Zonisamide 100 mg Zonegran 100mg capsules | 56 capsule [PoM](#)
£62.72 DT = £11.04

ANTIEPILEPTICS > BARBITURATES

Phenobarbital

(Phenobarbitone)

● **INDICATIONS AND DOSE**

All forms of epilepsy except typical absence seizures

▶ BY MOUTH

▶ Child 1 month-11 years: Initially 1–1.5 mg/kg twice daily, then increased in steps of 2 mg/kg daily as required; maintenance 2.5–4 mg/kg 1–2 times a day

▶ Child 12-17 years: 60–180 mg once daily

▶ Adult: 60–180 mg once daily, dose to be taken at night

Status epilepticus

▶ BY INTRAVENOUS INJECTION

▶ Adult: 10 mg/kg (max. per dose 1 g), dose to be administered at a rate not more than 100 mg/minute, injection to be diluted 1 in 10 with water for injections

▶ BY SLOW INTRAVENOUS INJECTION

▶ Neonate: Initially 20 mg/kg, dose to be administered at a rate no faster than 1 mg/kg/minute, then 2.5–5 mg/kg 1–2 times a day.

▶ Child 1 month-11 years: Initially 20 mg/kg, dose to be administered at a rate no faster than 1 mg/kg/minute, then 2.5–5 mg/kg 1–2 times a day

▶ Child 12-17 years: Initially 20 mg/kg (max. per dose 1 g), dose to be administered at a rate no faster than 1 mg/kg/minute, then 300 mg twice daily

DOSE EQUIVALENCE AND CONVERSION

▶ For therapeutic purposes phenobarbital and phenobarbital sodium may be considered equivalent in effect.

● **CAUTIONS** Avoid in Acute porphyrias p. 1025 · children · debilitated · elderly · history of alcohol abuse · history of drug abuse · respiratory depression (avoid if severe)

CAUTIONS, FURTHER INFORMATION Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

● **INTERACTIONS** → Appendix 1: antiepileptics

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

Agranulocytosis · anticonvulsant hypersensitivity syndrome · behaviour abnormal · bone disorders · bone fracture · cognitive impairment · confusion · depression · drowsiness · folate deficiency · hepatic disorders · memory loss · movement disorders · nystagmus · respiratory depression · skin reactions

SPECIFIC SIDE-EFFECTS

▶ With oral use Anxiety · hallucination · hypotension · megaloblastic anaemia · severe cutaneous adverse reactions (SCARs) · thrombocytopenia

▶ With parenteral use Agitation · anaemia · aplastic anaemia · Dupuytren's contracture · hypocalcaemia · irritability · toxic epidermal necrolysis

Overdose For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 1319.

● **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with phenobarbital. See under Epilepsy p. 304 for more information.

● **PREGNANCY**

Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

● **BREAST FEEDING** Avoid if possible; drowsiness may occur.

- **HEPATIC IMPAIRMENT** May precipitate coma. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS**
 - ▶ Plasma-phenobarbital concentration for optimum response is 15–40 mg/litre (60–180 micromol/litre); however, monitoring the plasma-drug concentration is less useful than with other drugs because tolerance occurs.
- **TREATMENT CESSATION** Avoid abrupt withdrawal (dependence with prolonged use).
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With oral use For administration by *mouth*, tablets may be crushed.
 - ▶ With intravenous use in adults Solution for injection must be diluted before intravenous administration.
 - ▶ With intravenous use in children For *intravenous injection*, dilute to a concentration of 20 mg/mL with Water for Injections; give over 20 minutes (no faster than 1 mg/kg/minute).
- **PRESCRIBING AND DISPENSING INFORMATION** Some hospitals supply **alcohol-free** formulations of varying phenobarbital strengths.
The RCPCH and NPPG recommend that, when a liquid special of phenobarbital is required, the following strength is used: 50 mg/5 mL.
Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients should be maintained on a specific manufacturer's product.

Primidone

• INDICATIONS AND DOSE

All forms of epilepsy except typical absence seizures

▶ BY MOUTH

- ▶ Child 1 month–1 year: Initially 125 mg daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 125–250 mg twice daily
- ▶ Child 2–4 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 250–375 mg twice daily
- ▶ Child 5–8 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 375–500 mg twice daily
- ▶ Child 9–17 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, increased to 250 mg twice daily, then increased in steps of 250 mg every 3 days (max. per dose 750 mg twice daily), adjusted according to response
- ▶ Adult: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, increased to 500 mg daily in 2 divided doses, then increased in steps of 250 mg every 3 days, adjusted according to response; maintenance 0.75–1.5 g daily in 2 divided doses

Essential tremor

▶ BY MOUTH

- ▶ Adult: Initially 50 mg daily, then adjusted according to response to up to 750 mg daily, dose to be increased over 2–3 weeks

- **CAUTIONS** Avoid in Acute porphyrias p. 1025 • children • debilitated • elderly • history of alcohol abuse • history of drug abuse • respiratory depression (avoid if severe)

CAUTIONS, FURTHER INFORMATION Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

- **INTERACTIONS** → Appendix 1: antiepileptics

• SIDE-EFFECTS

- ▶ **Common or very common** Apathy • ataxia • drowsiness • nausea • nystagmus • visual impairment
- ▶ **Uncommon** Dizziness • headache • hypersensitivity • skin reactions • vomiting
- ▶ **Rare or very rare** Arthralgia • blood disorder • bone disorders • Dupuytren's contracture • megaloblastic anaemia (may be treated with folic acid) • personality change • psychotic disorder • severe cutaneous adverse reactions (SCARs) • systemic lupus erythematosus (SLE)
- ▶ **Frequency not known** Bone fracture

- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with primidone. See under Epilepsy p. 304 for more information.

• PREGNANCY

Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **HEPATIC IMPAIRMENT** May precipitate coma.

Dose adjustments Reduce dose.

- **RENAL IMPAIRMENT** Use with caution.

• MONITORING REQUIREMENTS

- ▶ Monitor plasma concentrations of derived phenobarbital; plasma concentration for optimum response is 15–40 mg/litre (60–180 micromol/litre).

- **TREATMENT CESSATION** Avoid abrupt withdrawal (dependence with prolonged use).

● PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations. Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer's product.

HYPNOTICS, SEDATIVES AND ANXIOLYTICS > BENZODIAZEPINES**Clobazam**

07-Feb-2018

● INDICATIONS AND DOSE**Adjunct in epilepsy****▶ BY MOUTH**

- Child 6-17 years: Initially 5 mg daily, dose to be increased if necessary at intervals of 5 days, maintenance 0.3-1 mg/kg daily, daily doses of up to 30 mg may be given as a single dose at bedtime, higher doses should be divided; maximum 60 mg per day
- Adult: 20-30 mg daily, then increased if necessary up to 60 mg daily

Anxiety (short-term use)**▶ BY MOUTH**

- Adult: 20-30 mg daily in divided doses, alternatively 20-30 mg once daily, dose to be taken at bedtime; increased if necessary up to 60 mg daily in divided doses, dose only increased in severe anxiety (in hospital patients), for debilitated patients, use elderly dose
- Elderly: 10-20 mg daily

● UNLICENSED USE

- In children Not licensed as monotherapy.

IMPORTANT SAFETY INFORMATION**SAFE PRACTICE**

Clobazam has been confused with clonazepam; care must be taken to ensure the correct drug is prescribed and dispensed.

- CONTRA-INDICATIONS** Chronic psychosis (in adults) · hyperkinesia · not for use alone to treat anxiety associated with depression (in adults) · obsessional states · phobic states · respiratory depression

- CAUTIONS** Muscle weakness · organic brain changes
CAUTIONS, FURTHER INFORMATION The effectiveness of clobazam may decrease significantly after weeks or months of continuous therapy.

- INTERACTIONS** → Appendix 1: clobazam

- SIDE-EFFECTS** Appetite decreased · consciousness impaired · constipation · drug abuse · dry mouth · fall · fine tremor · gait unsteady · libido loss · movement disorders · muscle spasms · nystagmus · psychotic disorder · respiratory disorder · severe cutaneous adverse reactions (SCARs) · skin reactions · speech impairment · vision disorder · weight increased

- BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

Monitoring All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones.

- HEPATIC IMPAIRMENT** Can precipitate coma. Avoid in severe impairment.

Dose adjustments Start with smaller initial doses or reduce dose.

- RENAL IMPAIRMENT**

Dose adjustments Start with small doses in severe impairment.

- MONITORING REQUIREMENTS** Routine measurement of plasma concentrations of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. However, plasma drug concentrations may be measured in children with worsening seizures, status epilepticus, suspected noncompliance, or suspected toxicity. Similarly, haematological and biochemical monitoring should not be undertaken unless clinically indicated.

● PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic clobazam product.

- PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Clobazam for preventing seizures www.medicinesforchildren.org.uk/clobazam-preventing-seizures-0

- NATIONAL FUNDING/ACCESS DECISIONS**

NHS restrictions Clobazam is not prescribable in NHS primary care except for epilepsy and endorsed 'SLS'.

2.1 Status epilepticus

Other drugs used for Status epilepticus Diazepam, p. 340 · Fosphenytoin sodium, p. 313 · Phenobarbital, p. 331 · Phenytoin, p. 321

ANTI-EPILEPTICS > BARBITURATES

Thiopental sodium

(Thiopentone sodium)

● INDICATIONS AND DOSE

Status epilepticus (only if other measures fail)

► BY SLOW INTRAVENOUS INJECTION

- Adult: 75–125 mg for 1 dose, to be administered as a 2.5% (25 mg/mL) solution

Induction of anaesthesia

► BY SLOW INTRAVENOUS INJECTION

- Adult: Initially 100–150 mg, to be administered over 10–15 seconds usually as a 2.5% (25 mg/mL) solution, followed by 100–150 mg after 0.5–1 minute if required, dose to be given in fit and premedicated adults; debilitated patients or adults over 65 years may require a lower dose or increased administration time, alternatively initially up to 4 mg/kg (max. per dose 500 mg)

Anaesthesia of short duration

► BY SLOW INTRAVENOUS INJECTION

- Adult: Initially 100–150 mg, to be administered over 10–15 seconds usually as a 2.5% (25 mg/mL) solution, followed by 100–150 mg after 0.5–1 minute if required, dose to be given in fit and premedicated adults; debilitated patients or adults over 65 years may require a lower dose or increased administration time, alternatively initially up to 4 mg/kg (max. per dose 500 mg)

Reduction of raised intracranial pressure if ventilation controlled

► BY SLOW INTRAVENOUS INJECTION

- Adult: 1.5–3 mg/kg, repeated if necessary

IMPORTANT SAFETY INFORMATION

Thiopental sodium should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · myotonic dystrophy

- **CAUTIONS** Acute circulatory failure (shock) · avoid intra-arterial injection · cardiovascular disease · elderly · fixed cardiac output · hypovolaemia · reconstituted solution is highly alkaline (extravasation causes tissue necrosis and severe pain)

- **INTERACTIONS** → Appendix 1: thiopental

● SIDE-EFFECTS

- **Common or very common** Arrhythmia · myocardial contractility decreased
- **Frequency not known** Appetite decreased · circulatory collapse · cough · electrolyte imbalance · extravasation · hypotension · respiratory disorders · skin eruption · sneezing

- **PREGNANCY** May depress neonatal respiration when used during delivery.

- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

● HEPATIC IMPAIRMENT

Dose adjustments Use with caution—reduce dose.

- **RENAL IMPAIRMENT** Caution in severe impairment.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Powder for solution for injection

HYPNOTICS, SEDATIVES AND ANXIOLYTICS > BENZODIAZEPINES

339

Lorazepam

● INDICATIONS AND DOSE

Short-term use in anxiety

► BY MOUTH

- Adult: 1–4 mg daily in divided doses, for debilitated patients, use elderly dose
- Elderly: 0.5–2 mg daily in divided doses

Short-term use in insomnia associated with anxiety

► BY MOUTH

- Adult: 1–2 mg daily, to be taken at bedtime

Acute panic attacks

► BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION

- Adult: 25–30 micrograms/kg every 6 hours if required; usual dose 1.5–2.5 mg every 6 hours if required, intravenous injection to be administered into a large vein, only use intramuscular route when oral and intravenous routes not possible

Conscious sedation for procedures

► BY MOUTH

- Adult: 2–3 mg, to be taken the night before operation; 2–4 mg, to be taken 1–2 hours before operation

► BY SLOW INTRAVENOUS INJECTION

- Adult: 50 micrograms/kg, to be administered 30–45 minutes before operation

► BY INTRAMUSCULAR INJECTION

- Adult: 50 micrograms/kg, to be administered 60–90 minutes before operation

Premedication

► BY MOUTH

- Adult: 2–3 mg, to be taken the night before operation; 2–4 mg, to be taken 1–2 hours before operation

► BY SLOW INTRAVENOUS INJECTION

- Adult: 50 micrograms/kg, to be administered 30–45 minutes before operation

► BY INTRAMUSCULAR INJECTION

- Adult: 50 micrograms/kg, to be administered 60–90 minutes before operation

Status epilepticus | Febrile convulsions | Convulsions caused by poisoning

► BY SLOW INTRAVENOUS INJECTION

- Child 1 month–11 years: 100 micrograms/kg (max. per dose 4 mg) for 1 dose, then 100 micrograms/kg after 10 minutes (max. per dose 4 mg) if required for 1 dose, to be administered into a large vein

continued →

- ▶ Child 12–17 years: 4 mg for 1 dose, then 4 mg after 10 minutes if required for 1 dose, to be administered into a large vein
- ▶ Adult: 4 mg for 1 dose, then 4 mg after 10 minutes if required for 1 dose, to be administered into a large vein

● UNLICENSED USE

- ▶ In children Not licensed for use in febrile convulsions. Not licensed for use in convulsions caused by poisoning.

IMPORTANT SAFETY INFORMATION

ANAESTHESIA

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · chronic psychosis (in adults) · CNS depression · compromised airway · hyperkinesia · not for use alone to treat depression (or anxiety associated with depression) (in adults) · obsessional states · phobic states · respiratory depression

- **CAUTIONS** Muscle weakness · organic brain changes · parenteral administration

CAUTIONS, FURTHER INFORMATION

- ▶ Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.
- ▶ Special precautions for parenteral administration When given parenterally, facilities for managing respiratory depression with mechanical ventilation must be available. Close observation required until full recovery from sedation.

- **INTERACTIONS** → Appendix 1: lorazepam

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Apnoea · asthenia · coma · disinhibition · euphoric mood · extrapyramidal symptoms · hypothermia · memory loss · speech slurred · suicide attempt · vision blurred
- ▶ **Uncommon** Allergic dermatitis · constipation · sexual dysfunction
- ▶ **Rare or very rare** Agranulocytosis · hyponatraemia · pancytopenia · SIADH · thrombocytopenia

SPECIFIC SIDE-EFFECTS

- ▶ **Rare or very rare**
- ▶ With oral use Saliva altered
- ▶ **Frequency not known**
- ▶ With parenteral use Leucopenia

- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

- **HEPATIC IMPAIRMENT** Can precipitate coma. Avoid in severe impairment.

Dose adjustments Start with smaller initial doses or reduce dose.

- ▶ In adults If treatment is necessary, benzodiazepines with shorter half-lives are safer.

● RENAL IMPAIRMENT

Dose adjustments Start with small doses in severe impairment.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use in children For *intravenous injection*, dilute with an equal volume of Sodium Chloride 0.9% (for neonates, dilute injection solution to a concentration of 100 micrograms/mL). Give over 3–5 minutes; max. rate 50 micrograms/kg over 3 minutes.

- ▶ With intramuscular use in adults For intramuscular injection, solution for injection should be diluted with an equal volume of water for injections or sodium chloride 0.9% (but only use when oral and intravenous routes not possible).
- ▶ With intravenous use in adults For slow intravenous injection, solution for injection should preferably be diluted with an equal volume of water for injections or sodium chloride 0.9%.

● PATIENT AND CARER ADVICE

Driving and skilled tasks May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking **alcohol** should be emphasised.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol, propylene glycol

- ▶ **Ativan** (Pfizer Ltd)

Lorazepam 4 mg per 1 ml Ativan 4mg/1ml solution for injection ampoules | 10 ampoule [PoM] £3.54 [CD4-1]

Oral solution

CAUTIONARY AND ADVISORY LABELS 2, 19

EXCIPIENTS: May contain Ethanol

- ▶ **Lorazepam (Non-proprietary)**

Lorazepam 1 mg per 1 ml Lorazepam 1mg/ml oral solution sugar free sugar-free | 150 ml [PoM] £103.62 DT = £103.62 [CD4-1]

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 19

- ▶ **Lorazepam (Non-proprietary)**

Lorazepam 1 mg Lorazepam 1mg tablets | 28 tablet [PoM] £6.59 DT = £3.83 [CD4-1]

Lorazepam 2.5 mg Lorazepam 2.5mg tablets | 28 tablet [PoM] £11.43 DT = £9.14 [CD4-1]

Midazolam

21-Mar-2018

● INDICATIONS AND DOSE

Status epilepticus | Febrile convulsions

- ▶ BY BUCCAL ADMINISTRATION

- ▶ Child 1–2 months: 300 micrograms/kg (max. per dose 2.5 mg), then 300 micrograms/kg after 10 minutes (max. per dose 2.5 mg) if required
- ▶ Child 3–11 months: 2.5 mg, then 2.5 mg after 10 minutes if required
- ▶ Child 1–4 years: 5 mg, then 5 mg after 10 minutes if required
- ▶ Child 5–9 years: 7.5 mg, then 7.5 mg after 10 minutes if required
- ▶ Child 10–17 years: 10 mg, then 10 mg after 10 minutes if required
- ▶ Adult: 10 mg, then 10 mg after 10 minutes if required

Conscious sedation for procedures

- ▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: Initially 2–2.5 mg, to be administered 5–10 minutes before procedure at a rate of approximately 2 mg/minute, increased in steps of 1 mg if required, usual total dose is 3.5–5 mg; maximum 7.5 mg per course

- Elderly: Initially 0.5–1 mg, to be administered 5–10 minutes before procedure at a rate of approximately 2 mg/minute, increased in steps of 0.5–1 mg if required; maximum 3.5 mg per course

Sedative in combined anaesthesia

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- Adult: 30–100 micrograms/kg, repeated if necessary, alternatively (by continuous intravenous infusion) 30–100 micrograms/kg/hour
- Elderly: Lower doses needed

Premedication

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- Adult: 70–100 micrograms/kg, to be administered 20–60 minutes before induction, for debilitated patients, use elderly dose
- Elderly: 25–50 micrograms/kg, to be administered 20–60 minutes before induction
- ▶ BY INTRAVENOUS INJECTION
- Adult: 1–2 mg, repeated if necessary, to be administered 5–30 minutes before procedure, for debilitated patients, use elderly dose
- Elderly: 0.5 mg, repeated if necessary, initial dose to be administered 5–30 minutes before procedure, repeat dose slowly as required

Induction of anaesthesia (but rarely used)

- ▶ BY SLOW INTRAVENOUS INJECTION
- Adult: 150–200 micrograms/kg daily in divided doses (max. per dose 5 mg), dose to be given at intervals of 2 minutes, maximum total dose 600 micrograms/kg, for debilitated patients, use elderly dose
- Elderly: 50–150 micrograms/kg daily in divided doses (max. per dose 5 mg), dose to be given at intervals of 2 minutes, maximum total dose 600 micrograms/kg

Sedation of patient receiving intensive care

- ▶ INITIALLY BY SLOW INTRAVENOUS INJECTION
- Adult: Initially 30–300 micrograms/kg, dose to be given in steps of 1–2.5 mg every 2 minutes, then (by slow intravenous injection or by continuous intravenous infusion) 30–200 micrograms/kg/hour, reduce dose (or reduce or omit initial dose) in hypovolaemia, vasoconstriction, or hypothermia, lower doses may be adequate if opioid analgesic also used

Confusion and restlessness in palliative care (adjunct to antipsychotic)

- ▶ BY SUBCUTANEOUS INFUSION
- Adult: Initially 10–20 mg/24 hours, adjusted according to response; usual dose 20–60 mg/24 hours

Convulsions in palliative care

- ▶ BY CONTINUOUS SUBCUTANEOUS INFUSION
- Adult: Initially 20–40 mg/24 hours

- **UNLICENSED USE** Oromucosal solution not licensed for use in children under 3 months. Oromucosal solution not licensed for use in adults over 18 years. Unlicensed oromucosal formulations are also available and may have different doses—refer to product literature.

IMPORTANT SAFETY INFORMATION

ANAESTHESIA

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

PRESCRIBING OF MIDAZOLAM IN PALLIATIVE CARE

The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be considered in palliative care and other situations where a higher strength may be more

appropriate to administer the prescribed dose, and where the risk of overs dosage has been assessed. It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

- **CONTRA-INDICATIONS** CNS depression · compromised airway · severe respiratory depression
- **CAUTIONS** Cardiac disease · children (particularly if cardiovascular impairment) · concentration of midazolam in children under 15 kg not to exceed 1 mg/mL (in debilitated patients (reduce dose)(in children) · hypothermia · hypovolaemia (risk of severe hypotension) · neonates · risk of airways obstruction and hypoventilation in children under 6 months (monitor respiratory rate and oxygen saturation) · vasoconstriction

CAUTIONS, FURTHER INFORMATION

- ▶ Recovery when used for sedation Midazolam has a fast onset of action, recovery is faster than for other benzodiazepines such as diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing.

- **INTERACTIONS** → Appendix 1: midazolam

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Level of consciousness decreased · vomiting
- ▶ **Uncommon** Skin reactions
- ▶ **Rare or very rare** Apnoea · bradycardia · cardiac arrest · constipation · dry mouth · dyspnoea · euphoric mood · hiccups · hostility · movement disorders · physical assault · respiratory disorders · vasodilation
- ▶ **Frequency not known** Appetite increased · disinhibition (severe; with sedative and peri-operative use) (in children) · embolism and thrombosis · fall · saliva altered

SPECIFIC SIDE-EFFECTS

- ▶ With parenteral use Angioedema · drug abuse · drug tolerance · drug withdrawal seizure

SIDE-EFFECTS, FURTHER INFORMATION Higher doses are associated with prolonged sedation and risk of hypoventilation. The co-administration of midazolam with other sedative, hypnotic, or CNS-depressant drugs results in increased sedation. Midazolam accumulates in adipose tissue, which can significantly prolong sedation, especially in patients with obesity, hepatic impairment or renal impairment.

Overdose There have been reports of overs dosage when high strength midazolam has been used for conscious sedation. The use of high-strength midazolam (5mg/mL in 2mL and 10mL ampoules, or 2mg/mL in 5mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

- **BREAST FEEDING** Small amount present in milk—avoid breast-feeding for 24 hours after administration (although amount probably too small to be harmful after single doses).
- **HEPATIC IMPAIRMENT** Use with caution particularly in sedative doses; can precipitate coma. For status epilepticus and febrile convulsions: use with caution in mild to moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in chronic renal failure.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Hypnovel®), give continuously in Glucose 5% or Sodium chloride 0.9%.

● PRESCRIBING AND DISPENSING INFORMATION

Palliative care For further information on the use of midazolam in palliative care, see www.palliativedrugs.com/formulary/en/midazolam.html.

● PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer midazolam oromucosal solution.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking **alcohol** should be emphasised.

Medicines for Children leaflet: Midazolam for stopping seizures www.medicinesforchildren.org.uk/midazolam-for-stopping-seizures

● NATIONAL FUNDING/ACCESS DECISIONS

EPISTATUS OROMUCOSAL SOLUTION

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2017) that midazolam oromucosal solution (*Epistatus*®) is accepted for use within NHS Scotland for the treatment of prolonged, acute, convulsive seizures in patients aged 10 years to less than 18 years.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oromucosal solution, solution for injection, infusion, solution for infusion

Solution for injection

► Midazolam (Non-proprietary)

Midazolam (as Midazolam hydrochloride) 1 mg per 1 ml Midazolam 5mg/5ml solution for injection ampoules | 10 ampoule [PoM] £16.89 DT = £8.18 [CD3]
Midazolam 2mg/2ml solution for injection ampoules | 10 ampoule [PoM] £5.00 DT = £5.00 [CD3]

Midazolam (as Midazolam hydrochloride) 2 mg per 1 ml Midazolam 10mg/5ml solution for injection ampoules | 10 ampoule [PoM] £6.75 DT = £6.89 (Hospital only) [CD3] | 10 ampoule [PoM] £6.94 DT = £6.89 [CD3]

Midazolam (as Midazolam hydrochloride) 5 mg per 1 ml Midazolam 50mg/10ml solution for injection ampoules | 10 ampoule [PoM] £33.77 DT = £29.41 [CD3]
Midazolam 10mg/2ml solution for injection ampoules | 10 ampoule [PoM] £7.65 DT = £6.02 [CD3]

► Hypnovel (Roche Products Ltd)

Midazolam (as Midazolam hydrochloride) 5 mg per 1 ml Hypnovel 10mg/2ml solution for injection ampoules | 10 ampoule [PoM] £7.11 DT = £6.02 [CD3]

Solution for infusion

► Midazolam (Non-proprietary)

Midazolam (as Midazolam hydrochloride) 1 mg per 1 ml Midazolam 50mg/50ml solution for infusion vials | 1 vial [PoM] £9.56-£11.00 [CD3]

Midazolam (as Midazolam hydrochloride) 2 mg per 1 ml Midazolam 100mg/50ml solution for infusion vials | 1 vial [PoM] £9.05-£12.50 [CD3]

Oromucosal solution

CAUTIONARY AND ADVISORY LABELS 2

EXCIPIENTS: May contain Ethanol

► Buccolam (Shire Pharmaceuticals Ltd)

Midazolam (as Midazolam hydrochloride) 5 mg per 1 ml Buccolam 7.5mg/1.5ml oromucosal solution pre-filled oral syringes sugar-free | 4 unit dose [PoM] £89.00 DT = £89.00 [CD3]
Buccolam 10mg/2ml oromucosal solution pre-filled oral syringes sugar-free | 4 unit dose [PoM] £91.50 DT = £91.50 [CD3]
Buccolam 5mg/1ml oromucosal solution pre-filled oral syringes sugar-free | 4 unit dose [PoM] £85.50 DT = £85.50 [CD3]
Buccolam 2.5mg/0.5ml oromucosal solution pre-filled oral syringes sugar-free | 4 unit dose [PoM] £82.00 DT = £82.00 [CD3]

► Epistatus (Special Products Ltd)

Midazolam (as Midazolam maleate) 10 mg per 1 ml Epistatus 10mg/1ml oromucosal solution pre-filled oral syringes sugar-free | 1 unit dose [PoM] £45.76 DT = £45.76 [CD3]

3.1 Anxiety

Other drugs used for Anxiety

Duloxetine, p. 364 • Escitalopram, p. 361 • Lorazepam, p. 335 • Moclobemide, p. 359 • Oxprenolol hydrochloride, p. 149 • Paroxetine, p. 363 • Pericyazine, p. 384 • Perphenazine, p. 384 • Pregabalin, p. 322 • Trazodone hydrochloride, p. 366 • Trifluoperazine, p. 387 • Venlafaxine, p. 365

ANTIDEPRESSANTS > SEROTONIN RECEPTOR AGONISTS

Buspirone hydrochloride

● INDICATIONS AND DOSE

Anxiety (short-term use)

► BY MOUTH

► **Adult:** 5 mg 2–3 times a day, increased if necessary up to 45 mg daily, dose to be increased at intervals of 2–3 days; usual dose 15–30 mg daily in divided doses

DOSE ADJUSTMENTS DUE TO INTERACTIONS

► Manufacturer advises reduce dose to 2.5 mg twice daily with concurrent use of potent inhibitors of CYP3A4.

● CONTRA-INDICATIONS

Epilepsy

● CAUTIONS

Does not alleviate symptoms of benzodiazepine withdrawal

CAUTIONS, FURTHER INFORMATION A patient taking a benzodiazepine still needs to have the benzodiazepine withdrawn gradually; it is advisable to do this before starting buspirone.

● INTERACTIONS

→ Appendix 1: buspirone

● SIDE-EFFECTS

► **Common or very common** Abdominal pain • anger • anxiety • chest pain • cold sweat • concentration impaired • confusion • constipation • depression • diarrhoea • dizziness • drowsiness • dry mouth • fatigue • headache • laryngeal pain • movement disorders • musculoskeletal pain • nasal congestion • nausea • paraesthesia • skin reactions • sleep disorders • tachycardia • tinnitus • tremor • vision disorders • vomiting

► **Rare or very rare** Depersonalisation • emotional lability • galactorrhoea • hallucination • memory loss • parkinsonism • psychotic disorder • seizure • serotonin syndrome • syncope • urinary retention

● PREGNANCY

Avoid.

● BREAST FEEDING

Avoid.

● HEPATIC IMPAIRMENT

Avoid in severe disease.

Dose adjustments Reduce dose in mild to moderate disease.

● RENAL IMPAIRMENT

Avoid if eGFR less than 20 mL/minute/1.73 m².

Dose adjustments Reduce dose.

● PATIENT AND CARER ADVICE

Driving and skilled tasks May affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

Buspirone hydrochloride (Non-proprietary)

Buspirone hydrochloride 5 mg Buspirone 5mg tablets | 30 tablet [PoM] £13.30 DT = £4.92

Buspirone hydrochloride 10 mg Buspirone 10mg tablets | 30 tablet [PoM] £15.62 DT = £4.27

HYPNOTICS, SEDATIVES AND ANXIOLYTICS > BENZODIAZEPINES

Benzodiazepines

- **CONTRA-INDICATIONS** Acute pulmonary insufficiency · marked neuromuscular respiratory weakness · sleep apnoea syndrome · unstable myasthenia gravis
- **CAUTIONS** Avoid prolonged use (and abrupt withdrawal thereafter) · debilitated patients (reduce dose)(in adults) · elderly (reduce dose) · history of alcohol dependence or abuse · history of drug dependence or abuse · myasthenia gravis · personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence · respiratory disease

CAUTIONS, FURTHER INFORMATION

- ▶ **Paradoxical effects** A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

SIDE-EFFECTS

- ▶ **Common or very common** Alertness decreased · anxiety · ataxia (more common in elderly) · confusion (more common in elderly) · depression · dizziness · drowsiness · dysarthria · fatigue · gastrointestinal disorder · headache · hypotension · mood altered · muscle weakness · nausea · sleep disorders · suicidal ideation · tremor · vertigo · vision disorders · withdrawal syndrome
- ▶ **Uncommon** Agitation (more common in children and elderly) · anterograde amnesia · behaviour abnormal · hallucination · libido disorder · rash · urinary disorders
- ▶ **Rare or very rare** Aggression (more common in children and elderly) · blood disorder · delusions · jaundice · paradoxical drug reaction · psychosis · respiratory depression (particularly with high dose and intravenous use · facilities for its treatment are essential) · restlessness (frequency not known in children, with sedative and peri-operative use)
- ▶ **Frequency not known** Drug dependence
- Overdose** Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. For details on the management of poisoning, see Benzodiazepines, under Emergency treatment of poisoning p. 1319.

- **PREGNANCY** Risk of neonatal withdrawal symptoms when used during pregnancy. Avoid regular use and use only if there is a clear indication such as seizure control. High doses administered during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

- **RENAL IMPAIRMENT** Increased cerebral sensitivity to benzodiazepines.

PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including benzodiazepines, see *Drugs and driving* under Guidance on prescribing p. 1.

above

20-Jul-2017

Alprazolam

INDICATIONS AND DOSE

Short-term use in anxiety

- ▶ **BY MOUTH**
- ▶ **Adult:** 250–500 micrograms 3 times a day, increased if necessary up to 3 mg daily, for debilitated patients, use elderly dose
- ▶ **Elderly:** 250 micrograms 2–3 times a day, increased if necessary up to 3 mg daily

- **CONTRA-INDICATIONS** Chronic psychosis · hyperkinesia · not for use alone to treat depression (or anxiety associated with depression) · obsessional states · phobic states · respiratory depression
- **CAUTIONS** Muscle weakness · organic brain changes
- **INTERACTIONS** → Appendix 1: alprazolam
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Appetite decreased · concentration impaired · constipation · dermatitis · disorientation · dry mouth · hypersomnia · lethargy · memory loss · movement disorders · nervousness · sexual dysfunction · vision blurred · weight changes
 - ▶ **Uncommon** Menstruation irregular · mood altered
 - ▶ **Frequency not known** Angioedema · autonomic dysfunction · drug tolerance · hepatic disorders · hostility · hyperprolactinaemia · peripheral oedema · photosensitivity reaction · suicide · thinking abnormal
- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.
- **HEPATIC IMPAIRMENT** Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives (such as temazepam or oxazepam) are safer. Avoid in severe impairment.
- Dose adjustments** Start with smaller initial doses or reduce dose.
- **RENAL IMPAIRMENT**
 - Dose adjustments** Start with small doses in severe impairment.
- **PATIENT AND CARER ADVICE**
 - Driving and skilled tasks** May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - NHS restrictions** Alprazolam tablets are not prescribable in NHS primary care.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Chlordiazepoxide hydrochloride

20-Jul-2017

● INDICATIONS AND DOSE

Short-term use in anxiety

► BY MOUTH

- Adult: 10 mg 3 times a day, increased if necessary to 60–100 mg daily in divided doses, for debilitated patients, use elderly dose
- Elderly: 5 mg 3 times a day, increased if necessary to 30–50 mg daily in divided doses

Treatment of alcohol withdrawal in moderate dependence

► BY MOUTH

- Adult: 10–30 mg 4 times a day, dose to be gradually reduced over 5–7 days, consult local protocols for titration regimens

Treatment of alcohol withdrawal in severe dependence

► BY MOUTH

- Adult: 10–50 mg 4 times a day and 10–40 mg as required for the first 2 days, dose to be gradually reduced over 7–10 days, consult local protocols for titration regimens; maximum 250 mg per day

- **CONTRA-INDICATIONS** Chronic psychosis · hyperkinesia · not for use alone to treat depression (or anxiety associated with depression) · obsessional states · phobic states · respiratory depression

- **CAUTIONS** Muscle weakness · organic brain changes

- **INTERACTIONS** → Appendix 1: chlordiazepoxide

● SIDE-EFFECTS

- Common or very common Movement disorders
- Rare or very rare Abdominal distress · agranulocytosis · bone marrow disorders · erectile dysfunction · leucopenia · menstrual disorder · skin eruption · thrombocytopenia
- Frequency not known Appetite increased · gait abnormal · increased risk of fall · level of consciousness decreased · memory loss · psychotic disorder · saliva altered · suicide attempt

- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

- **HEPATIC IMPAIRMENT** Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives (such as temazepam or oxazepam) are safer. Avoid in severe impairment.

Dose adjustments Start with smaller initial doses or reduce dose.

● RENAL IMPAIRMENT

Dose adjustments Start with small doses in severe impairment.

● PATIENT AND CARER ADVICE

Driving and skilled tasks May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; chlordiazepoxide increases the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

● NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions *Librium*® is not prescribable in NHS primary care.

Diazepam

21-Nov-2016

● INDICATIONS AND DOSE

Muscle spasm of varied aetiology

► BY MOUTH

- Adult: 2–15 mg daily in divided doses, then increased if necessary to 60 mg daily, adjusted according to response, dose only increased in spastic conditions

Acute muscle spasm

► BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION

- Adult: 10 mg, then 10 mg after 4 hours if required, intravenous injection to be administered into a large vein at a rate of no more than 5 mg/minute

Tetanus

► BY INTRAVENOUS INJECTION

- Child: 100–300 micrograms/kg every 1–4 hours
- Adult: 100–300 micrograms/kg every 1–4 hours
- BY INTRAVENOUS INFUSION, OR BY NASODUODENAL TUBE
- Child: 3–10 mg/kg, adjusted according to response, to be given over 24 hours
- Adult: 3–10 mg/kg, adjusted according to response, to be given over 24 hours

Muscle spasm in cerebral spasticity or in postoperative skeletal muscle spasm

► BY MOUTH

- Child 1–11 months: Initially 250 micrograms/kg twice daily
- Child 1–4 years: Initially 2.5 mg twice daily
- Child 5–11 years: Initially 5 mg twice daily
- Child 12–17 years: Initially 10 mg twice daily; maximum 40 mg per day

Anxiety

► BY MOUTH

- Adult: 2 mg 3 times a day, then increased if necessary to 15–30 mg daily in divided doses, for debilitated patients, use elderly dose
- Elderly: 1 mg 3 times a day, then increased if necessary to 7.5–15 mg daily in divided doses

Insomnia associated with anxiety

► BY MOUTH

- Adult: 5–15 mg daily, to be taken at bedtime

Severe acute anxiety | Control of acute panic attacks |

Acute alcohol withdrawal

► BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION

- Adult: 10 mg, then 10 mg after at least 4 hours if required, intravenous injection to be administered into a large vein, at a rate of not more than 5 mg/minute

Acute drug-induced dystonic reactions

► BY INTRAVENOUS INJECTION

- Adult: 5–10 mg, then 5–10 mg after at least 10 minutes as required, to be administered into a large vein, at a rate of not more than 5 mg/minute

Acute anxiety and agitation

- ▶ BY RECTUM
- ▶ Adult: 500 micrograms/kg, then 500 micrograms/kg after 12 hours as required
- ▶ Elderly: 250 micrograms/kg, then 250 micrograms/kg after 12 hours as required

Premedication

- ▶ BY MOUTH
- ▶ Adult: 5–10 mg, to be given 1–2 hours before procedure, for debilitated patients, use elderly dose
- ▶ Elderly: 2.5–5 mg, to be given 1–2 hours before procedure
- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 100–200 micrograms/kg, to be administered into a large vein at a rate of not more than 5 mg/minute, immediately before procedure

Sedation in dental procedures carried out in hospital

- ▶ BY MOUTH
- ▶ Adult: Up to 20 mg, to be given 1–2 hours before procedure

Conscious sedation for procedures, and in conjunction with local anaesthesia

- ▶ BY MOUTH
- ▶ Adult: 5–10 mg, to be given 1–2 hours before procedure, for debilitated patients, use elderly dose
- ▶ Elderly: 2.5–5 mg, to be given 1–2 hours before procedure

Sedative cover for minor surgical and medical procedures

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 10–20 mg, to be administered into a large vein over 2–4 minutes, immediately before procedure

Status epilepticus | Febrile convulsions | Convulsions due to poisoning

- ▶ BY INTRAVENOUS INJECTION
- ▶ Neonate: 300–400 micrograms/kg, then 300–400 micrograms/kg after 10 minutes if required, to be given over 3–5 minutes.

- ▶ Child 1 month–11 years: 300–400 micrograms/kg (max. per dose 10 mg), then 300–400 micrograms/kg after 10 minutes if required, to be given over 3–5 minutes
- ▶ Child 12–17 years: 10 mg, then 10 mg after 10 minutes if required, to be given over 3–5 minutes
- ▶ Adult: 10 mg, then 10 mg after 10 minutes if required, administered at a rate of 1 mL (5 mg) per minute
- ▶ BY RECTUM

- ▶ Neonate: 1.25–2.5 mg, then 1.25–2.5 mg after 10 minutes if required.

- ▶ Child 1 month–1 year: 5 mg, then 5 mg after 10 minutes if required
- ▶ Child 2–11 years: 5–10 mg, then 5–10 mg after 10 minutes if required
- ▶ Child 12–17 years: 10–20 mg, then 10–20 mg after 10 minutes if required
- ▶ Adult: 10–20 mg, then 10–20 mg after 10–15 minutes if required
- ▶ Elderly: 10 mg, then 10 mg after 10–15 minutes if required

Life-threatening acute drug-induced dystonic reactions

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 1 month–11 years: 100 micrograms/kg, repeated if necessary, to be given over 3–5 minutes
- ▶ Child 12–17 years: 5–10 mg, repeated if necessary, to be given over 3–5 minutes

Dyspnoea associated with anxiety in palliative care

- ▶ BY MOUTH
- ▶ Adult: 5–10 mg daily

Pain of muscle spasm in palliative care

- ▶ BY MOUTH
- ▶ Adult: 5–10 mg daily

- **UNLICENSED USE** *Diazepam Desitin*®, *Diazepam Rectubes*®, and *Stesolid Rectal Tubes*® not licensed for use in children under 1 year.

IMPORTANT SAFETY INFORMATION**ANAESTHESIA**

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · chronic psychosis (in adults) · CNS depression · compromised airway · hyperkinesia · not for use alone to treat depression (or anxiety associated with depression) (in adults) · obsessional states · phobic states · respiratory depression

CAUTIONS

GENERAL CAUTIONS Muscle weakness · organic brain changes · parenteral administration (close observation required until full recovery from sedation)

SPECIFIC CAUTIONS

- ▶ With intravenous use high risk of venous thrombophlebitis with intravenous use (reduced by using an emulsion formulation)

CAUTIONS, FURTHER INFORMATION

- ▶ Special precautions for intravenous injection When given intravenously facilities for reversing respiratory depression with mechanical ventilation must be immediately available.

- **INTERACTIONS** → Appendix 1: diazepam

SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Appetite abnormal · movement disorders · muscle spasms · palpitations · sensory disorder
- ▶ **Uncommon** Concentration impaired · constipation · diarrhoea · hypersalivation · skin reactions · speech slurred · vomiting
- ▶ **Rare or very rare** Bradycardia · bronchial secretion increased · cardiac arrest · dry mouth · gynaecomastia · heart failure · leucopenia · loss of consciousness · memory loss · psychiatric disorder · respiratory arrest · sexual dysfunction · syncope
- ▶ **Frequency not known** Apnoea · nystagmus · vision blurred

SPECIFIC SIDE-EFFECTS

- ▶ With intramuscular use Chest pain · embolism and thrombosis · fall · increased risk of dementia · rebound effect
- **PREGNANCY** Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol.
Epilepsy and Pregnancy Register All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

- **BREAST FEEDING** Present in milk, and should be avoided if possible during breast-feeding.

- **HEPATIC IMPAIRMENT** Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half lives are safer, such as temazepam or oxazepam. Avoid in severe impairment.

Dose adjustments Start with smaller initial doses or reduce dose.

- **RENAL IMPAIRMENT**

Dose adjustments Start with small doses in severe impairment.

● DIRECTIONS FOR ADMINISTRATION

- With intravenous use Diazepam is adsorbed by plastics of infusion bags and giving sets. Emulsion formulation preferred for intravenous injection.
- With intravenous use in children For *continuous intravenous infusion* of diazepam emulsion, dilute to a concentration of max. 400 micrograms/mL with Glucose 5% or 10%; max. 6 hours between addition and completion of infusion. For *continuous intravenous infusion* of diazepam solution, dilute to a concentration of max. 50 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%.
- With intravenous use in adults For *intravenous infusion* (solution) (Diazepam, Wockhardt), give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of not more than 10 mg in 200 mL. For *intravenous infusion* (emulsion) (Diazemuls®), give continuously in Glucose 5% or 10%. May be diluted to a max. concentration of 200 mg in 500 mL; max. 6 hours between addition and completion of administration. May be given *via* drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%.
- With intramuscular use or intravenous use in adults Solution for injection should not be diluted, except for intravenous infusion.
- With intramuscular use in adults Only use intramuscular route when oral and intravenous routes not possible.

● PRESCRIBING AND DISPENSING INFORMATION

Palliative care For further information on the use of diazepam in palliative care, see www.palliativedrugs.com/formulary/en/diazepam.html.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Diazepam (rectal) for stopping seizures www.medicinesforchildren.org.uk/diazepam-rectal-stopping-seizures-0

Medicines for Children leaflet: Diazepam for muscle spasm www.medicinesforchildren.org.uk/diazepam-for-muscle-spasm

Driving and skilled tasks May impair judgement and increase reaction time, and so affect ability to drive or perform skilled tasks; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair performance on the following day.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking **alcohol** should be emphasised.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Diazepam Tablets may be prescribed.

Diazepam Oral Solution 2 mg/5 mL may be prescribed.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

Oxazepam

● INDICATIONS AND DOSE

Anxiety (short-term use)

► BY MOUTH

- Adult: 15–30 mg 3–4 times a day, for debilitated patients, use elderly dose
- Elderly: 10–20 mg 3–4 times a day

Insomnia associated with anxiety

► BY MOUTH

- Adult: 15–25 mg once daily (max. per dose 50 mg), dose to be taken at bedtime

- **CONTRA-INDICATIONS** Chronic psychosis · hyperkinesia · not for use alone to treat depression (or anxiety associated with depression) · obsessional states · phobic states · respiratory depression

- **CAUTIONS** Muscle weakness · organic brain changes

CAUTIONS, FURTHER INFORMATION

- Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

- **INTERACTIONS** → Appendix 1: oxazepam

- **SIDE-EFFECTS** Disorientation · dreaming excessive · fever · lethargy · leucopenia · memory loss · oedema · saliva altered · skin reactions · speech slurred · syncope · vision blurred

- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

- **HEPATIC IMPAIRMENT** Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives are safer. Avoid in severe impairment.

Dose adjustments Start with smaller initial doses or reduce dose.

- **RENAL IMPAIRMENT**

Dose adjustments Start with small doses in severe impairment.

- **PATIENT AND CARER ADVICE**

Driving and skilled tasks May impair judgement and increase reaction time, and so affect ability to drive or

operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

HYPNOTICS, SEDATIVES AND ANXIOLYTICS ► NON-BENZODIAZEPINE HYPNOTICS AND SEDATIVES

Meprobamate

06-Feb-2018

• INDICATIONS AND DOSE

Short-term use in anxiety—not recommended

► BY MOUTH

- Adult: 400 mg 3–4 times a day
- Elderly: Up to 200 mg 3–4 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: MEPROBAMATE: LICENCE TO BE CANCELLED (APRIL 2016)

Following an EU-wide review of meprobamate, the UK licence holder has ceased manufacturing and the licence is due to be cancelled by December 2016. No new stock will be released into the normal distribution chain after 31 December 2016, although existing stock placed on the market before that date is likely to be dispensed until the products approach their expiry date.

Prescribers should review the treatment of any patient who is currently receiving a meprobamate-containing medicine with a view to switching them to an alternative treatment, and not start any new patients on medicines that contain meprobamate.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · acute pulmonary insufficiency · respiratory depression
- **CAUTIONS** Abrupt withdrawal (may precipitate convulsions) · avoid prolonged use · debilitated · elderly · emotionally unstable personality (if taken over long periods)—increased risk of dependence · epilepsy (may induce seizures) · history of alcohol dependence · history of drug dependence · muscle weakness · respiratory disease
- **INTERACTIONS** → Appendix 1: meprobamate
- **SIDE-EFFECTS** Agitation · agranulocytosis · anal inflammation · ataxia · blood disorder · bone marrow disorders · dizziness · drowsiness · hypersensitivity · hypotension · nausea · paraesthesia · purpura non-thrombocytopenic · skin reactions · Stevens-Johnson syndrome · stomatitis · thrombocytopenia · vomiting · withdrawal syndrome
- **PREGNANCY** Avoid if possible.
- **BREAST FEEDING** Avoid. Concentration in milk may exceed maternal plasma concentrations fourfold and may cause drowsiness in infant.
- **HEPATIC IMPAIRMENT** Can precipitate coma.
- **RENAL IMPAIRMENT** Increased cerebral sensitivity.
Dose adjustments Start with small doses in severe impairment.

• PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

- **LESS SUITABLE FOR PRESCRIBING** Meprobamate is less suitable for prescribing.

3.2 Attention deficit hyperactivity disorder

Attention deficit hyperactivity disorder

01-Sep-2017

Description of condition

Attention deficit hyperactivity disorder (ADHD) is a behavioural syndrome characterised by hyperactivity, impulsivity and inattention, which can lead to psychological, social, educational or occupational impairment. While these symptoms tend to co-exist, some people are predominantly hyperactive and impulsive, while others are principally inattentive. Symptoms typically appear in children 3–7 years of age, but may not be recognised until after 7 years of age, especially if the predominant trait is inattention.

ADHD is usually a persisting disorder. Most older children with a sustained diagnosis will go on to have difficulties in adulthood, which may include continuing ADHD, personality disorders, emotional and social difficulties, and substance misuse.

Aims of treatment

The aims of treatment are to reduce functional impairment and the severity of symptoms, and to improve quality of life.

Drug treatment

[EvGr] Drug treatment, started by a specialist prescriber, is the first-line treatment for adults with ADHD with either moderate or severe levels of impairment. Methylphenidate hydrochloride p. 345 is the first-line drug. Psychological interventions without drug treatment may be effective for some patients with moderate impairment, but there are insufficient data to support this recommendation. If there is residual impairment despite some benefit from drug treatment, or there is no response to drug treatment, cognitive behavioural therapy (CBT) can be considered.

Atomoxetine p. 344 or dexamfetamine sulfate p. 347 should be considered in patients unresponsive or intolerant to methylphenidate (an adequate trial should usually be about 6 weeks). Where there may be concern about the potential for drug misuse and diversion, atomoxetine p. 344 may be used as first line. Further options for treatment include higher doses of methylphenidate hydrochloride p. 345 or atomoxetine p. 344; further or alternative psychological treatments; or referral to regional specialists for alternative drug treatment.

When starting drug treatment, patients should be monitored for side-effects. In particular, patients treated with atomoxetine p. 344 should be observed for agitation, irritability, suicidal thinking and self-harming behaviour, and unusual changes in behaviour, particularly during the

initial months of treatment, or after a change in dose. They should also be warned of potential liver damage in rare cases. Patients aged 30 years or younger should also be warned of the potential of atomoxetine below to increase agitation, anxiety, suicidal thinking and self-harming behaviour in some people, especially during the first few weeks of treatment.

For patients with ADHD stabilised on drug treatment but with persisting functional impairment associated with the disorder, or where there has been no response to drug treatment, a course of either group or individual CBT to address the patient's functional impairment should be considered.

Following an adequate response, drug treatment for ADHD should be continued for as long as it is clinically effective. Treatment should be reviewed annually. 

Related drugs

Other drugs used for attention deficit hyperactivity disorder: guanfacine p. 349, imipramine hydrochloride p. 372, lisdexamfetamine mesilate p. 348.

Atomoxetine

28-Sep-2016

● INDICATIONS AND DOSE

Attention deficit hyperactivity disorder (initiated by a specialist)

► BY MOUTH

- Child 6–17 years (body-weight up to 70 kg): Initially 500 micrograms/kg daily for 7 days, dose is increased according to response; maintenance 1.2 mg/kg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 1.8 mg/kg per day; maximum 120 mg per day
- Child 6–17 years (body-weight 70 kg and above): Initially 40 mg daily for 7 days, dose is increased according to response; maintenance 80 mg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 120 mg per day
- Adult (body-weight up to 70 kg): Initially 500 micrograms/kg daily for 7 days, dose is increased according to response; maintenance 1.2 mg/kg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 1.8 mg/kg per day; maximum 120 mg per day
- Adult (body-weight 70 kg and above): Initially 40 mg daily for 7 days, dose is increased according to response; maintenance 80–100 mg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 120 mg per day

- **UNLICENSED USE** Atomoxetine doses in BNF may differ from those in product literature.
- In children Doses above 100 mg daily not licensed.

- In adults Dose maximum of 120 mg not licensed.
- **CONTRA-INDICATIONS** Phaeochromocytoma • severe cardiovascular disease • severe cerebrovascular disease
- **CAUTIONS** QT-interval prolongation • aggressive behaviour • cardiovascular disease • cerebrovascular disease • emotional lability • history of seizures • hostility • hypertension • mania • psychosis • structural cardiac abnormalities • susceptibility to angle-closure glaucoma • tachycardia
- **INTERACTIONS** → Appendix 1: atomoxetine
- **SIDE-EFFECTS**
 - **Common or very common** Anxiety • appetite decreased • arrhythmias (uncommon in children) • asthenia • chills (in adults) • constipation • depression • dizziness • drowsiness • dry mouth (in adults) • feeling jittery (in adults) • flatulence (in adults) • gastrointestinal discomfort • genital pain (rare in children) • headaches • hyperhidrosis (uncommon in children) • menstrual cycle irregularities (in adults) • mood altered • mydriasis (in children) • nausea • palpitations (uncommon in children) • prostatitis (in adults) • sensation abnormal (uncommon in children) • sexual dysfunction (rare in children) • skin reactions • sleep disorders • taste altered (in adults) • thirst (in adults) • tremor (uncommon in children) • urinary disorders (rare in children) • vasodilation (in adults) • vomiting • weight decreased
 - **Uncommon** Behaviour abnormal • chest pain (very common in children) • dyspnoea • feeling cold (in adults) • hypersensitivity • muscle spasms (in adults) • peripheral coldness (in adults) • QT interval prolongation • suicidal behaviour • syncope • tic (very common in children) • vision blurred
 - **Rare or very rare** Hallucination (uncommon in children) • hepatic disorders • psychosis (uncommon in children) • Raynaud's phenomenon • seizure (uncommon in children)
 - **Frequency not known** Sudden cardiac death
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Avoid-present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT**
 - Dose adjustments** Halve dose in moderate impairment. Quarter dose in severe impairment.
- **MONITORING REQUIREMENTS**
 - Monitor for appearance or worsening of anxiety, depression or tics.
 - Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.
- **PATIENT AND CARER ADVICE**
 - Medicines for Children leaflet: Atomoxetine for attention deficit hyperactivity disorder (ADHD) www.medicinesforchildren.org.uk/atomoxetine-attention-deficit-hyperactivity-disorder-adhd
 - Suicidal ideation Following reports of suicidal thoughts and behaviour, patients and their carers should be informed about the risk and told to report clinical worsening, suicidal thoughts or behaviour, irritability, agitation, or depression.
 - Hepatic impairment Following rare reports of hepatic disorders, patients and carers should be advised of the risk and be told how to recognise symptoms; prompt medical attention should be sought in case of abdominal pain, unexplained nausea, malaise, darkening of the urine, or jaundice.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Methylphenidate, atomoxetine and dexamfetamine for attention deficit hyperactivity disorder (ADHD)** (March 2006) NICE TA98

Atomoxetine is recommended, within its licensed indications, as an option for the management of ADHD in children and adolescents.

www.nice.org.uk/TA98

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2015) that atomoxetine oral solution (*Strattera*®) is accepted for restricted use, within its licensed indications, for treating patients who are unable to swallow capsules.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

Methylphenidate hydrochloride 03-Oct-2017

● INDICATIONS AND DOSE

Attention deficit hyperactivity disorder (initiated under specialist supervision)

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- **Child 6–17 years:** Initially 5 mg 1–2 times a day, increased in steps of 5–10 mg daily if required, at weekly intervals, increased if necessary up to 60 mg daily in 2–3 divided doses, increased if necessary up to 2.1 mg/kg daily in 2–3 divided doses, the licensed maximum dose is 60 mg daily in 2–3 doses, higher dose (up to a maximum of 90 mg daily) under the direction of a specialist, discontinue if no response after 1 month, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose). Treatment may be started using a modified-release preparation
- **Adult:** Initially 5 mg 2–3 times a day, dose is increased if necessary at weekly intervals according to response, increased if necessary up to 100 mg daily in 2–3 divided doses, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose). Treatment may be started using a modified-release preparation

Narcolepsy

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- **Adult:** 10–60 mg daily in divided doses; usual dose 20–30 mg daily in divided doses, dose to be taken before meals

DOSE EQUIVALENCE AND CONVERSION

- When switching from *immediate-release* preparations to *modified-release* preparations—consult product literature.

CONCERTA® XL

Attention deficit hyperactivity disorder

- **BY MOUTH**

- **Child 6–17 years:** Initially 18 mg once daily, dose to be taken in the morning, increased in steps of 18 mg every week, adjusted according to response; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 54 mg once daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 108 mg per day
- **Adult:** Initially 18 mg once daily, dose to be taken in the morning; adjusted at weekly intervals according to response; maximum 108 mg per day

DOSE EQUIVALENCE AND CONVERSION

- Total daily dose of 15 mg of standard-release formulation is considered equivalent to *Concerta*® XL 18 mg once daily.

DELMOSART® PROLONGED-RELEASE TABLET

Attention deficit hyperactivity disorder (under expert supervision)

- **BY MOUTH**

- **Child 6–17 years:** Initially 18 mg once daily, dose to be taken in the morning, then increased in steps of 18 mg every week if required, discontinue if no response after 1 month; maximum 54 mg per day
- **Adult:** Initially 18 mg once daily, dose to be taken in the morning, then increased in steps of 18 mg every week if required, discontinue if no response after 1 month; maximum 54 mg per day

DOSE EQUIVALENCE AND CONVERSION

- Total daily dose of 15 mg of standard-release formulation is considered equivalent to *Delmosart*® 18 mg once daily.

EQUASYM® XL

Attention deficit hyperactivity disorder

- **BY MOUTH**

- **Child 6–17 years:** Initially 10 mg once daily, dose to be taken in the morning before breakfast; increased gradually at weekly intervals if necessary; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day
- **Adult:** Initially 10 mg once daily, dose to be taken in the morning before breakfast; increased gradually at weekly intervals if necessary; maximum 100 mg per day

MEDIKINET® XL

Attention deficit hyperactivity disorder

- **BY MOUTH**

- **Child 6–17 years:** Initially 10 mg once daily, dose to be taken in the morning with breakfast; adjusted at weekly intervals according to response; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day
- **Adult:** Initially 10 mg once daily, dose to be taken in the morning with breakfast; adjusted at weekly intervals according to response; maximum 100 mg per day

continued →

XAGGITIN® XL**Attention deficit hyperactivity disorder (under expert supervision)**► **BY MOUTH**

- Child 6–17 years: Initially 18 mg once daily, dose to be taken in the morning, increased in steps of 18 mg every week, adjusted according to response, discontinue if no response after 1 month; maximum 54 mg per day
- Adult: Initially 18 mg once daily, dose to be taken in the morning, increased in steps of 18 mg every week, adjusted according to response, discontinue if no response after 1 month; maximum 54 mg per day

DOSE EQUIVALENCE AND CONVERSION

- Total daily dose of 15 mg of standard-release formulation is considered equivalent to *Xaggitin*® XL 18 mg once daily.

- **UNLICENSED USE** Doses over 60 mg daily not licensed; doses of *Concerta XL* over 54 mg daily not licensed. Not licensed for use in narcolepsy. Not licensed for use in adults for attention deficit hyperactivity disorder.
- **CONTRA-INDICATIONS** Anorexia nervosa · arrhythmias · cardiomyopathy · cardiovascular disease · cerebrovascular disorders · heart failure · hyperthyroidism · pheochromocytoma · psychosis · severe depression · severe hypertension · structural cardiac abnormalities · suicidal ideation · uncontrolled bipolar disorder · vasculitis
- **CAUTIONS** Agitation · alcohol dependence · anxiety · drug dependence · epilepsy (discontinue if increased seizure frequency) · family history of Tourette syndrome · susceptibility to angle-closure glaucoma · tics
- **CONCERTA® XL, DELMOSART® PROLONGED-RELEASE TABLET** Dysphagia (dose form not appropriate) · restricted gastro-intestinal lumen (dose form not appropriate)
- **XAGGITIN® XL** Dysphagia (dose form not appropriate)
- **INTERACTIONS** → Appendix 1: methylphenidate
- **SIDE-EFFECTS**
 - **Common or very common** Alopecia · anxiety · appetite decreased · arrhythmias · arthralgia · behaviour abnormal · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · fever · gastrointestinal discomfort · growth retardation (in children) · headaches · hypertension · laryngeal pain · mood altered · movement disorders · nasopharyngitis · nausea · palpitations · sleep disorders · vomiting · weight decreased
 - **Uncommon** Chest discomfort · constipation · dyspnoea · fatigue · haematuria · hallucinations · muscle complaints · psychotic disorder · suicidal tendencies · tic · tremor · vision disorders
 - **Rare or very rare** Anaemia · angina pectoris · cardiac arrest · cerebrovascular insufficiency · confusion · gynaecomastia · hepatic coma · hyperfocus · hyperhidrosis · leucopenia · mydriasis · myocardial infarction · neuroleptic malignant syndrome · peripheral coldness · Raynaud's phenomenon · seizures · sexual dysfunction · skin reactions · sudden cardiac death · thinking abnormal · thrombocytopenia
 - **Frequency not known** Delusions · drug dependence · hyperpyrexia · intracranial haemorrhage · logorrhea · pancytopenia · vasculitis
- **PREGNANCY** Limited experience—avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Limited information available—avoid.
- **MONITORING REQUIREMENTS**
 - Monitor for psychiatric disorders.
 - Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.

● DIRECTIONS FOR ADMINISTRATION

MEDIKINET® XL Contents of capsule can be sprinkled on a tablespoon of apple sauce or yoghurt (then swallowed immediately without chewing).

EQUASYM® XL Contents of capsule can be sprinkled on a tablespoon of apple sauce (then swallowed immediately without chewing).

- **PRESCRIBING AND DISPENSING INFORMATION** Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of methylphenidate, prescribers should specify the brand to be dispensed.

CONCERTA® XL Consists of an immediate-release component (22% of the dose) and a modified-release component (78% of the dose).

MEDIKINET® XL Consists of an immediate-release component (50% of the dose) and a modified-release component (50% of the dose).

EQUASYM® XL Consists of an immediate-release component (30% of the dose) and a modified-release component (70% of the dose).

● PATIENT AND CARER ADVICE**Driving and skilled tasks**

Drugs and Driving Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

2015 legislation regarding driving whilst taking certain drugs, may also apply to methylphenidate, see *Drugs and driving* under Guidance on prescribing p. 1.

CONCERTA® XL Tablet membrane may pass through gastro-intestinal tract unchanged.

DELMOSART® PROLONGED-RELEASE TABLET Manufacturer advises tablet membrane may pass through gastro-intestinal tract unchanged.

CNS STIMULANTS > CENTRALLY ACTING SYMPATHOMIMETICS > AMFETAMINES

Dexamfetamine sulfate

(Dexamphetamine sulfate)

● **INDICATIONS AND DOSE**

Narcolepsy

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 10 mg daily in divided doses, increased in steps of 10 mg every week, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day
- ▶ **Elderly:** Initially 5 mg daily in divided doses, increased in steps of 5 mg every week, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day

Refractory attention deficit hyperactivity disorder (initiated under specialist supervision)

▶ **BY MOUTH**

- ▶ **Child 6–17 years:** Initially 2.5 mg 2–3 times a day, increased in steps of 5 mg once weekly if required, increased if necessary up to 1 mg/kg daily, maintenance dose to be given in 2–4 divided doses, up to 20 mg daily (40 mg daily has been required in some children)
- ▶ **Adult:** Initially 5 mg twice daily, dose is increased at weekly intervals according to response, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day

- **UNLICENSED USE** Not licensed for use in adults for refractory attention deficit hyperactivity disorder.
- **CONTRA-INDICATIONS** Advanced arteriosclerosis (in adults) · agitated states · cardiovascular disease · history of alcohol abuse · history of drug abuse · hyperexcitability · hyperthyroidism · moderate hypertension · severe hypertension · structural cardiac abnormalities
- **CAUTIONS** Anorexia · bipolar disorder · history of epilepsy (discontinue if seizures occur) · mild hypertension · psychosis · susceptibility to angle-closure glaucoma · tics · Tourette syndrome
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Tics and Tourette syndrome Discontinue use if tics occur.
 - ▶ Growth restriction in children Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but withdraw slowly to avoid inducing depression or renewed hyperactivity).
- **INTERACTIONS** → Appendix 1: amfetamines
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anxiety · appetite decreased · arrhythmias · arthralgia · behaviour abnormal · depression · dry mouth · headache · mood altered · movement disorders · muscle cramps · nausea · palpitations · poor weight gain · sleep disorders · vertigo · vomiting · weight decreased
 - ▶ **Rare or very rare** Anaemia · angina pectoris · cardiac arrest · cerebrovascular insufficiency · fatigue · growth retardation · hallucination · hepatic coma · hepatic function abnormal · intracranial haemorrhage · leucopenia · mydriasis · psychosis · seizure · skin reactions · suicidal tendencies · thrombocytopenia · tic (in those at risk) · vasculitis cerebral · vision disorders
 - ▶ **Frequency not known** Acidosis · alopecia · cardiomyopathy · chest pain · circulatory collapse · colitis ischaemic · concentration impaired · confusion · diarrhoea · dizziness · drug dependence · drug tolerance · hyperhidrosis · hypermetabolism · hyperpyrexia · kidney injury · myocardial infarction · neuroleptic malignant syndrome · obsessive-compulsive disorder · reflexes increased · rhabdomyolysis · sexual dysfunction · sudden death · taste altered · tremor

Overdose Amfetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. See Stimulants under Emergency treatment of poisoning p. 1319.

- **PREGNANCY** Avoid (retrospective evidence of uncertain significance suggesting possible embryotoxicity).
- **BREAST FEEDING** Significant amount in milk—avoid.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor growth in children.
 - ▶ Monitor for aggressive behaviour or hostility during initial treatment.

- ▶ Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

● **TREATMENT CESSATION** Avoid abrupt withdrawal.

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ In children Tablets can be halved.

● **PRESCRIBING AND DISPENSING INFORMATION** Data on safety and efficacy of long-term use not complete.

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks

Drugs and Driving Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including amfetamines, see *Drugs and driving* under Guidance on prescribing p. 1.

Lisdexamfetamine mesilate

23-Jan-2018

- **DRUG ACTION** Lisdexamfetamine is a prodrug of dexamfetamine.

● INDICATIONS AND DOSE

Attention deficit hyperactivity disorder (initiated by a specialist)

▶ **BY MOUTH**

- ▶ Child 6-17 years: Initially 30 mg once daily, alternatively initially 20 mg once daily, increased in steps of 10-20 mg every week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day
- ▶ Adult: Initially 30 mg once daily, increased in steps of 20 mg every week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day

- **CONTRA-INDICATIONS** Advanced arteriosclerosis · agitated states · hyperthyroidism · moderate hypertension · severe hypertension · symptomatic cardiovascular disease

- **CAUTIONS** Bipolar disorder · history of cardiovascular disease · history of substance abuse · may lower seizure threshold (discontinue if seizures occur) · psychotic disorders · susceptibility to angle-closure glaucoma · tics · Tourette syndrome

CAUTIONS, FURTHER INFORMATION

- ▶ Cardiovascular disease Manufacturer advises caution in patients with underlying conditions that might be compromised by increases in blood pressure or heart rate; see also *Contra-indications*.

- **INTERACTIONS** → Appendix 1: amfetamines

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain upper · anxiety · appetite decreased · behaviour abnormal · constipation · diarrhoea · dizziness · dry mouth · dyspnoea · fatigue · feeling jittery · headache · hyperhidrosis (uncommon in children) · insomnia · mood altered · movement disorders (uncommon in children) · nausea · palpitations · sexual dysfunction (uncommon in children) · tachycardia · tremor · weight decreased
- ▶ **Uncommon** Depression (very common in children) · drowsiness (very common in children) · fever (very common in children) · logorrhoea · psychiatric disorders (very common in children) · skin reactions (very common in children) · taste altered · vision blurred · vomiting (very common in children)
- ▶ **Frequency not known** Angioedema · cardiomyopathy (uncommon in children) · drug dependence · drug tolerance · hallucination (uncommon in children) · hepatitis allergic · mydriasis (uncommon in children) · psychotic disorder · Raynaud's phenomenon (uncommon in children) · seizure · Stevens-Johnson syndrome

Overdose Amfetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. See Stimulants under Emergency treatment of poisoning p. 1319.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in human milk.
- **RENAL IMPAIRMENT**
Dose adjustments Manufacturer advises max. dose 50 mg daily in severe impairment.
- **MONITORING REQUIREMENTS**
- ▶ Manufacturer advises monitor for aggressive behaviour or hostility during initial treatment.
- ▶ Manufacturer advises monitor pulse, blood pressure, and for psychiatric symptoms before treatment initiation,

following each dose adjustment, and at least every 6 months thereafter. Monitor weight in adults before treatment initiation and during treatment; in children, height and weight should be recorded before treatment initiation, and height, weight and appetite monitored at least every 6 months during treatment.

- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises swallow whole or mix contents of capsule with soft food such as yoghurt or in a glass of water or orange juice; contents should be dispersed completely and consumed immediately.

- **PATIENT AND CARER ADVICE** Patients and carers should be counselled on the administration of capsules.

Driving and skilled tasks

Drugs and Driving Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including amfetamines, see *Drugs and driving* under Guidance on prescribing p. 1.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2013) that lisdexamfetamine dimesylate (*Elvanse*®) is accepted for use within NHS Scotland as part of a comprehensive treatment programme for attention deficit hyperactivity disorder (ADHD) in children aged 6 years and over when response to previous methylphenidate treatment is considered clinically inadequate.

The *Scottish Medicines Consortium* has advised (September 2015) that lisdexamfetamine dimesylate (*Elvanse Adult*®) is accepted for use within NHS Scotland as part of a comprehensive treatment programme for attention deficit hyperactivity disorder (ADHD) in adults. Based on clinical judgment, patients should have ADHD of at least moderate severity.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (December 2013) that lisdexamfetamine dimesylate (*Elvanse*®) is recommended as an option for use within NHS Wales as part of a comprehensive treatment programme for attention deficit hyperactivity disorder (ADHD) in children aged six years and over when response to previous methylphenidate treatment is considered clinically inadequate. Treatment must be under the supervision of a specialist in childhood and/or adolescent behavioural disorders.

The *All Wales Medicines Strategy Group* has advised (October 2015) that lisdexamfetamine dimesylate (*Elvanse Adult*®) is recommended as an option for use within NHS Wales as part of a comprehensive treatment programme for attention deficit hyperactivity disorder (ADHD) in adults.

SYMPATHOMIMETICS > ALPHA₂-ADRENOCEPTOR AGONISTS

Guanfacine

26-May-2016

● INDICATIONS AND DOSE

Attention deficit hyperactivity disorder in children for whom stimulants are not suitable, not tolerated or ineffective (initiated under specialist supervision)

- ▶ **BY MOUTH**

- ▶ Child 6–12 years (body-weight 25 kg and above): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 4 mg), for optimal weight-adjusted dose titrations, consult product literature
- ▶ Child 13–17 years (body-weight 34–41.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 4 mg), for optimal weight-adjusted dose titrations, consult product literature
- ▶ Child 13–17 years (body-weight 41.5–49.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 5 mg), for optimal weight-adjusted dose titrations, consult product literature
- ▶ Child 13–17 years (body-weight 49.5–58.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 6 mg), for optimal weight-adjusted dose titrations, consult product literature
- ▶ Child 13–17 years (body-weight 58.5 kg and above): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 7 mg), for optimal weight-adjusted dose titrations, consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose by half with concurrent use of moderate and potent inhibitors of CYP3A4.
- ▶ Manufacturer advises increase dose up to max. 7 mg daily with concurrent use of potent inducers of CYP3A4—no specific recommendation made for children.

- **CAUTIONS** Bradycardia (risk of torsade de pointes) · heart block (risk of torsade de pointes) · history of cardiovascular disease · history of QT-interval prolongation · hypokalaemia (risk of torsade de pointes)

- **INTERACTIONS** → Appendix 1: guanfacine

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · appetite decreased · arrhythmias · asthenia · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · gastrointestinal discomfort · headache · hypotension · mood altered · nausea · skin reactions · sleep disorders · urinary disorders · vomiting · weight increased

- ▶ **Uncommon** Asthma · atrioventricular block · chest pain · hallucination · loss of consciousness · pallor · seizure · syncope
- ▶ **Rare or very rare** Hypertension · hypertensive encephalopathy · malaise
- ▶ **Frequency not known** Erectile dysfunction

SIDE-EFFECTS, FURTHER INFORMATION Somnolence and sedation may occur, predominantly during the first 2–3 weeks of treatment and with dose increases; manufacturer advises to consider dose reduction or discontinuation of treatment if symptoms are clinically significant or persistent.

Overdose Features may include hypotension, initial hypertension, bradycardia, lethargy, and respiratory depression. Manufacturer advises that patients who develop lethargy should be observed for development of more serious toxicity for up to 24 hours.

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception in females of childbearing potential.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT**
Dose adjustments Manufacturer advises consider dose reduction.
- **RENAL IMPAIRMENT**
Dose adjustments Manufacturer advises consider dose reduction in severe impairment and end-stage renal disease.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises to conduct a baseline evaluation to identify patients at risk of somnolence, sedation, hypotension, bradycardia, QT-prolongation, and arrhythmia; this should include assessment of cardiovascular status. Monitor for signs of these adverse effects weekly during dose titration and then every 3 months during the first year of treatment, and every 6 months thereafter. Monitor BMI prior to treatment and then every 3 months for the first year of treatment, and every 6 months thereafter. More frequent monitoring is advised following dose adjustments.
 - ▶ Monitor blood pressure and pulse during dose downward titration and following discontinuation of treatment.
- **TREATMENT CESSATION** Manufacturer advises avoid abrupt withdrawal; consider dose tapering to minimise potential withdrawal effects.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises avoid administration with high fat meals (may increase absorption).
- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on administration of guanfacine modified-release tablets.
Missed doses Manufacturer advises that patients and carers should inform their prescriber if more than one dose is missed; consider dose re-titration.
Driving and skilled tasks Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of dizziness and syncope.

3.3 Bipolar disorder and mania

Mania and hypomania

08-Jun-2018

Overview

Antimanic drugs are used to control acute attacks and to prevent recurrence of episodes of mania or hypomania. Long-term treatment of bipolar disorder should continue for at least two years from the last manic episode and up to five years if the patient has risk factors for relapse.

An antidepressant drug may also be required for the treatment of co-existing depression, but should be avoided in patients with rapid-cycling bipolar disorder, a recent history of hypomania, or with rapid mood fluctuations.

Benzodiazepines

Use of benzodiazepines (such as lorazepam p. 335) may be helpful in the initial stages of treatment for behavioural disturbance or agitation; they should not be used for long periods because of the risk of dependence.

Antipsychotic drugs

Antipsychotic drugs (normally olanzapine p. 394, quetiapine p. 397, or risperidone p. 398) are useful in acute episodes of mania and hypomania; if the response to antipsychotic drugs is inadequate, lithium or valproate may be added. An antipsychotic drug may be used concomitantly with lithium or valproate in the initial treatment of severe acute mania. See *Important safety information, Conception and contraception, and Pregnancy* in the valproic acid p. 351 and sodium valproate p. 325 monographs.

Olanzapine can be used for the long-term management of bipolar disorder in patients whose manic episode responded to olanzapine therapy. It can be given either as monotherapy, or in combination with lithium or valproate if the patient has frequent relapses or continuing functional impairment.

Asenapine p. 352, a second-generation antipsychotic, is licensed for the treatment of moderate to severe manic episodes associated with bipolar disorder.

When discontinuing antipsychotics, the dose should be reduced gradually over at least 4 weeks if the patient is continuing with other antimanic drugs; if the patient is not continuing with other antimanic drugs or if there is a history of manic relapse, a withdrawal period of up to 3 months should be considered.

Carbamazepine

Carbamazepine p. 309 may be used under specialist supervision for the prophylaxis of bipolar disorder (manic-depressive disorder) in patients unresponsive to a combination of other prophylactic drugs; it is used in patients with rapid-cycling manic-depressive illness (4 or more affective episodes per year). The dose of carbamazepine should not normally be increased if an acute episode of mania occurs.

Valproate

Valproate (valproic acid (as the semisodium salt) and sodium valproate) is used for the treatment of manic episodes associated with bipolar disorder. It must be started and supervised by a specialist experienced in managing bipolar disorder. Valproate (valproic acid and sodium valproate) is also used for the prophylaxis of bipolar disorder. Because of its high teratogenic risk, valproate must not be used in females of childbearing potential unless the conditions of

the Pregnancy Prevention Programme are met and alternative treatments are ineffective or not tolerated. Valproic acid and sodium valproate must not be used during pregnancy in bipolar disorder. The benefit and risk of valproate therapy should be carefully reconsidered at regular treatment reviews. For further information, see *Important safety information, Conception and contraception*, and *Pregnancy* in the valproic acid and sodium valproate monographs.

In patients with frequent relapse or continuing functional impairment, consider switching therapy to lithium or olanzapine, or adding lithium or olanzapine to valproate. If a patient taking valproate experiences an acute episode of mania that is not ameliorated by increasing the valproate dose, consider concomitant therapy with olanzapine, quetiapine, or risperidone.

Lithium

Lithium salts are used in the prophylaxis and treatment of mania, hypomania and depression in bipolar disorder (manic-depressive disorder), and in the prophylaxis and treatment of recurrent unipolar depression. Lithium is also used as concomitant therapy with antidepressant medication in patients who have had an incomplete response to treatment for acute bipolar depression and to augment other antidepressants in patients with treatment-resistant depression [unlicensed indication]. It is also licensed for the treatment of aggressive or self-harming behaviour.

The decision to give prophylactic lithium requires specialist advice, and must be based on careful consideration of the likelihood of recurrence in the individual patient, and the benefit of treatment weighed against the risks. The full prophylactic effect of lithium may not occur for six to twelve months after the initiation of therapy. Olanzapine or valproate (given alone or as adjunctive therapy with lithium) are alternative prophylactic treatments in patients who experience frequent relapses or continued functional impairment.

Other drugs used for Bipolar disorder and mania

Aripiprazole, p. 391 • Chlorpromazine hydrochloride, p. 381 • Haloperidol, p. 382 • Lamotrigine, p. 316 • Paliperidone, p. 395 • Perphenazine, p. 384 • Prochlorperazine, p. 385 • Zuclopentixol acetate, p. 387

ANTI-EPILEPTICS

Valproic acid

24-Apr-2018

● INDICATIONS AND DOSE

Treatment of manic episodes associated with bipolar disorder

► BY MOUTH

- Adult: Initially 750 mg daily in 2–3 divided doses, then increased to 1–2 g daily, adjusted according to response, doses greater than 45 mg/kg daily require careful monitoring

Migraine prophylaxis

► BY MOUTH

- Adult: Initially 250 mg twice daily, then increased if necessary to 1 g daily in twice doses

DOSE EQUIVALENCE AND CONVERSION

- Semisodium valproate comprises equimolar amounts of sodium valproate and valproic acid.

CONVULEX®

Epilepsy

► BY MOUTH

- Adult: Initially 600 mg daily in 2–4 divided doses, increased in steps of 150–300 mg every 3 days; usual maintenance 1–2 g daily in 2–4 divided doses, max. 2.5 g daily in 2–4 divided doses

DOSE EQUIVALENCE AND CONVERSION

- Convulex® has a 1:1 dose relationship with products containing sodium valproate, but nevertheless care is needed if switching or making changes.

- **UNLICENSED USE** Not licensed for migraine prophylaxis.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: VALPROATE MEDICINES: CONTRA-INDICATED IN WOMEN AND GIRLS OF CHILDBEARING POTENTIAL UNLESS CONDITIONS OF PREGNANCY PREVENTION PROGRAMME ARE MET (APRIL 2018)

Valproate is highly teratogenic and evidence supports that use in pregnancy leads to neurodevelopmental disorders (approx. 30–40% risk) and congenital malformations (approx. 10% risk).

Valproate must not be used in women and girls of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met (see *Conception and contraception*) and only if other treatments are ineffective or not tolerated, as judged by an experienced specialist.

Use of valproate in pregnancy is contra-indicated for migraine prophylaxis [unlicensed] and bipolar disorder; it must only be considered for epilepsy if there is no suitable alternative treatment (see *Pregnancy*).

Women and girls (and their carers) must be fully informed of the risks and the need to avoid exposure to valproate medicines in pregnancy; supporting materials have been provided to use in the implementation of the Pregnancy Prevention Programme (see *Prescribing and dispensing information*). The MHRA advises that:

- GPs must recall all women and girls who may be of childbearing potential, provide the Patient Guide, check they have been reviewed by a specialist in the last year and are on highly effective contraception;
- Specialists must book in review appointments at least annually with women and girls under the Pregnancy Prevention Programme, re-evaluate treatment as necessary, explain clearly the conditions as outlined in the supporting materials and complete and sign the Risk Acknowledgement Form—copies of the form must be given to the patient or carer and sent to their GP;
- Pharmacists must ensure valproate medicines are dispensed in whole packs whenever possible—all packs dispensed to women and girls of childbearing potential should have a warning label either on the carton or via a sticker. They must also discuss risks in pregnancy with female patients each time valproate medicines are dispensed, ensure they have the Patient Guide and have seen their GP or specialist to discuss their treatment and the need for contraception.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 • known or suspected mitochondrial disorders (higher rate of acute liver failure and liver-related deaths) • personal or family history of severe hepatic dysfunction

- **CAUTIONS** Systemic lupus erythematosus

CAUTIONS, FURTHER INFORMATION

- **Liver toxicity** Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).

Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

● **INTERACTIONS** → Appendix 1: antiepileptics

- **SIDE-EFFECTS** Abdominal pain · alertness increased · alopecia (regrowth may be curly) · anaemia · behaviour abnormal · bone disorders · bone fracture · cerebral atrophy · coma · confusion · consciousness impaired · dementia · diarrhoea · drowsiness · encephalopathy · fine postural tremor · gastrointestinal disorder · gynaecomastia · haemorrhage · hallucination · hearing loss · hepatic disorders · hirsutism · hyperammonaemia · leucopenia · menstrual cycle irregularities · movement disorders · nail disorder · nausea · obesity · pancreatitis · pancytopenia · parkinsonism · peripheral oedema · seizure · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · urine abnormalities · vasculitis · vomiting · weight increased

SIDE-EFFECTS, FURTHER INFORMATION

Hepatic dysfunction Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.

Pancreatitis Discontinue treatment if symptoms of pancreatitis develop.

- **CONCEPTION AND CONTRACEPTION** The MHRA advises that all women and girls of childbearing potential being treated with valproate medicines must be supported on a Pregnancy Prevention Programme—pregnancy should be excluded before treatment initiation and highly effective contraception must be used during treatment.

- **PREGNANCY** For *migraine prophylaxis* [unlicensed] and *bipolar disorder*, the MHRA advises that valproate must not be used. For *epilepsy*, the MHRA advises valproate must not be used unless there is no suitable alternative treatment; in such cases, access to counselling about the risks should be provided (see Healthcare Professional Guide for more information) and a Risk Acknowledgement Form signed by both specialist and patient. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Neonatal bleeding (related to hypofibrinaemia). Neonatal hepatotoxicity also reported.

Monitoring Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy.

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Present in milk—risk of haematological disorders in breast-fed newborns and infants.
- **HEPATIC IMPAIRMENT** Avoid if possible—hepatotoxicity and hepatic failure may occasionally occur (usually in first 6 months). Avoid in active liver disease.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose.
- **MONITORING REQUIREMENTS**
► Monitor closely if dose greater than 45 mg/kg daily.
► Monitor liver function before therapy and during first 6 months especially in patients most at risk.
► Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.
- **EFFECT ON LABORATORY TESTS** False-positive urine tests for ketones.
- **TREATMENT CESSATION** [Evr] In bipolar disorder, avoid abrupt withdrawal; if treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks. ⚠
- **PRESCRIBING AND DISPENSING INFORMATION** The Pregnancy Prevention Programme is supported by the

following materials provided by the manufacturer: *Patient Guide*, *Guide for Healthcare Professionals*, *Risk Acknowledgement Form*, and for pharmacists, *Patient Cards and Stickers with warning symbols*; the MHRA has also produced a patient information sheet providing advice for women and girls taking valproate medicines.

CONVULEX® Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic oral valproic acid product.

● **PATIENT AND CARER ADVICE**

Valproate use by women and girls The MHRA advises women and girls should **not** stop taking valproate without first discussing it with their doctor.

Blood or hepatic disorders Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.

Pancreatitis Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop.

Pregnancy Prevention Programme Pharmacists must ensure that female patients have a patient card—see also *Important safety information*.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

ANTI-PSYCHOTICS > SECOND-GENERATION

■ 380

Asenapine

● **INDICATIONS AND DOSE**

Monotherapy for the treatment of moderate to severe manic episodes associated with bipolar disorder

► BY MOUTH

► **Adult:** Initially 10 mg twice daily, reduced to 5 mg twice daily, adjusted according to response

Combination therapy for the treatment of moderate to severe manic episodes associated with bipolar disorder

► BY MOUTH

► **Adult:** Initially 5 mg twice daily, increased if necessary to 10 mg twice daily, adjusted according to response

- **CAUTIONS** Dementia with Lewy Bodies

- **INTERACTIONS** → Appendix 1: asenapine

● **SIDE-EFFECTS**

- **Common or very common** Anxiety · appetite increased · fatigue · muscle rigidity · nausea · oral disorders · sedation · taste altered
- **Uncommon** Arrhythmias · bundle branch block · dysarthria · dysphagia · movement disorders · postural hypotension · sexual dysfunction · syncope
- **Rare or very rare** Accommodation disorder · rhabdomyolysis

- **PREGNANCY** Use only if potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution in moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution if eGFR less than 15 mL/minute/1.73 m²—no information available.
- **PATIENT AND CARER ADVICE** Patient or carer should be given advice on how to administer asenapine sublingual tablet.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Sublingual tablet

ANTIPSYCHOTICS > LITHIUM SALTS

Lithium salts

- **CONTRA-INDICATIONS** Addison's disease • cardiac insufficiency • dehydration • family history of Brugada syndrome • low sodium diets • personal history of Brugada syndrome • rhythm disorder • untreated hypothyroidism
 - **CAUTIONS** Avoid abrupt withdrawal • cardiac disease • concurrent ECT (may lower seizure threshold) • diuretic treatment (risk of toxicity) • elderly (reduce dose) • epilepsy (may lower seizure threshold) • myasthenia gravis • psoriasis (risk of exacerbation) • QT interval prolongation • review dose as necessary in diarrhoea • review dose as necessary in intercurrent infection (especially if sweating profusely) • review dose as necessary in vomiting • surgery
 - **CAUTIONS, FURTHER INFORMATION**
 - ▶ Long-term use Long-term use of lithium has been associated with thyroid disorders and mild cognitive and memory impairment. Long-term treatment should therefore be undertaken only with careful assessment of risk and benefit, and with monitoring of thyroid function every 6 months (more often if there is evidence of deterioration).
- The need for continued therapy should be assessed regularly and patients should be maintained on lithium after 3–5 years only if benefit persists.
- **SIDE-EFFECTS**
 - ▶ Rare or very rare Nephropathy
 - ▶ Frequency not known Abdominal discomfort • alopecia • angioedema • appetite decreased • arrhythmias • atrioventricular block • cardiomyopathy • cerebellar syndrome • circulatory collapse • coma • delirium • diarrhoea • dizziness • dry mouth • electrolyte imbalance • encephalopathy • folliculitis • gastritis • goitre • hyperglycaemia • hyperparathyroidism • hypersalivation • hypotension • hypothyroidism • idiopathic intracranial hypertension • leucocytosis • memory loss • movement disorders • muscle weakness • myasthenia gravis • nausea • neoplasms • nystagmus • peripheral neuropathy • peripheral oedema • polydipsia • polyuria • QT interval prolongation • reflexes abnormal • renal disorders • renal impairment • rhabdomyolysis • seizure • sexual dysfunction • skin reactions • skin ulcer • speech impairment • taste altered • thyrotoxicosis • tremor • vertigo • vision disorders • vomiting • weight increased

Overdose Signs of intoxication require withdrawal of treatment and include increasing gastro-intestinal disturbances (vomiting, diarrhoea), visual disturbances,

polyuria, muscle weakness, fine tremor increasing to coarse tremor, CNS disturbances (confusion and drowsiness increasing to lack of coordination, restlessness, stupor); abnormal reflexes, myoclonus, incontinence, hypernatraemia. With severe overdose seizures, cardiac arrhythmias (including sino-atrial block, bradycardia and first-degree heart block), blood pressure changes, circulatory failure, renal failure, coma and sudden death reported.

For details on the management of poisoning, see Lithium, under Emergency treatment of poisoning p. 1319.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment for women of child bearing potential.

- **PREGNANCY** Avoid if possible, particularly in the first trimester (risk of teratogenicity, including cardiac abnormalities).

Dose adjustments Dose requirements increased during the second and third trimesters (but on delivery return abruptly to normal).

Monitoring Close monitoring of serum-lithium concentration advised in pregnancy (risk of toxicity in neonate).

- **BREAST FEEDING** Present in milk and risk of toxicity in infant—avoid.
 - **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- Monitoring** In renal impairment monitor serum-lithium concentration closely and adjust dose accordingly.

MONITORING REQUIREMENTS

- ▶ Serum concentrations Lithium salts have a narrow therapeutic/toxic ratio and should therefore not be prescribed unless facilities for monitoring serum-lithium concentrations are available.
- Samples should be taken 12 hours after the dose to achieve a serum-lithium concentration of 0.4–1 mmol/litre (lower end of the range for maintenance therapy and elderly patients).

A target serum-lithium concentration of 0.8–1 mmol/litre is recommended for acute episodes of mania, and for patients who have previously relapsed or have sub-syndromal symptoms. It is important to determine the optimum range for each individual patient.

Routine serum-lithium monitoring should be performed weekly after initiation and after each dose change until concentrations are stable, then every 3 months thereafter. Additional serum-lithium measurements should be made if a patient develops significant intercurrent disease or if there is a significant change in a patient's sodium or fluid intake.

- ▶ Manufacturer advises to assess renal, cardiac, and thyroid function before treatment initiation. [EvgR](#) An ECG is recommended in patients with cardiovascular disease or risk factors for it. Body-weight or BMI, serum electrolytes, and a full blood count should also be measured before treatment initiation.
- ▶ Monitor body-weight or BMI, serum electrolytes, eGFR, and thyroid function every 6 months during treatment, and more often if there is evidence of impaired renal or thyroid function, or raised calcium levels. [A](#) Manufacturer also advises to monitor cardiac function regularly.

- **TREATMENT CESSATION** While there is no clear evidence of withdrawal or rebound psychosis, abrupt discontinuation of lithium increases the risk of relapse. If lithium is to be discontinued, the dose should be reduced gradually over a period of at least 4 weeks (preferably over a period of up to 3 months). Patients and their carers should be warned of the risk of relapse if lithium is discontinued abruptly. If lithium is stopped or is to be discontinued abruptly,

consider changing therapy to an atypical antipsychotic or valproate.

- **PATIENT AND CARER ADVICE** Patients should be advised to report signs and symptoms of lithium toxicity, hypothyroidism, renal dysfunction (including polyuria and polydipsia), and benign intracranial hypertension (persistent headache and visual disturbance). Maintain adequate fluid intake and avoid dietary changes which reduce or increase sodium intake.
Lithium treatment packs A lithium treatment pack should be given to patients on initiation of treatment with lithium. The pack consists of a patient information booklet, lithium alert card, and a record book for tracking serum-lithium concentration. Packs may be purchased from 3M

Driving and skilled tasks May impair performance of skilled tasks (e.g. driving, operating machinery).

F 353

Lithium carbonate

● INDICATIONS AND DOSE

Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour

► BY MOUTH

- Adult: Dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

DOSE EQUIVALENCE AND CONVERSION

- Preparations vary widely in bioavailability; changing the preparation requires the same precautions as initiation of treatment.

CAMCOLIT® IMMEDIATE-RELEASE TABLET

Treatment of mania | Treatment of bipolar disorder | Treatment of recurrent depression | Treatment of aggressive or self-harming behaviour

► BY MOUTH

- Adult: Initially 1–1.5 g daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- Elderly: Reduce initial dose, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Prophylaxis of mania | Prophylaxis of bipolar disorder | Prophylaxis of recurrent depression | Prophylaxis of aggressive or self-harming behaviour

► BY MOUTH

- Adult: Initially 300–400 mg daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

CAMCOLIT® MODIFIED-RELEASE TABLET

Treatment of mania | Treatment of bipolar disorder | Treatment of recurrent depression | Treatment of aggressive or self-harming behaviour

► BY MOUTH

- Adult: Initially 1–1.5 g daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily

administration is preferred when serum-lithium concentration stabilised

- Elderly: Reduce initial dose, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Prophylaxis of mania | Prophylaxis of bipolar disorder | Prophylaxis of recurrent depression | Prophylaxis of aggressive or self-harming behaviour

► BY MOUTH

- Adult: Initially 300–400 mg daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

LISKONUM®

Treatment of mania | Treatment of bipolar disorder | Treatment of recurrent depression | Treatment of aggressive or self-harming behaviour

► BY MOUTH

- Adult: Initially 450–675 mg twice daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- Elderly: Initially 225 mg twice daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Prophylaxis of mania | Prophylaxis of bipolar disorder | Prophylaxis of recurrent depression | Prophylaxis of aggressive or self-harming behaviour

► BY MOUTH

- Adult: Initially 450 mg twice daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- Elderly: Initially 225 mg twice daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

PRIADEL® TABLETS

Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour

► BY MOUTH

- Adult (body-weight up to 50 kg): Initially 200–400 mg daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- Adult (body-weight 50 kg and above): Initially 0.4–1.2 g once daily, alternatively initially 0.4–1.2 g daily in 2 divided doses, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- Elderly: Initially 200–400 mg daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

- **INTERACTIONS** → Appendix 1: lithium

Lithium citrate

INDICATIONS AND DOSE

Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour

BY MOUTH

- Adult: Dose adjusted according to serum-lithium concentration; doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

DOSE EQUIVALENCE AND CONVERSION

- Preparations vary widely in bioavailability; changing the preparation requires the same precautions as initiation of treatment.

LI-LIQUID®

Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour

BY MOUTH

- Adult (body-weight up to 50 kg): Initially 509 mg daily in 2 divided doses, dose adjusted according to serum-lithium concentration
- Adult (body-weight 50 kg and above): Initially 1.018–3.054 g daily in 2 divided doses, dose adjusted according to serum-lithium concentration
- Elderly: Initially 509 mg daily in 2 divided doses, dose adjusted according to serum-lithium concentration

DOSE EQUIVALENCE AND CONVERSION

- For *Li-Liquid*®: Lithium citrate tetrahydrate 509 mg is equivalent to lithium carbonate 200 mg.

PRIADEL® LIQUID

Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour

BY MOUTH

- Adult (body-weight up to 50 kg): Initially 520 mg twice daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

- Adult (body-weight 50 kg and above): Initially 1.04–3.12 g daily in 2 divided doses, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

- Elderly: Initially 520 mg twice daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

DOSE EQUIVALENCE AND CONVERSION

- For *Priadel*® liquid: Lithium citrate tetrahydrate 520 mg is equivalent to lithium carbonate 204 mg.

INTERACTIONS → Appendix 1: lithium

3.4 Depression

Antidepressant drugs

Overview

Antidepressant drugs are effective for treating moderate to severe depression associated with psychomotor and physiological changes such as loss of appetite and sleep disturbance; improvement in sleep is usually the first benefit of therapy. Ideally, patients with moderate to severe depression should be treated with psychological therapy in addition to drug therapy. Antidepressant drugs are also effective for dysthymia (lower grade chronic depression (typically of at least 2 years duration)).

Antidepressant drugs should not be used routinely in mild depression, and psychological therapy should be considered initially; however, a trial of antidepressant therapy may be considered in cases refractory to psychological treatments or in those associated with psychosocial or medical problems. Drug treatment of mild depression may also be considered in patients with a history of moderate or severe depression.

Choice

The major classes of antidepressant drugs include the tricyclic and related antidepressants, the selective serotonin re-uptake inhibitors (SSRIs), and the monoamine oxidase inhibitors (MAOIs). A number of antidepressant drugs cannot be accommodated easily into this classification.

There is little to choose between the different classes of antidepressant drugs in terms of efficacy, so choice should be based on the individual patient's requirements, including the presence of concomitant disease, existing therapy, suicide risk, and previous response to antidepressant therapy. Since there may be an interval of 2 weeks before the

antidepressant action takes place, electroconvulsive treatment may be required in severe depression when delay is hazardous or intolerable. During the first few weeks of treatment, there is an increased potential for agitation, anxiety, and suicidal ideation.

SSRIs are better tolerated and are safer in overdose than other classes of antidepressants and should be considered first-line for treating depression. In patients with unstable angina or who have had a recent myocardial infarction, sertraline p. 364 has been shown to be safe.

Tricyclic antidepressants have similar efficacy to SSRIs but are more likely to be discontinued because of side-effects; toxicity in overdose is also a problem. SSRIs are less sedating and have fewer antimuscarinic and cardiotoxic effects than tricyclic antidepressants.

MAOIs have dangerous interactions with some foods and drugs, and should be reserved for use by specialists.

Although anxiety is often present in depressive illness (and may be the presenting symptom), the use of an antipsychotic or an anxiolytic may mask the true diagnosis. Anxiolytics or antipsychotic drugs should therefore be used with caution in depression but they are useful adjuncts in agitated patients. Augmenting antidepressants with antipsychotics under specialist supervision may also be necessary in patients who have depression with psychotic symptoms.

St John's wort (*Hypericum perforatum*) is a popular herbal remedy on sale to the public for treating mild depression. It should not be prescribed or recommended for depression because St John's wort can induce drug metabolising enzymes and a number of important interactions with conventional drugs, including conventional antidepressants, have been identified. Furthermore, the amount of active ingredient varies between different preparations of St John's wort and switching from one to another can change the degree of enzyme induction. If a patient stops taking St John's wort, the concentration of interacting drugs may increase, leading to toxicity.

Management

Patients should be reviewed every 1–2 weeks at the start of antidepressant treatment. Treatment should be continued for at least 4 weeks (6 weeks in the elderly) before considering whether to switch antidepressant due to lack of efficacy. In cases of partial response, continue for a further 2–4 weeks (elderly patients may take longer to respond).

Following remission, antidepressant treatment should be continued at the same dose for at least 6 months (about 12 months in the elderly), or for at least 12 months in patients receiving treatment for generalised anxiety disorder (as the likelihood of relapse is high). Patients with a history of recurrent depression should receive maintenance treatment for at least 2 years.

Hyponaatraemia and antidepressant therapy

Hyponaatraemia (usually in the elderly and possibly due to inappropriate secretion of antidiuretic hormone) has been associated with all types of antidepressants; however, it has been reported more frequently with SSRIs than with other antidepressants. Hyponaatraemia should be considered in all patients who develop drowsiness, confusion, or convulsions while taking an antidepressant.

Suicidal behaviour and antidepressant therapy

The use of antidepressants has been linked with suicidal thoughts and behaviour; children, young adults, and patients with a history of suicidal behaviour are particularly at risk. Where necessary patients should be monitored for suicidal behaviour, self-harm, or hostility, particularly at the beginning of treatment or if the dose is changed.

Serotonin syndrome

Serotonin syndrome or serotonin toxicity is a relatively uncommon adverse drug reaction caused by excessive central and peripheral serotonergic activity. Onset of

symptoms, which range from mild to lifethreatening, can occur within hours or days following the initiation, dose escalation, or overdose of a serotonergic drug, the addition of a new serotonergic drug, or the replacement of one serotonergic drug by another without allowing a long enough washout period in-between, particularly when the first drug is an irreversible MAOI or a drug with a long half-life. Severe toxicity, which is a medical emergency, usually occurs with a combination of serotonergic drugs, one of which is generally an MAOI.

The characteristic symptoms of serotonin syndrome fall into 3 main areas, although features from each group may not be seen in all patients—neuromuscular hyperactivity (such as tremor, hyperreflexia, clonus, myoclonus, rigidity), autonomic dysfunction (tachycardia, blood pressure changes, hyperthermia, diaphoresis, shivering, diarrhoea), and altered mental state (agitation, confusion, mania).

Treatment consists of withdrawal of the serotonergic medication and supportive care; specialist advice should be sought.

Failure to respond

Failure to respond to initial treatment with an SSRI may require an increase in the dose, or switching to a different SSRI or mirtazapine p. 368. Other second-line choices include lofepramine p. 373, moclobemide p. 359, and reboxetine p. 360. Other tricyclic antidepressants and venlafaxine p. 365 should be considered for more severe forms of depression; irreversible MAOIs should only be prescribed by specialists. Failure to respond to a second antidepressant may require the addition of another antidepressant of a different class, or use of an augmenting agent (such as lithium, aripiprazole p. 391 [unlicensed], olanzapine p. 394 [unlicensed], quetiapine p. 397, or risperidone p. 398 [unlicensed]), but such adjunctive treatment should be initiated only by doctors with special experience of these combinations. Electroconvulsive therapy may be initiated in severe refractory depression.

Anxiety disorders and obsessive-compulsive disorder

Management of acute anxiety generally involves the use of a benzodiazepine or buspirone hydrochloride p. 338. For chronic anxiety (of longer than 4 weeks' duration) it may be appropriate to use an antidepressant. Combined therapy with a benzodiazepine may be required until the antidepressant takes effect. Patients with *generalised anxiety disorder*, a form of chronic anxiety, should be offered psychological treatment before initiating an antidepressant. If drug treatment is needed, an SSRI such as escitalopram p. 361, paroxetine p. 363, or sertraline p. 364 [unlicensed], can be used. Duloxetine p. 364 and venlafaxine p. 365 (serotonin and noradrenaline reuptake inhibitors) are also recommended for the treatment of generalised anxiety disorder; if the patient cannot tolerate SSRIs or serotonin and noradrenaline reuptake inhibitors (or if treatment has failed to control symptoms), pregabalin p. 322 can be considered.

Panic disorder, obsessive-compulsive disorder, post-traumatic stress disorder, and phobic states such as *social anxiety disorder* are treated with SSRIs. Clomipramine hydrochloride p. 370 or imipramine hydrochloride p. 372 can be used second-line in panic disorder [unlicensed]; clomipramine hydrochloride can also be used second-line for obsessive-compulsive disorder. Moclobemide p. 359 is licensed for the treatment of social anxiety disorder.

Tricyclic and related antidepressant drugs

Choice

Tricyclic and related antidepressants block the re-uptake of both serotonin and noradrenaline, although to different extents. For example, clomipramine hydrochloride is more selective for serotonergic transmission, and imipramine hydrochloride is more selective for noradrenergic transmission. Tricyclic and related antidepressant drugs can

be roughly divided into those with additional sedative properties and those that are less sedating. Agitated and anxious patients tend to respond best to the sedative compounds, whereas withdrawn and apathetic patients will often obtain most benefit from the less sedating ones. Those with **sedative** properties include amitriptyline hydrochloride p. 369, clomipramine hydrochloride, dosulepin hydrochloride p. 371, doxepin p. 372, mianserin hydrochloride p. 367, trazodone hydrochloride p. 366, and trimipramine p. 375. Those with **less sedative** properties include imipramine hydrochloride, lofepramine p. 373, and nortriptyline p. 374.

Tricyclic and related antidepressants also have varying degrees of antimuscarinic side-effects and cardiotoxicity in overdosage, which may be important in individual patients. Lofepramine has a lower incidence of side-effects and is less dangerous in overdosage but is infrequently associated with hepatic toxicity. Imipramine hydrochloride is also well established, but has more marked antimuscarinic side-effects than other tricyclic and related antidepressants. Amitriptyline hydrochloride and dosulepin hydrochloride are effective but they are particularly dangerous in overdosage and are not recommended for the treatment of depression; dosulepin hydrochloride should be initiated by a specialist.

Dosage

About 10 to 20% of patients fail to respond to tricyclic and related antidepressant drugs and inadequate dosage may account for some of these failures. It is important to use doses that are sufficiently high for effective treatment but not so high as to cause toxic effects. Low doses should be used for initial treatment in the **elderly**. In most patients the long half-life of tricyclic antidepressant drugs allows **once-daily** administration, usually at night; the use of modified-release preparations is therefore unnecessary.

Some tricyclic antidepressants are used in the management of *panic* and other *anxiety disorders*. Some tricyclic antidepressants may also have a role in some forms of *neuralgia* and in *nocturnal enuresis* in children.

Children and adolescents

Studies have shown that tricyclic antidepressants are not effective for treating depression in children.

Monoamine-oxidase inhibitors

Monoamine-oxidase inhibitors are used much less frequently than tricyclic and related antidepressants, or SSRIs and related antidepressants because of the dangers of dietary and drug interactions and the fact that it is easier to prescribe MAOIs when tricyclic antidepressants have been unsuccessful than vice versa.

Tranlycypromine p. 359 has a greater stimulant action than phenelzine p. 359 or isocarboxazid p. 358 and is more likely to cause a hypertensive crisis. Isocarboxazid and phenelzine are more likely to cause hepatotoxicity than tranlycypromine.

Moclobemide should be reserved as a second line treatment.

Phobic patients and depressed patients with atypical, hypochondriacal, or hysterical features are said to respond best to MAOIs. However, MAOIs should be tried in any patients who are refractory to treatment with other antidepressants as there is occasionally a dramatic response. Response to treatment may be delayed for 3 weeks or more and may take an additional 1 or 2 weeks to become maximal.

Interactions

Other antidepressants should not be started for 2 weeks after treatment with MAOIs has been stopped (3 weeks if starting clomipramine or imipramine). Conversely, an MAOI should not be started until:

- at least 2 weeks after a previous MAOI has been stopped (then started at a reduced dose)

- at least 7–14 days after a tricyclic or related antidepressant (3 weeks in the case of clomipramine or imipramine) has been stopped
- at least a week after an SSRI or related antidepressant (at least 5 weeks in the case of fluoxetine) has been stopped

Other antidepressant drugs

The thioxanthene flupentixol p. 382 (Fluanxol[®]) has antidepressant properties when given by mouth in low doses. Flupentixol is also used for the treatment of psychoses.

Vortioxetine p. 376, an antidepressant thought to directly modulate serotonergic receptor activity and inhibit the re-uptake of serotonin, is recommended in patients whose condition has responded inadequately to 2 antidepressants within the current episode.

Tryptophan is licensed for use in treatment-resistant depression, used as monotherapy and as an adjunct to other antidepressant drugs; it should be initiated by hospital specialists.

Other drugs used for Depression Lithium carbonate, p. 354
• Lithium citrate, p. 355

ANTIDEPRESSANTS > MELATONIN RECEPTOR AGONISTS

Agomelatine

07-Feb-2017

- **DRUG ACTION** A melatonin receptor agonist and a selective serotonin-receptor antagonist; it does not affect the uptake of serotonin, noradrenaline, or dopamine.

• INDICATIONS AND DOSE

Major depression

- BY MOUTH
- Adult: 25 mg daily, dose to be taken at bedtime, dose to be increased if necessary after 2 weeks, increased if necessary to 50 mg daily, dose to be taken at bedtime

- **CONTRA-INDICATIONS** Dementia • patients over 75 years of age
- **CAUTIONS** Alcoholism • bipolar disorder • diabetes • excessive alcohol consumption • hypomania • mania • non-alcoholic fatty liver disease • obesity
- **INTERACTIONS** → Appendix 1: agomelatine
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain • anxiety • back pain • constipation • diarrhoea • dizziness • drowsiness • fatigue • headaches • nausea • sleep disorders • vomiting • weight changes
 - **Uncommon** Aggression • confusion • hyperhidrosis • mood altered • movement disorders • paraesthesia • skin reactions • suicidal tendencies • tinnitus • vision blurred
 - **Rare or very rare** Angioedema • face oedema • hallucination • hepatic disorders • urinary retention

SIDE-EFFECTS, FURTHER INFORMATION The use of antidepressants has been linked with suicidal thoughts and behaviour; children, young adults, and patients with a history of suicidal behaviour are particularly at risk. Where necessary patients should be monitored for suicidal behaviour, self-harm, or hostility, particularly at the beginning of treatment or if the dose is changed.

- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in impairment (or if baseline serum transaminases exceed 3 times the upper limit of reference range).
- **RENAL IMPAIRMENT** Caution in moderate to severe impairment.

• **MONITORING REQUIREMENTS** Test liver function before treatment and after 3, 6, 12 and 24 weeks of treatment, and then regularly thereafter when clinically indicated (restart monitoring schedule if dose increased); discontinue if serum transaminases exceed 3 times the upper limit of reference range or symptoms of liver disorder.

• **PATIENT AND CARER ADVICE**

Hepatotoxicity Patients should be told how to recognise signs of liver disorder, and advised to seek immediate medical attention if symptoms such as dark urine, light coloured stools, jaundice, bruising, fatigue, abdominal pain, or pruritus develop.

Patients should be given a booklet with more information on the risk of hepatic side-effects.

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► **Valdoxan** (Servier Laboratories Ltd)

Agomelatine 25 mg Valdoxan 25mg tablets | 28 tablet PoM £30.00
DT = £30.00

ANTIDEPRESSANTS > MONOAMINE-OXIDASE INHIBITORS

Monoamine-oxidase inhibitors

• **DRUG ACTION** MAOIs inhibit monoamine oxidase, thereby causing an accumulation of amine neurotransmitters.

• **CONTRA-INDICATIONS** Cerebrovascular disease • not indicated in manic phase • pheochromocytoma

• **CAUTIONS** Acute porphyrias p. 1025 • avoid in agitated patients • blood disorders • cardiovascular disease • concurrent electroconvulsive therapy • diabetes mellitus • elderly (great caution) • epilepsy • severe hypertensive reactions to certain drugs and foods • surgery

• **SIDE-EFFECTS**

► **Rare or very rare** Hepatic disorders

► **Frequency not known** Anxiety • appetite increased • arrhythmias • asthenia • behaviour abnormal • blood disorder • cardiovascular insufficiency • chest pain • confusion • constipation • delirium • diarrhoea • dizziness • drowsiness • drug dependence • dry mouth • dysuria • electrolyte imbalance • eye disorders • feeling jittery • fever • flushing • gastrointestinal disorder • glaucoma • granulocytopenia • hallucination • headaches • hyperhidrosis • hypermetabolism • hypertension • impaired driving ability • intracranial haemorrhage • lupus-like syndrome • malaise • mood altered • movement disorders • muscle tone increased • muscle twitching • nausea • neuroleptic malignant syndrome • oedema • pain • pallor • paraesthesia • peripheral neuritis • postural hypotension (more common in elderly) • reflexes increased • respiratory disorders • schizophrenia • seizure • sexual dysfunction • shock-like coma • skin reactions • sleep disorders • speech repetitive • suicidal tendencies • tremor • vision disorders • vomiting • weight increased

SIDE-EFFECTS, FURTHER INFORMATION Risk of postural hypotension and hypertensive responses. Discontinue if palpitations or frequent headaches occur.

• **PREGNANCY** Increased risk of neonatal malformations—manufacturer advises avoid unless there are compelling reasons.

• **HEPATIC IMPAIRMENT** MAOIs may cause idiosyncratic hepatotoxicity if used in patients with hepatic impairment.

• **MONITORING REQUIREMENTS** Monitor blood pressure (risk of postural hypotension and hypertensive responses).

• **TREATMENT CESSATION**

Withdrawal If possible avoid abrupt withdrawal.

MAOIs are associated with withdrawal symptoms on cessation of therapy. Symptoms include agitation, irritability, ataxia, movement disorders, insomnia, drowsiness, vivid dreams, cognitive impairment, and slowed speech. Withdrawal symptoms occasionally experienced when discontinuing MAOIs include hallucinations and paranoid delusions. If possible MAOIs should be withdrawn slowly.

Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

• **PATIENT AND CARER ADVICE** Patients should be advised to eat only fresh foods and avoid food that is suspected of being stale or 'going off'. This is especially important with meat, fish, poultry or offal; game should be avoided. The danger of interaction persists for up to 2 weeks after treatment with MAOIs is discontinued. Patients should also be advised to avoid alcoholic drinks or de-alcoholised (low alcohol) drinks.

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving).

ANTIDEPRESSANTS > MONOAMINE-OXIDASE A AND B INHIBITORS, IRREVERSIBLE

F above

Isocarboxazid

• **INDICATIONS AND DOSE**

Depressive illness

► **BY MOUTH**

► **Adult:** Initially 30 mg daily until improvement occurs, initial dose may be given in single or divided doses, dose may be increased if necessary after 4 weeks, increased to 60 mg daily for 4–6 weeks, dose to be increased under close supervision only, then reduced to 10–20 mg daily, usual maintenance dose, but up to 40 mg daily may be required

► **Elderly:** 5–10 mg daily

• **INTERACTIONS** → Appendix 1: monoamine-oxidase A and B inhibitors, irreversible

• **BREAST FEEDING** Avoid.

• **HEPATIC IMPAIRMENT** Avoid in hepatic impairment.

• **RENAL IMPAIRMENT** Use with caution.

• **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 3, 10

- **Tranylcypromine (Non-proprietary)**

Tranylcypromine (as Tranylcypromine sulfate)

10 mg Tranylcypromine 10mg tablets | 28 tablet [PoM] £270.00 DT = £241.50

ANTIDEPRESSANTS > MONOAMINE-OXIDASE A INHIBITORS, REVERSIBLE

Moclobemide

- **DRUG ACTION** Moclobemide is reported to act by reversible inhibition of monoamine oxidase type A (it is therefore termed a RIMA).

● INDICATIONS AND DOSE

Depressive illness

► BY MOUTH

- Adult: Initially 300 mg daily in divided doses, adjusted according to response; usual dose 150–600 mg daily, dose to be taken after food

Social anxiety disorder

► BY MOUTH

- Adult: Initially 300 mg daily for 3 days, then increased to 600 mg daily in 2 divided doses continued for 8–12 weeks to assess efficacy

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose to half or one-third of the usual dose with concurrent use of cimetidine.

- **CONTRA-INDICATIONS** Acute confusional states · phaeochromocytoma

- **CAUTIONS** Avoid in agitated or excited patients (or give with sedative for up to 2–3 weeks) · may provoke manic episodes in bipolar disorders · thyrotoxicosis

- **INTERACTIONS** → Appendix 1: moclobemide

● SIDE-EFFECTS

- **Common or very common** Anxiety · constipation · diarrhoea · dizziness · dry mouth · headache · hypotension · irritability · nausea · paraesthesia · skin reactions · sleep disorder · vomiting
- **Uncommon** Asthenia · confusion · flushing · oedema · suicidal tendencies · taste altered · visual impairment
- **Rare or very rare** Appetite decreased · delusions · hyponatraemia · serotonin syndrome

- **PREGNANCY** Safety in pregnancy has not been established—manufacturer advises avoid unless there are compelling reasons.

- **BREAST FEEDING** Amount too small to be harmful, but patient information leaflet advises avoid.

● HEPATIC IMPAIRMENT

Dose adjustments Reduce dose in severe hepatic disease.

- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

- **PATIENT AND CARER ADVICE** Moclobemide is claimed to cause less potentiation of the pressor effect of tyramine than the traditional (irreversible) MAOIs, but patients should avoid consuming large amounts of tyramine-rich food (such as mature cheese, yeast extracts and fermented soya bean products).

ANTIDEPRESSANTS > SELECTIVE SEROTONIN RE- UPTAKE INHIBITORS

Selective serotonin re-uptake inhibitors

- **DRUG ACTION** Selectively inhibit the re-uptake of serotonin (5-hydroxytryptamine, 5-HT).
- **CONTRA-INDICATIONS** Poorly controlled epilepsy · SSRIs should not be used if the patient enters a manic phase.
- **CAUTIONS** Cardiac disease · concurrent electroconvulsive therapy · diabetes mellitus · epilepsy (discontinue if convulsions develop) · history of bleeding disorders (especially gastro-intestinal bleeding) · history of mania · susceptibility to angle-closure glaucoma
- **SIDE-EFFECTS**
 - **Common or very common** Anxiety · appetite abnormal · arthralgias · arthralgia · asthenia · concentration impaired · confusion · constipation · depersonalisation · diarrhoea · dizziness · drowsiness · dry mouth · fever · gastrointestinal discomfort · haemorrhage · headache · hyperhidrosis · malaise · memory loss · menstrual cycle irregularities · myalgia · mydriasis · nausea (dose-related) · palpitations · paraesthesia · QT interval prolongation · sexual dysfunction · skin reactions · sleep disorders (uncommon in children) · taste altered · tinnitus · tremor · urinary disorders · visual impairment · vomiting · weight changes · yawning
 - **Uncommon** Alopecia · angioedema · behaviour abnormal · hallucination · mania (very common in children) · movement disorders · photosensitivity reaction · postural hypotension · seizure · suicidal tendencies · syncope
 - **Rare or very rare** Galactorrhoea · hepatitis · hyperprolactinaemia · hyponatraemia · serotonin syndrome · severe cutaneous adverse reactions (SCARs) · SIADH · thrombocytopenia
 - **Frequency not known** Withdrawal syndrome
- **Overdose** Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.
For details on the management of poisoning, see Selective serotonin re-uptake inhibitors, under Emergency treatment of poisoning p. 1319.
- **PREGNANCY** Manufacturers advise avoid during pregnancy unless the potential benefit outweighs the risk. There is a small increased risk of congenital heart defects when taken during early pregnancy. If used during the third trimester there is a risk of neonatal withdrawal symptoms, and persistent pulmonary hypertension in the newborn has been reported.
- **TREATMENT CESSATION** Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, electric shock sensation in the head, neck, and spine, tinnitus, sleep disturbances, fatigue, influenza-like symptoms, and sweating are the most common features of abrupt withdrawal of an SSRI or marked reduction of the dose; palpitation and visual disturbances can occur less commonly. The dose should be tapered over at least a few weeks to avoid these effects. For some patients, it may be necessary to withdraw treatment over a longer period; consider obtaining specialist advice if symptoms persist.
Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the

antidepressant is stopped suddenly after regular administration for 8 weeks or more.

● PATIENT AND CARER ADVICE

Driving and skilled tasks May also impair performance of skilled tasks (e.g. driving, operating machinery).

F 360

Citalopram

● INDICATIONS AND DOSE

Depressive illness

► BY MOUTH USING TABLETS

- Adult: 20 mg once daily, increased in steps of 20 mg daily if required, dose to be increased at intervals of 3–4 weeks; maximum 40 mg per day
- Elderly: 10–20 mg once daily; maximum 20 mg per day
- BY MOUTH USING ORAL DROPS
- Adult: 16 mg once daily, increased in steps of 16 mg daily if required, dose to be increased at intervals of 3–4 weeks; maximum 32 mg per day
- Elderly: 8–16 mg daily; maximum 16 mg per day

Panic disorder

► BY MOUTH USING TABLETS

- Adult: Initially 10 mg daily, increased in steps of 10 mg daily if required, dose to be increased gradually; usual dose 20–30 mg daily; maximum 40 mg per day
- Elderly: Initially 10 mg daily, increased in steps of 10 mg daily if required, dose to be increased gradually; maximum 20 mg per day
- BY MOUTH USING ORAL DROPS
- Adult: Initially 8 mg once daily, increased in steps of 8 mg if required, dose to be increased gradually; usual dose 16–24 mg daily; maximum 32 mg per day
- Elderly: Initially 8 mg once daily, increased in steps of 8 mg if required, dose to be increased gradually; maximum 16 mg per day

DOSE EQUIVALENCE AND CONVERSION

- 4 oral drops (8 mg) is equivalent in therapeutic effect to 10 mg tablet.

● CONTRA-INDICATIONS QT-interval prolongation

● CAUTIONS Susceptibility to QT-interval prolongation

● INTERACTIONS → Appendix 1: SSRIs

● SIDE-EFFECTS

- **Common or very common** Acute angle closure glaucoma · apathy · flatulence · hypersalivation · migraine · rhinitis
- **Uncommon** Oedema
- **Rare or very rare** Cough · generalised tonic-clonic seizure · haemorrhage
- **Frequency not known** Hypokalaemia

● BREAST FEEDING Present in milk—use with caution.

● HEPATIC IMPAIRMENT

Dose adjustments Use doses at lower end of range; for tablets up to maximum 20 mg; for oral solution up to maximum 16 mg.

● RENAL IMPAIRMENT No information available for eGFR less than 20 mL/minute/1.73 m².

● TREATMENT CESSATION The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

● DIRECTIONS FOR ADMINISTRATION Cipramil® oral drops should be mixed with water, orange juice, or apple juice before taking.

● PATIENT AND CARER ADVICE Counselling on administration of oral drops is advised.

Driving and skilled tasks Patients should be advised of the effects of citalopram on driving and skilled tasks.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

INDICATIONS AND DOSE

Major depression

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 20 mg daily, dose is increased after 3–4 weeks if necessary, and at appropriate intervals thereafter, daily dose may be administered as a single or divided dose; maximum 60 mg per day
- ▶ **Elderly:** Initially 20 mg daily, dose is increased after 3–4 weeks if necessary, and at appropriate intervals thereafter, daily dose may be administered as a single or divided dose, usual maximum dose is 40 mg daily but doses up to 60 mg daily can be used

Bulimia nervosa

- ▶ **BY MOUTH**
- ▶ **Adult:** 60 mg daily, daily dose may be administered as a single or divided dose
- ▶ **Elderly:** Up to 40 mg daily, daily dose may be administered as a single or divided dose, usual maximum dose is 40 mg daily but doses up to 60 mg daily can be used

Obsessive-compulsive disorder

- ▶ **BY MOUTH**
- ▶ **Adult:** 20 mg daily, increased if necessary up to 60 mg daily, daily dose may be administered as a single or divided dose, dose to be increased gradually, review treatment if inadequate response after 10 weeks; maximum 60 mg per day
- ▶ **Elderly:** 20 mg daily, increased if necessary up to 40 mg daily, daily dose may be administered as a single or divided dose, dose to be increased gradually, review treatment if inadequate response after 10 weeks, usual maximum dose is 40 mg daily but doses up to 60 mg daily can be used

Menopausal symptoms, particularly hot flushes, in women with breast cancer (except those taking tamoxifen)

- ▶ **BY MOUTH**
- ▶ **Adult:** 20 mg once daily

PHARMACOKINETICS

- ▶ Consider the long half-life of fluoxetine when adjusting dosage (or in overdosage).

- **UNLICENSED USE** [Evr] Not licensed for menopausal symptoms. ⚠

- **INTERACTIONS** → Appendix 1: SSRIs

SIDE-EFFECTS

- ▶ **Common or very common** Chills · feeling abnormal · haemorrhage · postmenopausal haemorrhage · uterine disorder · vasodilation · vision blurred
- ▶ **Uncommon** Cold sweat · dysphagia · dyspnoea · dysuria · hypotension · mood altered · muscle twitching · self-injurious behaviour · temperature sensation altered · thinking abnormal
- ▶ **Rare or very rare** Leucopenia · neutropenia · oral disorders · pharyngitis · respiratory disorders · serum sickness · speech disorder · vasculitis
- ▶ **Frequency not known** Bone fracture
- **BREAST FEEDING** Present in milk—avoid.
- **HEPATIC IMPAIRMENT**
Dose adjustments Reduce dose or increase dose interval.
- **DIRECTIONS FOR ADMINISTRATION** Dispersible tablets can be dispersed in water for administration or swallowed whole with plenty of water.
- **PATIENT AND CARER ADVICE** Patients and carers should be counselled on the administration of dispersible tablets.
Driving and skilled tasks Patients should be counselled about the effects on driving and skilled tasks.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

▶ Fluoxetine (Non-proprietary)

Fluoxetine (as Fluoxetine hydrochloride) 10 mg Fluoxetine 10mg tablets | 30 tablet [PoM] £44.00 DT = £44.00

Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 10

▶ Olena (AMCO)

Fluoxetine (as Fluoxetine hydrochloride) 20 mg Olena 20mg dispersible tablets sugar-free | 28 tablet [PoM] £3.44 DT = £3.44

Oral solution

▶ Fluoxetine (Non-proprietary)

Fluoxetine (as Fluoxetine hydrochloride) 4 mg per 1 ml Fluoxetine 20mg/5ml oral solution | 70 ml [PoM] £12.75 DT = £2.78
Fluoxetine 20mg/5ml oral solution sugar free sugar-free | 70 ml [PoM] £12.95 DT = £12.95

▶ Prozac (Eli Lilly and Company Ltd)

Fluoxetine (as Fluoxetine hydrochloride) 4 mg per 1 ml Prozac 20mg/5ml liquid | 70 ml [PoM] £11.12 DT = £2.78

▶ Prozep (Chemidex Pharma Ltd)

Fluoxetine (as Fluoxetine hydrochloride) 4 mg per 1 ml Prozep 20mg/5ml oral solution sugar-free | 70 ml [PoM] £12.95 DT = £12.95

Capsule

▶ Fluoxetine (Non-proprietary)

Fluoxetine (as Fluoxetine hydrochloride) 10 mg Fluoxetine 10mg capsules | 30 capsule [PoM] £55.00–£58.50 DT = £58.11

Fluoxetine (as Fluoxetine hydrochloride) 20 mg Fluoxetine 20mg capsules | 30 capsule [PoM] £20.00 DT = £0.58

Fluoxetine (as Fluoxetine hydrochloride) 30 mg Fluoxetine 30mg capsules | 30 capsule [PoM] £1.80 DT = £1.80

Fluoxetine (as Fluoxetine hydrochloride) 40 mg Fluoxetine 40mg capsules | 30 capsule [PoM] £1.80–£2.16 DT = £2.16

Fluoxetine (as Fluoxetine hydrochloride) 60 mg Fluoxetine 60mg capsules | 30 capsule [PoM] £54.36 DT = £3.72

▶ Oxactin (Discovery Pharmaceuticals)

Fluoxetine (as Fluoxetine hydrochloride) 20 mg Oxactin 20mg capsules | 30 capsule [PoM] £0.57 DT = £0.58

▶ Prozac (Eli Lilly and Company Ltd)

Fluoxetine (as Fluoxetine hydrochloride) 20 mg Prozac 20mg capsules | 30 capsule [PoM] £1.50 DT = £0.58

Fluvoxamine maleate

360

● INDICATIONS AND DOSE

Depressive illness

► BY MOUTH

- Adult: Initially 50–100 mg daily, dose to be taken in the evening, dose to be increased gradually, increased if necessary up to 300 mg daily, doses over 150 mg daily are given in divided doses; maintenance 100 mg daily

Obsessive-compulsive disorder

► BY MOUTH

- Adult: Initially 50 mg daily, dose to be taken in the evening, dose is increased gradually if necessary after several weeks, increased if necessary up to 300 mg daily; maintenance 100–300 mg daily, doses over 150 mg daily are given in divided doses, if no improvement in obsessive-compulsive disorder within 10 weeks, treatment should be reconsidered

● INTERACTIONS → Appendix 1: SSRIs

● SIDE-EFFECTS

- **Uncommon** Allergic dermatitis · ataxia
- **Rare or very rare** Hepatic function abnormal (discontinue)
- **Frequency not known** Bone fracture · glaucoma · haemorrhage · neuroleptic malignant-like syndrome · urinary disorders

● BREAST FEEDING Present in milk—avoid.

● HEPATIC IMPAIRMENT

Dose adjustments Start with low dose.

● RENAL IMPAIRMENT

Dose adjustments Start with low dose.

● TREATMENT CESSATION The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

● PATIENT AND CARER ADVICE

Driving and skilled tasks Patients should be counselled about the effects on driving and skilled tasks.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

► Fluvoxamine maleate (Non-proprietary)

Fluvoxamine maleate 50 mg Fluvoxamine 50mg tablets | 60 tablet [PoM] £20.98 DT = £18.32

Fluvoxamine maleate 100 mg Fluvoxamine 100mg tablets | 30 tablet [PoM] £20.98 DT = £18.32

► Faverin (Mylan)

Fluvoxamine maleate 50 mg Faverin 50mg tablets | 60 tablet [PoM] £17.10 DT = £18.32

Fluvoxamine maleate 100 mg Faverin 100mg tablets | 30 tablet [PoM] £17.10 DT = £18.32

360

Paroxetine

19-Jul-2017

● INDICATIONS AND DOSE

Major depression | Social anxiety disorder | Post-traumatic stress disorder | Generalised anxiety disorder

► BY MOUTH

- Adult: 20 mg daily, dose to be taken in the morning, no evidence of greater efficacy at higher doses; maximum 50 mg per day
- Elderly: 20 mg daily, dose to be taken in the morning, no evidence of greater efficacy at higher doses; maximum 40 mg per day

Obsessive-compulsive disorder

► BY MOUTH

- Adult: Initially 20 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually, increased to 40 mg daily, no evidence of greater efficacy at higher doses; maximum 60 mg per day
- Elderly: Initially 20 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually; maximum 40 mg per day

Panic disorder

► BY MOUTH

- Adult: Initially 10 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually, increased to 40 mg daily, no evidence of greater efficacy at higher doses; maximum 60 mg per day
- Elderly: Initially 10 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually; maximum 40 mg per day

Menopausal symptoms, particularly hot flushes, in women with breast cancer (except those taking tamoxifen).

► BY MOUTH

- Adult: 10 mg once daily

● UNLICENSED USE Not licensed for menopausal symptoms.

● CAUTIONS Achlorhydria · high gastric pH

CAUTIONS, FURTHER INFORMATION

- Achlorhydria or high gastric pH Causes reduced absorption of the oral suspension.

● INTERACTIONS → Appendix 1: SSRIs

● SIDE-EFFECTS

- **Common or very common** Vision blurred
- **Uncommon** Diabetic control impaired · sinus tachycardia
- **Rare or very rare** Acute glaucoma · erythema multiforme · hepatic disorders · peripheral oedema · restless legs

● PREGNANCY Increased risk of congenital malformations, especially if used in the first trimester.

● BREAST FEEDING Present in milk but amount too small to be harmful.

● HEPATIC IMPAIRMENT

Dose adjustments Reduce dose.

● RENAL IMPAIRMENT

Dose adjustments Reduce dose if eGFR less than 30 mL/minute/1.73 m².

● TREATMENT CESSATION Associated with a higher risk of withdrawal reactions. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

● PATIENT AND CARER ADVICE

Driving and skilled tasks Patients should be counselled about the effect on driving.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

CAUTIONARY AND ADVISORY LABELS 5, 21

► Seroxat (GlaxoSmithKline UK Ltd)

Paroxetine (as Paroxetine hydrochloride) 2 mg per 1 mL Seroxat 20mg/10mL liquid sugar-free | 150 mL [PoM] £9.12 DT = £9.12

Tablet

CAUTIONARY AND ADVISORY LABELS 21

► Paroxetine (Non-proprietary)

Paroxetine (as Paroxetine hydrochloride) 10 mg Paroxetine 10mg tablets | 28 tablet [PoM] £17.03 DT = £9.43

Paroxetine (as Paroxetine hydrochloride) 20 mg Paroxetine 20mg tablets | 30 tablet [PoM] £12.18 DT = £1.10

Paroxetine (as Paroxetine hydrochloride) 30 mg Paroxetine 30mg tablets | 30 tablet [PoM] £2.65 DT = £1.34

Paroxetine (as Paroxetine hydrochloride) 40 mg Paroxetine 40mg tablets | 28 tablet [PoM] £16.99–£17.03 | 30 tablet [PoM] £25.07

► **Seroxat** (GlaxoSmithKline UK Ltd)

Paroxetine (as Paroxetine hydrochloride) 10 mg Seroxat 10mg tablets | 28 tablet [PoM] £14.21 DT = £9.43

Paroxetine (as Paroxetine hydrochloride) 20 mg Seroxat 20mg tablets | 30 tablet [PoM] £15.23 DT = £1.10

Sertraline

● INDICATIONS AND DOSE

Depressive illness

► BY MOUTH

- Adult: Initially 50 mg daily, then increased in steps of 50 mg at intervals of at least 1 week if required; maintenance 50 mg daily; maximum 200 mg per day

Obsessive-compulsive disorder

► BY MOUTH

- Adult: Initially 50 mg daily, then increased in steps of 50 mg at intervals of at least 1 week if required; maximum 200 mg per day

Panic disorder | Post-traumatic stress disorder | Social anxiety disorder

► BY MOUTH

- Adult: Initially 25 mg daily for 1 week, then increased to 50 mg daily, then increased in steps of 50 mg at intervals of at least 1 week if required, increase only if response is partial and if drug is tolerated; maximum 200 mg per day

- **INTERACTIONS** → Appendix 1: SSRIs

● SIDE-EFFECTS

- **Common or very common** Chest pain · depression · gastrointestinal disorders · increased risk of infection · neuromuscular dysfunction · vasodilation
- **Uncommon** Back pain · burping · chills · cold sweat · dizziness postural · dysphagia · dyspnoea · ear pain · haemorrhage · hypertension · hypothyroidism · migraine · mood altered · movement disorders · muscle complaints · muscle weakness · oedema · oral disorders · osteoarthritis · periorbital oedema · respiratory disorders · sensation abnormal · skin reactions · speech disorder · thinking abnormal · thirst · urinary disorders
- **Rare or very rare** Balanoposthitis · bone disorder · cardiac disorder · coma · conversion disorder · diabetes mellitus · drug dependence · drug tolerance decreased · dysphonia · eye disorders · gait abnormal · genital discharge · glaucoma · hair texture abnormal · hepatic disorders · hiccups · hypercholesterolaemia · hypoglycaemia · injury · lymphadenopathy · myocardial infarction · neoplasms · oliguria · paranoia · peripheral ischaemia · psychotic disorder · sleep walking · vision disorders · vulvovaginal atrophy
- **Frequency not known** Cerebrovascular insufficiency · gynaecomastia · hyperglycaemia · leucopenia · neuroleptic malignant syndrome · pancreatitis · severe cutaneous adverse reactions (SCARs)
- **BREAST FEEDING** Not known to be harmful but consider discontinuing breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment. Dose adjustments Reduce dose or increase dose interval in mild or moderate impairment.
- **RENAL IMPAIRMENT** Use with caution.
- **TREATMENT CESSATION** The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

● PATIENT AND CARER ADVICE

Driving and skilled tasks Patients should be counselled on the effects on driving and skilled tasks.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

► **Sertraline (Non-proprietary)**

Sertraline (as Sertraline hydrochloride) 50 mg Sertraline 50mg tablets | 28 tablet [PoM] £19.25 DT = £0.67

Sertraline (as Sertraline hydrochloride) 100 mg Sertraline 100mg tablets | 28 tablet [PoM] £29.09 DT = £0.91

► **Lustral** (Pfizer Ltd)

Sertraline (as Sertraline hydrochloride) 50 mg Lustral 50mg tablets | 28 tablet [PoM] £17.82 DT = £0.67

Sertraline (as Sertraline hydrochloride) 100 mg Lustral 100mg tablets | 28 tablet [PoM] £29.16 DT = £0.91

ANTIDEPRESSANTS > SEROTONIN AND NORADRENALINE RE-UP TAKE INHIBITORS

Duloxetine

- **DRUG ACTION** Inhibits the re-uptake of serotonin and noradrenaline.

● INDICATIONS AND DOSE

Major depressive disorder

► BY MOUTH

- Adult: 60 mg once daily

Generalised anxiety disorder

► BY MOUTH

- Adult: Initially 30 mg once daily, increased if necessary to 60 mg once daily; maximum 120 mg per day

Diabetic neuropathy

► BY MOUTH

- Adult: 60 mg once daily, discontinue if inadequate response after 2 months; review treatment at least every 3 months, maximum dose to be given in divided doses; maximum 120 mg per day

Moderate to severe stress urinary incontinence

► BY MOUTH

- Adult (female): 40 mg twice daily, patient should be assessed for benefit and tolerability after 2–4 weeks, alternatively initially 20 mg twice daily for 2 weeks, this can minimise side effects, then increased to 40 mg twice daily, the patient should be assessed for benefit and tolerability after 2–4 weeks.

- **CAUTIONS** Bleeding disorders · cardiac disease · elderly · history of mania · history of seizures · hypertension (avoid if uncontrolled) · raised intra-ocular pressure · susceptibility to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1: duloxetine

● SIDE-EFFECTS

- **Common or very common** Anxiety · appetite decreased · constipation · diarrhoea · dizziness · drowsiness · dry mouth · fall · fatigue · flushing · gastrointestinal discomfort · gastrointestinal disorders · headache · muscle complaints · nausea · pain · palpitations · paraesthesia · sexual dysfunction · skin reactions · sleep disorders · sweat changes · tinnitus · tremor · urinary disorders · vision disorders · vomiting · weight changes · yawning
- **Uncommon** Apathy · arrhythmias · behaviour abnormal · burping · chills · concentration impaired · disorientation · dysphagia · ear pain · feeling abnormal · gait abnormal · haemorrhage · hepatic disorders · hyperglycaemia · increased risk of infection · malaise · menstrual disorder · movement disorders · mydriasis · peripheral coldness · photosensitivity reaction · postural hypotension · syncope

- taste altered • temperature sensation altered • testicular pain • thirst • throat tightness • vertigo
- ▶ **Rare or very rare** Angioedema • cutaneous vasculitis • dehydration • galactorrhoea • glaucoma • hallucination • hyperprolactinaemia • hypertensive crisis • hyponatraemia • hypothyroidism • mania • menopausal symptoms • oral disorders • seizure • serotonin syndrome • SIADH • Stevens-Johnson syndrome • urine odour abnormal

● **PREGNANCY** Toxicity in *animal* studies—avoid in patients with stress urinary incontinence; in other conditions use only if potential benefit outweighs risk. Risk of neonatal withdrawal symptoms if used near term.

● **BREAST FEEDING** Present in milk—manufacturer advises avoid.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

● **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

● **TREATMENT CESSATION** Nausea, vomiting, headache, anxiety, dizziness, paraesthesia, sleep disturbances, and tremor are the most common features of abrupt withdrawal or marked reduction of the dose; dose should be reduced over at least 1–2 weeks.

● NATIONAL FUNDING/ACCESS DECISIONS

CYMBALTA®

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2006) that duloxetine (*Cymbalta*®) should be restricted for use by specialists when other treatments for diabetic peripheral neuropathic pain are unsuitable or inadequate.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant capsule

CAUTIONARY AND ADVISORY LABELS 2

Duloxetine (as Duloxetine hydrochloride) 30 mg Ducilia 30mg gastro-resistant capsules | 28 capsule [PoM](#) £22.40 DT = £7.74

Duloxetine (as Duloxetine hydrochloride) 60 mg Ducilia 60mg gastro-resistant capsules | 28 capsule [PoM](#) £27.72 DT = £11.57

▶ Yentreve (Eli Lilly and Company Ltd)

Duloxetine (as Duloxetine hydrochloride) 20 mg Yentreve 20mg gastro-resistant capsules | 28 capsule [PoM](#) £18.48 DT = £6.46

Duloxetine (as Duloxetine hydrochloride) 40 mg Yentreve 40mg gastro-resistant capsules | 56 capsule [PoM](#) £36.96 DT = £13.39

Venlafaxine

26-Jul-2017

● **DRUG ACTION** A serotonin and noradrenaline re-uptake inhibitor.

● INDICATIONS AND DOSE

Major depression

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: Initially 75 mg daily in 2 divided doses, then increased if necessary up to 375 mg daily, dose to be increased if necessary at intervals of at least 2 weeks, faster dose titration may be necessary in some patients; maximum 375 mg per day

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Adult: Initially 75 mg once daily, increased if necessary up to 375 mg once daily, dose to be increased if necessary at intervals of at least 2 weeks, faster dose titration may be necessary in some patients; maximum 375 mg per day

Generalised anxiety disorder

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Adult: 75 mg once daily, increased if necessary up to 225 mg once daily, dose to be increased at intervals of at least 2 weeks; maximum 225 mg per day

Social anxiety disorder

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Adult: 75 mg once daily, there is no evidence of greater efficacy at higher doses, increased if necessary up to 225 mg once daily, dose to be increased if necessary at intervals of at least 2 weeks; maximum 225 mg per day

Menopausal symptoms, particularly hot flushes, in women with breast cancer

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Adult: 37.5 mg once daily for one week, then increased if necessary to 75 mg once daily

● **UNLICENSED USE** [EvrG](#) Not licensed for menopausal symptoms. [⚠](#)

● **CONTRA-INDICATIONS** Conditions associated with high risk of cardiac arrhythmia • uncontrolled hypertension

● **CAUTIONS** Diabetes • heart disease (monitor blood pressure) • history of bleeding disorders • history of epilepsy • history or family history of mania • susceptibility to angle-closure glaucoma

● **INTERACTIONS** → Appendix 1: venlafaxine

● SIDE-EFFECTS

▶ **Common or very common** Anxiety • appetite decreased • arrhythmias • asthenia • chills • confusion • constipation • depersonalisation • diarrhoea • dizziness • dry mouth • dyspnoea • headache • hot flush • hypertension • menstrual cycle irregularities • movement disorders • muscle tone increased • mydriasis • nausea • palpitations • paraesthesia • sedation • sexual dysfunction • skin reactions • sleep disorders • sweat changes • taste altered • tinnitus • tremor • urinary disorders • vision disorders • vomiting • weight changes • yawning

▶ **Uncommon** Alopecia • angioedema • apathy • behaviour abnormal • derealisation • haemorrhage • hallucination • hypotension • mood altered • photosensitivity reaction • syncope

▶ **Rare or very rare** Agranulocytosis • angle closure glaucoma • bone marrow disorders • delirium • hepatitis • hyponatraemia • neuroleptic malignant syndrome • neutropenia • pancreatitis • QT interval prolongation • respiratory disorders • rhabdomyolysis • seizure • serotonin syndrome • severe cutaneous adverse reactions (SCARs) • SIADH • thrombocytopenia

▶ **Frequency not known** Suicidal tendencies • vertigo • withdrawal syndrome

• **PREGNANCY** Avoid unless potential benefit outweighs risk—toxicity in *animal* studies. Risk of withdrawal effects in neonate.

• **BREAST FEEDING** Present in milk—avoid.

• **HEPATIC IMPAIRMENT**

Dose adjustments Consider reducing dose by 50% in mild or moderate impairment; use with caution and reduce dose by at least 50% in severe impairment.

• **RENAL IMPAIRMENT** Use with caution.

Dose adjustments Use half normal dose (immediate-release tablets may be given once daily) if eGFR less than 30 mL/minute/1.73 m².

• **TREATMENT CESSATION** Associated with a higher risk of withdrawal effects compared with other antidepressants.

Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, tremor, sleep disturbances, and sweating are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks.

• **PATIENT AND CARER ADVICE**

Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Modified-release tablet

ANTIDEPRESSANTS > SEROTONIN UPTAKE INHIBITORS

Trazodone hydrochloride

• **INDICATIONS AND DOSE**

Depressive illness (particularly where sedation is required)

► **BY MOUTH**

► **Adult:** Initially 150 mg daily in divided doses, dose to be taken after food, alternatively initially 150 mg once

daily, dose to be taken at bedtime, increased if necessary to 300 mg daily; increased if necessary to 600 mg daily in divided doses, higher dose for use in hospital patients only

- **Elderly:** Initially 100 mg daily in divided doses, dose to be taken after food, alternatively initially 100 mg once daily, dose to be taken at bedtime, increased if necessary to 300 mg daily; increased if necessary to 600 mg daily in divided doses, higher dose for use in hospital patients only

Anxiety

► BY MOUTH

- **Adult:** 75 mg daily, increased if necessary to 300 mg daily

- **CONTRA-INDICATIONS** Arrhythmias · during the manic phase of bipolar disorder · heart block · immediate recovery period after myocardial infarction

- **CAUTIONS** Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention

CAUTIONS, FURTHER INFORMATION Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- **INTERACTIONS** → Appendix 1: trazodone
- **SIDE-EFFECTS** Aggression · agranulocytosis · alertness decreased · anaemia · anxiety · aphasia · appetite abnormal · arrhythmias · arthralgia · asthenia · blood disorder · chest pain · confusion · constipation · delirium · delusions · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · eosinophilia · fever · gastroenteritis · gastrointestinal discomfort · hallucination · headache · hepatic disorders · hyperhidrosis · hypersalivation · hypertension · hyponatraemia · influenza like illness · leucopenia · libido decreased · mania · memory loss · movement disorders · myalgia · nasal congestion · nausea · neuroleptic malignant syndrome · oedema · pain · palpitations · paraesthesia · paralytic ileus · postural hypotension · priapism (discontinue) · QT interval prolongation · seizure · serotonin syndrome · SIADH · skin reactions · sleep disorders · suicidal tendencies · syncope · taste altered · thrombocytopenia · tremor · urinary disorder · vertigo · vision blurred · vomiting · weight decreased · withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

Overdose The tricyclic-related antidepressant drugs may be associated with a lower risk of cardiotoxicity in overdose.

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1319.

- **PREGNANCY** Avoid during first trimester—limited information available. Monitor infant for signs of withdrawal if used until delivery.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.

- **HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Use with caution in severe impairment.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving).
Effects of alcohol enhanced.

● MEDICINAL FORMS

► Moliapaxin (Zentiva)

Trazodone hydrochloride 50 mg Moliapaxin 50mg capsules | 84 capsule [PoM] £23.92 DT = £7.11

Trazodone hydrochloride 100 mg Moliapaxin 100mg capsules | 56 capsule [PoM] £28.14 DT = £7.59

ANTIDEPRESSANTS > TETRACYCLIC ANTIDEPRESSANTS

Mianserin hydrochloride

● INDICATIONS AND DOSE

Depressive illness (particularly where sedation is required)

► BY MOUTH

- **Adult:** Initially 30–40 mg daily in divided doses, alternatively initially 30–40 mg once daily, dose to be taken at bedtime, increase dose gradually as necessary; usual dose 30–90 mg
- **Elderly:** Initially 30 mg daily in divided doses, alternatively initially 30 mg once daily, dose to be taken at bedtime, increase dose gradually as necessary; usual dose 30–90 mg

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · arrhythmias · during the manic phase of bipolar disorder · heart block · immediate recovery period after myocardial infarction
- **CAUTIONS** Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention
- **CAUTIONS, FURTHER INFORMATION** Treatment should be stopped if the patient enters a manic phase.
Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.
- **INTERACTIONS** → Appendix 1: mianserin
- **SIDE-EFFECTS** Agranulocytosis · arthritis · bone marrow disorders · breast abnormalities · dizziness · granulocytopenia · gynaecomastia · hepatic disorders · hyperhidrosis · hyponatraemia · joint disorders · lactation in absence of pregnancy · leucopenia · mood altered · neuromuscular irritability · oedema · paranoid delusions · postural hypotension · psychosis · rash · seizure · sexual dysfunction · suicidal tendencies · tremor · withdrawal syndrome
- **SIDE-EFFECTS, FURTHER INFORMATION** The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.
- **Overdose** The tricyclic-related antidepressant drugs may be associated with a lower risk of cardiotoxicity in overdose.
- Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hyperthermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1319.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.
- **RENAL IMPAIRMENT**
• **Dose adjustments** Caution in renal impairment.
- **MONITORING REQUIREMENTS** A full **blood count** is recommended every 4 weeks during the first 3 months of treatment; clinical monitoring should continue subsequently and treatment should be stopped and a full blood count obtained if *fever, sore throat, stomatitis*, or other signs of infection develop.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.

• PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving).
Effects of alcohol enhanced.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 25

► Mianserin hydrochloride (Non-proprietary)

Mianserin hydrochloride 10 mg Mianserin 10mg tablets | 28 tablet **PoM** £8.58 DT = £8.58

Mianserin hydrochloride 30 mg Mianserin 30mg tablets | 28 tablet **PoM** £23.39 DT = £18.34

Mirtazapine

- **DRUG ACTION** Mirtazapine is a presynaptic α_2 -adrenoreceptor antagonist which increases central noradrenergic and serotonergic neurotransmission.

• INDICATIONS AND DOSE

Major depression

► BY MOUTH

- **Adult:** Initially 15–30 mg daily for 2–4 weeks, dose to be taken at bedtime, then adjusted according to response to up to 45 mg once daily, alternatively up to 45 mg daily in 2 divided doses

- **CAUTIONS** Cardiac disorders · diabetes mellitus · elderly · history of bipolar depression · history of seizures · history of urinary retention · hypotension · psychoses (may aggravate psychotic symptoms) · susceptibility to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1: mirtazapine
- **SIDE-EFFECTS**
► **Common or very common** Anxiety · appetite increased · arthralgia · back pain · confusion · constipation · diarrhoea · dizziness · drowsiness · dry mouth · fatigue · headache (on discontinuation) · myalgia · nausea · oedema · postural hypotension · sleep disorders · tremor · vomiting · weight increased
► **Uncommon** Hallucination · mania · movement disorders · oral disorders · syncope
► **Rare or very rare** Aggression · pancreatitis
► **Frequency not known** Agranulocytosis · arrhythmias · bone marrow disorders · dysarthria · eosinophilia · granulocytopenia · hyponatraemia · QT interval prolongation · rhabdomyolysis · seizure · serotonin syndrome · severe cutaneous adverse reactions (SCARs) · SIADH · skin reactions · sudden death · suicidal tendencies · thrombocytopenia · urinary retention · withdrawal syndrome
- **PREGNANCY** Use with caution—limited experience; monitor neonate for withdrawal effects.
- **BREAST FEEDING** Present in milk; use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Use with caution. Discontinue if jaundice occurs.
- **RENAL IMPAIRMENT** Clearance reduced by 30% if eGFR less than 40 mL/minute/1.73 m²; clearance reduced by 50% if eGFR less than 10 mL/minute/1.73 m².
- **TREATMENT CESSATION** Nausea, vomiting, dizziness, agitation, anxiety, and headache are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks.
- **DIRECTIONS FOR ADMINISTRATION** Orodispersible tablet (*Zispin SolTab*®) should be placed on the tongue, allowed to disperse and swallowed.

- **PATIENT AND CARER ADVICE** Counselling on administration of orodispersible tablet advised. Blood Disorders Patients should be advised to report any fever, sore throat, stomatitis or other signs of infection during treatment. Blood count should be performed and the drug stopped immediately if blood dyscrasia suspected.

ANTIDEPRESSANTS > TRICYCLIC ANTIDEPRESSANTS

Amitriptyline hydrochloride

● INDICATIONS AND DOSE

Abdominal pain or discomfort (in patients who have not responded to laxatives, loperamide, or antispasmodics)

► BY MOUTH

- Adult: Initially 5–10 mg daily, to be taken at night; increased in steps of 10 mg at least every 2 weeks as required; maximum 30 mg per day

Major depressive disorder [not recommended—increased risk of fatality in overdose]

► BY MOUTH

- Adult: Initially 50 mg daily in 2 divided doses, then increased in steps of 25 mg once daily on alternate days if required, maximum 150 mg daily in 2 divided doses
- Elderly: Initially 10–25 mg daily, increased if necessary up to 100–150 mg daily in 2 divided doses, dose increases dependent on individual patient response and tolerability—doses above 100 mg should be used with caution

Major depressive disorder in patients with cardiovascular disease [not recommended—increased risk of fatality in overdose]

► BY MOUTH

- Adult: Initially 10–25 mg daily, increased if necessary up to 100–150 mg daily in 2 divided doses, dose increases dependent on individual patient response and tolerability—doses above 100 mg should be used with caution

Neuropathic pain | Migraine prophylaxis | Chronic tension-type headache prophylaxis

► BY MOUTH

- Adult: Initially 10–25 mg daily, dose to be taken in the evening, then increased, if tolerated, in steps of 10–25 mg every 3–7 days in 1–2 divided doses; usual dose 25–75 mg daily, dose to be taken in the evening, doses above 100 mg should be used with caution (doses above 75 mg should be used with caution in the elderly and in patients with cardiovascular disease); maximum per dose 75 mg

- **UNLICENSED USE** Not licensed for use in abdominal pain or discomfort in patients who have not responded to laxatives, loperamide, or antispasmodics.

- **CONTRA-INDICATIONS** Arrhythmias · during manic phase of bipolar disorder · heart block · immediate recovery period after myocardial infarction

- **CAUTIONS** Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention

CAUTIONS, FURTHER INFORMATION Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- **INTERACTIONS** → Appendix 1: tricyclic antidepressants

● SIDE-EFFECTS

- **Common or very common** Anticholinergic syndrome · drowsiness · QT interval prolongation
- **Frequency not known** Agranulocytosis · alopecia · anxiety · appetite abnormal · arrhythmias · asthenia · bone marrow depression · breast enlargement · cardiac conduction disorders · coma · concentration impaired · confusion · constipation · delirium · delusions · diarrhoea · dizziness · dry mouth · dysarthria · eosinophilia · epigastric distress · face oedema · galactorrhoea · gynaecomastia · hallucination · headache · hepatic disorders · hyperhidrosis · hyperpyrexia · hypertension · hyponatraemia · hypotension · leucopenia · mood altered · movement disorders · mydriasis · myocardial infarction · nausea · neuroleptic malignant syndrome · oral disorders · palpitations · paralytic ileus · peripheral neuropathy · photosensitivity reaction · seizure · sensation abnormal · sexual dysfunction · SIADH · skin reactions · sleep disorders · stroke · sudden cardiac death · suicidal tendencies · syncope · taste altered · testicular swelling · thrombocytopenia · tinnitus · tremor · urinary disorders · urinary tract dilation · vision disorders · vomiting · weight changes · withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

Overdose Overdosage with amitriptyline is associated with a relatively high rate of fatality. Symptoms of overdosage may include dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning, see Tricyclic and related antidepressants, under Emergency treatment of poisoning p. 1319.

- **PREGNANCY** Use only if potential benefit outweighs risk.

- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving).
 Effects of alcohol enhanced.
- **LESS SUITABLE FOR PRESCRIBING** Amitriptyline hydrochloride is less suitable for prescribing, see Tricyclic and related antidepressant drugs in Antidepressant drugs p. 355.

Amitriptyline with perphenazine

The properties listed below are those particular to the combination only. For the properties of the components please consider, amitriptyline hydrochloride p. 369, perphenazine p. 384.

• INDICATIONS AND DOSE

Depression with anxiety

► BY MOUTH

- **Adult:** 1 tablet 3 times a day, an additional tablet may be taken at bedtime when required

- **INTERACTIONS** → Appendix 1: phenothiazines · tricyclic antidepressants
- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.
- **MEDICINAL FORMS**
 No licensed medicines listed.

Clomipramine hydrochloride

• INDICATIONS AND DOSE

Depressive illness

► BY MOUTH

- **Adult:** Initially 10 mg daily, then increased if necessary to 30–150 mg daily in divided doses, dose to be increased gradually, alternatively increased if necessary to 30–150 mg once daily, dose to be taken at bedtime; maximum 250 mg per day
- **Elderly:** Initially 10 mg daily, then increased to 30–75 mg daily, dose to be increased carefully over approximately 10 days

Phobic and obsessional states

► BY MOUTH

- **Adult:** Initially 25 mg daily, then increased to 100–150 mg daily, dose to be increased gradually over 2 weeks; maximum 250 mg per day
- **Elderly:** Initially 10 mg daily, then increased to 100–150 mg daily, dose to be increased gradually over 2 weeks; maximum 250 mg per day

Adjunctive treatment of cataplexy associated with narcolepsy

► BY MOUTH

- **Adult:** Initially 10 mg daily, dose to be gradually increased until satisfactory response; increased if necessary to 10–75 mg daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · arrhythmias · during the manic phase of bipolar disorder · heart block · immediate recovery period after myocardial infarction
- **CAUTIONS** Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention
- CAUTIONS, FURTHER INFORMATION** Treatment should be stopped if the patient enters a manic phase.
 Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.
- **INTERACTIONS** → Appendix 1: tricyclic antidepressants
- **SIDE-EFFECTS**
 - **Common or very common** Aggression · anxiety · arrhythmias · breast enlargement · concentration impaired · confusion · constipation · delirium · depersonalisation · depression exacerbated · diarrhoea · dizziness · drowsiness · dry mouth · fatigue · galactorrhoea · gastrointestinal disorder · hallucination · headache · hot flush · hyperhidrosis · hypotension · memory loss · mood altered · movement disorders · muscle tone increased · muscle weakness · mydriasis · nausea · palpitations · paraesthesia · photosensitivity reaction · sexual dysfunction · skin reactions · sleep disorders · speech disorder · taste altered · tinnitus · tremor · urinary disorders · vision disorders · vomiting · weight increased · yawning
 - **Uncommon** Psychosis · seizure
 - **Rare or very rare** Agranulocytosis · alopecia · cardiac conduction disorders · eosinophilia · glaucoma · hepatic disorders · hyperpyrexia · leucopenia · neuroleptic malignant syndrome · oedema · QT interval prolongation · respiratory disorders · thrombocytopenia · vaginal haemorrhage
 - **Frequency not known** Rhabdomyolysis · serotonin syndrome · suicidal tendencies · withdrawal syndrome
- SIDE-EFFECTS, FURTHER INFORMATION** The patient should be encouraged to persist with treatment as some tolerance

to these side-effects seems to develop. The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

Overdose Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hyperthermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1319.

- **PREGNANCY** Neonatal withdrawal symptoms reported if used during third trimester.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving).
Effects of alcohol enhanced.

(Dothiepin hydrochloride)

● INDICATIONS AND DOSE

Depressive illness, particularly where sedation is required (not recommended—increased risk of fatality in overdose) (initiated by a specialist)

► BY MOUTH

- **Adult:** Initially 75 mg daily in divided doses, alternatively initially 75 mg once daily, dose to be taken at bedtime, increased if necessary to 150 mg daily, doses to be increased gradually; up to 225 mg daily in some circumstances (e.g. hospital use)
- **Elderly:** Initially 50–75 mg daily in divided doses, alternatively initially 50–75 mg once daily, dose to be taken at bedtime, increased if necessary to 75–150 mg daily, doses to be increased gradually; up to 225 mg daily in some circumstances (e.g. hospital use)

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · arrhythmias · during the manic phase of bipolar disorder · heart block · immediate recovery period after myocardial infarction
- **CAUTIONS** Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention
- **CAUTIONS, FURTHER INFORMATION** Treatment should be stopped if the patient enters a manic phase.
Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.
- **INTERACTIONS** → Appendix 1: tricyclic antidepressants
- **SIDE-EFFECTS** Accommodation disorder · agranulocytosis · alveolitis · anticholinergic syndrome · appetite abnormal · arrhythmias · asthenia · bone marrow depression · cardiac conduction disorder · confusion · constipation · dizziness · drowsiness · dry mouth · endocrine disorder · eosinophilia · epigastric discomfort · galactorrhoea · gynaecomastia · hepatic disorders · hyperhidrosis · hypertension · hyponatraemia · hypotension · increased risk of fracture · leucopenia · mood altered · movement disorders · nausea · nervousness · paranoid delusions · photosensitivity reaction · psychosis · seizures · sexual dysfunction · SIADH · skin reactions · speech disorder · suicidal tendencies · testicular hypertrophy · thrombocytopenia · tremor · urinary hesitation · vomiting · weight changes · withdrawal syndrome
- **SIDE-EFFECTS, FURTHER INFORMATION** The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.
- **Overdose** Overdosage with dosulepin is associated with a relatively high rate of fatality.
Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hyperthermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1319.
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge. (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.
A maximum prescription equivalent to 2 weeks' supply of 75 mg daily should be considered in patients with increased risk factors for suicide at initiation of

treatment, during any dose adjustment, and until improvement occurs.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving).

Effects of alcohol enhanced.

● LESS SUITABLE FOR PRESCRIBING

Dosulepin hydrochloride is less suitable for prescribing, see Tricyclic and related antidepressant drugs in Antidepressant drugs p. 355.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 2

► Dosulepin hydrochloride (Non-proprietary)

Dosulepin hydrochloride 75 mg Dosulepin 75mg tablets | 28 tablet [PoM] £1.70 DT = £1.20

► Prothiaden (Teofarma)

Dosulepin hydrochloride 75 mg Prothiaden 75mg tablets | 28 tablet [PoM] £2.97 DT = £1.20

Capsule

CAUTIONARY AND ADVISORY LABELS 2

► Dosulepin hydrochloride (Non-proprietary)

Dosulepin hydrochloride 25 mg Dosulepin 25mg capsules | 28 capsule [PoM] £3.00 DT = £0.90

► Prothiaden (Teofarma)

Dosulepin hydrochloride 25 mg Prothiaden 25mg capsules | 28 capsule [PoM] £1.70 DT = £0.90

Doxepin

● INDICATIONS AND DOSE

Depressive illness (particularly where sedation is required)

► BY MOUTH

► **Adult:** Initially 75 mg daily in divided doses, alternatively 75 mg once daily, adjusted according to response, dose to taken at bedtime; maintenance 25–300 mg daily, doses above 100 mg given in 3 divided doses

► **Elderly:** Start with lower doses and adjust according to response

● **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · arrhythmias · during manic phase of bipolar disorder · heart block · immediate recovery period after myocardial infarction

● **CAUTIONS** Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention

CAUTIONS, FURTHER INFORMATION Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

● **INTERACTIONS** → Appendix 1: tricyclic antidepressants

● **SIDE-EFFECTS** Agitation · agranulocytosis · alopecia · anticholinergic syndrome · appetite decreased · asthenia · asthma exacerbated · bone marrow depression · breast enlargement · cardiovascular effects · chills · confusion · constipation · diarrhoea · dizziness · drowsiness · dry mouth · dyspepsia · eosinophilia · face oedema · flushing · galactorrhoea · gynaecomastia · haemolytic anaemia · hallucination · headache · hyperhidrosis · hyperpyrexia ·

increased risk of fracture · jaundice · leucopenia · mania · movement disorders · nausea · oral ulceration · paranoid delusions · photosensitivity reaction · postural hypotension · psychosis · seizure · sensation abnormal · sexual dysfunction · SIADH · skin reactions · sleep disorders · suicidal tendencies · tachycardia · taste altered · testicular swelling · thrombocytopenia · tinnitus · tremor · urinary retention · vision blurred · vomiting · weight increased

SIDE-EFFECTS, FURTHER INFORMATION The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

Overdose Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1319.

● **PREGNANCY** Use with caution—limited information available.

● **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful. Accumulation of metabolite may cause sedation and respiratory depression in neonate.

● **HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

● **RENAL IMPAIRMENT** Use with caution.

● **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

● **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving).

Effects of alcohol enhanced.

● MEDICAL FORMS

Doxepin (as Doxepin hydrochloride) 25 mg Doxepin 25mg capsules | 28 capsule [PoM] £97.00 DT = £97.00

Doxepin (as Doxepin hydrochloride) 50 mg Doxepin 50mg capsules | 28 capsule [PoM] £154.00 DT = £154.00

Imipramine hydrochloride

● INDICATIONS AND DOSE

Depressive illness

► BY MOUTH

► **Adult:** Initially up to 75 mg daily in divided doses, then increased to 150–200 mg daily, up to 150 mg may be given as a single dose at bedtime, dose to be increased gradually

- ▶ **Elderly:** Initially 10 mg daily, increased to 30–50 mg daily, dose to be increased gradually

Depressive illness in hospital patients

▶ BY MOUTH

- ▶ **Adult:** Initially up to 75 mg daily in divided doses, dose to be increased gradually, increased to up to 300 mg daily in divided doses

Nocturnal enuresis

▶ BY MOUTH

- ▶ **Child 6–7 years:** 25 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course
- ▶ **Child 8–10 years:** 25–50 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course
- ▶ **Child 11–17 years:** 50–75 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 . arrhythmia . during the manic phase of bipolar disorder . heart block . immediate recovery period after myocardial infarction (in adults)

- **CAUTIONS** Cardiovascular disease . chronic constipation . diabetes . epilepsy . history of bipolar disorder . history of psychosis . hyperthyroidism (risk of arrhythmias) . increased intra-ocular pressure (in adults) . patients with a significant risk of suicide . pheochromocytoma (risk of arrhythmias) . prostatic hypertrophy (in adults) . susceptibility to angle-closure glaucoma . urinary retention

CAUTIONS, FURTHER INFORMATION Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- **INTERACTIONS** → Appendix 1: tricyclic antidepressants

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety . appetite decreased . arrhythmias . asthenia . cardiac conduction disorders . confusion . delirium . depression . dizziness . drowsiness . epilepsy . hallucination . headache . hepatic disorders . hypotension . mood altered . nausea . palpitations . paraesthesia . sexual dysfunction . skin reactions . sleep disorder . tremor . vomiting . weight changes

- ▶ **Uncommon** Psychosis

- ▶ **Rare or very rare** Aggression . agranulocytosis . alopecia . bone marrow depression . enlarged mammary gland . eosinophilia . fever . galactorrhoea . gastrointestinal disorders . glaucoma . heart failure . leucopenia . movement disorders . mydriasis . oedema . oral disorders . peripheral vasospastic reaction . photosensitivity reaction . respiratory disorders . SIADH . speech disorder . thrombocytopenia

- ▶ **Frequency not known** Anticholinergic syndrome . cardiovascular effects . drug fever . hyponatraemia . increased risk of fracture . neurological effects . paranoid delusions exacerbated . psychiatric disorder . suicidal tendencies . tinnitus . urinary disorder . withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

Overdose Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses,

convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1319.

- **PREGNANCY** Colic, tachycardia, dyspnoea, irritability, muscle spasms, respiratory depression and withdrawal symptoms reported in neonates when used in the third trimester.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Use with caution in severe impairment.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic antidepressants should be withdrawn slowly.
- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

Lofepramine

● INDICATIONS AND DOSE

Depressive illness

▶ BY MOUTH

- ▶ **Adult:** 140–210 mg daily in divided doses
- ▶ **Elderly:** May respond to lower doses

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 . arrhythmias . during the manic phase of bipolar disorder . heart block . immediate recovery period after myocardial infarction

- **CAUTIONS** Cardiovascular disease . chronic constipation . diabetes . epilepsy . history of bipolar disorder . history of psychosis . hyperthyroidism (risk of arrhythmias) . increased intra-ocular pressure . patients with a significant risk of suicide . pheochromocytoma (risk of arrhythmias) .

prostatic hypertrophy • susceptibility to angle-closure glaucoma • urinary retention

CAUTIONS, FURTHER INFORMATION Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- **INTERACTIONS** → Appendix 1: tricyclic antidepressants

- **SIDE-EFFECTS** Accommodation disorder • agitation • agranulocytosis • arrhythmias • bone marrow disorders • cardiac conduction disorder • confusion • constipation • coordination abnormal • dizziness • drowsiness • dry mouth • eosinophilia • face oedema • galactorrhoea • glaucoma • granulocytopenia • gynaecomastia • hallucination • headache • heart failure aggravated • hepatic disorders • hyperhidrosis (on discontinuation) • hyponatraemia • hypotension • increased risk of fracture • leucopenia • malaise • mood altered • mucositis • nausea • paraesthesia • paranoid delusions • photosensitivity reaction • psychosis • respiratory depression • seizure • sexual dysfunction • SIADH • skin haemorrhage • skin reactions • sleep disorder • suicidal tendencies • taste altered • testicular disorders • thrombocytopenia • tinnitus • tremor • urinary disorders • vomiting • withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

Overdose Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hyperthermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Lofepamine is associated with the lowest risk of fatality in overdose, in comparison with other tricyclic antidepressant drugs. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1319.

- **PREGNANCY** Neonatal withdrawal symptoms and respiratory depression reported if used during third trimester.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid in severe impairment.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving).
Effects of alcohol enhanced.

Tablet

CAUTIONARY AND ADVISORY LABELS 2

► Lofepamine (Non-proprietary)

Lofepamine (as Lofepamine hydrochloride) 70 mg Lofepamine 70mg tablets | 56 tablet [PoM] £59.97 DT = £9.31

Nortriptyline

• INDICATIONS AND DOSE

Depressive illness

► BY MOUTH

- **Adult:** To be initiated at a low dose, then increased if necessary to 75–100 mg daily in divided doses, alternatively increased if necessary to 75–100 mg once daily; maximum 150 mg per day
- **Elderly:** To be initiated at a low dose, then increased if necessary to 30–50 mg daily in divided doses

Neuropathic pain

► BY MOUTH

- **Adult:** Initially 10 mg once daily, to be taken at night, increased if necessary to 75 mg daily, dose to be increased gradually; higher doses to be given under specialist supervision

- **UNLICENSED USE** Not licensed for use in neuropathic pain.
- **CONTRA-INDICATIONS** Arrhythmias • during the manic phase of bipolar disorder • heart block • immediate recovery period after myocardial infarction
- **CAUTIONS** Cardiovascular disease • chronic constipation • diabetes • epilepsy • history of bipolar disorder • history of psychosis • hyperthyroidism (risk of arrhythmias) • increased intra-ocular pressure • patients with a significant risk of suicide • phaeochromocytoma (risk of arrhythmias) • prostatic hypertrophy • susceptibility to angle-closure glaucoma • urinary retention
- **CAUTIONS, FURTHER INFORMATION** Treatment should be stopped if the patient enters a manic phase.
Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.
- **INTERACTIONS** → Appendix 1: tricyclic antidepressants
- **SIDE-EFFECTS** Agranulocytosis • alopecia • anxiety • appetite decreased • arrhythmias • asthenia • atrioventricular block • bone marrow disorders • breast enlargement • confusion • constipation • delusions • diarrhoea • dizziness • drowsiness • drug cross-reactivity • drug fever • dry mouth • eosinophilia • fever • flushing • galactorrhoea • gastrointestinal discomfort • gynaecomastia • hallucination • headache • hepatic disorders • hyperhidrosis • hypertension • hypomania • hypotension • increased risk of fracture • increased risk of infection • malaise • movement disorders • mydriasis • myocardial infarction • nausea • oedema • oral disorders • palpitations • paralytic ileus • peripheral neuropathy • photosensitivity reaction • psychosis exacerbated • seizure • sensation abnormal • sexual dysfunction • SIADH • skin reactions • sleep disorders • stroke • suicidal tendencies • taste altered • testicular swelling • thrombocytopenia • tinnitus • tremor • urinary disorders • urinary tract dilation • vision disorders • vomiting • weight changes

SIDE-EFFECTS, FURTHER INFORMATION The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

Overdose Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1319.

- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises plasma-nortriptyline concentration monitoring if dose above 100 mg daily, but evidence of practical value uncertain.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.
- **PATIENT AND CARER ADVICE** Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

Trimipramine (as Trimipramine maleate) 50 mg Trimipramine 50mg capsules | 28 capsule **[PoM]** £190.00 DT = £190.00

OTHER ANTIDEPRESSANTS**Tryptophan**

04-Oct-2017

(L-Tryptophan)

- **DRUG ACTION** Tryptophan is an essential dietary amino acid, and is a precursor of serotonin; it re-establishes the inhibitory action of serotonin on the amygdaloid nuclei, thereby reducing feelings of anxiety and depression.

INDICATIONS AND DOSE

Treatment-resistant depression (used alone or as adjunct to other antidepressant drugs) (initiated under direction of hospital consultant)

▶ BY MOUTH

Adult: 1 g 3 times a day; maximum 6 g per day

- **CONTRA-INDICATIONS** History of eosinophilia myalgia syndrome following use of tryptophan
- **INTERACTIONS** → Appendix 1: tryptophan
- **SIDE-EFFECTS** Asthenia · dizziness · drowsiness · eosinophilia myalgia syndrome · headache · myalgia · myopathy · nausea · oedema · suicidal tendencies
- SIDE-EFFECTS, FURTHER INFORMATION** If patients experience any symptoms of eosinophilia myalgia syndrome (EMS), manufacturer advises to withhold treatment until possibility of EMS is excluded.
- **PREGNANCY** Manufacturer advises caution—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises close monitoring for signs of suicidal thoughts, particularly in patients at high risk and during early treatment and dose changes.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should be advised to seek medical advice immediately if any clinical worsening, suicidal thoughts, or unusual behaviour develops.
- Driving and skilled tasks** Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of drowsiness.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Capsule

▶ **Optimax** (Intrapharm Laboratories Ltd)

Tryptophan 500 mg Optimax 500mg capsules | 84 capsule **[PoM]** £30.00

Vortioxetine

17-May-2016

- **DRUG ACTION** Vortioxetine inhibits the re-uptake of serotonin (5-HT) and is an antagonist at 5-HT₂ and an agonist at 5-HT_{1A} receptors. This multimodal activity appears to be associated with antidepressant and anxiolytic-like effects.

INDICATIONS AND DOSE**Major depression**

▶ BY MOUTH

Adult: Initially 10 mg once daily; adjusted according to response to 5–20 mg once daily

Elderly: Initially 5 mg once daily; increased if necessary up to 20 mg once daily

- **CAUTIONS** Bleeding disorders · cirrhosis of the liver (risk of hyponatraemia) · elderly (risk of hyponatraemia) · history of mania (discontinue if patient entering manic phase) · history of seizures · unstable epilepsy

CAUTIONS, FURTHER INFORMATION

- ▶ **Seizures** Discontinue treatment in patients who develop seizures or if there is an increase in seizure frequency.
- ▶ **Elderly** Manufacturer advises caution when treating elderly patients with doses over 10 mg daily—limited information.

- **INTERACTIONS** → Appendix 1: vortioxetine

SIDE-EFFECTS

▶ **Common or very common** Abnormal dreams · constipation · diarrhoea · dizziness · nausea · pruritus · vomiting

▶ **Uncommon** Flushing · night sweats

▶ **Frequency not known** Hyponatraemia · neuroleptic malignant syndrome (discontinue—potentially fatal) · serotonin syndrome

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. If used during the later stages of pregnancy, there is a risk of neonatal withdrawal symptoms and persistent pulmonary hypertension in the newborn.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—limited information available.

- **TREATMENT CESSATION** Manufacturer advises treatment can be stopped abruptly, without need for gradual dose reduction.

PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks, especially when starting treatment or changing the dose.

NATIONAL FUNDING/ACCESS DECISIONS**NICE decisions**

- ▶ **Vortioxetine for treating major depressive episodes (November 2015)** NICE TA367

Vortioxetine is recommended as an option for treating major depressive episodes in adults whose condition has responded inadequately to 2 antidepressants within the current episode.

Patients currently receiving vortioxetine whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA367

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Brintellix (Lundbeck Ltd) ▼

Vortioxetine (as Vortioxetine hydrobromide) 5 mg Brintellix 5mg tablets | 28 tablet [PoM] £27.72 DT = £27.72

3.5 Inappropriate sexual behaviour

ANTIPSYCHOTICS > FIRST-GENERATION

F 380

Benperidol

● INDICATIONS AND DOSE

Control of deviant antisocial sexual behaviour

► BY MOUTH

- Adult: 0.25–1.5 mg daily in divided doses, adjusted according to response, for debilitated patients, use elderly dose
- Elderly: Initially 0.125–0.75 mg daily in divided doses, adjusted according to response

- **CONTRA-INDICATIONS** CNS depression • comatose states • phaeochromocytoma

- **CAUTIONS** Risk factors for stroke

- **INTERACTIONS** → Appendix 1: benperidol

- **SIDE-EFFECTS** Appetite decreased • blood disorder • cardiac arrest • depression • dyspepsia • granulocytopenia • headache • hepatic disorders • hyperhidrosis • hypersalivation • hypertension • movement disorders • muscle rigidity • nausea • oculogyric crisis • oedema • oligomenorrhoea • paradoxical drug reaction • psychiatric disorder • skin reactions • temperature regulation disorders • vomiting • weight change

- **PREGNANCY** Extrapyramidal effects and withdrawal syndrome have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy. Following maternal use of antipsychotic drugs in the third trimester, neonates should be monitored for symptoms including agitation, hypertonia, hypotonia, tremor, drowsiness, feeding problems, and respiratory distress.

- **BREAST FEEDING** There is limited information available on the short- and long-term effects of antipsychotic drugs on the breast-fed infant. *Animal* studies indicate possible adverse effects of antipsychotic medicines on the developing nervous system. Chronic treatment with antipsychotic drugs whilst breast-feeding should be avoided unless absolutely necessary.

- **HEPATIC IMPAIRMENT** Can precipitate coma.

- **RENAL IMPAIRMENT**

Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

- **MONITORING REQUIREMENTS** Manufacturer advises regular blood counts and liver function tests during long-term treatment.

- **PRESCRIBING AND DISPENSING INFORMATION** The proprietary name *Benquil*® has been used for benperidol tablets.

MEDICINAL FORMS

3.6 Psychoses and schizophrenia

Psychoses and related disorders

06-Mar-2017

Advice of Royal College of Psychiatrists on doses of antipsychotic drugs above BNF upper limit

Unless otherwise stated, doses in the BNF are licensed doses—any higher dose is therefore **unlicensed**

- Consider alternative approaches including adjuvant therapy and newer or second-generation antipsychotic drugs such as clozapine.
- Bear in mind risk factors, including obesity; particular caution is indicated in older patients, especially those over 70.
- Consider potential for drug interactions—see interactions: Appendix 1 (antipsychotics).
- Carry out ECG to exclude untoward abnormalities such as prolonged QT interval; repeat ECG periodically and reduce dose if prolonged QT interval or other adverse cardiac abnormality develops.
- Increase dose slowly and not more often than once weekly.
- Carry out regular pulse, blood pressure, and temperature checks; ensure that patient maintains adequate fluid intake.
- Consider high-dose therapy to be for limited period and review regularly; abandon if no improvement after 3 months (return to standard dosage).

Important: When prescribing an antipsychotic for administration on an emergency basis, the intramuscular dose should be **lower** than the corresponding oral dose (owing to absence of first-pass effect), particularly if the patient is very active (increased blood flow to muscle considerably increases the rate of absorption). The prescription should specify the dose for **each route** and should **not** imply that the same dose can be given by mouth or by intramuscular injection. The dose of antipsychotic for emergency use should be reviewed at least **daily**.

Antipsychotic drugs

Antipsychotic drugs are also known as 'neuroleptics' and (misleadingly) as 'major tranquillisers'.

In the short term they are used to calm disturbed patients whatever the underlying psychopathology, which may be schizophrenia, brain damage, mania, toxic delirium, or agitated depression. Antipsychotic drugs are used to alleviate severe anxiety but this too should be a short-term measure.

Schizophrenia

The aim of treatment is to alleviate the suffering of the patient (and carer) and to improve social and cognitive functioning. Many patients require life-long treatment with antipsychotic medication. Antipsychotic drugs relieve positive psychotic symptoms such as thought disorder, hallucinations, and delusions, and prevent relapse; they are usually less effective on negative symptoms such as apathy

and social withdrawal. In many patients, negative symptoms persist between episodes of treated positive symptoms, but earlier treatment of psychotic illness may protect against the development of negative symptoms over time. Patients with acute schizophrenia generally respond better than those with chronic symptoms.

Long-term treatment of a patient with a definitive diagnosis of schizophrenia is usually required after the first episode of illness in order to prevent relapses. Doses that are effective in acute episodes should generally be continued as prophylaxis.

First-generation antipsychotic drugs

The first-generation antipsychotic drugs act predominantly by blocking dopamine D₂ receptors in the brain. First-generation antipsychotic drugs are not selective for any of the four dopamine pathways in the brain and so can cause a range of side-effects, particularly extrapyramidal symptoms and elevated prolactin. The **phenothiazine** derivatives can be divided into 3 main groups:

- **Group 1:** chlorpromazine hydrochloride p. 381, levomepromazine p. 435, and promazine hydrochloride p. 401, generally characterised by pronounced sedative effects and moderate antimuscarinic and extrapyramidal side-effects.
- **Group 2:** pericyazine p. 384, generally characterised by moderate sedative effects, but fewer extrapyramidal side-effects than groups 1 or 3.
- **Group 3:** fluphenazine decanoate p. 389, perphenazine p. 384, prochlorperazine p. 385, and trifluoperazine p. 387, generally characterised by fewer sedative and antimuscarinic effects, but more pronounced extrapyramidal side-effects than groups 1 and 2.

Butyrophenones (benperidol p. 377 and haloperidol p. 382) resemble the group 3 phenothiazines in their clinical properties. **Thioxanthenes** (flupentixol p. 382 and zuclopentixol p. 387) have moderate sedative, antimuscarinic effects, and extrapyramidal effects.

Diphenylbutylpiperidines (pimozide p. 385) and the **substituted benzamides** (sulpiride p. 386) have reduced sedative, antimuscarinic, and extrapyramidal effects.

Second-generation antipsychotic drugs

The second-generation antipsychotic drugs (sometimes referred to as atypical antipsychotic drugs) act on a range of receptors in comparison to first-generation antipsychotic drugs and have more distinct clinical profiles, particularly with regard to side-effects.

Prescribing for the elderly

The balance of risks and benefit should be considered before prescribing antipsychotic drugs for elderly patients. In elderly patients with dementia, antipsychotic drugs are associated with a small increased risk of mortality and an increased risk of stroke or transient ischaemic attack (see Dementia p. 299). Furthermore, elderly patients are particularly susceptible to postural hypotension and to hyper- and hypothermia in hot or cold weather.

It is recommended that:

- Antipsychotic drugs should not be used in elderly patients to treat mild to moderate psychotic symptoms.
- Initial doses of antipsychotic drugs in elderly patients should be reduced (to half the adult dose or less), taking into account factors such as the patient's weight, comorbidity, and concomitant medication.
- Treatment should be reviewed regularly.

Prescribing of antipsychotic drugs in patients with learning disabilities

[EvgGr](#) When prescribing for patients with learning disabilities who are prescribed antipsychotic drugs and who are not experiencing psychotic symptoms, the following considerations should be taken into account:

- a reduction in dose or the discontinuation of long-term antipsychotic treatment;
- review of the patient's condition after dose reduction or discontinuation of an antipsychotic drug;
- referral to a psychiatrist experienced in working with patients who have learning disabilities and mental health problems;
- annual documentation of the reasons for continuing a prescription if the antipsychotic is not reduced in dose or discontinued [A](#).

Side effects of antipsychotic drugs

Side-effects caused by antipsychotic drugs are common and contribute significantly to non-adherence to therapy.

Extrapyramidal symptoms

Extrapyramidal symptoms occur most frequently with the piperazine phenothiazines (fluphenazine, perphenazine, prochlorperazine, and trifluoperazine), the butyrophenones (benperidol and haloperidol), and the first-generation depot preparations. They are easy to recognise but cannot be predicted accurately because they depend on the dose, the type of drug, and on individual susceptibility.

Extrapyramidal symptoms consist of:

- **parkinsonian symptoms** (including tremor), which may occur more commonly in adults or the elderly and may appear gradually;
- **dystonia** (abnormal face and body movements) and **dyskinesia**, which occur more commonly in children or young adults and appear after only a few doses;
- **akathisia** (restlessness), which characteristically occurs after large initial doses and may resemble an exacerbation of the condition being treated;
- **tardive dyskinesia** (rhythmic, involuntary movements of tongue, face, and jaw), which usually develops on long-term therapy or with high dosage, but it may develop on short-term treatment with low doses—short-lived tardive dyskinesia may occur after withdrawal of the drug.

Parkinsonian symptoms remit if the drug is withdrawn and may be suppressed by the administration of antimuscarinic drugs. However, routine administration of such drugs is not justified because not all patients are affected and they may unmask or worsen tardive dyskinesia.

Tardive dyskinesia is the most serious manifestation of extrapyramidal symptoms; it is of particular concern because it may be irreversible on withdrawing therapy and treatment is usually ineffective. In children, tardive dyskinesia is more likely to occur when the antipsychotic drug is withdrawn. However, some manufacturers suggest that drug withdrawal at the earliest signs of tardive dyskinesia (fine vermicular movements of the tongue) may halt its full development. Tardive dyskinesia occurs fairly frequently, especially in the elderly, and treatment must be carefully and regularly reviewed.

Hyperprolactinaemia

Most antipsychotic drugs, both first- and second-generation, increase prolactin concentration to some extent because dopamine inhibits prolactin release. Aripiprazole reduces prolactin because it is a dopamine-receptor partial agonist. Risperidone, amisulpride, and first-generation antipsychotic drugs are most likely to cause symptomatic hyperprolactinaemia. The clinical symptoms of hyperprolactinaemia include sexual dysfunction, reduced bone mineral density, menstrual disturbances, breast enlargement, and galactorrhoea.

Sexual dysfunction

Sexual dysfunction is one of the main causes of non-adherence to antipsychotic medication; physical illness, psychiatric illness, and substance misuse are contributing factors. Antipsychotic-induced sexual dysfunction is caused by more than one mechanism. Reduced dopamine transmission and hyperprolactinaemia decrease libido; antimuscarinic effects can cause disorders of arousal; and

alpha₁-adrenoceptor antagonists are associated with erection and ejaculation problems in men. Risperidone and haloperidol commonly cause sexual dysfunction. If sexual dysfunction is thought to be antipsychotic-induced, dose reduction or switching medication should be considered.

Cardiovascular side-effects

Antipsychotic drugs have been associated with cardiovascular side-effects such as tachycardia, arrhythmias, and hypotension. QT-interval prolongation is a particular concern with pimozide and haloperidol. There is also a higher probability of QT-interval prolongation in patients using any intravenous antipsychotic drug, or any antipsychotic drug or combination of antipsychotic drugs with doses exceeding the recommended maximum. Cases of sudden death have occurred.

Hyperglycaemia and weight gain

Hyperglycaemia, and sometimes diabetes, can occur with antipsychotic drugs, particularly clozapine, olanzapine, quetiapine, and risperidone. All antipsychotic drugs may cause weight gain, but the risk and extent varies. Clozapine and olanzapine commonly cause weight gain.

Hypotension and interference with temperature regulation

Hypotension and interference with temperature regulation are dose-related side-effects that are liable to cause dangerous falls and hypothermia or hyperthermia in the elderly. Clozapine, chlorpromazine, lurasidone, and quetiapine can cause postural hypotension (especially during initial dose titration) which may be associated with syncope or reflex tachycardia in some patients.

Neuroleptic malignant syndrome

Neuroleptic malignant syndrome (hyperthermia, fluctuating level of consciousness, muscle rigidity, and autonomic dysfunction with pallor, tachycardia, labile blood pressure, sweating, and urinary incontinence) is a rare but potentially fatal side-effect of all antipsychotic drugs. Discontinuation of the antipsychotic drug is essential because there is no proven effective treatment, but bromocriptine and dantrolene have been used. The syndrome, which usually lasts for 5–7 days after drug discontinuation, may be unduly prolonged if depot preparations have been used.

Blood dyscrasias

Perform blood counts if unexplained infection or fever develops.

Choice

There is little meaningful difference in efficacy between each of the antipsychotic drugs (other than clozapine p. 392), and response and tolerability to each antipsychotic drug varies. There is no first-line antipsychotic drug which is suitable for all patients. Choice of antipsychotic medication is influenced by the patient's medication history, the degree of sedation required (although tolerance to this usually develops), and consideration of individual patient factors such as risk of extrapyramidal side-effects, weight gain, impaired glucose tolerance, QT-interval prolongation, or the presence of negative symptoms.

Negative symptoms

Second generation antipsychotic drugs may be better at treating the negative symptoms of schizophrenia.

Extrapyramidal side-effects

Second-generation antipsychotic drugs should be prescribed if extrapyramidal side-effects are a particular concern. Of these, aripiprazole p. 391, clozapine, olanzapine p. 394, and quetiapine p. 397 are least likely to cause extrapyramidal side-effects. Although amisulpride p. 390 is a dopamine-receptor antagonist, extrapyramidal side-effects are less common than with the first-generation antipsychotic drugs because amisulpride selectively blocks mesolimbic dopamine receptors, and extrapyramidal symptoms are caused by blockade of the striatal dopamine pathway.

QT interval

Aripiprazole has negligible effect on the QT interval. Other antipsychotic drugs with a reduced tendency to prolong QT interval include amisulpride, clozapine, flupentixol p. 382, fluphenazine decanoate p. 389, olanzapine, perphenazine p. 384, prochlorperazine p. 385, risperidone p. 398, and sulpiride p. 386.

Diabetes

Schizophrenia is associated with insulin resistance and diabetes; the risk of diabetes is increased in patients with schizophrenia who take antipsychotic drugs. First-generation antipsychotic drugs are less likely to cause diabetes than second-generation antipsychotic drugs, and of the first-generation antipsychotic drugs, fluphenazine decanoate and haloperidol p. 382 are lowest risk. Amisulpride and aripiprazole have the lowest risk of diabetes of the second-generation antipsychotic drugs. Amisulpride, aripiprazole, haloperidol, sulpiride, and trifluoperazine p. 387 are least likely to cause weight gain.

Sexual dysfunction and prolactin

The antipsychotic drugs with the lowest risk of sexual dysfunction are aripiprazole and quetiapine. Olanzapine may be considered if sexual dysfunction is judged to be secondary to hyperprolactinaemia. Hyperprolactinaemia is usually not clinically significant with aripiprazole, clozapine, olanzapine, and quetiapine treatment. When changing from other antipsychotic drugs, a reduction in prolactin concentration may increase fertility.

Patients should receive an antipsychotic drug for 4–6 weeks before it is deemed ineffective. Prescribing more than one antipsychotic drug at a time should be avoided except in exceptional circumstances (e.g. clozapine augmentation or when changing medication during titration) because of the increased risk of adverse effects such as extrapyramidal symptoms, QT-interval prolongation, and sudden cardiac death.

Clozapine is licensed for the treatment of schizophrenia in patients unresponsive to, or intolerant of, other antipsychotic drugs. Clozapine should be introduced if schizophrenia is not controlled despite the sequential use of two or more antipsychotic drugs (one of which should be a second-generation antipsychotic drug), each for at least 6–8 weeks. If symptoms do not respond adequately to an optimised dose of clozapine, plasma-clozapine concentration should be checked before adding a second antipsychotic drug to augment clozapine; allow 8–10 weeks' treatment to assess response. Patients must be registered with a clozapine patient monitoring service.

Monitoring

Full blood count, urea and electrolytes, and liver function test monitoring is required at the start of therapy with antipsychotic drugs, and then annually thereafter.

Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly.

Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly.

Before initiating antipsychotic drugs, an ECG may be required, particularly if physical examination identifies cardiovascular risk factors, if there is a personal history of cardiovascular disease, or if the patient is being admitted as an inpatient.

Blood pressure monitoring is advised before starting therapy and frequently during dose titration of antipsychotic drugs.

Other uses

Some antipsychotic drugs can be used for the treatment of nausea and vomiting, choreas, and motor tics. Chlorpromazine hydrochloride p. 381 and haloperidol p. 382 can be used for intractable hiccup. Benperidol p. 377 is used

in deviant antisocial sexual behaviour but its value is not established.

Psychomotor agitation should be investigated for an underlying cause; it can be managed with low doses of chlorpromazine hydrochloride or haloperidol used for short periods. Antipsychotic drugs can be used with caution for the short-term treatment of severe agitation and restlessness in the elderly.

Equivalent doses of oral antipsychotics

These equivalences are intended **only** as an approximate guide; individual dosage instructions should **also** be checked; patients should be carefully monitored after **any** change in medication. Equivalent daily dose of antipsychotic drug:

- Chlorpromazine 100 mg
- Clozapine 50 mg
- Haloperidol 2–3 mg
- Pimozide 2 mg
- Risperidone 0.5–1 mg
- Sulpiride 200 mg
- Trifluoperazine 5 mg

Important: These equivalences must **not** be extrapolated beyond the maximum dose for the drug. Higher doses require careful titration in specialist units and the equivalences shown here may not be appropriate.

Dosage

After an initial period of stabilisation, in most patients, the total daily oral dose can be given as a single dose. The Royal College of Psychiatrists has published advice on doses of antipsychotic drugs above BNF upper limit.

Antipsychotic depot injections

Long-acting depot injections are used for maintenance therapy especially when compliance with oral treatment is unreliable. However, depot injections of conventional antipsychotics may give rise to a higher incidence of extrapyramidal reactions than oral preparations; extrapyramidal reactions occur less frequently with second-generation antipsychotic depot preparations, such as risperidone p. 398 and olanzapine embonate p. 399.

Choice

There is no clear-cut division in the use of the conventional antipsychotics, but zuclopenthixol p. 387 may be suitable for the treatment of agitated or aggressive patients whereas flupentixol decanoate p. 388 can cause over-excitement in such patients. Zuclopenthixol decanoate p. 390 may be more effective in preventing relapses than other conventional antipsychotic depot preparations. The incidence of extrapyramidal reactions is similar for the conventional antipsychotics.

Dosage

Individual responses to neuroleptic drugs are variable and to achieve optimum effect, dosage and dosage interval must be titrated according to the patient's response.

Equivalent doses of depot antipsychotics

Antipsychotic drug/interval	Dosage (mg)
Flupentixol decanoate / 2 weeks	40
Fluphenazine decanoate / 2 weeks	25
Haloperidol (as decanoate) / 4 weeks	100
Zuclopenthixol decanoate / 2 weeks	200
Important: These equivalences must not be extrapolated beyond the maximum dose for the drug	

These equivalences are intended **only** as an approximate guide; individual dosage instructions should also be checked; patients should be carefully monitored after any change in medication.

ANTI-PSYCHOTICS

Antipsychotic drugs

- **CAUTIONS** Blood dyscrasias · cardiovascular disease · conditions predisposing to seizures · depression · diabetes (may raise blood glucose) · epilepsy · history of jaundice · myasthenia gravis · Parkinson's disease (may be exacerbated) · photosensitisation (may occur with higher dosages) · prostatic hypertrophy (in adults) · severe respiratory disease · susceptibility to angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION

- **Cardiovascular disease** An ECG may be required, particularly if physical examination identifies cardiovascular risk factors, personal history of cardiovascular disease, or if the patient is being admitted as an inpatient.

SIDE-EFFECTS

- **Common or very common** Agitation · amenorrhoea · arrhythmias · constipation · dizziness · drowsiness · dry mouth · galactorrhoea · gynaecomastia · hyperglycaemia · hyperprolactinaemia · hypotension (dose-related) · insomnia · leucopenia · movement disorders · neutropenia · parkinsonism · QT interval prolongation · rash · seizure · sexual dysfunction · tremor · urinary retention · weight increased
- **Uncommon** Agranulocytosis · confusion · embolism and thrombosis · neuroleptic malignant syndrome (discontinue—potentially fatal)
- **Rare or very rare** Sudden death

SIDE-EFFECTS, FURTHER INFORMATION For depot antipsychotics—side-effects may persist until the drug has been cleared from its depot site.

Overdose Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. For details on the management of poisoning see Antipsychotics under Emergency treatment of poisoning p. 1319.

- **PREGNANCY** Extrapyramidal effects and withdrawal syndrome have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy. Following maternal use of antipsychotic drugs in the third trimester, neonates should be monitored for symptoms including agitation, hypertonia, hypotonia, tremor, drowsiness, feeding problems, and respiratory distress.
- **BREAST FEEDING** There is limited information available on the short- and long-term effects of antipsychotic drugs on the breast-fed infant. *Animal studies* indicate possible adverse effects of antipsychotic medicines on the developing nervous system. Chronic treatment with antipsychotic drugs whilst breast-feeding should be avoided unless absolutely necessary. Phenothiazine derivatives are sometimes used in breast-feeding women for short-term treatment of nausea and vomiting.

MONITORING REQUIREMENTS

- It is advisable to monitor prolactin concentration at the start of therapy, at 6 months, and then yearly. Patients taking antipsychotic drugs not normally associated with symptomatic hyperprolactinaemia should be considered for prolactin monitoring if they show symptoms of hyperprolactinaemia (such as breast enlargement and galactorrhoea).
- Patients with schizophrenia should have physical health monitoring (including cardiovascular disease risk assessment) at least once per year.
- In children Regular clinical monitoring of endocrine function should be considered when children are taking an antipsychotic drug known to increase prolactin levels; this

includes measuring weight and height, assessing sexual maturation, and monitoring menstrual function.

- **TREATMENT CESSATION** There is a high risk of relapse if medication is stopped after 1–2 years. Withdrawal of antipsychotic drugs after long-term therapy should always be gradual and closely monitored to avoid the risk of acute withdrawal syndromes or rapid relapse. Patients should be monitored for 2 years after withdrawal of antipsychotic medication for signs and symptoms of relapse.
- **PATIENT AND CARER ADVICE** As photosensitisation may occur with higher dosages, patients should avoid direct sunlight.
Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving or operating machinery), especially at start of treatment; effects of alcohol are enhanced.

ANTIPSYCHOTICS > FIRST-GENERATION

F 380

Chlorpromazine hydrochloride

• INDICATIONS AND DOSE

Schizophrenia and other psychoses | Mania | Short-term adjunctive management of severe anxiety | Psychomotor agitation, excitement, and violent or dangerously impulsive behaviour

► BY MOUTH

- Adult: Initially 25 mg 3 times a day, adjusted according to response, alternatively initially 75 mg once daily, adjusted according to response, dose to be taken at night; maintenance 75–300 mg daily, increased if necessary up to 1 g daily, this dose may be required in psychoses; use a third to half adult dose in the elderly or debilitated patients

► BY RECTUM

- Adult: 100 mg every 6–8 hours, dose expressed as chlorpromazine base

Intractable hiccup

► BY MOUTH

- Adult: 25–50 mg 3–4 times a day

Relief of acute symptoms of psychoses (under expert supervision)

► BY DEEP INTRAMUSCULAR INJECTION

- Adult: 25–50 mg every 6–8 hours

Nausea and vomiting of terminal illness (where other drugs have failed or are not available)

► BY MOUTH

- Child 1–5 years: 500 micrograms/kg every 4–6 hours; maximum 40 mg per day
- Child 6–11 years: 500 micrograms/kg every 4–6 hours; maximum 75 mg per day
- Child 12–17 years: 10–25 mg every 4–6 hours
- Adult: 10–25 mg every 4–6 hours
- BY DEEP INTRAMUSCULAR INJECTION
- Child 1–5 years: 500 micrograms/kg every 6–8 hours; maximum 40 mg per day
- Child 6–11 years: 500 micrograms/kg every 6–8 hours; maximum 75 mg per day
- Child 12–17 years: Initially 25 mg, then 25–50 mg every 3–4 hours until vomiting stops
- Adult: Initially 25 mg, then 25–50 mg every 3–4 hours until vomiting stops

► BY RECTUM

- Adult: 100 mg every 6–8 hours

DOSE EQUIVALENCE AND CONVERSION

- For equivalent therapeutic effect 100 mg chlorpromazine base given *rectally* as a suppository \equiv 20–25 mg chlorpromazine hydrochloride *by intramuscular injection* \equiv 40–50 mg of chlorpromazine base or hydrochloride given *by mouth*.

- **UNLICENSED USE** Rectal route is not licensed.

- **CONTRA-INDICATIONS** CNS depression · comatose states · hypothyroidism · phaeochromocytoma

- **INTERACTIONS** → Appendix 1: phenothiazines

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Anxiety · glucose tolerance impaired · mood altered · muscle tone increased · postural hypotension
- **Frequency not known** Accommodation disorder · angioedema · atrioventricular block · cardiac arrest · eye deposit · eye disorders · gastrointestinal disorders · hepatic disorders · hypertriglyceridaemia · hyponatraemia · photosensitivity reaction · respiratory disorders · SIADH · skin reactions · systemic lupus erythematosus (SLE) · temperature regulation disorder · trismus

SPECIFIC SIDE-EFFECTS

- With intramuscular use Muscle rigidity · nasal congestion
- SIDE-EFFECTS, FURTHER INFORMATION** Acute dystonic reactions may occur; children are particularly susceptible.

- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.

• RENAL IMPAIRMENT

Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

• MONITORING REQUIREMENTS

- With intramuscular use Patients should remain supine, with blood pressure monitoring for 30 minutes after intramuscular injection.

- **HANDLING AND STORAGE** Owing to the risk of contact sensitisation, pharmacists, nurses, and other health workers should avoid direct contact with chlorpromazine; tablets should not be crushed and solutions should be handled with care.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, suppository

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 11

(Flupenthixol)

● INDICATIONS AND DOSE

Schizophrenia and other psychoses, particularly with apathy and withdrawal but not mania or psychomotor hyperactivity

- ▶ BY MOUTH
- ▶ Adult: Initially 3–9 mg twice daily, adjusted according to response, for debilitated patients, use elderly dose; maximum 18 mg per day
- ▶ Elderly: Initially 0.75–4.5 mg twice daily, adjusted according to response

Depressive illness

- ▶ BY MOUTH
- ▶ Adult: Initially 1 mg once daily, dose to be taken in the morning, increased if necessary to 2 mg after 1 week, doses above 2 mg to be given in divided doses, last dose to be taken before 4 pm; discontinue if no response after 1 week at maximum dosage; maximum 3 mg per day
- ▶ Elderly: Initially 500 micrograms daily, dose to be taken in the morning, then increased if necessary to 1 mg after 1 week, doses above 1 mg to be given in divided doses, last dose to be taken before 4 pm; discontinue if no response after 1 week at maximum dosage; maximum 1.5 mg per day

- **CONTRA-INDICATIONS** Circulatory collapse · CNS depression · comatose states · excitable patients · impaired consciousness · overactive patients · phaeochromocytoma

- **CAUTIONS** Cardiac disorders · cardiovascular disease · cerebral arteriosclerosis · elderly · hyperthyroidism · hypothyroidism · parkinsonism · QT-interval prolongation · senile confusional states

- **INTERACTIONS** → Appendix 1: flupentixol

● **SIDE-EFFECTS**

- ▶ **Common or very common** Appetite abnormal · asthenia · concentration impaired · depression · diarrhoea · dyspnoea · gastrointestinal discomfort · headache · hyperhidrosis · hypersalivation · muscle complaints · nervousness · palpitations · skin reactions · urinary disorder · vision disorders · vomiting
- ▶ **Uncommon** Flatulence · hot flush · nausea · oculogyration · photosensitivity reaction · speech disorder
- ▶ **Rare or very rare** Glucose tolerance impaired · jaundice · thrombocytopenia
- ▶ **Frequency not known** Suicidal tendencies
- **PREGNANCY** Avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Present in breast milk—avoid.
- **HEPATIC IMPAIRMENT** Can precipitate coma.
Monitoring Consider serum-flupentixol concentration monitoring in hepatic impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in renal failure.
Dose adjustments Start with small doses of antipsychotic drugs in severe renal impairment because of increased cerebral sensitivity.
- **PATIENT AND CARER ADVICE** Although drowsiness may occur, can also have an alerting effect so should not be taken in the evening.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 2

- ▶ **Depixol** (Lundbeck Ltd)

Flupentixol (as Flupentixol dihydrochloride) 3 mg Depixol 3mg tablets | 100 tablet [PoM] £13.92 DT = £13.92

- ▶ **Fluanxol** (Lundbeck Ltd)

Flupentixol (as Flupentixol dihydrochloride)
500 microgram Fluanxol 500microgram tablets | 60 tablet [PoM]
£2.88 DT = £2.88

Flupentixol (as Flupentixol dihydrochloride) 1 mg Fluanxol 1mg tablets | 60 tablet [PoM] £4.86 DT = £4.86

Haloperidol

● **INDICATIONS AND DOSE**

Nausea and vomiting

- ▶ BY INTRAMUSCULAR INJECTION

- ▶ Adult: 1–2 mg

Nausea and vomiting in palliative care

- ▶ BY MOUTH

- ▶ Adult: Initially 1.5 mg 1–2 times a day, increased if necessary to 5–10 mg daily in divided doses

- ▶ BY SUBCUTANEOUS INFUSION

- ▶ Adult: 2.5–10 mg/24 hours

Schizophrenia | Psychoses | Mania and hypomania | Organic brain damage (depending on symptoms)

- ▶ BY MOUTH

- ▶ Adult: Initially 2–20 mg once daily, alternatively initially 2–20 mg daily in divided doses; maintenance 1–3 mg 3 times a day, adjusted according to response, daily maximum to be given in divided doses, for debilitated patients, use elderly dose; maximum 20 mg per day

- ▶ Elderly: Initially 1–10 mg once daily, alternatively initially 1–10 mg daily in divided doses; maintenance 1–3 mg 3 times a day, adjusted according to response, daily maximum to be given in divided doses; maximum 20 mg per day

- ▶ BY INTRAMUSCULAR INJECTION

- ▶ Adult: Initially 2–5 mg, repeated if necessary, repeated dose given according to response and tolerability, for debilitated patients, use elderly dose; maximum 12 mg per day

- ▶ Elderly: Initially 1–2.5 mg, repeated if necessary, repeated dose given according to response and tolerability; maximum 12 mg per day

Agitation and restlessness in the elderly

- ▶ BY MOUTH

- ▶ Elderly: Initially 0.75–1.5 mg 2–3 times a day, adjusted according to response, if necessary

Management of mental or behavioural problems such as aggression, hyperactivity and self-mutilation in patients with intellectual disabilities and in patients with organic brain damage (depending on symptoms) | Gilles de la Tourette syndrome | Severe tics | Intractable hiccup | Adjunct to short-term management of moderate to severe psychomotor agitation, excitement and, violent or dangerously impulsive behaviour

- ▶ BY MOUTH

- ▶ Adult: Initially 1.5–3 mg 2–3 times a day, alternatively initially 3–5 mg 2–3 times a day, higher dose in severely affected or resistant patients; maintenance 0.5–1 mg 3 times a day, increased if necessary to 2–3 mg 3 times a day, once symptoms are controlled, gradually reduce dose to the lowest effective maintenance dose, for debilitated patients, use elderly dose

- **Elderly:** Initially 0.75–1.5 mg 2–3 times a day, alternatively initially 1.5–2.5 mg 2–3 times a day, higher dose in severely affected or resistant patients; maintenance 0.5–1 mg 3 times a day, increased if necessary to 2–3 mg 3 times a day, once symptoms are controlled, gradually reduce dose to the lowest effective maintenance dose

Restlessness and confusion in palliative care

- ▶ **BY MOUTH**
- ▶ **Adult:** 2 mg, then 2 mg every 2 hours if required
- ▶ **BY SUBCUTANEOUS INJECTION**
- ▶ **Adult:** 2.5 mg, then 2.5 mg every 2 hours if required
- ▶ **BY SUBCUTANEOUS INFUSION**
- ▶ **Adult:** 5–15 mg/24 hours

- **UNLICENSED USE** BNF doses for schizophrenia, psychoses, mania, hypomania, and organic brain damage differ from those in product literature.

IMPORTANT SAFETY INFORMATION

When prescribing, dispensing or administering, check that this injection is the correct preparation—this preparation is usually used in hospital for the rapid control of an *acute episode* and should **not** be confused with depot preparations which are usually used in the community or clinics for *maintenance* treatment.

- **CONTRA-INDICATIONS** CNS depression · comatose states · congenital long QT syndrome · dementia with Lewy bodies · history of torsade de pointes · history of ventricular arrhythmia · Parkinson's disease · progressive supranuclear palsy · QTc-interval prolongation · recent acute myocardial infarction · uncompensated heart failure · uncorrected hypokalaemia
- **CAUTIONS** Bradycardia · electrolyte disturbances (correct before treatment initiation) · family history of QTc-interval prolongation · history of heavy alcohol exposure · hyperthyroidism · hypotension (including orthostatic hypotension) · prolactin-dependent tumours · proclinaemia · risk factors for stroke
- **INTERACTIONS** → Appendix 1: haloperidol
- **SIDE-EFFECTS**
- ▶ **Common or very common** Depression · eye disorders · headache · hypersalivation · nausea · neuromuscular dysfunction · postural hypotension · psychotic disorder · vision disorders · vomiting · weight decreased
- ▶ **Uncommon** Breast abnormalities · dyspnoea · gait abnormal · hepatic disorders · hyperhidrosis · menstrual cycle irregularities · muscle complaints · musculoskeletal stiffness · oedema · photosensitivity reaction · restlessness · sedation · skin reactions · temperature regulation disorders
- ▶ **Rare or very rare** Respiratory disorders · trismus
- ▶ **Frequency not known** Angioedema · extrasystole · hypersensitivity vasculitis · hypertension · hypoglycaemia · pancytopenia · parkinsonism · rhabdomyolysis · severe cutaneous adverse reactions (SCARs) · SIADH · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION Haloperidol is a less sedating antipsychotic.

- **PREGNANCY** Manufacturer advises it is preferable to avoid—moderate amount of data indicate no malformative or fetal/neonatal toxicity, however there are isolated case reports of birth defects following fetal exposure, mostly in combination with other drugs; reproductive toxicity shown in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution.
Dose adjustments Manufacturer advises halve initial dose and then adjust if necessary with smaller increments and at longer intervals.

- **RENAL IMPAIRMENT** Manufacturer advises use with caution.
Dose adjustments Manufacturer advises consider lower initial dose in severe impairment and then adjust if necessary with smaller increments and at longer intervals.

MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor electrolytes before treatment initiation and periodically during treatment.
- ▶ Manufacturer advises perform ECG before treatment initiation and assess need for further ECGs during treatment on an individual basis; continuous ECG monitoring is recommended for repeated *intramuscular* doses, and for up to 6 hours after administration of *intramuscular* doses for prophylaxis or treatment of postoperative nausea and vomiting.

PRESCRIBING AND DISPENSING INFORMATION

- **Palliative care** For further information on the use of haloperidol in palliative care, see www.palliativedrugs.com/formulary/en/haloperidol.html.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 2

Haloperidol (Non-proprietary)

- ▶ **Haloperidol 500 microgram** Haloperidol 500microgram tablets | 28 tablet **[PoM]** £22.05 DT = £22.05

Solution for injection

Haloperidol (Non-proprietary)

- ▶ **Haloperidol 5mg per 1 ml** Haloperidol 5mg/1ml solution for injection ampoules | 10 ampoule **[PoM]** £35.00 DT = £35.00

Oral solution

CAUTIONARY AND ADVISORY LABELS 2

Haloperidol (Non-proprietary)

- ▶ **Haloperidol 1 mg per 1 ml** Haloperidol 5mg/5ml oral solution sugar free sugar-free | 100 ml **[PoM]** £35.99 DT = £6.47 sugar-free | 500 ml **[PoM]** £32.35
- ▶ **Haloperidol 2 mg per 1 ml** Haloperidol 10mg/5ml oral solution sugar free sugar-free | 100 ml **[PoM]** £46.75 DT = £7.10 sugar-free | 500 ml **[PoM]** £35.50
- ▶ **Haldol** (Janssen-Cilag Ltd)
- ▶ **Haloperidol 2 mg per 1 ml** Haldol 2mg/ml oral solution sugar-free | 100 ml **[PoM]** £4.45 DT = £7.10

Capsule

CAUTIONARY AND ADVISORY LABELS 2

Serenace (Teva UK Ltd)

- ▶ **Haloperidol 500 microgram** Serenace 500microgram capsules | 30 capsule **[PoM]** £1.18 DT = £1.18

Loxapine

25-Apr-2017

- **DRUG ACTION** Loxapine is a dopamine D₂ and serotonin 5-HT_{2A} receptor antagonist. It also binds to noradrenergic, histaminergic, and cholinergic receptors.

● INDICATIONS AND DOSE

Rapid control of mild-to-moderate agitation in patients with schizophrenia or bipolar disorder (specialist supervision in hospital)

► BY INHALATION

- Adult: 9.1 mg as a single dose, followed by 9.1 mg after 2 hours if required, alternatively 4.5 mg as a single dose, followed by 4.5 mg after 2 hours if required, lower dose may be given if more appropriate or if the higher dose not previously tolerated

- **CONTRA-INDICATIONS** Acute respiratory symptoms · asthma · cardiovascular disease · cerebrovascular disease · chronic obstructive pulmonary disease · dehydration—risk of hypotension · elderly patients (especially those with dementia-related psychosis) · hypovolaemia—risk of hypotension

- **CAUTIONS** Bronchodilator treatment should be available for treatment of possible severe respiratory side-effects (bronchospasm) · history of extrapyramidal symptoms · risk factors for hypoventilation

- **INTERACTIONS** → Appendix 1: loxapine

● SIDE-EFFECTS

- **Common or very common** Fatigue · sedation · taste altered · throat irritation
- **Uncommon** Bronchospasm · oculogyration · restlessness
- **Frequency not known** Dry eye · hypertension · postural hypotension · syncope · vision blurred

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises to avoid for 48 hours after dose (express and discard milk produced during this time)—present in milk in *animal* studies.

- **MONITORING REQUIREMENTS** Manufacturer advises to observe patient during the first hour after each dose for signs and symptoms of bronchospasm.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises remove pull-tab and wait for green light to turn on (product must be used within 15 minutes of pulling tab); instruct patient to inhale through mouthpiece and then hold breath briefly. When green light turns off, this indicates the dose has been delivered.

- **PRESCRIBING AND DISPENSING INFORMATION** Educational risk minimisation materials are available for health care professionals.

Adasuve® 4.5 mg inhalation powder may be difficult to obtain.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

► Adasuve (Galen Ltd)

Loxapine 9.1 mg Adasuve 9.1mg/dose inhalation powder | 1 dose [PoM] £58.30 (Hospital only)

Pericyazine

(Pericazine)

● INDICATIONS AND DOSE

Schizophrenia | Psychoses

► BY MOUTH

- Adult: Initially 75 mg daily in divided doses, then increased in steps of 25 mg every week, adjusted according to response; maximum 300 mg per day
- Elderly: Initially 15–30 mg daily in divided doses, then increased in steps of 25 mg every week, adjusted according to response; maximum 300 mg per day

Short-term adjunctive management of severe anxiety, psychomotor agitation, and violent or dangerously impulsive behaviour

► BY MOUTH

- Adult: Initially 15–30 mg daily in 2 divided doses, adjusted according to response, larger dose to be taken at bedtime
- Elderly: Initially 5–10 mg daily in 2 divided doses, adjusted according to response, larger dose to be taken at bedtime

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma

- **CAUTIONS** Hypothyroidism

- **INTERACTIONS** → Appendix 1: phenothiazines

- **SIDE-EFFECTS** Atrioventricular block · cardiac arrest · consciousness impaired · contact dermatitis · glucose tolerance impaired · hepatic disorders · hyperthermia · nasal congestion · postural hypotension · priapism · respiratory depression

- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.

- **RENAL IMPAIRMENT** Avoid in renal impairment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

CAUTIONARY AND ADVISORY LABELS 2

► Pericyazine (Non-proprietary)

Pericyazine 2 mg per 1 ml Pericyazine 10mg/5ml oral solution | 100 ml [PoM] £55.20 DT = £55.20

Tablet

CAUTIONARY AND ADVISORY LABELS 2

► Pericyazine (Non-proprietary)

Pericyazine 2.5 mg Pericyazine 2.5mg tablets | 84 tablet [PoM] £18.60 DT = £18.60

Pericyazine 10 mg Pericyazine 10mg tablets | 84 tablet [PoM] £48.00 DT = £48.00

Perphenazine

● INDICATIONS AND DOSE

Schizophrenia and other psychoses | Mania | Short-term adjunctive management of anxiety | Severe psychomotor agitation, excitement, and violent or dangerously impulsive behaviour | Severe nausea and vomiting unresponsive to other anti-emetics

► BY MOUTH

- Adult: Initially 4 mg 3 times a day, adjusted according to response; maximum 24 mg per day
- Elderly: Initially 1–2 mg 3 times a day; maximum 12 mg per day

- **CONTRA-INDICATIONS** Agitation in the elderly · CNS depression · comatose states · phaeochromocytoma · restlessness in the elderly

- **CAUTIONS** Hypothyroidism
- **INTERACTIONS** → Appendix 1: phenothiazines
- **SIDE-EFFECTS** Cardiac arrest · consciousness impaired · epilepsy · eye deposits · fatigue · headache · hepatic disorders · hyperhidrosis · menstruation with decreased bleeding · nasal congestion · nausea · oculogyric crisis · oedema · paralytic ileus · photosensitivity reaction · pigmented retinopathy · reflexes increased · saliva altered · systemic lupus erythematosus (SLE) · temperature regulation disorder · urinary hesitation · vision disorders
- SIDE-EFFECTS, FURTHER INFORMATION** Acute dystonias are more common with potent first-generation antipsychotics. The risk is increased in men, young adults, children, antipsychotic-naïve patients, rapid dose escalation, and abrupt treatment discontinuation.
- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.
- **RENAL IMPAIRMENT**
Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

● MEDICINAL FORMS

Forms available from special-order manufacturers include: tablet, oral suspension

Pimozide

● INDICATIONS AND DOSE

Schizophrenia

► BY MOUTH

- **Adult:** Initially 2 mg daily, adjusted according to response, then increased in steps of 2–4 mg at intervals of not less than 1 week; usual dose 2–20 mg daily
- **Elderly:** Initially 1 mg daily, adjusted according to response, increased in steps of 2–4 mg at intervals of not less than 1 week; usual dose 2–20 mg daily

Monosymptomatic hypochondriacal psychosis | Paranoid psychosis

► BY MOUTH

- **Adult:** Initially 4 mg daily, adjusted according to response, then increased in steps of 2–4 mg at intervals of not less than 1 week; maximum 16 mg per day
- **Elderly:** Initially 2 mg daily, adjusted according to response, increased in steps of 2–4 mg at intervals of not less than 1 week; maximum 16 mg per day

- **CONTRA-INDICATIONS** CNS depression · comatose states · history of arrhythmias · history or family history of congenital QT prolongation · phaeochromocytoma

- **INTERACTIONS** → Appendix 1: pimozide

● SIDE-EFFECTS

- **Common or very common** Appetite decreased · depression · fatigue · headache · hyperhidrosis · hypersalivation · lethargy · muscle complaints · restlessness · sebaceous gland overactivity · urinary disorders · vision blurred · vomiting
- **Uncommon** Cogwheel rigidity · dysarthria · face oedema · oculogyric crisis · skin reactions
- **Frequency not known** Cardiac arrest · generalised tonic-clonic seizure · glycosuria · hyponatraemia · libido decreased · neck stiffness · temperature regulation disorders

- **HEPATIC IMPAIRMENT** Can precipitate coma.

● RENAL IMPAIRMENT

Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

● MONITORING REQUIREMENTS

- **ECG monitoring** Following reports of sudden unexplained death, an ECG is recommended before treatment. It is also recommended that patients taking pimozide should have

an annual ECG (if the QT interval is prolonged, treatment should be reviewed and either withdrawn or dose reduced under close supervision) and that pimozide should not be given with other antipsychotic drugs (including depot preparations), tricyclic antidepressants or other drugs which prolong the QT interval, such as certain antimetabolites, antiarrhythmic drugs and certain antihistamines and should not be given with drugs which cause electrolyte disturbances (especially diuretics).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 2

Pimozide 4 mg Orap 4mg tablets | 100 tablet (PoM) £40.31 DT = £40.31

Prochlorperazine

● INDICATIONS AND DOSE

Schizophrenia and other psychoses | Mania

► BY MOUTH

- **Adult:** 12.5 mg twice daily for 7 days, dose to be adjusted at intervals of 4–7 days according to response; usual dose 75–100 mg daily

► BY DEEP INTRAMUSCULAR INJECTION

- **Adult:** 12.5–25 mg 2–3 times a day

Short-term adjunctive management of severe anxiety

► BY MOUTH

- **Adult:** 15–20 mg daily in divided doses; maximum 40 mg per day

Nausea and vomiting, acute attack

► BY MOUTH

- **Adult:** Initially 20 mg, then 10 mg after 2 hours

► BY DEEP INTRAMUSCULAR INJECTION

- **Adult:** 12.5 mg as required, to be followed if necessary after 6 hours by an oral dose

Nausea and vomiting, prevention

► BY MOUTH

- **Adult:** 5–10 mg 2–3 times a day

► BY DEEP INTRAMUSCULAR INJECTION

- **Adult:** 12.5 mg as required, to be followed if necessary after 6 hours by an oral dose

Prevention and treatment of nausea and vomiting

► BY MOUTH

- **Child 1–11 years** (body-weight 10 kg and above): 250 micrograms/kg 2–3 times a day
- **Child 12–17 years:** 5–10 mg up to 3 times a day if required

► BY INTRAMUSCULAR INJECTION

- **Child 2–4 years:** 1.25–2.5 mg up to 3 times a day if required
- **Child 5–11 years:** 5–6.25 mg up to 3 times a day if required
- **Child 12–17 years:** 12.5 mg up to 3 times a day if required

Labyrinthine disorders

► BY MOUTH

- **Adult:** 5 mg 3 times a day, increased if necessary to 30 mg daily in divided doses, dose to be increased gradually, then reduced to 5–10 mg daily, dose is reduced after several weeks

continued →

Nausea and vomiting in previously diagnosed migraine

► BY MOUTH USING BUCCAL TABLET

- Child 12–17 years: 3–6 mg twice daily, tablets to be placed high between upper lip and gum and left to dissolve
- Adult: 3–6 mg twice daily, tablets to be placed high between upper lip and gum and left to dissolve

DOSE EQUIVALENCE AND CONVERSION

- Doses are expressed as prochlorperazine maleate or mesilate; 1 mg prochlorperazine maleate = 1 mg prochlorperazine mesilate.

- **UNLICENSED USE** Injection not licensed for use in children. *Buccastem* M[®] tablets not licensed for use in children.

- **CONTRA-INDICATIONS** Avoid oral route in child under 10 kg · children (in psychotic disorders) · CNS depression · comatose states · phaeochromocytoma

- **CAUTIONS** Elderly · hypotension (more likely after intramuscular injection) · hypothyroidism (in adults)

- **INTERACTIONS** → Appendix 1: phenothiazines

● SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- **Rare or very rare** Glucose tolerance impaired · hyponatraemia · SIADH
- **Frequency not known** Photosensitivity reaction · postural hypotension · skin reactions

SPECIFIC SIDE-EFFECTS

- **Rare or very rare**
- With buccal use Blood disorder · hepatic disorders
- **Frequency not known**
- With buccal use Oral disorders
- With intramuscular or oral use Atrioventricular block · cardiac arrest · consciousness impaired · eye disorders · hyperthermia · jaundice · muscle rigidity · nasal congestion · oculogyric crisis · postural hypotension · respiratory depression

SIDE-EFFECTS, FURTHER INFORMATION Acute dystonias are more common with potent first-generation antipsychotics. The risk is increased in men, young adults, children, antipsychotic-naïve patients, rapid dose escalation, and abrupt treatment discontinuation.

- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.

● RENAL IMPAIRMENT

Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

● DIRECTIONS FOR ADMINISTRATION

- With buccal use Buccal tablets are placed high between upper lip and gum and left to dissolve.

● PATIENT AND CARER ADVICE

- With buccal use Patients or carers should be given advice on how to administer prochlorperazine buccal tablets.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

F 380**Sulpiride****● INDICATIONS AND DOSE****Schizophrenia with predominantly negative symptoms**

► BY MOUTH

- Adult: 200–400 mg twice daily; maximum 800 mg per day
- Elderly: Lower initial dose to be given, increased gradually according to response

Schizophrenia with mainly positive symptoms

► BY MOUTH

- Adult: 200–400 mg twice daily; maximum 2.4 g per day
- Elderly: Lower initial dose to be given, increased gradually according to response

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma

- **CAUTIONS** Aggressive patients (even low doses may aggravate symptoms) · agitated patients (even low doses may aggravate symptoms) · excited patients (even low doses may aggravate symptoms)

- **INTERACTIONS** → Appendix 1: sulpiride

● SIDE-EFFECTS

- **Common or very common** Breast abnormalities · sedation · skin reactions

- **Uncommon** Hypersalivation · muscle tone increased · postural hypotension

- **Rare or very rare** Oculogyric crisis

- **Frequency not known** Cardiac arrest · dyspnoea · hyponatraemia · SIADH · trismus

- **HEPATIC IMPAIRMENT** Can precipitate coma.

● RENAL IMPAIRMENT

Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

- **MONITORING REQUIREMENTS** Sulpiride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include lemon and aniseed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution**CAUTIONARY AND ADVISORY LABELS 2**► **Sulpiride (Non-proprietary)**

Trifluoperazine

● INDICATIONS AND DOSE

Schizophrenia and other psychoses | Short-term adjunctive management of psychomotor agitation, excitement, and violent or dangerously impulsive behaviour

► BY MOUTH

- Adult: Initially 5 mg twice daily, increased by 5 mg daily after 1 week, then at intervals of 3 days, according to response
- Elderly: Initially up to 2.5 mg twice daily, increased by 5 mg daily after 1 week, then at intervals of 3 days, according to response

Short-term adjunctive management of severe anxiety

► BY MOUTH

- Adult: 2–4 mg daily in divided doses, increased if necessary to 6 mg daily
- Elderly: Up to 2 mg daily in divided doses, increased if necessary to 6 mg daily

Severe nausea and vomiting

► BY MOUTH

- Adult: 2–4 mg daily in divided doses; maximum 6 mg per day

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma

- **INTERACTIONS** → Appendix 1: phenothiazines

- **SIDE-EFFECTS** Alertness decreased · anxiety · appetite decreased · blood disorder · cardiac arrest · fatigue · hyperpyrexia · jaundice · cholestatic · lens opacity · muscle weakness · oedema · pancytopenia · photosensitivity reaction · postural hypotension (dose-related) · skin reactions · thrombocytopenia · urinary hesitation · vision blurred · withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION Extrapyramidal symptoms are more frequent at doses exceeding 6mg daily. Acute dystonias are more common with potent first-generation antipsychotics. The risk is increased in men, young adults, children, antipsychotic-naïve patients, rapid dose escalation, and abrupt treatment discontinuation.

- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.

- **RENAL IMPAIRMENT**

Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

- **MONITORING REQUIREMENTS** Trifluoperazine does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

Zuclopenthixol

● INDICATIONS AND DOSE

Schizophrenia and other psychoses

► BY MOUTH

- Adult: Initially 20–30 mg daily in divided doses, increased if necessary up to 150 mg daily; usual maintenance 20–50 mg daily (max. per dose 40 mg), for debilitated patients, use elderly dose
- Elderly: Initially 5–15 mg daily in divided doses, increased if necessary up to 150 mg daily; usual maintenance 20–50 mg daily (max. per dose 40 mg)

- **CONTRA-INDICATIONS** Apathetic states · CNS depression · comatose states · phaeochromocytoma · withdrawn states

- **CAUTIONS** Hyperthyroidism · hypothyroidism

- **INTERACTIONS** → Appendix 1: zuclopenthixol

- **SIDE-EFFECTS** Anxiety · appetite abnormal · asthenia · concentration impaired · depression · diarrhoea · dyspnoea · eye disorders · fever · flatulence · gait abnormal · gastrointestinal discomfort · glucose tolerance impaired · headaches · hepatic disorders · hot flush · hyperacusia · hyperhidrosis · hyperlipidaemia · hypersalivation · hypothermia · malaise · memory loss · muscle complaints · nasal congestion · nausea · neuromuscular dysfunction · pain · palpitations · paraesthesia · photosensitivity reaction · reflexes increased · seborrhoea · skin reactions · sleep disorders · speech disorder · syncope · thirst · thrombocytopenia · tinnitus · urinary disorders · vertigo · vision disorders · vomiting · vulvovaginal dryness · weight decreased · withdrawal syndrome

- **HEPATIC IMPAIRMENT** Can precipitate coma.

Dose adjustments Halve dose.

Monitoring Consider serum-level monitoring in patients with hepatic impairment.

- **RENAL IMPAIRMENT**

Dose adjustments Halve dose in renal failure; smaller starting doses used in severe renal impairment because of increased cerebral sensitivity.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 2

► Clopixol (Lundbeck Ltd)

Zuclopenthixol (as Zuclopenthixol dihydrochloride) 2 mg Clopixol 2mg tablets | 100 tablet [PoM] £3.14 DT = £3.14
Zuclopenthixol (as Zuclopenthixol dihydrochloride)
10 mg Clopixol 10mg tablets | 100 tablet [PoM] £8.06 DT = £8.06
Zuclopenthixol (as Zuclopenthixol dihydrochloride)
25 mg Clopixol 25mg tablets | 100 tablet [PoM] £16.13 DT = £16.13

Zuclopenthixol acetate

● INDICATIONS AND DOSE

Short-term management of acute psychosis | Short-term management of mania | Short-term management of exacerbation of chronic psychosis

► BY DEEP INTRAMUSCULAR INJECTION

- Adult: 50–150 mg, then 50–150 mg after 2–3 days if required, (1 additional dose may be needed 1–2 days after the first injection); maximum cumulative dose 400 mg in 2 weeks and maximum 4 injections; maximum duration of treatment 2 weeks—if maintenance treatment necessary change to an oral antipsychotic 2–3 days after last injection, or to a longer acting antipsychotic depot injection given concomitantly with last injection of

continued →

zuclopenthixol acetate; to be administered into the gluteal muscle or lateral thigh

- **Elderly:** 50–100 mg, then 50–100 mg after 2–3 days if required, (1 additional dose may be needed 1–2 days after the first injection); maximum cumulative dose 400 mg in 2 weeks and maximum 4 injections; maximum duration of treatment 2 weeks—if maintenance treatment necessary change to an oral antipsychotic 2–3 days after last injection, or to a longer acting antipsychotic depot injection given concomitantly with last injection of zuclopenthixol acetate; to be administered into the gluteal muscle or lateral thigh

IMPORTANT SAFETY INFORMATION

When prescribing, dispensing, or administering, check that this is the correct preparation—this preparation is usually used in hospital for an *acute episode* and should **not** be confused with depot preparations which are usually used in the community or clinics for *maintenance* treatment.

SAFE PRACTICE

Zuclopenthixol acetate has been confused with zuclopenthixol decanoate; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma
- **CAUTIONS** Hyperthyroidism · hypothyroidism
- **INTERACTIONS** → Appendix 1: zuclopenthixol
- **SIDE-EFFECTS** Anxiety · appetite abnormal · asthenia · concentration impaired · depression · diarrhoea · dyspnoea · eye disorders · fever · flatulence · gait abnormal · gastrointestinal discomfort · glucose tolerance impaired · headaches · hepatic disorders · hot flush · hyperacusia · hyperhidrosis · hyperlipidaemia · hypersalivation · hypothermia (dose-related) · malaise · memory loss · muscle complaints · nasal congestion · nausea · neuromuscular dysfunction · pain · palpitations · paraesthesia · photosensitivity reaction · reflexes increased · seborrhoea · sexual dysfunction · skin reactions · sleep disorders · speech disorder · syncope · thirst · thrombocytopenia · tinnitus · urinary disorders · vertigo · vision disorders · vomiting · vulvovaginal dryness · weight decreased · withdrawal syndrome
- **HEPATIC IMPAIRMENT** Can precipitate coma.
- **RENAL IMPAIRMENT**
Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Clopixol Acuphase** (Lundbeck Ltd)
Zuclopenthixol acetate 50 mg per 1 ml Clopixol Acuphase 50mg/1ml solution for injection ampoules | 5 ampoule **[PoM]** £24.21 DT = £24.21

ANTIPSYCHOTICS > FIRST-GENERATION (DEPOT INJECTIONS)

F 380

Flupentixol decanoate (Flupentixol Decanoate)

• INDICATIONS AND DOSE

Maintenance in schizophrenia and other psychoses

► BY DEEP INTRAMUSCULAR INJECTION

- **Adult:** Test dose 20 mg, dose to be injected into the upper outer buttock or lateral thigh, then 20–40 mg after at least 7 days, then 20–40 mg every 2–4 weeks, adjusted according to response, usual maintenance dose 50 mg every 4 weeks to 300 mg every 2 weeks; maximum 400 mg per week
- **Elderly:** Dose is initially quarter to half adult dose

- **CONTRA-INDICATIONS** Children · CNS depression · comatose states · excitable patients · overactive patients · phaeochromocytoma
- **CAUTIONS** An alternative antipsychotic may be necessary if symptoms such as aggression or agitation appear · hyperthyroidism · hypothyroidism · when transferring from oral to depot therapy, the dose by mouth should be reduced gradually
- **INTERACTIONS** → Appendix 1: flupentixol
- **SIDE-EFFECTS**
 - **Common or very common** Appetite abnormal · asthenia · concentration impaired · depression · diarrhoea · dyspnoea · gastrointestinal discomfort · headache · hyperhidrosis · hypersalivation · muscle complaints · nervousness · palpitations · skin reactions · urinary disorder · vision disorders · vomiting
 - **Uncommon** Flatulence · hot flush · nausea · oculogyration · photosensitivity reaction · speech disorder
 - **Rare or very rare** Glucose tolerance impaired · jaundice · thrombocytopenia
 - **Frequency not known** Suicidal tendencies
- **HEPATIC IMPAIRMENT** Can precipitate coma.
- **RENAL IMPAIRMENT**
Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **MONITORING REQUIREMENTS** Treatment requires careful monitoring for optimum effect.
- **DIRECTIONS FOR ADMINISTRATION** In general not more than 2–3mL of oily injection should be administered at any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Flupentixol decanoate (Non-proprietary)

Flupentixol decanoate 100 mg per 1 ml Flupentixol 100mg/1ml solution for injection ampoules | 10 ampoule **[PoM]**  DT = £62.51

► Depixol (Lundbeck Ltd)

Flupentixol decanoate 20 mg per 1 ml Depixol 40mg/2ml solution for injection ampoules | 10 ampoule **[PoM]** £25.39 DT = £25.39

Depixol 20mg/1ml solution for injection ampoules | 10 ampoule **[PoM]** £15.17 DT = £15.17

Flupentixol decanoate 100 mg per 1 ml Depixol Conc 100mg/1ml solution for injection ampoules | 10 ampoule **[PoM]** £62.51 DT = £62.51

Flupentixol decanoate 200 mg per 1 ml Depixol Low Volume 200mg/1ml solution for injection ampoules | 5 ampoule **[PoM]** £97.59 DT = £97.59

► **Psytixol** (Mylan)

Flupentixol decanoate 20 mg per 1 ml Psytixol 40mg/2ml solution for injection ampoules | 10 ampoule [PoM] £25.38 DT = £25.39

Flupentixol decanoate 100 mg per 1 ml Psytixol 50mg/0.5ml solution for injection ampoules | 10 ampoule [PoM] £34.12 DT = £34.12

Psytixol 100mg/1ml solution for injection ampoules | 10 ampoule [PoM] £62.50 DT = £62.51

Flupentixol decanoate 200 mg per 1 ml Psytixol 200mg/1ml solution for injection ampoules | 5 ampoule [PoM] £97.58 DT = £97.59

► **380**

Fluphenazine decanoate

● INDICATIONS AND DOSE

Maintenance in schizophrenia and other psychoses

► BY DEEP INTRAMUSCULAR INJECTION

- Adult: Test dose 12.5 mg, dose to be administered into the gluteal muscle, then 12.5–100 mg after 4–7 days, then 12.5–100 mg every 14–35 days, adjusted according to response
- Elderly: Test dose 6.25 mg, dose to be administered into the gluteal muscle, then 12.5–100 mg after 4–7 days, then 12.5–100 mg every 14–35 days, adjusted according to response

- **CONTRA-INDICATIONS** Children · CNS depression · comatose states · marked cerebral atherosclerosis · phaeochromocytoma

- **CAUTIONS** Hypothyroidism · QT-interval prolongation · when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

- **INTERACTIONS** → Appendix 1: phenothiazines

- **SIDE-EFFECTS** Acute kidney injury · arrhythmia · blood disorder · cognitive impairment · epileptiform seizure · headache · hepatic disorders · hyponatraemia · lens opacity · lethargy · leucocytosis · nasal congestion · oculogyric crisis · oedema · oligomenorrhoea · opisthotonus · SIADH · skin pigmentation change · systemic lupus erythematosus (SLE) · temperature regulation disorder · thrombocytopenia · urinary disorders · vision blurred · vomiting

- **HEPATIC IMPAIRMENT** Avoid in hepatic failure. Can precipitate coma; phenothiazines are hepatotoxic.

- **RENAL IMPAIRMENT** Manufacturer advises caution. Avoid in renal failure.

Dose adjustments Start with small doses of antipsychotic drugs in severe renal impairment because of increased cerebral sensitivity.

- **MONITORING REQUIREMENTS** Treatment requires careful monitoring for optimum effect.

- **DIRECTIONS FOR ADMINISTRATION** In general not more than 2–3 mL of oily injection should be administered at any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Sesame oil

► **Modecate** (Sanofi)

Fluphenazine decanoate 25 mg per 1 ml Modecate 50mg/2ml solution for injection ampoules | 5 ampoule [PoM] £22.22

Modecate 25mg/1ml solution for injection ampoules | 10 ampoule [PoM] £22.55 DT = £22.55

Fluphenazine decanoate 100 mg per 1 ml Modecate Concentrate 100mg/1ml solution for injection ampoules | 5 ampoule [PoM] £43.73 DT = £43.73
Modecate Concentrate 50mg/0.5ml solution for injection ampoules | 10 ampoule [PoM] £44.73

► **380**

18-May-2018

Haloperidol decanoate

● INDICATIONS AND DOSE

Maintenance in schizophrenia and other psychoses

► BY DEEP INTRAMUSCULAR INJECTION

- Adult: Initially 50 mg every 4 weeks, increased in steps of 50 mg if required, increased if necessary up to 300 mg every 4 weeks, higher doses may be needed in some patients, dose to be administered into gluteal muscle, if 2-weekly administration preferred, doses should be halved
- Elderly: Initially 12.5–25 mg every 4 weeks, if 2-weekly administration preferred, doses should be halved

IMPORTANT SAFETY INFORMATION

When prescribing, dispensing or administering, check that this is the correct preparation—this preparation is used for *maintenance* treatment and should **not** be used for the rapid control of an *acute episode*.

- **CONTRA-INDICATIONS** Children · CNS depression · comatose states · congenital long QT syndrome · dementia with Lewy bodies · history of torsade de pointes · history of ventricular arrhythmia · Parkinson's disease · progressive supranuclear palsy · QT-interval prolongation · recent acute myocardial infarction · uncompensated heart failure · uncorrected hypokalaemia

- **CAUTIONS** Bradycardia · electrolyte disturbances (correct before treatment initiation) · family history of QTc-interval prolongation · history of heavy alcohol exposure · hyperthyroidism · hypotension (including orthostatic hypotension) · prolactin-dependent tumours · prolactinaemia · risk factors for stroke · when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

- **INTERACTIONS** → Appendix 1: haloperidol

● SIDE-EFFECTS

- **Common or very common** Depression · hypersalivation · muscle complaints · sedation
- **Uncommon** Eye disorders · headache · neuromuscular dysfunction · vision disorders
- **Frequency not known** Angioedema · breast abnormalities · cardiac arrest · dyspnoea · extrasystole · gait abnormal · hepatic disorders · hyperhidrosis · hypersensitivity vasculitis · hypoglycaemia · menstrual cycle irregularities · musculoskeletal stiffness · nausea · oedema · pancytopenia · photosensitivity reaction · postural hypotension · psychotic disorder · respiratory disorders · restlessness · rhabdomyolysis · SIADH · skin reactions · temperature regulation disorders · thrombocytopenia · trismus · vomiting · weight decreased

SIDE-EFFECTS, FURTHER INFORMATION Haloperidol is a less sedating antipsychotic.

- **PREGNANCY** Manufacturer advises it is preferable to avoid—moderate amount of data indicate no malformative or fetal/neonatal toxicity, however there are isolated case reports of birth defects following fetal exposure, mostly in combination with other drugs; reproductive toxicity shown in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution.

Dose adjustments Manufacturer advises halve initial dose and then adjust if necessary with smaller increments and at longer intervals.

- **RENAL IMPAIRMENT** Manufacturer advises use with caution.
Dose adjustments Manufacturer advises consider lower initial dose in severe impairment and then adjust if necessary with smaller increments and at longer intervals.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises perform ECG before treatment initiation and assess need for further ECGs during treatment on an individual basis.
 - ▶ Manufacturer advises monitor electrolytes before treatment initiation and periodically during treatment.
- **DIRECTIONS FOR ADMINISTRATION** In general not more than 2–3 mL of oily injection should be administered at any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

- **INTERACTIONS** → Appendix 1: zuclopenthixol
- **SIDE-EFFECTS** Anxiety • appetite abnormal • asthenia • concentration impaired • depression • diarrhoea • dyspnoea • eye disorders • fever • flatulence • gait abnormal • gastrointestinal discomfort • glucose tolerance impaired • headaches • hepatic disorders • hot flush • hyperacusia • hyperhidrosis • hyperlipidaemia • hypersalivation • hypothermia • malaise • memory loss • muscle complaints • nasal congestion • nausea • neuromuscular dysfunction • pain • palpitations • paraesthesia • photosensitivity reaction

ANTI-PSYCHOTICS > SECOND-GENERATION

F 380

Amisulpride

- **DRUG ACTION** Amisulpride is a selective dopamine receptor antagonist with high affinity for mesolimbic D₂ and D₃ receptors.

• INDICATIONS AND DOSE

Acute psychotic episode in schizophrenia

▶ BY MOUTH

- ▶ Adult: 400–800 mg daily in 2 divided doses, adjusted according to response; maximum 1.2 g per day

Schizophrenia with predominantly negative symptoms

▶ BY MOUTH

- ▶ Adult: 50–300 mg daily

- **CONTRA-INDICATIONS** CNS depression • comatose states • phaeochromocytoma • prolactin-dependent tumours

- **INTERACTIONS** → Appendix 1: amisulpride

• SIDE-EFFECTS

- ▶ **Common or very common** Anxiety • breast pain • hypersalivation • muscle rigidity • nausea • oculogyric crisis • trismus • vomiting
- ▶ **Uncommon** Bradycardia
- ▶ **Frequency not known** Angioedema • bone disorders • cardiac arrest • dyslipidaemia • hyponatraemia • nasal congestion • neoplasms • SIADH • urticaria • vision blurred

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid—no information available.

- **RENAL IMPAIRMENT** No information available if eGFR less than 10 mL/minute/1.73 m².

Dose adjustments Halve dose if eGFR

30–60 mL/minute/1.73 m².

Use one-third dose if eGFR 10–30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Amisulpride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include caramel.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

380

Aripiprazole

- **DRUG ACTION** Aripiprazole is a dopamine D₂ partial agonist with weak 5-HT_{1A} partial agonism and 5-HT_{2A} receptor antagonism.

● INDICATIONS AND DOSE

Maintenance in schizophrenia in patients stabilised with oral aripiprazole

▶ INITIALLY BY INTRAMUSCULAR INJECTION

- ▶ **Adult:** 400 mg every month, to be injected into the gluteal muscle, minimum of 26 days between injections, for dose adjustment due to side effects—consult product literature and (by mouth) 10–20 mg daily continued for 14 consecutive days after the first injection, for missed depot doses consult product literature

Schizophrenia

▶ BY MOUTH

- ▶ **Adult:** 10–15 mg once daily; usual dose 15 mg once daily (max. per dose 30 mg once daily)

Treatment and recurrence prevention of mania

▶ BY MOUTH

- ▶ **Adult:** 15 mg once daily, increased if necessary up to 30 mg once daily

Control of agitation and disturbed behaviour in schizophrenia

▶ BY INTRAMUSCULAR INJECTION

- ▶ **Adult:** Initially 5.25–15 mg for 1 dose, alternatively usual dose 9.75 mg for 1 dose, followed by 5.25–15 mg after 2 hours if required, maximum 3 injections daily; maximum daily combined oral and parenteral dose 30 mg

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ With oral use Manufacturer advises double the dose with concurrent use of potent inducers of CYP3A4. Manufacturer advises reduce dose by half with

concurrent use of potent inhibitors of CYP3A4 or CYP2D6.

- ▶ With intramuscular use For dose adjustments due to concurrent use of interacting drugs—consult product literature.

IMPORTANT SAFETY INFORMATION

When prescribing, dispensing, or administering, check that the correct preparation is used—the preparation usually used in hospital for the rapid control of an *acute episode* (solution for injection containing aripiprazole 7.5 mg/mL) should **not** be confused with depot preparations (aripiprazole 400-mg vial with solvent), which are usually used in the community or clinics for *maintenance treatment*.

- **CONTRA-INDICATIONS** CNS depression · comatose state · phaeochromocytoma

● CAUTIONS

GENERAL CAUTIONS Cerebrovascular disease · elderly (reduce initial dose)

SPECIFIC CAUTIONS

- ▶ With intramuscular use When transferring from oral to depot therapy, the dose by mouth should be reduced gradually
- **INTERACTIONS** → Appendix 1: aripiprazole
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anxiety · appetite abnormal · diabetes mellitus · extrapyramidal symptoms · fatigue · gastrointestinal discomfort · headache · hypersalivation · nausea · postural hypotension · sedation · vision disorders · vomiting
 - ▶ **Uncommon** Depression · hiccups
 - ▶ **Frequency not known** Aggression · alopecia · bradycardia · cardiac arrest · chest pain · diabetic hyperosmolar coma · diarrhoea · dysphagia · generalised tonic-clonic seizure · hepatic disorders · hyperhidrosis · hypertension · hyponatraemia · laryngospasm · musculoskeletal stiffness · myalgia · oropharyngeal spasm · pancreatitis · pathological gambling · peripheral oedema · photosensitivity reaction · pneumonia aspiration · rhabdomyolysis · serotonin syndrome · speech disorder · suicidal tendencies · syncope · temperature regulation disorder · thrombocytopenia · urinary incontinence · weight decreased

- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk.
- **HEPATIC IMPAIRMENT** Use with caution in severe impairment (oral treatment preferred to intramuscular administration).
- **MONITORING REQUIREMENTS**
 - ▶ Aripiprazole does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
 - ▶ With intramuscular use Treatment requires careful monitoring for optimum effect.

- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With oral use Orodispersible tablets should be placed on the tongue and allowed to dissolve, or be dispersed in water and swallowed.
 - ▶ With intramuscular use Correct injection technique (including the use of z-track technique) and rotation of injection sites are essential.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer aripiprazole orodispersible tablets.

Clozapine

27-Nov-2017

- **DRUG ACTION** Clozapine is a dopamine D₁, dopamine D₂, 5-HT_{2A}, alpha₁-adrenoceptor, and muscarinic-receptor antagonist.

● INDICATIONS AND DOSE

Schizophrenia in patients unresponsive to, or intolerant of, conventional antipsychotic drugs

► BY MOUTH

- Adult 18–59 years: 12.5 mg 1–2 times a day for day 1, then 25–50 mg for day 2, then increased, if tolerated, in steps of 25–50 mg daily, dose to be increased gradually over 14–21 days, increased to up to 300 mg daily in divided doses, larger dose to be taken at night, up to 200 mg daily may be taken as a single dose at bedtime; increased in steps of 50–100 mg 1–2 times a week if required, it is preferable to increase once a week; usual dose 200–450 mg daily, max. 900 mg per day, if restarting after interval of more than 48 hours, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing
- Adult 60 years and over: 12.5 mg once daily for day 1, then increased to 25–37.5 mg for day 2, then increased, if tolerated, in steps of up to 25 mg daily, dose to be increased gradually over 14–21 days, increased to up to 300 mg daily in divided doses, larger dose at to be taken night, up to 200 mg daily may be taken as a single dose at bedtime; increased in steps of 50–100 mg 1–2 times

a week if required, it is preferable to increase once a week; usual dose 200–450 mg daily, max. 900 mg per day, if restarting after interval of more than 48 hours, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing

Psychosis in Parkinson's disease

► BY MOUTH

- Adult: 12.5 mg once daily, dose to be taken at bedtime, then increased in steps of 12.5 mg up to twice weekly, adjusted according to response; usual dose 25–37.5 mg once daily, dose to be taken at bedtime; increased in steps of 12.5 mg once weekly, this applies only in exceptional cases, increased if necessary up to 100 mg daily in 1–2 divided doses; Usual maximum 50 mg/24 hours

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CLOZAPINE: REMINDER OF POTENTIALLY FATAL RISK OF INTESTINAL OBSTRUCTION, FAECAL IMPACTION, AND PARALYTIC ILEUS (OCTOBER 2017)

Clozapine has been associated with varying degrees of impairment of intestinal peristalsis—see Cautions and Contra-indications for further information. Patients and their carers should be advised to seek immediate medical advice before taking the next dose of clozapine if constipation develops.

- **CONTRA-INDICATIONS** Alcoholic and toxic psychoses · bone-marrow disorders · coma · drug intoxication · history of agranulocytosis · history of circulatory collapse · history of neutropenia · paralytic ileus · severe cardiac disorders (e.g. myocarditis) · severe CNS depression · uncontrolled epilepsy
- **CAUTIONS** Age over 60 years · prostatic hypertrophy · susceptibility to angle-closure glaucoma · taper off other antipsychotics before starting

CAUTIONS, FURTHER INFORMATION

- Agranulocytosis Neutropenia and potentially fatal agranulocytosis reported. Leucocyte and differential blood counts must be normal before starting; monitor counts every week for 18 weeks then at least every 2 weeks and if clozapine continued and blood count stable after 1 year at least every 4 weeks (and 4 weeks after discontinuation); if leucocyte count below 3000/mm³ or if absolute neutrophil count below 1500/mm³ discontinue permanently and refer to haematologist. Patients who have a low white blood cell count because of benign ethnic neutropenia may be started on clozapine with the agreement of a haematologist. Avoid drugs which depress leucopoiesis; patients should report immediately symptoms of infection, especially influenza-like illness.
- Myocarditis and cardiomyopathy Fatal myocarditis (most commonly in first 2 months) and cardiomyopathy reported.
 - Perform physical examination and take full medical history before starting
 - Specialist examination required if cardiac abnormalities or history of heart disease found—clozapine initiated only in absence of severe heart disease and if benefit outweighs risk
 - Persistent tachycardia especially in first 2 months should prompt observation for other indicators for myocarditis or cardiomyopathy
 - If myocarditis or cardiomyopathy suspected clozapine should be stopped and patient evaluated urgently by cardiologist
 - Discontinue permanently in clozapine-induced myocarditis or cardiomyopathy

- Intestinal obstruction Impairment of intestinal peristalsis, including constipation, intestinal obstruction, faecal impaction, and paralytic ileus, (including fatal cases) reported. Clozapine should be used with caution in patients receiving drugs that may cause constipation (e.g. antimuscarinic drugs) or in those with a history of colonic disease or lower abdominal surgery. It is essential that constipation is recognised and actively treated.

● **INTERACTIONS** → Appendix 1: clozapine

● **SIDE-EFFECTS**

- Common or very common** Appetite decreased · eosinophilia · fatigue · fever · headache · hypertension · leucocytosis · muscle complaints · nausea · oral disorders · postural hypotension (dose-related) · sedation · speech impairment · sweating abnormal · syncope · temperature regulation disorders · urinary disorders · vision blurred · vomiting
- Rare or very rare** Anaemia · cardiac arrest · cardiac inflammation · cardiomyopathy · circulatory collapse · delirium · diabetes mellitus · dyslipidaemia · dysphagia · gastrointestinal disorders · glucose tolerance impaired · hepatic disorders · increased risk of infection · intestinal obstruction (including fatal cases) · ketoacidosis · nephritis tubulointerstitial · obsessive-compulsive disorder · pancreatitis · pericardial effusion · respiratory disorders · restlessness · skin reactions · thrombocytopenia · thrombocytosis
- Frequency not known** Angina pectoris · angioedema · chest pain · cholinergic syndrome · diarrhoea · gastrointestinal discomfort · hypersensitivity vasculitis · muscle weakness · myocardial infarction · nasal congestion · pseudophaeochromocytoma · renal failure · systemic lupus erythematosus (SLE)

SIDE-EFFECTS, FURTHER INFORMATION Hypersalivation associated with clozapine therapy can be treated with hyoscine hydrobromide [unlicensed indication], provided that the patient is not at particular risk from the additive antimuscarinic side-effects of hyoscine and clozapine.

● **PREGNANCY** Use with caution.

● **BREAST FEEDING** Avoid.

● **HEPATIC IMPAIRMENT** Avoid in symptomatic liver disease. Avoid in progressive liver disease. Avoid in hepatic failure. **Monitoring** Monitor hepatic function regularly.

● **RENAL IMPAIRMENT** Avoid in severe impairment.

● **MONITORING REQUIREMENTS**

- Monitor leucocyte and differential blood counts. Clozapine requires differential white blood cell monitoring weekly for 18 weeks, then fortnightly for up to one year, and then monthly as part of the clozapine patient monitoring service.
- Close medical supervision during initiation (risk of collapse because of hypotension and convulsions).
- Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotics. Patients taking clozapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.
- Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking clozapine should have fasting blood glucose tested at baseline, after one month's treatment, then every 4–6 months.
- Patient, prescriber, and supplying pharmacist must be registered with the appropriate Patient Monitoring Service—it takes several days to do this.
- TREATMENT CESSATION** On planned withdrawal reduce dose over 1–2 weeks to avoid risk of rebound psychosis. If abrupt withdrawal necessary observe patient carefully.
- DIRECTIONS FOR ADMINISTRATION** Shake oral suspension well for 90 seconds when dispensing or if visibly settled

and stand for 24 hours before use; otherwise shake well for 10 seconds before use. May be diluted with water.

● **PRESCRIBING AND DISPENSING INFORMATION** Clozapine has been used for psychosis in Parkinson's disease in children aged 16 years and over.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer clozapine oral suspension.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

Lurasidone hydrochloride

● **DRUG ACTION** Lurasidone is a dopamine D₂, 5-HT_{2A}, 5-HT₇, alpha_{2A}- and alpha_{2C}-adrenoceptor antagonist, and is a partial agonist at 5-HT_{1A} receptors.

● **INDICATIONS AND DOSE**

● **Schizophrenia**

► **BY MOUTH**

- Adult: Initially 37 mg once daily, increased if necessary up to 148 mg once daily

Schizophrenia when given with concomitant moderate CYP3A4 inhibitors (e.g. diltiazem, erythromycin, fluconazole, and verapamil)

► **BY MOUTH**

- Adult: Initially 18.5 mg once daily (max. per dose 74 mg once daily)

● **CAUTIONS** High doses in elderly · susceptibility to QT-interval prolongation

● **INTERACTIONS** → Appendix 1: lurasidone

● **SIDE-EFFECTS**

- Common or very common** Anxiety · cogwheel rigidity · drooling · drowsiness · fatigue · gastrointestinal discomfort · muscle complaints · musculoskeletal stiffness · nausea · oculogyric crisis · oral disorders · pain · psychiatric disorders · sleep disorders · vomiting
- Uncommon** Appetite decreased · dysarthria · dysuria · gait abnormal · gastrointestinal disorders · hot flush · hyperhidrosis · hypertension · joint stiffness · nasopharyngitis · postural hypotension · vision blurred
- Rare or very rare** Eosinophilia · rhabdomyolysis

- **Frequency not known** Anaemia · angina pectoris · angioedema · atrioventricular block · bradycardia · breast abnormalities · diarrhoea · dysmenorrhoea · dysphagia · pruritus · renal failure · Stevens-Johnson syndrome · suicidal behaviour · vertigo
- **PREGNANCY** Use only if potential benefit outweighs risk—limited information available.
- **HEPATIC IMPAIRMENT**
Dose adjustments Initially 18.5 mg once daily, up to max. 74 mg once daily in moderate impairment.
 Use with caution in severe impairment—initially 18.5 mg once daily, up to max. 37 mg once daily.
- **RENAL IMPAIRMENT** Manufacturer advises use only if potential benefit outweighs risk if eGFR less than 15 mL/minute/1.73 m².
Dose adjustments Initially 18.5 mg once daily, up to max. 74 mg once daily if eGFR less than 50 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION** Patients on doses higher than 111 mg once daily whose treatment is interrupted for longer than 3 days should restart on 111 mg once daily and titrate to usual dose; for all other doses, restart on usual dose.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Olanzapine

- **DRUG ACTION** Olanzapine is a dopamine D₁, D₂, D₄, 5-HT₂, histamine- 1-, and muscarinic-receptor antagonist.

● INDICATIONS AND DOSE

Schizophrenia | Combination therapy for mania

► BY MOUTH

- **Adult:** 10 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 10 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

Preventing recurrence in bipolar disorder

► BY MOUTH

- **Adult:** 10 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 10 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

Monootherapy for mania

► BY MOUTH

- **Adult:** 15 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 15 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

Control of agitation and disturbed behaviour in schizophrenia or mania

► BY INTRAMUSCULAR INJECTION

- **Adult:** Initially 5–10 mg for 1 dose; usual dose 10 mg for 1 dose, followed by 5–10 mg after 2 hours if required, maximum 3 injections daily for 3 days; maximum daily combined oral and parenteral dose 20 mg, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase
- **Elderly:** Initially 2.5–5 mg, followed by 2.5–5 mg after 2 hours if required, maximum 3 injections daily for 3 days; maximum daily combined oral and parenteral dose 20 mg, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase

● CONTRA-INDICATIONS

- With intramuscular use Acute myocardial infarction · bradycardia · recent heart surgery · severe hypotension · sick sinus syndrome · unstable angina

- **CAUTIONS** Bone-marrow depression · hypereosinophilic disorders · low leucocyte count · low neutrophil count · myeloproliferative disease · paralytic ileus

CAUTIONS, FURTHER INFORMATION

- **CNS and respiratory depression**
- With intramuscular use Blood pressure, pulse and respiratory rate should be monitored for at least 4 hours after intramuscular injection, particularly in those also receiving a benzodiazepine or another antipsychotic (leave at least one hour between administration of olanzapine intramuscular injection and parenteral benzodiazepines).

- **INTERACTIONS** → Appendix 1: olanzapine

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Appetite increased · arthralgia · oedema
- **Uncommon** Alopecia · epistaxis · memory loss
- **Rare or very rare** Hepatic disorders · pancreatitis · rhabdomyolysis

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- With intramuscular use Dyslipidaemia · malaise
- With oral use Anticholinergic syndrome · asthenia · drowsiness · eosinophilia · fever · glycosuria · hypersomnia · postural hypotension
- **Uncommon**
- With oral use Abdominal distension · bradycardia · breast enlargement · diabetes mellitus · diabetic coma · dysarthria · ketoacidosis · oculogyration · photosensitivity reaction · thromboembolism · urinary disorders

► Rare or very rare

- With oral use Hypothermia · thrombocytopenia
- **Frequency not known**
- With intramuscular use Hypoventilation

- **PREGNANCY** Use only if potential benefit outweighs risk; neonatal lethargy, tremor, and hypertonia reported when used in third trimester.

- **BREAST FEEDING** Avoid—present in milk.

● HEPATIC IMPAIRMENT

Dose adjustments Consider initial dose of 5 mg daily.

● RENAL IMPAIRMENT

Dose adjustments Consider initial dose of 5 mg daily.

● MONITORING REQUIREMENTS

- Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotic drugs. Patients taking olanzapine require

more frequent monitoring of these parameters: every 3 months for the first year, then yearly.

- ▶ Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking olanzapine should have fasting blood glucose tested at baseline, after one month's treatment, then every 4–6 months.

- **DIRECTIONS FOR ADMINISTRATION** Olanzapine orodispersible tablet may be placed on the tongue and allowed to dissolve, or dispersed in water, orange juice, apple juice, milk, or coffee.

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ With intramuscular use When prescribing, dispensing, or administering, check that this injection is the correct preparation—this preparation is usually used in hospital for the rapid control of an *acute episode* and should **not** be confused with depot preparations which are usually used in the community or clinics for *maintenance* treatment.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer orodispersible tablets.

● MEDICINAL FORMS

£ 380

Paliperidone

15-Jun-2017

- **DRUG ACTION** Paliperidone is a metabolite of risperidone.

● INDICATIONS AND DOSE

Schizophrenia | Psychotic or manic symptoms of schizoaffective disorder

▶ BY MOUTH

- ▶ Adult: 6 mg once daily, dose to be taken in the morning, then adjusted in steps of 3 mg if required, dose to be adjusted over at least 5 days; usual dose 3–12 mg daily

TRIVECTA® PRE-FILLED SYRINGES

Maintenance of schizophrenia in patients who are clinically stable on once-monthly intramuscular paliperidone

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: Initially 175–525 mg every 3 months, adjusted according to response, to be administered into the deltoid or gluteal muscle, dose is based on previous once-monthly intramuscular paliperidone and should be initiated in place of the next scheduled dose—consult product literature

XEPLION® PRE-FILLED SYRINGES

Maintenance in schizophrenia in patients previously responsive to paliperidone or risperidone

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 150 mg for 1 dose on day 1, then 100 mg for 1 dose on day 8, to be injected into the deltoid muscle, dose subsequently adjusted at monthly intervals according to response; maintenance 75 mg once a month, alternatively maintenance 25–150 mg once a month, following the second dose, monthly maintenance doses can be administered into either the deltoid or gluteal muscle

● CONTRA-INDICATIONS

- ▶ With intramuscular use Children

● CAUTIONS

GENERAL CAUTIONS Cataract surgery (risk of intraoperative floppy iris syndrome) · dementia with Lewy bodies · elderly patients with dementia · elderly patients with risk factors for stroke · predisposition to gastrointestinal obstruction · prolactin-dependent tumours

SPECIFIC CAUTIONS When transferring from oral to depot therapy, the dose by mouth should be reduced gradually

• **INTERACTIONS** → Appendix 1: paliperidone

• **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · appetite abnormal · arrhythmias · asthenia · cardiac conduction disorders · cough · depression · diarrhoea · fever · gastrointestinal discomfort · headache · hypertension · increased risk of infection · joint disorders · laryngeal pain · nasal congestion · nausea · oral disorders · pain · postural hypotension · sedation · skin reactions · vision disorders · vomiting
- ▶ **Uncommon** Alopecia · anaemia · breast abnormalities · chest discomfort · chills · conjunctivitis · cystitis · dizziness · postural · dry eye · dysarthria · dysphagia · dyspnoea · ear pain · epistaxis · fall · gait abnormal · gastrointestinal disorders · generalised tonic-clonic seizure · hypoglycaemia · malaise · menstrual cycle irregularities · mood altered · muscle spasms · muscle weakness · oedema · palpitations · respiratory disorders · sensation abnormal · sleep disorders · syncope · taste altered · thirst · thrombocytopenia · tinnitus · urinary disorders · vertigo
- ▶ **Rare or very rare** Angioedema · cerebrovascular insufficiency · coma · consciousness impaired · dandruff · dysphonia · eye disorders · flushing · glaucoma · head titubation · hypothermia · ischaemia · jaundice · pancreatitis · polydipsia · posture abnormal · rhabdomyolysis · SIADH · sleep apnoea · vaginal discharge · water intoxication · withdrawal syndrome

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With oral use Weight decreased
- ▶ **Uncommon**
- ▶ With oral use Concentration impaired · diabetes mellitus
- ▶ **Rare or very rare**
- ▶ With parenteral use Diabetic ketoacidosis
- **PREGNANCY** Use only if potential benefit outweighs risk—toxicity in *animal* studies; if discontinuation during pregnancy is necessary, withdraw gradually.

TREVICTA® PRE-FILLED SYRINGES Manufacturer advises to consider long-acting nature of formulation—paliperidone detected in plasma up to 18 months after single dose.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk.

TREVICTA® PRE-FILLED SYRINGES Manufacturer advises to consider long-acting nature of formulation—paliperidone detected in plasma up to 18 months after single dose.

- **HEPATIC IMPAIRMENT** Caution in severe impairment—no information available.

• RENAL IMPAIRMENT

- ▶ With oral use Manufacturer advises avoid if creatinine clearance less than 10 mL/minute.
- ▶ With intramuscular use Manufacturer advises avoid if creatinine clearance less than 50 mL/minute.
- Dose adjustments** ▶ With oral use Manufacturer advises reduce initial dose to 3 mg once daily if creatinine clearance 50–80 mL/minute (max. 6 mg once daily). Manufacturer advises reduce initial dose to 1.5 mg once daily if creatinine clearance 10–50 mL/minute (max. 3 mg once daily).

TREVICTA® PRE-FILLED SYRINGES Manufacturer advises dose should be adjusted and stabilised using once-monthly injectable paliperidone before switching to three-monthly injectable paliperidone, if creatinine clearance 50–80 mL/minute.

XEPLION® PRE-FILLED SYRINGES Manufacturer advises initial dose 100 mg on day 1 and then 75 mg on day 8 if creatinine clearance 50–80 mL/minute; recommended

maintenance dose 50 mg (range 25–100 mg) monthly if creatinine clearance 50–80 mL/minute.

• MONITORING REQUIREMENTS

- ▶ With intramuscular use Treatment requires careful monitoring for optimum effect.

• DIRECTIONS FOR ADMINISTRATION

- ▶ With intramuscular use Correct injection technique (including the use of z-track technique) and rotation of injection sites are essential.
- ▶ With oral use Always take with breakfast or always take on an empty stomach.

• PATIENT AND CARER ADVICE

- ▶ With oral use Patients or carers should be given advice on how to administer paliperidone tablets.

Missed doses ▶ With intramuscular use For missed doses see product literature.

• NATIONAL FUNDING/ACCESS DECISIONS

TREVICTA® PRE-FILLED SYRINGES

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2016) that paliperidone palmitate (*Trevicta*®) is accepted for use within NHS Scotland for the maintenance treatment of schizophrenia in patients who are clinically stable on one-monthly paliperidone palmitate injectable product.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Prolonged-release suspension for injection

▶ *Trevicta* (Janssen-Cilag Ltd)

Xeplion 100mg/1mL suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £314.07 DT = £314.07

Xeplion 50mg/0.5mL suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £183.92 DT = £183.92

Quetiapine

- **DRUG ACTION** Quetiapine is a dopamine D₁, dopamine D₂, 5-HT₂, α₁-adrenoceptor, and histamine-1 receptor antagonist.

● INDICATIONS AND DOSE

Schizophrenia

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: 25 mg twice daily for day 1, then 50 mg twice daily for day 2, then 100 mg twice daily for day 3, then 150 mg twice daily for day 4, then, adjusted according to response, usual dose 300–450 mg daily in 2 divided doses, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 750 mg per day

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 300 mg once daily for day 1, then 600 mg once daily for day 2, then, adjusted according to response, usual dose 600 mg once daily, maximum dose under specialist supervision; maximum 800 mg per day
- Elderly: Initially 50 mg once daily, adjusted according to response. adjusted in steps of 50 mg daily

Treatment of mania in bipolar disorder

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: 50 mg twice daily for day 1, then 100 mg twice daily for day 2, then 150 mg twice daily for day 3, then 200 mg twice daily for day 4, then adjusted in steps of up to 200 mg daily, adjusted according to response, usual dose 400–800 mg daily in 2 divided doses, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 800 mg per day

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 300 mg once daily for day 1, then 600 mg once daily for day 2, then, adjusted according to response, usual dose 400–800 mg once daily
- Elderly: Initially 50 mg once daily, adjusted according to response. adjusted in steps of 50 mg daily

Treatment of depression in bipolar disorder

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: 50 mg once daily for day 1, dose to be taken at bedtime, then 100 mg once daily for day 2, then 200 mg once daily for day 3, then 300 mg once daily for day 4, then, adjusted according to response; usual dose 300 mg once daily, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 600 mg per day

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 50 mg once daily for day 1, dose to be taken at bedtime, then 100 mg once daily for day 2, then 200 mg once daily for day 3, then 300 mg once daily for day 4, then, adjusted according to response; usual dose 300 mg once daily; maximum 600 mg per day

Prevention of mania and depression in bipolar disorder

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Continue at the dose effective for treatment of bipolar disorder and adjust to lowest effective dose; usual dose 300–800 mg daily in 2 divided doses

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: Continue at the dose effective for treatment of bipolar disorder and adjust to lowest effective dose; usual dose 300–800 mg once daily

Adjunctive treatment of major depression

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 50 mg once daily for 2 days, dose to be taken at bedtime, then 150 mg once daily for 2 days, then, adjusted according to response, usual dose 150–300 mg once daily

- Elderly: Initially 50 mg once daily for 3 days, then increased if necessary to 100 mg once daily for 4 days, then adjusted in steps of 50 mg, adjusted according to response, usual dose 50–300 mg once daily, dose of 300 mg should not be reached before day 22 of treatment

DOSE EQUIVALENCE AND CONVERSION

- Patients can be switched from immediate-release to modified-release tablets at the equivalent daily dose; to maintain clinical response, dose titration may be required.

- **CAUTIONS** Cerebrovascular disease · elderly · patients at risk of aspiration pneumonia · treatment of depression in patients under 25 years (increased risk of suicide)
- **INTERACTIONS** → Appendix 1: quetiapine
- **SIDE-EFFECTS**
 - **Common or very common** Appetite increased · asthenia · dysarthria · dyspepsia · dyspnoea · fever · headache · irritability · palpitations · peripheral oedema · postural hypotension · rhinitis · sleep disorders · suicidal behaviour (particularly on initiation) · suicidal ideation (particularly on initiation) · syncope · vision blurred · vomiting · withdrawal syndrome
 - **Uncommon** Anaemia · bradycardia · diabetes mellitus · dysphagia · hyponatraemia · hypothyroidism · sexual dysfunction · skin reactions · thrombocytopenia
 - **Rare or very rare** Angioedema · breast swelling · gastrointestinal disorders · hepatic disorders · hypothermia · menstrual disorder · metabolic syndrome · pancreatitis · rhabdomyolysis · severe cutaneous adverse reactions (SCARs) · SIADH
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT**
 - Dose adjustments For *immediate-release tablets*, initially 25 mg daily, increased daily in steps of 25–50 mg.
 - For *modified-release tablets*, initially 50 mg daily, increased daily in steps of 50 mg.

Risperidone

07-Feb-2018

- **DRUG ACTION** Risperidone is a dopamine D₂, 5-HT_{2A}, alpha₁-adrenoceptor, and histamine-1 receptor antagonist.

● INDICATIONS AND DOSE

Schizophrenia and other psychoses in patients tolerant to risperidone by mouth and taking oral risperidone up to 4 mg daily

► **BY DEEP INTRAMUSCULAR INJECTION**

- Adult: Initially 25 mg every 2 weeks, to be administered into the deltoid or gluteal muscle, adjusted in steps of 12.5 mg (max. per dose 50 mg every 2 weeks) at intervals of at least 4 weeks, during initiation risperidone by mouth may need to be continued for 4–6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection

Schizophrenia and other psychoses in patients tolerant to risperidone by mouth and taking oral risperidone over 4 mg daily

► **BY DEEP INTRAMUSCULAR INJECTION**

- Adult: Initially 37.5 mg every 2 weeks, adjusted in steps of 12.5 mg (max. per dose 50 mg every 2 weeks) at intervals of at least 4 weeks, during initiation risperidone by mouth may need to be continued for 4–6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection

Acute and chronic psychosis

► **BY MOUTH**

- Adult: 2 mg daily in 1–2 divided doses for day 1, then 4 mg daily in 1–2 divided doses for day 2, slower titration is appropriate in some patients, usual dose 4–6 mg daily, doses above 10 mg daily only if benefit considered to outweigh risk; maximum 16 mg per day
- Elderly: Initially 500 micrograms twice daily, then increased in steps of 500 micrograms twice daily, increased to 1–2 mg twice daily

Mania

► **BY MOUTH**

- Adult: Initially 2 mg once daily, then increased in steps of 1 mg daily if required; usual dose 1–6 mg daily
- Elderly: Initially 500 micrograms twice daily, then increased in steps of 500 micrograms twice daily, increased to 1–2 mg twice daily

Short-term treatment (up to 6 weeks) of persistent aggression in patients with moderate to severe Alzheimer's dementia unresponsive to non-pharmacological interventions and when there is a risk of harm to self or others

► **BY MOUTH**

- Adult: Initially 250 micrograms twice daily, then increased in steps of 250 micrograms twice a day on alternate days, adjusted according to response; usual dose 500 micrograms twice daily (max. per dose 1 mg twice daily)

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Risperidone has been confused with ropinirole; care must be taken to ensure the correct drug is prescribed and dispensed.

● CONTRA-INDICATIONS

- With intramuscular use Children

● CAUTIONS

GENERAL CAUTIONS Avoid in Acute porphyrias p. 1025 · cataract surgery (risk of intra-operative floppy iris syndrome) · dehydration · dementia with Lewy bodies · prolactin-dependent tumours

SPECIFIC CAUTIONS When transferring from oral to depot therapy, the dose by mouth should be reduced gradually

● **INTERACTIONS** → Appendix 1: risperidone

● **SIDE-EFFECTS**

- ▶ **Common or very common** Anaemia • anxiety • appetite abnormal • asthenia • chest discomfort • conjunctivitis • cough • depression • diarrhoea • dyspnoea • epistaxis • fall • fever • gastrointestinal discomfort • headache • hypertension • increased risk of infection • joint disorders • laryngeal pain • muscle spasms • nasal congestion • nausea • oedema • oral disorders • pain • sedation • skin reactions • sleep disorders • urinary disorders • vision disorders • vomiting • weight decreased
- ▶ **Uncommon** Alopecia • arrhythmias • breast abnormalities • cardiac conduction disorders • cerebrovascular insufficiency • chills • coma • concentration impaired • consciousness impaired • cystitis • diabetes mellitus • dizziness postural • dry eye • dysarthria • dysphagia • dysphonia • ear pain • eye disorders • feeling abnormal • flushing • gait abnormal • gastrointestinal disorders • malaise • menstrual cycle irregularities • mood altered • muscle weakness • palpitations • polydipsia • postural hypotension • posture abnormal • respiratory disorders • sensation abnormal • syncope • taste altered • thirst • thrombocytopenia • tinnitus • vaginal discharge • vertigo
- ▶ **Rare or very rare** Angioedema • dandruff • eyelid crusting • glaucoma • head titubation • hypoglycaemia • hypothermia • jaundice • pancreatitis • peripheral coldness • rhabdomyolysis • SIADH • sleep apnoea • water intoxication • withdrawal syndrome

▶ **Frequency not known** Cardiac arrest

● **PREGNANCY** Use only if potential benefit outweighs risk.

● **BREAST FEEDING** Use only if potential benefit outweighs risk—small amount present in milk.

● **HEPATIC IMPAIRMENT**

Dose adjustments ▶ With intramuscular use If an oral dose of at least 2 mg daily tolerated, 25 mg as a depot injection can be given every 2 weeks.

▶ With oral use Initial and subsequent oral doses should be halved.

● **RENAL IMPAIRMENT**

Dose adjustments Initial and subsequent oral doses should be halved.

● **MONITORING REQUIREMENTS**

▶ With intramuscular use Treatment requires careful monitoring for optimum effect.

● **DIRECTIONS FOR ADMINISTRATION**

▶ With oral use Orodispersible tablets should be placed on the tongue, allowed to dissolve and swallowed. Oral liquid may be diluted with any non-alcoholic drink, except tea.

▶ With intramuscular use Correct injection technique (including the use of z-track technique) and rotation of injection sites are essential.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer risperidone orodispersible tablets and oral liquid (counselling on use of dose syringe advised).

● **MEDICINAL FORMS**

ANTIPSYCHOTICS > SECOND-GENERATION (DEPOT INJECTIONS)

▶ 380

Olanzapine embonate
(Olanzapine pamoate)

● **INDICATIONS AND DOSE**

Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 10 mg oral olanzapine daily)

▶ **BY DEEP INTRAMUSCULAR INJECTION**

▶ Adult 18-75 years: Initially 210 mg every 2 weeks, alternatively initially 405 mg every 4 weeks, then maintenance 150 mg every 2 weeks, alternatively maintenance 300 mg every 4 weeks, maintenance dose to be started after 2 months of initial treatment, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required

continued →

Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 15 mg oral olanzapine daily)

- BY DEEP INTRAMUSCULAR INJECTION
- Adult 18–75 years: Initially 300 mg every 2 weeks, then maintenance 210 mg every 2 weeks, alternatively maintenance 405 mg every 4 weeks, maintenance dose to be started after 2 months of initial treatment, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required

Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 20 mg oral olanzapine daily)

- BY DEEP INTRAMUSCULAR INJECTION
- Adult: Initially 300 mg every 2 weeks, then maintenance 300 mg every 2 weeks (max. per dose 300 mg every 2 weeks), adjusted according to response, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required

IMPORTANT SAFETY INFORMATION

When prescribing, dispensing or administering, check that this is the correct preparation—this preparation is used for *maintenance* treatment and should **not** be used for the rapid control of an *acute* episode.

- **CONTRA-INDICATIONS** Children
 - **CAUTIONS** Bone-marrow depression · hyereosinophilic disorders · low leucocyte count · low neutrophil count · myeloproliferative disease · paralytic ileus · when transferring from oral to depot therapy, the dose by mouth should be reduced gradually
 - **INTERACTIONS** → Appendix 1: olanzapine
 - **SIDE-EFFECTS**
 - **Common or very common** Anticholinergic syndrome · appetite increased · arthralgia · asthenia · eosinophilia · fever · glycosuria · oedema · postural hypotension
 - **Uncommon** Abdominal distension · alopecia · bradycardia · breast enlargement · diabetes mellitus · diabetic coma · dysarthria · epistaxis · ketoacidosis · memory loss · oculogyration · photosensitivity reaction · restless legs · urinary disorders
 - **Rare or very rare** Drug reaction with eosinophilia and systemic symptoms (DRESS) · hepatic disorders · hypothermia · pancreatitis · rhabdomyolysis · thrombocytopenia
 - **Frequency not known** Erythema · gait abnormal · increased risk of fall · lethargy · pneumonia · visual hallucinations
- Overdose** Post-injection reactions have been reported leading to signs and symptoms of overdose.
- **PREGNANCY** Use only if potential benefit outweighs risk; neonatal lethargy, tremor, and hypertonia reported when used in third trimester.
 - **BREAST FEEDING** Avoid—present in milk.
 - **HEPATIC IMPAIRMENT** Initially 150 mg every 4 weeks; increase with caution in moderate impairment.
 - **RENAL IMPAIRMENT**
 - Dose adjustments Initially 150 mg every 4 weeks.
 - **MONITORING REQUIREMENTS**
 - Observe patient for at least 3 hours after injection.
 - Treatment requires careful monitoring for optimum effect.
 - Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotic drugs. Patients taking olanzapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.

- Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking olanzapine should have fasting blood glucose tested at baseline, after one month's treatment, then every 4–6 months.
- **DIRECTIONS FOR ADMINISTRATION** Correct injection technique (including use of z-track technique) and rotation of injection sites are essential.

4 Movement disorders

Motor neurone disease

17-May-2017

Description of condition

Motor neurone disease is a neurodegenerative condition affecting the brain and spinal cord. Degeneration of motor neurones leads to progressive muscle weakness; resulting symptoms include muscle cramps, wasting and stiffness, loss of dexterity, reduced respiratory function and cognitive dysfunction. The most common form is amyotrophic lateral sclerosis.

[Evg](#) Patients suspected of having developed motor neurone disease should be referred to a neurologist without delay. [A](#)

Aims of treatment

As there is no cure, treatment focuses on maintaining functional ability and managing symptoms.

Non-drug treatment

Non-drug treatment includes nutrition, psychosocial support, physiotherapy, exercise programmes and use of special equipment or mobility aids.

Management of symptoms**Muscular symptoms**

[Evg](#) Quinine p. 608 [unlicensed indication] is recommended as first line treatment for muscle cramps. If quinine is ineffective, not tolerated or contra-indicated, baclofen p. 1092 [unlicensed indication] should be considered as second line treatment. Subsequent treatment options include tizanidine p. 1094 [unlicensed indication], dantrolene sodium p. 1307 [unlicensed indication] or gabapentin p. 314 [unlicensed indication].

Symptoms of muscle stiffness, spasticity or increased tone can be managed with baclofen, tizanidine, dantrolene sodium or gabapentin [unlicensed indication]. Treatment of severe spasticity may require specialist referral. [A](#)

Saliva problems

[Evg](#) A trial of an antimuscarinic drug [unlicensed indication] can be considered for excessive drooling of saliva. Glycopyrronium bromide p. 246 is recommended in patients who have cognitive impairment as it has fewer central nervous system side-effects. If initial treatment is ineffective, not tolerated or contra-indicated, referral for

specialist administration of botulinum toxin type A p. 403 [unlicensed indication] may be required.

Humidification, nebulisers and carbocysteine p. 290 can be used to treat patients with thick, tenacious saliva. 

Respiratory symptoms

 Reversible causes of worsening respiratory impairment (such as respiratory tract infections or secretion problems) should be treated before considering other options.

Patients experiencing breathlessness can be treated with opioids [unlicensed indication], or benzodiazepines [unlicensed indication] if the patient's symptoms are exacerbated by anxiety. Non-invasive ventilation should be considered in patients with respiratory impairment. 

Amiotrophic lateral sclerosis

Riluzole p. 1089 is licensed for use in patients with amyotrophic lateral sclerosis to extend life or to extend the time to mechanical ventilation—see *National funding/access decisions* under riluzole.

4.1 Dystonias and other involuntary movements

Essential tremor, chorea, tics, and related disorders

Drugs used in essential tremor, chorea, tics, and related disorders

Tetrabenazine p. 382 [unlicensed indication], olanzapine p. 394 [unlicensed indication], risperidone p. 398 [unlicensed indication], and quetiapine p. 397 [unlicensed indication], can also be used to suppress chorea in Huntington's disease. Tetrabenazine can also be prescribed for the treatment of tardive dyskinesia if switching or withdrawing the causative antipsychotic drug is not effective. It acts by depleting nerve endings of dopamine. It is effective in only a proportion of patients and its use may be limited by the development of depression.

Haloperidol p. 382 [unlicensed indication], olanzapine p. 394 [unlicensed indication], risperidone p. 398 [unlicensed indication], and quetiapine p. 397 [unlicensed indication], can also be used to suppress chorea in Huntington's disease.

Haloperidol can also improve motor tics and symptoms of Tourette syndrome and related choreas. Other treatments for Tourette syndrome include pimozide p. 385 [unlicensed indication] (**important:** ECG monitoring required), clonidine hydrochloride p. 144 [unlicensed indication], and sulpiride p. 386 [unlicensed indication]. Trihexyphenidyl hydrochloride p. 407 in high dosage can also improve some movement disorders; it is sometimes necessary to build the dose up over many weeks. Chlorpromazine hydrochloride p. 381 and haloperidol are used to relieve intractable hiccup.

Propranolol hydrochloride p. 149 or another beta-adrenoceptor blocking drug may be useful in treating essential tremor or tremors associated with anxiety or thyrotoxicosis.

Primidone p. 332 in some cases provides relief from benign essential tremor; the dose is increased slowly to reduce side-effects.

Piracetam p. 402 is used as an adjunctive treatment for myoclonus of cortical origin. After an acute episode, attempts should be made every 6 months to decrease or discontinue treatment.

Riluzole p. 1089 is used to extend life in patients with motor neurone disease who have amyotrophic lateral sclerosis.

Torsion dystonia and other involuntary movements

Treatment with botulinum toxin type A p. 403 can be considered after an acquired non-progressive brain injury if rapid-onset spasticity causes postural or functional difficulties.

Other drugs used for Dystonias and other involuntary movements

Clozapine, p. 392 • Diazepam, p. 340 • Orphenadrine hydrochloride, p. 406 • Pericyazine, p. 384 • Pramipexole, p. 417 • Prochlorperazine, p. 385 • Procyclidine hydrochloride, p. 406 • Ropinirole, p. 419 • Rotigotine, p. 421 • Trifluoperazine, p. 387

ANTIPSYCHOTICS > FIRST-GENERATION

P 380

Promazine hydrochloride

• INDICATIONS AND DOSE

Short-term adjunctive management of psychomotor agitation

- ▶ BY MOUTH
- ▶ Adult: 100–200 mg 4 times a day

Agitation and restlessness in elderly

- ▶ BY MOUTH
- ▶ Elderly: 25–50 mg 4 times a day

- **CONTRA-INDICATIONS** CNS depression • comatose states • phaeochromocytoma
- **CAUTIONS** Cerebral arteriosclerosis
- **INTERACTIONS** → Appendix 1: phenothiazines
- **SIDE-EFFECTS** Apathy • autonomic dysfunction • cardiac arrest • cardiovascular effects • consciousness impaired • corneal opacity • epilepsy • eye discolouration • gastrointestinal disorder • glaucoma • haemolytic anaemia • headache • hepatic disorders • hyperpyrexia • hypersensitivity • hyperthermia (dose-related) • hypothermia (dose-related) • lens opacity • menstrual disorder • muscle rigidity • nasal congestion • photosensitivity reaction • sedation • skin reactions • urinary hesitation • vision blurred • withdrawal syndrome
- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.
- **RENAL IMPAIRMENT**
Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **LESS SUITABLE FOR PRESCRIBING** Promazine hydrochloride is less suitable for prescribing.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

CAUTIONARY AND ADVISORY LABELS 2

▶ Promazine hydrochloride (Non-proprietary)

Promazine hydrochloride 5 mg per 1 ml Promazine 25mg/5ml syrup | 150 ml [PoM] £13.00 DT = £13.01
Promazine 25mg/5ml oral solution | 150 ml [PoM] £13.01 DT = £13.01
Promazine hydrochloride 10 mg per 1 ml Promazine 50mg/5ml syrup | 150 ml [PoM] £15.00 DT = £15.01
Promazine 50mg/5ml oral solution | 150 ml [PoM] £15.01 DT = £15.01

Tablet

CAUTIONARY AND ADVISORY LABELS 2

▶ Promazine hydrochloride (Non-proprietary)

Promazine hydrochloride 25 mg Promazine 25mg tablets | 100 tablet [PoM] £49.99 DT = £49.07
Promazine hydrochloride 50 mg Promazine 50mg tablets | 100 tablet [PoM] £76.49 DT = £76.34

CNS STIMULANTS

Piracetam

● INDICATIONS AND DOSE

Adjunctive treatment of cortical myoclonus

► BY MOUTH

- Adult: Initially 7.2 g daily in 2–3 divided doses, then increased in steps of 4.8 g every 3–4 days, adjusted according to response, subsequently, attempts should be made to reduce dose of concurrent therapy; maximum 24 g per day

- **CONTRA-INDICATIONS** Cerebral haemorrhage · Huntington's chorea

- **CAUTIONS** Gastric ulcer · history of haemorrhagic stroke · increased risk of bleeding · major surgery · underlying disorders of haemostasis

● **SIDE-EFFECTS**

- **Common or very common** Anxiety · movement disorders · weight increased
- **Uncommon** Asthenia · depression · drowsiness
- **Frequency not known** Angioedema · confusion · diarrhoea · epilepsy exacerbated · gastrointestinal discomfort · haemorrhagic disorder · hallucination · headache · insomnia · nausea · skin reactions · vertigo · vomiting

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

● **HEPATIC IMPAIRMENT**

Dose adjustments Adjust dose if both hepatic and renal impairment.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 20 mL/minute/1.73 m².

Dose adjustments Use two-thirds of normal dose if eGFR 50–80 mL/minute/1.73 m²; use one-third of normal dose in 2 divided doses if eGFR 30–50 mL/minute/1.73 m²; use one-sixth of normal dose as a single dose if eGFR 20–30 mL/minute/1.73 m².

- **TREATMENT CESSATION** Avoid abrupt withdrawal.

- **DIRECTIONS FOR ADMINISTRATION** Follow the oral solution with a glass of water (or soft drink) to reduce bitter taste.

- **PRESCRIBING AND DISPENSING INFORMATION** Piracetam has been used in children 16 years and over as adjunctive treatment for cortical myoclonus.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 3

► **Piracetam (Non-proprietary)**

Piracetam 333.3 mg per 1 ml Piracetam 333.3mg/ml oral solution sugar free sugar-free | 300 ml [PoM] 

► **Nootropil** (UCB Pharma Ltd)

Piracetam 333.3 mg per 1 ml Nootropil 33% oral solution sugar-free | 300 ml [PoM] £16.31

Tablet

CAUTIONARY AND ADVISORY LABELS 3

Piracetam 800 mg Nootropil 800mg tablets | 90 tablet [PoM] £11.75

Piracetam 1.2 gram Nootropil 1200mg tablets | 60 tablet [PoM] £10.97

MONOAMINE DEPLETING DRUGS

Tetrabenazine

● INDICATIONS AND DOSE

Movement disorders due to Huntington's chorea, hemiballismus, senile chorea, and related neurological conditions

► BY MOUTH

- Adult: Initially 25 mg 3 times a day, then increased, if tolerated, in steps of 25 mg every 3–4 days; maximum 200 mg per day
- Elderly: Lower initial dose may be necessary

Moderate to severe tardive dyskinesia

► BY MOUTH

- Adult: Initially 12.5 mg daily, dose to be gradually increased according to response

- **CONTRA-INDICATIONS** Depression · parkinsonism · pheochromocytoma · prolactin-dependent tumours

- **CAUTIONS** Susceptibility to QT-interval prolongation

- **INTERACTIONS** → Appendix 1: tetrabenazine

● **SIDE-EFFECTS**

- **Common or very common** Anxiety · confusion · constipation · depression · diarrhoea · drowsiness · hypotension · insomnia · nausea · parkinsonism · vomiting
- **Uncommon** Consciousness impaired · hyperthermia
- **Rare or very rare** Neuroleptic malignant syndrome · skeletal muscle damage
- **Frequency not known** Bradycardia · dizziness · dry mouth · epigastric pain · suicidal ideation

- **PREGNANCY** Avoid unless essential—toxicity in *animal* studies.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.

Dose adjustments Use half initial dose and slower dose titration in mild to moderate impairment.

- **RENAL IMPAIRMENT** Use with caution.

- **TREATMENT CESSATION** Avoid abrupt withdrawal.

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).

● **MEDICINAL FORMS**

MUSCLE RELAXANTS > PERIPHERALLY ACTING > NEUROTOXINS (BOTULINUM TOXINS)

Botulinum toxin type A

24-Apr-2017

● INDICATIONS AND DOSE

Treatment of focal spasticity (including hand and wrist disability associated with stroke) (specialist use only) | Blepharospasm (specialist use only) | Hemifacial spasm (specialist use only) | Spasmodic torticollis (specialist use only) | Severe hyperhidrosis of the axillae (specialist use only) | Prophylaxis of headaches in adults with chronic migraine (specialist use only) | Temporary improvement of moderate to severe wrinkles between the eyebrows in adults under 65 years (specialist use only) | Ankle disability due to lower limb spasticity associated with stroke (specialist use only) | Management of bladder dysfunctions (specialist use only) | Temporary improvement of moderate to severe crow's feet (specialist use only)

► BY SUBCUTANEOUS INJECTION, OR BY INTRADERMAL INJECTION, OR BY INTRAMUSCULAR INJECTION

► Adult: (consult product literature)

DOSE EQUIVALENCE AND CONVERSION

► **Important:** information is specific to each individual preparation.

- **CONTRA-INDICATIONS** Acute urinary retention (specific to use in bladder disorders only) · catheterisation difficulties (specific to use in bladder disorders only) · generalised disorders of muscle activity · infection at injection site · myasthenia gravis · presence of bladder calculi (specific to use in bladder disorders only) · urinary tract infection (specific to use in bladder disorders only)

● CAUTIONS

GENERAL CAUTIONS Atrophy in target muscle · chronic respiratory disorder · elderly · excessive weakness in target muscle · history of aspiration · history of dysphagia · inflammation in target muscle · neurological disorders · neuromuscular disorders · off-label use (fatal adverse events reported)

SPECIFIC CAUTIONS

- When used for blepharospasm or hemifacial spasm Risk of angle-closure glaucoma
- CAUTIONS, FURTHER INFORMATION** Neuromuscular or neurological disorders can lead to increased sensitivity and exaggerated muscle weakness including dysphagia and respiratory compromise.
- Blepharospasm or hemifacial spasm When used for blepharospasm or hemifacial spasm, reduced blinking can lead to corneal exposure, persistent epithelial defect and corneal ulceration (especially in those with VIIth nerve disorders)—careful testing of corneal sensation in previously operated eyes, avoidance of injection in lower lid area to avoid ectropion, and vigorous treatment of epithelial defect needed.

- **INTERACTIONS** → Appendix 1: botulinum toxin type A

● SIDE-EFFECTS

- **Common or very common** Alopecia · asthenia · autonomic dysreflexia · bladder diverticulum · constipation · dizziness · drowsiness · dry eye · dry mouth · dysphagia (most common after injection into sternomastoid muscle) · ecchymosis (minimised by applying gentle pressure at injection site immediately after injection) · eye discomfort · eye disorders · eye inflammation · fall · fever · gait abnormal · haematuria · headaches · hot flush · increased risk of infection · influenza like illness · insomnia · joint disorders · leukocyturia · malaise · muscle complaints · muscle weakness · musculoskeletal stiffness · nausea · neuromuscular dysfunction · oedema · pain · paresis ·

sensation abnormal · skin reactions · urinary disorders · vision disorders

- **Uncommon** Anxiety · coordination abnormal · depression · dysphonia · dyspnoea · facial paralysis · memory loss · oral paraesthesia · photosensitivity reaction · postural hypotension · vertigo
- **Frequency not known** Abdominal pain · angioedema · angle closure glaucoma · appetite decreased · arrhythmia · diarrhoea · dysarthria · hearing impairment · hypersensitivity · myocardial infarction · myopathy · nerve disorders · respiratory disorders · seizure · syncope · vomiting

- **CONCEPTION AND CONTRACEPTION** Avoid in women of child-bearing age unless using effective contraception.

- **PREGNANCY** Avoid unless essential—toxicity in *animal* studies (manufacturer of *Botox*® advise avoid).

- **BREAST FEEDING** Low risk of systemic absorption but avoid unless essential.

- **PRESCRIBING AND DISPENSING INFORMATION**

Preparations are not interchangeable.

- **PATIENT AND CARER ADVICE** Patients and carers should be warned of the signs and symptoms of toxin spread, such as muscle weakness and breathing difficulties; they should be advised to seek immediate medical attention if swallowing, speech or breathing difficulties occur.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- **Botulinum toxin type A for the prevention of headaches in adults with chronic migraine (June 2012)** NICE TA260 Botulinum toxin type A is recommended as an option for the prophylaxis of headaches in adults with chronic migraine, (defined as headaches on at least 15 days per month, of which at least 8 days are with migraine), that has not responded to at least three prior pharmacological prophylaxis therapies and whose condition is appropriately managed for medication overuse.

www.nice.org.uk/TA260

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised that *Azzalure*® and *Vistabel*® (December 2010), and *Bocouture*® (February 2011) are **not** recommended for use within NHS Scotland.

The *Scottish Medicines Consortium* has advised (February 2017) that botulinum toxin type A (*Botox*®) is accepted for restricted use within NHS Scotland for the prophylaxis of headaches in adults with chronic migraine, (defined as headaches on at least 15 days per month, of which at least 8 days are with migraine), that has not responded to at least three prior oral pharmacological prophylaxis therapies and whose condition is appropriately managed for medication overuse.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- **Azzalure** (Galderma (UK) Ltd)

4.2 Parkinson's disease**Parkinson's disease**

11-Aug-2017

Description of condition

Parkinson's disease is a progressive neurodegenerative condition resulting from the death of dopaminergic cells of the substantia nigra in the brain.

Patients with Parkinson's disease classically present with motor-symptoms including hypokinesia, bradykinesia, rigidity, rest tremor, and postural instability.

Non-motor symptoms include dementia, depression, sleep disturbances, bladder and bowel dysfunction, speech and language changes, swallowing problems and weight loss.

[EvG] Patients with suspected Parkinson's disease should be referred to a specialist and reviewed every 6 to 12 months. When Parkinson's disease diagnosis is confirmed, patients should be advised to inform the DVLA and their car insurer.

**Aims of treatment**

Parkinson's disease is an incurable progressive condition, and the aim of treatment is to control the symptoms and to improve the patient's quality of life.

Non-drug treatment

[EvG] Parkinson's disease patients should be offered physiotherapy if balance or motor function problems are present, speech and language therapy if they develop communication, swallowing or saliva problems, and occupational therapy if they experience difficulties with their daily activities. Dietitian referral should be considered. [A]

Drug treatment

Drug management of motor symptoms in Parkinson's disease First-line treatment

EvGr In early stages of Parkinson's disease, patients whose motor symptoms decrease their quality of life should be offered *levodopa* combined with *carbidopa* (co-careldopa p. 410) or *benserazide* (co-beneldopa p. 409).

Parkinson's disease patients whose motor symptoms *do not* affect their quality of life, could be prescribed a choice of *levodopa*, *non-ergot-derived dopamine-receptor agonists* (pramipexole p. 417, ropinirole p. 419 or rotigotine p. 421) or *monoamine-oxidase-B inhibitors* (rasagiline p. 422 or selegiline hydrochloride p. 423).

Before starting antiparkinsonian treatment, the patient's individual circumstances, including symptoms, comorbidities and preferences, should be discussed together with the potential benefits and harms from the different drugs available.

Patients and their carers should be informed about the risk of adverse reactions from antiparkinsonian drugs, including psychotic symptoms, excessive sleepiness and sudden onset of sleep with dopamine-receptor agonists, and impulse control disorders with all dopaminergic therapy (especially *dopamine-receptor agonists*). For further information see *Impulse control disorders*. **⚠**

Levodopa treatment is associated with motor complications, including response fluctuations and dyskinesias. Response fluctuations are characterised by large variations in motor performance, with normal function during the 'on' period, and weakness and restricted mobility during the 'off' period. 'End-of-dose' deterioration with progressively shorter duration of benefit can also occur. Modified-release preparations may help with 'end-of-dose' deterioration or nocturnal immobility.

The overall improvement in motor performance is more noticeable with *levodopa* than with *dopamine-receptor agonists*, and motor complications are less likely to occur with *dopamine-receptor agonists* when used alone long-term. Conversely, excessive sleepiness, hallucinations, and impulse control disorders are more likely to occur with *dopamine-receptor agonists* than with *levodopa*.

EvGr To avoid the potential for acute akinesia or neuroleptic malignant syndrome, antiparkinsonian drug concentrations should not be allowed to fall suddenly due to poor absorption or abrupt withdrawal. **⚠**

Adjuvant therapy

EvGr If a patient with Parkinson's disease develops dyskinesia or motor fluctuations, specialist advice should be sought before modifying antiparkinsonian drug therapy.

Patients who develop dyskinesia or motor fluctuations despite optimal *levodopa* therapy should be offered a choice of *non-ergotic dopamine-receptor agonists* (pramipexole, ropinirole, rotigotine), *monoamine oxidase B inhibitors* (rasagiline or selegiline hydrochloride) or COMT inhibitors (entacapone p. 407 or tolcapone p. 408) as an adjunct to *levodopa*.

An *ergot-derived dopamine-receptor agonist* (bromocriptine p. 414, cabergoline p. 415 or pergolide p. 417) should **only** be considered as an adjunct to *levodopa* if symptoms are not adequately controlled with a *non-ergot-derived dopamine-receptor agonist*.

If dyskinesia is not adequately managed by modifying existing therapy, amantadine hydrochloride p. 412 should be considered. **⚠**

Drug management of non-motor symptoms in Parkinson's disease

Daytime sleepiness and sudden onset of sleep

EvGr Patients who experience daytime sleepiness or sudden onset of sleep, should have their Parkinson's drug treatment adjusted under specialist medical guidance. If reversible pharmacological and physical causes have been excluded,

modafinil p. 485 should be considered to treat excessive daytime sleepiness, and treatment should be reviewed at least every 12 months.

Patients with Parkinson's disease who have daytime sleepiness or sudden onset of sleep should be advised not to drive, to inform the DVLA about their symptoms, and to think about any occupational hazards. **⚠**

Nocturnal akinesia

EvGr When treating nocturnal akinesia in patients with Parkinson's disease, *levodopa* or oral *dopamine-receptor agonists* should be considered as first-line options and rotigotine p. 421 as second-line (if both *levodopa* or oral *dopamine-receptor agonists* are ineffective). **⚠**

Postural hypotension

EvGr Patients with Parkinson's disease who develop postural hypotension should have their drug treatment reviewed to address any pharmacological cause. If drug therapy is required, midodrine hydrochloride p. 187 should be considered as the first option and fludrocortisone acetate p. 661 [unlicensed indication] as an alternative. **⚠**

Depression

See Antidepressant drugs p. 355.

Psychotic symptoms

EvGr Hallucinations and delusions need not be treated if they are well tolerated. Otherwise, the dosage of any antiparkinsonism drugs that might have triggered hallucinations or delusions should be reduced, taking into account the severity of symptoms and possible withdrawal effects. Specialist advice should be sought before modifying drug treatment.

In Parkinson's disease patients with no cognitive impairment, quetiapine p. 397 [unlicensed indication] can be considered to treat hallucinations and delusions. If standard treatment is not effective, clozapine p. 392 should be offered to treat hallucinations and delusions in patients with Parkinson's disease. **⚠** It is important to acknowledge that other antipsychotic medicines (such as phenothiazines and butyrophenones) can worsen the motor features of Parkinson's disease.

Rapid eye movement sleep behaviour disorder

EvGr Clonazepam p. 334 [unlicensed indication] or melatonin p. 482 [unlicensed indication] should be considered to treat rapid eye movement sleep behaviour disorder in Parkinson's patients once possible pharmacological causes have been addressed. **⚠**

Drizzling of saliva

EvGr Drug treatment for drooling of saliva in patients with Parkinson's disease should only be considered if non-drug treatment such as speech and language therapy is not available or is ineffective.

Glycopyrronium bromide p. 246 [unlicensed indication] should be considered as first-line treatment and botulinum toxin type A p. 403 [unlicensed indication] as second-line.

Other antimuscarinic drugs, should only be considered if the risk of cognitive adverse effects is thought to be minimal; topical preparations, such as *atropine* [unlicensed indication], should be used if possible to reduce the risk of adverse events. **⚠**

Parkinson's disease dementia

EvGr A cholinesterase inhibitor should be offered to patients with mild-to-moderate Parkinson's disease dementia and considered for patients with severe Parkinson's disease dementia [unlicensed indications apart from rivastigmine p. 302 capsules for the treatment of mild-to-moderate dementia in patients with Parkinson's disease]. If cholinesterase inhibitors are not tolerated or contra-indicated, memantine hydrochloride p. 303 [unlicensed indication] should be considered. **⚠** For further information see Dementia p. 299

Advanced Parkinson's disease

[EvGr] Patients with advanced Parkinson's disease can be offered apomorphine hydrochloride p. 413 as intermittent injections or continuous subcutaneous infusions. To control nausea and vomiting associated with *apomorphine*, administration of domperidone p. 426 is usually started two days before *apomorphine* therapy, and then discontinued as soon as possible. To reduce the risk of serious arrhythmia due to QT prolongation associated to the concomitant use of domperidone p. 426 and apomorphine hydrochloride p. 413, the MHRA recommends an assessment of cardiac risk factors and ECG monitoring and to ensure that the benefits outweigh the risks when initiating treatment. **[A]**

Levodopa-carbidopa intestinal gel is used for the treatment of advanced levodopa-responsive Parkinson's disease with severe motor fluctuations and hyperkinesia or dyskinesia. The gel is administered with a portable pump directly into the duodenum or upper jejunum.

[EvGr] Deep brain stimulation should *only* be considered for patients with advanced Parkinson's disease whose symptoms are *not* adequately controlled by best drug therapy. **[A]**

Impulse control disorders

Impulse control disorders (compulsive gambling, hypersexuality, binge eating, or obsessive shopping) can develop in a person with Parkinson's disease who is on any dopaminergic therapy at any stage in the disease course particularly if the patient has a history of previous impulsive behaviours, alcohol consumption, or smoking. **[EvGr]** Patients should be informed about the different types of impulse control disorders and that dopamine-receptor agonist therapy may be reduced or stopped if problematic impulse control disorders develop.

When managing impulse control disorders, dopamine-receptor agonist doses should be reduced gradually and patients should be monitored for symptoms of dopamine agonist withdrawal. Specialist cognitive behavioural therapy should be offered if modifying dopaminergic therapy is not effective. **[A]**

ANTIMUSCARINICS**Orphenadrine hydrochloride**

● **DRUG ACTION** Orphenadrine exerts its antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

● INDICATIONS AND DOSE**Parkinsonism | Drug-induced extrapyramidal symptoms (but not tardive dyskinesia)****► BY MOUTH**

- **Adult:** Initially 150 mg daily in divided doses, then increased in steps of 50 mg every 2–3 days, adjusted according to response; usual dose 150–300 mg daily in divided doses; maximum 400 mg per day
- **Elderly:** Preferably dose at lower end of range

● **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · gastro-intestinal obstruction · myasthenia gravis

● **CAUTIONS** Cardiovascular disease · elderly · hypertension · in patients susceptible to angle-closure glaucoma · liable to abuse · prostatic hypertrophy · psychotic disorders · pyrexia

● **INTERACTIONS** → Appendix 1: orphenadrine

● SIDE-EFFECTS

- **Common or very common** Accommodation disorder · anxiety · dizziness · dry mouth · gastrointestinal disorder · nausea
- **Uncommon** Confusion · constipation · coordination abnormal · euphoric mood · hallucination · insomnia · sedation · seizure · tachycardia · urinary retention
- **Rare or very rare** Memory loss

● **PREGNANCY** Caution.

● **BREAST FEEDING** Caution.

● **HEPATIC IMPAIRMENT** Use with caution.

● **RENAL IMPAIRMENT** Use with caution.

● **TREATMENT CESSATION** Avoid abrupt withdrawal in patients taking long-term treatment.

● PATIENT AND CARER ADVICE

Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Oral solution**Orphenadrine hydrochloride (Non-proprietary)**

Orphenadrine hydrochloride 10 mg per 1 ml Orphenadrine 50mg/5ml oral solution sugar free sugar-free | 150 ml **[PoM]** £37.50
DT = £37.50

Procyclidine hydrochloride

● **DRUG ACTION** Procyclidine exerts its antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

● INDICATIONS AND DOSE**Parkinsonism | Extrapyramidal symptoms (but not tardive dyskinesia)****► BY MOUTH**

- **Adult:** 2.5 mg 3 times a day, then increased in steps of 2.5–5 mg daily if required; increased if necessary up to 30 mg daily in 2–4 divided doses, to be increased at 2–3 day intervals. Maximum daily dose only to be used in exceptional circumstances; maximum 60 mg per day
- **Elderly:** Lower end of range preferable

Acute dystonia**► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**

- **Adult:** 5–10 mg, occasionally, more than 10 mg, dose usually effective in 5–10 minutes but may need 30 minutes for relief
- **Elderly:** Lower end of range preferable

● **CONTRA-INDICATIONS** Gastro-intestinal obstruction · myasthenia gravis

● **CAUTIONS** Cardiovascular disease · elderly · hypertension · liable to abuse · prostatic hypertrophy · psychotic disorders · pyrexia · those susceptible to angle-closure glaucoma

● **INTERACTIONS** → Appendix 1: procyclidine

● SIDE-EFFECTS

- **Common or very common** Constipation · dry mouth · urinary retention · vision blurred
- **Uncommon** Anxiety · cognitive impairment · confusion · dizziness · gingivitis · hallucination · memory loss · nausea · rash · vomiting
- **Rare or very rare** Psychotic disorder
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** No information available.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution.

- **TREATMENT CESSATION** Avoid abrupt withdrawal in patients taking long-term treatment.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection

▶ Procyclidine hydrochloride (Non-proprietary)

Procyclidine hydrochloride 5 mg per 1 ml Procyclidine 10mg/2ml solution for injection ampoules | 5 ampoule [PoM] £60.00-£78.75 DT = £72.50

Oral solution

▶ Procyclidine hydrochloride (Non-proprietary)

Procyclidine hydrochloride 500 microgram per 1 ml Procyclidine 2.5mg/5ml oral solution sugar free sugar-free | 150 ml [PoM] £8.22-£10.49 DT = £10.49

Procyclidine hydrochloride 1 mg per 1 ml Procyclidine 5mg/5ml oral solution sugar free sugar-free | 150 ml [PoM] £14.54-£18.54 DT = £18.54

Tablet

▶ Procyclidine hydrochloride (Non-proprietary)

Procyclidine hydrochloride 5 mg Procyclidine 5mg tablets | 28 tablet [PoM] £12.65 DT = £5.91 | 100 tablet [PoM] £8.94-£21.11 | 500 tablet [PoM] £44.63-£105.54

▶ Kemadrin (Aspen Pharma Trading Ltd)

Procyclidine hydrochloride 5 mg Kemadrin 5mg tablets | 100 tablet [PoM] £4.72 | 500 tablet [PoM] £23.62

Trihexyphenidyl hydrochloride

(Benzhexol hydrochloride)

- **DRUG ACTION** Trihexyphenidyl exerts its effects by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

● INDICATIONS AND DOSE

Parkinson's disease (if used in combination with co-careldopa or co-beneldopa)

▶ BY MOUTH

- ▶ Adult: Maintenance 2–6 mg daily in divided doses, use not recommended because of toxicity in the elderly and the risk of aggravating dementia

Parkinsonism | Drug-induced extrapyramidal symptoms (but not tardive dyskinesia)

▶ BY MOUTH

- ▶ Adult: 1 mg daily, then increased in steps of 2 mg every 3–5 days, adjusted according to response; maintenance 5–15 mg daily in 3–4 divided doses, not recommended for use in Parkinson's disease because of toxicity in the elderly and the risk of aggravating dementia; maximum 20 mg per day
- ▶ Elderly: Lower end of range preferable, not recommended for use in Parkinson's disease because of toxicity in the elderly and the risk of aggravating dementia

- **CONTRA-INDICATIONS** Gastro-intestinal obstruction · myasthenia gravis

- **CAUTIONS** Cardiovascular disease · elderly · hypertension · liable to abuse · prostatic hypertrophy · psychotic disorders · pyrexia · those susceptible to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1: trihexyphenidyl

- **SIDE-EFFECTS** Anxiety · bronchial secretion decreased · confusion · constipation · delusions · dizziness · dry mouth · dysphagia · euphoric mood · fever · flushing · hallucination · insomnia · memory loss · myasthenia gravis aggravated · mydriasis · nausea · skin reactions · tachycardia · thirst · urinary disorders · vision disorders · vomiting

- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution.

- **TREATMENT CESSATION** Avoid abrupt withdrawal in patients taking long-term treatment.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken with or after food.

● PATIENT AND CARER ADVICE

Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

EXCIPIENTS: May contain Propylene glycol

▶ Trihexyphenidyl hydrochloride (Non-proprietary)

Trihexyphenidyl hydrochloride 1 mg per 1 ml Trihexyphenidyl 5mg/5ml oral solution | 200 ml [PoM] £22.00 DT = £22.00

Tablet

▶ Trihexyphenidyl hydrochloride (Non-proprietary)

Trihexyphenidyl hydrochloride 2 mg Trihexyphenidyl 2mg tablets | 84 tablet [PoM] £4.20 DT = £3.28

Trihexyphenidyl hydrochloride 5 mg Trihexyphenidyl 5mg tablets | 84 tablet [PoM] £17.91 DT = £17.91

DOPAMINERGIC DRUGS > CATECHOL-O-METHYLTRANSFERASE INHIBITORS

Entacapone

- **DRUG ACTION** Entacapone prevents the peripheral breakdown of levodopa, by inhibiting catechol- O-methyltransferase, allowing more levodopa to reach the brain.

● INDICATIONS AND DOSE

Adjunct to co-beneldopa or co-careldopa in Parkinson's disease with 'end-of-dose' motor fluctuations (under expert supervision)

▶ BY MOUTH

- ▶ Adult: 200 mg, dose to be given with each dose of levodopa with dopa-decarboxylase inhibitor; maximum 2 g per day

- **CONTRA-INDICATIONS** History of neuroleptic malignant syndrome · history of non-traumatic rhabdomyolysis · pheochromocytoma

- **CAUTIONS** Concurrent levodopa dose may need to be reduced by about 10–30% · ischaemic heart disease

- **INTERACTIONS** → Appendix 1: entacapone

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · confusion · constipation · diarrhoea · dizziness · dry mouth · fall · fatigue · hallucination · hyperhidrosis · ischaemic heart disease · movement disorders · nausea · sleep disorders · urine discolouration · vomiting
- ▶ **Uncommon** Myocardial infarction
- ▶ **Rare or very rare** Agitation · appetite decreased · skin reactions · weight decreased
- ▶ **Frequency not known** Colitis · hair colour changes · hepatic disorders · impulse-control disorder · nail discolouration · neuroleptic malignant syndrome · rhabdomyolysis
- **PREGNANCY** Avoid—no information available.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Avoid.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.

- **PATIENT AND CARER ADVICE** Patient counselling is advised (may colour urine reddish-brown, concomitant iron containing products).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 14

Entacapone (Non-proprietary)

Entacapone 200 mg Entacapone 200mg tablets | 30 tablet [PoM](#)

Comtess (Orion Pharma (UK) Ltd)

Entacapone 200 mg Comtess 200mg tablets | 30 tablet [PoM](#)
£17.24 DT = £4.13 | 100 tablet [PoM](#) £57.45

Combinations available: *Levodopa with carbidopa and entacapone*, p. 412

Opicapone

11-Apr-2017

- **DRUG ACTION** Opicapone prevents the peripheral breakdown of levodopa, by inhibiting catechol- O-methyltransferase, allowing more levodopa to reach the brain.

INDICATIONS AND DOSE

Adjunct to co-beneldopa or co-careldopa in Parkinson's disease with 'end-of-dose' motor fluctuations (under expert supervision)

► BY MOUTH

- Adult: 50 mg once daily, dose to be taken at bedtime, at least one hour before or after levodopa combinations

- **CONTRA-INDICATIONS** Catecholamine-secreting neoplasms · history of neuroleptic malignant syndrome · history of non-traumatic rhabdomyolysis · paraganglioma · pheochromocytoma

- **CAUTIONS** Concurrent levodopa dose may need to be reduced · elderly over 85 years (limited information available)

- **INTERACTIONS** → Appendix 1: opicapone

SIDE-EFFECTS

- **Common or very common** Constipation · dizziness · drowsiness · dry mouth · hallucinations · headache · hypotension · movement disorders · muscle complaints · sleep disorders · vomiting
- **Uncommon** Anxiety · appetite decreased · depression · dry eye · dyspnoea · ear congestion · gastrointestinal discomfort · hypertension · hypertriglyceridaemia · musculoskeletal stiffness · nocturia · pain in extremity · palpitations · syncope · taste altered · urine discolouration · weight decreased

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises consider liver function tests in patients who experience progressive anorexia, asthenia and weight decrease within a relatively short period of time.

- **PREGNANCY** Manufacturer advises avoid—limited information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.

Dose adjustments Manufacturer advises use with caution in moderate impairment—dose adjustment may be necessary.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

► Ongentys (BIAL Pharma UK Ltd) ▼

Opicapone 50 mg Ongentys 50mg capsules | 30 capsule [PoM](#)
£93.90 DT = £93.90

Tolcapone

- **DRUG ACTION** Tolcapone prevents the peripheral breakdown of levodopa, by inhibiting catechol- O-methyltransferase, allowing more levodopa to reach the brain.

INDICATIONS AND DOSE

Adjunct to co-beneldopa or co-careldopa in Parkinson's disease with 'end-of-dose' motor fluctuations if another inhibitor of peripheral catechol-O-methyltransferase inappropriate (under expert supervision)

► BY MOUTH

- Adult: 100 mg 3 times a day (max. per dose 200 mg 3 times a day) continuing beyond 3 weeks **only** if substantial improvement, leave 6 hours between each dose; first daily dose should be taken at the same time as levodopa with dopa-decarboxylase inhibitor, dose maximum only in exceptional circumstances

- **CONTRA-INDICATIONS** Pheochromocytoma · previous history of hyperthermia · previous history of neuroleptic malignant syndrome · previous history of rhabdomyolysis · severe dyskinesia

- **CAUTIONS** Most patients receiving more than 600 mg levodopa daily require reduction of levodopa dose by about 30%

CAUTIONS, FURTHER INFORMATION

- **Hepatotoxicity** Potentially life-threatening hepatotoxicity including fulminant hepatitis reported rarely, usually in women and during the first 6 months, but late-onset liver injury also reported; discontinue if abnormal liver function tests or symptoms of liver disorder; do not re-introduce tolcapone once discontinued.

- **INTERACTIONS** → Appendix 1: tolcapone

SIDE-EFFECTS

- **Common or very common** Appetite decreased · chest pain · confusion · constipation · diarrhoea · dizziness · drowsiness · dry mouth · gastrointestinal discomfort · hallucination · headache · hyperhidrosis · influenza like illness · movement disorders · nausea · postural hypotension · sleep disorders · syncope · upper respiratory tract infection · urine discolouration · vomiting
- **Uncommon** Hepatocellular injury
- **Rare or very rare** Eating disorders · neuroleptic malignant syndrome (reported on dose reduction or withdrawal) · pathological gambling · psychiatric disorders · sexual dysfunction

- **PREGNANCY** Toxicity in *animal* studies—use only if potential benefit outweighs risk.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Avoid.

- **RENAL IMPAIRMENT** Caution if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Test liver function before treatment, and monitor every 2 weeks for first year, every 4 weeks for next 6 months and then every 8 weeks thereafter (restart monitoring schedule if dose increased).

- **TREATMENT CESSATION** Avoid abrupt withdrawal.

- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as

anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop.

Tolcapone 100 mg Tasmar 100mg tablets | 100 tablet [PoM] £95.20

DOPAMINERGIC DRUGS > DOPAMINE PRECURSORS

Co-beneldopa

● INDICATIONS AND DOSE

Parkinson's disease

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 50 mg 3–4 times a day, then increased in steps of 100 mg daily, dose to be increased once or twice weekly according to response; maintenance 400–800 mg daily in divided doses
- Elderly: Initially 50 mg 1–2 times a day, then increased in steps of 50 mg daily, dose to be increased every 3–4 days according to response

Parkinson's disease (in advanced disease)

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 100 mg 3 times a day, then increased in steps of 100 mg daily, dose to be increased once or twice weekly according to response; maintenance 400–800 mg daily in divided doses

Parkinson's disease (patients not taking levodopa/dopa-decarboxylase inhibitor therapy)

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: Initially 1 capsule 3 times a day; maximum 6 capsules per day

Parkinson's disease (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: Initially 1 capsule substituted for every 100 mg of levodopa and given at same dosage frequency, increased every 2–3 days according to response; average increase of 50% needed over previous levodopa dose and titration may take up to 4 weeks, supplementary dose of immediate-release *Madopar*® may be needed with first morning dose; if response still poor to total daily dose of *Madopar*® CR plus *Madopar*® corresponding to 1.2 g levodopa—consider alternative therapy.

DOSE EQUIVALENCE AND CONVERSION

- Dose is expressed as levodopa.

IMPORTANT SAFETY INFORMATION

IMPULSE CONTROL DISORDERS

Treatment with levodopa is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. If the patient develops an impulse control disorder, levodopa should be withdrawn or the dose reduced until the symptoms resolve.

- **CAUTIONS** Cushing's syndrome · diabetes mellitus · endocrine disorders · history of convulsions · history of myocardial infarction with residual arrhythmia · history of peptic ulcer · hyperthyroidism · osteomalacia · pheochromocytoma · psychiatric illness (avoid if severe and discontinue if deterioration) · severe cardiovascular

disease · severe pulmonary disease · susceptibility to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1: levodopa

● SIDE-EFFECTS

- **Common or very common** Anxiety · appetite decreased · arrhythmia · depression · diarrhoea · hallucination · movement disorders · nausea · parkinsonism · postural hypotension · sleep disorders · taste altered · vomiting
- **Rare or very rare** Leucopenia
- **Frequency not known** Aggression · confusion · delusions · drowsiness · eating disorders · euphoric mood · flushing · gastrointestinal haemorrhage · haemolytic anaemia · hyperhidrosis · oral disorders · pathological gambling · psychiatric disorders · psychosis · sexual dysfunction · skin reactions · thrombocytopenia · urine discolouration

- **PREGNANCY** Caution in pregnancy—toxicity has occurred in animal studies.

- **BREAST FEEDING** May suppress lactation; present in milk—avoid.

- **HEPATIC IMPAIRMENT** Use with caution.

- **RENAL IMPAIRMENT** Use with caution.

- **EFFECT ON LABORATORY TESTS** False positive tests for urinary ketones have been reported.

- **TREATMENT CESSATION** Avoid abrupt withdrawal (risk of neuroleptic malignant syndrome and rhabdomyolysis).

- **DIRECTIONS FOR ADMINISTRATION** The dispersible tablets can be dispersed in water or orange squash (not orange juice) or swallowed whole.

- **PRESCRIBING AND DISPENSING INFORMATION** Co-beneldopa is a mixture of benserazide hydrochloride and levodopa in mass proportions corresponding to 1 part of benserazide and 4 parts of levodopa.

When transferring patients from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued 12 hours before (although interval can be shorter).

When switching from modified-release levodopa to dispersible co-beneldopa, reduce dose by approximately 30%.

When administered as an adjunct to other antiparkinsonian drugs, once therapeutic effect apparent, the other drugs may be reduced or withdrawn.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer co-beneldopa dispersible tablets.

Driving and skilled tasks

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with co-beneldopa.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Co-careldopa

01-May-2018

• INDICATIONS AND DOSE

Parkinson's disease

► BY MOUTH

- Adult: Initially 25/100 mg 3 times a day, then increased in steps of 12.5/50 mg once daily or on alternate days, alternatively increased in steps of 25/100 mg once daily or on alternate days, dose to be adjusted according to response; dose increased until 800 mg levodopa (with 200 mg carbidopa) daily in divided doses is reached, then maintenance up to 200/2000 mg daily in divided doses, adjusted according to response, when co-careldopa is used, the total daily dose of carbidopa should be at least 70 mg. A lower dose may not achieve full inhibition of extracerebral dopa-decarboxylase, with a resultant increase in side-effects

Parkinson's disease—alternative regimen

► BY MOUTH

- Adult: Initially 12.5/50 mg 3–4 times a day, alternatively initially 10/100 mg 3–4 times a day, then increased in steps of 12.5/50 mg once daily or on alternate days, adjusted according to response, alternatively increased in steps of 10/100 mg once daily or on alternate days, adjusted according to response, dose increased until 800 mg levodopa (with up to 200 mg carbidopa) daily in divided doses is reached, then maintenance up to 200/2000 mg daily in divided doses, adjusted according to response, when co-careldopa is used, the total daily dose of carbidopa should be at least 70 mg. A lower dose may not achieve full inhibition of extracerebral dopa-decarboxylase, with a resultant increase in side-effects

DOSE EQUIVALENCE AND CONVERSION

- The proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.
- 2 tablets *Sinemet*® 12.5 mg/50 mg is equivalent to 1 tablet *Sinemet*® Plus 25 mg/100 mg.

CARAMET® CR

Parkinson's disease (patients not receiving levodopa/dopa-decarboxylase inhibitor preparations, expressed as levodopa)

► BY MOUTH USING MODIFIED-RELEASE TABLETS

- Adult: Initially 100–200 mg twice daily, dose to be given at least 6 hours apart; dose adjusted according to response at intervals of at least 2 days

Parkinson's disease (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)

► BY MOUTH USING MODIFIED-RELEASE TABLETS

- Adult: Discontinue previous preparation at least 12 hours before first dose of *Caramet*® CR; substitute *Caramet*® CR to provide a similar amount of levodopa daily and extend dosing interval by 30–50%; dose then adjusted according to response at intervals of at least 2 days.

DUODOPA®

Severe Parkinson's disease inadequately controlled by other preparations

- Adult: Administered as intestinal gel, for use with enteral tube (consult product literature)

HALF SINEMET® CR

Parkinson's disease (for fine adjustment of Sinemet® CR dose)

► BY MOUTH

- Adult: (consult product literature)

SINEMET® CR

Parkinson's disease (patients not receiving levodopa/dopa-decarboxylase inhibitor therapy)

► BY MOUTH

- Adult: Initially 1 tablet twice daily, both dose and interval then adjusted according to response at intervals of not less than 3 days

Parkinson's disease (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)

► BY MOUTH

- Adult: 1 tablet twice daily, dose can be substituted for a daily dose of levodopa 300–400 mg in immediate-release *Sinemet*® tablets (substitute *Sinemet*® CR to provide approximately 10% more levodopa per day and extend dosing interval by 30–50%); dose and interval then adjusted according to response at intervals of not less than 3 days.

IMPORTANT SAFETY INFORMATION

IMPULSE CONTROL DISORDERS

Treatment with levodopa is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. - **TREATMENT CESSATION** Avoid abrupt withdrawal (risk of neuroleptic malignant syndrome and rhabdomyolysis).
- **PRESCRIBING AND DISPENSING INFORMATION** Co-careldopa is a mixture of carbidopa and levodopa; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.

When transferring patients from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued at least 12 hours before.

Co-careldopa 25/100 provides an adequate dose of carbidopa when low doses of levodopa are needed.

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with co-careldopa.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

● **NATIONAL FUNDING/ACCESS DECISIONS**

DUODOPA®

Scottish Medicines Consortium (SMC) Decisions

SMC No. 316/06

The *Scottish Medicines Consortium* has advised (June 2016) that co-careldopa (*Duodopa*®) intestinal gel is accepted for restricted use within NHS Scotland, for the treatment of advanced levodopa-responsive Parkinson's disease with severe motor fluctuations and hyper-/dyskinesia when available combinations of Parkinson medicinal products have not given satisfactory results, only in patients not eligible for deep brain stimulation. This advice is contingent upon the continuing availability of the Patient

Access Scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) Decisions

AWMSG No. 3397

The *All Wales Medicines Strategy Group* has advised (March 2018) that *Duodopa*® intestinal gel is recommended as an option for restricted use within NHS Wales, for the treatment of advanced levodopa-responsive Parkinson's disease with severe motor fluctuations and hyper-/dyskinesia when available combinations of Parkinson medicinal products have not given satisfactory results, only in patients not eligible for deep brain stimulation. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

Levodopa with carbidopa and entacapone

The properties listed below are those particular to the combination only. For the properties of the components please consider, co-careldopa p. 410, entacapone p. 407.

● INDICATIONS AND DOSE**STALEVO® 100/25/200**

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

► BY MOUTH

► Adult: 1 tablet for each dose; maximum 10 tablets per day

STALEVO® 125/31.25/200

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

► BY MOUTH

► Adult: 1 tablet for each dose; maximum 10 tablets per day

STALEVO® 150/37.5/200

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

► BY MOUTH

► Adult: 1 tablet for each dose; maximum 10 tablets per day

STALEVO® 175/43.75/200

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

► BY MOUTH

► Adult: 1 tablet for each dose; maximum 8 tablets per day

STALEVO® 200/50/200

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

► BY MOUTH

► Adult: 1 tablet for each dose; maximum 7 tablets per day

STALEVO® 50/12.5/200

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

► BY MOUTH

► Adult: 1 tablet for each dose; maximum 10 tablets per day

STALEVO® 75/18.75/200

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

► BY MOUTH

► Adult: 1 tablet for each dose; maximum 10 tablets per day

● **INTERACTIONS** → Appendix 1: carbidopa · entacapone · levodopa

● **PRESCRIBING AND DISPENSING INFORMATION** Patients receiving standard-release co-careldopa or co-beneldopa alone, initiate **Stalevo®** at a dose that provides similar (or slightly lower) amount of levodopa.

Patients with dyskinesia or receiving more than 800 mg levodopa daily, introduce entacapone before transferring to **Stalevo®** (levodopa dose may need to be reduced by 10–30% initially).

Patients receiving entacapone and standard-release co-careldopa or co-beneldopa, initiate **Stalevo®** at a dose that provides similar (or slightly higher) amount of levodopa.

● PATIENT AND CARER ADVICE**Driving and skilled tasks**

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with carbidopa with entacapone and levodopa.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

DOPAMINERGIC DRUGS > DOPAMINE RECEPTOR AGONISTS

Amantadine hydrochloride

● **DRUG ACTION** Amantadine is a weak dopamine agonist with modest antiparkinsonian effects.

● INDICATIONS AND DOSE**Parkinson's disease**

► BY MOUTH

► Adult: 100 mg daily for 1 week, then increased to 100 mg twice daily, usually administered in conjunction with other treatment. Some patients may require higher doses; maximum 400 mg per day
► Elderly: 100 mg daily, adjusted according to response

Post-herpetic neuralgia

► BY MOUTH

- Adult: 100 mg twice daily for 14 days (continued for another 14 days if necessary)

Treatment of influenza A (but not recommended)

► BY MOUTH

- Adult: 100 mg daily 4–5 days

Prophylaxis of influenza A (but not recommended)

► BY MOUTH

- Adult: 100 mg daily usually for 6 weeks or with influenza vaccination for 2–3 weeks after vaccination

- **CONTRA-INDICATIONS** Epilepsy · history of gastric ulceration
- **CAUTIONS** Confused or hallucinatory states · congestive heart disease (may exacerbate oedema) · elderly · tolerance to the effects of amantadine may develop in Parkinson's disease
- **INTERACTIONS** → Appendix 1: dopamine receptor agonists
- **SIDE-EFFECTS**
 - **Common or very common** Anxiety · appetite decreased · concentration impaired · confusion · constipation · depression · dizziness · dry mouth · hallucination · headache · hyperhidrosis · lethargy · mood altered · movement disorders · myalgia · nausea · palpitations · peripheral oedema · postural hypotension · skin reactions · sleep disorders · speech slurred · vision disorders · vomiting
 - **Uncommon** Neuroleptic malignant-like syndrome · psychosis · seizure · tremor
 - **Rare or very rare** Cardiovascular insufficiency · diarrhoea · eye disorders · eye inflammation · heart failure · leucopenia · photosensitivity reaction · urinary disorders
 - **Frequency not known** Delirium
- **PREGNANCY** Avoid; toxicity in *animal* studies.
- **BREAST FEEDING** Avoid; present in milk; toxicity in infant reported.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 15 mL/minute/1.73 m².
Dose adjustments Reduce dose.
- **TREATMENT CESSATION** Avoid abrupt withdrawal in Parkinson's disease.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE decisions
 - Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158
Amantadine is **not** recommended for prophylaxis of influenza.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Oral solution► **Amantadine hydrochloride (Non-proprietary)**

Amantadine hydrochloride 10 mg per 1 mL Amantadine 50mg/5ml oral solution sugar free sugar-free | 150 mL [PoM] £118.00–£140.00 DT = £129.54

Capsule► **Amantadine hydrochloride (Non-proprietary)**

Amantadine hydrochloride 100 mg Amantadine 100mg capsules | 14 capsule [PoM] £10.00–£10.25 | 56 capsule [PoM] £40.98–£41.00 DT = £40.95

Apomorphine hydrochloride● **INDICATIONS AND DOSE**

Refractory motor fluctuations in Parkinson's disease ('off' episodes) inadequately controlled by co-beneldopa or co-careldopa or other dopaminergics (for capable and motivated patients) (under expert supervision)

► **BY SUBCUTANEOUS INJECTION**

- **Adult:** Initially 1 mg, dose to be administered at the first sign of 'off' episode, then 2 mg after 30 minutes, dose to be given if inadequate or no response following initial dose, thereafter increase dose at minimum 40-minute intervals until satisfactory response obtained, this determines threshold dose; usual dose 3–30 mg daily in divided doses (max. per dose 10 mg), subcutaneous infusion may be preferable in those requiring division of injections into more than 10 doses; maximum 100 mg per day

Refractory motor fluctuations in Parkinson's disease ('off' episodes) inadequately controlled by co-beneldopa or co-careldopa or other dopaminergics (in patients requiring division into more than 10 injections daily) (under expert supervision)

► **BY CONTINUOUS SUBCUTANEOUS INFUSION**

- **Adult:** Initially 1 mg/hour, adjusted according to response, then increased in steps of up to 500 micrograms/hour, dose to be increased at intervals not more often than every 4 hours; usual dose 1–4 mg/hour, alternatively usual dose 15–60 micrograms/kg/hour, change infusion site every 12 hours and give during waking hours only (tolerance may occur unless there is a 4-hour treatment-free period at night—24-hour infusions not recommended unless severe night time symptoms); intermittent bolus doses may be needed; maximum 100 mg per day

IMPORTANT SAFETY INFORMATION**IMPULSE CONTROL DISORDERS**

Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist or levodopa should be withdrawn or the dose reduced until the symptoms resolve.

- **CONTRA-INDICATIONS** Avoid if 'on' response to levodopa marred by severe dyskinesia or dystonia · dementia · psychosis · respiratory depression
- **CAUTIONS** Cardiovascular disease · history of postural hypotension (special care on initiation) · neuropsychiatric conditions · pulmonary disease · susceptibility to QT-interval prolongation
- **INTERACTIONS** → Appendix 1: dopamine receptor agonists
- **SIDE-EFFECTS**
 - **Common or very common** Confusion · dizziness · drowsiness · hallucinations · nausea · psychiatric disorders · vomiting · yawning

- ▶ **Uncommon** Dyskinesia (may require discontinuation) · dyspnoea · haemolytic anaemia · postural hypotension · skin reactions · sudden onset of sleep · thrombocytopenia
- ▶ **Rare or very rare** Bronchospasm · eosinophilia · hypersensitivity
- ▶ **Frequency not known** Aggression · agitation · eating disorders · pathological gambling · peripheral oedema · sexual dysfunction · syncope
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to opioids.
- **PREGNANCY** Avoid unless clearly necessary.
- **BREAST FEEDING** No information available; may suppress lactation.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor hepatic, haemopoietic, renal, and cardiovascular function.
 - ▶ With concomitant levodopa test initially and every 6 months for haemolytic anaemia and thrombocytopenia (development calls for specialist haematological care with dose reduction and possible discontinuation).
- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Drugs and driving Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

2015 legislation regarding driving whilst taking certain drugs, may also apply to apomorphine, see *Drugs and driving* under Guidance on prescribing p. 1.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10
EXCIPIENTS: May contain Sulfites

▶ **AP0-go** (Britannia Pharmaceuticals Ltd)

Apomorphine hydrochloride 10 mg per 1 ml AP0-go 50mg/5ml solution for injection ampoules | 5 ampoule (PoM) £73.11 DT = £73.11

▶ **AP0-go Pen** (Britannia Pharmaceuticals Ltd)

Apomorphine hydrochloride 10 mg per 1 ml AP0-go PEN 30mg/3ml solution for injection | 5 pre-filled disposable injection (PoM) £123.91 DT = £123.91

Solution for infusion

CAUTIONARY AND ADVISORY LABELS 10

EXCIPIENTS: May contain Sulfites

▶ **AP0-go PFS** (Britannia Pharmaceuticals Ltd)

Apomorphine hydrochloride 5 mg per 1 ml AP0-go PFS 50mg/10ml solution for infusion pre-filled syringes | 5 pre-filled disposable injection (PoM) £73.11 DT = £73.11

Bromocriptine

- **DRUG ACTION** Bromocriptine is a stimulant of dopamine receptors in the brain; it also inhibits release of prolactin by the pituitary.

● INDICATIONS AND DOSE

Prevention of lactation

▶ BY MOUTH

▶ Adult: Initially 2.5 mg daily for 1 day, then 2.5 mg twice daily for 14 days

Suppression of lactation

▶ BY MOUTH

▶ Adult: Initially 2.5 mg daily for 2–3 days, then 2.5 mg twice daily for 14 days

Hypogonadism | Galactorrhoea | Infertility

▶ BY MOUTH

▶ Adult: Initially 1–1.25 mg daily, dose to be taken at bedtime, increase dose gradually; usual dose 7.5 mg daily in divided doses, increased if necessary up to 30 mg daily, usual dose in infertility without hyperprolactinaemia is 2.5 mg twice daily

Acromegaly

▶ BY MOUTH

▶ Adult: Initially 1–1.25 mg daily, dose to be taken at bedtime, then increased to 5 mg every 6 hours, increase dose gradually

Prolactinoma

▶ BY MOUTH

▶ Adult: Initially 1–1.25 mg daily, dose to be taken at bedtime, then increased to 5 mg every 6 hours, increase dose gradually. Occasionally patients may require up to 30 mg daily

Parkinson's disease

▶ BY MOUTH

▶ Adult: Initially 1–1.25 mg daily for 1 week, dose to be taken at night, then 2–2.5 mg daily for 1 week, dose to be taken at night, then 2.5 mg twice daily for 1 week, then 2.5 mg 3 times a day for 1 week, then increased in steps of 2.5 mg every 3–14 days, adjusted according to response; maintenance 10–30 mg daily

IMPORTANT SAFETY INFORMATION

FIBROTIC REACTIONS

Bromocriptine has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions.

Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson's disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful.

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor

agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- **CONTRA-INDICATIONS** Avoid in pre-eclampsia · cardiac valvulopathy (exclude before treatment) · hypertension in postpartum women or in puerperium

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Postpartum or puerperium Should not be used postpartum or in puerperium in women with high blood pressure, coronary artery disease, or symptoms (or history) of serious mental disorder; monitor blood pressure carefully (especially during first few days) in postpartum women. Very rarely hypertension, myocardial infarction, seizures or stroke (both sometimes preceded by severe headache or visual disturbances), and mental disorders have been reported in postpartum women given bromocriptine for lactation suppression—caution with antihypertensive therapy and avoid other ergot alkaloids. Discontinue immediately if hypertension, unremitting headache, or signs of CNS toxicity develop.
- **CAUTIONS** Cardiovascular disease · history of peptic ulcer (particularly in acromegalic patients) · history of serious mental disorders (especially psychotic disorders) · Raynaud's syndrome

CAUTIONS, FURTHER INFORMATION

- ▶ Hyperprolactinaemic patients In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).

- **INTERACTIONS** → Appendix 1: dopamine receptor agonists

● SIDE-EFFECTS

- ▶ **Common or very common** Constipation · drowsiness · headache · nasal congestion · nausea
- ▶ **Uncommon** Allergic dermatitis · alopecia · confusion · dizziness · dry mouth · fatigue · hallucination · hypotension · leg cramps · movement disorders · vomiting
- ▶ **Rare or very rare** Abdominal pain · arrhythmias · cardiac valvulopathy · diarrhoea · dyspnoea · gastrointestinal disorders · gastrointestinal haemorrhage · neuroleptic malignant-like syndrome · pallor · paraesthesia · pericardial effusion · pericarditis · peripheral oedema · psychotic disorder · respiratory disorders · sleep disorders · tinnitus · vision disorders
- ▶ **Frequency not known** Eating disorders · hypertension · myocardial infarction · pathological gambling · psychiatric disorders · seizure · sexual dysfunction · stroke

SIDE-EFFECTS, FURTHER INFORMATION Treatment should be withdrawn if gastro-intestinal bleeding occurs.

- **ALLERGY AND CROSS-SENSITIVITY** Bromocriptine should not be used in patients with hypersensitivity to ergot alkaloids.

- **CONCEPTION AND CONTRACEPTION** Caution—provide contraceptive advice if appropriate (oral contraceptives may increase prolactin concentration).

- **BREAST FEEDING** Suppresses lactation; avoid breast feeding for about 5 days if lactation prevention fails.

● HEPATIC IMPAIRMENT

Dose adjustments Dose reduction may be necessary.

● MONITORING REQUIREMENTS

- ▶ Specialist evaluation—monitor for pituitary enlargement, particularly during pregnancy; monitor visual field to detect secondary field loss in macroprolactinoma.
- ▶ Monitor for fibrotic disease.
- ▶ Monitor blood pressure for a few days after starting treatment and following dosage increase.

- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

● PATIENT AND CARER ADVICE

Driving and skilled tasks

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

● MEDICINAL FORMS

Bromocriptine (as Bromocriptine mesilate) 5 mg Parlodel 5mg capsules | 100 capsule [PoM] £37.57 DT = £37.57

Bromocriptine (as Bromocriptine mesilate) 10 mg Parlodel 10mg capsules | 100 capsule [PoM] £69.50 DT = £69.50

Cabergoline

- **DRUG ACTION** Cabergoline is a stimulant of dopamine receptors in the brain and it also inhibits release of prolactin by the pituitary.

● INDICATIONS AND DOSE

Prevention of lactation

▶ BY MOUTH

- ▶ Adult: 1 mg, to be taken as a single dose on the first day postpartum

Suppression of established lactation

▶ BY MOUTH

- ▶ Adult: 250 micrograms every 12 hours for 2 days

Hyperprolactinaemic disorders

▶ BY MOUTH

- ▶ Adult: Initially 500 micrograms once weekly, dose may be taken as a single dose or as 2 divided doses on separate days, then increased in steps of 500 micrograms every month until optimal therapeutic response reached, increase dose following monthly monitoring of serum prolactin levels; usual dose 0.25–2 mg once weekly, usually 1 mg weekly; reduce initial dose and increase more gradually if patient intolerant, doses over 1 mg weekly to be given as divided dose; maximum 4.5 mg per week continued →

Alone or as adjunct to co-beneldopa or co-careldopa in Parkinson's disease where dopamine-receptor agonists other than ergot derivative not appropriate

► BY MOUTH

- **Adult:** Initially 1 mg daily, then increased in steps of 0.5–1 mg every 7–14 days, concurrent dose of levodopa may be decreased gradually while dose of cabergoline is increased; maximum 3 mg per day

IMPORTANT SAFETY INFORMATION

FIBROTIC REACTIONS

Cabergoline has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions.

Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson's disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- **CONTRA-INDICATIONS** Avoid in pre-eclampsia · cardiac valvulopathy (exclude before treatment) · history of pericardial fibrotic disorders · history of puerperal psychosis · history of pulmonary fibrotic disorders · history of retroperitoneal fibrotic disorders

- **CAUTIONS** Cardiovascular disease · history of peptic ulcer (particularly in acromegalic patients) · history of serious mental disorders (especially psychotic disorders) · Raynaud's syndrome

CAUTIONS, FURTHER INFORMATION

- **Hyperprolactinaemic patients** In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).
- **INTERACTIONS** → Appendix 1: dopamine receptor agonists
- **SIDE-EFFECTS**
 - **Common or very common** Angina pectoris · asthenia · cardiac valvulopathy · confusion · constipation · dizziness · drowsiness · dyspepsia · dyspnoea · gastritis · hallucination · headache · hypotension · movement disorders · nausea · oedema · pericardial effusion · pericarditis · sexual dysfunction · sleep disorders · vertigo · vomiting
 - **Uncommon** Delusions · erythromelalgia · hepatic function abnormal · psychotic disorder · rash · respiratory disorders
 - **Rare or very rare** Fibrosis
 - **Frequency not known** Aggression · alopecia · chest pain · digital vasospasm · leg cramps · pathological gambling · syncope · tremor · visual impairment

- **ALLERGY AND CROSS-SENSITIVITY** Cabergoline should not be used in patients with hypersensitivity to ergot alkaloids.
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before starting and perform monthly pregnancy tests during the amenorrhoeic period. Caution—advise non-hormonal contraception if pregnancy not desired. Discontinue 1 month before intended conception (ovulatory cycles persist for 6 months).
- **PREGNANCY** Discontinue if pregnancy occurs during treatment (specialist advice needed).
- **BREAST FEEDING** Suppresses lactation; avoid breast-feeding if lactation prevention fails.
- **HEPATIC IMPAIRMENT**
 - Dose adjustments** Reduce dose in severe hepatic impairment.
- **MONITORING REQUIREMENTS**
 - Monitor for fibrotic disease.
 - Monitor blood pressure for a few days after starting treatment and following dosage increase.
- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Pergolide

● INDICATIONS AND DOSE

Monotherapy in Parkinson's disease where dopamine-receptor agonists other than ergot derivative not appropriate

► BY MOUTH

- Adult: Initially 50 micrograms once daily for day 1, dose to be taken at bedtime, then 50 micrograms twice daily for days 2–4, then increased in steps of 100–250 micrograms daily, dose to be increased at intervals of 3–4 days, increased to 1.5 mg daily in 3 divided doses at day 28, then increased in steps of up to 250 micrograms every 3–4 days, this increase to be started after day 30; maintenance 2.1–2.5 mg daily; maximum 3 mg per day

Adjunctive therapy with co-beneldopa or co-careldopa in Parkinson's disease where dopamine-receptor agonists other than ergot derivative not appropriate

► BY MOUTH

- Adult: Initially 50 micrograms daily for 2 days, then increased in steps of 100–150 micrograms every 3 days, dose to be adjusted over next 12 days following initial dose and usually given in 3 divided doses, then increased in steps of 250 micrograms every 3 days, during pergolide titration, levodopa dose may be reduced cautiously; maximum 3 mg per day

IMPORTANT SAFETY INFORMATION

FIBROTIC REACTIONS

Pergolide has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions.

Exclude cardiac valvulopathy with echocardiography before starting treatment with pergolide; it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking pergolide should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist or levodopa should be withdrawn or the dose reduced until the symptoms resolve.

- **CONTRA-INDICATIONS** Cardiac valvulopathy (exclude before treatment) · history of fibrotic disorders
- **CAUTIONS** Acute porphyrias p. 1025 · arrhythmias · dyskinesia (may exacerbate) · hallucinations · history of confusion · psychosis · underlying cardiac disease
- **INTERACTIONS** → Appendix 1: dopamine receptor agonists
- **SIDE-EFFECTS** Cardiac valve disorders · compulsions · confusion · constipation · diarrhoea · diplopia · dizziness · drowsiness · dyskinesia · dyspnoea · eating disorders · erythromelalgia · gastrointestinal discomfort · hallucination · hiccups · nausea · neuroleptic malignant

syndrome · pain · palpitations · pathological gambling · pericardial effusion · pericarditis · postural hypotension · pulmonary hypertension · rash · Raynaud's phenomenon · respiratory disorders · retroperitoneal fibrosis · rhinitis · sexual dysfunction · sleep disorders · syncope · vomiting

- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** May suppress lactation.

- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

Pramipexole

● INDICATIONS AND DOSE

Parkinson's disease, used alone or as an adjunct to co-beneldopa or co-careldopa

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 88 micrograms 3 times a day, if tolerated dose to be increased by doubling dose every 5–7 days, increased to 350 micrograms 3 times a day, then increased in steps of 180 micrograms 3 times a day if required, dose to be increased at weekly intervals, during dose titration and maintenance, levodopa dose may be reduced, maximum daily dose to be given in 3 divided doses; maximum 3.3 mg per day

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: Initially 260 micrograms once daily, dose to be increased by doubling dose every 5–7 days, increased to 1.05 mg once daily, then increased in steps of 520 micrograms every week if required, during dose titration and maintenance, levodopa dose may be reduced according to response; maximum 3.15 mg per day

Moderate to severe restless legs syndrome

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 88 micrograms once daily, dose to be taken 2–3 hours before bedtime, dose to be increased by doubling dose every 4–7 days if necessary, repeat dose titration if restarting treatment after continued →

an interval of more than a few days; maximum 540 micrograms per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ Doses and strengths are stated in terms of pramipexole (base).
- ▶ Equivalent strengths of pramipexole (base) in terms of pramipexole dihydrochloride monohydrate (salt) for immediate-release preparations are as follows:
 - ▶ 88 micrograms base = 125 micrograms salt;
 - ▶ 180 micrograms base = 250 micrograms salt;
 - ▶ 350 micrograms base = 500 micrograms salt;
 - ▶ 700 micrograms base = 1 mg salt.
- ▶ Equivalent strengths of pramipexole (base) in terms of pramipexole dihydrochloride monohydrate (salt) for modified-release preparations are as follows:
 - ▶ 260 micrograms base = 375 micrograms salt;
 - ▶ 520 micrograms base = 750 micrograms salt;
 - ▶ 1.05 mg base = 1.5 mg salt;
 - ▶ 1.57 mg base = 2.25 mg salt;
 - ▶ 2.1 mg base = 3 mg salt;
 - ▶ 2.62 mg base = 3.75 mg salt;
 - ▶ 3.15 mg base = 4.5 mg salt.

IMPORTANT SAFETY INFORMATION

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- **CAUTIONS** Psychotic disorders · risk of visual disorders (ophthalmological testing recommended) · severe cardiovascular disease
- **INTERACTIONS** → Appendix 1: dopamine receptor agonists
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Appetite abnormal · behaviour abnormal · confusion · constipation · dizziness · drowsiness · fatigue · hallucination · headache · hypotension · movement disorders · nausea · peripheral oedema · psychiatric disorders · sleep disorders · vision disorders · vomiting · weight changes
 - ▶ **Uncommon** Anxiety · binge eating · delirium · delusions · dyspnoea · heart failure · hiccups · mania · memory loss · pathological gambling · pneumonia · sexual dysfunction · SIADH · skin reactions · syncope
 - ▶ **Symptoms not known** Depression · dopamine agonist withdrawal syndrome · generalised pain · sweating abnormal
- **PREGNANCY** Use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** May suppress lactation; avoid—present in milk in animal studies.
- **RENAL IMPAIRMENT** For *modified-release* tablets, avoid if eGFR less than 30 mL/minute/1.73 m².
Dose adjustments For *immediate-release* tablets in Parkinson's disease, initially 88 micrograms twice daily (max. 1.57 mg daily in 2 divided doses) if eGFR 20–50 mL/minute/1.73 m²; initially 88 micrograms once daily (max. 1.1 mg once daily) if eGFR less than 20 mL/minute/1.73 m². If renal function declines during

treatment, reduce dose by the same percentage as the decline in eGFR.

For *immediate-release* tablets in restless legs syndrome, reduce dose if eGFR less than 20 mL/minute/1.73 m².

For *modified-release* tablets, initially 260 micrograms on alternate days if eGFR 30–50 mL/minute/1.73 m², increased to 260 micrograms once daily after 1 week, further increased if necessary by 260 micrograms daily at weekly intervals to max. 1.57 mg daily.

- **MONITORING REQUIREMENTS** Risk of postural hypotension (especially on initiation)—monitor blood pressure.
- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

PATIENT AND CARER ADVICE

Driving and skilled tasks

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

Ropinirole● **INDICATIONS AND DOSE****Parkinson's disease, either used alone or as adjunct to co-beneldopa or co-careldopa**▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

▶ **Adult:** Initially 750 micrograms daily in 3 divided doses, then increased in steps of 750 micrograms daily, dose to be increased at weekly intervals, increased to 3 mg daily in 3 divided doses, then increased in steps of 1.5–3 mg daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 9–16 mg daily in 3 divided doses, higher doses may be required if used with levodopa, when administered as adjunct to levodopa, concurrent dose of levodopa may be reduced by approx. 20%, daily maximum dose to be given in 3 divided doses; maximum 24 mg per day

▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**

▶ **Adult:** Initially 2 mg once daily for 1 week, then 4 mg once daily, increased in steps of 2 mg at intervals of at least 1 week, adjusted according to response, increased to up to 8 mg once daily, dose to be increased further if still no response; increased in steps of 2–4 mg at intervals of at least 2 weeks if required, consider slower titration in patients over 75 years, when administered as adjunct to levodopa, concurrent dose of levodopa may gradually be reduced by approx. 30%; maximum 24 mg per day

Parkinson's disease in patients transferring from**ropinirole immediate-release tablets**▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**

▶ **Adult:** Initially ropinirole modified-release once daily substituted for total daily dose equivalent of ropinirole immediate-release tablets; if control not maintained after switching, titrate dose as above

Moderate to severe restless legs syndrome▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

▶ **Adult:** Initially 250 micrograms once daily for 2 days, increased if tolerated to 500 micrograms once daily for 5 days, then increased if tolerated to 1 mg once daily for 7 days, then increased in steps of 500 micrograms daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 2 mg once daily, doses to be taken at night; maximum 4 mg per day

● **UNLICENSED USE** Doses in the BNF may differ from those in product literature.**IMPORTANT SAFETY INFORMATION****SAFE PRACTICE**

Ropinirole has been confused with risperidone; care must be taken to ensure the correct drug is prescribed and dispensed.

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- **CAUTIONS** Elderly • major psychotic disorders • severe cardiovascular disease (risk of hypotension—monitor blood pressure)
- **INTERACTIONS** → Appendix 1: dopamine receptor agonists
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Confusion • dizziness • drowsiness • early morning awakening • fatigue • gastrointestinal discomfort • hallucination • movement disorders • nausea • nervousness • peripheral oedema • syncope • vertigo • vomiting
 - ▶ **Uncommon** Hypotension • sexual dysfunction
 - ▶ **Rare or very rare** Hepatic reaction
 - ▶ **Frequency not known** Behaviour abnormal • delirium • delusions • eating disorders • pathological gambling • psychiatric disorders • psychotic disorder
- **PREGNANCY** Avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** May suppress lactation—avoid.
- **HEPATIC IMPAIRMENT** Avoid—no information available.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.
- **PATIENT AND CARER ADVICE**

Missed doses ▶ When used for Parkinson's disease Manufacturer advises if treatment is interrupted for one day or more, re-initiation by dose titration should be considered—consult product literature.

▶ When used for Moderate to severe restless legs syndrome Manufacturer advises if treatment is interrupted for more than a few days, re-initiation by dose titration is recommended.

Driving and skilled tasks

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

● NATIONAL FUNDING/ACCESS DECISIONS**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (June 2006) that *Adartrel*[®] should be restricted for use in patients with a baseline score of 24 points or more on the International Restless Legs Scale.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 10, 25

Rotigotine

05-Jun-2017

● **INDICATIONS AND DOSE**

Monotherapy in Parkinson's disease

▶ BY TRANSDERMAL APPLICATION USING PATCHES

• **Adult:** Initially 2 mg/24 hours, then increased in steps of 2 mg/24 hours every week if required; maximum 8 mg/24 hours per day

Adjunctive therapy with co-beneldopa or co-careldopa in Parkinson's disease

▶ BY TRANSDERMAL APPLICATION USING PATCHES

• **Adult:** Initially 4 mg/24 hours, then increased in steps of 2 mg/24 hours every week if required; maximum 16 mg/24 hours per day

Moderate to severe restless legs syndrome

▶ BY TRANSDERMAL APPLICATION USING PATCHES

• **Adult:** Initially 1 mg/24 hours, then increased in steps of 1 mg/24 hours every week if required; maximum 3 mg/24 hours per day

IMPORTANT SAFETY INFORMATION

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

● **CAUTIONS** Avoid exposure of patch to heat • remove patch (aluminium-containing) before magnetic resonance imaging or cardioversion

● **INTERACTIONS** → Appendix 1: dopamine receptor agonists

● **SIDE-EFFECTS**

▶ **Common or very common** Asthenia • behaviour abnormal • constipation • dizziness • drowsiness • dry mouth • dyskinesia • eating disorders • fall • gastrointestinal discomfort • hallucinations • headache • hiccups • hyperhidrosis • hypertension • hypotension • loss of consciousness • malaise • nausea • palpitations • pathological gambling • perception altered • peripheral oedema • psychiatric disorders • skin reactions • sleep disorders • syncope • vertigo • vomiting • weight changes

▶ **Uncommon** Agitation • angioedema • arrhythmias • confusion • sexual dysfunction • vision disorders

▶ **Rare or very rare** Delirium • delusions • irritability • psychotic disorder • seizure

● **PREGNANCY** Avoid—no information available.

● **BREAST FEEDING** May suppress lactation; avoid—present in milk in animal studies.

● **HEPATIC IMPAIRMENT** Caution in severe impairment—no information available.

● **MONITORING REQUIREMENTS** Ophthalmic testing recommended.

● **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises apply patch to dry, non-irritated skin on torso, thigh, or upper arm by pressing the patch firmly against the skin for 20–30 seconds. Patches should be removed after 24 hours and the replacement patch applied on a different area (avoid using the same area for 14 days)—consult product literature for further information.

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised that *Neupro*® is accepted for restricted use for the treatment of advanced Parkinson's disease in combination with levodopa where the transdermal route would facilitate treatment (July 2007).

The *Scottish Medicines Consortium* has advised that *Neupro*® is accepted as monotherapy for the treatment of early-stage idiopathic Parkinson's disease (June 2007).

The *Scottish Medicines Consortium* has advised (April 2009) that rotigotine (*Neupro*®) is accepted for restricted use within NHS Scotland for the symptomatic treatment of moderate to severe idiopathic restless legs syndrome in

adults with a baseline score of 15 points or more on the International Restless Legs Scale.

DOPAMINERGIC DRUGS > MONOAMINE-OXIDASE B INHIBITORS

Rasagiline

- **DRUG ACTION** Rasagiline is a monoamine-oxidase B inhibitor.

• INDICATIONS AND DOSE

Parkinson's disease, used alone or as adjunct to co-beneldopa or co-careldopa for 'end-of-dose' fluctuations

- BY MOUTH
- Adult: 1 mg daily

- **INTERACTIONS** → Appendix 1: monoamine-oxidase B inhibitors
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · abnormal dreams · angina pectoris · arthralgia · arthritis · conjunctivitis · depression · dermatitis · dry mouth · fall · fever · flatulence · hallucination · headache · increased risk of infection · leucopenia · malaise · nausea · neoplasms · pain · postural hypotension · urinary urgency · vertigo · vomiting · weight decreased
 - **Uncommon** Appetite decreased · confusion
 - **Frequency not known** Eating disorders · pathological gambling · psychiatric disorders · sexual dysfunction
- **PREGNANCY** Use with caution.
- **BREAST FEEDING** Use with caution—may suppress lactation.
- **HEPATIC IMPAIRMENT** Use with caution in mild impairment. Avoid in moderate to severe impairment.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

► Rasagiline (Non-proprietary)

Rasagiline 1 mg Rasagiline 1mg tablets | 28 tablet [PoM] £70.72 DT = £5.29

► Azilect (Teva UK Ltd)

Rasagiline 1 mg Azilect 1mg tablets | 28 tablet [PoM] £70.72 DT = £5.29

Safinamide

18-Jul-2017

- **DRUG ACTION** Safinamide is a monoamine-oxidase-B inhibitor.

• INDICATIONS AND DOSE

Parkinson's disease, as an adjunct to levodopa alone or in combination with other antiparkinsonian drugs, for mid-to late-stage fluctuations

- BY MOUTH
- Adult: 50 mg once daily, increased if necessary to 100 mg once daily

- **CONTRA-INDICATIONS** Active retinopathy · albinism · family history of hereditary retinal disease · retinal degeneration · uveitis
- **CAUTIONS** Hypertension (may raise blood pressure) · may exacerbate pre-existing dyskinesia (requiring levodopa dose reduction)
- **INTERACTIONS** → Appendix 1: monoamine-oxidase B inhibitors
- **SIDE-EFFECTS**
 - **Common or very common** Cataract · dizziness · drowsiness · headache · hypotension · injury · nausea · sleep disorders
 - **Uncommon** Anaemia · anxiety · appetite abnormal · arrhythmias · asthenia · cognitive disorder · confusion · constipation · cough · decreased leucocytes · depression · diarrhoea · dry mouth · dysarthria · dyslipidaemia · dyspnoea · emotional lability · eye disorders · eye inflammation · gastrointestinal discomfort · gastrointestinal disorders · glaucoma · hallucination · hyperglycaemia · hypertension · increased risk of infection · joint disorders · movement disorders · muscle complaints · muscle weakness · neoplasms · oral disorders · pain · palpitations · peripheral oedema · photosensitivity reaction · psychotic disorder · QT interval prolongation · red blood cell abnormality · rhinorrhoea · sensation abnormal · sensation of pressure · sexual dysfunction · skin reactions · sweat changes · syncope · temperature sensation altered · urinary disorders · varicose veins · vertigo · vision disorders · vomiting · weight changes
 - **Rare or very rare** Alopecia · arterial spasm · atherosclerosis · benign prostatic hyperplasia · breast abnormalities · bronchospasm · cachexia · concentration impaired · delirium · diabetic retinopathy · drug effect decreased · dysphonia · eosinophilia · eye pain · fat embolism · fever · gambling · haemorrhage · hyperbilirubinaemia · hyperkalaemia · illusion · malaise · myocardial infarction · oropharyngeal complaints · osteoarthritis · paranoia · psychiatric disorders · pyuria · reflexes decreased · suicidal ideation · taste altered
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment.
Dose adjustments Manufacturer advises max. daily dose should not exceed 50 mg daily in moderate impairment.

• MEDICINAL FORMS

Tablet

► Xadago (Profile Pharma Ltd) ▼

Safinamide (as Safinamide methanesulfonate) 50 mg Xadago 50mg tablets | 30 tablet [PoM] £69.00 DT = £69.00

Safinamide (as Safinamide methanesulfonate) 100 mg Xadago 100mg tablets | 30 tablet [PoM] £69.00 DT = £69.00

Selegiline hydrochloride

- **DRUG ACTION** Selegiline is a monoamine-oxidase-B inhibitor.

● INDICATIONS AND DOSE

Parkinson's disease, used alone or as adjunct to co-beneldopa or co-careldopa to reduce 'end of dose' deterioration | Symptomatic parkinsonism

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
 - Adult: Initially 5 mg once daily for 2–4 weeks, then increased if tolerated to 10 mg daily, dose to be taken in the morning
- ▶ BY MOUTH USING ORAL LYOPHILISATE
 - Adult: 1.25 mg once daily, dose to be taken before breakfast

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1.25-mg oral lyophilisate is equivalent to 10-mg tablet.
- ▶ Patients receiving 10 mg conventional selegiline hydrochloride tablets can be switched to oral lyophilisates (*Zelapar*®) 1.25 mg.

- **CONTRA-INDICATIONS** Active duodenal ulceration · active gastric ulceration · avoid or use with great caution in postural hypotension (when used in combination with levodopa)
- **CAUTIONS** Angina · arrhythmias · duodenal ulceration · gastric ulceration · history of hepatic dysfunction · patients predisposed to confusion and psychosis · psychosis · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1: monoamine-oxidase B inhibitors
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arrhythmias · arthralgia · back pain · confusion · constipation · depression · diarrhoea · dizziness · dry mouth · fall · fatigue · hallucination · headache · hyperhidrosis · hypertension · hypotension · movement disorders · muscle cramps · nasal congestion · nausea · oral disorders · sleep disorders · throat pain · tremor · vertigo
 - ▶ **Uncommon** Alopecia · angina pectoris · anxiety · appetite decreased · chest pain · dyspnoea · leucopenia · mood altered · myopathy · palpitations · peripheral oedema · pharyngitis · psychosis · skin eruption · thrombocytopenia · urinary disorders · vision blurred
 - ▶ **Frequency not known** Hypersexuality

SIDE-EFFECTS, FURTHER INFORMATION Side-effects of levodopa may be increased—concurrent levodopa dosage can be reduced by 10–30% in steps of 10% every 3–4 days.

- **PREGNANCY** Avoid—no information available.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in severe impairment.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **DIRECTIONS FOR ADMINISTRATION** Oral lyophilisates should be placed on the tongue and allowed to dissolve. Advise patient not to drink, rinse, or wash mouth out for 5 minutes after taking the tablet.
- **PATIENT AND CARER ADVICE** Patients or carers should be advised on how to administer selegiline hydrochloride oral lyophilisates.

Driving and skilled tasks

Drugs and driving Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to

drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

2015 legislation regarding driving whilst taking certain drugs, may also apply to selegiline, see *Drugs and driving* under Guidance on prescribing p. 1.

5 Nausea and labyrinth disorders

Nausea and labyrinth disorders

Drug treatment

Antiemetics should be prescribed only when the cause of vomiting is known because otherwise they may delay diagnosis, particularly in children. Antiemetics are unnecessary and sometimes harmful when the cause can be treated, such as in diabetic ketoacidosis, or in digoxin p. 109 or antiepileptic overdose.

If antiemetic drug treatment is indicated, the drug is chosen according to the aetiology of vomiting.

Antihistamines are effective against nausea and vomiting resulting from many underlying conditions. There is no evidence that any one antihistamine is superior to another but their duration of action and incidence of adverse effects (drowsiness and antimuscarinic effects) differ.

The **phenothiazines** are dopamine antagonists and act centrally by blocking the chemoreceptor trigger zone. They are of considerable value for the prophylaxis and treatment of nausea and vomiting associated with diffuse neoplastic disease, radiation sickness, and the emesis caused by drugs such as opioids, general anaesthetics, and cytotoxics. Prochlorperazine p. 385, perphenazine p. 384, and trifluoperazine p. 387 are less sedating than chlorpromazine hydrochloride p. 381; severe dystonic reactions sometimes occur with phenothiazines, especially in children. Some phenothiazines are available as rectal suppositories, which can be useful in patients with persistent vomiting or with severe nausea; prochlorperazine can also be administered as a buccal tablet which is placed between the upper lip and the gum.

Other antipsychotic drugs including haloperidol p. 382 and levomepromazine p. 435 are used for the relief of nausea and vomiting in terminal illness.

Metoclopramide hydrochloride p. 426 is an effective antiemetic and its activity closely resembles that of the phenothiazines. Metoclopramide hydrochloride also acts directly on the gastro-intestinal tract and it may be superior to the phenothiazines for emesis associated with gastroduodenal, hepatic, and biliary disease.

Domperidone p. 426 acts at the chemoreceptor trigger zone; it is licensed only for the relief of nausea and vomiting. It has the advantage over metoclopramide hydrochloride and the phenothiazines of being less likely to cause central effects such as sedation and dystonic reactions because it does not readily cross the blood-brain barrier. In Parkinson's disease, it can be used to treat nausea caused by dopaminergic drugs.

Granisetron p. 429 and ondansetron p. 430 are of value in the management of nausea and vomiting in patients receiving cytotoxics and in postoperative nausea and vomiting. Palonosetron p. 431 is licensed for prevention of nausea and vomiting associated with moderately or highly emetogenic cytotoxic chemotherapy. Palonosetron is also available in combination with netupitant, a neurokinin 1-receptor antagonist, for the prevention of acute and delayed nausea and vomiting associated with moderately emetogenic chemotherapy and highly emetogenic cisplatin-based chemotherapy.

Dexamethasone p. 660 has antiemetic effects and it is used in vomiting associated with cancer chemotherapy. It can be used alone or with metoclopramide hydrochloride, prochlorperazine, lorazepam p. 335, or a 5HT₃-receptor antagonist.

Aprepitant p. 427, fosaprepitant p. 428, and rolapitant p. 428 are neurokinin 1-receptor antagonists. Aprepitant is licensed for the prevention of nausea and vomiting associated with highly and moderately emetogenic chemotherapy; fosaprepitant is licensed for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based chemotherapy and the prevention of nausea and vomiting associated with moderately emetogenic chemotherapy; rolapitant is licensed for the prevention of delayed nausea and vomiting associated with highly and moderately emetogenic chemotherapy. These drugs are given with dexamethasone and a 5HT₃-receptor antagonist.

Nabilone p. 425 is a synthetic cannabinoid with antiemetic properties. It may be used for nausea and vomiting caused by cytotoxic chemotherapy that is unresponsive to conventional antiemetics.

Vomiting during pregnancy

Nausea in the first trimester of pregnancy is generally mild and does not require drug therapy. On rare occasions if vomiting is severe, short-term treatment with an antihistamine, such as **promethazine**, may be required. Prochlorperazine or metoclopramide hydrochloride are alternatives. If symptoms do not settle in 24 to 48 hours then specialist opinion should be sought. Hyperemesis gravidarum is a more serious condition, which requires regular antiemetic therapy, intravenous fluid and electrolyte replacement and sometimes nutritional support. Supplementation with thiamine p. 1048 must be considered in order to reduce the risk of Wernicke's encephalopathy.

Postoperative nausea and vomiting

The incidence of postoperative nausea and vomiting depends on many factors including the anaesthetic used, and the type and duration of surgery. Other risk factors include female sex, non-smokers, a history of postoperative nausea and vomiting or motion sickness, and intraoperative and postoperative use of opioids. Therapy to prevent postoperative nausea and vomiting should be based on the assessed risk of postoperative nausea and vomiting in each patient. Drugs used include 5HT₃-receptor antagonists, droperidol p. 434, dexamethasone, some phenothiazines (e.g. prochlorperazine), and antihistamines (e.g. cyclizine below). A combination of two or more antiemetic drugs that have different mechanisms of action is often indicated in those at high risk of postoperative nausea and vomiting or where postoperative vomiting presents a particular danger (e.g. in some types of surgery). When a prophylactic

antiemetic drug has failed, postoperative nausea and vomiting should be treated with one or more drugs from a different class.

Motion sickness

Antiemetics should be given to prevent motion sickness rather than after nausea or vomiting develop. The most effective drug for the prevention of motion sickness is hyoscine hydrobromide p. 433. The sedating antihistamines are slightly less effective against motion sickness, but are generally better tolerated than hyoscine. If a sedative effect is desired **promethazine** is useful, but generally a slightly less sedating antihistamine such as cyclizine or cinnarizine p. 432 is preferred. Domperidone, metoclopramide hydrochloride, 5HT₃-receptor antagonists, and the phenothiazines (except the antihistamine phenothiazine promethazine) are **ineffective** in motion sickness.

Other vestibular disorders

Management of vestibular diseases is aimed at treating the underlying cause as well as treating symptoms of the balance disturbance and associated nausea and vomiting. Vertigo and nausea associated with Ménière's disease and middle-ear surgery can be difficult to treat.

Betahistine dihydrochloride p. 435 is an analogue of histamine and is claimed to reduce endolymphatic pressure by improving the microcirculation. Betahistine dihydrochloride is licensed for vertigo, tinnitus, and hearing loss associated with Ménière's disease.

A **diuretic** alone or combined with salt restriction may provide some benefit in vertigo associated with Ménière's disease; **antihistamines** (such as cinnarizine), and **phenothiazines** (such as prochlorperazine) are also used. Where possible, prochlorperazine should be reserved for the treatment of acute symptoms.

Nausea caused by cytotoxic chemotherapy, palliative care, and migraine

Antiemetics have a role in the management of nausea and vomiting induced by cytotoxic chemotherapy, in palliative care, and associated with migraine.

Other drugs used for Nausea and labyrinth disorders

Paracetamol with metoclopramide, p. 469 • Promethazine hydrochloride, p. 286

Nausea and vomiting of known cause | Nausea and vomiting associated with vestibular disorders and palliative care

► BY MOUTH, OR BY INTRAVENOUS INJECTION

► Child 1 month–5 years: 0.5–1 mg/kg up to 3 times a day (max. per dose 25 mg), intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure

- ▶ Child 6–11 years: 25 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure
- ▶ Child 12–17 years: 50 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure
- ▶ BY RECTUM
 - ▶ Child 2–5 years: 12.5 mg up to 3 times a day
 - ▶ Child 6–11 years: 25 mg up to 3 times a day
 - ▶ Child 12–17 years: 50 mg up to 3 times a day
- ▶ BY CONTINUOUS INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INFUSION
 - ▶ Child 1–23 months: 3 mg/kg, dose to be given over 24 hours
 - ▶ Child 2–5 years: 50 mg, dose to be given over 24 hours
 - ▶ Child 6–11 years: 75 mg, dose to be given over 24 hours
 - ▶ Child 12–17 years: 150 mg, dose to be given over 24 hours

Nausea and vomiting associated with palliative care

- ▶ BY SUBCUTANEOUS INFUSION
 - ▶ Adult: 150 mg, dose to be given over 24 hours
- ▶ BY MOUTH
 - ▶ Adult: 50 mg up to 3 times a day

- **UNLICENSED USE** Tablets not licensed for use in children under 6 years. Injection not licensed for use in children.
- **CAUTIONS** Epilepsy · glaucoma (in children) · may counteract haemodynamic benefits of opioids · neuromuscular disorders—increased risk of transient paralysis with intravenous use · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · severe heart failure—may cause fall in cardiac output and associated increase in heart rate, mean arterial pressure and pulmonary wedge pressure · susceptibility to angle-closure glaucoma (in adults) · urinary retention
- **INTERACTIONS** → Appendix 1: antihistamines, sedating
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

 - ▶ **Rare or very rare** Angle closure glaucoma · depression
 - ▶ **Frequency not known** Abdominal pain · agranulocytosis · angioedema · anxiety · apnoea · appetite decreased · arrhythmias · asthenia · bronchospasm · constipation · diarrhoea · disorientation · dizziness · drowsiness · dry mouth · dry throat · euphoric mood · haemolytic anaemia · hallucinations · headache · hepatic disorders · hypertension · hypotension · increased gastric reflux · insomnia · leucopenia · movement disorders · muscle complaints · nasal dryness · nausea · oculogyric crisis · palpitations · paraesthesia · photosensitivity reaction · seizure · skin reactions · speech disorder · thrombocytopenia · tinnitus · tremor · urinary retention · vision blurred · vomiting

SPECIFIC SIDE-EFFECTS

- ▶ **Rare or very rare**
 - ▶ With oral use Agitation (more common with high doses in children and elderly)
- ▶ **Frequency not known**
 - ▶ With oral use Level of consciousness decreased
 - ▶ With parenteral use Chills · consciousness impaired · pain · paralysis · sensation of pressure
- **PREGNANCY** Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** No information available. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.
- **DIRECTIONS FOR ADMINISTRATION** For administration by mouth, tablets may be crushed. Mixing and compatibility for the use of syringe drivers in palliative care. Cyclizine may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. cycling, driving); effects of alcohol enhanced.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

Tablet

CAUTIONARY AND ADVISORY LABELS 2

▶ Cyclizine (Non-proprietary)

Cyclizine hydrochloride 50 mg Cyclizine 50mg tablets | 30 tablet **P** £2.24–£5.00 | 100 tablet **P** £13.64 DT = £7.47

Solution for injection

▶ Cyclizine (Non-proprietary)

Cyclizine lactate 50 mg per 1 mL Cyclizine 50mg/1mL solution for injection ampoules | 5 ampoule **POM** £13.54 DT = £13.54

ANTIEMETICS AND ANTINAUSEANTS > CANNABINOIDS

Nabilone

● INDICATIONS AND DOSE

Nausea and vomiting caused by cytotoxic chemotherapy, unresponsive to conventional antiemetics (preferably in hospital setting) (under close medical supervision)

▶ BY MOUTH

- ▶ **Adult:** Initially 1 mg twice daily, increased if necessary to 2 mg twice daily throughout each cycle of cytotoxic therapy and, if necessary, for 48 hours after the last dose of each cycle, the first dose should be taken the night before initiation of cytotoxic treatment and the second dose 1–3 hours before the first dose of cytotoxic drug, daily dose maximum should be given in 3 divided doses; maximum 6 mg per day

- **CAUTIONS** Adverse effects on mental state can persist for 48–72 hours after stopping · elderly · heart disease · history of psychiatric disorder · hypertension
- **INTERACTIONS** → Appendix 1: nabilone
- **SIDE-EFFECTS** Abdominal pain · appetite decreased · concentration impaired · confusion · depression · dizziness · drowsiness · drug use disorders · dry mouth · euphoric mood · feeling of relaxation · hallucination · headache · hypotension · movement disorders · nausea · psychosis · sleep disorder · tachycardia · tremor · vertigo · visual impairment
- **SIDE-EFFECTS, FURTHER INFORMATION** Drowsiness and dizziness occur frequently with standard doses.
- **PREGNANCY** Avoid unless essential.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **PATIENT AND CARER ADVICE**

Behavioural effects

Patients should be made aware of possible changes of mood and other adverse behavioural effects.

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving).

Effects of alcohol enhanced.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including nabilone, see *Drugs and driving* under Guidance on prescribing p. 1.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Capsule

CAUTIONARY AND ADVISORY LABELS 2

ANTIEMETICS AND ANTINAUSEANTS > DOPAMINE RECEPTOR ANTAGONISTS

Domperidone

17-Oct-2016

• INDICATIONS AND DOSE

Relief of nausea and vomiting

► BY MOUTH

- Child (body-weight up to 35 kg): 250 micrograms/kg up to 3 times a day; maximum 750 micrograms/kg per day
- Child 12-17 years (body-weight 35 kg and above): 10 mg up to 3 times a day; maximum 30 mg per day
- Adult (body-weight 35 kg and above): 10 mg up to 3 times a day; maximum 30 mg per day

Gastro-intestinal pain in palliative care

► BY MOUTH

- Adult: 10 mg 3 times a day, before meals

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE—DOMPERIDONE: RISK OF CARDIAC SIDE-EFFECTS—RESTRICTED INDICATION, NEW CONTRA-INDICATIONS, REDUCED DOSE AND DURATION OF USE

The benefits and risks of domperidone have been reviewed. As domperidone is associated with a small increased risk of serious cardiac side-effects, the following restrictions to indication, dose and duration of treatment have been made, and new contra-indications added:

- Domperidone should only be used for the relief of the symptoms of nausea and vomiting;
- Domperidone should be used at the lowest effective dose for the shortest possible duration (max. treatment duration should not normally exceed 1 week);
- Domperidone is contra-indicated for use in conditions where cardiac conduction is, or could be, impaired, or where there is underlying cardiac disease, when administered concomitantly with drugs that prolong the QT interval or potent CYP3A4 inhibitors, and in severe hepatic impairment;
- The recommended dose in adults and adolescents over 12 years and over 35 kg is 10 mg up to 3 times daily;
- The recommended dose in children under 35 kg is 250 micrograms/kg up to 3 times daily;
- Oral liquid formulations should be given via an appropriately designed, graduated oral syringe to ensure dose accuracy.

This advice does not apply to unlicensed uses of domperidone (e.g. palliative care).

- **CONTRA-INDICATIONS** Cardiac disease · conditions where cardiac conduction is, or could be, impaired (in adults) · gastro-intestinal haemorrhage (in children) · if increased gastrointestinal motility harmful (in adults) · mechanical obstruction (in children) · mechanical perforation (in

children) · predisposition to cardiac conduction disorders (in children) · prolactinoma

- **CAUTIONS** Children · if there are cardiac concerns, obtain ECG before and during treatment (in children) · patients over 60 years—increased risk of ventricular arrhythmia
- **INTERACTIONS** → Appendix 1: domperidone
- **SIDE-EFFECTS**
 - **Common or very common** Dry mouth
 - **Uncommon** Anxiety · asthenia · breast abnormalities · diarrhoea · drowsiness · headache · lactation disorders · libido loss
 - **Frequency not known** Arrhythmias · depression · gynaecomastia · menstrual cycle irregularities · movement disorders · oculogyric crisis · QT interval prolongation · seizure · sudden cardiac death · urinary retention
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Avoid in moderate or severe impairment.
- **RENAL IMPAIRMENT**
 - Dose adjustments Reduce frequency.
- **PRESCRIBING AND DISPENSING INFORMATION**
 - Palliative care** For further information on the use of domperidone in palliative care, see www.palliativedrugs.com/formulary/en/domperidone.html.
- **PATIENT AND CARER ADVICE**
 - Arrhythmia** Patients and their carers should be told how to recognise signs of arrhythmia and advised to seek medical attention if symptoms such as palpitation or syncope develop.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Oral suspension

Metoclopramide hydrochloride

21-Nov-2016

• INDICATIONS AND DOSE

Symptomatic treatment of nausea and vomiting including that associated with acute migraine | Delayed (but not acute) chemotherapy-induced nausea and vomiting | Radiotherapy-induced nausea and vomiting | Prevention of postoperative nausea and vomiting

► BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION

- Adult (body-weight up to 60 kg): Up to 500 micrograms/kg daily in 3 divided doses, when administered by slow intravenous injection, to be given over at least 3 minutes
- Adult (body-weight 60 kg and above): 10 mg up to 3 times a day, when administered by slow intravenous injection, to be given over at least 3 minutes

Hiccup in palliative care

- BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- Adult: 10 mg every 6–8 hours

Nausea and vomiting in palliative care

- BY MOUTH
- Adult: 10 mg 3 times a day
- BY SUBCUTANEOUS INFUSION
- Adult: 30–100 mg/24 hours

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE—METOCLOPRAMIDE: RISK OF NEUROLOGICAL ADVERSE EFFECTS—RESTRICTED DOSE AND DURATION OF USE (AUGUST 2013)

The benefits and risks of metoclopramide have been reviewed by the European Medicines Agency's Committee on Medicinal Products for Human Use, which concluded that the risk of neurological effects such as extrapyramidal disorders and tardive dyskinesia outweigh the benefits in long-term or high-dose treatment. To help minimise the risk of potentially serious neurological adverse effects, the following restrictions to indications, dose, and duration of use have been made:

- In adults over 18 years, metoclopramide should only be used for prevention of postoperative nausea and vomiting, radiotherapy-induced nausea and vomiting, delayed (but not acute) chemotherapy-induced nausea and vomiting, and symptomatic treatment of nausea and vomiting, including that associated with acute migraine (where it may also be used to improve absorption of oral analgesics);
- Metoclopramide should only be prescribed for short-term use (up to 5 days);
- Usual dose is 10 mg, repeated up to 3 times daily; max. daily dose is 500 micrograms/kg;
- Intravenous doses should be administered as a slow bolus over at least 3 minutes;
- Oral liquid formulations should be given via an appropriately designed, graduated oral syringe to ensure dose accuracy.

This advice does not apply to unlicensed uses of metoclopramide (e.g. palliative care).

- **CONTRA-INDICATIONS** 3–4 days after gastrointestinal surgery · gastro-intestinal haemorrhage · gastro-intestinal obstruction · gastro-intestinal perforation · phaeochromocytoma
- **CAUTIONS** Asthma · atopic allergy · bradycardia · cardiac conduction disturbances · children · elderly · epilepsy · may mask underlying disorders such as cerebral irritation · Parkinson's disease · uncorrected electrolyte imbalance · young adults (15–19 years old)

- **INTERACTIONS** → Appendix 1: metoclopramide

• SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- **Common or very common** Asthenia · depression · diarrhoea · drowsiness · hypotension · menstrual cycle irregularities · movement disorders · parkinsonism
- **Uncommon** Arrhythmias · hallucination · hyperprolactinaemia · level of consciousness decreased
- **Rare or very rare** Confusion · galactorrhoea · seizure
- **Frequency not known** Atrioventricular block · blood disorders · cardiac arrest · gynaecomastia · hypertension · neuroleptic malignant syndrome · QT interval prolongation · shock · syncope

SPECIFIC SIDE-EFFECTS

- **Frequency not known**
- With parenteral use Anxiety · dizziness · dyspnoea · oedema · skin reactions · tremor · visual impairment

SIDE-EFFECTS, FURTHER INFORMATION Metoclopramide can induce acute dystonic reactions involving facial and skeletal muscle spasms and oculogyric crises. These dystonic effects are more common in the young (especially girls and young women) and the very old; they usually occur shortly after starting treatment with metoclopramide and subside within 24 hours of stopping it. Injection of an antiparkinsonian drug such as procyclidine will abort dystonic attacks.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Small amount present in milk; avoid.
- **HEPATIC IMPAIRMENT**

Dose adjustments Reduce dose.

• RENAL IMPAIRMENT

Dose adjustments Avoid or use small dose in severe impairment; increased risk of extrapyramidal reactions.

- **DIRECTIONS FOR ADMINISTRATION** Oral liquid preparation to be given via a graduated oral dosing syringe.

• PRESCRIBING AND DISPENSING INFORMATION

Palliative care For further information on the use of metoclopramide hydrochloride in palliative care, see www.palliativedrugs.com/formulary/en/metoclopramide.html.

- **PATIENT AND CARER ADVICE** Counselling on use of pipette advised with oral solution.

ANTIEMETICS AND ANTINAUSEANTS > NEUROKININ RECEPTOR ANTAGONISTS**Aprepitant**

13-Sep-2017

• INDICATIONS AND DOSE

Adjunct treatment to prevent nausea and vomiting associated with moderately and highly emetogenic chemotherapy

- BY MOUTH
- **Adult:** Initially 125 mg, dose to be taken 1 hour before chemotherapy, then 80 mg once daily for 2 days, consult product literature for dose of concomitant dexamethasone and 5HT₃-antagonist

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025

- **INTERACTIONS** → Appendix 1: aprepitant

● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · asthenia · constipation · gastrointestinal discomfort · headache · hiccups
- ▶ **Uncommon** Anaemia · anxiety · burping · dizziness · drowsiness · dry mouth · febrile neutropenia · gastrointestinal disorders · hot flush · malaise · nausea · palpitations · skin reactions · urinary disorders · vomiting
- ▶ **Rare or very rare** Bradycardia · cardiovascular disorder · chest discomfort · cognitive disorder · conjunctivitis · cough · disorientation · euphoric mood · gait abnormal · hyperhidrosis · increased risk of infection · muscle spasms · muscle weakness · oedema · oropharyngeal pain · photosensitivity reaction · polydipsia · seborrhoea · severe cutaneous adverse reactions (SCARs) · sneezing · stomatitis · taste altered · throat irritation · tinnitus · weight decreased
- ▶ **Frequency not known** Dysarthria · dyspnoea · insomnia · miosis · sensation abnormal · visual acuity decreased · wheezing

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effectiveness of hormonal contraceptives may be reduced—alternative non-hormonal methods of contraception necessary during treatment and for 2 months after stopping aprepitant.

● **PREGNANCY** Manufacturer advises avoid unless clearly necessary—no information available.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate-to-severe impairment—limited information available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Capable

Fosaprepitant

- **DRUG ACTION** Fosaprepitant is a prodrug of aprepitant.

● INDICATIONS AND DOSE

Adjunct to dexamethasone and a 5HT₃-receptor antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy

▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult:** 150 mg, dose to be administered over 20–30 minutes and given 30 minutes before chemotherapy on day 1 of cycle only, consult product literature for dose of concomitant corticosteroid and 5HT₃-receptor antagonist

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025

- **INTERACTIONS** → Appendix 1: fosaprepitant

● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · asthenia · constipation · gastrointestinal discomfort · headache · hiccups
- ▶ **Uncommon** Anaemia · anxiety · burping · dizziness · drowsiness · dry mouth · febrile neutropenia · gastrointestinal disorders · hot flush · malaise · nausea · palpitations · skin reactions · thrombophlebitis · urinary disorders · vomiting
- ▶ **Rare or very rare** Bradycardia · cardiovascular disorder · chest discomfort · cognitive disorder · conjunctivitis · cough · disorientation · euphoric mood · gait abnormal · hyperhidrosis · increased risk of infection · muscle spasms ·

muscle weakness · oedema · oropharyngeal pain · photosensitivity reaction · polydipsia · seborrhoea · severe cutaneous adverse reactions (SCARs) · sneezing · stomatitis · taste altered · throat irritation · tinnitus · weight decreased

- ▶ **Frequency not known** Dysarthria · dyspnoea · insomnia · miosis · sensation abnormal · visual acuity decreased · wheezing

● **CONCEPTION AND CONTRACEPTION** Effectiveness of hormonal contraceptives reduced—effective non-hormonal methods of contraception necessary during treatment and for 2 months after stopping fosaprepitant.

● **PREGNANCY** Avoid unless potential benefit outweighs risk—no information available.

● **BREAST FEEDING** Avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Caution in moderate to severe impairment.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion (Ivemend®)*, give intermittently in Sodium chloride 0.9%; reconstitute each 150-mg vial with 5 mL sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 145 mL infusion fluid; give over 20–30 minutes.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2011) that fosaprepitant (*Ivemend®*) is accepted for restricted use within NHS Scotland for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based chemotherapy.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Ivemend** (Merck Sharp & Dohme Ltd)

Fosaprepitant (as Fosaprepitant dimeglumine) 150 mg Ivemend 150mg powder for solution for infusion vials | 1 vial [PoM] £47.42

Rolapitant

26-Oct-2017

● INDICATIONS AND DOSE

Adjunct to dexamethasone and a 5HT₃-receptor antagonist in preventing delayed nausea and vomiting associated with moderately and highly emetogenic chemotherapy

▶ **BY MOUTH**

- ▶ **Adult:** 180 mg as a single dose, dose should be administered up to 2 hours before chemotherapy. Interval between repeated doses must be at least 2 weeks, consult product literature for dose of concomitant corticosteroid and 5HT₃-antagonist

- **INTERACTIONS** → Appendix 1: rolapitant

● SIDE-EFFECTS

- ▶ **Common or very common** Asthenia · constipation · headache
- ▶ **Uncommon** Appetite decreased · concentration impaired · diarrhoea · dizziness · drowsiness · gastrointestinal discomfort · hiccups · increased risk of infection · insomnia · myalgia · nausea · neutropenia · stomatitis · taste altered
- ▶ **Rare or very rare** Alopecia · angioedema · anxiety · arthralgia · back pain · dehydration · dry mouth · dyspnoea · gait abnormal · gastrointestinal disorders · hearing impairment · hypertension · hypomagnesaemia · leucopenia · movement disorders · muscle weakness · rhabdomyolysis · skin reactions · syncope · teeth grinding · thrombocytopenia · vision blurred · vomiting
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—limited information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution in severe impairment—limited information available.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

SMC No. 1266/17

The *Scottish Medicines Consortium* has advised (September 2017) that rolapitant (*Varuby*®) is accepted for restricted use within NHS Scotland as a first-line option for the prevention of delayed nausea and vomiting in adults undergoing highly emetogenic chemotherapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) Decisions

AWMSG No. 1303

The *All Wales Medicines Strategy Group* has advised (March 2018) that rolapitant (*Varuby*®) is **not** recommended for use within NHS Wales for the prevention of delayed nausea and vomiting associated with highly and moderately emetogenic cancer chemotherapy in adults. The case for cost-effectiveness has not been proven.

ANTIEMETICS AND ANTINAUSEANTS > SEROTONIN (5HT₃) RECEPTOR ANTAGONISTS

Gransetron

- **DRUG ACTION** Gransetron is a specific 5HT₃-receptor antagonist which blocks 5HT₃ receptors in the gastrointestinal tract and in the CNS.

● INDICATIONS AND DOSE

Nausea and vomiting induced by cytotoxic chemotherapy for planned duration of 3–5 days where oral antiemetics cannot be used

- ▶ BY TRANSDERMAL APPLICATION USING PATCHES
- ▶ Adult: Apply 3.1 mg/24 hours, apply patch to clean, dry, non-irritated, non-hairy skin on upper arm (or abdomen if upper arm cannot be used) 24–48 hours before treatment, patch may be worn for up to 7 days; remove at least 24 hours after completing chemotherapy

Prevention of postoperative nausea and vomiting

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 1 mg, to be administered before induction of anaesthesia, dose to be diluted to 5 mL and given over 30 seconds

Treatment of postoperative nausea and vomiting

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 1 mg, dose to be diluted to 5 mL and given over 30 seconds; maximum 3 mg per day

Management of nausea and vomiting induced by cytotoxic chemotherapy or radiotherapy

- ▶ BY MOUTH
- ▶ Adult: 1–2 mg, to be taken within 1 hour before start of treatment, then 2 mg daily in 1–2 divided doses for up

to 1 week following treatment, when intravenous route also used, maximum combined total dose 9 mg in 24 hours

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 10–40 micrograms/kg (max. per dose 3 mg), to be given 5 minutes before start of treatment, dose may be repeated if necessary, further maintenance doses must not be given less than 10 minutes apart, for intravenous injection, each 1 mg gransetron diluted to 5 mL and given over not less than 30 seconds, for intravenous infusion, to be given over 5 minutes; maximum 9 mg per day

- **CAUTIONS** Subacute intestinal obstruction · susceptibility to QT-interval prolongation (including electrolyte disturbances)
- **INTERACTIONS** → Appendix 1: gransetron
- **SIDE-EFFECTS**
GENERAL SIDE-EFFECTS
 - ▶ Common or very common Constipation · headache
- **SPECIFIC SIDE-EFFECTS**
 - ▶ Common or very common
 - ▶ With intravenous use or with oral use Diarrhoea · insomnia
 - ▶ Uncommon
 - ▶ With intravenous use or with oral use Extrapyramidal symptoms · QT interval prolongation · serotonin syndrome
 - ▶ With transdermal use Appetite decreased · arthralgia · dry mouth · flushing · generalised oedema · nausea · vertigo · vomiting
 - ▶ Rare or very rare
 - ▶ With transdermal use Dystonia
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute up to 3 mL in 20–50 mL infusion fluid; give over 5 minutes.
- **PATIENT AND CARER ADVICE**
 - ▶ With transdermal use Patients should be advised not to expose the site of the patch to sunlight during use and for 10 days after removal.

• INDICATIONS AND DOSE

Moderately emetogenic chemotherapy or radiotherapy

- **BY MOUTH**
 - Adult: Initially 8 mg, dose to be taken 1–2 hours before treatment, then 8 mg every 12 hours for up to 5 days
- **BY RECTUM**
 - Adult: Initially 16 mg, dose to be taken 1–2 hours before treatment, then 16 mg daily for up to 5 days
- **INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
 - Adult: Initially 8 mg, dose to be administered immediately before treatment, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
- **INITIALLY BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION**
 - Elderly: Initially 8 mg, dose to be administered immediately before treatment, intravenous infusion to be given over at least 15 minutes, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

Severely emetogenic chemotherapy (consult product literature for dose of concomitant corticosteroid)

- **BY MOUTH**
 - Adult: 24 mg, dose to be taken 1–2 hours before treatment, then 8 mg every 12 hours for up to 5 days
- **BY RECTUM**
 - Adult: 16 mg, dose to be administered 1–2 hours before treatment, then 16 mg daily for up to 5 days
- **INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
 - Adult: Initially 8 mg, dose to be administered immediately before treatment, followed by (by intramuscular injection or by slow intravenous injection) 8 mg every 4 hours if required for 2 doses, alternatively, followed by (by continuous intravenous infusion) 1 mg/hour for up to 24 hours, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
- **INITIALLY BY INTRAMUSCULAR INJECTION**
 - Adult 65–74 years: Initially 8 mg, to be given immediately before treatment, followed by (by intramuscular injection) 8 mg every 4 hours if required for 2 doses, alternatively, followed by (by continuous intravenous infusion) 1 mg/hour for up to 24 hours, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
- **INITIALLY BY INTRAVENOUS INFUSION**
 - Adult: Initially 16 mg, immediately before treatment (over at least 15 minutes), followed by (by intramuscular injection or by slow intravenous injection) 8 mg every 4 hours if required for 2 doses, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
- **Adult 65–74 years: Initially 8–16 mg, immediately before treatment (over at least 15 minutes), followed by (by intramuscular injection or by intravenous infusion) 8 mg every 4 hours if required for 2 doses, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days**
- **Adult 75 years and over: Initially 8 mg, immediately before treatment (over at least 15 minutes), followed by (by intravenous infusion) 8 mg every 4 hours if required for 2 doses, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days**

Prevention of postoperative nausea and vomiting

- **INITIALLY BY MOUTH**
 - Adult: 16 mg, dose to be taken 1 hour before anaesthesia, alternatively (by intramuscular injection or by slow intravenous injection) 4 mg, dose to be administered at induction of anaesthesia
- **Treatment of postoperative nausea and vomiting**
 - **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
 - Adult: 4 mg for 1 dose

- **CONTRA-INDICATIONS** Congenital long QT syndrome
- **CAUTIONS** Adenotonsillar surgery · subacute intestinal obstruction · susceptibility to QT-interval prolongation (including electrolyte disturbances)
- **INTERACTIONS** → Appendix 1: ondansetron
- **SIDE-EFFECTS**
 - **Common or very common** Constipation · feeling hot · headache · sensation abnormal
 - **Uncommon** Arrhythmias · chest pain · hiccups · hypotension · movement disorders · oculogyric crisis · seizure
 - **Rare or very rare** Dizziness · QT interval prolongation · vision disorders
- **PREGNANCY** No information available; avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Present in milk in *animal* studies—avoid.
- **HEPATIC IMPAIRMENT**
 - **Dose adjustments** Maximum 8 mg daily in moderate or severe impairment.
- **DIRECTIONS FOR ADMINISTRATION**
 - With intravenous use For *intravenous infusion* (Zofran®), give continuously or intermittently in Glucose 5% or Glucose 5% with Potassium chloride 0.3% or Sodium chloride 0.9% or Sodium chloride 0.9% with Potassium chloride 0.3% or Mannitol 10% or Ringers solution; for intermittent infusion, dilute the required dose in 50–100 mL of infusion fluid and give over at least 15 minutes.
 - With oral use Orodispersible films and lyophilisates should be placed on the tongue, allowed to disperse and swallowed.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer orodispersible films and lyophilisates.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

► Ondansetron (Non-proprietary)

Ondansetron (as Ondansetron hydrochloride) 4 mg Ondansetron 4mg tablets | 10 tablet [PoM] £0.81-£25.46 DT = £0.62 | 30 tablet [PoM] £1.86-£76.38

Ondansetron (as Ondansetron hydrochloride) 8 mg Ondansetron 8mg tablets | 10 tablet [PoM] £47.99 DT = £1.73

Ondansetron 4mg/2ml solution for injection ampoules | 5 ampoule [PoM] £1.50-£29.97 DT = £29.97 | 10 ampoule [PoM] £7.50 DT = £7.50

► **Zofran Flexi-amp** (Novartis Pharmaceuticals UK Ltd)

Ondansetron (as Ondansetron hydrochloride) 2 mg per 1 ml Zofran Flexi-amp 8mg/4ml solution for injection | 5 ampoule [PoM] £59.95 DT = £59.95
Zofran Flexi-amp 4mg/2ml solution for injection | 5 ampoule [PoM] £29.97 DT = £29.97

Oral solution► **Ondansetron (Non-proprietary)**

Ondansetron (as Ondansetron hydrochloride) 800 microgram per 1 ml Ondansetron 4mg/5ml oral solution sugar free sugar-free | 50 ml [PoM] £38.22 DT = £38.21

► **Zofran** (Novartis Pharmaceuticals UK Ltd)

Ondansetron (as Ondansetron hydrochloride) 800 microgram per 1 ml Zofran 4mg/5ml syrup sugar-free | 50 ml [PoM] £35.97 DT = £38.21

Orodispersible film► **Setofilm** (Norgine Pharmaceuticals Ltd)

Ondansetron 4 mg Setofilm 4mg orodispersible films sugar-free | 10 film [PoM] £28.50
Ondansetron 8 mg Setofilm 8mg orodispersible films sugar-free | 10 film [PoM] £57.00

Oral lyophilisate

EXCIPIENTS: May contain Aspartame

► **Zofran Melt** (Novartis Pharmaceuticals UK Ltd)

Ondansetron 4 mg Zofran Melt 4mg oral lyophilisates sugar-free | 10 tablet [PoM] £35.97 DT = £35.97
Ondansetron 8 mg Zofran Melt 8mg oral lyophilisates sugar-free | 10 tablet [PoM] £71.94 DT = £71.94

Orodispersible tablet► **Ondansetron (Non-proprietary)**

Ondansetron 4 mg Ondansetron 4mg orodispersible tablets | 10 tablet [PoM] £43.46 DT = £43.46
Ondansetron 8 mg Ondansetron 8mg orodispersible tablets | 10 tablet [PoM] £85.43 DT = £85.43

Palonosetron

- **DRUG ACTION** Palonosetron is a specific 5HT₃-receptor antagonist which blocks 5HT₃ receptors in the gastrointestinal tract and in the CNS.

● **INDICATIONS AND DOSE****Moderately emetogenic chemotherapy**► **INITIALLY BY MOUTH**

- **Adult:** 500 micrograms, dose to be taken 1 hour before treatment, alternatively (by intravenous injection) 250 micrograms for 1 dose, dose to be administered over 30 seconds, 30 minutes before treatment

Severely emetogenic chemotherapy► **BY INTRAVENOUS INJECTION**

- **Adult:** 250 micrograms for 1 dose, dose to be administered over 30 seconds, 30 minutes before treatment

- **CAUTIONS** History of constipation · intestinal obstruction · susceptibility to QT-interval prolongation (including electrolyte disturbances)

- **INTERACTIONS** → Appendix 1: palonosetron

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- **Common or very common** Constipation · headache
- **Uncommon** Dyspnoea

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- **With intravenous use** Diarrhoea · dizziness · electrolyte imbalance · metabolic disorder

► **Uncommon**

- **With intravenous use** Amblyopia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · drowsiness · dry mouth · dyspepsia · euphoric mood · eye irritation · feeling hot · fever · flatulence · glycosuria · hiccups · hyperbilirubinaemia · hyperglycaemia · hypertension · hypotension · influenza like illness · motion sickness · myocardial ischaemia · paraesthesia · peripheral neuropathy · QT interval prolongation · skin reactions · sleep disorders · tinnitus · urinary retention · vasodilation · vein discoloration

- **With oral use** Atrioventricular block · eye swelling · insomnia · myalgia

► **Rare or very rare**

- **With intravenous use** Shock

- **PREGNANCY** Avoid—no information available.

- **BREAST FEEDING** Avoid—no information available.

● **PATIENT AND CARER ADVICE**

- **Driving and skilled tasks** Dizziness or drowsiness may affect performance of skilled tasks (e.g. driving).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection► **Palonosetron (Non-proprietary)**

Palonosetron (as Palonosetron hydrochloride) 50 microgram per 1 ml Palonosetron 250micrograms/5ml solution for injection vials | 1 vial [PoM] £53.10-£55.89

► **Aloxi** (Sinclair IS Pharma Plc)

Palonosetron (as Palonosetron hydrochloride) 50 microgram per 1 ml Aloxi 250micrograms/5ml solution for injection vials | 1 vial [PoM] £55.89

Capsule► **Aloxi** (Sinclair IS Pharma Plc)

Palonosetron (as Palonosetron hydrochloride) 500 microgram Aloxi 500microgram capsules | 1 capsule [PoM] £55.89

Palonosetron with netupitant

20-Jun-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, palonosetron above.

● **INDICATIONS AND DOSE****Moderately emetogenic chemotherapy | Highly emetogenic cisplatin-based chemotherapy**► **BY MOUTH**

- **Adult:** 1 capsule, to be taken approximately 1 hour before the start of each chemotherapy cycle

- **CAUTIONS** Patients over 75 years

- **INTERACTIONS** → Appendix 1: netupitant · palonosetron

● **SIDE-EFFECTS**

- **Common or very common** Asthenia · constipation · headache

- **Uncommon** Alopecia · cardiac conduction disorders · cardiomyopathy · diarrhoea · dizziness · flatulence · gastrointestinal discomfort · hiccups · hypertension · increased leucocytes · neutropenia · QT interval prolongation · sleep disorders · urticaria · vertigo
- **Rare or very rare** Acute psychosis · arrhythmias · conjunctivitis · cystitis · dysphagia · feeling hot · hypokalaemia · hypotension · leucopenia · mitral valve incompetence · mood altered · myocardial ischaemia · numbness · pain · tongue coated · vision blurred

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends exclude pregnancy before treatment in females of childbearing age; ensure effective contraception during treatment and for one month after treatment.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid during treatment and for 1 month after last dose—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* (December 2015) has advised that palonosetron in combination with netupitant (Akyntzeo®) is accepted for restricted use within NHS Scotland for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based cancer chemotherapy.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

Palonosetron (as Palonosetron hydrochloride) 500 microgram, Netupitant 300 mg Akyntzeo 300mg/0.5mg capsules | 1 capsule [POM] £69.00 (Hospital only)

ANTIHISTAMINES > SEDATING

Cinnarizine

● INDICATIONS AND DOSE

Relief of symptoms of vestibular disorders, such as vertigo, tinnitus, nausea, and vomiting in Ménière's disease

► BY MOUTH

- Child 5–11 years: 15 mg 3 times a day
- Child 12–17 years: 30 mg 3 times a day
- Adult: 30 mg 3 times a day

Motion sickness

► BY MOUTH

- Child 5–11 years: Initially 15 mg, dose to be taken 2 hours before travel, then 7.5 mg every 8 hours if required, dose to be taken during journey
- Child 12–17 years: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey
- Adult: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey

- **CONTRA-INDICATIONS** Avoid in Acute porphyrias p. 1025
- **CAUTIONS** Epilepsy · glaucoma (in children) · Parkinson's disease · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · susceptibility to angle-closure glaucoma (in adults) · urinary retention
- **INTERACTIONS** → Appendix 1: antihistamines, sedating
- **SIDE-EFFECTS**
 - **Common or very common** Drowsiness · gastrointestinal discomfort · nausea · weight increased
 - **Uncommon** Fatigue · hyperhidrosis · vomiting
 - **Frequency not known** Dry mouth · gastrointestinal disorder · headache · jaundice · cholestatic · movement disorders · muscle rigidity · parkinsonism · skin reactions · subacute cutaneous lupus erythematosus · tremor
- **PREGNANCY** Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be

harmful, most manufacturers advise their use in mothers who are breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.
- **RENAL IMPAIRMENT** Use with caution—no information available.
- **PATIENT AND CARER ADVICE**
 - **Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. cycling, driving); sedating effects enhanced by alcohol.

► Arlevert (Hampton Pharmaceuticals Ltd)

Cinnarizine 20 mg, Dimenhydrinate 40 mg Arlevert tablets | 100 tablet [POM] £24.00

Promethazine teoclate

● INDICATIONS AND DOSE

Nausea | Vomiting | Labyrinthine disorders

► BY MOUTH

- Child 5–9 years: 12.5–37.5 mg daily
- Child 10–17 years: 25–75 mg daily; maximum 100 mg per day
- Adult: 25–75 mg daily; maximum 100 mg per day

Motion sickness prevention (acts longer than promethazine hydrochloride)

► BY MOUTH

- Child 5–9 years: 12.5 mg once daily, dose to be taken at bedtime on night before travel or 1–2 hours before travel
- Child 10–17 years: 25 mg once daily, dose to be taken at bedtime on night before travel or 1–2 hours before travel
- Adult: 25 mg once daily, dose to be taken at bedtime on night before travel or 1–2 hours before travel

Motion sickness treatment (acts longer than promethazine hydrochloride)

► BY MOUTH

- Child 5–9 years: 12.5 mg, dose to be taken at onset of motion sickness, then 12.5 mg daily for 2 days, dose to be taken at bedtime
- Child 10–17 years: 25 mg, dose to be taken at onset of motion sickness, then 25 mg once daily for 2 days, dose to be taken at bedtime
- Adult: 25 mg, dose to be taken at onset of motion sickness, then 25 mg once daily for 2 days, dose to be taken at bedtime

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN

Children under 6 years should not be given over-the-counter cough and cold medicines containing promethazine.

- **CONTRA-INDICATIONS** Should not be given to children under 2 years, except on specialist advice, because the safety of such use has not been established
- **CAUTIONS** Asthma · bronchiectasis · bronchitis · epilepsy · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · Reye's syndrome · severe coronary artery disease · susceptibility to angle-closure glaucoma · urinary retention
- **INTERACTIONS** → Appendix 1: antihistamines, sedating
- **SIDE-EFFECTS** Anticholinergic syndrome · anxiety · appetite decreased · arrhythmia · blood disorder · bronchial secretion viscosity increased · confusion · dizziness · drowsiness · dry mouth · epigastric discomfort · fatigue · haemolytic anaemia · headache · hypotension · jaundice · movement disorders · muscle spasms · nightmare · palpitations · photosensitivity reaction · urinary retention · vision blurred
- SIDE-EFFECTS, FURTHER INFORMATION** Elderly patients are more susceptible to anticholinergic side-effects.
In children paradoxical stimulation may occur, especially with high doses.
- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.
- **RENAL IMPAIRMENT** Use with caution.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

17-Oct-2016

Hyoscine hydrobromide (Scopolamine hydrobromide)

● INDICATIONS AND DOSE

Motion sickness

► BY MOUTH

- Child 4–9 years: 75–150 micrograms, dose to be taken up to 30 minutes before the start of journey, then 75–150 micrograms every 6 hours if required; maximum 450 micrograms per day
- Child 10–17 years: 150–300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150–300 micrograms every 6 hours if required; maximum 900 micrograms per day
- Adult: 150–300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150–300 micrograms every 6 hours if required; maximum 900 micrograms per day
- **BY TRANSDERMAL APPLICATION**
- Child 10–17 years: Apply 1 patch, apply behind ear 5–6 hours before journey, then apply 1 patch after 72 hours if required, remove old patch and site replacement patch behind the other ear
- Adult: Apply 1 patch, apply behind ear 5–6 hours before journey, then apply 1 patch after 72 hours if required, remove old patch and site replacement patch behind the other ear

Hypersalivation associated with clozapine therapy

► BY MOUTH

- Adult: 300 micrograms up to 3 times a day; maximum 900 micrograms per day

Excessive respiratory secretion (in palliative care)

► BY SUBCUTANEOUS INJECTION

- Adult: 400 micrograms every 4 hours as required, hourly use is occasionally necessary, particularly in excessive respiratory secretions

► BY CONTINUOUS SUBCUTANEOUS INFUSION

- Adult: 1.2–2 mg/24 hours

Bowel colic in palliative care

► BY SUBCUTANEOUS INJECTION

- Adult: 400 micrograms every 4 hours as required, hourly use is occasionally necessary

► BY SUBCUTANEOUS INFUSION

- Adult: 1.2–2 mg/24 hours

Bowel colic pain in palliative care

► BY MOUTH USING SUBLINGUAL TABLETS

- Adult: 300 micrograms 3 times a day, as *Kwells*®.

Premedication

► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- Adult: 200–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia

- **UNLICENSED USE** Not licensed for hypersalivation associated with clozapine therapy.

IMPORTANT SAFETY INFORMATION

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

- **CAUTIONS** Epilepsy

CAUTIONS, FURTHER INFORMATION

- Anticholinergic syndrome In some patients, especially the elderly, hyoscine may cause the central anticholinergic syndrome (excitement, ataxia, hallucinations, behavioural abnormalities, and drowsiness).

- **INTERACTIONS** → Appendix 1: hyoscine

- **SIDE-EFFECTS**

- GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Skin reactions

- SPECIFIC SIDE-EFFECTS**

- ▶ **Common or very common**
 - ▶ With transdermal use Eye disorders · eyelid irritation · myopia
- ▶ **Rare or very rare**
 - ▶ With transdermal use Concentration impaired · disorientation · glaucoma · hallucinations · memory loss · restlessness
- ▶ **Frequency not known**
 - ▶ With oral use Asthma · cardiovascular disorders · central nervous system stimulation · gastrointestinal disorder · hallucination · hypersensitivity · hyperthermia · hypohidrosis · mydriasis · oedema · respiratory tract reaction · restlessness · sedation · seizure
 - ▶ With parenteral use Agitation · angle closure glaucoma · arrhythmias · delirium · dysphagia · dyspnoea · epilepsy exacerbated · hallucination · hypersensitivity · idiosyncratic drug reaction · loss of consciousness · mydriasis · neuroleptic malignant syndrome · photophobia · psychotic disorder · thirst
 - ▶ With transdermal use Balance impaired
- **PREGNANCY** Use only if potential benefit outweighs risk. Injection may depress neonatal respiration.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With transdermal use in children Patch applied to hairless area of skin behind ear; if less than whole patch required either cut with scissors along full thickness ensuring membrane is not peeled away or cover portion to prevent contact with skin.
 - ▶ With oral use in children For administration by mouth, injection solution may be given orally.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of chewable tablet formulations may include raspberry.
Palliative care For further information on the use of hyoscine hydrobromide in palliative care, see www.palliativedrugs.com/formulary/en/hyoscine-hydrobromide.html.
- **PATIENT AND CARER ADVICE**
 - ▶ With transdermal use Explain accompanying instructions to patient and in particular emphasise advice to wash hands after handling and to wash application site after removing, and to use one patch at a time.
 - Driving and skilled tasks** ▶ With transdermal use Drowsiness may persist for up to 24 hours or longer after removal of patch; effects of alcohol enhanced.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, eye drops

Droperidol

- **DRUG ACTION** Droperidol is a butyrophenone, structurally related to haloperidol, which blocks dopamine receptors in the chemoreceptor trigger zone.

- **INDICATIONS AND DOSE**

Prevention and treatment of postoperative nausea and vomiting

- ▶ **BY INTRAVENOUS INJECTION**

- ▶ **Adult:** 0.625–1.25 mg, dose to be given 30 minutes before end of surgery, then 0.625–1.25 mg every 6 hours as required

- ▶ **Elderly:** 625 micrograms, dose to be given 30 minutes before end of surgery, then 625 micrograms every 6 hours as required

Prevention of nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia (PCA)

- ▶ **BY INTRAVENOUS INJECTION**

- ▶ **Adult:** 15–50 micrograms of droperidol for every 1 mg of morphine in PCA, reduce dose in elderly; maximum 5 mg per day

- **CONTRA-INDICATIONS** Bradycardia · CNS depression · comatose states · hypokalaemia · hypomagnesaemia · phaeochromocytoma · QT-interval prolongation

- **CAUTIONS** Chronic obstructive pulmonary disease · electrolyte disturbances · history of alcohol abuse · respiratory failure

- **INTERACTIONS** → Appendix 1: droperidol

- **SIDE-EFFECTS**

- ▶ **Uncommon** Anxiety · oculogyration

- ▶ **Rare or very rare** Arrhythmia · blood disorder · cardiac arrest · dysphoria · movement disorders

- ▶ **Frequency not known** Coma · epilepsy · hallucination · oligomenorrhoea · respiratory disorders · SIADH · syncope

- **BREAST FEEDING** Limited information available—avoid repeated administration.

- **HEPATIC IMPAIRMENT**

Dose adjustments In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required.

For nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia, reduce dose.

- **RENAL IMPAIRMENT**

Dose adjustments In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required.

For nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia, reduce dose.

- **MONITORING REQUIREMENTS** Continuous pulse oximetry required if risk of ventricular arrhythmia—continue for 30 minutes following administration.

F 380

Levomepromazine

(Methotrimeprazine)

12-Dec-2016

● INDICATIONS AND DOSE

Pain in palliative care (reserved for distressed patients with severe pain unresponsive to other measures)

- ▶ BY CONTINUOUS SUBCUTANEOUS INFUSION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: Seek specialist advice

Restlessness and confusion in palliative care

- ▶ BY CONTINUOUS SUBCUTANEOUS INFUSION
- ▶ Child 1-11 years: 0.35–3 mg/kg, to be administered over 24 hours
- ▶ Child 12-17 years: 12.5–200 mg, to be administered over 24 hours
- ▶ BY MOUTH
- ▶ Adult: 6 mg every 2 hours as required
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 6.25 mg every 2 hours as required
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 12.5–50 mg/24 hours, titrated according to response (doses greater than 100 mg/24 hours should be given under specialist supervision)

Nausea and vomiting in palliative care

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INFUSION
- ▶ Child 1 month-11 years: 100–400 micrograms/kg, to be administered over 24 hours
- ▶ Child 12-17 years: 5–25 mg, to be administered over 24 hours
- ▶ BY MOUTH
- ▶ Adult: 6 mg once daily, dose to be taken at bedtime, increased if necessary to 12.5–25 mg twice daily
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 6.25 mg once daily, dose to be given at bedtime, increased if necessary to 12.5–25 mg twice daily
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 5–25 mg/24 hours, sedation can limit the dose

Schizophrenia (bed patients)

- ▶ BY MOUTH
- ▶ Adult: Initially 100–200 mg daily in 3 divided doses, increased if necessary to 1 g daily

Schizophrenia

- ▶ BY MOUTH
- ▶ Adult: Initially 25–50 mg daily in divided doses, dose can be increased as necessary

- **CONTRA-INDICATIONS** CNS depression • comatose states • phaeochromocytoma

- **CAUTIONS** Patients receiving large initial doses should remain supine

CAUTIONS, FURTHER INFORMATION

- ▶ In adults Risk of postural hypotension; not recommended for ambulant patients over 50 years unless risk of hypotensive reaction assessed.

- **INTERACTIONS** → Appendix 1: phenothiazines

● SIDE-EFFECTS

- ▶ **Common or very common** Asthenia • heat stroke
- ▶ **Rare or very rare** Arrhythmia • cardiac arrest • hepatic disorders
- ▶ **Frequency not known** Allergic dermatitis • delirium • gastrointestinal disorders • glucose tolerance impaired • hyponatraemia • photosensitivity reaction • priapism • SIADH • sudden cardiac death

- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.

● RENAL IMPAIRMENT

- ▶ **Dose adjustments** Start with small doses in severe renal impairment because of increased cerebral sensitivity.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With subcutaneous use in children For administration by *subcutaneous infusion* dilute with a suitable volume of Sodium Chloride 0.9%.

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ **Palliative care** For further information on the use of levomepromazine in palliative care, see www.palliativedrugs.com/formulary/en/levomepromazine.html.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

Solution for injection

▶ Levomepromazine (Non-proprietary)

Levomepromazine hydrochloride 25 mg per 1 ml Levomepromazine 25mg/1ml solution for injection ampoules | 10 ampoule [PoM] £20.13 DT = £20.13

▶ Nozinan (Sanofi)

Levomepromazine hydrochloride 25 mg per 1 ml Nozinan 25mg/1ml solution for injection ampoules | 10 ampoule [PoM] £20.13 DT = £20.13

Tablet

CAUTIONARY AND ADVISORY LABELS 2

5.1 Ménière's disease

HISTAMINE ANALOGUES

Betahistine dihydrochloride

● INDICATIONS AND DOSE

Vertigo, tinnitus and hearing loss associated with Ménière's disease

- ▶ BY MOUTH
- ▶ Adult: Initially 16 mg 3 times a day, dose preferably taken with food; maintenance 24–48 mg daily

- **CONTRA-INDICATIONS** Phaeochromocytoma

- **CAUTIONS** Asthma • history of peptic ulcer

- **INTERACTIONS** → Appendix 1: betahistine

● SIDE-EFFECTS

- ▶ **Common or very common** Gastrointestinal discomfort • headache • nausea
- ▶ **Frequency not known** Allergic dermatitis • vomiting

- **PREGNANCY** Avoid unless clearly necessary—no information available.

- **BREAST FEEDING** Use only if potential benefit outweighs risk—no information available.

● MEDICINAL FORMS

6 Pain

Analgesics

Pain relief

The non-opioid drugs, paracetamol p. 438 and aspirin p. 121 (and other NSAIDs), are particularly suitable for pain in musculoskeletal conditions, whereas the opioid analgesics are more suitable for moderate to severe pain, particularly of visceral origin.

Pain in sickle-cell disease

The pain of mild sickle-cell crises is managed with paracetamol, a NSAID, codeine phosphate p. 448, or dihydrocodeine tartrate p. 450. Severe crises may require the use of morphine p. 456 or diamorphine hydrochloride p. 449; concomitant use of a NSAID may potentiate analgesia and allow lower doses of the opioid to be used. Pethidine hydrochloride p. 463 should be avoided if possible because accumulation of a neurotoxic metabolite can precipitate seizures; the relatively short half-life of pethidine hydrochloride necessitates frequent injections.

Dental and orofacial pain

Analgesics should be used judiciously in dental care as a **temporary** measure until the cause of the pain has been dealt with.

Dental pain of inflammatory origin, such as that associated with pulpitis, apical infection, localised osteitis or pericoronitis is usually best managed by treating the infection, providing drainage, restorative procedures, and other local measures. Analgesics provide temporary relief of pain (usually for about 1 to 7 days) until the causative factors have been brought under control. In the case of pulpitis, intra-osseous infection or abscess, reliance on analgesics alone is usually inappropriate.

Similarly the pain and discomfort associated with acute problems of the oral mucosa (e.g. acute herpetic gingivostomatitis, erythema multiforme) may be relieved by benzydamine hydrochloride p. 1180 mouthwash or spray until the cause of the mucosal disorder has been dealt with. However, where a patient is febrile, the antipyretic action of paracetamol or ibuprofen p. 1106 is often helpful.

The *choice* of an analgesic for dental purposes should be based on its suitability for the patient. Most dental pain is relieved effectively by non-steroidal anti-inflammatory drugs (NSAIDs). NSAIDs that are used for dental pain include ibuprofen, diclofenac sodium p. 1101, and aspirin. Paracetamol has analgesic and antipyretic effects but no anti-inflammatory effect.

Opioid analgesics such as dihydrocodeine tartrate act on the central nervous system and are traditionally used for *moderate to severe pain*. However, opioid analgesics are relatively ineffective in dental pain and their side-effects can be unpleasant. Paracetamol, ibuprofen, or aspirin are

adequate for most cases of dental pain and an opioid is rarely required.

Combining a non-opioid with an opioid analgesic can provide greater relief of pain than either analgesic given alone. However, this applies only when an adequate dose of each analgesic is used. Most combination analgesic preparations have not been shown to provide greater relief of pain than an adequate dose of the non-opioid component given alone. Moreover, combination preparations have the disadvantage of an increased number of side-effects.

Any analgesic given before a dental procedure should have a low risk of increasing postoperative bleeding. In the case of pain after the dental procedure, taking an analgesic before the effect of the local anaesthetic has worn off can improve control. Postoperative analgesia with ibuprofen or aspirin is usually continued for about 24 to 72 hours.

Temporomandibular dysfunction can be related to anxiety in some patients who may clench or grind their teeth (bruxism) during the day or night. The muscle spasm (which appears to be the main source of pain) may be treated empirically with an overlay appliance which provides a free sliding occlusion and may also interfere with grinding. In addition, diazepam p. 340, which has muscle relaxant as well as anxiolytic properties, may be helpful but it should only be prescribed on a short-term basis during the acute phase. Analgesics such as aspirin or ibuprofen may also be required.

Dysmenorrhoea

Use of an oral contraceptive prevents the pain of dysmenorrhoea which is generally associated with ovulatory cycles. If treatment is necessary paracetamol or a NSAID will generally provide adequate relief of pain. The vomiting and severe pain associated with dysmenorrhoea in women with endometriosis may call for an antiemetic (in addition to an analgesic). Antispasmodics (such as alverine citrate p. 86) have been advocated for dysmenorrhoea but the antispasmodic action does not generally provide significant relief.

Non-opioid analgesics and compound analgesic preparations

Aspirin is indicated for headache, transient musculoskeletal pain, dysmenorrhoea, and pyrexia. In inflammatory conditions, most physicians prefer anti-inflammatory treatment with another NSAID which may be better tolerated and more convenient for the patient. Aspirin is used increasingly for its antiplatelet properties. Aspirin tablets or dispersible aspirin tablets are adequate for most purposes as they act rapidly.

Gastric irritation may be a problem; it is minimised by taking the dose after food. Enteric-coated preparations are available, but have a slow onset of action and are therefore unsuitable for single-dose analgesic use (though their prolonged action may be useful for night pain).

Aspirin interacts significantly with a number of other drugs and its interaction with warfarin sodium p. 139 is a **special hazard**.

Paracetamol is similar in efficacy to aspirin, but has no demonstrable anti-inflammatory activity; it is less irritant to the stomach and for that reason is now generally preferred to aspirin, particularly in the elderly. **Overdosage** with paracetamol is particularly dangerous as it may cause hepatic damage which is sometimes not apparent for 4 to 6 days.

Nefopam hydrochloride p. 440 may have a place in the relief of persistent pain unresponsive to other non-opioid analgesics. It causes little or no respiratory depression, but sympathomimetic and antimuscarinic side-effects may be troublesome.

Non-steroidal anti-inflammatory analgesics (NSAIDs) are particularly useful for the treatment of patients with chronic disease accompanied by pain and inflammation. Some of them are also used in the short-term treatment of

mild to moderate pain including transient musculoskeletal pain but paracetamol is now often preferred, particularly in the elderly. They are also suitable for the relief of pain in *dysmenorrhoea* and to treat pain caused by *secondary bone tumours*, many of which produce lysis of bone and release prostaglandins. Selective inhibitors of cyclo-oxygenase-2 may be used in preference to non-selective NSAIDs for patients at high risk of developing serious gastro-intestinal side-effects. Several NSAIDs are also used for postoperative analgesia.

A non-opioid analgesic administered by intrathecal infusion (**ziconotide** (*Prialt*®), available from Eisai) is licensed for the treatment of chronic severe pain; ziconotide can be used by a hospital specialist as an adjunct to opioid analgesics.

Compound analgesic preparations

Compound analgesic preparations that contain a simple analgesic (such as aspirin or paracetamol p. 438) with an opioid component reduce the scope for effective titration of the individual components in the management of pain of varying intensity.

Compound analgesic preparations containing paracetamol or aspirin p. 121 with a *low dose* of an opioid analgesic (e.g. 8 mg of codeine phosphate p. 448 per compound tablet) are commonly used, but the advantages have not been substantiated. The low dose of the opioid may be enough to cause opioid side-effects (in particular, constipation) and can complicate the treatment of **overdosage** yet may not provide significant additional relief of pain.

A *full dose* of the opioid component (e.g. 60 mg codeine phosphate) in compound analgesic preparations effectively augments the analgesic activity but is associated with the full range of opioid side-effects (including nausea, vomiting, severe constipation, drowsiness, respiratory depression, and risk of dependence on long-term administration).

Important: the elderly are particularly susceptible to opioid side-effects and should receive lower doses.

In general, when assessing pain, it is necessary to weigh up carefully whether there is a need for a non-opioid and an opioid analgesic to be taken simultaneously.

Caffeine is a weak stimulant that is often included, in small doses, in analgesic preparations. It is claimed that the addition of caffeine may enhance the analgesic effect, but the alerting effect, mild habit-forming effect and possible provocation of headache may not always be desirable. Moreover, in excessive dosage or on withdrawal caffeine may itself induce headache.

Co-proxamol tablets (dextropropoxyphene in combination with paracetamol) are no longer licensed because of safety concerns, particularly toxicity in overdose. Co-proxamol tablets [unlicensed] may still be prescribed for patients who find it difficult to change, because alternatives are not effective or suitable.

Opioid analgesics and dependence

Opioid analgesics are usually used to relieve moderate to severe pain particularly of visceral origin. Repeated administration may cause dependence and tolerance, but this is no deterrent in the control of pain in terminal illness. Regular use of a potent opioid may be appropriate for certain cases of chronic non-malignant pain; treatment should be supervised by a specialist and the patient should be assessed at regular intervals.

Strong opioids

Morphine p. 456 remains the most valuable opioid analgesic for severe pain although it frequently causes nausea and vomiting. It is the standard against which other opioid analgesics are compared. In addition to relief of pain, morphine also confers a state of euphoria and mental detachment.

Morphine is the opioid of choice for the oral treatment of *severe pain in palliative care*. It is given regularly every

4 hours (or every 12 or 24 hours as modified-release preparations).

Buprenorphine p. 442 has both opioid agonist and antagonist properties and may precipitate withdrawal symptoms, including pain, in patients dependent on other opioids. It has abuse potential and may itself cause dependence. It has a much longer duration of action than morphine and sublingually is an effective analgesic for 6 to 8 hours. Unlike most opioid analgesics, the effects of buprenorphine are only partially reversed by naloxone hydrochloride p. 1329.

Dipipanone hydrochloride used alone is less sedating than morphine but the only preparation available contains an antiemetic and is therefore not suitable for regular regimens in palliative care.

Diamorphine hydrochloride p. 449 (heroin) is a powerful opioid analgesic. It may cause less nausea and hypotension than morphine. In *palliative care* the greater solubility of diamorphine hydrochloride allows effective doses to be injected in smaller volumes and this is important in the emaciated patient.

Alfentanil p. 1304, fentanyl p. 451 and remifentanyl p. 1304 are used by injection for intra-operative analgesia; fentanyl is available in a transdermal drug delivery system as a self-adhesive patch which is changed every 72 hours.

Methadone hydrochloride p. 495 is less sedating than morphine and acts for longer periods. In prolonged use, methadone hydrochloride should not be administered more often than twice daily to avoid the risk of accumulation and opioid overdose. Methadone hydrochloride may be used instead of morphine in the occasional patient who experiences excitation (or exacerbation of pain) with morphine.

Oxycodone hydrochloride p. 459 has an efficacy and side-effect profile similar to that of morphine. It is used primarily for control of *pain in palliative care*.

Papaveretum p. 462 is rarely used; morphine is easier to prescribe and less prone to error with regard to the strength and dose.

Pentazocine p. 462 has both agonist and antagonist properties and precipitates withdrawal symptoms, including pain in patients dependent on other opioids. By injection it is more potent than dihydrocodeine tartrate p. 450 or codeine phosphate, but hallucinations and thought disturbances may occur. It is not recommended and, in particular, should be avoided after myocardial infarction as it may increase pulmonary and aortic blood pressure as well as cardiac work.

Pethidine hydrochloride p. 463 produces prompt but short-lasting analgesia; it is less constipating than morphine, but even in high doses is a less potent analgesic. It is not suitable for severe continuing pain. It is used for analgesia in labour; however, other opioids, such as morphine or diamorphine hydrochloride, are often preferred for obstetric pain.

Tapentadol p. 464 produces analgesia by two mechanisms. It is an opioid-receptor agonist and it also inhibits noradrenaline reuptake. Nausea, vomiting, and constipation are less likely to occur with tapentadol than with other strong opioid analgesics.

Tramadol hydrochloride p. 464 produces analgesia by two mechanisms: an opioid effect and an enhancement of serotonergic and adrenergic pathways. It has fewer of the typical opioid side-effects (notably, less respiratory depression, less constipation and less addiction potential); psychiatric reactions have been reported.

Weak opioids

Codeine phosphate can be used for the relief of mild to moderate pain where other painkillers such as paracetamol or ibuprofen p. 1106 have proved ineffective.

Dihydrocodeine tartrate has an analgesic efficacy similar to that of codeine phosphate. Higher doses may provide

some additional pain relief but this may be at the cost of more nausea and vomiting.

Meptazinol p. 456 is claimed to have a low incidence of respiratory depression. It has a reported length of action of 2 to 7 hours with onset within 15 minutes.

Postoperative analgesia

A combination of opioid and non-opioid analgesics is used to treat postoperative pain. The use of intra-operative opioids affects the prescribing of postoperative analgesics. A postoperative opioid analgesic should be given with care since it may potentiate any residual respiratory depression.

Morphine is used most widely. Tramadol hydrochloride is not as effective in severe pain as other opioid analgesics. Buprenorphine may antagonise the analgesic effect of previously administered opioids and is generally not recommended. Pethidine hydrochloride is generally not recommended for postoperative pain because it is metabolised to norpethidine which may accumulate, particularly in renal impairment; norpethidine stimulates the central nervous system and may cause convulsions.

Opioids are also given epidurally [unlicensed route] in the postoperative period but are associated with side-effects such as pruritus, urinary retention, nausea and vomiting; respiratory depression can be delayed, particularly with morphine p. 456.

Patient-controlled analgesia (PCA) can be used to relieve postoperative pain—consult individual hospital protocols.

Pain management and opioid dependence

Although caution is necessary, patients who are dependent on opioids or have a history of drug dependence may be treated with opioid analgesics when there is a clinical need. Treatment with opioid analgesics in this patient group should normally be carried out with the advice of specialists. However, doctors do not require a special licence to prescribe opioid analgesics to patients with opioid dependence for relief of pain due to organic disease or injury.

Other drugs used for Pain Dexibuprofen, p. 1098 • Diclofenac potassium, p. 1100 • Fenoprofen, p. 1105 • Levomepromazine, p. 435 • Mefenamic acid, p. 1111

ANAESTHETICS, GENERAL > VOLATILE LIQUID ANAESTHETICS

Methoxyflurane

30-Jan-2018

● INDICATIONS AND DOSE

Moderate-to-severe pain associated with trauma (under close medical supervision)

- ▶ BY INHALATION
- ▶ Adult: 3–6 mL as required, avoid administration on consecutive days; administer using inhaler device; maximum 15 mL per week

IMPORTANT SAFETY INFORMATION

Manufacturer advises methoxyflurane should only be self-administered under the supervision of personnel experienced in its use, using a hand-held *Pentrox*® inhaler device.

- **CONTRA-INDICATIONS** Cardiovascular disease • history of liver damage associated with use of methoxyflurane or other halogenated anaesthetics • impaired consciousness • respiratory depression • susceptibility to malignant hyperthermia
- **CAUTIONS** Elderly—increased risk of hypotension • repeated administration more than once every 3 months—increased risk of hepatic injury • risk factors for hepatic impairment • risk factors for renal impairment

- **INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety • cough • depression • dizziness • drowsiness • dry mouth • dysarthria • headache • hyperhidrosis • hypotension • memory loss • mood altered • nausea • neuropathy sensory • taste altered
- ▶ **Uncommon** Appetite increased • chills • fatigue • oral discomfort • paraesthesia • vision disorders
- ▶ **Rare or very rare** Hepatic disorders
- ▶ **Frequency not known** Consciousness impaired • disorientation • dissociation • hypoxia • nystagmus • renal failure • vomiting

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to fluorinated anaesthetics.

- **PREGNANCY** Manufacturer advises use with caution—limited information available.

- **BREAST FEEDING** Manufacturer advises use with caution—limited information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **RENAL IMPAIRMENT** Manufacturer advises avoid.

- **PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of *Pentrox*® has provided an *Administration Checklist* and an *Administration Guide* for healthcare professionals.

- **HANDLING AND STORAGE** Manufacturer advises exposure of healthcare professionals to methoxyflurane should be minimised—risk of serious side-effects.

- **PATIENT AND CARER ADVICE** Manufacturer advises that patients should be given advice on appropriate inhaler technique.

A patient alert card should be provided.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and drowsiness.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

● INDICATIONS AND DOSE

Mild to moderate pain | Pyrexia

- ▶ BY MOUTH
- ▶ Adult: 0.5–1 g every 4–6 hours; maximum 4 g per day
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult (body-weight up to 50 kg): 15 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 60 mg/kg per day
- ▶ Adult (body-weight 50 kg and above): 1 g every 4–6 hours, dose to be administered over 15 minutes; maximum 4 g per day
- ▶ BY RECTUM
- ▶ Adult: 0.5–1 g every 4–6 hours; maximum 4 g per day

Mild to moderate pain in patients with risk factors for hepatotoxicity | Pyrexia in patients with risk factors for hepatotoxicity

► BY INTRAVENOUS INFUSION

- Adult (body-weight up to 50 kg): 15 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 60 mg/kg per day
- Adult (body-weight 50 kg and above): 1 g every 4–6 hours, dose to be administered over 15 minutes; maximum 3 g per day

Pain | Pyrexia with discomfort

► BY MOUTH

- Child 3–5 months: 60 mg every 4–6 hours; maximum 4 doses per day
- Child 6 months–1 year: 120 mg every 4–6 hours; maximum 4 doses per day
- Child 2–3 years: 180 mg every 4–6 hours; maximum 4 doses per day
- Child 4–5 years: 240 mg every 4–6 hours; maximum 4 doses per day
- Child 6–7 years: 240–250 mg every 4–6 hours; maximum 4 doses per day
- Child 8–9 years: 360–375 mg every 4–6 hours; maximum 4 doses per day
- Child 10–11 years: 480–500 mg every 4–6 hours; maximum 4 doses per day
- Child 12–15 years: 480–750 mg every 4–6 hours; maximum 4 doses per day
- Child 16–17 years: 0.5–1 g every 4–6 hours; maximum 4 doses per day

► BY RECTUM

- Child 3–11 months: 60–125 mg every 4–6 hours as required; maximum 4 doses per day
- Child 1–4 years: 125–250 mg every 4–6 hours as required; maximum 4 doses per day
- Child 5–11 years: 250–500 mg every 4–6 hours as required; maximum 4 doses per day
- Child 12–17 years: 500 mg every 4–6 hours

Prophylaxis of post-immunisation pyrexia following immunisation with meningococcal group B vaccine (Bexsero[®]) given as part of the routine immunisation schedule

► BY MOUTH

- Child 2 months: 60 mg, first dose to be given at the time of vaccination, then 60 mg after 4–6 hours, then 60 mg after 4–6 hours, use weight-based doses for preterm infants born at less than 32 weeks gestation and currently weighing less than 4 kg—see oral doses for pain and pyrexia with discomfort
- Child 4 months: 60 mg, first dose to be given at the time of vaccination, then 60 mg after 4–6 hours, then 60 mg after 4–6 hours, use weight-based doses for preterm infants born at less than 32 weeks gestation and currently weighing less than 4 kg—see oral doses for pain and pyrexia with discomfort

Post-immunisation pyrexia in infants

► BY MOUTH

- Child 2–3 months: 60 mg for 1 dose, then 60 mg after 4–6 hours if required
- Child 4 months: 60 mg for 1 dose, then 60 mg after 4–6 hours; maximum 4 doses per day

- **UNLICENSED USE** Paracetamol oral suspension 500 mg/5 mL not licensed for use in children under 16 years. [EvGr](#) Not licensed for use as prophylaxis of post-immunisation pyrexia following immunisation with meningococcal group B vaccine. [E](#)
- **CAUTIONS** Before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours • body-weight under 50 kg • chronic alcohol consumption • chronic dehydration • chronic

malnutrition • hepatocellular insufficiency • long-term use (especially in those who are malnourished)

CAUTIONS, FURTHER INFORMATION [EvGr](#) Some patients may be at increased risk of experiencing toxicity at therapeutic doses, particularly those with a body-weight under 50 kg and those with risk factors for hepatotoxicity. Clinical judgement should be used to adjust the dose of oral and intravenous paracetamol in these patients.

Co-administration of enzyme-inducing antiepileptic medications may increase toxicity; doses should be reduced. [E](#)

● **INTERACTIONS** → Appendix 1: paracetamol● **SIDE-EFFECTS**● **GENERAL SIDE-EFFECTS**► **Rare or very rare** Thrombocytopenia● **SPECIFIC SIDE-EFFECTS**► **Common or very common**

► With rectal use Anorectal erythema

► **Rare or very rare**

► With intravenous use Hypersensitivity • hypotension • leucopenia • malaise • neutropenia

► With rectal use Angioedema • liver injury • skin reactions

► **Frequency not known**

► With intravenous use Flushing • skin reactions • tachycardia

► With oral use Agranulocytosis • bronchospasm • hepatic function abnormal • severe cutaneous adverse reactions (SCARs)

► With rectal use Agranulocytosis • blood disorder

Overdose Important: liver damage and less frequently renal damage can occur following overdose.

Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis.

For specific details on the management of poisoning, see Paracetamol, under Emergency treatment of poisoning p. 1319.

● **PREGNANCY** Not known to be harmful.● **BREAST FEEDING** Amount too small to be harmful.● **HEPATIC IMPAIRMENT** Dose-related toxicity—avoid large doses.● **RENAL IMPAIRMENT**

Dose adjustments Increase infusion dose interval to every 6 hours if eGFR less than 30 mL/minute/1.73 m².

● **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Perfalgan*[®]), give in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of not less than 1 mg/mL and use within an hour; may also be given undiluted. For children under 33 kg, use 50 mL-vial.● **PRESCRIBING AND DISPENSING INFORMATION** BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed Paracetamol Oral Suspension 120 mg/5 mL should be dispensed.● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Paracetamol for mild-to-moderate pain www.medicinesforchildren.org.uk/paracetamol-for-mildtomoderate-pain

● **PROFESSION SPECIFIC INFORMATION****Dental practitioners' formulary**

Paracetamol Tablets may be prescribed.

Paracetamol Soluble Tablets 500 mg may be prescribed.

Paracetamol Oral Suspension may be prescribed.

● **EXCEPTIONS TO LEGAL CATEGORY** Paracetamol capsules or tablets can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

- Paracetamol 1g/100ml solution for infusion vials | 10 vial [PoM](#) £12.00
- **Perfalgan** (Bristol-Myers Squibb Pharmaceuticals Ltd)
- Paracetamol 10 mg per 1 ml** Perfalgan 1g/100ml solution for infusion vials | 12 vial [PoM](#) £14.96
- Perfalgan 500mg/50ml solution for infusion vials | 12 vial [PoM](#) £13.60

Oral solution

CAUTIONARY AND ADVISORY LABELS 30

► Paracetamol (Non-proprietary)

- Paracetamol 24 mg per 1 ml** Paracetamol 120mg/5ml oral solution paediatric sugar free sugar-free | 2000 ml [P](#) £23.80 DT = £23.80
- Paracetamol 100 mg per 1 ml** Paracetamol 500mg/5ml oral solution sugar free sugar-free | 150 ml [PoM](#) £24.00 sugar-free | 200 ml [PoM](#) £18.00 DT = £18.00

Powder

► Paracetamol (Non-proprietary)

- Paracetamol 1 gram** Paracetamol 1g oral powder sachets | 10 sachet [GSL](#) £1.11
- Brands may include Abidine Cold Relief

Capsule

CAUTIONARY AND ADVISORY LABELS 29, 30

► Paracetamol (Non-proprietary)

- Paracetamol 500 mg** Paracetamol 500mg capsules | 100 capsule [PoM](#) £3.84 DT = £1.88

Orodispersible tablet

CAUTIONARY AND ADVISORY LABELS 30

► Calpol Fastmelts (McNeil Products Ltd)

- Paracetamol 250 mg** Calpol Six Plus Fastmelts 250mg tablets sugar-free | 24 tablet [P](#) £4.12

Combinations available: *Co-codamol*, p. 447 • *Dihydrocodeine with paracetamol*, p. 450

ANALGESICS > NON-OPIOID, CENTRALLY ACTING

Nefopam hydrochloride

• INDICATIONS AND DOSE

Moderate pain

- **BY MOUTH**
- **Adult:** Initially 60 mg 3 times a day, adjusted according to response; usual dose 30–90 mg 3 times a day
- **Elderly:** Initially 30 mg 3 times a day, adjusted according to response; usual dose 30–90 mg 3 times a day

- **CONTRA-INDICATIONS** Convulsive disorders • not indicated for myocardial infarction

- **CAUTIONS** Elderly • urinary retention

- **INTERACTIONS** → Appendix 1: nefopam

• SIDE-EFFECTS

- **Uncommon** Coma • drowsiness • headache • hyperhidrosis • insomnia • tachycardia • vision blurred • vomiting
- **Rare or very rare** Urine red
- **Frequency not known** Abdominal pain • angioedema • confusion • diarrhoea • dizziness • dry mouth • gastrointestinal disorder • hallucination • hypotension • nausea • nervousness • palpitations • paraesthesia • seizure • syncope • tremor • urinary retention

- **PREGNANCY** No information available—avoid unless no safer treatment.

- **HEPATIC IMPAIRMENT** Caution.

- **RENAL IMPAIRMENT** Caution.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 14

► Nefopam hydrochloride (Non-proprietary)

Nefopam hydrochloride 30 mg Nefopam 30mg tablets | 90 tablet [PoM] £68.39 DT = £16.41

ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

Aspirin with codeine

The properties listed below are those particular to the combination only. For the properties of the components please consider, aspirin p. 121, codeine phosphate p. 448.

INDICATIONS AND DOSE

Mild to moderate pain | Pyrexia

► BY MOUTH

- Adult: 1–2 tablets every 4–6 hours as required, dose to be dispersed in water; maximum 8 tablets per day

INTERACTIONS → Appendix 1: aspirin · opioids

PRESCRIBING AND DISPENSING INFORMATION

When co-codaprin tablets or dispersible tablets are prescribed and no strength is stated, tablets or dispersible tablets, respectively, containing codeine phosphate 8 mg and aspirin 400 mg should be dispensed.

LESS SUITABLE FOR PRESCRIBING

Aspirin with codeine is less suitable for prescribing.

EXCEPTIONS TO LEGAL CATEGORY

Aspirin with codeine can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 13, 21, 32

► Aspirin with codeine (Non-proprietary)

Codeine phosphate 8 mg, Aspirin 400 mg Co-codaprin 8mg/400mg dispersible tablets | 100 tablet [PoM] £97.55 DT = £92.19 [CD5]

► Codis (Reckitt Benckiser Healthcare (UK) Ltd)

Codeine phosphate 8 mg, Aspirin 500 mg Codis 500 dispersible tablets sugar-free | 32 tablet [P] £3.23 [CD5]

Tablet

► Aspirin with codeine (Non-proprietary)

Codeine phosphate 8 mg, Aspirin 400 mg Aspirin and Codeine tablets | 32 tablet [P] [CD5]

ANALGESICS > OPIOIDS

Opioids

CONTRA-INDICATIONS

Acute respiratory depression · comatose patients · head injury (opioid analgesics interfere with pupillary responses vital for neurological assessment) · raised intracranial pressure (opioid analgesics interfere with pupillary responses vital for neurological assessment) · risk of paralytic ileus

CAUTIONS

Adrenocortical insufficiency (reduced dose is recommended) · asthma (avoid during an acute attack) · convulsive disorders · debilitated patients (reduced dose is recommended) (in adults) · diseases of the biliary tract · elderly (reduced dose is recommended) · hypotension · hypothyroidism (reduced dose is recommended) · impaired respiratory function (avoid in chronic obstructive pulmonary disease) · inflammatory bowel disorders ·

myasthenia gravis · obstructive bowel disorders · prostatic hypertrophy (in adults) · shock · urethral stenosis (in adults)

CAUTIONS, FURTHER INFORMATION

- Dependence Repeated use of opioid analgesics is associated with the development of psychological and physical dependence; although this is rarely a problem with therapeutic use, caution is advised if prescribing for patients with a history of drug dependence.
- Palliative care In the control of pain in terminal illness, the cautions listed should not necessarily be a deterrent to the use of opioid analgesics.

SIDE-EFFECTS

- Common or very common Arrhythmias · confusion · constipation · dizziness · drowsiness (uncommon in children) · dry mouth · euphoric mood · flushing · hallucination · headache (uncommon in children) · hyperhidrosis · hypotension (with high doses) · miosis · nausea (more common on initiation) · palpitations · respiratory depression (frequency not known in children, with high doses) · skin reactions · urinary retention · vertigo · visual impairment (uncommon in children) · vomiting (more common on initiation)
- Uncommon Drug dependence · drug tolerance · dysphoria · withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION

Respiratory depression Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by naloxone.

Dependence and withdrawal Psychological dependence rarely occurs when opioids are used therapeutically (e.g. for pain relief), but tolerance can develop during long-term treatment.

Overdose Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. For details on the management of poisoning, see Opioids, under Emergency treatment of poisoning p. 1319 and consider the specific antidote, naloxone hydrochloride.

- PREGNANCY** Respiratory depression and withdrawal symptoms can occur in the neonate if opioid analgesics are used during delivery; also gastric stasis and inhalation pneumonia has been reported in the mother if opioid analgesics are used during labour.
- HEPATIC IMPAIRMENT** Avoid use or reduce dose; may precipitate coma in patients with hepatic impairment.
- TREATMENT CESSATION** Avoid abrupt withdrawal after long-term treatment; they should be withdrawn gradually to avoid abstinence symptoms.
- PRESCRIBING AND DISPENSING INFORMATION** The Faculty of Pain Medicine has produced resources for healthcare professionals around opioid prescribing: www.fpm.ac.uk/faculty-of-pain-medicine/opioids-aware

PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced. Driving at the start of therapy with opioid analgesics, and following dose changes, should be avoided.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including opioids, see *Drugs and driving* under Guidance on prescribing p. 1.

Buprenorphine

19-Oct-2017

- **DRUG ACTION** Buprenorphine is an opioid-receptor partial agonist (it has opioid agonist and antagonist properties).

● INDICATIONS AND DOSE

Moderate to severe pain

- ▶ BY SUBLINGUAL ADMINISTRATION
- ▶ Child (body-weight 16–25 kg): 100 micrograms every 6–8 hours
- ▶ Child (body-weight 25–37.5 kg): 100–200 micrograms every 6–8 hours
- ▶ Child (body-weight 37.5–50 kg): 200–300 micrograms every 6–8 hours
- ▶ Child (body-weight 50 kg and above): 200–400 micrograms every 6–8 hours
- ▶ Adult: 200–400 micrograms every 6–8 hours
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION
- ▶ Child 6 months–11 years: 3–6 micrograms/kg every 6–8 hours (max. per dose 9 micrograms/kg)
- ▶ Child 12–17 years: 300–600 micrograms every 6–8 hours
- ▶ Adult: 300–600 micrograms every 6–8 hours

Premedication

- ▶ BY SUBLINGUAL ADMINISTRATION
- ▶ Adult: 400 micrograms
- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 300 micrograms

Intra-operative analgesia

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 300–450 micrograms

Adjunct in the treatment of opioid dependence

- ▶ BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS
- ▶ Adult: Initially 0.8–4 mg for 1 dose on the first day, adjusted in steps of 2–4 mg daily if required; usual dose 12–24 mg daily; maximum 32 mg per day
- ▶ BY MOUTH USING ORAL LYOPHILISATE
- ▶ Adult: Initially 2 mg daily, followed by 2–4 mg if required on day one, adjusted in steps of 4 mg daily if required, for adjustment of dosing interval following stabilisation, consult product literature; maximum 18 mg per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ For opioid substitution therapy, in patients taking methadone who want to switch to buprenorphine, the dose of methadone should be reduced to a maximum of 30 mg daily before starting buprenorphine treatment—consult product literature. For *sublingual tablets*, if the dose of methadone is over 10 mg daily, buprenorphine can be started at a dose of 4 mg daily and titrated according to requirements; if the methadone dose is below 10 mg daily, buprenorphine can be started at a dose of 2 mg daily.

BUTRANS®

Moderate, non-malignant pain unresponsive to non-opioid analgesics

- ▶ BY TRANSDERMAL APPLICATION USING PATCHES
- ▶ Adult: Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

BUPEAZE®

Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic

- ▶ BY TRANSDERMAL APPLICATION USING PATCHES
- ▶ Adult: Initially 35 micrograms/hour up to every 96 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

Moderate to severe chronic cancer pain in patients who have previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have previously received strong opioid analgesic

- ▶ BY TRANSDERMAL APPLICATION USING PATCHES
- ▶ Adult: The initial dose should be based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

PHARMACOKINETICS

- ▶ For *Bupeaze*®: it may take approximately 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

BUPLAST®

Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic

- ▶ BY TRANSDERMAL APPLICATION USING PATCHES
- ▶ Adult: Initially 35 micrograms/hour up to every 96 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

Moderate to severe chronic cancer pain in patients who have previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have previously received strong opioid analgesic

- ▶ BY TRANSFERMAL APPLICATION USING PATCHES
- ▶ Adult: The initial dose should be based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

PHARMACOKINETICS

- ▶ For *Buplast*®: it may take approximately 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

BUPRAMYL®**Moderate, non-malignant pain unresponsive to non-opioid analgesics**

▶ BY TRANSDERMAL APPLICATION USING PATCHES

- ▶ Adult: Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

PHARMACOKINETICS

- ▶ For *Bupramyl*®: it may take approximately 12 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

BUTEC®**Moderate, non-malignant pain unresponsive to non-opioid analgesics**

▶ BY TRANSDERMAL APPLICATION USING PATCHES

- ▶ Adult: Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

PHARMACOKINETICS

- ▶ For *Butece*®: it may take approximately 12 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

HAPOCTASIN®**Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic**

▶ BY TRANSDERMAL APPLICATION USING PATCHES

- ▶ Adult: Initially 35 micrograms/hour up to every 72 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 72 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

Moderate to severe chronic cancer pain in patients who have previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have previously received strong opioid analgesic

▶ BY TRANSDERMAL APPLICATION USING PATCHES

- ▶ Adult: The initial dose should be based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary,

dose should be adjusted at intervals of no longer than 72 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

PHARMACOKINETICS

- ▶ For *Hapoctasin*®: it may take approximately 25 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

PANITAZ®**Moderate, non-malignant pain unresponsive to non-opioid analgesics**

▶ BY TRANSDERMAL APPLICATION USING PATCHES

- ▶ Adult: Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

PHARMACOKINETICS

- ▶ For *Panitaz*®: it may take approximately 12 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

PRENOTRIX®**Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic**

▶ BY TRANSDERMAL APPLICATION USING PATCHES

- ▶ Adult: Initially 35 micrograms/hour up to every 72 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 72 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

Moderate to severe chronic cancer pain in patients who have previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have previously received strong opioid analgesic

▶ BY TRANSDERMAL APPLICATION USING PATCHES

- ▶ Adult: The initial dose should be based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 72 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

PHARMACOKINETICS

- ▶ For *Prenotrix*®: it may take approximately 25 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

RELETRANS®

Moderate, non-malignant pain unresponsive to non-opioid analgesics

- BY TRANSDERMAL APPLICATION USING PATCHES
- Adult: Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

PHARMACOKINETICS

- For *Reletrans*®: it may take approximately 12 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

RELEVTEC®

Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic

- BY TRANSDERMAL APPLICATION USING PATCHES
- Adult: Initially 35 micrograms/hour up to every 96 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

Moderate to severe chronic cancer pain in patients who have previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have previously received strong opioid analgesic

- BY TRANSDERMAL APPLICATION USING PATCHES
- Adult: The initial dose should be based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

PHARMACOKINETICS

- For *Relevtec*®: it may take approximately 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

SEVODYNE®

Moderate, non-malignant pain unresponsive to non-opioid analgesics

- BY TRANSDERMAL APPLICATION USING PATCHES
- Adult: Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

PHARMACOKINETICS

- For *Sevodyne*®: it may take approximately 12 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

TRANSTEC®

Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic

- BY TRANSDERMAL APPLICATION USING PATCHES
- Adult: Initially 35 micrograms/hour up to every 96 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

Moderate to severe chronic cancer pain in patients who have previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have previously received strong opioid analgesic

- BY TRANSDERMAL APPLICATION USING PATCHES
- Adult: The initial dose should be based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

PHARMACOKINETICS

- For *Transtec*®: it may take approximately 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

- **UNLICENSED USE** Sublingual tablets not licensed for use in children under 6 years.

IMPORTANT SAFETY INFORMATION

Do not confuse the formulations of transdermal patches which are available as 72-hourly, 96-hourly and 7-day patches, see *Prescribing and dispensing information*.

● CAUTIONS

GENERAL CAUTIONS Impaired consciousness

SPECIFIC CAUTIONS

- With transdermal use Fever or external heat • other opioids should not be administered within 24 hours of patch removal (long duration of action)
- When used for adjunct in the treatment of opioid dependence Hepatitis B infection • hepatitis C infection • pre-existing liver enzyme abnormalities
- **CAUTIONS, FURTHER INFORMATION**
- Fever or external heat Manufacturer advises monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat (may also increase absorption).

- **INTERACTIONS** → Appendix 1: opioids

● SIDE-EFFECTS

► Common or very common

- With sublingual use Fatigue · postural hypotension · sleep disorders
- With transdermal use Anxiety · appetite decreased · asthenia · depression · diarrhoea · dyspnoea · gastrointestinal discomfort · muscle weakness · oedema · sleep disorders · tremor

► Uncommon

- With sublingual use Anxiety · apnoea · appetite decreased · atrioventricular block · coma · conjunctivitis · coordination abnormal · cyanosis · depersonalisation · depression · diarrhoea · diplopia · disorientation · dyspepsia · dyspnoea · hypertension · pallor · paraesthesia · psychosis · seizure · speech slurred · tinnitus · tremor · urinary disorder
- With transdermal use Aggression · chest pain · chills · circulatory collapse · concentration impaired · cough · dry eye · fever · gastrointestinal disorders · hiccups · hypertension · injury · memory loss · migraine · mood altered · movement disorders · muscle complaints · respiratory disorders · sensation abnormal · sexual dysfunction · speech impairment · syncope · taste altered · tinnitus · urinary disorders · vision blurred · weight decreased

► Rare or very rare

- With sublingual use Angioedema · bronchospasm
- With transdermal use Angina pectoris · asthma exacerbated · dehydration · dysphagia · ear pain · eyelid oedema · increased risk of infection · influenza like illness · muscle contractions involuntary · postural hypotension · psychotic disorder · vasodilation

► Frequency not known

- With parenteral use Angioedema · bronchospasm · hepatic disorders · psychotic disorder · vision blurred
- With sublingual use Cerebrospinal fluid pressure increased · circulation impaired · haemorrhagic diathesis · hepatic disorders · oral disorders · syncope
- With transdermal use Biliary colic · depersonalisation · seizure

Overdose The effects of buprenorphine are only partially reversed by naloxone.

● BREAST FEEDING

Present in low levels in breast milk.

Monitoring Neonates should be monitored for drowsiness, adequate weight gain, and developmental milestones.

● RENAL IMPAIRMENT

Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity.

● PRE-TREATMENT SCREENING

Documentation of viral hepatitis status is recommended before commencing therapy for opioid dependence.

● MONITORING REQUIREMENTS

Monitor liver function; when used in opioid dependence baseline liver function test is recommended before commencing therapy, and regular liver function tests should be performed throughout treatment.

● DIRECTIONS FOR ADMINISTRATION

- In children *Sublingual tablets* may be halved.
- In adults Manufacturer advises *oral lyophilisates* should be placed on the tongue and allowed to dissolve. Patients should be advised not to swallow for 2 minutes and not to consume food or drink for at least 5 minutes after administration.

BUTRANS® Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after 7 days and siting replacement patch on a different area (avoid same area for at least 3 weeks).

PRENORTRIX® Manufacturer advises apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 72 hours and siting replacement patch on a different area (avoid same area for at least 7 days).

HAPOCTASIN® Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 72 hours and siting replacement patch on a different area (avoid same area for at least 7 days).

BUPRAMYL®, **BUTEC**®, **PANITAZ**®, **RELETRANS**®, **SEVODYNE**® Manufacturer advises apply patch to dry, non-irritated, non-hairy skin on upper torso or upper outer arm, removing after 7 days and siting replacement patch on a different area (avoid same area for at least 3 weeks).

TRANSTEC® Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 96 hours and siting replacement patch on a different area (avoid same area for at least 6 days).

BUPEAZE®, **BUPLAST**®, **RELEVTEC**® Manufacturer advises apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 96 hours and siting replacement patch on a different area (avoid same area for at least 7 days).

- **PRESCRIBING AND DISPENSING INFORMATION** Transdermal buprenorphine patches are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Transdermal patches are available as 72-hourly, 96-hourly and 7-day formulations; prescribers and dispensers must ensure that the correct preparation is prescribed and dispensed. Preparations that should be applied up to every 72 hours include *Hapoctasin*® and *Prenotrix*®. Preparations that should be applied up to every 96 hours include *Bupeaze*®, *Buplast*®, *Relevtec*®, and *Transtec*®. Preparations that should be applied up to every 7 days include *Bupramyl*®, *Butec*®, *BuTrans*®, *Panitaz*®, *Reletrans*®, and *Sevodyne*®. *Espranor*® oral lyophilisate has different bioavailability to other buprenorphine products and is not interchangeable with them—consult product literature before switching between products.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer buprenorphine products.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Methadone and buprenorphine for the management of opioid dependence (January 2007)** NICE TA114

Oral methadone and buprenorphine are recommended for maintenance therapy in the management of opioid dependence. Patients should be committed to a supportive care programme including a flexible dosing regimen administered under supervision for at least 3 months, until compliance is assured. Selection of methadone or buprenorphine should be made on a case-by-case basis, but methadone should be prescribed if both drugs are equally suitable.

www.nice.org.uk/guidance/TA114

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2017) that buprenorphine oral lyophilisate (*Espranor*®) is accepted for restricted use within NHS Scotland as substitution treatment for opioid dependence for patients in whom methadone is not suitable. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

BUTEC®

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2017) that buprenorphine transdermal patches (*Butec*®) are accepted for restricted use within NHS Scotland for the treatment of chronic non-malignant pain of moderate

intensity when an opioid is necessary for obtaining adequate analgesia in elderly patients (over 65 years).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Temgesic (Indivior UK Ltd)

Buprenorphine (as Buprenorphine hydrochloride)

300 microgram per 1 ml Temgesic 300micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £2.46 [CD3]

Sublingual tablet

CAUTIONARY AND ADVISORY LABELS 2, 26

► Buprenorphine (Non-proprietary)

Buprenorphine (as Buprenorphine hydrochloride)

200 microgram Buprenorphine 200microgram sublingual tablets sugar free sugar-free | 50 tablet [PoM] £5.04 DT = £5.04 [CD3]

Buprenorphine (as Buprenorphine hydrochloride)

400 microgram Buprenorphine 400microgram sublingual tablets sugar free sugar-free | 7 tablet [PoM] £1.60 DT = £1.60 [CD3] sugar-free | 50 tablet [PoM] £10.07 DT = £10.07 [CD3]

Buprenorphine (as Buprenorphine hydrochloride)

2 mg Buprenorphine 2mg sublingual tablets sugar free sugar-free | 7 tablet [PoM] £8.35 DT = £0.93 [CD3]

Buprenorphine (as Buprenorphine hydrochloride)

8 mg Buprenorphine 8mg sublingual tablets sugar free sugar-free | 7 tablet [PoM] £22.50 DT = £1.81 [CD3]

► Natzon (Morningside Healthcare Ltd)

Buprenorphine (as Buprenorphine hydrochloride)

400 microgram Natzon 0.4mg sublingual tablets sugar-free | 7 tablet [PoM] £1.60 DT = £1.60 [CD3]

Buprenorphine (as Buprenorphine hydrochloride) 2 mg Natzon 2mg sublingual tablets sugar-free | 7 tablet [PoM] £6.35 DT = £0.93 [CD3]

► Bupramyl (Mylan)

Buprenorphine 5 microgram per 1 hour Bupramyl 5micrograms/hour transdermal patches | 4 patch [PoM] £7.04 DT = £17.60 [CD3]

Buprenorphine 10 microgram per 1 hour Bupramyl 10micrograms/hour transdermal patches | 4 patch [PoM] £12.62 DT = £31.55 [CD3]

Buprenorphine 20 microgram per 1 hour Bupramyl 20micrograms/hour transdermal patches | 4 patch [PoM] £22.98 DT = £57.46 [CD3]

► Buteac (Qdem Pharmaceuticals Ltd)

Buprenorphine 5 microgram per 1 hour Buteac 5micrograms/hour transdermal patches | 4 patch [PoM] £7.92 DT = £17.60 [CD3]

Buprenorphine 10 microgram per 1 hour Buteac 10micrograms/hour transdermal patches | 4 patch [PoM] £14.20 DT = £31.55 [CD3]

Buprenorphine 15 microgram per 1 hour Buteac 15micrograms/hour transdermal patches | 4 patch [PoM] £22.12 DT = £49.15 [CD3]

Buprenorphine 20 microgram per 1 hour Buteac 20micrograms/hour transdermal patches | 4 patch [PoM] £25.86 DT = £57.46 [CD3]

► Hapoctasin (Actavis UK Ltd)

Buprenorphine 35 microgram per 1 hour Hapoctasin 35micrograms/hour transdermal patches | 4 patch [PoM] £9.48 DT = £15.80 [CD3]

Buprenorphine 52.5 microgram per 1 hour Hapoctasin 52.5micrograms/hour transdermal patches | 4 patch [PoM] £14.23 DT = £23.71 [CD3]

Buprenorphine 70 microgram per 1 hour Hapoctasin 70micrograms/hour transdermal patches | 4 patch [PoM] £18.96 DT = £31.60 [CD3]

► Panitaz (Dr Reddy's Laboratories (UK) Ltd)

Buprenorphine 5 microgram per 1 hour Panitaz 5micrograms/hour transdermal patches | 4 patch [PoM] £7.04 DT = £17.60 [CD3]

Buprenorphine 10 microgram per 1 hour Panitaz 10micrograms/hour transdermal patches | 4 patch [PoM] £12.62 DT = £31.55 [CD3]

Buprenorphine 20 microgram per 1 hour Panitaz 20micrograms/hour transdermal patches | 4 patch [PoM] £22.98 DT = £57.46 [CD3]

► Reletrans (Sandoz Ltd)

Buprenorphine 5 microgram per 1 hour Reletrans 5micrograms/hour transdermal patches | 4 patch [PoM] £7.92 DT = £17.60 [CD3]

- Buprenorphine 10 microgram per 1 hour** Reletrans
10micrograms/hour transdermal patches | 4 patch [PoM] £14.20 DT = £31.55 [CD3]
- Buprenorphine 15 microgram per 1 hour** Reletrans
15micrograms/hour transdermal patches | 4 patch [PoM] £22.12 DT = £49.15 [CD3]
- Buprenorphine 20 microgram per 1 hour** Reletrans
20micrograms/hour transdermal patches | 4 patch [PoM] £25.86 DT = £57.46 [CD3]
- ▶ **Relevtec** (Sandoz Ltd)
Buprenorphine 35 microgram per 1 hour Relevtec
35micrograms/hour transdermal patches | 4 patch [PoM] £11.06 DT = £15.80 [CD3]
- Buprenorphine 52.5 microgram per 1 hour** Relevtec
52.5micrograms/hour transdermal patches | 4 patch [PoM] £16.60 DT = £23.71 [CD3]
- Buprenorphine 70 microgram per 1 hour** Relevtec
70micrograms/hour transdermal patches | 4 patch [PoM] £22.12 DT = £31.60 [CD3]
- ▶ **Sevodyne** (Aspire Pharma Ltd)
Buprenorphine 5 microgram per 1 hour Sevodyne
5micrograms/hour transdermal patches | 4 patch [PoM] £7.92 DT = £17.60 [CD3]
- Buprenorphine 10 microgram per 1 hour** Sevodyne
10micrograms/hour transdermal patches | 4 patch [PoM] £14.20 DT = £31.55 [CD3]
- Buprenorphine 20 microgram per 1 hour** Sevodyne
20micrograms/hour transdermal patches | 4 patch [PoM] £25.86 DT = £57.46 [CD3]
- ▶ **Transtec** (Napp Pharmaceuticals Ltd)
Buprenorphine 35 microgram per 1 hour Transtec
35micrograms/hour transdermal patches | 4 patch [PoM] £15.80 DT = £15.80 [CD3]
- Buprenorphine 52.5 microgram per 1 hour** Transtec
52.5micrograms/hour transdermal patches | 4 patch [PoM] £23.71 DT = £23.71 [CD3]
- Buprenorphine 70 microgram per 1 hour** Transtec
70micrograms/hour transdermal patches | 4 patch [PoM] £31.60 DT = £31.60 [CD3]

F 441

Co-codamol

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 438.

● INDICATIONS AND DOSE

Moderate pain (using co-codamol 8/500 preparations only)

- ▶ BY MOUTH
- ▶ Adult: 8/500–16/1000 mg every 4–6 hours as required; maximum 64/4000 mg per day

Moderate pain (using co-codamol 15/500 preparations only)

- ▶ BY MOUTH
- ▶ Adult: 15/500–30/1000 mg every 4–6 hours as required; maximum 120/4000 mg per day

Moderate to severe pain (using co-codamol 30/500 preparations only)

- ▶ BY MOUTH
- ▶ Adult: 30/500–60/1000 mg every 4–6 hours as required; maximum 240/4000 mg per day

KAPAKE® 15/500

Mild to moderate pain

- ▶ BY MOUTH
- ▶ Adult: 2 tablets every 4–6 hours as required; maximum 8 tablets per day

SOLPADOL® CAPLETS

Severe pain

- ▶ BY MOUTH
- ▶ Adult: 2 tablets every 4–6 hours as required; maximum 8 tablets per day

SOLPADOL® CAPSULES

Severe pain

- ▶ BY MOUTH
- ▶ Adult: 2 capsules every 4–6 hours as required; maximum 8 capsules per day

SOLPADOL® EFFERVESCENT TABLETS

Severe pain

- ▶ BY MOUTH USING EFFERVESCENT TABLETS
- ▶ Adult: 2 tablets every 4–6 hours as required, tablets to be dispersed in water; maximum 8 tablets per day

- **CONTRA-INDICATIONS** Acute ulcerative colitis · antibiotic-associated colitis · conditions where abdominal distention develops · conditions where inhibition of peristalsis should be avoided · known ultra-rapid codeine metabolisers

- **CAUTIONS** Acute abdomen · alcohol dependence · avoid abrupt withdrawal after long-term treatment · cardiac arrhythmias · chronic alcoholism · chronic dehydration · chronic malnutrition · convulsive disorders · gallstones · hepatocellular insufficiency

CAUTIONS, FURTHER INFORMATION

- ▶ Variation in metabolism The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.

- **INTERACTIONS** → Appendix 1: opioids · paracetamol

- **SIDE-EFFECTS** Abdominal pain · addiction · agranulocytosis · blood disorder · irritability · pancreatitis · restlessness · severe cutaneous adverse reactions (SCARs) · thrombocytopenia

Overdose **Important:** liver damage (and less frequently renal damage) following overdose with paracetamol.

- **BREAST FEEDING** Avoid—although amount of codeine usually too small to be harmful, mothers vary considerably in their capacity to metabolise codeine—risk of morphine overdose in infant.

● HEPATIC IMPAIRMENT

Dose adjustments Dose-related toxicity with paracetamol—avoid large doses.

- **RENAL IMPAIRMENT** Reduce dose or avoid codeine; increased and prolonged effect; increased cerebral sensitivity.

- **PRESCRIBING AND DISPENSING INFORMATION** Co-codamol is a mixture of codeine phosphate and paracetamol; the proportions are expressed in the form x/y, where x and y are the strengths in milligrams of codeine phosphate and paracetamol respectively.

When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and **no strength is stated**, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and paracetamol 500 mg should be dispensed.

The Drug Tariff allows tablets of co-codamol labelled ‘dispersible’ to be dispensed against an order for ‘effervescent’ and vice versa.

- **LESS SUITABLE FOR PRESCRIBING** Co-codamol is less suitable for prescribing.

- **EXCEPTIONS TO LEGAL CATEGORY** Co-codamol 8/500 can be sold to the public in certain circumstances; for exemptions see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 2 (does not apply to the 8/500 tablet), 29, 30

► Co-codamol (Non-proprietary)

Acute diarrhoea

► BY MOUTH

► Child 12–17 years: 30 mg 3–4 times a day; usual dose 15–60 mg 3–4 times a day

► Adult: 30 mg 3–4 times a day; usual dose 15–60 mg 3–4 times a day

Mild to moderate pain

► BY MOUTH

► Adult: 30–60 mg every 4 hours if required; maximum 240 mg per day

► BY INTRAMUSCULAR INJECTION

► Adult: 30–60 mg every 4 hours if required

Short-term treatment of acute moderate pain

► BY MOUTH, OR BY INTRAMUSCULAR INJECTION

► Child 12–17 years: 30–60 mg every 6 hours if required for maximum 3 days; maximum 240 mg per day

Dry or painful cough

► BY MOUTH USING LINCTUS

► Adult: 15–30 mg 3–4 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JULY 2013) CODEINE FOR ANALGESIA: RESTRICTED USE IN CHILDREN DUE TO REPORTS OF MORPHINE TOXICITY

Codeine should only be used to relieve acute moderate pain in children older than 12 years and only if it cannot be relieved by other painkillers such as paracetamol or ibuprofen alone. A significant risk of serious and life-threatening adverse reactions has been identified in children with obstructive sleep apnoea who received codeine after tonsillectomy or adenoidectomy:

- in children aged 12–18 years, the maximum daily dose of codeine should not exceed 240 mg. Doses may be taken up to four times a day at intervals of no less than 6 hours. The lowest effective dose should be used and duration of treatment should be limited to 3 days
- codeine is contra-indicated in all children (under 18 years) who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea
- codeine is not recommended for use in children whose breathing may be compromised, including those with neuromuscular disorders, severe cardiac or respiratory conditions, respiratory infections, multiple trauma or extensive surgical procedures
- codeine is contra-indicated in patients of any age who are known to be ultra-rapid metabolisers of codeine (CYP2D6 ultra-rapid metabolisers)
- codeine should not be used in breast-feeding mothers because it can pass to the baby through breast milk
- parents and carers should be advised on how to recognise signs and symptoms of morphine toxicity, and to stop treatment and seek medical attention if signs or symptoms of toxicity occur (including reduced

consciousness, lack of appetite, somnolence, constipation, respiratory depression, 'pin-point' pupils, nausea, vomiting)

MHRA/CHM ADVICE (APRIL 2015) CODEINE FOR COUGH AND COLD: RESTRICTED USE IN CHILDREN

Do not use codeine in children under 12 years as it is associated with a risk of respiratory side effects. Codeine is not recommended for adolescents (12–18 years) who have problems with breathing. When prescribing or dispensing codeine-containing medicines for cough and cold, consider that codeine is contra-indicated in:

- children younger than 12 years old
- patients of any age known to be CYP2D6 ultra-rapid metabolisers
- breastfeeding mothers

- **CONTRA-INDICATIONS** Acute ulcerative colitis · antibiotic-associated colitis · children under 18 years who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea · conditions where abdominal distension develops · conditions where inhibition of peristalsis should be avoided · known ultra-rapid codeine metabolisers

- **CAUTIONS** Acute abdomen · cardiac arrhythmias · gallstones · not recommended for adolescents aged 12–18 years with breathing problems

CAUTIONS, FURTHER INFORMATION

- Variation in metabolism The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.

- **INTERACTIONS** → Appendix 1: opioids

• **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS Biliary spasm · hypothermia · mood altered · postural hypotension · sexual dysfunction · ureteral spasm

SPECIFIC SIDE-EFFECTS

- With oral use Abdominal cramps · addiction · appetite decreased · depression · drug reaction with eosinophilia and systemic symptoms (DRESS) · dyskinesia · dyspnoea · face oedema · fatigue · fever · hyperglycaemia · hypersensitivity · intracranial pressure increased · lymphadenopathy · malaise · muscle rigidity (with high doses) · nightmare · pancreatitis · restlessness · seizure · splenomegaly · urinary disorders · vision disorders
- With parenteral use Dysuria

- **BREAST FEEDING** Avoid—although amount usually too small to be harmful, mothers vary considerably in their capacity to metabolise codeine—risk of morphine overdose in infant.

- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

- **PRESCRIBING AND DISPENSING INFORMATION** BP directs that when Diabetic Codeine Linctus is prescribed, Codeine Linctus formulated with a vehicle appropriate for administration to diabetics, whether or not labelled 'Diabetic Codeine Linctus', shall be dispensed or supplied.

Diamorphine hydrochloride (Heroin hydrochloride)

10-Jun-2016

• **INDICATIONS AND DOSE**

Acute pain

- BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION

- Adult: 5 mg every 4 hours if required

- BY SLOW INTRAVENOUS INJECTION

- Adult: 1.25–2.5 mg every 4 hours if required

Acute pain (heavier, well-muscled patients)

- BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION

- Adult: Up to 10 mg every 4 hours if required

- BY SLOW INTRAVENOUS INJECTION

- Adult: 2.5–5 mg every 4 hours if required

Chronic pain not currently treated with a strong opioid analgesic

- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- Adult: Initially 2.5–5 mg every 4 hours, adjusted according to response

- BY SUBCUTANEOUS INFUSION

- Adult: Initially 5–10 mg, adjusted according to response, dose to be administered over 24 hours

Acute pulmonary oedema

- BY SLOW INTRAVENOUS INJECTION

- Adult: 2.5–5 mg, dose to be administered at a rate of 1 mg/minute

Myocardial infarction

- BY SLOW INTRAVENOUS INJECTION

- Adult: 5 mg, followed by 2.5–5 mg if required, dose to be administered at a rate of 1–2 mg/minute

- Elderly: 2.5 mg, followed by 1.25–2.5 mg if required, dose to be administered at a rate of 1–2 mg/minute

Myocardial infarction (frail patients)

- BY SLOW INTRAVENOUS INJECTION

- Adult: 2.5 mg, followed by 1.25–2.5 mg if required, dose to be administered at a rate of 1–2 mg/minute

- **CONTRA-INDICATIONS** Delayed gastric emptying · phaeochromocytoma
- **CAUTIONS** CNS depression · severe cor pulmonale · severe diarrhoea · toxic psychosis
- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS** Biliary spasm · circulatory depression · intracranial pressure increased · mood altered · postural hypotension
- **BREAST FEEDING** Therapeutic doses unlikely to affect infant; withdrawal symptoms in infants of dependent mothers; breast-feeding not best method of treating dependence in offspring.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity.

Powder for solution for injection

► **Diamorphine hydrochloride (Non-proprietary)**

Diamorphine hydrochloride 5 mg Diamorphine 5mg powder for solution for injection ampoules | 5 ampoule [PoM] £11.36 DT = £11.36 [CD2]

Diamorphine hydrochloride 10 mg Diamorphine 10mg powder for solution for injection ampoules | 5 ampoule [PoM] £12.95–£16.56 DT = £12.95 [CD2]

Diamorphine hydrochloride 30 mg Diamorphine 30mg powder for solution for injection ampoules | 5 ampoule [PoM] £13.80–£16.52 DT = £11.22 [CD2]

Diamorphine hydrochloride 100 mg Diamorphine 100mg powder for solution for injection ampoules | 5 ampoule [PoM] £42.39 DT = £42.39 [CD2]

Diamorphine hydrochloride 500 mg Diamorphine 500mg powder for solution for injection ampoules | 5 ampoule [PoM] £187.70 DT = £187.70 [CD2]

F 441

Dihydrocodeine tartrate

● INDICATIONS AND DOSE

Moderate to severe pain

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 4–11 years: 0.5–1 mg/kg every 4–6 hours (max. per dose 30 mg)
- Child 12–17 years: 30 mg every 4–6 hours
- Adult: 30 mg every 4–6 hours as required
- BY DEEP SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: Up to 50 mg every 4–6 hours if required

Chronic severe pain

- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12–17 years: 60–120 mg every 12 hours
- Adult: 60–120 mg every 12 hours

DF118 FORTE®

Severe pain

- BY MOUTH
- Child 12–17 years: 40–80 mg 3 times a day; maximum 240 mg per day
- Adult: 40–80 mg 3 times a day; maximum 240 mg per day

- **UNLICENSED USE** Most preparations not licensed for use in children under 4 years.
- **CAUTIONS** Pancreatitis · severe cor pulmonale
- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS Dysuria · mood altered · postural hypotension

SPECIFIC SIDE-EFFECTS

- With oral use Biliary spasm · bronchospasm · hypothermia · sexual dysfunction · ureteral spasm
- **BREAST FEEDING** Use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **PROFESSION SPECIFIC INFORMATION**

Dihydrocodeine with paracetamol

18-Jan-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 438.

● INDICATIONS AND DOSE

Mild to moderate pain (using 10/500 preparations only)

- BY MOUTH
- Adult: 10/500–20/1000 mg every 4–6 hours as required; maximum 80/4000 mg per day

Severe pain (using 20/500 preparations only)

- BY MOUTH
- Adult: 20/500–40/1000 mg every 4–6 hours as required; maximum 160/4000 mg per day

Severe pain (using 30/500 preparations only)

- BY MOUTH
- Adult: 30/500–60/1000 mg every 4–6 hours as required; maximum 240/4000 mg per day

DOSE EQUIVALENCE AND CONVERSION

- A mixture of dihydrocodeine tartrate and paracetamol; the proportions are expressed in the form x/y, where x

and y are the strengths in milligrams of dihydrocodeine and paracetamol respectively.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIHYDROCODEINE WITH PARACETAMOL (CO-DYDRAMOL): PRESCRIBE AND DISPENSE BY STRENGTH TO MINIMISE RISK OF MEDICATION ERROR (JANUARY 2018)

The MHRA has advised that dihydrocodeine with paracetamol preparations are prescribed and dispensed by strength to minimise dispensing errors and the risk of accidental opioid overdose—see Prescribing and dispensing information.

- **CAUTIONS** Alcohol dependence · before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours · chronic alcoholism · chronic dehydration · chronic malnutrition · hepatocellular insufficiency · pancreatitis · severe cor pulmonale
- **INTERACTIONS** → Appendix 1: opioids · paracetamol
- **SIDE-EFFECTS** Abdominal pain · blood disorder · leucopenia · malaise · neutropenia · pancreatitis · paraesthesia · paralytic ileus · severe cutaneous adverse reactions (SCARs) · thrombocytopenia
- **Overdose** Important liver damage (and less frequently renal damage) following overdosage with paracetamol
- **BREAST FEEDING** Amount of dihydrocodeine too small to be harmful but use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Dose-related toxicity with paracetamol—avoid large doses.
- **RENAL IMPAIRMENT** Reduce dose or avoid dihydrocodeine; increased and prolonged effect; increased cerebral sensitivity.
- **PRESCRIBING AND DISPENSING INFORMATION** The MHRA advises when prescribing dihydrocodeine with paracetamol, the tablet strength and dose must be clearly indicated; when dispensing dihydrocodeine with paracetamol, ensure the prescribed strength is supplied—contact the prescriber if in doubt.

The BP defines *Co-dyramol* Tablets as containing dihydrocodeine tartrate 10 mg and paracetamol 500 mg.

- **LESS SUITABLE FOR PRESCRIBING** Dihydrocodeine with paracetamol is less suitable for prescribing.

Dipipanone hydrochloride with cyclizine

F 441

INDICATIONS AND DOSE

Acute pain

- ▶ BY MOUTH
- ▶ Adult: Initially 1 tablet every 6 hours, then increased if necessary up to 3 tablets every 6 hours, dose to be increased gradually

- **CAUTIONS** Diabetes mellitus · palliative care (not recommended) · phaeochromocytoma
- **INTERACTIONS** → Appendix 1: antihistamines, sedating · opioids
- **SIDE-EFFECTS** Agranulocytosis · anxiety · biliary spasm · consciousness impaired · disorientation · dry throat · dysuria · hallucinations · hepatic disorders · insomnia · intracranial pressure increased · mood altered · movement disorders · muscle complaints · nasal dryness · psychosis · renal spasm · seizure · skin reactions · speech disorder · tremor · vision blurred
- **BREAST FEEDING** No information available.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

F 441

Fentanyl

21-May-2018

INDICATIONS AND DOSE

Chronic intractable pain not currently treated with a strong opioid analgesic

▶ BY TRANSDERMAL APPLICATION

- ▶ Child 16–17 years: Initially 12 micrograms/hour every 72 hours, alternatively initially 25 micrograms/hour every 72 hours, when starting, evaluation of the analgesic effect should not be made before the system has been worn for 24 hours (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic therapy should be phased out gradually from time of first patch application, dose should be adjusted at 48–72 hour intervals in steps of 12–25 micrograms/hour if necessary, more than one patch may be used at a time (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it takes 17 hours or more for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually)
- ▶ Adult: Initially 12 micrograms/hour every 72 hours, alternatively initially 25 micrograms/hour every 72 hours, when starting, evaluation of the analgesic effect should not be made before the system has been worn for 24 hours (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic therapy should be phased out gradually from time of first patch application, dose should be adjusted at 48–72 hour intervals in steps of 12–25 micrograms/hour if necessary, more than one patch may be used at a time (but applied at continued →

the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it takes 17 hours or more for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually)

Chronic intractable pain currently treated with a strong opioid analgesic

► BY TRANSDERMAL APPLICATION

- Child 2-17 years: Initial dose based on previous 24-hour opioid requirement (consult product literature), for evaluating analgesic efficacy and dose increments, see under *Chronic intractable pain not currently treated with a strong opioid analgesic*, for conversion from long term oral morphine to transdermal fentanyl, see *Pain management with opioids* under Prescribing in palliative care p. 23.
- Adult: Initial dose based on previous 24-hour opioid requirement (consult product literature), for evaluating analgesic efficacy and dose increments, see under *Chronic intractable pain not currently treated with a strong opioid analgesic*, for conversion from long term oral morphine to transdermal fentanyl, see *Pain management with opioids* under Prescribing in palliative care p. 23.

Spontaneous respiration: analgesia and enhancement of anaesthesia, during operation

► BY SLOW INTRAVENOUS INJECTION

- Adult: Initially 50–100 micrograms (max. per dose 200 micrograms), dose maximum on specialist advice, then 25–50 micrograms as required

► BY INTRAVENOUS INFUSION

- Adult: 3–4.8 micrograms/kg/hour, adjusted according to response

Assisted ventilation: analgesia and enhancement of anaesthesia during operation

► BY SLOW INTRAVENOUS INJECTION

- Adult: Initially 300–3500 micrograms, then 100–200 micrograms as required

► BY INTRAVENOUS INFUSION

- Adult: Initially 10 micrograms/kg, dose to be given over 10 minutes, then 6 micrograms/kg/hour, adjusted according to response, may require up to 180 micrograms/kg/hour during cardiac surgery

Assisted ventilation: analgesia and respiratory depression in intensive care

► BY SLOW INTRAVENOUS INJECTION

- Adult: Initially 300–3500 micrograms, then 100–200 micrograms as required

► BY INTRAVENOUS INFUSION

- Adult: Initially 10 micrograms/kg, dose to be given over 10 minutes, then 6 micrograms/kg/hour, adjusted according to response, may require up to 180 micrograms/kg/hour during cardiac surgery

Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

► BY BUCCAL ADMINISTRATION USING LOZENGES

- Child 16-17 years: Initially 200 micrograms, dose to be given over 15 minutes, then 200 micrograms after 15 minutes if required, no more than 2 dose units for each pain episode; if adequate pain relief not achieved with 1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily, if more than 4 episodes of breakthrough pain each day, adjust background analgesia
- Adult: Initially 200 micrograms, dose to be given over 15 minutes, then 200 micrograms after 15 minutes if required, no more than 2 dose units for each pain episode; if adequate pain relief not achieved with

1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

► BY BUCCAL ADMINISTRATION USING BUCCAL FILMS

- Adult: Initially 200 micrograms, adjusted according to response, consult product literature for information on dose adjustments, maximum 1.2 mg per episode of breakthrough pain; leave at least 4 hours between treatment of episodes of breakthrough pain, if more than 4 episodes of breakthrough pain each day occur on more than 4 consecutive days, adjust background analgesia

DOSE EQUIVALENCE AND CONVERSION

- Fentanyl films are **not bioequivalent** to other fentanyl preparations.

- Fentanyl preparations for the treatment of breakthrough pain are not interchangeable; if patients are switched from another fentanyl-containing preparation, a new dose titration is required.

DOSES AT EXTREMES OF BODY-WEIGHT

- To avoid excessive dosage in obese patients, weight-based doses may need to be calculated on the basis of ideal bodyweight.

ABSTRAL®

Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

► BY MOUTH USING SUBLINGUAL TABLETS

- Adult: Initially 100 micrograms, then 100 micrograms after 15–30 minutes if required, dose to be adjusted according to response—consult product literature, no more than 2 dose units 15–30 minutes apart, for each pain episode; max. 800 micrograms per episode of breakthrough pain; leave at least 2 hours between treatment of episodes of breakthrough pain, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

EFFENTORA®

Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

► BY MOUTH USING SUBLINGUAL TABLETS

- Adult: Initially 100 micrograms, then 100 micrograms after 30 minutes if required, dose to be adjusted according to response—consult product literature, no more than 2 dose units for each pain episode; max. 800 micrograms per episode of breakthrough pain; leave at least 4 hours between treatment of episodes of breakthrough pain during titration

INSTANYL®

Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

► BY INTRANASAL ADMINISTRATION

- Adult: Initially 50 micrograms, dose to be administered into one nostril, then 50 micrograms after 10 minutes if required, dose to be adjusted according to response, maximum 2 sprays for each pain episode and minimum 4 hours between treatment of each pain episode, if more than 4 breakthrough pain episodes daily, adjust background analgesia

PECFENT®

Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

► BY INTRANASAL ADMINISTRATION

- Adult: Initially 100 micrograms, adjusted according to response, dose to be administered into one nostril only, maximum 2 sprays for each pain episode and minimum 4 hours between treatment of each pain

episode, if more than 4 breakthrough pain episodes daily, adjust background analgesia

RECIVIT® SUBLINGUAL TABLETS

Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

► BY MOUTH

- Adult: Initially 133 micrograms, then 133 micrograms after 15–30 minutes (max. per dose 800 micrograms), dose to be repeated only if necessary. Consult product literature for dose adjustments, no more than 2 dose units, 15–30 minutes apart, for each pain episode, maximum of 800 micrograms per episode of breakthrough pain, if more than 4 episodes of breakthrough pain each day, adjust background analgesia; maximum 4 doses per day

● CAUTIONS

GENERAL CAUTIONS Cerebral tumour · diabetes mellitus (with Actiq® lozenges) · impaired consciousness

SPECIFIC CAUTIONS

- With buccal use mucositis—absorption from oral preparations may be increased, caution during dose titration (in adults)

CAUTIONS, FURTHER INFORMATION

- With transdermal use Transdermal fentanyl patches are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Risk of fatal respiratory depression, particularly in patients not previously treated with a strong opioid analgesic; manufacturer recommends use only in opioid tolerant patients.
- With intravenous use Repeated intra-operative doses should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

● INTERACTIONS → Appendix 1: opioids

● SIDE-EFFECTS

► Common or very common

- With parenteral use Allergic dermatitis · apnoea · arrhythmia · hypertension · movement disorders · muscle rigidity · respiratory disorders · vascular disorders
- With transdermal use Anxiety · appetite decreased · asthenia · depression · diarrhoea · dyspnoea · gastrointestinal discomfort · hypertension · insomnia · malaise · muscle complaints · peripheral oedema · sensation abnormal · skin reactions · temperature sensation altered · tremor

► Uncommon

- With parenteral use Airway complication of anaesthesia · chills · hiccups · hypothermia
- With transdermal use Consciousness impaired · cyanosis · disorientation · fever · gastrointestinal disorders · influenza like illness · memory loss · respiratory disorders · seizures · sexual dysfunction · vision blurred

► Rare or very rare

- With transdermal use Apnoea

► Frequency not known

- With intranasal use Circulatory depression · diarrhoea · epistaxis · fall · fatigue · fever · hot flush · insomnia · malaise · motion sickness · myoclonus · nasal complaints · peripheral oedema · seizure · sensation abnormal · shock · skin pain · stomatitis · taste altered · throat irritation
- With buccal use or oral use Adrenal insufficiency (long term use) · androgen deficiency · anxiety · appetite decreased · asthenia · circulatory depression · coma · depersonalisation · depression · diarrhoea · dyspnoea · emotional lability · fever · gait abnormal · gastrointestinal discomfort · gastrointestinal disorders · gingival haemorrhage · gingivitis · hypotension exacerbated · injury · loss of consciousness · malaise · movement disorders · oral

disorders · peripheral oedema · seizure · sensation abnormal · shock · sleep disorders · speech slurred · taste altered · thinking abnormal · throat oedema · ulcer · vasodilation · vision disorders · weight decreased

- With parenteral use Biliary spasm · cardiac arrest · cough · hyperalgesia · loss of consciousness · seizure
- With transdermal use Myoclonus

SIDE-EFFECTS, FURTHER INFORMATION

Muscle rigidity Intravenous administration of fentanyl can cause muscle rigidity, which may involve the thoracic muscles. Manufacturer advises administration by slow intravenous injection to avoid; higher doses may require premedication with benzodiazepines and muscle relaxants.

Transdermal use Monitor patients using patches for increased side-effects if fever is present (increased absorption possible); avoid exposing application site to external heat, for example a hot bath or sauna (may also increase absorption).

● BREAST FEEDING

- With buccal use or intranasal use or sublingual use Manufacturer advises avoid during treatment and for 5 days after last administration—present in milk.
- With intravenous use Manufacturer advises avoid during treatment and for 24 hours after last administration—present in milk.
- With transdermal use Manufacturer advises avoid during treatment and for 72 hours after removal of patch—present in milk.

- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

● DIRECTIONS FOR ADMINISTRATION

- With transdermal use For patches, apply to dry, non-irritated, non-irradiated, non-hairy skin on torso or upper arm, removing after 72 hours and siting replacement patch on a different area (avoid using the same area for several days).
- With intravenous use For intravenous infusion (Sublimaze), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%.
- With buccal use in adults For buccal films, moisten mouth, place film on inner lining of cheek (pink side to cheek), hold for at least 5 seconds until it sticks, and leave to dissolve (15–30 minutes); if more than 1 film required do not overlap, but use another area of the mouth. Avoid liquids for 5 minutes after application; avoid food until the film has dissolved.
- With buccal use Patients should be advised to place the lozenge in the mouth against the cheek and move it around the mouth using the applicator; each lozenge should be sucked over a 15 minute period. In patients with a dry mouth, water may be used to moisten the buccal mucosa. Patients with diabetes should be advised each lozenge contains approximately 2 g glucose.

INSTANYL® Patient should sit or stand during administration.

EFFENTORA® Place tablet between cheek and gum and leave to dissolve; if more than 1 tablet required, place second tablet on the other side of the mouth; tablet may alternatively be placed under the tongue (sublingually).

● PRESCRIBING AND DISPENSING INFORMATION

Prescriptions for fentanyl patches can be written to show the strength in terms of the release rate and it is acceptable to write 'Fentanyl 25 patches' to prescribe patches that release fentanyl 25 micrograms per hour. The dosage should be expressed in terms of the interval between applying a patch and replacing it with a new one, e.g. 'one patch to be applied every 72 hours'. The total quantity of patches to be supplied should be written in words and figures.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Fentanyl lozenges for pain www.medicinesforchildren.org.uk/fentanyl-lozenges-for-pain
Medicines for Children leaflet: Fentanyl patches for pain www.medicinesforchildren.org.uk/fentanyl-patches-for-pain

- ▶ With transdermal use Patients and carers should be informed about safe use, including correct administration and disposal, strict adherence to dosage instructions, and the symptoms and signs of opioid overdosage. Patches should be removed immediately in case of breathing difficulties, marked drowsiness, confusion, dizziness, or impaired speech, and patients and carers should seek prompt medical attention.
- ▶ In adults Patients or carers should be given advice on how to administer fentanyl buccal films or fentanyl lozenges. Patients or carers should be given advice on how to administer fentanyl nasal spray.

PECFENT® Avoid concomitant use of other nasal preparations.

Patients or carers should be given advice on how to administer *PecFent®* spray.

INSTANYL® Avoid concomitant use of other nasal preparations.

Patients or carers should be given advice on how to administer *Instanyl®* spray.

EFFENTORA® Patients or carers should be given advice on how to administer *Effentora®* buccal tablets.

Patients should be advised not to eat or drink until the tablet is completely dissolved; after 30 minutes, if any remnants remain, they may be swallowed with a glass of water. Patients with a dry mouth should be advised to drink water to moisten the buccal mucosa before administration of the tablets; if appropriate effervescence does not occur, a switch of therapy may be advised.

ABSTRAL® Patients should be advised not to eat or drink until the tablet is completely dissolved.

In patients with a dry mouth, the buccal mucosa may be moistened with water before administration of tablet.

RECIVIT® SUBLINGUAL TABLETS Patients should be advised not to eat or drink until the tablet is completely dissolved; after 30 minutes, if any remnants remain, they may be swallowed. In patients with a dry mouth, the buccal mucosa may be moistened with water before administration of tablet.

● NATIONAL FUNDING/ACCESS DECISIONS

PECFENT®

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2008) that *PecFent®* nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

INSTANYL®

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised that *Instanyl®* nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

EFFENTORA®

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised that *Effentora®* buccal tablets should be restricted for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short acting opioids are unsuitable.

ABSTRAL®

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2009) that *Abstral®* sublingual tablets should be restricted for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short acting opioids are unsuitable.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

F 441

Hydromorphone hydrochloride

● INDICATIONS AND DOSE

Severe pain in cancer

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12-17 years: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain
- Adult: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12-17 years: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain
- Adult: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain

- **CONTRA-INDICATIONS** Acute abdomen
- **CAUTIONS** Pancreatitis · toxic psychosis
- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS**
- **Common or very common** Anxiety · appetite decreased · asthenia · gastrointestinal discomfort · sleep disorders
- **Uncommon** Depression · diarrhoea · dyspnoea · malaise · movement disorders · paraesthesia · peripheral oedema · sexual dysfunction · taste altered · tremor
- **Rare or very rare** Bronchospasm · lethargy
- **Frequency not known** Hyperalgesia · paralytic ileus · seizure
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **DIRECTIONS FOR ADMINISTRATION** For *immediate-release* capsules, swallow whole capsule or sprinkle contents on soft food. For *modified-release* capsules, swallow whole or open capsule and sprinkle contents on soft cold food (swallow the pellets within the capsule whole; do not crush or chew).
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer hydromorphone hydrochloride capsules and modified-release capsules.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 2

Meptazinol

F 441

● INDICATIONS AND DOSE

Moderate to severe pain, including post-operative pain and renal colic

- BY MOUTH
- Adult: 200 mg every 3–6 hours as required
- BY INTRAMUSCULAR INJECTION
- Adult: 75–100 mg every 2–4 hours if required
- BY SLOW INTRAVENOUS INJECTION
- Adult: 50–100 mg every 2–4 hours if required

Obstetric analgesia

- BY INTRAMUSCULAR INJECTION
- Adult: 2 mg/kg, usual dose 100–150 mg

- **CONTRA-INDICATIONS** Myocardial infarction · phaeochromocytoma
- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS**
- **Common or very common** Diarrhoea · gastrointestinal discomfort
- Overdose** Effects only partially reversed by naloxone.
- **BREAST FEEDING** Use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

● INDICATIONS AND DOSE

Pain

- BY SUBCUTANEOUS INJECTION
- Child 1-5 months: Initially 100–200 micrograms/kg every 6 hours, adjusted according to response
- Child 6 months-1 year: Initially 100–200 micrograms/kg every 4 hours, adjusted according to response
- Child 2-11 years: Initially 200 micrograms/kg every 4 hours, adjusted according to response
- Child 12-17 years: Initially 2.5–10 mg every 4 hours, adjusted according to response
- **INITIALLY BY INTRAVENOUS INJECTION**
- Child 1-5 months: 100 micrograms/kg every 6 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 10–30 micrograms/kg/hour, adjusted according to response
- Child 6 months-11 years: 100 micrograms/kg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg, dose to be administered over at least 5 minutes,

followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response

- ▶ Child 12–17 years: 5 mg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 5 mg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response
- ▶ BY MOUTH, OR BY RECTUM
- ▶ Child 1–2 months: Initially 50–100 micrograms/kg every 4 hours, adjusted according to response
- ▶ Child 3–5 months: 100–150 micrograms/kg every 4 hours, adjusted according to response
- ▶ Child 6–11 months: 200 micrograms/kg every 4 hours, adjusted according to response
- ▶ Child 1 year: Initially 200–300 micrograms/kg every 4 hours, adjusted according to response
- ▶ Child 2–11 years: Initially 200–300 micrograms/kg every 4 hours (max. per dose 10 mg), adjusted according to response
- ▶ Child 12–17 years: Initially 5–10 mg every 4 hours, adjusted according to response

Acute pain

- ▶ BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 10 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients, dose can be given more frequently during titration, use dose for elderly in frail patients
- ▶ Elderly: Initially 5 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients, dose can be given more frequently during titration
- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: Initially 5 mg every 4 hours, adjusted according to response, dose can be adjusted more frequently during titration, reduced dose recommended in frail and elderly patients

Chronic pain

- ▶ BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 5–10 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients
- ▶ BY RECTUM
- ▶ Adult: Initially 15–30 mg every 4 hours, adjusted according to response

Pain (with modified-release 12-hourly preparations)

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: Every 12 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered

Pain (with modified-release 24-hourly preparations)

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: Every 24 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered

Pain management in palliative care (starting dose for opioid-naïve patients)

- ▶ BY MOUTH
- ▶ Adult: 20–30 mg daily in divided doses, using immediate-release preparation 4-hourly or a 12-hourly modified-release preparation, for management of breakthrough pain and other general advice, see *Pain management with opioids* under Prescribing in palliative care p. 23.

Pain management in palliative care (starting dose for patients being switched from a regular weak opioid)

- ▶ BY MOUTH
- ▶ Adult: 40–60 mg daily in divided doses, using immediate-release preparation 4-hourly or 12-hourly modified-release preparation, for management of breakthrough pain and other general advice, see *Pain management with opioids* under Prescribing in palliative care p. 23.

Pain in palliative care (following initial titration)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Usual dose 30 mg every 4 hours; up to 200 mg every 4 hours, higher dose may be required for some patients (occasionally more is needed); for management of breakthrough pain and other general advice, see *Pain management with opioids* under p. 23.
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: Usual dose 100 mg every 12 hours; up to 600 mg every 12 hours, higher dose may be required for some patients (occasionally more is needed); for management of breakthrough pain and other general advice, see *Pain management with opioids* under p. 23.

Cough in terminal disease

- ▶ BY MOUTH
- ▶ Adult: Initially 5 mg every 4 hours

Premedication

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: Up to 10 mg, dose to be administered 60–90 minutes before operation

Patient controlled analgesia (PCA)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult local protocol)

Myocardial infarction

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 5–10 mg, followed by 5–10 mg if required, dose to be administered at a rate of 1–2 mg/minute, use dose for elderly in frail patients
- ▶ Elderly: 2.5–5 mg, followed by 2.5–5 mg if required, dose to be administered at a rate of 1–2 mg/minute

Acute pulmonary oedema

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 5–10 mg, dose to be administered at a rate of 2 mg/minute, use dose for elderly in frail patients
- ▶ Elderly: 2.5–5 mg, dose to be administered at a rate of 2 mg/minute

Dyspnoea at rest in palliative care

- ▶ BY MOUTH
- ▶ Adult: Initially 5 mg every 4 hours, to be given in carefully titrated doses

DOSE EQUIVALENCE AND CONVERSION

- ▶ The doses stated refer equally to morphine hydrochloride and sulfate.

- **UNLICENSED USE** *Oramorph*® solution and *MXL*® capsules not licensed for use in children under 1 year. *Sevredol*® tablets not licensed for use in children under 3 years. *Oramorph*® unit dose vials and *Filnarine*® SR tablets not licensed for use in children under 6 years. *MST Continus*® preparations licensed to treat children with cancer pain (age-range not specified by manufacturer). Suppositories are not licensed for use in children.

IMPORTANT SAFETY INFORMATION

Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see *Prescribing and dispensing information*.

- **CONTRA-INDICATIONS** Acute abdomen · delayed gastric emptying · heart failure secondary to chronic lung disease · pheochromocytoma

- **CAUTIONS** Cardiac arrhythmias · pancreatitis · severe cor pulmonale
- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS**
 - ▶ Common or very common
 - ▶ With oral use Appetite decreased · asthenic conditions · gastrointestinal discomfort · insomnia · neuromuscular dysfunction
 - ▶ Uncommon
 - ▶ With oral use Agitation · bronchospasm · ileus · mood altered · myoclonus · paraesthesia · peripheral oedema · pulmonary oedema · seizure · syncope · taste altered
 - ▶ Frequency not known
 - ▶ With oral use Amenorrhoea · biliary pain · cough decreased · hyperalgesia · hypertension · pancreatitis exacerbated · sexual dysfunction · thinking abnormal · ureteral spasm
 - ▶ With parenteral use Alertness decreased · bile duct disorders · contact dermatitis · mood altered · myoclonus · postural hypotension · sexual dysfunction · ureteral spasm · urinary disorders · vision disorders
- **BREAST FEEDING** Therapeutic doses unlikely to affect infant.

- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use in children For *continuous intravenous infusion*, dilute with Glucose 5% or 10% or Sodium Chloride 0.9%.
 - ▶ With oral use For *modified release capsules*—swallow whole or open capsule and sprinkle contents on soft food.
- **PRESCRIBING AND DISPENSING INFORMATION** Modified-release preparations are available as 12-hourly or 24-hourly formulations; prescribers must ensure that the correct preparation is prescribed. Preparations that should be given 12-hourly include *Filinarne*® SR, *MST Continus*®, *Morphesic*® SR and *Zomorph*®. Preparations that should be given 24-hourly include *MXL*®.

Prescriptions must specify the 'form'.

- ▶ With rectal use Both the strength of the suppositories and the morphine salt contained in them must be specified by the prescriber.

Palliative care For further information on the use of morphine in palliative care, see www.palliativedrugs.com/formulary/en/morphine.html.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer morphine modified-release capsules.
Medicines for Children leaflet: Morphine for pain www.medicinesforchildren.org.uk/morphine-for-pain

• EXCEPTIONS TO LEGAL CATEGORY

Morphine Oral Solutions Prescription-only medicines or schedule 2 controlled drug. The proportion of morphine hydrochloride may be altered when specified by the prescriber; if above 13 mg per 5 mL the solution becomes a schedule 2 controlled drug. It is usual to adjust the strength so that the dose volume is 5 or 10 mL.

Oral solutions of morphine can be prescribed by writing the formula:

Morphine hydrochloride 5 mg
Chloroform water to 5 mL

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection, infusion, solution for infusion, suppository

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 2, 25

- ▶ **MST Continus** (Napp Pharmaceuticals Ltd)

Morphine sulfate 5 mg MST Continus 5mg tablets | 60 tablet [PoM]
£3.29 DT = £3.29 [CD2]

Morphine sulfate 10 mg MST Continus 10mg tablets | 60 tablet [PoM] £5.20 DT = £5.20 [CD2]

Morphine sulfate 15 mg MST Continus 15mg tablets | 60 tablet [PoM] £9.10 DT = £9.10 [CD2]

Morphine sulfate 30 mg MST Continus 30mg tablets | 60 tablet [PoM] £12.47 DT = £12.47 [CD2]

Morphine sulfate 60 mg MST Continus 60mg tablets | 60 tablet [PoM] £24.32 DT = £24.32 [CD2]

Morphine sulfate 100 mg MST Continus 100mg tablets | 60 tablet [PoM] £38.50 DT = £38.50 [CD2]

Morphine sulfate 200 mg MST Continus 200mg tablets | 60 tablet [PoM] £81.34 DT = £81.34 [CD2]

▶ **Morphesic SR** (AMCO)

Morphine sulfate 10 mg Morphesic SR 10mg tablets | 60 tablet [PoM] £3.85 DT = £5.20 [CD2]

Morphine sulfate 30 mg Morphesic SR 30mg tablets | 60 tablet [PoM] £9.24 DT = £12.47 [CD2]

Morphine sulfate 60 mg Morphesic SR 60mg tablets | 60 tablet [PoM] £18.04 DT = £24.32 [CD2]

Morphine sulfate 100 mg Morphesic SR 100mg tablets | 60 tablet [PoM] £28.54 DT = £38.50 [CD2]

Tablet

CAUTIONARY AND ADVISORY LABELS 2

- ▶ **Sevredol** (Napp Pharmaceuticals Ltd)

Morphine sulfate 10 mg Sevredol 10mg tablets | 56 tablet [PoM]
£5.31 DT = £5.31 [CD2]

Morphine sulfate 20 mg Sevredol 20mg tablets | 56 tablet [PoM]
£10.61 DT = £10.61 [CD2]

Morphine sulfate 50 mg Sevredol 50mg tablets | 56 tablet [PoM]
£28.02 DT = £28.02 [CD2]

Suppository

Morphine sulfate 10 mg Zomorph 10mg modified-release capsules | 60 capsule [PoM] £3.47 DT = £3.47 [CD2]

Morphine sulfate 30 mg Zomorph 30mg modified-release capsules | 60 capsule [PoM] £8.30 DT = £8.30 [CD2]

Morphine sulfate 60 mg Zomorph 60mg modified-release capsules | 60 capsule [PoM] £16.20 DT = £16.20 [CD2]

Morphine sulfate 100 mg Zomorph 100mg modified-release capsules | 60 capsule [PoM] £21.80 DT = £21.80 [CD2]

Morphine sulfate 200 mg Zomorph 200mg modified-release capsules | 60 capsule [PoM] £43.60 DT = £43.60 [CD2]

Solution for infusion

► Morphine (Non-proprietary)

Morphine sulfate 1 mg per 1 ml Morphine sulfate 50mg/50ml solution for infusion vials | 1 vial [PoM] £5.78 DT = £5.78 [CD2] | 10 vial [PoM] £38.70 [CD2]

Morphine sulfate 2 mg per 1 ml Morphine sulfate 100mg/50ml solution for infusion vials | 1 vial [PoM] £6.48 [CD2] | 10 vial [PoM] £64.80 [CD2]

Oral solution

CAUTIONARY AND ADVISORY LABELS 2

► Morphine (Non-proprietary)

Morphine sulfate 2 mg per 1 ml Morphine sulfate 10mg/5ml oral solution | 100 ml [PoM] £1.68–£1.82 [CD5] | 300 ml [PoM] £5.45 DT = £5.45 [CD5] | 500 ml [PoM] £7.10–£9.10 [CD5]

► Oramorph (Boehringer Ingelheim Ltd)

Morphine sulfate 2 mg per 1 ml Oramorph 10mg/5ml oral solution | 100 ml [PoM] £1.89 [CD5] | 300 ml [PoM] £5.45 DT = £5.45 [CD5] | 500 ml [PoM] £8.50 [CD5]

Morphine sulfate 20 mg per 1 ml Oramorph 20mg/ml concentrated oral solution sugar-free | 30 ml [PoM] £4.98 [CD2] sugar-free | 120 ml [PoM] £19.50 DT = £19.50 [CD2]

Modified-release granules

CAUTIONARY AND ADVISORY LABELS 2, 13

► MST Continus (Napp Pharmaceuticals Ltd)

Morphine sulfate 20 mg MST Continus Suspension 20mg granules sachets sugar-free | 30 sachet [PoM] £24.58 [CD2]

Morphine sulfate 30 mg MST Continus Suspension 30mg granules sachets sugar-free | 30 sachet [PoM] £25.54 [CD2]

Morphine sulfate 60 mg MST Continus Suspension 60mg granules sachets sugar-free | 30 sachet [PoM] £51.09 [CD2]

Morphine sulfate 100 mg MST Continus Suspension 100mg granules sachets sugar-free | 30 sachet [PoM] £85.15 [CD2]

Morphine sulfate 200 mg MST Continus Suspension 200mg granules sachets sugar-free | 30 sachet [PoM] £170.30 [CD2]

Morphine with cyclizine

The properties listed below are those particular to the combination only. For the properties of the components please consider, morphine p. 456, cyclizine p. 424.

● INDICATIONS AND DOSE

CYCLIMORPH-10®

Moderate to severe pain (short-term use only)

- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- Adult: 1 mL, do not repeat dose more often than every 4 hours; maximum 3 doses per day

CYCLIMORPH-15®

Moderate to severe pain (short-term use only)

- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- Adult: 1 mL, do not repeat dose more often than every 4 hours; maximum 3 doses per day

- **CAUTIONS** Myocardial infarction (cyclizine may aggravate severe heart failure and counteract the haemodynamic benefits of opioids) · not recommended in palliative care

- **INTERACTIONS** → Appendix 1: antihistamines, sedating · opioids

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Cyclimorph (AMCo)

Morphine tartrate 15 mg per 1 ml, Cyclizine tartrate 50 mg per 1 ml Cyclimorph 15 solution for injection 1ml ampoules | 5 ampoule [PoM] £9.12 [CD2]

Morphine tartrate 10 mg per 1 ml, Cyclizine tartrate 50 mg per 1 ml Cyclimorph 10 solution for injection 1ml ampoules | 5 ampoule [PoM] £8.77 [CD2]

441

19-May-2017

Oxycodone hydrochloride

● INDICATIONS AND DOSE

Postoperative pain | Severe pain | Moderate to severe pain in palliative care

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 5 mg every 4–6 hours, dose to be increased if necessary according to severity of pain, some patients may require higher doses than the maximum daily dose; maximum 400 mg per day

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: Initially 10 mg every 12 hours (max. per dose 200 mg every 12 hours), dose to be increased if necessary according to severity of pain, some patients might require higher doses than the maximum daily dose, use 12-hourly modified-release preparations for this dose; see *Prescribing and dispensing information*

► BY SLOW INTRAVENOUS INJECTION

- Adult: 1–10 mg every 4 hours as required

► BY INTRAVENOUS INFUSION

- Adult: Initially 2 mg/hour, adjusted according to response

► BY SUBCUTANEOUS INJECTION

- Adult: Initially 5 mg every 4 hours as required

► BY SUBCUTANEOUS INFUSION

- Adult: Initially 7.5 mg/24 hours, adjusted according to response

Patient controlled analgesia (PCA)

► BY INTRAVENOUS INFUSION

- Adult: (consult local protocol)

DOSE EQUIVALENCE AND CONVERSION

- 2 mg oral oxycodone is approximately equivalent to 1 mg parenteral oxycodone.

ONEXILA XL®

Severe pain

► BY MOUTH

- Adult: Initially 10 mg every 24 hours, dose to be increased if necessary according to severity of pain, some patients may require higher doses than the maximum daily dose; maximum 400 mg per day

IMPORTANT SAFETY INFORMATION

Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see *Prescribing and dispensing information*.

- **CONTRA-INDICATIONS** Acute abdomen · chronic constipation · cor pulmonale · delayed gastric emptying

- **CAUTIONS** Pancreatitis · toxic psychosis

- **INTERACTIONS** → Appendix 1: opioids

- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Anxiety · appetite abnormal · asthenia · bronchospasm · depression · diarrhoea · dyspnoea · gastrointestinal discomfort · hiccups · lethargy · mood altered · skin reactions · tremor
- **Uncommon** Biliary colic · burping · chills · dehydration · dysphagia · gastrointestinal disorders · malaise · memory loss · neuromuscular dysfunction · oedema · seizure · sensation abnormal · sexual dysfunction · speech disorder · supraventricular tachycardia · syncope · taste altered · thirst · vasodilation
- **Rare or very rare** Postural hypotension
- **Frequency not known** Aggression · amenorrhoea · cholestasis

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With oral use Cognitive impairment · insomnia · movement disorders · perception altered · psychiatric disorders · urinary frequency increased
- ▶ With parenteral use Cough decreased · sleep disorders · thinking abnormal
- ▶ **Uncommon**
- ▶ With oral use Chest pain · cough · hyperacusis · increased risk of infection · injury · lacrimation disorder · migraine · oral disorders · pain · SIADH · voice alteration
- ▶ With parenteral use Disorientation · fever · hypogonadism · uteratal spasm
- ▶ **Rare or very rare**
- ▶ With oral use Haemorrhage · lymphadenopathy · muscle spasms · photosensitivity reaction · weight changes
- ▶ **Frequency not known**
- ▶ With parenteral use Dental caries · hyperalgesia
- **BREAST FEEDING** Present in milk—avoid.
- **HEPATIC IMPAIRMENT** Avoid in moderate to severe impairment.

Dose adjustments Max. initial dose 2.5 mg every 6 hours in patients not currently treated with an opioid with mild impairment.

- **RENAL IMPAIRMENT** Opioid effects increased and prolonged and increased cerebral sensitivity occurs. Avoid if eGFR less than 10 mL/minute/1.73 m².
- Dose adjustments** Max. initial dose 2.5 mg every 6 hours in patients not currently treated with an opioid with mild to moderate impairment.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Oxynorm*®), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of 1 mg/mL.

- **PRESCRIBING AND DISPENSING INFORMATION** Modified-release preparations are available as 12-hourly or 24-hourly formulations. Preparations that should be given 12-hourly include *Abtard*®, *Carexil*®, *Leveraxo*®, *Longtec*®, *Oxelta*®, *OxyContin*®, *Oxylan*®, *Reltebon*®, and *Zomestine*®. Preparations that should be given 24-hourly include *Onexila*® XL.

Palliative care For further information on the use of oxycodone in palliative care, see www.palliativedrugs.com/formulary/en/oxycodone.html.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2004 and November 2010) that *OxyNorm*® injection is restricted for use within NHS Scotland for patients with cancer who have difficulty in tolerating morphine or diamorphine.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, solution for infusion

Oxycodone with naloxone

The properties listed below are those particular to the combination only. For the properties of the components please consider, oxycodone hydrochloride p. 459, naloxone hydrochloride p. 1329.

● INDICATIONS AND DOSE

Severe pain requiring opioid analgesia in patients not currently treated with opioid analgesics

► **BY MOUTH**

- Adult: Initially 10/5 mg every 12 hours (max. per dose 40/20 mg every 12 hours), dose to be increased according to response; patients already receiving opioid analgesics can start with a higher dose

Second-line treatment of symptomatic severe to very severe idiopathic restless legs syndrome after failure of dopaminergic therapy

► **BY MOUTH**

- Adult: Initially 5/2.5 mg every 12 hours, adjusted weekly according to response, usual dose 10/5 mg every 12 hours; maximum 60/30 mg per day continued →

DOSE EQUIVALENCE AND CONVERSION

- Dose quantities are expressed in the form x/y where x and y are the strengths in milligrams of oxycodone and naloxone respectively.

- **INTERACTIONS** → Appendix 1: opioids

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Modified-release tablet

Papaveretum

14-Mar-2018

- **INDICATIONS AND DOSE**

Postoperative analgesia | Severe chronic pain

- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- Adult: 7.7–15.4 mg every 4 hours if required

- Elderly: Initially 7.7 mg every 4 hours if required

- BY INTRAVENOUS INJECTION

- Adult: Use 25 to 50% of the corresponding subcutaneous/intramuscular dose

Premedication

- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- Adult: 7.7–15.4 mg

- Elderly: 7.7 mg

IMPORTANT SAFETY INFORMATION

Do **not** confuse with papaverine.

- **CONTRA-INDICATIONS** Heart failure secondary to chronic lung disease · phaeochromocytoma
- **CAUTIONS** Supraventricular tachycardia
- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS** Biliary spasm · dysuria · hypothermia · mood altered · postural hypotension · sexual dysfunction · ureteral spasm
- **BREAST FEEDING** Therapeutic doses unlikely to affect infant.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **PRESCRIBING AND DISPENSING INFORMATION** The name *Omnipon*® was formerly used for papaveretum preparations.
Papaveretum is a mixture of 253 parts of morphine hydrochloride, 23 parts of papaverine hydrochloride and 20 parts of codeine hydrochloride.
- **LESS SUITABLE FOR PRESCRIBING** Papaveretum is less suitable for prescribing.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

- **Papaveretum (Non-proprietary)**

Papaveretum 15.4 mg per 1 ml Papaveretum 15.4mg/1ml solution for injection ampoules | 10 ampoule [PoM] £48.96 [CD2]

Pentazocine

- **INDICATIONS AND DOSE**

Moderate to severe pain

- BY MOUTH

- Adult: 50 mg every 3–4 hours, dose to be taken preferably after food, usual dose 25–100 mg every 3–4 hours; maximum 600 mg per day

Moderate pain

- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- Adult: 30 mg every 3–4 hours as required; maximum 360 mg per day

Severe pain

- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- Adult: 45–60 mg every 3–4 hours as required; maximum 360 mg per day

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · heart failure secondary to chronic lung disease · patients dependent on opioids (can precipitate withdrawal)
- **CAUTIONS** Arterial hypertension · cardiac arrhythmias · myocardial infarction · pancreatitis · phaeochromocytoma · pulmonary hypertension
- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS** Biliary spasm · blood disorders · chills · circulatory depression · dermatitis · disorientation · face oedema · facial plethora · generalised tonic-clonic seizure · hypertension · hypothermia · intracranial pressure increased · mood altered · myalgia · paraesthesia · sexual dysfunction · sleep disorders · syncope · toxic epidermal necrolysis · tremor · ureteral spasm
- **Overdose** Effects only partially reversed by naloxone.
- **BREAST FEEDING** Use with caution—limited information available.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **LESS SUITABLE FOR PRESCRIBING** Pentazocine is less suitable for prescribing.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

(Meperidine)

• INDICATIONS AND DOSE

Acute pain

► BY MOUTH

- Adult: 50–150 mg every 4 hours

► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- Adult: 25–100 mg, then 25–100 mg after 4 hours, for debilitated patients use dose described for elderly patients

- Elderly: Initially 25 mg, then 25–100 mg after 4 hours

► BY SLOW INTRAVENOUS INJECTION

- Adult: 25–50 mg, then 25–50 mg after 4 hours, for debilitated patients use dose described for elderly patients

- Elderly: Initially 25 mg, then 25–50 mg after 4 hours

Obstetric analgesia

► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- Adult: 50–100 mg, then 50–100 mg after 1–3 hours if required; maximum 400 mg per day

Premedication

► BY INTRAMUSCULAR INJECTION

- Adult: 25–100 mg, dose to be given 1 hour before operation, for debilitated patients use dose described for elderly patients

- Elderly: 25 mg, dose to be given 1 hour before operation

Postoperative pain

► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- Adult: 25–100 mg every 2–3 hours if required, for debilitated patients use dose described for elderly patients

- Elderly: Initially 25 mg every 2–3 hours if required

- **CONTRA-INDICATIONS** Phaeochromocytoma

- **CAUTIONS** Accumulation of metabolites may result in neurotoxicity · cardiac arrhythmias · not suitable for severe continuing pain · severe cor pulmonale

- **INTERACTIONS** → Appendix 1: opioids

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS Biliary spasm · dysuria · hypothermia

SPECIFIC SIDE-EFFECTS

- With oral use Agitation · mood altered · muscle rigidity · postural hypotension · sexual dysfunction · ureteral spasm
- With parenteral use Anxiety · asthenia · coordination abnormal · delirium · seizure · syncope · tremor

Overdose Convulsions reported in overdosage.

- **BREAST FEEDING** Present in milk but not known to be harmful.

- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection

27-Feb-2017

Sufentanil

- **DRUG ACTION** Sufentanil is a potent, highly-selective μ -opioid receptor agonist.

• INDICATIONS AND DOSE

Acute moderate-to-severe post-operative pain

► BY SUBLINGUAL ADMINISTRATION

- Adult (specialist supervision in hospital): 15 micrograms every 20 minutes if required for a maximum of 72 hours

- **CAUTIONS** Brain tumour · head injury · history of bradyarrhythmias (increased risk of bradycardia) · increased susceptibility to cerebral effects of CO₂ retention (including increased intracranial pressure and impaired consciousness)

- **INTERACTIONS** → Appendix 1: opioids

• SIDE-EFFECTS

- **Common or very common** Dyspepsia · fever · muscle complaints

- **Uncommon** Apnoea · asthenia · chills · paraesthesia

- **Frequency not known** Apathy · biliary spasm · coma · movement disorders · nervousness · reflexes increased · respiratory arrest · seizure · skin reactions

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—risk of opioid effects or toxicity in the infant.

- **RENAL IMPAIRMENT** Manufacturer advises caution and close monitoring in severe impairment—limited information available.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises doses should be administered using patient controlled analgesia administration device—consult product literature.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients should avoid eating and drinking, and minimise talking, for 10 minutes after each dose. Patients should be instructed on appropriate use of the patient controlled analgesia administration device—consult product literature.

Driving and skilled tasks Manufacturer advises patients should be counselled on the effects on driving and skilled tasks—increased risk of dizziness and visual disturbances.

Tapentadol

● INDICATIONS AND DOSE

Moderate to severe acute pain which can be managed only with opioid analgesics

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 50 mg every 4–6 hours, adjusted according to response, maximum 700 mg in the first 24 hours, during the first 24 hours of treatment, an additional dose of 50 mg may be taken 1 hour after the initial dose, if pain control not achieved; maximum 600 mg per day

Severe chronic pain

- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: Initially 50 mg every 12 hours, adjusted according to response; maximum 500 mg per day

- **INTERACTIONS** → Appendix 1: opioids

● SIDE-EFFECTS

- **Common or very common** Anxiety · appetite decreased · asthenia · diarrhoea · feeling of body temperature change · gastrointestinal discomfort · muscle spasms · sleep disorders · tremor
- **Uncommon** Concentration impaired · depressed mood · disorientation · dysarthria · dyspnoea · feeling abnormal · irritability · memory loss · movement disorders · muscle contractions involuntary · oedema · presyncope · sensation abnormal · urinary disorders
- **Rare or very rare** Angioedema · impaired gastric emptying · level of consciousness decreased · seizure · thinking abnormal

- **BREAST FEEDING** Avoid—no information available.

● HEPATIC IMPAIRMENT

Dose adjustments For *immediate-release tablets*, initial max. daily dose 150 mg; for *modified-release tablets*, initial max. daily dose 50 mg.

- **RENAL IMPAIRMENT** Avoid in severe impairment; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

Dose adjustments Manufacturer advises no dose adjustment needed in mild or moderate impairment.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2011) that tapentadol (*Palexia*® SR) is accepted for restricted use within NHS Scotland for the management of severe chronic pain in adult patients, which can be adequately managed only with opioid analgesics, when morphine sulfate modified-release has failed to provide adequate pain control or is not tolerated.

● MEDICINAL FORMS

Tramadol hydrochloride

● INDICATIONS AND DOSE

Moderate to severe pain

- BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: 50–100 mg every 4–6 hours, intravenous injection to be given over 2–3 minutes

Moderate to severe acute pain

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; Usual maximum 400 mg/24 hours
- Adult: Initially 100 mg, then 50–100 mg every 4–6 hours; Usual maximum 400 mg/24 hours

Moderate to severe chronic pain

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12–17 years: Initially 50 mg, then, adjusted according to response; Usual maximum 400 mg/24 hours
- Adult: Initially 50 mg, then, adjusted according to response; Usual maximum 400 mg/24 hours

Postoperative pain

- BY INTRAVENOUS INJECTION
- Adult: Initially 100 mg, then 50 mg every 10–20 minutes if required up to total maximum 250 mg (including initial dose) in first hour, then 50–100 mg every 4–6 hours, intravenous injection to be given over 2–3 minutes; maximum 600 mg per day

Moderate to severe pain (with modified-release 12-hourly preparations)

- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12–17 years: 50–100 mg twice daily, increased if necessary to 150–200 mg twice daily, doses exceeding the usual maximum not generally required; Usual maximum 400 mg/24 hours
- Adult: 50–100 mg twice daily, increased if necessary to 150–200 mg twice daily, doses exceeding the usual maximum not generally required; Usual maximum 400 mg/24 hours

Moderate to severe pain (with modified-release 24-hourly preparations)

- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12–17 years: Initially 100–150 mg once daily, increased if necessary up to 400 mg once daily; Usual maximum 400 mg/24 hours
- Adult: Initially 100–150 mg once daily, increased if necessary up to 400 mg once daily; Usual maximum 400 mg/24 hours

ZYDOL® XL

Moderate to severe pain

- BY MOUTH USING MODIFIED-RELEASE TABLETS
- Child 12–17 years: Initially 150 mg once daily, increased if necessary up to 400 mg once daily

- Adult: Initially 150 mg once daily, increased if necessary up to 400 mg once daily

IMPORTANT SAFETY INFORMATION

Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see *Prescribing and dispensing information*.

- CONTRA-INDICATIONS** Acute intoxication with alcohol · acute intoxication with analgesics · acute intoxication with hypnotics · acute intoxication with opioids · not suitable for narcotic withdrawal treatment · uncontrolled epilepsy

- CAUTIONS** Excessive bronchial secretions · history of epilepsy—use tramadol only if compelling reasons · impaired consciousness · not suitable as a substitute in opioid-dependent patients · not suitable in some types of general anaesthesia · susceptibility to seizures—use tramadol only if compelling reasons

CAUTIONS, FURTHER INFORMATION

- General anaesthesia Not recommended for analgesia during potentially light planes of general anaesthesia (possibly increased intra-operative recall reported).

- INTERACTIONS** → Appendix 1: opioids

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Common or very common Fatigue
- Uncommon Postural hypotension
- Rare or very rare Dyspnoea · epileptiform seizure · respiratory disorders · sleep disorders · vision blurred
- Frequency not known Asthma exacerbated · hypoglycaemia

SPECIFIC SIDE-EFFECTS

- Uncommon
 - With parenteral use Circulatory collapse · gastrointestinal discomfort · skin eruption
- Rare or very rare
 - With parenteral use Angioedema · appetite change · behaviour abnormal · cognitive disorder · dysuria · hypersensitivity · mood altered · movement disorders · muscle weakness · perception disorders · psychiatric disorder · sensation abnormal
- Frequency not known
 - With oral use Anxiety · blood disorder · gastrointestinal disorder · hyperkinesia · hypertension · paraesthesia · syncope · tremor · urinary disorder

- PREGNANCY** Embryotoxic in animal studies—manufacturers advise avoid.

- BREAST FEEDING** Amount probably too small to be harmful, but manufacturer advises avoid.

- HEPATIC IMPAIRMENT** Caution (avoid for oral drops) in severe impairment.

- RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs. Caution (avoid for oral drops) in severe impairment.

- DIRECTIONS FOR ADMINISTRATION** Tramadol hydrochloride *orodispersible tablets* should be sucked and then swallowed. May also be dispersed in water. Some tramadol hydrochloride modified-release capsule preparations may be opened and the contents swallowed immediately without chewing—check individual preparations.

For intravenous infusion, dilute in Glucose 5% or Sodium Chloride 0.9%.

- PRESCRIBING AND DISPENSING INFORMATION** Modified-release preparations are available as 12-hourly or 24-hourly formulations. Non-proprietary preparations of modified-release tramadol may be available as either 12-hourly or 24-hourly formulations; prescribers and dispensers must ensure that the correct formulation is

prescribed and dispensed. Branded preparations that should be given 12-hourly include *Invodol*® SR, *Mabron*®, *Maneo*®, *Marol*®, *Maxitram*® SR, *Oldaram*®, *Tilodol*® SR, *Tramquel*® SR, *Tramulief*® SR, *Zamadol*® SR, *Zeridame*® SR and *Zydol*® SR. Preparations that should be given 24-hourly include *Tradorec* XL®, *Zamadol*® 24hr, and *Zydol* XL®.

- PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tramadol hydrochloride orodispersible tablets.

6.1a Migraine

Migraine

08-Jun-2018

Treatment of acute migraine

Treatment of a migraine attack should be guided by response to previous treatment and the severity of the attacks. A **simple analgesic** such as aspirin p. 121, paracetamol p. 438 (preferably in a soluble or dispersible form) or a NSAID is often effective; concomitant **antiemetic** treatment may be required. If treatment with an analgesic is inadequate, an attack may be treated with a specific antimigraine compound such as a **5HT₁-receptor agonist** ('triptan'). **Ergot alkaloids** are rarely required now; oral preparations are associated with many side-effects and should be avoided in cerebrovascular or cardiovascular disease.

Excessive use of acute treatments for migraine (opioid and non-opioid analgesics, 5HT₁-receptor agonists, and ergotamine) is associated with medication-overuse headache

(analgesic-induced headache); therefore, increasing consumption of these medicines needs careful management.

Analgesics

Most migraine headaches respond to analgesics such as aspirin or paracetamol but because peristalsis is often reduced during migraine attacks the medication may not be sufficiently well absorbed to be effective; dispersible or effervescent preparations are therefore preferred. Compound preparations containing analgesics and antiemetics are available.

The NSAID tolfenamic acid p. 469 is licensed specifically for the treatment of an acute attack of migraine; diclofenac potassium p. 1100, flurbiprofen p. 1106, and ibuprofen p. 1106 are also licensed for use in migraine.

5HT₁-receptor agonists

A 5HT₁-receptor agonist is of considerable value in the treatment of an acute migraine attack. The 5HT₁-receptor agonists ('triptans') act on the 5HT (serotonin) 1B/1D receptors and they are therefore sometimes referred to as 5HT_{1B/1D}-receptor agonists. A 5HT₁-receptor agonist may be used during the established headache phase of an attack and is the preferred treatment in those who fail to respond to conventional analgesics. 5HT₁-receptor agonists are **not** indicated for the treatment of hemiplegic, basilar, or ophthalmoplegic migraine.

The 5HT₁-receptor agonists available for treating migraine are almotriptan p. 471, eletriptan p. 471, frovatriptan p. 472, naratriptan p. 473, rizatriptan p. 473, sumatriptan p. 474, and zolmitriptan p. 475. If a patient does not respond to one 5HT₁-receptor agonist, an alternative 5HT₁-receptor agonist should be tried. For patients who have prolonged attacks that frequently recur despite treatment with a 5HT₁-receptor agonist, combination therapy with a NSAID such as naproxen can be considered. Sumatriptan or zolmitriptan are also used to treat cluster headache.

Ergot Alkaloids

The value of ergotamine tartrate p. 470 for migraine is limited by difficulties in absorption and by its side-effects, particularly nausea, vomiting, abdominal pain, and muscular cramps; it is best avoided. The recommended doses of ergotamine tartrate preparations should **not** be exceeded and treatment should **not** be repeated at intervals of less than 4 days.

To avoid habituation the frequency of administration of ergotamine tartrate should be limited to **no more than** twice a month. It should **never** be prescribed prophylactically but in the management of cluster headache a low dose is occasionally given for 1 to 2 weeks [unlicensed indication].

Antiemetics

Antiemetics, such as metoclopramide hydrochloride p. 426 or domperidone p. 426, or phenothiazine and antihistamine antiemetics, relieve the nausea associated with migraine attacks. Antiemetics may be given by intramuscular injection or rectally if vomiting is a problem. Metoclopramide hydrochloride and domperidone have the added advantage of promoting gastric emptying and normal peristalsis; a single dose should be given at the onset of symptoms. Oral analgesic preparations containing metoclopramide hydrochloride are a convenient alternative.

Prophylaxis of migraine

Where migraine attacks are frequent, possible provoking factors such as stress, irregular life-style (e.g. lack of sleep), or chemical triggers (e.g. alcohol and nitrates) should be sought; combined oral contraceptives may also provoke migraine.

Preventive treatment for migraine should be considered for patients who:

- suffer at least two attacks a month;
- suffer an increasing frequency of headaches;

- suffer significant disability despite suitable treatment for migraine attacks;
- cannot take suitable treatment for migraine attacks.

Prophylaxis is also necessary in some rare migraine subtypes and those at risk of migrainous infarction.

The beta-blockers propranolol hydrochloride p. 149, atenolol p. 151, metoprolol tartrate p. 154, nadolol p. 148, and timolol maleate p. 150 are all effective. Propranolol hydrochloride is the most commonly used.

Tricyclic antidepressants [unlicensed indication], gabapentin p. 314 [unlicensed indication], topiramate p. 328, sodium valproate p. 325 [unlicensed indication], and valproic acid p. 351 [unlicensed indication] are also effective for preventing migraine. See *Conception and contraception*, and *Pregnancy* in the topiramate drug monograph for information on use in females of childbearing potential and pregnancy.

Valproic acid and sodium valproate are highly teratogenic. They must not be used in females of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met and alternative treatments are ineffective or not tolerated, and must not be used during pregnancy for migraine prophylaxis. For further information see *Important safety information*, *Conception and contraception*, and *Pregnancy* in the valproic acid and sodium valproate drug monographs.

Pizotifen p. 467 is an antihistamine and a serotonin-receptor antagonist, structurally related to the tricyclic antidepressants. It is of limited value and may cause weight gain.

Botulinum toxin type A p. 403 is licensed for the prophylaxis of headaches in adults with chronic migraine.

Cluster headache and the trigeminal autonomic cephalalgias

Cluster headache rarely responds to standard analgesics. Sumatriptan given by subcutaneous injection is the drug of choice for the *treatment* of cluster headache. If an injection is unsuitable, sumatriptan nasal spray or zolmitriptan nasal spray [both unlicensed use] may be used. Alternatively, 100% oxygen at a rate of 10–15 litres/minute for 10–20 minutes is useful in aborting an attack.

Prophylaxis of cluster headache is considered if the attacks are frequent, last over 3 weeks, or if they cannot be treated effectively. Verapamil hydrochloride p. 163 or lithium [both unlicensed use] are used for prophylaxis.

Prednisolone p. 664 can be used for short-term prophylaxis of episodic cluster headache [unlicensed use] either as monotherapy, or in combination with verapamil hydrochloride during verapamil titration.

Ergotamine tartrate, used on an intermittent basis is an alternative for patients with short bouts, but it should not be used for prolonged periods.

The other trigeminal autonomic cephalalgias, paroxysmal hemicrania (sensitive to indometacin p. 1109), and short-lasting unilateral neuralgiform headache attacks with conjunctival injection and tearing, are seen rarely and are best managed by a specialist.

Other drugs used for Migraine Amitriptyline hydrochloride, p. 369 • Clonidine hydrochloride, p. 144 • Cyclizine, p. 424 • Trifluoperazine, p. 387

ANALGESICS > NON-OPIOID

Paracetamol with isometheptene

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 438.

● INDICATIONS AND DOSE

Treatment of acute attacks of migraine

► BY MOUTH

- Adult: 2 capsules, dose to be taken at onset of attack, followed by 1 capsule every 1 hour if required, maximum of 5 capsules in 12 hours

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025
- **INTERACTIONS** → Appendix 1: paracetamol · sympathomimetics, vasoconstrictor
- **PATIENT AND CARER ADVICE** Patient counselling is advised (dosage).
- **LESS SUITABLE FOR PRESCRIBING** Isometheptene with paracetamol is less suitable for prescribing (more effective treatments available).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 30

Isometheptene mucate 65 mg, Paracetamol 325 mg Midrid 325mg/65mg capsules | 30 capsule **[PoM]** £7.50

Paracetamol with metoclopramide

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 438, metoclopramide hydrochloride p. 426.

● INDICATIONS AND DOSE

Acute migraine

► BY MOUTH USING TABLETS

- Adult: 2 tablets, to be taken at the onset of attack, followed by 2 tablets every 4 hours if required; maximum 6 tablets per day

► BY MOUTH USING EFFERVESCENT POWDER SACHETS

- Adult: 2 sachets, to be taken at the onset of attack, followed by 2 sachets every 4 hours if required, sachets to be dissolved in a quarter tumblerful of water; maximum 6 sachets per day

IMPORTANT SAFETY INFORMATION

Metoclopramide can cause **severe extrapyramidal effects**, particularly in young adults.

- **CAUTIONS** Treatment should not exceed 3 months due to risk of tardive dyskinesia
- **INTERACTIONS** → Appendix 1: metoclopramide · paracetamol

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Metoclopramide hydrochloride 10 mg, Aspirin DL-Lysine

900 mg MigraMax oral powder sachets sugar-free | 6 sachet **[PoM]** £6.61 DT = £6.61

Tolfenamic acid

● INDICATIONS AND DOSE

Treatment of acute migraine

► BY MOUTH

- Adult: 200 mg, dose to be taken at onset, then 200 mg after 1–2 hours if required

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal haemorrhage (two or more distinct episodes) · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS** Agranulocytosis · angioedema · aplastic anaemia · asthma · confusion · constipation · Crohn's

disease aggravated · depression · diarrhoea · dizziness · drowsiness · dyspnoea · dysuria (most common in men) · euphoric mood · fatigue · fertility decreased female · gastrointestinal discomfort · gastrointestinal disorders · haemolytic anaemia · haemorrhage · hallucination · headache · heart failure · hepatic disorders · hypersensitivity · hypertension · increased risk of arterial thromboembolism · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · nausea · nephritis tubulointerstitial · nephropathy · neutropenia · oedema · optic neuritis · oral ulceration · pancreatitis · paraesthesia · photosensitivity reaction · renal failure (more common in patients with pre-existing renal impairment) · respiratory disorders · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · tinnitus · tremor · vertigo · visual impairment · vomiting

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1094.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Amount too small to be harmful. Use with caution during breast-feeding.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. **Dose adjustments** The lowest effective dose should be used for the shortest possible duration. **Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Codeine phosphate 8 mg, Paracetamol 500 mg Migraleve Yellow tablets | 16 tablet [P] [S] [CD5]

ERGOT ALKALOIDS

Ergotamine tartrate

• INDICATIONS AND DOSE

Management of cluster headache

- BY MOUTH USING TABLETS
- Adult: 1 mg once daily for 6 nights in 7; occasionally given for 1–2 weeks, dose to be taken at night

- **UNLICENSED USE** Not licensed for the management of cluster headache.
- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · coronary heart disease · hyperthyroidism · inadequately controlled hypertension · obliterative vascular disease · peripheral vascular disease · Raynaud's syndrome · sepsis · severe hypertension · temporal arteritis
- **CAUTIONS** Anaemia · cardiac disease · dependence · elderly · risk of peripheral vasospasm
- **INTERACTIONS** → Appendix 1: ergotamine
- **SIDE-EFFECTS**
- **Common or very common** Abdominal pain · dizziness · nausea · vomiting

- **Uncommon** Cyanosis · diarrhoea · muscle weakness · pain in extremity · sensation abnormal · vasoconstriction
- **Rare or very rare** Arrhythmias · cardiac valve fibrosis · dyspnoea · ergot poisoning (including absence of pulse and numbness in extremities) · gangrene · intestinal ischaemia · myalgia · myocardial infarction · myocardial ischaemia · skin reactions
- **Frequency not known** Anxiety · arthralgia · blood disorder · cerebral ischaemia · confusion · constipation · depression · drowsiness · dry mouth · extrapyramidal symptoms · hallucination · renal artery spasm · seizure · sleep disorder · thrombosis · tremor · urinary retention · vision blurred
- **PREGNANCY** Avoid; oxytocic effect on the uterus.
- **BREAST FEEDING** Avoid; ergotism may occur in infant; repeated doses may inhibit lactation.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment—risk of toxicity increased.
- **RENAL IMPAIRMENT** Avoid; risk of renal vasoconstriction.
- **PATIENT AND CARER ADVICE**
Peripheral vasospasm Warn patient to stop treatment immediately if numbness or tingling of extremities develops and to contact doctor.
- **LESS SUITABLE FOR PRESCRIBING** Ergotamine tartrate is less suitable for prescribing.

MEDICINAL FORMS

No licensed medicines listed

Ergotamine tartrate with caffeine hydrate and cyclizine hydrochloride

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergotamine tartrate p. 470, cyclizine p. 424.

INDICATIONS AND DOSE

Treatment of acute migraine and migraine variants unresponsive to analgesics

► BY MOUTH

- **Adult:** 1 tablet, to be taken at onset, followed by 0.5–1 tablet after 30 minutes, then 0.5–1 tablet every 30 minutes if required, max. 3 tablets in 24 hours, max. 4 tablets per attack, max. 6 tablets in one week

- **INTERACTIONS** → Appendix 1: antihistamines, sedating · ergotamine
- **PATIENT AND CARER ADVICE** Patient counselling is advised for cyclizine hydrochloride with caffeine hydrate and ergotamine tartrate tablets (dosage).
- **LESS SUITABLE FOR PRESCRIBING** Cyclizine hydrochloride with caffeine hydrate and ergotamine tartrate (*Migril*®) is less suitable for prescribing.

MEDICINAL FORMS

Ergotamine tartrate 2 mg, Cyclizine hydrochloride 50 mg, Caffeine hydrate 100 mg *Migril* tablets | 100 tablet [PoM] £51.00

TRIPTANS

Almotriptan

INDICATIONS AND DOSE

Treatment of acute migraine

► BY MOUTH

- **Adult:** 12.5 mg, dose to be taken as soon as possible after onset, followed by 12.5 mg after 2 hours if required, dose to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 25 mg per day

- **UNLICENSED USE** Not licensed for use in elderly.
- **CONTRA-INDICATIONS** Coronary vasospasm · ischaemic heart disease · peripheral vascular disease · previous cerebrovascular accident · previous myocardial infarction · previous transient ischaemic attack · Prinzmetal's angina · severe hypertension · uncontrolled hypertension
- **CAUTIONS** Conditions which predispose to coronary artery disease · elderly
- **INTERACTIONS** → Appendix 1: almotriptan
- **SIDE-EFFECTS**
 - **Common or very common** Asthenia · dizziness · drowsiness · nausea · vomiting
 - **Uncommon** Bone pain · chest pain · diarrhoea · dry mouth · dyspepsia · headache · myalgia · palpitations · paraesthesia · throat tightness · tinnitus
 - **Rare or very rare** Coronary vasospasm · myocardial infarction · tachycardia
 - **Frequency not known** Intestinal ischaemia · seizure · vision disorders

SIDE-EFFECTS, FURTHER INFORMATION Discontinue if symptoms of heat, heaviness, pressure or tightness (including throat and chest) occur.

- **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with sensitivity to sulfonamides.
- **PREGNANCY** There is limited experience of using 5HT₁-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.
- **BREAST FEEDING** Present in milk in *animal* studies—withhold breast-feeding for 24 hours.
- **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT**
Dose adjustments Max. 12.5 mg in 24 hours if eGFR less than 30 mL/minute/1.73 m².

- Adult: Initially 50–100 mg for 1 dose, followed by 50–100 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 300 mg per day

► **BY SUBCUTANEOUS INJECTION**

- Adult: Initially 6 mg for 1 dose, followed by 6 mg after at least 1 hour if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack), dose to be administered using an auto-injector; not for intravenous injection which may cause coronary vasospasm and angina; maximum 12 mg per day

► **BY INTRANASAL ADMINISTRATION**

- Adult 18–65 years: Initially 10–20 mg, to be administered into one nostril, followed by 10–20 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 40 mg per day

Treatment of acute cluster headache► **BY SUBCUTANEOUS INJECTION**

- Adult: Initially 6 mg for 1 dose, followed by 6 mg after at least 1 hour if required, to be taken only if headache recurs (patient not responding to initial dose should not take second dose for same attack), dose to be administered using an auto-injector; not for intravenous injection which may cause coronary vasospasm and angina; maximum 12 mg per day

► **BY INTRANASAL ADMINISTRATION**

- Adult 18–65 years: Initially 10–20 mg, dose to be administered into one nostril, followed by 10–20 mg after at least 2 hours if required, to be taken only if headache recurs (patient not responding to initial dose should not take second dose for same attack); maximum 40 mg per day

- **UNLICENSED USE** Not licensed for use in elderly.

- **CONTRA-INDICATIONS** Coronary vasospasm · ischaemic heart disease · mild uncontrolled hypertension · moderate and severe hypertension · peripheral vascular disease · previous cerebrovascular accident · previous myocardial infarction · previous transient ischaemic attack · Prinzmetal's angina

- **CAUTIONS** Conditions which predispose to coronary artery disease · elderly · history of seizures · mild, controlled

hypertension · pre-existing cardiac disease · risk factors for seizures

- **INTERACTIONS** → Appendix 1: sumatriptan

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- **Common or very common** Asthenia · dizziness · drowsiness · dyspnoea · feeling abnormal · flushing · myalgia · nausea · pain · sensation abnormal · temperature sensation altered · vomiting

- **Rare or very rare** Hypersensitivity

- **Frequency not known** Angina pectoris · anxiety · arrhythmias · arthralgia · colitis ischaemic · coronary vasospasm · diarrhoea · dystonia · hyperhidrosis · hypotension · myocardial infarction · nystagmus · palpitations · Raynaud's phenomenon · seizure · tremor · vision disorders

SPECIFIC SIDE-EFFECTS

- **Common or very common**

- With intranasal use Epistaxis · nasal irritation · taste altered · throat irritation

- With subcutaneous use Haemorrhage · skin reactions · swelling

- **Frequency not known**

- With intranasal use Skin reactions

- With oral use Allergic dermatitis

SIDE-EFFECTS, FURTHER INFORMATION Discontinue if symptoms of heat, heaviness, pressure or tightness (including throat and chest) occur.

- **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with sensitivity to sulfonamides.

- **PREGNANCY** There is limited experience of using 5HT₁-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.

- **BREAST FEEDING** Present in milk but amount probably too small to be harmful; withhold breast-feeding for 12 hours after treatment.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

Dose adjustments Reduce oral dose to 25–50 mg.

- **RENAL IMPAIRMENT** Use with caution.

● **PATIENT AND CARER ADVICE****Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving).

- **EXCEPTIONS TO LEGAL CATEGORY** Sumatriptan 50 mg tablets can be sold to the public to treat previously diagnosed migraine; max. daily dose 100 mg.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

6.2 Neuropathic pain**Neuropathic pain****Overview and management**

Neuropathic pain, which occurs as a result of damage to neural tissue, includes *phantom limb pain*, *compression neuropathies*, *peripheral neuropathies* (e.g. due to Diabetic complications p. 674, chronic excessive alcohol intake, HIV infection p. 628, chemotherapy, idiopathic neuropathy), *trauma*, *central pain* (e.g. pain following stroke, spinal cord

injury, and syringomyelia), and *postherpetic neuralgia* (peripheral nerve damage following acute herpes zoster infection (shingles)). The pain may occur in an area of sensory deficit and is sometimes accompanied by pain that is evoked by a non-noxious stimulus (allodynia).

Trigeminal neuralgia is also caused by dysfunction of neural tissue, but its management is distinct from other forms of neuropathic pain.

Neuropathic pain is generally managed with a **tricyclic antidepressant** or with certain **antiepileptic drugs**. Amitriptyline hydrochloride p. 369 [unlicensed indication] and pregabalin p. 322 are effective treatments for neuropathic pain. Amitriptyline hydrochloride and pregabalin can be used in combination if the patient has an inadequate response to either drug at the maximum tolerated dose.

Nortriptyline p. 374 [unlicensed indication] may be better tolerated than amitriptyline hydrochloride.

Gabapentin p. 314 is also effective for the treatment of neuropathic pain.

Neuropathic pain may respond to **opioid analgesics**. There is evidence of efficacy for tramadol hydrochloride p. 464, morphine p. 456, and oxycodone hydrochloride p. 459; however, treatment with morphine or oxycodone hydrochloride should be initiated only under specialist supervision. Tramadol hydrochloride can be prescribed when other treatments have been unsuccessful, while the patient is waiting for assessment by a specialist.

Patients with localised pain who are unable to take oral medicines may benefit from **topical local anaesthetic preparations**, such as lidocaine hydrochloride p. 1312 medicated plasters, while awaiting specialist review.

Capsaicin below is licensed for neuropathic pain (but the intense burning sensation during initial treatment may limit use). Capsaicin 0.075% cream is licensed for the symptomatic relief of *postherpetic neuralgia*. A self-adhesive patch containing capsaicin 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients. It should be used under specialist supervision.

A corticosteroid may help to relieve pressure in compression neuropathy and thereby reduce pain.

Neuromodulation by spinal cord stimulation may be of benefit in some patients. Many patients with chronic neuropathic pain require multidisciplinary management, including physiotherapy and psychological support.

Trigeminal neuralgia

Surgery may be the treatment of choice in many patients; a neurological assessment will identify those who stand to benefit. Carbamazepine p. 309 taken during the acute stages of trigeminal neuralgia, reduces the frequency and severity of attacks. It is very effective for the severe pain associated with trigeminal neuralgia and (less commonly) glossopharyngeal neuralgia. Blood counts and electrolytes should be monitored when high doses are given. Small doses should be used initially to reduce the incidence of side-effects e.g. dizziness. Some cases respond to phenytoin p. 321; the drug may be given by intravenous infusion (possibly as fosphenytoin sodium p. 313) in a crisis (specialist use only).

Chronic facial pain

Chronic oral and facial pain including *persistent idiopathic facial pain* (also termed 'atypical facial pain') and *temporomandibular dysfunction* (previously termed temporomandibular joint pain dysfunction syndrome) may call for prolonged use of analgesics or for other drugs.

Tricyclic antidepressants may be useful for facial pain [unlicensed indication], but are not on the Dental Practitioners' List. Disorders of this type require specialist referral and psychological support to accompany drug treatment. Patients on long-term therapy need to be monitored both for progress and for side-effects.

Other drugs used for Neuropathic pain Amantadine hydrochloride, p. 412

ANALGESICS > PLANT ALKALOIDS

Capsaicin

● INDICATIONS AND DOSE

AXSAIN®

Post-herpetic neuralgia

► TO THE SKIN

- Adult: Apply 3–4 times a day, dose to be applied sparingly; **important**; after lesions have healed, not more often than every 4 hours

Painful diabetic neuropathy (under expert supervision)

► TO THE SKIN

- Adult: Apply 3–4 times a day for 8 weeks then review, dose to be applied sparingly, not more often than every 4 hours

QUTENZA®

Peripheral neuropathic pain in non-diabetic patients (under the supervision of a physician)

► BY TRANSDERMAL APPLICATION USING PATCHES

- Adult: (consult product literature)

ZACIN®

Symptomatic relief in osteoarthritis

► TO THE SKIN

- Adult: Apply 4 times a day, dose to be applied sparingly, not more often than every 4 hours

● CAUTIONS

GENERAL CAUTIONS Avoid contact with broken skin · avoid contact with inflamed skin

SPECIFIC CAUTIONS

- With topical use Avoid contact with eyes · avoid hot shower or bath just before or after application (burning sensation enhanced) · avoid inhalation of vapours · not to be used under tight bandages
- With transdermal use avoid contact with the face, scalp or in proximity to mucous membranes · avoid holding near eyes or mucous membranes · recent cardiovascular events · uncontrolled hypertension

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Uncommon** Cough

SPECIFIC SIDE-EFFECTS

- **Common or very common**
 - With transdermal use Sensation abnormal
- **Uncommon**
 - With transdermal use Atrioventricular block · eye irritation · muscle spasms · nausea · palpitations · peripheral oedema · skin reactions · tachycardia · taste altered · throat irritation
- **Rare or very rare**
 - With topical use Sneezing · watering eye
- **Frequency not known**
 - With topical use Asthma exacerbated · dyspnoea · skin burning sensation (particularly if too much used or if administered more than 4 times daily) · skin irritation

● MONITORING REQUIREMENTS

- With transdermal use Monitor blood pressure during treatment procedure.

● HANDLING AND STORAGE

- With topical use Wash hands immediately after use (or wash hands 30 minutes after application if hands treated).
- With transdermal use Nitrile gloves to be worn while handling patches and cleaning treatment areas (latex gloves do not provide adequate protection).

● NATIONAL FUNDING/ACCESS DECISIONS

QUTENZA®

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2011) that capsaicin 179 mg (8%) patch (*Qutenza*®) is accepted for restricted use within NHS Scotland for the treatment of postherpetic neuralgia in patients who have not achieved adequate pain relief from, or who have not tolerated conventional first and second line treatments. Treatment should be under the supervision of a specialist in pain management.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cutaneous patch

EXCIPIENTS: May contain Butylated hydroxyanisole

▶ *Qutenza* (Grünenthal Ltd)

Capsaicin 179 mg *Qutenza* 179mg cutaneous patches | 1 patch (PoM) £210.00

Cream

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol)

▶ *Axsain* (Teva UK Ltd)

Capsaicin 750 microgram per 1 gram *Axsain* 0.075% cream | 45 gram (PoM) £14.58 DT = £14.58

▶ *Zacin* (Teva UK Ltd)

Capsaicin 250 microgram per 1 gram *Zacin* 0.025% cream | 45 gram (PoM) £17.71 DT = £17.71

7 Sleep disorders

7.1 Insomnia

Hypnotics and anxiolytics

Overview

Most anxiolytics ('sedatives') will induce sleep when given at night and most hypnotics will sedate when given during the day. Prescribing of these drugs is widespread but dependence (both physical and psychological) and tolerance occur. This may lead to difficulty in withdrawing the drug after the patient has been taking it regularly for more than a few weeks. Hypnotics and anxiolytics should therefore be reserved for short courses to alleviate acute conditions after causal factors have been established.

Benzodiazepines are the most commonly used anxiolytics and hypnotics; they act at benzodiazepine receptors which are associated with gamma-aminobutyric acid (GABA) receptors. Older drugs such as meprobamate p. 343 and barbiturates are **not** recommended—they have more side-effects and interactions than benzodiazepines and are much more dangerous in overdosage.

Benzodiazepine indications

- Benzodiazepines are indicated for the short-term relief (two to four weeks only) of anxiety that is severe, disabling, or causing the patient unacceptable distress, occurring alone or in association with insomnia or short-term psychosomatic, organic, or psychotic illness.
- The use of benzodiazepines to treat short-term 'mild' anxiety is inappropriate.
- Benzodiazepines should be used to treat insomnia only when it is severe, disabling, or causing the patient extreme distress.

Dependence and withdrawal

Withdrawal of a benzodiazepine should be gradual because abrupt withdrawal may produce confusion, toxic psychosis, convulsions, or a condition resembling delirium tremens.

The benzodiazepine withdrawal syndrome may develop at any time up to 3 weeks after stopping a long-acting benzodiazepine, but may occur within a day in the case of a short-acting one. It is characterised by insomnia, anxiety, loss of appetite and of body-weight, tremor, perspiration, tinnitus, and perceptual disturbances. Some symptoms may be similar to the original complaint and encourage further prescribing; some symptoms may continue for weeks or months after stopping benzodiazepines.

Benzodiazepine withdrawal should be flexible and carried out at a reduction rate that is tolerable for the patient. The rate should depend on the initial dose of benzodiazepine, duration of use, and the patient's clinical response. Short-term users of benzodiazepines (2–4 weeks only) can usually taper off within 2–4 weeks. However, long-term users should be withdrawn over a much longer period of several months or more.

A suggested protocol for withdrawal for prescribed long-term benzodiazepine patients is as follows:

- Transfer patient stepwise, one dose at a time over about a week, to an equivalent daily dose of diazepam preferably taken at night.
- Reduce diazepam dose, usually by 1–2 mg every 2–4 weeks (in patients taking high doses of benzodiazepines, initially it may be appropriate to reduce the dose by up to one-tenth every 1–2 weeks). If uncomfortable withdrawal symptoms occur, maintain this dose until symptoms lessen.
- Reduce diazepam dose further, if necessary in smaller steps; steps of 500 micrograms may be appropriate towards the end of withdrawal. Then stop completely.
- For long-term patients, the period needed for complete withdrawal may vary from several months to a year or more.

Approximate equivalent doses, diazepam 5 mg

- ≡ alprazolam 250 micrograms
- ≡ clobazam 10 mg
- ≡ clonazepam 250 micrograms
- ≡ flurazepam 7.5–15 mg
- ≡ chlordiazepoxide 12.5 mg
- ≡ lorazepam 0.5–1 mg
- ≡ lorazepam 500 micrograms
- ≡ lormetazepam 0.5–1 mg
- ≡ nitrazepam 5 mg
- ≡ oxazepam 10 mg
- ≡ temazepam 10 mg

Withdrawal symptoms for long-term users usually resolve within 6–18 months of the last dose. Some patients will recover more quickly, others may take longer. The addition of beta-blockers, antidepressants and antipsychotics should be **avoided** where possible.

Counselling can be of considerable help both during and after the taper.

Hypnotics

Before a hypnotic is prescribed the cause of the insomnia should be established and, where possible, underlying factors should be treated. However, it should be noted that some patients have unrealistic sleep expectations, and others understate their alcohol consumption which is often the cause of the insomnia. Short-acting hypnotics are preferable in patients with sleep onset insomnia, when sedation the following day is undesirable, or when prescribing for elderly patients. Long-acting hypnotics are indicated in patients with poor sleep maintenance (e.g. early morning waking) that causes daytime effects, when an anxiolytic effect is needed during the day, or when sedation the following day is acceptable.

Transient insomnia may occur in those who normally sleep well and may be due to extraneous factors such as noise, shift work, and jet lag. If a hypnotic is indicated one that is

rapidly eliminated should be chosen, and only one or two doses should be given.

Short-term insomnia is usually related to an emotional problem or serious medical illness. It may last for a few weeks and may recur; a hypnotic can be useful but should not be given for more than three weeks (preferably only one week). Intermittent use is desirable with omission of some doses. A short-acting drug is usually appropriate.

Chronic insomnia is rarely benefited by hypnotics and is sometimes due to mild dependence caused by injudicious prescribing of hypnotics. Psychiatric disorders such as anxiety, depression, and abuse of drugs and alcohol are common causes. Sleep disturbance is very common in depressive illness and early waking is often a useful pointer. The underlying psychiatric complaint should be treated, adapting the drug regimen to alleviate insomnia. For example, clomipramine hydrochloride p. 370 or mirtazapine p. 368 prescribed for depression will also help to promote sleep if taken at night. Other causes of insomnia include daytime cat-napping and physical causes such as pain, pruritus, and dyspnoea.

Hypnotics should **not** be prescribed indiscriminately and routine prescribing is undesirable. They should be reserved for short courses in the acutely distressed. Tolerance to their effects develops within 3 to 14 days of continuous use and long-term efficacy cannot be assured. A major drawback of long-term use is that withdrawal can cause rebound insomnia and a withdrawal syndrome.

Where prolonged administration is unavoidable hypnotics should be discontinued as soon as feasible and the patient warned that sleep may be disturbed for a few days before normal rhythm is re-established; broken sleep with vivid dreams may persist for several weeks.

Elderly

Benzodiazepines and the Z-drugs should be avoided in the elderly, because the elderly are at greater risk of becoming ataxic and confused, leading to falls and injury.

Dental patients

Some anxious patients may benefit from the use of hypnotics during dental procedures such as temazepam p. 481 or diazepam p. 340. Temazepam is preferred when it is important to minimise any residual effect the following day.

Benzodiazepines

Benzodiazepines used as hypnotics include nitrazepam p. 480 and flurazepam p. 479 which have a prolonged action and may give rise to residual effects on the following day; repeated doses tend to be cumulative.

Loprazolam p. 479, lormetazepam p. 480, and temazepam act for a shorter time and they have little or no hangover effect. Withdrawal phenomena are more common with the short-acting benzodiazepines.

If insomnia is associated with daytime anxiety then the use of a long-acting benzodiazepine anxiolytic such as diazepam given as a single dose at night may effectively treat both symptoms.

Zaleplon, zolpidem, and zopiclone

Zaleplon p. 483, zolpidem tartrate p. 483 and zopiclone p. 484 are non-benzodiazepine hypnotics (sometimes referred to as Z-drugs), but they act at the benzodiazepine receptor. They are not licensed for long-term use; dependence has been reported in a small number of patients. Zolpidem tartrate and zopiclone have a short duration of action; zaleplon is very short acting.

Chloral and derivatives

There is no convincing evidence that they are particularly useful in the elderly and their role as hypnotics is now very limited.

Clomethiazole

Clomethiazole p. 482 may be a useful hypnotic for elderly patients because of its freedom from hangover but, as with

all hypnotics, routine administration is undesirable and dependence occurs.

Antihistamines

Some **antihistamines** such as promethazine hydrochloride p. 286 are on sale to the public for occasional insomnia; their prolonged duration of action can often cause drowsiness the following day. The sedative effect of antihistamines may diminish after a few days of continued treatment; antihistamines are associated with headache, psychomotor impairment and antimuscarinic effects.

Alcohol

Alcohol is a poor hypnotic because the diuretic action interferes with sleep during the latter part of the night. Alcohol also disturbs sleep patterns, and so can worsen sleep disorders.

Melatonin

Melatonin p. 482 is a pineal hormone; it is licensed for the short-term treatment of insomnia in adults over 55 years.

Anxiolytics

Benzodiazepine anxiolytics can be effective in alleviating anxiety states. Although these drugs are sometimes prescribed for stress-related symptoms, unhappiness, or minor physical disease, their use in such conditions is inappropriate. Benzodiazepine anxiolytics should not be used as sole treatment for chronic anxiety, and they are not appropriate for treating depression or chronic psychosis. In bereavement, psychological adjustment may be inhibited by benzodiazepines.

Anxiolytic benzodiazepine treatment should be limited to the lowest possible dose for the shortest possible time. Dependence is particularly likely in patients with a history of alcohol or drug abuse and in patients with marked personality disorders.

Some antidepressant drugs are licensed for use in anxiety and related disorders. Some antipsychotic drugs, in low doses, are also sometimes used in severe anxiety for their sedative action, but long-term use should be avoided because of the risk of adverse effects. The use of antihistamines (e.g. hydroxyzine hydrochloride p. 284) for their sedative effect in anxiety is not appropriate.

Beta-adrenoceptor blocking drugs do not affect psychological symptoms of anxiety, such as worry, tension, and fear, but they do reduce autonomic symptoms, such as palpitation and tremor; they do not reduce non-autonomic symptoms, such as muscle tension. Beta-blockers are therefore indicated for patients with predominantly somatic symptoms; this, in turn, may prevent the onset of worry and fear.

Benzodiazepines

Benzodiazepines are indicated for the *short-term relief of severe anxiety*; long-term use should be avoided. Diazepam, alprazolam p. 339, chlordiazepoxide hydrochloride p. 340, and clobazam p. 333 have a sustained action. Shorter-acting compounds such as lorazepam p. 335 and oxazepam p. 342 may be preferred in patients with hepatic impairment but they carry a greater risk of withdrawal symptoms.

In *panic disorders* (with or without agoraphobia) resistant to antidepressant therapy, a benzodiazepine may be used; alternatively, a benzodiazepine may be used as short-term adjunctive therapy at the start of antidepressant treatment to prevent the initial worsening of symptoms.

Diazepam or lorazepam are very occasionally administered intravenously for the *control of panic attacks*. This route is the most rapid but the procedure is not without risk and should be used only when alternative measures have failed. The intramuscular route has no advantage over the oral route.

Buspirone

Buspirone hydrochloride p. 338 is thought to act at specific serotonin (5HT_{1A}) receptors. Response to treatment may take up to 2 weeks. It does not alleviate the symptoms of benzodiazepine withdrawal. Therefore a patient taking a benzodiazepine still needs to have the benzodiazepine withdrawn gradually; it is advisable to do this before starting buspirone hydrochloride. The dependence and abuse potential of buspirone hydrochloride is low; it is, however, licensed for short-term use only (but specialists occasionally use it for several months).

Meprobamate

Meprobamate p. 343 is **less effective** than the benzodiazepines, more hazardous in overdosage, and can also induce dependence. It is **not recommended**.

Barbiturates

The intermediate-acting **barbiturates** have a place only in the treatment of severe intractable insomnia in patients **already taking** barbiturates; they should be **avoided** in the elderly. Intermediate-acting barbiturate preparations containing amobarbital sodium, butobarbital, and secobarbital sodium are available on a named patient basis.

The long-acting barbiturate phenobarbital is still sometimes of value in epilepsy but its use as a sedative is unjustified.

The very short-acting barbiturate thiopental sodium p. 335 is used in anaesthesia.

Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

HYPNOTICS, SEDATIVES AND ANXIOLYTICS > BENZODIAZEPINES

F 339

Flurazepam

20-Jul-2017

● INDICATIONS AND DOSE**Insomnia (short-term use)****► BY MOUTH**

- Adult: 15–30 mg once daily, dose to be taken at bedtime, for debilitated patients, use elderly dose
- Elderly: 15 mg once daily, dose to be taken at bedtime

- CONTRA-INDICATIONS** Not for use alone to treat chronic psychosis · not for use alone to treat depression (or anxiety associated with depression) · respiratory depression

- CAUTIONS** Acute porphyrias p. 1025 · hypoalbuminaemia · muscle weakness

CAUTIONS, FURTHER INFORMATION

- Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

- INTERACTIONS** → Appendix 1: flurazepam

● SIDE-EFFECTS

- Common or very common Taste altered
- Rare or very rare Abdominal discomfort · skin eruption
- Frequency not known Agranulocytosis · extrapyramidal symptoms · leucopenia · pancytopenia · psychotic disorder · rebound effect · suicide attempt · thrombocytopenia

- BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

- HEPATIC IMPAIRMENT** Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives (such as temazepam or oxazepam) are safer. Avoid in severe impairment.

Dose adjustments Start with smaller initial doses or reduce dose.

● RENAL IMPAIRMENT

Dose adjustments Start with small doses in severe impairment.

● PATIENT AND CARER ADVICE

Driving and skilled tasks May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

● NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Flurazepam capsules are not prescribable in NHS primary care.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Temazepam

● INDICATIONS AND DOSE

Insomnia (short-term use)

► BY MOUTH

- Adult: 10–20 mg once daily, alternatively 30–40 mg once daily, higher dose range only to be administered in exceptional circumstances, dose to be taken at bedtime, for debilitated patients, use elderly dose
- Elderly: 10 mg once daily, alternatively 20 mg once daily, higher dose only to be administered in exceptional circumstances, dose to be taken at bedtime

Conscious sedation for dental procedures

► BY MOUTH

- Adult: 15–30 mg, to be administered 30–60 minutes before procedure

Premedication before surgery or investigatory procedures

► BY MOUTH

- Adult: 10–20 mg, to be taken 1–2 hours before procedure, alternatively 30 mg, to be taken 1–2 hours before procedure, higher alternate dose only administered in exceptional circumstances
- Elderly: 10 mg, to be taken 1–2 hours before procedure, alternatively 20 mg, to be taken 1–2 hours before procedure, higher alternate dose only administered in exceptional circumstances

- **UNLICENSED USE** Temazepam doses in BNF may differ from those in product literature.

Not licensed for conscious sedation for dental procedures.

- **CONTRA-INDICATIONS** CNS depression · compromised airway · hyperkinesia · not for use alone to treat chronic psychosis · not for use alone to treat depression (or anxiety associated with depression) · obsessional state · phobic states · respiratory depression

- **CAUTIONS** Hypoalbuminaemia · muscle weakness · organic brain changes

CAUTIONS, FURTHER INFORMATION

- Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

Chloral hydrate

- **INDICATIONS AND DOSE**

Insomnia (short-term use) using Chloral Mixture, BP 2000

► BY MOUTH USING ORAL SOLUTION

- Adult: 0.5–2 g daily, dose to be taken at bedtime

Insomnia (short-term use), using chloral hydrate

143.3 mg/5 mL oral solution

► BY MOUTH USING ORAL SOLUTION

- Adult: 430–860 mg once daily (max. per dose 2 g), dose to be taken with water or milk at bedtime

Insomnia (short-term use), using chloral betaine 707 mg (≡ 414 mg chloral hydrate) tablets

► BY MOUTH USING TABLETS

- Adult: 1–2 tablets, alternatively 414–828 mg once daily, dose to be taken with water or milk at bedtime; maximum 4 tablets per day; maximum 2 g per day

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · gastritis · severe cardiac disease

- **CAUTIONS** Avoid contact with mucous membranes · avoid contact with skin · avoid prolonged use (and abrupt withdrawal thereafter) · reduce dose in debilitated · reduce dose in elderly

- **INTERACTIONS** → Appendix 1: chloral hydrate

- **SIDE-EFFECTS** Agitation · allergic dermatitis · ataxia · confusion · delirium (more common on abrupt discontinuation) · drug tolerance · drug use disorders · gastrointestinal discomfort · gastrointestinal disorders · headache · injury · ketonuria · kidney injury

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Risk of sedation in infant—avoid.

- **HEPATIC IMPAIRMENT** Can precipitate coma. Avoid in severe impairment.

Dose adjustments Reduce dose in mild to moderate impairment.

- **RENAL IMPAIRMENT** Avoid in severe impairment.

- **DIRECTIONS FOR ADMINISTRATION** For administration by mouth dilute liquid with plenty of water or juice to mask unpleasant taste.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include black currant.

When prepared extemporaneously, the BP states Chloral Mixture, BP 2000 consists of chloral hydrate 500 mg/5 mL in a suitable vehicle.

• PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

• LESS SUITABLE FOR PRESCRIBING

Chloral hydrate is less suitable for prescribing in insomnia.

• MEDICINAL FORMS

Clomethiazole

(Chlormethiazole)

• INDICATIONS AND DOSE

Severe insomnia (short-term use)

► BY MOUTH USING CAPSULES

► Elderly: 192–384 mg once daily, dose to be taken at bedtime

► BY MOUTH USING ORAL SOLUTION

► Elderly: 5–10 mL once daily, dose to be taken at bedtime

Restlessness and agitation

► BY MOUTH USING CAPSULES

► Elderly: 192 mg 3 times a day

► BY MOUTH USING ORAL SOLUTION

► Elderly: 5 mL 3 times a day

Alcohol withdrawal

► BY MOUTH USING CAPSULES

► Adult: Initially 2–4 capsules, to be repeated if necessary after some hours. 9–12 capsules daily in 3–4 divided doses on day 1 (first 24 hours), then 6–8 capsules daily in 3–4 divided doses on day 2, then 4–6 capsules daily in 3–4 divided doses on day 3, dose then to be gradually reduced over days 4–6, total duration of treatment for no more than 9 days

► BY MOUTH USING ORAL SOLUTION

► Adult: Initially 10–20 mL, to be repeated if necessary after some hours, then 45–60 mL daily in 3–4 divided doses on day 1 (first 24 hours), then 30–40 mL daily in 3–4 divided doses on day 2, then 20–30 mL daily in 3–4 divided doses on day 3, dose then to be gradually reduced over days 4–6, total duration of treatment for no more than 9 days

• CONTRA-INDICATIONS

Acute pulmonary insufficiency · alcohol-dependent patients who continue to drink

• CAUTIONS

Avoid prolonged use (and abrupt withdrawal thereafter) · cardiac disease (confusional state may indicate hypoxia) · chronic pulmonary insufficiency · elderly · excessive sedation may occur (particularly with higher doses) · history of drug abuse · marked personality disorder · respiratory disease (confusional state may indicate hypoxia) · sleep apnoea syndrome

• INTERACTIONS

→ Appendix 1: clomethiazole

• **SIDE-EFFECTS** Agitation · bronchial secretion increased · confusion · conjunctival irritation · drug dependence · drug tolerance · excessive sedation · gastrointestinal disorder · hangover · nasal complaints · skin reactions · upper airway secretion increased

• **PREGNANCY** Avoid if possible—especially during the first and third trimesters.

• **BREAST FEEDING** Use only if benefit outweighs risk—present in breast milk but effects unknown.

• **HEPATIC IMPAIRMENT** Can precipitate coma. **Dose adjustments** Reduce dose.

• **RENAL IMPAIRMENT** Increased cerebral sensitivity. **Dose adjustments** Start with small doses in severe impairment.

• PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Zaleplon

INDICATIONS AND DOSE

Insomnia (short-term use)

► BY MOUTH

- Adult: 10 mg daily for up to 2 weeks, dose to be taken at bedtime or after going to bed if difficulty falling asleep
- Elderly: 5 mg daily for up to 2 weeks, dose to be taken at bedtime or after going to bed if difficulty falling asleep

● **CONTRA-INDICATIONS** Marked neuromuscular respiratory weakness · sleep apnoea syndrome · unstable myasthenia gravis

● **CAUTIONS** Avoid prolonged use (risk of tolerance and withdrawal symptoms) · depression (risk of suicidal ideation) · history of alcohol abuse · history of drug abuse · muscle weakness · myasthenia gravis · respiratory insufficiency (avoid if severe)

● **INTERACTIONS** → Appendix 1: zaleplon

● SIDE-EFFECTS

- **Common or very common** Drowsiness · dysmenorrhoea · memory loss · paraesthesia
- **Uncommon** Altered smell sensation · appetite decreased · asthenia · concentration impaired · confusion · coordination abnormal · depersonalisation · depression · dizziness · hallucination · hearing impairment · nausea · photosensitivity reaction · speech disorder · visual impairment
- **Frequency not known** Paradoxical drug reaction · sleep walking

SIDE-EFFECTS, FURTHER INFORMATION A paradoxical increase in hostility, anxiety and aggression has been reported. The effects range from talkativeness and excitement to aggression.

● **PREGNANCY** Use only if necessary and restrict to occasional short-term use. Risk of withdrawal symptoms in neonate if used in late pregnancy.

● **BREAST FEEDING** Present in milk but amount probably too small to be harmful.

● **HEPATIC IMPAIRMENT** Can precipitate coma. Avoid if severe impairment.

Dose adjustments Reduce dose to 5 mg.

● **RENAL IMPAIRMENT** Avoid in severe impairment.

● **PATIENT AND CARER ADVICE** Patients should be advised not to take a second dose during a single night.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Zaleplon, zolpidem, and zopiclone for the short-term management of insomnia (April 2004) NICE TA77**
Zaleplon is recommended for the short-term management of severe insomnia that interferes with normal daily life, and should be prescribed for short periods of time only.
www.nice.org.uk/TA77

MEDICINAL FORMS

No licensed medicines listed.

Zolpidem tartrate

INDICATIONS AND DOSE

Insomnia (short-term use)

► BY MOUTH

- Adult: 10 mg daily for up to 4 weeks, dose to be taken at bedtime, for debilitated patients, use elderly dose
- Elderly: 5 mg daily for up to 4 weeks, dose to be taken at bedtime

● **CONTRA-INDICATIONS** Acute respiratory depression · marked neuromuscular respiratory weakness · obstructive sleep apnoea · psychotic illness · severe respiratory depression · unstable myasthenia gravis

● **CAUTIONS** Avoid prolonged use (and abrupt withdrawal thereafter) · depression · elderly · history of alcohol abuse · history of drug abuse · muscle weakness · myasthenia gravis

● **INTERACTIONS** → Appendix 1: zolpidem

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · anterograde amnesia · anxiety · back pain · diarrhoea · dizziness · fatigue · hallucination · headache · increased risk of infection · nausea · sleep disorders · vomiting
- **Uncommon** Confusion · diplopia · irritability
- **Frequency not known** Angioedema · behaviour abnormal · concentration impaired · delusions · depression · drug dependence · drug tolerance · fall · gait abnormal · hepatic disorders · hyperhidrosis · level of consciousness decreased · libido disorder · muscle weakness · psychosis · respiratory depression · skin reactions · speech disorder · withdrawal syndrome

● **PREGNANCY** Avoid regular use (risk of neonatal withdrawal symptoms); high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

● **BREAST FEEDING** Small amounts present in milk—avoid.

● **HEPATIC IMPAIRMENT** Can precipitate coma. Avoid if severe impairment.

Dose adjustments Reduce dose to 5 mg.

● **RENAL IMPAIRMENT** Use with caution.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may persist the next day—leave at least 8 hours between taking zolpidem and performing skilled tasks (e.g. driving, or operating machinery); effects of alcohol and other CNS depressants included.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Zaleplon, zolpidem, and zopiclone for the short-term management of insomnia (April 2004) NICE TA77**
Zolpidem is recommended for the short-term management of severe insomnia that interferes with normal daily life, and should be prescribed for short periods of time only.

Zopiclone

• INDICATIONS AND DOSE

Insomnia (short-term use)

► BY MOUTH

- Adult: 7.5 mg once daily for up to 4 weeks, dose to be taken at bedtime
- Elderly: Initially 3.75 mg once daily for up to 4 weeks, dose to be taken at bedtime, increased if necessary to 7.5 mg daily

Insomnia (short-term use) in patients with chronic pulmonary insufficiency

► BY MOUTH

- Adult: Initially 3.75 mg once daily for up to 4 weeks, dose to be taken at bedtime, increased if necessary to 7.5 mg daily

- **CONTRA-INDICATIONS** Marked neuromuscular respiratory weakness · respiratory failure · severe sleep apnoea syndrome · unstable myasthenia gravis

- **CAUTIONS** Avoid prolonged use (risk of tolerance and withdrawal symptoms) · chronic pulmonary insufficiency (increased risk of respiratory depression) · elderly · history of drug abuse · muscle weakness · myasthenia gravis (avoid if unstable) · psychiatric illness

- **INTERACTIONS** → Appendix 1: zopiclone

• SIDE-EFFECTS

- **Common or very common** Dry mouth · taste bitter
- **Uncommon** Anxiety · dizziness · fatigue · headache · nausea · sleep disorders · vomiting
- **Rare or very rare** Behaviour abnormal · confusion · dyspnoea · fall · hallucination · irritability · libido disorder · memory impairment · skin reactions
- **Frequency not known** Cognitive disorder · concentration impaired · delusions · depressed mood · diplopia · drug dependence · dyspepsia · movement disorders · muscle weakness · paraesthesia · respiratory depression · speech disorder · withdrawal syndrome
- **PREGNANCY** Not recommended (risk of neonatal withdrawal symptoms). Use during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

- **BREAST FEEDING** Present in milk—avoid.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment—can precipitate encephalopathy.

Dose adjustments Reduce dose to 3.75 mg in mild to moderate impairment, dose can be increased with caution if necessary.

- **RENAL IMPAIRMENT** Increased cerebral sensitivity.

Dose adjustments Start with reduced dose of 3.75 mg.

• PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Zaleplon, zolpidem and zopiclone for the short-term management of insomnia (April 2004) NICE TA77 Zopiclone is recommended for the short-term management of severe insomnia that interferes with normal daily life, and should be prescribed for short periods of time only.

7.2 Narcolepsy

Other drugs used for Narcolepsy Dexamfetamine sulfate, p. 347 · Methylphenidate hydrochloride, p. 345

CENTRAL NERVOUS SYSTEM DEPRESSANTS

Sodium oxybate

- **DRUG ACTION** A central nervous system depressant.

• INDICATIONS AND DOSE

Narcolepsy with cataplexy (under expert supervision)

► BY MOUTH

- Adult: Initially 2.25 g daily, dose to be taken on retiring and 2.25 g after 2.5–4 hours, then increased in steps of 1.5 g daily in 2 divided doses, dose adjusted according to response at intervals of 1–2 weeks; dose titration should be repeated if restarting after interval of more than 14 days, maximum 9 g daily in 2 divided doses

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose by 20% with concurrent use of sodium valproate or valproic acid.

- **CONTRA-INDICATIONS** Major depression · succinic semi-aldehyde dehydrogenase deficiency

- **CAUTIONS** Body mass index of 40 kg/m² or greater (higher risk of sleep apnoea) · elderly · epilepsy · heart failure (high sodium content) · history of depression · history of drug abuse · hypertension (high sodium content) · respiratory disorders · risk of discontinuation effects including rebound cataplexy and withdrawal symptoms

- **INTERACTIONS** → Appendix 1: sodium oxybate

• SIDE-EFFECTS

- **Common or very common** Abdominal pain upper · anxiety · appetite abnormal · arthralgia · asthenia · back pain · concentration impaired · confusion · depression · diarrhoea · dizziness · dyspnoea · fall · feeling drunk · headache · hyperhidrosis · hypertension · increased risk of infection · movement disorders · muscle spasms · nasal congestion · nausea · palpitations · peripheral oedema · sedation · sensation abnormal · skin reactions · sleep disorders · sleep paralysis · snoring · taste altered · tremor · urinary disorders · vertigo · vision blurred · vomiting · weight decreased
- **Uncommon** Behaviour abnormal · faecal incontinence · hallucination · memory loss · psychosis · suicidal tendencies · thinking abnormal
- **Frequency not known** Angioedema · dehydration · delusions · dry mouth · homicidal ideation · loss of consciousness · mood altered · respiratory depression · seizure · sleep apnoea

- **PREGNANCY** Avoid.

● HEPATIC IMPAIRMENT

Dose adjustments Halve initial dose.

● RENAL IMPAIRMENT

Caution—contains 3.96 mmol Na⁺ per mL.

● DIRECTIONS FOR ADMINISTRATION

Dilute each dose with 60 mL water; prepare both doses before retiring. Observe the same time interval (2–3 hours) each night between the last meal and the first dose.

● PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer sodium oxybate oral solution.

Driving and skilled tasks Leave at least 6 hours between taking sodium oxybate and performing skilled tasks (e.g. driving or operating machinery); effects of alcohol and other CNS depressants enhanced.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 13, 19

ELECTROLYTES: May contain Sodium

Sodium oxybate 500 mg per 1 mL Xyrem 500mg/mL oral solution sugar-free | 180 mL [PoM] £360.00 DT = £360.00 [CD2]

CNS STIMULANTS

Pitolisant

11-Apr-2017

● DRUG ACTION

Pitolisant is a histamine H₃-receptor antagonist which enhances the activity of brain histaminergic neurons.

● INDICATIONS AND DOSE

Narcolepsy with or without cataplexy (initiated by a specialist)

▶ BY MOUTH

▶ **Adult:** Initially 9 mg once daily for 1 week, then increased if necessary to 18 mg once daily for 1 week, then increased if necessary to 36 mg once daily, dose to be taken in the morning with breakfast, dose can be decreased (down to 4.5 mg per day) or increased (up to 36 mg per day) according to response and tolerance

● CAUTIONS

Acid-related gastric disorders · epilepsy · history of psychiatric disorders · severe anorexia · severe obesity

● INTERACTIONS

→ Appendix 1: pitolisant

● SIDE-EFFECTS

▶ **Common or very common** Anxiety · asthenia · depression · dizziness · gastrointestinal discomfort · headaches · mood altered · nausea · sleep disorders · tremor · vertigo · vomiting

▶ **Uncommon** Appetite abnormal · arrhythmias · arthralgia · blepharospasm · chest pain · concentration impaired · constipation · diarrhoea · drowsiness · dry mouth · epilepsy · feeling abnormal · fluid retention · gastrointestinal disorders · hallucinations · hot flush · hypertension · hypotension · malaise · metrorrhagia · movement disorders · muscle complaints · muscle weakness · oedema · on and off phenomenon · oral paraesthesia · pain · paraesthesia · QT interval prolongation · sexual dysfunction · skin reactions · sweat changes · tinnitus · urinary frequency increased · visual acuity decreased · weight changes (review treatment if significant) · yawning

▶ **Rare or very rare** Behaviour abnormal · cognitive impairment · confusion · loss of consciousness · memory loss · obsessive thoughts · photosensitivity reaction · sense of oppression · swallowing difficulty

● CONCEPTION AND CONTRACEPTION

Manufacturer advises effective contraception in women of childbearing potential

for at least 21 days after treatment discontinuation—pitolisant may reduce the effectiveness of hormonal contraceptives.

● PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.

● BREAST FEEDING

Manufacturer advises avoid—present in milk in *animal* studies.

● HEPATIC IMPAIRMENT

Manufacturer advises caution in moderate impairment; avoid in severe impairment.

Dose adjustments Manufacturer advises initial dose may be increased after two weeks in moderate impairment—maximum daily dose should not exceed 18 mg.

● RENAL IMPAIRMENT

Dose adjustments Manufacturer advises use with caution; maximum daily dose should not exceed 18 mg.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

8 Substance dependence

Substance dependence

Guidance on treatment of drug misuse

The UK health departments have produced guidance on the treatment of drug misuse in the UK. *Drug Misuse and Dependence: UK Guidelines on Clinical Management* (2007) is available at www.nta.nhs.uk/uploads/clinical_guidelines_2007.pdf.

Alcohol dependence

See Alcohol dependence p. 488.

Nicotine dependence

Smoking cessation interventions are a cost-effective way of reducing ill health and prolonging life. Smokers should be advised to stop and offered help with follow-up when appropriate. If possible, smokers should have access to smoking cessation services for behavioural support.

Therapy to aid smoking cessation is chosen according to the smoker's likely adherence, availability of counselling and support, previous experience of smoking-cessation aids, contra-indications and adverse effects of the preparations, and the smoker's preferences. **Nicotine p. 492 replacement therapy**, bupropion hydrochloride p. 491, and varenicline p. 494 are effective aids to smoking cessation. The use of nicotine replacement therapy in an individual who is already accustomed to nicotine introduces few new risks and it is

widely accepted that there are no circumstances in which it is safer to smoke than to use nicotine replacement therapy.

Some patients benefit from having more than one type of nicotine replacement therapy prescribed, such as a combination of transdermal and oral preparations. The combination of nicotine replacement therapy with varenicline or bupropion hydrochloride is not recommended.

Concomitant medication

Cigarette smoking increases the metabolism of some medicines by stimulating the hepatic enzyme CYP1A2. When smoking is discontinued, the dose of these drugs, in particular theophylline, cinacalcet, ropinirole, and some antipsychotics (including clozapine, olanzapine, chlorpromazine hydrochloride, and haloperidol, may need to be reduced. Regular monitoring for adverse effects is advised.

Bupropion hydrochloride has been used as an antidepressant. Its mode of action in smoking cessation is not clear and may involve an effect on noradrenaline and dopamine neurotransmission.

Nicotine replacement therapy

Nicotine replacement therapy can be used in place of cigarettes after abrupt cessation of smoking, or alternatively to reduce the amount of cigarettes used in advance of making a quit attempt. Nicotine replacement therapy can also be used to minimise passive smoking, and to treat cravings and reduce compensatory smoking after enforced abstinence in smoke-free environments. Smokers who find it difficult to achieve abstinence should consult a healthcare professional for advice.

Choice

Nicotine patches are a prolonged-release formulation and are applied for 16 hours (with the patch removed overnight) or for 24 hours. If patients experience strong cravings for cigarettes on waking, a 24-hour patch may be more suitable. Immediate-release nicotine preparations (gum, lozenges, sublingual tablets, inhalator, nasal spray, and oral spray) are used whenever the urge to smoke occurs or to prevent cravings.

The choice of nicotine replacement preparation depends largely on patient preference, and should take into account what preparations, if any, have been tried before. Patients with a high level of nicotine dependence, or who have failed with nicotine replacement therapy previously, may benefit from using a combination of an immediate-release preparation and patches to achieve abstinence.

Side-effects of specific nicotine preparations

Mild local reactions at the beginning of treatment are common because of the irritant effect of nicotine. Oral preparations and *inhalation cartridges* can cause irritation of the throat, *gum*, *lozenges*, and *oral spray* can cause increased salivation, and *patches* can cause minor skin irritation. The *nasal spray* commonly causes coughing, nasal irritation, epistaxis, sneezing, and watery eyes; the *oral spray* can cause watery eyes and blurred vision.

Gastro-intestinal disturbances are common and may be caused by swallowed nicotine. Nausea, vomiting, dyspepsia, and hiccup occur most frequently. Ulcerative stomatitis has also been reported. Dry mouth is a common side-effect of *lozenges*, *patches*, *oral spray*, and *sublingual tablets*. *Lozenges* cause diarrhoea, constipation, dysphagia, oesophagitis, gastritis, mouth ulcers, bloating, flatulence, and less commonly, taste disturbance, thirst, gingival bleeding, and halitosis. The *oral spray* may also cause abdominal pain, flatulence, and taste disturbance.

Palpitations may occur with nicotine replacement therapy and rarely *patches* and *oral spray* can cause arrhythmia. *Patches*, *lozenges*, and *oral spray* can cause chest pain. The *inhalator* can very rarely cause reversible atrial fibrillation.

Paraesthesia is a common side-effect of *oral spray*.

Abnormal dreams can occur with *patches*; removal of the

patch before bed may help. *Lozenges* and *oral spray* may cause rash and hot flushes. Sweating and myalgia can occur with *patches* and *oral spray*; the *patches* can also cause arthralgia.

Opioid dependence

The management of opioid dependence requires medical, social, and psychological treatment; access to a multidisciplinary team is recommended. Treatment for opioid dependence should be initiated under the supervision of an appropriately qualified prescriber.

Untreated heroin dependence shows early withdrawal symptoms within 8 hours, with peak symptoms at 36–72 hours; symptoms subside substantially after 5 days. Methadone hydrochloride p. 495 or buprenorphine p. 442 withdrawal occurs later, with longer-lasting symptoms.

Opioid substitution therapy

Methadone hydrochloride and buprenorphine are used as substitution therapy in opioid dependence. Substitute medication should be commenced with a short period of stabilisation, followed by either a withdrawal regimen or by maintenance treatment. Maintenance treatment enables patients to achieve stability, reduces drug use and crime, and improves health; it should be regularly reviewed to ensure the patient continues to derive benefit. The prescriber should monitor for signs of toxicity, and the patient should be told to be aware of warning signs of toxicity on initiation and during titration.

A withdrawal regimen after stabilisation with methadone hydrochloride or buprenorphine should be attempted only after careful consideration. Enforced withdrawal is ineffective for sustained abstinence, and it increases the risk of patients relapsing and subsequently overdosing because of loss of tolerance. Complete withdrawal from opioids usually takes up to 4 weeks in an inpatient or residential setting, and up to 12 weeks in a community setting. If abstinence is not achieved, illicit drug use is resumed, or the patient cannot tolerate withdrawal, the withdrawal regimen should be stopped and maintenance therapy should be resumed at the optimal dose. Following successful withdrawal treatment, further support and monitoring to maintain abstinence should be provided for a period of at least 6 months.

Missed doses

Patients who miss 3 days or more of their regular prescribed dose of opioid maintenance therapy are at risk of overdose because of loss of tolerance. Consider reducing the dose in these patients.

If the patient misses 5 or more days of treatment, an assessment of illicit drug use is also recommended before restarting substitution therapy; this is particularly important for patients taking buprenorphine p. 442 because of the risk of precipitated withdrawal.

Buprenorphine

Buprenorphine is preferred by some patients because it is less sedating than methadone hydrochloride p. 495; for this reason it may be more suitable for employed patients or those undertaking other skilled tasks such as driving. Buprenorphine is safer than methadone hydrochloride when used in conjunction with other sedating drugs, and has fewer drug interactions. Dose reductions may be easier than with methadone hydrochloride because the withdrawal symptoms are milder, and patients generally require fewer adjunctive medications; there is also a lower risk of overdose. Buprenorphine can be given on alternate days in higher doses and it requires a shorter drug-free period than methadone hydrochloride before induction with naltrexone hydrochloride p. 491 for prevention of relapse.

Patients dependent on high doses of opioids may be at increased risk of precipitated withdrawal. Precipitated withdrawal can occur in any patient if buprenorphine is administered when other opioid agonist drugs are in

circulation. Precipitated opioid withdrawal, if it occurs, starts within 1–3 hours of the first buprenorphine dose and peaks at around 6 hours. Non-opioid adjunctive therapy, such as lofexidine hydrochloride p. 497, may be required if symptoms are severe.

To reduce the risk of precipitated withdrawal, the first dose of buprenorphine should be given when the patient is exhibiting signs of withdrawal, or 6–12 hours after the last use of heroin (or other short-acting opioid), or 24–48 hours after the last dose of methadone hydrochloride. It is possible to titrate the dose of buprenorphine within one week—more rapidly than with methadone hydrochloride therapy—but care is still needed to avoid toxicity or precipitated withdrawal; dividing the dose on the first day may be useful.

A combination preparation containing buprenorphine with naloxone p. 496 (Suboxone[®]) can be prescribed for patients when there is a risk of dose diversion for parenteral administration; the naloxone hydrochloride p. 1329 component precipitates withdrawal if the preparation is injected, but it has little effect when the preparation is taken sublingually.

Methadone

Methadone hydrochloride, a long-acting opioid agonist, is usually administered in a single daily dose as methadone hydrochloride oral solution 1 mg/mL. Patients with a long history of opioid misuse, those who typically abuse a variety of sedative drugs and alcohol, and those who experience increased anxiety during withdrawal of opioids may prefer methadone hydrochloride to buprenorphine because it has a more pronounced sedative effect.

Methadone hydrochloride is initiated at least 8 hours after the last heroin dose, provided that there is objective evidence of withdrawal symptoms. A supplementary dose on the first day may be considered if there is evidence of persistent opioid withdrawal symptoms. Because of the long half-life, plasma concentrations progressively rise during initial treatment even if the patient remains on the same daily dose (it takes 3–10 days for plasma concentrations to reach steady-state in patients on a stable dose); a dose tolerated on the first day of treatment may become a toxic dose on the third day as cumulative toxicity develops. Thus, titration to the optimal dose in methadone hydrochloride maintenance treatment may take several weeks.

Opioid substitution during pregnancy

Acute withdrawal of opioids should be avoided in pregnancy because it can cause fetal death. Opioid substitution therapy is recommended during pregnancy because it carries a lower risk to the fetus than continued use of illicit drugs. If a woman who is stabilised on methadone hydrochloride or buprenorphine for treatment of opioid dependence becomes pregnant, therapy should be continued [buprenorphine is not licensed for use in pregnancy]. Many pregnant patients choose a withdrawal regimen, but withdrawal during the first trimester should be avoided because it is associated with an increased risk of spontaneous miscarriage. Withdrawal of methadone hydrochloride or buprenorphine should be undertaken gradually during the second trimester, with dose reductions made every 3–5 days. If illicit drug use occurs, the patient should be re-stabilised at the optimal maintenance dose and consideration should be given to stopping the withdrawal regimen.

Further withdrawal of methadone hydrochloride or buprenorphine in the third trimester is not recommended because maternal withdrawal, even if mild, is associated with fetal distress, stillbirth, and the risk of neonatal mortality. Drug metabolism can be increased in the third trimester; it may be necessary to either increase the dose of methadone hydrochloride or change to twice-daily consumption (or a combination of both strategies) to prevent withdrawal symptoms from developing.

The neonate should be monitored for respiratory depression and signs of withdrawal if the mother is prescribed high doses of opioid substitute.

Signs of neonatal withdrawal from opioids usually develop 24–72 hours after delivery but symptoms may be delayed for up to 14 days, so monitoring may be required for several weeks. Symptoms include a high-pitched cry, rapid breathing, hungry but ineffective suckling, and excessive wakefulness; severe, but rare symptoms include hypertonicity and convulsions.

Opioid substitution during breastfeeding

Doses of methadone and buprenorphine should be kept as low as possible in breast-feeding mothers. Increased sleepiness, breathing difficulties, or limpness in breast-fed babies of mothers taking opioid substitutes should be reported urgently to a healthcare professional.

Adjunctive therapy and symptomatic treatment

Adjunctive therapy may be required for the management of opioid withdrawal symptoms. Loperamide hydrochloride p. 66 may be used for the control of diarrhoea; mebeverine hydrochloride p. 86 for controlling stomach cramps; paracetamol p. 438 and **non-steroidal anti-inflammatory drugs** for muscular pains and headaches; metoclopramide hydrochloride p. 426 or prochlorperazine p. 385 may be useful for nausea or vomiting. Topical **rubefaciants** can be helpful for relieving muscle pain associated with methadone hydrochloride withdrawal. If a patient is suffering from insomnia, short-acting **benzodiazepines** or zopiclone p. 484 may be prescribed, but because of the potential for abuse, prescriptions should be limited to a short course of a few days only. If anxiety or agitation is severe, specialist advice should be sought.

Lofexidine

Lofexidine hydrochloride may alleviate some of the physical symptoms of opioid withdrawal by attenuating the increase in adrenergic neurotransmission that occurs during opioid withdrawal. Lofexidine hydrochloride can be prescribed as an adjuvant to opioid substitution therapy, initiated either at the same time as the opioid substitute or during withdrawal of the opioid substitute. Alternatively, lofexidine hydrochloride may be prescribed instead of an opioid substitute in patients who have mild or uncertain dependence (including young people), and those with a short history of illicit drug use.

Opioid-receptor antagonists

Patients dependant on opioids can be given a supply of naloxone hydrochloride p. 1329 to be used in case of accidental overdose.

Naltrexone hydrochloride p. 491 precipitates withdrawal symptoms in opioid-dependent subjects. Because the effects of opioid-receptor agonists are blocked by naltrexone hydrochloride, it is prescribed as an aid to prevent relapse in formerly opioid-dependent patients.

Opioid dependence in children

In younger patients (under 18 years), the harmful effects of drug misuse are more often related to acute intoxication than to dependence, so substitution therapy is usually inappropriate. Maintenance treatment with opioid substitution therapy is therefore controversial in young people; however, it may be useful for the older adolescent who has a history of opioid use to undergo a period of stabilisation with buprenorphine p. 442 or methadone hydrochloride p. 495 before starting a withdrawal regimen.

8.1 Alcohol dependence

Alcohol dependence

01-Sep-2017

Description of condition

Alcohol dependence is a cluster of behavioural, cognitive and physiological factors that typically include a strong desire to drink alcohol, tolerance to its effects, and difficulties controlling its use. Someone who is alcohol-dependent may persist in drinking, despite harmful consequences, such as physical or mental health problems.

In severely dependent patients who have been drinking excessively for a prolonged period of time, an abrupt reduction in alcohol intake may result in the development of an alcohol withdrawal syndrome, which, in the absence of medical management, can lead to seizures, delirium tremens, and death.

Assisted alcohol withdrawal

[EvGr] Patients with mild alcohol dependence usually do not need assisted alcohol withdrawal. Patients with moderate dependence can generally be treated in a community setting unless they are at high risk of developing alcohol withdrawal seizures or delirium tremens; individuals with severe dependence should undergo withdrawal in an inpatient setting. Patients with decompensated liver disease should be treated under specialist supervision.

A long-acting benzodiazepine, such as chlordiazepoxide hydrochloride p. 340 or diazepam p. 340, is recommended to attenuate alcohol withdrawal symptoms; local clinical protocols should be followed.

In primary care, *fixed-dose reducing regimens* are used. This involves using a standard, initial dose (determined by the severity of alcohol dependence or level of alcohol consumption), followed by dose reduction to zero, usually over 7–10 days. In inpatient or residential settings, a *fixed-dose regimen* or a *symptom-triggered regimen* can be used. A symptom-triggered approach involves tailoring the drug regimen according to the severity of withdrawal and any complications in an individual patient; adequate monitoring facilities should be available. The patient should be monitored on a regular basis and treatment only continued as long as there are withdrawal symptoms.

Carbamazepine p. 309 [unlicensed indication] can be used as an alternative treatment in acute alcohol withdrawal.

Clomethiazole p. 482 may be considered as an alternative to a benzodiazepine or carbamazepine p. 309. It should only be used in an inpatient setting and should not be prescribed if the patient is liable to continue drinking alcohol. **Note:** Alcohol combined with clomethiazole p. 482, particularly in patients with cirrhosis, can lead to fatal respiratory depression even with short-term use.

[EvGr] When managing withdrawal from **co-existing** benzodiazepine and alcohol dependence, the dose of benzodiazepine used for withdrawal should be increased. The initial daily dose is calculated, based on the requirements for alcohol withdrawal plus the equivalent regularly used daily dose of benzodiazepine. A single benzodiazepine (chlordiazepoxide hydrochloride p. 340 or diazepam p. 340) should be used rather than multiple benzodiazepines. Inpatient withdrawal regimens should last for 2–3 weeks or longer, depending on the severity of benzodiazepine dependence. When withdrawal is managed in the community, or where there is a high level of benzodiazepine dependence, or both, the regimen should last for a minimum of 3 weeks (according to the patient's symptoms).

If alcohol withdrawal seizures occur, a fast-acting benzodiazepine (such as lorazepam p. 335 [unlicensed indication]) should be prescribed to reduce the likelihood of

further seizures. If alcohol withdrawal seizures develop in a person during treatment for acute alcohol withdrawal, review their withdrawal drug regimen. [A](#)

Delirium tremens

[EvGr] Delirium tremens is a medical emergency that requires specialist inpatient care. In patients with delirium tremens (characterised by agitation, confusion, paranoia, and visual and auditory hallucinations), oral lorazepam p. 335 should be used as first-line treatment. If symptoms persist or oral medication is declined, parenteral lorazepam p. 335 [unlicensed], or haloperidol p. 382 [unlicensed] can be given as adjunctive therapy. If delirium tremens develops during treatment for acute alcohol withdrawal, the withdrawal drug regimen should also be reviewed. [A](#)

Alcohol dependence

[EvGr] In harmful drinkers or patients with mild alcohol dependence, a psychological intervention (such as cognitive behavioural therapy) should be offered. In those who have not responded to psychological interventions alone or who have specifically requested a pharmacological treatment, acamprosate calcium p. 490 or oral naltrexone hydrochloride p. 491 can be used in combination with a psychological intervention.

Acamprosate calcium p. 490 or oral naltrexone hydrochloride p. 491 in combination with a psychological intervention are recommended for relapse prevention in patients with moderate and severe alcohol dependence, to start after successful assisted withdrawal. Disulfiram below is an alternative for patients in whom acamprosate calcium p. 490 and oral naltrexone hydrochloride p. 491 are not suitable, or if the patient prefers disulfiram below and understands the risks of taking the drug.

Nalmefene p. 490 is recommended for the reduction of alcohol consumption in patients with alcohol dependence who have a high drinking risk level, without physical withdrawal symptoms, and who do not require immediate detoxification (see *National funding/access decisions for nalmefene* p. 490).

Patients with severe alcohol-related hepatitis with a discriminant function of 32 or more can be given corticosteroids but only after any active infection or gastrointestinal bleeding is treated, any renal impairment is controlled, and following discussion of the potential benefits and risks of treatment. Corticosteroid treatment has been shown to improve survival in the short term (1 month) but not over a longer term (3 months to 1 year). It has also been shown to increase the risk of serious infections within the first 3 months of starting treatment.

Patients with chronic alcohol-related pancreatitis should be offered nutritional support; those who have symptoms of steatorrhea or who have poor nutritional status due to Exocrine pancreatic insufficiency p. 95 should be prescribed pancreatic enzyme supplements; supplements are not indicated when pain is the only symptom. [A](#)

Wernicke's encephalopathy

[EvGr] Patients with alcohol dependence are at risk of developing Wernicke's encephalopathy; patients at high risk are those who are malnourished, at risk of malnourishment, or have decompensated liver disease. Parenteral thiamine p. 1048, followed by oral thiamine p. 1048, should be given to patients with suspected Wernicke's encephalopathy, those who are malnourished or at risk of malnourishment, those who have decompensated liver disease or who are attending hospital for acute treatment. Prophylactic oral thiamine p. 1048 should also be given to harmful or dependent drinkers if they are in acute withdrawal, or before and during assisted alcohol withdrawal. [A](#). Parenteral thiamine is available as part of a vitamin B substances with ascorbic acid p. 1048 preparation.

ALDEHYDE DEHYDROGENASE INHIBITORS

Disulfiram

• INDICATIONS AND DOSE

Adjunct in the treatment of alcohol dependence (under expert supervision)

► BY MOUTH

• Adult: 200 mg daily, increased if necessary up to 500 mg daily

- **UNLICENSED USE** Disulfiram doses in BNF may differ from those in product literature.
- **CONTRA-INDICATIONS** Cardiac failure • coronary artery disease • history of cerebrovascular accident • hypertension • psychosis • severe personality disorder • suicide risk
- **CAUTIONS** Alcohol challenge **not** recommended on routine basis (if considered essential—specialist units only with resuscitation facilities) • avoid in Acute porphyrias p. 1025 • diabetes mellitus • epilepsy • respiratory disease
- **INTERACTIONS** → Appendix 1: disulfiram
- **SIDE-EFFECTS** Allergic dermatitis • breath odour • depression • drowsiness • encephalopathy • fatigue • hepatocellular injury • libido decreased • mania • nausea • nerve disorders • paranoia • schizophrenia • vomiting
- **PREGNANCY** High concentrations of acetaldehyde which occur in presence of alcohol may be teratogenic; avoid in first trimester.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution.
- **PRE-TREATMENT SCREENING** Before initiating disulfiram, prescribers should evaluate the patient's suitability for treatment, because some patient factors, for example memory impairment or social circumstances, make compliance to treatment or abstinence from alcohol difficult.
- **MONITORING REQUIREMENTS** During treatment with disulfiram, patients should be monitored at least every 2 weeks for the first 2 months, then each month for the following 4 months, and at least every 6 months thereafter.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be counselled on the disulfiram-alcohol reaction—reactions may occur following exposure to small amounts of alcohol found in perfume, aerosol sprays, or low alcohol and "non-alcohol" beers and wines; symptoms may be severe and life-threatening and can include nausea, flushing, palpitations, arrhythmias, hypotension, respiratory depression, and coma. **[EvGr]** Patients and their carers should be counselled on the signs of hepatotoxicity—patients should discontinue treatment and seek immediate medical attention if they feel unwell or symptoms such as fever or jaundice develop. GAMMA-AMINO BUTYRIC ACID ANALOGUES AND DERIVATIVES

Acamprosate calcium

INDICATIONS AND DOSE

Maintenance of abstinence in alcohol-dependent patients

BY MOUTH

- Adult 18–65 years (body-weight up to 60 kg): 666 mg once daily at breakfast and 333 mg twice daily at midday and at night
- Adult 18–65 years (body-weight 60 kg and above): 666 mg 3 times a day

- **CAUTIONS** Continued alcohol abuse (risk of treatment failure)

SIDE-EFFECTS

- **Common or very common** Abdominal pain · diarrhoea · flatulence · nausea · sexual dysfunction · skin reactions · vomiting

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Avoid if severe.

- **RENAL IMPAIRMENT** Avoid if serum-creatinine greater than 120 micromol/litre.

PRESCRIBING AND DISPENSING INFORMATION

Acamprosate calcium has been used for the maintenance of abstinence in alcohol dependence in children aged 16 years and over.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

OPIOID RECEPTOR ANTAGONISTS

Nalmefene

INDICATIONS AND DOSE

Reduction of alcohol consumption in patients with alcohol dependence who have a high drinking risk level without physical withdrawal symptoms, and who do not require immediate detoxification

BY MOUTH

- Adult: 18 mg daily if required, taken on each day there is a risk of drinking alcohol, preferably taken 1–2 hours before the anticipated time of drinking, if a dose has not been taken before drinking alcohol, 1 dose should be taken as soon as possible; maximum 18 mg per day

- **CONTRA-INDICATIONS** Recent history of acute alcohol withdrawal syndrome · recent or current opioid use

- **CAUTIONS** Continued treatment for more than 1 year · history of seizure disorders (including alcohol withdrawal seizures) · psychiatric illness

- **INTERACTIONS** → Appendix 1: nalmefene

SIDE-EFFECTS

- **Common or very common** Appetite decreased · asthenia · concentration impaired · confusion · diarrhoea · dizziness · drowsiness · dry mouth · feeling abnormal · headache · hyperhidrosis · libido decreased · malaise · muscle spasms · nausea · palpitations · restlessness · sensation abnormal · sleep disorders · tachycardia · tremor · vomiting · weight decreased

- **Frequency not known** Dissociation · hallucinations

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Use with caution—avoid in severe impairment.

- **RENAL IMPAIRMENT** Use with caution—avoid in severe impairment.

- **PRE-TREATMENT SCREENING** Before initiating treatment, prescribers should evaluate the patient's clinical status, alcohol dependence, and level of alcohol consumption. Nalmefene should only be prescribed for patients who continue to have a high drinking risk level two weeks after the initial assessment.

- **MONITORING REQUIREMENTS** During treatment, patients should be monitored regularly and the need for continued treatment assessed.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Nalmefene for reducing alcohol consumption in people with alcohol dependence (November 2014)** NICE TA325

Nalmefene is recommended within its marketing authorisation, as an option for reducing alcohol consumption, for patients with alcohol dependence:

- who have a high drinking risk level (defined as alcohol consumption of more than 60 g per day for men and more than 40 g per day for women, according to the World Health Organization's drinking risk levels) without physical withdrawal symptoms, **and**
- who do not require immediate detoxification.

The marketing authorisation states that nalmefene should:

- only be prescribed in conjunction with continuous psychosocial support focused on treatment adherence and reducing alcohol consumption, **and**
- be initiated only in patients who continue to have a high drinking risk level 2 weeks after initial assessment.

Naltrexone hydrochloride

17-Aug-2017

- **DRUG ACTION** Naltrexone is an opioid-receptor antagonist.

● INDICATIONS AND DOSE

Adjunct to prevent relapse in formerly opioid-dependent patients (who have remained opioid-free for at least 7–10 days) (initiated under specialist supervision)

► BY MOUTH

- **Adult:** Initially 25 mg daily, then increased to 50 mg daily, total weekly dose may be divided and given on 3 days of the week for improved compliance (e.g. 100 mg on Monday and Wednesday, and 150 mg on Friday); maximum 350 mg per week

Adjunct to prevent relapse in formerly alcohol-dependent patients (initiated under specialist supervision)

► BY MOUTH

- **Adult:** 25 mg once daily on the first day, then increased if tolerated to 50 mg daily

- **UNLICENSED USE** 25 mg dose for adjunct to prevent relapse in formerly alcohol-dependent patients is an unlicensed dose.

- **CONTRA-INDICATIONS** Patients currently dependent on opioids

- **CAUTIONS** Concomitant use of opioids

CAUTIONS, FURTHER INFORMATION

- Concomitant use of opioids Concomitant use of opioids should be avoided but increased dose of opioid analgesic may be required for pain—manufacturer advises to monitor for opioid intoxication.

- **INTERACTIONS** → Appendix 1: naltrexone

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · anxiety · appetite abnormal · arthralgia · asthenia · chest pain · chills · constipation · diarrhoea · dizziness · eye disorders · headache · hyperhidrosis · mood altered · myalgia · nausea · palpitations · sexual dysfunction · skin reactions · sleep disorders · tachycardia · thirst · vomiting
- **Uncommon** Alopecia · confusion · cough · depression · drowsiness · dry mouth · dysphonia · dyspnoea · ear discomfort · eye discomfort · eye swelling · feeling hot · fever · flatulence · flushing · hallucination · hepatic disorders · lymphadenopathy · nasal complaints · oropharyngeal pain · pain · paranoia · peripheral coldness · seborrhoea · sinus disorder · sputum increased · tinnitus · tremor · ulcer · urinary disorders · vertigo · vision disorders · weight changes · yawning
- **Rare or very rare** Immune thrombocytopenic purpura · rhabdomyolysis · suicidal tendencies
- **Frequency not known** Withdrawal syndrome

- **PREGNANCY** Use only if benefit outweighs risk.

- **BREAST FEEDING** Avoid—potential toxicity.

- **HEPATIC IMPAIRMENT** Avoid in acute hepatitis, hepatic failure, or severe impairment.

- **RENAL IMPAIRMENT** Avoid in severe impairment.

- **PRE-TREATMENT SCREENING** Test for opioid dependence with naloxone before treatment.

- **MONITORING REQUIREMENTS** Liver function tests needed before and during treatment.

- **PATIENT AND CARER ADVICE** Patients should be warned that an attempt to overcome the blockade of opioid receptors by overdosing could result in acute opioid intoxication.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Naltrexone for the management of opioid dependence (January 2007)** NICE TA115

Naltrexone is recommended for the prevention of relapse in formerly opioid-dependent patients who are motivated to remain in a supportive care abstinence programme. Naltrexone should be administered under supervision and its effectiveness in preventing opioid misuse reviewed regularly.

www.nice.org.uk/TA115

8.2 Nicotine dependence

ANTIDEPRESSANTS > SEROTONIN AND NORADRENALINE RE-UP TAKE INHIBITORS

Bupropion hydrochloride

07-Sep-2017

(Amfebutamone hydrochloride)

● INDICATIONS AND DOSE

To aid smoking cessation in combination with motivational support in nicotine-dependent patients

► BY MOUTH

- **Adult:** Initially 150 mg daily for 6 days, then 150 mg twice daily (max. per dose 150 mg), minimum 8 hours between doses; period of treatment 7–9 weeks, start treatment 1–2 weeks before target stop date, discontinue if abstinence not achieved at 7 weeks, consider maximum 150 mg daily in patients with risk factors for seizures; maximum 300 mg per day
- **Elderly:** 150 mg daily for 7–9 weeks, start treatment 1–2 weeks before target stop date, discontinue if abstinence not achieved at 7 weeks; maximum 150 mg per day

- **CONTRA-INDICATIONS** Acute alcohol withdrawal · acute benzodiazepine withdrawal · bipolar disorder · CNS tumour · eating disorders · history of seizures · severe hepatic cirrhosis

- **CAUTIONS** Alcohol abuse · diabetes · elderly · history of head trauma · predisposition to seizures (prescribe only if benefit clearly outweighs risk)

- **INTERACTIONS** → Appendix 1: bupropion

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · anxiety · concentration impaired · constipation · dizziness · dry mouth · fever · gastrointestinal disorder · headache · hyperhidrosis · hypersensitivity · insomnia (reduced by avoiding dose at bedtime) · nausea · skin reactions · taste altered · tremor · vomiting
- **Uncommon** Appetite decreased · asthenia · chest pain · confusion · tachycardia · tinnitus · vasodilation · visual impairment
- **Rare or very rare** Angioedema · arthralgia · behaviour abnormal · bronchospasm · delusions · depersonalisation ·

dyspnoea · hallucination · hepatic disorders · irritability · memory loss · movement disorders · muscle complaints · palpitations · paraesthesia · parkinsonism · postural hypotension · seizure · sleep disorders · Stevens-Johnson syndrome · syncope · urinary disorders

- ▶ **Frequency not known** Anaemia · hyponatraemia · leucopenia · psychosis · suicidal tendencies · thrombocytopenia

- **PREGNANCY** Avoid—no information available.

- **BREAST FEEDING** Present in milk—avoid.

- **HEPATIC IMPAIRMENT** Avoid in severe hepatic cirrhosis. **Dose adjustments** Reduce dose to 150 mg daily.

- **RENAL IMPAIRMENT**

Dose adjustments Reduce dose to 150 mg daily.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor blood pressure before and during treatment.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should be instructed to report any clinical worsening of depression, suicidal behaviour or thoughts and unusual changes in behaviour.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and light-headedness.

Bupropion hydrochloride 150 mg Zyban 150mg modified-release tablets | 60 tablet **[PoM]** £41.76 DT = £41.76

NICOTINIC RECEPTOR AGONISTS

Nicotine

● INDICATIONS AND DOSE

Nicotine replacement therapy in individuals who smoke fewer than 20 cigarettes each day

▶ **BY MOUTH USING CHEWING GUM**

▶ **Adult:** 2 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, if attempting smoking cessation, treatment should continue for 3 months before reducing the dose

▶ **BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS**

▶ **Adult:** 1 tablet every 1 hour, increased to 2 tablets every 1 hour if required, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose; maximum 40 tablets per day

Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day or who require more than 15 pieces of 2-mg strength gum each day

▶ **BY MOUTH USING CHEWING GUM**

▶ **Adult:** 4 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, individuals should not exceed 15 pieces of 4-mg strength gum daily, if attempting smoking cessation, treatment should continue for 3 months before reducing the dose

Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day

▶ **BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS**

▶ **Adult:** 2 tablets every 1 hour, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose; maximum 40 tablets per day

Nicotine replacement therapy

▶ **BY INHALATION USING INHALATOR**

▶ **Adult:** As required, the cartridges can be used when the urge to smoke occurs or to prevent cravings, individuals should not exceed 12 cartridges of the 10-mg strength daily, or 6 cartridges of the 15-mg strength daily

▶ **BY MOUTH USING LOZENGES**

▶ **Adult:** 1 lozenge every 1–2 hours as required, one lozenge should be used when the urge to smoke occurs, individuals who smoke less than 20 cigarettes each day should usually use the lower-strength lozenges; individuals who smoke more than 20 cigarettes each day and those who fail to stop smoking with the low-strength lozenges should use the higher-strength lozenges; If attempting smoking cessation, treatment should continue for 6–12 weeks before attempting a reduction in dose; maximum 15 lozenges per day

▶ **BY MOUTH USING OROMUCOSAL SPRAY**

▶ **Adult:** 1–2 sprays as required, individuals can spray in the mouth when the urge to smoke occurs or to prevent cravings, individuals should not exceed 2 sprays per episode (up to 4 sprays every hour); maximum 64 sprays per day

▶ **BY INTRANASAL ADMINISTRATION USING NASAL SPRAY**

▶ **Adult:** 1 spray as required, individuals can spray into each nostril when the urge to smoke occurs, up to twice every hour for 16 hours daily, if attempting smoking cessation, treatment should continue for 8 weeks before reducing the dose; maximum 64 sprays per day

▶ **BY TRANSDERMAL APPLICATION USING PATCHES**

▶ **Adult:** Individuals who smoke more than 10 cigarettes daily should apply a high-strength patch daily for 6–8 weeks, followed by the medium-strength patch for 2 weeks, and then the low-strength patch for the final 2 weeks; individuals who smoke fewer than 10 cigarettes daily can usually start with the medium-strength patch for 6–8 weeks, followed by the low-strength patch for 2–4 weeks; a slower titration schedule can be used in individuals who are not ready to quit but want to reduce cigarette consumption before a quit attempt; if abstinence is not achieved, or if withdrawal symptoms are experienced, the strength of the patch used should be maintained or increased until the patient is stabilised; individuals using the high-strength patch who experience excessive side-effects, that do not resolve within a few days, should change to a medium-strength patch for the remainder of the initial period and then use the low-strength patch for 2–4 weeks

● CAUTIONS

GENERAL CAUTIONS Diabetes mellitus—blood-glucose concentration should be monitored closely when initiating treatment · haemodynamically unstable patients hospitalised with cerebrovascular accident · haemodynamically unstable patients hospitalised with myocardial infarction · haemodynamically unstable patients hospitalised with severe arrhythmias · pheochromocytoma · uncontrolled hyperthyroidism

SPECIFIC CAUTIONS

- ▶ When used by inhalation Bronchospastic disease · chronic throat disease · obstructive lung disease
- ▶ With intranasal use Bronchial asthma (may exacerbate)
- ▶ With oral use *Gum* may also stick to and damage dentures · gastritis (can be aggravated by swallowed nicotine) · oesophagitis (can be aggravated by swallowed nicotine) · peptic ulcers (can be aggravated by swallowed nicotine)
- ▶ With transdermal use *Patches* should not be placed on broken skin · patients with skin disorders

CAUTIONS, FURTHER INFORMATION Most warnings for nicotine replacement therapy also apply to continued

cigarette smoking, but the risk of continued smoking outweighs any risks of using nicotine preparations.

Specific cautions for individual preparations are usually related to the local effect of nicotine.

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Dizziness · headache · hyperhidrosis · nausea · palpitations · skin reactions · vomiting
- ▶ **Uncommon** Flushing
- ▶ **SPECIFIC SIDE-EFFECTS**
- ▶ **Common or very common**
- ▶ When used by inhalation Asthenia · cough · dry mouth · flatulence · gastrointestinal discomfort · hiccups · hypersensitivity · nasal complaints · oral disorders · taste altered · throat complaints
- ▶ With intranasal use Chest discomfort · cough · dyspnoea · epistaxis · nasal complaints · paraesthesia · throat irritation
- ▶ With oral use Anxiety · appetite abnormal · burping · diarrhoea · dyspepsia (may be caused by swallowed nicotine) · gastrointestinal disorders · hiccups · increased risk of infection · mood altered · oral disorders · sleep disorders
- ▶ With sublingual use Asthenia · cough · dry mouth · flatulence · gastrointestinal discomfort · hiccups · hypersensitivity · oral disorders · rhinitis · taste altered · throat complaints
- ▶ **Uncommon**
- ▶ When used by inhalation Abnormal dreams · arrhythmias · bronchospasm · burping · chest discomfort · dysphonia · dyspnoea · hypertension · malaise
- ▶ With intranasal use Abnormal dreams · asthenia · hypertension · malaise
- ▶ With oral use Anger · asthma exacerbated · cough · dyspepsia aggravated · dysphagia · haemorrhage · laryngospasm · nasal complaints · nocturia · numbness · overdose · pain · palpitations exacerbated · peripheral oedema · tachycardia · taste altered · throat complaints · vascular disorders
- ▶ With sublingual use Abnormal dreams · arrhythmias · bronchospasm · burping · chest discomfort · dysphonia · dyspnoea · hypertension · malaise · nasal complaints
- ▶ With transdermal use Arrhythmias · asthenia · chest discomfort · dyspnoea · hypertension · malaise · myalgia · paraesthesia
- ▶ **Rare or very rare**
- ▶ When used by inhalation Dysphagia
- ▶ With intranasal use Arrhythmias
- ▶ With oral use Coagulation disorder · platelet disorder
- ▶ With sublingual use Dysphagia
- ▶ With transdermal use Abdominal discomfort · angioedema · pain in extremity
- ▶ **Frequency not known**
- ▶ When used by inhalation Angioedema · excessive tearing · vision blurred
- ▶ With intranasal use Abdominal discomfort · angioedema · excessive tearing · oropharyngeal complaints
- ▶ With sublingual use Excessive tearing · muscle tightness · vision blurred

SIDE-EFFECTS, FURTHER INFORMATION Some systemic effects occur on initiation of therapy, particularly if the patient is using high-strength preparations; however, the patient may confuse side-effects of the nicotine-replacement preparation with nicotine withdrawal symptoms. Common symptoms of nicotine withdrawal include malaise, headache, dizziness, sleep disturbance, coughing, influenza-like symptoms, depression, irritability, increased appetite, weight gain, restlessness, anxiety, drowsiness, aphthous ulcers, decreased heart rate, and impaired concentration.

- **PREGNANCY** The use of nicotine replacement therapy in pregnancy is preferable to the continuation of smoking,

but should be used only if smoking cessation without nicotine replacement fails. Intermittent therapy is preferable to patches but avoid liquorice-flavoured nicotine products. Patches are useful, however, if the patient is experiencing pregnancy-related nausea and vomiting. If patches are used, they should be removed before bed.

- **BREAST FEEDING** Nicotine is present in milk; however, the amount to which the infant is exposed is small and less hazardous than second-hand smoke. Intermittent therapy is preferred.
- **HEPATIC IMPAIRMENT** Use with caution in moderate to severe hepatic impairment.
- **RENAL IMPAIRMENT** Use with caution in severe renal impairment.
- **DIRECTIONS FOR ADMINISTRATION** Acidic beverages, such as coffee or fruit juice, may decrease the absorption of nicotine through the buccal mucosa and should be avoided for 15 minutes before the use of oral nicotine replacement therapy.
Administration by transdermal patch Patches should be applied on waking to dry, non-hairy skin on the hip, trunk, or upper arm and held in position for 10–20 seconds to ensure adhesion; place next patch on a different area and avoid using the same site for several days.
Administration by nasal spray Initially 1 spray should be used in both nostrils but when withdrawing from therapy, the dose can be gradually reduced to 1 spray in 1 nostril.
Administration by oral spray The oral spray should be released into the mouth, holding the spray as close to the mouth as possible and avoiding the lips. The patient should not inhale while spraying and avoid swallowing for a few seconds after use. If using the oral spray for the first time, or if unit not used for 2 or more days, prime the unit before administration.
Administration by sublingual tablet Each tablet should be placed under the tongue and allowed to dissolve.
Administration by lozenge Slowly allow each lozenge to dissolve in the mouth; periodically move the lozenge from one side of the mouth to the other. Lozenges last for 10–30 minutes, depending on their size.
Administration by inhalation Insert the cartridge into the device and draw in air through the mouthpiece; each session can last for approximately 5 minutes. The amount of nicotine from 1 puff of the cartridge is less than that from a cigarette, therefore it is necessary to inhale more often than when smoking a cigarette. A single 10 mg cartridge lasts for approximately 20 minutes of intense use; a single 15 mg cartridge lasts for approximately 40 minutes of intense use.
Administration by medicated chewing gum Chew the gum until the taste becomes strong, then rest it between the cheek and gum; when the taste starts to fade, repeat this process. One piece of gum lasts for approximately 30 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of chewing gum and lozenges may include mint, freshfruit, freshmint, icy white, or cherry.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer nicotine chewing gum, inhalators, lozenges, sublingual tablets, oral spray, nasal spray and patches.

Varenicline

- **DRUG ACTION** Varenicline is a selective nicotine-receptor partial agonist.

• **INDICATIONS AND DOSE**

To aid smoking cessation

► BY MOUTH

- **Adult:** Initially 500 micrograms once daily for 3 days, increased to 500 micrograms twice daily for 4 days, then 1 mg twice daily for 11 weeks; reduced if not tolerated to 500 micrograms twice daily, usually to be started 1–2 weeks before target stop date but can be started up to a maximum of 5 weeks before target stop date, 12-week course can be repeated in abstinent individuals to reduce risk of relapse

IMPORTANT SAFETY INFORMATION**MHRA/CHM ADVICE: SUICIDAL BEHAVIOUR AND VARENICLINE**

Patients should be advised to discontinue treatment and seek prompt medical advice if they develop agitation, depressed mood, or suicidal thoughts. Patients with a

history of psychiatric illness should be monitored closely while taking varenicline.

- **CAUTIONS** Conditions that may lower seizure threshold • history of cardiovascular disease • history of psychiatric illness (may exacerbate underlying illness including depression) • predisposition to seizures
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Appetite abnormal • asthenia • chest discomfort • constipation • diarrhoea • dizziness • drowsiness • dry mouth • gastrointestinal discomfort • gastrointestinal disorders • headache • joint disorders • muscle complaints • nausea • oral disorders • pain • skin reactions • sleep disorders • vomiting • weight increased
 - ▶ **Uncommon** Allergic rhinitis • anxiety • arrhythmias • behaviour abnormal • burping • conjunctivitis • depression • eye pain • fever • fungal infection • haemorrhage • hallucination • hot flush • hyperglycaemia • influenza like illness • malaise • menorrhagia • mood swings • numbness • palpitations • seizure • sexual dysfunction • suicidal ideation • sweat changes • thinking abnormal • tinnitus • tremor • urinary disorders
 - ▶ **Rare or very rare** Angioedema • bradyphrenia • coordination abnormal • costochondritis • cyst • diabetes mellitus • dysarthria • eye disorders • feeling cold • glycosuria • muscle tone increased • polydipsia • psychosis • scleral discolouration • severe cutaneous adverse reactions (SCARs) • snoring • vaginal discharge • vision disorders
- **PREGNANCY** Avoid—toxicity in animal studies.
- **BREAST FEEDING** Avoid—present in milk in animal studies.
- **RENAL IMPAIRMENT**

Dose adjustments If eGFR less than 30 mL/minute/1.73 m², initial dose 500 micrograms once daily, increased after 3 days to 1 mg once daily.
- **TREATMENT CESSATION** Risk of relapse, irritability, depression, and insomnia on discontinuation; consider dose tapering on completion of 12-week course.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

 - ▶ **Varenicline for smoking cessation (July 2007)** NICE TA123 Varenicline is recommended, within its licensed indications, as an option for smokers who have expressed a desire to quit smoking; it should normally be prescribed only as part of a programme of behavioural support. www.nice.org.uk/TA123

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

8.3 Opioid dependence

Other drugs used for Opioid dependence Buprenorphine, p. 442 • Naltrexone hydrochloride, p. 491

ANALGESICS > OPIOIDS

441

Methadone hydrochloride

• INDICATIONS AND DOSE

Severe pain

- ▶ BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ **Adult:** 5–10 mg every 6–8 hours, adjusted according to response, on prolonged use not to be given more frequently than every 12 hours

Adjunct in treatment of opioid dependence

▶ BY MOUTH USING ORAL SOLUTION

- ▶ **Adult:** Initially 10–30 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily

Adjunct in treatment of opioid dependence if tolerance low or not known

▶ BY MOUTH USING ORAL SOLUTION

- ▶ **Adult:** Initially 10–20 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily

Adjunct in treatment of opioid dependence if tolerance high (under expert supervision)

▶ BY MOUTH USING ORAL SOLUTION

- ▶ **Adult:** Initially up to 40 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily

Cough in terminal disease

▶ INITIALLY BY MOUTH USING LINCTUS

- ▶ **Adult:** 1–2 mg every 4–6 hours, (by mouth) reduced to 1–2 mg twice daily, use twice daily frequency if prolonged use

DOSE EQUIVALENCE AND CONVERSION

- ▶ See buprenorphine p. 442 for dose adjustments in opioid substitution therapy, for patients taking methadone who want to switch to buprenorphine.

- **UNLICENSED USE** Methadone hydrochloride doses for opioid dependence in the BNF may differ from those in the product literature.

IMPORTANT SAFETY INFORMATION

Methadone oral solution 1 mg/mL is 2½ times the strength of Methadone Linctus (2 mg/5mL). Many preparations of Methadone oral solution are licensed for opioid drug addiction only but some are also licensed for analgesia in severe pain.

- **CONTRA-INDICATIONS** Phaeochromocytoma
- **CAUTIONS** Family history of sudden death (ECG monitoring recommended) • history of cardiac conduction abnormalities
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ **QT-interval prolongation** Patients with the following risk factors for QT-interval prolongation should be carefully monitored while taking methadone: heart or liver disease, electrolyte abnormalities, or concomitant treatment with drugs that can prolong QT interval; patients requiring more than 100 mg daily should also be monitored.
- **INTERACTIONS** → Appendix 1: opioids

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS Asthma exacerbated · dry eye · dysuria · hyperprolactinaemia · hypothermia · menstrual cycle irregularities · mood altered · nasal dryness · postural hypotension · QT interval prolongation · torsade de pointes

● SPECIFIC SIDE-EFFECTS

- ▶ With oral use Galactorrhoea · intracranial pressure increased
- ▶ With parenteral use Biliary spasm · muscle rigidity · oedema · restlessness · sexual dysfunction · sleep disorder · ureteral spasm

SIDE-EFFECTS, FURTHER INFORMATION Methadone is a long-acting opioid therefore effects may be cumulative.

Methadone, even in low doses is a special hazard for children; non-dependent adults are also at risk of toxicity; dependent adults are at risk if tolerance is incorrectly assessed during induction.

Overdose Methadone has a very long duration of action; patients may need to be monitored for long periods following large overdoses.

- **BREAST FEEDING** Withdrawal symptoms in infant; breast-feeding permissible during maintenance but dose should be as low as possible and infant monitored to avoid sedation (high doses of methadone carry an increased risk of sedation and respiratory depression in the neonate).
 - **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
 - **TREATMENT CESSATION** Avoid abrupt withdrawal.
 - **DIRECTIONS FOR ADMINISTRATION** Syrup preserved with hydroxybenzoate (parabens) esters may be incompatible with methadone hydrochloride.
 - **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tolu.
- METHADOSE®** The final strength of the methadone mixture to be dispensed to the patient must be specified on the prescription.
- Important**—care is required in prescribing and dispensing the **correct strength** since any confusion could lead to an overdose; this preparation should be dispensed only **after dilution** as appropriate with *Methadose®* Diluent (life of diluted solution 3 months) and is for drug dependent persons.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Methadone and buprenorphine for the management of opioid dependence (January 2007)** NICE TA114
Oral methadone and buprenorphine are recommended for maintenance therapy in the management of opioid dependence. Patients should be committed to a supportive care programme including a flexible dosing regimen administered under supervision for at least 3 months, until compliance is assured. Selection of methadone or buprenorphine should be made on a case-by-case basis, but methadone should be prescribed if both drugs are equally suitable.
www.nice.org.uk/TA114

- **LESS SUITABLE FOR PRESCRIBING** Methadone linctus is less suitable for prescribing for cough in terminal disease (has a tendency to accumulate).

● MEDICINAL FORMS

Lofexidine hydrochloride 200 microgram BritLofex 200microgram tablets | 60 tablet [PoM] £61.79

SYMPATHOMIMETICS > ALPHA₂-ADRENOCEPTOR AGONISTS

Lofexidine hydrochloride

- **DRUG ACTION** Lofexidine is an alpha₂-adrenergic agonist.

- **INDICATIONS AND DOSE**

Management of symptoms of opioid withdrawal

- ▶ **BY MOUTH**

- ▶ **Adult:** Initially 800 micrograms daily in divided doses, increased in steps of 400–800 micrograms daily (max. per dose 800 micrograms) as required recommended duration of treatment 7–10 days if no opioid use (but longer may be required); maximum 2.4 mg per day

- **CAUTIONS** Bradycardia · cerebrovascular disease · depression · history of QT prolongation · hypotension (monitor pulse rate and blood pressure) · metabolic disturbances · recent myocardial infarction · severe coronary insufficiency

- **INTERACTIONS** → Appendix 1: lofexidine

- **SIDE-EFFECTS**

- ▶ **Common or very common** Bradycardia · dizziness · drowsiness · hypotension · mucosal dryness
- ▶ **Frequency not known** QT interval prolongation

- **PREGNANCY** Use only if benefit outweighs risk—no information available.

- **BREAST FEEDING** Use only if benefit outweighs risk—no information available.

- **RENAL IMPAIRMENT** Caution in chronic impairment.

- **MONITORING REQUIREMENTS** Monitoring of blood pressure and pulse rate is recommended on initiation, for at least 72 hours or until a stable dose is achieved, and on discontinuation.

- **TREATMENT CESSATION** Treatment should be withdrawn gradually over 2–4 days (or longer) to reduce the risk of rebound hypertension and associated symptoms.

- **PRESCRIBING AND DISPENSING INFORMATION** Lofexidine has been used in children over 12 years in the management of symptoms of opioid withdrawal.

- **PATIENT AND CARER ADVICE** The patient should take part of the dose at bedtime to offset insomnia associated with opioid withdrawal.

2 Bacterial infection

Antibacterials, principles of therapy

07-Mar-2017

Antibacterial drug choice

Before selecting an antibacterial the clinician must first consider two factors—the patient and the known or likely causative organism. Factors related to the patient which must be considered include history of allergy, renal and hepatic function, susceptibility to infection (i.e. whether immunocompromised), ability to tolerate drugs by mouth, severity of illness, ethnic origin, age, whether taking other medication and, if female, whether pregnant, breast-feeding or taking an oral contraceptive.

The known or likely organism and its antibacterial sensitivity, in association with the above factors, will suggest one or more antibacterials, the final choice depending on the microbiological, pharmacological, and toxicological properties.

An example of a rational approach to the selection of an antibacterial is treatment of a urinary-tract infection in a patient complaining of nausea and symptoms of a urinary-tract infection in early pregnancy. The organism is reported as being resistant to ampicillin p. 540 but sensitive to nitrofurantoin p. 579 (can cause nausea), gentamicin p. 510 (can be given only by injection and best avoided in pregnancy), tetracycline p. 557 (causes dental discoloration) and trimethoprim p. 563 (folate antagonist therefore theoretical teratogenic risk), and cefalexin p. 516. The safest antibiotics in pregnancy are the penicillins and cephalosporins; therefore, cefalexin would be indicated for this patient.

The principles involved in selection of an antibacterial must allow for a number of variables including changing renal and hepatic function, increasing bacterial resistance, and information on side-effects. Duration of therapy, dosage, and route of administration depend on site, type and severity of infection and response.

Antibacterial policies

Local policies often limit the antibacterials that may be used to achieve reasonable economy consistent with adequate cover, and to reduce the development of resistant organisms. A policy may indicate a range of drugs for general use, and permit other drugs only on the advice of the microbiologist or physician responsible for the control of infectious diseases.

Antibacterials, considerations before starting therapy

The following precepts should be considered before starting:

- Viral infections should not be treated with antibacterials. However, antibacterials may be used to treat secondary bacterial infection (e.g. bacterial pneumonia secondary to influenza);
- Samples should be taken for culture and sensitivity testing; 'blind' antibacterial prescribing for unexplained pyrexia usually leads to further difficulty in establishing the diagnosis;
- Knowledge of **prevalent organisms** and their current sensitivity is of great help in choosing an antibacterial before bacteriological confirmation is available. Generally, narrow-spectrum antibacterials are preferred to broad-spectrum antibacterials unless there is a clear clinical indication (e.g. life-threatening sepsis);
- The **dose** of an antibacterial varies according to a number of factors including age, weight, hepatic function, renal function, and severity of infection. The prescribing of the so-called 'standard' dose in serious infections may result in failure of treatment or even death of the patient; therefore it is important to prescribe a dose appropriate to the condition. An inadequate dose may also increase the likelihood of antibacterial resistance. On the other hand, for an antibacterial with a narrow margin between the toxic and therapeutic dose (e.g. an aminoglycoside) it is also important to avoid an excessive dose and the concentration of the drug in the plasma may need to be monitored;
- The **route** of administration of an antibacterial often depends on the severity of the infection. Life-threatening infections require intravenous therapy. Antibacterials that are well absorbed may be given by mouth even for some serious infections. Parenteral administration is also appropriate when the oral route cannot be used (e.g. because of vomiting) or if absorption is inadequate. Whenever possible, painful intramuscular injections should be avoided in children;
- **Duration** of therapy depends on the nature of the infection and the response to treatment. Courses should not be unduly prolonged because they encourage resistance, they may lead to side-effects and they are

costly. However, in certain infections such as tuberculosis or osteomyelitis it may be necessary to treat for prolonged periods. Conversely a single dose of an antibacterial may cure uncomplicated urinary-tract infections. The prescription for an antibacterial should specify the duration of treatment or the date when treatment is to be reviewed.

Superinfection

In general, broad-spectrum antibacterial drugs such as the cephalosporins are more likely to be associated with adverse reactions related to the selection of resistant organisms e.g. *fungal infections* or *antibiotic-associated colitis* (pseudomembranous colitis); other problems associated with superinfection include vaginitis and pruritus ani.

Antibacterial therapy

When the pathogen has been isolated treatment may be changed to a more appropriate antibacterial if necessary. If no bacterium is cultured the antibacterial can be continued or stopped on clinical grounds.

Notifiable diseases

Doctors must notify the Proper Officer of the local authority (usually the consultant in communicable disease control) when attending a patient suspected of suffering from any of the diseases listed below; a form is available from the Proper Officer.

Anthrax	Mumps
Botulism	Paratyphoid fever
Brucellosis	Plague
Cholera	Poliomyelitis, acute
Diarrhoea (infectious bloody)	Rabies
Diphtheria	Rubella
Encephalitis, acute	SARS
Food poisoning	Scarlet fever
Haemolytic uraemic syndrome	Smallpox
Haemorrhagic fever (viral)	Streptococcal disease (Group A, invasive)
Hepatitis, viral	Tetanus
Legionnaires' disease	Tuberculosis
Leprosy	Typhoid fever
Malaria	Typhus
Measles	Whooping cough
Meningitis	Yellow fever
Meningococcal septicaemia	

Note It is good practice for doctors to also inform the consultant in communicable disease control of instances of other infections (e.g. psittacosis) where there could be a public health risk.

Sepsis, early management

EvGr Patients identified as being at high risk of severe illness or death due to suspected sepsis should be given a broad-spectrum antibacterial at the maximum recommended dose without delay (ideally within one hour). Microbiological samples and blood cultures must be taken prior to administration of antibiotics; the prescription should be adjusted subsequently according to susceptibility results.

A thorough clinical examination should be carried out to identify sources of infection. If the source of infection is identified, treat in line with local antibacterial guidance or susceptibility results.

Patients who require empirical intravenous treatment for a suspected infection, but who have no confirmed diagnosis, should be treated with an intravenous antibiotic from the local formulary and in line with national guidelines.

The need for intravenous fluids, inotropes, vasopressors and oxygen should also be assessed without delay, taking into consideration the patient's lactate concentration, systolic blood pressure, and their risk of severe illness or

death. Patients at high risk should be monitored continuously if possible, and no less than every 30 minutes.

Patients with suspected sepsis who are not immediately deemed to be at high risk of severe illness or death, should be re-assessed regularly for the need for empirical treatment, taking into consideration all risk factors including lactate concentration and evidence of acute kidney injury. 

Antibacterials, use for prophylaxis

16-Mar-2017

Rheumatic fever: prevention of recurrence

- Phenoxymethylpenicillin p. 538 or sulfadiazine p. 553.

Invasive group A streptococcal infection: prevention of secondary cases

- Phenoxymethylpenicillin.

Patients who are penicillin allergic, *either* erythromycin p. 530 or azithromycin p. 528 [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England Laboratory).

Meningococcal meningitis: prevention of secondary cases

- Ciprofloxacin p. 548 or rifampicin p. 571 or i/m ceftriaxone p. 520 [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

Haemophilus influenzae type b disease: prevention of secondary cases

- Rifampicin or (if rifampicin cannot be used) i/m or i/v ceftriaxone [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

Within 4 weeks of illness onset in an index case with confirmed or suspected invasive *Haemophilus influenzae* type b disease, give antibacterial prophylaxis to all household contacts if there is a vulnerable individual in the household. Also, give antibacterial prophylaxis to the index case if they are in contact with vulnerable household contacts or if they are under 10 years of age. Vulnerable individuals include the immunocompromised, those with asplenia, or children under 10 years of age. If there are 2 or more cases of invasive *Haemophilus influenzae* type b disease within 120 days in a pre-school or primary school, antibacterial prophylaxis should also be given to all room contacts (including staff). Also see immunisation against *Haemophilus influenzae* type b disease.

Diphtheria in non-immune patients: prevention of secondary cases

- Erythromycin (or another macrolide e.g. azithromycin or clarithromycin p. 529).

Treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment.

Pertussis, antibacterial prophylaxis

- Clarithromycin (or azithromycin or erythromycin).

Within 3 weeks of onset of cough in the index case, give antibacterial prophylaxis to all close contacts if amongst them there is at least one unimmunised or partially immunised child under 1 year of age, or if there is at least one individual who has not received a pertussis-containing vaccine more than 1 week and less than 5 years ago (so long as that individual lives or works with children under 4 months of age, is pregnant at over 32 weeks gestation, or is a healthcare worker who works with children under 1 year of age or with pregnant women).

Pneumococcal infection in asplenia or in patients with sickle-cell disease, antibacterial prophylaxis

- Phenoxymethylpenicillin.

If penicillin-allergic, erythromycin.

Antibacterial prophylaxis is not fully reliable. Antibacterial prophylaxis may be discontinued in children over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection.

Tuberculosis antibacterial prophylaxis in susceptible close contacts or those who have become tuberculin positive

- See *Close contacts* and *Chemoprophylaxis for latent tuberculosis* under Tuberculosis p. 567.

Animal and human bites, antibacterial prophylaxis

- Co-amoxiclav p. 542 alone (or doxycycline p. 555 + metronidazole p. 533 if penicillin-allergic).

Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 1257 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection).

Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread.

Antibacterial prophylaxis recommended for wounds less than 48–72 hours old when the risk of infection is high (e.g. bites from humans or cats; bites to the hand, foot, face, or genital area; bites involving oedema, crush or puncture injury, or other moderate to severe injury; wounds that cannot be debrided adequately; patients with diabetes mellitus, cirrhosis, asplenia, prosthetic joints or valves, or those who are immunocompromised). Give antibacterial prophylaxis for up to 5 days.

Early-onset neonatal infection, antibacterial prophylaxis

- i/v benzylpenicillin sodium p. 537 (or i/v clindamycin p. 526 if history of allergy to penicillins).

Give intrapartum prophylaxis to women with group B streptococcal colonisation, bacteriuria, or infection in the current pregnancy, or to women who had a previous baby with an invasive group B streptococcal infection. Consider prophylaxis for women in preterm labour if there is prelabour rupture of membranes or if intrapartum rupture of membranes lasting more than 18 hours is suspected.

Gastro-intestinal procedures, antibacterial prophylaxis

Operations on stomach or oesophagus

- Single dose of i/v gentamicin p. 510 or i/v cefuroxime p. 518 or i/v co-amoxiclav (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Add i/v teicoplanin p. 524 (or vancomycin p. 525) if high risk of meticillin-resistant *Staphylococcus aureus*.

Open biliary surgery

- Single dose of i/v cefuroxime + i/v metronidazole or i/v gentamicin + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant *Staphylococcus aureus*.

Resections of colon and rectum for carcinoma, and resections in inflammatory bowel disease, and appendicectomy

- Single dose of i/v gentamicin + i/v metronidazole or i/v cefuroxime + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant *Staphylococcus aureus*.

Endoscopic retrograde cholangiopancreatography

- Single dose of i/v gentamicin p. 510 or oral or i/v ciprofloxacin p. 548.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Prophylaxis recommended if pancreatic pseudocyst, immunocompromised, history of liver transplantation, or risk of incomplete biliary drainage. For biliary complications following liver transplantation, add i/v amoxicillin p. 539 or i/v teicoplanin p. 524 (or vancomycin p. 525).

Percutaneous endoscopic gastrostomy or jejunostomy

- Single dose of i/v co-amoxiclav p. 542 or i/v cefuroxime p. 518.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v teicoplanin (or vancomycin) if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus*.

Orthopaedic surgery, antibacterial prophylaxis

Joint replacement including hip and knee

- Single dose of i/v cefuroxime alone or i/v flucloxacillin p. 544+ i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant *Staphylococcus aureus*, use single dose of i/v teicoplanin (or vancomycin) + i/v

gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Closed fractures

- Single dose of i/v cefuroxime or i/v flucloxacillin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant *Staphylococcus aureus*, use single dose of i/v teicoplanin (or vancomycin) (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Open fractures

- Use i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole p. 533 (or i/v clindamycin p. 526 alone if history of allergy to penicillins or to cephalosporins).

Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant *Staphylococcus aureus*. Start prophylaxis within 3 hours of injury and continue until soft tissue closure (max. 72 hours).

At first debridement also use a single dose of i/v cefuroxime + i/v metronidazole + i/v gentamicin or i/v co-amoxiclav + i/v gentamicin (or i/v clindamycin + i/v gentamicin if history of allergy to penicillins or to cephalosporins).

At time of skeletal stabilisation and definitive soft tissue closure use a single dose of i/v gentamicin + i/v teicoplanin (or vancomycin) (intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure).

High lower-limb amputation

- Use i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Continue antibacterial prophylaxis for at least 2 doses after procedure (max. duration of prophylaxis 5 days). If history of allergy to penicillin or to cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus*, use i/v teicoplanin (or vancomycin) + i/v gentamicin + i/v metronidazole.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Urological procedures, antibacterial prophylaxis

Transrectal prostate biopsy

- Single dose of oral ciprofloxacin + oral metronidazole or i/v gentamicin + i/v metronidazole (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin + i/v metronidazole if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses of antibacterial may be given for prolonged procedures or if there is major blood loss).

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Transurethral resection of prostate

- Single dose of oral ciprofloxacin or i/v gentamicin or i/v cefuroxime (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Obstetric and gynaecological surgery, antibacterial prophylaxis

Caesarean section

- Single dose of i/v cefuroxime (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Substitute i/v clindamycin if history of allergy to penicillins or cephalosporins. Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant *Staphylococcus aureus*.

Hysterectomy

- Single dose of i/v cefuroxime + i/v metronidazole or i/v gentamicin + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin + i/v metronidazole or add i/v teicoplanin (or vancomycin) to other regimens if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Termination of pregnancy

- Single dose of oral metronidazole (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

If genital chlamydial infection cannot be ruled out, give doxycycline p. 555 postoperatively.

Cardiology procedures, antibacterial prophylaxis

Cardiac pacemaker insertion

- Single dose of i/v cefuroxime alone or i/v flucloxacillin + i/v gentamicin or i/v teicoplanin (or vancomycin) + i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v teicoplanin (or vancomycin) + i/v cefuroxime or i/v teicoplanin (or vancomycin) + i/v gentamicin if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Vascular surgery, antibacterial prophylaxis

Reconstructive arterial surgery of abdomen, pelvis or legs

- Single dose of i/v cefuroxime alone or i/v flucloxacillin + i/v gentamicin p. 510 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Add i/v metronidazole p. 533 for patients at risk from anaerobic infections including those with diabetes, gangrene, or undergoing amputation. Use single dose of i/v

teicoplanin p. 524 (or vancomycin p. 525) + i/v gentamicin if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Infective endocarditis, antibacterial prophylaxis

NICE guidance: Antimicrobial prophylaxis against infective endocarditis in adults and children undergoing interventional procedures (March 2008, updated 2016)

- Chlorhexidine mouthwash is **not** recommended for the prevention of infective endocarditis in at risk patients undergoing dental procedures.

Antibacterial prophylaxis is **not routinely** recommended for the prevention of infective endocarditis in patients undergoing the following procedures:

- ▶ dental;
- ▶ upper and lower respiratory tract (including ear, nose, and throat procedures and bronchoscopy);
- ▶ genito-urinary tract (including urological, gynaecological, and obstetric procedures);
- ▶ upper and lower gastro-intestinal tract.

Whilst these procedures can cause bacteraemia, there is no clear association with the development of infective endocarditis. Prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

If patients at risk of endocarditis are undergoing a gastro-intestinal or genito-urinary tract procedure at a site where infection is suspected, they should receive appropriate antibacterial therapy that includes cover against organisms that cause infective endocarditis.

Patients at risk of infective endocarditis should be:

- ▶ advised to maintain good oral hygiene;
- ▶ told how to recognise signs of infective endocarditis, and advised when to seek expert advice.

Patients at risk of infective endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.

Dermatological procedures

- Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who undergo dermatological procedures do not require antibacterial prophylaxis against endocarditis.

The British Association of Dermatologists Therapy Guidelines and Audit Subcommittee advise that such dermatological procedures include skin biopsies and excision of moles or of malignant lesions.

Joint prostheses and dental treatment, antibacterial prophylaxis

- Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

Immunosuppression and indwelling intraperitoneal catheters

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

Blood infections, antibacterial therapy

Septicaemia (community-acquired)

- A broad-spectrum antipseudomonal penicillin (e.g. piperacillin with tazobactam p. 536, ticarcillin with clavulanic acid p. 537) or a broad-spectrum cephalosporin (e.g. cefuroxime p. 518)
 - ▶ If *meticillin-resistant Staphylococcus aureus* suspected, add vancomycin p. 525 (or teicoplanin p. 524).
 - ▶ If anaerobic infection suspected, add metronidazole p. 533 to broad-spectrum cephalosporin.
 - ▶ If other resistant micro-organisms suspected, use a more broad-spectrum beta-lactam antibacterial (e.g. meropenem p. 514).

Septicaemia (hospital-acquired)

- A broad-spectrum antipseudomonal beta-lactam antibacterial (e.g. piperacillin with tazobactam, ticarcillin with clavulanic acid, ceftazidime p. 519, imipenem with cilastatin p. 514, or meropenem)
 - ▶ If *meticillin-resistant Staphylococcus aureus* suspected, add vancomycin (or teicoplanin).
 - ▶ If anaerobic infection suspected, add metronidazole to broad-spectrum cephalosporin

Septicaemia related to vascular catheter

- Vancomycin (or teicoplanin)
 - ▶ If Gram-negative sepsis suspected, especially in the immunocompromised, add a broad-spectrum antipseudomonal beta-lactam.
 - ▶ Consider removing vascular catheter, particularly if infection caused by *Staphylococcus aureus*, *Pseudomonas*, or *Candida* species.

Meningococcal septicaemia

If meningococcal disease suspected, a single dose of benzylpenicillin sodium p. 537 should be given before urgent transfer to hospital, so long as this does not delay the transfer; cefotaxime p. 519 may be an alternative in penicillin allergy; chloramphenicol p. 558 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.

- Benzylpenicillin sodium or cefotaxime (or ceftriaxone p. 520)
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol

To eliminate nasopharyngeal carriage, ciprofloxacin p. 548, or rifampicin p. 571, or ceftriaxone may be used.

Cardiovascular system infections, antibacterial therapy

Endocarditis: initial 'blind' therapy

- *Native valve endocarditis*, amoxicillin p. 539 (or ampicillin p. 540)
 - ▶ Consider adding low-dose gentamicin p. 510
 - ▶ If penicillin-allergic, or if *meticillin-resistant Staphylococcus aureus* suspected, or if severe sepsis, use vancomycin p. 525 + low-dose gentamicin
 - ▶ If severe sepsis with risk factors for Gram-negative infection, use vancomycin + meropenem p. 514
- *If prosthetic valve endocarditis*, vancomycin + rifampicin p. 571 + low-dose gentamicin

Endocarditis (native valve) caused by staphylococci

- Flucloxacillin p. 544
 - ▶ *Suggested duration of treatment* 4 weeks (at least 6 weeks if secondary lung abscess or osteomyelitis also present)
- *If penicillin-allergic or if meticillin-resistant Staphylococcus aureus*, vancomycin + rifampicin
 - ▶ *Suggested duration of treatment* 4 weeks (at least 6 weeks if secondary lung abscess or osteomyelitis also present)

Endocarditis (prosthetic valve) caused by staphylococci

- Flucloxacillin + rifampicin + low-dose gentamicin
 - ▶ *Suggested duration of treatment* at least 6 weeks; review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- *If penicillin-allergic or if meticillin-resistant Staphylococcus aureus*, vancomycin + rifampicin + low-dose gentamicin
 - ▶ *Suggested duration of treatment* at least 6 weeks; review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks

Endocarditis caused by fully-sensitive streptococci

- Benzylpenicillin sodium p. 537
 - ▶ *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis)
- *If penicillin-allergic*, vancomycin (or teicoplanin p. 524) + low-dose gentamicin
 - ▶ *Suggested duration of treatment* 4–6 weeks (stop gentamicin after 2 weeks)

Endocarditis caused by less-sensitive streptococci

- Benzylpenicillin sodium + low-dose gentamicin
 - ▶ *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks; stop gentamicin at 2 weeks if micro-organisms moderately sensitive to penicillin
- *If penicillin-allergic or highly penicillin-resistant*, vancomycin (or teicoplanin) + low-dose gentamicin
 - ▶ *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks; stop gentamicin at 2 weeks if micro-organisms moderately sensitive to penicillin

Endocarditis caused by enterococci

- Amoxicillin (or ampicillin) + low dose gentamicin or benzylpenicillin sodium + low-dose gentamicin
 - ▶ *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue

gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks

- If *penicillin-allergic* or *penicillin-resistant*, vancomycin (or teicoplanin) + low-dose gentamicin
- *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- If gentamicin resistant, amoxicillin (or ampicillin)
- Add streptomycin p. 512 (if susceptible) for 2 weeks
- *Suggested duration of treatment* at least 6 weeks

Endocarditis caused by *Haemophilus*, *Actinobacillus*, *Cardiobacterium*, *Eikenella*, and *Kingella* species ('HACEK' micro-organisms)

- Amoxicillin (or ampicillin) + low-dose gentamicin
- *Suggested duration of treatment* 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks
- If *amoxicillin-resistant*, ceftriaxone p. 520 (or cefotaxime p. 519) + low-dose gentamicin
- *Suggested duration of treatment* 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks

Central nervous system infections, antibacterial therapy

Meningitis: initial empirical therapy

- Transfer patient to hospital urgently.
- If *meningococcal disease* (meningitis with non-blanching rash or meningococcal septicaemia) suspected, benzylpenicillin sodium p. 537 should be given before transfer to hospital, so long as this does not delay the transfer. If a patient with suspected bacterial meningitis without non-blanching rash cannot be transferred to hospital urgently, benzylpenicillin sodium should be given before the transfer. Cefotaxime p. 519 may be an alternative in penicillin allergy; chloramphenicol p. 558 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.
- In hospital, consider adjunctive treatment with dexamethasone p. 660 (particularly if pneumococcal meningitis suspected in adults), preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial; avoid dexamethasone in septic shock, meningococcal septicaemia, or if immunocompromised, or in meningitis following surgery.

In hospital, if aetiology unknown:

- *Adult and child 3 months–50 years*, cefotaxime (or ceftriaxone p. 520)
- Consider adding vancomycin p. 525 if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.
- *Suggested duration of treatment* at least 10 days
- *Adult over 50 years* cefotaxime (or ceftriaxone) + amoxicillin p. 539 (or ampicillin p. 540)
- Consider adding vancomycin if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.
- *Suggested duration of treatment* at least 10 days

Meningitis caused by meningococci

- Benzylpenicillin sodium or cefotaxime (or ceftriaxone)

- *Suggested duration of treatment* 7 days.
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol
- *Suggested duration of treatment* 7 days.

Meningitis caused by pneumococci

- Cefotaxime (or ceftriaxone)
- Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial (may reduce penetration of vancomycin into cerebrospinal fluid).
- If micro-organism penicillin-sensitive, replace cefotaxime with benzylpenicillin sodium.
- If micro-organism highly penicillin- and cephalosporin-resistant, add vancomycin and if necessary rifampicin p. 571.
- *Suggested duration of antibacterial treatment* 14 days

Meningitis caused by *Haemophilus influenzae*

- Cefotaxime (or ceftriaxone)
- Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
- *Suggested duration of antibacterial treatment* 10 days.
- For *H. influenzae* type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, or if micro-organism resistant to cefotaxime, chloramphenicol
- Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
- *Suggested duration of antibacterial treatment* 10 days.
- For *H. influenzae* type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts

Meningitis caused by *Listeria*

- Amoxicillin (or ampicillin) + gentamicin p. 510
- *Suggested duration of treatment* 21 days.
- Consider stopping gentamicin after 7 days.
- If history of immediate hypersensitivity reaction to penicillin, co-trimoxazole p. 552
- *Suggested duration of treatment* 21 days.

Ear infections, antibacterial therapy

Otitis externa

- For topical treatments, consider *Otitis externa*, under Ear p. 1159.
- Consider systemic antibacterial if spreading cellulitis or patient systemically unwell.
- Flucloxacillin p. 544
- If *penicillin-allergic*, clarithromycin p. 529 (or azithromycin p. 528 or erythromycin p. 530)
- If *pseudomonas* suspected, ciprofloxacin p. 548 (or an aminoglycoside)

Otitis media

- Many infections are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment. In children without systemic features, antibacterial treatment may be started after 72 hours if no improvement. Consider earlier treatment if deterioration,

if systemically unwell, if at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis present, or in children under 2 years of age with bilateral otitis media.

- Amoxicillin p. 539 (*or* ampicillin p. 540)
- Consider co-amoxiclav p. 542 if no improvement after 48 hours.
- In severe infection, initial parenteral therapy with co-amoxiclav *or* cefuroxime p. 518.
- *Suggested duration of treatment* 5 days (longer if severely ill).
- If *penicillin-allergic*, clarithromycin (*or* azithromycin *or* erythromycin)
- *Suggested duration of treatment* 5 days (longer if severely ill)

Eye infections, antibacterial therapy

Conjunctivitis (purulent)

- Chloramphenicol p. 558 eye drops.

Gastro-intestinal system infections, antibacterial therapy

Gastro-enteritis

- Frequently self-limiting and may not be bacterial.
- Antibacterial not usually indicated

Campylobacter enteritis

- Frequently self-limiting; treat if immunocompromised or if severe infection.
- Clarithromycin p. 529 (*or* azithromycin p. 528 *or* erythromycin p. 530)
- *Alternative*, ciprofloxacin p. 548
- Strains with decreased sensitivity to ciprofloxacin isolated frequently

Salmonella (non-typhoid)

- Treat invasive or severe infection. Do not treat less severe infection unless there is a risk of developing invasive infection (e.g. immunocompromised patients, those with haemoglobinopathy, or children under 6 months of age).
- Ciprofloxacin *or* cefotaxime p. 519

Shigellosis

- Antibacterial not indicated for mild cases.
- Ciprofloxacin *or* azithromycin
- *Alternatives if micro-organism sensitive*, amoxicillin p. 539 *or* trimethoprim p. 563

Typhoid fever

- Infections from Middle-East, South Asia, and South-East Asia may be multiple-antibacterial-resistant and sensitivity should be tested.
- Cefotaxime (*or* ceftriaxone p. 520)
- azithromycin may be an alternative in mild or moderate disease caused by multiple-antibacterial-resistant organisms.
- *Alternative if micro-organism sensitive*, ciprofloxacin

Clostridium difficile infection

- *Clostridium difficile* infection is caused by colonisation of the colon with *Clostridium difficile* and production of toxin. It often follows antibiotic therapy and is usually of acute onset, but may become chronic. It is a particular hazard of

ampicillin p. 540, amoxicillin, co-amoxiclav p. 542, second- and third-generation cephalosporins, clindamycin p. 526, and quinolones, but few antibiotics are free of this side-effect. Treatment options include metronidazole p. 533, vancomycin p. 525, and fidaxomicin p. 560.

- *For first episode of mild to moderate infection*, oral metronidazole
- *Suggested duration of treatment* 10–14 days
- *For second or subsequent episode of infection, for severe infection, for infection not responding to metronidazole, or in patients intolerant of metronidazole*, oral vancomycin
- *For severe infection in patients with multiple co-morbidities who are receiving treatment with other antibacterials, or for second or subsequent episode of infection*, fidaxomicin can replace vancomycin
- *Suggested duration of treatment* 10–14 days
- *For infection not responding to vancomycin or fidaxomicin, for life-threatening infection, or in patients with ileus*, oral vancomycin + i/v metronidazole
- *For infection not responding to vancomycin in patients without life-threatening infection or ileus*, fidaxomicin can be used instead of vancomycin + metronidazole
- *Suggested duration of treatment* 10–14 days

Biliary-tract infection

- Ciprofloxacin *or* gentamicin p. 510 *or* a cephalosporin

Peritonitis

- A cephalosporin + metronidazole *or* gentamicin + metronidazole *or* gentamicin + clindamycin *or* piperacillin with tazobactam p. 536 alone

Peritonitis: peritoneal dialysis-associated

- Vancomycin (*or* teicoplanin p. 524) + ceftazidime p. 519 added to dialysis fluid *or* vancomycin added to dialysis fluid + ciprofloxacin by mouth
- *Suggested duration of treatment* 14 days or longer

Genital system infections, antibacterial therapy

Bacterial vaginosis

- Oral metronidazole p. 533
- *Suggested duration of treatment* 5–7 days (or high-dose metronidazole as a single dose)
- *Alternatively*, topical metronidazole for 5 days *or* topical clindamycin p. 526 for 7 days

Uncomplicated genital chlamydial infection, non-gonococcal urethritis, and non-specific genital infection

- Contact tracing recommended.
- Azithromycin p. 528 *or* doxycycline p. 555
- *Suggested duration of treatment* azithromycin as a single dose *or* doxycycline for 7 days
- *Alternatively*, erythromycin p. 530.
- *Suggested duration of treatment* 14 days

Gonorrhoea: uncomplicated

- Contact tracing recommended. Consider chlamydia co-infection. Choice of alternative antibacterial regimen depends on locality where infection acquired.
- Azithromycin + i/m ceftriaxone p. 520
- *Suggested duration of treatment* is a single-dose of each antibacterial

- Alternatively, when parenteral administration is not possible, cefixime p. 518 + azithromycin
- Suggested duration of treatment is a single-dose of each antibacterial
- Alternatively, if micro-organism is sensitive to a quinolone, ciprofloxacin p. 548 + azithromycin
- Suggested duration of treatment is a single-dose of each antibacterial
- Pharyngeal infection, azithromycin + i/m ceftriaxone
- Suggested duration of treatment is a single-dose of each antibacterial

Pelvic inflammatory disease

- Contact tracing recommended.
- Doxycycline + metronidazole + single-dose of i/m ceftriaxone or ofloxacin p. 551 + metronidazole
- Suggested duration of treatment 14 days (except i/m ceftriaxone).
- In severely ill patients initial treatment with doxycycline + i/v ceftriaxone + i/v metronidazole, then switch to oral treatment with doxycycline + metronidazole to complete 14 days' treatment

Early syphilis (infection of less than 2 years)

- Contact tracing recommended.
- Benzathine benzylpenicillin [unlicensed]
- Suggested duration of treatment single-dose (repeat dose after 7 days for women in the third trimester of pregnancy)
- Alternatively, doxycycline or erythromycin
- Suggested duration of treatment 14 days

Late latent syphilis (asymptomatic infection of more than 2 years)

- Contact tracing recommended.
- Benzathine benzylpenicillin [unlicensed]
- Suggested duration of treatment once weekly for 2 weeks
- Alternatively, doxycycline
- Suggested duration of treatment 28 days

Asymptomatic contacts of patients with infectious syphilis

- Doxycycline
- Suggested duration of treatment 14 days

Musculoskeletal system infections, antibacterial therapy

Osteomyelitis

- Seek specialist advice if chronic infection or prostheses present.
- Flucloxacillin p. 544
- Consider adding fusidic acid p. 561 or rifampicin p. 571 for initial 2 weeks.
- Suggested duration of treatment 6 weeks for acute infection
- If penicillin-allergic, clindamycin p. 526
- Consider adding fusidic acid or rifampicin for initial 2 weeks.
- Suggested duration of treatment 6 weeks for acute infection
- If methicillin-resistant *Staphylococcus aureus* suspected, vancomycin p. 525 (or teicoplanin p. 524)
- Consider adding fusidic acid or rifampicin for initial 2 weeks.
- Suggested duration of treatment 6 weeks for acute infection

Septic arthritis

- Seek specialist advice if prostheses present.
- Flucloxacillin
- Suggested duration of treatment 4–6 weeks (longer if infection complicated).
- If penicillin-allergic, clindamycin
- Suggested duration of treatment 4–6 weeks (longer if infection complicated).
- If methicillin-resistant *Staphylococcus aureus* suspected, vancomycin (or teicoplanin)
- Suggested duration of treatment 4–6 weeks (longer if infection complicated).
- If gonococcal arthritis or Gram-negative infection suspected, cefotaxime p. 519 (or ceftriaxone p. 520)
- Suggested duration of treatment 4–6 weeks (longer if infection complicated; treat gonococcal infection for 2 weeks).

Nose infections, antibacterial therapy

31-Oct-2017

Sinusitis (acute)

Acute sinusitis is generally triggered by a viral infection, although occasionally it may become complicated by a bacterial infection caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*, *Moraxella catarrhalis*, or *Staphylococcus aureus*. For further information see Sinusitis (acute) p. 1168.

Treatment

EvGr Antibacterial therapy should *only* be offered to patients with acute sinusitis who are systemically very unwell, have signs and symptoms of a more serious illness, those who are at high-risk of complications due to pre-existing comorbidities, or whenever bacterial sinusitis is suspected.

Patients presenting with symptoms for around 10 days or more with no improvement may be prescribed a back-up antibiotic prescription, which can be used if symptoms do not improve within 7 days or if they worsen significantly at any time. **Ad** For further information see, Sinusitis (acute) p. 1168.

Choice of antibacterial therapy

No penicillin allergy

- **EvGr** First line:
 - Non-life threatening symptoms: phenoxymethylpenicillin p. 538.
 - Systemically very unwell, signs and symptoms of a more serious illness, or at high-risk of complications: co-amoxiclav p. 542.
- Second line (worsening symptoms despite 2 or 3 days of antibiotic treatment):
 - Non-life threatening symptoms: co-amoxiclav.
 - Systemically very unwell, signs and symptoms of a more serious illness or at high-risk of complications: consult local microbiologist. **Ad**

Penicillin allergy or intolerance

- **EvGr** First line: doxycycline p. 555 or clarithromycin p. 529 (erythromycin p. 530 in pregnancy).
- Second line (worsening symptoms despite 2 or 3 days of antibiotic treatment): consult local microbiologist. **Ad**

Oral bacterial infections

Antibacterial drugs

Antibacterial drugs should only be prescribed for the treatment of oral infections on the basis of defined need. They may be used in conjunction with (but not as an alternative to) other appropriate measures, such as providing drainage or extracting a tooth.

The 'blind' prescribing of an antibacterial for unexplained pyrexia, cervical lymphadenopathy, or facial swelling can lead to difficulty in establishing the diagnosis. In severe oral infections, a sample should always be taken for bacteriology.

Oral infections which may require antibacterial treatment include acute periapical or periodontal abscess, cellulitis, acutely created oral-antral communication (and acute sinusitis), severe pericoronitis, localised osteitis, acute necrotising ulcerative gingivitis, and destructive forms of chronic periodontal disease. Most of these infections are readily resolved by the early establishment of drainage and removal of the cause (typically an infected necrotic pulp). Antibacterials may be required if treatment has to be delayed, in immunocompromised patients, or in those with conditions such as diabetes or Paget's disease. Certain rarer infections including bacterial sialadenitis, osteomyelitis, actinomycosis, and infections involving fascial spaces such as Ludwig's angina, require antibiotics and specialist hospital care.

Antibacterial drugs may also be useful after dental surgery in some cases of spreading infection. Infection may spread to involve local lymph nodes, to fascial spaces (where it can cause airway obstruction), or into the bloodstream (where it can lead to cavernous sinus thrombosis and other serious complications). Extension of an infection can also lead to maxillary sinusitis; osteomyelitis is a complication, which usually arises when host resistance is reduced.

If the oral infection fails to respond to antibacterial treatment within 48 hours the antibacterial should be changed, preferably on the basis of bacteriological investigation. Failure to respond may also suggest an incorrect diagnosis, lack of essential additional measures (such as drainage), poor host resistance, or poor patient compliance.

Combination of a penicillin (or a macrolide) with metronidazole p. 533 may sometimes be helpful for the treatment of severe oral infections or oral infections that have not responded to initial antibacterial treatment.

Penicillins

Phenoxymethylpenicillin p. 538 is effective for dentoalveolar abscess.

Broad-spectrum penicillins

Amoxicillin p. 539 is as effective as phenoxymethylpenicillin but is better absorbed; however, it may encourage emergence of resistant organisms.

Like phenoxymethylpenicillin, amoxicillin is ineffective against bacteria that produce beta-lactamases.

Amoxicillin may be useful for short course oral regimens.

Co-amoxiclav p. 542 is active against beta-lactamase-producing bacteria that are resistant to amoxicillin. Co-amoxiclav may be used for severe dental infection with spreading cellulitis or dental infection not responding to first-line antibacterial treatment.

Cephalosporins

The cephalosporins offer little advantage over the penicillins in dental infections, often being less active against anaerobes. Infections due to oral streptococci (often termed viridans streptococci) which become resistant to penicillin are usually also resistant to cephalosporins. This is of importance in the case of patients who have had rheumatic fever and are on long-term penicillin therapy. Cefalexin

p. 516 and cefradine p. 516 have been used in the treatment of oral infections.

Tetracyclines

In adults, tetracyclines can be effective against oral anaerobes but the development of resistance (especially by oral streptococci) has reduced their usefulness for the treatment of acute oral infections; they may still have a role in the treatment of destructive (refractory) forms of periodontal disease. Doxycycline p. 555 has a longer duration of action than tetracycline p. 557 or oxytetracycline p. 557 and need only be given once daily; it is reported to be more active against anaerobes than some other tetracyclines.

Doxycycline may have a role in the treatment of recurrent aphthous ulceration, or as an adjunct to gingival scaling and root planing for periodontitis.

Macrolides

The macrolides are an alternative for oral infections in penicillin-allergic patients or where a beta-lactamase producing organism is involved. However, many organisms are now resistant to macrolides or rapidly develop resistance; their use should therefore be limited to short courses.

Clindamycin

Clindamycin p. 526 should not be used routinely for the treatment of oral infections because it may be no more effective than penicillins against anaerobes and there may be cross-resistance with erythromycin-resistant bacteria. Clindamycin can be used for the treatment of dentoalveolar abscess that has not responded to penicillin or to metronidazole.

Metronidazole and tinidazole

Metronidazole is an alternative to a penicillin for the treatment of many oral infections where the patient is allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes. It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent's infection) and pericoronitis; amoxicillin is a suitable alternative. For these purposes metronidazole for 3 days is sufficient, but the duration of treatment may need to be longer in pericoronitis. Tinidazole p. 534 is licensed for the treatment of acute ulcerative gingivitis.

Respiratory system infections, antibacterial therapy

Epiglottitis (*Haemophilus influenzae*)

- Cefotaxime p. 519 (or ceftriaxone p. 520)
- ▶ If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol p. 558

Chronic bronchitis: acute exacerbations

- Treat if increase in sputum purulence accompanied by an increase in sputum volume or increase in dyspnoea.
- ▶ Amoxicillin p. 539 (or ampicillin p. 540) or a tetracycline p. 557
- ▶ Some pneumococci and *Haemophilus influenzae* strains tetracycline-resistant; approx. 20% *H. influenzae* strains amoxicillin-resistant
- ▶ Suggested duration of treatment 5 days; longer treatment may be necessary in severely ill patients
- ▶ Alternative, clarithromycin p. 529 (or azithromycin p. 528 or erythromycin p. 530)
- ▶ Suggested duration of treatment 5 days; longer treatment may be necessary in severely ill patients

Community-acquired pneumonia: low-severity

- Amoxicillin (or ampicillin)
- ▶ Pneumococci with decreased penicillin sensitivity being isolated, but not yet common in UK.
- ▶ If atypical pathogens suspected, add clarithromycin (or azithromycin or erythromycin).
- ▶ If staphylococci suspected (e.g. in influenza or measles), add flucloxacillin p. 544.
- ▶ *Suggested duration of treatment* 7 days (14–21 days for infections caused by staphylococci)
- ▶ *Alternatives*, doxycycline p. 555 or clarithromycin (or azithromycin or erythromycin)
- ▶ *Suggested duration of treatment* 7 days (14–21 days for infections caused by staphylococci)

Community-acquired pneumonia: moderate-severity

- Amoxicillin (or ampicillin) + clarithromycin (or azithromycin or erythromycin) or doxycycline alone
- ▶ Pneumococci with decreased penicillin sensitivity being isolated, but not yet common in UK.
- ▶ If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin p. 525 (or teicoplanin p. 524).
- ▶ *Suggested duration of treatment* 7 days (14–21 days for infections caused by staphylococci)

Community-acquired pneumonia: high-severity

- Benzylpenicillin sodium p. 537 + clarithromycin (or azithromycin or erythromycin) or benzylpenicillin sodium + doxycycline
- ▶ If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin (or teicoplanin).
- ▶ *Suggested duration of treatment* 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci suspected)
- ▶ *If life-threatening infection, or if Gram-negative infection suspected, or if co-morbidities present, or if living in long-term residential or nursing home*, co-amoxiclav p. 542 + clarithromycin (or azithromycin or erythromycin)
- ▶ If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin (or teicoplanin)
- ▶ *Suggested duration of treatment* 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci or Gram-negative enteric bacilli suspected)
- ▶ *Alternatives if life-threatening infection, or if Gram-negative infection suspected, or if co-morbidities present, or if living in long-term residential or nursing home*, cefuroxime p. 518 + clarithromycin (or azithromycin or erythromycin) or cefotaxime (or ceftriaxone) + clarithromycin (or azithromycin or erythromycin)
- ▶ If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin (or teicoplanin).
- ▶ *Suggested duration of treatment* 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci or Gram-negative enteric bacilli suspected)

Pneumonia possibly caused by atypical pathogens

- Clarithromycin (or azithromycin or erythromycin)
- ▶ If high-severity Legionella infection, add rifampicin p. 571 for the first few days.
- ▶ *Suggested duration of treatment* 14 days (usually 7–10 days for Legionella)
- ▶ *Alternative if Legionella infection suspected*, a quinolone
- ▶ If high-severity Legionella infection, add clarithromycin (or azithromycin or erythromycin) or rifampicin for the first few days.
- ▶ *Suggested duration of treatment* usually 7–10 days
- ▶ *Alternative for chlamydial or mycoplasma infections*, doxycycline
- ▶ *Suggested duration of treatment* 14 days

Hospital-acquired pneumonia

- *Early-onset infection* less than 5 days after admission to hospital), co-amoxiclav or cefuroxime
- ▶ If life-threatening infection, or if history of antibacterial treatment in the last 3 months, or if resistant micro-organisms suspected, treat as for late-onset hospital-acquired pneumonia.
- ▶ *Suggested duration of treatment* 7 days
- ▶ *Late-onset infection* (more than 5 days after admission to hospital), an antipseudomonal penicillin (e.g. piperacillin with tazobactam p. 536) or a broad-spectrum cephalosporin (e.g. ceftazidime p. 519) or another antipseudomonal beta-lactam or a quinolone (e.g. ciprofloxacin p. 548)
- ▶ If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin.
- ▶ For severe illness caused by *Pseudomonas aeruginosa*, consider adding an aminoglycoside.
- ▶ *Suggested duration of treatment* 7 days (longer if *Pseudomonas aeruginosa* confirmed)

Skin infections, antibacterial therapy**Impetigo: small areas of skin infected**

- Seek local microbiology advice before using topical treatment in hospital.
- ▶ Topical fusidic acid p. 561
- ▶ *Suggested duration of treatment* 7 days is usually adequate (max. 10 days).
- ▶ *Alternatively*, if meticillin-resistant *Staphylococcus aureus*, topical mupirocin p. 1168
- ▶ *Suggested duration of treatment* 7 days is usually adequate (max. 10 days).

Impetigo: widespread infection

- Oral flucloxacillin p. 544
- ▶ If streptococci suspected in severe infection, add phenoxymethylpenicillin p. 538.
- ▶ *Suggested duration of treatment* 7 days.
- *If penicillin-allergic*, oral clarithromycin p. 529 (or azithromycin p. 528 or erythromycin p. 530)
- ▶ *Suggested duration of treatment* 7 days.

Erysipelas

- Phenoxymethylpenicillin or benzylpenicillin sodium p. 537
- ▶ If severe infection, replace phenoxymethylpenicillin or benzylpenicillin sodium with high-dose flucloxacillin
- ▶ *Suggested duration of treatment* at least 7 days.
- *If penicillin-allergic*, clindamycin p. 526 or clarithromycin (or azithromycin or erythromycin)
- ▶ *Suggested duration of treatment* at least 7 days

Cellulitis

- Flucloxacillin (high-dose)
- ▶ If streptococcal infection confirmed, replace flucloxacillin with phenoxymethylpenicillin or benzylpenicillin sodium
- ▶ If Gram-negative bacteria or anaerobes suspected, use broad-spectrum antibacterials.
- *If penicillin-allergic*, clindamycin or clarithromycin (or azithromycin or erythromycin) or vancomycin p. 525 (or teicoplanin p. 524)
- ▶ If Gram-negative bacteria suspected, use broad-spectrum antibacterials.

Animal and human bites

- Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 1257 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection). Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread.
- Co-amoxiclav p. 542
- If penicillin-allergic, doxycycline p. 555 + metronidazole p. 533

Mastitis during breast-feeding

- Treat if severe, if systemically unwell, if nipple fissure present, if symptoms do not improve after 12–24 hours of effective milk removal, or if culture indicates infection. Continue breast-feeding or expressing milk during treatment.
- Flucloxacillin
- Suggested duration of treatment 10–14 days.
- If penicillin-allergic, erythromycin
- Suggested duration of treatment 10–14 days.

ANTIBACTERIALS > AMINOGLYCOSIDES

Aminoglycosides

Overview

These include amikacin p. 510, gentamicin p. 510, neomycin sulfate p. 511, streptomycin p. 512, and tobramycin p. 512. All are bactericidal and active against some Gram-positive and many Gram-negative organisms. Amikacin, gentamicin, and tobramycin are also active against *Pseudomonas aeruginosa*; streptomycin is active against *Mycobacterium tuberculosis* and is now almost entirely reserved for tuberculosis.

The aminoglycosides are not absorbed from the gut (although there is a risk of absorption in inflammatory bowel disease and liver failure) and must therefore be given by injection for systemic infections.

Gentamicin is the aminoglycoside of choice in the UK and is used widely for the treatment of serious infections. It has a broad spectrum but is inactive against anaerobes and has poor activity against haemolytic streptococci and pneumococci. When used for the 'blind' therapy of undiagnosed serious infections it is usually given in conjunction with a penicillin or metronidazole p. 533 (or both). Gentamicin is used together with another antibiotic for the treatment of endocarditis. Streptomycin may be used as an alternative in gentamicin-resistant enterococcal endocarditis.

Loading and maintenance doses of gentamicin may be calculated on the basis of the patient's weight and renal function (e.g. using a nomogram); adjustments are then made according to serum-gentamicin concentrations. High doses are occasionally indicated for serious infections, especially in the neonate, in the patient with cystic fibrosis, or in the immunocompromised patient. Whenever possible treatment should not exceed 7 days.

Amikacin is more stable than gentamicin to enzyme inactivation. Amikacin is used in the treatment of serious infections caused by gentamicin-resistant Gram-negative bacilli.

Tobramycin has similar activity to gentamicin. It is slightly more active against *Ps. aeruginosa* but shows less activity against certain other Gram-negative bacteria. Tobramycin can be administered by nebuliser or by inhalation of powder on a cyclical basis (28 days of tobramycin followed by a 28-day tobramycin-free interval) for the treatment of

chronic pulmonary *Ps. aeruginosa* infection in cystic fibrosis; however, resistance may develop and some patients do not respond to treatment.

Neomycin sulfate is too toxic for parenteral administration and can only be used for infections of the skin or mucous membranes or to reduce the bacterial population of the colon prior to bowel surgery or in hepatic failure. Oral administration may lead to malabsorption. Small amounts of neomycin sulfate may be absorbed from the gut in patients with hepatic failure and, as these patients may also be uraemic, cumulation may occur with resultant ototoxicity.

Once daily dosage

Once daily administration of aminoglycosides is more convenient, provides adequate serum concentrations, and in many cases has largely superseded multiple daily dose regimens (given in 2–3 divided doses during the 24 hours). Local guidelines on dosage and serum concentrations should be consulted. A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with endocarditis due to Gram-positive bacteria, HACEK endocarditis, burns of more than 20% of the total body surface area, or creatinine clearance less than 20 mL/minute. There is insufficient evidence to recommend a once daily, high-dose regimen of an aminoglycoside in pregnancy.

Serum concentrations

Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. Serum-aminoglycoside concentrations should be monitored in patients receiving parenteral aminoglycosides and must be determined in the elderly, in obesity, and in cystic fibrosis, or if high doses are being given, or if there is renal impairment.

Aminoglycosides (by injection)

- **CONTRA-INDICATIONS** Myasthenia gravis (aminoglycosides may impair neuromuscular transmission)
- **CAUTIONS** Care must be taken with dosage (the main side-effects of the aminoglycosides are dose-related) • conditions characterised by muscular weakness (aminoglycosides may impair neuromuscular transmission) • if possible, dehydration should be corrected before starting an aminoglycoside • whenever possible, parenteral treatment should not exceed 7 days
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Hearing impairment
 - ▶ **Uncommon** Nausea • skin reactions (very common in children) • vomiting
 - ▶ **Rare or very rare** Anaemia • eosinophilia • fever • headache • hypomagnesaemia • paraesthesia • renal impairment
 - ▶ **Frequency not known** Bronchospasm • confusion • lethargy • nephrotoxicity

SIDE-EFFECTS, FURTHER INFORMATION Nephrotoxicity occurs most commonly in patients with renal impairment, who require reduced doses; monitoring is particularly important in the elderly.

- **PREGNANCY** There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy. The risk is greatest with streptomycin. The risk is probably very small with gentamicin and tobramycin, but their use should be avoided unless essential.

Monitoring If given during pregnancy, serum-aminoglycoside concentration monitoring is essential.

- **RENAL IMPAIRMENT** Excretion of aminoglycosides is principally via the kidney and accumulation occurs in renal impairment. Ototoxicity and nephrotoxicity occur commonly in patients with renal failure.

- ▶ In adults A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with a creatinine clearance less than 20 mL/minute.
- ▶ In children A once-daily, high-dose regimen of an aminoglycoside should be avoided in children over 1 month of age with a creatinine clearance less than 20 mL/minute/1.73 m².

Dose adjustments If there is impairment of renal function, the interval between doses must be increased; if the renal impairment is severe, the dose itself should be reduced as well.

Monitoring Serum-aminoglycoside concentrations **must** be monitored in patients with renal impairment; earlier and more frequent measurement of aminoglycoside concentration may be required.

● MONITORING REQUIREMENTS

- ▶ Serum concentrations Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. Serum-aminoglycoside concentrations should be measured in all patients receiving parenteral aminoglycosides and **must** be determined in obesity, if high doses are being given and in cystic fibrosis.
- ▶ In adults Serum aminoglycoside concentrations **must** be determined in the elderly. In patients with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen and after a dose change. For multiple daily dose regimens, blood samples should be taken approximately 1 hour after intramuscular or intravenous administration ('peak' concentration) and also just before the next dose ('trough' concentration). If the pre-dose ('trough') concentration is high, the interval between doses must be increased. If the post-dose ('peak') concentration is high, the dose must be decreased. For once daily dose regimens, consult local guidelines on serum concentration monitoring.
- ▶ In children In children with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen. Blood samples should be taken just before the next dose is administered ('trough' concentration). If the pre-dose ('trough') concentration is high, the interval between doses must be increased. For multiple daily dose regimens, blood samples should also be taken approximately 1 hour after intramuscular or intravenous administration ('peak' concentration). If the post-dose ('peak') concentration is high, the dose must be decreased.
- ▶ Renal function should be assessed before starting an aminoglycoside and during treatment.
- ▶ Auditory and vestibular function should also be monitored during treatment.

F 509

Amikacin

● INDICATIONS AND DOSE

Serious Gram-negative infections resistant to gentamicin (multiple daily dose regimen)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 15 mg/kg daily in 2 divided doses, increased to 22.5 mg/kg daily in 3 divided doses for up to 10 days, higher dose to be used in severe infections; maximum 1.5 g per day; maximum 15 g per course

Serious Gram-negative infections resistant to gentamicin (once daily dose regimen)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 15 mg/kg (max. per dose 1.5 g once daily), dose to be adjusted according to serum-amikacin concentration; maximum 15 g per course

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-amikacin concentration closely

- **INTERACTIONS** → Appendix 1: aminoglycosides

● SIDE-EFFECTS

- ▶ **Uncommon** Superinfection
- ▶ **Rare or very rare** Albuminuria · arthralgia · azotaemia · balance impaired · hypotension · muscle twitching · tremor
- ▶ **Frequency not known** Apnoea · neuromuscular blockade · paralysis

● MONITORING REQUIREMENTS

- ▶ With intravenous use *Multiple daily dose regimen*: one-hour ('peak') serum concentration should not exceed 30 mg/litre; pre-dose ('trough') concentration should be less than 10 mg/litre. *Once daily dose regimen*: pre-dose ('trough') concentration should be less than 5 mg/litre.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Amikin®); intermittent in Glucose 5% or Sodium chloride 0.9%. To be given over 30 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Once daily dose regimen not to be used for endocarditis, febrile neutropenia, or meningitis. Consult local guidelines.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

▶ Amikacin (Non-proprietary)

Amikacin (as Amikacin sulfate) 250 mg per 1 ml Amikacin 500mg/2ml solution for injection vials | 5 vial [POM] £60.00 (Hospital only)

▶ Amikin (Bristol-Myers Squibb Pharmaceuticals Ltd)

Amikacin (as Amikacin sulfate) 50 mg per 1 ml Amikin 100mg/2ml solution for injection vials | 5 vial [POM] £10.33

F 509

Gentamicin

11-Dec-2017

● INDICATIONS AND DOSE

Gram-positive bacterial endocarditis or HACEK endocarditis (in combination with other antibacterials)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1 mg/kg every 12 hours, intravenous injection to be administered over at least 3 minutes, to be given in a multiple daily dose regimen

Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Acute pyelonephritis | Endocarditis | Pneumonia in hospital patients | Adjunct in listerial meningitis | Prostatitis

- ▶ BY INTRAVENOUS INFUSION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 3–5 mg/kg daily in 3 divided doses, to be given in a multiple daily dose regimen, divided doses to be given every 8 hours, intravenous injection to be administered over at least 3 minutes
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 5–7 mg/kg, subsequent doses adjusted according to serum-gentamicin concentration, to be given in a once daily dose regimen

CNS infections (administered on expert advice)

- ▶ BY INTRATHECAL INJECTION
- ▶ Adult: 1 mg daily, increased if necessary to 5 mg daily, seek specialist advice

Surgical prophylaxis

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 1.5 mg/kg, intravenous injection to be administered over at least 3 minutes, administer dose up to 30 minutes before the procedure, dose may be

repeated every 8 hours for high-risk procedures; up to 3 further doses may be given

Surgical prophylaxis in joint replacement surgery

► BY INTRAVENOUS INFUSION

- Adult: 5 mg/kg for 1 dose, administer dose up to 30 minutes before the procedure

DOSES AT EXTREMES OF BODY-WEIGHT

- With intramuscular use or intravenous use
- To avoid excessive dosage in obese patients, use ideal weight for height to calculate parenteral dose and monitor serum-gentamicin concentration closely.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: POTENTIAL FOR HISTAMINE-RELATED ADVERSE DRUG REACTIONS WITH SOME BATCHES (NOVEMBER 2017)

Following reports that some batches of gentamicin sulphate active pharmaceutical ingredient (API) used to manufacture gentamicin may contain higher than expected levels of histamine, which is a residual from the manufacturing process, the MHRA advise to monitor patients for signs of histamine-related adverse reactions; particular caution is required in patients taking concomitant drugs known to cause histamine release, in children, and in patients with severe renal impairment.

- **INTERACTIONS** → Appendix 1: aminoglycosides
- **SIDE-EFFECTS** Antibiotic associated colitis · blood disorder · depression · encephalopathy · hallucination · hepatic reaction · neurotoxicity · peripheral neuropathy · purpura · seizure · stomatitis · vestibular damage
- **MONITORING REQUIREMENTS**
 - With intramuscular use or intravenous use For multiple daily dose regimen, one-hour ('peak') serum concentration should be 5–10 mg/litre; pre-dose ('trough') concentration should be less than 2 mg/litre.
 - For multiple daily dose regimen in endocarditis, one-hour ('peak') serum concentration should be 3–5 mg/litre; pre-dose ('trough') concentration should be less than 1 mg/litre. Serum-gentamicin concentration should be measured after 3 or 4 doses, then at least every 3 days and after a dose change (more frequently in renal impairment).
 - With intravenous use For once-daily dose regimen, consult local guidelines on monitoring serum-gentamicin concentration.
- **DIRECTIONS FOR ADMINISTRATION**
 - With intrathecal use For *intrathecal* injection, use preservative-free intrathecal preparations only.
 - With intravenous use For *intravenous infusion* (Cidomycin®); *Gentamicin paediatric injection*, *Beacon*; *Gentamicin injection* (Hospira), give intermittently or via drip tubing in Glucose 5% or Sodium Chloride 0.9%. Suggested volume for intermittent infusion 50–100 ml given over 20–30 minutes (given over 60 minutes for once daily dose regimen).
- **PRESCRIBING AND DISPENSING INFORMATION**
 - With intravenous use Local guidelines may vary in the dosing advice provided for once daily administration.
 - With intrathecal use Only preservative-free intrathecal preparation should be used.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Gentamicin (Non-proprietary)

Gentamicin (as Gentamicin sulfate) 5 mg per 1 ml Gentamicin Intrathecal 5mg/1ml solution for injection ampoules | 5 ampoule [PoM] £36.28 (Hospital only)

Gentamicin (as Gentamicin sulfate) 10 mg per 1 ml Gentamicin 20mg/2ml solution for injection ampoules | 5 ampoule [PoM] £11.25

Gentamicin Paediatric 20mg/2ml solution for injection vials | 5 vial [PoM] £11.25 DT = £11.25

Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Gentamicin 80mg/2ml solution for injection vials | 5 vial [PoM] £20.00 (Hospital only)

Gentamicin 80mg/2ml solution for injection ampoules | 5 ampoule [PoM] £6.88 | 10 ampoule [PoM] £10.00

► Cidomycin (Sanofi)

Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Cidomycin Adult Injectable 80mg/2ml solution for injection vials | 5 vial [PoM] £6.88

Cidomycin Adult Injectable 80mg/2ml solution for injection ampoules | 5 ampoule [PoM] £6.88

Infusion

► Gentamicin (Non-proprietary)

Gentamicin (as Gentamicin sulfate) 1 mg per 1 ml Gentamicin 80mg/80ml infusion bags | 20 bag [PoM] £40.17

Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml Gentamicin 240mg/80ml infusion bags | 20 bag [PoM] £122.57–£122.58

Gentamicin 360mg/120ml infusion bags | 20 bag [PoM] £174.07

Neomycin sulfate

● INDICATIONS AND DOSE

Bowel sterilisation before surgery

► BY MOUTH

- Adult: 1 g every 1 hour for 4 hours, then 1 g every 4 hours for 2–3 days

Hepatic coma

► BY MOUTH

- Adult: Up to 4 g daily in divided doses usually for 5–7 days

- **CONTRA-INDICATIONS** Intestinal obstruction · myasthenia gravis (aminoglycosides may impair neuromuscular transmission)
- **CAUTIONS** Avoid prolonged use
- **CAUTIONS, FURTHER INFORMATION** Although neomycin is associated with the same cautions as other aminoglycosides it is generally considered too toxic for systemic use.
- **INTERACTIONS** → Appendix 1: neomycin
- **SIDE-EFFECTS** Blood disorder · confusion · diarrhoea · drug cross-reactivity · electrolyte imbalance · gastrointestinal disorders · haemolytic anaemia · nausea · nephrotoxicity · nystagmus · oral disorders · ototoxicity · paraesthesia · superinfection · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION** Although neomycin is associated with the same side effects as other aminoglycosides, it is poorly absorbed after oral administration.
- **PREGNANCY** There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy.
- **HEPATIC IMPAIRMENT** Absorbed from gastro-intestinal tract in liver disease—increased risk of ototoxicity.
- **RENAL IMPAIRMENT** Avoid—risk of ototoxicity and nephrotoxicity.
- **MONITORING REQUIREMENTS**
 - Renal function should be assessed before starting an aminoglycoside and during treatment.
 - Auditory and vestibular function should also be monitored during treatment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

► Neomycin sulfate (Non-proprietary)

Neomycin sulfate 500 mg Neomycin 500mg tablets | 100 tablet [PoM] £34.69 DT = £34.69

Streptomycin

● INDICATIONS AND DOSE

Tuberculosis, resistant to other treatment, in combination with other drugs

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 15 mg/kg daily (max. per dose 1 g), reduce dose in those under 50 kg and those over 40 years

Adjunct to doxycycline in brucellosis (administered on expert advice)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: (consult local protocol)

Enterococcal endocarditis

- ▶ Adult: (consult local protocol)

- **UNLICENSED USE** Use in tuberculosis is an unlicensed indication.

IMPORTANT SAFETY INFORMATION

Side-effects increase after a cumulative dose of 100 g, which should only be exceeded in exceptional circumstances.

- **INTERACTIONS** → Appendix 1: aminoglycosides
- **SIDE-EFFECTS** Hypersensitivity · oral paraesthesia
- **RENAL IMPAIRMENT**
Dose adjustments Should preferably be avoided. If essential, use with great care and consider dose reduction.
- **MONITORING REQUIREMENTS**
▶ One-hour ('peak') concentration should be 15–40 mg/litre; pre-dose ('trough') concentration should be less than 5 mg/litre (less than 1 mg/litre in renal impairment or in those over 50 years).
- **MEDICINAL FORMS**
Forms available from special-order manufacturers include: powder for solution for injection

Tobramycin

28-Nov-2016

● INDICATIONS AND DOSE

Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Acute pyelonephritis or prostatitis | Pneumonia in hospital patients

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 3 mg/kg daily in 3 divided doses; increased if necessary up to 5 mg/kg daily in 3–4 divided doses, increased dose used in severe infection; dose to be reduced back to 3 mg/kg daily as soon as clinically indicated

Urinary-tract infection

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 2–3 mg/kg for 1 dose

Chronic *Pseudomonas aeruginosa* infection in patients with cystic fibrosis

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Adult: 300 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution
- ▶ BY INHALATION OF POWDER
- ▶ Adult: 112 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin inhalation powder

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, use ideal weight for height to calculate parenteral dose and monitor serum-tobramycin concentration closely.

VANTOBRA® NEBULISER SOLUTION

Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis

- ▶ BY INHALATION OF NEBULISED SOLUTION

- ▶ Adult: 170 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution

- **CAUTIONS**
 - ▶ When used by inhalation Conditions characterised by muscular weakness—may impair neuromuscular transmission · history of prolonged previous or concomitant intravenous aminoglycosides—increased risk of ototoxicity · renal impairment—limited information available · severe haemoptysis—risk of further haemorrhage
- **INTERACTIONS** → Appendix 1: aminoglycosides
- **SIDE-EFFECTS**
 - ▶ Common or very common
 - ▶ When used by inhalation Dysphonia · increased risk of infection · malaise · respiratory disorder · sputum discolouration
 - ▶ Frequency not known
 - ▶ When used by inhalation Aphonia · oropharyngeal pain · taste altered
 - ▶ With parenteral use Diarrhoea · disorientation · dizziness · exfoliative dermatitis · granulocytopenia · leucocytosis · leucopenia · nerve disorders · thrombocytopenia · urine abnormalities · vertigo
- **SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises to monitor serum-tobramycin concentration in patients with known or suspected signs of auditory dysfunction; if ototoxicity develops—discontinue treatment until serum concentration falls below 2 mg/litre.
- **RENAL IMPAIRMENT**
 - ▶ When used by inhalation Manufacturer advises monitor serum-tobramycin concentration; if nephrotoxicity develops—discontinue treatment until serum concentration falls below 2 mg/litre.
- **MONITORING REQUIREMENTS**
 - ▶ With intramuscular use or intravenous use One-hour ('peak') serum concentration should not exceed 10 mg/litre; pre-dose ('trough') concentration should be less than 2 mg/litre.
 - ▶ When used by inhalation Measure lung function before and after initial dose of tobramycin and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using bronchodilator. Manufacturer advises monitor renal function before treatment and then annually.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For intravenous infusion (Nebcin®); intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%. For adult intermittent infusion suggested volume 50–100 mL given over 20–60 minutes.
 - ▶ When used by inhalation Other inhaled drugs should be administered before tobramycin.
- **PATIENT AND CARER ADVICE**
 - ▶ When used by inhalation Patient counselling is advised for Tobramycin dry powder for inhalation (administration).
- **VANTOBRA® NEBULISER SOLUTION** Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **NICE decisions**
 - ▶ Tobramycin by dry powder inhalation for pseudomonas lung infection in cystic fibrosis (March 2013) NICE TA276
 - ▶ When used by inhalation Tobramycin dry powder for inhalation is recommended for chronic pulmonary

infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis only if there is an inadequate response to colistimethate sodium, or if colistimethate sodium cannot be used because of contra-indications or intolerance. The manufacturer must provide tobramycin dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving tobramycin dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.

▶ Vantobra (Pari Medical Ltd)

Tobramycin 100 mg per 1 ml Vantobra 170mg/1.7ml nebuliser solution 1.7ml ampoules | 56 ampoule [PoM] £1,305.00

ANTIBACTERIALS > CARBAPENEMS

Carbapenems

Overview

The carbapenems are beta-lactam antibacterials with a broad-spectrum of activity which includes many Gram-positive and Gram-negative bacteria, and anaerobes; **imipenem** (imipenem with cilastatin p. 514) and meropenem p. 514 have good activity against *Pseudomonas aeruginosa*. The carbapenems are not active against methicillin-resistant *Staphylococcus aureus* and *Enterococcus faecium*.

Imipenem (imipenem with cilastatin) and meropenem are used for the treatment of severe hospital-acquired infections and polymicrobial infections including septicaemia, hospital-acquired pneumonia, intra-abdominal infections, skin and soft-tissue infections, and complicated urinary-tract infections.

Ertapenem below is licensed for treating abdominal and gynaecological infections and for community-acquired pneumonia, but it is not active against atypical respiratory pathogens and it has limited activity against penicillin-resistant pneumococci. It is also licensed for treating foot infections of the skin and soft tissue in patients with diabetes. Unlike the other carbapenems, ertapenem is not active against *Pseudomonas* or against *Acinetobacter* spp.

Imipenem is partially inactivated in the kidney by enzymatic activity and is therefore administered in combination with **cilastatin** (imipenem with cilastatin), a specific enzyme inhibitor, which blocks its renal metabolism. Meropenem and ertapenem are stable to the renal enzyme which inactivates imipenem and therefore can be given without cilastatin.

Side-effects of imipenem with cilastatin are similar to those of other beta-lactam antibiotics. Meropenem has less seizure-inducing potential and can be used to treat central nervous system infection.

Ertapenem

• INDICATIONS AND DOSE

Abdominal infections | Acute gynaecological infections | Community-acquired pneumonia

▶ BY INTRAVENOUS INFUSION

▶ Adult: 1 g once daily

Diabetic foot infections of the skin and soft-tissue

▶ BY INTRAVENOUS INFUSION

▶ Adult: 1 g once daily

Surgical prophylaxis, colorectal surgery

▶ BY INTRAVENOUS INFUSION

▶ Adult: 1 g for 1 dose, dose to be completed within 1 hour before surgery

• **CAUTIONS** CNS disorders—risk of seizures • elderly

• **INTERACTIONS** → Appendix 1: carbapenems

• SIDE-EFFECTS

▶ **Common or very common** Diarrhoea • headache • nausea • vomiting

▶ **Uncommon** Appetite decreased • arrhythmias • asthenia • confusion • constipation • dizziness • drowsiness • dry mouth • gastrointestinal discomfort • gastrointestinal disorders • hypotension • increased risk of infection • insomnia • oedema • pseudomembranous enterocolitis • seizure • skin reactions • swelling • taste altered • throat discomfort

▶ **Rare or very rare** Anxiety • cholecystitis • depression • dysphagia • eye disorder • haemorrhage • hepatic disorders • hypersensitivity • hypoglycaemia • malaise • muscle cramps • nasal congestion • neutropenia • renal impairment • shoulder pain • syncope • thrombocytopenia • tremor

▶ **Frequency not known** Aggression • delirium • drug reaction with eosinophilia and systemic symptoms (DRESS) • gait abnormal • hallucination • level of consciousness decreased • movement disorders • muscle weakness • psychiatric disorder • tooth discolouration

• **ALLERGY AND CROSS-SENSITIVITY** Avoid if history of **immediate hypersensitivity** reaction to beta-lactam antibacterials.

Use with caution in patients with sensitivity to beta-lactam antibacterials.

• **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.

• **BREAST FEEDING** Present in milk—manufacturer advises avoid.

• RENAL IMPAIRMENT

Dose adjustments Risk of seizures; max. 500 mg daily if eGFR less than 30 mL/minute/1.73 m².

• **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Invanz[®]), give intermittently in Sodium chloride 0.9%. Reconstitute 1 g with 10 mL Water for injections or Sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration not exceeding 20 mg/mL; give over 30 minutes; incompatible with glucose solutions.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

► **Imvanz** (Merck Sharp & Dohme Ltd)

Ertapenem (as Ertapenem sodium) 1 gram Imvanz 1g powder for solution for infusion vials | 1 vial [PoM] £31.65

Imipenem with cilastatin

● INDICATIONS AND DOSE

Aerobic and anaerobic Gram-positive and Gram-negative infections (not indicated for CNS infections) | Hospital-acquired septicæmia

► BY INTRAVENOUS INFUSION

► Adult: 500 mg every 6 hours, alternatively 1 g every 8 hours

Infection caused by *Pseudomonas* or other less sensitive organisms | Empirical treatment of infection in febrile patients with neutropenia | Life-threatening infection

► BY INTRAVENOUS INFUSION

► Adult: 1 g every 6 hours

DOSE EQUIVALENCE AND CONVERSION

► Dose expressed in terms of imipenem.

● **CAUTIONS** CNS disorders · epilepsy

● **INTERACTIONS** → Appendix 1: carbapenems

● SIDE-EFFECTS

► **Common or very common** Diarrhoea · eosinophilia · nausea · skin reactions · vomiting

► **Uncommon** Bone marrow disorders · confusion · dizziness · drowsiness · hallucination · hypotension · leucopenia · movement disorders · psychiatric disorder · seizure · thrombocytopenia · thrombocytosis

► **Rare or very rare** Agranulocytosis · anaphylactic reaction · angioedema · chest discomfort · colitis haemorrhagic · cyanosis · dyspnoea · encephalopathy · flushing · focal tremor · gastrointestinal discomfort · haemolytic anaemia · headache · hearing impairment · hepatic disorders · hyperhidrosis · hyperventilation · increased risk of infection · myasthenia gravis aggravated · oral disorders · palpitations · paraesthesia · polyarthralgia · polyuria · pseudomembranous enterocolitis · renal impairment · severe cutaneous adverse reactions (SCARs) · spinal pain · tachycardia · taste altered · urine discolouration · vertigo

► **Frequency not known** Agitation

● **ALLERGY AND CROSS-SENSITIVITY** Avoid if history of **immediate hypersensitivity** reaction to beta-lactam antibacterials.

Use with caution in patients with sensitivity to beta-lactam antibacterials.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in *animal* studies).

● **BREAST FEEDING** Present in milk but unlikely to be absorbed.

● RENAL IMPAIRMENT

Dose adjustments Risk of CNS side-effects; reduce dose if eGFR less than 70 mL/minute/1.73 m²— consult product literature.

● **EFFECT ON LABORATORY TESTS** Positive Coombs' test.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* dilute to a concentration of 5 mg (as imipenem)/mL in Sodium chloride 0.9%; give up to 500 mg (as imipenem) over 20–30 minutes, give dose greater than 500 mg (as imipenem) over 40–60 minutes.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

► **Imipenem with cilastatin (Non-proprietary)**

Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg Imipenem 500mg / Cilastatin 500mg powder for solution for infusion vials | 1 vial [PoM] £12.00 (Hospital only) | 5 vial [PoM] £60.00 (Hospital only)

► **Primaxin I.V.** (Merck Sharp & Dohme Ltd)

Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg Primaxin IV 500mg powder for solution for infusion vials | 1 vial [PoM] £12.00

Meropenem

● INDICATIONS AND DOSE

Aerobic and anaerobic Gram-positive and Gram-negative infections | Hospital-acquired septicæmia

► BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION

► Adult: 0.5–1 g every 8 hours

Exacerbations of chronic lower respiratory-tract infection in cystic fibrosis

► BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION

► Adult: 2 g every 8 hours

Meningitis

► BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION

► Adult: 2 g every 8 hours

Endocarditis (in combination with another antibacterial)

► BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION

► Adult: 2 g every 8 hours

● **UNLICENSED USE** Not licensed for use in endocarditis.

● **INTERACTIONS** → Appendix 1: carbapenems

● SIDE-EFFECTS

► **Common or very common** Abdominal pain · diarrhoea · headache · inflammation · nausea · pain · skin reactions · thrombocytosis · vomiting

► **Uncommon** Agranulocytosis · antibiotic associated colitis · eosinophilia · haemolytic anaemia · increased risk of infection · leucopenia · neutropenia · paraesthesia · severe cutaneous adverse reactions (SCARs) · thrombocytopenia

► **Rare or very rare** Seizure

● **ALLERGY AND CROSS-SENSITIVITY** Avoid if history of **immediate hypersensitivity** reaction to beta-lactam antibacterials.

Use with caution in patients with sensitivity to beta-lactam antibacterials.

● **PREGNANCY** Use only if potential benefit outweighs risk—no information available.

● **BREAST FEEDING** Unlikely to be absorbed (however, manufacturer advises avoid).

● HEPATIC IMPAIRMENT

Monitoring Monitor liver function in hepatic impairment.

● RENAL IMPAIRMENT

Dose adjustments Use normal dose every 12 hours if eGFR 26–50 mL/minute/1.73 m².

Use half normal dose every 12 hours if eGFR 10–25 mL/minute/1.73 m².

Use half normal dose every 24 hours if eGFR less than 10 mL/minute/1.73 m².

● **EFFECT ON LABORATORY TESTS** Positive Coombs' test.

● **DIRECTIONS FOR ADMINISTRATION** *Intravenous injection* to be administered over 5 minutes.

For *intravenous infusion* (Meropenem®), give intermittently in Glucose 5% or Sodium chloride 0.9%.

Dilute dose in infusion fluid to a final concentration of 1–20 mg/mL; give over 15–30 minutes.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

Meropenem (as Meropenem trihydrate) 1 gram Meronom 1g powder for solution for injection vials | 10 vial [PoM] £206.28 DT = £169.30

ANTIBACTERIALS > CEPHALOSPORINS

Cephalosporins

Overview

The cephalosporins are broad-spectrum antibiotics which are used for the treatment of septicaemia, pneumonia, meningitis, biliary-tract infections, peritonitis, and urinary-tract infections. The pharmacology of the cephalosporins is similar to that of the penicillins, excretion being principally renal. Cephalosporins penetrate the cerebrospinal fluid poorly unless the meninges are inflamed; cefotaxime p. 519 and ceftiraxone p. 520 are suitable cephalosporins for infections of the CNS (e.g. meningitis).

The principal side-effect of the cephalosporins is hypersensitivity and about 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. If a cephalosporin is essential in patients with a history of immediate hypersensitivity to penicillin, because a suitable alternative antibacterial is not available, then cefixime p. 518, cefotaxime, ceftazidime p. 519, ceftiraxone, or cefuroxime p. 518 can be used with caution; cefaclor p. 517, cefadroxil below, cefalexin p. 516, cefradine p. 516, and ceftaroline fosamil p. 522 should be avoided.

The orally active 'first generation' cephalosporins, cefalexin, cefradine, and cefadroxil and the 'second generation' cephalosporin, cefaclor, have a similar antimicrobial spectrum. They are useful for urinary-tract infections which do not respond to other drugs or which occur in pregnancy, respiratory-tract infections, otitis media, and skin and soft-tissue infections. Cefaclor has good activity against *H. influenzae*. Cefadroxil has a long duration of action and can be given twice daily; it has poor activity against *H. influenzae*. **Cefuroxime axetil**, an ester of the 'second generation' cephalosporin cefuroxime, has the same antibacterial spectrum as the parent compound; it is poorly absorbed and needs to be given with food to maximise absorption.

Cefixime is an orally active 'third generation' cephalosporin. It has a longer duration of action than the other cephalosporins that are active by mouth. It is only licensed for acute infections.

Cefuroxime is a 'second generation' cephalosporin that is less susceptible than the earlier cephalosporins to inactivation by beta-lactamases. It is, therefore, active against certain bacteria which are resistant to the other drugs and has greater activity against *Haemophilus influenzae*.

Cefotaxime, ceftazidime and ceftiraxone are 'third generation' cephalosporins with greater activity than the 'second generation' cephalosporins against certain Gram-negative bacteria. However, they are less active than

cefuroxime against Gram-positive bacteria, most notably *Staphylococcus aureus*. Their broad antibacterial spectrum may encourage superinfection with resistant bacteria or fungi.

Ceftazidime has good activity against pseudomonas. It is also active against other Gram-negative bacteria.

Ceftiraxone has a longer half-life and therefore needs to be given only once daily. Indications include serious infections such as septicaemia, pneumonia, and meningitis. The calcium salt of ceftiraxone forms a precipitate in the gall bladder which may rarely cause symptoms but these usually resolve when the antibiotic is stopped.

Ceftaroline fosamil is a 'fifth generation' cephalosporin with bactericidal activity similar to cefotaxime; however, ceftaroline fosamil has an extended spectrum of activity against Gram-positive bacteria that includes methicillin-resistant *Staphylococcus aureus* and multi-drug resistant *Streptococcus pneumoniae*. Ceftaroline fosamil is licensed for the treatment of community-acquired pneumonia and complicated skin and soft-tissue infections, but there is no experience of its use in pneumonia caused by methicillin-resistant *S. aureus*.

Cephalosporins

• **DRUG ACTION** Cephalosporins are antibacterials that attach to penicillin binding proteins to interrupt cell wall biosynthesis, leading to bacterial cell lysis and death.

SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · diarrhoea · dizziness · eosinophilia · fungal infection · headache · leucopenia · nausea · neutropenia · skin reactions · thrombocytopenia · vomiting
- ▶ **Uncommon** Anaphylactic reaction · antibiotic associated colitis
- ▶ **Rare or very rare** Agranulocytosis · angioedema · haemolytic anaemia · nephritis tubulointerstitial (reversible) · severe cutaneous adverse reactions (SCARs)

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with cephalosporin hypersensitivity.
- **Cross-sensitivity with other beta-lactam antibacterials** About 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. Patients with a history of **immediate hypersensitivity** to penicillin and other beta-lactams should not receive a cephalosporin. Cephalosporins should be used with caution in patients with sensitivity to penicillin and other beta-lactams.

- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances). False positive Coombs' test.

ANTIBACTERIALS > CEPHALOSPORINS, FIRST-GENERATION

▀ above

Cefadroxil

INDICATIONS AND DOSE

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

BY MOUTH

- ▶ Child 6–17 years (body-weight up to 40 kg): 0.5 g twice daily
- ▶ Child 6–17 years (body-weight 40 kg and above): 0.5–1 g twice daily
- ▶ Adult: 0.5–1 g twice daily

continued →

Skin infections | Soft-tissue infections | Uncomplicated urinary-tract infections

- **BY MOUTH**
- Child 6–17 years (body-weight 40 kg and above): 1 g once daily
- Adult: 1 g daily

- **INTERACTIONS** → Appendix 1: cephalosporins
- **SIDE-EFFECTS**
 - Common or very common Dyspepsia · glossitis
 - Rare or very rare Arthralgia · drug fever · fatigue · hepatic disorders · insomnia · nervousness · serum sickness-like reaction
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT**

Dose adjustments ► In adults 1 g initially, then 500 mg every 12 hours if eGFR 26–50 mL/minute/1.73 m². 1 g initially, then 500 mg every 24 hours if eGFR 11–26 mL/minute/1.73 m². 1 g initially, then 500 mg every 36 hours if eGFR less than 11 mL/minute/1.73 m².

► In children Reduce dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

Cefalexin

(Cephalexin)

• **INDICATIONS AND DOSE****Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria**

- **BY MOUTH**
- Child 1–11 months: 12.5 mg/kg twice daily, alternatively 125 mg twice daily
- Child 1–4 years: 12.5 mg/kg twice daily, alternatively 125 mg 3 times a day
- Child 5–11 years: 12.5 mg/kg twice daily, alternatively 250 mg 3 times a day
- Child 12–17 years: 500 mg 2–3 times a day
- Adult: 250 mg every 6 hours, alternatively 500 mg every 8–12 hours; increased to 1–1.5 g every 6–8 hours, increased dose to be used for severe infections

Serious susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- **BY MOUTH**
- Child 1 month–11 years: 25 mg/kg 2–4 times a day (max. per dose 1 g 4 times a day)
- Child 12–17 years: 1–1.5 g 3–4 times a day

Prophylaxis of recurrent urinary-tract infection

- **BY MOUTH**
- Child: 12.5 mg/kg once daily (max. per dose 125 mg), dose to be taken at night
- Adult: 125 mg once daily, dose to be taken at night

- **INTERACTIONS** → Appendix 1: cephalosporins
- **SIDE-EFFECTS** Agitation · arthritis · confusion · fatigue · gastrointestinal discomfort · genital pruritus · hallucination · hepatitis (transient) · hypersensitivity · jaundice · cholestatic (transient) · joint disorders · vaginal discharge

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT**

Dose adjustments ► In adults Max. 3 g daily if eGFR 40–50 mL/minute/1.73 m². Max. 1.5 g daily if eGFR 10–40 mL/minute/1.73 m². Max. 750 mg daily if eGFR less than 10 mL/minute/1.73 m².

► In children Reduce dose in moderate impairment.

● INDICATIONS AND DOSE

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 1-11 months: 20 mg/kg daily in 3 divided doses, alternatively 62.5 mg 3 times a day
- ▶ Child 1-4 years: 20 mg/kg daily in 3 divided doses, alternatively 125 mg 3 times a day
- ▶ Child 5-11 years: 20 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 250 mg 3 times a day
- ▶ Child 12-17 years: 250 mg 3 times a day; maximum 4 g per day
- ▶ Adult: 250 mg 3 times a day; maximum 4 g per day
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12-17 years: 375 mg every 12 hours, dose to be taken with food
- ▶ Adult: 375 mg every 12 hours, dose to be taken with food

Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 1-11 months: 40 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 125 mg 3 times a day

- ▶ Child 1-4 years: 40 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 250 mg 3 times a day
- ▶ Child 5-11 years: 40 mg/kg daily in 3 divided doses, usual max. 1 g daily
- ▶ Child 12-17 years: 500 mg 3 times a day; maximum 4 g per day
- ▶ Adult: 500 mg 3 times a day; maximum 4 g per day

Pneumonia

▶ BY MOUTH USING MODIFIED-RELEASE TABLETS

- ▶ Child 12-17 years: 750 mg every 12 hours, dose to be taken with food
- ▶ Adult: 750 mg every 12 hours, dose to be taken with food

Lower urinary-tract infections

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Child 12-17 years: 375 mg every 12 hours, dose to be taken with food
- ▶ Adult: 375 mg every 12 hours, dose to be taken with food

Asymptomatic carriage of *Haemophilus influenzae* or mild exacerbations in cystic fibrosis

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 1-11 months: 125 mg every 8 hours
- ▶ Child 1-6 years: 250 mg 3 times a day
- ▶ Child 7-17 years: 500 mg 3 times a day

- **INTERACTIONS** → Appendix 1: cephalosporins
- **SIDE-EFFECTS** Akathisia · anxiety · aplastic anaemia · arthralgia · arthritis · asthenia · colitis · confusion · drowsiness · dyspnoea · fever · genital pruritus · hallucination · hepatitis (transient) · hypersensitivity · insomnia · jaundice · cholestatic (transient) · lymphadenopathy · lymphocytosis · muscle tone increased · oedema · paraesthesia · proteinuria · syncope · vasodilatation
- SIDE-EFFECTS, FURTHER INFORMATION** Cefaclor is associated with protracted skin reactions, especially in children.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
Dose adjustments No dose adjustment required.

Cefuroxime

17-Mar-2017

● **INDICATIONS AND DOSE****Susceptible infections due to Gram-positive and Gram-negative bacteria**► **BY MOUTH**

► Child 3 months–1 year: 10 mg/kg twice daily (max. per dose 125 mg)

► Child 2–11 years: 15 mg/kg twice daily (max. per dose 250 mg)

► Child 12–17 years: 250 mg twice daily, dose may be doubled in severe lower respiratory-tract infections or if pneumonia is suspected

► Adult: 250 mg twice daily, dose may be doubled in severe lower respiratory-tract infections or if pneumonia is suspected

► **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**

► Child: 20 mg/kg every 8 hours (max. per dose 750 mg); increased to 50–60 mg/kg every 6–8 hours (max. per dose 1.5 g), increased dose used for severe infection and cystic fibrosis

► Adult: 750 mg every 6–8 hours; increased if necessary up to 1.5 g every 6–8 hours, increased dose used for severe infections

Lyme disease► **BY MOUTH**

► Adult: 500 mg twice daily for 14–21 days (for 28 days in Lyme arthritis)

Lower urinary-tract infection► **BY MOUTH**

► Child 12–17 years: 125 mg twice daily

► Adult: 125 mg twice daily

Pyelonephritis► **BY MOUTH**

► Adult: 250 mg twice daily

Surgical prophylaxis► **INITIALLY BY INTRAVENOUS INJECTION**

► Adult: 1.5 g, to be administered up to 30 minutes before the procedure, then (by intravenous injection or by intramuscular injection) 750 mg every 8 hours if required for up to 3 doses (in high risk procedures)

Open fractures, prophylaxis► **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**

► Adult: 1.5 g every 8 hours until soft tissue closure (maximum duration 72 hours)

● **UNLICENSED USE** Duration of treatment in Lyme disease is unlicensed.● **INTERACTIONS** → Appendix 1: cephalosporins● **SIDE-EFFECTS**► **Uncommon**

► With parenteral use Gastrointestinal disorder

► **Frequency not known**

► With oral use Drug fever · hepatic disorders · Jarisch-Herxheimer reaction · serum sickness

► With parenteral use Cutaneous vasculitis · drug fever

● **PREGNANCY** Not known to be harmful.● **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.● **RENAL IMPAIRMENT**► **Dose adjustments** ► In adults Use parenteral dose of 750 mg twice daily if eGFR 10–20 mL/minute/1.73 m². Use parenteral dose of 750 mg once daily if eGFR less than 10 mL/minute/1.73 m².► In children Reduce parenteral dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².● **DIRECTIONS FOR ADMINISTRATION** Single doses over 750 mg should be administered by the intravenous route only.

► With intravenous use in children Displacement value may be significant when reconstituting injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%; give over 30 minutes.

► With intravenous use in adults *For intravenous infusion* (Zinacef®), give intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Dissolve initially in water for injections (at least 2 mL for each 250 mg, 15 mL for 1.5 g); suggested volume 50–100 mL given over 30 minutes.● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion

Cefotaxime (as Cefotaxime sodium) 2 gram Cefotaxime 2g powder for solution for injection vials | 10 vial [PoM] £37.50

F 515

Ceftazidime

02-Aug-2017

INDICATIONS AND DOSE**Prophylaxis for transurethral resection of prostate**

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 1 g, single dose to be administered up to 30 minutes before procedure and may be repeated if necessary when catheter removed

Pseudomonas lung infection in cystic fibrosis

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 100–150 mg/kg daily in 3 divided doses; maximum 9 g per day

Complicated urinary-tract infection

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 1–2 g every 8–12 hours

Septicaemia | Hospital-acquired pneumonia

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 2 g every 8 hours

Febrile neutropenia

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 2 g every 8 hours

Meningitis

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 2 g every 8 hours

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 1–2 g every 8 hours

- **INTERACTIONS** → Appendix 1: cephalosporins

• SIDE-EFFECTS

- ▶ **Common or very common** Thrombocytosis
- ▶ **Rare or very rare** Acute kidney injury
- ▶ **Frequency not known** Coma · drug reaction with eosinophilia and systemic symptoms (DRESS) · encephalopathy · jaundice · lymphocytosis · myoclonus · neurological effects · paraesthesia · seizure · taste altered · tremor

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.

• RENAL IMPAIRMENT

Dose adjustments Manufacturer advises reduce dose if creatinine clearance 50 mL/minute or less—consult product literature.

- **DIRECTIONS FOR ADMINISTRATION** Intramuscular administration used when intravenous administration not possible; single doses over 1 g by intravenous route only.
- ▶ With intravenous use For *intravenous infusion* give intermittently or *via* drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%. Dissolve 2 g initially in 10 mL (3 g in 15 mL) infusion fluid. For *Fortum*® dilute further to a concentration of 40 mg/mL. For *Kefadim*® dilute further to a concentration of 20 mg/mL. Give over up to 30 minutes.

515

Ceftriaxone

15-Jun-2016

• INDICATIONS AND DOSE

Community-acquired pneumonia | Hospital-acquired pneumonia | Intra-abdominal infections | Complicated urinary-tract infections | Acute exacerbations of chronic obstructive pulmonary disease

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 1–2 g once daily, 2 g dose to be used for hospital-acquired pneumonia and severe cases

Complicated skin and soft tissue infections | Infections of bones and joints

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 2 g once daily

Suspected bacterial infection in neutropenic patients

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 2–4 g daily, doses at the higher end of the recommended range used in severe cases

Bacterial meningitis | Bacterial endocarditis

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 2–4 g daily, doses at the higher end of the recommended range used in severe cases
- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 80–100 mg/kg once daily, 100 mg/kg once daily dose should be used for bacterial endocarditis; maximum 4 g per day
- ▶ Child 9–11 years (body-weight 50 kg and above): 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
- ▶ Child 12–17 years: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 9–11 years (body-weight 50 kg and above): 2–4 g once daily, doses at the higher end of the recommended range used in severe cases; doses of 50 mg/kg or more should be given by infusion
- ▶ Child 12–17 years: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 80–100 mg/kg daily, 100 mg/kg daily dose should be used for bacterial endocarditis; maximum 4 g per day
- ▶ Child 9–11 years (body-weight 50 kg and above): 2–4 g daily, doses at the higher end of the recommended range used in severe cases
- ▶ Child 12–17 years: 2–4 g daily, doses at the higher end of the recommended range used in severe cases

Surgical prophylaxis

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 2 g for 1 dose, dose to be administered 30–90 minutes before procedure

Uncomplicated gonorrhoea | Pelvic inflammatory disease

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 500 mg for 1 dose

Syphilis

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 0.5–1 g once daily for 10–14 days, dose increased to 2 g once daily for neurosyphilis

Disseminated Lyme borreliosis (early [Stage II] and late [Stage III])

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 2 g once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration

Prevention of secondary case of meningococcal meningitis

- ▶ BY INTRAMUSCULAR INJECTION

▶ Adult: 250 mg for 1 dose

Prevention of secondary case of Haemophilus influenzae type b disease

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1 g daily for 2 days

Acute otitis media

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 1–2 g for 1 dose, dose can be given for 3 days if severely ill or previous therapy failed

- **UNLICENSED USE** [EvGr] Not licensed for prophylaxis of *Haemophilus influenzae* type b disease. [E] Not licensed for prophylaxis of meningococcal meningitis. [EvGr] Dose not licensed for treatment of pelvic inflammatory disease in adults over 18 years. [A]

● CAUTIONS

GENERAL CAUTIONS History of hypercalcaemia · history of kidney stones

SPECIFIC CAUTIONS

- ▶ With intravenous use Concomitant treatment with intravenous calcium (including total parenteral nutrition containing calcium) (in adults)

- **INTERACTIONS** → Appendix 1: cephalosporins

● SIDE-EFFECTS

- ▶ **Uncommon** Anaemia · coagulation disorder · granulocytopenia
- ▶ **Rare or very rare** Bronchospasm · glycosuria · haematuria · oedema
- ▶ **Frequency not known** Acute generalised exanthematous pustulosis (AGEP) · cholelithiasis · hypersensitivity · nephrolithiasis · oliguria · oral disorders · pancreatitis · seizure · vertigo

SIDE-EFFECTS, FURTHER INFORMATION Precipitates of calcium ceftriaxone can occur in the gall bladder and urine (particularly in very young, dehydrated or those who are immobilised)—consider discontinuation if symptomatic.

- **PREGNANCY** Manufacturer advises use only if benefit outweighs risk—limited data available but not known to be harmful in *animal* studies. [EvGr] Specialist sources indicate suitable for use in pregnancy. [D]

- **BREAST FEEDING** [EvGr] Specialist sources advise ceftriaxone is compatible with breastfeeding—present in milk in low concentration but limited effects to breast-fed infant. [D]

● RENAL IMPAIRMENT

Dose adjustments Manufacturer advises reduce dose and monitor efficacy in patients with severe renal impairment in combination with hepatic impairment—no information available.

- ▶ In adults Manufacturer advises reduce dose if eGFR less than 10 mL/minute/1.73 m² (max. 2 g daily).
- ▶ In children Manufacturer advises reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m² max. 50 mg/kg daily or max. 2 g daily).

- **MONITORING REQUIREMENTS** Manufacturer advises to monitor full blood count regularly during prolonged treatment.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intramuscular use or intravenous use Twice daily dosing may be considered for doses greater than 2 g daily.
- ▶ With intravenous use in children For *intravenous infusion* (preferred route), dilute reconstituted solution with Glucose 5% (or 10% in neonates) or Sodium Chloride 0.9%; give over at least 30 minutes (60 minutes in neonates—may displace bilirubin from serum albumin). Not to be given simultaneously with parenteral nutrition or infusion fluids containing calcium, even by different infusion lines; in children, may be infused sequentially with infusion fluids containing calcium if infusion lines at different sites are used, or if the infusion lines are replaced or thoroughly flushed between infusions with Sodium Chloride 0.9% to avoid precipitation—consult product literature. Displacement value may be significant, consult local guidelines. For *intravenous injection*, give over 5 minutes.
- ▶ With intramuscular use in children For *intramuscular injection*, may be mixed with 1% Lidocaine Hydrochloride Injection to reduce pain at intramuscular injection site. Intramuscular injection should only be considered when the intravenous route is not possible or less appropriate. If administered by intramuscular injection, the lower end of

the dose range should be used for the shortest time possible; volume depends on the age and size of the child, but doses over 1 g must be divided between more than one site. Displacement value may be significant, consult local guidelines. The maximum single intramuscular dose is 2 g, doses greater than 2 g must be given in divided doses or by intravenous administration (see above).

- ▶ With intravenous use in adults For *intravenous infusion* (preferred route) (Rocephin®; Ceftriaxone Injection, Genus), give intermittently or via drip tubing in Glucose 5% or 10% or Sodium Chloride 0.9%. Reconstitute 2-g vial with 40 mL infusion fluid. Give by intermittent infusion over at least 30 minutes. Not to be given simultaneously with total parenteral nutrition or infusion fluids containing calcium, even by different infusion lines. May be infused sequentially with infusion fluids containing calcium if infusion lines at different sites are used, or if the infusion lines are replaced or thoroughly flushed between infusions with Sodium Chloride 0.9% to avoid precipitation—consult product literature. For *intravenous injection*, give over 5 minutes.
- ▶ With intramuscular use in adults For *intramuscular injection*, doses over 1 g must be divided between more than one site. Displacement value may be significant, consult local guidelines. The maximum single intramuscular dose is 2 g, doses greater than 2 g must be given in divided doses or by intravenous administration.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

Powder for solution for injection

ELECTROLYTES: May contain Sodium

▶ Ceftriaxone (Non-proprietary)

Ceftriaxone (as Ceftriaxone sodium) 250 mg Ceftriaxone 250mg powder for solution for injection vials | 1 vial [PoM] £2.30 DT = £2.40
Ceftriaxone (as Ceftriaxone sodium) 1 gram Ceftriaxone 1g powder for solution for injection vials | 1 vial [PoM] £9.58 DT = £9.58 | 10 vial [PoM] £91.50–£95.80

Ceftriaxone (as Ceftriaxone sodium) 2 gram Ceftriaxone 2g powder for solution for injection vials | 1 vial [PoM] £18.30 DT = £19.18 | 10 vial [PoM] £191.80

Ceftriaxone 2g powder for solution for infusion vials | 1 vial [PoM] £19.18 DT = £19.18

▶ Rocephin (Roche Products Ltd)

Ceftriaxone (as Ceftriaxone sodium) 250 mg Rocephin 250mg powder for solution for injection vials | 1 vial [PoM] £2.40 DT = £2.40

Ceftriaxone (as Ceftriaxone sodium) 1 gram Rocephin 1g powder for solution for injection vials | 1 vial [PoM] £9.58 DT = £9.58

Ceftriaxone (as Ceftriaxone sodium) 2 gram Rocephin 2g powder for solution for injection vials | 1 vial [PoM] £19.18 DT = £19.18

ANTIBACTERIALS > CEPHALOSPORINS, THIRD-GENERATION WITH BETA- LACTAMASE INHIBITOR

F 515

Ceftazidime with avibactam

27-Jul-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, ceftazidime p. 519.

● INDICATIONS AND DOSE

Complicated intra-abdominal infection

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 2/0.5 g every 8 hours for 5–14 days

Complicated urinary tract infection, including pyelonephritis

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 2/0.5 g every 8 hours for 5–10 days continued →

Hospital-acquired pneumonia, including ventilator-associated pneumonia

► BY INTRAVENOUS INFUSION

► Adult: 2/0.5 g every 8 hours for 7–14 days

Infections due to Gram-negative bacteria with limited treatment options

► BY INTRAVENOUS INFUSION

► Adult: 2/0.5 g every 8 hours, duration of treatment guided by infection severity, pathogen, and response

DOSE EQUIVALENCE AND CONVERSION

► Dose expressed as x/y g ceftazidime/avibactam

● **INTERACTIONS** → Appendix 1: cephalosporins● **SIDE-EFFECTS**► **Common or very common** Thrombocytosis► **Uncommon** Acute kidney injury · lymphocytosis · paraesthesia · taste altered► **Frequency not known** Coma · drug reaction with eosinophilia and systemic symptoms (DRESS) · encephalopathy · jaundice · myoclonus · neurological effects · seizures · tremor● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.● **BREAST FEEDING** Manufacturer advises avoid—presence of avibactam in milk unknown.● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion* (*Zavicefta*®) give in Glucose 5%, or Sodium Chloride 0.9%, or Sodium Chloride 0.45% with Glucose 2.5% combination or Lactated Ringer's solution. Reconstitute each 2 g/0.5 g vial with 10 mL water for injections; dilute requisite dose in an appropriate infusion bag and give over 120 minutes.● **PATIENT AND CARER ADVICE****Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—risk of dizziness.● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

F 515

Dose adjustments 400 mg every 12 hours if eGFR 30–50 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute 600 mg with 20 mL water for injections, then dilute with 250 mL infusion fluid (in fluid restriction, may be diluted with 50–100 mL infusion fluid); give over 60 minutes.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium*, has advised (Dec 2012) that ceftaroline fosamil (Zinforo[®]) is accepted for restricted use within NHS Scotland when meticillin-resistant *S. aureus* is suspected in complicated skin and soft-tissue infection and vancomycin cannot be used.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- Zinforo (Pfizer Ltd)

Ceftaroline fosamil (as Ceftaroline fosamil acetic acid solvate monohydrate) 600 mg Zinforo 600mg powder for concentrate for solution for infusion vials | 10 vial [PoM] £375.00 (Hospital only)

F 515

Ceftobiprole

12-Dec-2016

• INDICATIONS AND DOSE

Hospital-acquired pneumonia (excluding ventilator-associated pneumonia) | Community-acquired pneumonia

- BY INTRAVENOUS INFUSION
- Adult: 500 mg every 8 hours

- **CAUTIONS** Pre-existing seizure disorder—increased risk of seizures · supra-normal creatinine clearance

CAUTIONS, FURTHER INFORMATION

- Supra-normal creatinine clearance Manufacturer advises to measure baseline renal function and increase duration of infusion if creatinine clearance greater than 150 mL/minute.

- **INTERACTIONS** → Appendix 1: cephalosporins

• SIDE-EFFECTS

- **Common or very common** Drowsiness · dyspepsia · electrolyte imbalance · hypersensitivity · pruritic rash · taste altered
- **Uncommon** Anaemia · anxiety · asthma · dyspnoea · laryngeal pain · muscle spasms · peripheral oedema · renal failure · sleep disorders · thrombocytosis
- **Frequency not known** Seizure

- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **RENAL IMPAIRMENT** Manufacturer advises use with caution in severe impairment—limited information available.

Dose adjustments Reduce dose to 500 mg every 12 hours in moderate impairment and 250 mg every 12 hours in severe impairment.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion* (Zevtera[®]), give intermittently in Glucose 5%, or Sodium Chloride 0.9%, or Lactated Ringer's solution; reconstitute each 500 mg with 10 mL Water for injections or Glucose 5%; dilute in 250 mL infusion fluid and give over 2 hours (increased to 4 hours if creatinine clearance greater than 150 mL/minute). Do not mix with calcium-containing solutions (except Lactated Ringer's solution) in the same intravenous line—precipitation may occur.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for storage after reconstitution and dilution.

• PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

- Zevtera (Basilea Pharmaceutica International Ltd) ▼

Ceftobiprole (as Ceftobiprole medocartil sodium) 500 mg Zevtera 500mg powder for concentrate for solution for infusion vials | 10 vial [PoM] £396.30 (Hospital only)

ANTIBACTERIALS > GLYCOPEPTIDE

ANTIBACTERIALS

Dalbavancin

18-Jul-2017

- **DRUG ACTION** Dalbavancin is a glycopeptide antibacterial; it has bactericidal activity against Gram-positive bacteria including various staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides and increasing reports of glycopeptide-resistant enterococci.

• INDICATIONS AND DOSE

Acute bacterial skin and skin structure infections

- BY INTRAVENOUS INFUSION

- Adult: 1500 mg for 1 dose, alternatively 1000 mg, then 500 mg after 1 week

• SIDE-EFFECTS

- **Common or very common** Diarrhoea · headache · nausea
- **Uncommon** Anaemia · antibiotic associated colitis · appetite decreased · constipation · cough · dizziness · eosinophilia · flushing · gastrointestinal discomfort · increased risk of infection · infusion related reaction · insomnia · leucopenia · neutropenia · skin reactions · taste altered · thrombocytosis · vomiting · vulvovaginal pruritus
- **Rare or very rare** Bronchospasm
- **Frequency not known** Ototoxicity

- **ALLERGY AND CROSS-SENSITIVITY** Manufacturer advises use with caution in patients with other glycopeptide sensitivity.

• PREGNANCY

Dose adjustments Manufacturer advises avoid unless essential—toxicity in *animal* studies.

• BREAST FEEDING

Dose adjustments Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate-to-severe impairment—no information available.

• RENAL IMPAIRMENT

Dose adjustments Manufacturer advises reduce dose to 1000 mg as a single infusion or reduce dose to 750 mg followed one week later by 375 mg if creatinine clearance <30 mL/minute.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion* (Xydalba[®]), reconstitute each 500 mg vial to produce a 20 mg/mL solution with 25 mL water for injections. Dilute reconstituted solution to a concentration of 1–5 mg/mL with Glucose 5%; give intermittently over 30 minutes (avoid rapid infusion—risk of 'red man' syndrome).

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2017) that dalbavancin (*Xydalba*®) is accepted for restricted use within NHS Scotland for the treatment of acute bacterial skin and skin structure infections (ABSSSI), only if:

- used as second-line treatment, or
- methicillin-resistant *Staphylococcus aureus* infection is suspected, or
- under local microbiologist or infectious diseases specialist advice; **and**
- the patient is initially hospitalised due to ABSSSI requiring intravenous antibiotics but is eligible for early discharge as soon as their medical condition does not require further inpatient treatment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► *Xydalba* (Cardiome UK Ltd) ▼

Dalbavancin (as Dalbavancin hydrochloride) 500 mg *Xydalba* 500mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £558.70 (Hospital only)

Teicoplanin

27-Nov-2017

- **DRUG ACTION** The glycopeptide antibiotic teicoplanin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides and increasing reports of glycopeptide-resistant enterococci. Teicoplanin is similar to vancomycin, but has a significantly longer duration of action, allowing once daily administration after the loading dose.

INDICATIONS AND DOSE

Clostridium difficile infection

- BY MOUTH
- Adult: 100–200 mg twice daily for 7–14 days

Serious infections caused by Gram-positive bacteria (e.g. complicated skin and soft-tissue infections, pneumonia, complicated urinary tract infections)

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION
- Adult: Initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily

Streptococcal or enterococcal endocarditis (in combination with another antibacterial) | Bone and joint infections

- INITIALLY BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: 12 mg/kg every 12 hours for 3–5 doses, then (by intravenous injection or by intravenous infusion or by intramuscular injection) 12 mg/kg once daily

Surgical prophylaxis

- BY INTRAVENOUS INJECTION
- Adult: 400 mg, to be administered up to 30 minutes before the procedure

Surgical prophylaxis in open fractures

- BY INTRAVENOUS INFUSION
- Adult: 800 mg, to be administered up to 30 minutes before skeletal stabilisation and definitive soft-tissue closure

Peritonitis associated with peritoneal dialysis (added to dialysis fluid)

- BY INTRAPERITONEAL INFUSION
- Adult: (consult local protocol)

PHARMACOKINETICS

- Teicoplanin should **not** be given by mouth for systemic infections because it is not absorbed significantly.
- **UNLICENSED USE** Not licensed for surgical prophylaxis.
- **INTERACTIONS** → Appendix 1: teicoplanin
- **SIDE-EFFECTS**
 - **Common or very common** Fever · pain · skin reactions
 - **Uncommon** Bronchospasm · diarrhoea · dizziness · eosinophilia · headache · hearing impairment · hypersensitivity · leucopenia · nausea · thrombocytopenia · vomiting
 - **Rare or very rare** Abscess · red man syndrome
 - **Frequency not known** Agranulocytosis · angioedema · chills · neutropenia · overgrowth of nonsusceptible organisms · renal impairment · seizure · severe cutaneous adverse reactions (SCARs)
- SIDE-EFFECTS, FURTHER INFORMATION** Teicoplanin is associated with a lower incidence of nephrotoxicity than vancomycin.
- **ALLERGY AND CROSS-SENSITIVITY** Caution if history of vancomycin sensitivity.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** No information available.
- **RENAL IMPAIRMENT**

- Dose adjustments** Use normal dose regimen on days 1–4, then use normal maintenance dose every 48 hours if eGFR 30–80 mL/minute/1.73 m² and use normal maintenance dose every 72 hours if eGFR less than 30 mL/minute/1.73 m².
- Monitoring** Monitor renal and auditory function during prolonged treatment in renal impairment.
- **MONITORING REQUIREMENTS**

- With intramuscular use or intravenous use Manufacturer advises monitor serum-teicoplanin trough concentration at steady state after completion of loading dose and during maintenance treatment—consult product literature.
- Blood counts and liver and kidney function tests required.
- Manufacturer advises monitoring for adverse reactions when doses of 12 mg/kg twice daily are administered.
- **DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For intravenous infusion (*Targocid*®), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute initially with water for injections provided; infuse over 30 minutes. Continuous infusion not usually recommended.
- With oral use Injection can be used to prepare solution for oral administration.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Powder and solvent for solution for injection

ELECTROLYTES: May contain Sodium

► *Targocid* (Sanofi) ▼

Teicoplanin 200 mg *Targocid* 200mg powder and solvent for solution for injection vials | 1 vial [PoM] £3.93

Teicoplanin 400 mg *Targocid* 400mg powder and solvent for solution for injection vials | 1 vial [PoM] £7.32

Telavancin

- **DRUG ACTION** Telavancin is a glycopeptide antibacterial; it has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci.

● INDICATIONS AND DOSE

Hospital-acquired pneumonia, known or suspected to be caused by meticillin-resistant *Staphylococcus aureus* when other antibacterials cannot be used

► BY INTRAVENOUS INFUSION

► Adult: 10 mg/kg once daily for 7–21 days

- **CAUTIONS** Conditions that predispose to renal impairment
 - predisposition to QT interval prolongation (including electrolyte disturbances, congenital long QT syndrome, uncompensated heart failure, severe left ventricular hypertrophy)

- **INTERACTIONS** → Appendix 1: telavancin

● SIDE-EFFECTS

- **Common or very common** Asthenia • constipation • diarrhoea • dizziness • headaches • increased risk of infection • insomnia • nausea • renal impairment • skin reactions • taste altered • urine abnormalities • vomiting
- **Uncommon** Altered smell sensation • anaemia • angina pectoris • anxiety • appetite decreased • arrhythmias • arthralgia • confusion • congestive heart failure • depression • drowsiness • dry mouth • dyspnoea • electrolyte imbalance • eye irritation • flatulence • flushing • gastrointestinal discomfort • haematuria • hearing impairment • hepatitis • hiccups • hyperglycaemia • hyperhidrosis • hypertension • hypoglycaemia • hypotension • laryngeal pain • leucopenia • muscle complaints • nasal congestion • oedema • oral hypoesthesia • pain • palpitations • paraesthesia • QT interval prolongation • red man syndrome • thrombocytopenia • thrombocytosis • tremor • urinary disorders • vision blurred

- **ALLERGY AND CROSS-SENSITIVITY** Use with caution in patients with vancomycin or teicoplanin sensitivity.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

- **PREGNANCY** Avoid (teratogenic in *animal* studies).

- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

- **RENAL IMPAIRMENT** Avoid in acute renal failure—risk of mortality increased. In chronic renal failure, avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments In chronic renal failure, use 7.5 mg/kg once daily if eGFR 30–50 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor renal function daily for at least the first 3–5 days, then every 2–3 days thereafter.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Vibativ*®). Avoid rapid infusion (can cause 'red man' syndrome). Give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute each 750 mg with 45 mL glucose 5%, sodium chloride 0.9%, or water for injections to produce a 15 mg/mL solution; for doses of 150–800 mg, dilute requisite dose in 100 to 250 mL infusion fluid; for doses outside this range, dilute to a final concentration of 0.6–8 mg/mL; give over at least 60 minutes.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► **Vibativ** (Clinigen Healthcare Ltd) ▼

Telavancin (as Telavancin hydrochloride) 750 mg Vibativ 750mg powder for solution for infusion vials | 1 vial [PoM] £645.00 (Hospital only)

Vancomycin

11-May-2018

- **DRUG ACTION** The glycopeptide antibiotic vancomycin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci. Penetration into cerebrospinal fluid is poor.

● INDICATIONS AND DOSE

Clostridium difficile infection [first episode]

► BY MOUTH

- Adult: 125 mg every 6 hours for 10 days; increased if necessary to 500 mg every 6 hours for 10 days, increased dose if severe or complicated infection

Clostridium difficile infection [multiple recurrences]

► BY MOUTH

- Adult: 125 mg every 6 hours for 10 days, followed by either tapering the dose (gradually reducing until 125 mg daily) or a pulse regimen (125–500 mg every 2–3 days for at least 3 weeks)

Complicated skin and soft tissue infections | Bone infections | Joint infections | Community-acquired pneumonia | Hospital-acquired pneumonia [including ventilator-associated pneumonia] | Infective endocarditis | Acute bacterial meningitis | Bacteraemia [occurring in association with or suspected to be associated with the licensed indications]

► BY INTRAVENOUS INFUSION

- Adult: 15–20 mg/kg every 8–12 hours (max. per dose 2 g) adjusted according to plasma-concentration monitoring, duration should be tailored to type and severity of infection and the individual clinical response—consult product literature for further information, in seriously ill patients, a loading dose of 25–30 mg/kg (usual max. 2 g) can be used to facilitate rapid attainment of the target trough serum-vancomycin concentration

Perioperative prophylaxis of bacterial endocarditis [in patients at high risk of developing bacterial endocarditis when undergoing major surgical procedures]

► BY INTRAVENOUS INFUSION

- Adult: 15 mg/kg, to be given prior to induction of anaesthesia, a second dose may be required depending on duration of surgery

Surgical prophylaxis (when high risk of MRSA)

► BY INTRAVENOUS INFUSION

- Adult: 1 g for 1 dose

Peritonitis associated with peritoneal dialysis

► BY INTRAPERITONEAL ADMINISTRATION

- Adult: (consult local protocol)

PHARMACOKINETICS

- Vancomycin should **not** be given by mouth for systemic infections because it is not absorbed significantly.

- **UNLICENSED USE** Vancomycin doses in BNF publications may differ from those in product literature. Use of vancomycin (added to dialysis fluid) for the treatment of peritonitis associated with peritoneal dialysis is an unlicensed route.

● CONTRA-INDICATIONS

- ▶ With intravenous use Previous hearing loss

● CAUTIONS

- ▶ With oral use Systemic absorption may be enhanced in patients with inflammatory disorders of the intestinal mucosa or with *Clostridium difficile*-induced pseudomembranous colitis (increased risk of adverse reactions)

- **INTERACTIONS** → Appendix 1: vancomycin

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS Agranulocytosis · dizziness · drug fever · eosinophilia · hypersensitivity · nausea · nephritis tubulointerstitial · neutropenia (more common after 1 week or cumulative dose of 25g) · renal failure · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · tinnitus (discontinue) · vasculitis · vertigo

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Back pain · bradycardia · cardiac arrest (on rapid intravenous injection) · cardiogenic shock (on rapid intravenous injection) · chest pain · dyspnoea · hearing loss · hypotension · muscle complaints · pseudomembranous enterocolitis · red man syndrome · wheezing

SIDE-EFFECTS, FURTHER INFORMATION Vancomycin is associated with a higher incidence of nephrotoxicity than teicoplanin.

- **ALLERGY AND CROSS-SENSITIVITY** Caution if teicoplanin sensitivity.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

Monitoring Plasma-vancomycin concentration monitoring essential to reduce risk of fetal toxicity.

- **BREAST FEEDING** Present in milk—significant absorption following oral administration unlikely.

- **RENAL IMPAIRMENT** Manufacturer advises serial monitoring of renal function.

- ▶ With intravenous use Manufacturer advises use with caution—increased risk of toxic effects with prolonged high blood concentration.

Dose adjustments ▶ With oral use Manufacturer advises dose adjustment is unlikely to be required unless substantial oral absorption occurs in inflammatory disorders of the intestinal mucosa or with *Clostridium difficile*-induced pseudomembranous colitis, see *Monitoring*.

- ▶ With intravenous use Manufacturer advises initial dose must not be reduced—consult product literature.

● MONITORING REQUIREMENTS

- ▶ With intravenous use Manufacturer advises initial doses should be based on body-weight; subsequent dose adjustments should be based on serum-vancomycin concentrations to achieve targeted therapeutic concentrations. All patients require serum-vancomycin measurement (on the second day of treatment, immediately before the next dose if renal function normal, earlier if renal impairment—consult product literature). Frequency of monitoring depends on the clinical situation and response to treatment; regular monitoring indicated in high-dose therapy and longer-term use, particularly in patients with impaired renal function, impaired hearing, or concurrent use of nephrotoxic or ototoxic drugs. Manufacturer advises pre-dose ('trough') concentration should normally be 10–20 mg/litre depending on the site of infection and the susceptibility of the pathogen; trough concentration of 15–20 mg/litre is usually recommended to cover susceptible pathogens with MIC greater than or equal to 1 mg/litre—consult product literature.
- ▶ Manufacturer advises periodic testing of auditory function.

- ▶ Manufacturer advises monitor blood counts, urinalysis, hepatic and renal function periodically in all patients; monitor leucocyte count regularly in patients receiving long-term vancomycin or if given concurrently with other drugs that may cause neutropenia or agranulocytosis.
- ▶ Manufacturer advises monitor vestibular and auditory function during and after treatment in the elderly; avoid concurrent or sequential use of other ototoxic drugs.
- ▶ With oral use Manufacturer advises monitoring serum-vancomycin concentration in inflammatory intestinal disorders.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use Avoid rapid infusion (risk of anaphylactoid reactions) and rotate infusion sites.
For *intravenous infusion*, give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute each 500 mg with 10 mL water for injections and dilute with infusion fluid to a concentration of up to 5 mg/mL (10 mg/mL in fluid restriction but increased risk of infusion-related effects); give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not feasible.
- ▶ With oral use Injection can be used to prepare solution for oral administration—consult product literature.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection, infusion

ANTIBACTERIALS > LINCOSAMIDES

Clindamycin

- **DRUG ACTION** Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially *Bacteroides fragilis*. It is well concentrated in bone and excreted in bile and urine.

● INDICATIONS AND DOSE

Staphylococcal bone and joint infections such as osteomyelitis | Peritonitis | Intra-abdominal sepsis | Meticillin-resistant *Staphylococcus aureus* (MRSA) in bronchiectasis, bone and joint infections, and skin and soft-tissue infections | Erysipelas or cellulitis in penicillin-allergic patients (alternative to macrolides)

► BY MOUTH

- Child: 3–6 mg/kg 4 times a day (max. per dose 450 mg)
- Adult: 150–300 mg every 6 hours; increased if necessary up to 450 mg every 6 hours if required, increased dose used in severe infection

► BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION

- Adult: 0.6–2.7 g daily in 2–4 divided doses; increased if necessary up to 4.8 g daily, increased dose used in life-threatening infection, single doses above 600 mg to be administered by intravenous infusion only, single doses by intravenous infusion not to exceed 1.2 g

Treatment of mild to moderate pneumocystis pneumonia (in combination with primaquine)

► BY MOUTH

- Adult: 600 mg every 8 hours

Treatment of falciparum malaria (to be given with or following quinine)

► BY MOUTH

- Child: 7–13 mg/kg every 8 hours (max. per dose 450 mg) for 7 days
- Adult: 450 mg every 8 hours for 7 days

- **UNLICENSED USE** Not licensed for treatment of mild to moderate pneumocystis infection. Not licensed for treatment of falciparum malaria.

- **CONTRA-INDICATIONS** Diarrhoeal states

- **CAUTIONS** Avoid in Acute porphyrias p. 1025 • middle-aged and elderly women, especially after an operation (antibiotic-associated colitis more common)

- **INTERACTIONS** → Appendix 1: clindamycin

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Abdominal pain • antibiotic associated colitis • diarrhoea (discontinue) • skin reactions
- **Uncommon** Nausea • vomiting
- **Frequency not known** Agranulocytosis • angioedema • eosinophilia • jaundice • leucopenia • neutropenia • severe cutaneous adverse reactions (SCARs) • taste altered • thrombocytopenia • vulvovaginal infection

SPECIFIC SIDE-EFFECTS

- **Frequency not known**
- With oral use Gastrointestinal disorders
- With parenteral use Cardiac arrest • hypotension

SIDE-EFFECTS, FURTHER INFORMATION Clindamycin has been associated with antibiotic-associated colitis, which may be fatal. Although antibiotic-associated colitis can occur with most antibacterials, it occurs more frequently with clindamycin. If *C. difficile* infection is suspected or confirmed, discontinue the antibiotic if appropriate. Seek specialist advice if the antibiotic cannot be stopped and the diarrhoea is severe.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Amount probably too small to be harmful but bloody diarrhoea reported in 1 infant.

- **MONITORING REQUIREMENTS** Monitor liver and renal function if treatment exceeds 10 days.
- In children Monitor liver and renal function in neonates and infants.

- **DIRECTIONS FOR ADMINISTRATION** Avoid rapid intravenous administration.

For intravenous infusion (Dalacin® C Phosphate), give continuously or intermittently in Glucose 5% or Sodium

Chloride 0.9%; dilute to not more than 18 mg/mL and give over 10–60 minutes at a rate not exceeding 30 mg/minute (1.2 g over at least 60 minutes; higher doses by continuous infusion).

- **PATIENT AND CARER ADVICE** Capsules should be swallowed with a glass of water. Patients and their carers should be advised to discontinue immediately and contact doctor if diarrhoea develops.

● PROFESSION SPECIFIC INFORMATION

ANTIBACTERIALS > MACROLIDES

Macrolides

Overview

The macrolides have an antibacterial spectrum that is similar but not identical to that of penicillin; they are thus an alternative in penicillin-allergic patients. They are active against many penicillin-resistant staphylococci, but some are now also resistant to the macrolides.

Indications for the macrolides include campylobacter enteritis, respiratory infections (including pneumonia, whooping cough, Legionella, chlamydia, and mycoplasma infection), and skin infections.

Erythromycin p. 530 is also used in the treatment of early syphilis, uncomplicated genital chlamydial infection, and non-gonococcal urethritis. Erythromycin has poor activity against *Haemophilus influenzae*. Erythromycin causes nausea, vomiting, and diarrhoea in some patients; in mild to moderate infections this can be avoided by giving a lower dose, but if a more serious infection, such as Legionella pneumonia, is suspected higher doses are needed.

Azithromycin p. 528 is a macrolide with slightly less activity than erythromycin against Gram-positive bacteria, but enhanced activity against some Gram-negative organisms including *H. influenzae*. Plasma concentrations are very low, but tissue concentrations are much higher. It has a long tissue half-life and once daily dosage is recommended. Azithromycin is also used in the treatment of

uncomplicated genital chlamydial infection, non-gonococcal urethritis, uncomplicated gonorrhoea, typhoid [unlicensed indication], and trachoma [unlicensed indication].

Clarithromycin p. 529 is an erythromycin derivative with slightly greater activity than the parent compound. Tissue concentrations are higher than with erythromycin. It is given twice daily. Clarithromycin is also used in regimens for *Helicobacter pylori* eradication.

Erythromycin, azithromycin, and clarithromycin have a role in the treatment of Lyme disease p. 567.

Spiramycin is also a macrolide which is used for the treatment of toxoplasmosis.

Macrolides

● **CAUTIONS** Electrolyte disturbances (predisposition to QT interval prolongation) · may aggravate myasthenia gravis · predisposition to QT interval prolongation

● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · arthralgia · diarrhoea · dizziness · eye discomfort · gastrointestinal discomfort · gastrointestinal disorders · headache · hearing impairment · nausea · pancreatitis · sensation abnormal · skin reactions · sleep disorders · taste altered · vasodilation · vision disorders · vomiting
- ▶ **Uncommon** Angioedema · anxiety · arrhythmias · burping · candida infection · cardiac arrest · chest pain · constipation · drowsiness · dry mouth · eosinophilia · eye allergy · haemorrhage · hepatic disorders · leucopenia · loss of consciousness · movement disorders · muscle complaints · neutropenia · oedema · oral disorders · palpitations · photosensitivity reaction · pulmonary embolism · QT interval prolongation · severe cutaneous adverse reactions (SCARs) · thrombocytosis · tremor · vertigo
- ▶ **Rare or very rare** Antibiotic associated colitis · hearing loss (can occur after large doses) · myasthenia gravis · nephritis tubulointerstitial
- ▶ **Frequency not known** Aggression · agranulocytosis · atrioventricular block · cerebral impairment · depersonalisation · depression · haemolytic anaemia · hallucination · hypotension · mania · myopathy · psychotic disorder · renal impairment · seizure · smell altered · syncope · thrombocytopenia · urine discolouration

Azithromycin

● INDICATIONS AND DOSE

Prevention of secondary case of invasive group A streptococcal infection in patients who are allergic to penicillin

- ▶ **BY MOUTH**
- ▶ Child 6 months–11 years: 12 mg/kg once daily (max. per dose 500 mg) for 5 days
- ▶ Child 12–17 years: 500 mg once daily for 5 days
- ▶ Adult: 500 mg once daily for 5 days

Respiratory-tract infections, otitis media, skin and soft-tissue infections

- ▶ **BY MOUTH**
- ▶ Child 6 months–17 years: 10 mg/kg once daily (max. per dose 500 mg) for 3 days
- ▶ Child 6 months–17 years (body-weight 15–25 kg): 200 mg once daily for 3 days
- ▶ Child 6 months–17 years (body-weight 26–35 kg): 300 mg once daily for 3 days
- ▶ Child 6 months–17 years (body-weight 36–45 kg): 400 mg once daily for 3 days
- ▶ Child 6 months–17 years (body-weight 46 kg and above): 500 mg once daily for 3 days

- ▶ Adult: 500 mg once daily for 3 days, alternatively initially 500 mg once daily for 1 day, then 250 mg once daily for 4 days

Uncomplicated genital chlamydial infections | Non-gonococcal urethritis

- ▶ **BY MOUTH**
- ▶ Child 12–17 years: 1 g for 1 dose
- ▶ Adult: 1 g for 1 dose

Uncomplicated gonorrhoea

- ▶ **BY MOUTH**
- ▶ Adult: 1 g for 1 dose

Lyme disease (under expert supervision)

- ▶ **BY MOUTH**
- ▶ Adult: 500 mg once daily for 7–10 days

Mild to moderate typhoid due to multiple-antibacterial resistant organisms

- ▶ **BY MOUTH**
- ▶ Adult: 500 mg once daily for 7 days

Community-acquired pneumonia, low to moderate severity

- ▶ **BY MOUTH**
- ▶ Adult: 500 mg once daily for 3 days, alternatively initially 500 mg once daily for 1 day, then 250 mg once daily for 4 days

Community-acquired pneumonia, high severity

- ▶ **INITIALLY BY INTRAVENOUS INFUSION**
- ▶ Adult: Initially 500 mg once daily for at least 2 days, then (by mouth) 500 mg once daily for a total duration of 7–10 days

Antibacterial prophylaxis for insertion of intra-uterine device

- ▶ **BY MOUTH**
- ▶ Adult: 1 g for 1 dose

● UNLICENSED USE

- ▶ In children Not licensed for prophylaxis of group A streptococcal infection.
- ▶ In adults Oral azithromycin not licensed for trachoma which results from chronic infection with *Chlamydia trachomatis*. Not licensed for uncomplicated gonorrhoea, mild or moderate typhoid due to multiple-antibacterial-resistant organisms, Lyme disease, or prophylaxis of group A streptococcal infection. Not licensed for community-acquired pneumonia (high severity) when oral treatment continues for more than 3 days.

● **INTERACTIONS** → Appendix 1: macrolides

● **PREGNANCY** Manufacturers advise use only if adequate alternatives not available.

● **BREAST FEEDING** Present in milk; use only if no suitable alternatives.

● **HEPATIC IMPAIRMENT** Manufacturers advise avoid in severe liver disease—no information available.

● RENAL IMPAIRMENT

- ▶ **Dose adjustments** ▶ In adults Use with caution if eGFR less than 10 mL/minute/1.73 m².
- ▶ In children Use with caution if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

● **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Zedbac[®]), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute 500 mg with 4.8 mL water for injections to produce a 100 mg/mL solution, then dilute 5 mL of solution with infusion fluid to a final concentration of 1 or 2 mg/mL; give the 1 mg/mL solution over 3 hours or give the 2 mg/mL solution over 1 hour.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry or banana.

● PATIENT AND CARER ADVICE

Clarithromycin

● INDICATIONS AND DOSE

Respiratory-tract infections | Mild to moderate skin and soft-tissue infections | Otitis media

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily
- Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily
- Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily
- Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily
- Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily

- Child 12–17 years: 250 mg twice daily usually for 7–14 days, increased to 500 mg twice daily, if required in severe infections (e.g. pneumonia)
- Adult: 250 mg twice daily usually for 7–14 days, increased to 500 mg twice daily, if required in severe infections (e.g. pneumonia)
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- Child 12–17 years: 500 mg once daily usually for 7–14 days, increased to 1 g once daily, if required in severe infections (e.g. pneumonia)
- Adult: 500 mg once daily usually for 7–14 days, increased to 1 g once daily, if required in severe infections (e.g. pneumonia)
- **BY INTRAVENOUS INFUSION**
- Adult: 500 mg every 12 hours maximum duration 5 days, switch to oral route when appropriate, to be administered into a large proximal vein

Lyme disease

► BY MOUTH

- Child 12–17 years: 500 mg twice daily for 14–21 days
- Adult: 500 mg twice daily for 14–21 days

Prevention of pertussis

► BY MOUTH

- Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 7 days
- Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 7 days
- Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 7 days
- Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 7 days
- Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 7 days
- Child 12–17 years: 500 mg twice daily for 7 days
- Adult: 500 mg twice daily for 7 days

Helicobacter pylori eradication in combination with a proton pump inhibitor and amoxicillin

► BY MOUTH

- Adult: 500 mg twice daily

Helicobacter pylori eradication in combination with a proton pump inhibitor and metronidazole

► BY MOUTH

- Adult: 250 mg twice daily

Acute sinusitis

► BY MOUTH

- Adult: 500 mg twice daily for 5 days

- **UNLICENSED USE** [\[EvGr\]](#) Duration of treatment and child age ranges for acute sinusitis differ from product literature and adhere to national guidelines. [⚡](#) See Sinusitis (acute) p. 1168 for further information. Tablets not licensed for use in children under 12 years; oral suspension not licensed for use in infants under 6 months.

- **INTERACTIONS** → Appendix 1: macrolides
- **PREGNANCY** Manufacturer advises avoid, particularly in the first trimester, unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment if renal impairment also present.
- **RENAL IMPAIRMENT** Avoid if severe hepatic impairment also present.
- With oral use in adults Avoid *Klaricid XL*® or clarithromycin m/r preparations if eGFR less than 30 mL/minute/1.73 m².
- With oral use in children Avoid *Klaricid XL*® or clarithromycin m/r preparations if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- Dose adjustments** ► In adults Use half normal dose if eGFR less than 30 mL/minute/1.73 m², max. duration 14 days.

- In children Use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m², max. duration 14 days.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Klaricid*® I.V.), give intermittently in Glucose 5% or Sodium Chloride 0.9%; dissolve initially in water for injections (500 mg in 10 mL) then dilute to a concentration of 2 mg/mL; give over 60 minutes.

Erythromycin

- **INDICATIONS AND DOSE**

Susceptible infections in patients with penicillin hypersensitivity (e.g. respiratory-tract infections (including Legionella infection), skin and oral infections, and campylobacter enteritis)

- **BY MOUTH**

- Child 1 month-1 year: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 250 mg 4 times a day, dose increase may be used in severe infections

- Child 2-7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500 mg 4 times a day, dose increase may be used in severe infections

- Child 8-17 years: 250-500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500-1000 mg 4 times a day, dose increase may be used in severe infections

- Adult: 250-500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500-1000 mg 4 times a day, dose increase may be used in severe infections

- **BY INTRAVENOUS INFUSION**

- Child: 12.5 mg/kg every 6 hours (max. per dose 1 g)

- Adult: 6.25 mg/kg every 6 hours, for mild infections when oral treatment not possible. increased to 12.5 mg/kg every 6 hours, dose increase may be used in severe infections

Lyme disease (under expert supervision)

- **BY MOUTH**

- Adult: 500 mg 4 times a day for 14-21 days

Early syphilis

- **BY MOUTH**

- Adult: 500 mg 4 times a day for 14 days

Uncomplicated genital chlamydia | Non-gonococcal urethritis

- **BY MOUTH**

- Adult: 500 mg twice daily for 14 days

Chronic prostatitis

- **BY MOUTH**

- Adult: 250-500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 4 g daily in divided doses, dose increase may be used in severe infections

- **BY INTRAVENOUS INFUSION**

- Adult: 6.25 mg/kg every 6 hours, for mild infections when oral treatment is not possible, increased to 12.5 mg/kg every 6 hours, dose increase may be used in severe infections

Prevention and treatment of pertussis

- **BY MOUTH**

- Child 1 month-1 year: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 250 mg 4 times a day, dose increase may be used in severe infections

- Child 2-7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500 mg 4 times a day, dose increase may be used in severe infections

- Child 8-17 years: 250-500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500-1000 mg 4 times a day, dose increase may be used in severe infections

- Adult: (consult local protocol)

Prevention of secondary case of diphtheria in non-immune patient

► BY MOUTH

- Child 1 month–1 year: 125 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment
- Child 2–7 years: 250 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment
- Child 8–17 years: 500 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment
- Adult: 500 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment

Prevention of secondary case of invasive group A streptococcal infection in penicillin allergic patients

► BY MOUTH

- Child 1 month–1 year: 125 mg every 6 hours for 10 days
- Child 2–7 years: 250 mg every 6 hours for 10 days
- Child 8–17 years: 250–500 mg every 6 hours for 10 days
- Adult: 250–500 mg every 6 hours for 10 days

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease (if penicillin-allergic)

► BY MOUTH

- Child 1 month–1 year: 125 mg twice daily, antibiotic prophylaxis is not fully reliable
- Child 2–7 years: 250 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection
- Child 8–17 years: 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection
- Adult: 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection

Prevention of recurrence of rheumatic fever

► BY MOUTH

- Child 1 month–1 year: 125 mg twice daily
- Child 2–17 years: 250 mg twice daily

Rosacea

► BY MOUTH

- Adult: 500 mg twice daily courses usually last 6–12 weeks and are repeated intermittently

Acne

► BY MOUTH

- Adult: 500 mg twice daily

- **CAUTIONS** Avoid in Acute porphyrias p. 1025
- **INTERACTIONS** → Appendix 1: macrolides
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Only small amounts in milk—not known to be harmful.
- **HEPATIC IMPAIRMENT** May cause idiosyncratic hepatotoxicity.
- **RENAL IMPAIRMENT**
Dose adjustments ► In adults Max. 1.5 g daily in severe renal impairment (ototoxicity).
 ► In children Reduce dose in severe renal impairment (ototoxicity).
- **DIRECTIONS FOR ADMINISTRATION**
 ► With intravenous use in children Dilute reconstituted solution further in glucose 5% (neutralised with Sodium bicarbonate) or sodium chloride 0.9% to a concentration of

1–5 mg/mL; give over 20–60 minutes. Concentration of up to 10 mg/mL may be used in fluid-restriction if administered via a central venous catheter.

- With intravenous use in adults For *intravenous infusion* (as lactobionate), give intermittently in Glucose 5% (neutralised with sodium bicarbonate) or Sodium chloride 0.9%; dissolve initially in water for injections (1 g in 20 mL) then dilute to a concentration of 1–5 mg/mL; give over 20–60 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Erythromycin for bacterial infections www.medicinesforchildren.org.uk/erythromycin-for-bacterial-infections

1 gram Erythromycin 1g powder for solution for infusion vials | 1 vial [PoM] £18.45-£22.92

ANTIBACTERIALS > MONOBACTAMS

Aztreonam

- **DRUG ACTION** Aztreonam is a monocyclic beta-lactam ('monobactam') antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including *Pseudomonas aeruginosa*, *Neisseria meningitidis*, and *Haemophilus influenzae*; it should not be used alone for 'blind' treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against *Neisseria gonorrhoeae* (but not against concurrent chlamydial infection).

● INDICATIONS AND DOSE

Gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, and *Neisseria meningitidis*

- BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Adult: 1 g every 8 hours, alternatively 2 g every 12 hours, single doses over 1 g intravenous route only

Severe gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, *Neisseria meningitidis*, and lung infections in cystic fibrosis

- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Adult: 2 g every 6–8 hours

Gonorrhoea | Cystitis

- BY INTRAMUSCULAR INJECTION
- Adult: 1 g for 1 single dose

Urinary-tract infections

- BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Adult: 0.5–1 g every 8–12 hours

Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis

- BY INHALATION OF NEBULISED SOLUTION
- Adult: 75 mg 3 times a day for 28 days, doses to be administered at least 4 hours apart, subsequent courses repeated after 28-day interval without aztreonam nebuliser solution

● CAUTIONS

- When used by inhalation Haemoptysis—risk of further haemorrhage

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Dyspnoea · respiratory disorders

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- When used by inhalation Cough · haemoptysis · joint disorders · laryngeal pain · nasal complaints · rash
- **Rare or very rare**
- With parenteral use Anaemia · asthenia · breast tenderness · chest pain · confusion · diplopia · dizziness · eosinophilia · haemorrhage · headache · hepatic disorders · hypotension · insomnia · leucocytosis · myalgia · nasal congestion · neutropenia · oral disorders · pancytopenia · paraesthesia · pseudomembranous enterocolitis · seizure · thrombocytopenia · thrombocytosis · tinnitus · vertigo · vulvovaginal candidiasis

► Frequency not known

- With parenteral use Abdominal pain · angioedema · diarrhoea · nausea · skin reactions · taste altered · toxic epidermal necrolysis · vomiting

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in aztreonam hypersensitivity.

Use with caution in patients with hypersensitivity to other beta-lactam antibiotics (although aztreonam may be less likely than other beta-lactams to cause hypersensitivity in penicillin-sensitive patients).

● PREGNANCY

- With systemic use No information available; manufacturer of injection advises avoid.

- When used by inhalation No information available; manufacturer of powder for nebuliser solution advises avoid unless essential.

- **BREAST FEEDING** Amount in milk probably too small to be harmful.

● HEPATIC IMPAIRMENT

- With systemic use Use injection with caution.
- Monitoring** ► With systemic use Monitor liver function.

● RENAL IMPAIRMENT

Dose adjustments ► With systemic use If eGFR 10–30 mL/minute/1.73 m², usual initial dose of injection, then half normal dose. If eGFR less than 10 mL/minute/1.73 m², usual initial dose of injection, then one-quarter normal dose.

● MONITORING REQUIREMENTS

- When used by inhalation Measure lung function before and after initial dose of aztreonam and monitor for bronchospasm.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, give over 3–5 minutes. For *intravenous infusion* (Azactam[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%. Dissolve initially in water for injections (1 g per 3 mL) then dilute to a concentration of less than 20 mg/mL; to be given over 20–60 minutes.

- When used by inhalation Other inhaled drugs should be administered before aztreonam; a bronchodilator should be administered before each dose.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (December 2014) that aztreonam powder for nebuliser solution (Cayston[®]) is accepted for restricted use within NHS Scotland when inhaled colistimethate sodium and inhaled tobramycin are not tolerated or are not providing satisfactory therapeutic benefit (measured as ≥2% decline in forced expiratory volume in 1 second).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for nebuliser solution

- **Cayston** (Gilead Sciences International Ltd)

Aztreonam (as Aztreonam lysine) 75 mg Cayston 75mg powder and solvent for nebuliser solution vials with Altera Nebuliser Handset | 84 vial [PoM] £2,181.53

Powder for solution for injection

- **Azactam** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Aztreonam 1 gram Azactam 1g powder for solution for injection vials | 1 vial [PoM] £9.40 (Hospital only)

Aztreonam 2 gram Azactam 2g powder for solution for injection vials | 1 vial [PoM] £18.82 (Hospital only)

ANTIBACTERIALS > NITROIMIDAZOLE DERIVATIVES

Metronidazole

- **DRUG ACTION** Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

● INDICATIONS AND DOSE

Anaerobic infections

- ▶ BY MOUTH
 - ▶ Child 1 month: 7.5 mg/kg every 12 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
 - ▶ Child 2 months–11 years: 7.5 mg/kg every 8 hours (max. per dose 400 mg) usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
 - ▶ Child 12–17 years: 400 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
 - ▶ Adult: 400 mg every 8 hours, alternatively 500 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
- ▶ BY RECTUM
 - ▶ Child 1–11 months: 125 mg 3 times a day for 3 days, then 125 mg twice daily, for usual total treatment duration of 7 days
 - ▶ Child 1–4 years: 250 mg 3 times a day for 3 days, then 250 mg twice daily, for usual total treatment duration of 7 days
 - ▶ Child 5–9 years: 500 mg 3 times a day for 3 days, then 500 mg twice daily, for usual total treatment duration of 7 days
 - ▶ Child 10–17 years: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days
 - ▶ Adult: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days
- ▶ BY INTRAVENOUS INFUSION
 - ▶ Adult: 500 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection), to be given over 20 minutes

***Helicobacter pylori* eradication; in combination with clarithromycin and esomeprazole; or in combination with clarithromycin and lansoprazole; or in combination with amoxicillin and lansoprazole; or in combination with clarithromycin and omeprazole; or in combination with clarithromycin and pantoprazole; or in combination with clarithromycin and rabeprazole**

- ▶ BY MOUTH
 - ▶ Adult: 400 mg twice daily

***Helicobacter pylori* eradication; in combination with amoxicillin and omeprazole**

- ▶ BY MOUTH
 - ▶ Adult: 400 mg 3 times a day

Fistulating Crohn's disease

- ▶ BY MOUTH
 - ▶ Adult: 10–20 mg/kg daily in divided doses, usual dose 400–500 mg 3 times a day usually given for 1 month but no longer than 3 months because of concerns about peripheral neuropathy

Leg ulcers and pressure sores

- ▶ BY MOUTH
 - ▶ Adult: 400 mg every 8 hours for 7 days

Bacterial vaginosis (notably *Gardnerella vaginalis* infection)

- ▶ BY MOUTH
 - ▶ Adult: 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

Bacterial vaginosis

- ▶ BY VAGINA USING VAGINAL GEL
 - ▶ Adult: 1 applicatorful daily for 5 days, dose to be administered at night

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 applicator full delivers a 5 g dose of metronidazole 0.75%.

Pelvic inflammatory disease

- ▶ BY MOUTH
 - ▶ Adult: 400 mg twice daily for 14 days

Acute ulcerative gingivitis

- ▶ BY MOUTH
 - ▶ Child 1–2 years: 50 mg every 8 hours for 3 days
 - ▶ Child 3–6 years: 100 mg every 12 hours for 3 days
 - ▶ Child 7–9 years: 100 mg every 8 hours for 3 days
 - ▶ Child 10–17 years: 200–250 mg every 8 hours for 3 days
 - ▶ Adult: 400 mg every 8 hours for 3 days

Acute oral infections

- ▶ BY MOUTH
 - ▶ Child 1–2 years: 50 mg every 8 hours for 3–7 days
 - ▶ Child 3–6 years: 100 mg every 12 hours for 3–7 days
 - ▶ Child 7–9 years: 100 mg every 8 hours for 3–7 days
 - ▶ Child 10–17 years: 200–250 mg every 8 hours for 3–7 days
 - ▶ Adult: 400 mg every 8 hours for 3–7 days

Surgical prophylaxis

- ▶ BY MOUTH
 - ▶ Adult: 400–500 mg, to be administered 2 hours before surgery, then 400–500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)
- ▶ BY RECTUM
 - ▶ Adult: 1 g, to be administered 2 hours before surgery, then 1 g every 8 hours if required for up to 3 doses (in high-risk procedures)
- ▶ BY INTRAVENOUS INFUSION
 - ▶ Adult: 500 mg, to be administered up to 30 minutes before the procedure (if rectal administration inappropriate), then 500 mg every 8 hours if required for up to 3 further doses (in high-risk procedures)

Invasive intestinal amoebiasis | Extra-intestinal amoebiasis (including liver abscess)

- ▶ BY MOUTH
 - ▶ Child 1–2 years: 200 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
 - ▶ Child 3–6 years: 200 mg 4 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
 - ▶ Child 7–9 years: 400 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
 - ▶ Child 10–17 years: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
 - ▶ Adult: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)

Urogenital trichomoniasis

- ▶ BY MOUTH
 - ▶ Child 1–2 years: 50 mg 3 times a day for 7 days
 - ▶ Child 3–6 years: 100 mg twice daily for 7 days
 - ▶ Child 7–9 years: 100 mg 3 times a day for 7 days
 - ▶ Child 10–17 years: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose
 - ▶ Adult: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

continued →

Giardiasis

- ▶ BY MOUTH
- ▶ Child 1–2 years: 500 mg once daily for 3 days
- ▶ Child 3–6 years: 600–800 mg once daily for 3 days
- ▶ Child 7–9 years: 1 g once daily for 3 days
- ▶ Child 10–17 years: 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days
- ▶ Adult: 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days

Established case of tetanus

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

● UNLICENSED USE

- ▶ With systemic use in adults Metronidazole doses in the BNF may differ from those in product literature.

● CAUTIONS

- ▶ With vaginal use Not recommended during menstruation · some systemic absorption may occur with vaginal gel

● INTERACTIONS → Appendix 1: metronidazole**● SIDE-EFFECTS****▶ Common or very common**

- ▶ With systemic use Dry mouth · myalgia · nausea · oral disorders · taste altered · vomiting
- ▶ With vaginal use Pelvic discomfort · vulvovaginal candidiasis · vulvovaginal disorders

▶ Uncommon

- ▶ With systemic use Asthenia · headache · leucopenia (with long term or intensive therapy)
- ▶ With vaginal use Menstrual cycle irregularities · vaginal haemorrhage
- ▶ Rare or very rare
- ▶ With systemic use Agranulocytosis · angioedema · appetite decreased · ataxia · confusion · diarrhoea · dizziness · drowsiness · encephalopathy · epigastric pain · epileptiform seizure (with long term or intensive therapy) · hallucination · hepatic disorders · meningitis aseptic · mucositis · neutropenia · optic neuropathy · pancreatitis · pancytopenia · peripheral neuropathy (with long term or intensive therapy) · psychotic disorder · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · urine dark · vision disorders

▶ Frequency not known

- ▶ With systemic use Depressed mood · hearing impairment

● PREGNANCY

- ▶ With systemic use Manufacturer advises avoidance of high-dose regimens; use only if potential benefit outweighs risk.

● BREAST FEEDING

- ▶ With systemic use Significant amount in milk; manufacturer advises avoid large single doses though otherwise compatible; may give milk a bitter taste.

● HEPATIC IMPAIRMENT

- ▶ With systemic use Use with caution in hepatic encephalopathy.

Dose adjustments ▶ With systemic use In severe liver disease reduce total daily dose to one-third, and give once daily.

● MONITORING REQUIREMENTS

- ▶ With systemic use Clinical and laboratory monitoring advised if treatment exceeds 10 days.

● DIRECTIONS FOR ADMINISTRATION For intravenous infusion, give over 20–30 minutes.**● PRESCRIBING AND DISPENSING INFORMATION**

Metronidazole is well absorbed orally and the intravenous route is normally reserved for severe infections. Metronidazole by the rectal route is an effective alternative to the intravenous route when oral administration is not possible.

● PATIENT AND CARER ADVICE

Tinidazole

- **DRUG ACTION** Tinidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; it has a longer duration of action than metronidazole.

● INDICATIONS AND DOSE**Anaerobic infections****▶ BY MOUTH**

- ▶ Adult: Initially 2 g, followed by 1 g daily usually for 5–6 days, alternatively 500 mg twice daily usually for 5–6 days

Bacterial vaginosis | Acute ulcerative gingivitis**▶ BY MOUTH**

- ▶ Adult: 2 g for 1 single dose

Abdominal surgery prophylaxis

- ▶ BY MOUTH
- ▶ Adult: 2 g for 1 single dose, to be administered approximately 12 hours before surgery

Intestinal amoebiasis

- ▶ BY MOUTH
- ▶ Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 3 days
- ▶ Child 12–17 years: 2 g once daily for 2–3 days
- ▶ Adult: 2 g once daily for 2–3 days

Amoebic involvement of liver

- ▶ BY MOUTH
- ▶ Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 5 days
- ▶ Child 12–17 years: 1.5–2 g once daily for 3–6 days
- ▶ Adult: 1.5–2 g once daily for 3–6 days

Urogenital trichomoniasis | Giardiasis

- ▶ BY MOUTH
- ▶ Child 1 month–11 years: 50–75 mg/kg (max. per dose 2 g) for 1 single dose, dose may be repeated once if necessary
- ▶ Child 12–17 years: 2 g for 1 single dose, dose may be repeated once if necessary
- ▶ Adult: 2 g for 1 single dose

***Helicobacter pylori* eradication**

- ▶ BY MOUTH
- ▶ Adult: (consult local protocol)

● **INTERACTIONS** → Appendix 1: tinidazole● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · appetite decreased · diarrhoea · headache · nausea · skin reactions · vertigo · vomiting
- ▶ **Frequency not known** Angioedema · ataxia · dizziness · fatigue · flushing · leucopenia · oral disorders · peripheral neuropathy · seizure · sensation abnormal · taste altered · urine discolouration

● **PREGNANCY** Manufacturer advises avoid in first trimester.● **BREAST FEEDING** Present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment.● **MONITORING REQUIREMENTS** Clinical and laboratory monitoring advised if treatment exceeds 10 days.● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

DT = £11.04

ANTIBACTERIALS > PENICILLINS**Penicillins****Benzylpenicillin and phenoxymethylpenicillin**

Benzylpenicillin sodium p. 537 (Penicillin G) remains an important and useful antibiotic but is inactivated by bacterial beta-lactamases. It is effective for many streptococcal (including pneumococcal), gonococcal, and meningococcal infections and also for anthrax, diphtheria, gas-gangrene, leptospirosis, and treatment of Lyme disease. Pneumococci, meningococci, and gonococci which have decreased sensitivity to penicillin have been isolated; benzylpenicillin sodium is no longer the drug of first choice for pneumococcal meningitis. Although benzylpenicillin sodium is effective in the treatment of tetanus, metronidazole p. 533 is preferred. Benzylpenicillin is

inactivated by gastric acid and absorption from the gastrointestinal tract is low; therefore it must be given by injection.

Benzathine benzylpenicillin is used for the treatment of early syphilis and late latent syphilis; it is given by intramuscular injection.

Phenoxymethylpenicillin p. 538 (Penicillin V) has a similar antibacterial spectrum to benzylpenicillin sodium, but is less active. It is gastric acid-stable, so is suitable for oral administration. It should not be used for serious infections because absorption can be unpredictable and plasma concentrations variable. It is indicated principally for respiratory-tract infections in children, for streptococcal tonsillitis, and for continuing treatment after one or more injections of benzylpenicillin sodium when clinical response has begun. It should not be used for meningococcal or gonococcal infections. Phenoxymethylpenicillin is used for prophylaxis against streptococcal infections following rheumatic fever and against pneumococcal infections following splenectomy or in sickle-cell disease.

Penicillinase-resistant penicillins

Most staphylococci are now resistant to benzylpenicillin because they produce penicillinases. Flucloxacillin p. 544, however, is not inactivated by these enzymes and is thus effective in infections caused by penicillin-resistant staphylococci, which is the sole indication for its use. Flucloxacillin is acid-stable and can, therefore, be given by mouth as well as by injection. Flucloxacillin is well absorbed from the gut.

Temocillin p. 545 is active against Gram-negative bacteria and is stable against a wide range of beta-lactamases. It should be reserved for the treatment of infections caused by beta-lactamase-producing strains of Gram-negative bacteria, including those resistant to third-generation cephalosporins. Temocillin is not active against *Pseudomonas aeruginosa* or *Acinetobacter* spp.

Broad-spectrum penicillins

Ampicillin p. 540 is active against certain Gram-positive and Gram-negative organisms but is inactivated by penicillinases including those produced by *Staphylococcus aureus* and by common Gram-negative bacilli such as *Escherichia coli*. Almost all staphylococci, approx. 60% of *E. coli* strains and approx. 20% of *Haemophilus influenzae* strains are now resistant. The likelihood of resistance should therefore be considered before using ampicillin for the 'blind' treatment of infections; in particular, it should not be used for hospital patients without checking sensitivity.

Ampicillin is well excreted in the bile and urine. It is principally indicated for the treatment of exacerbations of chronic bronchitis and middle ear infections, both of which may be due to *Streptococcus pneumoniae* and *H. influenzae*, and for urinary-tract infections.

Ampicillin can be given by mouth but less than half the dose is absorbed, and absorption is further decreased by the presence of food in the gut.

Maculopapular rashes commonly occur with ampicillin (and amoxicillin p. 539) but are not usually related to true penicillin allergy. They almost always occur in patients with glandular fever; broad-spectrum penicillins should not therefore be used for 'blind' treatment of a sore throat. The risk of rash is also increased in patients with acute or chronic lymphocytic leukaemia or in cytomegalovirus infection.

Amoxicillin is a derivative of ampicillin and has a similar antibacterial spectrum. It is better absorbed than ampicillin when given by mouth, producing higher plasma and tissue concentrations; unlike ampicillin, absorption is not affected by the presence of food in the stomach. Amoxicillin may also be used for the treatment of Lyme disease [not licensed].

Co-amoxiclav p. 542 consists of amoxicillin with the betalactamase inhibitor clavulanic acid. Clavulanic acid itself has no significant antibacterial activity but, by inactivating

beta-lactamases, it makes the combination active against beta-lactamase-producing bacteria that are resistant to amoxicillin. These include resistant strains of *Staph. aureus*, *E. coli*, and *H. influenzae*, as well as many *Bacteroides* and *Klebsiella* spp. Co-amoxiclav should be reserved for infections likely, or known, to be caused by amoxicillin-resistant beta-lactamase-producing strains.

A combination of ampicillin with flucloxacillin (as co-fluampicil p. 541 is available to treat infections involving either streptococci or staphylococci (e.g. cellulitis).

Antipseudomonal penicillins

Piperacillin, a ureidopenicillin, is only available in combination with the beta-lactamase inhibitor tazobactam.

Ticarcillin, a carboxypenicillin, is only available in combination with the beta-lactamase inhibitor clavulanic acid. Both preparations have a broad spectrum of activity against a range of Gram-positive and Gram-negative bacteria, and anaerobes. Piperacillin with tazobactam below has activity against a wider range of Gram-negative organisms than ticarcillin with clavulanic acid p. 537 and it is more active against *Pseudomonas aeruginosa*. These antibacterials are not active against MRSA. They are used in the treatment of septicaemia, hospital-acquired pneumonia, and complicated infections involving the urinary tract, skin and soft tissues, or intra-abdomen. For severe pseudomonas infections these antipseudomonal penicillins can be given with an aminoglycoside (e.g. gentamicin p. 510) since they have a synergistic effect.

Mecillinams

Pivmecillinam hydrochloride p. 544 has significant activity against many Gram-negative bacteria including *Escherichia coli*, *Klebsiella*, enterobacter, and salmonellae. It is not active against *Pseudomonas aeruginosa* or enterococci.

Pivmecillinam hydrochloride is hydrolysed to mecillinam, which is the active drug.

Penicillins

● **DRUG ACTION** The penicillins are bactericidal and act by interfering with bacterial cell wall synthesis. They diffuse well into body tissues and fluids, but penetration into the cerebrospinal fluid is poor except when the meninges are inflamed. They are excreted in the urine in therapeutic concentrations.

● **CAUTIONS** History of allergy

● **SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea • hypersensitivity • nausea • skin reactions • thrombocytopenia • vomiting
- ▶ **Uncommon** Antibiotic associated colitis • leucopenia
- ▶ **Rare or very rare** Agranulocytosis • angioedema • haemolytic anaemia • hepatic disorders • nephritis • tubulointerstitial • neutropenia • seizure • severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Diarrhoea frequently occurs during oral penicillin therapy. It is most common with broad-spectrum penicillins, which can cause antibiotic-associated colitis.

● **ALLERGY AND CROSS-SENSITIVITY** The most important side-effect of the penicillins is hypersensitivity which causes rashes and anaphylaxis and can be fatal. Allergic reactions to penicillins occur in 1–10% of exposed individuals; anaphylactic reactions occur in fewer than 0.05% of treated patients. Patients with a history of atopic allergy (e.g. asthma, eczema, hay fever) are at a higher risk of anaphylactic reactions to penicillins. Individuals with a history of anaphylaxis, urticaria, or rash immediately after penicillin administration are at risk of immediate hypersensitivity to a penicillin; these individuals should not receive a penicillin. Individuals with a history of a

minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind. Other beta-lactam antibiotics (including cephalosporins) can be used in these patients.

Patients who are allergic to one penicillin will be allergic to all because the hypersensitivity is related to the basic penicillin structure. Patients with a history of immediate hypersensitivity to penicillins may also react to the cephalosporins and other beta-lactam antibiotics, they should not receive these antibiotics. If a penicillin (or another beta-lactam antibiotic) is essential in an individual with immediate hypersensitivity to penicillin then specialist advice should be sought on hypersensitivity testing or using a beta-lactam antibiotic with a different structure to the penicillin that caused the hypersensitivity.

ANTIBACTERIALS > PENICILLINS, ANTIPSEUDOMONAL WITH BETA-LACTAMASE INHIBITOR

above

Piperacillin with tazobactam

● INDICATIONS AND DOSE

Hospital-acquired pneumonia | Septicaemia | Complicated infections involving the urinary-tract | Complicated infections involving the skin | Complicated infections involving the soft-tissues

▶ BY INTRAVENOUS INFUSION

▶ **Adult:** 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections

Infections in neutropenic patients

▶ BY INTRAVENOUS INFUSION

▶ **Adult:** 4.5 g every 6 hours

● **CAUTIONS** High doses may lead to hypernatraemia (owing to sodium content of preparations)

● **INTERACTIONS** → Appendix 1: penicillins

● **SIDE-EFFECTS**

▶ **Common or very common** Anaemia • candida infection • constipation • gastrointestinal discomfort • headache • insomnia

▶ **Uncommon** Arthralgia • flushing • hypokalaemia • hypotension • myalgia

▶ **Rare or very rare** Epistaxis • stomatitis

▶ **Frequency not known** Eosinophilia • pancytopenia • pneumonia eosinophilic • renal failure • thrombocytosis

● **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk.

● **BREAST FEEDING** Trace amount in milk, but appropriate to use.

● **RENAL IMPAIRMENT**

Dose adjustments Max. 4.5 g every 8 hours if eGFR 20–40 mL/minute/1.73 m².

Max. 4.5 g every 12 hours if eGFR less than 20 mL/minute/1.73 m².

● **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially (2.25 g in 10 mL, 4.5 g in 20 mL) with water for injections, or glucose 5% (*Tazocin*® brand only), or sodium chloride 0.9%, then dilute to 50–150 mL with infusion fluid; give over 30 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Dose expressed as a combination of piperacillin and tazobactam (both as sodium salts) in a ratio of 8:1.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

Powder for solution for injection

ELECTROLYTES: May contain Sodium

- ▶ **Piperacillin with tazobactam (Non-proprietary)**
Tazobactam (as Tazobactam sodium) 250 mg, Piperacillin (as Piperacillin sodium) 2 gram | Piperacillin 2g / Tazobactam 250mg powder for solution for injection vials | 1 vial [PoM] £9.55 DT = £7.65 (Hospital only)
Piperacillin 2g / Tazobactam 250mg powder for solution for infusion vials | 1 vial [PoM] £7.85 DT = £7.65
- ▶ **Tazocin** (Pfizer Ltd)

F 536

Ticarcillin with clavulanic acid

● INDICATIONS AND DOSE

Infections due to *Pseudomonas* and *Proteus* spp.

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 3.2 g every 6–8 hours; increased if necessary to 3.2 g every 4 hours, increased frequency used for more severe infections

- **CAUTIONS** High doses may lead to hypernatraemia (owing to sodium content of preparations)

CAUTIONS, FURTHER INFORMATION

- ▶ **Cholestatic jaundice** Cholestatic jaundice is possibly associated with clavulanic acid. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav (amoxicillin, clavulanic acid) than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

- **INTERACTIONS** → Appendix 1: clavulanic acid · penicillins

- **SIDE-EFFECTS** Bullous dermatitis · eosinophilia · haemorrhage · hypokalaemia

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.

- **RENAL IMPAIRMENT** Accumulation of electrolytes contained in preparation can occur in patients with renal failure.

Dose adjustments Reduce dose to 3.2 g every eight hours if eGFR 30–60 mL/minute/1.73 m²; 1.6 g every eight hours if eGFR 10–30 mL/minute/1.73 m²; 1.6 g every twelve hours if eGFR less than 10 mL/minute/1.73 m².

- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Timentin®), give intermittently in Glucose 5%. Suggested volume (depending on dose) 100–150 mL; give over 30–40 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Dose is expressed as a combination of ticarcillin (as sodium salt) and clavulanic acid (as potassium salt) in a ratio of 15:1.

Benzylpenicillin sodium

(Penicillin G)

● INDICATIONS AND DOSE

Mild to moderate susceptible infections | Throat infections

Otitis media | Cellulitis | Pneumonia

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 0.6–1.2 g every 6 hours, dose may be increased if necessary in more serious infections (consult product literature), single doses over 1.2 g to be given by intravenous route only

Endocarditis (in combination with other antibacterial if necessary)

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1.2 g every 4 hours, increased if necessary to 2.4 g every 4 hours, dose may be increased in infections such as enterococcal endocarditis

Anthrax (in combination with other antibacterials)

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 2.4 g every 4 hours

Intrapartum prophylaxis against group B streptococcal infection

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 3 g for 1 dose, then 1.5 g every 4 hours until delivery

Meningitis | Meningococcal disease

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 2.4 g every 4 hours
- ▶ BY INTRAVENOUS INFUSION
- ▶ Neonate up to 7 days: 50 mg/kg every 12 hours.

- ▶ Neonate 7 days to 28 days: 50 mg/kg every 8 hours.

- ▶ Child: 50 mg/kg every 4–6 hours (max. per dose 2.4 g every 4 hours)

Suspected meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) prior to urgent transfer to hospital

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1–11 months: 300 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
- ▶ Child 1–9 years: 600 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
- ▶ Child 10–17 years: 1.2 g, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
- ▶ Adult: 1.2 g, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer

continued →

Suspected bacterial meningitis without non-blanching rash where patient cannot be transferred to hospital urgently

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1-11 months: 300 mg, administer as single dose prior to transfer to hospital
- ▶ Child 1-9 years: 600 mg, administer as single dose prior to transfer to hospital
- ▶ Child 10-17 years: 1.2 g, administer as single dose prior to transfer to hospital
- ▶ Adult: 1.2 g, administer as single dose prior to transfer to hospital

- **UNLICENSED USE** Benzylpenicillin doses in the BNF may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

Intrathecal injection of benzylpenicillin is **not** recommended.

- **CAUTIONS** Accumulation of sodium from injection can occur with high doses
- **INTERACTIONS** → Appendix 1: penicillins
- **SIDE-EFFECTS**
 - ▶ Common or very common Fever · Jarisch-Herxheimer reaction
 - ▶ Rare or very rare Neurotoxicity
 - ▶ Frequency not known Coma
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.
- **RENAL IMPAIRMENT** Accumulation of sodium from injection can occur in renal failure. High doses may cause neurotoxicity, including cerebral irritation, convulsions, or coma.
 - Dose adjustments** ▶ In adults Reduce dose—consult product literature.
 - ▶ In children Estimated glomerular filtration rate 10–50 mL/minute/1.73 m², use normal dose every 8–12 hours. Estimated glomerular filtration rate less than 10 mL/minute/1.73 m² use normal dose every 12 hours.
- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use in children Intravenous route recommended in neonates and infants. For *intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–30 minutes. Longer administration time is particularly important when using doses of 50 mg/kg (or greater) to avoid CNS toxicity.
 - ▶ With intravenous use in adults For *intravenous infusion* (Crystapen®), give intermittently in Glucose 5% or Sodium chloride 0.9%; suggested volume 100 mL given over 30–60 minutes. Continuous infusion not usually recommended.

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease—if cover also needed for *Haemophilus influenzae*

▶ BY MOUTH

- Child 1 month-4 years: 125 mg twice daily
- Child 5-11 years: 250 mg twice daily
- Child 12-17 years: 500 mg twice daily

Helicobacter pylori eradication in combination with metronidazole and omeprazole

▶ BY MOUTH

- Adult: 500 mg 3 times a day

Helicobacter pylori eradication in combination with clarithromycin and esomeprazole; or in combination with clarithromycin and lansoprazole; or in combination with metronidazole and lansoprazole; or in combination with clarithromycin and omeprazole; or in combination with clarithromycin and pantoprazole; or in combination with clarithromycin and rabeprazole

▶ BY MOUTH

- Adult: 1 g twice daily

- **UNLICENSED USE** Amoxicillin doses in BNF Publications may differ from those in product literature.

● CAUTIONS

GENERAL CAUTIONS Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common) · maintain adequate hydration with high doses (particularly during parenteral therapy)

SPECIFIC CAUTIONS

- ▶ With intravenous use Accumulation of sodium can occur with high parenteral doses

- **INTERACTIONS** → Appendix 1: penicillins

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Rare or very rare** Acute generalised exanthematous pustulosis (AGEP) · colitis haemorrhagic · crystalluria · dizziness · hyperkinesia · hypersensitivity vasculitis · mucocutaneous candidiasis
- ▶ **Frequency not known** Jarisch-Herxheimer reaction

SPECIFIC SIDE-EFFECTS

- ▶ **Rare or very rare**
- ▶ With oral use Black hairy tongue
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **RENAL IMPAIRMENT** Risk of crystalluria with high doses (particularly during parenteral therapy). Accumulation of sodium from injection can occur in patients with renal failure.

Dose adjustments Reduce dose in severe impairment; rashes more common.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Amoxil[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes or give via drip tubing in Glucose 5% or Sodium chloride 0.9%; continuous infusion not usually recommended.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations and sachets may include peach, strawberry, or lemon.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for Amoxicillin (Amoxil[®]) paediatric suspension (use of pipette).

Medicines for Children leaflet: Amoxicillin for bacterial infections www.medicinesforchildren.org.uk/amoxicillin-bacterial-infections-0

Ampicillin

• INDICATIONS AND DOSE

Susceptible infections (including bronchitis, urinary-tract infections, otitis media, sinusitis, uncomplicated community-acquired pneumonia, salmonellosis)

- BY MOUTH

► Child 1-11 months: 125 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day

► Child 1-4 years: 250 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day

► Child 5-11 years: 500 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day (max. per dose 1 g)

► Child 12-17 years: 500 mg 4 times a day; increased if necessary to 1 g 4 times a day, use increased dose in severe infection

► Adult: 0.5–1 g every 6 hours

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Adult: 500 mg every 4–6 hours

- BY INTRAMUSCULAR INJECTION

► Adult: 500 mg every 4–6 hours

Endocarditis (in combination with another antibiotic if necessary) | Listerial meningitis (in combination with another antibiotic)

- BY INTRAVENOUS INFUSION

► Adult: 2 g every 4 hours

- **UNLICENSED USE** Ampicillin doses in BNF may differ from those in product literature.

- **CAUTIONS**

GENERAL CAUTIONS Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common)

SPECIFIC CAUTIONS

- With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses

- **INTERACTIONS** → Appendix 1: penicillins

- **SIDE-EFFECTS** Colitis haemorrhagic · purpura

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.

- **RENAL IMPAIRMENT** Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

Dose adjustments ► In adults Reduce dose if eGFR less than 10 mL/minute/1.73 m²; rashes more common.

► In children If estimated glomerular filtration rate less than 10 mL/minute/1.73 m² reduce dose or frequency; rashes more common.

- **DIRECTIONS FOR ADMINISTRATION**

► With oral use Administer at least 30 minutes before food.

► With intravenous use For intravenous infusion (Penbritin[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9%. Continuous infusion not usually recommended.

Co-fluampicil

● INDICATIONS AND DOSE

Mixed infections involving beta-lactamase-producing staphylococci

▶ BY MOUTH

Child 1 month–9 years: 125/125 mg every 6 hours

Child 10–17 years: 250/250 mg every 6 hours

Adult: 250/250 mg every 6 hours

▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

Adult: 250/250 mg every 6 hours

Severe mixed infections involving beta-lactamase-producing staphylococci

▶ BY MOUTH

Child 1 month–9 years: 250/250 mg every 6 hours

Adult: 500/500 mg every 6 hours

▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

Adult: 500/500 mg every 6 hours

IMPORTANT SAFETY INFORMATION

HEPATIC DISORDERS

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:

- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin;
- flucloxacillin should be used with caution in patients with hepatic impairment;
- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials.

● CAUTIONS

GENERAL CAUTIONS Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common)

SPECIFIC CAUTIONS

- ▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses

● INTERACTIONS → Appendix 1: penicillins

- **SIDE-EFFECTS** Arthralgia · bronchospasm · coma · dyspnoea · electrolyte imbalance · eosinophilia · erythema nodosum · gastrointestinal disorder · hallucination · Jarisch-Herxheimer reaction · myalgia · purpura non-thrombocytopenic · vasculitis

● **PREGNANCY** Not known to be harmful.

● **BREAST FEEDING** Trace amount in milk, but appropriate to use.

● **HEPATIC IMPAIRMENT** Use with caution.

● **RENAL IMPAIRMENT** Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

Dose adjustments ▶ In adults Reduce dose if eGFR less than 10 mL/minute/1.73 m²; rashes more common.

▶ In children Reduce dose or frequency if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; rashes more common.

● **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

● **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Magnapen*®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes. Via drip tubing in Glucose 5% or Sodium chloride 0.9%.

● **PRESCRIBING AND DISPENSING INFORMATION** Dose expressed as a combination of equal parts by mass of flucloxacillin and ampicillin.

● MEDICINAL FORMS

ANTIBACTERIALS > PENICILLINS, BROAD-SPECTRUM WITH BETA- LACTAMASE INHIBITOR

F 536

Co-amoxiclav

• INDICATIONS AND DOSE

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate), including respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis and animal bites

- ▶ BY MOUTH USING TABLETS
 - ▶ Child 12-17 years: 250/125 mg every 8 hours; increased to 500/125 mg every 8 hours, increased dose used for severe infection
 - ▶ Adult: 250/125 mg every 8 hours; increased to 500/125 mg every 8 hours, increased dose used for severe infection
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
 - ▶ Child 1-2 months: 30 mg/kg every 12 hours
 - ▶ Child 3 months-17 years: 30 mg/kg every 8 hours (max. per dose 1.2 g every 8 hours)
 - ▶ Adult: 1.2 g every 8 hours

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 125/31 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
 - ▶ Child 1-11 months: 0.25 mL/kg/day 3 times a day, dose doubled in severe infection
 - ▶ Child 1-5 years: 0.25 mL/kg/day 3 times a day, alternatively 5 mL 3 times a day, dose doubled in severe infection

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 250/62 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
 - ▶ Child 6-11 years: 0.15 mL/kg/day 3 times a day, alternatively 5 mL 3 times a day, dose doubled in severe infection

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 400/57 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
 - ▶ Child 2 months-1 year: 0.15 mL/kg/day twice daily, doubled in severe infection
 - ▶ Child 2-6 years (body-weight 13-21 kg): 2.5 mL twice daily, doubled in severe infection
 - ▶ Child 7-12 years (body-weight 22-40 kg): 5 mL twice daily, doubled in severe infection
 - ▶ Child 12-17 years (body-weight 41 kg and above): 10 mL twice daily; increased if necessary to 10 mL 3 times a day, increased frequency to be used in severe infection
 - ▶ Adult: 10 mL twice daily; increased if necessary to 10 mL 3 times a day, increased frequency to be used in severe infection

Severe dental infection with spreading cellulitis | Dental infection not responding to first-line antibacterial

- ▶ BY MOUTH USING TABLETS
 - ▶ Child 12-17 years: 250/125 mg every 8 hours for 5 days
 - ▶ Adult: 250/125 mg every 8 hours for 5 days

Surgical prophylaxis

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
 - ▶ Adult: 1.2 g, to be administered up to 30 minutes before the procedure, then 1.2 g every 8 hours for up to 2-3 further doses in high risk procedures

Acute sinusitis (doses for 125/31 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
 - ▶ Child 1-11 months: 0.25 mL/kg/day 3 times a day for 5 days
 - ▶ Child 1-5 years: 5 mL 3 times a day for 5 days, alternatively 0.25 mL/kg/day 3 times a day for 5 days

Acute sinusitis (doses for 250/62 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
 - ▶ Child 6-11 years: 5 mL 3 times a day for 5 days, alternatively 0.15 mL/kg/day 3 times a day for 5 days

Acute sinusitis

- ▶ BY MOUTH
 - ▶ Child 12-17 years: 250/125 mg 3 times a day for 5 days, alternatively 500/125 mg 3 times a day for 5 days
 - ▶ Adult: 500/125 mg 3 times a day for 5 days

DOSE EQUIVALENCE AND CONVERSION

- ▶ Doses are expressed as co-amoxiclav.
- ▶ A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

- **UNLICENSED USE** [\[EwGr\]](#) Doses and duration of treatment for acute sinusitis in BNF Publications differ from product literature and adhere to national guidelines. [▶](#) See Sinusitis (acute) p. 1168 for further information.

- **CONTRA-INDICATIONS** History of co-amoxiclav-associated jaundice or hepatic dysfunction · history of penicillin-associated jaundice or hepatic dysfunction

● CAUTIONS

GENERAL CAUTIONS Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common) · maintain adequate hydration with high doses (particularly during parental therapy)

SPECIFIC CAUTIONS

- ▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses

CAUTIONS, FURTHER INFORMATION

- ▶ **Cholestatic jaundice** Cholestatic jaundice can occur either during or shortly after the use of co-amoxiclav. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

- **INTERACTIONS** → Appendix 1: clavulanic acid · penicillins

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Increased risk of infection
- ▶ **Uncommon** Dizziness · dyspepsia · headache
- ▶ **Frequency not known** Acute generalised exanthematous pustulosis (AGEP) · colitis haemorrhagic · crystalluria · hypersensitivity vasculitis · meningitis aseptic

SPECIFIC SIDE-EFFECTS

- ▶ With oral use Akathisia · black hairy tongue
- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Trace amount in milk, but appropriate to use.

● **HEPATIC IMPAIRMENT**

Monitoring Monitor liver function in liver disease.

- **RENAL IMPAIRMENT** Risk of crystalluria with high doses (particularly during parenteral therapy).
- ▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

Dose adjustments ▶ With oral use in adults *Co-amoxiclav* 250/125 tablets or 500/125 tablets: if eGFR 10–30 mL/minute/1.73 m², one 250/125 strength tablet every 12 hours or one 500/125 strength tablet every 12 hours; if eGFR less than 10 mL/minute/1.73 m², one 250/125 strength tablet every 24 hours or one 500/125 strength tablet every 24 hours.

Co-amoxiclav 400/57 suspension: avoid if eGFR less than 30 mL/minute/1.73 m².

- ▶ With intravenous use in adults *Co-amoxiclav injection* (expressed as co-amoxiclav): if eGFR 10–30 mL/minute/1.73 m², 1.2 g initially, then 600 mg every 12 hours; if eGFR less than 10 mL/minute/1.73 m², 1.2 g initially, then 600 mg every 24 hours.
- ▶ With oral use in children *Co-amoxiclav* 125/31 suspension, 250/62 suspension, 250/125 tablets, or 500/125 tablets: use normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Use the normal dose recommended for mild or moderate infections every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

Co-amoxiclav 400/57 suspension: avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- ▶ With intravenous use in children *Co-amoxiclav injection*: use normal initial dose and then use half normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; use normal initial dose and then use half normal dose every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use in children *For intravenous infusion*, dilute reconstituted solution to a concentration of 10 mg/mL with Sodium Chloride 0.9%; give intermittently over 30–40 minutes. *For intravenous injection*, administer over 3–4 minutes.
- ▶ With intravenous use in adults *For intravenous infusion* (*Augmentin*®), give intermittently in Sodium chloride 0.9%. Reconstitute 600 mg initially with 10 mL water for injections, then dilute with 50 mL infusion fluid; reconstitute 1.2 g initially with 20 mL water for injections, then dilute with 100 mL infusion fluid; give over 30–40 minutes. *For intravenous injection*, administer over 3–4 minutes. *Via drip tubing* in Sodium chloride 0.9%.

- **PRESCRIBING AND DISPENSING INFORMATION** Doses are expressed as co-amoxiclav: a mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

- ▶ With oral use Flavours of oral liquid formulations may include raspberry and orange.

Clavulanic acid (as Potassium clavulanate) 100 mg, Amoxicillin (as Amoxicillin sodium) 500 mg Co-amoxiclav 500mg/100mg powder for solution for injection vials | 10 vial [PoM] £13.50–£14.90

Clavulanic acid (as Potassium clavulanate) 200 mg, Amoxicillin (as Amoxicillin sodium) 1000 mg Co-amoxiclav 1000mg/200mg powder for solution for injection vials | 10 vial [PoM] £27.50–£29.70

▶ **Augmentin Intravenous** (GlaxoSmithKline UK Ltd)

Clavulanic acid (as Potassium clavulanate) 100 mg, Amoxicillin (as Amoxicillin sodium) 500 mg Augmentin Intravenous 600mg powder for solution for injection vials | 10 vial [PoM] £10.60

Clavulanic acid (as Potassium clavulanate) 200 mg, Amoxicillin (as Amoxicillin sodium) 1000 mg Augmentin Intravenous 1.2g powder for solution for injection vials | 10 vial [PoM] £10.60

ANTIBACTERIALS > PENICILLINS,
Mecillinam-type

F 536

Pivmecillinam hydrochloride

● INDICATIONS AND DOSE

Acute uncomplicated cystitis

- ▶ BY MOUTH
 - Child (body-weight 40 kg and above): Initially 400 mg for 1 dose, then 200 mg every 8 hours for 3 days
 - Adult (body-weight 40 kg and above): Initially 400 mg for 1 dose, then 200 mg every 8 hours for 3 days

Chronic or recurrent bacteriuria

- ▶ BY MOUTH
 - Child (body-weight 40 kg and above): 400 mg every 6–8 hours
 - Adult (body-weight 40 kg and above): 400 mg every 6–8 hours

Urinary-tract infections

- ▶ BY MOUTH
 - Child (body-weight up to 40 kg): 5–10 mg/kg every 6 hours, alternatively 20–40 mg/kg daily in 3 divided doses

- **UNLICENSED USE** Not licensed for use in children under 3 months.
- **CONTRA-INDICATIONS** Carnitine deficiency · gastro-intestinal obstruction · infants under 3 months · oesophageal strictures
- **CAUTIONS** Avoid in Acute porphyrias p. 1025
- **INTERACTIONS** → Appendix 1: penicillins
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Vulvovaginal fungal infection
 - ▶ **Uncommon** Dizziness · fatigue · gastrointestinal discomfort · gastrointestinal disorders · headache · hepatic function abnormal · oral ulceration · vertigo
- **PREGNANCY** Not known to be harmful, but manufacturer advises avoid.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **MONITORING REQUIREMENTS** Liver and renal function tests required in long-term use.
- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of fluid during meals while sitting or standing.
- **PATIENT AND CARER ADVICE** Patient counselling is advised on administration of pivmecillinam hydrochloride tablets (posture).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

penicillinase-resistant

F 536

Flucloxacillin

● INDICATIONS AND DOSE

Infections due to beta-lactamase-producing staphylococci including otitis externa | Adjunct in pneumonia | Adjunct in impetigo | Adjunct in cellulitis

- ▶ BY MOUTH
 - Child 1 month-1 year: 62.5–125 mg 4 times a day
 - Child 2–9 years: 125–250 mg 4 times a day
 - Child 10–17 years: 250–500 mg 4 times a day
 - Adult: 250–500 mg 4 times a day
- ▶ BY INTRAMUSCULAR INJECTION
 - Adult: 250–500 mg every 6 hours
- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
 - Adult: 0.25–2 g every 6 hours

Endocarditis (in combination with other antibacterial if necessary)

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
 - Adult (body-weight up to 85 kg): 8 g daily in 4 divided doses
 - Adult (body-weight 85 kg and above): 12 g daily in 6 divided doses

Osteomyelitis

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
 - Adult: Up to 8 g daily in 3–4 divided doses

Surgical prophylaxis

- ▶ INITIALLY BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
 - Adult: 1–2 g, to be administered up to 30 minutes before the procedure, then (by mouth or by intramuscular injection or by slow intravenous injection or by intravenous infusion) 500 mg every 6 hours if required for up to 4 further doses in high risk procedures

Staphylococcal lung infection in cystic fibrosis

- ▶ BY MOUTH
 - Child: 25 mg/kg 4 times a day (max. per dose 1 g), alternatively 100 mg/kg daily in 3 divided doses; maximum 4 g per day

Prevention of *Staphylococcus aureus* lung infection in cystic fibrosis—primary prevention

- ▶ BY MOUTH
 - Child 1 month-3 years: 125 mg twice daily

Prevention of *Staphylococcus aureus* lung infection in cystic fibrosis—secondary prevention

- ▶ BY MOUTH
 - Child: 50 mg/kg twice daily (max. per dose 1 g twice daily)

- **UNLICENSED USE** Flucloxacillin doses in the BNF may differ from those in product literature.

IMPORTANT SAFETY INFORMATION**HEPATIC DISORDERS**

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:

- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin
- flucloxacillin should be used with caution in patients with hepatic impairment

- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials

• CAUTIONS

- With intravenous use Accumulation of electrolytes can occur with high doses

- **INTERACTIONS** → Appendix 1: penicillins

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Rare or very rare** Arthralgia · fever

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**

- ▶ With oral use Gastrointestinal disorder

- ▶ **Uncommon**

- ▶ With oral use Purpura

- ▶ **Rare or very rare**

- ▶ With oral use Eosinophilia · myalgia

- ▶ **Frequency not known**

- ▶ With parenteral use Acute generalised exanthematous pustulosis (AGEP) · bronchospasm · bullous pemphigoid · coma · dyspnoea · electrolyte imbalance · erythema nodosum · hallucination · Jarisch-Herxheimer reaction · nephropathy · neurotoxicity · oral candidiasis · platelet dysfunction · purpura non-thrombocytopenic · vasculitis

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.

- **HEPATIC IMPAIRMENT** Use with caution.

• RENAL IMPAIRMENT

- ▶ With intravenous use Accumulation of electrolytes can occur in patients with renal failure.

Dose adjustments ▶ In adults Reduce dose if eGFR less than 10 mL/minute/1.73 m².

- ▶ In children Use normal dose every 8 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Floxapen[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%; suggested volume 100 mL given over 30–60 minutes. Via drip tubing in Glucose 5% or Sodium chloride 0.9%; continuous infusion not usually recommended.

29-May-2018

Temocillin

• INDICATIONS AND DOSE

Septicaemia | Urinary-tract infections | Lower respiratory-tract infections caused by susceptible Gram-negative bacteria

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 2 g every 12 hours, alternatively 2 g every 8 hours, higher daily dose to be used in critically ill patients

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature)

- **CAUTIONS** Accumulation of sodium from injection can occur with high doses

- **INTERACTIONS** → Appendix 1: penicillins

- **SIDE-EFFECTS** Arthralgia · fever · myalgia · nervous system disorder

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Trace amounts in milk.

- **RENAL IMPAIRMENT** Accumulation of sodium from injection can occur in patients with renal failure.

Dose adjustments Manufacturer advises reduce usual dose to 1 g every 12 hours if creatinine clearance 30–60 mL/minute; reduce usual dose to 1 g every 24 hours if creatinine clearance 10–30 mL/minute; reduce usual dose to 1 g every 48 hours or 500 mg every 24 hours if creatinine clearance less than 10 mL/minute; no information available to recommend dose adjustments with higher daily dose for use in critically ill patients.

- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for intramuscular injection, reconstitute 1 g with 2 mL water for injections or Sodium chloride 0.9% (or 0.5 or 1% lidocaine solution, if pain is experienced at injection site). Manufacturer advises for slow intravenous injection, reconstitute 1 g with 10 mL water for injections or Sodium chloride 0.9%; give over 3–4 minutes. Manufacturer advises for intermittent intravenous infusion, give in Glucose 5% or 10% or Sodium chloride 0.9% or Ringer's solution or Lactated Ringer's solution. Reconstitute 1 g with 10 mL water for injections or infusion fluid, then dilute in up to 150 mL infusion fluid; give over 30–40 minutes. For continuous intravenous infusion, consult product literature.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

ELECTROLYTES: May contain Sodium

- ▶ **Negaban** (Eumedica Pharmaceuticals)

Temocillin (as Temocillin sodium) 1 gram Negaban 1g powder for solution for injection vials | 1 vial [PoM] £25.45

ANTIBACTERIALS > POLYMYXINS

Colistimethate sodium

18-Dec-2016

(Colistin sulfomethate sodium)

- **DRUG ACTION** The polymyxin antibiotic, colistimethate sodium (colistin sulfomethate sodium), is active against Gram-negative organisms including *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, and *Klebsiella pneumoniae*. It is not absorbed by mouth and thus needs to be given by injection for a systemic effect.

● **INDICATIONS AND DOSE**

Gram-negative infections resistant to other antibacterials, including those caused by *Pseudomonas aeruginosa*, *Acinetobacter baumannii* and *Klebsiella pneumoniae*

- ▶ **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- ▶ Adult (body-weight up to 60 kg): 50 000–75 000 units/kg daily in 3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection
- ▶ Adult (body-weight 60 kg and above): 1–2 million units every 8 hours, to be administered into a totally implantable venous access device when giving via slow intravenous injection; maximum 6 million units per day

Adjunct to standard antibacterial therapy for *Pseudomonas aeruginosa* infection in cystic fibrosis

- ▶ **BY INHALATION OF NEBULISED SOLUTION**
- ▶ Adult: 1–2 million units twice daily, adjusted according to response, increased to 2 million units 3 times daily for subsequent respiratory isolates of *Pseudomonas aeruginosa*
- ▶ **BY INHALATION OF POWDER**
- ▶ Adult: 1.66 million units twice daily

PROMIXIN® INJECTION

Gram-negative infections resistant to other antibacterials, including those caused by *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, *Klebsiella pneumoniae*

- ▶ **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- ▶ Adult: 9 million units daily in 2–3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection, an initial loading dose of 9 million units (up to max. 12 million units, if adequate renal function) should be used in those who are critically ill, consult product literature for details

PROMIXIN® NEBULISER SOLUTION

Management of chronic pulmonary infections due to *Pseudomonas aeruginosa* in patients with cystic fibrosis

- ▶ **BY INHALATION OF NEBULISED SOLUTION**
- ▶ Child 2–17 years: 1–2 million units 2–3 times a day, for specific advice on administration using nebulisers—consult product literature; maximum 6 million units per day
- ▶ Adult: 1–2 million units 2–3 times a day, for specific advice on administration using nebulisers—consult product literature; maximum 6 million units per day

- **CONTRA-INDICATIONS** Myasthenia gravis
- **CAUTIONS**
- ▶ When used by inhalation Severe haemoptysis—risk of further haemorrhage
- **INTERACTIONS** → Appendix 1: colistimethate

● **SIDE-EFFECTS**

- ▶ **Common or very common**
 - ▶ When used by inhalation Arthralgia · asthenia · asthma · balance impaired · chest discomfort · cough · dyspnoea · dyspnoea · fever · haemorrhage · headache · lower respiratory tract infection · nausea · respiratory disorders · taste altered · throat complaints · tinnitus · vomiting
 - ▶ **Uncommon**
 - ▶ When used by inhalation Anxiety · appetite decreased · diarrhoea · drowsiness · ear congestion · flatulence · oral disorders · proteinuria · seizure · sputum purulent · thirst · weight change
 - ▶ **Rare or very rare**
 - ▶ With parenteral use Confusion · nephrotoxicity · presyncope · psychosis · speech slurred · visual impairment
 - ▶ **Frequency not known**
 - ▶ With parenteral use Apnoea · neurological effects · neurotoxicity · renal disorder · sensory disorder
- SIDE-EFFECTS, FURTHER INFORMATION** Neurotoxicity and nephrotoxicity are dose-related.

● **PREGNANCY**

- ▶ When used by inhalation Clinical use suggests probably safe.
- ▶ With intravenous use Use only if potential benefit outweighs risk.

- **BREAST FEEDING** Present in milk but poorly absorbed from gut; manufacturers advise avoid (or use only if potential benefit outweighs risk).

● **RENAL IMPAIRMENT**

Dose adjustments ▶ With intravenous use Reduce dose.

Monitoring ▶ With intravenous use In renal impairment, monitor plasma colistimethate sodium concentration during parenteral treatment—consult product literature. Recommended 'peak' plasma colistimethate sodium concentration (approx. 1 hour after intravenous injection or infusion) 5–15 mg/litre; pre-dose ('trough') concentration 2–6 mg/litre.

● **MONITORING REQUIREMENTS**

- ▶ With intravenous use Monitor renal function.
- ▶ When used by inhalation Measure lung function before and after initial dose of colistimethate sodium and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using a bronchodilator before the dose of colistimethate sodium.

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ When used by inhalation Other inhaled drugs should be administered before colistimethate sodium. For nebulisation administer required dose in 2–4 mL of sodium chloride 0.9% (or water for injections) or a 1:1 mixture of sodium chloride 0.9% and water for injection.
- ▶ With intravenous use For intravenous infusion (Colomycin®, Promixin®), give intermittently in Sodium chloride 0.9% (or Glucose 5% for Promixin® brand only); dilute with 50 mL infusion fluid and give over 30 minutes.

COLOMYCIN® Colomycin® Injection may be used for nebulisation; administer required dose in 2–4 mL of sodium chloride 0.9%, (or water for injections) or a 1:1 mixture of sodium chloride 0.9% and water for injection.

● **PRESCRIBING AND DISPENSING INFORMATION**

Colistimethate sodium is included in some preparations for topical application.

● **PATIENT AND CARER ADVICE**

- ▶ When used by inhalation Patient should be advised to rinse mouth with water after each dose of dry powder inhalation. Patients or carers should be given advice on how to administer colistimethate sodium; first dose should be given under medical supervision.
- Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness, confusion and visual disturbances.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Colistimethate sodium by dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013)**
NICE TA276

Colistimethate sodium dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis who would benefit from continued treatment, but do not tolerate the drug in its nebulised form. The manufacturer must provide colistimethate sodium dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving colistimethate sodium dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.

ANTIBACTERIALS > QUINOLONES

Quinolones

31-Oct-2017

Overview

Nalidixic acid and norfloxacin p. 551 are effective in uncomplicated urinary-tract infections.

Ciprofloxacin p. 548 is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including *Salmonella*, *Shigella*, *Campylobacter*, *Neisseria*, and *Pseudomonas*. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as *Streptococcus pneumoniae* and *Enterococcus faecalis*; it should not be used for pneumococcal pneumonia. It is active against *Chlamydia* and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin can be used for respiratory tract infections (but not for pneumococcal pneumonia), urinary-tract infections, infections of the gastro-intestinal system (including typhoid

fever), bone and joint infections, gonorrhoea and septicaemia caused by sensitive organisms.

Ofloxacin p. 551 is used for urinary-tract infections, lower respiratory-tract infections, gonorrhoea, and non-gonococcal urethritis and cervicitis.

Levofloxacin p. 549 is active against Gram-positive and Gram-negative organisms. It has greater activity against *Pneumococci* than ciprofloxacin.

Many *Staphylococci* are resistant to quinolones and their use should be avoided in MRSA infections.

Moxifloxacin p. 550 is active against Gram-positive and Gram-negative organisms. It has greater activity against Gram-positive organisms, including *Pneumococci*, than ciprofloxacin. Moxifloxacin is not active against *Pseudomonas aeruginosa* or meticillin-resistant *Staphylococcus aureus* (MRSA).

Quinolones

IMPORTANT SAFETY INFORMATION

The CSM has warned that quinolones may induce **convulsions** in patients with or without a history of convulsions; taking NSAIDs at the same time may also induce them.

TENDON DAMAGE

Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that:

- quinolones are contra-indicated in patients with a history of tendon disorders related to quinolone use;
- patients over 60 years of age are more prone to tendon damage;
- the risk of tendon damage is increased by the concomitant use of corticosteroids;
- if tendinitis is suspected, the quinolone should be discontinued immediately.

- **CONTRA-INDICATIONS** History of tendon disorders related to quinolone use

- **CAUTIONS** Can prolong the QT interval · children or adolescents (arthropathy has developed in weight-bearing joints in young animals) · conditions that predispose to seizures · diabetes (may affect blood glucose) · exposure to excessive sunlight should be avoided (discontinue if photosensitivity occurs) · G6PD deficiency · history of epilepsy · myasthenia gravis (risk of exacerbation)

CAUTIONS, FURTHER INFORMATION

- Use in children Quinolones cause arthropathy in the weight-bearing joints of immature animals and are therefore generally not recommended in children and growing adolescents. However, the significance of this effect in humans is uncertain and in some specific circumstances short-term use of ciprofloxacin may be justified in children.

● SIDE-EFFECTS

- **Common or very common** Appetite decreased · arthralgia · asthenia · constipation · diarrhoea · dizziness · dyspnoea · eye discomfort · eye disorders · fever · gastrointestinal discomfort · headache · hearing impairment · hepatic disorders · myalgia · nausea · QT interval prolongation · rhabdomyolysis · skin reactions · sleep disorders · taste altered · vision disorders · vomiting
- **Uncommon** Anaemia · anxiety · arrhythmias · chest pain · confusion · depression · drowsiness · dry eye · eosinophilia · eye inflammation · flatulence · hallucination · hyperhidrosis · hypersensitivity · hypotension · leucopenia · neutropenia · pain · paraesthesia · renal failure · seizure ·

- smell altered · tendon disorders · thrombocytopenia · tremor · vertigo
- **Rare or very rare** Agranulocytosis · angioedema · arthritis · coordination abnormal · haemolytic anaemia · hyperglycaemia · hypoglycaemia · muscle weakness · myasthenia gravis aggravated · nephritis tubulointerstitial · pancreatitis · photosensitivity reaction · polyneuropathy · pseudomembranous enterocolitis · psychotic disorder · severe cutaneous adverse reactions (SCARs) · stomatitis · suicidal tendencies · syncope · vasculitis
 - **Frequency not known** Peripheral neuropathy (sometimes irreversible)

SIDE-EFFECTS, FURTHER INFORMATION The drug should be discontinued if psychiatric, neurological, or hypersensitivity reactions (including severe rash) occur.

- **ALLERGY AND CROSS-SENSITIVITY** Use of quinolones contra-indicated in quinolone hypersensitivity.
- **PREGNANCY** Avoid in pregnancy—shown to cause arthropathy in *animal* studies; safer alternatives are available.

F 547

26-Apr-2018

Ciprofloxacin

● INDICATIONS AND DOSE

Fistulating Crohn's disease

- **BY MOUTH**
- Adult: 500 mg twice daily

Respiratory-tract infections

- **BY MOUTH**
- Adult: 500–750 mg twice daily
- **BY INTRAVENOUS INFUSION**
- Adult: 400 mg every 8–12 hours, to be given over 60 minutes

Pseudomonal lower respiratory-tract infection in cystic fibrosis

- **BY MOUTH**
- Adult: 750 mg twice daily

Urinary-tract infections

- **BY MOUTH**
- Adult: 250–750 mg twice daily
- **BY INTRAVENOUS INFUSION**
- Adult: 400 mg every 8–12 hours, to be given over 60 minutes

Acute uncomplicated cystitis in women

- **BY MOUTH**
- Adult: 250 mg twice daily for 3 days

Acute or chronic prostatitis

- **BY MOUTH**
- Adult: 500 mg twice daily for 28 days
- **BY INTRAVENOUS INFUSION**
- Adult: 400 mg every 8–12 hours, to be given over 60 minutes

Gonorrhoea

- **BY MOUTH**
- Adult: 500 mg for 1 dose

Most other infections

- **BY MOUTH**
- Adult: Initially 500 mg twice daily; increased to 750 mg twice daily, in severe or deep-seated infection
- **BY INTRAVENOUS INFUSION**
- Adult: 400 mg every 8–12 hours, to be given over 60 minutes

Surgical prophylaxis

- **BY MOUTH**
- Adult: 750 mg, to be taken 60 minutes before procedure

Anthrax (treatment and post-exposure prophylaxis)

- **BY MOUTH**
- Adult: 500 mg twice daily

► BY INTRAVENOUS INFUSION

- Adult: 400 mg every 12 hours, to be given over 60 minutes

Prevention of secondary case of meningococcal meningitis

► BY MOUTH

- Child 1 month–4 years: 30 mg/kg (max. per dose 125 mg) for 1 dose
- Child 5–11 years: 250 mg for 1 dose
- Child 12–17 years: 500 mg for 1 dose
- Adult: 500 mg for 1 dose

- **UNLICENSED USE** Not licensed for use in children for prophylaxis of meningococcal meningitis.
- **CAUTIONS** Acute myocardial infarction (risk factor for QT interval prolongation) · avoid excessive alkalinity of urine (risk of crystalluria) · bradycardia (risk factor for QT interval prolongation) · congenital long QT syndrome (risk factor for QT interval prolongation) · electrolyte disturbances (risk factor for QT interval prolongation) · ensure adequate fluid intake (risk of crystalluria) · heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) · history of symptomatic arrhythmias (risk factor for QT interval prolongation)
- **INTERACTIONS** → Appendix 1: quinolones
- **SIDE-EFFECTS**
- **Common or very common** Arthropathy (in children)
- **Uncommon** Akathisia · fungal superinfection · musculoskeletal pain · oedema · renal impairment · sensation abnormal · thrombocytosis · vasodilation
- **Rare or very rare** Antibiotic associated colitis · asthma · bone marrow disorders · crystalluria · erythema nodosum · gait abnormal · haematuria · intracranial pressure increased · leucocytosis · migraine · muscle cramps · muscle tone increased · olfactory nerve disorder · petechiae · status epilepticus
- **Frequency not known** Mood altered
- **PREGNANCY** A single dose of ciprofloxacin may be used for the prevention of a secondary case of meningococcal meningitis.
- **BREAST FEEDING** Amount too small to be harmful but manufacturer advises avoid.
- **RENAL IMPAIRMENT**
- Dose adjustments** ► With oral use in adults Give 250–500 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m² (every 24 hours if eGFR less than 30 mL/minute/1.73 m²).
- With intravenous use in adults Give (200 mg over 30 minutes), 200–400 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m² (every 24 hours if eGFR less than 30 mL/minute/1.73 m²).
- In children Reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—consult product literature.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.
- **PATIENT AND CARER ADVICE**
- Medicines for Children leaflet: Ciprofloxacin for bacterial infections www.medicinesforchildren.org.uk/ciprofloxacin-bacterial-infections-0
- Driving and skilled tasks** May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 7, 9, 25

► Ciprofloxacin (Non-proprietary)

Ciprofloxacin (as Ciprofloxacin hydrochloride)

100 mg Ciprofloxacin 100mg tablets | 6 tablet [PoM] £4.50 DT = £1.97

Ciprofloxacin (as Ciprofloxacin hydrochloride)

250 mg Ciprofloxacin 250mg tablets | 10 tablet [PoM] £7.25 DT = £0.39 | 20 tablet [PoM] £0.78-£11.20 | 100 tablet [PoM] £5.90

Ciprofloxacin (as Ciprofloxacin hydrochloride)

500 mg Ciprofloxacin 500mg tablets | 10 tablet [PoM] £14.00 DT = £0.71 | 20 tablet [PoM] £1.42-£21.23 | 100 tablet [PoM] £8.20

Ciprofloxacin (as Ciprofloxacin hydrochloride)

750 mg Ciprofloxacin 750mg tablets | 10 tablet [PoM] £20.00 DT = £8.00

► Ciproxin (Bayer Plc)

Ciprofloxacin (as Ciprofloxacin hydrochloride) 500 mg Ciproxin 500mg tablets | 10 tablet [PoM] £12.49 DT = £0.71

Ciprofloxacin (as Ciprofloxacin hydrochloride) 750 mg Ciproxin 750mg tablets | 10 tablet [PoM] £17.78 DT = £8.00

Oral suspension

CAUTIONARY AND ADVISORY LABELS 7, 9, 25

► Ciproxin (Bayer Plc)

Ciprofloxacin (as Ciprofloxacin lactate) 2 mg per

1 ml Ciprofloxacin 200mg/100ml infusion bags | 5 bag [PoM] £60.00 (Hospital only)

Ciprofloxacin 400mg/200ml infusion bags | 5 bag [PoM] £85.00 |

10 bag [PoM] £200.00 (Hospital only)

Levofloxacin

13-Jul-2017

● INDICATIONS AND DOSE

Acute sinusitis

► BY MOUTH

Adult: 500 mg once daily for 10–14 days

Acute exacerbation of chronic bronchitis

► BY MOUTH

Adult: 500 mg once daily for 7–10 days

Community-acquired pneumonia

► BY MOUTH

Adult: 500 mg 1–2 times a day for 7–14 days

► BY INTRAVENOUS INFUSION

Adult: 500 mg 1–2 times a day, to be given over at least 60 minutes

Urinary-tract infections

► BY MOUTH

Adult: 500 mg once daily for 7–14 days

Urinary-tract infections (uncomplicated infection)

► BY MOUTH

Adult: 250 mg once daily for 3 days

Complicated urinary-tract infections

► BY INTRAVENOUS INFUSION

Adult: 500 mg once daily, to be given over at least 60 minutes

Chronic prostatitis

► BY MOUTH

Adult: 500 mg once daily for 28 days

► BY INTRAVENOUS INFUSION

Adult: 500 mg once daily, to be given over at least 60 minutes

Complicated skin infections | Complicated soft-tissue infections

► BY MOUTH

Adult: 500 mg 1–2 times a day for 7–14 days

► BY INTRAVENOUS INFUSION

Adult: 500 mg 1–2 times a day, to be given over at least 60 minutes

Inhalation of anthrax (treatment and post-exposure prophylaxis)

► BY MOUTH

Adult: 500 mg once daily for 8 weeks

► BY INTRAVENOUS INFUSION

Adult: 500 mg once daily, to be given over at least 60 minutes

Chronic pulmonary infections due to *Pseudomonas aeruginosa* in cystic fibrosis

► BY INHALATION OF NEBULISED SOLUTION

Adult: 240 mg twice daily for 28 days, subsequent courses repeated after 28-day interval without levofloxacin nebuliser solution

- **CAUTIONS** History of psychiatric illness · risk factors for QT interval prolongation (e.g. electrolyte disturbances, acute myocardial infarction, heart failure with reduced left ventricular ejection fraction, bradycardia, congenital long QT syndrome, history of symptomatic arrhythmias)

- **INTERACTIONS** → Appendix 1: quinolones

● SIDE-EFFECTS

► Common or very common

- When used by inhalation Bronchial secretion changes · cough · dysphonia · exercise tolerance decreased · haemoptysis · increased risk of infection · respiratory disorders · weight decreased

► Uncommon

- When used by inhalation Costochondritis · hyperbilirubinaemia · joint stiffness
- With intravenous use or oral use Increased risk of infection

► Rare or very rare

- With intravenous use or oral use Acute kidney injury · nightmare · palpitations

► Frequency not known

- With intravenous use or oral use Anosmia · cardiac arrest · diarrhoea haemorrhagic · hypersensitivity vasculitis · hypoglycaemic coma · idiopathic intracranial hypertension · ligament rupture · movement disorders · muscle rupture · pancytopenia · respiratory disorders · uveitis · ventricular tachycardia · vision loss

SIDE-EFFECTS, FURTHER INFORMATION Systemic side-effects may occur with nebulised levofloxacin.

Bronchospasm Manufacturer advises if acute symptomatic bronchospasm occurs after receiving nebulised levofloxacin, patients may benefit from the use of a short-acting inhaled bronchodilator at least 15 minutes to 4 hours prior to subsequent doses.

- **BREAST FEEDING** Manufacturer advises avoid.

• RENAL IMPAIRMENT

Dose adjustments ▶ With intravenous use or oral use Usual initial dose, then use half normal dose if eGFR 20–50 mL/minute/1.73 m²; consult product literature if eGFR less than 20 mL/minute/1.73 m².

- ▶ When used by inhalation Manufacturer advises avoid if creatinine clearance less than 20 mL/minute.

• PATIENT AND CARER ADVICE

- ▶ When used by inhalation Manufacturer advises patients and carers should be given advice on how to administer levofloxacin.

Missed doses ▶ When used by inhalation Manufacturer advises if a dose is more than 4 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks May impair performance of skilled tasks (e.g. driving).

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2016) that levofloxacin (*Quinsair*®) is accepted for restricted use within NHS Scotland for the management of chronic pulmonary infections due to *Pseudomonas aeruginosa* in patients with cystic fibrosis, as a third-line treatment option after colistimethate sodium (first line) and tobramycin (second line). This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (November 2016) that levofloxacin (*Quinsair*®) is recommended as an option for restricted use within NHS Wales as third-line therapy for the management of chronic pulmonary infections due to *Pseudomonas aeruginosa* in patients with cystic fibrosis, who do not respond to, or are intolerant of, second-line treatment with tobramycin, only if the approved Wales Patient Access Scheme (WPAS) is used or where the list price is equivalent or lower.

• MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 6, 9, 25

Oflxacin● **INDICATIONS AND DOSE****Urinary-tract infections**

- BY MOUTH
- Adult: 200–400 mg daily, preferably taken in the morning; increased if necessary to 400 mg twice daily, in upper urinary tract infections

Complicated urinary-tract infection

- BY INTRAVENOUS INFUSION
- Adult: 200 mg daily, increased if necessary to 400 mg twice daily, dose increased for severe or complicated

infections, to be given over at least 30 minutes for each 200 mg

Acute or chronic prostatitis

- BY MOUTH
- Adult: 200 mg twice daily for 28 days

Lower respiratory-tract infections

- BY MOUTH
- Adult: 400 mg daily, dose preferably taken in the morning, then increased if necessary to 400 mg twice daily
- BY INTRAVENOUS INFUSION
- Adult: 200 mg twice daily, increased to 400 mg twice daily, dose to be increased for severe or complicated infections, to be given over at least 30 minutes for each 200 mg

Skin and soft-tissue infections

- BY MOUTH
- Adult: 400 mg twice daily
- BY INTRAVENOUS INFUSION
- Adult: 400 mg twice daily, to be given over at least 30 minutes for each 200 mg

Uncomplicated gonorrhoea

- BY MOUTH
- Adult: 400 mg as a single dose

Uncomplicated genital chlamydial infection | Non-gonococcal urethritis

- BY MOUTH
- Adult: 400 mg daily for 7 days, dose may be taken as a single daily dose or in divided doses

Pelvic inflammatory disease

- BY MOUTH
- Adult: 400 mg twice daily for 14 days

Septicaemia

- BY INTRAVENOUS INFUSION
- Adult: 200 mg twice daily, increased if necessary to 400 mg twice daily, dose to be increased for severe or complicated infections, to be given over at least 30 minutes for each 200 mg

- **CAUTIONS** Acute myocardial infarction (risk factor for QT interval prolongation) · bradycardia (risk factor for QT interval prolongation) · congenital long QT syndrome (risk factor for QT interval prolongation) · electrolyte disturbances (risk factor for QT interval prolongation) · heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) · history of psychiatric illness · history of symptomatic arrhythmias (risk factor for QT interval prolongation)

- **INTERACTIONS** → Appendix 1: quinolones

● **SIDE-EFFECTS**

- **Uncommon** Cough · increased risk of infection
- **Rare or very rare** Acute kidney injury · enterocolitis · hot flush · hypersensitivity · movement disorders · nightmare · respiratory disorders
- **Frequency not known** Acute generalised exanthematous pustulosis (AGEP) · bone marrow failure · hypoglycaemic coma · ligament rupture · muscle rupture · myopathy · nephritis acute interstitial · uveitis

- **BREAST FEEDING** Amount probably too small to be harmful but manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Use with caution; elimination may be reduced in severe impairment.

● **RENAL IMPAIRMENT**

Dose adjustments Usual initial dose, then use half normal dose if eGFR 20–50 mL/minute/1.73 m²; 100 mg every 24 hours if eGFR less than 20 mL/minute/1.73 m²

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks May affect performance of skilled tasks (e.g. driving); effects enhanced by alcohol.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 6, 9, 11

200mg/100ml solution for infusion bottles | 1 bottle [PoM] £16.16

ANTIBACTERIALS > SULFONAMIDES

Co-trimoxazole

- **DRUG ACTION** Sulfamethoxazole and trimethoprim are used in combination (as co-trimoxazole) because of their synergistic activity (the importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic).

• INDICATIONS AND DOSE

Treatment of susceptible infections

► BY MOUTH

- Child 6 weeks–5 months: 120 mg twice daily, alternatively 24 mg/kg twice daily
- Child 6 months–5 years: 240 mg twice daily, alternatively 24 mg/kg twice daily
- Child 6–11 years: 480 mg twice daily, alternatively 24 mg/kg twice daily
- Child 12–17 years: 960 mg twice daily
- Adult: 960 mg twice daily
- BY INTRAVENOUS INFUSION
- Adult: 960 mg every 12 hours, increased to 1.44 g every 12 hours, increased dose used in severe infection

Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature)

► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Child: 120 mg/kg daily in 2–4 divided doses for 14–21 days, oral route preferred for children
- Adult: 120 mg/kg daily in 2–4 divided doses for 14–21 days

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections

► BY MOUTH

- Child: 450 mg/m² twice daily (max. per dose 960 mg twice daily) for 3 days of the week (either consecutively or on alternate days), dose regimens may vary, consult local guidelines
- Adult: 960 mg once daily, reduced if not tolerated to 480 mg once daily, alternatively 960 mg once daily on alternate days, alternate day dose to be given 3 times weekly, alternatively 960 mg twice a day on alternate days, alternate day dose to be given 3 times weekly

DOSE EQUIVALENCE AND CONVERSION

- 480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg.

- **UNLICENSED USE** Not licensed for *Burkholderia cepacia* infections in cystic fibrosis. Not licensed for

Stenotrophomonas maltophilia infections. Not licensed for use in children under 6 weeks.

IMPORTANT SAFETY INFORMATION

RESTRICTIONS ON THE USE OF CO-TRIMOXAZOLE

Co-trimoxazole is the drug of choice in the prophylaxis and treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia; it is also indicated for nocardiasis, *Stenotrophomonas maltophilia* infection [unlicensed indication], and toxoplasmosis. It should only be considered for use in acute exacerbations of chronic bronchitis and infections of the urinary tract when there is bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in acute otitis media in children when there is good reason to prefer it. Co-trimoxazole is also used for the treatment of infections caused by *Burkholderia cepacia* in cystic fibrosis [unlicensed indication].

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025
- **CAUTIONS** Asthma · avoid in blood disorders (unless under specialist supervision) · avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus · elderly (increased risk of serious side-effects) · G6PD deficiency (risk of haemolytic anaemia) · maintain adequate fluid intake · predisposition to folate deficiency · predisposition to hyperkalaemia (in adults)
- **INTERACTIONS** → Appendix 1: sulfonamides · trimethoprim
- **SIDE-EFFECTS**
 - **Common or very common** Diarrhoea · electrolyte imbalance · fungal overgrowth · headache · nausea · skin reactions
 - **Uncommon** Vomiting
 - **Rare or very rare** Agranulocytosis · angioedema · aplastic anaemia · appetite decreased · arthralgia · ataxia · cough · depression · dizziness · dyspnoea · eosinophilia · fever · haemolysis · haemolytic anaemia · hallucination · hepatic disorders · hypoglycaemia · leucopenia · lung infiltration · megaloblastic anaemia · meningitis aseptic · metabolic acidosis · methaemoglobinaemia · myalgia · myocarditis allergic · nephritis tubulointerstitial · neutropenia · oral disorders · pancreatitis · peripheral neuritis · photosensitivity reaction · pseudomembranous enterocolitis · renal impairment · renal tubular acidosis · seizure · serum sickness · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · thrombocytopenia · tinnitus · uveitis · vasculitis · vertigo
- **SIDE-EFFECTS, FURTHER INFORMATION** Co-trimoxazole is associated with rare but serious side effects. Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome or toxic epidermal necrolysis) develop.
- **PREGNANCY** Teratogenic risk in first trimester (trimethoprim a folate antagonist). Neonatal haemolysis and methaemoglobinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole).
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe liver disease.
- **RENAL IMPAIRMENT**
 - In adults Avoid if eGFR less than 15 mL/minute/1.73 m² and if plasma-sulfamethoxazole concentration cannot be monitored.
 - In children Avoid if estimated glomerular filtration rate less than 15 mL/minute/1.73 m² and if plasma-sulfamethoxazole concentration cannot be monitored.

Dose adjustments ▶ In adults Use half normal dose if eGFR 15–30 mL/minute/1.73 m².

▶ In children Use half normal dose if estimated glomerular filtration rate 15–30 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- ▶ In children Plasma concentration monitoring may be required with high doses; seek expert advice.
- ▶ Monitor blood counts on prolonged treatment.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use in children For intermittent *intravenous infusion*, may be further diluted in glucose 5% and 10% or sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and the required dose infused over max. 60 minutes; check container for haze or precipitant during administration. In severe fluid restriction may be given undiluted via a central venous line.
- ▶ With intravenous use in adults For *intravenous infusion* (Septrin® for infusion), give intermittently in Glucose 5% or 10% or Sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and infused over max. 60 minutes.

● PRESCRIBING AND DISPENSING INFORMATION

Co-trimoxazole is a mixture of trimethoprim and sulfamethoxazole (sulphamethoxazole) in the proportions of 1 part to 5 parts.

Flavours of oral liquid formulations may include banana, or vanilla.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Sulfadiazine

(Sulphadiazine)

- **DRUG ACTION** Sulfadiazine is a short-acting sulphonamide with bacteriostatic activity against a broad spectrum of organisms. The importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

● INDICATIONS AND DOSE

Prevention of rheumatic fever recurrence

▶ BY MOUTH

- ▶ Adult (body-weight up to 30 kg): 500 mg daily
- ▶ Adult (body-weight 30 kg and above): 1 g daily

IMPORTANT SAFETY INFORMATION

SAFETY PRACTICE

Sulfadiazine has been confused with sulfasalazine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025
- **CAUTIONS** Asthma • avoid in blood disorders (unless under specialist supervision) • avoid in infants under 6 weeks (except for treatment or prophylaxis of *pneumocystis pneumonia*) because of the risk of kernicterus • elderly • G6PD deficiency (risk of haemolytic anaemia) • maintain adequate fluid intake • predisposition to folate deficiency • predisposition to hyperkalaemia
- **INTERACTIONS** → Appendix 1: sulfonamides
- **SIDE-EFFECTS**
 - ▶ **Rare or very rare** Haemolytic anaemia
 - ▶ **Frequency not known** Agranulocytosis • aplastic anaemia • appetite decreased • ataxia • back pain • blood disorders • cough • crystalluria • cyanosis • depression • diarrhoea • dizziness • drowsiness • dyspnoea • eosinophilia • erythema nodosum • fatigue • fever • haematuria • hallucination • headache • hepatic disorders • hypoglycaemia • hypoproteinaemia • hypothyroidism • idiopathic intracranial hypertension • insomnia • leucopenia • meningitis aseptic • myocarditis • nausea • nephritis tubulointerstitial • nephrotoxicity • nerve disorders • neurological effects • neutropenia • oral disorders • pancreatitis • photosensitivity reaction • pseudomembranous enterocolitis • psychosis • renal impairment • renal tubular necrosis • respiratory disorders • seizure • serum sickness-like reaction • severe cutaneous adverse reactions (SCARs) • skin reactions • systemic lupus erythematosus (SLE) • thrombocytopenia • tinnitus • vasculitis • vertigo • vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION** Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome or toxic epidermal necrolysis) develop.
- **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment; high risk of crystalluria.
- **MONITORING REQUIREMENTS** Monitor blood counts on prolonged treatment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 9, 27

Sulfadiazine 500 mg Sulfadiazine 500mg tablets | 56 tablet [PoM]
£190.74 DT = £152.95

ANTIBACTERIALS > TETRACYCLINES AND RELATED DRUGS**Tetracyclines****Overview**

The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. They remain, however, the treatment of choice for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline p. 555 with either streptomycin p. 512 or rifampicin p. 571), and the spirochaete, *Borrelia burgdorferi* (See Lyme disease). They are also used in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, in exacerbations of chronic bronchitis (because of their activity against *Haemophilus influenzae*), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin p. 530).

Tetracyclines have a role in the management of methicillin-resistant *Staphylococcus aureus* (MRSA) infection.

Microbiologically, there is little to choose between the various tetracyclines, the only exception being minocycline p. 556 which has a broader spectrum; it is active against *Neisseria meningitidis* and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo. Compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

Tetracyclines

● **CONTRA-INDICATIONS** Children under 12 years (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia)

● **CAUTIONS** Myasthenia gravis (muscle weakness may be increased) · systemic lupus erythematosus (may be exacerbated)

● **SIDE-EFFECTS**

► **Common or very common** Angioedema · diarrhoea · headache · Henocho-Schönlein purpura · hypersensitivity · nausea · pericarditis · photosensitivity reaction · skin reactions · systemic lupus erythematosus exacerbated · vomiting

► **Rare or very rare** Appetite decreased · discolouration of thyroid gland · dysphagia · eosinophilia · fontanelle bulging (in infants) · gastrointestinal disorders · haemolytic anaemia · hepatic disorders · idiopathic intracranial hypertension · increased risk of infection · neutropenia · oral disorders · pancreatitis · pseudomembranous enterocolitis · severe cutaneous adverse reactions (SCARs) · thrombocytopenia

► **Frequency not known** Dizziness

SIDE-EFFECTS, FURTHER INFORMATION Headache and visual disturbances may indicate benign intracranial hypertension (discontinue treatment if raised intracranial pressure develops).

● **PREGNANCY** Should **not** be given to pregnant women; effects on skeletal development have been documented in the first trimester in *animal* studies. Administration during the second or third trimester may cause discoloration of the child's teeth, and maternal hepatotoxicity has been reported with large parenteral doses.

● **BREAST FEEDING** Should **not** be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).

● **HEPATIC IMPAIRMENT** Should be avoided or used with caution in patients with hepatic impairment.

▮ above

Demeclocycline hydrochloride● **INDICATIONS AND DOSE**

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

► **BY MOUTH**

► **Adult:** 150 mg 4 times a day, alternatively 300 mg twice daily

Treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable

► **BY MOUTH**

► **Adult:** Initially 0.9–1.2 g daily in divided doses, maintenance 600–900 mg daily

● **CAUTIONS** Photosensitivity more common than with other tetracyclines

● **INTERACTIONS** → Appendix 1: tetracyclines

● **SIDE-EFFECTS**

► **Rare or very rare** Agranulocytosis · aplastic anaemia · hearing impairment · nephritis

► **Frequency not known** Intracranial pressure increased · muscle weakness · nephrogenic diabetes insipidus · vision disorders

● **HEPATIC IMPAIRMENT**

Dose adjustments Max. 1 g daily in divided doses.

● **RENAL IMPAIRMENT** May exacerbate renal failure and should **not** be given to patients with renal impairment.

● **PATIENT AND CARER ADVICE** Patients should be advised to avoid exposure to sunlight or sun lamps.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

Tablet

► **Demeclocycline hydrochloride (Non-proprietary)**

● INDICATIONS AND DOSE

Susceptible infections (e.g. *chlamydia*, *rickettsia* and *mycoplasma*)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily
- ▶ Adult: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily

Acute sinusitis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily for 4 days
- ▶ Adult: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily for 4 days

Severe infections (including refractory urinary-tract infections)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: 200 mg daily
- ▶ Adult: 200 mg once daily

Acne

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg once daily
- ▶ Adult: 100 mg once daily

Rosacea

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 100 mg once daily

Papulopustular facial rosacea (without ocular involvement)

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 40 mg once daily for 16 weeks, dose to be taken in the morning, consider discontinuing treatment if no response after 6 weeks

Early syphilis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg twice daily for 14 days
- ▶ Adult: 100 mg twice daily for 14 days

Late latent syphilis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg twice daily for 28 days
- ▶ Adult: 100 mg twice daily for 28 days

Neurosyphilis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 200 mg twice daily for 28 days

Uncomplicated genital chlamydia | Non-gonococcal urethritis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg twice daily for 7 days
- ▶ Adult: 100 mg twice daily for 7 days

Pelvic inflammatory disease

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg twice daily for 14 days
- ▶ Adult: 100 mg twice daily for 14 days

Lyme disease (under expert supervision)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg twice daily for 10–14 days (for 28 days in Lyme arthritis)
- ▶ Adult: 100 mg twice daily for 10–14 days (for 28 days in Lyme arthritis)

Anthrax (treatment or post-exposure prophylaxis)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg twice daily
- ▶ Adult: 100 mg twice daily

Prophylaxis of malaria

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years
- ▶ Adult: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years

Adjunct to quinine in treatment of *Plasmodium falciparum* malaria

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: 200 mg daily for 7 days
- ▶ Adult: 200 mg daily for 7 days

Periodontitis (as an adjunct to gingival scaling and root planing)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: 20 mg twice daily for 3 months
- ▶ Adult: 20 mg twice daily for 3 months

- **UNLICENSED USE** Doxycycline doses in BNF Publications may differ from those in product literature. Not licensed for malaria prophylaxis during pregnancy. Not licensed for treatment or post-exposure prophylaxis of anthrax. [EvGr](#) Duration of treatment for acute sinusitis adheres to national guidelines. [⬠](#) See Sinusitis (acute) p. 1168 for further information. Immediate-release doxycycline not licensed for treatment of rosacea.

- **CAUTIONS** Alcohol dependence

- **INTERACTIONS** → Appendix 1: tetracyclines

● SIDE-EFFECTS

- ▶ **Common or very common** Dyspnoea · hypotension · peripheral oedema · serum sickness · tachycardia
- ▶ **Uncommon** Gastritis · gastrointestinal discomfort
- ▶ **Rare or very rare** Antibiotic associated colitis · arthralgia · flushing · hepatic function abnormal · myalgia · photoonycholysis · tinnitus · vision disorders

- **PREGNANCY** When travel to malarious areas is unavoidable during pregnancy, doxycycline can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks' gestation.

- **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).

- **MONITORING REQUIREMENTS** When used for periodontitis, monitor for superficial fungal infection, particularly if predisposition to oral candidiasis.

- **DIRECTIONS FOR ADMINISTRATION** Capsules and Tablets should be swallowed whole with plenty of fluid, while sitting or standing. Capsules should be taken during meals.

- **PATIENT AND CARER ADVICE** Counselling on administration advised. Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.

Tetracycline

● INDICATIONS AND DOSE

Susceptible infections (e.g. *chlamydia*, *rickettsia*, *mycoplasma*)

- BY MOUTH
- Child 12–17 years: 250 mg 4 times a day, increased if necessary to 500 mg 3–4 times a day, increased dose used in severe infections
- Adult: 250 mg 4 times a day, increased if necessary to 500 mg 3–4 times a day, increased dose used in severe infections

Rosacea

- BY MOUTH
- Adult: 500 mg twice daily usually for 6–12 weeks (course may be repeated intermittently)

Acne

- BY MOUTH
- Child 12–17 years: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to

6 months but in more severe cases treatment may need to be continued for 2 years or longer

- Adult: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer

Diabetic diarrhoea in autonomic neuropathy

- BY MOUTH
- Adult: 250 mg for 2 or 3 doses

Non-gonococcal urethritis

- BY MOUTH
- Child 12–17 years: 500 mg 4 times a day for 7–14 days (21 days if failure or relapse after first course)
- Adult: 500 mg 4 times a day for 7–14 days (21 days if failure or relapse after first course)

- **UNLICENSED USE** Not licensed for treatment of diabetic diarrhoea in *autonomic neuropathy*.

- **INTERACTIONS** → Appendix 1: tetracyclines

- **SIDE-EFFECTS**

- **Rare or very rare** Agranulocytosis · aplastic anaemia · nephritis · renal impairment
- **Frequency not known** Gastrointestinal discomfort · hepatic steatosis · overgrowth of nonsusceptible organisms

- **HEPATIC IMPAIRMENT**

Dose adjustments Max. 1 g daily in divided doses.

- **RENAL IMPAIRMENT** May exacerbate renal failure and should **not** be given to patients with renal impairment.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of fluid while sitting or standing.

- **PATIENT AND CARER ADVICE** Counselling on administration advised.

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Tetracycline Tablets may be prescribed.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 7, 9, 23

- **Tetracycline (Non-proprietary)**

Tetracycline hydrochloride 250 mg Tetracycline 250mg tablets | 28 tablet [PoM] £13.90 DT = £1.27

Tigecycline

- **DRUG ACTION** Tigecycline is a glycylcycline antibacterial structurally related to the tetracyclines. Tigecycline is active against Gram-positive and Gram-negative bacteria, including tetracycline-resistant organisms, and some anaerobes. It is also active against meticillin-resistant *Staphylococcus aureus* and vancomycin-resistant enterococci, but *Pseudomonas aeruginosa* and many strains of *Proteus spp* are resistant to tigecycline.

- **INDICATIONS AND DOSE**

Treatment of complicated skin and soft-tissue infections and complicated abdominal infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used

- BY INTRAVENOUS INFUSION
- Adult: Initially 100 mg, then 50 mg every 12 hours for 5–14 days, not recommended for the treatment of foot infections in patients with diabetes

- **CAUTIONS** Cholestasis

- **INTERACTIONS** → Appendix 1: tetracyclines
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abscess · appetite decreased · diarrhoea · dizziness · gastrointestinal discomfort · headache · healing impaired · hyperbilirubinaemia · hypoglycaemia · hypoproteinaemia · increased risk of infection · nausea · sepsis · skin reactions · vomiting
 - ▶ **Uncommon** Hepatic disorders · pancreatitis · thrombocytopenia
 - ▶ **Frequency not known** Acidosis · azotaemia · hyperphosphataemia · hypofibrinogenaemia · idiopathic intracranial hypertension · photosensitivity reaction · pseudomembranous enterocolitis · severe cutaneous adverse reactions (SCARs) · tooth discolouration
- **SIDE-EFFECTS, FURTHER INFORMATION** Side-effects similar to those of the tetracyclines can potentially occur.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to tetracyclines.
- **PREGNANCY** Tetracyclines should **not** be given to pregnant women; effects on skeletal development have been documented in the first trimester in *animal* studies. Administration during the second or third trimester may cause discoloration of the child's teeth, and maternal hepatotoxicity has been reported with large parenteral doses.
- **BREAST FEEDING** Manufacturer advises caution—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT**
 - Dose adjustments** Initially 100 mg then 25 mg every 12 hours in severe hepatic impairment.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Tygacil®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute each vial with 5.3 mL infusion fluid to produce a 10 mg/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 30–60 minutes.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Tigecycline (Non-proprietary)**

Tigecycline 50 mg Tigecycline 50mg powder for solution for infusion vials | 10 vial [PoM] £290.79 (Hospital only)

▶ **Tygacil** (Pfizer Ltd)

Tigecycline 50 mg Tygacil 50mg powder for solution for infusion vials | 10 vial [PoM] £323.10 (Hospital only)

ANTIBACTERIALS > OTHER

Chloramphenicol

- **DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

● **INDICATIONS AND DOSE**

Life threatening infections particularly those caused by *Haemophilus influenzae* | Typhoid fever

- ▶ BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ **Adult:** 12.5 mg/kg every 6 hours, in exceptional cases dose can be doubled for severe infections such as septicaemia and meningitis, providing high doses reduced as soon as clinically indicated

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025
- **CAUTIONS** Avoid repeated courses and prolonged treatment
- **INTERACTIONS** → Appendix 1: chloramphenicol
- **SIDE-EFFECTS**
 - ▶ **Rare or very rare**
 - ▶ With parenteral use Aplastic anaemia (reversible or irreversible, with reports of resulting leukaemia)

▶ **Frequency not known**

- ▶ With oral use Bone marrow disorders · circulatory collapse · diarrhoea · enterocolitis · nausea · optic neuritis · oral disorders · ototoxicity · vomiting
- ▶ With parenteral use Agranulocytosis · bone marrow disorders · depression · diarrhoea · dry mouth · fungal superinfection · headache · nausea · nerve disorders · thrombocytopenic purpura · urticaria · vision disorders · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections.

- **PREGNANCY** Manufacturer advises avoid; neonatal 'grey-baby syndrome' if used in third trimester.
- **BREAST FEEDING** Manufacturer advises avoid; use another antibiotic; may cause bone-marrow toxicity in infant; concentration in milk usually insufficient to cause 'grey syndrome'.
- **HEPATIC IMPAIRMENT** Avoid if possible—increased risk of bone-marrow depression.
 - Dose adjustments** Reduce dose.
 - Monitoring** Monitor plasma-chloramphenicol concentration in hepatic impairment.
- **RENAL IMPAIRMENT** Avoid in severe renal impairment unless no alternative; dose-related depression of haematopoiesis.
- **MONITORING REQUIREMENTS**
 - ▶ Plasma concentration monitoring preferred in the elderly.
 - ▶ Recommended peak plasma concentration (approx. 2 hours after administration by mouth, intravenous injection or infusion) 10–25 mg/litre; pre-dose ('trough') concentration should not exceed 15 mg/litre.
 - ▶ Blood counts required before and periodically during treatment.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Chloramphenicol 250 mg Chloramphenicol 250mg capsules | 60 capsule [PoM] £377.00 DT = £377.00

Daptomycin

25-Apr-2018

- **DRUG ACTION** Daptomycin is a lipopeptide antibacterial with a spectrum of activity similar to vancomycin but its efficacy against enterococci has not been established. It needs to be given with other antibacterials for mixed infections involving Gram-negative bacteria and some anaerobes.

● **INDICATIONS AND DOSE**

Complicated skin and soft-tissue infections caused by Gram-positive bacteria

- ▶ BY INTRAVENOUS INFUSION
- ▶ **Child 12–23 months:** 10 mg/kg once daily for up to 14 days, alternatively 12 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteraemia—duration of treatment in accordance with risk of complications in individual patients

- ▶ Child 2-6 years: 9 mg/kg once daily for up to 14 days, alternatively 12 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteraemia—duration of treatment in accordance with risk of complications in individual patients
- ▶ Child 7-11 years: 7 mg/kg once daily for up to 14 days, alternatively 9 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteraemia—duration of treatment in accordance with risk of complications in individual patients
- ▶ Child 12-17 years: 5 mg/kg once daily for up to 14 days, alternatively 7 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteraemia—duration of treatment in accordance with risk of complications in individual patients

Complicated skin and soft-tissue infections caused by Gram-positive bacteria

▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 4 mg/kg once daily for 7-14 days or longer if necessary, alternatively 6 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteraemia—duration of treatment may need to be longer than 14 days in accordance with risk of complications in individual patients

Right-sided infective endocarditis caused by *Staphylococcus aureus* (administered on expert advice)

▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 6 mg/kg once daily, duration of treatment in accordance with official recommendations

● CAUTIONS Obesity (limited information on safety and efficacy)

● INTERACTIONS → Appendix 1: daptomycin

● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · anxiety · asthenia · constipation · diarrhoea · dizziness · fever · flatulence · gastrointestinal discomfort · headache · hypertension · hypotension · increased risk of infection · insomnia · nausea · pain · skin reactions · vomiting
- ▶ **Uncommon** Appetite decreased · arrhythmias · arthralgia · electrolyte imbalance · eosinophilia · flushing · glossitis · hyperglycaemia · muscle weakness · myalgia · myopathy · paraesthesia · renal impairment · taste altered · thrombocytosis · tremor · vertigo
- ▶ **Rare or very rare** Jaundice
- ▶ **Frequency not known** Acute generalised exanthematous pustulosis (AGEP) · antibiotic associated colitis · chills · cough · infusion related reaction · peripheral neuropathy · respiratory disorders · syncope

SIDE-EFFECTS, FURTHER INFORMATION If unexplained muscle pain, tenderness, weakness, or cramps develop during treatment, measure creatine kinase every 2 days; discontinue if unexplained muscular symptoms and creatine elevated markedly.

● PREGNANCY Manufacturer advises use only if potential benefit outweighs risk—no information available.

● BREAST FEEDING Present in milk in small amounts, but absorption from gastrointestinal tract negligible.

● HEPATIC IMPAIRMENT Manufacturer advises caution in severe hepatic impairment—no information available.

● RENAL IMPAIRMENT

- ▶ In children Manufacturer advises the dosage regimen has not been established—use with caution and monitor renal function regularly.
- ▶ In adults Manufacturer advises use only when potential benefit outweighs risk—higher risk of developing myopathy; monitor renal function regularly.

Dose adjustments ▶ In adults Use normal dose every 48 hours if eGFR less than 30 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor plasma creatine phosphokinase (CPK) before treatment and then at least weekly during treatment; monitor CPK more frequently in patients at higher risk of developing myopathy, including those with renal impairment, taking other drugs associated with myopathy, or if CPK elevated more than 5 times upper limit of normal before treatment.
- ▶ Manufacturer advises monitor renal function regularly during concomitant administration of potentially nephrotoxic drugs.

● EFFECT ON LABORATORY TESTS Interference with assay for prothrombin time and INR—take blood sample immediately before daptomycin dose.

● DIRECTIONS FOR ADMINISTRATION

- ▶ In children For *intravenous infusion*, manufacturer advises give intermittently in Sodium Chloride 0.9%; reconstitute with Sodium Chloride 0.9% (350 mg in 7 mL, 500 mg in 10 mL); gently rotate vial without shaking; allow to stand for at least 10 minutes then rotate gently to dissolve; dilute requisite dose in 50 mL infusion fluid and give over 60 minutes for children aged 1-6 years and over 30 minutes for children aged 7-17 years.
- ▶ In adults For *intravenous infusion*, manufacturer advises give intermittently in Sodium Chloride 0.9%; reconstitute with Sodium Chloride 0.9% (350 mg in 7 mL, 500 mg in 10 mL); gently rotate vial without shaking; allow to stand for at least 10 minutes then rotate gently to dissolve; dilute requisite dose in 50 mL infusion fluid and give over 30 minutes. For *intravenous injection*, give over 2 minutes.

● HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2-8 °C)—consult product literature for further information regarding storage after reconstitution and dilution.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

SMC No. 248/06

- ▶ In adults The *Scottish Medicines Consortium* has advised (April 2006) that daptomycin (*Cubicin*®) is accepted for restricted use within NHS Scotland for treatment of complicated skin and soft tissue infections in patients with known or suspected methicillin resistant *Staphylococcus aureus* infection and on the advice of local microbiologists or specialists in infectious disease.

SMC No. 449/08

- ▶ In adults The *Scottish Medicines Consortium* has advised (March 2008) that daptomycin (*Cubicin*®) is accepted for restricted use within NHS Scotland for the treatment of *Staphylococcus aureus* bacteraemia associated with right-sided endocarditis or with complicated skin and soft-tissue infections in patients with known or suspected methicillin resistant infection and on the advice of local microbiologists or specialists in infectious disease.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ Daptomycin (Non-proprietary)

Daptomycin 350 mg Daptomycin 350mg powder for solution for infusion vials | 1 vial [PoM] £60.00 (Hospital only)

Daptomycin 500 mg Daptomycin 500mg powder for solution for infusion vials | 1 vial [PoM] £88.00 (Hospital only)

▶ Cubicin (Merck Sharp & Dohme Ltd)

Daptomycin 350 mg Cubicin 350mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £62.00

Daptomycin 500 mg Cubicin 500mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £88.57 (Hospital only)

Fidaxomicin

- **DRUG ACTION** Fidaxomicin is a macrocyclic antibacterial that is poorly absorbed from the gastro-intestinal tract, and, therefore, it should not be used to treat systemic infections.

● INDICATIONS AND DOSE

Clostridium difficile infection

- BY MOUTH
- Adult: 200 mg every 12 hours for 10 days, limited clinical data is available on the use of fidaxomicin in severe or life-threatening *Clostridium difficile* infection

- **CAUTIONS** Inflammatory bowel disease · severe or life-threatening *C. difficile* infection
- **INTERACTIONS** → Appendix 1: fidaxomicin
- **SIDE-EFFECTS**
 - **Common or very common** Constipation · nausea · vomiting
 - **Uncommon** Abdominal distension · appetite decreased · dizziness · dry mouth · flatulence · headache · skin reactions · taste altered
 - **Frequency not known** Angioedema · dyspnoea · hypersensitivity
- **ALLERGY AND CROSS-SENSITIVITY** Use with caution in macrolide hypersensitivity.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - **Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (June 2012) that fidaxomicin (*Dificlr*®) is accepted for restricted use within NHS Scotland to treat the first recurrence of *C. difficile* infection, on the advice of a microbiologist or specialist in infectious diseases.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9

- **Dificlr** (Astellas Pharma Ltd)

Fidaxomicin 200 mg Dificlr 200mg tablets | 20 tablet **[PoM]**
£1,350.00

Fosfomycin

22-Mar-2017

- **DRUG ACTION** Fosfomycin, a phosphonic acid antibacterial, is active against a range of Gram-positive and Gram-negative bacteria including *Staphylococcus aureus* and Enterobacteriaceae.

● INDICATIONS AND DOSE

Acute uncomplicated lower urinary-tract infections

- BY MOUTH USING GRANULES
- Adult: 3 g for 1 dose

Prophylaxis of urinary-tract infections in transurethral surgical procedures

- BY MOUTH USING GRANULES
- Adult: 3 g, to be given 3 hours before surgery. Dose may be repeated once, 24 hours after surgery

Osteomyelitis when first-line treatments are inappropriate or ineffective | Hospital-acquired lower respiratory-tract infections when first-line treatments are inappropriate or ineffective

► BY INTRAVENOUS INFUSION

- Adult: 12–24 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

Complicated urinary-tract infections when first-line treatment ineffective or inappropriate

► BY INTRAVENOUS INFUSION

- Adult: 12–16 g daily in 2–3 divided doses (max. per dose 8 g)

Bacterial meningitis when first-line treatment ineffective or inappropriate

► BY INTRAVENOUS INFUSION

- Adult: 16–24 g daily in 3–4 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

● CAUTIONS

- With intravenous use Cardiac insufficiency · elderly (high doses) · hyperaldosteronism · hyponatraemia · hypertension · pulmonary oedema

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Abdominal pain · antibiotic associated colitis · diarrhoea · headache · nausea · vomiting
- **Uncommon** Skin reactions

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- With oral use Dizziness · vulvovaginal infection
- **Uncommon**
- With parenteral use Appetite decreased · dyspnoea · electrolyte imbalance · fatigue · oedema · taste altered · vertigo
- **Rare or very rare**
- With parenteral use Bone marrow disorders · eosinophilia · hepatic disorders · visual impairment
- **Frequency not known**
- With parenteral use Agranulocytosis · asthmatic attack · confusion · leucopenia · neutropenia · pseudomembranous enterocolitis · tachycardia · thrombocytopenia

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk.

● RENAL IMPAIRMENT

- With oral use Avoid *oral* treatment if eGFR less than 10 mL/minute/1.73 m².
- With intravenous use Use *intravenous* treatment with caution if eGFR 40–80 mL/minute/1.73 m² and consult product literature for dose if eGFR less than 40 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- With intravenous use Monitor electrolytes and fluid balance.

● DIRECTIONS FOR ADMINISTRATION

- With intravenous use For *intravenous infusion* (*Fomicyt*®), give intermittently in Glucose 5% or 10% or Water for Injections; reconstitute each 2-g vial with 50 mL infusion fluid; give 2 g over 15 minutes.
- With oral use Manufacturer advises granules should be taken on an empty stomach (about 2–3 hours before or after a meal), preferably before bedtime and after emptying the bladder. The granules should be dissolved into a glass of water and taken immediately.

- **PRESCRIBING AND DISPENSING INFORMATION** Doses expressed as fosfomycin base.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2015) that fosfomycin (*Fomicyt*®) is accepted for restricted use within NHS Scotland; initiation should be restricted to microbiologists or infectious disease specialists.

The *Scottish Medicines Consortium* has advised (September 2016) that fosfomycin trometamol (*Monuril*®) is accepted for use within NHS Scotland for the treatment of acute lower uncomplicated urinary tract infections, caused by pathogens sensitive to fosfomycin in adult and adolescent females and for prophylaxis in diagnostic and surgical transurethral procedures.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

▶ **Fomicyt** (Nordic Pharma Ltd)

Fosfomycin (as Fosfomycin sodium) 2 gram Fomicyt 2g powder for solution for infusion vials | 10 vial [PoM] £150.00

Fosfomycin (as Fosfomycin sodium) 4 gram Fomicyt 4g powder for solution for infusion vials | 10 vial [PoM] £300.00

Granules

CAUTIONARY AND ADVISORY LABELS 9, 13, 23

EXCIPIENTS: May contain Sucrose

▶ **Fosfomycin (Non-proprietary)**

Fosfomycin (as Fosfomycin trometamol) 3 gram Fosfomycin 3g granules sachets | 1 sachet [PoM] £75.45 DT = £4.86

▶ **Monuril** (Zambon S.p.A.)

Fosfomycin (as Fosfomycin trometamol) 3 gram Monuril 3g granules sachets | 1 sachet [PoM] £4.86 DT = £4.86

Fusidic acid

16-Jun-2017

- **DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

● INDICATIONS AND DOSE

Staphylococcal skin infection

▶ BY MOUTH USING TABLETS

▶ Child 12-17 years: 250 mg every 12 hours for 5-10 days, dose expressed as sodium fusidate

▶ Adult: 250 mg every 12 hours for 5-10 days, dose expressed as sodium fusidate

▶ TO THE SKIN

▶ Child: Apply 3-4 times a day usually for 7 days

▶ Adult: Apply 3-4 times a day

Penicillin-resistant staphylococcal infection including osteomyelitis | Staphylococcal endocarditis in combination with other antibacterials

▶ BY MOUTH USING ORAL SUSPENSION

▶ Child 1-11 months: 15 mg/kg 3 times a day

▶ Child 1-4 years: 250 mg 3 times a day

▶ Child 5-11 years: 500 mg 3 times a day

▶ Child 12-17 years: 750 mg 3 times a day

▶ Adult: 750 mg 3 times a day

▶ BY MOUTH USING TABLETS

▶ Child 12-17 years: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections, dose expressed as sodium fusidate

▶ Adult: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections, dose expressed as sodium fusidate

Staphylococcal infections due to susceptible organisms

▶ BY INTRAVENOUS INFUSION

▶ Child (body-weight up to 50 kg): 6-7 mg/kg 3 times a day, dose expressed as sodium fusidate

▶ Child (body-weight 50 kg and above): 500 mg 3 times a day, dose expressed as sodium fusidate

▶ Adult (body-weight up to 50 kg): 6-7 mg/kg 3 times a day, dose expressed as sodium fusidate

▶ Adult (body-weight 50 kg and above): 500 mg 3 times a day, dose expressed as sodium fusidate

DOSE EQUIVALENCE AND CONVERSION

▶ With oral use

▶ Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets.

● CAUTIONS

▶ With systemic use Impaired transport and metabolism of bilirubin

▶ With topical use Avoid contact of cream or ointment with eyes

CAUTIONS, FURTHER INFORMATION

▶ Avoiding resistance

▶ With topical use To avoid the development of resistance, fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital.

● **INTERACTIONS** → Appendix 1: fusidic acid

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

▶ **Common or very common** Dizziness · drowsiness · hepatic disorders · hyperbilirubinaemia

▶ **Uncommon** Appetite decreased · asthenia · headache · malaise · skin reactions

▶ **Frequency not known** Agranulocytosis · anaemia · leucopenia · neutropenia · pancytopenia · renal failure · rhabdomyolysis · thrombocytopenia

SPECIFIC SIDE-EFFECTS

▶ **Common or very common**

▶ With intravenous use Vascular pain (reduced if given via central vein)

▶ With oral use Diarrhoea · gastrointestinal discomfort · nausea · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Elevated liver enzymes, hyperbilirubinaemia and jaundice can occur with systemic use—these effects are usually reversible following withdrawal of therapy.

● PREGNANCY

▶ With systemic use Not known to be harmful; manufacturer advises use only if potential benefit outweighs risk.

● BREAST FEEDING

▶ With systemic use Present in milk—manufacturer advises caution.

● HEPATIC IMPAIRMENT

▶ With systemic use Manufacturer advises caution—monitor liver function periodically during treatment.

● MONITORING REQUIREMENTS

▶ With systemic use Manufacturer advises monitor liver function with high doses or on prolonged therapy; monitoring also advised for patients with biliary tract obstruction, those taking potentially hepatotoxic medication, or those taking concurrent medication with a similar excretion pathway.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for intravenous infusion, give intermittently in Sodium chloride 0.9% or Glucose 5%; reconstitute each vial with 10 mL buffer solution, then add contents of vial to 500 mL infusion fluid to give a solution containing approximately 1 mg/mL. Give requisite dose via a central line over

2 hours (give over at least 6 hours if administered via a large peripheral vein).

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana and orange.

● PROFESSIONAL SPECIFIC INFORMATION

Dental practitioners' formulary

May be prescribed as Sodium Fusidate ointment.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Linezolid

- **DRUG ACTION** Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including methicillin-resistant *Staphylococcus aureus* (MRSA), and glycopeptide-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is **not** active against common Gram-negative organisms; it must be given in combination with other antibacterials for mixed infections that also involve Gram-negative organisms.

● INDICATIONS AND DOSE

Pneumonia (when other antibacterials e.g. a glycopeptide, such as vancomycin, cannot be used) (initiated under specialist supervision) | Complicated skin and soft-tissue infections caused by Gram-positive bacteria, when other antibacterials cannot be used (initiated under specialist supervision)

► BY MOUTH

- Adult: 600 mg every 12 hours usually for 10–14 days (maximum duration of treatment 28 days)

► BY INTRAVENOUS INFUSION

- Adult: 600 mg every 12 hours

IMPORTANT SAFETY INFORMATION

CHM ADVICE (OPTIC NEUROPATHY)

Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
- visual function should be monitored regularly if treatment is required for longer than 28 days.

BLOOD DISORDERS

Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:

- receive treatment for more than 10–14 days;
- have pre-existing myelosuppression;
- are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
- have severe renal impairment.

If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

- **CAUTIONS** Acute confusional states · bipolar depression · carcinoid tumour · elderly (increased risk of blood disorders) · history of seizures · phaeochromocytoma · schizophrenia · thyrotoxicosis · uncontrolled hypertension

CAUTIONS, FURTHER INFORMATION

- **Close observation** Unless close observation and blood pressure monitoring possible, linezolid should be avoided in uncontrolled hypertension, phaeochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states.

- **INTERACTIONS** → Appendix 1: linezolid

● SIDE-EFFECTS

- **Common or very common** Anaemia · constipation · diarrhoea · dizziness · gastrointestinal discomfort · headache · hypertension · increased risk of infection · insomnia · localised pain · nausea · skin reactions · taste altered · vomiting
- **Uncommon** Arrhythmia · chills · dry mouth · eosinophilia · fatigue · gastritis · hyperhidrosis · hyponatraemia · leucopenia · neutropenia · oral disorders · pancreatitis · polyuria · renal failure · seizure · sensation abnormal · thirst · thrombocytopenia · tinnitus · transient ischaemic attack · vision disorders · vulvovaginal disorder
- **Rare or very rare** Antibiotic associated colitis · bone marrow disorders
- **Frequency not known** Alopecia · angioedema · lactic acidosis · nerve disorders · serotonin syndrome · severe cutaneous adverse reactions (SCARs)

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** In severe hepatic impairment manufacturer advises use only if potential benefit outweighs risk.

- **RENAL IMPAIRMENT** Manufacturer advises metabolites may accumulate if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor full blood count (including platelet count) weekly.

● DIRECTIONS FOR ADMINISTRATION

- With intravenous use Infusion to be administered over 30–120 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.
- **PATIENT AND CARER ADVICE** Patients should be advised to read the patient information leaflet given with linezolid.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Infusion

EXCIPIENTS: May contain Glucose
ELECTROLYTES: May contain Sodium

▶ Linezolid (Non-proprietary)

Linezolid 2 mg per 1 mL Linezolid 600mg/300mL infusion bags | 10 bag [PoM] £445.00 (Hospital only)

Tedizolid

26-Sep-2016

- **DRUG ACTION** Tedizolid is an oxazolidinone antibacterial, which inhibits bacterial protein synthesis.

● INDICATIONS AND DOSE

Treatment of acute bacterial skin and skin structure infections

▶ BY INTRAVENOUS INFUSION, OR BY MOUTH

- ▶ Adult: 200 mg once daily for 6 days, patients should be switched from the intravenous to the oral route when clinically appropriate

- **CAUTIONS** Neutropenia—limited clinical experience · patients aged 75 years and over—limited clinical experience

- **INTERACTIONS** → Appendix 1: tedizolid

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · dizziness · fatigue · headache · nausea · skin reactions · vomiting
- ▶ **Uncommon** Abscess · alopecia · antibiotic associated colitis · anxiety · arthralgia · bradycardia · chills · constipation · cough · dehydration · diabetic control impaired · drowsiness · dry mouth · fever · gastrointestinal discomfort · gastrointestinal disorders · haematochezia · hyperhidrosis · hyperkalaemia · increased risk of infection · infusion related reaction · irritability · limb discomfort · lymphadenopathy · muscle spasms · nasal dryness · pain · peripheral oedema · pulmonary congestion · sensation abnormal · sleep disorders · taste altered · tremor · urine odour abnormal · vasodilation · vision blurred · vitreous floater · vulvovaginal pruritus
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception in women of childbearing potential; an additional method of contraception is advised in women taking hormonal contraceptives—effectiveness may be reduced.
- **PREGNANCY** Manufacturer advises avoid—fetal developmental toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Sivextro[®]) give intermittently in Sodium Chloride 0.9%; reconstitute each 200 mg vial with 4 mL Water for Injections, then dilute reconstituted solution in 250 mL sodium chloride 0.9%; give over approx. 1 hour.

● PATIENT AND CARER ADVICE

Optic neuropathy Although neuropathy (peripheral and optic) has not been reported in patients treated with tedizolid, manufacturer advises patients and carers are warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately; patients should be evaluated promptly, and referred to an ophthalmologist if necessary.

Missed doses Manufacturer advises that if a dose is more than 16 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Patients and carers should be counselled on the effects on driving and skilled tasks—increased risk of dizziness and fatigue.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2015) that tedizolid (Sivextro[®]) is accepted for restricted use within NHS Scotland as an alternative oxazolidinone antibacterial for the treatment of acute bacterial skin and skin structure infections caused by Gram-positive *Staphylococcus aureus* (specifically methicillin-resistant *Staphylococcus aureus* [MRSA] isolates), on the specific advice of local microbiologists or specialists in infectious disease.

● MEDICINAL FORMS

- ▶ Child 6–11 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 50 mg once daily, dose to be taken at night
- ▶ Child 12–17 years: 100 mg once daily, dose to be taken at night
- ▶ Adult: 100 mg once daily, dose to be taken at night

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients who cannot tolerate co-trimoxazole (in combination with dapsone)

- ▶ BY MOUTH
- ▶ Child: 5 mg/kg every 6–8 hours
- ▶ Adult: 5 mg/kg every 6–8 hours

Acne resistant to other antibacterials

- ▶ BY MOUTH
- ▶ Adult: 300 mg twice daily

Prostatitis

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

Shigellosis | Invasive salmonella infection

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

- **UNLICENSED USE** Not licensed for treatment of pneumocystis pneumonia. Not licensed for use in children under 6 weeks. Not licensed for treatment of acne resistant to other antibacterials.

- **CONTRA-INDICATIONS** Blood dyscrasias

- **CAUTIONS** Elderly · Acute porphyrias p. 1025 · predisposition to folate deficiency

- **INTERACTIONS** → Appendix 1: trimethoprim

- **SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea · electrolyte imbalance · fungal overgrowth · headache · nausea · skin reactions · vomiting

- ▶ **Rare or very rare** Agranulocytosis · angioedema · anxiety · appetite decreased · arthralgia · behaviour abnormal · bone marrow disorders · confusion · constipation · cough · depression · dizziness · dyspnoea · eosinophilia · erythema nodosum · fever · haemolysis · haemolytic anaemia · haemorrhage · hallucination · hepatic disorders · hypoglycaemia · lethargy · leucopenia · meningitis aseptic · movement disorders · myalgia · neutropenia · oral disorders · pancreatitis · paraesthesia · peripheral neuritis · photosensitivity reaction · pseudomembranous enterocolitis · renal impairment · seizure · severe cutaneous adverse reactions (SCARs) · sleep disorders · syncope · systemic lupus erythematosus (SLE) · thrombocytopenia · tinnitus · tremor · uveitis · vasculitis · vertigo · wheezing

- ▶ **Frequency not known** Gastrointestinal disorder · megaloblastic anaemia · methaemoglobinemia

- **PREGNANCY** Teratogenic risk in first trimester (folate antagonist). Manufacturers advise avoid during pregnancy.

- **BREAST FEEDING** Present in milk—short-term use not known to be harmful.

- **RENAL IMPAIRMENT**

Dose adjustments ▶ In adults Use half normal dose after 3 days if eGFR 15–30 mL/minute/1.73 m². Use half normal dose if eGFR less than 15 mL/minute/1.73 m².

▶ In children Use half normal dose after 3 days if estimated glomerular filtration rate 15–30 mL/minute/1.73 m². Use half normal dose if estimated glomerular filtration rate less than 15 mL/minute/1.73 m².

Monitoring Monitor plasma-trimethoprim concentration if eGFR less than 10 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Manufacturer recommends blood counts on long-term therapy (but evidence of practical value unsatisfactory).

- **PATIENT AND CARER ADVICE**

Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

Medicines for Children leaflet: Trimethoprim for bacterial infections www.medicinesforchildren.org.uk/trimethoprim-for-bacterial-infections

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9

- ▶ **Trimethoprim (Non-proprietary)**

Trimethoprim 10 mg per 1 mL Trimethoprim 50mg/5ml oral suspension sugar free sugar-free | 100 mL [PoM] £5.24 DT = £2.30

- ▶ **Monotrim** (Chemidex Pharma Ltd)

Trimethoprim 10 mg per 1 mL Monotrim 50mg/5ml oral suspension sugar-free | 100 mL [PoM] £1.77 DT = £2.30

Tablet

CAUTIONARY AND ADVISORY LABELS 9

- ▶ **Trimethoprim (Non-proprietary)**

Trimethoprim 100 mg Trimethoprim 100mg tablets | 28 tablet [PoM] £9.99 DT = £0.86

Trimethoprim 200 mg Trimethoprim 200mg tablets | 6 tablet [PoM] £2.15 DT = £0.31 | 14 tablet [PoM] £9.99 DT = £0.73

Combinations available: **Co-trimoxazole**, p. 552

ANTIMYCOBACTERIALS > RIFAMYCINS

Rifabutin

- **INDICATIONS AND DOSE**

Prophylaxis of *Mycobacterium avium* complex infections in immunosuppressed patients with low CD4 count

- ▶ BY MOUTH

- ▶ Adult: 300 mg once daily, also consult product literature

Treatment of non-tuberculous mycobacterial disease, in combination with other drugs

- ▶ BY MOUTH

- ▶ Adult: 450–600 mg once daily for up to 6 months after cultures negative

Treatment of pulmonary tuberculosis, in combination with other drugs

- ▶ BY MOUTH

- ▶ Adult: 150–450 mg once daily for at least 6 months

- **CAUTIONS** Acute porphyrias p. 1025 · discolours soft contact lenses

- **INTERACTIONS** → Appendix 1: rifabutin

- **SIDE-EFFECTS** Agranulocytosis · anaemia · arthralgia · bronchospasm · chest pain · corneal deposits · decreased leucocytes · dyspnoea · eosinophilia · fever · haemolysis · hepatic disorders · influenza like illness · myalgia · nausea · neutropenia · pancytopenia · skin reactions · thrombocytopenia · urine discolouration · uveitis (more common following high doses or concomitant use with drugs that increase plasma concentration) · vomiting

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifamycin hypersensitivity.

- **CONCEPTION AND CONTRACEPTION**

Important Rifabutin induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced; alternative family planning advice should be offered.

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

● HEPATIC IMPAIRMENT

Dose adjustments Reduce dose in severe impairment.

Monitoring In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.

● RENAL IMPAIRMENT

Dose adjustments Use half normal dose if eGFR less than 30 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- ▶ *Renal function* should be checked before treatment.
- ▶ *Hepatic function* should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, hepatic function should be monitored on prolonged therapy.
- ▶ Blood counts should be monitored on prolonged therapy.
- ▶ Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months. Blood counts should also be monitored in these patients.

- **PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.

● PATIENT AND CARER ADVICE

Soft contact lenses Patients or their carers should be advised that rifabutin discolours soft contact lenses.

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

CAUTIONARY AND ADVISORY LABELS 8, 14

- ▶ **Mycobutin** (Pfizer Ltd)

Rifabutin 150 mg Mycobutin 150mg capsules | 30 capsule **[PoM]** £90.38

Rifaximin

- **DRUG ACTION** Rifaximin is a rifamycin that is poorly absorbed from the gastro-intestinal tract, and, therefore, should not be used to treat systemic infections.

● INDICATIONS AND DOSE

Travellers' diarrhoea that is not associated with fever, bloody diarrhoea, blood or leucocytes in the stool, or 4 or more unformed stools in the previous 24 hours

- ▶ BY MOUTH

Adult: 200 mg every 8 hours for 3 days

Reduction in recurrence of hepatic encephalopathy

- ▶ BY MOUTH

Adult: 550 mg twice daily

- **CONTRA-INDICATIONS** Intestinal obstruction

- **INTERACTIONS** → Appendix 1: rifaximin

● SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · ascites · constipation · depression · dizziness · dyspnoea · gastrointestinal discomfort · gastrointestinal disorders · headaches · muscle complaints · nausea · oedema · skin reactions · vomiting
- ▶ **Uncommon** Anaemia · anxiety · appetite decreased · asthenia · balance impaired · concentration impaired · confusion · cough · diplopia · drowsiness · dry lips · dry mouth · dry throat · ear pain · fall · haematuria · hot flush ·

hyperhidrosis · hyperkalaemia · increased risk of infection · lymphocytosis · memory loss · muscle weakness · nasal complaints · neutropenia · oropharyngeal pain · pain · palpitations · polymenorrhoea · respiratory disorders · seizure · sensation abnormal · sleep disorders · sunburn · taste altered · urinary disorders · urine abnormalities · vertigo

- ▶ **Rare or very rare** Hypertension · hypotension

- ▶ **Frequency not known** Angioedema · syncope · thrombocytopenia · urine discoloration

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of rifamycin hypersensitivity.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Unlikely to be present in milk in significant amounts, but manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution when used for hepatic encephalopathy in patients with severe hepatic impairment.

- **PRESCRIBING AND DISPENSING INFORMATION** Not recommended for diarrhoea associated with invasive organisms such as *Campylobacter* and *Shigella*.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Rifaximin for preventing episodes of overt hepatic encephalopathy (March 2015)** NICE TA337
Rifaximin is recommended, within its marketing authorisation, as an option for reducing the recurrence of episodes of overt hepatic encephalopathy in adults.
www.nice.org.uk/TA337

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 9 (Xifaxant[®] brand only), 14

- ▶ **Targaxan** (Norgine Pharmaceuticals Ltd)

Rifaximin 550 mg Targaxan 550mg tablets | 56 tablet **[PoM]** £259.23 DT = £259.23

Rifaximin 200 mg Xifaxanta 200mg tablets | 9 tablet **[PoM]** £15.15 DT = £15.15

2.1 Anthrax

Anthrax

Treatment and post-exposure prophylaxis

Inhalation or gastro-intestinal anthrax should be treated initially with either ciprofloxacin p. 548 or, in patients over 12 years, doxycycline p. 555 [unlicensed indication] combined with one or two other antibacterials (such as amoxicillin p. 539, benzylpenicillin sodium p. 537, chloramphenicol p. 558, clarithromycin p. 529, clindamycin p. 526, imipenem with cilastatin p. 514, rifampicin p. 571 [unlicensed indication], and vancomycin p. 525). When the condition improves and the sensitivity of the *Bacillus anthracis* strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

Cutaneous anthrax should be treated with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] for 7 days. Treatment may be switched to amoxicillin if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for *post-exposure prophylaxis*. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antibacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of *B. anthracis* is susceptible. Vaccination against anthrax may allow the duration of antibacterial prophylaxis to be shortened.

2.2 Leprosy

Leprosy

Management

Advice from a member of the Panel of Leprosy Opinion is essential for the treatment of leprosy (Hansen's disease). Details can be obtained from the Hospital for Tropical Diseases, London (telephone (020) 3456 7890).

The World Health Organization has made recommendations to overcome the problem of dapsone below resistance and to prevent the emergence of resistance to other antileprotic drugs. Drugs recommended are dapsone, rifampicin p. 571, and clofazimine below. Other drugs with significant activity against *Mycobacterium leprae* include ofloxacin p. 551, minocycline p. 556 and clarithromycin p. 529, but none of these are as active as rifampicin; at present they should be reserved as second-line drugs for leprosy.

A three-drug regimen is recommended for *multibacillary leprosy* (lepromatous, borderline-lepromatous, and borderline leprosy) and a two-drug regimen for *paucibacillary leprosy* (borderline-tuberculoid, tuberculoid, and indeterminate).

Multibacillary leprosy should be treated with a combination of rifampicin, dapsone and clofazimine for at least 2 years. Treatment should be continued unchanged during both type I (reversal) or type II (erythema nodosum leprosum) reactions. During reversal reactions neuritic pain or weakness can herald the rapid onset of permanent nerve damage. Treatment with prednisolone p. 664 should be instituted at once. Mild type II reactions may respond to aspirin. Severe type II reactions may require corticosteroids; thalidomide p. 936 [unlicensed] is also useful in patients who have become corticosteroid dependent, but it should be used only under **specialist supervision**. Thalidomide is teratogenic and, therefore, contra-indicated in pregnancy; it must **not** be given to women of child-bearing potential unless they comply with a pregnancy prevention programme. Increased doses of clofazimine are also useful.

Paucibacillary leprosy should be treated with rifampicin and dapsone for 6 months. If treatment is interrupted the regimen should be recommenced where it was left off to complete the full course.

Neither the multibacillary nor the paucibacillary antileprosy regimen is sufficient to treat tuberculosis.

ANTIMYCOBACTERIALS

Clofazimine

● INDICATIONS AND DOSE

Multibacillary leprosy in combination with rifampicin and dapsone (3-drug regimen) (administered on expert advice)

► BY MOUTH

- Adult: 300 mg once a month, to be administered under supervision and 50 mg daily, to be self-administered, alternatively 300 mg once a month, to be administered under supervision and 100 mg once daily on alternate days, to be self-administered

Lepromatous lepra reactions (administered on expert advice)

► BY MOUTH

- Adult: 300 mg daily for max. 3 months

Severe type II (erythema nodosum leprosum) reactions (administered on expert advice)

► BY MOUTH

- Adult: 100 mg 3 times a day for one month, subsequent dose reductions are required, may take 4–6 weeks to attain full effect

- **CAUTIONS** Avoid if persistent abdominal pain and diarrhoea · may discolour soft contact lenses
- **INTERACTIONS** → Appendix 1: clofazimine
- **SIDE-EFFECTS** Abdominal pain · appetite decreased · dry eye · eye discolouration · fatigue · gastrointestinal disorders · hair colour changes (reversible) · headache · lymphadenopathy · nausea · photosensitivity reaction · red discolouration of body fluids · skin discolouration (including areas exposed to light) · skin reactions · splenic infarction · urine red · visual impairment · vomiting (hospitalise if persistent) · weight decreased
- **PREGNANCY** Use with caution.
- **BREAST FEEDING** May alter colour of milk; skin discoloration of infant.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Dapsone

● INDICATIONS AND DOSE

Multibacillary leprosy in combination with rifampicin and clofazimine (3-drug regimen) | Paucibacillary leprosy in combination with rifampicin (2-drug regimen)

► BY MOUTH

- Adult (body-weight up to 35 kg): 50 mg daily, alternatively 1–2 mg/kg daily, may be self-administered
- Adult (body-weight 35 kg and above): 100 mg daily, may be self-administered

Dermatitis herpetiformis

► BY MOUTH

- Adult: (consult product literature or local protocols)

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (in combination with trimethoprim)

► BY MOUTH

- Adult: 100 mg once daily

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia

► BY MOUTH

- Adult: 100 mg daily

- **UNLICENSED USE** Not licensed for treatment of pneumocystis (*P. jirovecii*) pneumonia.
- **CAUTIONS** Anaemia (treat severe anaemia before starting) · avoid in Acute porphyrias p. 1025 · cardiac disease · G6PD deficiency · pulmonary disease · susceptibility to haemolysis
- **INTERACTIONS** → Appendix 1: dapsone
- **SIDE-EFFECTS** Agranulocytosis · appetite decreased · haemolysis · haemolytic anaemia · headache · hepatic disorders · hypoalbuminaemia · insomnia · lepra reaction · methaemoglobinemia · motor loss · nausea · peripheral

neuropathy · photosensitivity reaction · psychosis · severe cutaneous adverse reactions (SCARs) · skin reactions · tachycardia · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Side-effects are dose-related.

If dapsone syndrome occurs (rash with fever and eosinophilia)—discontinue immediately (may progress to exfoliative dermatitis, hepatitis, hypoalbuminaemia, psychosis and death).

- **PREGNANCY** Folic acid p. 993 (higher dose) should be given to mother throughout pregnancy; neonatal haemolysis and methaemoglobinaemia reported in third trimester.
- **BREAST FEEDING** Haemolytic anaemia; although significant amount in milk, risk to infant very small unless infant is G6PD deficient.
- **PATIENT AND CARER ADVICE**
Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 8

▶ Dapsone (Non-proprietary)

Dapsone 50 mg Dapsone 50mg tablets | 28 tablet [PoM] £38.04 DT = £38.04

Dapsone 100 mg Dapsone 100mg tablets | 28 tablet [PoM] £97.39 DT = £95.15

2.3 Lyme disease

Lyme disease

Treatment

Doxycycline p. 555, amoxicillin p. 539 [unlicensed indication] or cefuroxime p. 518 (as cefuroxime axetil) are the antibacterials of choice for *early Lyme disease* or *Lyme arthritis*. If these antibacterials are contra-indicated, a **macrolide** (e.g. clarithromycin p. 529) can be used for early Lyme disease. Intravenous administration of ceftriaxone p. 520, cefotaxime p. 519, or benzylpenicillin sodium p. 537 is recommended for Lyme disease associated with cardiac or neurological complications. The duration of treatment is usually 2–4 weeks; Lyme arthritis may require further treatment.

2.4 Methicillin-resistant *Staphylococcus aureus*

MRSA

Management

Infection from *Staphylococcus aureus* strains resistant to methicillin [now discontinued] (methicillin-resistant *Staph. aureus*, MRSA) and to flucloxacillin p. 544 can be difficult to manage. Treatment is guided by the sensitivity of the infecting strain.

Rifampicin p. 571 or fusidic acid p. 561 should **not** be used alone because resistance may develop rapidly. A **tetracycline** alone or a combination of rifampicin and fusidic acid can be used for *skin* and *soft-tissue infections*

caused by MRSA; clindamycin p. 526 alone is an alternative. A **glycopeptide** (e.g. vancomycin p. 525) can be used for severe skin and soft-tissue infections associated with MRSA; if a glycopeptide is unsuitable, linezolid p. 562 can be used on expert advice. As linezolid is **not** active against Gram-negative organisms, it can be used for mixed skin and soft-tissue infections only when other treatments are not available; linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms. A combination of a glycopeptide and fusidic acid or a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial.

Tigecycline p. 557 and daptomycin p. 558 are licensed for the treatment of complicated skin and soft-tissue infections involving MRSA.

A **tetracycline** or clindamycin can be used for *bronchiectasis* caused by MRSA. A **glycopeptide** can be used for *pneumonia* associated with MRSA; if a glycopeptide is unsuitable, linezolid can be used on expert advice. Linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms.

A **tetracycline** can be used for *urinary-tract infections* caused by MRSA; trimethoprim p. 563 or nitrofurantoin p. 579 are alternatives. A **glycopeptide** can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A **glycopeptide** can be used for *septicaemia* associated with MRSA.

See the management of *endocarditis*, *osteomyelitis*, or *septic arthritis* associated with MRSA.

Prophylaxis with vancomycin or teicoplanin p. 524 (alone or in combination with another antibacterial active against other pathogens) is appropriate for patients undergoing surgery if:

- there is a history of MRSA colonisation or infection without documented eradication;
- there is a risk that the patient's MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

See eradication of nasal carriage of MRSA in Nose p. 1165.

2.5 Tuberculosis

Tuberculosis

16-Mar-2017

Treatment phases, overview

Active tuberculosis is treated in two phases—an *initial phase* using four drugs and a *continuation phase* using two drugs in fully sensitive cases. Treatment requires specialised knowledge and supervision, particularly where the disease involves resistant organisms or non-respiratory organs.

There are two regimens recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen should be used; the two regimens should **not** be used concurrently. Compliance with therapy is a major determinant of its success.

Initial phase

The concurrent use of four drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as fixed-dose, combination preparations unless one of the components cannot be given because of resistance or intolerance. The treatment of choice for the initial phase is the daily use of rifampicin p. 571, ethambutol hydrochloride p. 575, pyrazinamide p. 577 and

isoniazid p. 576 (with pyridoxine hydrochloride p. 1047 for prophylaxis of isoniazid-induced neuropathy); modified according to drug susceptibility testing. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for two months. Where a positive culture for *M. tuberculosis* has been obtained, but susceptibility results are not available after two months, treatment with rifampicin, ethambutol hydrochloride, isoniazid and pyrazinamide (with pyridoxine hydrochloride) should be continued until full susceptibility is confirmed, even if this is for longer than two months.

Streptomycin p. 512 is rarely used in the UK but it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced, or when patients cannot tolerate standard treatment.

Continuation phase

After the initial phase, daily treatment is continued for a further four months with rifampicin and isoniazid (preferably given as a combination preparation) with pyridoxine hydrochloride. Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

Unsupervised treatment

The unsupervised treatment regimen should be used for patients who are likely to take antituberculosis drugs reliably **without supervision**. Patients who are unable or unlikely to comply with daily administration of therapy should be treated with the regimen described under *Supervised Treatment*.

Pregnancy and breast-feeding

The standard unsupervised six month treatment regimen may be used during pregnancy. Streptomycin should not be given in pregnancy.

The standard unsupervised six month treatment regimen may be used during breast-feeding.

Supervised treatment

Drug administration should be **fully supervised** (directly observed therapy, DOT) in patients who cannot comply reliably with the treatment regimen. If daily directly observed therapy is not possible, a supervised dosing schedule of three times a week should be considered. Regimens with a dosing schedule of fewer than three times a week should not be used.

Directly observed therapy should be offered to patients who:

- have a history of non-adherence;
- have previously been treated for tuberculosis;
- are in denial of the tuberculosis diagnosis;
- have multidrug-resistant tuberculosis;
- have a major psychiatric or cognitive disorder;
- have a history of homelessness, drug or alcohol misuse;
- are in prison, or have been in the past 5 years;
- are too ill to self-administer treatment;
- request directly observed therapy.

Immunocompromised patients

Multi-resistant *Mycobacterium tuberculosis* may be present in immunocompromised patients. The organism should always be cultured to confirm its type and drug sensitivity.

Confirmed *M. tuberculosis* infection sensitive to first-line drugs should be treated with a standard six month regimen; after completing treatment, patients should be closely monitored. The regimen may need to be modified if infection is caused by resistant organisms, and specialist advice is needed.

Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis for patients who are HIV-positive (see also *Latent tuberculosis* below); care is required in choosing the regimen and in avoiding potentially serious interactions. Starting antiretroviral treatment in the first two months of antituberculosis treatment increases the risk of immune reconstitution syndrome. Treatment for tuberculosis should not routinely exceed six months in patients who are HIV-positive, unless the tuberculosis has central nervous system involvement (in which case treatment should not routinely extend beyond twelve months).

Infection may also be caused by other mycobacteria e.g. *M. avium* complex, in which case specialist advice on management is needed.

Extrapulmonary tuberculosis

Central nervous system tuberculosis

Patients with active central nervous system tuberculosis should be offered treatment with rifampicin, ethambutol hydrochloride, isoniazid and pyrazinamide (with pyridoxine hydrochloride for prophylaxis of isoniazid-induced neuropathy) for two months. After completion of the initial treatment phase, rifampicin and isoniazid (with pyridoxine hydrochloride) should be continued for a further ten months. Treatment for tuberculosis meningitis should be offered if clinical signs and laboratory findings are consistent with the diagnosis, even if a rapid diagnostic test is negative.

An initial high dose of dexamethasone p. 660 or prednisolone p. 664 should be started at the same time as antituberculosis therapy, and then slowly withdrawn over 4–8 weeks.

Referral for surgery should be considered only in patients who have raised intracranial pressure.

Pericardial tuberculosis

An initial high dose of oral prednisolone should be offered to patients with active pericardial tuberculosis at the same time as initiation of antituberculosis therapy; it should then be slowly withdrawn over 2–3 weeks.

Latent tuberculosis

Clinicians should be aware that some patients with latent tuberculosis are at increased risk of developing active tuberculosis (such as patients who are HIV-positive, diabetic or receiving treatment with a tumour necrosis factor alpha inhibitor). These patients should be advised of the risks and symptoms of active tuberculosis.

Note: the risk of adverse events to chemoprophylaxis in patients aged over 35 years with a risk of hepatotoxicity is likely to be greater than the potential benefit of treating latent disease. *When indicated*, drug treatment should only be offered to patients aged 35–65 years if hepatotoxicity is not a concern. Treatment for latent tuberculosis is not usually indicated in patients over 65 years.

Close contacts

Anyone aged under 65 years who is a close contact (prolonged, frequent or intense contact, e.g. household contacts or partners) of a person with pulmonary or laryngeal tuberculosis should be tested for latent tuberculosis. Chemoprophylaxis should be offered to all patients aged younger than 65 years, with evidence of latent tuberculosis if the close contact has *suspected-infectious* or *confirmed-active* pulmonary or laryngeal drug-sensitive tuberculosis.

Immunocompromised

Patients who are immunocompromised, such as those with HIV or who have had a solid organ or allogeneic stem cell transplant, should be tested for latent tuberculosis using an appropriate method. Patients who test positive should then be assessed for active disease, and if negative, offered treatment for latent tuberculosis.

Recommended dosage for standard unsupervised 6-month treatment

Rifampicin with isoniazid and pyrazinamide	<p>Adult:</p> <ul style="list-style-type: none"> ▶ body-weight up to 40 kg 3 tablets daily for 2 months (initial phase), use <i>Rifater</i>® Tablets, preferably taken before breakfast; ▶ body-weight 40–49 kg 4 tablets daily for 2 months (initial phase), use <i>Rifater</i>® Tablets, preferably taken before breakfast; ▶ body-weight 50–64 kg 5 tablets daily for 2 months (initial phase), use <i>Rifater</i>® Tablets, preferably taken before breakfast; ▶ body-weight 65 kg and above 6 tablets daily for 2 months (initial phase), use <i>Rifater</i>® Tablets, preferably taken before breakfast
Ethambutol hydrochloride	Adult: 15 mg/kg once daily for 2 months (initial phase)
Rifampicin with isoniazid	<p>Adult:</p> <ul style="list-style-type: none"> ▶ body-weight up to 50 kg 450/300 mg daily for 4 months (continuation phase after 2-month initial phase), use <i>Rifinah</i>® 150/100 Tablets, preferably taken before breakfast; ▶ body-weight 50 kg and above 600/300 mg daily for 4 months (continuation phase after 2-month initial phase), use <i>Rifinah</i>® 300/150 Tablets, preferably taken before breakfast
or (if combination preparations not appropriate):	
Isoniazid	<p>Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)</p> <p>Adult: 300 mg daily for 6 months (initial and continuation phases)</p>
Rifampicin	<p>Child:</p> <ul style="list-style-type: none"> ▶ body-weight up to 50 kg 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day; ▶ body-weight 50 kg and above 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day <p>Adult:</p> <ul style="list-style-type: none"> ▶ body-weight up to 50 kg 450 mg once daily for 6 months (initial and continuation phases); ▶ body-weight 50 kg and above 600 mg once daily for 6 months (initial and continuation phases)

Ethambutol hydrochloride	<p>Child: 30 mg/kg 3 times a week for 2 months (initial phase)</p> <p>Adult: 30 mg/kg 3 times a week for 2 months (initial phase)</p>

Healthcare workers

New NHS employees who are new entrants from a high incidence country should be offered appropriate testing for latent tuberculosis; those who are not new entrants from a high incidence country, but who will be in contact with patients or clinical materials should be offered appropriate testing for latent tuberculosis if prior BCG vaccination cannot be verified (see also *BCG vaccine* under Vaccines p. 1259).

Those who test positive should then be assessed for active disease, and if negative, offered treatment for latent tuberculosis.

For healthcare workers who are immunocompromised, follow standard advice for testing and treatment (see *Immunocompromised* above).

Chemoprophylaxis for latent tuberculosis

Chemoprophylaxis involves use of either isoniazid p. 576 (with pyridoxine hydrochloride p. 1047) alone for six months (recommended if interactions with rifamycins are a concern) or rifampicin p. 571 and isoniazid (with pyridoxine hydrochloride) for three months (recommended when hepatotoxicity is a concern).

Choice of regimen is dependent on clinical factors, including age, risk of hepatotoxicity and possible drug interactions. Testing for HIV, hepatitis B and hepatitis C should be offered before starting antituberculosis treatment as this may affect choice of therapy.

Patients with severe liver disease should be treated under the care of a specialist team; careful monitoring of liver function is necessary in patients with non-severe liver disease, abnormal liver function, or who misuse alcohol or drugs.

See advice on immunisation against tuberculosis under Vaccines p. 1259.

Treatment failure

Major causes of treatment failure are incorrect prescribing by the physician and inadequate compliance by the patient. Monthly tablet counts and urine examination (rifampicin imparts an orange-red coloration) may be useful indicators of compliance with treatment. Avoid both excessive and inadequate dosage. Treatment should be supervised by a specialist physician.

Treatment interruptions

A break in antituberculosis treatment of at least two weeks (during the initial phase) or missing more than 20% of prescribed doses is classified as treatment interruption. Re-establishing treatment appropriately following interruptions is key to ensuring treatment success without relapse, drug resistance or further adverse events. If an adverse reaction recurs upon re-introducing a particular drug, do not give that drug in future regimens and consider extending the total regimen accordingly.

Treatment interruptions due to drug-induced hepatotoxicity

Following treatment interruption due to drug-induced hepatotoxicity, all potential causes of hepatotoxicity should be investigated. Once hepatic function has recovered, antituberculosis therapy should be sequentially re-introduced at previous full doses over a period of no more than ten days, initially with ethambutol hydrochloride p. 575 and either isoniazid (with pyridoxine hydrochloride) or rifampicin.

In patients with severe or highly infectious tuberculosis who need to interrupt the standard regimen, consider continuing treatment with at least two drugs with low risk of hepatotoxicity, such as ethambutol hydrochloride and streptomycin p. 512 (with or without a quinolone, such as levofloxacin p. 549 or moxifloxacin p. 550), with ongoing monitoring by a liver specialist.

Treatment interruptions due to cutaneous reactions

If a patient with severe or highly infectious tuberculosis has a cutaneous reaction, consider continuing treatment with a combination of at least two drugs with low risk for causing cutaneous reactions, such as ethambutol hydrochloride and streptomycin, with monitoring by a dermatologist.

Antituberculosis drugs

Isoniazid is cheap and highly effective. Like rifampicin it should always be included in any antituberculosis regimen unless there is a specific contra-indication.

Rifampicin, a rifamycin, is a key component of any antituberculosis regimen. Like isoniazid it should always be included unless there is a specific contra-indication.

During the first two months ('initial phase') of rifampicin administration transient disturbance of liver function with elevated serum transaminases is common but generally does not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease.

On intermittent treatment six toxicity syndromes have been recognised—fluenza-like, abdominal, and respiratory symptoms, shock, renal failure, and thrombocytopenic purpura—and can occur in 20–30% of patients.

Rifabutin p. 564, another rifamycin, is indicated for prophylaxis against *M. avium* complex infections in patients with a low CD4 count; it is also licensed for the treatment of non-tuberculous mycobacterial disease and pulmonary tuberculosis.

Pyrazinamide p. 577 is a bactericidal drug only active against intracellular dividing forms of *Mycobacterium tuberculosis*; it exerts its main effect only in the first two or three months. It is particularly useful in tuberculous meningitis because of good meningeal penetration. It is not active against *M. bovis*.

Ethambutol hydrochloride is included in a treatment regimen if isoniazid resistance is suspected; it can be omitted if the risk of resistance is low.

Streptomycin (unlicensed) is now rarely used in the UK except for resistant organisms.

Drug-resistant tuberculosis

Drug-resistant tuberculosis should be treated by a specialist physician with experience in such cases, and where appropriate facilities for infection-control exist. Multidrug-resistant tuberculosis (resistance to isoniazid and rifampicin, with or without any other resistance) requires treatment with at least six antituberculosis drugs to which the mycobacterium is likely to be sensitive. Testing for resistance to second-line drugs is recommended and treatment should be modified according to susceptibility. The risk of resistance is minimised by ensuring therapy is administered in the correct dose and combination for the prescribed duration.

Second-line drugs available for infections caused by resistant organisms, or when first-line drugs cause unacceptable side-effects, include aminosalicylic acid p. 573, amikacin p. 510, capreomycin p. 574, cycloserine p. 575, newer macrolides (e.g. azithromycin p. 528 and clarithromycin p. 529), moxifloxacin and prothionamide (prothionamide; no longer on UK market). Bedaquiline p. 574 and delamanid p. 575 are licensed for the treatment of multiple-drug resistant pulmonary tuberculosis. Bedaquiline has a long half-life.

Single drug-resistant tuberculosis

For single drug-resistance the following treatment regimens are recommended:

Resistance to isoniazid:

- First two months (initial phase): rifampicin, pyrazinamide and ethambutol hydrochloride

- Continue with (continuation phase): rifampicin and ethambutol hydrochloride for seven months (up to ten months for extensive disease)

Resistance to pyrazinamide:

- First two months (initial phase): rifampicin, ethambutol hydrochloride and isoniazid (with pyridoxine hydrochloride)
- Continue with (continuation phase): rifampicin and isoniazid (with pyridoxine hydrochloride) for seven months

Resistance to ethambutol hydrochloride:

- First two months (initial phase): rifampicin, pyrazinamide and isoniazid (with pyridoxine hydrochloride)
- Continue with (continuation phase): rifampicin and isoniazid (with pyridoxine hydrochloride) for four months

Resistance to rifampicin below:

- Offer treatment with at least six antituberculosis drugs to which the mycobacterium is likely to be sensitive.

Management of tuberculosis in children

Children are given isoniazid p. 576, rifampicin, pyrazinamide p. 577, and ethambutol hydrochloride p. 575 for the first two months followed by isoniazid and rifampicin during the next four months. However, care is needed in young children receiving ethambutol hydrochloride because of the difficulty in testing eyesight and in obtaining reports of visual symptoms.

ANTIMYCOBACTERIALS > RIFAMYCINS

Rifampicin

● INDICATIONS AND DOSE

Brucellosis in combination with other antibacterials | Legionnaires disease in combination with other antibacterials | Serious staphylococcal infections in combination with other antibacterials

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Child 1–11 months: 5–10 mg/kg twice daily
- ▶ Child 1–17 years: 10 mg/kg twice daily (max. per dose 600 mg)

- ▶ Adult: 0.6–1.2 g daily in 2–4 divided doses

Endocarditis in combination with other drugs

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 0.6–1.2 g daily in 2–4 divided doses

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

- ▶ BY MOUTH
- ▶ Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
- ▶ Adult: 600–900 mg 3 times a week for 6 months (initial and continuation phases)

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

- ▶ BY MOUTH
- ▶ Child (body-weight up to 50 kg): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day
- ▶ Child (body-weight 50 kg and above): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day
- ▶ Adult (body-weight up to 50 kg): 450 mg once daily for 6 months (initial and continuation phases)
- ▶ Adult (body-weight 50 kg and above): 600 mg once daily for 6 months (initial and continuation phases)

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, in combination with isoniazid

- ▶ BY MOUTH
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 15 mg/kg daily for 3 months; maximum 450 mg per day
- ▶ Child 1 month–11 years (body-weight 50 kg and above): 15 mg/kg daily for 3 months; maximum 600 mg per day
- ▶ Child 12–17 years (body-weight up to 50 kg): 450 mg daily for 3 months
- ▶ Child 12–17 years (body-weight 50 kg and above): 600 mg daily for 3 months
- ▶ Adult (body-weight up to 50 kg): 450 mg daily for 3 months
- ▶ Adult (body-weight 50 kg and above): 600 mg daily for 3 months

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant

- ▶ BY MOUTH
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 15 mg/kg daily for 6 months; maximum 450 mg per day
- ▶ Child 1 month–11 years (body-weight 50 kg and above): 15 mg/kg daily for 6 months; maximum 600 mg per day
- ▶ Child 12–17 years (body-weight up to 50 kg): 450 mg daily for 6 months
- ▶ Child 12–17 years (body-weight 50 kg and above): 600 mg daily for 6 months

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant and under 35 years

- ▶ BY MOUTH
- ▶ Adult 18–34 years (body-weight up to 50 kg): 450 mg daily for 6 months
- ▶ Adult 18–34 years (body-weight 50 kg and above): 600 mg daily for 6 months

Prevention of secondary case of *Haemophilus influenzae* type b disease

- ▶ BY MOUTH
- ▶ Child 1–2 months: 10 mg/kg once daily for 4 days
- ▶ Child 3 months–11 years: 20 mg/kg once daily (max. per dose 600 mg) for 4 days
- ▶ Child 12–17 years: 600 mg once daily for 4 days
- ▶ Adult: 600 mg once daily for 4 days

Prevention of secondary case of meningococcal meningitis

- ▶ BY MOUTH
- ▶ Child 1–11 months: 5 mg/kg every 12 hours for 2 days
- ▶ Child 1–11 years: 10 mg/kg every 12 hours (max. per dose 600 mg), for 2 days
- ▶ Child 12–17 years: 600 mg every 12 hours for 2 days
- ▶ Adult: 600 mg every 12 hours for 2 days

Multibacillary leprosy in combination with dapsone and clofazimine (3-drug regimen) | Paucibacillary leprosy in combination with dapsone (2-drug regimen)

- ▶ BY MOUTH
- ▶ Adult (body-weight up to 35 kg): 450 mg once a month, supervised administration
- ▶ Adult (body-weight 35 kg and above): 600 mg once a month, supervised administration

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · jaundice
- **CAUTIONS** Discolours soft contact lenses
- **INTERACTIONS** → Appendix 1: rifampicin

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Nausea • thrombocytopenia • vomiting
- ▶ **Uncommon** Diarrhoea • leucopenia
- ▶ **Frequency not known** Abdominal discomfort • acute kidney injury • adrenal insufficiency • agranulocytosis • appetite decreased • disseminated intravascular coagulation • dyspnoea • eosinophilia • flushing • haemolytic anaemia • hepatitis • hypersensitivity • influenza • intracranial haemorrhage • menstrual disorder • muscle weakness • myopathy • oedema • pseudomembranous enterocolitis • severe cutaneous adverse reactions (SCARs) • shock • skin reactions • sputum discolouration • sweat discolouration • tear discolouration • urine discolouration • vasculitis • wheezing

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Bone pain • gastrointestinal disorder • hyperbilirubinaemia • psychotic disorder
- ▶ With oral use Psychosis

SIDE-EFFECTS, FURTHER INFORMATION Side-effects that mainly occur with intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, and acute renal failure.

Discontinue if serious side-effects develop.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifampicin hypersensitivity.

• CONCEPTION AND CONTRACEPTION

Important Effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered.

- **PREGNANCY** Manufacturers advise very high doses teratogenic in *animal* studies in first trimester; risk of neonatal bleeding may be increased in third trimester.

- **BREAST FEEDING** Amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Impaired elimination.

Dose adjustments Avoid or do not exceed 8 mg/kg daily.

Monitoring In patients with pre-existing liver disease or hepatic impairment, monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.

• RENAL IMPAIRMENT

- ▶ In children Use with caution if doses above 10 mg/kg daily.
- ▶ In adults Use with caution if dose above 600 mg daily.

• MONITORING REQUIREMENTS

- ▶ **Renal function** should be checked before treatment.
- ▶ **Hepatic function** should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, liver function should be monitored on prolonged therapy.
- ▶ Blood counts should be monitored in patients on prolonged therapy.
- ▶ In adults Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months. Blood counts should also be monitored in these patients.

• DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use in adults For *intravenous infusion* (Rifadin®), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute with solvent provided then dilute with 500 mL infusion fluid; give over 2–3 hours.
- ▶ With intravenous use in children Displacement value may be significant, consult local reconstitution guidelines; reconstitute with solvent provided. May be further diluted with Glucose 5% or Sodium chloride 0.9% to a final concentration of 1.2 mg/mL. Infuse over 2–3 hours.

- **PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.

Flavours of syrup may include raspberry.

- ▶ With oral use in children In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children.

• PATIENT AND CARER ADVICE

Soft contact lenses Patients or their carers should be advised that rifampicin discolours soft contact lenses.

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

Bedaquiline

• INDICATIONS AND DOSE

Multiple-drug resistant pulmonary tuberculosis, in combination with other drugs

▶ BY MOUTH

- ▶ Adult: Initially 400 mg once daily for 2 weeks, then 200 mg 3 times a week for 22 weeks, intervals of at least 48 hours between each dose, continue appropriate combination therapy after bedaquiline

- **CONTRA-INDICATIONS** QTc interval more than 500 milliseconds (derived using Fridericia's formula) · ventricular arrhythmia
- **CAUTIONS** Hypothyroidism · QTc interval (derived using Fridericia's formula) 450–500 milliseconds—discontinue if QTc interval more than 500 milliseconds · risk factors for QT interval prolongation (e.g. electrolyte disturbances, heart failure with reduced left ventricular ejection fraction, history of symptomatic arrhythmias (avoid if ventricular arrhythmia present), bradycardia, congenital long QT syndrome)
- **INTERACTIONS** → Appendix 1: bedaquiline
- **SIDE-EFFECTS**
 - ▶ Common or very common Arthralgia · diarrhoea · dizziness · headache · hepatic function abnormal · myalgia · nausea · QT interval prolongation · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION** If syncope occurs, obtain ECG.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment—no

information available. Avoid concomitant use of hepatotoxic drugs unless essential.

- **RENAL IMPAIRMENT** Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - ▶ Determine serum potassium, calcium, and magnesium before starting treatment (correct if abnormal)—remeasure if QT prolongation occurs during treatment.
 - ▶ Obtain ECG before starting treatment, and then at least monthly during treatment or more frequently if concomitant use with other drugs known to prolong the QT interval.
 - ▶ Monitor liver function before starting treatment and then at least monthly during treatment—discontinue treatment if severe abnormalities in liver function tests.
- **PATIENT AND CARER ADVICE**

Missed doses If a dose is missed during the first two weeks of treatment, the missed dose should not be taken and the next dose should be taken at the usual time; if a dose is missed during weeks 3–24 of treatment, the missed dose should be taken as soon as possible and then the usual regimen resumed.

Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving)

Bedaquiline (as Bedaquiline fumarate) **100 mg** Sirturo 100mg tablets | 188 tablet (PoM) £18,700.00

Capreomycin

• INDICATIONS AND DOSE

Tuberculosis resistant to first-line drugs, in combination with other drugs

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 1 g daily (max. per dose 20 mg/kg) for 2–4 months, then reduced to 1 g 2–3 times a week

- **CAUTIONS** Auditory impairment
- **INTERACTIONS** → Appendix 1: capreomycin
- **SIDE-EFFECTS** Eosinophilia · febrile disorders · hearing impairment · leucocytosis · leucopenia · nephrotoxicity · pain · pseudo-Bartter syndrome · skin reactions · thrombocytopenia · vertigo
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—teratogenic in *animal* studies.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Nephrotoxic; ototoxic.
Dose adjustments Reduce dose—consult product literature.
- **MONITORING REQUIREMENTS** Monitor renal, hepatic, auditory, and vestibular function and electrolytes.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ **Capreomycin (Non-proprietary)**
Capreomycin (as Capreomycin sulfate) **1 gram** Capreomycin 1g powder for solution for injection vials | 1 vial (PoM) £31.47

Cycloserine

● INDICATIONS AND DOSE

Tuberculosis resistant to first-line drugs, in combination with other drugs

► BY MOUTH

- Adult: Initially 250 mg every 12 hours for 2 weeks, then increased if necessary up to 500 mg every 12 hours, dose to be increased according to blood concentration and response

PHARMACOKINETICS

- Cycloserine penetrates the CNS.

- **CONTRA-INDICATIONS** Alcohol dependence · depression · epilepsy · psychotic states · severe anxiety

- **INTERACTIONS** → Appendix 1: cycloserine

- **SIDE-EFFECTS** Behaviour abnormal · coma · confusion · congestive heart failure · drowsiness · dysarthria · headache · hyperirritability · megaloblastic anaemia · memory loss · neurological effects · paraesthesia · paresis · psychosis · rash · reflexes increased · seizures · suicidal ideation · tremor · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

CNS toxicity Discontinue or reduce dose if symptoms of CNS toxicity occur.

Rashes or allergic dermatitis Discontinue or reduce dose if rashes or allergic dermatitis develops.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.
- **BREAST FEEDING** Present in milk—amount too small to be harmful.
- **RENAL IMPAIRMENT**
Dose adjustments Increase interval between doses if creatinine clearance less than 50 mL/minute.
Monitoring Monitor blood-cycloserine concentration if creatinine clearance less than 50 mL/minute.
- **MONITORING REQUIREMENTS**
 - Blood concentration monitoring required especially in renal impairment or if dose exceeds 500 mg daily or if signs of toxicity; blood concentration should not exceed 30 mg/litre.
 - Monitor haematological, renal, and hepatic function.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

Cycloserine 250 mg Cycloserine 250mg capsules | 100 capsule [PoM](#) £442.89 DT = £442.89

Delamanid

● INDICATIONS AND DOSE

Multiple-drug resistant pulmonary tuberculosis, in combination with other drugs

► BY MOUTH

- Adult: 100 mg twice daily for 24 weeks, continue appropriate combination therapy after delamanid

- **CONTRA-INDICATIONS** QTc interval more than 500 milliseconds (derived using Fridericia's formula) · serum albumin less than 28 g/litre

- **CAUTIONS** Risk factors for QT interval prolongation (e.g. electrolyte disturbances, acute myocardial infarction, heart failure with reduced left ventricular ejection fraction, severe hypertension, left ventricular hypertrophy, bradycardia, congenital long QT syndrome, history of symptomatic arrhythmias)

- **INTERACTIONS** → Appendix 1: delamanid

● SIDE-EFFECTS

- **Common or very common** Anxiety · appetite decreased · asthenia · chest pain · cough · depression · dyslipidaemia · dyspnoea · ear pain · electrolyte imbalance · gastrointestinal discomfort · haemoptysis · headache · hyperhidrosis · hypertension · hypotension · malaise · muscle weakness · nausea · oropharyngeal pain · osteochondrosis · pain · palpitations · peripheral neuropathy · photophobia · psychotic disorder · QT interval prolongation · reticulocytosis · sensation abnormal · skin reactions · sleep disorders · throat irritation · tinnitus · tremor · vomiting
- **Uncommon** Aggression · atrioventricular block · balance impaired · dehydration · delusional disorder, persecutory type · dysphagia · extrasystole · hepatic function abnormal · increased risk of infection · lethargy · leucopenia · oral paraesthesia · psychiatric disorders · thrombocytopenia · urinary disorders

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

● MONITORING REQUIREMENTS

- Monitor serum albumin and electrolytes before starting treatment and then during treatment—discontinue treatment if serum albumin less than 28 g/litre.
- Obtain ECG before starting treatment and then monthly during treatment (more frequently if serum albumin 28–34 g/litre, or if concomitant use of potent CYP3A4 inhibitors, or if risk factors for QT interval prolongation, or if QTc interval 450–500 milliseconds in men or 470–500 milliseconds in women)—discontinue treatment if QTc interval more than 500 milliseconds (derived using Fridericia's formula).

- **HANDLING AND STORAGE** Dispense in original container (contains desiccant).

Delamanid 50 mg Deltyba 50mg tablets | 48 tablet [PoM](#) £1,250.00

Ethambutol hydrochloride

19-Mar-2018

● INDICATIONS AND DOSE

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

► BY MOUTH

- Child: 20 mg/kg once daily for 2 months (initial phase)
- Adult: 15 mg/kg once daily for 2 months (initial phase)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

► BY MOUTH

- Child: 30 mg/kg 3 times a week for 2 months (initial phase)
- Adult: 30 mg/kg 3 times a week for 2 months (initial phase)

- **CONTRA-INDICATIONS** Optic neuritis · poor vision

- **CAUTIONS** Elderly · young children

- **CAUTIONS, FURTHER INFORMATION**

- ▶ Understanding warnings Patients who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.

- **INTERACTIONS** → Appendix 1: ethambutol

- **SIDE-EFFECTS**

- ▶ **Common or very common** Hyperuricaemia · nerve disorders · visual impairment
 - ▶ **Rare or very rare** Nephritis tubulointerstitial
 - ▶ **Frequency not known** Alveolitis allergic · appetite decreased · asthenia · confusion · dizziness · eosinophilia · fever · flatulence · gastrointestinal discomfort · gout · hallucination · headache · jaundice · leucopenia · nausea · nephrotoxicity · neutropenia · photosensitive lichenoid eruption · sensation abnormal · severe cutaneous adverse reactions (SCARs) · skin reactions · taste metallic · thrombocytopenia · tremor · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Ocular toxicity is more common where excessive dosage is used or if the patient's renal function is impaired. Early discontinuation of the drug is almost always followed by recovery of eyesight.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Amount too small to be harmful.

- **RENAL IMPAIRMENT** Risk of optic nerve damage. Should preferably be avoided in patients with renal impairment.

Dose adjustments ▶ In adults If creatinine clearance less than 30 mL/minute, use 15–25 mg/kg (max. 2.5 g) 3 times a week.

▶ In children If creatinine clearance less than 30 mL/minute/1.73 m², use 15–25 mg/kg (max. 2.5 g) 3 times a week.

Monitoring If creatinine clearance less than 30 mL/minute, monitor plasma-ethambutol concentration.

- **MONITORING REQUIREMENTS**

- ▶ 'Peak' concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre); 'trough' (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre).
 - ▶ Renal function should be checked before treatment.
 - ▶ Visual acuity should be tested by Snellen chart before treatment with ethambutol.
 - ▶ In children In young children, routine ophthalmological monitoring recommended.

- **PRESCRIBING AND DISPENSING INFORMATION** The RCPCH and NPPG recommend that, when a liquid strength of ethambutol is required, the following strength is used: 400 mg/5 mL.

- **PATIENT AND CARER ADVICE**

Ocular toxicity The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice.

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- ▶ Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)
- ▶ Adult: 300 mg daily for 6 months (initial and continuation phases)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- ▶ Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
- ▶ Adult: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive

▶ INITIALLY BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- ▶ Child 1 month–11 years: 10 mg/kg daily (max. per dose 300 mg) for 6 months, alternatively (by mouth) 10 mg/kg daily (max. per dose 300 mg) for 3 months, to be taken in combination with rifampicin
- ▶ Child 12–17 years: 300 mg daily for 6 months, alternatively (by mouth) 300 mg daily for 3 months, to be taken in combination with rifampicin
- ▶ Adult: 300 mg daily for 6 months, alternatively (by mouth) 300 mg daily for 3 months, to be taken in combination with rifampicin

- **CONTRA-INDICATIONS** Drug-induced liver disease

- **CAUTIONS** Acute porphyrias p. 1025 · alcohol dependence · diabetes mellitus · epilepsy · history of psychosis · HIV infection · malnutrition · slow acetylator status (increased risk of side-effects)

- **CAUTIONS, FURTHER INFORMATION**

- ▶ Peripheral neuropathy Peripheral neuropathy is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, pregnancy, malnutrition and HIV infection. In patients at increased risk of peripheral neuropathy, pyridoxine hydrochloride p. 1047 should be given prophylactically from the start of treatment.

- **INTERACTIONS** → Appendix 1: isoniazid

- **SIDE-EFFECTS**

▶ **Uncommon** Hepatic disorders

▶ **Rare or very rare** Severe cutaneous adverse reactions (SCARs)

▶ **Frequency not known** Agranulocytosis · alopecia · anaemia · aplastic anaemia · eosinophilia · fever · gynaecomastia · haemolytic anaemia · hyperglycaemia · lupus-like syndrome · nerve disorders · optic atrophy · pancreatitis ·

pellagra · psychosis · seizure · skin reactions · thrombocytopenia · vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Hepatitis more common in those aged over 35 years and those with a daily alcohol intake.

- **PREGNANCY** Not known to be harmful; prophylactic pyridoxine recommended.
- **BREAST FEEDING** Theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother. **Monitoring** In breast-feeding, monitor infant for possible toxicity.
- **HEPATIC IMPAIRMENT** Use with caution. **Monitoring** In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months.
- **RENAL IMPAIRMENT** Risk of ototoxicity and peripheral neuropathy; prophylactic pyridoxine hydrochloride p. 1047 recommended.

• MONITORING REQUIREMENTS

- ▶ **Renal function** should be checked before treatment.
- ▶ **Hepatic function** should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.
- ▶ In adults Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months.

• PRESCRIBING AND DISPENSING INFORMATION

- ▶ With oral use in children In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The RCPCH and NPPG recommend that, when a liquid special of isoniazid is required, the following strength is used: 50 mg/5 mL.
- ▶ In children Doses may need to be recalculated to allow for weight gain in younger children.

• PATIENT AND CARER ADVICE

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

2.6 Urinary tract infections

Urinary-tract infections

Overview

Urinary-tract infection is more common in women than in men; when it occurs in men there is frequently an underlying abnormality of the renal tract. Recurrent episodes of infection are an indication for radiological investigation especially in children in whom untreated pyelonephritis may lead to permanent kidney damage.

Escherichia coli is the most common cause of urinary-tract infection; *Staphylococcus saprophyticus* is also common in sexually active young women. Less common causes include *Proteus* and *Klebsiella* spp. *Pseudomonas aeruginosa* infections usually occur in the hospital setting and may be associated with functional or anatomical abnormalities of the renal tract. *Staphylococcus epidermidis* and *Enterococcus faecalis* infection may complicate catheterisation or instrumentation.

A specimen of urine should be collected for culture and sensitivity testing before starting antibacterial therapy;

- in men;
- in pregnant women;
- in children under 3 years of age;
- in patients with suspected upper urinary-tract infection;
- complicated infection, or recurrent infection;
- if resistant organisms are suspected;
- if urine dipstick testing gives a single positive result for leucocyte esterase or nitrite;
- if clinical symptoms are not consistent with results of dipstick testing.

Treatment should not be delayed while waiting for results. The antibacterial chosen should reflect current local bacterial sensitivity to antibacterials.

Antibacterial therapy for lower urinary-tract infections

Uncomplicated lower urinary-tract infections often respond to trimethoprim p. 563 or nitrofurantoin p. 579, or alternatively, amoxicillin p. 539, ampicillin p. 540 or oral cephalosporin.

Suggested duration of treatment is 7 days, but a short course (e.g. 3 days) is usually adequate for uncomplicated urinary-tract infections in women.

Infections caused by fully sensitive bacteria respond to amoxicillin.

Widespread bacterial resistance to ampicillin, amoxicillin, and trimethoprim has been reported. Alternatives for resistant organisms include co-amoxiclav p. 542 (amoxicillin with clavulanic acid), an oral cephalosporin, nitrofurantoin, pivmecillinam hydrochloride p. 544, or a quinolone.

Fosfomycin p. 560 can be used, on the advice of a microbiologist, for the treatment of acute uncomplicated lower urinary-tract infections caused by organisms sensitive to fosfomycin.

Long-term low dose therapy may be required in selected patients to prevent recurrence of infection; indications include frequent relapses and significant kidney damage. Trimethoprim, nitrofurantoin and cefalexin p. 516 have been recommended for long-term therapy.

Methenamine hippurate p. 579 (hexamine hippurate) should not generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections.

Antibacterial therapy for upper urinary-tract infections

Acute pyelonephritis can lead to septicaemia and is treated initially by injection of a broad-spectrum antibacterial such as a cephalosporin (e.g. cefuroxime p. 518) or a quinolone if the patient is severely ill; gentamicin p. 510 can also be used.

Suggested duration of treatment is 10–14 days (longer treatment may be necessary in complicated pyelonephritis).

Prostatitis can be difficult to cure and requires treatment for several weeks with an antibacterial which penetrates prostatic tissue such as some of the quinolones (ciprofloxacin p. 548 or ofloxacin p. 551), or alternatively, trimethoprim.

Suggested duration of treatment is 28 days.

Where infection is localised and associated with an indwelling catheter, a bladder instillation is often effective.

Pregnancy

Urinary-tract infection in pregnancy may be asymptomatic and requires prompt treatment to prevent progression to acute pyelonephritis. Penicillins and cephalosporins are suitable for treating urinary-tract infection during pregnancy. Nitrofurantoin may also be used but it should be avoided at term. Sulfonamides and quinolones should be avoided during pregnancy; trimethoprim should also preferably be avoided particularly in the first trimester.

Renal impairment

In renal failure antibacterials normally excreted by the kidney accumulate with resultant toxicity unless the dose is reduced. This applies especially to the aminoglycosides which should be used with great caution; tetracyclines, methenamine hippurate, and nitrofurantoin should be avoided altogether.

ANTIBACTERIALS

Methenamine hippurate

(Hexamine hippurate)

● INDICATIONS AND DOSE

Prophylaxis and long-term treatment of chronic or recurrent uncomplicated lower urinary-tract infections

► BY MOUTH

► Adult: 1 g every 12 hours

Prophylaxis and long-term treatment of chronic or recurrent uncomplicated lower urinary-tract infections in patients with catheters

► BY MOUTH

► Adult: 1 g every 8–12 hours

● **CONTRA-INDICATIONS** Gout · metabolic acidosis · severe dehydration● **INTERACTIONS** → Appendix 1: methenamine● **SIDE-EFFECTS**► **Uncommon** Epigastric discomfort · skin reactions● **PREGNANCY** Use with caution.● **BREAST FEEDING** Amount too small to be harmful.● **HEPATIC IMPAIRMENT** Avoid.● **RENAL IMPAIRMENT** Avoid if eGFR less than 10 mL/minute/1.73 m²—risk of hippurate crystalluria.● **LESS SUITABLE FOR PRESCRIBING** Methenamine (hexamine) hippurate should **not** generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections. It is considered less suitable for prescribing.● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

CAUTIONARY AND ADVISORY LABELS 9

► **Hiprex** (Meda Pharmaceuticals Ltd)**Methenamine hippurate 1 gram** Hiprex 1g tablets | 60 tablet  £19.74 DT = £19.74

Nitrofurantoin

● INDICATIONS AND DOSE

Acute uncomplicated urinary-tract infections

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Child 3 months–11 years: 750 micrograms/kg 4 times a day for 3–7 days

► Child 12–17 years: 50 mg 4 times a day for 3–7 days

► Adult: 50 mg 4 times a day for 3–7 days, dose to be taken with food

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

► Child 12–17 years: 100 mg twice daily, dose to be taken with food

► Adult: 100 mg twice daily, dose to be taken with food

Severe chronic recurrent urinary-tract infections

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Child 12–17 years: 100 mg 4 times a day for 3–7 days

► Adult: 100 mg 4 times a day for 7 days, dose to be taken with food, reduce dose or discontinue treatment if severe nausea occurs

Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Child 3 months–11 years: 1 mg/kg once daily, dose to be taken at night

► Child 12–17 years: 50–100 mg once daily, dose to be taken at night

► Adult: 50–100 mg once daily, dose to be taken at night

Genito-urinary surgical prophylaxis

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

► Adult: 100 mg twice daily on day of procedure and for 3 days after

● **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · G6PD deficiency · infants less than 3 months old● **CAUTIONS** Anaemia · diabetes mellitus · electrolyte imbalance · folate deficiency · pulmonary disease · susceptibility to peripheral neuropathy · urine may be coloured yellow or brown · vitamin B deficiency● **INTERACTIONS** → Appendix 1: nitrofurantoin● **SIDE-EFFECTS** Agranulocytosis · alopecia · anaemia · angioedema · aplastic anaemia · appetite decreased · arthralgia · asthenia · chest pain · chills · circulatory collapse · confusion · cough · cyanosis · depression · diarrhoea · dizziness · drowsiness · dyspnoea · eosinophilia · euphoric mood · fever · granulocytopenia · haemolytic anaemia · headache · hepatic disorders · idiopathic intracranial hypertension · increased risk of infection · leucopenia · lupus-like syndrome · nausea · nerve disorders · nystagmus · pancreatitis · psychotic disorder · pulmonary hypersensitivity · pulmonary reaction (possible association with lupus erythematosus-like syndrome) · respiratory disorders · skin reactions · Stevens-Johnson syndrome · thrombocytopenia · urine discolouration · vertigo · vomiting● **PREGNANCY** Avoid at term—may produce neonatal haemolysis.● **BREAST FEEDING** Avoid; only small amounts in milk but enough to produce haemolysis in G6PD-deficient infants.● **HEPATIC IMPAIRMENT** Use with caution; cholestatic jaundice and chronic active hepatitis reported.● **RENAL IMPAIRMENT** Risk of peripheral neuropathy; antibacterial efficacy depends on renal secretion of the drug into urinary tract.► In adults Avoid if eGFR less than 45 mL/minute/1.73 m²; may be used with caution if eGFR30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.► In children Avoid if estimated glomerular filtration rate less than 45 mL/minute/1.73 m²; may be used with caution if estimated glomerular filtration rate30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.● **MONITORING REQUIREMENTS** On long-term therapy, monitor liver function and monitor for pulmonary symptoms, especially in the elderly (discontinue if deterioration in lung function).● **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances).● **PATIENT AND CARER ADVICE**Medicines for Children leaflet: Nitrofurantoin for urinary tract infections www.medicinesforchildren.org.uk/nitrofurantoin-for-urinary-tract-infections

3 Fungal infection

Antifungals, systemic use

Fungal infections

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. Local treatment is suitable for a number of fungal infections (genital, bladder, eye, ear, oropharynx, and skin).

Aspergillosis

Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. Voriconazole p. 588 is the treatment of choice for aspergillosis; liposomal amphotericin p. 583 is an alternative first-line treatment when voriconazole cannot be used. Caspofungin p. 582, or itraconazole p. 586, can be used in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin. Itraconazole is also used for the treatment of chronic pulmonary aspergillosis or as an adjunct in the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication]. Posaconazole p. 587 is licensed for use in patients with invasive aspergillosis who are refractory to, or intolerant of itraconazole or amphotericin.

Candidiasis

Many superficial candidal infections including infections of the skin are treated locally; widespread or intractable infection requires systemic antifungal treatment. Vaginal candidiasis may be treated with locally acting antifungals or with fluconazole p. 584 given by mouth; for resistant organisms in adults, itraconazole can be given by mouth.

Oropharyngeal candidiasis generally responds to topical therapy; fluconazole is given by mouth for unresponsive infections; it is effective and is reliably absorbed. Itraconazole may be used for infections that do not respond

to fluconazole. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

For *invasive or disseminated candidiasis*, an **echinocandin** can be used. Fluconazole is an alternative for *Candida albicans* infection in clinically stable patients who have not received an azole antifungal recently. Amphotericin is an alternative when an echinocandin or fluconazole cannot be used, however, amphotericin should be considered for the initial treatment of CNS candidiasis. Voriconazole can be used for infections caused by fluconazole-resistant *Candida* spp. when oral therapy is required, or in patients intolerant of amphotericin or an echinocandin. In refractory cases, flucytosine p. 590 can be used with intravenous amphotericin.

Cryptococcosis

Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV-positive patients, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is amphotericin by intravenous infusion and flucytosine by intravenous infusion for 2 weeks, followed by fluconazole by mouth for 8 weeks or until cultures are negative. In cryptococcosis, fluconazole is sometimes given alone as an alternative in HIV-positive patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

Histoplasmosis

Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons.

Itraconazole can be used for the treatment of immunocompetent patients with indolent non-meningeal infection, including chronic pulmonary histoplasmosis. Amphotericin by intravenous infusion is used for the initial treatment of fulminant or severe infections, followed by a course of itraconazole by mouth. Following successful treatment, itraconazole can be used for prophylaxis against relapse until immunity recovers.

Skin and nail infections

Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy. Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis). Oral imidazole or triazole antifungals (particularly itraconazole) and terbinafine p. 1200 are used more frequently than griseofulvin p. 590 because they have a broader spectrum of activity and require a shorter duration of treatment.

Tinea capitis is treated systemically; additional topical application of an antifungal may reduce transmission. Griseofulvin is used for tinea capitis in adults and children; it is effective against infections caused by *Trichophyton tonsurans* and *Microsporum* spp. Terbinafine is used for tinea capitis caused by *T. tonsurans* [unlicensed indication]. The role of terbinafine in the management of *Microsporum* infections is uncertain.

Pityriasis versicolor may be treated with itraconazole by mouth if topical therapy is ineffective; fluconazole by mouth is an alternative. Oral terbinafine is **not** effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. Terbinafine and itraconazole have largely replaced griseofulvin for the systemic treatment of *onychomycosis*, particularly of the toenail; terbinafine is considered to be the drug of choice. Itraconazole can be administered as intermittent 'pulse' therapy. Topical

antifungals also have a role in the treatment of onychomycosis.

Immunocompromised patients

Immunocompromised patients are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. Fluconazole is more reliably absorbed than itraconazole, but fluconazole is not effective against *Aspergillus* spp. Itraconazole is preferred in patients at risk of invasive aspergillosis. Posaconazole can be used for prophylaxis in patients who are undergoing haematopoietic stem cell transplantation or receiving chemotherapy for acute myeloid leukaemia or myelodysplastic syndrome. Micafungin p. 582 can be used for prophylaxis of candidiasis in patients undergoing haematopoietic stem cell transplantation when fluconazole, itraconazole or posaconazole cannot be used.

Amphotericin by intravenous infusion or caspofungin is used for the empirical treatment of serious fungal infections; caspofungin is not effective against fungal infections of the CNS.

Triazole antifungals

Triazole antifungal drugs have a role in the prevention and systemic treatment of fungal infections.

Fluconazole is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria.

Itraconazole is active against a wide range of dermatophytes. Itraconazole capsules require an acid environment in the stomach for optimal absorption. Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

Posaconazole is licensed for the treatment of invasive fungal infections unresponsive to conventional treatment.

Voriconazole is a broad-spectrum antifungal drug which is licensed for use in life-threatening infections.

Imidazole antifungals

The imidazole antifungals include clotrimazole p. 810, econazole nitrate p. 811, ketoconazole p. 666, and tioconazole p. 1199. They are used for the local treatment of vaginal candidiasis and for dermatophyte infections. Miconazole p. 811 can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.

Polyene antifungals

The polyene antifungals include amphotericin p. 583 and nystatin p. 1184; neither drug is absorbed when given by mouth. Nystatin is used for oral, oropharyngeal, and perioral infections by local application in the mouth. Nystatin is also used for *Candida albicans* infection of the skin.

Amphotericin by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (*Abelcet*® and *AmBisome*®) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive.

Echinocandin antifungals

The echinocandin antifungals include anidulafungin below, caspofungin p. 582 and micafungin p. 582. They are only active against *Aspergillus* spp. and *Candida* spp.; however, anidulafungin and micafungin are not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS.

Other antifungals

Flucytosine p. 590 is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. Flucytosine has a role in the treatment of systemic candidiasis and cryptococcal meningitis.

Griseofulvin p. 590 is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. It is the drug of choice for trichophyton infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months.

Terbinafine p. 1200 is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate.

ANTIFUNGALS > ECHINOCANDIN ANTIFUNGALS

Anidulafungin

● INDICATIONS AND DOSE

Invasive candidiasis

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 200 mg once daily for 1 day, then 100 mg once daily

● SIDE-EFFECTS

- ▶ Common or very common Bronchospasm · cholestasis · diarrhoea · dyspnoea · headache · hyperglycaemia · hypertension · hypokalaemia · hypotension · nausea · seizure · skin reactions · vomiting
- ▶ Uncommon Abdominal pain upper · coagulation disorder · vasodilation

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk in animal studies.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Ecalta*®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute each 100 mg with 30 mL water for injections and allow up to 5 minutes for reconstitution; dilute dose in infusion fluid to a concentration of 770 micrograms/mL; give at a rate not exceeding 1.1 mg/minute. Follow product information if using stock supplied with ethanol solvent.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ *Ecalta* (Pfizer Ltd)

Anidulafungin 100 mg *Ecalta* 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £299.99 (Hospital only)

Caspofungin

• INDICATIONS AND DOSE

Invasive aspergillosis | Invasive candidiasis | Empirical treatment of systemic fungal infections in patients with neutropenia

► BY INTRAVENOUS INFUSION

- Adult (body-weight up to 81 kg): 70 mg once daily for 1 day, then 50 mg once daily
- Adult (body-weight 81 kg and above): 70 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises increase dose to 70 mg daily with concurrent use of some enzyme inducers (such as carbamazepine, dexamethasone, phenytoin, and rifampicin); no dose adjustment required for patients already on 70 mg daily.

- **INTERACTIONS** → Appendix 1: caspofungin

• SIDE-EFFECTS

- **Common or very common** Arthralgia • diarrhoea • dyspnoea • electrolyte imbalance • fever • headache • hyperhidrosis • nausea • skin reactions • vomiting
- **Uncommon** Anaemia • anxiety • appetite decreased • arrhythmias • ascites • chest discomfort • coagulation disorder • congestive heart failure • constipation • cough • disorientation • dizziness • drowsiness • dry mouth • dysphagia • excessive tearing • eyelid oedema • fatigue • flatulence • fluid overload • flushing • gastrointestinal discomfort • haematuria • hepatic disorders • hyperbilirubinaemia • hyperglycaemia • hypertension • hypotension • hypoxia • insomnia • laryngeal pain • leucopenia • malaise • metabolic acidosis • muscle weakness • myalgia • nasal congestion • oedema • pain • palpitations • renal impairment • respiratory disorders • sensation abnormal • taste altered • thrombocytopenia • tremor • vision blurred
- **Frequency not known** Severe cutaneous adverse reactions (SCARs)

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.

- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** No information available for severe impairment.

Dose adjustments 70 mg on first day then 35 mg once daily in moderate impairment.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Cancidas[®]), give intermittently in Sodium chloride 0.9%. Allow vial to reach room temperature; initially reconstitute each vial with 10.5 mL water for injections, mixing gently to dissolve then dilute requisite dose in 250 mL infusion fluid (35- or 50-mg doses may be diluted in 100 mL infusion fluid if necessary); give over 60 minutes; incompatible with glucose solutions.

• MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► Caspofungin (Non-proprietary)

Caspofungin (as Caspofungin acetate) 50 mg Caspofungin 50mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £81.92-£327.67

Caspofungin (as Caspofungin acetate) 70 mg Caspofungin 70mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £104.20-£416.78

► Cancidas (Merck Sharp & Dohme Ltd)

Caspofungin (as Caspofungin acetate) 50 mg Cancidas 50mg powder for solution for infusion vials | 1 vial [PoM] £327.67

Caspofungin (as Caspofungin acetate) 70 mg Cancidas 70mg powder for solution for infusion vials | 1 vial [PoM] £416.78

Micafungin

• INDICATIONS AND DOSE

Invasive candidiasis

► BY INTRAVENOUS INFUSION

- Adult (body-weight up to 40 kg): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate
- Adult (body-weight 40 kg and above): 100 mg once daily for at least 14 days; increased if necessary to 200 mg once daily, increase dose if response inadequate

Oesophageal candidiasis

► BY INTRAVENOUS INFUSION

- Adult (body-weight up to 40 kg): 3 mg/kg once daily
- Adult (body-weight 40 kg and above): 150 mg once daily

Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days

► BY INTRAVENOUS INFUSION

- Adult (body-weight up to 40 kg): 1 mg/kg once daily continue for at least 7 days after neutrophil count is in desirable range
- Adult (body-weight 40 kg and above): 50 mg once daily continue for at least 7 days after neutrophil count is in desirable range

- **INTERACTIONS** → Appendix 1: micafungin

- **SIDE-EFFECTS** Anaemia • anxiety • appetite decreased • arrhythmias • confusion • constipation • diarrhoea • disseminated intravascular coagulation • dizziness • drowsiness • dyspnoea • electrolyte imbalance • eosinophilia • flushing • gastrointestinal discomfort • haemolysis • haemolytic anaemia • headache • hepatic disorders • hepatic failure (potentially life-threatening) • hyperbilirubinaemia • hyperhidrosis • hypersensitivity • hypertension • hypoalbuminaemia • hypotension • insomnia • leucopenia • nausea • neutropenia • palpitations • pancytopenia • peripheral oedema • renal impairment • severe cutaneous adverse reactions (SCARs) • shock • skin reactions • taste altered • thrombocytopenia • tremor • vomiting

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Use with caution; renal function may deteriorate.

• MONITORING REQUIREMENTS

- Monitor renal function.
- Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Mycamine[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute each vial with 5 mL infusion fluid; gently rotate vial, without shaking, to dissolve; dilute requisite dose with infusion fluid to 100 mL (final concentration of 0.5–2 mg/mL); protect infusion from light; give over 60 minutes.

• MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► Mycamine (Astellas Pharma Ltd)

Micafungin (as Micafungin sodium) 50 mg Mycamine 50mg powder for solution for infusion vials | 1 vial [PoM] £196.08

Micafungin (as Micafungin sodium) 100 mg Mycamine 100mg powder for solution for infusion vials | 1 vial [PoM] £341.00

ANTIFUNGALS > POLYENE ANTIFUNGALS

Amphotericin

(Amphotericin B)

● INDICATIONS AND DOSE

ABELCET®

Severe invasive candidiasis | Severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptococcosis in HIV patients

► BY INTRAVENOUS INFUSION

- Adult: Test dose 1 mg, to be given over 15 minutes, then 5 mg/kg once daily for at least 14 days

AMBISOME®

Severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin | Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials

► BY INTRAVENOUS INFUSION

- Adult: Test dose 1 mg, to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

Aspergillosis

► BY INTRAVENOUS INFUSION

- Adult: Test dose 1 mg, to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

Visceral leishmaniasis (unresponsive to the antimonial alone)

► BY INTRAVENOUS INFUSION

- Adult: 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg, alternatively 3 mg/kg for 5 consecutive days, followed by 3 mg/kg after 6 days for 1 dose

FUNGIZONE®

Systemic fungal infections

► BY INTRAVENOUS INFUSION

- Adult: Test dose 1 mg, to be given over 20–30 minutes, then 250 micrograms/kg daily, gradually increased over 2–4 days, increased if tolerated to 1 mg/kg daily, max. (severe infection) 1.5 mg/kg daily or on alternate days. Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually

● UNLICENSED USE

AMBISOME® Use at the maximum dose of 5 mg/kg once daily is an unlicensed dose.

- **CAUTIONS** Avoid rapid infusion (risk of arrhythmias) · when given parenterally, toxicity common (close supervision necessary and close observation required for at least 30 minutes after test dose)

CAUTIONS, FURTHER INFORMATION

- **Anaphylaxis** Anaphylaxis can occur with any intravenous amphotericin product and a test dose is advisable before the first infusion; the patient should be carefully observed for at least 30 minutes after the test dose. Prophylactic antipyretics or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential).

- **INTERACTIONS** → Appendix 1: amphotericin

● **SIDE-EFFECTS**

- **Common or very common** Anaemia · appetite decreased · azotaemia · chills · diarrhoea · dyspnoea · electrolyte imbalance · fever · headache · hepatic function abnormal

(discontinue) · hyposthenuria · hypotension · nausea · nephrocalcinosis · renal impairment · renal tubular acidosis · skin reactions · vomiting

- **Uncommon** Agranulocytosis · arrhythmias · flushing · gastrointestinal discomfort · hepatic disorders · leucopenia · myalgia · peripheral neuropathy · respiratory disorders · thrombocytopenia
- **Rare or very rare** Arthralgia · cardiac arrest · coagulation disorder · encephalopathy · eosinophilia · haemorrhage · hearing impairment · heart failure · hypersensitivity · hypertension · malaise · nephrogenic diabetes insipidus · pain · pulmonary oedema non-cardiogenic · seizure · severe cutaneous adverse reactions (SCARs) · shock · vertigo · vision disorders · weight decreased

- **PREGNANCY** Not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk.

- **BREAST FEEDING** No information available.

- **RENAL IMPAIRMENT** Use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation.

- **MONITORING REQUIREMENTS** Hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required.

● **DIRECTIONS FOR ADMINISTRATION****ABELCET® Amphotericin (lipid complex)**

For intravenous infusion, give intermittently in Glucose 5%. Allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20-mL syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute to a concentration of 1 mg/mL (2 mg/mL can be used in fluid restriction and in children); preferably give *via* an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose of 1 mg over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium chloride or other electrolyte solutions, flush existing intravenous line with glucose 5% or use separate line.

AMBISOME® Amphotericin (liposomal)

For intravenous infusion (AmBisome®), give intermittently in Glucose 5% or 10%. Reconstitute each vial with 12 mL water for injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into infusion fluid through the 5 micron filter provided to produce a final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur infuse over 2 hours (initial test dose of 1 mg over 10 minutes); an in-line filter (pore size no less than 1 micron) may be used; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or 10%, or use separate line.

FUNGIZONE® Amphotericin (as sodium deoxycholate complex)

For intravenous infusion (Fungizone®), give intermittently in Glucose 5%. Reconstitute each vial with 10 mL water of injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in infusion fluid to a concentration of 100 micrograms/mL; pH of the glucose must not be below 4.2 (check each container—consult product literature for details of the buffer); infuse over 2–4 hours, or longer if not tolerated (initial test dose of 1 mg over 20–30 minutes); begin infusion immediately after dilution; protect from light; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used.

- **PRESCRIBING AND DISPENSING INFORMATION** Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and

administration; these preparations should **not** be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for infusion

ELECTROLYTES: May contain Sodium

ANTIFUNGALS > TRIAZOLE ANTIFUNGALS

Fluconazole

• INDICATIONS AND DOSE

Candidal balanitis

► BY MOUTH

► Child 16–17 years: 150 mg for 1 dose

► Adult: 150 mg for 1 dose

Vaginal candidiasis

► BY MOUTH

► Child 16–17 years: 150 mg for 1 dose

► Adult: 150 mg for 1 dose

Vulvovaginal candidiasis (recurrent)

► BY MOUTH

► Adult: Initially 150 mg every 72 hours for 3 doses, then 150 mg once weekly for 6 months

Mucosal candidiasis (except genital)

► BY MOUTH, OR BY INTRAVENOUS INFUSION

► Child 1 month–11 years: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg daily (max. per dose 100 mg) for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections)

► Child 12–17 years: 50 mg daily for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections

► BY MOUTH

► Adult: 50 mg daily given for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14 days in atrophic oral candidiasis associated with dentures; for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections

Tinea pedis, corporis, cruris, pityriasis versicolor | Dermal candidiasis

► BY MOUTH

► Adult: 50 mg daily for 2–4 weeks (for up to 6 weeks in tinea pedis); max. duration of treatment 6 weeks

Invasive candidal infections (including candidaemia and disseminated candidiasis) and cryptococcal infections (including meningitis)

► BY MOUTH, OR BY INTRAVENOUS INFUSION

► Child: 6–12 mg/kg daily (max. per dose 800 mg), treatment continued according to response (at least 8 weeks for cryptococcal meningitis)

► Adult: 400 mg, dose to be given on first day, then 200–400 mg daily (max. per dose 800 mg once daily), treatment continued according to response (at least 8 weeks for cryptococcal meningitis), maximum dose for use in severe infections

Prevention of fungal infections in immunocompromised patients

► BY MOUTH, OR BY INTRAVENOUS INFUSION

► Child: 3–12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose given according to extent and duration of neutropenia

► Adult: 50–400 mg daily, commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose adjusted according to risk

Prevention of fungal infections in immunocompromised patients (for patients with high risk of systemic infections e.g. following bone-marrow transplantation)

► BY MOUTH, OR BY INTRAVENOUS INFUSION

► Adult: 400 mg daily, commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range

Prevention of relapse of cryptococcal meningitis in HIV-infected patients after completion of primary therapy

► BY MOUTH, OR BY INTRAVENOUS INFUSION

► Adult: 200 mg daily

• **CONTRA-INDICATIONS** Acute porphyrias p. 1025

• **CAUTIONS** Susceptibility to QT interval prolongation

• **INTERACTIONS** → Appendix 1: antifungals, azoles

• **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

► **Common or very common** Diarrhoea · gastrointestinal discomfort · headache · nausea · skin reactions · vomiting

► **Uncommon** Dizziness · flatulence · hepatic disorders · seizure · taste altered

► **Rare or very rare** Agranulocytosis · alopecia · dyslipidaemia · hypokalaemia · leucopenia · neutropenia · QT interval prolongation · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · torsade de pointes

SPECIFIC SIDE-EFFECTS

► **Uncommon**

► With parenteral use Anaemia · appetite decreased · asthenia · constipation · drowsiness · dry mouth · fever · hyperhidrosis · insomnia · malaise · myalgia · paraesthesia · vertigo

► **Rare or very rare**

► With parenteral use Angioedema · face oedema · tremor

► **Frequency not known**

► With oral use Cardio-respiratory distress · oedema

SIDE-EFFECTS, FURTHER INFORMATION If rash occurs, discontinue treatment (or monitor closely if infection invasive or systemic); severe cutaneous reactions are more likely in patients with AIDS.

• **PREGNANCY** Manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses.

• **BREAST FEEDING** Present in milk but amount probably too small to be harmful.

• **HEPATIC IMPAIRMENT** Toxicity with related drugs.

● RENAL IMPAIRMENT

- Dose adjustments** ▶ In adults Usual initial dose then halve subsequent doses if eGFR less than 50 mL/minute/1.73 m².
 ▶ In children Usual initial dose then halve subsequent doses if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

Monitor liver function with high doses or extended courses—discontinue if signs or symptoms of hepatic disease (risk of hepatic necrosis).

● DIRECTIONS FOR ADMINISTRATION

- ▶ In children For *intravenous infusion*, give over 10–30 minutes; do not exceed an infusion rate of 5–10 mL/minute.

● PRESCRIBING AND DISPENSING INFORMATION

Flavours of oral liquid formulations may include orange.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Fluconazole Capsules 50 mg may be prescribed.
 Fluconazole Oral Suspension 50 mg/5 mL may be prescribed.

● EXCEPTIONS TO LEGAL CATEGORY

Fluconazole capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Infusion

▶ Fluconazole (Non-proprietary)

Fluconazole 2 mg per 1 mL Fluconazole 200mg/100mL infusion bags
 | 5 bag [PoM] £19.45
 Fluconazole 400mg/200mL infusion bags | 5 bag [PoM] £72.50

Solution for infusion

ELECTROLYTES: May contain Sodium

▶ Fluconazole (Non-proprietary)

Fluconazole 2 mg per 1 mL Fluconazole 200mg/100mL solution for infusion vials | 1 vial [PoM] £3.00–£29.28
 Fluconazole 50mg/25mL solution for infusion vials | 1 vial [PoM] £7.31–£7.32

Fluconazole 200mg/100mL solution for infusion bottles | 5 bottle [PoM] £274.50

▶ Diflucan (Pfizer Ltd)

Fluconazole 2 mg per 1 mL Diflucan 200mg/100mL solution for infusion vials | 1 vial [PoM] £29.28 (Hospital only)

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9

▶ Fluconazole (Non-proprietary)

Fluconazole 10 mg per 1 mL Fluconazole 50mg/5mL oral suspension
 | 35 mL [PoM] £20.51 DT = £20.51

▶ Diflucan (Pfizer Ltd)

Fluconazole 10 mg per 1 mL Diflucan 50mg/5mL oral suspension | 35 mL [PoM] £16.61 DT = £20.51

Fluconazole 40 mg per 1 mL Diflucan 200mg/5mL oral suspension | 35 mL [PoM] £66.42 DT = £66.42

Capsule

CAUTIONARY AND ADVISORY LABELS 9 (50 mg and 200 mg strengths only)

▶ Fluconazole (Non-proprietary)

Fluconazole 50 mg Fluconazole 50mg capsules | 7 capsule [PoM] £5.00 DT = £0.45

Fluconazole 150 mg Fluconazole 150mg capsules | 1 capsule [PoM] £8.50 DT = £0.39 | 1 capsule [P] DT = £0.39

Fluconazole 200 mg Fluconazole 200mg capsules | 7 capsule [PoM] £6.02 DT = £5.30

▶ Canesten (fluconazole) (Bayer Plc)

Fluconazole 150 mg Canesten Thrush Oral 150mg capsules | 1 capsule [P] £6.33 DT = £0.39

▶ Diflucan (Pfizer Ltd)

Fluconazole 50 mg Diflucan 50mg capsules | 7 capsule [PoM] £16.61 DT = £0.45

Fluconazole 150 mg Diflucan 150mg capsules | 1 capsule [PoM] £7.12 DT = £0.39

Fluconazole 200 mg Diflucan 200mg capsules | 7 capsule [PoM] £66.42 DT = £5.30

Isavuconazole

22-Mar-2017

● DRUG ACTION

Isavuconazole is a triazole antifungal that blocks the synthesis of ergosterol, a key component of the fungal cell membrane.

● INDICATIONS AND DOSE

Invasive aspergillosis | Mucormycosis in patients for whom amphotericin B is inappropriate

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Adult: Loading dose 200 mg every 8 hours for 48 hours (6 administrations in total), then maintenance 200 mg once daily, maintenance dose to be started at least 12 hours after the last loading dose; long-term treatment should be reviewed after 6-months

● CONTRA-INDICATIONS

Acute porphyrias p. 1025 · short QT syndrome

● CAUTIONS

Elderly—limited information

● INTERACTIONS

→ Appendix 1: antifungals, azoles

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · asthenia · chest pain · delirium · diarrhoea · drowsiness · electrolyte imbalance · gastrointestinal discomfort · headache · hepatic disorders · nausea · skin reactions
- ▶ **Uncommon** Alopecia · anaemia · arrhythmias · back pain · circulatory collapse · confusion · constipation · depression · dizziness · dyspnoea · encephalopathy · haemorrhage · hypersensitivity · hypoalbuminaemia · hypoglycaemia · hypotension · insomnia · leucopenia · malaise · malnutrition · neutropenia · palpitations · pancytopenia · paraesthesia · peripheral neuropathy · renal failure · respiratory disorders · seizures · syncope · taste altered · thrombocytopenia · vertigo · vomiting

SPECIFIC SIDE-EFFECTS

▶ Common or very common

- ▶ With intravenous use Hyperbilirubinaemia

▶ Uncommon

- ▶ With intravenous use Peripheral oedema

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions have been reported, including hypotension, dyspnoea, dizziness, paraesthesia, nausea, and headache—manufacturer advises discontinue treatment if these reactions occur.

● PREGNANCY

Manufacturer advises avoid unless severe or life-threatening infection—toxicity in *animal* studies.

● BREAST FEEDING

Manufacturer advises avoid—present in milk in *animal* studies.

● HEPATIC IMPAIRMENT

Manufacturer advises use with caution and monitor for toxicity in severe impairment—no information available.

● DIRECTIONS FOR ADMINISTRATION

For *intravenous infusion*, reconstitute each 200 mg with 5 mL Water for Injection; dilute dose to concentration of 0.8 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give via a 0.2–1.2 micron filter over at least 1 hour.

● HANDLING AND STORAGE

- ▶ With intravenous use Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for storage after reconstitution or dilution.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of confusion, syncope and dizziness.

● NATIONAL FUNDING/ACCESS DECISIONS

All Wales Medicines Strategy Group (AWMSG) Decisions

The All Wales Medicines Strategy Group has advised (January 2017) that isavuconazole (*Cresamba*®) is

recommended as an option for use in adults within NHS Wales for the treatment of invasive aspergillosis, and the treatment of mucormycosis in patients for whom amphotericin B is inappropriate, only if the approved Wales Patient Access Scheme (WPAS) is used or where the list/contract price is equivalent or lower.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

Itraconazole

• INDICATIONS AND DOSE

Vulvovaginal candidiasis

► BY MOUTH

► Adult: 200 mg twice daily for 1 day

Vulvovaginal candidiasis (recurrent)

► BY MOUTH

► Adult: 50–100 mg daily for 6 months

Oral or oesophageal candidiasis that has not responded to fluconazole

► BY MOUTH USING ORAL SOLUTION

► Adult: 100–200 mg twice daily for 2 weeks (continue for another 2 weeks if no response; the higher dose should not be used for longer than 2 weeks if no signs of improvement)

Oral or oesophageal candidiasis in HIV-positive or other immunocompromised patients

► BY MOUTH USING ORAL SOLUTION

► Adult: 200 mg daily in 1–2 divided doses for 1 week (continue for another week if no response)

Systemic candidiasis where other antifungal drugs inappropriate or ineffective

► BY MOUTH

► Adult: 100–200 mg once daily

► BY INTRAVENOUS INFUSION

► Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

Systemic candidiasis (invasive or disseminated) where other antifungal drugs inappropriate or ineffective

► BY MOUTH

► Adult: 200 mg twice daily

Pityriasis versicolor

► BY MOUTH

► Adult: 200 mg once daily for 7 days

Tinea pedis | Tinea manuum

► BY MOUTH

► Adult: 100 mg once daily for 30 days, alternatively 200 mg twice daily for 7 days

Tinea corporis | Tinea cruris

► BY MOUTH

► Adult: 100 mg once daily for 15 days, alternatively 200 mg once daily for 7 days

Onychomycosis

► BY MOUTH

► Adult: 200 mg once daily for 3 months, alternatively 200 mg twice daily for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses

Aspergillosis

► BY MOUTH

► Adult: 200 mg twice daily

Systemic aspergillosis where other antifungal drugs inappropriate or ineffective

► BY INTRAVENOUS INFUSION

► Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

Histoplasmosis

► BY MOUTH

► Adult: 200 mg 3 times a day for 3 days, then 200 mg 1–2 times a day

► BY INTRAVENOUS INFUSION

► Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

Systemic cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective

► BY MOUTH

► Adult: 200 mg once daily, dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 200 mg twice daily

► BY INTRAVENOUS INFUSION

► Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

Maintenance in HIV-infected patients to prevent relapse of underlying fungal infection and prophylaxis in neutropenia when standard therapy inappropriate

► BY MOUTH

► Adult: 200 mg once daily, then increased to 200 mg twice daily, dose increased only if low plasma-itraconazole concentration

Prophylaxis of deep fungal infections (when standard therapy inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic

► BY MOUTH USING ORAL SOLUTION

► Adult: 5 mg/kg daily in 2 divided doses, to be started before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers, safety and efficacy not established in elderly patients

DOSE ADJUSTMENTS DUE TO INTERACTIONS

► Manufacturer advises max. dose 200 mg daily with concurrent use of cobicistat.

- **UNLICENSED USE** Itraconazole doses in BNF may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

HEART FAILURE

Following reports of heart failure, caution is advised when prescribing itraconazole to patients at high risk of heart failure. Those at risk include:

- patients receiving high doses and longer treatment courses;
- older adults and those with cardiac disease;
- patients with chronic lung disease (including chronic obstructive pulmonary disease) associated with pulmonary hypertension;
- patients receiving treatment with negative inotropic drugs, e.g. calcium channel blockers.

Itraconazole should be avoided in patients with ventricular dysfunction or a history of heart failure unless the infection is serious.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025
- **CAUTIONS** Active liver disease · history of hepatotoxicity with other drugs · susceptibility to congestive heart failure
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · constipation · diarrhoea · dyspnoea · gastrointestinal discomfort · headache · heart failure · hepatic disorders · hyperbilirubinaemia · hypotension · nausea · oedema · pulmonary oedema · skin reactions · vision disorders · vomiting
- ▶ **Uncommon** Taste altered
- ▶ **Rare or very rare** Angioedema · hypersensitivity vasculitis · hypertriglyceridaemia · pancreatitis · photosensitivity reaction · severe cutaneous adverse reactions (SCARs)
- ▶ **Frequency not known** Peripheral neuropathy (discontinue)

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intravenous use Chest pain · confusion · cough · dizziness · drowsiness · electrolyte imbalance · fatigue · gastrointestinal disorder · granulocytopenia · hyperglycaemia · hyperhidrosis · hypersensitivity · hypertension · myalgia · pain · renal impairment · tachycardia · tremor · urinary incontinence
- ▶ **Uncommon**
- ▶ With intravenous use Dysphonia · hearing loss · numbness · thrombocytopenia
- ▶ With oral use Flatulence · menstrual disorder
- ▶ **Rare or very rare**
- ▶ With oral use Erectile dysfunction · hearing impairment · leucopenia · sensations abnormal · serum sickness · urinary frequency increased

SIDE-EFFECTS, FURTHER INFORMATION Potentially life-threatening hepatotoxicity reported very rarely—discontinue if signs of hepatitis develop.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and until the next menstrual period following end of treatment.
- **PREGNANCY** Manufacturer advises use only in life-threatening situations (toxicity at high doses in *animal* studies).
- **BREAST FEEDING** Small amounts present in milk—may accumulate; manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use only if potential benefit outweighs risk of hepatotoxicity.
Dose adjustments Dose reduction may be necessary.
- **RENAL IMPAIRMENT** Risk of congestive heart failure.
▶ With oral use Bioavailability of oral formulations possibly reduced.
- ▶ With intravenous use Use intravenous infusion with caution if eGFR 30–80 mL/minute/1.73 m²; avoid intravenous infusion if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
- ▶ Absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary).
- ▶ Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, if history of hepatotoxicity with other drugs, or in hepatic impairment.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use For *intravenous infusion* (*Sporanox*®), give intermittently in Sodium Chloride 0.9%; dilute 250 mg in 50 mL infusion fluid and infuse only 60 mL through an in-line filter (0.2 micron) over 60 minutes.

- ▶ With oral use For *oral liquid*, do not take with food; swish around mouth and swallow, do not rinse afterwards.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.
- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop.
- ▶ With oral use Patients or carers should be given advice on how to administer itraconazole oral liquid.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for infusion

EXCIPIENTS: May contain Propylene glycol

▶ *Sporanox* (Janssen-Cilag Ltd)

Itraconazole 10 mg per 1 mL Sporanox I.V. 250mg/25ml solution for infusion ampoules and diluent | 1 ampoule [PoM] £79.71

Oral solution

CAUTIONARY AND ADVISORY LABELS 9, 23

▶ *Itraconazole* (Non-proprietary)

Itraconazole 10 mg per 1 mL Itraconazole 50mg/5ml oral solution sugar free sugar-free | 150 mL [PoM] £58.34 DT = £58.34

▶ *Sporanox* (Janssen-Cilag Ltd)

Itraconazole 10 mg per 1 mL Sporanox 50mg/5ml oral solution sugar-free | 150 mL [PoM] £58.34 DT = £58.34

Capsule

CAUTIONARY AND ADVISORY LABELS 5, 9, 21, 25

▶ *Itraconazole* (Non-proprietary)

Itraconazole 100 mg Itraconazole 100mg capsules | 15 capsule [PoM] £13.77 DT = £3.40 | 60 capsule [PoM] £13.60-£56.21

▶ *Sporanox* (Janssen-Cilag Ltd)

Itraconazole 100 mg Sporanox-Pulse 100mg capsules | 28 capsule [PoM] £25.72
Sporanox 100mg capsules | 4 capsule [PoM] £3.67 | 15 capsule [PoM] £13.77 DT = £3.40 | 60 capsule [PoM] £55.10

Posaconazole

10-Nov-2017

● INDICATIONS AND DOSE

Invasive aspergillosis either refractory to, or in patients intolerant of, itraconazole or amphotericin | Fusariosis either refractory to, or in patients intolerant of, amphotericin | Chromoblastomycosis and mycetoma either refractory to, or in patients intolerant of, itraconazole | Coccidioidomycosis either refractory to, or in patients intolerant of, amphotericin, itraconazole, or fluconazole

▶ BY MOUTH USING ORAL SUSPENSION

▶ Adult: 400 mg twice daily, to be taken with food, alternatively 200 mg 4 times a day, if unable to tolerate food

▶ BY MOUTH USING TABLETS, OR BY INTRAVENOUS INFUSION

▶ Adult: Loading dose 300 mg twice daily on first day, then 300 mg once daily, switch from intravenous to oral route when appropriate

Oropharyngeal candidiasis (severe infection or in immunocompromised patients only)

▶ BY MOUTH USING ORAL SUSPENSION

▶ Adult: Loading dose 200 mg on first day, then 100 mg once daily for 13 days, dose to be taken with food

continued →

Prophylaxis of invasive fungal infections in patients at high risk and undergoing high-dose immunosuppressive therapy for haematopoietic stem cell transplantation or receiving chemotherapy for acute myeloid leukaemia or myelodysplastic syndrome and expected to develop prolonged neutropenia

- **BY MOUTH USING ORAL SUSPENSION**
- Adult: 200 mg 3 times a day, dose to be taken with food, for chemotherapy patients, start several days before the expected onset of neutropenia and continue for 7 days after neutrophil count rises above 500 cells/mm³
- **BY MOUTH USING TABLETS, OR BY INTRAVENOUS INFUSION**
- Adult: Loading dose 300 mg twice daily on first day, then 300 mg once daily, for chemotherapy patients, start several days before the expected onset of neutropenia and continue for 7 days after neutrophil count rises above 500 cells/mm³, switch from intravenous to oral route when appropriate

DOSE EQUIVALENCE AND CONVERSION

- Posaconazole oral suspension is **not** interchangeable with tablets on a milligram-for-milligram basis.

PHARMACOKINETICS

- Posaconazole oral suspension should be taken with food (preferably a high fat meal) or nutritional supplement to ensure adequate exposure for systemic effects. Where possible, tablets should be used in preference to suspension because tablets have a higher bioavailability.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025
- **CAUTIONS** Administration by intravenous infusion, particularly by peripheral catheter—increased risk of QTc interval prolongation · body-weight over 120 kg—risk of treatment failure possibly increased · body-weight under 60 kg—risk of side effects increased · bradycardia · cardiomyopathy · history of QTc interval prolongation · symptomatic arrhythmias
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**
 - **Common or very common** Appetite decreased · asthenia · constipation · diarrhoea · dizziness · drowsiness · dry mouth · electrolyte imbalance · gastrointestinal discomfort · gastrointestinal disorders · headache · hypertension · nausea · neutropenia · sensation abnormal · skin reactions · taste altered · vomiting
 - **Uncommon** Alopecia · anaemia · aphasia · arrhythmias · burping · chest discomfort · confusion · cough · embolism and thrombosis · eosinophilia · feeling jittery · haemorrhage · hepatic disorders · hiccups · hyperglycaemia · hypoglycaemia · hypotension · leucopenia · lymphadenopathy · malaise · menstrual disorder · mucositis · nasal congestion · oedema · oral disorders · pain · palpitations · pancreatitis · peripheral neuropathy · QT interval prolongation · renal impairment · respiratory disorders · seizure · sleep disorders · splenic infarction · thrombocytopenia · tremor · vasculitis · vision disorders
 - **Rare or very rare** Adrenal insufficiency · breast pain · cardiac arrest · coagulation disorder · depression · encephalopathy · haemolytic uraemic syndrome · hearing impairment · heart failure · myocardial infarction · nephritis tubulointerstitial · pancytopenia · psychotic disorder · pulmonary hypertension · renal tubular acidosis · Stevens-Johnson syndrome · stroke · sudden cardiac death · syncope
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risks; toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises monitor efficacy in severe impairment—variable exposure expected.
 - With intravenous use Manufacturer advises caution if eGFR less than 50 mL/minute/1.73 m²—intravenous vehicle may accumulate.
- **MONITORING REQUIREMENTS**
 - Monitor electrolytes (including potassium, magnesium, and calcium) before and during therapy.
 - Monitor liver function before and during therapy.
- **DIRECTIONS FOR ADMINISTRATION**
 - With intravenous use Manufacturer advises for *intravenous infusion* (Noxafil®), give continuously in Glucose 5% or Sodium Chloride 0.9%; dilute requisite dose in infusion fluid to produce a final concentration of 1–2 mg/mL; give via a central venous catheter or peripherally inserted central catheter over approx. 90 minutes (can give a single dose via peripheral venous catheter if central access not established—dilute to a final concentration of 2 mg/mL and give over approx. 30 minutes).
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.
- **HANDLING AND STORAGE**
 - With intravenous use Manufacturer advises store in a refrigerator (2–8 °C).
- **PATIENT AND CARER ADVICE**
 - Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and somnolence.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

► **Noxafil** (Merck Sharp & Dohme Ltd)

Posaconazole 18 mg per 1 mL Noxafil 300mg/16.7mL concentrate for solution for infusion vials | 1 vial [PoM] £211.00 (Hospital only)

Oral suspension

CAUTIONARY AND ADVISORY LABELS 3, 9, 21

► **Noxafil** (Merck Sharp & Dohme Ltd)

Posaconazole 40 mg per 1 mL Noxafil 40mg/mL oral suspension | 105 mL [PoM] £491.20 (Hospital only)

Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 3, 9, 25

► **Noxafil** (Merck Sharp & Dohme Ltd)

Posaconazole 100 mg Noxafil 100mg gastro-resistant tablets | 24 tablet [PoM] £596.96 | 96 tablet [PoM] £2,387.85

Voriconazole

INDICATIONS AND DOSE

Invasive aspergillosis | Serious infections caused by *Scedosporium* spp., *Fusarium* spp., or invasive fluconazole-resistant *Candida* spp. (including *C. krusei*)

► **BY MOUTH**

- Adult (body-weight up to 40 kg): Initially 200 mg every 12 hours for 2 doses, then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours
- Adult (body-weight 40 kg and above): Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours
- **BY INTRAVENOUS INFUSION**
- Adult: Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours; reduced if not tolerated to 3 mg/kg every 12 hours; for max. 6 months

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ With intravenous use Manufacturer advises increase maintenance dose to 5 mg/kg every 12 hours with concurrent use of fosphenytoin, phenytoin or rifabutin.
- ▶ With oral use Manufacturer advises increase maintenance dose with concurrent use of fosphenytoin or phenytoin; 400 mg every 12 hours for patients of body-weight 40 kg and above; 200 mg every 12 hours for patients of body-weight less than 40 kg. Manufacturer advises if concurrent use of rifabutin is unavoidable, increase maintenance dose to 350 mg every 12 hours for patients of body-weight 40 kg and above; 200 mg every 12 hours for patients of body-weight less than 40 kg.

● **CONTRA-INDICATIONS** Acute porphyrias p. 1025

● **CAUTIONS** Avoid exposure to sunlight · bradycardia · cardiomyopathy · electrolyte disturbances · history of QT interval prolongation · patients at risk of pancreatitis · symptomatic arrhythmias

● **INTERACTIONS** → Appendix 1: antifungals, azoles

● SIDE-EFFECTS

▶ **Common or very common** Acute kidney injury · agranulocytosis · alopecia · anaemia · anxiety · arrhythmias · asthenia · bone marrow disorders · chest pain · chills · confusion · constipation · depression · diarrhoea · dizziness · drowsiness · dyspnoea · electrolyte imbalance · eye disorders · eye inflammation · fever · gastrointestinal discomfort · haemorrhage · hallucination · headache · hepatic disorders · hypoglycaemia · hypotension · increased risk of infection · insomnia · leucopenia · muscle tone increased · nausea · neutropenia · oedema · oral disorders · pain · pulmonary oedema · respiratory disorders · seizure · sensation abnormal · skin reactions · syncope · tetany · thrombocytopenia · tremor · vision disorders · vomiting

▶ **Uncommon** Adrenal insufficiency · arthritis · brain oedema · duodenitis · encephalopathy · eosinophilia · gallbladder disorders · hearing impairment · hypothyroidism · influenza like illness · lymphadenopathy · lymphangitis · movement disorders · nephritis · nerve disorders · pancreatitis · parkinsonism · phototoxicity · proteinuria · pseudomembranous enterocolitis · QT interval prolongation · renal tubular necrosis · severe cutaneous adverse reactions (SCARs) · taste altered · vertigo

▶ **Rare or very rare** Angioedema · cardiac conduction disorders · disseminated intravascular coagulation · hyperthyroidism

▶ **Frequency not known** Cutaneous lupus erythematosus · infusion related reaction · periostitis (more common in transplant patients) · squamous cell carcinoma (more common in presence of phototoxicity)

SIDE-EFFECTS, FURTHER INFORMATION

Hepatotoxicity Hepatitis, cholestasis, and acute hepatic failure have been reported; risk of hepatotoxicity increased in patients with haematological malignancy. Consider treatment discontinuation if severe abnormalities in liver function tests.

Phototoxicity Phototoxicity occurs uncommonly. If phototoxicity occurs, consider treatment discontinuation; if treatment is continued, monitor for pre-malignant skin lesions and squamous cell carcinoma, and discontinue treatment if they occur.

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

● **PREGNANCY** Toxicity in animal studies—manufacturer advises avoid unless potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● HEPATIC IMPAIRMENT

Dose adjustments In mild to moderate hepatic cirrhosis use usual initial dose then halve maintenance dose. No

information available for severe hepatic cirrhosis—manufacturer advises use only if potential benefit outweighs risk.

● **RENAL IMPAIRMENT** Intravenous vehicle may accumulate if eGFR less than 50 mL/minute/1.73 m²—use intravenous infusion only if potential benefit outweighs risk, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required).

● MONITORING REQUIREMENTS

▶ Monitor renal function.
▶ Monitor liver function before starting treatment, then at least weekly for 1 month, and then monthly during treatment.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, reconstitute each 200 mg with 19 mL Water for Injections or Sodium Chloride 0.9% to produce a 10 mg/mL solution; dilute dose to concentration of 0.5–5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give intermittently at a rate not exceeding 3 mg/kg/hour.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.

● **PATIENT AND CARER ADVICE** Patients and their carers should be told how to recognise symptoms of liver disorder, and advised to seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

Patients and their carers should be advised that patients should avoid intense or prolonged exposure to direct sunlight, and to avoid the use of sunbeds. In sunlight, patients should cover sun-exposed areas of skin and use a sunscreen with a high sun protection factor. Patients should seek medical attention if they experience sunburn or a severe skin reaction following exposure to light or sun.

Patients and their carers should be advised to keep the alert card with them at all times.

ANTIFUNGALS > OTHER

Flucytosine

● INDICATIONS AND DOSE

Systemic yeast and fungal infections | Adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections

▶ BY INTRAVENOUS INFUSION

- Adult: Usual dose 200 mg/kg daily in 4 divided doses usually for not more than 7 days, alternatively 100–150 mg/kg daily in 4 divided doses, lower dose may be sufficient for extremely sensitive organisms

Cryptococcal meningitis (adjunct to amphotericin)

▶ BY INTRAVENOUS INFUSION

- Adult: 100 mg/kg daily in 4 divided doses for 2 weeks

- **UNLICENSED USE** Use in cryptococcal meningitis for 2 weeks is an unlicensed duration.

- **CAUTIONS** Blood disorders · elderly

- **INTERACTIONS** → Appendix 1: flucytosine

- **SIDE-EFFECTS** Agranulocytosis · aplastic anaemia · blood disorder · cardiotoxicity · confusion · diarrhoea · hallucination · headache · hepatic disorders · leucopenia · nausea · rash · sedation · seizure · thrombocytopenia · toxic epidermal necrolysis · ventricular dysfunction · vertigo · vomiting

- **PREGNANCY** Teratogenic in *animal* studies; manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid.

- **RENAL IMPAIRMENT**

Dose adjustments Use 50 mg/kg every 12 hours if creatinine clearance 20–40 mL/minute; use 50 mg/kg every 24 hours if creatinine clearance 10–20 mL/minute; use initial dose of 50 mg/kg if creatinine clearance less than 10 mL/minute and then adjust dose according to plasma-flucytosine concentration.

Monitoring In renal impairment liver- and kidney-function tests and blood counts required weekly.

- **MONITORING REQUIREMENTS**

- ▶ For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre).
- ▶ Liver- and kidney-function tests and blood counts required (weekly in blood disorders).

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give over 20–40 minutes.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Ancitol** (Meda Pharmaceuticals Ltd)

Flucytosine 10 mg per 1 mL Ancitol 2.5g/250ml solution for infusion bottles | 5 bottle [PoM] £151.67 (Hospital only)

Griseofulvin

● INDICATIONS AND DOSE

Dermatophyte infections of the skin, scalp, hair and nails where topical therapy has failed or is inappropriate

▶ BY MOUTH

- Adult: 500 mg daily, increased if necessary to 1 g daily, for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses

Tinea capitis caused by *Trichophyton tonsurans*

▶ BY MOUTH

- Adult: 1 g once daily, alternatively 1 g daily in divided doses

- **UNLICENSED USE** Griseofulvin doses in BNF may differ from those in product literature.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · systemic lupus erythematosus (risk of exacerbation)

- **INTERACTIONS** → Appendix 1: griseofulvin

- **SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea · epigastric discomfort · headache · nausea · vomiting

- ▶ **Uncommon** Appetite decreased · confusion · coordination abnormal · dizziness · drowsiness · insomnia · irritability · peripheral neuropathy · photosensitivity reaction · skin reactions · taste altered · toxic epidermal necrolysis

- ▶ **Rare or very rare** Anaemia · hepatic disorders · leucopenia · neutropenia · systemic lupus erythematosus (SLE)

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 1 month after administration to women (important: effectiveness of oral contraceptives may be reduced, additional contraceptive precautions e.g. barrier method, required). Men should avoid fathering a child during and for at least 6 months after administration

- **PREGNANCY** Avoid (fetotoxicity and teratogenicity in *animals*).

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease.

- **PATIENT AND CARER ADVICE**

- ▶ **Driving and skilled tasks** May impair performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

3.1 Pneumocystis pneumonia

Pneumocystis pneumonia

Overview

Pneumonia caused by *Pneumocystis jirovecii* (*Pneumocystis carinii*) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

Treatment

Mild to moderate disease

Co-trimoxazole p. 552 in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

Atovaquone p. 591 is licensed for the treatment of mild to moderate pneumocystis infection in patients who cannot tolerate co-trimoxazole. A combination of dapsone p. 566 with trimethoprim p. 563 is given by mouth for the treatment of mild to moderate disease [unlicensed indication].

A combination of clindamycin p. 526 and primaquine p. 607 by mouth is used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

Severe disease

Co-trimoxazole in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isetionate below given by intravenous infusion is an alternative for patients who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion.

Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia.

Adjunctive therapy

In moderate to severe infections associated with HIV infection, prednisolone p. 664 is given by mouth for 5 days (alternatively, hydrocortisone p. 662 may be given parenterally); the dose is then reduced to complete 21 days of treatment. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

Prophylaxis

Prophylaxis against pneumocystis pneumonia should be given to all patients with a history of the infection. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised patients. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the patient has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

Co-trimoxazole by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. It is given daily or on alternate days (3 times a week); the dose may be reduced to improve tolerance.

Inhaled pentamidine isetionate is better tolerated than parenteral pentamidine isetionate. Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in patients unable to tolerate co-trimoxazole. It is effective but patients may be prone to extrapulmonary infection. Alternatively, dapsone can be used. Atovaquone has also been used for prophylaxis [unlicensed indication].

ANTIPROTOZOALS

Atovaquone

● INDICATIONS AND DOSE

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients intolerant of co-trimoxazole

- ▶ BY MOUTH
- ▶ Adult: 750 mg twice daily for 21 days, dose to be taken with food, particularly high fat food

Prophylaxis against pneumocystis pneumonia

- ▶ BY MOUTH
- ▶ Adult: 750 mg twice daily

- **UNLICENSED USE** Not licensed for prophylaxis against pneumocystis pneumonia.
- **CAUTIONS** Other causes of pulmonary disease should be sought and treated · elderly · initial diarrhoea and difficulty in taking with food may reduce absorption (and require alternative therapy)
- **INTERACTIONS** → Appendix 1: antimalarials

● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · angioedema · bronchospasm · diarrhoea · headache · hypersensitivity · hyponatraemia · insomnia · nausea · neutropenia · skin reactions · throat tightness · vomiting
- ▶ **Frequency not known** Stevens-Johnson syndrome
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. **Monitoring** Monitor more closely in hepatic impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution. **Monitoring** Monitor more closely in renal impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Wellvone** (GlaxoSmithKline UK Ltd)
Atovaquone 150 mg per 1 ml Wellvone 750mg/5ml oral suspension sugar-free | 226 ml [PoM] £486.37

Pentamidine isetionate

● INDICATIONS AND DOSE

Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 4 mg/kg once daily for at least 14 days

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Adult: 300 mg every 4 weeks, alternatively 150 mg every 2 weeks, using suitable equipment—consult product literature

Visceral leishmaniasis (specialist use only)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 3–4 mg/kg once daily on alternate days, maximum total of 10 injections, course may be repeated if necessary

Cutaneous leishmaniasis (specialist use only)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 3–4 mg/kg 1–2 times a week until condition resolves

Trypanosomiasis (specialist use only)

- ▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 4 mg/kg once daily or on alternate days for a total of 7–10 injections

- **UNLICENSED USE** Not licensed for primary prevention of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia by inhalation of nebulised solution.
- **CAUTIONS** Anaemia · bradycardia · coronary heart disease · history of ventricular arrhythmias · hyperglycaemia · hypertension · hypoglycaemia · hypokalaemia · hypomagnesaemia · hypotension · leucopenia · risk of severe hypotension following administration · thrombocytopenia
- **INTERACTIONS** → Appendix 1: pentamidine
- **SIDE-EFFECTS**
- GENERAL SIDE-EFFECTS**
 - ▶ **Common or very common** Dizziness · hypoglycaemia (can be severe and sometimes fatal) · hypotension (can be severe and sometimes fatal) · local reaction · nausea · rash · taste altered
 - ▶ **Rare or very rare** QT interval prolongation

- ▶ **Frequency not known** Pancreatitis acute (can be severe and sometimes fatal)

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
 - ▶ When used by inhalation Cough · dyspnoea · respiratory disorders
 - ▶ With parenteral use Acute kidney injury · anaemia · azotaemia · electrolyte imbalance · flushing · haematuria · hyperglycaemia · leucopenia · localised pain · myopathy · syncope · thrombocytopenia · vomiting
- ▶ **Rare or very rare**
 - ▶ With parenteral use Arrhythmia (can be severe and sometimes fatal) · pancreatitis (can be severe and sometimes fatal)
- ▶ **Frequency not known**
 - ▶ When used by inhalation Angioedema · appetite decreased · bradycardia · fatigue · renal failure
 - ▶ With parenteral use Arrhythmias · perioral hypoaesthesia · sensation abnormal · Stevens-Johnson syndrome
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT**
 - Dose adjustments** Reduce intravenous dose for pneumocystis pneumonia if creatinine clearance less than 10 mL/minute: in *life-threatening infection*, use 4 mg/kg once daily for 7–10 days, then 4 mg/kg on alternate days to complete course of at least 14 doses; in *less severe infection*, use 4 mg/kg on alternate days for at least 14 doses.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor blood pressure before starting treatment, during administration, and at regular intervals, until treatment concluded.
 - ▶ Carry out laboratory monitoring according to product literature.
- **DIRECTIONS FOR ADMINISTRATION** Patient should be lying down when receiving drug parenterally. Direct intravenous injection should be avoided whenever possible and **never** given rapidly; intramuscular injections should be deep and preferably given into the buttock. For *intravenous infusion*, reconstitute 300 mg with 3–5 mL Water for Injections (displacement value may be significant), then dilute required dose with 50–250 mL Glucose 5% or Sodium Chloride 0.9%; give over at least 60 minutes.
 - ▶ Powder for injection (dissolved in water for injection) may be used for nebulisation.
- **HANDLING AND STORAGE** Pentamidine isetionate is toxic and personnel should be adequately protected during handling and administration—consult product literature.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

Threadworms

Anthelmintics are effective in threadworm (pinworms, *Enterobius vermicularis*) infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment.

Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole p. 594 is the drug of choice for treating threadworm infection in patients of all ages over 6 months. It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.

Ascaricides (common roundworm infections)

Mebendazole is effective against *Ascaris lumbricoides* and is generally considered to be the drug of choice.

Levamisole p. 594 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative when mebendazole cannot be used. It is very well tolerated.

Tapeworm infections

Taenicides

Niclosamide [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in *Taenia solium* infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel p. 594 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is as effective as niclosamide.

Hydatid disease

Cysts caused by *Echinococcus granulosus* grow slowly and asymptomatic patients do not always require treatment. Surgical treatment remains the method of choice in many situations. Albendazole p. 593 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to *E. multilocularis* is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

Hookworms

Hookworms (ancylostomiasis, necatoriasis) live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

4 Helminth infection

Helminth infections

Specialist centres

Advice on prophylaxis and treatment of helminth infections is available from the following specialist centres:

Mebendazole has a useful broad-spectrum activity, and is effective against hookworms. Albendazole [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative. Levamisole is also is also effective in children.

Schistosomicides (bilharziasis)

Adult *Schistosoma haematobium* worms live in the genito-urinary veins and adult *S. mansoni* in those of the colon and mesentery. *S. japonicum* is more widely distributed in veins of the alimentary tract and portal system.

Praziquantel [unlicensed] is available from Merck Serono (Cysticide®) and is effective against all human schistosomes. No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

Filaricides

Diethylcarbamazine [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is effective against microfilariae and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions, treatment in adults and children over 1 month, is commenced with a dose of diethylcarbamazine citrate on the first day and increased gradually over 3 days. Length of treatment varies according to infection type, and usually gives a radical cure for these infections. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

Ivermectin below [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is very effective in *onchocerciasis* and it is now the drug of choice; reactions are usually slight. Diethylcarbamazine or suramin should no longer be used for *onchocerciasis* because of their toxicity.

Cutaneous larva migrans (creeping eruption)

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical tiabendazole (no commercial preparation available). Multiple infections respond to ivermectin, albendazole or **tiabendazole** (tiabendazole) by mouth [all unlicensed] (available from 'special-order' manufacturers or specialist importing companies).

Strongyloidiasis

Adult *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. Ivermectin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is the treatment of choice for chronic *Strongyloides* infection in adults and children over 5 years. Albendazole [unlicensed] (available from 'special order' manufacturers or specialist importing companies) is an alternative given to adults and children over 2 years.

ANTHELMINTICS

Albendazole

● INDICATIONS AND DOSE

Chronic *Strongyloides* infection

- ▶ BY MOUTH
- ▶ Adult: 400 mg twice daily for 3 days, dose may be repeated after 3 weeks if necessary

Hydatid disease, in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

Hookworm infections

- ▶ BY MOUTH
- ▶ Adult: 400 mg for 1 dose

- **UNLICENSED USE** Albendazole is an unlicensed drug.

- **INTERACTIONS** → Appendix 1: albendazole

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet, oral suspension

Tablet

5 Protozoal infection

Antiprotozoal drugs

Amoebicides

Metronidazole p. 533 is the drug of choice for *acute invasive amoebic dysentery* since it is very effective against vegetative forms of *Entamoeba histolytica* in ulcers. Tinidazole p. 534 is also effective. Metronidazole and tinidazole are also active against amoebae which may have migrated to the liver. Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate p. 498.

Diloxanide furoate is the drug of choice for asymptomatic patients with *E. histolytica* cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For *amoebic abscesses* of the liver metronidazole is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with more than 100 mL of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

Trichomonacides

Metronidazole is the treatment of choice for *Trichomonas vaginalis* infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole may be tried.

Antigiardial drugs

Metronidazole is the treatment of choice for *Giardia lamblia* infections. Alternative treatments are tinidazole or mepacrine hydrochloride p. 498.

Leishmaniacides

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

Sodium stibogluconate below, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dosage varies with different geographical regions and expert advice should be obtained. Some early non-inflamed lesions of cutaneous leishmaniasis can be treated with intralésional

injections of sodium stibogluconate under specialist supervision.

Amphotericin p. 583 is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (*AmBisome*®). *Abelcet*®, a lipid formulation of amphotericin, is also likely to be effective but less information is available.

Pentamidine isetionate p. 591 has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies).

Trypanocides

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

Toxoplasmosis

Most infections caused by *Toxoplasma gondii* are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma chorioretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine p. 609 and sulfadiazine p. 553, given for several weeks (expert advice **essential**). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folinic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin p. 526 or clarithromycin p. 529 or azithromycin p. 528. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus; specialist advice should be sought on management. Spiramycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) may reduce the risk of transmission of maternal infection to the fetus.

5.1 Leishmaniasis

Other drugs used for Leishmaniasis Amphotericin, p. 583 • Pentamidine isetionate, p. 591

ANTIPROTOZOALS

Sodium stibogluconate

INDICATIONS AND DOSE

Visceral leishmaniasis (specialist use only)

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 20 mg/kg daily for 28 days

Cutaneous leishmaniasis (specialist use only)

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 20 mg/kg daily for 20 days

- **CAUTIONS** Heart disease (withdraw if conduction disturbances occur) • mucocutaneous disease • predisposition to QT interval prolongation • treat intercurrent infection (e.g. pneumonia)

CAUTIONS, FURTHER INFORMATION

- ▶ Mucocutaneous disease Successful treatment of mucocutaneous leishmaniasis may induce severe

inflammation around the lesions (may be life-threatening if pharyngeal or tracheal involvement)—may require corticosteroid.

- **INTERACTIONS** → Appendix 1: sodium stibogluconate
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · appetite decreased · arthralgia · diarrhoea · headache · lethargy · malaise · myalgia · nausea · vomiting
 - ▶ **Rare or very rare** Chest pain · chills · fever · flushing · haemorrhage · hyperhidrosis · jaundice · skin reactions · vertigo
 - ▶ **Frequency not known** Arrhythmias · cough · pain · pancreatitis · pneumonia · QT interval prolongation · thrombosis
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Avoid in significant impairment.
- **MONITORING REQUIREMENTS** Monitor ECG before and during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Intravenous injections must be given slowly over 5 minutes (to reduce risk of local thrombosis) and stopped if coughing or substernal pain occur. Injection should be filtered immediately before administration using a filter of 5 microns or less.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Pentostam** (GlaxoSmithKline UK Ltd)
Antimony pentavalent (as Sodium stibogluconate) 100 mg per 1 ml Pentostam 10g/100ml solution for injection vials | 1 vial (POM)
£66.43

5.2 Malaria

Antimalarials

23-Jan-2018

Artemether with lumefantrine

Artemether with lumefantrine p. 603 is licensed for the treatment of acute non-complicated falciparum malaria.

Chloroquine

Chloroquine p. 604 is used for the prophylaxis of malaria in areas of the world where the risk of chloroquine-resistant falciparum malaria is still low. It is also used with proguanil hydrochloride p. 607 when chloroquine-resistant falciparum malaria is present but this regimen may not give optimal protection (for details, see Recommended regimens for prophylaxis against malaria p. 598).

Guidelines for malaria prevention in travellers from the United Kingdom (2017) published by Public Health England state that patients already taking hydroxychloroquine sulfate p. 1062 for another indication, and for whom chloroquine would be an appropriate antimalarial, can remain on hydroxychloroquine sulfate.

Chloroquine is **no longer recommended** for the treatment of falciparum malaria owing to widespread resistance, nor is it recommended if the infective species is *not known* or if the infection is *mixed*; in these cases treatment should be with quinine p. 608, Malarone®, or Riamet®. It is still recommended for the treatment of non-falciparum malaria.

Mefloquine

Mefloquine p. 606 is used for the prophylaxis of malaria in areas of the world where there is a high risk of chloroquine-

resistant falciparum malaria (for details, see Recommended regimens for prophylaxis against malaria p. 598).

Mefloquine is now rarely used for the treatment of falciparum malaria because of increased resistance. It is rarely used for the treatment of non-falciparum malaria because better tolerated alternatives are available. Mefloquine should not be used for treatment if it has been used for prophylaxis.

Piperaquine with arteminol

Arteminol with piperaquine phosphate p. 603 is not recommended for the first-line treatment of acute uncomplicated falciparum malaria because there is limited experience of its use in travellers who usually reside in areas where malaria is not endemic. Piperaquine has a long half-life.

Primaquine

Primaquine p. 607 is used to eliminate the liver stages of *P. vivax* or *P. ovale* following chloroquine treatment.

Proguanil

Proguanil hydrochloride is used (usually with chloroquine, but occasionally alone) for the prophylaxis of malaria, (for details, see Recommended regimens for prophylaxis against malaria p. 598).

Proguanil hydrochloride used alone is not suitable for the treatment of malaria; however, Malarone® (a combination of atovaquone with proguanil hydrochloride p. 604) is licensed for the treatment of acute uncomplicated falciparum malaria. Malarone® is also used for the prophylaxis of falciparum malaria in areas of widespread mefloquine or chloroquine resistance. Malarone® is also used as an alternative to mefloquine or doxycycline p. 555. Malarone® is particularly suitable for short trips to highly chloroquine-resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

Pyrimethamine

Pyrimethamine p. 609 should not be used alone, but is used with sulfadoxine.

Pyrimethamine with sulfadoxine is not recommended for the prophylaxis of malaria, but can be used in the treatment of falciparum malaria with (or following) quinine.

Quinine

Quinine is not suitable for the prophylaxis of malaria.

Quinine is used for the treatment of falciparum malaria or if the infective species is *not known* or if the infection is mixed (for details see Malaria, treatment p. 602).

Tetracyclines

Doxycycline is used in adults and children over 12 years for the prophylaxis of malaria in areas of widespread mefloquine or chloroquine resistance. Doxycycline is also used as an alternative to mefloquine or Malarone® (for details, see Recommended regimens for prophylaxis against malaria p. 598).

Malaria, prophylaxis

23-Jan-2018

Prophylaxis against malaria

The recommendations on prophylaxis reflect guidelines agreed by UK malaria specialists, published in the Public Health England Guidelines for malaria prevention in travellers from the United Kingdom, 2017. The advice is aimed at residents of the UK who travel to endemic areas.

For specialist centres offering advice on specific malaria-related problems, see Malaria, treatment p. 602. The choice of drug for a particular individual should take into account:

- risk of exposure to malaria
- extent of drug resistance
- efficacy of the recommended drugs
- side-effects of the drugs
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen)

For more information on choice of drug, see also Antimalarials p. 596.

Protection against bites

Prophylaxis is not absolute, and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important and is recommended even in malaria-free areas as a preventive measure against other insect vector-borne diseases. Mosquito nets impregnated with permethrin p. 1203 provide the most effective barrier protection against insects; mats and vaporised insecticides are also useful. Diethyltoluamide (DEET) 20–50% (available as sprays, and modified-release polymer formulations) is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. However, ingestion should be avoided, therefore breast-feeding mothers should wash their hands and breast tissue before handling infants. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. When sunscreen is also required, DEET should be applied after the sunscreen. DEET reduces the SPF of sunscreen, so a sunscreen of SPF 30–50 should be applied. Long sleeves and trousers worn after dusk also provide protection against bites.

Length of prophylaxis

In order to determine tolerance and to establish habit, prophylaxis should generally be started one week (2–3 weeks in the case of mefloquine p. 606) before travel into an endemic area; *Malarone*® or doxycycline p. 555 prophylaxis should be started 1–2 days before travel. Prophylaxis should be continued for **4 weeks after leaving** (except for *Malarone*® prophylaxis which should be stopped 1 week after leaving). For extensive journeys across different regions, the traveller must be protected in all areas of risk.

In those requiring long-term prophylaxis, chloroquine p. 604 and proguanil hydrochloride p. 607 may be used. However there is considerable concern over the protective efficacy of the combination of chloroquine and proguanil hydrochloride in certain areas where it was previously useful. Mefloquine is licensed for up to 1 year (although, if it is tolerated in the short term, there is no evidence of harm when it is used for up to 3 years). Doxycycline can be used for up to 2 years. *Malarone*® can be used for up to 1 year. Prophylaxis with mefloquine, doxycycline, or *Malarone*® may be considered for longer durations if it is justified by the risk of exposure to malaria. Specialist advice should be sought for long-term prophylaxis.

Return from malarial region

It is important to be aware that **any illness** that occurs within 1 year and **especially within 3 months of return might be malaria** even if all recommended precautions against malaria were taken. Travellers should be **warned** of this and told that if they develop any illness **particularly within 3 months** of their return they should go **immediately** to a doctor and specifically mention their exposure to malaria.

Epilepsy

Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In areas without chloroquine resistance proguanil hydrochloride alone is recommended; in areas with chloroquine resistance, doxycycline or *Malarone*® may be considered.

Asplenia

Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

Pregnancy

Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil hydrochloride can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined, particularly in Sub-Saharan Africa; in the case of proguanil hydrochloride, folic acid p. 993 (dosed as a pregnancy at 'high-risk' of neural tube defects) should be given for at least the first trimester. The centres listed (see Malaria, treatment p. 602) should be consulted for advice on prophylaxis in chloroquine-resistant areas. Although the manufacturer advises that mefloquine should not be used during pregnancy, particularly in the first trimester, unless the potential benefit outweighs the risk, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas. Doxycycline is contra-indicated during pregnancy; however, it can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks' gestation [unlicensed]. *Malarone*® should be avoided during pregnancy, however, it can be considered during the second and third trimesters if there is no suitable alternative.

Breast-feeding

Prophylaxis is required in **breast-fed infants**; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

Anticoagulants

Travellers taking warfarin sodium p. 139 should begin chemoprophylaxis 2–3 weeks before departure. The INR should be stable before departure. It should be measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

Standby treatment

Travellers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are likely to be more than 24 hours away from medical care. Self-medication should be **avoided** if medical help is accessible.

In order to avoid excessive self-medication, the traveller should be provided with **written instructions** that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller.

Malaria prophylaxis, specific recommendations

Where a journey requires two regimens, the regimen for the higher risk area should be used for the whole journey. Those travelling to remote or little-visited areas may require expert advice. See *Recommended regimens for prophylaxis against malaria*.

Important

Settled immigrants (or long-term visitors) to the UK may be unaware that **any immunity they may have acquired while living in malarious areas is lost rapidly** after migration to

Key to recommended regimens for prophylaxis against malaria

Codes for regimens	Details of regimens for prophylaxis against malaria
-	No risk
1	Chemoprophylaxis not recommended, but avoid mosquito bites and consider malaria if fever presents
2	Chloroquine only
3	Chloroquine with proguanil
4	Atovaquone with proguanil hydrochloride or doxycycline or mefloquine

Specific recommendations

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Afghanistan	Low risk below 2000 m from May–November	1
	Very low risk below 2000 m from December–April	1
Algeria	Very low risk in remote focus in Illizi department only	1
Andaman and Nicobar Islands (India)	Low risk	1
Angola	High risk	4
Argentina	Very low risk in low altitude areas of Salta provinces bordering Bolivia and in Chaco, Corrientes, and Misiones provinces close to border with Paraguay and Brazil	1
	No risk in Iguazu Falls and areas other than those above	-
Armenia	No risk	1
Azerbaijan	Very low risk	1
Bangladesh	High risk in Chittagong Hill Tract districts (but not Chittagong city)	4
	Very low risk in Chittagong city and other areas, except Chittagong Hill Tract districts	1
Belize	Low risk in rural areas	1
	No risk in Belize district (including Belize city and islands)	-
Benin	High risk	4
Bhutan	Low risk in southern belt districts, along border with India: Chukha, Geyleg-phug, Samchi, Samdrup Jonkhar, and Shemgang	1
	No risk in areas other than those above	-
Bolivia	Low risk in Amazon basin	1
	Low risk in rural areas below 2500 m (other than above)	1
	No risk above 2500 m	-
Botswana	High risk from November–June in northern half, including Okavango Delta area	4
	Low risk from July–October in northern half	1
	Very low risk in southern half	1
Brazil	Low risk in Amazon basin, including city of Manaus	1
	Very low risk in areas other than those above	1
	No risk in Iguazu Falls	-
Brunei Darussalam	Very low risk	1
Burkina Faso	High risk	4
Burundi	High risk	4
Cambodia	Low risk. Mefloquine resistance widespread in western provinces bordering Thailand	1
	Very low risk in Angkor Wat and Lake Tonle Sap, including Siem Reap	1
	No risk in Phnom Penh	-
Cameroon	High risk	4
Cape Verde	Very low risk on island of Santiago (Sao Tiago) and Boa Vista	1
Central African Republic	High risk	4
Chad	High risk	4
China	Low risk in Yunnan and Hainan provinces	1
	Very low risk in southern and some central provinces, including Anhui, Guizhou, Hena, Hubei, and Jiangsu below 1500 m	1
	Very low risk in areas other than those above and below	1
	No risk in Hong Kong	-

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Colombia	Low risk in rural areas below 1600 m	1
	Very low risk above 1600 m and in Cartagena	1
Comoros	High risk	4
Congo	High risk	4
Costa Rica	Low risk in Limon province (but not city of Limon)	1
	Very low risk in areas other than those above	1
Cote d'Ivoire (Ivory Coast)	High risk	4
Democratic Republic of the Congo	High risk	4
Djibouti	High risk	4
Dominican Republic	Low risk	1
	No risk in cities of Santiago and Santo Domingo	-
East Timor (Timor-Leste)	Risk present	4
Ecuador	Low risk in areas below 1500 m including coastal provinces and Amazon basin	1
	No risk in Galapagos islands or city of Guayaquil	-
Egypt	No risk	1
El Salvador	Low risk in rural areas of Santa Ana, Ahuachapán, and La Unión provinces in western part of country; very low risk in other areas	1
Equatorial Guinea	High risk	4
Eritrea	High risk below 2200 m	4
Ethiopia	High risk below 2000 m	4
	No risk in Addis Ababa or in areas above 2000 m	-
French Guiana	Risk present (particularly in border areas) except city of Cayenne or Devil's Island (Ile du Diable)	4
	Low risk in city of Cayenne or Devil's Island (Ile du Diable)	1
Gabon	High risk	4
Gambia	High risk	4
Georgia	Very low risk in rural south east from June-October	1
Ghana	High risk	4
Guatemala	Low risk below 1500 m	1
	No risk in Guatemala City, Antigua, or Lake Atitlan and above 1500 m	-
Guinea	High risk	4
Guinea-Bissau	High risk	4
Guyana	Risk present in all interior regions	4
	Very low risk in Georgetown and coastal region	1
Haiti	Risk present	3
Honduras	Low risk below 1000 m and in Roatán and other Bay Islands	1
	No risk in San Pedro Sula or Tegucigalpa and areas above 1000 m	-
India	Risk present in states of Assam and Orissa, districts of East Godavari, Srikakulam, Vishakhapatnam, and Vizianagaram in the state of Andhra Pradesh, and districts of Balaghat, Dindori, Mandla, and Seoni in the state of Madhya Pradesh	4
	Low risk in areas other than those above or below (including Goa, Andaman and Nicobar islands)	1
	Exceptional circumstances in low risk areas (dependent on individual risk assessment)	3
	No risk in Lakshadweep islands	-
Indonesia	High risk in Irian Jaya (Papua)	4
	Low risk in Bali, Lombok and islands of Java and Sumatra	1
	No risk in city of Jakarta	-
Indonesia (Borneo)	Low risk	1
Iran	Low risk from March-November in rural south eastern provinces and in north, along Azerbaijan border in Ardabil, and near Turkmenistan border in North Khorasan	1
	Very low risk in areas other than those above	1
Iraq	Very low risk from May-November in rural northern area below 1500 m	1
	No risk in areas other than those above	-

Treatment of malaria

Recommendations on the treatment of malaria reflect guidelines agreed by UK malaria specialists.

If the infective species is **not known**, or if the infection is **mixed**, initial treatment should be as for *falciparum malaria* with quinine p. 608, *Malarone*[®] (atovaquone with proguanil hydrochloride p. 604), or *Riamet*[®] (artemether with lumefantrine p. 603). *Falciparum malaria* can progress rapidly in unprotected individuals and antimalarial treatment should be considered in those with features of severe malaria and possible exposure, even if the initial blood tests for the organism are negative.

Falciparum malaria (treatment)

Falciparum malaria (malignant malaria) is caused by *Plasmodium falciparum*. In most parts of the world *P. falciparum* is now resistant to chloroquine p. 604 which should not therefore be given for treatment.

Quinine, *Malarone*[®] (atovaquone with proguanil hydrochloride), or *Riamet*[®] (artemether with lumefantrine) can be given *by mouth* if the patient can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given *by intravenous infusion* if the patient is seriously ill or unable to take tablets. Mefloquine p. 606 is now rarely used for treatment because of concerns about resistance.

Oral quinine is given by mouth for 5–7 days, together with or followed by either doxycycline p. 555 for 7 days or clindamycin p. 526 for 7 days [unlicensed].

If the parasite is likely to be sensitive, pyrimethamine with sulfadoxine as a single dose [unlicensed] may be given (instead of either clindamycin or doxycycline) together with, or after, a course of quinine.

Alternatively, *Malarone*[®], or *Riamet*[®] may be given instead of quinine. It is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after *Malarone*[®] or *Riamet*[®] treatment.

If the patient is seriously ill or unable to take tablets, or if more than 2% of red blood cell are parasitized, quinine should be given *by intravenous infusion* [unlicensed] (until patient can swallow tablets to complete the 7-day course *together with* or *followed by either* doxycycline or clindamycin).

Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous **artesunate** may be available for 'named-patient' use.

Pregnancy

Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The adult treatment doses of oral and intravenous quinine (including the loading dose) can safely be given to pregnant women. Clindamycin should be given after quinine [unlicensed indication]. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development); pyrimethamine with sulfadoxine, *Malarone*[®], and *Riamet*[®] are also best avoided until more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of

south east Asia) because intravenous artesunate may be available for 'named patient' use.

Non-falciparum malaria (treatment)

Non-falciparum malaria is usually caused by *Plasmodium vivax* and less commonly by *P. ovale* and *P. malariae*. *P. knowlesi* is also present in the Asia-Pacific region. Chloroquine is the drug of choice for the treatment of non-falciparum malaria (but chloroquine-resistant *P. vivax* has been reported in the Indonesian archipelago, the Malay Peninsula, including Myanmar, and eastward to Southern Vietnam).

For the treatment of chloroquine-resistant non-falciparum malaria, *Malarone*® [unlicensed indication], quinine, or *Riamet*® [unlicensed indication] can be used; as with chloroquine, primaquine p. 607 should be given for radical cure.

Chloroquine alone is adequate for *P. malariae* and *P. knowlesi* infections but in the case of *P. vivax* and *P. ovale*, a radical cure (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with primaquine [unlicensed] given after chloroquine, with the dose dependent on the infecting organism. For a radical cure, primaquine [unlicensed] is then given for 14 days, with the dose also dependent on the infecting organism.

Parenteral

Parenteral If the patient is unable to take oral therapy, quinine can be given by intravenous infusion [unlicensed], changed to oral chloroquine as soon as the patient's condition permits.

Pregnancy

The adult treatment doses of chloroquine can be given for non-falciparum malaria. In the case of *P. vivax* or *P. ovale*, however, the radical cure with primaquine should be postponed until the pregnancy is over; instead chloroquine should be continued, given weekly during the pregnancy.

ANTIPROTOZOALS > ANTIMALARIALS

Artemether with lumefantrine

● INDICATIONS AND DOSE

Treatment of acute uncomplicated falciparum malaria | Treatment of chloroquine-resistant non-falciparum malaria

► BY MOUTH

- Adult (body-weight 35 kg and above): Initially 4 tablets, followed by 4 tablets for 5 doses each given at 8, 24, 36, 48 and 60 hours (total 24 tablets over 60 hours)

- **UNLICENSED USE** Use in treatment of non-falciparum malaria is an unlicensed indication.
- **CONTRA-INDICATIONS** Family history of congenital QT interval prolongation · family history of sudden death · history of arrhythmias · history of clinically relevant bradycardia · history of congestive heart failure accompanied by reduced left ventricular ejection fraction
- **CAUTIONS** Avoid in Acute porphyrias p. 1025 · electrolyte disturbances
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · appetite decreased · arthralgia · asthenia · cough · diarrhoea · dizziness · gait abnormal · headache · movement disorders (uncommon in children) · myalgia · nausea · palpitations · QT interval prolongation · sensation abnormal · skin reactions · sleep disorders · vomiting
 - **Uncommon** Drowsiness
 - **Frequency not known** Angioedema

- **PREGNANCY** Toxicity in *animal* studies with artemether. Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid breastfeeding for at least 1 week after last dose. Present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **Monitoring** In severe renal impairment monitor ECG and plasma potassium concentration.
- **MONITORING REQUIREMENTS** Monitor patients unable to take food (greater risk of recrudescence).
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed just before administration.
- **PATIENT AND CARER ADVICE**
 - Driving and skilled tasks** Dizziness may affect performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

- **Riamet** (Novartis Pharmaceuticals UK Ltd)

Artemether 20 mg, Lumefantrine 120 mg Riamet tablets | 24 tablet [PoM] £22.50

Artenimol with piperazine phosphate

(Piperazine tetraphosphate with dihydroartemisinin)

● INDICATIONS AND DOSE

Treatment of uncomplicated falciparum malaria

► BY MOUTH

- Child 6 months-17 years (body-weight 7-12 kg): 0.5 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Child 6 months-17 years (body-weight 13-23 kg): 1 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Child 6 months-17 years (body-weight 24-35 kg): 2 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Child 6 months-17 years (body-weight 36-74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Child 6 months-17 years (body-weight 75-99 kg): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Adult (body-weight 36-74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Adult (body-weight 75-99 kg): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

- **CONTRA-INDICATIONS** Acute myocardial infarction · bradycardia · congenital long QT syndrome · electrolyte disturbances · family history of sudden death · heart failure with reduced left ventricular ejection fraction · history of symptomatic arrhythmias · left ventricular hypertrophy · risk factors for QT interval prolongation · severe hypertension
- **INTERACTIONS** → Appendix 1: antimalarials

● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · arrhythmias (in adults) · asthenia · conjunctivitis (in children) · eosinophilia · fever · headache (uncommon in children) · leucocytosis (in children) · leucopenia (in children) · neutropenia (in children) · QT interval prolongation · thrombocytopenia (in children)
- ▶ **Uncommon** Abdominal pain (very common in children) · appetite decreased (very common in children) · arthralgia · cardiac conduction disorder · cough (very common in children) · diarrhoea (very common in children) · dizziness (in adults) · epistaxis (in children) · hepatic disorders · hypochromia (in children) · increased risk of infection (very common in children) · lymphadenopathy (in children) · myalgia (in adults) · nausea · rhinorrhoea (in children) · seizure · skin reactions (very common in children) · splenomegaly (in children) · stomatitis (in children) · thrombocytosis (in children) · vomiting (very common in children)

● **PREGNANCY** Teratogenic in *animal* studies—manufacturer advises use only if other antimalarials cannot be used.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** No information available in moderate to severe impairment.

Monitoring Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe hepatic impairment.

● **RENAL IMPAIRMENT** No information available in moderate to severe impairment.

Monitoring Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe renal impairment.

● MONITORING REQUIREMENTS

- ▶ Consider obtaining ECG in all patients before third dose and 4–6 hours after third dose. If QT_C interval more than 500 milliseconds, discontinue treatment and monitor ECG for a further 24–48 hours.
- ▶ Obtain ECG as soon as possible after starting treatment then continue monitoring in those taking medicines that increase plasma-piperazine concentration, in children who are vomiting, in females, or in the elderly.

● **DIRECTIONS FOR ADMINISTRATION** Tablets to be taken at least 3 hours before and at least 3 hours after food. Tablets may be crushed and mixed with water immediately before administration.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tablets containing piperazine phosphate with arteminol.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Eurartesim** (Logixx Pharma Solutions Ltd) ▼
Arteminol 40 mg, Piperazine phosphate 320 mg Eurartesim 320mg/40mg tablets | 12 tablet [PoM] £40.00

Atovaquone with proguanil hydrochloride

● INDICATIONS AND DOSE

MALARONE® 250 MG/100 MG

Prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected

▶ BY MOUTH

- ▶ Adult (body-weight 41 kg and above): 1 tablet daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving

Treatment of acute uncomplicated falciparum malaria |

Treatment of non-falciparum malaria

▶ BY MOUTH

- ▶ Adult: 4 tablets once daily for 3 days

● **UNLICENSED USE** Not licensed for treatment of non-falciparum malaria.

● **CAUTIONS** Diarrhoea or vomiting (reduced absorption of atovaquone) · efficacy not evaluated in cerebral or complicated malaria (including hyperparasitaemia, pulmonary oedema or renal failure)

● **INTERACTIONS** → Appendix 1: antimalarials

● SIDE-EFFECTS

▶ **Common or very common** Abdominal pain · appetite decreased · cough · depression · diarrhoea · dizziness · fever · headache · nausea · skin reactions · sleep disorders · vomiting

▶ **Uncommon** Alopecia · anxiety · blood disorder · hyponatraemia · oral disorders · palpitations

▶ **Frequency not known** Hallucination · hepatic disorders · photosensitivity reaction · seizure · Stevens-Johnson syndrome · tachycardia · vasculitis

● **PREGNANCY** Manufacturer advises avoid unless essential.

● **BREAST FEEDING** Use only if no suitable alternative available.

● **RENAL IMPAIRMENT** Avoid for malaria prophylaxis (and if possible for malaria treatment) if eGFR less than 30 mL/minute/1.73m².

● **PATIENT AND CARER ADVICE** Warn travellers about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return.

● NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Proguanil hydrochloride 100 mg, Atovaquone 250 mg Malarone 250mg/100mg tablets | 12 tablet [PoM] £25.21 DT = £25.21

Chloroquine

● INDICATIONS AND DOSE

Active rheumatoid arthritis (administered on expert advice) | Systemic and discoid lupus erythematosus (administered on expert advice)

▶ BY MOUTH USING TABLETS

- ▶ Adult: 155 mg daily; maximum 2.5 mg/kg per day

Prophylaxis of malaria

▶ INITIALLY BY MOUTH USING SYRUP

- ▶ Child 4–5 weeks (body-weight up to 4.5 kg): 25 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 6 weeks–5 months (body-weight 4.5–7 kg): 50 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 6–11 months (body-weight 8–10 kg): 75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

- ▶ Child 1-2 years (body-weight 11-14 kg): 100 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 3-4 years (body-weight 15-16.4 kg): 125 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 5-7 years (body-weight 16.5-24 kg): 150 mg once weekly, alternatively (by mouth using tablets) 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 8-13 years (body-weight 25-44 kg): 225 mg once weekly, alternatively (by mouth using tablets) 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ INITIALLY BY MOUTH USING TABLETS
- ▶ Child 14-17 years (body-weight 45 kg and above): 310 mg once weekly, alternatively (by mouth using syrup) 300 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Adult (body-weight 45 kg and above): 310 mg once weekly, alternatively (by mouth using syrup) 300 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

Treatment of non-falciparum malaria

▶ BY MOUTH

- ▶ Child: Initially 10 mg/kg (max. per dose 620 mg), then 5 mg/kg after 6-8 hours (max. per dose 310 mg), then 5 mg/kg daily (max. per dose 310 mg) for 2 days
- ▶ Adult: Initially 620 mg, then 310 mg after 6-8 hours, then 310 mg daily for 2 days, approximate total cumulative dose of 25 mg/kg of base

P. vivax or P. ovale infection during pregnancy while radical cure is postponed

▶ BY MOUTH

- ▶ Adult: 310 mg once weekly

DOSE EQUIVALENCE AND CONVERSION

- ▶ Doses expressed as chloroquine base.
- ▶ Each tablet contains 155 mg of chloroquine base (equivalent to 250 mg of chloroquine phosphate). Syrup contains 50 mg/5 mL of chloroquine base (equivalent to 80 mg/5 mL of chloroquine phosphate).

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ With oral use in adults. In active rheumatoid arthritis and systemic and discoid lupus erythematosus, to avoid excessive dosage in obese patients, the daily maximum dose should be calculated on the basis of ideal body weight.

- **UNLICENSED USE** Chloroquine doses for the treatment and prophylaxis of malaria in BNF publications may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

▶ In adults

Ocular toxicity is unlikely if the dose of chloroquine phosphate does not exceed 4 mg/kg daily (equivalent to chloroquine base approx. 2.5 mg/kg daily).

- **CAUTIONS** Acute porphyrias p. 1025 · diabetes (may lower blood glucose) · elderly · G6PD deficiency · long-term therapy (regular ophthalmic examination recommended by manufacturers) · may aggravate myasthenia gravis · may exacerbate psoriasis · neurological disorders, especially epilepsy (avoid for prophylaxis of malaria if history of epilepsy) · severe gastro-intestinal disorders

CAUTIONS, FURTHER INFORMATION

- ▶ Screening for ocular toxicity
- ▶ In adults A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening to prevent ocular toxicity on long-term treatment with chloroquine and hydroxychloroquine (*Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening* 2009).

Chloroquine should be considered (for treating chronic inflammatory conditions) **only** if other drugs have failed. All patients taking chloroquine should receive ocular examination according to a protocol arranged locally between the prescriber and the ophthalmologist.

- **INTERACTIONS** → Appendix 1: antimalarials

● SIDE-EFFECTS

- ▶ **Rare or very rare** Cardiomyopathy · hallucination · hepatitis
- ▶ **Frequency not known** Abdominal pain · agranulocytosis · alopecia · anxiety · atrioventricular block · bone marrow disorders · confusion · corneal deposits · depression · diarrhoea · eye disorders · gastrointestinal disorder · headache · hearing impairment · hypoglycaemia · hypotension · insomnia · interstitial lung disease · movement disorders · myopathy · nausea · neuromyopathy · neutropenia · personality change · photosensitivity reaction · psychotic disorder · QT interval prolongation · seizure · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · tongue protrusion · vision disorders · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Side-effects which occur at doses used in the prophylaxis or treatment of malaria are generally not serious.

Overdose Chloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

- **PREGNANCY** Benefit of use in prophylaxis and treatment in malaria outweighs risk. For rheumatoid disease, it is not necessary to withdraw an antimalarial drug during pregnancy if the disease is well controlled.
- **BREAST FEEDING** Present in breast milk and breast-feeding should be avoided when used to treat rheumatic disease. Amount in milk probably too small to be harmful when used for malaria.
- **HEPATIC IMPAIRMENT** Use with caution in moderate to severe impairment.
- **RENAL IMPAIRMENT** Manufacturers advise caution. **Dose adjustments** Only partially excreted by the kidneys and reduction of the dose is not required for prophylaxis of malaria except in severe impairment.

For rheumatoid arthritis and lupus erythematosus, reduce dose.

● MONITORING REQUIREMENTS

- ▶ In adults Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory.
- ▶ In children Ophthalmic examination with long-term therapy.
- **PATIENT AND CARER ADVICE** Warn travellers going to malarious areas about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return.

● NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

Prophylaxis of malaria

► BY MOUTH

- Child (body-weight 5–15 kg): 62.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- Child (body-weight 16–24 kg): 125 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- Child (body-weight 25–44 kg): 187.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- Adult (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving

• **UNLICENSED USE** Mefloquine doses in BNF Publications may differ from those in product literature. Not licensed for use in children under 5 kg body-weight and under 3 months.

• **CONTRA-INDICATIONS** Avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions • avoid for standby treatment if history of convulsions • history of blackwater fever

• **CAUTIONS** Cardiac conduction disorders • epilepsy (avoid for prophylaxis) • not recommended in infants under 3 months (5 kg) • traumatic brain injury

CAUTIONS, FURTHER INFORMATION

► **Neuropsychiatric reactions** Mefloquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Psychiatric symptoms such as nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodromal for a more serious event. Adverse reactions may occur and persist up to several months after discontinuation because mefloquine has a long half-life. For a prescribing checklist, and further information on side-effects, particularly neuropsychiatric side-effects, which may be associated with the use of mefloquine for malaria prophylaxis, see the *Guide for Healthcare Professionals* provided by the manufacturer.

• **INTERACTIONS** → Appendix 1: antimalarials

SIDE-EFFECTS

► **Common or very common** Anxiety • depression • diarrhoea • dizziness • gastrointestinal discomfort • headache • nausea • skin reactions • sleep disorders • vision disorders • vomiting

► **Frequency not known** Acute kidney injury • agranulocytosis • alopecia • aplastic anaemia • appetite decreased • arrhythmias • arthralgia • asthenia • behaviour abnormal • cardiac conduction disorders • cataract • chest pain • chills • concentration impaired • confusion • cranial nerve paralysis • delusional disorder • depersonalisation • drowsiness • dyspnoea • encephalopathy • eye disorder • fever • flushing • gait abnormal • hallucination • hearing impairment • hepatic disorders • hyperacusis • hyperhidrosis • hypertension • hypotension • leucocytosis • leucopenia • malaise • memory loss • mood altered • movement disorders • muscle complaints • muscle weakness • nephritis • nerve disorders • oedema • palpitations • pancreatitis • paraesthesia • pneumonia • pneumonitis • psychosis • seizure • self-endangering behaviour • speech disorder • Stevens-Johnson syndrome • suicidal tendencies • syncope • thrombocytopenia • tremor • vertigo

• **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to quinine.

• **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during prophylaxis and for 3 months after stopping (teratogenicity in *animal* studies).

• **PREGNANCY** Manufacturer advises avoid (particularly in the first trimester) unless the potential benefit outweighs the risk; however, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas.

• **BREAST FEEDING** Present in milk but risk to infant minimal.

• **HEPATIC IMPAIRMENT** Elimination may be prolonged; avoid in severe impairment.

• **RENAL IMPAIRMENT** Manufacturer advises caution.

• **DIRECTIONS FOR ADMINISTRATION** Tablet may be crushed and mixed with food such as jam or honey just before administration.

• **PATIENT AND CARER ADVICE** Manufacturer advises that patients receiving mefloquine for malaria prophylaxis should be informed to discontinue its use if neuropsychiatric symptoms occur and seek immediate medical advice so that mefloquine can be replaced with an alternative antimalarial. Travellers should also be warned about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

A patient alert card should be provided.

Driving and skilled tasks Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may occur and persist up to several months after stopping mefloquine.

● NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.

Non-falciparum malaria

- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Adult:** 10 mg/kg every 8 hours (max. per dose 700 mg), infused over 4 hours, given if patient is unable to take oral therapy. Change to oral chloroquine as soon as the patient's condition permits, reduce dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours

Falciparum malaria

- ▶ **BY MOUTH**
- ▶ **Child:** 10 mg/kg every 8 hours (max. per dose 600 mg) for 7 days, to be given together with or followed by either doxycycline (in children over 12 years), or clindamycin
- ▶ **Adult:** 600 mg every 8 hours for 5–7 days, to be given together with or followed by either doxycycline or clindamycin
- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Adult:** Loading dose 20 mg/kg (max. per dose 1.4 g), infused over 4 hours, the loading dose of 20 mg/kg should **not** be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by either doxycycline or clindamycin, reduce maintenance dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours

Falciparum malaria (in intensive care unit)

- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Adult:** Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by either doxycycline or clindamycin, reduce maintenance dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours

DOSE EQUIVALENCE AND CONVERSION

- ▶ When using quinine for malaria, doses are valid for quinine hydrochloride, dihydrochloride, and sulfate; they are **not valid** for quinine bisulfate which contains a correspondingly smaller amount of quinine.

- ▶ Quinine (anhydrous base) 100 mg = quinine bisulfate 169 mg; quinine dihydrochloride 122 mg; quinine hydrochloride 122 mg; and quinine sulfate 121 mg. Quinine bisulfate 300 mg tablets are available but provide less quinine than 300 mg of the dihydrochloride, hydrochloride, or sulfate.

- **UNLICENSED USE** Injection not licensed.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: REMINDER OF DOSE-DEPENDENT QT-PROLONGING EFFECTS (NOVEMBER 2017)

Quinine has been associated with dose-dependent QT-interval-prolonging effects and should be used with caution in patients with risk factors for QT prolongation or in those with atrioventricular block—see Cautions for further information.

- **CONTRA-INDICATIONS** Haemoglobinuria · myasthenia gravis · optic neuritis · tinnitus
- **CAUTIONS** Atrial fibrillation (monitor ECG during parenteral treatment) · cardiac disease (monitor ECG during parenteral treatment) · conduction defects (monitor ECG during parenteral treatment) · elderly (monitor ECG during parenteral treatment) · electrolyte disturbance · G6PD deficiency · heart block (monitor ECG during parenteral treatment)
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS** Abdominal pain · agitation · agranulocytosis · angioedema · asthma · atrioventricular conduction changes · bronchospasm · cardiotoxicity · cerebral impairment · coagulation disorders · coma · confusion · death · diarrhoea · dyspnoea · fever · flushing · gastrointestinal disorder · haemoglobinuria · haemolysis · haemolytic uraemic syndrome · headache · hearing impairment · hypersensitivity · loss of consciousness · muscle weakness · myasthenia gravis aggravated · nausea · ocular toxicity · oedema · pancytopenia · photosensitivity reaction · QT interval prolongation · renal impairment · skin reactions · thrombocytopenia · vertigo · vision disorders · vomiting
- **Overdose** Quinine is very toxic in overdosage; life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

For details on the management of poisoning, see Emergency treatment of poisoning p. 1319.

- **PREGNANCY** High doses are teratogenic in *first trimester*, but in malaria benefit of treatment outweighs risk.
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **HEPATIC IMPAIRMENT**
Dose adjustments ▶ With intravenous use For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.
- **RENAL IMPAIRMENT**
Dose adjustments ▶ With intravenous use For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.
- **MONITORING REQUIREMENTS**
- ▶ With intravenous use Monitor blood glucose and electrolyte concentration during parenteral treatment.
- ▶ In adults Patients taking quinine for nocturnal leg cramps should be monitored closely during the early stages for adverse effects as well as for benefit.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give continuously in Glucose 5% or Sodium Chloride 0.9%. To be given over 4 hours.

● PRESCRIBING AND DISPENSING INFORMATION

- With intravenous use Intravenous injection of quinine is so hazardous that it has been superseded by infusion.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for infusion

Tablet

● Quinine (Non-proprietary)

Quinine sulfate 200 mg Quinine sulfate 200mg tablets |

28 tablet [PoM] £2.90 DT = £1.43

Quinine bisulfate 300 mg Quinine bisulfate 300mg tablets |

28 tablet [PoM] £2.57 DT = £1.94

Quinine sulfate 300 mg Quinine sulfate 300mg tablets |

28 tablet [PoM] £2.83 DT = £1.96

5.3 Toxoplasmosis

ANTIPROTOZOALS

Pyrimethamine

● INDICATIONS AND DOSE

Toxoplasmosis in pregnancy (in combination with sulfadiazine and folinic acid)

► BY MOUTH

Adult: 50 mg once daily until delivery

- **CAUTIONS** History of seizures—avoid large loading doses • predisposition to folate deficiency

- **INTERACTIONS** → Appendix 1: antimalarials

● SIDE-EFFECTS

- **Common or very common** Anaemia • diarrhoea • dizziness • headache • leucopenia • nausea • skin reactions • thrombocytopenia • vomiting

- **Uncommon** Fever

- **Rare or very rare** Abdominal pain • oral ulceration • pancytopenia • pneumonia eosinophilic • seizure

- **PREGNANCY** Theoretical teratogenic risk in *first trimester* (folate antagonist). Adequate folate supplements should be given to the mother.

- **BREAST FEEDING** Significant amount in milk—avoid administration of other folate antagonists to infant. Avoid breast-feeding during toxoplasmosis treatment.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **RENAL IMPAIRMENT** Manufacturer advises caution.

- **MONITORING REQUIREMENTS** Blood counts required with prolonged treatment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

£13.00

6 Viral infection

6.1 Hepatitis

Hepatitis

Overview

Treatment for viral hepatitis should be initiated by a specialist. The management of uncomplicated acute viral hepatitis is largely symptomatic. Early treatment of acute

hepatitis C with interferon alfa p. 930 [unlicensed indication] may reduce the risk of chronic infection. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. Active or passive immunisation against hepatitis A and B infections can be given.

Chronic hepatitis B

Peginterferon alfa p. 612 is an option for the initial treatment of chronic hepatitis B and may be preferable to interferon alfa. The use of peginterferon alfa and interferon alfa is limited by a response rate of 30–40% and relapse is frequent. Treatment should be discontinued if no improvement occurs after 4 months. The manufacturers of peginterferon alfa-2a and interferon alfa contraindicate use in decompensated liver disease, but low doses can be used with great caution in these patients. Although interferon alfa is contra-indicated in patients receiving immunosuppressant treatment (or who have received it recently), cautious use of peginterferon alfa-2a may be justified in some cases.

Entecavir p. 610 or tenofovir disoproxil p. 641 are options for the initial treatment of chronic hepatitis B. If the response is inadequate after 6–9 months of treatment, a change in treatment should be considered. Other drugs that are licensed for the treatment of chronic hepatitis B include adefovir dipivoxil p. 611, lamivudine p. 640, or telbivudine p. 611.

Entecavir alone, tenofovir disoproxil alone, or a combination of lamivudine with either adefovir dipivoxil or tenofovir disoproxil can be used in patients with decompensated liver disease.

If drug-resistant hepatitis B virus emerges during treatment, another antiviral drug to which the virus is sensitive should be added. Hepatitis B viruses with reduced susceptibility to lamivudine have emerged following extended therapy. Adefovir dipivoxil or tenofovir disoproxil can be given with lamivudine in lamivudine-resistant chronic hepatitis B; telbivudine or entecavir should not be used because cross-resistance can occur.

If there is no toxicity or loss in efficacy, treatment with adefovir dipivoxil, entecavir, lamivudine, telbivudine, or tenofovir disoproxil is usually continued until 6 months after adequate seroconversion has occurred. Treatment is usually continued long-term in patients with decompensated liver disease.

Tenofovir disoproxil, or a combination of tenofovir disoproxil with either emtricitabine p. 638 or lamivudine may be used with other antiretrovirals, as part of 'highly active antiretroviral therapy' in patients who require treatment for both HIV and chronic hepatitis B. If patients infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV, such as peginterferon alfa or adefovir dipivoxil. Treatment may be continued long-term, even if adequate seroconversion occurs. Management of these patients should be coordinated between HIV and hepatology specialists.

Chronic hepatitis C

Before starting treatment, the genotype of the infecting hepatitis C virus should be determined and the viral load measured as this may affect the choice and duration of treatment. A combination of ribavirin p. 615 and peginterferon alfa is used for the treatment of chronic hepatitis C. The combination of ribavirin and interferon alfa is less effective than the combination of peginterferon alfa and ribavirin. Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Ribavirin monotherapy is ineffective.

Daclatasvir p. 614 is licensed for use in combination with sofosbuvir p. 618 for the treatment of chronic hepatitis C infection of genotypes 1 or 4, with or without compensated cirrhosis; the addition of ribavirin should be considered for

patients with advanced liver disease or with other negative prognostic factors, such as prior treatment experience. It is also licensed in combination with sofosbuvir and ribavirin for the treatment of chronic hepatitis C infection of genotype 3 in patients who are treatment experienced, with or without compensated cirrhosis, and in combination with peginterferon alfa and ribavirin for the treatment of chronic hepatitis C infection of genotype 4. Daclatasvir must not be given as monotherapy.

Ombitasvir with paritaprevir and ritonavir p. 615 (*Viekirax*®), is licensed for use in combination with dasabuvir p. 621, with or without ribavirin, for the treatment of chronic hepatitis C infection of genotype 1 in patients with or without compensated cirrhosis; it is also licensed for use in combination with ribavirin for the treatment of chronic hepatitis C infection of genotype 4 with or without compensated cirrhosis.

Ribavirin inhibits a wide range of DNA and RNA viruses. It is given by mouth for the treatment of chronic hepatitis C infection, in double therapy with peginterferon alfa, interferon alfa, or sofosbuvir, or in triple therapy with peginterferon alfa and one protease inhibitor (i.e. simeprevir p. 620) or sofosbuvir. Ribavirin is also effective in Lassa fever [unlicensed indication].

Sofosbuvir is a pro-drug of a nucleoside inhibitor that is effective against hepatitis C virus polymerase NS5B. It is licensed for use in combination with ribavirin, with or without peginterferon alfa, for the treatment of chronic hepatitis C infection of genotypes 1, 2, 3, 4, 5, or 6 in patients with compensated liver disease. Sofosbuvir monotherapy is not recommended because it is less effective than combination therapy.

Ledipasvir is licensed for use in combination with sofosbuvir (ledipasvir with sofosbuvir p. 617), with or without ribavirin, for the treatment of chronic hepatitis C infections of genotypes 1, 3, 4, 5 or 6.

Sofosbuvir with velpatasvir and voxilaprevir p. 619 is licensed for the treatment of chronic hepatitis C of all genotypes.

Simeprevir is licensed for use in combination with ribavirin and peginterferon alfa for the treatment of chronic hepatitis C infection of genotype 1 or 4; regimens containing peginterferon alfa-2b are less effective than those containing peginterferon alfa-2a. Simeprevir may also be used in combination with sofosbuvir, with or without ribavirin, for the urgent treatment of chronic hepatitis C infection of genotypes 1 or 4 only when peginterferon alfa cannot be used because of intolerance or contra-indications. Simeprevir monotherapy is not recommended.

6.2 Hepatitis infections

6.2a Chronic hepatitis B

Other drugs used for Chronic hepatitis B Interferon alfa, p. 930 • Lamivudine, p. 640 • Tenofovir disoproxil, p. 641

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Entecavir

• INDICATIONS AND DOSE

Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) not previously treated with nucleoside analogues

- BY MOUTH
- Adult: 500 micrograms once daily

Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) and lamivudine-resistance

- BY MOUTH

- Adult: 1 mg once daily, consider other treatment if inadequate response after 6 months

Chronic hepatitis B in patients with decompensated liver disease

- BY MOUTH

- Adult: 1 mg once daily

- **CAUTIONS** HIV infection—risk of HIV resistance in patients not receiving 'highly active antiretroviral therapy' • lamivudine-resistant chronic hepatitis B—risk of entecavir resistance

CAUTIONS, FURTHER INFORMATION Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

● SIDE-EFFECTS

- **Common or very common** Diarrhoea • dizziness • drowsiness • dyspepsia • fatigue • headache • insomnia • nausea • vomiting

- **Uncommon** Alopecia • rash

- **Frequency not known** Lactic acidosis

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

- **PREGNANCY** Toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **RENAL IMPAIRMENT** Consult product literature. **Dose adjustments** Reduce dose if eGFR less than 50 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

- **DIRECTIONS FOR ADMINISTRATION** To be taken at least 2 hours before or 2 hours after food.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.

- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on the administration of entecavir tablets and oral solution.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Entecavir for chronic hepatitis B (August 2008) NICE TA153 Entecavir is an option for the treatment of chronic hepatitis B. www.nice.org.uk/TA153

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

- **Baraclude** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Entecavir (as Entecavir monohydrate) 50 microgram per 1 mL Baraclude 0.05mg/mL oral solution sugar-free | 210 mL [PoM] £423.80 DT = £423.80

Tablet

- **Entecavir (Non-proprietary)**

Entecavir (as Entecavir monohydrate) 500 microgram Entecavir 500microgram tablets | 30 tablet [PoM] £25.00-£363.26 DT = £363.26 Entecavir (as Entecavir monohydrate) 1 mg Entecavir 1mg tablets | 30 tablet [PoM] £35.00-£363.26 DT = £363.26

- **Baraclude** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Entecavir (as Entecavir monohydrate) 500 microgram Baraclude 0.5mg tablets | 30 tablet [PoM] £363.26 DT = £363.26

Entecavir (as Entecavir monohydrate) 1 mg Baraclude 1mg tablets | 30 tablet [PoM] £363.26 DT = £363.26

Telbivudine

● INDICATIONS AND DOSE

Chronic hepatitis B infection with compensated liver disease, evidence of viral replication, and histologically documented active liver inflammation or fibrosis, when other treatment is not appropriate

► BY MOUTH

Adult: 600 mg once daily

- **CAUTIONS** Lamivudine-resistant chronic hepatitis B—risk of telbivudine resistance

CAUTIONS, FURTHER INFORMATION Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

- **INTERACTIONS** → Appendix 1: telbivudine

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · cough · diarrhoea · dizziness · fatigue · headache · nausea · rash
- **Uncommon** Arthralgia · malaise · muscle complaints · nerve disorders · pain · sensation abnormal · taste altered
- **Rare or very rare** Lactic acidosis

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● RENAL IMPAIRMENT

Dose adjustments 600 mg every 48 hours if eGFR 30–49 mL/minute/1.73 m²; 600 mg every 72 hours if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor liver function tests every 3 months and viral markers of hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

● PATIENT AND CARER ADVICE

Muscle effects and peripheral neuropathy. Patients should be advised to promptly report unexplained muscle pain, tenderness, or weakness, or numbness, tingling or burning sensations.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Telbivudine for chronic hepatitis B (August 2008)** NICE TA154. Telbivudine is not recommended for the treatment of chronic hepatitis B. Patients currently receiving telbivudine can continue treatment until they and their clinician consider it appropriate to stop.
www.nice.org.uk/TA154

ANTIVIRALS > NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

Tenofovir alafenamide

26-Feb-2018

● INDICATIONS AND DOSE

Chronic hepatitis B (initiated by a specialist)

► BY MOUTH

Adult: 25 mg once daily (for duration of treatment consult product literature)

- **CAUTIONS** Decompensated liver disease · HIV co-infection

- **INTERACTIONS** → Appendix 1: tenofovir alafenamide

● SIDE-EFFECTS

- **Common or very common** Abdominal distension
- **Frequency not known** Hepatitis aggravated (during or following treatment)

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises monitor hepatic and renal function in decompensated liver disease—risk of adverse effects may be increased (no information available).

- **PRE-TREATMENT SCREENING** Manufacturer advises HIV antibody testing should be offered to those with unknown HIV-1 status before initiation of treatment.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor liver function tests at repeated intervals during treatment and for at least 6 months after last dose—recurrent hepatitis may occur on discontinuation.

● PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- **BREAST FEEDING** Manufacturers advise avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

- **Monitoring** Close monitoring required in mild to moderate hepatic impairment.

- **RENAL IMPAIRMENT** For further information on peginterferon alfa use in renal impairment consult product literature.

Dose adjustments Reduce dose in moderate to severe impairment.

Monitoring Close monitoring required in renal impairment.

- **MONITORING REQUIREMENTS** Monitoring of lipid concentration is recommended.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006 and September 2010)** NICE TA200

The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the disease has reached a moderate stage ('watchful waiting'). Peginterferon alfa alone can be used if ribavirin is contra-indicated or not tolerated.

www.nice.org.uk/TA200

- ▶ **Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010)** NICE TA200

The combination of peginterferon alfa and ribavirin should be used for treating moderate to severe chronic hepatitis C in patients aged over 18 years:

- not previously treated with interferon alfa or peginterferon alfa;
- treated previously with interferon alfa alone or in combination with ribavirin;
- whose condition did not respond to peginterferon alfa alone or to a combination of peginterferon alfa and ribavirin, or responded but subsequently relapsed;
- co-infected with HIV.

Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa.
www.nice.org.uk/TA200

ANTIVIRALS • HCV INHIBITORS

Elbasvir with grazoprevir

24-Apr-2017

- **DRUG ACTION** Elbasvir is an HCV NS5A inhibitor and grazoprevir is an HCV NS3/4A protease inhibitor; they reduce viral load by inhibiting hepatitis C virus RNA replication.

• **INDICATIONS AND DOSE**

Chronic hepatitis C infection of genotypes 1 or 4 (with or without ribavirin) (initiated by a specialist)

► **BY MOUTH**

- **Adult:** 50/100 mg once daily for 12 weeks (may extend to 16 weeks in some circumstances—consult product literature)

DOSE EQUIVALENCE AND CONVERSION

- Dose expressed as x/y mg elbasvir/grazoprevir.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be

monitored closely in patients receiving concomitant treatment.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C viruses must be monitored and managed according to current clinical guidelines.

- **CAUTIONS** Hepatitis B co-infection • re-treatment following previous exposure to elbasvir with grazoprevir, or to drugs of the same classes (NS5A inhibitors or NS3/4A inhibitors other than telaprevir, simeprevir, boceprevir)—efficacy not demonstrated
- **INTERACTIONS** → Appendix 1: elbasvir • grazoprevir
- **SIDE-EFFECTS**
 - **Common or very common** Alopecia • anxiety • appetite decreased • arthralgia • asthenia • constipation • depression • diarrhoea • dizziness • dry mouth • gastrointestinal discomfort • headache • insomnia • irritability • myalgia • nausea • pruritus • vomiting
 - **Uncommon** Anaemia • transient ischaemic attack
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate-to-severe impairment.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor liver function before treatment, at week 8 in all patients, at week 12 in patients receiving 16 weeks of treatment, and then as clinically indicated—consider discontinuing treatment if alanine aminotransferase (ALT) is greater than 10 times the upper limit of normal; discontinue treatment if ALT elevation is accompanied by signs or symptoms of hepatic impairment or inflammation.

• **PATIENT AND CARER ADVICE**

Hepatic effects Manufacturer advises that patients and their carers should consult a healthcare professional if signs and symptoms of hepatic dysfunction occur (including fatigue, weakness, lack of appetite, nausea and vomiting, jaundice or discoloured faeces).

Vomiting Manufacturer advises if vomiting occurs within 4 hours of a dose, an additional dose should be taken.

Missed doses Manufacturer advises if a dose is more than 16 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

• **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- **Elbasvir–grazoprevir for treating chronic hepatitis C (October 2016)** NICE TA413

Elbasvir with grazoprevir is recommended, within its marketing authorisation, as an option for treating genotype 1 or 4 chronic hepatitis C infection:

- of genotype 1a—12 weeks' treatment (consider use in combination with ribavirin for 16 weeks in patients with a baseline hepatitis C virus RNA level of more than 800 000 IU/mL or specific NS5A polymorphisms causing at least a 5-fold reduction in activity of elbasvir);
- of genotype 1b—12 weeks' treatment;
- of genotype 4—12 weeks' treatment (consider use in combination with ribavirin for 16 weeks in patients with a baseline hepatitis C virus RNA level of more than 800 000 IU/mL).

This is contingent on the manufacturer providing the drug at the same price or lower than that agreed with the Commercial Medicines Unit.

www.nice.org.uk/guidance/ta413

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* advises (December 2016) that *Zepatier*[®] (elbasvir with grazoprevir) is accepted for use within NHS Scotland for the treatment of chronic hepatitis C in adults with genotype 1a, 1b or 4; this advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 3

ELECTROLYTES: May contain Sodium

| 28 tablet [PoM] £12,166.67

ANTIVIRALS > NON-STRUCTURAL PROTEIN 5A INHIBITORS

Daclatasvir

11-May-2017

- **DRUG ACTION** Daclatasvir is an inhibitor of the multifunctional protein NS5A, which is an essential component of the hepatitis C virus replication process.

INDICATIONS AND DOSE

In combination with sofosbuvir for the treatment of chronic hepatitis C infection of genotypes 1 or 4, with or without compensated cirrhosis | In combination with sofosbuvir and ribavirin for the treatment of chronic hepatitis C infection of genotype 3 in patients who are treatment experienced, with or without compensated cirrhosis | In combination with peginterferon alfa and ribavirin for the treatment of chronic hepatitis C infection of genotype 4

► BY MOUTH

- Adult: Usual dose 60 mg once daily (for duration of treatment consult product literature)

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose to 30 mg once daily with concurrent use of some of the potent CYP3A4 inhibitors—consult product literature.
- Manufacturer advises increase dose to 90 mg once daily with bosentan.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C

viruses must be monitored and managed according to current clinical guidelines.

- **CAUTIONS** Decompensated liver disease · hepatitis B virus co-infection · human immunodeficiency virus co-infection · organ transplant patients · retreatment—efficacy not established in patients with prior exposure to a NS5A inhibitor

- **INTERACTIONS** → Appendix 1: daclatasvir

SIDE-EFFECTS

- **Common or very common** Abdominal pain · alopecia · anaemia · appetite decreased · arthralgia · constipation · cough · diarrhoea · dizziness · dry mouth · dyspnoea · fatigue · gastrointestinal disorders · headaches · hot flush · insomnia · irritability · myalgia · nasal congestion · nausea · skin reactions · vomiting

- **Frequency not known** Atrioventricular block · bradycardia

SIDE-EFFECTS, FURTHER INFORMATION Side-effects listed are reported when daclatasvir is used in combination with sofosbuvir with or without ribavirin or with ribavirin and peginterferon alfa.

- **CONCEPTION AND CONTRACEPTION** Highly effective contraception required during and for 5 weeks after treatment.

- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies).

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

PATIENT AND CARER ADVICE

Missed doses If a dose is more than 20 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks May affect performance of skilled tasks (e.g. driving)

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Daclatasvir for treating chronic hepatitis C (November 2015) NICE TA364

Daclatasvir in combination with sofosbuvir or peginterferon alfa, and with/without ribavirin, is recommended as an option for the treatment of chronic hepatitis C infection of genotypes 1, 3 or 4 in adults, depending on the level of fibrosis **and** only if the manufacturer provides daclatasvir at the same price or lower than agreed with the Commercial Medicines Unit. www.nice.org.uk/TA364

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2014) that daclatasvir (*Daklinza*[®]) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C virus infection in patients with significant fibrosis (Metavir score F3–F4) or compensated cirrhosis.

- Adult (body-weight 65–80 kg): 400 mg daily, dose to be taken in the morning and 600 mg daily, dose to be taken in the evening
- Adult (body-weight 81–104 kg): 600 mg twice daily
- Adult (body-weight 105 kg and above): 600 mg daily, dose to be taken in the morning and 800 mg daily, dose to be taken in the evening

- **UNLICENSED USE** Inhalation licensed for use in children (age range not specified by manufacturer). Intravenous preparation not licensed.

● **CONTRA-INDICATIONS**

- With systemic use Active severe psychiatric condition (in children) · autoimmune disease (in children) · autoimmune hepatitis (in children) · consult product literature for specific contra-indications when ribavirin used in combination with other medicinal products · haemoglobinopathies · history of severe psychiatric condition (in children) · severe cardiac disease (in adults) · severe debilitating medical conditions · severe, uncontrolled cardiac disease in children with chronic hepatitis C · unstable or uncontrolled cardiac disease in previous 6 months (in adults)

● **CAUTIONS**

- When used by inhalation Maintain standard supportive respiratory and fluid management therapy
- With systemic use Anaemia (haemoglobin concentration should be monitored during the treatment and corrective action taken) (in adults) · cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration) · consult product literature for specific cautions when ribavirin used in combination with other medicinal products · gout (in adults) · haemolysis (haemoglobin concentration should be monitored during the treatment and corrective action taken) (in adults) · patients with a transplant—risk of rejection · risk of growth retardation in children, the reversibility of which is uncertain—if possible, consider starting treatment after pubertal growth spurt · severe dental disorders (in adults) · severe ocular disorders (in adults) · severe periodontal disorders (in adults) · severe psychiatric effects (in adults)

- **INTERACTIONS** → Appendix 1: ribavirin

● **SIDE-EFFECTS**

- **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · arthritis · asthenia · behaviour abnormal · chest pain · chills · concentration impaired · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · dysphagia · dyspnoea · ear pain · eye disorders · eye inflammation · eye pain · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · hearing impairment · hyperthyroidism · hypotension · hypothyroidism · increased risk of infection · influenza like illness ·

lymphadenopathy · malaise · memory loss · mood altered · muscle complaints · muscle weakness · nasal congestion · nausea · neutropenia · oral disorders · pain · palpitations · peripheral oedema · photosensitivity reaction · respiratory disorders · sensation abnormal · sexual dysfunction · skin reactions · sleep disorders · sweat changes · syncope · taste altered · thirst · throat pain · thrombocytopenia · tremor · vasodilation · vertigo · vision disorders · vomiting · weight decreased

- **Uncommon** Dehydration · diabetes mellitus · hallucination · hepatic disorders · hypertension · nerve disorders · sarcoidosis · suicidal tendencies · thyroiditis
 - **Rare or very rare** Angina pectoris · angioedema · bone marrow disorders · cardiac inflammation · cerebral ischaemia · cholangitis · coma · congestive heart failure · facial paralysis · hypersensitivity · intracranial haemorrhage · myocardial infarction · myopathy · pancreatitis · psychotic disorder · pulmonary embolism · retinopathy · seizure · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · vasculitis
 - **Frequency not known** Haemolytic anaemia · homicidal ideation · nephrotic syndrome · pure red cell aplasia · renal failure · solid organ transplant rejection · ulcerative colitis
- SIDE-EFFECTS, FURTHER INFORMATION** Side effects listed are reported when oral ribavirin is used in combination with peginterferon alfa or interferon alfa, consult product literature for details.

● **CONCEPTION AND CONTRACEPTION**

- With systemic use Exclude pregnancy before treatment in females of childbearing age. Effective contraception essential during treatment and for 4 months after treatment in females and for 7 months after treatment in males of childbearing age. Routine monthly pregnancy tests recommended. Condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen).
- When used by inhalation Women planning pregnancy should avoid exposure to aerosol.
- **PREGNANCY** Avoid; teratogenicity in *animal* studies.
- When used by inhalation Pregnant women should avoid exposure to aerosol.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid oral ribavirin in severe hepatic dysfunction or decompensated cirrhosis. **Dose adjustments** No dosage adjustment required.

- **RENAL IMPAIRMENT** Plasma-ribavirin concentration increased.

- In adults Manufacturer advises avoid oral ribavirin unless essential if eGFR less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely.
- In children Manufacturer advises avoid oral ribavirin if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely. Manufacturer advises use intravenous preparation with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

● **MONITORING REQUIREMENTS**

- When used by inhalation Monitor electrolytes closely. Monitor equipment for precipitation.
 - With systemic use in children Determine full blood count, platelets, electrolytes, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature).
- Test thyroid function before treatment and then every 3 months.

- With systemic use in adults Determine full blood count, platelets, electrolytes, glucose, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature).

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include bubble-gum.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006 and September 2010) NICE TA200**
The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the disease has reached a moderate stage ('watchful waiting').
www.nice.org.uk/TA200
- ▶ **Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010) NICE TA200**
The combination of peginterferon alfa and ribavirin should be used for treating moderate to severe chronic hepatitis C in patients aged over 18 years:
 - not previously treated with interferon alfa or peginterferon alfa;
 - treated previously with interferon alfa alone or in combination with ribavirin;
 - whose condition did not respond to peginterferon alfa alone or to a combination of peginterferon alfa and ribavirin, or responded but subsequently relapsed;
 - co-infected with HIV.
 Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa.
www.nice.org.uk/TA200
- **LESS SUITABLE FOR PRESCRIBING** Ribavirin inhalation is less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

ANTIVIRALS > NUCLEOTIDE ANALOGUES

Ledipasvir with sofosbuvir

09-Nov-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, sofosbuvir p. 618.

- **DRUG ACTION** Sofosbuvir is a nucleotide analogue inhibitor and ledipasvir is an HCV inhibitor; they reduce viral load by inhibiting hepatitis C virus RNA replication.

● INDICATIONS AND DOSE

Chronic hepatitis C infection (initiated by a specialist)

- ▶ **BY MOUTH**
- ▶ **Adult:** 90/400 mg once daily, for duration of treatment consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose of concurrent H₂-receptor antagonist if above a dose comparable to famotidine 40 mg twice daily.
- ▶ Manufacturer advises reduce dose of concurrent proton pump inhibitor if above a dose comparable to omeprazole 20 mg; take at the same time as sofosbuvir with ledipasvir.

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg ledipasvir/sofosbuvir.

- **CAUTIONS** Retreatment following treatment failure—efficacy not established
- **INTERACTIONS** → Appendix 1: ledipasvir · sofosbuvir
- **SIDE-EFFECTS**
- ▶ **Common or very common** Fatigue · headache · rash
- ▶ **Frequency not known** Angioedema · arrhythmia
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).
- **PATIENT AND CARER ADVICE**
Vomiting If vomiting occurs within 5 hours of administration, an additional dose should be taken.
Missed doses If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Ledipasvir with sofosbuvir for the treatment of chronic hepatitis C (November 2015) NICE TA363**
Ledipasvir with sofosbuvir is recommended as an option for treating adults with chronic hepatitis C infection:
 - of genotype 1 without cirrhosis (treatment naive patients)—8 weeks' treatment
 - of genotype 1 or 4 with cirrhosis (treatment naive patients)—12 weeks' treatment
 - of genotype 1 or 4 without cirrhosis (or with cirrhosis but only if the person has a low risk of the disease getting worse) that has not responded adequately to previous treatment—12 weeks' treatment
 In addition, ledipasvir with sofosbuvir is only recommended in patients with cirrhosis for the durations mentioned above if the following criteria are met:
 - Child-Pugh class A
 - platelet count of 75 000/mm³ or more
 - no features of portal hypertension
 - no history of an HCV-associated decompensation episode
 - not previously treated with an NS5A inhibitor
 Patients whose treatment with ledipasvir with sofosbuvir is not recommended in this NICE guidance, but was started within the NHS before this guidance was published, should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA363

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March and September 2015) that *Harvoni*[®] (ledipasvir with sofosbuvir) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C infection of genotypes 1, 3 and 4 only, in patients who are ineligible for, or unable to tolerate, interferon.

MEDICINAL FORMS

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C viruses must be monitored and managed according to current clinical guidelines.

CAUTIONS

CAUTIONS, FURTHER INFORMATION Manufacturer advises in chronic hepatitis C of genotype 1, 4, 5, or 6, only use sofosbuvir with ribavirin dual therapy in those with intolerance or contra-indications to peginterferon alfa who require urgent treatment.

● **INTERACTIONS** → Appendix 1: sofosbuvir

SIDE-EFFECTS

- **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arthralgia · asthenia · chest pain · chills · concentration impaired · constipation · cough · depression · diarrhoea · dizziness · dry mouth · dyspnoea · fever · gastrointestinal discomfort · gastrooesophageal reflux disease · headaches · influenza like illness · insomnia · irritability · memory loss · muscle complaints · nasopharyngitis · nausea · neutropenia · pain · skin reactions · vision blurred · vomiting · weight decreased
- **Frequency not known** Arrhythmia

SIDE-EFFECTS, FURTHER INFORMATION Side-effects listed are reported when sofosbuvir is used in combination with ribavirin or with ribavirin and peginterferon alfa.

● **PREGNANCY** Manufacturer advises avoid—limited information available.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

● **RENAL IMPAIRMENT** Safety and efficacy not established if eGFR less than 30 mL/minute/1.73 m²—accumulation may occur.

● **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

PATIENT AND CARER ADVICE

● **Missed doses** Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS**NICE decisions**

► **Sofosbuvir for treating chronic hepatitis C (February 2015)** NICE TA330

Sofosbuvir in combination with peginterferon alfa and ribavirin is an option for treating adults with chronic hepatitis C infection:

- of genotype 1
 - of genotype 3 with cirrhosis (treatment naive patients)
 - of genotype 3 that has not adequately responded to interferon-based treatment
 - of genotype 4, 5, or 6 with cirrhosis
- Sofosbuvir in combination with ribavirin is an option for treating adults with chronic hepatitis C infection:
- of genotype 2 who are intolerant to or ineligible for interferon (treatment naive patients)
 - of genotype 2 that has not adequately responded to interferon-based treatment
 - of genotype 3 with cirrhosis who are intolerant to or ineligible for interferon (treatment naive patients)
 - of genotype 3 with cirrhosis that has not adequately responded to interferon-based treatment

● INDICATIONS AND DOSE

Chronic hepatitis C infection, with or without ribavirin (initiated by a specialist)

► BY MOUTH

- Adult: 400/100 mg once daily for 12 weeks (may extend to 24 weeks in some circumstances—consult product literature)

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose of concurrent H₂-receptor antagonist if above a dose comparable to famotidine 40 mg twice daily.
- Manufacturer advises reduce dose of concurrent proton pump inhibitor if above a dose comparable to omeprazole 20 mg; take 4 hours after sofosbuvir with velpatasvir.

DOSE EQUIVALENCE AND CONVERSION

- Dose expressed as x/y mg sofosbuvir/velpatasvir.

- **CAUTIONS** Hepatitis B co-infection

- **INTERACTIONS** → Appendix 1: sofosbuvir · velpatasvir

- **SIDE-EFFECTS** Atrioventricular block · bradycardia · fatigue · headache · nausea

● PATIENT AND CARER ADVICE

Vomiting Manufacturer advises if vomiting occurs within 3 hours of administration, an additional dose should be taken.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Sofosbuvir-velpatasvir for treating chronic hepatitis C (January 2017) NICE TA430

Sofosbuvir with velpatasvir is recommended as an option for treating chronic hepatitis C infection in adults, if the following criteria are met:

- of genotype 1, 3, 4, 5 or 6 with or without cirrhosis (previously treated or treatment naïve patients);
- of genotype 2 with cirrhosis (previously treated or treatment naïve patients);
- of genotype 2 without cirrhosis (treatment naïve patients), only if interferon not suitable or not tolerated, or without cirrhosis (previously treated patients).

This is contingent on the manufacturer providing the drug with the discount agreed in the simple discount agreement.

Patients whose treatment was started within the NHS before this guidance was published, should continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta430

Scottish Medicines Consortium (SMC) Decisions

SMC No. 1195/16

The *Scottish Medicines Consortium* has advised (November 2016) that sofosbuvir with velpatasvir (*Epclusa*®) is accepted for restricted use within NHS Scotland for the treatment of adults with chronic hepatitis C infection of genotype 3 only.

SMC No. 1271/17

The *Scottish Medicines Consortium* has advised (October 2017) that sofosbuvir with velpatasvir (*Epclusa*®) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C virus (HCV) infection in adults with genotype 2, 5 or 6 or decompensated cirrhosis, irrespective of chronic HCV genotype. This advice is

contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1271/17

The *Scottish Medicines Consortium* has advised (April 2018) that sofosbuvir with velpatasvir (*Epclusa*®) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C virus (HCV) infection in adults with genotype 1 or 4. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

Vomiting Manufacturer advises if vomiting occurs within 4 hours of administration, an additional dose should be taken.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Sofosbuvir-velpatasvir-voxilaprevir for treating chronic hepatitis C (February 2018) NICE TA507

Sofosbuvir with velpatasvir and voxilaprevir is recommended as an option for treating adults with chronic hepatitis C infection:

- of genotype 1 to 6 with or without compensated cirrhosis (previously treated with direct-acting antivirals)—recommended for 12 weeks, **or**
- of genotype 3 with or without compensated cirrhosis (no treatment history with direct-acting antivirals)—recommended for 8 weeks, **and**
- the manufacturer provides the drug at the same price or lower than that agreed with the Commercial Medicines Unit.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding

arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta507

Scottish Medicines Consortium (SMC) Decisions

SMC No. 1317/18

The *Scottish Medicines Consortium* has advised (April 2018) that sofosbuvir with velpatasvir and voxilaprevir (Vosevi[®]) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C virus (HCV) infection in adults who:

- have failed to achieve a sustained virologic response (SVR) with a direct-acting anti-viral (DAA), or
- are DAA-naïve, have genotype 3 (GT3) HCV infection, with or without cirrhosis, and are suitable for treatment with an eight-week course.

This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

Simeprevir

14-Feb-2017

• INDICATIONS AND DOSE

In combination with ribavirin and peginterferon alfa for chronic hepatitis C infection of genotype 1 or 4 | In combination with sofosbuvir (with or without ribavirin) for urgent treatment of chronic hepatitis C infection of genotype 1 or 4 when peginterferon alfa cannot be used because of intolerance or contra-indications

- BY MOUTH

- Adult: 150 mg once daily (for duration of treatment consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C viruses must be monitored and managed according to current clinical guidelines.

- **CAUTIONS** Consider alternative treatment in presence of NS3 Q80K polymorphism—efficacy of simeprevir is reduced · patients of East Asian origin
- **INTERACTIONS** → Appendix 1: simeprevir
- **SIDE-EFFECTS**
- **Common or very common** Constipation · dyspnoea · nausea · photosensitivity reaction · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION Monitor rash for deterioration if mild or moderate; discontinue if severe.

- **CONCEPTION AND CONTRACEPTION** Effective contraception essential during treatment.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in plasma of breast-fed *animals*.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—elimination reduced in severe impairment. Manufacturer advises caution in decompensated cirrhosis—elimination reduced in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m²—elimination may be reduced.
- **PRE-TREATMENT SCREENING** Test for NS3 Q80K polymorphism before combination treatment with ribavirin and peginterferon alfa in patients with chronic hepatitis C infection of genotype 1a. Consider testing for NS3 Q80K polymorphism before combination treatment with sofosbuvir (with or without ribavirin) in patients with chronic hepatitis C infection of genotype 1a.
- **PATIENT AND CARER ADVICE**

Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

6.3 Herpesvirus infections

Herpesvirus infections

Herpes simplex and varicella-zoster infection

The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella-zoster virus.

Herpes simplex infections

Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1

(HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection.

In individuals with good immune function, mild infection of the eye (ocular herpes) and of the lips (herpes labialis or cold sores) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics. Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance.

Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

Varicella-zoster infections

Regardless of immune function and the use of any immunoglobulins, neonates with chickenpox should be treated with a parenteral antiviral to reduce the risk of severe disease. Oral therapy in children is not recommended as absorption is variable. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required.

Chickenpox is more severe in adolescents and adults than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adults and adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

Pregnant women who develop severe chickenpox may be at risk of complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Those who have been exposed to chickenpox and are at special risk of complications may require prophylaxis with varicella-zoster immunoglobulin (see under Disease Specific Immunoglobulins).

In *herpes zoster* (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days. Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.

Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management.

Choice

Aciclovir p. 623 is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella-zoster and the systemic and topical treatment of herpes simplex infections of the skin and mucous membranes. It is used by mouth for severe herpetic stomatitis. Aciclovir eye ointment is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.

Famciclovir p. 625, a prodrug of penciclovir, is similar to aciclovir and is licensed for use in herpes zoster and genital herpes.

Valaciclovir p. 625 is an ester of aciclovir, licensed for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is also licensed for preventing cytomegalovirus disease following solid organ transplantation. Famciclovir or valaciclovir are suitable alternatives to aciclovir for oral lesions associated with herpes zoster. Valaciclovir once daily may reduce the

risk of transmitting genital herpes to heterosexual partners—specialist advice should be sought.

Foscarnet sodium p. 628 is used for mucocutaneous herpes simplex virus infection unresponsive to aciclovir in immunocompromised patients; it is toxic and can cause renal impairment.

Inosine pranobex below has been used by mouth for herpes simplex infections; its effectiveness remains unproven.

Cytomegalovirus infection

Ganciclovir p. 626 is related to aciclovir but it is more active against cytomegalovirus (CMV); it is also much more toxic than aciclovir and should therefore be prescribed only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the *initial treatment* of CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine p. 642; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration.

Valaciclovir is licensed for prevention of cytomegalovirus disease following renal transplantation.

Valganciclovir p. 627 is an ester of ganciclovir which is licensed for the *initial treatment and maintenance treatment* of CMV retinitis in AIDS patients. Valganciclovir is also licensed for preventing CMV disease following solid organ transplantation from a cytomegalovirus-positive donor.

Foscarnet sodium is also active against cytomegalovirus; it is toxic and can cause renal impairment.

See local treatment of CMV retinitis.

ANTIVIRALS > INOSINE COMPLEXES

Inosine pranobex

(Inosine acedoben dimepranol)

• INDICATIONS AND DOSE

Mucocutaneous herpes simplex

► BY MOUTH

► Adult: 1 g 4 times a day for 7–14 days

Adjunctive treatment of genital warts

► BY MOUTH

► Adult: 1 g 3 times a day for 14–28 days

Subacute sclerosing panencephalitis

► BY MOUTH

► Adult: 50–100 mg/kg daily in 6 divided doses

- **CAUTIONS** History of gout · history of hyperuricaemia
- **SIDE-EFFECTS** Arthralgia · constipation · diarrhoea · drowsiness · epigastric discomfort · fatigue · headache · insomnia · malaise · nausea · nervousness · polyuria · skin reactions · vertigo · vomiting
- **PREGNANCY** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Manufacturer advises caution; metabolised to uric acid.
- **LESS SUITABLE FOR PRESCRIBING** Inosine pranobex is less suitable for prescribing.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

(Acyclovir)

● INDICATIONS AND DOSE

Herpes simplex, suppression

- ▶ BY MOUTH
 - ▶ Child 12-17 years: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6-12 months to reassess recurrence frequency—consider restarting after two or more recurrences
 - ▶ Adult: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6-12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Herpes simplex, prophylaxis in the immunocompromised

- ▶ BY MOUTH
 - ▶ Child 1-23 months: 100-200 mg 4 times a day
 - ▶ Child 2-17 years: 200-400 mg 4 times a day
 - ▶ Adult: 200-400 mg 4 times a day
- ▶ BY INTRAVENOUS INFUSION
 - ▶ Adult: 5 mg/kg every 8 hours

Herpes simplex, treatment (non-genital)

- ▶ BY MOUTH
 - ▶ Adult: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Herpes simplex, treatment (non-genital) in immunocompromised or if absorption impaired

- ▶ BY MOUTH
 - ▶ Adult: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Herpes simplex, treatment

- ▶ BY MOUTH
 - ▶ Child 1-23 months: 100 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
 - ▶ Child 2-17 years: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Herpes simplex, treatment, in immunocompromised or if absorption impaired

- ▶ BY MOUTH
 - ▶ Child 1-23 months: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
 - ▶ Child 2-17 years: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Genital herpes simplex, treatment of first episode

- ▶ BY MOUTH
 - ▶ Adult: 200 mg 5 times a day, alternatively 400 mg 3 times a day both courses usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Genital herpes simplex, treatment of first episode, in immunocompromised or HIV-positive

- ▶ BY MOUTH
 - ▶ Adult: 400 mg 5 times a day for 7-10 days (longer if new lesions appear during treatment or if healing incomplete)

Severe genital herpes simplex, treatment, initial infection | Treatment of herpes simplex in the immunocompromised

- ▶ BY INTRAVENOUS INFUSION
 - ▶ Adult: Initially 5 mg/kg every 8 hours usually for 5 days, alternatively 10 mg/kg every 8 hours for at least 14 days in encephalitis (at least 21 days if also immunocompromised)—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment, higher dose to be used only if resistant organisms suspected or in simplex encephalitis

Genital herpes simplex, treatment of recurrent infection

- ▶ BY MOUTH
 - ▶ Adult: 800 mg 3 times a day for 2 days, alternatively 200 mg 5 times a day for 5 days, alternatively 400 mg 3 times a day for 3-5 days

Genital herpes simplex, treatment of recurrent infection in immunocompromised or HIV-positive patients

- ▶ BY MOUTH
 - ▶ Adult: 400 mg 3 times a day for 5-10 days

Varicella zoster (chickenpox), treatment | Herpes zoster (shingles), treatment

- ▶ BY MOUTH
 - ▶ Child 1-23 months: 200 mg 4 times a day for 5 days
 - ▶ Child 2-5 years: 400 mg 4 times a day for 5 days
 - ▶ Child 6-11 years: 800 mg 4 times a day for 5 days
 - ▶ Child 12-17 years: 800 mg 5 times a day for 7 days
 - ▶ Adult: 800 mg 5 times a day for 7 days
- ▶ BY INTRAVENOUS INFUSION
 - ▶ Adult: 5 mg/kg every 8 hours usually for 5 days

Varicella zoster (chickenpox), treatment in immunocompromised | Herpes zoster (shingles), treatment in immunocompromised

- ▶ BY INTRAVENOUS INFUSION
 - ▶ Adult: 10 mg/kg every 8 hours usually for 5 days

Herpes zoster (shingles), treatment in immunocompromised

- ▶ BY MOUTH
 - ▶ Child 1-23 months: 200 mg 4 times a day continued for 2 days after crusting of lesions
 - ▶ Child 2-5 years: 400 mg 4 times a day continued for 2 days after crusting of lesions
 - ▶ Child 6-11 years: 800 mg 4 times a day continued for 2 days after crusting of lesions
 - ▶ Child 12-17 years: 800 mg 5 times a day continued for 2 days after crusting of lesions
 - ▶ Adult: 800 mg 5 times a day continued for 2 days after crusting of lesions

Herpes zoster, treatment in encephalitis | Varicella zoster, treatment in encephalitis

- ▶ BY INTRAVENOUS INFUSION
 - ▶ Adult: 10 mg/kg every 8 hours given for 10-14 days in encephalitis, possibly longer if also immunocompromised or if severe infection

Varicella zoster (chickenpox), attenuation of infection if varicella-zoster immunoglobulin not indicated

- ▶ BY MOUTH
 - ▶ Child: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure
 - ▶ Adult: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure

continued →

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients parenteral dose should be calculated on the basis of ideal weight for height.

- **UNLICENSED USE** Tablets and suspension not licensed for suppression of herpes simplex or for treatment of herpes zoster in children (age range not specified by manufacturer).
- ▶ With oral use Aciclovir doses in BNF may differ from those in product literature. Attenuation of chickenpox is an unlicensed indication.
- **CAUTIONS**
 - ▶ With systemic use Elderly (risk of neurological reactions) - maintain adequate hydration (especially with infusion or high doses)
- **INTERACTIONS** → Appendix 1: aciclovir
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Nausea · photosensitivity reaction · skin reactions · vomiting
 - ▶ **Uncommon** Abdominal pain · anaemia · diarrhoea · dizziness · fatigue · fever · headache · leucopenia · thrombocytopenia
 - ▶ **Rare or very rare** Alopecia · agitation · angioedema · ataxia · coma · confusion · drowsiness · dysarthria · dyspnoea · encephalopathy · hallucination · hepatic disorders · psychosis · renal impairment · renal pain · seizure · tremor
 - ▶ **Frequency not known** Crystalluria
- **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.
- **RENAL IMPAIRMENT** Risk of neurological reactions increased. Maintain adequate hydration (especially during renal impairment).

Dose adjustments ▶ With intravenous use Use normal intravenous dose every 12 hours if eGFR 25–50 mL/minute/1.73 m² (every 24 hours if eGFR 10–25 mL/minute/1.73 m²). Consult product literature for intravenous dose if eGFR less than 10 mL/minute/1.73 m².

 - ▶ With oral use in adults For *herpes zoster*, use normal oral dose every 8 hours if eGFR 10–25 mL/minute/1.73 m² (every 12 hours if eGFR less than 10 mL/minute/1.73 m²). For *herpes simplex*, use normal oral dose every 12 hours if eGFR less than 10 mL/minute/1.73 m².
 - ▶ With oral use in children For *herpes zoster*, use normal oral dose every 8 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m² (every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²). For *herpes simplex*, use normal dose every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion Zovirax IV®, Aciclovir IV (Genus), give intermittently in Sodium chloride 0.9% or Sodium chloride and glucose; initially reconstitute to 25 mg/mL in water for injection or sodium chloride 0.9% then dilute to not more than 5 mg/mL with the infusion fluid; to be given over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and given over 1 hour; for Aciclovir IV (Hospira) dilute to not more than 5 mg/mL with infusion fluid; give over 1 hour.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid preparations may include banana, or orange.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Aciclovir (oral) for viral infections www.medicinesforchildren.org.uk/aciclovir-for-viral-infections

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Aciclovir Tablets 200 mg or 800 mg may be prescribed.
Aciclovir Oral Suspension 200 mg/5mL may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9

▶ Aciclovir (Non-proprietary)

Aciclovir 200 mg Aciclovir 200mg tablets | 25 tablet [PoM] £10.00 DT = £0.83

Aciclovir 400 mg Aciclovir 400mg tablets | 56 tablet [PoM] £15.00 DT = £2.39

Aciclovir 800 mg Aciclovir 800mg tablets | 35 tablet [PoM] £20.00 DT = £2.88

Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 9

▶ Aciclovir (Non-proprietary)

Aciclovir 200 mg Aciclovir 200mg dispersible tablets | 25 tablet [PoM] £0.86 DT = £0.86

Aciclovir 400 mg Aciclovir 400mg dispersible tablets | 56 tablet [PoM] £20.00 DT = £11.98

Aciclovir 800 mg Aciclovir 800mg dispersible tablets | 35 tablet [PoM] £65.00 DT = £10.98

▶ Zovirax (GlaxoSmithKline UK Ltd)

Aciclovir 200 mg Zovirax 200mg dispersible tablets | 25 tablet [PoM] £2.85 DT = £0.86

Aciclovir 800 mg Zovirax 800mg dispersible tablets | 35 tablet [PoM] £10.50 DT = £10.98

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9

▶ Aciclovir (Non-proprietary)

Aciclovir 40 mg per 1 mL Aciclovir 200mg/5ml oral suspension sugar free sugar-free | 125 mL [PoM] £35.76 DT = £35.76

Aciclovir 80 mg per 1 mL Aciclovir 400mg/5ml oral suspension sugar free sugar-free | 100 mL [PoM] £39.47 DT = £39.47

▶ Zovirax (GlaxoSmithKline UK Ltd)

Aciclovir 40 mg per 1 mL Zovirax 200mg/5ml oral suspension sugar-free | 125 mL [PoM] £29.56 DT = £35.76

Aciclovir 80 mg per 1 mL Zovirax Double Strength 400mg/5ml oral suspension sugar-free | 100 mL [PoM] £33.02 DT = £39.47

Solution for infusion

ELECTROLYTES: May contain Sodium

▶ Aciclovir (Non-proprietary)

Aciclovir (as Aciclovir sodium) 25 mg per 1 mL Aciclovir 1g/40ml solution for infusion vials | 1 vial [PoM] £40.00 (Hospital only)

Aciclovir 250mg/10ml concentrate for solution for infusion vials | 5 vial [PoM] £50.00 (Hospital only) | 5 vial [PoM] £9.00

Aciclovir 500mg/20ml solution for infusion vials | 5 vial [PoM] £100.00 (Hospital only) | 5 vial [PoM] £18.00

Aciclovir 500mg/20ml concentrate for solution for infusion vials | 5 vial [PoM] £18.00 (Hospital only)

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

▶ Aciclovir (Non-proprietary)

Aciclovir (as Aciclovir sodium) 250 mg Aciclovir 250mg powder for solution for infusion vials | 5 vial [PoM] £49.30

▶ Zovirax I.V. (GlaxoSmithKline UK Ltd)

Aciclovir (as Aciclovir sodium) 250 mg Zovirax I.V. 250mg powder for solution for infusion vials | 5 vial [PoM] £16.70

Aciclovir (as Aciclovir sodium) 500 mg Zovirax I.V. 500mg powder for solution for infusion vials | 5 vial [PoM] £17.00

Famciclovir

● INDICATIONS AND DOSE

Herpes zoster infection, treatment

- BY MOUTH
- Adult: 500 mg 3 times a day for 7 days, alternatively 750 mg 1–2 times a day for 7 days

Herpes zoster infection, treatment in immunocompromised patients

- BY MOUTH
- Adult: 500 mg 3 times a day for 10 days, continue for 2 days after crusting of lesions

Genital herpes, suppression

- BY MOUTH
- Adult: 250 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Genital herpes, suppression in immunocompromised or HIV-positive patients

- BY MOUTH
- Adult: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Genital herpes infection, treatment of first episode

- BY MOUTH
- Adult: 250 mg 3 times a day for 5 days or longer if new lesions appear during treatment or if healing incomplete

Genital herpes infection, treatment of first episode in immunocompromised or HIV-positive patients

- BY MOUTH
- Adult: 500 mg twice daily for 10 days

Genital herpes infection, treatment of recurrent infection

- BY MOUTH
- Adult: 125 mg twice daily for 5 days, alternatively 1 g twice daily for 1 day

Genital herpes infection, treatment of recurrent infections in immunocompromised or HIV-positive patients

- BY MOUTH
- Adult: 500 mg twice daily for 5–10 days

Herpes simplex infection (non-genital), treatment in immunocompromised patients

- BY MOUTH
- Adult: 500 mg twice daily for 7 days

- **UNLICENSED USE** Famciclovir doses in BNF may differ from those in product literature.

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · diarrhoea · dizziness · headache · nausea · skin reactions · vomiting
- **Uncommon** Angioedema · confusion · drowsiness
- **Rare or very rare** Hallucination · jaundice cholestatic · palpitations · thrombocytopenia

- **PREGNANCY** Manufacturers advise avoid unless potential benefit outweighs risk.

- **BREAST FEEDING** No information available—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Usual dose in well compensated liver disease (information not available on decompensated).

● RENAL IMPAIRMENT

Dose adjustments Reduce dose; consult product literature.

- **PRESCRIBING AND DISPENSING INFORMATION** Famciclovir is a pro-drug of penciclovir.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

Valaciclovir

● INDICATIONS AND DOSE

Herpes zoster infection, treatment

- BY MOUTH
- Adult: 1 g 3 times a day for 7 days

Herpes zoster infection, treatment in immunocompromised patients

- BY MOUTH
- Adult: 1 g 3 times a day for at least 7 days and continued for 2 days after crusting of lesions

Herpes simplex, treatment of first infective episode

- BY MOUTH
- Adult: 500 mg twice daily for 5 days (longer if new lesions appear during treatment or healing is incomplete)

Herpes simplex infections treatment of first episode in immunocompromised or HIV-positive patients

- BY MOUTH
- Adult: 1 g twice daily for 10 days

Herpes simplex, treatment of recurrent infections

- BY MOUTH
- Adult: 500 mg twice daily for 3–5 days

Treatment of recurrent herpes simplex infections in immunocompromised or HIV-positive patients

- BY MOUTH
- Adult: 1 g twice daily for 5–10 days

Herpes labialis treatment

- BY MOUTH
- Child 12–17 years: Initially 2 g, then 2 g after 12 hours
- Adult: Initially 2 g, then 2 g after 12 hours

Herpes simplex, suppression of infections

- BY MOUTH
- Adult: 500 mg daily in 1–2 divided doses, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Herpes simplex, suppression of infections in immunocompromised or HIV-positive patients

- BY MOUTH
- Adult: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Genital herpes, reduction of transmission (administered on expert advice)

- BY MOUTH
- Adult: 500 mg once daily, to be taken by the infected partner

continued →

Prevention of cytomegalovirus disease following solid organ transplantation when valganciclovir or ganciclovir cannot be used

► BY MOUTH

- Adult: 2 g 4 times a day usually for 90 days, preferably starting within 72 hours of transplantation

- **CAUTIONS** Elderly (risk of neurological reactions) · maintain adequate hydration (especially with high doses)
- **INTERACTIONS** → Appendix 1: valganciclovir
- **SIDE-EFFECTS**
 - **Common or very common** Diarrhoea · dizziness · headache · nausea · photosensitivity reaction · skin reactions · vomiting
 - **Uncommon** Abdominal discomfort · agitation · confusion · dyspnoea · haematuria · hallucination · leucopenia · level of consciousness decreased · renal pain · thrombocytopenia · tremor
 - **Rare or very rare** Angioedema · ataxia · coma · delirium · dysarthria · encephalopathy · nephrolithiasis · psychosis · renal impairment · seizure
 - **Frequency not known** Microangiopathic haemolytic anaemia

SIDE-EFFECTS, FURTHER INFORMATION Neurological reactions more frequent with higher doses.

- **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution with high doses used for herpes labialis and prevention of cytomegalovirus disease—no information available.
- **RENAL IMPAIRMENT** Maintain adequate hydration.
Dose adjustments ► In adults For *herpes zoster*, 1 g every 12 hours if eGFR 30–50 mL/minute/1.73 m² (1 g every 24 hours if eGFR 10–30 mL/minute/1.73 m²; 500 mg every 24 hours if eGFR less than 10 mL/minute/1.73 m²). For *treatment of herpes simplex*, 500 mg (1 g in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m². For *treatment of herpes labialis*, if eGFR 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if eGFR 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose; if eGFR less than 10 mL/minute/1.73 m², 500 mg as a single dose). For *suppression of herpes simplex*, 250 mg (500 mg in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m². For *reduction of genital herpes transmission*, 250 mg every 24 hours if eGFR less than 15 mL/minute/1.73 m². Reduce dose according to eGFR for *cytomegalovirus prophylaxis* following solid organ transplantation (consult product literature).
 ► In children For *treatment of herpes labialis*, if estimated glomerular filtration rate 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if estimated glomerular filtration rate 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose; if estimated glomerular filtration rate less than 10 mL/minute/1.73 m², 500 mg as a single dose).
- **PRESCRIBING AND DISPENSING INFORMATION** Valganciclovir is a pro-drug of aciclovir.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 9

6.3a Cytomegalovirus infections

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Ganciclovir

31-May-2018

● INDICATIONS AND DOSE

Prevention of cytomegalovirus disease [pre-emptive therapy in patients with drug-induced immunosuppression]

► BY INTRAVENOUS INFUSION

- Adult: Initially 5 mg/kg every 12 hours for 7–14 days, then maintenance 6 mg/kg once daily, on 5 days of the week, alternatively maintenance 5 mg/kg once daily

Prevention of cytomegalovirus disease [universal prophylaxis in patients with drug-induced immunosuppression]

► BY INTRAVENOUS INFUSION

- Adult: 6 mg/kg once daily, on 5 days of the week, alternatively 5 mg/kg once daily

Treatment of cytomegalovirus disease [in immunocompromised patients]

► BY INTRAVENOUS INFUSION

- Adult: Initially 5 mg/kg every 12 hours for 14–21 days, then maintenance 6 mg/kg once daily, on 5 days of the week, alternatively maintenance 5 mg/kg once daily, maintenance only for patients at risk of relapse; if disease progresses initial induction treatment may be repeated

- **CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) · abnormally low neutrophil count (consult product literature) · abnormally low platelet count (consult product literature)

- **CAUTIONS** History of cytopenia · potential carcinogen (including long-term carcinogenicity) · potential teratogen (including long-term teratogenicity) · radiotherapy

- **INTERACTIONS** → Appendix 1: ganciclovir

● SIDE-EFFECTS

- **Common or very common** Anaemia · anxiety · appetite decreased · arthralgia · asthenia · bone marrow disorders · chest pain · chills · confusion · constipation · cough · depression · diarrhoea · dizziness · dysphagia · dyspnoea · ear pain · eye disorders · eye inflammation · eye pain · fever · flatulence · gastrointestinal discomfort · headache · hepatic function abnormal · increased risk of infection · insomnia · leucopenia · malaise · muscle complaints · nausea · neutropenia · night sweats · pain · peripheral neuropathy · renal impairment · seizure · sensation abnormal · sepsis · skin reactions · taste altered · thinking abnormal · thrombocytopenia · vomiting · weight decreased

- **Uncommon** Alopecia · arrhythmia · deafness · haematuria · hypotension · infertility male · oral ulceration · pancreatitis · psychotic disorder · tremor · visual impairment
- **Rare or very rare** Agranulocytosis · hallucination

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to valganciclovir, aciclovir, or valaciclovir.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during and for at least 30 days after treatment; men with partners of childbearing potential should be advised to use barrier contraception during and for at least 90 days after treatment. Ganciclovir may cause temporary or permanent inhibition of spermatogenesis—impaired fertility observed in *animal* studies.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—teratogenicity in *animal* studies.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **RENAL IMPAIRMENT**

Dose adjustments Manufacturer advises reduce dose for patients receiving mg/kg dosing if creatinine clearance less than 70 mL/minute—consult product literature.

● **MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises, for *intravenous infusion*, give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute with Water for Injections (500 mg/10 mL) then dilute requisite dose to a concentration of not more than 10 mg/mL with infusion fluid; give over 1 hour into a vein with adequate flow, preferably using a plastic cannula.

● **HANDLING AND STORAGE**

Caution in handling Ganciclovir is a potential teratogen and carcinogen. Manufacturer advises avoid inhalation of the powder or direct contact of the powder or reconstituted solution with the skin or mucous membranes; if contact occurs, wash thoroughly with soap and water; rinse eyes thoroughly with plain water.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

► **Ganciclovir (Non-proprietary)**

Ganciclovir (as Ganciclovir sodium) 500 mg powder for concentrate for solution for infusion vials | 5 vial [PoM] £125.95

► **Cymevene (Roche Products Ltd)**

Ganciclovir (as Ganciclovir sodium) 500 mg Cymevene 500mg powder for solution for infusion vials | 5 vial [PoM] £148.83

DOSE EQUIVALENCE AND CONVERSION

- Oral valganciclovir 900 mg twice daily is equivalent to intravenous ganciclovir 5 mg/kg twice daily.
- **CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) · abnormally low neutrophil count (consult product literature) · abnormally low platelet count (consult product literature)
- **CAUTIONS** History of cytopenia · potential carcinogen (including long-term carcinogenicity) · potential teratogen (including long-term teratogenicity) · radiotherapy
- **INTERACTIONS** → Appendix 1: valganciclovir
- **SIDE-EFFECTS**
 - **Common or very common** Anaemia · anxiety · appetite decreased · arthralgia · asthenia · bone marrow disorders · chest pain · confusion · constipation · cough · depression · diarrhoea · dizziness · dysphagia · dyspnoea · ear pain · eye disorders · eye inflammation · eye pain · flatulence · gastrointestinal discomfort · headache · hepatic function abnormal · increased risk of infection · insomnia · leucopenia · malaise · muscle complaints · nausea · neutropenia · night sweats · pain · peripheral neuropathy · renal impairment · seizure · sensation abnormal · sepsis · skin reactions · taste altered · thinking abnormal · thrombocytopenia · vomiting · weight decreased
 - **Uncommon** Alopecia · arrhythmia · deafness · haematuria · hallucination · hypotension · infertility male · oral ulceration · pancreatitis · psychotic disorder · tremor · visual impairment

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to ganciclovir, aciclovir, or valaciclovir.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during and for at least 30 days after treatment; men with partners of childbearing potential should be advised to use barrier contraception during and for at least 90 days after treatment. *Ganciclovir* may cause temporary or permanent inhibition of spermatogenesis—impaired fertility observed in *animal* studies.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—teratogenicity observed with *ganciclovir* in *animal* studies.

● **BREAST FEEDING** Manufacturer advises avoid—*ganciclovir* present in milk in *animal* studies.

● **RENAL IMPAIRMENT**

Dose adjustments Manufacturer advises reduce dose if creatinine clearance less than 60 mL/minute—consult product literature.

● **MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).

● **PRESCRIBING AND DISPENSING INFORMATION**

Valganciclovir is a pro-drug of ganciclovir.

Flavours of oral liquid formulations may include tutti-frutti.

● **HANDLING AND STORAGE** Manufacturer advises reconstituted powder for oral solution should be stored in a refrigerator (2–8°C) for up to 49 days. Caution in handling Valganciclovir is a potential teratogen and carcinogen. Manufacturer advises caution when handling the powder, reconstituted solution, or broken tablets and avoid inhalation of powder; if contact with skin or mucous membranes occurs, wash thoroughly with soap and water; rinse eyes thoroughly with plain water.

Valganciclovir

31-May-2018

● **INDICATIONS AND DOSE**

Cytomegalovirus retinitis [induction and maintenance treatment in patients with AIDS]

► **BY MOUTH**

► **Adult:** Initially 900 mg twice daily for 21 days, then maintenance 900 mg daily, induction regimen may be repeated if retinitis progresses

Prevention of cytomegalovirus disease [following solid organ transplantation from a cytomegalovirus positive donor]

► **BY MOUTH**

► **Adult:** 900 mg daily for 100 days (for 100–200 days following kidney transplantation), to be started within 10 days of transplantation

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

ANTIVIRALS > OTHER

Foscarnet sodium

● INDICATIONS AND DOSE

Cytomegalovirus disease

► BY INTRAVENOUS INFUSION

- Adult: Initially 60 mg/kg every 8 hours for 2–3 weeks, alternatively initially 90 mg/kg every 12 hours for 2–3 weeks, then maintenance 60 mg/kg daily, then increased if tolerated to 90–120 mg/kg daily, if disease progresses on maintenance dose, repeat induction regimen

Mucocutaneous herpes simplex virus infections unresponsive to aciclovir in immunocompromised patients

► BY INTRAVENOUS INFUSION

- Adult: 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal

- **UNLICENSED USE** Licensed for CMV retinitis in AIDS patients only. Foscarnet doses in BNF may differ from those in product literature.

- **CAUTIONS** Ensure adequate hydration

- **INTERACTIONS** → Appendix 1: foscarnet

● SIDE-EFFECTS

- **Common or very common** Aggression · anaemia · anxiety · appetite decreased · arrhythmias · asthenia · chest pain · chills · confusion · constipation · coordination abnormal · dehydration · depression · diarrhoea · dizziness · electrolyte imbalance · fever · gastrointestinal discomfort · genital discomfort (due to high concentrations excreted in urine) · genital ulceration (due to high concentrations excreted in urine) · haemorrhage · headache · hepatic function abnormal · hypertension · hypotension · leucopenia · malaise · muscle contractions involuntary · myalgia · nausea (reduce infusion rate) · neutropenia · numbness · oedema · palpitations · pancreatitis · paraesthesia (reduce infusion rate) · peripheral neuropathy · proteinuria · renal impairment · seizure · sepsis · skin reactions · thrombocytopenia · tremor · urinary disorders · vomiting
- **Uncommon** Acidosis · angioedema · glomerulonephritis · nephropathy · pancytopenia
- **Frequency not known** Anaphylactoid reaction · diabetes insipidus · muscle weakness · myopathy · oesophageal ulcer · QT interval prolongation · renal pain · renal tubular acidosis · severe cutaneous adverse reactions (SCARs)

- **CONCEPTION AND CONTRACEPTION** Men should avoid fathering a child during and for 6 months after treatment.

- **PREGNANCY** Manufacturer advises avoid.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

● RENAL IMPAIRMENT

Dose adjustments Reduce dose; consult product literature.

● MONITORING REQUIREMENTS

- Monitor electrolytes, particularly calcium and magnesium.
- Monitor serum creatinine every second day during induction and every week during maintenance.

● DIRECTIONS FOR ADMINISTRATION

Avoid rapid infusion. For intravenous infusion (Foscavir[®]), give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 12 mg/mL for infusion into peripheral vein (undiluted solution via central venous line only); infuse over at least 1 hour (infuse doses greater than 60 mg/kg over 2 hours).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

6.4 HIV infection

HIV infection

02-Jun-2017

Overview

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. Drugs for HIV infection (antiretrovirals) may be associated with serious side-effects. Although antiretrovirals increase life expectancy considerably and decrease the risk of complications associated with premature ageing, mortality and morbidity remain slightly higher than in uninfected individuals. Treatment should be undertaken only by those experienced in their use.

Aims of treatment

Treatment aims to prevent the mortality and morbidity associated with chronic HIV infection whilst minimising drug toxicity. Although it should be started before the immune system is irreversibly damaged, the need for early drug treatment should be balanced against the risk of toxicity. Commitment to treatment and strict adherence over many years are required; the regimen chosen should take into account convenience and patient tolerance. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding.

Treatment also reduces the risk of HIV transmission to sexual partners, but the risk is not eliminated completely; this risk and strategies to reduce HIV transmission should be discussed with patients and their sexual partners.

Initiation of treatment

The optimum time for initiating antiretroviral treatment depends primarily on the CD4 cell count. The timing and choice of treatment should also take account of clinical symptoms, comorbidities, and the possible effect of antiretroviral drugs on factors such as the risk of cardiovascular events. Treatment includes a combination of drugs known as 'highly active antiretroviral therapy'. Treatment of HIV-1 infection is initiated with 2 nucleoside reverse transcriptase inhibitors and either a non-nucleoside

reverse transcriptase inhibitor, or a boosted protease inhibitor, or an integrase inhibitor; the regimens of choice contain tenofovir disoproxil p. 641 and emtricitabine p. 638 with *either* efavirenz p. 632 or ritonavir p. 646-boosted atazanavir p. 643, or ritonavir-boosted darunavir p. 643, or raltegravir p. 631. Alternative regimens contain abacavir p. 634 and lamivudine p. 640 with *either* lopinavir with ritonavir p. 645, or ritonavir-boosted fosamprenavir p. 645, or nevirapine p. 633, or rilpivirine p. 634. Patients who require treatment for both HIV and chronic hepatitis B should be treated with antivirals active against both diseases.

HIV infection, switching therapy

Deterioration of the condition (including clinical and virological changes) may require a change in therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance and the possibility of cross-resistance.

HIV infection in pregnancy

Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although information on the teratogenic potential of most antiretroviral drugs is limited), to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. **All treatment options require careful assessment by a specialist.** Combination antiretroviral therapy maximises the chance of preventing transmission and represents optimal therapy for the mother. However, it may be associated with a greater risk of preterm delivery. Pregnancies in HIV-positive women and babies born to them should be reported prospectively to the National Study of HIV in Pregnancy and Childhood at www.ucl.ac.uk/nshpc/ and to the Antiretroviral Pregnancy Registry at www.apregistry.com.

HIV infection and breast-feeding

Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

HIV infection, pre-exposure prophylaxis

The risk of acquiring HIV is increased in:

- men or transgender individuals who have unprotected anal intercourse with men;
- sexual partners of people who are HIV-positive with a detectable viral load; and
- HIV-negative heterosexual individuals who have unprotected intercourse with a HIV-positive person, and are likely to repeat this with the same person or another person with a similar status.

Emtricitabine with tenofovir disoproxil p. 639 may be appropriate for pre-exposure prophylaxis to reduce the risk of sexually acquired HIV-1 infection in combination with safer sex practices in adults at high risk; recommendations developed by the British Association for Sexual Health and HIV are available at: www.bashh.org.

HIV infection, post-exposure prophylaxis

Prophylaxis with antiretroviral drugs [unlicensed indication] may be appropriate following exposure to HIV-contaminated material. Immediate expert advice should be sought in such cases; national guidelines on post-exposure prophylaxis for healthcare workers have been developed (by the Chief Medical Officer's Expert Advisory Group on AIDS), www.gov.uk/dh and local ones may also be available. Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity. Prompt prophylaxis with antiretroviral drugs [unlicensed indication] is also appropriate following potential sexual exposure to HIV; recommendations have been developed by the British Association for Sexual Health and HIV, www.bashh.org.

Drug treatment

Zidovudine p. 642, a nucleoside reverse transcriptase inhibitor (or 'nucleoside analogue'), was the first anti-HIV drug to be introduced. Other nucleoside reverse transcriptase inhibitors include abacavir, didanosine p. 636, emtricitabine, lamivudine, stavudine p. 640, and tenofovir disoproxil.

The protease inhibitors include atazanavir, darunavir, fosamprenavir (a pro-drug of amprenavir), lopinavir (available as lopinavir with ritonavir), ritonavir, saquinavir p. 646, and tipranavir p. 646. Ritonavir in low doses boosts the activity of atazanavir, darunavir, fosamprenavir, lopinavir (available as lopinavir with ritonavir), saquinavir, and tipranavir increasing the persistence of plasma concentrations of these drugs; at such a low dose, ritonavir has no intrinsic antiviral activity. The protease inhibitors are metabolised by cytochrome P450 enzyme systems and therefore have a significant potential for drug interactions. Protease inhibitors are associated with lipodystrophy and metabolic effects.

The non-nucleoside reverse transcriptase inhibitors efavirenz, etravirine p. 633, nevirapine, and rilpivirine are used in the treatment of HIV-1 infection, but not against the subtype HIV-2, a subtype that is rare in the UK. Nevirapine is associated with a high incidence of rash (including Stevens-Johnson syndrome) and occasionally fatal hepatitis. Rash is also associated with efavirenz and etravirine but it is usually milder. Psychiatric or CNS disturbances are common with efavirenz; CNS disturbances are often self-limiting and can be reduced by taking the dose at bedtime (especially in the first 2–4 weeks of treatment). Efavirenz has also been associated with an increased plasma-cholesterol concentration. Etravirine is used in regimens containing a boosted protease inhibitor for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors.

Enfuvirtide p. 630, which inhibits the fusion of HIV to the host cell, is licensed for managing infection that has failed to respond to a regimen of other antiretroviral drugs; enfuvirtide should be combined with other potentially active antiretroviral drugs.

Maraviroc p. 647 is an antagonist of the CCR5 chemokine receptor. It is licensed for patients exclusively infected with CCR5-tropic HIV.

Dolutegravir p. 630, elvitegravir p. 631 and raltegravir p. 631 are inhibitors of HIV integrase. They are licensed for the treatment of HIV infection in combination with other antiretroviral drugs.

Cobicistat p. 647 is a pharmacokinetic enhancer that boosts the concentrations of other antiretrovirals, but it has no antiretroviral activity itself.

Immune reconstitution syndrome

Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms; these reactions may occur within the first few weeks or months of initiating treatment. Autoimmune disorders (such as Graves' disease) have also been reported many months after initiation of treatment.

Osteonecrosis

Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

HIV infection in children

HIV disease in children has a different natural progression to adults. Children infected with HIV should be managed within a formal paediatric HIV clinical network by specialists with access to guidelines and information on antiretroviral drugs for children.

ANTIVIRALS > HIV-FUSION INHIBITORS

Enfuvirtide

- **DRUG ACTION** Enfuvirtide inhibits the fusion of HIV to the host cell.

● **INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens

- BY SUBCUTANEOUS INJECTION
- Adult: 90 mg twice daily

● **SIDE-EFFECTS**

- **Common or very common** Anxiety · appetite decreased · asthenia · concentration impaired · conjunctivitis · diabetes mellitus · gastroesophageal reflux disease · haematuria · hypertriglyceridaemia · increased risk of infection · influenza like illness · irritability · lymphadenopathy · myalgia · nasal congestion · nephrolithiasis · nightmare · numbness · pancreatitis · peripheral neuropathy · skin papilloma · skin reactions · tremor · vertigo · weight decreased
- **Frequency not known** Diarrhoea · hypersensitivity · immune reconstitution inflammatory syndrome · nausea · osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION

Hypersensitivity Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge.

Osteonecrosis Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available; chronic hepatitis B or C (possibly greater risk of hepatic side-effects).
- **DIRECTIONS FOR ADMINISTRATION** For *subcutaneous injection*, reconstitute with 1.1 mL Water for Injections and allow to stand (for up to 45 minutes) to dissolve; do **not** shake or invert vial.
- **PATIENT AND CARER ADVICE** Hypersensitivity reactions Patients or carers should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

ELECTROLYTES: May contain Sodium

► **Fuzeon** (Roche Products Ltd)

Enfuvirtide 108 mg Fuzeon 108mg powder and solvent for solution for injection vials | 60 vial (PoM) £1,081.57

ANTIVIRALS > HIV-INTEGRASE INHIBITORS

Dolutegravir

05-Jun-2018

- **DRUG ACTION** Dolutegravir is an inhibitor of HIV integrase.

● **INDICATIONS AND DOSE**

HIV infection without resistance to other inhibitors of HIV integrase, in combination with other antiretroviral drugs

- BY MOUTH
- Adult: 50 mg once daily

HIV infection in patients where resistance to other inhibitors of HIV integrase suspected, in combination with other antiretroviral drugs

- BY MOUTH
 - Adult: 50 mg twice daily, dose to be taken with food
- HIV infection in combination with other antiretroviral drugs (with concomitant carbamazepine, efavirenz, etravirine (without boosted protease inhibitors, but see also Interactions), fosphenytoin, phenobarbital, phenytoin, primidone, nevirapine, oxcarbazepine, St John's wort, rifampicin, or tipranavir)**

- BY MOUTH
- Adult: 50 mg twice daily, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: **TIVICAY® (DOLUTEGRAVIR), TRIUMEQ® (DOLUTEGRAVIR, ABACAVIR, LAMIVUDINE), JULUCA® (DOLUTEGRAVIR, RILPIVIRINE): NEURAL TUBE DEFECTS REPORTED IN INFANTS BORN TO WOMEN EXPOSED TO DOLUTEGRAVIR AT THE TIME OF CONCEPTION (MAY 2018)**

In an ongoing birth outcome surveillance study conducted in Botswana, 4 cases of neural tube defects have been reported in 426 infants born to women who took dolutegravir as part of combined antiretroviral therapy at the time of conception. The manufacturer, in agreement with the European Medicines Agency, has recommended the following measures while this safety signal is being evaluated:

- Pregnancy testing should be performed and pregnancy excluded before initiation of treatment in females of childbearing potential; effective contraception should be used throughout treatment;
- Use of dolutegravir should be avoided in pregnancy; if pregnancy occurs and is confirmed in the first trimester, it is recommended to switch to an alternative treatment unless there is no suitable alternative.

- **INTERACTIONS** → Appendix 1: dolutegravir

● **SIDE-EFFECTS**

- **Common or very common** Depression · diarrhoea · dizziness · fatigue · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · sleep disorders · vomiting
- **Uncommon** Arthralgia · hepatitis · hypersensitivity · immune reconstitution inflammatory syndrome · myalgia · suicidal tendencies

SIDE-EFFECTS, FURTHER INFORMATION

Hypersensitivity Hypersensitivity reactions (including severe rash, or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, oral lesions, conjunctivitis, angioedema, eosinophilia, or raised liver enzymes) reported uncommonly. Discontinue immediately if any sign or symptoms of hypersensitivity reactions develop.

Osteonecrosis Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

- **PREGNANCY** Manufacturer advises avoid, see *Important Safety Information*.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer dolutegravir tablets.
Missed doses If a dose is more than 20 hours late on the once daily regimen (or more than 8 hours late on the twice daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2014) that dolutegravir (*Tivicay*®) is accepted for use within NHS Scotland when used in combination with other anti-retroviral medicines for the treatment of HIV infected adults. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (October 2017) that dolutegravir (*Tivicay*®) is recommended as an option for use within NHS Wales in combination with other anti-retroviral medicinal products for the treatment of HIV infected adults. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ *Tivicay* (ViiV Healthcare UK Ltd) ▼

Dolutegravir (as Dolutegravir sodium) 10 mg	Tivicay 10mg tablets
30 tablet [PoM]	£99.75
Dolutegravir (as Dolutegravir sodium) 25 mg	Tivicay 25mg tablets
30 tablet [PoM]	£249.38
Dolutegravir (as Dolutegravir sodium) 50 mg	Tivicay 50mg tablets
30 tablet [PoM]	£498.75

Combinations available: *Abacavir with dolutegravir and lamivudine*, p. 635

Elvitegravir

31-Jan-2017

- **DRUG ACTION** Elvitegravir is an inhibitor of HIV integrase, which is an enzyme required for viral replication.

● INDICATIONS AND DOSE

HIV infection without resistance to other inhibitors of HIV integrase, in combination with low-dose ritonavir and atazanavir or lopinavir

▶ BY MOUTH

- ▶ **Adult:** 85 mg once daily, take at the same time as a once daily ritonavir-boosted regimen or with the first dose of a twice daily ritonavir-boosted regimen

HIV infection without resistance to other inhibitors of HIV integrase, in combination with low-dose ritonavir and darunavir or fosamprenavir

▶ BY MOUTH

- ▶ **Adult:** 150 mg once daily, take with the first dose of a twice daily ritonavir-boosted regimen

- **CAUTIONS** Elderly—limited information available
- **INTERACTIONS** → Appendix 1: elvitegravir
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Diarrhoea · fatigue · headache · nausea · rash · vomiting
 - ▶ **Uncommon** Depression · dizziness · drowsiness · flatulence · gastrointestinal discomfort · insomnia · paraesthesia ·

suicidal ideation (in patients with history of depression or psychiatric illness) · taste altered

- ▶ **Frequency not known** Hyperglycaemia · osteonecrosis · weight increased

SIDE-EFFECTS, FURTHER INFORMATION For further information regarding **osteonecrosis** see HIV infection p. 628.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use effective contraception during treatment (if using a hormonal contraceptive, it must contain norgestimate as the progestogen and at least 30 micrograms ethinylestradiol).
- **PREGNANCY** Manufacturer advises avoid unless essential—limited data available.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in severe impairment—no information available. Use with caution in patients with chronic hepatitis B or C (greater risk of hepatic side-effects).
- **PATIENT AND CARER ADVICE**
Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. If vomiting occurs within 1 hour of taking a dose, a replacement dose should be taken.

● MEDICINAL FORMS

No licensed medicines listed.

Combinations available: *Elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide*, p. 637 · *Elvitegravir with cobicistat, emtricitabine and tenofovir disoproxil*, p. 637

Raltegravir

10-May-2018

- **DRUG ACTION** Raltegravir is an inhibitor of HIV integrase.

● INDICATIONS AND DOSE

HIV-1 infection (initiated by a specialist)

▶ BY MOUTH USING TABLETS

- ▶ **Adult:** 400 mg twice daily, alternatively 1200 mg once daily, once daily dosing for use in patients who are treatment naive or virologically suppressed on an initial regimen of 400 mg twice daily—use 600 mg tablets only

- **CAUTIONS** Psychiatric illness (may exacerbate underlying illness including depression) · risk factors for myopathy · risk factors for rhabdomyolysis

- **INTERACTIONS** → Appendix 1: raltegravir

● SIDE-EFFECTS

- ▶ **Common or very common** Akathisia · appetite abnormal · asthenia · behaviour abnormal · depression · diarrhoea · dizziness · fever · gastrointestinal discomfort · gastrointestinal disorders · headaches · nausea · skin reactions · sleep disorders · vertigo · vomiting
- ▶ **Uncommon** Alopecia · anaemia · anxiety · arrhythmias · arthralgia · arthritis · body fat disorder · burping · cachexia · chest discomfort · chills · cognitive disorder · concentration impaired · confusion · constipation · diabetes mellitus · drowsiness · dry mouth · dyslipidaemia · dysphonia · erectile dysfunction · feeling jittery · glossitis · gynaecomastia · haemorrhage · hepatic disorders · hot flush · hyperglycaemia · hypersensitivity · hypertension · immune reconstitution inflammatory syndrome · increased risk of infection · lipodystrophy · lymph node abscess · lymphatic abnormalities · malaise · memory loss · menopausal symptoms · mood altered · myalgia · myopathy · nasal congestion · nephritis · nephrolithiasis · nerve disorders · neutropenia · nocturia · odynophagia · oedema · osteopenia · pain · palpitations · pancreatitis acute · polydipsia · psychiatric disorder · renal cyst · renal impairment · sensation abnormal · severe cutaneous

adverse reactions (SCARs) · skin papilloma · submandibular mass · suicidal tendencies · sweat changes · taste altered · tendinitis · thrombocytopenia · tinnitus · tremor · visual impairment · weight increased

► **Frequency not known** Osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia.

For further information regarding **lipodystrophy** and **osteonecrosis** see HIV infection p. 628.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side-effects).
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense raltegravir chewable tablets in original container (contains desiccant).

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2010) that raltegravir (*ISENTRESS*®) is accepted for restricted use within NHS Scotland for the treatment of HIV-1 infection when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

The *Scottish Medicines Consortium* has advised (November 2017) that raltegravir 600 mg film-coated tablets (*ISENTRESS*®) are accepted for restricted use within NHS Scotland for the treatment of HIV-1 infection in adults and paediatric patients weighing at least 40 kg when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

ANTIVIRALS > NON-NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

Efavirenz

● **INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs

- **BY MOUTH USING CAPSULES**
- Adult: 600 mg once daily
- **BY MOUTH USING TABLETS**
- Adult: 600 mg once daily
- **BY MOUTH USING ORAL SOLUTION**
- Adult: 720 mg once daily

DOSE EQUIVALENCE AND CONVERSION

- The bioavailability of *Sustiva*® oral solution is lower than that of the capsules and tablets; the oral solution is **not** interchangeable with either capsules or tablets on a milligram-for-milligram basis.

- **UNLICENSED USE** Opening capsules and adding contents to food is an unlicensed method of administration.

- **CAUTIONS** Acute porphyrias p. 1025 · elderly · history of psychiatric disorders · history of seizures

- **INTERACTIONS** → Appendix 1: efavirenz

● **SIDE-EFFECTS**

- **Common or very common** Abdominal pain · anxiety · concentration impaired · depression · diarrhoea · dizziness · drowsiness · dyslipidaemia · fatigue · headache · movement disorders · nausea · skin reactions · sleep disorders · vomiting
- **Uncommon** Behaviour abnormal · confusion · flushing · gynecomastia · hallucination · hepatic disorders · memory loss · mood altered · pancreatitis · psychosis · seizure · Stevens-Johnson syndrome · suicidal tendencies · thinking abnormal · tinnitus · tremor · vertigo · vision blurred
- **Rare or very rare** Delusions · photosensitivity reaction
- **Frequency not known** Immune reconstitution inflammatory syndrome · osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION

For further information regarding **osteonecrosis**, **immune reconstitution syndrome** and **lipodystrophy**, see HIV infection p. 628.

Rash Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—usually resolves within 1 month.

CNS effects Administration at bedtime especially in first 2–4 weeks reduces CNS effects.

- **PREGNANCY** Reports of neural tube defects when used in first trimester.

- **HEPATIC IMPAIRMENT** Greater risk of hepatic side-effects in chronic hepatitis B or C. Avoid in moderate to severe impairment.

Monitoring In mild liver disease, monitor for dose related side-effects (e.g. CNS effects) and monitor liver function.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe renal failure—no information available.
- **MONITORING REQUIREMENTS** Monitor liver function if receiving other hepatotoxic drugs.
- **DIRECTIONS FOR ADMINISTRATION** Capsules may be opened and contents added to food (contents have a peppery taste).
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry and mint.

● **PATIENT AND CARER ADVICE**

Psychiatric disorders Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Etravirine

● INDICATIONS AND DOSE

HIV infection resistant to other non-nucleoside reverse transcriptase inhibitor and protease inhibitors in combination with other antiretroviral drugs (including a boosted protease inhibitor)

- BY MOUTH
- Adult: 200 mg twice daily, to be taken after food

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025
- **INTERACTIONS** → Appendix 1: etravirine
- **SIDE-EFFECTS**
 - **Common or very common** Diabetes mellitus · diarrhoea · headache · hyperglycaemia · myocardial infarction · nausea · skin reactions · vomiting
 - **Uncommon** Angioedema · bronchospasm · dry mouth · dyslipidaemia · gynaecomastia · haematemesis · hepatic disorders · hyperhidrosis · hypersensitivity · hypersomnia · numbness · pancreatitis · sluggishness · vision blurred
 - **Rare or very rare** Severe cutaneous adverse reactions (SCARs)
 - **Frequency not known** Haemorrhagic stroke · osteonecrosis · weight increased

SIDE-EFFECTS, FURTHER INFORMATION For further information regarding **osteonecrosis**, **immune reconstitution syndrome** and **lipodystrophy**, see HIV infection p. 628.

Hypersensitivity reactions Rash, usually in the second week, is the most common side-effect and appears more frequently in females. Life-threatening hypersensitivity reactions reported usually during week 3–6 of treatment and characterised by rash, eosinophilia, and systemic symptoms (including fever, general malaise, myalgia, arthralgia, blistering, oral lesions, conjunctivitis, and hepatitis). Discontinue permanently if hypersensitivity reaction or severe rash develop. If rash mild or moderate (without signs of hypersensitivity reaction), may continue without interruption—usually resolves within 2 weeks.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available; greater risk of hepatic side-effects in chronic hepatitis B or C.
- **DIRECTIONS FOR ADMINISTRATION** Patients with swallowing difficulties may disperse tablets in a glass of water just before administration.
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).
- **PATIENT AND CARER ADVICE**

Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develop.

Missed doses If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Etravirine 200 mg Intelligence 200mg tablets | 60 tablet [PoM] £301.27

Nevirapine

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (initial dose)

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 200 mg once daily for first 14 days, initial dose titration using 'immediate-release' preparation should not exceed 28 days; if rash occurs and is not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the lower dose of the 'immediate-release' preparation for the first 14 days as for new treatment

HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 200 mg twice daily
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 400 mg once daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · post-exposure prophylaxis
- **CAUTIONS** Females (at greater risk of hepatic side effects) · high CD4 cell count (at greater risk of hepatic side effects)
- **CAUTIONS, FURTHER INFORMATION**
 - **Hepatic effects** Patients with chronic hepatitis B or C, high CD4 cell count, and women are at increased risk of hepatic side effects—if plasma HIV-1 RNA detectable, manufacturer advises avoid in women with CD4 cell count greater than 250 cells/mm³ or in men with CD4 cell count greater than 400 cells/mm³ unless potential benefit outweighs risk.
- **INTERACTIONS** → Appendix 1: nevirapine
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · angioedema · diarrhoea · fatigue · fever · headache · hepatic disorders · hypersensitivity · hypertransaminasaemia · nausea · skin reactions · vomiting
 - **Uncommon** Anaemia · arthralgia · myalgia · severe cutaneous adverse reactions (SCARs)
 - **Frequency not known** Eosinophilia · osteonecrosis · weight increased

SIDE-EFFECTS, FURTHER INFORMATION

Hepatic effects Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction.

Rash Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased gradually (after 14 days); Discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves.

Osteonecrosis Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid modified-release preparation—no information available; use 'immediate-release' preparation with caution in

moderate impairment and avoid in severe impairment. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side effects).

- **RENAL IMPAIRMENT** Manufacturer advises avoid modified-release preparation—no information available.

• MONITORING REQUIREMENTS

- ▶ Hepatic disease Close monitoring of liver function required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly.
- ▶ Rash Monitor closely for skin reactions during first 18 weeks.

• PATIENT AND CARER ADVICE

Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop.

Missed doses If a dose is more than 8 hours late with the 'immediate-release' preparation (or more than 12 hours late with the modified-release preparation), the missed dose should not be taken and the next dose should be taken at the usual time.

- SIDE-EFFECTS, FURTHER INFORMATION** Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

• PREGNANCY

Monitoring Mitochondrial dysfunction has been reported in infants exposed to nucleoside reverse transcriptase inhibitors in utero; the main effects include haematological, metabolic, and neurological disorders; all infants whose mothers received nucleoside reverse transcriptase inhibitors during pregnancy should be monitored for relevant signs or symptoms.

- **HEPATIC IMPAIRMENT** Use with caution in patients with chronic hepatitis B or C (greater risk of hepatic side-effects).

above

Abacavir

• INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

- ▶ BY MOUTH
- ▶ Adult: 600 mg daily in 1–2 divided doses

- **CAUTIONS** HIV load greater than 100 000 copies/mL · patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%)

● **INTERACTIONS** → Appendix 1: abacavir

● **SIDE-EFFECTS**

- **Common or very common** Fever · lethargy
- **Rare or very rare** Erythema multiforme · severe cutaneous adverse reactions (SCARs)
- **Frequency not known** Hypersensitivity

SIDE-EFFECTS, FURTHER INFORMATION Life-threatening hypersensitivity reactions have been reported—characterised by fever or rash and possibly nausea, vomiting, diarrhoea, abdominal pain, dyspnoea, cough, lethargy, malaise, headache, and myalgia; less frequently mouth ulceration, oedema, hypotension, sore throat, acute respiratory distress syndrome, anaphylaxis, paraesthesia, arthralgia, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure; rarely myolysis. Laboratory abnormalities may include raised liver function tests and creatine kinase; symptoms usually appear in the first 6 weeks, but may occur at any time. Discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction).

● **ALLERGY AND CROSS-SENSITIVITY** Caution—increased risk of hypersensitivity reaction in presence of HLA-B*5701 allele.

● **HEPATIC IMPAIRMENT** Monitor closely in mild impairment (combination preparations not recommended as reduced abacavir dose may be required). Avoid in moderate impairment unless essential—close monitoring recommended. Avoid in severe impairment.

● **RENAL IMPAIRMENT** Manufacturer advises avoid in end-stage renal disease.

● **PRE-TREATMENT SCREENING** Test for HLA-B*5701 allele before treatment or if restarting treatment and HLA-B*5701 status not known.

● **MONITORING REQUIREMENTS** Monitor for symptoms of hypersensitivity reaction every 2 weeks for 2 months.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana, or strawberry.

● **PATIENT AND CARER ADVICE** Patients and their carers should be told the importance of regular dosing (intermittent therapy may increase the risk of sensitisation), how to recognise signs of hypersensitivity, and advised to seek immediate medical attention if symptoms develop or before re-starting treatment.

Patients should be provided with an alert card and advised to keep it with them at all times.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCIPIENTS: May contain Propylene glycol

► **Ziagen** (ViiV Healthcare UK Ltd)

Abacavir (as Abacavir sulfate) 20 mg per 1 ml Ziagen 20mg/ml oral solution sugar-free | 240 ml [PoM] £55.72

Tablet

► **Ziagen** (ViiV Healthcare UK Ltd)

Abacavir (as Abacavir sulfate) 300 mg Ziagen 300mg tablets | 60 tablet [PoM] £208.95

Abacavir with dolutegravir and lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 634, lamivudine p. 640, dolutegravir p. 630.

● **INDICATIONS AND DOSE**

HIV infection

- BY MOUTH
- Adult (body-weight 40 kg and above): 1 tablet once daily

● **INTERACTIONS** → Appendix 1: abacavir · dolutegravir · lamivudine

● **RENAL IMPAIRMENT** Avoid *Triumeq*® if eGFR less than 50 mL/minute/1.73 m² (consult product literature).

● **PATIENT AND CARER ADVICE**

Missed doses If a dose is more than 20 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► **Triumeq** (ViiV Healthcare UK Ltd) ▼

Dolutegravir (as Dolutegravir sodium) 50 mg, Lamivudine 300 mg, Abacavir (as Abacavir sulfate) 600 mg Triumeq 50mg/600mg/300mg tablets | 30 tablet [PoM] £798.16

Abacavir with lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 634, lamivudine p. 640.

● **INDICATIONS AND DOSE**

HIV infection in combination with other antiretrovirals

- BY MOUTH
- Adult (body-weight 40 kg and above): 1 tablet once daily

● **INTERACTIONS** → Appendix 1: abacavir · lamivudine

● **RENAL IMPAIRMENT** Avoid *Kivexa*® if eGFR less than 50 mL/minute/1.73 m² (consult product literature).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► **Abacavir with lamivudine (Non-proprietary)**

Lamivudine 300 mg, Abacavir 600 mg Abacavir 600mg / Lamivudine 300mg tablets | 30 tablet [PoM] £150.83-£299.41 | 30 tablet [PoM] £224.56 (Hospital only)

► **Kivexa** (ViiV Healthcare UK Ltd)

Lamivudine 300 mg, Abacavir 600 mg Kivexa 600mg/300mg tablets | 30 tablet [PoM] £352.25

Abacavir with lamivudine and zidovudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 634, lamivudine p. 640, zidovudine p. 642.

● **INDICATIONS AND DOSE**

HIV infection (use only if patient is stabilised for 6–8 weeks on the individual components in the same proportions)

- BY MOUTH
- Adult: 1 tablet twice daily

- **INTERACTIONS** → Appendix 1: abacavir · lamivudine · zidovudine
- **RENAL IMPAIRMENT** Avoid *Trizivir*® if eGFR less than 50 mL/minute/1.73 m² (consult product literature).

MEDICAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Trizivir** (ViiV Healthcare UK Ltd)
Lamivudine 150 mg, Abacavir (as Abacavir sulfate) 300 mg, Zidovudine 300 mg Trizivir tablets | 60 tablet [PoM] £509.06

P 634

01-Sep-2016

Didanosine

(ddi; DDI)

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

- BY MOUTH
- Adult (body-weight up to 60 kg): 250 mg daily in 1–2 divided doses
- Adult (body-weight 60 kg and above): 400 mg daily in 1–2 divided doses

- **CAUTIONS** History of pancreatitis (preferably avoid, otherwise extreme caution) · hyperuricaemia · lactic acidosis · peripheral neuropathy

CAUTIONS, FURTHER INFORMATION

- **Lactic acidosis** Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with didanosine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

- **INTERACTIONS** → Appendix 1: didanosine

SIDE-EFFECTS

- **Common or very common** Arthralgia · chills · dry mouth · fever · flatulence · gynaecomastia · hepatic disorders · pain · peripheral neuropathy (switch to another antiretroviral if develops)
- **Uncommon** Acute kidney injury · alopecia · diabetes mellitus · dry eye · haemodialysis · hyperglycaemia · hypoglycaemia · leucopenia · myopathy · optic neuritis · retinal discolouration · sialadenitis
- **Rare or very rare** Parotid gland enlargement
- **Frequency not known** Lipotrophy

SIDE-EFFECTS, FURTHER INFORMATION

Pancreatitis Suspend treatment if serum lipase raised or if symptoms of pancreatitis develop; discontinue if pancreatitis confirmed. Whenever possible avoid concomitant treatment with other drugs known to cause pancreatic toxicity; monitor closely if concomitant therapy unavoidable. Where significant elevations of triglycerides cause pancreatitis monitor closely if elevated.

Lipodystrophy syndrome Metabolic effects may occur with didanosine; these include fat redistribution, insulin resistance, and dyslipidaemia—collectively termed lipodystrophy syndrome. Manufacturer advises monitoring of plasma lipids and blood-glucose.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Insufficient information.
Monitoring In hepatic impairment, monitor for toxicity.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose if eGFR less than 60 mL/minute/1.73 m²; consult product literature.

- **MONITORING REQUIREMENTS** Ophthalmological examination (including visual acuity, colour vision, and dilated fundus examination) recommended annually or if visual changes occur.

- **DIRECTIONS FOR ADMINISTRATION** Capsules should be swallowed whole and taken at least 2 hours before or 2 hours after food.

With chewable tablets, to ensure sufficient antacid, each dose to be taken as at least 2 tablets chewed thoroughly, crushed or dispersed in water; clear apple juice may be added for flavouring; tablets to be taken 2 hours after lopinavir with ritonavir capsules and oral solution or atazanavir with ritonavir.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer didanosine capsules and chewable tablets.

MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant capsule

CAUTIONARY AND ADVISORY LABELS 25

- **Videx EC** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Didanosine 125 mg Videx EC 125mg capsules | 30 capsule [PoM]

£48.18 (Hospital only)

Didanosine 200 mg Videx EC 200mg capsules | 30 capsule [PoM]

£77.09 (Hospital only)

Didanosine 250 mg Videx EC 250mg capsules | 30 capsule [PoM]

£96.37 (Hospital only)

Didanosine 400 mg Videx EC 400mg capsules | 30 capsule [PoM]

£154.19 (Hospital only)

Chewable tablet

CAUTIONARY AND ADVISORY LABELS 23

EXCIPIENTS: May contain Aspartame

- **Videx** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Didanosine 25 mg Videx 25mg chewable dispersible tablets sugar-free | 60 tablet [PoM] £25.06 (Hospital only)

Efavirenz with emtricitabine and tenofovir disoproxil

The properties listed below are those particular to the combination only. For the properties of the components please consider, tenofovir disoproxil p. 641, efavirenz p. 632, emtricitabine p. 638.

INDICATIONS AND DOSE

HIV infection stabilised on antiretroviral therapy for more than 3 months

- BY MOUTH
- Adult: 1 tablet once daily

- **INTERACTIONS** → Appendix 1: efavirenz · tenofovir disoproxil
- **HEPATIC IMPAIRMENT** Manufacturer of *Atripla*® advises caution in mild impairment; avoid *Atripla*® in moderate to severe impairment.
- **RENAL IMPAIRMENT** Avoid *Atripla*® if eGFR less than 50 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE**
Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 23, 25

► **Efavirenz with emtricitabine and tenofovir disoproxil (Non-proprietary)**

Emtricitabine 200 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg, Efavirenz 600 mg. Efavirenz 600mg / Emtricitabine 200mg / Tenofovir disoproxil 245mg tablets | 30 tablet [PoM] £506.23–£532.87

► **Atripla** (Gilead Sciences International Ltd)

Emtricitabine 200 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg, Efavirenz 600 mg. Atripla 600mg/200mg/245mg tablets | 30 tablet [PoM] £532.87

Elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide

03-May-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 638, elvitegravir p. 631, cobicistat p. 647, tenofovir alafenamide p. 611.

INDICATIONS AND DOSE

HIV-1 infection (specialist use only)

► BY MOUTH

- Adult: 1 tablet once daily

INTERACTIONS → Appendix 1: cobicistat · elvitegravir · tenofovir alafenamide

SIDE-EFFECTS

- **Common or very common** Abnormal dreams · diarrhoea · dizziness · fatigue · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · vomiting
- **Uncommon** Anaemia · angioedema · depression
- **Frequency not known** Nephrotoxicity · osteonecrosis · weight increased

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential; if using a hormonal contraceptive, it must contain drospirenone or norgestimate as the progestogen and at least 30 micrograms ethinylestradiol.

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in mild-to-moderate impairment (greater risk of hepatic side-effects); avoid in severe impairment—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—limited information available.

- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container—contains desiccant.

PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2016) that elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide (*Genvoya*®) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 (HIV-1), without known mutations associated with resistance to the integrase inhibitor class, emtricitabine or tenofovir. This advice is contingent upon the continuing availability of the patient

access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (July 2016) that elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide (*Genvoya*®) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1 (HIV-1), without known mutations associated with resistance to the integrase inhibitor class, emtricitabine or tenofovir. The recommendation applies only if the approved Wales Patient Access Scheme (WPAS) is used or where the list price is equivalent or lower.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Elvitegravir with cobicistat, emtricitabine and tenofovir disoproxil

The properties listed below are those particular to the combination only. For the properties of the components please consider, tenofovir disoproxil p. 641, emtricitabine p. 638, cobicistat p. 647, elvitegravir p. 631.

INDICATIONS AND DOSE

HIV infection

► BY MOUTH

- Adult: 1 tablet once daily

INTERACTIONS → Appendix 1: cobicistat · elvitegravir · tenofovir disoproxil

SIDE-EFFECTS

- **Common or very common** Appetite decreased · asthenia · constipation · diarrhoea · dizziness · electrolyte imbalance · flatulence · gastrointestinal discomfort · headache · hyperbilirubinaemia · hyperglycaemia · hypersensitivity · hypertriglyceridaemia · nausea · neutropenia · pain · rash · pustular · skin reactions · sleep disorders · vomiting
- **Uncommon** Anaemia · angioedema · depression (in patients with history of depression or psychiatric illness) · muscle weakness · myopathy · pancreatitis · proteinuria · renal failure · renal tubular disorders · suicidal ideation (in patients with history of depression or psychiatric illness)
- **Rare or very rare** Acute tubular necrosis · hepatic disorders · lactic acidosis · nephritis · nephrogenic diabetes insipidus · osteomalacia
- **Frequency not known** Autoimmune disorder · Grave's disease · inflammation · osteonecrosis · weight increased

- **CONCEPTION AND CONTRACEPTION** Women of child-bearing potential should use effective contraception during treatment (if using a hormonal contraceptive, it must contain norgestimate as the progestogen and at least 30 micrograms ethinylestradiol).

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Avoid *Stribild*® in severe impairment.

- **RENAL IMPAIRMENT** If eGFR less than 90 mL/minute/1.73 m², only *initiate Stribild*® if other treatments cannot be used (avoid *initiating Stribild*® if eGFR less than 70 mL/minute/1.73 m²); if eGFR less than 70 mL/minute/1.73 m², only *continue Stribild*® if potential

benefit outweighs risk (discontinue *Stribild*® if eGFR less than 50 mL/minute/1.73 m²).

- **MONITORING REQUIREMENTS** Test urine glucose before treatment, then every 4 weeks for 1 year and then every 3 months.
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer *Stribild*®.
Missed doses If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Emtricitabine with rilpivirine and tenofovir alafenamide

05-Jun-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine above, rilpivirine p. 634, tenofovir alafenamide p. 611.

● INDICATIONS AND DOSE

HIV infection in patients with plasma HIV-1 RNA concentration of 100 000 copies/mL or less (specialist use only)

- **BY MOUTH**
- Adult: 1 tablet once daily

- **INTERACTIONS** → Appendix 1: rilpivirine · tenofovir alafenamide

● SIDE-EFFECTS

- **Common or very common** Appetite decreased · depression · diarrhoea · dizziness · drowsiness · dry mouth · fatigue · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · sleep disorders · vomiting
- **Uncommon** Anaemia · angioedema · arthralgia · immune reconstitution inflammatory syndrome
- **Frequency not known** Conjunctivitis · drug reaction with eosinophilia and systemic symptoms (DRESS) · eosinophilia · fever · osteonecrosis · QT interval prolongation · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Systemic symptoms reported with severe skin reactions include fever, blisters, conjunctivitis, angioedema, elevated liver function tests, and eosinophilia.

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in moderate impairment (greater risk of hepatic side-effects); avoid in severe impairment—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—no information available.

● PATIENT AND CARER ADVICE

Vomiting Manufacturer advises if vomiting occurs within 4 hours of taking a dose, a replacement dose should be taken.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2016) that emtricitabine with rilpivirine and tenofovir alafenamide (*Odefsey*®) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 (HIV-1), without known mutations associated with resistance to the non-nucleoside reverse transcriptase inhibitor (NNRTI) class, tenofovir or emtricitabine, and with viral load HIV-1 RNA of 100 000 copies/mL or less.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (November 2016) that emtricitabine with rilpivirine and tenofovir alafenamide (*Odefsey*®) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1, without known mutations associated with resistance to the non-nucleoside reverse transcriptase inhibitor (NNRTI) class, tenofovir or emtricitabine, and with viral load HIV-1 RNA of 100 000 copies/mL or less.

29-May-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, tenofovir disoproxil p. 641, emtricitabine p. 638.

INDICATIONS AND DOSE

HIV-1 infection (initiated by a specialist)

► BY MOUTH

Adult: 200/245 mg once daily

Pre-exposure prophylaxis of HIV-1 infection (initiated by a specialist)

► BY MOUTH

Adult: 200/245 mg once daily

DOSE EQUIVALENCE AND CONVERSION

► Dose expressed as x/y mg emtricitabine/tenofovir disoproxil.

● **INTERACTIONS** → Appendix 1: tenofovir disoproxil

RENAL IMPAIRMENT

► When used for HIV-1 infection Manufacturer advises avoid in severe impairment.

► When used for Pre-exposure prophylaxis of HIV-1 infection Manufacturer advises avoid if creatinine clearance less than 60 mL/minute.

Dose adjustments

► When used for HIV-1 infection Manufacturer advises use normal dose every 2 days in moderate impairment.

- **DIRECTIONS FOR ADMINISTRATION** Patients with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste).

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer emtricitabine with tenofovir tablets.

Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2017) that emtricitabine with tenofovir disoproxil (*Truvada*®) is accepted for use within NHS Scotland in combination with safer sex practices for pre-exposure prophylaxis of sexually acquired HIV-1 infection in adults at high risk.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (September 2017) that emtricitabine/tenofovir disoproxil (*Truvada*®) is not recommended for use within NHS Wales in combination with safer sex practices for pre-exposure prophylaxis to reduce the risk of sexually acquired HIV 1 infection in adults at high risk. The case for cost-effectiveness has not been proven.

Subsequent to this AWMSG recommendation, *Truvada*® has been made available in Wales and is being provided through NHS Wales from 17 July 2017 for up to three years for use as pre-exposure prophylaxis. During this time, eligible patients will receive *Truvada*® and data will be collected to assess its effectiveness at preventing HIV and address some of the concerns of AWMSG in relation to cost-effectiveness.

Lamivudine

(3TC)

- **INDICATIONS AND DOSE**

EPIVIR® ORAL SOLUTION

HIV infection in combination with other antiretroviral drugs

- **BY MOUTH**
- Adult: 150 mg every 12 hours, alternatively 300 mg once daily

EPIVIR® TABLETS

HIV infection in combination with other antiretroviral drugs

- **BY MOUTH**
- Adult: 150 mg every 12 hours, alternatively 300 mg once daily

ZEFFIX®

Chronic hepatitis B infection either with compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis) when first-line treatments cannot be used, or (in combination with another antiviral drug without cross-resistance to lamivudine) with decompensated liver disease

- **BY MOUTH**

► Adult: 100 mg once daily, patients receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection

- **CAUTIONS** Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine

- **INTERACTIONS** → Appendix 1: lamivudine

- **SIDE-EFFECTS**

- **Common or very common** Hepatitis aggravated · muscle cramps · myopathy
- **Rare or very rare** Angioedema
- **Frequency not known** Abdominal discomfort · malaise · respiratory tract infection · throat complaints

- **BREAST FEEDING** Can be used with caution in women infected with chronic hepatitis B alone, providing that adequate measures are taken to prevent hepatitis B infection in infants.

- **RENAL IMPAIRMENT**

Dose adjustments Reduce dose if eGFR less than 50 mL/minute/1.73 m²; consult product literature.

- **MONITORING REQUIREMENTS** When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral markers of hepatitis B every 3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana and strawberry.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCIPIENTS: May contain Sucrose

- **Epivir** (ViiV Healthcare UK Ltd)

Lamivudine 10 mg per 1 mL Epivir 50mg/5mL oral solution | 240 mL **[PoM]** £39.01

Tablet

- **Epivir** (ViiV Healthcare UK Ltd)

Lamivudine 100 mg Zeffix 100mg tablets | 28 tablet **[PoM]** £78.09 DT = £73.81

F 634

Stavudine

(d4T)

- **INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs when no suitable alternative available and when prescribed for shortest period possible

- **BY MOUTH**
- Adult (body-weight up to 60 kg): 30 mg every 12 hours, to be taken preferably at least 1 hour before food
- Adult (body-weight 60 kg and above): 40 mg every 12 hours, to be taken preferably at least 1 hour before food

01-Sep-2016

- **CAUTIONS** Excessive alcohol intake · history of pancreatitis · history of peripheral neuropathy · lactic acidosis (especially when used in combination with didanosine)—use only if alternative regimens are not suitable

CAUTIONS, FURTHER INFORMATION

- ▶ **Lactic acidosis** Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with stavudine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

- **INTERACTIONS** → Appendix 1: stavudine

SIDE-EFFECTS

- ▶ **Common or very common** Depression · drowsiness · dyspepsia · hyperlactacidaemia · lipodystrophy · nerve disorders · paraesthesia · peripheral neuropathy (switch to another antiretroviral if develops) · sleep disorders · thinking abnormal
- ▶ **Uncommon** Anxiety · arthralgia · emotional lability · gynaecomastia · hepatic disorders · urticaria
- ▶ **Rare or very rare** Diabetes mellitus · hyperglycaemia · muscle weakness · neutropenia

SIDE-EFFECTS, FURTHER INFORMATION Metabolic effects may occur with stavudine; plasma lipids and blood glucose concentrations should be measured routinely.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **RENAL IMPAIRMENT** Risk of peripheral neuropathy.

Dose adjustments Use half normal dose every 12 hours if eGFR 25–50 mL/minute/1.73 m².

Use half normal dose every 24 hours if eGFR less than 25 mL/minute/1.73 m².

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.

- **LESS SUITABLE FOR PRESCRIBING** Stavudine (especially in combination with didanosine) is associated with a higher risk of lipodystrophy and should be used only if alternative regimens are not suitable; it is considered to be less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

Stavudine 30 mg Zerit 30mg capsules | 56 capsule [PoM] £146.25 (Hospital only)
Stavudine 40 mg Zerit 40mg capsules | 56 capsule [PoM] £150.66 (Hospital only)

F 634

Tenofovir disoproxil

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs | Chronic hepatitis B infection with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) | Chronic hepatitis B infection with decompensated liver disease

▶ BY MOUTH

- ▶ **Adult:** 245 mg once daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ 7.5 scoops of granules contains approx. 245 mg tenofovir disoproxil (as fumarate).

- **INTERACTIONS** → Appendix 1: tenofovir disoproxil

SIDE-EFFECTS

- ▶ **Common or very common** Abdominal distension · flatulence
- ▶ **Uncommon** Proximal renal tubulopathy
- ▶ **Rare or very rare** Acute tubular necrosis · angioedema · hepatitis · nephritis · nephrogenic diabetes insipidus · renal impairment

RENAL IMPAIRMENT

Dose adjustments *Granules:* 132 mg once daily if eGFR 30–50 mL/minute/1.73 m²; 66 mg once daily if eGFR 20–30 mL/minute/1.73 m²; 33 mg once daily if eGFR 10–20 mL/minute/1.73 m².

Tablets: 245 mg every 2 days if eGFR

30–50 mL/minute/1.73 m²; 245 mg every 3–4 days if eGFR 10–30 mL/minute/1.73 m².

Monitoring Monitor renal function—interrupt treatment if further deterioration.

MONITORING REQUIREMENTS

- ▶ Test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases.
- ▶ When treating chronic hepatitis B with tenofovir, monitor liver function tests every 3 months and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

- **DIRECTIONS FOR ADMINISTRATION** *Granules:* mix 1 scoop of granules with 1 tablespoon of soft food (e.g. yoghurt, apple sauce) and take immediately without chewing. Do not mix granules with liquids.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tenofovir granules. **Missed doses** If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS

Zidovudine

(Azidothymidine; AZT)

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

- **BY MOUTH**
- Adult: 250–300 mg twice daily

Prevention of maternal-fetal HIV transmission

- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
- Adult: Seek specialist advice (combination therapy preferred) (consult local protocol)

HIV infection in combination with other antiretroviral drugs in patients temporarily unable to take zidovudine by mouth

- **BY INTRAVENOUS INFUSION**
- Adult: 0.8–1 mg/kg every 4 hours usually for not more than 2 weeks, dose approximating to 1.2–1.5 mg/kg every 4 hours by mouth

- **CONTRA-INDICATIONS** Abnormally low haemoglobin concentration (consult product literature) · abnormally low neutrophil counts (consult product literature)

- **CAUTIONS** Elderly · lactic acidosis · risk of haematological toxicity particularly with high dose and advanced disease · vitamin B₁₂ deficiency (increased risk of neutropenia)

CAUTIONS, FURTHER INFORMATION

- Lactic acidosis Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with zidovudine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

- **INTERACTIONS** → Appendix 1: zidovudine

● **SIDE-EFFECTS**

- **Common or very common** Leucopenia · malaise · neutropenia
- **Uncommon** Bone marrow disorders · dyspnoea · fever · flatulence · generalised pain · myopathy
- **Rare or very rare** Alertness decreased · anxiety · cardiomyopathy · chest pain · chills · cough · depression · drowsiness · dyspepsia · gynaecomastia · hepatic disorders · hyperhidrosis · influenza like illness · insomnia · nail discolouration · oral discolouration · paraesthesia · pure red cell aplasia · seizure · taste altered · urinary frequency increased

- **Frequency not known** Lipotrophy

SIDE-EFFECTS, FURTHER INFORMATION

Anaemia and myelosuppression If anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment.

Lipodystrophy syndrome Metabolic effects may occur with zidovudine; plasma lipids and blood glucose concentrations should be measured routinely.

- **HEPATIC IMPAIRMENT** Accumulation may occur.

● **RENAL IMPAIRMENT**

Dose adjustments Reduce oral dose to 300–400 mg daily in divided doses or intravenous dose to 1 mg/kg 3–4 times daily if eGFR is less than 10 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor full blood count after 4 weeks of treatment, then every 3 months.

- **DIRECTIONS FOR ADMINISTRATION** For intermittent intravenous infusion, dilute to a concentration of 2 mg/mL or 4 mg/mL with Glucose 5% and give over 1 hour.

- **PRESCRIBING AND DISPENSING INFORMATION** The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ANTIVIRALS > PROTEASE INHIBITORS

Protease inhibitors

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025

- **CAUTIONS** Haemophilia (increased risk of bleeding)

● **SIDE-EFFECTS**

- **Common or very common** Alopecia · anaemia · angioedema · anxiety · appetite abnormal · arthralgia · asthenia · diabetes mellitus · diarrhoea · dizziness · dry mouth · dyslipidaemia · dyspnoea · fever · gastrointestinal discomfort · gastrointestinal disorders · headache · hepatic disorders · hypersensitivity · hypertension · malaise · muscle complaints · nausea · neutropenia · oral ulceration · pancreatitis · peripheral neuropathy · seizure · skin reactions · sleep disorders · taste altered · vomiting

- **Uncommon** Drowsiness · immune reconstitution inflammatory syndrome · osteonecrosis · Stevens-Johnson syndrome · weight increased
- **HEPATIC IMPAIRMENT** Use with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

F 642

Atazanavir

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir

- BY MOUTH
- Adult: 300 mg once daily

HIV infection in combination with other antiretroviral drugs—with cobicistat

- BY MOUTH
- Adult: 300 mg daily

- **CAUTIONS** Cardiac conduction disorders · electrolyte disturbances · predisposition to QT interval prolongation

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● SIDE-EFFECTS

- **Uncommon** Abnormal dreams · chest pain · depression · disorientation · drug reaction with eosinophilia and systemic symptoms (DRESS) · gallbladder disorders · gastritis · gynaecomastia · haematuria · memory loss · myopathy · nephritis tubulointerstitial · nephrolithiasis · proteinuria · syncope · torsade de pointes · urinary frequency increased

- **Rare or very rare** Gait abnormal · oedema · palpitations · QT interval prolongation · renal pain · vasodilation

SIDE-EFFECTS, FURTHER INFORMATION Mild to moderate rash occurs commonly, usually within the first 3 weeks of therapy. Severe rash occurs less frequently and may be accompanied by systemic symptoms. Discontinue if severe rash develops.

- **PREGNANCY** Theoretical risk of hyperbilirubinaemia in neonate if used at term.

Monitoring In pregnancy, monitor viral load and plasma-atazanavir concentration during third trimester.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Darunavir

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy—with low-dose ritonavir

- BY MOUTH
- Adult: 600 mg twice daily, alternatively 800 mg once daily, once daily dose only to be used if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells × 10⁶/litre

HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy—with cobicistat

- BY MOUTH
- Adult: 800 mg once daily, dose appropriate if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells × 10⁶/litre

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—with low-dose ritonavir

- BY MOUTH
- Adult: 800 mg once daily

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—with cobicistat

- BY MOUTH
- Adult: 800 mg once daily

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● SIDE-EFFECTS

- **Common or very common** Hyperlipidaemia
- **Uncommon** Abdominal discomfort · angina pectoris · arrhythmias · burping · chest pain · concentration impaired · confusion · constipation · cough · depression · dry eye · eye erythema · feeling hot · flushing · gastritis · gout · gynaecomastia · haemorrhage · herpes simplex · hyperglycaemia · hypothyroidism · lethargy · leucopenia · memory loss · mood altered · muscle weakness · myocardial infarction · nail discolouration · nephrolithiasis · oral disorders · osteoporosis · pain · peripheral oedema · polydipsia · QT interval prolongation · renal impairment · sensation abnormal · sexual dysfunction · sweat changes · throat irritation · thrombocytopenia · urinary disorders · urine abnormalities · vertigo
- **Rare or very rare** Arthritis · chills · feeling abnormal · joint stiffness · musculoskeletal stiffness · palpitations · restlessness · rhinorrhoea · severe cutaneous adverse reactions (SCARs) · syncope · taste loss · visual impairment

SIDE-EFFECTS, FURTHER INFORMATION Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral

lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if this develops.

- **ALLERGY AND CROSS-SENSITIVITY** Use with caution in patients with sulfonamide sensitivity.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk; if required, use the twice daily dose regimen.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Monitor liver function before and during treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.
- **PATIENT AND CARER ADVICE**
Missed doses If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

F 642

Fosamprenavir

- **DRUG ACTION** Fosamprenavir is a pro-drug of amprenavir.

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir

► BY MOUTH

- Adult: 700 mg twice daily

DOSE EQUIVALENCE AND CONVERSION

- 700 mg fosamprenavir is equivalent to approximately 600 mg amprenavir.

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● SIDE-EFFECTS

- Common or very common Oral paraesthesia
- Frequency not known Rash erythematous

SIDE-EFFECTS, FURTHER INFORMATION Rash may occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption—usually resolves and may respond to antihistamines.

- **PREGNANCY** Toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment.

Dose adjustments Reduce dose to 450 mg twice daily in moderate impairment; reduce dose to 300 mg twice daily in severe impairment.

- **DIRECTIONS FOR ADMINISTRATION** In adults, oral suspension should be taken on an empty stomach.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include grape, bubblegum, or peppermint.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer fosamprenavir oral suspension.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

EXCIPIENTS: May contain Propylene glycol

- **Telzir** (ViiV Healthcare UK Ltd)

Fosamprenavir (as Fosamprenavir calcium) 50 mg per 1 ml Telzir 50mg/ml oral suspension | 225 ml [PoM] £69.06

Tablet

- **Telzir** (ViiV Healthcare UK Ltd)

F 642

Lopinavir with ritonavir

19-Mar-2018

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

► BY MOUTH USING TABLETS

- Adult: 400/100 mg twice daily, alternatively 800/200 mg once daily, once daily dose to be used only in adults with a HIV strain that has less than 3 mutations to protease inhibitors

► BY MOUTH USING ORAL SOLUTION

- Adult: 5 mL twice daily

DOSE EQUIVALENCE AND CONVERSION

- Oral solution contains 400 mg lopinavir, 100 mg ritonavir/5 mL (or 80 mg lopinavir, 20 mg ritonavir/mL).

- **CAUTIONS** Cardiac conduction disorders • pancreatitis • patients at high risk of cardiovascular disease (especially if

10-year cardiovascular risk greater than 20%) • structural heart disease

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● SIDE-EFFECTS

- Common or very common Increased risk of infection • leucopenia • lymphadenopathy • menstrual cycle irregularities • migraine • muscle weakness • myopathy • night sweats • pain • sexual dysfunction
- Uncommon Abnormal dreams • atherosclerosis • atrioventricular block • cholangitis • constipation • deep vein thrombosis • haemorrhage • hyperbilirubinaemia • hypogonadism • myocardial infarction • nephritis • stomatitis • stroke • taste loss • tinnitus • tremor • tricuspid valve incompetence • vasculitis • vertigo • visual impairment

SIDE-EFFECTS, FURTHER INFORMATION Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed

- **PREGNANCY** Avoid oral solution due to high alcohol and propylene glycol content; use tablets only if potential benefit outweighs risk (toxicity in *animal* studies).

- **HEPATIC IMPAIRMENT** Avoid oral solution due to propylene glycol content; manufacturer advises avoid tablets in severe impairment.

- **RENAL IMPAIRMENT** Avoid oral solution due to high propylene glycol content. Use tablets with caution in severe impairment.

● MONITORING REQUIREMENTS

- Monitor liver function before and during treatment.

- With oral solution, monitor for signs of alcohol and propylene glycol toxicity (particularly in infants).

- **PRESCRIBING AND DISPENSING INFORMATION** With oral solution, manufacturer advises high alcohol (42% v/v) and propylene glycol content—consider total amounts from all medicines that are to be given to infants in order to avoid toxicity; caution in patients for which consumption may be harmful.

- **PATIENT AND CARER ADVICE** Oral solution tastes bitter.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

SMC No. 326/06

The *Scottish Medicines Consortium* has advised (November 2006) that lopinavir with ritonavir tablet (*Kaletra*®) is accepted for use within NHS Scotland in combination with other antiretrovirals for the treatment of HIV-1 infected adults and children above the age of 2 years.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 21

EXCIPIENTS: May contain Alcohol, propylene glycol

- **Kaletra** (AbbVie Ltd)

Ritonavir 20 mg per 1 mL, Lopinavir 80 mg per 1 mL Kaletra 80mg/20mg/1ml oral solution | 120 mL [PoM] £122.96 | 300 mL [PoM] £307.39

Tablet

CAUTIONARY AND ADVISORY LABELS 25

- **Kaletra** (AbbVie Ltd)

Ritonavir 25 mg, Lopinavir 100 mg Kaletra 100mg/25mg tablets | 60 tablet [PoM] £76.85

Ritonavir 50 mg, Lopinavir 200 mg Kaletra 200mg/50mg tablets | 120 tablet [PoM] £285.41

Ritonavir

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (high-dose ritonavir)

► BY MOUTH

- Adult: Initially 300 mg every 12 hours for 3 days, increased in steps of 100 mg every 12 hours over not longer than 14 days; increased to 600 mg every 12 hours

Low-dose booster to increase effect of other protease inhibitors

► BY MOUTH

- Adult: 100–200 mg 1–2 times a day

- **CAUTIONS** Cardiac conduction disorders · pancreatitis · structural heart disease

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● SIDE-EFFECTS

- **Common or very common** Back pain · concentration impaired · confusion · cough · dehydration · feeling hot · flushing · gastrointestinal discomfort · gastrointestinal haemorrhage · gout · hypotension · menorrhagia · myopathy · oedema · oral paraesthesia · oropharyngeal pain · paraesthesia · peripheral coldness · pharyngitis · renal impairment · syncope · thrombocytopenia · urinary frequency increased · vision blurred
- **Uncommon** Myocardial infarction
- **Rare or very rare** Hyperglycaemia · toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed.

● PREGNANCY

Dose adjustments Only use low-dose booster to increase the effect of other protease inhibitors.

- **HEPATIC IMPAIRMENT** Avoid in decompensated liver disease; in severe impairment without decompensation, use 'booster' doses with caution (avoid treatment doses).

- **DIRECTIONS FOR ADMINISTRATION** Bitter taste of oral solution can be masked by mixing with chocolate milk; do not mix with water, measuring cup must be dry.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer ritonavir oral solution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

- **Norvir** (AbbVie Ltd)

Ritonavir 100 mg Norvir 100mg tablets | 30 tablet [PoM] £19.44

Saquinavir

● INDICATIONS AND DOSE

HIV infection in combination with other antiretrovirals in patients previously treated with antiretroviral therapy—with low-dose ritonavir

► BY MOUTH

- Adult: 1 g every 12 hours

HIV infection in combination with other antiretrovirals in patients not previously treated with antiretroviral therapy—with low-dose ritonavir

► BY MOUTH

- Adult: 500 mg every 12 hours for 7 days, then increased to 1 g every 12 hours

- **CONTRA-INDICATIONS** Bradycardia · congenital QT prolongation · electrolyte disturbances · heart failure with reduced left ventricular ejection fraction · history of symptomatic arrhythmias · predisposition to cardiac arrhythmias

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● SIDE-EFFECTS

- **Common or very common** Abdominal pain upper · burping · constipation · dry lips · libido decreased · lipatrophy · paraesthesia
- **Uncommon** Mucosal ulceration · renal impairment · visual impairment
- **Frequency not known** QT interval prolongation
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in decompensated liver disease.

- **RENAL IMPAIRMENT** Use with caution if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor ECG before starting treatment (do not initiate treatment if QT interval over 450 milliseconds); if baseline QT interval less than 450 milliseconds, monitor ECG during treatment (particularly 10 days after starting treatment in patients not previously treated with antiretroviral therapy)—discontinue if QT interval increases over 480 milliseconds, if QT interval more than 20 milliseconds above baseline, if prolongation of PR interval, or if arrhythmias occur.

● PATIENT AND CARER ADVICE

Arrhythmias Patients should be told how to recognise signs of arrhythmia and advised to seek medical attention if symptoms such as palpitation or syncope develop.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

- **Inivase** (Roche Products Ltd)

Saquinavir (as Saquinavir mesilate) 500 mg Inivase 500mg tablets | 120 tablet [PoM] £251.26

Tipranavir

● INDICATIONS AND DOSE

HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals—with low-dose ritonavir

► BY MOUTH USING CAPSULES

- Adult: 500 mg twice daily

DOSE EQUIVALENCE AND CONVERSION

- The bioavailability of tipranavir oral solution is higher than that of the capsules; the oral solution is not interchangeable with the capsules on a milligram-for-milligram basis.

- **CAUTIONS** Patients at risk of increased bleeding from trauma, surgery or other pathological conditions

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● SIDE-EFFECTS

- **Common or very common** Hyperlipidaemia
- **Uncommon** Exanthema · hyperamylasaemia · hyperglycaemia · influenza like illness · renal failure · thrombocytopenia
- **Rare or very rare** Dehydration · hyperbilirubinaemia · intracranial haemorrhage
- **Frequency not known** Bleeding tendency

SIDE-EFFECTS, FURTHER INFORMATION Potentially life-threatening hepatotoxicity reported. Discontinue if signs

or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature).

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate or severe impairment—no information available.
- **MONITORING REQUIREMENTS** Monitor liver function before treatment then every 2 weeks for 1 month, then every 3 months.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include toffee and mint.
- **PATIENT AND CARER ADVICE** Patients or carers should be told to observe the oral solution for crystallisation; the bottle should be replaced if more than a thin layer of crystals form (doses should continue to be taken at the normal time until the bottle is replaced).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 5, 21

EXCIPIENTS: May contain Vitamin e

ANTIVIRALS > OTHER

Maraviroc

- **DRUG ACTION** Maraviroc is an antagonist of the CCR5 chemokine receptor.

• INDICATIONS AND DOSE

CCR5-tropic HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretrovirals

► BY MOUTH

► Adult: 300 mg twice daily

- **CAUTIONS** Cardiovascular disease

- **INTERACTIONS** → Appendix 1: maraviroc

• SIDE-EFFECTS

- **Common or very common** Abdominal pain · anaemia · appetite decreased · asthenia · depression · diarrhoea · flatulence · headache · insomnia · nausea · rash
- **Uncommon** Hyperbilirubinaemia · increased risk of infection · myopathy · postural hypotension · proteinuria · renal failure · seizure
- **Rare or very rare** Angina pectoris · granulocytopenia · hepatic disorders · metastases · neoplasms · pancytopenia · severe cutaneous adverse reactions (SCARs)
- **Frequency not known** Fever · hypersensitivity · immune reconstitution inflammatory syndrome · organ dysfunction · osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in hepatic impairment, including patients with chronic hepatitis B or C.

- **RENAL IMPAIRMENT** If eGFR less than 80 mL/minute/1.73 m², consult product literature.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2008) that maraviroc (*Celsentri*®) is **not** recommended for use within NHS Scotland.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► **Celsentri** (Viiv Healthcare UK Ltd)

PHARMACOKINETIC ENHANCERS

Cobicistat

• INDICATIONS AND DOSE

Pharmacokinetic enhancer used to increase the effect of atazanavir or darunavir

► BY MOUTH

► Adult: 150 mg once daily

- **INTERACTIONS** → Appendix 1: cobicistat

• SIDE-EFFECTS

- **Common or very common** Appetite increased · asthenia · diarrhoea · dizziness · drowsiness · dry mouth · flatulence · gastrointestinal discomfort · headache · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · nausea · skin reactions · sleep disorders · taste altered · vomiting
- **Uncommon** Depression · fever · haematuria · myalgia · nephrolithiasis · proteinuria

- **PREGNANCY** Manufacturer advises avoid unless essential.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

- **RENAL IMPAIRMENT** No dose adjustment required; inhibits tubular secretion of creatinine; when any co-administered drug requires dose adjustment based on renal function, avoid initiating cobicistat if eGFR less than 70 mL/minute/1.73 m².

- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

• PATIENT AND CARER ADVICE

Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

6.5 Influenza

Influenza

Management

Oseltamivir below and zanamivir p. 649 are most effective for the treatment of influenza if started within a few hours of the onset of symptoms; they are licensed for use within 48 hours of the first symptoms. In otherwise healthy individuals they reduce the duration of symptoms by about 1–1.5 days. Oseltamivir or zanamivir can reduce the risk of complications from influenza in the elderly and in patients with chronic disease.

Oseltamivir and zanamivir are licensed for post-exposure prophylaxis of influenza when influenza is circulating in the community. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza. However, in patients with severe influenza or in those who are immunocompromised, antivirals may still be effective after this time if viral shedding continues [unlicensed use]. Oseltamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not cover the infecting strain) to prevent influenza in an epidemic.

There is evidence that some strains of influenza A virus have reduced susceptibility to oseltamivir, but may retain susceptibility to zanamivir. Resistance to oseltamivir may be greater in severely immunocompromised patients.

Zanamivir should be reserved for patients who are severely immunocompromised, or when oseltamivir cannot be used, or when resistance to oseltamivir is suspected. For those unable to use the dry powder for inhalation, zanamivir is available as a solution that can be administered by nebuliser or intravenously [unlicensed].

Amantadine hydrochloride p. 412 is licensed for prophylaxis and treatment of influenza A but it is no longer recommended.

Information on pandemic influenza, avian influenza, and swine influenza may be found at www.gov.uk/phe.

Immuneisation against influenza is recommended for persons at high risk, and to reduce transmission of infection.

Oseltamivir in children under 1 year of age

Data on the use of oseltamivir in children under 1 year of age is limited. Furthermore, oseltamivir may be ineffective in neonates because they may not be able to metabolise oseltamivir to its active form. However, oseltamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age. The Department of Health has advised (May 2009) that during a pandemic, treatment with oseltamivir can be overseen by healthcare professionals experienced in assessing children.

ANTIVIRALS > NEURAMINIDASE INHIBITORS

Oseltamivir

20-Jul-2017

- **DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

• INDICATIONS AND DOSE

Prevention of influenza

► BY MOUTH

- Child 1–11 months: 3 mg/kg once daily for 10 days for post-exposure prophylaxis
- Child 1–12 years (body-weight 10–15 kg): 30 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

- Child 1–12 years (body-weight 15–23 kg): 45 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 1–12 years (body-weight 23–40 kg): 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 1–12 years (body-weight 40 kg and above): 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 13–17 years: 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Adult: 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

Treatment of influenza

► BY MOUTH

- Child 1–11 months: 3 mg/kg twice daily for 5 days
- Child 1–12 years (body-weight 10–15 kg): 30 mg twice daily for 5 days
- Child 1–12 years (body-weight 15–23 kg): 45 mg twice daily for 5 days
- Child 1–12 years (body-weight 23–40 kg): 60 mg twice daily for 5 days
- Child 1–12 years (body-weight 40 kg and above): 75 mg twice daily for 5 days
- Child 13–17 years: 75 mg twice daily for 5 days
- Adult: 75 mg twice daily for 5 days

- **UNLICENSED USE** Not licensed for use in premature infants.

• SIDE-EFFECTS

- **Common or very common** Dizziness (in adults) · dyspepsia · herpes simplex (in adults) · insomnia (in adults) · pain (in adults) · vertigo (in adults)
- **Uncommon** Arrhythmia (in adults) · consciousness impaired · seizure · skin reactions
- **Rare or very rare** Agitation · angioedema (in adults) · anxiety · behaviour abnormal · confusion · delirium · delusions · haemorrhage (in adults) · hallucination · hepatic disorders (in adults) · nightmare · self-injurious behaviour (in adults) · severe cutaneous adverse reactions (SCARs) (in adults) · thrombocytopenia (in adults) · visual impairment (in adults)

SIDE-EFFECTS, FURTHER INFORMATION Neurological and psychiatric disorders occur more commonly in children and adolescents.

- **PREGNANCY** Although safety data are limited, oseltamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).
- **BREAST FEEDING** Although safety data are limited, oseltamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Oseltamivir is the preferred drug in women who are breast-feeding. Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

• RENAL IMPAIRMENT

- In adults Avoid for *treatment and prevention* if eGFR less than 10 mL/minute/1.73 m².
- In children Avoid for *treatment and prevention* if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
Dose adjustments ► In adults For *treatment*, use 30 mg twice daily if eGFR 30–60 mL/minute/1.73 m² (30 mg once daily if eGFR 10–30 mL/minute/1.73 m²). For *prevention*, use 30 mg once daily if eGFR 30–60 mL/minute/1.73 m² (30 mg every 48 hours if eGFR 10–30 mL/minute/1.73 m²).
► In children For *treatment*, use 40% of normal dose twice daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose once daily

if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²). For *prevention*, use 40% of normal dose once daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose every 48 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²).

- **DIRECTIONS FOR ADMINISTRATION** If suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.

- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Oseltamivir for influenza (flu) www.medicinesforchildren.org.uk/oseltamivir-for-influenza

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- **Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158**
Oseltamivir is **not** a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
 - Oseltamivir is **not** recommended for seasonal prophylaxis against influenza.
 - When influenza is circulating in the community, oseltamivir is an option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)
 - During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.

At risk patients include those aged 65 years or older *or* those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/guidance/ta158

- **Oseltamivir, zanamivir, and amantadine for treatment of influenza (February 2009) NICE TA168**
Oseltamivir is **not** a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
 - When influenza is circulating in the community, oseltamivir is an option recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who can start treatment within 48 hours of

the onset of symptoms. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)

- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for treatment in at-risk patients living in long-term residential or nursing homes.

At risk patients include those aged over 65 years or those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/guidance/ta168

NHS restrictions *Tamiflu*® is not prescribable in NHS primary care except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription 'SLS'.

- **INDICATIONS AND DOSE**

Post-exposure prophylaxis of influenza

- **BY INHALATION OF POWDER**

- Child 5–17 years: 10 mg once daily for 10 days
- Adult: 10 mg once daily for 10 days

continued →

Prevention of influenza during an epidemic

► BY INHALATION OF POWDER

- Child 5-17 years: 10 mg once daily for up to 28 days
- Adult: 10 mg once daily for up to 28 days

Treatment of influenza

► BY INHALATION OF POWDER

- Child 5-17 years: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)
- Adult: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)

- **UNLICENSED USE** Use of zanamivir for up to 10 days if resistance to oseltamivir suspected is an unlicensed duration.

- **CAUTIONS** Asthma • chronic pulmonary disease • uncontrolled chronic illness

CAUTIONS, FURTHER INFORMATION

- Asthma and chronic pulmonary disease Risk of bronchospasm—short-acting bronchodilator should be available.

Avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm.

● **SIDE-EFFECTS**

- **Common or very common** Skin reactions
- **Uncommon** Bronchospasm • dehydration • dyspnoea • oropharyngeal oedema • presyncope • severe cutaneous adverse reactions (SCARs) • throat tightness
- **Rare or very rare** Face oedema
- **Frequency not known** Behaviour abnormal • delirium • hallucination • level of consciousness decreased • psychiatric disorder • seizure

SIDE-EFFECTS, FURTHER INFORMATION Neurological and psychiatric disorders occur more commonly in children and adolescents.

- **PREGNANCY** Although safety data are limited, zanamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).

- **BREAST FEEDING** Although safety data are limited, zanamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

- **DIRECTIONS FOR ADMINISTRATION** Other inhaled drugs should be administered before zanamivir.

- **PRESCRIBING AND DISPENSING INFORMATION** Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription 'SLS'.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- **Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158**
Zanamivir is **not** a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
- Zanamivir is **not** recommended for seasonal prophylaxis against influenza.
- When influenza is circulating in the community, zanamivir is an option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Zanamivir should be given within 36 hours of exposure to influenza. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community).

- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, zanamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.

At risk patients include those aged over 65 years or those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/guidance/TA158

- **Oseltamivir, zanamivir, and amantadine for treatment of influenza (February 2009) NICE TA168**

Zanamivir is **not** a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

- When influenza is circulating in the community, zanamivir is an option recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who can start treatment within 48 hours (within 36 hours for zanamivir in children) of the onset of symptoms. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, zanamivir may be used for treatment in at-risk patients living in long-term residential or nursing homes.

At risk patients include those aged over 65 years or those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

- **Relenza** (GlaxoSmithKline UK Ltd)

Zanamivir 5 mg Relenza 5mg inhalation powder blisters with Diskhaler | 20 blister (PoM) £16.36

6.6 Respiratory syncytial virus

Respiratory syncytial virus

Management in children

Ribavirin p. 615 is licensed for administration by inhalation for the treatment of severe bronchiolitis caused by the respiratory syncytial virus (RSV) in infants, especially when they have other serious diseases. However, there is no evidence that ribavirin produces clinically relevant benefit in RSV bronchiolitis.

Palivizumab below is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation. Palivizumab is recommended for:

- children under 9 months of age with chronic lung disease (defined as requiring oxygen for at least 28 days from birth) and who were born preterm;
- children under 6 months of age with haemodynamically significant, acyanotic congenital heart disease who were born preterm.

Palivizumab should be considered for:

- children under 2 years of age with severe combined immunodeficiency syndrome;
- children under 1 year of age who require long-term ventilation;
- children 1–2 years of age who require long-term ventilation and have an additional co-morbidity (including cardiac disease or pulmonary hypertension).

For details of the preterm age groups included in the recommendations, see *Immunisation against Infectious Disease* (2006), available at www.gov.uk/dh.

DRUGS FOR RESPIRATORY DISEASES > MONOCLONAL ANTIBODIES

Palivizumab

• INDICATIONS AND DOSE

Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease (under expert supervision)

► BY INTRAMUSCULAR INJECTION

- Child 1–23 months: 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites

Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease and undergoing cardiac bypass surgery (under expert supervision)

► BY INTRAMUSCULAR INJECTION

- Child 1–23 months: Initially 15 mg/kg, to be administered as soon as stable after surgery, preferably in the anterolateral thigh, then 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites

- **UNLICENSED USE** Licensed for the prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus (RSV) in children under 6 months of age (at the start of the RSV season) and born at less than 35 weeks corrected gestational age, or in children under 2 years of age who have received treatment for bronchopulmonary

dysplasia in the last 6 months, or in children under 2 years of age with haemodynamically significant congenital heart disease.

- **CAUTIONS** Moderate to severe acute infection • moderate to severe febrile illness • serum-palivizumab concentration may be reduced after cardiac surgery • thrombocytopenia
- **SIDE-EFFECTS**
 - **Common or very common** Apnoea
 - **Uncommon** Seizure • thrombocytopenia • urticaria
 - **Frequency not known** Hypersensitivity
- **ALLERGY AND CROSS-SENSITIVITY** Hypersensitivity to humanised monoclonal antibodies.

• MEDICINAL FORMS

1 Antidiuretic hormone disorders

Posterior pituitary hormones and antagonists

Posterior pituitary hormones

Diabetes insipidus
Vasopressin p. 655 (antidiuretic hormone, ADH) is used in the treatment of *pituitary* ('cranial') *diabetes insipidus* as is its analogue desmopressin p. 653. Dosage is tailored to produce a slight diuresis every 24 hours to avoid water intoxication. Treatment may be required for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus. Following a dose intramuscularly or intranasally, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of cranial diabetes insipidus. Failure to respond occurs in nephrogenic diabetes insipidus.

In *nephrogenic* and *partial pituitary diabetes insipidus* benefit may be gained from the paradoxical antidiuretic effect of thiazides.

Carbamazepine p. 309 is sometimes useful in partial pituitary diabetes insipidus [unlicensed]; it may act by sensitising the renal tubules to the action of remaining endogenous vasopressin.

Other uses

Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand's disease; it is also used to test fibrinolytic response. Desmopressin may also have a role in nocturnal enuresis.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, prior to more definitive treatment and with variable results. Terlipressin acetate, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, is used similarly.

Oxytocin p. 804, another posterior pituitary hormone, is indicated in obstetrics.

Antidiuretic hormone antagonists

Demeclocycline hydrochloride p. 554 can be used in the treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable. Demeclocycline hydrochloride is thought to act by directly blocking the renal tubular effect of antidiuretic hormone.

Tolvaptan p. 655 is a vasopressin V₂-receptor antagonist licensed for the treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion; treatment duration with tolvaptan is determined by the underlying disease and its treatment.

Rapid correction of hyponatraemia during tolvaptan therapy can cause osmotic demyelination, leading to serious neurological events; close monitoring of serum sodium concentration and fluid balance is essential.

1.1 Diabetes insipidus

Other drugs used for Diabetes insipidus Chlortalidone, p. 229

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > VASOPRESSIN AND ANALOGUES

Desmopressin

09-Jun-2017

- **DRUG ACTION** Desmopressin is an analogue of vasopressin.

● INDICATIONS AND DOSE

Diabetes insipidus, treatment

- ▶ BY MOUTH
 - ▶ Child 1-23 months: Initially 10 micrograms 2–3 times a day, adjusted according to response; usual dose 30–150 micrograms daily
 - ▶ Child 2-11 years: Initially 50 micrograms 2–3 times a day, adjusted according to response; usual dose 100–800 micrograms daily
 - ▶ Child 12-17 years: Initially 100 micrograms 2–3 times a day, adjusted according to response; usual dose 0.2–1.2 mg daily
 - ▶ Adult: Initially 100 micrograms 3 times a day; maintenance 100–200 micrograms 3 times a day; usual dose 0.2–1.2 mg daily
- ▶ BY SUBLINGUAL ADMINISTRATION
 - ▶ Child 2-17 years: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day
 - ▶ Adult: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day
- ▶ BY INTRANASAL ADMINISTRATION
 - ▶ Child 1-23 months: Initially 2.5–5 micrograms 1–2 times a day, adjusted according to response
 - ▶ Child 2-11 years: Initially 5–20 micrograms 1–2 times a day, adjusted according to response
 - ▶ Child 12-17 years: Initially 10–20 micrograms 1–2 times a day, adjusted according to response
 - ▶ Adult: 10–40 micrograms daily in 1–2 divided doses
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
 - ▶ Adult: 1–4 micrograms daily

Primary nocturnal enuresis

- ▶ BY MOUTH
 - ▶ Child 5-17 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration
 - ▶ Adult 18-65 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration
- ▶ BY SUBLINGUAL ADMINISTRATION
 - ▶ Child 5-17 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week
 - ▶ Adult 18-65 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week

Postoperative polyuria or polydipsia

- ▶ BY MOUTH
 - ▶ Adult: Dose to be adjusted according to urine osmolality

Polyuria or polydipsia after hypophysectomy

- ▶ BY SUBLINGUAL ADMINISTRATION
 - ▶ Adult: Dose to be adjusted according to urine osmolality

Idiopathic nocturnal polyuria in females

- ▶ BY SUBLINGUAL ADMINISTRATION
 - ▶ Adult: 25 micrograms daily, to be taken 1 hour before bedtime

Idiopathic nocturnal polyuria in males

- ▶ BY SUBLINGUAL ADMINISTRATION
 - ▶ Adult: 50 micrograms daily, to be taken 1 hour before bedtime

Diabetes insipidus, diagnosis (water deprivation test)

- ▶ BY INTRANASAL ADMINISTRATION
 - ▶ Adult: 20 micrograms, limit fluid intake to 500 mL from 1 hour before to 8 hours after administration
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
 - ▶ Adult: 2 micrograms for 1 dose, limit fluid intake to 500 mL from 1 hour before to 8 hours after administration

Nocturia associated with multiple sclerosis (when other treatments have failed)

- ▶ BY INTRANASAL ADMINISTRATION
 - ▶ Adult 18-65 years: 10–20 micrograms once daily, to be taken at bedtime, dose not to be repeated within 24 hours, limit fluid intake from 1 hour before to 8 hours after administration

Renal function testing

- ▶ BY INTRANASAL ADMINISTRATION
 - ▶ Adult: 40 micrograms, empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
 - ▶ Adult: 2 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

Mild to moderate haemophilia and von Willebrand's disease

- ▶ BY INTRANASAL ADMINISTRATION
 - ▶ Adult: 300 micrograms every 12 hours if required, one 150 microgram spray into each nostril, 30 minutes before surgery or when bleeding, dose may alternatively be repeated at intervals of at least 3 days, if self-administered
- ▶ BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
 - ▶ Adult: 300 nanograms/kg for 1 dose, to be administered immediately before surgery or after trauma; may be repeated at intervals of 12 hours

Fibrinolytic response testing

- ▶ BY INTRANASAL ADMINISTRATION
 - ▶ Adult: 300 micrograms, blood to be sampled after 1 hour for fibrinolytic activity, one 150 microgram spray to be administered into each nostril
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
 - ▶ Adult: 300 nanograms/kg for 1 dose, blood to be sampled after 20 minutes for fibrinolytic activity

Lumbar-puncture-associated headache

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
 - ▶ Adult: (consult product literature)

- **UNLICENSED USE** Consult product literature for individual preparations. Oral use of *DDAVP* intravenous injection is not licensed.

- **CONTRA-INDICATIONS** Cardiac insufficiency · conditions treated with diuretics · history of hyponatraemia · polydipsia in alcohol dependence · psychogenic polydipsia · syndrome of inappropriate ADH secretion (in adults)

● CAUTIONS

GENERAL CAUTIONS Asthma · avoid fluid overload · cardiovascular disease (not indicated for nocturnal enuresis or nocturia) · conditions which might be aggravated by water retention · cystic fibrosis · elderly (avoid for primary nocturnal enuresis and nocturia associated with multiple sclerosis in those over 65 years) · epilepsy · heart failure · hypertension (not indicated for nocturnal enuresis or nocturia) · migraine · nocturia—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards · nocturnal enuresis—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards

SPECIFIC CAUTIONS

- ▶ With intranasal use Should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects

CAUTIONS, FURTHER INFORMATION Elderly patients are at increased risk of hyponatraemia and renal impairment—manufacturer advises measure baseline serum sodium concentration, then monitor regularly during treatment; discontinue treatment if levels fall below the normal range. Review treatment if no therapeutic benefit after 3 months.

- **INTERACTIONS** → Appendix 1: desmopressin

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Hyponatraemia (on administration without restricting fluid intake) · nausea
- ▶ **Frequency not known** Abdominal pain · aggression (in children) · allergic dermatitis · emotional disorder · fluid retention · headache · hyponatraemic seizure · vomiting · weight increased

SPECIFIC SIDE-EFFECTS

- ▶ With intranasal use Epistaxis · nasal congestion · rhinitis
- SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants)—increases risk of hyponatraemia.

- **PREGNANCY** Small oxytocic effect in third trimester; increased risk of pre-eclampsia.

- **BREAST FEEDING** Amount too small to be harmful.

- **RENAL IMPAIRMENT** Use with caution; antidiuretic effect may be reduced.

- **MONITORING REQUIREMENTS** In *nocturia*, periodic blood pressure and weight checks are needed to monitor for fluid overload.

- **DIRECTIONS FOR ADMINISTRATION** *DDAVP*[®] and *Desmotabs*[®] tablets may be crushed.

DDAVP[®] intranasal solution may be diluted with Sodium Chloride 0.9% to a concentration of 10 micrograms/mL.

DDAVP[®] injection may be administered orally. Desmopressin oral lyophilisates are for sublingual administration.

- ▶ With intravenous use in adults For *intravenous infusion* (*DDAVP*[®], *Octim*[®]), give intermittently in Sodium chloride 0.9%; dilute with 50 mL and give over 20 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Oral, intranasal, intravenous, subcutaneous and intramuscular doses are expressed as desmopressin acetate; sublingual doses are expressed as desmopressin base.

Children requiring an intranasal dose of less than 10 micrograms should be given *DDAVP*[®] intranasal solution.

● PATIENT AND CARER ADVICE

Hyponatraemic convulsions Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal).

Medicines for Children leaflet: Desmopressin for bedwetting www.medicinesforchildren.org.uk/desmopressin-bedwetting-0

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2017) that desmopressin oral lyophilisate (*Noqdirna*[®]) is accepted for restricted use within NHS Scotland for the symptomatic treatment of nocturia due to idiopathic nocturnal polyuria in patients aged 65 years and over.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (October 2017) that desmopressin acetate (*Noqdirna*[®]) is recommended for restricted use within NHS Wales for idiopathic nocturnal polyuria in adults aged over 65 years, for whom treatment options are currently limited.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, spray, nasal drops

Tablet

▶ Desmopressin (Non-proprietary)

Desmopressin acetate 100 microgram Desmopressin 100microgram tablets | 90 tablet [PoM] £76.62 DT = £63.08

Desmopressin acetate 200 microgram Desmopressin 200microgram tablets | 30 tablet [PoM] £35.23 DT = £9.09

▶ *DDAVP* (Ferring Pharmaceuticals Ltd)

Desmopressin acetate 100 microgram *DDAVP* 0.1mg tablets | 90 tablet [PoM] £44.12 DT = £63.08

Desmopressin acetate 200 microgram *DDAVP* 0.2mg tablets | 90 tablet [PoM] £88.23

▶ *Desmotabs* (Ferring Pharmaceuticals Ltd)

Desmopressin acetate 200 microgram *Desmotabs* 0.2mg tablets | 30 tablet [PoM] £29.43 DT = £9.09

Solution for injection

▶ *DDAVP* (Ferring Pharmaceuticals Ltd)

Desmopressin acetate 4 microgram per 1 ml *DDAVP* 4micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £13.16

▶ *Octim* (Ferring Pharmaceuticals Ltd)

Desmopressin acetate 15 microgram per 1 ml *Octim* 15micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £192.20

Spray

▶ Desmopressin (Non-proprietary)

Desmopressin acetate 10 microgram per 1 dose Desmopressin 10micrograms/dose nasal spray | 60 dose [PoM] £31.50 DT = £28.06

▶ *Desmospray* (Ferring Pharmaceuticals Ltd)

Desmopressin acetate 2.5 microgram per 1 dose *Desmospray* 2.5micrograms/dose nasal spray | 50 dose [PoM]

Desmopressin acetate 10 microgram per 1 dose *Desmospray* 10micrograms/dose nasal spray | 60 dose [PoM] £25.02 DT = £28.06

Oral lyophilisate

CAUTIONARY AND ADVISORY LABELS 26

▶ *DDAVP Melt* (Ferring Pharmaceuticals Ltd)

Desmopressin (as Desmopressin acetate) 60 microgram *DDAVP Melt* 60microgram oral lyophilisates sugar-free | 100 tablet [PoM] £50.53 DT = £50.53

Desmopressin (as Desmopressin acetate) 120 microgram *DDAVP Melt* 120microgram oral lyophilisates sugar-free | 100 tablet [PoM] £101.07 DT = £101.07

Desmopressin (as Desmopressin acetate) 240 microgram DDAVP
Melt 240microgram oral lyophilisates sugar-free | 100 tablet [PoM]
£202.14

► **DesmoMelt** (Ferring Pharmaceuticals Ltd)

Desmopressin (as Desmopressin acetate)
120 microgram DesmoMelt 120microgram oral lyophilisates sugar-free | 30 tablet [PoM] £30.34 DT = £30.34

Desmopressin (as Desmopressin acetate)

240 microgram DesmoMelt 240microgram oral lyophilisates sugar-free | 30 tablet [PoM] £60.68 DT = £60.68

► **Noqdirna** (Ferring Pharmaceuticals Ltd)

Desmopressin (as Desmopressin acetate) 25 microgram Noqdirna 25microgram oral lyophilisates sugar-free | 30 tablet [PoM] £15.16 DT = £15.16

Desmopressin (as Desmopressin acetate)

50 microgram Noqdirna 50microgram oral lyophilisates sugar-free | 30 tablet [PoM] £15.16 DT = £15.16

Nasal drops

► **DDAVP** (Ferring Pharmaceuticals Ltd)

Desmopressin acetate 100 microgram per 1 ml DDAVP
100micrograms/ml intranasal solution | 2.5 ml [PoM] £9.72 DT = £9.72

Vasopressin

● INDICATIONS AND DOSE

Pituitary diabetes insipidus

► BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION

► Adult: 5–20 units every 4 hours

Initial control of oesophageal variceal bleeding

► BY INTRAVENOUS INFUSION

► Adult: 20 units, dose to be administered over 15 minutes

● **CONTRA-INDICATIONS** Chronic nephritis (until reasonable blood nitrogen concentrations attained) · vascular disease (especially disease of coronary arteries) unless extreme caution

● **CAUTIONS** Asthma · avoid fluid overload · conditions which might be aggravated by water retention · epilepsy · heart failure · hypertension · migraine

● **SIDE-EFFECTS** Abdominal pain · angina pectoris · bronchospasm · cardiac arrest · chest pain · diarrhoea · flatulence · fluid imbalance · gangrene · headache · hyperhidrosis · hypertension · musculoskeletal chest pain · nausea · pallor · peripheral ischaemia · tremor · urticaria · vertigo · vomiting

● **PREGNANCY** Oxytocic effect in third trimester.

● **BREAST FEEDING** Not known to be harmful.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (argipressin), give intermittently in Glucose 5%; suggested concentration 20 units/100mL given over 15 minutes.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► **Vasopressin (Non-proprietary)**

Argipressin 20 unit per 1 ml Argipressin 20units/1ml solution for injection ampoules | 10 ampoule [PoM] £800.00 (Hospital only)

DIURETICS > SELECTIVE VASOPRESSIN V₂-RECEPTOR ANTAGONISTS

Tolvaptan

● **DRUG ACTION** Tolvaptan is a vasopressin V₂-receptor antagonist.

● INDICATIONS AND DOSE

JINARC®

Autosomal dominant polycystic kidney disease in adults with CKD stage 1 to 3 at initiation of treatment with evidence of rapidly progressing disease (initiated by a specialist)

► BY MOUTH

► Adult: Initially 60 mg daily in 2 divided doses for at least a week, 45 mg in the morning before breakfast, and then 15 mg taken 8 hours later; increased to 90 mg daily in 2 divided doses for at least a week, 60 mg in the morning before breakfast, and then 30 mg taken 8 hours later, then increased if tolerated to 120 mg daily in 2 divided doses, 90 mg in the morning before breakfast, and then 30 mg taken 8 hours later, dose titration should be performed cautiously; patients may down-titrate to lower doses based on tolerability

SAMSCA®

Treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion

► BY MOUTH

► Adult: 15 mg once daily, increased if necessary up to 60 mg daily; treatment duration is determined by the underlying disease and its treatment

● **CONTRA-INDICATIONS** Anuria · hyponatraemia · hypovolaemic hyponatraemia · impaired perception of thirst · volume depletion

● **CAUTIONS** Alcoholism (increased risk of demyelination syndrome if rapid correction of hyponatraemia) · diabetes mellitus · ensure adequate fluid intake · hypoxia (increased risk of demyelination syndrome if rapid correction of hyponatraemia) · malnutrition (increased risk of demyelination syndrome if rapid correction of hyponatraemia) · pseudohyponatraemia associated with diabetes mellitus (exclude before treatment)

● **INTERACTIONS** → Appendix 1: tolvaptan

● SIDE-EFFECTS

► **Common or very common** Appetite decreased · asthenia · constipation · dehydration · diarrhoea · dizziness · dry mouth · dyspnoea · gastrointestinal discomfort · gastrooesophageal reflux disease · headache · hepatic function abnormal (discontinue) · hyperglycaemia · hypernatraemia · hyperuricaemia · insomnia · muscle spasms · palpitations · polydipsia · skin reactions · thirst · urinary disorders · weight decreased

SIDE-EFFECTS, FURTHER INFORMATION Discontinue and perform liver-function tests promptly if symptoms of hepatic impairment (anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, pruritus).

● **PREGNANCY** Avoid—toxicity in *animal* studies.

● **BREAST FEEDING** Avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Use with caution in severe impairment—no information available.

● **RENAL IMPAIRMENT** No information available in severe impairment.

● MONITORING REQUIREMENTS

► Monitor for dehydration in patients who are fluid-restricted.

► Monitor serum-sodium concentration and fluid balance no later than 6 hours after initiating treatment and every 6 hours during the first 1–2 days of treatment and until

1.2 Syndrome of inappropriate antidiuretic hormone secretion

Other drugs used for Syndrome of inappropriate antidiuretic hormone secretion Demeclocycline hydrochloride, p. 554

dose stabilised. Discontinue if rapid rise in serum-sodium concentration (greater than 12 mmol/litre in 24 hours or 18 mmol/litre in 48 hours).

- **PATIENT AND CARER ADVICE** For *Jinarc*[®], morning dose to be taken 30 minutes before food, second dose can be taken with or without food.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Tolvaptan for treating autosomal dominant polycystic kidney disease (October 2015)** NICE TA358

Tolvaptan (*Jinarc*[®]) is recommended as an option for the treatment of autosomal dominant polycystic kidney disease in adults if:

- the patient has chronic kidney disease stage 2 or 3 at the start of treatment **and**
- there is evidence of rapidly progressing disease
- **and** the manufacturer provides tolvaptan with the discount agreed in the patient access scheme

Patients currently receiving tolvaptan (*Jinarc*[®]) whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA358

2 Corticosteroid responsive conditions

CORTICOSTEROIDS

Corticosteroids, general use

Overview

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used typically for the treatment of inflammatory conditions of the skin. Corticosteroids should be avoided or used only under specialist supervision in psoriasis.

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn's disease. They are also included in locally applied creams for haemorrhoids.

Use can be made of the mineralocorticoid activity of fludrocortisone acetate p. 661 to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, there is evidence that administration of lower doses of hydrocortisone p. 662 and fludrocortisone acetate is of benefit in adrenocortical insufficiency resulting from septic shock.

Dexamethasone p. 660 and betamethasone p. 660 have little if any mineralocorticoid action and their long duration of action makes them particularly suitable for suppressing corticotropin secretion in congenital adrenal hyperplasia where the dose should be tailored to clinical response and by measurement of adrenal androgens and 17-hydroxyprogesterone. In common with all glucocorticoids their suppressive action on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most individuals a single dose of dexamethasone at night, is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the 'overnight dexamethasone suppression test' for diagnosing Cushing's syndrome.

Betamethasone and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see Prescribing in palliative care p. 23); high doses of betamethasone or dexamethasone are generally used. However, a corticosteroid should not be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions, such as angioedema of the upper respiratory tract and anaphylaxis, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline/epinephrine p. 221. In such cases hydrocortisone (as sodium succinate) by intravenous injection may be required.

Corticosteroids are preferably used by inhalation in the management of asthma but systemic therapy in association with bronchodilators is required for the emergency treatment of severe acute asthma.

Corticosteroids may also be useful in conditions such as autoimmune hepatitis, rheumatoid arthritis and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia, and some cases of the nephrotic syndrome (particularly in children) and thrombocytopenic purpura.

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus, temporal arteritis, and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose, and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see: Prescribing in Palliative Care, immunosuppression, rheumatic diseases, eye, otitis externa allergic rhinitis, and aphthous ulcers.

Side-effects

MHRA/CHM advice: Corticosteroids: rare risk of central serous chorioretinopathy with local as well as systemic administration (August 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider

referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

Mineralocorticoid side effects

- hypertension
- sodium retention
- water retention
- potassium loss
- calcium loss

Mineralocorticoid side effects are most marked with fludrocortisone, but are significant with hydrocortisone, corticotropin, and tetracosactide. Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone, prednisolone, and triamcinolone.

Glucocorticoid side effects

- diabetes
- osteoporosis, which is a danger, particularly in the elderly, as it can result in osteoporotic fractures for example of the hip or vertebrae;
- in addition high doses are associated with avascular necrosis of the femoral head.
- muscle wasting (proximal myopathy) can also occur.
- corticosteroid therapy is also weakly linked with peptic ulceration and perforation.
- psychiatric reactions may also occur.

Managing side-effects

Side-effects can be minimised by using lowest effective dose for minimum period possible. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma. Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug.

Whenever possible *local treatment* with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to *systemic treatment*.

Inhaled corticosteroids have considerably fewer systemic effects than oral corticosteroids, but adverse effects including adrenal suppression have been reported. Use of other corticosteroid therapy (including topical) or concurrent use of drugs which inhibit corticosteroid metabolism should be taken into account when assessing systemic risk. In children, growth restriction associated with systemic corticosteroid therapy does not seem to occur with recommended doses of inhaled therapy; although initial growth velocity may be reduced, there appears to be no effect on achieving normal adult height. Large-volume spacer devices should be used for administering inhaled corticosteroids in children under 15 years; they are also useful in older children and adults, particularly if high doses are required. Spacer devices increase airway deposition and reduce oropharyngeal deposition.

Corticosteroids, replacement therapy

Overview

The adrenal cortex normally secretes hydrocortisone p. 662 (cortisol) which has glucocorticoid activity and weak

mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of hydrocortisone and the mineralocorticoid fludrocortisone acetate p. 661; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In *Addison's disease* or following adrenalectomy, hydrocortisone by mouth is usually required. This is given in 2 doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone acetate.

In *acute adrenocortical insufficiency*, hydrocortisone is given intravenously (preferably as sodium succinate) every 6 to 8 hours in sodium chloride intravenous infusion 0.9% p. 1008.

In *hypopituitarism*, glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required. Additional replacement therapy with levothyroxine sodium p. 756 and sex hormones should be given as indicated by the pattern of hormone deficiency.

Glucocorticoid therapy

Glucocorticoid and mineralocorticoid activity

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids). The mineralocorticoid activity of fludrocortisone acetate p. 661 is so high that its anti-inflammatory activity is of no clinical relevance.

Equivalent anti-inflammatory doses of corticosteroids
This table takes no account of mineralocorticoid effects, nor does it take account of variations in duration of action
Prednisolone 5 mg
≡ Betamethasone 750 micrograms
≡ Deflazacort 6 mg
≡ Dexamethasone 750 micrograms
≡ Hydrocortisone 20 mg
≡ Methylprednisolone 4 mg
≡ Prednisone 5 mg
≡ Triamcinolone 4 mg

The relatively high mineralocorticoid activity of hydrocortisone p. 662, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked.

Prednisolone p. 664 and prednisone p. 666 have predominantly glucocorticoid activity. Prednisolone is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone p. 660 and dexamethasone p. 660 have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion (e.g. congenital adrenal hyperplasia).

Some esters of betamethasone and of beclomethasone dipropionate p. 43 (beclomethasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort p. 660 has a high glucocorticoid activity; it is derived from prednisolone.

Corticosteroids (systemic)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periorcular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates (in neonates) · avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished) · systemic infection (unless specific therapy given)

CONTRA-INDICATIONS, FURTHER INFORMATION For further information on contra-indications associated with intra-articular, intradermal and intralesional preparations, consult product literature.

- **CAUTIONS** Congestive heart failure · diabetes mellitus (including a family history of) · diverticulitis · epilepsy · glaucoma (including a family history of or susceptibility to) · history of steroid myopathy · history of tuberculosis or X-ray changes (frequent monitoring required) · hypertension · hypothyroidism · infection (particularly untreated) · myasthenia gravis · ocular herpes simplex (risk of corneal perforation) · osteoporosis (in children) · osteoporosis (post-menopausal women and the elderly at special risk) · peptic ulcer · psychiatric reactions · recent intestinal anastomoses · recent myocardial infarction (rupture reported) · severe affective disorders (particularly if history of steroid-induced psychosis) · should not be used long-term · thromboembolic disorders · ulcerative colitis

CAUTIONS, FURTHER INFORMATION For further information on cautions associated with intra-articular, intradermal and intralesional preparations, consult product literature.

● SIDE-EFFECTS

- **Common or very common** Adrenal suppression · anxiety · appetite increased · behaviour abnormal · cataract subcapsular · cognitive impairment · Cushing's syndrome · diabetic control impaired · electrolyte imbalance · fluid

retention · gastrointestinal discomfort · glaucoma · headache · healing impaired · hirsutism · hypertension · increased risk of infection · leucocytosis · menstrual cycle irregularities · mood altered · nausea · osteoporosis · peptic ulcer · psychotic disorder · skin reactions · sleep disorders · telangiectasia · weight increased

- **Uncommon** Alkalosis hypokalaemic · bone fractures · haemorrhage · heart failure · hyperhidrosis · myopathy · oedema · osteonecrosis · pancreatitis · papilloedema · seizure · thromboembolism · tuberculosis reactivation · vertigo · vision blurred
- **Rare or very rare** Bruising · tendon rupture
- **Frequency not known** Chorioretinopathy · eye disorders · growth retardation (very common in children) · intracranial pressure increased with papilloedema (usually after withdrawal) (in children) · myocardial rupture (following recent myocardial infarction)

SIDE-EFFECTS, FURTHER INFORMATION

Adrenal suppression During prolonged therapy with corticosteroids, particularly with systemic use, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension, or death. To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary reintroduction of corticosteroid treatment. Patients on long-term corticosteroid treatment should carry a steroid treatment card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

Infections Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. septicaemia and tuberculosis may reach an advanced stage before being recognised, and amoebiasis or strongyloidiasis may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral ocular infections may also be exacerbated.

Chickenpox Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being at risk of severe chickenpox. Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature. Passive immunisation with varicella-zoster immunoglobulin is needed for exposed non-immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment. Corticosteroids should not be stopped and dosage may need to be increased.

Measles Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin may be needed.

Psychiatric reactions Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment. Systemic corticosteroids should

be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

- **PREGNANCY** The benefit of treatment with corticosteroids during pregnancy outweighs the risk. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) concluded that corticosteroids vary in their ability to cross the placenta but there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip. When administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome). Any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important. **Monitoring** Pregnant women with fluid retention should be monitored closely when given systemic corticosteroids.

- **BREAST FEEDING** The benefit of treatment with corticosteroids during breast-feeding outweighs the risk.

- **HEPATIC IMPAIRMENT** The plasma-drug concentration may be increased (particularly on systemic use). Oral and parenteral use should be undertaken with caution.

- **RENAL IMPAIRMENT** Use by oral and injectable routes should be undertaken with caution.

- **MONITORING REQUIREMENTS** The height and weight of children receiving prolonged treatment with corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.

- **EFFECT ON LABORATORY TESTS** Suppression of skin test reactions.

● **TREATMENT CESSATION**

- In adults Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension or death. Withdrawal can also be associated with fever, myalgia, arthralgia, rhinitis, conjunctivitis, painful itchy skin nodules and weight loss. The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. *Gradual* withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:

- received more than 40 mg prednisolone (or equivalent) daily for more than 1 week;
- been given repeat doses in the evening;
- received more than 3 weeks' treatment;
- recently received repeated courses (particularly if taken for longer than 3 weeks);
- taken a short course within 1 year of stopping long-term therapy;
- other possible causes of adrenal suppression.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse *and* who have received treatment for 3 weeks or less *and* who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 7.5 mg daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

- In children The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying

condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. *Gradual* withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:

- received more than 40 mg prednisolone (or equivalent) daily for more than 1 week or 2 mg/kg daily for 1 week or 1 mg/kg daily for 1 month;
- been given repeat doses in the evening;
- received more than 3 weeks' treatment;
- recently received repeated courses (particularly if taken for longer than 3 weeks);
- taken a short course within 1 year of stopping long-term therapy;
- other possible causes of adrenal suppression.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse *and* who have received treatment for 3 weeks or less *and* who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 2–2.5 mg/m² daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

● **PATIENT AND CARER ADVICE**

Advice for patients Patients on long-term corticosteroid treatment should carry a Steroid Treatment Card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed.

Patients should especially be advised of the following:

- **Immunosuppression** Prolonged courses of corticosteroids can increase susceptibility to infection and serious infections can go unrecognised. Unless already immune, patients are at risk of severe **chickenpox** and should avoid close contact with people who have chickenpox or shingles. Similarly, precautions should also be taken against contracting **measles**;
- **Adrenal suppression** If the corticosteroid is given for longer than 3 weeks, treatment must not be stopped abruptly. Adrenal suppression can last for a year or more after stopping treatment and the patient must mention the course of corticosteroid when receiving treatment for any illness or injury;
- **Mood and behaviour changes** Corticosteroid treatment, especially with high doses, can alter mood and behaviour early in treatment—the patient can become confused, irritable and suffer from delusion and suicidal thoughts. These effects can also occur when corticosteroid treatment is being withdrawn. Medical advice should be sought if worrying psychological changes occur;
- **Other serious effects** Serious gastro-intestinal, musculoskeletal, and ophthalmic effects which require medical help can also occur.

Steroid treatment cards Steroid treatment cards should be issued where appropriate. Consider giving a 'steroid card' to support communication of the risks associated with treatment, and specific written advice to consider corticosteroid replacement during an episode of stress, such as severe intercurrent illness or an operation, to patients using greater than maximum licensed doses of inhaled corticosteroids. Steroid treatment cards are available for purchase from the NHS Print online ordering portal www.nhsforms.co.uk

GP practices can obtain supplies through Primary Care Support England. NHS Trusts can order supplies via the online ordering portal.

In Scotland, steroid treatment cards can be obtained from APS Group Scotland by emailing stockorders.dppas@apsgroup.co.uk or by fax on 0131 629 9967.

F 658

Betamethasone

21-Dec-2017

● INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders | Congenital adrenal hyperplasia

- BY MOUTH
 - Adult: Usual dose 0.5–5 mg daily
- BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
 - Adult: 4–20 mg, repeated up to 4 times in 24 hours

● INTERACTIONS → Appendix 1: corticosteroids

● SIDE-EFFECTS Hiccups · malaise · Stevens-Johnson syndrome

● PREGNANCY Readily crosses the placenta. Transient effect on fetal movements and heart rate.

● DIRECTIONS FOR ADMINISTRATION For intravenous infusion (as sodium phosphate) (*Betnesol*®), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.

● PATIENT AND CARER ADVICE Patient counselling is advised for betamethasone soluble tablets (steroid card).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Soluble tablet

CAUTIONARY AND ADVISORY LABELS 10, 13, 21 (not for use as mouthwash for oral ulceration)

► Betamethasone (Non-proprietary)

Betamethasone (as Betamethasone sodium phosphate) 500 microgram Betamethasone 500microgram soluble tablets sugar free sugar-free | 100 tablet [PoM] £51.12 DT = £51.12

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

► Betamethasone (Non-proprietary)

Betamethasone (as Betamethasone sodium phosphate) 4 mg per 1 ml Betamethasone 4mg/1ml solution for injection ampoules | 5 ampoule [PoM] £18.81 DT = £17.25

F 658

Deflazacort

21-Dec-2017

● INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders

- BY MOUTH
 - Adult: Maintenance 3–18 mg daily

Suppression of inflammatory and allergic disorders (acute disorders)

- BY MOUTH
 - Adult: Initially up to 120 mg daily

Inflammatory and allergic disorders

- BY MOUTH
 - Child 1 month-11 years: 0.25–1.5 mg/kg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations
 - Child 12-17 years: 3–18 mg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations

● INTERACTIONS → Appendix 1: corticosteroids

● SIDE-EFFECTS Hypotension

● PATIENT AND CARER ADVICE Patient counselling is advised for deflazacort tablets (steroid card).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

F 658

Dexamethasone

21-Dec-2017

● INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders

- BY MOUTH
 - Adult: 0.5–10 mg daily

Mild croup

- BY MOUTH
 - Child: 150 micrograms/kg for 1 dose

Severe croup (or mild croup that might cause complications)

- INITIALLY BY MOUTH
 - Child: Initially 150 micrograms/kg for 1 dose, to be given before transfer to hospital, then (by mouth or by intravenous injection) 150 micrograms/kg, then (by mouth or by intravenous injection) 150 micrograms/kg after 12 hours if required

Congenital adrenal hyperplasia (under expert supervision)

- BY MOUTH
 - Adult: Consult specialist for advice on dosing
- BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
 - Adult: Consult specialist for advice on dosing

Overnight dexamethasone suppression test

- BY MOUTH
 - Adult: 1 mg for 1 dose, to be given at night

Adjunctive treatment of bacterial meningitis (starting before or with first dose of antibacterial)

- BY INTRAVENOUS INJECTION
 - Adult: 8.3 mg every 6 hours for 4 days

Symptom control of anorexia (in palliative care)

- Adult: 2–4 mg daily

Obstruction due to tumour (dysphagia in palliative care)

- Adult: 8 mg daily

Bronchospasm or partial obstruction (dyspnoea in palliative care)

- Adult: 4–8 mg daily

Nausea and vomiting (adjunct in palliative care)

- BY MOUTH
 - Adult: 8–16 mg daily

Headaches due to raised intracranial pressure (in palliative care)

- Adult: 16 mg daily for 4–5 days, then reduced to 4–6 mg daily, reduce dose if possible. To be given before 6pm to reduce the risk of insomnia

Pain due to nerve compression (in palliative care)

- Adult: 8 mg daily

Cerebral oedema associated with malignancy

- BY MOUTH
 - Adult: 0.5–10 mg daily

Cerebral oedema

- INITIALLY BY INTRAVENOUS INJECTION
 - Adult: Initially 8–16 mg for 1 dose, then (by intramuscular injection or by intravenous injection) 5 mg every 6 hours until adequate response achieved then taper-off gradually, use the 3.8 mg/mL injection preparation for this dose

Cerebral oedema associated with malignancy

► INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 8.3 mg for 1 dose, then (by intramuscular injection) 3.3 mg every 6 hours as required for 2–4 days, subsequently, reduce dose gradually and stop over 5–7 days, use the 3.3 mg/mL injection preparation for this dose

● **UNLICENSED USE**

- With intravenous use Consult product literature; not licensed for use in bacterial meningitis.

● **INTERACTIONS** → Appendix 1: corticosteroids● **SIDE-EFFECTS**

- With parenteral use Hypotension · perineal irritation (may occur following the intravenous injection of large doses of the phosphate ester)
- With oral use Exophthalmos · hiccups · hyperglycaemia · hypotension · malaise · protein catabolism

● **PREGNANCY** Dexamethasone readily crosses the placenta.● **DIRECTIONS FOR ADMINISTRATION**

- With oral use in children For administration *by mouth* tablets may be dispersed in water or injection solution given by mouth.
- With intravenous use in adults For *intravenous infusion* (Dexamethasone, Hospira) give continuously or intermittently or *via* drip tubing in Glucose 5% or Sodium Chloride 0.9%.

● **PRESCRIBING AND DISPENSING INFORMATION**

- With systemic use Dexamethasone 3.8 mg/mL Injection has replaced Dexamethasone 4 mg/mL Injection. All dosage recommendations for intravenous, intramuscular, intrarticular use or local infiltration; are given in units of dexamethasone base.

● **PATIENT AND CARER ADVICE** Patient counselling is advised for dexamethasone tablet, oral solution and injection (steroid card).

Fludrocortisone acetate● **INDICATIONS AND DOSE****Neuropathic postural hypotension**

- BY MOUTH
- Adult: 100–400 micrograms daily

Mineralocorticoid replacement in adrenocortical insufficiency

- BY MOUTH
- Adult: 50–300 micrograms once daily

Adrenocortical insufficiency resulting from septic shock (in combination with hydrocortisone)

- BY MOUTH
- Adult: 50 micrograms daily

- **UNLICENSED USE** Not licensed for use in neuropathic postural hypotension.
- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS** Conjunctivitis · exophthalmos · fatigue · idiopathic intracranial hypertension · muscle atrophy · muscle weakness · petechiae
- **HEPATIC IMPAIRMENT**
Monitoring Monitor patient closely in hepatic impairment.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension

Tablet

Fludrocortisone acetate 100 microgram Fludrocortisone
100microgram tablets | 30 tablet [PoM] £13.60 DT = £13.60

Hydrocortisone

● INDICATIONS AND DOSE

Thyrotoxic crisis (thyroid storm)

- BY INTRAVENOUS INJECTION
- Adult: 100 mg every 6 hours, to be administered as sodium succinate

Adrenocortical insufficiency resulting from septic shock

- BY INTRAVENOUS INJECTION
- Adult: 50 mg every 6 hours, given in combination with fludrocortisone

Acute hypersensitivity reactions such as angioedema of the upper respiratory tract and anaphylaxis (adjunct to adrenaline)

- BY INTRAVENOUS INJECTION
- Adult: 100–300 mg, to be administered as sodium succinate

Corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of minor surgery under general anaesthesia

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: Initially 25–50 mg, to be administered at induction of surgery, the patient's usual oral corticosteroid dose is recommenced after surgery

Corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of moderate or major surgery

- INITIALLY BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: Initially 25–50 mg, to be administered at induction of surgery (following usual oral corticosteroid dose on the morning of surgery), followed by (by intravenous injection) 25–50 mg 3 times a day for 24 hours after moderate surgery and for 48–72 hours after major surgery

Adrenocortical insufficiency in Addison's disease or following adrenalectomy

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 20–30 mg daily in 2 divided doses, the larger dose to be given in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion, the optimum daily dose is determined on the basis of clinical response

Adrenocortical insufficiency

- BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: 100–500 mg 3–4 times a day or when required

Severe inflammatory bowel disease

- BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: 100–500 mg 3–4 times a day or when required

Replacement in adrenocortical insufficiency

- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 20–30 mg once daily, adjusted according to response, dose to be taken in the morning
- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 20–30 mg daily in divided doses, adjusted according to response

Ulcerative colitis | Proctitis | Proctosigmoiditis

- BY RECTUM USING RECTAL FOAM
- Adult: Initially 1 metered application 1–2 times a day for 2–3 weeks, then reduced to 1 metered application once daily on alternate days, to be inserted into the rectum

Acute hypersensitivity reactions | Angioedema

- BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- Child 1–5 months: Initially 25 mg 3 times a day, adjusted according to response
- Child 6 months–5 years: Initially 50 mg 3 times a day, adjusted according to response
- Child 6–11 years: Initially 100 mg 3 times a day, adjusted according to response
- Child 12–17 years: Initially 200 mg 3 times a day, adjusted according to response

Severe acute asthma | Life-threatening acute asthma

- BY INTRAVENOUS INJECTION
- Child 1 month–1 year: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 25 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- Child 2–4 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 50 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- Child 5–11 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- Child 12–17 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- Adult: 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

DOSE EQUIVALENCE AND CONVERSION

- With oral use
- When switching from immediate-release hydrocortisone tablets to modified release *Plenadren*® use same total daily dose. Bioavailability of *Plenadren*® lower than immediate release tablets—monitor clinical response.

● CONTRA-INDICATIONS

- With rectal use Bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses

● CAUTIONS

- With rectal use Systemic absorption may occur

● INTERACTIONS → Appendix 1: corticosteroids

● SIDE-EFFECTS

- Uncommon
- With rectal use Skin discolouration
- Frequency not known
- With oral use Dyslipidaemia · fatigue · hypotension · malaise
- With parenteral use Exophthalmos · hiccups · Kaposi's sarcoma · lipomatosis · malaise

● DIRECTIONS FOR ADMINISTRATION

- With intravenous use in children For *intravenous administration*, dilute with Glucose 5% or Sodium Chloride 0.9%. For *intermittent infusion* give over 20–30 minutes.
- With intravenous use in adults For *intravenous infusion* (*SoluCortef*® or *Efcortel*®), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.

● PRESCRIBING AND DISPENSING INFORMATION

- In children The RCPCH and NPPG recommend that, when a liquid special of hydrocortisone is required, the following strength is used: 5 mg/5 mL.

● PATIENT AND CARER ADVICE Patient counselling is advised for hydrocortisone tablets and injections (steroid card).

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2016) that hydrocortisone modified release (*Plenadren*®) is **not** recommended for use within NHS Scotland for treatment of adrenal insufficiency in adults as there was insufficient evidence submitted.

● LESS SUITABLE FOR PRESCRIBING

- With intravenous use Hydrocortisone as the sodium phosphate is less suitable for prescribing as paraesthesia and pain (particularly in the perineal region) may follow intravenous injection.

- EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Modified-release tablet

Hydrocortisone acetate 100 mg per 1 gram Colifoam 10% aerosol | 14 dose [PoM] £9.33 DT = £9.33

Treatment of graft rejection reactions

- BY INTRAVENOUS INFUSION

- Adult: Up to 1 g daily for up to 3 days

Treatment of relapse in multiple sclerosis

- BY MOUTH

- Adult: 500 mg once daily for 5 days

Treatment of relapse in multiple sclerosis (when oral steroids have failed or have not been tolerated, or in those who require hospital admission)

- BY INTRAVENOUS INFUSION

- Adult: 1 g once daily for 3–5 days

DEPO-MEDRONE®

Suppression of inflammatory and allergic disorders

- BY DEEP INTRAMUSCULAR INJECTION

- Adult: 40–120 mg, then 40–120 mg after 2–3 weeks if required, to be injected into the gluteal muscle

- UNLICENSED USE** [\(Evgr\)](#) Not licensed for use by mouth for the treatment of multiple sclerosis relapse. Not licensed for use by intravenous infusion for the treatment of multiple sclerosis relapse for durations longer than 3 days. [⚠](#) Methylprednisolone doses in the BNF may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: METHYLPREDNISOLONE INJECTABLE MEDICINE CONTAINING LACTOSE (SOLU-MEDRONE® 40 MG): DO NOT USE IN PATIENTS WITH COWS' MILK ALLERGY (OCTOBER 2017)

- With intramuscular use or intravenous use

An EU-wide review has concluded that *Solu-Medrone*® 40 mg may contain trace amounts of milk proteins and should not be used in patients with a known or suspected allergy to cows' milk. Serious allergic reactions, including bronchospasm and anaphylaxis, have been reported in patients allergic to cows' milk proteins. If a patient's symptoms worsen or new allergic symptoms occur, administration should be stopped and the patient treated accordingly.

- CAUTIONS** Rapid intravenous administration of large doses associated with cardiovascular collapse
- INTERACTIONS** → Appendix 1: corticosteroids
- SIDE-EFFECTS** Diarrhoea · dizziness · dyslipidaemia · exophthalmos · fatigue · hiccups · hypotension · Kaposi's sarcoma · lipomatosis · malaise
- DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (as sodium succinate) (*Solu-Medrone*®), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially with water for injections; doses up to 250 mg should be given over at least 5 minutes, high doses over at least 30 minutes.
- PATIENT AND CARER ADVICE** Patient counselling is advised for methylprednisolone tablets and injections (steroid card).

Prednisolone

21-Dec-2017

• INDICATIONS AND DOSE

Acute exacerbation of chronic obstructive pulmonary disease (if increased breathlessness interferes with daily activities)

- BY MOUTH
- Adult: 30 mg daily for 7–14 days

Severe croup (before transfer to hospital) | Mild croup that might cause complications (before transfer to hospital)

- BY MOUTH
- Child: 1–2 mg/kg

Mild to moderate acute asthma (when oral corticosteroid taken for more than a few days) | Severe or life-threatening acute asthma (when oral corticosteroid taken for more than a few days)

- BY MOUTH
- Child 1 month–11 years: 2 mg/kg once daily (max. per dose 60 mg) for up to 3 days, longer if necessary

Mild to moderate acute asthma | Severe or life-threatening acute asthma

- BY MOUTH
- Child 1 month–11 years: 1–2 mg/kg once daily (max. per dose 40 mg) for up to 3 days, longer if necessary
- Child 12–17 years: 40–50 mg daily for at least 5 days
- Adult: 40–50 mg daily for at least 5 days

Suppression of inflammatory and allergic disorders

- BY MOUTH
- Adult: Initially 10–20 mg daily, dose preferably taken in the morning after breakfast, can often be reduced within a few days but may need to be continued for several weeks or months; maintenance 2.5–15 mg daily, higher doses may be needed; cushingoid side-effects increasingly likely with doses above 7.5 mg daily
- BY INTRAMUSCULAR INJECTION
- Adult: 25–100 mg 1–2 times a week, as prednisolone acetate

Suppression of inflammatory and allergic disorders (initial dose in severe disease)

► BY MOUTH

- Adult: Initially up to 60 mg daily, dose preferably taken in the morning after breakfast, can often be reduced within a few days but may need to be continued for several weeks or months

Idiopathic thrombocytopenic purpura

► BY MOUTH

- Adult: 1 mg/kg daily, gradually reduce dose over several weeks

Ulcerative colitis | Crohn's disease

► BY MOUTH

- Adult: Initially 20–40 mg daily until remission occurs, followed by reducing doses, up to 60 mg daily, may be used in some cases, doses preferably taken in the morning after breakfast

Neuritic pain or weakness heralding rapid onset of permanent nerve damage (during reversal reactions multibacillary leprosy)

► BY MOUTH

- Adult: Initially 40–60 mg daily, dose to be instituted at once

Generalised myasthenia gravis (when given on alternate days)

► BY MOUTH

- Adult: Initially 10 mg once daily on alternate days, then increased in steps of 10 mg once daily on alternate days, increased to 1–1.5 mg/kg once daily on alternate days (max. per dose 100 mg)

Generalised myasthenia gravis in ventilated patients (when given on alternate days)

► BY MOUTH

- Adult: Initially 1.5 mg/kg once daily on alternate days (max. per dose 100 mg)

Generalised myasthenia gravis (when giving daily)

► BY MOUTH

- Adult: Initially 5 mg daily, increased in steps of 5 mg daily, maintenance 60–80 mg daily, alternatively maintenance 0.75–1 mg/kg daily, ventilated patients may be started on 1.5 mg/kg (max. 100 mg) on alternate days

Ocular myasthenia

► BY MOUTH

- Adult: Usual dose 10–40 mg once daily on alternate days, reduce to minimum effective dose

Reduction in rate of joint destruction in moderate to severe rheumatoid arthritis of less than 2 years' duration

► BY MOUTH

- Adult: 7.5 mg daily

Polymyalgia rheumatica

► BY MOUTH

- Adult: 10–15 mg daily until remission of disease activity; maintenance 7.5–10 mg daily, reduce gradually to maintenance dose. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long term low-dose corticosteroid treatment

Giant cell (temporal) arteritis

► BY MOUTH

- Adult: 40–60 mg daily until remission of disease activity, the higher dose being used if visual symptoms occur; maintenance 7.5–10 mg daily, reduce gradually to maintenance dose. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long term low-dose corticosteroid treatment

Polyarteritis nodosa | Polymyositis | Systemic lupus erythematosus

► BY MOUTH

- Adult: Initially 60 mg daily, to be reduced gradually; maintenance 10–15 mg daily

Anorexia (symptom control in palliative care)

► BY MOUTH

- Adult: 15–30 mg daily

Pneumocystis pneumonia in moderate to severe infections associated with HIV infection

► BY MOUTH

- Adult: 50–80 mg daily for 5 days, the dose is then reduced to complete 21 days of treatment, corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete

Short-term prophylaxis of episodic cluster headache as monotherapy or in combination with verapamil during verapamil titration

► BY MOUTH

- Adult: 60–100 mg once daily for 2–5 days, then reduced in steps of 10 mg every 2–3 days until prednisolone is discontinued

Proctitis

► BY RECTUM USING RECTAL FOAM

- Adult: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

► BY RECTUM USING SUPPOSITORIES

- Adult: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

Distal ulcerative colitis

► BY RECTUM USING RECTAL FOAM

- Adult: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

Rectal complications of Crohn's disease

► BY RECTUM USING SUPPOSITORIES

- Adult: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

Rectal and rectosigmoidal ulcerative colitis | Rectal and rectosigmoidal Crohn's disease

► BY RECTUM USING ENEMA

- Adult: 20 mg daily for 2–4 weeks, continued if response good, to be used at bedtime

IMPORTANT SAFETY INFORMATION**SAFE PRACTICE**

Prednisolone has been confused with propranolol; care must be taken to ensure the correct drug is prescribed and dispensed.

● CONTRA-INDICATIONS

- With rectal use Bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses

● CAUTIONS

- With rectal use Systemic absorption may occur with rectal preparations
- With systemic use Duchenne's muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity)

- INTERACTIONS** → Appendix 1: corticosteroids

● SIDE-EFFECTS

- With intramuscular use Diarrhoea · dizziness · exophthalmos · hiccups · hypotension · Kaposi's sarcoma · malaise vomiting
- With oral use Diarrhoea · dizziness · dyslipidaemia · exophthalmos · fatigue · lipomatosis · malaise · protein catabolism

- PREGNANCY** As it crosses the placenta 88% of prednisolone is inactivated.

Monitoring ► With systemic use Pregnant women with fluid retention should be monitored closely.

- BREAST FEEDING** Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.

Monitoring ► With systemic use Infant should be monitored for adrenal suppression if mother is taking a dose higher than 40 mg.

- PATIENT AND CARER ADVICE** Patient counselling is advised for prednisolone tablets (steroid card).

21-Dec-2017

INDICATIONS AND DOSE**Moderate to severe rheumatoid arthritis**

- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 10–20 mg daily, adjusted according to response, dose to be taken at bedtime

- **INTERACTIONS** → Appendix 1: corticosteroids

- **SIDE-EFFECTS** Diarrhoea · dyslipidaemia · lipomatosis · vomiting

● **HEPATIC IMPAIRMENT**

Monitoring Monitor patient closely in hepatic impairment.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for prednisone tablets (steroid card).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 10, 21, 25

► **Lodotra** (Napp Pharmaceuticals Ltd)

Prednisone 1 mg Lodotra 1mg modified-release tablets |
 30 tablet [PoM] £26.70

Prednisone 2 mg Lodotra 2mg modified-release tablets |
 30 tablet [PoM] £26.70 | 100 tablet [PoM] £89.00

Prednisone 5 mg Lodotra 5mg modified-release tablets |
 30 tablet [PoM] £26.70 | 100 tablet [PoM] £89.00

Triamcinolone acetonide

21-Dec-2017

INDICATIONS AND DOSE**Suppression of inflammatory and allergic disorders**

- BY DEEP INTRAMUSCULAR INJECTION
- Adult: 40 mg (max. per dose 100 mg), repeated if necessary, dose given for depot effect, to be administered into gluteal muscle; repeated at intervals according to patient's response

- **CAUTIONS** High dosage (may cause proximal myopathy), avoid in chronic therapy

- **INTERACTIONS** → Appendix 1: corticosteroids

● **SIDE-EFFECTS**

- **Uncommon** Dizziness · exophthalmos · fatigue · flushing · hyperglycaemia · hypotension

- **PATIENT AND CARER ADVICE** Patient counselling is advised for triamcinolone acetonide injection (steroid card).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

CAUTIONARY AND ADVISORY LABELS 10

EXCIPIENTS: May contain Benzyl alcohol

► **Adcortyl Intra-articular / Intradermal** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Triamcinolone acetonide 10 mg per 1 ml Adcortyl Intra-articular /
 Intradermal 50mg/5ml suspension for injection vials | 1 vial [PoM]
 £3.63

Adcortyl Intra-articular / Intradermal 10mg/1ml suspension for
 injection ampoules | 5 ampoule [PoM] £4.47 DT = £4.47

► **Kenalog** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Triamcinolone acetonide 40 mg per 1 ml Kenalog Intra-articular /
 Intramuscular 40mg/1ml suspension for injection vials | 5 vial [PoM]
 £7.45 DT = £7.45

2.1 Cushing's syndrome and disease

Cushing's Syndrome

Management

Most types of *Cushing's syndrome* are treated surgically, that which occasionally accompanies carcinoma of the bronchus is not usually amenable to surgery. Metyrapone p. 667 has been found helpful in controlling the symptoms of the disease; it is also used in other forms of Cushing's syndrome to prepare the patient for surgery.

The dosages of metyrapone used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

Ketoconazole below may have a direct effect on corticotrophic tumour cells in patients with Cushing's disease. It is used under specialist supervision for treatment of endogenous Cushing's syndrome.

Other drugs used for Cushing's syndrome and disease

Pasireotide, p. 925

ENZYME INHIBITORS

Ketoconazole

20-Jul-2017

- **DRUG ACTION** An imidazole derivative which acts as a potent inhibitor of cortisol and aldosterone synthesis by inhibiting the activity of 17 α -hydroxylase, 11-hydroxylation steps and at higher doses the cholesterol side-chain cleavage enzyme. It also inhibits the activity of adrenal C17-20 lyase enzymes resulting in androgen synthesis inhibition, and may have a direct effect on corticotrophic tumour cells in patients with Cushing's disease.

INDICATIONS AND DOSE**Endogenous Cushing's syndrome (specialist use only)**

► BY MOUTH

- Adult: Initially 400–600 mg daily in 2–3 divided doses, increased to 800–1200 mg daily; maintenance 400–800 mg daily in 2–3 divided doses, for dose titrations in patients with established dose, adjustments in adrenal insufficiency, or concomitant corticosteroid replacement therapy, consult product literature; maximum 1200 mg per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises max. dose 200 mg daily with concurrent use of cobicistat.

IMPORTANT SAFETY INFORMATION**CHMP ADVICE: KETOCONAZOLE (JULY 2013)**

The CHMP has recommended that the marketing authorisation for oral ketoconazole to treat fungal infections should be suspended. The CHMP concluded that the risk of hepatotoxicity associated with oral ketoconazole is greater than the benefit in treating fungal infections. Doctors should review patients who are being treated with oral ketoconazole for fungal infections, with a view to stopping treatment or choosing an alternative treatment. Patients with a prescription of oral ketoconazole for fungal infections should be referred back to their doctors.

Oral ketoconazole for Cushing's syndrome and topical products containing ketoconazole are not affected by this advice.

- **CONTRA-INDICATIONS** Acquired QTc prolongation · Acute porphyrias p. 1025 · avoid concomitant use of hepatotoxic drugs · congenital QTc prolongation
- **CAUTIONS** Risk of adrenal insufficiency
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Adrenal insufficiency · diarrhoea · gastrointestinal discomfort · nausea · skin reactions · vomiting
 - ▶ **Uncommon** Allergic conditions · alopecia · angioedema · asthenia · dizziness · drowsiness · headache · thrombocytopenia
 - ▶ **Rare or very rare** Fever · hepatic disorders · taste altered
 - ▶ **Frequency not known** Alcohol intolerance · appetite abnormal · arthralgia · azoospermia · dry mouth · epistaxis · flatulence · fontanelle bulging · gynaecomastia · hot flush · insomnia · intracranial pressure increased · malaise · menstrual disorder · myalgia · nervousness · papilloedema · paraesthesia · peripheral oedema · photophobia · photosensitivity reaction · tongue discolouration
- **SIDE-EFFECTS, FURTHER INFORMATION** Potentially life-threatening hepatotoxicity reported rarely with oral use.
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used in women of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid—teratogenic in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in breast milk.
- **HEPATIC IMPAIRMENT** Avoid in acute or chronic impairment. Do not initiate treatment if liver enzymes greater than 2 times the normal upper limit.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor ECG before and one week after initiation, and then as clinically indicated thereafter.
 - ▶ Adrenal insufficiency Monitor adrenal function within one week of initiation, then regularly thereafter. When cortisol levels are normalised or close to target and effective dose established, monitor every 3–6 months as there is a risk of autoimmune disease development or exacerbation after normalisation of cortisol levels. If symptoms suggestive of adrenal insufficiency such as fatigue, anorexia, nausea, vomiting, hypotension, hyponatraemia, hyperkalaemia, and/or hypoglycaemia occur, measure cortisol levels and discontinue treatment temporarily (can be resumed thereafter at lower dose) or reduce dose and if necessary, initiate corticosteroid substitution.
 - ▶ Hepatotoxicity Monitor liver function before initiation of treatment, then weekly for 1 month after initiation, then

monthly for 6 months—more frequently if dose adjusted or abnormal liver function detected. Reduce dose if liver enzymes increase less than 3 times the normal upper limit—consult product literature; if liver enzymes are raised to 3 times or greater the normal upper limit, discontinue treatment permanently.

- **PATIENT AND CARER ADVICE** Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, jaundice, abdominal pain, or dark urine develop. Patients or their carers should also be told how to recognise signs of adrenal insufficiency.
- **Driving and skilled tasks** Dizziness and somnolence may affect the performance of skilled tasks (e.g. driving).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 5, 21

▶ **Ketoconazole (non-proprietary)** ▼

Ketoconazole 200 mg Ketoconazole 200mg tablets | 60 tablet [PoM] £480.00

Metyrapone

- **DRUG ACTION** Metyrapone is a competitive inhibitor of 11 β -hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. Metyrapone may be used as a test of anterior pituitary function.

INDICATIONS AND DOSE**Differential diagnosis of ACTH-dependent Cushing's syndrome (specialist supervision in hospital)**

- ▶ **BY MOUTH**
- ▶ Adult: 750 mg every 4 hours for 6 doses

Management of Cushing's syndrome (specialist supervision in hospital)

- ▶ **BY MOUTH**
- ▶ Adult: Usual dose 0.25–6 g daily, dose to be tailored to cortisol production, dose is either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed

Resistant oedema due to increased aldosterone secretion in cirrhosis, nephrotic syndrome, and congestive heart failure (with glucocorticoid replacement therapy) (specialist supervision in hospital)

- ▶ **BY MOUTH**
- ▶ Adult: 3 g daily in divided doses

- **CONTRA-INDICATIONS** Adrenocortical insufficiency
- **CAUTIONS** Avoid in Acute porphyrias p. 1025 · gross hypopituitarism (risk of precipitating acute adrenal failure) · hypertension on long-term administration · hypothyroidism (delayed response)
- **INTERACTIONS** → Appendix 1: metyrapone
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dizziness · headache · hypotension · nausea · sedation · vomiting
 - ▶ **Rare or very rare** Abdominal pain · adrenal insufficiency · allergic dermatitis · hirsutism
 - ▶ **Frequency not known** Alopecia · bone marrow failure · hypertension
- **PREGNANCY** Avoid (may impair biosynthesis of fetal-placental steroids).
- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Use with caution in hepatic impairment (delayed response).
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving).
