Access the BNF *your way*

The *British National Formulary (BNF)* and *BNF for Children* are updated monthly online via MedicinesComplete, ensuring healthcare professionals always have the latest prescribing advice.

ONLINE

BNF on MedicinesComplete

Access *BNF* and *BNF for Children* on MedicinesComplete and receive the very latest drug information through monthly online updates.

FormularyComplete Create, edit and manage your own local formulary content built upon the trusted prescribing advice of the *BNF* and *BNF for Children*.

BNF on Evidence Search

Search the *BNF* and *BNF for Children* alongside other authoritative clinical and non-clinical evidence and best practice at www.evidence.nhs.uk from NICE.

PRINT

Eligible health professionals will now receive one print copy a year – the September issue – to supplement online access. If you are entitled to an NHS copy please refer to page ii for full details on distribution, call 01268 495 609 or email BNF@wilmingtonhealthcare.com.

Turn the page for more details...

PRINT SUBSCRIPTION

BNF subscription – Take advantage of our print subscription option. We will send you the new *BNF* as soon as the book is published. One or two year packages (including or excluding *BNF for Children*) are available. Discounted pricing is also available on bulk sales.

MOBILE

BNF app – Stay up to date anywhere with the BNF app available for iOS and Android.

BNF eBook – Available as an ePDF.
See www.pharmpress.com/bnf.

BNF on MedicinesComplete – Now mobile responsive.

How to purchase

www

Buy direct from Pharmaceutical Press by visiting

or via our website www.pharmpress.com

For all bulk orders of more than 20 copies:

Tel: +44 (0) 207 572 2266

pharmpress-support@rpharms.com

The BNF is available as a mobile app, online (bnf.nice.org.uk/) and also through MedicinesComplete; a PDA version is also available. In addition, BNF content can be integrated into a local formulary by using BNF on FormularyComplete; see www.bnf.org for details.

Distribution of printed BNFs

In **England**, NICE purchases print editions of the BNF (September editions only) for distribution within the NHS. For details of who is eligible to receive a copy and further contact details, please refer to the NICE website: www.nice.org.uk/about/what-we-do/evidence-services/british-national-formulary. If you are entitled to a shared copy of the BNF, please call (0)1268 495 609 or email: BNF@wilmingtonhealthcare.com.

In **Scotland**, email: nss.psd-bnf@nhs.net

In **Wales**, contact NHS Wales Shared Services Partnership—Contractor Services:
Tel: 01792 607420

In **Northern Ireland**, email:

ni.bnf@hscni.net

About BNF content

The BNF is designed as a digest for rapid reference and it may not always include all the information necessary for prescribing and dispensing. Also, less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. *BNF for Children* should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from Medicines Information Services.

Please refer to digital versions of BNF for the most up-to-date content. BNF is published in print but interim updates are issued and published in the digital versions of BNF. The publishers work to ensure that the information is as accurate and up-to-date as possible at the date of publication, but knowledge and best practice in this field change regularly. BNF's accuracy and currency cannot be guaranteed and neither the publishers nor the authors accept any responsibility for errors or omissions. While considerable efforts have been made to check the material in this publication, it should be treated as a guide only. Prescribers, pharmacists and other healthcare professionals are advised to check www.bnf.org for information about key updates and corrections.

Pharmaid

Numerous requests have been received from developing countries for BNFs. The Pharmaid scheme of the Commonwealth Pharmacists Association will dispatch old BNFs to certain Commonwealth countries. For more information on this scheme see commonwealthpharmacy.org/what-we-do/pharmaid/. If you would like to donate your copy email: admin@commonwealthpharmacy.org

Preface

The BNF is a joint publication of the British Medical Association and the Royal Pharmaceutical Society. It is published under the authority of a Joint Formulary Committee which comprises representatives of the two professional bodies, the UK Health Departments, the Medicines and Healthcare products Regulatory Agency, and a national guideline producer. The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the Group includes representatives of the British Dental Association and a representative from the UK Health Departments. The Nurse Prescribers' Advisory Group advises on the content relevant to nurses and includes representatives from different parts of the nursing community and from the UK Health Departments.

The BNF aims to provide prescribers, pharmacists, and other healthcare professionals with sound up-to-date information about the use of medicines.

The BNF includes key information on the selection, prescribing, dispensing and administration of medicines. Medicines generally prescribed in the UK are covered and those considered less suitable for prescribing are clearly identified. Little or no information is included on medicines promoted for purchase by the public.

Information on drugs is drawn from the manufacturers' product literature, medical and pharmaceutical literature, UK health departments, regulatory authorities, and professional bodies. Advice is constructed from clinical literature and reflects, as far as possible, an evaluation of the evidence from diverse sources. The BNF also takes account of authoritative national guidelines and emerging safety concerns. In addition, the editorial team receives advice on all therapeutic areas from expert clinicians; this ensures that the BNF's recommendations are relevant to practice.

The BNF is designed as a digest for rapid reference and it may not always include all the information necessary for prescribing and dispensing. Also, less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. Similarly, little or no information is included on medicines for very rare conditions. *BNF for Children* should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services, see Medicines Information Services (see inside front cover).

It is **important** to use the most recent BNF information for making clinical decisions. The print edition of the BNF is updated in March and September each year. Monthly updates are provided online via Medicines Complete and the NHS Evidence portal. The more important changes are listed under Changes; changes listed online are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies.

The BNF Publications website (www.bnf.org) includes additional information of relevance to healthcare professionals. Other digital formats of the BNF—including versions for mobile devices and integration into local formularies—are also available.

BNF Publications welcomes comments from healthcare professionals. Comments and constructive criticism should be sent to:

British National Formulary,
Royal Pharmaceutical Society,

Acknowledgements

The Joint Formulary Committee is grateful to individuals and organisations that have provided advice and information to the BNF.

The principal contributors for this update were:

K.W. Ah-See, M.N. Badminton, A.K. Bahl, P.R.J. Barnes, D. Bilton, S.L. Bloom, M.F. Bultitude, I.F. Burgess, D.J. Burn, C.E. Dearden, D.W. Denning, P.N. Durrington, D.A.C. Elliman, P. Emery, M.D. Feher, A. Freyer, B.G. Gazzard, A.M. Geretti, N.J.L. Gittoes, P.J. Goadsby, M. Gupta, T.L. Hawkins, B.G. Higgins, S.P. Higgins, S.H.D. Jackson, A. Jones, D.M. Keeling, J.R. Kirwan, P.G. Kopelman, T.H. Lee, A. Lekkas, D.N.J. Lockwood, A.M. Lovering, M.G. Lucas, L. Luzzatto, P.D. Mason, D.A. McArthur, K.E.L. McColl, L.M. Melvin, E. Miller, R.M. Mirakian, P. Morrison, S.M.S. Nasser, C. Nelson-Piercy, J.M. Neuberger, D.J. Nutt, R. Patel, W.J. Penny, A.B. Provan, A.S.C. Rice, D.J. Rowbotham, J.W. Sander, J.A.T. Sandoe, M. Schacter, S.E. Slater, J. Soar, S.C.E. Sporton, M.D. Stewart, S. Thomas, J.P. Thompson, A.D. Weeks, A. Wilcock, A.P.R. Wilson, M.M. Yaqoob.

Expert advice on neurological conditions was kindly provided by the Association of British Neurologists.

Expert advice on the management of oral and dental conditions was kindly provided by M. Addy, P. Coulthard, A. Crighton, M.A.O. Lewis, J.G. Meechan, N.D. Robb, C. Scully, R.A. Seymour, R. Welbury, and J.M. Zakrzewska. S. Kaur provided valuable advice on dental prescribing policy.

Members of the British Association of Dermatologists' Therapy & Guidelines Subcommittee, D.A. Buckley, N. Chiang, M. Cork, K. Gibbon, R.Y.P. Hunasehally, G.A. Johnston, T.A. Leslie, E.C. Mallon, P.M. McHenry, J. Natkunarajah, C. Saunders, S. Ungureanu, S. Wakelin, F.S. Worsnop, A.G. Brain (Secretariat), and M.F. Mohd Mustapa (Secretariat) have provided valuable advice.

Members of the Advisory Committee on Malaria Prevention, R.H. Behrens, D. Bell, P.L. Chiodini, V. Field, F. Genasi, L. Goodyer, A. Green, J. Jones, G. Kassianos, D.G. Lalloo, D. Patel, H. Patel, M. Powell, D.V. Shingadia, N.O. Subair, C.J.M. Whitty, M. Blaze (Secretariat), and V. Smith (Secretariat) have provided valuable advice.

The MHRA have provided valuable assistance.

Correspondents in the pharmaceutical industry have provided information on new products and commented on products in the BNF.

Numerous doctors, pharmacists, nurses, and others have sent comments and suggestions.

The BNF has valuable access to the Martindale data banks by courtesy of A. Brayfield and staff.

The BNF team are grateful for the support and access to in-house expertise at Pharmaceutical Press and acknowledge the assistance of A. Lourie, J. Macdonald, N. Potter, H. Sondh and their teams.

E. Hagos, A. Pryde, M. Smith, and K. Sproston provided considerable assistance during the production of this update of the BNF.

How BNF Publications are constructed

Overview

The BNF is an independent professional publication that addresses the day-to-day prescribing information needs of healthcare professionals. Use of this resource throughout the health service helps to ensure that medicines are used safely, effectively, and appropriately.

Hundreds of changes are made between print editions, and are published monthly in a number of digital formats. The most clinically significant updates are listed under Changes p. xix.

The BNF is unique in bringing together authoritative, independent guidance on best practice with clinically validated drug information. Validation of information follows a standardised process, reviewing emerging evidence, best-practice guidelines, and advice from a network of clinical experts. Where the evidence base is weak, further validation is undertaken through a process of peer review. The process and its governance are outlined in greater detail in the sections that follow.

Joint Formulary Committee

The Joint Formulary Committee (JFC) is responsible for the content of the BNF. The JFC includes pharmacy, medical, nursing and lay representatives; there are also representatives from the Medicines and Healthcare products Regulatory Agency (MHRA), the UK Health Departments, and a national guideline producer. The JFC decides on matters of policy and reviews amendments to the BNF in the light of new evidence and expert advice.

Dental Advisory Group

The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the group includes representatives from the British Dental Association and a representative from the UK Health Departments.

Nurse Prescribers' Advisory Group

The Nurse Prescribers' Advisory Group oversees the list of drugs approved for inclusion in the Nurse Prescribers' Formulary; the group includes representatives from a range of nursing disciplines and stakeholder organisations.

Expert advisers

The BNF uses about 60 expert clinical advisers (including doctors, pharmacists, nurses, and dentists) throughout the UK to help with clinical content. The role of these expert advisers is to review existing text and to comment on amendments drafted by the clinical writers. These clinical experts help to ensure that the BNF remains reliable by:

- commenting on the relevance of the text in the context of best clinical practice in the UK;
- checking draft amendments for appropriate interpretation of any new evidence;
- providing expert opinion in areas of controversy or when reliable evidence is lacking;
- providing independent advice on drug interactions, prescribing in hepatic impairment, renal impairment, pregnancy, breast-feeding, children, the elderly, palliative care, and the emergency treatment of poisoning.

In addition to consulting with regular advisers, the BNF calls on other clinical specialists for specific developments when particular expertise is required.

The BNF works closely with a number of expert bodies that produce clinical guidelines. Drafts or pre-publication copies of guidelines are often received for comment and assimilation into the BNF.

Editorial team

BNF clinical writers have all worked as pharmacists or possess a pharmacy degree and a further, relevant post-graduate qualification, and have a sound understanding of

how drugs are used in clinical practice. As a team, the clinical writers are responsible for editing, maintaining, and updating BNF content. They follow a systematic prioritisation process in response to updates to the evidence base in order to ensure the most clinically important topics are reviewed as quickly as possible. In parallel the team of clinical writers undertakes a process of rolling revalidation, aiming to review all of the content in the BNF over a 3- to 4-year period.

Amendments to the text are drafted when the clinical writers are satisfied that any new information is reliable and relevant. A set of standard criteria define when content is referred to expert advisers, the Joint Formulary Committee or other advisory groups, or submitted for peer review.

Clinical writers prepare the text for publication and undertake a number of validation checks on the knowledge at various stages of the production process.

Sources of BNF information

The BNF uses a variety of sources for its information; the main ones are shown below.

Summaries of product characteristics

The BNF reviews summaries of product characteristics (SPCs) of all new products as well as revised SPCs for existing products. The SPCs are the principal source of product information and are carefully processed. Such processing involves:

- verifying the approved names of all relevant ingredients including 'non-active' ingredients (the BNF is committed to using approved names and descriptions as laid down by the Human Medicine Regulations 2012);
- comparing the indications, cautions, contra-indications, and side-effects with similar existing drugs. Where these are different from the expected pattern, justification is sought for their inclusion or exclusion;
- seeking independent data on the use of drugs in pregnancy and breast-feeding;
- incorporating the information into the BNF using established criteria for the presentation and inclusion of the data;
- checking interpretation of the information by a second clinical writer before submitting to a content manager; changes relating to doses receive a further check;
- identifying potential clinical problems or omissions and seeking further information from manufacturers or from expert advisers;
- constructing, with the help of expert advisers, a comment on the role of the drug in the context of similar drugs.

Much of this processing is applicable to the following sources as well.

Literature

Clinical writers monitor core medical and pharmaceutical journals. Research papers and reviews relating to drug therapy are carefully processed. When a difference between the advice in the BNF and the paper is noted, the new information is assessed for reliability (using tools based on SIGN methodology) and relevance to UK clinical practice. If necessary, new text is drafted and discussed with expert advisers and the Joint Formulary Committee. The BNF enjoys a close working relationship with a number of national information providers.

In addition to the routine process, which is used to identify 'triggers' for changing the content, systematic literature searches are used to identify the best quality evidence available to inform an update. Clinical writers receive training in critical appraisal, literature evaluation, and search strategies.

Consensus guidelines

The advice in the BNF is checked against consensus guidelines produced by expert bodies. The quality of the guidelines is assessed using adapted versions of the AGREE II tool. A number of bodies make drafts or pre-publication copies of the guidelines available to the BNF; it is therefore possible to ensure that a consistent message is disseminated. The BNF routinely processes guidelines from the National Institute for Health and Care Excellence (NICE), the All Wales Medicines Strategy Group (AWMSG), the Scottish Medicines Consortium (SMC), and the Scottish Intercollegiate Guidelines Network (SIGN).

Reference sources

Textbooks and reference sources are used to provide background information for the review of existing text or for the construction of new text. The BNF team works closely with the editorial team that produces *Martindale: The Complete Drug Reference*. The BNF has access to *Martindale* information resources and each team keeps the other informed of significant developments and shifts in the trends of drug usage.

Peer review

Although every effort is made to identify the most robust data available, inevitably there are areas where the evidence base is weak or contradictory. While the BNF has the valuable support of expert advisers and the Joint Formulary Committee, the recommendations made may be subject to a further level of scrutiny through peer review to ensure they reflect best practice.

Content for peer review is posted on bnf.org and interested parties are notified via a number of channels, including the BNF e-newsletter.

Statutory information

The BNF routinely processes relevant information from various Government bodies including Statutory Instruments and regulations affecting the Prescriptions only Medicines Order. Official compendia such as the British Pharmacopoeia and its addenda are processed routinely to ensure that the BNF complies with the relevant sections of the Human Medicines Regulations 2012.

The BNF maintains close links with the Home Office (in relation to controlled drug regulations) and the Medicines and Healthcare products Regulatory Agency (including the British Pharmacopoeia Commission). Safety warnings issued by the Commission on Human Medicines (CHM) and guidelines on drug are issued by the UK health departments are processed as a matter of routine.

Relevant professional statements issued by the Royal Pharmaceutical Society are included in the BNF as are guidelines from bodies such as the Royal College of General Practitioners.

Medicines and devices

NHS Prescription Services (from the NHS Business Services Authority) provides non-clinical, categorical information (including prices) on the medicines and devices included in the BNF.

Comments from readers

Readers of the BNF are invited to send in comments. Numerous letters and emails are received by the BNF team. Such feedback helps to ensure that the BNF provides practical and clinically relevant information. Many changes in the presentation and scope of the BNF have resulted from comments sent in by users.

Comments from industry

Close scrutiny of BNF by the manufacturers provides an additional check and allows them an opportunity to raise issues about BNF's presentation of the role of various drugs; this is yet another check on the balance of BNF's advice. All comments are looked at with care and, where necessary, additional information and expert advice are sought.

Market research

Market research is conducted at regular intervals to gather feedback on specific areas of development.

Assessing the evidence

From January 2016, recommendations made in BNF publications have been evidence graded to reflect the strength of the recommendation. The addition of evidence grading is to support clinical decision making based on the best available evidence.

The BNF aims to revalidate all content over a rolling 3- to 4-year period and evidence grading will be applied to recommendations as content goes through the revalidation process. Therefore, initially, only a small number of recommendations will have been graded.

Grading system

The BNF has adopted a five level grading system from A to E, based on the former SIGN grading system. This grade is displayed next to the recommendation within the text.

Evidence used to make a recommendation is assessed for validity using standardised methodology tools based on AGREE II and assigned a level of evidence. The recommendation is then given a grade that is extrapolated from the level of evidence, and an assessment of the body of evidence and its applicability.

Evidence assigned a level 1- or 2- score has an unacceptable level of bias or confounding and is not used to form recommendations.

Levels of evidence

- **Level 1++**
High quality meta-analyses, systematic reviews of randomised controlled trials (RCTs), or RCTs with a very low risk of bias.
- **Level 1+**
Well-conducted meta-analyses, systematic reviews, or RCTs with a low risk of bias.
- **Level 1-**
Meta-analyses, systematic reviews, or RCTs with a high risk of bias.
- **Level 2++**
High quality systematic reviews of case control or cohort studies; or high quality case control or cohort studies with a very low risk of confounding or bias and a high probability that the relationship is causal.
- **Level 2+**
Well-conducted case control or cohort studies with a low risk of confounding or bias and a moderate probability that the relationship is causal.
- **Level 2-**
Case control or cohort studies with a high risk of confounding or bias and a significant risk that the relationship is not causal.
- **Level 3**
Non-analytic studies, e.g. case reports, case series.
- **Level 4**
Expert advice or clinical experience from respected authorities.

Grades of recommendation

- **Grade A: High strength**
NICE-accredited guidelines; or guidelines that pass AGREE II assessment; or at least one meta-analysis, systematic review, or RCT rated as 1++, and directly applicable to the target population; or a body of evidence consisting principally of studies rated as 1+, directly applicable to the target population, and demonstrating overall consistency of results.
- **Grade B: Moderate strength**
A body of evidence including studies rated as 2++, directly applicable to the target population, and demonstrating

overall consistency of results; or extrapolated evidence from studies rated as 1++ or 1+.

- **Grade C: Low strength**

A body of evidence including studies rated as 2+, directly applicable to the target population and demonstrating overall consistency of results; or extrapolated evidence from studies rated as 2++.

- **Grade D: Very low strength**

Evidence level 3; or extrapolated evidence from studies rated as 2+; or tertiary reference source created by a transparent, defined methodology, where the basis for recommendation is clear.

- **Grade E: Practice point**

Evidence level 4.

How to use BNF Publications in print

How to use the BNF

This edition of the BNF continues to display the fundamental change to the structure of the content that was first shown in BNF 70. The changes were made to bring consistency and clarity to BNF content, and to the way that the content is arranged within print and digital products, increasing the ease with which information can be found.

For reference, the most notable changes to the structure of the content include:

- Drug monographs – where possible, all information that relates to a single drug is contained within its drug monograph, moving information previously contained in the prescribing notes. Drug monographs have also changed structurally: additional sections have been added, ensuring greater regularity around where information is located within the publication.
- Drug class monographs – where substantial amounts of information are common to all drugs within a drug class (e.g. macrolides p. 528), a drug class monograph has been created to contain the common information.
- Medicinal forms – categorical information about marketed medicines, such as price and pack size, continues to be sourced directly from the Dictionary of Medicines and Devices provided by the NHS Business Services Authority. However, clinical information curated by the BNF team has been clearly separated from the categorical pricing and pack size information and is included in the relevant section of the drug monograph.
- Section numbering – the BNF section numbering has been removed. This section numbering tied the content to a rigid structure and enforced the retention of defunct classifications, such as mercurial diuretics, and hindered the relocation of drugs where therapeutic use had altered. It also caused constraints between the BNF and BNF for Children, where drugs had different therapeutic uses in children.
- Appendix 4 – the content has been moved to individual drug monographs. The introductory notes have been replaced with a new guidance section, Guidance on intravenous infusions p. 16.

Introduction

In order to achieve the safe, effective, and appropriate use of medicines, healthcare professionals must be able to use the BNF effectively, and keep up to date with significant changes in the BNF that are relevant to their clinical practice. This *How to Use the BNF* is key in reinforcing the details of the new structure of the BNF to all healthcare professionals involved with prescribing, monitoring, supplying, and administering medicines, as well as supporting the learning of students training to join these professions.

Structure of the BNF

This BNF edition continues to broadly follow the high-level structure of earlier editions of the BNF (i.e. those published before BNF 70):

Front matter, comprising information on how to use the BNF, the significant content changes in each edition, and guidance on various prescribing matters (e.g. prescription writing, the use of intravenous drugs, particular considerations for special patient populations).

Chapters, containing drug monographs describing the uses, doses, safety issues and other considerations involved in the use of drugs; drug class monographs; and treatment summaries, covering guidance on the selection of drugs. Monographs and treatment summaries are divided into chapters based on specific aspects of medical care, such as Chapter 5, Infections, or Chapter 16, Emergency treatment

of poisoning; or drug use related to a particular system of the body, such as Chapter 2, Cardiovascular.

Within each chapter, content is organised alphabetically by therapeutic use (e.g. Airways disease, obstructive), with the treatment summaries first, (e.g. asthma), followed by the monographs of the drugs used to manage the conditions discussed in the treatment summary. Within each therapeutic use, the drugs are organised alphabetically by classification (e.g. Antimuscarinics, Beta 2-agonist bronchodilators) and then alphabetically within each classification (e.g. Acclidinium bromide, Glycopyrronium bromide, Ipratropium bromide).

Appendices, covering interactions, borderline substances, cautionary and advisory labels, and woundcare.

Back matter, covering the lists of medicines approved by the NHS for Dental and Nurse Practitioner prescribing, proprietary and specials manufacturers' contact details, and the index. Yellow cards are also included, to facilitate the reporting of adverse events, as well as quick reference guides for life support and key drug doses in medical emergencies, for ease of access.

Navigating the BNF

The contents page provides the high-level layout of information within the BNF; and in addition, each chapter begins with a small contents section, describing the therapeutic uses covered within that chapter. Once in a chapter, location is guided by the side of the page showing the chapter number (the *thumbnail*), alongside the chapter title. The top of the page includes the therapeutic use (the *running head*) alongside the page number.

Once on a page, visual cues aid navigation: treatment summary information is in black type, with therapeutic use titles similarly styled in black, whereas the use of colour indicates drug-related information, including drug classification titles, drug class monographs, and drug monographs.

Although navigation is possible by browsing, primarily access to the information is via the index, which covers the titles of drug class monographs, drug monographs, and treatment summaries. The index also includes the names of branded medicines and other topics of relevance, such as abbreviations, guidance sections, tables, and images.

Content types

Treatment summaries

Treatment summaries are of three main types;

- an overview of delivering a drug to a particular body system (e.g. Skin conditions, management p. 1185)
- a comparison between a group or groups of drugs (e.g. beta-adrenoceptor blockers (systemic) p. 146)
- an overview of the drug management or prophylaxis of common conditions intended to facilitate rapid appraisal of options (e.g. Hypertension p. 139, or Malaria, prophylaxis p. 596).

In order to select safe and effective medicines for individual patients, information in the treatment summaries must be used in conjunction with other prescribing details about the drugs and knowledge of the patient's medical and drug history.

Monographs Overview

In earlier editions (i.e. before BNF 70), a systemically administered drug with indications for use in different body systems was split across the chapters relating to those body systems. So, for example, codeine phosphate p. 448 was found in chapter 1, for its antitoxicity effects and chapter 4 for its analgesic effects. However, the monograph in chapter

1 contained only the dose and some selected safety precautions.

Now, all of the information for the systemic use of a drug is contained within one monograph, so codeine phosphate p. 448 is now included in chapter 4. This carries the advantage of providing all of the information in one place, so the user does not need to flick back and forth across several pages to find all of the relevant information for that drug. Cross references are included in chapter 1, where the management of diarrhoea is discussed, to the drug monograph to assist navigation.

Where drugs have systemic and local uses, for example, chloramphenicol p. 558, 1139, 1161, and the considerations around drug use are markedly different according to the route of administration, the monograph is split, as with earlier editions, into the relevant chapters.

This means that the majority of drugs are still placed in the same chapters and sections as earlier editions, and although there may be some variation in order, all of the relevant information will be easier to locate.

One of the most significant changes to the monograph structure is the increased granularity, with a move from around 9 sections to over 20 sections; sections are only included when relevant information has been identified. The following information describes these sections and their uses in more detail.

Nomenclature

Monograph titles follow the convention of recommended international non-proprietary names (rINNs), or, in the absence of a rINN, British Approved Names. Relevant synonyms are included below the title and, in some instances a brief description of the drug action is included. Over future editions these drug action statements will be rolled out for all drugs.

In some monographs, immediately below the nomenclature or drug action, there are a number of cross references or flags used to signpost the user to any additional information they need to consider about a drug. This is most common for drugs formulated in combinations, where users will be signposted to the monographs for the individual ingredients (e.g. senna with ispaghula husk p. 63) or for drugs that are related to a drug class monograph (see Drug class monographs, below).

Indication and dose

User feedback has highlighted that one of the main uses of the BNF is identifying indications and doses of drugs. Therefore, indication and dose information has been promoted to the top of the monograph and highlighted by a coloured panel to aid quick reference.

The indication and dose section is more highly structured than in earlier editions, giving greater clarity around which doses should be used for which indications and by which route. In addition, if the dose varies with a specific preparation or formulation, that dosing information has been moved out of the preparations section and in to the indication and dose panel, under a heading of the preparation name.

Doses are either expressed in terms of a definite frequency (e.g. 1 g 4 times daily) or in the total daily dose format (e.g. 6 g daily in 3 divided doses); the total daily dose should be divided into individual doses (in the second example, the patient should receive 2 g 3 times daily).

Doses for specific patient groups (e.g. the elderly) may be included if they are different to the standard dose. Doses for children can be identified by the relevant age range and may vary according to their age or body-weight.

In earlier editions of the BNF, age ranges and weight ranges overlapped. For clarity and to aid selection of the correct dose, wherever possible these age and weight ranges now do not overlap. When interpreting age ranges it is important to understand that a patient is considered to be 64 up until the point of their 65th birthday, meaning that an age

range of adult 18 to 64 is applicable to a patient from the day of their 18th birthday until the day before their 65th birthday. All age ranges should be interpreted in this way. Similarly, when interpreting weight ranges, it should be understood that a weight of up to 30 kg is applicable to a patient up to, but not including, the point that they tip the scales at 30 kg and a weight range of 35 to 59 kg is applicable to a patient as soon as they tip the scales at 35 kg right up until, but not including, the point that they tip the scales at 60 kg. All weight ranges should be interpreted in this way.

In all circumstances, it is important to consider the patient in question and their physical condition, and select the dose most appropriate for the individual.

Other information relevant to Indication and dose

The dose panel also contains, where known, an indication of **pharmacokinetic considerations** that may affect the choice of dose, and **dose equivalence** information, which may aid the selection of dose when switching between drugs or preparations.

The BNF includes **unlicensed** use of medicines when the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience. When the BNF recommends an unlicensed medicine or the 'off-label' use of a licensed medicine, this is shown below the indication and dose panel in the unlicensed use section.

Minimising harm and drug safety

The drug chosen to treat a particular condition should minimise the patient's susceptibility to adverse effects and, where co-morbidities exist, have minimal detrimental effects on the patient's other diseases. To achieve this, the *Contra-indications*, *Cautions* and *Side-effects* of the relevant drug should be reviewed.

The information under *Cautions* can be used to assess the risks of using a drug in a patient who has co-morbidities that are also included in the *Cautions* for that drug—if a safer alternative cannot be found, the drug may be prescribed while monitoring the patient for adverse-effects or deterioration in the co-morbidity. *Contra-indications* are far more restrictive than *Cautions* and mean that the drug should be avoided in a patient with a condition that is *contra-indicated*.

The impact that potential side-effects may have on a patient's quality of life should also be assessed. For instance, in a patient who has difficulty sleeping, it may be preferable to avoid a drug that frequently causes insomnia.

Clinically relevant *Side-effects* for drugs are included in the monographs or class monographs. Side-effects are listed in order of frequency, where known, and arranged alphabetically. The frequency of side-effects follows the regulatory standard:

- Very common — occurs more frequently than 1 in 10 administrations of a drug
- Common — occurs between 1 in 10 and 1 in 100 administrations of a drug
- Uncommon — between 1 in 100 and 1 in 1,000 administrations of a drug
- Rare — between 1 in 1,000 and 1 in 10,000 administrations of a drug
- Very rare — occurs less than 1 in 10,000 administrations of a drug
- Frequency not known

An exhaustive list of side-effects is not included, particularly for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). The BNF also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes).

Recognising that hypersensitivity reactions can occur with virtually all medicines, this effect is generally not listed, unless the drug carries an increased risk of such reactions,

Typical layout of a monograph and associated medicinal forms

1 Class Monographs and drug monographs

In most cases, all information that relates to an individual drug is contained in its drug monograph and there is no symbol. Class monographs have been created where substantial amounts of information are common to all drugs within a drug class, these are indicated by a flag symbol in a circle: 

Drug monographs with a corresponding class monograph are indicated by a tab with a flag symbol:  1234

The page number of the corresponding class monograph is indicated within the tab. For further information, see How to use BNF Publications

2 Drug classifications

Used to inform users of the class of a drug and to assist in finding other drugs of the same class. May be based on pharmacological class (e.g. opioids) but can also be associated with the use of the drug (e.g. cough suppressants)

3 Review date

The date of last review of the content

4 Specific preparation name

If the dose varies with a specific preparation or formulation it appears under a heading of the preparation name

Class monograph 1

CLASSIFICATION 2

 1234

Drug monograph 1

3 01-Jun-2016

(Synonym) another name by which a drug may be known

- **DRUG ACTION** how a drug exerts its effect in the body

• INDICATIONS AND DOSE

Indications are the clinical reasons a drug is used. The dose of a drug will often depend on the indications

Indication

- ▶ ROUTE
- ▶ Age groups: [Child/Adult/Elderly]
Dose and frequency of administration (max. dose)

SPECIFIC PREPARATION NAME 4

Indication

- ▶ ROUTE
- ▶ Age groups: [Child/Adult/Elderly]
Dose and frequency of administration (max. dose)

DOSE ADJUSTMENTS DUE TO INTERACTIONS dosing information when used concurrently with other drugs

DOSES AT EXTREMES OF BODY-WEIGHT dosing information for patients who are overweight or underweight

DOSE EQUIVALENCE AND CONVERSION information around the bioequivalence between formulations of the same drug, or equivalent doses of drugs that are members of the same class

PHARMACOKINETICS how the body affects a drug (absorption, distribution, metabolism, and excretion)

POTENCY a measure of drug activity expressed in terms of the concentration required to produce an effect of given intensity

- **UNLICENSED USE** describes the use of medicines outside the terms of their UK licence (off-label use), or use of medicines that have no licence for use in the UK

IMPORTANT SAFETY INFORMATION

Information produced and disseminated by drug regulators often highlights serious risks associated with the use of a drug, and may include advice that is mandatory

- **CONTRA-INDICATIONS** circumstances when a drug should be avoided
- **CAUTIONS** details of precautions required
- **INTERACTIONS** when one drug changes the effects of another drug; the mechanisms underlying drug interactions are explained in Appendix 1
- **SIDE-EFFECTS** listed in order of frequency, where known, and arranged alphabetically
- **ALLERGY AND CROSS-SENSITIVITY** for drugs that carry an increased risk of hypersensitivity reactions
- **CONCEPTION AND CONTRACEPTION** potential for a drug to have harmful effects on an unborn child when prescribing for a woman of childbearing age or for a man trying to father a child; information on the effect of drugs on the efficacy of latex condoms or diaphragms

- **PREGNANCY** advice on the use of a drug during pregnancy
- **BREAST FEEDING** EvGr advice on the use of a drug during breast feeding A B
- **HEPATIC IMPAIRMENT** advice on the use of a drug in hepatic impairment
- **RENAL IMPAIRMENT** advice on the use of a drug in renal impairment
- **PRE-TREATMENT SCREENING** covers one off tests required to assess the suitability of a patient for a particular drug
- **MONITORING REQUIREMENTS** specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index
- **EFFECTS ON LABORATORY TESTS** for drugs that can interfere with the accuracy of seemingly unrelated laboratory tests
- **TREATMENT CESSATION** specifies whether further monitoring or precautions are advised when the drug is withdrawn
- **DIRECTIONS FOR ADMINISTRATION** practical information on the preparation of intravenous drug infusions; general advice relevant to other routes of administration
- **PRESCRIBING AND DISPENSING INFORMATION** practical information around how a drug can be prescribed and dispensed including details of when brand prescribing is necessary
- **HANDLING AND STORAGE** includes information on drugs that can cause adverse effects to those who handle them before they are taken by, or administered to, a patient; advice on storage conditions
- **PATIENT AND CARER ADVICE** for drugs with a special need for counselling
- **PROFESSION SPECIFIC INFORMATION** provides details of the restrictions certain professions such as dental practitioners or nurse prescribers need to be aware of when prescribing on the NHS
- **NATIONAL FUNDING/ACCESS DECISIONS** details of NICE Technology Appraisals, SMC advice and AWMSG advice
- **LESS SUITABLE FOR PRESCRIBING** preparations that are considered by the Joint Formulary Committee to be less suitable for prescribing
- **EXCEPTION TO LEGAL CATEGORY** advice and information on drugs which may be sold without a prescription under specific conditions

● MEDICINAL FORMS

Form

CAUTIONARY AND ADVISORY LABELS if applicable
 EXCIPIENTS clinically important but not comprehensive
 [consult manufacturer information for full details]

ELECTROLYTES if clinically significant quantities occur

► **Preparation name** (Manufacturer/Non-proprietary)

Drug name and strength pack sizes PoM B Prices

Combinations available this indicates a combination preparation is available and a cross reference page number is provided to locate this preparation

● Evidence grading

Evidence grading to reflect the strengths of recommendations will be applied as content goes through the revalidation process. A five level evidence grading system based on the former SIGN grading system has been adopted. The grades A B C D E are displayed next to the recommendations within the text, and are preceded by the symbol: EvGr

For further information, see How BNF Publications are constructed

● Legal categories

PoM This symbol has been placed against those preparations that are available only on a prescription issued by an appropriate practitioner. For more detailed information see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition)

CD1 CD2 CD3 CD4-1 CD4-2 CD5 These symbols indicate that the preparations are subject to the prescription requirements of the Misuse of Drugs Act

For regulations governing prescriptions for such preparations, see Controlled Drugs and Drug Dependence

Not all monographs include all possible sections; sections are only included when relevant information has been identified

when the information is included under *Allergy and cross sensitivity*.

The *Important safety advice* section in the BNF, delineated by a coloured outline box, highlights important safety concerns, often those raised by regulatory authorities or guideline producers. Safety warnings issued by the Commission on Human Medicines (CHM) or Medicines and Healthcare products Regulatory Agency (MHRA) are found here.

Drug selection should aim to minimise drug interactions. If it is necessary to prescribe a potentially serious combination of drugs, patients should be monitored appropriately. The mechanisms underlying drug interactions are explained in Appendix 1, followed by details of drug interactions.

Use of drugs in specific patient populations

Drug selection should aim to minimise the potential for drug accumulation, adverse drug reactions, and exacerbation of pre-existing hepatic or renal disease. If it is necessary to prescribe drugs whose effect is altered by hepatic or renal disease, appropriate drug dose adjustments should be made, and patients should be monitored adequately. The general principles for prescribing are outlined under *Prescribing in hepatic impairment* p. 19, and *Prescribing in renal impairment* p. 19. Information about drugs that should be avoided or used with caution in hepatic disease or renal impairment can be found in drug monographs under *Hepatic impairment* and *Renal impairment* (e.g. fluconazole p. 584).

Similarly, drug selection should aim to minimise harm to the fetus, nursing infant, and mother. The infant should be monitored for potential side-effects of drugs used by the mother during pregnancy or breast-feeding. The general principles for prescribing are outlined under *Prescribing in pregnancy* p. 22 and *Prescribing in breast-feeding* p. 22. The Treatment Summaries provide guidance on the drug treatment of common conditions that can occur during pregnancy and breast-feeding (e.g. Asthma, acute p. 240). Information about the use of specific drugs during pregnancy and breast-feeding can be found in their drug monographs under *Pregnancy*, and *Breast-feeding* (e.g. fluconazole p. 584).

A section, *Conception and contraception*, containing information around considerations for females of childbearing potential or men who might father a child (e.g. isotretinoin p. 1234) has been included.

Administration and monitoring

When selecting the most appropriate drug, it may be necessary to screen the patient for certain genetic markers or metabolic states. This information is included within a section called *Pre-treatment screening* (e.g. abacavir p. 634). This section covers one-off tests required to assess the suitability of a patient for a particular drug.

Once the drug has been selected, it needs to be given in the most appropriate manner. A *Directions for administration* section contains the information about intravenous administration previously located in Appendix 4. This provides practical information on the preparation of intravenous drug infusions, including compatibility of drugs with standard intravenous infusion fluids, method of dilution or reconstitution, and administration rates. In addition, general advice relevant to other routes of administration is provided within this section (e.g. fentanyl p. 451).

After selecting and administering the most appropriate drug by the most appropriate route, patients should be monitored to ensure they are achieving the expected benefits from drug treatment without any unwanted side-effects. The *Monitoring* section specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index (e.g. theophylline p. 273). Monitoring may, in certain cases, be affected by the impact of a drug on

laboratory tests (e.g. hydroxocobalamin p. 994), and this information is included in *Effects on laboratory tests*.

In some cases, when a drug is withdrawn, further monitoring or precautions may be advised (e.g. clonidine hydrochloride p. 144): these are covered under *Treatment cessation*.

Choice and supply

The prescriber and the patient should agree on the health outcomes that the patient desires and on the strategy for achieving them (see *Taking Medicines to Best Effect*). Taking the time to explain to the patient (and carers) the rationale and the potential adverse effects of treatment may improve adherence. For some medicines there is a special need for counselling (e.g. appropriate posture during administration of doxycycline p. 555); this is shown in *Patient and carer advice*.

Other information contained in the latter half of the monograph also helps prescribers and those dispensing medicines choose medicinal forms by indicating information such as flavour or when branded products may not be interchangeable (e.g. diltiazem hydrochloride p. 157), assess the suitability of a drug for prescribing, understand the NHS funding status for a drug (e.g. sildenafil p. 794), or assess when a patient may be able to purchase a drug without prescription (e.g. loperamide hydrochloride p. 66).

Medicinal forms

In the BNF, preparations follow immediately after the monograph for the drug that is their main ingredient.

In earlier editions, when a particular preparation had safety information, dose advice or other clinical information specific to the product, it was contained within the preparations section. This information has been moved to the relevant section in the main body of the monograph under a heading of the name of the specific medicinal form (e.g. peppermint oil p. 47).

The medicinal forms (formerly preparations) section provides information on the type of formulation (e.g. tablet), the amount of active drug in a solid dosage form, and the concentration of active drug in a liquid dosage form. The legal status is shown for prescription-only medicines and controlled drugs, as well as pharmacy medicines and medicines on the general sales list. Practitioners are reminded, by a statement under the heading of "Medicinal Forms" that not all products containing a specific drug ingredient may be similarly licensed. To be clear on the precise licensing status of specific medicinal forms, practitioners should check the product literature for the particular product being prescribed or dispensed.

Details of all medicinal forms available on the dm+d for each drug in BNF Publications appears online on MedicinesComplete. In print editions, due to space constraints, only certain branded products are included in detail. Where medicinal forms are listed they should not be inferred as equivalent to the other brands listed under the same form heading. For example, all the products listed under a heading of "Modified release capsule" will be available as modified release capsules, however, the brands listed under that form heading may have different release profiles, the available strengths may vary and/or the products may have different licensing information. As with earlier editions of the BNF, practitioners must ensure that the particular product being prescribed or dispensed is appropriate.

As medicinal forms are derived from dm+d data, some drugs may appear under names derived from that data; this may vary slightly from those in previous BNF versions, e.g. sodium acid phosphate, is now sodium dihydrogen phosphate anhydrous.

Patients should be prescribed a preparation that complements their daily routine, and that provides the right dose of drug for the right indication and route of administration. When dispensing liquid preparations, a

sugar-free preparation should always be used in preference to one containing sugar. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries.

In earlier editions, the BNF only included excipients and electrolyte information for proprietary medicines. This information is now covered at the level of the dose form (e.g. tablet). It is not possible to keep abreast of all of the generic products available on the UK market, and so this information serves as a reminder to the healthcare professional that, if the presence of a particular excipient is of concern, they should check the product literature for the particular product being prescribed or dispensed.

Cautionary and advisory labels that pharmacists are recommended to add when dispensing are included in the medicinal forms section. Details of these labels can be found in Appendix 3, Guidance for cautionary and advisory labels p. 1534. As these labels have now been applied at the level of the dose form, a full list of medicinal products with their relevant labels would be extensive. This list has therefore been removed, but the information is retained within the monograph.

In the case of compound preparations, the prescribing information for all constituents should be taken into account.

Prices in the BNF

Basic NHS **net prices** are given in the BNF to provide an indication of relative cost. Where there is a choice of suitable preparations for a particular disease or condition the relative cost may be used in making a selection. Cost-effective prescribing must, however, take into account other factors (such as dose frequency and duration of treatment) that affect the total cost. The use of more expensive drugs is justified if it will result in better treatment of the patient, or a reduction of the length of an illness, or the time spent in hospital.

Prices are regularly updated using the Drug Tariff and proprietary price information published by the NHS dictionary of medicines and devices (dm+d, www.dmd.nhs.uk). The weekly updated dm+d data (including prices) can be accessed using the dm+d browser of the NHS Business Services Authority (apps.nhsbsa.nhs.uk/DMDBrowser/DMDBrowser.do). Prices have been calculated from the net cost used in pricing NHS prescriptions and generally reflect whole dispensing packs. Prices for extemporaneously prepared preparations are not provided in the BNF as prices vary between different manufacturers. In Appendix 4, prices stated are per dressing or bandage.

BNF prices are not suitable for quoting to patients seeking private prescriptions or contemplating over-the-counter purchases because they do not take into account VAT, professional fees, and other overheads.

A fuller explanation of costs to the NHS may be obtained from the Drug Tariff. Separate drug tariffs are applicable to England and Wales (www.ppa.org.uk/ppa/edt_intro.htm), Scotland (www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/), and Northern Ireland (www.hscbusiness.hscni.net/services/2034.htm); prices in the different tariffs may vary.

Drug class monographs

In earlier editions of the BNF, information relating to a class of drugs sharing the same properties (e.g. tetracyclines p. 554), was contained within the prescribing notes. In the updated structure, drug class monographs have been created to contain the common information; this ensures such information is easier to find, and has a more regularised structure.

For consistency and ease of use, the class monograph follows the same structure as a drug monograph. Class monographs are indicated by the presence of a flag  (e.g. beta-adrenoceptor blockers (systemic) p. 146). If a drug monograph has a corresponding class monograph, that

needs to be considered in tandem, in order to understand the full information about a drug, the monograph is also indicated by a flag  1234 (e.g. metoprolol tartrate p. 154). Within this flag, the page number of the drug class monograph is provided (e.g. 1234), to help navigate the user to this information. This is particularly useful where occasionally, due to differences in therapeutic use, the drug monograph may not directly follow the drug class monograph (e.g. sotalol hydrochloride p. 108).

Evidence grading

The BNF has adopted a five level evidence grading system (see How BNF Publications are constructed p. ix). Recommendations that are evidence graded can be identified by a symbol appearing immediately before the recommendation. The evidence grade is displayed at the end of the recommendation.

Other content

Nutrition

Appendix 2, Borderline substances p. 1500, includes tables of ACBS-approved enteral feeds and nutritional supplements based on their energy and protein content. There are separate tables for specialised formulae for specific clinical conditions. Classified sections on foods for special diets and nutritional supplements for metabolic diseases are also included.

Wound dressings

A table on wound dressings in Appendix 4, Wound management products and elasticated garments p. 1537, allows an appropriate dressing to be selected based on the appearance and condition of the wound. Further information about the dressing can be found by following the cross-reference to the relevant classified section in the Appendix.

Advanced wound contact dressings have been classified in order of increasing absorbency.

Other useful information

Finding significant changes in the BNF

- **Changes**, provides a list of significant changes, dose changes, classification changes, new names, and new preparations that have been incorporated into the BNF, as well as a list of preparations that have been discontinued and removed from the BNF. Changes listed online are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies. So many changes are made for each update of the BNF, that not all of them can be accommodated in the *Changes* section. We encourage healthcare professionals to regularly review the prescribing information on drugs that they encounter frequently;
- **Changes to the Dental Practitioners' Formulary**, are located at the end of the Dental List;
- **E-newsletter**, the BNF & BNFC e-newsletter service is available free of charge. It alerts healthcare professionals to details of significant changes in the clinical content of these publications and to the way that this information is delivered. Newsletters also review clinical case studies, provide tips on using these publications effectively, and highlight forthcoming changes to the publications. To sign up for e-newsletters go to www.bnf.org.
- An e-learning programme developed in collaboration with the Centre for Pharmacy Postgraduate Education (CPPE), enables pharmacists to identify and assess how significant changes in the BNF affect their clinical practice. The module can be found at www.cppe.ac.uk.

Using other sources for medicines information

The BNF is designed as a digest for rapid reference. Less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to

specialist literature. *BNF for Children* should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services.

Changes

Monthly updates are provided online via MedicinesComplete and the NHS Evidence portal. The changes listed below are cumulative (from one print edition to the next).

Significant changes

Significant changes that appear in the print edition of BNF 76 (September 2018–March 2019):

- Side-effects and their further information sections have been reviewed against the current product literature and terms used to define these have been standardised across all drug monographs in this edition of the BNF.
- Afibercept p. 975 for treating choroidal neovascularisation [NICE guidance].
- Alendronic acid p. 710, ibandronic acid p. 711, risedronate sodium p. 713 and zoledronic acid p. 715 for treating osteoporosis [updated NICE guidance].
- Asthma, chronic p. 236: updated guidance on management.
- Atezolizumab p. 840 for treating locally advanced or metastatic non-small-cell lung cancer after chemotherapy [NICE guidance].
- Atezolizumab p. 840 for untreated locally advanced or metastatic urothelial cancer when cisplatin unsuitable [NICE guidance].
- Attention deficit hyperactivity disorder p. 343: updated guidance on management.
- Avelumab p. 841 for treating metastatic Merkel cell carcinoma [NICE guidance].
- *Braltus*[®] (tiotropium p. 247): risk of inhalation of capsule if placed in the mouthpiece of the inhaler [MHRA/CHM advice].
- Brodalumab p. 1222 for treating moderate to severe plaque psoriasis [NICE guidance].
- Cabozantinib p. 943 for treating medullary thyroid cancer [NICE guidance].
- Ceritinib p. 945 for untreated ALK-positive non-small-cell lung cancer [NICE guidance].
- Cladribine p. 882 for leukaemia: reports of progressive multifocal encephalopathy (PML); stop treatment if PML suspected [MHRA/CHM advice].
- Cladribine p. 882 tablets for treating relapsing-remitting multiple sclerosis [NICE guidance].
- Corticosteroids [see Corticosteroids, general use p. 656]: rare risk of central serous chorioretinopathy with local and systemic administration [MHRA/CHM advice].
- Cystic fibrosis p. 291: updated guidance.
- Dacilizumab (*Zinbryta*[®]) and risk of severe liver injury: new restrictions to use and strengthened liver monitoring [MHRA/CHM advice].
- Dacilizumab (*Zinbryta*[®]) – marketing authorisation withdrawn for safety reasons.
- Dacilizumab (*Zinbryta*[®]) suspension and recall for safety reasons; review patients as soon as possible and start alternative therapy [MHRA/CHM advice].
- Daratumumab p. 846 monotherapy for treating relapsed and refractory multiple myeloma [NICE guidance].
- Dihydrocodeine with paracetamol p. 450 (co-dydramol): prescribe and dispense by strength to minimise risk of medication error (January 2018) [MHRA/CHM advice].
- Dihydrocodeine with paracetamol p. 450 [formerly co-dydramol].
- Drug name confusion: reminder to be vigilant for potential errors between clobazam and clonazepam, atenolol and amlodipine, propranolol and prednisolone, risperidone and ropinirole, sulfadiazine and sulfasalazine, amlodipine and nimodipine, mercaptamine and mercaptopurine, zuclopentixol acetate and zuclopentixol decanoate [MHRA/CHM advice].
- Eluxadoline p. 46 (*Truberzi*[®]): risk of pancreatitis; do not use in patients who have undergone cholecystectomy or in those with biliary disorders [MHRA/CHM advice].
- Emergency contraception p. 775: updated guidance on management.
- Endometriosis p. 733: new guidance on management.
- Eribulin p. 909 for treating locally advanced or metastatic breast cancer after 1 chemotherapy regimen [NICE guidance].
- *Esmya*[®] (ulipristal acetate p. 785) for uterine fibroids: do not initiate or re-start treatment; monitor liver function in current and recent users [MHRA/CHM advice].
- Fingolimod p. 834 (*Gilenya*[®]): new contra-indications in relation to cardiac risk (December 2017) [MHRA/CHM advice].
- Fingolimod p. 834 (*Gilenya*[®]): updated advice about risk of cancers and serious infections (December 2017) [MHRA/CHM advice].
- Fulvestrant p. 926 for untreated locally advanced or metastatic oestrogen-receptor positive breast cancer [NICE guidance].
- Glecaprevir with pibrentasvir p. 620 for treating chronic hepatitis C [NICE guidance].
- Golimumab p. 1080 for treating non-radiographic axial spondyloarthritis [NICE guidance].
- Ibrutinib p. 952 for treating relapsed or refractory mantle cell lymphoma [NICE guidance].
- Ibrutinib p. 952 for treating Waldenström's macroglobulinaemia [NICE guidance].
- Immunoglobulins p. 1252: updated guidance for Varicella-zoster immunoglobulin.
- Ixazomib p. 940 with lenalidomide p. 933 and dexamethasone for treating relapsed or refractory multiple myeloma [NICE guidance].
- Lenvatinib p. 957 with everolimus p. 950 for previously treated advanced renal cell carcinoma [NICE guidance].
- Mycophenolate mofetil p. 826, mycophenolic acid: updated contraception advice for male patients [MHRA/CHM advice].
- Malaria, prophylaxis p. 596: update to country recommendations and guidance.
- Naltrexone with bupropion p. 91 for managing overweight and obesity [NICE guidance].
- Nivolumab p. 850 for previously treated advanced renal cell carcinoma [updated NICE guidance].
- Nivolumab p. 850 for previously treated non-squamous non-small-cell lung cancer [NICE guidance].
- Nivolumab p. 850 for previously treated squamous non-small-cell lung cancer [NICE guidance].
- Nivolumab p. 850 for treating relapsed or refractory classical Hodgkin lymphoma [updated NICE guidance].
- Nivolumab p. 850 for treating squamous cell carcinoma of the head and neck after platinum-based chemotherapy [NICE guidance].
- Noradrenaline/norepinephrine 0.08 mg/mL (4 mg in 50 mL) solution for infusion p. 188 association with potential risk of medication errors.
- Obeticholic acid p. 88 (*Ocaliva*[®]): risk of serious liver injury in patients with pre-existing moderate or severe hepatic impairment; reminder to adjust dosing according to liver function monitoring [MHRA/CHM advice].
- Obinutuzumab p. 852 for untreated advanced follicular lymphoma [NICE guidance].
- Osteoporosis p. 708: updated guidance.
- Palbociclib p. 961 with an aromatase inhibitor for previously untreated, hormone receptor-positive, HER-2 negative, locally advanced or metastatic breast cancer [NICE guidance].

- Pembrolizumab p. 856 for treating locally advanced or metastatic urothelial carcinoma after platinum-containing chemotherapy [NICE guidance].
- Pertuzumab p. 857 with trastuzumab p. 862 and docetaxel p. 900 for treating HER2-positive breast cancer [NICE guidance].
- Pirfenidone p. 296 for treating idiopathic pulmonary fibrosis [NICE guidance].
- Quinine p. 608: clarification of parenteral dose for the treatment of malaria [dose reduction necessary if parenteral treatment is required for more than 48 hours].
- Raloxifene hydrochloride p. 736 and teriparatide p. 716 for the secondary prevention of osteoporotic fragility fractures in postmenopausal women [updated NICE guidance].
- Raloxifene hydrochloride p. 736 for the primary prevention of osteoporotic fragility fractures in postmenopausal women [updated NICE guidance].
- Recombinant human erythropoietins (epoetin alfa p. 981, epoetin beta p. 982, epoetin zeta p. 983, darbepoetin alfa p. 979, methoxy polyethylene glycol-epoetin): very rare risk of severe cutaneous adverse reactions [MHRA/CHM advice].
- Regorafenib p. 964 for previously treated advanced hepatocellular carcinoma [NICE guidance].
- Regorafenib p. 964 for previously treated unresectable or metastatic gastrointestinal stromal tumours (November 2017) [NICE guidance].
- Ribociclib p. 965 with an aromatase inhibitor for previously untreated, hormone receptor-positive, HER2-negative, locally advanced or metastatic breast cancer [NICE guidance].
- Sarilumab p. 1065 for moderate to severe rheumatoid arthritis [NICE guidance].
- Sinusitis (acute) p. 1168: updated guidance.
- Skin infections p. 1193: head lice eradication products: risk of serious burns if treated hair is exposed to open flames or other sources of ignition [MHRA/CHM advice].
- Sofosbuvir with velpatasvir and voxilaprevir p. 619 for treating chronic hepatitis C [NICE guidance].
- Terbinafine p. 1200: clarification of hepatic monitoring advice.
- Tivicay® (dolutegravir p. 630), Triumeq® (dolutegravir, abacavir, lamivudine), Juluca® (dolutegravir, rilpivirine): neural tube defects reported in infants born to women exposed to dolutegravir at the time of conception [MHRA/CHM advice].
- Tivozanib p. 969 for treating advanced renal cell carcinoma [NICE guidance].
- Tocilizumab p. 1068 for treating giant cell arteritis [NICE guidance].
- Trastuzumab emtansine p. 863 for treating HER2-positive advanced breast cancer after trastuzumab and a taxane [updated NICE guidance].
- Vaccines p. 1259: updated guidance for Hepatitis A Vaccine.
- Vaccines for travel p. 1270: updated guidance on Hepatitis A.
- Valproic acid p. 351 and sodium valproate p. 325: valproate medicines contraindicated in women and girls of childbearing potential unless conditions of Pregnancy Prevention Programme are met [MHRA/CHM advice].
- Venetoclax p. 974 for treating chronic lymphocytic leukaemia (November 2017) [NICE guidance].
- Vismodegib p. 974 for treating basal cell carcinoma [NICE guidance].
- Amitriptyline hydrochloride p. 369 [doses for depression, neuropathic pain and migraine prophylaxis].
- Bosutinib p. 942 [update to dose in renal impairment].
- Budesonide p. 43 [alternative dosing regimen for Crohn's disease updated for *Budenofalk*® capsules].
- Candesartan cilexetil p. 174 [clarification of maximum daily dose in heart failure].
- Chloroquine p. 604 [clarification of dose equivalence statement].
- Chloroquine p. 604 [clarification of dosing for rheumatoid arthritis, systemic and discoid lupus erythematosus].
- Clomifene citrate p. 750 [clarification of dosing].
- Daptomycin p. 558 [update to dosing advice].
- Dexibuprofen p. 1098.
- Ganciclovir p. 626.
- Gentamicin p. 510 [clarification of dosing for surgical prophylaxis, including joint replacement surgery].
- Haloperidol p. 382 [clarification of continuous subcutaneous dose for nausea and vomiting in palliative care].
- Hydroxycarbamide p. 910.
- Ivabradine p. 210.
- Lacosamide p. 315.
- Levonorgestrel p. 787 [update to effective duration for *Levosert*® intra-uterine device].
- Levonorgestrel p. 787 [update to timing for emergency contraception].
- Macrogl 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 56.
- Nilotinib p. 959 [update to dosing advice].
- Nivolumab p. 850 [doses for monotherapy].
- Olaparib p. 973 [dose in renal impairment].
- Sildenafil p. 794 Digital ulcers associated with systemic sclerosis [unlicensed].
- Sodium thiosulfate p. 1327.
- Tadalafil p. 796 [clarification of dosing for intermittent use in erectile dysfunction and dosing in hepatic and renal impairment].
- Temocillin p. 545.
- Tramadol with paracetamol p. 467 [clarification of dosing].
- Lisdexamfetamine mesilate p. 348 [dose for children updated].
- Lisdexamfetamine mesilate p. 348 [unlicensed use statement deleted].
- Papaveretum p. 462 [clarification of dosing].
- Raltegravir p. 631 [all doses updated].
- Vancomycin p. 525.

Classification changes

Classification changes that appear in the print edition of BNF 76 (September 2018–March 2019):

New names

Name changes that appear in the print edition of BNF 76 (September 2018–March 2019):

Deleted preparations

Preparations discontinued in the print edition of BNF 76 (September 2018–March 2019):

New preparations

New preparations that appear in the print edition of BNF 76 (September 2018–March 2019):

- *AirFluSal*® preparations [fluticasone with salmeterol p. 263].
- *Bavencio*® [avelumab p. 841].
- *Cetralax*® [ciprofloxacin ear drops p. 1161].
- *Chenodeoxycholic acid* [chenodeoxycholic acid capsules p. 88].
- *Dupixent*® [dupilumab p. 1223].
- *Fasenra*® [benralizumab p. 266].
- *Fotivda*® [tivozanib p. 969].
- *Hemlibra*® [emicizumab p. 111].
- *Kyleena*® [levonorgestrel intrauterine device p. 787].
- *Mylotarg*® [gemtuzumab ozogamicin p. 847].

Dose changes

Changes in dose statements that appear in the print edition of BNF 76 (September 2018–March 2019):

- Abatacept p. 1073 [update to dosing advice].
- Alprostadil p. 798 [Initial dose for erectile dysfunction and neurogenic erectile dysfunction for *Viridal*® Duo].

- *NACSYS*® [acetylcysteine effervescent tablets p. 290].
- *Ocrevus*® [ocrelizumab p. 838].
- *Penthrox*® [methoxyflurane p. 438].
- *Plenvu*® [macrogol 3350 with anhydrous sodium sulfate, ascorbic acid, potassium chloride, sodium ascorbate and sodium chloride p. 50].
- *RoActemra*® preparations [tocilizumab p. 1068].
- *Rydapt*® [midostaurin p. 958].
- *Skudexa*® [tramadol with dextetopfen p. 466].
- *Symtuza*® [darunavir with cobicistat, emtricitabine and tenofovir alafenamide p. 644].
- *Synagis*® [palivizumab p. 651].
- *Testogel*® 16.2 mg/g [testosterone gel p. 751].
- *Trelegy Ellipta*® [fluticasone with umeclidinium and vilanterol p. 264].
- *Tremfya*® [guselkumab p. 1224].
- *Vemlidy*® [tenofovir alafenamide p. 611].
- *Xylonor*® [lidocaine with cetrimide p. 1314].
- *Zejula*® [niraparib p. 972].

Guidance on prescribing

General guidance

Medicines should be prescribed only when they are necessary, and in all cases the benefit of administering the medicine should be considered in relation to the risk involved. This is particularly important during pregnancy, when the risk to both mother and fetus must be considered. It is important to discuss treatment options carefully with the patient to ensure that the patient is content to take the medicine as prescribed. In particular, the patient should be helped to distinguish the adverse effects of prescribed drugs from the effects of the medical disorder. When the beneficial effects of the medicine are likely to be delayed, the patient should be advised of this.

Prescribing competency framework The Royal Pharmaceutical Society has published a Prescribing Competency Framework that includes a common set of competencies that form the basis for prescribing, regardless of professional background. The competencies have been developed to help healthcare professionals to be safe and effective prescribers, with the aim of supporting patients to get the best outcomes from their medicines. It is available at www.rpharms.com/resources/frameworks/prescribers-competency-framework.

Multimorbidity

The presence of two or more long-term health conditions in a patient (multimorbidity) is associated with reduced quality of life, higher mortality, higher rates of adverse drug reactions, greater use of the health service, and a higher treatment burden (due to polypharmacy or multiple appointments). [Evgri](#) Treatment decisions in these patients should involve consideration of the patient's needs, preferences for treatment, health priorities, and lifestyle with the aim of improving quality of life by reducing treatment burden, adverse events, and unplanned or uncoordinated care.

Prescribers should consider the risks and benefits of treatments recommended for patients with multimorbidity from guidance for single health conditions; evidence for these recommendations is commonly drawn from patients without multimorbidity or who are taking fewer prescribed regular medicines.

Treatments intended to relieve symptoms should be reviewed for effectiveness, including reducing or stopping the treatment and monitoring the effects. Alternatively, non-pharmacological treatments may be offered or treatments of limited benefit can be considered for discontinuation. [A](#) The management of risk factors for future disease can be a major treatment burden for patients with multimorbidity and is not always appropriate.

Deprescribing

Deprescribing is the process of discontinuing or reducing the dose of medicines, supervised by a healthcare professional, with the aim of managing polypharmacy and improving outcomes. Deprescribing requires careful counselling and shared decision-making with patients, and is considered part of routine clinical care.

Taking medicines to best effect

Difficulties in adherence to drug treatment occur regardless of age. Factors contributing to poor compliance with prescribed medicines include:

- prescription not collected or not dispensed;
- purpose of medicine not clear;
- perceived lack of efficacy;

- real or perceived adverse effects;
- patients' perception of the risk and severity of side-effects may differ from that of the prescriber;
- instructions for administration not clear;
- physical difficulty in taking medicines (e.g. swallowing the medicine, handling small tablets, or opening medicine containers);
- unattractive formulation (e.g. unpleasant taste);
- complicated regimen.

The prescriber and the patient should agree on the health outcomes that the patient desires and on the strategy for achieving them ('concordance'). The prescriber should be sensitive to religious, cultural, and personal beliefs that can affect a patient's acceptance of medicines.

Taking the time to explain to the patient (and relatives) the rationale and the potential adverse effects of treatment may improve adherence. Reinforcement and elaboration of the physician's instructions by the pharmacist and other members of the healthcare team also helps. Advising the patient of the possibility of alternative treatments may encourage the patient to seek advice rather than merely abandon unacceptable treatment.

Simplifying the drug regimen may help; the need for frequent administration may reduce adherence, although there appears to be little difference in adherence between once-daily and twice-daily administration. Combination products reduce the number of drugs taken but at the expense of the ability to titrate individual doses.

Biological medicines

Biological medicines are medicines that are made by or derived from a biological source using biotechnology processes, such as recombinant DNA technology. The size and complexity of biological medicines, as well as the way they are produced, may result in a degree of natural variability in molecules of the same active substance, particularly in different batches of the medicine. This variation is maintained within strict acceptable limits. Examples of biological medicines include insulins and monoclonal antibodies. [Evgri](#) Biological medicines must be prescribed by brand name and the brand name specified on the prescription should be dispensed in order to avoid inadvertent switching. Automatic substitution of brands at the point of dispensing is not appropriate for biological medicines. [A](#)

Biosimilar medicines

A **biosimilar medicine** is a biological medicine that is highly similar and clinically equivalent (in terms of quality, safety, and efficacy) to an existing biological medicine that has already been authorised in the European Union (known as the reference biological medicine or originator medicine). The active substance of a biosimilar medicine is similar, but not identical, to the originator biological medicine. Once the patent for a biological medicine has expired, a biosimilar medicine may be authorised by the European Medicines Agency (EMA). A biosimilar medicine is not the same as a generic medicine, which contains a simpler molecular structure that is identical to the originator medicine.

Therapeutic equivalence [Evgri](#) Biosimilar medicines should be considered to be therapeutically equivalent to the originator biological medicine within their authorised indications. [A](#) Biosimilar medicines are usually licensed for all the indications of the originator biological medicine, but this depends on the evidence submitted to the EMA for

authorisation and must be scientifically justified on the basis of demonstrated or extrapolated equivalence.

Prescribing and dispensing The choice of whether to prescribe a biosimilar medicine or the originator biological medicine rests with the clinician in consultation with the patient. [EvGr](#) Biological medicines (including biosimilar medicines) must be prescribed by brand name and the brand name specified on the prescription should be dispensed in order to avoid inadvertent switching. Automatic substitution of brands at the point of dispensing is not appropriate for biological medicines. [A](#)

Safety monitoring Biosimilar medicines are subject to a black triangle status ([▼](#)) at the time of initial authorisation. [EvGr](#) It is important to report suspected adverse reactions using the Yellow Card Scheme (see Adverse reactions to drugs p. 12). For all biological medicines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine. [A](#) UK Medicines Information centres have developed a validated tool to determine potential safety issues associated with all new medicines. These 'in-use product safety assessment reports' will be published for new biosimilar medicines as they become available, see www.sps.nhs.uk/home/medicines/.

National funding/access decisions The Department of Health has confirmed that, in England, NICE can decide to apply the same remit, and the resulting technology appraisal guidance, to relevant biosimilar medicines which appear on the market subsequent to their originator biological medicine. In other circumstances, where a review of the evidence for a particular biosimilar medicine is necessary, NICE will consider producing an evidence summary (see *Evidence summary: new medicines*, www.nice.org.uk/about/what-we-do/our-programmes/nice-advice/evidence-summaries-new-medicines).

National information In England, see www.nice.org.uk/Media/Default/About/what-we-do/NICE-guidance/NICE-technology-appraisals/biosimilars-statement.pdf.

In Northern Ireland, see niformulary.hscni.net/ManagedEntry/bios/Pages/default.aspx.

In Scotland, see www.scottishmedicines.org.uk/About_SMC/Policy_statements/Biosimilar_Medicines.

In Wales, see www.wales.nhs.uk/sites3/Documents/814/BIOSIMILARS-ABUHpositionStatement%5BNov2015%5D.pdf.

Availability The following drugs are available as a biosimilar medicine:

- Adalimumab p. 1073
- Bevacizumab p. 841
- Enoxaparin sodium p. 131
- Epoetin alfa p. 981
- Epoetin zeta p. 983
- Etanercept p. 1078
- Filgrastim p. 997
- Follitropin alfa p. 728
- Infliximab p. 1082
- Insulin glargine p. 701
- Insulin lispro p. 698
- Rituximab p. 859
- Somatropin p. 731
- Teriparatide p. 716

Complementary and alternative medicine

An increasing amount of information on complementary and alternative medicine is becoming available. The scope of the BNF is restricted to the discussion of conventional medicines but reference is made to complementary treatments if they affect conventional therapy (e.g. interactions with St John's wort). Further information on herbal medicines is available at www.mhra.gov.uk.

Abbreviation of titles

In general, titles of drugs and preparations should be written in full. Unofficial abbreviations should not be used as they may be misinterpreted.

Non-proprietary titles

Where non-proprietary ('generic') titles are given, they should be used in prescribing. This will enable any suitable product to be dispensed, thereby saving delay to the patient and sometimes expense to the health service. The only exception is where there is a demonstrable difference in clinical effect between each manufacturer's version of the formulation, making it important that the patient should always receive the same brand; in such cases, the brand name or the manufacturer should be stated. Non-proprietary titles should not be invented for the purposes of prescribing generically since this can lead to confusion, particularly in the case of compound and modified-release preparations. Titles used as headings for monographs may be used freely in the United Kingdom but in other countries may be subject to restriction.

Many of the non-proprietary titles used in this book are titles of monographs in the European Pharmacopoeia, British Pharmacopoeia, or British Pharmaceutical Codex 1973. In such cases the preparations must comply with the standard (if any) in the appropriate publication, as required by the Human Medicines Regulations 2012.

Proprietary titles

Names followed by the symbol® are or have been used as proprietary names in the United Kingdom. These names may in general be applied only to products supplied by the owners of the trade marks.

Marketing authorisation and BNF advice

In general the *doses, indications, cautions, contra-indications, and side-effects* in the BNF reflect those in the manufacturers' data sheets or Summaries of Product Characteristics (SPCs) which, in turn, reflect those in the corresponding marketing authorisations (formerly known as Product Licences). The BNF does not generally include proprietary medicines that are not supported by a valid Summary of Product Characteristics or when the marketing authorisation holder has not been able to supply essential information. When a preparation is available from more than one manufacturer, the BNF reflects advice that is the most clinically relevant regardless of any variation in the marketing authorisations. Unlicensed products can be obtained from 'special-order' manufacturers or specialist importing companies.

Where an unlicensed drug is included in the BNF, this is indicated in square brackets after the entry. When the BNF suggests a use (or route) that is outside the licensed indication of a product ('off-label' use), this too is indicated. Unlicensed use of medicines becomes necessary if the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience.

The doses stated in the BNF are intended for general guidance and represent, unless otherwise stated, the usual range of doses that are generally regarded as being suitable for adults.

Prescribing unlicensed medicines

Prescribing medicines outside the recommendations of their marketing authorisation alters (and probably increases) the prescriber's professional responsibility and potential liability. The prescriber should be able to justify and feel competent in using such medicines, and also inform the patient or the patient's carer that the prescribed medicine is unlicensed.

Oral syringes

An **oral syringe** is supplied when oral liquid medicines are prescribed in doses other than multiples of 5 mL. The oral syringe is marked in 0.5 mL divisions from 1 to 5 mL to measure doses of less than 5 mL (other sizes of oral syringe may also be available). It is provided with an adaptor and an instruction leaflet. The 5-mL *spoon* is used for doses of 5 mL (or multiples thereof).

Important To avoid inadvertent intravenous administration of oral liquid medicines, only an appropriate oral or enteral syringe should be used to measure an oral liquid medicine (if a medicine spoon or graduated measure cannot be used); these syringes should not be compatible with intravenous or other parenteral devices. Oral or enteral syringes should be clearly labelled 'Oral' or 'Enteral' in a large font size; it is the healthcare practitioner's responsibility to label the syringe with this information if the manufacturer has not done so.

Excipients

Branded oral liquid preparations that do not contain *fructose*, *glucose*, or *sucrose* are described as 'sugar-free' in the BNF. Preparations containing hydrogenated glucose syrup, mannitol, maltitol, sorbitol, or xylitol are also marked 'sugar-free' since there is evidence that they do not cause dental caries. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries. Sugar-free preparations should be used whenever possible.

Where information on the presence of *aspartame*, *gluten*, *sulfites*, *tartrazine*, *arachis (peanut) oil* or *sesame oil* is available, this is indicated in the BNF against the relevant preparation.

Information is provided on selected excipients in skin preparations, in vaccines, and on *selected preservatives* and *excipients* in eye drops and injections.

The presence of *benzyl alcohol* and *polyoxyl castor oil* (polyethoxylated castor oil) in injections is indicated in the BNF. Benzyl alcohol has been associated with a fatal toxic syndrome in preterm neonates, and therefore, parenteral preparations containing the preservative should not be used in neonates. Polyoxyl castor oils, used as vehicles in intravenous injections, have been associated with severe anaphylactoid reactions.

The presence of *propylene glycol* in oral or parenteral medicines is indicated in the BNF; it can cause adverse effects if its elimination is impaired, e.g. in renal failure, in neonates and young children, and in slow metabolisers of the substance. It may interact with disulfiram p. 489 and metronidazole p. 533.

The *lactose* content in most medicines is too small to cause problems in most lactose-intolerant patients. However in severe lactose intolerance, the lactose content should be determined before prescribing. The amount of lactose varies according to manufacturer, product, formulation, and strength.

Important In the absence of information on excipients in the BNF and in the product literature (available at www.medicines.org.uk/emc), contact the manufacturer (see Index of Proprietary Manufacturers) if it is essential to check details.

Extemporaneous preparation

A product should be dispensed extemporaneously only when no product with a marketing authorisation is available.

The BP direction that a preparation must be *freshly prepared* indicates that it must be made not more than 24 hours before it is issued for use. The direction that a preparation should be *recently prepared* indicates that deterioration is likely if the preparation is stored for longer than about 4 weeks at 15–25°C.

The term **water** used without qualification means either potable water freshly drawn direct from the public supply and suitable for drinking or freshly boiled and cooled purified water. The latter should be used if the public supply is from a local storage tank or if the potable water is unsuitable for a particular preparation (Water for injections).

Drugs and driving

Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

A new offence of driving, attempting to drive, or being in charge of a vehicle, with certain specified controlled drugs in excess of specified limits, came into force on 2nd March 2015. This offence is an addition to the existing rules on drug impaired driving and fitness to drive, and applies to two groups of drugs—commonly abused drugs, including amfetamines, cannabis, cocaine, and ketamine p. 1305, and drugs used mainly for medical reasons, such as opioids and benzodiazepines. Anyone found to have any of the drugs (including related drugs, for example, apomorphine hydrochloride p. 413) above specified limits in their blood will be guilty of an offence, whether their driving was impaired or not. This also includes prescribed drugs which metabolise to those included in the offence, for example, selegiline hydrochloride p. 423. However, the legislation provides a statutory "medical defence" for patients taking drugs for medical reasons in accordance with instructions, *if their driving was not impaired*—it continues to be an offence to drive if actually impaired. Patients should therefore be advised to continue taking their medicines as prescribed, and when driving, to carry suitable evidence that the drug was prescribed, or sold, to treat a medical or dental problem, and that it was taken according to the instructions given by the prescriber, or information provided with the medicine (e.g. a repeat prescription form or the medicine's patient information leaflet). Further information is available from the Department for Transport at www.gov.uk/government/collections/drug-driving.

Patents

In the BNF, certain drugs have been included notwithstanding the existence of actual or potential patent rights. In so far as such substances are protected by Letters Patent, their inclusion in this Formulary neither conveys, nor implies, licence to manufacture.

Health and safety

When handling chemical or biological materials particular attention should be given to the possibility of allergy, fire, explosion, radiation, or poisoning. Substances such as corticosteroids, some antimicrobials, phenothiazines, and many cytotoxics, are irritant or very potent and should be handled with caution. Contact with the skin and inhalation of dust should be avoided.

Safety in the home

Patients must be warned to keep all medicines out of the reach of children. All solid dose and all oral and external liquid preparations must be dispensed in a reclosable *child-resistant container* unless:

- the medicine is in an original pack or patient pack such as to make this inadvisable;
- the patient will have difficulty in opening a child-resistant container;
- a specific request is made that the product shall not be dispensed in a child-resistant container;

- no suitable child-resistant container exists for a particular liquid preparation.

All patients should be advised to dispose of *unwanted medicines* by returning them to a supplier for destruction.

Labelling of prescribed medicines

There is a legal requirement for the following to appear on the label of any prescribed medicine:

- name of the patient;
- name and address of the supplying pharmacy;
- date of dispensing;
- name of the medicine;
- directions for use of the medicine;
- precautions relating to the use of the medicine.

The Royal Pharmaceutical Society recommends that the following also appears on the label:

- the words 'Keep out of the sight and reach of children';
- where applicable, the words 'Use this medicine only on your skin'.

A pharmacist can exercise professional skill and judgement to amend or include more appropriate wording for the name of the medicine, the directions for use, or the precautions relating to the use of the medicine.

Non-proprietary names of compound preparations

Non-proprietary names of **compound preparations** which appear in the BNF are those that have been compiled by the British Pharmacopoeia Commission or another recognised body; whenever possible they reflect the names of the active ingredients.

Prescribers should avoid creating their own compound names for the purposes of generic prescribing; such names do not have an approved definition and can be misinterpreted.

Special care should be taken to avoid errors when prescribing compound preparations; in particular the hyphen in the prefix 'co-' should be retained.

Special care should also be taken to avoid creating generic names for **modified-release** preparations where the use of these names could lead to confusion between formulations with different lengths of action.

EEA and Swiss prescriptions

Pharmacists can dispense prescriptions issued by doctors and dentists from the European Economic Area (EEA) or Switzerland (except prescriptions for controlled drugs in Schedules 1, 2, or 3, or for drugs without a UK marketing authorisation). Prescriptions should be written in ink or otherwise so as to be indelible, should be dated, should state the name of the patient, should state the address of the prescriber, should contain particulars indicating whether the prescriber is a doctor or dentist, and should be signed by the prescriber.

Security and validity of prescriptions

The Councils of the British Medical Association and the Royal Pharmaceutical Society have issued a joint statement on the security and validity of prescriptions.

In particular, prescription forms should:

- not be left unattended at reception desks;
- not be left in a car where they may be visible; and
- when not in use, be kept in a locked drawer within the surgery and at home.

Where there is any doubt about the authenticity of a prescription, the pharmacist should contact the prescriber. If this is done by telephone, the number should be obtained from the directory rather than relying on the information on the prescription form, which may be false.

Patient group direction (PGD)

In most cases, the most appropriate clinical care will be provided on an individual basis by a prescriber to a specific individual patient. However, a Patient Group Direction for supply and administration of medicines by other healthcare professionals can be used where it would benefit patient care without compromising safety.

A Patient Group Direction is a written direction relating to the supply and administration (or administration only) of a licensed prescription-only medicine (including some Controlled Drugs in specific circumstances) by certain classes of healthcare professionals; the Direction is signed by a doctor (or dentist) and by a pharmacist. Further information on Patient Group Directions is available in Health Service Circular HSC 2000/026 (England), HDL (2001) 7 (Scotland), and WHC (2000) 116 (Wales); see also the Human Medicines Regulations 2012.

NICE, Scottish Medicines Consortium and All Wales Medicines Strategy Group

Advice issued by the National Institute for Health and Care Excellence (NICE), the Scottish Medicines Consortium (SMC) and the All Wales Medicines Strategy Group (AWMSG) is included in the BNF when relevant. Details of the advice together with updates can be obtained from: www.nice.org.uk, www.scottishmedicines.org.uk and www.awmsg.org.

Prescription writing

Shared care

In its guidelines on responsibility for prescribing (circular EL (91) 127) between hospitals and general practitioners, the Department of Health has advised that legal responsibility for prescribing lies with the doctor who signs the prescription.

Requirements

Prescriptions should be written legibly in ink or otherwise so as to be indelible (it is permissible to issue carbon copies of NHS prescriptions as long as they are signed in ink), should be dated, should state the name and address of the patient, the address of the prescriber, an indication of the type of prescriber, and should be signed in ink by the prescriber (computer-generated facsimile signatures do not meet the legal requirement). The age and the date of birth of the patient should preferably be stated, and it is a legal requirement in the case of prescription-only medicines to state the age for children under 12 years. These recommendations are acceptable for **prescription-only medicines**. Prescriptions for controlled drugs have additional legal requirements.

Wherever appropriate the prescriber should state the current weight of the child to enable the dose prescribed to be checked. Consideration should also be given to including the dose per unit mass e.g. mg/kg or the dose per m² body-surface area e.g. mg/m² where this would reduce error. The following should be noted:

- The strength or quantity to be contained in capsules, lozenges, tablets etc. should be stated by the prescriber. In particular, strength of liquid preparations should be clearly stated (e.g. 125 mg/5 mL).
- The unnecessary use of decimal points should be avoided, e.g. 3 mg, not 3.0 mg. Quantities of 1 gram or more should be written as 1 g etc. Quantities less than 1 gram should be written in milligrams, e.g. 500 mg, not 0.5 g. Quantities less than 1 mg should be written in micrograms, e.g. 100 micrograms, not 0.1 mg. When decimals are unavoidable a zero should be written in front of the decimal point where there is no other figure, e.g. 0.5 mL, not .5 mL. Use of the decimal point is acceptable to express a range, e.g. 0.5 to 1 g.
- 'Micrograms' and 'nanograms' should **not** be abbreviated. Similarly 'units' should **not** be abbreviated.
- The term 'millilitre' (mL or mL) is used in medicine and pharmacy, and cubic centimetre, c.c., or cm³ should not be used. (The use of capital 'L' in mL is a printing convention throughout the BNF; both 'mL' and 'ml' are recognised SI abbreviations).
- Dose and dose frequency should be stated; in the case of preparations to be taken 'as required' a **minimum dose interval** should be specified. Care should be taken to ensure children receive the correct dose of the active drug. Therefore, the dose should normally be stated in terms of the mass of the active drug (e.g. '125 mg 3 times daily'); terms such as '5 mL' or '1 tablet' should be avoided except for compound preparations. When doses other than multiples of 5 mL are prescribed for *oral liquid preparations* the dose-volume will be provided by means of an **oral syringe**, (except for preparations intended to be measured with a pipette). Suitable quantities:
 - Elixirs, Linctuses, and Paediatric Mixtures (5-mL dose), 50, 100, or 150 mL
 - Adult Mixtures (10 mL dose), 200 or 300 mL
 - Ear Drops, Eye drops, and Nasal Drops, 10 mL (or the manufacturer's pack)
 - Eye Lotions, Gargles, and Mouthwashes, 200 mL
- The names of drugs and preparations should be written clearly and **not** abbreviated, using approved titles **only**;

avoid creating generic titles for modified-release preparations.

- The quantity to be supplied may be stated by indicating the number of days of treatment required in the box provided on NHS forms. In most cases the exact amount will be supplied. This does not apply to items directed to be used as required—if the dose and frequency are not given then the quantity to be supplied needs to be stated. When several items are ordered on one form the box can be marked with the number of days of treatment provided the quantity is added for any item for which the amount cannot be calculated.
- Although directions should preferably be in **English without abbreviation**, it is recognised that some Latin abbreviations are used.

Sample prescription

Pharmacy Stamp	Age 1yr 3mths	Title, Forename, Surname & Address Master Peter Patient
	Date 2/4/2010	Flat 1 50 Stanhope Street Newtown TE22 1ST
Please don't stamp over age box		
Number of days' treatment N.B. Ensure dose is stated	5	
Endorsements Amoxicillin oral suspension 125mg/5ml sugar-free 125mg three times daily Supply 100ml (No more items on this prescription)		
Signature of prescriber <i>D O Good</i>		Date 02/07/11
For dispenser No. of Prescrib. on form		
Anyborough Health Authority Dr D O Good 345543 7 High Street Anytown KB1 CD2 Tel: 0111 222 333		
NHS		FP10NC0105

Prescribing by dentists

Until new prescribing arrangements are in place for NHS prescriptions, dentists should use form FP10D (GP14 in Scotland, WP10D in Wales) to prescribe only those items listed in the Dental Practitioners' Formulary. The Human Medicines Regulations 2012 does not set any limitations upon the number and variety of substances which the dentist may administer to patients in the surgery or may order by private prescription—provided the relevant legal requirements are observed the dentist may use or order whatever is required for the clinical situation. There is no statutory requirement for the dentist to communicate with a patient's medical practitioner when prescribing for dental use. There are, however, occasions when this would be in the patient's interest and such communication is to be encouraged. For legal requirements relating to prescriptions

of Controlled Drugs, see Controlled drugs and drug dependence p. 8.

Computer-issued prescriptions

For computer-issued prescriptions the following advice, based on the recommendations of the Joint GP Information Technology Committee, should also be noted:

- 1 The computer must print out the date, the patient's surname, one forename, other initials, and address, and may also print out the patient's title and date of birth. The age of children under 12 years and of adults over 60 years must be printed in the box available; the age of children under 5 years should be printed in years and months. A facility may also exist to print out the age of patients between 12 and 60 years.
- 2 The doctor's name must be printed at the bottom of the prescription form; this will be the name of the doctor responsible for the prescription (who will normally sign it). The doctor's surgery address, reference number, and Primary Care Trust (PCT, Health Board in Scotland, Local Health Board in Wales) are also necessary. In addition, the surgery telephone number should be printed.
- 3 When prescriptions are to be signed by general practitioner registrars, assistants, locums, or deputising doctors, the name of the doctor printed at the bottom of the form must still be that of the responsible principal.
- 4 Names of medicines must come from a dictionary held in the computer memory, to provide a check on the spelling and to ensure that the name is written in full. The computer can be programmed to recognise both the non-proprietary and the proprietary name of a particular drug and to print out the preferred choice, but must not print out both names. For medicines not in the dictionary, separate checks are required—the user must be warned that no check was possible and the entire prescription must be entered in the lexicon.
- 5 The dictionary may contain information on the usual doses, formulations, and pack sizes to produce standard predetermined prescriptions for common preparations, and to provide a check on the validity of an individual prescription on entry.
- 6 The prescription must be printed in English without abbreviation; information may be entered or stored in abbreviated form. The dose must be in numbers, the frequency in words, and the quantity in numbers in brackets, thus: 40 mg four times daily (112). It must also be possible to prescribe by indicating the length of treatment required.
- 7 The BNF recommendations should be followed as listed above.
- 8 Checks may be incorporated to ensure that all the information required for dispensing a particular drug has been filled in. For instructions such as 'as directed' and 'when required', the maximum daily dose should normally be specified.
- 9 Numbers and codes used in the system for organising and retrieving data must never appear on the form.
- 10 Supplementary warnings or advice should be written in full, should not interfere with the clarity of the prescription itself, and should be in line with any warnings or advice in the BNF; numerical codes should not be used.
- 11 A mechanism (such as printing a series of nonspecific characters) should be incorporated to cancel out unused space, or wording such as 'no more items on this prescription' may be added after the last item. Otherwise the doctor should delete the space manually.
- 12 To avoid forgery the computer may print on the form the number of items to be dispensed (somewhere separate from the box for the pharmacist). The number of items per form need be limited only by the ability of the printer to produce clear and well-demarcated instructions with sufficient space for each item and a spacer line before each fresh item.
- 13 Handwritten alterations should only be made in exceptional circumstances—it is preferable to print out a new prescription. Any alterations must be made in the doctor's own handwriting and countersigned; computer records should be updated to fully reflect any alteration. Prescriptions for drugs used for contraceptive purposes (but which are not promoted as contraceptives) may need to be marked in handwriting with the symbol $\frac{\text{P}}{\text{C}}$, (or endorsed in another way to indicate that the item is prescribed for contraceptive purposes).
- 14 Prescriptions for controlled drugs can be printed from the computer, but the prescriber's signature must be handwritten (See Controlled Drugs and Drug Dependence; the prescriber may use a date stamp).
- 15 The strip of paper on the side of the FP10SS (GP10SS in Scotland, WP10SS in Wales) may be used for various purposes but care should be taken to avoid including confidential information. It may be advisable for the patient's name to appear at the top, but this should be preceded by 'confidential'.
- 16 In rural dispensing practices prescription requests (or details of medicines dispensed) will normally be entered in one surgery. The prescriptions (or dispensed medicines) may then need to be delivered to another surgery or location; if possible the computer should hold up to 10 alternatives.
- 17 Prescription forms that are reprinted or issued as a duplicate should be labelled clearly as such.

Emergency supply of medicines

Emergency supply requested by member of the public

Pharmacists are sometimes called upon by members of the public to make an emergency supply of medicines. The Human Medicines Regulations 2012 allows exemptions from the Prescription Only requirements for emergency supply to be made by a person lawfully conducting a retail pharmacy business provided:

- a) that the pharmacist has interviewed the person requesting the prescription-only medicine and is satisfied:
 - i) that there is immediate need for the prescription-only medicine and that it is impracticable in the circumstances to obtain a prescription without undue delay;
 - ii) that treatment with the prescription-only medicine has on a previous occasion been prescribed for the person requesting it;
 - iii) as to the dose that it would be appropriate for the person to take;
- b) that no greater quantity shall be supplied than will provide 5 days' treatment of phenobarbital p. 331, *phenobarbital sodium*, or Controlled Drugs in Schedules 4 or 5 (doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation) or 30 days' treatment for other prescription-only medicines, except when the prescription-only medicine is:
 - i) insulin, an ointment or cream, or a preparation for the relief of asthma in an aerosol dispenser when the smallest pack can be supplied;
 - ii) an oral contraceptive when a full cycle may be supplied;
 - iii) an antibiotic in liquid form for oral administration when the smallest quantity that will provide a full course of treatment can be supplied;
- c) that an entry shall be made by the pharmacist in the prescription book stating:
 - i) the date of supply;
 - ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
 - iii) the name and address of the patient;
 - iv) the nature of the emergency;
- d) that the container or package must be labelled to show:
 - i) the date of supply;
 - ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
 - iii) the name of the patient;
 - iv) the name and address of the pharmacy;
 - v) the words 'Emergency supply';
 - vi) the words 'Keep out of the reach of children' (or similar warning);
- e) that the prescription-only medicine is not a substance specifically excluded from the emergency supply provision, and does not contain a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 331 or *phenobarbital sodium* for the treatment of epilepsy: for details see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition). Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation.

Emergency supply requested by prescriber

Emergency supply of a prescription-only medicine may also be made at the request of a doctor, a dentist, a supplementary prescriber, a community practitioner nurse prescriber, a nurse, pharmacist, or optometrist independent prescriber, or a doctor or dentist from the European Economic Area or Switzerland, provided:

- a) that the pharmacist is satisfied that the prescriber by reason of some emergency is unable to furnish a prescription immediately;
- b) that the prescriber has undertaken to furnish a prescription within 72 hours;
- c) that the medicine is supplied in accordance with the directions of the prescriber requesting it;
- d) that the medicine is not a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 331 or *phenobarbital sodium* for the treatment of epilepsy: for details see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition); (Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation).
- e) that an entry shall be made in the prescription book stating:
 - i) the date of supply;
 - ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
 - iii) the name and address of the practitioner requesting the emergency supply;
 - iv) the name and address of the patient;
 - v) the date on the prescription;
 - vi) when the prescription is received the entry should be amended to include the date on which it is received.

Royal Pharmaceutical Society's guidelines

1. The pharmacist should consider the medical consequences of not supplying a medicine in an emergency.
2. If the pharmacist is unable to make an emergency supply of a medicine the pharmacist should advise the patient how to obtain essential medical care.

For conditions that apply to supplies made at the request of a patient see *Medicines, Ethics and Practice*, London, Pharmaceutical Press, (always consult latest edition).

Controlled drugs and drug dependence

Regulations and classification

The Misuse of Drugs Act, 1971 as amended prohibits certain activities in relation to 'Controlled Drugs', in particular their manufacture, supply, and possession (except where permitted by the 2001 Regulations or under licence from the Secretary of State). The penalties applicable to offences involving the different drugs are graded broadly according to the *harmfulness attributable to a drug when it is misused* and for this purpose the drugs are defined in the following three classes:

- **Class A** includes: alfentanil p. 1304, cocaine, diamorphine hydrochloride (heroin) p. 449, dipipanone hydrochloride, fentanyl p. 451, lysergide (LSD), methadone hydrochloride p. 495, 3, 4-methylenedioxymethamphetamine (MDMA, 'ecstasy'), morphine p. 456, opium, oxycodone hydrochloride p. 459, pethidine hydrochloride p. 463, phencyclidine, remifentanyl p. 1304, and class B substances when prepared for injection.
- **Class B** includes: oral amfetamines, barbiturates, cannabis, *Sativex*®, codeine phosphate p. 448, dihydrocodeine tartrate p. 450, ethylmorphine, glutethimide, ketamine p. 1305, nabillon p. 425, pentazocine, phenmetrazine, and pholcodine p. 295.
- **Class C** includes: certain drugs related to the amfetamines such as benzfetamine and chlorphentermine, buprenorphine p. 442, mazindol, meprobamate, pemoline, pipradrol, most benzodiazepines, tramadol hydrochloride p. 464, zaleplon, zolpidem tartrate, zopiclone, androgenic and anabolic steroids, clenbuterol, chorionic gonadotrophin (HCG), non-human chorionic gonadotrophin, somatotropin, somatrem, and somatropin p. 731.

The Misuse of Drugs (Safe Custody) Regulations 1973 as amended details the storage and safe custody requirements for Controlled Drugs.

The Misuse of Drugs Regulations 2001 (and subsequent amendments) defines the classes of person who are authorised to supply and possess Controlled Drugs while acting in their professional capacities and lays down the conditions under which these activities may be carried out. In the 2001 regulations, drugs are divided into five Schedules, each specifying the requirements governing such activities as import, export, production, supply, possession, prescribing, and record keeping which apply to them.

- **Schedule 1** includes drugs not used medicinally such as hallucinogenic drugs (e.g. LSD), ecstasy-type substances, raw opium, and cannabis. A Home Office licence is generally required for their production, possession, or supply. A Controlled Drug register must be used to record details of any Schedule 1 Controlled Drugs received or supplied by a pharmacy.
- **Schedule 2** includes opiates (e.g. diamorphine hydrochloride (heroin) p. 449, morphine p. 456, methadone hydrochloride p. 495, oxycodone hydrochloride p. 459, pethidine hydrochloride p. 463), major stimulants (e.g. amfetamines), quinalbarbitone (secobarbital), cocaine and ketamine p. 1305. Schedule 2 Controlled Drugs are subject to the full Controlled Drug requirements relating to prescriptions, safe custody (except for quinalbarbitone (secobarbital) and some liquid preparations), and the need to keep a Controlled Drug register, (unless exempted in Schedule 5). Possession, supply and procurement is authorised for pharmacists and other classes of persons named in the 2001 Regulations.
- **Schedule 3** includes the barbiturates (except secobarbital, now Schedule 2), buprenorphine p. 442, mazindol, meprobamate, midazolam p. 336,

pentazocine, phentermine, temazepam p. 481, and tramadol hydrochloride p. 464. They are subject to the special prescription requirements. Safe custody requirements do apply, except for any 5,5 disubstituted barbituric acid (e.g. phenobarbital), mazindol, meprobamate, midazolam p. 336, pentazocine, phentermine, tramadol hydrochloride p. 464, or any stereoisomeric form or salts of the above. Records in registers do not need to be kept (although there are requirements for the retention of invoices for 2 years).

- **Schedule 4** includes in Part I drugs that are subject to minimal control, such as benzodiazepines (except temazepam p. 481 and midazolam p. 336, which are in Schedule 3), non-benzodiazepine hypnotics (zaleplon, zolpidem tartrate, and zopiclone) and *Sativex*®. Part II includes androgenic and anabolic steroids, clenbuterol, chorionic gonadotrophin (HCG), non-human chorionic gonadotrophin, somatotropin, somatrem, and somatropin p. 731. Controlled drug prescription requirements do not apply and Schedule 4 Controlled Drugs are not subject to safe custody requirements. Records in registers do not need to be kept (except in the case of *Sativex*®).
- **Schedule 5** includes preparations of certain Controlled Drugs (such as codeine, pholcodine p. 295 or morphine p. 456) which due to their low strength, are exempt from virtually all Controlled Drug requirements other than retention of invoices for two years.

Since the Responsible Pharmacist Regulations were published in 2008, standing operation procedures for the management of Controlled Drugs, are required in registered pharmacies.

The Health Act 2006 introduced the concept of the 'accountable officer' with responsibility for the management of Controlled Drugs and related governance issues in their organisation. Most recently, in 2013 The Controlled Drugs (Supervision of Management and Use) Regulations were published to ensure good governance concerning the safe management and use of Controlled Drugs in England and Scotland.

Prescriptions

Preparations in Schedules 1, 2, 3, 4 and 5 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are identified throughout the BNF and BNF for children using the following symbols:

CD1	for preparations in Schedule 1
CD2	for preparations in Schedule 2
CD3	for preparations in Schedule 3
CD4-1	for preparations in Schedule 4 (Part I)
CD4-2	for preparations in Schedule 4 (Part II)
CD5	for preparations in Schedule 5

The principal legal requirements relating to medical prescriptions are listed below (see also Department of Health Guidance at www.gov.uk/dh).

Prescription requirements Prescriptions for Controlled Drugs that are subject to prescription requirements (all preparations in Schedules 2 and 3) must be indelible, must be signed by the prescriber, include the date on which they were signed, and specify the prescriber's address (must be within the UK). A machine-written prescription is acceptable, but the prescriber's signature must be handwritten. Advanced electronic signatures can be accepted for Schedule 2 and 3 Controlled Drugs where the Electronic Prescribing Service (EPS) is used. All prescriptions

for Controlled Drugs that are subject to the prescription requirements must always state:

- the name and address of the patient (use of a PO Box is not acceptable);
- in the case of a preparation, the form (the dosage form e.g. tablets must be included on a Controlled Drugs prescription irrespective of whether it is implicit in the proprietary name e.g. *MST Continus*, or whether only one form is available), and, where appropriate, the strength of the preparation (when more than one strength of a preparation exists the strength required must be specified); to avoid ambiguity, where a prescription requests multiple strengths of a medicine, each strength should be prescribed separately (i.e. separate dose, total quantity, etc);
- for liquids, the total volume in millilitres (in both words and figures) of the preparation to be supplied; for dosage units (tablets, capsules, ampoules), state the total number (in both words and figures) of dosage units to be supplied (e.g. 10 tablets [of 10 mg] rather than 100 mg total quantity);
- the dose, which must be clearly defined (i.e. the instruction 'one as directed' constitutes a dose but 'as directed' does not); it is not necessary that the dose is stated in both words and figures;
- the words 'for dental treatment only' if issued by a dentist.

A pharmacist is **not** allowed to dispense a Controlled Drug unless all the information required by law is given on the prescription. In the case of a prescription for a Controlled Drug in Schedule 2 or 3, a pharmacist can amend the prescription *if* it specifies the total quantity only in words or in figures or if it contains minor typographical errors, provided that such amendments are indelible and clearly attributable to the pharmacist (e.g. name, date, signature and GPhC registration number). The prescription should be marked with the date of supply at the time the Controlled Drug supply is made.

The Department of Health and the Scottish Government have issued a strong recommendation that the maximum quantity of Schedule 2, 3 or 4 Controlled Drugs prescribed should not exceed 30 days; exceptionally, to cover a justifiable clinical need and after consideration of any risk, a prescription can be issued for a longer period, but the reasons for the decision should be recorded on the patient's notes.

A prescription for a Controlled Drug in Schedules 2, 3, or 4 is valid for 28 days from the date stated thereon (the prescriber may forward-date the prescription; the start date may also be specified in the body of the prescription). Schedule 5 prescriptions are valid for 6 months from the appropriate date.

Medicines that are not Controlled Drugs should not be prescribed on the same form as a Schedule 2 or 3 Controlled Drug.

See sample prescription:

Pharmacy Stamp	Age 70yrs 1mth D.O.B 2/6/1941	Title, Forename, Surname & Address SMITH John 22 Bridge Street Anytown KB1 5SX

NHS		FP10NC0105

Instalments and repeatable prescriptions Prescriptions for Schedule 2 or 3 Controlled Drugs can be dispensed by instalments. An instalment prescription must have an instalment direction including both the dose and the instalment amount specified separately on the prescription, and it must also state the interval between each time the medicine can be supplied.

The first instalment must be dispensed within 28 days of the appropriate day (i.e. date of signing unless the prescriber indicates a date before which the Controlled Drug should not be dispensed) and the remainder should be dispensed in accordance with the instructions on the prescription. The prescription must be marked with the date of each supply. The instalment direction is a legal requirement and needs to be complied with, however, for certain situations (e.g. if a pharmacy is closed on the day an instalment is due) the Home Office has approved specific wording which provides pharmacists some flexibility for supply. For details, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition) or see Home Office approved wording for instalment prescribing (Circular 027/2015), available at www.gov.uk/.

Repeatable prescriptions are prescriptions which contain a direction that they can be dispensed more than once (e.g. repeat \times 3). Only Schedule 4 and 5 Controlled Drugs are permitted on repeatable prescriptions.

Private prescriptions Private prescriptions for Controlled Drugs in Schedules 2 and 3 must be written on specially designated forms which are provided by local NHS England area teams in England (form FP10PCD), local NHS Health Boards in Scotland (form PPCD) and Wales (form W10PCD); in addition, prescriptions must specify the *prescriber's identification number* (or a NHS prescriber code in Scotland).

Prescriptions to be supplied by a pharmacist in hospital are exempt from the requirements for private prescriptions.

Dependence and misuse

The most common drugs of addiction are **crack cocaine** and **opioids**, particularly **diamorphine hydrochloride (heroin)** **p. 449**. For arrangements for prescribing of diamorphine hydrochloride, dipipanone, or cocaine for addicts, see *Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts* below.

Along with traditional stimulants, such as amphetamine and cocaine, there has been an emerging use of methamphetamine and a range of psychoactive substances with stimulant, depressant or hallucinogenic properties such as lysergide (lysergic acid diethylamide, LSD), ketamine or gamma-hydroxybutyrate (sodium oxybate, GHB).

Benzodiazepines and z-drugs (i.e. zopiclone **p. 484**, zolpidem tartrate **p. 483**) have their own potential for misuse and dependence and are often taken in combination with opiates or stimulants.

Cannabis (Indian hemp) is a Schedule 1 Controlled Drug with no approved medicinal use, and doctors cannot prescribe it. It remains the most frequently used illicit drug by young people and dependence can develop in around 10% of users. Cannabis use can exacerbate depression and it may cause an acute short-lived toxic psychosis which resolves with cessation, however paranoid symptoms may persist in chronic users; withdrawal symptoms can occur in some users and these can contribute to sleep problems, agitation and risk of self-harm.

Supervised consumption

Supervised consumption is not a legal requirement under the 2001 Regulations. Nevertheless, when supervised consumption is directed on the prescription, the Department of Health recommends that any deviation from the prescriber's intended method of supply should be documented and the justification for this recorded. Individuals prescribed opioid substitution therapy can take their daily dose under the supervision of a doctor, nurse, or pharmacist during the dose stabilisation phase (usually the first 3 months of treatment), after a relapse or period of instability, or if there is a significant increase in the dose of methadone. Supervised consumption should continue (in accordance with local protocols) until the prescriber is confident that the patient is compliant with their treatment. It is good practice for pharmacists to alert the prescriber when a patient has missed consecutive daily doses.

Prescribing drugs likely to cause dependence or misuse

The prescriber has three main responsibilities:

- To avoid creating dependence by introducing drugs to patients without sufficient reason. In this context, the proper use of the morphine-like drugs is well understood. The dangers of other Controlled Drugs are less clear because recognition of dependence is not easy and its effects, and those of withdrawal, are less obvious.
- To see that the patient does not gradually increase the dose of a drug, given for good medical reasons, to the point where dependence becomes more likely. This tendency is seen especially with hypnotics and anxiolytics. The prescriber should keep a close eye on the amount prescribed to prevent patients from accumulating stocks. A minimal amount should be prescribed in the first instance, or when seeing a patient for the first time.
- To avoid being used as an unwitting source of supply for addicts and being vigilant to methods for obtaining medicines. Methods include visiting more than one doctor, fabricating stories, and forging prescriptions.

Patients under temporary care should be given only small supplies of drugs unless they present an unequivocal letter from their own doctor. Doctors should also remember that their own patients may be attempting to collect prescriptions from other prescribers, especially in hospitals. It is sensible to reduce dosages steadily or to issue weekly or even daily prescriptions for small amounts if it is apparent that dependence is occurring.

Prescribers are responsible for the security of prescription forms once issued to them. The stealing and misuse of prescription forms could be minimised by the following precautions:

- records of serial numbers received and issued should be retained for at least three years;
- blank prescriptions should never be pre-signed;
- prescription forms should not be left unattended and should be locked in a secure drawer, cupboard, or carrying case when not in use;
- doctors', dentists' and surgery stamps should be kept in a secure location separate from the prescription forms;
- alterations are best avoided but if any are made and the prescription is to be used, best practice is for the prescriber to cross out the error, initial and date the error, then write the correct information;
- if an error made in a prescription cannot be corrected, best practice for the prescriber is to put a line through the script and write 'spoiled' on the form, or destroy the form and start writing a new prescription;
- prescribers and pharmacists dispensing drugs prone to abuse should ensure compliance with all relevant legal requirements specially when dealing with prescriptions for Controlled Drugs (see *Prescription requirements and Instalments* above);
- at the time of dispensing, prescriptions should be stamped with the pharmacy stamp and endorsed by the pharmacist or pharmacy technician with what has been supplied; where loss or theft is suspected, the police should be informed immediately.

Travelling abroad

Prescribed drugs listed in Schedule 4 Part II (CD Anab) for self-administration and Schedule 5 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are not subject to export or import licensing. A personal import/export licence is required for patients travelling abroad with Schedules 2, 3, or 4 Part I (CD Benz) and Part II (CD Anab) Controlled Drugs if, they are carrying more than 3 months' supply or are travelling for 3 calendar months or more. A Home Office licence is required for any amount of a Schedule 1 Controlled Drug imported into the UK for personal use regardless of the duration of travel. Further details can be obtained at www.gov.uk/guidance/controlled-drugs-licences-fees-and-returns or from the Home Office by contacting DFLU.ie@homeoffice.gsi.gov.uk. In cases of emergency, telephone 0203 7035 6330.

Applications for obtaining a licence must be supported by a cover letter signed by the prescribing doctor or drug worker, which must confirm:

- the patient's name and address;
- the travel itinerary;
- the names of the prescribed Controlled Drug(s), doses and total amounts to be carried.

Applications for licences should be sent to the Home Office, Drugs & Firearms Licensing Unit, Fry Building, 2 Marsham Street, London, SW1P 4DF.

Alternatively, completed application forms can be emailed to DFLU.ie@homeoffice.gsi.gov.uk. A minimum of 10 days should be allowed for processing the application.

Patients travelling for less than 3 months or carrying less than 3 months supply of Controlled Drugs do not require a personal export/import licence, but are advised to carry a cover letter signed by the prescribing doctor or drug worker.

Those travelling for more than 3 months are advised to make arrangements to have their medication prescribed by a practitioner in the country they are visiting.

Doctors who want to take Controlled Drugs abroad while accompanying patients may similarly be issued with licences. Licences are not normally issued to doctors who want to take Controlled Drugs abroad solely in case a family emergency should arise.

Personal export/import licences do not have any legal status outside the UK and are issued only to comply with the Misuse of Drugs Act 2001 and to facilitate passage through UK Customs and Excise control. For clearance in the country to be visited it is necessary to approach that country's consulate in the UK.

Notification of patients receiving structured drug treatment for substance dependence

In **England**, doctors should report cases where they are providing structured drug treatment for substance dependence to their local National Drug Treatment Monitoring System (NDTMS) Team. General information about NDTMS can be found at www.nta.nhs.uk/ndtms.aspx. Enquiries about NDTMS, and how to submit data, should initially be directed to:

- EvidenceApplicationteam@phe.gov.uk

In **Scotland**, doctors should report cases to the Substance Drug Misuse Database. General information about the Scottish Drug Misuse Database can be found in www.isdscotland.org/Health-Topics/Drugs-and-Alcohol-Misuse/Drugs-Misuse/Scottish-Drug-Misuse-Database/. Enquiries about reporting can be directed to:

- nss.isdsubstancemisuse@nhs.net

In **Northern Ireland**, the Misuse of Drugs (Notification of and Supply to Addicts) (Northern Ireland) Regulations 1973 require doctors to send particulars of persons whom they consider to be addicted to certain Controlled Drugs to the Chief Medical Officer of the Ministry of Health and Social Services. The Northern Ireland contact is:

Public Health Information & Research Branch
Department of Health,
Annexe 2,
Castle Buildings,
Stormont,
Belfast
BT4 3SQ
Tel: 028 9052 2340
phirb@health-ni.gov.uk

Public Health Information & Research Branch also maintains the Northern Ireland Drug Misuse Database (NIDMD) which collects detailed information on those presenting for treatment, on drugs misused and injecting behaviour; participation is not a statutory requirement.

In **Wales**, doctors should report cases where they are providing structured drug treatment for substance dependence on the Welsh National Database for Substance Misuse; enquiries should be directed to: substancemisuse-queries@wales.nhs.uk.

Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts

The Misuse of Drugs (Supply to Addicts) Regulations 1997 require that **only** medical practitioners who hold a special licence issued by the Home Secretary (or Scottish Government's Chief Medical Officer) may prescribe, administer, or supply diamorphine hydrochloride p. 449, dipipanone, or cocaine *for the treatment of drug addiction*. Medical prescribers, pharmacists independent prescribers, nurses independent prescribers and supplementary prescribers do not require a special licence for prescribing diamorphine hydrochloride p. 449, dipipanone, or cocaine for patients (including addicts) for relieving pain from organic disease or injury.

Adverse reactions to drugs

Yellow card scheme

Any drug may produce unwanted or unexpected adverse reactions. Rapid detection and recording of adverse drug reactions is of vital importance so that unrecognised hazards are identified promptly and appropriate regulatory action is taken to ensure that medicines are used safely. Healthcare professionals and coroners are urged to report suspected adverse drug reactions directly to the Medicines and Healthcare products Regulatory Agency (MHRA) through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/yellowcard. Alternatively, prepaid Yellow Cards for reporting are available from the address below and are also bound in the inside back cover of the *BNF*.

Send Yellow Cards to:

FREEPOST YELLOW CARD

(No other address details required).

Tel: 0800 731 6789

Suspected adverse drug reactions to any therapeutic agent should be reported, including drugs (*self-medication* as well as those *prescribed*), blood products, vaccines, radiographic contrast media, complementary and herbal products. For biosimilar medicines and vaccines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine or vaccine.

Suspected adverse drug reactions should be reported through the Yellow Card Scheme at www.mhra.gov.uk/yellowcard. Yellow Cards can be used for reporting suspected adverse drug reactions to medicines, vaccines, herbal or complementary products, whether self-medicated or prescribed. This includes suspected adverse drug reactions associated with misuse, overdose, medication errors or from use of unlicensed and off-label medicines. Yellow Cards can also be used to report medical device incidents, defective medicines, and suspected fake medicines.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well recognised, or if other drugs have been given at the same time. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs.

A freephone service is available to all parts of the UK for advice and information on suspected adverse drug reactions; contact the National Yellow Card Information Service at the MHRA on 0800 731 6789. Outside office hours a telephone-answering machine will take messages.

The following Yellow Card Centres can be contacted for further information:

Yellow Card Centre Northwest

2nd Floor, 70 Pembroke Place, Liverpool, L69 3GF
Tel: (0151) 794 8122

Yellow Card Centre Wales

All Wales Therapeutics and Toxicology Centre, Academic Building, University Hospital Llandow, Penlan Road, Penarth, Vale of Glamorgan, CF64 2XX
Tel: (029) 2074 5831

Yellow Card Centre Northern & Yorkshire

Regional Drug and Therapeutics Centre, 16/17 Framlington Place, Newcastle upon Tyne, NE2 4AB
Tel: (0191) 213 7855

Yellow Card Centre West Midlands

City Hospital, Dudley Road, Birmingham, B18 7QH
Tel: (0121) 507 5672

Yellow Card Centre Scotland

CARDS, Royal Infirmary of Edinburgh, 51 Little France Crescent, Old Dalkeith Road, Edinburgh, EH16 4SA
Tel: (0131) 242 2919
YCCScotland@luht.scot.nhs.uk

The MHRA's database facilitates the monitoring of adverse drug reactions. More detailed information on reporting and a list of products currently under additional monitoring can be found on the MHRA website: www.mhra.gov.uk.

MHRA Drug Safety Update *Drug Safety Update* is a monthly newsletter from the MHRA and the Commission on Human Medicines (CHM); it is available at www.gov.uk/drug-safety-update.

Self-reporting

Patients and their carers can also report suspected adverse drug reactions to the MHRA. Reports can be submitted directly to the MHRA through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/yellowcard, by telephone on 0800 100 3352, or by downloading the Yellow Card form from www.mhra.gov.uk. Alternatively, patient Yellow Cards are available from pharmacies and GP surgeries. Information for patients about the Yellow Card Scheme is available in other languages at www.mhra.gov.uk/yellowcard.

Prescription-event monitoring

In addition to the MHRA's Yellow Card Scheme, an independent scheme monitors the safety of new medicines using a different approach. The Drug Safety Research Unit identifies patients who have been prescribed selected new medicines and collects data on clinical events in these patients. The data are submitted on a voluntary basis by general practitioners on green forms. More information about the scheme and the Unit's educational material is available from www.dsru.org.

Newer drugs and vaccines

Only limited information is available from clinical trials on the safety of new medicines. Further understanding about the safety of medicines depends on the availability of information from routine clinical practice.

The black triangle symbol identifies newly licensed medicines that require additional monitoring by the European Medicines Agency. Such medicines include new active substances, biosimilar medicines, and medicines that the European Medicines Agency consider require additional monitoring. The black triangle symbol also appears in the Patient Information Leaflets for relevant medicines, with a brief explanation of what it means. Products usually retain a black triangle for 5 years, but this can be extended if required.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. For medicines showing the black triangle symbol, the MHRA asks that **all** suspected reactions (including those considered not to be serious) are reported through the Yellow Card Scheme. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well recognised, or if other drugs have been given at the same time.

Established drugs and vaccines

Healthcare professionals and coroners are asked to report all suspected reactions to established drugs (including over-the-counter, herbal, and unlicensed medicines and medicines used off-label) and vaccines that are **serious, medically significant, or result in harm**. Serious reactions include those that are fatal, life-threatening, disabling,

incapacitating, or which result in or prolong hospitalisation, or a congenital abnormality; they should be reported even if the effect is well recognised. Examples include anaphylaxis, blood disorders, endocrine disturbances, effects on fertility, haemorrhage from any site, renal impairment, jaundice, ophthalmic disorders, severe CNS effects, severe skin reactions, reactions in pregnant women, and any drug interactions. Reports of serious adverse reactions are required to enable comparison with other drugs of a similar class. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs.

For established drugs there is no need to report well-known, relatively minor side-effects, such as dry mouth with tricyclic antidepressants or constipation with opioids.

Medication errors

Adverse drug reactions where harm occurs as a result of a medication error are reportable as a Yellow Card or through the local risk management systems into the National Reporting and Learning System (NRLS). If reported to the NRLS, these will be shared with the MHRA. If the NRLS is not available and harm occurs, report using a Yellow Card.

Adverse reactions to medical devices

Suspected adverse reactions to medical devices including dental or surgical materials, intra-uterine devices, and contact lens fluids should be reported. Information on reporting these can be found at: www.mhra.gov.uk.

Side-effects in the BNF

The BNF includes clinically relevant side-effects for most drugs; an exhaustive list is not included for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). Where causality has not been established, side-effects in the manufacturers' literature may be omitted from the BNF.

Recognising that hypersensitivity reactions (including anaphylactic and anaphylactoid reactions) can occur with virtually all drugs, this effect is not generally listed, unless the drug carries an increased risk of such reactions or specific management advice is provided by the manufacturer. Administration site reactions have been omitted from the BNF (e.g. pain at injection site). The BNF also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes). Drugs that are applied locally or topically carry a theoretical or low risk of systemic absorption and therefore systemic side-effects for these drugs are not listed in the BNF unless they are associated with a high risk to patient safety. Infections are a known complication of treatment with drugs that affect the immune system (e.g. corticosteroids or immunosuppressants); this side-effect is listed in the BNF as 'increased risk of infection'. Symptoms of drug withdrawal reactions are not individually listed, but are collectively termed 'withdrawal syndrome'. Side-effects are generally listed alphabetically in order of frequency. In the product literature the frequency of side-effects is generally described as follows:

Description of the frequency of side-effects	
<i>Very common</i>	greater than 1 in 10
<i>Common</i>	1 in 100 to 1 in 10
<i>Uncommon</i> [formerly 'less commonly' in BNF publications]	1 in 1000 to 1 in 100
<i>Rare</i>	1 in 10 000 to 1 in 1000
<i>Very rare</i>	less than 1 in 10 000
<i>Frequency not known</i>	frequency is not defined by product literature or the side-effect has been reported from post-marketing surveillance data

For consistency, the terms used to describe side-effects are standardised using a defined vocabulary across all of the drug monographs in the BNF (e.g. postural hypotension is used for the term orthostatic hypotension).

Special problems

Delayed drug effects Some reactions (e.g. cancers, chloroquine retinopathy, and retroperitoneal fibrosis) may become manifest months or years after exposure. Any suspicion of such an association should be reported directly to the MHRA through the Yellow Card Scheme.

The elderly Particular vigilance is required to identify adverse reactions in the elderly.

Congenital abnormalities When an infant is born with a congenital abnormality or there is a malformed aborted fetus doctors are asked to consider whether this might be an adverse reaction to a drug and to report all drugs (including self-medication) taken during pregnancy.

Children Particular vigilance is required to identify and report adverse reactions in children, including those resulting from the unlicensed use of medicines; **all** suspected reactions should be reported directly to the MHRA through the Yellow Card Scheme (see also Adverse Drug Reactions in Children).

Prevention of adverse reactions

Adverse reactions may be prevented as follows:

- never use any drug unless there is a good indication. If the patient is pregnant do not use a drug unless the need for it is imperative;
- allergy and idiosyncrasy are important causes of adverse drug reactions. Ask if the patient had previous reactions to the drug or formulation;
- ask if the patient is already taking other drugs including self-medication drugs, health supplements, complementary and alternative therapies; interactions may occur;
- age and hepatic or renal disease may alter the metabolism or excretion of drugs, so that much smaller doses may be needed. Genetic factors may also be responsible for variations in metabolism, and therefore for the adverse effect of the drug; notably of isoniazid p. 576 and the tricyclic antidepressants;
- prescribe as few drugs as possible and give very clear instructions to the elderly or any patient likely to misunderstand complicated instructions;
- whenever possible use a familiar drug; with a new drug, be particularly alert for adverse reactions or unexpected events;
- consider if excipients (e.g. colouring agents) may be contributing to the adverse reaction. If the reaction is minor, a trial of an alternative formulation of the same drug may be considered before abandoning the drug;
- warn the patient if serious adverse reactions are liable to occur.

Drug allergy (suspected or confirmed)

Suspected drug allergy is any reaction caused by a drug with clinical features compatible with an immunological mechanism. All drugs have the potential to cause adverse drug reactions, but not all of these are allergic in nature. A reaction is more likely to be caused by drug allergy if:

- The reaction occurred while the patient was being treated with the drug, or
- The drug is known to cause this pattern of reaction, or
- The patient has had a similar reaction to the same drug or drug-class previously.

A suspected reaction is less likely to be caused by a drug allergy if there is a possible non-drug cause or if there are only gastro-intestinal symptoms present.

The following signs, allergic patterns and timing of onset can be used to help decide whether to suspect drug allergy:

Immediate, rapidly-evolving reactions (onset usually less than 1 hour after drug exposure)

- Anaphylaxis, with erythema, urticaria or angioedema, and hypotension and/or bronchospasm. See also Antihistamines, allergen immunotherapy and allergic emergencies p. 276
- Urticaria or angioedema without systemic features
- Exacerbation of asthma e.g. with non-steroidal anti-inflammatory drugs (NSAIDs)

Non-immediate reactions, without systemic involvement (onset usually 6–10 days after first drug exposure or 3 days after second exposure)

- Cutaneous reactions, e.g. widespread red macules and/or papules, or, fixed drug eruption (localised inflamed skin)

Non-immediate reactions, with systemic involvement (onset may be variable, usually 3 days to 6 weeks after first drug exposure, depending on features, or 3 days after second exposure)

- Cutaneous reactions with systemic features, e.g. drug reaction with eosinophilia and systemic signs (DRESS) or drug hypersensitivity syndrome (DHS), characterised by widespread red macules, papules or erythroderma, fever, lymphadenopathy, liver dysfunction or eosinophilia
- Toxic epidermal necrolysis or Stevens–Johnson syndrome
- Acute generalised exanthematous pustulosis (AGEP)

EVGr Suspected drug allergy information should be clearly and accurately documented in clinical notes and prescriptions, and shared among all healthcare professionals. Patients should be given information about which drugs and drug-classes to avoid and encouraged to share their drug allergy status.

If a drug allergy is suspected, consider stopping the suspected drug and advising the patient or carer to avoid this drug in future. Symptoms of the acute reaction should be treated, in hospital if severe. Patients presenting with a suspected anaphylactic reaction, or a severe or non-immediate cutaneous reaction, should be referred to a specialist drug allergy service. Patients presenting with a suspected drug allergic reaction or anaphylaxis to NSAIDs, and local and general anaesthetics may also need to be referred to a specialist drug allergy service, e.g. in cases of anaphylactoid reactions or to determine future treatment options. Patients presenting with a suspected drug allergic reaction or anaphylaxis associated with beta-lactam antibiotics should be referred to a specialist drug allergy service if their disease or condition can only be treated by a beta-lactam antibiotic or they are likely to need beta-lactam antibiotics frequently in the future (e.g. immunodeficient patients).  For further information see Drug allergy: diagnosis and management. NICE Clinical Guideline 183 (September 2014) www.nice.org.uk/guidance/cg183.

Oral side-effects of drugs

Drug-induced disorders of the mouth may be due to a local action on the mouth or to a systemic effect manifested by oral changes. In the latter case urgent referral to the patient's medical practitioner may be necessary.

Oral mucosa Medicaments left in contact with or applied directly to the oral mucosa can lead to inflammation or ulceration; the possibility of allergy should also be borne in mind.

Aspirin tablets p. 121 allowed to dissolve in the sulcus for the treatment of toothache can lead to a white patch followed by ulceration.

Flavouring agents, particularly **essential oils**, may sensitise the skin, but mucosal swelling is not usually prominent.

The oral mucosa is particularly vulnerable to ulceration in patients treated with cytotoxic drugs, e.g. methotrexate p. 888. Other drugs capable of causing oral ulceration include **ACE inhibitors, gold, nicorandil p. 211, NSAIDs, pancreatin p. 96, penicillamine p. 1063, proguanil hydrochloride p. 607, and protease inhibitors**.

Erythema multiforme or Stevens–Johnson syndrome may follow the use of a wide range of drugs including **antibacterials, antiretrovirals, sulfonamide derivatives, and anticonvulsants**; the oral mucosa may be extensively ulcerated, with characteristic target lesions on the skin. Oral lesions of toxic epidermal necrolysis have been reported with a similar range of drugs.

Lichenoid eruptions are associated with **ACE inhibitors, NSAIDs, methyldopa p. 144, chloroquine p. 604, oral antidiabetics, thiazide diuretics, and gold**.

Candidiasis can complicate treatment with **antibacterials and immunosuppressants** and is an occasional side-effect of **corticosteroid inhalers**.

Teeth and jaw *Brown staining* of the teeth frequently follows the use of chlorhexidine mouthwash, spray or gel p. 1175, but can readily be removed by polishing. **Iron** salts in liquid form can stain the enamel black. Superficial staining has been reported rarely with co-amoxiclav suspension p. 542.

Intrinsic staining of the teeth is most commonly caused by **tetracyclines**. They will affect the teeth if given at any time from about the fourth month *in utero* until the age of twelve years; they are contra-indicated during pregnancy, in breast-feeding women, and in children under 12 years. All tetracyclines can cause permanent, unsightly staining in children, the colour varying from yellow to grey.

Excessive ingestion of **fluoride** leads to *dental fluorosis* with mottling of the enamel and areas of hypoplasia or pitting; fluoride supplements occasionally cause mild mottling (white patches) if the dose is too large for the child's age (taking into account the fluoride content of the local drinking water and of toothpaste).

The risk of *osteonecrosis of the jaw* is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget's disease. All patients receiving bisphosphonates should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients with cancer receiving bevacizumab p. 841 or sunitinib p. 967 may also be at risk of osteonecrosis of the jaw.

Periodontium *Gingival overgrowth* (gingival hyperplasia) is a side-effect of phenytoin p. 321 and sometimes of ciclosporin p. 818 or of nifedipine p. 162 (and some other calcium-channel blockers).

Thrombocytopenia may be drug related and may cause bleeding at the gingival margins, which may be spontaneous or may follow mild trauma (such as toothbrushing).

Salivary glands The most common effect that drugs have on the salivary glands is to *reduce flow* (xerostomia). Patients with a persistently dry mouth may have poor oral hygiene;

they are at an increased risk of dental caries and oral infections (particularly candidiasis). Many drugs have been implicated in xerostomia, particularly **antimuscarinics** (anticholinergics), **antidepressants** (including tricyclic antidepressants, and selective serotonin re-uptake inhibitors), **alpha-blockers**, **antihistamines**, **antipsychotics**, **baclofen** p. 1092, **bupropion hydrochloride** p. 491, **clonidine hydrochloride** p. 144, **5HT₁ agonists**, **opioids**, and **tizanidine** p. 1094. Excessive use of **diuretics** can also result in xerostomia. Some drugs (e.g. **clozapine** p. 392, **neostigmine** p. 1090) can *increase saliva production* but this is rarely a problem unless the patient has associated difficulty in swallowing. Pain in the salivary glands has been reported with some **antihypertensives** (e.g. **clonidine hydrochloride** p. 144, **methyl dopa** p. 144) and with **vinca alkaloids**. Swelling of the salivary glands can occur with **iodides**, **antithyroid drugs**, **phenothiazines**, and **sulfonamides**.

Taste There can be *decreased* taste acuity or *alteration* in taste sensation. Many drugs are implicated, including **amiodarone hydrochloride** p. 105, **calcitonin**, **ACE inhibitors**, **carbamazole** p. 754, **clarithromycin** p. 529, **gold**, **griseofulvin** p. 590, **lithium salts**, **metformin hydrochloride** p. 678, **metronidazole** p. 533, **penicillamine** p. 1063, **phenindione** p. 139, **propafenone hydrochloride** p. 104, **protease inhibitors**, **terbinafine** p. 1200, and **zopiclone** p. 484.

Defective medicines

During the manufacture or distribution of a medicine an error or accident may occur whereby the finished product does not conform to its specification. While such a defect may impair the therapeutic effect of the product and could adversely affect the health of a patient, it should **not** be confused with an Adverse Drug Reaction where the product conforms to its specification.

The Defective Medicines Report Centre assists with the investigation of problems arising from licensed medicinal products thought to be defective and co-ordinates any necessary protective action. Reports on suspect defective medicinal products should include the brand or the non-proprietary name, the name of the manufacturer or supplier, the strength and dosage form of the product, the product licence number, the batch number or numbers of the product, the nature of the defect, and an account of any action already taken in consequence. The Centre can be contacted at:

The Defective Medicines Report Centre
Medicines and Healthcare products Regulatory Agency,
151 Buckingham Palace Road, London, SW1W 9SZ
Tel: (020) 3080 6574
dmrc@mhra.gsi.gov.uk

Guidance on intravenous infusions

Intravenous additives policies

A local policy on the addition of drugs to intravenous fluids should be drawn up by a multi-disciplinary team and issued as a document to the members of staff concerned.

Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards.

The information that follows should be read in conjunction with local policy documents.

Guidelines

- Drugs should only be added to infusion containers when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.
- In general, only one drug should be added to any infusion container and the components should be compatible. Ready-prepared solutions should be used whenever possible. Drugs should not normally be added to blood products, mannitol, or sodium bicarbonate. Only specially formulated additives should be used with fat emulsions or amino-acid solutions.
- Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.
- Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).
- The infusion container should be labelled with the patient's name, the name and quantity of additives, and the date and time of addition (and the new expiry date or time). Such additional labelling should not interfere with information on the manufacturer's label that is still valid. When possible, containers should be retained for a period after use in case they are needed for investigation.
- It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

Problems

Microbial contamination The accidental entry and subsequent growth of micro-organisms converts the infusion fluid pathway into a potential vehicle for infection with micro-organisms, particularly species of *Candida*, *Enterobacter*, and *Klebsiella*. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should therefore be used in preference to making extemporaneous additions to infusion containers on wards etc. However, when this is necessary strict aseptic procedure should be followed.

Incompatibility Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or precipitation may occur, but in many instances there is no visual indication of incompatibility. Interaction may take place at any point in the infusion fluid pathway, and the potential for incompatibility is increased when more than one substance is added to the infusion fluid.

Common incompatibilities Precipitation reactions are numerous and varied and may occur as a result of pH, concentration changes, 'salting-out' effects, complexation or other chemical changes. Precipitation or other particle formation must be avoided since, apart from lack of control of dosage on administration, it may initiate or exacerbate adverse effects. This is particularly important in the case of drugs which have been implicated in either thrombophlebitis

(e.g. diazepam) or in skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and certain cytotoxic drugs). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin). It is considered undesirable to mix beta-lactam antibiotics, such as semi-synthetic penicillins and cephalosporins, with proteinaceous materials on the grounds that immunogenic and allergenic conjugates could be formed.

A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates. The breakdown products of dacarbazine have been implicated in adverse effects.

Blood Because of the large number of incompatibilities, drugs should not normally be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextrans (rouleaux formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (inactivated). If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

Intravenous fat emulsions These may break down with coalescence of fat globules and separation of phases when additions such as antibacterials or electrolytes are made, thus increasing the possibility of embolism. Only specially formulated products such as *Vitlipid N*[®] may be added to appropriate intravenous fat emulsions.

Other infusions Infusions that frequently give rise to incompatibility include amino acids, mannitol, and sodium bicarbonate.

Bactericides Bactericides such as chlorocresol 0.1% or phenylmercuric nitrate 0.001% are present in some injection solutions. The total volume of such solutions added to a container for infusion on one occasion should not exceed 15 mL.

Method

Ready-prepared infusions should be used whenever available. **Potassium chloride** is usually available in concentrations of 20, 27, and 40 mmol/litre in sodium chloride intravenous infusion (0.9%), glucose intravenous infusion (5%) or sodium chloride and glucose intravenous infusion. **Lidocaine hydrochloride** is usually available in concentrations of 0.1 or 0.2% in glucose intravenous infusion (5%).

When addition is required to be made extemporaneously, any product reconstitution instructions such as those relating to concentration, vehicle, mixing, and handling precautions should be strictly followed using an aseptic technique throughout. Once the product has been reconstituted, addition to the infusion fluid should be made immediately in order to minimise microbial contamination and, with certain products, to prevent degradation or other formulation change which may occur; e.g. reconstituted ampicillin injection degrades rapidly on standing, and also may form polymers which could cause sensitivity reactions. It is also important in certain instances that an infusion fluid of specific pH be used (e.g. **furosemide** injection requires dilution in infusions of pH greater than 5.5).

When drug additions are made it is important to mix thoroughly; additions should not be made to an infusion container that has been connected to a giving set, as mixing is hampered. If the solutions are not thoroughly mixed a concentrated layer of the additive may form owing to

differences in density. **Potassium chloride** is particularly prone to this 'layering' effect when added without adequate mixing to infusions packed in non-rigid infusion containers; if such a mixture is administered it may have a serious effect on the heart.

A time limit between addition and completion of administration must be imposed for certain admixtures to guarantee satisfactory drug potency and compatibility. For admixtures in which degradation occurs without the formation of toxic substances, an acceptable limit is the time taken for 10% decomposition of the drug. When toxic substances are produced stricter limits may be imposed. Because of the risk of microbial contamination a maximum time limit of 24 hours may be appropriate for additions made elsewhere than in hospital pharmacies offering central additive service.

Certain injections must be protected from light during continuous infusion to minimise oxidation, e.g. dacarbazine and sodium nitroprusside.

Dilution with a small volume of an appropriate vehicle and administration using a motorised infusion pump is advocated for preparations such as unfractionated heparin where strict control over administration is required. In this case the appropriate dose may be dissolved in a convenient volume (e.g. 24–48 mL) of sodium chloride intravenous infusion (0.9%).

Information provided in the *BNF*

The *BNF* gives information about preparations given by three methods:

- continuous infusion;
- intermittent infusion;
- addition via the drip tubing.

Drugs for **continuous infusion** must be diluted in a large volume infusion. Penicillins and cephalosporins are not usually given by continuous infusion because of stability problems and because adequate plasma and tissue concentrations are best obtained by intermittent infusion. Where it is necessary to administer them by continuous infusion, detailed literature should be consulted.

Drugs that are both compatible and clinically suitable may be given by **intermittent infusion** in a relatively small volume of infusion over a short period of time, e.g. 100 mL in 30 minutes. The method is used if the product is incompatible or unstable over the period necessary for continuous infusion; the limited stability of ampicillin or amoxicillin in large volume glucose or lactate infusions may be overcome in this way.

Intermittent infusion is also used if adequate plasma and tissue concentrations are not produced by continuous infusion as in the case of drugs such as dacarbazine, gentamicin, and ticarcillin.

An in-line burette may be used for intermittent infusion techniques in order to achieve strict control over the time and rate of administration, especially for infants and children and in intensive care units. Intermittent infusion may also make use of the 'piggy-back' technique provided that no additions are made to the primary infusion. In this method the drug is added to a small secondary container connected to a Y-type injection site on the primary infusion giving set; the secondary solution is usually infused within 30 minutes.

Addition via the drip tubing is indicated for a number of cytotoxic drugs in order to minimise extravasation. The preparation is added aseptically via the rubber septum of the injection site of a fast-running infusion. In general, drug preparations intended for a bolus effect should be given directly into a separate vein where possible. Failing this, administration may be made via the drip tubing provided that the preparation is compatible with the infusion fluid when given in this manner.

Drugs given by intravenous infusion The *BNF* includes information on addition to *Glucose intravenous infusion* 5 and 10%, and *Sodium chloride intravenous infusion* 0.9%. Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with *Sodium chloride and glucose intravenous infusion*. Infusion of a large volume of hypotonic solution should be avoided therefore care should be taken if water for injections is used. The information relates to the proprietary preparations indicated; for other preparations suitability should be checked with the manufacturer.

Prescribing in children

Overview

For detailed advice on medicines used for children, consult *BNF for Children*.

Children, and particularly neonates, differ from adults in their response to drugs. Special care is needed in the neonatal period (first 28 days of life) and doses should always be calculated with care. At this age, the risk of toxicity is increased by reduced drug clearance and differing target organ sensitivity.

Whenever possible, intramuscular injections should be **avoided** in children because they are painful.

Where possible, medicines for children should be prescribed within the terms of the marketing authorisation (product licence). However, many children may require medicines not specifically licensed for paediatric use.

Although medicines cannot be promoted outside the limits of the licence, the Human Medicines Regulations 2012 does not prohibit the use of unlicensed medicines. It is recognised that the informed use of unlicensed medicines or of licensed medicines for unlicensed applications ('off-label' use) is often necessary in paediatric practice.

Adverse drug reactions in children

Suspected adverse drug reactions in children and young adults under 18 years should be reported through the Yellow Card Scheme. Yellow cards can be used for reporting suspected adverse drug reactions to medicines, vaccines, herbal or complementary products, whether self-medicated or prescribed. This includes suspected adverse drug reactions associated with misuse, overdose, medication errors or from use of unlicensed and off-label medicines. Yellow Cards can also be used to report medical device incidents, defective medicines, and suspected fake medicines.

Report all suspected adverse drug reactions that are:

- **serious, medically significant or result in harm.** Serious events are fatal, life-threatening, a congenital abnormality, disabling or incapacitating, or resulting in hospitalisation;
- associated with **newer drugs and vaccines**; the most up to date list of black triangle medicines is available at:

www.mhra.gov.uk/blacktriangle

If in doubt whether to report a suspected adverse drug reaction, please complete a Yellow Card.

The identification and reporting of adverse reactions to drugs in children and neonates is particularly important because:

- the action of the drug and its pharmacokinetics in children (especially in the very young) may be different from that in adults;
- drugs may not have been extensively tested in children;
- many drugs are not specifically licensed for use in children and are used either 'off-label' or as unlicensed products;
- drugs may affect the way a child grows and develops or may cause delayed adverse reactions which do not occur in adults;
- suitable formulations may not be available to allow precise dosing in children or they may contain excipients that should be used with caution in children;
- the nature and course of illnesses and adverse drug reactions may differ between adults and children.

Even if reported through the British Paediatric Surveillance Unit's Orange Card Scheme, any identified suspected adverse drug reactions should also be submitted to the Yellow Card Scheme.

Adverse drug reactions where harm occurs as a result of a medication error are reportable as a Yellow Card or through the local risk management systems into the National

Reporting and Learning System (NRLS). If reported to the NRLS, these will be shared with the MHRA. If the NRLS is not available and harm occurs, report using a Yellow Card.

Prescription writing

Prescriptions should be written according to the guidelines in Prescription Writing. Inclusion of age is a legal requirement in the case of prescription-only medicines for children under 12 years of age, but it is preferable to state the age for **all** prescriptions for children.

It is particularly important to state the strengths of capsules or tablets. Although liquid preparations are particularly suitable for children, they may contain sugar which encourages dental decay. Sugar-free medicines are preferred for long-term treatment.

Many children are able to swallow tablets or capsules and may prefer a solid dose form; involving the child and parents in choosing the formulation is helpful.

When a prescription for a liquid oral preparation is written and the dose ordered is smaller than 5 mL an **oral syringe** will be supplied. Parents should be advised not to add any medicines to the infant's feed, since the drug may interact with the milk or other liquid in it; moreover the ingested dosage may be reduced if the child does not drink all the contents.

Parents must be warned to keep **all** medicines out of reach of children.

Rare paediatric conditions

Information on substances such as *biotin* and *sodium benzoate* used in rare metabolic conditions is included in *BNF for Children*; further information can be obtained from:

Alder Hey Children's Hospital
Drug Information Centre, Liverpool, L12 2AP
Tel: (0151) 252 5381

Great Ormond Street Hospital for Children
Pharmacy, Great Ormond St, London, WC1N 3JH
Tel: (020) 7405 9200

Dosage in children

Children's doses in the BNF are stated in the individual drug entries.

Doses are generally based on body-weight (in kilograms) or specific age ranges. In the BNF and *BNF for Children*, the term neonate is used to describe a newborn infant aged 0–28 days. The terms child or children are used generically to describe the entire range from infant to adolescent (1 month–17 years). An age range is specified when the dose information applies to a narrower age range than a child from 1 month–17 years.

Dose calculation

Many children's doses are standardised by **weight** (and therefore require multiplying by the body-weight in kilograms to determine the child's dose); occasionally, the doses have been standardised by **body surface area** (in m²). These methods should be used rather than attempting to calculate a child's dose on the basis of doses used in adults. For most drugs the adult maximum dose should not be exceeded. For example if the dose is stated as 8 mg/kg (max. 300 mg), a child weighing 10 kg should receive 80 mg but a child weighing 40 kg should receive 300 mg (rather than 320 mg).

Young children may require a higher dose per kilogram than adults because of their higher metabolic rates. Other problems need to be considered. For example, calculation by body-weight in the overweight child may result in much higher doses being administered than necessary; in such

cases, dose should be calculated from an ideal weight, related to height and age.

Body surface area (BSA) estimates are sometimes preferable to body-weight for calculation of paediatric doses since many physiological phenomena correlate better with body surface area. Body surface area can be estimated from weight. For more information, refer to *BNF for Children*. Where the dose for children is not stated, prescribers should consult *BNF for Children* or seek advice from a medicines information centre.

Prescribing in hepatic impairment

Overview

Liver disease may alter the response to drugs in several ways as indicated below, and drug prescribing should be kept to a minimum in all patients with severe liver disease. The main problems occur in patients with jaundice, ascites, or evidence of encephalopathy.

Impaired drug metabolism

Metabolism by the liver is the main route of elimination for many drugs, but hepatic reserve is large and liver disease has to be severe before important changes in drug metabolism occur. Routine liver-function tests are a poor guide to the capacity of the liver to metabolise drugs, and in the individual patient it is not possible to predict the extent to which the metabolism of a particular drug may be impaired. A few drugs, e.g. rifampicin p. 571 and fusidic acid p. 561, are excreted in the bile unchanged and can accumulate in patients with intrahepatic or extrahepatic obstructive jaundice.

Hypoproteinaemia

The hypoalbuminaemia in severe liver disease is associated with reduced protein binding and increased toxicity of some highly protein-bound drugs such as phenytoin p. 321 and prednisolone p. 664.

Reduced clotting

Reduced hepatic synthesis of blood-clotting factors, indicated by a prolonged prothrombin time, increases the

Dose frequency

Antibacterials are generally given at regular intervals throughout the day. Some flexibility should be allowed in children to avoid waking them during the night. For example, the night-time dose may be given at the child's bedtime.

Where new or potentially toxic drugs are used, the manufacturers' recommended doses should be carefully followed.

sensitivity to oral anticoagulants such as warfarin sodium p. 139 and phenindione p. 139.

Hepatic encephalopathy

In severe liver disease many drugs can further impair cerebral function and may precipitate hepatic encephalopathy. These include all sedative drugs, opioid analgesics, those diuretics that produce hypokalaemia, and drugs that cause constipation.

Fluid overload

Oedema and ascites in chronic liver disease can be exacerbated by drugs that give rise to fluid retention e.g. NSAIDs and corticosteroids.

Hepatotoxic drugs

Hepatotoxicity is either dose-related or unpredictable (idiosyncratic). Drugs that cause dose-related toxicity may do so at lower doses in the presence of hepatic impairment than in individuals with normal liver function, and some drugs that produce reactions of the idiosyncratic kind do so more frequently in patients with liver disease. These drugs should be avoided or used very carefully in patients with liver disease.

Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in the BNF.

Prescribing in renal impairment

Issues encountered in renal impairment

The use of drugs in patients with reduced renal function can give rise to problems for several reasons:

- reduced renal excretion of a drug or its metabolites may cause toxicity;
- sensitivity to some drugs is increased even if elimination is unimpaired;
- many side-effects are tolerated poorly by patients with renal impairment;
- some drugs are not effective when renal function is reduced.

Many of these problems can be avoided by reducing the dose or by using alternative drugs.

If even mild renal impairment is considered likely on clinical grounds, renal function should be checked before prescribing any drug which requires dose modification.

General guidance

Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug monograph in the BNF.

When both efficacy and toxicity are closely related to plasma-drug concentration, recommended regimens should be regarded only as a guide to initial treatment; subsequent doses must be adjusted according to clinical response and plasma-drug concentration.

Dose recommendations are based on the severity of renal impairment. The total daily maintenance dose of a drug can

be reduced either by reducing the size of the individual doses or by increasing the interval between doses.

For some drugs, although the size of the maintenance dose is reduced it is important to give a loading dose if an immediate effect is required. This is because it takes about five times the half-life of the drug to achieve steady-state plasma concentrations. Because the plasma half-life of drugs excreted by the kidney is prolonged in renal impairment it can take many doses for the reduced dosage to achieve a therapeutic plasma concentration.

Important: dosage adjustment advice in the BNF Clinical laboratories routinely report renal function in adults based on *estimated glomerular filtration rate* (eGFR) normalised to a body surface area of 1.73 m^2 —this is derived from either the Chronic Kidney Disease Epidemiology Collaboration (CKD-EPI) formula or the Modification of Diet in Renal Disease (MDRD) formula.

However, in product literature, the effects of renal impairment on drug elimination is usually stated in terms of *creatinine clearance* as a surrogate for GFR.

The information on dosage adjustment in the BNF is usually expressed in terms of eGFR. Exceptions to the use of eGFR include toxic drugs, in elderly patients and in patients at extremes of muscle mass (see *Estimating renal function in patients at extremes of muscle mass* and *Estimating renal function in elderly patients*, below) where calculation of CrCl is recommended. Although these two measures of renal function are not interchangeable, for most drugs and for most adult patients of average build and height, eGFR (rather than CrCl) can be used to determine dosage adjustments.

Nephrotoxic drugs Nephrotoxic drugs should, if possible, be avoided in patients with renal disease because the consequences of nephrotoxicity are likely to be more serious when renal reserve is already reduced. During intercurrent illness the risk of acute kidney injury is increased in patients with an eGFR of less than $60 \text{ mL/min/1.73 m}^2$; potentially nephrotoxic or renally excreted drugs may require dose reduction or temporary discontinuation.

Renal replacement therapy and transplantation For prescribing in patients who have received a renal transplant or who are on renal replacement therapy (peritoneal dialysis or haemodialysis), consult specialist literature.

Estimating renal function

Direct measure of Glomerular filtration rate (GFR) using plasma or urinary clearance is considered the best overall index of renal function. However, this is difficult to do in practice.

As an alternative, the *estimated* Glomerular filtration rate (eGFR) based on serum creatinine is used to assess renal function. Creatinine clearance (CrCl) is also used as an estimate of GFR.

Various equations for estimating glomerular filtration rate exist, however there is no compelling evidence to support the superiority of any given method for drug dosing in all patient populations or clinical situations. There is also insufficient evidence to provide *definitive* guidance about dosage adjustment of all drugs in patients with reduced renal function. Therefore, an understanding of drug pharmacokinetics is necessary in order to make appropriate dosing decisions.

Using serum creatinine to derive eGFR has a number of limitations; serum creatinine levels are dependent on muscle mass and diet, therefore estimates should be interpreted with caution in certain individuals (such as the elderly, body builders, amputees, in muscle-wasting disorders and vegans)—estimates will be higher or lower than the true value. Creatinine-derived measurements are also **not** useful in periods of rapidly changing renal function or in patients with AKI.

Estimated glomerular filtration rate

Chronic Kidney Disease Epidemiology Collaboration (CKD-EPI) formula The CKD-EPI formula is the recommended method for estimating GFR and calculating drug doses in **most** patients with renal impairment.

CKD-EPI is adjusted for body surface area (BSA) and utilises serum creatinine, age, sex and race as variables. Clinical laboratories should use the CKD-EPI formula to routinely report eGFR.

CKD-EPI equation

$$\text{eGFR (mL/min/1.73 m}^2\text{)} = 141 \times \text{min}(\text{S}_{\text{Cr}}/\text{K}, 1)^{\alpha} \times \text{max}(\text{S}_{\text{Cr}}/\text{K}, 1)^{1.209} \times 0.993^{\text{Age}} [\times 1.018 \text{ if female}]$$

[x 1.159 if black]

Where:

- S_{Cr} = serum creatinine in mg/dL;
- $\text{K} = 0.7$ for females and 0.9 for males;
- $\alpha = -0.329$ for females and -0.411 for males;
- $\text{min}(\text{S}_{\text{Cr}}/\text{K}, 1)$ indicates the minimum of $\text{S}_{\text{Cr}}/\text{K}$ or 1 ;
- $\text{max}(\text{S}_{\text{Cr}}/\text{K}, 1)$ indicates the maximum of $\text{S}_{\text{Cr}}/\text{K}$ or 1 .

Modification of Diet in Renal Disease (MDRD) The MDRD formula, like CKD-EPI, is expressed in terms of body surface area. It is less accurate than the CKD-EPI formula when eGFR is greater than $60 \text{ mL/min/1.73 m}^2$. It also overestimates GFR in elderly patients.

Estimated creatinine clearance

Cockcroft and Gault The Cockcroft and Gault formula is the preferred method for estimating renal function or calculating drug doses in patients with renal impairment who are elderly or at extremes of muscle mass (see below); it provides an estimate of CrCl (which is not equivalent to eGFR).

$$\text{Estimated Creatinine Clearance} = \frac{(140 - \text{Age}) \times \text{Weight} \times \text{Constant}}{\text{Serum creatinine}}$$

in mL/minute

- Age in years
- Weight in kilograms (use ideal body weight where fat is likely to be the major contributor to body mass)
- Serum creatinine in micromol/litre
- Constant = 1.23 for men; 1.04 for women

Estimating renal function in patients at extremes of muscle mass In patients at both extremes of muscle mass, eGFR should be interpreted with caution. Reduced muscle mass will lead to overestimation of GFR and increased muscle mass will lead to underestimation of the GFR.

Creatinine clearance or absolute glomerular filtration rate should be used to adjust drug doses in patients with a BMI less than 18 kg/m^2 or greater than 40 kg/m^2 .

Ideal body weight should be used to calculate the CrCl. Where the patient's actual body weight is less than their ideal body weight, actual body weight should be used instead.

The absolute glomerular filtration rate is determined by removing the normalisation for BSA from the eGFR using the following formula:

$$\text{GFR (Absolute)} = \text{eGFR} \times (\text{individual's body surface area} / 1.73)$$

The ideal body weight is calculated as follows:

$$\text{Ideal body weight (kilograms)} = \text{Constant} + 0.91 (\text{Height} - 152.4)$$

Where:

- Constant = 50 for men; 45.5 for women
- Height in centimetres

Estimating renal function in elderly patients The Cockcroft and Gault formula is the preferred method for estimating renal function in elderly patients aged 75 years and over.

Chronic kidney disease

Classification of chronic kidney disease using GFR and ACR categories Chronic kidney disease is classified using a combination of GFR and albumin:creatinine ratio (ACR). A decreased GFR and an increased ACR is associated with an increased risk of adverse outcomes. For example, a person with an eGFR of 25 ml/min/1.73 m² and an ACR of 15 mg/mmol has a CKD classification of G4A2.

GFR and ACR categories and risk of adverse outcomes			ACR categories (mg/mmol), description and range		
			<3 Normal to mild increase	3–30 Moderate increase	>30 Severe increase
			A1	A2	A3
GFR categories (ml/min/1.73m ²), description and range	≥90 Normal or high	G1	No CKD in the absence of markers of kidney damage		
	60–89 Mild reduction relative to normal range for a young adult	G2			
	45–59 Mild-moderate reduction	G3a			
	30–44 Moderate-severe reduction	G3b			
	15–29 Severe reduction	G4			
	<15 Kidney failure	G5			
			Increasing risk		
			Increasing risk		
Abbreviations: ACR, albumin:creatinine ratio; CKD, chronic kidney disease; GFR, glomerular filtration rate					

Adapted with the kind permission of the Kidney Disease: Improving Global Outcomes (KDIGO) CKD Work Group, 2013.

Prescribing in pregnancy

Overview

Drugs can have harmful effects on the embryo or fetus at any time during pregnancy. It is important to bear this in mind when prescribing for a woman of *childbearing age* or for men *trying to father* a child.

During the *first trimester* drugs can produce congenital malformations (teratogenesis), and the period of greatest risk is from the third to the eleventh week of pregnancy.

During the *second and third trimesters* drugs can affect the growth or functional development of the fetus, or they can have toxic effects on fetal tissues.

Drugs given shortly before term or during labour can have adverse effects on labour or on the neonate after delivery.

Not all the damaging effects of intra-uterine exposure to drugs are obvious at birth, some may only manifest later in life. Such late-onset effects include malignancy, e.g. adenocarcinoma of the vagina after puberty in females exposed to diethylstilbestrol in the womb, and adverse effects on intellectual, social, and functional development.

The *BNF* and *BNF for Children* identifies drugs which:

- may have harmful effects in pregnancy and indicates the trimester of risk
- are not known to be harmful in pregnancy

The information is based on human data, but information from *animal* studies has been included for some drugs when its omission might be misleading. Maternal drug doses may require adjustment during pregnancy due to changes in

maternal physiology but this is beyond the scope of the *BNF* and *BNF for Children*.

Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the *BNF* and *BNF for Children*.

Important

Drugs should be prescribed in pregnancy only if the expected benefit to the mother is thought to be greater than the risk to the fetus, and all drugs should be avoided if possible during the first trimester. Drugs which have been extensively used in pregnancy and appear to be usually safe should be prescribed in preference to new or untried drugs; and the smallest effective dose should be used. Few drugs have been shown conclusively to be teratogenic in humans, but no drug is safe beyond all doubt in early pregnancy. Screening procedures are available when there is a known risk of certain defects.

Absence of information does not imply safety. It should be noted that the *BNF* and *BNF for Children* provide independent advice and may not always agree with the product literature.

Information on drugs and pregnancy is also available from the UK Teratology Information Service. www.uktis.org.

Tel: 0344 892 0909 (09.00–17.00 Monday to Friday; urgent enquiries only outside these hours).

Prescribing in breast-feeding

Overview

Breast-feeding is beneficial; the immunological and nutritional value of breast milk to the infant is greater than that of formula feeds.

Although there is concern that drugs taken by the mother might affect the infant, there is very little information on this. In the absence of evidence of an effect, the potential for harm to the infant can be inferred from:

- the amount of drug or active metabolite of the drug delivered to the infant (dependent on the pharmacokinetic characteristics of the drug in the mother);
- the efficiency of absorption, distribution, and elimination of the drug by the infant (infant pharmacokinetics);
- the nature of the effect of the drug on the infant (pharmacodynamic properties of the drug in the infant).

The amount of drug transferred in breast milk is rarely sufficient to produce a discernible effect on the infant. This applies particularly to drugs that are poorly absorbed and need to be given parenterally. However, there is a theoretical possibility that a small amount of drug present in breast milk can induce a hypersensitivity reaction.

A clinical effect can occur in the infant if a pharmacologically significant quantity of the drug is present in milk. For some drugs (e.g. fluvastatin p. 201), the ratio between the concentration in milk and that in maternal plasma may be high enough to expose the infant to adverse effects. Some infants, such as those born prematurely or who have jaundice, are at a slightly higher risk of toxicity.

Some drugs inhibit the infant's sucking reflex (e.g. phenobarbital p. 331) while others can affect lactation (e.g. bromocriptine p. 414).

The *BNF* identifies drugs:

- that should be used with caution or are contra-indicated in breast-feeding;
- that can be given to the mother during breast-feeding because they are present in milk in amounts which are too small to be harmful to the infant;
- that might be present in milk in significant amount but are not known to be harmful.

Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the *BNF*.

Important

For many drugs insufficient evidence is available to provide guidance and it is advisable to administer only essential drugs to a mother during breast-feeding. Because of the inadequacy of information on drugs in breast-feeding, absence of information does not imply safety.

Prescribing in palliative care

Overview

Palliative care is an approach that improves the quality of life of patients and their families facing life-threatening illness, through the prevention and relief of suffering by means of early identification and impeccable assessment and treatment of pain and other problems, physical, psychosocial, and spiritual. Careful assessment of symptoms and needs of the patient should be undertaken by a multidisciplinary team.

Specialist palliative care is available in most areas as day hospice care, home-care teams (often known as Macmillan teams), in-patient hospice care, and hospital teams. Many acute hospitals and teaching centres now have consultative, hospital-based teams.

Hospice care of terminally ill patients has shown the importance of symptom control and psychosocial support of the patient and family. Families should be included in the care of the patient if they wish.

Many patients wish to remain at home with their families. Although some families may at first be afraid of caring for the patient at home, support can be provided by community nursing services, social services, voluntary agencies and hospices together with the general practitioner. The family may be reassured by the knowledge that the patient will be admitted to a hospital or hospice if the family cannot cope.

Drug treatment The number of drugs should be as few as possible, for even the taking of medicine may be an effort. Oral medication is usually satisfactory unless there is severe nausea and vomiting, dysphagia, weakness, or coma, when parenteral medication may be necessary.

Pain

Pain management in palliative care is focused on achieving control of pain by administering the right drug in the right dose at the right time. Analgesics can be divided into three broad classes: non-opioid (paracetamol p. 438, NSAID), opioid (e.g. codeine phosphate p. 448 'weak', morphine p. 456 'strong') and adjuvant (e.g. antidepressants, antiepileptics). Drugs from the different classes are used alone or in combination according to the type of pain and response to treatment. Analgesics are more effective in preventing pain than in the relief of established pain; it is important that they are given regularly.

Paracetamol p. 438 or a NSAID given regularly will often be sufficient to manage mild pain. If non-opioid analgesics alone are not sufficient, then an opioid analgesic alone or in combination with a non-opioid analgesic at an adequate dosage, may be helpful in the control of moderate pain. Codeine phosphate p. 448 or tramadol hydrochloride p. 464 can be considered for moderate pain. If these preparations do not control the pain then morphine p. 456 is the most useful opioid analgesic. Alternatives to morphine, including transdermal buprenorphine p. 442, transdermal fentanyl p. 451, hydromorphone hydrochloride p. 456, methadone hydrochloride p. 495, or oxycodone hydrochloride p. 459, should be initiated by those with experience in palliative care. Initiation of an opioid analgesic should not be delayed by concern over a theoretical likelihood of psychological dependence (addiction).

Bone metastases In addition to the above approach, radiotherapy, bisphosphonates, and radioactive isotopes of strontium chloride (*Metastron*® available from GE Healthcare) may be useful for pain due to bone metastases.

Neuropathic pain Patients with **neuropathic pain** may benefit from a trial of a tricyclic antidepressant. An antiepileptic may be added or substituted if pain persists; gabapentin p. 314 and pregabalin p. 322 are licensed for neuropathic pain. Ketamine p. 1305 is sometimes used under

specialist supervision for neuropathic pain that responds poorly to opioid analgesics. Pain due to nerve compression may be reduced by a corticosteroid such as dexamethasone p. 660, which reduces oedema around the tumour, thus reducing compression. Nerve blocks or regional anaesthesia techniques (including the use of epidural and intrathecal catheters) can be considered when pain is localised to a specific area.

Pain management with opioids

Oral route Treatment with morphine p. 456 is given by mouth as immediate-release or modified-release preparations. During the titration phase the initial dose is based on the previous medication used, the severity of the pain, and other factors such as presence of renal impairment, increasing age, or frailty. The dose is given either as an immediate-release preparation 4-hourly or as a modified-release preparation 12-hourly, in addition to rescue doses. If pain occurs between regular doses of morphine ('breakthrough pain'), an additional dose ('rescue dose') of immediate-release morphine should be given. An additional dose should also be given 30 minutes before an activity that causes pain, such as wound dressing. The standard dose of a strong opioid for breakthrough pain is usually one-tenth to one-sixth of the regular 24-hour dose, repeated every 2–4 hours as required (up to hourly may be needed if pain is severe or in the last days of life). Review pain management if rescue analgesic is required frequently (twice daily or more). Each patient should be assessed on an individual basis. Formulations of fentanyl p. 451 that are administered nasally, buccally or sublingually are also licensed for breakthrough pain.

When adjusting the dose of morphine p. 456, the number of rescue doses required and the response to them should be taken into account; increments of morphine should not exceed one-third to one-half of the total daily dose every 24 hours. Thereafter, the dose should be adjusted with careful assessment of the pain, and the use of adjuvant analgesics should also be considered. Upward titration of the dose of morphine stops when either the pain is relieved or unacceptable adverse effects occur, after which it is necessary to consider alternative measures.

Morphine immediate-release 30mg 4-hourly (or modified-release 100 mg 12-hourly) is usually adequate for most patients; some patients require morphine immediate-release up to 200mg 4-hourly (or modified-release 600 mg 12-hourly), occasionally more is needed.

Once their pain is controlled, patients started on 4-hourly immediate-release morphine can be transferred to the same total 24-hour dose of morphine given as the modified-release preparation for 12-hourly or 24-hourly administration. The first dose of the modified-release preparation is given with, or within 4 hours of, the last dose of the immediate-release preparation. For preparations suitable for 12-hourly or 24-hourly administration see modified-release preparations under morphine. Increments should be made to the dose, not to the frequency of administration. The patient must be monitored closely for efficacy and side-effects, particularly constipation, and nausea and vomiting. A suitable laxative should be prescribed routinely.

Oxycodone hydrochloride p. 459 can be used in patients who require an opioid but cannot tolerate morphine. If the patient is already receiving an opioid, oxycodone hydrochloride should be started at a dose equivalent to the current analgesic (see below). Oxycodone hydrochloride immediate-release preparations can be given for breakthrough pain.

Equivalent doses of opioid analgesics.

This table is only an **approximate** guide (doses may not correspond with those given in clinical practice); patients should be carefully monitored after any change in medication and dose titration may be required.

Analgesic/Route	Dose
Codeine: PO	100 mg
Diamorphine: IM, IV, SC	3 mg
Dihydrocodeine: PO	100 mg
Hydromorphone: PO	2 mg
Morphine: PO	10 mg
Morphine: IM, IV, SC	5 mg
Oxycodone: PO	6.6 mg
Tramadol: PO	100 mg

PO = by mouth; IM = intramuscular; IV = intravenous; SC = subcutaneous

Parenteral route The equivalent parenteral dose of morphine p. 456 (subcutaneous, intramuscular, or intravenous) is about half of the oral dose. If the patient becomes unable to swallow, generally morphine is administered as a continuous subcutaneous infusion (for details, see Continuous Subcutaneous Infusions below). Diamorphine hydrochloride p. 449 is sometimes preferred, because being more soluble, it can be given in a smaller volume. The equivalent subcutaneous dose of diamorphine hydrochloride is about one-third of the oral dose of morphine. If the patient can resume taking medicines by mouth, then oral morphine may be substituted for subcutaneous infusion of morphine or diamorphine hydrochloride, see table above of approximate equivalent doses of morphine and diamorphine hydrochloride. The infusion is discontinued when the first oral dose of morphine is given.

Rectal route Morphine p. 456 is also available for rectal administration as suppositories; alternatively oxycodone hydrochloride suppositories p. 459 can be obtained on special order.

Transdermal route Transdermal preparations of fentanyl p. 451 and buprenorphine p. 442 are available, they are not suitable for acute pain or in patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Prescribers should ensure that they are familiar with the correct use of transdermal preparations, see under buprenorphine p. 442 and fentanyl p. 451 (inappropriate use has caused fatalities). Immediate-release morphine p. 456 can be given for breakthrough pain. The following 24-hour oral doses of morphine are considered to be *approximately* equivalent to the buprenorphine and fentanyl patches shown, however when switching due to possible opioid-induced hyperalgesia, reduce the calculated equivalent dose of the new opioid by one-quarter to one-half.

Buprenorphine patches are *approximately* equivalent to the following 24-hour doses of oral morphine

morphine salt 12 mg daily	≡ buprenorphine '5' patch
morphine salt 24 mg daily	≡ buprenorphine '10' patch
morphine salt 36 mg daily	≡ buprenorphine '15' patch
morphine salt 48 mg daily	≡ buprenorphine '20' patch
morphine salt 84 mg daily	≡ buprenorphine '35' patch
morphine salt 126 mg daily	≡ buprenorphine '52.5' patch
morphine salt 168 mg daily	≡ buprenorphine '70' patch

Formulations of transdermal patches are available as 72-hourly, 96-hourly and 7-day patches, for further information see buprenorphine p. 442. Conversion ratios vary and these figures are a guide only. Morphine equivalences for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral morphine.

72-hour Fentanyl patches are *approximately* equivalent to the following 24-hour doses of oral morphine

morphine salt 30 mg daily	≡ fentanyl '12' patch
morphine salt 60 mg daily	≡ fentanyl '25' patch
morphine salt 120 mg daily	≡ fentanyl '50' patch
morphine salt 180 mg daily	≡ fentanyl '75' patch
morphine salt 240 mg daily	≡ fentanyl '100' patch

Fentanyl equivalences in this table are for patients on well-tolerated opioid therapy for long periods; for patients who are opioid naive or who have been stable on oral morphine or other immediate release opioid for only several weeks, see Transdermal Route. Conversion ratios vary and these figures are a guide only. Morphine equivalences for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral morphine.

Symptom control

Several recommendations in this section involve unlicensed indications or routes.

Anorexia Anorexia may be helped by prednisolone p. 664 or dexamethasone p. 660.

Bowel colic and excessive respiratory secretions Bowel colic and excessive respiratory secretions may be reduced by a subcutaneous injection of hyoscine hydrobromide p. 433, hyoscine butylbromide p. 85, or glycopyrronium bromide p. 246. These antimuscarinics are generally given every 4 hours when required, but hourly use is occasionally necessary, particularly in excessive respiratory secretions. If symptoms persist, they can be given regularly via a continuous infusion device. Care is required to avoid the discomfort of dry mouth.

Capillary bleeding Capillary bleeding can be treated with tranexamic acid p. 110 by mouth; treatment is usually discontinued one week after the bleeding has stopped, or, if necessary, it can be continued at a reduced dose. Alternatively, gauze soaked in tranexamic acid 100 mg/mL p. 110 or adrenaline/epinephrine solution 1 mg/mL (1 in 1000) p. 221 can be applied to the affected area. Vitamin K may be useful for the treatment and prevention of bleeding associated with prolonged clotting in liver disease. In severe chronic cholestasis, absorption of vitamin K may be impaired; either parenteral or water-soluble oral vitamin K (see phytomenadione p. 1056 and menadiol sodium phosphate p. 1056) should be considered.

Constipation Constipation is a common cause of distress and is almost invariable after administration of an opioid

analgesic. It should be prevented if possible by the regular administration of laxatives; a faecal softener with a peristaltic stimulant (e.g. co-danthramer p. 61) or lactulose solution p. 56 with a senna preparation p. 63 should be used. Methylnaltrexone bromide p. 64 is licensed for the treatment of opioid-induced constipation.

Convulsions Patients with cerebral tumours or uraemia may be susceptible to convulsions. Prophylactic treatment with phenytoin p. 321 or carbamazepine p. 309 should be considered. When oral medication is no longer possible, diazepam p. 340 given rectally, or phenobarbital p. 331 by injection is continued as prophylaxis. For the use of midazolam p. 336 by subcutaneous infusion using a continuous infusion device see below.

Dry mouth Dry mouth may be relieved by good mouth care and measures such as chewing sugar-free gum, sucking ice or pineapple chunks, or the use of artificial saliva, dry mouth associated with candidiasis can be treated by oral preparations of nystatin p. 1184 or miconazole p. 811, alternatively, fluconazole p. 584 can be given by mouth. Dry mouth may be caused by certain medications including opioids, antimuscarinic drugs (e.g. hyoscine), antidepressants and some antiemetics; if possible, an alternative preparation should be considered.

Dysphagia A corticosteroid such as dexamethasone p. 660 may help, temporarily, if there is an obstruction due to tumour. See also *Dry mouth*, above.

Dyspnoea Breathlessness at rest may be relieved by regular oral morphine p. 456 in carefully titrated doses. Diazepam p. 340 may be helpful for dyspnoea associated with anxiety. A corticosteroid, such as dexamethasone p. 660, may also be helpful if there is bronchospasm or partial obstruction.

Fungating tumours Fungating tumours can be treated by regular dressing and antibacterial drugs; systemic treatment with metronidazole p. 533 is often required to reduce malodour but topical metronidazole p. 533 is also used.

Gastro-intestinal pain The pain of bowel colic may be reduced by loperamide hydrochloride p. 66. Hyoscine hydrobromide p. 433 may also be helpful, given sublingually as *Kwells*® tablets. Subcutaneous injections of hyoscine butylbromide p. 85, hyoscine hydrobromide p. 433, and glycopyrronium bromide p. 246 can also be used to treat bowel colic.

Gastric distension pain due to pressure on the stomach may be helped by a preparation incorporating an antacid with an antilulant and a prokinetic such as domperidone p. 426 before meals.

Hiccup Hiccup due to gastric distension may be helped by a preparation incorporating an antacid with an antilulant. If this fails, metoclopramide hydrochloride p. 426 by mouth or by subcutaneous or intramuscular injection can be added; if this also fails, baclofen p. 1092, or nifedipine p. 162, or chlorpromazine hydrochloride p. 381 can be tried.

Insomnia Patients with advanced cancer may not sleep because of discomfort, cramps, night sweats, joint stiffness, or fear. There should be appropriate treatment of these problems before hypnotics are used. Benzodiazepines, such as temazepam p. 614, may be useful.

Intractable cough Intractable cough may be relieved by moist inhalations or by regular administration of oral morphine p. 456. Methadone hydrochloride linctus p. 495 should be avoided because it has a long duration of action and tends to accumulate.

Muscle spasm The pain of muscle spasm can be helped by a muscle relaxant such as diazepam p. 340 or baclofen p. 1092.

Nausea and vomiting Nausea and vomiting are common in patients with advanced cancer. Ideally, the cause should be determined before treatment with an antiemetic is started.

A prokinetic antiemetic may be a preferred choice for first-line therapy.

Nausea and vomiting may occur with opioid therapy particularly in the initial stages but can be prevented by giving an antiemetic such as haloperidol p. 382 or metoclopramide hydrochloride p. 426. An antiemetic is usually necessary only for the first 4 or 5 days and therefore combined preparations containing an opioid with an antiemetic are not recommended because they lead to unnecessary antiemetic therapy (and associated side-effects when used long-term).

Metoclopramide hydrochloride p. 426 has a prokinetic action and is used by mouth for nausea and vomiting associated with gastritis, gastric stasis, and functional bowel obstruction. Drugs with antimuscarinic effects antagonise prokinetic drugs and, if possible, should not be used concurrently.

Haloperidol p. 382 is used by mouth for most metabolic causes of vomiting (e.g. hypercalcaemia, renal failure). Cyclizine p. 424 is given by mouth. It is used for nausea and vomiting due to mechanical bowel obstruction, raised intracranial pressure, and motion sickness.

Levomepromazine p. 435 is used as an antiemetic; it is given by mouth or by subcutaneous injection at bedtime. For the dose by subcutaneous infusion see below. Dexamethasone p. 660 by mouth can be used as an adjunct.

Antiemetic therapy should be reviewed every 24 hours; it may be necessary to substitute the antiemetic or to add another one.

For the administration of antiemetics by subcutaneous infusion using a continuous infusion device, see below.

For the treatment of nausea and vomiting associated with cancer chemotherapy see Cytotoxic drugs p. 865.

Pruritus Pruritus, even when associated with obstructive jaundice, often responds to simple measures such as application of emollients. In the case of obstructive jaundice, further measures include administration of colestyramine p. 196.

Raised intracranial pressure Headache due to raised intracranial pressure often responds to a high dose of a corticosteroid, such as dexamethasone p. 660 and should be given before 6 p.m. to reduce the risk of insomnia.

Restlessness and confusion Restlessness and confusion may require treatment with an antipsychotic, e.g. haloperidol p. 382 or levomepromazine p. 435, by mouth or by subcutaneous injection, both repeated every 2 hours if required. The dose and frequency is adjusted according to the level of patient distress and the response. A regular maintenance dose should also be considered, given twice daily either by mouth or by subcutaneous injection; alternatively use a continuous infusion device. Levomepromazine p. 435 is licensed to treat pain in palliative care—this use is reserved for distressed patients with severe pain unresponsive to other measures (seek specialist advice).

Continuous subcutaneous infusions

Although drugs can usually be administered by mouth to control the symptoms of advanced cancer, the parenteral route may sometimes be necessary. Repeated administration of intramuscular injections can be difficult in a cachectic patient. This has led to the use of portable continuous infusion devices, such as syringe drivers, to give a continuous subcutaneous infusion, which can provide good control of symptoms with little discomfort or inconvenience to the patient.

Indications for the parenteral route are:

- the patient is unable to take medicines by mouth owing to nausea and vomiting, dysphagia, severe weakness, or coma

- there is *malignant bowel obstruction* in patients for whom further surgery is inappropriate (avoiding the need for an intravenous infusion or for insertion of a nasogastric tube)
- occasionally when the patient *does not wish* to take regular medication by mouth.

Syringe driver rate settings Staff using syringe drivers should be **adequately trained** and different rate settings should be **clearly identified** and **differentiated**; incorrect use of syringe drivers is a common cause of medication errors.

Bowel colic and excessive respiratory secretions Hyoscine hydrobromide p. 433 effectively reduces respiratory secretions and bowel colic and is sedative (but occasionally causes paradoxical agitation).

Hyoscine butylbromide p. 85 is used for bowel colic and for excessive respiratory secretions, and is less sedative than hyoscine hydrobromide.

Glycopyrronium bromide p. 246 may also be used to treat bowel colic or excessive respiratory secretions.

Confusion and restlessness Haloperidol p. 382 has little sedative effect.

Levomepromazine p. 435 has a sedative effect.

Midazolam p. 336 is a sedative and an antiepileptic that may be used in addition to an antipsychotic drug in a very restless patient. Midazolam is also used for myoclonus.

Convulsions If a patient has previously been receiving an antiepileptic drug *or* has a primary or secondary cerebral tumour *or* is at risk of convulsion (e.g. owing to uraemia) antiepileptic medication should not be stopped. Midazolam p. 336 is the benzodiazepine antiepileptic of choice for *continuous subcutaneous infusion*.

Nausea and vomiting Haloperidol p. 382 and levomepromazine p. 435 can both be given as a *subcutaneous infusion* but sedation can limit the dose of levomepromazine. Cyclizine is particularly likely to precipitate if mixed with diamorphine or other drugs (see under Mixing and Compatibility, below)

Metoclopramide hydrochloride p. 426 can cause skin reactions.

Octreotide p. 924, which stimulates water and electrolyte absorption and inhibits water secretion in the small bowel, can be used by subcutaneous infusion to reduce intestinal secretions and to reduce vomiting due to bowel obstruction.

Pain control Diamorphine hydrochloride p. 449 is the preferred opioid since its high solubility permits a large dose to be given in a small volume (see under Mixing and Compatibility, below). The table shows approximate equivalent doses of morphine p. 456 and diamorphine hydrochloride p. 449.

Mixing and compatibility The general principle that injections should be given into separate sites (and should not be mixed) does not apply to the use of syringe drivers in palliative care. Provided that there is evidence of compatibility, selected injections can be mixed in syringe drivers. Not all types of medication can be used in a subcutaneous infusion. In particular, chlorpromazine hydrochloride p. 381, prochlorperazine p. 385, and diazepam p. 340 are **contra-indicated** as they cause skin reactions at the injection site; to a lesser extent cyclizine p. 424 and levomepromazine p. 435 also sometimes cause local irritation.

In theory injections dissolved in water for injections are more likely to be associated with pain (possibly owing to their hypotonicity). The use of physiological saline (sodium chloride 0.9% p. 1008) however increases the likelihood of precipitation when more than one drug is used; moreover subcutaneous infusion rates are so slow (0.1–0.3 mL/hour) that pain is not usually a problem when water is used as a diluent.

Compatibility with diamorphine Diamorphine can be given by *subcutaneous infusion* in a strength of up to 250 mg/mL; up to a strength of 40 mg/mL either *water for injections* or *physiological saline* (sodium chloride 0.9%) is a suitable diluent—above that strength only *water for injections* is used (to avoid precipitation).

The following can be mixed with *diamorphine*:

- **Cyclizine**, may precipitate at concentrations above 10 mg/mL *or* in the presence of sodium chloride 0.9% *or* as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.
- **Dexamethasone**, special care is needed to avoid precipitation of dexamethasone when preparing it.
- **Haloperidol**, mixtures of haloperidol and diamorphine are likely to precipitate after 24 hours if haloperidol concentration is above 2 mg/mL.
- **Hyoscine butylbromide**
- **Hyoscine hydrobromide**
- **Levomepromazine**
- **Metoclopramide**, under some conditions infusions containing metoclopramide become discoloured; such solutions should be discarded.
- **Midazolam**

Subcutaneous infusion solution should be monitored regularly both to check for precipitation (and discolouration) and to ensure that the infusion is running at the correct rate.

Problems encountered with syringe drivers The following are problems that may be encountered with syringe drivers and the action that should be taken:

- if the subcutaneous infusion runs *too quickly* check the rate setting and the calculation;
- if the subcutaneous infusion runs *too slowly* check the start button, the battery, the syringe driver, the cannula, and make sure that the injection site is not inflamed;
- if there is an *injection site reaction* make sure that the site does not need to be changed—firmness or swelling at the site of injection is not in itself an indication for change, but pain or obvious inflammation is.

Equivalent doses of morphine sulfate and diamorphine hydrochloride given over 24 hours

These equivalences are *approximate only* and should be adjusted according to response

ORAL MORPHINE	PARENTERAL MORPHINE	PARENTERAL DIAMORPHINE
Oral morphine sulfate over 24 hours	Subcutaneous infusion of morphine sulfate over 24 hours	Subcutaneous infusion of diamorphine hydrochloride over 24 hours
30 mg	15 mg	10 mg
60 mg	30 mg	20 mg
90 mg	45 mg	30 mg
120 mg	60 mg	40 mg
180 mg	90 mg	60 mg
240 mg	120 mg	80 mg
360 mg	180 mg	120 mg
480 mg	240 mg	160 mg
600 mg	300 mg	200 mg
780 mg	390 mg	260 mg
960 mg	480 mg	320 mg
1200 mg	600 mg	400 mg

If breakthrough pain occurs give a subcutaneous (preferable) or intramuscular injection equivalent to one-tenth to one-sixth of the total 24-hour subcutaneous infusion dose. It is kinder to give an intermittent bolus injection *subcutaneously*—absorption is smoother so that the risk of adverse effects at peak absorption is avoided (an even better method is to use a subcutaneous butterfly needle). To minimise the risk of infection no individual subcutaneous infusion solution should be used for longer than 24 hours.

Prescribing in the elderly

Overview

Old people, especially the very old, require special care and consideration from prescribers. *Medicines for Older People*, a component document of the National Service Framework for Older People (Department of Health. National Service Framework for Older People. London: Department of Health, March 2001), describes how to maximise the benefits of medicines and how to avoid excessive, inappropriate, or inadequate consumption of medicines by older people.

Appropriate prescribing

Elderly patients often receive multiple drugs for their multiple diseases. This greatly increases the risk of drug interactions as well as adverse reactions, and may affect compliance. The balance of benefit and harm of some medicines may be altered in the elderly. Therefore, elderly patients' medicines should be reviewed regularly and medicines which are not of benefit should be stopped. Non-pharmacological measures may be more appropriate for symptoms such as headache, sleeplessness, and light-headedness when associated with social stress as in widowhood, loneliness, and family dispersal. In some cases prophylactic drugs are inappropriate if they are likely to complicate existing treatment or introduce unnecessary side-effects, especially in elderly patients with poor prognosis and with poor overall health. However, elderly patients should not be denied medicines which may help them, such as anticoagulants or antiplatelet drugs for atrial fibrillation, antihypertensives, statins, and drugs for osteoporosis.

Form of medicine

Frail elderly patients may have difficulty swallowing tablets; if left in the mouth, ulceration may develop. They should always be encouraged to take their tablets or capsules with enough fluid, and whilst in an upright position to avoid the possibility of oesophageal ulceration. It can be helpful to discuss with the patient the possibility of taking the drug as a liquid if available.

Manifestations of ageing

In the very old, manifestations of normal ageing may be mistaken for disease and lead to inappropriate prescribing. In addition, age-related muscle weakness and difficulty in maintaining balance should not be confused with neurological disease. Disorders such as light-headedness not associated with postural or postprandial hypotension are unlikely to be helped by drugs.

Sensitivity

The nervous system of elderly patients is more sensitive to many commonly used drugs, such as opioid analgesics, benzodiazepines, antipsychotics, and antiparkinsonian drugs, all of which must be used with caution. Similarly, other organs may also be more susceptible to the effects of drugs such as anti-hypertensives and NSAIDs.

Pharmacokinetics

Pharmacokinetic changes can markedly increase the tissue concentration of a drug in the elderly, especially in debilitated patients.

The most important effect of age is reduced renal clearance. Many aged patients thus *excrete drugs slowly*, and are *highly susceptible to nephrotoxic drugs*. Acute illness can lead to rapid reduction in renal clearance, especially if accompanied by dehydration. Hence, a patient stabilised on a drug with a narrow margin between the therapeutic and the toxic dose (e.g. digoxin p. 109) can rapidly develop adverse effects in the aftermath of a myocardial infarction or a respiratory-

tract infection. The hepatic metabolism of lipid soluble drugs is reduced in elderly patients because there is a reduction in liver volume. This is important for drugs with a narrow therapeutic window.

Adverse reactions

Adverse reactions often present in the elderly in a vague and non-specific fashion. *Confusion* is often the presenting symptom (caused by almost any of the commonly used drugs). Other common manifestations are *constipation* (with antimuscarinics and many tranquillisers) and postural *hypotension and falls* (with diuretics and many psychotropics).

Hypnotics

Many hypnotics with long half-lives have serious hangover effects, including drowsiness, unsteady gait, slurred speech, and confusion. Hypnotics with short half-lives should be used but they too can present problems. Short courses of hypnotics are occasionally useful for helping a patient through an acute illness or some other crisis but every effort must be made to avoid dependence. Benzodiazepines impair balance, which can result in falls.

Diuretics

Diuretics are overprescribed in old age and should **not** be used on a long-term basis to treat simple gravitational oedema which will usually respond to increased movement, raising the legs, and support stockings. A few days of diuretic treatment may speed the clearing of the oedema but it should rarely need continued drug therapy.

NSAIDs

Bleeding associated with aspirin and other NSAIDs is more common in the elderly who are more likely to have a fatal or serious outcome. NSAIDs are also a special hazard in patients with cardiac disease or renal impairment which may again place older patients at particular risk.

Owing to the *increased susceptibility of the elderly to the side-effects of NSAIDs* the following recommendations are made:

- for *osteoarthritis, soft-tissue lesions, and back pain*, first try measures such as weight reduction (if obese), warmth, exercise, and use of a walking stick;
- for *osteoarthritis, soft-tissue lesions, back pain, and pain in rheumatoid arthritis*, paracetamol p. 438 should be used first and can often provide adequate pain relief;
- alternatively, a low-dose NSAID (e.g. ibuprofen p. 1106 up to 1.2 g daily) may be given;
- for pain relief when either drug is inadequate, paracetamol in a full dose plus a low-dose NSAID may be given;
- if necessary, the NSAID dose can be increased or an opioid analgesic given with paracetamol p. 438;
- do not give two NSAIDs at the same time.

Prophylaxis of NSAID-induced peptic ulcers may be required if continued NSAID treatment is necessary see, *NSAID-associated ulcers* under Peptic ulceration p. 71.

Other drugs

Other drugs which commonly cause adverse reactions are *antiparkinsonian drugs, antihypertensives, psychotropics, and digoxin* p. 109. The usual maintenance dose of digoxin in very old patients is 125 micrograms daily (62.5 micrograms in those with renal disease); lower doses are often inadequate but toxicity is common in those given 250 micrograms daily. Drug-induced blood disorders are much more common in the elderly. Therefore drugs with a tendency to cause bone marrow depression (e.g. co-trimoxazole p. 552, mianserin

hydrochloride p. 367) should be avoided unless there is no acceptable alternative. The elderly generally require a lower maintenance dose of warfarin sodium p. 139 than younger adults; once again, the outcome of bleeding tends to be more serious.

Guidelines

Always consider whether a drug is indicated at all.

Limit range It is a sensible policy to prescribe from a limited range of drugs and to be thoroughly familiar with their effects in the elderly.

Reduce dose Dosage should generally be substantially lower than for younger patients and it is common to start with about 50% of the adult dose. Some drugs (e.g. long-acting antidiabetic drugs such as glibenclamide p. 692) should be avoided altogether.

Review regularly Review repeat prescriptions regularly. In many patients it may be possible to stop some drugs, provided that clinical progress is monitored. It may be necessary to reduce the dose of some drugs as renal function declines.

Simplify regimens Elderly patients benefit from simple treatment regimens. Only drugs with a clear indication should be prescribed and whenever possible given once or twice daily. In particular, regimens which call for a confusing array of dosage intervals should be avoided.

Explain clearly Write full instructions on every prescription (including repeat prescriptions) so that containers can be properly labelled with full directions. Avoid imprecisions like 'as directed'. Child-resistant containers may be unsuitable.

Repeats and disposal Instruct patients what to do when drugs run out, and also how to dispose of any that are no longer necessary. Try to prescribe matching quantities. If these guidelines are followed most elderly people will cope adequately with their own medicines. If not then it is essential to enrol the help of a third party, usually a relative or a friend.

Drugs and sport

Anti-doping

UK Anti-Doping, the national body responsible for the UK's anti-doping policy, advises that athletes are personally responsible should a prohibited substance be detected in their body. Information regarding the use of medicines in sport is available from:

UK Anti-doping
Fleetbank House
2-6 Salisbury Square
London
EC4Y 8AE
(020) 7842 3450
ukad@ukad.org.uk
www.ukad.org.uk

Information about the prohibited status of specific medications based on the current World Anti-Doping Agency Prohibited List is available from Global Drug Reference Online: www.globaldro.com/UK/search

General Medical Council's advice

Doctors who prescribe or collude in the provision of drugs or treatment with the intention of improperly enhancing an individual's performance in sport contravene the GMC's guidance, and such actions would usually raise a question of a doctor's continued registration. This does not preclude the provision of any care or treatment where the doctor's intention is to protect or improve the patient's health.

Prescribing in dental practice

General guidance

Advice on the drug management of dental and oral conditions has been integrated into the main text. For ease of access, guidance on such conditions is usually identified by means of a relevant heading (e.g. Dental and Orofacial Pain) in the appropriate sections of the BNF.

The following is a list of topics of particular relevance to dentists.

- Prescribing by dentists, see Prescription writing p. 5
- Oral side-effects of drugs, see Adverse reactions to drugs p. 12
- Medical emergencies in dental practice, see below
- Medical problems in dental practice, see below

Drug management of dental and oral conditions

Dental and orofacial pain

- Neuropathic pain p. 475

Dental Practitioners' Formulary p. 1562

Medical emergencies in dental practice

This section provides guidelines on the management of the more common medical emergencies which may arise in dental practice. Dentists and their staff should be familiar with standard resuscitation procedures, but in all circumstances it is advisable to summon medical assistance as soon as possible. See also **algorithm** of the procedure for Cardiopulmonary resuscitation p. 221.

The drugs referred to in this section include:

- Adrenaline/epinephrine Injection, adrenaline 1 in 1000, (adrenaline 1 mg/mL as acid tartrate), 1 mL amps p. 221
- Aspirin Dispersible Tablets 300 mg p. 121
- Glucagon Injection p. 707, glucagon (as hydrochloride), 1-unit vial (with solvent) p. 707
- Glucose (for administration by mouth) p. 1009
- Glyceryl trinitrate Spray p. 217
- Midazolam Oromucosal Solution p. 336
- Oxygen
- Salbutamol Aerosol Inhalation, salbutamol 100 micrograms/metered inhalation p. 252

Adrenal insufficiency

Adrenal insufficiency may follow prolonged therapy with corticosteroids and can persist for years after stopping. A patient with adrenal insufficiency may become hypotensive under the stress of a dental visit (important: see individual monographs for details of corticosteroid cover before dental surgical procedures under general anaesthesia).

Management

- Lay the patient flat
- Give **oxygen**
- Transfer patient urgently to hospital

Anaphylaxis

A severe allergic reaction may follow oral or parenteral administration of a drug. Anaphylactic reactions in dentistry may follow the administration of a drug or contact with substances such as latex in surgical gloves. In general, the more rapid the onset of the reaction the more profound it tends to be. Symptoms may develop within minutes and rapid treatment is essential.

Anaphylactic reactions may also be associated with *additives* and *excipients* in foods and medicines. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens (including those for topical application, particularly if they are intended for use in the mouth or for application to the nasal mucosa).

Symptoms and signs

- Paraesthesia, flushing, and swelling of face
- Generalised itching, especially of hands and feet
- Bronchospasm and laryngospasm (with wheezing and difficulty in breathing)
- Rapid weak pulse together with fall in blood pressure and pallor; finally cardiac arrest

Management

First-line treatment includes securing the airway, restoration of blood pressure (laying the patient flat and raising the feet, or in the recovery position if unconscious or nauseous and at risk of vomiting), and administration of adrenaline/epinephrine injection p. 221. This is given **intramuscularly** in a dose of 500 micrograms (0.5 mL adrenaline injection 1 in 1000); a dose of 300 micrograms (0.3 mL adrenaline injection 1 in 1000) may be appropriate for immediate self-administration. The dose is repeated if necessary at 5-minute intervals according to blood pressure,

pulse, and respiratory function. **Oxygen** administration is also of primary importance. Arrangements should be made to transfer the patient to hospital urgently.

Asthma

Patients with asthma may have an attack while at the dental surgery. Most attacks will respond to 2 puffs of the patient's short-acting beta₂ agonist inhaler such as salbutamol 100 micrograms/puff p. 252; further puffs are required if the patient does not respond rapidly. If the patient is unable to use the inhaler effectively, further puffs should be given through a large-volume spacer device (or, if not available, through a plastic or paper cup with a hole in the bottom for the inhaler mouthpiece). If the response remains unsatisfactory, or if further deterioration occurs, then the patient should be transferred urgently to hospital. Whilst awaiting transfer, **oxygen** should be given with salbutamol 5 mg p. 252 or terbutaline sulfate 10 mg by nebuliser p. 254; if a nebuliser is unavailable, then 2–10 puffs of salbutamol 100 micrograms/metered inhalation p. 252 should be given (preferably by a large-volume spacer), and repeated every 10–20 minutes if necessary. If asthma is part of a more generalised anaphylactic reaction, an intramuscular injection of adrenaline/epinephrine p. 221 (as detailed under Anaphylaxis) should be given. Patients with severe chronic asthma or whose asthma has deteriorated previously during a dental procedure may require an increase in their prophylactic medication before a dental procedure. This should be discussed with the patient's medical practitioner and may include increasing the dose of inhaled or oral corticosteroid.

Cardiac emergencies

If there is a history of *angina* the patient will probably carry glyceryl trinitrate spray or tablets p. 217 (or isosorbide dinitrate tablets p. 219) and should be allowed to use them. Hospital admission is not necessary if symptoms are mild and resolve rapidly with the patient's own medication. See also Coronary Artery Disease below.

Arrhythmias may lead to a sudden reduction in cardiac output with loss of consciousness. Medical assistance should be summoned. For advice on pacemaker interference, see also Pacemakers below.

The pain of *myocardial infarction* is similar to that of *angina* but generally more severe and more prolonged. For general advice see also Coronary Artery Disease below.

Symptoms and signs of myocardial infarction:

- Progressive onset of severe, crushing pain across front of chest; pain may radiate towards the shoulder and down arm, or into neck and jaw
- Skin becomes pale and clammy
- Nausea and vomiting are common
- Pulse may be weak and blood pressure may fall
- Breathlessness

Initial management of myocardial infarction:

Call immediately for medical assistance and an ambulance, as appropriate.

Allow the patient to rest in the position that feels most comfortable; in the presence of breathlessness this is likely to be sitting position, whereas the syncopal patient should be laid flat; often an intermediate position (dictated by the patient) will be most appropriate. **Oxygen** may be administered.

Sublingual glyceryl trinitrate p. 217 may relieve pain. Intramuscular injection of drugs should be avoided because absorption may be too slow (particularly when cardiac output is reduced) and pain relief is inadequate.

Intramuscular injection also increases the risk of local bleeding into the muscle if the patient is given a thrombolytic drug.

Reassure the patient as much as possible to relieve further anxiety. If available, aspirin p. 121 in a single dose of 300 mg should be given. A note (to say that aspirin has been given) should be sent with the patient to the hospital. For further details on the initial management of myocardial infarction, see Management of ST-Segment Elevation Myocardial Infarction.

If the patient collapses and loses consciousness attempt standard resuscitation measures. See also **algorithm** of the procedure for Cardiopulmonary resuscitation p. 221.

Epileptic seizures

Patients with epilepsy must continue with their normal dosage of anticonvulsant drugs when attending for dental treatment. It is not uncommon for epileptic patients not to volunteer the information that they are epileptic but there should be little difficulty in recognising a tonic-clonic (grand mal) seizure.

Symptoms and signs

- There may be a brief warning (but variable)
- Sudden loss of consciousness, the patient becomes rigid, falls, may give a cry, and becomes cyanotic (tonic phase)
- After 30 seconds, there are jerking movements of the limbs; the tongue may be bitten (clonic phase)
- There may be frothing from mouth and urinary incontinence
- The seizure typically lasts a few minutes; the patient may then become flaccid but remain unconscious. After a variable time the patient regains consciousness but may remain confused for a while

Management

During a convulsion try to ensure that the patient is not at risk from injury but make no attempt to put anything in the mouth or between the teeth (in mistaken belief that this will protect the tongue). Give **oxygen** to support respiration if necessary.

Do not attempt to restrain convulsive movements.

After convulsive movements have subsided place the patient in the coma (recovery) position and check the airway.

After the convulsion the patient may be confused ('post-ictal confusion') and may need reassurance and sympathy. The patient should not be sent home until fully recovered. Seek medical attention or transfer the patient to hospital if it was the first episode of epilepsy, or if the convulsion was atypical, prolonged (or repeated), or if injury occurred.

Medication should only be given if convulsive seizures are prolonged (convulsive movements lasting 5 minutes or longer) or repeated rapidly.

Midazolam oromucosal solution p. 336 can be given by the buccal route in adults as a single dose of 10 mg [unlicensed]. For further details on the management of status epilepticus, including details of paediatric doses of midazolam p. 336, see Drugs used in status epilepticus (Epilepsy p. 304).

Focal seizures similarly need very little active management (in an automatism only a minimum amount of restraint should be applied to prevent injury). Again, the patient should be observed until post-ictal confusion has completely resolved.

Hypoglycaemia

Insulin-treated diabetic patients attending for dental treatment under local anaesthesia should inject insulin and eat meals as normal. If food is omitted the blood glucose will fall to an abnormally low level (hypoglycaemia). Patients can often recognise the symptoms themselves and this state responds to sugar in water or a few lumps of sugar. Children may not have such prominent changes but may appear unduly lethargic.

Symptoms and signs

- Shaking and trembling
- Sweating
- 'Pins and needles' in lips and tongue
- Hunger
- Palpitation
- Headache (occasionally)
- Double vision
- Difficulty in concentration
- Slurring of speech
- Confusion
- Change of behaviour; truculence
- Convulsions
- Unconsciousness

Management

Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from non-diet versions of *Lucozade*® Energy Original 110 mL, *Coca-Cola*® 100 mL, *Ribena*® Blackcurrant 19 mL (to be diluted), 2 teaspoons sugar, and also from 3 sugar lumps. (Proprietary products of quick-acting carbohydrate (e.g. *GlucoGel*®, *DextroGel*®, *GSF-Syrup*®, *Rapilose*® gel) are available on prescription for the patient to keep to hand in case of hypoglycaemia.) If necessary this may be repeated in 10–15 minutes.

Note: the carbohydrate content of some commercially available glucose-containing drinks is currently subject to change—individual product labels should be checked. Patients should be aware that for a time, both old and new bottles and cans may be available—individual product labels should be checked.

If glucose cannot be given by mouth, if it is ineffective, or if the hypoglycaemia causes unconsciousness, **glucagon** 1 mg (1 unit) should be given by intramuscular (or subcutaneous) injection; a child under 8 years or of body-weight under 25 kg should be given 500 micrograms. Once the patient regains consciousness oral glucose should be administered as above. If glucagon is ineffective or contra-indicated, the patient should be transferred urgently to hospital. The patient must also be admitted to hospital if hypoglycaemia is caused by an oral antidiabetic drug.

Syncope

Insufficient blood supply to the brain results in loss of consciousness. The commonest cause is a vasovagal attack or simple faint (syncope) due to emotional stress.

Symptoms and signs

- Patient feels faint
- Low blood pressure
- Pallor and sweating
- Yawning and slow pulse
- Nausea and vomiting
- Dilated pupils
- Muscular twitching

Management

- Lay the patient as flat as is reasonably comfortable and, in the absence of associated breathlessness, raise the legs to improve cerebral circulation
- Loosen any tight clothing around the neck
- Once consciousness is regained, give sugar in water or a cup of sweet tea

Other possible causes Postural hypotension can be a consequence of rising abruptly or of standing upright for too long; antihypertensive drugs predispose to this. When rising, susceptible patients should take their time. Management is as for a vasovagal attack.

Under stressful circumstances, some patients hyperventilate. This gives rise to feelings of faintness but does not usually result in syncope. In most cases reassurance is all that is

necessary; rebreathing from cupped hands or a bag may be helpful but calls for careful supervision. Adrenal insufficiency or arrhythmias are other possible causes of syncope.

Medical problems in dental practice

Individuals presenting at the dental surgery may also suffer from an unrelated medical condition; this may require modification to the management of their dental condition. If the patient has systemic disease or is taking other medication, the matter may need to be discussed with the patient's general practitioner or hospital consultant.

Allergy

Patients should be asked about any history of allergy; those with a history of atopic allergy (asthma, eczema, hay fever, etc.) are at special risk. Those with a history of a severe allergy or of anaphylactic reactions are at high risk—it is essential to confirm that they are not allergic to any medication, or to any dental materials or equipment (including latex gloves). See also Anaphylaxis above.

Arrhythmias

Patients, especially those who suffer from heart failure or who have sustained a myocardial infarction, may have irregular cardiac rhythm. Atrial fibrillation is a common arrhythmia even in patients with normal hearts and is of little concern except that dentists should be aware that such patients may be receiving anticoagulant therapy. The patient's medical practitioner should be asked whether any special precautions are necessary. Premedication (e.g. with temazepam p. 481) may be useful in some instances for very anxious patients.

See also Cardiac emergencies above, and Dental Anaesthesia (Anaesthesia (local) p. 1307).

Cardiac prostheses

For an account of the risk of infective endocarditis in patients with prosthetic heart valves, see Infective Endocarditis below. For advice on patients receiving anticoagulants, see Thromboembolic disease below.

Coronary artery disease

Patients are vulnerable for at least 4 weeks following a myocardial infarction or following any sudden increase in the symptoms of angina. It would be advisable to check with the patient's medical practitioner before commencing treatment. See also Cardiac Emergencies above. Treatment with low-dose aspirin (75 mg daily), clopidogrel p. 122, or dipyridamole p. 123 should not be stopped routinely nor should the dose be altered before dental procedures.

A Working Party of the British Society for Antimicrobial Chemotherapy has not recommended antibiotic prophylaxis for patients following coronary artery bypass surgery.

Cyanotic heart disease

Patients with cyanotic heart disease are at risk in the dental chair, particularly if they have pulmonary hypertension. In such patients a syncopal reaction increases the shunt away from the lungs, causing more hypoxia which worsens the syncopal reaction—a vicious circle that may prove fatal. The advice of the cardiologist should be sought on any patient with congenital cyanotic heart disease. Treatment in hospital is more appropriate for some patients with this condition.

Hypertension

Patients with hypertension are likely to be receiving antihypertensive drugs. Their blood pressure may fall dangerously low under general anaesthesia, see also under Dental Anaesthesia (Anaesthesia (local) p. 1307).

Immunosuppression and indwelling intraperitoneal catheters

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

Infective endocarditis

While almost any dental procedure can cause bacteraemia, there is no clear association with the development of infective endocarditis. Routine daily activities such as tooth brushing also produce a bacteraemia and may present a greater risk of infective endocarditis than a single dental procedure.

Antibacterial prophylaxis and chlorhexidine mouthwash p. 1175 are **not** recommended for the prevention of endocarditis in patients undergoing dental procedures. Such prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Reduction of oral bacteraemia Patients at risk of endocarditis including those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis, should be advised to maintain the highest possible standards of oral hygiene in order to reduce the:

- need for dental extractions or other surgery;
- chances of severe bacteraemia if dental surgery is needed;
- possibility of 'spontaneous' bacteraemia.

Postoperative care Patients at risk of endocarditis including those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis, should be warned to report to the doctor or dentist any unexplained illness that develops after dental treatment.

Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

Patients on anticoagulant therapy

For general advice on dental surgery in patients receiving oral anticoagulant therapy see Thromboembolic Disease below.

Joint prostheses

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that

those who develop any intercurrent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

Pacemakers

Pacemakers prevent asystole or severe bradycardia. Some ultrasonic scalers, electronic apex locators, electro-analgesic devices, and electrocautery devices interfere with the normal function of pacemakers (including shielded pacemakers) and should not be used. The manufacturer's literature should be consulted whenever possible. If severe bradycardia occurs in a patient fitted with a pacemaker, electrical equipment should be switched off and the patient placed supine with the legs elevated. If the patient loses consciousness and the pulse remains slow or is absent, cardiopulmonary resuscitation may be needed. Call immediately for medical assistance and an ambulance, as appropriate.

A Working Party of the British Society for Antimicrobial Chemotherapy does not recommend antibacterial prophylaxis for patients with pacemakers.

Thromboembolic disease

Patients receiving a **heparin** or an oral anticoagulant such as warfarin sodium p. 139, acenocoumarol (nicoumalone) p. 138, phenindione p. 139, apixaban p. 124, dabigatran etexilate p. 135 or rivaroxaban p. 127 may be liable to excessive bleeding after extraction of teeth or other dental surgery. Often dental surgery can be delayed until the anticoagulant therapy has been completed.

For a patient requiring long-term therapy with warfarin sodium, the patient's medical practitioner should be consulted and the International Normalised Ratio (INR) should be assessed 72 hours before the dental procedure. This allows sufficient time for dose modification if necessary. In those with an unstable INR (including those who require weekly monitoring of their INR, or those who have had some INR measurements greater than 4.0 in the last 2 months), the INR should be assessed within 24 hours of the dental procedure. Patients requiring minor dental procedures (including extractions) who have an INR below 4.0 may continue warfarin sodium without dose adjustment. There is no need to check the INR for a patient requiring a non-invasive dental procedure.

If it is necessary to remove several teeth, a single extraction should be done first; if this goes well further teeth may be extracted at subsequent visits (two or three at a time). Measures should be taken to minimise bleeding during and after the procedure. This includes the use of sutures and a haemostatic such as oxidised cellulose, collagen sponge or resorbable gelatin sponge. Scaling and root planing should initially be restricted to a limited area to assess the potential for bleeding.

For a patient on long-term warfarin sodium, the advice of the clinician responsible for the patient's anticoagulation should be sought if:

- the INR is unstable, or if the INR is greater than 4.0;
- the patient has thrombocytopenia, haemophilia, or other disorders of haemostasis, or suffers from liver impairment, alcoholism, or renal failure;
- the patient is receiving antiplatelet drugs, cytotoxic drugs or radiotherapy.

Intramuscular injections are *contra-indicated* in patients taking anticoagulants with an INR above the therapeutic range, and in those with any disorder of haemostasis. In patients taking anticoagulants who have a stable INR within the therapeutic range, intramuscular injections should be avoided if possible; if an intramuscular injection is necessary, the patient should be informed of the increased risk of localised bleeding and monitored carefully.

A local anaesthetic containing a vasoconstrictor should be given by infiltration, or by intraligamentary or mental nerve injection if possible. If regional nerve blocks cannot be avoided the local anaesthetic should be given cautiously using an aspirating syringe.

Drugs which have potentially serious interactions with anticoagulants include aspirin and other NSAIDs, carbamazepine p. 309, imidazole and triazole antifungals (including miconazole p. 811), erythromycin p. 530, clarithromycin p. 529, and metronidazole p. 533; for details of these and other interactions with anticoagulants, see Appendix 1 (dabigatran etexilate, heparins, phenindione, rivaroxaban, and coumarins).

Although studies have failed to demonstrate an interaction, common experience in anticoagulant clinics is that the INR can be altered following a course of an oral broad-spectrum antibiotic, such as ampicillin p. 540 or amoxicillin p. 539.

Information on the treatment of patients who take anticoagulants is available at www.npsa.nhs.uk/patientsafety/alerts-and-directives/alerts/anticoagulant.

Liver disease

Liver disease may alter the response to drugs and drug prescribing should be kept to a minimum in patients with severe liver disease. Problems are likely mainly in patients with *jaundice*, *ascites*, or evidence of *encephalopathy*.

For guidance on prescribing for patients with hepatic impairment, see Prescribing in hepatic impairment p. 19.

Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in the BNF.

Renal impairment

The use of drugs in patients with reduced renal function can give rise to many problems. Many of these problems can be avoided by reducing the dose or by using alternative drugs. Special care is required in renal transplantation and immunosuppressed patients; if necessary such patients should be referred to specialists.

For guidance on prescribing in patients with renal impairment, see Prescribing in renal impairment p. 19.

Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug in the BNF.

Pregnancy

Drugs taken during pregnancy can be harmful to the fetus and should be prescribed only if the expected benefit to the mother is thought to be greater than the risk to the fetus; all drugs should be avoided if possible during the first trimester. For guidance on prescribing in pregnancy, see Prescribing in pregnancy p. 22. Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the BNF.

Breast-feeding

Some drugs taken by the mother whilst breast-feeding can be transferred to the breast milk, and may affect the infant.

For guidance on prescribing in breast-feeding, see Prescribing in breast-feeding p. 22. Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the BNF.

1 Chronic bowel disorders

1.1 Coeliac disease

Coeliac disease

25-Jul-2016

Description of condition

Coeliac disease is an autoimmune condition which is associated with chronic inflammation of the small intestine. Dietary proteins known as gluten, which are present in wheat, barley and rye, activate an abnormal immune response in the intestinal mucosa, which can lead to malabsorption of nutrients.

Aims of treatment

The management of coeliac disease is aimed at eliminating symptoms (such as diarrhoea, bloating and abdominal pain) and reducing the risk of complications, including those resulting from malabsorption.

Non-drug treatment

[EVGr] The only effective treatment for coeliac disease is a strict, life-long, gluten-free diet. A range of gluten-free products is available for prescription (see *Borderline substances*). 

Drug treatment

[EVGr] Patients who have coeliac disease are at an increased risk of malabsorption of key nutrients (such as calcium and vitamin D). Their risk of osteoporosis and the need for active treatment of bone disease should form part of the ongoing management of coeliac disease. Supplementation of key nutrients may be required if dietary intake is insufficient.

Patients who have coeliac disease should be advised **not** to self-medicate with over-the-counter vitamins or mineral supplements. Initiation of supplementation should involve a discussion with a member of the patient's healthcare team in order to identify the individual needs of the patient and to allow for appropriate ongoing monitoring.

Confirmed cases of refractory coeliac disease should be referred to a specialist centre. Treatment with prednisolone

p. 664 can be considered for initial management while awaiting specialist advice.

Coeliac disease: recognition, assessment and management. National Institute for Health and Care Excellence. Clinical guideline 20. September 2015.
www.nice.org.uk/guidance/ng20

1.2 Diverticular disease and diverticulitis

Diverticular disease and diverticulitis

24-Feb-2016

Description of condition

Diverticular disease is a condition where diverticula (sac-like protrusions of mucosa through the muscular colonic wall) cause intermittent lower abdominal pain in the absence of inflammation or infection. The prevalence of diverticula increases with age, with the majority of patients older than 50 years.

Diverticulitis occurs when the diverticula become inflamed and infected, causing marked lower abdominal pain usually accompanied by fever and general malaise, and occasionally, with large rectal bleeds. Complicated diverticulitis includes episodes associated with an abscess, free perforation, fistula, obstruction, or stricture.

To ensure that an accurate diagnosis of diverticular disease and diverticulitis is made, consider and exclude all other causes of lower abdominal pain prior to treatment.

Aims of treatment

The aim of treatment is to relieve symptoms of diverticular disease, cure episodes of diverticulitis, and reduce the risk of recurrences and complications.

Drug treatment

EvGr A high-fibre diet is recommended for the treatment of symptomatic diverticular disease, although evidence supporting this is inconsistent and of low quality. Bulk-forming drugs have also been used, but evidence of their effectiveness is lacking.

Treatment of uncomplicated diverticulitis includes a low residue diet and bowel rest. Antibacterials are recommended only when the patient presents with signs of infection or is immunocompromised, as there is no evidence to support routine administration.

Patients with complicated diverticulitis or with severe presentation, require hospital admission, treatment with intravenous antibacterials (covering Gram-negative organisms and anaerobes), and bowel rest.

There is insufficient evidence to justify the role of fibre, rifaximin p. 565, antispasmodics, mesalazine p. 39, and probiotics in the prevention or treatment of diverticulitis.

Elective surgery to provide symptomatic relief or prevent recurrence, should be considered for patients following recovery from an episode of complicated diverticulitis. This includes episodes associated with free perforation, abscess, fistula, obstruction, or stricture. Urgent sigmoid colectomy is required for patients with diffuse peritonitis or for those in whom non-operative management of acute diverticulitis fails. [A](#)

1.3 Inflammatory bowel disease

Inflammatory bowel disease

Chronic inflammatory bowel diseases include Crohn's disease below and Ulcerative colitis p. 37.

Drugs used in chronic bowel disorders

Aminosalicylates

Sulfasalazine p. 42 is a combination of 5-aminosalicylic acid ('5-ASA') and sulfapyridine; sulfapyridine acts only as a carrier to the colonic site of action but still causes side-effects. In the newer aminosalicylates, mesalazine (5-aminosalicylic acid) p. 39, balsalazide sodium p. 39 (a pro-drug of 5-aminosalicylic acid) and olsalazine sodium p. 42 (a dimer of 5-aminosalicylic acid which cleaves in the lower bowel), the sulfonamide-related side-effects of sulfasalazine are avoided, but 5-aminosalicylic acid alone can still cause side-effects including blood disorders and lupus-like syndrome also seen with sulfasalazine.

Drugs affecting the immune response

Folic acid p. 993 should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid is usually given once weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

Cytokine modulators

Infliximab p. 1082, adalimumab p. 1073, and golimumab p. 1080 are monoclonal antibodies which inhibit the pro-inflammatory cytokine, tumour necrosis factor alpha. They should be used under specialist supervision.

Crohn's disease

20-Dec-2016

Description of condition

Crohn's disease is a chronic, inflammatory bowel disease that mainly affects the gastro-intestinal tract. It is characterised by thickened areas of the gastro-intestinal wall with inflammation extending through all layers, deep ulceration and fissuring of the mucosa, and the presence of

granulomas; affected areas may occur in any part of the gastro-intestinal tract, interspersed with areas of relatively normal tissue. Crohn's disease may present as recurrent attacks, with acute exacerbations combined with periods of remission or less active disease. Symptoms depend on the site of disease but may include abdominal pain, diarrhoea, fever, weight loss and rectal bleeding.

Complications of Crohn's disease include intestinal strictures, abscesses in the wall of the intestine or adjacent structures, fistulae, anaemia, malnutrition, colorectal and small bowel cancers, and growth failure and delayed puberty in children. Crohn's disease may also be associated with extra-intestinal manifestation: the most common are arthritis and abnormalities of the joints, eyes, liver and skin. Crohn's disease is also a cause of secondary osteoporosis and those at greatest risk should be monitored for osteopenia and assessed for the risk of fractures.

Fistulating Crohn's disease

Fistulating Crohn's disease is a complication that involves the formation of a fistula between the intestine and adjacent structures, such as perianal skin, bladder, and vagina. It occurs in about one quarter of patients, mostly when the disease involves the ileocolonic area.

Aims of treatment

Treatment is largely directed at the induction and maintenance of remission and the relief of symptoms. Active treatment of acute Crohn's disease should be distinguished from preventing relapse. The aims of drug treatment are to reduce symptoms and maintain or improve quality of life, while minimising toxicity related to drugs over both the short and long term.

In fistulating Crohn's disease, surgery and medical treatment aim to close and maintain closure of the fistula.

Non-drug treatment

EvGr In addition to drug treatment, management options for Crohn's disease include smoking cessation and attention to nutrition, which plays an important role in supportive care. Surgery may be considered in certain patients with early disease limited to the distal ileum and in severe or chronic active disease. [A](#)

Drug treatment

Treatment of acute disease

Monotherapy

EvGr A corticosteroid (either prednisolone p. 664 or methylprednisolone p. 663 or intravenous hydrocortisone p. 662), is used to induce remission in patients with a first presentation or a single inflammatory exacerbation of Crohn's disease in a 12-month period.

In patients with distal ileal, ileocaecal or right-sided colonic disease, in whom a conventional corticosteroid is unsuitable or contra-indicated, budesonide p. 43 may be considered. Budesonide is less effective but may cause fewer side-effects than other corticosteroids, as systemic exposure is limited. Aminosalicylates (such as sulfasalazine p. 42 and mesalazine p. 39) are an alternative option in these patients. They are less effective than a corticosteroid or budesonide, but may be preferred because they have fewer side-effects. Aminosalicylates and budesonide are not appropriate for severe presentations or exacerbations. [A](#)

Add-on treatment

EvGr Add on treatment is prescribed if there are two or more inflammatory exacerbations in a 12-month period, or the corticosteroid dose cannot be reduced.

Azathioprine p. 816 or mercaptopurine p. 887 [unlicensed indications] can be added to a corticosteroid or budesonide to induce remission. In patients who cannot tolerate azathioprine or mercaptopurine or in whom thiopurine methyltransferase (TPMT) activity is deficient, methotrexate p. 888 can be added to a corticosteroid.

Under specialist supervision, monoclonal antibody therapies, adalimumab p. 1073 and infliximab p. 1082, are options for the treatment of severe, active Crohn's disease, following inadequate response to conventional therapies or in those who are intolerant of or have contra-indications to conventional therapy. Vedolizumab p. 44 is recommended as a treatment option for moderate to severely active Crohn's disease when therapy with adalimumab or infliximab is unsuccessful, is contra-indicated or not tolerated. See also *National funding/access decisions* for adalimumab, infliximab and vedolizumab.

Adalimumab and infliximab can be used as monotherapy or combined with an immunosuppressant although there is uncertainty about the comparative effectiveness and long-term side-effects of therapy. [▲](#)

Maintenance of remission

[EvGr](#) Patients who choose not to receive maintenance treatment during remission should be made aware of the symptoms that may suggest a relapse (most frequently unintended weight loss, abdominal pain, diarrhoea and general ill-health). For those who choose not to receive maintenance treatment during remission, a suitable follow up plan should be agreed upon and information provided on how to access healthcare if a relapse should occur.

Azathioprine or mercaptopurine [unlicensed indications] as monotherapy can be used to maintain remission when previously used with a corticosteroid to induce remission. They may also be used in patients who have not previously received these drugs (particularly those with adverse prognostic factors such as early age of onset, perianal disease, corticosteroid use at presentation, and severe presentations). Methotrexate can be used to maintain remission only in patients who required methotrexate to induce remission, or who are intolerant of or are not suitable for azathioprine or mercaptopurine for maintenance. Corticosteroids or budesonide should not be used. [▲](#)

Maintaining remission following surgery

[EvGr](#) Azathioprine or mercaptopurine [unlicensed indications] can be considered to maintain remission after surgery in patients with adverse prognostic factors such as more than one resection, or previously complicated or debilitating disease (for example abscess, involvement of adjacent structures, fistulating or penetrating disease). Aminosalicylates can also be considered as an option, however budesonide or enteral nutrition should not be used. [▲](#)

Other treatments

[EvGr](#) Loperamide hydrochloride p. 66 or codeine phosphate p. 448 can be used to manage diarrhoea associated with Crohn's disease in those who do not have colitis. [▲](#) Colestyramine p. 196 is licensed for the relief of diarrhoea associated with Crohn's disease. See also *Diarrhoea (acute)* p. 65.

Fistulating Crohn's disease

Perianal fistulae are the most common occurrence in patients with fistulating Crohn's disease. [EvGr](#) Treatment may not be necessary for simple, asymptomatic perianal fistulae. When fistulae are symptomatic, local drainage and surgery may be required in conjunction with the medical therapy.

Metronidazole p. 533 or ciprofloxacin p. 548 [unlicensed indications], alone or in combination, can improve symptoms of fistulating Crohn's disease but complete healing occurs rarely. Metronidazole is usually given for 1 month, but no longer than 3 months because of concerns about peripheral neuropathy. Other antibacterials should be given if specifically indicated (e.g. in sepsis associated with fistulae and perianal disease) and for managing bacterial overgrowth in the small bowel.

Either azathioprine or mercaptopurine [unlicensed indications] is used to control the inflammation in fistulating Crohn's disease and they are continued for maintenance.

Infliximab p. 1082 is recommended for patients with active fistulating Crohn's disease who have not responded to conventional therapy (including antibacterials, drainage and immunosuppressive treatments), or who are intolerant of or have contra-indications to conventional therapy. Infliximab should be used after ensuring that all sepsis is actively draining.

Abscess drainage, fistulotomy, and seton insertion may be appropriate, particularly before infliximab treatment.

Azathioprine, mercaptopurine, or infliximab should be continued as maintenance treatment for at least one year.

For the management of non-perianal fistulating Crohn's disease (including entero-gynaecological and enterovesical fistulae) surgery is the only recommended approach. [▲](#)

Ulcerative colitis

20-Feb-2017

Description of condition

Ulcerative colitis is a chronic inflammatory condition, characterised by diffuse mucosal inflammation—it has a relapsing-remitting pattern. It is a life-long disease that is associated with significant morbidity. It most commonly presents between the ages of 15 and 25 years, although diagnosis can be made at any age.

The pattern of inflammation is continuous, extending from the rectum upwards to a varying degree. Inflammation of the rectum is referred to as **proctitis**, and inflammation of the rectum and sigmoid colon as **proctosigmoiditis**. **Left-sided colitis** refers to disease involving the colon distal to the splenic flexure. **Extensive colitis** affects the colon proximal to the splenic flexure, and includes pan-colitis, where the whole colon is involved. Common symptoms of active disease or relapse include bloody diarrhoea, an urgent need to defaecate, and abdominal pain.

Ulcerative colitis is classified as **subacute** if it is moderate-to-severely active disease which can be managed in an outpatient setting, and does not require hospitalisation or consideration of urgent surgical intervention.

Complications associated with ulcerative colitis include an increased risk of colorectal cancer, secondary osteoporosis, venous thromboembolism and toxic megacolon.

Aims of treatment

Treatment is focussed on treating active disease to manage symptoms and to induce and maintain remission.

Drug treatment

Overview

[EvGr](#) Management of ulcerative colitis is dependent on factors such as clinical severity, extent of disease, and patient preference. Clinical and laboratory investigations are used to determine the extent and severity of disease and to guide treatment. Severity is classified as mild, moderate or severe by using the Truelove and Witts' Severity Index to assess bowel movements, heart rate, erythrocyte sedimentation rate and the presence of pyrexia, melaena or anaemia—see the NICE guideline for Ulcerative Colitis for further information (*Useful resources* below). [▲](#)

[EvGr](#) The extent of disease should be considered when choosing the route of administration for aminosalicylates and corticosteroids; whether oral treatment, topical treatment or both are to be used. If the inflammation is

distal, a rectal preparation is adequate but if the inflammation is extended, systemic medication is required. Either suppositories or enemas can be offered, taking into account the patient's preferences. [⚡](#)

[EvGr](#) Rectal foam preparations and suppositories can be used when patients have difficulty retaining liquid enemas.

Diarrhoea associated with ulcerative colitis is sometimes treated with anti-diarrhoeal drugs (such as loperamide hydrochloride p. 66 or codeine phosphate p. 448) on the advice of a specialist; however their use is contra-indicated in acute ulcerative colitis as they can increase the risk of toxic megacolon.

A macrogol-containing osmotic laxative (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 56) may be useful for proximal faecal loading in proctitis. [⚡](#)

Oral aminosaliculates for the treatment of ulcerative colitis are available in different preparations and release forms. [EvGr](#) The preparation and dosing schedule should be chosen taking into account the delivery characteristics and suitability for the patient. When used to maintain remission, single daily doses of oral aminosaliculates can be more effective than multiple daily dosing, but may result in more side-effects. [⚡](#)

Treatment of acute mild-to-moderate ulcerative colitis

[EvGr](#) Acute treatment to induce remission generally consists of an aminosaliculate with or without a corticosteroid. [⚡](#)

[EvGr](#) Oral and rectal aminosaliculate in combination can be used as first line treatment in patients with acute, mild-to-moderate extensive ulcerative colitis; as this is associated with higher rates of improvement in disease activity. [⚡](#)

Proctitis and proctosigmoiditis

[EvGr](#) **Aminosaliculates** are recommended as first-line treatment for patients with a mild-to-moderate initial presentation or inflammatory exacerbation. Using a rectal aminosaliculate (mesalazine p. 39 or sulfasalazine p. 42) alone is likely to be more effective for patients with **proctitis** and **proctosigmoiditis**. Monotherapy with an oral aminosaliculate (balsalazide sodium p. 39, mesalazine, olsalazine sodium p. 42, sulfasalazine) can be considered for patients who prefer not to use enemas or suppositories, although this may not be as effective.

A rectal **corticosteroid** (budesonide p. 43, hydrocortisone p. 662 or prednisolone p. 664) or oral prednisolone can be considered in patients who are intolerant to, decline, or have a contra-indication to aminosaliculates.

Oral prednisolone should be considered for the treatment of patients with subacute proctitis or proctosigmoiditis. [⚡](#)

Left-sided or extensive ulcerative colitis

[EvGr](#) First-line treatment in patients with **left-sided** or **extensive** ulcerative colitis is a high induction dose of an oral aminosaliculate, with addition of a rectal aminosaliculate or oral beclometasone dipropionate if necessary. Oral prednisolone alone is recommended for patients who cannot tolerate or who decline aminosaliculates, in whom aminosaliculates are contra-indicated or in patients with subacute left-sided or extensive ulcerative colitis. [⚡](#)

Initial treatment failure in all extents of mild-to-moderate disease

[EvGr](#) In all patients who are treated with an aminosaliculate, if there are no improvements within four weeks of initial treatment or if symptoms worsen, addition of oral prednisolone to aminosaliculate therapy can be considered (discontinue beclometasone dipropionate p. 43 if adding oral prednisolone). If there is still no response after 2–4 weeks of prednisolone, consider adding oral tacrolimus p. 821 [unlicensed indication] to induce remission. [⚡](#) Budesonide multimatrix (a corticosteroid that is taken orally but exerts its action topically in the colon) is licensed for inducing remission in mild-to-moderate active ulcerative colitis in

adults for whom aminosaliculate treatment is not sufficient and can be considered as an additional therapeutic option.

[EvGr](#) Moderate disease may require treatment with a monoclonal antibody due to inadequate response to conventional treatment or if conventional treatment is not tolerated or contra-indicated (see *Monoclonal antibodies for ulcerative colitis* below). [⚡](#)

Treatment of acute severe ulcerative colitis

Acute severe ulcerative colitis of any extent can be life-threatening and is regarded as a medical emergency. [EvGr](#) Immediate hospital admission is required for treatment.

Intravenous corticosteroids (such as hydrocortisone or methylprednisolone p. 663) should be given to induce remission in patients with acute severe ulcerative colitis (at first presentation or an exacerbation) while assessing the need for surgery. If intravenous corticosteroids are contra-indicated, declined or cannot be tolerated, then intravenous ciclosporin p. 818 [unlicensed indication] or surgery should be considered. A combination of intravenous ciclosporin with intravenous corticosteroids, or surgery is second line therapy for patients who have little or no improvement within 72 hours of starting intravenous corticosteroids or whose symptoms worsen despite treatment. [⚡](#)

[EvGr](#) Research has shown that infliximab p. 1082 is as effective as ciclosporin and, in practice, it is commonly used in these patients instead of ciclosporin—see also *Monoclonal antibodies for acute ulcerative colitis*, below.

In patients who experience an initial response to steroids followed by deterioration, stool cultures should be taken to exclude the presence of pathogens; cytomegalovirus activation should be considered. [⚡](#)

Monoclonal antibodies for acute ulcerative colitis

[EvGr](#) Adalimumab p. 1073, golimumab p. 1080, infliximab p. 1082 and vedolizumab p. 44 can be used to treat moderate-to-severe active ulcerative colitis following an inadequate response to conventional treatment options, or if conventional treatment options are not tolerated or contra-indicated. Treatment with these agents is continued into the maintenance phase, if effective and tolerated. See also *National funding/access decisions* for adalimumab, golimumab, infliximab and vedolizumab.

Infliximab can be used to treat acute exacerbations of severely active ulcerative colitis if ciclosporin is contra-indicated or clinically inappropriate. [⚡](#)

Maintaining remission in mild, moderate or severe ulcerative colitis

[EvGr](#) To reduce the chances of relapse occurring, maintenance therapy with an aminosaliculate is recommended in most patients. Corticosteroids are **not** suitable for maintenance treatment because of their side-effects.

After a mild-to-moderate inflammatory exacerbation of *proctitis* or *proctosigmoiditis*, a rectal aminosaliculate can be started alone or in combination with an oral aminosaliculate, administered daily or as part of an intermittent regimen (such as twice to three times weekly or the first seven days of each month). An oral aminosaliculate can be used alone in patients who prefer not to use enemas or suppositories, although, this may not be as effective.

A low-dose of oral aminosaliculate is given to maintain remission in patients after a mild-to-moderate inflammatory exacerbation of left-sided or extensive ulcerative colitis.

When used to maintain remission, single daily doses of oral aminosaliculates can be more effective than multiple daily dosing, but may result in more side-effects.

Oral azathioprine p. 816 or mercaptopurine p. 887 [unlicensed indications] can be considered to maintain remission, if there has been two or more inflammatory exacerbations in a 12-month period that required treatment with systemic corticosteroids, or if remission is not

maintained by aminosalicylates, or following a single acute severe episode. 

There is no evidence to support the use of methotrexate p. 888 to induce or maintain remission in ulcerative colitis, though its use is common in clinical practice.

Monoclonal antibodies for maintaining remission of ulcerative colitis

Treatment with these agents is continued into the maintenance phase, if effective and tolerated in acute disease. See also *National funding/access decisions* for adalimumab, golimumab, infliximab and vedolizumab.

Non-drug treatment

 Surgery may be necessary as emergency treatment for severe ulcerative colitis that does not respond to drug treatment. Patients can also choose to have elective surgery for unresponsive or frequently relapsing disease that is affecting their quality of life.

Other drugs used for Inflammatory bowel disease
Ustekinumab, p. 1069

AMINOSALICYLATES

Aminosalicylates

• SIDE-EFFECTS

- **Common or very common** Arthralgia · cough · diarrhoea · dizziness · fever · gastrointestinal discomfort · headache · leucopenia · nausea · skin reactions · vomiting
- **Uncommon** Alopecia · depression · dyspnoea · myalgia · photosensitivity reaction · thrombocytopenia
- **Rare or very rare** Agranulocytosis · bone marrow disorders · cardiac inflammation · hepatitis · neutropenia · pancreatitis · peripheral neuropathy · renal impairment · respiratory disorders
- **Frequency not known** Angioedema · eosinophilia · haemolytic anaemia · nephritis tubulointerstitial · oligozoospermia (reversible) · ulcerative colitis aggravated

SIDE-EFFECTS, FURTHER INFORMATION A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in salicylate hypersensitivity.

• RENAL IMPAIRMENT

Monitoring Renal function should be monitored more frequently in renal impairment.

- **MONITORING REQUIREMENTS** Renal function should be monitored before starting an oral aminosalicylate, at 3 months of treatment, and then annually during treatment.

• PATIENT AND CARER ADVICE

Blood disorders Patients receiving aminosalicylates, and their carers, should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise that occurs during treatment.

Balsalazide sodium

• INDICATIONS AND DOSE

Treatment of mild to moderate ulcerative colitis, acute attack

- **BY MOUTH**
- **Adult:** 2.25 g 3 times a day until remission occurs or for up to maximum of 12 weeks

Maintenance of remission of ulcerative colitis

- **BY MOUTH**
- **Adult:** 1.5 g twice daily (max. per dose 3 g), adjusted according to response; maximum 6 g per day

- **CAUTIONS** History of asthma

- **INTERACTIONS** → Appendix 1: balsalazide

- **SIDE-EFFECTS** Acute kidney injury · blood disorder · cholelithiasis · lupus-like syndrome

- **PREGNANCY** Manufacturer advises avoid.

- **BREAST FEEDING** Diarrhoea may develop in the infant.

Monitoring Monitor breast-fed infants for diarrhoea.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

- **Colazide** (Almirall Ltd)

Balsalazide disodium 750 mg Colazide 750mg capsules | 130 capsule [PoM] £30.42 DT = £30.42

Mesalazine

• INDICATIONS AND DOSE

DOSE EQUIVALENCE AND CONVERSION

There is no evidence to show that any one oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary.

ASACOL® MR 400MG TABLETS

Treatment of mild to moderate ulcerative colitis, acute attack

- **BY MOUTH**
- **Child 12-17 years:** 800 mg 3 times a day
- **Adult:** 2.4 g daily in divided doses

Maintenance of remission of ulcerative colitis and Crohn's ileo-colitis

- **BY MOUTH**
- **Child 12-17 years:** 400-800 mg 2-3 times a day
- **Adult:** 1.2-2.4 g daily in divided doses

ASACOL® MR 800MG TABLETS

Treatment of mild to moderate ulcerative colitis, acute attack

- **BY MOUTH**
- **Adult:** 2.4-4.8 g daily in divided doses

Maintenance of remission of ulcerative colitis

- **BY MOUTH**
- **Adult:** Up to 2.4 g once daily, alternatively up to 2.4 g daily in divided doses

Maintenance of remission of Crohn's ileo-colitis

- **BY MOUTH**
- **Adult:** Up to 2.4 g daily in divided doses continued →

ASACOL[®] FOAM ENEMA**Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectosigmoid region**

- BY RECTUM
- Adult: 1 g daily for 4–6 weeks, to be administered into the rectum

Treatment of acute attack of mild to moderate ulcerative colitis, affecting the descending colon

- BY RECTUM
- Adult: 2 g once daily for 4–6 weeks, to be administered into the rectum

ASACOL[®] SUPPOSITORIES**Treatment of acute attack of mild to moderate ulcerative colitis and maintenance of remission**

- BY RECTUM
- Adult: 0.75–1.5 g daily in divided doses, last dose to be administered at bedtime

MEZAVANT[®] XL**Treatment of mild to moderate ulcerative colitis, acute attack**

- BY MOUTH
- Adult: 2.4 g once daily, increased if necessary to 4.8 g once daily, review treatment at 8 weeks

Maintenance of remission of ulcerative colitis

- BY MOUTH
- Adult: 2.4 g once daily

OCTASA[®]**Treatment of mild to moderate ulcerative colitis, acute attack**

- BY MOUTH
- Adult: 2.4–4.8 g once daily, alternatively 2.4–4.8 g daily in divided doses, dose over 2.4 g daily in divided doses only

Maintenance of remission of ulcerative colitis and Crohn's ileo-colitis

- BY MOUTH
- Adult: 1.2–2.4 g once daily, alternatively daily in divided doses

PENTASA[®] GRANULES**Treatment of mild to moderate ulcerative colitis, acute attack**

- BY MOUTH
- Child 5–17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
- Child 5–17 years (body-weight 40 kg and above): 1–2 g twice daily, total daily dose may alternatively be given in 3–4 divided doses
- Adult: Up to 4 g once daily, alternatively up to 4 g daily in 2–4 divided doses

Maintenance of remission of ulcerative colitis

- BY MOUTH
- Child 5–17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- Child 5–17 years (body-weight 40 kg and above): 2 g once daily
- Adult: 2 g once daily

PENTASA[®] RETENTION ENEMA**Treatment of acute attack of mild to moderate ulcerative colitis or maintenance of remission**

- BY RECTUM
- Adult: 1 g once daily, dose to be administered at bedtime

Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectosigmoid region

- BY RECTUM
- Child 12–17 years: 1 g once daily, dose to be administered at bedtime

PENTASA[®] SUPPOSITORIES**Treatment of acute attack, ulcerative proctitis**

- BY RECTUM
- Adult: 1 g daily for 2–4 weeks

Maintenance, ulcerative proctitis

- BY RECTUM
- Adult: 1 g daily

PENTASA[®] TABLETS**Treatment of mild to moderate ulcerative colitis, acute attack**

- BY MOUTH
- Adult: Up to 4 g once daily, alternatively up to 4 g daily in 2–3 divided doses

Maintenance of remission of ulcerative colitis

- BY MOUTH
- Adult: 2 g once daily

SALOFALK[®] ENEMA**Treatment of acute attack of mild to moderate ulcerative colitis or maintenance of remission**

- BY RECTUM
- Adult: 2 g once daily, dose to be administered at bedtime

SALOFALK[®] GRANULES**Treatment of mild to moderate ulcerative colitis, acute attack**

- BY MOUTH
- Child 5–17 years (body-weight up to 40 kg): 30–50 mg/kg once daily, dose preferably given in the morning, alternatively 10–20 mg/kg 3 times a day
- Child 5–17 years (body-weight 40 kg and above): 1.5–3 g once daily, dose preferably given in the morning, alternatively 0.5–1 g 3 times a day
- Adult: 1.5–3 g once daily, dose preferably taken in the morning, alternatively 0.5–1 g 3 times a day

Maintenance of remission of ulcerative colitis

- BY MOUTH
- Child 5–17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- Child 5–17 years (body-weight 40 kg and above): 500 mg 3 times a day
- Adult: 500 mg 3 times a day

SALOFALK[®] RECTAL FOAM**Treatment of mild ulcerative colitis affecting sigmoid colon and rectum**

- BY RECTUM
- Child 12–17 years: 2 g once daily, dose to be administered into the rectum at bedtime, alternatively 2 g daily in 2 divided doses
- Adult: 2 g once daily, dose to be administered into the rectum at bedtime, alternatively 2 g daily in 2 divided doses

SALOFALK[®] SUPPOSITORIES**Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectum, sigmoid colon and descending colon**

- BY RECTUM
- Adult: 0.5–1 g 2–3 times a day, adjusted according to response, dose to be given using 500 mg suppositories

Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectum

- BY RECTUM
- Adult: 1 g daily, preferably at bedtime, dose to be given using 1 g suppositories

SALOFALK® TABLETS**Treatment of mild to moderate ulcerative colitis, acute attack**

► BY MOUTH

- Child 5–17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
- Child 5–17 years (body-weight 40 kg and above): 0.5–1 g 3 times a day
- Adult: 0.5–1 g 3 times a day

Maintenance of remission of ulcerative colitis

► BY MOUTH

- Adult: 500 mg 3 times a day

• UNLICENSED USE

- With oral use in children *Asacol*® (all preparations) not licensed for use in children under 18 years. *Pentasa*® granules and *Salofalk*® tablets and granules not licensed for use in children under 6 years.
- With rectal use in children *Salofalk*® rectal foam no dose recommendations for children (age range not specified by manufacturer).

- **CONTRA-INDICATIONS** Blood clotting abnormalities (in children)

- **CAUTIONS** Elderly · pulmonary disease

- **INTERACTIONS** → Appendix 1: mesalazine

• SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- **Rare or very rare** Flatulence · hepatic disorders · nephritis

SPECIFIC SIDE-EFFECTS

- **Rare or very rare**

- With rectal use Constipation

- **PREGNANCY** Negligible quantities cross placenta.

- **BREAST FEEDING** Diarrhoea reported in breast-fed infants, but negligible amounts of mesalazine detected in breast milk.

Monitoring Monitor breast-fed infant for diarrhoea.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

• RENAL IMPAIRMENT

- In adults Use with caution. Avoid if eGFR less than 20 mL/minute/1.73 m².
- In children Use with caution. Avoid if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

• DIRECTIONS FOR ADMINISTRATION

PENTASA® TABLETS Tablets may be halved, quartered, or dispersed in water, but should not be chewed.

PENTASA® GRANULES Granules should be placed on tongue and washed down with water or orange juice without chewing.

- In children Contents of one sachet should be weighed and divided immediately before use; discard any remaining granules.

SALOFALK® GRANULES Granules should be placed on tongue and washed down with water without chewing.

- **PRESCRIBING AND DISPENSING INFORMATION** There is no evidence to show that any one oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary.

Flavours of granule formulations of *Salofalk*® may include vanilla.

- **PATIENT AND CARER ADVICE** If it is necessary to switch a patient to a different brand of mesalazine, the patient should be advised to report any changes in symptoms.

Some products may require special administration advice; patients and carers should be informed.

Olsalazine sodium

• INDICATIONS AND DOSE

Treatment of acute attack of mild ulcerative colitis

- ▶ BY MOUTH
- ▶ Adult: 1 g daily in divided doses, doses to be taken after meals, then increased if necessary up to 3 g daily in divided doses (max. per dose 1 g), dose to be increased over 1 week

Maintenance of remission of mild ulcerative colitis

- ▶ BY MOUTH
- ▶ Adult: Maintenance 500 mg twice daily, dose to be taken after food

- **INTERACTIONS** → Appendix 1: olsalazine

• SIDE-EFFECTS

- ▶ **Uncommon** Paraesthesia · tachycardia
- ▶ **Frequency not known** Palpitations · vision blurred
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.

• BREAST FEEDING

Monitoring Monitor breast-fed infants for diarrhoea.

- **RENAL IMPAIRMENT** Use with caution; manufacturer advises avoid in significant impairment.

- **DIRECTIONS FOR ADMINISTRATION** Capsules can be opened and contents sprinkled on food.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Sulfasalazine

(Sulphasalazine)

07-Feb-2018

• INDICATIONS AND DOSE

Treatment of acute attack of mild to moderate and severe ulcerative colitis | Active Crohn's disease

- ▶ BY MOUTH
- ▶ Adult: 1–2 g 4 times a day until remission occurs, corticosteroids may also be given, if necessary
- ▶ BY RECTUM
- ▶ Adult: 0.5–1 g twice daily, administered alone or in conjunction with oral therapy, morning and night after a bowel movement

Maintenance of remission of mild to moderate and severe ulcerative colitis

- ▶ BY MOUTH
- ▶ Adult: 500 mg 4 times a day
- ▶ BY RECTUM
- ▶ Adult: 0.5–1 g twice daily, administered alone or in conjunction with oral therapy, morning and night after a bowel movement

Active rheumatoid arthritis (administered on expert advice)

- ▶ BY MOUTH
- ▶ Adult: Initially 500 mg daily, increased in steps of 500 mg every week, increased to 2–3 g daily in divided doses, enteric coated tablets to be administered

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Sulfasalazine has been confused with sulfadiazine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CAUTIONS** Acute porphyrias p. 1025 · G6PD deficiency · history of allergy · history of asthma · maintain adequate fluid intake · risk of haematological toxicity · risk of hepatic toxicity · slow acetylator status

- **INTERACTIONS** → Appendix 1: sulfasalazine

• SIDE-EFFECTS

- ▶ **Common or very common** Insomnia · stomatitis · taste altered · tinnitus · urine abnormalities
- ▶ **Uncommon** Face oedema · seizure · vasculitis · vertigo
- ▶ **Frequency not known** Anaemia · appetite decreased · ataxia · cyanosis · encephalopathy · haematuria · hallucination · hepatic disorders · hypoproteinaemia · idiopathic pulmonary fibrosis · lymphadenopathy · macrocytosis · meningitis aseptic · methaemoglobinemia · myocarditis allergic · nephrotic syndrome · parotitis · periorbital oedema · pseudomembranous enterocolitis · serum sickness · severe cutaneous adverse reactions (SCARs) · smell disorders · systemic lupus erythematosus (SLE) · yellow discolouration of body fluids

SIDE-EFFECTS, FURTHER INFORMATION Incidence of side-effects increases with higher doses.

Blood disorders Haematological abnormalities occur usually in the first 3 to 6 months of treatment—discontinue if these occur.

- **PREGNANCY** Theoretical risk of neonatal haemolysis in third trimester; adequate folate supplements should be given to mother.
- **BREAST FEEDING** Small amounts in milk (1 report of bloody diarrhoea); theoretical risk of neonatal haemolysis especially in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Risk of toxicity, including crystalluria, in moderate impairment—ensure high fluid intake. Avoid in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Blood disorders Close monitoring of full blood counts (including differential white cell count and platelet count) is necessary initially, and at monthly intervals during the first 3 months.
 - ▶ Renal function Although the manufacturer recommends renal function tests in rheumatic diseases, evidence of practical value is unsatisfactory.
 - ▶ Liver function Liver function tests should be performed at monthly intervals for first 3 months.
- **PATIENT AND CARER ADVICE**
 - Contact lenses Some soft contact lenses may be stained.

● **DRUG ACTION** Budesonide is a glucocorticoid, which exerts significant local anti-inflammatory effects.

● INDICATIONS AND DOSE

BUDENOFALK® CAPSULES

Mild to moderate Crohn's disease affecting the ileum or ascending colon

► BY MOUTH

► Adult: 9 mg once daily for 8 weeks, to be taken in the morning, alternatively 3 mg 3 times a day for 8 weeks, reduce dose gradually over two weeks following treatment

Collagenous colitis

► BY MOUTH

► Adult: 9 mg once daily for 8 weeks, to be taken in the morning, reduce dose gradually over two weeks following treatment

Autoimmune hepatitis, induction of remission

► BY MOUTH

► Adult: 3 mg 3 times a day

Autoimmune hepatitis, maintenance

► BY MOUTH

► Adult: 3 mg twice daily

BUDENOFALK® GRANULES

Mild to moderate Crohn's disease affecting the ileum or ascending colon | Collagenous colitis

► BY MOUTH

► Adult: 9 mg once daily for 8 weeks, to be taken in the morning about 30 minutes before breakfast, reduce dose gradually over two weeks following treatment

BUDENOFALK® RECTAL FOAM

Ulcerative colitis affecting sigmoid colon and rectum

► BY RECTUM

► Adult: 1 metered application once daily for up to 8 weeks

DOSE EQUIVALENCE AND CONVERSION

► For *Budenofalk*® rectal foam: 1 metered application is equivalent to budesonide 2 mg.

CORTIMENT®

Induction of remission of mild-to-moderate active ulcerative colitis

► BY MOUTH

► Adult: 9 mg once daily for up to 8 weeks, dose to be taken in the morning

ENTOCORT® CAPSULES

Active microscopic colitis

► BY MOUTH

► Adult: 9 mg once daily, to be taken in the morning

Mild to moderate Crohn's disease affecting the ileum or ascending colon

► BY MOUTH

► Adult: 9 mg once daily for up to 8 weeks; reduce dose for the last 2–4 weeks of treatment, to be taken in the morning

ENTOCORT® ENEMA

Ulcerative colitis involving rectal and recto-sigmoid disease

► BY RECTUM

► Adult: 1 enema daily for 4 weeks, to be administered at bedtime

● CAUTIONS

► With systemic use Autoimmune hepatitis

● **INTERACTIONS** → Appendix 1: corticosteroids

● SIDE-EFFECTS

- ▶ Common or very common
 - With oral use Muscle twitching · oedema
 - With rectal use Diarrhoea · gastrointestinal disorders
- ▶ Rare or very rare
 - With oral use Fatigue · malaise

● HEPATIC IMPAIRMENT

Monitoring When used in autoimmune hepatitis liver function tests should be monitored every 2 weeks for 1 month, then at least every 3 months.

- **DIRECTIONS FOR ADMINISTRATION** Granules should be placed on tongue and washed down with water without chewing.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of granule formulations may include lemon.

ENTOCORT® CAPSULES Dispense modified-release capsules in original container (contains desiccant).

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer budesonide granules.

● NATIONAL FUNDING/ACCESS DECISIONS

CORTIMENT®

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2016) that budesonide (*Cortiment*®) is accepted for restricted use within NHS Scotland for induction of remission of mild-to-moderate active ulcerative colitis where aminosalicylate treatment is not sufficient, and only if patients present with active left-sided disease and/or proctosigmoiditis who are not suitable for oral prednisolone, as an alternative to budesonide rectal formulations or off-label oral budesonide.

BUDENOFALK® CAPSULES

Scottish Medicines Consortium (SMC) Decisions

- ▶ With oral use The *Scottish Medicines Consortium* has advised (April 2015) that *Budenofalk*® gastro-resistant capsules are accepted for restricted use within NHS Scotland for the treatment of autoimmune hepatitis in non-cirrhotic patients who are intolerant of conventional oral corticosteroids (prednisolone) with severe corticosteroid-related side effects (actual or anticipated) such as psychosis, poorly controlled diabetes or osteoporosis.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES, ANTI-LYMPHOCYTE

Vedolizumab

04-Apr-2016

- **DRUG ACTION** Vedolizumab is a monoclonal antibody that binds specifically to the $\alpha_4\beta_7$ integrin, which is expressed on gut homing T helper lymphocytes and causes a reduction in gastrointestinal inflammation.

● INDICATIONS AND DOSE

Moderate to severe active ulcerative colitis in patients who have had an inadequate response with, lost response to, or are intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor (under expert supervision)

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 300 mg, then 300 mg after 2 weeks, followed by 300 mg after 4 weeks, followed by 300 mg every 8 weeks, dose to be given over 30 minutes, if treatment is interrupted or response decreases, dosing frequency may be increased—consult product literature; review treatment if no response within 10 weeks of initial dose

Moderate to severe active Crohn's disease in patients who have had an inadequate response with, lost response to, or are intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor (under expert supervision)

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 300 mg, then 300 mg after 2 weeks, followed by 300 mg after 4 weeks, followed by 300 mg every 8 weeks, dose to be given over 30 minutes, if no response is observed, an additional dose of 300 mg may be given 10 weeks after initial dose; if treatment is interrupted or response decreases, dosing frequency may be increased—consult product literature; review treatment if no response within 14 weeks of initial dose

- **CONTRA-INDICATIONS** Severe active infection

- **CAUTIONS** Controlled chronic severe infection · history of recurring severe infection · previous treatment with natalizumab (wait at least 12 weeks between natalizumab use and initiation of vedolizumab unless potential benefit outweighs risk) · previous treatment with rituximab

CAUTIONS, FURTHER INFORMATION

- ▶ Risk of infection Patients must be screened for tuberculosis before starting treatment; if latent tuberculosis is diagnosed, appropriate treatment must be initiated prior to vedolizumab treatment; if tuberculosis is diagnosed during treatment, discontinue vedolizumab until infection is resolved.

Patients should be brought up to date with current immunisation schedule before initiating treatment.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- ▶ Common or very common Arthralgia · constipation · cough · fatigue · fever · gastrointestinal discomfort · gastrointestinal disorders · headache · hypertension · increased risk of infection · muscle spasms · muscle weakness · nasal congestion · nausea · night sweats · oropharyngeal pain · pain · paraesthesia · skin reactions
- ▶ Uncommon Chills · feeling cold

- ▶ Frequency not known Hypersensitivity

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related and hypersensitivity reactions have been reported. Patients should be observed continuously during each

infusion for signs and symptoms of acute hypersensitivity reactions; they should also be observed for 2 hours after the initial two infusions, and for 1 hour after subsequent infusions. Discontinue treatment if a severe infusion-related or other severe reaction occurs and initiate appropriate treatment (e.g. adrenaline and antihistamines); if a mild to moderate infusion-related reaction occurs, interrupt infusion or reduce infusion rate and initiate appropriate treatment (if reaction subsides the infusion may be continued)—consider pretreatment with an antihistamine, hydrocortisone, and/or paracetamol prior to subsequent infusions in patients who experience mild to moderate infusion-related reactions.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required during and for at least 18 weeks after treatment.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor closely for infection before, during and after treatment—potential increased risk of opportunistic infection.
 - ▶ Manufacturer advises monitor for new onset or worsening neurological signs and symptoms (withhold treatment if progressive multifocal leukoencephalopathy (PML) is suspected).
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Entyvio®), give intermittently in Sodium chloride 0.9%; allow vial to reach room temperature then reconstitute with 4.8 mL of water for injection (using a syringe with a 21–25 gauge needle); gently swirl vial for at least 15 seconds, do not shake vigorously or invert; allow to stand for up to 20 minutes (gently swirl vial if needed), leave for an additional 10 minutes if not dissolved; gently invert vial three times, withdraw 5 mL of reconstituted solution (using a syringe with a 21–25 gauge needle), and add to 250 mL of infusion fluid; gently mix and give over 30 minutes.
- **PATIENT AND CARER ADVICE** Patients should be provided with a patient alert card.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Vedolizumab for treating moderately to severely active Crohn's disease after prior therapy (August 2015) NICE TA352 Vedolizumab is recommended as an option for the treatment of moderate to severe active Crohn's disease in adults if:
 - a tumour necrosis factor- α inhibitor has failed (that is, the disease has responded inadequately or has lost response to treatment) or
 - a tumour necrosis factor- α inhibitor cannot be tolerated or is contra-indicated,
 - and the manufacturer provides vedolizumab with the discount agreed in the patient access scheme.
 Vedolizumab should be given as a planned course of treatment until treatment fails, or surgery is needed, or until 12 months after starting treatment, whichever is the shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

Patients currently receiving vedolizumab whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA352

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (July 2015) that vedolizumab (Entyvio®) is accepted for restricted use within NHS Scotland for the treatment of adult patients with moderately to severely active Crohn's disease who have had an inadequate response with, lost response to, or were intolerant to a TNF α antagonist; it is also accepted for use in NHS Scotland for the treatment of adult patients with moderately to severely active ulcerative colitis who have had an inadequate response with, lost response to, or were intolerant to either conventional therapy or a TNF α antagonist.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

1.4 Irritable bowel syndrome

Irritable bowel syndrome

24-Feb-2016

Description of condition

Irritable bowel syndrome (IBS) is a common, chronic, relapsing, and often life-long condition, mainly affecting people aged between 20 and 30 years. It is more common in women. Symptoms include abdominal pain or discomfort, disordered defaecation (either diarrhoea, or constipation with straining, urgency, and incomplete evacuation), passage of mucus, and bloating. Symptoms are usually relieved by defaecation. Obtaining an accurate clinical diagnosis of IBS prior to treatment is crucial.

Aims of treatment

The treatment of IBS is focused on symptom control, in order to improve quality of life.

Non-drug treatment

[EvGr] Diet and lifestyle changes are important for effective self-management of IBS. Patients should be encouraged to increase physical activity, and advised to eat regularly, without missing meals or leaving long gaps between meals. Dietary advice should also include, limiting fresh fruit consumption to no more than 3 portions per day. The fibre intake of patients with IBS should be reviewed. If an increase in dietary fibre is required, soluble fibre such as ispaghula husk p. 54, or foods high in soluble fibre such as oats, are recommended. Intake of insoluble fibre (e.g. bran) and 'resistant starch' should be reduced or discouraged as they may exacerbate symptoms. Fluid intake (mostly water) should be increased to at least 8 cups each day and the intake of caffeine, alcohol and fizzy drinks reduced. The artificial sweetener sorbitol should be avoided in patients with diarrhoea. Where probiotics are being used, continue for at least 4 weeks while monitoring the effect.

If a patient's symptoms persist following lifestyle and dietary advice, single food avoidance and exclusion diets may be an option under the supervision of a dietitian or medical specialist. ⚡

Drug treatment

[EvGr] The choice of drug treatment depends on the nature and severity of the symptoms. Many drug treatment options for IBS are available over-the-counter.

Antispasmodic drugs (such as alverine citrate p. 86, mebeverine hydrochloride p. 86 and peppermint oil p. 47) can be taken in addition to dietary and lifestyle changes. A

laxative (excluding lactulose p. 56 as it may cause bloating) can be used to treat constipation. Patients who have not responded to laxatives from the different classes and who have had constipation for at least 12 months, can be treated with linaclotide p. 47. Loperamide hydrochloride p. 66 is the first-line choice of anti-motility drug for relief of diarrhoea. Patients with IBS should be advised how on to adjust their dose of laxative or anti-motility drug according to stool consistency, with the aim of achieving a soft, well-formed stool. [▶](#) See Constipation p. 52, for information on other drugs used for chronic constipation.

[Evg] A low-dose tricyclic antidepressant, such as amitriptyline hydrochloride p. 369 [unlicensed indication], can be used for abdominal pain or discomfort as a second-line option in patients who have not responded to antispasmodics, anti-motility drugs, or laxatives. A selective serotonin reuptake inhibitor may be considered in those who do not respond to a tricyclic antidepressant [unlicensed indication].

Psychological intervention can be offered to patients who have no relief of IBS symptoms after 12 months of drug treatment. [▶](#)

Useful Resources

Irritable bowel syndrome in adults: diagnosis and management. Clinical guideline 61. February 2015 www.nice.org.uk/guidance/cg61

ANTIARRHOEALS > ANTIPROPULSIVES

Eluxadoline

03-Jan-2018

- **DRUG ACTION** Eluxadoline acts locally on opioid receptors in the gut to reduce gastro-intestinal contractility and fluid secretion.

● INDICATIONS AND DOSE

Irritable bowel syndrome with diarrhoea (specialist use only)

▶ BY MOUTH

- ▶ Adult: 100 mg twice daily; reduced if not tolerated to 75 mg twice daily, dose should be administered in the morning and evening, the reduced dose may be more appropriate for elderly patients

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ELUXADOLINE (TRUBERZI®): RISK OF PANCREATITIS; DO NOT USE IN PATIENTS WHO HAVE UNDERGONE CHOLECYSTECTOMY OR IN THOSE WITH BILIARY DISORDERS (DECEMBER 2017)

Cases of pancreatitis, with or without sphincter of Oddi spasm, have been reported in patients taking eluxadoline. Some cases have resulted in hospitalisation and death, primarily in patients who have undergone cholecystectomy—see Contra-indications and Patient and carer advice for further information. Eluxadoline should be initiated and supervised by a specialist physician experienced in diagnosis and management of gastrointestinal disorders.

- **CONTRA-INDICATIONS** Alcoholism · cholecystectomy · diseases of the biliary tract · diseases of the pancreas · excessive alcohol use · gall bladder agenesis · gastro-intestinal obstruction · history of chronic constipation · history of hepatic impairment · history of pancreatitis · history of severe constipation · known or suspected biliary tree or pancreatic duct obstruction · sphincter of Oddi disease or dysfunction
- **CAUTIONS** Genetic predisposition for poor function of OATP1B1 transporter (increased risk of adverse events)
- **INTERACTIONS** → Appendix 1: eluxadoline

● SIDE-EFFECTS

- ▶ **Common or very common** Constipation · dizziness · drowsiness · gastrointestinal discomfort · gastrointestinal disorders · nausea · skin reactions · vomiting
- ▶ **Uncommon** Sphincter of Oddi spasm (discontinue)
- **PREGNANCY** Manufacturer advises avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—risk of significantly increased plasma-drug concentration.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor for symptoms suggestive of sphincter of Oddi spasm and pancreatitis.
- **PATIENT AND CARER ADVICE** Manufacturer advises that patients should be told to avoid alcohol during treatment; patients should also be advised to stop treatment and seek medical attention if they experience symptoms suggestive of pancreatitis or sphincter of Oddi spasm, (such as acute worsening of abdominal pain that may radiate to the back or shoulder, with or without nausea and vomiting), or if they develop severe constipation lasting for more than 4 days.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Eluxadoline for treating irritable bowel syndrome with diarrhoea (August 2017)** NICE TA471
Eluxadoline is recommended as an option for treating irritable bowel syndrome with diarrhoea in patients, only if:

- the condition has not responded to other pharmacological treatments (for example, antimotility agents, antispasmodics, tricyclic antidepressants), **or**
- pharmacological treatments are contra-indicated or not tolerated, **and**
- it is started in secondary care.

Stop eluxadoline at four weeks if there is inadequate relief of the symptoms of irritable bowel syndrome with diarrhoea.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta471

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2018) that eluxadoline (*Truberzi*®) is **not** recommended for use within NHS Scotland in adults for the treatment of irritable bowel syndrome with diarrhoea as the economic case was not demonstrated.

● MEDICINAL FORMS

Mebeverine with ispaghula husk

04-Feb-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, mebeverine hydrochloride p. 86, ispaghula husk p. 54.

● INDICATIONS AND DOSE

Irritable bowel syndrome

► BY MOUTH

- Child 12–17 years: 1 sachet twice daily, in water, morning and evening, 30 minutes before food and 1 sachet daily if required, taken 30 minutes before midday meal
- Adult: 1 sachet twice daily, in water, morning and evening, 30 minutes before food and 1 sachet daily if required, taken 30 minutes before midday meal

- **DIRECTIONS FOR ADMINISTRATION** Contents of one sachet should be stirred into a glass (approx. 150 mL) of cold water and drunk immediately.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer ispaghula husk with mebeverine granules.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Effervescent granules

CAUTIONARY AND ADVISORY LABELS 13, 22

EXCIPIENTS: May contain Aspartame

ELECTROLYTES: May contain Potassium

► **Fybogel Mebeverine** (Reckitt Benckiser Healthcare (UK) Ltd)

Mebeverine hydrochloride 135 mg, Ispaghula husk

3.5 gram Fybogel Mebeverine effervescent granules sachets orange sugar-free | 10 sachet **[P]** £4.64 DT = £4.64

Peppermint oil

● INDICATIONS AND DOSE

COLPERMIN®

Relief of abdominal colic and distension, particularly in irritable bowel syndrome

► BY MOUTH

- Child 15–17 years: 1–2 capsules 3 times a day for up to 3 months if necessary, capsule to be swallowed whole with water
- Adult: 1–2 capsules 3 times a day for up to 3 months if necessary, capsule to be swallowed whole with water

MINTEC®

Relief of abdominal colic and distension, particularly in irritable bowel syndrome

► BY MOUTH

- Adult: 1–2 capsules 3 times a day for up to 2–3 months if necessary, dose to be taken before meals, swallowed whole with water

- **CAUTIONS** Sensitivity to menthol

- **INTERACTIONS** → Appendix 1: peppermint oil

- **SIDE-EFFECTS** Ataxia · bradycardia · gastrointestinal discomfort · gastroesophageal reflux disease · headache · nausea · paraesthesia · rash erythematous · tremor · vomiting

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Significant levels of menthol in breast milk unlikely.

- **DIRECTIONS FOR ADMINISTRATION** Capsules should not be broken or chewed because peppermint oil may irritate mouth or oesophagus.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant capsule

LAXATIVES > GUANYLATE CYCLASE-C RECEPTOR AGONISTS

Linacotide

24-Feb-2016

● INDICATIONS AND DOSE

Moderate to severe irritable bowel syndrome with constipation

► BY MOUTH

- Adult: 290 micrograms once daily, dose to be taken at least 30 minutes before meals, review treatment if no response after 4 weeks

- **CONTRA-INDICATIONS** Gastro-intestinal obstruction · inflammatory bowel disease

- **CAUTIONS** Predisposition to fluid and electrolyte disturbances

● **SIDE-EFFECTS**

- **Common or very common** Diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders

- ▶ **Uncommon** Appetite decreased · dehydration · haemorrhage · hypokalaemia · nausea · postural hypotension · vomiting
 - ▶ **Frequency not known** Rash
- SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises if diarrhoea severe or prolonged, consider suspending treatment.
- **PREGNANCY** Manufacturer advises avoid.
 - **BREAST FEEDING** Unlikely to be present in milk in significant amounts, but manufacturer advises avoid.
 - **PRESCRIBING AND DISPENSING INFORMATION** Dispense capsules in original container (contains desiccant); discard any capsules remaining 18 weeks after opening.
 - **NATIONAL FUNDING/ACCESS DECISIONS**
- Scottish Medicines Consortium (SMC) Decisions**
The *Scottish Medicines Consortium* has advised (May 2013) that linaclotide (*Constella*®) is accepted for restricted use within NHS Scotland for moderate to severe irritable bowel syndrome in patients whose condition has not responded adequately to all other treatments, or who are intolerant of them.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

1.5 Short bowel syndrome

Short bowel syndrome

31-Aug-2016

Description of condition

Patients with a shortened bowel due to large surgical resection (with or without stoma formation) may require medical management to ensure adequate absorption of nutrients and fluid. Absorption of oral medication is also often impaired.

Aims of treatment

The management of short bowel syndrome focuses on ensuring adequate nutrition and drug absorption, thereby reducing the risk of complications resulting from these effects.

Drug treatment

Nutritional deficiencies

[EvGr] Patients with a short bowel may require replacement of vitamins and minerals depending on the extent and position of the bowel resection. Deficiencies in vitamins A, B₁₂, D, E, and K, essential fatty acids, zinc, and selenium can occur.

Hypomagnesaemia is common and is treated with oral or intravenous magnesium supplementation (see under *Magnesium*, p. 1017), though administration of oral magnesium may cause diarrhoea. Occasionally the use of oral alfacalcidol p. 1050 and correction of sodium depletion may be useful. Nutritional support can range from oral supplements to parenteral nutrition, depending on the severity of intestinal failure. **[A]**

Diarrhoea and high output stomas

Diarrhoea is common in short bowel syndrome and can be due to multiple factors. **[EvGr]** The use of oral rehydration salts can be considered in order to promote adequate

hydration. Oral intake influences the volume of stool passed, so reducing food intake will lessen diarrhoea, but will also exacerbate the problems of undernutrition. A patient may require parenteral nutrition to allow them to eat less, if the extent of diarrhoea is unacceptable.

Pharmacological treatment may be necessary, with the choice of drug depending on the potential for side-effects and the degree of resection. **[A]**

Antimotility drugs

[EvGr] Loperamide hydrochloride p. 66 and codeine phosphate p. 448 reduce intestinal motility and thus exert antidiarrhoeal actions. Loperamide hydrochloride is preferred as it is not sedative and does not cause dependence or fat malabsorption. High doses of loperamide hydrochloride [unlicensed] may be required in patients with a short bowel due to disrupted enterohepatic circulation and rapid gastrointestinal transit time. If the desired response is not obtained with loperamide hydrochloride, codeine phosphate may be added to therapy.

Co-phenotrope p. 66 has traditionally been used alone or in combination with other medications to help decrease faecal output. Co-phenotrope crosses the blood–brain barrier and can produce central nervous system side-effects, which may limit its use; the potential for dependence and anticholinergic effects may also restrict its use. **[A]**

Colestyramine

[EvGr] In patients with an intact colon and less than 100 cm of ileum resected, colestyramine p. 196 can be used to bind the unabsorbed bile salts and reduce diarrhoea. When colestyramine is given to these patients, it is important to monitor for evidence of fat malabsorption (steatorrhoea) or fat-soluble vitamin deficiencies. **[A]**

Antisecretory drugs

[EvGr] Drugs that reduce gastric acid secretion reduce jejunostomy output. Omeprazole p. 80 is readily absorbed in the duodenum and upper small bowel, but if less than 50 cm of jejunum remains, it may need to be given intravenously. Use of a proton pump inhibitor alone does not eliminate the need for further intervention for fluid control (such as antimotility agents, intravenous fluids, or oral rehydration salts).

Octreotide [unlicensed indication] reduces ileostomy diarrhoea and large volume jejunostomy output by inhibiting multiple pro-secretory substances. There is insufficient evidence to establish its role in the management of short bowel syndrome. **[A]**

Growth factors

Growth factors can be used to facilitate intestinal adaptation after surgery in patients with short bowel syndrome, thus enhancing fluid, electrolyte, and micronutrient absorption.

Teduglutide p. 49 is an analogue of endogenous human glucagon-like peptide 2 (GLP-2) which is licensed for use in the management of short bowel syndrome. It may be considered after a period of stabilisation following surgery, during which intravenous fluids and nutritional support should have been optimised.

Drug absorption

For *Prescribing in patients with stoma*, see *Stoma care* p. 97.

[EvGr] Many drugs are incompletely absorbed by patients with a short bowel and may need to be prescribed in much higher doses than usual (such as levothyroxine, warfarin, oral contraceptives, and digoxin) or may need to be given intravenously. **[A]**

Several factors can alter the absorption of drugs taken by mouth in patients with a compromised gastrointestinal system. The most important factors are the length of intestine available for drug absorption, and which section has been removed. The small intestine, with its large surface area and high blood flow, is the most important site of drug absorption. The larger the amount of the small intestine that has been removed, the higher the possibility that drug

absorption will be affected. Other factors, such as gastric emptying and gastric transit time, also affect drug handling.

EvGr Enteric-coated and modified-release preparations are unsuitable for use in patients with short bowel syndrome, particularly in patients with an ileostomy, as there may not be sufficient release of the active ingredient.

Dosage forms with quick dissolution (soluble tablets) should be used. Uncoated tablets and liquid formulations may also be suitable. **EvGr** Before prescribing liquid formulations, prescribers should consider the osmolality, excipient content and volume required. Hyperosmolar liquids and some excipients (such as sorbitol) can result in fluid loss. The calorie density of oral supplements should also be considered, as it will influence the volume to be taken. **E**

Other drugs used for Short bowel syndrome Cimetidine, p. 74

AMINO ACIDS AND DERIVATIVES

Teduglutide

15-May-2018

- **DRUG ACTION** Teduglutide is an analogue of human glucagon-like peptide-2 (GLP-2), which preserves mucosal integrity by promoting growth and repair of the intestine.

● INDICATIONS AND DOSE

Short bowel syndrome (initiated under specialist supervision)

► BY SUBCUTANEOUS INJECTION

- **Adult:** 0.05 mg/kg once daily, dose to be administered to alternating quadrants of the abdomen; alternatively the thigh can be used, for optimal injection volume per body weight, consult product literature. Review treatment after 6 months

- **CONTRA-INDICATIONS** Active or suspected malignancy · history of gastro-intestinal malignancy (in previous 5 years)

- **CAUTIONS** Abrupt withdrawal of parenteral support (reduce gradually with concomitant monitoring of fluid status) · cardiac insufficiency · cardiovascular disease · colo-rectal polyps · hypertension

● SIDE-EFFECTS

- **Common or very common** Anxiety · appetite decreased · congestive heart failure · cough · dyspnoea · fluid imbalance · gallbladder disorders · gastrointestinal discomfort · gastrointestinal disorders · headache · influenza like illness · insomnia · nausea · pancreatitis · peripheral oedema · respiratory tract infection · vomiting
- **Uncommon** Syncope

- **ALLERGY AND CROSS-SENSITIVITY** Manufacturer advises caution in patients with tetracycline hypersensitivity.

- **PREGNANCY** **EvGr** Specialist sources indicate use if necessary—no human data available. **D**

- **BREAST FEEDING** Manufacturer advises avoid—toxicity in animal studies.

● RENAL IMPAIRMENT

Dose adjustments Manufacturer advises use half the daily dose in moderate or severe impairment and end-stage renal disease.

- **MONITORING REQUIREMENTS** Manufacturer advises monitoring of small bowel function, gall bladder, bile ducts and pancreas during treatment.

- **TREATMENT CESSATION** Caution when discontinuing treatment—risk of dehydration.

- **PATIENT AND CARER ADVICE** Patients with cardiovascular disease should seek medical attention if they notice

sudden weight gain, swollen ankles or dyspnoea—may indicate increased fluid absorption.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

2 Constipation and bowel cleansing

2.1 Bowel cleansing

Other drugs used for Bowel cleansing Bisacodyl, p. 61 · Docusate sodium, p. 60 · Magnesium sulfate, p. 1019

LAXATIVES > OSMOTIC LAXATIVES

Citric acid with magnesium carbonate

(Formulated as a bowel cleansing preparation)

● INDICATIONS AND DOSE

Bowel evacuation for surgery, colonoscopy or radiological examination

► BY MOUTH

- **Child 5-9 years:** One-third of a sachet to be given at 8 a.m. the day before the procedure and, one-third of a sachet to be given between 2 and 4 p.m. the day before the procedure
- **Child 10-17 years:** 0.5–1 sachet, given at 8 a.m. the day before the procedure and 0.5–1 sachet, given between 2 and 4 p.m. the day before the procedure
- **Adult:** 1 sachet, given 8 a.m. the day before the procedure and 1 sachet, given between 2 and 4 p.m. the day before the procedure, use half the dose in frail elderly patients

- **CONTRA-INDICATIONS** Acute severe colitis · gastric retention · gastro-intestinal obstruction · gastro-intestinal perforation · toxic megacolon

- **CAUTIONS** Children · colitis (avoid if acute severe colitis) · debilitated · elderly · hypovolaemia (should be corrected before administration of bowel cleansing preparations) · impaired gag reflex or possibility of regurgitation or aspiration · patients with fluid and electrolyte disturbances
- CAUTIONS, FURTHER INFORMATION** Adequate hydration should be maintained during treatment.

- **INTERACTIONS** → Appendix 1: bowel cleansing preparations

● SIDE-EFFECTS

- **Common or very common** Gastrointestinal discomfort · nausea · vomiting
- **Uncommon** Dehydration · dizziness · electrolyte imbalance · headache

SIDE-EFFECTS, FURTHER INFORMATION Abdominal pain is usually transient and can be reduced by taking preparation more slowly.

- **PREGNANCY** Use with caution.

- **BREAST FEEDING** Use with caution.

- **HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.

50 Constipation and bowel cleansing

● RENAL IMPAIRMENT

- ▶ In adults Avoid if eGFR less than 30 mL/minute/1.73 m²—risk of hypermagnesaemia.
- ▶ In children Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—risk of hypermagnesaemia.

● **MONITORING REQUIREMENTS** Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.

● **DIRECTIONS FOR ADMINISTRATION** One sachet should be reconstituted with 200 mL of hot water; the solution should be allowed to cool for approx. 30 minutes before drinking.

● PRESCRIBING AND DISPENSING INFORMATION

Reconstitution of one sachet containing 11.57 g magnesium carbonate and 17.79 g anhydrous citric acid produces a solution containing magnesium citrate with 118 mmol Mg²⁺.

Flavours of oral powders may include lemon and lime.

● **PATIENT AND CARER ADVICE** Low residue or fluid only diet (e.g. water, fruit squash, clear soup, black tea or coffee) recommended before procedure (according to prescriber's advice) and copious intake of clear fluids recommended until procedure. Patient or carers should be given advice on how to administer oral powder.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

● INDICATIONS AND DOSE

MOVIPREP[®]

Bowel cleansing [before any procedure requiring a clean bowel]

▶ BY MOUTH

- ▶ Adult: 1 litre daily for 2 doses; first dose of reconstituted solution taken on the evening before procedure and the second dose on the morning of procedure, alternatively 2 litres daily for 1 dose; reconstituted solution to be taken on the evening before the procedure, or on the morning of the procedure, treatment should be completed at least 1 hour before clinical procedures conducted without general anaesthesia, and at least 2 hours before clinical procedures conducted under general anaesthesia

PLENVU[®]

Bowel cleansing [before any procedure requiring a clean bowel]

▶ BY MOUTH

- ▶ Adult: 500 mL daily for 2 doses; first dose of reconstituted solution taken on the evening before procedure and the second dose on the morning of procedure, alternatively 1 litre daily in 2 divided doses, reconstituted solution to be taken either on the evening before the procedure, or in the morning of the procedure—separate doses by at least 1 hour,

treatment should be completed at least 1 hour before clinical procedures conducted without general anaesthesia, and at least 2 hours before clinical procedures conducted under general anaesthesia

- **CONTRA-INDICATIONS** Disorders of gastric emptying · G6PD deficiency · gastro-intestinal obstruction · gastro-intestinal perforation · ileus · toxic megacolon
- **CAUTIONS** Dehydrated patients · dehydration (correct before administration) · impaired consciousness · impaired gag reflex or possibility of regurgitation or aspiration · moderate-to-severe cardiac impairment · patients at risk of arrhythmia (including those with thyroid disease or electrolyte imbalance) · severe acute inflammatory bowel disease

● **INTERACTIONS** → Appendix 1: bowel cleansing preparations

● SIDE-EFFECTS

- ▶ **Common or very common** Dehydration · nausea
- ▶ **Uncommon** Asthenia · chills · drowsiness · dry mouth · dry throat · electrolyte imbalance · gastrointestinal discomfort · headaches · hot flush · pain · palpitations · sinus tachycardia · temperature sensation altered · thirst · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Abdominal pain is usually transient and can be reduced by taking preparation more slowly.

● **PREGNANCY** Manufacturer advises use only if essential—no or limited information available.

● **BREAST FEEDING** Manufacturer advises use only if essential—no information available.

● **RENAL IMPAIRMENT** Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m².

● **MONITORING REQUIREMENTS** Manufacturer advises consider monitoring baseline and post-treatment electrolytes, renal function and ECG as appropriate, in debilitated patients, those with significant renal impairment, arrhythmia, or at risk of electrolyte imbalance.

● DIRECTIONS FOR ADMINISTRATION

PLENVU[®] Manufacturer advises the contents of the single sachet for Dose 1 should be made up to 500 mL with water and taken over 30 minutes; the contents of the 2 sachets (A and B) for Dose 2 should be made up to 500 mL with water and taken over 30 minutes. Each dose should be followed by 500 mL of clear fluid taken over 30 minutes.

MOVIPREP[®] Manufacturer advises one pair of sachets (A and B) should be made up to 1 litre with water and taken over 1–2 hours; 1 litre of other clear fluid should also be taken during treatment.

● PRESCRIBING AND DISPENSING INFORMATION

PLENVU[®] Dose 1 (single sachet) when reconstituted up to 500 mL with water provides Na⁺ 160.9 mmol, K⁺ 13.3 mmol, Cl⁻ 47.6 mmol; Dose 2 (sachets A and B) when reconstituted up to 500 mL with water provides Na⁺ 297.6 mmol, K⁺ 16.1 mmol, Cl⁻ 70.9 mmol.

MOVIPREP[®] 1 pair of sachets (A+B) when reconstituted up to 1 litre with water provides Na⁺ 181.6 mmol (Na⁺ 56.2 mmol absorbable), K⁺ 14.2 mmol, Cl⁻ 59.8 mmol.

● **PATIENT AND CARER ADVICE** Manufacturer advises solid food should not be taken during treatment until procedure completed.

MEDICINAL FORMS

disorder. In those patients with secondary constipation caused by a drug, the drug should be reviewed.

Overview

EvG In all patients with constipation, an increase in dietary fibre, adequate fluid intake and exercise is advised. Diet should be balanced and contain whole grains, fruits and vegetables. Fibre intake should be increased gradually (to minimise flatulence and bloating). The effects of a high-fibre diet may be seen in a few days although it can take as long as 4 weeks. Adequate fluid intake is important (particularly with a high-fibre diet or fibre supplements), but can be difficult for some people (for example, the frail or elderly). Fruits high in fibre and sorbitol, and fruit juices high in sorbitol, can help prevent and treat constipation. **⚠**

Misconceptions about bowel habits have led to excessive laxative use. Laxative abuse may lead to hypokalaemia. Before prescribing laxatives it is important to be sure that the patient is constipated and that the constipation is not secondary to an underlying undiagnosed complaint.

Laxatives

Bulk-forming laxatives

Bulk-forming laxatives include bran, ispaghula husk p. 54, methylcellulose p. 54 and sterculia p. 54. They are of particular value in adults with small hard stools if fibre cannot be increased in the diet. Onset of action is up to 72 hours. Symptoms of flatulence, bloating, and cramping may be exacerbated. Adequate fluid intake must be maintained to avoid intestinal obstruction.

Methylcellulose, ispaghula husk and sterculia may be used in patients who cannot tolerate bran. Methylcellulose also acts as a faecal softener.

Stimulant laxatives

Stimulant laxatives include bisacodyl p. 61, sodium picosulfate p. 63, and members of the anthraquinone group (senna p. 63, co-danthramer p. 61 and co-danthrusate p. 62). Stimulant laxatives increase intestinal motility and often cause abdominal cramp; manufacturer advises they should be avoided in intestinal obstruction.

The use of co-danthramer and co-danthrusate is limited to constipation in terminally ill patients because of potential carcinogenicity (based on animal studies) and evidence of genotoxicity.

Docusate sodium p. 60 is believed to act as both a stimulant laxative and as a faecal softener (below). Glycerol suppositories act as a lubricant and as a rectal stimulant by virtue of the mildly irritant action of glycerol.

Faecal softeners

Faecal softeners are claimed to act by decreasing surface tension and increasing penetration of intestinal fluid into the faecal mass. Docusate sodium and glycerol suppositories p. 62 have softening properties. Enemas containing arachis oil p. 60 (ground-nut oil, peanut oil) lubricate and soften impacted faeces and promote a bowel movement. Liquid paraffin p. 61 has also been used as a lubricant for the passage of stools but manufacturer advises that it should be used with caution because of its adverse effects, which include anal seepage and the risks of granulomatous disease of the gastro-intestinal tract or of lipid pneumonia on aspiration.

Osmotic laxatives

Osmotic laxatives increase the amount of water in the large bowel, either by drawing fluid from the body into the bowel or by retaining the fluid they were administered with. Lactulose p. 56 is a semi-synthetic disaccharide which is not absorbed from the gastro-intestinal tract. It produces an osmotic diarrhoea of low faecal pH, and discourages the proliferation of ammonia-producing organisms. It is therefore useful in the treatment of hepatic encephalopathy. Macrogols (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 56) are inert

2.2 Constipation

Constipation

06-Jun-2017

Description of condition

Constipation is defaecation that is unsatisfactory because of infrequent stools, difficult stool passage, or seemingly incomplete defaecation. It can occur at any age and is commonly seen in women, the elderly, and during pregnancy.

It is important for those who complain of constipation to understand that bowel habit can vary considerably in frequency without doing harm. Some people erroneously consider themselves constipated if they do not have a bowel movement each day.

New onset constipation, especially in patients over 50 years of age, or accompanying symptoms such as anaemia, abdominal pain, weight loss, or overt or occult blood in the stool should provoke urgent investigation because of the risk of malignancy or other serious bowel

polymers of ethylene glycol which sequester fluid in the bowel; giving fluid with macrogols may reduce the dehydrating effect sometimes seen with osmotic laxatives.

Other drugs used in constipation

Linacotide p. 47 is a guanylate cyclase-C receptor agonist that is licensed for the treatment of moderate to severe irritable bowel syndrome associated with constipation. It increases intestinal fluid secretion and transit, and decreases visceral pain.

Lubiprostone p. 55 is a chloride-channel activator that is licensed for the treatment of chronic idiopathic constipation in adults whose condition has not responded adequately to lifestyle changes (including dietary changes).

Prucalopride p. 59 is a selective serotonin 5HT₄-receptor agonist with prokinetic properties. It is licensed for the treatment of chronic constipation in adults, when other laxatives have failed to provide an adequate response.

Bowel cleansing preparations

Bowel cleansing preparations are used before colonic surgery, colonoscopy or radiological examination to ensure the bowel is free of solid contents; examples include macrogol 3350 with anhydrous sodium sulfate, potassium chloride, sodium bicarbonate and sodium chloride p. 51, citric acid with magnesium carbonate p. 49, magnesium citrate with sodium picosulfate p. 51 and sodium acid phosphate with sodium phosphate p. 58. Bowel cleansing treatments are not treatments for constipation.

Management

Short-duration constipation

[EvGr] In the management of short-duration constipation (where dietary measures are ineffective) treatment should be started with a bulk-forming laxative, ensuring adequate fluid intake. If stools remain hard, add or switch to an osmotic laxative. If stools are soft but difficult to pass or the person complains of inadequate emptying, a stimulant laxative should be added. **[A]**

Opioid-induced constipation

See also *Constipation* under Prescribing in palliative care p. 23. **[EvGr]** In patients with opioid-induced constipation, an osmotic laxative (or docusate sodium to soften the stools) and a stimulant laxative is recommended. Bulk-forming laxatives should be avoided.

Naloxegol p. 64 is recommended for the treatment of opioid-induced constipation when response to other laxatives is inadequate. **[A]**

Methylnaltrexone bromide p. 64 is licensed for the treatment of opioid-induced constipation when response to other laxatives is inadequate. Manufacturer advises that in patients receiving palliative care, methylnaltrexone bromide should be used as an adjunct to existing laxative therapy.

Faecal impaction

The treatment of faecal impaction depends on the stool consistency. **[EvGr]** In patients with hard stools, a high dose of an oral macrogol (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride) may be considered. In those with soft stools, or with hard stools after a few days treatment with a macrogol, an oral stimulant laxative should be started or added to the previous treatment. If the response to oral laxatives is inadequate, for soft stools consider rectal administration of bisacodyl, and for hard stools rectal administration of glycerol alone, or glycerol plus bisacodyl. Alternatively, a docusate sodium p. 60 or sodium citrate enema p. 770 may be tried. **[A]**

[EvGr] If the response is still insufficient, a sodium acid phosphate with sodium phosphate p. 58 or arachis oil p. 60 retention enema may be necessary. For hard faeces it can be helpful to give the arachis oil enema overnight before giving a sodium acid phosphate with sodium phosphate or sodium citrate enema the following day. Enemas may need to be repeated several times to clear hard impacted faeces. **[A]**

Chronic constipation

[EvGr] In the management of chronic constipation, treatment should be started with a bulk-forming laxative, whilst ensuring good hydration. If stools remain hard, add or change to an osmotic laxative such as a macrogol. Lactulose p. 56 is an alternative if macrogols are not effective, or not tolerated. If the response is inadequate, a stimulant laxative can be added. The dose of laxative should be adjusted gradually to produce one or two soft, formed stools per day.

If at least two laxatives (from different classes) have been tried at the highest tolerated recommended doses for at least 6 months, the use of prucalopride p. 59 (in women only) or lubiprostone p. 55 should be considered. If treatment with prucalopride is not effective after 4 weeks, or lubiprostone is not effective after 2 weeks, the patient should be re-examined and the benefit of continuing treatment reconsidered.

Laxatives can be slowly withdrawn when regular bowel movements occur without difficulty, according to the frequency and consistency of the stools. If a combination of laxatives has been used, reduce and stop one laxative at a time; if possible, the stimulant laxative should be reduced first. However, it may be necessary to also adjust the dose of the osmotic laxative to compensate. **[A]**

Constipation in pregnancy and breast-feeding

[EvGr] If dietary and lifestyle changes fail to control constipation in pregnancy, fibre supplements in the form of bran or wheat are likely to help women experiencing constipation in pregnancy, and raise no serious concerns about side-effects to the mother or fetus.

A bulk-forming laxative is the first choice during pregnancy if fibre supplements fail. An osmotic laxative, such as lactulose, can also be used. Bisacodyl p. 61 or senna p. 63 may be suitable if a stimulant effect is necessary but use of senna should be avoided near term or if there is a history of unstable pregnancy. Stimulant laxatives are more effective than bulk-forming laxatives but are more likely to cause side-effects (diarrhoea and abdominal discomfort), reducing their acceptability to patients. Docusate sodium and glycerol suppositories p. 62 can also be used.

A bulk-forming laxative is the first choice during breast-feeding, if dietary measures fail. Lactulose or a macrogol may be used if stools remain hard. As an alternative, a short course of a stimulant laxative such as bisacodyl or senna can be considered. **[A]**

Constipation in children

Early identification of constipation and effective treatment can improve outcomes for children. Without early diagnosis and treatment, an acute episode of constipation can lead to anal fissure and become chronic.

[EvGr] The first-line treatment for children with constipation requires the use of a laxative in combination with dietary modification or with behavioural interventions. Diet modification alone is not recommended as first-line treatment.

In children an increase in dietary fibre, adequate fluid intake, and exercise is advised. Diet should be balanced and contain fruits, and vegetables, high-fibre bread, baked beans, and wholegrain breakfast cereals. Unprocessed bran (which may cause bloating and flatulence and reduces the absorption of micronutrients) is **not** recommended.

If faecal impaction is not present (or has been treated), the child should be treated promptly with a laxative. A macrogol (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 56) is preferred as first-line management. If the response is inadequate, add a stimulant laxative or change to a stimulant laxative if the first-line therapy is not tolerated. If stools remain hard, lactulose or another laxative with softening effects, such as docusate sodium can be added.

In children with chronic constipation, laxatives should be continued for several weeks after a regular pattern of bowel movements or toilet training is established. The dose of laxatives should then be tapered gradually, over a period of months, according to response. Some children may require laxative therapy for several years.

A shorter duration of laxative treatment may be possible in some children with a short history of constipation.

Laxatives should be administered at a time that produces an effect that is likely to fit in with the child's toilet routine.

Faecal impaction in children

[EvGr] Treatment of faecal impaction may initially increase symptoms of soiling and abdominal pain. In children over 1 year of age with faecal impaction, an oral preparation containing a macrogol (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride) is used to clear faecal mass and to establish and maintain soft well-formed stools, using an escalating dose regimen depending on symptoms and response. If disimpaction does not occur after 2 weeks, a stimulant laxative can be added or if stools are hard, used in combination with an osmotic laxative such as lactulose. Long-term regular use of laxatives is essential to maintain well-formed stools and prevent recurrence of faecal impaction; intermittent use may provoke relapses.

LAXATIVES > BULK-FORMING LAXATIVES

Ispaghula husk

24-Feb-2016

- **DRUG ACTION** Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

• INDICATIONS AND DOSE

Constipation

► BY MOUTH

- Child 1 month–5 years: 2.5–5 mL twice daily, dose to be taken only when prescribed by a doctor, as half or whole level spoonful in water, preferably after meals, morning and evening
- Child 6–11 years: 2.5–5 mL twice daily, dose to be given as a half or whole level spoonful in water, preferably after meals, morning and evening
- Child 12–17 years: 1 sachet twice daily, dose to be given in water preferably after meals, morning and evening
- Adult: 1 sachet twice daily, dose to be given in water preferably taken after food, morning and evening

DOSE EQUIVALENCE AND CONVERSION

- 1 sachet equivalent to 2 level 5 mL spoonful.

- **CONTRA-INDICATIONS** Colonic atony · faecal impaction · intestinal obstruction · reduced gut motility
- **CAUTIONS** Adequate fluid intake should be maintained to avoid intestinal obstruction
- **SIDE-EFFECTS** Abdominal distension · bronchospasm · conjunctivitis · gastrointestinal disorders · hypersensitivity · rhinitis · skin reactions
- **DIRECTIONS FOR ADMINISTRATION** Dose to be taken with at least 150 mL liquid.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of soluble granules formulations may include plain, lemon, or orange.
- **HANDLING AND STORAGE** Ispaghula husk contains potent allergens. Individuals exposed to the product (including those handling the product) can develop hypersensitivity reactions such as rhinitis, conjunctivitis, bronchospasm and in some cases, anaphylaxis.
- **PATIENT AND CARER ADVICE** Manufacturer advises that preparations that swell in contact with liquid should always be carefully swallowed with water and should not

be taken immediately before going to bed. Patients and their carers should be advised that the full effect may take some days to develop and should be given advice on how to administer ispaghula husk.

• MEDICINAL FORMS

- **DRUG ACTION** Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

• INDICATIONS AND DOSE

Constipation | Diarrhoea

► BY MOUTH USING TABLETS

- Adult: 3–6 tablets twice daily

- **CONTRA-INDICATIONS** Colonic atony · difficulty in swallowing · faecal impaction · infective bowel disease · intestinal obstruction
- **CAUTIONS** Adequate fluid intake should be maintained to avoid intestinal obstruction
- **CAUTIONS, FURTHER INFORMATION** It may be necessary to supervise elderly or debilitated patients or those with intestinal narrowing or decreased motility to ensure adequate fluid intake.
- **SIDE-EFFECTS** Abdominal distension · gastrointestinal disorders
- **DIRECTIONS FOR ADMINISTRATION** In constipation the dose should be taken with at least 300 mL liquid. In diarrhoea, ileostomy, and colostomy control, avoid liquid intake for 30 minutes before and after dose.
- **PATIENT AND CARER ADVICE** Patients and their carers should be advised that the full effect may take some days to develop. Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed.

LAXATIVES > CHLORIDE-CHANNEL AGONISTS

Lubiprostone

23-Mar-2016

● **DRUG ACTION** Lubiprostone is a chloride-channel activator that acts locally in the gut to increase intestinal fluid secretion and intestinal motility, resulting in a laxative effect.

INDICATIONS AND DOSE

Chronic idiopathic constipation when response to lifestyle changes (including diet) inadequate

- ▶ BY MOUTH

- ▶ **Adult:** 24 micrograms twice daily for 2–4 weeks, discontinue if no response after initial 2 weeks

● **CONTRA-INDICATIONS** Gastro-intestinal obstruction

SIDE-EFFECTS

- ▶ **Common or very common** Chest discomfort · diarrhoea · dizziness · dyspnoea · gastrointestinal discomfort · gastrointestinal disorders · headache · hot flush · hyperhidrosis · nausea · oedema · palpitations
- ▶ **Uncommon** Muscle spasms · syncope · vomiting
- ▶ **Frequency not known** Hypotension · influenza like illness · skin reactions · tachycardia · throat tightness
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Unknown if excreted in milk. [EvGr](#) If benefits of use outweigh the risk, monitor infant for side effects (e.g. diarrhoea). [E](#)
- **HEPATIC IMPAIRMENT**

Dose adjustments In moderate to severe impairment initially 24 micrograms once daily; if tolerated, and if necessary, increased to 24 micrograms twice daily.

● **PRESCRIBING AND DISPENSING INFORMATION** Dispense capsules in original container; discard any capsules remaining 4 weeks after opening.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Lubiprostone for treating chronic idiopathic constipation (July 2014)** NICE TA318

Lubiprostone is recommended as an option for treating chronic idiopathic constipation for adults in whom treatment with at least 2 laxatives from different classes, at the highest tolerated recommended doses for at least 6 months, has failed to provide adequate relief and for whom invasive treatment for constipation is being considered. If treatment with lubiprostone is not effective after 2 weeks, the patient should be re-examined and the benefit of continuing treatment reconsidered.

Lubiprostone should only be prescribed by a clinician with experience of treating chronic idiopathic constipation, after careful review of the patient's previous courses of laxative treatments.

www.nice.org.uk/TA318

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2014) that lubiprostone (*Amitiza*)[®] is **not** recommended for use within NHS Scotland.

Magnesium hydroxide

• INDICATIONS AND DOSE

Constipation

▶ BY MOUTH

▶ Adult: 30–45 mL as required, dose to be given mixed with water at bedtime

• **CONTRA-INDICATIONS** Acute gastro-intestinal conditions

• **CAUTIONS** Debilitated patients • elderly

• **INTERACTIONS** → Appendix 1: magnesium

• **HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.

• **RENAL IMPAIRMENT** Increased risk of toxicity in renal impairment.

Dose adjustments Avoid or reduce dose.

• **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Magnesium Hydroxide Mixture, BP consists of an aqueous suspension containing about 8% hydrated magnesium oxide.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

▶ **Magnesium hydroxide (Non-proprietary)**

Magnesium hydroxide 79 mg per 1 ml Magnesium hydroxide 7.45-8.35% oral suspension BP | 500 ml [GSL] £5.15-£5.31

Magnesium hydroxide 80 mg per 1 ml Magnesium hydroxide 8% oral suspension | 200 ml [GSL] £3.22 DT = £3.22 | 500 ml [GSL] £7.99-£8.05

▶ Brands may include Phillips' Milk of Magnesia

Sodium acid phosphate with sodium phosphate

• INDICATIONS AND DOSE

Constipation (using Phosphates Enema BP Formula B) | Bowel evacuation before abdominal radiological procedures, endoscopy, and surgery (using Phosphates Enema BP Formula B)

▶ BY RECTUM

▶ Child 3-6 years: 45–65 mL once daily

▶ Child 7-11 years: 65–100 mL once daily

▶ Child 12-17 years: 100–128 mL once daily

▶ Adult: 128 mL daily

FLEET® READY-TO-USE ENEMA

Constipation | Bowel evacuation before abdominal radiological procedures | Bowel evacuation before endoscopy | Bowel evacuation before surgery

- BY RECTUM
- Adult: 118 mL

FLEET® PHOSPHO-SODA

Bowel evacuation before colonic surgery | Bowel evacuation before colonoscopy | Bowel evacuation before radiological examination

- BY MOUTH
- Adult: 45 mL twice daily, each dose must be diluted with half a glass (120 mL) of cold water, followed by one full glass (240 mL) of cold water, timing of doses is dependent on the time of the procedure, for morning procedure, the first dose should be taken at 7 a.m. and second at 7 p.m. on day before the procedure.; for afternoon procedure, first dose should be taken at 7 p.m. on day before and second dose at 7 a.m. on day of the procedure

PHARMACOKINETICS

- For *Fleet® phospho-soda*: onset of action is within half to 6 hours of first dose.

● CONTRA-INDICATIONS

- With oral use Acute severe colitis · ascites · congestive cardiac failure · gastric retention · gastro-intestinal obstruction · gastro-intestinal perforation · toxic megacolon
- With rectal use conditions associated with increased colonic absorption · gastro-intestinal obstruction · inflammatory bowel disease

● CAUTIONS

- With oral use cardiac disease (avoid in congestive cardiac failure) · colitis (avoid if acute severe colitis) · elderly and debilitated patients · fluid and electrolyte disturbances · hypovolaemia (should be corrected before administration) · impaired gag reflex or possibility of regurgitation or aspiration
- With rectal use Ascites · congestive heart failure · elderly and debilitated patients · electrolyte disturbances · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: bowel cleansing preparations

● SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- **Common or very common** Chills · gastrointestinal discomfort · nausea · vomiting
- **Uncommon** Dehydration
- **Rare or very rare** Electrolyte imbalance · metabolic acidosis

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- With oral use Asthenia · chest pain · dizziness · headache
- **Rare or very rare**
- With oral use Allergic dermatitis · arrhythmia · hypotension · loss of consciousness · muscle cramps · myocardial infarction · nephrocalcinosis · paraesthesia · renal impairment · tetany
- With rectal use Pain

● PREGNANCY

- With oral use Caution.

● BREAST FEEDING

- With oral use Caution.

- **HEPATIC IMPAIRMENT** Use with caution in cirrhosis.

● RENAL IMPAIRMENT

- With oral use Avoid if eGFR less than 60 mL/minute/1.73 m².
- With rectal use Use with caution.

● MONITORING REQUIREMENTS

- With oral use Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.

● DIRECTIONS FOR ADMINISTRATION

FLEET® PHOSPHO-SODA Copious intake of water or other clear fluids (e.g. clear soup, strained fruit juice without pulp, black tea or coffee) recommended until midnight before morning procedure and until 8 a.m. before afternoon procedure. At least one glass (approx 240 mL) of water or other clear fluid should also be taken immediately before each dose.

- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Phosphates Enema BP Formula B consists of sodium dihydrogen phosphate dihydrate 12.8 g, disodium phosphate dodecahydrate 10.24 g, purified water, freshly boiled and cooled, to 128 mL.

● PATIENT AND CARER ADVICE

FLEET® PHOSPHO-SODA Intake of solid food should be stopped for at least 6 hours before starting treatment and until procedure completed.

Patients or carers should be advised that adequate hydration should be maintained during treatment.

Patients or carers should be given advice on administration of *Fleet® Phospho-soda* oral solution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 10
ELECTROLYTES: May contain Phosphate, sodium

LAXATIVES > SELECTIVE 5-HT₄ RECEPTOR AGONISTS**Prucalopride**

24-Feb-2016

- **DRUG ACTION** A selective serotonin 5HT₄-receptor agonist with prokinetic properties.

● INDICATIONS AND DOSE

Chronic constipation when other laxatives fail to provide an adequate response

- BY MOUTH
- Adult: 2 mg once daily, review treatment if no response after 4 weeks
- Elderly: Initially 1 mg once daily, increased if necessary to 2 mg once daily, review treatment if no response after 4 weeks

- **CONTRA-INDICATIONS** Crohn's disease · intestinal obstruction · intestinal perforation · toxic megacolon · ulcerative colitis

- **CAUTIONS** History of arrhythmias · history of ischaemic heart disease
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Appetite decreased · diarrhoea · dizziness · fatigue · gastrointestinal discomfort · gastrointestinal disorders · headache · nausea · vomiting
 - ▶ **Uncommon** Anorectal haemorrhage · fever · malaise · palpitations · tremor · urinary frequency increased
- **SIDE-EFFECTS, FURTHER INFORMATION** Side-effects generally occur at the start of treatment and are usually transient.
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment.
- **PREGNANCY** Manufacturer advises avoid—limited data available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk.
- **HEPATIC IMPAIRMENT**
 - Dose adjustments** In severe impairment, manufacturer advises reduced dose of 1 mg once daily; increased if necessary to 2 mg once daily.
- **RENAL IMPAIRMENT**
 - Dose adjustments** Manufacturer recommends a reduced dose of 1 mg daily if eGFR less than 30 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE**
 - Driving and skilled tasks** Manufacturer advises that dizziness and fatigue may initially affect ability to drive or operate machinery.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Prucalopride for the treatment of chronic constipation in women (December 2010) NICE TA211**
Prucalopride is recommended as an option for the treatment of chronic constipation in women for whom treatment with at least 2 laxatives from different classes, at the highest tolerated recommended doses for at least 6 months, has failed to provide adequate relief and invasive treatment for constipation is being considered. If treatment with prucalopride is not effective after 4 weeks, the patient should be re-examined and the benefit of continuing treatment reconsidered.

Prucalopride should only be prescribed by a clinician with experience of treating chronic constipation, after careful review of the patient's previous courses of laxative treatments.

www.nice.org.uk/TA211

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2011) that prucalopride (*Resolor*®) is not recommended for use within NHS Scotland for the symptomatic treatment of chronic constipation of women in whom laxatives fail to provide adequate relief.

- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
- Tablet**
 - ▶ **Resolor** (Shire Pharmaceuticals Ltd)
Prucalopride (as Prucalopride succinate) 1 mg Resolor 1mg tablets | 28 tablet [PoM] £38.69 DT = £38.69
 - Prucalopride (as Prucalopride succinate) 2 mg** Resolor 2mg tablets | 28 tablet [PoM] £59.52 DT = £59.52

LAXATIVES > SOFTENING LAXATIVES

Arachis oil

● INDICATIONS AND DOSE

To soften impacted faeces

- ▶ BY RECTUM
- ▶ Adult: 130 mL as required

- **CAUTIONS** Hypersensitivity to soya · intestinal obstruction
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to arachis oil or peanuts.
- **DIRECTIONS FOR ADMINISTRATION** Warm enema in warm water before use.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Enema

- ▶ **Arachis oil (Non-proprietary)**

£47.50 DT = £47.50

Docusate sodium

20-Apr-2016

(Diocetyl sodium sulphosuccinate)

● INDICATIONS AND DOSE

Chronic constipation

- ▶ BY MOUTH
 - ▶ Child 6 months-1 year: 12.5 mg 3 times a day, adjusted according to response, use paediatric oral solution
 - ▶ Child 2-11 years: 12.5–25 mg 3 times a day, adjusted according to response, use paediatric oral solution
 - ▶ Child 12-17 years: Up to 500 mg daily in divided doses, adjusted according to response
 - ▶ Adult: Up to 500 mg daily in divided doses, adjusted according to response
- ▶ BY RECTUM
 - ▶ Adult: 120 mg for 1 dose

Adjunct in abdominal radiological procedures

- ▶ BY MOUTH
 - ▶ Adult: 400 mg, to be administered with barium meal
- ▶ BY RECTUM
 - ▶ Adult: 120 mg for 1 dose

PHARMACOKINETICS

- ▶ Oral preparations act within 1–2 days; response to rectal administration usually occurs within 20 minutes.

- **UNLICENSED USE** Adult oral solution and capsules not licensed for use in children under 12 years.
- **CONTRA-INDICATIONS** Avoid in intestinal obstruction
- **CAUTIONS** Do not give with liquid paraffin · excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia · rectal preparations not indicated if haemorrhoids or anal fissure
- **SIDE-EFFECTS**
 - ▶ Rare or very rare
 - ▶ With oral use Abdominal cramps · nausea · rash
- **PREGNANCY** Not known to be harmful—manufacturer advises caution.
- **BREAST FEEDING** Present in milk following oral administration—manufacturer advises caution.
Rectal administration not known to be harmful.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With oral use in children For administration by mouth, solution may be mixed with milk or squash.

Co-danthramer**INDICATIONS AND DOSE****Constipation in terminally ill patients (standard strength capsules)**▶ **BY MOUTH USING CAPSULES**

▶ **Child 6–11 years:** 1 capsule once daily, dose should be taken at night

▶ **Child 12–17 years:** 1–2 capsules once daily, dose should be taken at night

▶ **Adult:** 1–2 capsules once daily, dose should be taken at night continued →

Constipation in terminally ill patients (strong capsules)

► BY MOUTH USING CAPSULES

- Child 12-17 years: 1–2 capsules once daily, dose should be given at night
- Adult: 1–2 capsules once daily, dose should be given at night

Constipation in terminally ill patients (standard strength suspension)

► BY MOUTH USING ORAL SUSPENSION

- Child 2-11 years: 2.5–5 mL once daily, dose should be taken at night
- Child 12-17 years: 5–10 mL once daily, dose should be taken at night
- Adult: 5–10 mL once daily, dose should be taken at night

Constipation in terminally ill patients (strong suspension)

► BY MOUTH USING ORAL SUSPENSION

- Child 12-17 years: 5 mL once daily, dose should be taken at night
- Adult: 5 mL once daily, dose should be taken at night

DOSE EQUIVALENCE AND CONVERSION

- Co-danthramer (standard strength) capsules contain dantron 25 mg with poloxamer '188' 200 mg per capsule.
- Co-danthramer (standard strength) oral suspension contains dantron 25 mg with poloxamer '188' 200 mg per 5 mL.
- Co-danthramer **strong** capsules contain dantron 37.5 mg with poloxamer '188' 500 mg.
- Co-danthramer **strong** oral suspension contains dantron 75 mg with poloxamer '188' 1 g per 5 mL.
- Co-danthramer suspension 5 mL = one co-danthramer capsule, **but** strong co-danthramer suspension 5 mL = two strong co-danthramer capsules.

- **CONTRA-INDICATIONS** Acute abdominal conditions (in children) · acute inflammatory bowel disease · acute surgical abdominal conditions (in adults) · intestinal obstruction · severe dehydration

- **CAUTIONS** Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia · may cause local irritation · *rodent* studies indicate potential carcinogenic risk

CAUTIONS, FURTHER INFORMATION

- Local irritation Avoid prolonged contact with skin (as in incontinent patients or infants wearing nappies—risk of irritation and excoriation).
- **SIDE-EFFECTS** Abdominal cramps · asthenia · gastrointestinal disorders · hypermagnesaemia · skin reactions · urine red
- **PREGNANCY** Manufacturers advise avoid—limited information available.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Senna

20-Jul-2017

- **DRUG ACTION** Senna is a stimulant laxative. After metabolism of sennosides in the gut the anthrone component stimulates peristalsis thereby increasing the motility of the large intestine.

• INDICATIONS AND DOSE

Constipation

► BY MOUTH USING TABLETS

- Child 6–17 years: 7.5–30 mg once daily, adjusted according to response
- Adult: 7.5–15 mg daily (max. per dose 30 mg daily), dose usually taken at bedtime; initial dose should be low then gradually increased, higher doses may be prescribed under medical supervision

► BY MOUTH USING SYRUP

- Child 1 month–3 years: 3.75–15 mg once daily, adjusted according to response
- Child 4–17 years: 3.75–30 mg once daily, adjusted according to response
- Adult: 7.5–15 mg once daily (max. per dose 30 mg daily), dose usually taken at bedtime, higher doses may be prescribed under medical supervision

PHARMACOKINETICS

- Onset of action 8–12 hours.

- **UNLICENSED USE** Tablets not licensed for use in children under 6 years. Syrup not licensed for use in children under 2 years.

Doses in BNF adhere to national guidelines and may differ from those in product literature.

- **CONTRA-INDICATIONS** Intestinal obstruction · undiagnosed abdominal pain

- **SIDE-EFFECTS** Albuminuria · diarrhoea · electrolyte imbalance · fluid imbalance · gastrointestinal discomfort · haematuria · pseudomelanosis coli · skin reactions · urine discolouration

SIDE-EFFECTS, FURTHER INFORMATION Prolonged or excessive use can cause hypokalaemia.

- **PREGNANCY** [Evg](#) Specialist sources indicate suitable for use in pregnancy. [D](#)
- **BREAST FEEDING** [Evg](#) Specialist sources indicate suitable for use in breast-feeding in infants over 1 month. [D](#)

OPIOID RECEPTOR ANTAGONISTS

Methylnaltrexone bromide

12-Dec-2016

- **DRUG ACTION** Methylnaltrexone bromide is a peripherally acting opioid-receptor antagonist. It therefore blocks the gastro-intestinal (constipating) effects of opioids without altering their central analgesic effects.

● INDICATIONS AND DOSE

Opioid-induced constipation in patients with chronic pain (except palliative care patients with advanced illness)

▶ BY SUBCUTANEOUS INJECTION

▶ **Adult:** 12 mg once daily if required, to be given as 4–7 doses weekly

Adjunct to other laxatives in opioid-induced constipation in advanced illness (palliative care patients)

▶ BY SUBCUTANEOUS INJECTION

▶ **Adult (body-weight up to 38 kg):** 150 micrograms/kg once daily on alternate days for maximum duration of treatment 4 months, two consecutive doses may be given 24 hours apart if no response to treatment on the preceding day

▶ **Adult (body-weight 38–61 kg):** 8 mg once daily on alternate days for maximum duration of treatment 4 months, two consecutive doses may be given 24 hours apart if no response to treatment on the preceding day

▶ **Adult (body-weight 62–114 kg):** 12 mg once daily on alternate days for maximum duration of treatment 4 months, two consecutive doses may be given 24 hours apart if no response to treatment on the preceding day

▶ **Adult (body-weight 115 kg and above):** 150 micrograms/kg once daily on alternate days for maximum duration of treatment 4 months, two consecutive doses may be

given 24 hours apart if no response to treatment on the preceding day

PHARMACOKINETICS

- ▶ May act within 30–60 minutes.

- **CONTRA-INDICATIONS** Acute surgical abdominal conditions · gastro-intestinal obstruction
- **CAUTIONS** Diverticular disease (when active) · faecal impaction · gastro-intestinal tract lesions (known or suspected) · patients with colostomy · patients with peritoneal catheter
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · diarrhoea · dizziness · gastrointestinal disorders · nausea · opioid withdrawal-like syndrome · vomiting
- Overdose** Symptoms of overdose include orthostatic hypotension.
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity at high doses in *animal* studies.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT**
Dose adjustments If eGFR less than 30 mL/minute/1.73 m², reduce dose as follows: body-weight under 62 kg, 75 micrograms/kg on alternate days; body-weight 62–114 kg, 8 mg on alternate days; body-weight over 114 kg, 75 micrograms/kg on alternate days.
- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site.
- **PRESCRIBING AND DISPENSING INFORMATION**
Palliative care For further information on the use of methylnaltrexone in palliative care, see www.palliativedrugs.com/formulary/en/opioid-antagonists.html.
- **HANDLING AND STORAGE** Protect from light.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Relistor (Swedish Orphan Biovitrum Ltd)

Methylnaltrexone bromide 20 mg per 1 ml Relistor 12mg/0.6ml solution for injection vials | 1 vial [PoM] £21.05 | 7 vial [PoM] £147.35

Naloxegol

20-Jun-2016

- **DRUG ACTION** Naloxegol is a peripherally acting opioid receptor antagonist. It therefore decreases the constipating effects of opioids without altering their central analgesic effects.

● INDICATIONS AND DOSE

Opioid-induced constipation when response to laxatives inadequate

▶ BY MOUTH

▶ **Adult:** 25 mg once daily, to be taken in the morning

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce initial dose to 12.5 mg daily with concurrent use of moderate inhibitors of CYP3A4, increasing to 25 mg daily if well tolerated.

- **CONTRA-INDICATIONS** Gastro-intestinal or peritoneum malignancy (risk of gastro-intestinal perforation) · known or suspected gastro-intestinal obstruction · patients at risk of recurrent gastro-intestinal obstruction · recurrent or advanced ovarian cancer (risk of gastro-intestinal perforation) · vascular endothelial growth factor (VEGF) inhibitor treatment (risk of gastro-intestinal perforation)

- **CAUTIONS** Alzheimer's disease (advanced) · cardiovascular disease · CNS metastases · congestive heart failure (symptomatic) · Crohn's disease · diverticulitis (active or recurrent) · multiple sclerosis (active) · peptic ulcer disease (severe) · primary brain malignancies · QT interval over 500 milliseconds · recent history of myocardial infarction (within 6 months)

CAUTIONS, FURTHER INFORMATION

- ▶ Disruptions to blood-brain barrier Manufacturer advises caution in patients with clinically important disruptions to the blood-brain barrier (e.g. advanced Alzheimer's disease, active multiple sclerosis, primary brain malignancies)—risk of uptake into the CNS.
- ▶ Cardiovascular disorders Safety and efficacy has not been established in patients with these conditions.

- **INTERACTIONS** → Appendix 1: naloxegol

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · diarrhoea · flatulence · headache · hyperhidrosis · nasopharyngitis · nausea · vomiting
- ▶ **Uncommon** Withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises that gastrointestinal side-effects typically occur shortly after initiation of treatment—consider reducing the dose.

- **PREGNANCY** Manufacturer advises avoid—limited data available but toxicity at high doses in *animal* studies; theoretical risk of opioid withdrawal in fetus.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies and theoretical risk of opioid withdrawal in breast-fed infants.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—safety and efficacy not established.
- **RENAL IMPAIRMENT**
Dose adjustments Manufacturer advises lower initial dose in moderate to severe impairment—initially 12.5 mg daily, increase to 25 mg if well tolerated.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablets can be crushed, mixed with 120 mL of water and taken immediately if patients are unable to swallow tablets whole. The mixture may be administered via a nasogastric tube, if required.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients report severe, persistent or worsening gastro-intestinal effects (such as abdominal pain) to their prescriber.

● NATIONAL FUNDING/ACCESS DECISIONS

3 Diarrhoea

Diarrhoea (acute)

01-Aug-2017

Description of condition

Diarrhoea is the abnormal passing of loose or liquid stools, with increased frequency, increased volume, or both. Acute diarrhoea is that which lasts less than 14 days, but symptoms usually improve within 2–4 days. It can result from infection, as a side-effect of a drug, or as an acute symptom of a chronic gastro-intestinal disorder (such as inflammatory bowel disease p. 36 or Irritable bowel syndrome p. 45). It may also result from the accumulation of non-absorbed osmotically active solutes in the gastro-intestinal lumen (e.g. in lactase deficiency) or from the gastro-intestinal effects of secretory stimuli (other than the enterotoxins from an infection). It may also occur when intestinal motility or morphology is altered.

Prompt investigation is required to identify or exclude any serious underlying cause if the patient has any red flag symptoms such as unexplained weight loss, rectal bleeding, persistent diarrhoea, a systemic illness, has received recent hospital treatment or antibiotic treatment, or following foreign travel (other than to Western Europe, North America, Australia or New Zealand).

Aims of treatment

The priority of acute diarrhoea treatment, as in gastro-enteritis, is the prevention or reversal of fluid and electrolyte depletion and the management of dehydration when it is present. This is particularly important in infants, frail and elderly patients, when excessive water and electrolyte loss and dehydration can be life-threatening.

Treatment

Most episodes of acute diarrhoea will settle spontaneously without the need for any medical treatment. [EvGr](#) Oral rehydration therapy (ORT, such as disodium hydrogen citrate with glucose, potassium chloride and sodium chloride p. 1010; potassium chloride with sodium chloride p. 1008; potassium chloride with rice powder, sodium chloride and sodium citrate p. 1011) is the mainstay of treatment for acute diarrhoea to prevent or correct diarrhoea dehydration and to maintain the appropriate fluid intake once rehydration is achieved—see Fluids and electrolytes p. 1003.

However, in patients with severe dehydration and in those unable to drink, immediate admission to hospital and urgent replacement treatment with an intravenous rehydration fluid is recommended—see Fluids and electrolytes p. 1003.

The antimotility drug loperamide hydrochloride p. 66 is usually considered to be the standard treatment when rapid control of symptoms is required. It can also be used for mild-to-moderate travellers' diarrhoea (e.g. where toilet amenities are limited or unavailable) but should be avoided in bloody or suspected inflammatory diarrhoea (febrile patients) and in cases of significant abdominal pain (which also suggests inflammatory diarrhoea).

Loperamide hydrochloride is also the first-line treatment for patients with faecal incontinence [unlicensed indication] after the underlying cause of incontinence has been addressed. [Ad](#)

Racecadotril p. 67 is licensed as an adjunct to rehydration for the symptomatic treatment of uncomplicated acute diarrhoea in adults and children over 3 months.

There is insufficient evidence to recommend adsorbent preparations (such as kaolin p. 68) in acute diarrhoea.

Antibacterial drugs for acute diarrhoea

[EvGr](#) Ciprofloxacin p. 548 is occasionally used for prophylaxis against travellers' diarrhoea, but routine use is

not recommended.  See also Gastro-intestinal system infections, antibacterial therapy p. 505.

Related drugs

Other drugs used for diarrhoea: codeine phosphate p. 448, colestyramine, p. 196, methylcellulose p. 54, rifaximin p. 565.

ANTIDIARRHOEALS > ANTIPROPULSIVES

F 441

Co-phenotrope

● INDICATIONS AND DOSE

Adjunct to rehydration in acute diarrhoea

► BY MOUTH

- Child 4-8 years: 1 tablet 3 times a day
- Child 9-11 years: 1 tablet 4 times a day
- Child 12-15 years: 2 tablets 3 times a day
- Child 16-17 years: Initially 4 tablets, followed by 2 tablets every 6 hours until diarrhoea controlled
- Adult: Initially 4 tablets, followed by 2 tablets every 6 hours until diarrhoea controlled

Control of faecal consistency after colostomy or ileostomy

► BY MOUTH

- Child 4-8 years: 1 tablet 3 times a day
- Child 9-11 years: 1 tablet 4 times a day
- Child 12-15 years: 2 tablets 3 times a day
- Child 16-17 years: Initially 4 tablets, then 2 tablets 4 times a day
- Adult: Initially 4 tablets, then 2 tablets 4 times a day

- **UNLICENSED USE** Not licensed for use in children under 4 years.
- **CONTRA-INDICATIONS** Gastro-intestinal obstruction · intestinal atony · myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) · paralytic ileus · prostatic enlargement (in adults) · pyloric stenosis · severe ulcerative colitis · significant bladder outflow obstruction · toxic megacolon · urinary retention
- **CAUTIONS** Presence of subclinical doses of atropine may give rise to atropine side-effects in susceptible individuals or in overdose · young children are particularly susceptible to **overdosage**; symptoms may be delayed and observation is needed for at least 48 hours after ingestion
- **INTERACTIONS** → Appendix 1: atropine · opioids
- **SIDE-EFFECTS** Abdominal discomfort · angioedema · angle closure glaucoma · appetite decreased · arrhythmia · cardiac disorder · depression · dry skin · dysuria · fever · gastrointestinal disorders · lethargy · malaise · mucosal dryness · mydriasis · restlessness · vision disorders
- **PREGNANCY** Manufacturer advises caution.
- **BREAST FEEDING** May be present in milk.
- **HEPATIC IMPAIRMENT** Avoid in jaundice.
- **DIRECTIONS FOR ADMINISTRATION** For administration by mouth tablets may be crushed.
- **PRESCRIBING AND DISPENSING INFORMATION** A mixture of diphenoxylate hydrochloride and atropine sulfate in the mass proportions 100 parts to 1 part respectively.
- **EXCEPTIONS TO LEGAL CATEGORY** Co-phenotrope 2.5/0.025 can be sold to the public for adults and children over 16 years (provided packs do not contain more than 20 tablets) as an adjunct to rehydration in acute diarrhoea (max. daily dose 10 tablets).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Loperamide hydrochloride

11-Oct-2017

● INDICATIONS AND DOSE

Symptomatic treatment of acute diarrhoea

► BY MOUTH

- Child 4-7 years: 1 mg 3–4 times a day for up to 3 days only
- Child 8-11 years: 2 mg 4 times a day for up to 5 days
- Child 12-17 years: Initially 4 mg, followed by 2 mg for up to 5 days, dose to be taken after each loose stool; usual dose 6–8 mg daily; maximum 16 mg per day
- Adult: Initially 4 mg, followed by 2 mg for up to 5 days, dose to be taken after each loose stool; usual dose 6–8 mg daily; maximum 16 mg per day

Chronic diarrhoea

► BY MOUTH

- Adult: Initially 4–8 mg daily in divided doses, adjusted according to response; maintenance up to 16 mg daily in 2 divided doses

Faecal incontinence

► BY MOUTH

- Adult: Initially 500 micrograms daily, adjusted according to response, maximum daily dose to be given in divided doses; maximum 16 mg per day

Pain of bowel colic in palliative care

► BY MOUTH

- Adult: 2–4 mg 4 times a day

- **UNLICENSED USE** Capsules not licensed for use in children under 8 years.

- In adults Use for faecal incontinence is an unlicensed indication.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: REPORTS OF SERIOUS CARDIAC ADVERSE REACTIONS WITH HIGH DOSES OF LOPERAMIDE ASSOCIATED WITH ABUSE OR MISUSE (SEPTEMBER 2017)

Serious cardiovascular events (such as QT prolongation, torsades de pointes, and cardiac arrest), including fatalities, have been reported in association with large overdoses of loperamide.

Healthcare professionals are reminded that if symptoms of overdose occur, naloxone can be given as an antidote. The duration of action of loperamide is longer than that of naloxone (1–3 hours), so repeated treatment with naloxone might be indicated; patients should be monitored closely for at least 48 hours to detect possible CNS depression.

Pharmacists should remind patients not to take more than the recommended dose on the label.

- **CONTRA-INDICATIONS** Active ulcerative colitis · antibiotic-associated colitis · conditions where abdominal distension develops · conditions where inhibition of peristalsis should be avoided

- **CAUTIONS** Not recommended for children under 12 years

- **INTERACTIONS** → Appendix 1: loperamide

● **SIDE-EFFECTS**

- **Common or very common** Gastrointestinal disorders · headache · nausea
- **Uncommon** Dizziness · drowsiness · dry mouth · gastrointestinal discomfort · skin reactions · vomiting
- **Rare or very rare** Angioedema · consciousness impaired · coordination abnormal · fatigue · miosis · muscle tone increased · severe cutaneous adverse reactions (SCARs) · urinary retention

- **PREGNANCY** Manufacturers advise avoid—no information available.

- **BREAST FEEDING** Amount probably too small to be harmful.

- **HEPATIC IMPAIRMENT** Risk of accumulation—manufacturer advises caution.

● **PRESCRIBING AND DISPENSING INFORMATION**

Palliative care For further information on the use of loperamide in palliative care, see www.palliativedrugs.com/formulary/en/loperamide.html.

● **PATIENT AND CARER ADVICE** Patients and carers should be given advice on how to administer rabeprazole granules.

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium*, has advised (July 2014) that rabeprazole (*Hidrasec*®) is **not** recommended for use within NHS Scotland for the treatment of acute diarrhoea in children because there is insufficient evidence that it improves the recovery rate.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Granules

EXCIPIENTS: May contain Sucrose

▶ **Hidrasec** (Lincoln Medical Ltd)

Rabeprazole 10 mg Hidrasec Infants 10mg granules sachets | 20 sachet [PoM] £8.42

Rabeprazole 30 mg Hidrasec Children 30mg granules sachets | 20 sachet [PoM] £8.42

ANTIDIARRHOEALS > INTESTINAL ADSORBENTS

Kaolin

● **INDICATIONS AND DOSE**

Diarrhoea (not recommended for acute diarrhoea)

▶ **BY MOUTH**

▶ Adult: 10–20 mL every 4 hours

● **INTERACTIONS** → Appendix 1: Kaolin

● **DIRECTIONS FOR ADMINISTRATION** Warm and apply poultice directly or between layers of muslin; avoid application of overheated poultice.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include peppermint.

When prepared extemporaneously, the BP states Kaolin Mixture, BP consists of light kaolin or light kaolin (natural) 20%, light magnesium carbonate 5%, sodium bicarbonate 5% in a suitable vehicle with a peppermint flavour.

● **LESS SUITABLE FOR PRESCRIBING** Kaolin Mixture BP is less suitable for prescribing.

● **MEDICINAL FORMS**

No licensed medicines listed.

Combinations available: *Kaolin with morphine*, p. 66

4 Disorders of gastric acid and ulceration

4.1 Dyspepsia

Dyspepsia

Overview

Dyspepsia covers upper abdominal pain, fullness, early satiety, bloating, and nausea. It can occur with gastric and duodenal ulceration and, gastric cancer, but most commonly it is of uncertain origin.

Urgent endoscopic investigation is required if dyspepsia is accompanied by 'alarm features' (e.g. bleeding, dysphagia, recurrent vomiting, or weight loss). Urgent investigation should also be considered for patients over 55 years with unexplained, recent-onset dyspepsia that has not responded to treatment.

Patients with dyspepsia should be advised about lifestyle changes (avoidance of excess alcohol and of aggravating foods such as fats); other measures include weight reduction, smoking cessation, and raising the head of the bed. Some medications may cause dyspepsia—these should be stopped, if possible.

Antacids may provide some symptomatic relief, however if symptoms persist in *uninvestigated dyspepsia*, treatment involves a **proton pump inhibitor** for up to 4 weeks. A proton pump inhibitor can be used intermittently to control symptoms long term. Patients with *uninvestigated dyspepsia*, who do not respond to an initial trial with a proton pump inhibitor, should be tested for *Helicobacter pylori* and given eradication therapy if *H. pylori* is present. Alternatively, particularly in populations where *H. pylori* infection is more likely, the 'test and treat' strategy for *H. pylori* can be used before a trial with a proton pump inhibitor.

If *H. pylori* is present in patients with *functional (investigated, non-ulcer) dyspepsia*, eradication therapy should be provided. If symptoms persist, treatment with either a **proton pump inhibitor** or a **histamine H₂-receptor antagonist** can be given for 4 weeks. These antisecretory drugs can be used intermittently to control symptoms long term. However, most patients with functional dyspepsia do not benefit symptomatically from *H. pylori* eradication therapy or antisecretory drugs.

ANTACIDS

Antacids

Overview

Antacids (usually containing aluminium or magnesium compounds) can often relieve symptoms in *ulcer dyspepsia* and in *non-erosive gastro-oesophageal reflux*; they are also sometimes used in functional (non-ulcer) dyspepsia but the evidence of benefit is uncertain. Antacids are best given when symptoms occur or are expected, usually between meals and at bedtime, although additional doses may be required. Conventional doses of liquid magnesium–aluminium antacids promote ulcer healing, but less well than antisecretory drugs; proof of a relationship between

healing and neutralising capacity is lacking. Liquid preparations are more effective than tablet preparations.

Aluminium- and magnesium-containing antacids (e.g. aluminium hydroxide p. 1020, magnesium carbonate p. 70, co-magaldrox p. 70 and magnesium trisilicate p. 71), being relatively insoluble in water, are long-acting if retained in the stomach. They are suitable for most antacid purposes. Magnesium-containing antacids tend to be laxative whereas aluminium-containing antacids may be constipating; antacids containing both magnesium and aluminium may reduce these colonic side-effects. Aluminium accumulation does not appear to be a risk if renal function is normal.

The acid-neutralising capacity of preparations that contain more than one antacid may be the same as simpler preparations. Complexes such as **hydrotalcite** confer no special advantage.

Sodium bicarbonate p. 1006 should no longer be prescribed alone for the relief of dyspepsia but it is present as an ingredient in many indigestion remedies. However, it retains a place in the management of urinary-tract disorders and acidosis.

Bismuth-containing antacids (unless chelates) are not recommended because absorbed bismuth can be neurotoxic, causing encephalopathy; they tend to be constipating.

Calcium-containing antacids can induce rebound acid secretion: with modest doses the clinical significance is doubtful, but prolonged high doses also cause hypercalcaemia and alkalosis, and can precipitate the milk-alkali syndrome.

Simeticone

Simeticone (activated dimeticone) p. 71 is added to an antacid as an antifoaming agent to relieve flatulence. These preparations may be useful for the relief of hiccup in palliative care.

Alginate

Alginates taken in combination with an antacid increases the viscosity of stomach contents and can protect the oesophageal mucosa from acid reflux. Some alginate-containing preparations form a viscous gel ('raft') that floats on the surface of the stomach contents, thereby reducing symptoms of reflux.

The amount of additional ingredient or antacid in individual preparations varies widely, as does their sodium content, so that preparations may not be freely interchangeable.

ANTACIDS > ALGINATE

Alginic acid

● INDICATIONS AND DOSE

GAVISCON INFANT® POWDER SACHETS

Management of gastro-oesophageal reflux disease

► BY MOUTH

- Child 1-23 months (body-weight up to 4.5 kg): 1 dose as required, to be mixed with feeds (or water, for breast-fed infants); maximum 6 doses per day
- Child 1-23 months (body-weight 4.5 kg and above): 2 doses as required, to be mixed with feeds (or water, for breast-fed infants); maximum 12 doses per day

- **CONTRA-INDICATIONS** Intestinal obstruction • preterm neonates • where excessive water loss likely (e.g. fever, diarrhoea, vomiting, high room temperature)

GAVISCON INFANT® POWDER SACHETS Concurrent use of preparations containing thickening agents

- **HEPATIC IMPAIRMENT** In patients with fluid retention, avoid antacids containing large amounts of sodium. Avoid

antacids containing magnesium salts in hepatic coma if there is a risk of renal failure.

- **RENAL IMPAIRMENT** In patients with fluid retention, avoid antacids containing large amounts of sodium.
- **PRESCRIBING AND DISPENSING INFORMATION** Each half of the dual-sachet is identified as 'one dose'. To avoid errors prescribe with directions in terms of 'dose'.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder

ELECTROLYTES: May contain Sodium

- **Gaviscon Infant** (Forum Health Products Ltd)

Magnesium alginate 87.5 mg, Sodium alginate 225 mg Gaviscon Infant oral powder sachets sugar-free | 15 dual dose sachet [P] £4.82 DT = £4.82

Sodium alginate with potassium bicarbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, alginic acid above.

● INDICATIONS AND DOSE

Management of mild symptoms of dyspepsia and gastro-oesophageal reflux disease

► BY MOUTH USING CHEWABLE TABLETS

- Child 6-11 years (under medical advice only): 1 tablet, to be chewed after meals and at bedtime
 - Child 12-17 years: 1-2 tablets, to be chewed after meals and at bedtime
 - Adult: 1-2 tablets, to be chewed after meals and at bedtime
- ###### ► BY MOUTH USING ORAL SUSPENSION
- Child 2-11 years (under medical advice only): 2.5-5 mL, to be taken after meals and at bedtime
 - Child 12-17 years: 5-10 mL, to be taken after meals and at bedtime
 - Adult: 5-10 mL, to be taken after meals and at bedtime

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include aniseed or peppermint.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

ANTACIDS > ALUMINIUM AND MAGNESIUM

Co-magaldrox

The properties listed below are those particular to the combination only. For the properties of the components please consider, aluminium hydroxide p. 1020, magnesium hydroxide p. 58.

● INDICATIONS AND DOSE

MAALOX®

Dyspepsia

► BY MOUTH

- Child 14-17 years: 10–20 mL, to be taken 20–60 minutes after meals, and at bedtime or when required
- Adult: 10–20 mL, to be taken 20–60 minutes after meals, and at bedtime or when required

MUCOGEL®

Dyspepsia

► BY MOUTH

- Child 12-17 years: 10–20 mL 3 times a day, to be taken 20–60 minutes after meals, and at bedtime, or when required
- Adult: 10–20 mL 3 times a day, to be taken 20–60 minutes after meals, and at bedtime, or when required

- **INTERACTIONS** → Appendix 1: antacids · magnesium
- **PRESCRIBING AND DISPENSING INFORMATION** Co-magaldrox is a mixture of aluminium hydroxide and magnesium hydroxide; the proportions are expressed in the form x/y where x and y are the strengths in milligrams per unit dose of magnesium hydroxide and aluminium hydroxide respectively.
- **MAALOX®** *Maalox*® suspension is low in sodium.
- **MUCOGEL®** *Mucogel*® suspension is low in sodium.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension► **Maalox** (Sanofi)

Aluminium hydroxide 35 mg per 1 mL, Magnesium hydroxide 40 mg per 1 mL | Maalox 175mg/200mg/5mL oral suspension sugar-free | 250 mL [GSL] £2.33 DT = £2.33

► **Mucogel** (Chemidex Pharma Ltd)

Magnesium hydroxide 39 mg per 1 mL, Aluminium hydroxide gel dried 44 mg per 1 mL | Mucogel oral suspension sugar-free | 500 mL [GSL] £2.99 DT = £2.99

Co-simalcite

● INDICATIONS AND DOSE

Dyspepsia

► BY MOUTH

- Child 8-11 years: 5 mL 4 times a day as required, to be taken between meals and at bedtime
- Child 12-17 years: 10 mL 4 times a day as required, to be taken between meals and at bedtime
- Adult: 10 mL 4 times a day as required, to be taken between meals and at bedtime

- **CONTRA-INDICATIONS** Hypophosphataemia · infants · neonates

CONTRA-INDICATIONS, FURTHER INFORMATION

- Aluminium-containing antacids Aluminium-containing antacids should not be used in neonates and infants because accumulation may lead to increased plasma-aluminium concentrations.

- **HEPATIC IMPAIRMENT** Avoid; can cause constipation which can precipitate coma. Avoid in hepatic coma; risk of renal failure.
- **RENAL IMPAIRMENT**
Dose adjustments Antacids containing magnesium salts should be avoided or used at a reduced dose because there is an increased risk of toxicity.
- In adults There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).
- In children Aluminium-containing antacids should not be used in children with renal impairment, because accumulation may lead to increased plasma-aluminium concentrations.
- **PRESCRIBING AND DISPENSING INFORMATION** *Altacite Plus*® is low in Na⁺.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension► **Altacite Plus** (Peckforton Pharmaceuticals Ltd)

Combinations available: *Co-simlacte*, p. 70 · *Simeticone with aluminium hydroxide and magnesium hydroxide*, p. 70

4.2 Gastric and duodenal ulceration

Peptic ulceration

Overview

Peptic ulceration commonly involves the stomach, duodenum, and lower oesophagus; after gastric surgery it involves the gastro-enterostomy stoma. Healing can be promoted by general measures, stopping smoking and taking antacids and by antisecretory drug treatment, but relapse is

Recommended regimens for *Helicobacter pylori* eradication in adults

Acid suppressant	Antibacterial			Price for 7-day course
	Amoxicillin	Clarithromycin	Metronidazole	
Esomeprazole 20 mg twice daily	1 g twice daily –	500 mg twice daily 250 mg twice daily	– 400 mg twice daily	£6.63 £4.30
Lansoprazole 30 mg twice daily	1 g twice daily 1 g twice daily –	500 mg twice daily – 250 mg twice daily	– 400 mg twice daily 400 mg twice daily	£5.52 £3.70 £3.19
Omeprazole 20 mg twice daily	1 g twice daily 500 mg 3 times a day –	500 mg twice daily – 250 mg twice daily	– 400 mg 3 times a day 400 mg twice daily	£5.36 £3.40 £3.03
Pantoprazole 40 mg twice daily	1 g twice daily –	500 mg twice daily 250 mg twice daily	– 400 mg twice daily	£5.48 £3.15
Rabeprazole sodium 20 mg twice daily	1 g twice daily –	500 mg twice daily 250 mg twice daily	– 400 mg twice daily	£6.04 £3.71

common when treatment ceases. Nearly all duodenal ulcers and most gastric ulcers not associated with NSAIDs are caused by *Helicobacter pylori*.

Helicobacter pylori infection

Eradication of *Helicobacter pylori* reduces recurrence of gastric and duodenal ulcers and the risk of rebleeding. It also causes regression of most localised gastric mucosa associated lymphoid-tissue (MALT) lymphomas. The presence of *H. pylori* should be confirmed before starting eradication treatment. Acid inhibition combined with antibacterial treatment is highly effective in the eradication of *H. pylori*; reinfection is rare. Antibiotic associated colitis is an uncommon risk.

For initial treatment, a one-week triple-therapy regimen that comprises a proton pump inhibitor, clarithromycin p. 529, and either amoxicillin p. 539 or metronidazole p. 533 can be used. However, if a patient has been treated with metronidazole for other infections, a regimen containing a proton pump inhibitor, amoxicillin and clarithromycin is preferred for initial therapy. If a patient has been treated with a macrolide for other infections, a regimen containing a proton pump inhibitor, amoxicillin and metronidazole is preferred for initial therapy. These regimens eradicate *H. pylori* in about 85% of cases. There is usually no need to continue antisecretory treatment (with a proton pump inhibitor or H₂-receptor antagonist), however, if the ulcer is large, or complicated by haemorrhage or perforation, then antisecretory treatment is continued for a further 3 weeks. Treatment failure usually indicates antibacterial resistance or poor compliance. Resistance to amoxicillin is rare. However, resistance to clarithromycin and metronidazole is common and can develop during treatment.

Two-week triple-therapy regimens offer the possibility of higher eradication rates compared to one-week regimens, but adverse effects are common and poor compliance is likely to offset any possible gain.

Two-week dual-therapy regimens using a proton pump inhibitor and a single antibacterial are licensed, but produce low rates of *H. pylori* eradication and are **not** recommended.

Tinidazole p. 534 is also used occasionally for *H. pylori* eradication as an alternative to metronidazole; tinidazole should be combined with antisecretory drugs and other antibacterials.

Routine retesting, to confirm eradication, is not necessary unless the patient has gastric MALT lymphoma or complicated *H. pylori* associated peptic ulcer.

A two-week regimen comprising a proton pump inhibitor plus triptassium dicitratobismuthate, plus tetracycline p. 557, plus metronidazole can be used for eradication failure. Alternatively, the patient can be referred for endoscopy and treatment based on the results of culture and sensitivity testing.

See under *NSAID-associated ulcers* for the role of *H. pylori* eradication therapy in patients starting or taking a NSAID. Also see Dyspepsia p. 68 for *H. pylori* eradication in patients with dyspepsia.

Test for *Helicobacter pylori*

¹³C-Urea breath test kits are available for the diagnosis of gastro-duodenal infection with *Helicobacter pylori*. The test involves collection of breath samples before and after ingestion of an oral solution of ¹³C-urea; the samples are sent for analysis by an appropriate laboratory. The test should not be performed within 4 weeks of treatment with an antibacterial or within 2 weeks of treatment with an antisecretory drug. A specific ¹³C-urea breath test kit for children is available (*Helicobacter Test INFAI for children of the age 3–11*®). However, the appropriateness of testing for *H. pylori* infection in children has not been established.

NSAID-associated ulcers

Gastro-intestinal bleeding and ulceration can occur with NSAID use. The risk of serious upper gastro-intestinal side-effects varies between individual NSAIDs. Whenever possible, the NSAID should be **withdrawn** if an ulcer occurs.

Patients at high risk of developing gastro-intestinal complications with a NSAID include those aged over 65 years, those with a history of peptic ulcer disease or serious gastro-intestinal complication, those taking other medicines that increase the risk of gastro-intestinal side-effects, or those with serious co-morbidity (e.g. cardiovascular disease, diabetes, renal or hepatic impairment). In those at risk of ulceration, a proton pump inhibitor can be considered for protection against gastric and duodenal ulcers associated with non-selective NSAIDs; a H₂-receptor antagonist such as ranitidine p. 75 given at twice the usual dose or misoprostol p. 77 are alternatives. Colic and diarrhoea may limit the dose of misoprostol. Its use is most appropriate for the frail or very elderly from whom NSAIDs cannot be withdrawn. A combination of a cyclooxygenase-2 selective inhibitor with a proton pump inhibitor may be more appropriate for those with a history of upper gastro-intestinal bleeding or 3 or more risk factors for gastro-intestinal ulceration, but see NSAIDs and Cardiovascular Events.

NSAID use and *H. pylori* infection are independent risk factors for gastro-intestinal bleeding and ulceration. In patients already taking a NSAID, eradication of *H. pylori* is unlikely to reduce the risk of NSAID-induced bleeding or ulceration. However, in patients with dyspepsia or a history of gastric or duodenal ulcer, who are *H. pylori* positive, and who are about to start long-term treatment with a non-selective NSAID, eradication of *H. pylori* may reduce the overall risk of ulceration.

In a patient who has developed an ulcer, if the NSAID *can be discontinued*, a proton pump inhibitor usually produces

the most rapid healing; alternatively, the ulcer can be treated with a H₂-receptor antagonist or misoprostol. On healing, patients should be tested for *H. pylori* and given eradication therapy if *H. pylori* is present (see also Test for *Helicobacter pylori*).

If treatment with a non-selective NSAID needs to continue, the following options are suitable:

- Treat ulcer with a proton pump inhibitor and on healing continue the proton pump inhibitor (dose not normally reduced because asymptomatic ulcer recurrence may occur);
- Treat ulcer with a proton pump inhibitor and on healing switch to misoprostol for maintenance therapy (colic and diarrhoea may limit the dose of misoprostol);
- Treat ulcer with a proton pump inhibitor and switch non-selective NSAID to a cyclo-oxygenase-2 selective inhibitor, but see NSAIDs and Cardiovascular Events; on healing, continuation of the proton pump inhibitor in patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.

If treatment with a cyclo-oxygenase-2 selective inhibitor needs to continue, treat ulcer with a proton pump inhibitor; on healing continuation of the proton pump inhibitor in patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.

GASTROPROTECTIVE COMPLEXES AND CHELATORS

Chelates and complexes

Overview

Sucralfate below may act by protecting the mucosa from acid-pepsin attack in gastric and duodenal ulcers. It is a complex of aluminium hydroxide and sulfated sucrose but has minimal antacid properties.

Sucralfate

• INDICATIONS AND DOSE

Benign gastric ulceration | Benign duodenal ulceration

► BY MOUTH

- Child 15–17 years: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day
- Adult: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day

Chronic gastritis

► BY MOUTH

- Adult: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day

Prophylaxis of stress ulceration in child under intensive care

► BY MOUTH

- Child 15–17 years: 1 g 6 times a day; maximum 8 g per day

Prophylaxis of stress ulceration

► BY MOUTH

- Adult: 1 g 6 times a day; maximum 8 g per day

- **CAUTIONS** Patients under intensive care (**Important:** reports of bezoar formation)

CAUTIONS, FURTHER INFORMATION

- **Bezoar formation** Following reports of bezoar formation associated with sucralfate, caution is advised in seriously ill patients, especially those receiving concomitant enteral feeds or those with predisposing conditions such as delayed gastric emptying.
- **INTERACTIONS** → Appendix 1: sucralfate
- **SIDE-EFFECTS**
 - **Common or very common** Constipation
 - **Uncommon** Dry mouth · nausea
 - **Rare or very rare** Bezoar · rash
 - **Frequency not known** Back pain · bone disorders · diarrhoea · dizziness · drowsiness · encephalopathy · flatulence · headache · vertigo
- **PREGNANCY** No evidence of harm; absorption from gastro-intestinal tract negligible.
- **BREAST FEEDING** Amount probably too small to be harmful.
- **RENAL IMPAIRMENT** Use with caution; aluminium is absorbed and may accumulate.
- **DIRECTIONS FOR ADMINISTRATION** Administration of sucralfate and enteral feeds should be separated by 1 hour and for administration by mouth, sucralfate should be given 1 hour before meals. Oral suspension blocks fine-bore feeding tubes. Crushed tablets may be dispersed in water.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include aniseed and caramel.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension

H₂-receptor antagonists

Overview

Histamine H₂-receptor antagonists heal gastric and duodenal ulcers by reducing gastric acid output as a result of histamine H₂-receptor blockade; they are also used to relieve symptoms of gastro-oesophageal reflux disease. H₂-receptor antagonists should not normally be used for Zollinger-Ellison syndrome because proton pump inhibitors are more effective.

Maintenance treatment with low doses for the prevention of peptic ulcer disease has largely been replaced in *Helicobacter pylori* positive patients by eradication regimens.

In adults, H₂-receptor antagonists are used for the treatment of functional dyspepsia and may be used for the treatment of uninvestigated dyspepsia without alarm features.

H₂-receptor antagonist therapy can promote healing of NSAID-associated ulcers (particularly duodenal).

Treatment with a H₂-receptor antagonist has not been shown to be beneficial in haematemesis and melaena, but prophylactic use reduces the frequency of bleeding from gastroduodenal erosions in hepatic coma, and possibly in other conditions requiring intensive care. H₂-receptor antagonists also reduce the risk of acid aspiration in obstetric patients at delivery (Mendelson's syndrome).

H₂-receptor antagonists

- **CAUTIONS** Signs and symptoms of gastric cancer (in adults)
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Gastric cancer
 - ▶ In adults H₂-receptor antagonists might mask symptoms of gastric cancer; particular care is required in patients presenting with 'alarm features' in such cases gastric malignancy should be ruled out before treatment.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Constipation · diarrhoea · dizziness · fatigue · headache · myalgia · skin reactions
 - ▶ **Uncommon** Confusion · depression · erectile dysfunction · gynaecomastia · hallucination · hepatic disorders · leucopenia · nausea · tachycardia
 - ▶ **Rare or very rare** Agranulocytosis · alopecia · arthralgia · atrioventricular block · fever · galactorrhoea · pancytopenia · thrombocytopenia · vasculitis

Cimetidine

● INDICATIONS AND DOSE

Benign duodenal ulceration

- ▶ **BY MOUTH**
- ▶ **Adult:** 400 mg twice daily for at least 4 weeks, to be taken with breakfast and at night, alternatively 800 mg once daily for at least 4 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg once daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

Benign gastric ulceration

- ▶ **BY MOUTH**
- ▶ **Adult:** 400 mg twice daily for 6 weeks, to be taken with breakfast and at night, alternatively 800 mg daily for 6 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg once daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

NSAID-associated ulceration

- ▶ **BY MOUTH**
- ▶ **Adult:** 400 mg twice daily for 8 weeks, to be taken with breakfast and at night, alternatively 800 mg daily for 8 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

Reflux oesophagitis

- ▶ **BY MOUTH**
- ▶ **Adult:** 400 mg 4 times a day for 4–8 weeks

Prophylaxis of stress ulceration

- ▶ **BY MOUTH**
- ▶ **Adult:** 200–400 mg every 4–6 hours

Gastric acid reduction in obstetrics

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 400 mg, to be administered at start of labour, then increased if necessary up to 400 mg every 4 hours, do not use syrup in prophylaxis of acid aspiration; maximum 2.4 g per day

Gastric acid reduction during surgical procedures

- ▶ **BY MOUTH**
- ▶ **Adult:** 400 mg, to be given 90–120 minutes before induction of general anaesthesia

Short-bowel syndrome

- ▶ **BY MOUTH**
- ▶ **Adult:** 400 mg twice daily, adjusted according to response, to be taken with breakfast and at bedtime

To reduce degradation of pancreatic enzyme supplements

- ▶ **BY MOUTH**
- ▶ **Adult:** 0.8–1.6 g daily in 4 divided doses, dose to be taken 1–1½ hours before meals
- **INTERACTIONS** → Appendix 1: H₂ receptor antagonists
- **SIDE-EFFECTS**
 - ▶ **Rare or very rare** Anaphylactic reaction · aplastic anaemia · hypersensitivity vasculitis · nephritis tubulointerstitial · pancreatitis · sinus bradycardia
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Significant amount present in milk—not known to be harmful but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Increased risk of confusion.
Dose adjustments Reduce dose.
- **RENAL IMPAIRMENT** Occasional risk of confusion.
Dose adjustments Reduce dose to 200 mg 4 times daily if eGFR 30–50 mL/minute/1.73 m².
Reduce dose to 200 mg 3 times daily if eGFR 15–30 mL/minute/1.73 m².
Reduce dose to 200 mg twice daily if eGFR less than 15 mL/minute/1.73 m².
- **EXCEPTIONS TO LEGAL CATEGORY** Cimetidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks' supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity (max. single dose 200 mg, max. daily dose 800 mg), and for the prophylactic management of nocturnal heartburn (single night-time dose 100 mg).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Oral solution

EXCIPIENTS: May contain Propylene glycol

▶ Cimetidine (Non-proprietary)

Cimetidine 40 mg per 1 mL Cimetidine 200mg/5mL oral solution sugar free sugar-free | 300 mL [PoM] £14.24–£14.25 DT = £14.25

▶ Tagamet (Essential Pharma Ltd)

Cimetidine 40 mg per 1 mL Tagamet 200mg/5mL syrup | 600 mL [PoM] £28.49 DT = £28.49

Tablet

▶ Cimetidine (Non-proprietary)

Cimetidine 200 mg Cimetidine 200mg tablets | 60 tablet [PoM] £9.98–£45.59 | 120 tablet [PoM] £120.00

Cimetidine 400 mg Cimetidine 400mg tablets | 60 tablet [PoM] £120.00 DT = £16.37

Cimetidine 800 mg Cimetidine 800mg tablets | 30 tablet [PoM] £15.31 DT = £15.31

▶ Tagamet (Chemidex Pharma Ltd)

Cimetidine 400 mg Tagamet 400mg tablets | 60 tablet [PoM] £22.62 DT = £16.37

Cimetidine 800 mg Tagamet 800mg tablets | 30 tablet [PoM] £22.62 DT = £15.31

Famotidine

● INDICATIONS AND DOSE

Treatment of benign gastric and duodenal ulceration

- ▶ **BY MOUTH**
- ▶ **Adult:** 40 mg once daily for 4–8 weeks, dose to be taken at night

Maintenance treatment of duodenal ulceration

- ▶ **BY MOUTH**
- ▶ **Adult:** 20 mg once daily, dose to be taken at night

Reflux oesophagitis

- ▶ **BY MOUTH**
- ▶ **Adult:** 20–40 mg twice daily for 6–12 weeks; maintenance 20 mg twice daily

- **INTERACTIONS** → Appendix 1: H2 receptor antagonists
- **SIDE-EFFECTS**
 - **Uncommon** Appetite decreased · dry mouth · pruritus · taste altered · vomiting
 - **Rare or very rare** Anxiety · chest tightness · disorientation · drowsiness · insomnia · interstitial pneumonia · jaundice · cholestatic · libido decreased · muscle cramps · neutropenia · paraesthesia · psychiatric disorder · seizures · severe cutaneous adverse reactions (SCARs)
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Present in milk—not known to be harmful but manufacturer advises avoid.
- **RENAL IMPAIRMENT** Seizures reported very rarely.

Dose adjustments Use normal dose every 36–48 hours or use half normal dose if eGFR less than 50 mL/minute/1.73 m².
- **EXCEPTIONS TO LEGAL CATEGORY** Famotidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks' supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink including when they cause sleep disturbance (max. single dose 10 mg, max. daily dose 20 mg).

Nizatidine

• INDICATIONS AND DOSE

Benign gastric, duodenal or NSAID-associated ulceration

► BY MOUTH

- Adult: 300 mg once daily for 4–8 weeks, dose to be taken in the evening, alternatively 150 mg twice daily for 4–8 weeks; maintenance 150 mg once daily, dose to be taken at night

Gastro-oesophageal reflux disease

► BY MOUTH

- Adult: 150–300 mg twice daily for up to 12 weeks

- **INTERACTIONS** → Appendix 1: H2 receptor antagonists
- **SIDE-EFFECTS**
 - **Rare or very rare** Anaemia · cholestatic liver injury · exfoliative dermatitis · hyperuricaemia · serum sickness · thrombocytopenic purpura
 - **Frequency not known** Hyperhidrosis
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

• RENAL IMPAIRMENT

Dose adjustments Use half normal dose if eGFR 20–50 mL/minute/1.73 m².

Use one-quarter normal dose if eGFR less than 20 mL/minute/1.73 m².

- **EXCEPTIONS TO LEGAL CATEGORY** Nizatidine can be sold to the public for the prevention and treatment of symptoms of food-related heartburn and meal-induced indigestion in adults and children over 16 years; max. single dose 75 mg, max. daily dose 150 mg for max. 14 days.

• MEDICINAL FORMS

Ranitidine

• INDICATIONS AND DOSE

Benign gastric ulceration | Duodenal ulceration

► BY MOUTH

- Child 1–5 months: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
- Child 6 months–2 years: 2–4 mg/kg twice daily
- Child 3–11 years: 2–4 mg/kg twice daily (max. per dose 150 mg)
- Child 12–17 years: 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night
- Adult: 150 mg twice daily for 4–8 weeks, alternatively 300 mg once daily for 4–8 weeks, dose to be taken at night

Chronic episodic dyspepsia

► BY MOUTH

- Adult: 150 mg twice daily for 6 weeks, alternatively 300 mg once daily for 6 weeks, dose to be taken at night

NSAID-associated gastric ulceration

► BY MOUTH

- Adult: 150 mg twice daily for up to 8 weeks, alternatively 300 mg once daily for up to 8 weeks, dose to be taken at night

NSAID-associated duodenal ulcer

► BY MOUTH

- Adult: 300 mg twice daily for 4 weeks, to achieve a higher healing rate

Prophylaxis of NSAID-associated gastric ulcer |

Prophylaxis of NSAID-associated duodenal ulcer

► BY MOUTH

- Adult: 300 mg twice daily

Gastro-oesophageal reflux disease

► BY MOUTH

- Adult: 150 mg twice daily for up to 8 weeks or if necessary 12 weeks, alternatively 300 mg once daily for up to 8 weeks or if necessary 12 weeks, dose to be taken at night

Moderate to severe gastro-oesophageal reflux disease

► BY MOUTH

- Adult: 600 mg daily in 2–4 divided doses for up to 12 weeks

Long-term treatment of healed gastro-oesophageal reflux disease

► BY MOUTH

- Adult: 150 mg twice daily

Gastric acid reduction (prophylaxis of acid aspiration) in obstetrics

► BY MOUTH

- Adult: 150 mg, dose to be given at onset of labour, then 150 mg every 6 hours

Gastric acid reduction (prophylaxis of acid aspiration) in surgical procedures

- INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION

- Adult: 50 mg, to be given 45–60 minutes before induction of anaesthesia, intravenous injection diluted to 20 mL and given over at least 2 minutes, continued →

alternatively (by mouth) 150 mg, to be given 2 hours before induction of anaesthesia and also when possible on the preceding evening

Prophylaxis of stress ulceration

▶ INITIALLY BY SLOW INTRAVENOUS INJECTION

- Adult: 50 mg every 8 hours, dose to be diluted to 20 mL and given over at least 2 minutes, then (by mouth) 150 mg twice daily, may be given when oral feeding commences

Reflux oesophagitis and other conditions where gastric acid reduction is beneficial

▶ BY MOUTH

- Child 1-5 months: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
- Child 6 months-2 years: 2-4 mg/kg twice daily
- Child 3-11 years: 2-4 mg/kg twice daily (max. per dose 150 mg); increased to up to 5 mg/kg twice daily (max. per dose 300 mg), dose increase for severe gastro-oesophageal disease
- Child 12-17 years: 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night, then increased if necessary to 300 mg twice daily for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease, alternatively increased if necessary to 150 mg 4 times a day for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease

Conditions where reduction of gastric acidity is beneficial and oral route not available

▶ BY INTRAMUSCULAR INJECTION

- Adult: 50 mg every 6-8 hours

▶ BY SLOW INTRAVENOUS INJECTION

- Adult: 50 mg, dose to be diluted to 20 mL and given over at least 2 minutes; may be repeated every 6-8 hours

● UNLICENSED USE

- In children Oral preparations not licensed for use in children under 3 years.
- In adults Doses given for prophylaxis of NSAID-associated gastric or duodenal ulcer, and prophylaxis of stress ulceration, are not licensed.

● INTERACTIONS → Appendix 1: H2 receptor antagonists

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Rare or very rare Bone marrow depression · bradycardia · breast conditions · dyskinesia · erythema multiforme · hepatitis cholestatic · nephritis acute interstitial · pancreatitis acute · vision blurred
- Frequency not known Dyspnoea

SPECIFIC SIDE-EFFECTS

- Rare or very rare
- With parental use Anaphylactic shock · cardiac arrest
- PREGNANCY Manufacturer advises avoid unless essential, but not known to be harmful.

- BREAST FEEDING Significant amount present in milk, but not known to be harmful.

● RENAL IMPAIRMENT

Dose adjustments ▶ In adults Use half normal dose if eGFR less than 50 mL/minute/1.73 m².

- In children Use half normal dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Zantac[®]), give intermittently in Glucose 5% or Sodium Chloride 0.9%.

- PATIENT AND CARER ADVICE In fat malabsorption syndrome, give oral doses 1-2 hours before food to enhance effects of pancreatic enzyme replacement. Medicines for Children leaflet: Ranitidine for acid reflux www.medicinesforchildren.org.uk/ranitidine-for-acid-reflux

- EXCEPTIONS TO LEGAL CATEGORY Ranitidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks' supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink (max. single dose 75 mg, max. daily dose 300 mg).

● MEDICINAL FORMS

PROSTAGLANDIN ANALOGUES AND PROSTAMIDES > PROSTAGLANDINS, GASTROPROTECTIVE

Misoprostol

21-Feb-2018

- **DRUG ACTION** Misoprostol is a synthetic prostaglandin analogue that has antisecretory and protective properties, promoting healing of gastric and duodenal ulcers.

● INDICATIONS AND DOSE

Benign gastric ulcer | Benign duodenal ulcer | NSAID-induced peptic ulcer

► BY MOUTH

- Adult: 400 micrograms twice daily, alternatively 200 micrograms 4 times a day continued for at least 4 weeks or may be continued for up to 8 weeks if required, dose to be taken with breakfast (or main meals) and at bedtime

Prophylaxis of NSAID-induced peptic ulcer

► BY MOUTH

- Adult: 200 micrograms 2–4 times a day

- **CAUTIONS** Conditions where hypotension might precipitate severe complications (e.g. cerebrovascular disease, cardiovascular disease) - conditions which predispose to diarrhoea (e.g. inflammatory bowel disease)

● SIDE-EFFECTS

- **Common or very common** Constipation · diarrhoea · dizziness · flatulence · gastrointestinal discomfort · headache · nausea · rash · vomiting
- **Uncommon** Fever · haemorrhage · menstrual cycle irregularities · postmenopausal haemorrhage · uterine cramps
- **Frequency not known** Chills · uterine rupture

SIDE-EFFECTS, FURTHER INFORMATION Diarrhoea may occasionally be severe and require withdrawal, reduced by giving single doses not exceeding 200 micrograms and by avoiding magnesium-containing antacids.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises do not use in women of childbearing potential unless pregnancy has been excluded; patients must use effective contraception during treatment, and be informed of the risks of taking misoprostol if pregnant.

- **PREGNANCY** Manufacturer advises avoid—induces uterine contractions, and associated with abortion and birth defects; teratogenic in first trimester.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk, and may cause diarrhoea in nursing infants. [\[EvGr\]](#) Tertiary sources state present in milk but amount probably too small to be harmful; to further reduce risk following termination of pregnancy, consider interrupting breastfeeding for 5 hours after a dose. [\[D\]](#)

● PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

PROTON PUMP INHIBITORS

Proton pump inhibitors

Overview

Proton pump inhibitors are effective short-term treatments for *gastric and duodenal ulcers*; they are also used in combination with antibacterials for the eradication of *Helicobacter pylori* (see specific regimens). Following endoscopic treatment of severe peptic ulcer bleeding, an intravenous, high-dose proton pump inhibitor reduces the risk of rebleeding and the need for surgery. Proton pump inhibitors can be used for the treatment of *dyspepsia* and *gastro-oesophageal reflux disease*.

Proton pump inhibitors are also used for the prevention and treatment of NSAID-associated ulcers. In patients who need to continue NSAID treatment after an ulcer has healed, the dose of proton pump inhibitor should normally not be reduced because asymptomatic ulcer deterioration may occur.

A proton pump inhibitor can be used to reduce the degradation of pancreatic enzyme supplements in patients with cystic fibrosis. They can also be used to control excessive secretion of gastric acid in *Zollinger–Ellison syndrome*; high doses are often required.

Proton pump inhibitors

- **DRUG ACTION** Proton pump inhibitors inhibit gastric acid secretion by blocking the hydrogen-potassium adenosine triphosphatase enzyme system (the 'proton pump') of the gastric parietal cell.

IMPORTANT SAFETY INFORMATION

MHRA ADVICE: PROTON PUMP INHIBITORS (PPIS): VERY LOW RISK OF SUBACUTE CUTANEOUS LUPUS ERYTHEMATOSUS (SEPTEMBER 2015)

Very infrequent cases of subacute cutaneous lupus erythematosus (SCLE) have been reported in patients taking PPIs. Drug-induced SCLE can occur weeks, months or even years after exposure to the drug.

If a patient treated with a PPI develops lesions—especially in sun-exposed areas of the skin—and it is accompanied by arthralgia:

- advise them to avoid exposing the skin to sunlight;
- consider SCLE as a possible diagnosis;
- consider discontinuing PPI treatment unless it is imperative for a serious acid-related condition; a patient who develops SCLE with a particular PPI may be at risk of the same reaction with another;
- in most cases, symptoms resolve on PPI withdrawal; topical or systemic steroids might be necessary for treatment of SCLE only if there are no signs of remission after a few weeks or months.

- **CAUTIONS** Can increase the risk of fractures (particularly when used at high doses for over a year in the elderly) · may increase the risk of gastro-intestinal infections (including *Clostridium difficile* infection) · may mask the symptoms of gastric cancer (in adults) · patients at risk of osteoporosis

CAUTIONS, FURTHER INFORMATION

- **Risk of osteoporosis** Patients at risk of osteoporosis should maintain an adequate intake of calcium and vitamin D, and if necessary, receive other preventative therapy.
- **Gastric cancer**
- **In adults** Particular care is required in those presenting with 'alarm features', in such cases gastric malignancy should be ruled out before treatment.

• SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · constipation · diarrhoea · dizziness · dry mouth · gastrointestinal disorders · headache · insomnia · nausea · skin reactions · vomiting
- ▶ **Uncommon** Arthralgia · bone fractures · confusion · depression · drowsiness · leucopenia · malaise · myalgia · paraesthesia · peripheral oedema · thrombocytopenia · vertigo · vision disorders
- ▶ **Rare or very rare** Agranulocytosis · alopecia · gynaecomastia · hallucination · hepatic disorders · hyperhidrosis · hyponatraemia · nephritis tubulointerstitial · pancytopenia · photosensitivity reaction · severe cutaneous adverse reactions (SCARs) · stomatitis · taste altered
- ▶ **Frequency not known** Hypomagnesaemia (more common after 1 year of treatment, but sometimes after 3 months of treatment) · subacute cutaneous lupus erythematosus
- **MONITORING REQUIREMENTS** Measurement of serum-magnesium concentrations should be considered before and during prolonged treatment with a proton pump inhibitor, especially when used with other drugs that cause hypomagnesaemia or with digoxin.
- **PRESCRIBING AND DISPENSING INFORMATION** A proton pump inhibitor should be prescribed for appropriate indications at the lowest effective dose for the shortest period; the need for long-term treatment should be reviewed periodically.

F 77

Esomeprazole

• INDICATIONS AND DOSE

NSAID-associated gastric ulcer

- ▶ **BY MOUTH**
- ▶ Adult: 20 mg once daily for 4–8 weeks
- ▶ **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- ▶ Adult: 20 mg daily continue until oral administration possible, injection to be given over at least 3 minutes

Prophylaxis of NSAID-associated gastric ulcer in patients with an increased risk of gastroduodenal complications who require continued NSAID treatment

- ▶ **BY MOUTH**
- ▶ Adult: 20 mg daily

Prophylaxis of NSAID-associated gastric or duodenal ulcer

- ▶ **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- ▶ Adult: 20 mg daily continue until oral administration possible, injection to be given over at least 3 minutes

Gastro-oesophageal reflux disease (in the presence of erosive reflux oesophagitis)

- ▶ **BY MOUTH**
- ▶ Child 1–11 years (body-weight 10–19 kg): 10 mg once daily for 8 weeks
- ▶ Child 1–11 years (body-weight 20 kg and above): 10–20 mg once daily for 8 weeks
- ▶ Child 12–17 years: Initially 40 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed or symptoms persist; maintenance 20 mg daily
- ▶ Adult: Initially 40 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed or symptoms persist; maintenance 20 mg daily
- ▶ **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- ▶ Adult: 40 mg daily continue until oral administration possible, injection to be given over at least 3 minutes

Symptomatic treatment of gastro-oesophageal reflux disease (in the absence of oesophagitis)

- ▶ **BY MOUTH**
- ▶ Child 1–11 years (body-weight 10 kg and above): 10 mg once daily for up to 8 weeks
- ▶ Child 12–17 years: 20 mg once daily for up to 4 weeks

- ▶ Adult: 20 mg once daily for up to 4 weeks, then 20 mg daily if required
- ▶ **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- ▶ Adult: 20 mg once daily continue until oral administration is possible, injection to be given over at least 3 minutes

Zollinger-Ellison syndrome

- ▶ **BY MOUTH**
- ▶ Adult: Initially 40 mg twice daily, adjusted according to response; usual dose 80–160 mg daily, daily doses above 80 mg should be given in 2 divided doses

Severe peptic ulcer bleeding (following endoscopic treatment)

- ▶ **INITIALLY BY INTRAVENOUS INFUSION**
- ▶ Adult: Initially 80 mg, to be given over 30 minutes, then (by continuous intravenous infusion) 8 mg/hour for 72 hours, then (by mouth) 40 mg once daily for 4 weeks

Helicobacter pylori eradication in combination with clarithromycin and amoxicillin or metronidazole

- ▶ **BY MOUTH**
- ▶ Adult: 20 mg twice daily

- **UNLICENSED USE** Tablets and capsules not licensed for use in children 1–11 years.

- **INTERACTIONS** → Appendix 1: proton pump inhibitors

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Uncommon** Encephalopathy
- ▶ **Rare or very rare** Aggression · agitation · bronchospasm · increased risk of infection · muscle weakness
- ▶ **Frequency not known** Colitis microscopic

SPECIFIC SIDE-EFFECTS

- ▶ **Rare or very rare**
- ▶ With parenteral use Renal failure
- ▶ **Frequency not known**
- ▶ With parenteral use Electrolyte imbalance · vitamin B12 deficiency

- **PREGNANCY** Manufacturer advises caution—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

• HEPATIC IMPAIRMENT

Dose adjustments ▶ In adults In severe hepatic impairment max. 20 mg daily. Severe peptic ulcer bleeding in severe hepatic impairment, initial intravenous infusion of 80 mg, then by continuous intravenous infusion, 4 mg/hour for 72 hours.

- ▶ In children 1–11 years max. 10 mg daily in severe impairment. 12–17 years max. 20 mg daily in severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe renal insufficiency.

• DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use in adults For *intravenous infusion* (Nexium[®]), give continuously or intermittently in Sodium Chloride 0.9%; reconstitute 40–80 mg with up to 100 ml infusion fluid; for intermittent infusion, give requisite dose over 10–30 minutes; stable for 12 hours in Sodium Chloride 0.9%.
- ▶ With oral use Do not chew or crush capsules; swallow whole or mix capsule contents in water and drink within 30 minutes. Do not crush or chew tablets; swallow whole or disperse in water and drink within 30 minutes. Disperse the contents of each sachet of gastro-resistant granules in approx. 15 mL water. Stir and leave to thicken for a few minutes; stir again before administration and use within 30 minutes; rinse container with 15 mL water to obtain full dose. For administration through a gastric tube, consult product literature.

● PATIENT AND CARER ADVICE

- With oral use Counselling on administration of gastro-resistant capsules, tablets, and granules advised.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Gastro-resistant capsule

● Esomeprazole (Non-proprietary)

Esomeprazole (as Esomeprazole magnesium dihydrate)
20 mg Esomeprazole 20mg gastro-resistant capsules | 28 capsule [PoM] £12.95 DT = £2.64

10 mg Nexium 10mg gastro-resistant granules sachets | 28 sachet [PoM] £25.19 DT = £25.19

Benign gastric ulcer

► BY MOUTH

- Adult: 30 mg once daily for 8 weeks, dose to be taken in the morning

Duodenal ulcer

► BY MOUTH

- Adult: 30 mg once daily for 4 weeks, dose to be taken in the morning; maintenance 15 mg once daily

NSAID-associated duodenal ulcer | NSAID-associated gastric ulcer

► BY MOUTH

- Adult: 30 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed

Prophylaxis of NSAID-associated duodenal ulcer | Prophylaxis of NSAID-associated gastric ulcer

► BY MOUTH

- Adult: 15–30 mg once daily

Zollinger–Ellison syndrome (and other hypersecretory conditions)

► BY MOUTH

- Adult: Initially 60 mg once daily, adjusted according to response, daily doses of 120 mg or more given in two divided doses

Gastro-oesophageal reflux disease

► BY MOUTH

- Adult: 30 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed; maintenance 15–30 mg once daily, doses to be taken in the morning

Severe oesophagitis

► BY MOUTH

- Adult: 30 mg once daily for 8 weeks, continue as maintenance treatment if appropriate

Severe oesophagitis, refractory to initial treatment

► BY MOUTH

- Adult: 30 mg twice daily

Acid-related dyspepsia

► BY MOUTH

- Adult: 15–30 mg once daily for 2–4 weeks, doses to be taken in the morning

- **UNLICENSED USE** Lansoprazole doses in BNF may differ from those in product literature. [Evgi](#) Not licensed at 30 mg twice daily for severe oesophagitis refractory to initial treatment. [A](#)

- **INTERACTIONS** → Appendix 1: proton pump inhibitors

● SIDE-EFFECTS

- **Common or very common** Dry throat · fatigue
- **Uncommon** Eosinophilia · oedema
- **Rare or very rare** Anaemia · angioedema · appetite decreased · colitis · erectile dysfunction · fever · glossitis · oesophageal candidiasis · pancreatitis · restlessness · tremor

- **PREGNANCY** Manufacturer advises avoid.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

● HEPATIC IMPAIRMENT

Dose adjustments Use half normal dose in moderate to severe liver disease.

- **DIRECTIONS FOR ADMINISTRATION** Orodispersible tablets should be placed on the tongue, allowed to disperse and swallowed, or may be swallowed whole with a glass of water. Alternatively, tablets can be dispersed in a small amount of water and administered by an oral syringe or nasogastric tube.

- **PATIENT AND CARER ADVICE** Counselling on administration of orodispersible tablet advised.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Lansoprazole capsules may be prescribed.

4.3 Gastro-oesophageal reflux disease

Gastro-oesophageal reflux disease

Management

Gastro-oesophageal reflux disease (including non-erosive gastro-oesophageal reflux and erosive oesophagitis) is associated with heartburn, acid regurgitation, and sometimes, difficulty in swallowing (dysphagia); oesophageal inflammation (oesophagitis), ulceration, and stricture formation may occur and there is an association with asthma.

The management of gastro-oesophageal reflux disease includes drug treatment, lifestyle changes and, in some cases, surgery. Initial treatment is guided by the severity of symptoms and treatment is then adjusted according to response. The extent of healing depends on the severity of the disease, the treatment chosen, and the duration of therapy.

Patients with gastro-oesophageal reflux disease should be advised about lifestyle changes (avoidance of excess alcohol and of aggravating foods such as fats); other measures include weight reduction, smoking cessation, and raising the head of the bed.

For *mild symptoms* of gastro-oesophageal reflux disease, initial management may include the use of **antacids** and **alginates**. Alginate-containing antacids can form a 'raft' that floats on the surface of the stomach contents to reduce reflux and protect the oesophageal mucosa. **Histamine H₂-receptor antagonists** may relieve symptoms and permit reduction in antacid consumption. However, **proton pump inhibitors** provide more effective relief of symptoms than H₂-receptor antagonists. When symptoms abate, treatment is titrated down to a level which maintains remission (e.g. by giving treatment intermittently).

For *severe symptoms* of gastro-oesophageal reflux disease or for patients with a proven or severe pathology (e.g. oesophagitis, oesophageal ulceration, oesophagopharyngeal reflux, Barrett's oesophagus), initial management involves the use of a **proton pump inhibitor**; patients need to be reassessed if symptoms persist despite treatment for 4–6 weeks with a proton pump inhibitor. When symptoms abate, treatment is titrated down to a level which maintains remission (e.g. by reducing the dose of the proton pump inhibitor or by giving it intermittently, or by substituting treatment with a histamine H₂-receptor antagonist). However, for endoscopically confirmed *erosive, ulcerative, or stricturing* disease, or *Barrett's oesophagus*, treatment with a proton pump inhibitor usually needs to be maintained at the minimum effective dose.

Pregnancy

If dietary and lifestyle changes fail to control gastro-oesophageal reflux disease in pregnancy, an antacid or an alginate can be used. If this is ineffective, ranitidine p. 75 can be tried. Omeprazole p. 80 is reserved for women with severe or complicated reflux disease.

Gastro-oesophageal reflux disease in children

Gastro-oesophageal reflux disease is common in infancy but most symptoms resolve without treatment between 12 and 18 months of age. In infants, mild or moderate reflux without complications can be managed initially by changing the frequency and volume of feed; a feed thickener or thickened formula feed can be used (with advice of a dietitian). If necessary, a suitable alginate-containing preparation can be used instead of thickened feeds. For older children, life-style changes similar to those for adults may be helpful followed if necessary by treatment with an alginate-containing preparation.

Children who do not respond to these measures or who have problems such as respiratory disorders or suspected oesophagitis need to be referred to hospital; an H₂-receptor antagonist may be needed to reduce acid secretion. If the oesophagitis is resistant to H₂-receptor blockade, the proton pump inhibitor omeprazole can be tried.

ANTACIDS > ALGINATE

Sodium alginate with calcium carbonate and sodium bicarbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, alginic acid p. 69, sodium bicarbonate p. 1006, calcium carbonate p. 1013.

● INDICATIONS AND DOSE

Mild symptoms of gastro-oesophageal reflux disease

- **Helicobacter Test INFAI** (INFAI UK Ltd)

Urea [13-C] 45 mg Helicobacter Test INFAI for children breath test kit sugar-free | 1 kit [PoM] £19.10

Urea [13-C] 75 mg Helicobacter Test INFAI breath test kit sugar-free | 1 kit [PoM] £21.70

Tablet

- **Diabact UBT** (HFA Healthcare Products Ltd)

Urea [13-C] 50 mg diabact UBT 50mg tablets | 1 tablet [PoM] £21.25

5 Food allergy

Food allergy

15-Dec-2016

Description of condition

Food allergy is an adverse immune response to a food, commonly associated with cutaneous and gastro-intestinal reactions, and less frequently associated with respiratory reactions and anaphylaxis. It is distinct from food intolerance which is non-immunological. Cow's milk, hen's eggs, soy, wheat, peanuts, tree nuts, fish, and shellfish are the most common allergens. Cross-reactivity between similar foods can occur (e.g. allergy to other mammalian milk in patients with cow's milk allergy).

Management of food allergy

[EvGr] Allergy caused by specific foods should be managed by strict avoidance of the causal food. Sodium cromoglicate p. 270 is licensed as an adjunct to dietary avoidance in patients with food allergy. Educating patients about appropriate nutrition, food preparation, and the risks of accidental exposure is recommended, such as food and drinks to avoid, ensuring adequate nutritional intake, and interpreting food labels. **A**

Drug treatment

[EvGr] There is low quality evidence to support the use of antihistamines to treat acute, **non-life-threatening** symptoms (such as flushing and urticaria) if accidental ingestion of allergenic food has occurred (see *Antihistamines*, under Antihistamines, allergen immunotherapy and allergic emergencies p. 276). Chlorphenamine maleate p. 283 is licensed for the symptomatic control of food allergy. In case of food-induced anaphylaxis, adrenaline/epinephrine p. 221 is the first-line immediate treatment (see also *Allergic emergencies*, under Antihistamines, allergen immunotherapy and allergic emergencies p. 276). Patients who are at risk of anaphylaxis should be trained to use self-injectable adrenaline/epinephrine. **A**

6 Gastro-intestinal smooth muscle spasm

Antispasmodics

Antimuscarinics

The intestinal smooth muscle relaxant properties of antimuscarinic and other antispasmodic drugs may be useful in *irritable bowel syndrome*.

Antimuscarinics (formerly termed 'anticholinergics') reduce intestinal motility. They can be used for the management of *irritable bowel syndrome*.

Antimuscarinics that are used for gastro-intestinal smooth muscle spasm include the tertiary amines atropine sulfate p. 1295 and dicycloverine hydrochloride below and the quaternary ammonium compounds propantheline bromide p. 85 and hyoscine butylbromide p. 85. The quaternary ammonium compounds are less lipid soluble than atropine sulfate and are less likely to cross the blood-brain barrier; they are also less well absorbed from the gastro-intestinal tract.

Dicycloverine hydrochloride has a much less marked antimuscarinic action than atropine sulfate and may also have some direct action on smooth muscle. Hyoscine butylbromide is advocated as a gastro-intestinal antispasmodic, but it is poorly absorbed; the injection is useful in endoscopy and radiology. Atropine sulfate and the belladonna alkaloids are outmoded treatments, any clinical virtues being outweighed by atropinic side-effects.

Other indications for antimuscarinic drugs include arrhythmias, asthma and airways disease, motion sickness, parkinsonism, urinary incontinence, mydriasis and cycloplegia, premedication, and as an antidote to organophosphorus poisoning.

Other antispasmodics

Alverine citrate p. 86, mebeverine hydrochloride p. 86, and peppermint oil p. 47 are believed to be direct relaxants of intestinal smooth muscle and may relieve pain in *irritable bowel syndrome*. They have no serious adverse effects but, like all antispasmodics, should be avoided in paralytic ileus.

ANTIMUSCARINICS

F 759

Dicycloverine hydrochloride

(Dicyclomine hydrochloride)

● INDICATIONS AND DOSE

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

► BY MOUTH

- Child 6-23 months: 5-10 mg 3-4 times a day, dose to be taken 15 minutes before feeds
- Child 2-11 years: 10 mg 3 times a day
- Child 12-17 years: 10-20 mg 3 times a day
- Adult: 10-20 mg 3 times a day

● **CONTRA-INDICATIONS** Child under 6 months

● **INTERACTIONS** → Appendix 1: dicycloverine

● **SIDE-EFFECTS** Appetite decreased · fatigue · sedation · thirst

● **PREGNANCY** Not known to be harmful; manufacturer advises use only if essential.

● **BREAST FEEDING** Avoid—present in milk; apnoea reported in infant.

● **EXCEPTIONS TO LEGAL CATEGORY** Dicycloverine hydrochloride can be sold to the public provided that max. single dose is 10 mg and max. daily dose is 60 mg.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

► **Dicycloverine hydrochloride (Non-proprietary)**

Dicycloverine hydrochloride 2 mg per 1 mL Dicycloverine 10 mg/5 mL oral solution | 120 mL **[PoM]** £196.36 DT = £179.73

Tablet

► **Dicycloverine hydrochloride (Non-proprietary)**

Dicycloverine hydrochloride 10 mg Dicycloverine 10 mg tablets | 100 tablet **[PoM]** £201.22 DT = £184.25

Dicycloverine hydrochloride 20 mg Dicycloverine 20 mg tablets | 84 tablet **[PoM]** £203.42 DT = £196.69

Dicycloverine hydrochloride with aluminium hydroxide, magnesium oxide and simeticone

The properties listed below are those particular to the combination only. For the properties of the components please consider, dicycloverine hydrochloride above, aluminium hydroxide p. 1020, simeticone p. 71.

● INDICATIONS AND DOSE

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

► BY MOUTH

- Child 12-17 years: 10-20 mL every 4 hours as required
- Adult: 10-20 mL every 4 hours as required

● **INTERACTIONS** → Appendix 1: antacids · dicycloverine

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

► **Kolanticon** (Peckforton Pharmaceuticals Ltd)

Dicycloverine hydrochloride 500 microgram per 1 mL, Simeticone 4 mg per 1 mL, Magnesium oxide light 20 mg per 1 mL, Aluminium hydroxide dried 40 mg per 1 mL Kolanticon gel sugar-free | 200 mL **[P]** £4.00 sugar-free | 500 mL **[P]** £6.00

Hyoscine butylbromide

13-Mar-2017

● INDICATIONS AND DOSE

Symptomatic relief of gastro-intestinal or genito-urinary disorders characterised by smooth muscle spasm

► BY MOUTH

- Child 6–11 years: 10 mg 3 times a day
- Child 12–17 years: 20 mg 4 times a day
- Adult: 20 mg 4 times a day

Irritable bowel syndrome

► BY MOUTH

- Adult: 10 mg 3 times a day; increased if necessary up to 20 mg 4 times a day

Acute spasm | Spasm in diagnostic procedures

► INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION

- Adult: 20 mg, then (by intramuscular injection or by slow intravenous injection) 20 mg after 30 minutes if required, dose may be repeated more frequently in endoscopy; maximum 100 mg per day

Excessive respiratory secretions in palliative care

► BY MOUTH

- Child 1 month–1 year: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
- Child 2–4 years: 5 mg 3–4 times a day
- Child 5–11 years: 10 mg 3–4 times a day
- Child 12–17 years: 10–20 mg 3–4 times a day

► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- Child 1 month–4 years: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
- Child 5–11 years: 5–10 mg 3–4 times a day
- Child 12–17 years: 10–20 mg 3–4 times a day

► BY SUBCUTANEOUS INJECTION

- Adult: 20 mg every 4 hours if required, adjusted according to response to up to 20 mg every 1 hour

► BY SUBCUTANEOUS INFUSION

- Adult: 20–120 mg/24 hours

Bowel colic (in palliative care)

► BY MOUTH

- Child 1 month–1 year: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
- Child 2–4 years: 5 mg 3–4 times a day
- Child 5–11 years: 10 mg 3–4 times a day
- Child 12–17 years: 10–20 mg 3–4 times a day

► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- Child 1 month–4 years: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
- Child 5–11 years: 5–10 mg 3–4 times a day
- Child 12–17 years: 10–20 mg 3–4 times a day

► BY SUBCUTANEOUS INJECTION

- Adult: 20 mg every 4 hours if required, adjusted according to response to up to 20 mg every 1 hour

► BY SUBCUTANEOUS INFUSION

- Adult: 60–300 mg/24 hours

PHARMACOKINETICS

- Administration by mouth is associated with poor absorption.

- **UNLICENSED USE** Tablets not licensed for use in children under 6 years. Injection not licensed for use in children (age range not specified by manufacturer).

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: HYOSCINE BUTYLBROMIDE (BUSCOPAN®) INJECTION: RISK OF SERIOUS ADVERSE EFFECTS IN PATIENTS WITH UNDERLYING CARDIAC DISEASE (FEBRUARY 2017)

The MHRA advises that hyoscine butylbromide injection can cause serious adverse effects including tachycardia,

hypotension, and anaphylaxis; several reports have noted that anaphylaxis is more likely to be fatal in patients with underlying coronary heart disease.

Hyoscine butylbromide injection is contra-indicated in patients with tachycardia and should be used with caution in patients with cardiac disease; the MHRA recommends that these patients are monitored and that resuscitation equipment and trained personnel are readily available.

● CONTRA-INDICATIONS

- With intramuscular use or intravenous use or subcutaneous use Tachycardia

● INTERACTIONS → Appendix 1: hyoscine

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Uncommon Skin reactions
- Frequency not known Dyspnoea

SPECIFIC SIDE-EFFECTS

- With parenteral use Mydriasis
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Amount too small to be harmful.

● DIRECTIONS FOR ADMINISTRATION

- With oral use in children For administration by *mouth*, injection solution may be used; content of ampoule may be stored in a refrigerator for up to 24 hours after opening.
- With intravenous use in children For *intravenous injection*, may be diluted with Glucose 5% or Sodium Chloride 0.9%; give over at least 1 minute.

● PRESCRIBING AND DISPENSING INFORMATION

Palliative care For further information on the use of hyoscine butylbromide in palliative care, see www.palliativedrugs.com/formulary/en/hyoscine-butylbromide.html.

- **EXCEPTIONS TO LEGAL CATEGORY** Hyoscine butylbromide tablets can be sold to the public for medically confirmed irritable bowel syndrome, provided single dose does not exceed 20 mg, daily dose does not exceed 80 mg, and pack does not contain a total of more than 240 mg.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection

► Buscopan (Sanofi)

Hyoscine butylbromide 20 mg per 1 ml Buscopan 20mg/1ml solution for injection ampoules | 10 ampoule [PoM] £2.92 DT = £2.92

7 Liver disorders and related conditions

7.1 Biliary disorders

Cholestasis

01-May-2017

Description of condition

Cholestasis is an impairment of bile formation and/or bile flow, which may clinically present with fatigue, pruritus, dark urine, pale stools and, in its most overt form, jaundice and signs of fat soluble vitamin deficiencies.

Treatment of cholestatic pruritus

Several drugs are used to relieve cholestatic pruritus, even if evidence to support their use is limited.

[EvGr] Colestyramine p. 196 is the drug of choice for treating cholestatic pruritus. It is an anion-exchange resin that is not absorbed from the gastro-intestinal tract. It relieves pruritus by forming an insoluble complex in the intestine with bile acids and other compounds—the reduction of serum bile acid levels reduces excess deposition in the dermal tissue with a resultant decrease in pruritus. **[A]**

[EvGr] Ursodeoxycholic acid p. 89 has a small and variable impact on cholestatic pruritus. **[E]**

[EvGr] Rifampicin p. 571 [unlicensed indication] can be used as an alternative treatment for pruritus, but should be used with caution in patients with pre-existing liver disease because of possible hepatotoxicity. **[A]**

[EvGr] Where previous therapy has proved ineffective or was not tolerated, other drugs including sertraline p. 364 [unlicensed indication] and naltrexone hydrochloride p. 491 [unlicensed indication], may be used to treat cholestatic pruritus. However, their use is limited due to significant side-effects. **[E]**

Intrahepatic cholestasis in pregnancy

[EvGr] Ursodeoxycholic acid is effective for the treatment of pruritus associated with intrahepatic cholestasis in pregnancy. **[E]**

Intrahepatic cholestasis usually occurs in late pregnancy and is associated with adverse fetal outcomes. **[EvGr]** There is no evidence that ursodeoxycholic acid used in late pregnancy affects birth weight in the infant or the risk of preterm delivery. There is limited data about the effect of fetal exposure during the first trimester. **[D]**

Gallstones

01-May-2017

Description of condition

Gallstones (cholelithiasis) occur when hard mineral or fatty deposits form in the gallbladder. Gallstone disease is a general term that describes the presence of one or more stones in the gallbladder or in the bile duct, and the symptoms and complications that they may cause.

The majority of patients with gallstones remain asymptomatic. When the stones irritate the gallbladder or block part of the biliary system, the patient can experience symptoms such as pain, or infection and inflammation that if left untreated, can lead to severe complications such as biliary colic, acute cholecystitis, cholangitis, pancreatitis, and obstructive jaundice.

Non-drug treatment

[EvGr] Asymptomatic gallbladder stones do not need to be treated unless symptoms develop.

The definitive treatment of symptomatic gallstones (and all bile duct stones) is surgical removal by laparoscopic cholecystectomy. **[A]**

Drug treatment

[EvGr] Analgesia should be offered to control pain symptoms. Paracetamol p. 438 or a nonsteroidal anti-inflammatory drug (see Non-steroidal anti-inflammatory drugs p. 1094) is recommended for intermittent mild-to-moderate pain. Intramuscular diclofenac sodium p. 1101 can be given for severe pain or, if not suitable, an intramuscular opioid (such as morphine p. 456 or pethidine hydrochloride p. 463). **[A]**

Although ursodeoxycholic acid p. 89 has been used for the management of gallstone disease, there is no evidence to support its use.

Inborn errors of primary bile acid synthesis

27-Apr-2018

Description of condition

Inborn errors of primary bile acid synthesis are a group of diseases in which the liver does not produce enough primary bile acids due to enzyme deficiencies. These acids are the main components of the bile, and include cholic acid and chenodeoxycholic acid.

Treatment

Cholic acid p. 88 is licensed for the treatment of inborn errors in primary bile acid synthesis due to an inborn deficiency of two specific liver enzymes. It acts by replacing some of the missing bile acids, therefore relieving the symptoms of the disease.

Chenodeoxycholic acid p. 88 is licensed for the treatment of inborn errors of primary bile acid synthesis due to a deficiency of one specific enzyme in the bile acid synthesis pathway when presenting as cerebrotendinous xanthomatosis.

Ursodeoxycholic acid p. 89 [unlicensed indication] has been used to treat inborn errors of primary bile acid synthesis, but there is an absence of evidence to recommend its use.

Primary biliary cholangitis

30-May-2017

Description of condition

Primary biliary cholangitis (or primary biliary cirrhosis) is a chronic cholestatic disease which develops due to progressive destruction of small and intermediate bile ducts within the liver, subsequently evolving to fibrosis and cirrhosis.

Treatment

[EvGr] Ursodeoxycholic acid p. 89 is recommended for the management of primary biliary cholangitis, including those with asymptomatic disease. It slows disease progression, but the effect on overall survival is uncertain. Liver transplantation can be considered in patients with advanced primary biliary cholangitis. **[A]**

BILE ACIDS

Chenodeoxycholic acid

05-Apr-2018

● INDICATIONS AND DOSE

Cerebrotendinous xanthomatosis (specialist use only)

► BY MOUTH

- Adult: Initially 750 mg daily in 3 divided doses, increased if necessary up to 1000 mg daily in divided doses

- **CONTRA-INDICATIONS** Non-functioning gall bladder · radio-opaque stones
- **INTERACTIONS** → Appendix 1: chenodeoxycholic acid
- **SIDE-EFFECTS** Constipation
- **PREGNANCY** Manufacturer advises avoid—fetotoxicity reported in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises monitor—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises monitor—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises to monitor serum cholestanol levels and/or urine bile alcohols every 3 months during the initiation of therapy and dose adjustment, and then at least annually; liver function should also be monitored during initiation of therapy and then at least annually; additional or more frequent investigations may need to be undertaken to monitor therapy during periods of fast growth or concomitant disease.
- **DIRECTIONS FOR ADMINISTRATION** For administration by *mouth* in patients who are unable to swallow capsules and/or need to take a dose below 250 mg, manufacturer advises to add capsule contents to sodium bicarbonate solution 8.4%—for further information, consult product literature.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule► **Chenodeoxycholic acid (non-proprietary)** ▼

Chenodeoxycholic acid 250 mg Chenodeoxycholic acid 250mg capsules | 100 capsule [PoM] £14,000.00

Cholic acid

21-Mar-2016

- **DRUG ACTION** Cholic acid is the predominant primary bile acid in humans, which can be used to provide a source of bile acid in patients with inborn deficiencies in bile acid synthesis.

● INDICATIONS AND DOSE

Inborn errors of primary bile acid synthesis (initiated by a specialist)

► BY MOUTH

- Adult: Usual dose 5–15 mg/kg daily; increased in steps of 50 mg daily in divided doses if required, dose to be given with food at the same time each day; Usual maximum 500 mg/24 hours

- **INTERACTIONS** → Appendix 1: cholic acid
- **SIDE-EFFECTS** Cholelithiasis (long term use) · diarrhoea · pruritus
- **SIDE-EFFECTS, FURTHER INFORMATION** Patients presenting with pruritus and/or persistent diarrhoea should be investigated for potential overdose by a serum and/or urine bile acid assay.
- **PREGNANCY** Limited data available—no known to be harmful, manufacturer advises continue treatment.

Monitoring Manufacturer advises monitor patient parameters more frequently in pregnancy.

- **BREAST FEEDING** Present in milk but not known to be harmful.
- **HEPATIC IMPAIRMENT**
Monitoring Manufacturer advises monitor closely.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor serum and/or urine bile-acid concentrations every 3 months for the first year, then every 6 months for three years, then annually; monitor liver function tests at the same or greater frequency.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises capsules may be opened and the content added to infant formula, juice, fruit compote, or yoghurt for administration.
- **PATIENT AND CARER ADVICE** Counselling advised on administration.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Obeticholic acid

15-May-2018

- **DRUG ACTION** Obeticholic acid is a selective farnesoid X receptor agonist, which decreases circulating bile acid.

● INDICATIONS AND DOSE

Primary biliary cholangitis in combination with ursodeoxycholic acid when response to ursodeoxycholic acid has been inadequate, or as monotherapy in patients intolerant of ursodeoxycholic acid

► BY MOUTH

- Adult: Initially 5 mg once daily for 6 months, then increased if tolerated to 10 mg once daily, for dose adjustments due to severe pruritus, consult product literature

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: OBETICHOIC ACID (OCALIVA®): RISK OF SERIOUS LIVER INJURY IN PATIENTS WITH PRE-EXISTING MODERATE OR SEVERE HEPATIC IMPAIRMENT; REMINDER TO ADJUST DOSING ACCORDING TO LIVER FUNCTION MONITORING (APRIL 2018)

The MHRA is aware of reports of serious liver injuries and deaths in patients with primary biliary cholangitis with pre-existing moderate or severe liver impairment who were not adequately dose-adjusted. Follow dose reduction and monitoring advice in these patients to reduce the risk of serious liver injury; for further information, see *Hepatic impairment* and *Monitoring*.

- **CONTRA-INDICATIONS** Complete biliary obstruction
- **INTERACTIONS** → Appendix 1: obeticholic acid
- **SIDE-EFFECTS**
► **Common or very common** Arthralgia · constipation · dizziness · fatigue · fever · gastrointestinal discomfort · oropharyngeal pain · palpitations · peripheral oedema · skin reactions
- **Frequency not known** Hepatic failure
- **PREGNANCY**
Dose adjustments No evidence of harm but manufacturer advises avoid.

- **BREAST FEEDING** Not known to be harmful but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT**
Dose adjustments Manufacturer advises reduce initial dose to 5 mg once weekly in moderate-to-severe impairment; dose may be increased if necessary according to level of alkaline phosphatase and/or total bilirubin—consult product literature.
- **MONITORING REQUIREMENTS** Manufacturer advises assess hepatic status before treatment initiation and then monitor for progression of primary biliary cholangitis with laboratory and clinical assessment to evaluate the need for dose reduction; patients at an increased risk of hepatic decompensation, including those with laboratory evidence of worsening liver function and/or progression to cirrhosis, should be monitored more closely.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Obeticholic acid for treating primary biliary cholangitis (April 2017)** NICE TA443
 Obeticholic acid (*Ocaliva*®) is recommended as an option for treating primary biliary cholangitis, in combination with ursodeoxycholic acid when response to ursodeoxycholic acid is inadequate, or as monotherapy when ursodeoxycholic acid is not tolerated and only if the manufacturer provides obeticholic acid with the discount agreed in the patient access scheme. Response to obeticholic acid should be assessed after 12 months and treatment continued only if there is evidence of clinical benefit.

www.nice.org.uk/guidance/ta443

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2017) that obeticholic acid (*Ocaliva*®) is accepted for use within NHS Scotland for the treatment of primary biliary cholangitis in combination with ursodeoxycholic acid when response to ursodeoxycholic acid is inadequate, or as monotherapy when ursodeoxycholic acid is not tolerated. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

Ursodeoxycholic acid

● INDICATIONS AND DOSE

Dissolution of gallstones

▶ BY MOUTH

- ▶ Adult: 8–12 mg/kg once daily, dose to be taken at bedtime, alternatively 8–12 mg/kg daily in 2 divided doses for up to 2 years; treatment is continued for 3–4 months after stones dissolve

Primary biliary cirrhosis

▶ BY MOUTH

- ▶ Adult: 12–16 mg/kg daily in 3 divided doses for 3 months, then 12–16 mg/kg once daily, dose to be taken at bedtime

- **CONTRA-INDICATIONS** Acute inflammation of the gall bladder · frequent episodes of biliary colic · inflammatory diseases and other conditions of the colon, liver or small intestine which interfere with enterohepatic circulation of

bile salts · non-functioning gall bladder · radio-opaque stones

- **CAUTIONS** Liver disease
- **INTERACTIONS** → Appendix 1: ursodeoxycholic acid
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Diarrhoea · pale faeces
 - ▶ **Rare or very rare** Cholelithiasis calcification · skin reactions
 - ▶ **Frequency not known** Nausea · vomiting
- **PREGNANCY** No evidence of harm but manufacturer advises avoid.
- **BREAST FEEDING** Not known to be harmful but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Avoid in chronic liver disease (but used in primary biliary cirrhosis).
- **MONITORING REQUIREMENTS** In primary biliary cirrhosis, monitor liver function every 4 weeks for 3 months, then every 3 months.
- **PATIENT AND CARER ADVICE** Patients should be given dietary advice (including avoidance of excessive cholesterol and calories).

● MEDICINAL FORMS

Terlipressin acetate

INDICATIONS AND DOSE

GLYPRESSIN® INJECTION

Bleeding from oesophageal varices

► BY INTRAVENOUS INJECTION

- Adult (body-weight up to 50 kg): Initially 2 mg every 4 hours until bleeding controlled, then reduced to 1 mg every 4 hours if required, maximum duration 48 hours
- Adult (body-weight 50 kg and above): Initially 2 mg every 4 hours until bleeding controlled, reduced if not tolerated to 1 mg every 4 hours, maximum duration 48 hours

VARIQUEL® INJECTION

Bleeding from oesophageal varices

► BY INTRAVENOUS INJECTION

- Adult (body-weight up to 50 kg): Initially 1 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute
- Adult (body-weight 50–69 kg): Initially 1.5 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute
- Adult (body-weight 70 kg and above): Initially 2 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute

- **CAUTIONS** Arrhythmia · elderly · electrolyte and fluid disturbances · heart disease · history of QT-interval prolongation · respiratory disease · septic shock · uncontrolled hypertension · vascular disease

SIDE-EFFECTS

- **Common or very common** Abdominal cramps · arrhythmias · diarrhoea · headache · hypertension · hypotension · pallor · peripheral ischaemia · vasoconstriction
- **Uncommon** Chest pain · cyanosis · fluid overload · heart failure · hot flush · hyponatraemia · intestinal ischaemia · ischaemic heart disease · lymphangitis · myocardial infarction · nausea · pulmonary oedema · respiratory disorders · seizure · skin necrosis · uterine disorders · vomiting
- **Rare or very rare** Dyspnoea · hyperglycaemia · stroke
- **PREGNANCY** Avoid unless benefits outweigh risk—uterine contractions and increased intra-uterine pressure in early pregnancy, and decreased uterine blood flow reported.
- **BREAST FEEDING** Avoid unless benefits outweigh risk—no information available.
- **RENAL IMPAIRMENT** Use with caution in chronic renal failure.

8 Obesity

01-Jun-2016

Obesity

Description of condition

Obesity is directly linked to many health problems including cardiovascular disease, type 2 diabetes, fatty liver disease, gallstones, and gastro-oesophageal reflux disease. It is also linked to psychological and psychiatric morbidities.

In adults, obesity is generally classified as a body mass index (BMI) of $\geq 30 \text{ kg/m}^2$, though BMI should be interpreted with caution as it is not a direct measure of adiposity, particularly in patients who are very muscular or have muscle weakness or atrophy.

Waist circumference should also be considered as it may provide an indication of total body fat and a risk of obesity-related health problems. Men with a waist circumference $\geq 94 \text{ cm}$ ($\geq 90 \text{ cm}$ for Asian men), and women with a waist circumference of $\geq 80 \text{ cm}$ are at increased risk of obesity-related health problems. A waist circumference of $\geq 102 \text{ cm}$ in men and $\geq 88 \text{ cm}$ in women indicates a very high risk of obesity-related health problems.

Aims of treatment

Management should be aimed at modest, sustainable weight loss and maintenance of a healthy weight, to reduce the risk factors associated with obesity.

Overview

[EvGr](#) Obesity should be managed in an appropriate setting by staff who have been trained in the management of obesity. Patients should be monitored for changes in weight, as well as changes in blood pressure and blood lipids, and for other associated conditions.

An initial assessment should consider potential underlying causes (e.g. hypothyroidism) and a review of the appropriateness of current medications which are known to cause weight gain, e.g. atypical antipsychotics, beta-adrenoceptor blocking drugs, insulin (when used in the treatment of type 2 diabetes), lithium carbonate, lithium citrate, sodium valproate, sulphonylureas, thiazolidinediones, and tricyclic antidepressants. [A](#)

Lifestyle changes

[EvGr](#) Patients should be encouraged to engage in a sustainable weight management programme which includes strategies to change behaviour, increase physical activity, and improve diet and eating behaviour. [A](#)

Drug treatment

[EvGr](#) Drug treatment should **never** be used as the sole element of treatment and should be used as part of an overall weight management plan. An anti-obesity drug should be considered only for those with a BMI of $\geq 30 \text{ kg/m}^2$, in whom diet, exercise and behaviour changes fail to achieve a realistic reduction in weight. In the presence of associated risk factors, it may be appropriate to prescribe an anti-obesity drug to individuals with a BMI of $\geq 28 \text{ kg/m}^2$. A vitamin and mineral supplement may also be considered if

there is concern about inadequate micronutrient intake, particularly for vulnerable groups such as in the elderly and younger patients.

The effect of management should be monitored on a regular basis with reinforcement of supporting lifestyle advice. Rates of weight loss may be slower in patients with type 2 diabetes, so less strict goals than in those without diabetes may be appropriate.

Orlistat below, is the only drug currently available in the UK that is recommended specifically for the management of obesity; it acts by reducing the absorption of dietary fat.

Orlistat is licensed for use as an adjunct in the management of obesity in patients with a BMI of $\geq 30 \text{ kg/m}^2$, or, in individuals with a BMI of $\geq 28 \text{ kg/m}^2$ in the presence of other risk factors. Treatment with orlistat may also be used to maintain weight loss rather than to continue to lose weight. Discontinuation of treatment with orlistat should be considered after 12 weeks if weight loss has not exceeded 5% since the start of treatment. 

Drugs which produce a feeling of satiety (such as methylcellulose p. 54 and sterulia p. 54 [unlicensed indications]) have been used in an attempt to control appetite, but there is little evidence for their efficacy. Various centrally acting appetite suppressants, including stimulants and serotonergic drugs (such as dexfenfluramine, fenfluramine, sibutramine, and rimonabant), have been used in the management of obesity but have been withdrawn or are no longer recommended due to serious safety concerns or their additive potential.

Surgery

 Bariatric surgery may be considered for patients who have a BMI of $\geq 40 \text{ kg/m}^2$ (Obesity III, morbid obesity), or between $35\text{--}39.9 \text{ kg/m}^2$ (Obesity II) and a significant disease (such as type 2 diabetes or high blood pressure) which could be improved with weight loss, and if all appropriate non-surgical measures have been tried but clinically beneficial weight loss has not been achieved or maintained.

ANTIDEPRESSANTS > SEROTONIN AND NORADRENALINE RE-UP TAKE INHIBITORS

Naltrexone with bupropion

30-Jan-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, bupropion hydrochloride p. 491, naltrexone hydrochloride p. 491.

● INDICATIONS AND DOSE

Adjunct in obesity (in conjunction with dietary measures and increased physical activity in individuals with a body mass index (BMI) of 30 kg/m^2 or more or in individuals with a BMI of 27 kg/m^2 or more in the presence of one or more weight related co-morbidity)

► BY MOUTH

► Adult 18–75 years: Initially 1 tablet daily for 7 days, then increased to 1 tablet twice daily for 7 days, then increased to 3 tablets daily in divided doses for 7 days, two tablets to be taken in the morning, and one tablet to be taken in the evening, then maintenance 2 tablets twice daily, review treatment after 16 weeks and then annually

DOSE EQUIVALENCE AND CONVERSION

► Each tablet contains 8 mg naltrexone with 90 mg bupropion.

- **CONTRA-INDICATIONS** Uncontrolled hypertension
- **CAUTIONS** History of mania · hypertension
- **INTERACTIONS** → Appendix 1: bupropion · naltrexone
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in moderate-to-severe impairment—limited information available.
- **PRESCRIBING AND DISPENSING INFORMATION** Prescribers should consult the *Mysimba*® Physician Prescribing Checklist provided by the manufacturer, before initiation of treatment.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► Naltrexone-bupropion for managing overweight and obesity (December 2017) NICE TA494

Naltrexone-bupropion is not recommended within its marketing authorisation for managing overweight and obesity in adults alongside a reduced-calorie diet and increased physical activity.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

9 Rectal and anal disorders

9.1 Anal fissures

Anal fissure

31-Aug-2016

Description of condition

An anal fissure is a tear or ulcer in the lining of the anal canal, immediately within the anal margin. Clinical features of anal fissure include bleeding and persistent pain on defecation, and a linear split in the anal mucosa.

Aims of treatment

The aim of treatment is to relieve pain and promote healing of the fissure.

Drug treatment

Acute anal fissure

[EvGr] Initial management of acute anal fissures (present for less than 6 weeks) should focus on ensuring that stools are soft and easily passed. Bulk-forming laxatives (such as ispaghula husk p. 54) are recommended and an osmotic laxative (such as lactulose p. 56) can be considered as an alternative—see also Constipation p. 52, for further information about these laxatives. Short-term use of a topical preparation containing a local anaesthetic (such as lidocaine hydrochloride p. 1312) or a simple analgesic (such as paracetamol p. 438 or ibuprofen p. 1106) may be offered for prolonged burning pain following defecation. If these measures are inadequate, the patient should be referred for specialist treatment in hospital. **⚠**

Chronic anal fissure

[EvGr] Chronic anal fissures (present for 6 weeks or longer), and associated pain, may be treated with glyceryl trinitrate rectal ointment 0.4% or 0.2% p. 217 [unlicensed] (available from Special-order manufacturers p. 1573 or specialist importing companies). Limited evidence suggests that the strength used does not influence the effectiveness, but that the higher strength potentially increases the incidence of

side-effects. Healing rates with topical glyceryl trinitrate are marginally superior to placebo, but the incidence of headache as an adverse effect is quite high (about 20–30% of patients). Recurrence of the fissure after treatment is common.

As an alternative to glyceryl trinitrate rectal ointment, chronic anal fissure may also be treated with topical diltiazem hydrochloride 2% [unlicensed] or nifedipine 0.2–0.5% [unlicensed] (available from Special-order manufacturers or specialist importing companies), which have a lower incidence of adverse effects than topical glyceryl trinitrate. Oral nifedipine p. 162 [unlicensed indication] and oral diltiazem hydrochloride p. 157 [unlicensed indication] may be as effective as topical treatment, but the incidence of adverse effects are likely to be higher and topical preparations are preferred.

Patients who do not respond to first-line treatment may be referred to a specialist for local injection of botulinum toxin type A [unlicensed indication]. **⚠**

Non-drug treatment

[EvGr] Surgery is an effective option for the management of chronic anal fissure in adults but is generally reserved for those who do not respond to drug treatment. **⚠**

9.2 Haemorrhoids

Haemorrhoids

01-Dec-2016

Description of condition

Haemorrhoids, or piles, are abnormal swellings of the vascular mucosal anal cushions around the anus. Internal haemorrhoids arise above the dentate line and are usually painless unless they become strangulated. External haemorrhoids originate below the dentate line and can be itchy or painful. Women are predisposed to developing haemorrhoids during pregnancy.

Aims of treatment

The aims of treatment are to reduce the symptoms (pain, bleeding and swelling), promote healing, and prevent recurrence.

Non-drug treatment

[EvGr] Stools should be kept soft and easy to pass (to minimise straining) by increasing dietary fibre and fluid intake. Advice about perianal hygiene is helpful to aid healing and reduce irritation and itching. **⚠**

Drug treatment

[EvGr] If constipation is reported, it should be treated. A bulk-forming laxative can be prescribed (see Constipation p. 52)

A simple analgesic such as paracetamol p. 438 can be used for pain relief. Opioid analgesics should be avoided as they can cause constipation, and NSAIDs should be avoided if rectal bleeding is present. **⚠**

Topical preparations that contain a combination of local anaesthetics, corticosteroids, astringents, lubricants, and antiseptics are available—see *Related drugs* below. **[EvGr]** They can offer symptomatic relief of local pain and itching but evidence does not suggest that any preparation is more effective than any other.

Topical preparations containing local anaesthetics (lidocaine, benzocaine, cinchocaine and pramocaine) should only be used for a few days as they may cause sensitisation of the anal skin. Local anaesthetics can be absorbed through the rectal mucosa (with a theoretical risk of systemic side effects) and very rarely may cause increased irritation; therefore excessive application should be **avoided**. **⚠**

Topical preparations combining corticosteroids with local anaesthetics and soothing agents are available for the management of haemorrhoids. They may ameliorate local perianal inflammation, but no data suggest that they actually reduce haemorrhoidal swelling, bleeding, or protrusion.

EvGr Topical corticosteroids are suitable for occasional short-term use (no more than 7 days) after exclusion of infections (such as perianal streptococcal infection, *herpes simplex* or perianal thrush). Long-term use of corticosteroid creams can cause ulceration or permanent damage due to thinning of the perianal skin and should be avoided. **A** Continuous or excessive use carries a risk of adrenal suppression and systemic corticosteroid effects.

EvGr Recurrent symptoms, should be referred to secondary care for further investigation and management.

Treatments available from *specialists* include rubber band ligation, injection sclerotherapy (using phenol in oil p. 95), infrared coagulation/photocoagulation, bipolar diathermy and direct-current electrotherapy, haemorrhoidectomy, stapled haemorrhoidectomy, and haemorrhoidal artery ligation. **A**

Pregnancy

EvGr Bulk forming laxatives are not absorbed, and are therefore safe for use in pregnant women (see Pregnancy, under Constipation p. 52). **A** No topical haemorrhoidal preparations are licensed for use during pregnancy.

EvGr If treatment with a topical haemorrhoidal preparation is required, a soothing preparation containing simple, soothing products (**not** local anaesthetics or corticosteroids) can be considered. **A**

10 Reduced exocrine secretions

Exocrine pancreatic insufficiency

14-Dec-2016

Description of condition

Exocrine pancreatic insufficiency is characterised by reduced secretion of pancreatic enzymes into the duodenum.

The main clinical manifestations are maldigestion and malnutrition, associated with low circulating levels of micronutrients, fat-soluble vitamins and lipoproteins. Patients also present with gastro-intestinal symptoms such as diarrhoea, abdominal cramps and steatorrhoea.

Exocrine pancreatic insufficiency can result from chronic pancreatitis, cystic fibrosis, obstructive pancreatic tumours, coeliac disease, Zollinger-Ellison syndrome, and gastro-intestinal or pancreatic surgical resection.

Aims of treatment

The aim of treatment is to relieve gastro-intestinal symptoms and to achieve a normal nutritional status.

Drug treatment

Pancreatic enzyme replacement therapy with pancreatin p. 96 is the mainstay of treatment for exocrine pancreatic insufficiency.

Pancreatin contains the three main groups of digestive enzymes: lipase, amylase and protease. These enzymes respectively digest fats, carbohydrates and proteins into their basic components so that they can be absorbed and utilised by the body.  Pancreatin should be administered with meals and snacks. The dose should be adjusted, as necessary, to the lowest effective dose according to the symptoms of maldigestion and malabsorption. 

Fibrosing colonopathy has been reported in patients with cystic fibrosis taking high dose pancreatic enzyme replacement therapy (in excess of 10 000 units/kg/day of lipase). Possible risk factors are gender (in children, boys are at greater risk than girls), more severe cystic fibrosis, and concomitant use of laxatives. The peak age for developing fibrosing colonopathy is between 2 and 8 years. Manufacturers of *Pancrease HL*® and *Nutrizym 22*® recommend that the total dose of pancreatin used in patients with cystic fibrosis should not usually exceed 10 000 units/kg/day of lipase. Manufacturers of pancreatin recommend that if a patient taking pancreatin develops new abdominal symptoms (or any change in existing abdominal symptoms) the patient should be reviewed to exclude the possibility of colonic damage.

There is limited evidence that acid suppression may improve the effectiveness of pancreatin.  Acid-suppressing drugs (proton pump inhibitors or H₂-receptor antagonists) may be trialled in patients who continue to experience symptoms despite high doses of pancreatin.

Levels of fat-soluble vitamins and micronutrients (such as zinc and selenium) should be routinely assessed and supplementation advised whenever necessary. 

Pancreatin preparations

Preparation	Protease units	Amylase units	Lipase units
Creon [®] 10 000 capsule, e/c granules	600	8000	10 000
Creon [®] Micro e/c granules (per 100 mg)	200	3600	5000
Pancrex [®] granules (per gram)	300	4000	5000
Pancrex V [®] capsule, powder	430	9000	8000
Pancrex V '125' [®] capsule, powder	160	3300	2950
Pancrex V [®] e/c tablet	110	1700	1900
Pancrex V [®] Forte e/c tablet	330	5000	5600
Pancrex V [®] powder (per gram)	1400	30 000	25 000

Higher-strength pancreatin preparations

Preparation	Protease units	Amylase units	Lipase units
Creon [®] 25 000 capsule, e/c pellets	1000	18 000	25 000
Creon [®] 40000 capsule, e/c granules	1600	25 000	40 000
Nutrizym 22 [®] capsule, e/c minitablets	1100	19 800	22 000
Pancrease HL [®] capsule, e/c minitablets	1250	22 500	25 000

Non-drug treatment

[\[EvGr\]](#) Dietary advice should be provided. Food intake should be distributed between three main meals per day, and two or three snacks. Food that is difficult to digest should be avoided, such as legumes (peas, beans, lentils) and high-fibre foods. Alcohol should be avoided completely. Reduced fat diets are not recommended. [\[d\]](#)

Medium-chain triglycerides (see MCT oil, in *Borderline substances*), which are directly absorbed by the intestinal mucosa, were thought to be useful in some patients. However evidence has shown that MCT-enriched preparations offer no advantage over a normal balanced diet.

PANCREATIC ENZYMES

Pancreatin

08-Mar-2017

● **DRUG ACTION** Supplements of pancreatin are given to compensate for reduced or absent exocrine secretion. They assist the digestion of starch, fat, and protein.

● INDICATIONS AND DOSE

CREON[®] 10000

Pancreatic insufficiency

► BY MOUTH

- Child: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
- Adult: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

CREON[®] 25000

Pancreatic insufficiency

► BY MOUTH

- Child 2–17 years: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
- Adult: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

CREON[®] 40000

Pancreatic insufficiency

► BY MOUTH

- Child 2–17 years: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
- Adult: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

CREON[®] MICRO

Pancreatic insufficiency

► BY MOUTH

- Child: Initially 100 mg, for administration advice, see *Directions for administration*
- Adult: Initially 100 mg, for administration advice, see *Directions for administration*

DOSE EQUIVALENCE AND CONVERSION

- For Creon[®] Micro: 100 mg granules = one measured spoonful (scoop supplied with product).

NUTRIZYM 22[®] GASTRO-RESISTANT CAPSULES

Pancreatic insufficiency

► BY MOUTH

- Adult: Initially 1–2 capsules, dose to be taken with meals and 1 capsule as required, dose to be taken with snacks, doses should be swallowed whole or contents taken with water, or mixed with acidic fluid or soft food (then swallowed immediately without chewing)

PANCREASE HL[®]

Pancreatic insufficiency

► BY MOUTH

- Child 15–17 years: Initially 1–2 capsules, dose to be taken during each meal and 1 capsule, to be taken with snacks, all doses either taken whole or contents mixed with slightly acidic liquid or soft food (then swallowed immediately without chewing)
- Adult: Initially 1–2 capsules, dose to be taken during each meal and 1 capsule, to be taken with snacks, all doses either taken whole or contents mixed with slightly acidic liquid or soft food (then swallowed immediately without chewing)

PANCREX[®]

Pancreatic insufficiency

► BY MOUTH

- Child 2–17 years: 5–10 g, to be taken just before meals, washed down or mixed with milk or water
- Adult: 5–10 g, to be taken just before meals; washed down or mixed with milk or water

PANCREX[®] V**Pancreatic insufficiency**

► BY MOUTH

- Child 1-11 months: 1-2 capsules, contents of capsule to be mixed with feeds
- Child 1-17 years: 2-6 capsules, dose to be taken with each meal either swallowed whole or sprinkled on food
- Adult: 2-6 capsules, dose to be taken with each meal either swallowed whole or sprinkled on food

PANCREX[®] V POWDER**Pancreatic insufficiency**

► BY MOUTH

- Child: 0.5-2 g, to be taken before or with meals, washed down or mixed with milk or water
- Adult: 0.5-2 g, to be taken before or with meals, washed down or mixed with milk or water

PANCREX[®] V TABLETS**Pancreatic insufficiency**

► BY MOUTH

- Child 2-17 years: 5-15 tablets, to be taken before meals
- Adult: 5-15 tablets, to be taken before meals

PANCREX[®] V TABLETS FORTE**Pancreatic insufficiency**

► BY MOUTH

- Child 2-17 years: 6-10 tablets, to be taken before meals
- Adult: 6-10 tablets, to be taken before meals

● **CONTRA-INDICATIONS**

PANCREASE HL[®] Should not be used in children aged 15 years or less with cystic fibrosis

NUTRIZYM 22[®] GASTRO-RESISTANT CAPSULES Should not be used in children aged 15 years or less with cystic fibrosis

● **CAUTIONS** Can irritate the perioral skin and buccal mucosa if retained in the mouth · excessive doses can cause perianal irritation● **INTERACTIONS** → Appendix 1: pancreatin● **SIDE-EFFECTS**

- **Common or very common** Abdominal distension · constipation · nausea · vomiting
- **Uncommon** Skin reactions
- **Frequency not known** Fibrosing colonopathy

● **PREGNANCY** Not known to be harmful.

● **DIRECTIONS FOR ADMINISTRATION** Pancreatin is inactivated by gastric acid therefore manufacturer advises pancreatin preparations are best taken with food (or immediately before or after food). Since pancreatin is inactivated by heat, excessive heat should be avoided if preparations are mixed with liquids or food; manufacturer advises the resulting mixtures should not be kept for more than one hour and any left-over food or liquid containing pancreatin should be discarded. Enteric-coated preparations deliver a higher enzyme concentration in the duodenum (provided the capsule contents are swallowed whole without chewing). Manufacturer advises gastro-resistant granules should be mixed with slightly acidic soft food or liquid such as apple juice, and then swallowed immediately without chewing. Capsules containing enteric-coated granules can be opened and the granules administered in the same way. For infants, *Creon Micro[®]* granules can be mixed with a small amount of milk on a spoon and administered immediately—granules should not be added to the baby's bottle. Manufacturer advises *Pancrex[®] V* powder may be administered via nasogastric tube or gastrostomy tube—consult local and national official guidelines.

● **PRESCRIBING AND DISPENSING INFORMATION**

Preparations may contain pork pancreatin—consult product literature.

- **HANDLING AND STORAGE** Hypersensitivity reactions occur occasionally and may affect those handling the powder.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on administration. It is important to ensure adequate hydration at all times in patients receiving higher-strength pancreatin preparations. Medicines for Children leaflet: Pancreatin for pancreatic insufficiency www.medicinesforchildren.org.uk/pancreatin-for-pancreatic-insufficiency

11 Stoma care

Stoma care

24-Feb-2016

Description of condition

A stoma is an artificial opening on the abdomen to divert flow of faeces or urine into an external pouch located outside of the body. This procedure may be temporary or permanent. Colostomy and ileostomy are the most common forms of stoma but a gastrostomy, jejunostomy, duodenostomy or caecostomy may also be performed. Understanding the type and extent of surgical intervention in each patient is crucial in managing the patient's pharmaceutical needs correctly.

Overview

Prescribing for patients with stoma calls for special care due to modifications in drug delivery, resulting in a higher risk of sub-optimal absorption. The following is a brief account of some of the main points to be borne in mind.

Enteric-coated and modified-release medicines are **unsuitable**, particularly in patients with an ileostomy, as there may not be sufficient release of active ingredient. Soluble tablets, liquids, capsules or uncoated tablets are more suitable due to their quicker dissolution. When a solid-dose form such as a capsule or a tablet is given, the contents of the ostomy bag should be checked for any remnants.

Preparations containing sorbitol as an excipient should be avoided, due to its laxative side effects.

Analgesics

Opioid analgesics may cause troublesome constipation in colostomy patients. When a non-opioid analgesic is required, paracetamol is usually suitable. Anti-inflammatory analgesics may cause gastric irritation and bleeding; faecal output should be monitored for traces of blood.

Antacids

The tendency to diarrhoea from magnesium salts or constipation from aluminium or calcium salts may be increased in patients with stoma.

Antisecretory drugs

The gastric acid secretion often increases stoma output. Proton pump inhibitors and somatostatin analogues (octreotide p. 924 and lanreotide p. 923) are often used to reduce this risk.

Antidiarrhoeal drugs

Loperamide hydrochloride p. 66 and codeine phosphate p. 448 reduce intestinal motility and decrease water and sodium output from an ileostomy. Loperamide hydrochloride circulates through the enterohepatic circulation, which is disrupted in patients with a short bowel; high doses of loperamide hydrochloride may be required. Codeine phosphate can be added if response with loperamide hydrochloride alone is inadequate.

Digoxin

Patients with a stoma are particularly susceptible to hypokalaemia if taking digoxin p. 109, due to fluid and sodium depletion. Potassium supplements or a potassium-sparing diuretic may be advisable with monitoring for early signs of toxicity.

Diuretics

Diuretics should be used with caution in patients with an ileostomy or with urostomy as they may become excessively dehydrated and potassium depletion may easily occur. It is usually advisable to use a potassium-sparing diuretic.

Iron preparations

Iron preparations may cause loose stools and sore skin in these patients. If this is troublesome and if iron is definitely indicated, an intramuscular iron preparation should be used. Modified-release preparations should be avoided for the reasons given above.

Laxatives

Laxatives should not be used in patients with an ileostomy where possible as they may cause rapid and severe loss of water and electrolytes.

Colostomy patients may suffer from constipation and whenever possible should be treated by increasing fluid intake or dietary fibre. Bulk-forming drugs can be tried. If they are insufficient, as small a dose as possible of a

stimulant laxative such as senna p. 63 can be used with caution.

Potassium supplements

Liquid formulations are preferred to modified-release formulations. The daily dose should be split to avoid osmotic diarrhoea.

Care of stoma

Patients and their carers are usually given advice about the use of cleansing agents, protective creams, lotions, deodorants, or sealants whilst in hospital, either by the surgeon or by stoma care nurses. Voluntary organisations offer help and support to patients with stoma.

1 Arrhythmias

Arrhythmias

Overview

Management of an arrhythmia requires precise diagnosis of the type of arrhythmia, and electrocardiography is essential; underlying causes such as heart failure require appropriate treatment.

Ectopic beats

If ectopic beats are spontaneous and the patient has a normal heart, treatment is rarely required and reassurance to the patient will often suffice. If they are particularly troublesome, beta-blockers are sometimes effective and may be safer than other suppressant drugs.

Atrial fibrillation

Treatment of patients with atrial fibrillation aims to reduce symptoms and prevent complications, especially stroke. All patients with atrial fibrillation should be assessed for their risk of stroke and thromboembolism. Atrial fibrillation can be managed by either controlling the ventricular rate ('rate control') or by attempting to restore and maintain sinus rhythm ('rhythm control'). At any stage if treatment fails to control symptoms, or, if symptoms reoccur after cardioversion and specialised management is required, referral should be made within 4 weeks. If drug treatment fails to control the symptoms of atrial fibrillation or is unsuitable, ablation strategies can be considered. Review anticoagulation, stroke, and bleeding risk at least annually in all patients with atrial fibrillation.

Acute presentation

All patients with life-threatening haemodynamic instability caused by new-onset atrial fibrillation should undergo emergency electrical cardioversion without delaying to achieve anticoagulation. In patients presenting acutely but without life-threatening haemodynamic instability, rate or rhythm control can be offered if the onset of arrhythmia is less than 48 hours; rate control is preferred if onset is more than 48 hours or uncertain. Consideration of pharmacological or electrical cardioversion should be based on clinical circumstances. If pharmacological cardioversion

has been agreed, intravenous amiodarone hydrochloride p. 105, or alternatively flecainide acetate p. 103, can be used (amiodarone hydrochloride is preferred if there is structural heart disease). If urgent rate control is required, a beta-blocker or verapamil hydrochloride p. 163 can be given intravenously.

Cardioversion

Sinus rhythm can be restored by electrical cardioversion, or pharmacological cardioversion with an oral or intravenous antiarrhythmic drug e.g. flecainide acetate or amiodarone hydrochloride. If atrial fibrillation has been present for more than 48 hours, electrical cardioversion is preferred and should not be attempted until the patient has been fully anticoagulated for at least 3 weeks; if this is not possible, parenteral anticoagulation should be commenced, and a left atrial thrombus ruled out immediately before cardioversion; oral anticoagulation should be given after cardioversion and continued for at least 4 weeks; prior to cardioversion, offer rate control as appropriate.

Drug treatment

Rate control is the preferred first-line drug treatment strategy for atrial fibrillation except in patients with new-onset atrial fibrillation, heart failure secondary to atrial fibrillation, atrial flutter suitable for an ablation strategy, atrial fibrillation with a reversible cause, or if rhythm control is more suitable based on clinical judgement. Ventricular rate can be controlled with a standard beta-blocker (not sotalol hydrochloride p. 108) or a rate-limiting calcium channel blocker such as diltiazem hydrochloride p. 157 (unlicensed indication), or verapamil hydrochloride as monotherapy. Choice of drug should be based on individual symptoms, heart rate, comorbidities, and patient preference. Digoxin p. 109 is usually only effective for controlling the ventricular rate at rest, and should therefore only be used as monotherapy in predominantly sedentary patients with non-paroxysmal atrial fibrillation. When a single drug fails to adequately control the ventricular rate, a combination of two drugs including a beta-blocker, digoxin, or diltiazem hydrochloride can be used. If symptoms are not controlled with a combination of two drugs, a rhythm-control strategy should be considered. If ventricular function is diminished, the combination of a beta-blocker (that is licensed for use in heart failure) and digoxin is preferred. Digoxin is also used when atrial fibrillation is accompanied by congestive heart failure.

If drug treatment is required to maintain sinus rhythm ('rhythm control') post-cardioversion, a standard beta-blocker is used. If a standard beta-blocker is not appropriate or is ineffective, consider an oral anti-arrhythmic drug such as sotalol hydrochloride, flecainide acetate, propafenone hydrochloride p. 104, or amiodarone hydrochloride; dronedarone p. 106 may be considered in paroxysmal or persistent atrial fibrillation (see NICE guidance). If necessary, amiodarone hydrochloride can be started 4 weeks before and continuing for up to 12 months after electrical cardioversion to increase success of the procedure, and to maintain sinus rhythm. Flecainide acetate or propafenone hydrochlorides should not be given when there is known ischaemic or structural heart disease. Consider amiodarone hydrochloride in patients with left ventricular impairment or heart failure.

Paroxysmal atrial fibrillation

In symptomatic paroxysmal atrial fibrillation, ventricular rhythm is controlled with a standard beta-blocker. Alternatively, if symptoms persist or a standard beta-blocker is not appropriate, an oral anti-arrhythmic drug such as dronedarone (see NICE guidance), sotalol hydrochloride, flecainide acetate, propafenone hydrochloride, or amiodarone hydrochloride can be given (see also Paroxysmal supraventricular tachycardia and Supraventricular arrhythmias). In selected patients with infrequent episodes of symptomatic paroxysmal atrial fibrillation, sinus rhythm can be restored using the 'pill-in-the-pocket' approach; this involves the patient taking oral flecainide acetate or propafenone hydrochloride to self-treat an episode of atrial fibrillation when it occurs.

Stroke prevention

All patients with atrial fibrillation should be assessed for their risk of stroke and the need for thromboprophylaxis; this needs to be balanced with the patient's risk of bleeding; a NICE guideline (NICE clinical guideline 180 (June 2014). Atrial fibrillation: The management of atrial fibrillation) recommends using the CHA₂DS₂-VASc assessment tool for stroke risk and the HAS-BLED tool for bleeding risk prior to and during anticoagulation. Risk factors for stroke taken into account by CHA₂DS₂-VASc include prior ischaemic stroke, transient ischaemic attacks, or thromboembolic events, heart failure, left ventricular systolic dysfunction, vascular disease, diabetes, hypertension, females, and patients over 65 years. Patients with a very low risk of stroke (CHA₂DS₂-VASc score of 0 for men or 1 for women) do not require an antithrombotic for stroke prevention. Parenteral anticoagulation should be offered to patients with new-onset atrial fibrillation who are receiving subtherapeutic or no anticoagulation therapy until assessment is made, and appropriate anticoagulation is started. Oral anticoagulation should be offered to patients with confirmed diagnosis of atrial fibrillation in whom sinus rhythm has not been successfully restored within 48 hours of onset, patients who have had, or are at high risk of recurrence of atrial fibrillation such as those with structural heart disease, prolonged history of atrial fibrillation (more than 12 months), a history of failed attempts at cardioversion, and patients whom the risk of stroke outweighs the risk of bleeding. Anticoagulation treatment should not be withheld solely because of the risk of falls, and choice of treatment should be based on clinical features and patient preferences. Oral anticoagulation may be with a vitamin K antagonist (e.g. warfarin sodium p. 139, or in non-valvular atrial fibrillation with apixaban p. 124, dabigatran etexilate p. 135, edoxaban p. 125, or rivaroxaban p. 127. Anticoagulants are also indicated during cardioversion procedures. Aspirin p. 121 is less effective than warfarin sodium at preventing emboli; the modest benefit is offset by the risk of bleeding, and aspirin should not be offered as monotherapy solely for stroke prevention in atrial fibrillation. If anticoagulant treatment is contra-indicated or

not tolerated, left atrial appendage occlusion can be considered.

Atrial flutter

Like atrial fibrillation, treatment options for atrial flutter involve either controlling the ventricular rate or attempting to restore and maintain sinus rhythm. However, atrial flutter generally responds less well to drug treatment than atrial fibrillation.

Control of the ventricular rate is usually an interim measure pending restoration of sinus rhythm. Ventricular rate can be controlled by administration of a beta-blocker, diltiazem hydrochloride p. 157 [unlicensed indication], or verapamil hydrochloride p. 163; an intravenous beta-blocker or verapamil hydrochloride is preferred for rapid control. Digoxin p. 109 can be added if rate control remains inadequate, and may be particularly useful in those with heart failure.

Conversion to sinus rhythm can be achieved by electrical cardioversion (by cardiac pacing or direct current), pharmacological cardioversion, or catheter ablation. If the duration of atrial flutter is unknown, or it has lasted for over 48 hours, cardioversion should not be attempted until the patient has been fully anticoagulated for at least 3 weeks; if this is not possible, parenteral anticoagulation should be commenced and a left atrial thrombus ruled out immediately before cardioversion; oral anticoagulation should be given after cardioversion and continued for at least 4 weeks.

Direct current cardioversion is usually the treatment of choice when rapid conversion to sinus rhythm is necessary (e.g. when atrial flutter is associated with haemodynamic compromise); catheter ablation is preferred for the treatment of recurrent atrial flutter. There is a limited role for anti-arrhythmic drugs as their use is not always successful. Flecainide acetate p. 103 or propafenone hydrochloride p. 104 can slow atrial flutter, resulting in 1:1 conduction to the ventricles, and should therefore be prescribed in conjunction with a ventricular rate controlling drug such as a beta-blocker, diltiazem hydrochloride [unlicensed indication], or verapamil hydrochloride. Amiodarone hydrochloride p. 105 can be used when other drug treatments are contra-indicated or ineffective.

All patients should be assessed for their risk of stroke and the need for thromboprophylaxis; the choice of anticoagulant is based on the same criteria as for atrial fibrillation.

Paroxysmal supraventricular tachycardia

This will often terminate spontaneously or with reflex vagal stimulation such as a Valsalva manoeuvre, immersing the face in ice-cold water, or carotid sinus massage; such manoeuvres should be performed with ECG monitoring.

If the effects of reflex vagal stimulation are transient or ineffective, or if the arrhythmia is causing severe symptoms, intravenous adenosine p. 107 should be given. If adenosine is ineffective or contra-indicated, intravenous verapamil hydrochloride is an alternative, but it should be avoided in patients recently treated with beta-blockers.

Failure to terminate paroxysmal supraventricular tachycardia with reflex vagal stimulation or drug treatment may suggest an arrhythmia of atrial origin, such as focal atrial tachycardia or atrial flutter.

Treatment with direct current cardioversion is needed in haemodynamically unstable patients or when the above measures have failed to restore sinus rhythm (and an alternative diagnosis has not been found).

Recurrent episodes of paroxysmal supraventricular tachycardia can be treated by catheter ablation, or prevented with drugs such as diltiazem hydrochloride, verapamil hydrochloride, beta-blockers including sotalol hydrochloride p. 108, flecainide acetate or propafenone hydrochloride.

Arrhythmias after myocardial infarction

In patients with a paroxysmal tachycardia or rapid irregularity of the pulse it is best not to administer an anti-arrhythmic until an ECG record has been obtained. Bradycardia, particularly if complicated by hypotension, should be treated with an intravenous dose of atropine sulfate p. 1295 the dose may be repeated if necessary. If there is a risk of asystole, or if the patient is unstable and has failed to respond to atropine sulfate, adrenaline/epinephrine p. 221 should be given by intravenous infusion, and the dose adjusted according to response.

For further advice, refer to the most recent recommendations of the Resuscitation Council (UK) available at www.resus.org.uk.

Ventricular tachycardia

Pulseless ventricular tachycardia or ventricular fibrillation should be treated with immediate defibrillation (see Cardiopulmonary resuscitation).

Patients with unstable sustained ventricular tachycardia, who continue to deteriorate with signs of hypotension or reduced cardiac output, should receive direct current cardioversion to restore sinus rhythm. If this fails, intravenous amiodarone hydrochloride should be administered and direct current cardioversion repeated.

Patients with sustained ventricular tachycardia who are haemodynamically stable can be treated with intravenous anti-arrhythmic drugs. Amiodarone hydrochloride is the preferred drug. Flecainide acetate, propafenone hydrochloride, and, although less effective, lidocaine hydrochloride p. 103 have all been used. If sinus rhythm is not restored, direct current cardioversion or pacing should be considered. Catheter ablation is an alternative if cessation of the arrhythmia is not urgent. Non-sustained ventricular tachycardia can be treated with a beta-blocker.

All patients presenting with ventricular tachycardia should be referred to a specialist. Following restoration of sinus rhythm, patients who remain at high risk of cardiac arrest will require maintenance therapy. Most patients will be treated with an implantable cardioverter defibrillator. Beta-blockers or sotalol hydrochloride (in place of a standard beta-blocker), or amiodarone hydrochloride (in combination with a standard beta-blocker), can be used in addition to the device in some patients; alternatively, they can be used alone when use of an implantable cardioverter defibrillator is not appropriate.

Torsade de pointes

Torsade de pointes is a form of ventricular tachycardia associated with a long QT syndrome (usually drug-induced, but other factors including hypokalaemia, severe bradycardia, and genetic predisposition are also implicated). Episodes are usually self-limiting, but are frequently recurrent and can cause impairment or loss of consciousness. If not controlled, the arrhythmia can progress to ventricular fibrillation and sometimes death. Intravenous infusion of magnesium sulfate p. 1019 is usually effective. A beta-blocker (but not sotalol hydrochloride) and atrial (or ventricular) pacing can be considered. Anti-arrhythmics can further prolong the QT interval, thus worsening the condition.

Anti-arrhythmic drugs

Anti-arrhythmic drugs can be classified clinically into those that act on supraventricular arrhythmias (e.g. verapamil hydrochloride), those that act on both supraventricular and ventricular arrhythmias (e.g. amiodarone hydrochloride), and those that act on ventricular arrhythmias (e.g. lidocaine hydrochloride).

Anti-arrhythmic drugs can also be classified according to their effects on the electrical behaviour of myocardial cells

during activity (the Vaughan Williams classification) although this classification is of less clinical significance:

- Class I: membrane stabilising drugs (e.g. lidocaine, flecainide)
- Class II: beta-blockers
- Class III: amiodarone; sotalol (also Class II)
- Class IV: calcium-channel blockers (includes verapamil but not dihydropyridines)

The negative inotropic effects of anti-arrhythmic drugs tend to be additive. Therefore special care should be taken if two or more are used, especially if myocardial function is impaired. Most drugs that are effective in countering arrhythmias can also provoke them in some circumstances; moreover, hypokalaemia enhances the arrhythmogenic (pro-arrhythmic) effect of many drugs.

Supraventricular arrhythmias

Adenosine p. 107 is usually the treatment of choice for terminating paroxysmal supraventricular tachycardia. As it has a very short duration of action (half-life only about 8 to 10 seconds, but prolonged in those taking dipyridamole p. 123), most side-effects are short lived. Unlike verapamil hydrochloride p. 163, adenosine can be used after a beta-blocker. Verapamil hydrochloride may be preferable to adenosine in asthma.

Oral administration of a **cardiac glycoside** (such as digoxin p. 109) slows the ventricular response in cases of atrial fibrillation and atrial flutter. However, intravenous infusion of digoxin is rarely effective for rapid control of ventricular rate. Cardiac glycosides are contra-indicated in supraventricular arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome).

Verapamil hydrochloride is usually effective for supraventricular tachycardias. An initial intravenous dose (**important**: serious beta-blocker interaction hazard) may be followed by oral treatment; hypotension may occur with large doses. It should not be used for tachyarrhythmias where the QRS complex is wide (i.e. broad complex) unless a supraventricular origin has been established beyond reasonable doubt. It is also contra-indicated in atrial fibrillation or atrial flutter associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome). It should not be used in children with arrhythmias without specialist advice; some supraventricular arrhythmias in childhood can be accelerated by verapamil hydrochloride with dangerous consequences.

Intravenous administration of a **beta-blocker** such as esmolol hydrochloride p. 153 or propranolol hydrochloride p. 149, can achieve rapid control of the ventricular rate.

Drugs for both supraventricular and ventricular arrhythmias include amiodarone hydrochloride p. 105, **beta-blockers**, disopyramide p. 102, flecainide acetate p. 103, **procainamide** (available from 'special-order' manufacturers or specialist importing companies), and propafenone hydrochloride p. 104.

Supraventricular and ventricular arrhythmias

Amiodarone hydrochloride is used in the treatment of arrhythmias, particularly when other drugs are ineffective or contra-indicated. It can be used for paroxysmal supraventricular, nodal and ventricular tachycardias, atrial fibrillation and flutter, and ventricular fibrillation. It can also be used for tachyarrhythmias associated with Wolff-Parkinson-White syndrome. It should be initiated only under hospital or specialist supervision. Amiodarone hydrochloride may be given by intravenous infusion as well as by mouth, and has the advantage of causing little or no myocardial depression. Unlike oral amiodarone hydrochloride, intravenous amiodarone hydrochloride acts relatively rapidly.

Intravenous injection of amiodarone hydrochloride can be used in cardiopulmonary resuscitation for ventricular

fibrillation or pulseless tachycardia unresponsive to other interventions.

Amiodarone hydrochloride has a very long half-life (extending to several weeks) and only needs to be given once daily (but high doses can cause nausea unless divided). Many weeks or months may be required to achieve steady-state plasma-amiodarone concentration; this is particularly important when drug interactions are likely.

Beta-blockers act as anti-arrhythmic drugs principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. Sotalol hydrochloride p. 108 has a role in the management of ventricular arrhythmias.

Disopyramide can be given by intravenous injection to control arrhythmias after myocardial infarction (including those not responding to lidocaine hydrochloride), but it impairs cardiac contractility. Oral administration of disopyramide is useful, but it has an antimuscarinic effect which limits its use in patients susceptible to angle-closure glaucoma or with prostatic hyperplasia.

Flecainide acetate belongs to the same general class as lidocaine hydrochloride and may be of value for serious symptomatic ventricular arrhythmias. It may also be indicated for junctional re-entry tachycardias and for paroxysmal atrial fibrillation. However, it can precipitate serious arrhythmias in a small minority of patients (including those with otherwise normal hearts).

Propafenone hydrochloride is used for the prophylaxis and treatment of ventricular arrhythmias and also for some supraventricular arrhythmias. It has complex mechanisms of action, including weak beta-blocking activity (therefore caution is needed in obstructive airways disease—contra-indicated if severe).

Drugs for supraventricular arrhythmias include adenosine, **cardiac glycosides**, and verapamil hydrochloride. Drugs for ventricular arrhythmias include lidocaine hydrochloride.

Mexiletine and procainamide are both available from 'special-order' manufacturers or specialist importing companies. Mexiletine can be used for life-threatening ventricular arrhythmias; procainamide is given by intravenous injection to control ventricular arrhythmias.

Ventricular arrhythmias

Intravenous lidocaine hydrochloride can be used for the treatment of ventricular tachycardia in haemodynamically stable patients, and ventricular fibrillation and pulseless ventricular tachycardia in cardiac arrest refractory to defibrillation, however it is no longer the anti-arrhythmic drug of first choice.

Drugs for both supraventricular and ventricular arrhythmias include amiodarone hydrochloride, **beta-blockers**, disopyramide, flecainide acetate, **procainamide** (available from 'special-order' manufacturers or specialist importing companies), and propafenone hydrochloride.

Mexiletine is available from 'special-order' manufacturers or specialist importing companies for treatment of life-threatening ventricular arrhythmias.

Other drugs used for Arrhythmias Acebutolol, p. 151 • Atenolol, p. 151 • Metoprolol tartrate, p. 154 • Nadolol, p. 148 • Oxprenolol hydrochloride, p. 149

ANTIARRHYTHMICS > CLASS IA

Disopyramide

• INDICATIONS AND DOSE

Prevention and treatment of ventricular and supraventricular arrhythmias, including after myocardial infarction | Maintenance of sinus rhythm after cardioversion

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 300–800 mg daily in divided doses
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 250–375 mg every 12 hours

• **CONTRA-INDICATIONS** Bundle-branch block associated with first-degree AV block • second- and third-degree AV block or bifascicular block (unless pacemaker fitted) • severe heart failure (unless secondary to arrhythmia) • severe sinus node dysfunction

• **CAUTIONS** Atrial flutter or atrial tachycardia with partial block • avoid in Acute porphyrias p. 1025 • elderly • heart failure (avoid if severe) • myasthenia gravis • prostatic enlargement • structural heart disease • susceptibility to angle-closure glaucoma

• **INTERACTIONS** → Appendix 1: antiarrhythmics

• **SIDE-EFFECTS** Abdominal pain • appetite decreased • arrhythmias • cardiac conduction disorders • cardiogenic shock • cognitive disorder • constipation • diarrhoea • dizziness • dry mouth • erectile dysfunction • headache • heart failure • hyperhidrosis • hypoglycaemia • hypotension • jaundice cholestatic • nausea • neutropenia • psychotic disorder • QT interval prolongation • rash • urinary disorders • vision disorders • vomiting

• **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk; may induce labour if used in third trimester.

• **BREAST FEEDING** Present in milk—use only if essential. **Monitoring** Monitor infant for antimuscarinic effects.

• **HEPATIC IMPAIRMENT** Avoid modified-release preparation. **Dose adjustments** Half-life prolonged—may need dose reduction.

• **RENAL IMPAIRMENT** Avoid modified-release preparation. **Dose adjustments** Reduce dose by increasing dose interval; adjust according to response.

• MONITORING REQUIREMENTS

- ▶ Monitor for hypotension, hypoglycaemia, ventricular tachycardia, ventricular fibrillation or torsade de pointes (discontinue if occur).
- ▶ Monitor serum potassium.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

▶ **Rythmodan Retard** (Sanofi)

ANTIARRHYTHMICS > CLASS IB

Lidocaine hydrochloride

(Lignocaine hydrochloride)

● INDICATIONS AND DOSE

Cardiopulmonary resuscitation (as an alternative if amiodarone is not available)

▶ BY INTRAVENOUS INJECTION

- Adult: 1 mg/kg, do not exceed 3 mg/kg over the first hour

Ventricular arrhythmias, especially after myocardial infarction in patients without gross circulatory impairment

▶ INITIALLY BY INTRAVENOUS INJECTION

- Adult: 100 mg, to be given as a bolus dose over a few minutes, followed immediately by (by intravenous infusion) 4 mg/minute for 30 minutes, then (by intravenous infusion) 2 mg/minute for 2 hours, then (by intravenous infusion) 1 mg/minute, reduce concentration further if infusion continued beyond 24 hours (ECG monitoring and specialist advice for infusion), following intravenous injection lidocaine has a short duration of action (lasting for 15–20 minutes). If an intravenous infusion is not immediately available the initial intravenous injection of 100 mg can be repeated if necessary once or twice at intervals of not less than 10 minutes

Ventricular arrhythmias, especially after myocardial infarction in lighter patients or those whose circulation is severely impaired

▶ INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 50 mg, to be given as a bolus dose over a few minutes, followed immediately by (by intravenous infusion) 4 mg/minute for 30 minutes, then (by intravenous infusion) 2 mg/minute for 2 hours, then (by intravenous infusion) 1 mg/minute, reduce concentration further if infusion continued beyond 24 hours (ECG monitoring and specialist advice for infusion), following intravenous injection lidocaine has a short duration of action (lasting for 15–20 minutes). If an intravenous infusion is not immediately available the initial intravenous injection of 50 mg can be repeated if necessary once or twice at intervals of not less than 10 minutes

- **CONTRA-INDICATIONS** All grades of atrioventricular block · severe myocardial depression · sino-atrial disorders

- **CAUTIONS** Acute porphyrias p. 1025 (consider infusion with glucose for its anti-porphyrinogenic effects) · congestive cardiac failure (consider lower dose) · post cardiac surgery (consider lower dose)

- **INTERACTIONS** → Appendix 1: antiarrhythmics

- **SIDE-EFFECTS** Anxiety · arrhythmias · atrioventricular block · cardiac arrest · circulatory collapse · confusion · dizziness · drowsiness · euphoric mood · headache · hypotension (may lead to cardiac arrest) · loss of consciousness · methaemoglobinaemia · muscle twitching · myocardial contractility decreased · nausea · neurological effects · nystagmus · pain · psychosis · respiratory disorders · seizure · sensation abnormal · temperature sensation altered · tinnitus · tremor · vision blurred · vomiting

- **PREGNANCY** Crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk.

- **BREAST FEEDING** Present in milk but amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Caution—increased risk of side-effects.

- **RENAL IMPAIRMENT** Possible accumulation of lidocaine and active metabolite; caution in severe impairment.

- **MONITORING REQUIREMENTS** Monitor ECG and have resuscitation facilities available.

ANTIARRHYTHMICS > CLASS IC

Flecainide acetate

● INDICATIONS AND DOSE

AV nodal reciprocating tachycardia, arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome), disabling symptoms of paroxysmal atrial fibrillation in patients without left ventricular dysfunction (arrhythmias of recent onset will respond more readily) (specialist supervision in hospital) | Ventricular tachyarrhythmias resistant to other treatment (specialist supervision in hospital)

▶ INITIALLY BY SLOW INTRAVENOUS INJECTION

- Adult: Initially 2 mg/kg (max. per dose 150 mg), to be given over 10–30 minutes with ECG monitoring, followed by (by intravenous infusion) 1.5 mg/kg/hour if required for 1 hour, then (by intravenous infusion) reduced to 100–250 micrograms/kg/hour for up to 24 hours, maximum cumulative dose of 600 mg in first 24 hours, then transfer to oral treatment

Supraventricular arrhythmias

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 50 mg twice daily, increased if necessary up to 300 mg daily

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 200 mg daily

Ventricular arrhythmias (initiated under direction of hospital consultant)

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 100 mg twice daily for 3–5 days, maximum 400 mg daily reserved for rapid control or in heavily built patients; for maintenance, reduce to the lowest dose that controls the arrhythmia continued →

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose by half with concurrent use of amiodarone.

DOSE EQUIVALENCE AND CONVERSION

- ▶ Patients stabilised on 200 mg daily immediate-release flecainide may be transferred to modified-release medicines.

- **UNLICENSED USE** Capsules, tablets and injection: licensed for AV nodal reciprocating tachycardia, arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome), disabling symptoms of paroxysmal atrial fibrillation in patients without left ventricular dysfunction (arrhythmias of recent onset will respond more readily). Immediate-release tablets only: licensed for symptomatic sustained ventricular tachycardia, disabling symptoms of premature ventricular contractions and/or non-sustained ventricular tachycardia in patients resistant to or intolerant of other therapy. Injection only: licensed for ventricular tachyarrhythmias resistant to other treatment.

- **CONTRA-INDICATIONS** Abnormal left ventricular function · atrial conduction defects (unless pacing rescue available) · bundle branch block (unless pacing rescue available) · control of arrhythmias in acute situations (for modified-release forms only) · distal block (unless pacing rescue available) · haemodynamically significant valvular heart disease · heart failure · history of myocardial infarction and either asymptomatic ventricular ectopics or asymptomatic non-sustained ventricular tachycardia · long-standing atrial fibrillation where conversion to sinus rhythm not attempted · second-degree or greater AV block (unless pacing rescue available) · sinus node dysfunction (unless pacing rescue available)

- **CAUTIONS** Atrial fibrillation following heart surgery · elderly (accumulation may occur) · patients with pacemakers (especially those who may be pacemaker dependent because stimulation threshold may rise appreciably)

- **INTERACTIONS** → Appendix 1: antiarrhythmics

● SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmias · asthenia · dizziness · dyspnoea · fever · oedema · vision disorders
- ▶ **Uncommon** Alopecia · appetite decreased · constipation · diarrhoea · flatulence · gastrointestinal discomfort · nausea · skin reactions · vomiting
- ▶ **Rare or very rare** Anxiety · confusion · corneal deposits · depression · drowsiness · flushing · hallucination · headache · hepatic disorders · hyperhidrosis · insomnia · memory loss · movement disorders · peripheral neuropathy · photosensitivity reaction · respiratory disorders · seizure · sensation abnormal · syncope · tinnitus · tremor · vertigo
- ▶ **Frequency not known** Altered pacing threshold · atrioventricular block · cardiac arrest · chest pain · heart failure · hypotension · myocardial infarction · palpitations · QT interval prolongation

- **PREGNANCY** Used in pregnancy to treat maternal and fetal arrhythmias in specialist centres; toxicity reported in animal studies; infant hyperbilirubinaemia also reported.

- **BREAST FEEDING** Significant amount present in milk but not known to be harmful.

● HEPATIC IMPAIRMENT

Dose adjustments Avoid or reduce dose in severe impairment.

● RENAL IMPAIRMENT

Dose adjustments Reduce initial oral dose to max. 100 mg daily or reduce intravenous dose by 50%, if eGFR less than 35 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- ▶ With intravenous use ECG monitoring and resuscitation facilities must be available.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Tambacor[®]), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%. Minimum volume in infusion fluids containing chlorides 500 mL.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

ANTIARRHYTHMICS > CLASS III

Amiodarone hydrochloride

● INDICATIONS AND DOSE

Treatment of arrhythmias, particularly when other drugs are ineffective or contra-indicated (including paroxysmal supraventricular, nodal and ventricular tachycardias, atrial fibrillation and flutter, ventricular fibrillation, and tachyarrhythmias associated with Wolff-Parkinson-White syndrome) (initiated in hospital or under specialist supervision)

▶ BY MOUTH

- ▶ **Adult:** 200 mg 3 times a day for 1 week, then reduced to 200 mg twice daily for a further week, followed by maintenance dose, usually 200 mg daily or the minimum dose required to control arrhythmia

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 5 mg/kg, to be given over 20–120 minutes with ECG monitoring, subsequent infusions given if necessary according to response; maximum 1.2 g per day

Ventricular fibrillation or pulseless ventricular tachycardia refractory to defibrillation (for cardiopulmonary resuscitation)

▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ **Adult:** Initially 300 mg, dose to be considered after administration of adrenaline, dose should be given from a pre-filled syringe or diluted in 20 mL Glucose

5%, then (by intravenous injection) 150 mg if required, followed by (by intravenous infusion) 900 mg/24 hours

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SOFOSBUVIR WITH DACLATASVIR; SOFOSBUVIR AND LEDIPASVIR (MAY 2015); SIMEPREXVIR WITH SOFOSBUVIR (AUGUST 2015): RISK OF SEVERE BRADYCARDIA AND HEART BLOCK WHEN TAKEN WITH AMIODARONE

Avoid concomitant use unless other antiarrhythmics cannot be given.

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS

Avoid in severe conduction disturbances (unless pacemaker fitted) · avoid in sinus node disease (unless pacemaker fitted) · iodine sensitivity · sino-atrial heart block (except in cardiac arrest) · sinus bradycardia (except in cardiac arrest) · thyroid dysfunction

SPECIFIC CONTRA-INDICATIONS

- ▶ With intravenous use Avoid bolus injection in cardiomyopathy · avoid bolus injection in congestive heart failure · avoid in circulatory collapse · avoid in severe arterial hypotension · avoid in severe respiratory failure

● CAUTIONS

GENERAL CAUTIONS Acute porphyrias p. 1025 · conduction disturbances (in excessive dosage) · elderly · heart failure · hypokalaemia · severe bradycardia (in excessive dosage)

SPECIFIC CAUTIONS

- ▶ With intravenous use moderate and transient fall in blood pressure (circulatory collapse precipitated by rapid administration or overdosage) · severe hepatocellular toxicity

- **INTERACTIONS** → Appendix 1: antiarrhythmics

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmias · hepatic disorders · hyperthyroidism · nausea · respiratory disorders · skin reactions
- ▶ **Rare or very rare** Bronchospasm (in patients with severe respiratory failure) · headache · idiopathic intracranial hypertension · nerve disorders · SIADH
- ▶ **Frequency not known** Angioedema · confusion · delirium · pancreatitis · severe cutaneous adverse reactions (SCARs)

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With oral use Constipation · corneal deposits · hypothyroidism · movement disorders · photosensitivity reaction · sleep disorders · taste altered · vomiting
- ▶ With parenteral use Hypotension (following rapid injection)
- ▶ **Uncommon**
- ▶ With oral use Cardiac conduction disorders · dry mouth · myopathy (usually reversible on discontinuation) · peripheral neuropathy (usually reversible on discontinuation)
- ▶ **Rare or very rare**
- ▶ With oral use Alopecia · aplastic anaemia · epididymo-orchitis · erectile dysfunction · haemolytic anaemia · pulmonary haemorrhage · thrombocytopenia · vertigo
- ▶ With parenteral use Hot flush · hyperhidrosis
- ▶ **Frequency not known**
- ▶ With oral use Altered smell sensation · appetite decreased · parkinsonism · vasculitis
- ▶ With parenteral use Agranulocytosis · libido decreased · neutropenia

SIDE-EFFECTS, FURTHER INFORMATION

Corneal microdeposits Patients taking amiodarone may develop corneal microdeposits (reversible on withdrawal of treatment). However, if vision is impaired or if optic neuritis or optic neuropathy occur, amiodarone must be stopped to prevent blindness and expert advice sought.

Thyroid function Amiodarone contains iodine and can cause disorders of thyroid function; both hypothyroidism and hyperthyroidism can occur. Hypothyroidism can be treated with replacement therapy without withdrawing amiodarone if it is essential; careful supervision is required.

Hepatotoxicity Amiodarone is also associated with hepatotoxicity and treatment should be discontinued if severe liver function abnormalities or clinical signs of liver disease develop.

Pulmonary toxicity Pneumonitis should always be suspected if new or progressive shortness of breath or cough develops in a patient taking amiodarone.

• **PREGNANCY** Possible risk of neonatal goitre; use only if no alternative.

• **BREAST FEEDING** Avoid; present in milk in significant amounts; theoretical risk of neonatal hypothyroidism from release of iodine.

• MONITORING REQUIREMENTS

- ▶ Thyroid function tests should be performed before treatment and then every 6 months. Clinical assessment of thyroid function alone is unreliable. Thyroxine (T4) may be raised in the absence of hyperthyroidism; therefore tri-iodothyronine (T3), T4, and thyroid-stimulating hormone (thyrotrophin, TSH) should all be measured. A raised T3 and T4 with a very low or undetectable TSH concentration suggests the development of thyrotoxicosis.
- ▶ Liver function tests required before treatment and then every 6 months.
- ▶ Serum potassium concentration should be measured before treatment.
- ▶ Chest x-ray required before treatment.
- ▶ If concomitant use of amiodarone with sofosbuvir and daclatasvir, simeprevir and sofosbuvir, or sofosbuvir and ledipasvir cannot be avoided because other anti-arrhythmics are not tolerated or contra-indicated, patients should be closely monitored, particularly during the first weeks of treatment. Patients at high risk of bradycardia should be monitored continuously for 48 hours in an appropriate clinical setting after starting concomitant treatment. Patients who have stopped amiodarone within the last few months and need to start sofosbuvir and daclatasvir, simeprevir and sofosbuvir, or sofosbuvir and ledipasvir should be monitored.
- ▶ With intravenous use ECG monitoring and resuscitation facilities must be available. Monitor liver transaminases closely.

• DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion* (Cordarone X[®]), give continuously or intermittently in Glucose 5%. Suggested initial infusion volume 250 mL given over 20–120 minutes; for repeat infusions up to 1.2 g in max. 500 mL; should not be diluted to less than 600 micrograms/mL. See cardio-pulmonary resuscitation for details of infusion in extreme emergency. Incompatible with Sodium Chloride infusion fluids; avoid equipment containing the plasticizer di-2-ethylhexphthalate (DEHP).
- ▶ With oral use For administration *by mouth*, tablets may be crushed and dispersed in water; injection solution should not be given orally (irritant).

• **PATIENT AND CARER ADVICE** Because of the possibility of phototoxic reactions, patients should be advised to shield the skin from light during treatment and for several months after discontinuing amiodarone; a wide-spectrum sunscreen to protect against both long-wave ultraviolet and visible light should be used.

If taking amiodarone with concomitant sofosbuvir and daclatasvir, simeprevir and sofosbuvir, or sofosbuvir and ledipasvir, patients and their carers should be told how to recognise signs and symptoms of bradycardia and heart block and advised to seek immediate medical attention if

symptoms such as shortness of breath, light-headedness, palpitations, fainting, unusual tiredness or chest pain develop.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 11

▶ Amiodarone hydrochloride (Non-proprietary)

Amiodarone hydrochloride 100 mg Amiodarone 100mg tablets | 28 tablet **[PoM]** £4.25 DT = £1.63

Amiodarone hydrochloride 200 mg Amiodarone 200mg tablets | 28 tablet **[PoM]** £7.80 DT = £2.02

▶ Cordarone X (Sanofi)

Amiodarone hydrochloride 100 mg Cordarone X 100 tablets | 28 tablet **[PoM]** £4.28 DT = £1.63

Dronedarone

• **DRUG ACTION** Dronedarone is a multi-channel blocking anti-arrhythmic drug.

• INDICATIONS AND DOSE

Maintenance of sinus rhythm after cardioversion in clinically stable patients with paroxysmal or persistent atrial fibrillation, when alternative treatments are unsuitable (initiated under specialist supervision)

- ▶ BY MOUTH
- ▶ Adult: 400 mg twice daily

• **CONTRA-INDICATIONS** Atrial conduction defects · bradycardia · complete bundle branch block · distal block · existing or previous heart failure or left ventricular systolic dysfunction · haemodynamically unstable patients · liver toxicity associated with previous amiodarone use · lung toxicity associated with previous amiodarone use · permanent atrial fibrillation · prolonged QT interval · second- or third- degree AV block · sick sinus syndrome (unless pacemaker fitted) · sinus node dysfunction

• **CAUTIONS** Coronary artery disease · correct hypokalaemia and hypomagnesaemia before starting and during treatment

• **INTERACTIONS** → Appendix 1: antiarrhythmics

• SIDE-EFFECTS

- ▶ **Common or very common** Asthenia · bradycardia · congestive heart failure · diarrhoea · gastrointestinal discomfort · nausea · QT interval prolongation · skin reactions · vomiting
- ▶ **Uncommon** Photosensitivity reaction · respiratory disorders · taste altered
- ▶ **Rare or very rare** Hepatic disorders · vasculitis

SIDE-EFFECTS, FURTHER INFORMATION

Liver injury Liver injury including life-threatening acute liver failure reported rarely; discontinue treatment if 2 consecutive alanine aminotransferase concentrations exceed 3 times upper limit of normal.

Heart failure New onset or worsening heart failure reported. If heart failure or left ventricular systolic dysfunction develops, discontinue treatment.

Pulmonary toxicity Interstitial lung disease, pneumonitis and pulmonary fibrosis reported. Investigate if symptoms such as dyspnoea or dry cough develop and discontinue if confirmed.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - ▶ Ongoing monitoring should occur under specialist supervision.
 - ▶ Monitor for heart failure.
 - ▶ Perform ECG at least every 6 months—consider discontinuation if atrial fibrillation reoccurs.
 - ▶ Measure serum creatinine before treatment and 7 days after initiation—if raised, measure again after a further 7 days and consider discontinuation if creatinine continues to rise.
 - ▶ Monitor liver function before treatment, 1 week and 1 month after initiation of treatment, then monthly for 6 months, then every 3 months for 6 months and periodically thereafter.

• PATIENT AND CARER ADVICE

Heart failure Patients or their carers should be told how to recognise signs of heart failure and advised to seek prompt medical attention if symptoms such as weight gain, dependent oedema, or dyspnoea develop or worsen.

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as abdominal pain, anorexia, nausea, vomiting, fever, malaise, itching, dark urine, or jaundice develop.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Dronedaron for the treatment of non-permanent atrial fibrillation (December 2012)** NICE TA197
Dronedaron is an option for the maintenance of sinus rhythm after successful cardioversion in paroxysmal or persistent atrial fibrillation which is not controlled by first-line therapy (usually including beta-blockers), **and** after alternative options have been considered in patients:
 - who have at least 1 of the following cardiovascular risk factors: hypertension requiring drugs of at least 2 different classes, diabetes mellitus, previous transient ischaemic attack, stroke or systemic embolism, left atrial diameter of 50 mm or greater, or age 70 years or older **and**
 - who do not have left ventricular systolic dysfunction nor a history of, or current, heart failure
 Patients who do not meet the above criteria who are currently receiving dronedaron should have the option to continue treatment until they and their clinicians consider it appropriate to stop.
www.nice.org.uk/TA197

ANTIARRHYTHMICS > OTHER

Adenosine

• INDICATIONS AND DOSE

Rapid reversion to sinus rhythm of paroxysmal supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome) | Used to aid to diagnosis of broad or narrow complex supraventricular tachycardias

▶ BY RAPID INTRAVENOUS INJECTION

- ▶ **Adult:** Initially 6 mg, administer into central or large peripheral vein and give over 2 seconds, cardiac monitoring required, followed by 12 mg after 1–2 minutes if required, then 12 mg after 1–2 minutes if required, increments should not be given if high level AV block develops at any particular dose

Rapid reversion to sinus rhythm of paroxysmal supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome) in patients with a heart transplant | Aid to diagnosis of broad or narrow complex supraventricular tachycardias in patients with a heart transplant

▶ BY RAPID INTRAVENOUS INJECTION

- ▶ **Adult:** Initially 3 mg, administer into a central or large peripheral vein and give over 2 seconds, followed by 6 mg after 1–2 minutes if required, then 12 mg after 1–2 minutes if required, patients with a heart transplant are very sensitive to the effects of adenosine

Used in conjunction with radionuclide myocardial perfusion imaging in patients who cannot exercise adequately or for whom exercise is inappropriate

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** (consult product literature)

- **UNLICENSED USE** Adenosine doses in the BNF may differ from those in the product literature.
- **CONTRA-INDICATIONS** Asthma • chronic obstructive lung disease • decompensated heart failure • long QT syndrome • second- or third-degree AV block and sick sinus syndrome (unless pacemaker fitted) • severe hypotension
- **CAUTIONS** Atrial fibrillation with accessory pathway (conduction down anomalous pathway may increase) • atrial flutter with accessory pathway (conduction down anomalous pathway may increase) • autonomic dysfunction • bundle branch block • first-degree AV block • heart transplant • left main coronary artery stenosis • left to right shunt • pericardial effusion • pericarditis • QT-interval prolongation • recent myocardial infarction • severe heart failure • stenotic carotid artery disease with cerebrovascular insufficiency • stenotic valvular heart disease • uncorrected hypovolaemia
- **INTERACTIONS** → Appendix 1: antiarrhythmics
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal discomfort • arrhythmias • atrioventricular block • chest discomfort • chest pain (discontinue) • dizziness • dry mouth • dyspnoea • flushing • headache • hypotension (discontinue if severe) • pain • paraesthesia • throat discomfort
 - ▶ **Uncommon** Asthenia • back discomfort • bradycardia (discontinue if asystole or severe bradycardia occur) • hyperhidrosis • limb discomfort • nervousness • taste metallic
 - ▶ **Rare or very rare** Drowsiness • nasal congestion • nipple tenderness • respiratory disorders • respiratory failure (discontinue) • tinnitus • tremor • urinary urgency • vision blurred
 - ▶ **Frequency not known** Apnoea • cardiac arrest • loss of consciousness • nausea • seizure • syncope • vomiting

- **PREGNANCY** Large doses may produce fetal toxicity; manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** No information available—unlikely to be present in milk owing to short half-life.
- **MONITORING REQUIREMENTS** Monitor ECG and have resuscitation facilities available.
- **DIRECTIONS FOR ADMINISTRATION** For *rapid intravenous injection* give over 2 seconds into central or large peripheral vein followed by rapid Sodium Chloride 0.9% flush; injection solution may be diluted with Sodium Chloride 0.9% if required.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

Solution for injection

ELECTROLYTES: May contain Sodium

Adenosine (Non-proprietary)

Adenosine 3 mg per 1 ml Adenosine 6mg/2ml solution for injection vials | 5 vial [PoM] £7.00 (Hospital only) | 6 vial [PoM] £26.70–£29.24 (Hospital only)

Adenocor (Sanofi)

Adenosine 3 mg per 1 ml Adenocor 6mg/2ml solution for injection vials | 6 vial [PoM] £6.45 (Hospital only)

Solution for infusion

BETA-ADRENOCEPTOR BLOCKERS > NON-SELECTIVE

P 146

Sotalol hydrochloride

INDICATIONS AND DOSE

Symptomatic non-sustained ventricular tachyarrhythmias | **Prophylaxis of paroxysmal atrial tachycardia or fibrillation, paroxysmal AV re-entrant tachycardias (both nodal and involving accessory pathways), and paroxysmal supraventricular tachycardia after cardiac surgery** | **Maintenance of sinus rhythm following cardioversion of atrial fibrillation or flutter**

BY MOUTH

- ▶ **Adult:** Initially 80 mg daily in 1–2 divided doses, then increased to 160–320 mg daily in 2 divided doses, dose to be increased gradually at intervals of 2–3 days

Life-threatening arrhythmias including ventricular tachyarrhythmias

BY MOUTH

- ▶ **Adult:** Initially 80 mg daily in 1–2 divided doses, then increased to 160–320 mg daily in 2 divided doses, dose to be increased gradually at intervals of 2–3 days, higher doses of 480–640 mg daily may be required for life-threatening ventricular arrhythmias (under specialist supervision)

IMPORTANT SAFETY INFORMATION

Sotalol may prolong the QT interval, and it occasionally causes life threatening ventricular arrhythmias (**important:** particular care is required to avoid hypokalaemia in patients taking sotalol—electrolyte disturbances, particularly hypokalaemia and hypomagnesaemia should be corrected before sotalol started and during use).

- **CONTRA-INDICATIONS** Long QT syndrome (congenital or acquired) · torsade de pointes
- **CAUTIONS** Diarrhoea (severe or prolonged)
- **INTERACTIONS** → Appendix 1: beta blockers, non-selective
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anxiety · arrhythmia · chest pain · dyspepsia · fever · flatulence · hearing impairment · mood altered · muscle spasms · oedema · palpitations · presyncope · sexual dysfunction · taste altered · torsade de pointes (increased risk in females)
- **BREAST FEEDING** Water soluble beta-blockers such as sotalol are present in breast milk in greater amounts than other beta blockers.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 10 mL/minute/1.73 m².
Dose adjustments Use half normal dose if eGFR 30–60 mL/minute/1.73 m²; use one-quarter normal dose if eGFR 10–30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Measurement of corrected QT interval, and monitoring of ECG and electrolytes required; correct hypokalaemia, hypomagnesaemia, or other electrolyte disturbances.

MEDICINAL FORMS

CARDIAC GLYCOSIDES

Cardiac glycosides

Digoxin-specific antibody

Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (see further information, under Poisoning, emergency treatment p. 1319). Digoxin-specific antibody p. 1328 fragments are indicated for the treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular arrhythmias or bradyarrhythmias unresponsive to atropine sulfate p. 1295 and when measures beyond the withdrawal of digoxin p. 109 and correction of any electrolyte abnormalities are considered necessary.

Digoxin

Digoxin is most useful for controlling ventricular response in persistent and permanent atrial fibrillation and atrial flutter. Digoxin also has a role in heart failure.

For management of atrial fibrillation the maintenance dose of digoxin can usually be determined by the ventricular rate at rest, which should not usually be allowed to fall persistently below 60 beats per minute.

Digoxin is now rarely used for rapid control of heart rate (see management of supraventricular arrhythmias). Even with intravenous administration, response may take many hours; persistence of tachycardia is therefore not an

indication for exceeding the recommended dose. The intramuscular route is **not** recommended.

In patients with heart failure who are in sinus rhythm a loading dose is not required, and a satisfactory plasma-digoxin concentration can be achieved over a period of about a week.

Digoxin has a long half-life and maintenance doses need to be given only once daily (although higher doses may be divided to avoid nausea); renal function is the most important determinant of digoxin dosage.

Unwanted effects depend both on the concentration of digoxin in the plasma and on the sensitivity of the conducting system or of the myocardium, which is often increased in heart disease. It can sometimes be difficult to distinguish between toxic effects and clinical deterioration because symptoms of both are similar. The plasma concentration alone cannot indicate toxicity reliably, but the likelihood of toxicity increases progressively through the range 1.5 to 3 micrograms/litre for digoxin. Digoxin should be used with special care in the elderly, who may be particularly susceptible to digitalis toxicity.

Regular monitoring of plasma-digoxin concentration during maintenance treatment is not necessary unless problems are suspected. Hypokalaemia predisposes the patient to digitalis toxicity; it is managed by giving a potassium-sparing diuretic or, if necessary, potassium supplementation.

If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management. Digoxin-specific antibody fragments are available for reversal of life-threatening overdosage.

Digoxin

16-Jun-2017

- **DRUG ACTION** Digoxin is a cardiac glycoside that increases the force of myocardial contraction and reduces conductivity within the atrioventricular (AV) node.

● INDICATIONS AND DOSE

Rapid digitalisation, for atrial fibrillation or flutter

► BY MOUTH

- Adult: 0.75–1.5 mg in divided doses, dose to be given over 24 hours, reduce dose in the elderly

Maintenance, for atrial fibrillation or flutter

► BY MOUTH

- Adult: Maintenance 125–250 micrograms daily, dose according to renal function and initial loading dose, reduce dose in the elderly

Heart failure (for patients in sinus rhythm)

► BY MOUTH

- Adult: 62.5–125 micrograms once daily, reduce dose in the elderly

Emergency loading dose, for atrial fibrillation or flutter

► INITIALLY BY INTRAVENOUS INFUSION

- Adult: Loading dose 0.75–1 mg, to be given over at least 2 hours, then (by mouth) maintenance, loading dose is rarely necessary, maintenance dose to be started on the day following the loading dose, reduce dose in the elderly

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose by half with concurrent use of amiodarone, dronedarone and quinine.

DOSE EQUIVALENCE AND CONVERSION

- Dose may need to be reduced if digoxin (or another cardiac glycoside) has been given in the preceding 2 weeks.
- When switching from intravenous to oral route may need to increase dose by 20–33% to maintain the same plasma-digoxin concentration.

- **UNLICENSED USE** Digoxin doses in the BNF may differ from those in product literature.
- **CONTRA-INDICATIONS** Constrictive pericarditis (unless to control atrial fibrillation or improve systolic dysfunction—but use with caution) · hypertrophic cardiomyopathy (unless concomitant atrial fibrillation and heart failure—but use with caution) · intermittent complete heart block · myocarditis · second degree AV block · supraventricular arrhythmias associated with accessory conducting pathways e.g. Wolff-Parkinson-White syndrome (although can be used in infancy) · ventricular tachycardia or fibrillation

- **CAUTIONS** Hypercalcaemia (risk of digitalis toxicity) · hypokalaemia (risk of digitalis toxicity) · hypomagnesaemia (risk of digitalis toxicity) · hypoxia (risk of digitalis toxicity) · recent myocardial infarction · severe respiratory disease · sick sinus syndrome · thyroid disease

- **INTERACTIONS** → Appendix 1: digoxin

● SIDE-EFFECTS

- **Common or very common** Arrhythmias · cardiac conduction disorder · cerebral impairment · diarrhoea · dizziness · eosinophilia · nausea · skin reactions · vision disorders · vomiting

- **Uncommon** Depression

- **Rare or very rare** Appetite decreased · asthenia · confusion · gastrointestinal disorders · gynaecomastia · headache · malaise · psychosis · thrombocytopenia

Overdose If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management.

● PREGNANCY

Dose adjustments May need dosage adjustment.

- **BREAST FEEDING** Amount too small to be harmful.

● RENAL IMPAIRMENT

Dose adjustments Reduce dose.

Monitoring Monitor plasma-digoxin concentration in renal impairment.

● MONITORING REQUIREMENTS

- For plasma-digoxin concentration assay, blood should be taken at least 6 hours after a dose.
- Monitor serum electrolytes and renal function. Toxicity increased by electrolyte disturbances.

● DIRECTIONS FOR ADMINISTRATION

- With intravenous use Avoid rapid intravenous administration (risk of hypertension and reduced coronary flow). For intravenous infusion (Lanoxin®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of not more than 62.5 micrograms/mL. To be given over at least 2 hours.
- With oral use For oral administration, oral solution must **not** be diluted.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for digoxin elixir (use pipette).

2 Bleeding disorders

Antifibrinolytic drugs and haemostatics

Overview

Fibrin dissolution can be impaired by the administration of tranexamic acid below, which inhibits fibrinolysis. It can be used to prevent bleeding or to treat bleeding associated with excessive fibrinolysis (e.g. in surgery, dental extraction, obstetric disorders, and traumatic hyphaema) and in the management of menorrhagia. Tranexamic acid may also be used in hereditary angioedema, epistaxis, and in thrombolytic overdose.

Desmopressin p. 653 is used in the management of mild to moderate haemophilia and von Willebrand's disease. It is also used for fibrinolytic response testing.

Etamsylate p. 111 reduces capillary bleeding in the presence of a normal number of platelets; it does not act by fibrin stabilisation, but probably by correcting abnormal adhesion. Etamsylate is less effective than other treatments in the management of heavy menstrual bleeding and its use is no longer recommended.

ANTIHAEMORRHAGICS > ANTIFIBRINOLYTICS

Tranexamic acid

26-Apr-2017

● INDICATIONS AND DOSE

Local fibrinolysis

► BY MOUTH

- Adult: 1–1.5 g 2–3 times a day, alternatively 15–25 mg/kg 2–3 times a day

► INITIALLY BY SLOW INTRAVENOUS INJECTION

- Adult: 0.5–1 g 2–3 times a day, to be administered at a rate not exceeding 100 mg/minute, followed by (by continuous intravenous infusion) 25–50 mg/kg if required, dose to be given over 24 hours

Menorrhagia

► BY MOUTH

- Adult: 1 g 3 times a day for up to 4 days, to be initiated when menstruation has started; maximum 4 g per day

Hereditary angioedema

► BY MOUTH

- Adult: 1–1.5 g 2–3 times a day, for short-term prophylaxis of hereditary angioedema, tranexamic acid is started several days before planned procedures which may trigger an acute attack of hereditary angioedema (e.g. dental work) and continued for 2–5 days afterwards

Epistaxis

► BY MOUTH

- Adult: 1 g 3 times a day for 7 days

General fibrinolysis

► BY SLOW INTRAVENOUS INJECTION

- Adult: 1 g every 6–8 hours, alternatively 15 mg/kg every 6–8 hours, dose to be given at a rate not exceeding 100 mg/minute

Prevention and treatment of significant haemorrhage following trauma

► INITIALLY BY SLOW INTRAVENOUS INJECTION

- Adult: Loading dose 1 g to be given over 10 minutes, treatment should commence within 8 hours of injury, followed by (by intravenous infusion) 1 g to be given over 8 hours

- **UNLICENSED USE** Use of tranexamic acid by continuous intravenous infusion for treatment of local fibrinolysis is an unlicensed route of administration.

[EvG] Not licensed for prevention and treatment of significant haemorrhage following trauma. 

- **CONTRA-INDICATIONS** Fibrinolytic conditions following disseminated intravascular coagulation (system with predominant activation of fibrinolytic system with severe bleeding) · history of convulsions · thromboembolic disease

- **CAUTIONS** Irregular menstrual bleeding (establish cause before initiating therapy) · massive haematuria (avoid if risk of ureteric obstruction) · patients receiving oral contraceptives (increased risk of thrombosis)

CAUTIONS, FURTHER INFORMATION

- Menorrhagia Before initiating treatment for menorrhagia, exclude structural or histological causes or fibroids causing distortion of uterine cavity.

- **INTERACTIONS** → Appendix 1: tranexamic acid

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Diarrhoea (reduce dose) · nausea · vomiting
- **Uncommon** Allergic dermatitis
- **Rare or very rare** Colour vision change (discontinue) · embolism and thrombosis
- **Frequency not known** Seizure (more common at high doses) · visual impairment (discontinue)

SPECIFIC SIDE-EFFECTS

- With intravenous use Hypotension · malaise (on rapid intravenous injection)
- **PREGNANCY** No evidence of teratogenicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.
- **BREAST FEEDING** Small amount present in milk—antifibrinolytic effect in infant unlikely.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose—consult product literature for details.
- **MONITORING REQUIREMENTS** Regular liver function tests in long-term treatment of hereditary angioedema.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Cyllokapon®), give continuously in Glucose 5% or Sodium chloride 0.9%.

● MEDICINAL FORMS

► Cyllokapon (Meda Pharmaceuticals Ltd)

Tranexamic acid 500 mg Cyllokapon 500mg tablets | 60 tablet [PoM] £14.30 DT = £12.85

Solution for injection▶ **Tranexamic acid (Non-proprietary)**

Tranexamic acid 100 mg per 1 ml Tranexamic acid 500mg/5ml solution for injection ampoules | 5 ampoule [PoM] £7.50 (Hospital only) | 5 ampoule [PoM] £7.50 | 10 ampoule [PoM] £13.99–£15.47 (Hospital only)

▶ **Cyklokapon (Pfizer Ltd)**

Tranexamic acid 100 mg per 1 ml Cyklokapon 500mg/5ml solution for injection ampoules | 10 ampoule [PoM] £15.47

ANTIHAEMORRHAGICS > HAEMOSTATICS**Emicizumab**

09-May-2018

- **DRUG ACTION** Emicizumab is a monoclonal antibody that bridges activated factor IX and factor X to restore function of missing activated factor VIII, which is needed for haemostasis.

● **INDICATIONS AND DOSE****Prophylaxis of haemorrhage in patients with haemophilia A (initiated by a specialist)**▶ **BY SUBCUTANEOUS INJECTION**

- ▶ **Adult:** Initially 3 mg/kg once weekly for 4 weeks, then maintenance 1.5 mg/kg once weekly, administer into the thigh, abdomen or upper arm

- **CAUTIONS** Concomitant bypassing agent · risk factors for thrombotic microangiopathy

CAUTIONS, FURTHER INFORMATION

- ▶ Concomitant bypassing agent Manufacturer advises discontinue bypassing agents the day before starting emicizumab; if a bypassing agent is required—consult product literature.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arthralgia · diarrhoea · fever · headache · myalgia · thrombotic microangiopathy
 - ▶ **Uncommon** Cavernous sinus thrombosis · skin necrosis · thrombophlebitis
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 6 months after treatment in women of childbearing potential.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **EFFECT ON LABORATORY TESTS** Manufacturer advises to avoid intrinsic pathway clotting-based laboratory tests or use with caution as results may be misinterpreted—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises max. 2 mL per injection site; rotate injection site and avoid skin that is tender, damaged or scarred. Patients or their caregivers may self-administer *Hemlibra*® after appropriate training.
- **PRESCRIBING AND DISPENSING INFORMATION** Emicizumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.
- **PATIENT AND CARER ADVICE**
 - Missed doses** Manufacturer advises if a dose is missed by more than 5 days, the missed dose should not be taken and the next dose administered at the normal time.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection▶ **Hemlibra (Roche Products Ltd) ▼**

Emicizumab 30 mg per 1 ml Hemlibra 30mg/1ml solution for injection vials | 1 vial [PoM] £2,415.30

Emicizumab 150 mg per 1 ml Hemlibra 150mg/1ml solution for injection vials | 1 vial [PoM] £12,076.50

Hemlibra 105mg/0.7ml solution for injection vials | 1 vial [PoM] £8,453.55

Hemlibra 60mg/0.4ml solution for injection vials | 1 vial [PoM] £4,830.60

Etamsylate

(Ethamsylate)

● **INDICATIONS AND DOSE****Short-term blood loss in menorrhagia**▶ **BY MOUTH**

- ▶ **Adult:** 500 mg 4 times a day during menstruation

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025

- **CAUTIONS** Exclude structural or histological causes of menorrhagia, or fibroids causing distortion of the uterine cavity, before initiating treatment

- **SIDE-EFFECTS** Diarrhoea · fever (discontinue) · headache · nausea · rash · vomiting

- **BREAST FEEDING** Present in milk—manufacturer advises avoid.

- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

● **MEDICINAL FORMS**

Forms available from special-order manufacturers include: oral solution

2.1 Coagulation factor deficiencies**BLOOD AND RELATED PRODUCTS > COAGULATION PROTEINS****Dried prothrombin complex**

(Human prothrombin complex)

● **INDICATIONS AND DOSE**

Treatment and peri-operative prophylaxis of haemorrhage in patients with congenital deficiency of factors II, VII, IX, or X if purified specific coagulation factors not available | Treatment and peri-operative prophylaxis of haemorrhage in patients with acquired deficiency of factors II, VII, IX, or X (e.g. during warfarin treatment)

▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult:** (consult haematologist)

Major bleeding in patients on warfarin following phytonadione (initiated under specialist supervision)

▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult:** 25–50 units/kg

- **CONTRA-INDICATIONS** Angina · history of heparin induced thrombocytopenia · recent myocardial infarction (except in life-threatening haemorrhage following overdosage of oral anticoagulants, and before induction of fibrinolytic therapy)

- **CAUTIONS** Disseminated intravascular coagulation · history of myocardial infarction or coronary heart disease · postoperative use · risk of thrombosis
- **SIDE-EFFECTS**
 - ▶ Rare or very rare Fever · headache · hypersensitivity
 - ▶ Frequency not known Disseminated intravascular coagulation · nephrotic syndrome · thromboembolism
- **HEPATIC IMPAIRMENT**

Monitoring Monitor closely in hepatic impairment (risk of thromboembolic complications).
- **PRESCRIBING AND DISPENSING INFORMATION** Dried prothrombin complex is prepared from human plasma by a suitable fractionation technique, and contains factor IX, together with variable amounts of factors II, VII, and X.

Available from CSL Behring (*Beriplex® P/N*), Octapharma (*Octaplex®*).
- **MEDICINAL FORMS**

No licensed medicines listed.

Factor VIIa (recombinant) (Eptacog alfa (activated))

• INDICATIONS AND DOSE

Treatment and prophylaxis of haemorrhage in patients with haemophilia A or B with inhibitors to factors VIII or IX, acquired haemophilia, factor VII deficiency, or Glanzmann's thrombasthenia

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: (consult haematologist)

- **CAUTIONS** Disseminated intravascular coagulation · risk of thrombosis
- **SIDE-EFFECTS**
 - ▶ Uncommon Embolism and thrombosis · fever · hepatic disorders · intestinal ischaemia · skin reactions
 - ▶ Rare or very rare Angina pectoris · cerebrovascular insufficiency · coagulation disorders · headache · myocardial infarction · nausea · peripheral ischaemia
 - ▶ Frequency not known Angioedema · flushing

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- ▶ **NovoSeven** (Novo Nordisk Ltd)
 - Eptacog alfa activated 50000 unit** NovoSeven 1mg (50,000units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £525.20 (Hospital only)
 - NovoSeven 1mg (50,000units) powder and solvent for solution for injection vials | 1 vial [PoM] £525.20 (Hospital only)
 - Eptacog alfa activated 100000 unit** NovoSeven 2mg (100,000units) powder and solvent for solution for injection vials | 1 vial [PoM] £1,050.40 (Hospital only)
 - NovoSeven 2mg (100,000units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £1,050.40 (Hospital only)
 - Eptacog alfa activated 250000 unit** NovoSeven 5mg (250,000units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £2,626.00 (Hospital only)
 - NovoSeven 5mg (250,000units) powder and solvent for solution for injection vials | 1 vial [PoM] £2,626.00 (Hospital only)
 - Eptacog alfa activated 400000 unit** NovoSeven 8mg (400,000units) powder and solvent for solution for injection vials | 1 vial [PoM] £4,201.60 (Hospital only)
 - NovoSeven 8mg (400,000units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £4,201.60 (Hospital only)

Factor VIII fraction, dried (Human coagulation factor VIII, dried)

• INDICATIONS AND DOSE

Treatment and prophylaxis of haemorrhage in congenital factor VIII deficiency (haemophilia A), acquired factor VIII deficiency | Von Willebrand's disease

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Adult: (consult haematologist)

- **CAUTIONS** Intravascular haemolysis after large or frequently repeated doses in patients with blood groups A, B, or AB—less likely with high potency concentrates
- **SIDE-EFFECTS**
 - ▶ Uncommon Angioedema · cardiac discomfort · chills · flushing · headache · hypersensitivity · hypotension · lethargy · nausea · paraesthesia · restlessness · skin reactions · tachycardia · vomiting · wheezing
 - ▶ Rare or very rare Fever
- **MONITORING REQUIREMENTS** Monitor for development of factor VIII inhibitors.
- **PRESCRIBING AND DISPENSING INFORMATION** Dried factor VIII fraction is prepared from human plasma by a suitable fractionation technique; it may also contain varying amounts of von Willebrand factor. *Optivate®*, *Fanhdi®*, and *Octanate®* are not indicated for use in von Willebrand's disease.

Recombinant human coagulation factor VIII including octocog alfa, morococog alfa, and simococog alfa are not indicated for use in von Willebrand's disease.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Factor XIII 1250 unit Fibrogammin 1,250unit powder and solvent for solution for injection vials | 1 vial [PoM] £532.90

Factor IX fraction, dried

● **INDICATIONS AND DOSE**

Treatment and prophylaxis of haemorrhage in congenital factor IX deficiency (haemophilia B)

- BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION
- Adult: (consult haematologist)

- **CONTRA-INDICATIONS** Disseminated intravascular coagulation

- **CAUTIONS** Risk of thrombosis—principally with former low purity products

● **SIDE-EFFECTS**

- Common or very common Anxiety · back pain · dyspnoea · hypersensitivity · nausea · sensation abnormal · skin reactions · vasodilation
- Rare or very rare Angioedema · cardiac discomfort · chills · disseminated intravascular coagulation · embolism and thrombosis · headache · hypotension · lethargy · myocardial infarction · tachycardia · vomiting · wheezing
- Frequency not known Nephrotic syndrome

- **PRESCRIBING AND DISPENSING INFORMATION** Dried factor IX fraction is prepared from human plasma by a suitable

Fibrinogen, dried

(Human fibrinogen)

● **INDICATIONS AND DOSE**

Treatment of haemorrhage in congenital hypofibrinogenaemia or afibrinogenaemia

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: (consult haematologist)

- **CAUTIONS** Risk of thrombosis

● **SIDE-EFFECTS**

- Common or very common Fever · thromboembolism
- Frequency not known Chest pain · chills · cough · dyspnoea · nausea · skin reactions · tachycardia · vomiting

- **PREGNANCY** Manufacturer advises not known to be harmful—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **PRESCRIBING AND DISPENSING INFORMATION** Fibrinogen is prepared from human plasma.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Riastap** (CSL Behring UK Ltd)
Fibrinogen 1 gram Riastap 1g powder for solution for infusion vials | 1 vial [PoM] £400.00

Protein C concentrate

INDICATIONS AND DOSE

Congenital protein C deficiency

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: (consult haematologist)

- **CAUTIONS** Hypersensitivity to heparins
- **SIDE-EFFECTS**
 - ▶ Rare or very rare Dizziness · fever · skin reactions
 - ▶ Frequency not known Haemothorax · hyperhidrosis · restlessness
- **PRESCRIBING AND DISPENSING INFORMATION** Protein C is prepared from human plasma.

BLOOD AND RELATED PRODUCTS > PLASMA PRODUCTS

Fresh frozen plasma

INDICATIONS AND DOSE

Replacement of coagulation factors or other plasma proteins where their concentration or functional activity is critically reduced

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult haematologist)

Major bleeding in patients on warfarin following phytonadione (if dried prothrombin complex is unavailable)

- ▶ Adult: 15 mL/kilogram

- **CONTRA-INDICATIONS** Avoid use as a volume expander · IgA deficiency with confirmed antibodies to IgA
- **CAUTIONS** Cardiac decompensation · need for compatibility · pulmonary oedema · severe protein S deficiency (avoid products with low protein S activity e.g. OctaplasLG®)
- **SIDE-EFFECTS**
 - ▶ Common or very common Nausea · skin reactions
 - ▶ Uncommon Oedema · vomiting
 - ▶ Rare or very rare Agitation · arrhythmias · bronchospasm · cardio-respiratory distress · chills · fever · hypersensitivity · hypertension · thromboembolism
- **PRESCRIBING AND DISPENSING INFORMATION** Fresh frozen plasma is prepared from the supernatant liquid obtained by centrifugation of one donation of whole blood.
A preparation of solvent/detergent treated human plasma (frozen) from pooled donors is available from Octapharma (OctaplasLG®).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

2.2 Subarachnoid haemorrhage

CALCIUM-CHANNEL BLOCKERS

F 155

07-Feb-2018

Nimodipine

- **DRUG ACTION** Nimodipine is a dihydropyridine calcium-channel blocker.

- **INDICATIONS AND DOSE**

Prevention of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage

► **BY MOUTH**

- **Adult:** 60 mg every 4 hours, to be started within 4 days of aneurysmal subarachnoid haemorrhage and continued for 21 days

Treatment of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage

► **BY INTRAVENOUS INFUSION**

- **Adult (body-weight up to 70 kg):** Initially up to 0.5 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter
- **Adult (body-weight 70 kg and above):** Initially 1 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter

Treatment of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage in patients with unstable blood pressure

► **BY INTRAVENOUS INFUSION**

- **Adult:** Initially up to 0.5 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Nimodipine has been confused with amlodipine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CONTRA-INDICATIONS** Unstable angina · within 1 month of myocardial infarction
- **CAUTIONS** Cerebral oedema · hypotension · severely raised intracranial pressure
- **INTERACTIONS** → Appendix 1: calcium channel blockers
- **SIDE-EFFECTS**
 - **Uncommon** Thrombocytopenia · vasodilation
 - **Rare or very rare** Bradycardia · ileus
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk.
- **HEPATIC IMPAIRMENT**

Monitoring Elimination reduced in cirrhosis—monitor blood pressure.

- **RENAL IMPAIRMENT**

Monitoring ► With intravenous use Manufacturer advises monitor renal function closely in renal impairment.

- **DIRECTIONS FOR ADMINISTRATION** Avoid concomitant administration of nimodipine infusion and tablets.
 - **With oral use** For administration *by mouth*, tablets may be crushed or halved but are light sensitive—administer immediately.
 - **With intravenous use** For *intravenous infusion*, give via drip tubing in Glucose 5% or Sodium chloride 0.9%. Not to be added to infusion container; administer via an infusion pump through a Y-piece into a central catheter; incompatible with polyvinyl chloride giving sets or containers; protect infusion from light. Polyethylene, polypropylene, or glass apparatus should be used. PVC should be avoided.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Solution for infusion

► **Nimotop** (Bayer Plc)

Nimodipine 200 microgram per 1 ml Nimotop 0.02% solution for infusion 50ml vials | 5 vial [PoM] £68.00 (Hospital only)

Tablet

► **Nimotop** (Bayer Plc)

Nimodipine 30 mg Nimotop 30mg tablets | 100 tablet [PoM] £40.00

3 Blood clots

3.1 Blocked catheters and lines

Other drugs used for Blocked catheters and lines Heparin (unfractionated), p. 132 · Urokinase, p. 137

ANTITHROMBOTIC DRUGS ► PROSTAGLANDINS, CARDIOVASCULAR

Epoprostenol

(Prostacyclin)

- **DRUG ACTION** Epoprostenol is a prostaglandin and a potent vasodilator. It is also a powerful inhibitor of platelet aggregation.

- **INDICATIONS AND DOSE**

Inhibition of platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated

Treatment of primary pulmonary hypertension resistant to other treatments, usually with oral anti-coagulation (initiated by a specialist)

► **BY CONTINUOUS INTRAVENOUS INFUSION**

- **Adult:** (consult product literature)

PHARMACOKINETICS

- Short half-life of approximately 3 minutes, therefore it must be administered by continuous intravenous infusion.

- **CONTRA-INDICATIONS** Severe left ventricular dysfunction
- **CAUTIONS** Avoid abrupt withdrawal when used for primary pulmonary hypertension (risk of rebound pulmonary hypertension) · extreme caution in coronary artery disease · haemorrhagic diathesis · pulmonary veno-occlusive disease · reconstituted solution highly alkaline—avoid extravasation (irritant to tissues) · risk of pulmonary oedema (dose titration for pulmonary hypertension should be in hospital)
- **INTERACTIONS** → Appendix 1: epoprostenol

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · anxiety · arrhythmias · arthralgia · chest discomfort · diarrhoea · flushing · haemorrhage · headache · intracranial haemorrhage · nausea · pain · rash · sepsis · vomiting
- ▶ **Uncommon** Dry mouth · hyperhidrosis
- ▶ **Rare or very rare** Fatigue · hyperthyroidism · local infection · pallor
- ▶ **Frequency not known** Ascites · pulmonary oedema (avoid chronic use if occurs during dose titration) · spleen abnormalities
- **PREGNANCY** Use if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Anticoagulant monitoring required when given with anticoagulants.
- **TREATMENT CESSATION** Avoid abrupt withdrawal when used for primary pulmonary hypertension (risk of rebound pulmonary hypertension).
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Flolan®), give continuously in Sodium chloride 0.9%; reconstitute using the filter and solvent (glycine buffer diluent) provided to make a concentrate; may be diluted further (consult product literature); for *pulmonary hypertension* dilute further with glycine buffer diluent only and administer via a central venous catheter (can give via peripheral vein until central venous access established); for *renal dialysis* may be diluted further with sodium chloride 0.9%; protect infusion from light. For *intravenous infusion* (Veletri®), give continuously in Sodium chloride 0.9%; reconstitute each vial with 5 mL sodium chloride 0.9% then dilute to required concentration with sodium chloride 0.9% (consult product literature); administer through an in-line 0.22 micron filter; for *pulmonary hypertension*, administer via a central venous catheter (can give via peripheral vein until central venous access established); protect infusion from direct sunlight.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ Veletri (Actelion Pharmaceuticals UK Ltd)

Epoprostenol (as Epoprostenol sodium) 500 microgram Veletri 500microgram powder for solution for infusion vials | 1 vial [PoM] £24.44

Epoprostenol (as Epoprostenol sodium) 1.5 mg Veletri 1.5mg powder for solution for infusion vials | 1 vial [PoM] £49.24

Powder and solvent for solution for infusion

▶ Flolan (GlaxoSmithKline UK Ltd)

Epoprostenol (as Epoprostenol sodium) 500 microgram Flolan 500microgram powder and solvent (pH12) for solution for infusion vials | 1 vial [PoM] £22.22

Epoprostenol (as Epoprostenol sodium) 1.5 mg Flolan 1.5mg powder and solvent (pH12) for solution for infusion vials | 1 vial [PoM] £44.76

anticipated to have a substantial reduction in mobility, those with obesity, malignant disease, history of venous thromboembolism, thrombophilic disorder, or patients over 60 years. Patients with risk factors for bleeding (e.g. acute stroke, thrombocytopenia, acquired or untreated inherited bleeding disorders) should only receive pharmacological prophylaxis when the risk of bleeding does not outweigh the risk of venous thromboembolism. NICE clinical guideline 92 (January 2010) provides a full list of risk factors, and gives recommendations for prophylaxis. A venous thromboembolism risk assessment checklist is also available from the Department of Health (www.gov.uk/dh).

Patients scheduled for surgery should be offered mechanical prophylaxis (e.g. anti-embolism stockings) on admission if appropriate; prophylaxis should continue until the patient is sufficiently mobile. Choice of mechanical prophylaxis will depend on factors such as the type of surgery, suitability for the patient, and their condition.

Patients undergoing general or orthopaedic surgery, who are considered to be at high risk of venous thromboembolism, should be offered pharmacological prophylaxis. Choice of prophylaxis will depend on the type of surgery, suitability for the patient, and local policy. A low molecular weight heparin is suitable in all types of general and orthopaedic surgery; heparin (unfractionated) p. 132 is preferred for patients in renal failure. Fondaparinux sodium p. 126 is an option for patients undergoing hip or knee replacement surgery, hip fracture surgery, gastro-intestinal, bariatric, or day surgery procedures. The oral anticoagulants apixaban p. 124, dabigatran etexilate p. 135, and rivaroxaban p. 127 are indicated for thromboprophylaxis following hip or knee replacement surgery.

Pharmacological prophylaxis in general surgery should usually continue for 5–7 days, or until sufficient mobility has been re-established. Pharmacological prophylaxis should be extended to 28 days after major cancer surgery in the abdomen or pelvis. Hip or knee replacement surgery, and hip fracture surgery, require an extended duration of pharmacological prophylaxis, depending on the preparation used (consult product literature).

General medical patients who are considered to be at high risk of venous thromboembolism should be offered pharmacological prophylaxis on admission. Choice of prophylaxis will depend on the medical condition, suitability for the patient, and local policy. Patients should receive either a low molecular weight heparin, heparin (unfractionated) (if patient in renal failure), or fondaparinux sodium. Prophylaxis should continue until the patient is no longer considered to be at significant risk of venous thromboembolism. Mechanical prophylaxis (e.g. anti-embolism stockings) can be offered to medical patients in whom pharmacological prophylaxis is contra-indicated, and continued until the patient is sufficiently mobile.

Edoxaban

Edoxaban p. 125, an inhibitor of factor Xa, is given orally for the treatment and prophylaxis of venous thromboembolism, although, it should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolism. Duration of therapy should be determined by balancing the benefit of treatment with the bleeding risk; shorter duration of treatment (at least 3 months) should be based on transient risk factors i.e. recent surgery, trauma, immobilisation, and longer durations should be based on permanent risk factors or idiopathic deep-vein thrombosis or pulmonary embolism. Edoxaban is also licensed for the prophylaxis of stroke and systemic embolism in patients with non-valvular atrial fibrillation and at least one other risk factor.

3.2 Thromboembolism

Venous thromboembolism

Overview

Venous thromboembolism includes deep-vein thrombosis and pulmonary embolism, and occurs as a result of thrombus formation in a vein.

Venous thromboembolism prophylaxis

All patients admitted to hospital should undergo a risk assessment for venous thromboembolism on admission. Patients considered to be at high risk include those

Treatment of venous thromboembolism

For the initial treatment of deep-vein thrombosis and pulmonary embolism a low molecular weight heparin is used; alternatively, heparin (unfractionated) is given as an intravenous loading dose, followed by continuous intravenous infusion (using an infusion pump) or (for deep-vein thrombosis only) by intermittent subcutaneous injection. Intermittent intravenous injection of heparin (unfractionated) is no longer recommended. An oral anticoagulant (usually warfarin sodium p. 139) is started at the same time as unfractionated or low molecular weight heparin (the heparin needs to be continued for at least 5 days and until the INR is ≥ 2 for at least 24 hours). Laboratory monitoring for heparin (unfractionated), preferably on a daily basis, is essential; determination of the activated partial thromboplastin time (APTT) is the most widely used measure (for heparin (unfractionated)). A low molecular weight heparin or, in some circumstances, heparin (unfractionated) is also used in regimens for the management of myocardial infarction and unstable angina.

Venous thromboembolism in pregnancy

Heparins are used for the management of venous thromboembolism in pregnancy because they do not cross the placenta. Low molecular weight heparins are preferred because they have a lower risk of osteoporosis and of heparin-induced thrombocytopenia. Low molecular weight heparins are eliminated more rapidly in pregnancy, requiring alteration of the dosage regimen for drugs such as dalteparin sodium p. 130, enoxaparin sodium p. 131, and tinzaparin sodium p. 133. Treatment should be stopped at the onset of labour and advice sought from a specialist on continuing therapy after birth.

Extracorporeal circuits

Heparin (unfractionated) is also used in the maintenance of extracorporeal circuits in cardiopulmonary bypass and haemodialysis.

Haemorrhage

If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate p. 1328 is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

Management of stroke

16-May-2017

Overview

Stroke is associated with a significant risk of morbidity and mortality. Patients presenting with acute symptoms should be immediately transferred to hospital for accurate diagnosis of stroke type, and urgent initiation of appropriate treatment; patients should be managed by a specialist multidisciplinary stroke team.

The following notes give an overview of the initial and long-term management of transient ischaemic attack, ischaemic stroke, and intracerebral haemorrhage.

Transient ischaemic attack

Patients suspected of having a transient ischaemic attack should immediately receive aspirin p. 121 (patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor, should receive clopidogrel p. 122 [unlicensed use] as an alternative). Following a confirmed diagnosis, patients should receive treatment for secondary prevention (see Long-term Management, under Ischaemic Stroke).

Ischaemic stroke

Initial management

Alteplase p. 215 is recommended in the treatment of acute ischaemic stroke if it can be administered within 4.5 hours of symptom onset; it should be given by medical staff experienced in the administration of thrombolytics and the treatment of acute stroke, preferably within a specialist stroke centre. Treatment with aspirin should be initiated 24 hours after thrombolysis (or as soon as possible within 48 hours of symptom onset in patients not receiving thrombolysis); patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor, should receive clopidogrel [unlicensed use] as an alternative.

Anticoagulants are not recommended as an alternative to antiplatelet drugs in acute ischaemic stroke in patients who are in sinus rhythm. However, parenteral anticoagulants may be indicated in patients who are symptomatic of, or at high risk of developing, deep vein thrombosis or pulmonary embolism; warfarin sodium p. 139 should not be commenced in the acute phase of ischaemic stroke.

Anticoagulants should be considered after cardio-embolic ischaemic stroke in patients with atrial fibrillation, however patients presenting with atrial fibrillation following a disabling ischaemic stroke should receive aspirin before being considered for anticoagulant treatment. Patients already receiving anticoagulation for a prosthetic heart valve who experience a disabling ischaemic stroke and are at significant risk of haemorrhagic transformation, should have their anticoagulant treatment stopped for 7 days and substituted with aspirin.

Treatment of hypertension in the acute phase of ischaemic stroke can result in reduced cerebral perfusion, and should therefore only be instituted in the event of a hypertensive emergency, or in those patients considered for thrombolysis.

Long-term management

Patients should receive long-term treatment following a transient ischaemic attack or an ischaemic stroke to reduce the risk of further cardiovascular events.

Following a *transient ischaemic attack* or an *ischaemic stroke* (not associated with atrial fibrillation), long-term treatment with clopidogrel [unlicensed in transient ischaemic attack] is recommended. If clopidogrel is contra-indicated or not tolerated, patients can receive modified-release dipyridamole p. 123 in combination with aspirin; if both aspirin and clopidogrel are contra-indicated or not tolerated, then modified-release dipyridamole alone is recommended; if both modified-release dipyridamole and clopidogrel are contra-indicated or not tolerated, then aspirin alone is recommended.

Patients with stroke associated with atrial fibrillation should be reviewed for long-term treatment with warfarin sodium or an alternative anticoagulant (see Initial Management under Ischaemic Stroke).

Anticoagulants are not routinely recommended in the long-term prevention of recurrent stroke, except in patients with atrial fibrillation.

A statin should be initiated 48 hours after stroke symptom onset, irrespective of the patient's serum-cholesterol concentration.

Following the acute phase of ischaemic stroke, blood pressure should be measured and treatment initiated to achieve a target blood pressure of $<130/80$ mmHg. Beta-blockers should not be used in the management of hypertension following a stroke, unless they are indicated for a co-existing condition.

All patients should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight, alcohol intake, and smoking.

Intracerebral haemorrhage

Initial Management

Surgical intervention may be required following intracerebral haemorrhage to remove the haematoma and relieve intracranial pressure. Patients taking anticoagulants should have this treatment stopped and reversed; anticoagulant therapy has, however, been used in patients with intracerebral haemorrhage who are symptomatic of deep vein thrombosis or pulmonary embolism; placement of a caval filter is an alternative in this situation.

Long-term management

Aspirin therapy should only be given to patients at a high risk of a cardiac ischaemic event. Anticoagulant therapy is not recommended following an intracerebral haemorrhage, even in those with atrial fibrillation, unless the patient is at very high risk of an ischaemic stroke or cardiac ischaemic events; advice from a specialist should be sought in this situation. Blood pressure should be measured and treatment initiated where appropriate, taking care to avoid hypoperfusion. Statins should be avoided following intracerebral haemorrhage, however they can be used with caution when the risk of a vascular event outweighs the risk of further haemorrhage.

Oral anticoagulants

Overview

The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the thrombus consists of a fibrin web enmeshed with platelets and red cells.

Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin.

Coumarins and phenindione

The oral anticoagulants warfarin sodium p. 139, acenocoumarol p. 138 and phenindione p. 139, antagonise the effects of vitamin K, and take at least 48 to 72 hours for the anticoagulant effect to develop fully; warfarin sodium is the drug of choice. If an immediate effect is required, unfractionated or low molecular weight heparin must be given concomitantly.

These oral anticoagulants should not be used in cerebral artery thrombosis or peripheral artery occlusion as first-line therapy; aspirin p. 121 is more appropriate for reduction of risk in transient ischaemic attacks. Unfractionated or a low molecular weight heparin (see under Parenteral anticoagulants p. 119) is usually preferred for the prophylaxis of venous thromboembolism in patients undergoing surgery; alternatively, warfarin sodium can be continued in selected patients currently taking long-term warfarin sodium and who are at high risk of thromboembolism (seek expert advice).

Dose

The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.

Target INR

The following indications and target INRs for adults for warfarin take into account recommendations of the British Society for Haematology guidelines on oral anticoagulation with warfarin—fourth edition. *Br J Haematol* 2011; **154**: 311–324:

An INR which is within 0.5 units of the target value is generally satisfactory; larger deviations require dosage adjustment. Target values (rather than ranges) are now recommended.

INR 2.5 for:

- treatment of deep-vein thrombosis or pulmonary embolism (including those associated with antiphospholipid syndrome or for recurrence in patients no longer receiving warfarin sodium)
- atrial fibrillation
- cardioversion—target INR should be achieved at least 3 weeks before cardioversion and anticoagulation should continue for at least 4 weeks after the procedure (higher target values, such as an INR of 3, can be used for up to 4 weeks before the procedure to avoid cancellations due to low INR)
- dilated cardiomyopathy
- mitral stenosis or regurgitation in patients with either atrial fibrillation, a history of systemic embolism, a left atrial thrombus, or an enlarged left atrium
- bioprosthetic heart valves in the mitral position (treat for 3 months), or in patients with a history of systemic embolism (treat for at least 3 months), or with a left atrial thrombus at surgery (treat until clot resolves), or with other risk factors (e.g. atrial fibrillation or a low ventricular ejection fraction)
- acute arterial embolism requiring embolectomy (consider long-term treatment)
- myocardial infarction

INR 3.5 for:

- recurrent deep-vein thrombosis or pulmonary embolism in patients currently receiving anticoagulation and with an INR above 2;

Mechanical prosthetic heart valves:

- the recommended target INR depends on the type and location of the valve, and patient-related risk factors
- consider increasing the INR target or adding an antiplatelet drug, if an embolic event occurs whilst anticoagulated at the target INR.

Duration

The risks of thromboembolism recurrence and anticoagulant-related bleeding should be considered when deciding the duration of anticoagulation.

The following durations of warfarin sodium for the treatment of deep-vein thrombosis and pulmonary embolism reflect the recommendations of the British Society for Haematology (Guidelines on Oral Anticoagulation with Warfarin—fourth edition. *Br J Haematol* 2011; **154**: 311–324):

- 6 weeks for isolated calf-vein deep-vein thrombosis
- 3 months for venous thromboembolism provoked by surgery or other transient risk factor (e.g. combined oral contraceptive use, pregnancy, plaster cast)
- at least 3 months for unprovoked proximal deep-vein thrombosis or pulmonary embolism; long-term anticoagulation may be required.

Haemorrhage

The main adverse effect of all oral anticoagulants is haemorrhage. Checking the INR and omitting doses when appropriate is essential; if the anticoagulant is stopped but not reversed, the INR should be measured 2–3 days later to ensure that it is falling. The cause of an elevated INR should be investigated. The following recommendations (which take into account the recommendations of the British Society for Haematology Guidelines on Oral Anticoagulation with Warfarin—fourth edition. *Br J Haematol* 2011; **154**: 311–324) are based on the result of the INR and whether there is major or minor bleeding; the recommendations apply to adults taking warfarin:

- Major bleeding—stop warfarin sodium; give phytonadione p. 1056 (vitamin K₁) by slow intravenous injection; give dried prothrombin complex p. 111 (factors II, VII, IX, and X); if dried prothrombin complex unavailable, fresh frozen plasma can be given but is less

effective; recombinant factor VIIa is not recommended for emergency anticoagulation reversal

- INR >8.0, minor bleeding—stop warfarin sodium; give phytonadione (vitamin K₁) by slow intravenous injection; repeat dose of phytonadione if INR still too high after 24 hours; restart warfarin sodium when INR <5.0
- INR >8.0, no bleeding—stop warfarin sodium; give phytonadione (vitamin K₁) by mouth using the intravenous preparation orally [unlicensed use]; repeat dose of phytonadione if INR still too high after 24 hours; restart warfarin when INR <5.0
- INR 5.0–8.0, minor bleeding—stop warfarin sodium; give phytonadione (vitamin K₁) by slow intravenous injection; restart warfarin sodium when INR <5.0
- INR 5.0–8.0, no bleeding—withhold 1 or 2 doses of warfarin sodium and reduce subsequent maintenance dose
- Unexpected bleeding at therapeutic levels—always investigate possibility of underlying cause e.g. unsuspected renal or gastro-intestinal tract pathology

Peri-operative anticoagulation

Warfarin sodium should usually be stopped 5 days before elective surgery; phytonadione (vitamin K₁) by mouth (using the intravenous preparation orally [unlicensed use]) should be given the day before surgery if the INR is ≥ 1.5 . If haemostasis is adequate, warfarin sodium can be resumed at the normal maintenance dose on the evening of surgery or the next day.

Patients stopping warfarin sodium prior to surgery who are considered to be at high risk of thromboembolism (e.g. those with a venous thromboembolic event within the last 3 months, atrial fibrillation with previous stroke or transient ischaemic attack, or mitral mechanical heart valve) may require interim therapy ('bridging') with a low molecular weight heparin (using treatment dose). The low molecular weight heparin should be stopped at least 24 hours before surgery; if the surgery carries a high risk of bleeding, the low molecular weight heparin should not be restarted until at least 48 hours after surgery.

Patients on warfarin sodium p. 139 who require emergency surgery that can be delayed for 6–12 hours can be given intravenous phytonadione p. 1056 (vitamin K₁) to reverse the anticoagulant effect. If surgery cannot be delayed, dried prothrombin complex p. 111 can be given in addition to intravenous phytonadione (vitamin K₁) and the INR checked before surgery.

Combined anticoagulant and antiplatelet therapy

Existing antiplatelet therapy following an acute coronary syndrome or percutaneous coronary intervention should be continued for the necessary duration according to the indication being treated. The addition of warfarin sodium, when indicated (e.g. for venous thromboembolism or atrial fibrillation) should be considered following an assessment of the patient's risk of bleeding and discussion with a cardiologist. The duration of treatment with dual therapy (e.g. aspirin p. 121 and warfarin sodium) or triple therapy (e.g. aspirin with clopidogrel p. 122 and warfarin sodium) should be kept to a minimum where possible. The risk of bleeding with aspirin and warfarin sodium dual therapy is lower than with clopidogrel and warfarin sodium. Depending on the indications being treated and the patient's risk of thromboembolism, it may be possible to withhold antiplatelet therapy until warfarin sodium therapy is complete, or *vice versa* (on specialist advice) in order to reduce the length of time on dual or triple therapy.

Parenteral anticoagulants

Overview

The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the thrombus consists of a fibrin web enmeshed with platelets and red cells.

Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin.

Heparin

Heparin initiates anticoagulation rapidly but has a short duration of action. It is often referred to as '**standard**' or heparin (unfractionated) p. 132 to distinguish it from the **low molecular weight heparins**, which have a longer duration of action. Although a low molecular weight heparin is generally preferred for routine use, heparin (unfractionated) can be used in those at high risk of bleeding because its effect can be terminated rapidly by stopping the infusion.

Low molecular weight heparins

Low molecular weight heparins (dalteparin sodium p. 130, enoxaparin sodium p. 131, and tinzaparin sodium p. 133) are usually preferred over heparin (unfractionated) in the *prevention* of Venous thromboembolism p. 116 because they are as effective and they have a lower risk of heparin-induced thrombocytopenia. The standard prophylactic regimen does not require anticoagulant monitoring. The duration of action of low molecular weight heparins is longer than that of heparin (unfractionated) and *once-daily subcutaneous* administration is possible for some indications, making them convenient to use.

Low molecular weight heparins are generally preferred over heparin (unfractionated) in the *treatment* of deep vein thrombosis and pulmonary embolism, and are also used in the treatment of myocardial infarction, unstable coronary artery disease (see under Acute coronary syndromes p. 212) and for the prevention of clotting in extracorporeal circuits.

Dalteparin sodium and tinzaparin sodium (only 20 000 unit/mL syringe) are also licensed for the extended treatment and prophylaxis of venous thromboembolism in patients with solid tumours; treatment is recommended for a duration of 6 months. Treatment should be initiated by healthcare professionals experienced in the treatment of venous thromboembolism.

Heparinoids

Danaparoid sodium p. 129 is a heparinoid used for prophylaxis of deep-vein thrombosis in patients undergoing general or orthopaedic surgery. Providing there is no evidence of cross-reactivity, it also has a role in patients who develop heparin-induced thrombocytopenia.

Argatroban

An oral anticoagulant can be given with argatroban monohydrate p. 134, but it should only be started once thrombocytopenia has substantially resolved.

Hirudins

Bivalirudin, a hirudin analogue, is a thrombin inhibitor which is licensed for unstable angina or non-ST-segment elevation myocardial infarction in patients planned for urgent or early intervention, and as an anticoagulant for patients undergoing percutaneous coronary intervention (including patients with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention—see also Management of ST-segment elevation myocardial infarction (STEMI) in Acute coronary syndromes p. 212).

Heparin flushes

The use of heparin flushes should be kept to a minimum. For maintaining patency of peripheral venous catheters, sodium chloride injection 0.9% is as effective as heparin flushes. The role of heparin flushes in maintaining patency of arterial and central venous catheters is unclear.

Epoprostenol

Epoprostenol (prostacyclin) can be given to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated. It is also licensed for the treatment of primary pulmonary hypertension resistant to other treatment, usually with oral anticoagulation; it should be initiated by specialists in pulmonary hypertension. Epoprostenol is a potent vasodilator. It has a short half-life of approximately 3 minutes and therefore it must be administered by continuous intravenous infusion.

Fondaparinux

Fondaparinux sodium is a synthetic pentasaccharide that inhibits activated factor X.

Other drugs used for Thromboembolism Streptokinase, p. 216

ANTIDOTES AND CHELATORS

Idarucizumab

17-Mar-2017

- **DRUG ACTION** Idarucizumab is a humanised monoclonal antibody fragment that binds specifically to dabigatran and its metabolites, thereby reversing the anticoagulant effect.

● INDICATIONS AND DOSE

Rapid reversal of dabigatran for emergency procedures, or in life-threatening or uncontrolled bleeding (specialist supervision in hospital)

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 5 g, followed by 5 g if required

- **CAUTIONS** Risk of thrombosis

CAUTIONS, FURTHER INFORMATION Manufacturer advises to consider re-starting anticoagulant therapy as soon as medically appropriate to reduce the risk of thrombosis. Dabigatran can be re-started 24 hours after administration of idarucizumab; other anticoagulant therapy can be started at any time.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises that one dose of *Praxbind*[®] is administered as either two consecutive intravenous infusions, each given over 5–10 minutes, or as a bolus injection.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2016) that idarucizumab (*Praxbind*[®]) is accepted for use within NHS Scotland for adult patients treated with dabigatran etexilate when rapid reversal of its anticoagulant effects is required for emergency surgery/urgent procedures or in life-threatening or uncontrolled bleeding.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCipients: May contain Polysorbates, sorbitol

ELECTROLYTES: May contain Sodium

▶ **Praxbind** (Boehringer Ingelheim Ltd) ▼

Idarucizumab 50 mg per 1 ml Praxbind 2.5g/50ml solution for infusion vials | 2 vial (PoM) £2,400.00 (Hospital only)

ANTITHROMBOTIC DRUGS > ANTIPLATELET DRUGS

Antiplatelet drugs

Overview

Antiplatelet drugs decrease platelet aggregation and inhibit thrombus formation in the arterial circulation, because in faster-flowing vessels, thrombi are composed mainly of platelets with little fibrin.

Use of aspirin p. 121 in primary prevention of cardiovascular events, in patients with or without diabetes, is of unproven benefit. Long-term use of aspirin is of benefit in established cardiovascular disease (secondary prevention); unduly high blood pressure must be controlled before aspirin is given. If the patient is at a high risk of gastro-intestinal bleeding, a proton pump inhibitor can be added.

Aspirin is given following coronary bypass surgery. It is also used in atrial fibrillation, for intermittent claudication, for stable angina and acute coronary syndromes, for use following placement of coronary stents and for use in stroke.

Clopidogrel p. 122 is licensed for the prevention of atherothrombotic events in patients with a history of symptomatic ischaemic disease. Clopidogrel, in combination with low-dose aspirin, is also licensed for acute coronary syndrome without ST-segment elevation; in these circumstances the combination is given for up to 12 months (most benefit occurs during the first 3 months; there is no evidence of benefit beyond 12 months). Clopidogrel, in combination with low-dose aspirin, is also licensed for acute myocardial infarction with ST-segment elevation; the combination is licensed for at least 4 weeks, but the optimum treatment duration has not been established. In patients undergoing percutaneous coronary intervention, clopidogrel is used as an adjunct with aspirin. Patients who are not already taking clopidogrel should receive a loading dose prior to procedure.

Clopidogrel is also licensed, in combination with low-dose aspirin, for the prevention of atherothrombotic and thromboembolic events in patients with atrial fibrillation (and at least one risk factor for a vascular event), and for whom warfarin sodium p. 139 is unsuitable.

Use of clopidogrel with aspirin increases the risk of bleeding. Clopidogrel monotherapy may be an alternative when aspirin is contra-indicated, for example in those with aspirin hypersensitivity, or when aspirin is not tolerated despite the addition of a proton pump inhibitor (see also NICE guidance).

Clopidogrel also has uses in stroke.

Dipyridamole p. 123 is used by mouth as an adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves. Modified-release preparations are licensed for secondary prevention of ischaemic stroke and transient ischaemic attacks.

Prasugrel p. 213, in combination with aspirin, is licensed for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention; the combination is usually given for up to 12 months.

Ticagrelor p. 214, in combination with aspirin, is licensed for the prevention of atherothrombotic events in patients

with acute coronary syndrome; the combination is usually given for up to 12 months.

Cangrelor p. 208, in combination with aspirin, is licensed for the reduction of thrombotic cardiovascular events in patients with coronary artery disease undergoing percutaneous coronary intervention (PCI) who have not received treatment with oral clopidogrel, prasugrel or ticagrelor prior to the procedure and in whom oral therapy with these drugs is not suitable. Cangrelor is to be used under expert supervision only.

Antiplatelet drugs and coronary stents

Patients selected for percutaneous coronary intervention, with the placement of a coronary stent, will require dual antiplatelet therapy with aspirin and either cangrelor, clopidogrel, prasugrel, or ticagrelor. Aspirin therapy should continue indefinitely. Clopidogrel is recommended for 1 month following elective percutaneous coronary intervention with placement of a bare-metal stent, and for 12 months if percutaneous coronary intervention with placement of a bare-metal stent was for an acute coronary syndrome; clopidogrel should be given for 12 months following placement of a drug-eluting stent. Clopidogrel should not be discontinued prematurely in patients with a drug-eluting stent—there is an increased risk of stent thrombosis as a result of the eluted drug slowing the re-endothelialisation process. Patients considered to be at high risk of developing late stent thrombosis with a drug-eluting stent may require a longer duration of treatment with clopidogrel. Prasugrel or ticagrelor are alternatives to clopidogrel in certain patients undergoing percutaneous coronary intervention.

Glycoprotein IIb/IIIa inhibitors

Glycoprotein IIb/IIIa inhibitors prevent platelet aggregation by blocking the binding of fibrinogen to receptors on platelets. Abciximab p. 208 is a monoclonal antibody which binds to glycoprotein IIb/IIIa receptors and to other related sites; it is licensed as an adjunct to heparin (unfractionated) p. 132 and aspirin for the prevention of ischaemic complications in high-risk patients undergoing percutaneous transluminal coronary intervention. Abciximab should be used once only (to avoid additional risk of thrombocytopenia). Eptifibatide p. 209 (in combination with heparin (unfractionated) and aspirin) and tirofiban p. 209 (in combination with heparin (unfractionated), aspirin, and clopidogrel) also inhibit glycoprotein IIb/IIIa receptors; they are licensed for use to prevent early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction. Tirofiban is also licensed for use in combination with heparin (unfractionated), aspirin, and clopidogrel, for the reduction of major cardiovascular events in patients with ST-segment elevation myocardial infarction intended for primary percutaneous coronary intervention. Abciximab, eptifibatide and tirofiban should be used by specialists only.

Epoprostenol p. 115 is also used to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated.

Aspirin

(Acetylsalicylic Acid)

● INDICATIONS AND DOSE

Cardiovascular disease (secondary prevention)

- BY MOUTH
- Adult: 75 mg daily

Management of unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI) | Management of ST-segment elevation myocardial infarction (STEMI)

- BY MOUTH
- Adult: 300 mg, chewed or dispersed in water

Suspected transient ischaemic attack

- BY MOUTH
- Adult: 300 mg once daily until diagnosis established

Transient ischaemic attack (long-term treatment in combination with dipyridamole) | Ischaemic stroke not associated with atrial fibrillation (in combination with dipyridamole if clopidogrel contra-indicated or not tolerated) | Ischaemic stroke not associated with atrial fibrillation (used alone if clopidogrel and dipyridamole contra-indicated or not tolerated)

- BY MOUTH
- Adult: 75 mg once daily

Acute ischaemic stroke

- BY MOUTH
- Adult: 300 mg once daily for 14 days, to be initiated 24 hours after thrombolysis or as soon as possible within 48 hours of symptom onset in patients not receiving thrombolysis

Atrial fibrillation following a disabling ischaemic stroke (before being considered for anticoagulant treatment)

- BY MOUTH
- Adult: 300 mg once daily for 14 days

Following disabling ischaemic stroke in patients receiving anticoagulation for a prosthetic heart valve and who are at significant risk of haemorrhagic transformation

- BY MOUTH
- Adult: 300 mg once daily, anticoagulant treatment stopped for 7 days and to be substituted with aspirin

Following coronary by-pass surgery

- BY MOUTH
- Adult: 75–300 mg daily

Mild to moderate pain | Pyrexia

- BY MOUTH
- Adult: 300–900 mg every 4–6 hours as required; maximum 4 g per day
- BY RECTUM
- Adult: 450–900 mg every 4 hours; maximum 3.6 g per day

- **CONTRA-INDICATIONS** Active peptic ulceration · bleeding disorders (antiplatelet dose) · children under 16 years (risk of Reye's syndrome) · haemophilia · previous peptic ulceration (analgesic dose) · severe cardiac failure (analgesic dose)

CONTRA-INDICATIONS, FURTHER INFORMATION

- **Reye's syndrome** Owing to an association with Reye's syndrome, aspirin-containing preparations should not be given to children under 16 years, unless specifically indicated, e.g. for Kawasaki disease.
- **CAUTIONS** Allergic disease · anaemia · asthma · dehydration · elderly · G6PD deficiency · preferably avoid during fever or viral infection in children (risk of Reye's syndrome) · previous peptic ulceration (but manufacturers may advise avoidance of low-dose aspirin in history of peptic ulceration) · thyrotoxicosis · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1: aspirin
- **SIDE-EFFECTS**
 - **Common or very common** Dyspepsia · haemorrhage
 - **Uncommon** Dyspnoea · rhinitis · severe cutaneous adverse reactions (SCARs) · skin reactions
 - **Rare or very rare** Aplastic anaemia · asthmatic attack · bronchospasm · erythema nodosum · gastrointestinal haemorrhage (severe) · granulocytosis · haemorrhagic vasculitis · intracranial haemorrhage · menorrhagia · nausea · thrombocytopenia · vomiting
 - **Frequency not known** Fluid retention · gastrointestinal disorders · headache · hearing impairment · hepatic failure · hyperuricaemia · iron deficiency anaemia · renal impairment · sodium retention · vertigo

Overdose The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning.

For specific details on the management of poisoning, see Aspirin, under Emergency treatment of poisoning p. 1319.

- **ALLERGY AND CROSS-SENSITIVITY** Aspirin is **contra-indicated** in history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria, or rhinitis have been precipitated by aspirin or any other NSAID.
- **PREGNANCY** Use antiplatelet doses with caution during third trimester; impaired platelet function and risk of haemorrhage; delayed onset and increased duration of labour with increased blood loss; avoid analgesic doses if possible in last few weeks (low doses probably not harmful); high doses may be related to intra-uterine growth restriction, teratogenic effects, closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of newborn; kernicterus may occur in jaundiced neonates.
- **BREAST FEEDING** Avoid—possible risk of Reye's syndrome; regular use of high doses could impair platelet function and produce hypoprothrombinaemia in infant if neonatal vitamin K stores low.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment—increased risk of gastro-intestinal bleeding.
- **RENAL IMPAIRMENT** Use with caution; avoid in severe impairment; sodium and water retention; deterioration in renal function; increased risk of gastro-intestinal bleeding.
- **PRESCRIBING AND DISPENSING INFORMATION** BP directs that when no strength is stated the 300 mg strength should be dispensed, and that when soluble aspirin tablets are prescribed, dispersible aspirin tablets shall be dispensed.
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary
Aspirin Dispersible Tablets 300 mg may be prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

£0.50 DT = £0.33

Clopidogrel

INDICATIONS AND DOSE

Prevention of atherothrombotic events in percutaneous coronary intervention (adjunct with aspirin) in patients not already on clopidogrel

BY MOUTH

- ▶ Adult: Loading dose 300 mg, to be taken prior to the procedure, alternatively loading dose 600 mg, higher dose may produce a greater and more rapid inhibition of platelet aggregation

Transient ischaemic attack for patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor | Acute ischaemic stroke for patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor

BY MOUTH

- ▶ Adult: 75 mg once daily

Prevention of atherothrombotic events in peripheral arterial disease or within 35 days of myocardial infarction, or within 6 months of ischaemic stroke

BY MOUTH

- ▶ Adult: 75 mg once daily

Prevention of atherothrombotic events in acute coronary syndrome without ST-segment elevation (given with aspirin)

BY MOUTH

- ▶ Adult: Initially 300 mg, then 75 mg daily for up to 12 months

Prevention of atherothrombotic events in acute myocardial infarction with ST-segment elevation (given with aspirin)

BY MOUTH

- ▶ Adult 18-75 years: Initially 300 mg, then 75 mg for at least 4 weeks
- ▶ Adult 76 years and over: 75 mg daily for at least 4 weeks

Prevention of atherothrombotic and thromboembolic events in patients with atrial fibrillation and at least one risk factor for a vascular event (with aspirin) and for whom warfarin is unsuitable

BY MOUTH

- ▶ Adult: 75 mg once daily

- **UNLICENSED USE** 600 mg loading dose prior to percutaneous coronary intervention is an unlicensed dose. Use in transient ischaemic attack or acute ischaemic stroke, in patients with aspirin hypersensitivity or intolerant of aspirin, is unlicensed.
- **CONTRA-INDICATIONS** Active bleeding
- **CAUTIONS** Discontinue 7 days before elective surgery if antiplatelet effect not desirable - patients at risk of

increased bleeding from trauma, surgery, or other pathological conditions

● **INTERACTIONS** → Appendix 1: clopidogrel

● **SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea · gastrointestinal discomfort · haemorrhage · skin reactions
- ▶ **Uncommon** Constipation · dizziness · eosinophilia · gastrointestinal disorders · headache · intracranial haemorrhage · leucopenia · nausea · paraesthesia · thrombocytopenia · vomiting
- ▶ **Rare or very rare** Acquired haemophilia · agranulocytosis · anaemia · angioedema · arthralgia · arthritis · bone marrow disorders · confusion · fever · glomerulonephritis · gynaecomastia · hallucination · hepatic disorders · hypersensitivity · hypotension · myalgia · neutropenia · pancreatitis · respiratory disorders · severe cutaneous adverse reactions (SCARs) · stomatitis · taste altered · ulcerative colitis · vasculitis · vertigo
- ▶ **Frequency not known** Kounis syndrome

● **ALLERGY AND CROSS-SENSITIVITY** Caution with history of hypersensitivity reactions to thienopyridines (e.g. prasugrel).

● **PREGNANCY** Manufacturer advises avoid—no information available.

● **BREAST FEEDING** Manufacturer advises avoid.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of bleeding). Avoid in severe impairment.

● **RENAL IMPAIRMENT** Manufacturer advises caution.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Clopidogrel and modified-release dipyridamole in the prevention of occlusive vascular events (December 2010)** NICE TA210

The guidance applies to patients who have had an occlusive vascular event, or who have established peripheral arterial disease. The guidance does not apply to patients who have had, or are at risk of, stroke associated with atrial fibrillation, or who need prophylaxis for occlusive events following coronary revascularisation or carotid artery procedures.

Clopidogrel monotherapy is recommended as an option to prevent occlusive vascular events in patients who have had:

- an ischaemic stroke, or who have peripheral arterial disease or multivascular disease, **or**
- a myocardial infarction, only if aspirin is contra-indicated or not tolerated.

www.nice.org.uk/TA210

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2004) that clopidogrel be accepted for restricted use for the treatment of confirmed acute coronary syndrome (without ST-segment elevation), in combination with aspirin. Clopidogrel should be initiated in hospital inpatients **only**.

The *Scottish Medicines Consortium* has also advised (July 2007) that clopidogrel be accepted for restricted use for patients with ST-segment elevation acute myocardial infarction in combination with aspirin; treatment with clopidogrel is restricted to 4 weeks only.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

▶ **Clopidogrel (Non-proprietary)**

Clopidogrel 75 mg Clopidogrel 75mg tablets | 28 tablet [PoM] £30.53 DT = £1.30 | 30 tablet [PoM] £1.39-£32.71

▶ **Grepid** (Kent Pharmaceuticals Ltd)

Clopidogrel 75 mg Grepid 75mg tablets | 28 tablet [PoM] £33.93 DT = £1.30 | 30 tablet [PoM] £32.28

▶ **Plavix** (Sanofi)

Clopidogrel 75 mg Plavix 75mg tablets | 30 tablet [PoM] £35.64

Clopidogrel (as Clopidogrel hydrogen sulfate) 300 mg Plavix 300mg tablets | 30 tablet [PoM] £142.54 DT = £142.54

Dipyridamole

● **INDICATIONS AND DOSE**

Secondary prevention of ischaemic stroke (not associated with atrial fibrillation) and transient ischaemic attacks (used alone or with aspirin) Adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves

▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- ▶ **Adult:** 200 mg twice daily, to be taken preferably with food

Adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves

▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- ▶ **Adult:** 300–600 mg daily in 3–4 divided doses

Myocardial imaging—diagnostic use only

▶ **BY INTRAVENOUS INJECTION**

- ▶ **Adult:** (consult product literature)

- **CAUTIONS** Aortic stenosis · coagulation disorders · heart failure · hypotension · left ventricular outflow obstruction · may exacerbate migraine · myasthenia gravis (risk of exacerbation) · rapidly worsening angina · recent myocardial infarction

● **INTERACTIONS** → Appendix 1: dipyridamole

● **SIDE-EFFECTS**

- ▶ **Common or very common** Angina pectoris · diarrhoea · dizziness · headache · myalgia · nausea · skin reactions · vomiting
- ▶ **Frequency not known** Angioedema · bronchospasm · haemorrhage · hot flush · hypotension · tachycardia · thrombocytopenia

● **PREGNANCY** Not known to be harmful.

● **BREAST FEEDING** Manufacturers advise use only if essential—small amount present in milk.

● **PRESCRIBING AND DISPENSING INFORMATION** Modified-release capsules should be dispensed in original container (pack contains a desiccant) and any capsules remaining should be discarded 6 weeks after opening.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Clopidogrel and modified-release dipyridamole in the prevention of occlusive vascular events (December 2010)** NICE TA210

The guidance applies to patients who have had an occlusive vascular event, or who have established peripheral arterial disease. The guidance does not apply to patients who have had, or are at risk of, stroke associated with atrial fibrillation, or who need prophylaxis for occlusive events following coronary revascularisation or carotid artery procedures.

Modified-release dipyridamole, in combination with aspirin, is recommended as an option to prevent occlusive vascular events in patients who have had:

- a transient ischaemic attack, **or**
- an ischaemic stroke, only if clopidogrel is contra-indicated or not tolerated.

Modified-release dipyridamole monotherapy is recommended as an option to prevent occlusive vascular events in patients who have had:

- an ischaemic stroke, only if aspirin and clopidogrel are contra-indicated or not tolerated, **or**
- a transient ischaemic attack, only if aspirin is contra-indicated or not tolerated.

► Trolactin (Actavis UK Ltd)

Dipyridamole 200 mg Trolactin 200mg modified-release capsules | 60 capsule [PoM](#) £10.05 DT = £10.06

Tablet

CAUTIONARY AND ADVISORY LABELS 22

► Dipyridamole (Non-proprietary)

Dipyridamole 25 mg Dipyridamole 25mg tablets | 84 tablet [PoM](#) £9.40 DT = £9.40

Dipyridamole 100 mg Dipyridamole 100mg tablets | 84 tablet [PoM](#) £12.50 DT = £3.88

► Persantin (Boehringer Ingelheim Ltd)

Dipyridamole 100 mg Persantin 100mg tablets | 84 tablet [PoM](#) £6.30 DT = £3.88

Dipyridamole with aspirin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dipyridamole p. 123, aspirin p. 121.

INDICATIONS AND DOSE

Secondary prevention of ischaemic stroke and transient ischaemic attacks

- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 25/200 mg twice daily

INTERACTIONS → Appendix 1: aspirin · dipyridamole

PRESCRIBING AND DISPENSING INFORMATION Dispense in original container (pack contains a desiccant) and discard any capsules remaining 6 weeks after opening.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 21, 25, 32

► Dipyridamole with aspirin (Non-proprietary)

Aspirin 25 mg, Dipyridamole 200 mg Dipyridamole 200mg modified-release / Aspirin 25mg capsules | 100 capsule [PoM](#) [NS](#) DT = £9.35

► Atransipar (Par Laboratories Europe Ltd)

Aspirin 25 mg, Dipyridamole 200 mg Atransipar 200mg/25mg modified-release capsules | 60 capsule [PoM](#) £9.84

► Molita (Dr Reddy's Laboratories (UK) Ltd)

Aspirin 25 mg, Dipyridamole 200 mg Molita 200mg/25mg modified-release capsules | 100 capsule [PoM](#) £9.35 DT = £9.35

ANTITHROMBOTIC DRUGS > FACTOR Xa INHIBITORS

Apixaban

20-Apr-2017

DRUG ACTION Apixaban is a direct inhibitor of activated factor X (factor Xa).

INDICATIONS AND DOSE

Prophylaxis of venous thromboembolism following knee replacement surgery

► BY MOUTH

- Adult: 2.5 mg twice daily for 10–14 days, to be started 12–24 hours after surgery

Prophylaxis of venous thromboembolism following hip replacement surgery

► BY MOUTH

- Adult: 2.5 mg twice daily for 32–38 days, to be started 12–24 hours after surgery

Treatment of deep-vein thrombosis | Treatment of pulmonary embolism

► BY MOUTH

- Adult: Initially 10 mg twice daily for 7 days, then maintenance 5 mg twice daily

Prophylaxis of recurrent deep-vein thrombosis |

Prophylaxis of recurrent pulmonary embolism

► BY MOUTH

- Adult: 2.5 mg twice daily, following completion of 6 months anticoagulant treatment

Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and at least one risk factor (such as previous stroke or transient ischaemic attack, symptomatic heart failure, diabetes mellitus, hypertension, or age 75 years and over)

► BY MOUTH

- Adult: 5 mg twice daily, reduce dose to 2.5 mg twice daily in patients with at least two of the following characteristics: age 80 years and over, body-weight less than 61 kg, or serum creatinine 133 micromol/litre and over

DOSE EQUIVALENCE AND CONVERSION

- For information on changing from, or to, other anticoagulants, consult product literature.

CONTRA-INDICATIONS Active, clinically significant bleeding · risk factors for major bleeding

CONTRA-INDICATIONS, FURTHER INFORMATION

- Risk factors for major bleeding Manufacturer advises avoid in conditions with significant risk factors for major bleeding, including current or recent gastrointestinal ulceration, malignant neoplasms at high risk of bleeding, recent brain, spinal or ophthalmic surgery, recent intracranial haemorrhage, known or suspected oesophageal varices, arteriovenous malformations, vascular aneurysms or major intraspinal or intracerebral vascular abnormalities.
- CAUTIONS Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—monitor neurological signs and wait 20–30 hours after apixaban dose before removing catheter and do not give next dose until at least 5 hours after catheter removal) · prosthetic heart valve (efficacy not established) · risk of bleeding
- INTERACTIONS → Appendix 1: apixaban
- SIDE-EFFECTS
- Common or very common Anaemia · haemorrhage · nausea · skin reactions
- Uncommon CNS haemorrhage · hypotension · thrombocytopenia
- PREGNANCY Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in mild-to-moderate impairment; avoid in severe impairment and in hepatic disease associated with coagulopathy and clinically relevant bleeding risk.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 15 mL/minute—no information available. When used for *prophylaxis of venous thromboembolism following knee or hip replacement surgery, prophylaxis of recurrent deep-vein thrombosis or pulmonary embolism, and treatment of deep-vein thrombosis or pulmonary embolism*, use with caution if creatinine clearance 15–29 mL/minute.

Dose adjustments When used for *prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation*, reduce dose to 2.5 mg twice daily if serum-creatinine 133 micromol/litre and over is associated with age 80 years and over or body-weight less than 61 kg; reduce dose to 2.5 mg twice daily if creatinine clearance 15–29 mL/minute.

● MONITORING REQUIREMENTS

- ▶ Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
- ▶ No routine anticoagulant monitoring required (INR tests are unreliable).

- **PRESCRIBING AND DISPENSING INFORMATION** Duration of treatment should be determined by balancing the benefit of treatment with the bleeding risk; shorter duration of treatment (at least 3 months) should be based on transient risk factors i.e. recent surgery, trauma, immobilisation.

Apixaban should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolectomy.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Apixaban for the prevention of venous thromboembolism after total hip or knee replacement in adults (January 2012)** NICE TA245
Apixaban is an option for the prevention of venous thromboembolism in adults after elective hip or knee replacement surgery.
www.nice.org.uk/TA245

- ▶ **Apixaban for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation (February 2013)** NICE TA275
Apixaban is an option for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation in accordance with its licensed indication; with one or more of the following risk factors:

- previous stroke or transient ischaemic attack
- symptomatic heart failure
- age ≥ 75 years
- diabetes mellitus
- hypertension

The risks and benefits of apixaban compared to warfarin, dabigatran etexilate, and rivaroxaban should be discussed with the patient.

www.nice.org.uk/TA275

- ▶ **Apixaban for the treatment and secondary prevention of deep vein thrombosis and/or pulmonary embolism (June 2015)** NICE TA341

Apixaban is an option for the treatment and prevention of recurrent deep vein thrombosis and pulmonary embolism in adults.

www.nice.org.uk/TA341

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Eliquis** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Apixaban 2.5 mg Eliquis 2.5mg tablets | 10 tablet **[PoM]** £9.50 | 20 tablet **[PoM]** £19.00 | 60 tablet **[PoM]** £57.00 DT = £57.00

Apixaban 5 mg Eliquis 5mg tablets | 28 tablet **[PoM]** £26.60 | 56 tablet **[PoM]** £53.20 DT = £53.20

Edoxaban

25-Apr-2016

- **DRUG ACTION** Edoxaban is a direct and reversible inhibitor of activated factor X (factor Xa), which prevents conversion of prothrombin to thrombin and prolongs clotting time, thereby reducing the risk of thrombus formation.

● INDICATIONS AND DOSE

Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation, in patients with at least one risk factor (such as congestive heart failure, hypertension, aged 75 years and over, diabetes mellitus, previous stroke or transient ischaemic attack)

▶ BY MOUTH

- ▶ Adult (body-weight up to 61 kg): 30 mg once daily
- ▶ Adult (body-weight 61 kg and above): 60 mg once daily

Treatment of deep-vein thrombosis | Prophylaxis of recurrent deep-vein thrombosis | Treatment of pulmonary embolism | Prophylaxis of recurrent pulmonary embolism

▶ BY MOUTH

- ▶ Adult (body-weight up to 61 kg): 30 mg once daily, duration of treatment adjusted according to risk factors—consult product literature, treatment should follow initial use of parenteral anticoagulant for at least 5 days
- ▶ Adult (body-weight 61 kg and above): 60 mg once daily, duration of treatment adjusted according to risk factors—consult product literature, treatment should follow initial use of parenteral anticoagulant for at least 5 days

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises max. dose of 30 mg once daily with concurrent ciclosporin, dronedarone, erythromycin, or ketoconazole.

DOSE EQUIVALENCE AND CONVERSION

- ▶ For information on changing from, or to, other anticoagulants, consult product literature.

- **CONTRA-INDICATIONS** Active bleeding · arteriovenous malformations · current or recent gastro-intestinal ulceration · hepatic disease (associated with coagulopathy and clinically relevant bleeding risk) · known or suspected oesophageal varices · major intraspinal or intracerebral vascular abnormalities · presence of malignant neoplasms at high risk of bleeding · recent brain or spinal injury · recent brain, spinal or ophthalmic surgery · recent intracranial haemorrhage · uncontrolled severe hypertension · vascular aneurysms

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Risk for major bleeding. Edoxaban treatment is contra-indicated in patients with significant risk factors for major bleeding, these include those listed above.
- **CAUTIONS** Moderate to severe mitral stenosis (safety and efficacy not established) · prosthetic heart valve (safety and efficacy not established) · risk of bleeding · surgery
- **CAUTIONS, FURTHER INFORMATION**
- ▶ Surgery Manufacturer recommends to discontinue treatment at least 24 hours before a surgical procedure;

the risk of bleeding should be weighed against the urgency of the intervention—consult product literature.

- **INTERACTIONS** → Appendix 1: edoxaban

- **SIDE-EFFECTS**

- ▶ **Common or very common** Anaemia · haemorrhage · nausea · skin reactions

- ▶ **Uncommon** CNS haemorrhage

SIDE-EFFECTS, FURTHER INFORMATION Should a bleeding complication arise in a patient receiving edoxaban, the manufacturer recommends to delay the next dose or treatment should be discontinued as appropriate.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment; use with caution in mild to moderate impairment.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 15 mL/minute.
Dose adjustments Manufacturer advises use a dose of 30 mg once daily if creatinine clearance 15–50 mL/minute.

- **MONITORING REQUIREMENTS**

- ▶ Manufacturer advises monitor renal function before treatment and when clinically indicated during treatment; monitor hepatic function before treatment and repeat periodically if treatment duration longer than 1 year.

- ▶ Manufacturer advises monitor for signs of mucosal bleeding and anaemia in patients at increased risk; treatment should be stopped if severe bleeding occurs.
- ▶ No routine anticoagulant monitoring required (INR tests are unreliable).

- **PATIENT AND CARER ADVICE** Patients should be provided with an alert card and advised to keep it with them at all times.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ Edoxaban for treating and preventing deep vein thrombosis and pulmonary embolism (August 2015) NICE TA354

Edoxaban (*Lixiana*®) is recommended as an option for treating and preventing recurrent deep vein thrombosis and pulmonary embolism.

www.nice.org.uk/guidance/TA354

- ▶ Edoxaban for preventing stroke and systemic embolism in non-valvular atrial fibrillation (September 2015) NICE TA355
- Edoxaban (*Lixiana*®) is an option for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation, with one or more of the following risk factors:

- previous stroke or transient ischaemic attack
- congestive heart failure
- age ≥ 75 years
- diabetes mellitus
- hypertension

The risks and benefits of edoxaban treatment compared to warfarin, apixaban, dabigatran etexilate, and rivaroxaban should be discussed with the patient.

Fondaparinux sodium

21-May-2018

- **DRUG ACTION** Fondaparinux sodium is a synthetic pentasaccharide that inhibits activated factor X.

- **INDICATIONS AND DOSE**

Prophylaxis of venous thromboembolism in patients after undergoing major orthopaedic surgery of the hip or leg, or abdominal surgery

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 2.5 mg, dose to be given 6 hours after surgery, then 2.5 mg once daily

Prophylaxis of venous thromboembolism in medical patients immobilised because of acute illness

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** 2.5 mg once daily

Treatment of superficial-vein thrombosis

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult (body-weight 50 kg and above):** 2.5 mg once daily for at least 30 days (max. 45 days if high risk of thromboembolic complications), treatment should be stopped 24 hours before surgery and restarted at least 6 hours post operatively

Treatment of unstable angina and non-ST-segment elevation myocardial infarction

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner), treatment should be stopped 24 hours before coronary artery bypass graft surgery (where possible) and restarted 48 hours post operatively

Treatment of ST-segment elevation myocardial infarction

- ▶ INITIALLY BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 2.5 mg daily for the first day, then (by subcutaneous injection) 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner), treatment should be stopped 24 hours before coronary artery bypass graft surgery (where possible) and restarted 48 hours post operatively

Treatment of deep-vein thrombosis and pulmonary embolism

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult (body-weight up to 50 kg):** 5 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR ≥ 2 for at least 24 hours)

- ▶ **Adult (body-weight 50–100 kg):** 7.5 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR ≥ 2 for at least 24 hours)

- ▶ **Adult (body-weight 101 kg and above):** 10 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR ≥ 2 for at least 24 hours)

- **CONTRA-INDICATIONS** Active bleeding · bacterial endocarditis

- **CAUTIONS** Active gastro-intestinal ulcer disease · bleeding disorders · brain surgery · elderly patients · low body-weight · ophthalmic surgery · recent intracranial haemorrhage · risk of catheter thrombus during percutaneous coronary intervention · spinal or epidural anaesthesia (risk of spinal haematoma—avoid if using treatment doses) · spinal surgery

- **INTERACTIONS** → Appendix 1: fondaparinux

- **SIDE-EFFECTS**

- ▶ **Common or very common** Anaemia · haemorrhage

- **Uncommon** Chest pain · coagulation disorder · dyspnoea · fever · hepatic function abnormal · nausea · oedema · platelet abnormalities · skin reactions · thrombocytopenia · vomiting · wound secretion
- **Rare or very rare** Anxiety · confusion · constipation · cough · diarrhoea · dizziness · drowsiness · fatigue · gastritis · gastrointestinal discomfort · genital oedema · headache · hyperbilirubinaemia · hypersensitivity · hypokalaemia · hypotension · leg pain · syncope · vasodilation · vertigo
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs possible risk—no information available.
- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Caution in severe impairment (increased risk of bleeding).
- **RENAL IMPAIRMENT** Increased risk of bleeding in renal impairment.
- When used for treatment of acute coronary syndromes or prophylaxis of venous thromboembolism and treatment of superficial-vein thrombosis Avoid if eGFR less than 20 mL/minute/1.73 m².
- When used for treatment of venous thromboembolism Use with caution if eGFR 30–50 mL/minute/1.73 m², avoid if eGFR less than 30 mL/minute/1.73 m².
- Dose adjustments**
- When used for prophylaxis of venous thromboembolism and treatment of superficial-vein thrombosis Reduce dose to 1.5 mg daily if eGFR 20–50 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Arixtra®), give intermittently in Sodium chloride 0.9%. For ST-segment elevation myocardial infarction, add requisite dose to 25–50 mL infusion fluid and give over 1–2 minutes.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Fondaparinux sodium (Non-proprietary)

Fondaparinux sodium 5 mg per 1 mL Fondaparinux sodium 2.5mg/0.5mL solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £59.65

Fondaparinux sodium 12.5 mg per 1 mL Fondaparinux sodium 5mg/0.4mL solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £110.70

Fondaparinux sodium 10mg/0.8mL solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £110.70

Fondaparinux sodium 7.5mg/0.6mL solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £110.70–£116.53

► Arixtra (Aspen Pharma Trading Ltd)

Fondaparinux sodium 5 mg per 1 mL Arixtra 2.5mg/0.5mL solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £62.79

Arixtra 1.5mg/0.3mL solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £62.79 (Hospital only)

Fondaparinux sodium 12.5 mg per 1 mL Arixtra 7.5mg/0.6mL solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £116.53

Arixtra 5mg/0.4mL solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £116.53

Arixtra 10mg/0.8mL solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £116.53

Rivaroxaban

- **DRUG ACTION** Rivaroxaban is a direct inhibitor of activated factor X (factor Xa).

● INDICATIONS AND DOSE

Prophylaxis of venous thromboembolism following knee replacement surgery

► BY MOUTH

- Adult: 10 mg once daily for 2 weeks, to be started 6–10 hours after surgery

Prophylaxis of venous thromboembolism following hip replacement surgery

► BY MOUTH

- Adult: 10 mg once daily for 5 weeks, to be started 6–10 hours after surgery

Initial treatment of deep-vein thrombosis | Initial treatment of pulmonary embolism

► BY MOUTH

- Adult: Initially 15 mg twice daily for 21 days, to be taken with food

Continued treatment of deep-vein thrombosis (following initial treatment) | Continued treatment of pulmonary embolism (following initial treatment) | Prophylaxis of recurrent deep-vein thrombosis | Prophylaxis of recurrent pulmonary embolism

► BY MOUTH

- Adult: 20 mg once daily, to be taken with food, consult product literature for duration of treatment; also consult product literature for adjustment of dose for prophylaxis of recurrent deep-vein thrombosis or pulmonary embolism

Prophylaxis of stroke and systemic embolism in patients with non-valvular atrial fibrillation and with at least one of the following risk factors: congestive heart failure, hypertension, previous stroke or transient ischaemic attack, age ≥ 75 years, or diabetes mellitus

► BY MOUTH

- Adult: 20 mg once daily, to be taken with food

Prophylaxis of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers (in combination with aspirin alone or aspirin and clopidogrel)

► BY MOUTH

- Adult: 2.5 mg twice daily usual duration 12 months

DOSE EQUIVALENCE AND CONVERSION

- For information on changing from, or to, other anticoagulants—consult product literature.

- **CONTRA-INDICATIONS** Active bleeding · in *acute coronary syndrome*—previous stroke · in *acute coronary syndrome*—transient ischaemic attack · malignant neoplasms · oesophageal varices · recent brain surgery · recent gastrointestinal ulcer · recent intracranial haemorrhage · recent ophthalmic surgery · recent spine surgery · significant risk of major bleeding · vascular aneurysm
- **CAUTIONS** Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—monitor neurological signs and wait at least 18 hours after rivaroxaban dose before removing catheter and do not give next dose until at least 6 hours after catheter removal) · bronchiectasis · prosthetic heart valve (efficacy not established) · risk of bleeding · rivaroxaban should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolectomy · severe hypertension · vascular retinopathy

- **INTERACTIONS** → Appendix 1: rivaroxaban

● SIDE-EFFECTS

- **Common or very common** Anaemia · asthenia · constipation · diarrhoea · dizziness · fever · gastrointestinal discomfort ·

haemorrhage · headache · hypotension · menorrhagia · nausea · oedema · pain in extremity · renal impairment · skin reactions · vomiting

- **Uncommon** Allergic oedema · dry mouth · hepatic disorders · intracranial haemorrhage · malaise · syncope · tachycardia · thrombocytopenia · thrombocytosis
- **Rare or very rare** Vascular pseudoaneurysm

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
 - **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
 - **HEPATIC IMPAIRMENT** Avoid in liver disease with coagulopathy.
 - **RENAL IMPAIRMENT** Use with caution if concomitant use of drugs that increase plasma-rivaroxaban concentration (consult product literature). Avoid if creatinine clearance less than 15 mL/minute; manufacturer recommends Cockcroft and Gault formula to calculate creatinine clearance. When used for *prophylaxis of venous thromboembolism following knee or hip replacement surgery and prophylaxis of atherothrombotic events in acute coronary syndrome*, use with caution if creatinine clearance 15–29 mL/minute.
- Dose adjustments** When used for *treatment of deep-vein thrombosis or pulmonary embolism and prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism*, initially 15 mg twice daily for 21 days, then 20 mg once daily (but consider reducing to 15 mg once daily if risk of bleeding outweighs risk of recurrent deep-vein thrombosis or pulmonary embolism) if creatinine clearance 15–49 mL/minute.

For *prophylaxis of stroke and systemic embolism in atrial fibrillation*, reduce dose to 15 mg once daily if creatinine clearance 15–49 mL/minute.

- **MONITORING REQUIREMENTS**
 - Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
 - No routine anticoagulant monitoring required (INR tests are unreliable).
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed and mixed with water or apple puree just before administration.
- **PRESCRIBING AND DISPENSING INFORMATION** Low-dose rivaroxaban, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers. Treatment should be started as soon as possible after the patient has been stabilised following the acute coronary event, at the earliest 24 hours after admission to hospital, and at the time when parenteral anticoagulation therapy would normally be discontinued; the usual duration of treatment is 12 months.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Rivaroxaban for the prevention of venous thromboembolism after total hip or total knee replacement in adults** (April 2009) NICE TA170
Rivaroxaban is an option for the prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery.
www.nice.org.uk/TA170
- **Rivaroxaban for the prevention of stroke and systemic embolism in atrial fibrillation** (May 2012) NICE TA256
Rivaroxaban is an option for the prevention of stroke and systemic embolism (in accordance with its licensed indication) in patients with non-valvular atrial fibrillation and with at least one of the following risk factors:
 - previous stroke or transient ischaemic attack
 - congestive heart failure

- age ≥ 75 years
- diabetes mellitus
- hypertension

The risks and benefits of rivaroxaban compared with warfarin should be discussed with the patient.

www.nice.org.uk/TA256

- **Rivaroxaban for the treatment of deep-vein thrombosis and prevention of recurrent deep-vein thrombosis and pulmonary embolism** (July 2012) NICE TA261
Rivaroxaban is an option for the treatment of deep-vein thrombosis and prevention of recurrent deep-vein thrombosis and pulmonary embolism in adults after diagnosis of acute deep-vein thrombosis.
www.nice.org.uk/TA261
- **Rivaroxaban for treating pulmonary embolism and preventing recurrent venous thromboembolism** (June 2013) NICE TA287
Rivaroxaban is an option for treating pulmonary embolism and preventing recurrent deep-vein thrombosis and pulmonary embolism in adults.
www.nice.org.uk/TA287
- **Rivaroxaban for preventing adverse outcomes after acute management of acute coronary syndrome** (March 2015) NICE TA335
Rivaroxaban is an option within its marketing authorisation, in combination with aspirin plus clopidogrel or aspirin alone, for preventing atherothrombotic events in patients who have had an acute coronary syndrome with elevated cardiac biomarkers.

The patient's risk of bleeding should be carefully assessed before treatment is initiated and the risks and benefits of rivaroxaban in combination with aspirin plus clopidogrel or with aspirin alone, compared with aspirin plus clopidogrel or aspirin alone should be discussed with the patient.

A decision on continuation of treatment should be taken no later than 12 months after starting treatment.

www.nice.org.uk/TA335

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2012) that rivaroxaban (*Xarelto*®) is accepted for restricted use within NHS Scotland for the prevention of stroke and systemic embolism in accordance with the licensed indication; use is restricted to patients with poor INR control despite compliance with coumarin anticoagulant therapy, or to patients who are allergic to, or unable to tolerate, a coumarin anticoagulant.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

ANTITHROMBOTIC DRUGS > HEPARINOIDS

Danaparoid sodium

● INDICATIONS AND DOSE

Prevention of deep-vein thrombosis in general or orthopaedic surgery

► BY SUBCUTANEOUS INJECTION

- Adult: 750 units twice daily for 7–10 days, initiate treatment before operation, with last pre-operative dose 1–4 hours before surgery

Thromboembolic disease in patients with history of heparin-induced thrombocytopenia

► INITIALLY BY INTRAVENOUS INJECTION

- Adult (body-weight up to 55 kg): Initially 1250 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days
- Adult (body-weight 55–89 kg): Initially 2500 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days
- Adult (body-weight 90 kg and above): Initially 3750 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days

- **CONTRA-INDICATIONS** Active peptic ulcer (unless this is the reason for operation) · acute bacterial endocarditis · diabetic retinopathy · epidural anaesthesia (with treatment doses) · haemophilia and other haemorrhagic disorders · recent cerebral haemorrhage · severe hypertension · spinal anaesthesia (with treatment doses) · thrombocytopenia (unless patient has heparin-induced thrombocytopenia)

- **CAUTIONS** Antibodies to heparins (risk of antibody-induced thrombocytopenia) · body-weight over 90 kg · recent bleeding · risk of bleeding

- **INTERACTIONS** → Appendix 1: danaparoid

● **SIDE-EFFECTS**

- **Common or very common** Haemorrhage · heparin-induced thrombocytopenia · skin reactions · thrombocytopenia

- **PREGNANCY** Manufacturer advises avoid—limited information available but not known to be harmful.

- **BREAST FEEDING** Amount probably too small to be harmful but manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Caution in moderate impairment (increased risk of bleeding). Avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available.

- **RENAL IMPAIRMENT** Use with caution in moderate impairment. Avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available.

Monitoring Increased risk of bleeding in renal impairment, monitor anti-Factor Xa activity.

- **MONITORING REQUIREMENTS** Monitor anti factor Xa activity in patients with body-weight over 90 kg.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection► **Danaparoid sodium (Non-proprietary)**

Danaparoid sodium 1250 unit per 1 ml Danaparoid sodium 750units/0.6ml solution for injection ampoules | 10 ampoule [PoM]
£599.99

ANTITHROMBOTIC DRUGS > HEPARINS

Heparins

- **CONTRA-INDICATIONS** Acute bacterial endocarditis · after major trauma · epidural anaesthesia with treatment doses · haemophilia and other haemorrhagic disorders · peptic ulcer · recent cerebral haemorrhage · recent surgery to eye · recent surgery to nervous system · severe hypertension · spinal anaesthesia with treatment doses · thrombocytopenia (including history of heparin-induced thrombocytopenia)

- **CAUTIONS** Elderly

● **SIDE-EFFECTS**

- **Common or very common** Haemorrhage · heparin-induced thrombocytopenia · skin reactions · thrombocytopenia · thrombocytosis

- **Uncommon** CNS haemorrhage

- **Rare or very rare** Alopecia · hyperkalaemia · osteoporosis · priapism

- **Frequency not known** Hypoadosteronism

SIDE-EFFECTS, FURTHER INFORMATION

Haemorrhage If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

Heparin-induced thrombocytopenia Clinically important heparin-induced thrombocytopenia is immune-mediated and can be complicated by thrombosis. Signs of heparin-induced thrombocytopenia include a 30% reduction of platelet count, thrombosis, or skin allergy. If heparin-induced thrombocytopenia is strongly suspected or confirmed, the heparin should be stopped and an alternative anticoagulant, such as danaparoid, should be given. Ensure platelet counts return to normal range in those who require warfarin.

Hyperkalaemia Inhibition of aldosterone secretion by unfractionated or low molecular weight heparin can result in hyperkalaemia; patients with diabetes mellitus, chronic renal failure, acidosis, raised plasma potassium or those taking potassium-sparing drugs seem to be more susceptible. The risk appears to increase with duration of therapy.

- **ALLERGY AND CROSS-SENSITIVITY** Hypersensitivity to unfractionated or low molecular weight heparin.

● **MONITORING REQUIREMENTS**

- Heparin-induced thrombocytopenia Platelet counts should be measured just before treatment with unfractionated or low molecular weight heparin, and regular monitoring of platelet counts may be required if given for longer than 4 days. See the British Society for Haematology's Guidelines on the diagnosis and management of heparin-induced thrombocytopenia: second edition. *Br J Haematol* 2012; **159**: 528–540.

- **Hyperkalaemia** Plasma-potassium concentration should be measured in patients at risk of hyperkalaemia before starting the heparin and monitored regularly thereafter, particularly if treatment is to be continued for longer than 7 days.

Dalteparin sodium

● INDICATIONS AND DOSE

FRAGMIN®

Treatment of deep-vein thrombosis | Treatment of pulmonary embolism

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 200 units/kg daily (max. per dose 18 000 units) until adequate oral anticoagulation with vitamin K antagonist established (at least 5 days of combined treatment is usually required)

Treatment of deep-vein thrombosis (in patients at increased risk of haemorrhage) | Treatment of pulmonary embolism (in patients at increase risk of haemorrhage)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 100 units/kg twice daily until adequate oral anticoagulation with vitamin K antagonist established (at least 5 days of combined treatment is usually required)

Unstable coronary artery disease

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 120 units/kg every 12 hours (max. per dose 10 000 units twice daily) for 5–8 days

Prevention of clotting in extracorporeal circuits

- ▶ TO THE DEVICE AS A FLUSH
- ▶ Adult: (consult product literature)

FRAGMIN® GRADUATED SYRINGES

Unstable coronary artery disease (including non-ST-segment-elevation myocardial infarction)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 120 units/kg every 12 hours (max. per dose 10 000 units twice daily) for up to 8 days

Patients with unstable coronary artery disease (including non-ST-segment-elevation myocardial infarction) awaiting angiography or revascularisation and having already had 8 days treatment with dalteparin

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (body-weight up to 70 kg and male): 5000 units every 12 hours until the day of the procedure (max. 45 days).
- ▶ Adult (body-weight up to 80 kg and female): 5000 units every 12 hours until the day of the procedure (max. 45 days).
- ▶ Adult (body-weight 70 kg and above and male): 7500 units every 12 hours until the day of the procedure (max. 45 days).
- ▶ Adult (body-weight 80 kg and above and female): 7500 units every 12 hours until the day of the procedure (max. 45 days).

FRAGMIN® SINGLE-DOSE SYRINGES

Prophylaxis of deep-vein thrombosis in surgical patients—moderate risk

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 2500 units for 1 dose, dose to be given 1–2 hours before surgery, then 2500 units every 24 hours

Prophylaxis of deep-vein thrombosis in surgical patients—high risk

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 2500 units for 1 dose, dose to be administered 1–2 hours before surgery, followed by 2500 units after 8–12 hours, then 5000 units every 24 hours, alternatively initially 5000 units for 1 dose, dose to be given on the evening before surgery, followed by 5000 units after 24 hours, then 5000 units every 24 hours

Prophylaxis of deep-vein thrombosis in medical patients

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 5000 units every 24 hours

Treatment of deep-vein thrombosis | Treatment of pulmonary embolism

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (body-weight up to 46 kg): 7500 units once daily until adequate oral anticoagulation with vitamin K antagonist established (at least 5 days of combined treatment is usually required)
- ▶ Adult (body-weight 46–56 kg): 10 000 units once daily until adequate oral anticoagulation with vitamin K antagonist established (at least 5 days of combined treatment is usually required)
- ▶ Adult (body-weight 57–68 kg): 12 500 units once daily until adequate oral anticoagulation with vitamin K antagonist established (at least 5 days of combined treatment is usually required)
- ▶ Adult (body-weight 69–82 kg): 15 000 units once daily until adequate oral anticoagulation with vitamin K antagonist established (at least 5 days of combined treatment is usually required)
- ▶ Adult (body-weight 83 kg and above): 18 000 units once daily until adequate oral anticoagulation with vitamin K antagonist established (at least 5 days of combined treatment is usually required)

Extended treatment of venous thromboembolism and prevention of recurrence in patients with solid tumours

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (body-weight 40–45 kg): 7500 units once daily for 30 days, then 7500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- ▶ Adult (body-weight 46–56 kg): 10 000 units once daily for 30 days, then 7500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- ▶ Adult (body-weight 57–68 kg): 12 500 units once daily for 30 days, then 10 000 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- ▶ Adult (body-weight 69–82 kg): 15 000 units once daily for 30 days, then 12 500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- ▶ Adult (body-weight 83–98 kg): 18 000 units once daily for 30 days, then 15 000 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- ▶ Adult (body-weight 99 kg and above): 18 000 units once daily for 30 days, then 18 000 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature

Treatment of venous thromboembolism in pregnancy

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (body-weight up to 50 kg): 5000 units twice daily, use body-weight in early pregnancy to calculate the dose
- ▶ Adult (body-weight 50–69 kg): 6000 units twice daily, use body-weight in early pregnancy to calculate the dose
- ▶ Adult (body-weight 70–89 kg): 8000 units twice daily, use body-weight in early pregnancy to calculate the dose
- ▶ Adult (body-weight 90 kg and above): 10 000 units twice daily, use body-weight in early pregnancy to calculate the dose

- **UNLICENSED USE** Not licensed for treatment of venous thromboembolism in pregnancy.
- **INTERACTIONS** → Appendix 1: low molecular-weight heparins
- **PREGNANCY** Not known to be harmful, low molecular weight heparins do not cross the placenta. Multidose vial contains benzyl alcohol—manufacturer advises avoid.
- **BREAST FEEDING** Due to the relatively high molecular weight and inactivation in the gastro-intestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible, however manufacturers advise avoid.
- **HEPATIC IMPAIRMENT**
Dose adjustments Dose reduction may be required in severe impairment—risk of bleeding may be increased.
- **RENAL IMPAIRMENT** Use of unfractionated heparin may be preferable.
Dose adjustments Risk of bleeding may be increased—dose reduction may be required.
- **MONITORING REQUIREMENTS**
 - ▶ For monitoring during treatment of deep-vein thrombosis and of pulmonary embolism, blood should be taken 3–4 hours after a dose (recommended plasma concentration of anti-Factor Xa 0.5–1 unit/mL); monitoring not required for once-daily treatment regimen and not generally necessary for twice-daily regimen.
 - ▶ Routine monitoring of anti-Factor Xa activity is not usually required during treatment with dalteparin, but may be necessary in patients at increased risk of bleeding (e.g. in renal impairment and those who are underweight or overweight).
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
 The *Scottish Medicines Consortium* has advised (February 2011) that dalteparin (*Fragmin*®) is accepted for restricted use within NHS Scotland as extended treatment of symptomatic venous thromboembolism and prevention of its recurrence in patients with solid tumours.

● MEDICINAL FORMS

Enoxaparin sodium

● INDICATIONS AND DOSE

Treatment of venous thromboembolism in pregnancy

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (body-weight up to 50 kg): 40 mg twice daily, dose based on early pregnancy body-weight
- ▶ Adult (body-weight 50–69 kg): 60 mg twice daily, dose based on early pregnancy body-weight
- ▶ Adult (body-weight 70–89 kg): 80 mg twice daily, dose based on early pregnancy body-weight
- ▶ Adult (body-weight 90 kg and above): 100 mg twice daily, dose based on early pregnancy body-weight

Prophylaxis of deep-vein thrombosis, especially in surgical patients—moderate risk

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 20 mg for 1 dose, dose to be given approximately 2 hours before surgery, then 20 mg every 24 hours

Prophylaxis of deep-vein thrombosis, especially surgical patients—high risk (e.g. orthopaedic surgery)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 40 mg for 1 dose, dose to be given 12 hours before surgery, then 40 mg every 24 hours

Prophylaxis of deep-vein thrombosis in medical patients

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 40 mg every 24 hours

Treatment of deep-vein thrombosis in uncomplicated patients with low risk of recurrence | Treatment of pulmonary embolism in uncomplicated patients with low risk of recurrence

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 1.5 mg/kg every 24 hours until adequate oral anticoagulation established

Treatment of deep-vein thrombosis in patients with risk factors such as obesity, cancer, recurrent VTE, or proximal thrombosis | Treatment of pulmonary embolism in patients with risk factors such as obesity, symptomatic pulmonary embolism, cancer, or recurrent VTE

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 1 mg/kg every 12 hours until adequate oral anticoagulation established

Treatment of acute ST-segment elevation myocardial infarction (patients not undergoing percutaneous coronary intervention)

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult 18–74 years: Initially 30 mg, followed by (by subcutaneous injection) 1 mg/kg for 1 dose, then (by subcutaneous injection) 1 mg/kg every 12 hours (max. per dose 100 mg) for up to 8 days, maximum dose applies for the first two subcutaneous doses only
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult 75 years and over: 750 micrograms/kg every 12 hours (max. per dose 75 mg), maximum dose applies for the first two doses only

Treatment of acute ST-segment elevation myocardial infarction (patients undergoing percutaneous coronary intervention)

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult 18–74 years: Initially 30 mg, followed by (by subcutaneous injection) 1 mg/kg for 1 dose, then (by subcutaneous injection) 1 mg/kg every 12 hours (max. per dose 100 mg) for up to 8 days, maximum dose applies for the first two subcutaneous doses only, then (by intravenous injection) 300 micrograms/kg for 1 dose, dose to be given at the time of procedure if the last subcutaneous dose was given more than 8 hours previously

continued →

► INITIALLY BY SUBCUTANEOUS INJECTION

- Adult 75 years and over: 750 micrograms/kg every 12 hours (max. per dose 75 mg), maximum dose applies for the first two doses only, then (by intravenous injection) 300 micrograms/kg for 1 dose, dose to be given at the time of procedure if the last subcutaneous dose was given more than 8 hours previously

Unstable angina | Non-ST-segment-elevation myocardial infarction

► BY SUBCUTANEOUS INJECTION

- Adult: 1 mg/kg every 12 hours usually for 2–8 days (minimum 2 days)

Prevention of clotting in extracorporeal circuits

► TO THE DEVICE AS A FLUSH

- Adult: (consult product literature)

DOSE EQUIVALENCE AND CONVERSION

- 1 mg equivalent to 100 units.

- **UNLICENSED USE** Not licensed for treatment of venous thromboembolism in pregnancy.
- **CAUTIONS** Low body-weight (increased risk of bleeding)
- **INTERACTIONS** → Appendix 1: low molecular-weight heparins
- **SIDE-EFFECTS**
 - **Common or very common** Hypersensitivity
 - **Frequency not known** Cutaneous vasculitis · eosinophilia · haemorrhagic anaemia · headache · hepatic disorders
- **PREGNANCY** Not known to be harmful, low molecular weight heparins do not cross the placenta. Multidose vial contains benzyl alcohol—avoid.
- **BREAST FEEDING** Due to the relatively high molecular weight of enoxaparin and inactivation in the gastro-intestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible; however manufacturers advise avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** Risk of bleeding increased; use of unfractionated heparin may be preferable. Manufacturer advises avoid if creatinine clearance less than 15 mL/minute.
Dose adjustments Manufacturer advises reduce dose if creatinine clearance 15–30 mL/minute—consult product literature for details.
- **MONITORING REQUIREMENTS** Routine monitoring of anti-Factor Xa activity is not usually required during treatment with enoxaparin, but may be necessary in patients at increased risk of bleeding (e.g. in renal impairment and those who are underweight or overweight).
- **DIRECTIONS FOR ADMINISTRATION** When administered in conjunction with a thrombolytic, enoxaparin should be given between 15 minutes before and 30 minutes after the start of thrombolytic therapy.
- **PRESCRIBING AND DISPENSING INFORMATION** Enoxaparin sodium is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

► **Enoxaparin sodium (non-proprietary)** ▼

Enoxaparin sodium 100 mg per 1 ml Enoxaparin Becat 40mg/0.4ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £30.27 DT = £30.27

Enoxaparin Becat 60mg/0.6ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £39.26 DT = £39.26

Enoxaparin Becat 100mg/1ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £72.30 DT = £72.30
Enoxaparin Becat 20mg/0.2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £20.86 DT = £20.86
Enoxaparin Becat 80mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £55.13 DT = £55.13

► **Clexane (Sanofi)**

Enoxaparin sodium 100 mg per 1 ml Clexane 60mg/0.6ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £39.26 DT = £39.26
Clexane 300mg/3ml solution for injection multidose vials | 1 vial [PoM] £21.33 DT = £21.33
Clexane 80mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £55.13 DT = £55.13

Inhixa 20mg/0.2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £16.69 DT = £20.86

P 129

Heparin (unfractionated)● **INDICATIONS AND DOSE****Treatment of mild to moderate pulmonary embolism |****Treatment of unstable angina | Treatment of acute peripheral arterial occlusion**

► INITIALLY BY INTRAVENOUS INJECTION

- Adult: Loading dose 5000 units, alternatively (by intravenous injection) loading dose 75 units/kg, followed by (by continuous intravenous infusion) 18 units/kg/hour, laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly

Treatment of severe pulmonary embolism

► INITIALLY BY INTRAVENOUS INJECTION

- Adult: Loading dose 10 000 units, followed by (by continuous intravenous infusion) 18 units/kg/hour, laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly

Treatment of deep-vein thrombosis

► INITIALLY BY INTRAVENOUS INJECTION

- Adult: Loading dose 5000 units, alternatively (by intravenous injection) loading dose 75 units/kg, followed by (by continuous intravenous infusion) 18 units/kg/hour, alternatively (by subcutaneous injection) 15 000 units every 12 hours, laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly

Thromboprophylaxis in medical patients

► BY SUBCUTANEOUS INJECTION

- Adult: 5000 units every 8–12 hours

Thromboprophylaxis in surgical patients

► BY SUBCUTANEOUS INJECTION

- Adult: 5000 units for 1 dose, to be taken 2 hours before surgery, then 5000 units every 8–12 hours

Thromboprophylaxis during pregnancy

► BY SUBCUTANEOUS INJECTION

- Adult: 5000–10 000 units every 12 hours, to be administered with monitoring, **Important:** prevention of prosthetic heart-valve thrombosis in pregnancy calls for **specialist management**

Haemodialysis

► INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 1000–5000 units, followed by (by continuous intravenous infusion) 250–1000 units/hour

Prevention of clotting in extracorporeal circuits

► TO THE DEVICE AS A FLUSH

- Adult: (consult product literature)

To maintain patency of catheters, cannulas, other indwelling intravenous infusion devices

► TO THE DEVICE AS A FLUSH

- Adult: 10–200 units, to be flushed through every 4–8 hours, not for therapeutic use

- **INTERACTIONS** → Appendix 1: heparin (unfractionated)
- **SIDE-EFFECTS** Adrenal insufficiency · hypokalaemia · rebound hyperlipidaemia
- **PREGNANCY** Does not cross the placenta; maternal osteoporosis reported after prolonged use; multidose vials may contain benzyl alcohol—some manufacturers advise avoid.
- **BREAST FEEDING** Not excreted into milk due to high molecular weight.
- **HEPATIC IMPAIRMENT**
Dose adjustments Risk of bleeding increased—reduce dose or avoid in severe impairment (including oesophageal varices).
- **RENAL IMPAIRMENT**
Dose adjustments Risk of bleeding increased in severe impairment—dose may need to be reduced.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give continuously in Glucose 5% or Sodium chloride 0.9%; administration with a motorised pump is advisable.
- **PRESCRIBING AND DISPENSING INFORMATION** Doses listed take into account the guidelines of the British Society for Haematology.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

► **Heparin (unfractionated) (Non-proprietary)**

Heparin sodium 1000 unit per 1 ml Heparin sodium 1,000units/1ml solution for injection ampoules | 10 ampoule [PoM] £14.85
Heparin sodium 5,000units/5ml solution for injection vials | 10 vial [PoM] £16.50–£37.41

Heparin sodium 20,000units/20ml solution for injection ampoules | 10 ampoule [PoM] £70.80–£70.88

Tinzaparin sodium● **INDICATIONS AND DOSE****INNOHEP® 10,000 UNITS/ML****Prophylaxis of deep-vein thrombosis (general surgery)**

► BY SUBCUTANEOUS INJECTION

- Adult: 3500 units for 1 dose, dose to be given 2 hours before surgery, then 3500 units every 24 hours

Prophylaxis of deep-vein thrombosis (orthopaedic surgery)

► BY SUBCUTANEOUS INJECTION

- Adult: Initially 50 units/kg for 1 dose, dose to be given 2 hours before surgery, then 50 units/kg every 24 hours, alternatively initially 4500 units for 1 dose, dose to be given 12 hours before surgery, then 4500 units every 24 hours

Prevention of clotting in extracorporeal circuits

► TO THE DEVICE AS A FLUSH

- Adult: (consult product literature)

INNOHEP® 20,000 UNITS/ML**Extended treatment of venous thromboembolism and prevention of recurrence in patients with active cancer**

► BY SUBCUTANEOUS INJECTION

- Adult: 175 units/kg once daily for 6 months; the benefit of continued treatment beyond 6 months should be evaluated

Treatment of deep-vein thrombosis | Treatment of pulmonary embolism

► BY SUBCUTANEOUS INJECTION

- Adult: 175 units/kg once daily until adequate oral anticoagulation established, treatment regimens do not require anticoagulation monitoring

Treatment of venous thromboembolism in pregnancy

► BY SUBCUTANEOUS INJECTION

- Adult: 175 units/kg once daily, dose based on early pregnancy body-weight, treatment regimens do not require anticoagulation monitoring

- **UNLICENSED USE** Not licensed for the treatment of venous thromboembolism in pregnancy.

- **INTERACTIONS** → Appendix 1: low molecular-weight heparins

● **SIDE-EFFECTS**

- **Common or very common** Anaemia
- **Rare or very rare** Angioedema · Stevens-Johnson syndrome

- **PREGNANCY** Not known to be harmful, low molecular weight heparins do not cross the placenta. Vials contain benzyl alcohol—manufacturer advises avoid.

- **BREAST FEEDING** Due to the relatively high molecular weight of tinzaparin and inactivation in the gastrointestinal tract, passage into breast-milk and absorption

by the nursing infant are likely to be negligible; however manufacturer advise avoid.

- **RENAL IMPAIRMENT** Risk of bleeding may be increased. Unfractionated heparin may be preferable. Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m². **Monitoring** In renal impairment monitoring of anti-Factor Xa may be required if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Routine monitoring of anti-Factor Xa activity is not usually required during treatment with tinzaparin, but may be necessary in patients at increased risk of bleeding (e.g. in renal impairment and those who are underweight or overweight).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol, sulfites

► **Innohep** (LEO Pharma)

Tinzaparin sodium 10000 unit per 1 mL Innohep 20,000units/2mL solution for injection vials | 10 vial [PoM] £105.66 DT = £105.66

Tinzaparin sodium 20000 unit per 1 mL Innohep 18,000units/0.9mL solution for injection pre-filled syringes | 6 pre-filled disposable injection [PoM] £64.25 | 10 pre-filled disposable injection [PoM] £107.08 DT = £107.08

Innohep 40,000units/2mL solution for injection vials | 1 vial [PoM] £34.20 DT = £34.20

Innohep 10,000units/0.5mL solution for injection pre-filled syringes | 6 pre-filled disposable injection [PoM] £35.70 | 10 pre-filled disposable injection [PoM] £59.50 DT = £59.50

ANTITHROMBOTIC DRUGS > THROMBIN INHIBITORS, DIRECT

Argatroban monohydrate

● INDICATIONS AND DOSE

Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment

- INITIALLY BY CONTINUOUS INTRAVENOUS INFUSION
- Adult: Initially 2 micrograms/kg/minute, dose to be adjusted according to activated partial thromboplastin time, (by intravenous infusion) increased to up to 10 micrograms/kg/minute maximum duration of treatment 14 days

Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment (for dose in cardiac surgery, percutaneous coronary intervention, or critically ill patients)

- BY CONTINUOUS INTRAVENOUS INFUSION
- Adult: (consult product literature)

Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment (when initiating concomitant warfarin treatment)

- BY CONTINUOUS INTRAVENOUS INFUSION
- Adult: Reduced to 2 micrograms/kg/minute, dose should be temporarily reduced and INR measured after 4–6 hours; warfarin should be initiated at intended maintenance dose (do not give loading dose of warfarin); consult product literature for further details

- **CAUTIONS** Bleeding disorders · diabetic retinopathy · gastro-intestinal ulceration · immediately after lumbar puncture · major surgery (especially of brain, spinal cord, or eye) · risk of bleeding · severe hypertension · spinal anaesthesia

- **INTERACTIONS** → Appendix 1: argatroban

● SIDE-EFFECTS

- **Common or very common** Anaemia · haemorrhage · nausea · skin reactions
- **Uncommon** Alopecia · appetite decreased · arrhythmias · cardiac arrest · confusion · constipation · deafness · diarrhoea · dizziness · dysphagia · dyspnoea · fatigue · fever · gastritis · headache · hepatic disorders · hiccups · hyperbilirubinaemia · hyperhidrosis · hypertension · hypoglycaemia · hyponatraemia · hypotension · hypoxia · increased risk of infection · leucopenia · muscle tone decreased · muscle weakness · myalgia · myocardial infarction · pericardial effusion · peripheral ischaemia · peripheral oedema · pleural effusion · renal failure · shock · speech disorder · stroke · syncope · thrombocytopenia · tongue disorder · visual impairment · vomiting

- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment or in patients with hepatic impairment undergoing percutaneous coronary intervention.

Dose adjustments Reduce initial dose to 500 nanograms/kg/minute in moderate impairment.

- **MONITORING REQUIREMENTS** Determine activated partial thromboplastin time 2 hours after start of treatment, then 2 or 4 hours after infusion rate altered (consult product literature), and at least once daily thereafter.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Exembo[®]) give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute each 2.5-mL vial with 250 mL infusion fluid.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Ethanol

► **Exembo** (Mitsubishi Tanabe Pharma Europe Ltd)

Argatroban monohydrate 1 mg per 1 mL Exembo 50mg/50mL solution for infusion vials | 4 vial £198.80

Argatroban monohydrate 100 mg per 1 mL Exembo 250mg/2.5mL concentrate for solution for infusion vials | 4 vial [X]

Bivalirudin

- **DRUG ACTION** Bivalirudin, a hirudin analogue, is a thrombin inhibitor.

● INDICATIONS AND DOSE

Unstable angina or non-ST-segment elevation myocardial infarction in patients planned for urgent or early intervention (in addition to aspirin and clopidogrel)

- INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 100 micrograms/kg, then (by intravenous infusion) 250 micrograms/kg/hour (for up to 72 hours in medically managed patients)

Unstable angina or non-ST-segment elevation myocardial infarction (in addition to aspirin and clopidogrel) in patients proceeding to percutaneous coronary intervention or coronary artery bypass surgery without cardiopulmonary bypass

- INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 100 micrograms/kg for 1 dose, then (by intravenous injection) 500 micrograms/kg for 1 dose, then (by intravenous infusion) 1.75 mg/kg/hour for duration of procedure; (by intravenous infusion) reduced to 250 micrograms/kg/hour for 4–12 hours as necessary following percutaneous coronary intervention, for patients proceeding to coronary artery bypass surgery with cardiopulmonary bypass,

discontinue intravenous infusion 1 hour before procedure and treat with unfractionated heparin

Anticoagulation in patients undergoing percutaneous coronary intervention including patients with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention (in addition to aspirin and clopidogrel)

► INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 750 micrograms/kg, followed immediately by (by intravenous infusion) 1.75 mg/kg/hour during procedure and for up to 4 hours after procedure, then (by intravenous infusion) reduced to 250 micrograms/kg/hour for a further 4–12 hours if necessary

- **CONTRA-INDICATIONS** Active bleeding · bleeding disorders · severe hypertension · subacute bacterial endocarditis

- **CAUTIONS** Brachytherapy procedures · previous exposure to lepirudin (theoretical risk from lepirudin antibodies)

- **INTERACTIONS** → Appendix 1: bivalirudin

● **SIDE-EFFECTS**

- **Common or very common** Skin reactions
- **Uncommon** Anaemia · headache · hypersensitivity · hypotension · nausea · shock · thrombocytopenia
- **Rare or very rare** Arrhythmias · cardiac tamponade · chest pain · compartment syndrome · dyspnoea · embolism and thrombosis · intracranial haemorrhage · pain · vascular disorders · vomiting

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises caution—no information available.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments

- When used for percutaneous coronary intervention Reduce rate of infusion to 1.4 mg/kg/hour if eGFR 30–60 mL/minute/1.73 m² and monitor blood clotting parameters.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Angiox[®]), give continuously in Glucose 5% or Sodium chloride 0.9%. Reconstitute each 250-mg vial with 5 mL water for injections then withdraw 5 mL and dilute to 50 mL with infusion fluid.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- Bivalirudin for the treatment of ST-segment elevation myocardial infarction (July 2011) NICE TA230 Bivalirudin in combination with aspirin and clopidogrel is recommended for the treatment of adults with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention. www.nice.org.uk/TA230

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2008) that bivalirudin (Angiox[®]) is accepted for restricted use within NHS Scotland for patients with acute coronary syndromes planned for urgent or early intervention who would have been considered for treatment with unfractionated heparin in combination with a glycoprotein IIb/IIIa inhibitor; it should not be used as an alternative to heparin alone.

The *Scottish Medicines Consortium* has advised (August 2010) that bivalirudin (Angiox[®]) is accepted for restricted use within NHS Scotland as an anticoagulant in patients undergoing percutaneous coronary intervention who would have been considered for treatment with unfractionated heparin in combination with a glycoprotein IIb/IIIa inhibitor; it should not be used as an alternative to heparin alone.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► BY MOUTH

- Adult: 110–150 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant

Treatment of deep-vein thrombosis in patients receiving concomitant treatment with verapamil | Treatment of pulmonary embolism in patients receiving concomitant treatment with verapamil | Prophylaxis of recurrent deep-vein thrombosis in patients receiving concomitant treatment with verapamil | Prophylaxis of recurrent pulmonary embolism in patients receiving concomitant treatment with verapamil

► BY MOUTH

- Adult: 110 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant

Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age \geq 75 years, diabetes mellitus, or hypertension

► BY MOUTH

- Adult 18–74 years: 150 mg twice daily
- Adult 75–79 years: 110–150 mg twice daily
- Adult 80 years and over: 110 mg twice daily

Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age \geq 75 years, diabetes mellitus, or hypertension in patients receiving concomitant treatment with verapamil

► BY MOUTH

- Adult: 110 mg twice daily

Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age \geq 75 years, diabetes mellitus, or hypertension, in patients at increased risk of bleeding | Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age \geq 75 years, diabetes mellitus, or hypertension, in patients with moderate renal impairment

► BY MOUTH

- Adult: 110–150 mg twice daily

DOSE EQUIVALENCE AND CONVERSION

- For information on changing from, or to, other anticoagulants, consult product literature.

- **CONTRA-INDICATIONS** Active bleeding · do not use as anticoagulant for prosthetic heart valve · malignant neoplasms · oesophageal varices · recent brain surgery · recent gastro-intestinal ulcer · recent intracranial haemorrhage · recent ophthalmic surgery · recent spine surgery · significant risk of major bleeding · vascular aneurysm
- **CAUTIONS** Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—give initial dose at least 2 hours after catheter removal and monitor

neurological signs) · bacterial endocarditis · bleeding disorders · body-weight less than 50 kg · elderly · gastritis · gastro-oesophageal reflux · oesophagitis · recent biopsy · recent major trauma · thrombocytopenia

- **INTERACTIONS** → Appendix 1: dabigatran

• **SIDE-EFFECTS**

- Common or very common Hepatic function abnormal
- Uncommon Anaemia · diarrhoea · haemorrhage · hyperbilirubinaemia · nausea · vomiting
- Rare or very rare Angioedema · dysphagia · gastrointestinal discomfort · gastrointestinal disorders · intracranial haemorrhage · skin reactions · thrombocytopenia

- Frequency not known Bronchospasm

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal studies*.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease, especially if prothrombin time already prolonged.

- **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 30 mL/minute.

Dose adjustments When used for *prophylaxis of venous thromboembolism following knee or hip replacement surgery*, reduce initial dose to 75 mg and subsequent doses to 150 mg once daily if creatinine clearance 30–50 mL/minute; reduce dose to 75 mg once daily if creatinine clearance 30–50 mL/minute and patient receiving concomitant treatment with verapamil.

When used for *treatment of deep-vein thrombosis and pulmonary embolism, prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism, prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation*, consider reduced dose of 110 mg twice daily if creatinine clearance 30–50 mL/minute, based on individual assessment of thromboembolic risk and risk of bleeding.

Monitoring In renal impairment monitor renal function at least annually (manufacturer recommends Cockcroft and Gault formula to calculate creatinine clearance).

• **MONITORING REQUIREMENTS**

- Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
- No routine anticoagulant monitoring required (INR tests are unreliable).
- Assess renal function (manufacturer recommends Cockcroft and Gault formula to calculate creatinine clearance) before treatment in all patients and at least annually in elderly.
- **DIRECTIONS FOR ADMINISTRATION** When given concomitantly with amiodarone or verapamil, doses should be taken at the same time.

- **PRESCRIBING AND DISPENSING INFORMATION** Dabigatran etexilate, is given orally for prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery; it is also licensed for the treatment of deep-vein thrombosis and pulmonary embolism, and prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism in adults. Duration of treatment should be determined by balancing the benefit of treatment with the bleeding risk; shorter duration of treatment (at least 3 months) should be based on transient risk factors i.e recent surgery, trauma, immobilisation, and longer duration of treatment should be based on permanent risk factors, or idiopathic deep-vein thrombosis or pulmonary embolism.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Dabigatran etexilate for the prevention of venous thromboembolism after hip or knee replacement surgery in adults (September 2008)** NICE TA157
Dabigatran etexilate is an option for the prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery.
www.nice.org.uk/TA157
- ▶ **Dabigatran etexilate for the prevention of stroke and systemic embolism in atrial fibrillation (March 2012)** NICE TA249
Dabigatran etexilate is an option for the prevention of stroke and systemic embolism in patients with non-valvular atrial fibrillation and with one or more of the following risk factors:
 - previous stroke, transient ischaemic attack, or systemic embolism
 - left ventricular ejection fraction <40%
 - symptomatic heart failure
 - age ≥75 years
 - age ≥65 years in patients with diabetes mellitus, coronary artery disease, or hypertension
 The risks and benefits of dabigatran compared to warfarin should be discussed with the patient.
www.nice.org.uk/TA249
- ▶ **Dabigatran etexilate for the treatment and secondary prevention of deep vein thrombosis and/or pulmonary embolism (December 2014)** NICE TA327
Dabigatran etexilate is recommended, within its marketing authorisation, as an option for treating and for preventing recurrent deep vein thrombosis and pulmonary embolism in adults.
www.nice.org.uk/TA327

ANTITHROMBOTIC DRUGS > TISSUE PLASMINOGEN ACTIVATORS

F 215

Urokinase

● INDICATIONS AND DOSE

Deep-vein thrombosis (thromboembolic occlusive vascular disease)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 4400 units/kg, to be given over 10–20 minutes, followed by 100 000 units/hour for 2–3 days

Pulmonary embolism (thromboembolic occlusive vascular disease)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 4400 units/kg, to be given over 10–20 minutes, followed by 4400 units/kg/hour for 12 hours

Occlusive peripheral arterial disease (thromboembolic occlusive vascular disease)

- ▶ BY INTRA-ARTERIAL INFUSION
- ▶ Adult: (consult product literature)

Occluded central venous catheters (blocked by fibrin clots)

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: Inject directly into occluded catheter, to be dissolved in sodium chloride 0.9% to a concentration of 5000 units/mL; use a volume sufficient to fill the catheter lumen; leave for 20–60 minutes then aspirate the lysate; repeat if necessary

Occluded arteriovenous haemodialysis shunts (blocked by fibrin clots)

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRA-ARTERIAL INFUSION
- ▶ Adult: (consult product literature)

SYNER-KINASE®

Deep-vein thrombosis (thromboembolic occlusive vascular disease)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 4400 units/kg, to be given over 10 minutes, dose to be made up in 15 mL sodium chloride 0.9%, followed by 4400 units/kg/hour for 12–24 hours

Pulmonary embolism (thromboembolic occlusive vascular disease)

- ▶ INITIALLY BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 4400 units/kg, to be given over 10 minutes, dose to be made up in 15 mL sodium chloride 0.9%, followed by (by intravenous infusion) 4400 micrograms/kg/hour for 12 hours, alternatively (by intra-arterial injection) initially 15 000 units/kg, to be injected into pulmonary artery, subsequent doses adjusted according to response; maximum 3 doses per day

Occlusive peripheral arterial disease

- ▶ BY INTRA-ARTERIAL INFUSION
- ▶ Adult: (consult product literature)

Occluded intravenous catheters and cannulas (blocked by fibrin clots)

- ▶ BY INTRA-ARTERIAL INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 5000–25 000 units, to be injected directly into catheter or cannula, dose dissolved in suitable volume of sodium chloride 0.9% to fill the catheter or cannula lumen; leave for 20–60 minutes then aspirate the lysate; repeat if necessary

● INTERACTIONS → Appendix 1: urokinase

● SIDE-EFFECTS

- ▶ Common or very common Artery dissection · stroke
- ▶ Uncommon Renal failure

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

● HEPATIC IMPAIRMENT

Dose adjustments Dose reduction may be required.

● RENAL IMPAIRMENT

Dose adjustments Dose reduction may be required.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Syner-KINASE®), give continuously or intermittently in Sodium chloride 0.9%.

ANTITHROMBOTIC DRUGS > VITAMIN K ANTAGONISTS

Vitamin K antagonists

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

A EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

- **CONTRA-INDICATIONS** Avoid use within 48 hours postpartum • haemorrhagic stroke • significant bleeding
- **CAUTIONS** Bacterial endocarditis (use only if warfarin otherwise indicated) • conditions in which risk of bleeding is increased • history of gastrointestinal bleeding • hyperthyroidism • hypothyroidism • peptic ulcer • postpartum (delay warfarin until risk of haemorrhage is low—usually 5–7 days after delivery) • recent ischaemic stroke • recent surgery • uncontrolled hypertension
- **SIDE-EFFECTS**
 - **Common or very common** Haemorrhage
 - **Rare or very rare** Alopecia • appetite decreased • hepatic disorders • nausea • skin necrosis haemorrhagic (increased risk in patients with protein C or protein S deficiency) • vasculitis • vomiting
 - **Frequency not known** Agranulocytosis • albuminuria • blue toe syndrome • calciphylaxis • CNS haemorrhage • diarrhoea • eosinophilia • fever • haemothorax • increased leucocytes • kidney injury • leucopenia • lymphadenopathy • pancreatitis • pancytopenia • renal tubular necrosis • skin necrosis (increased risk in patients with protein C or protein S deficiency) • skin reactions • taste altered
- **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should be warned of the danger of teratogenicity.
- **PREGNANCY** Should not be given in the first trimester of pregnancy. Warfarin, acenocoumarol, and phenindione cross the placenta with risk of congenital malformations, and placental, fetal, or neonatal haemorrhage, especially during the last few weeks of pregnancy and at delivery. Therefore, if at all possible, they should be avoided in pregnancy, especially in the first and third trimesters (difficult decisions may have to be made, particularly in women with prosthetic heart valves, atrial fibrillation, or with a history of recurrent venous thrombosis or pulmonary embolism). Stopping these drugs before the sixth week of gestation may largely avoid the risk of fetal abnormality.
- **MONITORING REQUIREMENTS**
 - The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.

- It is essential that the INR be determined daily or on alternate days in early days of treatment, *then* at longer intervals (depending on response), *then* up to every 12 weeks.
- Change in patient's clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing.
- **PATIENT AND CARER ADVICE** Anticoagulant treatment booklets should be issued to all patients or their carers; these booklets include advice for patients on anticoagulant treatment, an alert card to be carried by the patient at all times, and a section for recording of INR results and dosage information. In **England, Wales, and Northern Ireland**, they are available for purchase from: 3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham
OL9 9QH
Tel: 0845 610 1112
GP practices can obtain supplies through their Local Area Team stores. NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@spsl.uk.com.
In **Scotland**, treatment booklets and starter information packs can be obtained by emailing stockorders.DPPAS@apsgroup.co.uk or by fax on (0131) 6299 967.
Electronic copies of the booklets and further advice are also available at www.npsa.nhs.uk/nrls/alerts-and-directives/alerts/anticoagulant.

Acenocoumarol (Nicoumalone)

● INDICATIONS AND DOSE

Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation | Prophylaxis after insertion of prosthetic heart valve | Prophylaxis and treatment of venous thrombosis and pulmonary embolism | Transient ischaemic attacks

► **BY MOUTH**

- **Adult:** Initially 2–4 mg once daily for 2 days, alternatively initially 6 mg on day 1, then 4 mg on day 2; maintenance 1–8 mg daily, adjusted according to response, dose to be taken at the same time each day, lower doses may be required in patients over 65 years, liver disease, severe heart failure with hepatic congestion, and malnutrition

- **CAUTIONS** Patients over 65 years
- **INTERACTIONS** → Appendix 1: coumarins
- **BREAST FEEDING** Risk of haemorrhage; increased by vitamin K deficiency—manufacturer recommends prophylactic vitamin K for the infant (consult product literature).
- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment, especially if prothrombin time is already prolonged.
- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **PATIENT AND CARER ADVICE** Anticoagulant card to be provided.

Warfarin sodium

10-Oct-2016

INDICATIONS AND DOSE

Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation | Prophylaxis after insertion of prosthetic heart valve | Prophylaxis and treatment of venous thrombosis and pulmonary embolism | Transient ischaemic attacks

BY MOUTH

- Adult: Initially 5–10 mg, to be taken on day 1; subsequent doses dependent on the prothrombin time, reported as INR (international normalised ratio), a lower induction dose can be given over 3–4 weeks in patients who do not require rapid anticoagulation, elderly patients to be given a lower induction dose; maintenance 3–9 mg daily, to be taken at the same time each day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: WARFARIN: REPORTS OF CALCIPHYLAXIS (JULY 2016)

An EU-wide review has concluded that on rare occasions, warfarin use may lead to calciphylaxis—patients should

be advised to consult their doctor if they develop a painful skin rash; if calciphylaxis is diagnosed, appropriate treatment should be started and consideration should be given to stopping treatment with warfarin. The MHRA has advised that calciphylaxis is most commonly observed in patients with known risk factors such as end-stage renal disease, however cases have also been reported in patients with normal renal function.

INTERACTIONS → Appendix 1: coumarins

- PREGNANCY** Babies of mothers taking warfarin at the time of delivery need to be offered immediate prophylaxis with intramuscular phytonadione (vitamin K₁).

- BREAST FEEDING** Not present in milk in significant amounts and appears safe. Risk of haemorrhage which is increased by vitamin K deficiency.

- HEPATIC IMPAIRMENT** Avoid in severe impairment, especially if prothrombin time is already prolonged.

- RENAL IMPAIRMENT** Use with caution in mild to moderate impairment.

Monitoring In severe renal impairment, monitor INR more frequently.

- PATIENT AND CARER ADVICE** Anticoagulant card to be provided.

4 Blood pressure conditions

4.1 Hypertension

Hypertension

Overview

Lowering raised blood pressure decreases the risk of stroke, coronary events, heart failure, and renal impairment. Advice on antihypertensive therapy in this section takes into account the recommendations of NICE clinical guidance 127 (August 2011), Hypertension—Clinical management of primary hypertension in adults.

Possible causes of hypertension (e.g. renal disease, endocrine causes), contributory factors, risk factors, and the presence of any complications of hypertension, such as left ventricular hypertrophy, should be established. Patients should be given advice on lifestyle changes to reduce blood pressure or cardiovascular risk; these include smoking cessation, weight reduction, reduction of excessive intake of alcohol and caffeine, reduction of dietary salt, reduction of total and saturated fat, increasing exercise, and increasing fruit and vegetable intake.

Hypertension thresholds and targets for treatment

Patients presenting with a blood pressure of 140/90 mmHg or higher when measured in a clinic setting, should be offered ambulatory blood pressure monitoring (or home blood pressure monitoring if ambulatory blood pressure monitoring is unsuitable) to confirm the diagnosis and stage of hypertension.

Stage 1 hypertension:

- Clinic blood pressure 140/90 mmHg or higher, *and* ambulatory daytime average or home blood pressure average 135/85 mmHg or higher
- Treat patients under 80 years who have stage 1 hypertension and target-organ damage (e.g. left ventricular hypertrophy, chronic kidney disease, hypertensive retinopathy), cardiovascular disease, renal disease, diabetes, or a 10 year cardiovascular risk $\geq 20\%$; in the absence of these conditions, advise lifestyle changes and review annually. For patients under 40 years with stage 1 hypertension but **no** overt target-organ damage, cardiovascular disease, renal disease, or diabetes, consider seeking specialist advice for evaluation of secondary causes of hypertension

Stage 2 hypertension:

- Clinic blood pressure 160/100 mmHg or higher, *and* ambulatory daytime average or home blood pressure average 150/95 mmHg or higher
- Treat all patients who have stage 2 hypertension, regardless of age

Severe hypertension:

- Clinic systolic blood pressure ≥ 180 mmHg or clinic diastolic blood pressure ≥ 110 mmHg; treat promptly—see Hypertensive Crises, below.

A target clinic blood pressure below 140/90 mmHg is suggested for patients under 80 years; a target ambulatory or home blood pressure average (during the patient's waking hours) of below 135/85 mmHg is suggested for patients under 80 years; see also Hypertension in the Elderly, below. A target clinic blood pressure below 130/80 mmHg should be considered for those with established atherosclerotic cardiovascular disease, or diabetes in the presence of kidney, eye, or cerebrovascular disease. In some individuals it may not be possible to reduce blood pressure below the suggested targets despite the use of appropriate therapy.

Drugs for hypertension

A single antihypertensive drug is often inadequate in the management of hypertension, and additional antihypertensive drugs are usually added in a step-wise manner until control is achieved. Unless it is necessary to lower the blood pressure urgently (see Hypertensive Crises), an interval of at least 4 weeks should be allowed to determine response; clinicians should ensure antihypertensive drugs are titrated to the optimum or maximum tolerated dose at each step of treatment. Response to drug treatment may be affected by age and ethnicity.

Patients under 55 years:

Step 1

- **ACE inhibitor**; if not tolerated, offer an **angiotensin-II receptor antagonist**. If both ACE inhibitors and angiotensin-II receptor antagonists are contra-indicated or not tolerated, consider a **beta-blocker**; beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or at high risk of developing diabetes

Step 2

- ACE inhibitor or angiotensin-II receptor antagonist in combination with a **calcium-channel blocker**. If a calcium-channel blocker is not tolerated or if there is

evidence of, or a high risk of, heart failure, give a **thiazide-related diuretic** (e.g. chlorthalidone or indapamide). If a beta-blocker was given at Step 1, add a calcium channel blocker in preference to a thiazide-related diuretic (see Step 1)

Step 3

- ACE inhibitor or angiotensin-II receptor antagonist in combination with a calcium-channel blocker *and* a thiazide-related diuretic

Step 4 (resistant hypertension)

- Consider seeking specialist advice
- Add low-dose **spironolactone** [unlicensed indication], or use high-dose thiazide related diuretic if plasma-potassium concentration above 4.5 mmol/litre
- Monitor renal function and electrolytes
- If additional diuretic therapy is contra-indicated, ineffective, or not tolerated, consider an **alpha-blocker** or a beta-blocker

Patients over 55 years, and patients of any age who are of African or Caribbean family origin:

Step 1

- Calcium-channel blocker; if not tolerated or if there is evidence of, or a high risk of, heart failure, give a thiazide-related diuretic (e.g. chlorthalidone or indapamide)

Step 2

- Calcium-channel blocker *or* thiazide-related diuretic in combination with an ACE inhibitor or angiotensin-II receptor antagonist (an angiotensin-II receptor antagonist in combination with a calcium-channel blocker is preferred in patients of African or Caribbean family origin)

Steps 3 and 4

- Treat as for patients under 55 years

Cardiovascular risk reduction

Aspirin p. 121 reduces the risk of cardiovascular events and myocardial infarction. Unduly high blood pressure must be controlled before aspirin is given. Unless contra-indicated, aspirin is recommended for all patients with established cardiovascular disease. Use of aspirin in primary prevention, in those with or without diabetes, is of unproven benefit. For the role of aspirin in the prevention of stroke in patients with atrial fibrillation, see Arrhythmias p. 99.

Statins are also of benefit in cardiovascular disease or in those who are at high risk of developing cardiovascular disease.

Hypertension in the elderly

Benefit from antihypertensive therapy is evident up to at least 80 years of age, but it is probably inappropriate to apply a strict age limit when deciding on drug therapy. Patients who reach 80 years of age while taking antihypertensive drugs should continue treatment, provided that it continues to be of benefit and does not cause significant side-effects. If patients are aged over 80 years when diagnosed with stage 1 hypertension, the decision to treat should be based on the presence of other comorbidities; patients with stage 2 hypertension should be treated as for patients over 55 years. A target clinic blood pressure below 150/90 mmHg is suggested for patients over 80 years; the suggested target ambulatory or home blood pressure average (during the patient's waking hours) is below 145/85 mmHg.

Isolated systolic hypertension

Isolated systolic hypertension (systolic pressure ≥ 160 mmHg, diastolic pressure < 90 mmHg) is common in patients over 60 years, and is associated with an increased cardiovascular disease risk; it should be treated as for patients with both a raised systolic and diastolic blood pressure. Patients with severe postural hypotension should be referred to a specialist.

Hypertension in diabetes

For patients with diabetes, a target clinic blood pressure below 140/80 mmHg is suggested (below 130/80 mmHg is advised if kidney, eye, or cerebrovascular disease are also present). However, in some individuals, it may not be possible to achieve this level of control despite appropriate therapy. Most patients require a combination of antihypertensive drugs.

Hypertension is common in type 2 diabetes, and antihypertensive treatment prevents macrovascular and microvascular complications. In type 1 diabetes, hypertension usually indicates the presence of diabetic nephropathy. An ACE inhibitor (or an angiotensin-II receptor antagonist) may have a specific role in the management of diabetic nephropathy; in patients with type 2 diabetes, an ACE inhibitor (or an angiotensin-II receptor antagonist) can delay progression of microalbuminuria to nephropathy.

Hypertension in renal disease

A target clinic blood pressure below 140/90 mmHg is suggested (below 130/80 mmHg is advised in patients with chronic kidney disease and diabetes, or if proteinuria exceeds 1 g in 24 hours). An ACE inhibitor (or an angiotensin-II receptor antagonist) should be considered for patients with proteinuria; however, ACE inhibitors should be used with caution in renal impairment. Thiazide diuretics may be ineffective and high doses of loop diuretics may be required.

Hypertension in pregnancy

Hypertensive complications in pregnancy can be hazardous for both the mother and the fetus, and are associated with a significant risk of morbidity and mortality; complications can occur in pregnant women with pre-existing chronic hypertension, or in those who develop hypertension in the latter half of pregnancy.

Labetalol hydrochloride p. 147 is widely used for treating hypertension in pregnancy. Methyldopa p. 144 is considered safe for use in pregnancy. Modified-release preparations of nifedipine p. 162 [unlicensed] are also used.

The following advice takes into account the recommendations of NICE Clinical Guideline 107 (August 2010), Hypertension in Pregnancy.

Pregnant women with chronic hypertension who are already receiving antihypertensive treatment should have their drug therapy reviewed. In uncomplicated chronic hypertension, a target blood pressure of <150/100 mmHg is recommended; women with target-organ damage as a result of chronic hypertension, and in women with chronic hypertension who have given birth, a target blood pressure of <140/90 mmHg is advised. Long-term antihypertensive treatment should be reviewed 2 weeks following the birth. Women managed with methyldopa during pregnancy should discontinue treatment and restart their original antihypertensive medication within 2 days of the birth.

Pregnant women are at high risk of developing pre-eclampsia if they have chronic kidney disease, diabetes mellitus, autoimmune disease, chronic hypertension, or if they have had hypertension during a previous pregnancy; these women are advised to take aspirin p. 121 once daily [unlicensed indication] from week 12 of pregnancy until the baby is born. Women with more than one moderate risk factor (first pregnancy, aged ≥ 40 years, pregnancy interval >10 years, BMI ≥ 35 kg/m² at first visit, multiple pregnancy, or family history of pre-eclampsia) for developing pre-eclampsia are also advised to take aspirin once daily [unlicensed indication] from week 12 of pregnancy until the baby is born.

Women with pre-eclampsia or gestational hypertension who present with a blood pressure over 150/100 mmHg, should receive initial treatment with oral labetalol

hydrochloride to achieve a target blood pressure of <150 mmHg systolic, and diastolic 80–100 mmHg. If labetalol hydrochloride is unsuitable, methyldopa or modified-release nifedipine may be considered. Women with gestational hypertension or pre-eclampsia who have been managed with methyldopa during pregnancy should discontinue treatment within 2 days of the birth. Women with a blood pressure of $\geq 160/110$ mmHg who require critical care during pregnancy or after birth should receive immediate treatment with either oral or intravenous labetalol hydrochloride, intravenous hydralazine hydrochloride p. 180, or oral modified-release nifedipine to achieve a target blood pressure of <150 mmHg systolic, and diastolic 80–100 mmHg.

Also see use of magnesium sulfate p. 1019 in pre-eclampsia and eclampsia. [Evid](#) In women with pre-eclampsia where birth is considered likely within 7 days, intramuscular betamethasone p. 660 [unlicensed indication] is recommended for fetal lung maturation. [A](#)

Hypertensive crises

If blood pressure is reduced too quickly in the management of hypertensive crises, there is a risk of reduced organ perfusion leading to cerebral infarction, blindness, deterioration in renal function, and myocardial ischaemia.

A *hypertensive emergency* is defined as severe hypertension with acute damage to the target organs (e.g. signs of papilloedema or retinal haemorrhage, or the presence of clinical conditions such as acute coronary syndromes, acute aortic dissection, acute pulmonary oedema, hypertensive encephalopathy, acute cerebral infarction, intracerebral or subarachnoid haemorrhage, eclampsia, or rapidly progressing renal failure); prompt treatment with intravenous antihypertensive therapy is generally required. Over the first few minutes or within 2 hours, blood pressure should be reduced by 20–25%. When intravenous therapy is indicated, treatment options include sodium nitroprusside p. 182 [unlicensed], nicardipine hydrochloride p. 161, labetalol hydrochloride, glyceryl trinitrate p. 217, phentolamine mesilate p. 181, hydralazine hydrochloride, or esmolol hydrochloride p. 153; choice of drug is dependent on concomitant conditions and clinical status of the patient.

Severe hypertension (blood pressure $\geq 180/110$ mmHg) without acute target-organ damage is defined as a *hypertensive urgency*; blood pressure should be reduced gradually over 24–48 hours with oral antihypertensive therapy, such as labetalol hydrochloride, or the calcium-channel blockers amlodipine p. 155 or felodipine p. 159. Use of sublingual nifedipine is not recommended.

Also see advice on short-term management of hypertensive episodes in phaeochromocytoma.

Phaeochromocytoma

Long-term management of phaeochromocytoma involves surgery. However, surgery should not take place until there is adequate blockade of both alpha- and beta-adrenoceptors; the optimal choice of drug therapy remains unclear. Alpha-blockers are used in the short-term management of hypertensive episodes in phaeochromocytoma. Once alpha blockade is established, tachycardia can be controlled by the cautious addition of a beta-blocker; a cardioselective beta-blocker is preferred.

Phenoxybenzamine hydrochloride p. 181, a powerful alpha-blocker, is effective in the management of phaeochromocytoma but it has many side-effects. Phentolamine mesilate is a short-acting alpha-blocker used mainly during surgery of phaeochromocytoma; its use for the diagnosis of phaeochromocytoma has been superseded by measurement of catecholamines in blood and urine.

Metirosine (available from 'special-order' manufacturers or specialist importing companies) inhibits the enzyme tyrosine hydroxylase, and hence the synthesis of

catecholamines. It is rarely used in the pre-operative management of pheochromocytoma, and long term in patients unsuitable for surgery; an alpha-adrenoceptor blocking drug may also be required. Metirosine should **not** be used to treat essential hypertension.

Antihypertensive drugs

Vasodilator antihypertensive drugs

Vasodilators have a potent hypotensive effect, especially when used in combination with a beta-blocker and a thiazide. **Important:** see Hypertension (hypertensive crises) for a warning on the hazards of a very rapid fall in blood pressure.

Hydralazine hydrochloride p. 180 is given by mouth as an adjunct to other antihypertensives for the treatment of resistant hypertension but is rarely used; when used alone it causes tachycardia and fluid retention.

Sodium nitroprusside p. 182 [unlicensed] is given by intravenous infusion to control severe hypertensive emergencies when parenteral treatment is necessary.

Minoxidil p. 181 should be reserved for the treatment of severe hypertension resistant to other drugs. Vasodilatation is accompanied by increased cardiac output and tachycardia and the patients develop fluid retention. For this reason the addition of a beta-blocker and a diuretic (usually furosemide p. 226, in high dosage) are mandatory. Hypertrichosis is troublesome and renders this drug unsuitable for females.

Prazosin p. 766, doxazosin p. 765, and terazosin p. 768 have alpha-blocking and vasodilator properties.

Ambrisentan p. 184, bosentan p. 184, iloprost p. 183, macitentan p. 185, sildenafil p. 794, and tadalafil p. 796 are licensed for the treatment of pulmonary arterial hypertension and should be used under specialist supervision. Epoprostenol p. 115 can be used in patients with primary pulmonary hypertension resistant to other treatments. Bosentan is also licensed to reduce the number of new digital ulcers in patients with systemic sclerosis and ongoing digital ulcer disease. Riociguat p. 185 is licensed for the treatment of pulmonary arterial hypertension and chronic thromboembolic pulmonary hypertension; it should be used under specialist supervision.

Sitaxentan has been withdrawn from the market because the benefit of treatment does not outweigh the risk of severe hepatotoxicity.

Centrally acting antihypertensive drugs

Methyldopa p. 144 is a centrally acting antihypertensive; it may be used for the management of hypertension in pregnancy.

Clonidine hydrochloride p. 144 has the disadvantage that sudden withdrawal of treatment may cause severe rebound hypertension.

Moxonidine p. 145, a centrally acting drug, is licensed for mild to moderate essential hypertension. It may have a role when thiazides, calcium-channel blockers, ACE inhibitors, and beta-blockers are not appropriate or have failed to control blood pressure.

Adrenergic neurone blocking drugs

Adrenergic neurone blocking drugs prevent the release of noradrenaline from postganglionic adrenergic neurones. These drugs do not control supine blood pressure and may cause postural hypotension. For this reason they have largely fallen from use, but may be necessary with other therapy in resistant hypertension.

Guanethidine monosulfate p. 182, which also depletes the nerve endings of noradrenaline, is licensed for rapid control of blood pressure, however alternative treatments are preferred.

Alpha-adrenoceptor blocking drugs

Prazosin has post-synaptic alpha-blocking and vasodilator properties and rarely causes tachycardia. It may, however, reduce blood pressure rapidly after the first dose and should be introduced with caution. Doxazosin, indoramin p. 766, and terazosin have properties similar to those of prazosin.

Alpha-blockers can be used with other antihypertensive drugs in the treatment of resistant hypertension.

Prostatic hyperplasia

Alfuzosin hydrochloride p. 764, doxazosin, indoramin, prazosin, tamsulosin hydrochloride p. 767, and terazosin are indicated for benign prostatic hyperplasia.

Drugs affecting the renin-angiotensin system

Angiotensin-converting enzyme inhibitors

Angiotensin-converting enzyme inhibitors (ACE inhibitors) inhibit the conversion of angiotensin I to angiotensin II. They have many uses and are generally well tolerated. The main indications of ACE inhibitors are shown below.

Heart failure

ACE inhibitors are used in all grades of heart failure, usually combined with a beta-blocker. Potassium supplements and potassium-sparing diuretics should be discontinued before introducing an ACE inhibitor because of the risk of hyperkalaemia. However, a low dose of spironolactone p. 190 may be beneficial in severe heart failure and can be used with an ACE inhibitor provided serum potassium is monitored carefully. Profound first-dose hypotension may occur when ACE inhibitors are introduced to patients with heart failure who are already taking a high dose of a loop diuretic (e.g. furosemide p. 226 80 mg daily or more). Temporary withdrawal of the loop diuretic reduces the risk, but may cause severe rebound pulmonary oedema. Therefore, for patients on high doses of loop diuretics, the ACE inhibitor may need to be initiated under specialist supervision. An ACE inhibitor can be initiated in the community in patients who are receiving a low dose of a diuretic or who are not otherwise at risk of serious hypotension; nevertheless, care is required and a very low dose of the ACE inhibitor is given initially.

Hypertension

An ACE inhibitor may be the most appropriate initial drug for hypertension in younger Caucasian patients; Afro-Caribbean patients, those aged over 55 years, and those with primary aldosteronism respond less well. ACE inhibitors are particularly indicated for hypertension in patients with type 1 diabetes with nephropathy. They may reduce blood pressure very rapidly in some patients particularly in those receiving diuretic therapy.

Diabetic nephropathy

ACE inhibitors have a role in the management of diabetic nephropathy.

Prophylaxis of cardiovascular events

ACE inhibitors are used in the early and long-term management of patients who have had a myocardial infarction. ACE inhibitors may also have a role in preventing cardiovascular events.

Initiation under specialist supervision

ACE inhibitors should be initiated under specialist supervision and with careful clinical monitoring in those with severe heart failure or in those:

- receiving multiple or high-dose diuretic therapy (e.g. more than 80 mg of furosemide daily or its equivalent);
- receiving concomitant angiotensin-II receptor antagonist or aliskiren;

- with hypovolaemia;
- with hyponatraemia (plasma-sodium concentration below 130 mmol/litre);
- with hypotension (systolic blood pressure below 90 mmHg);
- with unstable heart failure;
- receiving high-dose vasodilator therapy;
- known renovascular disease.

Renal effects

Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if features mentioned below present); hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function and the dose may need to be reduced. Although ACE inhibitors now have a specialised role in some forms of renal disease, including chronic kidney disease, they also occasionally cause impairment of renal function which may progress and become severe in other circumstances (at particular risk are the elderly). A specialist should be involved if renal function is significantly reduced as a result of treatment with an ACE inhibitor.

Concomitant treatment with NSAIDs increases the risk of renal damage, and potassium-sparing diuretics (or potassium-containing salt substitutes) increase the risk of hyperkalaemia.

In patients with severe bilateral renal artery stenosis (or severe stenosis of the artery supplying a single functioning kidney), ACE inhibitors reduce or abolish glomerular filtration and are likely to cause severe and progressive renal failure. They are therefore not recommended in patients known to have these forms of critical renovascular disease.

ACE inhibitor treatment is unlikely to have an adverse effect on overall renal function in patients with severe unilateral renal artery stenosis and a normal contralateral kidney, but glomerular filtration is likely to be reduced (or even abolished) in the affected kidney and the long-term consequences are unknown.

ACE inhibitors are therefore best avoided in patients with known or suspected renovascular disease, unless the blood pressure cannot be controlled by other drugs. If ACE inhibitors are used, they should be initiated only under specialist supervision and renal function should be monitored regularly.

ACE inhibitors should also be used with particular caution in patients who may have undiagnosed and clinically silent renovascular disease. This includes patients with peripheral vascular disease or those with severe generalised atherosclerosis.

ACE inhibitors in combination with other drugs

See also, *Concomitant use of drugs affecting the renin-angiotensin system*, below.

Concomitant diuretics

ACE inhibitors can cause a very rapid fall in blood pressure in volume-depleted patients; treatment should therefore be initiated with very low doses. If the dose of diuretic is greater than 80 mg furosemide or equivalent, the ACE inhibitor should be initiated under close supervision and in some patients the diuretic dose may need to be reduced or the diuretic discontinued at least 24 hours beforehand (may not be possible in heart failure—risk of pulmonary oedema). If high-dose diuretic therapy cannot be stopped, close observation is recommended after administration of the first dose of ACE inhibitor, for at least 2 hours or until the blood pressure has stabilised.

Combination products

Products incorporating an ACE inhibitor with a thiazide diuretic or a calcium-channel blocker are available for the management of hypertension. Use of these combination products should be reserved for patients whose blood pressure has not responded adequately to a single

antihypertensive drug and who have been stabilised on the individual components of the combination in the same proportions.

Angiotensin-II receptor antagonists

Azilsartan medoxomil p. 174, candesartan cilexetil p. 174, eprosartan p. 175, irbesartan p. 175, losartan potassium p. 176, olmesartan medoxomil p. 177, telmisartan p. 178, and valsartan p. 178 are angiotensin-II receptor antagonists with many properties similar to those of the ACE inhibitors. However, unlike ACE inhibitors, they do not inhibit the breakdown of bradykinin and other kinins, and thus are less likely to cause the persistent dry cough which can complicate ACE inhibitor therapy. They are therefore a useful alternative for patients who have to discontinue an ACE inhibitor because of persistent cough.

An angiotensin-II receptor antagonist may be used as an alternative to an ACE inhibitor in the management of heart failure or diabetic nephropathy. Candesartan cilexetil and valsartan are also licensed as adjuncts to ACE inhibitors under specialist supervision, in the management of heart failure when other treatments are unsuitable.

Renal effects

Angiotensin-II receptor antagonists should be used with caution in renal artery stenosis (see also Renal effects under Angiotensin-converting enzyme inhibitors, above).

Renin inhibitor

Aliskiren is a renin inhibitor that is licensed for the treatment of hypertension.

Concomitant use of drugs affecting the renin-angiotensin system

Combination therapy with two drugs affecting the renin-angiotensin system (ACE inhibitors, angiotensin-II receptor antagonists, and aliskiren p. 179 is not recommended due to an increased risk of hyperkalaemia, hypotension, and renal impairment, compared to use of a single drug. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor with an angiotensin-II receptor antagonist. There is some evidence that the benefits of combination use of an ACE inhibitor with candesartan or valsartan may outweigh the risks in selected patients with heart failure for whom other treatments are unsuitable, however, the concomitant use of this combination, together with an aldosterone antagonist or a potassium-sparing diuretic is not recommended.

For patients currently taking combination therapy, the need for continued combined therapy should be reviewed. If combination therapy is considered essential, it should be carried out under specialist supervision, with close monitoring of blood pressure, renal function, and electrolytes (particularly potassium); monitoring should be considered at the start of treatment, then monthly, and also after any change in dose or during intercurrent illness.

ANTIHYPERTENSIVES, CENTRALLY ACTING

Clonidine hydrochloride

01-Jun-2017

● INDICATIONS AND DOSE

Hypertension

► BY MOUTH

- Adult: Initially 50–100 micrograms 3 times a day, increase dose every second or third day, usual maximum dose 1.2 mg daily

Prevention of recurrent migraine | Prevention of vascular headache | Menopausal symptoms, particularly flushing and vasomotor conditions

► BY MOUTH

- Adult: Initially 50 micrograms twice daily for 2 weeks, then increased if necessary to 75 micrograms twice daily

- **UNLICENSED USE** Clonidine may also be used for Tourette syndrome and sedation—unlicensed indications.
- **CONTRA-INDICATIONS** Severe bradyarrhythmia secondary to second- or third-degree AV block or sick sinus syndrome
- **CAUTIONS** Cerebrovascular disease · constipation · heart failure · history of depression · mild to moderate bradyarrhythmia · polyneuropathy · Raynaud's syndrome or other occlusive peripheral vascular disease
- **INTERACTIONS** → Appendix 1: clonidine
- **SIDE-EFFECTS**
 - **Common or very common** Constipation · depression · dizziness · dry mouth · fatigue · headache · nausea · postural hypotension · salivary gland pain · sedation · sexual dysfunction · sleep disorders · vomiting
 - **Uncommon** Delusions · hallucination · malaise · paraesthesia · Raynaud's phenomenon · skin reactions
 - **Rare or very rare** Alopecia · atrioventricular block · dry eye · gynaecomastia · intestinal pseudo-obstruction · nasal dryness
 - **Frequency not known** Accommodation disorder · arrhythmias · confusion
- **PREGNANCY** May lower fetal heart rate. Avoid oral use unless potential benefit outweighs risk. Avoid using injection.
- **BREAST FEEDING** Avoid—present in milk.
- **RENAL IMPAIRMENT**
 - Dose adjustments** Use with caution in severe impairment—reduce initial dose and increase gradually.
- **TREATMENT CESSATION** In hypertension, must be withdrawn gradually to avoid severe rebound hypertension.
- **PATIENT AND CARER ADVICE**
 - Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.
- **LESS SUITABLE FOR PRESCRIBING** Clonidine is less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 3, 8

Methyldopa

● INDICATIONS AND DOSE

Hypertension

► BY MOUTH

- Adult: Initially 250 mg 2–3 times a day, dose should be increased gradually at intervals of at least 2 days; maximum 3 g per day
- Elderly: Initially 125 mg twice daily, dose should be increased gradually; maximum 2 g per day

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · depression · phaeochromocytoma
- **CAUTIONS** History of depression
- **INTERACTIONS** → Appendix 1: methyldopa
- **SIDE-EFFECTS** Abdominal distension · amenorrhoea · angina pectoris · angioedema · arthralgia · asthenia · atrioventricular block · bone marrow failure · bradycardia · breast enlargement · cardiac inflammation · carotid sinus syndrome · cerebrovascular insufficiency · choreoathetosis · cognitive impairment · constipation · depression · diarrhoea · dizziness · dry mouth · eosinophilia · facial paralysis · fever · gastrointestinal disorders · granulocytopenia · gynaecomastia · haemolytic anaemia · headache · hepatic disorders · hyperprolactinaemia · lactation disorder · leucopenia · lupus-like syndrome · myalgia · nasal congestion · nausea · nightmare · oedema · oral disorders · pancreatitis · paraesthesia · parkinsonism · postural hypotension · psychiatric disorder · psychosis · sedation · sexual dysfunction · sialadenitis · skin reactions · thrombocytopenia · toxic epidermal necrolysis · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION** Side-effects are minimised if the daily dose is kept below 1g.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in history of liver disease. Avoid in active liver disease.
- **RENAL IMPAIRMENT** Increased sensitivity to hypotensive and sedative effect.
 - Dose adjustments** Start with small dose.
- **MONITORING REQUIREMENTS** Monitor blood counts and liver-function before treatment and at intervals during first 6–12 weeks or if unexplained fever occurs.
- **EFFECT ON LABORATORY TESTS** Interference with laboratory tests. Positive direct Coombs' test in up to 20% of patients (may affect blood cross-matching).
- **PATIENT AND CARER ADVICE**
 - Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

Moxonidine

● INDICATIONS AND DOSE

Mild to moderate essential hypertension

► BY MOUTH

- Adult: 200 micrograms once daily for 3 weeks, dose to be taken in the morning, then increased if necessary to 400 micrograms daily in 1–2 divided doses (max. per dose 400 micrograms), maximum daily dose to be given in 2 divided doses; maximum 600 micrograms per day

- **CONTRA-INDICATIONS** Bradycardia · conduction disorders · second- or third-degree AV block · severe heart failure · sick sinus syndrome · sino-atrial block

- **CAUTIONS** First-degree AV block · moderate heart failure · severe coronary artery disease · unstable angina

- **INTERACTIONS** → Appendix 1: moxonidine

● SIDE-EFFECTS

- **Common or very common** Asthenia · diarrhoea · dizziness · drowsiness · dry mouth · dyspepsia · headache · insomnia · nausea · pain · skin reactions · vertigo · vomiting
- **Uncommon** Angioedema · bradycardia · nervousness · oedema · syncope · tinnitus

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Present in milk—manufacturer advises avoid.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments Max. single dose 200 micrograms and max. daily dose 400 micrograms if eGFR 30–60 mL/minute/1.73 m².

- **TREATMENT CESSATION** Avoid abrupt withdrawal (if concomitant treatment with beta-blocker has to be stopped, discontinue beta-blocker first, then moxonidine after a few days).

BETA-ADRENOCEPTOR BLOCKERS

Beta-adrenoceptor blocking drugs

Overview

Beta-adrenoceptor blocking drugs (beta-blockers) block the beta-adrenoceptors in the heart, peripheral vasculature, bronchi, pancreas, and liver.

Many beta-blockers are now available and in general they are all equally effective. There are, however, differences between them, which may affect choice in treating particular diseases or individual patients.

Intrinsic sympathomimetic activity (ISA, partial agonist activity) represents the capacity of beta-blockers to stimulate as well as to block adrenergic receptors.

Oxprenolol hydrochloride p. 149, pindolol p. 149, acebutolol p. 151, and celiprolol hydrochloride p. 153 have intrinsic sympathomimetic activity; they tend to cause less bradycardia than the other beta-blockers and may also cause less coldness of the extremities.

Some beta-blockers are lipid soluble and some are water soluble. Atenolol p. 151, celiprolol hydrochloride, nadolol p. 148, and sotalol hydrochloride p. 108 are the most water-soluble; they are less likely to enter the brain, and may therefore cause less sleep disturbance and nightmares. Water-soluble beta-blockers are excreted by the kidneys and dosage reduction is often necessary in renal impairment.

Beta-blockers with a relatively short duration of action have to be given two or three times daily. Many of these are, however, available in modified-release formulations so that administration once daily is adequate for hypertension. For angina twice-daily treatment may sometimes be needed even with a modified-release formulation. Some beta-blockers, such as atenolol, bisoprolol fumarate p. 152, celiprolol hydrochloride, and nadolol, have an intrinsically longer duration of action and need to be given only once daily.

Beta-blockers slow the heart and can depress the myocardium; they are contra-indicated in patients with second- or third-degree heart block. Beta-blockers should also be avoided in patients with worsening unstable heart failure; care is required when initiating a beta-blocker in those with stable heart failure.

Labetalol hydrochloride p. 147, celiprolol hydrochloride, carvedilol p. 147, and nebivolol p. 154 are beta-blockers that have, in addition, an arteriolar vasodilating action, by diverse mechanisms, and thus lower peripheral resistance. There is no evidence that these drugs have important advantages over other beta-blockers in the treatment of hypertension.

Beta-blockers can precipitate bronchospasm and should therefore usually be avoided in patients with a history of asthma. When there is no suitable alternative, it may be necessary for a patient with well-controlled asthma, or chronic obstructive pulmonary disease (without significant reversible airways obstruction), to receive treatment with a beta-blocker for a co-existing condition (e.g. heart failure or following myocardial infarction). In this situation, a cardioselective beta-blocker should be selected and initiated at a low dose by a specialist; the patient should be closely monitored for adverse effects. Atenolol, bisoprolol fumarate, metoprolol tartrate p. 154, nebivolol, and (to a lesser extent) acebutolol, have less effect on the beta₂(bronchial) receptors and are, therefore, relatively *cardioselective*, but they are not *cardiospecific*. They have a lesser effect on airways resistance but are not free of this side-effect.

Beta-blockers are also associated with fatigue, coldness of the extremities (may be less common with those with ISA), and sleep disturbances with nightmares (may be less common with the water-soluble beta-blockers).

Beta-blockers can affect carbohydrate metabolism, causing hypoglycaemia or hyperglycaemia in patients with or without diabetes; they can also interfere with metabolic and autonomic responses to hypoglycaemia, thereby masking symptoms such as tachycardia. However, beta-blockers are not contra-indicated in diabetes, although the cardioselective beta-blockers may be preferred. Beta-blockers should be avoided altogether in those with frequent episodes of hypoglycaemia. Beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or in those at high risk of developing diabetes.

Hypertension

The mode of action of beta-blockers in hypertension is not understood, but they reduce cardiac output, alter baroreceptor

reflex sensitivity, and block peripheral adrenoceptors. Some beta-blockers depress plasma renin secretion. It is possible that a central effect may also partly explain their mode of action.

Beta-blockers are effective for reducing blood pressure but other antihypertensives are usually more effective for reducing the incidence of stroke, myocardial infarction, and cardiovascular mortality, especially in the elderly. Other antihypertensives are therefore preferred for routine initial treatment of uncomplicated hypertension.

In general, the dose of a beta-blocker does not have to be high.

Beta-blockers can be used to control the pulse rate in patients with *phaeochromocytoma*. However, they should never be used alone as beta-blockade without concurrent alpha-blockade may lead to a hypertensive crisis. For this reason phenoxybenzamine hydrochloride p. 181 should always be used together with the beta-blocker.

Angina

By reducing cardiac work beta-blockers improve exercise tolerance and relieve symptoms in patients with *angina* (see management of stable angina and acute coronary syndromes for further details). As with hypertension there is no good evidence of the superiority of any one drug, although occasionally a patient will respond better to one beta-blocker than to another. There is some evidence that sudden withdrawal may cause an exacerbation of angina and therefore gradual reduction of dose is preferable when beta-blockers are to be stopped. There is a risk of precipitating heart failure when beta-blockers and verapamil are used together in established ischaemic heart disease.

Myocardial infarction

For specific comments see management of ST-segment elevation myocardial infarction and non-ST-segment elevation myocardial infarction.

Several studies have shown that some beta-blockers can reduce the recurrence rate of *myocardial infarction*. However, uncontrolled heart failure, hypotension, bradyarrhythmias, and obstructive airways disease render beta-blockers unsuitable in some patients following a myocardial infarction. Atenolol and metoprolol tartrate may reduce early mortality after intravenous and subsequent oral administration in the acute phase, while acebutolol, metoprolol tartrate, propranolol hydrochloride p. 149, and timolol maleate p. 150 have protective value when started in the early convalescent phase. The evidence relating to other beta-blockers is less convincing; some have not been tested in trials of secondary prevention.

Arrhythmias

Beta-blockers act as *anti-arrhythmic drugs* principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. They can be used in conjunction with digoxin to control the ventricular response in atrial fibrillation, especially in patients with thyrotoxicosis. Beta-blockers are also useful in the management of supraventricular tachycardias, and are used to control those following myocardial infarction.

Esmolol hydrochloride p. 153 is a relatively cardioselective beta-blocker with a very short duration of action, used intravenously for the short-term treatment of supraventricular arrhythmias, sinus tachycardia, or hypertension, particularly in the peri-operative period. It may also be used in other situations, such as acute myocardial infarction, when sustained beta-blockade might be hazardous.

Sotalol hydrochloride p. 108, a non-cardioselective beta-blocker with additional class III anti-arrhythmic activity, is used for prophylaxis in paroxysmal supraventricular arrhythmias. It also suppresses ventricular ectopic beats and

non-sustained ventricular tachycardia. It has been shown to be more effective than lidocaine in the termination of spontaneous sustained ventricular tachycardia due to coronary disease or cardiomyopathy. However, it may induce torsade de pointes in susceptible patients.

Heart failure

Beta-blockers may produce benefit in heart failure by blocking sympathetic activity. Bisoprolol fumarate p. 152 and carvedilol p. 147 reduce mortality in any grade of stable heart failure; nebivolol p. 154 is licensed for stable mild to moderate heart failure in patients over 70 years. Treatment should be initiated by those experienced in the management of heart failure.

Thyrotoxicosis

Beta-blockers are used in pre-operative preparation for thyroidectomy. Administration of propranolol hydrochloride p. 149 can reverse clinical symptoms of *thyrotoxicosis* within 4 days. Routine tests of increased thyroid function remain unaltered. The thyroid gland is rendered less vascular thus making surgery easier.

Other uses

Beta-blockers have been used to alleviate some symptoms of *anxiety*; probably patients with palpitation, tremor, and tachycardia respond best. Beta-blockers are also used in the *prophylaxis of migraine*. Betaxolol p. 1145, levobunolol hydrochloride p. 1146, and timolol maleate p. 150 are used topically in *glaucoma*.

Beta-adrenoceptor blockers (systemic)

- **CONTRA-INDICATIONS** Asthma · cardiogenic shock · hypotension · marked bradycardia · metabolic acidosis · phaeochromocytoma (apart from specific use with alpha-blockers) · Prinzmetal's angina · second-degree AV block · severe peripheral arterial disease · sick sinus syndrome · third-degree AV block · uncontrolled heart failure
- **CONTRA-INDICATIONS, FURTHER INFORMATION**
 - ▶ **Bronchospasm** Beta-blockers, including those considered to be cardioselective, should usually be avoided in patients with a history of asthma, bronchospasm or a history of obstructive airways disease. However, when there is no alternative, a cardioselective beta-blocker can be given to these patients with caution and under specialist supervision. In such cases the risk of inducing bronchospasm should be appreciated and appropriate precautions taken.
- **CAUTIONS** Diabetes · first-degree AV block · history of obstructive airways disease (introduce cautiously) · myasthenia gravis · portal hypertension (risk of deterioration in liver function) · psoriasis · symptoms of hypoglycaemia may be masked · symptoms of thyrotoxicosis may be masked
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal discomfort · bradycardia · bronchospasm · confusion · constipation · depression · diarrhoea · dizziness · dry eye (rare in children, reversible on discontinuation) · dry mouth · dyspnoea · erectile dysfunction · fatigue · headache · heart failure · hyperglycaemia · hyperhidrosis · hypoglycaemia · hypoglycaemia masked · nausea · paraesthesia · peripheral coldness · peripheral vascular disease · postural hypotension · rash (reversible on discontinuation) · sleep disorders · syncope · visual impairment · vomiting
 - ▶ **Uncommon** Alopecia · atrioventricular block · skin reactions · urinary disorders

- **Rare or very rare** Hallucination · psoriasis exacerbated · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION

Bradycardia With administration by intravenous injection, excessive bradycardia can occur and may be countered with **intravenous injection of atropine sulfate**.

Overdose Therapeutic overdoses with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. For details on the management of poisoning, see Beta-blockers, under Emergency treatment of poisoning p. 1319.

- **ALLERGY AND CROSS-SENSITIVITY** Caution is advised in patients with a history of hypersensitivity—may increase sensitivity to allergens and result in more serious hypersensitivity response. Furthermore beta-adrenoceptor blockers may reduce response to adrenaline (epinephrine).
- **PREGNANCY** Beta-blockers may cause intra-uterine growth restriction, neonatal hypoglycaemia, and bradycardia; the risk is greater in severe hypertension.
- **BREAST FEEDING** With systemic use in the mother, infants should be monitored as there is a risk of possible toxicity due to beta-blockade. However, the amount of most beta-blockers present in milk is too small to affect infants.
- **MONITORING REQUIREMENTS** Monitor lung function (in patients with a history of obstructive airway disease).
- **TREATMENT CESSATION** Avoid abrupt withdrawal especially in ischaemic heart disease. Sudden cessation of a beta-blocker can cause a rebound worsening of myocardial ischaemia and therefore gradual reduction of dose is preferable when beta-blockers are to be stopped.

increased risk of infection · oedema · pulmonary oedema · renal impairment · weight increased

- **Rare or very rare** Hypersensitivity · leucopenia · nasal congestion · severe cutaneous adverse reactions (SCARs)
- **PREGNANCY** Information on the safety of carvedilol during pregnancy is lacking. If carvedilol is used close to delivery, infants should be monitored for signs of alpha-blockade (as well as beta-blockade).
- **BREAST FEEDING** Infants should be monitored as there is a risk of possible toxicity due to alpha-blockade (in addition to beta-blockade).
- **HEPATIC IMPAIRMENT** Avoid in hepatic impairment.
- **MONITORING REQUIREMENTS** Monitor renal function during dose titration in patients with heart failure who also have renal impairment, low blood pressure, ischaemic heart disease, or diffuse vascular disease.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

ALPHA- AND BETA-ADRENOCEPTOR BLOCKERS

146

Carvedilol

INDICATIONS AND DOSE

Hypertension

BY MOUTH

- **Adult:** Initially 12.5 mg once daily for 2 days, then increased to 25 mg once daily; increased if necessary up to 50 mg daily, dose to be increased at intervals of at least 2 weeks and can be given as a single dose or in divided doses
- **Elderly:** Initially 12.5 mg daily, initial dose may provide satisfactory control

Angina

BY MOUTH

- **Adult:** Initially 12.5 mg twice daily for 2 days, then increased to 25 mg twice daily

Adjunct to diuretics, digoxin, or ACE inhibitors in symptomatic chronic heart failure

BY MOUTH

- **Adult:** Initially 3.125 mg twice daily, dose to be taken with food, then increased to 6.25 mg twice daily, then increased to 12.5 mg twice daily, then increased to 25 mg twice daily, dose should be increased at intervals of at least 2 weeks up to the highest tolerated dose, max. 25 mg twice daily in patients with severe heart failure or body-weight less than 85 kg; max. 50 mg twice daily in patients over 85 kg

- **CONTRA-INDICATIONS** Acute or decompensated heart failure requiring intravenous inotropes

- **INTERACTIONS** → Appendix 1: beta blockers, non-selective

SIDE-EFFECTS

- **Common or very common** Anaemia · asthma · eye irritation · fluid imbalance · genital oedema · hypercholesterolaemia ·

Labetalol hydrochloride

INDICATIONS AND DOSE

Controlled hypotension in anaesthesia

- **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
- **Adult:** (consult product literature or local protocols)

Hypertension of pregnancy

BY INTRAVENOUS INFUSION

- **Adult:** Initially 20 mg/hour, then increased if necessary to 40 mg/hour after 30 minutes, then increased if necessary to 80 mg/hour after 30 minutes, then increased if necessary to 160 mg/hour after 30 minutes, adjusted according to response; Usual maximum 160 mg/hour

BY MOUTH

- **Adult:** Use dose for hypertension

Hypertension following myocardial infarction

BY INTRAVENOUS INFUSION

- **Adult:** 15 mg/hour, then increased to up to 120 mg/hour, dose to be increased gradually

Hypertensive emergencies

BY INTRAVENOUS INJECTION

- **Adult:** 50 mg, to be given over at least 1 minute, then 50 mg every 5 minutes if required until a satisfactory response occurs; maximum 200 mg per course

BY INTRAVENOUS INFUSION

- **Adult:** Initially 2 mg/minute until a satisfactory response is achieved, then discontinue; usual dose 50–200 mg

Hypertension

BY MOUTH

- **Adult:** Initially 100 mg twice daily, dose to be increased at intervals of 14 days; usual dose 200 mg twice daily, increased if necessary up to 800 mg daily in 2 divided doses, to be taken with food, higher doses to be given in 3–4 divided doses; maximum 2.4 g per day

continued →

- ▶ **Elderly:** Initially 50 mg twice daily, dose to be increased at intervals of 14 days; usual dose 200 mg twice daily, increased if necessary up to 800 mg daily in 2 divided doses, to be taken with food, higher doses to be given in 3–4 divided doses; maximum 2.4 g per day
- ▶ **BY INTRAVENOUS INJECTION**
- ▶ **Adult:** 50 mg, dose to be given over at least 1 minute, then 50 mg after 5 minutes if required; maximum 200 mg per course
- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Adult:** Initially 2 mg/minute until a satisfactory response is achieved, then discontinue; usual dose 50–200 mg

- **CAUTIONS** Liver damage
- **INTERACTIONS** → Appendix 1: beta blockers, non-selective
- **SIDE-EFFECTS**
- ▶ **Common or very common** Drug fever · hypersensitivity
- ▶ **Rare or very rare** Hepatic disorders · systemic lupus erythematosus (SLE) · toxic myopathy · tremor
- ▶ **Frequency not known** Cyanosis · hyperkalaemia · interstitial lung disease · lethargy · lichenoid keratosis · muscle cramps · nasal congestion · peripheral oedema · photosensitivity reaction · psychosis
- **PREGNANCY** The use of labetalol in maternal hypertension is not known to be harmful, except possibly in the first trimester. If labetalol is used close to delivery, infants should be monitored for signs of alpha-blockade (as well as beta blockade).
- **BREAST FEEDING** Infants should be monitored as there is a risk of possible toxicity due to alpha-blockade (in addition to beta-blockade).
- **HEPATIC IMPAIRMENT** Avoid—severe hepatocellular injury reported.
- **RENAL IMPAIRMENT**
- ▶ **Dose adjustments** Dose reduction may be required.
- **MONITORING REQUIREMENTS**
- ▶ **Liver damage** Severe hepatocellular damage reported after both short-term and long-term treatment. Appropriate laboratory testing needed at first symptom of liver dysfunction and if laboratory evidence of damage (or if jaundice) labetalol should be stopped and not restarted.
- **EFFECT ON LABORATORY TESTS** Interferes with laboratory tests for catecholamines.
- **DIRECTIONS FOR ADMINISTRATION** *For intravenous infusion*, give intermittently in Glucose 5% or Sodium chloride and glucose. Dilute to a concentration of 1 mg/mL; suggested volume 200 mL; adjust rate with in-line burette. Avoid upright position during and for 3 hours after intravenous administration.

Nadolol

● INDICATIONS AND DOSE

Hypertension

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 80 mg once daily, then increased in steps of up to 80 mg every week if required, doses higher than the maximum are rarely necessary; maximum 240 mg per day

Angina

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 40 mg once daily, then increased if necessary up to 160 mg daily, doses should be increased at weekly intervals, maximum dose rarely is used; maximum 240 mg per day

Arrhythmias

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 40 mg once daily, then increased if necessary up to 160 mg once daily, doses should be increased at weekly intervals; reduced to 40 mg daily if bradycardia occurs

Migraine prophylaxis

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 40 mg once daily, then increased in steps of 40 mg every week, adjusted according to response; maintenance 80–160 mg once daily

Thyrotoxicosis (adjunct)

- ▶ **BY MOUTH**
- ▶ **Adult:** 80–160 mg once daily

- **INTERACTIONS** → Appendix 1: beta blockers, non-selective
- **SIDE-EFFECTS**
- ▶ **Uncommon** Appetite decreased · behaviour abnormal · cough · dyspepsia · facial swelling · flatulence · nasal congestion · sedation · speech slurred · tinnitus · vision blurred · weight increased
- **BREAST FEEDING** Water soluble beta-blockers such as nadolol are present in breast milk in greater amounts than other beta blockers.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT**
- ▶ **Dose adjustments** Increase dosage interval if eGFR less than 50 mL/minute/1.73 m².

Atenolol

07-Feb-2018

146

● INDICATIONS AND DOSE

Hypertension

- BY MOUTH
- Adult: 25–50 mg daily, higher doses are rarely necessary

Angina

- BY MOUTH
- Adult: 100 mg daily in 1–2 divided doses

Arrhythmias

- BY MOUTH
- Adult: 50–100 mg daily
- BY INTRAVENOUS INJECTION
- Adult: 2.5 mg every 5 minutes if required, to be given at a rate of 1 mg/minute, treatment course may be repeated every 12 hours if required; maximum 10 mg per course
- BY INTRAVENOUS INFUSION
- Adult: 150 micrograms/kg every 12 hours if required, to be given over 20 minutes

Migraine prophylaxis

- BY MOUTH
- Adult: 50–200 mg daily in divided doses

continued →

Early intervention within 12 hours of myocardial infarction

► INITIALLY BY INTRAVENOUS INJECTION

- Adult: 5–10 mg, to be given at a rate of 1 mg/minute, followed by (by mouth) 50 mg after 15 minutes, then (by mouth) 50 mg after 12 hours, then (by mouth) 100 mg after 12 hours, then (by mouth) 100 mg once daily

- **UNLICENSED USE** Use of atenolol for migraine prophylaxis is an unlicensed indication.

IMPORTANT SAFETY INFORMATION**SAFETY PRACTICE**

Atenolol has been confused with amlodipine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **INTERACTIONS** → Appendix 1: beta blockers, selective

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- **Common or very common** Gastrointestinal disorder
- **Rare or very rare** Mood altered · psychosis
- **Frequency not known** Hypersensitivity · lupus-like syndrome

SPECIFIC SIDE-EFFECTS

- **Rare or very rare** Hepatic disorders
- **BREAST FEEDING** Water soluble beta-blockers such as atenolol are present in breast milk in greater amounts than other beta blockers.

● **RENAL IMPAIRMENT****Dose adjustments**

- With oral use Max. 50 mg daily if eGFR 15–35 mL/minute/1.73 m²; max. 25 mg daily or 50 mg on alternate days if eGFR less than 15 mL/minute/1.73 m².
- With intravenous use Max. 10 mg on alternate days if eGFR 15–35 mL/minute/1.73 m²; max. 10 mg every 4 days if eGFR less than 15 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Tenormin®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Suggested infusion time 20 minutes.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection

- **Tenormin** (AstraZeneca UK Ltd)

Atenolol 500 microgram per 1 ml Tenormin 5mg/10ml solution for injection ampoules | 10 ampoule [PoM] £34.45 (Hospital only)

Oral solution

- **Atenolol (Non-proprietary)**

Atenolol 5 mg per 1 ml Atenolol 25mg/5ml oral solution sugar free sugar-free | 300 ml [PoM] £6.72 DT = £5.59

Tablet

Metoprolol tartrate

● INDICATIONS AND DOSE

Hypertension

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 100 mg daily, increased if necessary to 200 mg daily in 1–2 divided doses, high doses are rarely required; maximum 400 mg per day
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 200 mg once daily

Angina

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 50–100 mg 2–3 times a day
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 200–400 mg daily

Arrhythmias

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Usual dose 50 mg 2–3 times a day, then increased if necessary up to 300 mg daily in divided doses
- BY INTRAVENOUS INJECTION
- Adult: Up to 5 mg, dose to be given at a rate of 1–2 mg/minute, then up to 5 mg after 5 minutes if required, total dose of 10–15 mg

Migraine prophylaxis

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 100–200 mg daily in divided doses
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 200 mg daily

Hyperthyroidism (adjunct)

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 50 mg 4 times a day

In surgery

- BY SLOW INTRAVENOUS INJECTION
- Adult: Initially 2–4 mg, given at induction or to control arrhythmias developing during anaesthesia, then 2 mg, repeated if necessary; maximum 10 mg per course

Early intervention within 12 hours of infarction

- INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 5 mg every 2 minutes, to a max. of 15 mg, followed by (by mouth) 50 mg every 6 hours for 48 hours, to be taken 15 minutes after intravenous injection; (by mouth) maintenance 200 mg daily in divided doses

- **INTERACTIONS** → Appendix 1: beta blockers, selective

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Palpitations

- **Uncommon** Chest pain · drowsiness · dystrophic skin lesion · insomnia · muscle cramps · oedema · weight increased
- **Rare or very rare** Conjunctivitis · eye irritation · gangrene · hepatitis · rhinitis

SPECIFIC SIDE-EFFECTS

► Uncommon

- With intravenous use Cardiogenic shock · concentration impaired
- **Rare or very rare**
- With intravenous use Anxiety · arthralgia · memory loss · photosensitivity reaction · taste altered · tinnitus
- With oral use Alertness decreased · arthritis · auditory disorder · personality disorder
- **Frequency not known**
- With oral use Peyronie's disease · retroperitoneal fibrosis

CALCIUM-CHANNEL BLOCKERS

Calcium-channel blockers

Overview

Calcium-channel blockers differ in their predilection for the various possible sites of action and, therefore, their therapeutic effects are disparate, with much greater variation than those of beta-blockers. There are important differences between verapamil hydrochloride p. 163, diltiazem hydrochloride p. 157, and the dihydropyridine calcium-channel blockers (amlodipine below, felodipine p. 159, lacidipine p. 160, lercanidipine hydrochloride p. 160, nicardipine hydrochloride p. 161, nifedipine p. 162, and nimodipine p. 115). Verapamil hydrochloride and diltiazem hydrochloride should usually be **avoided** in heart failure because they may further depress cardiac function and cause clinically significant deterioration.

Verapamil hydrochloride is used for the treatment of angina, hypertension, and arrhythmias. It is a highly negatively inotropic calcium channel-blocker and it reduces cardiac output, slows the heart rate, and may impair atrioventricular conduction. It may precipitate heart failure, exacerbate conduction disorders, and cause hypotension at high doses and should **not** be used with beta-blockers. Constipation is the most common side-effect.

Nifedipine relaxes vascular smooth muscle and dilates coronary and peripheral arteries. It has more influence on vessels and less on the myocardium than does verapamil hydrochloride, and unlike verapamil hydrochloride has no anti-arrhythmic activity. It rarely precipitates heart failure because any negative inotropic effect is offset by a reduction in left ventricular work.

Nicardipine hydrochloride has similar effects to those of nifedipine and may produce less reduction of myocardial contractility. Amlodipine and felodipine also resemble nifedipine and nicardipine hydrochloride in their effects and do not reduce myocardial contractility and they do not produce clinical deterioration in heart failure. They have a longer duration of action and can be given once daily. Nifedipine, nicardipine hydrochloride, amlodipine, and felodipine are used for the treatment of angina or hypertension. All are valuable in forms of angina associated with coronary vasospasm. Side-effects associated with vasodilatation such as flushing and headache (which become less obtrusive after a few days), and ankle swelling (which may respond only partially to diuretics) are common.

Intravenous nicardipine hydrochloride is licensed for the treatment of acute life-threatening hypertension, for example in the event of malignant arterial hypertension or hypertensive encephalopathy; aortic dissection, when a short-acting beta-blocker is not suitable, or in combination with a beta-blocker when beta-blockade alone is not effective; severe pre-eclampsia, when other intravenous anti-hypertensives are not recommended or are contra-indicated; and for treatment of postoperative hypertension.

Lacidipine and lercanidipine hydrochloride have similar effects to those of nifedipine and nicardipine hydrochloride; they are indicated for hypertension only.

Nimodipine is related to nifedipine but the smooth muscle relaxant effect preferentially acts on cerebral arteries. Its use is confined to prevention and treatment of vascular spasm following aneurysmal subarachnoid haemorrhage.

Diltiazem hydrochloride is effective in most forms of angina; the longer-acting formulation is also used for hypertension. It may be used in patients for whom beta-blockers are contra-indicated or ineffective. It has a less negative inotropic effect than verapamil hydrochloride and significant myocardial depression occurs rarely. Nevertheless because of the risk of bradycardia it should be used with caution in association with beta-blockers.

Unstable angina

Calcium-channel blockers do not reduce the risk of myocardial infarction in unstable angina. The use of diltiazem hydrochloride or verapamil hydrochloride should be reserved for patients resistant to treatment with beta-blockers.

Calcium-channel blockers

● **DRUG ACTION** Calcium-channel blockers (less correctly called 'calcium-antagonists') interfere with the inward displacement of calcium ions through the slow channels of active cell membranes. They influence the myocardial cells, the cells within the specialised conducting system of the heart, and the cells of vascular smooth muscle. Thus, myocardial contractility may be reduced, the formation and propagation of electrical impulses within the heart may be depressed, and coronary or systemic vascular tone may be diminished.

● SIDE-EFFECTS

► **Common or very common** Dizziness · flushing · gastrointestinal disorders · headache · nausea · palpitations · peripheral oedema · sexual dysfunction · skin reactions · tachycardia · vomiting

► **Uncommon** Gingival hyperplasia

Overdose Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur.

In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

For details on the management of poisoning, see Calcium-channel blockers, under Emergency treatment of poisoning p. 1319.

● **TREATMENT CESSATION** There is some evidence that sudden withdrawal of calcium-channel blockers may be associated with an exacerbation of myocardial ischaemia.

► **above**

07-Feb-2018

Amlodipine

● **DRUG ACTION** Amlodipine is a dihydropyridine calcium-channel blocker.

● INDICATIONS AND DOSE

Prophylaxis of angina

► BY MOUTH

► **Adult:** Initially 5 mg once daily; maximum 10 mg per day

Hypertension

► BY MOUTH

► **Adult:** Initially 5 mg once daily; maximum 10 mg per day

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 2 mg/hour, dose may be doubled every 90 seconds as necessary; usual dose 4–6 mg/hour (max. per dose 32 mg/hour); maximum 500 mg per day

- **CONTRA-INDICATIONS** Defective lipid metabolism · uncorrected critical aortic stenosis
- **CAUTIONS** Hypertrophic obstructive cardiomyopathy (risk of reduced oxygen delivery) · lipid load restrictions (injection has a high lipid content) · mitral stenosis (risk of reduced oxygen delivery) · patients who are unable to increase their heart rate adequately to compensate for reduced blood pressure
- **INTERACTIONS** → Appendix 1: calcium channel blockers
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Acute kidney injury · arrhythmias · chest pain · feeling hot · hypotension · polyuria
 - ▶ **Uncommon** Cardiac conduction disorders · congestive heart failure · constipation · hypoxia · pulmonary congestion
 - ▶ **Rare or very rare** Ileus
- **SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises that systemic hypotension and reflex tachycardia have been reported – consider decreasing the dose by half or stopping the infusion.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to peanut, soy products, or egg products.
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies (recommendation also supported by specialist sources).
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor heart rate and blood pressure continuously during infusion, until vital signs are stable; continue to monitor patients who receive prolonged infusions and are not

transitioned to other antihypertensive therapies for at least 8 hours after the infusion is stopped.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Emulsion for infusion

EXCIPIENTS: May contain Disodium edetate

- ▶ **Cleviprex** (Chiesi Ltd)

Cleviprex 500 microgram per 1 ml Cleviprex 25mg/50ml emulsion for infusion vials | 10 vial [PoM] £1,200.00 (Hospital only)

F 155

Diltiazem hydrochloride

● INDICATIONS AND DOSE

Prophylaxis and treatment of angina

- ▶ BY MOUTH

- ▶ Adult: Initially 60 mg 3 times a day, adjusted according to response; maximum 360 mg per day
- ▶ Elderly: Initially 60 mg twice daily, adjusted according to response; maximum 360 mg per day

ADIZEM-SR® CAPSULES

Mild to moderate hypertension

- ▶ BY MOUTH

- ▶ Adult: 120 mg twice daily, dose form not appropriate for initial dose titration

Angina

- ▶ BY MOUTH

- ▶ Adult: Initially 90 mg twice daily; increased if necessary to 180 mg twice daily, dose form not appropriate for initial dose titration in the elderly

ADIZEM-XL®

Angina | Mild to moderate hypertension

- ▶ BY MOUTH

- ▶ Adult: Initially 240 mg once daily, increased if necessary to 300 mg once daily
- ▶ Elderly: Initially 120 mg once daily, increased if necessary up to 300 mg once daily

ANGITIL® SR

Angina | Mild to moderate hypertension

- ▶ BY MOUTH

- ▶ Adult: Initially 90 mg twice daily; increased if necessary to 120–180 mg twice daily

ANGITIL® XL

Angina | Mild to moderate hypertension

- ▶ BY MOUTH

- ▶ Adult: Initially 240 mg once daily; increased if necessary to 300 mg once daily, dose form not appropriate for initial dose titration in the elderly

DILCARDIA® SR

Angina | Mild to moderate hypertension

- ▶ BY MOUTH

- ▶ Adult: Initially 90 mg twice daily; increased if necessary to 180 mg twice daily
- ▶ Elderly: Initially 60 mg twice daily; increased if necessary to 90 mg twice daily

DILZEM® SR

Angina | Mild to moderate hypertension

- ▶ BY MOUTH

- ▶ Adult: Initially 90 mg twice daily; increased if necessary up to 180 mg twice daily
- ▶ Elderly: Initially 60 mg twice daily; increased if necessary up to 180 mg twice daily

DILZEM® XL

Angina | Mild to moderate hypertension

- ▶ BY MOUTH

- ▶ Adult: Initially 180 mg once daily; increased if necessary to 360 mg once daily
- ▶ Elderly: Initially 120 mg once daily; increased if necessary to 360 mg once daily

SLOZEM®

Angina | Mild to moderate hypertension

- ▶ BY MOUTH

- ▶ Adult: Initially 240 mg once daily; increased if necessary to 360 mg once daily
- ▶ Elderly: Initially 120 mg once daily; increased if necessary to 360 mg once daily

TILDIEM RETARD®

Mild to moderate hypertension

- ▶ BY MOUTH

- ▶ Adult: Initially 90–120 mg twice daily; increased if necessary to 360 mg daily in divided doses
- ▶ Elderly: Initially 120 mg once daily; increased if necessary to 120 mg twice daily

Angina

- ▶ BY MOUTH

- ▶ Adult: Initially 90–120 mg twice daily; increased if necessary to 480 mg daily in divided doses
- ▶ Elderly: Up to 120 mg twice daily, dose form not appropriate for initial dose titration

TILDIEM® LA

Angina | Mild to moderate hypertension

- ▶ BY MOUTH

- ▶ Adult: Initially 200 mg once daily, to be taken with or before food, increased if necessary to 300–400 mg once daily; maximum 500 mg per day
- ▶ Elderly: Initially 200 mg once daily, increased if necessary to 300 mg once daily

VIAZEM® XL

Angina | Mild to moderate hypertension

- ▶ BY MOUTH

- ▶ Adult: Initially 180 mg once daily, adjusted according to response to 240 mg once daily; maximum 360 mg per day
- ▶ Elderly: Initially 120 mg once daily, adjusted according to response

ZEMTARD®

Angina

- ▶ BY MOUTH

- ▶ Adult: 180–300 mg once daily, increased if necessary to 480 mg once daily
- ▶ Elderly: Initially 120 mg once daily, increased if necessary to 480 mg once daily

Mild to moderate hypertension

- ▶ BY MOUTH

- ▶ Adult: 180–300 mg once daily, increased if necessary to 360 mg once daily
- ▶ Elderly: Initially 120 mg once daily, increased if necessary to 360 mg once daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 • left ventricular failure with pulmonary congestion • second- or third-degree AV block (unless pacemaker fitted) • severe bradycardia • sick sinus syndrome
- **CAUTIONS** Bradycardia (avoid if severe) • first degree AV block • heart failure • prolonged PR interval • significantly impaired left ventricular function
- **INTERACTIONS** → Appendix 1: calcium channel blockers
- **SIDE-EFFECTS**
 - ▶ Common or very common Cardiac conduction disorders • constipation • gastrointestinal discomfort • malaise

- **Uncommon** Arrhythmias · diarrhoea · insomnia · nervousness · postural hypotension
 - **Rare or very rare** Dry mouth
 - **Frequency not known** Angioedema · cardiac arrest · congestive heart failure · depression · extrapyramidal symptoms · fever · gynaecomastia · hepatitis · hyperglycaemia · hyperhidrosis · mood altered · photosensitivity reaction · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · vasculitis
- Overdose** In overdose, diltiazem has a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole.

● **PREGNANCY** Avoid.

- **BREAST FEEDING** Significant amount present in milk—no evidence of harm but avoid unless no safer alternative.

● **HEPATIC IMPAIRMENT**

Dose adjustments Reduce dose.

TILDIEM RETARD® Dose for mild to moderate hypertension—initially 120 mg once a day; increased if necessary to 120 mg twice a day.

For treatment of angina, dose form not appropriate for initial titration; up to 120 mg twice a day may be required.

ADIZEM-XL® Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

DILZEM® **XL** Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

ZEMTARD® Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

DILCARDIA® **SR** Dose for angina and mild to moderate hypertension—initially 60 mg twice a day; maximum 90 mg twice a day.

ANGITIL® **XL** Dose form not appropriate for initial dose titration.

SLOZEM® Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

TILDIEM® **LA** Dose for angina and mild to moderate hypertension—initially 200 mg daily; increased if necessary to 300 mg daily.

VIAZEM® **XL** Dose for angina and mild to moderate hypertension—initially 120 mg once daily, adjusted according to response.

● **RENAL IMPAIRMENT**

Start with smaller dose.

TILDIEM RETARD® Dose for mild to moderate hypertension—initially 120 mg once a day; increased if necessary to 120 mg twice a day.

For treatment of angina, dose form not appropriate for initial titration; up to 120 mg twice a day may be required.

ADIZEM-XL® Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

DILZEM® **XL** Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

ZEMTARD® Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

DILCARDIA® **SR** Dose for angina and mild to moderate hypertension—initially 60 mg twice a day; maximum 90 mg twice a day.

ANGITIL® **XL** Dose form not appropriate for initial dose titration.

SLOZEM® Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

TILDIEM® **LA** Dose for angina and mild to moderate hypertension—initially 200 mg daily; increased if necessary to 300 mg daily.

VIAZEM® **XL** Dose for angina and mild to moderate hypertension—initially 120 mg once daily, adjusted according to response.

- **PRESCRIBING AND DISPENSING INFORMATION** The standard formulations containing 60 mg diltiazem hydrochloride are licensed as generics and there is no requirement for brand name dispensing. Although their means of formulation has called for the strict designation 'modified-release', their duration of action corresponds to that of tablets requiring administration more frequently.

Different versions of modified-release preparations containing more than 60 mg diltiazem hydrochloride may not have the same clinical effect. To avoid confusion between these different formulations of diltiazem, prescribers should specify the brand to be dispensed.

● **PATIENT AND CARER ADVICE**

TILDIEM RETARD® Tablet membrane may pass through gastro-intestinal tract unchanged, but being porous has no effect on efficacy.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

P 155

Felodipine

- **DRUG ACTION** Felodipine is a dihydropyridine calcium-channel blocker.

● INDICATIONS AND DOSE

Prophylaxis of angina

▶ BY MOUTH

- ▶ Adult: Initially 5 mg once daily; increased if necessary to 10 mg once daily, to be taken in the morning
- ▶ Elderly: Initially 2.5 mg once daily; increased if necessary to 10 mg once daily, to be taken in the morning

Hypertension

▶ BY MOUTH

- ▶ Adult: Initially 5 mg once daily; usual maintenance 5–10 mg once daily, to be taken in the morning, doses above 20 mg daily rarely needed
- ▶ Elderly: Initially 2.5 mg daily; usual maintenance 5–10 mg once daily, to be taken in the morning, doses above 20 mg daily rarely needed

- **CONTRA-INDICATIONS** Cardiac outflow obstruction · significant cardiac valvular obstruction (e.g. aortic stenosis) · uncontrolled heart failure · unstable angina · within 1 month of myocardial infarction
- **CAUTIONS** Predisposition to tachycardia · severe left ventricular dysfunction · withdraw if cardiogenic shock develops · withdraw if existing pain worsens shortly after initiating treatment · withdraw if ischaemic pain occurs shortly after initiating treatment
- **INTERACTIONS** → Appendix 1: calcium channel blockers
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Abdominal pain · fatigue · paraesthesia
 - ▶ **Rare or very rare** Arthralgia · hypersensitivity vasculitis · myalgia · photosensitivity reaction · syncope · urinary frequency increased
- **PREGNANCY** Avoid; toxicity in *animal* studies; may inhibit labour.
- **BREAST FEEDING** Present in milk but amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT** Dose adjustments Dose reduction may be required.

P 155

Lacidipine

- **DRUG ACTION** Lacidipine is a dihydropyridine calcium-channel blocker.

● INDICATIONS AND DOSE

Hypertension

► BY MOUTH

- **Adult:** Initially 2 mg daily; increased if necessary to 4 mg daily, then increased if necessary to 6 mg daily, dose increases should occur at intervals of 3–4 weeks, to be taken preferably in the morning

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · aortic stenosis · avoid within 1 month of myocardial infarction · cardiogenic shock · unstable angina
- **CAUTIONS** Cardiac conduction abnormalities · poor cardiac reserve
- **INTERACTIONS** → Appendix 1: calcium channel blockers
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal discomfort · asthenia · polyuria
 - **Uncommon** Ischaemic heart disease · syncope
 - **Rare or very rare** Angioedema · depression · muscle cramps · tremor
- **PREGNANCY** Manufacturer advises avoid; may inhibit labour.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Antihypertensive effect possibly increased.

Lercanidipine hydrochloride 20 mg Lercanidipine 20mg tablets | 28 tablet [PoM] £15.99 DT = £3.91

► **Zanidip** (Recordati Pharmaceuticals Ltd)

Lercanidipine hydrochloride 10 mg Zanidip 10mg tablets | 28 tablet [PoM] £5.70 DT = £3.28

Lercanidipine hydrochloride 20 mg Zanidip 20mg tablets | 28 tablet [PoM] £10.82 DT = £3.91

Nicardipine hydrochloride

- **DRUG ACTION** Nicardipine is a dihydropyridine calcium-channel blocker.

● INDICATIONS AND DOSE

Prophylaxis of angina

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 20 mg 3 times a day, then increased to 30 mg 3 times a day, dose increased after at least 3 days; usual dose 60–120 mg daily

Mild to moderate hypertension

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 20 mg 3 times a day, then increased to 30 mg 3 times a day, dose increased after at least 3 days; usual dose 60–120 mg daily

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: Initially 30 mg twice daily; increased if necessary up to 45 mg twice daily. usual dose 30–60 mg twice daily

Life-threatening hypertension (specialist use only) | Post-operative hypertension (specialist use only)

► BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: Initially 3–5 mg/hour for 15 minutes, increased in steps of 0.5–1 mg every 15 minutes, adjusted according to response, maximum rate 15 mg/hour, reduce dose gradually when target blood pressure achieved; maintenance 2–4 mg/hour
- Elderly: Initially 1–5 mg/hour, then adjusted in steps of 500 micrograms/hour after 30 minutes, adjusted according to response, maximum rate 15 mg/hour

Life-threatening hypertension in patients with hepatic or renal impairment (specialist use only) | Postoperative hypertension in patients with hepatic or renal impairment (specialist use only)

► BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: Initially 1–5 mg/hour, then adjusted in steps of 500 micrograms/hour after 30 minutes, adjusted according to response, maximum rate 15 mg/hour

Acute life-threatening hypertension in pregnancy (specialist use only)

► BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: Initially 1–5 mg/hour, then adjusted in steps of 500 micrograms/hour after 30 minutes, adjusted according to response, usual maximum rate 4 mg/hour in treatment of pre-eclampsia (maximum rate 15 mg/hour)

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Acute porphyrias p. 1025 · cardiogenic shock · significant or advanced aortic stenosis · unstable or acute attacks of angina

SPECIFIC CONTRA-INDICATIONS

- With intravenous use avoid within 8 days of myocardial infarction · compensatory hypertension
- With oral use avoid within 1 month of myocardial infarction

● CAUTIONS

GENERAL CAUTIONS Congestive heart failure · elderly · pulmonary oedema · significantly impaired left ventricular function · stroke · withdraw if ischaemic pain occurs or existing pain worsens within 30 minutes of initiating treatment or increasing dose

SPECIFIC CAUTIONS

- With intravenous use Elevated intracranial pressure · portal hypertension

- **INTERACTIONS** → Appendix 1: calcium channel blockers

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Common or very common Hypotension

- **Frequency not known** Hepatic disorders · Pulmonary oedema · thrombocytopenia

SPECIFIC SIDE-EFFECTS

- With intravenous use Atrioventricular block · erythema · ischaemic heart disease · paralytic ileus
- With oral use Asthenia · depression · drowsiness · dyspnoea · feeling hot · insomnia · nervous system disorder · paraesthesia · renal impairment · tinnitus · urinary frequency increased

SIDE-EFFECTS, FURTHER INFORMATION Systemic hypotension and reflex tachycardia with rapid reduction of blood pressure may occur—during intravenous use consider stopping infusion or decreasing dose by half.

- **PREGNANCY** May inhibit labour. Not to be used in multiple pregnancy (twins or more) unless there is no other acceptable alternative. Toxicity in *animal studies*. Risk of severe maternal hypotension and fatal fetal hypoxia—avoid excessive decrease in blood pressure. For treatment of acute life-threatening hypertension only.

- **BREAST FEEDING** Manufacturer advises avoid—present in breast milk.

● HEPATIC IMPAIRMENT

Dose adjustments ► With oral use Use with caution—consider using lowest initial dose and extending dosing interval according to individual response.

- With intravenous use Use with caution—use lower initial dose.

● RENAL IMPAIRMENT

Dose adjustments ► With oral use Consider using lowest initial dose and extending dosing interval according to individual response.

- With intravenous use Use with caution—use lower initial dose.

- **MONITORING REQUIREMENTS** Monitor blood pressure and heart rate at least every 5 minutes during intravenous infusion, and then until stable, and continue monitoring for at least 12 hours after end of infusion.

- **DIRECTIONS FOR ADMINISTRATION** Intravenous nicardipine should only be administered under the supervision of a specialist and in a hospital or intensive care setting in which patients can be closely monitored.

For intravenous infusion give continuously in Glucose 5%; dilute dose in infusion fluid to a final concentration of 100–200 micrograms/mL (undiluted solution *via* central venous line only) and give *via* volumetric infusion pump or syringe driver; protect from light; to minimise peripheral venous irritation, change site of infusion every 12 hours; risk of adsorption on to plastic of infusion set in the presence of saline solutions; incompatible with bicarbonate or alkaline solutions—consult product literature.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Modified-release capsule

Nifedipine

21-Nov-2016

- **DRUG ACTION** Nifedipine is a dihydropyridine calcium-channel blocker.

● **INDICATIONS AND DOSE****Raynaud's syndrome**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Adult: Initially 5 mg 3 times a day, then adjusted according to response to 20 mg 3 times a day

Angina prophylaxis (not recommended)

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Adult: Initially 5 mg 3 times a day, then adjusted according to response to 20 mg 3 times a day

Postponement of premature labour

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Adult: Initially 20 mg, followed by 10–20 mg 3–4 times a day, adjusted according to uterine activity

Hiccup in palliative care

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Adult: 10 mg 3 times a day

ADALAT RETARD®**Hypertension | Angina prophylaxis**

- **BY MOUTH**
- Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

ADALAT®**Angina prophylaxis (not recommended) | Raynaud's phenomenon**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Adult: Initially 5 mg 3 times a day, then adjusted according to response to 20 mg 3 times a day

DOSE EQUIVALENCE AND CONVERSION

- **Adalat®** liquid gel capsules contain 5 mg nifedipine in 0.17 mL and 10 mg nifedipine in 0.34 mL.

ADALAT® LA**Hypertension**

- **BY MOUTH**
- Adult: 20–30 mg once daily, increased if necessary up to 90 mg once daily

Angina prophylaxis

- **BY MOUTH**
- Adult: 30 mg once daily, increased if necessary up to 90 mg once daily

ADIPINE® MR**Hypertension | Angina prophylaxis**

- **BY MOUTH**
- Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

ADIPINE® XL**Hypertension | Angina prophylaxis**

- **BY MOUTH**
- Adult: 30 mg daily, increased if necessary up to 90 mg daily

CORACTEN® SR**Hypertension | Angina prophylaxis**

- **BY MOUTH**
- Adult: Initially 10 mg twice daily, increased if necessary up to 40 mg twice daily

CORACTEN® XL**Hypertension | Angina prophylaxis**

- **BY MOUTH**
- Adult: Initially 30 mg daily, increased if necessary up to 90 mg daily

FORTIPINE® LA 40**Hypertension | Angina prophylaxis**

- **BY MOUTH**
- Adult: Initially 40 mg once daily, increased if necessary to 80 mg daily in 1–2 divided doses

NIFEDIPRESS® MR**Hypertension | Angina prophylaxis**

- **BY MOUTH**
- Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

TENSIPINE® MR**Hypertension | Angina prophylaxis**

- **BY MOUTH**
- Adult: Initially 10 mg twice daily, adjusted according to response to 40 mg twice daily

VALNI® XL**Severe hypertension | Prophylaxis of angina**

- **BY MOUTH**
- Adult: 30 mg once daily, increased if necessary up to 90 mg once daily

- **UNLICENSED USE** Not licensed for use in postponing premature labour.
- **CONTRA-INDICATIONS** Acute attacks of angina · cardiogenic shock · significant aortic stenosis · unstable angina · within 1 month of myocardial infarction
- **CAUTIONS** Diabetes mellitus · elderly · heart failure · poor cardiac reserve · severe hypotension · short-acting formulations are not recommended for angina or long-term management of hypertension; their use may be associated with large variations in blood pressure and reflex tachycardia · significantly impaired left ventricular function (heart failure deterioration observed) · withdraw if ischaemic pain occurs or existing pain worsens shortly after initiating treatment
- **ADALAT® LA** Crohn's disease · decreased lumen diameter of the gastro-intestinal tract · history of gastro-intestinal obstruction · history of oesophageal obstruction · inflammatory bowel disease
- **CAUTIONS, FURTHER INFORMATION** Dose form not appropriate for use where there is a history of oesophageal or gastro-intestinal obstruction, decreased lumen diameter of the gastro-intestinal tract, or inflammatory bowel disease (including Crohn's disease).
- **VALNI® XL** Decreased lumen diameter of gastro-intestinal tract · history of gastro-intestinal obstruction · history of oesophageal obstruction · ileostomy after proctocolectomy · inflammatory bowel disease
- **CAUTIONS, FURTHER INFORMATION** Dose form not appropriate for use where there is a history of oesophageal or gastro-intestinal obstruction, decreased lumen diameter of the gastro-intestinal tract, inflammatory bowel disease, or ileostomy after proctocolectomy.
- **INTERACTIONS** → Appendix 1: calcium channel blockers
- **SIDE-EFFECTS**
- **Common or very common** Constipation · malaise · oedema · vasodilation

- **Uncommon** Allergic oedema • angioedema • anxiety • chills • dry mouth • epistaxis • gastrointestinal discomfort • hypotension • joint disorders • laryngeal oedema • migraine • muscle complaints • nasal congestion • pain • sleep disorder • syncope • tremor • urinary disorders • vertigo • visual impairment

- **Rare or very rare** Sensation abnormal

- **Frequency not known** Agranulocytosis • angina pectoris • chest pain • drowsiness • dyspnoea • eye pain • hyperglycaemia • jaundice • leucopenia • photoallergic reaction • pulmonary oedema • toxic epidermal necrolysis

- **PREGNANCY** May inhibit labour; manufacturer advises avoid before week 20, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension. Use only if other treatment options are not indicated or have failed.

- **BREAST FEEDING** Amount too small to be harmful but manufacturers advise avoid.

● **HEPATIC IMPAIRMENT**

Dose adjustments Dose reduction may be required in severe liver disease.

Some modified-release formulations may not be suitable for dose titration in hepatic disease—consult product literature.

ADALAT® LA Dose form not appropriate.

VALNI® XL Dose form not appropriate.

● **DIRECTIONS FOR ADMINISTRATION**

FORTIPINE® LA 40 Take with or just after food, or a meal.

- **PRESCRIBING AND DISPENSING INFORMATION** Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of nifedipine, prescribers should specify the brand to be dispensed.

Palliative care For further information on the use of nifedipine in palliative care, see www.palliativedrugs.com/formulary/en/nifedipine.html.

● **PATIENT AND CARER ADVICE**

ADALAT® LA Tablet membrane may pass through gastrointestinal tract unchanged, but being porous has no effect on efficacy.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral drops, ointment

Verapamil hydrochloride

● **INDICATIONS AND DOSE**

Treatment of supraventricular arrhythmias

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- **Adult:** 40–120 mg 3 times a day

- **BY SLOW INTRAVENOUS INJECTION**

- **Adult:** 5–10 mg, to be given over 2 minutes, preferably with ECG monitoring

- **Elderly:** 5–10 mg, to be given over 3 minutes, preferably with ECG monitoring

Paroxysmal tachyarrhythmias

- **BY SLOW INTRAVENOUS INJECTION**

- **Adult:** Initially 5–10 mg, followed by 5 mg after 5–10 minutes if required, to be given over 2 minutes, preferably with ECG monitoring

- **Elderly:** Initially 5–10 mg, followed by 5 mg after 5–10 minutes if required, to be given over 3 minutes, preferably with ECG monitoring

Angina

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- **Adult:** 80–120 mg 3 times a day

Hypertension

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- **Adult:** 240–480 mg daily in 2–3 divided doses

continued →

Prophylaxis of cluster headache (initiated under specialist supervision)

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 240–960 mg daily in 3–4 divided doses

HALF SECURON® SR**Hypertension (in patients new to verapamil)**

- BY MOUTH
- Adult: Initially 120 mg daily, increased if necessary up to 480 mg daily, doses above 240 mg daily as 2 divided doses

Hypertension

- BY MOUTH
- Adult: 240 mg daily, increased if necessary up to 480 mg daily, doses above 240 mg daily as 2 divided doses

Angina

- BY MOUTH
- Adult: 240 mg twice daily, may sometimes be reduced to once daily

Prophylaxis after myocardial infarction where beta-blockers not appropriate

- BY MOUTH
- Adult: 360 mg daily in divided doses, started at least 1 week after infarction, given as either 240 mg in the morning and 120 mg in the evening or 120 mg 3 times daily

SECURON® SR**Hypertension (in patients new to verapamil)**

VERAPRESS® MR**Hypertension**

- BY MOUTH
- Adult: 240 mg daily, increased if necessary to 240 mg twice daily

Angina

- BY MOUTH
- Adult: 240 mg twice daily, may sometimes be reduced to once daily

VERTAB® SR 240**Mild to moderate hypertension**

- BY MOUTH
- Adult: 240 mg daily, increased if necessary to 240 mg twice daily

Angina

- BY MOUTH
- Adult: 240 mg twice daily, may sometimes be reduced to once daily

● UNLICENSED USE

- With oral use Prophylaxis of cluster headaches is an unlicensed indication.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · atrial flutter or fibrillation associated with accessory conducting pathways (e.g. Wolff-Parkinson-White-syndrome) · bradycardia · cardiogenic shock · history of heart failure (even if controlled by therapy) · history of significantly impaired left ventricular function (even if controlled by therapy) · hypotension · second- and third-degree AV block · sick sinus syndrome · sino-atrial block

- **CAUTIONS** Acute phase of myocardial infarction (avoid if bradycardia, hypotension, left ventricular failure) · first-degree AV block

- **INTERACTIONS** → Appendix 1: calcium channel blockers

● SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- **Common or very common** Hypotension
- **Frequency not known** Atrioventricular block · extrapyramidal symptoms · gynaecomastia · Stevens-Johnson syndrome · vertigo

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- With intravenous use Bradycardia
- **Frequency not known**
- With intravenous use Cardiac arrest · drowsiness · hepatic impairment · hyperhidrosis · myocardial contractility decreased · nervousness · seizure
- With oral use Alopecia · angioedema · arthralgia · constipation · fatigue · galactorrhoea · gastrointestinal discomfort · heart failure · ileus · muscle weakness · myalgia · paraesthesia · tinnitus · tremor
- Overdose** In overdose, verapamil has a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole.

- **PREGNANCY** May reduce uterine blood flow with fetal hypoxia. Manufacturer advises avoid in first trimester unless absolutely necessary. May inhibit labour.

- **BREAST FEEDING** Amount too small to be harmful.

● HEPATIC IMPAIRMENT

Dose adjustments Oral dose may need to be reduced.

DIURETICS > THIAZIDES AND RELATED DIURETICS**Thiazides and related diuretics** ➔

- **CONTRA-INDICATIONS** Addison's disease · hypercalcaemia · hyponatraemia · refractory hypokalaemia · symptomatic hyperuricaemia

- **CAUTIONS** Diabetes · gout · hyperaldosteronism · malnourishment · nephrotic syndrome · systemic lupus erythematosus

CAUTIONS, FURTHER INFORMATION

- **Potassium loss** Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic.

Hypokalaemia is dangerous in severe cardiovascular disease and in patients also being treated with cardiac glycosides. Often the use of potassium-sparing diuretics avoids the need to take potassium supplements.

Potassium supplements or potassium-sparing diuretics are seldom necessary when thiazides are used in the routine treatment of hypertension.

In hepatic failure, hypokalaemia caused by diuretics can precipitate encephalopathy, particularly in alcoholic cirrhosis.

- **Elderly** Lower initial doses of diuretics should be used in the elderly because they are particularly susceptible to the side-effects. The dose should then be adjusted according to renal function. Diuretics should not be used continuously on a long-term basis to treat simple gravitational oedema (which will usually respond to increased movement, raising the legs, and support stockings).
- **Existing conditions** Thiazides and related diuretics can exacerbate diabetes, gout, and systemic lupus erythematosus.

● **SIDE-EFFECTS**

- **Common or very common** Constipation · electrolyte imbalance · headache · postural hypotension · severe cutaneous adverse reactions (SCARs) · skin reactions
- **Rare or very rare** Leucopenia · thrombocytopenia
- **PREGNANCY** Thiazides and related diuretics should not be used to treat gestational hypertension. They may cause neonatal thrombocytopenia, bone marrow suppression, jaundice, electrolyte disturbances, and hypoglycaemia; placental perfusion may also be reduced. Stimulation of labour, uterine inertia, and meconium staining have also been reported.
- **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe liver disease. Hypokalaemia may precipitate coma in hepatic impairment, although hypokalaemia can be prevented by using a potassium-sparing diuretic. There is an increased risk of hypomagnesaemia in alcoholic cirrhosis.
- **RENAL IMPAIRMENT** Thiazides and related diuretics are ineffective if eGFR is less than 30 mL/minute/1.73 m² and should be avoided. Metolazone remains effective if eGFR is less than 30 mL/minute/1.73 m² but is associated with a risk of excessive diuresis.
- Monitoring** Electrolytes should be monitored in renal impairment.
- **MONITORING REQUIREMENTS** Electrolytes should be monitored, particularly with high doses and long-term use.

Bendroflumethiazide 2.5 mg Aprinox 2.5mg tablets | 500 tablet [PoM] £27.31

► **Neo-Naclex** (AMCo)

Bendroflumethiazide 2.5 mg Neo-Naclex 2.5mg tablets | 28 tablet [PoM] £0.33 DT = £0.28

Combinations available: **Timolol with bendroflumethiazide**, p. 151

Co-amlozide

● INDICATIONS AND DOSE

Hypertension

► BY MOUTH

- Adult: Initially 2.5/25 mg daily, increased if necessary up to 5/50 mg daily

Congestive heart failure

► BY MOUTH

- Adult: Initially 2.5/25 mg daily; increased if necessary up to 10/100 mg daily, reduce dose for maintenance if possible

Oedema and ascites in cirrhosis of the liver

► BY MOUTH

- Adult: Initially 5/50 mg daily; increased if necessary up to 10/100 mg daily, reduce dose for maintenance if possible

DOSE EQUIVALENCE AND CONVERSION

- A mixture of amloride hydrochloride and hydrochlorothiazide in the mass proportions of 1 part amloride hydrochloride to 10 parts hydrochlorothiazide.

- **CONTRA-INDICATIONS** Anuria · hyperkalaemia

- **CAUTIONS** Diabetes mellitus · elderly

- **INTERACTIONS** → Appendix 1: potassium-sparing diuretics · thiazide diuretics

- **SIDE-EFFECTS** Angina pectoris · appetite abnormal · arrhythmias · arthralgia · asthenia · chest pain · confusion · depression · diarrhoea · dizziness · drowsiness · dyspnoea · electrolyte imbalance · erectile dysfunction · flatulence · flushing · gastrointestinal discomfort · gastrointestinal haemorrhage · gout · hiccups · hyperhidrosis · insomnia · malaise · muscle cramps · nasal congestion · nausea · nervousness · pain · paraesthesia · renal impairment · stupor · syncope · taste unpleasant · urinary disorders · vertigo · visual impairment · vomiting

- **BREAST FEEDING** Avoid—no information regarding amloride component available. Amount of hydrochlorothiazide in milk probably too small to be harmful. Large doses of hydrochlorothiazide may suppress lactation.

- **RENAL IMPAIRMENT** Manufacturers advise avoid in severe impairment.

Monitoring Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).

- **MONITORING REQUIREMENTS** Monitor electrolytes.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

► Co-amlozide (Non-proprietary)

Amloride hydrochloride 2.5 mg, Hydrochlorothiazide 25 mg Co-amlozide 2.5mg/25mg tablets | 28 tablet [PoM] £7.56 DT = £6.05

Amloride hydrochloride 5 mg, Hydrochlorothiazide 50 mg Co-amlozide 5mg/50mg tablets | 28 tablet [PoM] £1.68 DT = £1.24

► Moduret (Merck Sharp & Dohme Ltd)

Amloride hydrochloride 2.5 mg, Hydrochlorothiazide 25 mg Moduret 25 tablets | 28 tablet [PoM] £0.86 DT = £6.05

► Moduretic (Merck Sharp & Dohme Ltd)

Amloride hydrochloride 5 mg, Hydrochlorothiazide 50 mg Moduretic 5mg/50mg tablets | 28 tablet [PoM] £1.29 DT = £1.24

Hydrochlorothiazide

● INDICATIONS AND DOSE

Indications listed in combination monographs (available in the UK only in combination with other drugs)

► BY MOUTH

- Adult: Doses listed in combination monographs

- **INTERACTIONS** → Appendix 1: thiazide diuretics

● MEDICINAL FORMS

No licensed medicines listed.

Combinations available: *Co-zidocapt*, p. 168 .

Enalapril with hydrochlorothiazide, p. 169 .

Irbesartan with hydrochlorothiazide, p. 175 .

Lisinopril with hydrochlorothiazide, p. 170 .

Losartan with hydrochlorothiazide, p. 176 .

Olmesartan with amlodipine and hydrochlorothiazide, p. 177 .

Olmesartan with hydrochlorothiazide, p. 177 .

Quinapril with hydrochlorothiazide, p. 172 .

Telmisartan with hydrochlorothiazide, p. 178 .

Timolol with amloride and hydrochlorothiazide, p. 151 .

Valsartan with hydrochlorothiazide, p. 179

Indapamide

- **DRUG ACTION** Indapamide is a thiazide-like diuretic with antihypertensive effects. At lower doses, vasodilatation is more prominent than diuresis; the diuretic effect becomes more apparent with higher doses.

● INDICATIONS AND DOSE

Essential hypertension

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: 2.5 mg daily, dose to be taken in the morning

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 1.5 mg daily, dose to be taken preferably in the morning

- **CAUTIONS** Acute porphyrias p. 1025

- **INTERACTIONS** → Appendix 1: thiazide diuretics

● SIDE-EFFECTS

- **Common or very common** Hypersensitivity

- **Uncommon** Vomiting

- **Rare or very rare** Agranulocytosis · angioedema · aplastic anaemia · arrhythmias · dry mouth · fatigue · haemolytic anaemia · hepatic disorders · hypercalcaemia · nausea · pancreatitis · paraesthesia · renal failure · vertigo

- **Frequency not known** Hepatic encephalopathy · photosensitivity reaction · QT interval prolongation · syncope · systemic lupus erythematosus exacerbated · vision disorders

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to sulfonamides.

- **BREAST FEEDING** Present in milk—manufacturer advises avoid.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

► Indapamide (Non-proprietary)

Indapamide 1.5 mg Indapamide 1.5mg modified-release tablets | 30 tablet [PoM] £3.40 DT = £3.40

► Alkapamid XL (HBS Healthcare Ltd)

Indapamide 1.5 mg Alkapamid XL 1.5mg tablets | 30 tablet [PoM] £2.20 DT = £3.40

Indapamide hemihydrate 2.5 mg Indapamide 2.5mg tablets | 28 tablet [PoM] £29.00 DT = £0.70 | 56 tablet [PoM] £1.40-£12.68
- ▶ **Natrilix** (Servier Laboratories Ltd)
Indapamide hemihydrate 2.5 mg Natrilix 2.5mg tablets | 30 tablet [PoM] £3.40 | 60 tablet [PoM] £6.80

Combinations available: **Perindopril arginine with indapamide**, p. 171

DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM > ACE INHIBITORS

Angiotensin-converting enzyme inhibitors

- **CONTRA-INDICATIONS** The combination of an ACE inhibitor with aliskiren is contra-indicated in patients with an eGFR less than 60 mL/minute/1.73 m². The combination of an ACE inhibitor with aliskiren is contra-indicated in patients with diabetes mellitus
- **CAUTIONS** Afro-Caribbean patients (may respond less well to ACE inhibitors) · concomitant diuretics · diabetes (may lower blood glucose) · first dose hypotension (especially in patients taking high doses of diuretics, on a low-sodium diet, on dialysis, dehydrated, or with heart failure) · peripheral vascular disease or generalised atherosclerosis (risk of clinically silent renovascular disease) · primary aldosteronism (patients may respond less well to ACE inhibitors) · the risk of agranulocytosis is possibly increased in collagen vascular disease (blood counts recommended) · use with care (or avoid) in those with a history of idiopathic or hereditary angioedema · use with care in patients with hypertrophic cardiomyopathy · use with care in patients with severe or symptomatic aortic stenosis (risk of hypotension)

CAUTIONS, FURTHER INFORMATION

- ▶ Anaphylactoid reactions To prevent anaphylactoid reactions, ACE inhibitors should be avoided during dialysis with high-flux polyacrylonitrile membranes and during low-density lipoprotein apheresis with dextran sulfate; they should also be withheld before desensitisation with wasp or bee venom.

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · angina pectoris · angioedema (may be delayed; more common in Afro-Caribbean patients · arrhythmias · asthma · chest pain · constipation · cough · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · electrolyte imbalance · gastrointestinal discomfort · headache · hypotension · myalgia · nausea · palpitations · paraesthesia · renal impairment · rhinitis · skin reactions (uncommon in children) · sleep disorder · syncope · taste altered · tinnitus · vertigo · vomiting
- ▶ **Uncommon** Arthralgia · confusion · eosinophilia · erectile dysfunction · fever · haemolytic anaemia · hyperhidrosis · myocardial infarction · pancreatitis · peripheral oedema · photosensitivity reaction · respiratory disorders · stroke

- ▶ **Rare or very rare** Agranulocytosis · hepatic disorders · leucopenia · neutropenia · pancytopenia · Stevens-Johnson syndrome · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION In light of reports of cholestatic jaundice, hepatitis, fulminant hepatic necrosis, and hepatic failure, ACE inhibitors should be discontinued if marked elevation of hepatic enzymes or jaundice occur.

- **ALLERGY AND CROSS-SENSITIVITY** ACE inhibitors are contra-indicated in patients with hypersensitivity to ACE inhibitors (including angioedema).
- **PREGNANCY** ACE inhibitors should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; skull defects and oligohydramnios have also been reported.
- **BREAST FEEDING** Information on the use of ACE inhibitors in breast-feeding is limited.
- **RENAL IMPAIRMENT**
Dose adjustments Use with caution, starting with low dose, and adjust according to response. Hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function and the dose may need to be reduced.
- **MONITORING REQUIREMENTS** Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if side effects mentioned are present).
- **DIRECTIONS FOR ADMINISTRATION** For hypertension the first dose should preferably be given at bedtime.

above

Captopril

● INDICATIONS AND DOSE

Hypertension

▶ BY MOUTH

- ▶ **Adult:** Initially 12.5–25 mg twice daily, then increased if necessary up to 150 mg daily in 2 divided doses, doses to be increased at intervals of at least 2 weeks, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken
- ▶ **Elderly:** Initially 6.25 mg twice daily, then increased if necessary up to 150 mg daily in 2 divided doses, doses to be increased at intervals of at least 2 weeks, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken

Essential hypertension if used in volume depletion, cardiac decompensation, or renovascular hypertension

▶ BY MOUTH

- ▶ **Adult:** Initially 6.25–12.5 mg for 1 dose (under close medical supervision), then 6.25–12.5 mg twice daily; increased if necessary up to 100 mg daily in 1–2 divided doses, doses to be increased at intervals of at least 2 weeks, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken

Heart failure

▶ BY MOUTH

- ▶ **Adult (under close medical supervision):** Initially 6.25–12.5 mg 2–3 times a day, then increased if tolerated to up to 150 mg daily in divided doses, dose to be increased gradually at intervals of at least 2 weeks

Short-term treatment within 24 hours of onset of myocardial infarction in clinically stable patients

▶ BY MOUTH

- ▶ **Adult:** Initially 6.25 mg, then increased to 12.5 mg after 2 hours, followed by 25 mg after 12 hours; increased if tolerated to 50 mg twice daily for 4 weeks continued →

Prophylaxis of symptomatic heart failure after myocardial infarction in clinically stable patients with asymptomatic left ventricular dysfunction (starting 3–16 days after infarction) (under close medical supervision)

► **BY MOUTH**

- **Adult:** Initially 6.25 mg daily, then increased to 12.5 mg 3 times a day for 2 days, then increased if tolerated to 25 mg 3 times a day, then increased if tolerated to 75–150 mg daily in 2–3 divided doses, doses exceeding 75 mg per day to be increased gradually

Diabetic nephropathy in type 1 diabetes mellitus

► **BY MOUTH**

- **Adult:** 75–100 mg daily in divided doses

- **CAUTIONS** Children (efficacy and safety not fully established)

- **INTERACTIONS** → Appendix 1: ACE inhibitors

● **SIDE-EFFECTS**

- **Common or very common** Epigastric discomfort · peptic ulcer
- **Uncommon** Appetite decreased · flushing · malaise · pallor · postural hypotension · Raynaud's phenomenon
- **Rare or very rare** Alveolitis allergic · anaemia · aplastic anaemia · autoimmune disorder · cardiac arrest · cardiogenic shock · cerebrovascular insufficiency · depression · gynaecomastia · hypoglycaemia · lymphadenopathy · nephrotic syndrome · oliguria · oral disorders · proteinuria · urinary disorders · vision blurred
- **BREAST FEEDING** Avoid in first few weeks after delivery, particularly in preterm infants—risk of profound neonatal hypotension; can be used in mothers breast-feeding older infants if essential but monitor infant's blood pressure.

● **RENAL IMPAIRMENT**

Dose adjustments Reduce dose; max. initial dose 50 mg if eGFR above 40 mL/minute/1.73 m²; max. initial dose 25 mg daily (do not exceed 100 mg daily) if eGFR 20–40 mL/minute/1.73 m²; max. initial dose 12.5 mg daily (do not exceed 75 mg daily) if eGFR 10–20 mL/minute/1.73 m²; max. initial dose 6.25 mg daily (do not exceed 37.5 mg daily) if eGFR less than 10 mL/minute/1.73 m².

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

Tablet

► **Captopril (Non-proprietary)**

Captopril 12.5 mg Captopril 12.5mg tablets | 56 tablet [PoM] £2.80 DT = £2.06 | 100 tablet [PoM] £5.00

Captopril 25 mg Captopril 25mg tablets | 56 tablet [PoM] £4.52 DT = £0.56 | 100 tablet [PoM] £8.07

Captopril 50 mg Captopril 50mg tablets | 56 tablet [PoM] £5.83 DT = £2.15 | 100 tablet [PoM] £10.41

► **Ecopace (AMCo)**

Captopril 12.5 mg Ecopace 12.5mg tablets | 56 tablet [PoM] £0.48 DT = £2.06

Captopril 25 mg Ecopace 25mg tablets | 56 tablet [PoM] £0.60 DT = £0.56

Captopril 50 mg Ecopace 50mg tablets | 56 tablet [PoM] £0.72 DT = £2.15

Oral solution

ELECTROLYTES: May contain Sodium

► **Noyada** (Martindale Pharmaceuticals Ltd)

Hydrochlorothiazide 25 mg, Captopril 50 mg Co-zidocapt 25mg/50mg tablets | 28 tablet [PoM] £14.00

¶ 167

Enalapril maleate

● **INDICATIONS AND DOSE**

Hypertension

► **BY MOUTH**

- **Adult:** Initially 5 mg once daily, lower initial doses may be required when used in addition to diuretic or in renal impairment; maintenance 20 mg once daily; maximum 40 mg per day

Heart failure

► **BY MOUTH**

- **Adult (under close medical supervision):** Initially 2.5 mg once daily, increased if tolerated to 10–20 mg twice daily, dose to be increased gradually over 2–4 weeks

Prevention of symptomatic heart failure in patients with asymptomatic left ventricular dysfunction

► **BY MOUTH**

- **Adult (under close medical supervision):** Initially 2.5 mg once daily, increased if tolerated to 10–20 mg twice daily, dose to be increased gradually over 2–4 weeks

- **INTERACTIONS** → Appendix 1: ACE inhibitors

● **SIDE-EFFECTS**

- **Common or very common** Depression · hypersensitivity · postural hypotension · vision blurred
- **Uncommon** Anaemia · appetite decreased · asthma · bone marrow disorders · epigastric discomfort · flushing · gastrointestinal disorders · hoarseness · hypoglycaemia · malaise · muscle cramps · nervousness · proteinuria · rhinorrhoea · throat pain
- **Rare or very rare** Autoimmune disorder · gynaecomastia · lymphadenopathy · oliguria · oral disorders · Raynaud's phenomenon · toxic epidermal necrolysis
- **Frequency not known** Arthritis · leucocytosis · myositis · serositis · SIADH · vasculitis

- **BREAST FEEDING** Avoid in first few weeks after delivery, particularly in preterm infants—risk of profound neonatal hypotension; can be used in mothers breast-feeding older infants if essential but monitor infant's blood pressure.

● **HEPATIC IMPAIRMENT**

Monitoring Enalapril is a prodrug and requires close monitoring in patients with hepatic impairment.

● **RENAL IMPAIRMENT**

Dose adjustments Max. initial dose 2.5 mg daily if eGFR less than 30 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed and suspended in water immediately before use.

Fosinopril sodium

INDICATIONS AND DOSE

Hypertension

- BY MOUTH
- Adult: Initially 10 mg daily for 4 weeks, then increased if necessary up to 40 mg daily, doses over 40 mg not shown to increase efficacy

Congestive heart failure (adjunct) (under close medical supervision)

- BY MOUTH
- Adult: Initially 10 mg once daily, then increased if tolerated to 40 mg once daily, doses to be increased gradually

• **INTERACTIONS** → Appendix 1: ACE inhibitors

SIDE-EFFECTS

- Common or very common Eye disorder · increased risk of infection · mood altered · oedema · pain · postural hypotension · urinary disorder · visual impairment
- Frequency not known Abdominal distension · appetite abnormal · arthritis · balance impaired · behaviour abnormal · cardiac arrest · cardiac conduction disorder ·

cerebrovascular insufficiency · depression · dysphagia · dysphonia · ear pain · flatulence · flushing · gout · haemorrhage · hypertensive crisis · lymphadenopathy · memory loss · muscle weakness · oral disorders · prostatic disorder · tremor · weight changes

- **BREAST FEEDING** Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

HEPATIC IMPAIRMENT

Monitoring Fosinopril is a prodrug and requires close monitoring in patients with hepatic impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

Fosinopril sodium (Non-proprietary)

Fosinopril sodium 10 mg Fosinopril 10mg tablets | 28 tablet [PoM](#)

£38.98 DT = £4.86

Imidapril hydrochloride

INDICATIONS AND DOSE

Essential hypertension

- BY MOUTH
- Adult: Initially 5 mg daily, increased if necessary to 10 mg daily, dose to be taken before food, doses to be increased at intervals of at least 3 weeks; maximum 20 mg per day
- Elderly: Initially 2.5 mg daily, increased if necessary to 10 mg daily, dose to be taken before food, doses to be increased at intervals of at least 3 weeks

Essential hypertension in patients with heart failure, angina or cerebrovascular disease, or in renal or hepatic impairment

- BY MOUTH
- Adult: Initially 2.5 mg daily, increased if necessary to 10 mg daily, dose to be taken before food, dose to be increased at intervals of at least 3 weeks; maximum 20 mg per day

• **INTERACTIONS** → Appendix 1: ACE inhibitors

SIDE-EFFECTS

- Uncommon Cerebrovascular disorder · epigastric pain · increased risk of infection · joint swelling · limb pain · oedema
- Rare or very rare Anaemia
- **BREAST FEEDING** Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

HEPATIC IMPAIRMENT

Monitoring Imidapril is a prodrug and requires close monitoring in patients with hepatic impairment.

RENAL IMPAIRMENT

Avoid if eGFR less than 30 mL/minute/1.73 m².
Dose adjustments Initial dose 2.5 mg daily if eGFR 30–80 mL/minute/1.73 m².

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Tanatriil (Mitsubishi Tanabe Pharma Europe Ltd)

Imidapril hydrochloride 5 mg Tanatriil 5mg tablets | 28 tablet [PoM](#) £6.40 DT = £6.40

Imidapril hydrochloride 10 mg Tanatriil 10mg tablets | 28 tablet [PoM](#) £7.22 DT = £7.22

Imidapril hydrochloride 20 mg Tanatriil 20mg tablets | 28 tablet [PoM](#) £8.67 DT = £8.67

Lisinopril

● INDICATIONS AND DOSE

Hypertension

► BY MOUTH

- Adult: Initially 10 mg once daily; usual maintenance 20 mg once daily; maximum 80 mg per day

Hypertension, when used in addition to diuretic, in cardiac decompensation or in volume depletion

► BY MOUTH

- Adult: Initially 2.5–5 mg once daily; usual maintenance 20 mg once daily; maximum 80 mg per day

Short-term treatment following myocardial infarction in haemodynamically stable patients—systolic blood pressure over 120 mmHg

► BY MOUTH

- Adult: Initially 5 mg, taken within 24 hours of myocardial infarction, followed by 5 mg, to be taken 24 hours after initial dose, then 10 mg, to be taken 24 hours after second dose, then 10 mg once daily for 6 weeks (or continued if heart failure), temporarily reduce maintenance dose to 5 mg and if necessary 2.5 mg daily if systolic blood pressure 100 mmHg or less during treatment; withdraw if prolonged hypotension occurs during treatment (systolic blood pressure less than 90 mmHg for more than 1 hour)

Short-term treatment following myocardial infarction in haemodynamically stable patients—systolic blood pressure 100–120 mmHg

► BY MOUTH

- Adult: Initially 2.5 mg once daily, maintenance 5 mg once daily, increase to maintenance dose only after at least 3 days of the initial dose, should not be started after myocardial infarction if systolic blood pressure less than 100 mmHg, temporarily reduce maintenance dose to 2.5 mg daily if systolic blood pressure 100 mmHg or less during treatment; withdraw if prolonged hypotension occurs (systolic blood pressure less than 90 mmHg for more than 1 hour)

Renal complications of diabetes mellitus

► BY MOUTH

- Adult: Initially 2.5–5 mg once daily, adjusted according to response; usual dose 10–20 mg once daily

Heart failure (adjunct) (under close medical supervision)

► BY MOUTH

- Adult: Initially 2.5 mg once daily; increased in steps of up to 10 mg at least every 2 weeks; maximum 35 mg per day

- **INTERACTIONS** → Appendix 1: ACE inhibitors

● SIDE-EFFECTS

- **Common or very common** Postural disorders
- **Uncommon** Hallucination · mood altered · Raynaud's phenomenon
- **Rare or very rare** Alveolitis allergic · anaemia · autoimmune disorder · azotaemia · bone marrow depression · gynaecomastia · hypersensitivity · hypoglycaemia · lymphadenopathy · olfactory nerve disorder · SIADH · sinusitis · toxic epidermal necrolysis
- **Frequency not known** Leucocytosis · vasculitis

- **BREAST FEEDING** Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

● RENAL IMPAIRMENT

- Dose adjustments** Max. initial doses 5–10 mg daily if eGFR 30–80 mL/minute/1.73 m² (max. 40 mg daily); 2.5–5 mg daily if eGFR 10–30 mL/minute/1.73 m² (max. 40 mg daily); 2.5 mg daily if eGFR less than 10 mL/minute/1.73 m².

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

► **Lisinopril (Non-proprietary)**

Perindopril arginine

● INDICATIONS AND DOSE

Hypertension

► BY MOUTH

- Adult: Initially 5 mg once daily for 1 month, dose to be taken in the morning, then, adjusted according to response; maximum 10 mg per day

- Elderly: Initially 2.5 mg once daily for 1 month, dose to be taken in the morning, then, adjusted according to response; maximum 10 mg per day

Hypertension, if used in addition to diuretic, or in cardiac decompensation or volume depletion

► BY MOUTH

- Adult: Initially 2.5 mg once daily for 1 month, dose to be taken in the morning, then, adjusted according to response; maximum 10 mg per day

Symptomatic heart failure (adjunct) (under close medical supervision)

► BY MOUTH

- Adult: Initially 2.5 mg once daily for 2 weeks, then increased if tolerated to 5 mg once daily, dose to be taken in the morning

Prophylaxis of cardiac events following myocardial infarction or revascularisation in stable coronary artery disease

► BY MOUTH

- Adult: Initially 5 mg once daily for 2 weeks, then increased if tolerated to 10 mg once daily, dose to be taken in the morning
- Elderly: Initially 2.5 mg once daily for 1 week, then increased if tolerated to 5 mg once daily for 1 week, then increased if tolerated to 10 mg once daily, dose to be taken in the morning

● **INTERACTIONS** → Appendix 1: ACE inhibitors● **SIDE-EFFECTS**

- Common or very common Muscle cramps · visual impairment
- Uncommon Fall · hypoglycaemia · malaise · mood altered · vasculitis

● **HEPATIC IMPAIRMENT**

Monitoring Perindopril is a prodrug and requires close monitoring in patients with hepatic impairment.

● **RENAL IMPAIRMENT**

Dose adjustments Max. initial dose 2.5 mg once daily if eGFR 30–60 mL/minute/1.73 m²; 2.5 mg once daily on alternate days if eGFR 15–30 mL/minute/1.73 m².

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Quinapril

● INDICATIONS AND DOSE

Essential hypertension

► BY MOUTH

- Adult: Initially 10 mg once daily; maintenance 20–40 mg daily in up to 2 divided doses; maximum 80 mg per day
- Elderly: Initially 2.5 mg once daily; maintenance 20–40 mg daily in up to 2 divided doses; maximum 80 mg per day

Essential hypertension if used in addition to diuretic

► BY MOUTH

- Adult: Initially 2.5 mg once daily; maintenance 20–40 mg daily in up to 2 divided doses; maximum 80 mg per day

Heart failure (adjunct) (under close medical supervision)

► BY MOUTH

- Adult: Initially 2.5 mg daily, increased if tolerated to 10–20 mg daily in 1–2 divided doses, doses to be increased gradually; maximum 40 mg per day

- **INTERACTIONS** → Appendix 1: ACE inhibitors

● SIDE-EFFECTS

- **Common or very common** Back pain · increased risk of infection
- **Uncommon** Depression · dry throat · gastrointestinal disorders · generalised oedema · nervousness · proteinuria · vasodilation · vision disorders
- **Rare or very rare** Balance impaired · glossitis
- **Frequency not known** Arthritis · hypersensitivity · jaundice · cholestatic · leucocytosis · postural hypotension · pulmonary oedema · serositis · toxic epidermal necrolysis · vasculitis necrotising
- **BREAST FEEDING** Avoid in the first few weeks after delivery, particularly in preterm infants, due to the risk of profound neonatal hypotension; if essential, may be used in mothers breast-feeding older infants—the infant's blood pressure should be monitored.

● HEPATIC IMPAIRMENT

Monitoring Quinapril is a prodrug and requires close monitoring in patients with hepatic impairment.

● RENAL IMPAIRMENT

Dose adjustments Max. initial dose 2.5 mg once daily if eGFR less than 40 mL/minute/1.73 m².

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Quinapril (as Quinapril hydrochloride) 20 mg Accupro 20mg tablets | 28 tablet [PoM] £10.79 DT = £3.52

Quinapril (as Quinapril hydrochloride) 40 mg Accupro 40mg tablets | 28 tablet [PoM] £9.75 DT = £4.00

Quinapril with hydrochlorothiazide

The properties listed below are those particular to the combination only. For the properties of the components please consider, quinapril above, hydrochlorothiazide p. 166.

● INDICATIONS AND DOSE

Hypertension in patients stabilised on the individual components in the same proportions

► BY MOUTH

- Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: ACE inhibitors · thiazide diuretics

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Quinapril with hydrochlorothiazide (Non-proprietary)

Quinapril (as Quinapril hydrochloride) 10 mg, Hydrochlorothiazide 12.5 mg Quinapril 10mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet [PoM] £11.75 DT = £11.75

► Accretic (Pfizer Ltd)

Quinapril (as Quinapril hydrochloride) 10 mg, Hydrochlorothiazide 12.5 mg Accretic 12.5mg/10mg tablets | 28 tablet [PoM] £11.75 DT = £11.75

Ramipril

● INDICATIONS AND DOSE

Hypertension

► BY MOUTH

- Adult: Initially 1.25–2.5 mg once daily, increased if necessary up to 10 mg once daily, dose to be increased at intervals of 2–4 weeks

Symptomatic heart failure (adjunct) (under close medical supervision)

► BY MOUTH

- Adult: Initially 1.25 mg once daily, increased if tolerated to 10 mg daily, preferably taken in 2 divided doses, increase dose gradually at intervals of 1–2 weeks

Prophylaxis after myocardial infarction in patients with clinical evidence of heart failure (started at least 48 hours after infarction)

► BY MOUTH

- Adult: Initially 2.5 mg twice daily for 3 days, then increased to 5 mg twice daily

Prophylaxis after myocardial infarction in patients with clinical evidence of heart failure (started at least 48 hours after infarction) when initial dose not tolerated

► BY MOUTH

- Adult: 1.25 mg twice daily for 2 days, then increased to 2.5 mg twice daily, then increased to 5 mg twice daily, withdraw treatment if dose cannot be increased to 2.5 mg twice daily

Prevention of cardiovascular events in patients with atherosclerotic cardiovascular disease or with diabetes mellitus and at least one additional risk factor for cardiovascular disease

► BY MOUTH

- Adult: Initially 2.5 mg once daily for 1–2 weeks, then increased to 5 mg once daily for a further 2–3 weeks, then increased to 10 mg once daily

Nephropathy (consult product literature)

► BY MOUTH

- Adult: Initially 1.25 mg once daily for 2 weeks, then increased to 2.5 mg once daily for a further 2 weeks, then increased if tolerated to 5 mg once daily

- **INTERACTIONS** → Appendix 1: ACE inhibitors

• SIDE-EFFECTS

- **Common or very common** Gastrointestinal discomfort · gastrointestinal disorders · increased risk of infection · muscle spasms
- **Uncommon** Anxiety · appetite decreased · asthma exacerbated · depressed mood · flushing · libido decreased · myocardial ischaemia · nasal congestion · proteinuria aggravated · vision disorders
- **Rare or very rare** Conjunctivitis · hearing impairment · hypoperfusion · movement disorders · onycholysis · oral disorders · tremor · vascular stenosis · vasculitis
- **Frequency not known** Altered smell sensation · bone marrow failure · cerebrovascular insufficiency · concentration impaired · gynaecomastia · hypersensitivity · Raynaud's phenomenon · SIADH · toxic epidermal necrolysis

• **BREAST FEEDING** Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

• HEPATIC IMPAIRMENT

Dose adjustments Max. daily dose 2.5 mg.

Monitoring Ramipril is a prodrug and requires close monitoring in patients with hepatic impairment.

• RENAL IMPAIRMENT

Dose adjustments Max. daily dose 5 mg if eGFR 30–60 mL/minute/1.73 m²; max. initial dose 1.25 mg once daily (do not exceed 5 mg daily) if eGFR less than 30 mL/minute/1.73 m².

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

► Ramipril (Non-proprietary)

Ramipril 500 microgram per 1 mL Ramipril 2.5mg/5mL oral solution sugar free sugar-free | 150 mL [PoM] £96.00 DT = £96.00

Trandolapril

• INDICATIONS AND DOSE

Mild to moderate hypertension

- BY MOUTH
- Adult: Initially 500 micrograms once daily; increased to 1–2 mg once daily, dose to be increased at intervals of 2–4 weeks; maximum 4 mg per day

Prophylaxis after myocardial infarction in patients with left ventricular dysfunction (starting as early as 3 days after infarction)

- BY MOUTH
- Adult: Initially 500 micrograms once daily, then increased to up to 4 mg once daily, doses to be increased gradually

• **INTERACTIONS** → Appendix 1: ACE inhibitors

• SIDE-EFFECTS

- **Uncommon** Feeling abnormal · gastrointestinal disorders · hot flush · increased risk of infection · libido decreased · malaise · muscle spasms · pain · rhinorrhoea
- **Rare or very rare** Anaemia · anxiety · appetite abnormal · arrhythmias · azotaemia · cerebrovascular insufficiency · depression · enzyme abnormality · eye disorder · eye inflammation · gout · haemorrhage · hallucination · hyperbilirubinaemia · hyperglycaemia · hypersensitivity · hyperuricaemia · migraine · movement disorders · myocardial ischaemia · oedema · osteoarthritis · platelet disorder · postural hypotension · throat irritation · urinary disorders · vascular disorders · visual impairment · white blood cell disorder
- **Frequency not known** Atrioventricular block · cardiac arrest · jaundice · proteinuria · toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION If symptomatic hypotension develops during titration, do not increase dose further; if possible, reduce dose of any adjunctive treatment and if this is not effective or feasible, reduce dose of trandolapril.

• **BREAST FEEDING** Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

• HEPATIC IMPAIRMENT

Monitoring Trandolapril is a prodrug and requires close monitoring in patients with hepatic impairment.

● RENAL IMPAIRMENT

Dose adjustments Max. 2 mg daily if eGFR less than 10 mL/minute/1.73 m².

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM > ANGIOTENSIN II RECEPTOR ANTAGONISTS

Angiotensin II receptor antagonists

● **CONTRA-INDICATIONS** The combination of an angiotensin-II receptor antagonist with aliskiren is contra-indicated in patients with an eGFR less than 60 mL/minute/1.73 m² · the combination of an angiotensin-II receptor antagonist with aliskiren is contra-indicated in patients with diabetes mellitus

● **CAUTIONS** Afro-Caribbean patients—particularly those with left ventricular hypertrophy (may not benefit from an angiotensin-II receptor antagonist) · aortic or mitral valve stenosis · elderly (lower initial doses may be appropriate) · hypertrophic cardiomyopathy · patients with a history of angioedema · patients with primary aldosteronism (may not benefit from an angiotensin-II receptor antagonist) · renal artery stenosis

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · asthenia · back pain · cough · diarrhoea · dizziness · headache · hyperkalaemia (uncommon in children) · hypotension · nausea · postural hypotension (more common in patients with intravascular volume depletion, e.g. those taking high-dose diuretics) · renal impairment · vertigo · vomiting
- ▶ **Uncommon** Angioedema · myalgia · skin reactions (very common in children) · thrombocytopenia
- ▶ **Rare or very rare** Arthralgia · hepatic function abnormal (uncommon in children)

● **PREGNANCY** Angiotensin-II receptor antagonists should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; neonatal skull defects and oligohydramnios have also been reported.

● **BREAST FEEDING** Information on the use of angiotensin-II receptor antagonists in breast-feeding is limited. They are not recommended in breast-feeding and alternative treatment options, with better established safety information during breast-feeding, are available.

● RENAL IMPAIRMENT

Dose adjustments Use with caution, starting with low dose, and adjust according to response.

● **MONITORING REQUIREMENTS** Monitor plasma-potassium concentration, particularly in the elderly and in patients with renal impairment.

Azilsartan medoxomil

▮ above

● INDICATIONS AND DOSE

Hypertension

▶ BY MOUTH

- ▶ **Adult 18–74 years:** Initially 40 mg once daily, increased if necessary to 80 mg once daily
- ▶ **Adult 75 years and over:** Initially 20–40 mg once daily, increased if necessary to 80 mg once daily

Hypertension with intravascular volume depletion

▶ BY MOUTH

- ▶ **Adult:** Initially 20–40 mg daily, increased if necessary to 80 mg daily

● **CAUTIONS** Heart failure

● **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists

● SIDE-EFFECTS

▶ **Uncommon** Hyperuricaemia · muscle spasms · peripheral oedema

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (no information available).
Dose adjustments Manufacturer advises to consider initial dose of 20 mg in mild to moderate impairment (limited information available).

Monitoring Manufacturer advises monitor closely in mild to moderate hepatic impairment (limited information available).

● **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Irbesartan 75 mg Aprovel 75mg tablets | 28 tablet [PoM] £9.69 DT = £0.80

Irbesartan 150 mg Aprovel 150mg tablets | 28 tablet [PoM] £11.84 DT = £1.08

Irbesartan 300 mg Aprovel 300mg tablets | 28 tablet [PoM] £15.93 DT = £1.77

► Ifirmasta (Consilient Health Ltd)

Irbesartan 75 mg Ifirmasta 75mg tablets | 28 tablet [PoM] £8.23 DT = £0.80

Irbesartan 150 mg Ifirmasta 150mg tablets | 28 tablet [PoM] £10.06 DT = £1.08

Irbesartan 300 mg Ifirmasta 300mg tablets | 28 tablet [PoM] £13.54 DT = £1.77

Irbesartan with hydrochlorothiazide

The properties listed below are those particular to the combination only. For the properties of the components please consider, irbesartan above, hydrochlorothiazide p. 166.

● INDICATIONS AND DOSE

Hypertension not adequately controlled with irbesartan alone

- BY MOUTH
- Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists · thiazide diuretics

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Irbesartan with hydrochlorothiazide (Non-proprietary)

Hydrochlorothiazide 12.5 mg, Irbesartan 150 mg Irbesartan 150mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet [PoM] £10.06 DT = £4.65

Hydrochlorothiazide 25 mg, Irbesartan 300 mg Irbesartan 300mg / Hydrochlorothiazide 25mg tablets | 28 tablet [PoM] £13.54 DT = £6.46

Hydrochlorothiazide 12.5 mg, Irbesartan 300 mg Irbesartan 300mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet [PoM] £13.54 DT = £1.73

► CoAprovel (Sanofi)

Hydrochlorothiazide 12.5 mg, Irbesartan 150 mg CoAprovel 150mg/12.5mg tablets | 28 tablet [PoM] £11.84 DT = £4.65

Hydrochlorothiazide 25 mg, Irbesartan 300 mg CoAprovel 300mg/25mg tablets | 28 tablet [PoM] £15.93 DT = £6.46

Hydrochlorothiazide 12.5 mg, Irbesartan 300 mg CoAprovel 300mg/12.5mg tablets | 28 tablet [PoM] £15.93 DT = £1.73

174

Losartan potassium

● INDICATIONS AND DOSE

Diabetic nephropathy in type 2 diabetes mellitus

► BY MOUTH

- Adult 18-75 years: Initially 50 mg once daily for several weeks, then increased if necessary to 100 mg once daily
- Adult 76 years and over: Initially 25 mg once daily for several weeks, then increased if necessary to 100 mg once daily

Chronic heart failure when ACE inhibitors are unsuitable or contra-indicated

► BY MOUTH

- Adult: Initially 12.5 mg once daily, increased if tolerated to up to 150 mg once daily, doses to be increased at weekly intervals

Hypertension (including reduction of stroke risk in hypertension with left ventricular hypertrophy)

► BY MOUTH

- Adult 18-75 years: Initially 50 mg once daily for several weeks, then increased if necessary to 100 mg once daily
- Adult 76 years and over: Initially 25 mg once daily for several weeks, then increased if necessary to 100 mg once daily

Hypertension with intravascular volume depletion

► BY MOUTH

- Adult 18-75 years: Initially 25 mg once daily for several weeks, then increased if necessary up to 100 mg once daily

- **CAUTIONS** Severe heart failure

- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists

● SIDE-EFFECTS

- **Common or very common** Anaemia · hypoglycaemia
- **Uncommon** Angina pectoris · constipation · drowsiness · dyspnoea · oedema · palpitations · sleep disorder
- **Rare or very rare** Angioedema · atrial fibrillation · hepatitis · hypersensitivity · paraesthesia · stroke · syncope · vasculitis
- **Frequency not known** Depression · erectile dysfunction · hyponatraemia · increased risk of infection · influenza like illness · malaise · migraine · pancreatitis · photosensitivity reaction · rhabdomyolysis · taste altered · tinnitus
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

Dose adjustments Consider dose reduction in mild to moderate impairment.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include berry-citrus.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

► Cozaar (Merck Sharp & Dohme Ltd)

Losartan potassium 2.5 mg per 1 ml Cozaar 2.5mg/ml oral suspension sugar-free | 200 ml [PoM] £53.68 DT = £53.68

Tablet

► Losartan potassium (Non-proprietary)

Losartan potassium 12.5 mg Losartan 12.5mg tablets | 28 tablet [PoM] £30.00 DT = £4.50

Losartan potassium 25 mg Losartan 25mg tablets | 28 tablet [PoM] £16.18 DT = £0.55

Losartan potassium 50 mg Losartan 50mg tablets | 28 tablet [PoM] £12.80 DT = £0.57

Losartan potassium 100 mg Losartan 100mg tablets | 28 tablet [PoM] £16.18 DT = £1.16

► Cozaar (Merck Sharp & Dohme Ltd)

Losartan potassium 12.5 mg Cozaar 12.5mg tablets | 28 tablet [PoM] £9.70 DT = £4.50

Losartan potassium 25 mg Cozaar 25mg tablets | 28 tablet [PoM] £16.18 DT = £0.55

Losartan potassium 50 mg Cozaar 50mg tablets | 28 tablet [PoM] £12.80 DT = £0.57

Losartan potassium 100 mg Cozaar 100mg tablets | 28 tablet [PoM] £16.18 DT = £1.16

Losartan with hydrochlorothiazide

The properties listed below are those particular to the combination only. For the properties of the components please consider, losartan potassium above, hydrochlorothiazide p. 166.

● INDICATIONS AND DOSE

Hypertension not adequately controlled with losartan alone

► BY MOUTH

- Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists · thiazide diuretics

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Losartan with hydrochlorothiazide (Non-proprietary)

Hydrochlorothiazide 12.5 mg, Losartan potassium 50 mg Losartan 50mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet [PoM] £12.80 DT = £1.13

Hydrochlorothiazide 25 mg, Losartan potassium 100 mg Losartan 100mg / Hydrochlorothiazide 25mg tablets | 28 tablet [PoM] £16.18 DT = £1.48

Hydrochlorothiazide 12.5 mg, Losartan potassium 100 mg Losartan 100mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet [PoM] £16.18 DT = £9.83

► Cozaar-Comp (Merck Sharp & Dohme Ltd)

Hydrochlorothiazide 12.5 mg, Losartan potassium 50 mg Cozaar-Comp 50mg/12.5mg tablets | 28 tablet [PoM] £12.80 DT = £1.13

Hydrochlorothiazide 12.5 mg, Losartan potassium 100 mg Cozaar-Comp 100mg/12.5mg tablets | 28 tablet [PoM] £16.18 DT = £9.83

Olmesartan medoxomil

● INDICATIONS AND DOSE

Hypertension

► BY MOUTH

- Adult: Initially 10 mg daily, increased if necessary to 20 mg daily; maximum 40 mg per day

● CONTRA-INDICATIONS Biliary obstruction

● INTERACTIONS → Appendix 1: angiotensin-II receptor antagonists

● SIDE-EFFECTS

- Common or very common Arthritis · chest pain · dyspepsia · haemorrhage · hypertriglyceridaemia · hyperuricaemia · increased risk of infection · influenza like illness · oedema
- Uncommon Angina pectoris · malaise · skin reactions
- Rare or very rare Lethargy · muscle spasms · sprue-like enteropathy

● HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment—no information available.

Dose adjustments Dose should not exceed 20 mg daily in moderate impairment.

● RENAL IMPAIRMENT Avoid if eGFR less than 20 mL/minute/1.73 m².

Dose adjustments Max. 20 mg daily if eGFR 20–60 mL/minute/1.73 m².

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

► Olmesartan medoxomil (Non-proprietary)

Olmesartan medoxomil 10 mg Olmesartan medoxomil 10mg tablets | 28 tablet [PoM] £1.24–£10.40 DT = £1.24

Olmesartan medoxomil 20 mg Olmesartan medoxomil 20mg tablets | 28 tablet [PoM] £1.51–£12.30 DT = £1.51

Olmesartan medoxomil 40 mg Olmesartan medoxomil 40mg tablets | 28 tablet [PoM] £2.18–£16.63 DT = £2.26

Olmesartan medoxomil 10 mg Olmetec 10mg tablets | 28 tablet [PoM] £10.95 DT = £1.24

Olmesartan medoxomil 20 mg Olmetec 20mg tablets | 28 tablet [PoM] £12.95 DT = £1.51

Olmesartan medoxomil 40 mg Olmetec 40mg tablets | 28 tablet [PoM] £17.50 DT = £2.26

Olmesartan with amlodipine

The properties listed below are those particular to the combination only. For the properties of the components please consider, olmesartan medoxomil above, amlodipine p. 155.

● INDICATIONS AND DOSE

Hypertension in patients stabilised on the individual components in the same proportions

► BY MOUTH

- Adult: (consult product literature)

● INTERACTIONS → Appendix 1: angiotensin-II receptor antagonists · calcium channel blockers

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Sevika (Daiichi Sankyo UK Ltd)

Amlodipine (as Amlodipine besilate) 5 mg, Olmesartan medoxomil 20 mg Sevika 20mg/5mg tablets | 28 tablet [PoM] £16.95 DT = £16.95

Amlodipine (as Amlodipine besilate) 10 mg, Olmesartan medoxomil 40 mg Sevika 40mg/10mg tablets | 28 tablet [PoM] £16.95 DT = £16.95

Amlodipine (as Amlodipine besilate) 5 mg, Olmesartan medoxomil 40 mg Sevika 40mg/5mg tablets | 28 tablet [PoM] £16.95 DT = £16.95

Olmesartan with amlodipine and hydrochlorothiazide

The properties listed below are those particular to the combination only. For the properties of the components please consider, olmesartan medoxomil above, amlodipine p. 155, hydrochlorothiazide p. 166.

● INDICATIONS AND DOSE

Hypertension in patients stabilised on the individual components in the same proportions, or for hypertension not adequately controlled with olmesartan and amlodipine

► BY MOUTH

- Adult: (consult product literature)

● INTERACTIONS → Appendix 1: angiotensin-II receptor antagonists · calcium channel blockers · thiazide diuretics

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Sevika HCT (Daiichi Sankyo UK Ltd)

Amlodipine besilate 5 mg, Hydrochlorothiazide 12.5 mg, Olmesartan medoxomil 20 mg Sevika HCT 20mg/5mg/12.5mg tablets | 28 tablet [PoM] £16.95

Amlodipine besilate 5 mg, Hydrochlorothiazide 25 mg, Olmesartan medoxomil 40 mg Sevika HCT 40mg/5mg/25mg tablets | 28 tablet [PoM] £16.95

Amlodipine besilate 10 mg, Hydrochlorothiazide 25 mg, Olmesartan medoxomil 40 mg Sevika HCT 40mg/10mg/25mg tablets | 28 tablet [PoM] £16.95

Amlodipine besilate 5 mg, Hydrochlorothiazide 12.5 mg, Olmesartan medoxomil 40 mg Sevika HCT 40mg/5mg/12.5mg tablets | 28 tablet [PoM] £16.95

Amlodipine besilate 10 mg, Hydrochlorothiazide 12.5 mg, Olmesartan medoxomil 40 mg Sevika HCT 40mg/10mg/12.5mg tablets | 28 tablet [PoM] £16.95

Olmesartan with hydrochlorothiazide

The properties listed below are those particular to the combination only. For the properties of the components please consider, olmesartan medoxomil above, hydrochlorothiazide p. 166.

● INDICATIONS AND DOSE

Hypertension not adequately controlled with olmesartan alone

► BY MOUTH

- Adult: (consult product literature)

● INTERACTIONS → Appendix 1: angiotensin-II receptor antagonists · thiazide diuretics

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Olmetec Plus (Daiichi Sankyo UK Ltd)

Hydrochlorothiazide 12.5 mg, Olmesartan medoxomil 20 mg Olmetec Plus 20mg/12.5mg tablets | 28 tablet [PoM] £12.95 DT = £12.95

174

Telmisartan

INDICATIONS AND DOSE

Hypertension

► BY MOUTH

- Adult: Initially 20–40 mg once daily for at least 4 weeks, increased if necessary up to 80 mg once daily

Prevention of cardiovascular events in patients with established atherosclerotic cardiovascular disease, or type 2 diabetes mellitus with target-organ damage

► BY MOUTH

- Adult: 80 mg once daily

- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists

SIDE-EFFECTS

- **Uncommon** Anaemia · arrhythmias · chest pain · cystitis · depression · dyspnoea · flatulence · gastrointestinal discomfort · hyperhidrosis · increased risk of infection · insomnia · muscle spasms · sciatica · syncope
- **Rare or very rare** Anxiety · drowsiness · dry mouth · eosinophilia · hypoglycaemia · influenza like illness · interstitial lung disease · liver disorder · pain in extremity · sepsis · taste altered · tendon pain · visual impairment

- **HEPATIC IMPAIRMENT** Avoid in severe impairment or biliary obstruction.
Dose adjustments 20–40 mg once daily in mild or moderate impairment.

RENAL IMPAIRMENT

Dose adjustments Manufacturer advises initial dose of 20 mg once daily in severe impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Telmisartan (Non-proprietary)

Telmisartan 20 mg Telmisartan 20mg tablets | 28 tablet [PoM] £1.05–£10.55 DT = £0.63

Valsartan

INDICATIONS AND DOSE

Hypertension

► BY MOUTH

- Adult: Initially 80 mg once daily, increased if necessary up to 320 mg daily, doses to be increased at intervals of 4 weeks

Hypertension with intravascular volume depletion

► BY MOUTH

- Adult: Initially 40 mg once daily, increased if necessary up to 320 mg daily, doses to be increased at intervals of 4 weeks

Heart failure when ACE inhibitors cannot be used, or in conjunction with an ACE inhibitor when a beta-blocker cannot be used | Heart failure, in conjunction with an ACE inhibitor when a beta-blocker cannot be used (under expert supervision)

► BY MOUTH

- Adult: Initially 40 mg twice daily, increased to up to 160 mg twice daily, doses to be increased at intervals of at least 2 weeks

Myocardial infarction with left ventricular failure or left ventricular systolic dysfunction (adjunct)

► BY MOUTH

- Adult: Initially 20 mg twice daily, increased if necessary up to 160 mg twice daily, doses to be increased over several weeks if tolerated

- **CONTRA-INDICATIONS** Biliary cirrhosis · cholestasis
- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists
- **SIDE-EFFECTS**
 - **Uncommon** Heart failure · syncope
 - **Frequency not known** Neutropenia · serum sickness · vasculitis
- **HEPATIC IMPAIRMENT** Avoid in severe hepatic impairment. Dose adjustments Max. dose 80 mg daily in mild to moderate impairment.
- **RENAL IMPAIRMENT** Use with caution if eGFR less than 10 mL/minute/1.73 m²—no information available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

► **Diovan** (Novartis Pharmaceuticals UK Ltd)

Valsartan 3 mg per 1 mL Diovan 3mg/1ml oral solution | 160 mL [PoM] £7.20 DT = £7.20

Hydrochlorothiazide 12.5 mg, Valsartan 160 mg Co-Diovan 160mg/12.5mg tablets | 28 tablet [PoM] £22.09 DT = £1.85

DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM > RENIN INHIBITORS

Aliskiren

- **DRUG ACTION** Renin inhibitors inhibit renin directly; renin converts angiotensinogen to angiotensin I.

● INDICATIONS AND DOSE

Essential hypertension either alone or in combination with other antihypertensives

► BY MOUTH

- Adult: 150 mg once daily, increased if necessary to 300 mg once daily

- **CONTRA-INDICATIONS** Concomitant treatment with an ACE inhibitor or an angiotensin-II receptor antagonist in patients with an eGFR less than 60 mL/minute/1.73 m² · concomitant treatment with an ACE inhibitor or an angiotensin-II receptor antagonist in patients with diabetes mellitus · hereditary angioedema · idiopathic angioedema

- **CAUTIONS** Combination treatment with an ACE inhibitor · combination treatment with an angiotensin-II receptor antagonist · concomitant use of diuretics (first doses may cause hypotension—initiate with care) · history of angioedema · moderate to severe congestive heart failure · patients at risk of renal impairment · salt depletion (first doses may cause hypotension—initiate with care) · volume depletion (first doses may cause hypotension—initiate with care)

CAUTIONS, FURTHER INFORMATION

- Concomitant use of drugs affecting the renin-angiotensin system Combination therapy with two drugs affecting the renin-angiotensin system (ACE inhibitors, angiotensin-II receptor antagonists, and aliskiren) is not recommended due to an increased risk of hyperkalaemia, hypotension, and renal impairment, compared to use of a single drug. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor with an angiotensin-II receptor antagonist. There is some evidence that the benefits of combination use of an ACE inhibitor with candesartan or valsartan may outweigh the risks in selected patients with heart failure for whom other treatments are unsuitable, however, the concomitant use of this combination, together with an aldosterone antagonist or a potassium-sparing diuretic is not recommended. For patients currently taking combination therapy, the need for continued combined therapy should be reviewed. If combination therapy is considered essential, it should be carried out under specialist supervision, with close

monitoring of blood pressure, renal function, and electrolytes (particularly potassium); monitoring should be considered at the start of treatment, then monthly, and also after any change in dose or during intercurrent illness.

● **INTERACTIONS** → Appendix 1: aliskiren

● **SIDE-EFFECTS**

- ▶ **Common or very common** Arthralgia · diarrhoea · dizziness · electrolyte imbalance
- ▶ **Uncommon** Cough · oral disorder · palpitations · peripheral oedema · renal impairment · severe cutaneous adverse reactions (SCARs) · skin reactions
- ▶ **Rare or very rare** Angioedema · hypersensitivity
- ▶ **Frequency not known** Dyspnoea · hepatic disorders · nausea · vertigo · vomiting

SIDE-EFFECTS, FURTHER INFORMATION If diarrhoea is severe or persistent discontinue treatment.

- **PREGNANCY** Manufacturer advises avoid—no information available; other drugs acting on the renin-angiotensin system have been associated with fetal malformations and neonatal death.

- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.

- **RENAL IMPAIRMENT** Avoid if eGFR is less than 30 mL/minute/1.73 m²—no information available. Use with caution in renal artery stenosis—no information available.

Monitoring Monitor plasma-potassium concentration in renal impairment.

- **MONITORING REQUIREMENTS** Monitor patients with a history of angioedema closely during treatment.

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2010) that aliskiren (*Rasilez*®) is **not** recommended for use within NHS Scotland.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Aliskiren (as Aliskiren hemifumarate) 300 mg Rasilez 300mg tablets | 28 tablet [PoM] £34.27 DT = £34.27

VASODILATORS > VASODILATOR ANTIHYPERTENSIVES

Hydralazine hydrochloride

● **INDICATIONS AND DOSE**

Moderate to severe hypertension (adjunct)

▶ **BY MOUTH**

- ▶ **Adult:** Initially 25 mg twice daily, increased if necessary up to 50 mg twice daily

Heart failure (with long acting nitrate) (initiated in hospital or under specialist supervision)

▶ **BY MOUTH**

- ▶ **Adult:** Initially 25 mg 3–4 times a day, subsequent doses to be increased every 2 days if necessary; usual maintenance 50–75 mg 4 times a day

Hypertensive emergencies (including during pregnancy) | Hypertension with renal complications

- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Adult:** Initially 200–300 micrograms/minute; usual maintenance 50–150 micrograms/minute

▶ **BY SLOW INTRAVENOUS INJECTION**

- ▶ **Adult:** 5–10 mg, to be diluted with 10 mL sodium chloride 0.9%; dose may be repeated after 20–30 minutes

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · cor pulmonale · dissecting aortic aneurysm · high output heart failure · idiopathic systemic lupus erythematosus · myocardial insufficiency due to mechanical obstruction · severe tachycardia

- **CAUTIONS** Cerebrovascular disease · coronary artery disease (may provoke angina, avoid after myocardial infarction until stabilised) · occasionally blood pressure reduction too rapid even with low parenteral doses

- **INTERACTIONS** → Appendix 1: hydralazine

● **SIDE-EFFECTS**

- ▶ **Common or very common** Angina pectoris · diarrhoea · dizziness · flushing · gastrointestinal disorders · headache · hypotension · joint disorders · lupus-like syndrome after long-term therapy with over 100 mg daily (or less in women and in slow acetylators individuals) · myalgia · nasal congestion · nausea · palpitations · tachycardia · vomiting
- ▶ **Rare or very rare** Acute kidney injury · agranulocytosis · anaemia · anxiety · appetite decreased · conjunctivitis · depression · dyspnoea · eosinophilia · eye disorders · fever · glomerulonephritis · haematuria · haemolytic anaemia · hallucination · heart failure · hepatic disorders · leucocytosis · leucopenia · lymphadenopathy · malaise · nerve disorders · neutropenia · oedema · pancytopenia · paradoxical pressor response · paraesthesia · pleuritic pain · proteinuria · skin reactions · splenomegaly · thrombocytopenia · urinary retention · vasculitis · weight decreased

SIDE-EFFECTS, FURTHER INFORMATION The incidence of side-effects is lower if the dose is kept below 100mg daily, but systemic lupus erythematosus should be suspected if there is unexplained weight loss, arthritis, or any other unexplained ill health.

- **PREGNANCY** Neonatal thrombocytopenia reported, but risk should be balanced against risk of uncontrolled maternal hypertension. Manufacturer advises avoid before third trimester.

- **BREAST FEEDING** Present in milk but not known to be harmful.

Monitoring Monitor infant in breast-feeding.

● **HEPATIC IMPAIRMENT**

Dose adjustments Reduce dose.

● **RENAL IMPAIRMENT**

Dose adjustments Reduce dose if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Manufacturer advises test for antinuclear factor and for proteinuria every 6 months and check acetylator status before increasing dose above 100 mg daily, but evidence of clinical value unsatisfactory.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Apresoline*®) give continuously in Sodium chloride 0.9%. Suggested infusion volume 500 mL.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Hydralazine hydrochloride 20 mg Hydralazine 20mg powder for concentrate for solution for injection ampoules | 5 ampoule [PoM] £64.50

Minoxidil● **INDICATIONS AND DOSE**

Severe hypertension, in addition to a diuretic and a beta-blocker

► **BY MOUTH**

- Adult: Initially 5 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg, increased at intervals of at least 3 days, seldom necessary to exceed 50 mg daily; maximum 100 mg per day
- Elderly: Initially 2.5 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg, increased at intervals of at least 3 days, seldom necessary to exceed 50 mg daily; maximum 100 mg per day

● **CONTRA-INDICATIONS** Phaeochromocytoma● **CAUTIONS** Acute porphyrias p. 1025 · after myocardial infarction (until stabilised) · angina● **INTERACTIONS** → Appendix 1: minoxidil● **SIDE-EFFECTS**

- **Common or very common** Fluid retention · hair changes · oedema · pericardial disorders · tachycardia
- **Rare or very rare** Leucopenia · skin reactions · Stevens-Johnson syndrome · thrombocytopenia
- **Frequency not known** Angina pectoris · breast tenderness · gastrointestinal disorder · pleural effusion · sodium retention · weight increased

● **PREGNANCY** Avoid—possible toxicity including reduced placental perfusion. Neonatal hirsutism reported.● **BREAST FEEDING** Present in milk but not known to be harmful.● **RENAL IMPAIRMENT** Use with caution in significant impairment.● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet► **Loniten** (Pfizer Ltd)

Minoxidil 2.5 mg Loniten 2.5mg tablets | 60 tablet [PoM] £8.88 DT = £8.88

Minoxidil 5 mg Loniten 5mg tablets | 60 tablet [PoM] £15.83 DT = £15.83

Minoxidil 10 mg Loniten 10mg tablets | 60 tablet [PoM] £30.68 DT = £30.68

● **CONTRA-INDICATIONS** During recovery period after myocardial infarction (usually 3–4 weeks) · history of cerebrovascular accident● **CAUTIONS** Avoid contact with skin (risk of contact sensitisation) · avoid in Acute porphyrias p. 1025 · carcinogenic in *animals* · cerebrovascular disease · congestive heart failure · elderly · severe ischaemic heart disease● **SIDE-EFFECTS** Abdominal distress · dizziness · ejaculation failure · fatigue · miosis · nasal congestion · postural hypotension · reflex tachycardia● **PREGNANCY** Hypotension may occur in newborn.● **BREAST FEEDING** May be present in milk.● **RENAL IMPAIRMENT** Use with caution.● **HANDLING AND STORAGE** Owing to risk of contact sensitisation healthcare professionals should avoid contamination of hands.● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule► **Phenoxylbenzamine hydrochloride (Non-proprietary)**

Phenoxylbenzamine hydrochloride 10 mg Phenoxylbenzamine 10mg capsules | 30 capsule [PoM] £106.61 DT = £106.61

Phentolamine mesilate● **INDICATIONS AND DOSE**

Hypertensive episodes due to phaeochromocytoma e.g. during surgery

► **BY INTRAVENOUS INJECTION**

- Adult: 2–5 mg, repeated if necessary

Diagnosis of phaeochromocytoma► **BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**

- Adult: (consult product literature)

● **CONTRA-INDICATIONS** Angina · coronary insufficiency · evidence of coronary artery disease · history of myocardial infarction · hypotension● **CAUTIONS** Elderly · gastritis · peptic ulcer● **SIDE-EFFECTS**● **Common or very common** Arrhythmias · headache · hypertension · oral pain► **Uncommon** Abdominal pain upper · diarrhoea · facial swelling · pain · paraesthesia · pruritus · vomiting● **PREGNANCY** Use with caution—may cause marked decrease in maternal blood pressure with resulting fetal anoxia.● **BREAST FEEDING** Manufacturer advises avoid—no information available.● **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.● **MONITORING REQUIREMENTS** Monitor blood pressure and heart rate.● **MEDICINAL FORMS**

Forms available from special-order manufacturers include: solution for injection

4.1a Hypertension associated with phaeochromocytoma

Other drugs used for Hypertension associated with phaeochromocytoma Propranolol hydrochloride, p. 149

VASODILATORS > PERIPHERAL VASODILATORS**Phenoxylbenzamine hydrochloride**● **INDICATIONS AND DOSE**

Hypertension in phaeochromocytoma

► **BY MOUTH**

- Adult: Initially 10 mg daily, increased in steps of 10 mg daily until hypertension controlled or treatment not tolerated; maintenance 1–2 mg/kg daily in 2 divided doses

4.1b Hypertensive crises

Other drugs used for Hypertensive crises Hydralazine hydrochloride, p. 180 • Labetalol hydrochloride, p. 147

ANTIADRENERGIC AGENTS, PERIPHERALLY ACTING

Guanethidine monosulfate

● INDICATIONS AND DOSE

Hypertensive crisis (but no longer recommended)

► BY INTRAMUSCULAR INJECTION

- Adult: 10–20 mg, dose may be repeated after 3 hours if necessary

● CONTRA-INDICATIONS

Heart failure • phaeochromocytoma

● CAUTIONS

Asthma • cerebral arteriosclerosis • coronary arteriosclerosis • history of peptic ulceration

● INTERACTIONS

→ Appendix 1: guanethidine

● SIDE-EFFECTS

- **Uncommon** Depression • dermatitis • dry mouth • heart failure • nausea • vision blurred • vomiting
- **Rare or very rare** Alopecia • asthma • ischaemic heart disease • myalgia • parotid gland enlargement • tremor
- **Frequency not known** Abdominal distension gaseous • anaemia • arrhythmias • azotaemia • cerebral ischaemia • diarrhoea • dizziness • ejaculation disorder • fatigue • headache • intermittent claudication exacerbated • lethargy • leucopenia • nasal congestion • oedema • paraesthesia • postural hypotension • thrombocytopenia
- **PREGNANCY** Postural hypotension and reduced uteroplacental perfusion. Should not be used to treat hypertension in pregnancy.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 40 mL/minute/1.73 m².
Dose adjustments Reduce dose if eGFR 40–65 mL/minute/1.73 m².
- **LESS SUITABLE FOR PRESCRIBING** Guanethidine monosulfate is less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Guanethidine monosulfate (Non-proprietary)

Guanethidine monosulfate 10 mg per 1 mL Guanethidine 10mg/1ml solution for injection ampoules | 5 ampoule [PoM] £224.15

VASODILATORS > VASODILATOR ANTIHYPERTENSIVES

Sodium nitroprusside

● INDICATIONS AND DOSE

Hypertensive emergencies

► BY INTRAVENOUS INFUSION

- Adult: Initially 0.5–1.5 micrograms/kg/minute, adjusted in steps of 500 nanograms/kg/minute every 5 minutes, usual dose 0.5–8 micrograms/kg/minute, use lower doses if already receiving other antihypertensives, stop if response unsatisfactory with max. dose in 10 minutes, lower initial dose of 300 nanograms/kg/minute has been used

Maintenance of blood pressure at 30–40% lower than pretreatment diastolic blood pressure

► BY INTRAVENOUS INFUSION

- Adult: 20–400 micrograms/minute, use lower doses for patients being treated with other antihypertensives

Controlled hypotension in anaesthesia during surgery

► BY INTRAVENOUS INFUSION

- Adult: Up to 1.5 micrograms/kg/minute

Acute or chronic heart failure

► BY INTRAVENOUS INFUSION

- Adult: Initially 10–15 micrograms/minute, increased every 5–10 minutes as necessary; usual dose 10–200 micrograms/minute normally for max. 3 days

● UNLICENSED USE

Not licensed for use in the UK.

● CONTRA-INDICATIONS

Compensatory hypertension • Leber's optic atrophy • severe vitamin B₁₂ deficiency

● CAUTIONS

Elderly • hyponatraemia • hypothermia • hypothyroidism • impaired cerebral circulation • ischaemic heart disease

● INTERACTIONS

→ Appendix 1: sodium nitroprusside

● SIDE-EFFECTS

Abdominal pain • anxiety • chest discomfort • dizziness • headache • hyperhidrosis • nausea • palpitations • phlebitis (transient) • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects associated with over rapid reduction in blood pressure: Headache, dizziness, nausea, retching, abdominal pain, perspiration, palpitation, anxiety, retrosternal discomfort—reduce infusion rate if any of these side-effects occur.

Overdose Side-effects caused by excessive plasma concentration of the cyanide metabolite include tachycardia, sweating, hyperventilation, arrhythmias, marked metabolic acidosis (discontinue and give antidote, see Cyanide in Emergency treatment of poisoning p. 1319).

● PREGNANCY

Avoid prolonged use—potential for accumulation of cyanide in fetus.

● BREAST FEEDING

No information available. Caution advised due to thiocyanate metabolite.

● HEPATIC IMPAIRMENT

Use with caution. Avoid in hepatic failure—cyanide or thiocyanate metabolites may accumulate.

● RENAL IMPAIRMENT

Avoid prolonged use—cyanide or thiocyanate metabolites may accumulate.

● MONITORING REQUIREMENTS

Monitor blood pressure (including intra-arterial blood pressure) and blood-cyanide concentration, and if treatment exceeds 3 days, also blood thiocyanate concentration.

● TREATMENT CESSATION

Avoid sudden withdrawal—terminate infusion over 15–30 minutes.

● DIRECTIONS FOR ADMINISTRATION

For *continuous intravenous infusion* in Glucose 5%, infuse via infusion device to allow precise control. For further details, consult product literature. Protect infusion from light.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for infusion

Epoprostenol, p. 115 • Sildenafil, p. 794 • Tadalafil, p. 796

ANTITHROMBOTIC DRUGS > ANTIPLATELET DRUGS

Selexipag

23-May-2018

- **DRUG ACTION** Selexipag is a selective prostacyclin (IP) receptor agonist.

● INDICATIONS AND DOSE

Pulmonary arterial hypertension either as combination therapy (if insufficiently controlled with an endothelin receptor antagonist and/or a phosphodiesterase type-5 inhibitor), or as monotherapy (initiated under specialist supervision)

► BY MOUTH

- **Adult:** Initially 200 micrograms twice daily, increased in steps of 200 micrograms twice daily at weekly intervals up to the highest tolerated dose, usual maintenance 200–1600 micrograms twice daily, initial dose and first dose after each dose increase should be taken in the evening; maximum 3200 micrograms per day

- **CONTRA-INDICATIONS** Cerebrovascular event (within the last 3 months) • congenital or acquired valvular defects with myocardial function disorders (not related to pulmonary hypertension) • decompensated cardiac failure (unless under close medical supervision) • myocardial infarction (within last 6 months) • severe arrhythmias • severe coronary heart disease • unstable angina

- **CAUTIONS** Elderly (limited information available)

- **INTERACTIONS** → Appendix 1: selexipag

● SIDE-EFFECTS

- **Common or very common** Abdominal pain • anaemia • appetite decreased • arthralgia • diarrhoea • flushing • headache • hyperthyroidism • hypotension • myalgia • nasal congestion • nasopharyngitis • nausea • pain • skin reactions • vomiting • weight decreased
- **Uncommon** Sinus tachycardia

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.

Dose adjustments Manufacturer advises reduce initial dose to 200 micrograms once daily in moderate impairment and increase in steps of 200 micrograms once daily at weekly intervals, as tolerated.

- **RENAL IMPAIRMENT** Manufacturer advises caution with dose titration in severe impairment.

● PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time; if a dose is missed for 3 days or more, treatment should be restarted at a lower dose and then increased—consult product literature.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

SMC No. 1235/17

The *Scottish Medicines Consortium* has advised (updated May 2018) that selexipag (*Upravi*®) is accepted for

restricted use within NHS Scotland for the long-term treatment of pulmonary arterial hypertension in adults with WHO functional class III, as combination therapy in patients insufficiently controlled with an endothelin receptor antagonist and a phosphodiesterase type-5 inhibitor, and who would be considered for treatment with inhaled iloprost. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

ANTITHROMBOTIC DRUGS > PROSTAGLANDINS, CARDIOVASCULAR

Iloprost

● INDICATIONS AND DOSE

Idiopathic or familial pulmonary arterial hypertension (initiated under specialist supervision)

► BY INHALATION OF NEBULISED SOLUTION

- **Adult:** Initially 2.5 micrograms for 1 dose, increased to 5 micrograms for 1 dose, increased if tolerated to 5 micrograms 6–9 times a day, adjusted according to response; reduced if not tolerated to 2.5 micrograms 6–9 times a day, reduce to lower maintenance dose if high dose not tolerated

- **CONTRA-INDICATIONS** Conditions which increase risk of haemorrhage • congenital or acquired valvular defects of the myocardium • decompensated cardiac failure (unless under close medical supervision) • pulmonary veno-occlusive disease • severe arrhythmias • unstable angina • within 3 months of cerebrovascular events • within 6 months of myocardial infarction

- **CAUTIONS** Acute pulmonary infection • chronic obstructive pulmonary disease • hypotension (do not initiate if systolic blood pressure below 85 mmHg) • severe asthma • unstable pulmonary hypertension with advanced right heart failure

- **INTERACTIONS** → Appendix 1: iloprost

● SIDE-EFFECTS

- **Common or very common** Chest discomfort • cough • diarrhoea • dizziness • dyspnoea • haemorrhage • headache • hypotension • nausea • oral disorders • pain • palpitations • rash • syncope • tachycardia • throat complaints • vasodilation • vomiting
- **Frequency not known** Respiratory disorders • taste altered • thrombocytopenia

- **PREGNANCY** Use if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Elimination reduced.

Dose adjustments Initially 2.5 micrograms at intervals of 3–4 hours (max. 6 times daily), adjusted according to response (consult product literature).

- **DIRECTIONS FOR ADMINISTRATION** For *inhaled treatment*, to minimise accidental exposure use only with nebulisers listed in *Ventavis*® product literature in a well ventilated room.

- **PRESCRIBING AND DISPENSING INFORMATION** Delivery characteristics of nebuliser devices may vary—only switch devices under medical supervision.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2005) that iloprost (*Ventavis*®) is accepted for restricted use within NHS Scotland in patients in whom bosentan is ineffective or not tolerated, and should only be prescribed by specialists in the Scottish Pulmonary Vascular Unit.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Nebuliser liquid

ENDOTHELIN RECEPTOR ANTAGONISTS

Ambrisentan

• INDICATIONS AND DOSE

Pulmonary arterial hypertension (initiated under specialist supervision)

- ▶ BY MOUTH

▶ Adult: 5 mg once daily, increased if necessary to 10 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises max. dose 5 mg daily and close monitoring with concurrent use of ciclosporin.

- **CONTRA-INDICATIONS** Idiopathic pulmonary fibrosis

- **CAUTIONS** Not to be initiated in significant anaemia

- **INTERACTIONS** → Appendix 1: ambrisentan

• SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · anaemia · asthenia · constipation · diarrhoea · dizziness · epistaxis · flushing · headaches · hearing impairment · hypersensitivity · increased risk of infection · nasal congestion · nausea · palpitations · skin reactions · syncope · vision disorders · vomiting

- ▶ **Uncommon** Hepatic disorders

- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment and ensure effective contraception during treatment. Monthly pregnancy tests advised.

- **PREGNANCY** Avoid (teratogenic in *animal studies*).

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

- **RENAL IMPAIRMENT** Use with caution if eGFR less than 30 mL/minute/1.73 m².

• MONITORING REQUIREMENTS

- ▶ Monitor haemoglobin concentration or haematocrit after 1 month and 3 months of starting treatment, and periodically thereafter (reduce dose or discontinue treatment if significant decrease in haemoglobin concentration or haematocrit observed).

- ▶ Monitor liver function before treatment, and monthly thereafter—discontinue if liver enzymes raised significantly or if symptoms of liver impairment develop.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2008) that ambrisentan (*Volibris*®) should be prescribed only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Ambrisentan 5 mg Volibris 5mg tablets | 30 tablet [PoM] £1,618.08

Ambrisentan 10 mg Volibris 10mg tablets | 30 tablet [PoM] £1,618.08

Bosentan

• INDICATIONS AND DOSE

Pulmonary arterial hypertension (initiated under specialist supervision)

- ▶ BY MOUTH

▶ Adult: Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily (max. per dose 250 mg); maximum 500 mg per day

Systemic sclerosis with ongoing digital ulcer disease (to reduce number of new digital ulcers)

- ▶ BY MOUTH

▶ Adult: Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025

- **CAUTIONS** Not to be initiated if systemic systolic blood pressure is below 85 mmHg

- **INTERACTIONS** → Appendix 1: bosentan

• SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · diarrhoea · flushing · gastrooesophageal reflux disease · headache · nasal congestion · palpitations · skin reactions · syncope
- ▶ **Uncommon** Hepatic disorders · leucopenia · neutropenia · thrombocytopenia

- ▶ **Rare or very rare** Angioedema

- ▶ **Frequency not known** Vision blurred

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during administration (hormonal contraception not considered effective). Monthly pregnancy tests advised.

- **PREGNANCY** Avoid (teratogenic in *animal studies*).

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in moderate and severe impairment.

• MONITORING REQUIREMENTS

- ▶ Monitor haemoglobin before and during treatment (monthly for first 4 months, then 3-monthly).
- ▶ Monitor liver function before treatment, at monthly intervals during treatment, and 2 weeks after dose increase (reduce dose or suspend treatment if liver enzymes raised significantly)—discontinue if symptoms of liver impairment.
- **TREATMENT CESSATION** Avoid abrupt withdrawal—withdraw treatment gradually.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Macitentan

● INDICATIONS AND DOSE

Pulmonary arterial hypertension (initiated under specialist supervision)

▶ BY MOUTH

▶ Adult: 10 mg daily

● **CONTRA-INDICATIONS** Severe anaemia

● **CAUTIONS** Patients over 75 years · pulmonary veno-occlusive disease

● **INTERACTIONS** → Appendix 1: macitentan

● SIDE-EFFECTS

▶ **Common or very common** Anaemia · headache · increased risk of infection · nasal congestion

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before treatment and ensure effective contraception during and for one month after stopping treatment. Monthly pregnancy tests advised.

● **PREGNANCY** Toxicity in *animal* studies.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Do not initiate if serum transaminases exceed 3 times upper limit of normal. Avoid in moderate and severe impairment.

● **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment and avoid in patients undergoing dialysis (no information available).
Monitoring In renal impairment consider monitoring blood pressure (risk of hypotension).

● MONITORING REQUIREMENTS

▶ Monitor liver function before treatment, then monthly thereafter (discontinue if unexplained persistent raised serum transaminases or signs of hepatic injury—can restart on advice on hepatologist if liver function tests return to normal and no hepatic injury).
▶ Monitor haemoglobin concentration before treatment and then as indicated.

● **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as dark urine, nausea, vomiting, fatigue, abdominal pain, or pruritus develop.

Patient card should be provided.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (March 2014) that macitentan (Opsumit®) should be initiated and prescribed only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Macitentan 10 mg Opsumit 10mg tablets | 30 tablet [PoM] £2,306.00

GUANYLATE CYCLASE STIMULATORS

Riociguat

19-Oct-2016

● INDICATIONS AND DOSE

Chronic thromboembolic pulmonary hypertension that is recurrent or persistent following surgery, or is inoperable (initiated under specialist supervision) | Monotherapy or in combination with an endothelin receptor antagonist for idiopathic or hereditary pulmonary arterial hypertension, or pulmonary arterial hypertension associated with connective tissue disease (initiated under specialist supervision)

▶ BY MOUTH

▶ **Adult:** Initially 1 mg 3 times a day for 2 weeks, increased in steps of 0.5 mg 3 times a day, dose to be increased every 2 weeks, increased to up to 2.5 mg 3 times a day (max. per dose 2.5 mg 3 times a day), increase up to maximum dose only if systolic blood pressure ≥ 95 mmHg and no signs of hypotension, if treatment interrupted for 3 or more days, restart at 1 mg three times daily for 2 weeks and titrate as before, during titration, reduce dose by 0.5 mg three times daily if systolic blood pressure falls below 95 mmHg and patient shows signs of hypotension

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PULMONARY HYPERTENSION ASSOCIATED WITH IDIOPATHIC INTERSTITIAL PNEUMONIAS (PH-IIP) (AUGUST 2016)

Interim results from a terminated study to investigate the efficacy and safety of riociguat in patients with symptomatic PH-IIP, showed increased mortality and increased risk of serious adverse events in the riociguat group compared with the placebo group. The MHRA has advised that use of riociguat is contra-indicated in these patients and that existing treatment for this unauthorised indication should be discontinued.

● **CONTRA-INDICATIONS** History of serious haemoptysis · previous bronchial artery embolisation · pulmonary hypertension associated with idiopathic interstitial pneumonias · pulmonary veno-occlusive disease

● **CAUTIONS** Autonomic dysfunction · elderly (risk of hypotension) · hypotension (do not initiate if systolic blood pressure below 95 mmHg) · hypovolaemia · severe left ventricular outflow obstruction

CAUTIONS, FURTHER INFORMATION

▶ **Smoking** Smoking cessation advised (response possibly reduced); dose adjustment may be necessary if smoking started or stopped during treatment.

● **INTERACTIONS** → Appendix 1: riociguat

● SIDE-EFFECTS

▶ **Common or very common** Anaemia · constipation · diarrhoea · dizziness · dysphagia · gastroenteritis · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hypotension · nasal congestion · nausea · palpitations · peripheral oedema · vomiting

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment. Monthly pregnancy tests advised.

● **PREGNANCY** Avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
Dose adjustments Titrate dose cautiously in moderate impairment.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m²—limited information available.
Dose adjustments Titrate dose cautiously—risk of hypotension.
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed and mixed with water or soft foods and swallowed immediately.
- **PATIENT AND CARER ADVICE** Smoking cessation advised (response possibly reduced). Patients should inform prescriber if smoking started or stopped during treatment; dose adjustment may be necessary.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2014) that riociguat (*Adempas*®) is accepted for restricted use within NHS Scotland for the treatment of chronic thromboembolic pulmonary hypertension in patients for whom a phosphodiesterase type-5 inhibitor is inappropriate, not tolerated, or ineffective, and should only be prescribed by specialists in the Scottish Pulmonary Vascular Unit.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

4.2 Hypotension and shock

Sympathomimetics

Inotropic sympathomimetics

Shock

Shock is a medical emergency associated with a high mortality. The underlying causes of shock such as haemorrhage, sepsis, or myocardial insufficiency should be corrected. The profound hypotension of shock must be treated promptly to prevent tissue hypoxia and organ failure. Volume replacement is essential to correct the hypovolaemia associated with haemorrhage and sepsis but may be detrimental in cardiogenic shock. Depending on haemodynamic status, cardiac output may be improved by the use of sympathomimetic inotropes such as adrenaline/epinephrine p. 221, dobutamine p. 220 or dopamine hydrochloride below. In septic shock, when fluid replacement and inotropic support fail to maintain blood pressure, the vasoconstrictor noradrenaline/norepinephrine p. 188 may be considered. In cardiogenic shock peripheral resistance is frequently high and to raise it further may worsen myocardial performance and exacerbate tissue ischaemia.

The use of sympathomimetic inotropes and vasoconstrictors should preferably be confined to the intensive care setting and undertaken with invasive haemodynamic monitoring.

See also advice on the management of anaphylactic shock in Antihistamines, allergen immunotherapy and allergic emergencies p. 276.

Vasoconstrictor sympathomimetics

Vasoconstrictor sympathomimetics raise blood pressure transiently by acting on alpha-adrenergic receptors to constrict peripheral vessels. They are sometimes used as an emergency method of elevating blood pressure where other measures have failed.

The danger of vasoconstrictors is that although they raise blood pressure they also reduce perfusion of vital organs such as the kidney.

Spinal and epidural anaesthesia may result in sympathetic block with resultant hypotension. Management may include intravenous fluids (which are usually given prophylactically), oxygen, elevation of the legs, and injection of a pressor drug such as ephedrine hydrochloride p. 271. As well as constricting peripheral vessels ephedrine hydrochloride also accelerates the heart rate (by acting on beta receptors). Use is made of this dual action of ephedrine hydrochloride to manage associated bradycardia (although intravenous injection of atropine sulfate p. 1295 may also be required if bradycardia persists).

SYMPATHOMIMETICS > INOTROPIC

Dopamine hydrochloride

- **DRUG ACTION** Dopamine is a cardiac stimulant which acts on beta₁ receptors in cardiac muscle, and increases contractility with little effect on rate.

• INDICATIONS AND DOSE

Cardiogenic shock in infarction or cardiac surgery

► BY INTRAVENOUS INFUSION

► Adult: Initially 2–5 micrograms/kg/minute

- **CONTRA-INDICATIONS** Phaeochromocytoma • tachyarrhythmia
- **CAUTIONS** Correct hypovolaemia • hypertension (may raise blood pressure) • hyperthyroidism • low dose in shock due to acute myocardial infarction
- **INTERACTIONS** → Appendix 1: sympathomimetics, inotropic
- **SIDE-EFFECTS** Angina pectoris • anxiety • arrhythmias • azotaemia • cardiac conduction disorder • dyspnoea • gangrene • headache • hypertension • mydriasis • nausea • palpitations • piloerection • polyuria • tremor • vasoconstriction • vomiting
- **PREGNANCY** No evidence of harm in *animal* studies—manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** May suppress lactation—not known to be harmful.
- **DIRECTIONS FOR ADMINISTRATION** Dopamine concentrate for intravenous infusion to be diluted before use.

For *intravenous infusion* give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to max. concentration of 3.2 mg/mL; incompatible with bicarbonate.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for infusion▶ **Dopamine hydrochloride (Non-proprietary)**

Dopamine hydrochloride 40 mg per 1 ml Dopamine 200mg/5ml solution for infusion ampoules | 5 ampoule [PoM] £20.00 (Hospital only) | 5 ampoule [PoM] £20.00 | 10 ampoule [PoM] £9.04
Dopamine 200mg/5ml concentrate for solution for infusion ampoules | 10 ampoule [PoM] £5
Dopamine hydrochloride 160 mg per 1 ml Dopamine 800mg/5ml solution for infusion ampoules | 10 ampoule [PoM] £34.00

SYMPATHOMIMETICS > VASOCONSTRICTOR**Metaraminol****INDICATIONS AND DOSE****Acute hypotension**▶ **BY INTRAVENOUS INFUSION**

▶ **Adult:** 15–100 mg, adjusted according to response

Emergency treatment of acute hypotension▶ **INITIALLY BY INTRAVENOUS INJECTION**

▶ **Adult:** Initially 0.5–5 mg, then (by intravenous infusion) 15–100 mg, adjusted according to response

CONTRA-INDICATIONS Hypertension**CAUTIONS** Cirrhosis · coronary vascular thrombosis · diabetes mellitus · elderly · extravasation at injection site may cause necrosis · following myocardial infarction · hypercapnia · hyperthyroidism · hypoxia · mesenteric vascular thrombosis · peripheral vascular thrombosis · Prinzmetal's variant angina · uncorrected hypovolaemia**CAUTIONS, FURTHER INFORMATION**

▶ Hypertensive response Metaraminol has a longer duration of action than noradrenaline, and an excessive vasopressor response may cause a prolonged rise in blood pressure.

INTERACTIONS → Appendix 1: sympathomimetics, vasoconstrictor**SIDE-EFFECTS**

- ▶ **Common or very common** Headache · hypertension
- ▶ **Rare or very rare** Skin exfoliation · soft tissue necrosis
- ▶ **Frequency not known** Abscess · arrhythmias · nausea · palpitations · peripheral ischaemia

PREGNANCY May reduce placental perfusion—manufacturer advises use only if potential benefit outweighs risk.**BREAST FEEDING** Manufacturer advises caution—no information available.**MONITORING REQUIREMENTS** Monitor blood pressure and rate of flow frequently.**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection▶ **Metaraminol (Non-proprietary)**

Metaraminol (as Metaraminol tartrate) 10 mg per 1 ml Metaraminol 10mg/1ml solution for injection ampoules | 10 ampoule [PoM] £39.40

Midodrine hydrochloride

01-Apr-2016

DRUG ACTION Midodrine hydrochloride is a pro-drug of desglymidodrine. Desglymidodrine is a sympathomimetic agent, which acts on peripheral alpha-adrenergic receptors to increase arterial resistance, resulting in an increase in blood pressure.**INDICATIONS AND DOSE****Severe orthostatic hypotension due to autonomic dysfunction when corrective factors have been ruled out and other forms of treatment are inadequate**▶ **BY MOUTH**

▶ **Adult:** Initially 2.5 mg 3 times a day, increased if necessary up to 10 mg 3 times a day, dose to be increased at weekly intervals, according to blood pressure measurements; usual maintenance 10 mg 3 times a day, avoid administration at night; the last daily dose should be taken at least 4 hours before bedtime

CONTRA-INDICATIONS Aortic aneurysm · blood vessel spasm · bradycardia · cardiac conduction disturbances · cerebrovascular occlusion · congestive heart failure · hypertension · hyperthyroidism · myocardial infarction · narrow-angle glaucoma · pheochromocytoma · proliferative diabetic retinopathy · serious obliterative blood vessel disease · serious prostate disorder · urinary retention**CAUTIONS** Atherosclerotic cardiovascular disease (especially with symptoms of intestinal angina or claudication of the legs) · autonomic dysfunction · elderly (manufacturer recommends cautious dose titration) · prostate disorders**INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor**SIDE-EFFECTS**

- ▶ **Common or very common** Chills · flushing · gastrointestinal discomfort · headache · nausea · paraesthesia · piloerection · supine hypertension (dose-dependent) · scalp pruritus · skin reactions · stomatitis · urinary disorders
 - ▶ **Uncommon** Anxiety · arrhythmias · irritability · sleep disorders
 - ▶ **Rare or very rare** Hepatic function abnormal · palpitations
 - ▶ **Frequency not known** Confusion · diarrhoea · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises that treatment must be stopped if supine hypertension is not controlled by reducing the dose.

CONCEPTION AND CONTRACEPTION Manufacturer recommends effective contraception during treatment in women of childbearing potential.**PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.**BREAST FEEDING** Manufacturer advises avoid—no information available.**RENAL IMPAIRMENT** Manufacturer advises avoid in severe or acute impairment.**MONITORING REQUIREMENTS**

- ▶ Manufacturer advises measure hepatic and renal function before treatment and at regular intervals during treatment.
- ▶ Manufacturer advises regular monitoring of supine and standing blood pressure due to the risk of hypertension in the supine position.

PATIENT AND CARER ADVICE Manufacturer advises that patients report symptoms of supine hypertension (such as chest pain, palpitations, shortness of breath, headache and blurred vision) immediately. The risk of supine hypertension at night can be reduced by raising the head of the bed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Midodrine hydrochloride (Non-proprietary)

Midodrine hydrochloride 2.5 mg Midodrine 2.5mg tablets | 100 tablet [PoM] £55.05 DT = £55.05

Midodrine hydrochloride 5 mg Midodrine 5mg tablets | 100 tablet [PoM] £75.05 DT = £75.05

► Bramox (Brancastra Pharma Ltd)

Midodrine hydrochloride 2.5 mg Bramox 2.5mg tablets | 100 tablet [PoM] £55.05 DT = £55.05

Midodrine hydrochloride 5 mg Bramox 5mg tablets | 100 tablet [PoM] £75.05 DT = £75.05

Midodrine hydrochloride 2.5 mg Midotense 2.5mg tablets | 30 tablet [PoM] £15.69

Noradrenaline/norepinephrine

03-Apr-2018

● INDICATIONS AND DOSE

Acute hypotension [initial and on-going treatment]

► BY INTRAVENOUS INFUSION

► Adult: Initially 0.16–0.33 mL/minute, adjusted according to response, dose applies to a solution containing noradrenaline 40 micrograms(base)/mL only; dilute the 1 mg/mL concentrate for infusion for this solution—consult product literature

On-going treatment of acute hypotension [with escalating dose requirements]

► BY INTRAVENOUS INFUSION

► Adult (body-weight 50 kg and above): Use the 0.08 mg/mL solution for infusion (consult product literature)

DOSE EQUIVALENCE AND CONVERSION

► 1 mg of noradrenaline base is equivalent to 2 mg of noradrenaline acid tartrate. **Doses expressed as the base.**

IMPORTANT SAFETY INFORMATION

ASSOCIATION OF NORADRENALINE/NOREPINEPHRINE 0.08 MG/ML (4 MG IN 50 ML) SOLUTION FOR INFUSION WITH POTENTIAL RISK OF MEDICATION ERRORS

Healthcare professionals should be aware of the differences in strength and presentation between noradrenaline/norepinephrine products—manufacturer advises noradrenaline 0.08 mg/mL solution for infusion must **not** be diluted before use and should only be used for the on-going treatment of patients already established on noradrenaline therapy, whose dose requirements are clinically confirmed to be escalating.

● CONTRA-INDICATIONS Hypertension

● CAUTIONS Coronary vascular thrombosis · diabetes mellitus · elderly · extravasation at injection site may cause necrosis · following myocardial infarction · hypercapnia · hyperthyroidism · hypoxia · mesenteric vascular thrombosis · peripheral vascular thrombosis · Prinzmetal's variant angina · uncorrected hypovolaemia

● INTERACTIONS → Appendix 1: sympathomimetics, vasoconstrictor

● SIDE-EFFECTS Anxiety · arrhythmias · dyspnoea · extravasation necrosis · headache · hypertension · hypovolaemia · peripheral ischaemia

● PREGNANCY Manufacturer advises use if potential benefit outweighs risk—may reduce placental perfusion and induce fetal bradycardia.

● MONITORING REQUIREMENTS Monitor blood pressure and rate of flow frequently.

● DIRECTIONS FOR ADMINISTRATION For intravenous infusion using a solution containing noradrenaline 40 micrograms (base)/mL, manufacturer advises give continuously in

Glucose 5% or Sodium Chloride and Glucose via a controlled infusion device. For administration via syringe pump, dilute 2 mg (2 mL of 1 mg/mL concentrate for infusion) noradrenaline base with 48 mL infusion fluid. For administration via drip counter dilute 20 mg (20 mL of 1 mg/mL concentrate for infusion) noradrenaline base with 480 mL infusion fluid; give through a central venous catheter; incompatible with alkalis.

● PRESCRIBING AND DISPENSING INFORMATION For a period of time, preparations on the UK market may be described as either noradrenaline base or noradrenaline acid tartrate; doses in the BNF are expressed as the base.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Solution for infusion

► Noradrenaline/norepinephrine (Non-proprietary)

Noradrenaline (as Noradrenaline acid tartrate) 80 microgram per 1 mL Noradrenaline (base) 4mg/50ml solution for infusion vials | 10 vial [PoM] £5

Noradrenaline (as Noradrenaline acid tartrate) 1 mg per 1 mL Noradrenaline (Norepinephrine) 4mg/4ml concentrate for

solution for infusion ampoules | 10 ampoule [PoM] £44.00

Noradrenaline (base) 8mg/8ml concentrate for solution for infusion ampoules | 10 ampoule [PoM] £116.00

Noradrenaline (base) 2mg/2ml solution for infusion ampoules | 5 ampoule [PoM] £12.00 (Hospital only)

Noradrenaline (base) 4mg/4ml solution for infusion ampoules | 5 ampoule [PoM] £22.00 (Hospital only)

Noradrenaline (base) 4mg/4ml concentrate for solution for infusion ampoules | 10 ampoule [PoM] £58.00

Noradrenaline (Norepinephrine) 2mg/2ml concentrate for solution for infusion ampoules | 5 ampoule [PoM] £11.00

Phenylephrine hydrochloride

● INDICATIONS AND DOSE

Acute hypotension

► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

► Adult: Initially 2–5 mg, followed by 1–10 mg, after at least 15 minutes if required

► BY SLOW INTRAVENOUS INJECTION

► Adult: 100–500 micrograms, repeated as necessary after at least 15 minutes

► BY INTRAVENOUS INFUSION

► Adult: Initially up to 180 micrograms/minute, reduced to 30–60 micrograms/minute, adjusted according to response

● CONTRA-INDICATIONS Hypertension · severe hyperthyroidism

● CAUTIONS

Coronary disease · coronary vascular thrombosis · diabetes · elderly · extravasation at injection site may cause necrosis · following myocardial infarction · hypercapnia · hyperthyroidism · hypoxia · mesenteric vascular thrombosis · peripheral vascular thrombosis · Prinzmetal's variant angina · susceptibility to angle-closure glaucoma · uncorrected hypovolaemia

CAUTIONS, FURTHER INFORMATION

► Hypertensive response Phenylephrine has a longer duration of action than noradrenaline (norepinephrine), and an excessive vasopressor response may cause a prolonged rise in blood pressure.

● INTERACTIONS → Appendix 1: sympathomimetics, vasoconstrictor

● SIDE-EFFECTS Angina pectoris · arrhythmias · cardiac arrest · dizziness · dyspnoea · flushing · glucose tolerance impaired · headache · hyperhidrosis · hypersalivation · hypotension · intracranial haemorrhage · metabolic change

• mydriasis • palpitations • paraesthesia • peripheral coldness • pulmonary oedema • soft tissue necrosis • syncope • urinary disorders • vomiting

- **PREGNANCY** Avoid if possible; malformations reported following use in first trimester; fetal hypoxia and bradycardia reported in late pregnancy and labour.
- **MONITORING REQUIREMENTS** Contra-indicated in hypertension—monitor blood pressure and rate of flow frequently.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion give intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute 10 mg in 500 mL infusion fluid.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, eye drops

Solution for injection

• Phenylephrine hydrochloride (Non-proprietary)

Phenylephrine (as Phenylephrine hydrochloride) 50 microgram per 1 mL Phenylephrine 500micrograms/10mL solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £15.00 | 10 pre-filled disposable injection [PoM] £150.00

Phenylephrine hydrochloride 10 mg per 1 mL Phenylephrine 10mg/1mL solution for injection ampoules | 10 ampoule [PoM] £99.12

5 Heart failure

Heart failure

Drug treatment

Drug treatment of **heart failure** associated with a reduced left ventricular ejection fraction (left ventricular systolic dysfunction) is covered below; optimal management of heart failure with a preserved left ventricular ejection fraction has not been established.

The treatment of chronic heart failure aims to relieve symptoms, improve exercise tolerance, reduce the incidence of acute exacerbations, and reduce mortality. An **ACE inhibitor**, titrated to a 'target dose' (or the maximum tolerated dose if lower), together with a **beta-blocker**, form the basis of treatment for all patients with heart failure due to left ventricular systolic dysfunction.

An ACE inhibitor is generally advised for patients with asymptomatic left ventricular systolic dysfunction or symptomatic heart failure. An **angiotensin-II receptor antagonist** may be a useful alternative for patients who, because of side-effects such as cough, cannot tolerate ACE inhibitors; a relatively high dose of the angiotensin-II receptor antagonist may be required to produce benefit. Candesartan cilexetil p. 174 or valsartan p. 178 may be given under specialist supervision as adjuncts to an ACE inhibitor in the treatment of heart failure when other treatments are unsuitable; the concomitant use of this combination, together with an aldosterone antagonist or a potassium-sparing diuretic is not recommended. The combination of sacubitril with valsartan p. 191, an angiotensin-II receptor antagonist with a neprilysin inhibitor, may be a suitable alternative for those patients already stabilised on an ACE inhibitor or angiotensin-II receptor antagonist.

The beta-blockers bisoprolol fumarate p. 152 and carvedilol p. 147 are of value in any grade of stable heart failure due to left ventricular systolic dysfunction; nebivolol p. 154 is licensed for stable mild to moderate heart failure in patients over 70 years. Beta-blocker treatment should be started by those experienced in the management of heart failure, at a very low dose and titrated very slowly over a

period of weeks or months. Symptoms may deteriorate initially, calling for adjustment of concomitant therapy.

The aldosterone antagonist spironolactone p. 190 can be added to an ACE inhibitor and a beta-blocker in patients who continue to remain symptomatic (particularly in those with moderate to severe heart failure); low doses of spironolactone reduce symptoms and mortality in these patients. If spironolactone cannot be used, eplerenone p. 190 may be considered for the management of heart failure after an acute myocardial infarction with evidence of left ventricular systolic dysfunction, or for chronic mild heart failure with left ventricular systolic dysfunction. Close monitoring of serum creatinine, eGFR, and potassium is necessary, particularly following any change in treatment or any change in the patient's clinical condition.

Patients who cannot tolerate an ACE inhibitor or an angiotensin-II receptor antagonist, or in whom they are contra-indicated, may be given isosorbide dinitrate p. 219 with hydralazine hydrochloride p. 180 but this combination may be poorly tolerated. The combination of isosorbide dinitrate and hydralazine hydrochloride may be considered in addition to standard therapy with an ACE inhibitor and a beta-blocker in patients who continue to remain symptomatic (particularly in patients of African or Caribbean origin who have moderate to severe heart failure).

Digoxin p. 109 improves symptoms of heart failure and exercise tolerance and reduces hospitalisation due to acute exacerbations but it does not reduce mortality. Digoxin is reserved for patients with worsening or severe heart failure due to left ventricular systolic dysfunction who remain symptomatic despite treatment with an ACE inhibitor and a beta-blocker in combination with either an aldosterone antagonist, candesartan cilexetil, or isosorbide dinitrate with hydralazine hydrochloride.

Patients with fluid overload should also receive either a loop or a thiazide diuretic (with salt or fluid restriction where appropriate). A **thiazide diuretic** may be of benefit in patients with mild heart failure and good renal function; however, thiazide diuretics are ineffective in patients with poor renal function (eGFR less than 30 mL/minute/1.73 m²) and a **loop diuretic** is preferred. If diuresis with a single diuretic is insufficient, a combination of a loop diuretic and a thiazide diuretic may be tried; addition of metolazone p. 230 may also be considered but the resulting diuresis may be profound and care is needed to avoid potentially dangerous electrolyte disturbances.

Other drugs used for Heart failure Bendroflumethiazide,

p. 165 • Captopril, p. 167 • Chlortalidone, p. 229 • Coamilofide, p. 166 • Cyclopenthiadiazide, p. 230 • Enalapril maleate, p. 168 • Fosinopril sodium, p. 169 • Glyceryl trinitrate, p. 217 • Isosorbide mononitrate, p. 219 • Ivabradine, p. 210 • Lisinopril, p. 170 • Losartan potassium, p. 176 • Metoprolol tartrate, p. 154 • Perindopril arginine, p. 170 • Perindopril erbumine, p. 171 • Prazosin, p. 766 • Quinapril, p. 172 • Ramipril, p. 172 • Sodium nitroprusside, p. 182

DIURETICS > POTASSIUM-SPARING DIURETICS > ALDOSTERONE ANTAGONISTS

Co-flumactone

The properties listed below are those particular to the combination only. For the properties of the components please consider, spironolactone below.

● INDICATIONS AND DOSE

Congestive heart failure

- **BY MOUTH**
- **Adult:** Initially 100/100 mg daily; maintenance 25/25–200/200 mg daily, maintenance dose not recommended because spironolactone generally given in lower dose

- **INTERACTIONS** → Appendix 1: aldosterone antagonists · thiazide diuretics

- **LESS SUITABLE FOR PRESCRIBING** Co-flumactone tablets are less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Aldactide** (Pfizer Ltd)
Hydroflumethiazide 25 mg, Spironolactone 25 mg Aldactide 25 tablets | 100 tablet [PoM](#) £20.23 DT = £20.23
Hydroflumethiazide 50 mg, Spironolactone 50 mg Aldactide 50 tablets | 28 tablet [PoM](#) £10.70 | 100 tablet [PoM](#) £38.23 DT = £38.23

Eplerenone

● INDICATIONS AND DOSE

Adjunct in stable patients with left ventricular ejection fraction $\leq 40\%$ with evidence of heart failure, following myocardial infarction (start therapy within 3–14 days of event) (Adjunct in chronic mild heart failure with left ventricular ejection fraction $\leq 30\%$)

- **BY MOUTH**
- **Adult:** Initially 25 mg daily, then increased to 50 mg daily, increased within 4 weeks of initial treatment

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises max. dose 25 mg daily with concurrent use of amiodarone or moderate inhibitors of CYP3A4.

- **CONTRA-INDICATIONS** Hyperkalaemia

- **CAUTIONS** Elderly

- **INTERACTIONS** → Appendix 1: aldosterone antagonists

● SIDE-EFFECTS

- **Common or very common** Arrhythmias · asthenia · constipation · cough · diarrhoea · dizziness · dyslipidaemia · electrolyte imbalance · headache · insomnia · muscle spasms · nausea · pain · renal impairment · skin reactions · syncope · vomiting
- **Uncommon** Angioedema · arterial thrombosis · cholecystitis · eosinophilia · flatulence · gynaecomastia · hyperhidrosis · hypothyroidism · increased risk of infection · malaise · numbness · postural hypotension

- **PREGNANCY** Manufacturer advises caution—no information available.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
Dose adjustments Initially 25 mg on alternate days if eGFR 30–60 mL/minute/1.73 m², adjust dose according to

serum-potassium concentration—consult product literature.

Monitoring Increased risk of hyperkalaemia in renal impairment—close monitoring required.

- **MONITORING REQUIREMENTS** Monitor plasma-potassium concentration before treatment, during initiation, and when dose changed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Spironolactone

19-Mar-2018

● INDICATIONS AND DOSE

Oedema | Ascites in cirrhosis of the liver

- **BY MOUTH**
- **Adult:** 100–400 mg daily, adjusted according to response

Malignant ascites

- **BY MOUTH**
- **Adult:** Initially 100–200 mg daily, then increased if necessary to 400 mg daily, maintenance dose adjusted according to response

Nephrotic syndrome

- **BY MOUTH**
- **Adult:** 100–200 mg daily

Oedema in congestive heart failure

- **BY MOUTH**
- **Adult:** Initially 100 mg daily, alternatively initially 25–200 mg daily, dose may be taken as a single dose or divided doses, maintenance dose adjusted according to response

Moderate to severe heart failure (adjunct)

- **BY MOUTH**
- **Adult:** Initially 25 mg once daily, then adjusted according to response to 50 mg once daily

Resistant hypertension (adjunct)

- **BY MOUTH**
- **Adult:** 25 mg once daily

Primary hyperaldosteronism in patients awaiting surgery

- **BY MOUTH**
- **Adult:** 100–400 mg daily, may be used for long-term maintenance if surgery inappropriate, use lowest effective dose

- **UNLICENSED USE** Resistant hypertension (adjunct) unlicensed indication.

- **CONTRA-INDICATIONS** Addison's disease · anuria · hyperkalaemia

- **CAUTIONS** Acute porphyrias p. 1025 · elderly · potential metabolic products carcinogenic in rodents

- **INTERACTIONS** → Appendix 1: aldosterone antagonists

- **SIDE-EFFECTS** Acidosis hyperchloraemic · acute kidney injury · agranulocytosis · alopecia · breast neoplasm benign · breast pain · confusion · dizziness · electrolyte imbalance · gastrointestinal disorder · gynaecomastia · hepatic function abnormal · hyperkalaemia (discontinue) · hypertrichosis · leg cramps · leucopenia · libido disorder · malaise · menstrual disorder · nausea · severe cutaneous

adverse reactions (SCARs) • skin reactions • thrombocytopenia

- **PREGNANCY** Use only if potential benefit outweighs risk—feminisation of male fetus in *animal* studies.
- **BREAST FEEDING** Metabolites present in milk, but amount probably too small to be harmful.
- **RENAL IMPAIRMENT** Avoid in acute renal insufficiency or severe impairment.
Monitoring Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).
- **MONITORING REQUIREMENTS** Monitor electrolytes—discontinue if hyperkalaemia occurs (in *severe heart failure* monitor potassium and creatinine 1 week after initiation and after any dose increase, monthly for first 3 months, then every 3 months for 1 year, and then every 6 months).

DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM > ANGIOTENSIN II RECEPTOR ANTAGONISTS

Sacubitril with valsartan

11-Sep-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, valsartan p. 178.

- **DRUG ACTION** Sacubitril (a prodrug) inhibits the breakdown of natriuretic peptides resulting in varied effects including increased diuresis, natriuresis, and vasodilation.

• INDICATIONS AND DOSE

Symptomatic chronic heart failure with reduced ejection fraction (in patients not currently taking an ACE inhibitor or angiotensin II receptor antagonist, or stabilised on low doses of either of these agents)

► BY MOUTH

- **Adult:** Initially 24/26 mg twice daily for 3–4 weeks, increased if tolerated to 49/51 mg twice daily for 3–4 weeks, then increased if tolerated to 97/103 mg twice daily

Symptomatic chronic heart failure with reduced ejection fraction (in patients currently stabilised on an ACE inhibitor or angiotensin II receptor antagonist)

► BY MOUTH

- **Adult:** Initially 49/51 mg twice daily for 2–4 weeks, increased if tolerated to 97/103 mg twice daily, consider a starting dose of 24/26 mg if systolic blood pressure less than 110 mmHg

DOSE EQUIVALENCE AND CONVERSION

- **Entresto[®]** tablets contain sacubitril and valsartan; the proportions are expressed in the form x/y where x and y

are the strength in milligrams of sacubitril and valsartan respectively. Valsartan, in this formulation, is more bioavailable than other tablet formulations—26 mg, 51 mg, and 103 mg valsartan is equivalent to 40 mg, 80 mg and 160 mg, respectively. Furthermore, note that the 24/26 mg, 49/51 mg and 97/103 mg strengths are sometimes referred to as a total of both drug strengths, that is, 50 mg, 100 mg and 200 mg, respectively.

- **CONTRA-INDICATIONS** Systolic blood pressure less than 100 mmHg

- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists • sacubitril

• SIDE-EFFECTS

- **Common or very common** Anaemia • asthenia • cough • diarrhoea • dizziness • electrolyte imbalance • gastritis • headache • hypoglycaemia • hypotension • nausea • renal impairment • syncope • vertigo
- **Uncommon** Angioedema • skin reactions

- **PREGNANCY** Manufacturer advises avoid—toxicity with sacubitril in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Contra-indicated in severe impairment.

Dose adjustments Manufacturer advises starting dose of 26/24 mg twice daily in moderate impairment.

• RENAL IMPAIRMENT

Dose adjustments Manufacturer recommends a starting dose of 26/24 mg twice daily if eGFR less than 30 mL/minute/1.73m². Also consider this starting dose if eGFR 30 to 60 mL/minute/1.73m².

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Sacubitril valsartan** for treating symptomatic chronic heart failure with reduced ejection fraction (April 2016) NICE TA388 Sacubitril valsartan is recommended as an option for treating symptomatic chronic heart failure with reduced ejection fraction, only in adults:

- with New York Heart Association class II to IV symptoms **and**
- a left ventricular ejection fraction of 35% or less **and**
- who are already taking a stable dose of an ACE inhibitor or angiotensin II receptor antagonist.

PHOSPHODIESTERASE TYPE-3 INHIBITORS

Enoximone

- **DRUG ACTION** Enoximone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

● **INDICATIONS AND DOSE**

Congestive heart failure where cardiac output reduced and filling pressures increased

► **BY SLOW INTRAVENOUS INJECTION**

- **Adult:** Initially 0.5–1 mg/kg, rate not exceeding 12.5 mg/minute, then 500 micrograms/kg every 30 minutes until satisfactory response or total of 3 mg/kg given; maintenance, initial dose of up to 3 mg/kg may be repeated every 3–6 hours as required

► **BY INTRAVENOUS INFUSION**

- **Adult:** Initially 90 micrograms/kg/minute, dose to be given over 10–30 minutes, followed by 5–20 micrograms/kg/minute, dose to be given as either a continuous or intermittent infusion; maximum 24 mg/kg per day

- **CAUTIONS** Heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction

● **SIDE-EFFECTS**

- **Common or very common** Headache · hypotension · insomnia
- **Uncommon** Arrhythmias · diarrhoea · dizziness · nausea · vomiting
- **Rare or very rare** Chills · fever · fluid retention · myalgia · oliguria · urinary retention

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises caution—no information available.

● **HEPATIC IMPAIRMENT**

Dose adjustments Dose reduction may be required.

● **RENAL IMPAIRMENT**

Dose adjustments Consider dose reduction.

- **MONITORING REQUIREMENTS** Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.

- **DIRECTIONS FOR ADMINISTRATION** Incompatible with glucose solutions. Use only plastic containers or syringes; crystal formation if glass used. Avoid extravasation.

For *intravenous infusion* (*Perfan*®), give continuously or intermittently in Sodium chloride 0.9% or Water for injections; dilute to a concentration of 2.5 mg/mL.

- **PRESCRIBING AND DISPENSING INFORMATION** Sustained haemodynamic benefit has been observed after administration of phosphodiesterase type-3 inhibitors, but there is no evidence of any beneficial effect on survival.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Alcohol, propylene glycol

► **Perfan** (Myogen GmbH)

Enoximone 5 mg per 1 ml Perfian 100mg/20ml solution for injection ampoules | 10 ampoule [PoM] (Hospital only)

Milrinone

- **DRUG ACTION** Milrinone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

● **INDICATIONS AND DOSE**

Short-term treatment of severe congestive heart failure unresponsive to conventional maintenance therapy (not immediately after myocardial infarction) | Acute heart failure, including low output states following heart surgery

► **INITIALLY BY INTRAVENOUS INJECTION**

- **Adult:** Initially 50 micrograms/kg, given over 10 minutes, followed by (by intravenous infusion) 375–750 nanograms/kg/minute usually given following surgery for up to 12 hours or in congestive heart failure for 48–72 hours; maximum 1.13 mg/kg per day

- **CONTRA-INDICATIONS** Severe hypovolaemia

- **CAUTIONS** Correct hypokalaemia · heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction

● **SIDE-EFFECTS**

- **Common or very common** Arrhythmia supraventricular (increased risk in patients with pre-existing arrhythmias) · headache · hypotension
- **Uncommon** Angina pectoris · chest pain · hypokalaemia · thrombocytopenia · tremor
- **Rare or very rare** Anaphylactic shock · bronchospasm · skin eruption
- **Frequency not known** Renal failure

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **RENAL IMPAIRMENT**

Dose adjustments Reduce dose and monitor response if eGFR less than 50 mL/minute/1.73 m²—consult product literature for details.

- **MONITORING REQUIREMENTS** Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.

- **DIRECTIONS FOR ADMINISTRATION** Avoid extravasation.

For *intravenous injection*, may be given either undiluted or diluted before use.

For *intravenous infusion* (*Primacor*®) give continuously in Glucose 5% or Sodium chloride 0.9%; dilute to a suggested concentration of 200 micrograms/mL.

- **PRESCRIBING AND DISPENSING INFORMATION** Sustained haemodynamic benefit has been observed after administration of phosphodiesterase type-3 inhibitors, but there is no evidence of any beneficial effect on survival.

● **MEDICINAL FORMS**

Milrinone 1 mg per 1 ml Primacor 10mg/10ml solution for injection ampoules | 10 ampoule [PoM] £199.06

6 Hyperlipidaemia

Lipid-regulating drugs

Cardiovascular disease, primary and secondary prevention

Preventative measures should be taken in individuals with a high risk of developing cardiovascular disease (primary prevention) and to prevent recurrence of events in those with established cardiovascular disease (secondary prevention).

Cardiovascular disease, primary prevention

Individuals at high risk of developing cardiovascular disease include those who have diabetes mellitus, chronic kidney disease (eGFR < 60 mL/minute/1.73 m²) and/or albuminuria, and those with familial hypercholesterolaemia. The risk also increases with age; those aged 85 years and over are at particularly high risk, especially if they smoke or have hypertension. Preventative measures are also required for other individuals who are considered to be at high risk of developing atherosclerotic cardiovascular disease based on risk estimated using risk calculators (see Risk calculators); those with a 10-year risk of cardiovascular disease of 10% or more stand to benefit most from drug treatment. Patients with a 10-year cardiovascular risk of less than 10% may benefit from an assessment of their lifetime risk (using the JBS3 tool—see Risk calculators for more detail), discussion on the impact of lifestyle interventions and, if necessary, drug therapy.

Cardiovascular disease risk calculators

Risk assessment calculators are recommended by both NICE (clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease) and JBS3 (Joint British Societies' consensus recommendations for the prevention of cardiovascular disease 2014). They should not be used in patients at high cardiovascular risk. Both calculators are unsuitable for assessing risk in those aged 85 years and over, and NICE advises against using a risk assessment tool in those with type 1 diabetes mellitus.

The QRISK[®] 2 risk calculator www.qrisk.org/ is recommended by NICE clinical guideline 181, and the JBS3 risk calculator www.jbs3risk.com/pages/risk_calculator.htm is endorsed by JBS3. Both tools assess cardiovascular risk—coronary heart disease (angina and myocardial infarction), stroke, and transient ischaemic attack, on the basis of lipid profile, systolic blood pressure, gender, age, ethnicity, smoking status, BMI, chronic kidney disease, diabetes mellitus, atrial fibrillation, treated hypertension, rheumatoid arthritis, or a family history of premature cardiovascular disease. Risk assessment tools underestimate risk in patients with additional risk due to existing conditions or medication, such as:

- serious mental disorder
- autoimmune disorders such as systemic lupus erythematosus and other systemic inflammatory disorders
- antiretroviral treatment
- medication causing dyslipidaemia as a side-effect e.g. antipsychotics, corticosteroids, or immunosuppressants
- triglyceride concentration > 4.5 mmol/litre

Cardiovascular disease risk is also underestimated in those who are already taking antihypertensive or lipid-regulating drugs, and in those who have recently stopped smoking. Severe obesity (BMI > 40 kg/m²) also increases cardiovascular risk; the need for further treatment of risk

factors in patients below the cardiovascular risk threshold for treatment should be based on clinical judgement.

Cardiovascular disease, measures for primary prevention

All patients at high risk of cardiovascular disease should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight management, alcohol consumption, and smoking cessation.

Offer a statin as first-line drug treatment if lifestyle modifications are inappropriate or ineffective (see also Statins for the prevention of cardiovascular disease). Lipid-regulating drug treatment must be combined with advice on diet and lifestyle measures, and where appropriate, treatment of comorbidities and secondary causes of dyslipidaemia.

Cardiovascular disease, secondary prevention

Statins should be offered to all patients, including the elderly, with cardiovascular disease such as those with coronary heart disease (including history of angina or acute myocardial infarction), occlusive arterial disease (including peripheral vascular disease, non-haemorrhagic stroke, or transient ischaemic attacks).

Cardiovascular disease, measures for secondary prevention

Patients should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight management, alcohol consumption, and smoking cessation, however, initiation of lipid-regulating drug treatment should not be delayed to manage modifiable risk factors, and must be combined with advice on diet and lifestyle measures, and where appropriate, treatment of co-morbidities and secondary causes of dyslipidaemia.

Statins for the prevention of cardiovascular disease

A statin reduces the risk of cardiovascular disease events, and is the drug of first choice for primary and secondary prevention of cardiovascular disease. Before starting treatment with statins, secondary causes of dyslipidaemia should be addressed; these include uncontrolled diabetes mellitus, hepatic disease, nephrotic syndrome, and excessive alcohol consumption. Patients with hypothyroidism should receive adequate thyroid replacement therapy (before assessing the requirement for lipid-regulating treatment if for primary prevention) because correcting hypothyroidism itself may resolve the lipid abnormality. Untreated hypothyroidism increases the risk of myositis with lipid-regulating drugs.

For the purpose of reducing cardiovascular risk, NICE Clinical Guideline 181 (NICE clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease) defines statins by the percentage reduction in LDL-cholesterol they achieve:

For *primary prevention*, NICE Clinical Guideline 181 recommends that atorvastatin p. 200 a high-intensity statin (when prescribed at a dose of at least 20 mg/day [unlicensed dose]), should be offered to those with a 10-year risk of cardiovascular disease of 10% or more; patients aged 85 years and over may benefit from atorvastatin to reduce the risk of non-fatal myocardial infarction. For *secondary prevention*, atorvastatin is also recommended [unlicensed indication]. Patients taking a low- or medium-intensity statin should discuss the benefits and risks of switching to a high intensity statin at their next medication review.

A statin should be considered for *all* adults with type 1 diabetes mellitus, particularly those aged 40 years and over, or who have had diabetes for more than 10 years, or who have established nephropathy, or other risk factors for

cardiovascular disease. JBS3 recommendations (Joint British Societies' consensus recommendations for the prevention of cardiovascular disease (JBS3) 2014) in diabetes mellitus differ in certain respects from NICE Clinical Guideline 181 (NICE clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease)—see JBS3 recommendations for further details. In type 2 diabetes, assess level of risk using the risk calculator and treat for primary prevention if necessary.

Total cholesterol, HDL-cholesterol, and non-HDL cholesterol concentrations should be checked 3 months after starting treatment with a high intensity statin. NICE Clinical Guideline 181 recommends aiming for a reduction in non-HDL cholesterol concentration greater than 40%; JBS3 recommends a target non-HDL cholesterol concentration below 2.5 mmol/litre. If these are not achieved, ensure lifestyle modifications are optimised and consider increasing the dose of the statin if started on less than atorvastatin 80 mg and the patient is judged to be at higher risk because of comorbidities, risk score or, using clinical judgement.

Specialist advice should be sought about treatment options for patients at high risk of cardiovascular disease or those with existing cardiovascular disease, who are intolerant of three different statins.

Fibrates should not be routinely used for primary or secondary prevention. Nicotinic acid p. 199, **bile acid sequestrants**, and **omega-3 fatty acid compounds** are not recommended for primary or secondary prevention.

Hypercholesterolaemia, hypertriglyceridaemia, and familial hypercholesterolaemia

A statin is also the drug of first choice for treating hypercholesterolaemia and moderate hypertriglyceridaemia. Severe hyperlipidaemia not adequately controlled with a maximal dose of a statin may require the use of an additional lipid-regulating drug such as ezetimibe p. 196; such treatment should generally be supervised by a specialist.

A number of conditions, some familial, are characterised by very high LDL-cholesterol concentration, high triglyceride concentration, or both. Fenofibrate p. 198 may be added to statin therapy if triglycerides remain high even after the LDL-cholesterol concentration has been reduced adequately; nicotinic acid may also be used to further lower triglyceride or LDL-cholesterol concentration.

Combination of a statin with a fibrate or with nicotinic acid carries an increased risk of side-effects (including rhabdomyolysis) and should be used under specialist supervision; monitoring of liver function and creatine kinase should also be considered. The concomitant administration of gemfibrozil with a statin increases the risk of rhabdomyolysis considerably—this combination should **not** be used.

A statin is recommended for all patients with familial hypercholesterolaemia. A 'high-intensity' statin (as defined in NICE Clinical Guideline 71, August 2008. Identification and management of familial hypercholesterolaemia) e.g. rosuvastatin p. 202 (initiated by a specialist) or atorvastatin p. 200 should be considered in order to achieve the recommended reduction in LDL-cholesterol concentration of greater than 50% from baseline; a 'high-intensity' statin is one that produces a greater LDL-cholesterol reduction than simvastatin 40 mg. Patients with heterozygous familial hypercholesterolaemia who have contra-indications to, or are intolerant of, statins should receive ezetimibe. The combination of a statin and ezetimibe can be considered if a statin alone fails to provide adequate control (or if intolerance limits dose titration), and when a switch to an alternative statin is being considered. Patients for whom statins and ezetimibe are inappropriate, should be referred

to a specialist for the consideration of treatment with a bile acid sequestrant, nicotinic acid, or a fibrate.

The prescribing of drug therapy in homozygous familial hypercholesterolaemia should be undertaken in a specialist centre.

Reduction in low-density lipoprotein cholesterol		
Therapy intensity	Drug	Daily dose (reduction in LDL cholesterol)
High-intensity	Atorvastatin	20 mg (43%)
		40 mg (49%)
		80 mg (55%)
	Rosuvastatin	10 mg (43%)
		20 mg (48%)
		40 mg (53%)
Simvastatin	80 mg (42%)	
Medium-intensity	Atorvastatin	10 mg (37%)
	Fluvastatin	80 mg (33%)
	Rosuvastatin	5 mg (38%)
	Simvastatin	20 mg (32%)
		40 mg (37%)
Low-intensity	Fluvastatin	20 mg (21%)
		40 mg (27%)
	Pravastatin	10 mg (20%)
		20 mg (24%)
		40 mg (29%)
	Simvastatin	10 mg (27%)
Advice from the MHRA: there is an increased risk of myopathy associated with high-dose (80 mg) simvastatin. The 80 mg dose should be considered only in patients with severe hypercholesterolaemia and high risk of cardiovascular complications who have not achieved their treatment goals on lower doses, when the benefits are expected to outweigh the potential risks.		

Statins

Statins are more effective than other lipid-regulating drugs at lowering LDL-cholesterol concentration but they are less effective than the fibrates in reducing triglyceride concentration. However, statins reduce cardiovascular disease events and total mortality irrespective of the initial cholesterol concentration.

Alirocumab and evolocumab

Alirocumab p. 204 and evolocumab p. 205 are licensed for the treatment of primary hypercholesterolaemia (heterozygous familial and non-familial) or mixed dyslipidaemia as an adjunct to dietary measures. They can be used in combination with a statin, or with a statin and other lipid-regulating therapies, in patients unable to achieve their LDL-cholesterol treatment goals with the maximum tolerated dose of a statin. They can be used alone or in combination with other lipid-regulating therapies if a statin is contra-indicated or not tolerated. Evolocumab is also licensed for the treatment of homozygous familial hypercholesterolaemia in combination with other lipid-lowering therapies.

Bile acid sequestrants

Bile acid sequestrants effectively reduce LDL-cholesterol but can aggravate hypertriglyceridaemia. Treatment with bile acid sequestrants may be appropriate under specialist supervision if statins and ezetimibe are inappropriate, and when LDL-cholesterol is severely raised, for example in familial hypercholesterolaemia.

Fibrates

Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

Lomitapide

Lomitapide p. 206 is licensed as an adjunct to dietary measures and other lipid-regulating drugs for the treatment of homozygous familial hypercholesterolaemia.

Nicotinic acid group

The value of nicotinic acid is limited by its side-effects, especially vasodilatation.

Nicotinic acid is used by specialists in combination with a statin if the statin alone cannot adequately control dyslipidaemia (raised LDL-cholesterol, triglyceridaemia, and low HDL-cholesterol).

Acipimox p. 199 seems to have fewer side-effects than nicotinic acid but may be less effective in its lipid-regulating capabilities.

Omega-3 fatty acid compounds

There is no evidence that omega-3 fatty acid compounds reduce the risk of cardiovascular disease.

Other drugs used for Hyperlipidaemia Inositol nicotinate, p. 232

LIPID MODIFYING DRUGS > BILE ACID SEQUESTRANTS

Bile acid sequestrants

- **DRUG ACTION** Bile acid sequestrants act by binding bile acids, preventing their reabsorption; this promotes hepatic conversion of cholesterol into bile acids; the resultant increased LDL-receptor activity of liver cells increases the clearance of LDL-cholesterol from the plasma.
- **CAUTIONS** Interference with the absorption of fat-soluble vitamins (supplements of vitamins A, D, K, and folic acid may be required when treatment is prolonged).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Constipation · gastrointestinal discomfort · gastrointestinal disorders · headaches · nausea · vomiting
 - ▶ **Uncommon** Appetite decreased · diarrhoea · dysphagia · haemorrhage · hypoprothrombinaemia · myalgia · night blindness · osteoporosis · skin reactions · tongue irritation · vitamin deficiencies
 - ▶ **Rare or very rare** Pancreatitis
 - ▶ **Frequency not known** Angina pectoris · arthralgia · arthritis · asthenia · burping · chest pain · dizziness · dyspnoea · gallbladder disorders · inflammation · insomnia · pain · tachycardia
- **PREGNANCY** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.
- **BREAST FEEDING** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.

Colesevelam hydrochloride

● INDICATIONS AND DOSE

Primary hypercholesterolaemia as an adjunct to dietary measures (monotherapy)

- ▶ **BY MOUTH**
- ▶ **Adult:** 3.75 g daily in 1–2 divided doses; maximum 4.375 g per day

Primary hypercholesterolaemia as an adjunct to dietary measures, in combination with a statin | Primary and familial hypercholesterolaemia, in combination with ezetimibe, either with or without a statin

- ▶ **BY MOUTH**
- ▶ **Adult:** 2.5–3.75 g daily in 1–2 divided doses, may be taken at the same time as the statin and ezetimibe

- **CONTRA-INDICATIONS** Biliary obstruction · bowel obstruction
- **CAUTIONS** Gastro-intestinal motility disorders · inflammatory bowel disease · major gastro-intestinal surgery
- **INTERACTIONS** → Appendix 1: colesevelam
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **MONITORING REQUIREMENTS** Patients receiving ciclosporin should have their blood-ciclosporin concentration monitored before, during, and after treatment with colesevelam.
- **PATIENT AND CARER ADVICE** Patient counselling on administration is advised for colesevelam hydrochloride tablets (avoid other drugs at same time).

● MEDICINAL FORMS

LIPID MODIFYING DRUGS > CHOLESTEROL ABSORPTION INHIBITORS

Ezetimibe

19-May-2016

- **DRUG ACTION** Ezetimibe inhibits the intestinal absorption of cholesterol.

If used alone, it has a modest effect on lowering LDL-cholesterol, with little effect on other lipoproteins.

● INDICATIONS AND DOSE

Adjunct to dietary measures and statin treatment in primary hypercholesterolaemia | Adjunct to dietary measures and statin in homozygous familial hypercholesterolaemia | Primary hypercholesterolaemia (if statin inappropriate or not tolerated) | Adjunct to dietary measures in homozygous sitosterolaemia

- ▶ BY MOUTH
- ▶ Adult: 10 mg daily

- **INTERACTIONS** → Appendix 1: ezetimibe

● SIDE-EFFECTS

- ▶ **Common or very common** Asthenia · diarrhoea · gastrointestinal disorders
- ▶ **Uncommon** Appetite decreased · arthralgia · chest pain · cough · hot flush · hypertension · muscle complaints · nausea · pain
- ▶ **Frequency not known** Constipation · depression · dizziness · dyspnoea · hepatitis · myopathy · pancreatitis · paraesthesia · skin reactions · thrombocytopenia
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Avoid in moderate and severe impairment—may accumulate.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ Ezetimibe for treating primary heterozygous-familial and non-familial hypercholesterolaemia (February 2016) NICE TA385 This guidance should be used with NICE's guidelines on cardiovascular disease: risk assessment and reduction, including lipid modification and familial hypercholesterolaemia: identification and management (see Lipid-regulating drugs p. 193).

Ezetimibe, alone, is recommended as an option for the treatment of primary (heterozygous-familial or non-familial) hypercholesterolaemia in adult patients in whom initial statin therapy is contra-indicated, or who are intolerant of initial statin therapy.

Ezetimibe, in combination with initial statin therapy, is also recommended as an option for the treatment of primary (heterozygous-familial or non-familial) hypercholesterolaemia in adult patients when:

- serum total or low-density lipoprotein (LDL) cholesterol concentration is not appropriately controlled either after appropriate dose titration of initial statin therapy or because dose titration is limited by intolerance to the initial statin therapy **and**
- a change from initial statin therapy to an alternative statin is being considered.

When prescribing ezetimibe in combination with statin, ezetimibe should be prescribed on the basis of lowest acquisition cost.

LIPID MODIFYING DRUGS > FIBRATES

Bezafibrate

- **DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

● INDICATIONS AND DOSE

Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: 200 mg 3 times a day

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

Adult: 400 mg once daily, modified-release dose form is not appropriate in patients with renal impairment

- **CONTRA-INDICATIONS** Gall bladder disease · hypoalbuminaemia · nephrotic syndrome · photosensitivity to fibrates

- **CAUTIONS** Correct hypothyroidism before initiating treatment

- **INTERACTIONS** → Appendix 1: fibrates

● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · gastrointestinal disorder
- ▶ **Uncommon** Acute kidney injury · alopecia · cholestasis · constipation · diarrhoea · dizziness · erectile dysfunction · gastrointestinal discomfort · headache · muscle complaints · muscle weakness · nausea · photosensitivity reaction · skin reactions
- ▶ **Rare or very rare** Cholelithiasis · depression · insomnia · interstitial lung disease · pancreatitis · pancytopenia · paraesthesia · peripheral neuropathy · rhabdomyolysis (increased risk in renal impairment) · severe cutaneous adverse reactions (SCARs) · thrombocytopenic purpura

- **PREGNANCY** Manufacturers advise avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease.

- **RENAL IMPAIRMENT** Avoid immediate-release preparations if eGFR less than 15 mL/minute/1.73 m².

Avoid modified-release preparations if eGFR less than 60 mL/minute/1.73 m².

Dose adjustments Reduce dose to 400 mg daily if eGFR 40–60 mL/minute/1.73 m².

Reduce dose to 200 mg every 1–2 days if eGFR 15–40 mL/minute/1.73 m².

Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

- **MONITORING REQUIREMENTS** Consider monitoring of liver function and creatine kinase when fibrates used in combination with a statin.

- **PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

Ciprofibrate

- **DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

● INDICATIONS AND DOSE

Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia

▶ BY MOUTH

Adult: 100 mg daily

- **CONTRA-INDICATIONS** Gall bladder disease · hypoalbuminaemia · nephrotic syndrome · photosensitivity to fibrates

- **CAUTIONS** Correct hypothyroidism before initiating treatment

- **INTERACTIONS** → Appendix 1: fibrates

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · diarrhoea · dizziness · drowsiness · fatigue · gastrointestinal discomfort · headache · myalgia · nausea · skin reactions · vertigo · vomiting

- ▶ **Frequency not known** Cholelithiasis · erectile dysfunction · hepatic disorders · leucopenia · myopathy · photosensitivity reaction · respiratory disorders · rhabdomyolysis (increased risk in renal impairment) · thrombocytopenia

- **PREGNANCY** Manufacturers advise avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Avoid in severe impairment.

Dose adjustments Reduce dose to 100 mg on alternate days in moderate impairment.

Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

● MONITORING REQUIREMENTS

- ▶ Liver function tests recommended every 3 months for first year (discontinue treatment if significantly raised).
- ▶ Consider monitoring liver function and creatine kinase when fibrates used in combination with a statin.
- **PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ Ciprofibrate (Non-proprietary)

Ciprofibrate 100 mg Ciprofibrate 100mg tablets | 28 tablet [PoM]
£134.21 DT = £112.06

Fenofibrate

14-Jun-2017

- **DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

● INDICATIONS AND DOSE

Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia | Adjunct to statin in mixed hyperlipidaemia if triglycerides and HDL-cholesterol inadequately controlled in patients at high cardiovascular risk

▶ BY MOUTH USING CAPSULES

- ▶ Adult: Initially 200 mg daily, then increased if necessary to 267 mg daily, maximum 200 mg daily with concomitant statin, 267 mg capsules not appropriate for initial dose titration

▶ BY MOUTH USING TABLETS

- ▶ Adult: 160 mg daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises max. dose 200 mg daily with concurrent use of a statin.

- **CONTRA-INDICATIONS** Gall bladder disease · pancreatitis (unless due to severe hypertriglyceridaemia) · photosensitivity to ketoprofen

- **CAUTIONS** Correct hypothyroidism before initiating treatment

- **INTERACTIONS** → Appendix 1: fibrates

● SIDE-EFFECTS

- ▶ Common or very common Abdominal pain · diarrhoea · flatulence · nausea · vomiting
- ▶ Uncommon Cholelithiasis · embolism and thrombosis · headache · muscle complaints · myopathy · pancreatitis · sexual dysfunction · skin reactions
- ▶ Rare or very rare Alopecia · hepatic disorders · photosensitivity reaction
- ▶ Frequency not known Fatigue · interstitial lung disease · rhabdomyolysis (increased risk in renal impairment) · severe cutaneous adverse reactions (SCARs)

- **PREGNANCY** Avoid—embryotoxicity in animal studies.

- **BREAST FEEDING** Manufacturers advise avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid.

- **RENAL IMPAIRMENT** Manufacturer advises use with caution in mild-to-moderate impairment; avoid if eGFR less than 30 mL/minute/1.73 m².
Dose adjustments Manufacturer advises max. 67 mg daily if eGFR 30–59 mL/minute/1.73 m².
Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may

result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor hepatic transaminases every 3 months during the first 12 months of treatment and periodically thereafter—discontinue treatment if levels increase to more than 3 times the upper limit of normal; monitor serum creatinine levels during the first 3 months of treatment and periodically thereafter—interrupt treatment if creatinine level is 50% above the upper limit of normal.
- **PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

Combinations available: *Simvastatin with fenofibrate*, p. 204

Gemfibrozil

- **DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

● INDICATIONS AND DOSE

Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in primary hypercholesterolaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia | Adjunct to diet and other appropriate measures in primary prevention of cardiovascular disease in men with hyperlipidaemias if statin contra-indicated or not tolerated

▶ BY MOUTH

- ▶ Adult: 1.2 g daily in 2 divided doses, maintenance 0.9–1.2 g daily

- **CONTRA-INDICATIONS** History of gall-bladder or biliary tract disease including gallstones · photosensitivity to fibrates

- **CAUTIONS** Correct hypothyroidism before initiating treatment · elderly

- **INTERACTIONS** → Appendix 1: fibrates

• SIDE-EFFECTS

- ▶ **Common or very common** Constipation · diarrhoea · fatigue · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · vertigo · vomiting
- ▶ **Uncommon** Atrial fibrillation
- ▶ **Rare or very rare** Alopecia · anaemia · angioedema · appendicitis · bone marrow failure · depression · dizziness · drowsiness · eosinophilia · gallbladder disorders · hepatic disorders · joint disorders · laryngeal oedema · leucopenia · muscle weakness · myopathy · pain in extremity · pancreatitis · paraesthesia · peripheral neuropathy · photosensitivity reaction · sexual dysfunction · thrombocytopenia · vision blurred

• **PREGNANCY** Manufacturers advise avoid unless essential— toxicity in *animal* studies.

• **BREAST FEEDING** Manufacturer advises avoid—no information available.

• **HEPATIC IMPAIRMENT** Avoid.

• **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments Initially 900 mg daily if eGFR 30–80 mL/minute/1.73 m².

Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

• MONITORING REQUIREMENTS

- ▶ Monitor blood counts for first year.
- ▶ Monitor liver-function (discontinue treatment if abnormalities persist).
- ▶ Consider monitoring creatine kinase if used in combination with a statin.

• **PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

LIPID MODIFYING DRUGS > NICOTINIC ACID DERIVATIVES

Acipimox

• INDICATIONS AND DOSE

Adjunct or alternative treatment in hyperlipidaemias of types IIb and IV in patients who have not responded adequately to other lipid-regulating drugs such as a statin or fibrate, and lifestyle changes (including diet, exercise, and weight reduction)

▶ BY MOUTH

▶ Adult: 250 mg 2–3 times a day

• **CONTRA-INDICATIONS** Peptic ulcer

• SIDE-EFFECTS

- ▶ **Common or very common** Asthenia · gastrointestinal discomfort · headache · skin reactions · vasodilation
- ▶ **Uncommon** Angioedema · arthralgia · feeling hot · malaise · myalgia · myositis · nausea
- ▶ **Frequency not known** Bronchospasm · diarrhoea · dry eye · eye disorder

• **PREGNANCY** Manufacturer advises avoid—no information available.

• **BREAST FEEDING** Manufacturer advises avoid—no information available.

• **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments Reduce dose to 250 mg 1–2 times daily if eGFR 30–60 mL/minute/1.73 m².

• **MONITORING REQUIREMENTS** Monitor hepatic and renal function.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 21

▶ Olbetam (Pfizer Ltd)

Acipimox 250 mg Olbetam 250mg capsules | 90 capsule [PoM] £46.33 DT = £46.33

Nicotinic acid

- **DRUG ACTION** In doses of 1.5 to 3 g daily, it lowers both cholesterol and triglyceride concentrations by inhibiting synthesis; it also increases HDL-cholesterol.

• INDICATIONS AND DOSE

Adjunct to statin in dyslipidaemia or used alone if statin not tolerated

▶ BY MOUTH

▶ Adult: (consult product literature)

• **CONTRA-INDICATIONS** Active peptic ulcer disease · arterial bleeding

• **CAUTIONS** Acute myocardial infarction · diabetes mellitus · gout · history of peptic ulceration · unstable angina

• **INTERACTIONS** → Appendix 1: nicotinic acid

• SIDE-EFFECTS

• **Common or very common** Diarrhoea · flushing · gastrointestinal discomfort · nausea · skin reactions · vomiting

• **Uncommon** Dizziness · dyspnoea · headache · hypophosphataemia · palpitations · peripheral oedema · tachycardia

• **Rare or very rare** Appetite decreased · hypotension · insomnia · myalgia · myopathy · rhinitis · syncope · visual impairment

• **Frequency not known** Jaundice

SIDE-EFFECTS, FURTHER INFORMATION Prostaglandin-mediated flushing is common, typically within an hour of dosing and lasting for 15–30 minutes (particularly with the initial doses). Taking after a meal or taking aspirin before dosing minimises flushing.

• **PREGNANCY** No information available—manufacturer advises avoid unless potential benefit outweighs risk.

• **BREAST FEEDING** Present in milk—avoid.

• **HEPATIC IMPAIRMENT** Avoid in severe impairment.

Discontinue if severe abnormalities in liver function tests. **Monitoring** Manufacturer advises monitor liver function in mild to moderate hepatic impairment.

• **RENAL IMPAIRMENT** Manufacturer advises use with caution—no information available.

MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, modified-release tablet, capsule

Capsule

► Nicotinic acid (Non-proprietary)

Nicotinic acid 500 mg Solgar Niacin 500mg capsules | 100 capsule 

LIPID MODIFYING DRUGS > STATINS

Statins

• **DRUG ACTION** Statins competitively inhibit 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase, an enzyme involved in cholesterol synthesis, especially in the liver.

• **CAUTIONS** Elderly · high alcohol intake · history of liver disease · hypothyroidism · patients at increased risk of muscle toxicity, including myopathy or rhabdomyolysis (e.g. those with a personal or family history of muscular disorders, previous history of muscular toxicity and a high alcohol intake)

CAUTIONS, FURTHER INFORMATION

► **Muscle effects** Muscle toxicity can occur with all statins, however the likelihood increases with higher doses and in certain patients (see below). Statins should be used with caution in patients at increased risk of muscle toxicity, including those with a personal or family history of muscular disorders, previous history of muscular toxicity, a high alcohol intake, renal impairment or hypothyroidism.

In patients at increased risk of muscle effects, a statin should not usually be started if the baseline creatine kinase concentration is more than 5 times the upper limit of normal (some patients may present with an extremely elevated baseline creatine kinase concentration, for example because of a physical occupation or rigorous exercise—specialist advice should be sought regarding consideration of statin therapy in these patients).

► **Hypothyroidism** Hypothyroidism should be managed adequately before starting treatment with a statin.

• SIDE-EFFECTS

► **Common or very common** Asthenia · constipation · diarrhoea · dizziness · flatulence · gastrointestinal discomfort · headache · myalgia · nausea · sleep disorders · thrombocytopenia

► **Uncommon** Alopecia · hepatic disorders · memory loss · pancreatitis · paraesthesia · sexual dysfunction · skin reactions · vomiting

► **Rare or very rare** Myopathy · peripheral neuropathy · tendinopathy

► **Frequency not known** Depression · diabetes mellitus (in those at risk) · interstitial lung disease

SIDE-EFFECTS, FURTHER INFORMATION

Muscle effects The risk of myopathy, myositis, and rhabdomyolysis associated with statin use is rare.

Although myalgia has been reported commonly in patients receiving statins, muscle toxicity truly attributable to statin use is rare. When a statin is suspected to be the cause of myopathy, and creatine kinase concentration is markedly elevated or if muscular symptoms are severe, treatment should be discontinued. If symptoms resolve and creatine kinase concentrations return to normal, the statin should be reintroduced at a lower dose and the patient monitored closely. Statins should not be discontinued if there is an increase in the blood-glucose concentration as the benefits continue to outweigh the risks

Interstitial lung disease If patients develop symptoms such as dyspnoea, cough, and weight loss, they should seek medical attention.

• **CONCEPTION AND CONTRACEPTION** Adequate contraception is required during treatment and for 1 month afterwards.

• **PREGNANCY** Statins should be avoided in pregnancy (discontinue 3 months before attempting to conceive) as congenital anomalies have been reported and the decreased synthesis of cholesterol possibly affects fetal development.

• **HEPATIC IMPAIRMENT** Statins should be used with caution in those with a history of liver disease. Avoid in active liver disease or when there are unexplained persistent elevations in serum transaminases.

• MONITORING REQUIREMENTS

► **Before starting treatment with statins**, at least one full lipid profile (non-fasting) should be measured, including total cholesterol, HDL-cholesterol, non-HDL-cholesterol (calculated as total cholesterol minus HDL-cholesterol), and triglyceride concentrations, thyroid-stimulating hormone, and renal function should also be assessed.

► **Liver function** There is little information available on a rational approach to liver-function monitoring; however, NICE suggests that liver enzymes should be measured before treatment, and repeated within 3 months and at 12 months of starting treatment, unless indicated at other times by signs or symptoms suggestive of hepatotoxicity (NICE clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease).

Those with serum transaminases that are raised, but less than 3 times the upper limit of the reference range, should **not** be routinely excluded from statin therapy. Those with serum transaminases of more than 3 times the upper limit of the reference range should discontinue statin therapy.

► **Creatine kinase** Before initiation of statin treatment, creatine kinase concentration should be measured in patients who have had persistent, generalised, unexplained muscle pain (whether associated or not with previous lipid-regulating drugs); if the concentration is more than 5 times the upper limit of normal, a repeat measurement should be taken after 7 days. If the repeat concentration remains above 5 times the upper limit, statin treatment should not be started; if concentrations are still raised but less than 5 times the upper limit, the statin should be started at a lower dose.

► **Diabetes** Patients at high risk of diabetes mellitus should have fasting blood-glucose concentration or HbA_{1c} checked before starting statin treatment, and then repeated after 3 months.

• **PATIENT AND CARER ADVICE** Advise patients to report promptly unexplained muscle pain, tenderness, or weakness.

 **above**

Atorvastatin

07-Jun-2017

• INDICATIONS AND DOSE

Primary hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures | Combined (mixed) hyperlipidaemia in patients who have not responded adequately to diet and other appropriate measures

► BY MOUTH

► **Adult:** Usual dose 10 mg once daily; increased if necessary up to 80 mg once daily, dose to be increased at intervals of at least 4 weeks

Heterozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures | Homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures

► BY MOUTH

- Adult: Initially 10 mg once daily, then increased to 40 mg once daily, dose to be increased at intervals of at least 4 weeks; maximum 80 mg per day

Primary prevention of cardiovascular events in patients at high risk of a first cardiovascular event

► BY MOUTH

- Adult: 20 mg once daily, dose can be increased if necessary

Secondary prevention of cardiovascular events

► BY MOUTH

- Adult: 80 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises if concurrent use of ciclosporin is unavoidable, max. dose cannot exceed 10 mg daily.
- Manufacturer advises max. dose 40 mg daily when combined with anion-exchange resin for heterozygous familial hypercholesterolaemia.
- Manufacturer advises max. dose 20 mg daily with concurrent use of elbasvir with grazoprevir.

- **UNLICENSED USE** [EvGr] Not licensed for secondary prevention of cardiovascular events. Starting dose of 20 mg once daily is not licensed for the primary prevention of cardiovascular events. 

- **CAUTIONS** Haemorrhagic stroke

- **INTERACTIONS** → Appendix 1: statins

● **SIDE-EFFECTS**

- **Common or very common** Epistaxis · hyperglycaemia · hypersensitivity · joint disorders · laryngeal pain · pain
- **Uncommon** Appetite decreased · burping · chest pain · fatigue · fever · hearing impairment · hypoglycaemia · malaise · numbness · peripheral oedema · taste altered · vision disorders · weight increased
- **Rare or very rare** Angioedema · gynaecomastia · severe cutaneous adverse reactions (SCARs)

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **RENAL IMPAIRMENT**

Dose adjustments In chronic kidney disease, for primary and secondary prevention of cardiovascular events [unlicensed starting dose in *primary* prevention; unlicensed in *secondary* prevention], initially 20 mg once daily, increased if necessary (on specialist advice if eGFR < 30 mL/minute/1.73 m²); max. 80 mg once daily.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for atorvastatin tablets (muscle effects).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

● **INDICATIONS AND DOSE**

Adjunct to diet in primary hypercholesterolaemia or combined (mixed) hyperlipidaemia (types IIa and IIb)

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 20–40 mg daily, dose to be taken in the evening, increased if necessary up to 80 mg daily in 2 divided doses, dose to be adjusted at intervals of at least 4 weeks

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 80 mg daily, dose form is not appropriate for initial dose titration

Prevention of coronary events after percutaneous coronary intervention

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: 80 mg daily

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 80 mg daily, dose form is not appropriate for initial dose titration

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Max. dose 20 mg daily with concomitant elbasvir with grazoprevir.

- **INTERACTIONS** → Appendix 1: statins

● **SIDE-EFFECTS**

- **Rare or very rare** Angioedema · face oedema · lupus-like syndrome · sensation abnormal · vasculitis

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **RENAL IMPAIRMENT**

Dose adjustments Manufacturer advises doses above 40 mg daily should be initiated with caution if eGFR less than 30 mL/minute/1.73 m².

- **PATIENT AND CARER ADVICE** Patient counselling is advised for fluvastatin tablets/capsules (muscle effects).

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2004) that fluvastatin is accepted for restricted use for the secondary prevention of coronary events after percutaneous coronary angioplasty; if the patient has previously been receiving another statin, then there is no need to change the statin.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

04-Jun-2017

INDICATIONS AND DOSE

Adjunct to diet for primary hypercholesterolaemia or combined (mixed) hyperlipidaemias in patients who have not responded adequately to dietary control

BY MOUTH

- Adult: 10–40 mg daily, dose to be taken at night, dose to be adjusted at intervals of at least 4 weeks

Prevention of cardiovascular events in patients with previous myocardial infarction or unstable angina |

Adjunct to diet to prevent cardiovascular events in patients with hypercholesterolaemia

BY MOUTH

- Adult: 40 mg daily, dose to be taken at night

Reduction of hyperlipidaemia in patients receiving immunosuppressive therapy following solid-organ transplantation

BY MOUTH

- Adult: Initially 20 mg daily, then increased if necessary up to 40 mg daily, dose to be taken at night, close medical supervision is required if dose is increased to maximum dose

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose by half with concurrent use of ombitasvir with paritaprevir and ritonavir.
- Manufacturer advises max. 20 mg daily with concurrent use of glecaprevir with pibrentasvir.
- Manufacturer advises max. 40 mg daily with concurrent use of sofosbuvir with velpatasvir and voxaleprevir.

INTERACTIONS → Appendix 1: statins

SIDE-EFFECTS

- Uncommon** Fatigue · hair abnormal · scalp abnormal · urinary disorders · vision disorders
- Rare or very rare** Fulminant hepatic necrosis · polymyositis
- BREAST FEEDING** Manufacturer advises avoid—small amount of drug present in breast milk.

RENAL IMPAIRMENT

Dose adjustments Manufacturer advises initial dose of 10 mg once daily in moderate to severe impairment.

- PATIENT AND CARER ADVICE** Patient counselling is advised for pravastatin tablets (muscle effects).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

Pravastatin sodium (Non-proprietary)

Pravastatin sodium 10 mg Pravastatin 10mg tablets | 28 tablet [PoM] £16.10 DT = £0.55

Pravastatin sodium 20 mg Pravastatin 20mg tablets | 28 tablet [PoM] £29.60 DT = £0.87

Pravastatin sodium 40 mg Pravastatin 40mg tablets | 28 tablet [PoM] £29.60 DT = £1.10

Rosuvastatin

05-Feb-2018

INDICATIONS AND DOSE

Primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures

BY MOUTH

- Adult 18–69 years: Initially 5–10 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks
- Adult (patients of Asian origin): Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks.
- Adult 70 years and over: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks

Primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures and who have risk factors for myopathy or rhabdomyolysis

BY MOUTH

- Adult: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks

Severe primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients with high cardiovascular risk who have not responded adequately to diet and other appropriate measures (specialist use only)

BY MOUTH

- Adult 18–69 years: Initially 5–10 mg once daily, then increased if necessary up to 40 mg once daily, dose to be increased gradually at intervals of at least 4 weeks
- Adult (patients of Asian origin): Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks.
- Adult 70 years and over: Initially 5 mg once daily, then increased if necessary up to 40 mg once daily, dose to be increased gradually at intervals of at least 4 weeks

Severe primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients with high cardiovascular risk who have not responded adequately to diet and other appropriate measures, and who have risk factors for myopathy or rhabdomyolysis (specialist use only)

► BY MOUTH

- Adult: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks

Prevention of cardiovascular events in patients at high risk of a first cardiovascular event

► BY MOUTH

- Adult 18–69 years: 20 mg once daily
- Adult (patients of Asian origin): Initially 5 mg once daily, then increased if tolerated to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks.
- Adult 70 years and over: Initially 5 mg once daily, then increased if tolerated to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks

Prevention of cardiovascular events in patients at high risk of a first cardiovascular event and with risk factors for myopathy or rhabdomyolysis

► BY MOUTH

- Adult: Initially 5 mg once daily, then increased if tolerated to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises initially 5 mg daily with concurrent use of bezafibrate, ciprofibrate, and fenofibrate—40 mg dose is contra-indicated.
- Manufacturer advises initially 5 mg daily with concurrent use of clopidogrel—max. dose 20 mg daily.
- Manufacturer advises initially 5 mg daily with concurrent use of simvastatin—max. dose 10 mg daily.
- Manufacturer advises max. dose 5 mg daily with concurrent ombitasvir, paritaprevir, and ritonavir given with dasabuvir, but max. 10 mg daily with concurrent ombitasvir, paritaprevir, and ritonavir given without dasabuvir.
- Manufacturer advises max. dose 10 mg daily with concurrent use of sofosbuvir with velpatasvir, or elbasvir with grazoprevir.
- Manufacturer advises reduce dose by half with concurrent use of teriflunomide.
- Manufacturer advises max. 5 mg daily with concurrent use of glecaprevir with pibrentasvir.

- **CAUTIONS** Known genetic polymorphisms—consult product literature · patients of Asian origin

- **INTERACTIONS** → Appendix 1: statins

● **SIDE-EFFECTS**

- **Rare or very rare** Arthralgia · gynaecomastia · haematuria · polyneuropathy
- **Frequency not known** Cough · dyspnoea · oedema · proteinuria · Stevens-Johnson syndrome · tendon disorders

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments Initially 5 mg once daily (do not exceed 20 mg daily) if eGFR 30–60 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Manufacturer advises consider routine monitoring of renal function when using 40 mg daily dose.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for rosuvastatin tablets (muscle effects).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

■ 200

Simvastatin

● **INDICATIONS AND DOSE**

Primary hypercholesterolaemia, or combined (mixed) hyperlipidaemia in patients who have not responded adequately to diet and other appropriate measures

► BY MOUTH

- Adult: 10–20 mg once daily, then increased if necessary up to 80 mg once daily, adjusted at intervals of at least 4 weeks, dose to be taken at night; 80 mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications

Homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures

► BY MOUTH

- Adult: Initially 40 mg once daily, then increased if necessary up to 80 mg once daily, adjusted at intervals of at least 4 weeks, dose to be taken at night; 80 mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications

Prevention of cardiovascular events in patients with atherosclerotic cardiovascular disease or diabetes mellitus

► BY MOUTH

- Adult: Initially 20–40 mg once daily, increased if necessary up to 80 mg once daily, adjusted at intervals of at least 4 weeks, dose to be taken at night; 80 mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises max. 10 mg daily with concurrent use of bezafibrate or ciprofibrate.
- Manufacturer advises max. 20 mg daily with concurrent use of amiodarone, amlodipine, or ranolazine.
- Manufacturer advises reduce dose with concurrent use of some moderate inhibitors of CYP3A4 (max. 20 mg daily with verapamil and diltiazem).
- Manufacturer advises max. 40 mg daily with concurrent use of lomitapide or ticagrelor.
- Manufacturer advises max. 20 mg daily with concurrent use of elbasvir with grazoprevir.

- **INTERACTIONS** → Appendix 1: statins

● **SIDE-EFFECTS**

- **Rare or very rare** Acute kidney injury · anaemia · muscle cramps
- **Frequency not known** Cognitive impairment

- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Doses above 10 mg daily should be used with caution if eGFR less than 30 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE** Patient counselling is advised for simvastatin tablets/oral suspension (muscle effects).
- **EXCEPTIONS TO LEGAL CATEGORY** Simvastatin 10 mg tablets can be sold to the public to reduce risk of first coronary event in individuals at moderate risk of coronary heart disease (approx. 10–15 % risk of major event in 10 years), max. daily dose 10 mg and pack size of 28 tablets; treatment should form part of a programme to reduce risk of coronary heart disease.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

EXCIPIENTS: May contain Propylene glycol

► Simvastatin (Non-proprietary)

Simvastatin 4 mg per 1 ml Simvastatin 20mg/5ml oral suspension sugar free sugar-free | 150 ml [PoM] £126.87 DT = £126.87

Simvastatin 8 mg per 1 ml Simvastatin 40mg/5ml oral suspension sugar free sugar-free | 150 ml [PoM] £193.80 DT = £193.80

Simvastatin 20 mg, Fenofibrate 145 mg Cholib 145mg/20mg tablets | 30 tablet [PoM] £7.71 DT = £7.71

Simvastatin 40 mg, Fenofibrate 145 mg Cholib 145mg/40mg tablets | 30 tablet [PoM] £8.33 DT = £8.33

LIPID MODIFYING DRUGS > OTHER

Alirocumab

24-Oct-2016

- **DRUG ACTION** Alirocumab binds to a pro-protein involved in the regulation of LDL receptors on liver cells; receptor numbers are increased, which results in increased uptake of LDL-cholesterol from the blood.

• INDICATIONS AND DOSE

Primary hypercholesterolaemia or mixed dyslipidaemia in patients who have not responded adequately to other appropriate measures (in combination with a statin, or with a statin and other lipid-lowering therapies, or with other lipid-lowering therapies or alone if a statin contraindicated or not tolerated)

► BY SUBCUTANEOUS INJECTION

► Adult: 75–150 mg every 2 weeks, adjusted according to response, to be administered into the thigh, abdomen or upper arm, dose adjustments should be made at 4-weekly intervals

• SIDE-EFFECTS

- **Common or very common** Nasal complaints · oropharyngeal pain · pulmonary reaction · skin reactions
- **Rare or very rare** Hypersensitivity vasculitis

- **PREGNANCY** Manufacturer advises avoid unless clinical condition requires treatment—maternal toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution in severe impairment—no information available.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage outside refrigerator.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Alirocumab for treating primary hypercholesterolaemia and mixed dyslipidaemia (June 2016) NICE TA393**

Alirocumab is recommended as an option for treating primary hypercholesterolaemia or mixed dyslipidaemia, only if:

- low-density lipoprotein cholesterol (LDL-C) concentrations are persistently above the thresholds specified in the NICE documentation **and**
- the manufacturer provides alicumab with the discount agreed in the patient access scheme.

Patients whose treatment was started before this guidance was published should continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA393

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (Aug 2016) that alicumab (*Praluent*®) is accepted for restricted use within NHS Scotland for treatment of primary hypercholesterolaemia or mixed dyslipidaemia (alone or in combination with other lipid lowering therapies, as specified within its license), for specialist use only and only in patients at high cardiovascular risk as follows:

- patients with heterozygous familial hypercholesterolaemia (HeFH) and LDL-C ≥ 5.0 mmol/L, for primary prevention of cardiovascular events, or
- patients with HeFH and LDL-C ≥ 3.5 mmol/L, for secondary prevention of cardiovascular events, or
- patients at high risk due to previous cardiovascular events and LDL-C ≥ 4.0 mmol/L, or
- patients with recurrent/polyvascular disease and LDL-C ≥ 3.5 mmol/L

This advice is contingent upon the continuing availability of the Patient Access Scheme (PAS) in NHS Scotland or a list price that is equivalent or lower.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Polysorbates

- ▶ **Praluent** (Sanofi) ▼

Alirocumab 75 mg per 1 ml Praluent 75mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £168.00 | 2 pre-filled disposable injection [PoM] £336.00

Alirocumab 150 mg per 1 ml Praluent 150mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £168.00 | 2 pre-filled disposable injection [PoM] £336.00

Evolocumab

24-Apr-2017

- **DRUG ACTION** Evolocumab binds to a pro-protein involved in the regulation of LDL receptors on liver cells; receptor numbers are increased, which results in increased uptake of LDL-cholesterol from the blood.

INDICATIONS AND DOSE

Primary hypercholesterolaemia or mixed dyslipidaemia in patients who have not responded adequately to other appropriate measures (in combination with a statin, or with a statin and other lipid-lowering therapies, or with other lipid-lowering therapies or alone if a statin contra-indicated or not tolerated)

- ▶ BY SUBCUTANEOUS INJECTION

Adult: 140 mg every 2 weeks, alternatively 420 mg every month, to be administered into the thigh, abdomen or upper arm

Homozygous familial hypercholesterolaemia (in combination with other lipid-lowering therapies)

- ▶ BY SUBCUTANEOUS INJECTION

Adult: Initially 420 mg every month; increased if necessary to 420 mg every 2 weeks, if inadequate response after 12 weeks of treatment, to be administered into the thigh, abdomen or upper arm

Homozygous familial hypercholesterolaemia in patients on apheresis (in combination with other lipid-lowering therapies)

- ▶ BY SUBCUTANEOUS INJECTION

Adult: 420 mg every 2 weeks, to correspond with apheresis schedule, to be administered into the thigh, abdomen or upper arm

SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · back pain · increased risk of infection · nausea · skin reactions

- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises monitor in moderate impairment—possible reduced efficacy; use with caution in severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m²—no information available.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage outside refrigerator.

- **PATIENT AND CARER ADVICE** Patients and their carers should be given training in subcutaneous injection technique.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Evolocumab for treating primary hypercholesterolaemia and mixed dyslipidaemia (June 2016) NICE TA394**

Evolocumab is recommended as an option for treating primary hypercholesterolaemia or mixed dyslipidaemia, only if:

- it is given at a dose of 140 mg every 2 weeks; **and**
- low-density lipoprotein cholesterol (LDL-C) concentrations are persistently above the thresholds specified in the NICE documentation; **and**
- the manufacturer provides evolocumab with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA394

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2017) that evolocumab (*Repatha*®) is accepted for restricted use within NHS Scotland for the treatment of primary hypercholesterolaemia (heterozygous familial hypercholesterolaemia and non-familial) or mixed dyslipidaemia (alone or in combination with other lipid lowering therapies, as specified within its license), for specialist use only when administered at a dose of 140 mg every 2 weeks and only in patients at high cardiovascular risk as follows:

- patients with heterozygous familial hypercholesterolaemia (HeFH) and LDL-C 5 mmol/L or greater for primary prevention of cardiovascular events, or
- patients with HeFH and LDL-C 3.5 mmol/L or greater for secondary prevention of cardiovascular event, or
- patients with high risk due to previous cardiovascular events and LDL-C 4 mmol/L or greater, or
- patients with recurrent/polyvascular disease and LDL-C 3.5 mmol/L or greater

This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Repatha** (Amgen Ltd) ▼
Evolocumab 140 mg per 1 ml Repatha 140mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £170.10
- ▶ **Repatha SureClick** (Amgen Ltd) ▼
Evolocumab 140 mg per 1 ml Repatha SureClick 140mg/1ml solution for injection pre-filled disposable devices | 2 pre-filled disposable injection [PoM] £340.20

Lomitapide

- **DRUG ACTION** Lomitapide, an inhibitor of microsomal triglyceride transfer protein (MTP), reduces lipoprotein secretion and circulating concentrations of lipoprotein-borne lipids such as cholesterol and triglycerides.

INDICATIONS AND DOSE

Adjunct to dietary measures and other lipid-regulating drugs with or without low-density lipoprotein apheresis in homozygous familial hypercholesterolaemia (under expert supervision)

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 5 mg daily for 2 weeks, dose to be taken at least 2 hours after evening meal, then increased if necessary to 10 mg daily, for at least 4 weeks, then increased to 20 mg daily for at least 4 weeks, then increased in steps of 20 mg daily, adjusted at intervals of at least 4 weeks; maximum 60 mg per day

- **CONTRA-INDICATIONS** Significant or chronic bowel disease
- **CAUTIONS** Concomitant use of hepatotoxic drugs • lomitapide can interfere with the absorption of fat-soluble nutrients and supplementation of vitamin E and fatty acids is required • patients over 65 years
- **INTERACTIONS** → Appendix 1: lomitapide
- **SIDE-EFFECTS**
- ▶ **Common or very common** Aerophagia • appetite abnormal • asthenia • burping • constipation • diarrhoea • dizziness • gastrointestinal discomfort • gastrointestinal disorders • haemorrhage • headaches • hepatic disorders • increased risk of infection • muscle complaints • nausea • skin reactions • vomiting • weight decreased
- ▶ **Uncommon** Anaemia • chest pain • chills • dehydration • drowsiness • dry mouth • eye swelling • fever • gait abnormal

• hyperhidrosis • joint disorders • malaise • pain in extremity • paraesthesia • throat lesion • upper-airway cough syndrome • vertigo

- ▶ **Frequency not known** Alopecia

SIDE-EFFECTS, FURTHER INFORMATION Reduce dose if serum transaminases raised during treatment (consult product literature).

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before treatment and ensure effective contraception used.
- **PREGNANCY** Avoid—teratogenicity and embryotoxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid in moderate to severe impairment, or if unexplained persistent abnormal liver function tests.
Dose adjustments Reduce dose if serum transaminases raised during treatment (consult product literature).
Max. 40 mg daily in mild impairment.
- **RENAL IMPAIRMENT**
Dose adjustments Max. 40 mg daily in end-stage renal disease.

MONITORING REQUIREMENTS

- ▶ Monitor liver function tests before treatment, then at least monthly and before each dose increase for first year, then at least every 3 months and before each dose increase thereafter.
- ▶ Screen for hepatic steatosis and fibrosis before treatment, then annually thereafter.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

Omega-3-acid ethyl esters**INDICATIONS AND DOSE**

Adjunct to diet and statin in type IIb or III hypertriglyceridaemia | Adjunct to diet in type IV hypertriglyceridaemia

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 2 capsules daily, dose to be taken with food, increased if necessary to 4 capsules daily

Adjunct in secondary prevention in those who have had a myocardial infarction in the preceding 3 months

- ▶ **BY MOUTH**
- ▶ **Adult:** 1 capsule daily, dose to be taken with food

- **CAUTIONS** Anticoagulant treatment (bleeding time increased) • haemorrhagic disorders
- **INTERACTIONS** → Appendix 1: omega-3-acid ethyl esters
- **SIDE-EFFECTS**
- ▶ **Common or very common** Burping • constipation • diarrhoea • gastrointestinal discomfort • gastrointestinal disorders • nausea • vomiting
- ▶ **Uncommon** Dizziness • gout • haemorrhage • headache • hyperglycaemia • hypotension • skin reactions • taste altered
- ▶ **Rare or very rare** Liver disorder
- **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **HEPATIC IMPAIRMENT**
Monitoring Monitor liver function in hepatic impairment.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
The *Scottish Medicines Consortium* has advised (November 2002) that omega-3-acid ethyl esters are **not** recommended for use within NHS Scotland for the treatment of hypertriglyceridaemia.

7 Myocardial ischaemia

Stable angina

Overview

It is important to distinguish stable angina from unstable angina. *Stable angina* usually results from atherosclerotic plaques in the coronary arteries that restrict blood flow and oxygen supply to the heart; it is often precipitated by exertion and relieved by rest. Treatment involves management of acute anginal pain, and long term management to prevent angina attacks and to reduce the risk of cardiovascular events.

Management

Acute attacks of stable angina should be managed with sublingual glyceryl trinitrate p. 217 which can be taken immediately before performing activities that are known to bring on an attack. If attacks occur more than twice a week, regular drug therapy is required and should be introduced in a step-wise manner according to response.

Patients with stable angina should be given a **beta-blocker** or a **calcium-channel blocker**. In those with left-ventricular dysfunction, beta-blocker treatment should be started at a very low dose and titrated very slowly over a period of weeks or months. If a beta-blocker or a calcium-channel blocker alone fails to control symptoms adequately,

a combination of a beta-blocker and a dihydropyridine calcium-channel blocker (e.g. amlodipine p. 155, felodipine p. 159, modified-release nifedipine p. 162) should be used; if this combination is not appropriate due to intolerance of, or contra-indication to, *either* beta-blockers *or* calcium-channel blockers, addition of a long-acting **nitrate**, ivabradine p. 210, nicorandil p. 211, or ranolazine p. 210 can be considered.

For those patients in whom both beta-blockers and calcium-channel blockers are not tolerated or are contra-indicated, monotherapy with a long-acting nitrate, ivabradine, nicorandil, or ranolazine should be considered.

Response to treatment should be assessed every 2–4 weeks after initiating or changing drug therapy; the drug should be titrated (according to symptom control) to the maximum tolerated dose. Consider referring the patient to a specialist if a combination of two drugs fails to control symptoms. Addition of a third antianginal drug should only be considered if symptom control is not achieved with two drugs and the patient is either due to undergo a revascularisation procedure, or a revascularisation procedure is considered inappropriate. See the use of antiplatelet drugs in patients undergoing coronary stenting.

For long-term prevention of cardiovascular events, see Prevention of cardiovascular events.

Antianginal drugs

Nitrates, calcium-channel blockers, and potassium channel activators (use in adults only) have a vasodilating and, consequently, blood pressure lowering effect. Vasodilators can act in heart failure by arteriolar dilatation which reduces both peripheral vascular resistance and left ventricular pressure during systole resulting in improved cardiac output. They can also cause venous dilatation which results in dilatation of capacitance vessels, increase of venous pooling, and diminution of venous return to the heart (decreasing left ventricular end-diastolic pressure).

Nicorandil, a potassium-channel activator with a nitrate component, has both arterial and venous vasodilating properties and is licensed for the prevention and long-term treatment of angina. Nicorandil has similar efficacy to other antianginal drugs in controlling symptoms; it may produce additional symptomatic benefit in combination with other antianginal drugs [unlicensed indication].

Ivabradine lowers the heart rate by its action on the sinus node. It is licensed for the treatment of angina in patients who are in normal sinus rhythm in combination with a beta-blocker, or when beta-blockers are contra-indicated or not tolerated. Ivabradine, in combination with standard therapy including a beta-blocker (unless contra-indicated or not tolerated), is also licensed for mild to severe stable chronic heart failure in patients who are in sinus rhythm.

Ranolazine is licensed as adjunctive therapy in patients who are inadequately controlled or intolerant of first-line antianginal drugs.

ANTITHROMBOTIC DRUGS > ANTIPLATELET DRUGS

Cangrelor

16-Feb-2016

- **DRUG ACTION** Cangrelor is a direct P2Y₁₂ platelet receptor antagonist that blocks adenosine diphosphate induced platelet activation and aggregation.

● INDICATIONS AND DOSE

In combination with aspirin for the reduction of thrombotic cardiovascular events in patients with coronary artery disease undergoing percutaneous coronary intervention (PCI) who have not received an oral P2Y₁₂ inhibitor (e.g. clopidogrel, prasugrel, ticagrelor) prior to the PCI procedure and in whom oral therapy with a P2Y₁₂ inhibitor is not suitable (under expert supervision)

► INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 30 micrograms/kg, to be given as a bolus dose, followed immediately by (by intravenous infusion) 4 micrograms/kg/minute, start treatment before percutaneous coronary intervention and continue infusion for at least 2 hours or for the duration of intervention if longer; maximum duration of infusion 4 hours

- **CONTRA-INDICATIONS** Active bleeding · history of stroke · history of transient ischaemic attack · patients at increased risk of bleeding (e.g. impaired haemostasis, irreversible coagulation disorders, major surgery or trauma, uncontrolled severe hypertension)

- **CAUTIONS** Disease states associated with increased bleeding risk

- **INTERACTIONS** → Appendix 1: cangrelor

● SIDE-EFFECTS

- **Common or very common** Dyspnoea · haemorrhage · skin reactions
- **Uncommon** Cardiac tamponade · haemodynamic instability · renal impairment · retroperitoneal haemorrhage (including fatal cases)
- **Rare or very rare** Anaemia · intracranial haemorrhage · menorrhagia · stroke · thrombocytopenia

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises potential risk to infant—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe renal impairment—increased risk of bleeding.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous bolus injection* and *intravenous infusion*, reconstitute each 50 mg vial with 5 mL of water for injection and gently swirl, do not shake vigorously. Withdraw 5 mL of reconstituted solution, add to 250 mL of either Sodium Chloride 0.9% or Glucose 5% and mix thoroughly. The bolus injection and infusion should be administered from the infusion solution.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

► **Kengrexal** (Chiesi Ltd) ▼

Cangrelor (as Cangrelor tetrasodium) 50 mg Kengrexal 50mg powder for concentrate for solution for injection / infusion vials | 10 vial [PoM] [S] (Hospital only)

ANTITHROMBOTIC DRUGS > GLYCOPROTEIN IIB/IIIA INHIBITORS

Abciximab

● INDICATIONS AND DOSE

Prevention of ischaemic cardiac complications in patients undergoing percutaneous coronary intervention (specialist use only)

► INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 250 micrograms/kg, to be given over 1 minute, then (by intravenous infusion) 125 nanograms/kg/minute (max. per dose 10 micrograms/minute), to be started 10–60 minutes before percutaneous coronary intervention and continue for 12 hours

Short-term prevention of myocardial infarction in patients with unstable angina not responding to conventional treatment and who are scheduled for percutaneous coronary intervention (specialist use only)

► INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 250 micrograms/kg, to be given over 1 minute, then (by intravenous infusion) 125 nanograms/kg/minute (max. per dose 10 micrograms/minute), to be started up to 24 hours before possible percutaneous coronary intervention and continue infusion for 12 hours after intervention

- **CONTRA-INDICATIONS** Active internal bleeding · arteriovenous malformation or aneurysm · haemorrhagic diathesis · hypertensive retinopathy · intracranial neoplasm · intracranial or intraspinal surgery or trauma within last 2 months · major surgery within last 2 months · severe hypertension · stroke within last 2 years · thrombocytopenia · vasculitis

- **CAUTIONS** Discontinue if uncontrollable serious bleeding occurs or emergency cardiac surgery needed (consult product literature for details of procedures to minimise bleeding) · elderly

- **INTERACTIONS** → Appendix 1: abciximab

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · back pain · bradycardia · chest pain · fever · haemorrhage · headache · hypotension · nausea · peripheral oedema · thrombocytopenia · vomiting

- **Uncommon** Intracranial haemorrhage

- **Rare or very rare** Acute respiratory distress syndrome (ARDS) · cardiac tamponade · hypersensitivity

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of bleeding.

- **RENAL IMPAIRMENT** Caution in severe impairment—increased risk of bleeding.

● MONITORING REQUIREMENTS

- Measure baseline prothrombin time, activated clotting time, activated partial thromboplastin time, platelet count, haemoglobin and haematocrit.

- Monitor haemoglobin and haematocrit 12 hours and 24 hours after start of treatment and platelet count 2–4 hours and 24 hours after start of treatment.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (ReoPro[®]), give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute requisite dose in infusion fluid and give via infusion pump; filter upon dilution through a non-pyrogenic low proteinbinding 0.2, 0.22, or 5 micron filter

or upon administration through an in-line non-progenic low protein-binding 0.2 or 0.22 micron filter.

MEDICINAL FORMS

No licensed medicines listed.

Eptifibatide

INDICATIONS AND DOSE

In combination with aspirin and unfractionated heparin for the prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction and with last episode of chest pain within 24 hours (specialist use only)

INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 180 micrograms/kg, then (by intravenous infusion) 2 micrograms/kg/minute for up to 72 hours (up to 96 hours if percutaneous coronary intervention during treatment)

- CONTRA-INDICATIONS** Abnormal bleeding within 30 days · aneurysm · arteriovenous malformation · haemorrhagic diathesis · history of haemorrhagic stroke · increased INR · increased prothrombin time · intracranial disease · major surgery or severe trauma within 6 weeks · neoplasm · severe hypertension · stroke within last 30 days · thrombocytopenia

- CAUTIONS** Discontinue if emergency cardiac surgery necessary · discontinue if intra-aortic balloon pump necessary · discontinue if thrombolytic therapy necessary · risk of bleeding—discontinue immediately if uncontrolled serious bleeding

- INTERACTIONS** → Appendix 1: eptifibatide

SIDE-EFFECTS

- Common or very common Arrhythmias · atrioventricular block · cardiac arrest · congestive heart failure · haemorrhage · hypotension · intracranial haemorrhage · shock

- Uncommon Cerebral ischaemia · thrombocytopenia

- Rare or very rare Rash

- PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- BREAST FEEDING** Manufacturer advises avoid—no information available.

- HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of bleeding.

- RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments Reduce infusion to

1 microgram/kg/minute if eGFR 30–50 mL/minute/1.73 m².

MONITORING REQUIREMENTS

- Measure baseline prothrombin time, activated partial thromboplastin time, platelet count, haemoglobin, haematocrit and serum creatinine.
- Monitor haemoglobin, haematocrit and platelets within 6 hours after start of treatment, then at least once daily.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Solution for infusion

Eptifibatide (Non-proprietary)

Eptifibatide 750 microgram per 1 mL Eptifibatide 75mg/100mL solution for infusion vials | 1 vial [PoM] £17.14 (Hospital only)

Integrilin (GlaxoSmithKline UK Ltd)

Eptifibatide 750 microgram per 1 mL Integrilin 75mg/100mL solution for infusion vials | 1 vial [PoM] £42.79 (Hospital only)

Tirofiban

INDICATIONS AND DOSE

In combination with unfractionated heparin, aspirin, and clopidogrel for prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction (NSTEMI) and with last episode of chest pain within 12 hours (with angiography planned for 4–48 hours after diagnosis) (initiated under specialist supervision)

BY INTRAVENOUS INFUSION

- Adult: Initially 400 nanograms/kg/minute for 30 minutes, then 100 nanograms/kg/minute for at least 48 hours (continue during and for 12–24 hours after percutaneous coronary intervention), maximum duration of treatment 108 hours

In combination with unfractionated heparin, aspirin, and clopidogrel for prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction (NSTEMI) and with last episode of chest pain within 12 hours (with angiography within 4 hours of diagnosis) (initiated under specialist supervision)

INITIALLY BY INTRAVENOUS INJECTION

- Adult: 25 micrograms/kg, to be given over 3 minutes at start of percutaneous coronary intervention, then (by intravenous infusion) 150 nanograms/kg/minute for 12–24 hours, maximum duration of treatment 48 hours

In combination with unfractionated heparin, aspirin, and clopidogrel for reduction of major cardiovascular events in patients with ST-segment elevation myocardial infarction (STEMI) intended for primary percutaneous coronary intervention (PCI) (initiated under specialist supervision)

INITIALLY BY INTRAVENOUS INJECTION

- Adult: 25 micrograms/kg, to be given over 3 minutes at start of percutaneous coronary intervention, then (by intravenous infusion) 150 nanograms/kg/minute for 12–24 hours, maximum duration of treatment 48 hours

- CONTRA-INDICATIONS** Abnormal bleeding within 30 days · history of aneurysm · history of arteriovenous malformation · history of haemorrhagic stroke · history of intracranial disease · history of neoplasm · increased INR · increased prothrombin time · severe hypertension · stroke within 30 days · thrombocytopenia

- CAUTIONS** Active peptic ulcer (within 3 months) · acute pericarditis · anaemia · aortic dissection · cardiogenic shock · discontinue if intra-aortic balloon pump necessary · discontinue if thrombolytic therapy necessary · discontinue immediately if serious or uncontrollable bleeding occurs · discontinue if emergency cardiac surgery necessary · elderly · faecal occult blood · haematuria · haemorrhagic retinopathy · low body-weight · major surgery within 3 months (avoid if within 6 weeks) · organ biopsy or lithotripsy within last 2 weeks · puncture of non-compressible vessel within 24 hours · risk of bleeding (within 3 months) · severe heart failure · severe trauma within 3 months (avoid if within 6 weeks) · traumatic or protracted cardiopulmonary resuscitation within last 2 weeks · uncontrolled severe hypertension · vasculitis

- INTERACTIONS** → Appendix 1: tirofiban

SIDE-EFFECTS

- Common or very common Ecchymosis · fever · haemorrhage · headache · nausea · thrombocytopenia
- Frequency not known Intracranial haemorrhage

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Caution in mild to moderate liver disease. Avoid in severe liver disease—increased risk of bleeding.
- **RENAL IMPAIRMENT** Increased risk of bleeding.
Dose adjustments Use half normal dose if eGFR less than 30 mL/minute/1.73 m².
Monitoring Monitor carefully if eGFR less than 60 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor platelet count, haemoglobin and haematocrit before treatment, 2–6 hours after start of treatment and then at least once daily.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Aggrastat®), give continuously in Glucose 5% or Sodium chloride 0.9%. Withdraw 50 mL infusion fluid from 250 mL bag and replace with 50 mL tirofiban concentrate (250 micrograms/mL) to give a final concentration of 50 micrograms/mL.

SELECTIVE SINUS NODE I_f INHIBITORS

Ivabradine

10-May-2018

• INDICATIONS AND DOSE

Treatment of angina in patients in normal sinus rhythm

► BY MOUTH

► **Adult 18–74 years:** Initially 2.5–5 mg twice daily for 3–4 weeks, then increased if necessary up to 7.5 mg twice daily, dose to be increased gradually; reduced if not tolerated to 2.5–5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute, discontinue treatment if no improvement in symptoms within 3 months

► **Adult 75 years and over:** Initially 2.5 mg twice daily for 3–4 weeks, then increased if necessary up to 7.5 mg twice daily, dose to be increased gradually; reduced if not tolerated to 2.5–5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute, discontinue treatment if no improvement in symptoms within 3 months

Mild to severe chronic heart failure

► BY MOUTH

► **Adult 18–74 years:** Initially 5 mg twice daily for 2 weeks, then increased if necessary to 7.5 mg twice daily; reduced if not tolerated to 2.5–5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute

► **Adult 75 years and over:** Initially 2.5 mg twice daily for 2 weeks, then increased if necessary up to 7.5 mg twice daily, dose to be increased gradually; reduced if not tolerated to 2.5–5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce initial dose to 2.5 mg twice daily with concurrent use of moderate CYP3A4 inhibitors (except diltiazem, erythromycin and verapamil where concurrent use is contra-indicated).

● **CONTRA-INDICATIONS** Acute myocardial infarction · cardiogenic shock · congenital QT syndrome · do not initiate for angina if heart rate below 70 beats per minute · do not initiate for chronic heart failure if heart rate below 75 beats per minute · immediately after cerebrovascular accident · patients dependent on pacemaker · second- and third-degree heart block · severe hypotension · sick-sinus syndrome · sino-atrial block · unstable angina · unstable or acute heart failure

● **CAUTIONS** Atrial fibrillation or other arrhythmias (treatment ineffective) · elderly · in angina, consider stopping if there is no or limited symptom improvement after 3 months · intraventricular conduction defects · mild to moderate hypotension (avoid if severe) · retinitis pigmentosa

● **INTERACTIONS** → Appendix 1: ivabradine

● SIDE-EFFECTS

▶ **Common or very common** Arrhythmias · atrioventricular block · dizziness · headache · hypertension · vision disorders

▶ **Uncommon** Abdominal pain · angioedema · constipation · diarrhoea · eosinophilia · hyperuricaemia · hypotension · muscle cramps · nausea · QT interval prolongation · skin reactions · syncope · vertigo

● **PREGNANCY** Manufacturer advises avoid—*toxicity* in animal studies.

● **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment. Avoid in severe impairment.

● **RENAL IMPAIRMENT** Manufacturer advises use with caution if eGFR less than 15 mL/minute/1.73 m²—no information available.

● MONITORING REQUIREMENTS

- ▶ Monitor regularly for atrial fibrillation (consider benefits and risks of continued treatment if atrial fibrillation occurs).
- ▶ Monitor for bradycardia, especially after any dose increase, and discontinue if resting heart rate persistently below 50 beats per minute or continued symptoms of bradycardia despite dose reduction.

● NATIONAL FUNDING/ACCESS DECISIONS**NICE decisions**

- ▶ **Ivabradine for the treatment of chronic heart failure (November 2012)** NICE TA267
Ivabradine, in combination with standard therapy including a beta-blocker (unless contra-indicated or not tolerated), an ACE inhibitor, and an aldosterone antagonist, is an option for treating mild to severe stable chronic heart failure in patients who:

- have a left ventricular ejection fraction of $\leq 35\%$, and
- are in sinus rhythm with a heart rate of ≥ 75 beats per minute

Ivabradine should be initiated only by a heart failure specialist after 4 weeks of stable optimal standard therapy; monitoring and dose titration should be carried out by a heart failure specialist, or a GP with special interest in heart failure, or by a heart failure specialist nurse.

www.nice.org.uk/TA267

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2012) that ivabradine (*Procoralan*®) is accepted for restricted use within NHS Scotland in accordance with its licensed indication for heart failure only if resting heart

rate remains ≥ 75 beats per minute despite optimal standard therapy.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

7.1 Acute coronary syndromes

Acute coronary syndromes

Overview

Acute coronary syndromes encompass a spectrum of conditions which include unstable angina, and myocardial infarction with or without ST-segment elevation. Patients with different acute coronary syndromes may present similarly; definitive diagnosis is made on the basis of clinical presentation, ECG changes, and measurement of biochemical cardiac markers.

Unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI)

These are related acute coronary syndromes that fall between the classifications of stable angina and ST-segment elevation myocardial infarction (STEMI). They usually occur as a result of atheromatous plaque rupture, and are often characterised by stable angina that suddenly worsens, recurring or prolonged angina at rest, or new onset of severe angina. Patients with unstable angina have no evidence of myocardial necrosis, whereas in NSTEMI, myocardial necrosis (less significant than with STEMI) will be evident. There is a risk of progression to STEMI or sudden death, particularly in patients who experience pain at rest.

Management of unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI)

These conditions are managed similarly; the aims of management are to provide supportive care and pain relief during the acute attack and to prevent further cardiac events and death. For advice on the management of patients with acute ST-segment elevation myocardial infarction (STEMI), see below.

Initial management

Oxygen should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hyperoxia should be avoided and particular care is required in patients with chronic obstructive airways disease.

Nitrates are used to relieve ischaemic pain. If sublingual glyceryl trinitrate p. 217 is not effective, intravenous or buccal glyceryl trinitrate or intravenous isosorbide dinitrate p. 219 is given. If pain continues, diamorphine hydrochloride p. 449 or morphine p. 456 can be given by slow intravenous injection; an antiemetic such as metoclopramide hydrochloride p. 426 should also be given.

Aspirin p. 121 (chewed or dispersed in water) is given for its antiplatelet effect. If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel p. 122 should also be given. Prasugrel p. 213 is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see NICE guidance). Ticagrelor p. 214 is also an alternative to clopidogrel (see NICE guidance). Patients should also

receive either heparin (unfractionated) p. 132, a **low molecular weight heparin**, or fondaparinux sodium p. 126.

Patients without contra-indications should receive **beta-blockers** which should be continued indefinitely. In patients without left ventricular dysfunction and in whom beta-blockers are inappropriate, diltiazem hydrochloride p. 157 or verapamil hydrochloride p. 163 can be given.

The glycoprotein IIb/IIIa inhibitors eptifibatide p. 209 (in combination with heparin (unfractionated) and aspirin) and tirofiban p. 209 (in combination with heparin (unfractionated), aspirin, and clopidogrel) can be used for unstable angina or for NSTEMI in patients at a high risk of either myocardial infarction or death.

In intermediate- and high-risk patients, abciximab p. 208 or eptifibatide (in combination with heparin (unfractionated) and aspirin), or tirofiban (in combination with heparin (unfractionated), aspirin, and clopidogrel) can also be used in patients undergoing percutaneous coronary intervention, to reduce the immediate risk of vascular occlusion. In intermediate- and high-risk patients in whom early intervention is planned, bivalirudin p. 134 can be considered as an alternative to the combination of a glycoprotein IIb/IIIa inhibitor plus a heparin.

Revascularisation procedures are often appropriate for patients with unstable angina or NSTEMI; see Antiplatelet drugs p. 120 for the use of antiplatelet drugs in patients undergoing coronary stenting.

Long-term management

The need for long-term angina treatment or for coronary angiography should be assessed. Most patients will require standard angina treatment to prevent recurrence of symptoms.

ST-segment elevation myocardial infarction (STEMI)

This is an acute coronary syndrome where atheromatous plaque rupture leads to thrombosis and myocardial ischaemia, with irreversible necrosis of the heart muscle, often leading to long-term complications. STEMI can also occasionally occur as a result of coronary spasm or embolism, arteritis, spontaneous thrombosis, or sudden severe elevation in blood pressure.

Management of ST-segment elevation myocardial infarction (STEMI)

These notes give an overview of the initial and long-term management of myocardial infarction with ST segment elevation (STEMI). For advice on the management of non-ST-segment elevation myocardial infarction (NSTEMI) and unstable angina, see above. The aims of management of STEMI are to provide supportive care and pain relief, to promote reperfusion and to reduce mortality. Oxygen, nitrates, and diamorphine hydrochloride or morphine can provide initial support and pain relief; aspirin and percutaneous coronary intervention or thrombolytics promote reperfusion; anticoagulants help to reduce re-occlusion and systemic embolisation; long-term use of aspirin, beta-blockers, ACE inhibitors, and statins help to reduce mortality further.

Local guidelines for the management of myocardial infarction should be followed where they exist.

Initial management

Oxygen should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hyperoxia should be avoided and particular care is required in patients with chronic obstructive airways disease.

The pain (and anxiety) of myocardial infarction is managed with slow intravenous injection of diamorphine hydrochloride or morphine; an antiemetic such as metoclopramide hydrochloride (or, if left ventricular function is not compromised, cyclizine p. 424) by intravenous injection should also be given.

Aspirin (chewed or dispersed in water) is given for its antiplatelet effect. If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel, should also be given. Prasugrel, is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see NICE guidance). Ticagrelor, is also an alternative to clopidogrel (see NICE guidance).

Patency of the occluded artery can be restored by percutaneous coronary intervention or by giving a **thrombolytic drug**, unless contra-indicated. Percutaneous coronary intervention is the preferred method; a **glycoprotein IIb/IIIa inhibitor** can be used to reduce the risk of immediate vascular occlusion in intermediate- and high-risk patients. Patients undergoing percutaneous coronary intervention should also receive either heparin (unfractionated) or a low molecular weight heparin (e.g. enoxaparin sodium p. 131); bivalirudin is an alternative to the combination of a glycoprotein IIb/IIIa inhibitor plus a heparin (see also NICE guidance). In patients who cannot be offered percutaneous coronary intervention within 90 minutes of diagnosis, a thrombolytic drug should be administered along with either heparin (unfractionated) (for maximum 2 days), a low molecular weight heparin (e.g. enoxaparin sodium), or fondaparinux sodium. See use of antiplatelet drugs in patients undergoing coronary stenting in Antiplatelet drugs p. 120.

Patients who do not receive reperfusion therapy (with percutaneous coronary intervention or a thrombolytic) should be treated with either fondaparinux sodium, enoxaparin sodium, or heparin (unfractionated). Prescribers should consult product literature and local protocols (where they exist) for details of anticoagulant dose and duration.

Nitrates are used to relieve ischaemic pain. If sublingual glyceryl trinitrate p. 217 is not effective, intravenous glyceryl trinitrate or isosorbide dinitrate p. 219 is given.

Early administration of some **beta-blockers** has been shown to be of benefit and should be given to patients without contra-indications.

ACE inhibitors, and angiotensin-II receptor antagonists if an ACE inhibitor cannot be used, are also of benefit to patients who have no contra-indications; in hypertensive and normotensive patients treatment with an ACE inhibitor, or an angiotensin-II receptor antagonist, can be started within 24 hours of the myocardial infarction and continued for at least 5–6 weeks (see below for long-term treatment).

All patients should be closely monitored for hyperglycaemia; those with diabetes or raised blood-glucose concentration should receive insulin p. 696.

Long-term management

Long-term management following STEMI involves the use of several drugs which should ideally be started before the patient is discharged from hospital.

Aspirin p. 121 should be given to all patients, unless contra-indicated. The addition of clopidogrel p. 122 has been shown to reduce morbidity and mortality. Prasugrel below or ticagrelor p. 214 are alternatives to clopidogrel in certain patients. For those intolerant of clopidogrel, and who are at low risk of bleeding, the combination of warfarin sodium p. 139 and aspirin should be considered. In those intolerant of both aspirin and clopidogrel, warfarin sodium alone can be used. Warfarin sodium should be continued for those who are already being treated for another indication, such as atrial fibrillation, with the addition of aspirin if there is a low risk of bleeding. The combination of aspirin with clopidogrel or warfarin sodium increases the risk of bleeding. Low-dose rivaroxaban p. 127, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following STEMI—see Prevention of cardiovascular events. For details of antiplatelet drug duration following coronary stenting—see also Antiplatelet drugs and coronary stents in Antiplatelet drugs p. 120.

Beta-blockers should be given to all patients in whom they are not contra-indicated. Acebutolol p. 151, metoprolol tartrate p. 154, propranolol hydrochloride p. 149 and timolol maleate p. 150 are suitable; for patients with left ventricular dysfunction, carvedilol p. 147, bisoprolol fumarate p. 152, or long-acting metoprolol tartrate may be appropriate.

Diltiazem hydrochloride p. 157 (unlicensed) or verapamil hydrochloride p. 163 can be considered if a beta-blocker cannot be used; however, they are contra-indicated in those with left ventricular dysfunction. Other calcium-channel blockers have no place in routine long-term management after a myocardial infarction.

An **ACE inhibitor** should be considered for all patients, especially those with evidence of left ventricular dysfunction. If an ACE inhibitor cannot be used, an angiotensin-II receptor antagonist may be used for patients with heart failure. A relatively high dose of either the ACE inhibitor or angiotensin-II receptor antagonist may be required to produce benefit.

Nitrates are used for patients with angina.

Eplerenone p. 190 is licensed for use following a myocardial infarction in those with left ventricular dysfunction and evidence of heart failure.

See also the role of **statins** in preventing recurrent cardiovascular events in Lipid-regulating drugs p. 193.

Prevention of cardiovascular events

Patients with stable angina, unstable angina, or NSTEMI should be given advice and treatments to reduce their cardiovascular risk. The importance of life-style changes, especially stopping smoking, should be emphasised. Aspirin should be given indefinitely. Antihypertensive treatment should be initiated if appropriate, and a **statin** should also be given.

In patients with stable angina, addition of an **ACE inhibitor** should be considered for patients with diabetes (and should be continued if indicated for a co-morbidity).

In patients with unstable angina or NSTEMI, clopidogrel is given, in combination with aspirin, for up to 12 months—most benefit occurs during the first 3 months. Prasugrel or ticagrelor are alternatives to clopidogrel in certain patients. An ACE inhibitor should also be given.

Low-dose rivaroxaban, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers.

Other drugs used for Acute coronary syndromes

Captopril, p. 167 • Dalteparin sodium, p. 130 • Lisinopril, p. 170 • Perindopril arginine, p. 170 • Perindopril erbumine, p. 171 • Ramipril, p. 172 • Trandolapril, p. 173 • Valsartan, p. 178

ANTITHROMBOTIC DRUGS > ANTIPLATELET DRUGS

Prasugrel

• INDICATIONS AND DOSE

In combination with aspirin for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention

► BY MOUTH

- ▶ Adult 18–74 years (body-weight up to 60 kg): Initially 60 mg for 1 dose, then 5 mg once daily usually for up to 12 months
- ▶ Adult 18–74 years (body-weight 60 kg and above): Initially 60 mg for 1 dose, then 10 mg once daily usually for up to 12 months
- ▶ Adult 75 years and over: Initially 60 mg for 1 dose, then 5 mg once daily usually for up to 12 months continued →

Patients undergoing coronary angiography within 48 hours of admission for unstable angina or NSTEMI

► BY MOUTH

- Adult: Loading dose 60 mg, not to be administered until the time of percutaneous coronary intervention in order to minimise the risk of bleeding, maintenance dose of 10 mg or 5 mg daily should then be selected as appropriate based on age and weight

Alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention

► BY MOUTH

- Adult: 60 mg, as a single dose

- **CONTRA-INDICATIONS** Active bleeding · history of stroke or transient ischaemic attack
 - **CAUTIONS** Body-weight less than 60 kg · discontinue at least 7 days before elective surgery if antiplatelet effect not desirable · elderly · patients at increased risk of bleeding (e.g. from recent trauma, surgery, gastro-intestinal bleeding, or active peptic ulcer disease)
 - **INTERACTIONS** → Appendix 1: prasugrel
 - **SIDE-EFFECTS**
 - Common or very common Anaemia · haemorrhage · skin reactions
 - Uncommon Angioedema
 - Rare or very rare Thrombocytopenia
 - **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with history of hypersensitivity reactions to thienopyridines (e.g. clopidogrel).
 - **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
 - **BREAST FEEDING** Manufacturer advises avoid—no information available.
 - **HEPATIC IMPAIRMENT** Use with caution in moderate impairment—increased risk of bleeding. Avoid in severe impairment.
 - **RENAL IMPAIRMENT** Use with caution—increased risk of bleeding.
 - **NATIONAL FUNDING/ACCESS DECISIONS**
 - NICE decisions**
 - Prasugrel with percutaneous coronary intervention for treating acute coronary syndromes (July 2014) NICE TA317
- Prasugrel 10 mg in combination with aspirin is recommended as an option, within its marketing authorisation, for preventing atherothrombotic events in adults with acute coronary syndrome (unstable angina (UA), non-ST segment elevation myocardial infarction (NSTEMI) or ST segment elevation myocardial infarction (STEMI)) having primary or delayed percutaneous coronary intervention.
- www.nice.org.uk/TA317
- Scottish Medicines Consortium (SMC) Decisions**
- The *Scottish Medicines Consortium* has advised (August 2009) that prasugrel (*Eflent*®), in combination with aspirin, be accepted for restricted use within NHS Scotland for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention who are eligible to receive the 10 mg dose of prasugrel.

● **MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Eflent** (Eli Lilly and Company Ltd)

Prasugrel (as Prasugrel hydrochloride) 5 mg Eflent 5mg tablets | 28 tablet [PoM] £47.56 DT = £47.56

Prasugrel (as Prasugrel hydrochloride) 10 mg Eflent 10mg tablets | 28 tablet [PoM] £47.56 DT = £47.56

Ticagrelor● **INDICATIONS AND DOSE****In combination with aspirin for the prevention of atherothrombotic events in patients with acute coronary syndrome**

► BY MOUTH

- Adult: Initially 180 mg for 1 dose, then 90 mg twice daily usually for up to 12 months

Alternative to clopidogrel in patients undergoing percutaneous coronary intervention

► BY MOUTH

- Adult: 180 mg, as a single dose

- **CONTRA-INDICATIONS** Active bleeding · history of intracranial haemorrhage
 - **CAUTIONS** Asthma · bradycardia (unless pacemaker fitted) · chronic obstructive pulmonary disease · discontinue 7 days before elective surgery if antiplatelet effect not desirable · history of hyperuricaemia · patients at increased risk of bleeding (e.g. from recent trauma, surgery, gastro-intestinal bleeding, or coagulation disorders) · second- or third-degree AV block (unless pacemaker fitted) · sick sinus syndrome (unless pacemaker fitted)
 - **INTERACTIONS** → Appendix 1: ticagrelor
 - **SIDE-EFFECTS**
 - Common or very common Constipation · diarrhoea · dizziness · dyspepsia · dyspnoea · gout · gouty arthritis · haemorrhage · headache · hyperuricaemia · hypotension · nausea · skin reactions · syncope · vertigo
 - Uncommon Angioedema · confusion · intracranial haemorrhage
 - **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
 - **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
 - **HEPATIC IMPAIRMENT** Avoid in moderate or severe impairment—no information available.
 - **MONITORING REQUIREMENTS** Monitor renal function 1 month after initiation.
 - **NATIONAL FUNDING/ACCESS DECISIONS**
 - NICE decisions**
 - Ticagrelor for the treatment of acute coronary syndromes (October 2011) NICE TA236
- Ticagrelor, in combination with low-dose aspirin, is recommended for up to 12 months as a treatment option in adults with acute coronary syndromes, that is, people:
- with ST-segment elevation myocardial infarction—defined as ST elevation or new left bundle branch block on electrocardiogram—that cardiologists intend to treat with primary percutaneous coronary intervention, **or**
 - with non-ST-segment elevation myocardial infarction (NSTEMI), **or**
 - admitted to hospital with unstable angina—defined as ST or T wave changes on electrocardiogram suggestive of ischaemia plus one of the characteristics defined below. Before ticagrelor is continued beyond the initial treatment, the diagnosis of unstable angina should first be confirmed, ideally by a cardiologist. Characteristics to be used in defining treatment with ticagrelor for unstable angina are:
- age 60 years or older;
 - previous myocardial infarction or previous coronary artery bypass grafting;
 - coronary artery disease with stenosis of 50% or more in at least two vessels;
 - previous ischaemic stroke;
 - previous transient ischaemic attack, carotid stenosis of at least 50%, or cerebral revascularisation;
 - diabetes mellitus;

- peripheral arterial disease, or
- chronic renal dysfunction (creatinine clearance less than 60 mL/minute/1.73 m²).

www.nice.org.uk/TA236

- **Ticagrelor for preventing atherothrombotic events after myocardial infarction (December 2016) NICE TA420**
Ticagrelor, in combination with aspirin, is recommended within its marketing authorisation as an option for preventing atherothrombotic events in adults who had a myocardial infarction and who are at high risk of a further event. Treatment should be stopped when clinically indicated or at a maximum of 3 years.
www.nice.org.uk/TA420

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Brilique** (AstraZeneca UK Ltd)

Ticagrelor 60 mg Brilique 60mg tablets | 56 tablet **[PoM]** £54.60 DT = £54.60

Ticagrelor 90 mg Brilique 90mg tablets | 56 tablet **[PoM]** £54.60 DT = £54.60

ANTITHROMBOTIC DRUGS > TISSUE PLASMINOGEN ACTIVATORS

Fibrinolytic drugs

Overview

The value of thrombolytic drugs for the treatment of *myocardial infarction* has been established. Streptokinase p. 216 and alteplase below have been shown to reduce mortality. Reteplase and tenecteplase p. 216 are also licensed for acute myocardial infarction. Thrombolytic drugs are indicated for any patient with acute myocardial infarction for whom the benefit is likely to outweigh the risk of treatment. Trials have shown that the benefit is greatest in those with ECG changes that include ST segment elevation (especially in those with anterior infarction) and in patients with bundle branch block. Patients should not be denied thrombolytic treatment on account of age alone because mortality in the elderly is high and the reduction in mortality is the same as in younger patients. Alteplase should be given within 6–12 hours of symptom onset, reteplase and streptokinase within 12 hours of symptom onset, but ideally all should be given within 1 hour; use after 12 hours requires specialist advice. Tenecteplase should be given as early as possible and usually within 6 hours of symptom onset.

Alteplase, streptokinase and urokinase p. 137 can be used for other thromboembolic disorders such as deep-vein thrombosis and pulmonary embolism. Alteplase is also used for acute ischaemic stroke.

Urokinase is also licensed to restore the patency of occluded intravenous catheters and cannulas blocked with fibrin clots.

Fibrinolytics

- **DRUG ACTION** Fibrinolytic drugs act as thrombolytics by activating plasminogen to form plasmin, which degrades fibrin and so breaks up thrombi.
- **CONTRA-INDICATIONS** Active pulmonary disease with cavitation · acute pancreatitis · aneurysm · aortic dissection · bacterial endocarditis · bleeding diatheses · coagulation defects · coma · heavy vaginal bleeding · history of cerebrovascular disease (especially recent events or with any residual disability) · oesophageal varices · pericarditis · recent haemorrhage · recent surgery (including dental extraction) · recent symptoms of possible peptic ulceration · recent trauma · severe hypertension

- **CAUTIONS** Conditions in which thrombolysis might give rise to embolic complications such as enlarged left atrium with atrial fibrillation (risk of dissolution of clot and subsequent embolisation) · elderly · external chest compression · hypertension · risk of bleeding (including that from venepuncture or invasive procedures)

• SIDE-EFFECTS

- **Common or very common** Anaphylactic reaction · angina pectoris · cardiac arrest · cardiogenic shock · chills · CNS haemorrhage · ecchymosis · fever · haemorrhage · haemorrhagic stroke · heart failure · hypotension · ischaemia recurrent (when used in myocardial infarction) · nausea · pericarditis · pulmonary oedema · vomiting
 - **Uncommon** Aphasia · mitral valve incompetence · myocardial rupture · pericardial disorders · reperfusion arrhythmia (when used in myocardial infarction) · seizure
- SIDE-EFFECTS, FURTHER INFORMATION** Serious bleeding calls for discontinuation of the thrombolytic and may require administration of coagulation factors and antifibrinolytic drugs.

- **PREGNANCY** Thrombolytic drugs can possibly lead to premature separation of the placenta in the first 18 weeks of pregnancy. There is also a risk of maternal haemorrhage throughout pregnancy and post-partum, and also a theoretical risk of fetal haemorrhage throughout pregnancy.
- **HEPATIC IMPAIRMENT** Avoid in severe hepatic impairment as there is an increased risk of bleeding.

[above](#)

Alteplase

(rt-PA; Tissue-type plasminogen activator)

• INDICATIONS AND DOSE

Acute myocardial infarction, accelerated regimen

► INITIALLY BY INTRAVENOUS INJECTION

- **Adult** (body-weight up to 65 kg): Initially 15 mg, to be initiated within 6 hours of symptom onset, followed by (by intravenous infusion) 0.75 mg/kg, to be given over 30 minutes, then (by intravenous infusion) 0.5 mg/kg, to be given over 60 minutes, maximum total dose of 100 mg administered over 90 minutes
- **Adult** (body-weight 65 kg and above): Initially 15 mg, to be initiated within 6 hours of symptom onset, followed by (by intravenous infusion) 50 mg, to be given over 30 minutes, then (by intravenous infusion) 35 mg, to be given over 60 minutes, maximum total dose of 100 mg administered over 90 minutes

Acute myocardial infarction

► INITIALLY BY INTRAVENOUS INJECTION

- **Adult:** Initially 10 mg, to be initiated within 6–12 hours of symptom onset, followed by (by intravenous infusion) 50 mg, to be given over 60 minutes, then (by intravenous infusion) 10 mg for 4 infusions, each 10 mg infusion dose to be given over 30 minutes, total dose of 100 mg over 3 hours; maximum 1.5 mg/kg in patients less than 65 kg

Pulmonary embolism

► INITIALLY BY INTRAVENOUS INJECTION

- **Adult:** Initially 10 mg, to be given over 1–2 minutes, followed by (by intravenous infusion) 90 mg, to be given over 2 hours, maximum 1.5 mg/kg in patients less than 65 kg

Acute ischaemic stroke (under specialist neurology physician only)

► BY INTRAVENOUS INFUSION

- **Adult** 18–79 years: Initially 900 micrograms/kg (max. per dose 90 mg), treatment **must** begin within 4.5 hours of symptom onset, to be given over 60 minutes, the initial 10% of dose is to be continued →

administered by intravenous injection and the remainder by intravenous infusion

ACTILYSE CATHFLO®

Thrombolytic treatment of occluded central venous access devices (including those used for haemodialysis)

- BY INTRAVENOUS INJECTION
- Adult: (consult product literature)

● CONTRA-INDICATIONS

- When used for acute ischaemic stroke Convulsion accompanying stroke · history of stroke in patients with diabetes · hyperglycaemia · hypoglycaemia · severe stroke · stroke in last 3 months

● INTERACTIONS → Appendix 1: alteplase

● SIDE-EFFECTS

- **Uncommon** Cerebral embolism · haemothorax
- **Rare or very rare** Agitation · confusion · delirium · depression · epilepsy · psychosis · speech disorder
- **Frequency not known** Brain oedema (caused by reperfusion)

● ALLERGY AND CROSS-SENSITIVITY

Contra-indicated if history of hypersensitivity to gentamicin (residue from manufacturing process).

● MONITORING REQUIREMENTS

- When used for acute ischaemic stroke Monitor for intracranial haemorrhage, and monitor blood pressure (antihypertensive recommended if systolic above 180 mmHg or diastolic above 105 mmHg).

● DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (Actilyse®), give intermittently or continuously in Sodium chloride 0.9%; dissolve in water for injections to a concentration of 1 mg/mL or 2 mg/mL and infuse intravenously; alternatively dilute the solution further in the infusion fluid to a concentration of not less than 200 micrograms/mL; not to be infused in glucose solution.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Alteplase for the treatment of acute ischaemic stroke (September 2012) NICE TA264**
Alteplase is recommended for the treatment of acute ischaemic stroke in adults in accordance with its licensed indication if:
 - treatment is started as early as possible within 4.5 hours of onset of stroke symptoms, and
 - intracranial haemorrhage has been excluded by appropriate imaging techniques.www.nice.org.uk/TA264

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Powder and solvent for solution for injection

- **Actilyse** (Boehringer Ingelheim Ltd)
Alteplase 10 mg Actilyse 10mg powder and solvent for solution for injection vials | 1 vial [PoM] £172.80
- Alteplase 20 mg** Actilyse 20mg powder and solvent for solution for injection vials | 1 vial [PoM] £259.20

Powder and solvent for solution for infusion

- **Actilyse** (Boehringer Ingelheim Ltd)
Alteplase 50 mg Actilyse 50mg powder and solvent for solution for infusion vials | 1 vial [PoM] £432.00

Deep-vein thrombosis | Pulmonary embolism | Acute arterial thromboembolism | Central retinal venous or arterial thrombosis

► BY INTRAVENOUS INFUSION

- **Adult:** 250 000 units, dose to be given over 30 minutes, then 100 000 units every 1 hour for up to 12–72 hours, duration is adjusted according to condition with monitoring of clotting parameters (consult product literature)

● INTERACTIONS → Appendix 1: streptokinase

● SIDE-EFFECTS

- **Common or very common** Arrhythmias · asthenia · diarrhoea · epigastric pain · headache · malaise · pain
- **Uncommon** Respiratory arrest · splenic rupture
- **Rare or very rare** Arthritis · eye inflammation · nephritis · nerve disorders · neurological effects · pulmonary oedema non-cardiogenic (caused by reperfusion) · shock · vasculitis

● ALLERGY AND CROSS-SENSITIVITY

Contra-indicated if previous allergic reaction to either streptokinase or anistreplase (no longer available). Prolonged persistence of antibodies to streptokinase and anistreplase can reduce the effectiveness of subsequent treatment; therefore, streptokinase should not be used again beyond 4 days of first administration of either streptokinase or anistreplase.

● DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (Streptase®), give continuously or intermittently; reconstitute with sodium chloride 0.9%, then dilute further with Glucose 5% or Sodium Chloride 0.9% after reconstitution.

● MEDICINAL FORMS

No licensed medicines listed.

■ 215

Tenecteplase

● INDICATIONS AND DOSE

Acute myocardial infarction

► BY INTRAVENOUS INJECTION

- **Adult:** 30–50 mg (max. per dose 50 mg), dose to be given over 10 seconds and initiated within 6 hours of symptom onset, dose varies according to body weight—consult product literature

● INTERACTIONS → Appendix 1: tenecteplase

● SIDE-EFFECTS

- **Uncommon** Drowsiness · hemiparesis

● BREAST FEEDING

Manufacturer advises avoid breast-feeding for 24 hours after dose (express and discard milk during this time).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- **Metalyse** (Boehringer Ingelheim Ltd)
Tenecteplase 8000 unit Metalyse 8,000unit powder and solvent for solution for injection vials | 1 vial [PoM] £602.70
- Tenecteplase 10000 unit** Metalyse 10,000unit powder and solvent for solution for injection vials | 1 vial [PoM] £602.70

NITRATES

Nitrates

Overview

Nitrates have a useful role in *angina*. Although they are potent coronary vasodilators, their principal benefit follows from a reduction in venous return which reduces left ventricular work. Unwanted effects such as flushing, headache, and postural hypotension may limit therapy,

Streptokinase

● INDICATIONS AND DOSE

Acute myocardial infarction

► BY INTRAVENOUS INFUSION

- **Adult:** 1 500 000 units, to be initiated within 12 hours of symptom onset, dose to be given over 60 minutes

■ 215

especially when angina is severe or when patients are unusually sensitive to the effects of nitrates.

Sublingual glyceryl trinitrate below is one of the most effective drugs for providing rapid symptomatic relief of angina, but its effect lasts only for 20 to 30 minutes; the 300-microgram tablet is often appropriate when glyceryl trinitrate is first used. The *aerosol* spray provides an alternative method of rapid relief of symptoms for those who find difficulty in dissolving sublingual preparations. Duration of action may be prolonged by *transdermal* preparations (but tolerance may develop).

Isosorbide dinitrate p. 219 is active *sublingually* and is a more stable preparation for those who only require nitrates infrequently. It is also effective by mouth for prophylaxis; although the effect is slower in onset, it may persist for several hours. Duration of action of up to 12 hours is claimed for *modified-release* preparations. The activity of isosorbide dinitrate may depend on the production of active metabolites, the most important of which is isosorbide mononitrate p. 219. Isosorbide mononitrate itself is also licensed for angina prophylaxis; modified-release formulations (for once daily administration) are available.

Glyceryl trinitrate or isosorbide dinitrate may be tried by *intravenous injection* when the sublingual form is ineffective in patients with chest pain due to myocardial infarction or severe ischaemia. Intravenous injections are also useful in the treatment of congestive heart failure.

Nitrates

- **CONTRA-INDICATIONS** Aortic stenosis · cardiac tamponade · constrictive pericarditis · hypertrophic cardiomyopathy · hypotensive conditions · hypovolaemia · marked anaemia · mitral stenosis · raised intracranial pressure due to cerebral haemorrhage · raised intracranial pressure due to head trauma · toxic pulmonary oedema

- **CAUTIONS** Heart failure due to obstruction · hypothermia · hypothyroidism · hypoxaemia · malnutrition · metal-containing transdermal systems should be removed before magnetic resonance imaging procedures, cardioversion, or diathermy · recent history of myocardial infarction · susceptibility to angle-closure glaucoma · tolerance · ventilation and perfusion abnormalities

CAUTIONS, FURTHER INFORMATION

- ▶ **Tolerance** Many patients on long-acting or transdermal nitrates rapidly develop tolerance (with reduced therapeutic effects). Reduction of blood-nitrate concentrations to low levels for 4 to 12 hours each day usually maintains effectiveness in such patients. If tolerance is suspected during the use of transdermal patches they should be left off for 8–12 hours (usually overnight) in each 24 hours; in the case of modified-release tablets of isosorbide dinitrate (and conventional formulations of isosorbide mononitrate), the second of the two daily doses should be given after about 8 hours rather than after 12 hours. Conventional formulations of isosorbide mononitrate should not usually be given more than twice daily unless small doses are used; modified-release formulations of isosorbide mononitrate should only be given once daily, and used in this way do not produce tolerance.

● SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmias · asthenia · cerebral ischaemia · dizziness · drowsiness · flushing · headache · hypotension · nausea · peripheral oedema · vomiting
- ▶ **Uncommon** Anorectal disorder · cardiac disorder · circulatory collapse · cyanosis · diarrhoea · gastrointestinal discomfort · haemorrhage · skin reactions · syncope
- ▶ **Rare or very rare** Angioedema · angle closure glaucoma · hypoxia · methaemoglobinaemia · myalgia · respiratory disorders · restlessness · Stevens-Johnson syndrome

- ▶ **Frequency not known** Drug tolerance · hyperhidrosis · palpitations · tongue blistering · vertigo

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in nitrate hypersensitivity.
- **BREAST FEEDING** No information available—manufacturers advise use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Caution in severe impairment.
- **RENAL IMPAIRMENT** Manufacturers advise use with caution in severe impairment.
- **MONITORING REQUIREMENTS** Monitor blood pressure and heart rate during intravenous infusion.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.

➤ above

09-Mar-2018

Glyceryl trinitrate

● INDICATIONS AND DOSE

Prophylaxis of angina

- ▶ BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS
- ▶ Adult: 1 tablet, to be administered prior to activity likely to cause angina

Treatment of angina

- ▶ BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS
- ▶ Adult: 1 tablet, dose may be repeated at 5 minute intervals if required; if symptoms have not resolved after 3 doses, medical attention should be sought

Prophylaxis of angina

- ▶ BY SUBLINGUAL ADMINISTRATION USING AEROSOL SPRAY
- ▶ Adult: 400–800 micrograms, to be administered under the tongue and then close mouth prior to activity likely to cause angina

Treatment of angina

- ▶ BY SUBLINGUAL ADMINISTRATION USING AEROSOL SPRAY
- ▶ Adult: 400–800 micrograms, to be administered under the tongue and then close mouth, dose may be repeated at 5 minute intervals if required; if symptoms have not resolved after 3 doses, medical attention should be sought

Control of hypertension and myocardial ischaemia during and after cardiac surgery | Induction of controlled hypotension during surgery | Congestive heart failure | Unstable angina

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 10–200 micrograms/minute (max. per dose 400 micrograms/minute), adjusted according to response, consult product literature for recommended starting doses specific to indication

Anal fissure

- ▶ BY RECTUM USING OINTMENT
- ▶ Adult: Apply 2.5 centimetres every 12 hours until pain stops. Max. duration of use 8 weeks, apply to anal canal, 2.5 cm of ointment contains 1.5 mg of glyceryl trinitrate

DEPONIT®

Prophylaxis of angina

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: One '5' or one '10' patch to be applied to lateral chest wall, upper arm, thigh, abdomen, or shoulder; increase to two '10' patches every 24 hours if necessary, to be replaced every 24 hours, siting replacement patch on different area

MINITRAN®

Prophylaxis of angina

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: One '5' patch to be applied to chest or upper arm; replace every 24 hours, siting replacement patch on different area, dose to be adjusted according to response

continued →

Maintenance of venous patency ('5' patch only)

- BY TRANSDERMAL APPLICATION
- Adult: (consult product literature)

NITRO-DUR®**Prophylaxis of angina**

- BY TRANSDERMAL APPLICATION
- Adult: One '0.2mg/h' patch to be applied to chest or outer upper arm and replaced every 24 hours, siting replacement patch on different area, dose adjusted according to response; maximum 15 mg per day

PERCUTOL®**Prophylaxis of angina**

- TO THE SKIN
- Adult: Usual dose 1–2 inches every 3–4 hours as required, to be measured on to *Applirule®* and applied (usually to chest, arm, or thigh) without rubbing in and secured with surgical tape, approx. 800 micrograms/hour absorbed from 1 inch of ointment.

Prophylaxis of angina (to determine dose)

- TO THE SKIN
- Adult: ½ inch to be administered on first day then increased by ½ inch/day until headache occurs, then reduced by ½ inch, to be measured on to *Applirule®* and applied (usually to chest, arm, or thigh) without rubbing in and secured with surgical tape, approx. 800 micrograms/hour absorbed from 1 inch of ointment.

TRANSIDERM-NITRO®**Prophylaxis of angina**

- BY TRANSDERMAL APPLICATION
- Adult: One '5' or one '10' patch to be applied to lateral chest wall and replaced every 24 hours, siting replacement patch on different area, max. two '10' patches daily

Prophylaxis of phlebitis and extravasation ('5' patch only)

- BY TRANSDERMAL APPLICATION
- Adult: (consult product literature)

● **INTERACTIONS** → Appendix 1: nitrates● **PREGNANCY** Not known to be harmful.● **DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For *intravenous infusion (Nitrocline®, Nitronal®)*, give continuously in Glucose 5% or Sodium Chloride 0.9%. For *Nitrocline®*, suggested infusion concentration 100 micrograms/mL; incompatible with polyvinyl chloride infusion containers such as *Viaflex®* or *Steriflex®*; use glass or polyethylene containers or give via a syringe pump.

Glass or polyethylene apparatus is preferable; loss of potency will occur if PVC is used. Glyceryl trinitrate 1 mg/mL to be diluted before use or given undiluted with syringe pump. Glyceryl trinitrate 5 mg/mL to be diluted before use.

● **PRESCRIBING AND DISPENSING INFORMATION**

- With sublingual use Glyceryl trinitrate tablets are available in strengths of 300-, 500- and 600-micrograms—manufacturer advises tablets should be supplied in glass containers of not more than 100 tablets, closed with a foil-lined cap, and containing no cotton wool wadding; they should be discarded after 8 weeks in use.

● **PATIENT AND CARER ADVICE** Rectal ointment should be discarded 8 weeks after first opening.

PERCUTOL® Patients or carers should be given advice on how to administer glyceryl trinitrate ointment.

● **NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (January 2008) that glyceryl trinitrate 0.4% ointment (*Rectogesic®*)

is **not** recommended for use within NHS Scotland for the relief of pain associated with chronic anal fissure.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

Solution for infusion

EXCIPIENTS: May contain Ethanol, propylene glycol

► **Glyceryl trinitrate (Non-proprietary)**

Glyceryl trinitrate 1 mg per 1 ml Glyceryl trinitrate 50mg/50ml solution for infusion vials | 1 vial [PoM] £15.90

Glyceryl trinitrate 5 mg per 1 ml Glyceryl trinitrate 50mg/10ml solution for infusion ampoules | 5 ampoule [PoM] £64.90 (Hospital only)

Glyceryl trinitrate 25mg/5ml solution for infusion ampoules | 5 ampoule [PoM] £32.45 (Hospital only)

► **Nitrocline** (Aspire Pharma Ltd)

Glyceryl trinitrate 1 mg per 1 ml Nitrocline 10mg/10ml solution for infusion ampoules | 10 ampoule [PoM] £58.75 (Hospital only)

► **Nitronal** (Intrapharm Laboratories Ltd)

Glyceryl trinitrate 1 mg per 1 ml Nitronal 5mg/5ml solution for infusion ampoules | 10 ampoule [PoM] £18.04
Nitronal 50mg/50ml solution for infusion vials | 1 vial [PoM] £14.76

Sublingual tablet

F 217

Isosorbide dinitrate

● INDICATIONS AND DOSE

Prophylaxis and treatment of angina

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 30–120 mg daily in divided doses
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 2–10 mg/hour, increased if necessary up to 20 mg/hour
- ▶ BY SUBLINGUAL ADMINISTRATION USING AEROSOL SPRAY
- ▶ Adult: 1–3 sprays, to be administered under tongue whilst holding breath, allow a 30 second interval between each dose

Left ventricular failure

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 40–160 mg daily in divided doses, increased if necessary up to 240 mg daily in divided doses
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 2–10 mg/hour, increased if necessary up to 20 mg/hour

Prophylaxis of angina

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 40 mg daily in 1–2 divided doses, increased if necessary to 60–80 mg daily in 2–3 divided doses

● INTERACTIONS → Appendix 1: nitrates

● PREGNANCY May cross placenta—manufacturers advise avoid unless potential benefit outweighs risk.

● DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Isoket 0.05% [®], Isoket 0.1% [®]), give continuously in Glucose 5% or Sodium chloride 0.9%. Adsorbed to some extent by polyvinyl chloride infusion containers; preferably use glass or polyethylene containers or give via a syringe pump; Isoket 0.05% [®] can alternatively be administered undiluted using a syringe pump with a glass or rigid plastic syringe. Glass or polyethylene infusion apparatus is preferable; loss of potency if PVC used.

● MEDICINAL FORMS

Isosorbide mononitrate

● INDICATIONS AND DOSE

Prophylaxis of angina | Adjunct in congestive heart failure

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Initially 20 mg 2–3 times a day, alternatively initially 40 mg twice daily, increased if necessary up to 120 mg daily in divided doses

Prophylaxis of angina (for patients who have not previously had a nitrate) | Adjunct in congestive heart failure (for patients who have not previously had a nitrate)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Initially 10 mg twice daily, increased if necessary up to 120 mg daily in divided doses

CHEMYDUR [®] 60XL

Prophylaxis of angina

- ▶ BY MOUTH
- ▶ Adult: Initially 0.5 tablet daily for 2–4 days, to minimise possibility of headache, then 1 tablet daily, increased if necessary to 2 tablets daily, dose to be taken in the morning

ELANTAN [®] LA

Prophylaxis of angina

- ▶ BY MOUTH
- ▶ Adult: 25–50 mg once daily, then increased if necessary to 50–100 mg once daily, dose to be taken in the morning, the lowest effective dose should be used

IMDUR [®]

Prophylaxis of angina

- ▶ BY MOUTH
- ▶ Adult: Initially 0.5 tablet once daily, to minimise the occurrence of headache, then 1 tablet once daily, then increased if necessary to 2 tablets once daily, dose to be taken in the morning

ISIB [®] 60XL

Prophylaxis of angina

- ▶ BY MOUTH
- ▶ Adult: Initially 0.5 tablet once daily for 2–4 days, to minimise the occurrence of headache, then 1 tablet once daily, increased if necessary to 2 tablets once daily, dose to be taken in the morning

SYMPATHOMIMETICS > SYMPATHOMIMETICS, INTROPIC**Dobutamine**

- **DRUG ACTION** Dobutamine is a cardiac stimulant which acts on beta₁ receptors in cardiac muscle, and increases contractility.

● **INDICATIONS AND DOSE**

Inotropic support in infarction, cardiac surgery, cardiomyopathies, septic shock, cardiogenic shock, and during positive end expiratory pressure ventilation

► BY INTRAVENOUS INFUSION

- Adult: Usual dose 2.5–10 micrograms/kg/minute, adjusted according to response, alternatively 0.5–40 micrograms/kg/minute

Cardiac stress testing

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Pheochromocytoma
- **CAUTIONS** Acute heart failure · acute myocardial infarction · arrhythmias · correct hypercapnia before starting and during treatment · correct hypovolaemia before starting and during treatment · correct hypoxia before starting and during treatment · correct metabolic acidosis before starting and during treatment · diabetes mellitus · elderly · extravasation may cause tissue necrosis · extreme caution or avoid in marked obstruction of cardiac ejection (such as idiopathic hypertrophic subaortic stenosis) · hyperthyroidism · ischaemic heart disease · occlusive vascular disease · severe hypotension · susceptibility to angle-closure glaucoma · tachycardia · tolerance may develop with continuous infusions longer than 72 hours
- **INTERACTIONS** → Appendix 1: sympathomimetics, inotropic
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arrhythmias · bronchospasm · chest pain · dyspnoea · eosinophilia · fever · headache · inflammation localised · ischaemic heart disease · nausea · palpitations · platelet aggregation inhibition (on prolonged administration) · skin reactions · urinary urgency · vasoconstriction
 - ▶ **Uncommon** Myocardial infarction
 - ▶ **Rare or very rare** Atrioventricular block · cardiac arrest · coronary vasospasm · hypertension · hypokalaemia · hypotension
 - ▶ **Frequency not known** Anxiety · cardiomyopathy · feeling hot · myoclonus · paraesthesia · tremor
- **PREGNANCY** No evidence of harm in *animal* studies—manufacturers advise use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor serum-potassium concentration.
- **DIRECTIONS FOR ADMINISTRATION** Dobutamine injection should be diluted before use or given undiluted with syringe pump. Dobutamine concentrate for intravenous infusion should be diluted before use.

For *intravenous infusion*, give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of 0.5–1 mg/mL and give via an infusion pump; give higher concentration (max. 5 mg/mL) through central venous catheter; incompatible with bicarbonate and other strong alkaline solutions.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for infusion

EXCIPIENTS: May contain Sulfites

- ▶ **Dobutamine (Non-proprietary)**

Dobutamine (as Dobutamine hydrochloride) 5 mg per 1 ml Dobutamine 250mg/50ml solution for infusion vials | 1 vial [PoM] £7.50

Dobutamine (as Dobutamine hydrochloride) 12.5 mg per 1 ml Dobutamine 250mg/20ml concentrate for solution for infusion ampoules | 5 ampoule [PoM] £10.00–£26.25

7.1a Cardiac arrest

Cardiopulmonary resuscitation**Overview**

The algorithm for cardiopulmonary resuscitation (Life support algorithm (image) p. 1618) reflects the most recent recommendations of the Resuscitation Council (UK). These guidelines are available at www.resus.org.uk.

Cardiac arrest can be associated with ventricular fibrillation, pulseless ventricular tachycardia, asystole, and pulseless electrical activity (electromechanical dissociation). Adrenaline/epinephrine below 1 in 10000 (100 micrograms/mL) is recommended by intravenous injection repeated every 3–5 minutes if necessary. Administration through a central line results in a faster response than peripheral administration, however placement of a central line must not interfere with chest compressions; drugs administered peripherally must be followed by a flush of at least 20 mL Sodium Chloride 0.9% injection to aid entry into the central circulation. Intravenous injection of amiodarone hydrochloride p. 105 should be considered after adrenaline/epinephrine to treat ventricular fibrillation or pulseless ventricular tachycardia in cardiac arrest refractory to defibrillation. An additional dose of amiodarone hydrochloride can be given if necessary, followed by an intravenous infusion of amiodarone hydrochloride. Lidocaine hydrochloride p. 103, is an alternative if amiodarone hydrochloride is not available. Atropine sulfate p. 1295 is no longer recommended in the treatment of asystole or pulseless electrical activity.

During cardiopulmonary arrest if intravenous access cannot be obtained, the intraosseous route can be used instead. Drug administration via the endotracheal route is no longer recommended.

For the management of acute anaphylaxis, see allergic emergencies under Antihistamines, allergen immunotherapy and allergic emergencies p. 276.

SYMPATHOMIMETICS > VASOCONSTRICTOR**Adrenaline/epinephrine**

27-Sep-2017

- **DRUG ACTION** Acts on both alpha and beta receptors and increases both heart rate and contractility (beta, effects); it can cause peripheral vasodilation (a beta, effect) or vasoconstriction (an alpha effect).

- **INDICATIONS AND DOSE**

Cardiopulmonary resuscitation

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 1 mg every 3–5 minutes as required, a 1 in 10 000 (100 micrograms/mL) solution is recommended

Acute hypotension

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Neonate: Initially 100 nanograms/kg/minute, adjusted according to response, higher doses up to 1.5 micrograms/kg/minute have been used in acute hypotension.
- ▶ Child: Initially 100 nanograms/kg/minute, adjusted according to response, higher doses up to 1.5 micrograms/kg/minute have been used in acute hypotension

continued →

Emergency treatment of acute anaphylaxis (under expert supervision) | Angioedema (if laryngeal oedema is present) (under expert supervision)**► BY INTRAMUSCULAR INJECTION**

- Child 1 month–5 years: 150 micrograms, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, suitable syringe to be used for measuring small volume; injected preferably into the anterolateral aspect of the middle third of the thigh
- Child 6–11 years: 300 micrograms, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, to be injected preferably into the anterolateral aspect of the middle third of the thigh
- Child 12–17 years: 500 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, 300 micrograms (0.3 mL) to be administered if child small or prepubertal
- Adult: 500 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function

Acute anaphylaxis when there is doubt as to the adequacy of the circulation (specialist use only) | Angioedema (if laryngeal oedema is present) (specialist use only)**► BY SLOW INTRAVENOUS INJECTION**

- Adult: 50 micrograms, using 0.5 mL of the dilute 1 in 10 000 adrenaline injection, dose to be repeated according to response, if multiple doses required, adrenaline should be given as a slow intravenous infusion stopping when a response has been obtained

Control of bradycardia in patients with arrhythmias after myocardial infarction, if there is a risk of asystole, or if the patient is unstable and has failed to respond to atropine**► BY INTRAVENOUS INFUSION**

- Adult: 2–10 micrograms/minute, adjusted according to response

EMERADE® 150 MICROGRAMS**Acute anaphylaxis (for self-administration)****► BY INTRAMUSCULAR INJECTION**

- Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
- Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

EMERADE® 300 MICROGRAMS**Acute anaphylaxis (for self-administration)****► BY INTRAMUSCULAR INJECTION**

• UNLICENSED USE

- With intramuscular use for acute anaphylaxis in children Auto-injectors delivering 150-microgram dose of adrenaline may not be licensed for use in children with body-weight under 15 kg.
- With intravenous use for acute hypotension in children Adrenaline 1 in 1000 (1 mg/mL) solution is not licensed for intravenous administration.

IMPORTANT SAFETY INFORMATION**SAFE PRACTICE**

Intravenous route should be used with **extreme care** by specialists only.

MHRA/CHM ADVICE: ADRENALINE AUTO-INJECTORS: UPDATED ADVICE AFTER EUROPEAN REVIEW (AUGUST 2017)

Following a European review of all adrenaline auto-injectors approved in the EU, the MHRA recommend that 2 adrenaline auto-injectors are prescribed, which patients should carry at all times. This is particularly important for patients with allergic asthma, who are at increased risk of a severe anaphylactic reaction. Patients with allergies and their carers should be trained to use the particular auto-injector they have been prescribed and encouraged to practise using a trainer device. Patients are advised to check the expiry date of the adrenaline auto-injectors and obtain replacements before they expire.

- **CAUTIONS** Arteriosclerosis (in adults) • arrhythmias • cerebrovascular disease • cor pulmonale • diabetes mellitus • elderly • hypercalcaemia • hyperreflexia • hypertension • hyperthyroidism • hypokalaemia • ischaemic heart disease • obstructive cardiomyopathy • occlusive vascular disease • organic brain damage • pheochromocytoma • prostate disorders • psychoneurosis • severe angina • susceptibility to angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION Cautions listed are only for non-life-threatening situations.

- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

Angina pectoris · angle closure glaucoma · anxiety · appetite decreased · arrhythmias · asthenia · cardiomyopathy · CNS haemorrhage · confusion · dizziness · dry mouth · dyspnoea · headache · hepatic necrosis · hyperglycaemia · hyperhidrosis · hypersalivation · hypertension (increased risk of cerebral haemorrhage) · hypokalaemia · insomnia · intestinal necrosis · metabolic acidosis · mydriasis · myocardial infarction · nausea · pallor · palpitations · peripheral coldness · psychosis · pulmonary oedema (on excessive dosage or extreme sensitivity) · renal necrosis · soft tissue necrosis · tremor · urinary disorders · vomiting

SPECIFIC SIDE-EFFECTS

► **Frequency not known**

- With intramuscular use Muscle necrosis · necrotising fasciitis · peripheral ischaemia
- With intravenous use Hemiplegia · muscle rigidity

- **PREGNANCY** May reduce placental perfusion and cause tachycardia, cardiac irregularities, and extrasystoles in fetus. Can delay second stage of labour. Manufacturers advise use only if benefit outweighs risk.

- **BREAST FEEDING** Present in milk but unlikely to be harmful as poor oral bioavailability.

- **RENAL IMPAIRMENT** Manufacturers advise use with caution in severe impairment.

- **MONITORING REQUIREMENTS** Monitor blood pressure and ECG.

● **DIRECTIONS FOR ADMINISTRATION**

Acute hypotension

- With intravenous use in children For *continuous intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9% and give through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. *Neonatal intensive care*, dilute 3 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 100 nanograms/kg/minute; infuse through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. These infusions are usually made up with adrenaline 1 in 1000 (1 mg/mL) solution.
- Cardiopulmonary resuscitation
- With intravenous use in adults Administration through a central line results in a faster response than peripheral administration, however placement of a central line must not interfere with chest compressions; drugs administered peripherally must be followed by a flush of at least 20 mL Sodium Chloride 0.9% injection to aid entry into the central circulation.

- **PRESCRIBING AND DISPENSING INFORMATION** It is important, in acute anaphylaxis where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.

Great vigilance is needed to ensure that the *correct strength* of adrenaline injection is used; anaphylactic shock kits need to make a *very clear distinction* between the 1 in 10 000 strength and the 1 in 1000 strength.

Patients with severe allergy should be instructed in the self-administration of adrenaline by intramuscular injection.

Packs for self-administration need to be **clearly labelled with instructions** on how to administer adrenaline (intramuscularly, preferably at the midpoint of the outer thigh, through light clothing if necessary) so that in the case of rapid collapse someone else is able to give it. It is

important to ensure individuals at risk and their carers understand that:

- two injection devices should be carried at all times to treat symptoms until medical assistance is available; if, after the first injection, the individual does not start to feel better, the second injection should be given 5 to 15 minutes after the first;
- an ambulance should be called after every administration, even if symptoms improve;
- the individual should lie down with their legs raised (unless they have breathing difficulties, in which case they should sit up) and should not be left alone.

Adrenaline for administration by intramuscular injection is available in 'auto-injectors' (e.g. *Emerade*®, *EpiPen*®, or *Jext*®), pre-assembled syringes fitted with a needle suitable for very rapid administration (if necessary by a bystander or a healthcare provider if it is the only preparation available); injection technique is device specific.

To ensure patients receive the auto-injector device that they have been trained to use, prescribers should specify the brand to be dispensed.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Adrenaline auto-injector for anaphylaxis www.medicinesforchildren.org.uk/adrenaline-for-anaphylaxis

- With intramuscular use Individuals at considerable risk of anaphylaxis need to carry (or have available) adrenaline at all times and the patient, or their carers, need to be *instructed in advance* when and how to inject it.

The MHRA has produced an advice sheet on the use of adrenaline auto-injectors, which should be provided to patients and their carers.

JEXT® 300 MICROGRAMS 1.1 mL of the solution remains in the auto-injector device after use.

JEXT® 150 MICROGRAMS 1.25 mL of the solution remains in the auto-injector device after use.

EPIPEN® JR AUTO-INJECTOR 0.15MG 1.7 mL of the solution remains in the auto-injector device after use.

EMERADE® 150 MICROGRAMS 0.35 mL of the solution remains in the auto-injector device after use.

EMERADE® 500 MICROGRAMS No solution remains in the auto-injector device after use.

EMERADE® 300 MICROGRAMS 0.2 mL of the solution remains in the auto-injector device after use.

EPIPEN® AUTO-INJECTOR 0.3MG 1.7 mL of the solution remains in the auto-injector device after use.

- **EXCEPTIONS TO LEGAL CATEGORY** POM restriction does not apply to the intramuscular administration of up to 1 mg of adrenaline injection 1 in 1000 (1 mg/mL) for the emergency treatment of anaphylaxis.

● **MEDICINAL FORMS**

diuretic for this indication, although patients with stable and controlled blood pressure currently taking bendroflumethiazide can continue treatment.

Chlortalidone, a thiazide-related compound, has a longer duration of action than the thiazides and may be given on alternate days to control oedema. It is also useful if acute retention is liable to be precipitated by a more rapid diuresis or if patients dislike the altered pattern of micturition caused by other diuretics. Chlortalidone can also be used under close supervision for the treatment of ascites due to cirrhosis in stable patients.

Xipamide p. 231 and indapamide are chemically related to chlortalidone. Indapamide is claimed to lower blood pressure with less metabolic disturbance, particularly less aggravation of diabetes mellitus.

Metolazone p. 230 is particularly effective when combined with a loop diuretic (even in renal failure); profound diuresis can occur and the patient should therefore be monitored carefully.

The thiazide diuretics benzthiazide, clopamide, cyclopenthiazide p. 230, hydrochlorothiazide, and hydroflumethiazide do not offer any significant advantage over other thiazides and related diuretics.

Loop diuretics

Loop diuretics are used in pulmonary oedema due to left ventricular failure; intravenous administration produces relief of breathlessness and reduces pre-load sooner than would be expected from the time of onset of diuresis. Loop diuretics are also used in patients with chronic heart failure. Diuretic-resistant oedema (except lymphoedema and oedema due to peripheral venous stasis or calcium-channel blockers) can be treated with a loop diuretic combined with a thiazide or related diuretic (e.g. bendroflumethiazide or metolazone).

If necessary, a loop diuretic can be added to antihypertensive treatment to achieve better control of blood pressure in those with resistant hypertension, or in patients with impaired renal function or heart failure.

Loop diuretics can exacerbate diabetes (but hyperglycaemia is less likely than with thiazides) and gout. If there is an enlarged prostate, urinary retention can occur, although this is less likely if small doses and less potent diuretics are used initially.

Furosemide p. 226 and bumetanide p. 225 are similar in activity; both act within 1 hour of oral administration and diuresis is complete within 6 hours so that, if necessary, they can be given twice in one day without interfering with sleep. Following intravenous administration furosemide has a peak effect within 30 minutes. The diuresis associated with these drugs is dose related.

Torsemide p. 227 has properties similar to those of furosemide and bumetanide, and is indicated for oedema and for hypertension.

Potassium-sparing diuretics and aldosterone antagonists

Amiloride hydrochloride p. 228 and triamterene p. 229 on their own are weak diuretics. They cause retention of potassium and are therefore given with thiazide or loop diuretics as a more effective alternative to potassium supplements. See compound preparations with thiazides or loop diuretics.

Potassium supplements must **not** be given with potassium-sparing diuretics. Administration of a potassium sparing diuretic to a patient receiving an ACE inhibitor or an angiotensin-II receptor antagonist can also cause severe hyperkalaemia.

Aldosterone antagonists

Spironolactone p. 190 potentiates thiazide or loop diuretics by antagonising aldosterone; it is a potassium-sparing diuretic. Spironolactone is of value in the treatment of

8 Oedema

Diuretics

Overview

Thiazides are used to relieve oedema due to chronic heart failure and, in lower doses, to reduce blood pressure.

Loop diuretics are used in pulmonary oedema due to left ventricular failure and in patients with chronic heart failure.

Combination diuretic therapy may be effective in patients with oedema resistant to treatment with one diuretic. Vigorous diuresis, particularly with loop diuretics, may induce acute hypotension; rapid reduction of plasma volume should be avoided.

Thiazides and related diuretics

Thiazides and related compounds are moderately potent diuretics; they inhibit sodium reabsorption at the beginning of the distal convoluted tubule. They act within 1 to 2 hours of oral administration and most have a duration of action of 12 to 24 hours; they are usually administered early in the day so that the diuresis does not interfere with sleep.

In the management of *hypertension* a low dose of a thiazide produces a maximal or near-maximal blood pressure lowering effect, with very little biochemical disturbance. Higher doses cause more marked changes in plasma potassium, sodium, uric acid, glucose, and lipids, with little advantage in blood pressure control. Chlortalidone p. 229 and indapamide p. 166 are the preferred diuretics in the management of hypertension. Thiazides also have a role in chronic heart failure.

Bendroflumethiazide p. 165 can be used for mild or moderate heart failure; it is licensed for the treatment of hypertension but is no longer considered the first-line

oedema and ascites caused by cirrhosis of the liver; furosemide can be used as an adjunct. Low doses of spironolactone are beneficial in moderate to severe heart failure and when used in resistant hypertension [unlicensed indication].

Spironolactone is also used in primary hyperaldosteronism (Conn's syndrome). It is given before surgery or if surgery is not appropriate, in the lowest effective dose for maintenance.

Eplerenone p. 190 is licensed for use as an adjunct in left ventricular dysfunction with evidence of heart failure after a myocardial infarction; it is also licensed as an adjunct in chronic mild heart failure with left ventricular systolic dysfunction.

Potassium supplements must **not** be given with aldosterone antagonists

Potassium-sparing diuretics with other diuretics

Although it is preferable to prescribe thiazides and potassium-sparing diuretics separately, the use of fixed combinations may be justified if compliance is a problem. Potassium-sparing diuretics are not usually necessary in the routine treatment of hypertension, unless hypokalaemia develops.

Other diuretics

Mannitol p. 228 is an osmotic diuretic that can be used to treat cerebral oedema and raised intra-ocular pressure.

Mercurial diuretics are effective but are now almost never used because of their nephrotoxicity.

The carbonic anhydrase inhibitor acetazolamide p. 1147 is a weak diuretic and is little used for its diuretic effect. It is used for prophylaxis against mountain sickness [unlicensed indication] but is not a substitute for acclimatisation.

Eye drops of dorzolamide p. 1148 and brinzolamide p. 1147 inhibit the formation of aqueous humour and are used in glaucoma.

Diuretics with potassium

Many patients on diuretics do not need potassium supplements. For many of those who do, the amount of potassium in combined preparations may not be enough, and for this reason their use is to be discouraged.

Diuretics with potassium and potassium-sparing diuretics should **not** usually be given together. Diuretics and potassium supplements should be prescribed separately for children.

Other drugs used for Oedema Diamorphine hydrochloride, p. 449

DIURETICS > LOOP DIURETICS

Loop diuretics

• **DRUG ACTION** Loop diuretics inhibit reabsorption from the ascending limb of the loop of Henlé in the renal tubule and are powerful diuretics.

• **CONTRA-INDICATIONS** Anuria • comatose and precomatose states associated with liver cirrhosis • renal failure due to nephrotoxic or hepatotoxic drugs • severe hypokalaemia • severe hyponatraemia

• **CAUTIONS** Can exacerbate diabetes (but hyperglycaemia less likely than with thiazides) • can exacerbate gout • hypotension should be corrected before initiation of treatment • hypovolaemia should be corrected before initiation of treatment • urinary retention can occur in prostatic hyperplasia

CAUTIONS, FURTHER INFORMATION

• **Elderly** Lower initial doses of diuretics should be used in the elderly because they are particularly susceptible to the

side-effects. The dose should then be adjusted according to renal function. Diuretics should not be used continuously on a long-term basis to treat simple gravitational oedema (which will usually respond to increased movement, raising the legs, and support stockings).

• **Potassium loss** Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic.

Hypokalaemia is dangerous in severe cardiovascular disease and in patients also being treated with cardiac glycosides. Often the use of potassium-sparing diuretics avoids the need to take potassium supplements.

In hepatic failure, hypokalaemia caused by diuretics can precipitate encephalopathy, particularly in alcoholic cirrhosis.

• **Urinary retention** If there is an enlarged prostate, urinary retention can occur, although this is less likely if small doses and less potent diuretics are used initially; an adequate urinary output should be established before initiating treatment.

• SIDE-EFFECTS

• **Common or very common** Asthenia • dehydration • dizziness • electrolyte imbalance • gastrointestinal disorder • headache • hypotension • metabolic alkalosis • muscle complaints • nausea • skin reactions

• **Uncommon** Bladder dilation • breast pain • chest discomfort • diarrhoea • ear pain • urinary disorders • vertigo

• **Rare or very rare** Bone marrow disorders • hearing impairment • photosensitivity reaction

• **Frequency not known** Acute kidney injury • agranulocytosis • anaemia • arthralgia • auditory disorder (more common with rapid intravenous administration, and in renal impairment) • cerebral ischaemia • confusion • deafness (more common in renal impairment) • diabetes mellitus • dry mouth • embolism • encephalopathy • eosinophilia • fever • gastrointestinal discomfort • gout • gynaecomastia • haemolytic anaemia • hepatic disorders • hyperglycaemia • hyperuricaemia • ischaemic heart disease • leucopenia • malaise • metabolic acidosis • mucosal reaction • musculoskeletal pain (with high doses in renal failure) • myocardial infarction • nephritis tubulointerstitial • pancreatitis • paraesthesia • psychiatric disorder • severe cutaneous adverse reactions (SCARs) • shock • syncope • tetany • thrombocytopenia • tinnitus (more common with rapid intravenous administration, and in renal impairment) • vasculitis • visual impairment • vomiting

• **HEPATIC IMPAIRMENT** Hypokalaemia induced by loop diuretics may precipitate hepatic encephalopathy and coma—potassium-sparing diuretics can be used to prevent this. Diuretics can increase the risk of hypomagnesaemia in alcoholic cirrhosis, leading to arrhythmias.

• **RENAL IMPAIRMENT** High doses or rapid intravenous administration can cause tinnitus and deafness.

Dose adjustments High doses of loop diuretics may occasionally be needed in renal impairment.

• **MONITORING REQUIREMENTS** Monitor electrolytes during treatment.

➤ above

Bumetanide

• INDICATIONS AND DOSE

Oedema

➤ BY MOUTH

• **Adult:** 1 mg, dose to be taken in the morning, then 1 mg after 6–8 hours if required

• **Elderly:** 500 micrograms daily, this lower dose may be sufficient in elderly patients

continued ➔

Oedema, severe cases

- **BY MOUTH**
- **Adult:** Initially 5 mg daily, increased in steps of 5 mg every 12–24 hours, adjusted according to response

- **INTERACTIONS** → Appendix 1: loop diuretics
- **PREGNANCY** Bumetanide should not be used to treat gestational hypertension because of the maternal hypovolaemia associated with this condition.
- **BREAST FEEDING** No information available. May inhibit lactation.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Oral solution

- **Bumetanide (Non-proprietary)**
Bumetanide 200 microgram per 1 ml Bumetanide 1mg/5ml oral solution sugar free sugar-free | 150 ml [PoM] £198.00 DT = £198.00

9 Vascular disease

Peripheral vascular disease

Classification and management

Peripheral vascular disease can be either occlusive (e.g. *intermittent claudication*) in which occlusion of the peripheral arteries is caused by atherosclerosis, or vasospastic (e.g. *Raynaud's syndrome*). Peripheral arterial occlusive disease is associated with an increased risk of cardiovascular events; this risk is reduced by measures such as smoking cessation, effective control of blood pressure, regulating blood lipids, optimising glycaemic control in diabetes, taking aspirin p. 121 in a dose of 75 mg daily, and possibly weight reduction in obesity. Exercise training can improve symptoms of intermittent claudication; revascularisation procedures may be appropriate.

Naftidrofuryl oxalate p. 233 can alleviate symptoms of intermittent claudication and improve pain-free walking distance in moderate disease. Patients taking naftidrofuryl oxalate should be assessed for improvement after 3–6 months.

Cilostazol below is licensed for use in intermittent claudication to improve walking distance in patients without peripheral tissue necrosis who do not have pain at rest; use is restricted to second-line treatment where lifestyle modifications and other appropriate interventions have failed to improve symptoms. Cilostazol should be initiated by those experienced in the management of intermittent claudication. Patients receiving cilostazol should be assessed for improvement after 3 months; consider discontinuation of

treatment if there is no clinically relevant improvement in walking distance.

Inositol nicotinate p. 232 and pentoxifylline p. 233 are not established as being effective for the treatment of intermittent claudication.

Intravenous iloprost p. 183 [unlicensed] is a treatment option for critical limb ischaemia in patients unsuitable for surgery.

Management of *Raynaud's syndrome* includes avoidance of exposure to cold and stopping smoking. More severe symptoms may require vasodilator treatment, which is most often successful in primary Raynaud's syndrome. Nifedipine p. 162 is useful for reducing the frequency and severity of vasospastic attacks. Alternatively, naftidrofuryl oxalate may produce symptomatic improvement; inositol nicotinate (a nicotinic acid derivative) may also be considered. Pentoxifylline, prazosin p. 766, and moxislyte p. 232 are not established as being effective for the treatment of Raynaud's syndrome.

Vasodilator therapy is not established as being effective for *chilblains*.

ANTITHROMBOTIC DRUGS > ANTIPLATELET DRUGS

Cilostazol

● INDICATIONS AND DOSE

Intermittent claudication in patients without rest pain and no peripheral tissue necrosis

► BY MOUTH

- Adult: 100 mg twice daily, to be taken 30 minutes before food, cilostazol should be initiated by those experienced in the management of intermittent claudication, patients receiving cilostazol should be assessed for improvement after 3 months; consider discontinuation of treatment if there is no clinically relevant improvement in walking distance

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose to 50 mg twice daily with concurrent use of potent inhibitors of CYP3A4, potent inhibitors of CYP2C19, omeprazole and erythromycin.

- **CONTRA-INDICATIONS** Active peptic ulcer · congestive heart failure · coronary intervention in previous 6 months · haemorrhagic stroke in previous 6 months · history of severe tachyarrhythmia · myocardial infarction in previous 6 months · poorly controlled hypertension · predisposition to bleeding · proliferative diabetic retinopathy · prolongation of QT interval · severe atrial flutter · unstable angina

- **CAUTIONS** Atrial fibrillation · atrial or ventricular ectopy · diabetes mellitus (higher risk of intraocular bleeding) · mild to moderate atrial flutter · stable coronary disease · surgery

- **INTERACTIONS** → Appendix 1: cilostazol

● SIDE-EFFECTS

- **Common or very common** Appetite decreased · arrhythmias · diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders · headache · increased risk of infection · nausea · oedema · palpitations · skin reactions · vomiting
- **Uncommon** Anaemia · anxiety · congestive heart failure · cough · dyspnoea · haemorrhage · hyperglycaemia · hypotension · sleep disorders · syncope
- **Rare or very rare** Renal impairment · thrombocytosis
- **Frequency not known** Agranulocytosis · bone marrow disorders · conjunctivitis · fever · granulocytopenia · hepatic disorders · hot flush · hypertension · intracranial haemorrhage · leucopenia · paresis · severe cutaneous

adverse reactions (SCARs) · thrombocytopenia · tinnitus · urinary frequency increased

- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Avoid in moderate or severe liver disease.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 25 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE**
Blood disorders Patients should be advised to report any unexplained bleeding, bruising, sore throat, or fever.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ Cilostazol, naftidrofuryl oxalate, pentoxifylline and inositol nicotinate for the treatment of intermittent claudication in people with peripheral arterial disease (May 2011) NICE TA223
Cilostazol is not recommended for the treatment of intermittent claudication in patients with peripheral arterial disease; patients currently receiving this treatment should have the option to continue until they and their clinician consider it appropriate to stop.
www.nice.org.uk/TA223

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2005) that cilostazol is not recommended for the treatment of intermittent claudication within NHS Scotland.

NICE decisions

- ▶ Cilostazol, naftidrofuryl oxalate, pentoxifylline and inositol nicotinate for the treatment of intermittent claudication in people with peripheral arterial disease (May 2011) NICE TA223
Inositol nicotinate is not recommended for the treatment of intermittent claudication in patients with peripheral arterial disease; patients currently receiving treatment should have the option to continue until they and their clinician consider it appropriate to stop.
www.nice.org.uk/TA223

- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Capsule

▶ Inositol nicotinate (Non-proprietary)

Inositol nicotinate 500 mg Solgar No-Flush Niacin 500mg capsules | 50 capsule [N]

VASODILATORS > FLAVONOIDS

Oxerutins

● INDICATIONS AND DOSE

Relief of symptoms of oedema associated with chronic venous insufficiency

- ▶ BY MOUTH
- ▶ Adult: 500 mg twice daily

● SIDE-EFFECTS

- ▶ **Rare or very rare** Alopecia · arthralgia · diarrhoea · dizziness · fatigue · flushing · gastrointestinal discomfort · gastrointestinal disorders · headache · photosensitivity reaction · skin reactions

- **LESS SUITABLE FOR PRESCRIBING** Oxerutins (rutosides) are not vasodilators and are not generally regarded as effective preparations as capillary sealants or for the treatment of cramps; they are less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

▶ Paroven (GlaxoSmithKline Consumer Healthcare)

Oxerutins 250 mg Paroven 250mg capsules | 120 capsule [P]
£24.61 DT = £24.61

VASODILATORS > PERIPHERAL VASODILATORS

Moxisylyte

(Thymoxamine)

● INDICATIONS AND DOSE

Primary Raynaud's syndrome (short-term treatment)

- ▶ BY MOUTH
- ▶ Adult: Initially 40 mg 4 times a day, increased if necessary to 80 mg 4 times a day, increase dose if poor initial response, discontinue after 2 weeks if no response

- **CONTRA-INDICATIONS** Active liver disease

- **CAUTIONS** Diabetes mellitus

- **INTERACTIONS** → Appendix 1: moxisylyte

● SIDE-EFFECTS

- ▶ **Rare or very rare** Hepatic disorders · rash
- ▶ **Frequency not known** Diarrhoea · flushing · headache · nausea · vertigo

- **PREGNANCY** Manufacturer advises avoid.

- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

Pentoxifylline

(Oxpentifylline)

INDICATIONS AND DOSE

Peripheral vascular disease | Venous leg ulcer (adjunct)

- ▶ BY MOUTH

- ▶ Adult: 400 mg 2–3 times a day

- **UNLICENSED USE** Use of pentoxifylline as adjunct therapy for venous leg ulcers is an unlicensed indication.

- **CONTRA-INDICATIONS** Acute myocardial infarction · cerebral haemorrhage · extensive retinal haemorrhage · severe cardiac arrhythmias

- **CAUTIONS** Avoid in Acute porphyrias p. 1025 · coronary artery disease · diabetes (may lower blood glucose) · hypotension

- **INTERACTIONS** → Appendix 1: pentoxifylline

- **SIDE-EFFECTS** Agitation · angina pectoris · angioedema · arrhythmias · bronchospasm · cholestasis · constipation · diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorder · haemorrhage · headache · hot flush · hypersalivation · hypotension · leucopenia · meningitis aseptic · nausea · neutropenia · skin reactions · sleep disorder · thrombocytopenia · vomiting

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Present in milk—manufacturer advises use only if potential benefit outweighs risk.

HEPATIC IMPAIRMENT

Dose adjustments Manufacturer advises reduce dose in severe impairment.

RENAL IMPAIRMENT

Dose adjustments Reduce dose by 30–50% if eGFR less than 30 mL/minute/1.73 m².

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Cilostazol, naftidrofuryl oxalate, pentoxifylline and isosinonitrate for the treatment of intermittent claudication in people with peripheral arterial disease (May 2011) NICE TA223 Pentoxifylline is not recommended for the treatment of intermittent claudication in patients with peripheral arterial disease; patients currently receiving this treatment should have the option to continue until they and their clinician consider it appropriate to stop.

Respiratory system, drug delivery

Inhalation

This route delivers the drug directly to the airways; the dose required is smaller than when given by mouth and side-effects are reduced.

Inhaler devices

These include *pressurised metered-dose inhalers*, *breath-actuated inhalers*, and *dry powder inhalers*. Many patients can be taught to use a pressurised metered-dose inhaler effectively but some patients, particularly the elderly and children, find them difficult to use. *Spacer devices* can help such patients because they remove the need to co-ordinate actuation with inhalation. Dry powder inhalers may be useful in adults and children over 5 years who are unwilling or unable to use a pressurised metered-dose inhaler. Alternatively, breath-actuated inhalers are suitable for adults and older children provided they can use the device effectively.

Pressurised metered-dose inhalers are an effective and convenient method of drug administration in mild to moderate asthma.

On changing from a pressurised metered-dose inhaler to a dry powder inhaler, patients may notice a lack of sensation in the mouth and throat previously associated with each actuation. Coughing may also occur.

The patient should be instructed carefully on the use of the inhaler and it is important to check that the inhaler continues to be used correctly because inadequate inhalation technique may be mistaken for a lack of response to the drug.

Spacer devices

Spacer devices remove the need for coordination between actuation of a pressurised metered-dose inhaler and inhalation. The spacer device reduces the velocity of the aerosol and subsequent impaction on the oropharynx and allows more time for evaporation of the propellant so that a larger proportion of the particles can be inhaled and deposited in the lungs. Spacer devices are particularly useful for patients with poor inhalation technique, for children, for patients requiring high doses of inhaled corticosteroids, for nocturnal asthma, and for patients prone to candidiasis with inhaled corticosteroids. The size of the spacer is important, the larger spacers with a one-way valve (*Volumatic*®) being most effective. It is important to prescribe a spacer device that is compatible with the metered-dose inhaler, see devices below. Spacer devices should not be regarded as interchangeable; patients should be advised not to switch between spacer devices.

Use and care of spacer devices

Patients should inhale from the spacer device as soon as possible after actuation because the drug aerosol is very short-lived; single-dose actuation is recommended. Tidal breathing is as effective as single breaths. The device should be cleaned once a month by washing in mild detergent and then allowed to dry in air without rinsing; the mouthpiece should be wiped clean of detergent before use. Some manufacturers recommend more frequent cleaning, but this should be avoided since any electrostatic charge may affect drug delivery. Spacer devices should be replaced every 6–12 months.

Respiratory drug delivery, nebulisers

Solutions for nebulisation are available for use in severe acute asthma. They are administered over 5–10 minutes from a nebuliser usually driven by oxygen in hospital.

Patients with a severe attack of asthma should preferably have oxygen during nebulisation since beta₂ agonists can increase arterial hypoxaemia.

A nebuliser converts a solution of a drug into an aerosol for inhalation. It is used to deliver higher doses of drug to the airways than is usual with standard inhalers. The main indications for use of a nebuliser are to deliver:

- a beta₂ agonist or ipratropium bromide p. 246 to a patient with an *acute exacerbation* of asthma or of chronic obstructive pulmonary disease;
- a beta₂ agonist, corticosteroid, or ipratropium bromide on a *regular basis* to a patient with severe asthma or reversible airways obstruction when the patient is unable to use other inhalational devices;
- an antibiotic (such as colistimethate sodium p. 546) or a mucolytic to a patient with cystic fibrosis;
- Budesonide p. 259 or adrenaline/epinephrine p. 221 to a child with severe croup;
- Pentamidine isetionate p. 591 for the prophylaxis and treatment of pneumocystis pneumonia.

The use of nebulisers in chronic persistent asthma and chronic obstructive pulmonary disease should be considered only:

- after a review of the diagnosis;
- after review of therapy (see also Chronic Obstructive Pulmonary Disease) and the patient's ability to use hand-held devices;
- after increased doses of inhaled therapy from hand-held inhalers (with a spacer if necessary) have been tried for 2 weeks;
- if the patient remains breathless, despite correctly using optimal therapy.

Before prescribing a nebuliser, a home trial should preferably be undertaken to monitor response for up to 2 weeks on

standard treatment and up to 2 weeks on nebulised treatment. If prescribed, patients must:

- have clear instructions from a doctor, specialist nurse, physiotherapist, or pharmacist on the use of the nebuliser (including maintenance and cleaning) and on peak-flow monitoring;
- be instructed not to treat acute attacks at home without also seeking help;
- have regular follow up by a doctor, specialist nurse or physiotherapist after about 1 month and annually thereafter.

The proportion of a nebuliser solution that reaches the lungs depends on the type of nebuliser and although it can be as high as 30%, it is more frequently close to 10% and sometimes below 10%. The remaining solution is left in the nebuliser as residual volume or is deposited in the mouthpiece and tubing. The extent to which the nebulised solution is deposited in the airways or alveoli depends on the droplet size, pattern of breath inhalation, and condition of the lung. Droplets with a mass median diameter of 1–5 microns are deposited in the airways and are therefore appropriate for asthma, whereas a particle size of 1–2 microns is needed for alveolar deposition of pentamidine isetionate to combat pneumocystis infection. The type of nebuliser is therefore chosen according to the deposition required and according to the viscosity of the solution.

Jet nebulisers

Jet nebulisers are more widely used than ultrasonic nebulisers. Most jet nebulisers require an optimum gas flow rate of 6–8 litres/minute and in hospital can be driven by piped air or oxygen; in acute asthma the nebuliser should be driven by oxygen. Domiciliary oxygen cylinders do not provide an adequate flow rate therefore an electrical compressor is required for domiciliary use.

For patients at risk of hypercapnia, such as those with chronic obstructive pulmonary disease, oxygen can be dangerous and the nebuliser should be driven by air. If oxygen is required, it should be given simultaneously by nasal cannula.

Tubing

The Department of Health has reminded users of the need to use the correct grade of tubing when connecting a nebuliser to a medical gas supply or compressor.

Ultrasonic nebulisers

Ultrasonic nebulisers produce an aerosol by ultrasonic vibration of the drug solution and therefore do not require a gas flow; they are not suitable for the nebulisation of some drugs, such as domes alpha p. 292 and nebulised suspensions.

Nebuliser diluent

Nebulisation may be carried out using an undiluted nebuliser solution or it may require dilution beforehand. The usual diluent is sterile sodium chloride 0.9% (physiological saline).

In England and Wales nebulisers and compressors are not available on the NHS (but they are free of VAT); some nebulisers (but not compressors) are available on form GP10A in Scotland (for details consult Scottish Drug Tariff).

Oral

The oral route is used when administration by inhalation is not possible. Systemic side-effects occur more frequently when a drug is given orally rather than by inhalation. Drugs given by mouth for the treatment of asthma include beta₂ agonists, corticosteroids, theophylline p. 273, and leukotriene receptor antagonists.

Parenteral

Drugs such as beta₂ agonists, corticosteroids, and aminophylline p. 272 can be given by injection in acute severe asthma when administration by nebulisation is inadequate or inappropriate. If the patient is being treated in

the community, urgent transfer to hospital should be arranged.

Peak flow meters

When used in addition to symptom-based monitoring, peak flow monitoring has not been proven to improve asthma control in either adults or children, however measurement of peak flow may be of benefit in adult patients who are 'poor perceivers' and hence slow to detect deterioration in their asthma, and for those with more severe asthma.

When peak flow meters are used, patients must be given clear guidelines as to the action they should take if their peak flow falls below a certain level. Patients can be encouraged to adjust some of their own treatment (within specified limits) according to changes in peak flow rate.

Peak flow charts should be issued to patients where appropriate, and are available to purchase from:

3M Security Print and Systems Limited, Gorse Street, Chadderton, Oldham, OL9 9QH. Tel: 0845 610 1112

GP practices can obtain supplies through their Area Team stores.

NHS Hospitals can order supplies from www.nhsforms.co.uk/ or by emailing nhsforms@mmm.com.

In Scotland, peak flow charts can be obtained by emailing stockorders.dppas@apsgroup.co.uk.

NICE decisions

Inhaler devices for children under 5 years with chronic asthma (August 2000) NICE TA10

When selecting inhaler devices for children under 5 years with chronic asthma, a child's needs and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

- corticosteroid and bronchodilator therapy should be delivered by pressurised metered-dose inhaler and spacer device, with a facemask if necessary;
- if this is not effective, and depending on the child's condition, nebulised therapy may be considered and, in children over 3 years, a dry powder inhaler may also be considered.

www.nice.org.uk/TA10

Inhaler devices for children 5–15 years with chronic asthma (March 2002) NICE TA38

When selecting inhaler devices for children between 5–15 years with chronic asthma, a child's needs, ability to develop and maintain effective technique, and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

- corticosteroid therapy should be routinely delivered by a pressurised metered-dose inhaler and spacer device;
- for other inhaled drugs, particularly bronchodilators, a wider range of devices should be considered;
- children and their carers should be trained in the use of the chosen device; suitability of the device should be reviewed at least annually. Inhaler technique and compliance should be monitored.

www.nice.org.uk/TA38

1 Airways disease, obstructive

Asthma, chronic

05-Apr-2018

Description of condition

Asthma is a common chronic inflammatory condition of the airways, associated with airway hyperresponsiveness and variable airflow obstruction. The most frequent symptoms of asthma are cough, wheeze, chest tightness, and

breathlessness. Asthma symptoms vary over time and in intensity and can gradually or suddenly worsen, provoking an acute asthma attack that, if severe, may require hospitalisation.

Aims of treatment

The aim of treatment is to achieve control of asthma. Complete control of asthma is defined as no daytime symptoms, no night-time awakening due to asthma, no asthma attacks, no need for rescue medication, no limitations on activity including exercise, normal lung function (in practical terms forced expiratory volume in 1 second (FEV₁) and/or peak expiratory flow (PEF) > 80% predicted or best), and minimal side-effects from treatment. In clinical practice, patients may choose to balance the aims of asthma management against the potential side-effects or inconvenience of taking medication necessary to achieve perfect control.

Lifestyle changes

EvGr Weight loss in overweight patients may lead to an improvement in asthma symptoms. Parents with asthma should be advised about the danger of smoking, to themselves and to their children with asthma, and be offered appropriate support to stop smoking. Breathing exercise programmes (including physiotherapist-taught methods) can be offered as an adjuvant to drug treatment to improve quality of life and reduce symptoms. **A**

Management

EvGr A stepwise approach aims to stop symptoms quickly and to improve peak flow. Treatment should be started at the level most appropriate to initial severity of asthma. The aim is to achieve early control and to maintain it by stepping up treatment as necessary and decreasing treatment when control is good. Before initiating a new drug or adjusting treatment consider whether diagnosis is correct, check adherence and inhaler technique, and eliminate trigger factors for acute attacks.

A self-management programme comprising of a written personalised action plan and education should be offered to all patients with asthma (and/or their family or carers). **A**

Recommendations on the management of chronic asthma from the *National Institute for Health and Care Excellence (NICE)—Asthma: diagnosis, monitoring and chronic asthma management guidelines* (NG80, November 2017), and *British Thoracic Society (BTS) and Scottish Intercollegiate Guidelines Network (SIGN)—British guideline on the management of asthma* (SIGN 153, September 2016) differ significantly. Recommendations in BNF publications are based on NICE guidelines, and differences with BTS/SIGN (2016) have been highlighted.

Adult

NICE (2017) treatment recommendations for adults apply to patients aged 17 years and over. BTS/SIGN (2016) treatment recommendations for adults apply to patients over 12 years.

Intermittent reliever therapy

EvGr Start an inhaled short-acting beta₂ agonist (such as salbutamol p. 252 or terbutaline sulfate p. 254), to be used as required, in all patients with asthma. For those with infrequent short-lived wheeze, occasional use of reliever therapy may be the only treatment required. Patients using more than one short-acting beta₂ agonist inhaler device a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma. **A**

Regular preventer (maintenance) therapy

NICE (2017) define inhaled corticosteroid doses for adults as low, moderate, or high. BTS/SIGN (2016) instead define inhaled corticosteroid doses for adults as low, medium or high (refer to individual guidelines for inhaled corticosteroid dosing information).

EvGr A low dose of inhaled corticosteroid should be started as maintenance therapy in patients who present with any one of the following features: using an inhaled short-acting beta₂ agonist three times a week or more, symptomatic three times a week or more, or waking at night due to asthma symptoms at least once a week. BTS/SIGN (2016) also recommend initiation in patients who have had an asthma attack in the last 2 years, and starting inhaled corticosteroids at a dose appropriate to the severity of asthma.

BTS/SIGN (2016) recommend that inhaled corticosteroids (except ciclesonide p. 262) should be initially taken twice daily, however, the same total daily dose, taken once a day, can be considered in patients with milder disease if good or complete control of asthma is established. The dose of inhaled corticosteroid should be adjusted over time to the lowest effective dose at which control of asthma is maintained.

BTS/SIGN (2016) recommend the prescribing of inhalers by brand. **A**

Initial add-on therapy

EvGr If asthma is uncontrolled on a low dose of inhaled corticosteroid as maintenance therapy, a leukotriene receptor antagonist (such as montelukast p. 268 or zafirlukast p. 269) should be offered in addition to the inhaled corticosteroid, and the response to treatment reviewed in 4 to 8 weeks.

BTS/SIGN (2016) instead recommend a long-acting beta₂ agonist (LABA—such as salmeterol p. 251 or formoterol fumarate p. 250) as initial add-on therapy to inhaled corticosteroids if asthma is uncontrolled. **A**

Additional add-on therapy

EvGr If asthma is uncontrolled on a low dose of inhaled corticosteroid and a leukotriene receptor antagonist as maintenance therapy, a LABA in combination with the inhaled corticosteroid should be offered with or without continued leukotriene receptor antagonist treatment, depending on the response achieved from the leukotriene receptor antagonist.

If asthma remains uncontrolled, offer to change the inhaled corticosteroid and LABA maintenance therapy to a MART regimen (Maintenance And Reliever Therapy—a combination of an inhaled corticosteroid and a fast-acting LABA such as formoterol in a single inhaler), with a low dose of inhaled corticosteroid as maintenance. See beclomethasone with formoterol p. 258 and budesonide with formoterol p. 260.

If asthma remains uncontrolled on a MART regimen with a low dose of inhaled corticosteroid as maintenance with or without a leukotriene antagonist, consider increasing to a moderate dose of inhaled corticosteroid (either continuing a MART regimen or changing to a fixed-dose regimen of an inhaled corticosteroid and a LABA, with a short-acting beta₂ agonist as reliever therapy).

If asthma is still uncontrolled in patients on a moderate dose of inhaled corticosteroid as maintenance with a LABA (either as MART or a fixed-dose regimen), with or without a leukotriene receptor antagonist, consider the following options:

- increasing the inhaled corticosteroid dose to a high-dose as maintenance (this should only be offered as part of a fixed-dose regimen, with a short-acting beta₂ agonist used as a reliever therapy), or
- a trial of an additional drug, for example, a long-acting muscarinic receptor antagonist (such as tiotropium p. 247) or modified-release theophylline p. 273, or
- seek advice from an asthma specialist.

BTS/SIGN (2016) instead recommend that if the patient is gaining some benefit from addition of a LABA but control remains inadequate, that the LABA be continued and the dose of inhaled corticosteroid be increased to a medium-dose, if not already on this dose. If increasing the dose of inhaled corticosteroid is ineffective, consider continuing on

a low dose of inhaled corticosteroid and a LABA and try adding a leukotriene receptor antagonist, or a long-acting muscarinic receptor antagonist, or modified-release theophylline p. 273.

If there is no response to the LABA, discontinue it and increase the dose of the inhaled corticosteroid to a medium-dose, if not already on this dose. If increasing the dose of inhaled corticosteroid is ineffective, consider continuing on a low dose of inhaled corticosteroid and try adding a leukotriene receptor antagonist or a long-acting muscarinic receptor antagonist. [▲](#)

High-dose inhaled corticosteroids and further add-on treatment

[EvGr](#) BTS/SIGN (2016) recommend that if control remains inadequate on a combination of short-acting beta₂ agonist as required, a medium dose of inhaled corticosteroid, plus an additional drug, usually a LABA, to consider the following interventions:

- increase the inhaled corticosteroid to a high-dose—with high doses of inhaled corticosteroid via a pressurised metered dose inhaler (pMDI), a spacer should be used, or
- add a leukotriene receptor antagonist, or
- add modified-release theophylline p. 273, or
- add tiotropium p. 247.

If a trial of a further add-on treatment is ineffective, stop the drug (or in the case of increased dose of inhaled corticosteroid, reduce to the original dose) and refer to specialist care. [▲](#)

Continuous or frequent use of oral corticosteroids

[EvGr](#) BTS/SIGN (2016) recommend adding a regular oral corticosteroid (prednisolone p. 664) at the lowest dose to provide adequate control (under specialist care) in patients with very severe asthma uncontrolled on high-dose inhaled corticosteroids, and who have also tried (or are still receiving) a LABA, a leukotriene receptor antagonist, or modified-release theophylline p. 273. [▲](#)

Monoclonal antibodies and immunosuppressants

[EvGr](#) BTS/SIGN (2016) recommend, that under specialist initiation, immunosuppressants such as methotrexate p. 888 [unlicensed], and monoclonal antibodies such as omalizumab (for severe persistent allergic asthma), and mepolizumab and reslizumab (in adults for severe eosinophilic asthma), may be considered in patients with severe asthma to achieve control and reduce the use of oral corticosteroids. [▲](#) See mepolizumab p. 266, omalizumab p. 267, reslizumab p. 267 National funding/access decisions.

Child over 5 years

For children over 5 years, NICE (2017) treatment recommendations for children apply to children aged 5–16 years and adult treatment recommendations apply to those aged 17 years and over. Whereas, for children over 5 years, BTS/SIGN (2016) treatment recommendations for children apply to children aged 5–12 years and adult treatment recommendations apply to those aged over 12 years.

Intermittent reliever therapy

[EvGr](#) Start an inhaled short-acting beta₂ agonist (such as salbutamol p. 252 or terbutaline sulfate p. 254), to be used as required, in all children with asthma. For those with infrequent short-lived wheeze, occasional use of reliever therapy may be the only treatment required. Children using more than one short-acting beta₂ agonist inhaler device a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma. [▲](#)

Regular preventer (maintenance) therapy

NICE (2017) define inhaled corticosteroid doses for children (5–16 years) as paediatric low, moderate, or high. BTS/SIGN (2016) instead define inhaled corticosteroid doses for children (5–12 years) as very low, low, or medium, and for children over 12 years as low, medium or high (refer to individual guidelines for inhaled corticosteroid dosing information).

[EvGr](#) A paediatric low dose of inhaled corticosteroid should be started as maintenance therapy in children who present with any one of the following features: using an inhaled short-acting beta₂ agonist three times a week or more, symptomatic three times a week or more, or waking at night due to asthma symptoms at least once a week.

BTS/SIGN (2016) instead recommend starting a very low dose (child 5–12 years) or a low dose (child over 12 years) of inhaled corticosteroid in children presenting with any one of the following features: using an inhaled short-acting beta₂ agonist three times a week or more, symptomatic three times a week or more, or waking at night due to asthma symptoms at least once a week, or have had an asthma attack in the last 2 years, and starting inhaled corticosteroids at a dose appropriate to the severity of asthma.

BTS/SIGN (2016) recommend that inhaled corticosteroids (except ciclesonide p. 262) should be initially taken twice daily, however, the same total daily dose, taken once a day, can be considered in patients with milder disease if good or complete control of asthma is established. The dose of inhaled corticosteroid should be adjusted over time, to the lowest effective dose at which control of asthma is maintained.

BTS/SIGN (2016) recommend the prescribing of inhalers by brand. [▲](#)

Initial add-on therapy

[EvGr](#) If asthma is uncontrolled on a paediatric low dose of inhaled corticosteroid as maintenance therapy, consider a leukotriene receptor antagonist (such as montelukast p. 268 or zafirlukast p. 269 [unlicensed in under 12 years]) in addition to the inhaled corticosteroid, and review the response to treatment in 4 to 8 weeks.

BTS/SIGN (2016) instead recommend a long-acting beta₂ agonist (LABA—such as salmeterol p. 251 or formoterol fumarate p. 250) in children over 12 years, or a LABA or a leukotriene receptor antagonist in children 5–12 years, as initial add-on therapy to inhaled corticosteroids if asthma is uncontrolled. [▲](#)

Additional add-on therapy

[EvGr](#) If asthma is uncontrolled on a paediatric low dose of inhaled corticosteroid and a leukotriene receptor antagonist as maintenance therapy, consider discontinuation of the leukotriene receptor antagonist and initiation of a LABA in combination with the inhaled corticosteroid.

If asthma remains uncontrolled on a paediatric low dose of inhaled corticosteroid and a LABA as maintenance therapy, consider changing to a MART regimen (Maintenance And Reliever Therapy—a combination of an inhaled corticosteroid and fast-acting LABA such as formoterol in a single inhaler) with a paediatric low dose of inhaled corticosteroid as maintenance. See budesonide with formoterol p. 260 [not licensed in all age groups].

If asthma remains uncontrolled on a MART regimen with a paediatric low dose of inhaled corticosteroid as maintenance, consider increasing to a paediatric moderate dose of inhaled corticosteroid (either continuing a MART regimen or changing to a fixed-dose regimen of an inhaled corticosteroid and a LABA, with a short-acting beta₂ agonist as reliever therapy).

If asthma is still uncontrolled on a paediatric moderate dose of inhaled corticosteroid as maintenance with a LABA (either as MART or a fixed-dose regimen), consider seeking advice from an asthma specialist and the following options:

- increasing the inhaled corticosteroid dose to a paediatric high dose as maintenance (this should only be offered as part of a fixed-dose regimen, with a short-acting beta₂ agonist as reliever therapy), or
- a trial of an additional drug, such as modified-release theophylline p. 273.

BTS/SIGN (2016) instead recommend that if the child is gaining some benefit from addition of a LABA but control remains inadequate, continue the LABA and increase the dose of the inhaled corticosteroid to a low-dose (child 5–12 years) or medium-dose (child over 12 years), if not already on this dose. If increasing the dose of inhaled corticosteroid is ineffective, consider continuing a very low dose (child 5–12 years) or low dose (child over 12 years) of inhaled corticosteroid and a LABA and try adding a leukotriene receptor antagonist, or modified-release theophylline p. 273, or long-acting muscarinic receptor antagonist (in children over 12 years).

If there is no response to the LABA, discontinue it and increase the dose of inhaled corticosteroid to a low-dose (child 5–12 years) or medium-dose (child over 12 years), if not already on this dose. If increasing the dose of inhaled corticosteroid is ineffective, consider continuing on a very low dose (child 5–12 years) or low dose (child over 12 years) of inhaled corticosteroid and try adding a leukotriene receptor antagonist or long-acting muscarinic receptor antagonist (in children over 12 years). [▲](#)

High-dose inhaled corticosteroids and further add-on treatment

[EvGr](#) BTS/SIGN (2016) recommend that if control remains inadequate on a combination of a short-acting beta₂ agonist as required, a low dose (child 5–12 years) or medium dose (child over 12 years) of inhaled corticosteroid, plus an additional drug, usually a LABA, to consider the following interventions:

- increase the inhaled corticosteroid to a medium-dose (child 5–12 years) or high-dose (child over 12 years)—with high doses of inhaled corticosteroid via a pressurised metered dose inhaler (pMDI), a spacer should be used, or
- add a leukotriene receptor antagonist, or
- add modified-release theophylline p. 273, or
- add tiotropium p. 247 (in children over 12 years).

If a trial of a further add-on treatment is ineffective, stop the drug (or in the case of increased dose of inhaled corticosteroid, reduce to the original dose) and refer to specialist care. [▲](#)

Continuous or frequent use of oral corticosteroids

[EvGr](#) BTS/SIGN (2016) recommend adding a regular oral corticosteroid (prednisolone p. 664) at the lowest dose to provide adequate control (under specialist care) in children with very severe asthma uncontrolled on a medium dose (child 5–12 years) or high dose (child over 12 years) of inhaled corticosteroid, and who have also tried (or are still receiving) a LABA, a leukotriene receptor antagonist, or modified-release theophylline p. 273. [▲](#)

Monoclonal antibodies and immunosuppressants

[EvGr](#) BTS/SIGN (2016) recommend, that under specialist initiation, immunosuppressants such as methotrexate p. 888 [unlicensed], and monoclonal antibodies such as omalizumab (child over 6 years for severe persistent allergic asthma) can be considered in children with severe asthma to achieve control and reduce the use of oral corticosteroids.

[▲](#) See omalizumab p. 267 National funding/access decisions.

Child under 5 years

Intermittent reliever therapy

[EvGr](#) A short-acting beta₂ agonist (such as salbutamol p. 252) as reliever therapy should be offered to children under 5 years with suspected asthma. A short-acting beta₂ agonist should be used for symptom relief alongside maintenance treatment.

Children using more than one short-acting beta₂ agonist inhaler device a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma. [▲](#)

Regular preventer (maintenance) therapy

NICE (2017) define inhaled corticosteroid doses for children under 5 years as paediatric low or moderate. BTS/SIGN (2016) instead define inhaled corticosteroid doses for children under 5 years as very low (refer to individual guidelines for inhaled corticosteroid dosing information).

[EvGr](#) Consider an 8-week trial of a paediatric moderate dose of inhaled corticosteroid in children presenting with any of the following features: asthma-related symptoms three times a week or more, experiencing night-time awakening at least once a week, or suspected asthma that is uncontrolled with a short-acting beta₂ agonist alone.

BTS/SIGN (2016) recommend the prescribing of inhalers by brand.

After 8 weeks, stop inhaled corticosteroid treatment and continue to monitor the child's symptoms:

- if symptoms did not resolve during the trial period, review whether an alternative diagnosis is likely;
- if symptoms resolved then reoccurred within 4 weeks of stopping inhaled corticosteroid treatment, restart the inhaled corticosteroid at a paediatric low-dose as first-line maintenance therapy;
- if symptoms resolved but reoccurred beyond 4 weeks after stopping inhaled corticosteroid treatment, repeat the 8-week trial of a paediatric moderate dose of inhaled corticosteroid.

BTS/SIGN (2016) instead recommend starting a very low dose of inhaled corticosteroid as initial regular preventer therapy in children presenting with any one of the following features: using an inhaled short-acting beta₂ agonist three times a week or more, symptomatic three times a week or more, or waking at night due to asthma symptoms at least once a week. In children unable to take an inhaled corticosteroid, a leukotriene receptor antagonist (such as montelukast p. 268) may be used as an alternative. [▲](#)

Initial add-on therapy

[EvGr](#) If suspected asthma is uncontrolled in children under 5 years on a paediatric low dose of inhaled corticosteroid as maintenance therapy, consider a leukotriene receptor antagonist (such as montelukast p. 268) in addition to the inhaled corticosteroid.

If suspected asthma is uncontrolled in children under 5 years on a paediatric low dose of inhaled corticosteroid and a leukotriene receptor antagonist as maintenance therapy, stop the leukotriene receptor antagonist and refer the child to an asthma specialist. [▲](#)

Decreasing treatment

[EvGr](#) Consider decreasing maintenance therapy when a patient's asthma has been controlled with their current maintenance therapy for at least three months. When deciding which drug to decrease first and at what rate, the severity of asthma, the side-effects of treatment, duration on current dose, the beneficial effect achieved, and the patient's preference, should be considered. Patients should be regularly reviewed when decreasing treatment.

Patients should be maintained at the lowest possible dose of inhaled corticosteroid. Reductions should be considered every three months, decreasing the dose by approximately 25–50% each time. Reduce the dose slowly as patients deteriorate at different rates. Only consider stopping inhaled corticosteroid treatment completely for people who are using a paediatric or adult low dose inhaled corticosteroid alone as maintenance therapy and are symptom-free. [▲](#)

Exercise-induced asthma

EvGr For most patients, exercise-induced asthma is an illustration of poorly controlled asthma and regular treatment including inhaled corticosteroids should therefore be reviewed. If exercise is a specific problem in patients already taking inhaled corticosteroids who are otherwise well controlled, consider adding either a leukotriene receptor antagonist, a long-acting beta₂ agonist, an oral beta₂ agonist, sodium cromoglicate p. 270 or nedocromil sodium p. 270, or theophylline p. 273. An inhaled short-acting beta₂ agonist used immediately before exercise is the drug of choice. 

Pregnancy

EvGr Women with asthma should be closely monitored during pregnancy. It is particularly important that asthma be well controlled during pregnancy; when this is achieved there is little or no increased risk of adverse maternal or fetal complications.

Women should be counselled about the importance and safety of taking their asthma medication during pregnancy to maintain good control. Women who smoke should be advised about the dangers to themselves and to their baby and be offered appropriate support to stop smoking.

Short-acting beta₂ agonists, LABAs, oral and inhaled corticosteroids, sodium cromoglicate p. 270 and nedocromil sodium p. 270, and oral and intravenous theophylline p. 273 (with appropriate monitoring) can be used as normal during pregnancy. There is limited information on use of a leukotriene receptor antagonist during pregnancy, however, where indicated to achieve adequate control, they should not be withheld.

Asthma: diagnosis, monitoring and chronic asthma management. National Institute for Health and Care Excellence. NICE guideline 80. November 2017.
www.nice.org.uk/guidance/ng80

British guideline on the management of asthma. British Thoracic Society and Scottish Intercollegiate Guidelines Network. Full guidance - A national clinical guideline 153. September 2016.
www.sign.ac.uk/assets/sign153.pdf

- Poor respiratory effort
- Arrhythmia
- Exhaustion
- Altered conscious level
- Hypotension

Near-fatal acute asthma

- Raised PaCO₂, requiring mechanical ventilation with raised inflation pressures, or both

Management

EvGr Patients with moderate asthma should be treated at home or in primary care according to response to treatment, while patients with severe or life-threatening acute asthma should start treatment as soon as possible and be admitted to hospital immediately following initial assessment.

Supplementary oxygen should be given to all hypoxaemic patients with acute severe asthma to maintain a SpO₂ level between 94–98%.

First-line treatment for acute asthma is a high-dose inhaled short-acting beta₂ agonist (salbutamol p. 252 or terbutaline sulfate p. 254) given as soon as possible. A pressurised metered dose inhaler with spacer device is preferred in patients with non-life-threatening acute asthma. Whereas, in patients with life-threatening acute asthma, a beta₂ agonist administered by an oxygen-driven nebuliser is recommended. If the response to an initial dose of short-acting beta₂ agonist is poor, consider continuous nebulisation with an appropriate nebuliser. Intravenous beta₂ agonists are reserved for those patients in whom inhaled therapy cannot be used reliably.

In all cases of acute asthma, patients should be prescribed an adequate dose of oral prednisolone p. 664 once daily for at least 5 days or until recovery. Parenteral hydrocortisone p. 662 or intramuscular methylprednisolone p. 663 are alternatives in patients who are unable to take oral prednisolone.

Nebulised ipratropium bromide p. 246 may be combined with a nebulised beta₂ agonist in patients with acute severe or life-threatening asthma or in those with a poor initial response to beta₂ agonist therapy to provide greater bronchodilation.

There is some evidence that magnesium sulfate p. 1019 has bronchodilator effects. A single intravenous dose of magnesium sulfate may be considered in patients with severe acute asthma (peak flow < 50% best or predicted) who have not had a good initial response to inhaled bronchodilator therapy [unlicensed use]. In an acute asthma attack, intravenous aminophylline p. 272 is not likely to produce any additional bronchodilation compared to standard therapy with inhaled bronchodilators and corticosteroids. However, in some patients with near-fatal or life-threatening acute asthma with a poor response to initial therapy, intravenous aminophylline may provide some benefit. Magnesium sulfate by intravenous infusion or aminophylline should only be used after consultation with, or on the recommendation of, senior medical staff. 

Child over 2 years

Levels of severity

The nature of treatment required for the management of acute asthma depends on the level of severity, described as follows:

Moderate acute asthma

- Able to talk in sentences
- Arterial oxygen saturation (SpO₂) ≥ 92%
- Peak flow ≥ 50% best or predicted
- Heart rate ≤ 140/minute in children aged 2–5 years; heart rate ≤ 125/minute in children over 5 years
- Respiratory rate ≤ 40/minute in children aged 2–5 years; respiratory rate ≤ 30/minute in children over 5 years

Asthma, acute

30-Nov-2016

Adults

Levels of severity

The nature of treatment required for the management of acute asthma depends on the level of severity, described as follows:

Moderate acute asthma

- Increasing symptoms
- Peak flow > 50–75% best or predicted
- No features of acute severe asthma

Severe acute asthma

Any one of the following:

- Peak flow 33–50% best or predicted
- Respiratory rate ≥ 25/min
- Heart rate ≥ 110/min
- Inability to complete sentences in one breath

Life-threatening acute asthma

Any one of the following, in a patient with severe asthma:

- Peak flow < 33% best or predicted
- Arterial oxygen saturation (SpO₂) < 92%
- Partial arterial pressure of oxygen (PaO₂) < 8 kPa
- Normal partial arterial pressure of carbon dioxide (PaCO₂) (4.6–6.0 kPa)
- Silent chest
- Cyanosis

Severe acute asthma

- Can't complete sentences in one breath or too breathless to talk or feed
- $\text{SpO}_2 < 92\%$
- Peak flow 33–50% best or predicted
- Heart rate $> 140/\text{minute}$ in children aged 2–5 years; heart rate $> 125/\text{minute}$ in children aged over 5 years
- Respiratory rate $> 40/\text{minute}$ in children aged 2–5 years; respiratory rate $> 30/\text{minute}$ in children aged over 5 years

Life-threatening acute asthma

Any one of the following in a child with severe asthma:

- $\text{SpO}_2 < 92\%$
- Peak flow $< 33\%$ best or predicted
- Silent chest
- Cyanosis
- Poor respiratory effort
- Hypotension
- Exhaustion
- Confusion

Management

[EvGr] Following initial assessment, supplementary high flow oxygen should be given to all children with life-threatening acute asthma or $\text{SpO}_2 < 94\%$ to achieve normal saturations of 94–98%.

First-line treatment for acute asthma is an inhaled short-acting β_2 agonist (salbutamol or terbutaline sulfate) given as soon as possible, ideally via a metered dose inhaler and spacer device in mild to moderate acute asthma. Children with severe or life-threatening acute asthma should be transferred to hospital urgently.

In all cases of acute asthma, children should be prescribed an adequate once daily dose of oral prednisolone. Treatment for up to 3 days is usually sufficient, but the length of course should be tailored to the number of days necessary to bring about recovery. Intravenous hydrocortisone should be reserved for severely affected children who are unable to retain oral medication.

Nebulised ipratropium bromide can be combined with β_2 agonist treatment for children with severe or life-threatening acute asthma or in those with a poor initial response to β_2 agonist therapy to provide greater bronchodilation. Consider adding magnesium sulfate to nebulised salbutamol and ipratropium bromide in the first hour in children with a short duration of acute severe asthma symptoms presenting with an oxygen saturation less than 92%.

Children with continuing severe asthma despite frequent nebulised β_2 agonists and ipratropium bromide plus oral corticosteroids, and those with life-threatening features, need urgent review by a specialist with a view to transfer to a high dependency unit or paediatric intensive care unit (PICU) to receive second-line intravenous therapies.

In a severe asthma attack where the child has not responded to initial inhaled therapy, early addition of a single bolus dose of intravenous salbutamol may be an option. Continuous intravenous infusion of salbutamol, administered under specialist supervision with continuous ECG and electrolyte monitoring, should be considered in children with unreliable inhalation or severe refractory asthma. Aminophylline may be considered in children with severe or life-threatening acute asthma unresponsive to maximal doses of bronchodilators and corticosteroids. Aminophylline is not recommended in children with mild to moderate acute asthma. Intravenous magnesium sulfate p. 1019 has been used for acute asthma [unlicensed use] although its place in management is not yet established. **[A]**

Child under 2 years

[EvGr] Inhaled short-acting β_2 agonists are the initial treatment of choice for acute asthma in children under 2 years. For mild to moderate acute asthma attacks, a metered-dose inhaler with a spacer and mask is the optimal drug delivery device. In a hospital setting, consider oral prednisolone daily for up to 3 days, early in the management of severe asthma attacks. For more severe symptoms, inhaled ipratropium bromide p. 246 in combination with an inhaled β_2 agonist is also an option. **[A]**

Follow up in all cases

[EvGr] Episodes of acute asthma may be a failure of preventative therapy, review is required to prevent further episodes. A careful history should be taken to establish the reason for the asthma attack. Inhaler technique should be checked and regular treatment should be reviewed. Patients should be given a written asthma action plan aimed at preventing relapse, optimising treatment, and preventing delay in seeking assistance in future attacks. It is essential that the patient's GP practice is informed within 24 hours of discharge from the emergency department or hospital following an asthma attack. Patients who have had a near-fatal asthma attack should be kept under specialist supervision indefinitely. A respiratory specialist should follow up all patients admitted with a severe asthma attack for at least one year after the admission. **[A]**

Bronchodilators

29-Nov-2017

Adrenoceptor agonists (sympathomimetics)

Selective β_2 agonists produce bronchodilation. A short-acting β_2 agonist (such as salbutamol p. 252 and terbutaline sulfate p. 254) is used for immediate relief of asthma symptoms while some long-acting β_2 agonists are added to an inhaled corticosteroid in patients requiring prophylactic treatment.

Adrenaline/epinephrine p. 221 (which has both α - and β -adrenoceptor agonist properties) is used in the emergency management of acute allergic and anaphylactic reactions, in angioedema, in cardiopulmonary resuscitation, and in the management of severe croup.

Long-acting β_2 agonists

Formoterol fumarate p. 250 and salmeterol p. 251 are longer-acting β_2 agonists which are administered by inhalation. They should be used for asthma only in patients who regularly use an inhaled corticosteroid.

Combination inhalers that contain a long-acting β_2 agonist and a corticosteroid ensure that long-acting β_2 agonists are not used without concomitant corticosteroids.

Indacaterol p. 251 and olodaterol p. 251 are long-acting β_2 agonists licensed for chronic obstructive pulmonary disease in adults; they are not indicated for the relief of acute bronchospasm.

Vilanterol is a long-acting β_2 agonist available only in a combination inhaler with fluticasone furoate *or/and* with umeclidinium p. 248.

Oral

Oral preparations of β_2 agonists may be used by patients who cannot manage the inhaled route. They are sometimes used for children and the elderly, but inhaled β_2 agonists are more effective and have fewer side-effects. The longer-acting oral preparations, including bambuterol hydrochloride p. 249, may be of value in nocturnal asthma but they have a limited role and inhaled long-acting β_2 agonists are usually preferred.

Parenteral

Salbutamol or terbutaline sulfate can be given intravenously for severe or life-threatening acute asthma; patients should be carefully monitored and the dose adjusted according to response and heart rate. The regular use of beta₂ agonists by the subcutaneous route is not recommended since the evidence of benefit is uncertain and it may be difficult to withdraw such treatment once started. In adults, beta₂ agonists may also be given by intramuscular injection.

Children

A pressurised metered-dose inhaler should be used with a spacer device in children under 5 years. A beta₂ agonist may also be given by mouth but administration by inhalation is preferred; a long-acting inhaled beta₂ agonist may be used where appropriate. In severe attacks nebulisation using a selective beta₂ agonist or ipratropium bromide p. 246 is advisable.

Antimuscarinic bronchodilators

Ipratropium bromide can provide short-term relief in chronic asthma, but short-acting beta₂ agonists act more quickly and are preferred. Ipratropium bromide by nebulisation can be added to other standard treatment in life-threatening asthma or if acute asthma fails to improve with standard therapy.

The aerosol inhalation of ipratropium bromide can be used for short-term relief in mild chronic obstructive pulmonary disease in patients who are not using a long-acting antimuscarinic drug. Its maximal effect occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

Acclidinium bromide p. 245, glycopyrronium bromide p. 246, tiotropium p. 247, and umeclidinium p. 248 are licensed for the maintenance treatment of adults with chronic obstructive pulmonary disease. They are not suitable for the relief of acute bronchospasm.

Theophylline

Theophylline p. 273 is a xanthine used as a bronchodilator in *asthma* and stable *chronic obstructive pulmonary disease*; it is not generally effective in exacerbations of chronic obstructive pulmonary disease. Theophylline may have an additive effect when used in conjunction with small doses of beta₂ agonists; the combination may increase the risk of side-effects, including hypokalaemia.

Theophylline is given by injection as aminophylline p. 272, a mixture of theophylline with ethylenediamine, which is 20 times more soluble than theophylline alone. Aminophylline injection is needed rarely for severe acute asthma.

Compound bronchodilator preparations

In general, patients are best treated with single-ingredient preparations, such as a selective beta₂ agonist or ipratropium bromide, so that the dose of each drug can be adjusted. However, a combination product may be appropriate for patients stabilised on individual components in the same proportion.

Chronic obstructive pulmonary disease

Management

Smoking cessation reduces the progressive decline in lung function in chronic obstructive pulmonary disease (COPD, chronic bronchitis, or emphysema). Infection can complicate chronic obstructive pulmonary disease and may be prevented by vaccination (pneumococcal polysaccharide

conjugate vaccine (adsorbed) p. 1277 and influenza vaccine p. 1282).

A trial of a high-dose inhaled corticosteroid or an oral corticosteroid is recommended for patients with moderate or severe airflow obstruction if the diagnosis is in doubt.

Symptoms of chronic obstructive pulmonary disease may be alleviated by an inhaled **short-acting beta₂ agonist** or a **short-acting antimuscarinic bronchodilator** used as required.

When the airways obstruction is more severe, regular inhaled therapy should be used. It is important to check compliance and inhaler technique before initiating a new drug.

If the Forced Expiratory Volume in 1 second (FEV₁), is 50% of predicted or more, *either* a long-acting antimuscarinic bronchodilator or a long-acting beta₂ agonist should be used. Short-acting antimuscarinic bronchodilators should be discontinued when a long-acting antimuscarinic bronchodilator is started. A long-acting beta₂ agonist with a corticosteroid in a combination inhaler can be used for patients who remain symptomatic despite regular treatment with a long-acting beta₂ agonist.

If FEV₁ is less than 50% of predicted, *either* a long-acting antimuscarinic bronchodilator or a long-acting beta₂ agonist with a corticosteroid in a combination inhaler should be used.

In any patient who remains breathless or continues to have exacerbations, triple therapy with a long-acting beta₂ agonist and a corticosteroid in a combination inhaler *plus* a long-acting antimuscarinic bronchodilator should be used.

If an inhaled corticosteroid is not appropriate, a long-acting antimuscarinic bronchodilator can be used with a long-acting beta₂ agonist, (see Use of inhaled therapies in chronic obstructive pulmonary disease algorithm, below).

If symptoms persist or if the patient is unable to use an inhaler, oral modified-release aminophylline p. 272 or theophylline p. 273 can be used.

Indacaterol p. 251 is a long-acting beta₂ agonist licensed for the maintenance treatment of chronic obstructive pulmonary disease.

In patients with severe chronic obstructive pulmonary disease associated with chronic bronchitis and a history of frequent exacerbations, roflumilast p. 271 is licensed as an adjunct to existing bronchodilator treatment.

A **mucoytic** drug may be considered for a patient with a chronic productive cough.

Long-term **oxygen** therapy prolongs survival in patients with severe chronic obstructive pulmonary disease and hypoxaemia.

During an exacerbation of chronic obstructive pulmonary disease, bronchodilator therapy can be administered through a nebuliser if necessary and oxygen given if appropriate. Aminophylline can be given intravenously if response to nebulised bronchodilators is poor. A short course of **oral corticosteroid**, such as prednisolone for 7–14 days, should be given if increased breathlessness interferes with daily activities. **Antibacterial** treatment is required if sputum becomes more purulent than usual, or if there are other signs of infection.

Patients who have had an episode of hypercapnic respiratory failure should be given a 24% or 28% Venturi mask and an **oxygen alert card** endorsed with the oxygen saturations required during previous exacerbations. Patients and their carers should be instructed to show the card to emergency healthcare providers in the event of an exacerbation.

Oxygen alert card based on British Thoracic Society guideline for emergency oxygen use in adult patients (October 2008)

Oxygen alert card

Name: _____

I am at risk of type II respiratory failure with a raised CO_2 level.

Please use my _____% Venturi mask to achieve an oxygen saturation of _____% to _____% during exacerbations.

Use compressed air to drive nebulisers (with nasal oxygen at 2 litres/minute). If compressed air not available, limit oxygen-driven nebulisers to 6 minutes.

Oxygen alert card is available at www.brit-thoracic.org.uk.

Oxygen

Overview

Oxygen should be regarded as a drug. It is prescribed for hypoxaemic patients to increase alveolar oxygen tension and decrease the work of breathing. The concentration of oxygen required depends on the condition being treated; the administration of an inappropriate concentration of oxygen can have serious or even fatal consequences.

Oxygen is probably the most common drug used in medical emergencies. It should be prescribed initially to achieve a normal or near-normal oxygen saturation; in most acutely ill patients with a normal or low arterial carbon dioxide ($P_a\text{CO}_2$), oxygen saturation should be 94–98% oxygen saturation. However, in some clinical situations such as cardiac arrest and carbon monoxide poisoning it is more appropriate to aim for the highest possible oxygen saturation until the patient is stable. A lower target of 88–92% oxygen saturation is indicated for patients at risk of hypercapnic respiratory failure.

High concentration oxygen therapy is safe in uncomplicated cases of conditions such as pneumonia, pulmonary thromboembolism, pulmonary fibrosis, shock, severe trauma, sepsis, or anaphylaxis. In such conditions low arterial oxygen ($P_a\text{O}_2$) is usually associated with low or normal arterial carbon dioxide ($P_a\text{CO}_2$), and therefore there is little risk of hypoventilation and carbon dioxide retention.

In acute severe asthma, the arterial carbon dioxide ($P_a\text{CO}_2$) is usually subnormal but as asthma deteriorates it may rise steeply (particularly in children). These patients usually require high concentrations of oxygen and if the arterial carbon dioxide ($P_a\text{CO}_2$) remains high despite other treatment, intermittent positive-pressure ventilation needs to be considered urgently.

Low concentration oxygen therapy (controlled oxygen therapy) is reserved for patients at risk of hypercapnic respiratory failure, which is more likely in those with:

- chronic obstructive pulmonary disease;
- advanced cystic fibrosis;
- severe non-cystic fibrosis bronchiectasis;
- severe kyphoscoliosis or severe ankylosing spondylitis;
- severe lung scarring caused by tuberculosis;
- musculoskeletal disorders with respiratory weakness, especially if on home ventilation;
- an overdose of opioids, benzodiazepines, or other drugs causing respiratory depression.

Until blood gases can be measured, initial oxygen should be given using a controlled concentration of 28% or less,

titrated towards a target oxygen saturation of 88–92%. The aim is to provide the patient with enough oxygen to achieve an acceptable arterial oxygen tension without worsening carbon dioxide retention and respiratory acidosis. Patients may carry an *oxygen alert card*.

Domiciliary oxygen

Oxygen should only be prescribed for use in the home after careful evaluation in hospital by respiratory experts. Patients should be advised of the risks of continuing to smoke when receiving oxygen therapy, including the risk of fire. Smoking cessation therapy should be recommended before home oxygen prescription.

Air travel

Some patients with arterial hypoxaemia require supplementary oxygen for air travel. The patient's requirement should be discussed with the airline before travel.

Long-term oxygen therapy

Long-term administration of oxygen (usually at least 15 hours daily) prolongs survival in some patients with chronic obstructive pulmonary disease.

Assessment for long-term oxygen therapy requires measurement of arterial blood gas tensions. Measurements should be taken on 2 occasions at least 3 weeks apart to demonstrate clinical stability, and not sooner than 4 weeks after an acute exacerbation of the disease. Long-term oxygen therapy should be considered for patients with:

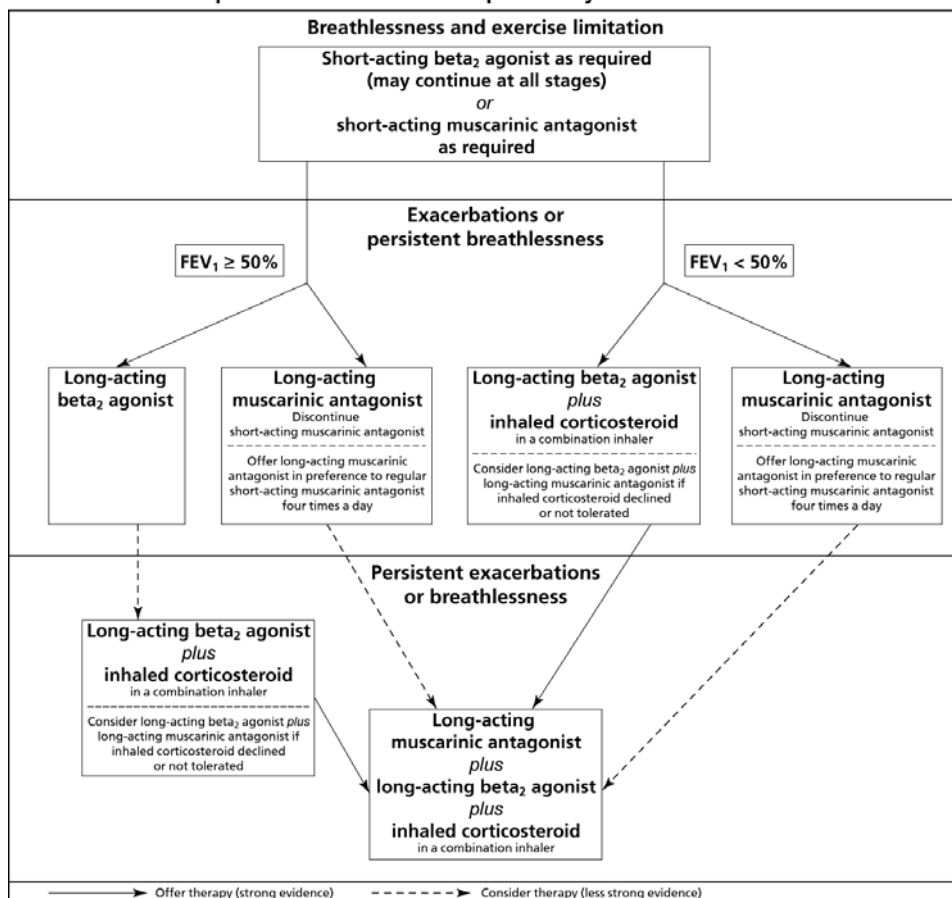

- chronic obstructive pulmonary disease with $P_a\text{O}_2 < 7.3$ kPa when breathing air during a period of clinical stability;
- chronic obstructive pulmonary disease with $P_a\text{O}_2$ 7.3–8 kPa in the presence of secondary polycythaemia, nocturnal hypoxaemia, peripheral oedema, or evidence of pulmonary hypertension;
- severe chronic asthma with $P_a\text{O}_2 < 7.3$ kPa or persistent disabling breathlessness;
- interstitial lung disease with $P_a\text{O}_2 < 8$ kPa and in patients with $P_a\text{O}_2 > 8$ kPa with disabling dyspnoea;
- cystic fibrosis when $P_a\text{O}_2 < 7.3$ kPa or if $P_a\text{O}_2$ 7.3–8 kPa in the presence of secondary polycythaemia, nocturnal hypoxaemia, pulmonary hypertension, or peripheral oedema;
- pulmonary hypertension, without parenchymal lung involvement when $P_a\text{O}_2 < 8$ kPa;
- neuromuscular or skeletal disorders, after specialist assessment;
- obstructive sleep apnoea despite continuous positive airways pressure therapy, after specialist assessment;
- pulmonary malignancy or other terminal disease with disabling dyspnoea;
- heart failure with daytime $P_a\text{O}_2 < 7.3$ kPa when breathing air or with nocturnal hypoxaemia;
- paediatric respiratory disease, after specialist assessment.

Increased respiratory depression is seldom a problem in patients with stable respiratory failure treated with low concentrations of oxygen although it may occur during exacerbations; patients and relatives should be warned to call for medical help if drowsiness or confusion occur.

Short-burst oxygen therapy

Oxygen is occasionally prescribed for short-burst (intermittent) use for episodes of breathlessness not relieved by other treatment in patients with severe chronic obstructive pulmonary disease, interstitial lung disease, heart failure, and in palliative care. It is important, however, that the patient does not rely on oxygen instead of obtaining medical help or taking more specific treatment. Short-burst oxygen therapy can be used to improve exercise capacity and recovery; it should only be continued if there is proven improvement in breathlessness or exercise tolerance.

Use of inhaled therapies in chronic obstructive pulmonary disease

Advice on the use of inhaled therapies in chronic obstructive pulmonary disease is based on the recommendations of the National Institute for Health and Care Excellence (2010). Management of chronic obstructive pulmonary disease in adults in primary and secondary care. London: NICE. Available from www.nice.org.uk/CG101 Reproduced with permission

Ambulatory oxygen therapy

Ambulatory oxygen is prescribed for patients on long-term oxygen therapy who need to be away from home on a regular basis. Patients who are not on long-term oxygen therapy can be considered for ambulatory oxygen therapy if there is evidence of exercise-induced oxygen desaturation and of improvement in blood oxygen saturation and exercise capacity with oxygen. Ambulatory oxygen therapy is not recommended for patients with heart failure or those who smoke.

Oxygen therapy equipment

Under the NHS oxygen may be supplied as **oxygen cylinders**. Oxygen flow can be adjusted as the cylinders are equipped with an oxygen flow meter with 'medium' (2 litres/minute) and 'high' (4 litres/minute) settings. Oxygen delivered from a cylinder should be passed through a humidifier if used for long periods.

Oxygen concentrators are more economical for patients who require oxygen for long periods, and in England and Wales can be ordered on the NHS on a regional tendering basis. A concentrator is recommended for a patient who

requires oxygen for more than 8 hours a day (or 21 cylinders per month). Exceptionally, if a higher concentration of oxygen is required the output of 2 oxygen concentrators can be combined using a 'Y' connection.

A nasal cannula is usually preferred for long-term oxygen therapy from an oxygen concentrator. It can, however, produce dermatitis and mucosal drying in sensitive individuals.

Giving oxygen by nasal cannula allows the patient to talk, eat, and drink, but the concentration of oxygen is not controlled; this may not be appropriate for acute respiratory failure. When oxygen is given through a nasal cannula at a rate of 1–2 litres/minute the inspiratory oxygen concentration is usually low, but it varies with ventilation and can be high if the patient is underventilating.

Arrangements for supplying oxygen

The following oxygen services may be ordered in England and Wales:

- emergency oxygen;
- short-burst (intermittent) oxygen therapy;
- long-term oxygen therapy;
- ambulatory oxygen.

The type of oxygen service (or combination of services) should be ordered on a Home Oxygen Order Form (HOOF); the amount of oxygen required (hours per day) and flow rate should be specified. The clinician will determine the appropriate equipment to be provided. Special needs or preferences should be specified on the HOOF.

The clinician should obtain the patient or carers consent, to pass on the patient's details to the supplier, the fire brigade, and other relevant organisations. The supplier will contact the patient to make arrangements for delivery, installation, and maintenance of the equipment. The supplier will also train the patient or carer to use the equipment.

The clinician should send the HOOF to the supplier who will continue to provide the service until a revised HOOF is received, or until notified that the patient no longer requires the home oxygen service.

In **Scotland** refer the patient for assessment by a respiratory consultant. If the need for a concentrator is confirmed the consultant will arrange for the provision of a concentrator through the Common Services Agency. Prescribers should complete a Scottish Home Oxygen Order Form (SHOOF) and email it to Health Facilities Scotland. Health Facilities Scotland will then liaise with their contractor to arrange the supply of oxygen. Further information can be obtained at: www.dolbyvivisol.com/our-services/healthcare-professionals/home-oxygen-services-sco.aspx.

In **Northern Ireland** oxygen concentrators and cylinders should be prescribed on form HS21; oxygen concentrators are supplied by a local contractor. Prescriptions for oxygen cylinders and accessories can be dispensed by pharmacists contracted to provide domiciliary oxygen services.

Croup

Management

Mild croup is largely self-limiting, but treatment with a single dose of a corticosteroid (e.g. dexamethasone p. 660) by mouth may be of benefit.

More severe croup (or mild croup that might cause complications) should for hospital admission; a single dose of a corticosteroid (e.g. dexamethasone or prednisolone p. 664 by mouth) should be administered before transfer to hospital. In hospital, dexamethasone (by mouth or by injection) or budesonide p. 259 (by nebulisation) will often reduce symptoms; the dose may need to be repeated after 12 hours if necessary.

For severe croup not effectively controlled with corticosteroid treatment, nebulised adrenaline/epinephrine solution 1 in 1000 (1 mg/mL) p. 221 should be given with close clinical monitoring; the effects of nebulised adrenaline/epinephrine last 2–3 hours and the child needs to be monitored carefully for recurrence of the obstruction.

ANTIMUSCARINICS

Antimuscarinics (inhaled)

09-Feb-2016

- **CAUTIONS** Bladder outflow obstruction · paradoxical bronchospasm · prostatic hyperplasia · susceptibility to angle-closure glaucoma
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arrhythmias · cough · dizziness · dry mouth · epistaxis · headache · nausea
 - ▶ **Uncommon** Constipation · dysphonia · glaucoma · palpitations · skin reactions · stomatitis · urinary disorders · vision blurred

above

Acidinium bromide

15-Feb-2016

• INDICATIONS AND DOSE

Maintenance treatment of chronic obstructive pulmonary disease

- ▶ **BY INHALATION OF POWDER**
- ▶ **Adult:** 375 micrograms twice daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ Each 375 microgram inhalation of acidinium bromide delivers 322 micrograms of acclidinium.

- **CAUTIONS** Arrhythmia (when newly diagnosed within last 3 months) · heart failure (hospitalisation with moderate or severe heart failure within last 12 months) · myocardial infarction within last 6 months · unstable angina
- **INTERACTIONS** → Appendix 1: acclidinium
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Diarrhoea · nasopharyngitis
 - ▶ **Uncommon** Angioedema
 - ▶ **Rare or very rare** Hypersensitivity
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises only use if potential benefits outweigh risks.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on appropriate inhaler technique.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

- ▶ **Acclidinium bromide (non-proprietary)** ▼
Acclidinium bromide 375 microgram per 1 dose Acclidinium bromide 375micrograms/dose powder inhaler | 60 dose [PoM] DT = £28.60
- ▶ **Eklira (AstraZeneca UK Ltd)** ▼
Acclidinium bromide 375 microgram per 1 dose Eklira 322micrograms/dose Genuair | 60 dose [PoM] £28.60 DT = £28.60

Acclidinium bromide with formoterol

19-Feb-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, acclidinium bromide above, formoterol fumarate p. 250.

• INDICATIONS AND DOSE

Maintenance treatment of chronic obstructive pulmonary disease

- ▶ **BY INHALATION OF POWDER**
- ▶ **Adult:** 1 inhalation twice daily

- **CAUTIONS** Convulsive disorders · phaeochromocytoma
- **INTERACTIONS** → Appendix 1: acclidinium · beta₂ agonists

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on appropriate inhaler technique.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

- ▶ **Duaklir** (AstraZeneca UK Ltd) ▼

F 245

Glycopyrronium bromide

13-Sep-2017

(Glycopyrrolate)

● INDICATIONS AND DOSE

Maintenance treatment of chronic obstructive pulmonary disease

- ▶ BY INHALATION OF POWDER

Adult: 1 capsule once daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ Each capsule delivers 55 micrograms of glycopyrronium bromide (equivalent to 44 micrograms of glycopyrronium).

- **CAUTIONS** Arrhythmia (excluding chronic stable atrial fibrillation) · history of myocardial infarction · history of QT-interval prolongation · left ventricular failure · unstable ischaemic heart disease
- **INTERACTIONS** → Appendix 1: glycopyrronium
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Increased risk of infection · insomnia · pain
 - ▶ **Uncommon** Asthenia · cystitis · dental caries · hyperglycaemia · hypersensitivity · numbness · productive cough · respiratory disorders · throat irritation
- SIDE-EFFECTS, FURTHER INFORMATION** The possibility of systemic side-effects should be considered; however, glycopyrronium is poorly absorbed and systemic effects are unlikely with topical use.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** Manufacturer advises use only if potential benefit outweighs risk if eGFR less than 30 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on appropriate inhaler technique.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

F 245

Ipratropium bromide

22-Jan-2018

● INDICATIONS AND DOSE

Reversible airways obstruction

- ▶ BY INHALATION OF AEROSOL

- ▶ Child 1 month–5 years: 20 micrograms 3 times a day
- ▶ Child 6–11 years: 20–40 micrograms 3 times a day
- ▶ Child 12–17 years: 20–40 micrograms 3–4 times a day

Reversible airways obstruction, particularly in chronic obstructive pulmonary disease

- ▶ BY INHALATION OF AEROSOL

- ▶ Adult: 20–40 micrograms 3–4 times a day
- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Adult: 250–500 micrograms 3–4 times a day

Acute bronchospasm

- ▶ BY INHALATION OF NEBULISED SOLUTION

- ▶ Child 1 month–5 years: 125–250 micrograms as required; maximum 1 mg per day
- ▶ Child 6–11 years: 250 micrograms as required; maximum 1 mg per day
- ▶ Child 12–17 years: 500 micrograms as required, doses higher than max. can be given under medical supervision; maximum 2 mg per day
- ▶ Adult: 500 micrograms as required, doses higher than max. can be given under medical supervision; maximum 2 mg per day

Severe or life-threatening acute asthma

- ▶ BY INHALATION OF NEBULISED SOLUTION

- ▶ Child 1 month–11 years: 250 micrograms every 20–30 minutes for the first 2 hours, then 250 micrograms every 4–6 hours as required
- ▶ Child 12–17 years: 500 micrograms every 4–6 hours as required
- ▶ Adult: 500 micrograms every 4–6 hours as required

PHARMACOKINETICS

- ▶ The maximal effect of inhaled ipratropium occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

● **UNLICENSED USE** [EvG] The dose of ipratropium for severe or life-threatening acute asthma is unlicensed.  *Inhalvent*® not licensed for use in children under 6 years.

● **CAUTIONS** Avoid spraying near eyes · cystic fibrosis **CAUTIONS, FURTHER INFORMATION**

➤ **Glaucoma** *Acute angle-closure glaucoma* has been reported with nebulised ipratropium, particularly when given with nebulised salbutamol (and possibly other beta₂ agonists); care needed to protect the patient's eyes from nebulised drug or from drug powder.

● **INTERACTIONS** → Appendix 1: ipratropium

● **SIDE-EFFECTS**

➤ **Common or very common** Gastrointestinal motility disorder · throat complaints

➤ **Uncommon** Corneal oedema · diarrhoea · eye disorders · eye pain · respiratory disorders · vision disorders · vomiting

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to atropine or its derivatives.

● **PREGNANCY** Manufacturer advises only use if potential benefit outweighs the risk.

● **BREAST FEEDING** No information available—manufacturer advises only use if potential benefit outweighs risk.

● **DIRECTIONS FOR ADMINISTRATION** If dilution of ipratropium bromide nebuliser solution is necessary use only sterile sodium chloride 0.9%.

● **PATIENT AND CARER ADVICE** Patients or carers should be counselled on appropriate administration technique and warned against accidental contact with the eye (due to risk of ocular complications).

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and vision disorders.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Nebuliser liquid

➤ **Ipratropium bromide (Non-proprietary)**

Ipratropium bromide 250 microgram per 1 ml Ipratropium bromide 500micrograms/2ml nebuliser liquid unit dose vials | 20 unit dose [PoM] £5.60 DT = £3.36

Tiotropium

12-Jun-2018

● **INDICATIONS AND DOSE**

Maintenance treatment of chronic obstructive pulmonary disease

➤ **BY INHALATION OF POWDER**
➤ Adult: 1 capsule once daily

DOSE EQUIVALENCE AND CONVERSION

➤ For *Spiriva*® inhalation powder, 1 capsule contains a metered dose of 18 micrograms tiotropium; for *Braltus*® inhalation powder, 1 capsule contains a metered dose of 13 micrograms tiotropium.

➤ The delivered dose of *Spiriva*® and *Braltus*® inhalation powder products are the same (10 micrograms); no dose adjustment is necessary when switching between brands.

SPIRIVA RESPIMAT®

Maintenance treatment of chronic obstructive pulmonary disease | Severe asthma [add-on to inhaled corticosteroid (at least 800 micrograms budesonide daily or equivalent) and at least 1 controller in patients who have suffered one or more severe exacerbations in the last year]

➤ **BY INHALATION OF AEROSOL**
➤ Adult: 5 micrograms once daily

Severe asthma [add-on to inhaled corticosteroid (over 400 micrograms budesonide daily or equivalent) and 1 controller, or inhaled corticosteroid (200–400 micrograms budesonide daily or equivalent) and 2 controllers, in patients who have suffered one or more severe exacerbations in the last year]

➤ **BY INHALATION OF AEROSOL**
➤ Child 6–11 years: 5 micrograms once daily

Severe asthma [add-on to inhaled corticosteroid (over 800 micrograms budesonide daily or equivalent) and 1 controller, or inhaled corticosteroid (400–800 micrograms budesonide daily or equivalent) and 2 controllers, in patients who have suffered one or more severe exacerbations in the last year]

➤ **BY INHALATION OF AEROSOL**
➤ Child 12–17 years: 5 micrograms once daily continued →

DOSE EQUIVALENCE AND CONVERSION

- ▶ For *Spiriva Respimat*® 2 puffs is equivalent to 5 micrograms tiotropium.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: *BRALTUS*® (TIOTROPUM): RISK OF INHALATION OF CAPSULE IF PLACED IN THE MOUTHPIECE OF THE INHALER (MAY 2018)

The MHRA have received reports of patients who have inhaled a *Braltus*® capsule from the mouthpiece into the back of the throat, resulting in coughing and risking aspiration or airway obstruction. Patients should be trained in the correct use of their inhaler and told to store capsules in the screw-top bottle provided (never in the inhaler) and to always check the mouthpiece is clear before inhaling.

Pharmacists dispensing *Braltus*® capsules should remind patients always to read the instructions for use in the package leaflet and that they must never place a capsule directly into the mouthpiece.

- **CAUTIONS** Arrhythmia (unstable, life-threatening or requiring intervention in the previous 12 months) · heart failure (hospitalisation for moderate to severe heart failure in the previous 12 months) · myocardial infarction in the previous 6 months
- **INTERACTIONS** → Appendix 1: tiotropium
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Gastrointestinal disorders · increased risk of infection · taste altered
 - ▶ **Rare or very rare** Bronchospasm · dysphagia · insomnia · oral disorders
 - ▶ **Frequency not known** Dehydration · dry skin · joint swelling · skin ulcer
- **PREGNANCY** Manufacturer advises avoid—limited data available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises use only if potential benefit outweighs risk if creatinine clearance less than or equal to 50 mL/minute—plasma-tiotropium concentration raised.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on appropriate inhaler technique and reminded that the powder inhalation capsules are not for oral administration; for *Braltus*®, see also *Important safety Information*.
- **NATIONAL FUNDING/ACCESS DECISIONS**

SPIRIVA RESPIMAT®

Scottish Medicines Consortium (SMC) Decisions

- ▶ In adults The *Scottish Medicines Consortium* has advised (August 2015) that tiotropium (*Spiriva Respimat*®) is accepted for use within NHS Scotland as add-on maintenance bronchodilator treatment in adults with asthma who are currently treated with the maintenance combination of inhaled corticosteroids (≥800 micrograms budesonide/day or equivalent) and long-acting beta₂-agonists and who experienced one or more severe exacerbations in the previous year.
- ▶ In adults The *Scottish Medicines Consortium* has advised (December 2017) that tiotropium (*Spiriva Respimat*®) is accepted for use within NHS Scotland as a maintenance bronchodilator treatment to relieve symptoms of patients with chronic obstructive pulmonary disease.

All Wales Medicines Strategy Group (AWMSG) Decisions

- ▶ In adults The *All Wales Medicines Strategy Group* has advised (October 2017) that tiotropium (*Spiriva Respimat*®) is recommended as an option for use within NHS Wales as an add-on maintenance bronchodilator treatment in adults with asthma who are currently treated

with the maintenance combination of inhaled corticosteroids (≥800 micrograms budesonide daily or equivalent) and long-acting beta₂-agonists and who experienced one or more severe exacerbations in the previous year.

● MEDICINAL FORMS

Umeclidinium

19-Feb-2016

● INDICATIONS AND DOSE

Maintenance treatment of chronic obstructive pulmonary disease

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 55 micrograms once daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ Each 65 microgram inhalation of umeclidinium bromide delivers 55 micrograms of umeclidinium.

- **CAUTIONS** Cardiac disorders (particularly cardiac rhythm disorders)

- **INTERACTIONS** → Appendix 1: umeclidinium

● SIDE-EFFECTS

- ▶ **Uncommon** Taste altered
- ▶ **Rare or very rare** Eye pain

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises to use with caution in severe impairment—no information available.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on appropriate inhaler technique.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

- ▶ **Incruse Ellipta** (GlaxoSmithKline UK Ltd) ▼

Umeclidinium bromide 65 microgram per 1 dose Incruse Ellipta 55micrograms/dose dry powder inhaler | 30 dose [POM] £27.50 DT = £27.50

Combinations available: *Fluticasone with umeclidinium and vilanterol*, p. 264

Umeclidinium with vilanterol

19-Feb-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, umeclidinium p. 248.

INDICATIONS AND DOSE

Maintenance treatment of chronic obstructive pulmonary disease

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 1 inhalation once daily

- **CONTRA-INDICATIONS** Severe pre-eclampsia

- **CAUTIONS** Arrhythmias · cardiovascular disease · diabetes (risk of hyperglycaemia and ketoacidosis) · hypertension · hyperthyroidism · hypokalaemia · susceptibility to QT-interval prolongation

CAUTIONS, FURTHER INFORMATION

- ▶ Hypokalaemia Potentially serious hypokalaemia may result from beta₂ agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, diuretics, and by hypoxia.

- **INTERACTIONS** → Appendix 1: beta₂ agonists · umeclidinium

SIDE-EFFECTS

- ▶ **Common or very common** Constipation · dry mouth · headache · oropharyngeal pain · sinusitis
- ▶ **Uncommon** Dysphonia · palpitations · taste altered · tremor
- ▶ **Rare or very rare** Bronchospasm paradoxical · glaucoma · urinary disorders

MONITORING REQUIREMENTS

- ▶ In severe asthma, plasma-potassium concentration should be monitored (risk of hypokalaemia).
- ▶ In patients with diabetes, monitor blood glucose (risk of hyperglycaemia and ketoacidosis, especially when beta₂ agonist given intravenously).

- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on appropriate inhaler technique.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

- ▶ **Umeclidinium with vilanterol (non-proprietary)** ▼

Vilanterol (as Vilanterol trifenate) 22 microgram per 1 dose, Umeclidinium bromide 65 microgram per 1 dose Umeclidinium bromide 65micrograms/dose / Vilanterol 22micrograms/dose dry powder inhaler | 30 dose [POM] DT = £32.50

- ▶ **Anoro Ellipta** (GlaxoSmithKline UK Ltd) ▼

Vilanterol (as Vilanterol trifenate) 22 microgram per 1 dose, Umeclidinium bromide 65 microgram per 1 dose Anoro Ellipta 55micrograms/dose / 22micrograms/dose dry powder inhaler | 30 dose [POM] £32.50 DT = £32.50

BETA₂-ADRENOCEPTOR AGONISTS, SELECTIVE

Beta₂-adrenoceptor agonists, selective

12-Feb-2016

- **CONTRA-INDICATIONS** Severe pre-eclampsia

- **CAUTIONS** Arrhythmias · cardiovascular disease · diabetes (risk of hyperglycaemia and ketoacidosis, especially with intravenous use) · hypertension · hyperthyroidism · hypokalaemia · susceptibility to QT-interval prolongation

CAUTIONS, FURTHER INFORMATION

- ▶ Hypokalaemia Potentially serious hypokalaemia may result from beta₂ agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, diuretics, and by hypoxia.

SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmias · dizziness · headache · hypokalaemia (with high doses) · nausea · palpitations · tremor
- ▶ **Uncommon** Hyperglycaemia · myocardial ischaemia
- ▶ **Rare or very rare** Bronchospasm paradoxical (sometimes severe)

- **PREGNANCY** Women planning to become pregnant should be counselled about the importance of taking their asthma medication regularly to maintain good control.

MONITORING REQUIREMENTS

- ▶ In severe asthma, plasma-potassium concentration should be monitored (risk of hypokalaemia).
- ▶ In patients with diabetes, monitor blood glucose (risk of hyperglycaemia and ketoacidosis, especially when beta₂ agonist given intravenously).

PATIENT AND CARER ADVICE

- ▶ When used by inhalation The **dose**, the frequency, and the maximum number of inhalations in 24 hours of the beta₂ agonist should be **stated explicitly** to the patient or their carer. The patient or their carer should be advised to seek medical advice when the prescribed dose of beta₂ agonist fails to provide the usual degree of symptomatic relief because this usually indicates a worsening of the asthma and the patient may require a prophylactic drug. Patients or their carers should be advised to follow manufacturers' instructions on the care and cleansing of inhaler devices.

BETA₂-ADRENOCEPTOR AGONISTS, SELECTIVE > LONG-ACTING

above

Bambuterol hydrochloride

- **DRUG ACTION** Bambuterol is a pro-drug of terbutaline.

INDICATIONS AND DOSE

Asthma (patients who have previously tolerated beta₂-agonists) | Other conditions associated with reversible airways obstruction (patients who have previously tolerated beta₂-agonists)

- ▶ BY MOUTH
- ▶ Adult: 20 mg once daily, dose to be taken at bedtime

Asthma (patients who have not previously tolerated beta₂-agonists) | Other conditions associated with reversible airways obstruction (patients who have not previously tolerated beta₂-agonists)

- ▶ BY MOUTH
- ▶ Adult: Initially 10 mg once daily for 1–2 weeks, then increased if necessary to 20 mg once daily, dose to be taken at bedtime

- **INTERACTIONS** → Appendix 1: beta₂ agonists

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · behaviour abnormal · muscle cramps · sleep disorder
- ▶ **Frequency not known** Akathisia · angioedema · circulatory collapse · hypersensitivity · hypotension · skin reactions
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce initial dose by half if eGFR less than 50 mL/minute/1.73 m².

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Bambec** (AstraZeneca UK Ltd)
Bambuterol hydrochloride 10 mg Bambec 10mg tablets | 28 tablet [PoM] £28.92 DT = £28.92
Bambuterol hydrochloride 20 mg Bambec 20mg tablets | 28 tablet [PoM] £15.77 DT = £15.77

F 249

Formoterol fumarate

(Eformoterol fumarate)

● INDICATIONS AND DOSE

Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy | Nocturnal asthma in patients requiring long-term regular bronchodilator therapy | Prophylaxis of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy | Chronic asthma in patients who regularly use an inhaled corticosteroid

- ▶ **BY INHALATION OF POWDER**
- ▶ Child 6–11 years: 12 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose
- ▶ Child 12–17 years: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose
- ▶ Adult: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily
- ▶ **BY INHALATION OF AEROSOL**
- ▶ Child 12–17 years: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose
- ▶ Adult: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily

Chronic obstructive pulmonary disease

- ▶ **BY INHALATION OF POWDER**
- ▶ Adult: 12 micrograms twice daily
- ▶ **BY INHALATION OF AEROSOL**
- ▶ Adult: 12 micrograms twice daily (max. per dose 24 micrograms), for symptom relief additional doses may be taken to maximum daily dose; maximum 48 micrograms per day

OXIS®

Chronic asthma

- ▶ **BY INHALATION OF POWDER**
- ▶ Child 6–17 years: 6–12 micrograms 1–2 times a day (max. per dose 12 micrograms), occasionally doses up to the maximum daily may be needed, reassess treatment if additional doses required on more than 2 days a week; maximum 48 micrograms per day
- ▶ Adult: 6–12 micrograms 1–2 times a day, increased if necessary up to 24 micrograms twice daily (max. per dose 36 micrograms), occasionally doses up to the maximum daily may be needed, reassess treatment if additional doses required on more than 2 days a week; maximum 72 micrograms per day

Relief of bronchospasm

- ▶ **BY INHALATION OF POWDER**
- ▶ Child 6–17 years: 6–12 micrograms
- ▶ Adult: 6–12 micrograms

Prophylaxis of exercise-induced bronchospasm

- ▶ **BY INHALATION OF POWDER**
- ▶ Child 6–17 years: 6–12 micrograms, dose to be taken before exercise
- ▶ Adult: 12 micrograms, dose to be taken before exercise

Chronic obstructive pulmonary disease

- ▶ **BY INHALATION OF POWDER**
- ▶ Adult: 12 micrograms 1–2 times a day (max. per dose 24 micrograms), for symptom relief additional doses up to maximum daily dose can be taken; maximum 48 micrograms per day

PHARMACOKINETICS

- ▶ At recommended inhaled doses, the duration of action of formoterol is about 12 hours.

IMPORTANT SAFETY INFORMATION

CHM ADVICE

To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta₂ agonist (formoterol) should:

- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;
- not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used;
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

- **CAUTIONS** High doses of beta₂ agonists can be dangerous in some children

- **INTERACTIONS** → Appendix 1: beta₂ agonists

● SIDE-EFFECTS

- ▶ **Common or very common** Muscle cramps
- ▶ **Uncommon** Angina pectoris · bronchospasm · skin reactions · sleep disorder · taste altered
- ▶ **Rare or very rare** Anxiety · QT interval prolongation

- **PREGNANCY** Inhaled drugs for asthma can be taken as normal during pregnancy.

- **BREAST FEEDING** Inhaled drugs for asthma can be taken as normal during breast-feeding.

- **PATIENT AND CARER ADVICE** Advise patients not to exceed prescribed dose, and to follow manufacturer's directions; if a previously effective dose of inhaled formoterol fails to provide adequate relief, a doctor's advice should be obtained as soon as possible. Patients should be advised to

report any deterioration in symptoms following initiation of treatment with a long-acting beta₂ agonist. Patient or carer should be given advice on how to administer formoterol fumarate inhalers.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

- ▶ **Easyhaler (formoterol)** (Orion Pharma (UK) Ltd)
Formoterol fumarate dihydrate 12 microgram per 1 dose Formoterol Easyhaler 12micrograms/dose dry powder inhaler | 120 dose [PoM] £23.75 DT = £23.75
- ▶ **Foradil** (Novartis Pharmaceuticals UK Ltd)
Formoterol fumarate dihydrate 12 microgram Foradil 12microgram inhalation powder capsules with device | 60 capsule [PoM] £28.06 DT = £28.06
- ▶ **Oxis Turbohaler** (AstraZeneca UK Ltd)
Formoterol fumarate dihydrate 6 microgram per 1 dose Oxis 6 Turbohaler | 60 dose [PoM] £24.80 DT = £24.80
Formoterol fumarate dihydrate 12 microgram per 1 dose Oxis 12 Turbohaler | 60 dose [PoM] £24.80 DT = £24.80

Pressurised inhalation

- ▶ **Atimos Modulite** (Chiesi Ltd)
Formoterol fumarate dihydrate 12 microgram per 1 dose Atimos Modulite 12micrograms/dose inhaler | 100 dose [PoM] £30.06 DT = £30.06

Combinations available: *Acclidinium bromide with formoterol*, p. 245 • *Beclometasone with formoterol*, p. 258 • *Beclometasone with formoterol and glycopyrronium*, p. 259 • *Budesonide with formoterol*, p. 260 • *Fluticasone with formoterol*, p. 262

Indacaterol

• INDICATIONS AND DOSE

Maintenance treatment of chronic obstructive pulmonary disease

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 150 micrograms once daily, then increased to 300 micrograms once daily

- **CAUTIONS** Convulsive disorders
- **INTERACTIONS** → Appendix 1: beta₂ agonists
- **SIDE-EFFECTS**
 - ▶ Common or very common Chest pain • cough • increased risk of infection • muscle complaints • oropharyngeal pain • peripheral oedema • rhinorrhoea • throat irritation
 - ▶ Uncommon Diabetes mellitus • hypersensitivity • musculoskeletal pain • paraesthesia • skin reactions
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Use with caution in severe impairment—no information available.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer indacaterol inhalation powder.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

- ▶ **Onbrez Breezhaler** (Novartis Pharmaceuticals UK Ltd)
Indacaterol (as Indacaterol maleate) 150 microgram Onbrez Breezhaler 150microgram inhalation powder capsules with device | 30 capsule [PoM] £32.19 DT = £32.19
Indacaterol (as Indacaterol maleate) 300 microgram Onbrez Breezhaler 300microgram inhalation powder capsules with device | 30 capsule [PoM] £32.19 DT = £32.19

Combinations available: *Glycopyrronium with indacaterol*, p. 246

Olodaterol

• INDICATIONS AND DOSE

Maintenance treatment of chronic obstructive pulmonary disease

- ▶ BY INHALATION
- ▶ Adult: 5 micrograms once daily
- DOSE EQUIVALENCE AND CONVERSION**
- ▶ 2 puffs is equivalent to 5 micrograms.

- **CAUTIONS** Aneurysm • convulsive disorders
- **INTERACTIONS** → Appendix 1: beta₂ agonists
- **SIDE-EFFECTS**
 - ▶ Uncommon Nasopharyngitis • rash
 - ▶ Rare or very rare Arthralgia • hypertension
 - ▶ Frequency not known Angina pectoris • dry mouth • fatigue • hypotension • insomnia • malaise • metabolic acidosis • muscle spasms • nervousness
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Use with caution in severe hepatic impairment—no information available.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer olodaterol solution for inhalation.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Pressurised inhalation

- ▶ **Striverdi Respimat** (Boehringer Ingelheim Ltd) ▼
Olodaterol (as Olodaterol hydrochloride) 2.5 microgram per 1 dose Striverdi Respimat 2.5micrograms/dose solution for inhalation cartridge with device | 60 dose [PoM] £26.35 DT = £26.35

Combinations available: *Tiotropium with olodaterol*, p. 248

Salmeterol

• INDICATIONS AND DOSE

Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy | Nocturnal asthma in patients requiring long-term regular bronchodilator therapy | Prevention of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy | Chronic asthma only in patients who regularly use an inhaled corticosteroid (not for immediate relief of acute asthma)

- ▶ BY INHALATION OF AEROSOL, OR BY INHALATION OF POWDER
- ▶ Child 5-11 years: 50 micrograms twice daily
- ▶ Child 12-17 years: 50 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 100 micrograms twice daily
- ▶ Adult: 50 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 100 micrograms twice daily

Chronic obstructive pulmonary disease

- ▶ BY INHALATION OF AEROSOL, OR BY INHALATION OF POWDER
- ▶ Adult: 50 micrograms twice daily

PHARMACOKINETICS

- ▶ At recommended inhaled doses, the duration of action of salmeterol is about 12 hours.

- **UNLICENSED USE** *Neovent*® not licensed for use in children under 12 years.

IMPORTANT SAFETY INFORMATION**CHM ADVICE**

To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta₂ agonist (salmeterol) should:

- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;
- not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used;
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

- **CAUTIONS** High doses of beta₂ agonists can be dangerous in some children
- **INTERACTIONS** → Appendix 1: beta₂ agonists
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Muscle cramps
 - ▶ **Uncommon** Nervousness · skin reactions
 - ▶ **Rare or very rare** Arthralgia · bronchospasm · chest pain · insomnia · oedema · oropharyngeal irritation
- **PREGNANCY** Inhaled drugs for asthma can be taken as normal during pregnancy.
- **BREAST FEEDING** Inhaled drugs for asthma can be taken as normal during breast-feeding.
- **PATIENT AND CARER ADVICE** Advise patients that salmeterol should **not** be used for relief of acute attacks, not to exceed prescribed dose, and to follow manufacturer's directions; if a previously effective dose of inhaled salmeterol fails to provide adequate relief, a doctor's advice should be obtained as soon as possible. Patients should be advised to report any deterioration in symptoms following initiation of treatment with a long-acting beta₂ agonist.

BETA₂-ADRENOCEPTOR AGONISTS, SELECTIVE > SHORT-ACTING

F 249

Salbutamol

(Albuterol)

INDICATIONS AND DOSE**Asthma | Other conditions associated with reversible airways obstruction**

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
 - ▶ **Adult:** 4 mg 3–4 times a day, maximum single dose 8 mg (but unlikely to provide much extra benefit or to be tolerated), inhalation route preferred over oral route, use elderly dose for sensitive patients
 - ▶ **Elderly:** Initially 2 mg 3–4 times a day, maximum single dose 8 mg (but unlikely to provide much extra benefit or to be tolerated), inhalation route preferred over oral route
- ▶ **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
 - ▶ **Adult:** 500 micrograms every 4 hours if required
- ▶ **BY SLOW INTRAVENOUS INJECTION**
 - ▶ **Adult:** 250 micrograms, repeated if necessary, injection to be diluted to a concentration of 50 micrograms/mL, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably
- ▶ **BY INTRAVENOUS INFUSION**
 - ▶ **Adult:** Initially 5 micrograms/minute, adjusted according to response and heart rate, usual dose 3–20 micrograms/minute, higher doses may be required, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably
- ▶ **BY INHALATION OF AEROSOL**
 - ▶ **Adult:** 100–200 micrograms, up to 4 times a day for persistent symptoms
- ▶ **BY INHALATION OF NEBULISED SOLUTION**
 - ▶ **Adult:** 2.5–5 mg, repeated up to 4 times daily or more frequently in severe cases

Prophylaxis of allergen- or exercise-induced bronchospasm

- ▶ **BY INHALATION OF AEROSOL**
 - ▶ **Adult:** 200 micrograms

Acute asthma

- ▶ **BY INTRAVENOUS INJECTION**
 - ▶ **Child 1–23 months:** 5 micrograms/kg for 1 dose, dose to be administered over 5 minutes, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
 - ▶ **Child 2–17 years:** 15 micrograms/kg (max. per dose 250 micrograms) for 1 dose, dose to be administered over 5 minutes, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

Moderate, severe, or life-threatening acute asthma

- ▶ **BY INHALATION OF NEBULISED SOLUTION**
 - ▶ **Child 1 month–4 years:** 2.5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
 - ▶ **Child 5–11 years:** 2.5–5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
 - ▶ **Child 12–17 years:** 5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

- ▶ Adult: 5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

Moderate and severe acute asthma

- ▶ BY INHALATION OF AEROSOL
- ▶ Child: 2–10 puffs, each puff is to be inhaled separately, repeat every 10–20 minutes or when required, give via large volume spacer (and a close-fitting face mask in children under 3 years), each puff is equivalent to 100 micrograms
- ▶ Adult: 2–10 puffs, each puff is to be inhaled separately, repeat every 10–20 minutes or when required, give via large volume spacer, each puff is equivalent to 100 micrograms

Exacerbation of reversible airways obstruction (including nocturnal asthma) | Prophylaxis of allergen- or exercise-induced bronchospasm

- ▶ BY INHALATION OF AEROSOL
- ▶ Child: 100–200 micrograms, up to 4 times a day for persistent symptoms
- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 1 month–1 year: 100 micrograms/kg 3–4 times a day (max. per dose 2 mg), inhalation route preferred over oral route
- ▶ Child 2–5 years: 1–2 mg 3–4 times a day, inhalation route preferred over oral route
- ▶ Child 6–11 years: 2 mg 3–4 times a day, inhalation route preferred over oral route
- ▶ Child 12–17 years: 2–4 mg 3–4 times a day, inhalation route preferred over oral route

Chronic asthma

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 3–11 years: 4 mg twice daily
- ▶ Child 12–17 years: 8 mg twice daily
- ▶ Adult: 8 mg twice daily

Uncomplicated premature labour (between 22 and 37 weeks of gestation) (specialist supervision in hospital)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 10 micrograms/minute, rate increased gradually according to response at 10-minute intervals until contractions diminish then increase rate slowly until contractions cease (maximum rate 45 micrograms/minute), maintain rate for 1 hour after contractions have stopped, then gradually reduce by 50% every 6 hours, maximum duration 48 hours

EASYHALER® SALBUTAMOL

Acute bronchospasm

- ▶ BY INHALATION OF POWDER
- ▶ Adult: Initially 100–200 micrograms, increased if necessary to 400 micrograms; maximum 800 micrograms per day

Prophylaxis of allergen- or exercise-induced bronchospasm

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 200 micrograms

PULVINAL® SALBUTAMOL

Acute bronchospasm

- ▶ BY INHALATION OF POWDER
- ▶ Child 5–17 years: Initially 200 micrograms, up to 800 micrograms daily for persistent symptoms
- ▶ Adult: Initially 200 micrograms, up to 800 micrograms daily for persistent symptoms

Prophylaxis of allergen- or exercise-induced bronchospasm

- ▶ BY INHALATION OF POWDER
- ▶ Child 5–17 years: 200 micrograms
- ▶ Adult: 200 micrograms

SALBULIN NOVOLIZER®

Acute bronchospasm

- ▶ BY INHALATION OF POWDER
- ▶ Adult: Initially 100–200 micrograms, up to 800 micrograms daily for persistent symptoms

Prophylaxis of allergen- or exercise-induced bronchospasm

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 200 micrograms

VENTOLIN ACCUHALER®

Acute bronchospasm

- ▶ BY INHALATION OF POWDER
- ▶ Adult: Initially 200 micrograms, up to 4 times daily for persistent symptoms

Prophylaxis of allergen- or exercise-induced bronchospasm

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 200 micrograms

PHARMACOKINETICS

- ▶ At recommended inhaled doses, the duration of action of salbutamol is about 3 to 5 hours.

- **UNLICENSED USE** Syrup and tablets not licensed for use in children under 2 years. Modified-release tablets not licensed for use in children under 3 years. Injection and solution for intravenous infusion not licensed for use in children under 12 years.
- ▶ With intravenous use in children Administration of undiluted salbutamol injection through a central venous catheter is not licensed.
- **CONTRA-INDICATIONS**
- ▶ When used for uncomplicated premature labour under specialist supervision Abruptio placenta · antepartum haemorrhage · cord compression · eclampsia · history of cardiac disease · intra-uterine fetal death · intra-uterine infection · placenta praevia · pulmonary hypertension · severe pre-eclampsia · significant risk factors for myocardial ischaemia · threatened miscarriage
- **CAUTIONS**
- GENERAL CAUTIONS** High doses of beta₂ agonists can be dangerous in some children
- SPECIFIC CAUTIONS**
- ▶ With intravenous use Mild to moderate pre-eclampsia (when used for uncomplicated premature labour) · suspected cardiovascular disease (should be assessed by a cardiologist before initiating therapy for uncomplicated premature labour)
- **INTERACTIONS** → Appendix 1: beta₂ agonists
- **SIDE-EFFECTS**
- GENERAL SIDE-EFFECTS**
- ▶ Rare or very rare Akathisia · vasodilation
- ▶ Frequency not known Metabolic change
- SPECIFIC SIDE-EFFECTS**
- ▶ Common or very common Muscle complaints
- ▶ Uncommon
- ▶ When used by inhalation Oral and throat irritation
- ▶ With parenteral use Pulmonary oedema
- ▶ Frequency not known
- ▶ With parenteral use Lactic acidosis (with high doses) · vomiting
- **BREAST FEEDING** Inhaled drugs for asthma can be taken as normal during breast-feeding.
- **MONITORING REQUIREMENTS** In uncomplicated premature labour it is important to monitor blood pressure, pulse rate (should not exceed 120 beats per minute), ECG (discontinue treatment if signs of myocardial ischaemia develop), blood glucose and lactate concentrations, and the patient's fluid and electrolyte status (avoid over-

hydration—discontinue drug immediately and initiate diuretic therapy if pulmonary oedema occurs).

• DIRECTIONS FOR ADMINISTRATION

- With intravenous use in children For *continuous intravenous infusion*, dilute to a concentration of 200 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%. If fluid-restricted, can be given undiluted through central venous catheter [unlicensed]. For *intravenous injection*, dilute to a concentration of 50 micrograms/mL with Glucose 5%, Sodium Chloride 0.9%, or Water for injections.
- When used by inhalation For *nebulisation*, dilute nebuliser solution with a suitable volume of sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; salbutamol and ipratropium bromide solutions are compatible and can be mixed for nebulisation.
- With intravenous use in adults For *bronchodilation by continuous intravenous infusion*, dilute to a concentration of 200 micrograms/mL with glucose 5% or sodium chloride 0.9%. For *premature labour by continuous intravenous infusion*, dilute with glucose 5% to a concentration of 200 micrograms/mL for use in a syringe pump or for other infusion methods (preferably *via* controlled infusion device), dilute to a concentration of 20 micrograms/mL; close attention to patient's fluid and electrolyte status essential.

- PATIENT AND CARER ADVICE** For *inhalation by aerosol or dry powder*, advise patients and carers not to exceed prescribed dose and to follow manufacturer's directions; if a previously effective dose of inhaled salbutamol fails to provide at least 3 hours relief, a doctor's advice should be obtained as soon as possible. For *inhalation by nebuliser*, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution.

Nebuliser liquid

► Salbutamol (Non-proprietary)

- Salbutamol (as Salbutamol sulfate) 1 mg per 1 ml Salbutamol 2.5mg/2.5ml nebuliser liquid unit dose vials | 20 unit dose [PoM] £1.91 DT = £1.91

- Salbutamol (as Salbutamol sulfate) 2 mg per 1 ml Salbutamol 5mg/2.5ml nebuliser liquid unit dose vials | 20 unit dose [PoM] £3.82 DT = £3.82

► Salamol Steri-Neb (Teva UK Ltd)

- Salbutamol (as Salbutamol sulfate) 1 mg per 1 ml Salamol 2.5mg/2.5ml nebuliser liquid Steri-Neb unit dose vials | 20 unit dose [PoM] £1.91 DT = £1.91

- Salbutamol (as Salbutamol sulfate) 2 mg per 1 ml Salamol 5mg/2.5ml nebuliser liquid Steri-Neb unit dose vials | 20 unit dose [PoM] £3.82 DT = £3.82

► Ventolin (GlaxoSmithKline UK Ltd)

- Salbutamol (as Salbutamol sulfate) 5 mg per 1 ml Ventolin 5mg/ml respirator solution | 20 ml [PoM] £2.18 DT = £2.18

► Ventolin Nebules (GlaxoSmithKline UK Ltd)

- Salbutamol (as Salbutamol sulfate) 1 mg per 1 ml Ventolin 2.5mg Nebules | 20 unit dose [PoM] £1.65 DT = £1.91
- Salbutamol (as Salbutamol sulfate) 2 mg per 1 ml Ventolin 5mg Nebules | 20 unit dose [PoM] £2.78 DT = £3.82

Combinations available: *Ipratropium with salbutamol*, p. 247

Terbutaline sulfate

• INDICATIONS AND DOSE

Asthma | Other conditions associated with reversible airways obstruction

► BY MOUTH

- Adult: Initially 2.5 mg 3 times a day for 1–2 weeks, then increased to up to 5 mg 3 times a day, use by inhalation preferred over by mouth

- ▶ BY SUBCUTANEOUS INJECTION, OR BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 250–500 micrograms up to 4 times a day, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Adult: 90–300 micrograms/hour for 8–10 hours, to be administered as a solution containing 3–5 micrograms/mL, high doses require close monitoring, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
- ▶ BY INHALATION OF POWDER
- ▶ Adult: 500 micrograms up to 4 times a day, for persistent symptoms
- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Adult: 5–10 mg 2–4 times a day, additional doses may be necessary in severe acute asthma

Acute asthma

- ▶ BY SUBCUTANEOUS INJECTION, OR BY SLOW INTRAVENOUS INJECTION
- ▶ Child 2–14 years: 10 micrograms/kg up to 4 times a day (max. per dose 300 micrograms), reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
- ▶ Child 15–17 years: 250–500 micrograms up to 4 times a day, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Child: Loading dose 2–4 micrograms/kg, then 1–10 micrograms/kg/hour, dose to be adjusted according to response and heart rate, close monitoring is required for doses above 10 micrograms/kg/hour, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

Moderate, severe, or life-threatening acute asthma

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Child 1 month–4 years: 5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
- ▶ Child 5–11 years: 5–10 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
- ▶ Child 12–17 years: 10 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
- ▶ Adult: 10 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

Exacerbation of reversible airways obstruction (including nocturnal asthma) | Prevention of exercise-induced bronchospasm

- ▶ BY INHALATION OF POWDER
- ▶ Child 5–17 years: 500 micrograms up to 4 times a day, for occasional use only
- ▶ BY MOUTH
- ▶ Child 1 month–6 years: 75 micrograms/kg 3 times a day (max. per dose 2.5 mg), administration by mouth is not recommended
- ▶ Child 7–14 years: 2.5 mg 2–3 times a day, administration by mouth is not recommended
- ▶ Child 15–17 years: Initially 2.5 mg 3 times a day, then increased if necessary to 5 mg 3 times a day, administration by mouth is not recommended

Uncomplicated premature labour (between 22 and 37 weeks of gestation) (specialist supervision in hospital)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 5 micrograms/minute for 20 minutes, then increased in steps of 2.5 micrograms/minute every 20 minutes until contractions have ceased (more than 10 micrograms/minute should **seldom** be given—20 micrograms/minute should **not** be exceeded), continue for 1 hour, then reduced in steps of 2.5 micrograms/minute every 20 minutes to lowest dose that maintains suppression (maximum total duration 48 hours)

PHARMACOKINETICS

- ▶ At recommended inhaled doses, the duration of action of terbutaline is about 3 to 5 hours.

- **UNLICENSED USE** Tablets not licensed for use in children under 7 years. Injection not licensed for use in children under 2 years.

CONTRA-INDICATIONS

- ▶ When used for uncomplicated premature labour · Abruptio placenta · antepartum haemorrhage · cord compression · eclampsia · history of cardiac disease · intra-uterine fetal death · intra-uterine infection · placenta praevia · pulmonary hypertension · severe pre-eclampsia · significant risk factors for myocardial ischaemia · threatened miscarriage

- **CAUTIONS** High doses of beta₂ agonists can be dangerous in some children · mild to moderate pre-eclampsia (when used for uncomplicated premature labour) · suspected cardiovascular disease (should be assessed by a cardiologist before initiating therapy for uncomplicated premature labour)

- **INTERACTIONS** → Appendix 1: beta₂ agonists

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Hypotension · muscle spasms
- ▶ **Rare or very rare** Vasodilation
- ▶ **Frequency not known** Angioedema · anxiety · behaviour abnormal · bronchospasm · circulatory collapse · oral irritation · skin reactions · sleep disorder · throat irritation

SPECIFIC SIDE-EFFECTS

- ▶ **Uncommon**
- ▶ With parenteral use Pulmonary oedema
- ▶ **Rare or very rare**
- ▶ With parenteral use Lactic acidosis
- ▶ **Frequency not known**
- ▶ With parenteral use Akathisia · bleeding tendency
- **PREGNANCY** Inhaled drugs for asthma can be taken as normal during pregnancy.
- **BREAST FEEDING** Inhaled drugs for asthma can be taken as normal during breast-feeding.
- **MONITORING REQUIREMENTS** In uncomplicated premature labour it is important to monitor blood pressure, pulse rate (should not exceed 120 beats per minute), ECG (discontinue treatment if signs of myocardial ischaemia develop), blood glucose and lactate concentrations, and the patient's fluid and electrolyte status (avoid over-hydration—discontinue drug immediately and initiate diuretic therapy if pulmonary oedema occurs).
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use in children For *continuous intravenous infusion*, dilute to a concentration of 5 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; if fluid-restricted, dilute to a concentration of 100 micrograms/mL.
- ▶ When used by inhalation For *nebulisation*, dilute nebuliser solution with sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of

administration; terbutaline and ipratropium bromide solutions are compatible and may be mixed for nebulisation.

- With intravenous use in adults For bronchodilation by continuous intravenous infusion, dilute 1.5–2.5 mg with 500 mL glucose 5% or sodium chloride 0.9% and give over 8–10 hours. For premature labour by continuous intravenous infusion, dilute in glucose 5% and give via controlled infusion device preferably a syringe pump; if syringe pump available dilute to a concentration of 100 micrograms/mL; if syringe pump not available dilute to a concentration of 10 micrograms/mL; close attention to patient's fluid and electrolyte status essential.
- PATIENT AND CARER ADVICE** For inhalation by dry powder, advise patients and carers not to exceed prescribed dose and to follow manufacturer's directions; if a previously effective dose of inhaled terbutaline fails to provide at least 3 hours relief, a doctor's advice should be obtained as soon as possible. For inhalation by nebuliser, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

Bricalnyl (AstraZeneca UK Ltd)

Terbutaline sulfate 500 microgram per 1 mL Bricalnyl 2.5mg/5mL solution for injection ampoules | 10 ampoule [PoM] £20.09 DT = £20.09

Bricalnyl 500micrograms/1mL solution for injection ampoules | 5 ampoule [PoM] £6.48 DT = £6.48

Inhalation powder

Bricalnyl Turbohaler (AstraZeneca UK Ltd)

Terbutaline sulfate 500 microgram per 1 dose Bricalnyl 500micrograms/dose Turbohaler | 100 dose [PoM] £8.30 DT = £8.30

Nebuliser liquid

Terbutaline sulfate (Non-proprietary)

Terbutaline sulfate 2.5 mg per 1 mL Terbutaline 5mg/2mL nebuliser liquid unit dose vials | 20 unit dose [PoM] £4.04 DT = £4.04

Bricalnyl Respules (AstraZeneca UK Ltd)

Terbutaline sulfate 2.5 mg per 1 mL Bricalnyl 5mg/2mL Respules | 20 unit dose [PoM] £11.64 DT = £4.04

Tablet

Bricalnyl (AstraZeneca UK Ltd)

Terbutaline sulfate 5 mg Bricalnyl 5mg tablets | 100 tablet [PoM] £14.73 DT = £14.73

CORTICOSTEROIDS

Airways disease, use of corticosteroids

30-Nov-2017

Asthma, use of corticosteroids

Inhaled corticosteroids

Corticosteroids are effective in asthma; they reduce airway inflammation (and hence reduce oedema and secretion of mucus into the airway).

An inhaled corticosteroid is used regularly for prophylaxis of asthma. Regular use of inhaled corticosteroids reduces the risk of exacerbation of asthma.

Current and previous smoking reduces the effectiveness of inhaled corticosteroids and higher doses may be necessary.

Corticosteroid inhalers must be used regularly for maximum benefit. Beclomethasone dipropionate p. 257, budesonide p. 259, fluticasone p. 262, and mometasone furoate p. 265 appear to be equally effective.

In adults using an inhaled corticosteroid and a long-acting beta₂ agonist for the prophylaxis of asthma, but who are

poorly controlled, *Symbicort*® or *DuoResp Spiromax*® (both containing budesonide with formoterol p. 260) or *Fostair*® beclomethasone with formoterol p. 258 can be used as relievers (instead of a short-acting beta₂ agonist), in addition to their regular use for the prophylaxis of asthma.

Oral corticosteroids

Systemic corticosteroid therapy may be necessary during episodes of stress, such as severe infection, or when airway obstruction or mucus prevent drug access to smaller airways.

An acute attack of asthma should be treated with a short course of an oral corticosteroid starting with a high dose. Patients whose asthma has deteriorated rapidly usually respond quickly to corticosteroids. The dose can usually be stopped abruptly; tapering is not needed provided that the patient receives an inhaled corticosteroid in an adequate dose (apart from those on maintenance oral corticosteroid treatment or where oral corticosteroids are required for 3 or more weeks). In patients who have needed several courses of oral corticosteroids and in whom the possibility of a period on maintenance corticosteroids is being considered, it may be useful to taper the corticosteroid dose gradually to identify a threshold dose for asthma control. This should only be done after other standard options for controlling asthma have been tried.

An oral corticosteroid should normally be taken as a single dose in the morning to reduce the disturbance to circadian cortisol secretion. Dosage should always be titrated to the lowest dose that controls symptoms. Regular peak-flow measurements help to optimise the dose.

Parenteral corticosteroids

Hydrocortisone injection p. 662 has a role in the emergency treatment of acute severe asthma.

Chronic obstructive pulmonary disease, use of corticosteroids

Inhaled corticosteroids

In chronic obstructive pulmonary disease inhaled corticosteroid therapy may reduce exacerbations when given in combination with an inhaled long-acting beta₂ agonist.

Oral corticosteroids

During an acute exacerbation of chronic obstructive pulmonary disease, prednisolone p. 664 should be given; treatment can be stopped abruptly. Prolonged treatment with oral prednisolone is of no benefit and maintenance treatment is not normally recommended.

Corticosteroids (inhaled)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

SIDE-EFFECTS

- Common or very common Altered smell sensation • Cushing's syndrome • epistaxis • headache • nasal complaints • oral candidiasis • skin reactions • taste altered • throat irritation • voice alteration

- **Uncommon** Adrenal suppression • anxiety • bronchospasm paradoxical • cataract • glaucoma • vision blurred
- **Rare or very rare** Behaviour abnormal • growth retardation (in children) • hypertrichosis • sleep disorder
- **Frequency not known** Pneumonia (in patients with COPD)

SIDE-EFFECTS, FURTHER INFORMATION Systemic absorption may follow inhaled administration particularly if high doses are used or if treatment is prolonged. Therefore also consider the side-effects of systemic corticosteroids.

Candidiasis The risk of oral candidiasis can be reduced by using a spacer device with the corticosteroid inhaler; rinsing the mouth with water after inhalation of a dose may also be helpful. An anti-fungal oral suspension or oral gel can be used to treat oral candidiasis without discontinuing corticosteroid therapy.

Paradoxical bronchospasm The potential for paradoxical bronchospasm (calling for discontinuation and alternative therapy) should be borne in mind. Mild bronchospasm may be prevented by inhalation of a short-acting beta₂ agonist beforehand (or by transfer from an aerosol inhalation to a dry powder inhalation).

- **PREGNANCY** Inhaled drugs for asthma can be taken as normal during pregnancy.
- **BREAST FEEDING** Inhaled corticosteroids for asthma can be taken as normal during breast-feeding.
- **MONITORING REQUIREMENTS** The height and weight of children receiving prolonged treatment with inhaled corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Inhaled corticosteroids for the treatment of chronic asthma in children under 12 years (November 2007)** NICE TA131
For children under 12 years with chronic asthma in whom treatment with an inhaled corticosteroid is considered appropriate, the least costly product that is suitable for an individual child (taking into consideration NICE TAs 38 and 10), within its marketing authorisation, is recommended. For children under 12 years with chronic asthma in whom treatment with an inhaled corticosteroid and a long-acting beta₂ agonist is considered appropriate, the following apply:
 - the use of a combination inhaler within its marketing authorisation is recommended as an option;
 - the decision to use a combination inhaler or two agents in separate inhalers should be made on an individual basis, taking into consideration therapeutic need and the likelihood of treatment adherence;
 - if a combination inhaler is chosen, then the least costly inhaler that is suitable for the individual child is recommended.

www.nice.org.uk/TA131

- **Inhaled corticosteroids for the treatment of chronic asthma in adults and children over 12 years (March 2008)** NICE TA138
For adults and children over 12 years with chronic asthma in whom treatment with an inhaled corticosteroid is considered appropriate, the least costly product that is suitable for an individual (taking into consideration NICE TAs 38 and 10), within its marketing authorisation is recommended.

For adults and children over 12 years with chronic asthma in whom treatment with an inhaled corticosteroid and a long-acting beta₂ agonist is considered appropriate, the following apply:

- the use of a combination inhaler within its marketing authorisation is recommended as an option;
- the decision to use a combination inhaler or two agents in separate inhalers should be made on an individual basis, taking into consideration therapeutic need, and the likelihood of treatment adherence;

- if a combination inhaler is chosen, then the least costly inhaler that is suitable for the individual is recommended.

F 256

Beclomethasone dipropionate

04-Jan-2016

(Beclomethasone dipropionate)

● INDICATIONS AND DOSE

Prophylaxis of asthma

► BY INHALATION OF POWDER

- Child 5–11 years: 100–200 micrograms twice daily, dose to be adjusted as necessary
- Child 12–17 years: 200–400 micrograms twice daily; increased if necessary up to 800 micrograms twice daily, dose to be adjusted as necessary
- Adult: 200–400 micrograms twice daily; increased if necessary up to 800 micrograms twice daily, dose to be adjusted as necessary

DOSE EQUIVALENCE AND CONVERSION

- Dose adjustments may be required for some inhaler devices, see under individual preparations.

CLENIL MODULITE®

Prophylaxis of asthma

► BY INHALATION OF AEROSOL

- Child 2–11 years: 100–200 micrograms twice daily
- Child 12–17 years: 200–400 micrograms twice daily, adjusted according to response; increased if necessary up to 1 mg twice daily
- Adult: 200–400 micrograms twice daily, adjusted according to response; increased if necessary up to 1 mg twice daily

QVAR® PREPARATIONS

Prophylaxis of asthma

► BY INHALATION OF AEROSOL

- Child 12–17 years: 50–200 micrograms twice daily; increased if necessary up to 400 micrograms twice daily
- Adult: 50–200 micrograms twice daily; increased if necessary up to 400 micrograms twice daily

POTENCY

- *Qvar®* has extra-fine particles, is more potent than traditional beclomethasone dipropionate CFC-containing inhalers and is approximately twice as potent as *Clenil Modulite®*.

- **UNLICENSED USE** *Easylhaler®* Beclomethasone Dipropionate is not licensed for use in children under 18 years. *Clenil Modulite®* -200 and -250 are not licensed for use in children under 12 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JULY 2008)

Beclomethasone dipropionate CFC-free pressurised metered-dose inhalers (*Qvar®* and *Clenil Modulite®*) are **not** interchangeable and should be prescribed by brand name; *Qvar®* has extra-fine particles, is more potent than traditional beclomethasone dipropionate CFC-containing inhalers, and is approximately twice as potent as *Clenil Modulite®*.

- **INTERACTIONS** → Appendix 1: corticosteroids
- **PRESCRIBING AND DISPENSING INFORMATION** The MHRA has advised (July 2008) that beclomethasone dipropionate CFC-free inhalers should be prescribed by brand name.
QVAR® PREPARATIONS When switching a patient with well-controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of *Qvar®* should be prescribed for 200–250 micrograms of beclomethasone dipropionate or budesonide and for

100 micrograms of fluticasone propionate. When switching a patient with poorly controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of *Qvar*® should be prescribed for 100 micrograms of beclometasone dipropionate, budesonide, or fluticasone propionate; the dose of *Qvar*® should be adjusted according to response.

CLENIL MODULITE® *Clenil Modulite*® is not interchangeable with other CFC-free beclometasone dipropionate inhalers.

- **PATIENT AND CARER ADVICE** Steroid card should be issued with high doses of inhaled beclometasone dipropionate. Medicines for Children leaflet: Beclometasone for asthma prevention (prophylaxis) www.medicinesforchildren.org.uk/beclometasone-inhaler-asthma-prevention-prophylaxis-0

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Clenil Modulite® 50 micrograms/metered inhalation may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

CAUTIONARY AND ADVISORY LABELS 8, 10

- **Easyhaler (beclometasone)** (Orion Pharma (UK) Ltd)

Beclometasone dipropionate 100 microgram per 1 dose Qvar 100micrograms/dose Easi-Breathe inhaler | 200 dose [PoM] £16.95 DT = £17.21

Beclometasone with formoterol

09-Jun-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, beclometasone dipropionate p. 257, formoterol fumarate p. 250.

● INDICATIONS AND DOSE

FOSTAIR NEXTHALER® 100/6

Asthma maintenance therapy

- BY INHALATION OF POWDER

► Adult: 1–2 inhalations twice daily; maximum 4 inhalations per day

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 50% of predicted

- BY INHALATION OF POWDER

► Adult: 2 inhalations twice daily

DOSE EQUIVALENCE AND CONVERSION

- For inhalation of powder, when switching patients from other beclometasone dipropionate formulations with non-extrafine particle size distribution to *Fostair NEXThaler*®, the dose should be adjusted according to response.

► 1 inhalation is equivalent to 100 micrograms beclometasone dipropionate and 6 micrograms formoterol fumarate.

FOSTAIR NEXTHALER® 200/6

Asthma maintenance therapy

- BY INHALATION OF POWDER

► Adult: 2 inhalations twice daily; maximum 4 inhalations per day

DOSE EQUIVALENCE AND CONVERSION

- For inhalation of powder, when switching patients from other beclometasone dipropionate formulations with non-extrafine particle size distribution to *Fostair NEXThaler*®, the dose should be adjusted according to response.

► 1 inhalation is equivalent to 200 micrograms beclometasone dipropionate and 6 micrograms formoterol fumarate.

FOSTAIR® 100/6

Asthma maintenance therapy

- BY INHALATION OF AEROSOL

► Adult: 1–2 inhalations twice daily; maximum 4 inhalations per day

Asthma, maintenance and reliever therapy

- BY INHALATION OF AEROSOL

► Adult: Maintenance 1 inhalation twice daily; 1 inhalation as required, for relief of symptoms; maximum 8 inhalations per day

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 50% of predicted

- BY INHALATION OF AEROSOL

► Adult: 2 inhalations twice daily

DOSE EQUIVALENCE AND CONVERSION

- For inhalation of aerosol, when switching patients from other beclometasone dipropionate and formoterol fumarate inhalers, dose should be adjusted according to response—100 micrograms of beclometasone dipropionate extrafine in *Fostair*® is equivalent to 250 micrograms of beclometasone dipropionate in a non-extrafine formulation.

► 1 inhalation is equivalent to 100 micrograms beclometasone dipropionate and 6 micrograms formoterol fumarate.

FOSTAIR® 200/6**Asthma maintenance therapy**

► BY INHALATION OF AEROSOL

- Adult: 2 inhalations twice daily; maximum 4 inhalations per day

DOSE EQUIVALENCE AND CONVERSION

- For inhalation of aerosol, when switching patients from other beclometasone dipropionate and formoterol fumarate inhalers, dose should be adjusted according to response—100 micrograms of beclometasone dipropionate extrafine in *Fostair®* is equivalent to 250 micrograms of beclometasone dipropionate in a non-extrafine formulation.
- 1 inhalation is equivalent to 200 micrograms beclometasone dipropionate and 6 micrograms formoterol fumarate.

IMPORTANT SAFETY INFORMATION**MHRA/CHM ADVICE (JULY 2008)**

Fostair® contains extra-fine particles of beclometasone dipropionate and is more potent than traditional beclometasone dipropionate CFC-free inhalers. The dose of beclometasone dipropionate in *Fostair®* should be lower than non-extra-fine formulations of beclometasone dipropionate and will need to be adjusted to the individual needs of the patient.

- INTERACTIONS** → Appendix 1: beta₂ agonists • corticosteroids
- PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer beclometasone with formoterol aerosol for inhalation.
With high doses, a steroid card should be supplied.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Formoterol fumarate dihydrate 5 microgram per 1 dose, Glycopyrronium (as Glycopyrronium bromide) 9 microgram per 1 dose, Beclometasone dipropionate 87 microgram per 1 dose Trimbow 87micrograms/dose / 5micrograms/dose / 9micrograms/dose inhaler | 120 dose [PoM] £44.50

F 256

Budesonide

21-Dec-2017

- DRUG ACTION** Budesonide is a glucocorticoid, which exerts significant local anti-inflammatory effects.

INDICATIONS AND DOSE**Prophylaxis of mild to moderate asthma (in patients stabilised on twice daily dose)**

► BY INHALATION OF POWDER

- Child 6–11 years: 200–400 micrograms once daily, dose to be given in the evening
- Child 12–17 years: 200–400 micrograms once daily (max. per dose 800 micrograms), dose to be given in the evening
- Adult: 200–400 micrograms once daily (max. per dose 800 micrograms), dose to be given in the evening

Prophylaxis of asthma

► BY INHALATION OF POWDER

- Child 6–11 years: 100–400 micrograms twice daily, dose to be adjusted as necessary
- Child 12–17 years: 100–800 micrograms twice daily, dose to be adjusted as necessary
- Adult: 100–800 micrograms twice daily, dose to be adjusted as necessary
- BY INHALATION OF NEBULISED SUSPENSION
- Child 6 months–11 years: 125–500 micrograms twice daily, adjusted according to response; maximum 2 mg per day
- Child 12–17 years: Initially 0.25–1 mg twice daily, adjusted according to response, doses higher than recommended max. may be used in severe disease; maximum 2 mg per day
- Adult: Initially 0.25–1 mg twice daily, adjusted according to response, doses higher than recommended max. may be used in severe disease; maximum 2 mg per day

POTENCY

- Dose adjustments may be required for some inhaler devices, see under individual preparations.

BUDELIN NOVOLIZER®**Prophylaxis of asthma**

► BY INHALATION OF POWDER

- Adult: 200–800 micrograms twice daily, dose is adjusted as necessary

continued →

Alternative in mild to moderate asthma, for patients previously stabilised on a twice daily dose

- BY INHALATION OF POWDER
- Adult: 200–400 micrograms once daily (max. per dose 800 micrograms), to be taken in the evening

PULMICORT® RESPULES**Prophylaxis of asthma**

- BY INHALATION OF NEBULISED SUSPENSION
- Child 3 months–11 years: Initially 0.5–1 mg twice daily, reduced to 250–500 micrograms twice daily
- Child 12–17 years: Initially 1–2 mg twice daily, reduced to 0.5–1 mg twice daily
- Adult: Initially 1–2 mg twice daily, reduced to 0.5–1 mg twice daily

PULMICORT® TURBOHALER**Prophylaxis of asthma**

- BY INHALATION OF POWDER
- Adult: 100–800 micrograms twice daily, dose to be adjusted as necessary

Alternative in mild to moderate asthma, for patients previously stabilised on a twice daily dose

- BY INHALATION OF POWDER
- Adult: 200–400 micrograms once daily (max. per dose 800 micrograms), to be taken in the evening

- **INTERACTIONS** → Appendix 1: corticosteroids
- **DIRECTIONS FOR ADMINISTRATION** Budesonide nebuliser suspension is not suitable for use in ultrasonic nebulisers.
- **PATIENT AND CARER ADVICE** With high doses, a steroid card should be supplied. Patients or carers should be given advice on how to administer budesonide dry powder inhaler and nebuliser suspension. Medicines for Children leaflet: Budesonide inhaler for asthma prevention (prophylaxis) www.medicinesforchildren.org.uk/budesonide-inhaler-asthma-prevention-prophylaxis
- BUDELIN NOVOLIZER®** Patients or carers should be given advice on administration of *Budelin Novolizer*A®.

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 1 puff twice daily

SYMBICORT® 200/6 PRESSURISED INHALER

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 70% of predicted (post bronchodilator)

- ▶ BY INHALATION OF AEROSOL
- ▶ Adult: 2 inhalations twice daily

- **INTERACTIONS** → Appendix 1: beta₂ agonists · corticosteroids
- **PATIENT AND CARER ADVICE** Patient counselling is advised for budesonide with formoterol inhalation (administration).
With high doses, a steroid card should be supplied.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
 - ▶ In adults The *Scottish Medicines Consortium* has advised (June 2007) that budesonide/formoterol 100 micrograms/6 micrograms and 200 micrograms/6 micrograms (*Symbicort*® SMART®) is accepted for use within NHS Scotland, in adults, for regular treatment of asthma where use of a combination (inhaled corticosteroid and a long-acting β_2 agonist) is appropriate; *Symbicort* is taken as regular maintenance treatment and as needed in response to symptoms.
 - ▶ In children The *Scottish Medicines Consortium* has advised (June 2017) that budesonide/formoterol 100 micrograms/6 micrograms and 200 micrograms/6 micrograms (*Symbicort*® SMART®) is accepted for use within NHS Scotland for regular treatment of asthma where use of a combination (inhaled corticosteroid and a long-acting β_2 adrenoreceptor agonist) is appropriate: patients already adequately controlled on both or patients not adequately controlled with inhaled corticosteroids and “as needed” short-acting β_2 adrenoreceptor agonists. This advice relates to the extension of the license for *Symbicort* maintenance and reliever therapy (SMART®) to adolescents aged 12 years and over.

Fluticasone with umeclidinium and vilanterol

16-Mar-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluticasone p. 262, umeclidinium p. 248.

● INDICATIONS AND DOSE

Maintenance of moderate-to-severe chronic obstructive pulmonary disease

► BY INHALATION OF POWDER

- Adult: 1 inhalation once daily, dose should be taken at the same time each day

- **CAUTIONS** Convulsive disorders • pulmonary tuberculosis • thyrotoxicosis

- **INTERACTIONS** → Appendix 1: beta₂ agonists • corticosteroids • umeclidinium

● SIDE-EFFECTS

- **Common or very common** Back pain
- **Uncommon** Oropharyngeal pain

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in moderate-to-severe impairment.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on appropriate inhaler technique.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2018) that fluticasone furoate with umeclidinium and vilanterol (as trifenate) (*Trelegy[®] Ellipta[®]*) is accepted for restricted use within NHS Scotland for the maintenance treatment in adults with severe chronic obstructive pulmonary disease (forced expiratory volume in one second [FEV1] <50% predicted normal).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

► Trelegy Ellipta (GlaxoSmithKline UK Ltd) ▼

Vilanterol (as Vilanterol trifenate) 22 microgram per 1 dose, Umeclidinium bromide 65 microgram per 1 dose, Fluticasone furoate 92 microgram per 1 dose Trelegy Ellipta 92micrograms/dose / 55micrograms/dose / 22micrograms/dose dry powder inhaler | 30 dose [PoM] £44.50

Fluticasone with vilanterol

01-Nov-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluticasone p. 262.

● INDICATIONS AND DOSE

RELVAR ELLIPTA[®] 184 MICROGRAMS/22 MICROGRAMS

Prophylaxis of asthma

► BY INHALATION OF POWDER

- Child 12–17 years: 1 inhalation once daily
- Adult: 1 inhalation once daily

RELVAR ELLIPTA[®] 92 MICROGRAMS/22 MICROGRAMS

Prophylaxis of asthma

► BY INHALATION OF POWDER

- Child 12–17 years: 1 inhalation once daily
- Adult: 1 inhalation once daily

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 70% of predicted

► BY INHALATION OF POWDER

- Adult: 1 inhalation once daily

- **INTERACTIONS** → Appendix 1: beta₂ agonists • corticosteroids

● SIDE-EFFECTS

- **Common or very common** Abdominal pain • arthralgia • back pain • bone fracture • cough • dysphonia • fever • muscle spasms • oropharyngeal pain
- **Uncommon** Vision blurred
- **Rare or very rare** Angioedema • anxiety

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution.

RELVAR ELLIPTA[®]

- **184 MICROGRAMS/22 MICROGRAMS** Avoid in moderate to severe impairment.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer fluticasone with vilanterol powder for inhalation.

A steroid card should be provided.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

- ▶ In adults The *Scottish Medicines Consortium* has advised (March 2014) that fluticasone furoate/vilanterol (*Relvar Ellipta*®) is accepted for restricted use within NHS Scotland in patients with severe chronic obstructive pulmonary disease with a forced expiratory volume in 1 second (FEV₁) less than 50% of the predicted normal value.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

256

Mometasone furoate

21-Dec-2017

● INDICATIONS AND DOSE

Prophylaxis of asthma

▶ BY INHALATION OF POWDER

- ▶ Child 12-17 years: Initially 400 micrograms daily in 1–2 divided doses, single dose to be inhaled in the evening, reduced to 200 micrograms once daily, if control maintained
- ▶ Adult: Initially 400 micrograms daily in 1–2 divided doses, single dose to be inhaled in the evening, reduced to 200 micrograms once daily, if control maintained

Prophylaxis of severe asthma

▶ BY INHALATION OF POWDER

- ▶ Child 12-17 years: Increased if necessary up to 400 micrograms twice daily
- ▶ Adult: Increased if necessary up to 400 micrograms twice daily

- **INTERACTIONS** → Appendix 1: corticosteroids

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer mometasone by inhaler. With high doses, a steroid card should be supplied. Medicines for Children leaflet: Mometasone furoate inhaler for asthma prevention (prophylaxis) www.medicinesforchildren.org.uk/mometasone-furoate-inhaler-for-asthma-prevention-prophylaxis

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2003) that *Asmanex*® is restricted for use following failure of first-line inhaled corticosteroids.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

CAUTIONARY AND ADVISORY LABELS 8, 10

Mometasone furoate 200 microgram per 1 dose Asmanex 200micrograms/dose Twisthaler | 30 dose [PoM] £15.70 DT = £15.70 | 60 dose [PoM] £23.54 DT = £23.54

Mometasone furoate 400 microgram per 1 dose Asmanex 400micrograms/dose Twisthaler | 30 dose [PoM] £21.78 DT = £21.78 | 60 dose [PoM] £36.05 DT = £36.05

ENZYME INHIBITORS

Human alpha₁-proteinase inhibitor

17-Aug-2017

- **DRUG ACTION** Human alpha₁-proteinase inhibitor is a normal plasma constituent; it inhibits neutrophil elastase (an enzyme released in response to inflammation) in the lungs.

● INDICATIONS AND DOSE

Progression of emphysema in patients with severe alpha₁-proteinase inhibitor deficiency, despite optimal treatment with other standard therapies (specialist use only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 60 mg/kg once weekly

- **CONTRA-INDICATIONS** IgA deficiency with confirmed antibodies against IgA—increased risk of severe hypersensitivity reactions

- **CAUTIONS** Consider vaccination against hepatitis A and hepatitis B · hypersensitivity reactions · IgA deficiency (without known antibodies to IgA)—increased risk of hypersensitivity reactions

CAUTIONS, FURTHER INFORMATION

- ▶ Hypersensitivity reactions Hypersensitivity reactions may occur, even in patients who have previously tolerated treatment. Manufacturer advises close monitoring, including vital signs, during the first infusions. If a reaction occurs, manufacturer advises to decrease the rate of infusion or discontinue treatment; if symptoms improve promptly after stopping, the infusion may be resumed at a slower infusion rate.

● SIDE-EFFECTS

- ▶ **Common or very common** Dizziness · headache · nausea
- ▶ **Uncommon** Asthenia · confusion · flushing · hypersensitivity · hypotension · sensation abnormal · skin reactions · syncope · tachycardia · throat oedema
- ▶ **Rare or very rare** Chest pain · chills · fever · hyperhidrosis
- ▶ **Frequency not known** Eye swelling · facial swelling · lip swelling · lymph node pain

- **PREGNANCY** Manufacturer advises caution—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

● PRESCRIBING AND DISPENSING INFORMATION

Manufacturer advises to record the brand name and batch number after each administration (in case of transmission of infective agents).

- **PATIENT AND CARER ADVICE** Manufacturer advises patients receiving treatment at home should receive appropriate training regarding self-administration, and be informed of the signs of hypersensitivity reactions.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2016) that human alpha₁-proteinase inhibitor (*Resprezza*®) is **not** recommended for use within NHS Scotland for maintenance treatment, to slow the progression of emphysema in adults with documented severe alpha₁-proteinase inhibitor deficiency. The manufacturer did not present a sufficiently robust clinical or economic analysis.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (March 2017) that human alpha₁-proteinase inhibitor

(*Resprezza*®) is **not** recommended for use within NHS Wales for maintenance treatment, to slow the progression of emphysema in adults with documented severe α_1 -proteinase inhibitor deficiency. The case for clinical and cost-effectiveness has not been proven.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for infusion

ELECTROLYTES: May contain Sodium

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES

Benralizumab

02-May-2018

- **DRUG ACTION** Benralizumab is a humanised monoclonal antibody that interferes with interleukin-5 receptor binding, thereby reducing the survival of eosinophils and basophils.

• INDICATIONS AND DOSE

Severe eosinophilic asthma (specialist use only)

► BY SUBCUTANEOUS INJECTION

► **Adult:** Initially 30 mg every 4 weeks for the first 3 doses, then maintenance 30 mg every 8 weeks, to be administered into the thigh, abdomen or upper arm

PHARMACOKINETICS

► The half-life of benralizumab is approx. 15 days.

- **CAUTIONS** Pre-existing helminth infection
- **CAUTIONS, FURTHER INFORMATION**
 - Helminth infection Manufacturer advises to treat pre-existing helminth infections before starting benralizumab—if patient becomes infected during therapy and does not respond to anti-helminth treatment, discontinue benralizumab until infection is resolved.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - **Common or very common** Fever · headache · hypersensitivity (may be delayed) · pharyngitis
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—limited data available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to take the syringe out of the refrigerator at least 30 minutes before administration, and to avoid injecting into areas of the skin that are tender, bruised, erythematous, or hardened—consult product literature for further information.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be instructed to seek medical advice if their asthma remains uncontrolled or if symptoms worsen after initiation of treatment.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► *Fasenra* (AstraZeneca UK Ltd) ▼

Mepolizumab

09-Feb-2017

- **DRUG ACTION** Mepolizumab is a humanised anti-interleukin-5 (anti-IL-5) monoclonal antibody; it reduces the production and survival of eosinophils

• INDICATIONS AND DOSE

Add on treatment for severe refractory eosinophilic asthma (under expert supervision)

► BY SUBCUTANEOUS INJECTION

► **Adult:** 100 mg every 4 weeks

- **CAUTIONS** Helminth infection
- **CAUTIONS, FURTHER INFORMATION**
 - Helminth infections Manufacturer advises pre-existing helminth infections should be treated before initiation of therapy; if patients become infected during treatment and do not respond to anti-helminth treatment, consider treatment interruption.
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain upper · back pain · eczema · fever · headache · hypersensitivity · increased risk of infection · nasal congestion
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—limited data available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **PATIENT AND CARER ADVICE**

Asthma Patients and their carers should be advised to seek medical advice if their asthma remains uncontrolled or worsens after initiation of treatment.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- **Mepolizumab for treating severe refractory eosinophilic asthma (January 2017)** NICE TA431

Mepolizumab, as an add-on to optimised standard therapy, is recommended as an option for treating severe refractory eosinophilic asthma in adults, only if:

- the blood eosinophil count is 300 cells/microlitre or more in the previous 12 months **and**
- the person has agreed to and followed the optimised standard treatment plan **and** has had 4 or more asthma exacerbations requiring systemic corticosteroids in the previous 12 months **or** had continuous oral corticosteroids over the previous 6 months **and**
- the manufacturer provides mepolizumab with the discount agreed in the patient access scheme

www.nice.org.uk/TA431

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2016) that mepolizumab (*Nucala*®) is accepted for restricted use within NHS Scotland as an add-on treatment for severe refractory eosinophilic asthma in adult patients who have eosinophils of at least 150 cells/microlitre ($0.15 \times 10^9/L$) at initiation of treatment and have had at least four asthma exacerbations in the preceding year or are receiving maintenance treatment with oral corticosteroids.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

Mepolizumab 100 mg *Nucala* 100mg powder for solution for injection vials | 1 vial [PoM] £840.00 (Hospital only)

Omalizumab

● INDICATIONS AND DOSE

Prophylaxis of severe persistent allergic asthma

► BY SUBCUTANEOUS INJECTION

- Adult: Dose according to immunoglobulin E concentration and body-weight (consult product literature)

Add-on therapy for chronic spontaneous urticaria in patients who have had an inadequate response to H₁ antihistamine treatment

► BY SUBCUTANEOUS INJECTION

- Adult: 300 mg every 4 weeks

- **CAUTIONS** Autoimmune disease · susceptibility to helminth infection—discontinue if infection does not respond to anthelmintic

● SIDE-EFFECTS

- **Common or very common** Headache · skin reactions
- **Uncommon** Cough · diarrhoea · dizziness · drowsiness · fatigue · flushing · gastrointestinal discomfort (very common in children) · increased risk of infection · influenza like illness · limb swelling · nausea · paraesthesia · photosensitivity reaction · postural hypotension · respiratory disorders · syncope · weight increased
- **Rare or very rare** Angioedema · hypersensitivity · systemic lupus erythematosus (SLE)
- **Frequency not known** Alopecia · eosinophilic granulomatosis with polyangiitis · immune thrombocytopenic purpura · joint disorders · lymphadenopathy · myalgia

SIDE-EFFECTS, FURTHER INFORMATION

Eosinophilic granulomatosis with polyangiitis (Churg-Strauss syndrome) Churg-Strauss syndrome has occurred rarely in patients given omalizumab; the reaction is usually associated with the reduction of oral corticosteroid therapy. Churg-Strauss syndrome can present as eosinophilia, vasculitic rash, cardiac complications, worsening pulmonary symptoms, or peripheral neuropathy.

Hypersensitivity reactions Hypersensitivity reactions can also occur immediately following treatment with omalizumab or sometimes more than 24 hours after the first injection.

- **PREGNANCY** Manufacturer advises avoid unless essential—crosses the placenta.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- **Omalizumab for severe persistent allergic asthma (April 2013)** NICE TA278
Omalizumab is recommended as an option for treating severe persistent confirmed allergic IgE-mediated asthma as an add-on to optimised standard therapy in patients aged 6 years and over:
 - who need continuous or frequent treatment with oral corticosteroids (defined as 4 or more courses in the previous year), **and**
 - only if the manufacturer makes omalizumab available with the discount agreed in the patient access scheme.
 Optimised standard therapy is defined as a full trial of and, if tolerated, documented compliance with inhaled high-dose corticosteroids, long-acting beta₂ agonists, leukotriene receptor antagonists, theophyllines, oral corticosteroids, and smoking cessation if clinically appropriate.

Patients currently receiving omalizumab whose disease does not meet the criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA278

- **Omalizumab for previously treated chronic spontaneous urticaria (June 2015)** NICE TA339

Omalizumab is an option as add-on therapy for the treatment of severe chronic spontaneous urticaria in patients 12 years and over, only if:

- the severity of the condition is assessed objectively, for example, using a weekly urticaria activity score of 28 or more,
- the patient's condition has not responded to standard treatment with H₁-antihistamines and leukotriene receptor antagonists,
- omalizumab is stopped at or before the fourth dose if the condition has not responded,
- omalizumab is stopped at the end of a course of treatment (6 doses) if the condition has responded and is restarted only if the condition relapses,
- omalizumab is administered under the management of a secondary care specialist in dermatology, immunology or allergy,
- the manufacturer provides omalizumab with the discount agreed in the patient access scheme.

Patients currently receiving omalizumab whose disease does not meet the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA339

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2014) that omalizumab (*Xolair*®) is accepted for restricted use within NHS Scotland for the treatment of chronic spontaneous urticaria in patients aged 12 years and over, who have had an inadequate response to combination therapy with H₁-antihistamines, leukotriene receptor antagonists and H₂-antihistamines, used according to current treatment guidelines.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Xolair** (Novartis Pharmaceuticals UK Ltd)

Omalizumab 150 mg per 1 ml Xolair 150mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PoM) £256.15

Xolair 75mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PoM) £128.07

Reslizumab

01-Nov-2017

- **DRUG ACTION** Reslizumab is a humanised monoclonal antibody that interferes with interleukin-5 receptor binding, thereby reducing the survival and activity of eosinophils.

● INDICATIONS AND DOSE

Severe eosinophilic asthma (adjunctive therapy when inadequately controlled by high-dose corticosteroids plus another standard treatment) (specialist use only)

- **BY INTRAVENOUS INFUSION**
- **Adult:** (consult product literature)

PHARMACOKINETICS

- The half-life of reslizumab is approx. 24 days.

- **CAUTIONS** Hypersensitivity reactions · pre-existing helminth infection

CAUTIONS, FURTHER INFORMATION

- **Helminth infection** Manufacturer advises to treat pre-existing helminth infections before starting reslizumab—

consider temporarily discontinuing reslizumab if patient becomes infected during therapy and does not respond to anti-helminth treatment.

- **Hypersensitivity reactions** Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur and manufacturer advises to monitor closely during treatment and for at least 20 minutes after completion of infusion; in the event of a hypersensitivity reaction, treatment should be permanently discontinued.

● **SIDE-EFFECTS**

- **Uncommon** Anaphylactic reaction · myalgia
- **Frequency not known** Secondary malignancy

- **PREGNANCY** Manufacturer advises avoid—limited information available.

- **BREAST FEEDING** Manufacturer advises avoid during first few days after birth—risk of transfer of antibodies to infant cannot be excluded; present in milk in *animal* studies.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, manufacturer advises give intermittently in Sodium chloride 0.9%; administer over 20–50 minutes through an in-line 0.2 micron filter.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after preparation of infusion.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be instructed to seek medical advice if their asthma remains uncontrolled or if symptoms worsen after initiation of treatment.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- **Reslizumab** for treating severe eosinophilic asthma (October 2017) NICE TA479

Reslizumab, as an add-on therapy, is recommended as an option for the treatment of severe eosinophilic asthma that is inadequately controlled in adults despite maintenance therapy with high-dose inhaled corticosteroids plus another drug, only if:

- the blood eosinophil count has been recorded as 400 cells per microlitre or more, **and**
- the person has had 3 or more severe asthma exacerbations needing systemic corticosteroids in the past 12 months, **and**
- the manufacturer provides reslizumab with the discount agreed in the patient access scheme.

At 12 months, stop reslizumab if the asthma has not responded adequately or continue reslizumab if the asthma has responded adequately and assess response each year.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta479

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2017) that reslizumab (*Cinquaero*®) is **not** recommended for use within NHS Scotland as add-on therapy in adults with severe eosinophilic asthma inadequately controlled with high-dose inhaled corticosteroids plus another medicinal product for maintenance treatment, as the economic case was not demonstrated.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

LEUKOTRIENE RECEPTOR ANTAGONISTS

Leukotriene receptor antagonists

29-Nov-2017

Overview

The leukotriene receptor antagonists, montelukast below and zafirlukast p. 269, block the effects of cysteinyl leukotrienes in the airways.

Montelukast has not been shown to be more effective than a standard dose of inhaled corticosteroid, but the two drugs appear to have an additive effect. The leukotriene receptor antagonists may be of benefit in exercise-induced asthma and in those with concomitant rhinitis, but they are less effective in those with severe asthma who are also receiving high doses of other drugs.

Montelukast

● **INDICATIONS AND DOSE**

Prophylaxis of asthma

- **BY MOUTH**

- Child 6 months–5 years: 4 mg once daily, dose to be taken in the evening
- Child 6–14 years: 5 mg once daily, dose to be taken in the evening
- Child 15–17 years: 10 mg once daily, dose to be taken in the evening
- Adult: 10 mg once daily, dose to be taken in the evening

Symptomatic relief of seasonal allergic rhinitis in patients with asthma.

- **BY MOUTH**

- Child 15–17 years: 10 mg once daily, dose to be taken in the evening
- Adult: 10 mg once daily, dose to be taken in the evening

- **INTERACTIONS** → Appendix 1: montelukast

● **SIDE-EFFECTS**

- **Common or very common** Diarrhoea · fever · gastrointestinal discomfort · headache · nausea · skin reactions · upper respiratory tract infection · vomiting
- **Uncommon** Akathisia · anxiety · arthralgia · asthenia · behaviour abnormal · depression · dizziness · drowsiness · dry mouth · haemorrhage · irritability · malaise · muscle complaints · oedema · seizure · sensation abnormal · sleep disorders
- **Rare or very rare** Angioedema · concentration impaired · disorientation · eosinophilic granulomatosis with polyangiitis · erythema nodosum · hallucination · hepatic disorders · memory loss · palpitations · pulmonary eosinophilia · suicidal tendencies · tremor

SIDE-EFFECTS, FURTHER INFORMATION Eosinophilic granulomatosis with polyangiitis (Churg–Strauss syndrome) has occurred very rarely in association with the use of montelukast; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. Prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening

pulmonary symptoms, cardiac complications, or peripheral neuropathy.

- **PREGNANCY** Manufacturer advises avoid unless essential. There is limited evidence for the safe use of montelukast during pregnancy; however, it can be taken as normal in women who have shown a significant improvement in asthma not achievable with other drugs before becoming pregnant.
- **BREAST FEEDING** Manufacturer advises avoid unless essential.
- **DIRECTIONS FOR ADMINISTRATION** Granules may be swallowed or mixed with cold, soft food (not liquid) and taken immediately.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of chewable tablet formulations may include cherry.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer montelukast granules. Medicines for Children leaflet: Montelukast for asthma www.medicinesforchildren.org.uk/montelukast-for-asthma
- **NATIONAL FUNDING/ACCESS DECISIONS**

SINGULAIR® GRANULES

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2007) that *Singulair*® granules are restricted for use as an alternative to low-dose inhaled corticosteroids for children 2–14 years with mild persistent asthma who have not recently had serious asthma attacks that required oral corticosteroid use and who are not capable of using inhaled corticosteroids; *Singulair*® granules should be initiated by a specialist in paediatric asthma.

SINGULAIR® CHEWABLE TABLETS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2007) that *Singulair*® chewable tablets are restricted for use as an alternative to low-dose inhaled corticosteroids for children 2–14 years with mild persistent asthma who have not recently had serious asthma attacks that required oral corticosteroid use and who are not capable of using inhaled corticosteroids; *Singulair*® chewable tablets should be initiated by a specialist in paediatric asthma.

Zafirlukast

• INDICATIONS AND DOSE

Prophylaxis of asthma

- ▶ BY MOUTH
- ▶ Child 12–17 years: 20 mg twice daily
- ▶ Adult: 20 mg twice daily

• CAUTIONS

Elderly

• SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · headache · infection · myalgia · nausea · skin reactions · vomiting
- ▶ **Uncommon** Angioedema · arthralgia · hyperbilirubinaemia · malaise · oedema · sleep disorders
- ▶ **Rare or very rare** Haemorrhagic disorder · hepatic disorders · menorrhagia · thrombocytopenia
- ▶ **Frequency not known** Agranulocytosis · dizziness · sensation abnormal

SIDE-EFFECTS, FURTHER INFORMATION

Eosinophilic granulomatosis with polyangiitis (Churg-Strauss syndrome) Churg-Strauss syndrome has occurred rarely in association with the use of zafirlukast; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. Prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or neuropathy.

Hepatic disorder Symptoms such as as persistent nausea, vomiting, malaise, or jaundice may develop, and indicate the development of a liver disorder.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk. There is limited evidence for the safe use of zafirlukast during pregnancy; however, it can be taken as normal in women who have shown a significant improvement in asthma not achievable with other drugs before becoming pregnant.

- **BREAST FEEDING** Present in milk—manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

• RENAL IMPAIRMENT

- ▶ In adults Manufacturer advises caution in moderate to severe impairment.
- ▶ In children Manufacturer advises caution.

No licensed medicines listed.

MAST-CELL STABILISERS

Cromoglicate and related therapy

Overview

The mode of action of sodium cromoglicate p. 270 and nedocromil sodium p. 270 is not completely understood. They may be of value in asthma with an allergic basis, but, in practice, it is difficult to predict who will benefit; they could probably be given for 4 to 6 weeks to assess response. Dose frequency is adjusted according to response but is usually 3 to 4 times a day initially; this may subsequently be reduced.

In general, *prophylaxis* with sodium cromoglicate is less effective than prophylaxis with corticosteroid inhalations. There is evidence of efficacy of nedocromil sodium in children aged 5–12 years. Sodium cromoglicate and nedocromil sodium are of no value in the treatment of acute attacks of asthma.

Sodium cromoglicate can prevent exercise-induced asthma. However, exercise-induced asthma may reflect poor overall control and the patient should be reassessed.

Sodium cromoglicate and nedocromil sodium may also have a role in allergic conjunctivitis; sodium cromoglicate is used also in allergic rhinitis and allergy-related diarrhoea.

Nedocromil sodium

● INDICATIONS AND DOSE

Prophylaxis of asthma

► BY INHALATION OF AEROSOL

- Child 5-17 years: Initially 4 mg 4 times a day, when control achieved may be possible to reduce to twice daily
- Adult: Initially 4 mg 4 times a day, when control achieved may be possible to reduce to twice daily

DOSE EQUIVALENCE AND CONVERSION

- 2 puffs = 4 mg.

- **UNLICENSED USE** Not licensed for use in children under 6 years.
- **SIDE-EFFECTS**
 - **Common or very common** Bronchospasm · cough · gastrointestinal discomfort · headache · nausea · taste altered · vomiting
 - **Frequency not known** Pharyngitis · throat irritation
- **SIDE-EFFECTS, FURTHER INFORMATION** If paradoxical bronchospasm occurs, fast-acting inhaled bronchodilator such as salbutamol or terbutaline should be used to control symptoms; treatment with nedocromil should be discontinued.
- **PREGNANCY** Inhaled drugs can be taken as normal during pregnancy.
- **BREAST FEEDING** Inhaled drugs can be taken as normal during breast-feeding.
- **TREATMENT CESSATION** Withdrawal should be done gradually over a period of one week—symptoms of asthma may recur.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of inhalers may include mint.
- **PATIENT AND CARER ADVICE** Regular use is necessary. Patient counselling is advised for Nedocromil aerosol for inhalation (administration).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Pressurised inhalation

CAUTIONARY AND ADVISORY LABELS 8

Nedocromil sodium 2 mg per 1 dose Tilade 2mg/dose inhaler CFC free | 112 dose [PoM] £39.94

Sodium cromoglicate

(Sodium cromoglycate)

● INDICATIONS AND DOSE

Prophylaxis of asthma

► BY INHALATION OF AEROSOL

- Child 5-17 years: Initially 10 mg 4 times a day, additional dose may also be taken before exercise, increased if necessary to 10 mg 6-8 times a day; maintenance 5 mg 4 times a day, 5 mg is equivalent to 1 puff
- Adult: Initially 10 mg 4 times a day, additional dose may also be taken before exercise, increased if necessary to 10 mg 6-8 times a day; maintenance 5 mg 4 times a day, 5 mg is equivalent to 1 puff

Food allergy (in conjunction with dietary restriction)

► BY MOUTH

- Child 2-13 years: Initially 100 mg 4 times a day for 2-3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals
- Child 14-17 years: Initially 200 mg 4 times a day for 2-3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals
- Adult: Initially 200 mg 4 times a day for 2-3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals

● CAUTIONS

- When used by inhalation Discontinue if eosinophilic pneumonia occurs

● SIDE-EFFECTS

- When used by inhalation Cough · headache · pneumonia eosinophilic · rhinitis · throat irritation
 - With oral use Arthralgia · nausea · rash
- SIDE-EFFECTS, FURTHER INFORMATION** When used by inhalation, if paradoxical bronchospasm occurs, a short-acting beta₂ agonist should be used to control symptoms; treatment with sodium cromoglicate should be discontinued.

- **PREGNANCY** Not known to be harmful.

- When used by inhalation Can be taken as normal during pregnancy.

- **BREAST FEEDING** Unlikely to be present in milk.

- When used by inhalation Can be taken as normal during breast-feeding.

● TREATMENT CESSATION

- When used by inhalation Withdrawal of sodium cromoglicate should be done gradually over a period of one week—symptoms of asthma may recur.

- **DIRECTIONS FOR ADMINISTRATION** Capsules may be swallowed whole or the contents dissolved in hot water and diluted with cold water before taking.

● PATIENT AND CARER ADVICE

- With oral use Patient counselling is advised for sodium cromoglicate capsules (administration).
- When used by inhalation Patient counselling is advised for sodium cromoglicate pressurised inhalation (administration).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

PHOSPHODIESTERASE TYPE-4 INHIBITORS

Roflumilast

30-Jun-2017

- **DRUG ACTION** Roflumilast is a phosphodiesterase type-4 inhibitor with anti-inflammatory properties.

● **INDICATIONS AND DOSE**

Adjuvant to bronchodilators for the maintenance treatment of patients with severe chronic obstructive pulmonary disease associated with chronic bronchitis and a history of frequent exacerbations

► BY MOUTH

► Adult: 500 micrograms once daily

- **CONTRA-INDICATIONS** Cancer (except basal cell carcinoma) · concomitant treatment with immunosuppressive drugs (except short-term systemic corticosteroids) · history of depression associated with suicidal ideation or behaviour · moderate to severe cardiac failure · severe acute infectious disease · severe immunological disease

- **CAUTIONS** History of psychiatric illness (discontinue if new or worsening psychiatric symptoms occur) · latent infection (such as tuberculosis, viral hepatitis, herpes infection)

- **INTERACTIONS** → Appendix 1: roflumilast

● **SIDE-EFFECTS**

► **Common or very common** Appetite decreased · diarrhoea · gastrointestinal discomfort · headache · insomnia · nausea · weight decreased

► **Uncommon** Anxiety · asthenia · back pain · dizziness · gastrointestinal disorders · malaise · muscle complaints · muscle weakness · palpitations · skin reactions · tremor · vertigo · vomiting

► **Rare or very rare** Angioedema · constipation · depression · gynaecomastia · haematochezia · respiratory tract infection · suicidal tendencies · taste altered

- **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should use effective contraception.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Caution in mild impairment. Avoid in moderate to severe impairment.

- **MONITORING REQUIREMENTS** Monitor body-weight.

- **PATIENT AND CARER ADVICE** Patients should be given a patient card before starting treatment and advised to record body-weight at regular intervals.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- Roflumilast for treating chronic obstructive pulmonary disease (July 2017) NICE TA461

Roflumilast, as an add-on to bronchodilator therapy, is recommended as an option for treating severe chronic obstructive pulmonary disease in patients with chronic bronchitis, only if:

- the disease is severe, defined as a forced expiratory volume in one second (FEV₁) after a bronchodilator of less than 50% of predicted normal, **and**
- the person has had two or more exacerbations in the previous 12 months despite triple inhaled therapy with a long-acting muscarinic antagonist, a long-acting beta-2 agonist and an inhaled corticosteroid.

Treatment with roflumilast should be started by a specialist in respiratory medicine.

Patients currently receiving roflumilast whose disease does not meet the above criteria should be able to

continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA461

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2017) that roflumilast (*Daxas*®) is not recommended for use within NHS Scotland for maintenance treatment of severe chronic obstructive pulmonary disease (forced expiratory volume in one second [FEV₁] after a bronchodilator of less than 50% predicted) associated with chronic bronchitis in adults with a history of frequent exacerbations as add on to bronchodilator treatment as there was insufficient evidence submitted and the economic case was not demonstrated.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

SYMPATHOMIMETICS > VASOCONSTRICTOR

Ephedrine hydrochloride

● **INDICATIONS AND DOSE**

Reversal of hypotension from spinal or epidural anaesthesia

- BY SLOW INTRAVENOUS INJECTION

► Adult: 3–6 mg every 3–4 minutes (max. per dose 9 mg), adjusted according to response, injection solution to contain ephedrine hydrochloride 3 mg/ml; maximum 30 mg per course

Reversible airways obstruction

- BY MOUTH

► Adult: 15–60 mg 3 times a day

Neuropathic oedema

- BY MOUTH

► Adult: 30–60 mg 3 times a day

- **UNLICENSED USE** Not licensed for neuropathic oedema.

● **CAUTIONS**

GENERAL CAUTIONS Diabetes mellitus · elderly · hypertension · hyperthyroidism · ischaemic heart disease · prostatic hypertrophy (risk of acute urinary retention)

SPECIFIC CAUTIONS

- With intravenous use Susceptibility to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- **Common or very common** Anxiety · headache · insomnia · nausea

- **Frequency not known** Tremor

SPECIFIC SIDE-EFFECTS

- **Common or very common**

► With intravenous use Arrhythmias · asthenia · confusion · depression · dyspnoea · hyperhidrosis · irritability · palpitations · vomiting

- **Rare or very rare**

► With intravenous use Acute urinary retention

► With oral use Myocardial infarction

- **Frequency not known**

► With intravenous use Acute angle closure glaucoma · angina pectoris · appetite decreased · cardiac arrest · dizziness · hypokalaemia · intracranial haemorrhage · psychotic disorder · pulmonary oedema

- ▶ With oral use Arrhythmias · circulation impaired · drug tolerance · dry mouth · enuresis · hypertension · sedation
- **PREGNANCY**
 - ▶ With oral use Manufacturer advises avoid.
 - ▶ With intravenous use Increased fetal heart rate reported with parenteral ephedrine.
- **BREAST FEEDING** Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.
- **RENAL IMPAIRMENT** Use with caution.
- **LESS SUITABLE FOR PRESCRIBING** Ephedrine tablets are less suitable and less safe for use as a bronchodilator than the selective beta₂ agonists.
- **EXCEPTIONS TO LEGAL CATEGORY** For exceptions relating to ephedrine tablets see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).

XANTHINES

Aminophylline

● INDICATIONS AND DOSE

Severe acute asthma in patients not previously treated with theophylline

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Child: 5 mg/kg (max. per dose 500 mg), to be followed by intravenous infusion
- ▶ Adult: 250–500 mg (max. per dose 5 mg/kg), to be followed by intravenous infusion

Severe acute asthma

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 1 month–11 years: 1 mg/kg/hour, adjusted according to plasma-theophylline concentration
- ▶ Child 12–17 years: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration
- ▶ Adult: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration
- ▶ Elderly: 300 micrograms/kg/hour, adjusted according to plasma-theophylline concentration

Severe acute exacerbation of chronic obstructive pulmonary disease in patients not previously treated with theophylline

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 250–500 mg (max. per dose 5 mg/kg), to be followed by intravenous infusion

Severe acute exacerbation of chronic obstructive pulmonary disease

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration

- ▶ Elderly: 300 micrograms/kg/hour, adjusted according to plasma-theophylline concentration

Chronic asthma

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Child (body-weight 40 kg and above): Initially 225 mg twice daily for 1 week, then increased if necessary to 450 mg twice daily, adjusted according to plasma-theophylline concentration

Reversible airway obstruction

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult (body-weight 40 kg and above): Initially 225 mg twice daily for 1 week, then increased if necessary to 450 mg twice daily, adjusted according to plasma-theophylline concentration

PHYLLLOCONTIN CONTINUS® FORTE

Reversible airways obstruction

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: Initially 350 mg twice daily for 1 week, then increased if necessary to 700 mg twice daily, increase dose according to plasma-theophylline concentration

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Dose adjustment may be necessary if smoking started or stopped during treatment.

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal weight for height.

PHARMACOKINETICS

- ▶ Aminophylline is a stable mixture or combination of theophylline and ethylenediamine; the ethylenediamine confers greater solubility in water.
- ▶ Theophylline is metabolised in the liver. The plasma-theophylline concentration is increased in heart failure, hepatic impairment, and in viral infections. The plasma-theophylline concentration is decreased in smokers, and by alcohol consumption. Differences in the half-life of aminophylline are important because the toxic dose is close to the therapeutic dose.

- **UNLICENSED USE** Aminophylline injection not licensed for use in children under 6 months.

- **CAUTIONS** Arrhythmias following rapid intravenous injection · cardiac arrhythmias or other cardiac disease · elderly (increased plasma-theophylline concentration) · epilepsy · fever · hypertension · hyperthyroidism · peptic ulcer · risk of hypokalaemia

- **INTERACTIONS** → Appendix 1: aminophylline

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS Arrhythmia (more common when given too rapidly by intravenous injection) · headache · nausea · palpitations · seizure (more common when given too rapidly by intravenous injection)

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Abdominal pain · anxiety · confusion · delirium · diarrhoea · dizziness · electrolyte imbalance · gastrointestinal haemorrhage · gastroesophageal reflux disease · hyperthermia · hyperventilation · hypotension (more common when given too rapidly by intravenous injection) · insomnia · mania · metabolic disorder · pain · skin reactions · tachycardia (more common when given too rapidly by intravenous injection) · thirst · tremor · vertigo · visual impairment · vomiting
- ▶ With oral use Central nervous system stimulation · epigastric discomfort

SIDE-EFFECTS, FURTHER INFORMATION Potentially serious hypokalaemia may result from beta 2 agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium

concentration should therefore be monitored in severe asthma.

Overdose Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

For specific details on the management of poisoning, see *Theophylline*, under Emergency treatment of poisoning p. 1319.

- **ALLERGY AND CROSS-SENSITIVITY** Allergy to ethylenediamine can cause urticaria, erythema, and exfoliative dermatitis.
- **PREGNANCY** Neonatal irritability and apnoea have been reported. Theophylline can be taken as normal during pregnancy as it is particularly important that asthma should be well controlled during pregnancy.
- **BREAST FEEDING** Present in milk—irritability in infant reported; modified-release preparations preferable. Theophylline can be taken as normal during breast-feeding.

- **HEPATIC IMPAIRMENT** Dose adjustments Reduce dose.

• MONITORING REQUIREMENTS

- ▶ Aminophylline is monitored therapeutically in terms of plasma-theophylline concentrations.
- ▶ Measurement of plasma-theophylline concentration may be helpful and is **essential** if a loading dose of intravenous aminophylline is to be given to patients who are already taking theophylline, because serious side-effects such as convulsions and arrhythmias can occasionally precede other symptoms of toxicity.
- ▶ In most individuals, a plasma-theophylline concentration of 10–20 mg/litre (55–110 micromol/litre) is required for satisfactory bronchodilation, although a lower plasma-theophylline concentration of 5–15 mg/litre may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.
- ▶ If aminophylline is given intravenously, a blood sample should be taken 4–6 hours after starting treatment.
- ▶ With oral use Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should usually be taken 4–6 hours after an oral dose of a modified-release preparation (sampling times may vary—consult local guidelines).

• DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous injection*, give **very slowly** over at least 20 minutes (with close monitoring).
- ▶ With intravenous use in children For *intravenous infusion*, dilute to a concentration of 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%.
- ▶ With intravenous use in adults For *intravenous infusion*, give continuously in Glucose 5% or Sodium Chloride 0.9%.
- ▶ With intramuscular use Aminophylline is too irritant for intramuscular use.

- **PRESCRIBING AND DISPENSING INFORMATION** Patients taking oral theophylline or aminophylline should not normally receive a loading dose of intravenous aminophylline.

Consider intravenous aminophylline for treatment of severe and life-threatening acute asthma only after consultation with senior medical staff.

Modified release The rate of absorption from modified-release preparations can vary between brands. If a prescription for a modified-release oral aminophylline preparation does not specify a brand name, the pharmacist should contact the prescriber and agree the brand to be

dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient.

PHYLLOCONTIN CONTINUS® FORTE *Phyllocontin Continus®* Forte tablets are for smokers and other patients where theophylline half-life is shorter.

Nebuliser solutions

● HYPERTONIC SODIUM CHLORIDE SOLUTIONS

● INDICATIONS AND DOSE

MUCOCLEAR® 3%

Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis) | Mild to moderate acute viral bronchiolitis in infants

▶ BY INHALATION OF NEBULISED SOLUTION

- ▶ Adult: 4 mL 2–4 times a day, temporary irritation, such as coughing, hoarseness, or reversible

bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects

MucoClear 3% inhalation solution 4ml ampoules (Pari Medical Ltd) Sodium chloride 30 mg per 1 ml | 20 ampoule • NHS indicative price = £12.98 • Drug Tariff (Part IXa) | 60 ampoule • NHS indicative price = £27.00 • Drug Tariff (Part IXa)

● INDICATIONS AND DOSE

MUCOCLEAR® 6%

Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis)

► BY INHALATION OF NEBULISED SOLUTION

- Adult: 4 mL twice daily, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects

MucoClear 6% inhalation solution 4ml ampoules (Pari Medical Ltd) Sodium chloride 60 mg per 1 ml | 20 ampoule • NHS indicative price = £12.98 • Drug Tariff (Part IXa) | 60 ampoule • NHS indicative price = £27.00 • Drug Tariff (Part IXa)

● INDICATIONS AND DOSE

NEBUSAL®

Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis)

► BY INHALATION OF NEBULISED SOLUTION

- Adult: 4 mL up to twice daily, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects

Nebusal 7% inhalation solution 4ml vials (Forest Laboratories UK Ltd) Sodium chloride 70 mg per 1 ml | 60 vial • NHS indicative price = £27.00 • Drug Tariff (Part IXa)

Peak flow meters: low range

● LOW RANGE PEAK FLOW METERS

MEDI® LOW RANGE

Range 40–420 litres/minute.

Compliant to standard EN ISO 23747:2007 except for scale range.

Medi peak flow meter low range (Medicareplus International Ltd)
1 device • NHS indicative price = £6.50 • Drug Tariff (Part IXa) price = £6.50

MINI-WRIGHT® LOW RANGE

Range 30–400 litres/minute.

Compliant to standard EN ISO 23747:2007 except for scale range.

Mini-Wright peak flow meter low range (Clement Clarke International Ltd)

1 device • NHS indicative price = £7.14 • Drug Tariff (Part IXa) price = £6.50

POCKETPEAK® LOW RANGE

Range 50–400 litres/minute.

Compliant to standard EN ISO 23747:2007 except for scale range.

Haleraid-200 (GlaxoSmithKline UK Ltd)

1 device • No NHS indicative price available • Drug Tariff (Part IXa)

OPTICHAMBER®

For use with all pressurised (aerosol) inhalers.

OptiChamber (Respironics (UK) Ltd)

1 device • NHS indicative price = £4.28 • Drug Tariff (Part IXa)

OPTICHAMBER® DIAMOND

For use with all pressurised (aerosol) inhalers.

OptiChamber Diamond (Respironics (UK) Ltd)

1 device • NHS indicative price = £4.49 • Drug Tariff (Part IXa)

OptiChamber Diamond with large LiteTouch mask 5 years-adult (Respironics (UK) Ltd)

1 device • NHS indicative price = £7.49 • Drug Tariff (Part IXa)

OptiChamber Diamond with medium LiteTouch mask 1-5 years (Respironics (UK) Ltd)

1 device • NHS indicative price = £7.49 • Drug Tariff (Part IXa)

OptiChamber Diamond with small LiteTouch mask 0-18 months (Respironics (UK) Ltd)

1 device • NHS indicative price = £7.49 • Drug Tariff (Part IXa)

POCKET CHAMBER®

Small volume device. For use with all pressurised (aerosol) inhalers.

Pocket Chamber (nSpire Health Ltd)

1 device • NHS indicative price = £4.18 • Drug Tariff (Part IXa)

Pocket Chamber with adult mask (nSpire Health Ltd)

1 device • NHS indicative price = £9.75 • Drug Tariff (Part IXa)

Pocket Chamber with child mask (nSpire Health Ltd)

1 device • NHS indicative price = £9.75 • Drug Tariff (Part IXa)

Pocket Chamber with infant mask (nSpire Health Ltd)

1 device • NHS indicative price = £9.75 • Drug Tariff (Part IXa)

Pocket Chamber with teenager mask (nSpire Health Ltd)

1 device • NHS indicative price = £9.75 • Drug Tariff (Part IXa)

SPACE CHAMBER PLUS®

For use with all pressurised (aerosol) inhalers.

Space Chamber Plus (Medical Developments International Ltd)

1 device • NHS indicative price = £4.26 • Drug Tariff (Part IXa)

Space Chamber Plus with large mask (Medical Developments International Ltd)

1 device • NHS indicative price = £6.98 • Drug Tariff (Part IXa)

Space Chamber Plus with medium mask (Medical Developments International Ltd)

1 device • NHS indicative price = £6.98 • Drug Tariff (Part IXa)

Space Chamber Plus with small mask (Medical Developments International Ltd)

1 device • NHS indicative price = £6.98 • Drug Tariff (Part IXa)

VOLUMATIC®

Large-volume device. For use with *Clenil Modulite®*, *Flixotide®*, *Seretide®*, *Serevent®*, and *Ventolin®* inhalers.

Volumatic (GlaxoSmithKline UK Ltd)

1 device • NHS indicative price = £3.88 • Drug Tariff (Part IXa)

Volumatic with paediatric mask (GlaxoSmithKline UK Ltd)

1 device • NHS indicative price = £6.83 • Drug Tariff (Part IXa)

VORTEX®

Medium-volume device. For use with all pressurised (aerosol) inhalers.

Vortex Spacer (Pari Medical Ltd)

1 device • NHS indicative price = £6.28 • Drug Tariff (Part IXa)

Vortex with baby mask 0-2 years (Pari Medical Ltd)

1 device • NHS indicative price = £7.99 • Drug Tariff (Part IXa)

Vortex with child mask 2 years+ (Pari Medical Ltd)

1 device • NHS indicative price = £7.99 • Drug Tariff (Part IXa)

2 Allergic conditions

Antihistamines, allergen immunotherapy and allergic emergencies

Antihistamines

All antihistamines are of potential value in the treatment of nasal allergies, particularly seasonal allergic rhinitis (hayfever), and they may be of some value in vasomotor rhinitis. They reduce rhinorrhoea and sneezing but are usually less effective for nasal congestion. Antihistamines are used topically in the eye, in the nose, and on the skin.

Oral antihistamines are also of some value in preventing urticaria and are used to treat urticarial rashes, pruritus, and insect bites and stings; they are also used in drug allergies. Injections of chlorphenamine maleate p. 283 or promethazine hydrochloride p. 286 are used as an adjunct to adrenaline/epinephrine p. 221 in the emergency treatment of anaphylaxis and angioedema. Antihistamines (including cinnarizine p. 432, cyclizine p. 424, and promethazine teoclate p. 432) may also have a role in nausea and vomiting. Buclizine is included as an anti-emetic in a preparation for migraine. Antihistamines may also have a role in occasional insomnia.

All older antihistamines cause sedation but alimemazine tartrate p. 282 and **promethazine** may be more sedating whereas chlorphenamine maleate and cyclizine may be less so. This sedating activity is sometimes used to manage the pruritus associated with some allergies. There is little evidence that any one of the older, 'sedating' antihistamines is superior to another and patients vary widely in their response.

Non-sedating antihistamines such as acrivastine p. 278, bilastine p. 278, cetirizine hydrochloride p. 279, desloratadine p. 279 (an active metabolite of loratadine p. 281), fexofenadine hydrochloride p. 280 (an active metabolite of terfenadine), levocetirizine hydrochloride p. 280 (an isomer of cetirizine hydrochloride), loratadine and mizolastine p. 281 cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

Allergen immunotherapy

Immunotherapy using allergen vaccines containing house dust mite, animal dander (cat or dog), or extracts of grass and tree pollen can reduce symptoms of asthma and allergic rhinoconjunctivitis. A vaccine containing extracts of wasp and bee venom is used to reduce the risk of severe anaphylaxis and systemic reactions in individuals with hypersensitivity to wasp and bee stings. An oral preparation of grass pollen extract (*Grazax*[®]) is also licensed for disease-modifying treatment of grass pollen-induced rhinitis and conjunctivitis. Those requiring immunotherapy must be referred to a hospital specialist for accurate diagnosis, assessment, and treatment.

Omalizumab p. 267 is a monoclonal antibody that binds to immunoglobulin E (IgE). It is used as additional therapy in individuals with proven IgE-mediated sensitivity to inhaled allergens, whose severe persistent allergic asthma cannot be controlled adequately with high dose inhaled corticosteroid together with a long-acting beta₂ agonist. Omalizumab should be initiated by physicians in specialist centres experienced in the treatment of severe persistent asthma. Omalizumab is also indicated as add-on therapy for the treatment of chronic spontaneous urticaria in patients who have had an inadequate response to H₁ antihistamine treatment.

Anaphylaxis and allergic emergencies

Anaphylaxis

Anaphylaxis is a severe, life-threatening, generalised or systemic hypersensitivity reaction. It is characterised by the rapid onset of respiratory and/or circulatory problems and is usually associated with skin and mucosal changes; prompt treatment is required. Patients with pre-existing asthma, especially poorly controlled asthma, are at particular risk of life-threatening reactions. Insect stings are a recognised risk (in particular wasp and bee stings). Latex and certain foods, including eggs, fish, cow's milk protein, peanuts, sesame, shellfish, soy, and tree nuts may also precipitate anaphylaxis (see Food allergy p. 83). Medicinal products particularly associated with anaphylaxis include blood products, vaccines, hyposensitising (allergen) preparations, antibacterials, aspirin and other NSAIDs, and neuromuscular blocking drugs. In the case of drugs, anaphylaxis is more likely after parenteral administration; resuscitation facilities must always be available for injections associated with special risk. Anaphylactic reactions may also be associated with *additives and excipients* in foods and medicines. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens.

Treatment of anaphylaxis

Adrenaline/epinephrine provides physiological reversal of the immediate symptoms associated with hypersensitivity reactions such as *anaphylaxis* and *angioedema*.

First-line treatment includes:

- securing the airway, restoration of blood pressure (laying the patient flat and raising the legs, or in the recovery position if unconscious or nauseous and at risk of vomiting);
- administering adrenaline/epinephrine (by **intramuscular** injection in a dose of 500 micrograms (a dose of 300 micrograms may be appropriate for *immediate self-administration*); the dose should be repeated if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function. Patients receiving beta-blockers require special consideration;
- administering high-flow **oxygen** and **intravenous fluids** is also of primary importance;
- administering an antihistamine, such as chlorphenamine maleate, by slow intravenous injection or intramuscular

injection is a useful adjunctive treatment, given after adrenaline.

- Administering an intravenous corticosteroid such as hydrocortisone p. 662 (preferably as sodium succinate) is of secondary value in the initial management of anaphylaxis because the onset of action is delayed for several hours, but should be given to prevent further deterioration in severely affected patients.

Continuing respiratory deterioration requires further treatment with **bronchodilators** including inhaled or intravenous salbutamol p. 252, inhaled ipratropium bromide p. 246, intravenous aminophylline p. 272, or intravenous magnesium sulfate p. 1019 [unlicensed indication] (as for acute severe asthma); in addition to oxygen, assisted respiration and possibly emergency tracheotomy may be necessary.

When a patient is so ill that there is doubt about the adequacy of the circulation, the initial injection of adrenaline/epinephrine may need to be given as a *dilute solution by the intravenous route*.

Cardiopulmonary arrest may follow an anaphylactic reaction; resuscitation should be started immediately.

On discharge, patients should be considered for further treatment with an oral antihistamine and an oral corticosteroid for up to 3 days to reduce the risk of further reaction. Patients should be instructed to return to hospital if symptoms recur and to contact their general practitioner for follow-up.

Patients who are suspected of having had an anaphylactic reaction should be referred to a specialist for specific allergy diagnosis. Avoidance of the allergen is the principal treatment; if appropriate, an adrenaline/epinephrine auto-injector should be given for self-administration or a replacement supplied.

Intramuscular adrenaline (epinephrine)

The *intramuscular route* is the *first choice route* for the administration of adrenaline/epinephrine in the management of anaphylaxis. Adrenaline/epinephrine is best given as an intramuscular injection into the anterolateral aspect of the middle third of the thigh; it has a rapid onset of action after intramuscular administration and in the shocked patient its absorption from the intramuscular site is faster and more reliable than from the subcutaneous site.

Patients with severe allergy should be instructed in the self-administration of adrenaline/epinephrine p. 221 by intramuscular injection.

Prompt injection of adrenaline/epinephrine is of paramount importance. The adrenaline/epinephrine doses recommended for the emergency treatment of anaphylaxis by appropriately trained healthcare professionals are based on the revised recommendations of the Working Group of the Resuscitation Council (UK).

Dose of intramuscular injection of adrenaline (epinephrine) for the emergency treatment of anaphylaxis by healthcare professionals

Age	Dose	Volume of adrenaline
▶ Child 1 month–5 years	150 micrograms	0.15 mL 1 in 1000 (1 mg/mL) adrenaline ¹
▶ Child 6–11 years	300 micrograms	0.3 mL 1 in 1000 (1 mg/mL) adrenaline
▶ Child 12–17 years	500 micrograms	0.5 mL 1 in 1000 (1 mg/mL) adrenaline ²
▶ Adult	500 micrograms	0.5 mL 1 in 1000 (1 mg/mL) adrenaline

These doses may be repeated several times if necessary at 5-minute intervals according to blood pressure, pulse and respiratory function.

1. Use suitable syringe for measuring small volume
2. 300 micrograms (0.3 mL) if child is small or prepubertal

Intravenous adrenaline (epinephrine)

Intravenous adrenaline/epinephrine should be given only by those experienced in its use, in a setting where patients can be carefully monitored.

When the patient is severely ill and there is real doubt about the adequacy of the circulation and absorption after intramuscular injection, adrenaline/epinephrine can be given by **slow intravenous injection** repeated according to response; if multiple doses are required, adrenaline/epinephrine should be given as a **slow intravenous infusion stopping when a response has been obtained**.

It is important that, where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.

The intravenous route is also used for *cardiac resuscitation*.

Angioedema

Angioedema is dangerous if *laryngeal oedema* is present. In this circumstance adrenaline/epinephrine injection and **oxygen** should be given as described under **Anaphylaxis**; antihistamines and corticosteroids should also be given. Tracheal intubation may be necessary.

Hereditary angioedema

The treatment of hereditary angioedema should be under specialist supervision. Unlike allergic angioedema, adrenaline/epinephrine, corticosteroids, and antihistamines should not be used for the treatment of acute attacks, including attacks involving laryngeal oedema, as they are ineffective and may delay appropriate treatment—intubation may be necessary. The administration of C1-esterase inhibitor p. 289, an endogenous complement blocker derived from human plasma, (in fresh frozen plasma or in partially purified form) can terminate acute attacks of *hereditary angioedema*; it can also be used for short-term prophylaxis before dental, medical or surgical procedures. Conestat alfa p. 289 and icatibant p. 290 are licensed for the treatment of acute attacks of hereditary angioedema in adults with C1-esterase inhibitor deficiency.

Tranexamic acid p. 110 and danazol p. 725 [unlicensed indication] are used for short-term and long-term prophylaxis of hereditary angioedema. Short-term prophylaxis with tranexamic acid or danazol is started several days before planned procedures (e.g. dental work) and continued for 2–5 days afterwards. Danazol should be avoided in children because of its androgenic effects

ANTIHISTAMINES > NON-SEDATING**Acrivastine**

19-May-2017

● INDICATIONS AND DOSE

Symptomatic relief of allergy such as hayfever, chronic idiopathic urticaria

► BY MOUTH

- Child 12–17 years: 8 mg 3 times a day
- Adult: 8 mg 3 times a day

- **CONTRA-INDICATIONS** Avoid in Acute porphyrias p. 1025 · elderly

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

● SIDE-EFFECTS

- **Common or very common** Drowsiness · dry mouth
- **Frequency not known** Dizziness · rash

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as acrivastine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to triprolidine.
- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **RENAL IMPAIRMENT** Avoid in severe impairment.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

■ Capsule

► **Benadryl Allergy Relief** (McNeil Products Ltd)

Acrivastine 8 mg Benadryl Allergy Relief 8mg capsules | 24 capsule  £5.45

Bilastine

22-May-2017

● INDICATIONS AND DOSE

Symptomatic relief of allergic rhinoconjunctivitis and urticaria

► BY MOUTH

- Child 12–17 years: 20 mg once daily
- Adult: 20 mg once daily

- **CONTRA-INDICATIONS** Avoid in Acute porphyrias p. 1025

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

● SIDE-EFFECTS

- **Common or very common** Drowsiness · headache

► **Uncommon** Anxiety · appetite increased · asthenia · bundle branch block · diarrhoea · dry mouth · dyspnoea · fever · gastritis · gastrointestinal discomfort · insomnia · nasal complaints · nausea · oral herpes · pre-existing condition improved · pruritus · QT interval prolongation · sinus arrhythmia · thirst · tinnitus · vertigo · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as bilastine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

- **PREGNANCY** Avoid—limited information available. Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

- **BREAST FEEDING** Avoid—no information available. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **DIRECTIONS FOR ADMINISTRATION** Take tablet 1 hour before or 2 hours after food or fruit juice.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer bilastine tablets.

Driving and skilled tasks Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

- ▶ **Common or very common** Asthenia · dry mouth · headache
- ▶ **Rare or very rare** Akathisia · arrhythmias · diarrhoea · dizziness · drowsiness · gastrointestinal discomfort · hallucination · hepatic disorders · insomnia · myalgia · nausea · palpitations · seizure · vomiting

- ▶ **Frequency not known** Behaviour abnormal · photosensitivity reaction · QT interval prolongation

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as desloratadine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

ALLERGY AND CROSS-SENSITIVITY Contra-indicated if history of hypersensitivity to loratadine.

PREGNANCY Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

BREAST FEEDING Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

RENAL IMPAIRMENT Use with caution in severe impairment.

PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include bubblegum.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); excess alcohol should be avoided.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCIPIENTS: May contain Propylene glycol, sorbitol

► Desloratadine (Non-proprietary)

Desloratadine 500 microgram per 1 ml Desloratadine 2.5mg/5ml oral solution sugar free sugar-free | 100 ml [PoM] £6.43-£6.77 sugar-free | 150 ml [PoM] £8.00-£10.15 DT = £10.15

► Neoclarityn (Merck Sharp & Dohme Ltd)

Desloratadine 500 microgram per 1 ml Neoclarityn 2.5mg/5ml oral solution sugar-free | 100 ml [PoM] £6.77 sugar-free | 150 ml [PoM] £10.15 DT = £10.15

Tablet

► Desloratadine (Non-proprietary)

Desloratadine 5 mg Desloratadine 5mg tablets | 30 tablet [PoM] £6.77 DT = £0.86

► Neoclarityn (Merck Sharp & Dohme Ltd)

Desloratadine 5 mg Neoclarityn 5mg tablets | 30 tablet [PoM] £6.77 DT = £0.86

Fexofenadine hydrochloride

22-May-2017

● INDICATIONS AND DOSE

Symptomatic relief of seasonal allergic rhinitis

► BY MOUTH

- Child 6-11 years: 30 mg twice daily
- Child 12-17 years: 120 mg once daily
- Adult: 120 mg once daily

Symptomatic relief of chronic idiopathic urticaria

► BY MOUTH

- Child 12-17 years: 180 mg once daily
- Adult: 180 mg once daily

PHARMACOKINETICS

- Fexofenadine is a metabolite of terfenadine.

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

● SIDE-EFFECTS

- **Common or very common** Dizziness · drowsiness · headache · nausea
- **Uncommon** Fatigue
- **Frequency not known** Diarrhoea · nervousness · palpitations · skin reactions · sleep disorders · tachycardia
- SIDE-EFFECTS, FURTHER INFORMATION** Non-sedating antihistamines such as fexofenadine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 5

► Fexofenadine hydrochloride (Non-proprietary)

Fexofenadine hydrochloride 120 mg Fexofenadine 120mg tablets | 30 tablet [PoM] £6.23 DT = £1.76

Fexofenadine hydrochloride 180 mg Fexofenadine 180mg tablets | 30 tablet [PoM] £7.89 DT = £2.84

Levocetirizine hydrochloride

24-May-2017

● INDICATIONS AND DOSE

Symptomatic relief of allergy such as hay fever, urticaria

► BY MOUTH

- Child 6-17 years: 5 mg once daily
- Adult: 5 mg once daily

PHARMACOKINETICS

- Levocetirizine is an isomer of cetirizine.

- **CONTRA-INDICATIONS** Avoid in Acute porphyrias p. 1025

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

● SIDE-EFFECTS

- **Common or very common** Asthenia · constipation (in children) · drowsiness · dry mouth
- **Uncommon** Abdominal pain
- **Frequency not known** Aggression · agitation · angioedema · appetite increased · arthralgia · depression · diarrhoea (very common in children) · dizziness · dyspnoea · hallucination · hepatitis · myalgia · nausea · oedema · palpitations · paraesthesia · seizure · skin reactions · sleep disorders (very common in children) · suicidal ideation · syncope · tachycardia · taste altered · tremor · urinary disorders · vertigo · vision disorders · vomiting · weight increased
- SIDE-EFFECTS, FURTHER INFORMATION** Non-sedating antihistamines such as levocetirizine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

● RENAL IMPAIRMENT

- In adults Avoid if eGFR less than 10 mL/minute/1.73 m².
- In children Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

Dose adjustments • In adults 5 mg on alternate days if eGFR 30-50 mL/minute/1.73 m². 5 mg every 3 days if eGFR 10-30 mL/minute/1.73 m².

- In children Reduce dose frequency to alternate days if estimated glomerular filtration rate 30-50 mL/minute/1.73 m². Reduce dose frequency to every 3 days if estimated glomerular filtration rate 10-30 mL/minute/1.73 m².

● PATIENT AND CARER ADVICE

Driving and skilled tasks Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

- ▶ **Xyzal** (UCB Pharma Ltd)
Levocetirizine dihydrochloride 500 microgram per 1 ml Xyzal 0.5mg/ml oral solution sugar-free | 200 ml [PoM] £6.00 DT = £6.00

Tablet

- ▶ **Levocetirizine hydrochloride (Non-proprietary)**
Levocetirizine dihydrochloride 5 mg Levocetirizine 5mg tablets | 30 tablet [PoM] £4.45 DT = £4.37
- ▶ **Xyzal** (UCB Pharma Ltd)
Levocetirizine dihydrochloride 5 mg Xyzal 5mg tablets | 30 tablet [PoM] £4.39 DT = £4.37

Loratadine

22-May-2017

● INDICATIONS AND DOSE

Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria

▶ **BY MOUTH**

- ▶ Child 2-11 years (body-weight up to 31 kg): 5 mg once daily
- ▶ Child 2-11 years (body-weight 31 kg and above): 10 mg once daily
- ▶ Child 12-17 years: 10 mg once daily
- ▶ Adult: 10 mg once daily

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

● SIDE-EFFECTS

- ▶ **Common or very common** Drowsiness · nervousness (in children)
- ▶ **Uncommon** Appetite increased · headache (very common in children) · insomnia
- ▶ **Rare or very rare** Alopecia · angioedema · dizziness · dry mouth · fatigue (very common in children) · gastritis · hepatic function abnormal · nausea · palpitations · rash · seizure · tachycardia

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as loratadine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** **Dose adjustments** Reduce dose frequency to alternate days in severe impairment.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Although drowsiness is rare, nevertheless patients and their carers should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Loratadine 10 mg tablets may be prescribed.

Loratadine syrup 5 mg/5 mL may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCIPIENTS: May contain Propylene glycol

▶ **Loratadine (Non-proprietary)**

Loratadine 1 mg per 1 ml Loratadine 5mg/5ml oral solution | 100 ml [PoM] £2.24 DT = £1.33

Tablet▶ **Loratadine (Non-proprietary)**

Mizolastine

22-May-2017

● INDICATIONS AND DOSE

Symptomatic relief of allergy such as hay fever, urticaria

▶ **BY MOUTH**

- ▶ Child 12-17 years: 10 mg once daily
- ▶ Adult: 10 mg once daily

- **CONTRA-INDICATIONS** Cardiac disease · hypokalaemia · susceptibility to QT-interval prolongation

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

● SIDE-EFFECTS

- ▶ **Common or very common** Appetite increased · asthenia · diarrhoea · dizziness · drowsiness · dry mouth · gastrointestinal discomfort · headache · nausea · weight increased
- ▶ **Uncommon** Anxiety · arrhythmias · arthralgia · depression · myalgia · palpitations
- ▶ **Rare or very rare** Hypersensitivity
- ▶ **Frequency not known** Asthma exacerbated · bronchospasm · QT interval prolongation

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as mizolastine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in significant impairment.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Although drowsiness is rare, nevertheless patients and their carers should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

▶ **Mizollen** (Sanofi)

Mizolastine 10 mg Mizollen 10mg modified-release tablets | 30 tablet [PoM] £6.92 DT = £6.92

Rupatadine

14-Aug-2017

- **DRUG ACTION** Rupatadine is a second generation non-sedating antihistamine.

● INDICATIONS AND DOSE

Symptomatic relief of allergic rhinitis and urticaria

► BY MOUTH

- Child 12–17 years: 10 mg once daily
- Adult: 10 mg once daily

- **CAUTIONS** Elderly—limited information available · history of QT-interval prolongation · predisposition to arrhythmia · uncorrected hypokalaemia

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

● SIDE-EFFECTS

- **Common or very common** Asthenia · dizziness · drowsiness · dry mouth · headache
- **Uncommon** Appetite increased · arthralgia · back pain · concentration impaired · constipation · cough · diarrhoea · dry throat · epistaxis · fever · gastrointestinal discomfort · increased risk of infection · irritability · malaise · myalgia · nasal dryness · nausea · oropharyngeal pain · rash · thirst · vomiting · weight increased
- **Rare or very rare** Palpitations · tachycardia

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as rupatadine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises avoid—no information available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Rupatadine (Non-proprietary)

Rupatadine (as Rupatadine fumarate) 10 mg Rupatadine 10mg tablets | 30 tablet [PoM] £30.00 DT = £30.00

ANTIHISTAMINES > SEDATING

Alimemazine tartrate

(Trimeprazine tartrate)

● INDICATIONS AND DOSE

Urticaria | Pruritus

► BY MOUTH

- Child 2–4 years: 2.5 mg 3–4 times a day
- Child 5–11 years: 5 mg 3–4 times a day
- Child 12–17 years: 10 mg 2–3 times a day, in severe cases up to maximum daily dose has been used; maximum 100 mg per day
- Adult: 10 mg 2–3 times a day, in severe cases up to maximum daily dose has been used; maximum 100 mg per day
- Elderly: 10 mg 1–2 times a day

- **CONTRA-INDICATIONS** Children under 2 years except on specialist advice (safety of such use has not been established) · epilepsy · hepatic dysfunction · history of narrow angle glaucoma · hypothyroidism · myasthenia gravis · Parkinson's disease · pheochromocytoma · prostatic hypertrophy (in adults) · renal dysfunction
- **CAUTIONS** Cardiovascular diseases (due to tachycardia-inducing and hypotensive effects of phenothiazines) · elderly · exposure to sunlight should be avoided during treatment with high doses · pyloroduodenal obstruction · urinary retention · volume depleted patients who are more susceptible to orthostatic hypotension
- **INTERACTIONS** → Appendix 1: antihistamines, sedating
- **SIDE-EFFECTS** Agitation · agranulocytosis · amenorrhoea · atrioventricular block · autonomic dysfunction · bile thrombus · consciousness impaired · drug fever · dry mouth · eosinophilia · erectile dysfunction · eye disorder · galactorrhoea · gynaecomastia · hepatic disorders · hyperprolactinaemia · hyperthermia · hypotension · insomnia · leucopenia (on prolonged high dose) · movement disorders · muscle rigidity · nasal congestion · neuroleptic malignant syndrome · pallor · parkinsonism · photosensitivity reaction · postural hypotension (more common in the elderly or in volume depletion) · QT interval prolongation · respiratory depression · seizure · skin reactions · tardive dyskinesia (more common after long term high doses) · tremor · ventricular fibrillation (increased risk with hypokalaemia and cardiac disease) · ventricular tachycardia (increased risk with hypokalaemia and cardiac disease)

SIDE-EFFECTS, FURTHER INFORMATION Drowsiness may diminish after a few days. Patients on high dosage may develop photosensitivity and should avoid exposure to direct sunlight.

Children and elderly patients are more susceptible to side-effects.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.
- **RENAL IMPAIRMENT** Avoid.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

Chlorphenamine maleate

(Chlorpheniramine maleate)

● INDICATIONS AND DOSE

Symptomatic relief of allergy such as hay fever, urticaria, food allergy, drug reactions | Relief of itch associated with chickenpox

► BY MOUTH

- Child 1-23 months: 1 mg twice daily
- Child 2-5 years: 1 mg every 4-6 hours; maximum 6 mg per day
- Child 6-11 years: 2 mg every 4-6 hours; maximum 12 mg per day
- Child 12-17 years: 4 mg every 4-6 hours; maximum 24 mg per day
- Adult: 4 mg every 4-6 hours; maximum 24 mg per day
- Elderly: 4 mg every 4-6 hours; maximum 12 mg per day

► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- Child 1-5 months: 250 micrograms/kg (max. per dose 2.5 mg), repeated if necessary; maximum 4 doses per day
- Child 6 months-5 years: 2.5 mg, repeated if necessary; maximum 4 doses per day
- Child 6-11 years: 5 mg, repeated if necessary; maximum 4 doses per day
- Child 12-17 years: 10 mg, repeated if necessary; maximum 4 doses per day
- Adult: 10 mg, repeated if necessary; maximum 4 doses per day

Emergency treatment of anaphylactic reactions

► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- Child 1-5 months: 250 micrograms/kg (max. per dose 2.5 mg), repeated if necessary; maximum 4 doses per day
- Child 6 months-5 years: 2.5 mg, repeated if necessary; maximum 4 doses per day
- Child 6-11 years: 5 mg, repeated if necessary; maximum 4 doses per day
- Child 12-17 years: 10 mg, repeated if necessary; maximum 4 doses per day
- Adult: 10 mg, repeated if necessary; maximum 4 doses per day

- **UNLICENSED USE** Tablets not licensed for use in children under 6 years. Syrup not licensed for use in children under 1 year.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN Children under 6 years should not be given over-the-counter cough and cold medicines containing chlorphenamine.

- **CAUTIONS** Epilepsy · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · susceptibility to angle-closure glaucoma · urinary retention

- **INTERACTIONS** → Appendix 1: antihistamines, sedating

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Concentration impaired · coordination abnormal · dizziness · dry mouth · fatigue · headache · nausea · vision blurred
- **Frequency not known** Agitation · appetite decreased · blood disorder · bronchial secretion viscosity increased · depression · diarrhoea · gastrointestinal disorder · haemolytic anaemia · hypotension · irritability · muscle twitching · muscle weakness · nightmare · palpitations ·

photosensitivity reaction · skin reactions · tinnitus · urinary retention · vomiting

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- **With oral use** Drowsiness
- **Frequency not known**
- **With oral use** Angioedema · arrhythmias · chest tightness · confusion · hepatic disorders
- **With parenteral use** Central nervous system stimulation · confusional psychosis (in adults) · dyspepsia · hepatitis · sedation

SIDE-EFFECTS, FURTHER INFORMATION Children and elderly patients are more susceptible to side-effects.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, give over 1 minute; if small dose required, dilute with Sodium Chloride 0.9%.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Chlorphenamine maleate for allergy symptoms www.medicinesforchildren.org.uk/chlorphenamine-maleate-allergy-symptoms-0

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Chlorphenamine tablets may be prescribed. Chlorphenamine oral solution may be prescribed.

- ▶ Child 6 months–5 years: 5–15 mg daily in divided doses, dose adjusted according to weight; maximum 2 mg/kg per day
- ▶ Child 6–17 years (body-weight up to 40 kg): Initially 15–25 mg daily in divided doses, dose increased as necessary, adjusted according to weight; maximum 2 mg/kg per day
- ▶ Child 6–17 years (body-weight 40 kg and above): Initially 15–25 mg daily in divided doses, increased if necessary to 50–100 mg daily in divided doses, dose adjusted according to weight
- ▶ Adult: Initially 25 mg daily, dose to be taken at night; increased if necessary to 25 mg 3–4 times a day
- ▶ Elderly: Initially 25 mg daily, dose to be taken at night; increased if necessary to 25 mg twice daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: RISK OF QT-INTERVAL PROLONGATION AND TORSADE DE POINTES (APRIL 2015)

Following concerns of heart rhythm abnormalities, the safety and efficacy of hydroxyzine has been reviewed by the European Medicines Agency. The review concludes that hydroxyzine is associated with a small risk of QT-interval prolongation and torsade de pointes; these events are most likely to occur in patients who have risk factors for QT prolongation, e.g. concomitant use of drugs that prolong the QT-interval, cardiovascular

disease, family history of sudden cardiac death, significant electrolyte imbalance (low plasma-potassium or plasma-magnesium concentrations), or significant bradycardia. To minimise the risk of such adverse effects, the following dose restrictions have been made and new cautions and contra-indications added:

- **Hydroxyzine** is contra-indicated in patients with prolonged QT-interval or who have risk factors for QT-interval prolongation;
- Avoid use in the elderly due to increased susceptibility to the side-effects of hydroxyzine;
- Consider the risks of QT-interval prolongation and torsade de pointes before prescribing to patients taking drugs that lower heart rate or plasma-potassium concentration;
- In children with body-weight up to 40 kg, the maximum daily dose is 2 mg/kg;
- In adults, the maximum daily dose is 100 mg;
- In the elderly, the maximum daily dose is 50 mg (if use of hydroxyzine cannot be avoided);
- The lowest effective dose for the shortest period of time should be prescribed.

- **CONTRA-INDICATIONS** Acquired or congenital QT interval prolongation · predisposition to QT interval prolongation

CONTRA-INDICATIONS, FURTHER INFORMATION

- **QT interval prolongation** Risk factors for QT interval prolongation include significant electrolyte imbalance, bradycardia, cardiovascular disease, and family history of sudden cardiac death.

- **CAUTIONS** Bladder outflow obstruction · breathing problems · cardiovascular disease · children · decreased gastrointestinal motility · dementia · elderly · epilepsy · hypertension · hyperthyroidism · myasthenia gravis · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · stenosing peptic ulcer · susceptibility to angle-closure glaucoma · urinary retention

CAUTIONS, FURTHER INFORMATION Elderly patients are particularly susceptible to side-effects; manufacturers advise avoid or reduce dose.

Children have an increased susceptibility to side-effects, particularly CNS effects.

- **INTERACTIONS** → Appendix 1: antihistamines, sedating

● SIDE-EFFECTS

- **Rare or very rare** Severe cutaneous adverse reactions (SCARs) · skin reactions
- **Frequency not known** Agranulocytosis · alopecia · anticholinergic syndrome · anxiety · appetite decreased · arrhythmias · asthenia · blood disorder · bronchial secretion viscosity increased · chest tightness · chills · coma · concentration impaired · confusion · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · dry throat · dyskinesia (on discontinuation) · epigastric pain · fever · flushing · gastrointestinal disorders · haemolytic anaemia · hallucination · headache · hepatic function abnormal · hyperhidrosis · hypotension · irritability · labyrinthitis · leucopenia · malaise · menstruation irregular · movement disorders · myalgia · nasal congestion · nausea · palpitations · paraesthesia · QT interval prolongation · respiratory disorders · respiratory tract dryness · seizure (with high doses) · sexual dysfunction · sleep disorders · speech slurred · taste bitter · thrombocytopenia · tinnitus · tremor (with high doses) · urinary disorders · vertigo · vision disorders · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Paradoxical stimulation may occur rarely, especially with high doses or in the elderly. Drowsiness may diminish after a few days of treatment.

- **ALLERGY AND CROSS-SENSITIVITY** Manufacturer advises hydroxyzine should be avoided in patients with previous

hypersensitivity to cetirizine or other piperazine derivatives, and aminophylline.

- **PREGNANCY** Manufacturers advise avoid—toxicity in animal studies with higher doses. Use in the latter part of the third trimester may cause irritability, paradoxical excitability, and tremor in the neonate.
- **BREAST FEEDING** Manufacturer advises avoid—expected to be present in milk but effect unknown.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe liver disease—increased risk of coma.
Dose adjustments Manufacturer advises reduce daily dose by one-third.
- **RENAL IMPAIRMENT**
Dose adjustments Manufacturers advise reduce daily dose by half in moderate to severe renal impairment.
- **EFFECT ON LABORATORY TESTS** May interfere with methacholine test—manufacturer advises stop treatment 96 hours prior to test. May interfere with skin testing for allergy—manufacturer advises stop treatment one week prior to test.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 2

➤ Hydroxyzine hydrochloride (Non-proprietary)

Hydroxyzine hydrochloride 10 mg Hydroxyzine 10mg tablets | 84 tablet (PoM) £1.20-£1.53 DT = £1.37

Hydroxyzine hydrochloride 25 mg Hydroxyzine 25mg tablets | 28 tablet (PoM) £0.62-£0.80 DT = £0.71

➤ Atarax (Alliance Pharmaceuticals Ltd)

Hydroxyzine hydrochloride 10 mg Atarax 10mg tablets | 84 tablet (PoM) £1.20 DT = £1.37

Hydroxyzine hydrochloride 25 mg Atarax 25mg tablets | 28 tablet (PoM) £0.62 DT = £0.71

Ketotifen

● INDICATIONS AND DOSE

Allergic rhinitis

➤ BY MOUTH

- **Child 3-17 years:** 1 mg twice daily
- **Adult:** 1 mg twice daily, increased if necessary to 2 mg twice daily, to be taken with food

Allergic rhinitis in readily sedated patients

➤ BY MOUTH

- **Adult:** Initially 0.5-1 mg once daily, dose to be taken at night

- **CONTRA-INDICATIONS** Avoid in Acute porphyrias p. 1025

- **CAUTIONS** Epilepsy · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · susceptibility to angle-closure glaucoma · urinary retention

- **INTERACTIONS** → Appendix 1: antihistamines, sedating

● SIDE-EFFECTS

- **Common or very common** Anxiety · insomnia · irritability
- **Uncommon** Cystitis · dizziness · dry mouth · skin reactions
- **Rare or very rare** Hepatitis · sedation · seizure · Stevens-Johnson syndrome · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of

treatment and is considerably less of a problem with the newer antihistamines.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving or cycling); sedating effects enhanced by alcohol.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 2, 21

• Zaditen (CD Pharma AB)

Ketotifen (as Ketotifen fumarate) 200 microgram per 1 mL Zaditen 1mg/5mL elixir sugar-free | 300 mL PoM £8.91 DT = £8.91

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 21

• Zaditen (CD Pharma AB)

Ketotifen (as Ketotifen fumarate) 1 mg Zaditen 1mg tablets | 60 tablet PoM £7.53

Promethazine hydrochloride

• INDICATIONS AND DOSE

Symptomatic relief of allergy such as hay fever and urticaria | Insomnia associated with urticaria and pruritus

► BY MOUTH

- Child 2-4 years: 5 mg twice daily, alternatively 5–15 mg once daily, dose to be taken at night
- Child 5-9 years: 5–10 mg twice daily, alternatively 10–25 mg once daily, dose to be taken at night
- Child 10-17 years: 10–20 mg 2–3 times a day, alternatively 25 mg once daily, dose to be taken at night, increased if necessary to 25 mg twice daily
- Adult: 10–20 mg 2–3 times a day
- **BY DEEP INTRAMUSCULAR INJECTION**
- Adult: 25–50 mg (max. per dose 100 mg)

Emergency treatment of anaphylactic reactions

► BY SLOW INTRAVENOUS INJECTION

- Adult: 25–50 mg, to be administered as a solution containing 2.5 mg/mL in water for injections; maximum 100 mg per course

Sedation (short-term use)

► BY MOUTH

- Child 2-4 years: 15–20 mg
- Child 5-9 years: 20–25 mg
- Child 10-17 years: 25–50 mg
- Adult: 25–50 mg

► BY DEEP INTRAMUSCULAR INJECTION

- Adult: 25–50 mg

Nausea | Vomiting | Vertigo | Labyrinthine disorders | Motion sickness

► BY MOUTH

- Child 2-4 years: 5 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
- Child 5-9 years: 10 mg, to be taken at bedtime on night before travel, repeat following morning if necessary

- Child 10-17 years: 20–25 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
- Adult: 20–25 mg, to be taken at bedtime on night before travel, repeat following morning if necessary

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN

Children under 6 years should not be given over-the-counter cough and cold medicines containing promethazine.

- **CONTRA-INDICATIONS** Should not be given to children under 2 years, except on specialist advice, because the safety of such use has not been established

• CAUTIONS

GENERAL CAUTIONS Epilepsy · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · severe coronary artery disease · susceptibility to angle-closure glaucoma · urinary retention

SPECIFIC CAUTIONS

- With intravenous use Avoid extravasation with intravenous injection

- **INTERACTIONS** → Appendix 1: antihistamines, sedating

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Arrhythmia · blood disorder · confusion · dizziness · drowsiness · dry mouth · headache · hypotension · jaundice · movement disorders · palpitations · photosensitivity reaction · urinary retention · vision blurred

SPECIFIC SIDE-EFFECTS

- With oral use Agranulocytosis · angle closure glaucoma · anticholinergic syndrome · anxiety · insomnia · leucopenia · nasal congestion · nausea · rash · seizure · thrombocytopenia · tinnitus · tremor · vomiting
- With parenteral use Appetite decreased · epigastric discomfort · fatigue · haemolytic anaemia · hypersensitivity · muscle spasms · nightmare · restlessness · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION Elderly patients are more susceptible to anticholinergic side-effects.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.

- **RENAL IMPAIRMENT** Use with caution.

• PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

• PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Promethazine Hydrochloride Tablets 10 mg or 25 mg may be prescribed.

Promethazine Hydrochloride Oral Solution (elixir) 5 mg/5 mL may be prescribed.

- **LESS SUITABLE FOR PRESCRIBING** Promethazine is less suitable for prescribing for sedation.
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply to promethazine

hydrochloride injection where administration is for saving life in emergency.

VACCINES > ALLERGEN-TYPE VACCINES

Bee venom extract

● INDICATIONS AND DOSE

Hypersensitivity to bee venom

- ▶ BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

DESENSITISING VACCINES

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:

- seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
- hypersensitivity to wasp and bee venoms.

Desensitising vaccines should generally be avoided or used with particular care in patients with asthma.

- **CONTRA-INDICATIONS** Consult product literature

- **CAUTIONS** Consult product literature

- **INTERACTIONS** → Appendix 1: bee venom extract

● SIDE-EFFECTS

SIDE-EFFECTS, FURTHER INFORMATION Life-threatening hypersensitivity reactions can occur. Cardiopulmonary resuscitation must be immediately available. Manufacturer advises monitoring for at least 1 hour after injection.

- **PREGNANCY** Avoid.

- **PRESCRIBING AND DISPENSING INFORMATION** Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Pharmalgen[®] for bee and wasp venom allergy** (February 2012) NICE TA246

Pharmalgen[®] is an option for the treatment of IgE-mediated bee and wasp venom allergy in those who have had:

- a severe systemic reaction to bee or wasp venom;
- a moderate systemic reaction to bee or wasp venom and who have a raised baseline serum-tryptase concentration, a high risk of future stings, or anxiety about future stings.

Treatment with **Pharmalgen[®]** should be initiated and monitored in a specialist centre experienced in venom immunotherapy.

Grass pollen extract

● INDICATIONS AND DOSE

Treatment of seasonal allergic hay fever due to grass pollen in patients who have failed to respond to anti-allergy drugs

- ▶ BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature)

Treatment of seasonal allergic hay fever due to grass pollen in patients who have failed to respond to anti-allergy drugs (initiated under specialist supervision)

- ▶ BY MOUTH
- Adult: 1 tablet daily, treatment to be started at least 4 months before start of pollen season and continue for up to 3 years

IMPORTANT SAFETY INFORMATION

DESENSITISING VACCINES

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:

- seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
- hypersensitivity to wasp and bee venoms.

Desensitising vaccines should generally be avoided or used with particular care in patients with asthma.

- **CONTRA-INDICATIONS** Consult product literature

- **CAUTIONS** Consult product literature

- **INTERACTIONS** → Appendix 1: grass pollen extract

● SIDE-EFFECTS

SIDE-EFFECTS, FURTHER INFORMATION Hypersensitivity reactions to immunotherapy can be life-threatening; bronchospasm usually develops within 1 hour and anaphylaxis within 30 minutes of injection. Therefore, cardiopulmonary resuscitation must be immediately available and patients need to be monitored for at least 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria,

bronchospasm, faintness), **even when mild**, the patient should be observed until these have resolved completely.

- **PREGNANCY** Should be avoided in pregnant women—consult product literature.
- **MONITORING REQUIREMENTS** The first dose of grass pollen extract should be (*Grazax*®) should be taken under medical supervision and the patient should be monitored for 20–30 minutes.
- **DIRECTIONS FOR ADMINISTRATION** Oral lyophilisates should be placed under the tongue and allowed to disperse. Advise patient not to swallow for 1 minute, or eat or drink for 5 minutes after taking the tablet. The first should be taken under medical supervision and the patient should be monitored for 20–30 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer oral lyophilisates.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

2.1 Angioedema

Other drugs used for Angioedema Adrenaline/epinephrine, p. 221

DRUGS USED IN HEREDITARY ANGIOEDEMA > COMPLEMENT REGULATORY PROTEINS

C1-esterase inhibitor

05-Dec-2017

● INDICATIONS AND DOSE

BERINERT®

Acute attacks of hereditary angioedema (under expert supervision)

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 20 units/kg

Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures (under expert supervision)

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1000 units for 1 dose, to be administered less than 6 hours before procedure

CINRYZE®

Acute attacks of hereditary angioedema (under expert supervision)

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 1000 units, repeated if necessary for 1 dose, dose may be repeated if necessary after 60 minutes (or sooner for patients experiencing laryngeal attacks or if treatment initiation is delayed)

Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures (under expert supervision)

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 1000 units for 1 dose, to be administered up to 24 hours before procedure

Long-term prophylaxis of severe, recurrent attacks of hereditary angioedema where acute treatment is inadequate, or when oral prophylaxis is inadequate or not tolerated (under expert supervision)

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 1000 units every 3–4 days, interval between doses to be adjusted according to response

- **CAUTIONS** Vaccination against hepatitis A and hepatitis B may be required

● SIDE-EFFECTS

- ▶ **Rare or very rare** Dizziness · dyspnoea · flushing · headache · hypersensitivity · hypertension · hypotension · nausea · tachycardia · thrombosis (with high doses) · urticaria

- **PREGNANCY** Manufacturer advises avoid unless essential.

- **PRESCRIBING AND DISPENSING INFORMATION** C1-esterase inhibitor is prepared from human plasma.

● NATIONAL FUNDING/ACCESS DECISIONS

CINRYZE®

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (October 2017) that C1-esterase inhibitor (*Cinryze*®) is recommended as an option for use within NHS Wales for the treatment and pre-procedure prevention of angioedema attacks in adults with hereditary angioedema (HAE); routine prevention of angioedema attacks in adults with severe and recurrent attacks of HAE, who are intolerant to or insufficiently protected by oral prevention treatments, or patients who are inadequately managed with repeated acute treatment.

£5.00 DT = £5.00

3.1 Cystic fibrosis

Cystic fibrosis

10-Nov-2017

Description of condition

Cystic fibrosis is a genetic disorder affecting the lungs, pancreas, liver, intestine, and reproductive organs. The main clinical signs are pulmonary disease, with recurrent infections and the production of copious viscous sputum, and malabsorption due to pancreatic insufficiency. Other complications include hepatobiliary disease, osteoporosis, cystic fibrosis-related diabetes, and distal intestinal obstruction syndrome.

Aims of treatment

The aim of treatment includes preventing and managing lung infections, loosening and removing thick, sticky mucus from the lungs, preventing or treating intestinal obstruction, and providing sufficient nutrition and hydration.

Lung function is a key predictor of life expectancy in people with cystic fibrosis and optimising lung function is a major aim of care.

Non-drug treatment

Specialist physiotherapists should assess patients with cystic fibrosis and provide advice on airway clearance, nebuliser use, musculoskeletal disorders, physical activity, and urinary incontinence. The importance of airway clearance techniques should be discussed with patients and their parents or carers or appropriate training provided. Patients should be advised that regular exercise improves both lung function and overall fitness.

Drug treatment

Treatment for cystic fibrosis lung disease is based on the prevention of lung infection and the maintenance of lung function. [EvGr](#) In patients with cystic fibrosis, who have clinical evidence of lung disease, the frequency of routine review should be based on their clinical condition, but adults should be reviewed at least every 3 months. More frequent review is required immediately after diagnosis. [A](#)

Mucolytics

[EvGr](#) Patients with cystic fibrosis who have evidence of lung disease should be offered a mucolytic. Dornase alfa p. 292 is the first choice mucolytic. If there is an inadequate response, dornase alfa and hypertonic sodium chloride p. 274, or hypertonic sodium chloride alone should be considered.

Mannitol dry powder for inhalation is recommended as an option when dornase alfa is unsuitable (because of ineligibility, intolerance, or inadequate response), when lung function is rapidly declining, and if other osmotic drugs are not considered appropriate (see Mannitol p. 294 National funding/access decisions). [A](#)

Lumacaftor with ivacaftor is not recommended for treating cystic fibrosis within its marketing authorisation (see Lumacaftor with ivacaftor p. 293 National funding/access decisions).

Pulmonary infection *Staphylococcus aureus*

[EvGr](#) Patients who are not taking prophylaxis and have a new *Staphylococcus aureus* infection can be given an oral anti-

Staph. aureus antibacterial, if they are clinically well. If they are clinically unwell and have pulmonary disease, oral or intravenous (depending on infection severity) broad-spectrum antibacterials with activity against *Staph. aureus* should be given (consult local protocol).

A long-term antibacterial should be considered to suppress **chronic *Staph. aureus*** respiratory infections in patients whose pulmonary disease is stable. In patients with chronic *Staph. aureus* respiratory infections who become clinically unwell with pulmonary disease, oral or intravenous (depending on infection severity) broad-spectrum antibacterials with activity against *Staph. aureus* should be given. In those patients with new evidence of **meticillin-resistant *Staphylococcus aureus* (MRSA)** respiratory infection (with or without pulmonary exacerbation), specialist microbiological advice should be sought.

Antibacterials should not be routinely used to suppress chronic MRSA in patients with stable pulmonary disease.

If a patient with cystic fibrosis and chronic MRSA respiratory infection becomes unwell with a pulmonary exacerbation or shows a decline in pulmonary function, specialist microbiological advice should be sought. [A](#)

Pseudomonas aeruginosa

[EvGr](#) If a patient with cystic fibrosis develops a new *Pseudomonas aeruginosa* infection, eradication therapy with a course of oral antibacterial should be started (by intravenous injection, if they are clinically unwell), in combination with an inhaled antibacterial. An extended course of oral and inhaled antibacterial should follow (consult local protocol).

If eradication therapy is not successful, sustained treatment with an inhaled antibacterial should be offered. Nebulised colistimethate sodium p. 546 should be considered as first-line treatment (but see also colistimethate sodium by dry powder inhalation p. 546 National funding/access decisions).

In patients with **chronic *Ps. aeruginosa*** infection (when treatment has not eradicated the infection) who become clinically unwell with pulmonary exacerbations, an oral antibacterial or a combination of two intravenous antibacterial drugs of different classes (depending on infection severity) should be used. Changing antibacterial regimens should be considered to treat exacerbations (consult local protocol).

Nebulised aztreonam p. 532, nebulised tobramycin, or tobramycin dry powder for inhalation (see Tobramycin p. 512 National funding/access decisions) should be considered for those who are deteriorating despite regular inhaled colistimethate sodium p. 546. [A](#)

Burkholderia cepacia complex

[EvGr](#) Patients who develop a new *Burkholderia cepacia* complex infection, should be given eradication therapy with a combination of intravenous antibacterial drugs (specialist microbiological advice should be sought on the choice of antibacterials). [A](#) There is no evidence to support using antibacterials to suppress **chronic *Burkholderia cepacia*** complex infection in patients with cystic fibrosis who have stable pulmonary status.

[EvGr](#) Specialist microbiological advice should be sought for patients with chronic *Burkholderia cepacia* complex infection (when treatment has not eradicated the infection) and who become clinically unwell with a pulmonary disease exacerbation.

An inhaled antibacterial should be considered for those who have chronic *Burkholderia cepacia* complex infection and declining pulmonary status; treatment should be stopped if there is no observed benefit. [A](#)

Haemophilus influenzae

[EvGr](#) *Haemophilus influenzae* infection in the absence of clinical evidence of pulmonary infection should be treated with an appropriate oral antibacterial drug. In those who are unwell with clinical evidence of pulmonary infection, an

appropriate antibacterial should be given by mouth or intravenously depending on the severity of the illness (consult local protocol). [A](#)

Non-tuberculous mycobacteria

[EvGr](#) Non-tuberculous mycobacterial eradication therapy should be considered for patients with cystic fibrosis who are clinically unwell and whose pulmonary disease has not responded to other recommended treatments. Specialist microbiological advice should be sought on the choice of antibacterial and on the duration of treatment. [A](#)

Aspergillus fumigatus complex

[EvGr](#) Treatment with an antifungal drug should only be considered to suppress **chronic *Aspergillus fumigatus* complex** respiratory infection in patients with declining pulmonary status. Specialist microbiological advice should be sought on the choice of antifungal drug. [A](#)

Unidentified infections

[EvGr](#) An oral or intravenous (depending on the exacerbation severity) broad-spectrum antibacterial should be used for patients who have a pulmonary disease exacerbation and no clear cause. If a causative pathogen is identified, an appropriate treatment should be selected (consult local protocol). [A](#)

Immunomodulatory drugs

[EvGr](#) Long-term treatment with azithromycin p. 528 [unlicensed indication], at an immunomodulatory dose, should be offered to patients with deteriorating lung function or repeated pulmonary exacerbations. In those patients with continued deterioration in lung function or continuing pulmonary exacerbations, long-term azithromycin should be discontinued and the use of an oral corticosteroid considered. [A](#)

Nutrition and exocrine pancreatic insufficiency

[EvGr](#) The cystic fibrosis specialist dietitian should offer advice on optimal nutrition.

Pancreatin p. 96 should be offered to patients with exocrine pancreatic insufficiency. Dose should be adjusted as needed to minimise any symptoms or signs of malabsorption (see Exocrine pancreatic insufficiency p. 95). An acid-suppressing drug, such as an H₂ receptor antagonist or a proton pump inhibitor [unlicensed indications] can be considered for patients who have persistent symptoms or signs of malabsorption.

A short-term trial of an appetite stimulant (for example up to 3 months) [unlicensed indication] can be considered in adult patients if attempts to increase calorie intake are not effective. [A](#)

Distal intestinal obstruction syndrome

[EvGr](#) Oral or intravenous fluids should be offered to ensure adequate hydration for patients with distal intestinal obstruction syndrome. Meglumine amidotrizoate with sodium amidotrizoate solution (orally or via an enteral tube) should be considered as first-line treatment for distal intestinal obstruction syndrome. An iso-osmotic polyethylene glycol and electrolyte solution (macrogols) (orally or via an enteral tube) can be considered as a second-line treatment. Surgery is a last resort, if prolonged treatment with a polyethylene glycol solution is not effective. Suspected distal intestinal obstruction syndrome should be managed in a specialist cystic fibrosis centre. [A](#)

Liver disease

[EvGr](#) If liver function blood tests are abnormal in patients with cystic fibrosis, ursodeoxycholic acid p. 89 [unlicensed indication] can be given until liver function is restored. [A](#)

Bone mineral density

[EvGr](#) Patients should be monitored for cystic fibrosis-related low bone mineral density. [A](#)

Cystic fibrosis-related diabetes

[EvGr](#) Patients should be monitored for cystic fibrosis-related diabetes. [A](#)

MUCOLYTICS

Dornase alfa

(Phosphorylated glycosylated recombinant human deoxyribonuclease 1 (rhDNase))

- **DRUG ACTION** Dornase alfa is a genetically engineered version of a naturally occurring human enzyme which cleaves extracellular deoxyribonucleic acid (DNA).

• INDICATIONS AND DOSE

Management of cystic fibrosis patients with a forced vital capacity (FVC) of greater than 40% of predicted to improve pulmonary function

► BY INHALATION OF NEBULISED SOLUTION

► Adult: 2500 units once daily, administered by jet nebuliser, patients over 21 years may benefit from twice daily dosage

DOSE EQUIVALENCE AND CONVERSION

► Dornase alfa 1000 units is equivalent to 1 mg

- **SIDE-EFFECTS** Chest pain • conjunctivitis • dyspepsia • dysphonia • dyspnoea • fever • increased risk of infection • skin reactions
- **PREGNANCY** No evidence of teratogenicity; manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount probably too small to be harmful—manufacturer advises caution.
- **DIRECTIONS FOR ADMINISTRATION** Dornase alfa is administered by inhalation using a jet nebuliser, usually once daily at least 1 hour before physiotherapy; however, alternate-day therapy may be as effective as daily treatment.

For use undiluted with jet nebulisers only; ultrasonic nebulisers are unsuitable.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Nebuliser liquid

► **Pulmozyme** (Roche Products Ltd)

Dornase alfa 1 mg per 1 ml Pulmozyme 2.5mg nebuliser liquid 2.5ml ampoules | 30 ampoule [PoM](#) £496.43 DT = £496.43

Ivacaftor

22-Mar-2017

• INDICATIONS AND DOSE

Cystic fibrosis (specialist use only)

► BY MOUTH

► Adult: 150 mg every 12 hours

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose to 150 mg twice a week with concurrent use of potent inhibitors of CYP3A4.
- Manufacturer advises reduce dose to 150 mg once daily with concurrent use of moderate inhibitors of CYP3A4.

- **CONTRA-INDICATIONS** Organ transplantation (no information available)

- **INTERACTIONS** → Appendix 1: ivacaftor

• SIDE-EFFECTS

- **Common or very common** Breast abnormalities · diarrhoea · dizziness · ear discomfort · headache · hearing impairment · rash · tympanic membrane hyperaemia
- **Uncommon** Gynaecomastia

• **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

• **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.

• HEPATIC IMPAIRMENT

Dose adjustments Max. 150 mg once daily in moderate impairment; in severe impairment, manufacturer recommends use only if potential benefit outweighs risk—starting dose 150 mg on alternate days, dosing interval adjusted according to clinical response and tolerability.

• **RENAL IMPAIRMENT** Caution in severe impairment.

• **MONITORING REQUIREMENTS** Manufacturer advises monitor liver function before treatment, every 3 months during the first year of treatment, then annually thereafter (more frequent monitoring should be considered in patients with a history of transaminase elevations).

• **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken with fat-containing food.

• **PRESCRIBING AND DISPENSING INFORMATION** Ivacaftor should be prescribed by a physician experienced in the treatment of cystic fibrosis.

• **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer ivacaftor tablets. **Driving and skilled tasks** Manufacturer advises that patients and their carers should be counselled on the effects on driving and skilled tasks—increased risk of dizziness.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2016) that ivacaftor (*Kalydeco*®) is **not** recommended for use within NHS Scotland for the treatment of patients with cystic fibrosis aged 18 years and above who have an R117H mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene, as insufficient clinical and economic evidence was submitted.

All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (October 2017) that ivacaftor (*Kalydeco*®) is recommended for restricted use within NHS Wales for the treatment of adults with cystic fibrosis (CF) who have an R117H mutation in the CF transmembrane conductance regulator (CFTR) gene. This recommendation will apply only when people are treated in line with the relevant Welsh clinical access policy **and** only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 25

Ivacaftor 150 mg Kalydeco 150mg tablets | 56 tablet [POM]
£14,000.00

Lumacaftor with ivacaftor

22-Nov-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, ivacaftor p. 292.

• INDICATIONS AND DOSE

Treatment of cystic fibrosis in patients who are homozygous for the F508del mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene (under expert supervision)

- **BY MOUTH**
- **Adult:** 400/250 mg every 12 hours

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce initial dose to 200/125 mg daily for the first week in those also taking a potent inhibitor of CYP3A4.

DOSE EQUIVALENCE AND CONVERSION

- Dose expressed as x/y mg of lumacaftor/ivacaftor.

• **CAUTIONS** Forced expiratory volume in 1 second (FEV₁) less than 40% of the predicted normal value—additional monitoring required at initiation of treatment · pulmonary exacerbation—no information available

• **INTERACTIONS** → Appendix 1: ivacaftor · lumacaftor

• SIDE-EFFECTS

- **Common or very common** Breast abnormalities · diarrhoea · dizziness · ear discomfort · flatulence · headache · hearing impairment · menstrual cycle irregularities · nausea · rash · tympanic membrane hyperaemia · vomiting
- **Uncommon** Gynaecomastia · hepatic encephalopathy · hepatitis cholestatic · hypertension
- **Frequency not known** Cataract · chest pain

• **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

• **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in severe impairment.

Dose adjustments Manufacturer advises reduce dose to 400/250 mg in the morning and 200/125 mg in the evening (600/375 mg total daily dose) in moderate impairment; reduce dose to 200/125 mg every 12 hours (400/250 mg total daily dose) in severe impairment.

• **PRE-TREATMENT SCREENING** If the patient's genotype is unknown, a validated genotyping method should be performed to confirm the presence of the F508del mutation on both alleles of the CFTR gene before starting treatment.

• **MONITORING REQUIREMENTS** Manufacturer advises monitor blood pressure periodically during treatment.

• **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken with fat-containing food.

• **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tablets.

Missed doses Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Lumacaftor with ivacaftor for treating cystic fibrosis homozygous for the F508del mutation (July 2016)** NICE TA398 Lumacaftor with ivacaftor is **not** recommended, within its marketing authorisation, for treating cystic fibrosis in patients who are homozygous for the F508del mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene.

Patients whose treatment was started before this guidance was published may continue treatment until they (or their carers) and their clinician consider it appropriate to stop.

www.nice.org.uk/TA398

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2016) that lumacaftor with ivacaftor (*Orkambi*®) is **not** recommended within NHS Scotland for the treatment of cystic fibrosis in patients who are homozygous for the F508del mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Mannitol**INDICATIONS AND DOSE****Treatment of cystic fibrosis as an add-on therapy to standard care**

► BY INHALATION OF POWDER

► Adult: Maintenance 400 mg twice daily, an initiation dose assessment must be carried out under medical supervision, for details of the initiation dose regimen, consult product literature

● **CONTRA-INDICATIONS** Bronchial hyperresponsiveness to inhaled mannitol · impaired lung function (forced expiratory volume in 1 second < 30% of predicted) · non-CF bronchiectasis

● **CAUTIONS** Asthma · haemoptysis

SIDE-EFFECTS

► **Common or very common** Chest discomfort · condition aggravated · cough · haemoptysis · headache · respiratory disorders · throat complaints · vomiting
► **Uncommon** Abdominal pain upper · appetite decreased · asthma · burping · cold sweat · cystic fibrosis related diabetes · dehydration · diarrhoea · dizziness · dysphonia · dyspnoea · ear pain · fatigue · fever · gastrointestinal disorders · hypoxia · increased risk of infection · influenza like illness · insomnia · joint disorders · malaise · morbid thoughts · nausea · odynophagia · oral disorders · pain · rhinorrhoea · skin reactions · sputum discolouration · urinary incontinence

● **PREGNANCY** Manufacturer advises avoid.

● **BREAST FEEDING** Manufacturer advises avoid.

● **PRE-TREATMENT SCREENING** Patients must be assessed for bronchial hyperresponsiveness to inhaled mannitol before starting the therapeutic dose regimen; an initiation dose assessment must be carried out under medical supervision—for details of the initiation dose regimen, consult product literature.

● **DIRECTIONS FOR ADMINISTRATION** The dose should be administered 5–15 minutes after a bronchodilator and before physiotherapy; the second daily dose should be taken 2–3 hours before bedtime.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer mannitol inhalation powder.

NATIONAL FUNDING/ACCESS DECISIONS**NICE decisions**

► **Mannitol dry powder for inhalation for treating cystic fibrosis (November 2012)** NICE TA266
Mannitol dry powder for inhalation is recommended as an option for treating cystic fibrosis in adults:
● who cannot use dornase alfa (rhDNase) because of ineligibility, intolerance or inadequate response to dornase alfa (rhDNase), and

- whose lung function is rapidly declining (forced expiratory volume in 1 second decline greater than 2% annually), and
- for whom other osmotic agents are not considered appropriate.

www.nice.org.uk/TA266

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium*, has advised (November 2013) that mannitol (*Bronchitol*®) is accepted for restricted use within NHS Scotland for the treatment of cystic fibrosis in adults aged 18 years and over as an add-on therapy to best standard of care. Mannitol is restricted to patients who are not currently using dornase alfa due to lack of response, intolerance, or ineligibility and have rapidly declining lung function and in whom other osmotic agents are considered unsuitable.

MEDICINAL FORMS

Bronchitol 40mg inhalation powder capsules with device | 10 capsule [PoM] [S]

4 Cough and congestion**Aromatic inhalations, cough preparations and systemic nasal decongestants****Aromatic inhalations in adults**

Inhalations containing volatile substances such as eucalyptus oil are traditionally used and although the vapour may contain little of the additive it encourages deliberate inspiration of warm moist air which is often comforting in bronchitis; boiling water should not be used owing to the risk of scalding. In practice, inhalations are also used for the relief of nasal obstruction in acute rhinitis or sinusitis.

Cough preparations in adults**Cough suppressants**

Cough may be a symptom of an underlying disorder, such as asthma, gastro-oesophageal reflux disease, or rhinitis, which should be addressed before prescribing cough suppressants. Cough may be a side-effect of another drug, such as an ACE inhibitor, or it can be associated with smoking or environmental pollutants. Cough can also have a significant habit component. When there is no identifiable cause, cough suppressants may be useful, for example if sleep is disturbed. They may cause sputum retention and this may be harmful in patients with chronic bronchitis and bronchiectasis.

Codeine phosphate p. 448 may be effective but it is constipating and can cause dependence;
dextromethorphan and **pholcodine** p. 295 have fewer side-effects.

Sedating antihistamines are used as the cough suppressant component of many compound cough

preparations on sale to the public; all tend to cause drowsiness which may reflect their main mode of action.

Palliative care

Diamorphine hydrochloride p. 449 and methadone hydrochloride p. 495 have been used to control distressing cough in terminal lung cancer although morphine p. 456 is now preferred. In other circumstances they are contra-indicated because they induce sputum retention and ventilatory failure as well as causing opioid dependence. Methadone hydrochloride linctus should be avoided because it has a long duration of action and tends to accumulate.

Demulcent and expectorant cough preparations

Demulcent cough preparations contain soothing substances such as syrup or glycerol and some patients believe that such preparations relieve a dry irritating cough. Preparations such as **simple linctus** have the advantage of being harmless and inexpensive; **paediatric simple linctus** is particularly useful in children.

Expectorants are claimed to promote expulsion of bronchial secretions, but there is no evidence that any drug can specifically facilitate expectoration.

Compound preparations are on sale to the public for the treatment of cough and colds but should not be used in children under 6 years; the rationale for some is dubious. Care should be taken to give the correct dose and to not use more than one preparation at a time.

Nasal decongestants, systemic

Nasal decongestants for administration by mouth may not be as effective as preparations for local application but they do not give rise to rebound nasal congestion on withdrawal. Pseudoephedrine hydrochloride p. 1167 is available over the counter; it has few sympathomimetic effects.

Aromatic inhalations in children

The use of strong aromatic decongestants (applied as rubs or to pillows) is not advised for infants under the age of 3 months. Carers of young infants in whom nasal obstruction with mucus is a problem can readily be taught appropriate techniques of suction aspiration but sodium chloride 0.9% p. 1008 given as nasal drops is preferred; administration before feeds may ease feeding difficulties caused by nasal congestion.

Cough preparations in children

The use of over-the-counter cough suppressants containing codeine phosphate should be avoided in children under 12 years and in children of any age known to be CYP2D6 ultra-rapid metabolisers. Cough suppressants containing similar opioid analgesics such as dextromethorphan and pholcodine are not generally recommended in children and should be avoided in children under 6 years.

MHRA/CHM advice (March 2008 and February 2009)

Children under 6 years should not be given over-the-counter cough and cold medicines containing the following ingredients:

- brompheniramine, chlorphenamine maleate p. 283, diphenhydramine, doxylamine, promethazine, or triprolidine (antihistamines);
- dextromethorphan or pholcodine (cough suppressants);
- guaifenesin or ipecacuanha (expectorants);
- Phenylephrine hydrochloride p. 188, pseudoephedrine hydrochloride, ephedrine hydrochloride p. 271, oxymetazoline, or xylometazoline hydrochloride p. 1167 (decongestants).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to five days or less. Children should not be given more than 1 cough or cold preparation at a time because

different brands may contain the same active ingredient; care should be taken to give the correct dose.

COUGH AND COLD PREPARATIONS > COUGH SUPPRESSANTS

Pholcodine

• INDICATIONS AND DOSE

Dry cough

- ▶ BY MOUTH USING LINCTUS
- ▶ Child 6–11 years: 2–5 mg 3–4 times a day
- ▶ Child 12–17 years: 5–10 mg 3–4 times a day
- ▶ Adult: 5–10 mg 3–4 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN

Children under 6 years should not be given over-the-counter cough and cold medicines containing pholcodine (cough suppressant).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to 5 days or less. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

- **CONTRA-INDICATIONS** Bronchiectasis • bronchiolitis (in children) • chronic bronchitis • chronic obstructive pulmonary disease (in adults) • patients at risk of respiratory failure
- **CAUTIONS** Asthma • chronic cough • persistent cough • productive cough
- **INTERACTIONS** → Appendix 1: pholcodine
- **SIDE-EFFECTS** Agitation • confusion • constipation • dizziness • drowsiness • gastrointestinal disorder • nausea • skin reactions • sputum retention • vomiting
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **HEPATIC IMPAIRMENT** Avoid in hepatic impairment.
- **RENAL IMPAIRMENT** Use with caution in renal impairment. Avoid in severe renal impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Pholcodine is not generally recommended for children.
Flavours of oral liquid formulations may include orange. When prepared extemporaneously, the BP states Pholcodine Linctus, BP consists of pholcodine 5 mg/5 mL in a suitable flavoured vehicle, containing citric acid monohydrate 1% and Pholcodine Linctus, Strong, BP consists of pholcodine 10 mg/5 mL in a suitable flavoured vehicle, containing citric acid monohydrate 2%

COUGH AND COLD PREPARATIONS > OTHER

Citric acid

(Formulated as Simple Linctus)

● INDICATIONS AND DOSE

Cough

- ▶ **BY MOUTH**
- ▶ **Adult:** 5 mL 3–4 times a day, this dose is for Simple Linctus, BP (2.5%)
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include anise.
When prepared extemporaneously, the BP states Simple Linctus, BP consists of citric acid monohydrate 2.5%, in a suitable vehicle with an anise flavour.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

- ▶ **Citric acid (Non-proprietary)**
Citric acid monohydrate 25 mg per 1 ml Simple linctus sugar free sugar-free | 200 ml | GSL | £1.25 DT = £0.92 sugar-free | 2000 ml | GSL | £9.20
Simple linctus | 200 ml | GSL | £0.96 DT = £0.93

MENTHOL AND DERIVATIVES

Eucalyptus with menthol

● INDICATIONS AND DOSE

Aromatic inhalation for relief of nasal congestion

- ▶ **BY INHALATION**
- ▶ **Adult:** Add one teaspoonful to a pint of hot, **not** boiling, water and inhale the vapour
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Menthol and Eucalyptus Inhalation, BP 1980 consists of racementhol or levomenthol 2 g, eucalyptus oil 10 mL, light magnesium carbonate 7 g, water to 100 mL.
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary
Menthol and Eucalyptus Inhalation BP, 1980 may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation vapour

- ▶ **Eucalyptus with menthol (Non-proprietary)**
Menthol 20 mg per 1 ml, Magnesium carbonate light 70 mg per 1 ml, Eucalyptus oil 100 microlitre per 1 ml Menthol and Eucalyptus inhalation | 100 ml | GSL | £1.38–£1.39 DT = £1.38

RESINS

Benzoin tincture

(Friars' Balsam)

● INDICATIONS AND DOSE

Aromatic inhalation for relief of nasal congestion

- ▶ **BY INHALATION**
- ▶ **Child:** Add 5 mL to a pint of hot, **not** boiling, water and inhale the vapour; repeat after 4 hours if necessary
- ▶ **Adult:** Add 5 mL to a pint of hot, **not** boiling, water and inhale the vapour; repeat after 4 hours if necessary

● SIDE-EFFECTS

Skin sensitisation

● PRESCRIBING AND DISPENSING INFORMATION

Not recommended (applied as a rub or to pillows) for infants under 3 months.
When prepared extemporaneously, the BP states Benzoin Tincture, Compound, BP consists of balsamic acids approx. 4.5%.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Liquid

CAUTIONARY AND ADVISORY LABELS 15

▶ Benzoin tincture (Non-proprietary)

Balsamic acids 16.5 mg per 1 ml Benzoin tincture | 500 ml | GSL

5 Idiopathic pulmonary fibrosis

Other drugs used for Idiopathic pulmonary fibrosis

Nintedanib, p. 960

ANTIFIBROTICS

Pirfenidone

06-Jul-2017

- **DRUG ACTION** The exact mechanism of action of pirfenidone is not yet understood, but it is believed to slow down the progression of idiopathic pulmonary fibrosis by exerting both antifibrotic and anti-inflammatory properties.

● INDICATIONS AND DOSE

Treatment of mild to moderate idiopathic pulmonary fibrosis (initiated under specialist supervision)

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 267 mg 3 times a day for 7 days, then increased to 534 mg 3 times a day for 7 days, then increased to 801 mg 3 times a day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Caution with concomitant use with ciprofloxacin—reduce dose of pirfenidone to 534 mg three times daily with high-dose ciprofloxacin (750 mg twice daily).

● CONTRA-INDICATIONS

Cigarette smoking

● CAUTIONS

CAUTIONS, FURTHER INFORMATION

- ▶ **Photosensitivity** Avoid exposure to direct sunlight—if photosensitivity reaction or rash occurs, dose adjustment or treatment interruption may be required (consult product literature).
- ▶ **Treatment interruption** If treatment is interrupted for 14 consecutive days or more, the initial 2 week titration regimen should be repeated; if treatment is interrupted for

less than 14 consecutive days, the dose can be resumed at the previous daily dose without titration.

● **INTERACTIONS** → Appendix 1: pirfenidone

● **SIDE-EFFECTS**

- ▶ **Common or very common** Appetite decreased · arthralgia · asthenia · constipation · cough · diarrhoea · dizziness · drowsiness · dyspnoea · gastrointestinal discomfort · gastrointestinal disorders · headache · hot flush · increased risk of infection · insomnia · musculoskeletal chest pain · myalgia · nausea · photosensitivity reaction · skin reactions · sunburn · taste altered · vomiting · weight decreased
 - ▶ **Uncommon** Angioedema
 - ▶ **Rare or very rare** Agranulocytosis
- SIDE-EFFECTS, FURTHER INFORMATION** Gastrointestinal side-effects may require dose reduction or treatment interruption—consult product literature.

● **PREGNANCY** Manufacturer advises avoid—no information available.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Use with caution in mild to moderate hepatic impairment, particularly if concomitant use of CYP1A2 inhibitors. Avoid use in severe hepatic impairment.

● **RENAL IMPAIRMENT** Avoid use if eGFR less than 30 mL/minute/1.73 m².

● **MONITORING REQUIREMENTS**

- ▶ Monitor for weight loss.
- ▶ Test liver function before treatment, then at monthly intervals for the next 6 months, and then every 3 months thereafter; review if abnormal liver function tests—dose reduction, treatment interruption or discontinuation may be required (consult product literature).

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks Dizziness or malaise may affect performance of skilled tasks (e.g. driving).

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Pirfenidone for treating idiopathic pulmonary fibrosis (February 2018)** NICE TA504
Pirfenidone is recommended as an option for treating idiopathic pulmonary fibrosis in adults only if:
 - the patient has a forced vital capacity (FVC) between 50% and 80% predicted, **and**
 - the manufacturer provides pirfenidone with the discount agreed in the patient access scheme, **and**
 - treatment is stopped if there is evidence of disease progression (an absolute decline of 10% or more in predicted FVC within any 12-month period).

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta504

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (August 2013) that pirfenidone is accepted for restricted use within NHS Scotland for the treatment of mild to moderate idiopathic pulmonary fibrosis. Pirfenidone is restricted for use in patients with a predicted forced vital capacity less than or equal to 80%, and only whilst pirfenidone is available at the price agreed in the patient access scheme.

6 Respiratory depression, respiratory distress syndrome and apnoea

Respiratory stimulants

Overview

Respiratory stimulants (analeptic drugs) have a limited place in the treatment of ventilatory failure in patients with chronic obstructive pulmonary disease. They are effective only when given by intravenous injection or infusion and have a short duration of action. Their use has largely been replaced by ventilatory support including nasal intermittent positive pressure ventilation. However, occasionally when ventilatory support is contra-indicated and in patients with hypercapnic respiratory failure who are becoming drowsy or comatose, respiratory stimulants in the short term may arouse patients sufficiently to co-operate and clear their secretions.

Respiratory stimulants can also be harmful in respiratory failure since they stimulate non-respiratory as well as respiratory muscles. They should only be given under **expert supervision** in hospital and must be combined with active physiotherapy. There is at present no oral respiratory stimulant available for long-term use in chronic respiratory failure.

RESPIRATORY STIMULANTS

Doxapram hydrochloride

● **INDICATIONS AND DOSE**

Postoperative respiratory depression

▶ **INITIALLY BY INTRAVENOUS INJECTION**

- ▶ **Adult:** Initially 1–1.5 mg/kg, to be administered over at least 30 seconds, repeated if necessary after intervals of one hour, alternatively (by intravenous infusion) 2–3 mg/minute, adjusted according to response

Acute respiratory failure

▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult:** 1.5–4 mg/minute, adjusted according to response, to be given concurrently with oxygen and whenever possible monitor with frequent measurement of blood gas tensions

● **CONTRA-INDICATIONS** Cerebral oedema · cerebrovascular accident · coronary artery disease · epilepsy and other convulsive disorders · hyperthyroidism · physical obstruction of respiratory tract · severe hypertension · status asthmaticus

● **CAUTIONS** Give with beta₂ agonist in bronchoconstriction · give with oxygen in severe irreversible airways obstruction

or severely decreased lung compliance (because of increased work load of breathing) · hypertension · impaired cardiac reserve · phaeochromocytoma

- **INTERACTIONS** → Appendix 1: doxapram
- **SIDE-EFFECTS** Arrhythmias · chest discomfort · confusion · cough · dizziness · dyspnoea · fever · flushing · hallucination · headache · hyperhidrosis · movement disorders · nausea · neuromuscular dysfunction · oral disorders · perineal warmth · reflexes abnormal · respiratory disorders · seizure · urinary disorders · vomiting
- **PREGNANCY** No evidence of harm, but manufacturer advises avoid unless benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS** Frequent arterial blood gas and pH measurements are necessary during treatment to ensure correct dosage.

1 Dementia

Dementia

27-Sep-2016

Description of condition

Dementia is a progressive and largely irreversible clinical syndrome that is characterised by a widespread impairment of mental function. There are a number of conditions that cause the symptoms of dementia. Alzheimer's disease accounts for most cases; other common causes include vascular dementia (due to cerebrovascular disease) and dementia with Lewy bodies. The symptoms of dementia include cognitive dysfunction (such as problems with memory, concentration and problem-solving), non-cognitive symptoms (such as psychiatric and behavioural problems) and difficulties with activities of daily living.

Aims of treatment

The aims of treatment are to promote independence, maintain function and treat symptoms.

Non-drug treatment

EvGr Patients with all types of *mild-to-moderate* dementia presenting with **cognitive symptoms** should be given the opportunity to participate in a structured group cognitive stimulation programme. 

Drug treatment

Management of cognitive symptoms

EvGr When pharmacological treatments are used, they should be initiated and supervised by a specialist experienced in the management of dementia.  The manufacturers of donepezil hydrochloride p. 300, galantamine p. 301, rivastigmine p. 302 and memantine hydrochloride p. 303 recommend that treatment should be reassessed on a regular basis.

EvGr Treatment should be continued only when it is considered to be having a worthwhile effect on symptoms.

Donepezil hydrochloride, galantamine and rivastigmine (acetylcholinesterase inhibitors) are recommended for the treatment of cognitive symptoms of *mild-to-moderate* dementia due to Alzheimer's disease. Memantine

hydrochloride is a suitable alternative for patients with *moderate* Alzheimer's disease when acetylcholinesterase inhibitors are contra-indicated or are not tolerated. Memantine hydrochloride is the drug of choice for patients with *severe* Alzheimer's disease.

Pharmacological treatments are **not** recommended for the treatment of cognitive symptoms in cases of vascular dementia. 

Management of non-cognitive symptoms

EvGr Patients with dementia who develop non-cognitive symptoms (such as delusions or anxiety) or 'behaviour that challenges' (such as aggression or agitation) should only be offered a pharmacological intervention if they are severely distressed or if there is an immediate risk of harm to the patient or others. Less severe non-cognitive symptoms are treated with non-pharmacological interventions, such as multisensory stimulation or aromatherapy. 

Antipsychotic drugs

EvGr Patients with *mild-to-moderate* non-cognitive symptoms due to Alzheimer's disease, vascular dementia, mixed dementias or dementia with Lewy bodies should **not** be prescribed antipsychotic drugs.

Patients with *severe* non-cognitive symptoms due to Alzheimer's disease, vascular dementia, mixed dementias or dementia with Lewy bodies which are causing significant distress can be offered treatment with an antipsychotic drug (see *Antipsychotic drugs* under Psychoses and related disorders p. 377). Careful consideration should be given to the patient's co-morbid conditions and the benefits and risks of treatment.  The MHRA has reported (2009) a clear increased risk of stroke and a small increased risk of death when antipsychotic drugs are used in elderly patients with dementia. The balance of risks and benefits should be carefully assessed, including any previous history of stroke or transient ischaemic attack and any risk factors for cerebrovascular disease including hypertension, diabetes, smoking and atrial fibrillation.

EvGr Treatment with antipsychotic drugs should be started with a low dose and titrated upwards, with regular review. In patients who have dementia with Lewy bodies, careful monitoring for severe untoward reactions, such as neuroleptic sensitivity reactions, is recommended. 

Acetylcholinesterase inhibitors and memantine

EvGr An acetylcholinesterase inhibitor may be used to manage non-cognitive symptoms in patients with *mild-to-moderate* dementia due to Alzheimer's disease, if a non-pharmacological approach or an antipsychotic drug is inappropriate or ineffective.

Memantine hydrochloride may be considered in patients with *severe* symptoms, if a non-pharmacological approach or an antipsychotic drug is inappropriate or ineffective. Memantine hydrochloride may also be used in patients with *moderate* symptoms in whom acetylcholinesterase inhibitors are contra-indicated.

Patients who have dementia with Lewy bodies should be offered an acetylcholinesterase inhibitor for the treatment of non-cognitive symptoms. Acetylcholinesterase inhibitors are **not** recommended in patients with vascular dementia.

**Management of violence, aggression, and extreme agitation**

EvGr In cases of dementia associated with severe behavioural disturbance that requires urgent treatment (if violence, aggression and extreme agitation threaten the safety of the patient or others), an antipsychotic drug or a benzodiazepine may be given (see *Antipsychotic drugs* under Psychoses and related disorders p. 377; see *Benzodiazepines* under Hypnotics and anxiolytics p. 477). High doses or combinations of drugs should be avoided, and the lowest effective dose should be used. Oral treatment should be offered before parenteral administration. If intramuscular administration is needed for behavioural control, lorazepam p. 335, haloperidol p. 382 or olanzapine p. 394 should be used. Diazepam and chlorpromazine hydrochloride are **not** recommended. Intravenous administration should be used only in exceptional circumstances.

ANTICHOLINESTERASES > CENTRALLY ACTING**Donepezil hydrochloride**

26-Sep-2016

- **DRUG ACTION** Donepezil is a reversible inhibitor of acetylcholinesterase.

● **INDICATIONS AND DOSE****Mild to moderate dementia in Alzheimer's disease**

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 5 mg once daily for one month, then increased if necessary up to 10 mg daily, doses to be given at bedtime

- **CAUTIONS** Asthma · chronic obstructive pulmonary disease · sick sinus syndrome · supraventricular conduction abnormalities · susceptibility to peptic ulcers

- **INTERACTIONS** → Appendix 1: anticholinesterases, centrally acting

● **SIDE-EFFECTS**

- ▶ **Common or very common** Aggression · agitation · appetite decreased · common cold · diarrhoea · dizziness · fatigue · gastrointestinal disorders · hallucination · headache · injury · muscle cramps · nausea · pain · skin reactions · sleep disorders · syncope · urinary incontinence · vomiting
- ▶ **Uncommon** Bradycardia · gastrointestinal haemorrhage · hypersalivation · seizure

- ▶ **Rare or very rare** Cardiac conduction disorders · extrapyramidal symptoms · hepatic disorders · neuroleptic malignant syndrome · rhabdomyolysis

SIDE-EFFECTS, FURTHER INFORMATION Dose should be started low and increased if tolerated and necessary.

- **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. No information available for severe impairment.
- **DIRECTIONS FOR ADMINISTRATION** Donepezil orodispersible tablet should be placed on the tongue, allowed to disperse, and swallowed.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer donepezil hydrochloride orodispersible tablets.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer's disease—updated May 2016

NICE TA217

Donepezil can be used for the treatment of mild to moderate Alzheimer's disease. Treatment should only be prescribed under the following conditions:

- treatment should be initiated on the advice of a specialist
- ensure that local arrangements for prescribing, supply and treatment review follow the NICE guideline on medicines optimisation
- treatment should continue only if it is considered to have a worthwhile effect on cognitive, global, functional, or behavioural symptoms.

Healthcare professionals should not rely solely on assessment scales to determine the severity of Alzheimer's disease when the patient has learning or other disabilities, or other communication difficulties.

www.nice.org.uk/TA217

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Oral solution

- ▶ **Donepezil hydrochloride (Non-proprietary)**

Donepezil hydrochloride 1 mg per 1 ml Donepezil 1mg/ml oral solution sugar free sugar-free | 150 ml **[PoM]** £48.00 DT = £48.00

- ▶ **Aricept** (Eisai Ltd)

Donepezil hydrochloride 5 mg Aricept 5mg tablets | 28 tablet **[PoM]** £59.85 DT = £0.52

Donepezil hydrochloride 10 mg Aricept 10mg tablets | 28 tablet **[PoM]** £83.89 DT = £0.76

Galantamine

26-Sep-2016

- **DRUG ACTION** Galantamine is a reversible inhibitor of acetylcholinesterase and it also has nicotinic receptor agonist properties.

● INDICATIONS AND DOSE

Mild to moderately severe dementia in Alzheimer's disease

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ **Adult:** Initially 4 mg twice daily for 4 weeks, increased to 8 mg twice daily for at least 4 weeks; maintenance 8–12 mg twice daily
- ▶ **BY MOUTH USING MODIFIED-RELEASE CAPSULES**
- ▶ **Adult:** Initially 8 mg once daily for 4 weeks, increased to 16 mg once daily for at least 4 weeks; maintenance 16–24 mg daily

- **CAUTIONS** Avoid in gastro-intestinal obstruction · avoid in urinary outflow obstruction · avoid whilst recovering from bladder surgery · avoid whilst recovering from gastro-intestinal surgery · cardiac disease · chronic obstructive pulmonary disease · congestive heart failure · electrolyte disturbances · history of seizures · history of severe asthma · pulmonary infection · sick sinus syndrome · supraventricular conduction abnormalities · susceptibility to peptic ulcers · unstable angina

- **INTERACTIONS** → Appendix 1: anticholinesterases, centrally acting

● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · arrhythmias · asthenia · depression · diarrhoea · dizziness · drowsiness · fall · gastrointestinal discomfort · hallucinations · headache · hypertension · malaise · muscle spasms · nausea · skin reactions · syncope · tremor · vomiting · weight decreased
- ▶ **Uncommon** Atrioventricular block · dehydration · flushing · hyperhidrosis · hypersomnia · hypotension · muscle weakness · palpitations · paraesthesia · seizure · taste altered · tinnitus · vision blurred
- ▶ **Rare or very rare** Hepatitis · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises increasing dose according to response and tolerability.

Serious skin reactions Serious skin reactions (including Stevens-Johnson syndrome and acute generalized exanthematous pustulosis) have been reported—manufacturer advises discontinue at the first appearance of skin rash.

- **PREGNANCY** Use with caution—toxicity in *animal* studies.

- **BREAST FEEDING** Avoid—no information available.

● HEPATIC IMPAIRMENT

Dose adjustments For *immediate-release* preparations in moderate impairment, initially 4 mg once daily (preferably in the morning) for at least 7 days, then 4 mg twice daily for at least 4 weeks; max. 8 mg twice daily; avoid in severe impairment.

For *modified-release* preparations in moderate impairment, initially 8 mg on alternate days (preferably in the morning) for 7 days, then 8 mg once daily for 4 weeks; max. 16 mg daily; avoid in severe impairment.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 9 mL/minute/1.73 m².

- **PATIENT AND CARER ADVICE** Manufacturer recommends that patients are warned of the signs of serious skin reactions; they should be advised to stop taking galantamine immediately and seek medical advice if symptoms occur.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer's disease—updated May 2016 NICE TA217

Galantamine can be used for the treatment of mild to moderate Alzheimer's disease. Treatment should only be prescribed under the following conditions:

- treatment should be initiated on the advice of a specialist
- ensure that local arrangements for prescribing, supply and treatment review follow the NICE guideline on medicines optimisation
- treatment should continue only if it is considered to have a worthwhile effect on cognitive, global, functional, or behavioural symptoms.

Healthcare professionals should not rely solely on assessment scales to determine the severity of Alzheimer's disease when the patient has learning or other disabilities, or other communication difficulties.

Rivastigmine

26-Sep-2016

- **DRUG ACTION** Rivastigmine is a reversible non-competitive inhibitor of acetylcholinesterases.

● INDICATIONS AND DOSE**Mild to moderate dementia in Alzheimer's disease**▶ **BY MOUTH**

- ▶ **Adult:** Initially 1.5 mg twice daily, increased in steps of 1.5 mg twice daily, dose to be increased at intervals of at least 2 weeks according to response and tolerance; usual dose 3–6 mg twice daily (max. per dose 6 mg twice daily), if treatment interrupted for more than several days, retitrate from 1.5 mg twice daily

▶ **BY TRANSDERMAL APPLICATION USING PATCHES**

- ▶ **Adult:** Apply 4.6 mg/24 hours daily for at least 4 weeks, increased if tolerated to 9.5 mg/24 hours daily for a further 6 months, then increased if necessary to 13.3 mg/24 hours daily, increase to 13.3 mg/24 hours patch if well tolerated and cognitive deterioration or functional decline demonstrated; use caution in patients with body-weight less than 50 kg, if treatment interrupted for more than 3 days, retitrate from 4.6 mg/24 hours patch

Mild to moderate dementia in Parkinson's disease▶ **BY MOUTH**

- ▶ **Adult:** Initially 1.5 mg twice daily, increased in steps of 1.5 mg twice daily, dose to be increased at intervals of at least 2 weeks according to response and tolerance; usual dose 3–6 mg twice daily (max. per dose 6 mg twice daily), if treatment interrupted for more than several days, retitrate from 1.5 mg twice daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ When switching from oral to transdermal therapy, patients taking 3–6 mg by mouth daily should initially switch to 4.6 mg/24 hours patch, then titrate as above. Patients taking 9 mg by mouth daily should switch to 9.5 mg/24 hours patch if oral dose stable and well tolerated; if oral dose not stable or well tolerated, patients should switch to 4.6 mg/24 hours patch, then titrate as above. Patients taking 12 mg by mouth daily should switch to 9.5 mg/24 hours patch. The first patch should be applied on the day following the last oral dose

- **CAUTIONS** Bladder outflow obstruction · conduction abnormalities · duodenal ulcers · gastric ulcers · history of asthma · history of chronic obstructive pulmonary disease · history of seizures · risk of fatal overdose with patch administration errors · sick sinus syndrome · susceptibility to ulcers
- **INTERACTIONS** → Appendix 1: anticholinesterases, centrally acting
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · appetite decreased · arrhythmias · asthenia · dehydration · depression · diarrhoea · dizziness · drowsiness · fall · gastrointestinal discomfort · headache · hyperhidrosis · hypersalivation · hypertension · movement disorders · nausea · skin reactions · syncope · tremor · urinary incontinence · urinary tract infection · vomiting · weight decreased
- ▶ **Uncommon** Aggression · atrioventricular block
- ▶ **Rare or very rare** Pancreatitis · seizure
- ▶ **Frequency not known** Hepatitis

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With oral use Confusion · gait abnormal · hallucinations · malaise · parkinsonism · sleep disorders
- ▶ **Uncommon**
- ▶ With oral use Hypotension
- ▶ With transdermal use Gastric ulcer
- ▶ **Rare or very rare**
- ▶ With oral use Angina pectoris · gastrointestinal disorders · gastrointestinal haemorrhage
- ▶ **Frequency not known**
- ▶ With transdermal use Hallucination · nightmare

SIDE-EFFECTS, FURTHER INFORMATION Dose should be started low and increased according to response if tolerated.

Treatment should be interrupted if dehydration resulting from prolonged vomiting or diarrhoea occurs and withheld until resolution—retitrate dose if necessary. Transdermal administration less likely to cause side-effects.

- **HEPATIC IMPAIRMENT** Use with caution in severe impairment—no information available.
Dose adjustments Titrate according to individual tolerability in mild to moderate impairment.
- **RENAL IMPAIRMENT**
Dose adjustments Titrate according to individual tolerability.
- **MONITORING REQUIREMENTS** Monitor body-weight.

● DIRECTIONS FOR ADMINISTRATION

- With transdermal use Apply patches to clean, dry, non-hairy, non-irritated skin on back, upper arm, or chest, removing after 24 hours and siting a replacement patch on a different area (avoid using the same area for 14 days).

● PATIENT AND CARER ADVICE

EXELON® PATCHES Advise patients and carers of patch administration instructions, particularly to remove the previous day's patch before applying the new patch—consult product literature.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer's disease—updated May 2016 NICE TA217

Rivastigmine can be used for the treatment of mild to moderate Alzheimer's disease. Treatment should only be prescribed under the following conditions:

- treatment should be initiated on the advice of a specialist
- ensure that local arrangements for prescribing, supply and treatment review follow the NICE guideline on medicines optimisation
- treatment should continue only if it is considered to have a worthwhile effect on cognitive, global, functional, or behavioural symptoms.

Healthcare professionals should not rely solely on assessment scales to determine the severity of Alzheimer's disease when the patient has learning or other disabilities, or other communication difficulties.

www.nice.org.uk/TA217

EXELON® PATCHES

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2007) that *Exelon®* patches should be restricted for use in patients with moderately severe Alzheimer's disease under the conditions of the NICE guidance (September 2007) and when a transdermal patch is an appropriate choice of formulation.

DOPAMINERGIC DRUGS > NMDA RECEPTOR ANTAGONISTS

Memantine hydrochloride

22-Nov-2016

- DRUG ACTION** Memantine is a glutamate receptor antagonist.

● INDICATIONS AND DOSE

Moderate to severe dementia in Alzheimer's disease

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 5 mg once daily, then increased in steps of 5 mg every week; usual maintenance 20 mg daily; maximum 20 mg per day

- **CAUTIONS** Epilepsy · history of convulsions · risk factors for epilepsy
- **INTERACTIONS** → Appendix 1: memantine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Balance impaired · constipation · dizziness · drowsiness · dyspnoea · headache · hypersensitivity · hypertension
 - ▶ **Uncommon** Confusion · embolism and thrombosis · fatigue · fungal infection · hallucination · heart failure · vomiting
 - ▶ **Rare or very rare** Seizure
 - ▶ **Frequency not known** Hepatitis · pancreatitis · psychotic disorder
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 5 mL/minute/1.73 m².
Dose adjustments Reduce dose to 10 mg daily if eGFR 30–49 mL/minute/1.73 m², if well tolerated after at least 7 days dose can be increased in steps to 20 mg daily;

reduce dose to 10 mg daily if eGFR 5–29 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION** For oral solution, manufacturer advises solution should be dosed onto a spoon or into a glass of water. For soluble tablets, manufacturer advises drink resulting solution immediately when dissolved in water.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer's disease—updated May 2016 NICE TA217

Memantine is recommended as an option for managing moderate Alzheimer's disease in patients who are unable to take acetylcholinesterase inhibitors, and for patients with severe disease; combination treatment with memantine and an acetylcholinesterase inhibitor is not recommended. Treatment should only be prescribed under the following conditions:

- treatment should be initiated on the advice of a specialist
- ensure that local arrangements for prescribing, supply and treatment review follow the NICE guideline on medicines optimisation
- treatment should continue only if it is considered to have a worthwhile effect on cognitive, global, functional, or behavioural symptoms.

Healthcare professionals should not rely solely on assessment scales to determine the severity of Alzheimer's disease when the patient has learning or other disabilities, or other communication difficulties.

2 Epilepsy and other seizure disorders

Epilepsy

26-May-2017

Epilepsy control

The object of treatment is to prevent the occurrence of seizures by maintaining an effective dose of one or more antiepileptic drugs. Careful adjustment of doses is necessary, starting with low doses and increasing gradually until seizures are controlled or there are significant adverse effects.

When choosing an antiepileptic drug, the presenting epilepsy syndrome should first be considered. If the syndrome is not clear, the seizure type should determine the choice of treatment. Concomitant medication, co-morbidity, age, and sex should also be taken into account.

The dosage frequency is often determined by the plasma-drug half-life, and should be kept as low as possible to encourage adherence with the prescribed regimen. Most antiepileptics, when used in the usual dosage, can be given twice daily. Lamotrigine p. 316, perampanel p. 320, phenobarbital p. 331, and phenytoin p. 321, which have long half-lives, can be given once daily at bedtime. However, with large doses, some antiepileptics may need to be given more frequently to avoid adverse effects associated with high peak plasma-drug concentration.

Management

When monotherapy with a first-line antiepileptic drug has failed, monotherapy with a second drug should be tried; the diagnosis should be checked before starting an alternative drug if the first drug showed lack of efficacy. The change from one antiepileptic drug to another should be cautious, slowly withdrawing the first drug only when the new regimen has been established. Combination therapy with two or more antiepileptic drugs may be necessary, but the concurrent use of antiepileptic drugs increases the risk of adverse effects and drug interactions. If combination therapy does not bring

about worthwhile benefits, revert to the regimen (monotherapy or combination therapy) that provided the best balance between tolerability and efficacy. A single antiepileptic drug should be prescribed wherever possible.

MHRA/CHM advice: Antiepileptic drugs: new advice on switching between different manufacturers' products for a particular drug (November 2013)

The CHM has reviewed spontaneous adverse reactions received by the MHRA and publications that reported potential harm arising from switching of antiepileptic drugs in patients previously stabilised on a branded product to a generic. The CHM concluded that reports of loss of seizure control and/or worsening of side-effects around the time of switching between products could be explained as chance associations, but that a causal role of switching could not be ruled out in all cases. The following guidance has been issued to help minimise risk:

- Different antiepileptic drugs vary considerably in their characteristics, which influences the risk of whether switching between different manufacturers' products of a particular drug may cause adverse effects or loss of seizure control;
- Antiepileptic drugs have been divided into three risk-based categories to help healthcare professionals decide whether it is necessary to maintain continuity of supply of a specific manufacturer's product. These categories are listed below;
- If it is felt desirable for a patient to be maintained on a specific manufacturer's product this should be prescribed either by specifying a brand name, or by using the generic drug name and name of the manufacturer (otherwise known as the Marketing Authorisation Holder);
- This advice relates only to antiepileptic drug use for treatment of epilepsy; it does not apply to their use in other indications (e.g. mood stabilisation, neuropathic pain);
- Please report on a Yellow Card any suspected adverse reactions to antiepileptic drugs;
- Dispensing pharmacists should ensure the continuity of supply of a particular product when the prescription specifies it. If the prescribed product is unavailable, it may be necessary to dispense a product from a different manufacturer to maintain continuity of treatment of that antiepileptic drug. Such cases should be discussed and agreed with both the prescriber and patient (or carer);
- Usual dispensing practice can be followed when a specific product is not stated.

Category 1

Phenytoin, carbamazepine p. 309, phenobarbital, primidone p. 332. For these drugs, doctors are advised to ensure that their patient is maintained on a specific manufacturer's product.

Category 2

Valproate, lamotrigine, perampanel, rufinamide p. 324, clobazam p. 333, clonazepam p. 334, oxcarbazepine p. 319, eslicarbazepine acetate p. 312, zonisamide p. 330, topiramate p. 328. For these drugs, the need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient and/or carer taking into account factors such as seizure frequency and treatment history.

Category 3

Levetiracetam p. 318, lacosamide p. 315, tiagabine p. 327, gabapentin p. 314, pregabalin p. 322, ethosuximide p. 312, vigabatrin p. 329. For these drugs, it is usually unnecessary to ensure that patients are maintained on a specific manufacturer's product unless there are specific concerns such as patient anxiety, and risk of confusion or dosing errors.

Antiepileptic hypersensitivity syndrome

Antiepileptic hypersensitivity syndrome is a rare but potentially fatal syndrome associated with some antiepileptic drugs (**carbamazepine, lacosamide, lamotrigine, oxcarbazepine, phenobarbital, phenytoin, primidone, and rufinamide**); rarely cross-sensitivity occurs between some of these antiepileptic drugs. Some other antiepileptics (**eslicarbazepine, stiripentol, and zonisamide**) have a theoretical risk. The symptoms usually start between 1 and 8 weeks of exposure; fever, rash, and lymphadenopathy are most commonly seen. Other systemic signs include liver dysfunction, haematological, renal, and pulmonary abnormalities, vasculitis, and multi-organ failure. If signs or symptoms of hypersensitivity syndrome occur, the drug should be withdrawn immediately, the patient must not be re-exposed, and expert advice should be sought.

Risk of suicidal thoughts and behaviour

The MHRA has advised (August 2008) that all antiepileptic drugs are associated with a small increased risk of suicidal thoughts and behaviour. Symptoms may occur as early as one week after starting treatment. Patients should be advised to seek medical advice if they develop any mood changes, distressing thoughts, or feelings about suicide or harming themselves, and should be referred for appropriate treatment if necessary.

Interactions

Interactions between antiepileptics are complex and may increase toxicity without a corresponding increase in antiepileptic effect. Interactions are usually caused by hepatic enzyme induction or inhibition; displacement from protein binding sites is not usually a problem. These interactions are highly variable and unpredictable.

Withdrawal

Antiepileptic drugs should be withdrawn under specialist supervision. Avoid abrupt withdrawal, particularly of barbiturates and benzodiazepines, because this can precipitate severe rebound seizures. Reduction in dosage should be gradual and, in the case of barbiturates, withdrawal of the drug may take months.

The decision to withdraw antiepileptic drugs from a seizure-free patient, and its timing, is often difficult and depends on individual circumstances. Even in patients who have been seizure-free for several years, there is a significant risk of seizure recurrence on drug withdrawal. In patients receiving several antiepileptic drugs, only one drug should be withdrawn at a time.

Driving

If a driver has a seizure (of any type) they must stop driving immediately and inform the Driver and Vehicle Licensing Agency (DVLA)

Patients who have had a first unprovoked epileptic seizure or a single isolated seizure must not drive for 6 months; driving may then be resumed, provided the patient has been assessed by a specialist as fit to drive and investigations do not suggest a risk of further seizures.

Patients with established epilepsy may drive a motor vehicle provided they are not a danger to the public and are compliant with treatment and follow up. To continue driving, these patients must be seizure-free for at least one year (or have a pattern of seizures established for one year where there is no influence on their level of consciousness or the ability to act); also, they must not have a history of unprovoked seizures.

Note: additional criteria apply for drivers of large goods or passenger carrying vehicles—consult DVLA guidance.

Patients who have had a *seizure while asleep* are not permitted to drive for one year from the date of each seizure, unless:

- a history or pattern of sleep seizures occurring **only** ever while asleep has been established over the course of at least one year from the date of the first sleep seizure; or
- an established pattern of purely asleep seizures can be demonstrated over the course of three years if the patient has previously had seizures whilst awake (or awake and asleep).

The DVLA recommends that patients should not drive during medication changes or withdrawal of antiepileptic drugs, and for 6 months after their last dose. If a seizure occurs due to a prescribed change or withdrawal of epilepsy treatment, the patient will have their driving license revoked for 1 year; relicensing may be considered earlier if treatment has been reinstated for 6 months and no further seizures have occurred.

Pregnancy

Women of child-bearing potential should discuss with a specialist the impact of both epilepsy, and its treatment, on the outcome of pregnancy.

There is an increased risk of teratogenicity associated with the use of antiepileptic drugs (especially if used during the first trimester and particularly if the patient takes two or more antiepileptic drugs). Valproate is associated with the highest risk of serious developmental disorders (up to 30–40% risk) and congenital malformations (approx. 10% risk). Valproate must **not** be used in females of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met and alternative treatments are ineffective or not tolerated; during pregnancy, it must not be used for epilepsy, unless it is the only possible treatment. There is also an increased risk of teratogenicity with phenytoin, primidone, phenobarbital, lamotrigine, and carbamazepine. Topiramate carries an increased risk of congenital malformations (including cleft palate, hypospadias, and anomalies involving various body systems) if taken in the first trimester of pregnancy. There is not enough evidence to establish the risk of teratogenicity with other antiepileptic drugs.

Prescribers should also consider carefully the choice of antiepileptic therapy in pre-pubescent girls who may later become pregnant. Women of child-bearing potential who take antiepileptic drugs should be given advice about the need for an effective contraception method to avoid unplanned pregnancy—for further information, see *Conception and contraception* in the individual drug monographs. Some antiepileptic drugs can reduce the efficacy of hormonal contraceptives, and the efficacy of some antiepileptics may be affected by hormonal contraceptives.

Women who want to become pregnant should be referred to a specialist for advice in advance of conception. For some women, the severity of seizure or the seizure type may not pose a serious threat, and drug withdrawal may be considered; therapy may be resumed after the first trimester. If treatment with antiepileptic drugs must continue throughout pregnancy, then monotherapy is preferable at the lowest effective dose.

Once an unplanned pregnancy is discovered it is usually too late for changes to be made to the treatment regimen; the risk of harm to the mother and fetus from convulsive seizures outweighs the risk of continued therapy. The likelihood of a woman who is taking antiepileptic drugs having a baby with no malformations is at least 90%, and it is important that women do not stop taking essential treatment because of concern over harm to the fetus. To reduce the risk of neural tube defects, folate supplementation is advised before conception and throughout the first trimester. In the case of sodium valproate p. 325 and valproic acid p. 351 an urgent consultation is required to reconsider the benefits and risks of valproate therapy.

The concentration of antiepileptic drugs in the plasma can change during pregnancy. Doses of phenytoin,

carbamazepine, and lamotrigine should be adjusted on the basis of plasma-drug concentration monitoring; the dose of other antiepileptic drugs should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. Plasma-drug concentration monitoring during pregnancy is also useful to check compliance. Additionally, in patients taking topiramate or levetiracetam, it is recommended that fetal growth should be monitored. Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol.

Routine injection of vitamin K at birth minimises the risk of neonatal haemorrhage associated with antiepileptics. Withdrawal effects in the newborn may occur with some antiepileptic drugs, in particular benzodiazepines and phenobarbital.

Epilepsy and Pregnancy Register

All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

Breast-feeding

Women taking antiepileptic monotherapy should generally be encouraged to breast-feed; if a woman is on combination therapy or if there are other risk factors, such as premature birth, specialist advice should be sought.

All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones. Infants should also be monitored for adverse effects associated with the antiepileptic drug particularly with newer antiepileptics, if the antiepileptic is readily transferred into breast-milk causing high infant serum-drug concentrations (e.g. ethosuximide, lamotrigine, primidone, and zonisamide), or if slower metabolism in the infant causes drugs to accumulate (e.g. phenobarbital and lamotrigine). Serum-drug concentration monitoring should be undertaken in breast-fed infants if suspected adverse reactions develop; if toxicity develops it may be necessary to introduce formula feeds to limit the infant's drug exposure, or to wean the infant off breast-milk altogether.

Primidone, phenobarbital, and the benzodiazepines are associated with an established risk of drowsiness in breast-fed babies and caution is required.

Withdrawal effects may occur in infants if a mother suddenly stops breast-feeding, particularly if she is taking phenobarbital, primidone, or lamotrigine.

Focal seizures with or without secondary generalisation

Carbamazepine p. 309 and lamotrigine p. 316 are first-line options for treating newly diagnosed focal seizures; oxcarbazepine p. 319, sodium valproate p. 325 and levetiracetam p. 318 may be used if carbamazepine or lamotrigine are unsuitable or not tolerated. If monotherapy is unsuccessful with two of these first-line antiepileptic drugs, adjunctive treatment may be considered. Options for adjunctive treatment include carbamazepine, clobazam p. 333, gabapentin p. 314, lamotrigine, levetiracetam, oxcarbazepine, sodium valproate, or topiramate p. 328. If adjunctive treatment is ineffective or not tolerated, a tertiary epilepsy specialist should be consulted who may consider eslicarbazepine acetate p. 312, lacosamide p. 315, phenobarbital p. 331, phenytoin p. 321, pregabalin p. 322, tiagabine p. 327, vigabatrin p. 329 and zonisamide p. 330.

Generalised seizures

Tonic-clonic seizures

Sodium valproate is the first-line treatment for newly diagnosed generalised tonic-clonic seizures (except in female patients who are premenopausal, see *Valproate* below). Lamotrigine is the alternative choice if sodium valproate is not suitable, but may exacerbate myoclonic

seizures. In those with established epilepsy with generalised tonic-clonic seizures only, lamotrigine or sodium valproate may be prescribed as the first-line treatment. Carbamazepine and oxcarbazepine may also be considered in newly diagnosed and established tonic-clonic seizures, but may exacerbate myoclonic and absence seizures. Clobazam, lamotrigine, levetiracetam, sodium valproate or topiramate may be used as adjunctive treatment if monotherapy is ineffective or not tolerated.

Absence seizures

Ethosuximide p. 312, or sodium valproate (except in female patients who are premenopausal, see *Valproate* below), are the drugs of choice in absence seizures and syndromes; lamotrigine is a suitable alternative when ethosuximide and sodium valproate are unsuitable, ineffective or not tolerated. Sodium valproate should be used as the first choice if there is a high risk of generalised tonic-clonic seizures. A combination of any two of these drugs may be used if monotherapy is ineffective. Clobazam, clonazepam p. 334, levetiracetam, topiramate or zonisamide may be considered by a tertiary epilepsy specialist if adjunctive treatment fails. Carbamazepine, gabapentin, oxcarbazepine, phenytoin, pregabalin, tiagabine and vigabatrin are not recommended in absence seizures or syndromes.

Myoclonic seizures

Myoclonic seizures (myoclonic jerks) occur in a variety of syndromes, and response to treatment varies considerably. Sodium valproate is the drug of choice in newly diagnosed myoclonic seizures (except in female patients who are premenopausal, see *Valproate* below); topiramate and levetiracetam are alternative options if sodium valproate is unsuitable but consideration should be given to the less favourable side-effect profile of topiramate. A combination of two of these drugs may be used if monotherapy is ineffective or not tolerated. If adjunctive treatment fails, a tertiary epilepsy specialist should be consulted and may consider clobazam, clonazepam, zonisamide or piracetam p. 402. Carbamazepine, gabapentin, oxcarbazepine, phenytoin, pregabalin, tiagabine and vigabatrin are not recommended for the treatment of myoclonic seizures.

Sodium valproate and levetiracetam are effective in treating the generalised tonic-clonic seizures that coexist with myoclonic seizures in idiopathic generalised epilepsy.

Atonic and tonic seizures

Atonic and tonic seizures are usually seen in childhood, in specific epilepsy syndromes, or associated with cerebral damage or mental retardation. They may respond poorly to the traditional drugs. Sodium valproate is the drug of choice (except in female patients who are premenopausal, see *Valproate* below); lamotrigine can be added as adjunctive treatment. If adjunctive treatment is ineffective or not tolerated, a tertiary epilepsy specialist should be consulted, and may consider rufinamide p. 324 or topiramate. Carbamazepine, gabapentin, oxcarbazepine, pregabalin, tiagabine or vigabatrin are not recommended in atonic and tonic seizures.

Epilepsy syndromes

Some drugs are licensed for use in particular epilepsy syndromes, such as lamotrigine and rufinamide in Lennox-Gastaut syndrome. The epilepsy syndromes are specific types of epilepsy that are characterised according to a number of features including seizure type, age of onset, and EEG characteristics.

Antiepileptic drugs

Carbamazepine and related antiepileptics

Carbamazepine is a drug of choice for simple and complex focal seizures and is a first-line treatment option for generalised tonic-clonic seizures. It can be used as adjunctive treatment for focal seizures when monotherapy

has been ineffective. It is essential to initiate carbamazepine therapy at a low dose and build this up slowly. Carbamazepine may exacerbate tonic, atonic, myoclonic and absence seizures and is therefore not recommended if these seizures are present.

Oxcarbazepine is licensed as monotherapy or adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures. It can also be considered for the treatment of primary generalised tonic-clonic seizures [unlicensed]. Oxcarbazepine is not recommended in tonic, atonic, absence or myoclonic seizures due to the risk of seizure exacerbation.

Eslicarbazepine acetate is licensed for adjunctive treatment in adults with focal seizures with or without secondary generalisation.

Ethosuximide

Ethosuximide is a first-line treatment option for absence seizures. It may also be prescribed as adjunctive treatment for absence seizures when monotherapy is ineffective. Ethosuximide is also licensed for myoclonic seizures.

Gabapentin and pregabalin

Gabapentin and pregabalin are used for the treatment of focal seizures with or without secondary generalisation. They are not recommended if tonic, atonic, absence or myoclonic seizures are present. Both are also licensed for the treatment of neuropathic pain. Pregabalin is licensed for the treatment of generalised anxiety disorder. Gabapentin is an effective treatment for migraine prophylaxis [unlicensed].

Lamotrigine

Lamotrigine is an antiepileptic drug recommended as a first-line treatment for focal seizures and primary and secondary generalised tonic-clonic seizures. It is also licensed for typical absence seizures in children (but efficacy may not be maintained in all children) and is an unlicensed treatment option in adults if first-line treatments have been unsuccessful. Lamotrigine can also be used as adjunctive treatment in atonic or tonic seizures if first-line treatment has failed [unlicensed]. Myoclonic seizures may be exacerbated by lamotrigine and it can cause serious rashes especially in children; dose recommendations should be adhered to closely.

Lamotrigine is used either as sole treatment or as an adjunct to treatment with other antiepileptic drugs. Valproate increases plasma-lamotrigine concentration, whereas the enzyme-inducing antiepileptics reduce it; care is therefore required in choosing the appropriate initial dose and subsequent titration. When the potential for interaction is not known, treatment should be initiated with lower doses, such as those used with valproate.

Levetiracetam and brivaracetam

Levetiracetam p. 318 is used for monotherapy and adjunctive treatment of focal seizures with or without secondary generalisation, and for adjunctive treatment of myoclonic seizures in patients with juvenile myoclonic epilepsy and primary generalised tonic-clonic seizures. Levetiracetam may be prescribed alone and in combination for the treatment of myoclonic seizures, and under specialist supervision for absence seizures [both unlicensed].

Brivaracetam p. 309 is used as adjunctive therapy in the treatment of partial-onset seizures with or without secondary generalisation.

Phenobarbital and primidone

Phenobarbital p. 331 is effective for tonic-clonic and focal seizures but may be sedative in adults. It may be tried for atypical absence, atonic, and tonic seizures. Rebound seizures may be a problem on withdrawal.

Primidone p. 332 is largely converted to phenobarbital and this is probably responsible for its antiepileptic action. A low initial dose of primidone is essential.

Phenytoin

Phenytoin p. 321 is licensed for tonic-clonic and focal seizures but may exacerbate absence or myoclonic seizures and should be avoided if these seizures are present. It has a narrow therapeutic index and the relationship between dose and plasma-drug concentration is non-linear; small dosage increases in some patients may produce large increases in plasma concentration with acute toxic side-effects. Similarly, a few missed doses or a small change in drug absorption may result in a marked change in plasma-drug concentration. Monitoring of plasma-drug concentration improves dosage adjustment.

When only parenteral administration is possible, fosphenytoin sodium p. 313, a pro-drug of phenytoin, may be convenient to give. Unlike phenytoin (which should only be given intravenously), fosphenytoin sodium may also be given by intramuscular injection.

Rufinamide

Rufinamide p. 324 is licensed for the adjunctive treatment of seizures in Lennox-Gastaut syndrome. It may be considered by a tertiary specialist for the treatment of refractory tonic or atonic seizures [unlicensed].

Topiramate

Topiramate p. 328 can be given alone or as adjunctive treatment in generalised tonic-clonic seizures or focal seizures with or without secondary generalisation. It can be used as adjunctive treatment for seizures associated with Lennox-Gastaut syndrome and for absence, tonic and atonic seizures under specialist supervision [unlicensed]. It can also be considered as an option in myoclonic seizures [unlicensed]. Female patients should be fully informed of the risks related to the use of topiramate during pregnancy and the need to use effective contraception—for further information, see *Conception and contraception and Pregnancy* in the topiramate drug monograph.

Valproate

Sodium valproate p. 325 is effective in controlling tonic-clonic seizures, particularly in primary generalised epilepsy. It is a drug of choice in primary generalised tonic-clonic seizures, focal seizures, generalised absences and myoclonic seizures, and can be tried in atypical absence seizures. It is recommended as a first-line option in atonic and tonic seizures. Sodium valproate has widespread metabolic effects and monitoring of liver function tests and full blood count is essential. Because of its high teratogenic potential, valproate must not be used in females of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met and alternative treatments are ineffective or not tolerated. During pregnancy, it must not be used for epilepsy unless it is the only possible treatment. For further information see *Important safety information, Conception and contraception, and Pregnancy* in the sodium valproate and valproic acid p. 351 drug monographs.

Valproic acid (as semisodium valproate) is licensed for acute mania associated with bipolar disorder.

Zonisamide

Zonisamide p. 330 can be used alone for the treatment of focal seizures with or without secondary generalisation in adults with newly diagnosed epilepsy, and as adjunctive treatment for refractory focal seizures with or without secondary generalisation in adults and children aged 6 years and above. It can also be used under the supervision of a specialist for refractory absence and myoclonic seizures [unlicensed indications].

Benzodiazepines

Clobazam p. 333 may be used as adjunctive therapy in the treatment of generalised tonic-clonic and refractory focal seizures. It may be prescribed under the care of a specialist for refractory absence and myoclonic seizures. Clonazepam p. 334 may be prescribed by a specialist for refractory

absence and myoclonic seizures, but its sedative side-effects may be prominent.

Other drugs

Acetazolamide p. 1147, a carbonic anhydrase inhibitor, has a specific role in treating epilepsy associated with menstruation. Piracetam p. 402 is used as adjunctive treatment for cortical myoclonus.

Status epilepticus**Convulsive status epilepticus**

Immediate measures to manage status epilepticus include positioning the patient to avoid injury, supporting respiration including the provision of oxygen, maintaining blood pressure, and the correction of any hypoglycaemia. Parenteral thiamine p. 1048 should be considered if alcohol abuse is suspected; pyridoxine hydrochloride p. 1047 should be given if the status epilepticus is caused by pyridoxine hydrochloride deficiency.

Seizures lasting longer than 5 minutes should be treated urgently with intravenous lorazepam p. 335 (repeated once after 10 minutes if seizures recur or fail to respond). Intravenous diazepam p. 340 is effective but it carries a high risk of thrombophlebitis (reduced by using an emulsion formulation). Absorption of diazepam from intramuscular injection or from suppositories is too slow for treatment of status epilepticus. Patients should be monitored for respiratory depression and hypotension.

Where facilities for resuscitation are not immediately available, diazepam can be administered as a rectal solution or midazolam p. 336 oromucosal solution can be given into the buccal cavity.

Important

If, after initial treatment with benzodiazepines, seizures recur or fail to respond 25 minutes after onset, phenytoin sodium, fosphenytoin sodium, or phenobarbital sodium should be used; contact intensive care unit if seizures continue. If these measures fail to control seizures 45 minutes after onset, anaesthesia with thiopental sodium p. 335, midazolam, or a non-barbiturate anaesthetic such as propofol p. 1291 [unlicensed indication], should be instituted with full intensive care support.

Phenytoin sodium can be given by slow intravenous injection, followed by the maintenance dosage if appropriate.

Alternatively, fosphenytoin sodium (a pro-drug of phenytoin), can be given more rapidly and when given intravenously causes fewer injection-site reactions than phenytoin sodium. Although it can also be given intramuscularly, absorption is too slow by this route for treatment of status epilepticus. Doses of fosphenytoin sodium should be expressed in terms of phenytoin sodium.

Non-convulsive status epilepticus

The urgency to treat non-convulsive status epilepticus depends on the severity of the patient's condition. If there is incomplete loss of awareness, usual oral antiepileptic therapy should be continued or restarted. Patients who fail to respond to oral antiepileptic therapy or have complete lack of awareness can be treated in the same way as for convulsive status epilepticus, although anaesthesia is rarely needed.

Febrile convulsions

Brief febrile convulsions need no specific treatment; antipyretic medication (e.g. paracetamol p. 438), is commonly used to reduce fever and prevent further convulsions but evidence to support this practice is lacking. *Prolonged febrile convulsions* (those lasting 5 minutes or longer), or *recurrent febrile convulsions* without recovery must be treated actively (as for convulsive status epilepticus). Long-term anticonvulsant prophylaxis for febrile convulsions is rarely indicated.

Other drugs used for Epilepsy and other seizure disorders Magnesium sulfate, p. 1019

ANTIEPILEPTICS

Brivaracetam

13-Feb-2017

● INDICATIONS AND DOSE

Adjunctive therapy of partial-onset seizures with or without secondary generalisation

- ▶ BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child 16–17 years: Initially 25–50 mg twice daily, adjusted according to response; usual maintenance 25–100 mg twice daily
- ▶ Adult: Initially 25–50 mg twice daily, adjusted according to response; usual maintenance 25–100 mg twice daily

● INTERACTIONS → Appendix 1: antiepileptics

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · appetite decreased · constipation · cough · depression · dizziness · drowsiness · fatigue · increased risk of infection · insomnia · irritability · nausea · vertigo · vomiting
- ▶ **Uncommon** Aggression · psychotic disorder

● PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk—limited information available.

● BREAST FEEDING

Manufacturer advises avoid—present in milk in animal studies.

● HEPATIC IMPAIRMENT

Dose adjustments Manufacturer advises consider a starting dose of 25 mg twice daily in chronic liver disease; max. maintenance dose 75 mg twice daily in all stages of impairment.

● TREATMENT CESSATION

Manufacturer advises avoid abrupt withdrawal—reduce daily dose in steps of 50 mg at weekly intervals, then reduce to 20 mg daily for a final week.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For intermittent intravenous infusion, manufacturer advises dilute in Glucose 5% or Sodium Chloride 0.9% or Lactated Ringer's solution; give over 15 minutes.
- ▶ With oral use Manufacturer advises oral solution can be diluted in water or juice shortly before swallowing.

● PRESCRIBING AND DISPENSING INFORMATION

Manufacturer advises if switching between oral therapy and intravenous therapy (for those temporarily unable to take oral medication), the total daily dose and the frequency of administration should be maintained.

● PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if one or more doses are missed, a single dose should be taken as soon as possible and the next dose should be taken at the usual time.

Driving and skilled tasks Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (July 2016) that brivaracetam (*Briviact*®) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of partial-onset seizures with or without secondary generalisation in patients with refractory epilepsy. Treatment should be initiated by physicians who have appropriate experience in the treatment of epilepsy.

All Wales Medicines Strategy Group (AWMSG) Decisions

The All Wales Medicines Strategy Group has advised (October 2016) that Brivaracetam (*Briviact*®) is recommended as an option for restricted use within NHS Wales. Brivaracetam (*Briviact*®) should be restricted to use in the treatment of patients with refractory epilepsy, who remain uncontrolled with, or are intolerant to, other adjunctive anti-epileptic medicines, within its licensed indication as adjunctive therapy in the treatment of partial-onset seizures (POS) with or without secondary generalisation in adult and adolescent patients from 16 years of age with epilepsy. Brivaracetam (*Briviact*®) is not recommended for use within NHS Wales outside of this subpopulation.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

● INDICATIONS AND DOSE

Focal and secondary generalised tonic-clonic seizures |

Primary generalised tonic-clonic seizures

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Initially 100–200 mg 1–2 times a day, increased in steps of 100–200 mg every 2 weeks; usual dose 0.8–1.2 g daily in divided doses; increased if necessary up to 1.6–2 g daily in divided doses
- ▶ Elderly: Reduce initial dose
- ▶ BY RECTUM
- ▶ Adult: Up to 1 g daily in 4 divided doses for up to 7 days, for short-term use when oral therapy temporarily not possible

Trigeminal neuralgia

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: Initially 100 mg 1–2 times a day, some patients may require higher initial dose, increase gradually according to response; usual dose 200 mg 3–4 times a day, increased if necessary up to 1.6 g daily

Prophylaxis of bipolar disorder unresponsive to lithium

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: Initially 400 mg daily in divided doses, increased until symptoms controlled; usual dose 400–600 mg daily; maximum 1.6 g per day

continued →

Adjunct in acute alcohol withdrawal

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Initially 800 mg daily in divided doses, then reduced to 200 mg daily for usual treatment duration of 7–10 days, dose to be reduced gradually over 5 days

Diabetic neuropathy

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Initially 100 mg 1–2 times a day, increased gradually according to response; usual dose 200 mg 3–4 times a day, increased if necessary up to 1.6 g daily

Focal and generalised tonic-clonic seizures

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 1 month–11 years: Initially 5 mg/kg once daily, dose to be taken at night, alternatively initially 2.5 mg/kg twice daily, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 5 mg/kg 2–3 times a day, increased if necessary up to 20 mg/kg daily
- ▶ Child 12–17 years: Initially 100–200 mg 1–2 times a day, then increased to 200–400 mg 2–3 times a day, increased if necessary up to 1.8 g daily, dose should be increased slowly

DOSE EQUIVALENCE AND CONVERSION

- ▶ Suppositories of 125 mg may be considered to be approximately equivalent in therapeutic effect to tablets of 100 mg but final adjustment should always depend on clinical response (plasma concentration monitoring recommended).

CARBAGEN® SR**Focal and secondary generalised tonic-clonic seizures |****Primary generalised tonic-clonic seizures**

- ▶ BY MOUTH
- ▶ Adult: Initially 100–400 mg daily in 1–2 divided doses, increased in steps of 100–200 mg every 2 weeks, dose should be increased slowly; usual dose 0.8–1.2 g daily in 1–2 divided doses, increased if necessary up to 1.6–2 g daily in 1–2 divided doses
- ▶ Elderly: Reduce initial dose

Trigeminal neuralgia

- ▶ BY MOUTH
- ▶ Adult: Initially 100–200 mg daily in 1–2 divided doses, some patients may require higher initial dose, increase gradually according to response; usual dose 600–800 mg daily in 1–2 divided doses, increased if necessary up to 1.6 g daily in 1–2 divided doses

Prophylaxis of bipolar disorder unresponsive to lithium

- ▶ BY MOUTH
- ▶ Adult: Initially 400 mg daily in 1–2 divided doses, increased until symptoms controlled; usual dose 400–600 mg daily in 1–2 divided doses; maximum 1.6 g per day

Focal and generalised tonic-clonic seizures | Prophylaxis of bipolar disorder

- ▶ BY MOUTH
- ▶ Child 5–11 years: Initially 5 mg/kg daily in 1–2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required, dose should be increased slowly; maintenance 10–15 mg/kg daily in 1–2 divided doses, increased if necessary up to 20 mg/kg daily in 1–2 divided doses
- ▶ Child 12–17 years: Initially 100–400 mg daily in 1–2 divided doses, then increased to 400–1200 mg daily in 1–2 divided doses, increased if necessary up to 1.8 g daily in 1–2 divided doses, dose should be increased slowly

TEGRETOL® PROLONGED RELEASE**Focal and secondary generalised tonic-clonic seizures |****Primary generalised tonic-clonic seizures**

- ▶ BY MOUTH
- ▶ Adult: Initially 100–400 mg daily in 2 divided doses, increased in steps of 100–200 mg every 2 weeks, dose should be increased slowly; usual dose 0.8–1.2 g daily in 2 divided doses, increased if necessary up to 1.6–2 g daily in 2 divided doses
- ▶ Elderly: Reduce initial dose

Focal and generalised tonic-clonic seizures | Prophylaxis of bipolar disorder

- ▶ BY MOUTH
- ▶ Child 5–11 years: Initially 5 mg/kg daily in 2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 10–15 mg/kg daily in 2 divided doses, increased if necessary up to 20 mg/kg daily in 2 divided doses
- ▶ Child 12–17 years: Initially 100–400 mg daily in 2 divided doses, dose should be increased slowly; maintenance 400–1200 mg daily in 2 divided doses, increased if necessary up to 1.8 g daily in 2 divided doses

Trigeminal neuralgia

- ▶ BY MOUTH
- ▶ Adult: Initially 100–200 mg daily in 2 divided doses, some patients may require higher initial dose. After initial dose, increase according to response; usual dose 600–800 mg daily in 2 divided doses, increased if necessary up to 1.6 g daily in 2 divided doses, dose should be increased slowly

Prophylaxis of bipolar disorder unresponsive to lithium

- ▶ BY MOUTH
- ▶ Adult: Initially 400 mg daily in 2 divided doses, increased until symptoms controlled; usual dose 400–600 mg daily in 2 divided doses; maximum 1.6 g per day

- **UNLICENSED USE** Not licensed for use in acute alcohol withdrawal. Use in diabetic neuropathy is an unlicensed indication.
- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 • AV conduction abnormalities (unless paced) • history of bone-marrow depression
- **CAUTIONS** Cardiac disease • history of haematological reactions to other drugs • may exacerbate absence and myoclonic seizures • skin reactions • susceptibility to angle-closure glaucoma
- CAUTIONS, FURTHER INFORMATION** Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.
- ▶ Blood, hepatic, or skin disorders Carbamazepine should be withdrawn immediately in cases of aggravated liver dysfunction or acute liver disease. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative).
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
- GENERAL SIDE-EFFECTS**
- ▶ **Common or very common** Dizziness • drowsiness • dry mouth • eosinophilia • fatigue • fluid imbalance • headache • hyponatraemia • leucopenia • movement disorders • nausea • oedema • skin reactions • thrombocytopenia • vision disorders • vomiting • weight increased
- ▶ **Uncommon** Constipation • diarrhoea • eye disorders • tic • tremor
- ▶ **Rare or very rare** Aggression • agranulocytosis • albuminuria • alopecia • anaemia • angioedema • anxiety • appetite decreased • arrhythmias • arthralgia • azotaemia •

bone disorders • bone marrow disorders • cardiac conduction disorders • circulatory collapse • confusion • congestive heart failure • conjunctivitis • coronary artery disease aggravated • depression • dyspnoea • embolism and thrombosis • erythema nodosum • fever • folate deficiency • galactorrhoea • gynaecomastia • haematuria • haemolytic anaemia • hallucinations • hearing impairment • hepatic disorders • hirsutism • hyperacusia • hyperhidrosis • hypersensitivity • hypertension • hypogammaglobulinaemia • hypotension • lens opacity • leucocytosis • lymphadenopathy • meningitis aseptic • muscle complaints • muscle weakness • nephritis tubulointerstitial • nervous system disorder • neuroleptic malignant syndrome • oral disorders • pancreatitis • paraesthesia • paresis • peripheral neuropathy • photosensitivity reaction • pneumonia • pneumonitis • pseudolymphoma • psychosis • red blood cell abnormalities • renal impairment • severe cutaneous adverse reactions (SCARs) • sexual dysfunction • speech impairment • spermatogenesis abnormal • syncope • systemic lupus erythematosus (SLE) • taste altered • urinary disorders • vanishing bile duct syndrome • vasculitis

- **Frequency not known** Bone fracture • colitis • human herpesvirus 6 infection reactivation • memory loss • nail loss

SPECIFIC SIDE-EFFECTS

- **Common or very common**

- With oral or rectal use Gastrointestinal discomfort

SIDE-EFFECTS, FURTHER INFORMATION Some side-effects (such as headache, ataxia, drowsiness, nausea, vomiting, blurring of vision, dizziness and allergic skin reactions) are dose-related, and may be dose-limiting. These side-effects are more common at the start of treatment and in the elderly.

Overdose For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 1319.

- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with carbamazepine. See under Epilepsy p. 304 for more information. Caution—cross-sensitivity reported with oxcarbazepine and with phenytoin.

● **PREGNANCY**

Monitoring Doses should be adjusted on the basis of plasma-drug concentration monitoring.

- **BREAST FEEDING** Amount probably too small to be harmful.

Monitoring Monitor infant for possible adverse reactions.

- **HEPATIC IMPAIRMENT** Metabolism impaired in advanced liver disease.

- **RENAL IMPAIRMENT** Use with caution.

- **PRE-TREATMENT SCREENING** Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens–Johnson syndrome in presence of HLA-B*1502 allele).

● **MONITORING REQUIREMENTS**

- Plasma concentration for optimum response 4–12 mg/litre (20–50 micromol/litre) measured after 1–2 weeks.
- Manufacturer recommends blood counts and hepatic and renal function tests (but evidence of practical value uncertain).

- **TREATMENT CESSATION** When stopping treatment with carbamazepine for bipolar disorder, reduce the dose gradually over a period of at least 4 weeks.

● **DIRECTIONS FOR ADMINISTRATION**

- In children Oral liquid has been used rectally—should be retained for at least 2 hours (but may have laxative effect).

TEGRETOL® PROLONGED RELEASE *Tegretol® Prolonged Release* tablets can be halved but should not be chewed.

● **PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer's product.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Carbamazepine (oral) for preventing seizures www.medicinesforchildren.org.uk/carbamazepine-oral-preventing-seizures-0

Blood, hepatic, or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop.

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Carbamazepine Tablets may be prescribed.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 3, 8, 25

Eslicarbazepine acetate

• INDICATIONS AND DOSE

Adjunctive treatment in adults with focal seizures with or without secondary generalisation

► BY MOUTH

- Adult: Initially 400 mg once daily for 1–2 weeks, then increased to 800 mg once daily (max. per dose 1.2 g)

- **CONTRA-INDICATIONS** Second- or third-degree AV block

- **CAUTIONS** Elderly · hyponatraemia · PR-interval prolongation

- **INTERACTIONS** → Appendix 1: antiepileptics

• SIDE-EFFECTS

- **Common or very common** Appetite decreased · asthenia · concentration impaired · diarrhoea · dizziness · drowsiness · electrolyte imbalance · gait abnormal · headaches · movement disorders · nausea · skin reactions · sleep disorders · vertigo · vision disorders · vomiting

- **Uncommon** Alopecia · anaemia · anxiety · bradycardia · chest pain · chills · confusion · constipation · depression · dry mouth · eye disorders · flushing · gastritis · gastrointestinal discomfort · haemorrhage · hearing impairment · hyperhidrosis · hypertension · hypotension · hypothyroidism · increased risk of infection · liver disorder · malaise · mood altered · muscle weakness · myalgia · pain in extremity · palpitations · peripheral coldness · peripheral neuropathy · peripheral oedema · psychomotor retardation · psychotic disorder · sensation abnormal · speech impairment · toothache · weight decreased

- **Frequency not known** Leucopenia · pancreatitis · thrombocytopenia

- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome theoretically associated with eslicarbazepine. See under Epilepsy p. 304 for more information.

• PREGNANCY

Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment—no information available.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments Reduce initial dose to 400 mg every other day for 2 weeks then 400 mg once daily if eGFR 30–60 mL/minute/1.73 m², adjusted according to response.

- **PRE-TREATMENT SCREENING** Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative— risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

- **MONITORING REQUIREMENTS** Monitor plasma-sodium concentration in patients at risk of hyponatraemia and discontinue treatment if hyponatraemia occurs.

• PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2010) that eslicarbazepine (*Zebinix*®) is accepted for restricted use within NHS Scotland as adjunctive therapy in adults with focal seizures with or without secondary generalisation. It is restricted for use in refractory epilepsy.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 8

► *Zebinix* (Eisai Ltd)

Eslicarbazepine acetate 200 mg *Zebinix* 200mg tablets | 60 tablet **[PoM]** £68.00 DT = £68.00

Eslicarbazepine acetate 800 mg *Zebinix* 800mg tablets | 30 tablet **[PoM]** £136.00 DT = £136.00

Ethosuximide

• INDICATIONS AND DOSE

Absence seizures | Atypical absence seizures (adjunct) | Myoclonic seizures

► BY MOUTH

- Child 1 month–5 years: Initially 5 mg/kg twice daily (max. per dose 125 mg), dose to be increased every 5–7 days; maintenance 10–20 mg/kg twice daily (max. per dose 500 mg), total daily dose may rarely be given in 3 divided doses
- Child 6–17 years: Initially 250 mg twice daily, then increased in steps of 250 mg every 5–7 days; usual dose 500–750 mg twice daily, increased if necessary up to 1 g twice daily
- Adult: Initially 500 mg daily in 2 divided doses, then increased in steps of 250 mg every 5–7 days; usual dose 1–1.5 g daily in 2 divided doses, increased if necessary up to 2 g daily

- **CAUTIONS** Avoid in Acute porphyrias p. 1025

- **INTERACTIONS** → Appendix 1: antiepileptics

- **SIDE-EFFECTS** Aggression · agranulocytosis · appetite decreased · blood disorder · bone marrow disorders · concentration impaired · depression · diarrhoea · dizziness · drowsiness · erythema nodosum · fatigue · gastrointestinal discomfort · generalised tonic-clonic seizure · headache · hiccups · leucopenia · libido increased · lupus-like syndrome · mood altered · movement disorders · nausea · nephrotic syndrome · oral disorders · psychosis · rash · sleep disorders · Stevens-Johnson syndrome · vaginal haemorrhage · vision disorders · vomiting · weight decreased

SIDE-EFFECTS, FURTHER INFORMATION Blood counts required if features of fever, sore throat, mouth ulcers, bruising or bleeding.

• PREGNANCY

Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Present in milk. Hyperexcitability and sedation reported.

- **HEPATIC IMPAIRMENT** Use with caution.

- **RENAL IMPAIRMENT** Use with caution.

• PATIENT AND CARER ADVICE

Medicines for Children leaflet: Ethosuximide for preventing seizures www.medicinesforchildren.org.uk/ethosuximide-for-preventing-seizures

Blood disorders Patients or their carers should be told how to recognise signs of blood disorders, and advised to seek immediate medical attention if symptoms such as fever, mouth ulcers, bruising, or bleeding develop.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 8

► **Ethosuximide (Non-proprietary)**

Ethosuximide 50 mg per 1 mL Ethosuximide 250mg/5mL syrup | 200 mL [PoM] £173.00 DT = £173.00

Capsule

CAUTIONARY AND ADVISORY LABELS 8

► **Ethosuximide (Non-proprietary)**

Ethosuximide 250 mg Ethosuximide 250mg capsules | 56 capsule [PoM] £173.00 DT = £173.00

Fosphenytoin sodium**DRUG ACTION** Fosphenytoin is a pro-drug of phenytoin.**INDICATIONS AND DOSE****Status epilepticus**► **BY INTRAVENOUS INFUSION**

- Adult: Initially 20 mg(PE)/kg, dose to be administered at a rate of 100–150 mg(PE)/minute, then 4–5 mg(PE)/kg daily in 1–2 divided doses, dose to be administered at a rate of 50–100 mg(PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration
- Elderly: Consider 10–25% reduction in dose or infusion rate

Prophylaxis or treatment of seizures associated with neurosurgery or head injury► **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION**

- Adult: Initially 10–15 mg(PE)/kg, intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute, then 4–5 mg(PE)/kg daily in 1–2 divided doses, intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration
- Elderly: Consider 10–25% reduction in dose or infusion rate

Temporary substitution for oral phenytoin► **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION**

- Adult: Same dose and same dosing frequency as oral phenytoin therapy, intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute
- Elderly: Consider 10–25% reduction in dose or infusion rate

DOSE EQUIVALENCE AND CONVERSION

- Doses are expressed as phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg = phenytoin sodium 1 mg.

UNLICENSED USE Fosphenytoin sodium doses in BNF may differ from those in product literature.**CONTRA-INDICATIONS** Acute porphyrias p. 1025 · second-degree heart block · sino-atrial block · sinus bradycardia · Stokes-Adams syndrome · third-degree heart block**CAUTIONS** Heart failure · hypotension · injection solutions alkaline (irritant to tissues) · respiratory depression · resuscitation facilities must be available**INTERACTIONS** → Appendix 1: antiepileptics**SIDE-EFFECTS**

- Common or very common** Asthenia · chills · dizziness · drowsiness · dry mouth · dysarthria · euphoric mood · headache · hearing impairment · hypotension · movement disorders · nausea · nystagmus · sensation abnormal · skin reactions · stupor · taste altered · tremor · vasodilation · vertigo · vision disorders · vomiting
- Uncommon** Cardiac arrest · confusion · muscle complaints · muscle weakness · nervousness · oral disorders · reflexes

- abnormal · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · thinking abnormal
- **Frequency not known** Acute psychosis · agranulocytosis · appetite disorder · atrial conduction depression (more common if injection too rapid) · atrioventricular block · bone disorders · bone fracture · bone marrow disorders · bradycardia · cardiotoxicity · cerebrovascular insufficiency · circulatory collapse (more common if injection too rapid) · coarsening of the facial features · constipation · delirium · Dupuytren's contracture · encephalopathy · granulocytopenia · groin tingling · hair changes · hepatic disorders · hyperglycaemia · hypersensitivity · insomnia · leucopenia · lymphadenopathy · nephritis · tubulointerstitial · Peyronie's disease · polyarteritis nodosa · polyarthritits · purple glove syndrome · respiratory disorders · sensory peripheral polyneuropathy · thrombocytopenia · tonic seizure · ventricular conduction depression (more common if injection too rapid) · ventricular fibrillation (more common if injection too rapid)

SIDE-EFFECTS, FURTHER INFORMATION Fosphenytoin has been associated with severe cardiovascular reactions including asystole, ventricular fibrillation, and cardiac arrest. Hypotension, bradycardia, and heart block have also been reported. The following are recommended: monitor heart rate, blood pressure, and respiratory function for duration of infusion; observe patient for at least 30 minutes after infusion; if hypotension occurs, reduce infusion rate or discontinue; reduce dose or infusion rate in elderly, and in renal or hepatic impairment.

ALLERGY AND CROSS-SENSITIVITY Cross-sensitivity reported with carbamazepine.**PREGNANCY**

Monitoring Changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction.

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

BREAST FEEDING Small amounts present in milk, but not known to be harmful.**HEPATIC IMPAIRMENT**

Dose adjustments Consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus).

RENAL IMPAIRMENT

Dose adjustments Consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus).

PRE-TREATMENT SCREENING HLA-B* 1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome).**MONITORING REQUIREMENTS**

- Manufacturer recommends blood counts (but evidence of practical value uncertain).

- With intravenous use Monitor heart rate, blood pressure, ECG, and respiratory function for during infusion.

DIRECTIONS FOR ADMINISTRATION For intermittent intravenous infusion (Pro-Epanutin[®]), give in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of 1.5–25 mg (phenytoin sodium equivalent (PE))/mL.**PRESCRIBING AND DISPENSING INFORMATION**

Prescriptions for fosphenytoin sodium should state the dose in terms of phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg = phenytoin sodium 1 mg.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

ELECTROLYTES: May contain Phosphate

► **Pro-Epanutin** (Pfizer Ltd)

Fosphenytoin sodium 75 mg per 1 ml Pro-Epanutin 750mg/10ml concentrate for solution for injection vials | 10 vial [PoM] £400.00 (Hospital only)

Gabapentin

19-Jul-2017

INDICATIONS AND DOSE**Adjunctive treatment of focal seizures with or without secondary generalisation**

► BY MOUTH

- Child 6–11 years: 10 mg/kg once daily (max. per dose 300 mg) on day 1, then 10 mg/kg twice daily (max. per dose 300 mg) on day 2, then 10 mg/kg 3 times a day (max. per dose 300 mg) on day 3; usual dose 25–35 mg/kg daily in 3 divided doses, some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate, daily dose maximum to be given in 3 divided doses; maximum 70 mg/kg per day
- Child 12–17 years: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate
- Adult: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day)

Monotherapy for focal seizures with or without secondary generalisation

► BY MOUTH

- Child 12–17 years: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate
- Adult: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day)

Peripheral neuropathic pain

► BY MOUTH

- Adult: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; maximum 3.6 g per day

Migraine prophylaxis

► BY MOUTH

- Adult: Initially 300 mg daily, then increased to up to 2.4 g daily in divided doses, adjusted according to response

Menopausal symptoms, particularly hot flushes, in women with breast cancer

► BY MOUTH

- Adult: 300 mg 3 times a day, initial dose should be lower and titrated up over three days

- **UNLICENSED USE** Not licensed at doses over 50 mg/kg daily in children under 12 years. Not licensed for migraine prophylaxis. [EvGr] Not licensed for menopausal symptoms.

**IMPORTANT SAFETY INFORMATION**

The levels of propylene glycol, acesulfame K and saccharin sodium may exceed the recommended WHO daily intake limits if high doses of gabapentin oral solution (Rosemont brand) are given to adolescents or adults with low body-weight (39–50 kg)—consult product literature.

MHRA/CHM ADVICE: GABAPENTIN (NEURONTIN®): RISK OF SEVERE RESPIRATORY DEPRESSION (OCTOBER 2017)

Gabapentin has been associated with a rare risk of severe respiratory depression even without concomitant opioid medicines. Patients with compromised respiratory function, respiratory or neurological disease, renal impairment, concomitant use of central nervous system (CNS) depressants, and elderly people might be at higher risk of experiencing severe respiratory depression and dose adjustments may be necessary in these patients.

- **CAUTIONS** Diabetes mellitus · elderly · high doses of oral solution in adolescents and adults with low body-weight · history of psychotic illness · mixed seizures (including absences)
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
 - **Common or very common** Anxiety · appetite abnormal · arthralgia · asthenia · behaviour abnormal (frequency not known in children) · confusion · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · dysarthria · dyspnoea · emotional lability · flatulence · gait abnormal · gastrointestinal discomfort · headache · hypertension · increased risk of infection · insomnia · leucopenia · malaise · movement disorders · muscle complaints · nausea · nystagmus · oedema · pain · reflexes abnormal · seizure (in children) · sensation abnormal · sexual dysfunction · skin reactions · thinking abnormal · tooth disorder · tremor · vasodilation · vertigo · visual impairment · vomiting
 - **Uncommon** Cognitive impairment · palpitations
 - **Frequency not known** Acute kidney injury · alopecia · angioedema · breast enlargement · gynaecomastia · hallucination · hepatic disorders · hyponatraemia · pancreatitis · rhabdomyolysis · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · tinnitus · urinary incontinence
- **PREGNANCY**
 - **Monitoring** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Present in milk—manufacturer advises use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT**
 - **Dose adjustments** In adults Reduce dose to 0.6–1.8 g daily in 3 divided doses if eGFR 50–80 mL/minute/1.73 m². Reduce dose to 300–900 mg daily in 3 divided doses if eGFR 30–50 mL/minute/1.73 m². Reduce dose to 300 mg

on alternate days (up to max. 600 mg daily) in 3 divided doses if eGFR 15–30 mL/minute/1.73 m². Reduce dose to 300 mg on alternate days (up to max. 300 mg daily) in 3 divided doses if eGFR less than 15 mL/minute/1.73 m²—consult product literature.

► In children Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m²; consult product literature.

● **EFFECT ON LABORATORY TESTS** False positive readings with some urinary protein tests.

● **DIRECTIONS FOR ADMINISTRATION** Capsules can be opened but the bitter taste is difficult to mask.

22-Feb-2018

● **INDICATIONS AND DOSE**

Monotherapy of focal seizures with or without secondary generalisation

► BY MOUTH, OR BY INTRAVENOUS INFUSION

► **Child (body-weight 50 kg and above):** Initially 50 mg twice daily, then increased to 100 mg twice daily, after one week, alternatively initially 100 mg twice daily; increased in steps of 50 mg twice daily (max. per dose 300 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals

► **Child 4–17 years (body-weight up to 50 kg):** (consult product literature)

► **Adult:** Initially 50 mg twice daily, then increased to 100 mg twice daily, after one week, alternatively initially 100 mg twice daily; increased in steps of 50 mg

twice daily (max. per dose 300 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals

Monotherapy of focal seizures with or without secondary generalisation (alternative loading dose regimen when it is necessary to rapidly attain therapeutic plasma concentrations) (under close medical supervision)

► BY MOUTH, OR BY INTRAVENOUS INFUSION

► **Child (body-weight 50 kg and above):** Loading dose 200 mg, followed by 100 mg twice daily, to be given 12 hours after initial dose; increased in steps of 50 mg twice daily (max. per dose 300 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals

► **Adult:** Loading dose 200 mg, followed by 100 mg twice daily, to be given 12 hours after initial dose; increased in steps of 50 mg twice daily (max. per dose 300 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals

Adjunctive treatment of focal seizures with or without secondary generalisation

► BY MOUTH, OR BY INTRAVENOUS INFUSION

► **Child (body-weight 50 kg and above):** Initially 50 mg twice daily, then increased to 100 mg twice daily, after one week; increased in steps of 50 mg twice daily (max. per dose 200 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals

► **Child 4–17 years (body-weight up to 50 kg):** (consult product literature)

► **Adult:** Initially 50 mg twice daily, then increased to 100 mg twice daily, after one week; increased in steps of 50 mg twice daily (max. per dose 200 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals

Adjunctive treatment of focal seizures with or without secondary generalisation (alternative loading dose regimen when it is necessary to rapidly attain therapeutic plasma concentrations) (under close medical supervision)

► BY MOUTH, OR BY INTRAVENOUS INFUSION

► **Child (body-weight 50 kg and above):** Loading dose 200 mg, followed by 100 mg twice daily, to be given 12 hours after initial dose; increased in steps of 50 mg twice daily (max. per dose 200 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals

► **Adult:** Loading dose 200 mg, followed by 100 mg twice daily, to be given 12 hours after initial dose; increased in steps of 50 mg twice daily (max. per dose 200 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals

● **CONTRA-INDICATIONS** Second- or third-degree AV block

● **CAUTIONS** Conduction problems · elderly · risk of PR-interval prolongation · severe cardiac disease

● **INTERACTIONS** → Appendix 1: antiepileptics

● **SIDE-EFFECTS**

► **Common or very common** Asthenia · concentration impaired · confusion · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · dysarthria · dyspepsia · flatulence · gait abnormal · headache · insomnia · mood altered · movement disorders · muscle spasms · nausea · nystagmus · sensation abnormal · skin reactions · tinnitus · vertigo · vision disorders · vomiting

► **Uncommon** Aggression · agitation · angioedema · arrhythmias · atrioventricular block · hallucination · psychotic disorder · suicidal tendencies · syncope

► **Frequency not known** Agranulocytosis

● **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with lacosamide. See under Epilepsy p. 304 for more information.

● PREGNANCY

Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● HEPATIC IMPAIRMENT

Dose adjustments Consult product literature.

- **RENAL IMPAIRMENT** Consult product literature.

● DIRECTIONS FOR ADMINISTRATION

For *intermittent intravenous infusion*, manufacturer advises give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9% or Lactated Ringer's Solution; give over 15–60 minutes—give doses greater than 200 mg over at least 30 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of syrup may include strawberry.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Lacosamide for preventing seizures www.medicinesforchildren.org.uk/lacosamide-for-preventing-seizures

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

SMC No. 532/09

The *Scottish Medicines Consortium* has advised (February 2009) that lacosamide (*Vimpat*®) is accepted for restricted use within NHS Scotland as adjunctive treatment for focal seizures with or without secondary generalisation in patients from 16 years. It is restricted for specialist use in refractory epilepsy.

SMC No. 1301/18

The *Scottish Medicines Consortium* has advised (February 2018) that lacosamide (*Vimpat*®) is accepted for restricted use within NHS Scotland as adjunctive treatment for focal seizures with or without secondary generalisation in adolescents and children from 4 years of age with epilepsy. It is restricted for specialist use in refractory epilepsy.

All Wales Medicines Strategy Group (AWMSG) Decisions

AWMSG No. 3343

The *All Wales Medicines Strategy Group* has advised (March 2018) that lacosamide (*Vimpat*®) is recommended as an option for use within NHS Wales as adjunctive therapy in the treatment of focal seizures with or without secondary generalisation in children from 4 years of age up to 15 years of age with epilepsy.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Vimpat** (UCB Pharma Ltd)

Lacosamide 10 mg per 1 ml Vimpat 200mg/20ml solution for infusion vials | 1 vial [PoM] £29.70

Oral solution

CAUTIONARY AND ADVISORY LABELS 8

EXCIPIENTS: May contain Aspartame, propylene glycol

ELECTROLYTES: May contain Sodium

- ▶ **Vimpat** (UCB Pharma Ltd)

Lacosamide 10 mg per 1 ml Vimpat 10mg/ml syrup sugar-free | 200 ml [PoM] £25.74 DT = £25.74

Tablet

CAUTIONARY AND ADVISORY LABELS 8

- ▶ **Vimpat** (UCB Pharma Ltd)

Lacosamide 50 mg Vimpat 50mg tablets | 14 tablet [PoM] £10.81 DT = £10.81

Lacosamide 100 mg Vimpat 100mg tablets | 14 tablet [PoM] £21.62 | 56 tablet [PoM] £86.50 DT = £86.50

Lacosamide 150 mg Vimpat 150mg tablets | 14 tablet [PoM] £32.44 | 56 tablet [PoM] £129.74 DT = £129.74

Lacosamide 200 mg Vimpat 200mg tablets | 56 tablet [PoM] £144.16 DT = £144.16

Lamotrigine

● INDICATIONS AND DOSE

Monotherapy of focal seizures | Monotherapy of primary and secondary generalised tonic-clonic seizures | Monotherapy of seizures associated with Lennox-Gastaut syndrome

► BY MOUTH

- ▶ Child 12–17 years: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses; increased if necessary up to 500 mg daily, dose titration should be repeated if restarting after interval of more than 5 days
- ▶ Adult: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses; increased if necessary up to 500 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

Adjunctive therapy of focal seizures with valproate |

Adjunctive therapy of primary and secondary generalised tonic-clonic seizures with valproate |

Adjunctive therapy of seizures associated with Lennox-Gastaut syndrome with valproate

► BY MOUTH

- ▶ Child 2–11 years (body-weight up to 13 kg): Initially 2 mg once daily on alternate days for first 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7–14 days; maintenance 1–5 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
- ▶ Child 2–11 years (body-weight 13 kg and above): Initially 150 micrograms/kg once daily for 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7–14 days; maintenance 1–5 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
- ▶ Child 12–17 years: Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then increased in steps of up to 50 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days
- ▶ Adult: Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then increased in steps of up to 50 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

Adjunctive therapy of focal seizures (with enzyme inducing drugs) without valproate | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures (with enzyme inducing drugs) without valproate | Adjunctive therapy of seizures associated with Lennox-Gastaut syndromes (with enzyme inducing drugs) without valproate

► BY MOUTH

- ▶ Child 2–11 years: Initially 300 micrograms/kg twice daily for 14 days, then 600 micrograms/kg twice daily for further 14 days, then increased in steps of up to 1.2 mg/kg every 7–14 days; maintenance 5–15 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 400 mg per day

- **Child 12-17 years:** Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 200–400 mg daily in 2 divided doses, increased if necessary up to 700 mg daily, dose titration should be repeated if restarting after interval of more than 5 days
- **Adult:** Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 200–400 mg daily in 2 divided doses, increased if necessary up to 700 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

Adjunctive therapy of focal seizures (without enzyme inducing drugs) without valproate | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures (without enzyme inducing drugs) without valproate | Adjunctive therapy of seizures associated with Lennox-Gastaut syndromes (without enzyme inducing drugs) without valproate

► BY MOUTH

- **Child 2-11 years:** Initially 300 micrograms/kg daily in 1–2 divided doses for 14 days, then 600 micrograms/kg daily in 1–2 divided doses for further 14 days, then increased in steps of up to 600 micrograms/kg every 7–14 days; maintenance 1–10 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
- **Child 12-17 years:** Initially 25 mg once daily for 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days
- **Adult:** Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

Monotherapy or adjunctive therapy of bipolar disorder (without enzyme inducing drugs) without valproate

► BY MOUTH

- **Adult:** Initially 25 mg once daily for 14 days, then 50 mg daily in 1–2 divided doses for further 14 days, then 100 mg daily in 1–2 divided doses for further 7 days; maintenance 200 mg daily in 1–2 divided doses, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days; maximum 400 mg per day

Adjunctive therapy of bipolar disorder with valproate

► BY MOUTH

- **Adult:** Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then 50 mg daily in 1–2 divided doses for further 7 days; maintenance 100 mg daily in 1–2 divided doses, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day

Adjunctive therapy of bipolar disorder (with enzyme inducing drugs) without valproate

► BY MOUTH

- **Adult:** Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased to

100 mg twice daily for further 7 days, then increased to 150 mg twice daily for further 7 days; maintenance 200 mg twice daily, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Do not confuse the different combinations or indications.

- **CAUTIONS** Myoclonic seizures (may be exacerbated) • Parkinson's disease (may be exacerbated)
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
 - **Common or very common** Aggression • agitation • arthralgia • diarrhoea • dizziness • drowsiness • dry mouth • fatigue • headache • irritability • nausea • pain • rash • sleep disorders • tremor • vomiting
 - **Uncommon** Alopecia • movement disorders • vision disorders
 - **Rare or very rare** Confusion • conjunctivitis • disseminated intravascular coagulation • face oedema • fever • hallucination • hepatic disorders • lupus-like syndrome • lymphadenopathy • meningitis aseptic • multi organ failure • nystagmus • seizure • severe cutaneous adverse reactions (SCARs) • tic

SIDE-EFFECTS, FURTHER INFORMATION Serious skin reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis have developed (especially in children); most rashes occur in the first 8 weeks. Rash is sometimes associated with hypersensitivity syndrome and is more common in patients with history of allergy or rash from other antiepileptic drugs. Consider withdrawal if rash or signs of hypersensitivity syndrome develop. Factors associated with increased risk of serious skin reactions include concomitant use of valproate, initial lamotrigine dosing higher than recommended, and more rapid dose escalation than recommended.

- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with lamotrigine. See under Epilepsy p. 304 for more information.
- **PREGNANCY**
 - Monitoring** Doses should be adjusted on the basis of plasma-drug concentration monitoring.
- **BREAST FEEDING** Present in milk, but limited data suggest no harmful effect on infant.
- **HEPATIC IMPAIRMENT**
 - Dose adjustments** Halve dose in moderate impairment. Quarter dose in severe impairment.
- **RENAL IMPAIRMENT** Caution in renal failure; metabolite may accumulate.
 - Dose adjustments** Consider reducing maintenance dose in significant impairment.
- **TREATMENT CESSATION** Avoid abrupt withdrawal (taper off over 2 weeks or longer) unless serious skin reaction occurs.
- **PRESCRIBING AND DISPENSING INFORMATION** Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic lamotrigine product.

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Lamotrigine for preventing seizures www.medicinesforchildren.org.uk/lamotrigine-for-preventing-seizures

Skin reactions Warn patients and carers to see their doctor immediately if rash or signs or symptoms of hypersensitivity syndrome develop.

Blood disorders Patients and their carers should be alert for symptoms and signs suggestive of bone-marrow failure, such as anaemia, bruising, or infection. Aplastic anaemia, bone-marrow depression, and pancytopenia have been associated rarely with lamotrigine.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 8, 13

Levetiracetam

03-Apr-2018

● INDICATIONS AND DOSE

Monotherapy of focal seizures with or without secondary generalisation

► BY MOUTH, OR BY INTRAVENOUS INFUSION

► Child 16-17 years: Initially 250 mg once daily for 1 week, then increased to 250 mg twice daily, then increased in steps of 250 mg twice daily (max. per dose 1.5 g twice daily), adjusted according to response, dose to be increased every 2 weeks

► Adult: Initially 250 mg once daily for 1-2 weeks, then increased to 250 mg twice daily, then increased in steps of 250 mg twice daily (max. per dose 1.5 g twice daily), adjusted according to response, dose to be increased every 2 weeks

Adjunctive therapy of focal seizures with or without secondary generalisation

► BY MOUTH

- Child 1-5 months: Initially 7 mg/kg once daily, then increased in steps of up to 7 mg/kg twice daily (max. per dose 21 mg/kg twice daily), dose to be increased every 2 weeks
- Child 6 months-17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
- Child 12-17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2-4 weeks
- Adult: Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2-4 weeks

► BY INTRAVENOUS INFUSION

- Child 4-17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
- Child 12-17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks
- Adult: Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2-4 weeks

Adjunctive therapy of myoclonic seizures and tonic-clonic seizures

► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Child 12-17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
- Child 12-17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks
- Adult: Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2-4 weeks

- **UNLICENSED USE** [EwGr] Initial dosing recommendations for levetiracetam [E] in BNF Publications differ from product licence.

Manufacturer advises *granules* not licensed for use in children under 6 years, for initial treatment in children with body-weight less than 25 kg, or for the administration of doses below 250 mg—oral solution should be used.

- **INTERACTIONS** → Appendix 1: antiepileptics

● SIDE-EFFECTS

- **Common or very common** Anxiety · appetite decreased · asthenia · behaviour abnormal · cough · depression · diarrhoea · dizziness · drowsiness · gastrointestinal discomfort · headache · increased risk of infection · insomnia · mood altered · movement disorders · nausea · skin reactions · vertigo · vomiting
- **Uncommon** Alopecia · concentration impaired · confusion · hallucination · leucopenia · muscle weakness · myalgia · paraesthesia · psychotic disorder · suicidal tendencies · thrombocytopenia · vision disorders · weight changes
- **Rare or very rare** Acute kidney injury · agranulocytosis · hepatic disorders · hyponatraemia · neutropenia · pancreatitis · pancytopenia · personality disorder · rhabdomyolysis · severe cutaneous adverse reactions (SCARs) · thinking abnormal

● PREGNANCY

Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

It is recommended that the fetal growth should be monitored.

- **BREAST FEEDING** Present in milk—manufacturer advises avoid.

● HEPATIC IMPAIRMENT

Dose adjustments ▶ In adults Halve dose in severe hepatic impairment if eGFR less than 60 mL/minute/1.73 m².

▶ In children Halve dose in severe hepatic impairment if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².

● RENAL IMPAIRMENT

Dose adjustments ▶ In children Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m² (consult product literature).

▶ In adults Maximum 2 g daily if eGFR 50–80 mL/minute/1.73 m². Maximum 1.5 g daily if eGFR 30–50 mL/minute/1.73 m². Maximum 1 g daily if eGFR less than 30 mL/minute/1.73 m².

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion* (Keppra®), dilute requisite dose with at least 100 mL Glucose 5% or Sodium Chloride 0.9%; give over 15 minutes.
- ▶ With oral use For administration of *oral solution*, requisite dose may be diluted in a glass of water.

- **PRESCRIBING AND DISPENSING INFORMATION** If switching between oral therapy and intravenous therapy (for those temporarily unable to take oral medication), the intravenous dose should be the same as the established oral dose.

Oxcarbazepine

● INDICATIONS AND DOSE

Monotherapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures

- ▶ **BY MOUTH**

- ▶ Child 6–17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maximum 46 mg/kg per day
- ▶ Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

Adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures

- ▶ **BY MOUTH**

- ▶ Child 6–17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maintenance 15 mg/kg twice daily; maximum 46 mg/kg per day
- ▶ Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

Treatment of primary generalised tonic-clonic seizures

- ▶ **BY MOUTH**

- ▶ Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ In adjunctive therapy, the dose of concomitant antiepileptics may need to be reduced when using high doses of oxcarbazepine.

- **UNLICENSED USE** Not licensed for the treatment of primary generalised tonic-clonic seizures.

- **CAUTIONS** Avoid in Acute porphyrias p. 1025 · cardiac conduction disorders · heart failure · hyponatraemia

- **INTERACTIONS** → Appendix 1: antiepileptics

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · agitation · alopecia · asthenia · ataxia · concentration impaired · constipation · depression · diarrhoea · dizziness · drowsiness · emotional lability · headache · hyponatraemia · nausea · nystagmus · skin reactions · vertigo · vision disorders · vomiting
- ▶ **Uncommon** Leucopenia
- ▶ **Rare or very rare** Angioedema · arrhythmia · atrioventricular block · hepatitis · hypothyroidism · pancreatitis · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · thrombocytopenia
- ▶ **Frequency not known** Agranulocytosis · bone disorders · bone marrow disorders · hypertension · inappropriate antidiuretic hormone secretion like-syndrome · neutropenia · speech impairment

- **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with hypersensitivity to carbamazepine. Antiepileptic hypersensitivity syndrome associated with oxcarbazepine. See under Epilepsy p. 304 for more information.

● PREGNANCY

Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Amount probably too small to be harmful but manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Caution in severe impairment—no information available.

● RENAL IMPAIRMENT

Dose adjustments ▶ In adults Halve initial dose if eGFR less than 30 mL/minute/1.73 m²; increase according to response at intervals of at least 1 week.

- ▶ In children Halve initial dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m², increase according to response at intervals of at least 1 week.

- **PRE-TREATMENT SCREENING** Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

● MONITORING REQUIREMENTS

- ▶ Monitor plasma-sodium concentration in patients at risk of hyponatraemia.
- ▶ Monitor body-weight in patients with heart failure.

- **PRESCRIBING AND DISPENSING INFORMATION** Patients may need to be maintained on a specific manufacturer's branded or generic oxcarbazepine product.

Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

● PATIENT AND CARER ADVICE

Medicines for Children: Oxcarbazepine for preventing seizures www.medicinesforchildren.org.uk/oxcarbazepine-for-preventing-seizures

Blood, hepatic, or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as lethargy, confusion, muscular twitching, fever, rash, blistering, mouth ulcers, bruising, or bleeding develop.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Oral suspension

CAUTIONARY AND ADVISORY LABELS 3, 8

EXCIPIENTS: May contain Propylene glycol

Perampanel

● INDICATIONS AND DOSE

Adjunctive treatment of focal seizures with or without secondary generalised seizures

- ▶ **BY MOUTH**

- ▶ Child 12–17 years: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response; maintenance 4–8 mg once daily; maximum 12 mg per day
- ▶ Adult: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response; maintenance 4–8 mg once daily; maximum 12 mg per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Titrate at intervals of at least 1 week with concomitant carbamazepine, fosphenytoin, oxcarbazepine, or phenytoin.

- **INTERACTIONS** → Appendix 1: antiepileptics

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · appetite abnormal · back pain · behaviour abnormal · confusion · dizziness · drowsiness · dysarthria · fatigue · gait abnormal · irritability · movement disorders · nausea · vertigo · vision disorders · weight increased

- **PREGNANCY** Manufacturer advises avoid.

Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

Dose adjustments Increase at intervals of at least 2 weeks, up to max. 8 mg daily in mild or moderate impairment.

- **RENAL IMPAIRMENT** Avoid in moderate or severe impairment.

● PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients may need to be maintained on a specific manufacturer's branded or generic perampanel product.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 3, 8, 25

• Fycompa (Eisai Ltd)

Phenytoin

19-Apr-2017

• INDICATIONS AND DOSE

Tonic-clonic seizures | Focal seizures

► BY MOUTH

- Child 1 month–11 years: Initially 1.5–2.5 mg/kg twice daily, then adjusted according to response to 2.5–5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), dose also adjusted according to plasma-phenytoin concentration; maximum 300 mg per day
- Child 12–17 years: Initially 75–150 mg twice daily, then adjusted according to response to 150–200 mg twice daily (max. per dose 300 mg twice daily), dose also adjusted according to plasma-phenytoin concentration

Tonic-clonic seizures | Focal seizures | Prevention and treatment of seizures during or following neurosurgery or severe head injury

► BY MOUTH

- Adult: Initially 3–4 mg/kg daily, alternatively 150–300 mg once daily, alternatively 150–300 mg daily in 2 divided doses; usual maintenance 200–500 mg daily, to be taken preferably with or after food, dose to be increased gradually as necessary (with plasma-phenytoin concentration monitoring), exceptionally, higher doses may be used

Prevention and treatment of seizures during or following neurosurgery or severe head injury

► BY MOUTH

- Child: Initially 2.5 mg/kg twice daily, then adjusted according to response to 4–8 mg/kg daily, dose also adjusted according to plasma-phenytoin concentration; maximum 300 mg per day

Status epilepticus | Acute symptomatic seizures associated with head trauma or neurosurgery

► INITIALLY BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Child 1 month–11 years: Loading dose 20 mg/kg, then (by slow intravenous injection or by intravenous infusion) 2.5–5 mg/kg twice daily
- Child 12–17 years: Loading dose 20 mg/kg, then (by intravenous infusion or by slow intravenous injection) up to 100 mg 3–4 times a day
- Adult: Loading dose 20 mg/kg (max. per dose 2 g), then (by intravenous infusion or by slow intravenous injection or by mouth) maintenance 100 mg every 6–8 hours adjusted according to plasma-concentration monitoring

DOSE EQUIVALENCE AND CONVERSION

- Preparations containing phenytoin sodium are not bioequivalent to those containing phenytoin base

(such as *Epanutin Infatabs*® and *Epanutin*® suspension); 100 mg of phenytoin sodium is approximately equivalent in therapeutic effect to 92 mg phenytoin base. The dose is the same for all phenytoin products when initiating therapy. However, if switching between these products the difference in phenytoin content may be clinically significant. Care is needed when making changes between formulations and plasma-phenytoin concentration monitoring is recommended.

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).
- With intravenous use Phenytoin doses in BNF publications may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF DEATH AND SEVERE HARM FROM ERROR WITH INJECTABLE PHENYTOIN (NOVEMBER 2016)

Use of injectable phenytoin is error-prone throughout the prescribing, preparation, administration and monitoring processes; all relevant staff should be made aware of appropriate guidance on the safe use of injectable phenytoin to reduce the risk of error.

• CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Acute porphyrias p. 1025

SPECIFIC CONTRA-INDICATIONS

- With intravenous use Second- and third-degree heart block · sino-atrial block · sinus bradycardia · Stokes-Adams syndrome
- **CAUTIONS**
- **GENERAL CAUTIONS** Enteral feeding (interrupt feeding for 2 hours before and after dose; more frequent monitoring may be necessary)
- **SPECIFIC CAUTIONS**
- With intravenous use Heart failure · hypotension · injection solutions alkaline (irritant to tissues) · respiratory depression · resuscitation facilities must be available
- **CAUTIONS, FURTHER INFORMATION** Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.
- Intramuscular phenytoin should not be used (absorption is slow and erratic).
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS Agranulocytosis · bone disorders · bone fracture · bone marrow disorders · cerebrovascular insufficiency · coarsening of the facial features · confusion · constipation · dizziness · drowsiness · Dupuytren's contracture · dysarthria · eosinophilia · fever · gingival hyperplasia (maintain good oral hygiene) · granulocytopenia · hair changes · headache · hepatic disorders · hypersensitivity · insomnia · joint disorders · leucopenia · lip swelling · lymphatic abnormalities · macrocytosis · megaloblastic anaemia · movement disorders · muscle twitching · nausea · neoplasms · nephritis tubulointerstitial · nervousness · nystagmus · paraesthesia · Peyronie's disease · polyarteritis nodosa · pseudolymphoma · sensory peripheral polyneuropathy · severe cutaneous adverse reactions (SCARs) · skin reactions · systemic lupus erythematosus (SLE) · taste altered · thrombocytopenia · tremor · vertigo · vomiting

SPECIFIC SIDE-EFFECTS

- With oral use Electrolyte imbalance · pneumonitis · vitamin D deficiency
- With parenteral use Arrhythmias · atrial conduction depression (more common if injection too rapid) · cardiac arrest · hypotension · purple glove syndrome · respiratory

arrest (more common if injection too rapid) · respiratory disorders · tonic seizure (more common if injection too rapid) · ventricular conduction depression (more common if injection too rapid) · ventricular fibrillation (more common if injection too rapid)

SIDE-EFFECTS, FURTHER INFORMATION

Rash Discontinue; if mild re-introduce cautiously but discontinue immediately if recurrence.

Bradycardia and hypotension With intravenous use; reduce rate of administration if bradycardia or hypotension occurs.

Overdose Symptoms of phenytoin toxicity include nystagmus, diplopia, slurred speech, ataxia, confusion, and hyperglycaemia.

- **ALLERGY AND CROSS-SENSITIVITY** Cross-sensitivity reported with carbamazepine. Antiepileptic hypersensitivity syndrome associated with phenytoin. See under Epilepsy p. 304 for more information.

● PREGNANCY

Monitoring Changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction.

Doses should be adjusted on the basis of plasma-drug concentration monitoring.

- **BREAST FEEDING** Small amounts present in milk, but not known to be harmful.
- **HEPATIC IMPAIRMENT**
Dose adjustments Reduce dose to avoid toxicity.
- **PRE-TREATMENT SCREENING** HLAB* 1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens–Johnson syndrome).

● MONITORING REQUIREMENTS

- ▶ Manufacturer recommends blood counts (but evidence of practical value uncertain).
- ▶ In adults The usual total plasma-phenytoin concentration for optimum response is 10–20 mg/litre (or 40–80 micromol/litre). In pregnancy, the elderly, and certain disease states where protein binding may be reduced, careful interpretation of total plasma-phenytoin concentration is necessary; it may be more appropriate to measure free plasma-phenytoin concentration.
- ▶ In children Therapeutic plasma-phenytoin concentrations reduced in first 3 months of life because of reduced protein binding. Trough plasma concentration for optimum response: neonate–3 months, 6–15 mg/litre (25–60 micromol/litre); child 3 months–18 years, 10–20 mg/litre (40–80 micromol/litre).
- ▶ With intravenous use Monitor ECG and blood pressure.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises each injection or infusion should be preceded and followed by an injection of Sodium Chloride 0.9% through the same needle or catheter to avoid local venous irritation.
- ▶ With intravenous use in children **[EvGr]** For *intravenous injection*, give into a large vein at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute). **[D]** Manufacturer advises for *intravenous infusion*, dilute to a concentration not exceeding 10 mg/mL with Sodium Chloride 0.9% and give into a large vein through an in-line filter (0.22–0.50 micron). **[EvGr]** Give at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute). **[D]** Complete administration within 1 hour of preparation.
- ▶ With intravenous use in adults Manufacturer advises for *intravenous injection*, give into a large vein at a rate not exceeding 50 mg/minute; rate of 25 mg/minute or lower may be more appropriate in some patients (including the elderly and those with heart disease). Manufacturer advises for *intravenous infusion*, dilute in 50–100 mL Sodium Chloride 0.9% (final concentration not to exceed 10 mg/mL) and give into a large vein through an in-line filter (0.22–0.50 micron) at a rate not exceeding 50 mg/minute; rate of 25 mg/minute or lower may be more

appropriate in some patients (including the elderly and those with heart disease). Complete administration within 1 hour of preparation.

● PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer's product.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Phenytoin for preventing seizures www.medicinesforchildren.org.uk/phenytoin-for-preventing-seizures

Blood or skin disorders Patients or their carers should be told how to recognise signs of blood or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative).

Pregabalin

● INDICATIONS AND DOSE

Peripheral and central neuropathic pain

▶ BY MOUTH

- ▶ Adult: Initially 150 mg daily in 2–3 divided doses, then increased if necessary to 300 mg daily in 2–3 divided doses, dose to be increased after 3–7 days, then increased if necessary up to 600 mg daily in 2–3 divided doses, dose to be increased after 7 days

Adjunctive therapy for focal seizures with or without secondary generalisation

► BY MOUTH

- Adult: Initially 25 mg twice daily, then increased in steps of 50 mg daily, dose to be increased at 7 day intervals, increased to 300 mg daily in 2–3 divided doses for 7 days, then increased if necessary up to 600 mg daily in 2–3 divided doses

Generalised anxiety disorder

► BY MOUTH

- Adult: Initially 150 mg daily in 2–3 divided doses, then increased in steps of 150 mg daily if required, dose to be increased at 7 day intervals, increased if necessary up to 600 mg daily in 2–3 divided doses

- **UNLICENSED USE** Pregabalin doses in BNF may differ from those in product literature.

- **CAUTIONS** Conditions that may precipitate encephalopathy · severe congestive heart failure

- **INTERACTIONS** → Appendix 1: antiepileptics

● **SIDE-EFFECTS**

- **Common or very common** Abdominal distension · appetite abnormal · asthenia · cervical spasm · concentration impaired · confusion · constipation · diarrhoea · dizziness · drowsiness · dry mouth · feeling abnormal · gait abnormal · gastrointestinal disorders · headache · increased risk of infection · joint disorders · memory loss · mood altered · movement disorders · muscle complaints · nausea · oedema · pain · sensation abnormal · sexual dysfunction · sleep disorders · speech impairment · vertigo · vision disorders · vomiting · weight changes
- **Uncommon** Aggression · anxiety · arrhythmias · atrioventricular block · breast abnormalities · chest tightness · chills · consciousness impaired · cough · depression · dry eye · dyspnoea · epistaxis · eye discomfort · eye disorders · eye inflammation · fever · hallucination · hyperacusis · hypertension · hypoglycaemia · hypotension · malaise · menstrual cycle irregularities · nasal complaints · neutropenia · oral disorders · peripheral coldness · psychiatric disorders · reflexes decreased · skin reactions · snoring · sweat changes · syncope · taste loss · thirst · urinary disorders · vasodilation
- **Rare or very rare** Altered smell sensation · ascites · dysgraphia · dysphagia · gynaecomastia · hepatic disorders · pancreatitis · QT interval prolongation · renal impairment · rhabdomyolysis · Stevens-Johnson syndrome · throat tightness

● **RENAL IMPAIRMENT**

Dose adjustments Initially 75 mg daily and maximum 300 mg daily if eGFR 30–60 mL/minute/1.73 m².

Initially 25–50 mg daily and maximum 150 mg daily in 1–2 divided doses if eGFR 15–30 mL/minute/1.73 m².

Initially 25 mg once daily and maximum 75 mg once daily if eGFR less than 15 mL/minute/1.73 m².

- **TREATMENT CESSATION** Avoid abrupt withdrawal (taper over at least 1 week).

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

● **NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (July 2007) that pregabalin (*Lyrica*®) is not recommended for the treatment of central neuropathic pain.

The *Scottish Medicines Consortium* has advised (April 2009) that pregabalin (*Lyrica*®) is accepted for restricted use within NHS Scotland for the treatment of peripheral neuropathic pain in adults who have not achieved adequate pain relief with, or have not tolerated, first- or second-line treatments; discontinue treatment if sufficient

benefit is not achieved within 8 weeks of reaching the maximum tolerated dose.

Rufinamide

● INDICATIONS AND DOSE

Adjunctive treatment of seizures in Lennox-Gastaut syndrome

► BY MOUTH

- Child 4-17 years (body-weight up to 30 kg): Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 500 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- Child 4-17 years (body-weight 30-49 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 900 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- Child 4-17 years (body-weight 50-69 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.2 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- Child 4-17 years (body-weight 70 kg and above): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.6 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- Adult (body-weight 30-49 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 900 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- Adult (body-weight 50-69 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.2 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- Adult (body-weight 70 kg and above): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.6 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

Adjunctive treatment of seizures in Lennox-Gastaut syndrome with valproate

► BY MOUTH

- Child 4-17 years (body-weight up to 30 kg): Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 300 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

- **INTERACTIONS** → Appendix 1: antiepileptics

● SIDE-EFFECTS

- **Common or very common** Anxiety · appetite decreased · back pain · constipation · diarrhoea · dizziness · drowsiness · eating disorder · epistaxis · fatigue · gait abnormal · gastrointestinal discomfort · headache · increased risk of infection · insomnia · movement disorders · nausea · nystagmus · oligomenorrhoea · seizures · skin reactions · tremor · vertigo · vision disorders · vomiting · weight decreased

- **Uncommon** Hypersensitivity

- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with rufinamide. See under Epilepsy p. 304 for more information.

● PREGNANCY

- **Monitoring** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

- **Dose adjustments** Caution and careful dose titration in mild to moderate impairment.

- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed and given in half a glass of water.

● PRESCRIBING AND DISPENSING INFORMATION

- Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

- Patients may need to be maintained on a specific manufacturer's branded or generic rufinamide product.

- **PATIENT AND CARER ADVICE** Counselling on antiepileptic hypersensitivity syndrome is advised.

- Medicines for Children leaflet: Rufinamide for preventing seizures www.medicinesforchildren.org.uk/rufinamide-for-preventing-seizures

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

- The *Scottish Medicines Consortium* has advised (October 2008) that rufinamide (*Inovelon*®) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of seizures associated with Lennox-Gastaut syndrome in patients 4 years and above. It is restricted for use when alternative traditional antiepileptic drugs are unsatisfactory.

● MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

CAUTIONARY AND ADVISORY LABELS 8, 21

EXCIPIENTS: May contain Propylene glycol

► **Inovelon** (Eisai Ltd)

Rufinamide 40 mg per 1 ml Inovelon 40mg/ml oral suspension sugar-free | 460 ml [PoM] £94.71 DT = £94.71

Tablet

CAUTIONARY AND ADVISORY LABELS 8, 21

► **Inovelon** (Eisai Ltd)

Rufinamide 100 mg Inovelon 100mg tablets | 10 tablet [PoM] £5.15

Rufinamide 200 mg Inovelon 200mg tablets | 60 tablet [PoM] £61.77

Rufinamide 400 mg Inovelon 400mg tablets | 60 tablet [PoM] £102.96

Sodium valproate

24-Apr-2018

● INDICATIONS AND DOSE

All forms of epilepsy

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 1 month–11 years: Initially 10–15 mg/kg daily in 1–2 divided doses (max. per dose 600 mg); maintenance 25–30 mg/kg daily in 2 divided doses, doses up to 60 mg/kg daily in 2 divided doses may be used in infantile spasms; monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily
- Child 12–17 years: Initially 600 mg daily in 1–2 divided doses, increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily in 2 divided doses; maximum 2.5 g per day
- Adult: Initially 600 mg daily in 1–2 divided doses, then increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily, alternatively maintenance 20–30 mg/kg daily; maximum 2.5 g per day

Initiation of valproate treatment

- INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 10 mg/kg, (usually 400–800 mg), followed by (by intravenous infusion or by intravenous injection) up to 2.5 g daily in 2–4 divided doses, alternatively (by continuous intravenous infusion) up to 2.5 g daily; (by intravenous injection or by intravenous infusion or by continuous intravenous infusion) usual dose 1–2 g daily, alternatively (by intravenous injection or by intravenous infusion or by continuous intravenous infusion) usual dose 20–30 mg/kg daily, intravenous injection to be administered over 3–5 minutes

Continuation of valproate treatment

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY CONTINUOUS INTRAVENOUS INFUSION
- Adult: If switching from oral therapy to intravenous therapy give the same dose as current oral daily dose, give over 3–5 minutes by intravenous injection or in 2–4 divided doses by intravenous infusion

Migraine prophylaxis

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 200 mg twice daily, then increased if necessary to 1.2–1.5 g daily in divided doses

EPILIM CHRONOSPHERE[®]

All forms of epilepsy

- BY MOUTH
- Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

EPILIM CHRONO[®]

All forms of epilepsy

- BY MOUTH
- Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

EPISENTA[®] CAPSULES

All forms of epilepsy

- BY MOUTH
- Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

Mania

- BY MOUTH
- Adult: Initially 750 mg daily in 1–2 divided doses, adjusted according to response, usual dose 1–2 g daily in 1–2 divided doses, doses greater than 45 mg/kg daily require careful monitoring

EPISENTA[®] GRANULES

All forms of epilepsy

- BY MOUTH
- Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

Mania

- BY MOUTH
- Adult: Initially 750 mg daily in 1–2 divided doses, adjusted according to response, usual dose 1–2 g daily in 1–2 divided doses, doses greater than 45 mg/kg daily require careful monitoring

EPIVAL[®]

All forms of epilepsy

- BY MOUTH
- Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

- **UNLICENSED USE** Not licensed for migraine prophylaxis.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: VALPROATE MEDICINES: CONTRA-INDICATED IN WOMEN AND GIRLS OF CHILDBEARING POTENTIAL UNLESS CONDITIONS OF PREGNANCY PREVENTION PROGRAMME ARE MET (APRIL 2018)

Valproate is highly teratogenic and evidence supports that use in pregnancy leads to neurodevelopmental disorders (approx. 30–40% risk) and congenital malformations (approx. 10% risk).

Valproate must not be used in women and girls of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met (see *Conception and contraception*) and only if other treatments are ineffective or not tolerated, as judged by an experienced specialist.

Use of valproate in pregnancy is contra-indicated for migraine prophylaxis [unlicensed] and bipolar disorder; it must only be considered for epilepsy if there is no suitable alternative treatment (see *Pregnancy*).

Women and girls (and their carers) must be fully informed of the risks and the need to avoid exposure to valproate medicines in pregnancy; supporting materials have been provided to use in the implementation of the Pregnancy Prevention Programme (see *Prescribing and dispensing Information*). The MHRA advises that:

- GPs must recall all women and girls who may be of childbearing potential, provide the Patient Guide, check they have been reviewed by a specialist in the last year and are on highly effective contraception;
- Specialists must book in review appointments at least annually with women and girls under the Pregnancy Prevention Programme, re-evaluate treatment as necessary, explain clearly the conditions as outlined in the supporting materials and complete and sign the Risk Acknowledgement Form—copies of the form must be given to the patient or carer and sent to their GP;
- Pharmacists must ensure valproate medicines are dispensed in whole packs whenever possible—all packs dispensed to women and girls of childbearing potential should have a warning label either on the carton or via a sticker. They must also discuss risks in pregnancy with female patients each time valproate medicines are dispensed, ensure they have the Patient Guide and have seen their GP or specialist to discuss their treatment and the need for contraception.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1025 · known or suspected mitochondrial disorders (higher rate of acute liver failure and liver-related deaths) · personal or family history of severe hepatic dysfunction
- **CAUTIONS** Systemic lupus erythematosus

CAUTIONS, FURTHER INFORMATION Consider vitamin D supplementation in patients that are immobilised for long

periods or who have inadequate sun exposure or dietary intake of calcium.

- ▶ **Liver toxicity** Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).

● **INTERACTIONS** → Appendix 1: antiepileptics

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · agitation · alopecia (regrowth may be curly) · anaemia · behaviour abnormal · concentration impaired · confusion · deafness · diarrhoea · dizziness · drowsiness · haemorrhage · headache · hepatic disorders · hypersensitivity · hyponatraemia · memory loss · menstrual cycle irregularities · movement disorders · nausea · nystagmus · seizures · stupor · thrombocytopenia · tremor · weight increased
- ▶ **Uncommon** Angioedema · bone disorders · bone fracture · bone marrow disorders · coma · encephalopathy · leucopenia · pancreatitis · paraesthesia · parkinsonism · peripheral oedema · pleural effusion · SIADH · skin reactions · vasculitis
- ▶ **Rare or very rare** Agranulocytosis · cerebral atrophy · cognitive disorder · dementia · enuresis · gynaecomastia · hirsutism · hyperammonaemia · hypothyroidism · infertility male · learning disability · myelodysplastic syndrome · polycystic ovaries · red blood cell abnormalities · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · urine abnormalities
- ▶ **Frequency not known** Alertness increased · hallucination

SIDE-EFFECTS, FURTHER INFORMATION

Hepatic dysfunction Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.

Pancreatitis Discontinue treatment if symptoms of pancreatitis develop.

- **CONCEPTION AND CONTRACEPTION** The MHRA advises that all women and girls of childbearing potential being treated with valproate medicines must be supported on a Pregnancy Prevention Programme—pregnancy should be excluded before treatment initiation and highly effective contraception must be used during treatment.
- **PREGNANCY** For *migraine prophylaxis* [unlicensed] and *bipolar disorder*, the MHRA advises that valproate must not be used. For *epilepsy*, the MHRA advises valproate must not be used unless there is no suitable alternative treatment; in such cases, access to counselling about the risks should be provided (see Healthcare Professional Guide for more information) and a Risk Acknowledgement Form signed by both specialist and patient. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses or as modified-release tablets to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Neonatal bleeding (related to hypofibrinaemia) reported. Neonatal hepatotoxicity also reported.
- Monitoring** Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy.

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Present in milk—risk of haematological disorders in breast-fed newborns and infants.
- **HEPATIC IMPAIRMENT** Avoid if possible—hepatotoxicity and hepatic failure may occasionally occur (usually in first 6 months). Avoid in active liver disease.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose.
- **MONITORING REQUIREMENTS**
 - ▶ Plasma-valproate concentrations are not a useful index of efficacy, therefore routine monitoring is unhelpful.
 - ▶ Monitor liver function before therapy and during first 6 months especially in patients most at risk.
 - ▶ Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.
- **EFFECT ON LABORATORY TESTS** False-positive urine tests for ketones.
- **TREATMENT CESSATION** ^[EvGr] Avoid abrupt withdrawal; if treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks. ^(A)
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use in children For *intravenous injection*, may be diluted in Glucose 5% or Sodium Chloride 0.9% and given over 3–5 minutes. For *intravenous infusion*, dilute injection solution with Glucose 5% or Sodium Chloride 0.9%.
 - ▶ With intravenous use in adults For *intravenous infusion* (*Epilim*®, *Episenta*®), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute *Epilim*® with solvent provided then dilute with infusion fluid.
 - ▶ With rectal use in children For *rectal administration*, sodium valproate oral solution may be given rectally and retained for 15 minutes (may require dilution with water to prevent rapid expulsion).
- **EPIVAL**® Tablets may be halved but not crushed or chewed.
- **EPISENTA**® **CAPSULES** Contents of capsule may be mixed with cold soft food or drink and swallowed immediately without chewing.
- **EPIILIM**® **SYRUP** May be diluted, preferably in Syrup BP; use within 14 days.
- **EPISENTA**® **GRANULES** Granules may be mixed with cold soft food or drink and swallowed immediately without chewing.
- **EPIILIM CHRONOSPHERE**® Granules may be mixed with soft food or drink that is cold or at room temperature, and swallowed immediately without chewing.
- **PRESCRIBING AND DISPENSING INFORMATION** The Pregnancy Prevention Programme is supported by the following materials provided by the manufacturer: *Patient Guide*, *Guide for Healthcare Professionals*, *Risk Acknowledgement Form*, and for pharmacists, *Patient Cards and Stickers with warning symbols*; the MHRA has also produced a patient information sheet providing advice for women and girls taking valproate medicines.
Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.
Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic oral sodium valproate product.
- **EPIILIM CHRONOSPHERE**® Prescribe dose to the nearest whole 50-mg sachet.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Sodium valproate for preventing seizures www.medicinesforchildren.org.uk/sodium-valproate-for-preventing-seizures

Valproate use by women and girls The MHRA advises women and girls should **not** stop taking valproate without first discussing it with their doctor.

Blood or hepatic disorders Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.

Pancreatitis Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop.

Pregnancy Prevention Programme Pharmacists must ensure that female patients have a patient card—see also *Important safety information*.

EPISENTA® CAPSULES Patients and carers should be counselled on the administration of capsules.

EPISENTA® GRANULES Patients and carers should be counselled on the administration of granules.

EPIILIM CHRONOSPHERE® Patients and carers should be counselled on the administration of granules.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 8, 10, 21, 25

► **Epilim Chrono** (Sanofi) ▼

Sodium valproate 200 mg Epilim Chrono 200 tablets | 100 tablet [PoM] £11.65 DT = £11.65

Tiagabine

● INDICATIONS AND DOSE

Adjunctive treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics (with enzyme-inducing drugs)

► BY MOUTH

Child 12–17 years: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every week; maintenance 30–45 mg daily in 2–3 divided doses

Adult: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every week; maintenance 30–45 mg daily in 2–3 divided doses

Adjunctive treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics (without enzyme-inducing drugs)

► BY MOUTH

Child 12–17 years: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every week; maintenance 15–30 mg daily in 2–3 divided doses

Adult: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every week; maintenance 15–30 mg daily in 2–3 divided doses

● CAUTIONS Avoid in Acute porphyrias p. 1025

CAUTIONS, FURTHER INFORMATION Tiagabine should be avoided in absence, myoclonic, tonic and atonic seizures due to risk of seizure exacerbation.

● INTERACTIONS → Appendix 1: antiepileptics

● SIDE-EFFECTS

► **Common or very common** Abdominal pain · behaviour abnormal · concentration impaired · depression · diarrhoea · dizziness · emotional lability · fatigue · gait abnormal · insomnia · nausea · nervousness · speech disorder · tremor · vision disorders · vomiting

► **Uncommon** Drowsiness · psychosis · skin reactions

► **Rare or very rare** Delusions · hallucination

● PREGNANCY

Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

● HEPATIC IMPAIRMENT

Avoid in severe impairment.
Dose adjustments In mild to moderate impairment reduce dose, prolong the dose interval, or both.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Tiagabine for preventing seizures www.medicinesforchildren.org.uk/tiagabine-for-preventing-seizures

Driving and skilled tasks May impair performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

Topiramate

25-Jan-2018

● INDICATIONS AND DOSE

Monotherapy of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation

► BY MOUTH

► Child 6-17 years: Initially 0.5–1 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 250–500 micrograms/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 50 mg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate titration regimens recommended above then smaller steps or longer interval between steps may be used; maximum 500 mg per day

► Adult: Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25–50 mg every 1–2 weeks, dose to be taken in 2 divided doses; usual dose 100–200 mg daily in 2 divided doses, adjusted according to response, doses of 1 g daily have been used in refractory epilepsy; maximum 500 mg per day

Adjunctive treatment of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation | Adjunctive treatment for seizures associated with Lennox-Gastaut syndrome

► BY MOUTH

► Child 2-17 years: Initially 1–3 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 0.5–1.5 mg/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 2.5–4.5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate recommended titration regimen then smaller steps or longer interval between steps may be used; maximum 400 mg per day

► Adult: Initially 25–50 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25–50 mg every 1–2 weeks, dose to be taken in 2 divided doses; usual dose 200–400 mg daily in 2 divided doses; maximum 400 mg per day

Migraine prophylaxis

► BY MOUTH

► Adult: Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25 mg every week; usual dose 50–100 mg daily in 2 divided doses; maximum 200 mg per day

● **CAUTIONS** Avoid in Acute porphyrias p. 1025 • risk of metabolic acidosis • risk of nephrolithiasis—ensure adequate hydration (especially in strenuous activity or warm environment)

● **INTERACTIONS** → Appendix 1: antiepileptics

● SIDE-EFFECTS

► **Common or very common** Alopecia • anaemia • anxiety • appetite abnormal • asthenia • behaviour abnormal • cognitive impairment • concentration impaired • confusion • constipation • cough • depression • diarrhoea • dizziness • drowsiness • dry mouth • dyspnoea • ear discomfort • eye disorders • feeling abnormal • fever (in children) • gait abnormal • gastrointestinal discomfort • gastrointestinal disorders • haemorrhage • hearing impairment • hypersensitivity • joint disorders • malaise • memory loss • mood altered • movement disorders (uncommon in children) • muscle complaints • muscle weakness • nasal complaints • nasopharyngitis • nausea • oral disorders • pain • seizures • sensation abnormal • skin reactions • sleep disorders • speech impairment • taste altered • tremor • urinary disorders • urolithiasis • vertigo (in children) • vision disorders • vomiting (in children) • weight changes

► **Uncommon** Abnormal sensation in eye • anhidrosis • arrhythmias • aura • cerebellar syndrome • consciousness impaired • crying • drooling • dry eye • dysgraphia • dysphonia • eosinophilia (in children) • facial swelling • hallucinations • hyperthermia (in children) • hypokalaemia • hypotension • influenza like illness • learning disability (in children) • leucopenia • lymphadenopathy • metabolic acidosis • musculoskeletal stiffness • palpitations • pancreatitis • paranasal sinus hypersecretion • peripheral coldness • peripheral neuropathy • polydipsia • psychotic disorder • renal pain • sexual dysfunction • smell altered • suicidal tendencies • syncope • thinking abnormal • thirst • thrombocytopenia • vasodilation

► **Rare or very rare** Eye inflammation • face oedema • glaucoma • hepatic disorders • limb discomfort • neutropenia • Raynaud's phenomenon • renal tubular acidosis • severe cutaneous adverse reactions (SCARs) • unresponsive to stimuli

SIDE-EFFECTS, FURTHER INFORMATION Topiramate has been associated with acute myopia with secondary angle-closure glaucoma, typically occurring within 1 month of starting treatment. Choroidal effusions resulting in anterior displacement of the lens and iris have also been reported. If raised intra-ocular pressure occurs: seek specialist ophthalmological advice; use appropriate measures to reduce intra-ocular pressure and stop topiramate as rapidly as feasible.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises perform pregnancy test before the initiation of treatment—a highly effective contraceptive method is advised in women of child-bearing potential; patients should be fully informed of the risks related to the use of topiramate during pregnancy.

● **PREGNANCY** Increased risk of major congenital malformations following exposure during the first trimester. *For migraine prophylaxis* manufacturer advises avoid. *For epilepsy* manufacturer advises consider alternative treatment options.

Monitoring Manufacturer advises in case of administration during first trimester, careful prenatal monitoring should be performed.

It is recommended that the fetal growth should be monitored.

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk.
- **HEPATIC IMPAIRMENT** Use with caution in moderate to severe impairment—clearance may be reduced.
- **RENAL IMPAIRMENT** Use with caution.
Dose adjustments ▶ In adults Half usual starting and maintenance dose if eGFR less than 70 mL/minute/1.73 m²—reduced clearance and longer time to steady-state plasma concentration.
 ▶ In children Half usual starting and maintenance dose if estimated glomerular filtration less than 70 mL/minute/1.73 m²—reduced clearance and longer time to steady-state plasma concentration.
- **DIRECTIONS FOR ADMINISTRATION** *Topamax*® Sprinkle capsules can either be swallowed whole or the contents of the capsule can be sprinkled on soft food and swallowed immediately without chewing.
- **PRESCRIBING AND DISPENSING INFORMATION**
 Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic topiramate product.

• PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer *Topamax*® Sprinkle capsules.

Vigabatrin

• INDICATIONS AND DOSE

Adjunctive treatment of focal seizures with or without secondary generalisation not satisfactorily controlled with other antiepileptics (under expert supervision)

▶ BY MOUTH

▶ Child 1-23 months: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg)

▶ Child 2-11 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g)

▶ Child 12-17 years: Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily

▶ Adult: Initially 1 g once daily, alternatively initially 1 g daily in 2 divided doses, then increased in steps of 500 mg every week, adjusted according to response; usual dose 2–3 g daily; maximum 3 g per day

▶ BY RECTUM

▶ Child 1-23 months: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg)

▶ Child 2-11 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g)

▶ Child 12-17 years: Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily

- **UNLICENSED USE** Granules not licensed for rectal use. Tablets not licensed to be crushed and dispersed in liquid. Vigabatrin doses in BNF publications may differ from those in product literature.

- **CONTRA-INDICATIONS** Visual field defects

- **CAUTIONS** Elderly · history of behavioural problems · history of depression · history of psychosis

CAUTIONS, FURTHER INFORMATION Vigabatrin may worsen absence, myoclonic, tonic and atonic seizures.

- ▶ Visual field defects Vigabatrin is associated with visual field defects. The onset of symptoms varies from 1 month to several years after starting. In most cases, visual field defects have persisted despite discontinuation, and further deterioration after discontinuation cannot be excluded. Product literature advises visual field testing before treatment and at 6-month intervals. Patients and their carers should be warned to report any new visual symptoms that develop and those with symptoms should be referred for an urgent ophthalmological opinion. Gradual withdrawal of vigabatrin should be considered.

- **INTERACTIONS** → Appendix 1: antiepileptics

• SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · anaemia · anxiety · arthralgia · behaviour abnormal · concentration impaired · depression · dizziness · drowsiness · eye disorders · fatigue · headache · memory loss · mood altered · nausea · oedema · paraesthesia · speech disorder ·

thinking abnormal · tremor · vision field defects · vomiting · weight increased

- **Uncommon** Movement disorders · psychotic disorder · seizure (patients with myoclonic seizures at greater risk) · skin reactions
- **Rare or very rare** Angioedema · encephalopathy · hallucination · hepatitis · optic neuritis · suicide attempt
- **Frequency not known** Muscle tone increased

SIDE-EFFECTS, FURTHER INFORMATION

Encephalopathic symptoms Encephalopathic symptoms including marked sedation, stupor, and confusion with non-specific slow wave EEG can occur rarely—reduce dose or withdraw.

Visual field defects About one-third of patients treated with vigabatrin have suffered visual field defects; counselling and careful monitoring for this side-effect are required.

● PREGNANCY

Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Present in milk—manufacturer advises avoid.

● RENAL IMPAIRMENT

Dose adjustments ► In adults Consider reduced dose or increased dose interval if eGFR less than 60 mL/minute/1.73 m².

- In children Consider reduced dose or increased dose interval if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Closely monitor neurological function.

● DIRECTIONS FOR ADMINISTRATION

- With oral use The contents of a sachet should be dissolved in water or a soft drink immediately before taking. Tablets may be crushed and dispersed in liquid.
- With rectal use Dissolve contents of sachet in small amount of water and administer rectally [unlicensed use].

- **PATIENT AND CARER ADVICE** Patients and their carers should be warned to report any new visual symptoms that develop.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Powder

CAUTIONARY AND ADVISORY LABELS 3, 8, 13

- **Sabril** (Sanofi)

Vigabatrin 500 mg Sabril 500mg oral powder sachets sugar-free | 50 sachet [PoM] £24.60 DT = £24.60

Tablet

CAUTIONARY AND ADVISORY LABELS 3, 8

- **Sabril** (Sanofi)

Vigabatrin 500 mg Sabril 500mg tablets | 100 tablet [PoM] £44.41 DT = £44.41

Adjunctive treatment for refractory focal seizures with or without secondary generalisation

► BY MOUTH

- Child 6–17 years (body-weight 20–54 kg): Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 6–8 mg/kg once daily (max. per dose 500 mg once daily), dose to be increased at 2-week intervals in patients who are **not** receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4
- Child 6–17 years (body-weight 55 kg and above): Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 300–500 mg once daily, dose to be increased at 2-week intervals in patients who are **not** receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4
- Adult: Initially 50 mg daily in 2 divided doses for 7 days, then increased to 100 mg daily in 2 divided doses, then increased in steps of 100 mg every 7 days, usual maintenance 300–500 mg daily in 1–2 divided doses, dose to be increased at 2-week intervals in patients who are **not** receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4

- **CAUTIONS** Elderly · low body-weight or poor appetite—monitor weight throughout treatment (fatal cases of weight loss reported in children) · metabolic acidosis—monitor serum bicarbonate concentration in children and those with other risk factors (consider dose reduction or discontinuation if metabolic acidosis develops) · risk factors for renal stone formation (particularly predisposition to nephrolithiasis)

CAUTIONS, FURTHER INFORMATION Avoid overheating and ensure adequate hydration especially in children, during strenuous activity or if in warm environment (fatal cases of heat stroke reported in children).

- **INTERACTIONS** → Appendix 1: antiepileptics

● SIDE-EFFECTS

- **Common or very common** Alopecia · anxiety · appetite decreased · ataxia · bradyphrenia · concentration impaired · confusion · constipation · depression · diarrhoea · dizziness · drowsiness · fatigue · fever · gastrointestinal discomfort · hypersensitivity · influenza like illness · insomnia · memory loss · mood altered · nausea · nystagmus · paraesthesia · peripheral oedema · psychosis · rash (consider discontinuation) · skin reactions · speech disorder · tremor · urolithiasis · vision disorders · vomiting · weight decreased

- **Uncommon** Behaviour abnormal · gallbladder disorders · hallucination · hypokalaemia · increased risk of infection · leucopenia · respiratory disorders · seizures · suicidal tendencies · thrombocytopenia

- **Rare or very rare** Agranulocytosis · angle closure glaucoma · anhidrosis · bone marrow disorders · coma · dyspnoea · eye pain · heat stroke · hepatocellular injury · hydronephrosis · leucocytosis · lymphadenopathy · metabolic acidosis · myasthenic syndrome · neuroleptic malignant syndrome · pancreatitis · renal failure · renal tubular acidosis · rhabdomyolysis · severe cutaneous adverse reactions (SCARs) · urine abnormal

- **Frequency not known** Sudden unexplained death in epilepsy

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in sulfonamide hypersensitivity.

Antiepileptic hypersensitivity syndrome theoretically associated with zonisamide. See under Epilepsy p. 304 for more information.

Zonisamide

14-Mar-2018

● INDICATIONS AND DOSE

Monotherapy for treatment of focal seizures with or without secondary generalisation in adults with newly diagnosed epilepsy

► BY MOUTH

- Adult: Initially 100 mg once daily for 2 weeks, then increased in steps of 100 mg every 2 weeks, usual maintenance dose 300 mg once daily; maximum 500 mg per day

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during treatment and for one month after last dose—avoid in women of childbearing potential not using effective contraception unless clearly necessary and the potential benefit outweighs risk; patients should be fully informed of the risks related to the use of zonisamide during pregnancy.

● **PREGNANCY** Manufacturer advises use only if clearly necessary and the potential benefit outweighs risk—toxicity in *animal* studies; patients should be fully informed of the risks related to the use of zonisamide during pregnancy.

Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

● **BREAST FEEDING** Manufacturer advises avoid for 4 weeks after last dose.

● **HEPATIC IMPAIRMENT** Avoid in severe impairment. **Dose adjustments** Initially increase dose at 2-week intervals if mild or moderate impairment.

● **RENAL IMPAIRMENT**

Dose adjustments Initially increase dose at 2-week intervals; discontinue if renal function deteriorates.

● **TREATMENT CESSATION** Avoid abrupt withdrawal (consult product literature for recommended withdrawal regimens in children).

● **PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients may need to be maintained on a specific manufacturer's branded or generic zonisamide product.

● **PATIENT AND CARER ADVICE** Children and their carers should be made aware of how to prevent and recognise overheating and dehydration.

Medicines for Children leaflet: Zonisamide for preventing seizures www.medicinesforchildren.org.uk/zonisamide-for-preventing-seizures

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2014) that zonisamide (*Zonegran*®) is accepted for restricted use within NHS Scotland as adjunctive treatment of focal seizures, with or without secondary generalisation, in adolescents and children aged 6 years and above. It is restricted to use on advice from specialists in paediatric neurology or epilepsy.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule
