Topiramate p. 348 can be given alone or as adjunctive treatment in generalised tonic-clonic seizures or focal seizures with or without secondary generalisation. It can be used as adjunctive treatment for seizures associated with Lennox-Gastaut syndrome and for absence, tonic and atonic seizures under specialist supervision [unlicensed]. It can also be considered as an option in myoclonic seizures [unlicensed]. Female patients should be fully informed of the risks related to the use of topiramate during pregnancy and the need to use effective contraception—for further information, see *Conception and contraception* and *Pregnancy* in the topiramate drug monograph.

Valproate

Sodium valproate p. 344 is effective in controlling tonic-clonic seizures, particularly in primary generalised epilepsy. It is a drug of choice in primary generalised tonic-clonic seizures, focal seizures, generalised absences and myoclonic seizures, and can be tried in atypical absence seizures. It is recommended as a first-line option in atonic and tonic seizures. Sodium valproate has widespread metabolic effects and monitoring of liver function tests and full blood count is essential. Because of its high teratogenic potential, valproate must not be used in females of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met and alternative treatments are ineffective or not tolerated. During pregnancy, it must not be used for epilepsy unless it is the only possible treatment. For further information see *Important safety information*, *Conception and contraception*, and *Pregnancy* in the sodium valproate and valproic acid p. 372 drug monographs.

Valproic acid (as semisodium valproate) is licensed for acute mania associated with bipolar disorder.

Zonisamide

Zonisamide p. 350 can be used alone for the treatment of focal seizures with or without secondary generalisation in adults with newly diagnosed epilepsy, and as adjunctive treatment for refractory focal seizures with or without secondary generalisation in adults and children aged 6 years and above. It can also be used under the supervision of a specialist for refractory absence and myoclonic seizures [unlicensed indications].

Benzodiazepines

Clobazam p. 353 may be used as adjunctive therapy in the treatment of generalised tonic-clonic and refractory focal seizures. It may be prescribed under the care of a specialist for refractory absence and myoclonic seizures. Clonazepam p. 354 may be prescribed by a specialist for refractory absence and myoclonic seizures, but its sedative side-effects may be prominent.

Other drugs

Acetazolamide p. 1244, a carbonic anhydrase inhibitor, has a specific role in treating epilepsy associated with menstruation. Piracetam p. 424 is used as adjunctive treatment for cortical myoclonus.

Status epilepticus**Convulsive status epilepticus**

Immediate measures to manage status epilepticus include positioning the patient to avoid injury, supporting respiration including the provision of oxygen, maintaining blood pressure, and the correction of any hypoglycaemia. Parenteral thiamine p. 1141 should be considered if alcohol abuse is suspected; pyridoxine hydrochloride p. 1141 should be given if the status epilepticus is caused by pyridoxine hydrochloride deficiency.

Seizures lasting longer than 5 minutes should be treated urgently with intravenous lorazepam p. 355 (repeated once after 10 minutes if seizures recur or fail to respond). Intravenous diazepam p. 360 is effective but it carries a high risk of thrombophlebitis (reduced by using an emulsion formulation). Absorption of diazepam from intramuscular injection or from suppositories is too slow for treatment of status epilepticus. Patients should be monitored for respiratory depression and hypotension.

Where facilities for resuscitation are not immediately available, diazepam p. 360 can be administered as a rectal solution or midazolam oromucosal solution p. 356 can be given into the buccal cavity.

Important

If, after initial treatment with benzodiazepines, seizures recur or fail to respond 25 minutes after onset, phenytoin sodium, fosphenytoin sodium p. 330, or phenobarbital sodium should be used; contact intensive care unit if seizures continue. If these measures fail to control seizures 45 minutes after onset, anaesthesia with thiopental sodium p. 354, midazolam, or a non-barbiturate anaesthetic such as propofol p. 1400 [unlicensed indication], should be instituted with full intensive care support.

Phenytoin sodium can be given by slow intravenous injection, followed by the maintenance dosage if appropriate.

Alternatively, fosphenytoin sodium (a pro-drug of phenytoin), can be given more rapidly and when given intravenously causes fewer injection-site reactions than phenytoin sodium. Although it can also be given intramuscularly, absorption is too slow by this route for treatment of status epilepticus. Doses of fosphenytoin sodium should be expressed in terms of phenytoin sodium.

Non-convulsive status epilepticus

The urgency to treat non-convulsive status epilepticus depends on the severity of the patient's condition. If there is incomplete loss of awareness, usual oral antiepileptic therapy should be continued or restarted. Patients who fail to respond to oral antiepileptic therapy or have complete lack of awareness can be treated in the same way as for convulsive status epilepticus, although anaesthesia is rarely needed.

Febrile convulsions

Brief febrile convulsions need no specific treatment; antipyretic medication (e.g. paracetamol p. 465), is commonly used to reduce fever and prevent further

convulsions but evidence to support this practice is lacking. *Prolonged febrile convulsions* (those lasting 5 minutes or longer), or *recurrent febrile convulsions* without recovery must be treated actively (as for convulsive status epilepticus). Long-term anticonvulsant prophylaxis for febrile convulsions is rarely indicated.

Other drugs used for Epilepsy and other seizure disorders Magnesium sulfate, p. 1112

ANTIEPILEPTICS**Brivaracetam**

19-Jul-2018

● INDICATIONS AND DOSE**Adjunctive therapy of focal seizures with or without secondary generalisation**

- ▶ BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 25–50 mg twice daily, adjusted according to response; usual maintenance 25–100 mg twice daily (max. per dose 100 mg twice daily)

● INTERACTIONS → Appendix 1: antiepileptics**● SIDE-EFFECTS**

- ▶ **Common or very common** Anxiety · appetite decreased · constipation · cough · depression · dizziness · drowsiness · fatigue · increased risk of infection · insomnia · irritability · nausea · vertigo · vomiting
- ▶ **Uncommon** Aggression · psychotic disorder
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—limited information available. See also *Pregnancy* in *Epilepsy* p. 321.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).
Dose adjustments Manufacturer advises consider initial dose of 25 mg twice daily; max. maintenance dose of 75 mg twice daily (limited information available).
- **TREATMENT CESSATION** Manufacturer advises avoid abrupt withdrawal—reduce daily dose in steps of 50 mg at weekly intervals, then reduce to 20 mg daily for a final week.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For intermittent *intravenous infusion*, manufacturer advises dilute in Glucose 5% or Sodium Chloride 0.9% or Lactated Ringer's solution; give over 15 minutes.
 - ▶ With oral use Manufacturer advises oral solution can be diluted in water or juice shortly before swallowing.

● PRESCRIBING AND DISPENSING INFORMATION

Manufacturer advises if switching between oral therapy and intravenous therapy (for those temporarily unable to take oral medication), the total daily dose and the frequency of administration should be maintained.

● PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if one or more doses are missed, a single dose should be taken as soon as possible and the next dose should be taken at the usual time.

Driving and skilled tasks Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness.

● NATIONAL FUNDING/ACCESS DECISIONS**Scottish Medicines Consortium (SMC) decisions**

SMC No. 1160/16

The *Scottish Medicines Consortium* has advised (July 2016) that brivaracetam (*Briviact*®) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of partial-onset seizures with or without

secondary generalisation in patients from 16 years of age with refractory epilepsy. Treatment should be initiated by physicians who have appropriate experience in the treatment of epilepsy.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3387

The *All Wales Medicines Strategy Group* has advised (December 2018) that brivaracetam (*Briivact*[®]) is recommended as an option for restricted use within NHS Wales. Brivaracetam (*Briivact*[®]) should be restricted for use in the treatment of patients with refractory epilepsy, who remain uncontrolled with, or are intolerant to, other adjunctive anti-epileptic medicines, within its licensed indication as adjunctive therapy in the treatment of partial-onset seizures with or without secondary generalisation in patients from 4 years of age with epilepsy. Brivaracetam (*Briivact*[®]) is not recommended for use within NHS Wales outside of this subpopulation.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Cannabidiol

16-Jan-2020

● INDICATIONS AND DOSE

Seizures associated with Lennox-Gastaut syndrome [adjunctive treatment with clobazam] (specialist use only)

▶ BY MOUTH

- ▶ **Adult:** Initially 2.5 mg/kg twice daily for 1 week, then increased to 5 mg/kg twice daily, then increased in steps of 2.5 mg/kg twice daily, adjusted according to response, dose to be increased at weekly intervals, food may affect absorption (take at the same time with respect to food); maximum 20 mg/kg per day

Seizures associated with Dravet syndrome [adjunctive treatment with clobazam] (specialist use only)

▶ BY MOUTH

- ▶ **Adult:** Initially 2.5 mg/kg twice daily for 1 week, then increased to 5 mg/kg twice daily, then increased in steps of 2.5 mg/kg twice daily, adjusted according to response, dose to be increased at weekly intervals, food may affect absorption (take at the same time with respect to food); maximum 20 mg/kg per day

- **CAUTIONS** Elderly

- **INTERACTIONS** → Appendix 1: cannabidiol

● SIDE-EFFECTS

- ▶ **Common or very common** Agitation · appetite abnormal · behaviour abnormal · cough · diarrhoea · drooling · drowsiness · fatigue · fever · increased risk of infection · insomnia · irritability · rash · tremor · vomiting · weight decreased
- ▶ **Frequency not known** Anaemia · seizure · suicidal tendencies
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—limited information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (risk of increased exposure).
Dose adjustments Manufacturer advises dose reduction in moderate to severe impairment—consult product literature.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor liver function at baseline, at 1 month, 3 months, and 6 months of treatment, then periodically thereafter; more frequent monitoring is recommended in patients with raised baseline ALT or AST or taking valproate. Restart monitoring schedule if dose increased above 10 mg/kg/day. If transaminase or bilirubin levels increase significantly or symptoms of hepatic dysfunction occur, treatment should be withheld or permanently discontinued based on severity—consult product literature.
- **TREATMENT CESSATION** Manufacturer advises avoid abrupt withdrawal—withdraw treatment gradually.
- **PATIENT AND CARER ADVICE**
Missed doses Manufacturer advises if more than 7 doses are missed, dose titration should be re-started.
Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of somnolence and sedation. Effects of alcohol increased.
For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including cannabis, see Drugs and driving under Guidance on prescribing p. 1.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE decisions
▶ **Cannabidiol with clobazam for treating seizures associated with Dravet syndrome (December 2019)** NICE TA614 Cannabidiol (*Epidyolex*[®]) with clobazam is recommended as an option for treating seizures associated with Dravet syndrome in patients aged 2 years and older, only if:
 - the frequency of convulsive seizures is checked every 6 months, and cannabidiol is stopped if the frequency has not fallen by at least 30% compared with the 6 months before starting treatment
 - the manufacturer provides cannabidiol according to the commercial arrangement.
 Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta614
- ▶ **Cannabidiol with clobazam for treating seizures associated with Lennox-Gastaut syndrome (December 2019)** NICE TA615 Cannabidiol (*Epidyolex*[®]) with clobazam is recommended as an option for treating seizures associated with Lennox-Gastaut syndrome in patients aged 2 years and older, only if:
 - the frequency of drop seizures is checked every 6 months, and cannabidiol is stopped if the frequency has not fallen by at least 30% compared with the 6 months before starting treatment,

- the manufacturer provides cannabidiol according to the commercial arrangement.
- Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

Carbamazepine

26-Jun-2018

● INDICATIONS AND DOSE

Focal and secondary generalised tonic-clonic seizures | Primary generalised tonic-clonic seizures

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 100–200 mg 1–2 times a day, increased in steps of 100–200 mg every 2 weeks; usual dose 0.8–1.2 g daily in divided doses; increased if necessary up to 1.6–2 g daily in divided doses
- Elderly: Reduce initial dose
- BY RECTUM
- Adult: Up to 1 g daily in 4 divided doses for up to 7 days, for short-term use when oral therapy temporarily not possible

Trigeminal neuralgia

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 100 mg 1–2 times a day, some patients may require higher initial dose, increase gradually according to response; usual dose 200 mg 3–4 times a day, increased if necessary up to 1.6 g daily

Prophylaxis of bipolar disorder unresponsive to lithium

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 400 mg daily in divided doses, increased until symptoms controlled; usual dose 400–600 mg daily; maximum 1.6 g per day

Adjunct in acute alcohol withdrawal

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 800 mg daily in divided doses, then reduced to 200 mg daily for usual treatment duration of 7–10 days, dose to be reduced gradually over 5 days

Diabetic neuropathy

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 100 mg 1–2 times a day, increased gradually according to response; usual dose 200 mg 3–4 times a day, increased if necessary up to 1.6 g daily

Focal and generalised tonic-clonic seizures

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 1 month–11 years: Initially 5 mg/kg once daily, dose to be taken at night, alternatively initially 2.5 mg/kg twice daily, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 5 mg/kg 2–3 times a day, increased if necessary up to 20 mg/kg daily
- Child 12–17 years: Initially 100–200 mg 1–2 times a day, then increased to 200–400 mg 2–3 times a day, increased if necessary up to 1.8 g daily, dose should be increased slowly

DOSE EQUIVALENCE AND CONVERSION

- Suppositories of 125 mg may be considered to be approximately equivalent in therapeutic effect to

tablets of 100 mg but final adjustment should always depend on clinical response (plasma concentration monitoring recommended).

CARBAGEN[®] SR

Focal and secondary generalised tonic-clonic seizures | Primary generalised tonic-clonic seizures

- BY MOUTH
- Adult: Initially 100–400 mg daily in 1–2 divided doses, increased in steps of 100–200 mg every 2 weeks, dose should be increased slowly; usual dose 0.8–1.2 g daily in 1–2 divided doses, increased if necessary up to 1.6–2 g daily in 1–2 divided doses
- Elderly: Reduce initial dose

Trigeminal neuralgia

- BY MOUTH
- Adult: Initially 100–200 mg daily in 1–2 divided doses, some patients may require higher initial dose, increase gradually according to response; usual dose 600–800 mg daily in 1–2 divided doses, increased if necessary up to 1.6 g daily in 1–2 divided doses

Prophylaxis of bipolar disorder unresponsive to lithium

- Adult: Initially 100–200 mg daily in 2 divided doses, some patients may require higher initial dose. After initial dose, increase according to response; usual dose 600–800 mg daily in 2 divided doses, increased if necessary up to 1.6 g daily in 2 divided doses, dose should be increased slowly

continued →

Prophylaxis of bipolar disorder unresponsive to lithium

▶ BY MOUTH

▶ **Adult:** Initially 400 mg daily in 2 divided doses, increased until symptoms controlled; usual dose 400–600 mg daily in 2 divided doses; maximum 1.6 g per day

● **UNLICENSED USE**

▶ In children Not licensed for use in trigeminal neuralgia or prophylaxis of bipolar disorder.
▶ In adults Not licensed for use in acute alcohol withdrawal. Use in diabetic neuropathy is an unlicensed indication.

● **CONTRA-INDICATIONS** Acute porphyrias p. 1120 • AV conduction abnormalities (unless paced) • history of bone-marrow depression

● **CAUTIONS** Cardiac disease • history of haematological reactions to other drugs • may exacerbate absence and myoclonic seizures • skin reactions • susceptibility to angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

▶ Blood, hepatic, or skin disorders Carbamazepine should be withdrawn immediately in cases of aggravated liver dysfunction or acute liver disease. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative).

● **INTERACTIONS** → Appendix 1: antiepileptics

● **SIDE-EFFECTS**

▶ **Common or very common** Dizziness • drowsiness • dry mouth • eosinophilia • fatigue • fluid imbalance • gastrointestinal discomfort • headache • hyponatraemia • leucopenia • movement disorders • nausea • oedema • skin reactions • thrombocytopenia • vision disorders • vomiting • weight increased

▶ **Uncommon** Constipation • diarrhoea • eye disorders • tic-tremor

▶ **Rare or very rare** Aggression • agranulocytosis • albuminuria • alopecia • anaemia • angioedema • anxiety • appetite decreased • arrhythmias • arthralgia • azotaemia • bone disorders • bone marrow disorders • cardiac conduction disorders • circulatory collapse • confusion • congestive heart failure • conjunctivitis • coronary artery disease aggravated • depression • dyspnoea • embolism and thrombosis • erythema nodosum • fever • folate deficiency • galactorrhoea • gynaecomastia • haematuria • haemolytic anaemia • hallucinations • hearing impairment • hepatic disorders • hirsutism • hyperacusia • hyperhidrosis • hypersensitivity • hypertension • hypogammaglobulinaemia • hypotension • lens opacity • leucocytosis • lymphadenopathy • meningitis aseptic • muscle complaints • muscle weakness • nephritis tubulointerstitial • nervous system disorder • neuroleptic malignant syndrome • oral disorders • pancreatitis • paraesthesia • paresis • peripheral neuropathy • photosensitivity reaction • pneumonia • pneumonitis • pseudolymphoma • psychosis • red blood cell abnormalities • renal impairment • severe cutaneous adverse reactions (SCARs) • sexual dysfunction • speech impairment • spermatogenesis abnormal • syncope • systemic lupus erythematosus (SLE) • taste altered • tinnitus • urinary disorders • vanishing bile duct syndrome • vasculitis

▶ **Frequency not known** Bone fracture • colitis • human herpesvirus 6 infection reactivation • memory loss • nail loss

SIDE-EFFECTS, FURTHER INFORMATION Some side-effects (such as headache, ataxia, drowsiness, nausea, vomiting, blurring of vision, dizziness and allergic skin reactions) are dose-related, and may be dose-limiting. These side-effects

are more common at the start of treatment and in the elderly.

Overdose For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 1430.

● **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with carbamazepine. See under Epilepsy p. 321 for more information. Caution—cross-sensitivity reported with oxcarbazepine and with phenytoin.

● **PREGNANCY** See *Pregnancy* in Epilepsy p. 321.

Monitoring Doses should be adjusted on the basis of plasma-drug concentration monitoring.

● **BREAST FEEDING** Amount probably too small to be harmful.

Monitoring Monitor infant for possible adverse reactions.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution and close monitoring—no information available.

● **RENAL IMPAIRMENT** Use with caution.

● **PRE-TREATMENT SCREENING** Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

● **MONITORING REQUIREMENTS**

▶ Plasma concentration for optimum response 4–12 mg/litre (20–50 micromol/litre) measured after 1–2 weeks.

▶ Manufacturer recommends blood counts and hepatic and renal function tests (but evidence of practical value uncertain).

● **TREATMENT CESSATION** When stopping treatment with carbamazepine for bipolar disorder, reduce the dose gradually over a period of at least 4 weeks.

● **DIRECTIONS FOR ADMINISTRATION**

▶ In children Oral liquid has been used rectally—should be retained for at least 2 hours (but may have laxative effect).

TEGRETOL® PROLONGED RELEASE *Tegretol® Prolonged Release* tablets can be halved but should not be chewed.

● **PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer's product.

● **PATIENT AND CARER ADVICE**

Blood, hepatic, or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop.

Medicines for Children leaflet: Carbamazepine (oral) for preventing seizures www.medicinesforchildren.org.uk/carbamazepine-oral-preventing-seizures-0

● **PROFESSION SPECIFIC INFORMATION****Dental practitioners' formulary**

Carbamazepine Tablets may be prescribed.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

● **INDICATIONS AND DOSE****Monotherapy of focal seizures with or without secondary generalisation**

▶ BY MOUTH

- ▶ **Adult:** Initially 400 mg once daily for 1–2 weeks, then increased to 800 mg once daily, then increased if necessary to 1.2 g once daily (max. per dose 1.6 g)
- ▶ **Elderly:** Initially 400 mg once daily for 1–2 weeks, then increased to 800 mg once daily (max. per dose 1.2 g)

Adjunctive therapy of focal seizures with or without secondary generalisation

▶ BY MOUTH

- ▶ **Adult:** Initially 400 mg once daily for 1–2 weeks, then increased to 800 mg once daily (max. per dose 1.2 g)

- **CONTRA-INDICATIONS** Second- or third-degree AV block

- **CAUTIONS** Elderly · hyponatraemia · PR-interval prolongation

- **INTERACTIONS** → Appendix 1: antiepileptics

● **SIDE-EFFECTS**

- ▶ **Common or very common** Appetite decreased · asthenia · concentration impaired · diarrhoea · dizziness · drowsiness · electrolyte imbalance · gait abnormal · headaches · movement disorders · nausea · skin reactions · sleep disorders · vertigo · vision disorders · vomiting
- ▶ **Uncommon** Alopecia · anaemia · anxiety · bradycardia · chest pain · chills · confusion · constipation · depression · dry mouth · eye disorders · flushing · gastritis · gastrointestinal discomfort · haemorrhage · hearing impairment · hyperhidrosis · hypertension · hypotension · hypothyroidism · increased risk of infection · liver disorder · malaise · mood altered · muscle weakness · myalgia · pain in extremity · palpitations · peripheral coldness · peripheral neuropathy · peripheral oedema · psychomotor retardation · psychotic disorder · sensation abnormal · speech impairment · tinnitus · toothache · weight decreased
- ▶ **Frequency not known** Angioedema · leucopenia · pancreatitis · severe cutaneous adverse reactions (SCARs) · thrombocytopenia
- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome theoretically associated with eslicarbazepine. See under Epilepsy p. 321 for more information.

- **PREGNANCY** Manufacturer advises minimum effective doses and monotherapy if possible—reproductive toxicity in *animal* studies.

Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment—limited information; avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute. **Dose adjustments** Manufacturer advises reduce initial dose to 200 mg once daily or 400 mg every other day for 2 weeks, then increase to 400 mg once daily if creatinine clearance 30–60 mL/minute. The dose may be further increased based on individual response.

- **PRE-TREATMENT SCREENING** Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative— risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

- **MONITORING REQUIREMENTS** Monitor plasma-sodium concentration in patients at risk of hyponatraemia and discontinue treatment if hyponatraemia occurs.

● **PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness, somnolence and visual disorders.

● **NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) decisions**

SMC No. 592/09

The *Scottish Medicines Consortium* has advised (November 2010) that eslicarbazepine (*Zebinix*®) is accepted for restricted use within NHS Scotland as adjunctive therapy in adults with focal seizures with or without secondary generalisation. It is restricted for use in refractory epilepsy in patients who have been heavily pre-treated and remain uncontrolled with existing anti-epileptic drugs. This advice is contingent upon the continuing availability of the patient access scheme in Scotland.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 1214

The *All Wales Medicines Strategy Group* has advised (June 2019) that eslicarbazepine acetate (*Zebinix*®) is recommended as an option for restricted use within NHS Wales for the treatment of highly refractory patients who remain uncontrolled with, or are intolerant to, other anti-epileptic medicine combinations, within its licensed indication as adjunctive therapy in adults, adolescents and children aged above six years, with partial onset seizures, with or without secondary generalisation. It is not recommended for use within NHS Wales outside of this subpopulation.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

CAUTIONARY AND ADVISORY LABELS 8

▶ **Zebinix** (Eisai Ltd)**Eslicarbazepine acetate 50 mg per 1 ml** Zebinix 50mg/1ml oral suspension sugar-free | 200 ml [PoM] £56.67 DT = £56.67

Tablet

CAUTIONARY AND ADVISORY LABELS 8

▶ **Zebinix** (Eisai Ltd)**Eslicarbazepine acetate 200 mg** Zebinix 200mg tablets | 60 tablet [PoM] £68.00 DT = £68.00**Eslicarbazepine acetate 800 mg** Zebinix 800mg tablets | 30 tablet [PoM] £136.00 DT = £136.00**Ethosuximide**● **INDICATIONS AND DOSE****Absence seizures | Atypical absence seizures (adjunct) | Myoclonic seizures**▶ **BY MOUTH**

- ▶ Child 1 month-5 years: Initially 5 mg/kg twice daily (max. per dose 125 mg), dose to be increased every 5–7 days; maintenance 10–20 mg/kg twice daily (max. per dose 500 mg), total daily dose may rarely be given in 3 divided doses
- ▶ Child 6-17 years: Initially 250 mg twice daily, then increased in steps of 250 mg every 5–7 days; usual dose 500–750 mg twice daily, increased if necessary up to 1 g twice daily
- ▶ Adult: Initially 500 mg daily in 2 divided doses, then increased in steps of 250 mg every 5–7 days; usual dose 1–1.5 g daily in 2 divided doses, increased if necessary up to 2 g daily

- **CAUTIONS** Avoid in Acute porphyrias p. 1120
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS** Aggression · agranulocytosis · appetite decreased · blood disorder · bone marrow disorders · concentration impaired · depression · diarrhoea · dizziness · drowsiness · erythema nodosum · fatigue · gastrointestinal discomfort · generalised tonic-clonic seizure · headache · hiccups · leucopenia · libido increased · lupus-like syndrome · mood altered · movement disorders · nausea · nephrotic syndrome · oral disorders · psychosis · rash · sleep disorders · Stevens-Johnson syndrome · vaginal haemorrhage · vision disorders · vomiting · weight decreased

SIDE-EFFECTS, FURTHER INFORMATION Blood counts required if features of fever, sore throat, mouth ulcers, bruising or bleeding.

- **PREGNANCY** See also *Pregnancy* in Epilepsy p. 321.
- **Monitoring** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Present in milk. Hyperexcitability and sedation reported.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution.
- **PATIENT AND CARER ADVICE**
Blood disorders Patients or their carers should be told how to recognise signs of blood disorders, and advised to seek immediate medical attention if symptoms such as fever, mouth ulcers, bruising, or bleeding develop.
Medicines for Children leaflet: Ethosuximide for preventing seizures www.medicinesforchildren.org.uk/ethosuximide-preventing-seizures

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 8

▶ **Ethosuximide (Non-proprietary)****Ethosuximide 50 mg per 1 ml** Ethosuximide 250mg/5ml syrup | 200 ml [PoM] £173.00 DT = £173.00**Ethosuximide 250mg/5ml oral solution sugar free** sugar-free | 125 ml [PoM] £86.50-£108.13 sugar-free | 200 ml [PoM] £173.00-£205.17 sugar-free | 250 ml [PoM] £216.25 DT = £216.25**Capsule**

CAUTIONARY AND ADVISORY LABELS 8

▶ **Ethosuximide (Non-proprietary)****Ethosuximide 250 mg** Ethosuximide 250mg capsules | 56 capsule [PoM] £192.26 DT = £192.26**Fosphenytoin sodium**

23-Jul-2018

- **DRUG ACTION** Fosphenytoin is a pro-drug of phenytoin.

● **INDICATIONS AND DOSE****Status epilepticus**▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult:** Initially 20 mg(PE)/kg, dose to be administered at a rate of 100–150 mg(PE)/minute, then 4–5 mg(PE)/kg daily in 1–2 divided doses, dose to be administered at a rate of 50–100 mg(PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration
- ▶ **Elderly:** Consider 10–25% reduction in dose or infusion rate

Prophylaxis or treatment of seizures associated with neurosurgery or head injury▶ **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION**

- ▶ **Adult:** Initially 10–15 mg(PE)/kg, intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute, then 4–5 mg(PE)/kg daily in 1–2 divided doses, intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration
- ▶ **Elderly:** Consider 10–25% reduction in dose or infusion rate

Temporary substitution for oral phenytoin▶ **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION**

- ▶ **Adult:** Same dose and same dosing frequency as oral phenytoin therapy, intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute
- ▶ **Elderly:** Consider 10–25% reduction in dose or infusion rate

DOSE EQUIVALENCE AND CONVERSION

- ▶ Doses are expressed as phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg ≡ phenytoin sodium 1 mg.

- **UNLICENSED USE** Fosphenytoin sodium doses in BNF may differ from those in product literature.
- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · second-degree heart block · sino-atrial block · sinus bradycardia · Stokes-Adams syndrome · third-degree heart block
- **CAUTIONS** Heart failure · hypotension · injection solutions alkaline (irritant to tissues) · respiratory depression · resuscitation facilities must be available
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Asthenia · chills · dizziness · drowsiness · dry mouth · dysarthria · euphoric mood · headache · hypotension · movement disorders · nausea · nystagmus · sensation abnormal · skin reactions · stupor · taste altered · tinnitus · tremor · vasodilation · vertigo · vision disorders · vomiting
 - ▶ **Uncommon** Cardiac arrest · confusion · hearing impairment · muscle complaints · muscle weakness · nervousness · oral disorders · reflexes abnormal · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · thinking abnormal
 - ▶ **Frequency not known** Acute psychosis · agranulocytosis · appetite disorder · atrial conduction depression (more common if injection too rapid) · atrioventricular block · bone disorders · bone fracture · bone marrow disorders · bradycardia · cardiotoxicity · cerebrovascular insufficiency ·

circulatory collapse (more common if injection too rapid) · coarsening of the facial features · constipation · delirium · Dupuytren's contracture · encephalopathy · granulocytopenia · groin tingling · hair changes · hepatic disorders · hyperglycaemia · hypersensitivity · insomnia · leucopenia · lymphadenopathy · nephritis · tubulointerstitial · Peyronie's disease · polyarthritis nodosa · polyarthritis · purple glove syndrome · respiratory disorders · sensory peripheral polyneuropathy · thrombocytopenia · tonic seizure · ventricular conduction depression (more common if injection too rapid) · ventricular fibrillation (more common if injection too rapid)

SIDE-EFFECTS, FURTHER INFORMATION Fosphenytoin has been associated with severe cardiovascular reactions including asystole, ventricular fibrillation, and cardiac arrest. Hypotension, bradycardia, and heart block have also been reported. The following are recommended: monitor heart rate, blood pressure, and respiratory function for duration of infusion; observe patient for at least 30 minutes after infusion; if hypotension occurs, reduce infusion rate or discontinue; reduce dose or infusion rate in elderly, and in renal or hepatic impairment.

- **ALLERGY AND CROSS-SENSITIVITY** Cross-sensitivity reported with carbamazepine.
- **PREGNANCY** See also *Pregnancy* in *Epilepsy* p. 321. **Monitoring** Changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction.
The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Small amounts present in milk, but not known to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor free plasma-phenytoin concentration (rather than total plasma-phenytoin concentration) in hepatic impairment or hypoalbuminaemia and in hyperbilirubinaemia.
Dose adjustments Manufacturer advises consider a 10–25% reduction in dose or infusion rate (except in the treatment of status epilepticus) in hepatic impairment or hypoalbuminaemia.
- **RENAL IMPAIRMENT**
Dose adjustments Consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus).
- **PRE-TREATMENT SCREENING** HLA-B* 1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome).
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer recommends blood counts (but evidence of practical value uncertain).
 - ▶ With intravenous use Monitor heart rate, blood pressure, ECG, and respiratory function for during infusion.
- **DIRECTIONS FOR ADMINISTRATION** For *intermittent intravenous infusion (Pro-Epanutin®)*, give in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of 1.5–25 mg (phenytoin sodium equivalent (PE))/mL.
- **PRESCRIBING AND DISPENSING INFORMATION**
Prescriptions for fosphenytoin sodium should state the dose in terms of phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg = phenytoin sodium 1 mg.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

ELECTROLYTES: May contain Phosphate

▶ **Pro-Epanutin** (Pfizer Ltd)

Fosphenytoin sodium 75 mg per 1 ml Pro-Epanutin 750mg/10ml concentrate for solution for injection vials | 10 vial [PoM] £400.00 (Hospital only)

Gabapentin

02-Dec-2019

● INDICATIONS AND DOSE

Adjunctive treatment of focal seizures with or without secondary generalisation

▶ BY MOUTH

- ▶ Child 6–11 years: 10 mg/kg once daily (max. per dose 300 mg) on day 1, then 10 mg/kg twice daily (max. per dose 300 mg) on day 2, then 10 mg/kg 3 times a day (max. per dose 300 mg) on day 3; usual dose 25–35 mg/kg daily in 3 divided doses, some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate, daily dose maximum to be given in 3 divided doses; maximum 70 mg/kg per day
- ▶ Child 12–17 years: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate
- ▶ Adult: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day)

Monotherapy for focal seizures with or without secondary generalisation

▶ BY MOUTH

- ▶ Child 12–17 years: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate
- ▶ Adult: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day)

Peripheral neuropathic pain

▶ BY MOUTH

- ▶ Adult: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; maximum 3.6 g per day

continued →

Menopausal symptoms, particularly hot flushes, in women with breast cancer

▶ BY MOUTH

- ▶ Adult: 300 mg 3 times a day, initial dose should be lower and titrated up over three days

Oscillopsia in multiple sclerosis

▶ BY MOUTH

- ▶ Adult: Initially 300 mg once daily, then increased in steps of 300 mg, every 4–7 days, adjusted according to response; usual maximum 900 mg 3 times a day

Spasticity in multiple sclerosis

▶ BY MOUTH

- ▶ Adult: Initially 300 mg once daily for 1–2 weeks, then 300 mg twice daily for 1–2 weeks, then 300 mg 3 times a day for 1–2 weeks, alternatively initially 100 mg 3 times a day, then increased in steps of 100 mg 3 times a day, every 1–2 weeks, adjusted according to response; usual maximum 900 mg 3 times a day

● UNLICENSED USE

- ▶ In children Not licensed at doses over 50 mg/kg daily in children under 12 years.
- ▶ In adults [EvdGr](#) Gabapentin is used for the treatment of menopausal symptoms, [E](#) but is not licensed for this indication. [EvdGr](#) Gabapentin is used for oscillopsia in multiple sclerosis, [E](#) but is not licensed for this indication. [EvdGr](#) Gabapentin is used for spasticity in multiple sclerosis, [E](#) but is not licensed for this indication.

IMPORTANT SAFETY INFORMATION

The levels of propylene glycol, acesulfame K and saccharin sodium may exceed the recommended WHO daily intake limits if high doses of gabapentin oral solution (Rosemont brand) are given to adolescents or adults with low body-weight (39–50 kg)—consult product literature.

MHRA/CHM ADVICE: GABAPENTIN (NEURONTIN®): RISK OF SEVERE RESPIRATORY DEPRESSION (OCTOBER 2017)

Gabapentin has been associated with a rare risk of severe respiratory depression even without concomitant opioid medicines. Patients with compromised respiratory function, respiratory or neurological disease, renal impairment, concomitant use of central nervous system (CNS) depressants, and elderly people might be at higher risk of experiencing severe respiratory depression and dose adjustments may be necessary in these patients.

MHRA/CHM ADVICE: GABAPENTIN (NEURONTIN®) AND RISK OF ABUSE AND DEPENDENCE: NEW SCHEDULING REQUIREMENTS FROM 1 APRIL (APRIL 2019)

Following concerns about abuse, gabapentin has been reclassified as a Class C controlled substance and is now a Schedule 3 drug, but is exempt from safe custody requirements. Healthcare professionals should evaluate patients carefully for a history of drug abuse before prescribing gabapentin, and observe patients for signs of abuse and dependence. Patients should be informed of the potentially fatal risks of interactions between gabapentin and alcohol, and with other medicines that cause CNS depression, particularly opioids.

- **CAUTIONS** Diabetes mellitus · elderly · high doses of oral solution in adolescents and adults with low body-weight · history of psychotic illness · history of substance abuse · mixed seizures (including absences)
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
- ▶ **Common or very common** Anxiety · appetite abnormal · arthralgia · asthenia · behaviour abnormal · confusion · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · dysarthria · dyspnoea · emotional

- lability · flatulence · gait abnormal · gastrointestinal discomfort · headache · hypertension · increased risk of infection · insomnia · leucopenia · malaise · movement disorders · muscle complaints · nausea · nystagmus · oedema · pain · reflexes abnormal · seizure (in children) · sensation abnormal · sexual dysfunction · skin reactions · thinking abnormal · tooth disorder · tremor · vasodilation · vertigo · visual impairment · vomiting
- ▶ **Uncommon** Cognitive impairment · palpitations
- ▶ **Frequency not known** Acute kidney injury · alopecia · angioedema · breast enlargement · drug use disorders · gynaecomastia · hallucination · hepatic disorders · hyponatraemia · pancreatitis · rhabdomyolysis · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · tinnitus · urinary incontinence

- **PREGNANCY** Manufacturer advises avoid unless benefit outweighs risk — toxicity reported. See also *Pregnancy* in *Epilepsy* p. 321.
- **BREAST FEEDING** Present in milk—manufacturer advises use only if potential benefit outweighs risk. See also *Breast-feeding* in *Epilepsy* p. 321.
- **RENAL IMPAIRMENT**
Dose adjustments ▶ In adults Manufacturer advises reduce dose to 600–1800 mg daily in 3 divided doses if creatinine clearance 50–79 mL/minute. Manufacturer advises reduce dose to 300–900 mg daily in 3 divided doses if creatinine clearance 30–49 mL/minute. Manufacturer advises reduce dose to 150–600 mg daily in 3 divided doses if creatinine clearance 15–29 mL/minute (150 mg daily dose to be given as 300 mg in 3 divided doses on alternate days). Manufacturer advises reduce dose to 150–300 mg daily in 3 divided doses if creatinine clearance is less than 15 mL/minute (150 mg daily dose to be given as 300 mg in 3 divided doses on alternate days)—further dose reductions may be required in proportion to creatinine clearance, consult product literature.
▶ In children Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m²; consult product literature.
- **MONITORING REQUIREMENTS** Monitor for signs of gabapentin abuse.
- **EFFECT ON LABORATORY TESTS** False positive readings with some urinary protein tests.
- **DIRECTIONS FOR ADMINISTRATION** Capsules can be opened but the bitter taste is difficult to mask.
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Gabapentin for neuropathic pain www.medicinesforchildren.org.uk/gabapentin-neuropathic-pain

Lacosamide

10-Mar-2020

● **INDICATIONS AND DOSE****Monotherapy of focal seizures with or without secondary generalisation**

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Child (body-weight 50 kg and above): Initially 50 mg twice daily, then increased to 100 mg twice daily, after one week, alternatively initially 100 mg twice daily; increased in steps of 50 mg twice daily (max. per dose 300 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals
- ▶ Child 4-17 years (body-weight up to 50 kg): (consult product literature)
- ▶ Adult: Initially 50 mg twice daily, then increased to 100 mg twice daily, after one week, alternatively initially 100 mg twice daily; increased in steps of 50 mg twice daily (max. per dose 300 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals

Monotherapy of focal seizures with or without secondary generalisation (alternative loading dose regimen when it is necessary to rapidly attain therapeutic plasma concentrations) (under close medical supervision)

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Child (body-weight 50 kg and above): Loading dose 200 mg, followed by 100 mg twice daily, to be given 12 hours after initial dose; increased in steps of 50 mg twice daily (max. per dose 300 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals
- ▶ Adult: Loading dose 200 mg, followed by 100 mg twice daily, to be given 12 hours after initial dose; increased in steps of 50 mg twice daily (max. per dose 300 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals

Adjunctive treatment of focal seizures with or without secondary generalisation

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Child (body-weight 50 kg and above): Initially 50 mg twice daily, then increased to 100 mg twice daily, after one week; increased in steps of 50 mg twice daily (max. per dose 200 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals
- ▶ Child 4-17 years (body-weight up to 50 kg): (consult product literature)
- ▶ Adult: Initially 50 mg twice daily, then increased to 100 mg twice daily, after one week; increased in steps

of 50 mg twice daily (max. per dose 200 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals

Adjunctive treatment of focal seizures with or without secondary generalisation (alternative loading dose regimen when it is necessary to rapidly attain therapeutic plasma concentrations) (under close medical supervision)

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Child (body-weight 50 kg and above): Loading dose 200 mg, followed by 100 mg twice daily, to be given 12 hours after initial dose; increased in steps of 50 mg twice daily (max. per dose 200 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals
- ▶ Adult: Loading dose 200 mg, followed by 100 mg twice daily, to be given 12 hours after initial dose; increased in steps of 50 mg twice daily (max. per dose 200 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals

- **CONTRA-INDICATIONS** Second- or third-degree AV block
- **CAUTIONS** Conduction problems · elderly · risk of PR-interval prolongation · severe cardiac disease
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
 - ▶ Common or very common Asthenia · concentration impaired · confusion · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · dysarthria · dyspepsia · flatulence · gait abnormal · headache · insomnia · mood altered · movement disorders · muscle spasms · nausea · nystagmus · sensation abnormal · skin reactions · tinnitus · vertigo · vision disorders · vomiting
 - ▶ Uncommon Aggression · agitation · angioedema · arrhythmias · atrioventricular block · hallucination · psychotic disorder · suicidal tendencies · syncope
 - ▶ Frequency not known Agranulocytosis
- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with lacosamide. See under Epilepsy p. 321 for more information.
- **PREGNANCY** See also *Pregnancy* in Epilepsy p. 321. **Monitoring** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure), particularly in severe impairment (no information available). **Dose adjustments** Manufacturer advises consider dose reduction—consult product literature.
- **RENAL IMPAIRMENT** Consult product literature.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For *intermittent intravenous infusion*, manufacturer advises give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9% or Lactated Ringer's Solution; give over 15–60 minutes—give doses greater than 200 mg over at least 30 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of syrup may include strawberry.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Lacosamide for preventing seizures www.medicinesforchildren.org.uk/lacosamide-preventing-seizures
- **NATIONAL FUNDING/ACCESS DECISIONS** **Scottish Medicines Consortium (SMC) decisions** SMC No. 532/09 The *Scottish Medicines Consortium* has advised (February 2009) that lacosamide (*Vimpat*®) is accepted for restricted use within NHS Scotland as adjunctive treatment for focal

seizures with or without secondary generalisation in patients from 16 years. It is restricted for specialist use in refractory epilepsy.

SMC No. 1301/18

The *Scottish Medicines Consortium* has advised (February 2018) that lacosamide (*Vimpat*®) is accepted for restricted use within NHS Scotland as adjunctive treatment for focal seizures with or without secondary generalisation in adolescents and children from 4 years of age with epilepsy. It is restricted for specialist use in refractory epilepsy.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3343

The *All Wales Medicines Strategy Group* has advised (March 2018) that lacosamide (*Vimpat*®) is recommended as an option for use within NHS Wales as adjunctive therapy in the treatment of focal seizures with or without secondary generalisation in children from 4 years of age up to 15 years of age with epilepsy.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Lamotrigine

04-Dec-2019

• INDICATIONS AND DOSE

Monotherapy of focal seizures | Monotherapy of primary and secondary generalised tonic-clonic seizures | Monotherapy of seizures associated with Lennox-Gastaut syndrome

▶ BY MOUTH

- ▶ **Child 12-17 years:** Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7-14 days; maintenance 100-200 mg daily in 1-2 divided doses; increased if necessary up to 500 mg daily, dose titration should be repeated if restarting after interval of more than 5 days
- ▶ **Adult:** Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7-14 days; maintenance 100-200 mg daily in 1-2 divided doses; increased if necessary up to 500 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

Adjunctive therapy of focal seizures with valproate | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures with valproate | Adjunctive therapy of seizures associated with Lennox-Gastaut syndrome with valproate

▶ BY MOUTH

- ▶ **Child 2-11 years (body-weight up to 13 kg):** Initially 2 mg once daily on alternate days for first 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7-14 days; maintenance 1-5 mg/kg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
- ▶ **Child 2-11 years (body-weight 13 kg and above):** Initially 150 micrograms/kg once daily for 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7-14 days; maintenance 1-5 mg/kg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
- ▶ **Child 12-17 years:** Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then increased in steps of up to 50 mg every 7-14 days; maintenance 100-200 mg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days
- ▶ **Adult:** Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then increased in steps of up to 50 mg every 7-14 days; maintenance 100-200 mg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

Adjunctive therapy of focal seizures (with enzyme inducing drugs) without valproate | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures (with enzyme inducing drugs) without valproate | Adjunctive therapy of seizures associated with Lennox-Gastaut syndromes (with enzyme inducing drugs) without valproate

▶ BY MOUTH

- ▶ **Child 2-11 years:** Initially 300 micrograms/kg twice daily for 14 days, then 600 micrograms/kg twice daily for further 14 days, then increased in steps of up to 1.2 mg/kg every 7-14 days; maintenance 5-15 mg/kg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 400 mg per day
- ▶ **Child 12-17 years:** Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased in steps of up to 100 mg every 7-14 days; maintenance 200-400 mg daily in 2 divided doses, increased if necessary up to 700 mg daily, dose titration should be repeated if restarting after interval of more than 5 days
- ▶ **Adult:** Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased in steps of up to 100 mg every 7-14 days; maintenance 200-400 mg daily in 2 divided doses, increased if necessary up to 700 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

Adjunctive therapy of focal seizures (without enzyme inducing drugs) without valproate | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures (without enzyme inducing drugs) without valproate | Adjunctive therapy of seizures associated with Lennox-Gastaut syndrome (without enzyme inducing drugs) without valproate

▶ BY MOUTH

- ▶ Child 2-11 years: Initially 300 micrograms/kg daily in 1-2 divided doses for 14 days, then 600 micrograms/kg daily in 1-2 divided doses for further 14 days, then increased in steps of up to 600 micrograms/kg every 7-14 days; maintenance 1-10 mg/kg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
- ▶ Child 12-17 years: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7-14 days; maintenance 100-200 mg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days
- ▶ Adult: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7-14 days; maintenance 100-200 mg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

Monotherapy or adjunctive therapy of bipolar disorder (without enzyme inducing drugs) without valproate

▶ BY MOUTH

- ▶ Adult: Initially 25 mg once daily for 14 days, then 50 mg daily in 1-2 divided doses for further 14 days, then 100 mg daily in 1-2 divided doses for further 7 days; maintenance 200 mg daily in 1-2 divided doses, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days; maximum 400 mg per day

Adjunctive therapy of bipolar disorder with valproate

▶ BY MOUTH

- ▶ Adult: Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then 50 mg daily in 1-2 divided doses for further 7 days; maintenance 100 mg daily in 1-2 divided doses, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day

Adjunctive therapy of bipolar disorder (with enzyme inducing drugs) without valproate

▶ BY MOUTH

- ▶ Adult: Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased to 100 mg twice daily for further 7 days, then increased to 150 mg twice daily for further 7 days; maintenance 200 mg twice daily, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days

- **CAUTIONS** Myoclonic seizures (may be exacerbated) · Parkinson's disease (may be exacerbated)(in adults)
- **INTERACTIONS** → Appendix 1: antiepileptics

● **SIDE-EFFECTS**

- ▶ **Common or very common** Aggression · agitation · arthralgia · diarrhoea · dizziness · drowsiness · dry mouth · fatigue · headache · irritability · nausea · pain · rash · sleep disorders · tremor · vomiting
- ▶ **Uncommon** Alopecia · movement disorders · vision disorders
- ▶ **Rare or very rare** Confusion · conjunctivitis · disseminated intravascular coagulation · face oedema · fever · hallucination · hepatic disorders · lupus-like syndrome · lymphadenopathy · meningitis aseptic · multi organ failure · nystagmus · seizure · severe cutaneous adverse reactions (SCARs) · tic

SIDE-EFFECTS, FURTHER INFORMATION Serious skin reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis have developed (especially in children); most rashes occur in the first 8 weeks. Rash is sometimes associated with hypersensitivity syndrome and is more common in patients with history of allergy or rash from other antiepileptic drugs. Consider withdrawal if rash or signs of hypersensitivity syndrome develop. Factors associated with increased risk of serious skin reactions include concomitant use of valproate, initial lamotrigine dosing higher than recommended, and more rapid dose escalation than recommended.

- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with lamotrigine. See under Epilepsy p. 321 for more information.
- **PREGNANCY** See also *Pregnancy* in Epilepsy p. 321.
- **Monitoring** Doses should be adjusted on the basis of plasma-drug concentration monitoring.
- **BREAST FEEDING** Present in milk, but limited data suggest no harmful effect on infant.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment.
Dose adjustments Manufacturer advises dose reduction of approx. 50% in moderate impairment, and approx. 75% in severe impairment; adjust according to response.
- **RENAL IMPAIRMENT** Caution in renal failure; metabolite may accumulate.
Dose adjustments Consider reducing maintenance dose in significant impairment.
- **TREATMENT CESSATION** Avoid abrupt withdrawal (taper off over 2 weeks or longer) unless serious skin reaction occurs.
- **PRESCRIBING AND DISPENSING INFORMATION** Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic lamotrigine product.
Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

● **PATIENT AND CARER ADVICE**

Skin reactions Warn patients and carers to see their doctor immediately if rash or signs or symptoms of hypersensitivity syndrome develop.
Blood disorders Patients and their carers should be alert for symptoms and signs suggestive of bone-marrow failure, such as anaemia, bruising, or infection. Aplastic anaemia, bone-marrow depression, and pancytopenia have been associated rarely with lamotrigine.

Medicines for Children leaflet: Lamotrigine for preventing seizures www.medicinesforchildren.org.uk/lamotrigine-preventing-seizures

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Levetiracetam

10-Mar-2020

• **INDICATIONS AND DOSE****Monotherapy of focal seizures with or without secondary generalisation**

- ▶ **BY MOUTH, OR BY INTRAVENOUS INFUSION**
- ▶ **Child 16-17 years:** Initially 250 mg once daily for 1 week, then increased to 250 mg twice daily, then increased in steps of 250 mg twice daily (max. per dose 1.5 g twice daily), adjusted according to response, dose to be increased every 2 weeks
- ▶ **Adult:** Initially 250 mg once daily for 1-2 weeks, then increased to 250 mg twice daily, then increased in steps of 250 mg twice daily (max. per dose 1.5 g twice daily), adjusted according to response, dose to be increased every 2 weeks

Adjunctive therapy of focal seizures with or without secondary generalisation

- ▶ **BY MOUTH**
- ▶ **Child 1-5 months:** Initially 7 mg/kg once daily, then increased in steps of up to 7 mg/kg twice daily (max. per dose 21 mg/kg twice daily), dose to be increased every 2 weeks
- ▶ **Child 6 months-17 years (body-weight up to 50 kg):** Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
- ▶ **Child 12-17 years (body-weight 50 kg and above):** Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2-4 weeks

- ▶ **Adult:** Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2-4 weeks
- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Child 4-17 years (body-weight up to 50 kg):** Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
- ▶ **Child 12-17 years (body-weight 50 kg and above):** Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks
- ▶ **Adult:** Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2-4 weeks

Adjunctive therapy of myoclonic seizures and tonic-clonic seizures

- ▶ **BY MOUTH, OR BY INTRAVENOUS INFUSION**
- ▶ **Child 12-17 years (body-weight up to 50 kg):** Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
- ▶ **Child 12-17 years (body-weight 50 kg and above):** Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks
- ▶ **Adult:** Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2-4 weeks

- **UNLICENSED USE** [EvGr](#) Initial dosing recommendations for levetiracetam [E](#) in BNF Publications differ from product licence.

- ▶ **With oral use in children** Manufacturer advises *granules* not licensed for use in children under 6 years, for initial treatment in children with body-weight less than 25 kg, or for the administration of doses below 250 mg—oral solution should be used.

- **INTERACTIONS** → Appendix 1: antiepileptics

• **SIDE-EFFECTS**

- ▶ **Common or very common** Anxiety · appetite decreased · asthenia · behaviour abnormal · cough · depression · diarrhoea · dizziness · drowsiness · gastrointestinal discomfort · headache · increased risk of infection · insomnia · mood altered · movement disorders · nausea · skin reactions · vertigo · vomiting
- ▶ **Uncommon** Alopecia · concentration impaired · confusion · hallucination · leucopenia · muscle weakness · myalgia · paraesthesia · psychotic disorder · suicidal tendencies · thrombocytopenia · vision disorders · weight changes
- ▶ **Rare or very rare** Acute kidney injury · agranulocytosis · hepatic disorders · hyponatraemia · neutropenia · pancreatitis · pancytopenia · personality disorder · rhabdomyolysis · severe cutaneous adverse reactions (SCARs) · thinking abnormal

- **PREGNANCY** See also *Pregnancy* in Epilepsy p. 321.

- ▶ **Monitoring** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

It is recommended that the fetal growth should be monitored.

- **BREAST FEEDING** Present in milk—manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.

Dose adjustments Manufacturer advises maintenance dose reduction of 50% in severe impairment if creatinine clearance is less than 60 mL/minute/1.73 m²—consult product literature.

● RENAL IMPAIRMENT

Dose adjustments ▶ In children Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m² (consult product literature).

- ▶ In adults Maximum 2 g daily if eGFR 50–80 mL/minute/1.73 m². Maximum 1.5 g daily if eGFR 30–50 mL/minute/1.73 m². Maximum 1 g daily if eGFR less than 30 mL/minute/1.73 m².

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion* (Keppra®), dilute requisite dose with at least 100 mL Glucose 5% or Sodium Chloride 0.9%; give over 15 minutes.
- ▶ With oral use For administration of *oral solution*, requisite dose may be diluted in a glass of water.

● **PRESCRIBING AND DISPENSING INFORMATION** If switching between oral therapy and intravenous therapy (for those temporarily unable to take oral medication), the intravenous dose should be the same as the established oral dose.

● PATIENT AND CARER ADVICE

Oxcarbazepine

● INDICATIONS AND DOSE

Monotherapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures

- ▶ BY MOUTH
- ▶ Child 6–17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maximum 46 mg/kg per day
- ▶ Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

Adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures

- ▶ BY MOUTH
- ▶ Child 6–17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maintenance 15 mg/kg twice daily; maximum 46 mg/kg per day
- ▶ Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

Treatment of primary generalised tonic-clonic seizures

- ▶ BY MOUTH
- ▶ Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ In adjunctive therapy, the dose of concomitant antiepileptics may need to be reduced when using high doses of oxcarbazepine.

- **UNLICENSED USE** Not licensed for the treatment of primary generalised tonic-clonic seizures.
- **CAUTIONS** Avoid in Acute porphyrias p. 1120 · cardiac conduction disorders · heart failure · hyponatraemia
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · agitation · alopecia · asthenia · ataxia · concentration impaired · constipation · depression · diarrhoea · dizziness · drowsiness · emotional lability · headache · hyponatraemia · nausea · nystagmus · skin reactions · vertigo · vision disorders · vomiting
 - ▶ **Uncommon** Leucopenia
 - ▶ **Rare or very rare** Angioedema · arrhythmia · atrioventricular block · hepatitis · hypothyroidism · pancreatitis · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · thrombocytopenia
 - ▶ **Frequency not known** Agranulocytosis · bone disorders · bone marrow disorders · hypertension · inappropriate antidiuretic hormone secretion like-syndrome · neutropenia · speech impairment
- **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with hypersensitivity to carbamazepine. Antiepileptic hypersensitivity syndrome associated with oxcarbazepine. See under Epilepsy p. 321 for more information.
- **PREGNANCY** See also *Pregnancy* in Epilepsy p. 321.

Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Amount probably too small to be harmful but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).
- **RENAL IMPAIRMENT**
Dose adjustments ▶ In adults Halve initial dose if eGFR less than 30 mL/minute/1.73 m²; increase according to response at intervals of at least 1 week.
 ▶ In children Halve initial dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m², increase according to response at intervals of at least 1 week.
- **PRE-TREATMENT SCREENING** Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).
- **MONITORING REQUIREMENTS**
 ▶ Monitor plasma-sodium concentration in patients at risk of hyponatraemia.
 ▶ Monitor body-weight in patients with heart failure.
- **PRESCRIBING AND DISPENSING INFORMATION** Patients may need to be maintained on a specific manufacturer's branded or generic oxcarbazepine product. Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.
- **PATIENT AND CARER ADVICE**
 Blood, hepatic, or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as lethargy, confusion, muscular twitching, fever, rash, blistering, mouth ulcers, bruising, or bleeding develop.
 Medicines for Children: Oxcarbazepine for preventing seizures www.medicinesforchildren.org.uk/oxcarbazepine-preventing-seizures

Adjunctive treatment of focal seizures with or without secondary generalised seizures

▶ BY MOUTH

- ▶ Child 12-17 years: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response; maintenance 4–8 mg once daily; maximum 12 mg per day
- ▶ Adult: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response; maintenance 4–8 mg once daily; maximum 12 mg per day

Adjunctive treatment of primary generalised tonic-clonic seizures

▶ BY MOUTH

- ▶ Child 12-17 years: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response, maintenance up to 8 mg once daily; maximum 12 mg per day
- ▶ Adult: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response, maintenance up to 8 mg once daily; maximum 12 mg per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Titrate at intervals of at least 1 week with concomitant carbamazepine, fosphenytoin, oxcarbazepine, or phenytoin.

- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
 ▶ **Common or very common** Anxiety · appetite abnormal · back pain · behaviour abnormal · confusion · dizziness · drowsiness · dysarthria · fatigue · gait abnormal · irritability · movement disorders · nausea · vertigo · vision disorders · weight increased
 ▶ **Frequency not known** Severe cutaneous adverse reactions (SCARs)
- **PREGNANCY** Manufacturer advises avoid. See also *Pregnancy* in Epilepsy p. 321.
Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
Dose adjustments Manufacturer advises maximum 8 mg per day in mild to moderate impairment.
- **RENAL IMPAIRMENT** Avoid in moderate or severe impairment.
- **PRESCRIBING AND DISPENSING INFORMATION**
 Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.
 Patients may need to be maintained on a specific manufacturer's branded or generic perampanel product.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness and drowsiness.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 819/12

The *Scottish Medicines Consortium* has advised (December 2012) that perampanel (*Fycompa*®) is accepted for restricted use within NHS Scotland as a second-line adjunctive treatment in patients with refractory focal seizures, with or without secondary generalised seizures. Treatment should be initiated only by physicians who have appropriate experience in the treatment of epilepsy. This advice is contingent upon the continuing availability of the patient access scheme or a list price that is equivalent or lower.

SMC No. SMC2172

The *Scottish Medicines Consortium* has advised (August 2019) that perampanel (*Fycompa*®) oral suspension is accepted for restricted use within NHS Scotland as a second-line adjunctive treatment in patients with refractory focal seizures, with or without secondary generalised seizures, who are unable to swallow perampanel tablets. Treatment should be initiated only by physicians who have appropriate experience in the treatment of epilepsy.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Oral suspension

CAUTIONARY AND ADVISORY LABELS 3, 8

Phenytoin

02-Dec-2019

● INDICATIONS AND DOSE

Tonic-clonic seizures | Focal seizures

► BY MOUTH

- Child 1 month–11 years: Initially 1.5–2.5 mg/kg twice daily, then adjusted according to response to 2.5–5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), dose also adjusted according to plasma-phenytoin concentration; maximum 300 mg per day
- Child 12–17 years: Initially 75–150 mg twice daily, then adjusted according to response to 150–200 mg twice daily (max. per dose 300 mg twice daily), dose also adjusted according to plasma-phenytoin concentration

Tonic-clonic seizures | Focal seizures | Prevention and treatment of seizures during or following neurosurgery or severe head injury

► BY MOUTH

- Adult: Initially 3–4 mg/kg daily, alternatively 150–300 mg once daily, alternatively 150–300 mg daily in 2 divided doses; usual maintenance 200–500 mg daily, to be taken preferably with or after food, dose to be increased gradually as necessary (with plasma-

phenytoin concentration monitoring), exceptionally, higher doses may be used

Prevention and treatment of seizures during or following neurosurgery or severe head injury

► BY MOUTH

- Child: Initially 2.5 mg/kg twice daily, then adjusted according to response to 4–8 mg/kg daily, dose also adjusted according to plasma-phenytoin concentration; maximum 300 mg per day

Status epilepticus | Acute symptomatic seizures associated with head trauma or neurosurgery

► INITIALLY BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Child 1 month–11 years: Loading dose 20 mg/kg, then (by slow intravenous injection or by intravenous infusion) 2.5–5 mg/kg twice daily
- Child 12–17 years: Loading dose 20 mg/kg, then (by intravenous infusion or by slow intravenous injection) up to 100 mg 3–4 times a day
- Adult: Loading dose 20 mg/kg (max. per dose 2 g), then (by intravenous infusion or by slow intravenous injection or by mouth) maintenance 100 mg every 6–8 hours adjusted according to plasma-concentration monitoring

DOSE EQUIVALENCE AND CONVERSION

- Preparations containing phenytoin sodium are **not** bioequivalent to those containing phenytoin base (such as *Epanutin Infatabs*® and *Epanutin*® suspension); 100 mg of phenytoin sodium is approximately equivalent in therapeutic effect to 92 mg phenytoin base. The dose is the same for all phenytoin products when initiating therapy. However, if switching between these products the difference in phenytoin content may be clinically significant. Care is needed when making changes between formulations and plasma-phenytoin concentration monitoring is recommended.

● UNLICENSED USE

- With oral use in children Licensed for use in children (age range not specified by manufacturer).
- With intravenous use Phenytoin doses in BNF publications may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF DEATH AND SEVERE HARM FROM ERROR WITH INJECTABLE PHENYTOIN (NOVEMBER 2016)

Use of injectable phenytoin is error-prone throughout the prescribing, preparation, administration and monitoring processes; all relevant staff should be made aware of appropriate guidance on the safe use of injectable phenytoin to reduce the risk of error.

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Acute porphyrias p. 1120
SPECIFIC CONTRA-INDICATIONS

- With intravenous use Second- and third-degree heart block · sino-atrial block · sinus bradycardia · Stokes-Adams syndrome

● CAUTIONS

GENERAL CAUTIONS Enteral feeding (interrupt feeding for 2 hours before and after dose; more frequent monitoring may be necessary)

SPECIFIC CAUTIONS

- With intravenous use Heart failure · hypotension · injection solutions alkaline (irritant to tissues) · respiratory depression · resuscitation facilities must be available

CAUTIONS, FURTHER INFORMATION Consider vitamin D supplementation in patients who are immobilised for long

periods or who have inadequate sun exposure or dietary intake of calcium.

Intramuscular phenytoin should not be used (absorption is slow and erratic).

- **INTERACTIONS** → Appendix 1: antiepileptics

- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

Agranulocytosis · bone disorders · bone fracture · bone marrow disorders · cerebrovascular insufficiency · coarsening of the facial features · confusion · constipation · dizziness · drowsiness · Dupuytren's contracture · dysarthria · eosinophilia · fever · gingival hyperplasia (maintain good oral hygiene) · granulocytopenia · hair changes · headache · hepatic disorders · hypersensitivity · insomnia · joint disorders · leucopenia · lip swelling · lymphatic abnormalities · macrocytosis · megaloblastic anaemia · movement disorders · muscle twitching · nausea · neoplasms · nephritis tubulointerstitial · nervousness · nystagmus · paraesthesia · Peyronie's disease · polyarteritis nodosa · pseudolymphoma · sensory peripheral polyneuropathy · severe cutaneous adverse reactions (SCARs) · skin reactions · systemic lupus erythematosus (SLE) · taste altered · thrombocytopenia · tremor · vertigo · vomiting

SPECIFIC SIDE-EFFECTS

- ▶ With oral use Electrolyte imbalance · pneumonitis · vitamin D deficiency
- ▶ With parenteral use Arrhythmias · atrial conduction depression (more common if injection too rapid) · cardiac arrest · extravasation necrosis · hypotension · injection site necrosis · purple glove syndrome · respiratory arrest (more common if injection too rapid) · respiratory disorders · tonic seizure (more common if injection too rapid) · ventricular conduction depression (more common if injection too rapid) · ventricular fibrillation (more common if injection too rapid)

SIDE-EFFECTS, FURTHER INFORMATION **Rash** Discontinue; if mild re-introduce cautiously but discontinue immediately if recurrence.

Bradycardia and hypotension With intravenous use; reduce rate of administration if bradycardia or hypotension occurs.

Overdose Symptoms of phenytoin toxicity include nystagmus, diplopia, slurred speech, ataxia, confusion, and hyperglycaemia.

- **ALLERGY AND CROSS-SENSITIVITY** Cross-sensitivity reported with carbamazepine. Antiepileptic hypersensitivity syndrome associated with phenytoin. See under Epilepsy p. 321 for more information.
- **PREGNANCY** See also *Pregnancy* in Epilepsy p. 321. **Monitoring** Changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction. Doses should be adjusted on the basis of plasma-drug concentration monitoring.
- **BREAST FEEDING** Small amounts present in milk, but not known to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of accumulation and toxicity due to decreased protein binding in hepatic impairment, hypoalbuminaemia, or hyperbilirubinaemia). **Dose adjustments** ▶ With oral use Manufacturer advises consider dose reduction. ▶ With intravenous use Manufacturer advises consider maintenance dose reduction.
- **PRE-TREATMENT SCREENING** HLAB* 1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome).

- **MONITORING REQUIREMENTS**

- ▶ **Blood counts** Manufacturer recommends blood counts (but evidence of practical value uncertain).
- ▶ In adults The usual total plasma-phenytoin concentration for optimum response is 10–20 mg/litre (or 40–80 micromol/litre). In pregnancy, the elderly, and certain disease states where protein binding may be reduced, careful interpretation of total plasma-phenytoin concentration is necessary; it may be more appropriate to measure free plasma-phenytoin concentration.
- ▶ In children Therapeutic plasma-phenytoin concentrations reduced in first 3 months of life because of reduced protein binding. Trough plasma concentration for optimum response: neonate–3 months, 6–15 mg/litre (25–60 micromol/litre); child 3 months–18 years, 10–20 mg/litre (40–80 micromol/litre).
- ▶ With intravenous use Monitor ECG and blood pressure.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises each injection or infusion should be preceded and followed by an injection of Sodium Chloride 0.9% through the same needle or catheter to avoid local venous irritation.
- ▶ With intravenous use in children **[EvGr]** For *intravenous injection*, give into a large vein at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute). **[D]** Manufacturer advises for *intravenous infusion*, dilute to a concentration not exceeding 10 mg/mL with Sodium Chloride 0.9% and give into a large vein through an in-line filter (0.22–0.50 micron). **[EvGr]** Give at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute). **[D]** Complete administration within 1 hour of preparation.
- ▶ With intravenous use in adults Manufacturer advises for *intravenous injection*, give into a large vein at a rate not exceeding 50 mg/minute; rate of 25 mg/minute or lower may be more appropriate in some patients (including the elderly and those with heart disease). Manufacturer advises for *intravenous infusion*, dilute in 50–100 mL Sodium Chloride 0.9% (final concentration not to exceed 10 mg/mL) and give into a large vein through an in-line filter (0.22–0.50 micron) at a rate not exceeding 50 mg/minute; rate of 25 mg/minute or lower may be more appropriate in some patients (including the elderly and those with heart disease). Complete administration within 1 hour of preparation.

- **PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer's product.

- **PATIENT AND CARER ADVICE**

Blood or skin disorders Patients or their carers should be told how to recognise signs of blood or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative). Medicines for Children leaflet: Phenytoin for preventing seizures www.medicinesforchildren.org.uk/phenytoin-preventing-seizures

Pregabalin

22-May-2019

● **INDICATIONS AND DOSE****Peripheral and central neuropathic pain**

▶ BY MOUTH

- ▶ **Adult:** Initially 150 mg daily in 2–3 divided doses, then increased if necessary to 300 mg daily in 2–3 divided doses, dose to be increased after 3–7 days, then increased if necessary up to 600 mg daily in 2–3 divided doses, dose to be increased after 7 days

Adjunctive therapy for focal seizures with or without secondary generalisation

▶ BY MOUTH

- ▶ **Adult:** Initially 25 mg twice daily, then increased in steps of 50 mg daily, dose to be increased at 7 day intervals; increased to 300 mg daily in 2–3 divided doses for 7 days, then increased if necessary up to 600 mg daily in 2–3 divided doses

Generalised anxiety disorder

▶ BY MOUTH

- ▶ **Adult:** Initially 150 mg daily in 2–3 divided doses, then increased in steps of 150 mg daily if required, dose to be increased at 7 day intervals, increased if necessary up to 600 mg daily in 2–3 divided doses

- **UNLICENSED USE** Pregabalin doses in BNF may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PREGABALIN (LYRICA®) AND RISK OF ABUSE AND DEPENDENCE: NEW SCHEDULING REQUIREMENTS FROM 1 APRIL (APRIL 2019)

Following concerns about abuse, pregabalin has been reclassified as a Class C controlled substance and is now a Schedule 3 drug, but is exempt from safe custody requirements. Healthcare professionals should evaluate patients carefully for a history of drug abuse before prescribing pregabalin, and observe patients for signs of abuse and dependence. Patients should be informed of the potentially fatal risks of interactions between

pregabalin and alcohol, and with other medicines that cause CNS depression, particularly opioids.

- **CAUTIONS** Conditions that may precipitate encephalopathy · history of substance abuse · severe congestive heart failure
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal distension · appetite abnormal · asthenia · cervical spasm · concentration impaired · confusion · constipation · diarrhoea · dizziness · drowsiness · dry mouth · feeling abnormal · gait abnormal · gastrointestinal disorders · headache · increased risk of infection · joint disorders · memory loss · mood altered · movement disorders · muscle complaints · nausea · oedema · pain · sensation abnormal · sexual dysfunction · sleep disorders · speech impairment · vertigo · vision disorders · vomiting · weight changes
 - ▶ **Uncommon** Aggression · anxiety · arrhythmias · atrioventricular block · breast abnormalities · chest tightness · chills · consciousness impaired · cough · depression · dry eye · dyspnoea · epistaxis · eye discomfort · eye disorders · eye inflammation · fever · hallucination · hyperaemia · hypertension · hypoglycaemia · hypotension · malaise · menstrual cycle irregularities · nasal complaints · neutropenia · oral disorders · peripheral coldness · psychiatric disorders · reflexes decreased · skin reactions · snoring · sweat changes · syncope · taste loss · thirst · urinary disorders · vasodilation
 - ▶ **Rare or very rare** Altered smell sensation · ascites · dysgraphia · dysphagia · gynaecomastia · hepatic disorders · pancreatitis · QT interval prolongation · renal impairment · rhabdomyolysis · Stevens-Johnson syndrome · throat tightness
 - ▶ **Frequency not known** Drug use disorders
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk — toxicity in animal studies. See also *Pregnancy* in *Epilepsy* p. 321.
- **BREAST FEEDING** See *Breast-feeding* in *Epilepsy* p. 321.
- **RENAL IMPAIRMENT**

Dose adjustments Initially 75 mg daily and maximum 300 mg daily if eGFR 30–60 mL/minute/1.73 m².
Initially 25–50 mg daily and maximum 150 mg daily in 1–2 divided doses if eGFR 15–30 mL/minute/1.73 m².
Initially 25 mg once daily and maximum 75 mg once daily if eGFR less than 15 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor for signs of pregabalin abuse.
- **TREATMENT CESSATION** Avoid abrupt withdrawal (taper over at least 1 week).
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.
- **PATIENT AND CARER ADVICE** Patient leaflet NHS England has produced a patient leaflet with information on the reclassification of pregabalin.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (July 2007) that pregabalin (Lyrica®) is not recommended for the treatment of central neuropathic pain.

The *Scottish Medicines Consortium* has advised (April 2009) that pregabalin (Lyrica®) is accepted for restricted use within NHS Scotland for the treatment of peripheral neuropathic pain in adults who have not achieved adequate pain relief with, or have not tolerated, first- or second-line treatments; discontinue treatment if sufficient benefit is not achieved within 8 weeks of reaching the maximum tolerated dose.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Rufinamide

15-May-2019

• **INDICATIONS AND DOSE****Adjunctive treatment of seizures in Lennox-Gastaut syndrome without valproate (initiated by a specialist)**▶ **BY MOUTH**

- ▶ Child 1-3 years: Initially 5 mg/kg twice daily, then increased in steps of up to 5 mg/kg twice daily (max. per dose 22.5 mg/kg twice daily), adjusted according to response, dose to be increased at intervals of not less than 3 days to the target dose (maximum dose), each dose should be given to the nearest 0.5 mL
- ▶ Child 4-17 years (body-weight up to 30 kg): Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 500 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 3 days
- ▶ Child 4-17 years (body-weight 30-50 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 900 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Child 4-17 years (body-weight 50.1-70 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.2 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Child 4-17 years (body-weight 70.1 kg and above): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.6 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Adult (body-weight 30-50 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 900 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Adult (body-weight 50.1-70 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.2 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Adult (body-weight 70.1 kg and above): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.6 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

Adjunctive treatment of seizures in Lennox-Gastaut syndrome with valproate (initiated by a specialist)▶ **BY MOUTH**

- ▶ Child 1-3 years: Initially 5 mg/kg twice daily, then increased in steps of up to 5 mg/kg twice daily (max. per dose 15 mg/kg twice daily), adjusted according to response, dose to be increased at intervals of not less

than 3 days to the target dose (maximum dose), each dose should be given to the nearest 0.5 mL

- ▶ Child 4-17 years (body-weight up to 30 kg): Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 300 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Child 4-17 years (body-weight 30-50 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 600 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Child 4-17 years (body-weight 50.1-70 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 800 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Child 4-17 years (body-weight 70.1 kg and above): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.1 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Adult (body-weight 30-50 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 600 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Adult (body-weight 50.1-70 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 800 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Adult (body-weight 70.1 kg and above): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.1 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

● **CAUTIONS** Patients at risk of further shortening of QTc interval

● **INTERACTIONS** → Appendix 1: antiepileptics

● **SIDE-EFFECTS**

▶ **Common or very common** Anxiety · appetite decreased · back pain · constipation · diarrhoea · dizziness · drowsiness · eating disorder · epistaxis · fatigue · gait abnormal · gastrointestinal discomfort · headache · increased risk of infection · insomnia · movement disorders · nausea · nystagmus · oligomenorrhoea · seizures · skin reactions · tremor · vertigo · vision disorders · vomiting · weight decreased

▶ **Uncommon** Hypersensitivity

● **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with rufinamide. See under Epilepsy p. 321 for more information.

● **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies. See also *Pregnancy* in Epilepsy p. 321.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).

Dose adjustments Manufacturer advises cautious dose titration in mild to moderate impairment.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablets may be crushed and given in half a glass of water.

● **PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation

with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients may need to be maintained on a specific manufacturer's branded or generic rufinamide product.

● **PATIENT AND CARER ADVICE** Counselling on antiepileptic hypersensitivity syndrome is advised.

Medicines for Children leaflet: Rufinamide for preventing seizures www.medicinesforchildren.org.uk/rufinamide-preventing-seizures

Driving and skilled tasks Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness, somnolence and blurred vision.

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 416/07

The *Scottish Medicines Consortium* has advised (November 2008) that rufinamide (*Inovelon*®) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of seizures associated with Lennox-Gastaut syndrome in patients 4 years and above. It is restricted for use when alternative traditional antiepileptic drugs are unsatisfactory.

SMC No. 795/12

The *Scottish Medicines Consortium* has advised (July 2012) that rufinamide 40 mg/mL oral suspension (*Inovelon*®) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of seizures associated with Lennox-Gastaut syndrome in patients 4 years and above. It is restricted for use when alternative traditional antiepileptic drugs are unsatisfactory.

SMC No. SMC2146

▶ In children The *Scottish Medicines Consortium* has advised (April 2019) that rufinamide (*Inovelon*®) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of seizures associated with Lennox-Gastaut syndrome in patients aged 1 year up to 4 years. It is restricted for use when alternative traditional antiepileptic drugs are unsatisfactory.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 991

The *All Wales Medicines Strategy Group* has advised (June 2019) that rufinamide 40 mg/mL oral suspension (*Inovelon*®) is recommended as an option for restricted use within NHS Wales as adjunctive therapy in the treatment of seizures associated with Lennox-Gastaut syndrome in patients aged one year and older where other adjunctive treatments have proved sub-optimal or have not been tolerated. It is not recommended for use within NHS Wales outside of this subpopulation.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

CAUTIONARY AND ADVISORY LABELS 8, 21

EXCIPIENTS: May contain Propylene glycol

▶ **Inovelon** (Eisai Ltd)

Rufinamide 40 mg per 1 ml Inovelon 40mg/ml oral suspension sugar-free | 460 ml [PoM] £94.71 DT = £94.71

Tablet

CAUTIONARY AND ADVISORY LABELS 8, 21

▶ **Inovelon** (Eisai Ltd)

Rufinamide 100 mg Inovelon 100mg tablets | 10 tablet [PoM] £5.15 DT = £5.15

Rufinamide 200 mg Inovelon 200mg tablets | 60 tablet [PoM] £61.77 DT = £61.77

Rufinamide 400 mg Inovelon 400mg tablets | 60 tablet [PoM] £102.96 DT = £102.96

Sodium valproate

14-Feb-2020

● INDICATIONS AND DOSE

All forms of epilepsy

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 1 month–11 years: Initially 10–15 mg/kg daily in 1–2 divided doses (max. per dose 600 mg); maintenance 25–30 mg/kg daily in 2 divided doses, doses up to 60 mg/kg daily in 2 divided doses may be used in infantile spasms; monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily
- ▶ Child 12–17 years: Initially 600 mg daily in 1–2 divided doses, increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily in 2 divided doses; maximum 2.5 g per day
- ▶ Adult: Initially 600 mg daily in 1–2 divided doses, then increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily, alternatively maintenance 20–30 mg/kg daily; maximum 2.5 g per day

Initiation of valproate treatment

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 10 mg/kg, (usually 400–800 mg), followed by (by intravenous infusion or by intravenous injection) up to 2.5 g daily in 2–4 divided doses, alternatively (by continuous intravenous infusion) up to 2.5 g daily; (by intravenous injection or by intravenous infusion or by continuous intravenous infusion) usual dose 1–2 g daily, alternatively (by intravenous injection or by intravenous infusion or by continuous intravenous infusion) usual dose 20–30 mg/kg daily, intravenous injection to be administered over 3–5 minutes

Continuation of valproate treatment

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Adult: If switching from oral therapy to intravenous therapy give the same dose as current oral daily dose, give over 3–5 minutes by intravenous injection or in 2–4 divided doses by intravenous infusion

Migraine prophylaxis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Initially 200 mg twice daily, then increased if necessary to 1.2–1.5 g daily in divided doses

EPILIM CHRONOSPHERE[®]

All forms of epilepsy

- ▶ BY MOUTH
- ▶ Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

EPILIM CHRONO[®]

All forms of epilepsy

- ▶ BY MOUTH
- ▶ Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

EPISENTA[®] CAPSULES

All forms of epilepsy

- ▶ BY MOUTH
- ▶ Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

Mania

- ▶ BY MOUTH
- ▶ Adult: Initially 750 mg daily in 1–2 divided doses, adjusted according to response, usual dose 1–2 g daily in 1–2 divided doses, doses greater than 45 mg/kg daily require careful monitoring

EPISENTA[®] GRANULES

All forms of epilepsy

- ▶ BY MOUTH
- ▶ Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

Mania

- ▶ BY MOUTH
- ▶ Adult: Initially 750 mg daily in 1–2 divided doses, adjusted according to response, usual dose 1–2 g daily in 1–2 divided doses, doses greater than 45 mg/kg daily require careful monitoring

EPIVAL[®]

All forms of epilepsy

- ▶ BY MOUTH
- ▶ Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

- **UNLICENSED USE** Not licensed for migraine prophylaxis.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: VALPROATE MEDICINES: CONTRA-INDICATED IN WOMEN AND GIRLS OF CHILDBEARING POTENTIAL UNLESS CONDITIONS OF PREGNANCY PREVENTION PROGRAMME ARE MET (APRIL 2018)

Valproate is highly teratogenic and evidence supports that use in pregnancy leads to neurodevelopmental disorders (approx. 30–40% risk) and congenital malformations (approx. 10% risk).

Valproate must not be used in women and girls of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met (see *Conception and contraception*) and only if other treatments are ineffective or not tolerated, as judged by an experienced specialist.

Use of valproate in pregnancy is contra-indicated for migraine prophylaxis [unlicensed] and bipolar disorder; it must only be considered for epilepsy if there is no suitable alternative treatment (see *Pregnancy*).

Women and girls (and their carers) must be fully informed of the risks and the need to avoid exposure to valproate medicines in pregnancy; supporting materials have been provided to use in the implementation of the Pregnancy Prevention Programme (see *Prescribing and dispensing Information*). The MHRA advises that:

- GPs must recall all women and girls who may be of childbearing potential, provide the Patient Guide, check they have been reviewed by a specialist in the last year and are on highly effective contraception;
- Specialists must book in review appointments at least annually with women and girls under the Pregnancy Prevention Programme, re-evaluate treatment as necessary, explain clearly the conditions as outlined in the supporting materials and complete and sign the Risk Acknowledgement Form—copies of the form must be given to the patient or carer and sent to their GP;
- Pharmacists must ensure valproate medicines are dispensed in whole packs whenever possible—all packs dispensed to women and girls of childbearing potential should have a warning label either on the carton or via a sticker. They must also discuss risks in pregnancy with female patients each time valproate medicines are dispensed, ensure they have the Patient Guide and have seen their GP or specialist to discuss their treatment and the need for contraception.

MHRA/CHM ADVICE: VALPROATE MEDICINES: ARE YOU ACTING IN COMPLIANCE WITH THE PREGNANCY PREVENTION MEASURES? (DECEMBER 2018)

The MHRA advises that all healthcare professionals must continue to identify and review all female patients on valproate, including when used outside licensed indications (off-label use) and provide them with the

patient information materials every time they attend appointments or receive their medicines.

Guidance for psychiatrists on the withdrawal of, and alternatives to, valproate in women of childbearing potential who have a psychiatric illness is available from the Royal College of Psychiatrists.

MHRA/CHM ADVICE: VALPROATE MEDICINES AND SERIOUS HARMS IN PREGNANCY: NEW ANNUAL RISK ACKNOWLEDGEMENT FORM AND CLINICAL GUIDANCE FROM PROFESSIONAL BODIES TO SUPPORT COMPLIANCE WITH THE PREGNANCY PREVENTION PROGRAMME (APRIL 2019)

The Annual Risk Acknowledgement Form has been updated and should be used for all future reviews of female patients on valproate. Specialists should comply with guidance given on the form if they consider the patient is not at risk of pregnancy, including the need for review in case her risk status changes.

Guidance has been published to support healthcare professionals with the use of valproate. These include a summary by NICE of their guidance and safety advice, pan-college guidance by national healthcare bodies, and paediatric guidance by the British Paediatric Neurology Association and the Royal College of Paediatrics and Child Health.

MHRA/CHM ADVICE (UPDATED JANUARY 2020): VALPROATE PREGNANCY PREVENTION PROGRAMME

The Guide for Healthcare Professionals has been updated and should be used for all future reviews of female patients on valproate medicines, in conjunction with other supporting materials (see *Prescribing and dispensing Information*).

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · known or suspected mitochondrial disorders (higher rate of acute liver failure and liver-related deaths) · personal or family history of severe hepatic dysfunction · urea cycle disorders (risk of hyperammonaemia)
- **CAUTIONS** Systemic lupus erythematosus
- CAUTIONS, FURTHER INFORMATION** Consider vitamin D supplementation in patients that are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.
- ▶ Liver toxicity Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
- GENERAL SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · agitation · alopecia (regrowth may be curly) · anaemia · behaviour abnormal · concentration impaired · confusion · deafness · diarrhoea · drowsiness · haemorrhage · hallucination · headache · hepatic disorders · hypersensitivity · hyponatraemia · memory loss · menstrual cycle irregularities · movement disorders · nail disorder · nausea · nystagmus · oral disorders · seizures · stupor · thrombocytopenia · tremor · urinary disorders · vomiting · weight increased
- ▶ **Uncommon** Androgenetic alopecia · angioedema · bone disorders · bone fracture · bone marrow disorders · coma · encephalopathy · hair changes · hypothermia · leucopenia ·

- pancreatitis · paraesthesia · parkinsonism · peripheral oedema · pleural effusion · renal failure · SIADH · skin reactions · vasculitis · virilism
- ▶ **Rare or very rare** Agranulocytosis · cerebral atrophy · cognitive disorder · dementia · diplopia · gynaecomastia · hyperammonaemia · hypothyroidism · infertility male · learning disability · myelodysplastic syndrome · nephritis tubulointerstitial · polycystic ovaries · red blood cell abnormalities · rhabdomyolysis · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · urine abnormalities
 - ▶ **Frequency not known** Alertness increased
 - SPECIFIC SIDE-EFFECTS**
 - ▶ **Common or very common**
 - ▶ With intravenous use Dizziness
 - SIDE-EFFECTS, FURTHER INFORMATION** **Hepatic dysfunction** Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.
 - ▶ **Pancreatitis** Discontinue treatment if symptoms of pancreatitis develop.

- **CONCEPTION AND CONTRACEPTION** The MHRA advises that all women and girls of childbearing potential being treated with valproate medicines must be supported on a Pregnancy Prevention Programme—pregnancy should be excluded before treatment initiation and highly effective contraception must be used during treatment.
- **PREGNANCY** For *migraine prophylaxis*[unlicensed] and *bipolar disorder*, the MHRA advises that valproate must not be used. For *epilepsy*, the MHRA advises valproate must not be used unless there is no suitable alternative treatment; in such cases, access to counselling about the risks should be provided (see Healthcare Professional Guide for more information) and a Risk Acknowledgement Form signed by both specialist and patient. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses or as modified-release tablets to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Neonatal bleeding (related to hypofibrinaemia) reported. Neonatal hepatotoxicity also reported. See also *Pregnancy in Epilepsy* p. 321.

Monitoring Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy.

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Present in milk—risk of haematological disorders in breast-fed newborns and infants.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT**
- Dose adjustments** Reduce dose.
- **MONITORING REQUIREMENTS**
- ▶ Plasma-valproate concentrations are not a useful index of efficacy, therefore routine monitoring is unhelpful.
- ▶ Monitor liver function before therapy and during first 6 months especially in patients most at risk.
- ▶ Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.
- **EFFECT ON LABORATORY TESTS** False-positive urine tests for ketones.
- **TREATMENT CESSATION** [Evid](#) Avoid abrupt withdrawal; if treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks. [A](#)
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use Manufacturer advises for *intravenous injection*, give over 3–5 minutes. For *intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%.

Reconstitute *Epilim*[®] with solvent provided then dilute with infusion fluid if required. Displacement value may be significant, consult local guidelines.

EPIVAL[®] Tablets may be halved but not crushed or chewed.

EPISENTA[®] **CAPSULES** Contents of capsule may be mixed with cold soft food or drink and swallowed immediately without chewing.

EPIILIM[®] **SYRUP** May be diluted, preferably in Syrup BP; use within 14 days.

EPISENTA[®] **GRANULES** Granules may be mixed with cold soft food or drink and swallowed immediately without chewing.

EPIILIM CHRONOSPHERE[®] Granules may be mixed with soft food or drink that is cold or at room temperature, and swallowed immediately without chewing.

- **PRESCRIBING AND DISPENSING INFORMATION** The Pregnancy Prevention Programme is supported by the following materials provided by the manufacturer: *Patient Guide, Guide for Healthcare Professionals, Risk Acknowledgement Form*, and for pharmacists, *Patient Cards and Stickers with warning symbols*; the MHRA has also produced a patient information sheet providing advice for women and girls taking valproate medicines.

The Royal Pharmaceutical Society has also produced a safe supply algorithm, available at: www.rpharms.com/safesupplyvalproate

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic oral sodium valproate product.

EPIILIM CHRONOSPHERE[®] Prescribe dose to the nearest whole 50-mg sachet.

● PATIENT AND CARER ADVICE

Valproate use by women and girls The MHRA advises women and girls should **not** stop taking valproate without first discussing it with their doctor.

Blood or hepatic disorders Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.

Pancreatitis Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop.

Pregnancy Prevention Programme Pharmacists must ensure that female patients have a patient card—see also *Important safety information*.

Stiripentol

10-Mar-2020

● INDICATIONS AND DOSE

Adjunctive therapy of refractory generalised tonic-clonic seizures in patients with severe myoclonic epilepsy in infancy (Dravet syndrome) in combination with clobazam and valproate (under expert supervision)

▶ BY MOUTH

- ▶ **Adult:** Doses of up to 50 mg/kg daily in 2–3 divided doses should be continued for as long as efficacy is observed

DOSE EQUIVALENCE AND CONVERSION

- ▶ Stiripentol capsules and oral powder sachets are **not** bioequivalent. If a switch of formulation is required, manufacturer advises this is done under clinical supervision in case of intolerance.

- **CONTRA-INDICATIONS** History of psychosis in the form of episodes of delirium

- **INTERACTIONS** → Appendix 1: antiepileptics

● SIDE-EFFECTS

- ▶ **Common or very common** Agitation · appetite decreased · behaviour abnormal · drowsiness · irritability · movement disorders · muscle tone decreased · nausea · neutropenia · sleep disorders · vomiting · weight decreased

- ▶ **Uncommon** Diplopia · fatigue · photosensitivity reaction · skin reactions

- ▶ **Rare or very rare** Thrombocytopenia

- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome theoretically associated with stiripentol. See under Epilepsy p. 321 for more information.

- **PREGNANCY** See also *Pregnancy* in Epilepsy p. 321.

Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid (no information available).

- **RENAL IMPAIRMENT** Avoid—no information available.

- **MONITORING REQUIREMENTS** Perform full blood count and liver function tests prior to initiating treatment and every 6 months thereafter.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (September 2017) that stiripentol (*Diacomit*[®]) is accepted for use within NHS Scotland in conjunction with clobazam and valproate as adjunctive therapy of refractory generalised tonic-clonic seizures in patients with severe myoclonic epilepsy in infancy whose seizures are not adequately controlled with clobazam and valproate.

All Wales Medicines Strategy Group (AWMSG) decisions

The *All Wales Medicines Strategy Group* has advised (November 2017) that stiripentol (*Diacomit*[®]) is recommended for use within NHS Wales for use in conjunction with clobazam and valproate as adjunctive therapy of refractory generalised tonic-clonic seizures in patients with severe myoclonic epilepsy in infancy (SMEI, Dravet syndrome) whose seizures are not adequately controlled with clobazam and valproate.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder

CAUTIONARY AND ADVISORY LABELS 1, 8, 13, 21

EXCIPIENTS: May contain Aspartame

- ▶ **Diacomit** (Alan Pharmaceuticals)

Stiripentol 250 mg Diacomit 250mg oral powder sachets | 60 sachet [PoM] £284.00 DT = £284.00

Stiripentol 500 mg Diacomit 500mg oral powder sachets | 60 sachet [PoM] £493.00 DT = £493.00

Capsule

CAUTIONARY AND ADVISORY LABELS 1, 8, 21

- ▶ **Diacomit** (Alan Pharmaceuticals)

Stiripentol 250 mg Diacomit 250mg capsules | 60 capsule [PoM] £284.00 DT = £284.00

Stiripentol 500 mg Diacomit 500mg capsules | 60 capsule [PoM] £493.00 DT = £493.00

Tiagabine

● INDICATIONS AND DOSE

Adjunctive treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics (with enzyme-inducing drugs)

▶ BY MOUTH

- ▶ **Child 12–17 years:** Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every week; maintenance 30–45 mg daily in 2–3 divided doses

- ▶ **Adult:** Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every week; maintenance 30–45 mg daily in 2–3 divided doses

Adjunctive treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics (without enzyme-inducing drugs)

▶ BY MOUTH

- ▶ **Child 12–17 years:** Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every week; maintenance 15–30 mg daily in 2–3 divided doses

- ▶ **Adult:** Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every week; maintenance 15–30 mg daily in 2–3 divided doses

- **CAUTIONS** Avoid in Acute porphyrias p. 1120

CAUTIONS, FURTHER INFORMATION Tiagabine should be avoided in absence, myoclonic, tonic and atonic seizures due to risk of seizure exacerbation.

- **INTERACTIONS** → Appendix 1: antiepileptics

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · behaviour abnormal · concentration impaired · depression · diarrhoea · dizziness · emotional lability · fatigue · gait abnormal · insomnia · nausea · nervousness · speech disorder · tremor · vision disorders · vomiting

- ▶ **Uncommon** Drowsiness · psychosis · skin reactions

- ▶ **Rare or very rare** Delusions · hallucination

- **PREGNANCY** See also *Pregnancy* in Epilepsy p. 321.

Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment (risk of increased exposure); avoid in severe impairment.

Dose adjustments Manufacturer advises dose reduction and/or longer dose interval with careful titration in mild to moderate impairment.

- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Tiagabine for preventing seizures www.medicinesforchildren.org.uk/tiagabine-preventing-seizures

Driving and skilled tasks May impair performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Gabitril** (Teva UK Ltd)

Tiagabine (as Tiagabine hydrochloride monohydrate)

5 mg Gabitril 5mg tablets | 100 tablet [PoM] £52.04 DT = £52.04

Tiagabine (as Tiagabine hydrochloride monohydrate)

10 mg Gabitril 10mg tablets | 100 tablet [PoM] £104.09 DT = £104.09

Tiagabine (as Tiagabine hydrochloride monohydrate)

15 mg Gabitril 15mg tablets | 100 tablet [PoM] £156.13 DT = £156.13

Topiramate

10-Mar-2020

- **INDICATIONS AND DOSE**

Monotherapy of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation

- ▶ BY MOUTH

▶ **Child 6-17 years:** Initially 0.5–1 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 250–500 micrograms/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 50 mg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate titration regimens recommended above then smaller steps or longer interval between steps may be used; maximum 500 mg per day

▶ **Adult:** Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25–50 mg every 1–2 weeks, dose to be taken in 2 divided doses; usual dose 100–200 mg daily in 2 divided doses, adjusted according to response, doses of 1 g daily have been used in refractory epilepsy; maximum 500 mg per day

Adjunctive treatment of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation | Adjunctive treatment for seizures associated with Lennox-Gastaut syndrome

- ▶ BY MOUTH

▶ **Child 2-17 years:** Initially 1–3 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 0.5–1.5 mg/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 2.5–4.5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate recommended titration regimen then smaller steps or longer interval between steps may be used; maximum 400 mg per day

▶ **Adult:** Initially 25–50 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25–50 mg every 1–2 weeks, dose to be taken in 2 divided doses; usual dose 200–400 mg daily in 2 divided doses; maximum 400 mg per day

Migraine prophylaxis

- ▶ BY MOUTH

▶ **Adult:** Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25 mg every week; usual dose 50–100 mg daily in 2 divided doses; maximum 200 mg per day

- **CAUTIONS** Avoid in Acute porphyrias p. 1120 · risk of metabolic acidosis · risk of nephrolithiasis—ensure adequate hydration (especially in strenuous activity or warm environment)
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
- ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite abnormal · asthenia · behaviour abnormal · cognitive impairment · concentration impaired · confusion · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · ear discomfort · eye disorders · feeling abnormal · fever (in children) · gait abnormal · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · hypersensitivity · joint disorders · malaise · memory loss · mood altered · movement disorders · muscle complaints · muscle weakness · nasal complaints · nasopharyngitis · nausea · oral disorders · pain · seizures · sensation abnormal · skin reactions · sleep disorders · speech impairment · taste altered · tinnitus · tremor · urinary disorders · urolithiasis · vertigo (in children) · vision disorders · vomiting (in children) · weight changes
- ▶ **Uncommon** Abnormal sensation in eye · anhidrosis · arrhythmias · aura · cerebellar syndrome · consciousness impaired · crying · drooling · dry eye · dysgraphia · dysphonia · eosinophilia (in children) · facial swelling · hallucinations · hearing impairment · hyperthermia (in children) · hypokalaemia · hypotension · influenza like illness · learning disability (in children) · leucopenia · lymphadenopathy · metabolic acidosis · musculoskeletal stiffness · palpitations · pancreatitis · paranasal sinus hypersecretion · peripheral coldness · peripheral neuropathy · polydipsia · psychotic disorder · renal pain · sexual dysfunction · smell altered · suicidal tendencies · syncope · thinking abnormal · thirst · thrombocytopenia · vasodilation
- ▶ **Rare or very rare** Eye inflammation · face oedema · glaucoma · hepatic disorders · limb discomfort · neutropenia · Raynaud's phenomenon · renal tubular acidosis · severe cutaneous adverse reactions (SCARs) · unresponsive to stimuli
- SIDE-EFFECTS, FURTHER INFORMATION** Topiramate has been associated with acute myopia with secondary angle-closure glaucoma, typically occurring within 1 month of starting treatment. Choroidal effusions resulting in anterior displacement of the lens and iris have also been reported. If raised intra-ocular pressure occurs: seek specialist ophthalmological advice; use appropriate measures to reduce intra-ocular pressure and stop topiramate as rapidly as feasible.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises perform pregnancy test before the initiation of treatment—a highly effective contraceptive method is advised in women of child-bearing potential; patients should be fully informed of the risks related to the use of topiramate during pregnancy.
- **PREGNANCY** Increased risk of major congenital malformations following exposure during the first trimester. *For migraine prophylaxis* manufacturer advises avoid. *For epilepsy* manufacturer advises consider alternative treatment options. See also *Pregnancy* in Epilepsy p. 321.
- Monitoring** Manufacturer advises in case of administration during first trimester, careful prenatal monitoring should be performed.

It is recommended that the fetal growth should be monitored.

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of decreased clearance).
- **RENAL IMPAIRMENT** Use with caution.
 - Dose adjustments** ▶ In adults Half usual starting and maintenance dose if eGFR less than 70 mL/minute/1.73 m²—reduced clearance and longer time to steady-state plasma concentration.
 - ▶ In children Half usual starting and maintenance dose if estimated glomerular filtration less than 70 mL/minute/1.73 m²—reduced clearance and longer time to steady-state plasma concentration.
- **DIRECTIONS FOR ADMINISTRATION**

TOPAMAX® CAPSULES Swallow whole or sprinkle contents of capsule on soft food and swallow immediately without chewing.
- **PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic topiramate product.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Topiramate for preventing seizures www.medicinesforchildren.org.uk/topiramate-preventing-seizures

TOPAMAX® CAPSULES Patients or carers should be given advice on how to administer *Topamax® Sprinkle* capsules.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Vigabatrin

● INDICATIONS AND DOSE

Adjunctive treatment of focal seizures with or without secondary generalisation not satisfactorily controlled with other antiepileptics (under expert supervision)

▶ BY MOUTH

- ▶ Child 1-23 months: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg)
- ▶ Child 2-11 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g)
- ▶ Child 12-17 years: Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily
- ▶ Adult: Initially 1 g once daily, alternatively initially 1 g daily in 2 divided doses, then increased in steps of 500 mg every week, adjusted according to response; usual dose 2–3 g daily; maximum 3 g per day

▶ BY RECTUM

- ▶ Child 1-23 months: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg)
- ▶ Child 2-11 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g)
- ▶ Child 12-17 years: Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily

- **UNLICENSED USE** Granules not licensed for rectal use. Tablets not licensed to be crushed and dispersed in liquid. Vigabatrin doses in BNF publications may differ from those in product literature.
- **CONTRA-INDICATIONS** Visual field defects
- **CAUTIONS** Elderly · history of behavioural problems · history of depression · history of psychosis
- **CAUTIONS, FURTHER INFORMATION** Vigabatrin may worsen absence, myoclonic, tonic and atonic seizures.
- ▶ **Visual field defects** Vigabatrin is associated with visual field defects. The onset of symptoms varies from 1 month to several years after starting. In most cases, visual field defects have persisted despite discontinuation, and further deterioration after discontinuation cannot be excluded. Product literature advises visual field testing before treatment and at 6-month intervals. Patients and their carers should be warned to report any new visual symptoms that develop and those with symptoms should be referred for an urgent ophthalmological opinion. Gradual withdrawal of vigabatrin should be considered.
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anaemia · anxiety · arthralgia · behaviour abnormal · concentration impaired · depression · dizziness · drowsiness · eye disorders · fatigue · headache · memory loss · mood altered

- nausea • oedema • paraesthesia • speech disorder • thinking abnormal • tremor • vision disorders • vomiting • weight increased
- ▶ **Uncommon** Movement disorders • psychotic disorder • seizure (patients with myoclonic seizures at greater risk) • skin reactions
- ▶ **Rare or very rare** Angioedema • encephalopathy • hallucination • hepatitis • optic neuritis • suicide attempt
- ▶ **Frequency not known** Muscle tone increased

SIDE-EFFECTS, FURTHER INFORMATION **Encephalopathic symptoms** Encephalopathic symptoms including marked sedation, stupor, and confusion with non-specific slow wave EEG can occur rarely—reduce dose or withdraw.

Visual field defects About one-third of patients treated with vigabatrin have suffered visual field defects; counselling and careful monitoring for this side-effect are required.

- **PREGNANCY** See also *Pregnancy* in Epilepsy p. 321. **Monitoring** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Present in milk—manufacturer advises avoid.

- **RENAL IMPAIRMENT**

Dose adjustments ▶ In adults Consider reduced dose or increased dose interval if eGFR less than 60 mL/minute/1.73 m².

▶ In children Consider reduced dose or increased dose interval if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Closely monitor neurological function.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With oral use The contents of a sachet should be dissolved in water or a soft drink immediately before taking. Tablets may be crushed and dispersed in liquid.
- ▶ With rectal use Dissolve contents of sachet in small amount of water and administer rectally [unlicensed use].
- **PATIENT AND CARER ADVICE** Patients and their carers should be warned to report any new visual symptoms that develop.

Medicines for Children leaflet: Vigabatrin for preventing seizures www.medicinesforchildren.org.uk/vigabatrin-preventing-seizures

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Vigabatrin 500 mg Sabril 500mg tablets | 100 tablet [PoM] £44.41 DT = £44.41

Zonisamide

20-Feb-2019

- **INDICATIONS AND DOSE**

Monotherapy for treatment of focal seizures with or without secondary generalisation in adults with newly diagnosed epilepsy

- ▶ **BY MOUTH**

▶ **Adult:** Initially 100 mg once daily for 2 weeks, then increased in steps of 100 mg every 2 weeks, usual maintenance dose 300 mg once daily; maximum 500 mg per day

Adjunctive treatment for refractory focal seizures with or without secondary generalisation

- ▶ **BY MOUTH**

- ▶ **Child 6-17 years (body-weight 20-54 kg):** Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 6-8 mg/kg once daily (max. per dose 500 mg once daily), dose to be increased at 2-week intervals in patients who are **not** receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4

- ▶ **Child 6-17 years (body-weight 55 kg and above):** Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 300-500 mg once daily, dose to be increased at 2-week intervals in patients who are **not** receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4

- ▶ **Adult:** Initially 50 mg daily in 2 divided doses for 7 days, then increased to 100 mg daily in 2 divided doses, then increased in steps of 100 mg every 7 days, usual maintenance 300-500 mg daily in 1-2 divided doses, dose to be increased at 2-week intervals in patients who are **not** receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4

- **CAUTIONS** Elderly • low body-weight or poor appetite—monitor weight throughout treatment (fatal cases of weight loss reported in children) • metabolic acidosis—monitor serum bicarbonate concentration in children and those with other risk factors (consider dose reduction or discontinuation if metabolic acidosis develops) • risk factors for renal stone formation (particularly predisposition to nephrolithiasis)

CAUTIONS, FURTHER INFORMATION Avoid overheating and ensure adequate hydration especially in children, during strenuous activity or if in warm environment (fatal cases of heat stroke reported in children).

- **INTERACTIONS** → Appendix 1: antiepileptics

- **SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia • anxiety • appetite decreased • ataxia • bradyphrenia • concentration impaired • confusion • constipation • depression • diarrhoea • dizziness • drowsiness • fatigue • fever • gastrointestinal discomfort • hypersensitivity • influenza like illness • insomnia • memory loss • mood altered • nausea • nystagmus • paraesthesia • peripheral oedema • psychosis • rash (consider discontinuation) • skin reactions • speech disorder • tremor • urolithiasis • vision disorders • vomiting • weight decreased

- ▶ **Uncommon** Behaviour abnormal • gallbladder disorders • hallucination • hypokalaemia • increased risk of infection • leucopenia • respiratory disorders • seizures • suicidal tendencies • thrombocytopenia

- ▶ **Rare or very rare** Agranulocytosis • angle closure glaucoma • anhidrosis • bone marrow disorders • coma • dyspnoea • eye pain • heat stroke • hepatocellular injury • hydronephrosis • leucocytosis • lymphadenopathy • metabolic acidosis • myasthenic syndrome • neuroleptic malignant syndrome • pancreatitis • renal failure • renal tubular acidosis • rhabdomyolysis • severe cutaneous adverse reactions (SCARs) • urine abnormal

- ▶ **Frequency not known** Sudden unexplained death in epilepsy

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in sulfonamide hypersensitivity.

Antiepileptic hypersensitivity syndrome theoretically associated with zonisamide. See under Epilepsy p. 321 for more information.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during treatment and for one month after last dose—avoid in women of childbearing potential not using effective contraception unless clearly necessary and the potential benefit outweighs risk; patients should be fully informed of the risks related to the use of zonisamide during pregnancy.

● **PREGNANCY** Manufacturer advises use only if clearly necessary and the potential benefit outweighs risk—toxicity in *animal* studies; patients should be fully informed of the risks related to the use of zonisamide during pregnancy. See also *Pregnancy* in *Epilepsy* p. 321. **Monitoring** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

● **BREAST FEEDING** Manufacturer advises avoid for 4 weeks after last dose.

● **HEPATIC IMPAIRMENT** Avoid in severe impairment. **Dose adjustments** Initially increase dose at 2-week intervals if mild or moderate impairment.

● **RENAL IMPAIRMENT**

Dose adjustments Initially increase dose at 2-week intervals; discontinue if renal function deteriorates.

● **TREATMENT CESSATION** Avoid abrupt withdrawal (consult product literature for recommended withdrawal regimens in children).

● **PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients may need to be maintained on a specific manufacturer's branded or generic zonisamide product.

● **PATIENT AND CARER ADVICE** Children and their carers should be made aware of how to prevent and recognise overheating and dehydration.

Medicines for Children leaflet: Zonisamide for preventing seizures www.medicinesforchildren.org.uk/zonisamide-preventing-seizures

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 949/14

The *Scottish Medicines Consortium* has advised (March 2014) that zonisamide (*Zonegran*®) is accepted for restricted use within NHS Scotland as adjunctive treatment of focal seizures, with or without secondary generalisation, in adolescents and children aged 6 years and above. It is restricted to use on advice from specialists in paediatric neurology or epilepsy.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

ANTI-EPILEPTICS > BARBITURATES

Phenobarbital

10-Mar-2020

(Phenobarbitone)

● **INDICATIONS AND DOSE**

All forms of epilepsy except typical absence seizures

▶ **BY MOUTH**

▶ Child 1 month-11 years: Initially 1–1.5 mg/kg twice daily, then increased in steps of 2 mg/kg daily as required; maintenance 2.5–4 mg/kg 1–2 times a day

▶ Child 12-17 years: 60–180 mg once daily

▶ Adult: 60–180 mg once daily, dose to be taken at night

Status epilepticus

▶ **BY INTRAVENOUS INJECTION**

▶ Adult: 10 mg/kg (max. per dose 1 g), dose to be administered at a rate no more than 100 mg/minute, injection to be diluted 1 in 10 with water for injections

▶ **BY SLOW INTRAVENOUS INJECTION**

▶ Neonate: Initially 20 mg/kg, dose to be administered at a rate no faster than 1 mg/kg/minute, then 2.5–5 mg/kg 1–2 times a day.

▶ Child 1 month-11 years: Initially 20 mg/kg, dose to be administered at a rate no faster than 1 mg/kg/minute, then 2.5–5 mg/kg 1–2 times a day

▶ Child 12-17 years: Initially 20 mg/kg (max. per dose 1 g), dose to be administered at a rate no faster than 1 mg/kg/minute, then 300 mg twice daily

DOSE EQUIVALENCE AND CONVERSION

▶ For therapeutic purposes phenobarbital and phenobarbital sodium may be considered equivalent in effect.

● **CAUTIONS** Avoid in Acute porphyrias p. 1120 · children · debilitated · elderly · history of alcohol abuse · history of drug abuse · respiratory depression (avoid if severe)

CAUTIONS, FURTHER INFORMATION Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

● **INTERACTIONS** → Appendix 1: antiepileptics

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

Agranulocytosis · anticonvulsant hypersensitivity syndrome · behaviour abnormal · bone disorders · bone fracture · cognitive impairment · confusion · depression · drowsiness · folate deficiency · hepatic disorders · memory loss · movement disorders · nystagmus · respiratory depression · skin reactions

SPECIFIC SIDE-EFFECTS

▶ With oral use Anxiety · hallucination · hypotension · megaloblastic anaemia · severe cutaneous adverse reactions (SCARs) · thrombocytopenia

▶ With parenteral use Agitation · anaemia · aplastic anaemia · Dupuytren's contracture · hypocalcaemia · irritability · toxic epidermal necrolysis

Overdose For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 1430.

● **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with phenobarbital. See under *Epilepsy* p. 321 for more information.

● **PREGNANCY**

Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

● **BREAST FEEDING** Avoid if possible; drowsiness may occur.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS**
 - ▶ Plasma-phenobarbital concentration for optimum response is 15–40 mg/litre (60–180 micromol/litre); however, monitoring the plasma-drug concentration is less useful than with other drugs because tolerance occurs.
- **TREATMENT CESSATION** Avoid abrupt withdrawal (dependence with prolonged use).
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With oral use For administration by *mouth*, tablets may be crushed.
 - ▶ With intravenous use in adults Solution for injection must be diluted before intravenous administration.
 - ▶ With intravenous use in children For *intravenous injection*, dilute to a concentration of 20 mg/mL with Water for Injections; give over 20 minutes (no faster than 1 mg/kg/minute).
- **PRESCRIBING AND DISPENSING INFORMATION**
 - ▶ In children The RCPCH and NPPG recommend that, when a liquid special of phenobarbital is required, it is alcohol-free and the following strength is used: 50 mg/5 mL. Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients should be maintained on a specific manufacturer's product.
- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Phenobarbital for preventing seizures www.medicinesforchildren.org.uk/phenobarbital-preventing-seizures

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 8

▶ **Phenobarbital (Non-proprietary)**

Phenobarbital 15 mg Phenobarbital 15mg tablets | 28 tablet [PoM]
£24.95 DT = £21.13 [CD3]

Phenobarbital 30 mg Phenobarbital 30mg tablets | 28 tablet [PoM]
£5.99 DT = £1.01 [CD3]

Phenobarbital 60 mg Phenobarbital 60mg tablets | 28 tablet [PoM]
£7.99 DT = £7.35 [CD3]

Solution for injection

EXCIPIENTS: May contain Propylene glycol

▶ **Phenobarbital (Non-proprietary)**

Phenobarbital sodium 30 mg per 1 ml Phenobarbital 30mg/1ml solution for injection ampoules | 10 ampoule [PoM] £113.67 DT = £113.67 [CD3]

Phenobarbital sodium 60 mg per 1 ml Phenobarbital 60mg/1ml solution for injection ampoules | 10 ampoule [PoM] £119.93 DT = £119.93 [CD3]

Phenobarbital sodium 200 mg per 1 ml Phenobarbital 200mg/1ml solution for injection ampoules | 10 ampoule [PoM] £97.78 DT = £97.78 [CD3]

Oral solution

CAUTIONARY AND ADVISORY LABELS 2, 8

EXCIPIENTS: May contain Alcohol

▶ **Phenobarbital (Non-proprietary)**

Phenobarbital 3 mg per 1 ml Phenobarbital 15mg/5ml elixir | 500 ml [PoM] £83.00-£83.01 DT = £83.01 [CD3]

- ▶ Child 2-4 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 250–375 mg twice daily
- ▶ Child 5-8 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 375–500 mg twice daily
- ▶ Child 9-17 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, increased to 250 mg twice daily, then increased in steps of 250 mg every 3 days (max. per dose 750 mg twice daily), adjusted according to response
- ▶ Adult: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, increased to 500 mg daily in 2 divided doses, then increased in steps of 250 mg every 3 days, adjusted according to response; maintenance 0.75–1.5 g daily in 2 divided doses

Essential tremor

▶ BY MOUTH

- ▶ Adult: Initially 50 mg daily, then adjusted according to response to up to 750 mg daily, dose to be increased over 2–3 weeks

- **CAUTIONS** Avoid in Acute porphyrias p. 1120 · children · debilitated · elderly · history of alcohol abuse · history of drug abuse · respiratory depression (avoid if severe)
- **CAUTIONS, FURTHER INFORMATION** Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Apathy · ataxia · drowsiness · nausea · nystagmus · visual impairment
 - ▶ **Uncommon** Dizziness · headache · hypersensitivity · skin reactions · vomiting
 - ▶ **Rare or very rare** Arthralgia · blood disorder · bone disorders · Dupuytren's contracture · megaloblastic anaemia (may be treated with folic acid) · personality change · psychotic disorder · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE)
 - ▶ **Frequency not known** Bone fracture
- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with primidone. See under Epilepsy p. 321 for more information.
- **PREGNANCY**

Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. **Dose adjustments** Manufacturer advises consider dose reduction.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor plasma concentrations of derived phenobarbital; plasma concentration for optimum response is 15–40 mg/litre (60–180 micromol/litre).
- **TREATMENT CESSATION** Avoid abrupt withdrawal (dependence with prolonged use).
- **PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer's product.

Primidone

• INDICATIONS AND DOSE**All forms of epilepsy except typical absence seizures**

▶ BY MOUTH

- ▶ Child 1 month-1 year: Initially 125 mg daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 125–250 mg twice daily

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension

Oral suspension

- ▶ **LiskantIn Saft** (Imported (Germany))
Primidone 25 mg per 1 ml LiskantIn Saft 125mg/5ml oral suspension | 250 ml [PoM] [X]

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 8

- ▶ **Primidone (Non-proprietary)**
Primidone 50 mg Primidone 50mg tablets | 100 tablet [PoM] £112.50 DT = £111.66
Primidone 250 mg Primidone 250mg tablets | 100 tablet [PoM] £99.65-£123.00 DT = £111.12

HYPNOTICS, SEDATIVES AND ANXIOLYTICS > BENZODIAZEPINES

F 359

Clobazam

10-Mar-2020

● INDICATIONS AND DOSE

Adjunct in epilepsy

▶ BY MOUTH

- ▶ Child 6-17 years: Initially 5 mg daily, dose to be increased if necessary at intervals of 5 days, maintenance 0.3-1 mg/kg daily, daily doses of up to 30 mg may be given as a single dose at bedtime, higher doses should be divided; maximum 60 mg per day
- ▶ Adult: 20-30 mg daily, then increased if necessary up to 60 mg daily

Anxiety (short-term use)

▶ BY MOUTH

- ▶ Adult: 20-30 mg daily in divided doses, alternatively 20-30 mg once daily, dose to be taken at bedtime; increased if necessary up to 60 mg daily in divided doses, dose only increased in severe anxiety (in hospital patients), for debilitated patients, use elderly dose
- ▶ Elderly: 10-20 mg daily

● UNLICENSED USE

- ▶ In children Not licensed as monotherapy.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Clobazam has been confused with clonazepam; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CONTRA-INDICATIONS** Respiratory depression
- **CAUTIONS** Muscle weakness · organic brain changes
CAUTIONS, FURTHER INFORMATION The effectiveness of clobazam may decrease significantly after weeks or months of continuous therapy.
- **INTERACTIONS** → Appendix 1: clobazam
- **SIDE-EFFECTS** Appetite decreased · consciousness impaired · constipation · drug abuse · dry mouth · fall · gait unsteady · libido loss · movement disorders · muscle spasms · nystagmus · respiratory disorder · severe cutaneous adverse reactions (SCARs) · skin reactions · speech impairment · weight increased
- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.
Monitoring All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones.
- **RENAL IMPAIRMENT**
Dose adjustments Start with small doses in severe impairment.

● MONITORING REQUIREMENTS

- ▶ In children Routine measurement of plasma concentrations of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. However, plasma drug concentrations may be measured in children with worsening seizures, status epilepticus, suspected noncompliance, or suspected toxicity. Similarly, haematological and biochemical monitoring should not be undertaken unless clinically indicated.

● PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic clobazam product.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Clobazam for preventing seizures www.medicinesforchildren.org.uk/clobazam-preventing-seizures-0

● NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Clobazam is not prescribable in NHS primary care except for the treatment of epilepsy; endorse prescription 'SLS'.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension

Oral suspension

Clonazepam

● INDICATIONS AND DOSE

All forms of epilepsy

► BY MOUTH

- Child 1-11 months: Initially 250 micrograms once daily for 4 nights, dose to be increased over 2-4 weeks, usual dose 0.5-1 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
- Child 1-4 years: Initially 250 micrograms once daily for 4 nights, dose to be increased over 2-4 weeks, usual dose 1-3 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
- Child 5-11 years: Initially 500 micrograms once daily for 4 nights, dose to be increased over 2-4 weeks, usual dose 3-6 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
- Child 12-17 years: Initially 1 mg once daily for 4 nights, dose to be increased over 2-4 weeks, usual dose 4-8 mg daily, dose usually taken at night; may be given in 3-4 divided doses if necessary

All forms of epilepsy | Myoclonus

► BY MOUTH

- Adult: Initially 1 mg once daily for 4 nights, dose to be increased over 2-4 weeks, usual dose 4-8 mg daily, adjusted according to response, dose usually taken at night; may be given in 3-4 divided doses if necessary
- Elderly: Initially 500 micrograms once daily for 4 nights, dose to be increased over 2-4 weeks, usual dose 4-8 mg daily, adjusted according to response, dose usually taken at night; may be given in 3-4 divided doses if necessary

Panic disorders (with or without agoraphobia) resistant to antidepressant therapy

► BY MOUTH

- Adult: 1-2 mg daily

- **UNLICENSED USE** Clonazepam doses in BNF may differ from those in product literature. Use for panic disorders (with or without agoraphobia) resistant to antidepressant therapy is an unlicensed indication.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Clonazepam has been confused with clobazam; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CONTRA-INDICATIONS** Coma · current alcohol abuse · current drug abuse · respiratory depression
- **CAUTIONS** Acute porphyrias p. 1120 · airways obstruction · brain damage · cerebellar ataxia · depression · spinal ataxia · suicidal ideation
- CAUTIONS, FURTHER INFORMATION** The effectiveness of clonazepam may decrease significantly after weeks or months of continuous therapy.
- **INTERACTIONS** → Appendix 1: clonazepam
- **SIDE-EFFECTS** Alopecia · bronchial secretion increased (in children) · concentration impaired · coordination abnormal · drooling (in children) · hypersalivation (in children) · incomplete precocious puberty (in children) · increased risk of fall (in adults) · increased risk of fracture (in adults) · muscle tone decreased · nystagmus · seizures · sexual dysfunction · skin reactions · speech impairment
- **BREAST FEEDING** Present in milk, and should be avoided if possible during breast-feeding.
- Monitoring** All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones.

● RENAL IMPAIRMENT

Dose adjustments Start with small doses in severe impairment.

● MONITORING REQUIREMENTS

- In children Routine measurement of plasma concentrations of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. However, plasma drug concentrations may be measured in children with worsening seizures, status epilepticus, suspected noncompliance, or suspected toxicity. Similarly, haematological and biochemical monitoring should not be undertaken unless clinically indicated.

- **PRESCRIBING AND DISPENSING INFORMATION** The RCPCH and NPPG recommend that, when a liquid special of clonazepam is required, the following strength is used: 2 mg/5 mL.

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic oral clonazepam product.

Thiopental sodium

(Thiopentone sodium)

02-Dec-2019

● INDICATIONS AND DOSE

Status epilepticus (only if other measures fail)

► BY SLOW INTRAVENOUS INJECTION

- Adult: 75-125 mg for 1 dose, to be administered as a 2.5% (25 mg/mL) solution

Induction of anaesthesia

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: Initially 100–150 mg, to be administered over 10–15 seconds usually as a 2.5% (25 mg/mL) solution, followed by 100–150 mg after 0.5–1 minute if required, dose to be given in fit and premedicated adults; debilitated patients or adults over 65 years may require a lower dose or increased administration time, alternatively initially up to 4 mg/kg (max. per dose 500 mg)

Anaesthesia of short duration

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: Initially 100–150 mg, to be administered over 10–15 seconds usually as a 2.5% (25 mg/mL) solution, followed by 100–150 mg after 0.5–1 minute if required, dose to be given in fit and premedicated adults; debilitated patients or adults over 65 years may require a lower dose or increased administration time, alternatively initially up to 4 mg/kg (max. per dose 500 mg)

Reduction of raised intracranial pressure if ventilation controlled

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 1.5–3 mg/kg, repeated if necessary

IMPORTANT SAFETY INFORMATION

Thiopental sodium should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · myotonic dystrophy
- **CAUTIONS** Acute circulatory failure (shock) · avoid intra-arterial injection · cardiovascular disease · elderly · fixed cardiac output · hypovolaemia · reconstituted solution is highly alkaline (extravasation causes tissue necrosis and severe pain)
- **INTERACTIONS** → Appendix 1: thiopental
- **SIDE-EFFECTS**
- ▶ **Common or very common** Arrhythmia · myocardial contractility decreased
- ▶ **Frequency not known** Appetite decreased · circulatory collapse · cough · electrolyte imbalance · extravasation necrosis · hypotension · respiratory disorders · skin eruption · sneezing
- **PREGNANCY** May depress neonatal respiration when used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. **Dose adjustments** Manufacturer advises dose reduction.
- **RENAL IMPAIRMENT** Caution in severe impairment.
- **PATIENT AND CARER ADVICE**
- Driving and skilled tasks** Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Powder for solution for injection

21-Oct-2019

Lorazepam**● INDICATIONS AND DOSE****Short-term use in anxiety**

- ▶ BY MOUTH
- ▶ Adult: 1–4 mg daily in divided doses, for debilitated patients, use elderly dose
- ▶ Elderly: 0.5–2 mg daily in divided doses

Short-term use in insomnia associated with anxiety

- ▶ BY MOUTH
- ▶ Adult: 1–2 mg daily, to be taken at bedtime

Acute panic attacks

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 25–30 micrograms/kg every 6 hours if required; usual dose 1.5–2.5 mg every 6 hours if required, intravenous injection to be administered into a large vein, only use intramuscular route when oral and intravenous routes not possible

Conscious sedation for procedures

- ▶ BY MOUTH
- ▶ Adult: 2–3 mg, to be taken the night before operation; 2–4 mg, to be taken 1–2 hours before operation
- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 50 micrograms/kg, to be administered 30–45 minutes before operation
- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 50 micrograms/kg, to be administered 60–90 minutes before operation

Premedication

- ▶ BY MOUTH
- ▶ Adult: 2–3 mg, to be taken the night before operation; 2–4 mg, to be taken 1–2 hours before operation
- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 50 micrograms/kg, to be administered 30–45 minutes before operation
- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 50 micrograms/kg, to be administered 60–90 minutes before operation

Status epilepticus | Febrile convulsions | Convulsions caused by poisoning

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Child 1 month-11 years: 100 micrograms/kg (max. per dose 4 mg) for 1 dose, then 100 micrograms/kg after 10 minutes (max. per dose 4 mg) if required for 1 dose, to be administered into a large vein
- ▶ Child 12-17 years: 4 mg for 1 dose, then 4 mg after 10 minutes if required for 1 dose, to be administered into a large vein
- ▶ Adult: 4 mg for 1 dose, then 4 mg after 10 minutes if required for 1 dose, to be administered into a large vein

● UNLICENSED USE

- ▶ In children Not licensed for use in febrile convulsions. Not licensed for use in convulsions caused by poisoning.

IMPORTANT SAFETY INFORMATION

ANAESTHESIA

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · CNS depression · compromised airway · respiratory depression

- **CAUTIONS** Muscle weakness · organic brain changes · parenteral administration

CAUTIONS, FURTHER INFORMATION

- ▶ Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.
- ▶ Special precautions for parenteral administration When given parenterally, facilities for managing respiratory depression with mechanical ventilation must be available. Close observation required until full recovery from sedation.

- **INTERACTIONS** → Appendix 1: lorazepam

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Apnoea · asthenia · coma · disinhibition · extrapyramidal symptoms · hypothermia · memory loss · speech slurred · suicide attempt
- ▶ **Uncommon** Allergic dermatitis · constipation · sexual dysfunction
- ▶ **Rare or very rare** Agranulocytosis · hyponatraemia · pancytopenia · SIADH · thrombocytopenia

SPECIFIC SIDE-EFFECTS

- ▶ **Rare or very rare**
- ▶ With oral use Saliva altered
- ▶ **Frequency not known**
- ▶ With parenteral use Leucopenia
- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

● RENAL IMPAIRMENT

Dose adjustments Start with small doses in severe impairment.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use in children For *intravenous injection*, dilute with an equal volume of Sodium Chloride 0.9% (for neonates, dilute injection solution to a concentration of 100 micrograms/mL). Give over 3–5 minutes; max. rate 50 micrograms/kg over 3 minutes.
- ▶ With intramuscular use in adults For intramuscular injection, solution for injection should be diluted with an equal volume of water for injections or sodium chloride 0.9% (but only use when oral and intravenous routes not possible).
- ▶ With intravenous use in adults For slow intravenous injection, solution for injection should preferably be diluted with an equal volume of water for injections or sodium chloride 0.9%.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to **at least 24 hours** after administration. Responsible persons should be

available to take patients home afterwards. The dangers of taking **alcohol** should be emphasised.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

Midazolam

21-Mar-2018

● INDICATIONS AND DOSE

Status epilepticus / Febrile convulsions

▶ BY BUCCAL ADMINISTRATION

- ▶ Child 1-2 months: 300 micrograms/kg (max. per dose 2.5 mg), then 300 micrograms/kg after 10 minutes (max. per dose 2.5 mg) if required
- ▶ Child 3-11 months: 2.5 mg, then 2.5 mg after 10 minutes if required
- ▶ Child 1-4 years: 5 mg, then 5 mg after 10 minutes if required
- ▶ Child 5-9 years: 7.5 mg, then 7.5 mg after 10 minutes if required
- ▶ Child 10-17 years: 10 mg, then 10 mg after 10 minutes if required
- ▶ Adult: 10 mg, then 10 mg after 10 minutes if required

Conscious sedation for procedures

▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: Initially 2–2.5 mg, to be administered 5–10 minutes before procedure at a rate of approximately 2 mg/minute, increased in steps of 1 mg if required, usual total dose is 3.5–5 mg; maximum 7.5 mg per course
- ▶ Elderly: Initially 0.5–1 mg, to be administered 5–10 minutes before procedure at a rate of approximately 2 mg/minute, increased in steps of 0.5–1 mg if required; maximum 3.5 mg per course

Sedative in combined anaesthesia

▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: 30–100 micrograms/kg, repeated if necessary, alternatively (by continuous intravenous infusion) 30–100 micrograms/kg/hour
- ▶ Elderly: Lower doses needed

Premedication

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 70–100 micrograms/kg, to be administered 20–60 minutes before induction, for debilitated patients, use elderly dose
- ▶ Elderly: 25–50 micrograms/kg, to be administered 20–60 minutes before induction

► BY INTRAVENOUS INJECTION

- Adult: 1–2 mg, repeated if necessary, to be administered 5–30 minutes before procedure, for debilitated patients, use elderly dose
- Elderly: 0.5 mg, repeated if necessary, initial dose to be administered 5–30 minutes before procedure, repeat dose slowly as required

Induction of anaesthesia (but rarely used)

► BY SLOW INTRAVENOUS INJECTION

- Adult: 150–200 micrograms/kg daily in divided doses (max. per dose 5 mg), dose to be given at intervals of 2 minutes, maximum total dose 600 micrograms/kg, for debilitated patients, use elderly dose
- Elderly: 50–150 micrograms/kg daily in divided doses (max. per dose 5 mg), dose to be given at intervals of 2 minutes, maximum total dose 600 micrograms/kg

Sedation of patient receiving intensive care

► INITIALLY BY SLOW INTRAVENOUS INJECTION

- Adult: Initially 30–300 micrograms/kg, dose to be given in steps of 1–2.5 mg every 2 minutes, then (by slow intravenous injection or by continuous intravenous infusion) 30–200 micrograms/kg/hour, reduce dose (or reduce or omit initial dose) in hypovolaemia, vasoconstriction, or hypothermia, lower doses may be adequate if opioid analgesic also used

Adjunct to antipsychotic for confusion and restlessness in palliative care

► BY SUBCUTANEOUS INFUSION

- Adult: Initially 10–20 mg/24 hours, adjusted according to response; usual dose 20–60 mg/24 hours

Convulsions in palliative care

► BY CONTINUOUS SUBCUTANEOUS INFUSION

- Adult: Initially 20–40 mg/24 hours

- **UNLICENSED USE** Unlicensed oromucosal formulations are also available and may have different doses—refer to product literature.
- In adults Oromucosal solution not licensed for use in adults over 18 years.
- In children Oromucosal solution not licensed for use in children under 3 months. Injection not licensed for use in status epilepticus or febrile convulsions. Not licensed for use in children under 6 months for premedication and conscious sedation. Not licensed for use by mouth. Not licensed for use by buccal administration for conscious sedation.

IMPORTANT SAFETY INFORMATION**ANAESTHESIA**

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

NHS NEVER EVENT: MIS-SELECTION OF HIGH-STRENGTH MIDAZOLAM DURING CONSCIOUS SEDATION (JANUARY 2018).

In clinical areas performing conscious sedation, high-strength preparations (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should **not** be selected in place of the 1 mg/mL preparation.

The areas where high-strength midazolam is used should be restricted to those performing general anaesthesia, intensive care, palliative care, or areas where its use has been formally risk-assessed in the organisation. In these situations the higher strength may be more appropriate to administer the prescribed dose.

It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

- **CONTRA-INDICATIONS** CNS depression · compromised airway · severe respiratory depression

- **CAUTIONS** Cardiac disease · children (particularly if cardiovascular impairment) · concentration of midazolam in children under 15 kg not to exceed 1 mg/mL · debilitated patients (reduce dose) (in children) · hypothermia · hypovolaemia (risk of severe hypotension) · neonates · risk of airways obstruction and hypoventilation in children under 6 months (monitor respiratory rate and oxygen saturation) · vasoconstriction

CAUTIONS, FURTHER INFORMATION

- Recovery when used for sedation Midazolam has a fast onset of action, recovery is faster than for other benzodiazepines such as diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing.

- **INTERACTIONS** → Appendix 1: midazolam

SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- **Common or very common** Vomiting
- **Uncommon** Skin reactions
- **Rare or very rare** Dry mouth · dyspnoea · hiccups · movement disorders · respiratory disorders
- **Frequency not known** Disinhibition (severe; with sedative and peri-operative use) (in children)

SPECIFIC SIDE-EFFECTS► **Common or very common**

- With buccal use Level of consciousness decreased
- **Rare or very rare**
- With buccal use Apnoea · bradycardia · cardiac arrest · constipation · physical assault · vasodilation
- **Frequency not known**
- With buccal use Appetite increased · fall · saliva altered · thrombosis
- With oral use Angioedema (in children) · arrhythmias (in children) · asthenia (in children) · gait instability (in children) · hypersalivation (in children) · hypoxia (in children) · myopathy (in children)
- With parenteral use Angioedema · apnoea · appetite increased · bradycardia · cardiac arrest · constipation · drug abuse · drug withdrawal seizure · embolism and thrombosis · fall · level of consciousness decreased · physical assault · saliva altered · vasodilation
- With rectal use Angioedema (in children) · apnoea (in children) · appetite increased (in children) · bradycardia (in children) · cardiac arrest (in children) · constipation (in children) · drug abuse (in children) · drug withdrawal seizure (in children) · embolism and thrombosis (in children) · fall (in children) · level of consciousness decreased (in children) · physical assault (in children) · respiratory arrest (more common with high doses or on rapid injection) (in children) · saliva altered (in children) · vasodilation (in children)

SIDE-EFFECTS, FURTHER INFORMATION Higher doses are associated with prolonged sedation and risk of hypoventilation. The co-administration of midazolam with other sedative, hypnotic, or CNS-depressant drugs results in increased sedation. Midazolam accumulates in adipose tissue, which can significantly prolong sedation, especially in patients with obesity, hepatic impairment or renal impairment.

Overdose There have been reports of overdose when high strength midazolam has been used for conscious sedation. The use of high-strength midazolam (5mg/mL in 2mL and 10mL ampoules, or 2mg/mL in 5mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

- **BREAST FEEDING** Small amount present in milk—avoid breast-feeding for 24 hours after administration (although amount probably too small to be harmful after single doses).

• **HEPATIC IMPAIRMENT** For *parenteral preparations* manufacturer advises caution in all degrees of impairment. **Dose adjustments** For *parenteral preparations* manufacturer advises consider dose reduction in all degrees of impairment.

• **RENAL IMPAIRMENT** Use with caution in chronic renal failure.

• **DIRECTIONS FOR ADMINISTRATION**

▶ With intravenous use in adults For *intravenous infusion* (Hypnovel®), give continuously in Glucose 5% or Sodium chloride 0.9%.

• **PRESCRIBING AND DISPENSING INFORMATION**

Palliative care For further information on the use of midazolam in palliative care, see www.medicinescomplete.com/#/content/palliative/benzodiazepines-and-z-drugs.

• **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how and when to administer midazolam oromucosal solution.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking **alcohol** should be emphasised.

Medicines for Children leaflet: Midazolam for stopping seizures www.medicinesforchildren.org.uk/midazolam-stopping-seizures

• **NATIONAL FUNDING/ACCESS DECISIONS**

EPISTATUS OROMUCOSAL SOLUTION

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (November 2017) that midazolam oromucosal solution (*Epistatus*®) is accepted for use within NHS Scotland for the treatment of prolonged, acute, convulsive seizures in patients aged 10 years to less than 18 years.

• **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oromucosal solution, solution for injection, infusion, solution for infusion

Solution for injection

▶ **Midazolam (Non-proprietary)**

Midazolam (as Midazolam hydrochloride) 1 mg per

1 ml Midazolam 5mg/5ml solution for injection ampoules | 10 ampoule [PoM] £10.29 DT = £10.29 [CD3] | 10 ampoule [PoM] £16.89 DT = £10.29 (Hospital only) [CD3]

Midazolam 2mg/2ml solution for injection ampoules |

10 ampoule [PoM] £4.50-£6.00 DT = £6.00 [CD3]

Midazolam (as Midazolam hydrochloride) 2 mg per

1 ml Midazolam 10mg/5ml solution for injection ampoules | 10 ampoule [PoM] £7.51 DT = £7.26 [CD3] | 10 ampoule [PoM] £6.75 DT = £7.26 (Hospital only) [CD3]

Midazolam (as Midazolam hydrochloride) 5 mg per

1 ml Midazolam 50mg/10ml solution for injection ampoules |

10 ampoule [PoM] £33.77 DT = £29.25 (Hospital only) [CD3] |

10 ampoule [PoM] £29.25 DT = £29.25 [CD3]

Midazolam 10mg/2ml solution for injection ampoules |

10 ampoule [PoM] £7.65 DT = £7.04 [CD3] | 10 ampoule [PoM] £6.75 DT = £7.04 (Hospital only) [CD3]

▶ **Hypnovel** (Cheplapharm Arzneimittel GmbH)

Midazolam (as Midazolam hydrochloride) 5 mg per 1 ml Hypnovel

10mg/2ml solution for injection ampoules | 10 ampoule [PoM] £7.11 DT = £7.04 [CD3]

Solution for infusion

▶ **Midazolam (Non-proprietary)**

Midazolam (as Midazolam hydrochloride) 1 mg per

1 ml Midazolam 50mg/50ml solution for infusion pre-filled syringes | 1 pre-filled disposable injection [PoM] [S] (Hospital only) [CD3] | Midazolam 50mg/50ml solution for infusion vials | 1 vial [PoM] £9.56-£12.00 [CD3]

Midazolam (as Midazolam hydrochloride) 2 mg per

1 ml Midazolam 100mg/50ml solution for infusion vials | 1 vial [PoM] £9.96-£13.50 [CD3]

Midazolam 100mg/50ml solution for infusion pre-filled syringes | 1 pre-filled disposable injection [PoM] [S] (Hospital only) [CD3]

Oromucosal solution

CAUTIONARY AND ADVISORY LABELS 2

EXCIPIENTS: May contain Ethanol

▶ **Buccolam** (Shire Pharmaceuticals Ltd)

Midazolam (as Midazolam hydrochloride) 5 mg per

1 ml Buccolam 10mg/2ml oromucosal solution pre-filled oral syringes

sugar-free | 4 unit dose [PoM] £91.50 DT = £91.50 [CD3]

Buccolam 7.5mg/1.5ml oromucosal solution pre-filled oral syringes

sugar-free | 4 unit dose [PoM] £89.00 DT = £89.00 [CD3]

Buccolam 5mg/1ml oromucosal solution pre-filled oral syringes sugar-free | 4 unit dose [PoM] £85.50 DT = £85.50 [CD3]

Buccolam 2.5mg/0.5ml oromucosal solution pre-filled oral syringes

sugar-free | 4 unit dose [PoM] £82.00 DT = £82.00 [CD3]

▶ **Epistatus** (Veriton Pharma Ltd)

Midazolam (as Midazolam maleate) 10 mg per 1 ml Epistatus

10mg/1ml oromucosal solution pre-filled oral syringes sugar-free |

1 unit dose [PoM] £45.76 DT = £45.76 [CD3]

Escitalopram, p. 382 · Lorazepam, p. 355 · Moclobemide, p. 380 · Paroxetine, p. 384 · Pericyazine, p. 406 · Pregabalin, p. 341 · Trazodone hydrochloride, p. 388 · Trifluoperazine, p. 408 · Venlafaxine, p. 386

ANTIDEPRESSANTS > SEROTONIN RECEPTOR AGONISTS

Buspirone hydrochloride

13-Jun-2018

• **INDICATIONS AND DOSE**

Anxiety (short-term use)

▶ **BY MOUTH**

▶ **Adult:** 5 mg 2–3 times a day, increased if necessary up to 45 mg daily, dose to be increased at intervals of 2–3 days; usual dose 15–30 mg daily in divided doses

DOSE ADJUSTMENTS DUE TO INTERACTIONS

▶ Manufacturer advises reduce dose to 2.5 mg twice daily with concurrent use of potent inhibitors of CYP3A4.

• **CONTRA-INDICATIONS** Epilepsy

• **CAUTIONS** Does not alleviate symptoms of benzodiazepine withdrawal

CAUTIONS, FURTHER INFORMATION A patient taking a benzodiazepine still needs to have the benzodiazepine withdrawn gradually; it is advisable to do this before starting bupirone.

• **INTERACTIONS** → Appendix 1: bupirone

• **SIDE-EFFECTS**

▶ **Common or very common** Abdominal pain · anger · anxiety · chest pain · cold sweat · concentration impaired · confusion · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · fatigue · headache · laryngeal pain · movement disorders · musculoskeletal pain · nasal congestion · nausea · paraesthesia · skin reactions · sleep disorders · tachycardia · tinnitus · tremor · vision disorders · vomiting

▶ **Rare or very rare** Depersonalisation · emotional lability · galactorrhoea · hallucination · memory loss · parkinsonism · psychotic disorder · seizure · serotonin syndrome · syncope · urinary retention

• **PREGNANCY** Avoid.

• **BREAST FEEDING** Avoid.

• **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in severe hepatic failure.

Dose adjustments Manufacturer advises titrate individual dose carefully in cirrhosis—consult product literature.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 20 mL/minute/1.73 m².

Dose adjustments Reduce dose.

- **PATIENT AND CARER ADVICE**

Driving and skilled tasks May affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

- ▶ **Bupirone hydrochloride (Non-proprietary)**

Bupirone hydrochloride 5 mg Bupirone 5mg tablets | 30 tablet [PoM] £21.00 DT = £4.16

Bupirone hydrochloride 7.5 mg Bupirone 7.5mg tablets | 30 tablet [PoM] £25.99 DT = £25.99

Bupirone hydrochloride 10 mg Bupirone 10mg tablets | 30 tablet [PoM] £29.00 DT = £4.66

HYPNOTICS, SEDATIVES AND ANXIOLYTICS > BENZODIAZEPINES

Benzodiazepines

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BENZODIAZEPINES AND OPIOIDS: REMINDER OF RISK OF POTENTIALLY FATAL RESPIRATORY DEPRESSION (MARCH 2020)

The MHRA reminds healthcare professionals that benzodiazepines and benzodiazepine-like drugs co-prescribed with opioids can produce additive CNS depressant effects, thereby increasing the risk of sedation, respiratory depression, coma, and death. Healthcare professionals are advised to only co-prescribe if there is no alternative and, if necessary, the lowest possible doses should be given for the shortest duration. Patients should be closely monitored for signs of respiratory depression at initiation of treatment and when there is any change in prescribing, such as dose adjustments or new interactions. If methadone is co-prescribed with a benzodiazepine or benzodiazepine-like drug, the respiratory depressant effect of methadone may be delayed; patients should be monitored for at least 2 weeks after initiation or changes in prescribing. Patients should be informed of the signs and symptoms of respiratory depression and sedation, and advised to seek urgent medical attention should these occur.

- **CONTRA-INDICATIONS** Acute pulmonary insufficiency · marked neuromuscular respiratory weakness · not for use alone to treat chronic psychosis (in adults) · not for use alone to treat depression (or anxiety associated with depression) (in adults) · obsessive states · phobic states · sleep apnoea syndrome · unstable myasthenia gravis
- **CAUTIONS** Avoid prolonged use (and abrupt withdrawal thereafter) · debilitated patients (reduce dose)(in adults) · elderly (reduce dose) · history of alcohol dependence or abuse · history of drug dependence or abuse · myasthenia gravis · personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence · respiratory disease

CAUTIONS, FURTHER INFORMATION

- ▶ **Paradoxical effects** A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

- ▶ **Elderly** Prescription potentially inappropriate (STOPP criteria):
 - for a duration of 4 weeks or longer (no indication for longer treatment; risk of adverse events); all benzodiazepines should be withdrawn gradually if taken for more than 2 weeks as there is a risk of causing a benzodiazepine withdrawal syndrome if stopped abruptly)
 - with acute or chronic respiratory failure i.e. PaO₂ < 8 kPa with or without PaCO₂ > 6.5 kPa (risk of exacerbation of respiratory failure)
 - in patients prone to falls (sedative, may cause reduced sensorium and impair balance)
- See also Prescribing in the elderly p. 33.

● SIDE-EFFECTS

- ▶ **Common or very common** Alertness decreased · anxiety · ataxia (more common in elderly) · confusion (more common in elderly) · depression · dizziness · drowsiness · dysarthria · fatigue · gastrointestinal disorder · headache · hypotension · mood altered · muscle weakness · nausea · respiratory depression (particularly with high dose and intravenous use—facilities for its treatment are essential) · sleep disorders · suicidal ideation · tremor · vertigo · vision disorders · withdrawal syndrome
 - ▶ **Uncommon** Agitation (more common in children and elderly) · anterograde amnesia · behaviour abnormal · hallucination · libido disorder · rash · urinary disorders
 - ▶ **Rare or very rare** Aggression (more common in children and elderly) · blood disorder · delusions · jaundice · paradoxical drug reaction · psychosis · restlessness (with sedative and peri-operative use)
 - ▶ **Frequency not known** Drug dependence
- Overdose** Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. For details on the management of poisoning, see Benzodiazepines, under Emergency treatment of poisoning p. 1430.
- **PREGNANCY** Risk of neonatal withdrawal symptoms when used during pregnancy. Avoid regular use and use only if there is a clear indication such as seizure control. High doses administered during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.
 - **HEPATIC IMPAIRMENT** In general, manufacturers advise caution in mild to moderate impairment; avoid in severe impairment. Benzodiazepines with a shorter half-life are considered safer.
- Dose adjustments** In general, manufacturers advise dose reduction in mild to moderate impairment, adjust dose according to response.

- **RENAL IMPAIRMENT** Increased cerebral sensitivity to benzodiazepines.

● PATIENT AND CARER ADVICE

Driving and skilled tasks May cause drowsiness, impair judgement and increase reaction time, and so affect ability to drive or perform skilled tasks; effects of alcohol increased. Moreover the hangover effects of a night dose may impair performance on the following day.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including benzodiazepines, see *Drugs and driving* under Guidance on prescribing p. 1.

Alprazolam

359
21-Oct-2019

INDICATIONS AND DOSE

Short-term use in anxiety

BY MOUTH

- Adult: 250–500 micrograms 3 times a day, increased if necessary up to 3 mg daily, for debilitated patients, use elderly dose
- Elderly: 250 micrograms 2–3 times a day, increased if necessary up to 3 mg daily

● **CONTRA-INDICATIONS** Respiratory depression

● **CAUTIONS** Muscle weakness · organic brain changes

● **INTERACTIONS** → Appendix 1: alprazolam

SIDE-EFFECTS

- Common or very common Appetite decreased · concentration impaired · constipation · dermatitis · dry mouth · memory loss · movement disorders · sexual dysfunction · weight changes
- Uncommon Menstruation irregular
- Frequency not known Angioedema · autonomic dysfunction · hepatic disorders · hyperprolactinaemia · peripheral oedema · photosensitivity reaction · suicide · thinking abnormal

● **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

RENAL IMPAIRMENT

Dose adjustments Start with small doses in severe impairment.

NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Alprazolam tablets are not prescribable in NHS primary care.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

Chlordiazepoxide hydrochloride

21-Oct-2019

INDICATIONS AND DOSE

Short-term use in anxiety

BY MOUTH

- Adult: 10 mg 3 times a day, increased if necessary to 60–100 mg daily in divided doses, for debilitated patients, use elderly dose
- Elderly: 5 mg 3 times a day, increased if necessary to 30–50 mg daily in divided doses

Treatment of alcohol withdrawal in moderate dependence

BY MOUTH

- Adult: 10–30 mg 4 times a day, dose to be gradually reduced over 5–7 days, consult local protocols for titration regimens

Treatment of alcohol withdrawal in severe dependence

BY MOUTH

- Adult: 10–50 mg 4 times a day and 10–40 mg as required for the first 2 days, dose to be gradually reduced over 7–10 days, consult local protocols for titration regimens; maximum 250 mg per day

● **CONTRA-INDICATIONS** Chronic psychosis · respiratory depression

● **CAUTIONS** Muscle weakness · organic brain changes

● **INTERACTIONS** → Appendix 1: chlordiazepoxide

SIDE-EFFECTS

- Common or very common Movement disorders
 - Rare or very rare Abdominal distress · agranulocytosis · bone marrow disorders · erectile dysfunction · leucopenia · menstrual disorder · skin eruption · thrombocytopenia
 - Frequency not known Appetite increased · gait abnormal · increased risk of fall · level of consciousness decreased · memory loss · saliva altered · suicide attempt
- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

HEPATIC IMPAIRMENT

Dose adjustments Manufacturer advises dose reduction to max. 50% of the usual dose in mild to moderate impairment.

RENAL IMPAIRMENT

Dose adjustments Start with small doses in severe impairment.

NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions *Librium*® is not prescribable in NHS primary care.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Diazepam

21-Oct-2019

INDICATIONS AND DOSE

Muscle spasm of varied aetiology

BY MOUTH

- Adult: 2–15 mg daily in divided doses, then increased if necessary to 60 mg daily, adjusted according to response, dose only increased in spastic conditions

Acute muscle spasm

BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION

- Adult: 10 mg, then 10 mg after 4 hours if required, intravenous injection to be administered into a large vein at a rate of no more than 5 mg/minute

Tetanus

BY INTRAVENOUS INJECTION

- Child: 100–300 micrograms/kg every 1–4 hours
- Adult: 100–300 micrograms/kg every 1–4 hours
- BY INTRAVENOUS INFUSION, OR BY NASODUODENAL TUBE
- Child: 3–10 mg/kg, adjusted according to response, to be given over 24 hours
- Adult: 3–10 mg/kg, adjusted according to response, to be given over 24 hours

Muscle spasm in cerebral spasticity or in postoperative skeletal muscle spasm

BY MOUTH

- Child 1-11 months: Initially 250 micrograms/kg twice daily
- Child 1-4 years: Initially 2.5 mg twice daily
- Child 5-11 years: Initially 5 mg twice daily
- Child 12-17 years: Initially 10 mg twice daily; maximum 40 mg per day

Anxiety

▶ BY MOUTH

- ▶ Adult: 2 mg 3 times a day, then increased if necessary to 15–30 mg daily in divided doses, for debilitated patients, use elderly dose
- ▶ Elderly: 1 mg 3 times a day, then increased if necessary to 7.5–15 mg daily in divided doses

Insomnia associated with anxiety

▶ BY MOUTH

- ▶ Adult: 5–15 mg daily, to be taken at bedtime

Severe acute anxiety | Control of acute panic attacks | Acute alcohol withdrawal

▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 10 mg, then 10 mg after at least 4 hours if required, intravenous injection to be administered into a large vein, at a rate of not more than 5 mg/minute

Acute drug-induced dystonic reactions

▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 5–10 mg, then 5–10 mg after at least 10 minutes as required, to be administered into a large vein, at a rate of not more than 5 mg/minute

Acute anxiety and agitation

▶ BY RECTUM

- ▶ Adult: 500 micrograms/kg, then 500 micrograms/kg after 12 hours as required
- ▶ Elderly: 250 micrograms/kg, then 250 micrograms/kg after 12 hours as required

Premedication

▶ BY MOUTH

- ▶ Adult: 5–10 mg, to be given 1–2 hours before procedure, for debilitated patients, use elderly dose
- ▶ Elderly: 2.5–5 mg, to be given 1–2 hours before procedure

▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 100–200 micrograms/kg, to be administered into a large vein at a rate of not more than 5 mg/minute, immediately before procedure

Sedation in dental procedures carried out in hospital

▶ BY MOUTH

- ▶ Adult: Up to 20 mg, to be given 1–2 hours before procedure

Conscious sedation for procedures, and in conjunction with local anaesthesia

▶ BY MOUTH

- ▶ Adult: 5–10 mg, to be given 1–2 hours before procedure, for debilitated patients, use elderly dose
- ▶ Elderly: 2.5–5 mg, to be given 1–2 hours before procedure

Sedative cover for minor surgical and medical procedures

▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 10–20 mg, to be administered into a large vein over 2–4 minutes, immediately before procedure

Status epilepticus | Febrile convulsions | Convulsions due to poisoning

▶ BY INTRAVENOUS INJECTION

- ▶ Neonate: 300–400 micrograms/kg, then 300–400 micrograms/kg after 10 minutes if required, to be given over 3–5 minutes.
- ▶ Child 1 month–11 years: 300–400 micrograms/kg (max. per dose 10 mg), then 300–400 micrograms/kg after 10 minutes if required, to be given over 3–5 minutes
- ▶ Child 12–17 years: 10 mg, then 10 mg after 10 minutes if required, to be given over 3–5 minutes
- ▶ Adult: 10 mg, then 10 mg after 10 minutes if required, administered at a rate of 1 mL (5 mg) per minute

▶ BY RECTUM

- ▶ Neonate: 1.25–2.5 mg, then 1.25–2.5 mg after 10 minutes if required.

- ▶ Child 1 month–1 year: 5 mg, then 5 mg after 10 minutes if required
- ▶ Child 2–11 years: 5–10 mg, then 5–10 mg after 10 minutes if required
- ▶ Child 12–17 years: 10–20 mg, then 10–20 mg after 10 minutes if required
- ▶ Adult: 10–20 mg, then 10–20 mg after 10–15 minutes if required
- ▶ Elderly: 10 mg, then 10 mg after 10–15 minutes if required

Life-threatening acute drug-induced dystonic reactions

▶ BY INTRAVENOUS INJECTION

- ▶ Child 1 month–11 years: 100 micrograms/kg, repeated if necessary, to be given over 3–5 minutes
- ▶ Child 12–17 years: 5–10 mg, repeated if necessary, to be given over 3–5 minutes

Dyspnoea associated with anxiety in palliative care

▶ BY MOUTH

- ▶ Adult: 5–10 mg daily

Pain of muscle spasm in palliative care

▶ BY MOUTH

- ▶ Adult: 5–10 mg daily

● **UNLICENSED USE**

- ▶ With rectal use in children *Diazepam Desitin*[®], *Diazepam Rectubes*[®], and *Stesolid Rectal Tubes*[®] not licensed for use in children under 1 year.

IMPORTANT SAFETY INFORMATION**ANAESTHESIA**

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · chronic psychosis (in adults) · CNS depression · compromised airway · hyperkinesia · respiratory depression

● **CAUTIONS**

GENERAL CAUTIONS Muscle weakness · organic brain changes · parenteral administration (close observation required until full recovery from sedation)

SPECIFIC CAUTIONS

- ▶ With intravenous use high risk of venous thrombophlebitis with intravenous use (reduced by using an emulsion formulation)
- CAUTIONS, FURTHER INFORMATION**
- ▶ Special precautions for intravenous injection
- ▶ With intravenous use When given intravenously facilities for reversing respiratory depression with mechanical ventilation must be immediately available.

- **INTERACTIONS** → Appendix 1: diazepam

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Appetite abnormal · concentration impaired · movement disorders · muscle spasms · palpitations · sensory disorder · vomiting
- ▶ **Uncommon** Constipation · diarrhoea · hypersalivation · speech slurred
- ▶ **Rare or very rare** Bradycardia · bronchial secretion increased · cardiac arrest · dry mouth · gynaecomastia · heart failure · leucopenia · loss of consciousness · memory loss · respiratory arrest · sexual dysfunction · syncope
- ▶ **Frequency not known** Apnoea · nystagmus

SPECIFIC SIDE-EFFECTS

► Uncommon

- With intravenous use Skin reactions
- With oral use Skin reactions
- With rectal use Skin reactions

► Rare or very rare

- With intravenous use Psychiatric disorder
- With oral use Psychiatric disorder

► Frequency not known

- With intramuscular use Chest pain · embolism and thrombosis · fall · increased risk of dementia · psychiatric disorders · soft tissue necrosis · urticaria

- **PREGNANCY** Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol.

Epilepsy and Pregnancy Register All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

- **BREAST FEEDING** Present in milk, and should be avoided if possible during breast-feeding.

● **RENAL IMPAIRMENT**

Dose adjustments Start with small doses in severe impairment.

● **DIRECTIONS FOR ADMINISTRATION**

- With intravenous use Diazepam is adsorbed by plastics of infusion bags and giving sets. Emulsion formulation preferred for intravenous injection.
- With intravenous use in children For *continuous intravenous infusion* of diazepam emulsion, dilute to a concentration of max. 400 micrograms/mL with Glucose 5% or 10%; max. 6 hours between addition and completion of infusion. For *continuous intravenous infusion* of diazepam solution, dilute to a concentration of max. 50 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%.
- With intravenous use in adults For *intravenous infusion* (solution) (*Diazepam*, Wockhardt), give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of not more than 10 mg in 200 mL. For *intravenous infusion* (emulsion) (*Diazemuls*[®]), give continuously in Glucose 5% or 10%. May be diluted to a max. concentration of 200 mg in 500 mL; max. 6 hours between addition and completion of administration. May be given *via* drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%.
- With intramuscular use or intravenous use in adults Solution for injection should not be diluted, except for intravenous infusion.
- With intramuscular use Only use intramuscular route when oral and intravenous routes not possible.

● **PRESCRIBING AND DISPENSING INFORMATION**

Palliative care For further information on the use of diazepam in palliative care, see www.medicinescomplete.com/#/content/palliative/benzodiazepines-and-z-drugs.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how and when to administer rectal diazepam. Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

Oxazepam

21-Oct-2019

● **INDICATIONS AND DOSE****Anxiety (short-term use)**

► BY MOUTH

► **Adult:** 15–30 mg 3–4 times a day, for debilitated patients, use elderly dose

► **Elderly:** 10–20 mg 3–4 times a day

Insomnia associated with anxiety

► BY MOUTH

► **Adult:** 15–25 mg once daily (max. per dose 50 mg), dose to be taken at bedtime

- **CONTRA-INDICATIONS** Chronic psychosis · respiratory depression

- **CAUTIONS** Muscle weakness · organic brain changes

CAUTIONS, FURTHER INFORMATION

- **Paradoxical effects** A paradoxical increase in hostility and aggression may be reported by patients taking

benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

- **INTERACTIONS** → Appendix 1: oxazepam
- **SIDE-EFFECTS** Fever · leucopenia · memory loss · oedema · saliva altered · speech slurred · syncope · urticaria
- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.
- **RENAL IMPAIRMENT**
Dose adjustments Start with small doses in severe impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

HYPNOTICS, SEDATIVES AND ANXIOLYTICS > NON-BENZODIAZEPINE HYPNOTICS AND SEDATIVES

Meprobamate

26-May-2020

● INDICATIONS AND DOSE

Short-term use in anxiety—not recommended

- BY MOUTH
- Adult: 400 mg 3–4 times a day
- Elderly: Up to 200 mg 3–4 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: MEPROBAMATE: LICENCE TO BE CANCELLED (APRIL 2016)

Following an EU-wide review of meprobamate, the UK licence holder has ceased manufacturing and the licence is due to be cancelled by December 2016. No new stock will be released into the normal distribution chain after 31 December 2016, although existing stock placed on the market before that date is likely to be dispensed until the products approach their expiry date.

Prescribers should review the treatment of any patient who is currently receiving a meprobamate-containing medicine with a view to switching them to an alternative treatment, and not start any new patients on medicines that contain meprobamate.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · acute pulmonary insufficiency · respiratory depression
- **CAUTIONS** Abrupt withdrawal (may precipitate convulsions) · avoid prolonged use · elderly · emotionally unstable personality (if taken over long periods)—increased risk of dependence · epilepsy (may induce seizures) · history of alcohol dependence · history of drug dependence · muscle weakness · respiratory disease
- **INTERACTIONS** → Appendix 1: meprobamate
- **SIDE-EFFECTS** Agitation · agranulocytosis · anal inflammation · ataxia · blood disorder · bone marrow disorders · dizziness · drowsiness · hypersensitivity · hypotension · nausea · paraesthesia · purpura non-thrombocytopenic · skin reactions · Stevens-Johnson syndrome · stomatitis · thrombocytopenia · vomiting · withdrawal syndrome
- **PREGNANCY** Avoid if possible.

- **BREAST FEEDING** Avoid. Concentration in milk may exceed maternal plasma concentrations fourfold and may cause drowsiness in infant.
- **HEPATIC IMPAIRMENT** Elimination may be prolonged in chronic impairment.
- **RENAL IMPAIRMENT** Increased cerebral sensitivity.
Dose adjustments Start with small doses in severe impairment.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.
- **LESS SUITABLE FOR PRESCRIBING** Meprobamate is less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

3.2 Attention deficit hyperactivity disorder

Attention deficit hyperactivity disorder

04-Aug-2018

Description of condition

Attention deficit hyperactivity disorder (ADHD) is a behavioural disorder characterised by hyperactivity, impulsivity and inattention, which can lead to functional impairment such as psychological, social, educational or occupational difficulties. While these symptoms tend to co-exist, some patients are predominantly hyperactive and impulsive, while others are principally inattentive. Symptoms typically appear in children aged 3–7 years, but may not be recognised until after 7 years of age, especially if hyperactivity is not present. ADHD is more commonly diagnosed in males than in females.

ADHD is usually a persisting disorder and some children continue to have symptoms throughout adolescence and into adulthood, where inattentive symptoms tend to persist, and hyperactive-impulsive symptoms tend to recede over time. ADHD is also associated with an increased risk of disorders such as oppositional defiant disorder (ODD), conduct disorder, and possibly mood disorders such as depression, mania, and anxiety, as well as substance misuse.

Aims of treatment

The aims of treatment are to reduce functional impairment, severity of symptoms, and to improve quality of life.

Non-drug treatment

[EvGr] Patients should be advised about the importance of a balanced diet, good nutrition and regular exercise. **[A]**

Environmental modifications are changes made to the physical environment that can help reduce the impact of ADHD symptoms on a person's day-to-day life. **[EvGr]** The modifications should be specific to the person's circumstances, and may involve changes to seating arrangements, lighting and noise, reducing distractions, optimising work or education by having shorter periods of focus with movement breaks, and reinforcing verbal requests with written instructions. These changes should form part of

the discussion at the time of diagnosis of ADHD and be trialled and reviewed for effectiveness before drug treatment is started.

ADHD focused psychological interventions which may involve elements of, or a complete course of cognitive behavioural therapy (CBT) may be effective in patients who have refused drug treatment, have difficulty with adherence, are intolerant of, or unresponsive to drug treatment. In patients who have benefited from drug treatment, but whose symptoms are still causing significant impairment in at least one area of function (such as interpersonal relationships, education and occupational attainment, and risk awareness), consider a combination of non-drug treatment with drug treatment. \blacklozenge

Drug treatment

EVGr Drug treatment should be initiated by a specialist trained in the diagnosis and management of ADHD. Following dose stabilisation, continuation and monitoring of drug treatment can be undertaken by the patient's general practitioner under a shared care arrangement. Treatment should be started in patients with ADHD whose symptoms are still causing significant impairment in at least one area of function, despite environmental modifications. Patients with ADHD and anxiety disorder, tic disorder, or autism spectrum disorder should be offered the same treatment options as other patients with ADHD.

Lisdexamfetamine mesilate p. 369 or methylphenidate hydrochloride p. 365 are recommended as first-line treatment. If symptoms have not improved following a 6-week trial of either drug, switching to the alternative first-line treatment should be considered. Dexamfetamine sulfate p. 368 [unlicensed] can be tried if the patient is having a beneficial response to lisdexamfetamine mesilate but cannot tolerate its longer duration of effect.

Modified-release preparations of stimulants are preferred because of their pharmacokinetic profile, convenience, improved adherence, reduced risk of drug diversion (drugs being forwarded to others for non-prescription use or misuse), and the lack of need to be taken to work. Immediate-release preparations can be given when more flexible dosing regimens are required, or during initial dose titration. A combination of modified-release and immediate-release preparations taken at different times of the day can be used to extend the duration of effect. The magnitude, duration of effect, and side-effects of stimulants vary between patients.

In patients who are intolerant to both methylphenidate hydrochloride p. 365 and lisdexamfetamine mesilate, or who have not responded to separate 6-week trials of both drugs, treatment with the non-stimulant atomoxetine below can be considered.

Advice from, or referral to a tertiary specialist ADHD service should be considered if the patient is unresponsive to one or more stimulant drugs (e.g. methylphenidate hydrochloride p. 365 and lisdexamfetamine mesilate) and atomoxetine below. A specialist service should also be consulted for advice before starting treatment with guanfacine p. 370 [unlicensed], or an atypical antipsychotic in addition to stimulants in patients with ADHD and co-existing pervasive aggression, rages or irritability. If sustained orthostatic hypotension or fainting episodes occur with guanfacine p. 370 treatment, the dose should be reduced or an alternative treatment offered. \blacklozenge

Other treatment options such as bupropion hydrochloride p. 521, modafinil p. 514, tricyclic antidepressants, and venlafaxine p. 386 [all unlicensed] have been used in the management of ADHD, but due to limited evidence their use is not recommended without specialist advice.

EVGr Patients should be monitored for effectiveness of medication and side-effects, as well as changes in sleep pattern, sexual dysfunction (associated with atomoxetine

below), and stimulant diversion or misuse. If the patient develops new, or has worsening of existing seizures, review drug treatment and stop any drug that might be contributing to the seizures; treatment can be cautiously reintroduced if it is unlikely to be the cause. Monitor patients for the development of tics associated with stimulant use. If tics are stimulant related, consider a dose reduction, stopping treatment, or changing to a non-stimulant drug. If there is worsening of behaviour, consider adjusting drug treatment and reviewing the diagnosis.

Treatment should be reviewed by a specialist at least once a year and trials of treatment-free periods, or dose reductions considered where appropriate. \blacklozenge

CNS STIMULANTS > CENTRALLY ACTING SYMPATHOMIMETICS

Atomoxetine

30-Jul-2018

• INDICATIONS AND DOSE

Attention deficit hyperactivity disorder (initiated by a specialist)

- ▶ BY MOUTH
- ▶ Child 6-17 years (body-weight up to 70 kg): Initially 500 micrograms/kg daily for 7 days, dose is increased according to response; maintenance 1.2 mg/kg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 1.8 mg/kg per day; maximum 120 mg per day
- ▶ Child 6-17 years (body-weight 70 kg and above): Initially 40 mg daily for 7 days, dose is increased according to response; maintenance 80 mg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 120 mg per day
- ▶ Adult (body-weight up to 70 kg): Initially 500 micrograms/kg daily for 7 days, dose is increased according to response; maintenance 1.2 mg/kg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 1.8 mg/kg per day; maximum 120 mg per day
- ▶ Adult (body-weight 70 kg and above): Initially 40 mg daily for 7 days, dose is increased according to response; maintenance 80-100 mg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 120 mg per day

• **UNLICENSED USE** Atomoxetine doses in BNF may differ from those in product literature.

- ▶ In children Doses above 100 mg daily not licensed.
- ▶ In adults Dose maximum of 120 mg not licensed.

• **CONTRA-INDICATIONS** Phaeochromocytoma · severe cardiovascular disease · severe cerebrovascular disease

• **CAUTIONS** Aggressive behaviour · cardiovascular disease · cerebrovascular disease · emotional lability · history of seizures · hostility · hypertension · mania · psychosis · QT-interval prolongation · structural cardiac abnormalities · susceptibility to angle-closure glaucoma · tachycardia

- **INTERACTIONS** → Appendix 1: atomoxetine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anxiety · appetite decreased · arrhythmias (uncommon in children) · asthenia · chills (in adults) · constipation · depression · dizziness · drowsiness · dry mouth (in adults) · feeling jittery (in adults) · flatulence (in adults) · gastrointestinal discomfort · genital pain (rare in children) · headaches · hyperhidrosis (uncommon in children) · menstrual cycle irregularities (in adults) · mood altered · mydriasis (in children) · nausea · palpitations (uncommon in children) · prostatitis (in adults) · sensation abnormal (uncommon in children) · sexual dysfunction (rare in children) · skin reactions · sleep disorders · taste altered (in adults) · thirst (in adults) · tremor (uncommon in children) · urinary disorders (rare in children) · vasodilation (in adults) · vomiting · weight decreased
 - ▶ **Uncommon** Behaviour abnormal · chest pain (very common in children) · dyspnoea · feeling cold (in adults) · hypersensitivity · muscle spasms (in adults) · peripheral coldness (in adults) · QT interval prolongation · suicidal behaviour · syncope · tic (very common in children) · vision blurred
 - ▶ **Rare or very rare** Hallucination (uncommon in children) · hepatic disorders · psychosis (uncommon in children) · Raynaud's phenomenon · seizure (uncommon in children)
- ▶ **Frequency not known** Sudden cardiac death
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Avoid-present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT**

Dose adjustments Manufacturer advises halve dose in moderate impairment and quarter dose in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for appearance or worsening of anxiety, depression or tics.
 - ▶ Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.
- **PATIENT AND CARER ADVICE**

Suicidal ideation Following reports of suicidal thoughts and behaviour, patients and their carers should be informed about the risk and told to report clinical worsening, suicidal thoughts or behaviour, irritability, agitation, or depression.

Hepatic impairment Following rare reports of hepatic disorders, patients and carers should be advised of the risk and be told how to recognise symptoms; prompt medical attention should be sought in case of abdominal pain, unexplained nausea, malaise, darkening of the urine, or jaundice.

Medicines for Children leaflet: Atomoxetine for attention deficit hyperactivity disorder (ADHD) www.medicinesforchildren.org.uk/atomoxetine-attention-deficit-hyperactivity-disorder-adhd
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions
SMC No. 1107/15
The *Scottish Medicines Consortium* has advised (December 2015) that atomoxetine oral solution (*Strattera*®) is accepted for restricted use within NHS Scotland for the treatment of attention deficit hyperactivity disorder (ADHD) in children of 6 years and older, in adolescents and in adults. It is restricted to patients who are unable to swallow capsules.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Methylphenidate hydrochloride 01-Oct-2019● **INDICATIONS AND DOSE****Attention deficit hyperactivity disorder (initiated under specialist supervision)**

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- ▶ **Child 6-17 years:** Initially 5 mg 1-2 times a day, increased in steps of 5-10 mg daily if required, at weekly intervals, increased if necessary up to 60 mg daily in 2-3 divided doses, increased if necessary up to 2.1 mg/kg daily in 2-3 divided doses, the licensed maximum dose is 60 mg daily in 2-3 doses, higher dose (up to a maximum of 90 mg daily) under the direction of a specialist, discontinue if no response after 1 month, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose). Treatment may be started using a modified-release preparation
- ▶ **Adult:** Initially 5 mg 2-3 times a day, dose is increased if necessary at weekly intervals according to response, increased if necessary up to 100 mg daily in 2-3 divided doses, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be continued →

appropriate (establish need with trial bedtime dose). Treatment may be started using a modified-release preparation

Narcolepsy

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: 10–60 mg daily in divided doses; usual dose 20–30 mg daily in divided doses, dose to be taken before meals

DOSE EQUIVALENCE AND CONVERSION

- When switching from *immediate-release* preparations to *modified-release* preparations—consult product literature.

CONCERTA® XL

Attention deficit hyperactivity disorder

► BY MOUTH

- Child 6–17 years: Initially 18 mg once daily, dose to be taken in the morning, increased in steps of 18 mg every week, adjusted according to response; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 54 mg once daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 108 mg per day
- Adult: Initially 18 mg once daily, dose to be taken in the morning; adjusted at weekly intervals according to response; maximum 108 mg per day

DOSE EQUIVALENCE AND CONVERSION

- Total daily dose of 15 mg of standard-release formulation is considered equivalent to *Concerta*® XL 18 mg once daily.

DELMOSART® PROLONGED-RELEASE TABLET

Attention deficit hyperactivity disorder (under expert supervision)

► BY MOUTH

- Child 6–17 years: Initially 18 mg once daily, dose to be taken in the morning, then increased in steps of 18 mg every week if required, discontinue if no response after 1 month; maximum 54 mg per day
- Adult: Initially 18 mg once daily, dose to be taken in the morning, then increased in steps of 18 mg every week if required, discontinue if no response after 1 month; maximum 54 mg per day

DOSE EQUIVALENCE AND CONVERSION

- Total daily dose of 15 mg of standard-release formulation is considered equivalent to *Delmosart*® 18 mg once daily.

EQUASYM® XL

Attention deficit hyperactivity disorder

► BY MOUTH

- Child 6–17 years: Initially 10 mg once daily, dose to be taken in the morning before breakfast; increased gradually at weekly intervals if necessary; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day
- Adult: Initially 10 mg once daily, dose to be taken in the morning before breakfast; increased gradually at weekly intervals if necessary; maximum 100 mg per day

MEDIKINET® XL

Attention deficit hyperactivity disorder

► BY MOUTH

- Child 6–17 years: Initially 10 mg once daily, dose to be taken in the morning with breakfast; adjusted at weekly intervals according to response; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day
- Adult: Initially 10 mg once daily, dose to be taken in the morning with breakfast; adjusted at weekly

intervals according to response; maximum 100 mg per day

XAGGITIN® XL

Attention deficit hyperactivity disorder (under expert supervision)

► BY MOUTH

- Child 6–17 years: Initially 18 mg once daily, dose to be taken in the morning, increased in steps of 18 mg every week, adjusted according to response, discontinue if no response after 1 month; maximum 54 mg per day
- Adult: Initially 18 mg once daily, dose to be taken in the morning, increased in steps of 18 mg every week, adjusted according to response, discontinue if no response after 1 month; maximum 54 mg per day

DOSE EQUIVALENCE AND CONVERSION

- Total daily dose of 15 mg of standard-release formulation is considered equivalent to *Xaggitin*® XL 18 mg once daily.

- **UNLICENSED USE** Doses over 60 mg daily not licensed; doses of *Concerta XL* over 54 mg daily not licensed. Not licensed for use in narcolepsy. Not licensed for use in adults for attention deficit hyperactivity disorder.
- **CONTRA-INDICATIONS** Anorexia nervosa · arrhythmias · cardiomyopathy · cardiovascular disease · cerebrovascular disorders · heart failure · hyperthyroidism · mania · phaeochromocytoma · psychosis · severe depression · severe hypertension · structural cardiac abnormalities · suicidal tendencies · uncontrolled bipolar disorder · vasculitis
- **CAUTIONS** Agitation · alcohol dependence · anxiety · drug dependence · epilepsy (discontinue if increased seizure frequency) · family history of Tourette syndrome · susceptibility to angle-closure glaucoma · tics
- **CONCERTA® XL, DELMOSART® PROLONGED-RELEASE TABLET** Dysphagia (dose form not appropriate) · restricted gastro-intestinal lumen (dose form not appropriate)
- **XAGGITIN® XL** Dysphagia (dose form not appropriate)
- **INTERACTIONS** → Appendix 1: methylphenidate
- **SIDE-EFFECTS**
 - **Common or very common** Alopecia · anxiety · appetite decreased · arrhythmias · arthralgia · behaviour abnormal · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · fever · gastrointestinal discomfort · growth retardation (in children) · headaches · hypertension · laryngeal pain · mood altered · movement disorders · nasopharyngitis · nausea · palpitations · sleep disorders · vomiting · weight decreased
 - **Uncommon** Chest discomfort · constipation · dyspnoea · fatigue · haematuria · hallucinations · muscle complaints · psychotic disorder · suicidal tendencies · tic · tremor · vision disorders
 - **Rare or very rare** Anaemia · angina pectoris · cardiac arrest · cerebrovascular insufficiency · confusion · gynaecomastia · hepatic coma · hyperfocus · hyperhidrosis · leucopenia · mydriasis · myocardial infarction · neuroleptic malignant syndrome · peripheral coldness · Raynaud's phenomenon · seizures · sexual dysfunction · skin reactions · sudden cardiac death · thinking abnormal · thrombocytopenia
 - **Frequency not known** Delusions · drug dependence · hyperpyrexia · intracranial haemorrhage · logorrhoea · pancytopenia · vasculitis
- **PREGNANCY** Limited experience—avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Limited information available—avoid.
- **MONITORING REQUIREMENTS**
 - Monitor for psychiatric disorders.
 - Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of

therapy, following each dose adjustment, and at least every 6 months thereafter.

- **TREATMENT CESSATION** Avoid abrupt withdrawal.

- **DIRECTIONS FOR ADMINISTRATION**

MEDIKINET® XL Contents of capsule can be sprinkled on a tablespoon of apple sauce or yoghurt (then swallowed immediately without chewing).

EQUASYM® XL Contents of capsule can be sprinkled on a tablespoon of apple sauce (then swallowed immediately without chewing).

- **PRESCRIBING AND DISPENSING INFORMATION** Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of methylphenidate, prescribers should specify the brand to be dispensed.

CONCERTA® XL Consists of an immediate-release component (22% of the dose) and a modified-release component (78% of the dose).

MEDIKINET® XL Consists of an immediate-release component (50% of the dose) and a modified-release component (50% of the dose).

EQUASYM® XL Consists of an immediate-release component (30% of the dose) and a modified-release component (70% of the dose).

- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Methylphenidate for attention deficit hyperactivity disorder (ADHD) www.medicinesforchildren.org.uk/methylphenidate-attention-deficit-hyperactivity-disorder-adhd

Driving and skilled tasks **Drugs and Driving** Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.gov.uk/government/organisations/driver-and-vehicle-licensing-agency.

2015 legislation regarding driving whilst taking certain drugs, may also apply to methylphenidate, see *Drugs and driving* under Guidance on prescribing p. 1.

CONCERTA® XL Tablet membrane may pass through gastro-intestinal tract unchanged.

DELMOSART® PROLONGED-RELEASE TABLET Manufacturer advises tablet membrane may pass through gastro-intestinal tract unchanged.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, oral suspension, oral solution

Modified-release tablet

CNS STIMULANTS > CENTRALLY ACTING SYMPATHOMIMETICS > AMFETAMINES

Dexamfetamine sulfate

13-Dec-2019

(Dexamphetamine sulfate)

● INDICATIONS AND DOSE

Narcolepsy

▶ BY MOUTH

- ▶ **Adult:** Initially 10 mg daily in divided doses, increased in steps of 10 mg every week, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day
- ▶ **Elderly:** Initially 5 mg daily in divided doses, increased in steps of 5 mg every week, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day

Refractory attention deficit hyperactivity disorder (initiated under specialist supervision)

▶ BY MOUTH

- ▶ **Child 6–17 years:** Initially 2.5 mg 2–3 times a day, increased in steps of 5 mg once weekly if required; usual maximum 1 mg/kg daily, up to 20 mg daily (40 mg daily has been required in some children); maintenance dose to be given in 2–4 divided doses
- ▶ **Adult:** Initially 5 mg twice daily, dose is increased at weekly intervals according to response, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day

- **UNLICENSED USE** Not licensed for use in adults for refractory attention deficit hyperactivity disorder.
- **CONTRA-INDICATIONS** Advanced arteriosclerosis · anorexia · arrhythmias (life-threatening) · cardiomyopathies · cardiovascular disease · cerebrovascular disorders · heart failure · history of alcohol abuse · history of drug abuse · hyperexcitability · hyperthyroidism · moderate hypertension · psychiatric disorders · psychosis · severe hypertension · structural cardiac abnormalities · suicidal tendencies
- **CONTRA-INDICATIONS, FURTHER INFORMATION**
 - ▶ Psychiatric disorders Psychiatric disorders include severe depression, schizophrenia, borderline personality disorder and uncontrolled bipolar disorder. Co-morbidity with psychiatric disorders is common in attention deficit hyperactivity disorder. Manufacturer advises if new psychiatric symptoms develop or exacerbation of psychiatric disorders occurs, continue use only if benefits outweigh risks.
- **CAUTIONS** History of epilepsy (discontinue if seizures occur) · mild hypertension · susceptibility to angle-closure glaucoma · tics · Tourette syndrome
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Tics and Tourette syndrome Discontinue use if tics occur.
 - ▶ Growth restriction in children Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but withdraw slowly to avoid inducing depression or renewed hyperactivity).
- **INTERACTIONS** → Appendix 1: amfetamines
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anxiety · appetite decreased · arrhythmias · arthralgia · behaviour abnormal · depression · dry mouth · headache · mood

altered · movement disorders · muscle cramps · nausea · palpitations · poor weight gain · sleep disorders · vertigo · vomiting · weight decreased

- ▶ **Rare or very rare** Anaemia · angina pectoris · cardiac arrest · cerebrovascular insufficiency · fatigue · growth retardation · hallucination · hepatic coma · hepatic function abnormal · intracranial haemorrhage · leucopenia · mydriasis · psychosis · seizure · skin reactions · suicidal tendencies · thrombocytopenia · tic (in those at risk) · vasculitis cerebral · vision disorders
- ▶ **Frequency not known** Acidosis · alopecia · cardiomyopathy · chest pain · circulatory collapse · colitis ischaemic · concentration impaired · confusion · diarrhoea · dizziness · drug dependence · hyperhidrosis · hypermetabolism · hyperpyrexia · kidney injury · myocardial infarction · neuroleptic malignant syndrome · obsessive-compulsive disorder · reflexes increased · rhabdomyolysis · sexual dysfunction · sudden death · taste altered · tremor
- ▶ **Overdose** Amfetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. See Stimulants under **Emergency treatment of poisoning p. 1430**.

- **PREGNANCY** Avoid (retrospective evidence of uncertain significance suggesting possible embryotoxicity).
- **BREAST FEEDING** Significant amount in milk—avoid.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor growth in children.
 - ▶ Monitor for aggressive behaviour or hostility during initial treatment.
 - ▶ Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ In children Tablets can be halved.
- **PRESCRIBING AND DISPENSING INFORMATION** Data on safety and efficacy of long-term use not complete.
- **PATIENT AND CARER ADVICE**
 - ▶ **Driving and skilled tasks** Drugs and Driving Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk. For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including amfetamines, see *Drugs and driving* under Guidance on prescribing p. 1.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release capsule, oral suspension, oral solution

Oral solution

▶ Dexamfetamine sulfate (Non-proprietary)

Dexamfetamine sulfate 1 mg per 1 ml Dexamfetamine 5mg/5ml oral solution sugar free sugar-free | 150 ml [PoM] £114.49 DT = £114.49 [CD2]

Modified-release capsule

▶ Dexedrine (Imported (United States))

Dexamfetamine sulfate 5 mg Dexedrine 5mg Spansules | 100 capsule [PoM] [X] [CD2]

Dexamfetamine sulfate 10 mg Dexedrine 10mg Spansules | 100 capsule [PoM] [X] [CD2]

Dexamfetamine sulfate 15 mg Dexedrine 15mg Spansules | 100 capsule [PoM] [X] [CD2]

Tablet

- ▶ **Dexamfetamine sulfate (Non-proprietary)**
Dexamfetamine sulfate 5 mg Dexamfetamine 5mg tablets | 28 tablet [PoM] £24.75 DT = £39.78 [CD2]
- ▶ **Amfexa** (Flynn Pharma Ltd)
Dexamfetamine sulfate 5 mg Amfexa 5mg tablets | 30 tablet [PoM] £19.89 [CD2]
- Dexamfetamine sulfate 10 mg** Amfexa 10mg tablets | 30 tablet [PoM] £39.78 DT = £39.78 [CD2]
- Dexamfetamine sulfate 20 mg** Amfexa 20mg tablets | 30 tablet [PoM] £79.56 DT = £79.56 [CD2]

Lisdexamfetamine mesilate

14-Jan-2020

- **DRUG ACTION** Lisdexamfetamine is a prodrug of dexamfetamine.

● **INDICATIONS AND DOSE****Attention deficit hyperactivity disorder (initiated by a specialist)**▶ **BY MOUTH**

- ▶ **Child 6–17 years:** Initially 30 mg once daily, alternatively initially 20 mg once daily, increased in steps of 10–20 mg every week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day
- ▶ **Adult:** Initially 30 mg once daily, increased in steps of 20 mg every week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day

- **CONTRA-INDICATIONS** Advanced arteriosclerosis · agitated states · hyperthyroidism · moderate hypertension · severe hypertension · symptomatic cardiovascular disease

- **CAUTIONS** Bipolar disorder · history of cardiovascular disease · history of substance abuse · may lower seizure threshold (discontinue if seizures occur) · psychotic disorders · susceptibility to angle-closure glaucoma · tics · Tourette syndrome

CAUTIONS, FURTHER INFORMATION

- ▶ **Cardiovascular disease** Manufacturer advises caution in patients with underlying conditions that might be compromised by increases in blood pressure or heart rate; see also *Contra-indications*.

- **INTERACTIONS** → Appendix 1: amfetamines

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain upper · anxiety · appetite decreased · behaviour abnormal · constipation · diarrhoea · dizziness · dry mouth · dyspnoea · fatigue · feeling jittery · headache · hyperhidrosis (uncommon in children) · insomnia · mood altered · movement disorders (uncommon in children) · nausea · palpitations · sexual dysfunction (uncommon in children) · tachycardia · tremor · weight decreased
- ▶ **Uncommon** Depression (very common in children) · drowsiness (very common in children) · fever (very common in children) · logorrhoea · psychiatric disorders (very common in children) · skin reactions (very common in children) · taste altered · vision blurred · vomiting (very common in children)
- ▶ **Frequency not known** Angioedema · cardiomyopathy (uncommon in children) · drug dependence · hallucination (uncommon in children) · hepatitis allergic · mydriasis (uncommon in children) · psychotic disorder · Raynaud's phenomenon (uncommon in children) · seizure · Stevens-Johnson syndrome

Overdose Amfetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. See Stimulants under Emergency treatment of poisoning p. 1430.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in human milk.
- **RENAL IMPAIRMENT**
Dose adjustments Manufacturer advises max. dose 50 mg daily in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor for aggressive behaviour or hostility during initial treatment.
 - ▶ Manufacturer advises monitor pulse, blood pressure, and for psychiatric symptoms before treatment initiation, following each dose adjustment, and at least every 6 months thereafter. Monitor weight in adults before treatment initiation and during treatment; in children, height and weight should be recorded before treatment initiation, and height, weight and appetite monitored at least every 6 months during treatment.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises swallow whole or mix contents of capsule with soft food such as yoghurt or in a glass of water or orange juice; contents should be dispersed completely and consumed immediately.
- **PATIENT AND CARER ADVICE** Patients and carers should be counselled on the administration of capsules.
Driving and skilled tasks **Drugs and Driving** Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.gov.uk/government/organisations/driver-and-vehicle-licensing-agency.
 For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including amfetamines, see *Drugs and driving* under Guidance on prescribing p. 1.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) decisions
 The *Scottish Medicines Consortium* has advised (May 2013) that lisdexamfetamine dimesylate (*Elvanse*[®]) is accepted for use within NHS Scotland as part of a comprehensive treatment programme for attention deficit hyperactivity disorder (ADHD) in children aged 6 years and over when response to previous methylphenidate treatment is considered clinically inadequate.
 - ▶ In adults The *Scottish Medicines Consortium* has advised (September 2015) that lisdexamfetamine dimesylate (*Elvanse Adult*[®]) is accepted for use within NHS Scotland as part of a comprehensive treatment programme for attention deficit hyperactivity disorder (ADHD) in adults. Based on clinical judgment, patients should have ADHD of at least moderate severity.**All Wales Medicines Strategy Group (AWMSG) decisions**
 The *All Wales Medicines Strategy Group* has advised (December 2013) that lisdexamfetamine dimesylate (*Elvanse*[®]) is recommended as an option for use within NHS Wales as part of a comprehensive treatment programme for attention deficit hyperactivity disorder (ADHD) in children aged six years and over when response to previous methylphenidate treatment is considered clinically inadequate. Treatment must be under the supervision of a specialist in childhood and/or adolescent behavioural disorders.
 - ▶ In adults The *All Wales Medicines Strategy Group* has advised (October 2015) that lisdexamfetamine dimesylate (*Elvanse Adult*[®]) is recommended as an option for use within NHS Wales as part of a comprehensive treatment

programme for attention deficit hyperactivity disorder (ADHD) in adults.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

SYMPATHOMIMETICS > ALPHA₂-ADRENOCEPTOR AGONISTS

Guanfacine

03-Apr-2020

• INDICATIONS AND DOSE

Attention deficit hyperactivity disorder in children for whom stimulants are not suitable, not tolerated or ineffective (initiated under specialist supervision)

▶ BY MOUTH

- ▶ Child 6–12 years (body-weight 25 kg and above): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 4 mg), for optimal weight-adjusted dose titrations, consult product literature
- ▶ Child 13–17 years (body-weight 34–41.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 4 mg), for optimal weight-adjusted dose titrations, consult product literature
- ▶ Child 13–17 years (body-weight 41.5–49.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 5 mg), for optimal weight-adjusted dose titrations, consult product literature
- ▶ Child 13–17 years (body-weight 49.5–58.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 6 mg), for optimal weight-adjusted dose titrations, consult product literature
- ▶ Child 13–17 years (body-weight 58.5 kg and above): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 7 mg), for optimal weight-adjusted dose titrations, consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose by half with concurrent use of moderate and potent inhibitors of CYP3A4.
- ▶ Manufacturer advises increase dose up to max. 7 mg with concurrent use of potent inducers of CYP3A4—no specific recommendation made for children.

- **CAUTIONS** Bradycardia (risk of torsade de pointes) · heart block (risk of torsade de pointes) · history of cardiovascular disease · history of QT-interval prolongation · hypokalaemia (risk of torsade de pointes)

CAUTIONS, FURTHER INFORMATION

- ▶ **Elderly** For centrally-acting antihypertensives, prescription potentially inappropriate (STOPP criteria), unless clear intention of, or lack of efficacy with, other classes of antihypertensives (generally less well tolerated by older people). See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: guanfacine

• SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · appetite decreased · arrhythmias · asthenia · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · gastrointestinal discomfort · headache · hypotension · mood altered · nausea · skin reactions · sleep disorders · urinary disorders · vomiting · weight increased
- ▶ **Uncommon** Asthma · atrioventricular block · chest pain · hallucination · loss of consciousness · pallor · seizure · syncope
- ▶ **Rare or very rare** Hypertension · hypertensive encephalopathy · malaise

- ▶ **Frequency not known** Erectile dysfunction

SIDE-EFFECTS, FURTHER INFORMATION

Somnolence and sedation may occur, predominantly during the first 2–3 weeks of treatment and with dose increases; manufacturer advises to consider dose reduction or discontinuation of treatment if symptoms are clinically significant or persistent.

Overdose Features may include hypotension, initial hypertension, bradycardia, lethargy, and respiratory depression. Manufacturer advises that patients who develop lethargy should be observed for development of more serious toxicity for up to 24 hours.

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception in females of childbearing potential.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (pharmacokinetics have not been assessed in paediatric patients with hepatic impairment).
Dose adjustments Manufacturer advises consider dose reduction.
- **RENAL IMPAIRMENT**
Dose adjustments Manufacturer advises consider dose reduction in severe impairment and end-stage renal disease.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises to conduct a baseline evaluation to identify patients at risk of somnolence, sedation, hypotension, bradycardia, QT-prolongation, and arrhythmia; this should include assessment of cardiovascular status. Monitor for signs of these adverse effects weekly during dose titration and then every 3 months during the first year of treatment, and every 6 months thereafter. Monitor BMI prior to treatment and then every 3 months for the first year of treatment, and every 6 months thereafter. More frequent monitoring is advised following dose adjustments.
 - ▶ Monitor blood pressure and pulse during dose downward titration and following discontinuation of treatment.
- **TREATMENT CESSATION** Manufacturer advises avoid abrupt withdrawal; consider dose tapering to minimise potential withdrawal effects.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises avoid administration with high fat meals (may increase absorption).
- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on administration of guanfacine modified-release tablets.
Missed doses Manufacturer advises that patients and carers should inform their prescriber if more than one dose is missed; consider dose re-titration.
Driving and skilled tasks Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of dizziness and syncope.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 2, 25

▶ **Intuniv** (Shire Pharmaceuticals Ltd) ▼

- Guanfacine (as Guanfacine hydrochloride) 1 mg** Intuniv 1mg modified-release tablets | 28 tablet **[PoM]** £56.00 DT = £56.00
- Guanfacine (as Guanfacine hydrochloride) 2 mg** Intuniv 2mg modified-release tablets | 28 tablet **[PoM]** £58.52 DT = £58.52
- Guanfacine (as Guanfacine hydrochloride) 3 mg** Intuniv 3mg modified-release tablets | 28 tablet **[PoM]** £65.52 DT = £65.52

3.3 Bipolar disorder and mania

Mania and hypomania

21-Feb-2020

Overview

Antimanic drugs are used to control acute attacks and to prevent recurrence of episodes of mania or hypomania.

An antidepressant drug may also be required for the treatment of co-existing depression, but should be avoided in patients with rapid-cycling bipolar disorder, a recent history of hypomania, or with rapid mood fluctuations.

Benzodiazepines

Use of benzodiazepines (such as lorazepam p. 355) may be helpful in the initial stages of treatment for behavioural disturbance or agitation; they should not be used for long periods because of the risk of dependence.

Antipsychotic drugs

Antipsychotic drugs (normally olanzapine p. 416, quetiapine p. 419, or risperidone p. 421) are useful in acute episodes of mania and hypomania; if the response to antipsychotic drugs is inadequate, lithium or valproate may be added. An antipsychotic drug may be used concomitantly with lithium or valproate in the initial treatment of severe acute mania. See *Important safety information, Conception and contraception*, and *Pregnancy* in the valproic acid p. 372 and sodium valproate p. 344 monographs.

Olanzapine can be used for the long-term management of bipolar disorder in patients whose manic episode responded to olanzapine therapy. It can be given either as monotherapy, or in combination with lithium or valproate if the patient has frequent relapses or continuing functional impairment.

Asenapine p. 373, a second-generation antipsychotic, is licensed for the treatment of moderate to severe manic episodes associated with bipolar disorder.

When discontinuing antipsychotics, the dose should be reduced gradually over at least 4 weeks if the patient is continuing with other antimanic drugs; if the patient is not continuing with other antimanic drugs or if there is a history of manic relapse, a withdrawal period of up to 3 months should be considered.

Carbamazepine

Carbamazepine p. 327 may be used under specialist supervision for the prophylaxis of bipolar disorder (manic-depressive disorder) in patients unresponsive to a combination of other prophylactic drugs; it is used in patients with rapid-cycling manic-depressive illness (4 or more affective episodes per year). The dose of carbamazepine should not normally be increased if an acute episode of mania occurs.

Valproate

Valproate (valproic acid (as the semisodium salt) and sodium valproate) is used for the treatment of manic episodes associated with bipolar disorder. It must be started and supervised by a specialist experienced in managing bipolar disorder. Valproate (valproic acid and sodium valproate) is also used for the prophylaxis of bipolar disorder. Because of its high teratogenic risk, valproate must not be used in females of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met and alternative treatments are ineffective or not tolerated. Valproic acid and sodium valproate must not be used during pregnancy in bipolar disorder. The benefit and risk of valproate therapy should be carefully reconsidered at regular treatment reviews. For further information, see *Important safety information, Conception and contraception*, and *Pregnancy* in the valproic acid and sodium valproate monographs.

In patients with frequent relapse or continuing functional impairment, consider switching therapy to lithium or olanzapine, or adding lithium or olanzapine to valproate. If a patient taking valproate experiences an acute episode of mania that is not ameliorated by increasing the valproate dose, consider concomitant therapy with olanzapine, quetiapine, or risperidone.

Lithium

Lithium salts are used in the prophylaxis and treatment of mania, hypomania and depression in bipolar disorder (manic-depressive disorder), and in the prophylaxis and treatment of recurrent unipolar depression. Lithium is also used as concomitant therapy with antidepressant medication in patients who have had an incomplete response to treatment for acute bipolar depression and to augment other antidepressants in patients with treatment-resistant depression [unlicensed indication]. It is also licensed for the treatment of aggressive or self-harming behaviour.

The decision to give prophylactic lithium requires specialist advice, and must be based on careful consideration of the likelihood of recurrence in the individual patient, and the benefit of treatment weighed against the risks. The full prophylactic effect of lithium may not occur for six to twelve months after the initiation of therapy. Olanzapine or valproate (given alone or as adjunctive therapy with lithium) are alternative prophylactic treatments in patients who experience frequent relapses or continued functional impairment.

Other drugs used for Bipolar disorder and mania

Aripiprazole, p. 413 · Chlorpromazine hydrochloride, p. 402 · Haloperidol, p. 404 · Lamotrigine, p. 334 · Paliperidone, p. 418 · Prochlorperazine, p. 407 · Zuclopentixol acetate, p. 409

ANTIPILEPTICS

Valproic acid

14-Feb-2020

● INDICATIONS AND DOSE

Treatment of manic episodes associated with bipolar disorder

- ▶ BY MOUTH
- ▶ Adult: Initially 750 mg daily in 2–3 divided doses, then increased to 1–2 g daily, adjusted according to response, doses greater than 45 mg/kg daily require careful monitoring

Migraine prophylaxis

- ▶ BY MOUTH
- ▶ Adult: Initially 250 mg twice daily, then increased if necessary to 1 g daily in divided doses

DOSE EQUIVALENCE AND CONVERSION

- ▶ Semisodium valproate comprises equimolar amounts of sodium valproate and valproic acid.

CONVULEX®**Epilepsy**

- ▶ BY MOUTH
- ▶ Adult: Initially 600 mg daily in 2–4 divided doses, increased in steps of 150–300 mg every 3 days; usual maintenance 1–2 g daily in 2–4 divided doses, max. 2.5 g daily in 2–4 divided doses

DOSE EQUIVALENCE AND CONVERSION

- ▶ *Convulex®* has a 1:1 dose relationship with products containing sodium valproate, but nevertheless care is needed if switching or making changes.

- **UNLICENSED USE** Not licensed for migraine prophylaxis.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: VALPROATE MEDICINES: CONTRA-INDICATED IN WOMEN AND GIRLS OF CHILDBEARING POTENTIAL UNLESS CONDITIONS OF PREGNANCY PREVENTION PROGRAMME ARE MET (APRIL 2018)

Valproate is highly teratogenic and evidence supports that use in pregnancy leads to neurodevelopmental disorders (approx. 30–40% risk) and congenital malformations (approx. 10% risk).

Valproate must not be used in women and girls of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met (see *Conception and contraception*) and only if other treatments are ineffective or not tolerated, as judged by an experienced specialist.

Use of valproate in pregnancy is contra-indicated for migraine prophylaxis [unlicensed] and bipolar disorder; it must only be considered for epilepsy if there is no suitable alternative treatment (see *Pregnancy*).

Women and girls (and their carers) must be fully informed of the risks and the need to avoid exposure to valproate medicines in pregnancy; supporting materials have been provided to use in the implementation of the Pregnancy Prevention Programme (see *Prescribing and dispensing information*). The MHRA advises that:

- GPs must recall all women and girls who may be of childbearing potential, provide the Patient Guide, check they have been reviewed by a specialist in the last year and are on highly effective contraception;
- Specialists must book in review appointments at least annually with women and girls under the Pregnancy Prevention Programme, re-evaluate treatment as necessary, explain clearly the conditions as outlined in the supporting materials and complete and sign the Risk Acknowledgement Form—copies of the form must be given to the patient or carer and sent to their GP;
- Pharmacists must ensure valproate medicines are dispensed in whole packs whenever possible—all packs

dispensed to women and girls of childbearing potential should have a warning label either on the carton or via a sticker. They must also discuss risks in pregnancy with female patients each time valproate medicines are dispensed, ensure they have the Patient Guide and have seen their GP or specialist to discuss their treatment and the need for contraception.

MHRA/CHM ADVICE: VALPROATE MEDICINES: ARE YOU ACTING IN COMPLIANCE WITH THE PREGNANCY PREVENTION MEASURES? (DECEMBER 2018)

The MHRA advises that all healthcare professionals must continue to identify and review all female patients on valproate, including when used outside licensed indications (off-label use) and provide them with the patient information materials every time they attend appointments or receive their medicines.

Guidance for psychiatrists on the withdrawal of, and alternatives to, valproate in women of childbearing potential who have a psychiatric illness is available from the Royal College of Psychiatrists.

MHRA/CHM ADVICE: VALPROATE MEDICINES AND SERIOUS HARMS IN PREGNANCY: NEW ANNUAL RISK ACKNOWLEDGEMENT FORM AND CLINICAL GUIDANCE FROM PROFESSIONAL BODIES TO SUPPORT COMPLIANCE WITH THE PREGNANCY PREVENTION PROGRAMME (APRIL 2019)

The Annual Risk Acknowledgement Form has been updated and should be used for all future reviews of female patients on valproate. Specialists should comply with guidance given on the form if they consider the patient is not at risk of pregnancy, including the need for review in case her risk status changes.

Guidance has been published to support healthcare professionals with the use of valproate. These include a summary by NICE of their guidance and safety advice, pan-college guidance by national healthcare bodies, and paediatric guidance by the British Paediatric Neurology Association and the Royal College of Paediatrics and Child Health.

MHRA/CHM ADVICE (UPDATED JANUARY 2020): VALPROATE PREGNANCY PREVENTION PROGRAMME

The Guide for Healthcare Professionals has been updated and should be used for all future reviews of female patients on valproate medicines, in conjunction with other supporting materials (see *Prescribing and dispensing Information*).

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · known or suspected mitochondrial disorders (higher rate of acute liver failure and liver-related deaths) · personal or family history of severe hepatic dysfunction
- **CAUTIONS** Systemic lupus erythematosus
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Liver toxicity Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).
- Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS** Abdominal pain · alertness increased · alopecia (regrowth may be curly) · anaemia · behaviour abnormal · bone disorders · bone fracture · cerebral atrophy

· coma · confusion · consciousness impaired · dementia · diarrhoea · diplopia · drowsiness · encephalopathy · fine postural tremor · gastrointestinal disorder · gynaecomastia · haemorrhage · hallucination · hearing loss · hepatic disorders · hirsutism · hyperammonaemia · leucopenia · menstrual cycle irregularities · movement disorders · nail disorder · nausea · obesity · pancreatitis · pancytopenia · parkinsonism · peripheral oedema · seizure · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · urine abnormalities · vasculitis · vomiting · weight increased

SIDE-EFFECTS, FURTHER INFORMATION **Hepatic dysfunction** Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.

Pancreatitis Discontinue treatment if symptoms of pancreatitis develop.

- **CONCEPTION AND CONTRACEPTION** The MHRA advises that all women and girls of childbearing potential being treated with valproate medicines must be supported on a Pregnancy Prevention Programme—pregnancy should be excluded before treatment initiation and highly effective contraception must be used during treatment.
- **PREGNANCY** For *migraine prophylaxis* [unlicensed] and *bipolar disorder*, the MHRA advises that valproate must not be used. For *epilepsy*, the MHRA advises valproate must not be used unless there is no suitable alternative treatment; in such cases, access to counselling about the risks should be provided (see Healthcare Professional Guide for more information) and a Risk Acknowledgement Form signed by both specialist and patient. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Neonatal bleeding (related to hypofibrinaemia). Neonatal hepatotoxicity also reported. See also *Pregnancy* in *Epilepsy* p. 321.
- **Monitoring** Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Present in milk—risk of haematological disorders in breast-fed newborns and infants.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor closely if dose greater than 45 mg/kg daily.
 - ▶ Monitor liver function before therapy and during first 6 months especially in patients most at risk.
 - ▶ Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.
- **EFFECT ON LABORATORY TESTS** False-positive urine tests for ketones.
- **TREATMENT CESSATION** EvGr In bipolar disorder, avoid abrupt withdrawal; if treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks. ⚠
- **PRESCRIBING AND DISPENSING INFORMATION** The Pregnancy Prevention Programme is supported by the following materials provided by the manufacturer: *Patient Guide*, *Guide for Healthcare Professionals*, *Risk Acknowledgement Form*, and for pharmacists, *Patient Cards* and *Stickers with warning symbols*; the MHRA has also produced a patient information sheet providing advice for women and girls taking valproate medicines.

The Royal Pharmaceutical Society has also produced a safe supply algorithm, available at: www.rpharms.com/safesupplyvalproate

CONVULEX® Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic oral valproic acid product.

● PATIENT AND CARER ADVICE

Valproate use by women and girls The MHRA advises women and girls should **not** stop taking valproate without first discussing it with their doctor.

Blood or hepatic disorders Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.

Pancreatitis Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop.

Pregnancy Prevention Programme Pharmacists must ensure that female patients have a patient card—see also *Important safety information*.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Gastro-resistant capsule

CAUTIONARY AND ADVISORY LABELS 8, 10, 21, 25

▶ **Depakote** (Imported (United States))

Valproic acid (as Valproate semisodium) 125 mg Depakote 125mg sprinkle gastro-resistant capsules | 100 capsule PoM X

▶ **Convulex** (G.L. Pharma UK Ltd) ▼

Valproic acid 150 mg Convulex 150mg gastro-resistant capsules | 100 capsule PoM £3.68 DT = £3.68

ANTIpsychotics > SECOND-GENERATION

401

Asenapine

18-Jun-2018

● INDICATIONS AND DOSE

Monotherapy for the treatment of moderate to severe manic episodes associated with bipolar disorder

▶ BY MOUTH

▶ Adult: Initially 10 mg twice daily, reduced to 5 mg twice daily, adjusted according to response

Combination therapy for the treatment of moderate to severe manic episodes associated with bipolar disorder

▶ BY MOUTH

▶ Adult: Initially 5 mg twice daily, increased if necessary to 10 mg twice daily, adjusted according to response

- **CAUTIONS** Dementia with Lewy Bodies

- **INTERACTIONS** → Appendix 1: asenapine

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · appetite increased · fatigue · muscle rigidity · nausea · oral disorders · taste altered
- ▶ **Uncommon** Bundle branch block · dysarthria · dysphagia · hyperglycaemia · sexual dysfunction · syncope

- ▶ **Rare or very rare** Accommodation disorder · rhabdomyolysis
- **PREGNANCY** Use only if potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment (risk of increased exposure).
- **RENAL IMPAIRMENT** Use with caution if eGFR less than 15 mL/minute/1.73 m²—no information available.
- **PATIENT AND CARER ADVICE** Patient or carer should be given advice on how to administer asenapine sublingual tablet.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Sublingual tablet

CAUTIONARY AND ADVISORY LABELS 2, 26

▶ **Sycrest** (Lundbeck Ltd)**Asenapine (as Asenapine maleate) 5 mg** Sycrest 5mg sublingual

tablets sugar-free | 60 tablet [PoM] £102.60 DT = £102.60

Asenapine (as Asenapine maleate) 10 mg Sycrest 10mg sublingual tablets sugar-free | 60 tablet [PoM] £102.60 DT = £102.60**ANTIPSYCHOTICS** > LITHIUM SALTS**Lithium salts**

- **CONTRA-INDICATIONS** Addison's disease · cardiac disease associated with rhythm disorder · cardiac insufficiency · dehydration · family history of Brugada syndrome · low sodium diets · personal history of Brugada syndrome · untreated hypothyroidism
- **CAUTIONS** Avoid abrupt withdrawal · cardiac disease · concurrent ECT (may lower seizure threshold) · diuretic treatment (risk of toxicity) · elderly (reduce dose) · epilepsy (may lower seizure threshold) · myasthenia gravis · psoriasis (risk of exacerbation) · QT interval prolongation · review dose as necessary in diarrhoea · review dose as necessary in intercurrent infection (especially if sweating profusely) · review dose as necessary in vomiting · surgery
- ▶ **CAUTIONS, FURTHER INFORMATION**
- ▶ Long-term use Long-term use of lithium has been associated with thyroid disorders and mild cognitive and memory impairment. Long-term treatment should therefore be undertaken only with careful assessment of risk and benefit, and with monitoring of thyroid function every 6 months (more often if there is evidence of deterioration).

The need for continued therapy should be assessed regularly and patients should be maintained on lithium after 3–5 years only if benefit persists.

● **SIDE-EFFECTS**

- ▶ **Rare or very rare** Nephropathy
- ▶ **Frequency not known** Abdominal discomfort · alopecia · angioedema · appetite decreased · arrhythmias · atrioventricular block · cardiomyopathy · cerebellar syndrome · circulatory collapse · coma · delirium · diarrhoea · dizziness · dry mouth · electrolyte imbalance · encephalopathy · folliculitis · gastritis · goitre · hyperglycaemia · hyperparathyroidism · hypersalivation · hypotension · hypothyroidism · idiopathic intracranial hypertension · leucocytosis · memory loss · movement disorders · muscle weakness · myasthenia gravis · nausea · neoplasms · nystagmus · peripheral neuropathy · peripheral oedema · polyuria · QT interval prolongation · reflexes abnormal · renal disorders · renal impairment · rhabdomyolysis · seizure · sexual dysfunction · skin reactions · skin ulcer · speech impairment · taste altered · thyrotoxicosis · tremor · vertigo · vision disorders · vomiting · weight increased

SIDE-EFFECTS, FURTHER INFORMATION **Overdose** Signs of intoxication require withdrawal of treatment and include increasing gastro-intestinal disturbances (vomiting, diarrhoea), visual disturbances, polyuria, muscle weakness, fine tremor increasing to coarse tremor, CNS disturbances (confusion and drowsiness increasing to lack of coordination, restlessness, stupor); abnormal reflexes, myoclonus, incontinence, hypernatraemia. With severe overdose seizures, cardiac arrhythmias (including sino-atrial block, bradycardia and first-degree heart block), blood pressure changes, circulatory failure, renal failure, coma and sudden death reported.

For details on the management of poisoning, see Lithium, under Emergency treatment of poisoning p. 1430.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment for women of child bearing potential.
- **PREGNANCY** Avoid if possible, particularly in the first trimester (risk of teratogenicity, including cardiac abnormalities).
- **Dose adjustments** Dose requirements increased during the second and third trimesters (but on delivery return abruptly to normal).

Monitoring Close monitoring of serum-lithium concentration advised in pregnancy (risk of toxicity in neonate).

- **BREAST FEEDING** Present in milk and risk of toxicity in infant—avoid.
- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **Monitoring** In renal impairment monitor serum-lithium concentration closely and adjust dose accordingly.

● **MONITORING REQUIREMENTS**

- ▶ Serum concentrations Lithium salts have a narrow therapeutic/toxic ratio and should therefore not be prescribed unless facilities for monitoring serum-lithium concentrations are available. Samples should be taken 12 hours after the dose to achieve a serum-lithium concentration of 0.4–1 mmol/litre (lower end of the range for maintenance therapy and elderly patients).

A target serum-lithium concentration of 0.8–1 mmol/litre is recommended for acute episodes of mania, and for patients who have previously relapsed or have sub-syndromal symptoms. It is important to determine the optimum range for each individual patient.

[EvGr] Routine serum-lithium monitoring should be performed weekly after initiation and after each dose change until concentrations are stable, then every 3 months for the first year, and every 6 months thereafter. Patients who are 65 years and older, taking drugs that interact with lithium, at risk of impaired renal or thyroid function, raised calcium levels or other complications, have poor symptom control or poor adherence, or whose last serum-lithium concentration was 0.8 mmol/litre or higher, should be monitored every 3 months. **[A]** Additional serum-lithium measurements should be made if a patient develops significant intercurrent disease or if there is a significant change in a patient's sodium or fluid intake.

- ▶ Manufacturer advises to assess renal, cardiac, and thyroid function before treatment initiation. **[EvGr]** An ECG is recommended in patients with cardiovascular disease or risk factors for it. Body-weight or BMI, serum electrolytes, and a full blood count should also be measured before treatment initiation.
- ▶ Monitor body-weight or BMI, serum electrolytes, eGFR, and thyroid function every 6 months during treatment, and more often if there is evidence of impaired renal or thyroid function, or raised calcium levels. **[A]**

Manufacturer also advises to monitor cardiac function regularly.

- **TREATMENT CESSATION** While there is no clear evidence of withdrawal or rebound psychosis, abrupt discontinuation of lithium increases the risk of relapse. If lithium is to be discontinued, the dose should be reduced gradually over a period of at least 4 weeks (preferably over a period of up to 3 months). Patients and their carers should be warned of the risk of relapse if lithium is discontinued abruptly. If lithium is stopped or is to be discontinued abruptly, consider changing therapy to an atypical antipsychotic or valproate.

- **PATIENT AND CARER ADVICE** Patients should be advised to report signs and symptoms of lithium toxicity, hypothyroidism, renal dysfunction (including polyuria and polydipsia), and benign intracranial hypertension (persistent headache and visual disturbance). Maintain adequate fluid intake and avoid dietary changes which reduce or increase sodium intake.

Lithium treatment packs A lithium treatment pack should be given to patients on initiation of treatment with lithium. The pack consists of a patient information booklet, lithium alert card, and a record book for tracking serum-lithium concentration. Packs may be purchased from

- 3M
- 0845 610 1112
- nhsforms@mhm.uk.com

Driving and skilled tasks May impair performance of skilled tasks (e.g. driving, operating machinery).

Lithium carbonate

• INDICATIONS AND DOSE

Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour

► BY MOUTH

- **Adult:** Dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

DOSE EQUIVALENCE AND CONVERSION

- **Preparations vary widely in bioavailability;** changing the preparation requires the same precautions as initiation of treatment.

CAMCOLIT[®] IMMEDIATE-RELEASE TABLET

Treatment of mania | Treatment of bipolar disorder | Treatment of recurrent depression | Treatment of aggressive or self-harming behaviour

► BY MOUTH

- **Adult:** Initially 1–1.5 g daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- **Elderly:** Reduce initial dose, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Prophylaxis of mania | Prophylaxis of bipolar disorder | Prophylaxis of recurrent depression | Prophylaxis of aggressive or self-harming behaviour

► BY MOUTH

- **Adult:** Initially 300–400 mg daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily

administration is preferred when serum-lithium concentration stabilised

CAMCOLIT[®] MODIFIED-RELEASE TABLET

Treatment of mania | Treatment of bipolar disorder | Treatment of recurrent depression | Treatment of aggressive or self-harming behaviour

► BY MOUTH

- **Adult:** Initially 1–1.5 g daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- **Elderly:** Reduce initial dose, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Prophylaxis of mania | Prophylaxis of bipolar disorder | Prophylaxis of recurrent depression | Prophylaxis of aggressive or self-harming behaviour

► BY MOUTH

- **Adult:** Initially 300–400 mg daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

LISKONUM[®]

Treatment of mania | Treatment of bipolar disorder | Treatment of recurrent depression | Treatment of aggressive or self-harming behaviour

► BY MOUTH

- **Adult:** Initially 450–675 mg twice daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- **Elderly:** Initially 225 mg twice daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Prophylaxis of mania | Prophylaxis of bipolar disorder | Prophylaxis of recurrent depression | Prophylaxis of aggressive or self-harming behaviour

► BY MOUTH

- **Adult:** Initially 450 mg twice daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- **Elderly:** Initially 225 mg twice daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

PRIADEL[®] TABLETS

Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour

► BY MOUTH

- **Adult (body-weight up to 50 kg):** Initially 200–400 mg daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

- ▶ Elderly: Initially 520 mg twice daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

DOSE EQUIVALENCE AND CONVERSION

- ▶ For *Priadel*® liquid: Lithium citrate tetrahydrate 520 mg is equivalent to lithium carbonate 204 mg.

● **INTERACTIONS** → Appendix 1: lithium

- **SIDE-EFFECTS** Polydipsia

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Li-Liquid** (Rosemont Pharmaceuticals Ltd)

Lithium citrate 101.8 mg per 1 ml Li-Liquid 509mg/5ml oral solution | 150 ml [PoM] £5.79 DT = £5.79

Lithium citrate 203.6 mg per 1 ml Li-Liquid 1.018g/5ml oral solution | 150 ml [PoM] £17.49 DT = £11.58

- ▶ **Priadel (lithium citrate)** (Essential Pharma M)

Lithium citrate 104 mg per 1 ml Priadel 520mg/5ml liquid sugar-free | 150 ml [PoM] £6.73 DT = £6.73

3.4 Depression

Antidepressant drugs

Overview

Antidepressant drugs are effective for treating moderate to severe depression associated with psychomotor and physiological changes such as loss of appetite and sleep disturbance; improvement in sleep is usually the first benefit of therapy. Ideally, patients with moderate to severe depression should be treated with psychological therapy in addition to drug therapy. Antidepressant drugs are also effective for dysthymia (lower grade chronic depression (typically of at least 2 years duration)).

Antidepressant drugs should not be used routinely in mild depression, and psychological therapy should be considered initially; however, a trial of antidepressant therapy may be considered in cases refractory to psychological treatments or in those associated with psychosocial or medical problems. Drug treatment of mild depression may also be considered in patients with a history of moderate or severe depression.

Choice

The major classes of antidepressant drugs include the tricyclic and related antidepressants, the selective serotonin re-uptake inhibitors (SSRIs), and the monoamine oxidase inhibitors (MAOIs). A number of antidepressant drugs cannot be accommodated easily into this classification.

There is little to choose between the different classes of antidepressant drugs in terms of efficacy, so choice should be based on the individual patient's requirements, including the presence of concomitant disease, existing therapy, suicide risk, and previous response to antidepressant therapy. Since there may be an interval of 2 weeks before the antidepressant action takes place, electroconvulsive treatment may be required in severe depression when delay is hazardous or intolerable. During the first few weeks of treatment, there is an increased potential for agitation, anxiety, and suicidal ideation.

SSRIs are better tolerated and are safer in overdose than other classes of antidepressants and should be considered first-line for treating depression. In patients with unstable angina or who have had a recent myocardial infarction, sertraline p. 385 has been shown to be safe.

Tricyclic antidepressants have similar efficacy to SSRIs but are more likely to be discontinued because of side-effects; toxicity in overdosage is also a problem. SSRIs are less sedating and have fewer antimuscarinic and cardiotoxic effects than tricyclic antidepressants.

MAOIs have dangerous interactions with some foods and drugs, and should be reserved for use by specialists.

Although anxiety is often present in depressive illness (and may be the presenting symptom), the use of an antipsychotic or an anxiolytic may mask the true diagnosis. Anxiolytics or antipsychotic drugs should therefore be used with caution in depression but they are useful adjuncts in agitated patients. Augmenting antidepressants with antipsychotics under specialist supervision may also be necessary in patients who have depression with psychotic symptoms.

St John's wort (*Hypericum perforatum*) is a popular herbal remedy on sale to the public for treating mild depression. It should not be prescribed or recommended for depression because St John's wort can induce drug metabolising enzymes and a number of important interactions with conventional drugs, including conventional antidepressants, have been identified. Furthermore, the amount of active ingredient varies between different preparations of St John's wort and switching from one to another can change the degree of enzyme induction. If a patient stops taking St John's wort, the concentration of interacting drugs may increase, leading to toxicity.

Management

Patients should be reviewed every 1–2 weeks at the start of antidepressant treatment. Treatment should be continued for at least 4 weeks (6 weeks in the elderly) before considering whether to switch antidepressant due to lack of efficacy. In cases of partial response, continue for a further 2–4 weeks (elderly patients may take longer to respond).

Following remission, antidepressant treatment should be continued at the same dose for at least 6 months (about 12 months in the elderly), or for at least 12 months in patients receiving treatment for generalised anxiety disorder (as the likelihood of relapse is high). Patients with a history of recurrent depression should receive maintenance treatment for at least 2 years.

Hyponatraemia and antidepressant therapy

Hyponatraemia (usually in the elderly and possibly due to inappropriate secretion of antidiuretic hormone) has been associated with all types of antidepressants; however, it has been reported more frequently with SSRIs than with other antidepressants. Hyponatraemia should be considered in all patients who develop drowsiness, confusion, or convulsions while taking an antidepressant.

Suicidal behaviour and antidepressant therapy

The use of antidepressants has been linked with suicidal thoughts and behaviour; children, young adults, and patients with a history of suicidal behaviour are particularly at risk. Where necessary patients should be monitored for

suicidal behaviour, self-harm, or hostility, particularly at the beginning of treatment or if the dose is changed.

Serotonin syndrome

Serotonin syndrome or serotonin toxicity is a relatively uncommon adverse drug reaction caused by excessive central and peripheral serotonergic activity. Onset of symptoms, which range from mild to lifethreatening, can occur within hours or days following the initiation, dose escalation, or overdose of a serotonergic drug, the addition of a new serotonergic drug, or the replacement of one serotonergic drug by another without allowing a long enough washout period in-between, particularly when the first drug is an irreversible MAOI or a drug with a long half-life. Severe toxicity, which is a medical emergency, usually occurs with a combination of serotonergic drugs, one of which is generally an MAOI.

The characteristic symptoms of serotonin syndrome fall into 3 main areas, although features from each group may not be seen in all patients—neuromuscular hyperactivity (such as tremor, hyperreflexia, clonus, myoclonus, rigidity), autonomic dysfunction (tachycardia, blood pressure changes, hyperthermia, diaphoresis, shivering, diarrhoea), and altered mental state (agitation, confusion, mania).

Treatment consists of withdrawal of the serotonergic medication and supportive care; specialist advice should be sought.

Failure to respond

Failure to respond to initial treatment with an SSRI may require an increase in the dose, or switching to a different SSRI or mirtazapine p. 389. Other second-line choices include lofepramine p. 395, moclobemide p. 380, and reboxetine p. 381. Other tricyclic antidepressants and venlafaxine p. 386 should be considered for more severe forms of depression; irreversible MAOIs should only be prescribed by specialists. Failure to respond to a second antidepressant may require the addition of another antidepressant of a different class, or use of an augmenting agent (such as lithium, aripiprazole p. 413 [unlicensed], olanzapine p. 416 [unlicensed], quetiapine p. 419, or risperidone p. 421 [unlicensed]), but such adjunctive treatment should be initiated only by doctors with special experience of these combinations. Electroconvulsive therapy may be initiated in severe refractory depression.

Anxiety disorders and obsessive-compulsive disorder

Management of acute anxiety generally involves the use of a benzodiazepine or buspirone hydrochloride p. 358. For chronic anxiety (of longer than 4 weeks' duration) it may be appropriate to use an antidepressant. Combined therapy with a benzodiazepine may be required until the antidepressant takes effect. Patients with *generalised anxiety disorder*, a form of chronic anxiety, should be offered psychological treatment before initiating an antidepressant. If drug treatment is needed, an SSRI such as escitalopram p. 382, paroxetine p. 384, or sertraline p. 385 [unlicensed], can be used. Duloxetine p. 385 and venlafaxine p. 386 (serotonin and noradrenaline reuptake inhibitors) are also recommended for the treatment of generalised anxiety disorder; if the patient cannot tolerate SSRIs or serotonin and noradrenaline reuptake inhibitors (or if treatment has failed to control symptoms), pregabalin p. 341 can be considered.

Panic disorder, obsessive-compulsive disorder, post-traumatic stress disorder, and phobic states such as *social anxiety disorder* are treated with SSRIs. Clomipramine hydrochloride p. 391 or imipramine hydrochloride p. 394 can be used second-line in panic disorder [unlicensed]; clomipramine hydrochloride can also be used second-line for obsessive-compulsive disorder. Moclobemide p. 380 is licensed for the treatment of social anxiety disorder.

Tricyclic and related antidepressant drugs

Choice

Tricyclic and related antidepressants block the re-uptake of both serotonin and noradrenaline, although to different extents. For example, clomipramine hydrochloride is more selective for serotonergic transmission, and imipramine hydrochloride is more selective for noradrenergic transmission. Tricyclic and related antidepressant drugs can be roughly divided into those with additional sedative properties and those that are less sedating. Agitated and anxious patients tend to respond best to the sedative compounds, whereas withdrawn and apathetic patients will often obtain most benefit from the less sedating ones. Those with **sedative** properties include amitriptyline hydrochloride p. 390, clomipramine hydrochloride, dosulepin hydrochloride p. 392, doxepin p. 393, mianserin hydrochloride p. 389, trazodone hydrochloride p. 388, and trimipramine p. 396. Those with **less sedative** properties include imipramine hydrochloride, lofepramine p. 395, and nortriptyline p. 395.

Tricyclic and related antidepressants also have varying degrees of antimuscarinic side-effects and cardiotoxicity in overdosage, which may be important in individual patients. Lofepamine has a lower incidence of side-effects and is less dangerous in overdosage but is infrequently associated with hepatic toxicity. Imipramine hydrochloride is also well established, but has more marked antimuscarinic side-effects than other tricyclic and related antidepressants. Amitriptyline hydrochloride and dosulepin hydrochloride are effective but they are particularly dangerous in overdosage and are not recommended for the treatment of depression; dosulepin hydrochloride should be initiated by a specialist.

Dosage

About 10 to 20% of patients fail to respond to tricyclic and related antidepressant drugs and inadequate dosage may account for some of these failures. It is important to use doses that are sufficiently high for effective treatment but not so high as to cause toxic effects. Low doses should be used for initial treatment in the **elderly**. In most patients the long half-life of tricyclic antidepressant drugs allows **once-daily** administration, usually at night; the use of modified-release preparations is therefore unnecessary.

Some tricyclic antidepressants are used in the management of *panic* and other *anxiety disorders*. Some tricyclic antidepressants may also have a role in some forms of *neuralgia* and in *nocturnal enuresis* in children.

Children and adolescents

Studies have shown that tricyclic antidepressants are not effective for treating depression in children.

Considerations in the elderly

The use of tricyclic antidepressants in elderly patients is potentially inappropriate (STOPP criteria):

- if prescribed in those with dementia, narrow angle glaucoma, cardiac conduction abnormalities, prostatism, or history of urinary retention (risk of worsening these conditions);
- if initiated as first-line antidepressant treatment (higher risk of adverse drug reactions than with SSRIs or SNRIs).

For further information, see *STOPP/START criteria* in Prescribing in the elderly p. 33.

Monoamine-oxidase inhibitors

Monoamine-oxidase inhibitors are used much less frequently than tricyclic and related antidepressants, or SSRIs and related antidepressants because of the dangers of dietary and drug interactions and the fact that it is easier to prescribe MAOIs when tricyclic antidepressants have been unsuccessful than vice versa.

Tranlycypromine p. 380 has a greater stimulant action than phenelzine p. 380 or isocarboxazid p. 379 and is more likely to cause a hypertensive crisis. Isocarboxazid and phenelzine are more likely to cause hepatotoxicity than tranlycypromine.

Moclobemide should be reserved as a second line treatment.

Phobic patients and depressed patients with atypical, hypochondriacal, or hysterical features are said to respond best to MAOIs. However, MAOIs should be tried in any patients who are refractory to treatment with other antidepressants as there is occasionally a dramatic response. Response to treatment may be delayed for 3 weeks or more and may take an additional 1 or 2 weeks to become maximal.

Interactions

Other antidepressants should not be started for 2 weeks after treatment with MAOIs has been stopped (3 weeks if starting clomipramine or imipramine). Conversely, an MAOI should not be started until:

- at least 2 weeks after a previous MAOI has been stopped (then started at a reduced dose)
- at least 7–14 days after a tricyclic or related antidepressant (3 weeks in the case of clomipramine or imipramine) has been stopped
- at least a week after an SSRI or related antidepressant (at least 5 weeks in the case of fluoxetine) has been stopped

Other antidepressant drugs

The thioxanthene flupentixol p. 403 (Fluanxol[®]) has antidepressant properties when given by mouth in low doses. Flupentixol is also used for the treatment of psychoses.

Vortioxetine p. 397, an antidepressant thought to directly modulate serotonergic receptor activity and inhibit the re-uptake of serotonin, is recommended in patients whose condition has responded inadequately to 2 antidepressants within the current episode.

Tryptophan is licensed for use in treatment-resistant depression, used as monotherapy and as an adjunct to other antidepressant drugs; it should be initiated by hospital specialists.

Other drugs used for Depression Lithium carbonate, p. 375
• Lithium citrate, p. 376

ANTIDEPRESSANTS > MELATONIN RECEPTOR AGONISTS

Agomelatine

21-May-2020

- **DRUG ACTION** A melatonin receptor agonist and a selective serotonin-receptor antagonist; it does not affect the uptake of serotonin, noradrenaline, or dopamine.

• INDICATIONS AND DOSE

Major depression

- ▶ BY MOUTH
- ▶ **Adult:** 25 mg daily, dose to be taken at bedtime, dose to be increased if necessary after 2 weeks, increased if necessary to 50 mg daily, dose to be taken at bedtime

- **CONTRA-INDICATIONS** Dementia · patients over 75 years of age
- **CAUTIONS** Alcoholism · bipolar disorder · diabetes · excessive alcohol consumption · hypomania · mania · non-alcoholic fatty liver disease · obesity
- **INTERACTIONS** → Appendix 1: agomelatine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anxiety · back pain · constipation · diarrhoea · dizziness · drowsiness ·

fatigue · headaches · nausea · sleep disorders · vomiting · weight changes

- ▶ **Uncommon** Aggression · confusion · hyperhidrosis · mood altered · movement disorders · paraesthesia · skin reactions · suicidal tendencies · tinnitus · vision blurred
- ▶ **Rare or very rare** Angioedema · face oedema · hallucination · hepatic disorders · urinary retention

SIDE-EFFECTS, FURTHER INFORMATION The use of antidepressants has been linked with suicidal thoughts and behaviour; children, young adults, and patients with a history of suicidal behaviour are particularly at risk. Where necessary patients should be monitored for suicidal behaviour, self-harm, or hostility, particularly at the beginning of treatment or if the dose is changed.

- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution if transaminases are elevated; avoid in hepatic impairment or if transaminases exceed 3 times the upper limit of normal.
- **RENAL IMPAIRMENT** Caution in moderate to severe impairment.
- **MONITORING REQUIREMENTS** Test liver function before treatment and after 3, 6, 12 and 24 weeks of treatment, and then regularly thereafter when clinically indicated (restart monitoring schedule if dose increased); discontinue if serum transaminases exceed 3 times the upper limit of reference range or symptoms of liver disorder.
- **PATIENT AND CARER ADVICE** Hepatotoxicity Patients should be told how to recognise signs of liver disorder, and advised to seek immediate medical attention if symptoms such as dark urine, light coloured stools, jaundice, bruising, fatigue, abdominal pain, or pruritus develop.
Patients should be given a booklet with more information on the risk of hepatic side-effects.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ Agomelatine (Non-proprietary)

Agomelatine 25 mg Agomelatine 25mg tablets | 28 tablet [Pom] £34.48 DT = £31.90

▶ Valdoxan (Servier Laboratories Ltd)

Agomelatine 25 mg Valdoxan 25mg tablets | 28 tablet [Pom] £30.00 DT = £31.90

ANTIDEPRESSANTS > MONOAMINE-OXIDASE INHIBITORS

Monoamine-oxidase inhibitors

- **DRUG ACTION** MAOIs inhibit monoamine oxidase, thereby causing an accumulation of amine neurotransmitters.
- **CONTRA-INDICATIONS** Cerebrovascular disease · not indicated in manic phase · pheochromocytoma · severe cardiovascular disease
- **CAUTIONS** Acute porphyrias p. 1120 · avoid in agitated patients · blood disorders · cardiovascular disease · concurrent electroconvulsive therapy · diabetes mellitus · elderly (great caution) · epilepsy · severe hypertensive reactions to certain drugs and foods · surgery
- **SIDE-EFFECTS** Akathisia · anxiety · appetite increased · arrhythmia · asthenia · behaviour abnormal · blood disorder · confusion · constipation · dizziness · drowsiness · dry mouth · dysuria · hallucination · headache · hyperhidrosis · insomnia · jaundice · nausea · paraesthesia · peripheral neuritis · postural hypotension (more common in elderly) · reflexes increased · skin reactions · suicidal

tendencies · tremor · vision blurred · vomiting · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Risk of postural hypotension and hypertensive responses. Discontinue if palpitations or frequent headaches occur.

- **PREGNANCY** Increased risk of neonatal malformations—manufacturer advises avoid unless there are compelling reasons.
- **HEPATIC IMPAIRMENT** In general, manufacturers advise avoid.
- **MONITORING REQUIREMENTS** Monitor blood pressure (risk of postural hypotension and hypertensive responses).
- **TREATMENT CESSATION**

Withdrawal If possible avoid abrupt withdrawal.

MAOIs are associated with withdrawal symptoms on cessation of therapy. Symptoms include agitation, irritability, ataxia, movement disorders, insomnia, drowsiness, vivid dreams, cognitive impairment, and slowed speech. Withdrawal symptoms occasionally experienced when discontinuing MAOIs include hallucinations and paranoid delusions. If possible MAOIs should be withdrawn slowly.

Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

- **PATIENT AND CARER ADVICE** Patients should be advised to eat only fresh foods and avoid food that is suspected of being stale or 'going off'. This is especially important with meat, fish, poultry or offal; game should be avoided. The danger of interaction persists for up to 2 weeks after treatment with MAOIs is discontinued. Patients should also be advised to avoid alcoholic drinks or de-alcoholised (low alcohol) drinks.
Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving).

ANTIDEPRESSANTS > MONOAMINE-OXIDASE A AND B INHIBITORS, IRREVERSIBLE

 above

Isocarboxazid

30-Mar-2017

● INDICATIONS AND DOSE

Depressive illness

▶ BY MOUTH

- ▶ **Adult:** Initially 30 mg daily until improvement occurs, initial dose may be given in single or divided doses, dose may be increased if necessary after 4 weeks, increased to 60 mg daily for 4–6 weeks, dose to be increased under close supervision only, then reduced to 10–20 mg daily, usual maintenance dose, but up to 40 mg daily may be required
- ▶ **Elderly:** 5–10 mg daily

- **INTERACTIONS** → Appendix 1: MAOIs, irreversible
- **SIDE-EFFECTS** Granulocytopenia · peripheral oedema · sexual dysfunction
- **BREAST FEEDING** Avoid.
- **RENAL IMPAIRMENT** Use with caution.
- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

ANTIDEPRESSANTS > MONOAMINE-OXIDASE A INHIBITORS, REVERSIBLE

Moclobemide

21-May-2020

- **DRUG ACTION** Moclobemide is reported to act by reversible inhibition of monoamine oxidase type A (it is therefore termed a RIMA).

- **INDICATIONS AND DOSE**

Depressive illness

▶ BY MOUTH

- ▶ **Adult:** Initially 300 mg daily in divided doses, adjusted according to response; usual dose 150–600 mg daily, dose to be taken after food

Social anxiety disorder

▶ BY MOUTH

- ▶ **Adult:** Initially 300 mg daily for 3 days, then increased to 600 mg daily in 2 divided doses continued for 8–12 weeks to assess efficacy

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose to half or one-third of the usual dose with concurrent use of cimetidine.

- **CONTRA-INDICATIONS** Acute confusional states · phaeochromocytoma

- **CAUTIONS** Avoid in agitated or excited patients (or give with sedative for up to 2–3 weeks) · may provoke manic episodes in bipolar disorders · thyrotoxicosis

- **INTERACTIONS** → Appendix 1: moclobemide

● **SIDE-EFFECTS**

- ▶ **Common or very common** Anxiety · constipation · diarrhoea · dizziness · dry mouth · headache · hypotension · irritability · nausea · paraesthesia · skin reactions · sleep disorder · vomiting
- ▶ **Uncommon** Asthenia · confusion · flushing · oedema · suicidal tendencies · taste altered · visual impairment
- ▶ **Rare or very rare** Appetite decreased · delusions · hyponatraemia · serotonin syndrome

- **PREGNANCY** Safety in pregnancy has not been established—manufacturer advises avoid unless there are compelling reasons.

- **BREAST FEEDING** Amount too small to be harmful, but patient information leaflet advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (risk of decreased metabolism).

- ▶ **Dose adjustments** Manufacturer advises dose reduction to half or one-third of the daily dose in severe impairment,

- ▶ **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

● **PATIENT AND CARER ADVICE** Moclobemide is claimed to cause less potentiation of the pressor effect of tyramine than the traditional (irreversible) MAOIs, but patients should avoid consuming large amounts of tyramine-rich food (such as mature cheese, yeast extracts and fermented soya bean products).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

ANTIDEPRESSANTS > NORADRENALINE REUPTAKE INHIBITORS

Reboxetine

● **DRUG ACTION** Reboxetine is a selective inhibitor of noradrenaline re-uptake.

● INDICATIONS AND DOSE

Major depression

► BY MOUTH

► **Adult:** 4 mg twice daily for 3–4 weeks, then increased if necessary to 10 mg daily in divided doses; maximum 12 mg per day

● **CAUTIONS** Bipolar disorder · history of cardiovascular disease · history of epilepsy · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention

● **INTERACTIONS** → Appendix 1: reboxetine

● SIDE-EFFECTS

► **Common or very common** Accommodation disorder · akathisia · anxiety · appetite decreased · chills · constipation · dizziness · dry mouth · headache · hyperhidrosis · hypertension · hypotension · insomnia · nausea · palpitations · paraesthesia · sexual dysfunction · skin reactions · tachycardia · taste altered · urinary disorders · urinary tract infection · vasodilation · vomiting

► **Uncommon** Mydriasis · vertigo

► **Rare or very rare** Glaucoma

► **Frequency not known** Aggression · hallucination · hyponatraemia · irritability · peripheral coldness · potassium depletion (long term use) · Raynaud's phenomenon · suicidal tendencies · testicular pain

● **PREGNANCY** Use only if potential benefit outweighs risk—limited information available.

● **BREAST FEEDING** Small amount present in milk—use only if potential benefit outweighs risk.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).

Dose adjustments Manufacturer advises initial dose reduction to 2 mg twice daily, increased according to tolerance.

● RENAL IMPAIRMENT

Dose adjustments Initial dose 2 mg twice daily, increased according to tolerance.

● **TREATMENT CESSATION** Caution—avoid abrupt withdrawal.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Counselling advised.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Edronax (Pfizer Ltd)

Reboxetine (as Reboxetine mesilate) 4 mg Edronax 4mg tablets | 60 tablet PoM £18.91 DT = £18.91

ANTIDEPRESSANTS > SELECTIVE SEROTONIN REUPTAKE INHIBITORS

Selective serotonin re-uptake inhibitors

● **DRUG ACTION** Selectively inhibit the re-uptake of serotonin (5-hydroxytryptamine, 5-HT).

● **CONTRA-INDICATIONS** Poorly controlled epilepsy · SSRIs should not be used if the patient enters a manic phase

● **CAUTIONS** Cardiac disease · concurrent electroconvulsive therapy · diabetes mellitus · epilepsy (discontinue if convulsions develop) · history of bleeding disorders (especially gastro-intestinal bleeding) · history of mania · susceptibility to angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION

► **Elderly** Prescription potentially inappropriate (STOPP criteria) with current or recent significant hyponatraemia i.e. serum sodium less than 130 mmol/l (risk of exacerbating or precipitating hyponatraemia). See also Prescribing in the elderly p. 33.

● SIDE-EFFECTS

► **Common or very common** Anxiety · appetite abnormal · arrhythmias · arthralgia · asthenia · concentration impaired · confusion · constipation · depersonalisation · diarrhoea · dizziness · drowsiness · dry mouth · fever · gastrointestinal discomfort · haemorrhage · headache · hyperhidrosis · malaise · memory loss · menstrual cycle irregularities · myalgia · mydriasis · nausea (dose-related) · palpitations · paraesthesia · QT interval prolongation · sexual dysfunction · skin reactions · sleep disorders · taste altered · tinnitus · tremor · urinary disorders · visual impairment · vomiting · weight changes · yawning

► **Uncommon** Alopecia · angioedema · behaviour abnormal · hallucination · mania · movement disorders · photosensitivity reaction · postural hypotension · seizure · suicidal tendencies · syncope

► **Rare or very rare** Galactorrhoea · hepatitis · hyperprolactinaemia · hyponatraemia · serotonin syndrome · severe cutaneous adverse reactions (SCARs) · SIADH · thrombocytopenia

► **Frequency not known** Withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION Symptoms of sexual dysfunction may persist after treatment has stopped.

Overdose Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

For details on the management of poisoning, see Selective serotonin re-uptake inhibitors, under Emergency treatment of poisoning p. 1430.

● **PREGNANCY** Manufacturers advise avoid during pregnancy unless the potential benefit outweighs the risk. There is a small increased risk of congenital heart defects when taken during early pregnancy. If used during the third trimester there is a risk of neonatal withdrawal symptoms, and

persistent pulmonary hypertension in the newborn has been reported.

- **HEPATIC IMPAIRMENT** In general, manufacturers advise caution (prolonged half-life).
- **TREATMENT CESSATION** Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, electric shock sensation in the head, neck, and spine, tinnitus, sleep disturbances, fatigue, influenza-like symptoms, and sweating are the most common features of abrupt withdrawal of an SSRI or marked reduction of the dose; palpitation and visual disturbances can occur less commonly. The dose should be tapered over at least a few weeks to avoid these effects. For some patients, it may be necessary to withdraw treatment over a longer period; consider obtaining specialist advice if symptoms persist. Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks May also impair performance of skilled tasks (e.g. driving, operating machinery).

381

Citalopram

31-Jul-2018

● INDICATIONS AND DOSE

Depressive illness

- ▶ BY MOUTH USING TABLETS
- ▶ Adult: 20 mg once daily, increased in steps of 20 mg daily if required, dose to be increased at intervals of 3–4 weeks; maximum 40 mg per day
- ▶ Elderly: 10–20 mg once daily; maximum 20 mg per day
- ▶ BY MOUTH USING ORAL DROPS
- ▶ Adult: 16 mg once daily, increased in steps of 16 mg daily if required, dose to be increased at intervals of 3–4 weeks; maximum 32 mg per day
- ▶ Elderly: 8–16 mg daily; maximum 16 mg per day

Panic disorder

- ▶ BY MOUTH USING TABLETS
- ▶ Adult: Initially 10 mg daily, increased in steps of 10 mg daily if required, dose to be increased gradually; usual dose 20–30 mg daily; maximum 40 mg per day
- ▶ Elderly: Initially 10 mg daily, increased in steps of 10 mg daily if required, dose to be increased gradually; maximum 20 mg per day
- ▶ BY MOUTH USING ORAL DROPS
- ▶ Adult: Initially 8 mg once daily, increased in steps of 8 mg if required, dose to be increased gradually; usual dose 16–24 mg daily; maximum 32 mg per day
- ▶ Elderly: Initially 8 mg once daily, increased in steps of 8 mg if required, dose to be increased gradually; maximum 16 mg per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ 4 oral drops (8 mg) is equivalent in therapeutic effect to 10 mg tablet.

- **CONTRA-INDICATIONS** QT-interval prolongation
- **CAUTIONS** Susceptibility to QT-interval prolongation
- **INTERACTIONS** → Appendix 1: SSRIs
- **SIDE-EFFECTS**
- ▶ **Common or very common** Acute angle closure glaucoma · apathy · flatulence · hypersalivation · migraine · rhinitis
- ▶ **Uncommon** Oedema
- ▶ **Rare or very rare** Cough · generalised tonic-clonic seizure
- ▶ **Frequency not known** Hypokalaemia
- **BREAST FEEDING** Present in milk—use with caution.

● HEPATIC IMPAIRMENT

Dose adjustments For tablets manufacturer advises initial dose of 10 mg daily for the first two weeks in mild to moderate impairment—dose may be increased to max. 20 mg daily; use with extra caution and careful dose titration in severe impairment.

For oral drops manufacturer advises initial dose of 8 mg daily for the first two weeks in mild to moderate impairment—dose may be increased to max. 16 mg daily; use with extra caution and careful dose titration in severe impairment.

- **RENAL IMPAIRMENT** No information available for eGFR less than 20 mL/minute/1.73 m².
- **TREATMENT CESSATION** The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).
- **DIRECTIONS FOR ADMINISTRATION** Cipramil® oral drops should be mixed with water, orange juice, or apple juice before taking.
- **PATIENT AND CARER ADVICE** Counselling on administration of oral drops is advised.
Driving and skilled tasks Patients should be advised of the effects of citalopram on driving and skilled tasks.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral drops

EXCIPIENTS: May contain Alcohol

▶ Citalopram (Non-proprietary)

Citalopram (as Citalopram hydrochloride) 40 mg per

1 ml Citalopram 40mg/ml oral drops sugar free sugar-free | 15 ml [PoM] £18.17 DT = £15.16

1 ml Cipramil 40mg/ml drops sugar-free | 15 ml [PoM] £10.08 DT = £15.16

Tablet

▶ Citalopram (Non-proprietary)

Citalopram (as Citalopram hydrobromide) 10 mg Citalopram 10mg tablets | 28 tablet [PoM] £12.36 DT = £0.90

Citalopram (as Citalopram hydrobromide) 20 mg Citalopram 20mg tablets | 28 tablet [PoM] £14.66 DT = £0.95

Citalopram (as Citalopram hydrobromide) 40 mg Citalopram 40mg tablets | 28 tablet [PoM] £16.47 DT = £1.11

▶ Cipramil (Lundbeck Ltd)

Citalopram (as Citalopram hydrobromide) 20 mg Cipramil 20mg tablets | 28 tablet [PoM] £8.95 DT = £0.95

381

Escitalopram

13-Jul-2018

- **DRUG ACTION** Escitalopram is the active enantiomer of citalopram.

● INDICATIONS AND DOSE

Depressive illness | Generalised anxiety disorder | Obsessive-compulsive disorder

- ▶ BY MOUTH
- ▶ Adult: 10 mg once daily; increased if necessary up to 20 mg daily
- ▶ Elderly: Initially 5 mg once daily; maximum 10 mg per day

Panic disorder

- ▶ BY MOUTH
- ▶ Adult: Initially 5 mg once daily for 7 days, then increased to 10 mg daily; maximum 20 mg per day
- ▶ Elderly: Initially 2.5 mg once daily; maximum 10 mg per day

Social anxiety disorder

- ▶ BY MOUTH
- ▶ Adult: Initially 10 mg once daily for 2–4 weeks, dose to be adjusted after 2–4 weeks of treatment; usual dose 5–20 mg daily

- **CONTRA-INDICATIONS** QT-interval prolongation
- **CAUTIONS** Susceptibility to QT-interval prolongation
- **INTERACTIONS** → Appendix 1: SSRIs
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Sinusitis
 - ▶ **Uncommon** Oedema
- **BREAST FEEDING** Present in breast milk; avoid.
- **HEPATIC IMPAIRMENT**

Dose adjustments Manufacturer advises initially 5 mg once daily for 2 weeks in mild to moderate impairment, thereafter increased to 10 mg once daily according to response; titrate dose with extra caution in severe impairment.
- **RENAL IMPAIRMENT** Caution if eGFR less than 30 mL/minute/1.73m².
- **TREATMENT CESSATION** The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).
- **DIRECTIONS FOR ADMINISTRATION** Oral drops can be mixed with water, orange juice, or apple juice before taking.
- **PATIENT AND CARER ADVICE** Counselling on administration of oral drops advised.

Driving and skilled tasks Patients should be counselled about the effects on driving.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral drops

- ▶ **Ciprallex** (Lundbeck Ltd) Escitalopram (as Escitalopram oxalate) 20 mg per 1 ml Ciprallex 20mg/ml oral drops sugar-free | 15 ml [PoM] £20.16 DT = £20.16

Tablet

- ▶ **Escitalopram (Non-proprietary)** Escitalopram (as Escitalopram oxalate) 5 mg Escitalopram 5mg tablets | 28 tablet [PoM] £8.97 DT = £2.41
- ▶ **Escitalopram (as Escitalopram oxalate) 10 mg** Escitalopram 10mg tablets | 28 tablet [PoM] £14.91 DT = £2.37
- ▶ **Escitalopram (as Escitalopram oxalate) 20 mg** Escitalopram 20mg tablets | 28 tablet [PoM] £25.20 DT = £2.92
- ▶ **Ciprallex** (Lundbeck Ltd) Escitalopram (as Escitalopram oxalate) 5 mg Ciprallex 5mg tablets | 28 tablet [PoM] £8.97 DT = £2.41
- ▶ **Escitalopram (as Escitalopram oxalate) 10 mg** Ciprallex 10mg tablets | 28 tablet [PoM] £14.91 DT = £2.37
- ▶ **Escitalopram (as Escitalopram oxalate) 20 mg** Ciprallex 20mg tablets | 28 tablet [PoM] £25.20 DT = £2.92

23-Jul-2018

Fluoxetine● **INDICATIONS AND DOSE****Major depression**

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 20 mg daily, dose is increased after 3–4 weeks if necessary, and at appropriate intervals thereafter, daily dose may be administered as a single or divided dose; maximum 60 mg per day
- ▶ **Elderly:** Initially 20 mg daily, dose is increased after 3–4 weeks if necessary, and at appropriate intervals thereafter, daily dose may be administered as a single or divided dose, usual maximum dose is 40 mg daily but doses up to 60 mg daily can be used

Bulimia nervosa

- ▶ **BY MOUTH**
- ▶ **Adult:** 60 mg daily, daily dose may be administered as a single or divided dose
- ▶ **Elderly:** Up to 40 mg daily, daily dose may be administered as a single or divided dose, usual maximum dose is 40 mg daily but doses up to 60 mg daily can be used

Obsessive-compulsive disorder

- ▶ **BY MOUTH**
- ▶ **Adult:** 20 mg daily, increased if necessary up to 60 mg daily, daily dose may be administered as a single or divided dose, dose to be increased gradually, review treatment if inadequate response after 10 weeks; maximum 60 mg per day
- ▶ **Elderly:** 20 mg daily, increased if necessary up to 40 mg daily, daily dose may be administered as a single or divided dose, dose to be increased gradually, review treatment if inadequate response after 10 weeks, usual maximum dose is 40 mg daily but doses up to 60 mg daily can be used

Menopausal symptoms, particularly hot flushes, in women with breast cancer (except those taking tamoxifen)

- ▶ **BY MOUTH**
- ▶ **Adult:** 20 mg once daily

PHARMACOKINETICS

- ▶ Consider the long half-life of fluoxetine when adjusting dosage (or in overdose).

- **UNLICENSED USE** [EvGr] Fluoxetine is used for menopausal symptoms, but it is not licensed for this indication.
- **INTERACTIONS** → Appendix 1: SSRIs
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Chills · feeling abnormal · postmenopausal haemorrhage · uterine disorder · vasodilation · vision blurred
 - ▶ **Uncommon** Cold sweat · dysphagia · dyspnoea · hypotension · mood altered · muscle twitching · self-injurious behaviour · temperature sensation altered · thinking abnormal
 - ▶ **Rare or very rare** Buccoglossal syndrome · leucopenia · neutropenia · oesophageal pain · pharyngitis · respiratory disorders · serum sickness · speech disorder · vasculitis
 - ▶ **Frequency not known** Bone fracture
- **BREAST FEEDING** Present in milk—avoid.
- **HEPATIC IMPAIRMENT**

Dose adjustments Manufacturer advises dose reduction or increasing dose interval.
- **DIRECTIONS FOR ADMINISTRATION** Dispersible tablets can be dispersed in water for administration or swallowed whole with plenty of water.
- **PATIENT AND CARER ADVICE** Patients and carers should be counselled on the administration of dispersible tablets.

Driving and skilled tasks Patients should be counselled about the effects on driving and skilled tasks.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

- ▶ **Fluoxetine (Non-proprietary)** Fluoxetine (as Fluoxetine hydrochloride) 10 mg Fluoxetine 10mg tablets | 30 tablet [PoM] £64.66 DT = £56.09

Dispersible tablet**CAUTIONARY AND ADVISORY LABELS 10**

- ▶ **Olena** (Advanz Pharma) Fluoxetine (as Fluoxetine hydrochloride) 20 mg Olena 20mg dispersible tablets sugar-free | 28 tablet [PoM] £3.44 DT = £3.44

Fluoxetine (as Fluoxetine hydrochloride) 40 mg Fluoxetine 40mg capsules | 30 capsule [PoM] £1.80 DT = £1.80

Fluoxetine (as Fluoxetine hydrochloride) 60 mg Fluoxetine 60mg capsules | 30 capsule [PoM] £54.36 DT = £4.98

F 381

Fluvoxamine maleate

23-Jul-2018

● **INDICATIONS AND DOSE****Depressive illness**

▶ BY MOUTH

- ▶ **Adult:** Initially 50–100 mg daily, dose to be taken in the evening, dose to be increased gradually, increased if necessary up to 300 mg daily, doses over 150 mg daily are given in divided doses; maintenance 100 mg daily

Obsessive-compulsive disorder

▶ BY MOUTH

- ▶ **Adult:** Initially 50 mg daily, dose to be taken in the evening, dose is increased gradually if necessary after several weeks, increased if necessary up to 300 mg daily; maintenance 100–300 mg daily, doses over 150 mg daily are given in divided doses, if no improvement in obsessive-compulsive disorder within 10 weeks, treatment should be reconsidered

- **INTERACTIONS** → Appendix 1: SSRIs

● **SIDE-EFFECTS**

- **Rare or very rare** Hepatic function abnormal (discontinue)

- ▶ **Frequency not known** Bone fracture · glaucoma · neuroleptic malignant-like syndrome · withdrawal syndrome neonatal

- **BREAST FEEDING** Present in milk—avoid.

● **HEPATIC IMPAIRMENT**

Dose adjustments Manufacturer advises low initial dose.

● **RENAL IMPAIRMENT**

Dose adjustments Start with low dose.

- **TREATMENT CESSATION** The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks Patients should be counselled about the effects on driving and skilled tasks.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet▶ **Fluvoxamine maleate (Non-proprietary)**

Fluvoxamine maleate 50 mg Fluvoxamine 50mg tablets | 60 tablet [PoM] £20.98 DT = £17.53

Fluvoxamine maleate 50 mg Faverin 50mg tablets | 60 tablet [PoM] £17.10 DT = £17.53

Fluvoxamine maleate 100 mg Faverin 100mg tablets | 30 tablet [PoM] £17.10 DT = £17.70

Paroxetine

19-Jul-2017

F 381

● **INDICATIONS AND DOSE****Major depression | Social anxiety disorder | Post-traumatic stress disorder | Generalised anxiety disorder**

▶ BY MOUTH

- ▶ **Adult:** 20 mg daily, dose to be taken in the morning, no evidence of greater efficacy at higher doses; maximum 50 mg per day

- ▶ **Elderly:** 20 mg daily, dose to be taken in the morning, no evidence of greater efficacy at higher doses; maximum 40 mg per day

Obsessive-compulsive disorder

▶ BY MOUTH

- ▶ **Adult:** Initially 20 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually, increased to 40 mg daily, no evidence of greater efficacy at higher doses; maximum 60 mg per day

- ▶ **Elderly:** Initially 20 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually; maximum 40 mg per day

Panic disorder

▶ BY MOUTH

- ▶ **Adult:** Initially 10 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually, increased to 40 mg daily, no evidence of greater efficacy at higher doses; maximum 60 mg per day

- ▶ **Elderly:** Initially 10 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually; maximum 40 mg per day

Menopausal symptoms, particularly hot flushes, in women with breast cancer (except those taking tamoxifen).

▶ BY MOUTH

- ▶ **Adult:** 10 mg once daily

- **UNLICENSED USE** [EvGr] Paroxetine is used for menopausal symptoms,  but it is not licensed for this indication.

- **CAUTIONS** Achlorhydria · high gastric pH

CAUTIONS, FURTHER INFORMATION

- ▶ Achlorhydria or high gastric pH Causes reduced absorption of the oral suspension.

- **INTERACTIONS** → Appendix 1: SSRIs

● **SIDE-EFFECTS**

- ▶ **Common or very common** Vision blurred

- ▶ **Uncommon** Diabetic control impaired

- ▶ **Rare or very rare** Acute glaucoma · hepatic disorders · peripheral oedema

- **PREGNANCY** Increased risk of congenital malformations, especially if used in the first trimester.

- **BREAST FEEDING** Present in milk but amount too small to be harmful.

● **HEPATIC IMPAIRMENT**

Dose adjustments Manufacturer advises dose at the lower end of the range.

● **RENAL IMPAIRMENT**

Dose adjustments Reduce dose if eGFR less than 30 mL/minute/1.73 m².

- **TREATMENT CESSATION** Associated with a higher risk of withdrawal reactions. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks Patients should be counselled about the effect on driving.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

ANTIDEPRESSANTS > SEROTONIN AND NORADRENALINE RE-UPTAKE INHIBITORS

Duloxetine

25-Jul-2018

- **DRUG ACTION** Inhibits the re-uptake of serotonin and noradrenaline.

• INDICATIONS AND DOSE

Major depressive disorder

- ▶ BY MOUTH

- ▶ **Adult:** 60 mg once daily

Generalised anxiety disorder

- ▶ BY MOUTH

- ▶ **Adult:** Initially 30 mg once daily, increased if necessary to 60 mg once daily; maximum 120 mg per day

Diabetic neuropathy

- ▶ BY MOUTH

- ▶ **Adult:** 60 mg once daily, discontinue if inadequate response after 2 months; review treatment at least every 3 months, maximum dose to be given in divided doses; maximum 120 mg per day

Moderate to severe stress urinary incontinence

- ▶ BY MOUTH

- ▶ **Adult (female):** 40 mg twice daily, patient should be assessed for benefit and tolerability after 2–4 weeks, alternatively initially 20 mg twice daily for 2 weeks, this can minimise side effects, then increased to 40 mg twice daily, the patient should be assessed for benefit and tolerability after 2–4 weeks.

- **CAUTIONS** Bleeding disorders · cardiac disease · elderly · history of mania · history of seizures · hypertension (avoid if uncontrolled) · raised intra-ocular pressure · susceptibility to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1: duloxetine

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · appetite decreased · constipation · diarrhoea · dizziness · drowsiness · dry mouth · fall · fatigue · flushing · gastrointestinal discomfort · gastrointestinal disorders · headache · muscle complaints · nausea · pain · palpitations · paraesthesia · sexual dysfunction · skin reactions · sleep disorders · sweat changes · tinnitus · tremor · urinary disorders · vision disorders · vomiting · weight changes · yawning
- ▶ **Uncommon** Apathy · arrhythmias · behaviour abnormal · burping · chills · concentration impaired · disorientation · dysphagia · ear pain · feeling abnormal · gait abnormal · haemorrhage · hepatic disorders · hyperglycaemia · increased risk of infection · malaise · menstrual disorder · movement disorders · mydriasis · peripheral coldness · photosensitivity reaction · postural hypotension · suicidal tendencies · syncope · taste altered · temperature sensation altered · testicular pain · thirst · throat tightness · vertigo
- ▶ **Rare or very rare** Angioedema · cutaneous vasculitis · dehydration · galactorrhoea · glaucoma · hallucination · hyperprolactinaemia · hypertensive crisis · hyponatraemia · hypothyroidism · mania · menopausal symptoms · oral disorders · seizure · serotonin syndrome · SIADH · Stevens-Johnson syndrome · urine odour abnormal

SIDE-EFFECTS, FURTHER INFORMATION Symptoms of sexual dysfunction may persist after treatment has stopped.

- **PREGNANCY** Toxicity in *animal* studies—avoid in patients with stress urinary incontinence; in other conditions use only if potential benefit outweighs risk. Risk of neonatal withdrawal symptoms if used near term.

- **BREAST FEEDING** Present in milk—manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

- **TREATMENT CESSATION** Nausea, vomiting, headache, anxiety, dizziness, paraesthesia, sleep disturbances, and tremor are the most common features of abrupt withdrawal or marked reduction of the dose; dose should be reduced over at least 1–2 weeks.

● NATIONAL FUNDING/ACCESS DECISIONS

CYMBALTA[®]

Scottish Medicines Consortium (SMC) decisions

- ▶ With oral use for Diabetic neuropathy The *Scottish Medicines Consortium* has advised (September 2006) that duloxetine (Cymbalta[®]) should be restricted for use by specialists when other treatments for diabetic peripheral neuropathic pain are unsuitable or inadequate.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant capsule

Venlafaxine

17-Jul-2019

- **DRUG ACTION** A serotonin and noradrenaline re-uptake inhibitor.

● INDICATIONS AND DOSE

Major depression

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: Initially 75 mg daily in 2 divided doses, then increased if necessary up to 375 mg daily, dose to be increased if necessary at intervals of at least 2 weeks, faster dose titration may be necessary in some patients; maximum 375 mg per day

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: Initially 75 mg once daily, increased if necessary up to 375 mg once daily, dose to be increased if necessary at intervals of at least 2 weeks, faster dose titration may be necessary in some patients; maximum 375 mg per day

Generalised anxiety disorder

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 75 mg once daily, increased if necessary up to 225 mg once daily, dose to be increased at intervals of at least 2 weeks; maximum 225 mg per day

Social anxiety disorder

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 75 mg once daily, there is no evidence of greater efficacy at higher doses, increased if necessary up to 225 mg once daily, dose to be increased if necessary at intervals of at least 2 weeks; maximum 225 mg per day

Panic disorder

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: Initially 37.5 mg once daily for 7 days, increased to 75 mg once daily, increased if necessary up to 225 mg once daily, dose to be increased at intervals of at least 2 weeks; maximum 225 mg per day

Menopausal symptoms, particularly hot flushes, in women with breast cancer

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 37.5 mg once daily for one week, then increased if necessary to 75 mg once daily

- **UNLICENSED USE** EVGR Venlafaxine is used for menopausal symptoms, A but it is not licensed for this indication.

- **CONTRA-INDICATIONS** Uncontrolled hypertension

- **CAUTIONS** Conditions associated with high risk of cardiac arrhythmia · diabetes · heart disease (monitor blood pressure) · history of bleeding disorders · history of epilepsy · history or family history of mania · susceptibility to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1: venlafaxine

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · appetite decreased · arrhythmias · asthenia · chills · confusion · constipation · depersonalisation · diarrhoea · dizziness · dry mouth · dyspnoea · headache · hot flush · hypertension · menstrual cycle irregularities · movement disorders · muscle tone increased · mydriasis · nausea · palpitations · paraesthesia · sedation · sexual dysfunction · skin reactions · sleep disorders · sweat changes · taste altered · tinnitus · tremor · urinary disorders · vision disorders · vomiting · weight changes · yawning
- ▶ **Uncommon** Alopecia · angioedema · apathy · behaviour abnormal · derealisation · haemorrhage · hallucination · hypotension · mood altered · photosensitivity reaction · syncope
- ▶ **Rare or very rare** Agranulocytosis · angle closure glaucoma · bone marrow disorders · delirium · hepatitis · hyponatraemia · neuroleptic malignant syndrome · neutropenia · pancreatitis · QT interval prolongation · respiratory disorders · rhabdomyolysis · seizure · serotonin syndrome · severe cutaneous adverse reactions (SCARs) · SIADH · thrombocytopenia
- ▶ **Frequency not known** Suicidal tendencies · vertigo · withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION Symptoms of sexual dysfunction may persist after treatment has stopped.

- **PREGNANCY** Avoid unless potential benefit outweighs risk—toxicity in *animal* studies. Risk of withdrawal effects in neonate.
- **BREAST FEEDING** Present in milk—avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (inter-individual variability in clearance; limited information available in severe impairment).
Dose adjustments Manufacturer advises consider dose reduction of 50% in mild to moderate impairment and of more than 50% in severe impairment.
- **RENAL IMPAIRMENT** Use with caution.
Dose adjustments Use half normal dose (immediate-release tablets may be given once daily) if eGFR less than 30 mL/minute/1.73 m².
- **TREATMENT CESSATION** Associated with a higher risk of withdrawal effects compared with other antidepressants.
Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, tremor, sleep disturbances, and sweating are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Modified-release tablet

ANTIDEPRESSANTS > SEROTONIN UPTAKE INHIBITORS

Trazodone hydrochloride

02-Aug-2019

• INDICATIONS AND DOSE

Depressive illness (particularly where sedation is required)

► BY MOUTH

► Adult: Initially 150 mg daily in divided doses, dose to be taken after food, alternatively initially 150 mg once daily, dose to be taken at bedtime, increased if necessary to 300 mg daily; increased if necessary to 600 mg daily in divided doses, higher dose for use in hospital patients only

► Elderly: Initially 100 mg daily in divided doses, dose to be taken after food, alternatively initially 100 mg once daily, dose to be taken at bedtime, increased if necessary to 300 mg daily; increased if necessary to 600 mg daily in divided doses, higher dose for use in hospital patients only

Anxiety

► BY MOUTH

► Adult: 75 mg daily, increased if necessary to 300 mg daily

- **CONTRA-INDICATIONS** During the manic phase of bipolar disorder · immediate recovery period after myocardial infarction
- **CAUTIONS** Arrhythmias · cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention

CAUTIONS, FURTHER INFORMATION Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- **INTERACTIONS** → Appendix 1: trazodone
- **SIDE-EFFECTS** Aggression · agranulocytosis · alertness decreased · anaemia · anxiety · aphasia · appetite abnormal · arrhythmias · arthralgia · asthenia · blood disorder · chest pain · confusion · constipation · delirium · delusions · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · eosinophilia · fever · gastroenteritis · gastrointestinal discomfort · hallucination · headache · hepatic disorders · hyperhidrosis · hypersalivation · hypertension · hyponatraemia · influenza like illness · jaundice (discontinue) · leucopenia · libido decreased · mania · memory loss · movement disorders · myalgia · nasal congestion · nausea · neuroleptic malignant syndrome · oedema · pain · palpitations · paraesthesia · paralytic ileus · postural hypotension · priapism (discontinue) · QT interval

prolongation · seizure · serotonin syndrome · SIADH · skin reactions · sleep disorders · suicidal tendencies · syncope · taste altered · thrombocytopenia · tremor · urinary disorder · vertigo · vision blurred · vomiting · weight decreased · withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

Overdose The tricyclic-related antidepressant drugs may be associated with a lower risk of cardiotoxicity in overdose.

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1430.

- **PREGNANCY** Avoid during first trimester—limited information available. Monitor infant for signs of withdrawal if used until delivery.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution, particularly in severe impairment (increased risk of side-effects).
- **RENAL IMPAIRMENT** Use with caution in severe impairment.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving).
Effects of alcohol enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

ANTIDEPRESSANTS > TETRACYCLIC**ANTIDEPRESSANTS****Mianserin hydrochloride**

21-May-2020

● **INDICATIONS AND DOSE****Depressive illness (particularly where sedation is required)**► **BY MOUTH**

- **Adult:** Initially 30–40 mg daily in divided doses, alternatively initially 30–40 mg once daily, dose to be taken at bedtime, increase dose gradually as necessary; usual dose 30–90 mg
- **Elderly:** Initially 30 mg daily in divided doses, alternatively initially 30 mg once daily, dose to be taken at bedtime, increase dose gradually as necessary; usual dose 30–90 mg

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · during the manic phase of bipolar disorder
- **CAUTIONS** Arrhythmias · cardiovascular disease · chronic constipation · diabetes · epilepsy · heart block · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · immediate recovery period after myocardial infarction · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention

CAUTIONS, FURTHER INFORMATION Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- **INTERACTIONS** → Appendix 1: mianserin
- **SIDE-EFFECTS** Agranulocytosis · arthritis · bone marrow disorders · breast abnormalities · dizziness · granulocytopenia · gynaecomastia · hepatic disorders · hyperhidrosis · hyponatraemia · joint disorders · lactation in absence of pregnancy · leucopenia · mood altered · neuromuscular irritability · oedema · paranoid delusions · postural hypotension · psychosis · rash · seizure · sexual dysfunction · suicidal tendencies · tremor · withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.**Overdose** The tricyclic-related antidepressant drugs may be associated with a lower risk of cardiotoxicity in overdose.

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and

arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1430.

- **PREGNANCY** Avoid.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in severe impairment.
- **RENAL IMPAIRMENT**
Dose adjustments Caution in renal impairment.
- **MONITORING REQUIREMENTS** A full **blood count** is recommended every 4 weeks during the first 3 months of treatment; clinical monitoring should continue subsequently and treatment should be stopped and a full blood count obtained if *fever, sore throat, stomatitis*, or other signs of infection develop.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.

► **Mianserin hydrochloride (Non-proprietary)****Mianserin hydrochloride 10 mg** Mianserin 10mg tablets |
28 tablet **[PoM]** £14.53 DT = £14.35**Mianserin hydrochloride 30 mg** Mianserin 30mg tablets |
28 tablet **[PoM]** £36.99 DT = £36.99**Mirtazapine**

21-May-2020

- **DRUG ACTION** Mirtazapine is a presynaptic α_2 -adrenoreceptor antagonist which increases central noradrenergic and serotonergic neurotransmission.

● **INDICATIONS AND DOSE****Major depression**► **BY MOUTH**

- **Adult:** Initially 15–30 mg daily for 2–4 weeks, dose to be taken at bedtime, then adjusted according to response to up to 45 mg once daily, alternatively up to 45 mg daily in 2 divided doses

- **CAUTIONS** Cardiac disorders · diabetes mellitus · elderly · history of bipolar depression · history of seizures · history of urinary retention · hypotension · psychoses (may aggravate psychotic symptoms) · susceptibility to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1: mirtazapine

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · appetite increased · arthralgia · back pain · confusion · constipation · diarrhoea · dizziness · drowsiness · dry mouth · fatigue · headache (on discontinuation) · myalgia · nausea · oedema · postural hypotension · sleep disorders · tremor · vomiting · weight increased
- ▶ **Uncommon** Hallucination · mania · movement disorders · oral disorders · syncope
- ▶ **Rare or very rare** Aggression · pancreatitis
- ▶ **Frequency not known** Agranulocytosis · arrhythmias · bone marrow disorders · dysarthria · eosinophilia · granulocytopenia · hyponatraemia · jaundice (discontinue) · QT interval prolongation · rhabdomyolysis · seizure · serotonin syndrome · severe cutaneous adverse reactions (SCARs) · SIADH · skin reactions · sudden death · suicidal tendencies · thrombocytopenia · urinary retention · withdrawal syndrome
- **PREGNANCY** Use with caution—limited experience; monitor neonate for withdrawal effects.
- **BREAST FEEDING** Present in milk; use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased plasma concentration, no information available in severe impairment).
- **RENAL IMPAIRMENT** Clearance reduced by 30% if eGFR less than 40 mL/minute/1.73 m²; clearance reduced by 50% if eGFR less than 10 mL/minute/1.73 m².
- **TREATMENT CESSATION** Nausea, vomiting, dizziness, agitation, anxiety, and headache are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks.
- **DIRECTIONS FOR ADMINISTRATION** Orodispersible tablet (*Zispin SolTab*®) should be placed on the tongue, allowed to disperse and swallowed.
- **PATIENT AND CARER ADVICE** Counselling on administration of orodispersible tablet advised. Blood Disorders Patients should be advised to report any fever, sore throat, stomatitis or other signs of infection during treatment. Blood count should be performed and the drug stopped immediately if blood dyscrasia suspected.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

ANTIDEPRESSANTS > TRICYCLIC ANTIDEPRESSANTS

Amitriptyline hydrochloride

16-Jul-2019

● INDICATIONS AND DOSE

Abdominal pain or discomfort (in patients who have not responded to laxatives, loperamide, or antispasmodics)

▶ BY MOUTH

- ▶ **Adult:** Initially 5–10 mg daily, to be taken at night; increased in steps of 10 mg at least every 2 weeks as required; maximum 30 mg per day

Major depressive disorder [not recommended—increased risk of fatality in overdose]

▶ BY MOUTH

- ▶ **Adult:** Initially 50 mg daily in 2 divided doses, then increased in steps of 25 mg once daily on alternate days if required, maximum 150 mg daily in 2 divided doses
- ▶ **Elderly:** Initially 10–25 mg daily, increased if necessary up to 100–150 mg daily in 2 divided doses, dose increases dependent on individual patient response and tolerability—doses above 100 mg should be used with caution

Major depressive disorder in patients with cardiovascular disease [not recommended—increased risk of fatality in overdose]

▶ BY MOUTH

- ▶ **Adult:** Initially 10–25 mg daily, increased if necessary up to 100–150 mg daily in 2 divided doses, dose increases dependent on individual patient response and tolerability—doses above 100 mg should be used with caution

Neuropathic pain | Migraine prophylaxis | Chronic tension-type headache prophylaxis

▶ BY MOUTH

- ▶ **Adult:** Initially 10–25 mg daily, dose to be taken in the evening, then increased, if tolerated, in steps of 10–25 mg every 3–7 days in 1–2 divided doses; usual dose 25–75 mg daily, dose to be taken in the evening, doses above 100 mg should be used with caution (doses above 75 mg should be used with caution in the elderly and in patients with cardiovascular disease); maximum per dose 75 mg

Emotional lability in multiple sclerosis

▶ BY MOUTH

- ▶ **Adult:** Initially 10–25 mg daily; increased, if tolerated, in steps of 10–25 mg every 1–7 days; maximum 75 mg per day

- **UNLICENSED USE** Not licensed for use in abdominal pain or discomfort in patients who have not responded to laxatives, loperamide, or antispasmodics. [EvoGr](#) Amitriptyline hydrochloride is used for emotional lability in multiple sclerosis,  but is not licensed for this indication.

- **CONTRA-INDICATIONS** Arrhythmias · during manic phase of bipolar disorder · heart block · immediate recovery period after myocardial infarction

- **CAUTIONS** Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention

CAUTIONS, FURTHER INFORMATION Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

● **INTERACTIONS** → Appendix 1: tricyclic antidepressants

● **SIDE-EFFECTS**

- ▶ **Common or very common** Anticholinergic syndrome · drowsiness · QT interval prolongation
- ▶ **Frequency not known** Agranulocytosis · alopecia · anxiety · appetite abnormal · arrhythmias · asthenia · bone marrow depression · breast enlargement · cardiac conduction disorders · coma · concentration impaired · confusion · constipation · delirium · delusions · diarrhoea · dizziness · dry mouth · dysarthria · eosinophilia · epigastric distress · face oedema · galactorrhoea · gynaecomastia · hallucination · headache · hepatic disorders · hyperhidrosis · hyperpyrexia · hypertension · hyponatraemia · hypotension · leucopenia · mood altered · movement disorders · mydriasis · myocardial infarction · nausea · neuroleptic malignant syndrome · oral disorders · palpitations · paralytic ileus · peripheral neuropathy · photosensitivity reaction · seizure · sensation abnormal · sexual dysfunction · SIADH · skin reactions · sleep disorders · stroke · sudden cardiac death · suicidal tendencies · syncope · taste altered · testicular swelling · thrombocytopenia · tinnitus · tremor · urinary disorders · urinary tract dilation · vision disorders · vomiting · weight changes · withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

Overdose Overdosage with amitriptyline is associated with a relatively high rate of fatality. Symptoms of overdosage may include dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning, see Tricyclic and related antidepressants, under Emergency treatment of poisoning p. 1430.

- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in mild-to-moderate impairment; avoid in severe impairment.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving).
Effects of alcohol enhanced.

- **LESS SUITABLE FOR PRESCRIBING** Amitriptyline hydrochloride is less suitable for prescribing, see Tricyclic and related antidepressant drugs in Antidepressant drugs p. 376.

- **MEDICAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from standard-order manufacturers include: oral suspension, oral solution

Oral solution

02-Jul-2018

● **INDICATIONS AND DOSE**

Depressive illness

▶ **BY MOUTH**

- ▶ **Adult:** Initially 10 mg daily, then increased if necessary to 30–150 mg daily in divided doses, dose to be increased gradually, alternatively increased if necessary to 30–150 mg once daily, dose to be taken at bedtime; maximum 250 mg per day
- ▶ **Elderly:** Initially 10 mg daily, then increased to 30–75 mg daily, dose to be increased carefully over approximately 10 days

Phobic and obsessional states

▶ **BY MOUTH**

- ▶ **Adult:** Initially 25 mg daily, then increased to 100–150 mg daily, dose to be increased gradually over 2 weeks; maximum 250 mg per day
- ▶ **Elderly:** Initially 10 mg daily, then increased to 100–150 mg daily, dose to be increased gradually over 2 weeks; maximum 250 mg per day

Adjunctive treatment of cataplexy associated with narcolepsy

▶ **BY MOUTH**

- ▶ **Adult:** Initially 10 mg daily, dose to be gradually increased until satisfactory response; increased if necessary to 10–75 mg daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · arrhythmias · during the manic phase of bipolar disorder · heart block · immediate recovery period after myocardial infarction
- **CAUTIONS** Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention
- CAUTIONS, FURTHER INFORMATION** Treatment should be stopped if the patient enters a manic phase.
Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial

doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

● **INTERACTIONS** → Appendix 1: tricyclic antidepressants

● **SIDE-EFFECTS**

- ▶ **Common or very common** Aggression · anxiety · arrhythmias · breast enlargement · concentration impaired · confusion · constipation · delirium · depersonalisation · depression exacerbated · diarrhoea · dizziness · drowsiness · dry mouth · fatigue · galactorrhoea · gastrointestinal disorder · hallucination · headache · hot flush · hyperhidrosis · hypotension · memory loss · mood altered · movement disorders · muscle tone increased · muscle weakness · mydriasis · nausea · palpitations · paraesthesia · photosensitivity reaction · sexual dysfunction · skin reactions · sleep disorders · speech disorder · taste altered · tinnitus · tremor · urinary disorders · vision disorders · vomiting · weight increased · yawning
 - ▶ **Uncommon** Psychosis · seizure
 - ▶ **Rare or very rare** Agranulocytosis · alopecia · cardiac conduction disorders · eosinophilia · glaucoma · hepatic disorders · hyperpyrexia · leucopenia · neuroleptic malignant syndrome · oedema · QT interval prolongation · respiratory disorders · thrombocytopenia · vaginal haemorrhage
 - ▶ **Frequency not known** Rhabdomyolysis · serotonin syndrome · suicidal tendencies · withdrawal syndrome
- SIDE-EFFECTS, FURTHER INFORMATION** The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop.

The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

Overdose Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1430.

- **PREGNANCY** Neonatal withdrawal symptoms reported if used during third trimester.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in severe impairment (risk of hypertensive crisis).
- **MONITORING REQUIREMENTS** Manufacturer advises monitor cardiac and hepatic function during long-term use.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving).
 Effects of alcohol enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, oral suspension, oral solution

Capsule

Dosulepin hydrochloride

(Dothiepin hydrochloride)

● INDICATIONS AND DOSE

Depressive illness, particularly where sedation is required (not recommended—increased risk of fatality in overdose) (initiated by a specialist)

▶ **BY MOUTH**

- ▶ **Adult:** Initially 75 mg daily in divided doses, alternatively initially 75 mg once daily, dose to be taken at bedtime, increased if necessary to 150 mg daily, doses to be increased gradually; up to 225 mg daily in some circumstances (e.g. hospital use)
- ▶ **Elderly:** Initially 50–75 mg daily in divided doses, alternatively initially 50–75 mg once daily, dose to be taken at bedtime, increased if necessary to 75–150 mg daily, doses to be increased gradually; up to 225 mg daily in some circumstances (e.g. hospital use)

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · arrhythmias · during the manic phase of bipolar disorder · heart block · immediate recovery period after myocardial infarction
- **CAUTIONS** Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention

CAUTIONS, FURTHER INFORMATION Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- **INTERACTIONS** → Appendix 1: tricyclic antidepressants
- **SIDE-EFFECTS** Accommodation disorder · agranulocytosis · alveolitis · anticholinergic syndrome · appetite abnormal · arrhythmias · asthenia · bone marrow depression · cardiac conduction disorder · confusion · constipation · dizziness · drowsiness · dry mouth · endocrine disorder · eosinophilia · epigastric discomfort · galactorrhoea · gynaecomastia · hepatic disorders · hyperhidrosis · hypertension · hyponatraemia · hypotension · increased risk of fracture · leucopenia · mood altered · movement disorders · nausea · nervousness · paranoid delusions · photosensitivity reaction · psychosis · seizures · sexual dysfunction · SIADH · skin reactions · speech disorder · suicidal tendencies · testicular hypertrophy · thrombocytopenia · tremor · urinary hesitation · vomiting · weight changes · withdrawal syndrome
- SIDE-EFFECTS, FURTHER INFORMATION** The risk of side-effects are reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

Overdose Overdosage with dosulepin is associated with a relatively high rate of fatality.

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning.

- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge. (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.
- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose. A maximum prescription equivalent to 2 weeks' supply of 75 mg daily should be considered in patients with increased risk factors for suicide at initiation of treatment, during any dose adjustment, and until improvement occurs.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.
- **LESS SUITABLE FOR PRESCRIBING** Dosulepin hydrochloride is less suitable for prescribing, see Tricyclic and related antidepressant drugs in Antidepressant drugs p. 376.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Doxepin

• INDICATIONS AND DOSE

Depressive illness (particularly where sedation is required)

► BY MOUTH

- **Adult:** Initially 75 mg daily in divided doses, alternatively 75 mg once daily, adjusted according to response, dose to taken at bedtime; maintenance 25–300 mg daily, doses above 100 mg given in 3 divided doses
- **Elderly:** Start with lower doses and adjust according to response

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · during manic phase of bipolar disorder
- **CAUTIONS** Arrhythmias · cardiovascular disease · chronic constipation · diabetes · epilepsy · heart block · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · immediate recovery period after myocardial infarction · increased intra-ocular pressure · patients with significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention
CAUTIONS, FURTHER INFORMATION Treatment should be stopped if the patient enters a manic phase.
- **Elderly** Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.
- **INTERACTIONS** → Appendix 1: tricyclic antidepressants
- **SIDE-EFFECTS** Agitation · agranulocytosis · alopecia · anticholinergic syndrome · appetite decreased · asthenia · asthma exacerbated · bone marrow depression · breast enlargement · cardiovascular effects · chills · confusion · constipation · diarrhoea · dizziness · drowsiness · dry mouth · dyspepsia · eosinophilia · face oedema · flushing · galactorrhoea · gynaecomastia · haemolytic anaemia · hallucination · headache · hyperhidrosis · hyperpyrexia · increased risk of fracture · jaundice · leucopenia · mania · movement disorders · nausea · oral ulceration · paranoid delusions · photosensitivity reaction · postural hypotension · psychosis · seizure · sensation abnormal · sexual dysfunction · SIADH · skin reactions · sleep disorders · suicidal tendencies · tachycardia · taste altered · testicular swelling · thrombocytopenia · tinnitus · tremor · urinary retention · vision blurred · vomiting · weight increased
- SIDE-EFFECTS, FURTHER INFORMATION** The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.
- Overdose** Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1430.
- **PREGNANCY** Use with caution—limited information available.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful. Accumulation of metabolite may cause sedation and respiratory depression in neonate.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
Dose adjustments Manufacturer advises consider dose reduction in mild to moderate impairment.

- **RENAL IMPAIRMENT** Use with caution.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

- Adult: To be initiated at a low dose, then increased if necessary to 75–100 mg daily in divided doses, alternatively increased if necessary to 75–100 mg once daily; maximum 150 mg per day
- Elderly: To be initiated at a low dose, then increased if necessary to 30–50 mg daily in divided doses

continued →

Neuropathic pain

▶ BY MOUTH

▶ **Adult:** Initially 10 mg once daily, to be taken at night, increased if necessary to 75 mg daily, dose to be increased gradually; higher doses to be given under specialist supervision

- **UNLICENSED USE** Not licensed for use in neuropathic pain.
- **CONTRA-INDICATIONS** Arrhythmias · during the manic phase of bipolar disorder · heart block · immediate recovery period after myocardial infarction
- **CAUTIONS** Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention

CAUTIONS, FURTHER INFORMATION Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- **INTERACTIONS** → Appendix 1: tricyclic antidepressants
- **SIDE-EFFECTS** Agranulocytosis · alopecia · anxiety · appetite decreased · arrhythmias · asthenia · atrioventricular block · bone marrow disorders · breast enlargement · confusion · constipation · delusions · diarrhoea · dizziness · drowsiness · drug cross-reactivity · drug fever · dry mouth · eosinophilia · fever · flushing · galactorrhoea · gastrointestinal discomfort · gynaecomastia · hallucination · headache · hepatic disorders · hyperhidrosis · hypertension · hypomania · hypotension · increased risk of fracture · increased risk of infection · malaise · movement disorders · mydriasis · myocardial infarction · nausea · oedema · oral disorders · palpitations · paralytic ileus · peripheral neuropathy · photosensitivity reaction · psychosis exacerbated · seizure · sensation abnormal · sexual dysfunction · SIADH · skin reactions · sleep disorders · stroke · suicidal tendencies · taste altered · testicular swelling · thrombocytopenia · tinnitus · tremor · urinary disorders · urinary tract dilation · vision disorders · vomiting · weight changes

SIDE-EFFECTS, FURTHER INFORMATION The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

Overdose Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1430.

- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacture advises avoid in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises plasma-nortriptyline concentration monitoring if dose above 100 mg daily, but evidence of practical value uncertain.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after

regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.
- **PATIENT AND CARER ADVICE** Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution▶ **Nortriptyline (Non-proprietary)**

OTHER ANTIDEPRESSANTS

Tryptophan

04-Oct-2017

(L-Tryptophan)

- **DRUG ACTION** Tryptophan is an essential dietary amino acid, and is a precursor of serotonin; it re-establishes the inhibitory action of serotonin on the amygdaloid nuclei, thereby reducing feelings of anxiety and depression.

● INDICATIONS AND DOSE

Treatment-resistant depression (used alone or as adjunct to other antidepressant drugs) (initiated under direction of hospital consultant)

- ▶ BY MOUTH
- ▶ Adult: 1 g 3 times a day; maximum 6 g per day

- **CONTRA-INDICATIONS** History of eosinophilia myalgia syndrome following use of tryptophan
- **INTERACTIONS** → Appendix 1: tryptophan
- **SIDE-EFFECTS** Asthenia · dizziness · drowsiness · eosinophilia myalgia syndrome · headache · myalgia · myopathy · nausea · oedema · suicidal tendencies
- SIDE-EFFECTS, FURTHER INFORMATION** If patients experience any symptoms of eosinophilia myalgia syndrome (EMS), manufacturer advises to withhold treatment until possibility of EMS is excluded.
- **PREGNANCY** Manufacturer advises caution—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises close monitoring for signs of suicidal thoughts, particularly in patients at high risk and during early treatment and dose changes.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should be advised to seek medical advice immediately if any clinical worsening, suicidal thoughts, or unusual behaviour develops.
Driving and skilled tasks Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of drowsiness.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Capsule

- ▶ **Optimax** (Intrapharm Laboratories Ltd)
Tryptophan 500 mg Optimax 500mg capsules | 84 capsule [POM](#) | £42.00

Vortioxetine

21-May-2020

- **DRUG ACTION** Vortioxetine inhibits the re-uptake of serotonin (5-HT) and is an antagonist at 5-HT₃ and an agonist at 5-HT_{1A} receptors. This multimodal activity appears to be associated with antidepressant and anxiolytic-like effects.

● INDICATIONS AND DOSE

Major depression

- ▶ BY MOUTH
- ▶ Adult: Initially 10 mg once daily; adjusted according to response to 5–20 mg once daily
- ▶ Elderly: Initially 5 mg once daily; increased if necessary up to 20 mg once daily

- **CAUTIONS** Bleeding disorders · cirrhosis of the liver (risk of hyponatraemia) · elderly (risk of hyponatraemia) · history of mania (discontinue if patient entering manic phase) · history of seizures · unstable epilepsy

CAUTIONS, FURTHER INFORMATION

- ▶ Seizures Discontinue treatment in patients who develop seizures or if there is an increase in seizure frequency.
- ▶ Elderly Manufacturer advises caution when treating elderly patients with doses over 10 mg daily—limited information.
- **INTERACTIONS** → Appendix 1: vortioxetine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abnormal dreams · constipation · diarrhoea · dizziness · nausea · skin reactions · vomiting
 - ▶ **Uncommon** Flushing · night sweats
 - ▶ **Frequency not known** Angioedema · haemorrhage · hyponatraemia · neuroleptic malignant syndrome (discontinue immediately) · serotonin syndrome (discontinue immediately)
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. If used during the later stages of pregnancy, there is a risk of neonatal withdrawal symptoms and persistent pulmonary hypertension in the newborn.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—limited information available.
- **TREATMENT CESSATION** Manufacturer advises treatment can be stopped abruptly, without need for gradual dose reduction.
- **PATIENT AND CARER ADVICE**
 - ▶ **Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks, especially when starting treatment or changing the dose.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Vortioxetine for treating major depressive episodes (November 2015) NICE TA367**
Vortioxetine (*Brintellix*®) is recommended as an option for treating major depressive episodes in adults whose condition has responded inadequately to 2 antidepressants within the current episode.
Patients currently receiving vortioxetine whose disease does not meet the above criteria should be able to continue treatment until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta367

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Brintellix** (Lundbeck Ltd)
Vortioxetine (as Vortioxetine hydrobromide) 5 mg Brintellix 5mg tablets | 28 tablet [PoM] £27.72 DT = £27.72

3.5 Inappropriate sexual behaviour

ANTIPSYCHOTICS > FIRST-GENERATION

F 401

07-Jun-2018

Benperidol

● INDICATIONS AND DOSE

Control of deviant antisocial sexual behaviour

▶ BY MOUTH

- ▶ **Adult:** 0.25–1.5 mg daily in divided doses, adjusted according to response, for debilitated patients, use elderly dose
- ▶ **Elderly:** Initially 0.125–0.75 mg daily in divided doses, adjusted according to response

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma
- **CAUTIONS** Risk factors for stroke
- **INTERACTIONS** → Appendix 1: benperidol
- **SIDE-EFFECTS** Appetite decreased · blood disorder · cardiac arrest · confusion · depression · dyspepsia · headache · hepatic disorders · hyperhidrosis · hypersalivation · hypertension · muscle rigidity · nausea · oculogyric crisis · oedema · oligomenorrhoea · paradoxical drug reaction · pruritus · psychiatric disorder · temperature regulation disorders · weight change
- **PREGNANCY** Extrapyramidal effects and withdrawal syndrome have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy. Following maternal use of antipsychotic drugs in the third trimester, neonates should be monitored for symptoms including agitation, hypertonia, hypotonia, tremor, drowsiness, feeding problems, and respiratory distress.
- **BREAST FEEDING** There is limited information available on the short- and long-term effects of antipsychotic drugs on the breast-fed infant. *Animal* studies indicate possible adverse effects of antipsychotic medicines on the developing nervous system. Chronic treatment with antipsychotic drugs whilst breast-feeding should be avoided unless absolutely necessary.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT**
Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **MONITORING REQUIREMENTS** Manufacturer advises regular blood counts and liver function tests during long-term treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** The proprietary name *Benquil*® has been used for benperidol tablets.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 2

3.6 Psychoses and schizophrenia

Psychoses and related disorders

06-Mar-2017

Advice of Royal College of Psychiatrists on doses of antipsychotic drugs above BNF upper limit

Unless otherwise stated, doses in the BNF are licensed doses—any higher dose is therefore **unlicensed**

- Consider alternative approaches including adjuvant therapy and newer or second-generation antipsychotic drugs such as clozapine.
- Bear in mind risk factors, including obesity; particular caution is indicated in older patients, especially those over 70.
- Consider potential for drug interactions—see interactions: Appendix 1 (antipsychotics).
- Carry out ECG to exclude untoward abnormalities such as prolonged QT interval; repeat ECG periodically and reduce dose if prolonged QT interval or other adverse cardiac abnormality develops.
- Increase dose slowly and not more often than once weekly.
- Carry out regular pulse, blood pressure, and temperature checks; ensure that patient maintains adequate fluid intake.
- Consider high-dose therapy to be for limited period and review regularly; abandon if no improvement after 3 months (return to standard dosage).

Important: When prescribing an antipsychotic for administration on an emergency basis, the intramuscular dose should be **lower** than the corresponding oral dose (owing to absence of first-pass effect), particularly if the patient is very active (increased blood flow to muscle considerably increases the rate of absorption). The prescription should specify the dose for **each route** and should **not** imply that the same dose can be given by mouth or by intramuscular injection. The dose of antipsychotic for emergency use should be reviewed at least **daily**.

Antipsychotic drugs

Antipsychotic drugs are also known as 'neuroleptics' and (misleadingly) as 'major tranquillisers'.

In the short term they are used to calm disturbed patients whatever the underlying psychopathology, which may be schizophrenia, brain damage, mania, toxic delirium, or agitated depression. Antipsychotic drugs are used to alleviate severe anxiety but this too should be a short-term measure.

Schizophrenia

The aim of treatment is to alleviate the suffering of the patient (and carer) and to improve social and cognitive functioning. Many patients require life-long treatment with antipsychotic medication. Antipsychotic drugs relieve positive psychotic symptoms such as thought disorder, hallucinations, and delusions, and prevent relapse; they are usually less effective on negative symptoms such as apathy and social withdrawal. In many patients, negative symptoms persist between episodes of treated positive symptoms, but earlier treatment of psychotic illness may protect against the development of negative symptoms over time. Patients with acute schizophrenia generally respond better than those with chronic symptoms.

Long-term treatment of a patient with a definitive diagnosis of schizophrenia is usually required after the first episode of illness in order to prevent relapses. Doses that are effective in acute episodes should generally be continued as prophylaxis.

First-generation antipsychotic drugs

The first-generation antipsychotic drugs act predominantly by blocking dopamine D₂ receptors in the brain. First-generation antipsychotic drugs are not selective for any of the four dopamine pathways in the brain and so can cause a range of side-effects, particularly extrapyramidal symptoms and elevated prolactin. The **phenothiazine** derivatives can be divided into 3 main groups:

- **Group 1:** chlorpromazine hydrochloride p. 402, levomepromazine p. 460, and promazine hydrochloride p. 424, generally characterised by pronounced sedative effects and moderate antimuscarinic and extrapyramidal side-effects.
- **Group 2:** pericyazine p. 406, generally characterised by moderate sedative effects, but fewer extrapyramidal side-effects than groups 1 or 3.
- **Group 3:** fluphenazine decanoate p. 410, perphenazine, prochlorperazine p. 407, and trifluoperazine p. 408, generally characterised by fewer sedative and antimuscarinic effects, but more pronounced extrapyramidal side-effects than groups 1 and 2.

Butyrophenones (benperidol p. 398 and haloperidol p. 404) resemble the group 3 phenothiazines in their clinical properties. **Thioxanthenes** (flupentixol p. 403 and zuclopentixol p. 409) have moderate sedative, antimuscarinic effects, and extrapyramidal effects.

Diphenylbutylpiperidines (pimozide p. 406) and the **substituted benzamides** (sulpiride p. 408) have reduced sedative, antimuscarinic, and extrapyramidal effects.

Second-generation antipsychotic drugs

The second-generation antipsychotic drugs (sometimes referred to as atypical antipsychotic drugs) act on a range of receptors in comparison to first-generation antipsychotic drugs and have more distinct clinical profiles, particularly with regard to side-effects.

Prescribing for the elderly

The balance of risks and benefit should be considered before prescribing antipsychotic drugs for elderly patients. In elderly patients with dementia, antipsychotic drugs are associated with a small increased risk of mortality and an increased risk of stroke or transient ischaemic attack (see Dementia p. 315). Furthermore, elderly patients are particularly susceptible to postural hypotension and to hyper- and hypothermia in hot or cold weather.

It is recommended that:

- Antipsychotic drugs should not be used in elderly patients to treat mild to moderate psychotic symptoms.
- Initial doses of antipsychotic drugs in elderly patients should be reduced (to half the adult dose or less), taking into account factors such as the patient's weight, comorbidity, and concomitant medication.
- Treatment should be reviewed regularly.

Prescribing of antipsychotic drugs in patients with learning disabilities

[Evg] When prescribing for patients with learning disabilities who are prescribed antipsychotic drugs and who are not experiencing psychotic symptoms, the following considerations should be taken into account:

- a reduction in dose or the discontinuation of long-term antipsychotic treatment;
- review of the patient's condition after dose reduction or discontinuation of an antipsychotic drug;
- referral to a psychiatrist experienced in working with patients who have learning disabilities and mental health problems;
- annual documentation of the reasons for continuing a prescription if the antipsychotic is not reduced in dose or discontinued **⚠**.

Side effects of antipsychotic drugs

Side-effects caused by antipsychotic drugs are common and contribute significantly to non-adherence to therapy.

Extrapyramidal symptoms

Extrapyramidal symptoms occur most frequently with the piperazine phenothiazines (fluphenazine, perphenazine, prochlorperazine, and trifluoperazine), the butyrophenones (benperidol and haloperidol), and the first-generation depot preparations. They are easy to recognise but cannot be predicted accurately because they depend on the dose, the type of drug, and on individual susceptibility.

Extrapyramidal symptoms consist of:

- *parkinsonian symptoms* (including tremor), which may occur more commonly in adults or the elderly and may appear gradually;
- *dystonia* (abnormal face and body movements) and *dyskinesia*, which occur more commonly in children or young adults and appear after only a few doses;
- *akathisia* (restlessness), which characteristically occurs after large initial doses and may resemble an exacerbation of the condition being treated;
- *tardive dyskinesia* (rhythmic, involuntary movements of tongue, face, and jaw), which usually develops on long-term therapy or with high dosage, but it may develop on short-term treatment with low doses—short-lived tardive dyskinesia may occur after withdrawal of the drug.

Parkinsonian symptoms remit if the drug is withdrawn and may be suppressed by the administration of antimuscarinic drugs. However, routine administration of such drugs is not justified because not all patients are affected and they may unmask or worsen tardive dyskinesia.

Tardive dyskinesia is the most serious manifestation of extrapyramidal symptoms; it is of particular concern because it may be irreversible on withdrawing therapy and treatment is usually ineffective. In children, tardive dyskinesia is more likely to occur when the antipsychotic drug is withdrawn. However, some manufacturers suggest that drug withdrawal at the earliest signs of tardive dyskinesia (fine vermicular movements of the tongue) may halt its full development. Tardive dyskinesia occurs fairly frequently, especially in the elderly, and treatment must be carefully and regularly reviewed.

Hyperprolactinaemia

Most antipsychotic drugs, both first- and second-generation, increase prolactin concentration to some extent because dopamine inhibits prolactin release. Aripiprazole reduces prolactin because it is a dopamine-receptor partial agonist. Risperidone, amisulpride, and first-generation antipsychotic drugs are most likely to cause symptomatic hyperprolactinaemia. The clinical symptoms of hyperprolactinaemia include sexual dysfunction, reduced bone mineral density, menstrual disturbances, breast enlargement, and galactorrhoea.

Sexual dysfunction

Sexual dysfunction is one of the main causes of non-adherence to antipsychotic medication; physical illness, psychiatric illness, and substance misuse are contributing factors. Antipsychotic-induced sexual dysfunction is caused by more than one mechanism. Reduced dopamine transmission and hyperprolactinaemia decrease libido; antimuscarinic effects can cause disorders of arousal; and α_1 -adrenoceptor antagonists are associated with erection and ejaculation problems in men. Risperidone and haloperidol commonly cause sexual dysfunction. If sexual dysfunction is thought to be antipsychotic-induced, dose reduction or switching medication should be considered.

Cardiovascular side-effects

Antipsychotic drugs have been associated with cardiovascular side-effects such as tachycardia, arrhythmias, and hypotension. QT-interval prolongation is a particular concern with pimozide and haloperidol. There is also a

higher probability of QT-interval prolongation in patients using any intravenous antipsychotic drug, or any antipsychotic drug or combination of antipsychotic drugs with doses exceeding the recommended maximum. Cases of sudden death have occurred.

Hyperglycaemia and weight gain

Hyperglycaemia, and sometimes diabetes, can occur with antipsychotic drugs, particularly clozapine, olanzapine, quetiapine, and risperidone. All antipsychotic drugs may cause weight gain, but the risk and extent varies. Clozapine and olanzapine commonly cause weight gain.

Hypotension and interference with temperature regulation

Hypotension and interference with temperature regulation are dose-related side-effects that are liable to cause dangerous falls and hypothermia or hyperthermia in the elderly. Clozapine, chlorpromazine, lurasidone, and quetiapine can cause postural hypotension (especially during initial dose titration) which may be associated with syncope or reflex tachycardia in some patients.

Neuroleptic malignant syndrome

Neuroleptic malignant syndrome (hyperthermia, fluctuating level of consciousness, muscle rigidity, and autonomic dysfunction with pallor, tachycardia, labile blood pressure, sweating, and urinary incontinence) is a rare but potentially fatal side-effect of all antipsychotic drugs. Discontinuation of the antipsychotic drug is essential because there is no proven effective treatment, but bromocriptine and dantrolene have been used. The syndrome, which usually lasts for 5–7 days after drug discontinuation, may be unduly prolonged if depot preparations have been used.

Blood dyscrasias

Perform blood counts if unexplained infection or fever develops.

Choice

There is little meaningful difference in efficacy between each of the antipsychotic drugs (other than clozapine p. 414), and response and tolerability to each antipsychotic drug varies. There is no first-line antipsychotic drug which is suitable for all patients. Choice of antipsychotic medication is influenced by the patient's medication history, the degree of sedation required (although tolerance to this usually develops), and consideration of individual patient factors such as risk of extrapyramidal side-effects, weight gain, impaired glucose tolerance, QT-interval prolongation, or the presence of negative symptoms.

Negative symptoms

Second generation antipsychotic drugs may be better at treating the negative symptoms of schizophrenia.

Extrapyramidal side-effects

Second-generation antipsychotic drugs should be prescribed if extrapyramidal side-effects are a particular concern. Of these, aripiprazole p. 413, clozapine, olanzapine p. 416, and quetiapine p. 419 are least likely to cause extrapyramidal side-effects. Although amisulpride p. 412 is a dopamine-receptor antagonist, extrapyramidal side-effects are less common than with the first-generation antipsychotic drugs because amisulpride selectively blocks mesolimbic dopamine receptors, and extrapyramidal symptoms are caused by blockade of the striatal dopamine pathway.

QT interval

Aripiprazole has negligible effect on the QT interval. Other antipsychotic drugs with a reduced tendency to prolong QT interval include amisulpride, clozapine, flupentixol p. 403, fluphenazine decanoate p. 410, olanzapine, perphenazine, prochlorperazine p. 407, risperidone p. 421, and sulpiride p. 408.

Diabetes

Schizophrenia is associated with insulin resistance and diabetes; the risk of diabetes is increased in patients with schizophrenia who take antipsychotic drugs. First-

generation antipsychotic drugs are less likely to cause diabetes than second-generation antipsychotic drugs, and of the first-generation antipsychotic drugs, fluphenazine decanoate and haloperidol p. 404 are lowest risk.

Amisulpride and aripiprazole have the lowest risk of diabetes of the second-generation antipsychotic drugs. Amisulpride, aripiprazole, haloperidol, sulpiride, and trifluoperazine p. 408 are least likely to cause weight gain.

Sexual dysfunction and prolactin

The antipsychotic drugs with the lowest risk of sexual dysfunction are aripiprazole and quetiapine. Olanzapine may be considered if sexual dysfunction is judged to be secondary to hyperprolactinaemia. Hyperprolactinaemia is usually not clinically significant with aripiprazole, clozapine, olanzapine, and quetiapine treatment. When changing from other antipsychotic drugs, a reduction in prolactin concentration may increase fertility.

Patients should receive an antipsychotic drug for 4–6 weeks before it is deemed ineffective. Prescribing more than one antipsychotic drug at a time should be avoided except in exceptional circumstances (e.g. clozapine augmentation or when changing medication during titration) because of the increased risk of adverse effects such as extrapyramidal symptoms, QT-interval prolongation, and sudden cardiac death.

Clozapine is licensed for the treatment of schizophrenia in patients unresponsive to, or intolerant of, other antipsychotic drugs. Clozapine should be introduced if schizophrenia is not controlled despite the sequential use of two or more antipsychotic drugs (one of which should be a second-generation antipsychotic drug), each for at least 6–8 weeks. If symptoms do not respond adequately to an optimised dose of clozapine, plasma-clozapine concentration should be checked before adding a second antipsychotic drug to augment clozapine; allow 8–10 weeks' treatment to assess response. Patients must be registered with a clozapine patient monitoring service.

Monitoring

Full blood count, urea and electrolytes, and liver function test monitoring is required at the start of therapy with antipsychotic drugs, and then annually thereafter.

Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly.

Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly.

Before initiating antipsychotic drugs, an ECG may be required, particularly if physical examination identifies cardiovascular risk factors, if there is a personal history of cardiovascular disease, or if the patient is being admitted as an inpatient.

Blood pressure monitoring is advised before starting therapy and frequently during dose titration of antipsychotic drugs.

Other uses

Some antipsychotic drugs can be used for the treatment of nausea and vomiting, choreas, and motor tics. Chlorpromazine hydrochloride p. 402 and haloperidol p. 404 can be used for intractable hiccup. Benperidol p. 398 is used in deviant antisocial sexual behaviour but its value is not established.

Psychomotor agitation should be investigated for an underlying cause; it can be managed with low doses of chlorpromazine hydrochloride or haloperidol used for short periods. Antipsychotic drugs can be used with caution for the short-term treatment of severe agitation and restlessness in the elderly.

Dosage

After an initial period of stabilisation, in most patients, the total daily oral dose can be given as a single dose. The Royal

College of Psychiatrists has published advice on doses of antipsychotic drugs above BNF upper limit.

Antipsychotic depot injections

Long-acting depot injections are used for maintenance therapy especially when compliance with oral treatment is unreliable. However, depot injections of conventional antipsychotics may give rise to a higher incidence of extrapyramidal reactions than oral preparations; extrapyramidal reactions occur less frequently with second-generation antipsychotic depot preparations, such as risperidone p. 421 and olanzapine embonate p. 422.

Choice

There is no clear-cut division in the use of the conventional antipsychotics, but zuclopenthixol p. 409 may be suitable for the treatment of agitated or aggressive patients whereas flupentixol decanoate p. 410 can cause over-excitement in such patients. Zuclopenthixol decanoate p. 412 may be more effective in preventing relapses than other conventional antipsychotic depot preparations. The incidence of extrapyramidal reactions is similar for the conventional antipsychotics.

Dosage

Individual responses to neuroleptic drugs are variable and to achieve optimum effect, dosage and dosage interval must be titrated according to the patient's response.

ANTI-PSYCHOTICS

Antipsychotic drugs

- **CAUTIONS** Blood dyscrasias · cardiovascular disease · conditions predisposing to seizures · depression · diabetes (may raise blood glucose) · epilepsy · history of jaundice · myasthenia gravis · Parkinson's disease (may be exacerbated) (in adults) · photosensitisation (may occur with higher dosages) · prostatic hypertrophy (in adults) · severe respiratory disease · susceptibility to angle-closure glaucoma
 - **CAUTIONS, FURTHER INFORMATION**
 - ▶ Cardiovascular disease An ECG may be required, particularly if physical examination identifies cardiovascular risk factors, personal history of cardiovascular disease, or if the patient is being admitted as an inpatient.
 - ▶ Elderly Prescription potentially inappropriate (STOPP criteria):
 - for all antipsychotics (other than quetiapine and clozapine) in patients with parkinsonism or Lewy Body Disease (risk of severe extrapyramidal symptoms)
 - in behavioural and psychological symptoms of dementia (BPSD), unless symptoms are severe and other non-pharmacological treatments have failed (increased risk of stroke)
 - for use as a hypnotic, unless sleep disorder is due to psychosis or dementia (risk of confusion, hypotension, extrapyramidal side-effects and falls)
 - in patients prone to falls (may cause gait dyspraxia, parkinsonism)
 - if prescribed a **phenothiazine** (other than prochlorperazine for nausea, vomiting or vertigo; chlorpromazine for relief of persistent hiccups; levomepromazine as an antiemetic in palliative care) as first-line treatment (sedative, significant antimuscarinic (anticholinergic) toxicity in older people, and safer and more efficacious alternatives exist)–
 - if prescribed an antipsychotic drug with **moderate or marked antimuscarinic effects** (e.g. chlorpromazine, clozapine, flupentixol, fluphenazine, pipothiazine, promazine and zuclopenthixol) in patients with a history of prostatism or urinary retention (high risk of urinary retention).
- See also Prescribing in the elderly p. 33.

● SIDE-EFFECTS

- ▶ **Common or very common** Agitation · amenorrhoea · arrhythmias · constipation · dizziness · drowsiness · dry mouth · erectile dysfunction · galactorrhoea · gynaecomastia · hyperprolactinaemia · hypotension (dose-related) · insomnia · leucopenia · movement disorders · neutropenia · parkinsonism · QT interval prolongation · rash · seizure · tremor · urinary retention · vomiting · weight increased
- ▶ **Uncommon** Agranulocytosis · embolism and thrombosis · neuroleptic malignant syndrome (discontinue—potentially fatal)
- ▶ **Rare or very rare** Sudden death · withdrawal syndrome neonatal

SIDE-EFFECTS, FURTHER INFORMATION For depot antipsychotics—side-effects may persist until the drug has been cleared from its depot site.

Overdose Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. For details on the management of poisoning see Antipsychotics under Emergency treatment of poisoning p. 1430.

- **PREGNANCY** Extrapyramidal effects and withdrawal syndrome have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy. Following maternal use of antipsychotic drugs in the third trimester, neonates should be monitored for symptoms including agitation, hypertonia, hypotonia, tremor, drowsiness, feeding problems, and respiratory distress.

- **BREAST FEEDING** There is limited information available on the short- and long-term effects of antipsychotic drugs on the breast-fed infant. *Animal studies* indicate possible adverse effects of antipsychotic medicines on the developing nervous system. Chronic treatment with antipsychotic drugs whilst breast-feeding should be avoided unless absolutely necessary. Phenothiazine derivatives are sometimes used in breast-feeding women for short-term treatment of nausea and vomiting.

● MONITORING REQUIREMENTS

- ▶ It is advisable to monitor prolactin concentration at the start of therapy, at 6 months, and then yearly. Patients taking antipsychotic drugs not normally associated with symptomatic hyperprolactinaemia should be considered for prolactin monitoring if they show symptoms of hyperprolactinaemia (such as breast enlargement and galactorrhoea).
- ▶ Patients with schizophrenia should have physical health monitoring (including cardiovascular disease risk assessment) at least once per year.
- ▶ In children Regular clinical monitoring of endocrine function should be considered when children are taking an antipsychotic drug known to increase prolactin levels; this includes measuring weight and height, assessing sexual maturation, and monitoring menstrual function.

- **TREATMENT CESSATION** There is a high risk of relapse if medication is stopped after 1–2 years. Withdrawal of antipsychotic drugs after long-term therapy should always be gradual and closely monitored to avoid the risk of acute withdrawal syndromes or rapid relapse. Patients should be monitored for 2 years after withdrawal of antipsychotic medication for signs and symptoms of relapse.

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ Patient decision aid
- ▶ In adults Antipsychotic medicines for treating agitation, aggression and distress in people living with dementia. National Institute for Health and Care Excellence. June 2018. www.nice.org.uk/about/what-we-do/our-programmes/nice-guidance/nice-guidelines/shared-decision-making

- **PATIENT AND CARER ADVICE** As photosensitisation may occur with higher dosages, patients should avoid direct sunlight.

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving or operating machinery), especially at start of treatment; effects of alcohol are enhanced.

ANTIPSYCHOTICS > FIRST-GENERATION

F 401

Chlorpromazine hydrochloride

13-Mar-2020

● INDICATIONS AND DOSE

Schizophrenia and other psychoses | Mania | Short-term adjunctive management of severe anxiety | Psychomotor agitation, excitement, and violent or dangerously impulsive behaviour

▶ BY MOUTH

- ▶ Adult: Initially 25 mg 3 times a day, adjusted according to response, alternatively initially 75 mg once daily, adjusted according to response, dose to be taken at night; maintenance 75–300 mg daily, increased if necessary up to 1 g daily, this dose may be required in psychoses; use a third to half adult dose in the elderly or debilitated patients

▶ BY RECTUM

- ▶ Adult: 100 mg every 6–8 hours, dose expressed as chlorpromazine base

Intractable hiccup

▶ BY MOUTH

- ▶ Adult: 25–50 mg 3–4 times a day

Relief of acute symptoms of psychoses (under expert supervision)

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 25–50 mg every 6–8 hours

Nausea and vomiting in palliative care (where other drugs have failed or are not available)

▶ BY MOUTH

- ▶ Child 1–5 years: 500 micrograms/kg every 4–6 hours; maximum 40 mg per day
- ▶ Child 6–11 years: 500 micrograms/kg every 4–6 hours; maximum 75 mg per day
- ▶ Child 12–17 years: 10–25 mg every 4–6 hours
- ▶ Adult: 10–25 mg every 4–6 hours
- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 1–5 years: 500 micrograms/kg every 6–8 hours; maximum 40 mg per day
- ▶ Child 6–11 years: 500 micrograms/kg every 6–8 hours; maximum 75 mg per day
- ▶ Child 12–17 years: Initially 25 mg, then 25–50 mg every 3–4 hours until vomiting stops
- ▶ Adult: Initially 25 mg, then 25–50 mg every 3–4 hours until vomiting stops

▶ BY RECTUM

- ▶ Adult: 100 mg every 6–8 hours

DOSE EQUIVALENCE AND CONVERSION

- ▶ For equivalent therapeutic effect 100 mg chlorpromazine base given *rectally* as a suppository ≡ 20–25 mg chlorpromazine hydrochloride by *intramuscular injection* ≡ 40–50 mg of chlorpromazine base or hydrochloride given by *mouth*.

- **UNLICENSED USE** Rectal route is not licensed.
- **CONTRA-INDICATIONS** CNS depression · comatose states · hypothyroidism · phaeochromocytoma
- **INTERACTIONS** → Appendix 1: phenothiazines
- **SIDE-EFFECTS**
- **GENERAL SIDE-EFFECTS**
- ▶ **Common or very common** Anxiety · glucose tolerance impaired · mood altered · muscle tone increased

- ▶ **Frequency not known** Accommodation disorder · angioedema · atrioventricular block · cardiac arrest · eye deposit · eye disorders · gastrointestinal disorders · hepatic disorders · hyperglycaemia · hypertriglyceridaemia · hyponatraemia · photosensitivity reaction · respiratory disorders · sexual dysfunction · SIADH · skin reactions · systemic lupus erythematosus (SLE) · temperature regulation disorder · trismus

SPECIFIC SIDE-EFFECTS

- ▶ With intramuscular use Muscle rigidity · nasal congestion
- SIDE-EFFECTS, FURTHER INFORMATION** Acute dystonic reactions may occur; children are particularly susceptible.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe hepatic failure (increased risk of accumulation).

● RENAL IMPAIRMENT

Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

● MONITORING REQUIREMENTS

- ▶ With intramuscular use Patients should remain supine, with blood pressure monitoring for 30 minutes after intramuscular injection.

● PRESCRIBING AND DISPENSING INFORMATION

Palliative care For further information on the use of chlorpromazine hydrochloride in palliative care, see www.medicinescomplete.com/#/content/palliative/antipsychotics.

- **HANDLING AND STORAGE** Owing to the risk of contact sensitisation, pharmacists, nurses, and other health workers should avoid direct contact with chlorpromazine; tablets should not be crushed and solutions should be handled with care.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, suppository

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 11

▶ Chlorpromazine hydrochloride (Non-proprietary)

Chlorpromazine hydrochloride 25 mg Chlorpromazine 25mg tablets | 28 tablet [PoM] £37.13 DT = £26.46

Chlorpromazine hydrochloride 50 mg Chlorpromazine 50mg tablets | 28 tablet [PoM] £37.50 DT = £26.23

Chlorpromazine hydrochloride 100 mg Chlorpromazine 100mg tablets | 28 tablet [PoM] £39.99 DT = £26.79

Solution for injection

▶ Largactil (Sanofi)

Chlorpromazine hydrochloride 25 mg per 1 ml Largactil 50mg/2ml solution for injection ampoules | 10 ampoule [PoM] £7.51

Oral solution

CAUTIONARY AND ADVISORY LABELS 2, 11

▶ Chlorpromazine hydrochloride (Non-proprietary)

Chlorpromazine hydrochloride 5 mg per 1 ml Chlorpromazine 25mg/5ml syrup | 150 ml [PoM] £2.35 DT = £2.35

Chlorpromazine 25mg/5ml oral solution sugar free sugar-free | 150 ml [PoM] £2.66 DT = £2.40

Chlorpromazine 25mg/5ml oral solution | 150 ml [PoM] £2.35 DT = £2.35

Chlorpromazine hydrochloride 20 mg per 1 ml Chlorpromazine 100mg/5ml oral solution | 150 ml [PoM] £5.50 DT = £5.50

Flupentixol

(Flupenthixol)

● INDICATIONS AND DOSE

Schizophrenia and other psychoses, particularly with apathy and withdrawal but not mania or psychomotor hyperactivity

▶ BY MOUTH

- ▶ Adult: Initially 3–9 mg twice daily, adjusted according to response, for debilitated patients, use elderly dose; maximum 18 mg per day
- ▶ Elderly: Initially 0.75–4.5 mg twice daily, adjusted according to response

Depressive illness

▶ BY MOUTH

- ▶ Adult: Initially 1 mg once daily, dose to be taken in the morning, increased if necessary to 2 mg after 1 week, doses above 2 mg to be given in divided doses, last dose to be taken before 4 pm; discontinue if no response after 1 week at maximum dosage; maximum 3 mg per day
- ▶ Elderly: Initially 500 micrograms daily, dose to be taken in the morning, then increased if necessary to 1 mg after 1 week, doses above 1 mg to be given in divided doses, last dose to be taken before 4 pm; discontinue if no response after 1 week at maximum dosage; maximum 1.5 mg per day

- **CONTRA-INDICATIONS** Circulatory collapse · CNS depression · comatose states · excitable patients · impaired consciousness · overactive patients

- **CAUTIONS** Cardiac disorders · cardiovascular disease · cerebral arteriosclerosis · elderly · hyperthyroidism · hypothyroidism · parkinsonism · phaeochromocytoma · QT-interval prolongation · senile confusional states

- **INTERACTIONS** → Appendix 1: flupentixol

● SIDE-EFFECTS

- ▶ **Common or very common** Appetite abnormal · asthenia · concentration impaired · depression · diarrhoea · dyspnoea · gastrointestinal discomfort · headache · hyperhidrosis · hypersalivation · muscle complaints · nervousness · palpitations · sexual dysfunction · skin reactions · urinary disorder · vision disorders

- ▶ **Uncommon** Confusion · flatulence · hot flush · nausea · oculogyration · photosensitivity reaction · speech disorder

- ▶ **Rare or very rare** Glucose tolerance impaired · hyperglycaemia · jaundice · thrombocytopenia

- ▶ **Frequency not known** Suicidal tendencies

- **PREGNANCY** Avoid unless potential benefit outweighs risk.

- **BREAST FEEDING** Present in breast milk—avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor serum drug concentration.

- **RENAL IMPAIRMENT** Manufacturer advises caution in renal failure.

Dose adjustments Start with small doses of antipsychotic drugs in severe renal impairment because of increased cerebral sensitivity.

- **PATIENT AND CARER ADVICE** Although drowsiness may occur, can also have an alerting effect so should not be taken in the evening.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 2

tablets | 60 tablet [PoM] £4.86 DT = £4.86

20-Nov-2019

Haloperidol● **INDICATIONS AND DOSE****Prophylaxis of postoperative nausea and vomiting [in patients at moderate to high risk and when alternatives ineffective or not tolerated]**

▶ BY INTRAMUSCULAR INJECTION

▶ Adult: 1–2 mg, to be given at induction or 30 minutes before the end of anaesthesia

▶ Elderly: 500 micrograms, to be given at induction or 30 minutes before the end of anaesthesia

Combination treatment of postoperative nausea and vomiting [when alternatives ineffective or not tolerated]

▶ BY INTRAMUSCULAR INJECTION

▶ Adult: 1–2 mg

▶ Elderly: 500 micrograms

Nausea and vomiting in palliative care

▶ BY MOUTH

▶ Adult: Initially 1.5 mg 1–2 times a day, increased if necessary to 5–10 mg daily in divided doses

▶ BY SUBCUTANEOUS INFUSION

▶ Adult: 2.5–10 mg/24 hours

Schizophrenia and schizoaffective disorder

▶ BY MOUTH

▶ Adult: 2–10 mg daily in 1–2 divided doses; usual dose 2–4 mg daily, in first-episode schizophrenia, up to 10 mg daily, in multiple-episode schizophrenia, dose adjusted according to response at intervals of 1–7 days. Individual benefit-risk should be assessed when considering doses above 10 mg daily; maximum 20 mg per day

▶ Elderly: Initially, use half the lowest adult dose, then adjust gradually according to response up to maximum 5 mg daily, doses above 5 mg daily should only be considered in patients who have tolerated higher doses and after reassessment of the individual benefit-risk

Acute delirium [when non-pharmacological treatments ineffective]

▶ BY MOUTH

▶ Adult: 1–10 mg daily in 1–3 divided doses, treatment should be started at the lowest possible dose and adjusted in increments at 2–4 hourly intervals if required; maximum 10 mg per day

▶ Elderly: Initially, use half the lowest adult dose, then adjust gradually according to response up to maximum 5 mg daily, doses above 5 mg daily should only be considered in patients who have tolerated higher doses and after reassessment of the individual benefit-risk

▶ BY INTRAMUSCULAR INJECTION

▶ Adult: 1–10 mg, treatment should be started at the lowest possible dose and adjusted in increments at 2–4 hourly intervals if required; maximum 10 mg per day

▶ Elderly: Initially 500 micrograms, dose adjusted gradually according to response up to maximum 5 mg daily, doses above 5 mg daily should only be considered in patients who have tolerated higher doses and after reassessment of the individual benefit-risk

Moderate to severe manic episodes associated with bipolar I disorder

▶ BY MOUTH

▶ Adult: 2–10 mg daily in 1–2 divided doses, dose adjusted according to response at intervals of 1–3 days.

Individual benefit-risk should be assessed when considering doses above 10 mg daily; continued use should be evaluated early in treatment; maximum 15 mg per day

▶ Elderly: Initially, use half the lowest adult dose, then adjust gradually according to response up to maximum 5 mg daily, doses above 5 mg daily should only be considered in patients who have tolerated higher doses and after reassessment of the individual benefit-risk; continued use should be evaluated early in treatment

Acute psychomotor agitation associated with psychotic disorder or manic episodes of bipolar I disorder

▶ BY MOUTH

▶ Adult: 5–10 mg, dose may be repeated after 12 hours if necessary; continued use should be evaluated early in treatment; maximum 20 mg per day

▶ Elderly: Initially 2.5 mg, dose may be repeated after 12 hours if necessary up to maximum 5 mg daily, doses above 5 mg daily should only be considered in patients who have tolerated higher doses and after reassessment of the individual benefit-risk; continued use should be evaluated early in treatment

Rapid control of severe acute psychomotor agitation associated with psychotic disorder or manic episodes of bipolar I disorder [when oral therapy is not appropriate]

▶ BY INTRAMUSCULAR INJECTION

▶ Adult: 5 mg, dose may be repeated hourly if required—up to 15 mg daily is usually sufficient; continued use should be evaluated early in treatment; maximum 20 mg per day

▶ Elderly: 2.5 mg, dose may be repeated hourly if required up to maximum 5 mg daily, doses above 5 mg daily should only be considered in patients who have tolerated higher doses and after reassessment of the individual benefit-risk; continued use should be evaluated early in treatment

Persistent aggression and psychotic symptoms in moderate to severe Alzheimer's dementia and vascular dementia [when non-pharmacological treatments ineffective and there is a risk of harm to self or others]

▶ BY MOUTH

▶ Adult: 0.5–5 mg daily in 1–2 divided doses, dose adjusted according to response at intervals of 1–3 days. Reassess treatment after no more than 6 weeks

▶ Elderly: 500 micrograms daily, reassess treatment after no more than 6 weeks

Severe tic disorders, including Tourette's syndrome [when educational, psychological and other pharmacological treatments ineffective]

▶ BY MOUTH

▶ Adult: 0.5–5 mg daily in 1–2 divided doses, dose adjusted according to response at intervals of 1–7 days. Reassess treatment every 6–12 months

▶ Elderly: Initially, use half the lowest adult dose, then adjust gradually according to response up to maximum 5 mg daily. Reassess treatment every 6–12 months

Mild to moderate chorea in Huntington's disease [when alternatives ineffective or not tolerated]

▶ BY MOUTH

▶ Adult: 2–10 mg daily in 1–2 divided doses, dose adjusted according to response at intervals of 1–3 days

▶ Elderly: Initially, use half the lowest adult dose, then adjust gradually according to response up to maximum 5 mg daily, doses above 5 mg daily should only be considered in patients who have tolerated higher doses and after reassessment of the individual benefit-risk

Mild to moderate chorea in Huntington's disease [when alternatives ineffective or not tolerated and oral therapy inappropriate]

- ▶ BY INTRAMUSCULAR INJECTION
 - ▶ Adult: 2–5 mg, dose may be repeated hourly if required; maximum 10 mg per day
 - ▶ Elderly: Initially 1 mg, dose may be repeated hourly if required up to maximum 5 mg daily, doses above 5 mg daily should only be considered in patients who have tolerated higher doses and after reassessment of the individual benefit-risk

Restlessness and confusion in palliative care

- ▶ BY MOUTH
 - ▶ Adult: 2 mg, then 2 mg every 2 hours if required
- ▶ BY SUBCUTANEOUS INJECTION
 - ▶ Adult: 2.5 mg, then 2.5 mg every 2 hours if required
- ▶ BY SUBCUTANEOUS INFUSION
 - ▶ Adult: 5–15 mg/24 hours

- **UNLICENSED USE** Not licensed for use in palliative care.

IMPORTANT SAFETY INFORMATION

When prescribing, dispensing or administering, check that this injection is the correct preparation—this preparation is usually used in hospital for the rapid control of an *acute episode* and should **not** be confused with depot preparations which are usually used in the community or clinics for *maintenance* treatment.

- **CONTRA-INDICATIONS** CNS depression · comatose states · congenital long QT syndrome · dementia with Lewy bodies · history of torsade de pointes · history of ventricular arrhythmia · Parkinson's disease · progressive supranuclear palsy · QTc-interval prolongation · recent acute myocardial infarction · uncompensated heart failure · uncorrected hypokalaemia
- **CAUTIONS** Bradycardia · electrolyte disturbances (correct before treatment initiation) · family history of QTc-interval prolongation · history of heavy alcohol exposure · hyperthyroidism · hypotension (including orthostatic hypotension) · prolactin-dependent tumours · prolactinaemia · risk factors for stroke
- **INTERACTIONS** → Appendix 1: haloperidol
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Depression · eye disorders · headache · hypersalivation · nausea · neuromuscular dysfunction · psychotic disorder · vision disorders · weight decreased
- ▶ **Uncommon** Breast abnormalities · confusion · dyspnoea · gait abnormal · hepatic disorders · hyperhidrosis · menstrual cycle irregularities · muscle complaints · musculoskeletal stiffness · oedema · photosensitivity reaction · restlessness · sexual dysfunction · skin reactions · temperature regulation disorders
- ▶ **Rare or very rare** Hypoglycaemia · respiratory disorders · SIADH · trismus
- ▶ **Frequency not known** Hypersensitivity vasculitis · pancytopenia · rhabdomyolysis · thrombocytopenia

SPECIFIC SIDE-EFFECTS

- ▶ With oral use Angioedema
- ▶ With parenteral use Hypertension · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Haloperidol is a less sedating antipsychotic.

- **PREGNANCY** Manufacturer advises it is preferable to avoid—moderate amount of data indicate no malformative or fetal/neonatal toxicity, however there are isolated case reports of birth defects following fetal exposure, mostly in combination with other drugs; reproductive toxicity shown in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution. **Dose adjustments** Manufacturer advises halve initial dose and then adjust if necessary with smaller increments and at longer intervals.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution. **Dose adjustments** Manufacturer advises consider lower initial dose in severe impairment and then adjust if necessary with smaller increments and at longer intervals.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor electrolytes before treatment initiation and periodically during treatment.
 - ▶ Manufacturer advises perform ECG before treatment initiation and assess need for further ECGs during treatment on an individual basis; continuous ECG monitoring is recommended for repeated *intramuscular* doses, and for up to 6 hours after administration of *intramuscular* doses for prophylaxis or treatment of postoperative nausea and vomiting.
- **PRESCRIBING AND DISPENSING INFORMATION**

Palliative care For further information on the use of haloperidol in palliative care, see www.medicinescomplete.com/#/content/palliative/haloperidol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection

 - ▶ Haloperidol 10 mg Haloperidol 10mg tablets | 28 tablet [PoM] £18.00 DT = £17.73

F 401

Loxapine

25-Apr-2017

- **DRUG ACTION** Loxapine is a dopamine D₂ and serotonin 5-HT_{2A} receptor antagonist. It also binds to noradrenergic, histaminergic, and cholinergic receptors.

INDICATIONS AND DOSE**Rapid control of mild-to-moderate agitation in patients with schizophrenia or bipolar disorder (specialist supervision in hospital)**

- ▶ BY INHALATION
 - ▶ Adult: 9.1 mg as a single dose, followed by 9.1 mg after 2 hours if required, alternatively 4.5 mg as a single dose, followed by 4.5 mg after 2 hours if required, lower dose may be given if more appropriate or if the higher dose not previously tolerated

- **CONTRA-INDICATIONS** Acute respiratory symptoms · asthma · cardiovascular disease · cerebrovascular disease · chronic obstructive pulmonary disease · dehydration—risk of hypotension · elderly patients (especially those with dementia-related psychosis) · hypovolaemia—risk of hypotension
- **CAUTIONS** Bronchodilator treatment should be available for treatment of possible severe respiratory side-effects (bronchospasm) · history of extrapyramidal symptoms · risk factors for hypoventilation
- **INTERACTIONS** → Appendix 1: loxapine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Fatigue · taste altered · throat irritation
 - ▶ **Uncommon** Bronchospasm · oculogyration · restlessness
 - ▶ **Frequency not known** Dry eye · hypertension · syncope · vision blurred
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises to avoid for 48 hours after dose (express and discard milk produced during this time)—present in milk in *animal* studies.
- **MONITORING REQUIREMENTS** Manufacturer advises to observe patient during the first hour after each dose for signs and symptoms of bronchospasm.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises remove pull-tab and wait for green light to turn on (product must be used within 15 minutes of pulling tab); instruct patient to inhale through mouthpiece and then hold breath briefly. When green light turns off, this indicates the dose has been delivered.
- **PRESCRIBING AND DISPENSING INFORMATION** Educational risk minimisation materials are available for health care professionals.
Adasuve® 4.5 mg inhalation powder may be difficult to obtain.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

- ▶ **Adasuve** (Galen Ltd)
Loxapine 9.1 mg Adasuve 9.1mg/dose inhalation powder | 1 dose [PoM] £58.30 (Hospital only)

Pericyazine
(Pericazine)**INDICATIONS AND DOSE****Schizophrenia | Psychoses**

▶ BY MOUTH

- ▶ **Adult:** Initially 75 mg daily in divided doses, then increased in steps of 25 mg every week, adjusted according to response; maximum 300 mg per day
- ▶ **Elderly:** Initially 15–30 mg daily in divided doses, then increased in steps of 25 mg every week, adjusted according to response; maximum 300 mg per day

Short-term adjunctive management of severe anxiety, psychomotor agitation, and violent or dangerously impulsive behaviour

▶ BY MOUTH

- ▶ **Adult:** Initially 15–30 mg daily in 2 divided doses, adjusted according to response, larger dose to be taken at bedtime
- ▶ **Elderly:** Initially 5–10 mg daily in 2 divided doses, adjusted according to response, larger dose to be taken at bedtime

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma

- **CAUTIONS** Hypothyroidism
- **INTERACTIONS** → Appendix 1: phenothiazines
- **SIDE-EFFECTS** Atrioventricular block · cardiac arrest · consciousness impaired · contact dermatitis · glucose tolerance impaired · hepatic disorders · hyperglycaemia · hyperthermia · nasal congestion · priapism · respiratory depression
- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.
- **RENAL IMPAIRMENT** Avoid in renal impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

CAUTIONARY AND ADVISORY LABELS 2

Pericyazine 10 mg Pericyazine 10mg tablets | 84 tablet [PoM] £72.00 DT = £72.00

F 401

Pimozide**INDICATIONS AND DOSE****Schizophrenia**

▶ BY MOUTH

- ▶ **Adult:** Initially 2 mg daily, adjusted according to response, then increased in steps of 2–4 mg at intervals of not less than 1 week; usual dose 2–20 mg daily
- ▶ **Elderly:** Initially 1 mg daily, adjusted according to response, increased in steps of 2–4 mg at intervals of not less than 1 week; usual dose 2–20 mg daily

Monosymptomatic hypochondriacal psychosis | Paranoid psychosis

▶ BY MOUTH

- ▶ **Adult:** Initially 4 mg daily, adjusted according to response, then increased in steps of 2–4 mg at intervals of not less than 1 week; maximum 16 mg per day
- ▶ **Elderly:** Initially 2 mg daily, adjusted according to response, increased in steps of 2–4 mg at intervals of not less than 1 week; maximum 16 mg per day

- **CONTRA-INDICATIONS** CNS depression · comatose states · history of arrhythmias · history or family history of congenital QT prolongation · phaeochromocytoma

- **INTERACTIONS** → Appendix 1: pimozide

SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · depression · fatigue · headache · hyperhidrosis · hypersalivation · muscle complaints · restlessness · sebaceous gland overactivity · urinary disorders · vision blurred
- ▶ **Uncommon** Dysarthria · face oedema · oculogyric crisis · skin reactions
- ▶ **Frequency not known** Cardiac arrest · generalised tonic-clonic seizure · glycosuria · hyperglycaemia · hyponatraemia · libido decreased · neck stiffness · temperature regulation disorders

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

RENAL IMPAIRMENT

Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

MONITORING REQUIREMENTS

- ▶ ECG monitoring Following reports of sudden unexplained death, an ECG is recommended before treatment. It is also

recommended that patients taking pimozide should have an annual ECG (if the QT interval is prolonged, treatment should be reviewed and either withdrawn or dose reduced under close supervision) and that pimozide should not be given with other antipsychotic drugs (including depot preparations), tricyclic antidepressants or other drugs which prolong the QT interval, such as certain antimalarials, antiarrhythmic drugs and certain antihistamines and should not be given with drugs which cause electrolyte disturbances (especially diuretics).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 2

- ▶ **Orap 1mg tablets** (Imported (United States))

Pimozide 1 mg Orap 1mg tablets | 100 tablet (PoM) 

- ▶ **Orap** (Eumedica Pharmaceuticals)

Pimozide 4 mg Orap 4mg tablets | 100 tablet (PoM) £40.31 DT = £40.31

Prochlorperazine

● INDICATIONS AND DOSE

Schizophrenia and other psychoses | Mania

▶ BY MOUTH

- ▶ Adult: 12.5 mg twice daily for 7 days, dose to be adjusted at intervals of 4–7 days according to response; usual dose 75–100 mg daily

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 12.5–25 mg 2–3 times a day

Short-term adjunctive management of severe anxiety

▶ BY MOUTH

- ▶ Adult: 15–20 mg daily in divided doses; maximum 40 mg per day

Nausea and vomiting, acute attack

▶ BY MOUTH

- ▶ Adult: Initially 20 mg, then 10 mg after 2 hours
- ##### ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 12.5 mg as required, to be followed if necessary after 6 hours by an oral dose

Nausea and vomiting, prevention

▶ BY MOUTH

- ▶ Adult: 5–10 mg 2–3 times a day

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 12.5 mg as required, to be followed if necessary after 6 hours by an oral dose

Prevention and treatment of nausea and vomiting

▶ BY MOUTH

- ▶ Child 1–11 years (body-weight 10 kg and above): 250 micrograms/kg 2–3 times a day
- ▶ Child 12–17 years: 5–10 mg up to 3 times a day if required

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 2–4 years: 1.25–2.5 mg up to 3 times a day if required
- ▶ Child 5–11 years: 5–6.25 mg up to 3 times a day if required
- ▶ Child 12–17 years: 12.5 mg up to 3 times a day if required

Labyrinthine disorders

▶ BY MOUTH

- ▶ Adult: 5 mg 3 times a day, increased if necessary to 30 mg daily in divided doses, dose to be increased gradually, then reduced to 5–10 mg daily, dose is reduced after several weeks

Nausea and vomiting in previously diagnosed migraine

▶ BY MOUTH USING BUCCAL TABLET

- ▶ Child 12–17 years: 3–6 mg twice daily, tablets to be placed high between upper lip and gum and left to dissolve
- ▶ Adult: 3–6 mg twice daily, tablets to be placed high between upper lip and gum and left to dissolve

Acute migraine

▶ BY MOUTH

- ▶ Adult: 10 mg for 1 dose, to be taken as soon as migraine symptoms develop

DOSE EQUIVALENCE AND CONVERSION

- ▶ Doses are expressed as prochlorperazine maleate or mesilate; 1 mg prochlorperazine maleate = 1 mg prochlorperazine mesilate.

- **UNLICENSED USE**  Prochlorperazine is used for the treatment of acute migraine,  but is not licensed for this indication.

Injection not licensed for use in children. *Buccastem M[®]* tablets not licensed for use in children.

- **CONTRA-INDICATIONS** Avoid oral route in child under 10 kg · CNS depression · comatose states · phaeochromocytoma

● CAUTIONS

GENERAL CAUTIONS Elderly · hypotension (more likely after intramuscular injection)

SPECIFIC CAUTIONS

- ▶ With systemic use Hypothyroidism (in adults)

CAUTIONS, FURTHER INFORMATION

- ▶ Elderly Prescription potentially inappropriate (STOPP criteria) in patients with parkinsonism (risk of exacerbating parkinsonian symptoms). See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: phenothiazines

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Rare or very rare** Glucose tolerance impaired · hyperglycaemia · hyponatraemia · SIADH
- ▶ **Frequency not known** Photosensitivity reaction

SPECIFIC SIDE-EFFECTS

- ▶ **Rare or very rare**
- ▶ With buccal use Blood disorder · hepatic disorders
- ▶ **Frequency not known**
- ▶ With buccal use Oral disorders · skin eruption
- ▶ With intramuscular use Atrioventricular block · cardiac arrest · eye disorders · jaundice · muscle rigidity · nasal congestion · respiratory depression · skin reactions
- ▶ With oral use Atrioventricular block · autonomic dysfunction · cardiac arrest · consciousness impaired · hyperthermia · jaundice · muscle rigidity · nasal congestion · oculogyric crisis · respiratory depression · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION Acute dystonias are more common with potent first-generation antipsychotics. The risk is increased in men, young adults, children, antipsychotic-naïve patients, rapid dose escalation, and abrupt treatment discontinuation.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

● RENAL IMPAIRMENT

Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With buccal use Buccal tablets are placed high between upper lip and gum and left to dissolve.

● PATIENT AND CARER ADVICE

- ▶ With buccal use Patients or carers should be given advice on how to administer prochlorperazine buccal tablets.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Trifluoperazine• **INDICATIONS AND DOSE****Schizophrenia and other psychoses | Short-term adjunctive management of psychomotor agitation, excitement, and violent or dangerously impulsive behaviour**

▶ BY MOUTH

- ▶ **Adult:** Initially 5 mg twice daily, daily dose may be increased by 5 mg after 1 week. If necessary, dose may be further increased in steps of 5 mg at intervals of 3 days. When satisfactory control has been achieved, reduce gradually until an effective maintenance level has been established
- ▶ **Elderly:** Initially up to 2.5 mg twice daily, daily dose may be increased by 5 mg after 1 week. If necessary, dose may be further increased in steps of 5 mg at intervals of 3 days. When satisfactory control has been achieved, reduce gradually until an effective maintenance level has been established

Short-term adjunctive management of severe anxiety

▶ BY MOUTH

- ▶ **Adult:** 2–4 mg daily in divided doses, increased if necessary to 6 mg daily
- ▶ **Elderly:** Up to 2 mg daily in divided doses, increased if necessary to 6 mg daily

Severe nausea and vomiting

▶ BY MOUTH

- ▶ **Adult:** 2–4 mg daily in divided doses; maximum 6 mg per day

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma

- **INTERACTIONS** → Appendix 1: phenothiazines

- **SIDE-EFFECTS** Alertness decreased · anxiety · appetite decreased · blood disorder · cardiac arrest · confusion · fatigue · hyperpyrexia · jaundice · cholestatic · lens opacity · muscle weakness · oedema · pancytopenia · photosensitivity reaction · postural hypotension (dose-related) · skin reactions · thrombocytopenia · urinary hesitation · vision blurred · withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION Extrapyramidal symptoms are more frequent at doses exceeding 6mg daily. Acute dystonias are more common with potent first generation antipsychotics. The risk is increased in men, young adults, children, antipsychotic-naïve patients, rapid dose escalation, and abrupt treatment discontinuation.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

• **RENAL IMPAIRMENT**

Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

- **MONITORING REQUIREMENTS** Trifluoperazine does not affect blood pressure to the same extent as other

antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Zuclopendixol

● INDICATIONS AND DOSE

Schizophrenia and other psychoses

▶ BY MOUTH

- Adult: Initially 20–30 mg daily in divided doses, increased if necessary up to 150 mg daily; usual maintenance 20–50 mg daily (max. per dose 40 mg), for debilitated patients, use elderly dose
- Elderly: Initially 5–15 mg daily in divided doses, increased if necessary up to 150 mg daily; usual maintenance 20–50 mg daily (max. per dose 40 mg)

- **CONTRA-INDICATIONS** Apathetic states · CNS depression · comatose states · phaeochromocytoma · withdrawn states

- **CAUTIONS** Hyperthyroidism · hypothyroidism

- **INTERACTIONS** → Appendix 1: zuclopendixol

- **SIDE-EFFECTS** Anxiety · appetite abnormal · asthenia · concentration impaired · confusion · depression · diarrhoea · dyspnoea · eye disorders · fever · flatulence · gait abnormal · gastrointestinal discomfort · glucose tolerance impaired · headaches · hepatic disorders · hot flush · hyperacusia · hyperglycaemia · hyperhidrosis · hyperlipidaemia · hypersalivation · hypothermia · malaise · memory loss · muscle complaints · nasal congestion · nausea · neuromuscular dysfunction · pain · palpitations · paraesthesia · photosensitivity reaction · reflexes increased · seborrhoea · sexual dysfunction · skin reactions · sleep disorders · speech disorder · syncope · thirst · thrombocytopenia · tinnitus · urinary disorders · vertigo · vision disorders · vulvovaginal dryness · weight decreased · withdrawal syndrome

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor serum drug concentration.

Dose adjustments Manufacturer advises dose reduction of half the recommended dose.

- **RENAL IMPAIRMENT**

Dose adjustments Halve dose in renal failure; smaller starting doses used in severe renal impairment because of increased cerebral sensitivity.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral drops

Zuclopendixol acetate

20-Nov-2019

● INDICATIONS AND DOSE

Short-term management of acute psychosis | Short-term management of mania | Short-term management of exacerbation of chronic psychosis

▶ BY DEEP INTRAMUSCULAR INJECTION

- Adult: 50–150 mg, then 50–150 mg after 2–3 days if required, (1 additional dose may be needed 1–2 days after the first injection); maximum cumulative dose 400 mg in 2 weeks and maximum 4 injections; maximum duration of treatment 2 weeks—if maintenance treatment necessary change to an oral antipsychotic 2–3 days after last injection, or to a longer acting antipsychotic depot injection given concomitantly with last injection of zuclopendixol acetate; to be administered into the gluteal muscle or lateral thigh
- Elderly: 50–100 mg, then 50–100 mg after 2–3 days if required, (1 additional dose may be needed 1–2 days after the first injection); maximum cumulative dose 400 mg in 2 weeks and maximum 4 injections; maximum duration of treatment 2 weeks—if maintenance treatment necessary change to an oral antipsychotic 2–3 days after last injection, or to a longer acting antipsychotic depot injection given concomitantly with last injection of zuclopendixol acetate; to be administered into the gluteal muscle or lateral thigh

IMPORTANT SAFETY INFORMATION

When prescribing, dispensing, or administering, check that this is the correct preparation—this preparation is usually used in hospital for an *acute episode* and should **not** be confused with depot preparations which are usually used in the community or clinics for *maintenance* treatment.

SAFE PRACTICE

Zuclopendixol acetate has been confused with zuclopendixol decanoate; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma
- **CAUTIONS** Hyperthyroidism · hypothyroidism
- **INTERACTIONS** → Appendix 1: zuclopendixol
- **SIDE-EFFECTS** Anxiety · appetite abnormal · asthenia · concentration impaired · confusion · depression · diarrhoea · dyspnoea · eye disorders · fever · flatulence · gait abnormal · gastrointestinal discomfort · glucose tolerance impaired · headaches · hepatic disorders · hot flush · hyperacusia · hyperglycaemia · hyperhidrosis · hyperlipidaemia · hypersalivation · hypothermia (dose-related) · malaise · memory loss · muscle complaints · nasal congestion · nausea · neuromuscular dysfunction · pain · palpitations · paraesthesia · photosensitivity reaction · reflexes increased · seborrhoea · sexual dysfunction · skin reactions · sleep disorders · speech disorder · syncope · thirst · thrombocytopenia · tinnitus · urinary disorders · vertigo · vision disorders · vulvovaginal dryness · weight decreased · withdrawal syndrome

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor serum drug concentration.
Dose adjustments Manufacturer advises dose reduction to half the recommended dose.
- **RENAL IMPAIRMENT**
Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Clopixol Acuphase** (Lundbeck Ltd)

ANTIPSYCHOTICS > FIRST-GENERATION (DEPOT INJECTIONS)**Flupentixol decanoate (Flupenthixol Decanoate)**

F 401

09-Aug-2019

INDICATIONS AND DOSE**Maintenance in schizophrenia and other psychoses**

- ▶ **BY DEEP INTRAMUSCULAR INJECTION**
- ▶ **Adult:** Test dose 20 mg, dose to be injected into the upper outer buttock or lateral thigh, then 20–40 mg after at least 7 days, then 20–40 mg every 2–4 weeks, adjusted according to response, usual maintenance dose 50 mg every 4 weeks to 300 mg every 2 weeks; maximum 400 mg per week
- ▶ **Elderly:** Dose is initially quarter to half adult dose

- **CONTRA-INDICATIONS** Children · CNS depression · comatose states · excitable patients · overactive patients
- **CAUTIONS** An alternative antipsychotic may be necessary if symptoms such as aggression or agitation appear · hyperthyroidism · hypothyroidism · phaeochromocytoma · when transferring from oral to depot therapy, the dose by mouth should be reduced gradually
- **INTERACTIONS** → Appendix 1: flupentixol
- **SIDE-EFFECTS**
- ▶ **Common or very common** Appetite abnormal · asthenia · concentration impaired · depression · diarrhoea · dyspnoea · gastrointestinal discomfort · headache · hyperhidrosis · hypersalivation · muscle complaints · nervousness · palpitations · sexual dysfunction · skin reactions · urinary disorder · vision disorders
- ▶ **Uncommon** Confusion · flatulence · hot flush · nausea · oculogyration · photosensitivity reaction · speech disorder
- ▶ **Rare or very rare** Glucose tolerance impaired · hyperglycaemia · jaundice · thrombocytopenia
- ▶ **Frequency not known** Suicidal tendencies

SIDE-EFFECTS, FURTHER INFORMATION Side-effects may persist until the drug has been cleared from its depot site.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor serum drug concentration.
Dose adjustments Manufacturer advises initiate at low dose orally to check for tolerability before switching to depot formulation.
- **RENAL IMPAIRMENT**
Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **MONITORING REQUIREMENTS** Treatment requires careful monitoring for optimum effect.
- **DIRECTIONS FOR ADMINISTRATION** In general not more than 2–3mL of oily injection should be administered at any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release

preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

F 401

20-Nov-2019

Haloperidol decanoate

• INDICATIONS AND DOSE

Maintenance in schizophrenia and schizoaffective disorder [in patients currently stabilised on oral haloperidol]

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ **Adult:** Initially 25–150 mg every 4 weeks, initial dose should be based on previous daily dose of oral haloperidol (10–15 times the daily dose of oral haloperidol is recommended), adjusted in steps of up to 50 mg every 4 weeks if required, adjustment of the dosing interval may be required, depending on individual patient response; usual maintenance 50–200 mg every 4 weeks (max. per dose 300 mg every 4 weeks), dose to be administered into gluteal muscle, the individual benefit-risk should be assessed when considering doses above 200 mg every 4 weeks, if supplementation with oral haloperidol is required, the combined total dose of haloperidol from both formulations must not exceed the corresponding maximum oral haloperidol dose of 20 mg per day
- ▶ **Elderly:** Initially 12.5–25 mg every 4 weeks, increased if necessary to 25–75 mg every 4 weeks, adjustment of the dosing interval may be required, depending on individual patient response, dose to be administered into gluteal muscle, doses above 75 mg every 4 weeks should only be considered in patients who have tolerated higher doses and after reassessment of the individual benefit-risk, if supplementation with oral haloperidol is required, the combined total dose of haloperidol from both formulations must not exceed the corresponding maximum oral haloperidol dose of 5 mg per day, or the previously administered oral haloperidol dose in patients who have received long-term treatment with oral haloperidol

DOSE EQUIVALENCE AND CONVERSION

- ▶ A range of equivalent doses is quoted in the literature; the consensus is that 2 mg per day of oral haloperidol is approximately equivalent to 15 mg per week of haloperidol decanoate depot injection.

IMPORTANT SAFETY INFORMATION

When prescribing, dispensing or administering, check that this is the correct preparation—this preparation is used for *maintenance* treatment and should **not** be used for the rapid control of an *acute episode*.

- **CONTRA-INDICATIONS** CNS depression · comatose states · congenital long QT syndrome · dementia with Lewy bodies · history of torsade de pointes · history of ventricular arrhythmia · Parkinson's disease · progressive supranuclear palsy · QT-interval prolongation · recent acute myocardial

infarction · uncompensated heart failure · uncorrected hypokalaemia

- **CAUTIONS** Bradycardia · electrolyte disturbances (correct before treatment initiation) · family history of QTc-interval prolongation · history of heavy alcohol exposure · hyperthyroidism · hypotension (including orthostatic hypotension) · prolactin-dependent tumours · prolactinaemia · risk factors for stroke · when transferring from oral to depot therapy, the dose by mouth should be reduced gradually
- **INTERACTIONS** → Appendix 1: haloperidol
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Depression · hypersalivation · muscle complaints · sexual dysfunction
 - ▶ **Uncommon** Eye disorders · headache · neuromuscular dysfunction · vision disorders
 - ▶ **Frequency not known** Angioedema · breast abnormalities · cardiac arrest · confusion · dyspnoea · gait abnormal · hepatic disorders · hyperhidrosis · hypersensitivity vasculitis · hypoglycaemia · menstrual cycle irregularities · musculoskeletal stiffness · nausea · oedema · pancytopenia · photosensitivity reaction · psychotic disorder · respiratory disorders · restlessness · rhabdomyolysis · SIADH · skin reactions · temperature regulation disorders · thrombocytopenia · trismus · weight decreased
- **SIDE-EFFECTS, FURTHER INFORMATION** Haloperidol is a less sedating antipsychotic.
- **PREGNANCY** Manufacturer advises it is preferable to avoid—moderate amount of data indicate no malformative or fetal/neonatal toxicity, however there are isolated case reports of birth defects following fetal exposure, mostly in combination with other drugs; reproductive toxicity shown in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
 - Dose adjustments** Manufacturer advises halve initial dose and then adjust if necessary with smaller increments and at longer intervals.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution.
 - Dose adjustments** Manufacturer advises consider lower initial dose in severe impairment and then adjust if necessary with smaller increments and at longer intervals.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises perform ECG before treatment initiation and assess need for further ECGs during treatment on an individual basis.
 - ▶ Manufacturer advises monitor electrolytes before treatment initiation and periodically during treatment.
- **DIRECTIONS FOR ADMINISTRATION** In general not more than 2–3 mL of oily injection should be administered at any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol, sesame oil

▶ Haldol decanoate (Janssen-Cilag Ltd)

Haloperidol (as Haloperidol decanoate) 50 mg per 1 ml Haldol Decanoate 50mg/1ml solution for injection ampoules | 5 ampoule [PoM] £19.06 DT = £19.06

Haloperidol (as Haloperidol decanoate) 100 mg per 1 ml Haldol Decanoate 100mg/1ml solution for injection ampoules | 5 ampoule [PoM] £25.26 DT = £25.26

Zuclopenthixol decanoate

F 401
20-Nov-2019

● INDICATIONS AND DOSE

Maintenance in schizophrenia and paranoid psychoses

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: Test dose 100 mg, dose to be administered into the upper outer buttock or lateral thigh, followed by 200–500 mg after at least 7 days, then 200–500 mg every 1–4 weeks, adjusted according to response, higher doses of more than 500mg can be used; do not exceed 600 mg weekly
- ▶ Elderly: A quarter to half usual starting dose to be used

IMPORTANT SAFETY INFORMATION

When prescribing, dispensing, or administering, check that this is the correct preparation—this preparation is used for *maintenance* treatment and should **not** be used for the short-term management of an *acute episode*.

SAFE PRACTICE

Zuclopenthixol decanoate has been confused with zuclopenthixol acetate; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma
- **CAUTIONS** Hyperthyroidism · hypothyroidism · QT interval prolongation · when transferring from oral to depot therapy, the dose by mouth should be reduced gradually
- **INTERACTIONS** → Appendix 1: zuclopenthixol
- **SIDE-EFFECTS** Anxiety · appetite abnormal · asthenia · concentration impaired · confusion · depression · diarrhoea · dyspnoea · eye disorders · fever · flatulence · gait abnormal · gastrointestinal discomfort · glucose tolerance impaired · headaches · hepatic disorders · hot flush · hyperacusia · hyperglycaemia · hyperhidrosis · hyperlipidaemia · hypersalivation · hypothermia · malaise · memory loss · muscle complaints · nasal congestion · nausea · neuromuscular dysfunction · pain · palpitations · paraesthesia · photosensitivity reaction · reflexes increased · seborrhoea · sexual dysfunction · skin reactions · sleep disorders · speech disorder · syncope · thirst · thrombocytopenia · tinnitus · urinary disorders · vertigo · vision disorders · vulvovaginal dryness · weight decreased · withdrawal syndrome
- SIDE-EFFECTS, FURTHER INFORMATION** Side-effects may persist until the drug has been cleared from its depot site.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor serum drug concentration.
Dose adjustments Manufacturer advises dose reduction to half the recommended dose.
- **RENAL IMPAIRMENT**
Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **MONITORING REQUIREMENTS** Treatment requires careful monitoring for optimum effect.
- **DIRECTIONS FOR ADMINISTRATION** In general not more than 2–3 mL of oily injection should be administered at any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Clopixol (Lundbeck Ltd)

Zuclopenthixol decanoate 200 mg per 1 ml Clopixol 200mg/1ml solution for injection ampoules | 10 ampoule [PoM] £31.51 DT = £31.51

Zuclopenthixol decanoate 500 mg per 1 ml Clopixol Conc 500mg/1ml solution for injection ampoules | 5 ampoule [PoM] £37.18 DT = £37.18

ANTIPSYCHOTICS > SECOND-GENERATION

F 401

Amisulpride

- **DRUG ACTION** Amisulpride is a selective dopamine receptor antagonist with high affinity for mesolimbic D₂ and D₃ receptors.

● INDICATIONS AND DOSE

Acute psychotic episode in schizophrenia

▶ BY MOUTH

- ▶ Adult: 400–800 mg daily in 2 divided doses, adjusted according to response; maximum 1.2 g per day

Schizophrenia with predominantly negative symptoms

▶ BY MOUTH

- ▶ Adult: 50–300 mg daily

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma · prolactin-dependent tumours
- **INTERACTIONS** → Appendix 1: amisulpride
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anxiety · breast pain · hypersalivation · muscle rigidity · nausea · oculogyric crisis · orgasm abnormal · trismus
 - ▶ **Uncommon** Hyperglycaemia
 - ▶ **Frequency not known** Angioedema · bone disorders · cardiac arrest · confusion · dyslipidaemia · hyponatraemia · nasal congestion · neoplasms · SIADH · urticaria · vision blurred
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** No information available if eGFR less than 10 mL/minute/1.73 m².
Dose adjustments Halve dose if eGFR 30–60 mL/minute/1.73 m². Use one-third dose if eGFR 10–30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Amisulpride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include caramel.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

preparations (aripiprazole 400-mg vial with solvent), which are usually used in the community or clinics for *maintenance treatment*.

- **CONTRA-INDICATIONS** CNS depression · comatose state · phaeochromocytoma
 - **CAUTIONS**

GENERAL CAUTIONS Cerebrovascular disease · elderly (reduce initial dose)

SPECIFIC CAUTIONS

 - ▶ With intramuscular use When transferring from oral to depot therapy, the dose by mouth should be reduced gradually
 - **INTERACTIONS** → Appendix 1: aripiprazole
 - **SIDE-EFFECTS**
 - ▶ **Common or very common** Anxiety · appetite abnormal · diabetes mellitus · fatigue · gastrointestinal discomfort · headache · hypersalivation · nausea · vision disorders
 - ▶ **Uncommon** Depression · hiccups · hyperglycaemia · sexual dysfunction
 - ▶ **Frequency not known** Aggression · alopecia · cardiac arrest · chest pain · diabetic hyperosmolar coma · diabetic ketoacidosis · diarrhoea · dysphagia · generalised tonic-clonic seizure · hepatic disorders · hyperhidrosis · hypertension · hyponatraemia · laryngospasm · musculoskeletal stiffness · myalgia · oropharyngeal spasm · pancreatitis · pathological gambling · peripheral oedema · photosensitivity reaction · pneumonia aspiration · rhabdomyolysis · serotonin syndrome · speech disorder · suicidal tendencies · syncope · temperature regulation disorder · thrombocytopenia · urinary incontinence · weight decreased
 - **PREGNANCY** Use only if potential benefit outweighs risk.
 - **BREAST FEEDING** Manufacturer advises avoid—present in milk.
 - **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (oral treatment preferred to intramuscular administration; limited information available).
 - **MONITORING REQUIREMENTS**
 - ▶ Aripiprazole does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
 - ▶ With intramuscular use Treatment requires careful monitoring for optimum effect.
 - **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With oral use Orodispersible tablets should be placed on the tongue and allowed to dissolve, or be dispersed in water and swallowed.
 - ▶ With intramuscular use Correct injection technique (including the use of z-track technique) and rotation of injection sites are essential.
 - **PATIENT AND CARER ADVICE**
 - ▶ With oral use Patients or carers should be given advice on how to administer aripiprazole orodispersible tablets.
 - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution
- Tablet**
- CAUTIONARY AND ADVISORY LABELS 2
- ▶ **Aripiprazole (Non-proprietary)**

 - ▶ **Arpoya** (Torrent Pharma (UK) Ltd)
 - Aripiprazole 5 mg** Arpoya 5mg tablets | 28 tablet [PoM] £96.04 DT = £1.36

Aripiprazole

20-Nov-2019

- **DRUG ACTION** Aripiprazole is a dopamine D₂ partial agonist with weak 5-HT_{1A} partial agonism and 5-HT_{2A} receptor antagonism.

INDICATIONS AND DOSE

Maintenance of schizophrenia in patients stabilised with oral aripiprazole (CYP2D6 poor metabolisers)

▶ BY INTRAMUSCULAR INJECTION

- ▶ **Adult:** 300 mg every month, to be injected into the gluteal or deltoid muscle, minimum of 26 days between injections, treatment with 10–20 mg oral aripiprazole daily should be continued for 14 consecutive days after the first injection, for dose adjustment due to side-effects and for advice on missed doses, consult product literature

Maintenance of schizophrenia in patients stabilised with oral aripiprazole

▶ BY INTRAMUSCULAR INJECTION

- ▶ **Adult:** 400 mg every month, to be injected into the gluteal or deltoid muscle, minimum of 26 days between injections, treatment with 10–20 mg oral aripiprazole daily should be continued for 14 consecutive days after the first injection, for dose adjustment due to side-effects and for advice on missed doses, consult product literature

Schizophrenia

▶ BY MOUTH

- ▶ **Adult:** 10–15 mg once daily; usual dose 15 mg once daily (max. per dose 30 mg once daily)

Treatment and recurrence prevention of mania

▶ BY MOUTH

- ▶ **Adult:** 15 mg once daily, increased if necessary up to 30 mg once daily

Control of agitation and disturbed behaviour in schizophrenia

▶ BY INTRAMUSCULAR INJECTION

- ▶ **Adult:** Initially 5.25–15 mg for 1 dose, alternatively usual dose 9.75 mg for 1 dose, followed by 5.25–15 mg after 2 hours if required, maximum 3 injections daily; maximum daily combined oral and parenteral dose 30 mg

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ With oral use Manufacturer advises double the dose with concurrent use of potent inducers of CYP3A4. Manufacturer advises reduce dose by half with concurrent use of potent inhibitors of CYP3A4 or CYP2D6.
- ▶ With intramuscular use For dose adjustments due to concurrent use of interacting drugs—consult product literature.

IMPORTANT SAFETY INFORMATION

When prescribing, dispensing, or administering, check that the correct preparation is used—the preparation usually used in hospital for the rapid control of an *acute episode* (solution for injection containing aripiprazole 7.5 mg/mL) should **not** be confused with depot

- Aripiprazole 10 mg** Arpyva 10mg tablets | 28 tablet [PoM] £96.04 DT = £1.36
Aripiprazole 15 mg Arpyva 15mg tablets | 28 tablet [PoM] £96.04 DT = £1.57
Aripiprazole 30 mg Arpyva 30mg tablets | 28 tablet [PoM] £192.08 DT = £13.94

Solution for injection

- **Abilify** (Otsuka Pharmaceuticals (U.K.) Ltd)
Aripiprazole 7.5 mg per 1 ml Abilify 9.75mg/1.3ml solution for injection vials | 1 vial [PoM] £3.43

Oral solution

F 401

Cariprazine

28-May-2019

● INDICATIONS AND DOSE**Schizophrenia**► **BY MOUTH**

- **Adult:** 1.5 mg once daily, increased in steps of 1.5 mg if required; maximum 6 mg per day

● INTERACTIONS → Appendix 1: cariprazine**● SIDE-EFFECTS**

- **Common or very common** Anxiety · appetite abnormal · bradyphrenia · drooling · dyslipidaemia · eye disorders · fatigue · gait abnormal · hypertension · joint stiffness · muscle complaints · musculoskeletal stiffness · nausea · oral disorders · pain · reflexes abnormal · sleep disorders · speech impairment · teeth grinding · vision disorders
 ► **Uncommon** Anaemia · cardiac conduction disorder · delirium · depression · diabetes mellitus · dysaesthesia · eosinophilia · eye irritation · gastroesophageal reflux disease · grimacing · hiccups · pruritus · sexual dysfunction · suicidal behaviour · thirst · urinary disorders · vertigo
 ► **Rare or very rare** Cataract · dysphagia · hypothyroidism · memory loss · rhabdomyolysis
 ► **Frequency not known** Hepatitis toxic

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises highly effective contraception in women of childbearing potential during treatment and for at least 10 weeks after the last dose; addition of barrier method recommended in women using systemically-acting hormonal contraceptives.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (no information available).

- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment (no information available).

● NATIONAL FUNDING/ACCESS DECISIONS**Scottish Medicines Consortium (SMC) decisions**

SMC No. SMC2137

The *Scottish Medicines Consortium* has advised (May 2019) that cariprazine (*Reagila*®) is accepted for use within NHS Scotland as second-line treatment for schizophrenia in adults where predominantly negative symptoms have been identified as an important feature.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

- **Reagila** (Recordati Pharmaceuticals Ltd) ▼
Cariprazine (as Cariprazine hydrochloride) 1.5 mg Reagila 1.5mg capsules | 28 capsule [PoM] £80.36 DT = £80.36
Cariprazine (as Cariprazine hydrochloride) 3 mg Reagila 3mg capsules | 28 capsule [PoM] £80.36 DT = £80.36
Cariprazine (as Cariprazine hydrochloride) 4.5 mg Reagila 4.5mg capsules | 28 capsule [PoM] £80.36 DT = £80.36
Cariprazine (as Cariprazine hydrochloride) 6 mg Reagila 6mg capsules | 28 capsule [PoM] £80.36 DT = £80.36

F 401

Clozapine

02-Jul-2018

- **DRUG ACTION** Clozapine is a dopamine D₁, dopamine D₂, 5-HT_{2A}, alpha₁-adrenoceptor, and muscarinic-receptor antagonist.

● INDICATIONS AND DOSE**Schizophrenia in patients unresponsive to, or intolerant of, conventional antipsychotic drugs**► **BY MOUTH**

- **Adult 18–59 years:** 12.5 mg 1–2 times a day for day 1, then 25–50 mg for day 2, then increased, if tolerated, in steps of 25–50 mg daily, dose to be increased gradually over 14–21 days, increased to up to 300 mg daily in divided doses, larger dose to be taken at night, up to 200 mg daily may be taken as a single dose at bedtime; increased in steps of 50–100 mg 1–2 times a week if required, it is preferable to increase once a week; usual dose 200–450 mg daily, max. 900 mg per day, if restarting after interval of more than 48 hours, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing
 ► **Adult 60 years and over:** 12.5 mg once daily for day 1, then increased to 25–37.5 mg for day 2, then increased, if tolerated, in steps of up to 25 mg daily, dose to be increased gradually over 14–21 days, increased to up to 300 mg daily in divided doses, larger dose at to be taken night, up to 200 mg daily may be taken as a single dose at bedtime; increased in steps of 50–100 mg 1–2 times a week if required, it is preferable to increase once a week; usual dose 200–450 mg daily, max. 900 mg per day, if restarting after interval of more than 48 hours, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing

Psychosis in Parkinson's disease► **BY MOUTH**

- **Adult:** 12.5 mg once daily, dose to be taken at bedtime, then increased in steps of 12.5 mg up to twice weekly, adjusted according to response; usual dose 25–37.5 mg once daily, dose to be taken at bedtime; increased in steps of 12.5 mg once weekly, this applies only in exceptional cases, increased if necessary up to 100 mg daily in 1–2 divided doses; Usual maximum 50 mg/24 hours

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CLOZAPINE: REMINDER OF POTENTIALLY FATAL RISK OF INTESTINAL OBSTRUCTION, FAECAL IMPACTION, AND PARALYTIC ILEUS (OCTOBER 2017)

Clozapine has been associated with varying degrees of impairment of intestinal peristalsis—see Cautions and Contra-indications for further information. Patients and their carers should be advised to seek immediate medical advice before taking the next dose of clozapine if constipation develops.

- **CONTRA-INDICATIONS** Alcoholic and toxic psychoses · bone-marrow disorders · coma · drug intoxication · history of agranulocytosis · history of circulatory collapse · history of neutropenia · paralytic ileus · severe cardiac disorders (e.g. myocarditis) · severe CNS depression · uncontrolled epilepsy
- **CAUTIONS** Age over 60 years · prostatic hypertrophy · susceptibility to angle-closure glaucoma · taper off other antipsychotics before starting
- CAUTIONS, FURTHER INFORMATION**
 - ▶ **Agranulocytosis** Neutropenia and potentially fatal agranulocytosis reported. Leucocyte and differential blood counts must be normal before starting; monitor counts every week for 18 weeks then at least every 2 weeks and if clozapine continued and blood count stable after 1 year at least every 4 weeks (and 4 weeks after discontinuation); if leucocyte count below 3000/mm³ or if absolute neutrophil count below 1500/mm³ discontinue permanently and refer to haematologist. Patients who have a low white blood cell count because of benign ethnic neutropenia may be started on clozapine with the agreement of a haematologist. Avoid drugs which depress leucopoiesis; patients should report immediately symptoms of infection, especially influenza-like illness.
 - ▶ **Myocarditis and cardiomyopathy** Fatal myocarditis (most commonly in first 2 months) and cardiomyopathy reported.
 - Perform physical examination and take full medical history before starting
 - Specialist examination required if cardiac abnormalities or history of heart disease found—clozapine initiated only in absence of severe heart disease and if benefit outweighs risk
 - Persistent tachycardia especially in first 2 months should prompt observation for other indicators for myocarditis or cardiomyopathy
 - If myocarditis or cardiomyopathy suspected clozapine should be stopped and patient evaluated urgently by cardiologist
 - Discontinue permanently in clozapine-induced myocarditis or cardiomyopathy
 - ▶ **Intestinal obstruction** Impairment of intestinal peristalsis, including constipation, intestinal obstruction, faecal impaction, and paralytic ileus, (including fatal cases) reported. Clozapine should be used with caution in patients receiving drugs that may cause constipation (e.g. antimuscarinic drugs) or in those with a history of colonic disease or lower abdominal surgery. It is essential that constipation is recognised and actively treated.
- **INTERACTIONS** → Appendix 1: clozapine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Appetite decreased · eosinophilia · fatigue · fever · headache · hypertension · leucocytosis · muscle complaints · nausea · oral disorders · postural hypotension (dose-related) · speech impairment · sweating abnormal · syncope · temperature regulation disorders · urinary disorders · vision blurred
 - ▶ **Uncommon** Fall
 - ▶ **Rare or very rare** Anaemia · cardiac arrest · cardiac inflammation · cardiomyopathy · circulatory collapse · confusion · delirium · diabetes mellitus · dyslipidaemia · dysphagia · gastrointestinal disorders · glucose tolerance impaired · hepatic disorders · hyperglycaemia · increased risk of infection · intestinal obstruction (including fatal cases) · ketoacidosis · nephritis tubulointerstitial · obsessive-compulsive disorder · pancreatitis · pericardial effusion · respiratory disorders · restlessness · sexual dysfunction · skin reactions · sleep apnoea · thrombocytopenia · thrombocytosis
 - ▶ **Frequency not known** Angina pectoris · angioedema · chest pain · cholinergic syndrome · diarrhoea · gastrointestinal discomfort · hypersensitivity vasculitis · mitral valve incompetence · muscle weakness · myocardial infarction · nasal congestion · palpitations · polyserositis · pseudophaeochromocytoma · renal failure · rhabdomyolysis · sepsis · systemic lupus erythematosus (SLE)
- SIDE-EFFECTS, FURTHER INFORMATION** Hypersalivation associated with clozapine therapy can be treated with hyoscine hydrobromide [unlicensed indication], provided that the patient is not at particular risk from the additive antimuscarinic side-effects of hyoscine and clozapine.
- **PREGNANCY** Use with caution.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor liver function (discontinue if liver enzymes are greater than 3 times the upper limit of normal or jaundice occurs); avoid in symptomatic or progressive impairment and in hepatic failure.
- **RENAL IMPAIRMENT** Avoid in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor leucocyte and differential blood counts. Clozapine requires differential white blood cell monitoring weekly for 18 weeks, then fortnightly for up to one year, and then monthly as part of the clozapine patient monitoring service.
 - ▶ Close medical supervision during initiation (risk of collapse because of hypotension and convulsions).
 - ▶ Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotics. Patients taking clozapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.
 - ▶ Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking clozapine should have fasting blood glucose tested at baseline, after one month's treatment, then every 4–6 months.
 - ▶ Patient, prescriber, and supplying pharmacist must be registered with the appropriate Patient Monitoring Service—it takes several days to do this.
- **TREATMENT CESSATION** On planned withdrawal reduce dose over 1–2 weeks to avoid risk of rebound psychosis. If abrupt withdrawal necessary observe patient carefully.
- **DIRECTIONS FOR ADMINISTRATION** Shake oral suspension well for 90 seconds when dispensing or if visibly settled and stand for 24 hours before use; otherwise shake well for 10 seconds before use. May be diluted with water. Orodispersible tablets should be placed on the tongue, allowed to dissolve and swallowed.
- **PRESCRIBING AND DISPENSING INFORMATION** Clozapine has been used for psychosis in Parkinson's disease in children aged 16 years and over.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer clozapine oral suspension and orodispersible tablets.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Lurasidone hydrochloride

03-Aug-2018

F 401

- **DRUG ACTION** Lurasidone is a dopamine D₂, 5-HT_{2A}, 5-HT₇, alpha_{2A}- and alpha_{2C}- adrenoceptor antagonist, and is a partial agonist at 5-HT_{1A} receptors.

INDICATIONS AND DOSE**Schizophrenia**

▶ BY MOUTH

▶ Adult: Initially 37 mg once daily, increased if necessary up to 148 mg once daily

Schizophrenia when given with concomitant moderate CYP3A4 inhibitors (e.g. diltiazem, erythromycin, fluconazole, and verapamil)

▶ BY MOUTH

▶ Adult: Initially 18.5 mg once daily (max. per dose 74 mg once daily)

- **CAUTIONS** High doses in elderly · susceptibility to QT-interval prolongation

- **INTERACTIONS** → Appendix 1: lurasidone

SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · drooling · fatigue · gastrointestinal discomfort · muscle complaints · musculoskeletal stiffness · nausea · oculogyric crisis · oral disorders · pain · psychiatric disorders · sleep disorders
- ▶ **Uncommon** Appetite decreased · dysarthria · dysuria · gait abnormal · gastrointestinal disorders · hot flush ·

hyperhidrosis · hypertension · joint stiffness · nasopharyngitis · vision blurred

- ▶ **Rare or very rare** Eosinophilia · rhabdomyolysis
- ▶ **Frequency not known** Anaemia · angina pectoris · angioedema · atrioventricular block · breast abnormalities · diarrhoea · dysmenorrhoea · dysphagia · pruritus · renal failure · Stevens-Johnson syndrome · suicidal behaviour · vertigo

- **PREGNANCY** Use only if potential benefit outweighs risk—limited information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (risk of increased exposure).

Dose adjustments Manufacturer advises initially 18.5 mg once daily in moderate to severe impairment, increased if necessary up to 74 mg once daily in moderate impairment, or up to max. 37 mg once daily in severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises use only if potential benefit outweighs risk if eGFR less than 15 mL/minute/1.73 m².

Dose adjustments Initially 18.5 mg once daily, up to max. 74 mg once daily if eGFR less than 50 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION** Patients on doses higher than 111 mg once daily whose treatment is interrupted for longer than 3 days should restart on 111 mg once daily and titrate to usual dose; for all other doses, restart on usual dose.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

F 401

Olanzapine

- **DRUG ACTION** Olanzapine is a dopamine D₁, D₂, D₄, 5-HT₂, histamine-1-, and muscarinic-receptor antagonist.

INDICATIONS AND DOSE**Schizophrenia | Combination therapy for mania**

▶ BY MOUTH

▶ Adult: 10 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 10 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

Preventing recurrence in bipolar disorder

▶ BY MOUTH

▶ Adult: 10 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 10 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

Monotherapy for mania

▶ BY MOUTH

▶ Adult: 15 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 15 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider

lower initial dose and more gradual dose increase; maximum 20 mg per day

Control of agitation and disturbed behaviour in schizophrenia or mania

► BY INTRAMUSCULAR INJECTION

- **Adult:** Initially 5–10 mg for 1 dose; usual dose 10 mg for 1 dose, followed by 5–10 mg after 2 hours if required, maximum 3 injections daily for 3 days; maximum daily combined oral and parenteral dose 20 mg, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase
- **Elderly:** Initially 2.5–5 mg, followed by 2.5–5 mg after 2 hours if required, maximum 3 injections daily for 3 days; maximum daily combined oral and parenteral dose 20 mg, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase

● CONTRA-INDICATIONS

- With intramuscular use Acute myocardial infarction · bradycardia · recent heart surgery · severe hypotension · sick sinus syndrome · unstable angina

- **CAUTIONS** Bone-marrow depression · hypereosinophilic disorders · low leucocyte count · low neutrophil count · myeloproliferative disease · paralytic ileus

CAUTIONS, FURTHER INFORMATION

- CNS and respiratory depression
- With intramuscular use Blood pressure, pulse and respiratory rate should be monitored for at least 4 hours after intramuscular injection, particularly in those also receiving a benzodiazepine or another antipsychotic (leave at least one hour between administration of olanzapine intramuscular injection and parenteral benzodiazepines).

- **INTERACTIONS** → Appendix 1: olanzapine

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Anticholinergic syndrome · appetite increased · arthralgia · asthenia · eosinophilia · fever · glycosuria · oedema · sexual dysfunction
- **Uncommon** Abdominal distension · alopecia · breast enlargement · diabetes mellitus · dysarthria · epistaxis · memory loss · photosensitivity reaction · urinary disorders
- **Rare or very rare** Hepatic disorders · hypothermia · pancreatitis · rhabdomyolysis · thrombocytopenia

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- With intramuscular use Dyslipidaemia
- With oral use Hypersomnia
- **Uncommon**
- With intramuscular use Hypoventilation
- With oral use Diabetic coma · ketoacidosis · oculogyration
- **Rare or very rare**
- With intramuscular use Withdrawal syndrome
- **Frequency not known**
- With intramuscular use Cardiovascular event · erythema · fall · gait abnormal · hallucinations · pneumonia

- **PREGNANCY** Use only if potential benefit outweighs risk; neonatal lethargy, tremor, and hypertonia reported when used in third trimester.

- **BREAST FEEDING** Avoid—present in milk.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

Dose adjustments Manufacturer advises consider initial dose of 5 mg daily and cautious titration.

● RENAL IMPAIRMENT

Dose adjustments Consider initial dose of 5 mg daily.

● MONITORING REQUIREMENTS

- Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotic drugs. Patients taking olanzapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.
 - Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking olanzapine should have fasting blood glucose tested at baseline, after one month's treatment, then every 4–6 months.
- **DIRECTIONS FOR ADMINISTRATION** Olanzapine orodispersible tablet may be placed on the tongue and allowed to dissolve, or dispersed in water, orange juice, apple juice, milk, or coffee.

● PRESCRIBING AND DISPENSING INFORMATION

- With intramuscular use When prescribing, dispensing, or administering, check that this injection is the correct preparation—this preparation is usually used in hospital for the rapid control of an *acute episode* and should not be confused with depot preparations which are usually used in the community or clinics for *maintenance* treatment. Available from specialist importing companies.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer orodispersible tablets.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

F 401

Paliperidone

15-Jun-2017

- **DRUG ACTION** Paliperidone is a metabolite of risperidone.

● **INDICATIONS AND DOSE****Schizophrenia | Psychotic or manic symptoms of schizoaffective disorder**▶ **BY MOUTH**

- ▶ **Adult:** 6 mg once daily, dose to be taken in the morning, then adjusted in steps of 3 mg if required, dose to be adjusted over at least 5 days; usual dose 3–12 mg daily

TREVICTA® PRE-FILLED SYRINGES**Maintenance of schizophrenia in patients who are clinically stable on once-monthly intramuscular paliperidone**▶ **BY DEEP INTRAMUSCULAR INJECTION**

- ▶ **Adult:** Initially 175–525 mg every 3 months, adjusted according to response, to be administered into the deltoid or gluteal muscle, dose is based on previous once-monthly intramuscular paliperidone and should be initiated in place of the next scheduled dose—consult product literature

XEPLION® PRE-FILLED SYRINGES**Maintenance in schizophrenia in patients previously responsive to paliperidone or risperidone**▶ **BY DEEP INTRAMUSCULAR INJECTION**

- ▶ **Adult:** 150 mg for 1 dose on day 1, then 100 mg for 1 dose on day 8, to be injected into the deltoid muscle, dose subsequently adjusted at monthly intervals according to response; maintenance 75 mg once a month, alternatively maintenance 25–150 mg once a month, following the second dose, monthly maintenance doses can be administered into either the deltoid or gluteal muscle

● **CAUTIONS**

GENERAL CAUTIONS Cataract surgery (risk of intraoperative floppy iris syndrome) · dementia with Lewy bodies · elderly patients with dementia · elderly patients with risk factors for stroke · predisposition to gastrointestinal obstruction · prolactin-dependent tumours

SPECIFIC CAUTIONS

- ▶ With intramuscular use when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

- **INTERACTIONS** → Appendix 1: paliperidone

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Anxiety · appetite abnormal · asthenia · cardiac conduction disorders · cough · depression · diarrhoea · fever · gastrointestinal discomfort · headache · hyperglycaemia · hypertension · increased risk of infection · joint disorders · laryngeal pain · mood altered · nasal congestion · nausea · oral disorders · pain · skin reactions · vision disorders
- ▶ **Uncommon** Alopecia · anaemia · breast abnormalities · chest discomfort · chills · conjunctivitis · cystitis · dry eye · dysarthria · dysphagia · dyspnoea · ear pain · epistaxis · fall · gait abnormal · gastrointestinal disorders · generalised tonic-clonic seizure · hypoglycaemia · induration · malaise · menstrual cycle irregularities · muscle spasms · muscle weakness · oedema · palpitations · respiratory disorders · sensation abnormal · sexual dysfunction · sleep disorders · syncope · taste altered · thirst · thrombocytopenia · tinnitus · urinary disorders · vertigo
- ▶ **Rare or very rare** Angioedema · cerebrovascular insufficiency · coma · consciousness impaired · dandruff · diabetic ketoacidosis · dysphonia · eye disorders · flushing · glaucoma · hypothermia · ischaemia · jaundice · pancreatitis · polydipsia · posture abnormal · rhabdomyolysis · SIADH · sleep apnoea · vaginal discharge · water intoxication · withdrawal syndrome

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With oral use Weight decreased
- ▶ **Uncommon**
- ▶ With oral use Concentration impaired · confusion · diabetes mellitus
- ▶ **Frequency not known**
- ▶ With intramuscular use Injection site necrosis
- **PREGNANCY** Use only if potential benefit outweighs risk—toxicity in *animal* studies; if discontinuation during pregnancy is necessary, withdraw gradually.

TREVICTA® PRE-FILLED SYRINGES Manufacturer advises to consider long-acting nature of formulation—paliperidone detected in plasma up to 18 months after single dose.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk.

TREVICTA® PRE-FILLED SYRINGES Manufacturer advises to consider long-acting nature of formulation—paliperidone detected in plasma up to 18 months after single dose.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).

● **RENAL IMPAIRMENT**

- ▶ With oral use Manufacturer advises avoid if creatinine clearance less than 10 mL/minute.
- ▶ With intramuscular use Manufacturer advises avoid if creatinine clearance less than 50 mL/minute.
- Dose adjustments** ▶ With oral use Manufacturer advises reduce initial dose to 3 mg once daily if creatinine clearance 50–80 mL/minute (max. 6 mg once daily). Manufacturer advises reduce initial dose to 1.5 mg once daily if creatinine clearance 10–50 mL/minute (max. 3 mg once daily).

TREVICTA® PRE-FILLED SYRINGES Dose adjustments Manufacturer advises dose should be adjusted and

stabilised using once-monthly injectable paliperidone before switching to three-monthly injectable paliperidone, if creatinine clearance 50–80 mL/minute.

XEPLION® PRE-FILLED SYRINGES Dose adjustments
Manufacturer advises initial dose 100 mg on day 1 and then 75 mg on day 8 if creatinine clearance 50–80 mL/minute; recommended maintenance dose 50 mg (range 25–100 mg) monthly if creatinine clearance 50–80 mL/minute.

● MONITORING REQUIREMENTS

- ▶ With intramuscular use Treatment requires careful monitoring for optimum effect.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intramuscular use Correct injection technique (including the use of z-track technique) and rotation of injection sites are essential.
- ▶ With oral use Always take with breakfast or always take on an empty stomach.

● PRESCRIBING AND DISPENSING INFORMATION

XEPLION® PRE-FILLED SYRINGES *Xeplion*® 25 mg pre-filled syringes may be difficult to obtain.

● PATIENT AND CARER ADVICE

- ▶ With oral use Patients or carers should be given advice on how to administer paliperidone tablets.
- Missed doses** ▶ With intramuscular use For missed doses see product literature.

● NATIONAL FUNDING/ACCESS DECISIONS

TRIVICTA® PRE-FILLED SYRINGES

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (September 2016) that paliperidone palmitate (*Trivicta*®) is accepted for use within NHS Scotland for the maintenance treatment of schizophrenia in patients who are clinically stable on one-monthly paliperidone palmitate injectable product.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Prolonged-release suspension for injection

▶ **Trivicta** (Janssen-Cilag Ltd)

- Paliperidone (as Paliperidone palmitate) 200 mg per 1 ml** *Trivicta* 175mg/0.875ml prolonged-release suspension for injection pre-filled syringes | 1 pre-filled disposable injection [POM] £551.76 DT = £551.76

Quetiapine

- **DRUG ACTION** Quetiapine is a dopamine D₁, dopamine D₂, 5-HT₂, alpha₁-adrenoceptor, and histamine-1 receptor antagonist.

● INDICATIONS AND DOSE

Schizophrenia

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 25 mg twice daily for day 1, then 50 mg twice daily for day 2, then 100 mg twice daily for day 3, then 150 mg twice daily for day 4, then, adjusted according to response, usual dose 300–450 mg daily in 2 divided doses, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 750 mg per day

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 300 mg once daily for day 1, then 600 mg once daily for day 2, then, adjusted according to response, usual dose 600 mg once daily, maximum dose under specialist supervision; maximum 800 mg per day
- ▶ Elderly: Initially 50 mg once daily, adjusted according to response. adjusted in steps of 50 mg daily

Treatment of mania in bipolar disorder

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 50 mg twice daily for day 1, then 100 mg twice daily for day 2, then 150 mg twice daily for day 3, then 200 mg twice daily for day 4, then adjusted in steps of up to 200 mg daily, adjusted according to response, usual dose 400–800 mg daily in 2 divided doses, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 800 mg per day

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 300 mg once daily for day 1, then 600 mg once daily for day 2, then, adjusted according to response, usual dose 400–800 mg once daily
- ▶ Elderly: Initially 50 mg once daily, adjusted according to response. adjusted in steps of 50 mg daily

Treatment of depression in bipolar disorder

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 50 mg once daily for day 1, dose to be taken at bedtime, then 100 mg once daily for day 2, then 200 mg once daily for day 3, then 300 mg once daily for day 4, then, adjusted according to response; usual dose 300 mg once daily, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 600 mg per day

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 50 mg once daily for day 1, dose to be taken at bedtime, then 100 mg once daily for day 2, then 200 mg once daily for day 3, then 300 mg once daily for day 4, then, adjusted according to response; usual dose 300 mg once daily; maximum 600 mg per day

Prevention of mania and depression in bipolar disorder

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: Continue at the dose effective for treatment of bipolar disorder and adjust to lowest effective dose; usual dose 300–800 mg daily in 2 divided doses

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: Continue at the dose effective for treatment of bipolar disorder and adjust to lowest effective dose; usual dose 300–800 mg once daily

Adjunctive treatment of major depression

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 50 mg once daily for 2 days, dose to be taken at bedtime, then 150 mg once daily for 2 days, then, adjusted according to response, usual dose 150–300 mg once daily

continued →

- ▶ **Elderly:** Initially 50 mg once daily for 3 days, then increased if necessary to 100 mg once daily for 4 days, then adjusted in steps of 50 mg, adjusted according to response, usual dose 50–300 mg once daily, dose of 300 mg should not be reached before day 22 of treatment

DOSE EQUIVALENCE AND CONVERSION

- ▶ Patients can be switched from immediate-release to modified-release tablets at the equivalent daily dose; to maintain clinical response, dose titration may be required.

- **CAUTIONS** Cerebrovascular disease · elderly · patients at risk of aspiration pneumonia · treatment of depression in patients under 25 years (increased risk of suicide)
- **INTERACTIONS** → Appendix 1: quetiapine
- **SIDE-EFFECTS**
- ▶ **Common or very common** Appetite increased · asthenia · dysarthria · dyspepsia · dyspnoea · fever · headache · hyperglycaemia · irritability · palpitations · peripheral oedema · rhinitis · sleep disorders · suicidal behaviour (particularly on initiation) · suicidal ideation (particularly on initiation) · syncope · vision blurred · withdrawal syndrome
- ▶ **Uncommon** Anaemia · diabetes mellitus · dysphagia · hyponatraemia · hypothyroidism · sexual dysfunction · skin reactions · thrombocytopenia
- ▶ **Rare or very rare** Angioedema · breast swelling · gastrointestinal disorders · hepatic disorders · hypothermia · menstrual disorder · metabolic syndrome · pancreatitis · rhabdomyolysis · severe cutaneous adverse reactions (SCARs) · SIADH
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased plasma concentrations).
Dose adjustments Manufacturer advises for *immediate-release tablets*, initially 25 mg daily, increased daily in steps of 25–50 mg.
Manufacturer advises for *modified-release tablets*, initially 50 mg daily, increased daily in steps of 50 mg.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder

Risperidone

- **DRUG ACTION** Risperidone is a dopamine D₂, 5-HT_{2A}, alpha₁-adrenoceptor, and histamine-1 receptor antagonist.

● INDICATIONS AND DOSE

Schizophrenia and other psychoses in patients tolerant to risperidone by mouth and taking oral risperidone up to 4 mg daily

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 25 mg every 2 weeks, to be administered into the deltoid or gluteal muscle, adjusted in steps of 12.5 mg (max. per dose 50 mg every 2 weeks) at intervals of at least 4 weeks, during initiation risperidone by mouth may need to be continued for 4–6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection

Schizophrenia and other psychoses in patients tolerant to risperidone by mouth and taking oral risperidone over 4 mg daily

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 37.5 mg every 2 weeks, adjusted in steps of 12.5 mg (max. per dose 50 mg every 2 weeks) at intervals of at least 4 weeks, during initiation risperidone by mouth may need to be continued for 4–6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection

Acute and chronic psychosis

- ▶ BY MOUTH
- ▶ Adult: 2 mg daily in 1–2 divided doses for day 1, then 4 mg daily in 1–2 divided doses for day 2, slower titration is appropriate in some patients, usual dose 4–6 mg daily, doses above 10 mg daily only if benefit considered to outweigh risk; maximum 16 mg per day
- ▶ Elderly: Initially 500 micrograms twice daily, then increased in steps of 500 micrograms twice daily, increased to 1–2 mg twice daily

Mania

- ▶ BY MOUTH
- ▶ Adult: Initially 2 mg once daily, then increased in steps of 1 mg daily if required; usual dose 1–6 mg daily
- ▶ Elderly: Initially 500 micrograms twice daily, then increased in steps of 500 micrograms twice daily, increased to 1–2 mg twice daily

Short-term treatment (up to 6 weeks) of severe aggression in patients with moderate to persistent Alzheimer's dementia unresponsive to non-pharmacological interventions and when there is a risk of harm to self or others

- ▶ BY MOUTH
- ▶ Adult: Initially 250 micrograms twice daily, then increased in steps of 250 micrograms twice a day on alternate days, adjusted according to response; usual dose 500 micrograms twice daily (max. per dose 1 mg twice daily)

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Risperidone has been confused with ropinirole; care must be taken to ensure the correct drug is prescribed and dispensed.

● CAUTIONS

GENERAL CAUTIONS Avoid in Acute porphyrias p. 1120. cataract surgery (risk of intra-operative floppy iris syndrome) · dehydration · dementia with Lewy bodies · prolactin-dependent tumours

SPECIFIC CAUTIONS

- ▶ With intramuscular use when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

- **INTERACTIONS** → Appendix 1: risperidone

● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · anxiety · appetite abnormal · asthenia · chest discomfort · conjunctivitis · cough · depression · diarrhoea · dyspnoea · epistaxis · fall · fever · gastrointestinal discomfort · headache · hyperglycaemia · hypertension · increased risk of infection · joint disorders · laryngeal pain · muscle spasms · nasal congestion · nausea · oedema · oral disorders · pain · sexual dysfunction · skin reactions · sleep disorders · urinary disorders · vision disorders · weight decreased
- ▶ **Uncommon** Alopecia · breast abnormalities · cardiac conduction disorders · cerebrovascular insufficiency · chills · coma · concentration impaired · confusion · consciousness impaired · cystitis · diabetes mellitus · dry eye · dysarthria · dysphagia · dysphonia · ear pain · eye disorders · feeling abnormal · flushing · gait abnormal · gastrointestinal disorders · induration · malaise · menstrual cycle irregularities · mood altered · muscle weakness · palpitations · polydipsia · posture abnormal · procedural pain · respiratory disorders · sensation abnormal · syncope · taste altered · thirst · thrombocytopenia · tinnitus · vaginal discharge · vertigo
- ▶ **Rare or very rare** Angioedema · dandruff · diabetic ketoacidosis · eyelid crusting · glaucoma · hypoglycaemia · hypothermia · jaundice · pancreatitis · peripheral coldness · rhabdomyolysis · SIADH · sleep apnoea · water intoxication · withdrawal syndrome
- ▶ **Frequency not known** Cardiac arrest

- **PREGNANCY** Use only if potential benefit outweighs risk.

- **BREAST FEEDING** Use only if potential benefit outweighs risk—small amount present in milk.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

Dose adjustments ▶ With intramuscular use Manufacturer advises if an oral dose of at least 2 mg daily tolerated, 25 mg as a depot injection can be given every 2 weeks (no information available).

- ▶ With oral use Manufacturer advises dose reduction to half the usual dose, and slower dose titration.

- **RENAL IMPAIRMENT**

Dose adjustments Initial and subsequent oral doses should be halved.

- **MONITORING REQUIREMENTS**

▶ With intramuscular use Treatment requires careful monitoring for optimum effect.

- **DIRECTIONS FOR ADMINISTRATION**

▶ With oral use Orodispersible tablets should be placed on the tongue, allowed to dissolve and swallowed. Oral liquid may be diluted with any non-alcoholic drink, except tea.

▶ With intramuscular use Correct injection technique (including the use of z-track technique) and rotation of injection sites are essential.

- **PATIENT AND CARER ADVICE**

▶ With oral use Patients or carers should be given advice on how to administer risperidone orodispersible tablets and oral liquid (counselling on use of dose syringe advised).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

ANTIPSYCHOTICS > SECOND-GENERATION (DEPOT INJECTIONS)

401

Olanzapine embonate

(Olanzapine pamoate)

20-Nov-2019

● **INDICATIONS AND DOSE**

Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 10 mg oral olanzapine daily)

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult 18-75 years: Initially 210 mg every 2 weeks, alternatively initially 405 mg every 4 weeks, then maintenance 150 mg every 2 weeks, alternatively maintenance 300 mg every 4 weeks, maintenance dose to be started after 2 months of initial treatment, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required

Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 15 mg oral olanzapine daily)

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult 18-75 years: Initially 300 mg every 2 weeks, then maintenance 210 mg every 2 weeks, alternatively maintenance 405 mg every 4 weeks, maintenance dose to be started after 2 months of initial treatment, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required

Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 20 mg oral olanzapine daily)

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: Initially 300 mg every 2 weeks, then maintenance 300 mg every 2 weeks (max. per dose 300 mg every 2 weeks), adjusted according to response, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required

IMPORTANT SAFETY INFORMATION

When prescribing, dispensing or administering, check that this is the correct preparation—this preparation is used for *maintenance* treatment and should **not** be used for the rapid control of an *acute* episode.

- **CAUTIONS** Bone-marrow depression · hyper eosinophilic disorders · low leucocyte count · low neutrophil count · myeloproliferative disease · paralytic ileus · when transferring from oral to depot therapy, the dose by mouth should be reduced gradually
- **INTERACTIONS** → Appendix 1: olanzapine
- **SIDE-EFFECTS**
- **Common or very common** Anticholinergic syndrome · appetite increased · arthralgia · asthenia · eosinophilia · fever · glycosuria · oedema · sexual dysfunction
- ▶ **Uncommon** Abdominal distension · alopecia · breast enlargement · diabetes mellitus · diabetic coma · dysarthria · epistaxis · ketoacidosis · memory loss · oculogyration · photosensitivity reaction · urinary disorders
- ▶ **Rare or very rare** Drug reaction with eosinophilia and systemic symptoms (DRESS) · hepatic disorders · hypothermia · pancreatitis · rhabdomyolysis · thrombocytopenia
- ▶ **Frequency not known** Erythema · gait abnormal · increased risk of fall · pneumonia · visual hallucinations
- SIDE-EFFECTS, FURTHER INFORMATION** Side-effects may persist until the drug has been cleared from its depot site.
- Overdose** Post-injection reactions have been reported leading to signs and symptoms of overdose.
- **PREGNANCY** Use only if potential benefit outweighs risk; neonatal lethargy, tremor, and hypertonia reported when used in third trimester.
- **BREAST FEEDING** Avoid—present in milk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. **Dose adjustments** Manufacturer advises consider initial dose of 150 mg every 4 weeks.
- **RENAL IMPAIRMENT** **Dose adjustments** Initially 150 mg every 4 weeks.
- **MONITORING REQUIREMENTS**
- ▶ Observe patient for at least 3 hours after injection.
- ▶ Treatment requires careful monitoring for optimum effect.
- ▶ Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotic drugs. Patients taking olanzapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.

- ▶ Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking olanzapine should have fasting blood glucose tested at baseline, after one month's treatment, then every 4–6 months.
- **DIRECTIONS FOR ADMINISTRATION** Correct injection technique (including use of z-track technique) and rotation of injection sites are essential.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

4 Movement disorders

Cerebral palsy and spasticity 05-Apr-2019

Overview

Cerebral palsy is a group of permanent, non-progressive abnormalities of the developing fetal or neonatal brain that lead to movement and posture disorders, causing activity limitation and functional impact. There can be accompanying clinical and developmental comorbidities. These include disturbances of sensation, perception, cognition, communication and behaviour, epilepsy, and secondary musculoskeletal problems (such as muscle contracture and abnormal torsion). Cerebral palsy is not curable and the comorbidities can impact on many areas of participation and quality of life, particularly eating, drinking, comfort, and sleep.

There are an increasing number of adults now living with cerebral palsy. These patients have a wide range of abilities — from full independence in everyday life to requiring 24 hour care and attention. It is therefore important that patients and their family and carers are provided with information about the network of general and specialised adult services available, to ensure their changing needs are met. The management of adults with cerebral palsy is a continuation from childhood under the care of specialists. For guidance on the management of patients with cerebral palsy, see *Cerebral Palsy and Spasticity* in BNF for Children.

Motor neurone disease

17-May-2017

Description of condition

Motor neurone disease is a neurodegenerative condition affecting the brain and spinal cord. Degeneration of motor neurones leads to progressive muscle weakness; resulting symptoms include muscle cramps, wasting and stiffness, loss of dexterity, reduced respiratory function and cognitive dysfunction. The most common form is amyotrophic lateral sclerosis.

[EvGr] Patients suspected of having developed motor neurone disease should be referred to a neurologist without delay. 

Aims of treatment

As there is no cure, treatment focuses on maintaining functional ability and managing symptoms.

Non-drug treatment

Non-drug treatment includes nutrition, psychosocial support, physiotherapy, exercise programmes and use of special equipment or mobility aids.

Management of symptoms

Muscular symptoms

[EvGr] Quinine p. 655 [unlicensed indication] is recommended as first line treatment for muscle cramps. If quinine is ineffective, not tolerated or contra-indicated, baclofen p. 1190 [unlicensed indication] should be considered as second line treatment. Subsequent treatment options include tizanidine p. 1192 [unlicensed indication], dantrolene sodium p. 1417 [unlicensed indication] or gabapentin p. 331 [unlicensed indication].

Symptoms of muscle stiffness, spasticity or increased tone can be managed with baclofen, tizanidine, dantrolene sodium or gabapentin [unlicensed indication]. Treatment of severe spasticity may require specialist referral. 

Saliva problems

[EvGr] A trial of an antimuscarinic drug [unlicensed indication] can be considered for excessive drooling of saliva. Glycopyrronium bromide p. 1405 is recommended in patients who have cognitive impairment as it has fewer central nervous system side-effects. If initial treatment is ineffective, not tolerated or contra-indicated, referral for specialist administration of botulinum toxin type A p. 425 [unlicensed indication] may be required.

Humidification, nebulisers and carbocysteine p. 306 can be used to treat patients with thick, tenacious saliva. 

Respiratory symptoms

[EvGr] Reversible causes of worsening respiratory impairment (such as respiratory tract infections or secretion problems) should be treated before considering other options.

Patients experiencing breathlessness can be treated with opioids [unlicensed indication], or benzodiazepines [unlicensed indication] if the patient's symptoms are exacerbated by anxiety. Non-invasive ventilation should be considered in patients with respiratory impairment. 

Amyotrophic lateral sclerosis

Riluzole p. 1186 is licensed for use in patients with amyotrophic lateral sclerosis to extend life or to extend the time to mechanical ventilation—see *National funding/access decisions* under riluzole.

4.1 Dystonias and other involuntary movements

Essential tremor, chorea, tics, and related disorders

Drugs used in essential tremor, chorea, tics, and related disorders

Tetrabenazine p. 425 is mainly used to control movement disorders in Huntington's chorea and related disorders. Tetrabenazine can also be prescribed for the treatment of tardive dyskinesia if switching or withdrawing the causative antipsychotic drug is not effective. It acts by depleting nerve endings of dopamine. It is effective in only a proportion of patients and its use may be limited by the development of depression.

Haloperidol p. 404 [unlicensed indication], olanzapine p. 416 [unlicensed indication], risperidone p. 421 [unlicensed indication], and quetiapine p. 419 [unlicensed indication], can also be used to suppress chorea in Huntington's disease.

Haloperidol can also improve motor tics and symptoms of Tourette syndrome and related choreas. Other treatments for Tourette syndrome include pimozide p. 406 [unlicensed indication] (**important**: ECG monitoring required), clonidine hydrochloride p. 156 [unlicensed indication], and sulphiride p. 408 [unlicensed indication]. Trihexyphenidyl hydrochloride p. 431 in high dosage can also improve some movement disorders; it is sometimes necessary to build the dose up over many weeks. Chlorpromazine hydrochloride p. 402 and haloperidol are used to relieve intractable hiccup.

Propranolol hydrochloride p. 162 or another beta-adrenoceptor blocking drug may be useful in treating essential tremor or tremors associated with anxiety or thyrotoxicosis.

Primidone p. 352 in some cases provides relief from benign essential tremor; the dose is increased slowly to reduce side-effects.

Piracetam below is used as an adjunctive treatment for myoclonus of cortical origin. After an acute episode, attempts should be made every 6 months to decrease or discontinue treatment.

Riluzole p. 1186 is used to extend life in patients with motor neurone disease who have amyotrophic lateral sclerosis.

Torsion dystonia and other involuntary movements

Treatment with botulinum toxin type A p. 425 can be considered after an acquired non-progressive brain injury if rapid-onset spasticity causes postural or functional difficulties.

Other drugs used for Dystonias and other involuntary movements

Clozapine, p. 414 · Diazepam, p. 360 · Orphenadrine hydrochloride, p. 430 · Pericyazine, p. 406 · Pramipexole, p. 442 · Prochlorperazine, p. 407 · Procyclidine hydrochloride, p. 431 · Ropinirole, p. 444 · Rotigotine, p. 445 · Trifluoperazine, p. 408

ANTIPSYCHOTICS > FIRST-GENERATION

F 401

Promazine hydrochloride

INDICATIONS AND DOSE

Short-term adjunctive management of psychomotor agitation

▶ BY MOUTH

▶ Adult: 100–200 mg 4 times a day

Agitation and restlessness in elderly

▶ BY MOUTH

▶ Elderly: 25–50 mg 4 times a day

- **CONTRA-INDICATIONS** CNS depression · comatose states · pheochromocytoma
- **CAUTIONS** Cerebral arteriosclerosis
- **INTERACTIONS** → Appendix 1: phenothiazines
- **SIDE-EFFECTS** Apathy · autonomic dysfunction · cardiac arrest · cardiovascular effects · confusion · consciousness impaired · corneal opacity · epilepsy · eye discoloration · gastrointestinal disorder · glaucoma · haemolytic anaemia · headache · hepatic disorders · hyperpyrexia · hypersensitivity · hyperthermia (dose-related) · hypothermia (dose-related) · lens opacity · menstrual disorder · muscle rigidity · nasal congestion · photosensitivity reaction · skin reactions · urinary hesitation · vision blurred · withdrawal syndrome
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT**
Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **LESS SUITABLE FOR PRESCRIBING** Promazine hydrochloride is less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

CAUTIONARY AND ADVISORY LABELS 2

▶ Promazine hydrochloride (Non-proprietary)

Promazine hydrochloride 5 mg per 1 ml Promazine 25mg/5ml syrup | 150 ml [PoM] £26.96 DT = £26.96

Promazine 25mg/5ml oral solution | 150 ml [PoM] £26.96 DT = £26.96

Promazine hydrochloride 10 mg per 1 ml Promazine 50mg/5ml syrup | 150 ml [PoM] £33.15 DT = £33.15

Promazine 50mg/5ml oral solution | 150 ml [PoM] £33.15 DT = £33.15

Tablet

CAUTIONARY AND ADVISORY LABELS 2

▶ Promazine hydrochloride (Non-proprietary)

Promazine hydrochloride 25 mg Promazine 25mg tablets | 100 tablet [PoM] £49.99 DT = £47.97

Promazine hydrochloride 50 mg Promazine 50mg tablets | 100 tablet [PoM] £76.49 DT = £76.17

CNS STIMULANTS

Piracetam

INDICATIONS AND DOSE

Adjunctive treatment of cortical myoclonus

▶ BY MOUTH

▶ Adult: Initially 7.2 g daily in 2–3 divided doses, then increased in steps of 4.8 g every 3–4 days, adjusted according to response, subsequently, attempts should be made to reduce dose of concurrent therapy; maximum 24 g per day

- **CONTRA-INDICATIONS** Cerebral haemorrhage · Huntington's chorea
- **CAUTIONS** Gastric ulcer · history of haemorrhagic stroke · increased risk of bleeding · major surgery · underlying disorders of haemostasis
- **SIDE-EFFECTS**
▶ **Common or very common** Anxiety · movement disorders · weight increased
▶ **Uncommon** Asthenia · depression · drowsiness
▶ **Frequency not known** Angioedema · confusion · diarrhoea · epilepsy exacerbated · gastrointestinal discomfort · haemorrhagic disorder · hallucination · headache · insomnia · nausea · skin reactions · vertigo · vomiting

- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in combined hepatic and renal impairment.
Dose adjustments Manufacturer advises dose reduction in combined hepatic and renal impairment.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 20 mL/minute/1.73 m².
Dose adjustments Use two-thirds of normal dose if eGFR 50–80 mL/minute/1.73 m²; use one-third of normal dose in 2 divided doses if eGFR 30–50 mL/minute/1.73 m²; use one-sixth of normal dose as a single dose if eGFR 20–30 mL/minute/1.73 m².
- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **DIRECTIONS FOR ADMINISTRATION** Follow the oral solution with a glass of water (or soft drink) to reduce bitter taste.
- **PRESCRIBING AND DISPENSING INFORMATION** Piracetam has been used in children 16 years and over as adjunctive treatment for cortical myoclonus.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 3

- ▶ **Nootropil** (UCB Pharma Ltd)

Piracetam 333.3 mg per 1 mL Nootropil 33% oral solution sugar-free | 300 mL [PoM] £16.31 DT = £16.31

Tablet

CAUTIONARY AND ADVISORY LABELS 3

- ▶ **Nootropil** (UCB Pharma Ltd)

Piracetam 800 mg Nootropil 800mg tablets | 90 tablet [PoM] £11.75 DT = £11.75

Piracetam 1.2 gram Nootropil 1200mg tablets | 60 tablet [PoM] £10.97 DT = £10.97

MONOAMINE DEPLETING DRUGS**Tetrabenazine**● **INDICATIONS AND DOSE**

Movement disorders due to Huntington's chorea, hemiballismus, senile chorea, and related neurological conditions

- ▶ BY MOUTH

▶ **Adult:** Initially 25 mg 3 times a day, then increased, if tolerated, in steps of 25 mg every 3–4 days; maximum 200 mg per day

▶ **Elderly:** Lower initial dose may be necessary

Moderate to severe tardive dyskinesia

- ▶ BY MOUTH

▶ **Adult:** Initially 12.5 mg daily, dose to be gradually increased according to response

- **CONTRA-INDICATIONS** Depression · parkinsonism · phaeochromocytoma · prolactin-dependent tumours
- **CAUTIONS** Susceptibility to QT-interval prolongation
- **INTERACTIONS** → Appendix 1: tetrabenazine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anxiety · confusion · constipation · depression · diarrhoea · drowsiness · hypotension · insomnia · nausea · parkinsonism · vomiting
 - ▶ **Uncommon** Consciousness impaired · hyperthermia
 - ▶ **Rare or very rare** Neuroleptic malignant syndrome · skeletal muscle damage
 - ▶ **Frequency not known** Bradycardia · dizziness · dry mouth · epigastric pain · suicidal ideation
- **PREGNANCY** Avoid unless essential—*toxicity in animal studies.*
- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of exposure), particularly in severe impairment (no information available).
Dose adjustments Manufacturer advises initial dose reduction of 50% and slower dose titration in mild to moderate impairment.
- **RENAL IMPAIRMENT** Use with caution.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
Tablet

MUSCLE RELAXANTS > PERIPHERALLY ACTING > NEUROTOXINS (BOTULINUM TOXINS)**Botulinum toxin type A**

27-Nov-2019

● **INDICATIONS AND DOSE**

Hand and wrist disability due to upper limb spasticity associated with stroke (specialist use only) | Foot and ankle disability due to lower limb spasticity associated with stroke (specialist use only) | Blepharospasm (specialist use only) | Hemifacial spasm (specialist use only) | Spasmodic torticollis (specialist use only) | Severe hyperhidrosis of the axillae (specialist use only) | Prophylaxis of headaches in chronic migraine (specialist use only) | Temporary improvement of moderate to severe upper facial lines in adults under 65 years (specialist use only) | Management of bladder dysfunctions (specialist use only) | Chronic sialorrhoea [due to neurological disorders] (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRADERMAL INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY LOCAL INFILTRATION

- ▶ **Adult:** (consult product literature)

DOSE EQUIVALENCE AND CONVERSION

- ▶ **Important:** information is specific to each individual preparation.

- **CONTRA-INDICATIONS** Acute urinary retention (specific to use in bladder disorders only) · catheterisation difficulties (specific to use in bladder disorders only) · infection at injection site · presence of bladder calculi (specific to use in bladder disorders only) · urinary tract infection (specific to use in bladder disorders only)

● **CAUTIONS**

GENERAL CAUTIONS Atrophy in target muscle · chronic respiratory disorder · elderly · excessive weakness in target muscle · history of aspiration · history of dysphagia · inflammation in target muscle · neurological disorders · neuromuscular disorders · off-label use (fatal adverse events reported)

SPECIFIC CAUTIONS

- ▶ When used for blepharospasm or hemifacial spasm Risk of angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION Neuromuscular or neurological disorders can lead to increased sensitivity and

exaggerated muscle weakness including dysphagia and respiratory compromise.

- ▶ **Blepharospasm or hemifacial spasm** When used for blepharospasm and hemifacial spasm, reduced blinking can lead to corneal exposure, persistent epithelial defect and corneal ulceration (especially in those with VIIth nerve disorders)—careful testing of corneal sensation in previously operated eyes, avoidance of injection in lower lid area to avoid ectropion, and vigorous treatment of epithelial defect needed.
 - **INTERACTIONS** → Appendix 1: botulinum toxins
 - **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · asthenia · autonomic dysreflexia · bladder diverticulum · constipation · dizziness · drowsiness · dry eye · dry mouth · dysphagia (most common after injection into sternocleidomastoid muscle and salivary gland) · ecchymosis (minimised by applying gentle pressure at injection site immediately after injection) · eye discomfort · eye disorders · eye inflammation · fall · fever · gait abnormal · haematuria · headaches · hot flush · increased risk of infection · influenza like illness · insomnia · joint disorders · leukocyturia · malaise · muscle complaints · muscle weakness · musculoskeletal stiffness · nausea · neuromuscular dysfunction · oedema · pain · paresis · sensation abnormal · skin reactions · subcutaneous nodule · urinary disorders · vision disorders
 - ▶ **Uncommon** Anxiety · coordination abnormal · depression · dysphonia · dyspnoea · facial paralysis · memory loss · oral paraesthesia · photosensitivity reaction · postural hypotension · speech impairment · taste altered · vertigo
 - ▶ **Frequency not known** Abdominal pain · angioedema · angle closure glaucoma · appetite decreased · arrhythmia · diarrhoea · hearing impairment · hypersensitivity · myocardial infarction · myopathy · nerve disorders · respiratory disorders · seizure · syncope · tinnitus · vomiting
 - **CONCEPTION AND CONTRACEPTION** Avoid in women of child-bearing age unless using effective contraception.
 - **PREGNANCY** Avoid unless essential—toxicity in *animal studies* (manufacturer of *Botox*® advise avoid).
 - **BREAST FEEDING** Low risk of systemic absorption but avoid unless essential.
 - **PRESCRIBING AND DISPENSING INFORMATION** Preparations are not interchangeable.
 - **PATIENT AND CARER ADVICE** Patients and carers should be warned of the signs and symptoms of toxin spread, such as muscle weakness and breathing difficulties; they should be advised to seek immediate medical attention if swallowing, speech or breathing difficulties occur.
 - **NATIONAL FUNDING/ACCESS DECISIONS**
 - **NICE decisions**
 - ▶ **Botulinum toxin type A for the prevention of headaches in adults with chronic migraine (June 2012)** NICE TA260 Botulinum toxin type A (*Botox*®) is recommended as an option for the prophylaxis of headaches in adults with chronic migraine, (defined as headaches on at least 15 days per month, of which at least 8 days are with migraine):
 - that has not responded to at least three prior pharmacological prophylaxis therapies, **and**
 - whose condition is appropriately managed for medication overuse.
- Treatment should be stopped in people whose condition:
- is not adequately responding to treatment (defined as less than a 30% reduction in headache days per month after two treatment cycles), **or**
 - has changed to episodic migraine (defined as fewer than 15 headache days per month) for three consecutive months.
- Patients currently receiving treatment that is not as recommended above should have the option to continue

treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta260

- ▶ **Xeomin**® (botulinum neurotoxin type A) for treating chronic sialorrhoea (October 2019) NICE TA605

Xeomin® (botulinum neurotoxin type A) is recommended, within its marketing authorisation, as an option for treating chronic sialorrhoea caused by neurological conditions in adults. It is recommended only if the manufacturer provides it according to the commercial arrangement.

www.nice.org.uk/guidance/ta605

Scottish Medicines Consortium (SMC) decisions

SMC No. 931/13

The *Scottish Medicines Consortium* has advised (July 2014) that botulinum toxin type A (*Botox*®) is accepted for restricted use within NHS Scotland for the management of bladder dysfunctions in adults who are not adequately managed with anticholinergics (overactive bladder with symptoms of urinary incontinence, urgency and frequency), who have failed appropriate oral treatment options.

SMC No. 692/11

The *Scottish Medicines Consortium* has advised (February 2017) that botulinum toxin type A (*Botox*®) is accepted for restricted use within NHS Scotland for the prophylaxis of headaches in adults with chronic migraine, (defined as headaches on at least 15 days per month, of which at least 8 days are with migraine), that has not responded to at least three prior oral pharmacological prophylaxis therapies and whose condition is appropriately managed for medication overuse.

SMC No. 5MC2212

The *Scottish Medicines Consortium* has advised (November 2019) that clostridium botulinum neurotoxin type A (*Xeomin*®) is accepted for use within NHS Scotland for the symptomatic treatment of chronic sialorrhoea due to neurological disorders in adults.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

 - **Botulinum toxin type A 200 unit** Xeomin 200unit powder for solution for injection vials | 1 vial [PoM] £259.80 (Hospital only)

Botulinum toxin type B

● INDICATIONS AND DOSE

Spasmodic torticollis (cervical dystonia) (specialist use only)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 5000–10 000 units, adjusted according to response, dose to be divided between 2–4 most affected muscles

DOSE EQUIVALENCE AND CONVERSION

- ▶ **Important:** information specific to each individual preparation.

- **CONTRA-INDICATIONS** Neuromuscular disorders · neuromuscular junctional disorders
- **CAUTIONS** History of dysphagia or aspiration · off-label use (risk of toxin spread) · tolerance may occur
- **INTERACTIONS** → Appendix 1: botulinum toxins
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dry mouth · dysphagia · dysphonia · headache · influenza like illness · muscle weakness · neck pain · taste altered · vision disorders
 - ▶ **Frequency not known** Angioedema · asthenia · constipation · dyspnoea · pneumonia aspiration · ptosis · skin reactions · vomiting
- **PREGNANCY** Low risk of systemic absorption but avoid unless essential.
- **BREAST FEEDING** Low risk of systemic absorption but avoid unless essential.
- **DIRECTIONS FOR ADMINISTRATION** Injection may be diluted with sodium chloride 0.9%.
- **PRESCRIBING AND DISPENSING INFORMATION Important:** not interchangeable with other botulinum toxin preparations.
- **PATIENT AND CARER ADVICE** Patients should be warned of the signs and symptoms of toxin spread, such as muscle weakness and breathing difficulties; they should be advised to seek immediate medical attention if swallowing, speech or breathing difficulties occur.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **NeuroBloc** (Sloan Pharma Sarl)
Botulinum toxin type B 5000 unit per 1 ml NeuroBloc 5,000units/1ml solution for injection vials | 1 vial [PoM](#) £148.27 (Hospital only)
NeuroBloc 10,000units/2ml solution for injection vials | 1 vial [PoM](#) £197.69 (Hospital only)
NeuroBloc 2,500units/0.5ml solution for injection vials | 1 vial [PoM](#) £111.20 (Hospital only)

NEUROPROTECTIVE DRUGS

Inotersen

06-Jun-2019

- **DRUG ACTION** Inotersen is an antisense oligonucleotide inhibitor which inhibits transthyretin production.

● INDICATIONS AND DOSE

Stage 1 or stage 2 polyneuropathy in patients with hereditary transthyretin amyloidosis (hATTR) (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 284 mg once weekly, for dose adjustments due to side-effects and information on Vitamin A supplementation—consult product literature

- **CONTRA-INDICATIONS** Patients undergoing liver transplantation (no information available) · platelet count less than 100×10^9 /litre before starting treatment · urine

protein to creatinine ratio (UPCR) greater than or equal to 113 mg/mmol before starting treatment

- **CAUTIONS** Concomitant administration with nephrotoxic drugs · elderly · history of major bleeding
- **INTERACTIONS** → Appendix 1: inotersen
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · appetite decreased · chills · eosinophilia · fever · glomerulonephritis · haematoma · headache · hypotension · influenza like illness · nausea · peripheral oedema · peripheral swelling · proteinuria · renal impairment · skin reactions · thrombocytopenia · vomiting
 - ▶ **Frequency not known** Intracranial haemorrhage · vitamin A deficiency
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during treatment; if conception is planned, inotersen and vitamin A supplementation should be stopped and vitamin A levels monitored—consult product literature.
- **PREGNANCY** Manufacturer advises avoid unless essential (limited information available)—potential teratogenic risk due to unbalanced vitamin A levels, consult product literature.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 45 mL/minute/1.73 m².
- **PRE-TREATMENT SCREENING** Manufacturer advises plasma vitamin A levels below the lower limit of normal should be corrected and any ocular symptoms or signs of vitamin A deficiency should have resolved before starting treatment.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor platelet count before starting treatment, every 2 weeks during treatment, and for 8 weeks after stopping treatment—consult product literature.
 - ▶ Manufacturer advises monitor UPCR and eGFR before starting treatment, every 3 months or more frequently as clinically indicated during treatment, and for 8 weeks after stopping treatment—consult product literature.
 - ▶ Manufacturer advises monitor hepatic enzymes before starting treatment, then 4 months after starting treatment, and annually thereafter or more frequently as clinically indicated.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to take the syringe out of the refrigerator at least 30 minutes before administration. Patients may self-administer *Tegsedi*® after appropriate training in subcutaneous injection technique.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients should immediately report any signs of unusual or prolonged bleeding, neck stiffness, or atypical severe headache.
Self-administration Manufacturer advises patients and carers should be given training in subcutaneous injection technique.
Missed doses If a dose is missed, the next dose should be administered as soon as possible, unless the next scheduled dose is within 2 days, in which case the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Inotersen** for treating hereditary transthyretin amyloidosis (May 2019) NICE HST9
- Inotersen is recommended, within its marketing authorisation, as an option for treating stage 1 and stage 2 polyneuropathy in adults with hereditary transthyretin amyloidosis. It is recommended only if the manufacturer provides inotersen according to the commercial arrangement.

www.nice.org.uk/guidance/hst9

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2188

The *Scottish Medicines Consortium* has advised (August 2019) that inotersen (*Tegsedi*®) is accepted for use within NHS Scotland for the treatment of stage 1 or stage 2 polyneuropathy in adults with hereditary transthyretin amyloidosis (hATTR). This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Tegsedi** (Akcea Therapeutics UK Ltd) ▼

Inotersen (as inotersen sodium) 189.33 mg per 1 mL Tegsedi 284mg/1.5mL solution for injection pre-filled syringes | 4 pre-filled disposable injection [PoM] £23,700.00

Patisiran

12-Sep-2019

- **DRUG ACTION** Patisiran is a double-stranded small interfering RNA which reduces transthyretin production.

● INDICATIONS AND DOSE

Stage 1 or stage 2 polyneuropathy in patients with hereditary transthyretin amyloidosis (hATTR) (initiated under specialist supervision)

- ▶ **BY INTRAVENOUS INFUSION**

▶ **Adult:** 300 micrograms/kg every 3 weeks (max. per dose 30 mg), dosage is based on actual body weight, for information on premedication, vitamin A supplementation, and missed doses—consult product literature

● SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · dyspepsia · dyspnoea · erythema · increased risk of infection · infusion related reaction · muscle spasms · peripheral oedema · vertigo
- ▶ **Frequency not known** Vitamin A deficiency

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during treatment; if conception is planned, patisiran and vitamin A supplementation should be stopped and vitamin A levels monitored—consult product literature.

- **PREGNANCY** Manufacturer advises avoid unless essential (limited information available)—potential teratogenic risk due to unbalanced vitamin A levels, consult product literature.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate or severe impairment (no information available).

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).

- **PRE-TREATMENT SCREENING** Manufacturer advises plasma vitamin A levels below the lower limit of normal should be corrected and any ocular symptoms or signs of vitamin A deficiency should be evaluated before starting treatment.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion* (*Onpattro*®), filter through 0.45-micron syringe filter and dilute requisite dose with Sodium Chloride 0.9% to final volume of 200 mL; use a DEHP-free infusion set and give over about 80 minutes through an in-line filter (1.2 micron) at a rate of about 1 mL/minute for the first 15 minutes, then increase to about 3 mL/minute for the remainder of the infusion.

● PRESCRIBING AND DISPENSING INFORMATION

Manufacturer advises patients should receive pre-medication (to reduce the risk of infusion-related reactions)—consult product literature.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for further information regarding storage outside refrigerator.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Patisiran** for treating hereditary transthyretin amyloidosis (August 2019) NICE HST10

Patisiran (*Onpattro*®) is recommended, within its marketing authorisation, as an option for treating hereditary transthyretin amyloidosis in adults with stage 1 and stage 2 polyneuropathy. It is recommended only if the manufacturer provides patisiran according to the commercial arrangement.

www.nice.org.uk/guidance/hst10

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2157

The *Scottish Medicines Consortium* has advised (June 2019) that patisiran (*Onpattro*®) is accepted for use within NHS Scotland for the treatment of hereditary transthyretin-mediated amyloidosis (hATTR) in adults with stage 1 or stage 2 polyneuropathy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

4.2 Parkinson's disease

Parkinson's disease

19-Feb-2020

Description of condition

Parkinson's disease is a progressive neurodegenerative condition resulting from the death of dopaminergic cells of the substantia nigra in the brain.

Patients with Parkinson's disease classically present with motor-symptoms including hypokinesia, bradykinesia, rigidity, rest tremor, and postural instability.

Non-motor symptoms include dementia, depression, sleep disturbances, bladder and bowel dysfunction, speech and language changes, swallowing problems and weight loss.

EvGr Patients with suspected Parkinson's disease should be referred to a specialist and reviewed every 6 to 12 months. When Parkinson's disease diagnosis is confirmed, patients should be advised to inform the DVLA and their car insurer.

Aims of treatment

Parkinson's disease is an incurable progressive condition, and the aim of treatment is to control the symptoms and to improve the patient's quality of life.

Non-drug treatment

EvGr Parkinson's disease patients should be offered physiotherapy if balance or motor function problems are present, speech and language therapy if they develop communication, swallowing or saliva problems, and occupational therapy if they experience difficulties with their daily activities. Dietitian referral should be considered. ⚠

Drug treatment

Drug management of motor symptoms in Parkinson's disease

First-line treatment

EvGr In early stages of Parkinson's disease, patients whose motor symptoms decrease their quality of life should be offered *levodopa* combined with *carbidopa* (co-careldopa p. 434) or *benserazide* (co-beneldopa p. 433).

Parkinson's disease patients whose motor symptoms do not affect their quality of life, could be prescribed a choice of *levodopa*, *non-ergot-derived dopamine-receptor agonists* (pramipexole p. 442, ropinirole p. 444 or rotigotine p. 445) or *monoamine-oxidase-B inhibitors* (rasagiline p. 446 or selegiline hydrochloride p. 447).

Before starting antiparkinsonian treatment, the patient's individual circumstances, including symptoms, comorbidities and preferences, should be discussed together with the potential benefits and harms from the different drugs available.

Patients and their carers should be informed about the risk of adverse reactions from antiparkinsonian drugs, including psychotic symptoms, excessive sleepiness and sudden onset of sleep with dopamine-receptor agonists, and impulse control disorders with all dopaminergic therapy (especially dopamine-receptor agonists). For further information see *Impulse control disorders*. ⚠

Levodopa treatment is associated with motor complications, including response fluctuations and dyskinesias. Response fluctuations are characterised by large variations in motor performance, with normal function

during the 'on' period, and weakness and restricted mobility during the 'off' period. 'End-of-dose' deterioration with progressively shorter duration of benefit can also occur. Modified-release preparations may help with 'end-of-dose' deterioration or nocturnal immobility.

The overall improvement in motor performance is more noticeable with *levodopa* than with *dopamine-receptor agonists*, and motor complications are less likely to occur with *dopamine-receptor agonists* when used alone long-term. Conversely, excessive sleepiness, hallucinations, and impulse control disorders are more likely to occur with *dopamine-receptor agonists* than with *levodopa*.

EvGr To avoid the potential for acute akinesia or neuroleptic malignant syndrome, antiparkinsonian drug concentrations should not be allowed to fall suddenly due to poor absorption or abrupt withdrawal. ⚠

Adjuvant therapy

EvGr If a patient with Parkinson's disease develops dyskinesia or motor fluctuations, specialist advice should be sought before modifying antiparkinsonian drug therapy.

Patients who develop dyskinesia or motor fluctuations despite optimal *levodopa* therapy should be offered a choice of *non-ergotic dopamine-receptor agonists* (pramipexole, ropinirole, rotigotine), *monoamine oxidase B inhibitors* (rasagiline or selegiline hydrochloride) or COMT inhibitors (entacapone p. 432 or tolcapone p. 432) as an adjunct to *levodopa*.

An *ergot-derived dopamine-receptor agonist* (bromocriptine p. 439, cabergoline p. 440 or pergolide p. 441) should **only** be considered as an adjunct to *levodopa* if symptoms are not adequately controlled with a *non-ergot-derived dopamine-receptor agonist*.

If dyskinesia is not adequately managed by modifying existing therapy, amantadine hydrochloride p. 437 should be considered. ⚠

Drug management of non-motor symptoms in Parkinson's disease

Daytime sleepiness and sudden onset of sleep

EvGr Patients who experience daytime sleepiness or sudden onset of sleep, should have their Parkinson's drug treatment adjusted under specialist medical guidance. If reversible pharmacological and physical causes have been excluded, modafinil p. 514 should be considered to treat excessive daytime sleepiness, and treatment should be reviewed at least every 12 months.

Patients with Parkinson's disease who have daytime sleepiness or sudden onset of sleep should be advised not to drive, to inform the DVLA about their symptoms, and to think about any occupational hazards. ⚠

Nocturnal akinesia

EvGr When treating nocturnal akinesia in patients with Parkinson's disease, *levodopa* or oral *dopamine-receptor agonists* should be considered as first-line options and rotigotine p. 445 as second-line (if both *levodopa* or oral *dopamine-receptor agonists* are ineffective). ⚠

Postural hypotension

EvGr Patients with Parkinson's disease who develop postural hypotension should have their drug treatment reviewed to address any pharmacological cause. If drug therapy is required, midodrine hydrochloride p. 199 should be considered as the first option and fludrocortisone acetate p. 713 [unlicensed indication] as an alternative. ⚠

Depression

See Antidepressant drugs p. 376.

Psychotic symptoms

EvGr Hallucinations and delusions need not be treated if they are well tolerated. Otherwise, the dosage of any antiparkinsonism drugs that might have triggered hallucinations or delusions should be reduced, taking into account the severity of symptoms and possible withdrawal

effects. Specialist advice should be sought before modifying drug treatment.

In Parkinson's disease patients with no cognitive impairment, quetiapine p. 419 [unlicensed indication] can be considered to treat hallucinations and delusions. If standard treatment is not effective, clozapine p. 414 should be offered to treat hallucinations and delusions in patients with Parkinson's disease. **A** It is important to acknowledge that other antipsychotic medicines (such as phenothiazines and butyrophenones) can worsen the motor features of Parkinson's disease.

Rapid eye movement sleep behaviour disorder

EvGr Clonazepam p. 354 [unlicensed indication] or melatonin p. 511 [unlicensed indication] should be considered to treat rapid eye movement sleep behaviour disorder in Parkinson's patients once possible pharmacological causes have been addressed. **A**

Drooling of saliva

EvGr Drug treatment for drooling of saliva in patients with Parkinson's disease should only be considered if non-drug treatment such as speech and language therapy is not available or is ineffective.

Glycopyrronium bromide p. 1405 [unlicensed indication] should be considered as first-line treatment and botulinum toxin type A p. 425 [unlicensed indication] as second-line.

Other antimuscarinic drugs, should only be considered if the risk of cognitive adverse effects is thought to be minimal; topical preparations, such as *atropine* [unlicensed indication], should be used if possible to reduce the risk of adverse events. **A**

Parkinson's disease dementia

EvGr An acetylcholinesterase inhibitor should be offered to patients with mild-to-moderate Parkinson's disease dementia and considered for patients with severe Parkinson's disease dementia [unlicensed indications apart from rivastigmine capsules and oral solution p. 318 for the treatment of mild-to-moderate dementia in patients with Parkinson's disease]. If acetylcholinesterase inhibitors are not tolerated or contra-indicated, memantine hydrochloride p. 320 [unlicensed indication] should be considered. **A** For further information see Dementia p. 315

Advanced Parkinson's disease

EvGr Patients with advanced Parkinson's disease can be offered apomorphine hydrochloride p. 438 as intermittent injections or continuous subcutaneous infusions. **A** To control nausea and vomiting associated with *apomorphine*, the manufacturers recommend that administration of domperidone p. 451 [unlicensed in those weighing less than 35 kg] will usually need to be started two days before *apomorphine* therapy, and then discontinued as soon as possible. To reduce the risk of serious arrhythmia due to QT prolongation associated to the concomitant use of domperidone p. 451 and apomorphine hydrochloride p. 438, the MHRA and CHM (2016) recommend an assessment of cardiac risk factors and ECG monitoring and to ensure that the benefits outweighs the risks when initiating treatment. In addition, the MHRA and CHM (2019) have released important safety information and restrictions regarding the use of domperidone for nausea and vomiting in those weighing less than 35 kg, and a reminder of contra-indications. For further information, see *Important safety information* for domperidone p. 451.

Levodopa-carbidopa intestinal gel is used for the treatment of advanced levodopa-responsive Parkinson's disease with severe motor fluctuations and hyperkinesia or dyskinesia. The gel is administered with a portable pump directly into the duodenum or upper jejunum.

EvGr Deep brain stimulation should *only* be considered for patients with advanced Parkinson's disease whose symptoms are not adequately controlled by best drug therapy. **A**

Impulse control disorders

Impulse control disorders (compulsive gambling, hypersexuality, binge eating, or obsessive shopping) can develop in a person with Parkinson's disease who is on any dopaminergic therapy at any stage in the disease course particularly if the patient has a history of previous impulsive behaviours, alcohol consumption, or smoking. **EvGr** Patients should be informed about the different types of impulse control disorders and that dopamine-receptor agonist therapy may be reduced or stopped if problematic impulse control disorders develop.

When managing impulse control disorders, dopamine-receptor agonist doses should be reduced gradually and patients should be monitored for symptoms of dopamine agonist withdrawal. Specialist cognitive behavioural therapy should be offered if modifying dopaminergic therapy is not effective. **A**

ANTIMUSCARINICS

Orphenadrine hydrochloride

20-Dec-2019

● **DRUG ACTION** Orphenadrine exerts its antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

● INDICATIONS AND DOSE

Parkinsonism | Drug-induced extrapyramidal symptoms (but not tardive dyskinesia)

- ▶ BY MOUTH
- ▶ **Adult:** Initially 150 mg daily in divided doses, then increased in steps of 50 mg every 2–3 days, adjusted according to response; usual dose 150–300 mg daily in divided doses; maximum 400 mg per day
- ▶ **Elderly:** Preferably dose at lower end of range

● **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · gastro-intestinal obstruction

● **CAUTIONS** Cardiovascular disease · elderly · hypertension · in patients susceptible to angle-closure glaucoma · liable to abuse · prostatic hypertrophy · psychotic disorders · pyrexia

● **INTERACTIONS** → Appendix 1: orphenadrine

● SIDE-EFFECTS

- ▶ **Common or very common** Accommodation disorder · anxiety · dizziness · dry mouth · gastrointestinal disorder · nausea
- ▶ **Uncommon** Confusion · constipation · coordination abnormal · euphoric mood · hallucination · insomnia · sedation · seizure · tachycardia · urinary retention
- ▶ **Rare or very rare** Memory loss

● **PREGNANCY** Caution.

● **BREAST FEEDING** Caution.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution.

● **RENAL IMPAIRMENT** Use with caution.

● **TREATMENT CESSATION** Avoid abrupt withdrawal in patients taking long-term treatment.

● PATIENT AND CARER ADVICE

Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Oral solution

- ▶ **Orphenadrine hydrochloride (Non-proprietary)**

Orphenadrine hydrochloride 10 mg per 1 ml Orphenadrine 50mg/5ml oral solution sugar-free | 150 ml [PoM] £45.30 DT = £42.76

Procyclidine hydrochloride

31-Oct-2019

- **DRUG ACTION** Procyclidine exerts its antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

● INDICATIONS AND DOSE

Parkinsonism | Extrapyramidal symptoms (but not tardive dyskinesia)

▶ BY MOUTH

- ▶ Adult: 2.5 mg 3 times a day, then increased in steps of 2.5–5 mg daily if required; increased if necessary up to 30 mg daily in 2–4 divided doses, to be increased at 2–3 day intervals. Maximum daily dose only to be used in exceptional circumstances; maximum 60 mg per day
- ▶ Elderly: Lower end of range preferable

Acute dystonia

▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- ▶ Adult: 5–10 mg, occasionally, more than 10 mg, dose usually effective in 5–10 minutes but may need 30 minutes for relief
- ▶ Elderly: Lower end of range preferable

- **CONTRA-INDICATIONS** Gastro-intestinal obstruction
- **CAUTIONS** Cardiovascular disease · elderly · hypertension · liable to abuse · prostatic hypertrophy · psychotic disorders · pyrexia · those susceptible to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1: procyclidine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Constipation · dry mouth · urinary retention · vision blurred
 - ▶ **Uncommon** Anxiety · cognitive impairment · confusion · dizziness · gingivitis · hallucination · memory loss · nausea · rash · vomiting
 - ▶ **Rare or very rare** Psychotic disorder
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** No information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Use with caution.
- **TREATMENT CESSATION** Avoid abrupt withdrawal in patients taking long-term treatment.
- **PATIENT AND CARER ADVICE** Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection

- ▶ **Procyclidine hydrochloride (Non-proprietary)**

Procyclidine hydrochloride 5 mg per 1 ml Procyclidine 10mg/2ml solution for injection ampoules | 5 ampoule [PoM] £72.50-£73.16 DT = £73.16

Oral solution

- ▶ **Procyclidine hydrochloride (Non-proprietary)**

Procyclidine hydrochloride 500 microgram per 1 ml Procyclidine 2.5mg/5ml oral solution sugar-free | 150 ml [PoM] £17.10 DT = £14.02
Procyclidine hydrochloride 1 mg per 1 ml Procyclidine 5mg/5ml oral solution sugar-free | 150 ml [PoM] £24.63 DT = £21.67

Tablet

- ▶ **Procyclidine hydrochloride (Non-proprietary)**

Procyclidine hydrochloride 5 mg Procyclidine 5mg tablets | 28 tablet [PoM] £12.65 DT = £1.62 | 100 tablet [PoM] £5.79-£8.94 | 500 tablet [PoM] £28.93-£44.63

- ▶ **Kemadrin (Aspen Pharma Trading Ltd)**

Procyclidine hydrochloride 5 mg Kemadrin 5mg tablets | 100 tablet [PoM] £4.72 | 500 tablet [PoM] £23.62

Trihexyphenidyl hydrochloride

10-Jul-2019

(Benzhexol hydrochloride)

- **DRUG ACTION** Trihexyphenidyl exerts its effects by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

● INDICATIONS AND DOSE

Parkinson's disease (if used in combination with co-careldopa or co-beneldopa)

▶ BY MOUTH

- ▶ Adult: Maintenance 2–6 mg daily in divided doses, use not recommended because of toxicity in the elderly and the risk of aggravating dementia

Parkinsonism | Drug-induced extrapyramidal symptoms (but not tardive dyskinesia)

▶ BY MOUTH

- ▶ Adult: 1 mg daily, then increased in steps of 2 mg every 3–5 days, adjusted according to response; maintenance 5–15 mg daily in 3–4 divided doses, not recommended for use in Parkinson's disease because of toxicity in the elderly and the risk of aggravating dementia; maximum 20 mg per day
- ▶ Elderly: Lower end of range preferable, not recommended for use in Parkinson's disease because of toxicity in the elderly and the risk of aggravating dementia

- **CONTRA-INDICATIONS** Myasthenia gravis
- **CAUTIONS** Cardiovascular disease · elderly · gastro-intestinal obstruction · hypertension · liable to abuse · prostatic hypertrophy · psychotic disorders · pyrexia · those susceptible to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1: trihexyphenidyl
- **SIDE-EFFECTS** Anxiety · bronchial secretion decreased · confusion · constipation · delusions · dizziness · dry mouth · dysphagia · euphoric mood · fever · flushing · hallucination · insomnia · memory loss · myasthenia gravis aggravated · mydriasis · nausea · skin reactions · tachycardia · thirst · urinary disorders · vision disorders · vomiting
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Use with caution.
- **TREATMENT CESSATION** Avoid abrupt withdrawal in patients taking long-term treatment.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken with or after food.
- **PATIENT AND CARER ADVICE** Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

EXCIPIENTS: May contain Propylene glycol

- ▶ **Trihexyphenidyl hydrochloride (Non-proprietary)**

Trihexyphenidyl hydrochloride 1 mg per 1 ml Trihexyphenidyl 5mg/5ml oral solution | 200 ml [PoM] £31.60 DT = £27.47

Tablet

- ▶ **Trihexyphenidyl hydrochloride (Non-proprietary)**
Trihexyphenidyl hydrochloride 2 mg Trihexyphenidyl 2mg tablets
| 84 tablet [PoM](#) £13.50 DT = £4.65
- Trihexyphenidyl hydrochloride 5 mg Trihexyphenidyl 5mg tablets
| 84 tablet [PoM](#) £21.00 DT = £19.48

DOPAMINERGIC DRUGS > CATECHOL-O-METHYLTRANSFERASE INHIBITORS**Entacapone**

26-May-2020

- **DRUG ACTION** Entacapone prevents the peripheral breakdown of levodopa, by inhibiting catechol-O-methyltransferase, allowing more levodopa to reach the brain.

INDICATIONS AND DOSE

Adjunct to co-beneldopa or co-careldopa in Parkinson's disease with 'end-of-dose' motor fluctuations (under expert supervision)

- ▶ **BY MOUTH**
- ▶ **Adult:** 200 mg, dose to be given with each dose of levodopa with dopa-decarboxylase inhibitor; maximum 2 g per day
- **CONTRA-INDICATIONS** History of neuroleptic malignant syndrome · history of non-traumatic rhabdomyolysis · phaeochromocytoma
- **CAUTIONS** Concurrent levodopa dose may need to be reduced by about 10–30% · ischaemic heart disease
- **INTERACTIONS** → Appendix 1: entacapone
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · confusion · constipation · diarrhoea · dizziness · dry mouth · fall · fatigue · hallucination · hyperhidrosis · ischaemic heart disease · movement disorders · nausea · sleep disorders · urine discolouration · vomiting
 - ▶ **Uncommon** Myocardial infarction
 - ▶ **Rare or very rare** Agitation · appetite decreased · skin reactions · weight decreased
 - ▶ **Frequency not known** Colitis · drowsiness · hair colour changes · hepatic disorders · impulse-control disorder · nail discolouration · neuroleptic malignant syndrome · rhabdomyolysis
- **PREGNANCY** Avoid—no information available.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **PATIENT AND CARER ADVICE** Patient counselling is advised (may colour urine reddish-brown, concomitant iron containing products).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 14

- ▶ **Entacapone (Non-proprietary)**
Entacapone 200 mg Entacapone 200mg tablets | 30 tablet [PoM](#)
£16.38 DT = £3.60 | 100 tablet [PoM](#) £11.93-£54.58
- ▶ **Comtess (Orion Pharma (UK) Ltd)**
Entacapone 200 mg Comtess 200mg tablets | 30 tablet [PoM](#)
£17.24 DT = £3.60 | 100 tablet [PoM](#) £57.45

Combinations available: *Levodopa with carbidopa and entacapone*, p. 436

Opicapone

11-Apr-2017

- **DRUG ACTION** Opicapone prevents the peripheral breakdown of levodopa, by inhibiting catechol-O-methyltransferase, allowing more levodopa to reach the brain.

INDICATIONS AND DOSE

Adjunct to co-beneldopa or co-careldopa in Parkinson's disease with 'end-of-dose' motor fluctuations (under expert supervision)

- ▶ **BY MOUTH**
- ▶ **Adult:** 50 mg once daily, dose to be taken at bedtime, at least one hour before or after levodopa combinations
- **CONTRA-INDICATIONS** Catecholamine-secreting neoplasms · history of neuroleptic malignant syndrome · history of non-traumatic rhabdomyolysis · paraganglioma · phaeochromocytoma
- **CAUTIONS** Concurrent levodopa dose may need to be reduced · elderly over 85 years (limited information available)
- **INTERACTIONS** → Appendix 1: opicapone
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Constipation · dizziness · drowsiness · dry mouth · hallucinations · headache · hypotension · movement disorders · muscle complaints · sleep disorders · vomiting
 - ▶ **Uncommon** Anxiety · appetite decreased · depression · dry eye · dyspnoea · ear congestion · gastrointestinal discomfort · hypertension · hypertriglyceridaemia · musculoskeletal stiffness · nocturia · pain in extremity · palpitations · syncope · taste altered · urine discolouration · weight decreased
- **SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises consider liver function tests in patients who experience progressive anorexia, asthenia and weight decrease within a relatively short period of time.
- **PREGNANCY** Manufacturer advises avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment (risk of increased exposure); avoid in severe impairment (no information available).

Dose adjustments Manufacturer advises consider dose reduction in moderate impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

- ▶ **Ongentys (BIAL Pharma UK Ltd)** ▼
Opicapone 50 mg Ongentys 50mg capsules | 30 capsule [PoM](#)
£93.90 DT = £93.90

Tolcapone

26-May-2020

- **DRUG ACTION** Tolcapone prevents the peripheral breakdown of levodopa, by inhibiting catechol-O-methyltransferase, allowing more levodopa to reach the brain.

INDICATIONS AND DOSE

Adjunct to co-beneldopa or co-careldopa in Parkinson's disease with 'end-of-dose' motor fluctuations if another inhibitor of peripheral catechol-O-methyltransferase inappropriate (under expert supervision)

- ▶ **BY MOUTH**
- ▶ **Adult:** 100 mg 3 times a day (max. per dose 200 mg 3 times a day) continuing beyond 3 weeks **only** if substantial improvement, leave 6 hours between each

dose; first daily dose should be taken at the same time as levodopa with dopa-decarboxylase inhibitor, dose maximum only in exceptional circumstances

- **CONTRA-INDICATIONS** Pheochromocytoma · previous history of hyperthermia · previous history of neuroleptic malignant syndrome · previous history of rhabdomyolysis · severe dyskinesia
- **CAUTIONS** Most patients receiving more than 600 mg levodopa daily require reduction of levodopa dose by about 30%
- CAUTIONS, FURTHER INFORMATION**
 - ▶ Hepatotoxicity Potentially life-threatening hepatotoxicity including fulminant hepatitis reported rarely, usually in women and during the first 6 months, but late-onset liver injury also reported; discontinue if abnormal liver function tests or symptoms of liver disorder; do not re-introduce tolcopone once discontinued.
- **INTERACTIONS** → Appendix 1: tolcopone
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Appetite decreased · chest pain · confusion · constipation · diarrhoea · dizziness · drowsiness · dry mouth · gastrointestinal discomfort · hallucination · headache · hyperhidrosis · influenza like illness · movement disorders · nausea · postural hypotension · sleep disorders · syncope · upper respiratory tract infection · urine discolouration · vomiting
 - ▶ **Uncommon** Hepatocellular injury
 - ▶ **Rare or very rare** Eating disorders · neuroleptic malignant syndrome (reported on dose reduction or withdrawal) · pathological gambling · psychiatric disorders · sexual dysfunction
- **PREGNANCY** Toxicity in *animal* studies—use only if potential benefit outweighs risk.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Caution if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Test liver function before treatment, and monitor every 2 weeks for first year, every 4 weeks for next 6 months and then every 8 weeks thereafter (restart monitoring schedule if dose increased).
- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 14, 25

 - ▶ **Tasmar** (Mylan)
 - ▶ **Tolcapone 100 mg** Tasmar 100mg tablets | 100 tablet (PoM) £95.20 DT = £95.20

DOPAMINERGIC DRUGS > DOPAMINE PRECURSORS

Co-beneldopa

20-Dec-2019

● INDICATIONS AND DOSE

Parkinson's disease

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ **Adult:** Initially 50 mg 3–4 times a day, then increased in steps of 100 mg daily, dose to be increased once or twice weekly according to response; maintenance 400–800 mg daily in divided doses

- ▶ **Elderly:** Initially 50 mg 1–2 times a day, then increased in steps of 50 mg daily, dose to be increased every 3–4 days according to response

Parkinson's disease (in advanced disease)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ **Adult:** Initially 100 mg 3 times a day, then increased in steps of 100 mg daily, dose to be increased once or twice weekly according to response; maintenance 400–800 mg daily in divided doses

Parkinson's disease (patients not taking levodopa/dopa-decarboxylase inhibitor therapy)

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ **Adult:** Initially 1 capsule 3 times a day; maximum 6 capsules per day

Parkinson's disease (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ **Adult:** Initially 1 capsule substituted for every 100 mg of levodopa and given at same dosage frequency, increased every 2–3 days according to response; average increase of 50% needed over previous levodopa dose and titration may take up to 4 weeks, supplementary dose of immediate-release *Madopar*[®] may be needed with first morning dose; if response still poor to total daily dose of *Madopar*[®] CR plus *Madopar*[®] corresponding to 1.2 g levodopa—consider alternative therapy.

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose is expressed as levodopa.

IMPORTANT SAFETY INFORMATION

IMPULSIVE CONTROL DISORDERS

Treatment with levodopa is associated with impulsive control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulsive control disorders. See Parkinson's disease p. 429.

- **CAUTIONS** Cushing's syndrome · diabetes mellitus · endocrine disorders · history of convulsions · history of myocardial infarction with residual arrhythmia · history of peptic ulcer · hyperthyroidism · osteomalacia · pheochromocytoma · psychiatric illness (avoid if severe and discontinue if deterioration) · severe cardiovascular disease · severe pulmonary disease · susceptibility to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1: levodopa
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anxiety · appetite decreased · arrhythmia · depression · diarrhoea · hallucination · movement disorders · nausea · parkinsonism · postural hypotension · sleep disorders · taste altered · vomiting
 - ▶ **Rare or very rare** Leucopenia
 - ▶ **Frequency not known** Aggression · compulsions · confusion · delusions · dopamine dysregulation syndrome · drowsiness · eating disorders · euphoric mood · flushing · gastrointestinal haemorrhage · haemolytic anaemia · hyperhidrosis · oral disorders · pathological gambling · psychosis · sexual dysfunction · skin reactions · thrombocytopenia · tongue discolouration · tooth discolouration · urine discolouration
- **PREGNANCY** Caution in pregnancy—toxicity has occurred in *animal* studies.
- **BREAST FEEDING** May suppress lactation; present in milk—avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in decompensated hepatic function.
- **RENAL IMPAIRMENT** Use with caution.

- **EFFECT ON LABORATORY TESTS** False positive tests for urinary ketones have been reported.
- **TREATMENT CESSATION** Avoid abrupt withdrawal (risk of neuroleptic malignant syndrome and rhabdomyolysis).
- **DIRECTIONS FOR ADMINISTRATION** The dispersible tablets can be dispersed in water or orange squash (not orange juice) or swallowed whole.

- **PRESCRIBING AND DISPENSING INFORMATION** Co-beneldopa is a mixture of benserazide hydrochloride and levodopa in mass proportions corresponding to 1 part of benserazide and 4 parts of levodopa.

When transferring patients from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued 12 hours before (although interval can be shorter).

When switching from modified-release levodopa to dispersible co-beneldopa, reduce dose by approximately 30%.

When administered as an adjunct to other antiparkinsonian drugs, once therapeutic effect apparent, the other drugs may be reduced or withdrawn.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer co-beneldopa dispersible tablets.

Dopamine dysregulation syndrome Manufacturer advises patients and their carers should be informed of the risk of developing dopamine dysregulation syndrome; addiction-like symptoms should be reported.

Driving and skilled tasks Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with co-beneldopa.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 10, 14, 21

- ▶ **Madopar** (Roche Products Ltd)

Co-careldopa

20-Dec-2019

● INDICATIONS AND DOSE

Parkinson's disease

▶ BY MOUTH

- ▶ **Adult:** Initially 25/100 mg 3 times a day, then increased in steps of 12.5/50 mg once daily or on alternate days, alternatively increased in steps of 25/100 mg once daily or on alternate days, dose to be adjusted according to response; dose increased until 800 mg levodopa (with 200 mg carbidopa) daily in divided doses is reached, then maintenance up to 200/2000 mg daily in divided doses, adjusted according to response, when co-careldopa is used, the total daily dose of carbidopa should be at least 70 mg. A lower dose may not achieve full inhibition of extracerebral dopa-decarboxylase, with a resultant increase in side-effects

Parkinson's disease—alternative regimen

▶ BY MOUTH

- ▶ **Adult:** Initially 12.5/50 mg 3–4 times a day, alternatively initially 10/100 mg 3–4 times a day, then increased in steps of 12.5/50 mg once daily or on alternate days, adjusted according to response, alternatively increased in steps of 10/100 mg once daily or on alternate days, adjusted according to response, dose increased until 800 mg levodopa (with up to 200 mg carbidopa) daily in divided doses is reached, then maintenance up to 200/2000 mg daily in divided doses, adjusted according to response, when co-careldopa is used, the total daily dose of carbidopa should be at least 70 mg. A lower dose may not achieve full inhibition of extracerebral dopa-decarboxylase, with a resultant increase in side-effects

DOSE EQUIVALENCE AND CONVERSION

- ▶ The proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.
- ▶ 2 tablets *Sinemet*[®] 12.5 mg/50 mg is equivalent to 1 tablet *Sinemet*[®] Plus 25 mg/100 mg.

CARAMET[®] CR

Parkinson's disease (patients not receiving levodopa/dopa-decarboxylase inhibitor preparations, expressed as levodopa)

▶ BY MOUTH USING MODIFIED-RELEASE TABLETS

- ▶ **Adult:** Initially 100–200 mg twice daily, dose to be given at least 6 hours apart; dose adjusted according to response at intervals of at least 2 days

Parkinson's disease (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)

▶ BY MOUTH USING MODIFIED-RELEASE TABLETS

- ▶ **Adult:** Discontinue previous preparation at least 12 hours before first dose of *Caramet*[®] CR; substitute *Caramet*[®] CR to provide a similar amount of levodopa daily and extend dosing interval by 30–50%; dose then adjusted according to response at intervals of at least 2 days.

DUODOPA[®]

Severe Parkinson's disease inadequately controlled by other preparations

- ▶ **Adult:** Administered as intestinal gel, for use with enteral tube (consult product literature)

HALF SINEMET® CR**Parkinson's disease (for fine adjustment of Sinemet® CR dose)**

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

SINEMET® CR**Parkinson's disease (patients not receiving levodopa/dopa-decarboxylase inhibitor therapy)**

- ▶ BY MOUTH
- ▶ Adult: Initially 1 tablet twice daily, both dose and interval then adjusted according to response at intervals of not less than 3 days

Parkinson's disease (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)

- ▶ BY MOUTH
- ▶ Adult: 1 tablet twice daily, dose can be substituted for a daily dose of levodopa 300–400 mg in immediate-release *Sinemet*® tablets (substitute *Sinemet*® CR to provide approximately 10% more levodopa per day and extend dosing interval by 30–50%); dose and interval then adjusted according to response at intervals of not less than 3 days.

IMPORTANT SAFETY INFORMATION**IMPULSE CONTROL DISORDERS**

Treatment with levodopa is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. See Parkinson's disease p. 429.

- **CAUTIONS** Cushing's syndrome · diabetes mellitus · endocrine disorders · history of convulsions · history of myocardial infarction with residual arrhythmia · history of peptic ulcer · hyperthyroidism · osteomalacia · phaeochromocytoma · psychiatric illness (avoid if severe and discontinue if deterioration) · severe cardiovascular disease · severe pulmonary disease · susceptibility to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1: carbidopa · levodopa
- **SIDE-EFFECTS**
- ▶ **Rare or very rare** Drowsiness · seizure · sleep disorders
- ▶ **Frequency not known** Agranulocytosis · alertness decreased · alopecia · anaemia · angioedema · anxiety · appetite decreased · asthenia · cardiac disorder · chest pain · compulsions · confusion · constipation · delusions · dementia · depression · diarrhoea · dizziness · dopamine dysregulation syndrome · dry mouth · dyskinesia (may be dose-limiting) · dysphagia · dyspnoea · eating disorders · euphoric mood · eye disorders · fall · focal tremor · gait abnormal · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal haemorrhage · haemolytic anaemia · hallucination · headache · Hensch-Schönlein purpura · hiccups · hoarseness · Horner's syndrome exacerbated · hypertension · hypotension · leucopenia · malaise · malignant melanoma · movement disorders · muscle complaints · nausea · neuroleptic malignant syndrome (on abrupt discontinuation) · oedema · on and off phenomenon · oral disorders · palpitations · pathological gambling · postural disorders · psychotic disorder · respiration abnormal · sensation abnormal · sexual dysfunction · skin reactions · suicidal ideation · sweat changes · syncope · taste bitter · teeth grinding · thrombocytopenia · trismus · urinary disorders · urine dark · vasodilation · vision disorders · vomiting · weight changes
- **PREGNANCY** Use with caution—toxicity has occurred in animal studies.
- **BREAST FEEDING** May suppress lactation; present in milk—avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in hepatic disease.
- **DUODOPA® Dose adjustments** Manufacturer advises titrate dose with caution in severe impairment.
- **RENAL IMPAIRMENT** Use with caution.
- **EFFECT ON LABORATORY TESTS** False positive tests for urinary ketones have been reported.
- **TREATMENT CESSATION** Avoid abrupt withdrawal (risk of neuroleptic malignant syndrome and rhabdomyolysis).
- **PRESCRIBING AND DISPENSING INFORMATION** Co-careldopa is a mixture of carbidopa and levodopa; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.
 - When transferring patients from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued at least 12 hours before.
 - Co-careldopa 25/100 provides an adequate dose of carbidopa when low doses of levodopa are needed.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be informed of the risk of developing dopamine dysregulation syndrome; addiction-like symptoms should be reported.
 - Driving and skilled tasks** Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with co-careldopa.
 - Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.
 - Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **DUODOPA®**
- **Scottish Medicines Consortium (SMC) decisions**
- SMC No. 316/06
- The *Scottish Medicines Consortium* has advised (June 2016) that co-careldopa (*Duodopa*®) intestinal gel is accepted for restricted use within NHS Scotland, for the treatment of advanced levodopa-responsive Parkinson's disease with severe motor fluctuations and hyper-/dyskinesia when available combinations of Parkinson medicinal products have not given satisfactory results, only in patients not eligible for deep brain stimulation. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.
- **All Wales Medicines Strategy Group (AWMSG) decisions**
- AWMSG No. 3397
- The *All Wales Medicines Strategy Group* has advised (March 2018) that *Duodopa*® intestinal gel is recommended as an option for restricted use within NHS Wales, for the treatment of advanced levodopa-responsive Parkinson's disease with severe motor fluctuations and hyper-/dyskinesia when available combinations of Parkinson medicinal products have not given satisfactory results, only in patients not eligible for deep brain stimulation. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Levodopa with carbidopa and entacapone

The properties listed below are those particular to the combination only. For the properties of the components please consider, co-careldopa p. 434, entacapone p. 432.

• **INDICATIONS AND DOSE****STALEVO[®] 100/25/200**

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

▶ BY MOUTH

▶ Adult: 1 tablet for each dose; maximum 10 tablets per day

STALEVO[®] 125/31.25/200

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

▶ BY MOUTH

▶ Adult: 1 tablet for each dose; maximum 10 tablets per day

STALEVO[®] 150/37.5/200

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

▶ BY MOUTH

▶ Adult: 1 tablet for each dose; maximum 10 tablets per day

STALEVO[®] 175/43.75/200

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

▶ BY MOUTH

▶ Adult: 1 tablet for each dose; maximum 8 tablets per day

STALEVO[®] 200/50/200

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

▶ BY MOUTH

▶ Adult: 1 tablet for each dose; maximum 7 tablets per day

STALEVO[®] 50/12.5/200

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

▶ BY MOUTH

▶ Adult: 1 tablet for each dose; maximum 10 tablets per day

STALEVO[®] 75/18.75/200

Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

▶ BY MOUTH

▶ Adult: 1 tablet for each dose; maximum 10 tablets per day

- **INTERACTIONS** → Appendix 1: carbidopa · entacapone · levodopa

- **PRESCRIBING AND DISPENSING INFORMATION** Patients receiving standard-release co-careldopa or co-beneldopa alone, initiate *Stalevo*[®] at a dose that provides similar (or slightly lower) amount of levodopa.

Patients with dyskinesia or receiving more than 800 mg levodopa daily, introduce entacapone before transferring to *Stalevo*[®] (levodopa dose may need to be reduced by 10–30% initially).

Patients receiving entacapone and standard-release co-careldopa or co-beneldopa, initiate *Stalevo*® at a dose that provides similar (or slightly higher) amount of levodopa.

● PATIENT AND CARER ADVICE

Driving and skilled tasks **Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with carbidopa with entacapone and levodopa.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

DOPAMINERGIC DRUGS > DOPAMINE RECEPTOR AGONISTS

Amantadine hydrochloride

08-Feb-2019

- **DRUG ACTION** Amantadine is a weak dopamine agonist with modest antiparkinsonian effects.

● INDICATIONS AND DOSE

Parkinson's disease

▶ BY MOUTH

- ▶ **Adult:** 100 mg daily for 1 week, then increased to 100 mg twice daily, usually administered in conjunction with other treatment. Some patients may require higher doses; maximum 400 mg per day
- ▶ **Elderly:** 100 mg daily, adjusted according to response

Post-herpetic neuralgia

▶ BY MOUTH

- ▶ **Adult:** 100 mg twice daily for 14 days (continued for another 14 days if necessary)

Treatment of influenza A (but not recommended)

▶ BY MOUTH

- ▶ **Adult:** 100 mg daily 4–5 days

Prophylaxis of influenza A (but not recommended)

▶ BY MOUTH

- ▶ **Adult:** 100 mg daily usually for 6 weeks or with influenza vaccination for 2–3 weeks after vaccination

Fatigue in multiple sclerosis (initiated by a specialist)

▶ BY MOUTH

- ▶ **Adult:** 100 mg daily for 1 week, dose to be taken in the morning, then increased to 100 mg twice daily; maximum 400 mg per day

- **UNLICENSED USE** [Evgr] Amantadine is used for fatigue in multiple sclerosis, ⚠ but is not licensed for this indication.
- **CONTRA-INDICATIONS** Epilepsy · history of gastric ulceration
- **CAUTIONS** Confused or hallucinatory states · congestive heart disease (may exacerbate oedema) · elderly · tolerance to the effects of amantadine may develop in Parkinson's disease
- **INTERACTIONS** → Appendix 1: dopamine receptor agonists
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anxiety · appetite decreased · concentration impaired · confusion · constipation · depression · dizziness · dry mouth · hallucination · headache · hyperhidrosis · lethargy · mood altered · movement disorders · myalgia · nausea · palpitations · peripheral oedema · postural hypotension · skin reactions · sleep disorders · speech slurred · vision disorders · vomiting
 - ▶ **Uncommon** Neuroleptic malignant-like syndrome · psychosis · seizure · tremor
 - ▶ **Rare or very rare** Cardiovascular insufficiency · diarrhoea · eye disorders · eye inflammation · heart failure · leucopenia · photosensitivity reaction · urinary disorders
 - ▶ **Frequency not known** Delirium
- **PREGNANCY** Avoid; toxicity in *animal* studies.
- **BREAST FEEDING** Avoid; present in milk; toxicity in infant reported.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in liver disorders.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 15 mL/minute/1.73 m².
Dose adjustments Reduce dose.
- **TREATMENT CESSATION** Avoid abrupt withdrawal in Parkinson's disease.
- **PATIENT AND CARER ADVICE**
 - Driving and skilled tasks** May affect performance of skilled tasks (e.g. driving).
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ Oseltamivir, amantadine (review) and zanamivir for the prophylaxis of influenza (September 2008) NICE TA158 Amantadine is **not** recommended for prophylaxis of influenza.

Oral solution

▶ Amantadine hydrochloride (Non-proprietary)

Amantadine hydrochloride 10 mg per 1 ml Amantadine 50mg/5ml oral solution sugar-free | 150 ml [PoM] £140.00 DT = £129.27

Capsule

▶ Amantadine hydrochloride (Non-proprietary)

Amantadine hydrochloride 100 mg Amantadine 100mg capsules | 14 capsule [PoM] £8.72-£10.25 | 56 capsule [PoM] £41.00 DT = £33.61

Apomorphine hydrochloride

20-Dec-2019

● INDICATIONS AND DOSE

Refractory motor fluctuations in Parkinson's disease ('off episodes) inadequately controlled by co-beneldopa or co-careldopa or other dopaminergics (for capable and motivated patients) (under expert supervision)

▶ BY SUBCUTANEOUS INJECTION

▶ **Adult:** Initially 1 mg, dose to be administered at the first sign of 'off' episode, then 2 mg after 30 minutes, dose to be given if inadequate or no response following initial dose, thereafter increase dose at minimum 40-minute intervals until satisfactory response obtained, this determines threshold dose; usual dose 3–30 mg daily in divided doses (max. per dose 10 mg), subcutaneous infusion may be preferable in those requiring division of injections into more than 10 doses; maximum 100 mg per day

Refractory motor fluctuations in Parkinson's disease ('off episodes) inadequately controlled by co-beneldopa or co-careldopa or other dopaminergics (in patients requiring division into more than 10 injections daily) (under expert supervision)

▶ BY CONTINUOUS SUBCUTANEOUS INFUSION

▶ **Adult:** Initially 1 mg/hour, adjusted according to response, then increased in steps of up to 500 micrograms/hour, dose to be increased at intervals not more often than every 4 hours; usual dose 1–4 mg/hour, alternatively usual dose 15–60 micrograms/kg/hour, change infusion site every 12 hours and give during waking hours only (tolerance may occur unless there is a 4-hour treatment-free period at night—24-hour infusions not recommended unless severe night time symptoms); intermittent bolus doses may be needed; maximum 100 mg per day

IMPORTANT SAFETY INFORMATION

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. Ergot- and non-ergot-derived dopamine-receptor agonists do not differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists will not control these side-effects. See Parkinson's disease p. 429.

● **CONTRA-INDICATIONS** Avoid if 'on' response to levodopa marred by severe dyskinesia or dystonia · dementia · psychosis · respiratory depression

● **CAUTIONS** Cardiovascular disease · history of postural hypotension (special care on initiation) · neuropsychiatric conditions · pulmonary disease · susceptibility to QT-interval prolongation

● **INTERACTIONS** → Appendix 1: dopamine receptor agonists

● SIDE-EFFECTS

▶ **Common or very common** Confusion · dizziness · drowsiness · hallucinations · nausea · psychiatric disorders · subcutaneous nodule · vomiting · yawning

▶ **Uncommon** Dyskinesia (may require discontinuation) · dyspnoea · haemolytic anaemia · injection site necrosis · postural hypotension · skin reactions · sudden onset of sleep · thrombocytopenia

▶ **Rare or very rare** Bronchospasm · eosinophilia · hypersensitivity

▶ **Frequency not known** Aggression · agitation · dopamine dysregulation syndrome · eating disorders · pathological gambling · peripheral oedema · sexual dysfunction · syncope

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to opioids.

● **PREGNANCY** Avoid unless clearly necessary.

● **BREAST FEEDING** No information available; may suppress lactation.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in hepatic insufficiency.

● **RENAL IMPAIRMENT** Use with caution.

● MONITORING REQUIREMENTS

▶ Monitor hepatic, haemopoietic, renal, and cardiovascular function.

▶ *With concomitant levodopa* test initially and every 6 months for haemolytic anaemia and thrombocytopenia (development calls for specialist haematological care with dose reduction and possible discontinuation).

● **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

● **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be informed of the risk of developing dopamine dysregulation syndrome; addiction-like symptoms should be reported.

Driving and skilled tasks Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Drugs and driving Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.gov.uk/government/organisations/driver-and-vehicle-licensing-agency.

2015 legislation regarding driving whilst taking certain drugs, may also apply to apomorphine, see *Drugs and driving* under Guidance on prescribing p. 1.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

EXCIPIENTS: May contain Sulfités

▶ **APO-go** (Britannia Pharmaceuticals Ltd)

Solution for infusion

CAUTIONARY AND ADVISORY LABELS 10

EXCIPIENTS: May contain Sulfites

▶ **APO-go PFS** (Britannia Pharmaceuticals Ltd)**Apomorphine hydrochloride 5 mg per 1 ml** APO-go PFS 50mg/10ml solution for infusion pre-filled syringes | 5 pre-filled disposable injection [PoM] £73.11 DT = £73.11▶ **Dacepton** (Ever Pharma UK Ltd)**Apomorphine hydrochloride hemihydrate 5 mg per 1 ml** Dacepton 100mg/20ml solution for infusion vials | 5 vial [PoM] £145.00 DT = £145.00**Bromocriptine**

20-Dec-2019

- **DRUG ACTION** Bromocriptine is a stimulant of dopamine receptors in the brain; it also inhibits release of prolactin by the pituitary.

● **INDICATIONS AND DOSE****Prevention of lactation**

▶ BY MOUTH

- ▶ **Adult:** Initially 2.5 mg daily for 1 day, then 2.5 mg twice daily for 14 days

Suppression of lactation

▶ BY MOUTH

- ▶ **Adult:** Initially 2.5 mg daily for 2–3 days, then 2.5 mg twice daily for 14 days

Hypogonadism | Galactorrhoea | Infertility

▶ BY MOUTH

- ▶ **Adult:** Initially 1–1.25 mg daily, dose to be taken at bedtime, increase dose gradually; usual dose 7.5 mg daily in divided doses, increased if necessary up to 30 mg daily, usual dose in infertility without hyperprolactinaemia is 2.5 mg twice daily

Acromegaly

▶ BY MOUTH

- ▶ **Adult:** Initially 1–1.25 mg daily, dose to be taken at bedtime, then increased to 5 mg every 6 hours, increase dose gradually

Prolactinoma

▶ BY MOUTH

- ▶ **Adult:** Initially 1–1.25 mg daily, dose to be taken at bedtime, then increased to 5 mg every 6 hours, increase dose gradually. Occasionally patients may require up to 30 mg daily

Parkinson's disease

▶ BY MOUTH

- ▶ **Adult:** Initially 1–1.25 mg daily for 1 week, dose to be taken at night, then 2–2.5 mg daily for 1 week, dose to be taken at night, then 2.5 mg twice daily for 1 week, then 2.5 mg 3 times a day for 1 week, then increased in steps of 2.5 mg every 3–14 days, adjusted according to response; maintenance 10–30 mg daily

IMPORTANT SAFETY INFORMATION**FIBROTIC REACTIONS**

Bromocriptine has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions.

Manufacturer advises exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson's disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful.

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists are associated with impulse control disorders, including

pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. Ergot- and non-ergot-derived dopamine-receptor agonists do not differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists will not control these side-effects. See Parkinson's disease p. 429.

- **CONTRA-INDICATIONS** Cardiac valvulopathy (exclude before treatment) · hypertension in postpartum women or in puerperium · hypertensive disorders of pregnancy (e.g. pre-eclampsia, eclampsia or pregnancy-induced hypertension)

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Use in suppression of lactation or other non-life threatening indications. Manufacturer advises avoid in these indications for patients with a history of severe cardiovascular conditions, including coronary artery disease, or symptoms (or history) of serious mental disorder. Very rarely hypertension, myocardial infarction, seizures or stroke (both sometimes preceded by severe headache or visual disturbances), and mental disorders have been reported in postpartum women given bromocriptine for lactation suppression—caution with antihypertensive therapy and avoid other ergot alkaloids. Discontinue immediately if hypertension, unremitting headache, or signs of CNS toxicity develop.

- **CAUTIONS** Cardiovascular disease · history of peptic ulcer (particularly in acromegalic patients) · history of serious mental disorders (especially psychotic disorders) · Raynaud's syndrome

CAUTIONS, FURTHER INFORMATION

- ▶ Hyperprolactinemic patients. In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).

- **INTERACTIONS** → Appendix 1: dopamine receptor agonists

● **SIDE-EFFECTS**

- ▶ **Common or very common** Constipation · drowsiness · headache · nasal congestion · nausea
- ▶ **Uncommon** Allergic dermatitis · alopecia · confusion · dizziness · dry mouth · fatigue · hallucination · hypotension · leg cramps · movement disorders · vomiting
- ▶ **Rare or very rare** Abdominal pain · arrhythmias · cardiac valvulopathy · diarrhoea · dyspnoea · gastrointestinal disorders · gastrointestinal haemorrhage · neuroleptic malignant-like syndrome · pallor · paraesthesia · pericardial effusion · pericarditis · peripheral oedema · psychotic disorder · respiratory disorders · sleep disorders · tinnitus · vision disorders
- ▶ **Frequency not known** Eating disorders · hypertension · myocardial infarction · pathological gambling · psychiatric disorders · seizure · sexual dysfunction · stroke

SIDE-EFFECTS, FURTHER INFORMATION Treatment should be withdrawn if gastro-intestinal bleeding occurs.

- **ALLERGY AND CROSS-SENSITIVITY** Bromocriptine should not be used in patients with hypersensitivity to ergot alkaloids.
- **CONCEPTION AND CONTRACEPTION** Caution—provide contraceptive advice if appropriate (oral contraceptives may increase prolactin concentration).
- **BREAST FEEDING** Suppresses lactation; avoid breast feeding for about 5 days if lactation prevention fails.
- **HEPATIC IMPAIRMENT**
Dose adjustments Manufacturer advises dose adjustment may be necessary—risk of increased plasma concentration.

● MONITORING REQUIREMENTS

- ▶ Specialist evaluation—monitor for pituitary enlargement, particularly during pregnancy; monitor visual field to detect secondary field loss in macroprolactinoma.
- ▶ Monitor for fibrotic disease.
- ▶ Monitor blood pressure for a few days after starting treatment and following dosage increase.

● **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

● PATIENT AND CARER ADVICE

Driving and skilled tasks **Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 10, 21

▶ Bromocriptine (Non-proprietary)

Bromocriptine (as Bromocriptine mesilate) 2.5 mg Bromocriptine 2.5mg tablets | 30 tablet [PbM] £74.99 DT = £74.99

Capsule

CAUTIONARY AND ADVISORY LABELS 10, 21

▶ Parlodel (Mylan)

Bromocriptine (as Bromocriptine mesilate) 5 mg Parlodel 5mg capsules | 100 capsule [PbM] £37.57 DT = £37.57

Bromocriptine (as Bromocriptine mesilate) 10 mg Parlodel 10mg capsules | 100 capsule [PbM] £69.50 DT = £69.50

Cabergoline

20-Dec-2019

● **DRUG ACTION** Cabergoline is a stimulant of dopamine receptors in the brain and it also inhibits release of prolactin by the pituitary.

● INDICATIONS AND DOSE

Prevention of lactation

▶ BY MOUTH

- ▶ Adult: 1 mg, to be taken as a single dose on the first day postpartum

Suppression of established lactation

▶ BY MOUTH

- ▶ Adult: 250 micrograms every 12 hours for 2 days

Hyperprolactinaemic disorders

▶ BY MOUTH

- ▶ Adult: Initially 500 micrograms once weekly, dose may be taken as a single dose or as 2 divided doses on separate days, then increased in steps of 500 micrograms every month until optimal therapeutic response reached, increase dose following monthly monitoring of serum prolactin levels; usual dose 0.25–2 mg once weekly, usually 1 mg weekly; reduce initial dose and increase more gradually if patient intolerant, doses over 1 mg weekly to be given as divided dose; maximum 4.5 mg per week

Alone or as adjunct to co-beneldopa or co-careldopa in Parkinson's disease where dopamine-receptor agonists other than ergot derivative not appropriate

▶ BY MOUTH

- ▶ Adult: Initially 1 mg daily, then increased in steps of 0.5–1 mg every 7–14 days, concurrent dose of levodopa may be decreased gradually while dose of cabergoline is increased; maximum 3 mg per day

IMPORTANT SAFETY INFORMATION

FIBROTIC REACTIONS

Cabergoline has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions.

Manufacturer advises exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson's disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. Ergot- and non-ergot-derived dopamine-receptor agonists do not differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists will not control these side-effects. See Parkinson's disease p. 429.

- **CONTRA-INDICATIONS** Avoid in pre-eclampsia · cardiac valvulopathy—exclude before treatment (does not apply to suppression of lactation) · history of pericardial fibrotic disorders · history of puerperal psychosis · history of pulmonary fibrotic disorders · history of retroperitoneal fibrotic disorders
- **CAUTIONS** Cardiovascular disease · history of peptic ulcer (particularly in acromegalic patients) · history of serious mental disorders (especially psychotic disorders) · Raynaud's syndrome
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Hyperprolactinaemic patients In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).
- **INTERACTIONS** → Appendix 1: dopamine receptor agonists
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Angina pectoris · asthenia · cardiac valvulopathy · confusion · constipation · dizziness · drowsiness · dyspepsia · dyspnoea · gastritis · hallucination · headache · hypertension · movement disorders · nausea · oedema · pericardial effusion · pericarditis · sexual dysfunction · sleep disorders · vertigo · vomiting
 - ▶ **Uncommon** Delusions · erythromelalgia · hepatic function abnormal · psychotic disorder · rash · respiratory disorders
 - ▶ **Rare or very rare** Fibrosis
 - ▶ **Frequency not known** Aggression · alopecia · chest pain · digital vasospasm · leg cramps · pathological gambling · syncope · tremor · visual impairment
- **ALLERGY AND CROSS-SENSITIVITY** Cabergoline should not be used in patients with hypersensitivity to ergot alkaloids.

- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before starting and perform monthly pregnancy tests during the amenorrhoeic period. Caution—advise non-hormonal contraception if pregnancy not desired. Discontinue 1 month before intended conception (ovulatory cycles persist for 6 months).
- **PREGNANCY** Discontinue if pregnancy occurs during treatment (specialist advice needed).
- **BREAST FEEDING** Suppresses lactation; avoid breast-feeding if lactation prevention fails.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (risk of increased of exposure).
Dose adjustments Manufacturer advises consider dose reduction in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for fibrotic disease.
 - ▶ Monitor blood pressure for a few days after starting treatment and following dosage increase.
- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.
Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.
Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.
Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

● **INDICATIONS AND DOSE****Monotherapy in Parkinson's disease where dopamine-receptor agonists other than ergot derivative not appropriate**▶ **BY MOUTH**

- ▶ **Adult:** Initially 50 micrograms once daily for day 1, dose to be taken at bedtime, then 50 micrograms twice daily for days 2–4, then increased in steps of 100–250 micrograms daily, dose to be increased at intervals of 3–4 days, increased to 1.5 mg daily in 3 divided doses at day 28, then increased in steps of up to 250 micrograms every 3–4 days, this increase to be started after day 30; maintenance 2.1–2.5 mg daily; maximum 3 mg per day

Adjunctive therapy with co-beneldopa or co-careldopa in Parkinson's disease where dopamine-receptor agonists other than ergot derivative not appropriate▶ **BY MOUTH**

- ▶ **Adult:** Initially 50 micrograms daily for 2 days, then increased in steps of 100–150 micrograms every 3 days, dose to be adjusted over next 12 days following initial dose and usually given in 3 divided doses, then increased in steps of 250 micrograms every 3 days, during pergolide titration, levodopa dose may be reduced cautiously; maximum 3 mg per day

IMPORTANT SAFETY INFORMATION**FIBROTIC REACTIONS**

Pergolide has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions.

Manufacturer advises exclude cardiac valvulopathy with echocardiography before starting treatment with pergolide; it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking pergolide should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. Ergot- and non-ergot-derived dopamine-receptor agonists do not differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists will not control these side-effects. See Parkinson's disease p. 429.

Pramipexole

20-Dec-2019

• INDICATIONS AND DOSE

Parkinson's disease, used alone or as an adjunct to co-beneldopa or co-careldopa

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ **Adult:** Initially 88 micrograms 3 times a day, if tolerated dose to be increased by doubling dose every 5–7 days, increased to 350 micrograms 3 times a day, then increased in steps of 180 micrograms 3 times a day if required, dose to be increased at weekly intervals, during dose titration and maintenance, levodopa dose may be reduced, maximum daily dose to be given in 3 divided doses; maximum 3.3 mg per day
- ▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- ▶ **Adult:** Initially 260 micrograms once daily, dose to be increased by doubling dose every 5–7 days, increased to 1.05 mg once daily, then increased in steps of 520 micrograms every week if required, during dose titration and maintenance, levodopa dose may be reduced according to response; maximum 3.15 mg per day

Moderate to severe restless legs syndrome

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ **Adult:** Initially 88 micrograms once daily, dose to be taken 2–3 hours before bedtime, dose to be increased by doubling dose every 4–7 days if necessary, repeat dose titration if restarting treatment after an interval of more than a few days; maximum 540 micrograms per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ Doses and strengths are stated in terms of pramipexole (base).
- ▶ Equivalent strengths of pramipexole (base) in terms of pramipexole dihydrochloride monohydrate (salt) for immediate-release preparations are as follows:
 - ▶ 88 micrograms base ≡ 125 micrograms salt;
 - ▶ 180 micrograms base ≡ 250 micrograms salt;
 - ▶ 350 micrograms base ≡ 500 micrograms salt;
 - ▶ 700 micrograms base ≡ 1 mg salt.

- ▶ Equivalent strengths of pramipexole (base) in terms of pramipexole dihydrochloride monohydrate (salt) for modified-release preparations are as follows:
 - ▶ 260 micrograms base ≡ 375 micrograms salt;
 - ▶ 520 micrograms base ≡ 750 micrograms salt;
 - ▶ 1.05 mg base ≡ 1.5 mg salt;
 - ▶ 1.57 mg base ≡ 2.25 mg salt;
 - ▶ 2.1 mg base ≡ 3 mg salt;
 - ▶ 2.62 mg base ≡ 3.75 mg salt;
 - ▶ 3.15 mg base ≡ 4.5 mg salt.

IMPORTANT SAFETY INFORMATION

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. Ergot- and non-ergot-derived dopamine-receptor agonists do not differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists will not control these side-effects. See Parkinson's disease p. 429

- **CAUTIONS** Psychotic disorders · risk of visual disorders (ophthalmological testing recommended) · severe cardiovascular disease
- **INTERACTIONS** → Appendix 1: dopamine receptor agonists
- **SIDE-EFFECTS**
- ▶ **Common or very common** Appetite abnormal · behaviour abnormal · confusion · constipation · dizziness · drowsiness · fatigue · hallucination · headache · hypotension · movement disorders · nausea · peripheral oedema · psychiatric disorders · sleep disorders · vision disorders · vomiting · weight changes
- ▶ **Uncommon** Anxiety · binge eating · delirium · delusions · dyspnoea · heart failure · hiccups · mania · memory loss · pathological gambling · pneumonia · sexual dysfunction · SIADH · skin reactions · syncope
- ▶ **Frequency not known** Depression · dopamine agonist withdrawal syndrome · generalised pain · sweating abnormal
- **PREGNANCY** Use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** May suppress lactation; avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** For *modified-release* tablets, avoid if eGFR less than 30 mL/minute/1.73 m².
Dose adjustments For *immediate-release* tablets in Parkinson's disease, initially 88 micrograms twice daily (max. 1.57 mg daily in 2 divided doses) if eGFR 20–50 mL/minute/1.73 m²; initially 88 micrograms once daily (max. 1.1 mg once daily) if eGFR less than 20 mL/minute/1.73 m². If renal function declines during treatment, reduce dose by the same percentage as the decline in eGFR.
For *immediate-release* tablets in restless legs syndrome, reduce dose if eGFR less than 20 mL/minute/1.73 m².
For *modified-release* tablets, initially 260 micrograms on alternate days if eGFR 30–50 mL/minute/1.73 m², increased to 260 micrograms once daily after 1 week, further increased if necessary by 260 micrograms daily at weekly intervals to max. 1.57 mg daily.
- **MONITORING REQUIREMENTS** Risk of postural hypotension (especially on initiation)—monitor blood pressure.
- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

● PATIENT AND CARER ADVICE

Driving and skilled tasks **Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

Ropinirole

20-Dec-2019

● INDICATIONS AND DOSE

Parkinson's disease, either used alone or as adjunct to co-beneldopa or co-careldopa

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Initially 750 micrograms daily in 3 divided doses, then increased in steps of 750 micrograms daily, dose to be increased at weekly intervals, increased to 3 mg daily in 3 divided doses, then increased in steps of 1.5–3 mg daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 9–16 mg daily in 3 divided doses, higher doses may be required if used with levodopa, when administered as adjunct to levodopa, concurrent dose of levodopa may be reduced by approx. 20%, daily maximum dose to be given in 3 divided doses; maximum 24 mg per day
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: Initially 2 mg once daily for 1 week, then 4 mg once daily, increased in steps of 2 mg at intervals of at least 1 week, adjusted according to response, increased to up to 8 mg once daily, dose to be increased further if still no response; increased in steps of 2–4 mg at intervals of at least 2 weeks if required, when administered as adjunct to levodopa, concurrent dose of levodopa may gradually be reduced by approx. 30%; maximum 24 mg per day

Parkinson's disease in patients transferring from ropinirole immediate-release tablets

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: Initially ropinirole modified-release once daily substituted for total daily dose equivalent of ropinirole immediate-release tablets; if control not maintained after switching, titrate dose as above

Moderate to severe restless legs syndrome

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Initially 250 micrograms once daily for 2 days, increased if tolerated to 500 micrograms once daily for 5 days, then increased if tolerated to 1 mg once daily for 7 days, then increased in steps of 500 micrograms daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 2 mg once daily, doses to be taken at night; maximum 4 mg per day

- **UNLICENSED USE** Doses in the BNF may differ from those in product literature.

IMPORTANT SAFETY INFORMATION**SAFE PRACTICE**

Ropinirole has been confused with risperidone; care must be taken to ensure the correct drug is prescribed and dispensed.

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. Ergot- and non-ergot-derived dopamine-receptor agonists do not differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists will not control these side-effects. See Parkinson's disease p. 429

- **CAUTIONS** Elderly · major psychotic disorders · severe cardiovascular disease (risk of hypotension—monitor blood pressure)
- **INTERACTIONS** → Appendix 1: dopamine receptor agonists

● **SIDE-EFFECTS**

- ▶ **Common or very common** Confusion · dizziness · drowsiness · fatigue · gastrointestinal discomfort · hallucination · movement disorders · nausea · nervousness · peripheral oedema · sleep disorders · syncope · vertigo · vomiting
- ▶ **Uncommon** Hypotension · sexual dysfunction
- ▶ **Rare or very rare** Hepatic reaction
- ▶ **Frequently not known** Behaviour abnormal · compulsions · delirium · delusions · dopamine dysregulation syndrome · eating disorders · pathological gambling · psychotic disorder
- **PREGNANCY** Avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** May suppress lactation—avoid.
- **HEPATIC IMPAIRMENT**
- ▶ When used for Parkinson's disease Manufacturer advises avoid (no information available).
- ▶ When used for Restless legs syndrome Manufacturer advises caution in moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be informed of the risk of developing dopamine dysregulation syndrome; addiction-like symptoms should be reported.

Missed doses

- ▶ When used for Parkinson's disease Manufacturer advises if treatment is interrupted for one day or more, re-initiation by dose titration should be considered—consult product literature.
- ▶ When used for Moderate to severe restless legs syndrome Manufacturer advises if treatment is interrupted for more than a few days, re-initiation by dose titration is recommended.

Driving and skilled tasks Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

● **NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) decisions**

SMC No. 165/05

The *Scottish Medicines Consortium* has advised (July 2006) that ropinirole (*Adartrel*[®]) should be restricted for use in patients with a baseline score of 24 points or more on the International Restless Legs Scale.

SMC No. 491/08

The *Scottish Medicines Consortium* has advised (September 2008) that ropinirole (*Requip*[®] XL) is accepted for use within NHS Scotland for the treatment of idiopathic Parkinson's disease in patients already taking ropinirole immediate release tablets and in whom adequate symptomatic control has been established.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Rotigotine

20-Dec-2019

● INDICATIONS AND DOSE

Monotherapy in Parkinson's disease

▶ BY TRANSDERMAL APPLICATION USING PATCHES

- ▶ Adult: Initially 2 mg/24 hours, then increased in steps of 2 mg/24 hours every week if required; maximum 8 mg/24 hours per day

Adjunctive therapy with co-beneldopa or co-careldopa in Parkinson's disease

▶ BY TRANSDERMAL APPLICATION USING PATCHES

- ▶ Adult: Initially 4 mg/24 hours, then increased in steps of 2 mg/24 hours every week if required; maximum 16 mg/24 hours per day

Moderate to severe restless legs syndrome

▶ BY TRANSDERMAL APPLICATION USING PATCHES

- ▶ Adult: Initially 1 mg/24 hours, then increased in steps of 1 mg/24 hours every week if required; maximum 3 mg/24 hours per day

IMPORTANT SAFETY INFORMATION

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. Ergot- and non-ergot-derived dopamine-receptor agonists do not differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists will not control these side-effects. See Parkinson's disease p. 429

- **CAUTIONS** Avoid exposure of patch to heat · remove patch (aluminium-containing) before magnetic resonance imaging or cardioversion

- **INTERACTIONS** → Appendix 1: dopamine receptor agonists

● SIDE-EFFECTS

- ▶ **Common or very common** Asthenia · behaviour abnormal · constipation · dizziness · drowsiness · dry mouth · dyskinesia · eating disorders · fall · gastrointestinal discomfort · hallucinations · headache · hiccups · hyperhidrosis · hypertension · hypotension · loss of consciousness · malaise · nausea · palpitations · pathological gambling · perception altered · peripheral

oedema · psychiatric disorders · skin reactions · sleep disorders · syncope · vertigo · vomiting · weight changes

- ▶ **Uncommon** Agitation · angioedema · arrhythmias · confusion · sexual dysfunction · vision disorders
- ▶ **Rare or very rare** Delirium · delusions · irritability · psychotic disorder · seizure
- ▶ **Frequency not known** Dopamine dysregulation syndrome
- **PREGNANCY** Avoid—no information available.
- **BREAST FEEDING** May suppress lactation; avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).

Dose adjustments Manufacturer advises consider dose reduction in severe impairment.

- **MONITORING REQUIREMENTS** Ophthalmic testing recommended.
- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises apply patch to clean, dry, intact, healthy and non-irritated skin on torso, thigh, hip, shoulder or upper arm by pressing the patch firmly against the skin for about 30 seconds. Patches should be removed after 24 hours and the replacement patch applied on a different area (avoid using the same area for 14 days)—consult product literature for further information.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be informed of the risk of developing dopamine dysregulation syndrome; addiction-like symptoms should be reported.

Driving and skilled tasks **Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (August 2007) that *Neupro*[®] is accepted for restricted use for the treatment of advanced Parkinson's disease in combination with levodopa where the transdermal route would facilitate treatment.

The *Scottish Medicines Consortium* has advised (July 2007) that *Neupro*[®] is accepted for use as monotherapy for the treatment of early-stage idiopathic Parkinson's disease.

The *Scottish Medicines Consortium* has advised (August 2009) that rotigotine (*Neupro*[®]) is accepted for restricted use within NHS Scotland for the symptomatic treatment of moderate to severe idiopathic restless legs syndrome in adults with a baseline score of 15 points or more on the International Restless Legs Scale.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Transdermal patch

CAUTIONARY AND ADVISORY LABELS 10

▶ *Neupro* (UCB Pharma Ltd)

Rotigotine 1 mg per 24 hour *Neupro* 1mg/24hours transdermal patches | 28 patch [PoM](#) £77.24 DT = £77.24

DOPAMINERGIC DRUGS > MONOAMINE-OXIDASE B INHIBITORS

Rasagiline

26-May-2020

- **DRUG ACTION** Rasagiline is a monoamine-oxidase B inhibitor.

● INDICATIONS AND DOSE

Parkinson's disease, used alone or as adjunct to co-beneldopa or co-careldopa for 'end-of-dose' fluctuations

- ▶ BY MOUTH
- ▶ Adult: 1 mg daily

- **INTERACTIONS** → Appendix 1: MAO-B inhibitors
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · angina pectoris · arthralgia · arthritis · conjunctivitis · depression · dermatitis · dry mouth · fall · fever · flatulence · hallucination · headache · increased risk of infection · leucopenia · malaise · nausea · neoplasms · pain · postural hypotension · sleep disorders · urinary urgency · vertigo · vomiting · weight decreased
 - ▶ **Uncommon** Appetite decreased · confusion
 - ▶ **Frequency not known** Dopamine dysregulation syndrome · drowsiness · eating disorders · pathological gambling · psychiatric disorders · sexual dysfunction
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Use with caution—may suppress lactation.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment (risk of increased exposure).
- **TREATMENT CESSATION** Avoid abrupt withdrawal.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

▶ *Rasagiline* (Non-proprietary)

Rasagiline 1 mg *Rasagiline* 1mg tablets | 28 tablet [PoM](#) £70.72 DT = £2.38

▶ *Azilect* (Teva UK Ltd)

Rasagiline 1 mg *Azilect* 1mg tablets | 28 tablet [PoM](#) £70.72 DT = £2.38

Safinamide

18-Jul-2017

● **DRUG ACTION** Safinamide is a monoamine-oxidase-B inhibitor.

● INDICATIONS AND DOSE

Parkinson's disease, as an adjunct to levodopa alone or in combination with other antiparkinsonian drugs, for mid- to late-stage fluctuations

► BY MOUTH

► Adult: 50 mg once daily, increased if necessary to 100 mg once daily

- **CONTRA-INDICATIONS** Active retinopathy · albinism · family history of hereditary retinal disease · retinal degeneration · uveitis
- **CAUTIONS** Hypertension (may raise blood pressure) · may exacerbate pre-existing dyskinesia (requiring levodopa dose reduction)
- **INTERACTIONS** → Appendix 1: MAO-B inhibitors

● SIDE-EFFECTS

- **Common or very common** Cataract · dizziness · drowsiness · headache · hypotension · injury · nausea · sleep disorders
 - **Uncommon** Anaemia · anxiety · appetite abnormal · arrhythmias · asthenia · cognitive disorder · confusion · constipation · cough · decreased leucocytes · depression · diarrhoea · dry mouth · dysarthria · dyslipidaemia · dyspnoea · emotional lability · eye disorders · eye inflammation · gastrointestinal discomfort · gastrointestinal disorders · glaucoma · hallucination · hyperglycaemia · hypertension · increased risk of infection · joint disorders · movement disorders · muscle complaints · muscle weakness · neoplasms · oral disorders · pain · palpitations · peripheral oedema · photosensitivity reaction · psychotic disorder · QT interval prolongation · red blood cell abnormality · rhinorrhoea · sensation abnormal · sensation of pressure · sexual dysfunction · skin reactions · sweat changes · syncope · temperature sensation altered · urinary disorders · varicose veins · vertigo · vision disorders · vomiting · weight changes
 - **Rare or very rare** Alopecia · arterial spasm · atherosclerosis · benign prostatic hyperplasia · breast abnormalities · bronchospasm · cachexia · concentration impaired · delirium · diabetic retinopathy · dysphonia · eosinophilia · eye pain · fat embolism · fever · gambling · haemorrhage · hyperbilirubinaemia · hyperkalaemia · illusion · malaise · myocardial infarction · oropharyngeal complaints · osteoarthritis · paranoia · psychiatric disorders · pyuria · reflexes decreased · suicidal ideation · taste altered
 - **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
 - **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
 - **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment (risk of increased exposure); avoid in severe impairment.
- Dose adjustments** Manufacturer advises max. daily dose should not exceed 50 mg daily in moderate impairment.

- **MEDICAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

► **Xadago** (Profile Pharma Ltd)

Safinamide (as Safinamide methanesulfonate) 50 mg Xadago 50mg tablets | 30 tablet [POM] £69.00 DT = £69.00

Safinamide (as Safinamide methanesulfonate) 100 mg Xadago 100mg tablets | 30 tablet [POM] £69.00 DT = £69.00

Selegiline hydrochloride

● **DRUG ACTION** Selegiline is a monoamine-oxidase-B inhibitor.

● INDICATIONS AND DOSE

Parkinson's disease, used alone or as adjunct to co-beneldopa or co-careldopa to reduce 'end of dose' deterioration | Symptomatic parkinsonism

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Adult: Initially 5 mg once daily for 2–4 weeks, then increased if tolerated to 10 mg daily, dose to be taken in the morning

► BY MOUTH USING ORAL LYOPHILISATE

► Adult: 1.25 mg once daily, dose to be taken before breakfast

DOSE EQUIVALENCE AND CONVERSION

- 1.25-mg oral lyophilisate is equivalent to 10-mg tablet.
- Patients receiving 10 mg conventional selegiline hydrochloride tablets can be switched to oral lyophilisates (*Zelapar*[®]) 1.25 mg.

- **CONTRA-INDICATIONS** Active duodenal ulceration · active gastric ulceration · avoid or use with great caution in postural hypotension (when used in combination with levodopa)
- **CAUTIONS** Angina · arrhythmias · duodenal ulceration · gastric ulceration · history of hepatic dysfunction · patients predisposed to confusion and psychosis · psychosis · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1: MAO-B inhibitors
- **SIDE-EFFECTS**
 - **Common or very common** Arrhythmias · arthralgia · back pain · confusion · constipation · depression · diarrhoea · dizziness · dry mouth · fall · fatigue · hallucination · headache · hyperhidrosis · hypertension · hypotension · movement disorders · muscle cramps · nasal congestion · nausea · oral disorders · sleep disorders · throat pain · tremor · vertigo
 - **Uncommon** Alopecia · angina pectoris · anxiety · appetite decreased · chest pain · dyspnoea · leucopenia · mood altered · myopathy · palpitations · peripheral oedema · pharyngitis · psychosis · skin eruption · thrombocytopenia · urinary disorders · vision blurred
 - **Frequency not known** Hypersexuality
- SIDE-EFFECTS, FURTHER INFORMATION** Side-effects of levodopa may be increased—concurrent levodopa dosage can be reduced by 10–30% in steps of 10% every 3–4 days.
- **PREGNANCY** Avoid—no information available.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in severe impairment.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **DIRECTIONS FOR ADMINISTRATION** Oral lyophilisates should be placed on the tongue and allowed to dissolve. Advise patient not to drink, rinse, or wash mouth out for 5 minutes after taking the tablet.
- **PATIENT AND CARER ADVICE** Patients or carers should be advised on how to administer selegiline hydrochloride oral lyophilisates.

Driving and skilled tasks **Drugs and driving** Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

2015 legislation regarding driving whilst taking certain drugs, may also apply to selegiline, see *Drugs and driving* under Guidance on prescribing p. 1.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

5 Nausea and labyrinth disorders

Nausea and labyrinth disorders

19-Feb-2020

Drug treatment

Antiemetics should be prescribed only when the cause of vomiting is known because otherwise they may delay diagnosis, particularly in children. Antiemetics are unnecessary and sometimes harmful when the cause can be treated, such as in diabetic ketoacidosis, or in digoxin p. 116 or antiepileptic overdose.

If antiemetic drug treatment is indicated, the drug is chosen according to the aetiology of vomiting.

Antihistamines are effective against nausea and vomiting resulting from many underlying conditions. There is no evidence that any one antihistamine is superior to another but their duration of action and incidence of adverse effects (drowsiness and antimuscarinic effects) differ.

The **phenothiazines** are dopamine antagonists and act centrally by blocking the chemoreceptor trigger zone. They are of considerable value for the prophylaxis and treatment of nausea and vomiting associated with diffuse neoplastic disease, radiation sickness, and the emesis caused by drugs such as opioids, general anaesthetics, and cytotoxics. Prochlorperazine p. 407, perphenazine, and trifluoperazine p. 408 are less sedating than chlorpromazine hydrochloride p. 402; severe dystonic reactions sometimes occur with phenothiazines, especially in children. Some phenothiazines are available as rectal suppositories, which can be useful in patients with persistent vomiting or with severe nausea; prochlorperazine can also be administered as a buccal tablet which is placed between the upper lip and the gum.

Other antipsychotic drugs including haloperidol p. 404 and levomepromazine p. 460 are used for the relief of nausea and vomiting in terminal illness.

Metoclopramide hydrochloride p. 452 is an effective antiemetic and its activity closely resembles that of the phenothiazines. Metoclopramide hydrochloride also acts directly on the gastro-intestinal tract and it may be superior to the phenothiazines for emesis associated with gastroduodenal, hepatic, and biliary disease.

Domperidone p. 451 acts at the chemoreceptor trigger zone. It has the advantage over metoclopramide hydrochloride and the phenothiazines of being less likely to cause central effects such as sedation and dystonic reactions because it does not readily cross the blood-brain barrier. In Parkinson's disease, domperidone [unlicensed in those weighing less than 35 kg] can be used to treat nausea caused

by dopaminergic drugs. The MHRA and CHM have released important safety information and restrictions regarding the use of domperidone for nausea and vomiting in those weighing less than 35 kg, and a reminder of contra-indications. For further information, see *Important safety information* for domperidone.

Granisetron p. 454 and **ondansetron** p. 455 are of value in the management of nausea and vomiting in patients receiving cytotoxics and in postoperative nausea and vomiting. **Palonosetron** p. 456 is licensed for prevention of nausea and vomiting associated with moderately or highly emetogenic cytotoxic chemotherapy. **Palonosetron** is also available in combination with netupitant, a neurokinin 1-receptor antagonist, for the prevention of acute and delayed nausea and vomiting associated with moderately emetogenic chemotherapy and highly emetogenic cisplatin-based chemotherapy.

Dexamethasone p. 712 has antiemetic effects and it is used in vomiting associated with cancer chemotherapy. It can be used alone or with metoclopramide hydrochloride, prochlorperazine, lorazepam p. 355, or a 5HT₃-receptor antagonist.

Aprepitant p. 453, **fosaprepitant** p. 453, and **rolapitant** p. 454 are neurokinin 1-receptor antagonists. Aprepitant is licensed for the prevention of nausea and vomiting associated with highly and moderately emetogenic chemotherapy; fosaprepitant is licensed for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based chemotherapy and the prevention of nausea and vomiting associated with moderately emetogenic chemotherapy; rolapitant is licensed for the prevention of delayed nausea and vomiting associated with highly and moderately emetogenic chemotherapy. These drugs are given with dexamethasone and a 5HT₃-receptor antagonist. For further information on the prevention of nausea and vomiting caused by chemotherapy, see Cytotoxic drugs p. 938.

Nabilone p. 450 is a synthetic cannabinoid. [EvGr] It can be considered as an add-on treatment for chemotherapy-induced nausea and vomiting unresponsive to optimised conventional antiemetics. 

Vomiting during pregnancy

Nausea in the first trimester of pregnancy is generally mild and does not require drug therapy. On rare occasions if vomiting is severe, short-term treatment with an antihistamine, such as **promethazine**, may be required. Prochlorperazine or metoclopramide hydrochloride are alternatives. If symptoms do not settle in 24 to 48 hours then specialist opinion should be sought. Hyperemesis gravidarum is a more serious condition, which requires regular antiemetic therapy, intravenous fluid and electrolyte replacement and sometimes nutritional support. Supplementation with thiamine p. 1141 must be considered in order to reduce the risk of Wernicke's encephalopathy.

Postoperative nausea and vomiting

The incidence of postoperative nausea and vomiting depends on many factors including the anaesthetic used, and the type and duration of surgery. Other risk factors include female sex, non-smokers, a history of postoperative nausea and vomiting or motion sickness, and intraoperative and postoperative use of opioids. Therapy to prevent postoperative nausea and vomiting should be based on the assessed risk of postoperative nausea and vomiting in each patient. Drugs used include **5HT₃-receptor antagonists**, droperidol p. 460, dexamethasone, some **phenothiazines** (e.g. prochlorperazine), and **antihistamines** (e.g. cyclizine p. 449). A combination of two or more antiemetic drugs that have different mechanisms of action is often indicated in those at high risk of postoperative nausea and vomiting or where postoperative vomiting presents a particular danger

(e.g. in some types of surgery). When a prophylactic antiemetic drug has failed, postoperative nausea and vomiting should be treated with one or more drugs from a different class.

Motion sickness

Antiemetics should be given to prevent motion sickness rather than after nausea or vomiting develop. The most effective drug for the prevention of motion sickness is hyoscine hydrobromide p. 458. The sedating antihistamines are slightly less effective against motion sickness, but are generally better tolerated than hyoscine. If a sedative effect is desired **promethazine** is useful, but generally a slightly less sedating antihistamine such as cyclizine or cinnarizine p. 457 is preferred. Domperidone, metoclopramide hydrochloride, 5HT₃-receptor antagonists, and the phenothiazines (except the antihistamine phenothiazine promethazine) are **ineffective** in motion sickness.

Other vestibular disorders

Management of vestibular diseases is aimed at treating the underlying cause as well as treating symptoms of the balance disturbance and associated nausea and vomiting. Vertigo and nausea associated with Ménière's disease and middle-ear surgery can be difficult to treat.

Bethahistine dihydrochloride p. 461 is an analogue of histamine and is claimed to reduce endolymphatic pressure by improving the microcirculation. Bethahistine dihydrochloride is licensed for vertigo, tinnitus, and hearing loss associated with Ménière's disease.

A **diuretic** alone or combined with salt restriction may provide some benefit in vertigo associated with Ménière's disease; **antihistamines** (such as cinnarizine p. 457), and **phenothiazines** (such as prochlorperazine p. 407) are also used. Where possible, prochlorperazine should be reserved for the treatment of acute symptoms.

Nausea and vomiting associated with migraine

For information on the use of antiemetics in migraine attacks, see Migraine p. 495.

Other drugs used for Nausea and labyrinth disorders

Paracetamol with metoclopramide, p. 497 • Promethazine hydrochloride, p. 301

ANTIEMETICS AND ANTINAUSEANTS > ANTIHISTAMINES

30-Jun-2018

Cyclizine

● INDICATIONS AND DOSE

Nausea | Vomiting | Vertigo | Motion sickness | Labyrinthine disorders

► BY MOUTH

• Adult: 50 mg up to 3 times a day, for motion sickness, take 1–2 hours before departure

► BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

• Adult: 50 mg 3 times a day

Nausea and vomiting of known cause | Nausea and vomiting associated with vestibular disorders

► BY MOUTH, OR BY INTRAVENOUS INJECTION

• Child 1 month–5 years: 0.5–1 mg/kg up to 3 times a day (max. per dose 25 mg), intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure

• Child 6–11 years: 25 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure

• Child 12–17 years: 50 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure

► BY RECTUM

• Child 2–5 years: 12.5 mg up to 3 times a day

• Child 6–11 years: 25 mg up to 3 times a day

• Child 12–17 years: 50 mg up to 3 times a day

► BY CONTINUOUS INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INFUSION

• Child 1–23 months: 3 mg/kg, dose to be given over 24 hours

• Child 2–5 years: 50 mg, dose to be given over 24 hours

• Child 6–11 years: 75 mg, dose to be given over 24 hours

• Child 12–17 years: 150 mg, dose to be given over 24 hours

Nausea and vomiting in palliative care

► BY SUBCUTANEOUS INFUSION

• Child 1–23 months: 3 mg/kg, dose to be given over 24 hours

• Child 2–5 years: 50 mg, dose to be given over 24 hours

• Child 6–11 years: 75 mg, dose to be given over 24 hours

• Child 12–17 years: 150 mg, dose to be given over 24 hours

• Adult: 150 mg, dose to be given over 24 hours

► BY MOUTH

• Child 1 month–5 years: 0.5–1 mg/kg up to 3 times a day (max. per dose 25 mg)

• Child 6–11 years: 25 mg up to 3 times a day

• Child 12–17 years: 50 mg up to 3 times a day

• Adult: 50 mg up to 3 times a day

► BY INTRAVENOUS INJECTION

• Child 1 month–5 years: 0.5–1 mg/kg up to 3 times a day (max. per dose 25 mg), intravenous injection to be given over 3–5 minutes

• Child 6–11 years: 25 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes

• Child 12–17 years: 50 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes

► BY CONTINUOUS INTRAVENOUS INFUSION

• Child 1–23 months: 3 mg/kg, dose to be given over 24 hours

• Child 2–5 years: 50 mg, dose to be given over 24 hours

• Child 6–11 years: 75 mg, dose to be given over 24 hours

• Child 12–17 years: 150 mg, dose to be given over 24 hours

► BY RECTUM

• Child 2–5 years: 12.5 mg up to 3 times a day

• Child 6–11 years: 25 mg up to 3 times a day

• Child 12–17 years: 50 mg up to 3 times a day

● UNLICENSED USE

• In children Tablets not licensed for use in children under 6 years. Injection not licensed for use in children.

• **CAUTIONS** Epilepsy • glaucoma (in children) • may counteract haemodynamic benefits of opioids • neuromuscular disorders—increased risk of transient paralysis with intravenous use • prostatic hypertrophy (in adults) • pyloroduodenal obstruction • severe heart failure—may cause fall in cardiac output and associated increase in heart rate, mean arterial pressure and pulmonary wedge pressure • susceptibility to angle-closure glaucoma (in adults) • urinary retention

• **INTERACTIONS** → Appendix 1: antihistamines, sedating

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

► **Rare or very rare** Agitation (more common at high doses) • angle closure glaucoma • depression

► **Frequency not known** Abdominal pain • agranulocytosis • angioedema • anxiety • apnoea • appetite decreased • arrhythmias • asthenia • bronchospasm • constipation • diarrhoea • disorientation • dizziness • drowsiness • dry

mouth · dry throat · euphoric mood · haemolytic anaemia · hallucinations · headache · hepatic disorders · hypertension · hypotension · increased gastric reflux · insomnia · leucopenia · movement disorders · muscle complaints · nasal dryness · nausea · oculogyric crisis · palpitations · paraesthesia · photosensitivity reaction · seizure · skin reactions · speech disorder · thrombocytopenia · tinnitus · tremor · urinary retention · vision blurred · vomiting

SPECIFIC SIDE-EFFECTS

- ▶ With oral use Level of consciousness decreased
- ▶ With parenteral use Chills · consciousness impaired · injection site necrosis · pain · paralysis · sensation of pressure · thrombophlebitis
- **PREGNANCY** Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** No information available. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **DIRECTIONS FOR ADMINISTRATION** For administration by mouth, tablets may be crushed. Mixing and compatibility for the use of syringe drivers in palliative care Cyclizine may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.
- **PRESCRIBING AND DISPENSING INFORMATION**

Palliative care For further information on the use of cyclizine in palliative care, see www.medicinescomplete.com/#/content/palliative/antihistaminic-antimuscarinic-anti-emetics.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling, driving); effects of alcohol enhanced.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

Tablet

CAUTIONARY AND ADVISORY LABELS 2

▶ Cyclizine (Non-proprietary)

Cyclizine hydrochloride 50 mg Cyclizine 50mg tablets | 30 tablet [P] £2.95-£5.00 | 100 tablet [P] £12.15 DT = £7.04

Solution for injection

▶ Cyclizine (Non-proprietary)

Cyclizine lactate 50 mg per 1 ml Cyclizine 50mg/1ml solution for injection ampoules | 5 ampoule [PoM] £17.42 DT = £18.58 | 10 ampoule [PoM] £25.00-£37.16

Doxylamine with pyridoxine

28-May-2019

- **DRUG ACTION** Doxylamine is a first-generation antihistamine which selectively binds H₁ receptors in the brain; pyridoxine (vitamin B₆) is a water-soluble vitamin.

● INDICATIONS AND DOSE

Nausea and vomiting in pregnancy

▶ BY MOUTH

- ▶ Adult: 20/20 mg once daily for 2 days, to be taken at bedtime; increased if necessary to 10/10 mg, to be taken in the morning and 20/20 mg, to be taken at bedtime; increased if necessary to 10/10 mg, to be

taken in the morning, 10/10 mg, to be taken mid-afternoon and 20/20 mg, to be taken at bedtime; maximum 40/40 mg per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg of doxylamine/pyridoxine.

- **CAUTIONS** Asthma · bladder neck obstruction · increased intra-ocular pressure · narrow angle glaucoma · pyloroduodenal obstruction · stenosing peptic ulcer
- **INTERACTIONS** → Appendix 1: antihistamines, sedating
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dizziness · drowsiness · dry mouth · fatigue
 - ▶ **Frequency not known** Akathisia · anxiety · chest discomfort · constipation · diarrhoea · disorientation · dyspnoea · gastrointestinal discomfort · headaches · hyperhidrosis · irritability · malaise · palpitations · paraesthesia · skin reactions · sleep disorders · tachycardia · urinary disorders · vertigo · vision disorders
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of somnolence and dizziness.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions
SMC No. SMC2140
The *Scottish Medicines Consortium* has advised (May 2019) that doxylamine succinate and pyridoxine hydrochloride (*Xonvea*[®]) is **not** recommended for use within NHS Scotland for the treatment of nausea and vomiting of pregnancy in women who do not respond to conservative management, as the clinical and economic case was not demonstrated.

All Wales Medicines Strategy Group (AWMSG) decisions
AWMSG No. 2170
The *All Wales Medicines Strategy Group* has advised (June 2019) that doxylamine succinate with pyridoxine hydrochloride (*Xonvea*[®]) is **not** recommended for use within NHS Wales for the treatment of nausea and vomiting of pregnancy in women who do not respond to conservative management, as the case for cost-effectiveness has not been proven.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 2, 23, 25

▶ Xonvea (Alliance Pharmaceuticals Ltd)

Doxylamine succinate 10 mg, Pyridoxine hydrochloride 10 mg Xonvea 10mg/10mg gastro-resistant tablets | 20 tablet [PoM] £28.50 DT = £28.50

ANTIEMETICS AND ANTINAUSEANTS > CANNABINOIDS

Nabilone

21-Jan-2020

● INDICATIONS AND DOSE

Nausea and vomiting caused by cytotoxic chemotherapy, unresponsive to conventional antiemetics (preferably in hospital setting) (under close medical supervision)

▶ BY MOUTH

- ▶ Adult: Initially 1 mg twice daily, increased if necessary to 2 mg twice daily throughout each cycle of cytotoxic therapy and, if necessary, for 48 hours after the last dose of each cycle, the first dose should be taken the night before initiation of cytotoxic treatment and the second dose 1–3 hours before the first dose of cytotoxic drug, daily dose maximum should be given in 3 divided doses; maximum 6 mg per day

- **CAUTIONS** Adverse effects on mental state can persist for 48–72 hours after stopping · elderly · heart disease · history of psychiatric disorder · hypertension
 - **INTERACTIONS** → Appendix 1: nabilone
 - **SIDE-EFFECTS** Abdominal pain · appetite decreased · concentration impaired · confusion · depression · dizziness · drowsiness · drug use disorders · dry mouth · euphoric mood · feeling of relaxation · hallucination · headache · hypotension · movement disorders · nausea · psychosis · sleep disorder · tachycardia · tremor · vertigo · visual impairment
- SIDE-EFFECTS, FURTHER INFORMATION** Drowsiness and dizziness occur frequently with standard doses.
- **PREGNANCY** Avoid unless essential.
 - **BREAST FEEDING** Avoid—no information available.
 - **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (primarily biliary excretion).
 - **PATIENT AND CARER ADVICE**
Behavioural effects Patients should be made aware of possible changes of mood and other adverse behavioural effects.
Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving).
Effects of alcohol enhanced.
For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including nabilone, see *Drugs and driving* under Guidance on prescribing p. 1.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Capsule

CAUTIONARY AND ADVISORY LABELS 2

▶ **Nabilone (Non-proprietary)**

Nabilone 250 microgram Nabilone 250microgram capsules | 20 capsule [PoM] £150.00 DT = £150.00 [CD2]

Nabilone 1 mg Nabilone 1mg capsules | 20 capsule [PoM] £196.00 DT = £196.00 [CD2]

ANTIEMETICS AND ANTINAUSEANTS >

DOPAMINE RECEPTOR ANTAGONISTS

Domperidone

21-Jan-2020

● **INDICATIONS AND DOSE****Relief of nausea and vomiting**

▶ BY MOUTH

- ▶ Child 12–17 years (body-weight 35 kg and above): 10 mg up to 3 times a day for a usual maximum of 1 week; maximum 30 mg per day
- ▶ Adult (body-weight 35 kg and above): 10 mg up to 3 times a day for a usual maximum of 1 week; maximum 30 mg per day

Gastro-intestinal pain in palliative care

▶ BY MOUTH

- ▶ Adult: 10 mg 3 times a day, before meals

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED DECEMBER 2019): DOMPERIDONE FOR NAUSEA AND VOMITING: LACK OF EFFICACY IN CHILDREN; REMINDER OF CONTRA-INDICATIONS IN ADULTS AND ADOLESCENTS

Domperidone is no longer indicated for the relief of nausea and vomiting in children aged under 12 years or those weighing less than 35 kg. A European review concluded that domperidone is not as effective in this population as previously thought and alternative treatments should be considered. Healthcare professionals are advised to adhere to the licensed dose and to use the lowest effective dose for the shortest

possible duration (max. treatment duration should not usually exceed 1 week).

Healthcare professionals are also reminded of the existing contra-indications for use of domperidone (see *Contra-indications, Hepatic impairment, and Interactions*).

- **CONTRA-INDICATIONS** Cardiac disease · conditions where cardiac conduction is, or could be, impaired · gastro-intestinal haemorrhage · gastro-intestinal mechanical obstruction · gastro-intestinal mechanical perforation · if increased gastro-intestinal motility harmful · prolactinoma
- **CAUTIONS** Patients over 60 years—increased risk of ventricular arrhythmia (in adults)
- **INTERACTIONS** → Appendix 1: domperidone
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dry mouth
 - ▶ **Uncommon** Anxiety · asthenia · breast abnormalities · diarrhoea · drowsiness · headache · lactation disorders · libido loss
 - ▶ **Frequency not known** Arrhythmias · depression · gynaecomastia · menstrual cycle irregularities · movement disorders · oculogyric crisis · QT interval prolongation · seizure · sudden cardiac death · urinary retention
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce frequency.
- **PRESCRIBING AND DISPENSING INFORMATION**
Palliative care For further information on the use of domperidone in palliative care, see www.medicinescomplete.com/#/content/palliative/domperidone.
- **PATIENT AND CARER ADVICE**
Arrhythmia Patients and their carers should be told how to recognise signs of arrhythmia and advised to seek medical attention if symptoms such as palpitation or syncope develop.

Metoclopramide hydrochloride

03-Feb-2020

• INDICATIONS AND DOSE

Symptomatic treatment of nausea and vomiting including that associated with acute migraine | Delayed (but not acute) chemotherapy-induced nausea and vomiting | Radiotherapy-induced nausea and vomiting | Prevention of postoperative nausea and vomiting

- ▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION
- ▶ Adult (body-weight up to 60 kg): Up to 500 micrograms/kg daily in 3 divided doses, when administered by slow intravenous injection, to be given over at least 3 minutes
- ▶ Adult (body-weight 60 kg and above): 10 mg up to 3 times a day, when administered by slow intravenous injection, to be given over at least 3 minutes

Hiccup in palliative care

- ▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: 10 mg every 6–8 hours

Nausea and vomiting in palliative care

- ▶ BY MOUTH
- ▶ Adult: 10 mg 3 times a day
- ▶ BY SUBCUTANEOUS INFUSION
- ▶ Adult: 30–100 mg/24 hours

Acute migraine

- ▶ BY MOUTH, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 10 mg for 1 dose, to be administered as soon as migraine symptoms develop; intravenous injection to be given over at least 3 minutes

- **UNLICENSED USE** [Evidr](#) Metoclopramide is used for the treatment of acute migraine,  but is not licensed for this indication.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE—METOCLOPRAMIDE: RISK OF NEUROLOGICAL ADVERSE EFFECTS—RESTRICTED DOSE AND DURATION OF USE (AUGUST 2013)

The benefits and risks of metoclopramide have been reviewed by the European Medicines Agency's Committee on Medicinal Products for Human Use, which concluded that the risk of neurological effects such as extrapyramidal disorders and tardive dyskinesia outweigh the benefits in long-term or high-dose treatment. To help minimise the risk of potentially serious neurological adverse effects, the following restrictions to indications, dose, and duration of use have been made:

- In adults over 18 years, metoclopramide should only be used for prevention of postoperative nausea and vomiting, radiotherapy-induced nausea and vomiting, delayed (but not acute) chemotherapy-induced nausea and vomiting, and symptomatic treatment of nausea and vomiting, including that associated with acute migraine (where it may also be used to improve absorption of oral analgesics);
- Metoclopramide should only be prescribed for short-term use (up to 5 days);
- Usual dose is 10 mg, repeated up to 3 times daily; max. daily dose is 500 micrograms/kg;
- Intravenous doses should be administered as a slow bolus over at least 3 minutes;
- Oral liquid formulations should be given via an appropriately designed, graduated oral syringe to ensure dose accuracy.

This advice does not apply to unlicensed uses of metoclopramide (e.g. palliative care).

- **CONTRA-INDICATIONS** 3–4 days after gastrointestinal surgery · epilepsy · gastro-intestinal haemorrhage · gastro-intestinal obstruction · gastro-intestinal perforation · phaeochromocytoma

- **CAUTIONS** Asthma · atopic allergy · bradycardia · cardiac conduction disturbances · children · elderly · may mask underlying disorders such as cerebral irritation · Parkinson's disease · uncorrected electrolyte imbalance · young adults

CAUTIONS, FURTHER INFORMATION

- ▶ Elderly Prescription potentially inappropriate (STOPP criteria) in patients with parkinsonism (risk of exacerbating parkinsonian symptoms). See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: metoclopramide

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Asthenia · depression · diarrhoea · drowsiness · hypotension · menstrual cycle irregularities · movement disorders · parkinsonism
- ▶ **Uncommon** Arrhythmias · hallucinations · hyperprolactinaemia · level of consciousness decreased
- ▶ **Rare or very rare** Confusion · galactorrhoea · seizure
- ▶ **Frequency not known** Atrioventricular block · blood disorders · cardiac arrest · gynaecomastia · hypertension · neuroleptic malignant syndrome · QT interval prolongation · shock · syncope · tremor

SPECIFIC SIDE-EFFECTS

- ▶ With parenteral use Anxiety · dizziness · dyspnoea · oedema · skin reactions · visual impairment

SIDE-EFFECTS, FURTHER INFORMATION

Metoclopramide can induce acute dystonic reactions involving facial and skeletal muscle spasms and oculogyric crises. These dystonic effects are more common in the young (especially girls and young women) and the very old; they usually occur shortly after starting treatment with metoclopramide and subside within 24 hours of stopping it. Injection of an antiparkinsonian drug such as procyclidine will abort dystonic attacks.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Small amount present in milk; avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (risk of accumulation).
Dose adjustments Manufacturer advises dose reduction of 50% in severe impairment.
- **RENAL IMPAIRMENT**
Dose adjustments Avoid or use small dose in severe impairment; increased risk of extrapyramidal reactions.
- **DIRECTIONS FOR ADMINISTRATION** Oral liquid preparation to be given via a graduated oral dosing syringe.
- **PRESCRIBING AND DISPENSING INFORMATION**
Palliative care For further information on the use of metoclopramide hydrochloride in palliative care, see www.medicinescomplete.com/#/content/palliative/metoclopramide.
- **PATIENT AND CARER ADVICE** Counselling on use of pipette advised with oral solution.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Solution for injection

ANTIEMETICS AND ANTINAUSEANTS >

NEUROKININ RECEPTOR ANTAGONISTS

Aprepitant

11-Sep-2018

● **INDICATIONS AND DOSE**

Adjunct treatment to prevent nausea and vomiting associated with moderately and highly emetogenic chemotherapy

▶ **BY MOUTH**

▶ **Adult:** Initially 125 mg, dose to be taken 1 hour before chemotherapy, then 80 mg once daily for 2 days, consult product literature for dose of concomitant dexamethasone and 5HT₃-antagonist

● **CONTRA-INDICATIONS** Acute porphyrias p. 1120

● **INTERACTIONS** → Appendix 1: aprepitant

● **SIDE-EFFECTS**

▶ **Common or very common** Appetite decreased · asthenia · constipation · gastrointestinal discomfort · headache · hiccups

▶ **Uncommon** Anaemia · anxiety · burping · dizziness · drowsiness · dry mouth · febrile neutropenia · gastrointestinal disorders · hot flush · malaise · nausea · palpitations · skin reactions · urinary disorders · vomiting

▶ **Rare or very rare** Bradycardia · cardiovascular disorder · chest discomfort · cognitive disorder · conjunctivitis · cough · disorientation · euphoric mood · gait abnormal · hyperhidrosis · increased risk of infection · muscle spasms · muscle weakness · oedema · oropharyngeal pain · photosensitivity reaction · polydipsia · seborrhoea · severe cutaneous adverse reactions (SCARs) · sneezing · stomatitis · taste altered · throat irritation · tinnitus · weight decreased

▶ **Frequency not known** Dysarthria · dyspnoea · insomnia · miosis · sensation abnormal · visual acuity decreased · wheezing

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effectiveness of hormonal contraceptives may be reduced—alternative non-hormonal methods of contraception necessary during treatment and for 2 months after stopping aprepitant.

● **PREGNANCY** Manufacturer advises avoid unless clearly necessary—no information available.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—limited information available.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Capsule▶ **Aprepitant (Non-proprietary)**

Aprepitant 80 mg Aprepitant 80mg capsules | 2 capsule [PoM] £26.87-£31.61 DT = £31.61 | 2 capsule [PoM] £31.61 DT = £31.61 (Hospital only)

Aprepitant 125 mg Aprepitant 125mg capsules | 5 capsule [PoM] £67.18-£79.03 DT = £79.03 | 5 capsule [PoM] £79.03 DT = £79.03 (Hospital only)

▶ **Emend** (Merck Sharp & Dohme Ltd)

Aprepitant 80 mg Emend 80mg capsules | 2 capsule [PoM] £31.61 DT = £31.61

Aprepitant 125 mg Emend 125mg capsules | 5 capsule [PoM] £79.03 DT = £79.03

Fosaprepitant

29-Aug-2018

● **DRUG ACTION** Fosaprepitant is a prodrug of aprepitant.

● **INDICATIONS AND DOSE**

Adjunct to dexamethasone and a 5HT₃-receptor antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy

▶ **BY INTRAVENOUS INFUSION**

▶ **Adult:** 150 mg, dose to be administered over 20–30 minutes and given 30 minutes before chemotherapy on day 1 of cycle only, consult product literature for dose of concomitant corticosteroid and 5HT₃-receptor antagonist

● **CONTRA-INDICATIONS** Acute porphyrias p. 1120

● **INTERACTIONS** → Appendix 1: fosaprepitant

● **SIDE-EFFECTS**

▶ **Common or very common** Appetite decreased · asthenia · constipation · gastrointestinal discomfort · headache · hiccups

▶ **Uncommon** Anaemia · anxiety · burping · dizziness · drowsiness · dry mouth · febrile neutropenia · flushing · gastrointestinal disorders · malaise · nausea · palpitations · skin reactions · thrombophlebitis · urinary disorders · vomiting

▶ **Rare or very rare** Bradycardia · cardiovascular disorder · chest discomfort · cognitive disorder · conjunctivitis · cough · disorientation · euphoric mood · gait abnormal · hyperhidrosis · increased risk of infection · muscle spasms · muscle weakness · oedema · oropharyngeal pain · photosensitivity reaction · polydipsia · seborrhoea · severe cutaneous adverse reactions (SCARs) · sneezing · stomatitis · taste altered · throat irritation · tinnitus · weight decreased

▶ **Frequency not known** Dysarthria · dyspnoea · insomnia · miosis · sensation abnormal · visual acuity decreased · wheezing

● **CONCEPTION AND CONTRACEPTION** Effectiveness of hormonal contraceptives reduced—effective non-hormonal methods of contraception necessary during treatment and for 2 months after stopping fosaprepitant.

● **PREGNANCY** Avoid unless potential benefit outweighs risk—no information available.

● **BREAST FEEDING** Avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—limited information available.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Ivemend[®]), manufacturer advises give intermittently in Sodium chloride 0.9%; reconstitute each 150 mg vial with 5 mL sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 145 mL infusion fluid; give over 20–30 minutes.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 678/11

The *Scottish Medicines Consortium* has advised (March 2011) that fosaprepitant (*Ivemend*[®]) is accepted for restricted use within NHS Scotland for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based chemotherapy in adults.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Ivemend** (Merck Sharp & Dohme Ltd)

Fosaprepitant (as Fosaprepitant dimeglumine) 150 mg Ivemend 150mg powder for solution for infusion vials | 1 vial [PoM] £47.42

Rolapitant

26-Oct-2017

● INDICATIONS AND DOSE

Adjunct to dexamethasone and a 5HT₃-receptor antagonist in preventing delayed nausea and vomiting associated with moderately and highly emetogenic chemotherapy

▶ BY MOUTH

▶ Adult: 180 mg as a single dose, dose should be administered up to 2 hours before chemotherapy. Interval between repeated doses must be at least 2 weeks, consult product literature for dose of concomitant corticosteroid and 5HT₃-antagonist

- **INTERACTIONS** → Appendix 1: rolapitant

● SIDE-EFFECTS

- ▶ **Common or very common** Asthenia · constipation · headache
- ▶ **Uncommon** Appetite decreased · concentration impaired · diarrhoea · dizziness · drowsiness · gastrointestinal discomfort · hiccups · increased risk of infection · insomnia · myalgia · nausea · neutropenia · stomatitis · taste altered
- ▶ **Rare or very rare** Alopecia · angioedema · anxiety · arthralgia · back pain · dehydration · dry mouth · dyspnoea · gait abnormal · gastrointestinal disorders · hearing impairment · hypertension · hypomagnesaemia · leucopenia · movement disorders · muscle weakness · rhabdomyolysis · skin reactions · syncope · teeth grinding · thrombocytopenia · tinnitus · vision blurred · vomiting

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—limited information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).

- **RENAL IMPAIRMENT** Manufacturer advises use with caution in severe impairment—limited information available.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 1266/17

The *Scottish Medicines Consortium* has advised (September 2017) that rolapitant (*Varuby*[®]) is accepted for restricted use within NHS Scotland as a first-line option for the prevention of delayed nausea and vomiting in adults undergoing highly emetogenic chemotherapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 1303

The *All Wales Medicines Strategy Group* has advised (March 2018) that rolapitant (*Varuby*[®]) is **not** recommended for

use within NHS Wales for the prevention of delayed nausea and vomiting associated with highly and moderately emetogenic cancer chemotherapy in adults. The case for cost-effectiveness has not been proven.

- **MEDICINAL FORMS** No licensed medicines listed.

ANTIEMETICS AND ANTINAUSEANTS > SEROTONIN (5HT₃) RECEPTOR ANTAGONISTS

Granisetron

21-Jan-2020

- **DRUG ACTION** Granisetron is a specific 5HT₃-receptor antagonist which blocks 5HT₃ receptors in the gastrointestinal tract and in the CNS.

● INDICATIONS AND DOSE

Nausea and vomiting induced by cytotoxic chemotherapy for planned duration of 3–5 days where oral antiemetics cannot be used

▶ BY TRANSDERMAL APPLICATION USING PATCHES

▶ Adult: Apply 3.1 mg/24 hours, apply patch to clean, dry, non-irritated, non-hairy skin on upper arm (or abdomen if upper arm cannot be used) 24–48 hours before treatment, patch may be worn for up to 7 days; remove at least 24 hours after completing chemotherapy

Prevention of postoperative nausea and vomiting

▶ BY INTRAVENOUS INJECTION

▶ Adult: 1 mg, to be administered before induction of anaesthesia, dose to be diluted to 5 mL and given over 30 seconds

Treatment of postoperative nausea and vomiting

▶ BY INTRAVENOUS INJECTION

▶ Adult: 1 mg, dose to be diluted to 5 mL and given over 30 seconds; maximum 3 mg per day

Management of nausea and vomiting induced by cytotoxic chemotherapy or radiotherapy

▶ BY MOUTH

▶ Adult: 1–2 mg, to be taken within 1 hour before start of treatment, then 2 mg daily in 1–2 divided doses for up to 1 week following treatment, when intravenous route also used, maximum combined total dose 9 mg in 24 hours

▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Adult: 10–40 micrograms/kg (max. per dose 3 mg), to be given 5 minutes before start of treatment, dose may be repeated if necessary, further maintenance doses must not be given less than 10 minutes apart, for intravenous injection, each 1 mg granisetron diluted to 5 mL and given over not less than 30 seconds, for intravenous infusion, to be given over 5 minutes; maximum 9 mg per day

- **CAUTIONS** Subacute intestinal obstruction · susceptibility to QT-interval prolongation (including electrolyte disturbances)

- **INTERACTIONS** → Appendix 1: granisetron

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Constipation · headache

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**

▶ With intravenous or oral use Diarrhoea · insomnia

▶ **Uncommon**

▶ With intravenous or oral use Extrapyramidal symptoms · QT interval prolongation · serotonin syndrome

▶ With transdermal use Appetite decreased · arthralgia · dry mouth · flushing · generalised oedema · vertigo

▶ **Rare or very rare**

▶ With transdermal use Dystonia

- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For *intravenous infusion*, give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute up to 3 mL in 20–50 mL infusion fluid; give over 5 minutes.
- **PATIENT AND CARER ADVICE**
 - ▶ With transdermal use Patients should be advised not to expose the site of the patch to sunlight during use and for 10 days after removal.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection▶ **Granisetron (Non-proprietary)**

- ▶ **Granisetron (as Granisetron hydrochloride) 1 mg per 1 ml** Granisetron 3mg/3ml concentrate for solution for injection ampoules | 10 ampoule [PoM] £60.00
- ▶ **Granisetron 1mg/1ml concentrate for solution for injection ampoules** | 5 ampoule [PoM] £10.00–£20.00 | 10 ampoule [PoM] £20.00

Tablet▶ **Granisetron (Non-proprietary)**

- ▶ **Granisetron (as Granisetron hydrochloride) 1 mg** Granisetron 1mg tablets | 10 tablet [PoM] £51.20 DT = £40.80
- ▶ **Granisetron (as Granisetron hydrochloride) 2 mg** Granisetron 2mg tablets | 5 tablet [PoM] DT = £52.39
- ▶ **Kytril** (Atrnas Pharma UK Ltd)
- ▶ **Granisetron (as Granisetron hydrochloride) 1 mg** Kytril 1mg tablets | 10 tablet [PoM] £52.39 DT = £40.80
- ▶ **Granisetron (as Granisetron hydrochloride) 2 mg** Kytril 2mg tablets | 5 tablet [PoM] £52.39 DT = £52.39

Transdermal patch

- ▶ **Sancuso** (Kyowa Kirin Ltd)
- ▶ **Granisetron 3.1 mg per 24 hour** Sancuso 3.1mg/24hours transdermal patches | 1 patch [PoM] £56.00 DT = £56.00

Ondansetron

22-Apr-2020

- **DRUG ACTION** Ondansetron is a specific 5HT₃-receptor antagonist which blocks 5HT₃ receptors in the gastrointestinal tract and in the CNS.

● **INDICATIONS AND DOSE****Moderately emetogenic chemotherapy or radiotherapy**

- ▶ **BY MOUTH**
 - ▶ **Adult:** Initially 8 mg, dose to be taken 1–2 hours before treatment, then 8 mg every 12 hours for up to 5 days
- ▶ **BY RECTUM**
 - ▶ **Adult:** Initially 16 mg, dose to be taken 1–2 hours before treatment, then 16 mg daily for up to 5 days
- ▶ **INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
 - ▶ **Adult:** Initially 8 mg, dose to be administered immediately before treatment, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
- ▶ **INITIALLY BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION**
 - ▶ **Elderly:** Initially 8 mg, dose to be administered immediately before treatment, intravenous infusion to be given over at least 15 minutes, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

Severely emetogenic chemotherapy (consult product literature for dose of concomitant corticosteroid)

- ▶ **BY MOUTH**
 - ▶ **Adult:** 24 mg, dose to be taken 1–2 hours before treatment, then 8 mg every 12 hours for up to 5 days

▶ **BY RECTUM**

- ▶ **Adult:** 16 mg, dose to be administered 1–2 hours before treatment, then 16 mg daily for up to 5 days
- ▶ **INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
 - ▶ **Adult:** Initially 8 mg, dose to be administered immediately before treatment, followed by (by intramuscular injection or by slow intravenous injection) 8 mg every 4 hours if required for 2 doses, alternatively, followed by (by continuous intravenous infusion) 1 mg/hour for up to 24 hours, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
- ▶ **INITIALLY BY INTRAMUSCULAR INJECTION**
 - ▶ **Adult 65–74 years:** Initially 8 mg, to be given immediately before treatment, followed by (by intramuscular injection) 8 mg every 4 hours if required for 2 doses, alternatively, followed by (by continuous intravenous infusion) 1 mg/hour for up to 24 hours, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
- ▶ **INITIALLY BY INTRAVENOUS INFUSION**
 - ▶ **Adult:** Initially 16 mg, immediately before treatment (over at least 15 minutes), followed by (by intramuscular injection or by slow intravenous injection) 8 mg every 4 hours if required for 2 doses, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
 - ▶ **Adult 65–74 years:** Initially 8–16 mg, immediately before treatment (over at least 15 minutes), followed by (by intramuscular injection or by intravenous infusion) 8 mg every 4 hours if required for 2 doses, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
 - ▶ **Adult 75 years and over:** Initially 8 mg, immediately before treatment (over at least 15 minutes), followed by (by intravenous infusion) 8 mg every 4 hours if required for 2 doses, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

Prevention of postoperative nausea and vomiting

- ▶ **INITIALLY BY MOUTH**
 - ▶ **Adult:** 16 mg, dose to be taken 1 hour before anaesthesia, alternatively (by intramuscular injection or by slow intravenous injection) 4 mg, dose to be administered at induction of anaesthesia

Treatment of postoperative nausea and vomiting

- ▶ **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
 - ▶ **Adult:** 4 mg for 1 dose

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ONDANSETRON: SMALL INCREASED RISK OF ORAL CLEFTS FOLLOWING USE IN THE FIRST 12 WEEKS OF PREGNANCY (JANUARY 2020)

Epidemiological studies have identified a small increased risk of cleft lip and/or cleft palate in babies born to women who used oral ondansetron during the first trimester of pregnancy. Healthcare professionals are advised that if there is a clinical need for ondansetron in pregnancy, patients should be counselled on the potential benefits and risks, and the final decision made jointly.

- **CONTRA-INDICATIONS** Congenital long QT syndrome
- **CAUTIONS** Adenotonsillar surgery · subacute intestinal obstruction · susceptibility to QT-interval prolongation (including electrolyte disturbances)
- **INTERACTIONS** → Appendix 1: ondansetron

● SIDE-EFFECTS

- ▶ **Common or very common** Constipation · feeling hot · headache · sensation abnormal
- ▶ **Uncommon** Arrhythmias · chest pain · hiccups · hypotension · movement disorders · oculogyric crisis · seizure
- ▶ **Rare or very rare** Dizziness · QT interval prolongation · vision disorders
- **PREGNANCY** Manufacturer advises avoid in first trimester—small increased risk of congenital abnormalities such as orofacial clefts, see *Important safety information*.
- **BREAST FEEDING** Present in milk in *animal studies*—avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (decreased clearance). **Dose adjustments** Manufacturer advises maximum 8 mg daily in moderate to severe impairment.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For *intravenous infusion (Zofran®)*, give continuously or intermittently in Glucose 5% or Glucose 5% with Potassium chloride 0.3% or Sodium chloride 0.9% or Sodium chloride 0.9% with Potassium chloride 0.3% or Mannitol 10% or Ringers solution; for intermittent infusion, dilute the required dose in 50–100 mL of infusion fluid and give over at least 15 minutes.
 - ▶ With oral use Orodispersible films and lyophilisates should be placed on the tongue, allowed to disperse and swallowed.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer orodispersible films and lyophilisates.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

▶ Ondansetron (Non-proprietary)

Palonosetron

22-Jan-2020

- **DRUG ACTION** Palonosetron is a specific 5HT₃-receptor antagonist which blocks 5HT₃ receptors in the gastrointestinal tract and in the CNS.

● INDICATIONS AND DOSE

Moderately emetogenic chemotherapy

▶ INITIALLY BY MOUTH

- ▶ **Adult:** 500 micrograms, dose to be taken 1 hour before treatment, alternatively (by intravenous injection) 250 micrograms for 1 dose, dose to be administered over 30 seconds, 30 minutes before treatment

Severely emetogenic chemotherapy

▶ BY INTRAVENOUS INJECTION

- ▶ **Adult:** 250 micrograms for 1 dose, dose to be administered over 30 seconds, 30 minutes before treatment

- **CAUTIONS** History of constipation · intestinal obstruction · susceptibility to QT-interval prolongation (including electrolyte disturbances)

- **INTERACTIONS** → Appendix 1: palonosetron

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Constipation · headache

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**

- ▶ With intravenous use Diarrhoea · dizziness · electrolyte imbalance · metabolic disorder

▶ Uncommon

- ▶ With intravenous use Amblyopia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · drowsiness · dry mouth · dyspepsia · euphoric mood · eye irritation · feeling hot · fever · flatulence · glycosuria · hiccups · hyperbilirubinaemia · hyperglycaemia · hypertension · hypotension · influenza like illness · motion sickness · myocardial ischaemia · paraesthesia · peripheral neuropathy · QT interval prolongation · skin reactions · sleep disorders · tinnitus · urinary retention · vasodilation · vein discoloration
- ▶ With oral use Atrioventricular block · dyspnoea · eye swelling · insomnia · myalgia

- ▶ **Rare or very rare**
- ▶ With intravenous use Shock
- **PREGNANCY** Avoid—no information available.
- **BREAST FEEDING** Avoid—no information available.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Dizziness or drowsiness may affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Palonosetron with netupitant

22-Jan-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, palonosetron p. 456.

● INDICATIONS AND DOSE

Moderately emetogenic chemotherapy | Highly emetogenic cisplatin-based chemotherapy

▶ BY MOUTH

- ▶ Adult: 1 capsule, to be taken approximately 1 hour before the start of each chemotherapy cycle

- **CAUTIONS** Patients over 75 years
- **INTERACTIONS** → Appendix 1: netupitant · palonosetron
- **SIDE-EFFECTS**
- ▶ **Common or very common** Asthenia · constipation · headache
- ▶ **Uncommon** Alopecia · cardiac conduction disorders · cardiomyopathy · diarrhoea · dizziness · flatulence · gastrointestinal discomfort · hiccups · hypertension · increased leucocytes · neutropenia · QT interval prolongation · sleep disorders · urticaria · vertigo
- ▶ **Rare or very rare** Acute psychosis · arrhythmias · conjunctivitis · cystitis · dysphagia · feeling hot · hypokalaemia · hypotension · leucopenia · mitral valve incompetence · mood altered · myocardial ischaemia · numbness · pain · tongue coated · vision blurred
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends exclude pregnancy before treatment in females of childbearing age; ensure effective contraception during treatment and for one month after treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid during treatment and for 1 month after last dose—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (risk of increased exposure, limited information available).
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) decisions
The *Scottish Medicines Consortium* (December 2015) has advised that palonosetron in combination with netupitant (Akyzreo[®]) is approved for restricted use within NHS

Scotland for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based cancer chemotherapy.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 25

Palonosetron (as Palonosetron hydrochloride) 500 microgram, **Netupitant** 300 mg Akyzreo 300mg/0.5mg capsules | 1 capsule [PoM] £69.00 (Hospital only)

ANTIHISTAMINES > SEDATING ANTIHISTAMINES

Cinnarizine

20-Mar-2020

● INDICATIONS AND DOSE

Relief of symptoms of vestibular disorders, such as vertigo, tinnitus, nausea, and vomiting in Ménière's disease

▶ BY MOUTH

- ▶ Child 5-11 years: 15 mg 3 times a day
- ▶ Child 12-17 years: 30 mg 3 times a day
- ▶ Adult: 30 mg 3 times a day

Motion sickness

▶ BY MOUTH

- ▶ Child 5-11 years: Initially 15 mg, dose to be taken 2 hours before travel, then 7.5 mg every 8 hours if required, dose to be taken during journey
- ▶ Child 12-17 years: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey
- ▶ Adult: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey

- **CONTRA-INDICATIONS** Avoid in Acute porphyrias p. 1120
- **CAUTIONS** Epilepsy · glaucoma (in children) · Parkinson's disease (in adults) · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · susceptibility to angle-closure glaucoma (in adults) · urinary retention
- **INTERACTIONS** → Appendix 1: antihistamines, sedating
- **SIDE-EFFECTS**
- ▶ **Common or very common** Drowsiness · gastrointestinal discomfort · nausea · weight increased
- ▶ **Uncommon** Fatigue · hyperhidrosis · vomiting
- ▶ **Frequency not known** Dry mouth · gastrointestinal disorder · headache · jaundice cholestatic · movement disorders · muscle rigidity · parkinsonism · skin reactions · subacute cutaneous lupus erythematosus · tremor
- **PREGNANCY** Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in hepatic insufficiency—no information available.
- **RENAL IMPAIRMENT** Use with caution—no information available.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling, driving); sedating effects enhanced by alcohol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

28-Nov-2019

● **INDICATIONS AND DOSE****Nausea | Vomiting | Labyrinthine disorders**

- ▶ BY MOUTH

▶ Child 5-9 years: 12.5-37.5 mg daily

▶ Child 10-17 years: 25-75 mg daily; maximum 100 mg per day

▶ Adult: 25-75 mg daily; maximum 100 mg per day

Motion sickness prevention (acts longer than promethazine hydrochloride)

- ▶ BY MOUTH

▶ Child 5-9 years: 12.5 mg once daily, dose to be taken at bedtime on night before travel or 1-2 hours before travel

▶ Child 10-17 years: 25 mg once daily, dose to be taken at bedtime on night before travel or 1-2 hours before travel

▶ Adult: 25 mg once daily, dose to be taken at bedtime on night before travel or 1-2 hours before travel

Motion sickness treatment (acts longer than promethazine hydrochloride)

- ▶ BY MOUTH

▶ Child 5-9 years: 12.5 mg, dose to be taken at onset of motion sickness, then 12.5 mg daily for 2 days, dose to be taken at bedtime

▶ Child 10-17 years: 25 mg, dose to be taken at onset of motion sickness, then 25 mg once daily for 2 days, dose to be taken at bedtime

▶ Adult: 25 mg, dose to be taken at onset of motion sickness, then 25 mg once daily for 2 days, dose to be taken at bedtime

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN (APRIL 2009)

Children under 6 years should not be given over-the-counter cough and cold medicines containing promethazine.

- **CAUTIONS** Asthma · bronchiectasis · bronchitis · epilepsy · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · Reye's syndrome · severe coronary artery disease · susceptibility to angle-closure glaucoma · urinary retention

- **INTERACTIONS** → Appendix 1: antihistamines, sedating

- **SIDE-EFFECTS** Anticholinergic syndrome · anxiety · appetite decreased · arrhythmia · blood disorder · bronchial secretion viscosity increased · confusion · dizziness · drowsiness · dry mouth · epigastric discomfort · fatigue · haemolytic anaemia · headache · hypotension · jaundice · movement disorders · muscle spasms · nightmare · palpitations · photosensitivity reaction · urinary retention · vision blurred

SIDE-EFFECTS, FURTHER INFORMATION Elderly patients are more susceptible to anticholinergic side-effects. In children paradoxical stimulation may occur, especially with high doses.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **RENAL IMPAIRMENT** Use with caution.

- **PATIENT AND CARER ADVICE**

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 2

- ▶ **Avomine** (Manx Healthcare Ltd)

Promethazine teoclate 25 mg Avomine 25mg tablets | 10 tablet [P] £1.13 | 28 tablet [P] £3.13 DT = £3.13

- ▶ **Vertigon** (Manx Healthcare Ltd)

ANTIMUSCARINICS

820

Hyoscine hydrobromide

06-Dec-2019

(Scopolamine hydrobromide)● **INDICATIONS AND DOSE****Motion sickness**

- ▶ BY MOUTH

▶ Child 4-9 years: 75-150 micrograms, dose to be taken up to 30 minutes before the start of journey, then 75-150 micrograms every 6 hours if required; maximum 450 micrograms per day

▶ Child 10-17 years: 150-300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150-300 micrograms every 6 hours if required; maximum 900 micrograms per day

▶ Adult: 150-300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150-300 micrograms every 6 hours if required; maximum 900 micrograms per day

- ▶ BY TRANSDERMAL APPLICATION

▶ Child 10-17 years: Apply 1 patch, apply behind ear 5-6 hours before journey, then apply 1 patch after 72 hours if required, remove old patch and site replacement patch behind the other ear

- ▶ **Adult:** Apply 1 patch, apply behind ear 5–6 hours before journey, then apply 1 patch after 72 hours if required, remove old patch and site replacement patch behind the other ear

Hypersalivation associated with clozapine therapy

▶ BY MOUTH

- ▶ **Adult:** 300 micrograms up to 3 times a day; maximum 900 micrograms per day

Excessive respiratory secretion in palliative care

▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** 400 micrograms every 4 hours as required, hourly use is occasionally necessary, particularly in excessive respiratory secretions

▶ BY CONTINUOUS SUBCUTANEOUS INFUSION

- ▶ **Adult:** 1.2–2 mg/24 hours

Bowel colic in palliative care

▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** 400 micrograms every 4 hours as required, hourly use is occasionally necessary

▶ BY SUBCUTANEOUS INFUSION

- ▶ **Adult:** 1.2–2 mg/24 hours

Bowel colic pain in palliative care

▶ BY MOUTH USING SUBLINGUAL TABLETS

- ▶ **Adult:** 300 micrograms 3 times a day, as *Kwells*®.

Premedication

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ **Adult:** 200–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia

- **UNLICENSED USE** Not licensed for hypersalivation associated with clozapine therapy.

IMPORTANT SAFETY INFORMATION

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

- **CAUTIONS** Epilepsy

CAUTIONS, FURTHER INFORMATION

- ▶ Anticholinergic syndrome
- ▶ With systemic use in adults In some patients, especially the elderly, hyoscine may cause the central anticholinergic syndrome (excitement, ataxia, hallucinations, behavioural abnormalities, and drowsiness).
- ▶ With systemic use in children In some children hyoscine may cause the central anticholinergic syndrome (excitement, ataxia, hallucinations, behavioural abnormalities, and drowsiness).

- **INTERACTIONS** → Appendix 1: hyoscine

● SIDE-EFFECTS

- ▶ **Common or very common**
 - ▶ With transdermal use Eye disorders · eyelid irritation
- ▶ **Rare or very rare**
 - ▶ With transdermal use Concentration impaired · glaucoma · hallucinations · memory loss · restlessness
- ▶ **Frequency not known**
 - ▶ With oral use Asthma · cardiovascular disorders · central nervous system stimulation · gastrointestinal disorder · hallucination · hypersensitivity · hyperthermia · hypohidrosis · mydriasis · oedema · respiratory tract reaction · restlessness · seizure
 - ▶ With parenteral use Agitation · angle closure glaucoma · arrhythmias · delirium · dysphagia · dyspnoea · epilepsies exacerbated · hallucination · hypersensitivity · idiosyncratic drug reaction · loss of consciousness · mydriasis · neuroleptic malignant syndrome · psychotic disorder · thirst
 - ▶ With transdermal use Balance impaired

- **PREGNANCY** Use only if potential benefit outweighs risk. Injection may depress neonatal respiration.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Use with caution.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With transdermal use in children Patch applied to hairless area of skin behind ear; if less than whole patch required either cut with scissors along full thickness ensuring membrane is not peeled away or cover portion to prevent contact with skin.
 - ▶ With oral use in children For administration by *mouth*, injection solution may be given orally.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of chewable tablet formulations may include raspberry.

Palliative care For further information on the use of hyoscine hydrobromide in palliative care, see www.medicinescomplete.com/#/content/palliative/hyoscine-hydrobromide.
- **PATIENT AND CARER ADVICE**
 - ▶ With transdermal use Explain accompanying instructions to patient and in particular emphasise advice to wash hands after handling and to wash application site after removing, and to use one patch at a time.

Driving and skilled tasks Drowsiness may persist for up to 24 hours or longer after removal of patch; effects of alcohol enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, eye drops

Droperidol

06-Aug-2019

- **DRUG ACTION** Droperidol is a butyrophenone, structurally related to haloperidol, which blocks dopamine receptors in the chemoreceptor trigger zone.

● INDICATIONS AND DOSE

Prevention and treatment of postoperative nausea and vomiting

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 0.625–1.25 mg, dose to be given 30 minutes before end of surgery, then 0.625–1.25 mg every 6 hours as required
- ▶ Elderly: 625 micrograms, dose to be given 30 minutes before end of surgery, then 625 micrograms every 6 hours as required

Prevention of nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia (PCA)

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 15–50 micrograms of droperidol for every 1 mg of morphine in PCA, reduce dose in elderly; maximum 5 mg per day

- **CONTRA-INDICATIONS** Bradycardia · comatose states · hypokalaemia · hypomagnesaemia · phaeochromocytoma · QT-interval prolongation

- **CAUTIONS** Chronic obstructive pulmonary disease · CNS depression · electrolyte disturbances · history of alcohol abuse · respiratory failure

- **INTERACTIONS** → Appendix 1: droperidol

● **SIDE-EFFECTS**

- ▶ **Uncommon** Anxiety · oculogyration
- ▶ **Rare or very rare** Blood disorder · cardiac arrest · confusion · dysphoria

- ▶ **Frequency not known** Coma · epilepsy · hallucination · oligomenorrhoea · respiratory disorders · SIADH · syncope

- **BREAST FEEDING** Limited information available—avoid repeated administration.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

Dose adjustments

- ▶ When used for Prevention and treatment of postoperative nausea and vomiting Manufacturer advises maximum 625 micrograms repeated every 6 hours as required.
- ▶ When used for Prevention of nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia Manufacturer advises dose reduction (no information available).

● **RENAL IMPAIRMENT**

Dose adjustments In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required.

For nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia, reduce dose.

- **MONITORING REQUIREMENTS** Continuous pulse oximetry required if risk of ventricular arrhythmia—continue for 30 minutes following administration.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection▶ **Droperidol (Non-proprietary)**

Droperidol 2.5 mg per 1 ml Droperidol 2.5mg/1ml solution for injection ampoules | 10 ampoule [POM] S

▶ **Xomolix** (Kyowa Kirin Ltd)

Droperidol 2.5 mg per 1 ml Xomolix 2.5mg/1ml solution for injection ampoules | 10 ampoule [POM] £39.40

Levomepromazine

(Methotrimeprazine)

● INDICATIONS AND DOSE

Pain in palliative care (reserved for distressed patients with severe pain unresponsive to other measures)

- ▶ BY CONTINUOUS SUBCUTANEOUS INFUSION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: Seek specialist advice

Restlessness and confusion in palliative care

- ▶ BY CONTINUOUS SUBCUTANEOUS INFUSION
- ▶ Child 1–11 years: 0.35–3 mg/kg, to be administered over 24 hours
- ▶ Child 12–17 years: 12.5–200 mg, to be administered over 24 hours
- ▶ BY MOUTH
- ▶ Adult: 6 mg every 2 hours as required
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 6.25 mg every 2 hours as required
- ▶ BY SUBCUTANEOUS INFUSION
- ▶ Adult: Initially 12.5–50 mg/24 hours, titrated according to response (doses greater than 100 mg/24 hours should be given under specialist supervision)

Nausea and vomiting in palliative care

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INFUSION
- ▶ Child 1 month–11 years: 100–400 micrograms/kg, to be administered over 24 hours
- ▶ Child 12–17 years: 5–25 mg, to be administered over 24 hours
- ▶ BY MOUTH
- ▶ Adult: 6 mg once daily, dose to be taken at bedtime, increased if necessary to 12.5–25 mg twice daily
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 6.25 mg once daily, dose to be given at bedtime, increased if necessary to 12.5–25 mg twice daily
- ▶ BY SUBCUTANEOUS INFUSION
- ▶ Adult: 5–25 mg/24 hours, sedation can limit the dose

Schizophrenia (bed patients)

- ▶ BY MOUTH
- ▶ Adult: Initially 100–200 mg daily in 3 divided doses, increased if necessary to 1 g daily

Schizophrenia

- ▶ BY MOUTH
- ▶ Adult: Initially 25–50 mg daily in divided doses, dose can be increased as necessary

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma

- **CAUTIONS** Patients receiving large initial doses should remain supine

CAUTIONS, FURTHER INFORMATION

- ▶ In adults Risk of postural hypotension; not recommended for ambulant patients over 50 years unless risk of hypotensive reaction assessed.

- **INTERACTIONS** → Appendix 1: phenothiazines

● **SIDE-EFFECTS**

- ▶ **Common or very common** Asthenia · heat stroke
- ▶ **Rare or very rare** Cardiac arrest · hepatic disorders
- ▶ **Frequency not known** Allergic dermatitis · confusion · delirium · gastrointestinal disorders · glucose tolerance impaired · hyperglycaemia · hyponatraemia · photosensitivity reaction · priapism · SIADH

- **HEPATIC IMPAIRMENT** Manufacturer advises consider avoiding.

● **RENAL IMPAIRMENT**

Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With subcutaneous use in children For administration by *subcutaneous infusion* dilute with a suitable volume of Sodium Chloride 0.9%.

● PRESCRIBING AND DISPENSING INFORMATION

Palliative care For further information on the use of levomepromazine in palliative care, see www.medicinescomplete.com/#/content/palliative/levomepromazine.

6 Pain

Pain, Chronic

01-Oct-2019

Overview

Pain is described as an unpleasant sensory and emotional experience associated with actual or potential tissue damage. Physiologically, it can be described as **neuropathic** or **nociceptive**, and classified as either **acute** or **chronic** in nature. Nociceptive pain generally responds to treatment with conventional analgesics whereas neuropathic pain responds poorly to conventional analgesics and can be difficult to treat.

Chronic pain is defined as pain that has been present for more than 12 weeks; beyond the expected time of wound healing. It is a complex phenomenon and can have a considerable impact on quality of life, resulting in significant suffering and disability.

Aims of treatment

Treatment aims to reduce the impact of chronic pain on quality of life, mood and function.

Management of chronic pain

A wide range of both pharmacological and non-pharmacological management strategies are available for chronic pain. For guidance on the management of chronic pain in osteoarthritis, see Osteoarthritis and soft-tissue disorders p. 1152, for musculoskeletal conditions, see Soft-tissue disorders p. 1218, and for neuropathic pain, see Neuropathic pain p. 505.

[EvGr] Consider specialist referral when non-specialist management is failing, the pain is poorly controlled, the patient is experiencing significant distress, and/or where a specialist intervention is being considered. **⚠**

Non-drug treatment

[EvGr] Exercise and exercise therapies, regardless of their form, are recommended in the management of chronic pain; strategies to improve adherence (such as supervised exercise sessions) should be implemented.

Transcutaneous electrical nerve stimulation (either high or low frequency) should be considered for the relief of chronic pain.

Referral to a pain management programme and psychologically based interventions such as cognitive behavioural therapy, biofeedback, and progressive relaxation should be considered for patients with chronic pain; brief education should be given to all patients.

The use of self-management resources (safe, low-technology, community-based, and affordable programmes) should be considered to complement other therapies in the treatment of chronic pain. For information on self-management resources, see SIGN clinical guideline:

Management of chronic pain (see *Useful resources*). **⚠**

Drug treatment

A variety of analgesics are used in the treatment of chronic pain and can be divided into **non-opioid** and **opioid** analgesics. Although developed and validated for cancer pain, the World Health Organisation (WHO) analgesic ladder is widely used to guide the basic treatment of acute and chronic pain; whilst there is little evidence to support its use in chronic pain it may provide an analgesic strategy for non-

specialists. The WHO analgesic ladder is available at: www.who.int/cancer/palliative/painladder/en/.

Individual responses to analgesia vary considerably, both in terms of efficacy and side effects; even with the same chronic pain syndrome, the underlying pain mechanisms may differ between individuals. This provides challenges with assessment and management in routine clinical practice. **EvGr** If an individual either fails to tolerate, or has an inadequate response to a drug, then it is worthwhile considering a different agent from the same class.

Individuals using analgesics to manage chronic pain should be reviewed at least annually, with review frequency increased if there are any changes to their medication, underlying pain syndrome or comorbidities. **A**

For comparative information on analgesic options, see Analgesics below.

EvGr **Depression** is a common comorbidity in those with chronic pain; individuals should be monitored and treated for depression when necessary. Optimising antidepressant therapy should be considered in individuals with moderate depression and chronic pain. **A** For information on the treatment of depression in adults, see Antidepressant drugs p. 376.

Non-opioid analgesics

Non-opioid analgesics include paracetamol p. 465 and non-steroidal anti-inflammatory drugs (NSAIDs). For information on the use of NSAIDs, see Non-steroidal anti-inflammatory drugs p. 1193.

EvGr Cannabis-based medicinal products (nabilone, dronabinol, delta-9-tetrahydrocannabinol (THC), and combination cannabidiol (CBD) with THC) are not recommended for managing chronic pain. The use of CBD is not recommended unless as part of a clinical trial. If the patient is already using cannabis-based treatment for chronic pain, it may be continued until they and the appropriate clinician deem it suitable to stop. **A**

Topical analgesic preparations may be useful for the management of chronic pain in different disorders. Preparations include capsaicin or lidocaine (see Neuropathic pain p. 505), NSAIDs (see Osteoarthritis and soft-tissue disorders p. 1152), and rubefacients (see Soft-tissue disorders p. 1218).

Compound preparations

EvGr The use of single-ingredient analgesics is preferred to allow for independent titration of each drug; however, fixed dose combination analgesics (except those with low-dose opioids) may be considered for those with stable chronic pain. **A**

Opioids

Opioid analgesics can be divided into those used for mild-to-moderate pain (such as codeine phosphate p. 475) and those used for moderate-to-severe pain (such as morphine p. 484 or oxycodone hydrochloride p. 487).

EvGr Opioids should only be considered in carefully selected individuals for the short- to medium-term treatment of chronic non-malignant pain, when other therapies have been insufficient; the benefits should outweigh the risks of serious harms (such as addiction, overdose and death). With continuous longer-term use of opioids, tolerance and dependence compromise both safety and efficacy. Prescribers should have knowledge of opioid pharmacology, and be competent and experienced in the use of strong opioids.

When starting treatment with an opioid there should be an agreement between the prescriber and patient about the expected outcomes—with advanced agreement on the reduction and cessation of the opioid if these are not met. Opioids should be reviewed at least annually but more frequently if required; consideration should be given to a gradual reduction of the opioid to the lowest effective dose or complete cessation. Pain specialist advice or review

should be sought for individuals taking doses >90 mg/day morphine equivalent. **A**

There is a rationale for switching between opioids if the initial choice is ineffective or if side effects are unacceptable.

EvGr Caution should be used with dose comparisons and switching due to limited evidence for the accuracy of dose equivalence tables and considerable variation between individuals. **A** For more information on opioid dose conversions or equivalents, see Prescribing in palliative care p. 28. Resources for the prescribing of opioids have been produced by the *Faculty of Pain Medicine* in partnership with *Public Health England*, and are available at: fpm.ac.uk/opioids-aware.

Management of chronic pain. Scottish Intercollegiate Guidelines Network. SIGN guideline 136. August 2019. www.sign.ac.uk/sign-136-management-of-chronic-pain.html

Analgesics

Pain relief

The non-opioid drugs, paracetamol p. 465 and aspirin p. 130 (and other NSAIDs), are particularly suitable for pain in musculoskeletal conditions, whereas the opioid analgesics are more suitable for moderate to severe pain, particularly of visceral origin.

Pain in sickle-cell disease

The pain of mild sickle-cell crises is managed with paracetamol, a NSAID, codeine phosphate p. 475, or dihydrocodeine tartrate p. 477. Severe crises may require the use of morphine p. 484 or diamorphine hydrochloride p. 477; concomitant use of a NSAID may potentiate analgesia and allow lower doses of the opioid to be used. Pethidine hydrochloride p. 490 should be avoided if possible because accumulation of a neurotoxic metabolite can precipitate seizures; the relatively short half-life of pethidine hydrochloride necessitates frequent injections.

Dental and orofacial pain

Analgesics should be used judiciously in dental care as a **temporary** measure until the cause of the pain has been dealt with.

Dental pain of inflammatory origin, such as that associated with pulpitis, apical infection, localised osteitis or pericoronitis is usually best managed by treating the infection, providing drainage, restorative procedures, and other local measures. Analgesics provide temporary relief of pain (usually for about 1 to 7 days) until the causative factors have been brought under control. In the case of pulpitis, intra-osseous infection or abscess, reliance on analgesics alone is usually inappropriate.

Similarly the pain and discomfort associated with acute problems of the oral mucosa (e.g. acute herpetic gingivostomatitis, erythema multiforme) may be relieved by benzylamine hydrochloride mouthwash or spray p. 1280 until the cause of the mucosal disorder has been dealt with. However, where a patient is febrile, the antipyretic action of paracetamol or ibuprofen p. 1203 is often helpful.

The *choice* of an analgesic for dental purposes should be based on its suitability for the patient. Most dental pain is relieved effectively by non-steroidal anti-inflammatory drugs (NSAIDs). NSAIDs that are used for dental pain include ibuprofen, diclofenac sodium p. 1198, and aspirin. Paracetamol has analgesic and antipyretic effects but no anti-inflammatory effect.

Opioid analgesics such as dihydrocodeine tartrate act on the central nervous system and are traditionally used for *moderate to severe pain*. However, opioid analgesics are relatively ineffective in dental pain and their side-effects can be unpleasant. Paracetamol, ibuprofen, or aspirin are

adequate for most cases of dental pain and an opioid is rarely required.

Combining a non-opioid with an opioid analgesic can provide greater relief of pain than either analgesic given alone. However, this applies only when an adequate dose of each analgesic is used. Most combination analgesic preparations have not been shown to provide greater relief of pain than an adequate dose of the non-opioid component given alone. Moreover, combination preparations have the disadvantage of an increased number of side-effects.

Any analgesic given before a dental procedure should have a low risk of increasing postoperative bleeding. In the case of pain after the dental procedure, taking an analgesic before the effect of the local anaesthetic has worn off can improve control. Postoperative analgesia with ibuprofen or aspirin is usually continued for about 24 to 72 hours.

Temporomandibular dysfunction can be related to anxiety in some patients who may clench or grind their teeth (bruxism) during the day or night. The muscle spasm (which appears to be the main source of pain) may be treated empirically with an overlay appliance which provides a free sliding occlusion and may also interfere with grinding. In addition, diazepam p. 360, which has muscle relaxant as well as anxiolytic properties, may be helpful but it should only be prescribed on a short-term basis during the acute phase. Analgesics such as aspirin or ibuprofen may also be required.

Dysmenorrhoea

Use of an oral contraceptive prevents the pain of dysmenorrhoea which is generally associated with ovulatory cycles. If treatment is necessary paracetamol or a NSAID will generally provide adequate relief of pain. The vomiting and severe pain associated with dysmenorrhoea in women with endometriosis may call for an antiemetic (in addition to an analgesic). Antispasmodics (such as alverine citrate p. 93) have been advocated for dysmenorrhoea but the antispasmodic action does not generally provide significant relief.

Non-opioid analgesics and compound analgesic preparations

Aspirin is indicated for headache, transient musculoskeletal pain, dysmenorrhoea, and pyrexia. In inflammatory conditions, most physicians prefer anti-inflammatory treatment with another NSAID which may be better tolerated and more convenient for the patient. Aspirin is used increasingly for its antiplatelet properties. Aspirin tablets or dispersible aspirin tablets are adequate for most purposes as they act rapidly.

Gastric irritation may be a problem; it is minimised by taking the dose after food. Enteric-coated preparations are available, but have a slow onset of action and are therefore unsuitable for single-dose analgesic use (though their prolonged action may be useful for night pain).

Aspirin interacts significantly with a number of other drugs and its interaction with warfarin sodium p. 150 is a **special hazard**.

Paracetamol is similar in efficacy to aspirin, but has no demonstrable anti-inflammatory activity; it is less irritant to the stomach and for that reason is now generally preferred to aspirin, particularly in the elderly. **Overdosage** with paracetamol is particularly dangerous as it may cause hepatic damage which is sometimes not apparent for 4 to 6 days.

Nefopam hydrochloride p. 467 may have a place in the relief of persistent pain unresponsive to other non-opioid analgesics. It causes little or no respiratory depression, but sympathomimetic and antimuscarinic side-effects may be troublesome.

Non-steroidal anti-inflammatory analgesics (NSAIDs) are particularly useful for the treatment of patients with chronic disease accompanied by pain and inflammation. Some of them are also used in the short-term treatment of

mild to moderate pain including transient musculoskeletal pain but paracetamol is now often preferred, particularly in the elderly. They are also suitable for the relief of pain in *dysmenorrhoea* and to treat pain caused by *secondary bone tumours*, many of which produce lysis of bone and release prostaglandins. Selective inhibitors of cyclo-oxygenase-2 may be used in preference to non-selective NSAIDs for patients at high risk of developing serious gastro-intestinal side-effects. Several NSAIDs are also used for postoperative analgesia.

A non-opioid analgesic administered by intrathecal infusion (**ziconotide** (*Prialt*®), available from Eisai) is licensed for the treatment of chronic severe pain; ziconotide can be used by a hospital specialist as an adjunct to opioid analgesics.

Compound analgesic preparations

Compound analgesic preparations that contain a simple analgesic (such as aspirin p. 130 or paracetamol p. 465) with an opioid component reduce the scope for effective titration of the individual components in the management of pain of varying intensity.

Compound analgesic preparations containing paracetamol or aspirin with a *low dose* of an opioid analgesic (e.g. 8 mg of codeine phosphate p. 475 per compound tablet) are commonly used, but the advantages have not been substantiated. The low dose of the opioid may be enough to cause opioid side-effects (in particular, constipation) and can complicate the treatment of **overdosage** yet may not provide significant additional relief of pain.

A *full dose* of the opioid component (e.g. 60 mg codeine phosphate) in compound analgesic preparations effectively augments the analgesic activity but is associated with the full range of opioid side-effects (including nausea, vomiting, severe constipation, drowsiness, respiratory depression, and risk of dependence on long-term administration).

Important: the elderly are particularly susceptible to opioid side-effects and should receive lower doses.

In general, when assessing pain, it is necessary to weigh up carefully whether there is a need for a non-opioid and an opioid analgesic to be taken simultaneously.

Caffeine is a weak stimulant that is often included, in small doses, in analgesic preparations. It is claimed that the addition of caffeine may enhance the analgesic effect, but the alerting effect, mild habit-forming effect and possible provocation of headache may not always be desirable. Moreover, in excessive dosage or on withdrawal caffeine may itself induce headache.

Co-proxamol tablets (dextropropoxyphene in combination with paracetamol) are no longer licensed because of safety concerns, particularly toxicity in overdose. Co-proxamol tablets [unlicensed] may still be prescribed for patients who find it difficult to change, because alternatives are not effective or suitable.

Opioid analgesics and dependence

Opioid analgesics are usually used to relieve moderate to severe pain particularly of visceral origin. Repeated administration may cause dependence and tolerance, but this is no deterrent in the control of pain in terminal illness. Regular use of a potent opioid may be appropriate for certain cases of chronic non-malignant pain.

For general guidance on the use of opioid analgesics in chronic pain, see Pain, Chronic p. 461.

Strong opioids

Morphine p. 484 remains the most valuable opioid analgesic for severe pain although it frequently causes nausea and vomiting. It is the standard against which other opioid analgesics are compared. In addition to relief of pain, morphine also confers a state of euphoria and mental detachment.

Morphine is the opioid of choice for the oral treatment of *severe pain in palliative care*. It is given regularly every

4 hours (or every 12 or 24 hours as modified-release preparations).

Buprenorphine p. 468 has both opioid agonist and antagonist properties and may precipitate withdrawal symptoms, including pain, in patients dependent on other opioids. It has abuse potential and may itself cause dependence. It has a much longer duration of action than morphine and sublingually is an effective analgesic for 6 to 8 hours. Unlike most opioid analgesics, the effects of buprenorphine are only partially reversed by naloxone hydrochloride p. 1440.

Dipipanone hydrochloride used alone is less sedating than morphine but the only preparation available contains an antiemetic and is therefore not suitable for regular regimens in palliative care.

Diamorphine hydrochloride p. 477 (heroin) is a powerful opioid analgesic. It may cause less nausea and hypotension than morphine. In *palliative care* the greater solubility of diamorphine hydrochloride allows effective doses to be injected in smaller volumes and this is important in the emaciated patient.

Alfentanil p. 1413, fentanyl p. 479 and remifentanyl p. 1414 are used by injection for intra-operative analgesia; fentanyl is available in a transdermal drug delivery system as a self-adhesive patch which is changed every 72 hours.

Methadone hydrochloride p. 524 is less sedating than morphine and acts for longer periods. In prolonged use, methadone hydrochloride should not be administered more often than twice daily to avoid the risk of accumulation and opioid overdose. Methadone hydrochloride may be used instead of morphine in the occasional patient who experiences excitation (or exacerbation of pain) with morphine.

Oxycodone hydrochloride p. 487 has an efficacy and side-effect profile similar to that of morphine. It is commonly used as a second-line drug if morphine is not tolerated or does not control the pain.

Papaveretum is rarely used; morphine is easier to prescribe and less prone to error with regard to the strength and dose.

Pentazocine p. 490 has both agonist and antagonist properties and precipitates withdrawal symptoms, including pain in patients dependent on other opioids. By injection it is more potent than dihydrocodeine tartrate p. 477 or codeine phosphate, but hallucinations and thought disturbances may occur. It is not recommended and, in particular, should be avoided after myocardial infarction as it may increase pulmonary and aortic blood pressure as well as cardiac work.

Pethidine hydrochloride p. 490 produces prompt but short-lasting analgesia; it is less constipating than morphine, but even in high doses is a less potent analgesic. It is not suitable for severe continuing pain. It is used for analgesia in labour; however, other opioids, such as morphine or diamorphine hydrochloride, are often preferred for obstetric pain.

Tapentadol p. 491 produces analgesia by two mechanisms. It is an opioid-receptor agonist and it also inhibits noradrenaline reuptake. Nausea, vomiting, and constipation are less likely to occur with tapentadol than with other strong opioid analgesics.

Tramadol hydrochloride p. 491 produces analgesia by two mechanisms: an opioid effect and an enhancement of serotonergic and adrenergic pathways. It has fewer of the typical opioid side-effects (notably, less respiratory depression, less constipation and less addiction potential); psychiatric reactions have been reported.

Weak opioids

Codeine phosphate can be used for the relief of mild to moderate pain where other painkillers such as paracetamol or ibuprofen p. 1203 have proved ineffective.

Dihydrocodeine tartrate has an analgesic efficacy similar to that of codeine phosphate. Higher doses may provide

some additional pain relief but this may be at the cost of more nausea and vomiting.

Meptazinol p. 484 is claimed to have a low incidence of respiratory depression. It has a reported length of action of 2 to 7 hours with onset within 15 minutes.

Postoperative analgesia

A combination of opioid and non-opioid analgesics is used to treat postoperative pain. The use of intra-operative opioids affects the prescribing of postoperative analgesics. A postoperative opioid analgesic should be given with care since it may potentiate any residual respiratory depression.

Morphine is used most widely. Tramadol hydrochloride is not as effective in severe pain as other opioid analgesics. Buprenorphine p. 468 may antagonise the analgesic effect of previously administered opioids and is generally not recommended. Pethidine hydrochloride p. 490 is generally not recommended for postoperative pain because it is metabolised to norpethidine which may accumulate, particularly in renal impairment; norpethidine stimulates the central nervous system and may cause convulsions.

Opioids are also given epidurally [unlicensed route] in the postoperative period but are associated with side-effects such as pruritus, urinary retention, nausea and vomiting; respiratory depression can be delayed, particularly with morphine p. 484.

Patient-controlled analgesia (PCA) can be used to relieve postoperative pain—consult individual hospital protocols.

Pain management and opioid dependence

Although caution is necessary, patients who are dependent on opioids or have a history of drug dependence may be treated with opioid analgesics when there is a clinical need. Treatment with opioid analgesics in this patient group should normally be carried out with the advice of specialists. However, doctors do not require a special licence to prescribe opioid analgesics to patients with opioid dependence for relief of pain due to organic disease or injury.

ANAESTHETICS, GENERAL > VOLATILE LIQUID ANAESTHETICS

Methoxyflurane

30-Jan-2018

● INDICATIONS AND DOSE

Moderate-to-severe pain associated with trauma (under close medical supervision)

- ▶ BY INHALATION
- ▶ Adult: 3–6 mL as required, avoid administration on consecutive days; administer using inhaler device; maximum 15 mL per week

● IMPORTANT SAFETY INFORMATION

Manufacturer advises methoxyflurane should only be self-administered under the supervision of personnel experienced in its use, using a hand-held *Penthrox*[®] inhaler device.

- **CONTRA-INDICATIONS** Cardiovascular disease · history of liver damage associated with use of methoxyflurane or other halogenated anaesthetics · impaired consciousness · respiratory depression · susceptibility to malignant hyperthermia
- **CAUTIONS** Elderly—increased risk of hypotension · repeated administration more than once every 3 months—increased risk of hepatic injury · risk factors for hepatic impairment · risk factors for renal impairment

- **INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Cough · dizziness · drowsiness · dry mouth · dysarthria · feeling abnormal · headache · hypertension · memory loss · mood altered · nausea · taste altered
 - ▶ **Uncommon** Anxiety · appetite increased · chills · depression · fatigue · flushing · hyperhidrosis · oral discomfort · paraesthesia · peripheral neuropathy · vision disorders
 - ▶ **Frequency not known** Choking · confusion · consciousness impaired · dissociation · hepatic disorders · hypoxia · nystagmus · renal failure · vomiting
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to fluorinated anaesthetics.
- **PREGNANCY** Manufacturer advises use with caution—limited information available.
- **BREAST FEEDING** Manufacturer advises use with caution—limited information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).
- **RENAL IMPAIRMENT** Manufacturer advises avoid.
- **PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of *Penthrox*[®] has provided an *Administration Checklist* and an *Administration Guide* for healthcare professionals.
- **HANDLING AND STORAGE** Manufacturer advises exposure of healthcare professionals to methoxyflurane should be minimised—risk of serious side-effects.
- **PATIENT AND CARER ADVICE** Manufacturer advises that patients should be given advice on appropriate inhaler technique.

A patient alert card should be provided.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and drowsiness.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Inhalation vapour

EXCIPIENTS: May contain Butylated hydroxytoluene

Methoxyflurane 999 mg per 1 gram *Penthrox* inhalation vapour
3ml bottles with device | 1 bottle (PoM) £17.89 (Hospital only)

ANALGESICS > NON-OPIOID

Paracetamol (Acetaminophen)

10-Mar-2020

● INDICATIONS AND DOSE

Mild to moderate pain | Pyrexia

- ▶ BY MOUTH
 - ▶ Adult: 0.5–1 g every 4–6 hours; maximum 4 g per day
- ▶ BY INTRAVENOUS INFUSION
 - ▶ Adult (body-weight up to 50 kg): 15 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 60 mg/kg per day
 - ▶ Adult (body-weight 50 kg and above): 1 g every 4–6 hours, dose to be administered over 15 minutes; maximum 4 g per day
- ▶ BY RECTUM
 - ▶ Adult: 0.5–1 g every 4–6 hours; maximum 4 g per day

Mild to moderate pain in patients with risk factors for hepatotoxicity | Pyrexia in patients with risk factors for hepatotoxicity

- ▶ BY INTRAVENOUS INFUSION
 - ▶ Adult (body-weight up to 50 kg): 15 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 60 mg/kg per day
 - ▶ Adult (body-weight 50 kg and above): 1 g every 4–6 hours, dose to be administered over 15 minutes; maximum 3 g per day

Parainfluenza | Pyrexia with discomfort

- ▶ BY MOUTH
 - ▶ Child 3–5 months: 60 mg every 4–6 hours; maximum 4 doses per day
 - ▶ Child 6–23 months: 120 mg every 4–6 hours; maximum 4 doses per day
 - ▶ Child 2–3 years: 180 mg every 4–6 hours; maximum 4 doses per day
 - ▶ Child 4–5 years: 240 mg every 4–6 hours; maximum 4 doses per day
 - ▶ Child 6–7 years: 240–250 mg every 4–6 hours; maximum 4 doses per day
 - ▶ Child 8–9 years: 360–375 mg every 4–6 hours; maximum 4 doses per day
 - ▶ Child 10–11 years: 480–500 mg every 4–6 hours; maximum 4 doses per day
 - ▶ Child 12–15 years: 480–750 mg every 4–6 hours; maximum 4 doses per day
 - ▶ Child 16–17 years: 0.5–1 g every 4–6 hours; maximum 4 doses per day
- ▶ BY RECTUM
 - ▶ Child 3–11 months: 60–125 mg every 4–6 hours as required; maximum 4 doses per day
 - ▶ Child 1–4 years: 125–250 mg every 4–6 hours as required; maximum 4 doses per day
 - ▶ Child 5–11 years: 250–500 mg every 4–6 hours as required; maximum 4 doses per day
 - ▶ Child 12–17 years: 500 mg every 4–6 hours

Post-immunisation pyrexia in infants

- ▶ BY MOUTH
 - ▶ Child 2–3 months: 60 mg for 1 dose, then 60 mg after 4–6 hours if required
 - ▶ Child 4 months: 60 mg for 1 dose, then 60 mg after 4–6 hours; maximum 4 doses per day

Acute migraine

- ▶ BY MOUTH
 - ▶ Adult: 1 g for 1 dose, to be taken as soon as migraine symptoms develop

● UNLICENSED USE

- ▶ In children *Paracetamol* oral suspension 500 mg/5 mL not licensed for use in children under 16 years. [E_{Gr}](#) Not licensed for use as prophylaxis of post-immunisation pyrexia following immunisation with meningococcal group B vaccine. [E](#)
- **CAUTIONS** Before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours · body-weight under 50 kg · chronic alcohol consumption · chronic dehydration · chronic malnutrition · hepatocellular insufficiency · long-term use (especially in those who are malnourished)
- CAUTIONS, FURTHER INFORMATION** [E_{Gr}](#) Some patients may be at increased risk of experiencing toxicity at therapeutic doses, particularly those with a body-weight under 50 kg and those with risk factors for hepatotoxicity. Clinical judgement should be used to adjust the dose of oral and intravenous paracetamol in these patients. [E](#)
- [E_{Gr}](#) Co-administration of enzyme-inducing antiepileptic medications may increase toxicity; doses should be reduced. [E](#)
- **INTERACTIONS** → Appendix 1: paracetamol

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Rare or very rare** Thrombocytopenia
- SPECIFIC SIDE-EFFECTS**
- ▶ **Common or very common**
- ▶ With rectal use Anorectal erythema
- ▶ **Rare or very rare**
- ▶ With intravenous use Hypersensitivity · hypotension · leucopenia · malaise · neutropenia
- ▶ With rectal use Angioedema · liver injury · skin reactions
- ▶ **Frequency not known**
- ▶ With intravenous use Flushing · skin reactions · tachycardia
- ▶ With oral use Agranulocytosis · bronchospasm · hepatic function abnormal · rash · severe cutaneous adverse reactions (SCARs)
- ▶ With rectal use Agranulocytosis · blood disorder · severe cutaneous adverse reactions (SCARs)

Overdose Liver damage and less frequently renal damage can occur following overdose.

Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis.

For specific details on the management of poisoning, see Paracetamol, under Emergency treatment of poisoning p. 1430.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of toxicity).
- **RENAL IMPAIRMENT**
Dose adjustments ▶ In adults Increase infusion dose interval to every 6 hours if eGFR less than 30 mL/minute/1.73 m².
 ▶ In children Increase infusion dose interval to every 6 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use For *intravenous infusion (Perfalgan®)*, give in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of not less than 1 mg/mL and use within an hour; may also be given undiluted. For children under 33 kg, use 50 mL-vial.
- **PRESCRIBING AND DISPENSING INFORMATION** BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed Paracetamol Oral Suspension 120 mg/5 mL should be dispensed.
- **PATIENT AND CARER ADVICE**
 Medicines for Children leaflet: Paracetamol for mild-to-moderate pain www.medicinesforchildren.org.uk/paracetamol-mild-moderate-pain
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary
 Paracetamol Tablets may be prescribed.
 Paracetamol Soluble Tablets 500 mg may be prescribed.
 Paracetamol Oral Suspension may be prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** Paracetamol capsules or tablets can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository, powder

ANALGESICS > OPIOIDS

Opioids

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BENZODIAZEPINES AND OPIOIDS: REMINDER OF RISK OF POTENTIALLY FATAL RESPIRATORY DEPRESSION (MARCH 2020)

The MHRA reminds healthcare professionals that opioids co-prescribed with benzodiazepines and benzodiazepine-like drugs can produce additive CNS depressant effects, thereby increasing the risk of sedation, respiratory depression, coma, and death. Healthcare professionals are advised to only co-prescribe if there is no alternative and, if necessary, the lowest possible doses should be given for the shortest duration. Patients should be closely monitored for signs of respiratory depression at initiation of treatment and when there is any change in prescribing, such as dose adjustments or new interactions. If methadone is co-

prescribed with a benzodiazepine or benzodiazepine-like drug, the respiratory depressant effect of methadone may be delayed; patients should be monitored for at least 2 weeks after initiation or changes in prescribing. Patients should be informed of the signs and symptoms of respiratory depression and sedation, and advised to seek urgent medical attention should these occur.

- **CONTRA-INDICATIONS** Acute respiratory depression · comatose patients · head injury (opioid analgesics interfere with pupillary responses vital for neurological assessment) · raised intracranial pressure (opioid analgesics interfere with pupillary responses vital for neurological assessment) · risk of paralytic ileus
- **CAUTIONS** Adrenocortical insufficiency (reduced dose is recommended) · asthma (avoid during an acute attack) · convulsive disorders · debilitated patients (reduced dose is recommended) (in adults) · diseases of the biliary tract · elderly (reduced dose is recommended) · hypotension · hypothyroidism (reduced dose is recommended) · impaired respiratory function (avoid in chronic obstructive pulmonary disease) · inflammatory bowel disorders · myasthenia gravis · obstructive bowel disorders · prostatic hypertrophy (in adults) · shock · urethral stenosis (in adults)

CAUTIONS, FURTHER INFORMATION

- ▶ **Dependence** Repeated use of opioid analgesics is associated with the development of psychological and physical dependence; although this is rarely a problem with therapeutic use, caution is advised if prescribing for patients with a history of drug dependence.
- ▶ **Palliative care** In the control of pain in terminal illness, the cautions listed should not necessarily be a deterrent to the use of opioid analgesics.
- ▶ **Elderly** Prescription potentially inappropriate (STOPP criteria):
 - if prescribed a **strong, oral or transdermal** opioid (i.e. morphine, oxycodone, fentanyl, buprenorphine, diamorphine, methadone, tramadol, pethidine, pentazocine) as first-line therapy for mild pain (WHO analgesic ladder not observed)
 - if used regularly without concomitant laxative (risk of severe constipation)
 - if prescribed a **long-acting (modified-release)** opioid without a **short-acting (immediate-release)** opioid for breakthrough pain (risk of persistence of severe pain) See also Prescribing in the elderly p. 33.

● SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmias · confusion · constipation · dizziness · drowsiness · dry mouth · euphoric mood · flushing · hallucination · headache · hyperhidrosis · hypotension (with high doses) · miosis · nausea (more common on initiation) · palpitations · respiratory depression (with high doses) · skin reactions · urinary retention · vertigo · visual impairment · vomiting (more common on initiation) · withdrawal syndrome
- ▶ **Uncommon** Drug dependence · dysphoria

SIDE-EFFECTS, FURTHER INFORMATION Respiratory depression

Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by naloxone.

Dependence and withdrawal Psychological dependence rarely occurs when opioids are used therapeutically (e.g. for pain relief), but tolerance can develop during long-term treatment.

Overdose Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. For details on the management of poisoning, see Opioids, under Emergency treatment of poisoning p. 1430 and consider the specific antidote, naloxone hydrochloride.

- **PREGNANCY** Respiratory depression and withdrawal symptoms can occur in the neonate if opioid analgesics are used during delivery; also gastric stasis and inhalation pneumonia has been reported in the mother if opioid analgesics are used during labour.

- **TREATMENT CESSATION** Avoid abrupt withdrawal after long-term treatment; they should be withdrawn gradually to avoid abstinence symptoms.

- **PRESCRIBING AND DISPENSING INFORMATION** *The Faculty of Pain Medicine* has produced resources for healthcare professionals around opioid prescribing: www.fpm.ac.uk/faculty-of-pain-medicine/opioids-aware

● PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced. Driving at the start of therapy with opioid analgesics, and following dose changes, should be avoided.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including opioids, see *Drugs and driving* under Guidance on prescribing p. 1.

F 467

Buprenorphine

02-Dec-2019

- **DRUG ACTION** Buprenorphine is an opioid-receptor partial agonist (it has opioid agonist and antagonist properties).

● INDICATIONS AND DOSE

Moderate to severe pain

- ▶ BY SUBLINGUAL ADMINISTRATION
 - ▶ Child (body-weight 16–25 kg): 100 micrograms every 6–8 hours
 - ▶ Child (body-weight 25–37.5 kg): 100–200 micrograms every 6–8 hours
 - ▶ Child (body-weight 37.5–50 kg): 200–300 micrograms every 6–8 hours
 - ▶ Child (body-weight 50 kg and above): 200–400 micrograms every 6–8 hours
 - ▶ Adult: 200–400 micrograms every 6–8 hours
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION
 - ▶ Child 6 months–11 years: 3–6 micrograms/kg every 6–8 hours (max. per dose 9 micrograms/kg)
 - ▶ Child 12–17 years: 300–600 micrograms every 6–8 hours
 - ▶ Adult: 300–600 micrograms every 6–8 hours

Premedication

- ▶ BY SUBLINGUAL ADMINISTRATION
 - ▶ Adult: 400 micrograms
- ▶ BY INTRAMUSCULAR INJECTION
 - ▶ Adult: 300 micrograms

Intra-operative analgesia

- ▶ BY SLOW INTRAVENOUS INJECTION
 - ▶ Adult: 300–450 micrograms

Adjunct in the treatment of opioid dependence

- ▶ BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS
 - ▶ Adult: Initially 0.8–4 mg for 1 dose on the first day, adjusted in steps of 2–4 mg daily if required; usual dose 12–24 mg daily; maximum 32 mg per day
- ▶ BY MOUTH USING ORAL LYOPHILISATE
 - ▶ Adult: Initially 2 mg daily, followed by 2–4 mg if required on day one, adjusted in steps of 2–6 mg daily if required, for adjustment of dosing interval following stabilisation, consult product literature; maximum 18 mg per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ For opioid substitution therapy, in patients taking methadone who want to switch to buprenorphine, the dose of methadone should be reduced to a maximum of 30 mg daily before starting buprenorphine treatment—consult product literature. For *sublingual tablets*, if the

dose of methadone is over 10 mg daily, buprenorphine can be started at a dose of 4 mg daily and titrated according to requirements; if the methadone dose is below 10 mg daily, buprenorphine can be started at a dose of 2 mg daily.

BUTRANS[®]

Moderate, non-malignant pain unresponsive to non-opioid analgesics

► BY TRANSDERMAL APPLICATION USING PATCHES

- Adult: Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

BUPEAZE[®]

Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic

► BY TRANSDERMAL APPLICATION USING PATCHES

- Adult: Initially 35 micrograms/hour up to every 96 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

Moderate to severe chronic cancer pain in patients who have previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have previously received strong opioid analgesic

► BY TRANSDERMAL APPLICATION USING PATCHES

- Adult: The initial dose should be based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

PHARMACOKINETICS

- For *Bupeaze*[®]: It may take approximately 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

BUPLAST[®]

Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic

► BY TRANSDERMAL APPLICATION USING PATCHES

- Adult: Initially 35 micrograms/hour up to every 96 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using

2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

Moderate to severe chronic cancer pain in patients who have previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have previously received strong opioid analgesic

► BY TRANSDERMAL APPLICATION USING PATCHES

- Adult: The initial dose should be based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

PHARMACOKINETICS

- For *Buplast*[®]: It may take approximately 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

BUPRAMYL[®]

Moderate, non-malignant pain unresponsive to non-opioid analgesics

► BY TRANSDERMAL APPLICATION USING PATCHES

- Adult: Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

PHARMACOKINETICS

- For *Bupramyl*[®]: It may take approximately 12 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

BUTEC[®]

Moderate, non-malignant pain unresponsive to non-opioid analgesics

► BY TRANSDERMAL APPLICATION USING PATCHES

- Adult: Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

PHARMACOKINETICS

- For *Butec*[®]: It may take approximately 12 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

BUVIDAL[®]

Adjunct in the treatment of opioid dependence

► BY SUBCUTANEOUS INJECTION

- Adult: (consult product literature)

PHARMACOKINETICS

- Weekly *Buvidal*[®] has a terminal half-life ranging from 3 to 5 days.

- Monthly *Buvidal*[®] has a terminal half-life ranging from 19 to 25 days. continued →

HAPOCTASIN[®]

Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic

▶ BY TRANSDERMAL APPLICATION USING PATCHES

- ▶ Adult: Initially 35 micrograms/hour up to every 72 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 72 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

Moderate to severe chronic cancer pain in patients who have previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have previously received strong opioid analgesic

▶ BY TRANSDERMAL APPLICATION USING PATCHES

- ▶ Adult: The initial dose should be based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 72 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

PHARMACOKINETICS

- ▶ For *Hapoctasin[®]*: It may take approximately 25 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

PANITAZ[®]

Moderate, non-malignant pain unresponsive to non-opioid analgesics

▶ BY TRANSDERMAL APPLICATION USING PATCHES

- ▶ Adult: Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at *same time* to avoid confusion). PHARMACOKINETICS

- ▶ For *Transtec*[®]: It may take approximately 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

● UNLICENSED USE

- ▶ With oral use in children Sublingual tablets not licensed for use in children under 6 years.

IMPORTANT SAFETY INFORMATION

- ▶ With transdermal use in adults

Do not confuse the formulations of transdermal patches which are available as 72-hourly, 96-hourly and 7-day patches, see *Prescribing and dispensing information*.

● CAUTIONS

- GENERAL CAUTIONS Impaired consciousness

SPECIFIC CAUTIONS

- ▶ With transdermal use Fever or external heat · other opioids should not be administered within 24 hours of patch removal (long duration of action)
- ▶ When used for adjunct in the treatment of opioid dependence Hepatitis B infection · hepatitis C infection · pre-existing liver enzyme abnormalities
- CAUTIONS, FURTHER INFORMATION
- ▶ Fever or external heat
- ▶ With transdermal use Manufacturer advises monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat (may also increase absorption).

- BUVIDAL[®] Susceptibility to QT-interval prolongation

- INTERACTIONS → Appendix 1: opioids

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ Common or very common Anxiety · appetite decreased · depression · diarrhoea · dyspnoea · syncope · tremor

SPECIFIC SIDE-EFFECTS

- ▶ Common or very common

- ▶ With parental use Arthralgia (in adults) · asthenia (in adults) · asthma (in adults) · behaviour abnormal (in adults) · chest pain (in adults) · chills (in adults) · cough (in adults) · dysmenorrhoea (in adults) · eye disorders (in adults) · fever (in adults) · gastrointestinal discomfort (in adults) · gastrointestinal disorders (in adults) · hypersensitivity · increased risk of infection (in adults) · insomnia (in adults) · lymphadenopathy (in adults) · malaise (in adults) · migraine (in adults) · muscle complaints (in adults) · muscle tone increased (in adults) · pain (in adults) · paraesthesia (in adults) · peripheral oedema (in adults) · speech disorder (in adults) · thinking abnormal (in adults) · vasodilation (in adults) · withdrawal syndrome neonatal · yawning (in adults)
- ▶ With sublingual use Fatigue · sleep disorders
- ▶ With transdermal use Asthenia · gastrointestinal discomfort · muscle weakness · oedema · sleep disorders
- ▶ Uncommon
- ▶ With parental use Procedural dizziness (in adults)
- ▶ With sublingual use Apnoea · atrioventricular block · coma · conjunctivitis · coordination abnormal · cyanosis · depersonalisation · diplopia · dyspepsia · hypertension · pallor · paraesthesia · psychosis · seizure · speech slurred · tinnitus · urinary disorder
- ▶ With transdermal use Aggression · chest pain · chills · circulatory collapse · concentration impaired · cough · dry eye · fever · gastrointestinal disorders · hiccups · hypertension · injury · memory loss · migraine · mood altered · movement disorders · muscle complaints · respiratory disorders · sensation abnormal · sexual dysfunction · speech impairment · taste altered · tinnitus · urinary disorders · vision blurred · weight decreased
- ▶ Rare or very rare
- ▶ With sublingual use Angioedema · bronchospasm
- ▶ With transdermal use Angina pectoris · asthma exacerbated · dehydration · dysphagia · ear pain · eyelid oedema ·

increased risk of infection · influenza like illness · muscle contractions involuntary · psychotic disorder · vasodilation

► **Frequency not known**

- With parenteral use Angioedema · bronchospasm · death (in adults) · hepatic disorders · hepatic encephalopathy (in adults) · psychotic disorder · vision blurred
- With sublingual use Cerebrospinal fluid pressure increased · circulation impaired · haemorrhagic diathesis · hepatic disorders · oral disorders
- With transdermal use Biliary colic · depersonalisation · seizure · withdrawal syndrome neonatal

Overdose The effects of buprenorphine are only partially reversed by naloxone.

● **BREAST FEEDING** Present in low levels in breast milk.

Monitoring Neonates should be monitored for drowsiness, adequate weight gain, and developmental milestones.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in severe impairment (limited information available).

For *transdermal patch*, manufacturer advises caution avoiding in severe impairment.

Dose adjustments For *oral lyophilisate*, manufacturer advises initial dose reduction in mild to moderate impairment.

● **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity.

● **PRE-TREATMENT SCREENING** Documentation of viral hepatitis status is recommended before commencing therapy for opioid dependence.

● **MONITORING REQUIREMENTS** Monitor liver function; when used in opioid dependence baseline liver function test is recommended before commencing therapy, and regular liver function tests should be performed throughout treatment.

● **DIRECTIONS FOR ADMINISTRATION**

- In children *Sublingual tablets* may be halved.
- In adults Manufacturer advises *oral lyophilisates* should be placed on the tongue and allowed to dissolve. Patients should be advised not to swallow for 2 minutes and not to consume food or drink for at least 5 minutes after administration.

BUTRANS® Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after 7 days and siting replacement patch on a different area (avoid same area for at least 3 weeks).

PRENOTRIX® Manufacturer advises apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 72 hours and siting replacement patch on a different area (avoid same area for at least 7 days).

HAPTOASIN® Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 72 hours and siting replacement patch on a different area (avoid same area for at least 7 days).

BUPRAMYL®, **BUTEC**®, **PANITAZ**®, **RELETRANS**®, **SEVODYNE**® Manufacturer advises apply patch to dry, non-irritated, non-hairy skin on upper torso or upper outer arm, removing after 7 days and siting replacement patch on a different area (avoid same area for at least 3 weeks).

TRANSTEC® Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 96 hours and siting replacement patch on a different area (avoid same area for at least 6 days).

BUPEAZE®, **BUPLAST**®, **RELEVTEC**® Manufacturer advises apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 96 hours and siting replacement patch on a different area (avoid same area for at least 7 days).

● **PRESCRIBING AND DISPENSING INFORMATION** Transdermal buprenorphine patches are not suitable for acute pain or in

those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Transdermal patches are available as 72-hourly, 96-hourly and 7-day formulations; prescribers and dispensers must ensure that the correct preparation is prescribed and dispensed. Preparations that should be applied up to every 72 hours include *Haptoasin*® and *Prenotrix*®. Preparations that should be applied up to every 96 hours include *Bupeaze*®, *Buplast*®, *Relevtec*®, and *Transtec*®. Preparations that should be applied up to every 7 days include *Bupramyl*®, *Butec*®, *BuTrans*®, *Panitaz*®, *Reletrans*®, and *Sevodyne*®. *Espranor*® oral lyophilisate has different bioavailability to other buprenorphine products and is not interchangeable with them—consult product literature before switching between products.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer buprenorphine products.

● **NATIONAL FUNDING/ACCESS DECISIONS**

● **NICE decisions**

► **Methadone and buprenorphine for the management of opioid dependence (January 2007)** NICE TA114

- In adults Oral methadone and buprenorphine are recommended for maintenance therapy in the management of opioid dependence. Patients should be committed to a supportive care programme including a flexible dosing regimen administered under supervision for at least 3 months, until compliance is assured. Selection of methadone or buprenorphine should be made on a case-by-case basis, but methadone should be prescribed if both drugs are equally suitable.

www.nice.org.uk/guidance/ta114

Scottish Medicines Consortium (SMC) decisions

SMC No. 1213/17

- In adults The *Scottish Medicines Consortium* has advised (January 2017) that buprenorphine transdermal patches (*Butec*®) are accepted for restricted use within NHS Scotland for the treatment of chronic non-malignant pain of moderate intensity when an opioid is necessary for obtaining adequate analgesia in elderly patients (over 65 years).

SMC No. 1245/17

- In adults The *Scottish Medicines Consortium* has advised (June 2017) that buprenorphine oral lyophilisate (*Espranor*®) is accepted for restricted use within NHS Scotland as substitution treatment for opioid dependence for patients in whom methadone is not suitable. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. SMC2169

- In adults The *Scottish Medicines Consortium* has advised (August 2019) that buprenorphine (*Buvidal*®) is accepted for restricted use within NHS Scotland for the treatment of opioid dependence in patients aged 16 years or over in whom methadone is not suitable and for whom the use of buprenorphine is considered appropriate.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3977

- In adults The *All Wales Medicines Strategy Group* has advised (September 2019) that buprenorphine prolonged-release solution for subcutaneous injection (*Buvidal*®) is recommended as an option for use within NHS Wales for the treatment of opioid dependence in patients aged 16 years or over, within a framework of medical, social and psychological treatment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Buvidal 32mg/0.64ml prolonged-release solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £55.93 DT = £55.93 [CD3]

Buprenorphine 355.56 mg per 1 ml Buvidal 96mg/0.27ml prolonged-release solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £239.70 DT = £239.70 [CD3]

Buvidal 64mg/0.18ml prolonged-release solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £239.70 DT = £239.70 [CD3]

Buvidal 128mg/0.36ml prolonged-release solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £239.70 DT = £239.70 [CD3]

Co-codamol

26-May-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 465.

• INDICATIONS AND DOSE**Moderate pain (using co-codamol 8/500 preparations only)**

- BY MOUTH
- Adult: 8/500–16/1000 mg every 4–6 hours as required; maximum 64/4000 mg per day

Moderate pain (using co-codamol 15/500 preparations only)

- BY MOUTH
- Adult: 15/500–30/1000 mg every 4–6 hours as required; maximum 120/4000 mg per day

Moderate to severe pain (using co-codamol 30/500 preparations only)

- BY MOUTH
- Adult: 30/500–60/1000 mg every 4–6 hours as required; maximum 140/4000 mg per day

KAPAKE® 15/500**Mild to moderate pain**

- BY MOUTH
- Adult: 2 tablets every 4–6 hours as required; maximum 8 tablets per day

SOLPADOL® CAPLETS**Severe pain**

- BY MOUTH
- Adult: 2 tablets every 4–6 hours as required; maximum 8 tablets per day

SOLPADOL® CAPSULES**Severe pain**

- BY MOUTH
- Adult: 2 capsules every 4–6 hours as required; maximum 8 capsules per day

SOLPADOL® EFFERVESCENT TABLETS**Severe pain**

- BY MOUTH USING EFFERVESCENT TABLETS
- Adult: 2 tablets every 4–6 hours as required, tablets to be dispersed in water; maximum 8 tablets per day

- **CONTRA-INDICATIONS** Acute ulcerative colitis · antibiotic-associated colitis · conditions where abdominal distention develops · conditions where inhibition of peristalsis should be avoided · known ultra-rapid codeine metabolisers

- **CAUTIONS** Acute abdomen · alcohol dependence · avoid abrupt withdrawal after long-term treatment · cardiac arrhythmias · chronic alcoholism · chronic dehydration · chronic malnutrition · convulsive disorders · gallstones · hepatocellular insufficiency

CAUTIONS, FURTHER INFORMATION

- **Variation in metabolism** The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.

- **INTERACTIONS** → Appendix 1: opioids · paracetamol

- **SIDE-EFFECTS** Abdominal pain · addiction · agranulocytosis · blood disorder · irritability · pancreatitis · restlessness · severe cutaneous adverse reactions (SCARs) · thrombocytopenia

- **Overdose** Liver damage (and less frequently renal damage) following overdose with paracetamol.

- **BREAST FEEDING** Manufacturer advises avoid (recommendation also supported by MHRA and specialist

sources). Present in milk and mothers vary considerably in their capacity to metabolise codeine; risk of opioid toxicity in infant.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment. **Dose adjustments** Manufacturer advises consider dose reduction in mild to moderate impairment.

● **RENAL IMPAIRMENT** Reduce dose or avoid codeine; increased and prolonged effect; increased cerebral sensitivity.

● **PRESCRIBING AND DISPENSING INFORMATION** Co-codamol is a mixture of codeine phosphate and paracetamol; the proportions are expressed in the form x/y, where x and y are the strengths in milligrams of codeine phosphate and paracetamol respectively.

When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and **no strength is stated**, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and paracetamol 500 mg should be dispensed.

The Drug Tariff allows tablets of co-codamol labelled 'dispersible' to be dispensed against an order for 'effervescent' and *vice versa*.

● **LESS SUITABLE FOR PRESCRIBING** Co-codamol is less suitable for prescribing.

● **EXCEPTIONS TO LEGAL CATEGORY** Co-codamol 8/500 can be sold to the public in certain circumstances; for exemptions see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 2 (does not apply to the 8/500 tablet), 29, 30

▶ Tylex (UCB Pharma Ltd)

Codeine phosphate 30 mg, Paracetamol 500 mg Tylex 30mg/500mg capsules | 100 capsule [PoM] £7.93 DT = £5.46 [CD5]

▶ Zapain (Advanz Pharma)

Codeine phosphate 30 mg, Paracetamol 500 mg Zapain 30mg/500mg capsules | 100 capsule [PoM] £3.85 DT = £5.46 [CD5]

467

Codeine phosphate

26-May-2020

● INDICATIONS AND DOSE

Acute diarrhoea

▶ BY MOUTH

- ▶ Child 12-17 years: 30 mg 3-4 times a day; usual dose 15-60 mg 3-4 times a day
- ▶ Adult: 30 mg 3-4 times a day; usual dose 15-60 mg 3-4 times a day

Mild to moderate pain

▶ BY MOUTH

- ▶ Adult: 30-60 mg every 4 hours if required; maximum 240 mg per day
- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 30-60 mg every 4 hours if required

Short-term treatment of acute moderate pain

▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION

- ▶ Child 12-17 years: 30-60 mg every 6 hours if required for maximum 3 days; maximum 240 mg per day

continued →

Dry or painful cough

- ▶ BY MOUTH USING LINCTUS
- ▶ Adult: 15–30 mg 3–4 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JULY 2013) CODEINE FOR ANALGESIA: RESTRICTED USE IN CHILDREN DUE TO REPORTS OF MORPHINE TOXICITY

Codeine should only be used to relieve acute moderate pain in children older than 12 years and only if it cannot be relieved by other painkillers such as paracetamol or ibuprofen alone. A significant risk of serious and life-threatening adverse reactions has been identified in children with obstructive sleep apnoea who received codeine after tonsillectomy or adenoidectomy:

- in children aged 12–18 years, the maximum daily dose of codeine should not exceed 240 mg. Doses may be taken up to four times a day at intervals of no less than 6 hours. The lowest effective dose should be used and duration of treatment should be limited to 3 days
- codeine is contra-indicated in all children (under 18 years) who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea
- codeine is not recommended for use in children whose breathing may be compromised, including those with neuromuscular disorders, severe cardiac or respiratory conditions, respiratory infections, multiple trauma or extensive surgical procedures
- codeine is contra-indicated in patients of any age who are known to be ultra-rapid metabolisers of codeine (CYP2D6 ultra-rapid metabolisers)
- codeine should not be used in breast-feeding mothers because it can pass to the baby through breast milk
- parents and carers should be advised on how to recognise signs and symptoms of morphine toxicity, and to stop treatment and seek medical attention if signs or symptoms of toxicity occur (including reduced consciousness, lack of appetite, somnolence, constipation, respiratory depression, 'pin-point' pupils, nausea, vomiting)

MHRA/CHM ADVICE (APRIL 2015) CODEINE FOR COUGH AND COLD: RESTRICTED USE IN CHILDREN

Do not use codeine in children under 12 years as it is associated with a risk of respiratory side effects. Codeine is not recommended for adolescents (12–18 years) who have problems with breathing. When prescribing or dispensing codeine-containing medicines for cough and cold, consider that codeine is contra-indicated in:

- children younger than 12 years old
- patients of any age known to be CYP2D6 ultra-rapid metabolisers
- breastfeeding mothers

- **CONTRA-INDICATIONS** Acute ulcerative colitis · antibiotic-associated colitis · children under 18 years who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea · conditions where abdominal distension develops · conditions where inhibition of peristalsis should be avoided · known ultra-rapid codeine metabolisers

- **CAUTIONS** Acute abdomen · cardiac arrhythmias · gallstones · not recommended for adolescents aged 12–18 years with breathing problems

CAUTIONS, FURTHER INFORMATION

- ▶ Variation in metabolism The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.

- **INTERACTIONS** → Appendix 1: opioids

● SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

Biliary spasm · hypothermia · mood altered · sexual dysfunction · ureteral spasm

SPECIFIC SIDE-EFFECTS

- ▶ With oral use Abdominal cramps · addiction · appetite decreased · depression · drug reaction with eosinophilia and systemic symptoms (DRESS) · dyskinesia · dyspnoea · face oedema · fatigue · fever · hyperglycaemia · hypersensitivity · intracranial pressure increased · lymphadenopathy · malaise · muscle rigidity (with high doses) · nightmare · pancreatitis · restlessness · seizure · splenomegaly · urinary disorders · vision disorders
- ▶ With parenteral use Dysuria
- **BREAST FEEDING** Manufacturer advises avoid (recommendation also supported by MHRA and specialist sources). Present in milk and mothers vary considerably in their capacity to metabolise codeine; risk of opioid toxicity in infant.
- **HEPATIC IMPAIRMENT**
 - ▶ With oral use Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
 - ▶ With intravenous use Manufacturer advises avoid. **Dose adjustments** ▶ With oral use Manufacturer advises dose reduction in mild to moderate impairment.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **PRESCRIBING AND DISPENSING INFORMATION** BP directs that when Diabetic Codeine Linctus is prescribed, Codeine Linctus formulated with a vehicle appropriate for administration to diabetics, whether or not labelled 'Diabetic Codeine Linctus', shall be dispensed or supplied.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Codeine phosphate for pain www.medicinesforchildren.org.uk/codeine-phosphate-pain-0

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

Tablet

Codeine phosphate 3 mg per 1 ml Codeine 15mg/5ml linctus sugar-free | 200 ml [P] £1.90 DT = £1.63 [CD5] sugar-free | 2000 ml [P] £16.30 [CD5]

Codeine 15mg/5ml linctus | 200 ml [P] £1.73-£1.90 DT = £1.90 [CD5]

Codeine phosphate 5 mg per 1 ml Codeine 25mg/5ml oral solution | 500 ml [PoM] £6.64 DT = £6.64 [CD5]

▶ **Galcodine** (Thornton & Ross Ltd)

Codeine phosphate 3 mg per 1 ml Galcodine 15mg/5ml linctus sugar-free | 2000 ml [P] £9.90 [CD5]

Combinations available: Aspirin with codeine, p. 467

Diamorphine hydrochloride

(Heroin hydrochloride)

● INDICATIONS AND DOSE

Acute pain

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: 5 mg every 4 hours if required
- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 1.25–2.5 mg every 4 hours if required

Acute pain (heavier, well-muscled patients)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: Up to 10 mg every 4 hours if required
- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 2.5–5 mg every 4 hours if required

Chronic pain not currently treated with a strong opioid analgesic

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 2.5–5 mg every 4 hours, adjusted according to response
- ▶ BY SUBCUTANEOUS INFUSION
- ▶ Adult: Initially 5–10 mg, adjusted according to response, dose to be administered over 24 hours

Acute pulmonary oedema

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 2.5–5 mg, dose to be administered at a rate of 1 mg/minute

Myocardial infarction

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 5 mg, followed by 2.5–5 mg if required, dose to be administered at a rate of 1–2 mg/minute
- ▶ Elderly: 2.5 mg, followed by 1.25–2.5 mg if required, dose to be administered at a rate of 1–2 mg/minute

Myocardial infarction (frail patients)

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 2.5 mg, followed by 1.25–2.5 mg if required, dose to be administered at a rate of 1–2 mg/minute

- **CONTRA-INDICATIONS** Delayed gastric emptying · phaeochromocytoma
- **CAUTIONS** CNS depression · severe cor pulmonale · severe diarrhoea · toxic psychosis
- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS** Biliary spasm · circulatory depression · intracranial pressure increased · mood altered
- **BREAST FEEDING** Therapeutic doses unlikely to affect infant; withdrawal symptoms in infants of dependent mothers; breast-feeding not best method of treating dependence in offspring.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. **Dose adjustments** Manufacturer advises dose reduction.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection, powder for solution for injection

Powder for solution for injection

▶ Diamorphine hydrochloride (Non-proprietary)

Diamorphine hydrochloride 5 mg Diamorphine 5mg powder for solution for injection ampoules | 5 ampoule [PoM] £12.81 DT = £12.81 [CD2]

Diamorphine hydrochloride 10 mg Diamorphine 10mg powder for solution for injection ampoules | 5 ampoule [PoM] £16.56 DT = £15.02 [CD2]

Diamorphine hydrochloride 30 mg Diamorphine 30mg powder for solution for injection ampoules | 5 ampoule [PoM] £16.91 DT = £15.66 [CD2]

Diamorphine hydrochloride 100 mg Diamorphine 100mg powder for solution for injection ampoules | 5 ampoule [PoM] £43.50 DT = £43.10 [CD2]

Diamorphine hydrochloride 500 mg Diamorphine 500mg powder for solution for injection ampoules | 5 ampoule [PoM] £189.72 DT = £188.99 [CD2]

Dihydrocodeine tartrate

● INDICATIONS AND DOSE

Moderate to severe pain

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 4–11 years: 0.5–1 mg/kg every 4–6 hours (max. per dose 30 mg)
- ▶ Child 12–17 years: 30 mg every 4–6 hours
- ▶ Adult: 30 mg every 4–6 hours as required
- ▶ BY DEEP SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: Up to 50 mg every 4–6 hours if required

Chronic severe pain

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12–17 years: 60–120 mg every 12 hours
- ▶ Adult: 60–120 mg every 12 hours

DF118 FORTE®

Severe pain

- ▶ BY MOUTH
- ▶ Child 12–17 years: 40–80 mg 3 times a day; maximum 240 mg per day
- ▶ Adult: 40–80 mg 3 times a day; maximum 240 mg per day

- **CAUTIONS** Pancreatitis · severe cor pulmonale
- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS**
- GENERAL SIDE-EFFECTS**
Dysuria · mood altered
- SPECIFIC SIDE-EFFECTS**
- ▶ With oral use Biliary spasm · bronchospasm · hypothermia · sexual dysfunction · ureteral spasm
- **BREAST FEEDING** Use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; consider avoiding. **Dose adjustments** Manufacturer advises dose reduction, if used.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary
Dihydrocodeine tablets 30 mg may be prescribed.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

F 467

Dihydrocodeine with paracetamol

18-Jan-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 465.

INDICATIONS AND DOSE**Mild to moderate pain (using 10/500 preparations only)**

▶ BY MOUTH

▶ Adult: 10/500–20/1000 mg every 4–6 hours as required; maximum 80/4000 mg per day

Severe pain (using 20/500 preparations only)

▶ BY MOUTH

▶ Adult: 20/500–40/1000 mg every 4–6 hours as required; maximum 160/4000 mg per day

Severe pain (using 30/500 preparations only)

▶ BY MOUTH

▶ Adult: 30/500–60/1000 mg every 4–6 hours as required; maximum 240/4000 mg per day

DOSE EQUIVALENCE AND CONVERSION

▶ A mixture of dihydrocodeine tartrate and paracetamol; the proportions are expressed in the form x/y, where x and y are the strengths in milligrams of dihydrocodeine and paracetamol respectively.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIHYDROCODEINE WITH PARACETAMOL (CO-DYDRAMOL): PRESCRIBE AND DISPENSE BY STRENGTH TO MINIMISE RISK OF MEDICATION ERROR (JANUARY 2018)

The MHRA has advised that dihydrocodeine with paracetamol preparations are prescribed and dispensed by strength to minimise dispensing errors and the risk of accidental opioid overdose—see Prescribing and dispensing information.

- **CAUTIONS** Alcohol dependence · before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours · chronic alcoholism · chronic dehydration · chronic malnutrition · hepatocellular insufficiency · pancreatitis · severe cor pulmonale
- **INTERACTIONS** → Appendix 1: opioids · paracetamol
- **SIDE-EFFECTS** Abdominal pain · blood disorder · leucopenia · malaise · neutropenia · pancreatitis · paraesthesia · paralytic ileus · severe cutaneous adverse reactions (SCARs) · thrombocytopenia
- **Overdose** Liver damage (and less frequently renal damage) following overdosage with paracetamol.
- **BREAST FEEDING** Amount of dihydrocodeine too small to be harmful but use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Manufacturer advises consider avoiding in mild to moderate impairment; avoid in severe impairment.

Dose adjustments Manufacturer advises dose reduction in mild to moderate impairment, if used.

- **RENAL IMPAIRMENT** Reduce dose or avoid dihydrocodeine; increased and prolonged effect; increased cerebral sensitivity.
- **PRESCRIBING AND DISPENSING INFORMATION** The MHRA advises when prescribing dihydrocodeine with paracetamol, the tablet strength and dose must be clearly indicated; when dispensing dihydrocodeine with paracetamol, ensure the prescribed strength is supplied—contact the prescriber if in doubt.

The BP defines *Co-dyramol* Tablets as containing dihydrocodeine tartrate 10 mg and paracetamol 500 mg.

- **LESS SUITABLE FOR PRESCRIBING** Dihydrocodeine with paracetamol is less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 29, 30

▶ **Dihydrocodeine with paracetamol (Non-proprietary)**

Dihydrocodeine tartrate 30 mg, Paracetamol 500 mg Remedeine Forte tablets | 56 tablet [PoM] £6.82 DT = £12.46 [CD5]

F 467

Dipipanone hydrochloride with cyclizine**INDICATIONS AND DOSE****Acute pain**

▶ BY MOUTH

▶ Adult: Initially 1 tablet every 6 hours, then increased if necessary up to 3 tablets every 6 hours, dose to be increased gradually

- **CAUTIONS** Diabetes mellitus · palliative care (not recommended) · phaeochromocytoma
- **INTERACTIONS** → Appendix 1: antihistamines, sedating · opioids
- **SIDE-EFFECTS** Agranulocytosis · anxiety · biliary spasm · consciousness impaired · dry throat · dysuria · hallucinations · hepatic disorders · insomnia · intracranial pressure increased · mood altered · movement disorders · muscle complaints · nasal dryness · psychosis · renal spasm · seizure · speech disorder · tremor · vision blurred
- **BREAST FEEDING** No information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- Dose adjustments** Manufacturer advises dose reduction in mild to moderate impairment; adjust according to response.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Dipipanone hydrochloride with cyclizine (Non-proprietary)**
Dipipanone hydrochloride 10 mg, Cyclizine hydrochloride 30 mg Dipipanone 10mg / Cyclizine 30mg tablets | 50 tablet **[PoM]**
£440.65 DT = £440.65 **[CD2]**

F 467

25-Oct-2018

Fentanyl**● INDICATIONS AND DOSE****Chronic intractable pain not currently treated with a strong opioid analgesic**

- ▶ **BY TRANSDERMAL APPLICATION**
- ▶ **Child 16-17 years:** Initially 12 micrograms/hour every 72 hours, alternatively initially 25 micrograms/hour every 72 hours, when starting, evaluation of the analgesic effect should not be made before the system has been worn for 24 hours (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic therapy should be phased out gradually from time of first patch application, dose should be adjusted at 48–72 hour intervals in steps of 12–25 micrograms/hour if necessary, more than one patch may be used at a time (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it takes 17 hours or more for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually)
- ▶ **Adult:** Initially 12 micrograms/hour every 72 hours, alternatively initially 25 micrograms/hour every 72 hours, when starting, evaluation of the analgesic effect should not be made before the system has been worn for 24 hours (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic therapy should be phased out gradually from time of first patch application, dose should be adjusted at 48–72 hour intervals in steps of 12–25 micrograms/hour if necessary, more than one patch may be used at a time (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it takes 17 hours or more for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually)

Chronic intractable pain currently treated with a strong opioid analgesic

- ▶ **BY TRANSDERMAL APPLICATION**
- ▶ **Child 2-17 years:** Initial dose based on previous 24-hour opioid requirement (consult product literature), for evaluating analgesic efficacy and dose increments, see under *Chronic intractable pain not currently treated with a strong opioid analgesic*, for conversion from long term oral morphine to transdermal fentanyl, see *Pain management with opioids* under Prescribing in palliative care p. 28.
- ▶ **Adult:** Initial dose based on previous 24-hour opioid requirement (consult product literature), for evaluating analgesic efficacy and dose increments, see under *Chronic intractable pain not currently treated with a*

strong opioid analgesic, for conversion from long term oral morphine to transdermal fentanyl, see *Pain management with opioids* under Prescribing in palliative care p. 28.

Spontaneous respiration: analgesia and enhancement of anaesthesia, during operation

- ▶ **BY SLOW INTRAVENOUS INJECTION**
- ▶ **Adult:** Initially 50–100 micrograms (max. per dose 200 micrograms), dose maximum on specialist advice, then 25–50 micrograms as required
- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Adult:** 3–4.8 micrograms/kg/hour, adjusted according to response

Assisted ventilation: analgesia and enhancement of anaesthesia during operation

- ▶ **BY SLOW INTRAVENOUS INJECTION**
- ▶ **Adult:** Initially 300–3500 micrograms, then 100–200 micrograms as required
- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Adult:** Initially 10 micrograms/kg, dose to be given over 10 minutes, then 6 micrograms/kg/hour, adjusted according to response, may require up to 180 micrograms/kg/hour during cardiac surgery

Assisted ventilation: analgesia and respiratory depression in intensive care

- ▶ **BY SLOW INTRAVENOUS INJECTION**
- ▶ **Adult:** Initially 300–3500 micrograms, then 100–200 micrograms as required
- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Adult:** Initially 10 micrograms/kg, dose to be given over 10 minutes, then 6 micrograms/kg/hour, adjusted according to response, may require up to 180 micrograms/kg/hour during cardiac surgery

Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

- ▶ **BY BUCCAL ADMINISTRATION USING LOZENGES**
- ▶ **Child 16-17 years:** Initially 200 micrograms, dose to be given over 15 minutes, then 200 micrograms after 15 minutes if required, no more than 2 dose units for each pain episode; if adequate pain relief not achieved with 1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily, if more than 4 episodes of breakthrough pain each day, adjust background analgesia
- ▶ **Adult:** Initially 200 micrograms, dose to be given over 15 minutes, then 200 micrograms after 15 minutes if required, no more than 2 dose units for each pain episode; if adequate pain relief not achieved with 1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily, if more than 4 episodes of breakthrough pain each day, adjust background analgesia
- ▶ **BY BUCCAL ADMINISTRATION USING BUCCAL FILMS**
- ▶ **Adult:** Initially 200 micrograms, adjusted according to response, consult product literature for information on dose adjustments, maximum 1.2 mg per episode of breakthrough pain; leave at least 4 hours between treatment of episodes of breakthrough pain, if more than 4 episodes of breakthrough pain each day occur on more than 4 consecutive days, adjust background analgesia

DOSE EQUIVALENCE AND CONVERSION

- ▶ Fentanyl films are **not bioequivalent** to other fentanyl preparations.
- ▶ Fentanyl preparations for the treatment of breakthrough pain are not interchangeable; if patients are switched from another fentanyl-containing preparation, a new dose titration is required.

continued →

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, weight-based doses may need to be calculated on the basis of ideal bodyweight.

ABSTRAL[®]**Breakthrough pain in patients receiving opioid therapy for chronic cancer pain**

▶ BY MOUTH USING SUBLINGUAL TABLETS

- ▶ Adult: Initially 100 micrograms, then 100 micrograms after 15–30 minutes if required, dose to be adjusted according to response—consult product literature, no more than 2 dose units 15–30 minutes apart, for each pain episode; max. 800 micrograms per episode of breakthrough pain; leave at least 2 hours between treatment of episodes of breakthrough pain, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

EFFENTORA[®]**Breakthrough pain in patients receiving opioid therapy for chronic cancer pain**

▶ BY MOUTH USING BUCCAL TABLET

- ▶ Adult: Initially 100 micrograms, then 100 micrograms after 30 minutes if required, dose to be adjusted according to response—consult product literature, no more than 2 dose units for each pain episode; max. 800 micrograms per episode of breakthrough pain; leave at least 4 hours between treatment of episodes of breakthrough pain during titration

INSTANLY[®]**Breakthrough pain in patients receiving opioid therapy for chronic cancer pain**

▶ BY INTRANASAL ADMINISTRATION

- ▶ Adult: Initially 50 micrograms, dose to be administered into one nostril, then 50 micrograms after 10 minutes if required, dose to be adjusted according to response, maximum 2 sprays for each pain episode and minimum 4 hours between treatment of each pain episode, if more than 4 breakthrough pain episodes daily, adjust background analgesia

PECFENT[®]**Breakthrough pain in patients receiving opioid therapy for chronic cancer pain**

▶ BY INTRANASAL ADMINISTRATION

- ▶ Adult: Initially 100 micrograms, adjusted according to response, dose to be administered into one nostril only, maximum 2 sprays for each pain episode and minimum 4 hours between treatment of each pain episode, if more than 4 breakthrough pain episodes daily, adjust background analgesia

IMPORTANT SAFETY INFORMATION**MHRA/CHM ADVICE: TRANSDERMAL FENTANYL PATCHES: LIFE-THREATENING AND FATAL OPIOID TOXICITY FROM ACCIDENTAL EXPOSURE, PARTICULARLY IN CHILDREN (OCTOBER 2018)**

Accidental exposure to transdermal fentanyl can occur if a patch is swallowed or transferred to another individual. Always fully inform patients and their carers about directions for safe use of fentanyl patches, including the importance of:

- not exceeding the prescribed dose;
- following the correct frequency of patch application, avoiding touching the adhesive side of patches, and washing hands after application;
- not cutting patches and avoiding exposure of patches to heat including via hot water;
- ensuring that old patches are removed before applying a new one;
- following instructions for safe storage and properly disposing of used patches or those which are not needed.

Patients and carers should be advised to seek immediate medical attention if overdose is suspected—see *Side-effects* and *Patient and carer advice* for further information.

● CAUTIONS

GENERAL CAUTIONS Cerebral tumour · diabetes mellitus (with *Actiq[®]* and *Cynril[®]* lozenges) · impaired consciousness

SPECIFIC CAUTIONS

- ▶ With buccal use mucositis—absorption from oral preparations may be increased, caution during dose titration (in adults)

CAUTIONS, FURTHER INFORMATION

- ▶ With transdermal use Transdermal fentanyl patches are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Risk of fatal respiratory depression, particularly in patients not previously treated with a strong opioid analgesic; manufacturer recommends use only in opioid tolerant patients.

- ▶ With intravenous use Repeated intra-operative doses should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

● INTERACTIONS → Appendix 1: opioids

● SIDE-EFFECTS**▶ Common or very common**

- ▶ With parenteral use Apnoea · hypertension · movement disorders · muscle rigidity · post procedural complications · respiratory disorders · vascular pain
- ▶ With sublingual use Asthenia · dyspnoea · oral disorders
- ▶ With transdermal use Anxiety · appetite decreased · asthenia · depression · diarrhoea · dyspnoea · gastrointestinal discomfort · hypertension · insomnia · malaise · muscle complaints · peripheral oedema · sensation abnormal · temperature sensation altered · tremor

▶ Uncommon

- ▶ With parenteral use Airway complication of anaesthesia · chills · hiccups · hypothermia
- ▶ With sublingual use Altered smell sensation · anxiety · appetite decreased · bruising tendency · concentration impaired · depression · emotional lability · erectile dysfunction · gastrointestinal discomfort · impaired gastric emptying · joint disorders · malaise · memory loss · musculoskeletal stiffness · night sweats · numbness · oropharyngeal pain · overdose · paranoia · psychiatric disorder · sleep disorders · taste altered · throat tightness · tremor · vision blurred
- ▶ With transdermal use Consciousness impaired · cyanosis · fever · gastrointestinal disorders · influenza like illness · memory loss · respiratory disorders · seizures · sexual dysfunction · vision blurred

▶ Rare or very rare

- ▶ With transdermal use Apnoea

▶ Frequency not known

- ▶ With buccal use Adrenal insufficiency · androgen deficiency · anxiety · appetite decreased · asthenia · coma · depersonalisation · depression · diarrhoea · dyspnoea · emotional lability · fever · gait abnormal · gastrointestinal discomfort · gastrointestinal disorders · gingival haemorrhage · gingivitis · injury · loss of consciousness · malaise · myoclonus · oral disorders · peripheral oedema · seizure · sensation abnormal · sleep disorders · speech slurred · taste altered · thinking abnormal · throat oedema · vasodilation · vision disorders · weight decreased · withdrawal syndrome neonatal
- ▶ With intranasal use Diarrhoea · epistaxis · fatigue · fever · hot flush · insomnia · malaise · motion sickness · myoclonus ·

- nasal complaints · peripheral oedema · seizure · sensation abnormal · stomatitis · taste altered · throat irritation
- With parenteral use Biliary spasm · cardiac arrest · cough · hyperalgesia · loss of consciousness · seizure
 - With sublingual use Addiction · consciousness impaired · diarrhoea · fall · fever · hot flush · peripheral oedema · seizure · withdrawal syndrome neonatal
 - With transdermal use Myoclonus · withdrawal syndrome neonatal

SIDE-EFFECTS, FURTHER INFORMATION **Muscle rigidity** Intravenous administration of fentanyl can cause muscle rigidity, which may involve the thoracic muscles. Manufacturer advises administration by slow intravenous injection to avoid; higher doses may require premedication with benzodiazepines and muscle relaxants.

Transdermal use Monitor patients using patches for increased side-effects if fever is present (increased absorption possible); avoid exposing application site to external heat, for example a hot bath or sauna (may also increase absorption).

● BREAST FEEDING

- With buccal use or intranasal use or sublingual use Manufacturer advises avoid during treatment and for 5 days after last administration—present in milk.
- With intravenous use Manufacturer advises avoid during treatment and for 24 hours after last administration—present in milk.
- With transdermal use Manufacturer advises avoid during treatment and for 72 hours after removal of patch—present in milk.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of accumulation).

Dose adjustments Manufacturer advises cautious dose titration.

● **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

● DIRECTIONS FOR ADMINISTRATION

- With transdermal use For patches, apply to dry, non-irritated, non-irradiated, non-hairy skin on torso or upper arm, removing after 72 hours and siting replacement patch on a different area (avoid using the same area for several days).
- With intravenous use in adults For intravenous infusion (Sublimaze), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%.
- With buccal use in adults For buccal films, moisten mouth, place film on inner lining of cheek (pink side to cheek), hold for at least 5 seconds until it sticks, and leave to dissolve (15–30 minutes); if more than 1 film required do not overlap, but use another area of the mouth. Avoid liquids for 5 minutes after application; avoid food until the film has dissolved.
- With buccal use Patients should be advised to place the lozenge in the mouth against the cheek and move it around the mouth using the applicator; each lozenge should be sucked over a 15 minute period. In patients with a dry mouth, water may be used to moisten the buccal mucosa. Patients with diabetes should be advised each lozenge contains approximately 2 g glucose.

INSTANYL® Patient should sit or stand during administration.

EFFENTORA® Place tablet between cheek and gum and leave to dissolve; if more than 1 tablet required, place second tablet on the other side of the mouth; tablet may alternatively be placed under the tongue (sublingually).

● PRESCRIBING AND DISPENSING INFORMATION

- With transdermal use Prescriptions for fentanyl patches can be written to show the strength in terms of the release rate and it is acceptable to write 'Fentanyl 25 patches' to

prescribe patches that release fentanyl 25 micrograms per hour. The dosage should be expressed in terms of the interval between applying a patch and replacing it with a new one, e.g. 'one patch to be applied every 72 hours'. The total quantity of patches to be supplied should be written in words and figures.

● PATIENT AND CARER ADVICE

- With transdermal use Patients and carers should be informed about safe use, including correct administration and disposal, strict adherence to dosage instructions, and the symptoms and signs of opioid overdose. Patches should be removed immediately in case of breathing difficulties, marked drowsiness, confusion, dizziness, or impaired speech, and patients and carers should seek prompt medical attention.
- In adults Patients or carers should be given advice on how to administer fentanyl buccal films or fentanyl lozenges. Patients or carers should be given advice on how to administer fentanyl nasal spray.

Medicines for Children leaflet: Fentanyl lozenges for pain www.medicinesforchildren.org.uk/fentanyl-lozenges-pain
Medicines for Children leaflet: Fentanyl patches for pain www.medicinesforchildren.org.uk/fentanyl-patches-pain
PECFENT® Avoid concomitant use of other nasal preparations.

Patients or carers should be given advice on how to administer **PecFent**® spray.

INSTANYL® Avoid concomitant use of other nasal preparations.

Patients or carers should be given advice on how to administer **Instanyl**® spray.

EFFENTORA® Patients or carers should be given advice on how to administer **Effentora**® buccal tablets.

Patients should be advised not to eat or drink until the tablet is completely dissolved; after 30 minutes, if any remnants remain, they may be swallowed with a glass of water. Patients with a dry mouth should be advised to drink water to moisten the buccal mucosa before administration of the tablets; if appropriate effervescence does not occur, a switch of therapy may be advised.

ABSTRAL® Patients should be advised not to eat or drink until the tablet is completely dissolved.

In patients with a dry mouth, the buccal mucosa may be moistened with water before administration of tablet.

● NATIONAL FUNDING/ACCESS DECISIONS

PECFENT®

Scottish Medicines Consortium (SMC) decisions

- With intranasal use The *Scottish Medicines Consortium* has advised (January 2011) that **PecFent**® nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

INSTANYL®

Scottish Medicines Consortium (SMC) decisions

- With intranasal use The *Scottish Medicines Consortium* has advised (November 2009) that **Instanyl**® nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

EFFENTORA®

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (February 2009) that **Effentora**® buccal tablets should be restricted for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short acting opioids are unsuitable.

ABSTRAL®**Scottish Medicines Consortium (SMC) decisions**

The *Scottish Medicines Consortium* has advised (February 2009) that *Abstral*® sublingual tablets should be restricted for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short acting opioids are unsuitable.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

Hydromorphone hydrochloride

● INDICATIONS AND DOSE

Severe pain in cancer

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
 - ▶ Child 12-17 years: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain
 - ▶ Adult: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
 - ▶ Child 12-17 years: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain
 - ▶ Adult: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain

● **CONTRA-INDICATIONS** Acute abdomen

● **CAUTIONS** Pancreatitis · toxic psychosis

● **INTERACTIONS** → Appendix 1: opioids

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · anxiety · appetite decreased · asthenia · sleep disorders
- ▶ **Uncommon** Depression · diarrhoea · dyspnoea · erectile dysfunction · malaise · movement disorders · paraesthesia · peripheral oedema · taste altered · tremor
- ▶ **Frequency not known** Hyperalgesia · paralytic ileus · seizure · withdrawal syndrome neonatal

● **BREAST FEEDING** Avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

● **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

● **DIRECTIONS FOR ADMINISTRATION** For *immediate-release* capsules, swallow whole capsule or sprinkle contents on soft food. For *modified-release* capsules, swallow whole or open capsule and sprinkle contents on soft cold food (swallow the pellets within the capsule whole; do not crush or chew).

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer hydromorphone hydrochloride capsules and modified-release capsules.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Modified-release capsule

Meptazinol

● INDICATIONS AND DOSE

Moderate to severe pain, including post-operative pain and renal colic

- ▶ BY MOUTH
 - ▶ Adult: 200 mg every 3–6 hours as required
- ▶ BY INTRAMUSCULAR INJECTION
 - ▶ Adult: 75–100 mg every 2–4 hours if required
- ▶ BY SLOW INTRAVENOUS INJECTION
 - ▶ Adult: 50–100 mg every 2–4 hours if required

Obstetric analgesia

- ▶ BY INTRAMUSCULAR INJECTION
 - ▶ Adult: 2 mg/kg, usual dose 100–150 mg

- **CONTRA-INDICATIONS** Myocardial infarction · phaeochromocytoma
- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Diarrhoea · gastrointestinal discomfort
- Overdose** Effects only partially reversed by naloxone.
- **BREAST FEEDING** Use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
 - Dose adjustments** Manufacturer advises dose reduction.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Morphine

● INDICATIONS AND DOSE

Pain

- ▶ BY SUBCUTANEOUS INJECTION
 - ▶ Child 1–5 months: Initially 100–200 micrograms/kg every 6 hours, adjusted according to response
 - ▶ Child 6 months–1 year: Initially 100–200 micrograms/kg every 4 hours, adjusted according to response
 - ▶ Child 2–11 years: Initially 200 micrograms/kg every 4 hours, adjusted according to response
 - ▶ Child 12–17 years: Initially 2.5–10 mg every 4 hours, adjusted according to response
- ▶ INITIALLY BY INTRAVENOUS INJECTION
 - ▶ Child 1–5 months: 100 micrograms/kg every 6 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 10–30 micrograms/kg/hour, adjusted according to response
 - ▶ Child 6 months–11 years: 100 micrograms/kg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg,

dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response

- ▶ Child 12–17 years: 5 mg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 5 mg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response
- ▶ BY MOUTH, OR BY RECTUM
 - ▶ Child 1–2 months: Initially 50–100 micrograms/kg every 4 hours, adjusted according to response
 - ▶ Child 3–5 months: 100–150 micrograms/kg every 4 hours, adjusted according to response
 - ▶ Child 6–11 months: 200 micrograms/kg every 4 hours, adjusted according to response
 - ▶ Child 1 year: Initially 200–300 micrograms/kg every 4 hours, adjusted according to response
 - ▶ Child 2–11 years: Initially 200–300 micrograms/kg every 4 hours (max. per dose 10 mg), adjusted according to response
 - ▶ Child 12–17 years: Initially 5–10 mg every 4 hours, adjusted according to response

Acute pain

- ▶ BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
 - ▶ Adult: Initially 10 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients, dose can be given more frequently during titration, use dose for elderly in frail patients
 - ▶ Elderly: Initially 5 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients, dose can be given more frequently during titration
- ▶ BY SLOW INTRAVENOUS INJECTION
 - ▶ Adult: Initially 5 mg every 4 hours, adjusted according to response, dose can be adjusted more frequently during titration, reduced dose recommended in frail and elderly patients

Chronic pain

- ▶ BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
 - ▶ Adult: Initially 5–10 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients
- ▶ BY RECTUM
 - ▶ Adult: Initially 15–30 mg every 4 hours, adjusted according to response

Pain (with modified-release 12-hourly preparations)

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
 - ▶ Adult: Every 12 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered

Pain (with modified-release 24-hourly preparations)

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
 - ▶ Adult: Every 24 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered

Pain management in palliative care (starting dose for opioid-naïve patients)

- ▶ BY MOUTH
 - ▶ Adult: 20–30 mg daily in divided doses, using immediate-release preparation 4-hourly or a 12-hourly modified-release preparation, for management of breakthrough pain and other general advice, see *Pain management with opioids* under Prescribing in palliative care p. 28.

Pain management in palliative care (starting dose for patients being switched from a regular weak opioid)

► BY MOUTH

- Adult: 40–60 mg daily in divided doses, using immediate-release preparation 4-hourly or 12-hourly modified-release preparation, for management of breakthrough pain and other general advice, see *Pain management with opioids* under Prescribing in palliative care p. 28.

Pain in palliative care (following initial titration)

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Usual dose 30 mg every 4 hours; up to 200 mg every 4 hours, higher dose may be required for some patients (occasionally more is needed); for management of breakthrough pain and other general advice, see *Pain management with opioids* under Prescribing in palliative care p. 28.

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: Usual dose 100 mg every 12 hours; up to 600 mg every 12 hours, higher dose may be required for some patients (occasionally more is needed); for management of breakthrough pain and other general advice, see *Pain management with opioids* under Prescribing in palliative care p. 28.

Cough in palliative care

► BY MOUTH

- Adult: Initially 5 mg every 4 hours

Premedication

► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- Adult: Up to 10 mg, dose to be administered 60–90 minutes before operation

Patient controlled analgesia (PCA)

► BY INTRAVENOUS INFUSION

- Adult: (consult local protocol)

Myocardial infarction

► BY SLOW INTRAVENOUS INJECTION

- Adult: 5–10 mg, followed by 5–10 mg if required, dose to be administered at a rate of 1–2 mg/minute, use dose for elderly in frail patients
- Elderly: 2.5–5 mg, followed by 2.5–5 mg if required, dose to be administered at a rate of 1–2 mg/minute

Acute pulmonary oedema

► BY SLOW INTRAVENOUS INJECTION

- Adult: 5–10 mg, dose to be administered at a rate of 2 mg/minute, use dose for elderly in frail patients
- Elderly: 2.5–5 mg, dose to be administered at a rate of 2 mg/minute

Dyspnoea at rest in palliative care

► BY MOUTH

- Adult: Initially 5 mg every 4 hours, to be given in carefully titrated doses

DOSE EQUIVALENCE AND CONVERSION

- The doses stated refer equally to morphine hydrochloride and sulfate.

- **UNLICENSED USE** *Oramorph*[®] solution and *MXL*[®] capsules not licensed for use in children under 1 year. *Sevedol*[®] tablets not licensed for use in children under 3 years. *Oramorph*[®] unit dose vials and *Filnarine*[®] SR tablets not licensed for use in children under 6 years. *MST Continus*[®] preparations licensed to treat children with cancer pain (age-range not specified by manufacturer).
- With rectal use in children Suppositories are not licensed for use in children.

IMPORTANT SAFETY INFORMATION

Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see *Prescribing and dispensing information*.

- **CONTRA-INDICATIONS** Acute abdomen · delayed gastric emptying · heart failure secondary to chronic lung disease · pheochromocytoma
 - **CAUTIONS** Cardiac arrhythmias · pancreatitis · severe cor pulmonale
 - **INTERACTIONS** → Appendix 1: opioids
 - **SIDE-EFFECTS**
 - **Common or very common**
 - With oral use Appetite decreased · asthenic conditions · gastrointestinal discomfort · insomnia · neuromuscular dysfunction
 - **Uncommon**
 - With oral use Agitation · bronchospasm · ileus · mood altered · myoclonus · peripheral oedema · pulmonary oedema · seizure · sensation abnormal · syncope · taste altered
 - **Frequency not known**
 - With oral use Amenorrhoea · biliary pain · cough decreased · hyperalgesia · hypertension · pancreatitis exacerbated · sexual dysfunction · thinking abnormal · ureteral spasm
 - With parenteral use Alertness decreased · bile duct disorders · mood altered · myoclonus · sexual dysfunction · ureteral spasm · urinary disorders · vision disorders
 - **BREAST FEEDING** Therapeutic doses unlikely to affect infant.
 - **HEPATIC IMPAIRMENT** Manufacturer advises caution. Avoid oral preparations in acute impairment; for injectable preparations—consult product literature. **Dose adjustments** Manufacturer advises consider dose reduction—consult product literature.
 - **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity.
 - **MONITORING REQUIREMENTS** Possible association between acute chest syndrome in patients with sickle cell disease treated with morphine during a vaso-occlusive crisis—manufacturer advises close monitoring for acute chest syndrome symptoms during treatment.
 - **DIRECTIONS FOR ADMINISTRATION**
 - With intravenous use in children For *continuous intravenous infusion*, dilute with Glucose 5% or 10% or Sodium Chloride 0.9%.
 - With oral use For *modified release capsules*—swallow whole or open capsule and sprinkle contents on soft food.
 - **PRESCRIBING AND DISPENSING INFORMATION** Modified-release preparations are available as 12-hourly or 24-hourly formulations; prescribers must ensure that the correct preparation is prescribed. Preparations that should be given 12-hourly include *Filnarine*[®] SR, *MST Continus*[®], *Morphgesic*[®] SR and *Zomorph*[®]. Preparations that should be given 24-hourly include *MXL*[®]. Prescriptions must specify the 'form'.
 - With rectal use Both the strength of the suppositories and the morphine salt contained in them must be specified by the prescriber.

Palliative care For further information on the use of morphine in palliative care, see www.medicinescomplete.com/#/content/palliative/morphine.
- **PATIENT AND CARER ADVICE**
 - With oral use Patients or carers should be given advice on how to administer morphine modified-release capsules. Medicines for Children leaflet: Morphine for pain www.medicinesforchildren.org.uk/morphine-pain
- **EXCEPTIONS TO LEGAL CATEGORY**

Morphine Oral Solutions Prescription-only medicines or schedule 2 controlled drug. The proportion of morphine hydrochloride may be altered when specified by the prescriber; if above 13 mg per 5 mL the solution becomes a schedule 2 controlled drug. It is usual to adjust the strength so that the dose volume is 5 or 10 mL.

Oral solutions of morphine can be prescribed by writing the formula:

Morphine hydrochloride 5 mg
Chloroform water to 5 mL

- MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection, infusion, solution for infusion, suppository

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 2, 25

- MST Continus** (Napp Pharmaceuticals Ltd)

Morphine sulfate 5 mg MST Continus 5mg tablets | 60 tablet [PoM] £3.29 DT = £3.29 [CD2]

Morphine sulfate 10 mg MST Continus 10mg tablets | 60 tablet [PoM] £5.20 DT = £5.20 [CD2]

Morphine sulfate 15 mg MST Continus 15mg tablets | 60 tablet [PoM] £9.10 DT = £9.10 [CD2]

Morphine sulfate 30 mg MST Continus 30mg tablets | 60 tablet [PoM] £12.47 DT = £12.47 [CD2]

Morphine sulfate 60 mg MST Continus 60mg tablets | 60 tablet [PoM] £24.32 DT = £24.32 [CD2]

Morphine sulfate 100 mg MST Continus 100mg tablets | 60 tablet [PoM] £38.50 DT = £38.50 [CD2]

Morphine sulfate 200 mg MST Continus 200mg tablets | 60 tablet [PoM] £81.34 DT = £81.34 [CD2]

- Morphgesic SR** (Advanz Pharma)

Morphine sulfate 10 mg Morphgesic SR 10mg tablets | 60 tablet [PoM] £3.85 DT = £5.20 [CD2]

Morphine sulfate 30 mg Morphgesic SR 30mg tablets | 60 tablet [PoM] £9.24 DT = £12.47 [CD2]

Morphine sulfate 60 mg Morphgesic SR 60mg tablets | 60 tablet [PoM] £18.04 DT = £38.50 [CD2]

Morphine sulfate 100 mg Morphgesic SR 100mg tablets | 60 tablet [PoM] £28.54 DT = £38.50 [CD2]

Tablet

CAUTIONARY AND ADVISORY LABELS 2

- Sevredol** (Napp Pharmaceuticals Ltd)

Morphine sulfate 10 mg Sevredol 10mg tablets | 56 tablet [PoM] £5.31 DT = £5.31 [CD2]

Morphine sulfate 20 mg Sevredol 20mg tablets | 56 tablet [PoM] £10.61 DT = £10.61 [CD2]

Morphine sulfate 50 mg Sevredol 50mg tablets | 56 tablet [PoM] £28.02 DT = £28.02 [CD2]

Solution for injection

- Morphine (Non-proprietary)**

Morphine sulfate 1 mg per 1 ml Morphine sulfate 5mg/5ml solution for injection ampoules | 10 ampoule [PoM] £47.30 DT = £47.30 [CD2]

Morphine sulfate 1mg/1ml solution for injection ampoules | 10 ampoule [PoM] £37.50 [CD2]

Morphine sulfate 10mg/10ml solution for injection ampoules | 10 ampoule [PoM] £15.00-£49.30 [CD2]

Morphine sulfate 10 mg per 1 ml Morphine sulfate 10mg/1ml solution for injection ampoules | 10 ampoule [PoM] £11.87 DT = £11.47 [CD2]

Morphine sulfate 15 mg per 1 ml Morphine sulfate 15mg/1ml solution for injection ampoules | 10 ampoule [PoM] £10.74-£13.10 DT = £10.74 [CD2]

Morphine sulfate 20 mg per 1 ml Morphine sulfate 20mg/1ml solution for injection ampoules | 10 ampoule [PoM] £75.85 DT = £75.85 [CD2]

Morphine sulfate 30 mg per 1 ml Morphine sulfate 30mg/1ml solution for injection ampoules | 10 ampoule [PoM] £14.02 DT = £11.49 [CD2]

Morphine sulfate 60mg/2ml solution for injection ampoules | 5 ampoule [PoM] £10.07 DT = £10.07 [CD2]

Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 2

- MXL** (Napp Pharmaceuticals Ltd)

Morphine sulfate 30 mg MXL 30mg capsules | 28 capsule [PoM] £10.91 [CD2]

Morphine sulfate 60 mg MXL 60mg capsules | 28 capsule [PoM] £14.95 [CD2]

Morphine sulfate 90 mg MXL 90mg capsules | 28 capsule [PoM] £22.04 DT = £22.04 [CD2]

Morphine sulfate 200 mg Zomorph 200mg modified-release capsules | 60 capsule [PoM] £43.60 DT = £43.60 [CD2]

Solution for infusion

- Morphine (Non-proprietary)**

Morphine sulfate 1 mg per 1 ml Morphine sulfate 50mg/50ml solution for infusion vials | 1 vial [PoM] £5.78 DT = £5.78 [CD2] | 10 vial [PoM] £43.90 [CD2]

Morphine sulfate 2 mg per 1 ml Morphine sulfate 100mg/50ml solution for infusion vials | 1 vial [PoM] £6.48 [CD2] | 10 vial [PoM] £69.70 [CD2]

Oral solution

CAUTIONARY AND ADVISORY LABELS 2

- Morphine (Non-proprietary)**

Morphine sulfate 2 mg per 1 ml Morphine sulfate 10mg/5ml oral solution | 100 ml [PoM] £1.68-£3.00 [CD5] | 300 ml [PoM] £9.00 DT = £6.21 [CD5] | 500 ml [PoM] £7.10-£15.00 [CD5]

- Oramorph** (Boehringer Ingelheim Ltd)

Morphine sulfate 2 mg per 1 ml Oramorph 10mg/5ml oral solution | 100 ml [PoM] £1.89 [CD5] | 300 ml [PoM] £5.45 DT = £6.21 [CD5] | 500 ml [PoM] £8.50 [CD5]

Morphine sulfate 20 mg per 1 ml Oramorph 20mg/ml concentrated oral solution sugar-free | 120 ml [PoM] £19.50 DT = £19.50 [CD2]

Modified-release granules

CAUTIONARY AND ADVISORY LABELS 2, 13

- MST Continus** (Napp Pharmaceuticals Ltd)

Morphine sulfate 20 mg MST Continus suspension 20mg granules sachets sugar-free | 30 sachet [PoM] £24.58 DT = £24.58 [CD2]

Morphine sulfate 30 mg MST Continus suspension 30mg granules sachets sugar-free | 30 sachet [PoM] £25.54 DT = £25.54 [CD2]

Morphine sulfate 60 mg MST Continus suspension 60mg granules sachets sugar-free | 30 sachet [PoM] £51.09 DT = £51.09 [CD2]

Morphine sulfate 100 mg MST Continus suspension 100mg granules sachets sugar-free | 30 sachet [PoM] £85.15 DT = £85.15 [CD2]

Morphine sulfate 200 mg MST Continus suspension 200mg granules sachets sugar-free | 30 sachet [PoM] £170.30 DT = £170.30 [CD2]

Morphine with cyclizine

The properties listed below are those particular to the combination only. For the properties of the components please consider, morphine p. 484, cyclizine p. 449.

• INDICATIONS AND DOSE

CYCLIMORPH-10[®]

Moderate to severe pain (short-term use only)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- ▶ Adult: 1 mL, do not repeat dose more often than every 4 hours; maximum 3 doses per day

CYCLIMORPH-15[®]

Moderate to severe pain (short-term use only)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- ▶ Adult: 1 mL, do not repeat dose more often than every 4 hours; maximum 3 doses per day

- CAUTIONS** Myocardial infarction (cyclizine may aggravate severe heart failure and counteract the haemodynamic benefits of opioids) · not recommended in palliative care
- INTERACTIONS** → Appendix 1: antihistamines, sedating · opioids

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Cyclimorph** (Avanz Pharma)

Morphine tartrate 15 mg per 1 ml, Cyclizine tartrate 50 mg per 1 ml Cyclimorph 15 solution for injection 1ml ampoules | 5 ampoule (PoM) £9.12 DT = £9.12 (C02)

Morphine tartrate 10 mg per 1 ml, Cyclizine tartrate 50 mg per 1 ml Cyclimorph 10 solution for injection 1ml ampoules | 5 ampoule (PoM) £8.77 DT = £8.77 (C02)

467

Oxycodone hydrochloride

12-Apr-2019

● INDICATIONS AND DOSE

Postoperative pain | Severe pain

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ **Adult:** Initially 5 mg every 4–6 hours, dose to be increased if necessary according to severity of pain, some patients may require higher doses than the maximum daily dose; maximum 400 mg per day

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ **Adult:** Initially 10 mg every 12 hours (max. per dose 200 mg every 12 hours), dose to be increased if necessary according to severity of pain, some patients might require higher doses than the maximum daily dose, use 12-hourly modified-release preparations for this dose; see *Prescribing and dispensing information*

- ▶ BY SLOW INTRAVENOUS INJECTION

▶ **Adult:** 1–10 mg every 4 hours as required

- ▶ BY INTRAVENOUS INFUSION

▶ **Adult:** Initially 2 mg/hour, adjusted according to response

- ▶ BY SUBCUTANEOUS INJECTION

▶ **Adult:** Initially 5 mg every 4 hours as required

- ▶ BY SUBCUTANEOUS INFUSION

▶ **Adult:** Initially 7.5 mg/24 hours, adjusted according to response

Patient controlled analgesia (PCA)

- ▶ BY INTRAVENOUS INFUSION

▶ **Adult:** (consult local protocol)

Moderate to severe pain in palliative care

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ **Adult:** Initially 5 mg every 4–6 hours, dose to be increased if necessary according to severity of pain, some patients may require higher doses than the maximum daily dose; maximum 400 mg per day

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ **Adult:** Initially 10 mg every 12 hours (max. per dose 200 mg every 12 hours), dose to be increased if necessary according to severity of pain, some patients might require higher doses than the maximum daily dose, use 12-hourly modified-release preparations for this dose; see *Prescribing and dispensing information*

- ▶ BY SLOW INTRAVENOUS INJECTION

▶ **Adult:** 1–10 mg every 4 hours as required

- ▶ BY INTRAVENOUS INFUSION

▶ **Adult:** Initially 2 mg/hour, adjusted according to response

- ▶ BY SUBCUTANEOUS INJECTION

▶ **Adult:** Initially 5 mg every 4 hours as required

- ▶ BY SUBCUTANEOUS INFUSION

▶ **Adult:** Initially 7.5 mg/24 hours, adjusted according to response

DOSE EQUIVALENCE AND CONVERSION

- ▶ 2 mg oral oxycodone is approximately equivalent to 1 mg parenteral oxycodone.

ONEXILA XL®

Severe pain

- ▶ BY MOUTH

▶ **Adult:** Initially 10 mg every 24 hours, dose to be increased if necessary according to severity of pain, some patients may require higher doses than the maximum daily dose; maximum 400 mg per day

IMPORTANT SAFETY INFORMATION

Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see *Prescribing and dispensing information*.

- **CONTRA-INDICATIONS** Acute abdomen · chronic constipation · cor pulmonale · delayed gastric emptying

- **CAUTIONS** Pancreatitis · toxic psychosis

- **INTERACTIONS** → Appendix 1: opioids

- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · bronchospasm · depression · diarrhoea · dyspnoea · gastrointestinal discomfort · hiccups · mood altered · tremor
- ▶ **Uncommon** Biliary colic · burping · chills · dehydration · dysphagia · gastrointestinal disorders · malaise · memory loss · neuromuscular dysfunction · oedema · seizure · sensation abnormal · sexual dysfunction · speech disorder · syncope · taste altered · thirst · vasodilation
- ▶ **Frequency not known** Aggression · amenorrhoea · cholestasis

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**

- ▶ With oral use Appetite abnormal · asthenic conditions · cognitive impairment · insomnia · movement disorders · perception altered · psychiatric disorders · urinary frequency increased
- ▶ With parenteral use Appetite decreased · asthenia · cough decreased · sleep disorders · thinking abnormal
- ▶ **Uncommon**
- ▶ With oral use Chest pain · cough · hyperacusis · increased risk of infection · injury · lacrimation disorder · migraine · oral disorders · pain · SIADH · voice alteration
- ▶ With parenteral use Fever · hypogonadism · ureteral spasm
- ▶ **Rare or very rare**
- ▶ With oral use Haemorrhage · lymphadenopathy · muscle spasms · photosensitivity reaction · tooth discolouration · weight changes
- ▶ **Frequency not known**
- ▶ With parenteral use Dental caries · hyperalgesia · withdrawal syndrome neonatal

- **BREAST FEEDING** Present in milk—avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

Dose adjustments Manufacturer advises initial dose reduction of 50% in mild impairment; adjust according to response.

- **RENAL IMPAIRMENT** Opioid effects increased and prolonged and increased cerebral sensitivity occurs. Avoid if eGFR less than 10 mL/minute/1.73 m².

Dose adjustments Max. initial dose 2.5 mg every 6 hours in patients not currently treated with an opioid with mild to moderate impairment.

- **DIRECTIONS FOR ADMINISTRATION**

▶ With intravenous use For intravenous infusion (*Oxynorm*®), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of 1 mg/mL.

- **PRESCRIBING AND DISPENSING INFORMATION** Modified-release preparations are available as 12-hourly or 24-hourly formulations. Preparations that should be given 12-hourly include *Abtard*®, *Carexil*®, *Ixyldone*®, *Leveraxo*®,

Longtec[®], Oxeltra[®], OxyContin[®], Oxypro[®], Oxylan[®], Reltebon[®], and Renocontin[®]. Preparations that should be given 24-hourly include *Onexila[®] XL*.

Palliative care For further information on the use of oxycodone in palliative care, see www.medicinescomplete.com/#/content/palliative/oxycodone.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 125/04

The *Scottish Medicines Consortium* has advised (October 2004) that oxycodone (*OxyNorm[®]*) injection is accepted for restricted use within NHS Scotland for the treatment of moderate to severe pain in patients with cancer who have difficulty in tolerating morphine or diamorphine.

SMC No. 197/05

The *Scottish Medicines Consortium* has advised (September 2005) that oxycodone (*OxyContin[®]*) 5 mg, 10 mg, 20 mg, 40 mg and 80 mg prolonged release tablets are accepted for restricted use within NHS Scotland for the treatment of severe non-malignant pain in patients in whom controlled release morphine sulphate is ineffective or not tolerated.

SMC No. 648/10

The *Scottish Medicines Consortium* has advised (November 2010) that oxycodone hydrochloride (*OxyNorm[®]*) 50 mg/mL injection is accepted for restricted use within NHS Scotland for the treatment of moderate to severe pain in patients with cancer who have difficulty in tolerating morphine or diamorphine.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, solution for infusion

Oxycodone with naloxone

The properties listed below are those particular to the combination only. For the properties of the components please consider, oxycodone hydrochloride p. 487, naloxone hydrochloride p. 1440.

● **INDICATIONS AND DOSE**

Severe pain requiring opioid analgesia in patients not currently treated with opioid analgesics

▶ **BY MOUTH**

Adult: Initially 10/5 mg every 12 hours (max. per dose 40/20 mg every 12 hours), dose to be increased according to response; patients already receiving opioid analgesics can start with a higher dose

Second-line treatment of symptomatic severe to very severe idiopathic restless legs syndrome after failure of dopaminergic therapy

▶ **BY MOUTH**

Adult: Initially 5/2.5 mg every 12 hours, adjusted weekly according to response, usual dose 10/5 mg every 12 hours; maximum 60/30 mg per day

continued →

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose quantities are expressed in the form x/y where x and y are the strengths in milligrams of oxycodone and naloxone respectively.

- **INTERACTIONS** → Appendix 1: opioids

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Modified-release tablet

Pentazocine**INDICATIONS AND DOSE****Moderate to severe pain**

- ▶ BY MOUTH
- ▶ Adult: 50 mg every 3–4 hours, dose to be taken preferably after food, usual dose 25–100 mg every 3–4 hours; maximum 600 mg per day

Moderate pain

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 30 mg every 3–4 hours as required; maximum 360 mg per day

Severe pain

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 45–60 mg every 3–4 hours as required; maximum 360 mg per day

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · heart failure secondary to chronic lung disease · patients dependent on opioids (can precipitate withdrawal)
- **CAUTIONS** Arterial hypertension · cardiac arrhythmias · myocardial infarction · pancreatitis · phaeochromocytoma · pulmonary hypertension
- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS** Biliary spasm · blood disorder · chills · circulatory depression · face oedema · facial plethora · generalised tonic-clonic seizure · hypertension · hypothermia · intracranial pressure increased · mood altered · myalgia · paraesthesia · sexual dysfunction · sleep disorders · syncope · toxic epidermal necrolysis · tremor · ureteral spasm
- Overdose** Effects only partially reversed by naloxone.
- **BREAST FEEDING** Use with caution—limited information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (risk of increased bioavailability).
Dose adjustments Manufacturer advises consider dose reduction in severe impairment.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **LESS SUITABLE FOR PRESCRIBING** Pentazocine is less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Pethidine hydrochloride**(Meperidine)****INDICATIONS AND DOSE****Acute pain**

- ▶ BY MOUTH
- ▶ Adult: 50–150 mg every 4 hours
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 25–100 mg, then 25–100 mg after 4 hours, for debilitated patients use dose described for elderly patients
- ▶ Elderly: Initially 25 mg, then 25–100 mg after 4 hours
- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 25–50 mg, then 25–50 mg after 4 hours, for debilitated patients use dose described for elderly patients
- ▶ Elderly: Initially 25 mg, then 25–50 mg after 4 hours

Obstetric analgesia

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 50–100 mg, then 50–100 mg after 1–3 hours if required; maximum 400 mg per day

Premedication

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 25–100 mg, dose to be given 1 hour before operation, for debilitated patients use dose described for elderly patients
- ▶ Elderly: 25 mg, dose to be given 1 hour before operation

Postoperative pain

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 25–100 mg every 2–3 hours if required, for debilitated patients use dose described for elderly patients
- ▶ Elderly: Initially 25 mg every 2–3 hours if required

- **CONTRA-INDICATIONS** Phaeochromocytoma
- **CAUTIONS** Accumulation of metabolites may result in neurotoxicity · cardiac arrhythmias · not suitable for severe continuing pain · severe cor pulmonale
- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS**
- GENERAL SIDE-EFFECTS**
- Biliary spasm · dysuria · hypothermia
- SPECIFIC SIDE-EFFECTS**
- ▶ With oral use Agitation · mood altered · muscle rigidity · sexual dysfunction · ureteral spasm
- ▶ With parenteral use Anxiety · asthenia · coordination abnormal · delirium · seizure · syncope · tremor
- Overdose** Convulsions reported in overdose.
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

Dose adjustments Manufacturer advises dose reduction in mild to moderate impairment.

- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection

Tapentadol

● INDICATIONS AND DOSE

Moderate to severe acute pain which can be managed only with opioid analgesics

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ **Adult:** Initially 50 mg every 4–6 hours, adjusted according to response, on the first day of treatment, an additional dose of 50 mg may be taken 1 hour after the initial dose; maximum 700 mg in the first 24 hours; maximum 600 mg per day

Severe chronic pain

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ **Adult:** Initially 50 mg every 12 hours, adjusted according to response; maximum 500 mg per day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: TAPENTADOL (PALEXIA®): RISK OF SEIZURES AND REPORTS OF SEROTONIN SYNDROME WHEN CO-ADMINISTERED WITH OTHER MEDICINES (JANUARY 2019)

Tapentadol can induce seizures and should be prescribed with caution in patients with a history of seizure disorders or epilepsy. Seizure risk may be increased in patients taking other medicines that lower seizure threshold, for example, antidepressants such as selective serotonin reuptake inhibitors (SSRIs), serotonin-noradrenaline reuptake inhibitors (SNRIs), tricyclic antidepressants, and antipsychotics.

Serotonin syndrome has been reported when tapentadol is used in combination with serotonergic antidepressants—withdrawal of the serotonergic medicine, together with supportive symptomatic care, usually brings about a rapid improvement in serotonin syndrome.

- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS**
- ▶ **Common or very common** Anxiety · appetite decreased · asthenia · diarrhoea · feeling of body temperature change · gastrointestinal discomfort · muscle spasms · sleep disorders · tremor
- ▶ **Uncommon** Concentration impaired · depressed mood · dysarthria · dyspnoea · feeling abnormal · irritability · memory loss · movement disorders · muscle contractions involuntary · oedema · sensation abnormal · urinary disorders
- ▶ **Rare or very rare** Angioedema · impaired gastric emptying · level of consciousness decreased · seizure · thinking abnormal

- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment (no information available).
Dose adjustments Manufacturer advises reduce initial daily dose in moderate impairment. For *immediate-release tablets*, initiate at 50 mg up to every 8 hours; for *oral solution*, initiate at 25 mg up to every 8 hours; for *modified-release tablets*, initiate at 50 mg up to every 24 hours.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment (no information available).
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 654/10

The *Scottish Medicines Consortium* has advised (June 2011) that tapentadol (*Palexia*® SR) is accepted for restricted use within NHS Scotland for the management of severe chronic pain in adult patients, which can be adequately managed only with opioid analgesics, when morphine sulfate modified-release has failed to provide adequate pain control or is not tolerated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tramadol hydrochloride

● INDICATIONS AND DOSE

Moderate to severe pain

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** 50–100 mg every 4–6 hours, intravenous injection to be given over 2–3 minutes; Usual maximum 400 mg/24 hours

Moderate to severe acute pain

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ **Child 12–17 years:** Initially 100 mg, then 50–100 mg every 4–6 hours; Usual maximum 400 mg/24 hours
- ▶ **Adult:** Initially 100 mg, then 50–100 mg every 4–6 hours; Usual maximum 400 mg/24 hours

continued →

Moderate to severe chronic pain

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: Initially 50 mg, then, adjusted according to response; Usual maximum 400 mg/24 hours
- ▶ Adult: Initially 50 mg, then, adjusted according to response; Usual maximum 400 mg/24 hours

Postoperative pain

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 100 mg, then 50 mg every 10–20 minutes if required up to total maximum 250 mg (including initial dose) in first hour, then 50–100 mg every 4–6 hours, intravenous injection to be given over 2–3 minutes; Usual maximum 400 mg/24 hours

Moderate to severe pain (with modified-release 12-hourly preparations)

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12-17 years: 50–100 mg twice daily, increased if necessary to 150–200 mg twice daily, doses exceeding the usual maximum not generally required; Usual maximum 400 mg/24 hours
- ▶ Adult: 50–100 mg twice daily, increased if necessary to 150–200 mg twice daily, doses exceeding the usual maximum not generally required; Usual maximum 400 mg/24 hours

Moderate to severe pain (with modified-release 24-hourly preparations)

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12-17 years: Initially 100–150 mg once daily, increased if necessary up to 400 mg once daily; Usual maximum 400 mg/24 hours
- ▶ Adult: Initially 100–150 mg once daily, increased if necessary up to 400 mg once daily; Usual maximum 400 mg/24 hours

ZYDOL[®] XL**Moderate to severe pain**

- ▶ BY MOUTH USING MODIFIED-RELEASE TABLETS
- ▶ Child 12-17 years: Initially 150 mg once daily, increased if necessary up to 400 mg once daily
- ▶ Adult: Initially 150 mg once daily, increased if necessary up to 400 mg once daily

IMPORTANT SAFETY INFORMATION

Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see *Prescribing and dispensing information*.

- **CONTRA-INDICATIONS** Acute intoxication with alcohol · acute intoxication with analgesics · acute intoxication with hypnotics · acute intoxication with opioids · compromised respiratory function (in children) · not suitable for narcotic withdrawal treatment · uncontrolled epilepsy
- **CAUTIONS** Excessive bronchial secretions · history of epilepsy—use tramadol only if compelling reasons · impaired consciousness · not suitable as a substitute in opioid-dependent patients · not suitable in some types of general anaesthesia · postoperative use (in children) · susceptibility to seizures—use tramadol only if compelling reasons · variation in metabolism
- CAUTIONS, FURTHER INFORMATION**
 - ▶ General anaesthesia Not recommended for analgesia during potentially light planes of general anaesthesia (possibly increased intra-operative recall reported).
 - ▶ Variation in metabolism The capacity to metabolise tramadol can vary considerably between individuals; there is a risk of developing side-effects of opioid toxicity in patients who are ultra-rapid tramadol metabolisers (CYP2D6 ultra-

rapid metabolisers) and the therapeutic effect may be reduced in poor tramadol metabolisers.

- ▶ Postoperative use Manufacturer advises extreme caution when used for postoperative pain relief in children—reports of rare, but life threatening adverse events after tonsillectomy and/or adenoidectomy for obstructive sleep apnoea; if used, monitor closely for symptoms of opioid toxicity.
- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS**
 - GENERAL SIDE-EFFECTS**
 - ▶ Common or very common Fatigue
 - ▶ Rare or very rare Dyspnoea · epileptiform seizure · respiratory disorders · sleep disorders · vision blurred
 - ▶ Frequency not known Asthma exacerbated · hypoglycaemia
 - SPECIFIC SIDE-EFFECTS**
 - ▶ Uncommon
 - ▶ With parental use Circulatory collapse · gastrointestinal discomfort
 - ▶ Rare or very rare
 - ▶ With parental use Angioedema · appetite change · behaviour abnormal · cognitive disorder · dysuria · hypersensitivity · mood altered · movement disorders · muscle weakness · perception disorders · psychiatric disorder · sensation abnormal
 - ▶ Frequency not known
 - ▶ With oral use Anxiety · blood disorder · gastrointestinal disorder · hyperkinesia · hypertension · paraesthesia · syncope · tremor · urinary disorder
 - **PREGNANCY** Embryotoxic in *animal studies*—manufacturers advise avoid.
 - **BREAST FEEDING** Amount probably too small to be harmful, but manufacturer advises avoid.
 - **HEPATIC IMPAIRMENT** Manufacturers advise caution (risk of delayed elimination); some *oral preparations* should be avoided in severe impairment—consult product literature. **Dose adjustments** Manufacturers advise consider increasing dosage interval.
 - **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs. Caution (avoid for *oral drops*) in severe impairment.
 - **TREATMENT CESSATION** Manufacturer advises consider tapering the dose gradually to prevent withdrawal symptoms.
 - **DIRECTIONS FOR ADMINISTRATION** Tramadol hydrochloride *orodispersible tablets* should be sucked and then swallowed. May also be dispersed in water. Some tramadol hydrochloride modified-release capsule preparations may be opened and the contents swallowed immediately without chewing—check individual preparations.
 - For *intravenous infusion*, dilute in Glucose 5% or Sodium Chloride 0.9%.
 - **PRESCRIBING AND DISPENSING INFORMATION** Modified-release preparations are available as 12-hourly or 24-hourly formulations. Non-proprietary preparations of modified-release tramadol may be available as either 12-hourly or 24-hourly formulations; prescribers and dispensers must ensure that the correct formulation is prescribed and dispensed. Branded preparations that should be given 12-hourly include *Invadol[®] SR*, *Mabron[®]*, *Maneo[®]*, *Marol[®]*, *Maxitram[®] SR*, *Oldaram[®]*, *Tilodal[®] SR*, *Tramquel[®] SR*, *Tramulief[®] SR*, *Zamadol[®] SR*, *Zeridame[®] SR* and *Zydol[®] SR*. Preparations that should be given 24-hourly include *Tradorec XL[®]*, *Zamadol[®] 24hr*, and *Zydol XL[®]*.
 - **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tramadol hydrochloride orodispersible tablets.

6.1 Headache

Cluster headache and other trigeminal autonomic cephalalgias

Management

Cluster headache rarely responds to standard analgesics. Sumatriptan p. 503 given by subcutaneous injection is the drug of choice for the *treatment* of cluster headache. If an injection is unsuitable, sumatriptan nasal spray or zolmitriptan nasal spray p. 504 [both unlicensed use] may be used. Alternatively, 100% oxygen at a rate of 10–15 litres/minute for 10–20 minutes is useful in aborting an attack.

Prophylaxis of cluster headache is considered if the attacks are frequent, last over 3 weeks, or if they cannot be treated effectively. Verapamil hydrochloride p. 175 or lithium [both unlicensed use] are used for prophylaxis.

Prednisolone p. 716 can be used for short-term prophylaxis of episodic cluster headache [unlicensed use] either as monotherapy, or in combination with verapamil hydrochloride during verapamil titration.

Ergotamine tartrate p. 500, used on an intermittent basis is an alternative for patients with short bouts, but it should not be used for prolonged periods.

The other trigeminal autonomic cephalalgias, paroxysmal hemicrania (sensitive to indometacin p. 1206), and short-lasting unilateral neuralgiform headache attacks with conjunctival injection and tearing, are seen rarely and are best managed by a specialist.

Other drugs used for Headache Clonidine hydrochloride, p. 156

ANTIHISTAMINES > SEDATING ANTIHISTAMINES

Pizotifen

● INDICATIONS AND DOSE

Prevention of vascular headache | Prevention of classical migraine | Prevention of common migraine | Prevention of cluster headache

▶ BY MOUTH

- ▶ Adult: Initially 500 micrograms once daily, then increased to 1.5 mg once daily, dose to be increased gradually and taken at night, alternatively increased to 1.5 mg daily in 3 divided doses, doses to be increased gradually; increased if necessary up to 4.5 mg daily (max. per dose 3 mg), this dose is rarely necessary

Prophylaxis of migraine

▶ BY MOUTH

- ▶ Child 5-17 years: Initially 500 micrograms once daily, dose to be taken at night, then increased to up to 1.5 mg daily in divided doses, dose to be increased gradually, max. single dose (at night) 1 mg

● **UNLICENSED USE** 1.5 mg tablets not licensed for use in children.

● **CONTRA-INDICATIONS** Acute porphyrias p. 1120

● **CAUTIONS** Avoid abrupt withdrawal · history of epilepsy · susceptibility to angle-closure glaucoma · urinary retention

● **INTERACTIONS** → Appendix 1: antihistamines, sedating

● SIDE-EFFECTS

- ▶ **Common or very common** Appetite increased · dizziness · drowsiness · dry mouth · fatigue · nausea · weight increased
- ▶ **Uncommon** Constipation

- ▶ **Rare or very rare** Aggression · anxiety · arthralgia · central nervous system stimulation · depression · hallucination · muscle complaints · paraesthesia · seizure · skin reactions · sleep disorders
- ▶ **Frequency not known** Hepatic disorders
- **PREGNANCY** Avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Amount probably too small to be harmful, but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. **Dose adjustments** Manufacturer advises consider dose reduction.
- **RENAL IMPAIRMENT** Use with caution.

6.1a Migraine

Migraine

19-Feb-2020

Description of condition

Migraine is a common type of primary headache disorder. It occurs more commonly in women than in men, and is characterised by recurrent attacks of typically moderate to severe headaches that usually last between 4–72 hours. The headache is usually unilateral, pulsating, aggravated by routine physical activity, and may be severe enough to impact or prevent daily activities. It is frequently accompanied by nausea and vomiting, photophobia and phonophobia, or both. Migraine is subdivided into migraine *with* or *without* aura, and is defined as either episodic or chronic.

Migraine *with* aura consists of visual symptoms (zigzag or flickering lights, spots, lines, or loss of vision), sensory symptoms (pins and needles, or numbness), or dysphasia, which usually precede the onset of headache. Symptoms usually develop gradually and resolve within 1 hour.

Episodic migraine is defined as headache which occurs on less than 15 days per month, and can be further subdivided into low frequency (1–9 days per month) and high frequency (10–14 days per month). Chronic migraine is defined as headache which occurs on at least 15 days per month and has the characteristics of a migraine headache on at least 8 days per month for greater than 3 months.

In some women, the drop in oestrogen levels just before menstruation is a trigger for migraine, with symptoms generally occurring from two days before the start of bleeding up until three days after.

Medication-overuse headache is a complication of migraine; the frequent use of acute treatment for migraine increases the frequency and intensity of headache, and can become the cause of the headache.

Aims of treatment

Treatment of acute migraine aims to stop the attack, or to significantly reduce the severity of the headache and other associated symptoms. Preventative treatment aims to reduce the frequency, severity and duration of migraine attacks, and development of medication-overuse headache.

Lifestyle advice

[EvGr] Patients should be encouraged to eat regular meals, and to maintain adequate hydration, sleep and exercise. **[A]** Other potential triggers include stress, relaxation after stress, some foods and drinks, and bright lights. **[EvGr]** Known triggers should be avoided; keeping a headache diary may be useful to identify potential triggers and should be continued for a minimum of 8 weeks. **[A]**

Acute migraine treatment

[EvGr] The choice of treatment for acute migraine should be guided by the patient's preference, response to previous treatment, the severity and frequency of headache attacks, other associated symptoms, and co-morbidities. Treatment should ideally be restricted to 2 days per week and patients should be advised of the risk of developing medication-overuse headache.

Monotherapy, with either aspirin p. 130, ibuprofen p. 1203, or a 5HT₁-receptor agonist ('triptan') is recommended as first-line treatment and should be taken as soon as the patient knows that they are developing a migraine (start of headache phase).

In patients who experience aura with their migraine, it is recommended that 5HT₁-receptor agonists are taken at the start of the headache and not at the start of the aura (unless the aura and headache start at the same time). Treatment with a 5HT₁-receptor agonist can be repeated after 2 hours with the same or different drug if there has been an inadequate response to the initial dose.

Based on its clinical efficacy and safety profile, sumatriptan p. 503 is the 5HT₁-receptor agonist of choice. **[A]** Alternative 5HT₁-receptor agonists include almotriptan p. 500, eletriptan p. 501, frovatriptan p. 501, naratriptan p. 502, rizatriptan p. 502, and zolmitriptan p. 504. **[EvGr]** In patients who do not respond to one 5HT₁-receptor agonist, a different 5HT₁-receptor agonist should be tried as response can be variable between patients. Subcutaneous sumatriptan p. 503 or nasal zolmitriptan p. 504 can be given to patients who present with early vomiting or who have severe migraine attacks. **[A]**

[EvGr] Other NSAIDs that may be used for the treatment of acute migraine include, naproxen p. 1211 [unlicensed indication], tolfenamic acid p. 497, and diclofenac potassium p. 1197. In patients presenting with severe nausea and vomiting, diclofenac sodium suppositories p. 1198 [unlicensed indication] may be an option. Mefenamic acid p. 1208 [unlicensed indication] can also be used for menstrual migraine in women already using it for other indications such as dysmenorrhoea, or menorrhagia. **[E]**

[EvGr] Treatment with paracetamol p. 465 can be considered in patients who are unable to take other acute treatment options.

In patients who fail to respond to monotherapy, combination therapy with sumatriptan p. 503 and naproxen p. 1211 can be given.

In addition to their use as antiemetics, metoclopramide hydrochloride p. 452 [unlicensed indication] or prochlorperazine p. 407 [unlicensed indication] can also be given as a single dose at the onset of migraine symptoms for the treatment of headache. They can be given orally or by injection, depending on the severity of the patients' symptoms and the setting. **[A]**

Antiemetics

EvGr Metoclopramide hydrochloride p. 452 or prochlorperazine p. 407 can be given orally or by injection to relieve nausea or vomiting. Metoclopramide hydrochloride p. 452 should not be used regularly due to the risk of extrapyramidal side effects. **⚠** The MHRA and CHM (2013) have released important safety information regarding the use of metoclopramide and risk of neurological adverse effects. See *Important safety information* for metoclopramide hydrochloride p. 452.

EvGr Domperidone p. 451 [unlicensed in those weighing less than 35 kg] may be used as an alternative antiemetic. **⚠** The MHRA and CHM (2019) have released important safety information and restrictions regarding the use of domperidone for nausea and vomiting in those weighing less than 35 kg, and a reminder of contra-indications. For further information, see *Important safety information* for domperidone.

Preventative migraine treatment

EvGr The decision to start prophylactic treatment should be based on the impact of the migraine on the patient's quality of life. The choice of treatment depends on factors such as patient preference, drug interactions, and other comorbidities. Treatment should be started at a low dose and gradually increased to the maximum effective and tolerated dose.

Propranolol hydrochloride p. 162 is recommended as first-line preventative treatment in patients with episodic or chronic migraine. **⚠** **EvGr** For patients in whom propranolol is unsuitable, other beta-blockers that can be considered are metoprolol tartrate p. 166, atenolol p. 164 [unlicensed indication], nadolol p. 161, and timolol maleate p. 163. Bisoprolol fumarate p. 165 [unlicensed indication] may also be considered, especially in patients already taking it for cardiac reasons under the advice of their cardiologist.

⚠ **EvGr** Topiramate p. 348 can be given if a beta-blocker is unsuitable, however in women of childbearing potential, advice should be given on the associated risks during pregnancy, the need to use highly effective contraception and to seek further information if pregnant or planning a pregnancy. **⚠** See *Conception and contraception*, and *Pregnancy* in the topiramate p. 348 drug monograph for further information.

EvGr Amitriptyline hydrochloride p. 390 is effective for migraine prophylaxis and should be considered for patients with episodic or chronic migraine. A less sedative tricyclic antidepressant can be used if amitriptyline hydrochloride p. 390 is not tolerated.

Candesartan cilexetil p. 186 [unlicensed indication] can be considered in patients with episodic or chronic migraine, although there is limited evidence to support its use.

Sodium valproate p. 344 [unlicensed indication] can also be considered in patients with episodic or chronic migraine.

⚠ The MHRA has advised that sodium valproate must not be used in women of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met and alternative treatments are ineffective or not tolerated; it must not be used during pregnancy for migraine prophylaxis. For further information, see *Important safety information*, *Conception and contraception*, and *Pregnancy* in the sodium valproate p. 344 drug monograph.

EvGr Flunarizine [unlicensed] can also be considered in patients with episodic or chronic migraine (specialist use only). Pizotifen p. 494 is used but evidence to recommend its use is limited.

Preventative treatment should be tried for at least 3 months at the maximum tolerated dose, before deciding whether or not it is effective. **⚠** A good response to treatment is defined as a 50% reduction in the severity and frequency of migraine attacks. **EvGr** A review of ongoing prophylaxis should be considered after 6–12 months;

treatment can be gradually withdrawn in many patients. Patients should be referred to a neurology or specialist headache clinic if trials with 3 or more drugs have been unsuccessful.

Botulinum toxin type A p. 425 (specialist use only) is recommended for prophylaxis of chronic migraine where medication-overuse has been addressed and where 3 or more oral prophylactic treatments have failed. **⚠**

Menstrual migraine prophylaxis

EvGr Frovatriptan p. 501 [unlicensed indication] can be given instead of, or in addition to, standard prophylactic treatment in women with perimenstrual migraine. It is given from 2 days before until 3 days after menstruation starts. Zolmitriptan p. 504 [unlicensed indication] or naratriptan p. 502 [unlicensed indication] are suitable alternatives to frovatriptan p. 501. In order for treatment to be effective, the patient's menstrual cycle must be regular.

Women with menstrual-related migraine who are using 5HT₁-receptor agonists for both perimenstrual prophylaxis and at other times in the month should be advised of the increased risk of developing medication-overuse headache. **⚠**

Medication-overuse headache

EvGr Medication overuse should be addressed in patients overusing acute treatments such as 5HT₁-receptor agonists, combination analgesics, ergots, or opioids for migraine. **⚠** Withdrawing the overused medication can reduce the frequency and intensity of headaches but is often associated with transient worsening. Not all patients overusing acute treatment will develop medication-overuse headache; in some patients, continued headaches may be a sign of poorly treated migraine.

- ▶ **Midrid** (DHP Healthcare Ltd)

Isometheptene mucate 65 mg, Paracetamol 325 mg Midrid 325mg/65mg capsules | 30 capsule [PoM] £7.50 DT = £7.50

Paracetamol with metoclopramide

22-Jan-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 465, metoclopramide hydrochloride p. 452.

• INDICATIONS AND DOSE

Acute migraine

- ▶ BY MOUTH USING TABLETS

- ▶ Adult: 2 tablets, to be taken at the onset of attack, followed by 2 tablets every 4 hours if required; maximum 6 tablets per day

- ▶ BY MOUTH USING EFFERVESCENT POWDER SACHETS

- ▶ Adult: 2 sachets, to be taken at the onset of attack, followed by 2 sachets every 4 hours if required, sachets to be dissolved in a quarter tumblerful of water; maximum 6 sachets per day

IMPORTANT SAFETY INFORMATION

Metoclopramide can cause **severe extrapyramidal effects**, particularly in young adults.

- **CAUTIONS** Treatment should not exceed 3 months due to risk of tardive dyskinesia
- **INTERACTIONS** → Appendix 1: metoclopramide · paracetamol

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Metoclopramide hydrochloride 10 mg, Aspirin DL-Lysine

900 mg MigraMax oral powder sachets sugar-free | 6 sachet [PoM] £6.61 DT = £6.61

Tolfenamic acid

20-Apr-2020

• INDICATIONS AND DOSE

Treatment of acute migraine

- ▶ BY MOUTH

- ▶ Adult: 200 mg, dose to be taken at onset, then 200 mg after 1–2 hours if required

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal haemorrhage (two or more distinct episodes) · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · dehydration (risk of renal impairment) · elderly (risk of serious side-effects and fatalities) · heart failure · history of gastro-intestinal disorders (e.g. ulcerative colitis, Crohn's disease) · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1: NSAIDS
- **SIDE-EFFECTS** Agranulocytosis · angioedema · aplastic anaemia · asthma · confusion · constipation · Crohn's disease aggravated · depression · diarrhoea · dizziness · drowsiness · dyspnoea · dysuria (most common in men) · euphoric mood · fatigue · fertility decreased female · gastrointestinal discomfort · gastrointestinal disorders · haemolytic anaemia · haemorrhage · hallucination · headache · heart failure · hepatic disorders · hypersensitivity · hypertension · increased risk of arterial thromboembolism · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · nausea · nephritis tubulointerstitial · nephropathy · neutropenia · oedema · optic neuritis · oral ulceration · pancreatitis · paraesthesia · photosensitivity reaction · renal failure (more common in patients with pre-existing renal impairment) · respiratory disorders · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · tinnitus · tremor · vertigo · visual impairment · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1193
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Amount too small to be harmful. Use with caution during breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. **Dose adjustments** The lowest effective dose should be used for the shortest possible duration. **Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

● **INDICATIONS AND DOSE****MIGRALEVE®****Acute migraine**

▶ BY MOUTH

- ▶ Child 12-15 years: Initially 1 tablet, (pink tablet) to be taken at onset of attack, or if it is imminent, followed by 1 tablet every 4 hours if required, (yellow tablet) to be taken following initial dose; maximum 1 pink and 3 yellow tablets in 24 hours
- ▶ Child 16-17 years: Initially 2 tablets, (pink tablets) to be taken at onset of attack or if it is imminent, followed by 2 tablets every 4 hours if required, (yellow tablets) to be taken following initial dose; maximum 2 pink and 6 yellow tablets in 24 hours
- ▶ Adult: Initially 2 tablets, (pink tablets) to be taken at onset of attack or if it is imminent, followed by 2 tablets every 4 hours if required, (yellow tablets) to be taken following initial dose; maximum 2 pink and 6 yellow tablets in 24 hours

- **INTERACTIONS** → Appendix 1: antihistamines, sedating · opioids · paracetamol
- **PRESCRIBING AND DISPENSING INFORMATION** See co-codamol p. 474 for Migraleve Yellow preparations.
- **LESS SUITABLE FOR PRESCRIBING**

MIGRALEVE® Migraleve® is less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 17, 30

▶ **Migraleve Pink** (McNeil Products Ltd)**Bucizine hydrochloride 6.25 mg, Codeine phosphate 8 mg, Paracetamol 500 mg** Migraleve Pink tablets | 48 tablet [PoM] £3.97 [CDS]**CALCITONIN GENE-RELATED PEPTIDE INHIBITORS****Erenumab**

11-Nov-2019

- **DRUG ACTION** Erenumab is a human monoclonal antibody that binds to the calcitonin gene-related peptide (CGRP) receptor, inhibiting the function of CGRP, and thereby preventing migraine attacks.

● **INDICATIONS AND DOSE****Prophylaxis of migraine (in patients who have at least 4 migraine days per month) (initiated by a specialist)**

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 70 mg every 4 weeks; increased if necessary to 140 mg every 4 weeks, consider discontinuing if no response after 3 months of treatment

● **SIDE-EFFECTS**

- ▶ **Common or very common** Constipation · muscle spasms · skin reactions
- ▶ **Frequency not known** Oedema · swelling

- **PREGNANCY** Manufacturer advises avoid—limited information available.

- **BREAST FEEDING** Manufacturer advises avoid during first few days after birth—possible risk from transfer of antibodies to infant. After this time, use during breast-feeding only if clinically needed.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises injection into the abdomen, thigh, or upper arm (if not self-administered). Patients may self-administer Aimovig® after appropriate training in subcutaneous injection technique.

- **PRESCRIBING AND DISPENSING INFORMATION** Erenumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2-8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.

● **PATIENT AND CARER ADVICE**

Self-administration Manufacturer advises that patients and their carers should be given training in subcutaneous injection technique if appropriate.

● **NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) decisions**

SMC No. SMC2134

The *Scottish Medicines Consortium* has advised (April 2019) that erenumab (*Aimovig*®) is accepted for restricted use within NHS Scotland for the prophylaxis of migraine in adults who have at least four migraine days per month and in whom at least three prior prophylactic treatments have failed. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Fremanezumab

21-Jan-2020

- **DRUG ACTION** Fremanezumab is a humanised monoclonal antibody that binds to the calcitonin gene-related peptide (CGRP) ligand, inhibiting the function of CGRP at its receptor, and thereby preventing migraine attacks.

● INDICATIONS AND DOSE

Prophylaxis of migraine [in patients who have at least 4 migraine days per month] (initiated by a specialist)

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 225 mg once a month, alternatively 675 mg every 3 months, review treatment within first 3 months and regularly thereafter

- **CAUTIONS** Major cardiovascular disease (no information available)
- **SIDE-EFFECTS** Hypersensitivity
- **PREGNANCY** Manufacturer advises avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid during first few days after birth—possible risk from transfer of antibodies to infant. After this time, use during breast-feeding only if clinically needed.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises injection into the abdomen, thigh or upper arm. Patients may self-administer *Ajovy*® after appropriate training in subcutaneous injection technique.
- **PRESCRIBING AND DISPENSING INFORMATION** Fremanezumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.
- **PATIENT AND CARER ADVICE** Self-administration Manufacturer advises patients and their carers should be given training in subcutaneous injection technique if appropriate.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions
SMC No. SMC2226

The *Scottish Medicines Consortium* has advised (January 2020) that fremanezumab (*Ajovy*®) is accepted for restricted use within NHS Scotland for the prophylaxis of chronic and episodic migraine in adults who have had prior failure on three or more migraine preventive treatments. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Edetic acid (edta), polysorbates, sucrose

Fremanezumab 150 mg per 1 ml Ajovy 225mg/1.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £450.00

Galcanezumab

05-Sep-2019

- **DRUG ACTION** Galcanezumab is a humanised monoclonal antibody that binds to the calcitonin gene-related peptide (CGRP) ligand, inhibiting the function of CGRP at its receptor, and thereby preventing migraine attacks.

● INDICATIONS AND DOSE

Prophylaxis of migraine [in patients who have at least 4 migraine days per month] (initiated by a specialist)

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: Loading dose 240 mg for 1 dose, then maintenance 120 mg once a month, maintenance dosing to start 1 month after loading dose. Review treatment 3 months after initiation

● SIDE-EFFECTS

- ▶ **Common or very common** Constipation · skin reactions · vertigo
- **PREGNANCY** Manufacturer advises avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid during first few days after birth—possible risk from transfer of antibodies to infant. After this time, use during breast-feeding only if clinically needed.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises injection into the abdomen, thigh, back of the upper arm, or the gluteal region. Patients may self-administer *Emgality*® after appropriate training in subcutaneous injection technique.
- **PRESCRIBING AND DISPENSING INFORMATION** Galcanezumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.
- **PATIENT AND CARER ADVICE** Self-administration Manufacturer advises patients and their carers should be given training in subcutaneous injection technique if appropriate.
- **Driving and skilled tasks** Manufacturer advises patients and their carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of vertigo.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Polysorbates

- ▶ **Emgality** (Eli Lilly and Company Ltd) ▼

Galcanezumab 120 mg per 1 ml Emgality 120mg/1ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £386.50

ERGOT ALKALOIDS

Ergotamine tartrate

● INDICATIONS AND DOSE

Management of cluster headache

▶ BY MOUTH USING TABLETS

- ▶ Adult: 1 mg once daily for 6 nights in 7; occasionally given for 1–2 weeks, dose to be taken at night

- **UNLICENSED USE** Not licensed for the management of cluster headache.
- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · coronary heart disease · hyperthyroidism · inadequately controlled hypertension · obliterative vascular disease · peripheral vascular disease · Raynaud's syndrome · sepsis · severe hypertension · temporal arteritis
- **CAUTIONS** Anaemia · cardiac disease · dependence · elderly · risk of peripheral vasospasm
- **INTERACTIONS** → Appendix 1: ergotamine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · dizziness · nausea · vomiting
 - ▶ **Uncommon** Cyanosis · diarrhoea · muscle weakness · pain in extremity · sensation abnormal · vasoconstriction
 - ▶ **Rare or very rare** Arrhythmias · cardiac valve fibrosis · dyspnoea · ergot poisoning (including absence of pulse and numbness in extremities) · gangrene · intestinal ischaemia · myalgia · myocardial infarction · myocardial ischaemia · skin reactions
 - ▶ **Frequency not known** Anxiety · arthralgia · blood disorder · cerebral ischaemia · confusion · constipation · depression · drowsiness · dry mouth · extrapyramidal symptoms · hallucination · renal artery spasm · seizure · sleep disorder · thrombosis · tremor · urinary retention · vision blurred
- **PREGNANCY** Avoid; oxytocic effect on the uterus.
- **BREAST FEEDING** Avoid; ergotism may occur in infant; repeated doses may inhibit lactation.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment—risk of toxicity increased.
- **RENAL IMPAIRMENT** Avoid; risk of renal vasoconstriction.
- **PATIENT AND CARER ADVICE** Peripheral vasospasm Warn patient to stop treatment immediately if numbness or tingling of extremities develops and to contact doctor.
- **LESS SUITABLE FOR PRESCRIBING** Ergotamine tartrate is less suitable for prescribing.
- **MEDICINAL FORMS** No licensed medicines listed.

Ergotamine tartrate with caffeine hydrate and cyclizine hydrochloride

22-Nov-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergotamine tartrate above, cyclizine p. 449.

● INDICATIONS AND DOSE

Treatment of acute migraine

▶ BY MOUTH

- ▶ Adult: 1 tablet, to be taken at onset, then 0.5–1 tablet every 30 minutes if required, max. 3 tablets in 24 hours, max. 4 tablets per attack, max. 6 tablets in one week, max. 2 courses of treatment in one month

- **INTERACTIONS** → Appendix 1: antihistamines, sedating · ergotamine

- **PATIENT AND CARER ADVICE** Patient counselling is advised for cyclizine hydrochloride with caffeine hydrate and ergotamine tartrate tablets (dosage).
- **LESS SUITABLE FOR PRESCRIBING** Cyclizine hydrochloride with caffeine hydrate and ergotamine tartrate (*Migril*®) is less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

• INDICATIONS AND DOSE

Treatment of acute migraine

▶ BY MOUTH

- ▶ Adult: 2.5 mg, dose to be taken as soon as possible after onset, followed by 2.5 mg after 2 hours if required, dose to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 5 mg per day

Menstrual migraine prophylaxis

▶ BY MOUTH

- ▶ Adult: 2.5 mg twice daily, to be taken from 2 days before until 3 days after bleeding starts

- **UNLICENSED USE** Not licensed for use in elderly.

[EvG] Frovatriptan may be used for menstrual migraine prophylaxis,  but it is not licensed for this indication.

- **CONTRA-INDICATIONS** Coronary vasospasm · ischaemic heart disease · peripheral vascular disease · previous cerebrovascular accident · previous myocardial infarction · previous transient ischaemic attack · Prinzmetal's angina · severe hypertension · uncontrolled hypertension
- **CAUTIONS** Conditions which predispose to coronary artery disease · elderly
- **INTERACTIONS** → Appendix 1: frovatriptan
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Asthenia · chest discomfort · dizziness · drowsiness · dry mouth · flushing · gastrointestinal discomfort · headache · hyperhidrosis · nausea · sensation abnormal · throat complaints · vision disorders
 - ▶ **Uncommon** Anxiety · arrhythmias · arthralgia · concentration impaired · confusion · dehydration · depression · diarrhoea · dysphagia · ear discomfort · eye discomfort · gastrointestinal disorders · hypertension · increased risk of infection · malaise · musculoskeletal stiffness · neuromuscular dysfunction · pain · palpitations · peripheral coldness · psychiatric disorders · skin reactions · sleep disorders · taste altered · temperature sensation altered · thirst · tinnitus · tremor · urinary disorders · vertigo
 - ▶ **Rare or very rare** Breast tenderness · burping · constipation · ear disorder · epistaxis · fever · hiccups · hyperacusia · hypoglycaemia · irritable bowel syndrome · lymphadenopathy · memory loss · movement disorder · oesophageal spasm · oral disorders · piloerection · reflexes decreased · renal pain · respiratory disorders · self mutilation
 - ▶ **Frequency not known** Angioedema · coronary vasospasm · hypersensitivity · myocardial infarction
- SIDE-EFFECTS, FURTHER INFORMATION** Discontinue if symptoms of heat, heaviness, pressure or tightness (including throat and chest) occur.
- **PREGNANCY** There is limited experience of using 5HT₁-receptor agonists during pregnancy; manufacturers advise

that they should be avoided unless the potential benefit outweighs the risk.

- **BREAST FEEDING** Present in milk in *animal* studies— withhold breast-feeding for 24 hours.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 3

2.5 mg Migard 2.5mg tablets | 6 tablet [PoM] £16.67 DT = £9.64
- ▶ **Mylatrip** (Mylan)
Frovatriptan (as Frovatriptan succinate monohydrate)
2.5 mg Mylatrip 2.5mg tablets | 6 tablet [PoM] £16.50 DT = £9.64

Naratriptan

05-Mar-2020

● INDICATIONS AND DOSE

Treatment of acute migraine

▶ BY MOUTH

- ▶ **Adult:** 2.5 mg, followed by 2.5 mg after at least 4 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 5 mg per day

Menstrual migraine prophylaxis

▶ BY MOUTH

- ▶ **Adult:** 2.5 mg twice daily, to be taken from 2 days before until 3 days after bleeding starts

- **UNLICENSED USE** [\[EvGr\]](#) Naratriptan is used for menstrual migraine prophylaxis, [⚠](#) but is not licensed for this indication. Not licensed for use in elderly.
- **CONTRA-INDICATIONS** Coronary vasospasm · ischaemic heart disease · moderate or severe hypertension · peripheral vascular disease · previous cerebrovascular accident · previous myocardial infarction · previous transient ischaemic attack · Prinzmetal's angina · uncontrolled hypertension
- **CAUTIONS** Conditions which predispose to coronary artery disease · elderly
- **INTERACTIONS** → Appendix 1: naratriptan
- **SIDE-EFFECTS**
- ▶ **Common or very common** Dizziness · drowsiness · fatigue · feeling hot · malaise · nausea · paraesthesia · vomiting
- ▶ **Uncommon** Arrhythmias · feeling abnormal · pain · palpitations · visual impairment
- ▶ **Rare or very rare** Angina pectoris · colitis ischaemic · coronary vasospasm · face oedema · myocardial infarction · peripheral vascular disease · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION Discontinue if symptoms of heat, heaviness, pressure or tightness (including throat and chest) occur.

- **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with sensitivity to sulfonamides.
- **PREGNANCY** There is limited experience of using 5HT₁-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.
- **BREAST FEEDING** Withhold breast-feeding for 24 hours.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment (risk of decreased clearance); avoid in severe impairment.
Dose adjustments Manufacturer advises maximum 2.5 mg in 24 hours in mild to moderate impairment.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 15 mL/minute/1.73 m².

Dose adjustments Max. 2.5 mg in 24 hours.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 3

▶ Naratriptan (Non-proprietary)

● INDICATIONS AND DOSE

Treatment of acute migraine

▶ BY MOUTH

- ▶ **Adult:** 10 mg, dose to be taken as soon as possible after onset, followed by 10 mg after 2 hours if required, dose to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 20 mg per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose to 5 mg with concurrent use of propranolol.

- **UNLICENSED USE** Not licensed for use in elderly.
- **CONTRA-INDICATIONS** Coronary vasospasm · ischaemic heart disease · peripheral vascular disease · previous cerebrovascular accident · previous myocardial infarction · previous transient ischaemic attack · Prinzmetal's angina · severe hypertension · uncontrolled hypertension
- **CAUTIONS** Conditions which predispose to coronary artery disease · elderly
- **INTERACTIONS** → Appendix 1: rizatriptan
- **SIDE-EFFECTS**
- ▶ **Common or very common** Alertness decreased · asthenia · diarrhoea · dizziness · drowsiness · dry mouth · dyspepsia · feeling abnormal · headache · palpitations · musculoskeletal stiffness · nausea · pain · tachycardia · sensation abnormal · throat complaints · vasodilation · vomiting
- ▶ **Uncommon** Angioedema · arrhythmias · ataxia · disorientation · dyspnoea · face oedema · hyperhidrosis · hypertension · muscle weakness · myalgia · nervousness · skin reactions · syncope · taste altered · thirst · tongue swelling · tremor · vertigo · vision blurred
- ▶ **Rare or very rare** Hypersensitivity · stroke · wheezing
- ▶ **Frequently not known** Colitis ischaemic · myocardial infarction · myocardial ischaemia · peripheral vascular disease · seizure · serotonin syndrome · toxic epidermal necrolysis
- SIDE-EFFECTS, FURTHER INFORMATION** Discontinue if symptoms of heat, heaviness, pressure or tightness (including throat and chest) occur.
- **PREGNANCY** There is limited experience of using 5HT₁-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.
- **BREAST FEEDING** Present in milk in *animal* studies— withhold breast-feeding for 24 hours.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).

Dose adjustments Manufacturer advises dose reduction to 5 mg in mild to moderate impairment.

- **RENAL IMPAIRMENT** Avoid in severe impairment.
Dose adjustments Reduce dose to 5 mg in mild to moderate impairment.
- **DIRECTIONS FOR ADMINISTRATION** Rizatriptan orodispersible tablets should be placed on the tongue, allowed to disperse and swallowed. Rizatriptan oral lyophilisates should be placed on the tongue and allowed to dissolve.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer rizatriptan orodispersible tablets and oral lyophilisates.
Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Sumatriptan

05-Mar-2020

● INDICATIONS AND DOSE

Treatment of acute migraine

▶ BY MOUTH

- ▶ **Adult:** Initially 50–100 mg for 1 dose, followed by 50–100 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 300 mg per day

▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 6 mg for 1 dose, followed by 6 mg after at least 1 hour if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack), dose to be administered using an auto-injector; not for intravenous injection which may cause coronary vasospasm and angina; maximum 12 mg per day

▶ BY INTRANASAL ADMINISTRATION

- ▶ **Adult 18–65 years:** Initially 10–20 mg, to be administered into one nostril, followed by 10–20 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose

should not take second dose for same attack); maximum 40 mg per day

Treatment of acute cluster headache

▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 6 mg for 1 dose, followed by 6 mg after at least 1 hour if required, to be taken only if headache recurs (patient not responding to initial dose should not take second dose for same attack), dose to be administered using an auto-injector; not for intravenous injection which may cause coronary vasospasm and angina; maximum 12 mg per day
- ▶ **BY INTRANASAL ADMINISTRATION**
- ▶ **Adult 18–65 years:** Initially 10–20 mg, dose to be administered into one nostril, followed by 10–20 mg after at least 2 hours if required, to be taken only if headache recurs (patient not responding to initial dose should not take second dose for same attack); maximum 40 mg per day

- **UNLICENSED USE** Not licensed for use in elderly.

- **CONTRA-INDICATIONS** Coronary vasospasm · ischaemic heart disease · mild uncontrolled hypertension · moderate and severe hypertension · peripheral vascular disease · previous cerebrovascular accident · previous myocardial infarction · previous transient ischaemic attack · Prinzmetal's angina

- **CAUTIONS** Conditions which predispose to coronary artery disease · elderly · history of seizures · mild, controlled hypertension · risk factors for seizures

- **INTERACTIONS** → Appendix 1: sumatriptan

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Asthenia · dizziness · drowsiness · dyspnoea · feeling abnormal · flushing · myalgia · nausea · pain · sensation abnormal · skin reactions · temperature sensation altered · vomiting
- ▶ **Rare or very rare** Hypersensitivity
- ▶ **Frequency not known** Angina pectoris · anxiety · arrhythmias · arthralgia · colitis ischaemic · coronary vasospasm · diarrhoea · dystonia · hyperhidrosis · hypotension · myocardial infarction · nystagmus · palpitations · Raynaud's phenomenon · seizure · tremor · vision disorders

SPECIFIC SIDE-EFFECTS

▶ **Common or very common**

- ▶ With intranasal use Epistaxis · nasal irritation · taste altered · throat irritation
- ▶ With subcutaneous use Haemorrhage · swelling

SIDE-EFFECTS, FURTHER INFORMATION

Discontinue if symptoms of heat, heaviness, pressure or tightness (including throat and chest) occur.

- **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with sensitivity to sulfonamides.
- **PREGNANCY** There is limited experience of using 5HT₂-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.
- **BREAST FEEDING** Present in milk but amount probably too small to be harmful; withhold breast-feeding for 12 hours after treatment.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (reduced pre-systemic clearance increases exposure); avoid in severe impairment (no information available).
Dose adjustments ▶ With oral use Manufacturer advises consider dose reduction to 25–50 mg in mild to moderate impairment.
- **RENAL IMPAIRMENT** Use with caution.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving).

● EXCEPTIONS TO LEGAL CATEGORY

- ▶ With oral use Sumatriptan 50 mg tablets can be sold to the public to treat previously diagnosed migraine; max. daily dose 100 mg.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

6.2 Neuropathic pain

Neuropathic pain

Overview and management

Neuropathic pain, which occurs as a result of damage to neural tissue, includes *phantom limb pain*, *compression neuropathies*, *peripheral neuropathies* (e.g. due to Diabetic complications p. 726, chronic excessive alcohol intake, HIV infection p. 677, chemotherapy, idiopathic neuropathy), *trauma*, *central pain* (e.g. pain following stroke, spinal cord injury, and syringomyelia), and *postherpetic neuralgia* (peripheral nerve damage following acute herpes zoster infection (shingles)). The pain may occur in an area of sensory deficit and is sometimes accompanied by pain that is evoked by a non-noxious stimulus (allodynia).

Trigeminal neuralgia is also caused by dysfunction of neural tissue, but its management is distinct from other forms of neuropathic pain.

Neuropathic pain is generally managed with a **tricyclic antidepressant** or with certain **antiepileptic drugs**. Amitriptyline hydrochloride p. 390 and pregabalin p. 341 are effective treatments for neuropathic pain. Amitriptyline hydrochloride and pregabalin can be used in combination if the patient has an inadequate response to either drug at the maximum tolerated dose.

Nortriptyline p. 395 [unlicensed indication] may be better tolerated than amitriptyline hydrochloride.

Gabapentin p. 331 is also effective for the treatment of neuropathic pain.

Neuropathic pain may respond to **opioid analgesics**. There is evidence of efficacy for tramadol hydrochloride p. 491, morphine p. 484, and oxycodone hydrochloride p. 487; however, treatment with morphine or oxycodone hydrochloride should be initiated only under specialist supervision. Tramadol hydrochloride can be prescribed when other treatments have been unsuccessful, while the patient is waiting for assessment by a specialist.

Patients with localised pain who are unable to take oral medicines may benefit from **topical local anaesthetic preparations**, such as lidocaine hydrochloride medicated plasters p. 1422, while awaiting specialist review.

Capsaicin below is licensed for neuropathic pain (but the intense burning sensation during initial treatment may limit use). Capsaicin 0.075% cream is licensed for the symptomatic relief of *postherpetic neuralgia*. A self-adhesive patch containing capsaicin 8% is licensed for the treatment of peripheral neuropathic pain. It should be used under specialist supervision.

A corticosteroid may help to relieve pressure in compression neuropathy and thereby reduce pain.

Neuromodulation by spinal cord stimulation may be of benefit in some patients. Many patients with chronic neuropathic pain require multidisciplinary management, including physiotherapy and psychological support.

Trigeminal neuralgia

Surgery may be the treatment of choice in many patients; a neurological assessment will identify those who stand to benefit. Carbamazepine p. 327 taken during the acute stages of trigeminal neuralgia, reduces the frequency and severity of attacks. It is very effective for the severe pain associated with trigeminal neuralgia and (less commonly) glossopharyngeal neuralgia. Blood counts and electrolytes should be monitored when high doses are given. Small doses should be used initially to reduce the incidence of side-effects e.g. dizziness. Some cases respond to phenytoin p. 339; the drug may be given by intravenous infusion (possibly as fosphenytoin sodium p. 330) in a crisis (specialist use only).

Chronic facial pain

Chronic oral and facial pain including *persistent idiopathic facial pain* (also termed 'atypical facial pain') and *temporomandibular dysfunction* (previously termed temporomandibular joint pain dysfunction syndrome) may call for prolonged use of analgesics or for other drugs. **Tricyclic antidepressants** may be useful for facial pain [unlicensed indication], but are not on the Dental Practitioners' List. Disorders of this type require specialist referral and psychological support to accompany drug treatment. Patients on long-term therapy need to be monitored both for progress and for side-effects.

Other drugs used for Neuropathic pain Amantadine hydrochloride, p. 437

ANALGESICS > PLANT ALKALOIDS

Capsaicin

03-Mar-2020

● **INDICATIONS AND DOSE****Localised neuropathic pain**

▶ TO THE SKIN USING CREAM

▶ Adult: Apply 3–4 times a day, using 0.075% strength; apply sparingly, not more often than every 4 hours

AXSAIN®**Post-herpetic neuralgia**

▶ TO THE SKIN

▶ Adult: Apply 3–4 times a day, apply sparingly; **important**; after lesions have healed, not more often than every 4 hours**Painful diabetic neuropathy (under expert supervision)**

▶ TO THE SKIN

▶ Adult: Apply 3–4 times a day for 8 weeks then review, apply sparingly, not more often than every 4 hours

QUTENZA®**Peripheral neuropathic pain (under the supervision of a physician)**

▶ BY TRANSDERMAL APPLICATION USING PATCHES

▶ Adult: (consult product literature)

ZACIN®**Symptomatic relief in osteoarthritis**

▶ TO THE SKIN

▶ Adult: Apply 4 times a day, apply sparingly, not more often than every 4 hours

- **UNLICENSED USE** [EvGr] Capsaicin is used in the treatment of localised neuropathic pain, <E> but is not licensed for this indication.

CAUTIONS

GENERAL CAUTIONS Avoid contact with broken skin · avoid contact with inflamed skin

SPECIFIC CAUTIONS

- ▶ With topical use Avoid contact with eyes · avoid hot shower or bath just before or after application (burning sensation enhanced) · avoid inhalation of vapours · not to be used under tight bandages
- ▶ With transdermal use avoid contact with the face, scalp or in proximity to mucous membranes · avoid holding near eyes or mucous membranes · recent cardiovascular events · uncontrolled hypertension

SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- ▶ **Uncommon** Cough
- SPECIFIC SIDE-EFFECTS**
- ▶ **Common or very common**
- ▶ With transdermal use Sensation abnormal
- ▶ **Uncommon**
- ▶ With transdermal use Atrioventricular block · eye irritation · muscle spasms · nausea · palpitations · peripheral oedema · skin reactions · tachycardia · taste altered · throat irritation
- ▶ **Rare or very rare**
- ▶ With topical use Sneezing · watering eye
- ▶ **Frequency not known**
- ▶ With topical use Asthma exacerbated · dyspnoea · skin burning sensation (particularly if too much used or if administered more than 4 times daily) · skin irritation

MONITORING REQUIREMENTS

- ▶ With transdermal use Monitor blood pressure during treatment procedure.

HANDLING AND STORAGE

- ▶ With topical use Wash hands immediately after use (or wash hands 30 minutes after application if hands treated).
- ▶ With transdermal use Nitrile gloves to be worn while handling patches and cleaning treatment areas (latex gloves do not provide adequate protection).

NATIONAL FUNDING/ACCESS DECISIONS**QUTENZA[®]****Scottish Medicines Consortium (SMC) decisions**

The *Scottish Medicines Consortium* has advised (January 2011) that capsaicin 179 mg (8%) patch (*Qutenza[®]*) is accepted for restricted use within NHS Scotland for the treatment of postherpetic neuralgia in patients who have not achieved adequate pain relief from, or who have not tolerated conventional first and second line treatments. Treatment should be under the supervision of a specialist in pain management.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream

Cutaneous patch

EXCIPIENTS: May contain Butylated hydroxyanisole

- ▶ **Qutenza** (Grünenthal Ltd)

Capsaicin 179 mg Qutenza 179mg cutaneous patches | 1 patch [PoM] £210.00 DT = £210.00

Cream

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl) and stearyl alcohol

- ▶ **Axsain** (Teva UK Ltd)

Capsaicin 750 microgram per 1 gram Axsain 0.075% cream | 45 gram [PoM] £14.58 DT = £14.58

- ▶ **Zacin** (Teva UK Ltd)

Capsaicin 250 microgram per 1 gram Zacin 0.025% cream | 45 gram [PoM] £17.71 DT = £17.71

7 Sleep disorders

7.1 Insomnia

Hypnotics and anxiolytics

Overview

Most anxiolytics ('sedatives') will induce sleep when given at night and most hypnotics will sedate when given during the day. Prescribing of these drugs is widespread but dependence (both physical and psychological) and tolerance occur. This may lead to difficulty in withdrawing the drug after the patient has been taking it regularly for more than a few weeks. Hypnotics and anxiolytics should therefore be reserved for short courses to alleviate acute conditions after causal factors have been established.

Benzodiazepines are the most commonly used anxiolytics and hypnotics; they act at benzodiazepine receptors which are associated with gamma-aminobutyric acid (GABA) receptors. Older drugs such as meprobamate p. 363 and barbiturates are **not** recommended—they have more side-effects and interactions than benzodiazepines and are much more dangerous in overdose.

Benzodiazepine indications

- Benzodiazepines are indicated for the short-term relief (two to four weeks only) of anxiety that is severe, disabling, or causing the patient unacceptable distress, occurring alone or in association with insomnia or short-term psychosomatic, organic, or psychotic illness.
- The use of benzodiazepines to treat short-term 'mild' anxiety is inappropriate.
- Benzodiazepines should be used to treat insomnia only when it is severe, disabling, or causing the patient extreme distress.

Dependence and withdrawal

Withdrawal of a benzodiazepine should be gradual because abrupt withdrawal may produce confusion, toxic psychosis, convulsions, or a condition resembling delirium tremens. The benzodiazepine withdrawal syndrome may develop at any time up to 3 weeks after stopping a long-acting benzodiazepine, but may occur within a day in the case of a short-acting one. It is characterised by insomnia, anxiety, loss of appetite and of body-weight, tremor, perspiration, tinnitus, and perceptual disturbances. Some symptoms may be similar to the original complaint and encourage further prescribing; some symptoms may continue for weeks or months after stopping benzodiazepines.

Benzodiazepine withdrawal should be flexible and carried out at a reduction rate that is tolerable for the patient. The rate should depend on the initial dose of benzodiazepine, duration of use, and the patient's clinical response. Short-term users of benzodiazepines (2–4 weeks only) can usually taper off within 2–4 weeks. However, long-term users should be withdrawn over a much longer period of several months or more.

A suggested protocol for withdrawal for prescribed long-term benzodiazepine patients is as follows:

- Transfer patient stepwise, one dose at a time over about a week, to an equivalent daily dose of diazepam preferably taken at night.
- Reduce diazepam dose, usually by 1–2 mg every 2–4 weeks (in patients taking high doses of benzodiazepines, initially it may be appropriate to reduce the dose by up to one-tenth every 1–2 weeks). If uncomfortable withdrawal symptoms occur, maintain this dose until symptoms lessen.

- Reduce diazepam dose further, if necessary in smaller steps; steps of 500 micrograms may be appropriate towards the end of withdrawal. Then stop completely.
- For long-term patients, the period needed for complete withdrawal may vary from several months to a year or more.

Approximate equivalent doses, diazepam 5 mg

- ≡ alprazolam 250 micrograms
- ≡ clobazam 10 mg
- ≡ clonazepam 250 micrograms
- ≡ flurazepam 7.5–15 mg
- ≡ chlordiazepoxide 12.5 mg
- ≡ loprazolam 0.5–1 mg
- ≡ lorazepam 500 micrograms
- ≡ lormetazepam 0.5–1 mg
- ≡ nitrazepam 5 mg
- ≡ oxazepam 10 mg
- ≡ temazepam 10 mg

Withdrawal symptoms for long-term users usually resolve within 6–18 months of the last dose. Some patients will recover more quickly, others may take longer. The addition of beta-blockers, antidepressants and antipsychotics should be **avoided** where possible.

Counselling can be of considerable help both during and after the taper.

Hypnotics

Before a hypnotic is prescribed the cause of the insomnia should be established and, where possible, underlying factors should be treated. However, it should be noted that some patients have unrealistic sleep expectations, and others understate their alcohol consumption which is often the cause of the insomnia. Short-acting hypnotics are preferable in patients with sleep onset insomnia, when sedation the following day is undesirable, or when prescribing for elderly patients. Long-acting hypnotics are indicated in patients with poor sleep maintenance (e.g. early morning waking) that causes daytime effects, when an anxiolytic effect is needed during the day, or when sedation the following day is acceptable.

Transient insomnia may occur in those who normally sleep well and may be due to extraneous factors such as noise, shift work, and jet lag. If a hypnotic is indicated one that is rapidly eliminated should be chosen, and only one or two doses should be given.

Short-term insomnia is usually related to an emotional problem or serious medical illness. It may last for a few weeks and may recur; a hypnotic can be useful but should not be given for more than three weeks (preferably only one week). Intermittent use is desirable with omission of some doses. A short-acting drug is usually appropriate.

Chronic insomnia is rarely benefited by hypnotics and is sometimes due to mild dependence caused by injudicious prescribing of hypnotics. Psychiatric disorders such as anxiety, depression, and abuse of drugs and alcohol are common causes. Sleep disturbance is very common in depressive illness and early waking is often a useful pointer. The underlying psychiatric complaint should be treated, adapting the drug regimen to alleviate insomnia. For example, clomipramine hydrochloride p. 391 or mirtazapine p. 389 prescribed for depression will also help to promote sleep if taken at night. Other causes of insomnia include daytime cat-napping and physical causes such as pain, pruritus, and dyspnoea.

Hypnotics should **not** be prescribed indiscriminately and routine prescribing is undesirable. They should be reserved for short courses in the acutely distressed. Tolerance to their effects develops within 3 to 14 days of continuous use and long-term efficacy cannot be assured. A major drawback of long-term use is that withdrawal can cause rebound insomnia and a withdrawal syndrome.

Where prolonged administration is unavoidable hypnotics should be discontinued as soon as feasible and the patient warned that sleep may be disturbed for a few days before normal rhythm is re-established; broken sleep with vivid dreams may persist for several weeks.

Elderly

Benzodiazepines and the Z-drugs should be avoided in the elderly, because the elderly are at greater risk of becoming ataxic and confused, leading to falls and injury.

Dental patients

Some anxious patients may benefit from the use of hypnotics during dental procedures such as temazepam p. 509 or diazepam p. 360. Temazepam is preferred when it is important to minimise any residual effect the following day.

Benzodiazepines

Benzodiazepines used as hypnotics include nitrazepam p. 509 and flurazepam p. 508 which have a prolonged action and may give rise to residual effects on the following day; repeated doses tend to be cumulative.

Loprazolam p. 508, lormetazepam p. 509, and temazepam act for a shorter time and they have little or no hangover effect. Withdrawal phenomena are more common with the short-acting benzodiazepines.

If insomnia is associated with daytime anxiety then the use of a long-acting benzodiazepine anxiolytic such as diazepam given as a single dose at night may effectively treat both symptoms.

Zolpidem, and zopiclone

Zolpidem tartrate p. 512 and zopiclone p. 512 are non-benzodiazepine hypnotics (sometimes referred to as Z-drugs), but they act at the benzodiazepine receptor. They are not licensed for long-term use; dependence has been reported in a small number of patients. Both zolpidem tartrate and zopiclone have a short duration of action.

Chloral and derivatives

There is no convincing evidence that they are particularly useful in the elderly and their role as hypnotics is now very limited.

Clomethiazole

Clomethiazole p. 511 may be a useful hypnotic for elderly patients because of its freedom from hangover but, as with all hypnotics, routine administration is undesirable and dependence occurs.

Antihistamines

Some **antihistamines** such as promethazine hydrochloride p. 301 are on sale to the public for occasional insomnia; their prolonged duration of action can often cause drowsiness the following day. The sedative effect of antihistamines may diminish after a few days of continued treatment; antihistamines are associated with headache, psychomotor impairment and antimuscarinic effects.

Alcohol

Alcohol is a poor hypnotic because the diuretic action interferes with sleep during the latter part of the night. Alcohol also disturbs sleep patterns, and so can worsen sleep disorders.

Melatonin

Melatonin p. 511 is a pineal hormone; it is licensed for the short-term treatment of insomnia in adults over 55 years; and for the short-term treatment of jet-lag in adults.

Anxiolytics

Benzodiazepine anxiolytics can be effective in alleviating anxiety states. Although these drugs are sometimes prescribed for stress-related symptoms, unhappiness, or minor physical disease, their use in such conditions is inappropriate. Benzodiazepine anxiolytics should not be used as sole treatment for chronic anxiety, and they are not appropriate for treating depression or chronic psychosis. In

bereavement, psychological adjustment may be inhibited by benzodiazepines.

Anxiolytic benzodiazepine treatment should be limited to the lowest possible dose for the shortest possible time. Dependence is particularly likely in patients with a history of alcohol or drug abuse and in patients with marked personality disorders.

Some antidepressant drugs are licensed for use in anxiety and related disorders. Some antipsychotic drugs, in low doses, are also sometimes used in severe anxiety for their sedative action, but long-term use should be avoided because of the risk of adverse effects. The use of antihistamines (e.g. hydroxyzine hydrochloride p. 299) for their sedative effect in anxiety is not appropriate.

Beta-adrenoceptor blocking drugs do not affect psychological symptoms of anxiety, such as worry, tension, and fear, but they do reduce autonomic symptoms, such as palpitation and tremor; they do not reduce non-autonomic symptoms, such as muscle tension. Beta-blockers are therefore indicated for patients with predominantly somatic symptoms; this, in turn, may prevent the onset of worry and fear.

Benzodiazepines

Benzodiazepines are indicated for the *short-term relief of severe anxiety*; long-term use should be avoided. Diazepam, alprazolam p. 360, chlordiazepoxide hydrochloride p. 360, and clobazam p. 353 have a sustained action. Shorter-acting compounds such as lorazepam p. 355 and oxazepam p. 362 may be preferred in patients with hepatic impairment but they carry a greater risk of withdrawal symptoms.

In *panic disorders* (with or without agoraphobia) resistant to antidepressant therapy, a benzodiazepine may be used; alternatively, a benzodiazepine may be used as short-term adjunctive therapy at the start of antidepressant treatment to prevent the initial worsening of symptoms.

Diazepam or lorazepam are very occasionally administered intravenously for the *control of panic attacks*. This route is the most rapid but the procedure is not without risk and should be used only when alternative measures have failed. The intramuscular route has no advantage over the oral route.

Buspirone

Buspirone hydrochloride p. 358 is thought to act at specific serotonin (5HT_{1A}) receptors. Response to treatment may take up to 2 weeks. It does not alleviate the symptoms of benzodiazepine withdrawal. Therefore a patient taking a benzodiazepine still needs to have the benzodiazepine withdrawn gradually; it is advisable to do this before starting buspirone hydrochloride. The dependence and abuse potential of buspirone hydrochloride is low; it is, however, licensed for short-term use only (but specialists occasionally use it for several months).

Meprobamate

Meprobamate p. 363 is **less effective** than the benzodiazepines, more hazardous in overdose, and can also induce dependence. It is **not** recommended.

Barbiturates

The intermediate-acting **barbiturates** have a place only in the treatment of severe intractable insomnia in patients **already taking** barbiturates; they should be **avoided** in the elderly. Intermediate-acting barbiturate preparations containing amobarbital sodium, butobarbital, and secobarbital sodium are available on a named patient basis.

The long-acting barbiturate phenobarbital is still sometimes of value in epilepsy but its use as a sedative is unjustified.

The very short-acting barbiturate thiopental sodium p. 354 is used in anaesthesia.

Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

HYPNOTICS, SEDATIVES AND ANXIOLYTICS > BENZODIAZEPINES

F 359

Flurazepam

21-Oct-2019

• INDICATIONS AND DOSE

Insomnia (short-term use)

- ▶ BY MOUTH
- ▶ Adult: 15–30 mg once daily, dose to be taken at bedtime, for debilitated patients, use elderly dose
- ▶ Elderly: 15 mg once daily, dose to be taken at bedtime

- **CONTRA-INDICATIONS** Respiratory depression

- **CAUTIONS** Acute porphyrias p. 1120 · hypoalbuminaemia · muscle weakness

CAUTIONS, FURTHER INFORMATION

- ▶ Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

- **INTERACTIONS** → Appendix 1: flurazepam

• SIDE-EFFECTS

- ▶ Common or very common Taste altered
- ▶ Rare or very rare Abdominal discomfort · skin eruption
- ▶ Frequency not known Agranulocytosis · extrapyramidal symptoms · leucopenia · pancytopenia · suicide attempt · thrombocytopenia

- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

• HEPATIC IMPAIRMENT

Dose adjustments Manufacturer advises dose of 15 mg in mild to moderate impairment.

• RENAL IMPAIRMENT

Dose adjustments Start with small doses in severe impairment.

• NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Flurazepam capsules are not prescribable in NHS primary care.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Premedication before surgery or investigatory procedures

► BY MOUTH

- Adult: 10–20 mg, to be taken 1–2 hours before procedure, alternatively 30 mg, to be taken 1–2 hours before procedure, higher alternate dose only administered in exceptional circumstances
- Elderly: 10 mg, to be taken 1–2 hours before procedure, alternatively 20 mg, to be taken 1–2 hours before procedure, higher alternate dose only administered in exceptional circumstances

- **UNLICENSED USE** Temazepam doses in BNF may differ from those in product literature.

Not licensed for conscious sedation for dental procedures.

- **CONTRA-INDICATIONS** Chronic psychosis · CNS depression · compromised airway · respiratory depression

- **CAUTIONS** Hypoalbuminaemia · muscle weakness · organic brain changes

CAUTIONS, FURTHER INFORMATION

- **Paradoxical effects** A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

- **INTERACTIONS** → Appendix 1: temazepam

- **SIDE-EFFECTS** Drug abuse · dry mouth · hypersalivation · speech slurred

- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

HEPATIC IMPAIRMENT

Dose adjustments ► When used for Insomnia Manufacturer advises initiate at 5 mg once daily, increase to 10 mg or 20 mg once daily in extreme cases. Dose to be taken at bedtime.

RENAL IMPAIRMENT

Dose adjustments Start with small doses in severe impairment.

PATIENT AND CARER ADVICE

Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. Responsible persons should be available to take patients home afterwards. The dangers of taking **alcohol** should be emphasised.

PROFESSION SPECIFIC INFORMATION**Dental practitioners' formulary**

HYPNOTICS, SEDATIVES AND ANXIOLYTICS >**NON-BENZODIAZEPINE HYPNOTICS AND SEDATIVES****Chloral hydrate**

20-May-2020

● INDICATIONS AND DOSE**Insomnia (short-term use), using chloral hydrate 143.3 mg/5 ml oral solution**

► BY MOUTH USING ORAL SOLUTION

- Adult: 430–860 mg once daily (max. per dose 2 g), dose to be taken with water or milk at bedtime

Insomnia (short-term use), using chloral betaine 707 mg (= 414 mg chloral hydrate) tablets

► BY MOUTH USING TABLETS

- Adult: 1–2 tablets, alternatively 414–828 mg once daily, dose to be taken with water or milk at bedtime; maximum 4 tablets per day; maximum 2 g per day

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · gastritis · severe cardiac disease

- **CAUTIONS** Avoid contact with mucous membranes · avoid contact with skin · avoid prolonged use (and abrupt withdrawal thereafter) · reduce dose in frail elderly

- **INTERACTIONS** → Appendix 1: chloral hydrate

- **SIDE-EFFECTS** Agitation · allergic dermatitis · ataxia · confusion · delirium (more common on abrupt discontinuation) · drug use disorders · gastrointestinal discomfort · gastrointestinal disorders · headache · injury · ketonuria · kidney injury

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Risk of sedation in infant—avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in marked impairment.

Dose adjustments Manufacturer advises consider dose reduction in the elderly with hepatic impairment.

- **RENAL IMPAIRMENT** Avoid in severe impairment.

- **DIRECTIONS FOR ADMINISTRATION** For administration by *mouth* dilute liquid with plenty of water or juice to mask unpleasant taste.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include black currant.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

- **LESS SUITABLE FOR PRESCRIBING** Chloral hydrate is less suitable for prescribing in insomnia.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository, enema

Clomethiazole

05-Jul-2018

(Chlormethiazole)

● INDICATIONS AND DOSE

Severe insomnia (short-term use)

► BY MOUTH USING CAPSULES

- Elderly: 192–384 mg once daily, dose to be taken at bedtime

► BY MOUTH USING ORAL SOLUTION

- Elderly: 5–10 mL once daily, dose to be taken at bedtime

Restlessness and agitation

► BY MOUTH USING CAPSULES

- Elderly: 192 mg 3 times a day

► BY MOUTH USING ORAL SOLUTION

- Elderly: 5 mL 3 times a day

Alcohol withdrawal

► BY MOUTH USING CAPSULES

- Adult: Initially 2–4 capsules, to be repeated if necessary after some hours. 9–12 capsules daily in 3–4 divided doses on day 1 (first 24 hours), then 6–8 capsules daily in 3–4 divided doses on day 2, then 4–6 capsules daily in 3–4 divided doses on day 3, dose then to be gradually reduced over days 4–6, total duration of treatment for no more than 9 days

► BY MOUTH USING ORAL SOLUTION

- Adult: Initially 10–20 mL, to be repeated if necessary after some hours, then 45–60 mL daily in 3–4 divided doses on day 1 (first 24 hours), then 30–40 mL daily in 3–4 divided doses on day 2, then 20–30 mL daily in 3–4 divided doses on day 3, dose then to be gradually reduced over days 4–6, total duration of treatment for no more than 9 days

- **CONTRA-INDICATIONS** Acute pulmonary insufficiency · alcohol-dependent patients who continue to drink
- **CAUTIONS** Avoid prolonged use (and abrupt withdrawal thereafter) · cardiac disease (confusional state may indicate hypoxia) · chronic pulmonary insufficiency · elderly · excessive sedation may occur (particularly with higher doses); · history of drug abuse · marked personality disorder · respiratory disease (confusional state may indicate hypoxia) · sleep apnoea syndrome
- **INTERACTIONS** → Appendix 1: clomethiazole
- **SIDE-EFFECTS** Agitation · bronchial secretion increased · confusion · conjunctival irritation · drug dependence · excessive sedation · gastrointestinal disorder · hangover · nasal complaints · skin reactions · upper airway secretion increased
- **PREGNANCY** Avoid if possible—especially during the first and third trimesters.
- **BREAST FEEDING** Use only if benefit outweighs risk—present in breast milk but effects unknown.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (risk of increased exposure).
Dose adjustments Manufacturer advises consider dose reduction in moderate hepatic disorders associated with alcoholism.
- **RENAL IMPAIRMENT** Increased cerebral sensitivity.
Dose adjustments Start with small doses in severe impairment.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Melatonin

10-Mar-2020

● INDICATIONS AND DOSE

Insomnia [short-term use]

► BY MOUTH USING MODIFIED-RELEASE TABLETS

- Adult 55 years and over: 2 mg once daily for up to 13 weeks, dose to be taken 1–2 hours before bedtime

Jet lag [short-term use]

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: 3 mg once daily, increased if necessary to 6 mg once daily for up to 5 days, the first dose should be taken at the habitual bedtime after arrival at destination. Doses should not be taken before 8pm or after 4am. Maximum of 16 treatment courses per year

Insomnia in patients with learning disabilities [where sleep hygiene measures have been insufficient] (initiated under specialist supervision)

► BY MOUTH USING MODIFIED-RELEASE TABLETS

- Adult: Initially 2 mg once daily, increased if necessary to 4–6 mg once daily, dose to be taken 30–60 minutes before bedtime; maximum 10 mg per day

PHARMACOKINETICS

- The intake of food with *immediate-release* melatonin may increase the bioavailability of melatonin

- **UNLICENSED USE** [EvGr] Melatonin is used for insomnia in patients with learning disabilities,  but is not licensed for this indication.
- **CAUTIONS** Autoimmune disease (manufacturer advises avoid—no information available)
- **INTERACTIONS** → Appendix 1: melatonin
- **SIDE-EFFECTS**
 - **Common or very common** Arthralgia · headaches · increased risk of infection · pain
 - **Uncommon** Anxiety · asthenia · chest pain · dizziness · drowsiness · dry mouth · gastrointestinal discomfort · hyperbilirubinaemia · hypertension · menopausal symptoms · mood altered · movement disorders · nausea · night sweats · oral disorders · skin reactions · sleep disorders · urine abnormalities · weight increased
 - **Rare or very rare** Aggression · angina pectoris · arthritis · concentration impaired · crying · depression · disorientation · electrolyte imbalance · excessive tearing · gastrointestinal disorders · haematuria · hot flush · hypertriglyceridaemia · leucopenia · memory loss · muscle complaints · nail disorder · palpitations · paraesthesia · partial complex seizure · prostatitis · sexual dysfunction · syncope · thirst · thrombocytopenia · urinary disorders · vertigo · vision disorders · vomiting
 - **Frequency not known** Angioedema · galactorrhoea · hyperglycaemia
- **PREGNANCY** No information available—avoid.
- **BREAST FEEDING** Present in milk—avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid (risk of decreased clearance; limited information available).

- **RENAL IMPAIRMENT** No information available—use with caution.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturers advise that modified-release tablets should be taken with or after food. Licensed immediate-release formulations should be taken on an empty stomach, 2 hours before or 2 hours after food—intake with carbohydrate-rich meals may impair blood glucose control.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, modified-release tablet, oral solution

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 2, 21, 25

- ▶ **Melatonin (Non-proprietary)**
Melatonin 3 mg Melatonin 3mg modified-release tablets | 120 tablet [PoM](#) [X](#)

EXCIPIENTS: May contain Ethanol, propylene glycol, sorbitol

- ▶ **Melatonin (Non-proprietary)**
Melatonin 1 mg per 1 ml Melatonin 1mg/ml oral solution sugar-free | 150 ml [PoM](#) £130.00 DT = £130.00

Zolpidem tartrate

02-Feb-2019

● **INDICATIONS AND DOSE****Insomnia (short-term use)**

- ▶ BY MOUTH
- ▶ Adult: 10 mg daily for up to 4 weeks, dose to be taken at bedtime, for debilitated patients, use elderly dose
- ▶ Elderly: 5 mg daily for up to 4 weeks, dose to be taken at bedtime

- **CONTRA-INDICATIONS** Acute respiratory depression · marked neuromuscular respiratory weakness · obstructive sleep apnoea · psychotic illness · severe respiratory depression · unstable myasthenia gravis

- **CAUTIONS** Avoid prolonged use (and abrupt withdrawal thereafter) · depression · elderly · history of alcohol abuse · history of drug abuse · muscle weakness · myasthenia gravis

CAUTIONS, FURTHER INFORMATION

- ▶ Elderly For hypnotic Z-drugs, prescription potentially inappropriate (STOPP criteria) in elderly (may cause protracted daytime sedation and/or ataxia). See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: zolpidem

SIDE-EFFECTS

- **Common or very common** Abdominal pain · anterograde amnesia · anxiety · back pain · diarrhoea · dizziness · fatigue · hallucination · headache · increased risk of infection · nausea · sleep disorders · vomiting

- ▶ **Uncommon** Confusion · diplopia · irritability
- ▶ **Frequency not known** Angioedema · behaviour abnormal · concentration impaired · delusions · depression · drug dependence · fall · gait abnormal · hepatic disorders · hyperhidrosis · level of consciousness decreased · libido disorder · muscle weakness · psychosis · respiratory depression · skin reactions · speech disorder · withdrawal syndrome

- **PREGNANCY** Avoid regular use (risk of neonatal withdrawal symptoms); high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

- **BREAST FEEDING** Small amounts present in milk—avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment (risk of decreased clearance); avoid in severe impairment.

Dose adjustments Manufacturer advises initial dose reduction to 5 mg daily in mild to moderate impairment.

- **RENAL IMPAIRMENT** Use with caution.

PATIENT AND CARER ADVICE**Driving and skilled tasks** Drowsiness may persist the next day—leave at least 8 hours between taking zolpidem and performing skilled tasks (e.g. driving, or operating machinery); effects of alcohol and other CNS depressants enhanced.**NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- ▶ **Guidance on the use of zaleplon, zolpidem, and zopiclone for the short-term management of insomnia (April 2004)**

NICE TA77

Zolpidem is recommended for the short-term management of severe insomnia that interferes with normal daily life, and should be prescribed for short periods of time only.

www.nice.org.uk/guidance/ta77

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

7.2 Narcolepsy

Other drugs used for Narcolepsy Dexamfetamine sulfate, p. 368 · Methylphenidate hydrochloride, p. 365

CENTRAL NERVOUS SYSTEM DEPRESSANTS

Sodium oxybate

- **DRUG ACTION** A central nervous system depressant.

● INDICATIONS AND DOSE

Narcolepsy with cataplexy (under expert supervision)

▶ BY MOUTH

- ▶ **Adult:** Initially 2.25 g daily, dose to be taken on retiring and 2.25 g after 2.5–4 hours, then increased in steps of 1.5 g daily in 2 divided doses, dose adjusted according to response at intervals of 1–2 weeks; dose titration should be repeated if restarting after interval of more than 14 days, maximum 9 g daily in 2 divided doses

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose by 20 % with concurrent use of sodium valproate or valproic acid.

- **CONTRA-INDICATIONS** Major depression · succinic semi-aldehyde dehydrogenase deficiency
- **CAUTIONS** Body mass index of 40 kg/m² or greater (higher risk of sleep apnoea) · elderly · epilepsy · heart failure (high sodium content) · history of depression · history of drug abuse · hypertension (high sodium content) · respiratory disorders · risk of discontinuation effects including rebound cataplexy and withdrawal symptoms
- **INTERACTIONS** → Appendix 1: sodium oxybate
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain upper · anxiety · appetite abnormal · arthralgia · asthenia · back pain · concentration impaired · confusion · depression · diarrhoea · dizziness · dyspnoea · fall · feeling drunk · headache · hyperhidrosis · hypertension · increased risk of infection · movement disorders · muscle spasms · nasal congestion · nausea · palpitations · peripheral oedema · sedation · sensation abnormal · skin reactions · sleep disorders · sleep paralysis · snoring · taste altered · tremor · urinary disorders · vertigo · vision blurred · vomiting · weight decreased
 - ▶ **Uncommon** Behaviour abnormal · faecal incontinence · hallucination · memory loss · psychosis · suicidal tendencies · thinking abnormal
 - ▶ **Frequency not known** Angioedema · dehydration · delusions · dry mouth · homicidal ideation · loss of consciousness · mood altered · respiratory depression · seizure · sleep apnoea
- **PREGNANCY** Avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).
Dose adjustments Manufacturer advises initial dose reduction of 50%.
- **RENAL IMPAIRMENT** Caution—contains 3.96 mmol Na⁺ per mL.
- **DIRECTIONS FOR ADMINISTRATION** Dilute each dose with 60 mL water; prepare both doses before retiring. Observe the same time interval (2–3 hours) each night between the last meal and the first dose.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer sodium oxybate oral solution.
Driving and skilled tasks Leave at least 6 hours between taking sodium oxybate and performing skilled tasks (e.g.

driving or operating machinery); effects of alcohol and other CNS depressants enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CNS STIMULANTS

Pitolisant

11-Apr-2017

- **DRUG ACTION** Pitolisant is a histamine H₃-receptor antagonist which enhances the activity of brain histaminergic neurons.

● INDICATIONS AND DOSE

Narcolepsy with or without cataplexy (initiated by a specialist)

► BY MOUTH

- **Adult:** Initially 9 mg once daily for 1 week, then increased if necessary to 18 mg once daily for 1 week, then increased if necessary to 36 mg once daily, dose to be taken in the morning with breakfast, dose can be decreased (down to 4.5 mg per day) or increased (up to 36 mg per day) according to response and tolerance

- **CAUTIONS** Acid-related gastric disorders · epilepsy · history of psychiatric disorders · severe anorexia · severe obesity
- **INTERACTIONS** → Appendix 1: pitolisant
- **SIDE-EFFECTS**
 - **Common or very common** Anxiety · asthenia · depression · dizziness · gastrointestinal discomfort · headaches · mood altered · nausea · sleep disorders · tremor · vertigo · vomiting
 - **Uncommon** Appetite abnormal · arrhythmias · arthralgia · blepharospasm · chest pain · concentration impaired · constipation · diarrhoea · drowsiness · dry mouth · epilepsy · feeling abnormal · fluid retention · gastrointestinal disorders · hallucinations · hot flush · hypertension · hypotension · malaise · metrorrhagia · movement disorders · muscle complaints · muscle weakness · oedema · on and off phenomenon · oral paraesthesia · pain · paraesthesia · QT interval prolongation · sexual dysfunction · skin reactions · sweat changes · tinnitus · urinary frequency increased · visual acuity decreased · weight decreased (review treatment if significant) · weight increased (review treatment if significant) · yawning
 - **Rare or very rare** Behaviour abnormal · cognitive impairment · confusion · loss of consciousness · memory loss · obsessive thoughts · photosensitivity reaction · sense of oppression · swallowing difficulty
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential for at least 21 days after treatment discontinuation—pitolisant may reduce the effectiveness of hormonal contraceptives.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment.

Dose adjustments Manufacturer advises consider dose increase two weeks after initiation in moderate impairment; maximum daily dose of 18 mg.

● RENAL IMPAIRMENT

Dose adjustments Manufacturer advises use with caution; maximum daily dose should not exceed 18 mg.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

CNS STIMULANTS > CENTRALLY ACTING SYMPATHOMIMETICS

Modafinil

10-Mar-2020

● INDICATIONS AND DOSE

Excessive sleepiness associated with narcolepsy with or without cataplexy

► BY MOUTH

- **Adult:** Initially 200 mg daily in 2 divided doses, dose to be taken in the morning and at noon, alternatively initially 200 mg once daily, dose to be taken in the morning, adjusted according to response to 200–400 mg daily in 2 divided doses, alternatively adjusted according to response to 200–400 mg once daily
- **Elderly:** Initially 100 mg daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: MODAFINIL: POTENTIAL RISK OF CONGENITAL MALFORMATIONS DURING PREGNANCY (FEBRUARY 2020)

Post-marketing reports show that the use of modafinil in pregnancy is suspected to cause congenital malformations such as congenital heart defects, hypospadias, and orofacial clefts. Healthcare professionals are advised that modafinil is contra-indicated in pregnancy; alternative treatment options should be used, including behaviour modifying measures, sleep hygiene, and scheduled daytime naps. Females of childbearing potential should be advised on the use of contraception (see *Conception and Contraception*) and informed of the risk of congenital malformations.

- **CONTRA-INDICATIONS** Arrhythmia · history of clinically significant signs of CNS stimulant-induced mitral valve prolapse (including ischaemic ECG changes, chest pain and arrhythmias) · history of cor pulmonale · history of left ventricular hypertrophy · moderate to severe uncontrolled hypertension
- **CAUTIONS** History of alcohol abuse · history of depression · history of drug abuse · history of mania · history of psychosis · possibility of dependence
- **INTERACTIONS** → Appendix 1: modafinil
- **SIDE-EFFECTS**
 - **Common or very common** Anxiety · appetite abnormal · arrhythmias · asthenia · chest pain · confusion · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · gastrointestinal discomfort · headaches · mood altered · nausea · palpitations · sensation abnormal · sleep disorders · thinking abnormal · vasodilation · vision disorders
 - **Uncommon** Allergic rhinitis · arthralgia · asthma · behaviour abnormal · central nervous system stimulation ·

cough aggravated · diabetes mellitus · dry eye · dysphagia · dyspnoea · eosinophilia · epistaxis · gastrointestinal disorders · hypercholesterolaemia · hyperglycaemia · hyperhidrosis · hypertension · hypotension · increased risk of infection · leucopenia · libido decreased · memory loss · menstrual disorder · movement disorders · muscle complaints · muscle tone increased · muscle weakness · oral disorders · pain · peripheral oedema · psychiatric disorders · skin reactions · speech disorder · suicidal ideation · taste altered · thirst · tremor · urinary frequency increased · urine abnormal · vertigo · vomiting · weight changes

- ▶ **Rare or very rare** Hallucination · psychosis
- ▶ **Frequency not known** Angioedema · delusions · fever · hypersensitivity · lymphadenopathy · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Discontinue treatment if rash develops. Discontinue treatment if psychiatric symptoms develop.

- **CONCEPTION AND CONTRACEPTION** The MHRA advises females of childbearing potential should use effective contraception during treatment and 2 months after last treatment.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (risk of increased plasma concentrations).
Dose adjustments Manufacturer advises dose reduction of 50% in severe impairment.
- **RENAL IMPAIRMENT** Use with caution—limited information available.
- **PRE-TREATMENT SCREENING** ECG required before initiation.
- **MONITORING REQUIREMENTS** Monitor blood pressure and heart rate in hypertensive patients.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

8 Substance dependence

Substance dependence

08-Apr-2018

Guidance on treatment of drug misuse

The UK health departments have produced guidance on the treatment of drug misuse in the UK. *Drug Misuse and Dependence: UK Guidelines on Clinical Management* (2017) is available at www.gov.uk/government/publications/drug-misuse-and-dependence-uk-guidelines-on-clinical-management.

Alcohol dependence

See Alcohol dependence p. 517.

Nicotine dependence

See Smoking cessation p. 520.

Opioid dependence

The management of opioid dependence requires medical, social, and psychological treatment; access to a multidisciplinary team is recommended. Treatment for opioid dependence should be initiated under the supervision of an appropriately qualified prescriber.

Untreated heroin dependence shows early withdrawal symptoms within 8 hours, with peak symptoms at 36–72 hours; symptoms subside substantially after 5 days. Methadone hydrochloride p. 524 or buprenorphine p. 468 withdrawal occurs later, with longer-lasting symptoms.

Opioid substitution therapy

Methadone hydrochloride and buprenorphine are used as substitution therapy in opioid dependence. Substitute medication should be commenced with a short period of stabilisation, followed by either a withdrawal regimen or by maintenance treatment. Maintenance treatment enables patients to achieve stability, reduces drug use and crime, and improves health; it should be regularly reviewed to ensure the patient continues to derive benefit. The prescriber should monitor for signs of toxicity, and the patient should be told to be aware of warning signs of toxicity on initiation and during titration.

A withdrawal regimen after stabilisation with methadone hydrochloride or buprenorphine should be attempted only after careful consideration. Enforced withdrawal is ineffective for sustained abstinence, and it increases the risk of patients relapsing and subsequently overdosing because of loss of tolerance. Complete withdrawal from opioids usually takes up to 4 weeks in an inpatient or residential setting, and up to 12 weeks in a community setting. If abstinence is not achieved, illicit drug use is resumed, or the patient cannot tolerate withdrawal, the withdrawal regimen should be stopped and maintenance therapy should be resumed at the optimal dose. Following successful withdrawal treatment, further support and monitoring to maintain abstinence should be provided for a period of at least 6 months.

Missed doses

Patients who miss 3 days or more of their regular prescribed dose of opioid maintenance therapy are at risk of overdose because of loss of tolerance. Consider reducing the dose in these patients.

If the patient misses 5 or more days of treatment, an assessment of illicit drug use is also recommended before restarting substitution therapy; this is particularly important for patients taking buprenorphine because of the risk of precipitated withdrawal.

Buprenorphine

Buprenorphine is preferred by some patients because it is less sedating than methadone hydrochloride; for this reason it may be more suitable for employed patients or those undertaking other skilled tasks such as driving. Buprenorphine is safer than methadone hydrochloride when used in conjunction with other sedating drugs, and has fewer drug interactions. Dose reductions may be easier than with methadone hydrochloride because the withdrawal symptoms are milder, and patients generally require fewer adjunctive medications; there is also a lower risk of overdose. Buprenorphine can be given on alternate days in higher doses and it requires a shorter drug-free period than methadone hydrochloride before induction with naltrexone hydrochloride p. 519 for prevention of relapse.

Patients dependent on high doses of opioids may be at increased risk of precipitated withdrawal. Precipitated withdrawal can occur in any patient if buprenorphine is administered when other opioid agonist drugs are in circulation. Precipitated opioid withdrawal, if it occurs, starts within 1–3 hours of the first buprenorphine dose and peaks at around 6 hours. Non-opioid adjunctive therapy,

such as lofexidine hydrochloride p. 526, may be required if symptoms are severe.

To reduce the risk of precipitated withdrawal, the first dose of buprenorphine should be given when the patient is exhibiting signs of withdrawal, or 6–12 hours after the last use of heroin (or other short-acting opioid), or 24–48 hours after the last dose of methadone hydrochloride. It is possible to titrate the dose of buprenorphine within one week—more rapidly than with methadone hydrochloride therapy—but care is still needed to avoid toxicity or precipitated withdrawal; dividing the dose on the first day may be useful.

A combination preparation containing buprenorphine with naloxone p. 526 (*Suboxone*®) can be prescribed for patients when there is a risk of dose diversion for parenteral administration; the naloxone hydrochloride p. 1440 component precipitates withdrawal if the preparation is injected, but it has little effect when the preparation is taken sublingually.

Where there is a risk of diversion of opioid substitution medicines, or difficulties with adherence to daily supervised opioid substitution medication, buprenorphine prolonged-release injection may be an option.

Methadone

Methadone hydrochloride, a long-acting opioid agonist, is usually administered in a single daily dose as methadone hydrochloride oral solution 1 mg/mL. Patients with a long history of opioid misuse, those who typically abuse a variety of sedative drugs and alcohol, and those who experience increased anxiety during withdrawal of opioids may prefer methadone hydrochloride to buprenorphine because it has a more pronounced sedative effect.

Methadone hydrochloride is initiated at least 8 hours after the last heroin dose, provided that there is objective evidence of withdrawal symptoms. A supplementary dose on the first day may be considered if there is evidence of persistent opioid withdrawal symptoms. Because of the long half-life, plasma concentrations progressively rise during initial treatment even if the patient remains on the same daily dose (it takes 3–10 days for plasma concentrations to reach steady-state in patients on a stable dose); a dose tolerated on the first day of treatment may become a toxic dose on the third day as cumulative toxicity develops. Thus, titration to the optimal dose in methadone hydrochloride maintenance treatment may take several weeks.

Opioid substitution during pregnancy

Acute withdrawal of opioids should be avoided in pregnancy because it can cause fetal death. Opioid substitution therapy is recommended during pregnancy because it carries a lower risk to the fetus than continued use of illicit drugs. If a woman who is stabilised on methadone hydrochloride or buprenorphine for treatment of opioid dependence becomes pregnant, therapy should be continued [buprenorphine is not licensed for use in pregnancy]. Many pregnant patients choose a withdrawal regimen, but withdrawal during the first trimester should be avoided because it is associated with an increased risk of spontaneous miscarriage. Withdrawal of methadone hydrochloride or buprenorphine should be undertaken gradually during the second trimester, with dose reductions made every 3–5 days. If illicit drug use occurs, the patient should be re-stabilised at the optimal maintenance dose and consideration should be given to stopping the withdrawal regimen.

Further withdrawal of methadone hydrochloride p. 524 or buprenorphine p. 468 in the third trimester is not recommended because maternal withdrawal, even if mild, is associated with fetal distress, stillbirth, and the risk of neonatal mortality. Drug metabolism can be increased in the third trimester; it may be necessary to either increase the dose of methadone hydrochloride or change to twice-daily consumption (or a combination of both strategies) to prevent withdrawal symptoms from developing.

The neonate should be monitored for respiratory depression and signs of withdrawal if the mother is prescribed high doses of opioid substitute.

Signs of neonatal withdrawal from opioids usually develop 24–72 hours after delivery but symptoms may be delayed for up to 14 days, so monitoring may be required for several weeks. Symptoms include a high-pitched cry, rapid breathing, hungry but ineffective suckling, and excessive wakefulness; severe, but rare symptoms include hypertonicity and convulsions.

Opioid substitution during breastfeeding

Doses of methadone and buprenorphine should be kept as low as possible in breast-feeding mothers. Increased sleepiness, breathing difficulties, or limpness in breast-fed babies of mothers taking opioid substitutes should be reported urgently to a healthcare professional.

Adjunctive therapy and symptomatic treatment

Adjunctive therapy may be required for the management of opioid withdrawal symptoms. Loperamide hydrochloride p. 71 may be used for the control of diarrhoea; metoclopramide hydrochloride p. 93 for controlling stomach cramps; paracetamol p. 465 and **non-steroidal anti-inflammatory drugs** for muscular pains and headaches; metoclopramide hydrochloride p. 452 or prochlorperazine p. 407 may be useful for nausea or vomiting. Topical **rubefaciants** can be helpful for relieving muscle pain associated with methadone hydrochloride withdrawal. If a patient is suffering from insomnia, short-acting **benzodiazepines** or zopiclone p. 512 may be prescribed, but because of the potential for abuse, prescriptions should be limited to a short course of a few days only. If anxiety or agitation is severe, specialist advice should be sought.

Lofexidine

Lofexidine hydrochloride p. 526 may alleviate some of the physical symptoms of opioid withdrawal by attenuating the increase in adrenergic neurotransmission that occurs during opioid withdrawal. Lofexidine hydrochloride can be prescribed as an adjuvant to opioid substitution therapy, initiated either at the same time as the opioid substitute or during withdrawal of the opioid substitute. Alternatively, lofexidine hydrochloride may be prescribed instead of an opioid substitute in patients who have mild or uncertain dependence (including young people), and those with a short history of illicit drug use.

Opioid-receptor antagonists

Patients dependant on opioids can be given a supply of naloxone hydrochloride p. 1440 to be used in case of accidental overdose.

Naltrexone hydrochloride p. 519 precipitates withdrawal symptoms in opioid-dependent subjects. Because the effects of opioid-receptor agonists are blocked by naltrexone hydrochloride, it is prescribed as an aid to prevent relapse in formerly opioid-dependent patients.

Opioid dependence in children

In younger patients (under 18 years), the harmful effects of drug misuse are more often related to acute intoxication than to dependence, so substitution therapy is usually inappropriate. Maintenance treatment with opioid substitution therapy is therefore controversial in young people; however, it may be useful for the older adolescent who has a history of opioid use to undergo a period of stabilisation with buprenorphine or methadone hydrochloride before starting a withdrawal regimen.

8.1 Alcohol dependence

Alcohol dependence

01-Sep-2017

Description of condition

Alcohol dependence is a cluster of behavioural, cognitive and physiological factors that typically include a strong desire to drink alcohol, tolerance to its effects, and difficulties controlling its use. Someone who is alcohol-dependent may persist in drinking, despite harmful consequences, such as physical or mental health problems.

In severely dependent patients who have been drinking excessively for a prolonged period of time, an abrupt reduction in alcohol intake may result in the development of an alcohol withdrawal syndrome, which, in the absence of medical management, can lead to seizures, delirium tremens, and death.

Assisted alcohol withdrawal

EvGr Patients with mild alcohol dependence usually do not need assisted alcohol withdrawal. Patients with moderate dependence can generally be treated in a community setting unless they are at high risk of developing alcohol withdrawal seizures or delirium tremens; individuals with severe dependence should undergo withdrawal in an inpatient setting. Patients with decompensated liver disease should be treated under specialist supervision.

A long-acting benzodiazepine, such as chlordiazepoxide hydrochloride p. 360 or diazepam p. 360, is recommended to attenuate alcohol withdrawal symptoms; local clinical protocols should be followed.

In primary care, *fixed-dose reducing regimens* are used. This involves using a standard, initial dose (determined by the severity of alcohol dependence or level of alcohol consumption), followed by dose reduction to zero, usually over 7–10 days. In inpatient or residential settings, a *fixed-dose regimen* or a *symptom-triggered regimen* can be used. A symptom-triggered approach involves tailoring the drug regimen according to the severity of withdrawal and any complications in an individual patient; adequate monitoring facilities should be available. The patient should be monitored on a regular basis and treatment only continued as long as there are withdrawal symptoms.

Carbamazepine p. 327 [unlicensed indication] can be used as an alternative treatment in acute alcohol withdrawal.

Clomethiazole p. 511 may be considered as an alternative to a benzodiazepine or carbamazepine p. 327. It should only be used in an inpatient setting and should not be prescribed if the patient is liable to continue drinking alcohol. **Note:** Alcohol combined with clomethiazole p. 511, particularly in patients with cirrhosis, can lead to fatal respiratory depression even with short-term use.

EvGr When managing withdrawal from **co-existing** benzodiazepine and alcohol dependence, the dose of benzodiazepine used for withdrawal should be increased. The initial daily dose is calculated, based on the requirements for alcohol withdrawal plus the equivalent regularly used daily dose of benzodiazepine. A single benzodiazepine (chlordiazepoxide hydrochloride p. 360 or diazepam p. 360) should be used rather than multiple benzodiazepines. Inpatient withdrawal regimens should last for 2–3 weeks or longer, depending on the severity of benzodiazepine dependence. When withdrawal is managed in the community, or where there is a high level of benzodiazepine dependence, or both, the regimen should last for a minimum of 3 weeks (according to the patient's symptoms).

If alcohol withdrawal seizures occur, a fast-acting benzodiazepine (such as lorazepam p. 355 [unlicensed indication]) should be prescribed to reduce the likelihood of

further seizures. If alcohol withdrawal seizures develop in a person during treatment for acute alcohol withdrawal, review their withdrawal drug regimen. **Note**

Delirium tremens

EvGr Delirium tremens is a medical emergency that requires specialist inpatient care. In patients with delirium tremens (characterised by agitation, confusion, paranoia, and visual and auditory hallucinations), oral lorazepam p. 355 should be used as first-line treatment. If symptoms persist or oral medication is declined, parenteral lorazepam p. 355 [unlicensed], or haloperidol p. 404 [unlicensed] can be given as adjunctive therapy. If delirium tremens develops during treatment for acute alcohol withdrawal, the withdrawal drug regimen should also be reviewed. **Note**

Alcohol dependence

EvGr In harmful drinkers or patients with mild alcohol dependence, a psychological intervention (such as cognitive behavioural therapy) should be offered. In those who have not responded to psychological interventions alone or who have specifically requested a pharmacological treatment, acamprostate calcium p. 518 or oral naltrexone hydrochloride p. 519 can be used in combination with a psychological intervention.

Acamprostate calcium p. 518 or oral naltrexone hydrochloride p. 519 in combination with a psychological intervention are recommended for relapse prevention in patients with moderate and severe alcohol dependence, to start after successful assisted withdrawal. Disulfiram p. 518 is an alternative for patients in whom acamprostate calcium p. 518 and oral naltrexone hydrochloride p. 519 are not suitable, or if the patient prefers disulfiram p. 518 and understands the risks of taking the drug.

Nalmefene p. 518 is recommended for the reduction of alcohol consumption in patients with alcohol dependence who have a high drinking risk level, without physical withdrawal symptoms, and who do not require immediate detoxification (see *National funding/access decisions* for nalmefene p. 518).

Patients with severe alcohol-related hepatitis with a discriminant function of 32 or more can be given corticosteroids but only after any active infection or gastrointestinal bleeding is treated, any renal impairment is controlled, and following discussion of the potential benefits and risks of treatment. Corticosteroid treatment has been shown to improve survival in the short term (1 month) but not over a longer term (3 months to 1 year). It has also been shown to increase the risk of serious infections within the first 3 months of starting treatment.

Patients with chronic alcohol-related pancreatitis should be offered nutritional support; those who have symptoms of steatorrhea or who have poor nutritional status due to Exocrine pancreatic insufficiency p. 103 should be prescribed pancreatic enzyme supplements; supplements are not indicated when pain is the only symptom. **Note**

Wernicke's encephalopathy

EvGr Patients with alcohol dependence are at risk of developing Wernicke's encephalopathy; patients at high risk are those who are malnourished, at risk of malnourishment, or have decompensated liver disease. Parenteral thiamine p. 1141, followed by oral thiamine p. 1141, should be given to patients with suspected Wernicke's encephalopathy, those who are malnourished or at risk of malnourishment, those who have decompensated liver disease or who are attending hospital for acute treatment. Prophylactic oral thiamine p. 1141 should also be given to harmful or dependent drinkers if they are in acute withdrawal, or before and during assisted alcohol withdrawal. **Note** Parenteral thiamine is available as part of a vitamin B substances with ascorbic acid p. 1142 preparation.

ALDEHYDE DEHYDROGENASE INHIBITORS

Disulfiram

23-Jan-2020

● INDICATIONS AND DOSE

Adjunct in the treatment of alcohol dependence (under expert supervision)

- ▶ BY MOUTH
- ▶ Adult: 200 mg daily, increased if necessary up to 500 mg daily

- **UNLICENSED USE** Disulfiram doses in BNF may differ from those in product literature.
- **CONTRA-INDICATIONS** Cardiac failure · coronary artery disease · history of cerebrovascular accident · hypertension · psychosis · severe personality disorder · suicide risk
- **CAUTIONS** Alcohol challenge **not** recommended on routine basis (if considered essential—specialist units only with resuscitation facilities) · avoid in Acute porphyrias p. 1120 · diabetes mellitus · epilepsy · respiratory disease
- **INTERACTIONS** → Appendix 1: disulfiram
- **SIDE-EFFECTS** Allergic dermatitis · breath odour · depression · drowsiness · encephalopathy · fatigue · hepatocellular injury · libido decreased · mania · nausea · nerve disorders · paranoia · psychotic disorder · vomiting
- **PREGNANCY** High concentrations of acetaldehyde which occur in presence of alcohol may be teratogenic; avoid in first trimester.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Use with caution.
- **PRE-TREATMENT SCREENING** Before initiating disulfiram, prescribers should evaluate the patient's suitability for treatment, because some patient factors, for example memory impairment or social circumstances, make compliance to treatment or abstinence from alcohol difficult.
- **MONITORING REQUIREMENTS** During treatment with disulfiram, patients should be monitored at least every 2 weeks for the first 2 months, then each month for the following 4 months, and at least every 6 months thereafter.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be counselled on the disulfiram-alcohol reaction—reactions may occur following exposure to small amounts of alcohol found in perfume, aerosol sprays, or low alcohol and "non-alcohol" beers and wines; symptoms may be severe and life-threatening and can include nausea, flushing, palpitations, arrhythmias, hypotension, respiratory depression, and coma. [\[EvGr\]](#) Patients and their carers should be counselled on the signs of hepatotoxicity—patients should discontinue treatment and seek immediate medical attention if they feel unwell or symptoms such as fever or jaundice develop. 

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 2

▶ Disulfiram (Non-proprietary)

Disulfiram 200 mg Disulfiram 200mg tablets | 50 tablet [\[PoM\]](#) £127.22 DT = £111.54

GAMMA-AMINOBTYRIC ACID ANALOGUES AND DERIVATIVES

Acamprosate calcium

10-Sep-2018

● INDICATIONS AND DOSE

Maintenance of abstinence in alcohol-dependent patients

- ▶ BY MOUTH
- ▶ Adult 18–65 years (body-weight up to 60 kg): 666 mg once daily at breakfast and 333 mg twice daily at midday and at night
- ▶ Adult 18–65 years (body-weight 60 kg and above): 666 mg 3 times a day

- **CAUTIONS** Continued alcohol abuse (risk of treatment failure)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · diarrhoea · flatulence · nausea · sexual dysfunction · skin reactions · vomiting
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe hepatic failure—no information available.
- **RENAL IMPAIRMENT** Avoid if serum-creatinine greater than 120 micromol/litre.
- **PRESCRIBING AND DISPENSING INFORMATION** Acamprosate calcium has been used for the maintenance of abstinence in alcohol dependence in children aged 16 years and over.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 5, 21, 25
ELECTROLYTES: May contain Calcium

Acamprosate calcium 333 mg Camprial EC 333mg tablets | 168 tablet [\[PoM\]](#) £28.80 DT = £38.14

OPIOID RECEPTOR ANTAGONISTS

Nalmefene

● INDICATIONS AND DOSE

Reduction of alcohol consumption in patients with alcohol dependence who have a high drinking risk level without physical withdrawal symptoms, and who do not require immediate detoxification

- ▶ BY MOUTH
- ▶ Adult: 18 mg daily if required, taken on each day there is a risk of drinking alcohol, preferably taken 1–2 hours before the anticipated time of drinking, if a dose has not been taken before drinking alcohol, 1 dose should be taken as soon as possible; maximum 18 mg per day

- **CONTRA-INDICATIONS** Recent history of acute alcohol withdrawal syndrome · recent or current opioid use
- **CAUTIONS** Continued treatment for more than 1 year · history of seizure disorders (including alcohol withdrawal seizures) · psychiatric illness
- **INTERACTIONS** → Appendix 1: nalmefene
- **SIDE-EFFECTS**
- ▶ **Common or very common** Appetite decreased · asthenia · concentration impaired · confusion · diarrhoea · dizziness · drowsiness · dry mouth · feeling abnormal · headache · hyperhidrosis · libido decreased · malaise · muscle spasms · nausea · palpitations · restlessness · sensation abnormal · sleep disorders · tachycardia · tremor · vomiting · weight decreased
- ▶ **Frequency not known** Dissociation · hallucinations
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment (risk of increased exposure); avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT** Use with caution—avoid in severe impairment.
- **PRE-TREATMENT SCREENING** Before initiating treatment, prescribers should evaluate the patient's clinical status, alcohol dependence, and level of alcohol consumption. Nalmefene should only be prescribed for patients who continue to have a high drinking risk level two weeks after the initial assessment.
- **MONITORING REQUIREMENTS** During treatment, patients should be monitored regularly and the need for continued treatment assessed.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Nalmefene for reducing alcohol consumption in people with alcohol dependence (November 2014)** NICE TA325 Nalmefene (*Selincro*[®]) is recommended within its marketing authorisation, as an option for reducing alcohol consumption, for patients with alcohol dependence:
 - who have a high drinking risk level (defined as alcohol consumption of more than 60 g per day for men and more than 40 g per day for women, according to the World Health Organization's drinking risk levels) without physical withdrawal symptoms, **and**
 - who do not require immediate detoxification.
 The marketing authorisation states that nalmefene should:
 - only be prescribed in conjunction with continuous psychosocial support focused on treatment adherence and reducing alcohol consumption, **and**
 - be initiated only in patients who continue to have a high drinking risk level 2 weeks after initial assessment.

www.nice.org.uk/guidance/ta325

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 25

- ▶ **Selincro** (Lundbeck Ltd)

Nalmefene (as Nalmefene hydrochloride) 18 mg Selincro 18mg tablets | 14 tablet **[PoM]** £42.42 DT = £42.42 | 28 tablet **[PoM]** £84.84

Naltrexone hydrochloride

17-Aug-2017

- **DRUG ACTION** Naltrexone is an opioid-receptor antagonist.

● INDICATIONS AND DOSE

Adjunct to prevent relapse in formerly opioid-dependent patients (who have remained opioid-free for at least 7–10 days) (initiated under specialist supervision)

▶ BY MOUTH

- ▶ **Adult:** Initially 25 mg daily, then increased to 50 mg daily, total weekly dose may be divided and given on 3 days of the week for improved compliance (e.g. 100 mg on Monday and Wednesday, and 150 mg on Friday); maximum 350 mg per week

Adjunct to prevent relapse in formerly alcohol-dependent patients (initiated under specialist supervision)

▶ BY MOUTH

- ▶ **Adult:** 25 mg once daily on the first day, then increased if tolerated to 50 mg daily

- **UNLICENSED USE** 25 mg dose for adjunct to prevent relapse in formerly alcohol-dependent patients is an unlicensed dose.
- **CONTRA-INDICATIONS** Patients currently dependent on opioids
- **CAUTIONS** Concomitant use of opioids
- **CAUTIONS, FURTHER INFORMATION**
- ▶ Concomitant use of opioids Concomitant use of opioids should be avoided but increased dose of opioid analgesic may be required for pain—manufacturer advises to monitor for opioid intoxication.
- **INTERACTIONS** → Appendix 1: naltrexone
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · anxiety · appetite abnormal · arthralgia · asthenia · chest pain · chills · constipation · diarrhoea · dizziness · eye disorders · headache · hyperhidrosis · mood altered · myalgia · nausea · palpitations · sexual dysfunction · skin reactions · sleep disorders · tachycardia · thirst · vomiting
- ▶ **Uncommon** Alopecia · confusion · cough · depression · drowsiness · dry mouth · dysphonia · dyspnoea · ear discomfort · eye discomfort · eye swelling · feeling hot · fever · flatulence · flushing · hallucination · hepatic disorders · lymphadenopathy · nasal complaints · oropharyngeal pain · pain · paranoia · peripheral coldness · seborrhoea · sinus disorder · sputum increased · tinnitus · tremor · ulcer · urinary disorders · vertigo · vision disorders · weight changes · yawning
- ▶ **Rare or very rare** Immune thrombocytopenic purpura · rhabdomyolysis · suicidal tendencies
- ▶ **Frequency not known** Withdrawal syndrome
- **PREGNANCY** Use only if benefit outweighs risk.
- **BREAST FEEDING** Avoid—potential toxicity.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe or acute impairment, acute hepatitis, or hepatic failure.
- **Dose adjustments** Manufacturer advises consider dose adjustment in mild to moderate impairment.
- **RENAL IMPAIRMENT** Avoid in severe impairment.
- **PRE-TREATMENT SCREENING** Test for opioid dependence with naloxone before treatment.
- **MONITORING REQUIREMENTS** Liver function tests needed before and during treatment.
- **PATIENT AND CARER ADVICE** Patients should be warned that an attempt to overcome the blockade of opioid receptors by overdosing could result in acute opioid intoxication.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Naltrexone for the management of opioid dependence (January 2007)** NICE TA115

Naltrexone is recommended for the prevention of relapse in formerly opioid-dependent patients who are motivated to remain in a supportive care abstinence programme. Naltrexone should be administered under supervision and its effectiveness in preventing opioid misuse reviewed regularly.

www.nice.org.uk/guidance/ta115

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

8.2 Nicotine dependence

Smoking cessation

14-Aug-2018

Overview

Smoking tobacco is the main cause of preventable illness and premature death in the UK. It is linked to a number of diseases such as cancer (primarily lung cancer), chronic obstructive pulmonary disease, and cardiovascular disease, and can lead to complications during pregnancy. Smoking cessation reduces the risk of developing or worsening of smoking-related illnesses, and the benefits begin as soon as a person stops smoking.

Smoking cessation may be associated with temporary withdrawal symptoms caused by nicotine dependence, making it difficult for people to stop. These symptoms include nicotine cravings, irritability, depression, restlessness, poor concentration, light-headedness, sleep disturbances, and increased appetite. Weight gain is a concern for many people who stop smoking, however it is less likely to occur when drug treatment is used to aid smoking cessation.

Non-drug treatment

[EvGr] All smokers, including those who smoke e-cigarettes, should be advised to stop smoking and be offered support to facilitate smoking cessation. They should also be advised that stopping in one step ('abrupt quitting') offers the best chance of lasting success, and that a combination of drug treatment and behavioural support is likely to be the most effective approach. **▲** 'Abrupt quitting' is when a smoker makes a commitment to stop smoking on or before a particular date (the quit date), rather than by gradually reducing their smoking.

[EvGr] Smokers who wish to stop smoking should be referred to their local NHS Stop Smoking Services, where they will be provided with advice, drug treatment, and behavioural support options such as individual counselling or group meetings. Smokers who decline to attend their local NHS Stop Smoking Services should be referred to a suitable healthcare professional who can also offer drug treatment and practical advice. **▲**

Drug treatment

Nicotine replacement therapy (NRT), varenicline p. 524, and bupropion hydrochloride p. 521, are effective drug treatments to aid smoking cessation. **[EvGr]** The choice of

drug treatment should take into consideration the smoker's likely adherence, preferences, and previous experience of smoking-cessation aids, as well as contra-indications and side-effects of each preparation. Varenicline, or a combination of long-acting NRT (transdermal patch) and short-acting NRT (lozenges, gum, sublingual tablets, inhalator, nasal spray and oral spray), are the most effective treatment options and thus the preferred choices. If these options are not appropriate, bupropion hydrochloride or single therapy NRT should be considered instead. **▲**

Nicotine transdermal patches are generally applied for 16 hours, with the patch removed overnight; if smokers experience strong nicotine cravings upon waking, a 24-hour patch can be used instead. Short-acting nicotine preparations are used whenever the urge to smoke occurs or to prevent cravings; there is no evidence that one form of NRT is more effective than another. **[EvGr]** The use of NRT combined with varenicline or bupropion hydrochloride is not recommended, and both varenicline and bupropion hydrochloride should not be prescribed together.

A quit date should be agreed when drug treatment is prescribed for smoking cessation, and treatment should be available before the person stops smoking. Smokers should be prescribed enough treatment to last 2 weeks after their agreed quit date and be re-assessed shortly before their supply finishes.

Smokers who are unwilling or not ready to stop smoking may also benefit from the use of NRT as part of a 'harm reduction approach', because the amount of nicotine in NRT is much lower and less addictive than in smoking tobacco. Harm reduction approaches include stopping smoking whilst using NRT to prevent relapse, and smoking reduction or temporary abstinence with or without the use of NRT. These smokers should be advised that NRT will make it easier to reduce how much they smoke and improve their chance of stopping smoking in the long-term. **▲**

E-cigarettes

E-cigarettes deliver nicotine without the toxins found in tobacco smoke. Evidence suggests that e-cigarettes are substantially less harmful to health than tobacco smoking, but long-term effects are still largely unknown. Some smokers have found e-cigarettes useful for smoking cessation, however they cannot be prescribed or supplied by smoking cessation services. **[EvGr]** People who wish to use e-cigarettes should be advised that although these products are not licensed drugs, they are regulated by the Tobacco and Related Products Regulations 2016. **▲** In the UK, sale of e-cigarettes is prohibited in children under 18 years of age.

Pregnancy

[EvGr] Pregnant females should be advised to stop smoking completely, and be informed about the risks to the unborn child of smoking during pregnancy, and the harmful effects of exposure to second-hand smoke for both mother and baby. All pregnant females who smoke or have stopped smoking in the last 2 weeks should be referred to their local NHS Stop Smoking Services, and ongoing support should be offered during and following pregnancy. Smoking cessation should also be encouraged for all members of the household. Pregnant females who smoke should be advised to contact the NHS Pregnancy Smoking Helpline for further information (Tel: 0800 169 9169).

NRT should only be used in pregnant females if non-drug treatment options have failed. Clinical judgement should be used when deciding whether to prescribe NRT following a discussion about its risks and benefits. Subsequent prescriptions should only be given to pregnant females who have demonstrated they are still not smoking. **▲**

Concomitant drugs

Polycyclic aromatic hydrocarbons found in tobacco smoke increase the metabolism of some drugs by inducing hepatic

enzymes, often requiring an increase in dose. Information about drugs interacting with tobacco smoke can be found under *Interactions* of the relevant drug monograph.

ANTIDEPRESSANTS > SEROTONIN AND NORADRENALINE RE-UPTAKE INHIBITORS

Bupropion hydrochloride

08-Jun-2018

(Amfebutamone hydrochloride)

● INDICATIONS AND DOSE

To aid smoking cessation in combination with motivational support in nicotine-dependent patients

▶ BY MOUTH

- Adult: Initially 150 mg daily for 6 days, then 150 mg twice daily (max. per dose 150 mg), minimum 8 hours between doses; period of treatment 7–9 weeks, start treatment 1–2 weeks before target stop date, discontinue if abstinence not achieved at 7 weeks, consider maximum 150 mg daily in patients with risk factors for seizures; maximum 300 mg per day
- Elderly: 150 mg daily for 7–9 weeks, start treatment 1–2 weeks before target stop date, discontinue if abstinence not achieved at 7 weeks; maximum 150 mg per day

- **CONTRA-INDICATIONS** Acute alcohol withdrawal · acute benzodiazepine withdrawal · bipolar disorder · CNS tumour · eating disorders · history of seizures · severe hepatic cirrhosis

- **CAUTIONS** Alcohol abuse · diabetes · elderly · history of head trauma · predisposition to seizures (prescribe only if benefit clearly outweighs risk)

- **INTERACTIONS** → Appendix 1: bupropion

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · anxiety · concentration impaired · constipation · dizziness · dry mouth · fever · gastrointestinal disorder · headache · hyperhidrosis · hypersensitivity · insomnia (reduced by avoiding dose at bedtime) · nausea · skin reactions · taste altered · tremor · vomiting
- ▶ **Uncommon** Appetite decreased · asthenia · chest pain · confusion · tachycardia · tinnitus · vasodilation · visual impairment
- ▶ **Rare or very rare** Angioedema · arthralgia · behaviour abnormal · bronchospasm · delusions · depersonalisation · dyspnoea · hallucination · hepatic disorders · irritability · memory loss · movement disorders · muscle complaints · palpitations · paraesthesia · parkinsonism · postural hypotension · seizure · sleep disorders · Stevens-Johnson syndrome · syncope · urinary disorders
- ▶ **Frequency not known** Anaemia · hyponatraemia · leucopenia · psychosis · suicidal tendencies · thrombocytopenia
- **PREGNANCY** Avoid—no information available.
- **BREAST FEEDING** Present in milk—avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution—monitor closely for adverse effects; avoid in severe cirrhosis.

Dose adjustments Manufacturer advises reduce dose to 150 mg daily in mild to moderate impairment

● RENAL IMPAIRMENT

Dose adjustments Reduce dose to 150 mg daily.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor blood pressure before and during treatment.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should be instructed to report any clinical worsening of depression, suicidal behaviour or thoughts and unusual changes in behaviour.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and light-headedness.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

- ▶ **Zyban** (GlaxoSmithKline UK Ltd)

Bupropion hydrochloride 150 mg Zyban 150mg modified-release tablets | 60 tablet [PoM] £41.76 DT = £41.76

NICOTINIC RECEPTOR AGONISTS

Nicotine

● INDICATIONS AND DOSE

Nicotine replacement therapy in individuals who smoke fewer than 20 cigarettes each day

▶ BY MOUTH USING CHEWING GUM

- Adult: 2 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, if attempting smoking cessation, treatment should continue for 3 months before reducing the dose
- ▶ **BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS**
- Adult: 1 tablet every 1 hour, increased to 2 tablets every 1 hour if required, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose; maximum 40 tablets per day

Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day or who require more than 15 pieces of 2-mg strength gum each day

▶ BY MOUTH USING CHEWING GUM

- Adult: 4 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, individuals should not exceed 15 pieces of 4-mg strength gum daily, if attempting smoking cessation, treatment should continue for 3 months before reducing the dose

Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day

▶ BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS

- Adult: 2 tablets every 1 hour, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose; maximum 40 tablets per day

Nicotine replacement therapy

▶ BY INHALATION USING INHALATOR

- Adult: As required, the cartridges can be used when the urge to smoke occurs or to prevent cravings, individuals should not exceed 12 cartridges of the 10-mg strength daily, or 6 cartridges of the 15-mg strength daily

▶ BY MOUTH USING LOZENGES

- Adult: 1 lozenge every 1–2 hours as required, one lozenge should be used when the urge to smoke occurs, individuals who smoke less than 20 cigarettes each day should usually use the lower-strength lozenges; individuals who smoke more than 20 cigarettes each day and those who fail to stop smoking continued →

with the low-strength lozenges should use the higher-strength lozenges; If attempting smoking cessation, treatment should continue for 6–12 weeks before attempting a reduction in dose; maximum 15 lozenges per day

► **BY MOUTH USING OROMUCOSAL SPRAY**

► **Adult:** 1–2 sprays as required, individuals can spray in the mouth when the urge to smoke occurs or to prevent cravings, individuals should not exceed 2 sprays per episode (up to 4 sprays every hour); maximum 64 sprays per day

► **BY INTRANASAL ADMINISTRATION USING NASAL SPRAY**

► **Adult:** 1–5 spray as required, individuals can spray into each nostril when the urge to smoke occurs, up to twice every hour for 16 hours daily, if attempting smoking cessation, treatment should continue for 8 weeks before reducing the dose; maximum 64 sprays per day

► **BY TRANSDERMAL APPLICATION USING PATCHES**

► **Adult:** Individuals who smoke more than 10 cigarettes daily should apply a high-strength patch daily for 6–8 weeks, followed by the medium-strength patch for 2 weeks, and then the low-strength patch for the final 2 weeks; individuals who smoke fewer than 10 cigarettes daily can usually start with the medium-strength patch for 6–8 weeks, followed by the low-strength patch for 2–4 weeks; a slower titration schedule can be used in individuals who are not ready to quit but want to reduce cigarette consumption before a quit attempt; if abstinence is not achieved, or if withdrawal symptoms are experienced, the strength of the patch used should be maintained or increased until the patient is stabilised; individuals using the high-strength patch who experience excessive side-effects, that do not resolve within a few days, should change to a medium-strength patch for the remainder of the initial period and then use the low-strength patch for 2–4 weeks

● **CAUTIONS**

GENERAL CAUTIONS Diabetes mellitus—blood-glucose concentration should be monitored closely when initiating treatment · haemodynamically unstable patients hospitalised with cerebrovascular accident · haemodynamically unstable patients hospitalised with myocardial infarction · haemodynamically unstable patients hospitalised with severe arrhythmias · phaeochromocytoma · uncontrolled hyperthyroidism

SPECIFIC CAUTIONS

- When used by inhalation Bronchospastic disease · chronic throat disease · obstructive lung disease
- With intranasal use Bronchial asthma (may exacerbate)
- With oral use gastritis (can be aggravated by swallowed nicotine) · gum may also stick to and damage dentures · oesophagitis (can be aggravated by swallowed nicotine) · peptic ulcers (can be aggravated by swallowed nicotine)
- With transdermal use patches should not be placed on broken skin · patients with skin disorders

CAUTIONS, FURTHER INFORMATION Most warnings for nicotine replacement therapy also apply to continued cigarette smoking, but the risk of continued smoking outweighs any risks of using nicotine preparations.

Specific cautions for individual preparations are usually related to the local effect of nicotine.

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Dizziness · headache · hyperhidrosis · nausea · palpitations · skin reactions · vomiting
- **Uncommon** Flushing

SPECIFIC SIDE-EFFECTS

- **Common or very common**
 - When used by inhalation Asthenia · cough · dry mouth · flatulence · gastrointestinal discomfort · hiccups · hypersensitivity · nasal complaints · oral disorders · taste altered · throat complaints
 - With intranasal use Chest discomfort · cough · dyspnoea · epistaxis · nasal complaints · paraesthesia · throat irritation
 - With oral use Anxiety · appetite abnormal · burping · diarrhoea · dyspepsia (may be caused by swallowed nicotine) · gastrointestinal disorders · hiccups · increased risk of infection · mood altered · oral disorders · sleep disorders
 - With sublingual use Asthenia · cough · dry mouth · flatulence · gastrointestinal discomfort · hiccups · hypersensitivity · oral disorders · rhinitis · taste altered · throat complaints
 - **Uncommon**
 - When used by inhalation Abnormal dreams · arrhythmias · bronchospasm · burping · chest discomfort · dysphonia · dyspnoea · hypertension · malaise
 - With intranasal use Abnormal dreams · asthenia · hypertension · malaise
 - With oral use Anger · asthma exacerbated · cough · dyspepsia aggravated · dysphagia · haemorrhage · laryngospasm · nasal complaints · nocturia · numbness · overdose · pain · palpitations exacerbated · peripheral oedema · tachycardia · taste altered · throat complaints · vascular disorders
 - With sublingual use Abnormal dreams · arrhythmias · bronchospasm · burping · chest discomfort · dysphonia · dyspnoea · hypertension · malaise · nasal complaints
 - With transdermal use Arrhythmias · asthenia · chest discomfort · dyspnoea · hypertension · malaise · myalgia · paraesthesia
 - **Rare or very rare**
 - When used by inhalation Dysphagia
 - With intranasal use Arrhythmias
 - With oral use Coagulation disorder · platelet disorder
 - With sublingual use Dysphagia
 - With transdermal use Abdominal discomfort · angioedema · pain in extremity
 - **Frequency not known**
 - When used by inhalation Angioedema · excessive tearing · vision blurred
 - With intranasal use Abdominal discomfort · angioedema · excessive tearing · oropharyngeal complaints
 - With sublingual use Excessive tearing · muscle tightness · vision blurred
- SIDE-EFFECTS, FURTHER INFORMATION** Some systemic effects occur on initiation of therapy, particularly if the patient is using high-strength preparations; however, the patient may confuse side-effects of the nicotine-replacement preparation with nicotine withdrawal symptoms. Common symptoms of nicotine withdrawal include malaise, headache, dizziness, sleep disturbance, coughing, influenza-like symptoms, depression, irritability, increased appetite, weight gain, restlessness, anxiety, drowsiness, aphthous ulcers, decreased heart rate, and impaired concentration.
- **PREGNANCY** The use of nicotine replacement therapy in pregnancy is preferable to the continuation of smoking, but should be used only if smoking cessation without nicotine replacement fails. Intermittent therapy is preferable to patches but avoid liquorice-flavoured nicotine products. Patches are useful, however, if the patient is experiencing pregnancy-related nausea and vomiting. If patches are used, they should be removed before bed.
 - **BREAST FEEDING** Nicotine is present in milk; however, the amount to which the infant is exposed is small and less hazardous than second-hand smoke. Intermittent therapy is preferred.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (risk of decreased clearance).

● **RENAL IMPAIRMENT** Use with caution in severe renal impairment.

● **DIRECTIONS FOR ADMINISTRATION** Acidic beverages, such as coffee or fruit juice, may decrease the absorption of nicotine through the buccal mucosa and should be avoided for 15 minutes before the use of oral nicotine replacement therapy.

Administration by transdermal patch Patches should be applied on waking to dry, non-hairy skin on the hip, trunk, or upper arm and held in position for 10–20 seconds to ensure adhesion; place next patch on a different area and avoid using the same site for several days.

Administration by nasal spray Initially 1 spray should be used in both nostrils but when withdrawing from therapy, the dose can be gradually reduced to 1 spray in 1 nostril.

Administration by oral spray The oral spray should be released into the mouth, holding the spray as close to the mouth as possible and avoiding the lips. The patient should not inhale while spraying and avoid swallowing for a few seconds after use. If using the oral spray for the first time, or if unit not used for 2 or more days, prime the unit before administration.

Administration by sublingual tablet Each tablet should be placed under the tongue and allowed to dissolve.

Administration by lozenge Slowly allow each lozenge to dissolve in the mouth; periodically move the lozenge from one side of the mouth to the other. Lozenges last for 10–30 minutes, depending on their size.

Administration by inhalation Insert the cartridge into the device and draw in air through the mouthpiece; each session can last for approximately 5 minutes. The amount of nicotine from 1 puff of the cartridge is less than that from a cigarette, therefore it is necessary to inhale more often than when smoking a cigarette. A single 10 mg cartridge lasts for approximately 20 minutes of intense use; a single 15 mg cartridge lasts for approximately 40 minutes of intense use.

Administration by medicated chewing gum Chew the gum until the taste becomes strong, then rest it between the cheek and gum; when the taste starts to fade, repeat this process. One piece of gum lasts for approximately 30 minutes.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of chewing gum and lozenges may include mint, freshfruit, freshmint, icy white, or cherry.

● **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer nicotine chewing gum, inhalators, lozenges, sublingual tablets, oral spray, nasal spray and patches.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Varenicline

15-Apr-2020

- **DRUG ACTION** Varenicline is a selective nicotine-receptor partial agonist.

● **INDICATIONS AND DOSE**

To aid smoking cessation

▶ **BY MOUTH**

- ▶ **Adult:** Initially 500 micrograms once daily for 3 days, increased to 500 micrograms twice daily for 4 days, then 1 mg twice daily for 11 weeks; reduced if not tolerated to 500 micrograms twice daily, usually to be started 1–2 weeks before target stop date but can be started up to a maximum of 5 weeks before target stop date, 12-week course can be repeated in abstinent individuals to reduce risk of relapse

- **CAUTIONS** Conditions that may lower seizure threshold · history of cardiovascular disease · history of psychiatric illness (may exacerbate underlying illness including depression) · predisposition to seizures

● **SIDE-EFFECTS**

- ▶ **Common or very common** Appetite abnormal · asthenia · chest discomfort · constipation · diarrhoea · dizziness · drowsiness · dry mouth · gastrointestinal discomfort · gastrointestinal disorders · headache · joint disorders · muscle complaints · nausea · oral disorders · pain · skin reactions · sleep disorders · vomiting · weight increased
- ▶ **Uncommon** Allergic rhinitis · anxiety · arrhythmias · behaviour abnormal · burping · conjunctivitis · depression · eye pain · fever · fungal infection · haemorrhage · hallucination · hot flush · hyperglycaemia · influenza like illness · malaise · menorrhagia · mood swings · numbness · palpitations · seizure · sexual dysfunction · suicidal ideation · sweat changes · thinking abnormal · tinnitus · tremor · urinary disorders
- ▶ **Rare or very rare** Angioedema · bradyphrenia · coordination abnormal · costochondritis · cyst · diabetes mellitus · dysarthria · eye disorders · feeling cold · glycosuria · muscle tone increased · polydipsia · psychosis · scleral discolouration · severe cutaneous adverse reactions (SCARs) · snoring · vaginal discharge · vision disorders
- ▶ **Frequency not known** Loss of consciousness

- **PREGNANCY** Avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

● **RENAL IMPAIRMENT**

- Dose adjustments** If eGFR less than 30 mL/minute/1.73 m², initial dose 500 micrograms once daily, increased after 3 days to 1 mg once daily.

- **TREATMENT CESSATION** Risk of relapse, irritability, depression, and insomnia on discontinuation; consider dose tapering on completion of 12-week course.

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness, somnolence, and transient loss of consciousness.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Varenicline for smoking cessation (July 2007)** NICE TA123 Varenicline (*Champix*[®]) is recommended, within its licensed indications, as an option for smokers who have expressed a desire to quit smoking; it should normally be prescribed only as part of a programme of behavioural support.

www.nice.org.uk/guidance/ta123

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

8.3 Opioid dependence

Other drugs used for Opioid dependence Buprenorphine, p. 468 · Naltrexone hydrochloride, p. 519

ANALGESICS > OPIOIDS

F 467

Metadone hydrochloride

04-Dec-2019

● **INDICATIONS AND DOSE**

Severe pain

- ▶ **BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
- ▶ **Adult:** 5–10 mg every 6–8 hours, adjusted according to response, on prolonged use not to be given more frequently than every 12 hours

Adjunct in treatment of opioid dependence

- ▶ **BY MOUTH USING ORAL SOLUTION**
- ▶ **Adult:** Initially 10–30 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily

Adjunct in treatment of opioid dependence if tolerance low or not known

- ▶ **BY MOUTH USING ORAL SOLUTION**
- ▶ **Adult:** Initially 10–20 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily

Adjunct in treatment of opioid dependence if tolerance high (under expert supervision)

- ▶ **BY MOUTH USING ORAL SOLUTION**
- ▶ **Adult:** Initially up to 40 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily

Cough in palliative care

- ▶ INITIALLY BY MOUTH USING LINCTUS
- ▶ Adult: 1–2 mg every 4–6 hours, (by mouth) reduced to 1–2 mg twice daily, use twice daily frequency if prolonged use

DOSE EQUIVALENCE AND CONVERSION

- ▶ See buprenorphine p. 468 for dose adjustments in opioid substitution therapy, for patients taking methadone who want to switch to buprenorphine.

- **UNLICENSED USE** Methadone hydrochloride doses for opioid dependence in the BNF may differ from those in the product literature.

IMPORTANT SAFETY INFORMATION

Many preparations of Methadone oral solution are licensed for opioid drug addiction only but some are also licensed for analgesia in severe pain.

- **CONTRA-INDICATIONS** Pheochromocytoma
- **CAUTIONS** Family history of sudden death (ECG monitoring recommended) · history of cardiac conduction abnormalities
- CAUTIONS, FURTHER INFORMATION**
 - ▶ QT-interval prolongation Patients with the following risk factors for QT-interval prolongation should be carefully monitored while taking methadone: heart or liver disease, electrolyte abnormalities, or concomitant treatment with drugs that can prolong QT interval; patients requiring more than 100 mg daily should also be monitored.
- **INTERACTIONS** → Appendix 1: opioids

SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

Asthma exacerbated · dry eye · dysuria · hyperprolactinaemia · hypothermia · menstrual cycle irregularities · mood altered · nasal dryness · QT interval prolongation

SPECIFIC SIDE-EFFECTS

- ▶ With oral use Galactorrhoea · intracranial pressure increased
- ▶ With parenteral use Biliary spasm · muscle rigidity · oedema · restlessness · sexual dysfunction · sleep disorder · ureteral spasm · withdrawal syndrome neonatal

SIDE-EFFECTS, FURTHER INFORMATION Methadone is a long-acting opioid therefore effects may be cumulative.

Methadone, even in low doses is a special hazard for children; non-dependent adults are also at risk of toxicity; dependent adults are at risk if tolerance is incorrectly assessed during induction.

Overdose Methadone has a very long duration of action; patients may need to be monitored for long periods following large overdoses.

- **BREAST FEEDING** Withdrawal symptoms in infant; breast-feeding permissible during maintenance but dose should be as low as possible and infant monitored to avoid sedation (high doses of methadone carry an increased risk of sedation and respiratory depression in the neonate).
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; consider avoiding in severe impairment (risk of increased exposure).
Dose adjustments Manufacturer advises consider dose reduction.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **DIRECTIONS FOR ADMINISTRATION** Syrup preserved with hydroxybenzoate (parabens) esters may be incompatible with methadone hydrochloride.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tolu.

Palliative care For further information on the use of methadone in palliative care, see www.medicinescomplete.com/#/content/palliative/methadone

METHADOSE® The final strength of the methadone mixture to be dispensed to the patient must be specified on the prescription.

Important—care is required in prescribing and dispensing the **correct strength** since any confusion could lead to an overdose; this preparation should be dispensed only **after dilution** as appropriate with *Methadose*® Diluent (life of diluted solution 3 months) and is for drug dependent persons.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Methadone and buprenorphine for the management of opioid dependence (January 2007)** NICE TA114
- ▶ With oral use Oral methadone and buprenorphine are recommended for maintenance therapy in the management of opioid dependence. Patients should be committed to a supportive care programme including a flexible dosing regimen administered under supervision for at least 3 months, until compliance is assured. Selection of methadone or buprenorphine should be made on a case-by-case basis, but methadone should be prescribed if both drugs are equally suitable. www.nice.org.uk/guidance/ta114
- **LESS SUITABLE FOR PRESCRIBING** Methadone linctus is less suitable for prescribing for cough in terminal disease (has a tendency to accumulate).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection, suppository

OPIOID RECEPTOR ANTAGONISTS

Buprenorphine with naloxone

27-Apr-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, buprenorphine p. 468, naloxone hydrochloride p. 1440.

● INDICATIONS AND DOSE

Adult in the treatment of opioid dependence (dose expressed as buprenorphine)

▶ BY SUBLINGUAL ADMINISTRATION

- ▶ Adult: Initially 2–4 mg once daily, an additional dose of 2–4 mg may be administered on day 1 depending on the individual patient's requirement, increased in steps of 2–8 mg, adjusted according to response, total weekly dose may be divided and given on alternate days or 3 times weekly; maximum 24 mg per day

- **INTERACTIONS** → Appendix 1: opioids

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 355/07

The *Scottish Medicines Consortium* has advised (March 2007) that buprenorphine/naloxone (*Suboxone*®) is accepted for restricted use within NHS Scotland for substitution treatment for opioid drug dependence, within a framework of medical, social and psychological treatment in whom methadone is not suitable.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Sublingual tablet

- **CAUTIONS** Bradycardia · cerebrovascular disease · depression · hypotension (monitor pulse rate and blood pressure) · metabolic disturbances · recent myocardial infarction · risk factors for QT interval prolongation · severe coronary insufficiency

- **INTERACTIONS** → Appendix 1: lofexidine

● **SIDE-EFFECTS**

- ▶ **Common or very common** Bradycardia · dizziness · drowsiness · hypotension · mucosal dryness
- ▶ **Frequency not known** QT interval prolongation

- **PREGNANCY** Use only if benefit outweighs risk—no information available.

- **BREAST FEEDING** Use only if benefit outweighs risk—no information available.

- **RENAL IMPAIRMENT** Caution in chronic impairment.

- **MONITORING REQUIREMENTS** Monitoring of blood pressure and pulse rate is recommended on initiation, for at least 72 hours or until a stable dose is achieved, and on discontinuation.

- **TREATMENT CESSATION** Treatment should be withdrawn gradually over 2–4 days (or longer) to reduce the risk of rebound hypertension and associated symptoms.

- **PRESCRIBING AND DISPENSING INFORMATION** Lofexidine has been used in children over 12 years in the management of symptoms of opioid withdrawal.

Available from specialist importing companies.

- **PATIENT AND CARER ADVICE** The patient should take part of the dose at bedtime to offset insomnia associated with opioid withdrawal.

- **MEDICINAL FORMS** No licensed medicines listed.

SYMPATHOMIMETICS > ALPHA₂-ADRENOCEPTOR AGONISTS

Lofexidine hydrochloride

03-Apr-2020

- **DRUG ACTION** Lofexidine is an alpha₂-adrenergic agonist.

● **INDICATIONS AND DOSE****Management of symptoms of opioid withdrawal**

▶ BY MOUTH

- ▶ Adult: Initially 800 micrograms daily in divided doses, increased in steps of 400–800 micrograms daily (max. per dose 800 micrograms) as required recommended duration of treatment 7–10 days if no opioid use (but longer may be required); maximum 2.4 mg per day

1 Amoebic infection

Other drugs used for Amoebic infection Metronidazole, p. 572 • Tinidazole, p. 574

ANTIPROTOZOALS

Mepacrine hydrochloride

● INDICATIONS AND DOSE

Giardiasis

- ▶ BY MOUTH
- Adult: 100 mg every 8 hours for 5–7 days

- **UNLICENSED USE** Not licensed for use in giardiasis.
- **CAUTIONS** Avoid in psoriasis • elderly • history of psychosis
- **INTERACTIONS** → Appendix 1: mepacrine
- **SIDE-EFFECTS** Aplastic anaemia (long term use) • central nervous system stimulation (with high doses) • corneal deposits • dermatosis (long term use) • dizziness • exfoliative dermatitis (severe; long term use) • gastrointestinal disorder • headache • hepatitis (long term use) • nail discolouration • nausea (with high doses) • oral discolouration • skin discolouration (long term use) • toxic psychosis (transient; with high doses) • urine discolouration (long term use) • visual impairment • vomiting (with high doses)
- **HEPATIC IMPAIRMENT** Use with caution.
- **MEDICINAL FORMS** Forms available from special-order manufacturers include: tablet

2 Bacterial infection

Antibacterials, principles of therapy

25-Mar-2020

Antibacterial drug choice

Before selecting an antibacterial the clinician must first consider three factors— the patient, the known or likely causative organism, and the risk of bacterial resistance with repeated courses.

Factors related to the patient which must be considered include history of allergy, renal and hepatic function, susceptibility to infection (i.e. whether immunocompromised), ability to tolerate drugs by mouth, severity of illness, risk of complications, ethnic origin, age, whether taking other medication and, if female, whether pregnant, breast-feeding or taking an oral contraceptive.

The known or likely organism and its antibacterial sensitivity, in association with the factors above, will provide one or more antibacterial option. [EVR](#) In patients receiving antibacterial prophylaxis, an antibacterial from a different class should be used. [⚡](#)

Some patients may be at higher risk of treatment failure. They include those who have had repeated antibacterial courses, a previous or current culture with resistant bacteria, or those at higher risk of developing complications.

Antibacterials, considerations before starting therapy

The following precepts should be considered before starting:

- Viral infections should not be treated with antibacterials. However, antibacterials may be used to treat secondary bacterial infection (e.g. bacterial pneumonia secondary to influenza);
- Samples should be taken for culture and sensitivity testing as appropriate; ‘**blind**’ antibacterial prescribing for unexplained pyrexia usually leads to further difficulty in establishing the diagnosis;
- Knowledge of **prevalent organisms** and their current sensitivity is of great help in choosing an antibacterial

before bacteriological confirmation is available. Generally, narrow-spectrum antibacterials are preferred to broad-spectrum antibacterials unless there is a clear clinical indication (e.g. life-threatening sepsis);

- The **dose** of an antibacterial varies according to a number of factors including age, weight, hepatic function, renal function, and severity of infection. The prescribing of the so-called 'standard' dose in serious infections may result in failure of treatment or even death of the patient; therefore it is important to prescribe a dose appropriate to the condition. An inadequate dose may also increase the likelihood of antibacterial resistance. On the other hand, for an antibacterial with a narrow margin between the toxic and therapeutic dose (e.g. an aminoglycoside) it is also important to avoid an excessive dose and the concentration of the drug in the plasma may need to be monitored;
- The **route** of administration of an antibacterial often depends on the severity of the infection. Life-threatening infections require intravenous therapy. Antibacterials that are well absorbed may be given by mouth even for some serious infections. Parenteral administration is also appropriate when the oral route cannot be used (e.g. because of vomiting) or if absorption is inadequate. Whenever possible, painful intramuscular injections should be avoided in children;
- **Duration** of therapy depends on the nature of the infection and the response to treatment. Courses should not be unduly prolonged because they encourage resistance, they may lead to side-effects and they are costly. However, in certain infections such as tuberculosis or osteomyelitis it may be necessary to treat for prolonged periods. The prescription for an antibacterial should specify the duration of treatment or the date when treatment is to be reviewed.

For further guidance on the appropriate and effective use of antibacterials, see Antimicrobial stewardship p. 20

Advice to be given to patients and their family and/or carers

If an antibacterial is given, advise patients about directions for correct use and possible side-effects using verbal and written information.

If an antibacterial is **not** given, advise patients about an antibacterial not being needed currently—discuss alternative options as appropriate, such as self-care with over-the-counter preparations, back-up (delayed) prescribing, or other non-pharmacological interventions.

Patients should be advised to seek medical help if symptoms worsen rapidly or significantly at any time, if symptoms do not start to improve within an agreed time, if problems arise as a result of treatment, or if the patient becomes systemically very unwell.

For further information on advice for patients and their family and/or carers when deciding if antibacterial treatment is necessary, see *Advice for patients and their family and/or carers* in Antimicrobial stewardship p. 20.

Antibacterials, considerations during therapy

EvGr Review choice of antibacterial if susceptibility results indicate bacterial resistance and symptoms are not improving—consult local microbiologist as needed. **A** If no bacterium is cultured, the antibacterial can be continued or stopped on clinical grounds.

EvGr Review intravenous antibacterials within 48 hours and consider stepping down to oral antibacterials where possible. **A**

Superinfection

In general, broad-spectrum antibacterial drugs such as the cephalosporins are more likely to be associated with adverse reactions related to the selection of resistant organisms e.g.

fungus infections or antibiotic-associated colitis (pseudomembranous colitis); other problems associated with superinfection include vaginitis and pruritus ani.

Notifiable diseases

Registered medical practitioners must notify the Proper Officer at their local council or local health protection team of any patient(s) suspected of suffering from any of the diseases listed below; a notification form should be completed immediately. For further information on reporting notifiable diseases, see **Public Health England** guidance at: www.gov.uk/guidance/notifiable-diseases-and-causative-organisms-how-to-report.

Anthrax	Mumps
Botulism	Paratyphoid fever
Brucellosis	Plague
Cholera	Poliomyelitis, acute
Diarrhoea (infectious bloody)	Rabies
Diphtheria	Rubella
Encephalitis, acute	SARS
Food poisoning	Scarlet fever
Haemolytic uraemic syndrome	Smallpox
Haemorrhagic fever (viral)	Streptococcal disease (Group A, invasive)
Hepatitis, viral	Tetanus
Legionnaires' disease	Tuberculosis
Leprosy	Typhoid fever
Malaria	Typhus
Measles	Whooping cough
Meningitis	Yellow fever
Meningococcal septicaemia	

Note It is good practice for registered medical practitioners to report other diseases that may present a significant risk to human health. These should be done under the category 'other significant disease'.

Sepsis, early management

EvGr Patients identified as being at high risk of severe illness or death due to suspected sepsis should be given a broad-spectrum antibacterial at the maximum recommended dose without delay (ideally within one hour). Microbiological samples and blood cultures must be taken prior to administration of antibiotics; the prescription should be adjusted subsequently according to susceptibility results.

A thorough clinical examination should be carried out to identify sources of infection. If the source of infection is identified, treat in line with local antibacterial guidance or susceptibility results.

Patients who require empirical intravenous treatment for a suspected infection, but who have no confirmed diagnosis, should be treated with an intravenous antibiotic from the local formulary and in line with national guidelines.

The need for intravenous fluids, inotropes, vasopressors and oxygen should also be assessed without delay, taking into consideration the patient's lactate concentration, systolic blood pressure, and their risk of severe illness or death. Patients at high risk should be monitored continuously if possible, and no less than every 30 minutes.

Patients with suspected sepsis who are not immediately deemed to be at high risk of severe illness or death, should be re-assessed regularly for the need for empirical treatment, taking into consideration all risk factors including lactate concentration and evidence of acute kidney injury. **A**

Antibacterials, use for prophylaxis

16-Mar-2017

Rheumatic fever: prevention of recurrence

- Phenoxymethylpenicillin p. 578 or sulfadiazine p. 596.

Invasive group A streptococcal infection: prevention of secondary cases

- Phenoxymethylpenicillin.

Patients who are penicillin allergic, *either* erythromycin p. 569 or azithromycin p. 566 [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England Laboratory).

Meningococcal meningitis: prevention of secondary cases

- Ciprofloxacin p. 590 or rifampicin p. 615 or i/m ceftriaxone p. 556 [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

Haemophilus influenzae type b disease: prevention of secondary cases

- Rifampicin or (if rifampicin cannot be used) i/m or i/v ceftriaxone [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

Within 4 weeks of illness onset in an index case with confirmed or suspected invasive *Haemophilus influenzae* type b disease, give antibacterial prophylaxis to all household contacts if there is a vulnerable individual in the household. Also, give antibacterial prophylaxis to the index case if they are in contact with vulnerable household contacts or if they are under 10 years of age. Vulnerable individuals include the immunocompromised, those with asplenia, or children under 10 years of age. If there are 2 or more cases of invasive *Haemophilus influenzae* type b disease within 120 days in a pre-school or primary school, antibacterial prophylaxis should also be given to all room contacts (including staff). Also see immunisation against *Haemophilus influenzae* type b disease.

Diphtheria in non-immune patients: prevention of secondary cases

- Erythromycin (or another macrolide e.g. azithromycin or clarithromycin p. 567).

Treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment.

Pertussis, antibacterial prophylaxis

- Clarithromycin (or azithromycin or erythromycin).

Within 3 weeks of onset of cough in the index case, give antibacterial prophylaxis to all close contacts if amongst them there is at least one unimmunised or partially immunised child under 1 year of age, or if there is at least

one individual who has not received a pertussis-containing vaccine more than 1 week and less than 5 years ago (so long as that individual lives or works with children under 4 months of age, is pregnant at over 32 weeks gestation, or is a healthcare worker who works with children under 1 year of age or with pregnant women).

Pneumococcal infection in asplenia or in patients with sickle-cell disease, antibacterial prophylaxis

- Phenoxymethylpenicillin.

If penicillin-allergic, erythromycin.

Antibacterial prophylaxis is not fully reliable. Antibacterial prophylaxis may be discontinued in children over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection.

Tuberculosis antibacterial prophylaxis in susceptible close contacts or those who have become tuberculin positive

- See *Close contacts and Treatment of latent tuberculosis* under Tuberculosis p. 612.

Animal and human bites, antibacterial prophylaxis

- Co-amoxiclav p. 582 alone (or doxycycline p. 597 + metronidazole p. 572 if penicillin-allergic).

Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 1360 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection).

Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread.

Antibacterial prophylaxis recommended for wounds less than 48–72 hours old when the risk of infection is high (e.g. bites from humans or cats; bites to the hand, foot, face, or genital area; bites involving oedema, crush or puncture injury, or other moderate to severe injury; wounds that cannot be debrided adequately; patients with diabetes mellitus, cirrhosis, asplenia, prosthetic joints or valves, or those who are immunocompromised). Give antibacterial prophylaxis for up to 5 days.

Early-onset neonatal infection, antibacterial prophylaxis

- i/v benzylpenicillin sodium p. 577 (or i/v clindamycin p. 564 if history of allergy to penicillins).

Give intrapartum prophylaxis to women with group B streptococcal colonisation, bacteriuria, or infection in the current pregnancy, or to women who had a previous baby with an invasive group B streptococcal infection. Consider prophylaxis for women in preterm labour if there is prelabour rupture of membranes or if intrapartum rupture of membranes lasting more than 18 hours is suspected.

Gastro-intestinal procedures, antibacterial prophylaxis

Operations on stomach or oesophagus

- Single dose of i/v gentamicin p. 545 or i/v cefuroxime p. 553 or i/v co-amoxiclav (additional intra-operative postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Add i/v teicoplanin p. 561 (or vancomycin p. 562) if high risk of methicillin-resistant *Staphylococcus aureus*.

Open biliary surgery

- Single dose of i/v cefuroxime + i/v metronidazole or i/v gentamicin + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin (or vancomycin) if high risk of methicillin-resistant *Staphylococcus aureus*.

Resections of colon and rectum for carcinoma, and resections in inflammatory bowel disease, and appendicectomy

- Single dose of i/v gentamicin + i/v metronidazole or i/v cefuroxime + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin p. 561 (or vancomycin p. 562) if high risk of methicillin-resistant *Staphylococcus aureus*.

Endoscopic retrograde cholangiopancreatography

- Single dose of i/v gentamicin p. 545 or oral or i/v ciprofloxacin p. 590.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Prophylaxis recommended if pancreatic pseudocyst, immunocompromised, history of liver transplantation, or risk of incomplete biliary drainage. For biliary complications following liver transplantation, add i/v amoxicillin p. 579 or i/v teicoplanin (or vancomycin).

Percutaneous endoscopic gastrostomy or jejunostomy

- Single dose of i/v co-amoxiclav p. 582 or i/v cefuroxime p. 553.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v teicoplanin (or vancomycin) if history of allergy to penicillins or cephalosporins, or if high risk of methicillin-resistant *Staphylococcus aureus*.

Orthopaedic surgery, antibacterial prophylaxis**Joint replacement including hip and knee**

- Single dose of i/v cefuroxime alone or i/v flucloxacillin p. 586 + i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of methicillin-resistant *Staphylococcus aureus*, use single dose of i/v teicoplanin (or vancomycin) + i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Closed fractures

- Single dose of i/v cefuroxime or i/v flucloxacillin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of methicillin-resistant *Staphylococcus aureus*, use single dose of i/v teicoplanin (or vancomycin) (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Open fractures

- Use i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole p. 572 (or i/v clindamycin p. 564 alone if history of allergy to penicillins or to cephalosporins).

Add i/v teicoplanin (or vancomycin) if high risk of methicillin-resistant *Staphylococcus aureus*. Start prophylaxis within 3 hours of injury and continue until soft tissue closure (max. 72 hours).

At first debridement also use a single dose of i/v cefuroxime + i/v metronidazole + i/v gentamicin or i/v co-amoxiclav + i/v gentamicin (or i/v clindamycin + i/v gentamicin if history of allergy to penicillins or to cephalosporins).

At time of skeletal stabilisation and definitive soft tissue closure use a single dose of i/v gentamicin + i/v teicoplanin (or vancomycin) (intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure).

High lower-limb amputation

- Use i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Continue antibacterial prophylaxis for at least 2 doses after procedure (max. duration of prophylaxis 5 days). If history of allergy to penicillin or to cephalosporins, or if high risk of methicillin-resistant *Staphylococcus aureus*, use i/v teicoplanin (or vancomycin) + i/v gentamicin + i/v metronidazole.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Urological procedures, antibacterial prophylaxis**Transrectal prostate biopsy**

- Single dose of oral ciprofloxacin + oral metronidazole or i/v gentamicin + i/v metronidazole (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin + i/v metronidazole if high risk of methicillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses of antibacterial may be given for prolonged procedures or if there is major blood loss).

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Transurethral resection of prostate

- Single dose of oral ciprofloxacin or i/v gentamicin or i/v cefuroxime (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin if high risk of methicillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Obstetric and gynaecological surgery, antibacterial prophylaxis

Caesarean section

- Single dose of i/v cefuroxime (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Substitute i/v clindamycin if history of allergy to penicillins or cephalosporins. Add i/v teicoplanin (or vancomycin) if high risk of methicillin-resistant *Staphylococcus aureus*.

Hysterectomy

- Single dose of i/v cefuroxime + i/v metronidazole or i/v gentamicin + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin + i/v metronidazole or add i/v teicoplanin (or vancomycin) to other regimens if high risk of methicillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Termination of pregnancy

- Single dose of oral metronidazole (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

If genital chlamydial infection cannot be ruled out, give doxycycline p. 597 postoperatively.

Cardiology procedures, antibacterial prophylaxis

Cardiac pacemaker insertion

- Single dose of i/v cefuroxime alone or i/v flucloxacillin + i/v gentamicin or i/v teicoplanin (or vancomycin) + i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v teicoplanin (or vancomycin) + i/v cefuroxime or i/v teicoplanin (or vancomycin) + i/v gentamicin if high risk of methicillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Vascular surgery, antibacterial prophylaxis

Reconstructive arterial surgery of abdomen, pelvis or legs

- Single dose of i/v cefuroxime p. 553 alone or i/v flucloxacillin p. 586 + i/v gentamicin p. 545 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Add i/v metronidazole p. 572 for patients at risk from anaerobic infections including those with diabetes, gangrene, or undergoing amputation. Use single dose of i/v teicoplanin p. 561 (or vancomycin p. 562) + i/v gentamicin if history of allergy to penicillins or cephalosporins, or if high risk of methicillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Infective endocarditis, antibacterial prophylaxis

NICE guidance: Antimicrobial prophylaxis against infective endocarditis in adults and children undergoing interventional procedures (March 2008, updated 2016)

- Chlorhexidine mouthwash is **not** recommended for the prevention of infective endocarditis in at risk patients undergoing dental procedures.

Antibacterial prophylaxis is **not routinely** recommended for the prevention of infective endocarditis in patients undergoing the following procedures:

- dental;
- upper and lower respiratory tract (including ear, nose, and throat procedures and bronchoscopy);
- genito-urinary tract (including urological, gynaecological, and obstetric procedures);
- upper and lower gastro-intestinal tract.

Whilst these procedures can cause bacteraemia, there is no clear association with the development of infective endocarditis. Prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

If patients at risk of endocarditis are undergoing a gastro-intestinal or genito-urinary tract procedure at a site where infection is suspected, they should receive appropriate antibacterial therapy that includes cover against organisms that cause infective endocarditis.

Patients at risk of infective endocarditis should be:

- advised to maintain good oral hygiene;
- told how to recognise signs of infective endocarditis, and advised when to seek expert advice.

Patients at risk of infective endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.

Dermatological procedures

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who undergo dermatological procedures do not require antibacterial prophylaxis against endocarditis.

The British Association of Dermatologists Therapy Guidelines and Audit Subcommittee advise that such dermatological procedures include skin biopsies and excision of moles or of malignant lesions.

Joint prostheses and dental treatment, antibacterial prophylaxis

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

Immunosuppression and indwelling intraperitoneal catheters

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

Blood infections, antibacterial therapy

Septicaemia (community-acquired)

- A broad-spectrum antipseudomonal penicillin (e.g. piperacillin with tazobactam p. 576, ticarcillin with clavulanic acid p. 576) or a broad-spectrum cephalosporin (e.g. cefuroxime p. 553)
 - ▶ If methicillin-resistant *Staphylococcus aureus* suspected, add vancomycin p. 562 (or teicoplanin p. 561).
 - ▶ If anaerobic infection suspected, add metronidazole p. 572 to broad-spectrum cephalosporin.
 - ▶ If other resistant micro-organisms suspected, use a more broad-spectrum beta-lactam antibacterial (e.g. meropenem p. 549).

Septicaemia (hospital-acquired)

- A broad-spectrum antipseudomonal beta-lactam antibacterial (e.g. piperacillin with tazobactam, ticarcillin with clavulanic acid, ceftazidime p. 555, imipenem with cilastatin p. 548, or meropenem)
 - ▶ If methicillin-resistant *Staphylococcus aureus* suspected, add vancomycin (or teicoplanin).
 - ▶ If anaerobic infection suspected, add metronidazole to broad-spectrum cephalosporin

Septicaemia related to vascular catheter

- Vancomycin (or teicoplanin)
 - ▶ If Gram-negative sepsis suspected, especially in the immunocompromised, add a broad-spectrum antipseudomonal beta-lactam.
 - ▶ Consider removing vascular catheter, particularly if infection caused by *Staphylococcus aureus*, pseudomonas, or *Candida* species.

Meningococcal septicaemia

If meningococcal disease suspected, a single dose of benzylpenicillin sodium p. 577 should be given before urgent transfer to hospital, so long as this does not delay the transfer; cefotaxime p. 555 may be an alternative in penicillin allergy; chloramphenicol p. 601 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.

- Benzylpenicillin sodium or cefotaxime (or ceftriaxone p. 556)
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol

To eliminate nasopharyngeal carriage, ciprofloxacin p. 590, or rifampicin p. 615, or ceftriaxone may be used.

Cardiovascular system infections, antibacterial therapy

Endocarditis: initial 'blind' therapy

- *Native valve endocarditis*, amoxicillin p. 579 (or ampicillin p. 581)
 - ▶ Consider adding low-dose gentamicin p. 545
 - ▶ If penicillin-allergic, or if methicillin-resistant *Staphylococcus aureus* suspected, or if severe sepsis, use vancomycin p. 562 + low-dose gentamicin
 - ▶ If severe sepsis with risk factors for Gram-negative infection, use vancomycin + meropenem p. 549
- *If prosthetic valve endocarditis*, vancomycin + rifampicin p. 615 + low-dose gentamicin

Endocarditis (native valve) caused by staphylococci

- Flucloxacillin p. 586
 - ▶ *Suggested duration of treatment* 4 weeks (at least 6 weeks if secondary lung abscess or osteomyelitis also present)
- *If penicillin-allergic or if methicillin-resistant Staphylococcus aureus*, vancomycin + rifampicin
 - ▶ *Suggested duration of treatment* 4 weeks (at least 6 weeks if secondary lung abscess or osteomyelitis also present)

Endocarditis (prosthetic valve) caused by staphylococci

- Flucloxacillin + rifampicin + low-dose gentamicin
 - ▶ *Suggested duration of treatment* at least 6 weeks; review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- *If penicillin-allergic or if methicillin-resistant Staphylococcus aureus*, vancomycin + rifampicin + low-dose gentamicin
 - ▶ *Suggested duration of treatment* at least 6 weeks; review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks

Endocarditis caused by fully-sensitive streptococci

- Benzylpenicillin sodium p. 577
 - ▶ *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis)
- *If penicillin-allergic*, vancomycin (or teicoplanin p. 561) + low-dose gentamicin
 - ▶ *Suggested duration of treatment* 4–6 weeks (stop gentamicin after 2 weeks)

Endocarditis caused by less-sensitive streptococci

- Benzylpenicillin sodium + low-dose gentamicin
 - ▶ *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks; stop gentamicin at 2 weeks if micro-organisms moderately sensitive to penicillin
- *If penicillin-allergic or highly penicillin-resistant*, vancomycin (or teicoplanin) + low-dose gentamicin
 - ▶ *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks; stop gentamicin at 2 weeks if micro-organisms moderately sensitive to penicillin

Endocarditis caused by enterococci

- Amoxicillin (or ampicillin) + low dose gentamicin or benzylpenicillin sodium + low-dose gentamicin
 - ▶ *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue

gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks

- If penicillin-allergic or penicillin-resistant, vancomycin (or teicoplanin) + low-dose gentamicin
- ▶ Suggested duration of treatment 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- If gentamicin resistant, amoxicillin (or ampicillin)
- ▶ Add streptomycin p. 546 (if susceptible) for 2 weeks
- ▶ Suggested duration of treatment at least 6 weeks

Endocarditis caused by *Haemophilus*, *Actinobacillus*, *Cardiobacterium*, *Eikenella*, and *Kingella* species ('HACEK' micro-organisms)

- Amoxicillin (or ampicillin) + low-dose gentamicin
- ▶ Suggested duration of treatment 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks
- If amoxicillin-resistant, ceftriaxone p. 556 (or cefotaxime p. 555) + low-dose gentamicin
- ▶ Suggested duration of treatment 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks

Central nervous system infections, antibacterial therapy

Meningitis: initial empirical therapy

- Transfer patient to hospital urgently.
- If meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) suspected, benzylpenicillin sodium p. 577 should be given before transfer to hospital, so long as this does not delay the transfer. If a patient with suspected bacterial meningitis without non-blanching rash cannot be transferred to hospital urgently, benzylpenicillin sodium should be given before the transfer. Cefotaxime p. 555 may be an alternative in penicillin allergy; chloramphenicol p. 601 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.
- In hospital, consider adjunctive treatment with dexamethasone p. 712 (particularly if pneumococcal meningitis suspected in adults), preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial; avoid dexamethasone in septic shock, meningococcal septicaemia, or if immunocompromised, or in meningitis following surgery.

In hospital, if aetiology unknown:

- Adult and child 3 months–50 years, cefotaxime (or ceftriaxone p. 556)
- ▶ Consider adding vancomycin p. 562 if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.
- ▶ Suggested duration of treatment at least 10 days
- Adult over 50 years cefotaxime (or ceftriaxone) + amoxicillin p. 579 (or ampicillin p. 581)
- ▶ Consider adding vancomycin if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.
- ▶ Suggested duration of treatment at least 10 days

Meningitis caused by meningococci

- Benzylpenicillin sodium or cefotaxime (or ceftriaxone)
- ▶ Suggested duration of treatment 7 days.
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol
- ▶ Suggested duration of treatment 7 days.

Meningitis caused by pneumococci

- Cefotaxime (or ceftriaxone)
- ▶ Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial (may reduce penetration of vancomycin into cerebrospinal fluid).
- ▶ If micro-organism penicillin-sensitive, replace cefotaxime with benzylpenicillin sodium.
- ▶ If micro-organism highly penicillin- and cephalosporin-resistant, add vancomycin and if necessary rifampicin p. 615.
- ▶ Suggested duration of antibacterial treatment 14 days

Meningitis caused by *Haemophilus influenzae*

- Cefotaxime (or ceftriaxone)
- ▶ Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
- ▶ Suggested duration of antibacterial treatment 10 days.
- ▶ For *H. influenzae* type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, or if micro-organism resistant to cefotaxime, chloramphenicol
- ▶ Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
- ▶ Suggested duration of antibacterial treatment 10 days.
- ▶ For *H. influenzae* type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts

Meningitis caused by *Listeria*

- Amoxicillin (or ampicillin) + gentamicin p. 545
- ▶ Suggested duration of treatment 21 days.
- ▶ Consider stopping gentamicin after 7 days.
- If history of immediate hypersensitivity reaction to penicillin, co-trimoxazole p. 594
- ▶ Suggested duration of treatment 21 days.

Diabetic foot infections, antibacterial therapy

13-Nov-2019

Diabetic foot infection

Diabetic foot infection is defined as any type of skin, soft tissue or bone infection below the ankle in patients with diabetes. It includes cellulitis, paronychia, abscesses, myositis, tendonitis, necrotising fasciitis, osteomyelitis, and septic arthritis. It is defined clinically by the presence of at least 2 of the following: local swelling or induration, erythema, local tenderness or pain, local warmth, or purulent discharge.

For guidance on classification of infection severity, see NICE guideline: **Diabetic foot problems** (see *Useful resources*).

Treatment

EvGr Refer patients immediately to acute services and inform the multidisciplinary foot care service if they have a limb-threatening or life-threatening problem, such as ulceration with fever or any signs of sepsis, ulceration with limb ischaemia, or gangrene.

Antibacterial treatment should be started as soon as possible if diabetic foot infection is suspected. Samples (such as soft tissue, bone sample, or deep swab) should be taken for microbiological testing before, or as close as possible to, the start of antibacterial treatment.

Offer an antibacterial taking into account the severity of infection, risk of complications, previous microbiological results, recent antibacterial use, and patient preferences. **A**

For other considerations such as switching from intravenous to oral antibacterials, and for advice to be given to patients, see Antibacterials, principles of therapy p. 527.

Reassessment

EvGr Reassess if symptoms worsen rapidly or significantly at any time, do not start to improve within 1–2 days of starting antibacterial treatment, or the patient becomes systemically very unwell or has severe pain out of proportion to the infection. Take into account other diagnoses (such as pressure sores, gout, or non-infected ulcers), signs and symptoms of a more serious illness (such as limb ischaemia, osteomyelitis, necrotising fasciitis, or sepsis), and previous antibacterial use.

Review the choice of antibacterial when microbiological results are available and change according to the results, using a narrower-spectrum antibacterial if appropriate. **A**

Choice of antibacterial therapy

EvGr Treatment should be based on clinical assessment, infection severity, suspected micro-organism, and be guided by microbiological results when available. Treatment duration should be based on the severity of infection, and clinical assessment of response to treatment. Review the need for continued antibacterials regularly.

Offer oral antibacterials to patients who are able to take oral treatment and the severity of their condition does not require intravenous treatment. **A**

Mild infection

- **Oral first line** :
 - ▶ **EvGr** Flucloxacillin p. 586.
 - ▶ Alternative in penicillin allergy or flucloxacillin unsuitable: clarithromycin p. 567, doxycycline p. 597, or erythromycin p. 569 (in pregnancy). **A**

Moderate or severe infection

- Treatment duration is based on clinical assessment; minimum of 7 days and up to 6 weeks for osteomyelitis (use oral antibacterials for prolonged treatment). In severe infection, intravenous antibacterials should be given for at least 48 hours (until stabilised).
- **Oral or Intravenous first line** :
 - ▶ **EvGr** Flucloxacillin **with** or **without** intravenous gentamicin p. 545 **and/or** metronidazole p. 572, or co-amoxiclav p. 582 **with** or **without** intravenous gentamicin p. 545, or intravenous ceftriaxone p. 556 **with** metronidazole p. 572.
 - ▶ Alternative in penicillin allergy: co-trimoxazole p. 594 [unlicensed] **with** or **without** intravenous gentamicin p. 545 **and/or** metronidazole p. 572.
 - ▶ Additional antibacterial choices if *Pseudomonas aeruginosa* suspected or confirmed: intravenous piperacillin with tazobactam p. 576, or clindamycin p. 564 **with** ciprofloxacin p. 590 **and/or** intravenous gentamicin p. 545.
 - ▶ If methicillin-resistant *Staphylococcus aureus* (MRSA) confirmed or suspected **add** intravenous vancomycin p. 562, or intravenous teicoplanin p. 561, or linezolid p. 605 (specialist use only if vancomycin or teicoplanin cannot be used).

- ▶ Other antibacterials may be appropriate based on microbiological results and specialist advice. **A**

Useful Resources

Diabetic foot problems: prevention and management. National Institute for Health and Care Excellence. NICE guideline 19. August 2015, updated October 2019. www.nice.org.uk/guidance/ng19

Ear infections, antibacterial therapy

03-Sep-2018

Otitis externa

Otitis externa can be triggered by a bacterial infection caused by *Pseudomonas aeruginosa* or *Staphylococcus aureus*. Consider systemic antibacterial if spreading cellulitis or patient systemically unwell.

Choice of antibacterial therapy**No penicillin allergy**

- Flucloxacillin p. 586

Penicillin allergy or intolerance

- Clarithromycin p. 567 (or azithromycin p. 566 or erythromycin p. 569)

If pseudomonas suspected

- Ciprofloxacin p. 590 (or an aminoglycoside)
- For topical treatments, see *Otitis externa*, under Ear p. 1259.

Otitis media

Acute otitis media is an inflammation in the middle ear associated with effusion and accompanied by an ear infection. Acute otitis media is commonly seen in children and is generally caused by viruses (respiratory syncytial virus and rhinovirus) or bacteria (*Haemophilus influenzae*, *Streptococcus pneumoniae*, *Streptococcus pyogenes*, and *Moraxella catarrhalis*); both virus and bacteria often co-exist. For further information see *Acute otitis media* in Ear p. 1259.

EvGr Antibacterial therapy should be offered to children with acute otitis media who are systemically very unwell, have signs and symptoms of a more serious illness, or those who are at high-risk of serious complications due to pre-existing comorbidities. Antibacterial therapy should also be considered if otorrhoea (discharge following perforation of the eardrum) is present, or in children under 2 years of age with bilateral otitis media. **A**

Choice of antibacterial therapy in children**No penicillin allergy**

- **First line**: **EvGr** amoxicillin p. 579. **A**
- **Second line** (worsening symptoms despite 2 to 3 days of antibacterial treatment): **EvGr** co-amoxiclav p. 582. **A**

Penicillin allergy or intolerance

- **First line**: **EvGr** clarithromycin p. 567 or erythromycin p. 569 (preferred in pregnancy). **A**
- **Second line** (worsening symptoms despite 2 to 3 days of antibacterial treatment): **EvGr** Consult local microbiologist. **A**

Eye infections, antibacterial therapy**Conjunctivitis (purulent)**

- Chloramphenicol eye drops p. 1236.

Gastro-intestinal system infections, antibacterial therapy

20-Feb-2020

Gastro-enteritis

Frequently self-limiting and may not be bacterial.

- Antibacterial not usually indicated

Campylobacter enteritis

Microbially self-limiting; treat if immunocompromised or if severe infection.

- Clarithromycin p. 567 (or azithromycin p. 566 or erythromycin p. 569)
- *Alternative*, ciprofloxacin p. 590
- ▶ Strains with decreased sensitivity to ciprofloxacin isolated frequently

Diverticulitis, acute

Acute diverticulitis is a condition where diverticula (small pouches protruding from the walls of the large intestine) suddenly become inflamed or infected. Complicated acute diverticulitis refers to diverticulitis associated with complications such as abscess, bowel perforation and peritonitis, fistula, intestinal obstruction, haemorrhage, or sepsis. For further information on acute diverticulitis including the non-antibacterial management, see Diverticular disease and diverticulitis p. 40.

Treatment

EvGr For patients with acute diverticulitis who are systemically well, consider a watchful waiting and a no antibacterial prescribing strategy. Advise patients to re-present if symptoms persist or worsen.

For patients who are systemically unwell, immunosuppressed, or have significant comorbidities, an antibacterial prescribing strategy should be offered.

Oral antibacterials should be offered to patients who are systemically unwell but do not meet the referral criteria for suspected complicated acute diverticulitis.

Patients with persistent or worsening symptoms should be reassessed in primary care and considered for referral to hospital for further assessment.

Patients with suspected complicated acute diverticulitis and uncontrolled abdominal pain should be referred for same-day hospital assessment.

Patients admitted to hospital with suspected or confirmed complicated acute diverticulitis should be treated with intravenous antibacterials. **Ad** For guidance on the management of suspected sepsis, see NICE guideline *Sepsis* at: www.nice.org.uk/guidance/ng51.

For other considerations such as switching from intravenous to oral antibacterials, and for advice to be given to patients, see Antibacterials, principles of therapy p. 527.

EvGr Antibacterial prophylaxis is not recommended to prevent recurrent acute diverticulitis. **Ad**

Choice of antibacterial therapy

EvGr Patients unable to take oral treatment should be referred to hospital. **Ad**

Suspected or confirmed uncomplicated acute diverticulitis

- **Oral first line** :

- ▶ **EvGr** Co-amoxiclav p. 582.
- ▶ *Alternative* in penicillin allergy or co-amoxiclav unsuitable: cefalexin p. 551 (caution in penicillin allergy) **with** metronidazole p. 572, or trimethoprim p. 607 **with** metronidazole p. 572, or ciprofloxacin p. 590 (only if switching from intravenous route with specialist advice) **with** metronidazole p. 572. **Ad**

Suspected or confirmed complicated acute diverticulitis

- **Intravenous first line** :

- ▶ **EvGr** Co-amoxiclav, or cefuroxime p. 553 **with** metronidazole p. 572, or amoxicillin p. 579 **with** gentamicin p. 545 **and** metronidazole p. 572.
- ▶ *Alternative* in penicillin and cephalosporins allergy: ciprofloxacin p. 590 **with** metronidazole p. 572.
- ▶ For *alternative* antibacterials consult local microbiologist. **Ad**

Salmonella (non-typhoid)

Treat invasive or severe infection. Do not treat less severe infection unless there is a risk of developing invasive infection (e.g. immunocompromised patients, those with haemoglobinopathy, or children under 6 months of age).

- Ciprofloxacin or cefotaxime p. 555

Shigellosis

Antibacterial not indicated for mild cases.

- Ciprofloxacin or azithromycin
- *Alternatives if micro-organism sensitive*, amoxicillin p. 579 or trimethoprim p. 607

Typhoid fever

Infections from Middle-East, South Asia, and South-East Asia may be multiple-antibacterial-resistant and sensitivity should be tested.

- Cefotaxime (or ceftriaxone p. 556)
- ▶ azithromycin may be an *alternative* in mild or moderate disease caused by multiple-antibacterial-resistant organisms.
- *Alternative if micro-organism sensitive*, ciprofloxacin

Clostridioides difficile infection

Clostridioides difficile infection is caused by colonisation of the colon with *Clostridioides difficile* and production of toxin. It often follows antibiotic therapy and is usually of acute onset, but may become chronic. It is a particular hazard of ampicillin p. 581, amoxicillin, co-amoxiclav, second- and third-generation cephalosporins, clindamycin p. 564, and quinolones, but few antibiotics are free of this side-effect. Treatment options include metronidazole p. 572, vancomycin p. 562, and fidaxomicin p. 603.

- *For first episode of mild to moderate infection*, oral metronidazole
- ▶ *Suggested duration of treatment* 10–14 days
- *For second or subsequent episode of infection, for severe infection, for infection not responding to metronidazole, or in patients intolerant of metronidazole*, oral vancomycin
- ▶ For severe infection in patients with multiple comorbidities who are receiving treatment with other antibacterials, or for second or subsequent episode of infection, fidaxomicin can replace vancomycin
- ▶ *Suggested duration of treatment* 10–14 days
- *For infection not responding to vancomycin or fidaxomicin, for life-threatening infection, or in patients with ileus*, oral vancomycin + i/v metronidazole
- ▶ For infection not responding to vancomycin in patients without life-threatening infection or ileus, fidaxomicin can be used instead of vancomycin + metronidazole
- ▶ *Suggested duration of treatment* 10–14 days

Biliary-tract infection

- Ciprofloxacin or gentamicin p. 545 or a cephalosporin

Peritonitis

- A cephalosporin + metronidazole or gentamicin + metronidazole or gentamicin + clindamycin or piperacillin with tazobactam p. 576 alone

Peritonitis: peritoneal dialysis-associated

- Vancomycin (or teicoplanin p. 561) + ceftazidime p. 555 added to dialysis fluid or vancomycin added to dialysis fluid + ciprofloxacin by mouth
- ▶ *Suggested duration of treatment* 14 days or longer

Genital system infections, antibacterial therapy**Bacterial vaginosis**

- Oral metronidazole p. 572
- ▶ *Suggested duration of treatment* 5–7 days (or high-dose metronidazole as a single dose)
- *Alternatively*, topical metronidazole for 5 days or topical clindamycin p. 874 for 7 days

Uncomplicated genital chlamydial infection, non-gonococcal urethritis, and non-specific genital infection

Contact tracing recommended.

- Azithromycin p. 566 or doxycycline p. 597
- ▶ *Suggested duration of treatment* azithromycin as a single dose or doxycycline for 7 days
- *Alternatively*, erythromycin p. 569.
- ▶ *Suggested duration of treatment* 14 days

Gonorrhoea: uncomplicated

Contact tracing recommended. Consider chlamydia co-infection. Choice of alternative antibacterial regimen depends on locality where infection acquired.

- Azithromycin + i/m ceftriaxone p. 556
- ▶ *Suggested duration of treatment* is a single-dose of each antibacterial
- *Alternatively, when parenteral administration is not possible*, cefixime p. 555 + azithromycin
- ▶ *Suggested duration of treatment* is a single-dose of each antibacterial
- *Alternatively, if micro-organism is sensitive to a quinolone*, ciprofloxacin p. 590 + azithromycin
- ▶ *Suggested duration of treatment* is a single-dose of each antibacterial
- *Pharyngeal infection*, azithromycin + i/m ceftriaxone
- ▶ *Suggested duration of treatment* is a single-dose of each antibacterial

Pelvic inflammatory disease

Contact tracing recommended.

- Doxycycline + metronidazole + single-dose of i/m ceftriaxone or ofloxacin p. 593 + metronidazole
- ▶ *Suggested duration of treatment* 14 days (except i/m ceftriaxone).
- ▶ In severely ill patients initial treatment with doxycycline + i/v ceftriaxone + i/v metronidazole, then switch to oral treatment with doxycycline + metronidazole to complete 14 days' treatment

Early syphilis (infection of less than 2 years)

Contact tracing recommended.

- Benzathine benzylpenicillin p. 577
- ▶ *Suggested duration of treatment* single-dose (repeat dose after 7 days for women in the third trimester of pregnancy)
- *Alternatively*, doxycycline or erythromycin
- ▶ *Suggested duration of treatment* 14 days

Late latent syphilis (asymptomatic infection of more than 2 years)

Contact tracing recommended.

- Benzathine benzylpenicillin

- ▶ *Suggested duration of treatment* once weekly for 2 weeks
- *Alternatively*, doxycycline
- ▶ *Suggested duration of treatment* 28 days

Asymptomatic contacts of patients with infectious syphilis

- Doxycycline
- ▶ *Suggested duration of treatment* 14 days

Musculoskeletal system infections, antibacterial therapy**Osteomyelitis**

For management of osteomyelitis below the ankle in individuals with diabetes mellitus, see Diabetic foot infections, antibacterial therapy p. 533.

Seek specialist advice if chronic infection or prostheses present.

- Flucloxacillin p. 586
- ▶ Consider adding fusidic acid p. 604 or rifampicin p. 615 for initial 2 weeks.
- ▶ *Suggested duration of treatment* 6 weeks for acute infection
- *If penicillin-allergic*, clindamycin p. 564
- ▶ Consider adding fusidic acid or rifampicin for initial 2 weeks.
- ▶ *Suggested duration of treatment* 6 weeks for acute infection
- *If meticillin-resistant Staphylococcus aureus suspected*, vancomycin p. 562 (or teicoplanin p. 561)
- ▶ Consider adding fusidic acid or rifampicin for initial 2 weeks.
- ▶ *Suggested duration of treatment* 6 weeks for acute infection

Septic arthritis

For management of septic arthritis below the ankle in individuals with diabetes mellitus, see Diabetic foot infections, antibacterial therapy p. 533.

Seek specialist advice if prostheses present.

- Flucloxacillin
- ▶ *Suggested duration of treatment* 4–6 weeks (longer if infection complicated).
- *If penicillin-allergic*, clindamycin
- ▶ *Suggested duration of treatment* 4–6 weeks (longer if infection complicated).
- *If meticillin-resistant Staphylococcus aureus suspected*, vancomycin (or teicoplanin)
- ▶ *Suggested duration of treatment* 4–6 weeks (longer if infection complicated).
- *If gonococcal arthritis or Gram-negative infection suspected*, cefotaxime p. 555 (or ceftriaxone p. 556)
- ▶ *Suggested duration of treatment* 4–6 weeks (longer if infection complicated; treat gonococcal infection for 2 weeks).

Nose infections, antibacterial therapy

31-Oct-2017

Sinusitis (acute)

Acute sinusitis is generally triggered by a viral infection, although occasionally it may become complicated by a bacterial infection caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*, *Moraxella catharrhalis*, or *Staphylococcus aureus*. For further information see Sinusitis (acute) p. 1268.

Treatment

EvGr Antibacterial therapy should *only* be offered to patients with acute sinusitis who are systemically very unwell, have

signs and symptoms of a more serious illness, those who are at high-risk of complications due to pre-existing comorbidities, or whenever bacterial sinusitis is suspected.

Patients presenting with symptoms for around 10 days or more with no improvement may be prescribed a back-up antibiotic prescription, which can be used if symptoms do not improve within 7 days or if they worsen significantly at any time. [▲](#) For further information see, Sinusitis (acute) p. 1268.

Choice of antibacterial therapy

No penicillin allergy

- **First line:**
 - ▶ [EvGr](#) Non-life threatening symptoms: phenoxymethylpenicillin p. 578.
 - ▶ Systemically very unwell, signs and symptoms of a more serious illness, or at high-risk of complications: co-amoxiclav p. 582. [▲](#)
- **Second line** (worsening symptoms despite 2 or 3 days of antibiotic treatment):
 - ▶ [EvGr](#) Non-life threatening symptoms: co-amoxiclav.
 - ▶ Systemically very unwell, signs and symptoms of a more serious illness or at high-risk of complications: consult local microbiologist. [▲](#)

Penicillin allergy or intolerance

- **First line:** [EvGr](#) doxycycline p. 597 or clarithromycin p. 577 (erythromycin p. 569 in pregnancy). [▲](#)
- **Second line** (worsening symptoms despite 2 or 3 days of antibiotic treatment): [EvGr](#) Consult local microbiologist. [▲](#)

Useful Resources

Sinusitis (acute): antimicrobial prescribing. National Institute for Health and Care Excellence. NICE guideline 79. October 2017.

www.nice.org.uk/guidance/ng79

Oral bacterial infections

Antibacterial drugs

Antibacterial drugs should only be prescribed for the treatment of oral infections on the basis of defined need. They may be used in conjunction with (but not as an alternative to) other appropriate measures, such as providing drainage or extracting a tooth.

The 'blind' prescribing of an antibacterial for unexplained pyrexia, cervical lymphadenopathy, or facial swelling can lead to difficulty in establishing the diagnosis. In severe oral infections, a sample should always be taken for bacteriology.

Oral infections which may require antibacterial treatment include acute periapical or periodontal abscess, cellulitis, acutely created oral-antral communication (and acute sinusitis), severe pericoronitis, localised osteitis, acute necrotising ulcerative gingivitis, and destructive forms of chronic periodontal disease. Most of these infections are readily resolved by the early establishment of drainage and removal of the cause (typically an infected necrotic pulp). Antibacterials may be required if treatment has to be delayed, in immunocompromised patients, or in those with conditions such as diabetes or Paget's disease. Certain rare infections including bacterial sialadenitis, osteomyelitis, actinomycosis, and infections involving fascial spaces such as Ludwig's angina, require antibiotics and specialist hospital care.

Antibacterial drugs may also be useful after dental surgery in some cases of spreading infection. Infection may spread to involve local lymph nodes, to fascial spaces (where it can cause airway obstruction), or into the bloodstream (where it can lead to cavernous sinus thrombosis and other serious complications). Extension of an infection can also lead to

maxillary sinusitis; osteomyelitis is a complication, which usually arises when host resistance is reduced.

If the oral infection fails to respond to antibacterial treatment within 48 hours the antibacterial should be changed, preferably on the basis of bacteriological investigation. Failure to respond may also suggest an incorrect diagnosis, lack of essential additional measures (such as drainage), poor host resistance, or poor patient compliance.

Combination of a penicillin (or a macrolide) with metronidazole p. 572 may sometimes be helpful for the treatment of severe oral infections or oral infections that have not responded to initial antibacterial treatment.

Penicillins

Phenoxymethylpenicillin p. 578 is effective for dentoalveolar abscess.

Broad-spectrum penicillins

- Amoxicillin p. 579 is as effective as phenoxymethylpenicillin but is better absorbed; however, it may encourage emergence of resistant organisms. Like phenoxymethylpenicillin, amoxicillin is ineffective against bacteria that produce beta-lactamases.

Amoxicillin may be useful for short course oral regimens. Co-amoxiclav p. 582 is active against beta-lactamase-producing bacteria that are resistant to amoxicillin. Co-amoxiclav may be used for severe dental infection with spreading cellulitis or dental infection not responding to first-line antibacterial treatment.

Cephalosporins

The cephalosporins offer little advantage over the penicillins in dental infections, often being less active against anaerobes. Infections due to oral streptococci (often termed viridans streptococci) which become resistant to penicillin are usually also resistant to cephalosporins. This is of importance in the case of patients who have had rheumatic fever and are on long-term penicillin therapy. Cefalexin p. 551 and cefradine p. 552 have been used in the treatment of oral infections.

Tetracyclines

In adults, tetracyclines can be effective against oral anaerobes but the development of resistance (especially by oral streptococci) has reduced their usefulness for the treatment of acute oral infections; they may still have a role in the treatment of destructive (refractory) forms of periodontal disease. Doxycycline p. 597 has a longer duration of action than tetracycline p. 600 or oxytetracycline p. 600 and need only be given once daily; it is reported to be more active against anaerobes than some other tetracyclines.

Doxycycline may have a role in the treatment of recurrent aphthous ulceration, or as an adjunct to gingival scaling and root planing for periodontitis.

Macrolides

The macrolides are an alternative for oral infections in penicillin-allergic patients or where a beta-lactamase producing organism is involved. However, many organisms are now resistant to macrolides or rapidly develop resistance; their use should therefore be limited to short courses.

Clindamycin

Clindamycin p. 564 should not be used routinely for the treatment of oral infections because it may be no more effective than penicillins against anaerobes and there may be cross-resistance with erythromycin-resistant bacteria p. 569. Clindamycin can be used for the treatment of dentoalveolar abscess that has not responded to penicillin or to metronidazole.

Metronidazole and tinidazole

Metronidazole is an alternative to a penicillin for the treatment of many oral infections where the patient is allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes. It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent's infection) and pericoronitis; amoxicillin is a suitable alternative. For these purposes metronidazole for 3 days is sufficient, but the duration of treatment may need to be longer in pericoronitis. Tinidazole p. 574 is licensed for the treatment of acute ulcerative gingivitis.

Respiratory system infections, antibacterial therapy

06-May-2020

Epiglottitis (*Haemophilus influenzae*)

- Cefotaxime p. 555 (or ceftriaxone p. 556)
- *If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol p. 601*

Bronchiectasis (non-cystic fibrosis), acute exacerbation

Bronchiectasis is a persistent or progressive condition, caused by chronic inflammatory damage to the airways and is characterised by thick-walled, dilated bronchi. Signs and symptoms may range from intermittent expectoration and infection, to chronic cough, persistent daily production of sputum, bacterial colonisation, and recurrent infections. An acute exacerbation is defined as sustained deterioration of the patient's signs and symptoms from their baseline, and presents with worsening local symptoms, with or without increased wheeze, breathlessness or haemoptysis and may be accompanied by fever or pleurisy.

Treatment

EVGr Obtain a sputum sample and send for culture and susceptibility testing. Antibacterial therapy should be given to all patients with an acute exacerbation. **A**

For patients receiving prophylactic antibacterial therapy, switching from intravenous to oral antibacterials, and for advice to be given to patients, see Antibacterials, principles of therapy p. 527.

EVGr Refer patients to hospital if they have signs or symptoms suggestive of a more serious illness such as cardiorespiratory failure or sepsis. **A**

Reassessment

EVGr Reassess if symptoms worsen rapidly or significantly at any time and consider:

- Other diagnoses such as pneumonia, or signs and symptoms of a more serious illness such as cardiorespiratory failure, or sepsis;
 - Previous antibacterial use that may have led to resistance.
- Review choice of antibacterial if susceptibility results indicate bacterial resistance and symptoms are not improving—consult local microbiologist as needed. **A**

Choice of antibacterial therapy

EVGr The recommended total duration of treatment is 7–14 days.

Treatment should be guided by the most recent sputum culture and susceptibility results when available.

Seek specialist advice for patients whose symptoms are not improving with repeated courses, or who are resistant to, or cannot take oral antibacterials. **A**

• Oral first line :

- ▶ **EVGr** Amoxicillin p. 579, clarithromycin p. 567, or doxycycline p. 597.
- ▶ Alternative if at high risk of treatment failure (repeated courses of antibacterials, previous culture with resistant or

atypical bacteria, or high risk of complications): co-amoxiclav p. 582, or levofloxacin p. 592. **A**

- ▶ **Intravenous first line** (severely unwell or unable to take oral treatment):

▶ **EVGr** Co-amoxiclav, piperacillin with tazobactam p. 576, or levofloxacin. **A**

Antibacterial prophylaxis

- **EVGr** For patients with repeated acute exacerbations, a trial of antibacterial prophylaxis may be given on specialist advice only. **A**

Chronic obstructive pulmonary disease, acute exacerbation

An acute exacerbation of chronic obstructive pulmonary disease (COPD) is a sustained worsening of symptoms from the patient's usual stable state, that is beyond the usual day to day variations. Many exacerbations are not caused by bacterial infections, but instead can be triggered by other factors such as smoking or viral infections.

For the non-antibacterial management of acute exacerbations of COPD, see Chronic obstructive pulmonary disease p. 256.

Treatment

EVGr Consider antibacterial treatment taking into account:

- The severity of symptoms, sputum colour changes and increases in volume and thickness;
- The need for hospital admission;
- Previous exacerbations and hospital admission history, and risk of developing complications. **A**

For other considerations such as in patients receiving prophylactic antibacterial therapy, switching from intravenous to oral antibacterials, and for advice to be given to patients, see Antibacterials, principles of therapy p. 527.

EVGr Refer patients to hospital if they have signs or symptoms suggestive of a more serious illness such as cardiorespiratory failure or sepsis. **A**

Reassessment

EVGr Reassess if symptoms worsen rapidly or significantly at any time and consider:

- Other diagnoses such as pneumonia, or signs and symptoms of a more serious illness such as cardiorespiratory failure, or sepsis;
 - Previous antibacterial use that may have led to resistance.
- Send a sputum sample for testing if there is no improvement after antibacterial therapy and this has not already been done.

Review choice of antibacterial if susceptibility results indicate bacterial resistance and symptoms are not improving—consult local microbiologist as needed. **A**

Choice of antibacterial therapy

EVGr The recommended total duration of treatment is 5 days.

Treatment should be guided by the most recent sputum culture and susceptibility results when available.

Seek specialist advice for patients whose symptoms are not improving with repeated courses, or who are resistant to, or cannot take oral antibacterials. **A**

• Oral first line :

- ▶ **EVGr** Amoxicillin, clarithromycin, or doxycycline.
- ▶ Alternative if at high risk of treatment failure (repeated courses of antibacterials, previous culture with resistant or atypical bacteria, or high risk of complications): co-amoxiclav, or levofloxacin. **A**
- **Oral second line** (if no improvement after at least 2 to 3 days):
 - ▶ **EVGr** Use a first line antibacterial from a different class to the antibacterial used previously.
 - ▶ Alternative if at high risk of treatment failure: co-amoxiclav, levofloxacin, or co-trimoxazole p. 594 (only when sensitivities are available and there is good reason to use co-trimoxazole over single antibacterials). **A**

- **Intravenous first line** (severely unwell or unable to take oral treatment):
 - ▶ [EVGr](#) Amoxicillin, co-amoxiclav, clarithromycin, co-trimoxazole, or piperacillin with tazobactam. [▲](#)
- **Intravenous second line** : [EVGr](#) Choice should be made in consultation with a local microbiologist. [▲](#)

Cough, acute

Acute cough is usually self-limiting and often resolves within 3–4 weeks without antibacterials. It is most commonly caused by a viral upper respiratory tract infection, but can have other infective causes such as acute bronchitis or pneumonia, or non-infective causes such as interstitial lung disease or gastro-oesophageal reflux disease.

Treatment

[EVGr](#) Patients should be advised that an acute cough is usually self-limiting and to manage their symptoms using self-care treatments. These include honey and over-the-counter cough medicines containing expectorants or cough suppressants, however there is limited evidence to support the use of such products. For more information, see Aromatic inhalations, cough preparations and systemic nasal decongestants p. 311.

Patients with an acute cough who are systemically very unwell should be offered immediate antibacterial treatment.

Do not routinely offer an antibacterial to treat an acute cough associated with an upper respiratory tract infection or acute bronchitis in patients who are not systemically very unwell or at higher risk of complications. [▲](#)

Patients with a pre-existing co-morbidity, young children who were born prematurely, and patients aged over 65 years of age and the presence of certain criteria (hospitalisation in the previous year, type 1 or 2 diabetes, history of congestive heart failure, or currently taking oral corticosteroids) are considered to be at a higher risk of complications if they present with an acute cough. [EVGr](#) Immediate or back-up antibacterial treatment should be considered in these patients based on the face-to-face clinical examination. If back-up treatment is given, advise patients to start treatment if symptoms worsen rapidly or significantly at any time. [▲](#)

For general advice to give to patients, see Antibacterials, principles of therapy p. 527.

[EVGr](#) Seek specialist advice, or refer patients with an acute cough to hospital if they have signs or symptoms of a more serious illness or condition. [▲](#)

Reassessment

[EVGr](#) Reassess if symptoms worsen rapidly or significantly taking into account alternative diagnoses, signs or symptoms suggestive of a more serious condition, and previous antibacterial use which may have led to resistant bacteria. [▲](#)

Choice of antibacterial therapy

[EVGr](#) The recommended duration of oral treatment is 5 days. [▲](#)

- **First line**
 - ▶ [EVGr](#) Doxycycline p. 597.
 - ▶ Alternative first line choices: amoxicillin p. 579, clarithromycin p. 567, or erythromycin p. 569. [▲](#)
- Choice during pregnancy:
 - ▶ [EVGr](#) Amoxicillin or erythromycin. [▲](#)

Pneumonia, community-acquired

Pneumonia is an acute infection of the lung parenchyma that presents with symptoms such as cough, chest pain, dyspnoea, and fever. It is classified as community-acquired if acquired outside of hospital or in a nursing home.

For recommendations on the management of pneumonia during the COVID-19 pandemic, see NICE rapid guidelines:

Managing suspected or confirmed pneumonia in adults in the community (available at: www.nice.org.uk/guidance/

[ng165](#)), and **Antibiotics for pneumonia in adults in hospital** for patients presenting to hospital with community acquired pneumonia (available at: www.nice.org.uk/guidance/ng173). Where the new recommendations cover existing recommendations discussed below, follow the rapid guideline recommendations during the pandemic. For further information on COVID-19, see COVID-19 p. 656.

Treatment

[EVGr](#) Offer an antibacterial taking into account the severity assessment, risk of complications, local antimicrobial resistance and surveillance data, recent antibacterial use, and recent microbiological results. [▲](#) For severity assessment and guidance on monitoring, see NICE guideline on pneumonia in adults (see *Useful resources*).

[EVGr](#) Antibacterial treatment should be started as soon as possible and within 4 hours of establishing a diagnosis (within 1 hour if the patient has suspected sepsis and meets any of the high risk criteria for this – see NICE guideline on sepsis at: www.nice.org.uk/guidance/ng51).

Refer patients to hospital as recommended in the NICE guideline on pneumonia in adults, or if they have signs or symptoms suggestive of a more serious illness (such as cardiorespiratory failure or sepsis).

In patients with moderate or high-severity community-acquired pneumonia, obtain blood and sputum cultures and consider performing pneumococcal and legionella urinary antigen tests.

Do not routinely offer a glucocorticoid to patients with community-acquired pneumonia unless they have other conditions for which glucocorticoid treatment is indicated. [▲](#)

For other considerations such as switching from intravenous to oral antibacterials, and for advice to be given to patients, see Antibacterials, principles of therapy p. 527. [▲](#)

Reassessment

[EVGr](#) Reassess if signs or symptoms do not improve or worsen rapidly or significantly, and consider other possible non-bacterial causes such as influenza.

If a sample has been sent for microbiological testing, review the choice of antibacterial and consider changing according to the results, using a narrower-spectrum antibacterial if appropriate.

Send a sample (such as sputum sample) for testing if there is no improvement after antibacterial therapy and this has not already been done.

Refer patients to hospital if symptoms do not improve as expected with antibacterial treatment. [▲](#)

Choice of antibacterial therapy

[EVGr](#) Treatment should be based on severity assessment using clinical judgement and CRB65 or CURB65, suspected micro-organism, and in moderate and high-severity community-acquired pneumonia microbiological results when available.

Offer oral antibacterials to patients who are able to take oral treatment and the severity of their condition does not require intravenous treatment.

Consider referral to hospital or seeking specialist advice if bacteria are resistant to oral antibacterials or patients cannot take oral treatment. [▲](#)

Low severity

- **Oral first line** :
 - ▶ [EVGr](#) Amoxicillin.
 - ▶ Alternative in penicillin allergy or amoxicillin unsuitable (e.g. atypical pathogens suspected): clarithromycin, doxycycline, or erythromycin (in pregnancy). [▲](#)

Moderate severity

- **Oral first line** :
 - ▶ [EVGr](#) Amoxicillin.
 - ▶ If atypical pathogens suspected: amoxicillin with clarithromycin or erythromycin (in pregnancy).

- ▶ Alternative in penicillin allergy: clarithromycin, or doxycycline. 

High severity

● Oral or Intravenous first line :

-  Co-amoxiclav p. 582 with clarithromycin or oral erythromycin (in pregnancy).
- ▶ Alternative in penicillin allergy: levofloxacin p. 592 (consult local microbiologist if fluoroquinolone not appropriate). 

Pneumonia, hospital-acquired

Pneumonia is an acute infection of the lung parenchyma that presents with symptoms such as cough, chest pain, dyspnoea, and fever. It is classified as hospital-acquired when it develops 48 hours or more after hospital admission.

For recommendations on the management of suspected or confirmed pneumonia during the COVID-19 pandemic, see NICE rapid guideline: **Antibiotics for pneumonia in adults in hospital** (available at: www.nice.org.uk/guidance/ng173). Where the new recommendations cover existing recommendations discussed below, follow the rapid guideline recommendations during the pandemic. For further information on COVID-19, see COVID-19 p. 656.

Treatment

 In patients with signs or symptoms of pneumonia starting within 48 hours of hospital admission, follow recommendations for patients with community-acquired pneumonia.

Offer an antibacterial taking into account:

- The severity of signs or symptoms;
- The number of days in hospital before onset of symptoms;
- The risk of complications;
- Local hospital and ward-based antimicrobial resistance data;
- Recent antibacterial use;
- Recent microbiological test results;
- Recent contact with health or social care settings;
- Risk of adverse effects such as *Clostridioides difficile* infection.

Antibacterial treatment should be started as soon as possible and within 4 hours of establishing a diagnosis (within 1 hour if the patient has suspected sepsis and meets any of the high risk criteria for this — see NICE guideline on sepsis at: www.nice.org.uk/guidance/ng51).

A sample (for example, sputum sample, nasopharyngeal swab, or tracheal aspirate) should be taken for microbiological testing. 

For other considerations such as switching from intravenous to oral antibacterials, and for advice to be given to patients, see Antibacterials, principles of therapy p. 527.

Reassessment

 Reassess if symptoms do not improve or worsen rapidly or significantly.

When microbiological results are available, review choice of antibacterial and change treatment according to the results, using a narrower-spectrum antibacterial if appropriate.

Seek advice from a microbiologist if symptoms do not improve as expected with treatment, or multidrug-resistant bacteria are present. 

Choice of antibacterial therapy

 For patients with non-severe signs or symptoms and not at higher risk of resistance, treatment should be guided by microbiological results when available. For patients with severe signs or symptoms or at higher risk of resistance, treatment should be based on specialist microbiological advice and local resistance data.

Higher risk of resistance includes signs or symptoms starting more than 5 days after hospital admission, relevant comorbidity, recent use of broad-spectrum antibacterials, colonisation with multidrug-resistant bacteria, and recent

contact with a health or social care setting before the current admission.

In patients with signs or symptoms of pneumonia starting within 3 to 5 days of hospital admission who are not at higher risk of resistance, consider following the recommendations for community-acquired pneumonia for choice of antibacterial treatment. 

Non-severe signs or symptoms and not at higher risk of resistance

● Oral first line :

- ▶  Co-amoxiclav p. 582.
- ▶ Alternative in penicillin allergy or co-amoxiclav unsuitable (based on specialist microbiological advice and local resistance data): doxycycline p. 597, cefalexin p. 551 (caution in penicillin allergy), co-trimoxazole p. 594 [unlicensed], or levofloxacin p. 592 [unlicensed] (only if switching from intravenous levofloxacin under specialist advice). 

Severe signs or symptoms or at higher risk of resistance

● Intravenous first line :

- ▶  Piperacillin with tazobactam p. 576, ceftazidime p. 555, ceftazidime with avibactam p. 558, ceftriaxone p. 556, cefuroxime p. 553, levofloxacin [unlicensed], or meropenem p. 549.
- ▶ If methicillin-resistant *Staphylococcus aureus* confirmed or suspected **add** vancomycin p. 562, or teicoplanin p. 561, or linezolid p. 605 (under specialist advice only if vancomycin cannot be used).

Skin infections, antibacterial therapy

22-Mar-2020

Impetigo

Impetigo is a contagious, superficial bacterial infection of the skin that affects all age groups, but it is more common in young children. Transmission occurs directly through close contact with an infected individual or indirectly via contaminated objects such as toys, clothing, or towels.

Impetigo can develop as a primary infection or as a secondary complication of pre-existing skin conditions such as eczema, scabies, or chickenpox. The two main clinical forms are non-bullous impetigo (most common form) and bullous impetigo. Non-bullous impetigo is characterised by

thin-walled vesicles or pustules that rupture quickly, forming a golden-brown crust, while bullous impetigo is characterised by the presence of fluid-filled vesicles and blisters that rupture, leaving a thin, flat, yellow-brown crust.

Initial treatment

[EvGr] Patients, and if appropriate their family or carers, should be advised on good hygiene measures to reduce the spread of impetigo to other body areas and to other people.

In patients with **localised non-bullous impetigo** who are not systemically unwell or at high risk of complications, consider hydrogen peroxide 1% cream p. 1345; if unsuitable (e.g. if impetigo is around the eyes), offer a topical antibacterial.

In patients with **widespread non-bullous impetigo** who are not systemically unwell or at high risk of complications, offer a topical or oral antibacterial. Take into account that both routes of administration are effective; any previous use of topical antibacterials that could have led to resistance; and the preferences of the patient and, their family or carers (if appropriate), including the practicalities of administration (particularly to large areas).

In patients with **non-bullous impetigo** who are systemically unwell or at high risk of complications and in all patients with **bullous impetigo**, offer an oral antibacterial.

Combination treatment with a topical and oral antibacterial is not recommended. **[A]**

For other considerations such as advice to be given to patients, and if appropriate their family or carers, see Antibacterials, principles of therapy p. 527.

[EvGr] Refer patients to hospital if they have any signs or symptoms suggestive of a more serious condition or illness, or if they have widespread impetigo and are immunocompromised.

Consider referral to hospital or seeking specialist advice for patients who are systemically unwell, have a higher risk of complications, or if impetigo is difficult to treat (such as bullous impetigo (particularly in children aged under 1 year) or frequently recurrent impetigo). **[A]**

Reassessment and further treatment

[EvGr] Reassess if symptoms worsen rapidly or significantly at any time, or do not improve after completion of the treatment course. Take into consideration other possible diagnoses (such as herpes simplex infection), signs or symptoms suggesting a more serious illness or condition (such as cellulitis), and previous antibacterial use that might have led to resistance.

For patients whose impetigo is worsening or has not improved after treatment with hydrogen peroxide 1% cream, offer a topical antibacterial if the infection remains localised, or a topical or oral antibacterial if infection has become widespread.

Offer an oral antibacterial to patients whose impetigo is worsening or has not improved after completing a course of topical antibacterial.

For patients whose impetigo is worsening or has not improved after completing a course of topical or oral antibacterials, consider sending a skin swab for microbiological testing.

For patients with impetigo that recurs frequently, send a skin swab for microbiological testing and consider taking a nasal swab and starting treatment for decolonisation (using topical treatments and personal hygiene measures).

If a skin swab has been sent for microbiological testing, review the choice of antibacterial and change according to the results if symptoms are not improving, using a narrower-spectrum antibacterial if possible. **[A]**

Choice of antibacterial therapy

[EvGr] Treatment should be based on infection severity and number of lesions, suspected micro-organism, local antibacterial resistance data, and be guided by microbiological results if available. **[A]**

- **Topical first line** if hydrogen peroxide unsuitable or ineffective:

- ▶ **[EvGr]** fusidic acid p. 604.

- ▶ Alternative if fusidic acid resistance suspected or confirmed: mupirocin p. 1297. **[A]**

- **Oral first line**:

- ▶ **[EvGr]** Flucloxacillin p. 586.

- ▶ Alternative if penicillin allergy or flucloxacillin unsuitable: clarithromycin p. 567 or erythromycin p. 569 (in pregnancy). **[A]**

- If methicillin-resistant *Staphylococcus aureus* (MRSA) infection suspected or confirmed: **[EvGr]** Consult local microbiologist. **[A]**

Cellulitis and erysipelas

Cellulitis and erysipelas are infections of the subcutaneous tissues, which usually result from contamination of a break in the skin. Both conditions are characterised by acute localised inflammation and oedema. Lesions are more superficial in erysipelas and have a well-defined, raised margin.

For management of an infected leg ulcer, see *Leg Ulcer*, and for infection below the ankle in patients with diabetes, see Diabetic foot infections, antibacterial therapy p. 533.

Treatment

[EvGr] Consider taking a swab for microbiological testing **only** if the skin is broken and there is risk of infection by an uncommon pathogen (for example, after a penetrating injury, exposure to water-born organisms, or an infection acquired outside the UK).

Drawing around the extent of the infection to monitor progress before initiating antibacterial treatment can also be considered, taking into account that redness may be less visible on darker skin tones.

Offer an antibacterial taking into account the severity of symptoms, site of infection, risk of uncommon pathogens, previous microbiological results from a swab, and the patient's methicillin-resistant *Staphylococcus aureus* (MRSA) status if known. **[A]**

For other considerations such as in patients receiving prophylactic antibacterial therapy, switching from intravenous to oral antibacterials, and for advice to be given to patients, see Antibacterials, principles of therapy p. 527.

[EvGr] Manage any underlying condition that may predispose to cellulitis or erysipelas, such as diabetes mellitus, venous insufficiency, eczema, and oedema.

Refer patients to hospital if they have signs or symptoms suggestive of a more serious illness, such as orbital cellulitis, osteomyelitis, septic arthritis, necrotising fasciitis, or sepsis.

Consider referral to hospital or seeking specialist advice for patients who have lymphangitis, are severely unwell, are unable to take oral antibacterials, have infection near the eyes or nose, or that could be caused by an uncommon pathogen. **[A]**

Reassessment

[EvGr] Reassess if symptoms worsen rapidly or significantly at any time, do not improve within 2–3 days of starting an antibacterial, or the patient becomes systemically very unwell, has severe pain out of proportion to the infection, or has redness or swelling spreading beyond the initial presentation (taking into account that some initial spreading may occur). Take into consideration other possible diagnoses (such as an inflammatory reaction to an insect bite or deep vein thrombosis), any underlying condition that may predispose to cellulitis or erysipelas, signs or symptoms suggesting a more serious illness, results from microbiological tests, and previous antibacterial use that might have led to resistance.

Consider taking a swab for testing if the skin is broken and this has not already been done.

If a swab has been sent for microbiological testing, review the choice of antibacterial and change according to the

results if signs or symptoms are not improving, using a narrower-spectrum antibacterial if possible.

Consider referral to hospital or seeking specialist advice if the infection has spread and is not responding to oral antibacterials. 

Choice of antibacterial therapy

 Treatment should be based on clinical assessment, infection severity, suspected micro-organism, and site of infection.

Offer oral antibacterials to patients who are able to take oral treatment and the severity of their condition does not require intravenous treatment.

Consider referral to hospital or seeking specialist advice if bacteria are resistant to oral antibacterials, patients cannot take oral treatment, or have infection near the eyes or nose. 

First choice antibacterials

- **Oral or Intravenous first line :**
 - ▶  Flucloxacillin p. 586.
 - ▶ Alternative in penicillin allergy or flucloxacillin unsuitable: clarithromycin p. 567, oral erythromycin p. 569 (in pregnancy), or oral doxycycline p. 597. 
- **Oral or Intravenous first line if infection near the eyes or nose :**
 - ▶  Co-amoxiclav p. 582.
 - ▶ Alternative in penicillin allergy or co-amoxiclav unsuitable: clarithromycin **with** metronidazole p. 572. 

Alternative choice antibacterials for severe infection

- **Oral or Intravenous:**
 - ▶  Co-amoxiclav, clindamycin p. 564, intravenous cefuroxime p. 553, or intravenous ceftriaxone p. 556 (ambulatory care only).
 - ▶ If meticillin-resistant *Staphylococcus aureus* confirmed or suspected, **add** intravenous vancomycin p. 562, intravenous teicoplanin p. 561, or linezolid p. 605 (specialist use only if vancomycin or teicoplanin cannot be used).
 - ▶ For ambulatory care, and in MRSA confirmed or suspected infections, other antibacterials may be appropriate based on microbiological results and specialist advice. 

Antibacterial prophylaxis

 For patients who have been treated in hospital, or under specialist advice, for at least 2 separate episodes of cellulitis or erysipelas in the previous 12 months, a trial of antibacterial prophylaxis may be considered by a specialist.

If cellulitis or erysipelas recurs, stop or change the prophylactic antibacterial to an alternative once the acute infection has been treated.

Review antibacterial prophylaxis at least every 6 months, assessing the success of therapy and discussing continuing, stopping or changing prophylaxis taking into account the patient's preference for antibacterial use and the risk of antibacterial resistance. 

Leg Ulcer

Leg ulcers usually develop on the lower leg, between the shin and the ankle, and take more than 4–6 weeks to heal.

Although the majority of leg ulcers may be colonised with bacteria, this does not necessarily mean that the wound is infected. Signs and symptoms of an infected leg ulcer include redness (may be less visible on darker skin tones) or swelling spreading beyond the ulcer, localised warmth, increased pain, or fever.

Treatment

 Any underlying condition that may cause a leg ulcer, such as venous insufficiency and oedema should be managed to promote healing.

Taking a sample for microbiological testing at initial presentation with a leg ulcer is not recommended, even if the ulcer may be infected.

Offer an antibacterial to patients who have signs or symptoms of infection taking into account the severity of signs or symptoms, risk of developing complications, and previous antibacterial use. 

For other considerations such as switching from intravenous to oral antibacterials and for advice to be given to patients, see Antibacterials, principles of therapy p. 527.

 Refer patients to hospital if they have signs or symptoms suggestive of a more serious condition or illness, such as sepsis, necrotising fasciitis, or osteomyelitis.

Consider referral to hospital or seeking specialist advice for patients with an infected leg ulcer who have lymphangitis or a higher risk of complications due to comorbidities, such as diabetes or immunosuppression. 

Reassessment

 Reassess if signs or symptoms worsen rapidly or significantly at any time, do not improve within 2–3 days, or the patient becomes systemically unwell or has severe pain out of proportion to the infection. Take into consideration previous antibacterial use that might have led to resistance, and be aware that full resolution of an infected leg ulcer is not expected until after the antibacterial course is completed.

Consider taking a sample from the leg ulcer (after cleaning) for microbiological testing if signs or symptoms of infection are worsening or have not improved as expected. Review the choice of antibacterial(s) and change according to the results if signs or symptoms are not improving, using a narrower-spectrum antibacterial if possible.

Consider referral to hospital or seeking specialist advice if patients have a spreading infection that is not responding to oral antibacterials. 

Choice of antibacterial therapy

 Treatment should be based on clinical assessment, infection severity, suspected micro-organism, and be guided by microbiological results if available.

Offer oral antibacterials to patients who are able to take oral treatment and the severity of their condition does not require intravenous treatment. For patients unable to take oral treatment, consider referring or seeking specialist advice and where appropriate, explore options for administration of intravenous or intramuscular antibiotics at home or in the community. 

Non-severely unwell patients

- **Oral first line :**
 - ▶  Flucloxacillin.
 - ▶ Alternative in penicillin allergy or flucloxacillin unsuitable: doxycycline, clarithromycin, or erythromycin (in pregnancy). 
- **Oral second line** (guided by microbiological results when available):
 - ▶  Co-amoxiclav.
 - ▶ Alternative in penicillin allergy: co-trimoxazole p. 594 [unlicensed]. 

Severely unwell patients

- **Oral or Intravenous first line** (guided by microbiological results if available):
 - ▶  Intravenous flucloxacillin **with** or **without** intravenous gentamicin p. 545 **and/or** metronidazole, or intravenous co-amoxiclav **with** or **without** intravenous gentamicin.
 - ▶ Alternative in penicillin allergy: intravenous co-trimoxazole [unlicensed] **with** or **without** intravenous gentamicin **and/or** metronidazole. 
- **Oral or Intravenous second line** (guided by microbiological results when available or following specialist advice):
 - ▶  Intravenous piperacillin with tazobactam p. 576, or intravenous ceftriaxone **with** or **without** metronidazole. 

Antibacterials to be added if methicillin-resistant *Staphylococcus aureus* (MRSA) infection suspected or confirmed

- **Oral or Intravenous** (in addition to antibacterials listed above):
- ▶ **EvGr** Intravenous vancomycin, intravenous teicoplanin, or linezolid (specialist use only if vancomycin or teicoplanin cannot be used). 

Animal and human bites

Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 1360 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection). Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread.

- Co-amoxiclav
- If penicillin-allergic, doxycycline + metronidazole

Mastitis during breast-feeding

Treat if severe, if systemically unwell, if nipple fissure present, if symptoms do not improve after 12–24 hours of effective milk removal, or if culture indicates infection. Continue breast-feeding or expressing milk during treatment.

- Flucloxacillin p. 586
- ▶ Suggested duration of treatment 10–14 days.
- If penicillin-allergic, erythromycin p. 569
- ▶ Suggested duration of treatment 10–14 days.

ANTIBACTERIALS > AMINOGLYCOSIDES

Aminoglycosides

Overview

These include amikacin p. 544, gentamicin p. 545, neomycin sulfate p. 546, streptomycin p. 546, and tobramycin p. 546. All are bactericidal and active against some Gram-positive and many Gram-negative organisms. Amikacin, gentamicin, and tobramycin are also active against *Pseudomonas aeruginosa*; streptomycin is active against *Mycobacterium tuberculosis* and is now almost entirely reserved for tuberculosis.

The aminoglycosides are not absorbed from the gut (although there is a risk of absorption in inflammatory bowel disease and liver failure) and must therefore be given by injection for systemic infections.

Gentamicin is the aminoglycoside of choice in the UK and is used widely for the treatment of serious infections. It has a broad spectrum but is inactive against anaerobes and has poor activity against haemolytic streptococci and pneumococci. When used for the 'blind' therapy of undiagnosed serious infections it is usually given in conjunction with a penicillin or metronidazole p. 572 (or both). Gentamicin is used together with another antibiotic

for the treatment of endocarditis. Streptomycin may be used as an alternative in gentamicin-resistant enterococcal endocarditis.

Loading and maintenance doses of gentamicin may be calculated on the basis of the patient's weight and renal function (e.g. using a nomogram); adjustments are then made according to serum-gentamicin concentrations. High doses are occasionally indicated for serious infections, especially in the neonate, in the patient with cystic fibrosis, or in the immunocompromised patient. Whenever possible treatment should not exceed 7 days.

Amikacin is more stable than gentamicin to enzyme inactivation. Amikacin is used in the treatment of serious infections caused by gentamicin-resistant Gram-negative bacilli.

Tobramycin has similar activity to gentamicin. It is slightly more active against *Ps. aeruginosa* but shows less activity against certain other Gram-negative bacteria. Tobramycin can be administered by nebuliser or by inhalation of powder on a cyclical basis (28 days of tobramycin followed by a 28-day tobramycin-free interval) for the treatment of chronic pulmonary *Ps. aeruginosa* infection in cystic fibrosis; however, resistance may develop and some patients do not respond to treatment.

Neomycin sulfate is too toxic for parenteral administration and can only be used for infections of the skin or mucous membranes or to reduce the bacterial population of the colon prior to bowel surgery or in hepatic failure. Oral administration may lead to malabsorption. Small amounts of neomycin sulfate may be absorbed from the gut in patients with hepatic failure and, as these patients may also be uraemic, cumulation may occur with resultant ototoxicity.

Once daily dosage

Once daily administration of aminoglycosides is more convenient, provides adequate serum concentrations, and in many cases has largely superseded *multiple-daily dose regimens* (given in 2–3 divided doses during the 24 hours). Local guidelines on dosage and serum concentrations should be consulted. A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with endocarditis due to Gram-positive bacteria, HACEK endocarditis, burns of more than 20% of the total body surface area, or creatinine clearance less than 20 mL/minute. There is insufficient evidence to recommend a once daily, high-dose regimen of an aminoglycoside in pregnancy.

Serum concentrations

Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. Serum-aminoglycoside concentrations should be monitored in patients receiving parenteral aminoglycosides and **must** be determined in the elderly, in obesity, and in cystic fibrosis, or if high doses are being given, or if there is renal impairment.

Aminoglycosides (by injection)

- **CONTRA-INDICATIONS** Myasthenia gravis (aminoglycosides may impair neuromuscular transmission)
- **CAUTIONS** Auditory disorder · care must be taken with dosage (the main side-effects of the aminoglycosides are dose-related) · conditions characterised by muscular weakness (aminoglycosides may impair neuromuscular transmission) · if possible, dehydration should be corrected before starting an aminoglycoside · vestibular disorder · whenever possible, parenteral treatment should not exceed 7 days
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Skin reactions · tinnitus
 - ▶ **Uncommon** Nausea · vomiting

- ▶ **Rare or very rare** Anaemia · azotaemia · bronchospasm · eosinophilia · fever · headache · hearing impairment · hypomagnesaemia · paraesthesia · renal impairment
- ▶ **Frequency not known** Confusion · lethargy · leucopenia · nephrotoxicity · thrombocytopenia · vertigo

SIDE-EFFECTS, FURTHER INFORMATION Ototoxicity and nephrotoxicity are important side-effects to consider with aminoglycoside therapy. Nephrotoxicity occurs most commonly in patients with renal impairment, who may require reduced doses; monitoring is particularly important in the elderly.

- **PREGNANCY** There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy. The risk is greatest with streptomycin. The risk is probably very small with gentamicin and tobramycin, but their use should be avoided unless essential.

Monitoring If given during pregnancy, serum-aminoglycoside concentration monitoring is essential.

- **RENAL IMPAIRMENT** Excretion of aminoglycosides is principally via the kidney and accumulation occurs in renal impairment. Ototoxicity and nephrotoxicity occur commonly in patients with renal failure.
- ▶ In adults A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with a creatinine clearance less than 20 mL/minute.
- ▶ In children A once-daily, high-dose regimen of an aminoglycoside should be avoided in children over 1 month of age with a creatinine clearance less than 20 mL/minute/1.73 m².

Dose adjustments If there is impairment of renal function, the interval between doses must be increased; if the renal impairment is severe, the dose itself should be reduced as well.

Monitoring Serum-aminoglycoside concentrations **must** be monitored in patients with renal impairment; earlier and more frequent measurement of aminoglycoside concentration may be required.

● MONITORING REQUIREMENTS

- ▶ Serum concentrations Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy.

Serum-aminoglycoside concentrations should be measured in all patients receiving parenteral aminoglycosides and **must** be determined in obesity, if high doses are being given and in cystic fibrosis.

- ▶ In adults Serum aminoglycoside concentrations **must** be determined in the elderly. In patients with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen and after a dose change. For multiple daily dose regimens, blood samples should be taken approximately 1 hour after intramuscular or intravenous administration ('peak' concentration) and also just before the next dose ('trough' concentration). If the pre-dose ('trough') concentration is high, the interval between doses must be increased. If the post-dose ('peak') concentration is high, the dose must be decreased. For once daily dose regimens, consult local guidelines on serum concentration monitoring.
- ▶ In children In children with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen. Blood samples should be taken just before the next dose is administered ('trough' concentration). If the pre-dose ('trough') concentration is high, the interval between doses must be increased. For multiple daily dose regimens, blood samples should also be taken approximately 1 hour after intramuscular or intravenous administration ('peak' concentration). If the post-dose ('peak') concentration is high, the dose must be decreased.

- ▶ Renal function should be assessed before starting an aminoglycoside and during treatment.
- ▶ Auditory and vestibular function should also be monitored during treatment.

F 543

Amikacin

● INDICATIONS AND DOSE

Serious Gram-negative infections resistant to gentamicin (multiple daily dose regimen)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 15 mg/kg daily in 2 divided doses, increased to 22.5 mg/kg daily in 3 divided doses for up to 10 days, higher dose to be used in severe infections; maximum 1.5 g per day; maximum 15 g per course

Serious Gram-negative infections resistant to gentamicin (once daily dose regimen)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 15 mg/kg once daily (max. per dose 1.5 g once daily), dose to be adjusted according to serum-amikacin concentration; maximum 15 g per course

Acute prostatitis (once daily dose regimen)

- ▶ BY INTRAVENOUS INFUSION, OR BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: Initially 15 mg/kg once daily (max. per dose 1.5 g once daily), dose to be adjusted according to serum-amikacin concentration; maximum 15 g per course

Acute pyelonephritis (once daily dose regimen) | Urinary tract infection (catheter-associated, once daily dose regimen)

- ▶ BY INTRAVENOUS INFUSION, OR BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: Initially 15 mg/kg once daily (max. per dose 1.5 g once daily), dose to be adjusted according to serum-amikacin concentration; maximum 15 g per course

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-amikacin concentration closely

- **INTERACTIONS** → Appendix 1: aminoglycosides

● SIDE-EFFECTS

- ▶ **Uncommon** Superinfection
- ▶ **Rare or very rare** Albuminuria · arthralgia · balance impaired · hypotension · muscle twitching · tremor
- ▶ **Frequency not known** Apnoea · neuromuscular blockade · paralysis

● MONITORING REQUIREMENTS

- ▶ With intravenous use *Multiple daily dose regimen*: one-hour ('peak') serum concentration should not exceed 30 mg/litre; pre-dose ('trough') concentration should be less than 10 mg/litre. *Once daily dose regimen*: pre-dose ('trough') concentration should be less than 5 mg/litre.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion (Amikin®)*; intermittent in Glucose 5% or Sodium chloride 0.9%. To be given over 30 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Once daily dose regimen not to be used for endocarditis, febrile neutropenia, or meningitis. Consult local guidelines.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

▶ Amikacin (Non-proprietary)

- Amikacin (as Amikacin sulfate) 250 mg per 1 ml Amikacin 500mg/2ml solution for injection vials | 5 vial **POM** £60.00 (Hospital only)

▶ **Amikcin** (Vianex S.A.)

Amikacin (as Amikacin sulfate) 50 mg per 1 ml Amikcin 100mg/2ml solution for injection vials | 5 vial [PoM] £10.33

F 543

19-Mar-2020

Gentamicin

● INDICATIONS AND DOSE

Moderate diabetic foot infection | Severe diabetic foot infection | Acute diverticulitis [in combination with amoxicillin and metronidazole]

▶ BY INTRAVENOUS INFUSION

▶ Adult: Initially 5–7 mg/kg once daily, subsequent doses adjusted according to serum-gentamicin concentration

Gram-positive bacterial endocarditis or HACEK endocarditis (in combination with other antibacterials)

▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Adult: 1 mg/kg every 12 hours, intravenous injection to be administered over at least 3 minutes, to be given in a multiple daily dose regimen

Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Endocarditis | Pneumonia in hospital patients | Adjunct in listerial meningitis | Prostatitis

▶ BY INTRAVENOUS INFUSION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

▶ Adult: 3–5 mg/kg daily in 3 divided doses, to be given in a multiple daily dose regimen, divided doses to be given every 8 hours, intravenous injection to be administered over at least 3 minutes

▶ BY INTRAVENOUS INFUSION

▶ Adult: Initially 5–7 mg/kg, subsequent doses adjusted according to serum-gentamicin concentration, to be given in a once daily dose regimen

CNS infections (administered on expert advice)

▶ BY INTRATHECAL INJECTION

▶ Adult: 1 mg daily, increased if necessary to 5 mg daily, seek specialist advice

Surgical prophylaxis

▶ BY SLOW INTRAVENOUS INJECTION

▶ Adult: 1.5 mg/kg, intravenous injection to be administered over at least 3 minutes, administer dose up to 30 minutes before the procedure, dose may be repeated every 8 hours for high-risk procedures; up to 3 further doses may be given

Surgical prophylaxis in joint replacement surgery

▶ BY INTRAVENOUS INFUSION

▶ Adult: 5 mg/kg for 1 dose, administer dose up to 30 minutes before the procedure

Acute pyelonephritis (once daily dose regimen) | Urinary tract infection (catheter-associated, once daily dose regimen)

▶ BY INTRAVENOUS INFUSION

▶ Adult: Initially 5–7 mg/kg once daily, subsequent doses adjusted according to serum-gentamicin concentration

DOSES AT EXTREMES OF BODY-WEIGHT

▶ With intramuscular use or intravenous use. To avoid excessive dosage in obese patients, use ideal weight for height to calculate parenteral dose and monitor serum-gentamicin concentration closely.

● **UNLICENSED USE** Gentamicin doses in BNF publications may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: POTENTIAL FOR HISTAMINE-RELATED ADVERSE DRUG REACTIONS WITH SOME BATCHES (NOVEMBER 2017)

Following reports that some batches of gentamicin sulphate active pharmaceutical ingredient (API) used to manufacture gentamicin may contain higher than expected levels of histamine, which is a residual from the

manufacturing process, the MHRA advise to monitor patients for signs of histamine-related adverse reactions; particular caution is required in patients taking concomitant drugs known to cause histamine release, in children, and in patients with severe renal impairment.

● **INTERACTIONS** → Appendix 1: aminoglycosides

● **SIDE-EFFECTS** Antibiotic associated colitis · blood disorder · depression · encephalopathy · hallucination · hepatic reaction · neurotoxicity · peripheral neuropathy · seizure · stomatitis · vestibular damage

● **MONITORING REQUIREMENTS**

▶ With intramuscular use or intravenous use For multiple daily dose regimen, one-hour ('peak') serum concentration should be 5–10 mg/litre; pre-dose ('trough') concentration should be less than 2 mg/litre. For multiple daily dose regimen in endocarditis, one-hour ('peak') serum concentration should be 3–5 mg/litre; pre-dose ('trough') concentration should be less than 1 mg/litre. Serum-gentamicin concentration should be measured after 3 or 4 doses, then at least every 3 days and after a dose change (more frequently in renal impairment).

▶ With intravenous use For once-daily dose regimen, consult local guidelines on monitoring serum-gentamicin concentration.

● **DIRECTIONS FOR ADMINISTRATION**

▶ With intrathecal use For *intrathecal* injection, use preservative-free intrathecal preparations only.

▶ With intravenous use For *intravenous infusion* (Cidomycin[®]); *Gentamicin paediatric injection*, *Beacon*; *Gentamicin injection* (Hospira), give intermittently or via drip tubing in Glucose 5% or Sodium Chloride 0.9%. Suggested volume for intermittent infusion 50–100 ml given over 20–30 minutes (given over 60 minutes for once daily dose regimen).

● **PRESCRIBING AND DISPENSING INFORMATION**

▶ With intravenous use Local guidelines may vary in the dosing advice provided for once daily administration.

▶ With intrathecal use Only preservative-free intrathecal preparation should be used.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Gentamicin (Non-proprietary)**

Gentamicin (as Gentamicin sulfate) 5 mg per 1 ml Gentamicin Intrathecal 5mg/1ml solution for injection ampoules | 5 ampoule [PoM] £36.28 DT = £36.28 (Hospital only)

Gentamicin (as Gentamicin sulfate) 10 mg per 1 ml Gentamicin 20mg/2ml solution for injection ampoules | 5 ampoule [PoM] £11.25 DT = £11.25

Gentamicin Paediatric 20mg/2ml solution for injection vials | 5 vial [PoM] £11.25 DT = £11.25

Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Gentamicin 80mg/2ml solution for injection vials | 5 vial [PoM] £20.00 DT = £6.88 (Hospital only)

Gentamicin 80mg/2ml solution for injection ampoules | 5 ampoule [PoM] £6.88 DT = £6.88 | 10 ampoule [PoM] £12.00

▶ **Cidomycin** (Sanofi)

Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Cidomycin 80mg/2ml solution for injection vials | 5 vial [PoM] £6.88 DT = £6.88
Cidomycin 80mg/2ml solution for injection ampoules | 5 ampoule [PoM] £6.88 DT = £6.88

Infusion

▶ **Gentamicin (Non-proprietary)**

Gentamicin (as Gentamicin sulfate) 1 mg per 1 ml Gentamicin 80mg/80ml infusion bags | 20 bag [PoM] £40.17-£44.19

Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml Gentamicin 240mg/80ml infusion bags | 20 bag [PoM] £122.58-£134.83

Gentamicin 360mg/120ml infusion bags | 20 bag [PoM] £174.07-£191.48

Neomycin sulfate

● INDICATIONS AND DOSE

Bowel sterilisation before surgery

- ▶ BY MOUTH
- ▶ Adult: 1 g every 1 hour for 4 hours, then 1 g every 4 hours for 2–3 days

Hepatic coma

- ▶ BY MOUTH
- ▶ Adult: Up to 4 g daily in divided doses usually for 5–7 days

- **CONTRA-INDICATIONS** Intestinal obstruction · myasthenia gravis (aminoglycosides may impair neuromuscular transmission)

- **CAUTIONS** Avoid prolonged use

CAUTIONS, FURTHER INFORMATION Although neomycin is associated with the same cautions as other aminoglycosides it is generally considered too toxic for systemic use.

- **INTERACTIONS** → Appendix 1: neomycin

- **SIDE-EFFECTS** Blood disorder · confusion · diarrhoea · drug cross-reactivity · electrolyte imbalance · gastrointestinal disorders · haemolytic anaemia · nausea · nephrotoxicity · nystagmus · oral disorders · ototoxicity · paraesthesia · superinfection · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Although neomycin is associated with the same side effects as other aminoglycosides, it is poorly absorbed after oral administration.

- **PREGNANCY** There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of ototoxicity and nephrotoxicity).

- **RENAL IMPAIRMENT** Avoid—risk of ototoxicity and nephrotoxicity.

● MONITORING REQUIREMENTS

- ▶ Renal function should be assessed before starting an aminoglycoside and during treatment.
- ▶ Auditory and vestibular function should also be monitored during treatment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

- ▶ **Neomycin sulfate (Non-proprietary)**

Neomycin sulfate 500 mg Neomycin 500mg tablets | 100 tablet **[PoM]** £34.69 DT = £34.69

543

Streptomycin

● INDICATIONS AND DOSE

Tuberculosis, resistant to other treatment, in combination with other drugs

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 15 mg/kg daily (max. per dose 1 g), reduce dose in those under 50 kg and those over 40 years

Adjunct to doxycycline in brucellosis (administered on expert advice)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: (consult local protocol)

Enterococcal endocarditis

- ▶ Adult: (consult local protocol)

- **UNLICENSED USE** Use in tuberculosis is an unlicensed indication.

IMPORTANT SAFETY INFORMATION

Side-effects increase after a cumulative dose of 100 g, which should only be exceeded in exceptional circumstances.

- **INTERACTIONS** → Appendix 1: aminoglycosides

- **SIDE-EFFECTS** Amblyopia · angioedema · Clostridioides difficile colitis · haemolytic anaemia · muscle weakness · ototoxicity · pancytopenia

● RENAL IMPAIRMENT

Dose adjustments Should preferably be avoided. If essential, use with great care and consider dose reduction.

● MONITORING REQUIREMENTS

- ▶ One-hour ('peak') concentration should be 15–40 mg/litre; pre-dose ('trough') concentration should be less than 5 mg/litre (less than 1 mg/litre in renal impairment or in those over 50 years).

- **MEDICINAL FORMS** Forms available from special-order manufacturers include: powder for solution for injection

543

Tobramycin

16-Mar-2020

● INDICATIONS AND DOSE

Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Acute pyelonephritis or prostatitis | Pneumonia in hospital patients

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 3 mg/kg daily in 3 divided doses; increased if necessary up to 5 mg/kg daily in 3–4 divided doses, increased dose used in severe infection; dose to be reduced back to 3 mg/kg daily as soon as clinically indicated

Urinary-tract infection

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 2–3 mg/kg for 1 dose

Chronic *Pseudomonas aeruginosa* infection in patients with cystic fibrosis

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Adult: 300 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution
- ▶ BY INHALATION OF POWDER
- ▶ Adult: 112 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin inhalation powder

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ With intramuscular use or intravenous use To avoid excessive dosage in obese patients, use ideal weight for height to calculate parenteral dose and monitor serum-tobramycin concentration closely.

VANTOBR[®] NEBULISER SOLUTION

Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Adult: 170 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution

● CAUTIONS

- ▶ When used by inhalation Auditory disorder · conditions characterised by muscular weakness (may impair neuromuscular transmission) · history of prolonged previous or concomitant intravenous aminoglycosides (increased risk of ototoxicity) · renal impairment (limited

information available) · severe haemoptysis (risk of further haemorrhage) · vestibular disorder

● **INTERACTIONS** → Appendix 1: aminoglycosides

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

► **Rare or very rare** Diarrhoea · dizziness

SPECIFIC SIDE-EFFECTS

► **Common or very common**

► When used by inhalation Dysphonia · malaise · respiratory disorder · sputum discolouration

► **Uncommon**

► When used by inhalation Cough

► **Rare or very rare**

► When used by inhalation Abdominal pain · aphonia · appetite decreased · asthenia · asthma · chest discomfort · drowsiness · ear disorder · ear pain · haemorrhage · hypoxia · increased risk of infection · lymphadenopathy · oral ulceration · pain · taste altered

► **Frequency not known**

► When used by inhalation Oropharyngeal pain

► With parenteral use Granulocytopenia · leucocytosis · nerve disorders · urine abnormalities

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises to monitor serum-tobramycin concentration in patients with known or suspected signs of auditory dysfunction; if ototoxicity develops — discontinue treatment until serum concentration falls below 2 mg/litre.

● **RENAL IMPAIRMENT**

► When used by inhalation Manufacturer advises monitor serum-tobramycin concentration; if nephrotoxicity develops—discontinue treatment until serum concentration falls below 2 mg/litre.

● **MONITORING REQUIREMENTS**

► With intramuscular use or intravenous use One-hour ('peak') serum concentration should not exceed 10 mg/litre; pre-dose ('trough') concentration should be less than 2 mg/litre.

► When used by inhalation Measure lung function before and after initial dose of tobramycin and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using bronchodilator. Manufacturer advises monitor renal function before treatment and then annually.

● **DIRECTIONS FOR ADMINISTRATION**

► With intravenous use For *intravenous infusion (Nebcin®)*; intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%. For adult intermittent infusion suggested volume 50–100 mL given over 20–60 minutes.

► When used by inhalation Other inhaled drugs should be administered before tobramycin.

● **PATIENT AND CARER ADVICE**

► When used by inhalation Patient counselling is advised for Tobramycin dry powder for inhalation (administration).

VANTOBRA® NEBULISER SOLUTION

Missed doses ► When used by inhalation Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

► **Tobramycin by dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013)** NICE TA276

► When used by inhalation Tobramycin dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis only if there is an inadequate response to colistimethate sodium, or if colistimethate sodium cannot be used because of contra-indications or intolerance. The manufacturer must provide tobramycin dry powder for inhalation at the discount agreed as part of

the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving tobramycin dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta276

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► **Tobramycin (Non-proprietary)**

Tobramycin 40 mg per 1 ml Tobramycin 80mg/2ml solution for injection vials | 1 vial [PoM] £5.37 DT = £5.37 | 5 vial [PoM] £20.80 DT = £20.80

ANTIBACTERIALS > CARBAPENEMS

Carbapenems

Overview

The carbapenems are beta-lactam antibacterials with a broad-spectrum of activity which includes many Gram-positive and Gram-negative bacteria, and anaerobes; **imipenem** (imipenem with cilastatin p. 548) and meropenem p. 549 have good activity against *Pseudomonas aeruginosa*. The carbapenems are not active against methicillin-resistant *Staphylococcus aureus* and *Enterococcus faecium*.

Imipenem (imipenem with cilastatin) and meropenem are used for the treatment of severe hospital-acquired infections and polymicrobial infections including septicaemia, hospital-acquired pneumonia, intra-abdominal infections, skin and soft-tissue infections, and complicated urinary-tract infections.

Ertapenem p. 548 is licensed for treating abdominal and gynaecological infections and for community-acquired pneumonia, but it is not active against atypical respiratory pathogens and it has limited activity against penicillin-resistant pneumococci. It is also licensed for treating foot infections of the skin and soft tissue in patients with diabetes. Unlike the other carbapenems, ertapenem is not active against *Pseudomonas* or against *Acinetobacter spp.*

Imipenem is partially inactivated in the kidney by enzymatic activity and is therefore administered in combination with **cilastatin** (imipenem with cilastatin), a specific enzyme inhibitor, which blocks its renal metabolism. Meropenem and ertapenem are stable to the renal enzyme

which inactivates imipenem and therefore can be given without cilastatin.

Side-effects of imipenem with cilastatin are similar to those of other beta-lactam antibiotics. Meropenem has less seizure-inducing potential and can be used to treat central nervous system infection.

Ertapenem

29-Apr-2020

● INDICATIONS AND DOSE

Abdominal infections | Acute gynaecological infections | Community-acquired pneumonia

► BY INTRAVENOUS INFUSION

► Adult: 1 g once daily

Diabetic foot infections of the skin and soft-tissue

► BY INTRAVENOUS INFUSION

► Adult: 1 g once daily

Surgical prophylaxis, colorectal surgery

► BY INTRAVENOUS INFUSION

► Adult: 1 g for 1 dose, dose to be completed within 1 hour before surgery

● **CAUTIONS** CNS disorders—risk of seizures · elderly

● **INTERACTIONS** → Appendix 1: carbapenems

● SIDE-EFFECTS

► **Common or very common** Diarrhoea · headache · nausea · skin reactions · thrombophlebitis · vomiting

► **Uncommon** Appetite decreased · arrhythmias · asthenia · confusion · constipation · dizziness · drowsiness · dry mouth · gastrointestinal discomfort · gastrointestinal disorders · hypotension · increased risk of infection · insomnia · oedema · pseudomembranous enterocolitis · seizure · swelling · taste altered · throat discomfort

► **Rare or very rare** Anxiety · cholecystitis · depression · dysphagia · eye disorder · haemorrhage · hepatic disorders · hypersensitivity · hypoglycaemia · malaise · muscle cramps · nasal congestion · neutropenia · renal impairment · shoulder pain · syncope · thrombocytopenia · tremor

► **Frequency not known** Aggression · delirium · drug reaction with eosinophilia and systemic symptoms (DRESS) · gait abnormal · hallucination · level of consciousness decreased · movement disorders · muscle weakness · psychiatric disorder · tooth discolouration

● **ALLERGY AND CROSS-SENSITIVITY** Avoid if history of **immediate hypersensitivity** reaction to beta-lactam antibacterials.

Use with caution in patients with sensitivity to beta-lactam antibacterials.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.

● **BREAST FEEDING** Present in milk—manufacturer advises avoid.

● RENAL IMPAIRMENT

Dose adjustments Risk of seizures; max. 500 mg daily if eGFR less than 30 mL/minute/1.73 m².

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Invanz*®), give intermittently in Sodium chloride 0.9%. Reconstitute 1 g with 10 mL Water for injections or Sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration not exceeding 20 mg/mL; give over 30 minutes; incompatible with glucose solutions.

● **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 529, Diabetic foot infections, antibacterial therapy p. 533, Gastro-intestinal system infections, antibacterial therapy p. 535, Respiratory system infections, antibacterial therapy p. 538.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

► Ertapenem (Non-proprietary)

Ertapenem (as Ertapenem sodium) 1 gram Ertapenem 1g powder for concentrate for solution for infusion vials | 10 vial **POM** **ⓧ** (Hospital only)

► Invanz (Merck Sharp & Dohme Ltd)

Ertapenem (as Ertapenem sodium) 1 gram Invanz 1g powder for solution for infusion vials | 1 vial **POM** £31.65 DT = £31.65

Imipenem with cilastatin

29-Apr-2020

● INDICATIONS AND DOSE

Aerobic and anaerobic Gram-positive and Gram-negative infections (not indicated for CNS infections) | Hospital-acquired septicæmia

► BY INTRAVENOUS INFUSION

► Adult: 500 mg every 6 hours, alternatively 1 g every 8 hours

Infection caused by *Pseudomonas* or other less sensitive organisms | Empirical treatment of infection in febrile patients with neutropenia | Life-threatening infection

► BY INTRAVENOUS INFUSION

► Adult: 1 g every 6 hours

DOSE EQUIVALENCE AND CONVERSION

► Dose expressed in terms of imipenem.

● **CAUTIONS** CNS disorders · epilepsy

● **INTERACTIONS** → Appendix 1: carbapenems

● SIDE-EFFECTS

► **Common or very common** Diarrhoea · eosinophilia · nausea · skin reactions · thrombophlebitis · vomiting

► **Uncommon** Bone marrow disorders · confusion · dizziness · drowsiness · hallucination · hypotension · leucopenia · movement disorders · psychiatric disorder · seizure · thrombocytopenia · thrombocytosis

► **Rare or very rare** Agranulocytosis · anaphylactic reaction · angioedema · chest discomfort · colitis haemorrhagic · cyanosis · dyspnoea · encephalopathy · flushing · focal tremor · gastrointestinal discomfort · haemolytic anaemia · headache · hearing loss · hepatic disorders · hyperhidrosis · hyperventilation · increased risk of infection · myasthenia gravis aggravated · oral disorders · palpitations · paraesthesia · polyarthralgia · polyuria · pseudomembranous enterocolitis · renal impairment · severe cutaneous adverse reactions (SCARs) · spinal pain · tachycardia · taste altered · tinnitus · tongue discolouration · tooth discolouration · urine discolouration · vertigo

► **Frequency not known** Agitation

● **ALLERGY AND CROSS-SENSITIVITY** Avoid if history of **immediate hypersensitivity** reaction to beta-lactam antibacterials.

Use with caution in patients with sensitivity to beta-lactam antibacterials.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in *animal* studies).

● **BREAST FEEDING** Present in milk but unlikely to be absorbed.

● **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 15 mL/minute.

Dose adjustments Manufacturer advises reduce dose if creatinine clearance less than 90 mL/minute (risk of CNS side-effects)—consult product literature.

● **EFFECT ON LABORATORY TESTS** Positive Coombs' test.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* dilute to a concentration of 5 mg (as imipenem)/mL in Sodium chloride 0.9%; give up to 500 mg (as imipenem)

over 20–30 minutes, give dose greater than 500 mg (as imipenem) over 40–60 minutes.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Imipenem with cilastatin (Non-proprietary)**

Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg Imipenem 500mg / Cilastatin 500mg powder for solution for infusion vials | 10 vial [PoM] £130.30

- ▶ **Primaxin I.V. (Merck Sharp & Dohme Ltd)**

Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg Primaxin IV 500mg powder for solution for infusion vials | 1 vial [PoM] £12.00

Meropenem

06-Aug-2018

● INDICATIONS AND DOSE

Aerobic and anaerobic Gram-positive and Gram-negative infections | Hospital-acquired septicæmia

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 0.5–1 g every 8 hours

Exacerbations of chronic lower respiratory-tract infection in cystic fibrosis

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 2 g every 8 hours

Meningitis

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 2 g every 8 hours

Endocarditis (in combination with another antibacterial)

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 2 g every 8 hours

- **UNLICENSED USE** Not licensed for use in endocarditis.

- **INTERACTIONS** → Appendix 1: carbapenems

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · diarrhoea · headache · inflammation · nausea · pain · skin reactions · thrombocytosis · vomiting
- ▶ **Uncommon** Agranulocytosis · antibiotic associated colitis · eosinophilia · haemolytic anaemia · increased risk of infection · leucopenia · neutropenia · paraesthesia · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · thrombophlebitis
- ▶ **Rare or very rare** Seizure

- **ALLERGY AND CROSS-SENSITIVITY** Avoid if history of **immediate hypersensitivity** reaction to beta-lactam antibacterials.

Use with caution in patients with sensitivity to beta-lactam antibacterials.

- **PREGNANCY** Use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Unlikely to be absorbed (however, manufacturer advises avoid).

● RENAL IMPAIRMENT

Dose adjustments Use normal dose every 12 hours if eGFR 26–50 mL/minute/1.73 m².

Use half normal dose every 12 hours if eGFR 10–25 mL/minute/1.73 m².

Use half normal dose every 24 hours if eGFR less than 10 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Manufacturer advises monitor liver function—risk of hepatotoxicity.

- **EFFECT ON LABORATORY TESTS** Positive Coombs' test.

- **DIRECTIONS FOR ADMINISTRATION** *Intravenous injection* to be administered over 5 minutes.

For *intravenous infusion (Meronom[®])*, give intermittently in Glucose 5% or Sodium chloride 0.9%.

Dilute dose in infusion fluid to a final concentration of 1–20 mg/mL; give over 15–30 minutes.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

ELECTROLYTES: May contain Sodium

- ▶ **Meropenem (Non-proprietary)**

Meropenem (as Meropenem trihydrate) 500 mg Meropenem 500mg powder for solution for injection vials | 10 vial [PoM] £103.14 DT = £93.30 (Hospital only) | 10 vial [PoM] £90.00-£103.14 DT = £93.30

Meropenem (as Meropenem trihydrate) 1 gram Meropenem 1g powder for solution for injection vials | 10 vial [PoM] £186.70-£206.30 DT = £186.70 | 10 vial [PoM] £206.28 DT = £186.70 (Hospital only)

- ▶ **Meropenem (Pfizer Ltd)**

Meropenem (as Meropenem trihydrate) 500 mg Meropenem 500mg powder for solution for injection vials | 10 vial [PoM] £103.14 DT = £93.30

Meropenem (as Meropenem trihydrate) 1 gram Meropenem 1g powder for solution for injection vials | 10 vial [PoM] £206.28 DT = £186.70

Meropenem with vaborbactam

11-Dec-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, meropenem above.

● INDICATIONS AND DOSE

Complicated urinary-tract infection [including pyelonephritis] | Complicated intra-abdominal infection

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 2 g every 8 hours for 5–10 days; may be continued for up to 14 days

Hospital-acquired pneumonia | Ventilator-associated pneumonia

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 2 g every 8 hours for 7–14 days

Bacteraemia [occurring in association with or suspected to be associated with the licensed indications]

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 2 g every 8 hours, duration should be tailored to site of infection

Aerobic Gram-negative infections [in patients with limited treatment options] (administered on expert advice)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 2 g every 8 hours, duration should be tailored to site of infection

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed in terms of meropenem.

- **INTERACTIONS** → Appendix 1: carbapenems · vaborbactam

● SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · electrolyte imbalance · headache · hypoglycaemia · hypotension · nausea · thrombocytosis · vomiting
- ▶ **Uncommon** Appetite decreased · bronchospasm · chest discomfort · Clostridioides difficile colitis · dizziness · eosinophilia · gastrointestinal discomfort · hallucination · hyperglycaemia · increased risk of infection · infusion related reaction · insomnia · lethargy · leucopenia · neutropenia · pain · paraesthesia · renal impairment · skin reactions · thrombocytopenia · tremor · urinary incontinence · vascular pain
- ▶ **Rare or very rare** Seizure
- ▶ **Frequency not known** Agranulocytosis · angioedema · haemolytic anaemia · severe cutaneous adverse reactions (SCARs)

- **PREGNANCY** Manufacturer advises avoid—no or limited information available.

- **BREAST FEEDING** Manufacturer advises discontinue breast-feeding.

● RENAL IMPAIRMENT

Dose adjustments Manufacturer advises reduce dose to 1 g every 8 hours if creatinine clearance 20–39 mL/minute.

Manufacturer advises reduce dose to 1 g every 12 hours if creatinine clearance 10–19 mL/minute.

Manufacturer advises reduce dose to 0.5 g every 12 hours if creatinine clearance less than 10 mL/minute.

● DIRECTIONS FOR ADMINISTRATION For *continuous intravenous infusion*, manufacturer advises reconstitute each 1 g (as meropenem) vial to produce a 0.05 g (as meropenem)/mL solution with 20 mL Sodium Chloride 0.9%. Dilute reconstituted solution to a final volume of 250 mL with Sodium Chloride 0.9%; give over 3 hours.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness, lethargy, and paraesthesia.

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

Meropenem (as Meropenem trihydrate) 1 gram, Vaborbactam 1 gram Vaborem 1g/1g powder for concentrate for solution for infusion vials | 6 vial [PoM] £334.00 (Hospital only)

ANTIBACTERIALS > CEPHALOSPORINS**Cephalosporins****Overview**

The cephalosporins are broad-spectrum antibiotics which are used for the treatment of septicaemia, pneumonia, meningitis, biliary-tract infections, peritonitis, and urinary-tract infections. The pharmacology of the cephalosporins is similar to that of the penicillins, excretion being principally renal. Cephalosporins penetrate the cerebrospinal fluid poorly unless the meninges are inflamed; cefotaxime p. 555 and ceftriaxone p. 556 are suitable cephalosporins for infections of the CNS (e.g. meningitis).

The principal side-effect of the cephalosporins is hypersensitivity and about 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. If a cephalosporin is essential in patients with a history of immediate hypersensitivity to penicillin, because a suitable alternative antibiotic is not available, then cefixime p. 555, cefotaxime, ceftazidime p. 555, ceftriaxone, or cefuroxime p. 553 can be used with caution; cefaclor p. 552, cefadroxil p. 551, cefalexin p. 551, cefradine p. 552, and ceftaroline fosamil p. 559 should be avoided.

The orally active 'first generation' cephalosporins, cefalexin, cefradine, and cefadroxil and the 'second generation' cephalosporin, cefaclor, have a similar antimicrobial spectrum. They are useful for urinary-tract infections, respiratory-tract infections, otitis media, and skin and soft-tissue infections. Cefaclor has good activity against *H. influenzae*. Cefadroxil has a long duration of action and can be given twice daily; it has poor activity against *H. influenzae*. **Cefuroxime axetil**, an ester of the 'second generation' cephalosporin cefuroxime, has the same antibacterial spectrum as the parent compound; it is poorly absorbed and needs to be given with food to maximise absorption.

Cefixime is an orally active 'third generation' cephalosporin. It has a longer duration of action than the other cephalosporins that are active by mouth. It is only licensed for acute infections.

Cefuroxime is a 'second generation' cephalosporin that is less susceptible than the earlier cephalosporins to inactivation by beta-lactamases. It is, therefore, active

against certain bacteria which are resistant to the other drugs and has greater activity against *Haemophilus influenzae*.

Cefotaxime, ceftazidime and ceftriaxone are 'third generation' cephalosporins with greater activity than the 'second generation' cephalosporins against certain Gram-negative bacteria. However, they are less active than cefuroxime against Gram-positive bacteria, most notably *Staphylococcus aureus*. Their broad antibacterial spectrum may encourage superinfection with resistant bacteria or fungi.

Ceftazidime has good activity against pseudomonas. It is also active against other Gram-negative bacteria.

Ceftriaxone has a longer half-life and therefore needs to be given only once daily. Indications include serious infections such as septicaemia, pneumonia, and meningitis. The calcium salt of ceftriaxone forms a precipitate in the gall bladder which may rarely cause symptoms but these usually resolve when the antibiotic is stopped.

Ceftaroline fosamil is a 'fifth generation' cephalosporin with bactericidal activity similar to cefotaxime; however, ceftaroline fosamil has an extended spectrum of activity against Gram-positive bacteria that includes methicillin-resistant *Staphylococcus aureus* and multi-drug resistant *Streptococcus pneumoniae*. Ceftaroline fosamil is licensed for the treatment of community-acquired pneumonia and complicated skin and soft-tissue infections, but there is no experience of its use in pneumonia caused by methicillin-resistant *S. aureus*.

Cephalosporins

- **DRUG ACTION** Cephalosporins are antibacterials that attach to penicillin binding proteins to interrupt cell wall biosynthesis, leading to bacterial cell lysis and death.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · diarrhoea · dizziness · eosinophilia · headache · leucopenia · nausea · neutropenia · skin reactions · thrombocytopenia · vomiting · vulvovaginal candidiasis
 - ▶ **Uncommon** Anaphylactic reaction · pseudomembranous enterocolitis
 - ▶ **Rare or very rare** Agranulocytosis · angioedema · nephritis tubulointerstitial (reversible) · severe cutaneous adverse reactions (SCARs)
 - ▶ **Frequency not known** Haemolytic anaemia
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with cephalosporin hypersensitivity.
- ▶ Cross-sensitivity with other beta-lactam antibacterials. About 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. Patients with a history of **immediate hypersensitivity** to penicillin and other beta-lactams should not receive a cephalosporin. Cephalosporins should be used with caution in patients with sensitivity to penicillin and other beta-lactams.
- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances). False positive Coombs' test.

ANTIBACTERIALS > CEPHALOSPORINS, FIRST-GENERATION

Cefadroxil

● INDICATIONS AND DOSE

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- ▶ BY MOUTH
- ▶ Child 6-17 years (body-weight up to 40 kg): 0.5 g twice daily
- ▶ Child 6-17 years (body-weight 40 kg and above): 0.5-1 g twice daily
- ▶ Adult: 0.5-1 g twice daily

Skin infections | Soft-tissue infections | Uncomplicated urinary-tract infections

- ▶ BY MOUTH
- ▶ Child 6-17 years (body-weight 40 kg and above): 1 g once daily
- ▶ Adult: 1 g daily

- **INTERACTIONS** → Appendix 1: cephalosporins

● SIDE-EFFECTS

- ▶ **Common or very common** Dyspepsia · glossitis
- ▶ **Uncommon** Fungal infection
- ▶ **Rare or very rare** Arthralgia · drug fever · fatigue · hepatic disorders · insomnia · nervousness · serum sickness-like reaction

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

● RENAL IMPAIRMENT

- Dose adjustments** ▶ In adults 1 g initially, then 500 mg every 12 hours if eGFR 26-50 mL/minute/1.73 m². 1 g initially, then 500 mg every 24 hours if eGFR 11-26 mL/minute/1.73 m². 1 g initially, then 500 mg every 36 hours if eGFR less than 11 mL/minute/1.73 m².
- ▶ In children Reduce dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

(Cephalexin)

● INDICATIONS AND DOSE

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- ▶ BY MOUTH
- ▶ Child 1-11 months: 12.5 mg/kg twice daily, alternatively 125 mg twice daily
- ▶ Child 1-4 years: 12.5 mg/kg twice daily, alternatively 125 mg 3 times a day
- ▶ Child 5-11 years: 12.5 mg/kg twice daily, alternatively 250 mg 3 times a day
- ▶ Child 12-17 years: 500 mg 2-3 times a day
- ▶ Adult: 250 mg every 6 hours, alternatively 500 mg every 8-12 hours; increased to 1-1.5 g every 6-8 hours, increased dose to be used for severe infections

Serious susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- ▶ BY MOUTH
- ▶ Child 1 month-11 years: 25 mg/kg 2-4 times a day (max. per dose 1 g 4 times a day)
- ▶ Child 12-17 years: 1-1.5 g 3-4 times a day

Hospital-acquired pneumonia | Acute diverticulitis [in combination with metronidazole]

- ▶ BY MOUTH
- ▶ Adult: 500 mg 2-3 times a day; increased if necessary to 1-1.5 g 3-4 times a day for 5 days then review, use increased dose in severe infection

Prophylaxis of recurrent urinary-tract infection

- ▶ BY MOUTH
- ▶ Child 3 months-15 years: 12.5 mg/kg once daily (max. per dose 125 mg), dose to be taken at night
- ▶ Child 16-17 years: 125 mg once daily, dose to be taken at night, alternatively 500 mg for 1 dose, following exposure to a trigger
- ▶ Adult: 125 mg once daily, dose to be taken at night, alternatively 500 mg for 1 dose, following exposure to a trigger

Acute pyelonephritis | Urinary-tract infection (catheter-associated)

- ▶ BY MOUTH
- ▶ Child 3-11 months: 12.5 mg/kg twice daily for 7 to 10 days, alternatively 125 mg twice daily; increased if necessary to 25 mg/kg 2-4 times a day (max. per dose 1 g 4 times a day), increased dose used in severe infections
- ▶ Child 1-4 years: 12.5 mg/kg twice daily, alternatively 125 mg 3 times a day for 7 to 10 days; increased if necessary to 25 mg/kg 2-4 times a day (max. per dose 1 g 4 times a day), increased dose used in severe infections
- ▶ Child 5-11 years: 12.5 mg/kg twice daily, alternatively 250 mg 3 times a day for 7 to 10 days; increased if necessary to 25 mg/kg 2-4 times a day (max. per dose 1 g 4 times a day), increased dose used in severe infections
- ▶ Child 12-17 years: 500 mg 2-3 times a day for 7 to 10 days; increased to 1-1.5 g 3-4 times a day, increased dose used in severe infections
- ▶ Adult: 500 mg 2-3 times a day for 7 to 10 days; increased if necessary to 1-1.5 g 3-4 times a day, increased dose used in severe infections

Lower urinary-tract infection in pregnancy

- ▶ BY MOUTH
- ▶ Child 12-17 years: 500 mg twice daily for 7 days
- ▶ Adult: 500 mg twice daily for 7 days

Lower urinary-tract infection

- ▶ BY MOUTH
- ▶ Child 3-11 months: 12.5 mg/kg twice daily, alternatively 125 mg twice daily for 3 days
- ▶ Child 1-4 years: 12.5 mg/kg twice daily, alternatively 125 mg 3 times a day for 3 days
- ▶ Child 5-11 years: 12.5 mg/kg twice daily, alternatively 250 mg 3 times a day for 3 days
- ▶ Child 12-15 years: 500 mg twice daily for 3 days

- **UNLICENSED USE** Evrn Cefalexin is used for prophylaxis of recurrent urinary-tract infection, A but is not licensed for this indication.

- **INTERACTIONS** → Appendix 1: cephalosporins

- **SIDE-EFFECTS** Agitation · arthritis · confusion · fatigue · fungal infection · gastrointestinal discomfort · genital pruritus · hallucination · hepatitis (transient) · hypersensitivity · jaundice cholestatic (transient) · joint disorders · vaginal discharge

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT**
Dose adjustments ▶ In adults Max. 3 g daily if eGFR 40–50 mL/minute/1.73 m². Max. 1.5 g daily if eGFR 10–40 mL/minute/1.73 m². Max. 750 mg daily if eGFR less than 10 mL/minute/1.73 m².
 ▶ In children Reduce dose in moderate impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Gastro-intestinal system infections, antibacterial therapy p. 535, Respiratory system infections, antibacterial therapy p. 538, Urinary-tract infections p. 622.

Cefaclor (as Cefaclor monohydrate) 500 mg Distaclor 500mg capsules | 21 capsule [PoM] £7.50 DT = £7.50

Cefoxitin

21-Aug-2019

● INDICATIONS AND DOSE**Complicated urinary tract infection | Pyelonephritis**

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 2 g every 4-6 hours; maximum 12 g per day

- **INTERACTIONS** → Appendix 1: cephalosporins
- **SIDE-EFFECTS** Anaemia · bone marrow failure · encephalopathy · fever · hypersensitivity · local reaction · myasthenia gravis aggravated · overgrowth of nonsusceptible organisms · renal impairment · thrombophlebitis

- **PREGNANCY** Manufacturer advises not known to be harmful.
- **BREAST FEEDING** [EvGr] Specialist sources indicate present in milk in low concentrations, but appropriate to use. ◊
- **RENAL IMPAIRMENT**
Dose adjustments Manufacturer advises increase dosing interval to every 8-12 hours if creatinine clearance 30-50 mL/minute, or every 12-24 hours if creatinine clearance 10-29 mL/minute. Consult product literature if creatinine clearance less than 10 mL/minute.
- **DIRECTIONS FOR ADMINISTRATION** For slow intravenous injection, reconstitute with 10 mL water for injections; give over 3 to 5 minutes.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder for solution for injection

Powder for solution for injection

ELECTROLYTES: May contain Sodium

- ▶ **Renoxitin** (Renascience Pharma Ltd)
Cefoxitin (as Cefoxitin sodium) 1 gram Renoxitin 1g powder for solution for injection vials | 10 vial [PoM] £156.00 (Hospital only)
- ▶ **Cefoxitin** (as Cefoxitin sodium) 2 gram Renoxitin 2g powder for solution for injection vials | 10 vial [PoM] £269.00 (Hospital only)
- ▶ Cefoxitin 2g powder for solution for injection vials | 10 vial [PoM] X

Cefuroxime

21-May-2020

● INDICATIONS AND DOSE**Susceptible infections due to Gram-positive and Gram-negative bacteria**

- ▶ BY MOUTH
- ▶ Child 3 months-1 year: 10 mg/kg twice daily (max. per dose 125 mg)
- ▶ Child 2-11 years: 15 mg/kg twice daily (max. per dose 250 mg)
- ▶ Child 12-17 years: 250 mg twice daily, dose may be doubled in severe lower respiratory-tract infections or if pneumonia is suspected
- ▶ Adult: 250 mg twice daily, dose may be doubled in severe lower respiratory-tract infections or if pneumonia is suspected
- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child: 20 mg/kg every 8 hours (max. per dose 750 mg); increased to 50-60 mg/kg every 6-8 hours (max. per dose 1.5 g), increased dose used for severe infection and cystic fibrosis
- ▶ Adult: 750 mg every 6-8 hours; increased if necessary up to 1.5 g every 6-8 hours, increased dose used for severe infections

Cellulitis | Erysipelas

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: 20 mg/kg every 8 hours (max. per dose 750 mg); increased if necessary up to 50-60 mg/kg every 6-8 hours (max. per dose 1.5 g)
- ▶ Adult: 750 mg every 6-8 hours; increased if necessary up to 1.5 g every 6-8 hours

Acute diverticulitis [in combination with metronidazole]

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 750 mg every 6-8 hours; increased if necessary up to 1.5 g every 6-8 hours, use increased dose in severe infection

Lyme disease

- ▶ BY MOUTH
- ▶ Child 3 months-11 years: 15 mg/kg twice daily (max. per dose 500 mg) for 14-21 days (for 28 days in Lyme arthritis)
- ▶ Child 12-17 years: 500 mg twice daily for 14-21 days (for 28 days in Lyme arthritis)

continued →

- ▶ Adult: 500 mg twice daily for 14–21 days (for 28 days in Lyme arthritis)

Surgical prophylaxis

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: 1.5 g, to be administered up to 30 minutes before the procedure, then (by intravenous injection or by intramuscular injection) 750 mg every 8 hours if required for up to 3 doses (in high risk procedures)

Open fractures, prophylaxis

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 1.5 g every 8 hours until soft tissue closure (maximum duration 72 hours)

Acute prostatitis

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 1.5 g every 6–8 hours

Urinary-tract infection (lower)

- ▶ BY MOUTH
- ▶ Child (body-weight up to 40 kg): 15 mg/kg twice daily (max. per dose 250 mg)
- ▶ Child (body-weight 40 kg and above): 250 mg twice daily
- ▶ Adult: 250 mg twice daily

Urinary tract infection (catheter-associated)

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Child 3 months–15 years: 20 mg/kg every 8 hours (max. per dose 750 mg); increased to 50–60 mg/kg every 6–8 hours (max. per dose 1.5 g), increased dose used for severe infection
- ▶ Child 16–17 years: 0.75–1.5 g every 6–8 hours
- ▶ Adult: 0.75–1.5 g every 6–8 hours

Acute pyelonephritis

- ▶ BY MOUTH
- ▶ Child (body-weight up to 40 kg): 15 mg/kg twice daily (max. per dose 250 mg)
- ▶ Child (body-weight 40 kg and above): 250 mg twice daily
- ▶ Adult: 250 mg twice daily
- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Child 3 months–15 years: 20 mg/kg every 8 hours (max. per dose 750 mg); increased to 50–60 mg/kg every 6–8 hours (max. per dose 1.5 g), increased dose used for severe infection
- ▶ Child 16–17 years: 0.75–1.5 g every 6–8 hours
- ▶ Adult: 0.75–1.5 g every 6–8 hours

● UNLICENSED USE

- ▶ In children [EvgGr](#) Cefuroxime is used for the treatment of cellulitis, [A](#) but the dose increase is not licensed for this indication. [EvgGr](#) Cefuroxime is used for the treatment of erysipelas, [A](#) but the dose increase is not licensed for this indication. Not licensed for treatment of Lyme disease in children under 12 years.

- ▶ Duration of treatment in Lyme disease is unlicensed.

- **INTERACTIONS** → Appendix 1: cephalosporins

● SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With oral use Increased risk of infection
- ▶ **Uncommon**
- ▶ With parenteral use Gastrointestinal disorder
- ▶ **Frequency not known**
- ▶ With oral use Drug fever · hepatic disorders · Jarisch-Herxheimer reaction · serum sickness
- ▶ With parenteral use Cutaneous vasculitis · drug fever · increased risk of infection

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

● RENAL IMPAIRMENT

- ▶ **Dose adjustments** ▶ With intravenous use in adults Use parenteral dose of 750 mg twice daily if eGFR 10–20 mL/minute/1.73 m². Use parenteral dose of 750 mg once daily if eGFR less than 10 mL/minute/1.73 m².

- ▶ In children Reduce parenteral dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intramuscular use or intravenous use Single doses over 750 mg should be administered by the intravenous route only.
- ▶ With intravenous use in children Displacement value may be significant when reconstituting injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%; give over 30 minutes.
- ▶ With intravenous use in adults For *intravenous infusion* (Zinacef[®]), give intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Dissolve initially in water for injections (at least 2 mL for each 250 mg, 15 mL for 1.5 g); suggested volume 50–100 mL given over 30 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 529, Gastro-intestinal system infections, antibacterial therapy p. 535, Lyme disease p. 611, Skin infections, antibacterial therapy p. 540, Urinary-tract infections p. 622.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion

F 550

Cefixime

● INDICATIONS AND DOSE

Acute infections due to sensitive Gram-positive and Gram-negative bacteria

- ▶ BY MOUTH
- ▶ Child 6–11 months: 75 mg daily
- ▶ Child 1–4 years: 100 mg daily
- ▶ Child 5–9 years: 200 mg daily
- ▶ Child 10–17 years: 200–400 mg daily, alternatively 100–200 mg twice daily
- ▶ Adult: 200–400 mg daily in 1–2 divided doses

Uncomplicated gonorrhoea

- ▶ BY MOUTH
- ▶ Adult: 400 mg for 1 dose

- **UNLICENSED USE** Use of cefixime for uncomplicated gonorrhoea is an unlicensed indication.
- **INTERACTIONS** → Appendix 1: cephalosporins
- **SIDE-EFFECTS** Acute kidney injury · arthralgia · drug fever · dyspepsia · dyspnoea · face oedema · flatulence · genital pruritus · hyperosinophilia · jaundice · serum sickness-like reaction · thrombocytosis
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.
- **RENAL IMPAIRMENT**
Dose adjustments ▶ In adults Reduce dose if eGFR less than 20 mL/minute/1.73 m² (max. 200 mg once daily).
▶ In children Reduce dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Cefotaxime

● INDICATIONS AND DOSE

Uncomplicated gonorrhoea

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 500 mg for 1 dose

Infections due to sensitive Gram-positive and Gram-negative bacteria | Surgical prophylaxis | Haemophilus epiglottitis

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1 g every 12 hours

Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria | Meningitis

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 8 g daily in 4 divided doses, increased if necessary to 12 g daily in 3–4 divided doses, intramuscular doses over 1 g should be divided between more than one site

Emergency treatment of suspected bacterial meningitis or meningococcal disease, before urgent transfer to hospital, in patients who cannot be given benzylpenicillin (e.g. because of an allergy)

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1 month–11 years: 50 mg/kg for 1 dose
- ▶ Child 12–17 years: 1 g for 1 dose
- ▶ Adult: 1 g for 1 dose

- **INTERACTIONS** → Appendix 1: cephalosporins
- **SIDE-EFFECTS**
- **Uncommon** Drug fever · Jarisch-Herxheimer reaction · renal impairment · seizure
- ▶ **Frequency not known** Arrhythmia (following rapid injection) · bronchospasm · encephalopathy · fungal infection · hepatic disorders
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT**
Dose adjustments ▶ In adults If eGFR less than 5 mL/minute/1.73 m², initial dose of 1 g then use half normal dose.
▶ In children Usual initial dose, then use half normal dose if estimated glomerular filtration rate less than 5 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use in children Displacement value may be significant, consult local guidelines. For intermittent intravenous infusion dilute in glucose 5% or sodium chloride 0.9%; administer over 20–60 minutes; incompatible with alkaline solutions.
- ▶ With intravenous use in adults For intravenous infusion, give intermittently in Glucose 5% or Sodium chloride 0.9%. Suggested volume 40–100 mL given over 20–60 minutes; incompatible with alkaline solutions.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Ceftazidime

15-Jun-2018

● INDICATIONS AND DOSE

Prophylaxis for transurethral resection of prostate

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 1 g, single dose to be administered up to 30 minutes before procedure and may be repeated if necessary when catheter removed

Pseudomonas lung infection in cystic fibrosis

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 100–150 mg/kg daily in 3 divided doses; maximum 9 g per day

Complicated urinary-tract infection

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 1–2 g every 8–12 hours

continued →

Septicaemia | Hospital-acquired pneumonia

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 2 g every 8 hours

Febrile neutropenia

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 2 g every 8 hours

Meningitis

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 2 g every 8 hours

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 1–2 g every 8 hours

● **INTERACTIONS** → Appendix 1: cephalosporins● **SIDE-EFFECTS**

- ▶ **Common or very common** Thrombocytosis · thrombophlebitis
- ▶ **Uncommon** Antibiotic associated colitis · fungal infection
- ▶ **Rare or very rare** Acute kidney injury
- ▶ **Frequency not known** Coma · encephalopathy · jaundice · lymphocytosis · myoclonus · neurological effects · paraesthesia · seizure · taste altered · tremor

● **PREGNANCY** Not known to be harmful.● **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.● **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).● **RENAL IMPAIRMENT**

Dose adjustments Manufacturer advises reduce dose if creatinine clearance 50 mL/minute or less—consult product literature.

● **DIRECTIONS FOR ADMINISTRATION** Intramuscular administration used when intravenous administration not possible; single doses over 1 g by intravenous route only.

- ▶ With intravenous use For *intravenous infusion* give intermittently or *via* drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%. Dissolve 2 g initially in 10 mL (3 g in 15 mL) infusion fluid. For *Fortum*® dilute further to a concentration of 40 mg/mL. For *Kefadim*® dilute further to a concentration of 20 mg/mL. Give over up to 30 minutes.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion**Powder for solution for injection**

F 550

22-May-2020

Ceftriaxone● **INDICATIONS AND DOSE****Community-acquired pneumonia | Hospital-acquired pneumonia | Intra-abdominal infections | Complicated urinary-tract infections | Acute exacerbations of chronic obstructive pulmonary disease**

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 1–2 g once daily, 2 g dose to be used for hospital-acquired pneumonia and severe cases

Cellulitis | Erysipelas | Moderate diabetic foot infection | Severe diabetic foot infection | Leg ulcer infection

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 2 g once daily

Complicated skin and soft tissue infections | Infections of bones and joints

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 2 g once daily

Suspected bacterial infection in neutropenic patients

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 2–4 g daily, doses at the higher end of the recommended range used in severe cases

Bacterial meningitis | Bacterial endocarditis

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 2–4 g daily, doses at the higher end of the recommended range used in severe cases
- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 80–100 mg/kg once daily, 100 mg/kg once daily dose should be used for bacterial endocarditis; maximum 4 g per day
- ▶ Child 9–11 years (body-weight 50 kg and above): 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
- ▶ Child 12–17 years: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases

▶ BY INTRAVENOUS INJECTION

- ▶ Child 9–11 years (body-weight 50 kg and above): 2–4 g once daily, doses at the higher end of the recommended range used in severe cases; doses of 50 mg/kg or more should be given by infusion
- ▶ Child 12–17 years: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Child 1 month–11 years (body-weight up to 50 kg): 80–100 mg/kg daily, 100 mg/kg daily dose should be used for bacterial endocarditis; maximum 4 g per day
- ▶ Child 9–11 years (body-weight 50 kg and above): 2–4 g daily, doses at the higher end of the recommended range used in severe cases
- ▶ Child 12–17 years: 2–4 g daily, doses at the higher end of the recommended range used in severe cases

Surgical prophylaxis

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 2 g for 1 dose, dose to be administered 30–90 minutes before procedure

Uncomplicated gonorrhoea | Pelvic inflammatory disease

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 500 mg for 1 dose

Syphilis

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 0.5–1 g once daily for 10–14 days, dose increased to 2 g once daily for neurosyphilis

Lyme disease [affecting central nervous system]

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 2 g twice daily for 21 days, alternatively 4 g once daily for 21 days

Lyme arthritis | Acrodermatitis chronica atrophicans

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 2 g once daily for 28 days

Lyme carditis

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 2 g once daily for 21 days

Prevention of secondary case of meningococcal meningitis

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 250 mg for 1 dose

Prevention of secondary case of *Haemophilus influenzae* type b disease

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1 g daily for 2 days

Acute otitis media

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 1–2 g for 1 dose, dose can be given for 3 days if severely ill or previous therapy failed

Acute prostatitis

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 2 g once daily

- **UNLICENSED USE** [EvGr](#) Not licensed for prophylaxis of *Haemophilus influenzae* type b disease. [E](#) Not licensed for prophylaxis of meningococcal meningitis.
- ▶ In adults [EvGr](#) Dose not licensed for treatment of pelvic inflammatory disease in adults over 18 years. Ceftriaxone is used for Lyme disease affecting the central nervous system, [A](#) but the dose is not licensed for this indication.

● CAUTIONS

GENERAL CAUTIONS History of hypercalciuria · history of kidney stones

SPECIFIC CAUTIONS

- ▶ With intravenous use concomitant treatment with intravenous calcium (including total parenteral nutrition containing calcium)
 - **INTERACTIONS** → Appendix 1: cephalosporins
 - **SIDE-EFFECTS**
 - ▶ **Uncommon** Anaemia · coagulation disorder · fungal infection
 - ▶ **Rare or very rare** Bronchospasm · glycosuria · haematuria · oedema
 - ▶ **Frequency not known** Antibiotic associated colitis · cholelithiasis · hypersensitivity · nephrolithiasis · oral disorders · pancreatitis · seizure · vertigo
- SIDE-EFFECTS, FURTHER INFORMATION** Precipitates of calcium ceftriaxone can occur in the gall bladder and urine (particularly in very young, dehydrated or those who are immobilised)—consider discontinuation if symptomatic.

- **PREGNANCY** Manufacturer advises use only if benefit outweighs risk—limited data available but not known to be harmful in *animal* studies. [EvGr](#) Specialist sources indicate suitable for use in pregnancy. [D](#)

- **BREAST FEEDING** [EvGr](#) Specialist sources advise ceftriaxone is compatible with breastfeeding—present in milk in low concentration but limited effects to breast-fed infant. [D](#)

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).

● RENAL IMPAIRMENT

Dose adjustments Manufacturer advises reduce dose and monitor efficacy in patients with severe renal impairment in combination with hepatic impairment—no information available.

- ▶ In adults Manufacturer advises reduce dose if eGFR less than 10 mL/minute/1.73 m² (max. 2 g daily).
- ▶ In children Manufacturer advises reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m² max. 50 mg/kg daily or max. 2 g daily).

- **MONITORING REQUIREMENTS** Manufacturer advises to monitor full blood count regularly during prolonged treatment.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intramuscular use or intravenous use Twice daily dosing may be considered for doses greater than 2 g daily.
- ▶ With intravenous use in children For *intravenous infusion* (preferred route), dilute reconstituted solution with Glucose 5% (or 10% in neonates) or Sodium Chloride 0.9%; give over at least 30 minutes (60 minutes in neonates—may displace bilirubin from serum albumin). Not to be given simultaneously with parenteral nutrition or infusion fluids containing calcium, even by different infusion lines; in children, may be infused sequentially with infusion fluids containing calcium if infusion lines at different sites are used, or if the infusion lines are replaced or thoroughly flushed between infusions with Sodium Chloride 0.9% to avoid precipitation—consult product literature. Displacement value may be significant, consult local guidelines. For *intravenous injection*, give over 5 minutes.
- ▶ With intramuscular use in children For *intramuscular injection*, may be mixed with 1% Lidocaine Hydrochloride Injection to reduce pain at intramuscular injection site. Intramuscular injection should only be considered when the intravenous route is not possible or less appropriate. If administered by intramuscular injection, the lower end of the dose range should be used for the shortest time possible; volume depends on the age and size of the child, but doses over 1 g must be divided between more than one site. Displacement value may be significant, consult local guidelines. The maximum single intramuscular dose is 2 g, doses greater than 2 g must be given in divided doses or by intravenous administration (see above).
- ▶ With intravenous use in adults For *intravenous infusion* (preferred route) (*Rocephin*[®]; *Ceftriaxone Injection*, Genus), give intermittently or *via* drip tubing in Glucose 5% or 10% or Sodium Chloride 0.9%. Reconstitute 2-g vial with 40 mL infusion fluid. Give by intermittent infusion over at least 30 minutes. Not to be given simultaneously with total parenteral nutrition or infusion fluids containing calcium, even by different infusion lines. May be infused sequentially with infusion fluids containing calcium if infusion lines at different sites are used, or if the infusion lines are replaced or thoroughly flushed between infusions with Sodium Chloride 0.9% to avoid precipitation—consult product literature. For *intravenous injection*, give over 5 minutes.
- ▶ With intramuscular use in adults For *intramuscular injection*, doses over 1 g must be divided between more than one site. Displacement value may be significant, consult local guidelines. The maximum single intramuscular dose is 2 g, doses greater than 2 g must be given in divided doses or by intravenous administration.
- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 529, Cardiovascular system infections, antibacterial therapy p. 532, Central nervous system infections, antibacterial therapy p. 533, Diabetic foot infections, antibacterial therapy p. 533, Ear infections, antibacterial therapy p. 534, Gastro-intestinal system infections, antibacterial therapy p. 535, Genital system infections, antibacterial therapy p. 536, Lyme disease

p. 611, Musculoskeletal system infections, antibacterial therapy p. 536, Respiratory system infections, antibacterial therapy p. 538, Skin infections, antibacterial therapy p. 540, Urinary-tract infections p. 622.

F 550

Ceftazidime with avibactam

27-Jul-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, ceftazidime p. 555.

• INDICATIONS AND DOSE

Complicated intra-abdominal infection

▶ BY INTRAVENOUS INFUSION

▶ Adult: 2/0.5 g every 8 hours for 5–14 days

Complicated urinary tract infection, including pyelonephritis

▶ BY INTRAVENOUS INFUSION

▶ Adult: 2/0.5 g every 8 hours for 5–10 days

Hospital-acquired pneumonia, including ventilator-associated pneumonia

▶ BY INTRAVENOUS INFUSION

▶ Adult: 2/0.5 g every 8 hours for 7–14 days

Infections due to Gram-negative bacteria with limited treatment options

▶ BY INTRAVENOUS INFUSION

▶ Adult: 2/0.5 g every 8 hours, duration of treatment guided by infection severity, pathogen, and response

DOSE EQUIVALENCE AND CONVERSION

▶ Dose expressed as x/y g ceftazidime/avibactam

- **INTERACTIONS** → Appendix 1: cephalosporins

• SIDE-EFFECTS

▶ **Common or very common** Increased risk of infection · thrombocytosis

▶ **Uncommon** Acute kidney injury · antibiotic associated colitis · lymphocytosis · paraesthesia · taste altered

▶ **Frequency not known** Coma · encephalopathy · jaundice · myoclonus · neurological effects · seizures · tremor

• **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.

• **BREAST FEEDING** Manufacturer advises avoid—presence of avibactam in milk unknown.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion* (Zavicefta[®]) give in Glucose 5%, or Sodium Chloride 0.9%, or Sodium Chloride 0.45% with Glucose 2.5% combination or Lactated Ringer's solution. Reconstitute each 2 g/0.5 g vial with 10 mL water for injections; dilute requisite dose in an appropriate infusion bag and give over 120 minutes.

• PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—risk of dizziness.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

▶ Zavicefta (Pfizer Ltd) ▼

Avibactam (as Avibactam sodium) 500 mg, Ceftazidime (as Ceftazidime pentahydrate) 2 gram Zavicefta 2g/0.5g powder for concentrate for solution for infusion vials | 10 vial [PoM] £857.00 (Hospital only)

F 550

Ceftolozane with tazobactam

16-Jan-2020

• INDICATIONS AND DOSE

Complicated intra-abdominal infection

▶ BY INTRAVENOUS INFUSION

▶ Adult: 1/0.5 g every 8 hours for 4–14 days

Complicated urinary tract infection | Acute pyelonephritis

▶ BY INTRAVENOUS INFUSION

▶ Adult: 1/0.5 g every 8 hours for 7 days

Hospital-acquired pneumonia | Ventilator-associated pneumonia

▶ BY INTRAVENOUS INFUSION

▶ Adult: 2/1 g every 8 hours for 8–14 days

DOSE EQUIVALENCE AND CONVERSION

▶ Dose expressed as x/y g where x and y are ceftolozane and tazobactam respectively.

- **INTERACTIONS** → Appendix 1: cephalosporins

• SIDE-EFFECTS

▶ **Common or very common** Antibiotic associated colitis · anxiety · constipation · electrolyte imbalance · hypotension · insomnia · thrombocytosis

▶ **Uncommon** Anaemia · angina pectoris · arrhythmias · dyspnoea · gastrointestinal discomfort · gastrointestinal disorders · hyperglycaemia · increased risk of infection · ischaemic stroke · renal impairment · venous thrombosis

• **PREGNANCY** Manufacturer advises to use only if potential benefit outweighs risk—toxicity in *animal* studies with tazobactam.

• **BREAST FEEDING** Manufacturer advises avoid—no information available.

• **RENAL IMPAIRMENT** Manufacturer advises monitor for changes in renal function.

Dose adjustments

▶ When used for Complicated intra-abdominal infection or Complicated urinary tract infection or Acute pyelonephritis Manufacturer advises reduce dose to 500/250 mg every 8 hours if creatinine clearance 30–50 mL/minute and 250/125 mg every 8 hours if creatinine clearance 15–29 mL/minute.

▶ When used for Hospital-acquired pneumonia or Ventilator-associated pneumonia Manufacturer advises reduce dose to 1/0.5 g every 8 hours if creatinine clearance 30–50 mL/minute and 500/250 mg every 8 hours if creatinine clearance 15–29 mL/minute.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Zerbaxa[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute initially each vial with 10 mL Water for Injections or Sodium chloride 0.9% to give a final

volume of 11.4 mL; dilute requisite dose in 100 mL of Glucose 5% or Sodium chloride 0.9%; give over 1 hour.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2°C–8°C.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Manufacturer advises ceftolozane with tazobactam may influence driving and performance of skilled tasks—increased risk of dizziness.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 1146/16

The *Scottish Medicines Consortium* has advised (May 2016) that ceftolozane with tazobactam (*Zerbaxa*®) is **not** recommended for use within NHS Scotland for the treatment of complicated intra-abdominal infections, complicated urinary tract infections, and acute pyelonephritis as the clinical and economic case was not demonstrated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Zerbaxa** (Merck Sharp & Dohme Ltd) ▼

Tazobactam (as Tazobactam sodium) 500 mg, Ceftolozane (as Ceftolozane sulfate) 1 gram Zerbaxa 1g/0.5g powder for concentrate for solution for infusion vials | 10 vial (PoM) £670.30 (Hospital only)

ANTIBACTERIALS > CEPHALOSPORINS, OTHER

F 550

Cefepime

12-Dec-2019

● INDICATIONS AND DOSE

Infections due to sensitive Gram-positive and Gram-negative bacteria

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult (body-weight up to 41 kg): 50 mg/kg every 12 hours (max. per dose 2 g), increased if necessary to 50 mg/kg every 8 hours (max. per dose 2 g), increased dose used for severe infections, intravenous route preferred in severe infections

Mild to moderate urinary tract infections

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult (body-weight 41 kg and above): 0.5–1 g every 12 hours

Mild to moderate infections due to sensitive Gram-positive and Gram-negative bacteria

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult (body-weight 41 kg and above): 1 g every 12 hours

Severe infections due to sensitive Gram-positive and Gram-negative bacteria

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult (body-weight 41 kg and above): 2 g every 12 hours, increased if necessary to 2 g every 8 hours, increased dose used for very severe infections

- **INTERACTIONS** → Appendix 1: cephalosporins
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia
 - ▶ **Uncommon** Gastrointestinal disorders · increased risk of infection
 - ▶ **Rare or very rare** Constipation · dyspnoea · genital pruritus · paraesthesia · seizure · taste altered · vasodilation
 - ▶ **Frequency not known** Anaphylactic shock · aplastic anaemia · coma · confusion · consciousness impaired ·

encephalopathy · haemorrhage · hallucination · myoclonus · nephrotoxicity · renal failure

- **PREGNANCY** Manufacturer advises caution—no data available but not known to be harmful in *animal* studies.
- **BREAST FEEDING** Manufacturer advises caution—present in milk in very low quantities.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution.
Dose adjustments Manufacturer advises reduce dose—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** After reconstitution the solution is yellow to yellow-brown. Displacement value may be significant when reconstituting injection, consult local guidelines. For *intravenous infusion*, manufacturer advises reconstitute with 50 mL Glucose 5% or 10% or Sodium Chloride 0.9%; give over 30 minutes. For *intravenous injection*, manufacturer advises reconstitute with 10 mL Glucose 5% or 10% or Sodium Chloride 0.9%. For *intramuscular injection*, manufacturer advises reconstitute with 3 mL Water for Injection.

● NATIONAL FUNDING/ACCESS DECISIONS

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 4129

The *All Wales Medicines Strategy Group* has advised (November 2019) that ceftepime (*Renapime*®) is recommended as an option for restricted use within NHS Wales. It should be restricted to use in the treatment of resistant pseudomonas infections where first-line agents are not effective or contra-indicated. It is not recommended for use within NHS Wales outside of this subpopulation.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- ▶ **Renapime** (Renascence Pharma Ltd)

Cefepime (as Cefepime dihydrochloride monohydrate)

1 gram Renapime 1g powder for solution for injection vials | 10 vial (PoM) £70.00

Cefepime (as Cefepime dihydrochloride monohydrate)

2 gram Renapime 2g powder for solution for injection vials | 10 vial (PoM) £110.00

F 550

Ceftaroline fosamil

21-May-2020

● INDICATIONS AND DOSE

Community-acquired pneumonia

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 600 mg every 12 hours for 5–7 days

Complicated skin infections | Complicated soft-tissue infections

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 600 mg every 12 hours for 5–14 days, for high dose regimen consult product literature

- **CAUTIONS** Seizure disorders
- **INTERACTIONS** → Appendix 1: cephalosporins
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Anaemia · antibiotic associated colitis · hypersensitivity
- **PREGNANCY** Manufacturer advises avoid unless essential—limited information; *animal* studies do not indicate toxicity.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT**
Dose adjustments Manufacturer advises reduce dose if creatinine clearance less than 51 mL/minute—consult product literature.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute reconstituted solution to 50, 100, or 250 mL with infusion fluid; give over 5 to 60 minutes. Consult product literature for administration of high-dose regimen.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium*, has advised (Dec 2012) that ceftaroline fosamil (*Zinforo*[®]) is accepted for restricted use within NHS Scotland when meticillin-resistant *S. aureus* is suspected in complicated skin and soft-tissue infection and vancomycin cannot be used.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ *Zinforo* (Pfizer Ltd)

Ceftaroline fosamil (as Ceftaroline fosamil acetic acid solvate monohydrate) 600 mg *Zinforo* 600mg powder for concentrate for solution for infusion vials | 10 vial **[PoM]** £375.00 (Hospital only)

Ceftobiprole

£ 550

21-May-2020

- **INDICATIONS AND DOSE**

Hospital-acquired pneumonia (excluding ventilator-associated pneumonia) | Community-acquired pneumonia

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg every 8 hours

- **CAUTIONS** Pre-existing seizure disorder—increased risk of seizures · supra-normal creatinine clearance

CAUTIONS, FURTHER INFORMATION

- ▶ Supra-normal creatinine clearance Manufacturer advises to measure baseline renal function and increase duration of infusion if creatinine clearance greater than 150 mL/minute.

- **INTERACTIONS** → Appendix 1: cephalosporins

- **SIDE-EFFECTS**

- ▶ **Common or very common** Drowsiness · dyspepsia · electrolyte imbalance · fungal infection · hypersensitivity · taste altered
- ▶ **Uncommon** Anaemia · antibiotic associated colitis · anxiety · asthma · dyspnoea · laryngeal pain · muscle spasms · peripheral oedema · renal failure · sleep disorders · thrombocytosis
- ▶ **Frequency not known** Seizure

- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **RENAL IMPAIRMENT** Manufacturer advises use with caution in severe impairment—limited information available.

Dose adjustments Reduce dose to 500 mg every 12 hours in moderate impairment and 250 mg every 12 hours in severe impairment.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion* (*Zevtera*[®]), give intermittently in Glucose 5%, or Sodium Chloride 0.9%, or Lactated Ringer's solution; reconstitute each 500 mg with 10 mL Water for injections or Glucose 5%; dilute in 250 mL infusion fluid and give over 2 hours (increased to 4 hours if creatinine clearance greater than 150 mL/minute). Do not mix with calcium-containing solutions (except Lactated Ringer's solution) in the same intravenous line—precipitation may occur.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for storage after reconstitution and dilution.

- **PATIENT AND CARER ADVICE**

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ *Zevtera* (Correvio UK Ltd)

Ceftobiprole (as Ceftobiprole medocaril sodium) 500 mg *Zevtera* 500mg powder for concentrate for solution for infusion vials | 10 vial **[PoM]** £396.30 (Hospital only)

ANTIBACTERIALS > GLYCOPEPTIDE ANTIBACTERIALS

Dalbavancin

18-Jul-2017

- **DRUG ACTION** Dalbavancin is a glycopeptide antibacterial; it has bactericidal activity against Gram-positive bacteria including various staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides and increasing reports of glycopeptide-resistant enterococci.

- **INDICATIONS AND DOSE**

Acute bacterial skin and skin structure infections

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 1500 mg for 1 dose, alternatively 1000 mg, then 500 mg after 1 week

- **SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea · headache · nausea
- ▶ **Uncommon** Anaemia · antibiotic associated colitis · appetite decreased · constipation · cough · dizziness · eosinophilia · flushing · gastrointestinal discomfort · increased risk of infection · infusion related reaction · insomnia · leucopenia · neutropenia · skin reactions · taste altered · thrombocytosis · vomiting · vulvovaginal pruritus
- ▶ **Rare or very rare** Bronchospasm
- ▶ **Frequency not known** Ototoxicity

- **ALLERGY AND CROSS-SENSITIVITY** Manufacturer advises use with caution in patients with other glycopeptide sensitivity.

- **PREGNANCY**

Dose adjustments Manufacturer advises avoid unless essential—toxicity in *animal* studies.

- **BREAST FEEDING**

Dose adjustments Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (no information available).

- **RENAL IMPAIRMENT**

Dose adjustments Manufacturer advises reduce dose to 1000 mg as a single infusion or reduce dose to 750 mg followed one week later by 375 mg if creatinine clearance <30 mL/minute.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion* (*Xydalba*[®]), reconstitute each 500 mg vial to produce a 20 mg/mL solution with 25 mL water for injections. Dilute reconstituted solution to a concentration of 1–5 mg/mL with Glucose 5%; give intermittently over 30 minutes (avoid rapid infusion—risk of 'red man' syndrome).

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 1105/15

The *Scottish Medicines Consortium* has advised (January 2017) that dalbavancin (*Xydalba*®) is accepted for restricted use within NHS Scotland for the treatment of acute bacterial skin and skin structure infections (ABSSSI), only if:

- used as second-line treatment, **or**
- met icillin-resistant *Staphylococcus aureus* infection is suspected, **or**
- under local microbiologist or infectious diseases specialist advice; **and**
- the patient is initially hospitalised due to ABSSSI requiring intravenous antibiotics but is eligible for early discharge as soon as their medical condition does not require further inpatient treatment.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 2001

The *All Wales Medicines Strategy Group* has advised (July 2018) that dalbavancin (*Xydalba*®) is recommended as an option for restricted use within NHS Wales for the treatment of acute bacterial skin and skin structure infections (ABSSSI) in adults:

- as a second-line treatment of ABSSSI, **or**
- when met icillin-resistant *Staphylococcus aureus* (MRSA) infection is suspected, **or**
- on the advice of local microbiologists or infectious disease specialists, **and**
- the patient is at first hospitalised due to ABSSSI and needs intravenous antibiotics but is allowed early discharge as they don't need further inpatient treatment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ *Xydalba* (Correvio UK Ltd)

Dalbavancin (as Dalbavancin hydrochloride) 500 mg *Xydalba* 500mg powder for concentrate for solution for infusion vials | 1 vial (POM) £558.70 (Hospital only)

Teicoplanin

18-May-2020

- **DRUG ACTION** The glycopeptide antibiotic teicoplanin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides and increasing reports of glycopeptide-resistant enterococci. Teicoplanin is similar to vancomycin, but has a significantly longer duration of action, allowing once daily administration after the loading dose.

● INDICATIONS AND DOSE

Clostridioides difficile infection

- ▶ BY MOUTH

- ▶ Adult: 100–200 mg twice daily for 7–14 days

Moderate diabetic foot infection | Severe diabetic foot infection | Leg ulcer infection

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily

Cellulitis | Erysipelas

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily

Serious infections caused by Gram-positive bacteria (e.g. complicated skin and soft-tissue infections, pneumonia, complicated urinary tract infections)

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily

Streptococcal or enterococcal endocarditis (in combination with another antibacterial) | Bone and joint infections

- ▶ INITIALLY BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 12 mg/kg every 12 hours for 3–5 doses, then (by intravenous injection or by intravenous infusion or by intramuscular injection) 12 mg/kg once daily

Surgical prophylaxis

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 400 mg, to be administered up to 30 minutes before the procedure

Surgical prophylaxis in open fractures

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 800 mg, to be administered up to 30 minutes before skeletal stabilisation and definitive soft-tissue closure

Peritonitis associated with peritoneal dialysis (added to dialysis fluid)

- ▶ BY INTRAPERITONEAL INFUSION
- ▶ Adult: (consult local protocol)

PHARMACOKINETICS

- ▶ Teicoplanin should **not** be given by mouth for systemic infections because it is not absorbed significantly.

- **UNLICENSED USE** Not licensed for surgical prophylaxis.
- **INTERACTIONS** → Appendix 1: teicoplanin
- **SIDE-EFFECTS**
- ▶ **Common or very common** Fever · pain · skin reactions
- ▶ **Uncommon** Bronchospasm · diarrhoea · dizziness · eosinophilia · headache · hearing impairment · hypersensitivity · leucopenia · nausea · ototoxicity · thrombocytopenia · vomiting
- ▶ **Rare or very rare** Abscess · red man syndrome
- ▶ **Frequency not known** Agranulocytosis · angioedema · chills · neutropenia · overgrowth of nonsusceptible organisms · renal impairment · seizure · severe cutaneous adverse reactions (SCARs) · thrombophlebitis
- SIDE-EFFECTS, FURTHER INFORMATION** Teicoplanin is associated with a lower incidence of nephrotoxicity than vancomycin.
- **ALLERGY AND CROSS-SENSITIVITY** Caution if history of vancomycin sensitivity.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** No information available.
- **RENAL IMPAIRMENT**
- Dose adjustments** Use normal dose regimen on days 1–4, then use normal maintenance dose every 48 hours if eGFR 30–80 mL/minute/1.73 m² and use normal maintenance dose every 72 hours if eGFR less than 30 mL/minute/1.73 m².
- Monitoring** Monitor renal and auditory function during prolonged treatment in renal impairment.
- **MONITORING REQUIREMENTS**
- ▶ With intramuscular use or intravenous use Manufacturer advises monitor serum-teicoplanin trough concentration at steady state after completion of loading dose and during maintenance treatment—consult product literature.
- ▶ Blood counts and liver and kidney function tests required.
- ▶ Manufacturer advises monitoring for adverse reactions when doses of 12 mg/kg twice daily are administered.

● DIRECTIONS FOR ADMINISTRATION

▶ With intravenous use For intravenous infusion (*Targocid*[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute initially with water for injections provided; infuse over 30 minutes. Continuous infusion not usually recommended.

▶ With oral use Injection can be used to prepare solution for oral administration.

● **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 529, Cardiovascular system infections, antibacterial therapy p. 532, Diabetic foot infections, antibacterial therapy p. 533, Gastro-intestinal system infections, antibacterial therapy p. 535, Musculoskeletal system infections, antibacterial therapy p. 536, Respiratory system infections, antibacterial therapy p. 538, Skin infections, antibacterial therapy p. 540, Urinary-tract infections p. 622.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Powder and solvent for solution for injection

ELECTROLYTES: May contain Sodium

▶ **Teicoplanin (non-proprietary)** ▼

Teicoplanin 200 mg Teicoplanin 200mg powder and solvent for solution for injection vials | 1 vial [PoM] £4.45 DT = £3.93

Teicoplanin 400 mg Teicoplanin 400mg powder and solvent for solution for injection vials | 1 vial [PoM] £7.57 DT = £7.32

▶ **Targocid (Sanofi)** ▼

Teicoplanin 400 mg Targocid 400mg powder and solvent for solution for injection vials | 1 vial [PoM] £7.32 DT = £7.32

Telavancin

● **DRUG ACTION** Telavancin is a glycopeptide antibacterial; it has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci.

● INDICATIONS AND DOSE

Hospital-acquired pneumonia, known or suspected to be caused by methicillin-resistant *Staphylococcus aureus* when other antibacterials cannot be used

▶ BY INTRAVENOUS INFUSION

▶ Adult: 10 mg/kg once daily for 7–21 days

● **CAUTIONS** Conditions that predispose to renal impairment · predisposition to QT interval prolongation (including electrolyte disturbances, congenital long QT syndrome, uncompensated heart failure, severe left ventricular hypertrophy)

● **INTERACTIONS** → Appendix 1: telavancin

● SIDE-EFFECTS

▶ **Common or very common** Asthenia · constipation · diarrhoea · dizziness · headaches · increased risk of infection · insomnia · nausea · renal impairment · skin reactions · taste altered · urine abnormalities · vomiting

▶ **Uncommon** Altered smell sensation · anaemia · angina pectoris · anxiety · appetite decreased · arrhythmias · arthralgia · Clostridium colitis · confusion · congestive heart failure · depression · drowsiness · dry mouth · dyspnoea · electrolyte imbalance · eye irritation · flatulence · flushing · gastrointestinal discomfort · haematuria · hepatitis · hiccups · hyperglycaemia · hyperhidrosis · hypertension · hypoglycaemia · hypotension · laryngeal pain · leucopenia · muscle complaints · nasal congestion ·

oedema · oral hypoesthesia · pain · palpitations · paraesthesia · QT interval prolongation · red man syndrome · thrombocytopenia · thrombocytosis · tinnitus · tremor · urinary disorders · vision blurred

▶ **Rare or very rare** Deafness

● **ALLERGY AND CROSS-SENSITIVITY** Use with caution in patients with vancomycin or teicoplanin sensitivity.

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

● **PREGNANCY** Avoid (teratogenic in *animal studies*).

● **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).

● **RENAL IMPAIRMENT** Avoid in acute renal failure—risk of mortality increased. In chronic renal failure, avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments In chronic renal failure, use 7.5 mg/kg once daily if eGFR 30–50 mL/minute/1.73 m².

● **MONITORING REQUIREMENTS** Monitor renal function daily for at least the first 3–5 days, then every 2–3 days thereafter.

● **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Vibativ*[®]). Avoid rapid infusion (can cause 'red man' syndrome). Give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute each 750 mg with 45 mL glucose 5%, sodium chloride 0.9%, or water for injections to produce a 15 mg/mL solution; for doses of 150–800 mg, dilute requisite dose in 100 to 250 mL infusion fluid; for doses outside this range, dilute to a final concentration of 0.6–8 mg/mL; give over at least 60 minutes.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Vibativ (Clingen Healthcare Ltd)**

Telavancin (as Telavancin hydrochloride) 750 mg Vibativ 750mg powder for solution for infusion vials | 1 vial [PoM] £645.00 (Hospital only)

Vancomycin

18-May-2020

● **DRUG ACTION** The glycopeptide antibiotic vancomycin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci. Penetration into cerebrospinal fluid is poor.

● INDICATIONS AND DOSE

Clostridioides difficile infection [first episode]

▶ BY MOUTH

▶ Adult: 125 mg every 6 hours for 10 days; increased if necessary to 500 mg every 6 hours for 10 days, increased dose if severe or complicated infection

Clostridioides difficile infection [multiple recurrences]

▶ BY MOUTH

▶ Adult: 125 mg every 6 hours for 10 days, followed by, either tapering the dose (gradually reducing until 125 mg daily) or a pulse regimen (125–500 mg every 2–3 days for at least 3 weeks)

Moderate diabetic foot infection | Severe diabetic foot infection | Leg ulcer infection

▶ BY INTRAVENOUS INFUSION

▶ Adult: 15–20 mg/kg every 8–12 hours (max. per dose 2 g) adjusted according to plasma-concentration monitoring

Cellulitis | Erysipelas

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 15–20 mg/kg every 8–12 hours (max. per dose 2 g) adjusted according to plasma-concentration monitoring

Complicated skin and soft tissue infections | Bone infections | Joint infections | Community-acquired pneumonia | Hospital-acquired pneumonia [including ventilator-associated pneumonia] | Infective endocarditis | Acute bacterial meningitis | Bacteraemia [occurring in association with or suspected to be associated with the licensed indications]

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 15–20 mg/kg every 8–12 hours (max. per dose 2 g) adjusted according to plasma-concentration monitoring, duration should be tailored to type and severity of infection and the individual clinical response—consult product literature for further information, in seriously ill patients, a loading dose of 25–30 mg/kg (usual max. 2 g) can be used to facilitate rapid attainment of the target trough serum-vancomycin concentration

Perioperative prophylaxis of bacterial endocarditis [in patients at high risk of developing bacterial endocarditis when undergoing major surgical procedures]

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 15 mg/kg, to be given prior to induction of anaesthesia, a second dose may be required depending on duration of surgery

Surgical prophylaxis (when high risk of MRSA)

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 1 g for 1 dose

Peritonitis associated with peritoneal dialysis

▶ BY INTRAPERITONEAL ADMINISTRATION

- ▶ Adult: (consult local protocol)

PHARMACOKINETICS

- ▶ Vancomycin should **not** be given by mouth for systemic infections because it is not absorbed significantly.

- **UNLICENSED USE** Vancomycin doses in BNF publications may differ from those in product literature. Use of vancomycin (added to dialysis fluid) for the treatment of peritonitis associated with peritoneal dialysis is an unlicensed route.

● **CONTRA-INDICATIONS**

- ▶ With intravenous use Previous hearing loss

● **CAUTIONS**

- ▶ With oral use systemic absorption may be enhanced in patients with inflammatory disorders of the intestinal mucosa or with *Clostridioides difficile*-induced pseudomembranous colitis (increased risk of adverse reactions)

- **INTERACTIONS** → Appendix 1: vancomycin

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- Agranulocytosis · dizziness · drug fever · eosinophilia · hypersensitivity · nausea · nephritis tubulointerstitial · neutropenia (more common after 1 week or cumulative dose of 25g) · renal failure · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · tinnitus (discontinue) · vasculitis · vertigo

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Back pain · bradycardia · cardiac arrest (on rapid intravenous injection) · cardiogenic shock (on rapid intravenous injection) · chest pain · dyspnoea · hearing loss · hypotension · muscle complaints · pseudomembranous enterocolitis · red man syndrome · wheezing

SIDE-EFFECTS, FURTHER INFORMATION Vancomycin is associated with a higher incidence of nephrotoxicity than teicoplanin.

- **ALLERGY AND CROSS-SENSITIVITY** Caution if teicoplanin sensitivity.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **Monitoring** Plasma-vancomycin concentration monitoring essential to reduce risk of fetal toxicity.
- **BREAST FEEDING** Present in milk—significant absorption following oral administration unlikely.
- **RENAL IMPAIRMENT** Manufacturer advises serial monitoring of renal function.
 - ▶ With intravenous use Manufacturer advises use with caution—increased risk of toxic effects with prolonged high blood concentration.
 - **Dose adjustments** ▶ With oral use Manufacturer advises dose adjustment is unlikely to be required unless substantial oral absorption occurs in inflammatory disorders of the intestinal mucosa or with *Clostridioides difficile*-induced pseudomembranous colitis, see *Monitoring*.
 - ▶ With intravenous use Manufacturer advises initial dose must not be reduced—consult product literature.
- **MONITORING REQUIREMENTS**
 - ▶ With intravenous use Manufacturer advises initial doses should be based on body-weight; subsequent dose adjustments should be based on serum-vancomycin concentrations to achieve targeted therapeutic concentrations. All patients require serum-vancomycin measurement (on the second day of treatment, immediately before the next dose if renal function normal, earlier if renal impairment—consult product literature). Frequency of monitoring depends on the clinical situation and response to treatment; regular monitoring indicated in high-dose therapy and longer-term use, particularly in patients with impaired renal function, impaired hearing, or concurrent use of nephrotoxic or ototoxic drugs. Manufacturer advises pre-dose ('trough') concentration should normally be 10–20 mg/litre depending on the site of infection and the susceptibility of the pathogen; trough concentration of 15–20 mg/litre is usually recommended to cover susceptible pathogens with MIC greater than or equal to 1 mg/litre—consult product literature.
 - ▶ Manufacturer advises periodic testing of auditory function. Manufacturer advises monitor blood counts, urinalysis, hepatic and renal function periodically in all patients; monitor leucocyte count regularly in patients receiving long-term vancomycin or if given concurrently with other drugs that may cause neutropenia or agranulocytosis.
 - ▶ Manufacturer advises monitor vestibular and auditory function during and after treatment in the elderly; avoid concurrent or sequential use of other ototoxic drugs.
 - ▶ With oral use Manufacturer advises monitoring serum-vancomycin concentration in inflammatory intestinal disorders.
 - ▶ Manufacturer advises serial tests of auditory function may be helpful to minimise the risk of ototoxicity in patients with an underlying hearing loss, or who are receiving concomitant therapy with other ototoxic drugs.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use Avoid rapid infusion (risk of anaphylactoid reactions) and rotate infusion sites. For *intravenous infusion*, give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute each 500 mg with 10 mL water for injections and dilute with infusion fluid to a concentration of up to 5 mg/mL (10 mg/mL in fluid restriction but increased risk of infusion-related effects); give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not feasible.

- ▶ With oral use Injection can be used to prepare solution for oral administration—consult product literature.
- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 529, Blood infections, antibacterial therapy p. 532, Cardiovascular system infections, antibacterial therapy p. 532, Central nervous system infections, antibacterial therapy p. 533, Diabetic foot infections, antibacterial therapy p. 533, Gastro-intestinal system infections, antibacterial therapy p. 535, Musculoskeletal system infections, antibacterial therapy p. 536, Respiratory system infections, antibacterial therapy p. 538, Skin infections, antibacterial therapy p. 540.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection, infusion

Powder for solution for infusion

▶ Vancomycin (Non-proprietary)

Vancomycin (as Vancomycin hydrochloride) 500 mg Vancomycin 500mg powder for solution for infusion vials | 1 vial [PoM] £7.25 DT = £5.49 | 10 vial [PoM] £62.50 DT = £62.50

Vancomycin 500mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £5.49-£8.50 DT = £5.49 (Hospital only) | 10 vial [PoM] £62.50 DT = £62.50 (Hospital only) | 10 vial [PoM] £62.50-£72.50 DT = £62.50

Vancomycin (as Vancomycin hydrochloride) 1 gram Vancomycin 1g powder for solution for infusion vials | 1 vial [PoM] £14.50 DT = £11.25 | 10 vial [PoM] £125.00 DT = £125.00

Vancomycin 1g powder for concentrate for solution for infusion vials | 1 vial [PoM] £11.25-£17.25 DT = £11.25 (Hospital only) | 10 vial [PoM] £125.00 DT = £125.00 (Hospital only) | 10 vial [PoM] £125.00 DT = £125.00

ANTIBACTERIALS > LINCOSAMIDES

Clindamycin

18-May-2020

- **DRUG ACTION** Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially *Bacteroides fragilis*. It is well concentrated in bone and excreted in bile and urine.

● INDICATIONS AND DOSE

Staphylococcal bone and joint infections such as osteomyelitis | Peritonitis | Intra-abdominal sepsis | Meticillin-resistant *Staphylococcus aureus* (MRSA) in bronchiectasis, bone and joint infections, and skin and soft-tissue infections

▶ BY MOUTH

- ▶ Child: 3–6 mg/kg 4 times a day (max. per dose 450 mg)
- ▶ Adult: 150–300 mg every 6 hours; increased if necessary up to 450 mg every 6 hours if required, increased dose used in severe infection

▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 0.6–2.7 g daily in 2–4 divided doses; increased if necessary up to 4.8 g daily, increased dose used in life-threatening infection, single doses above 600 mg to be administered by intravenous infusion only, single doses by intravenous infusion not to exceed 1.2 g

Moderate diabetic foot infection | Severe diabetic foot infection

▶ BY MOUTH

- ▶ Adult: 150–300 mg every 6 hours; increased if necessary up to 450 mg every 6 hours

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 0.6–2.7 g daily in 2–4 divided doses; increased if necessary up to 4.8 g daily, increased dose used in life-threatening infection, single doses not to exceed 1.2 g

Cellulitis | Erysipelas

▶ BY MOUTH

- ▶ Child: 3–6 mg/kg 4 times a day (max. per dose 450 mg) for 7 days then review

- ▶ Adult: 150–300 mg every 6 hours; increased if necessary up to 450 mg every 6 hours for 7 days then review

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 0.6–2.7 g daily in 2–4 divided doses; increased if necessary to 1.2 g 4 times a day, increased dose used in life-threatening infection

Treatment of mild to moderate pneumocystis pneumonia (in combination with primaquine)

▶ BY MOUTH

- ▶ Adult: 600 mg every 8 hours

Treatment of falciparum malaria (to be given with or following quinine)

▶ BY MOUTH

- ▶ Child: 7–13 mg/kg every 8 hours (max. per dose 450 mg) for 7 days

- ▶ Adult: 450 mg every 8 hours for 7 days

- **UNLICENSED USE** Not licensed for treatment of mild to moderate pneumocystis infection. Not licensed for treatment of falciparum malaria.

- **CONTRA-INDICATIONS** Diarrhoeal states

- **CAUTIONS** Avoid in Acute porphyrias p. 1120

- **INTERACTIONS** → Appendix 1: clindamycin

- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ Common or very common Skin reactions

SPECIFIC SIDE-EFFECTS

- ▶ Common or very common

- ▶ With oral use Abdominal pain · antibiotic associated colitis · diarrhoea (discontinue)

- ▶ Uncommon

- ▶ With oral use Nausea · vomiting

- ▶ Frequency not known

- ▶ With oral use Agranulocytosis · angioedema · eosinophilia · gastrointestinal disorders · jaundice · leucopenia · neutropenia · severe cutaneous adverse reactions (SCARs) · taste altered · thrombocytopenia · vulvovaginal infection

- ▶ With parenteral use Abdominal pain · agranulocytosis · antibiotic associated colitis · cardiac arrest · diarrhoea (discontinue) · eosinophilia · hypotension · jaundice · leucopenia · nausea · neutropenia · severe cutaneous adverse reactions (SCARs) · taste altered · thrombocytopenia · thrombophlebitis · vomiting · vulvovaginal infection

SIDE-EFFECTS, FURTHER INFORMATION Antibiotic-associated colitis

Clindamycin has been associated with antibiotic-associated colitis, which may be fatal. Although antibiotic-associated colitis can occur with most antibacterials, it occurs more frequently with clindamycin.

If *C difficile* infection is suspected or confirmed, discontinue the antibiotic if appropriate. Seek specialist advice if the antibiotic cannot be stopped and the diarrhoea is severe.

- **PREGNANCY** Manufacturer advises not known to be harmful in the second and third trimesters; use with caution in the first trimester—limited data.
- **BREAST FEEDING** [EvG] Specialist sources indicate use with caution—present in milk. Monitor infant for effects on the gastrointestinal flora such as diarrhoea, candidiasis, or rarely, blood in the stool indicating possible antibiotic-associated colitis. 
- **MONITORING REQUIREMENTS** Monitor liver and renal function if treatment exceeds 10 days.
 - ▶ In children Monitor liver and renal function in neonates and infants.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use Avoid rapid intravenous administration. For *intravenous infusion (Dalacin® C Phosphate)*, give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute to not more than 18 mg/mL and give over 10–60 minutes at a rate not exceeding 30 mg/minute (1.2 g over at least 60 minutes; higher doses by continuous infusion).
- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Diabetic foot infections, antibacterial therapy p. 533, Gastro-intestinal system infections, antibacterial therapy p. 535, Genital system infections, antibacterial therapy p. 536, Malaria, treatment p. 649, MRSA p. 612, Musculoskeletal system infections, antibacterial therapy p. 536, Pneumocystis pneumonia p. 637, Skin infections, antibacterial therapy p. 540.
- **PATIENT AND CARER ADVICE** Patients and their carers should be advised to discontinue and contact a doctor immediately if severe, prolonged or bloody diarrhoea develops.
 - ▶ With oral use Capsules should be swallowed with a glass of water.
- **PROFESSION SPECIFIC INFORMATION**
 - Dental practitioners' formulary**
 - ▶ With oral use Clindamycin capsules may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

▶ Clindamycin (Non-proprietary)

Clindamycin (as Clindamycin phosphate) 150 mg per 1 ml Clindamycin 600mg/4ml solution for injection ampoules | 5 ampoule [PoM] £59.00 (Hospital only) | 5 ampoule [PoM] £61.75
Clindamycin 300mg/2ml solution for injection ampoules | 5 ampoule [PoM] £29.50 (Hospital only) | 5 ampoule [PoM] £31.01

▶ Dalacin C (Pfizer Ltd)

Clindamycin (as Clindamycin phosphate) 150 mg per 1 ml Dalacin C Phosphate 300mg/2ml solution for injection ampoules | 5 ampoule [PoM] £31.01 (Hospital only)
 Dalacin C Phosphate 600mg/4ml solution for injection ampoules | 5 ampoule [PoM] £61.75 (Hospital only)

Capsule

CAUTIONARY AND ADVISORY LABELS 9, 27

▶ Clindamycin (Non-proprietary)

Clindamycin (as Clindamycin hydrochloride) 75 mg Clindamycin 75mg capsules | 24 capsule [PoM] £7.45 DT = £7.45
Clindamycin (as Clindamycin hydrochloride) 150 mg Clindamycin 150mg capsules | 24 capsule [PoM] £13.72 DT = £2.51 | 100 capsule [PoM] £4.26–£55.08

Clindamycin (as Clindamycin hydrochloride) 300 mg Clindamycin 300mg capsules | 30 capsule [PoM] £42.00 DT = £38.23

ANTIBACTERIALS > MACROLIDES

Macrolides

18-Jun-2018

Overview

The macrolides have an antibacterial spectrum that is similar but not identical to that of penicillin; they are thus an alternative in penicillin-allergic patients. They are active against many penicillin-resistant staphylococci, but some are now also resistant to the macrolides.

Indications for the macrolides include campylobacter enteritis, respiratory infections (including pneumonia, whooping cough, Legionella, chlamydia, and mycoplasma infection), and skin infections.

Erythromycin p. 569 is also used in the treatment of early syphilis, uncomplicated genital chlamydial infection, and non-gonococcal urethritis. Erythromycin has poor activity against *Haemophilus influenzae*. Erythromycin causes nausea, vomiting, and diarrhoea in some patients; in mild to moderate infections this can be avoided by giving a lower dose, but if a more serious infection, such as Legionella pneumonia, is suspected higher doses are needed.

Azithromycin p. 566 is a macrolide with slightly less activity than erythromycin against Gram-positive bacteria, but enhanced activity against some Gram-negative organisms including *H. influenzae*. Plasma concentrations are very low, but tissue concentrations are much higher. It has a long tissue half-life and once daily dosage is recommended. Azithromycin is also used in the treatment of uncomplicated genital chlamydial infection, non-gonococcal urethritis, uncomplicated gonorrhoea, typhoid [unlicensed indication], trachoma [unlicensed indication], and Lyme disease [unlicensed indication].

Clarithromycin p. 567 is an erythromycin derivative with slightly greater activity than the parent compound. Tissue concentrations are higher than with erythromycin. Clarithromycin is also used in regimens for *Helicobacter pylori* eradication.

Spiramycin is also a macrolide which is used for the treatment of toxoplasmosis.

Macrolides

● CAUTIONS

- ▶ With intravenous use or oral use electrolyte disturbances (predisposition to QT interval prolongation) · may aggravate myasthenia gravis · predisposition to QT interval prolongation

● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders · headache · hearing impairment · insomnia · nausea · pancreatitis · paraesthesia · skin reactions · taste altered · vasodilation · vision disorders · vomiting
- ▶ **Uncommon** Angioedema · anxiety · arrhythmias · candida infection · chest pain · constipation · drowsiness · eosinophilia · hepatic disorders · leucopenia · neutropenia · palpitations · QT interval prolongation · severe cutaneous adverse reactions (SCARs) · tinnitus · vertigo
- ▶ **Rare or very rare** Antibiotic associated colitis · myasthenia gravis · nephritis tubulointerstitial
- ▶ **Frequency not known** Hallucination · hypotension · seizure · smell altered · thrombocytopenia · tongue discoloration

Azithromycin

565
03-Mar-2020

● INDICATIONS AND DOSE

Prevention of secondary case of invasive group A streptococcal infection in patients who are allergic to penicillin

- ▶ BY MOUTH
- ▶ Child 6 months-11 years: 12 mg/kg once daily (max. per dose 500 mg) for 5 days
- ▶ Child 12-17 years: 500 mg once daily for 5 days
- ▶ Adult: 500 mg once daily for 5 days

Respiratory-tract infections, otitis media, skin and soft-tissue infections

- ▶ BY MOUTH
- ▶ Child 6 months-17 years: 10 mg/kg once daily (max. per dose 500 mg) for 3 days
- ▶ Child 6 months-17 years (body-weight 15-25 kg): 200 mg once daily for 3 days
- ▶ Child 6 months-17 years (body-weight 26-35 kg): 300 mg once daily for 3 days
- ▶ Child 6 months-17 years (body-weight 36-45 kg): 400 mg once daily for 3 days
- ▶ Child 6 months-17 years (body-weight 46 kg and above): 500 mg once daily for 3 days
- ▶ Adult: 500 mg once daily for 3 days, alternatively initially 500 mg once daily for 1 day, then 250 mg once daily for 4 days

Uncomplicated genital chlamydial infections | Non-gonococcal urethritis

- ▶ BY MOUTH
- ▶ Child 12-17 years: 1 g for 1 dose
- ▶ Adult: 1 g for 1 dose

Uncomplicated gonorrhoea

- ▶ BY MOUTH
- ▶ Adult: 1 g for 1 dose

Lyme disease [erythema migrans and/or non-focal symptoms]

- ▶ BY MOUTH
- ▶ Adult: 500 mg daily for 17 days

Mild to moderate typhoid due to multiple-antibacterial resistant organisms

- ▶ BY MOUTH
- ▶ Adult: 500 mg once daily for 7 days

Community-acquired pneumonia, low to moderate severity

- ▶ BY MOUTH
- ▶ Adult: 500 mg once daily for 3 days, alternatively initially 500 mg once daily for 1 day, then 250 mg once daily for 4 days

Community-acquired pneumonia, high severity

- ▶ INITIALLY BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 500 mg once daily for at least 2 days, then (by mouth) 500 mg once daily for a total duration of 7-10 days

Antibacterial prophylaxis for insertion of intra-uterine device

- ▶ BY MOUTH
- ▶ Adult: 1 g for 1 dose

● UNLICENSED USE

- ▶ In children Not licensed for prevention of group A streptococcal infection;
- ▶ In adults Azithromycin may be used as detailed below, although these situations are considered outside the scope of its licence:
 - prevention of group A streptococcal infection;
 - uncomplicated gonorrhoea;
 - [EvGr] Lyme disease ;
 - mild to moderate typhoid due to multiple-antibacterial resistant organisms;

- community-acquired pneumonia (high severity) when oral treatment continues for more than 3 days.

● INTERACTIONS → Appendix 1: macrolides

● SIDE-EFFECTS

- ▶ Common or very common
- ▶ With oral use Arthralgia
- ▶ Uncommon Numbness · oedema · photosensitivity reaction
- ▶ Frequency not known Acute kidney injury · aggression · akathisia · haemolytic anaemia · syncope

● PREGNANCY

Manufacturers advise use only if adequate alternatives not available.

● BREAST FEEDING

Present in milk; use only if no suitable alternatives.

● HEPATIC IMPAIRMENT

Manufacturer advises caution; consider avoiding in severe impairment (no information available).

● RENAL IMPAIRMENT

- ▶ In adults Use with caution if eGFR less than 10 mL/minute/1.73 m².
- ▶ In children Use with caution if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use in adults For *intravenous infusion* (Zedbac[®]), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute 500 mg with 4.8 mL water for injections to produce a 100 mg/mL solution, then dilute 5 mL of solution with infusion fluid to a final concentration of 1 or 2 mg/mL; give the 1 mg/mL solution over 3 hours or give the 2 mg/mL solution over 1 hour.

● PRESCRIBING AND DISPENSING INFORMATION

See Lyme disease p. 611 for place in therapy and further information on treatment. Flavours of oral liquid formulations may include cherry or banana.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Azithromycin for bacterial infections www.medicinesforchildren.org.uk/azithromycin-bacterial-infections-0

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

- ▶ With oral use Azithromycin Capsules may be prescribed. Azithromycin Tablets may be prescribed. Azithromycin Oral Suspension 200 mg/5 mL may be prescribed.

● EXCEPTIONS TO LEGAL CATEGORY

- ▶ With oral use Azithromycin tablets can be sold to the public for the treatment of confirmed, asymptomatic *Chlamydia trachomatis* genital infection in those over 16 years of age, and for the epidemiological treatment of their sexual partners, subject to maximum single dose of 1 g, maximum daily dose 1 g, and a pack size of 1 g.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Clarithromycin

18-May-2020

● **INDICATIONS AND DOSE****Mild diabetic foot infection**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 500 mg twice daily for 7 days then review

Leg ulcer infection

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 500 mg twice daily for 7 days

Cellulitis | Erysipelas

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 1 month-11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5-7 days then review (review after 7 days if infection near the eyes or nose)
- ▶ Child 1 month-11 years (body-weight 8-11 kg): 62.5 mg twice daily for 5-7 days then review (review after 7 days if infection near the eyes or nose)
- ▶ Child 1 month-11 years (body-weight 12-19 kg): 125 mg twice daily for 5-7 days then review (review after 7 days if infection near the eyes or nose)
- ▶ Child 1 month-11 years (body-weight 20-29 kg): 187.5 mg twice daily for 5-7 days then review (review after 7 days if infection near the eyes or nose)
- ▶ Child 1 month-11 years (body-weight 30-40 kg): 250 mg twice daily for 5-7 days then review (review after 7 days if infection near the eyes or nose)
- ▶ Child 12-17 years: 250-500 mg twice daily for 5-7 days then review (review after 7 days if infection near the eyes or nose)
- ▶ Adult: 500 mg twice daily for 5-7 days then review (review after 7 days if infection near the eyes or nose)
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg every 12 hours

Impetigo

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 1 month-11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5-7 days
- ▶ Child 1 month-11 years (body-weight 8-11 kg): 62.5 mg twice daily for 5-7 days
- ▶ Child 1 month-11 years (body-weight 12-19 kg): 125 mg twice daily for 5-7 days
- ▶ Child 1 month-11 years (body-weight 20-29 kg): 187.5 mg twice daily for 5-7 days
- ▶ Child 1 month-11 years (body-weight 30-40 kg): 250 mg twice daily for 5-7 days
- ▶ Child 12-17 years: 250 mg twice daily for 5-7 days, increased if necessary to 500 mg twice daily, increased dose used in severe infections
- ▶ Adult: 250 mg twice daily for 5-7 days, increased if necessary to 500 mg twice daily, increased dose used in severe infections

Community-acquired pneumonia

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 1 month-11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5 days
- ▶ Child 1 month-11 years (body-weight 8-11 kg): 62.5 mg twice daily for 5 days
- ▶ Child 1 month-11 years (body-weight 12-19 kg): 125 mg twice daily for 5 days
- ▶ Child 1 month-11 years (body-weight 20-29 kg): 187.5 mg twice daily for 5 days
- ▶ Child 1 month-11 years (body-weight 30-40 kg): 250 mg twice daily for 5 days
- ▶ Child 12-17 years: 250-500 mg twice daily for 5 days
- ▶ Adult: 500 mg twice daily for 5 days
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg every 12 hours

Hospital-acquired pneumonia

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 1 month-11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5 days then review
- ▶ Child 1 month-11 years (body-weight 8-11 kg): 62.5 mg twice daily for 5 days then review
- ▶ Child 1 month-11 years (body-weight 12-19 kg): 125 mg twice daily for 5 days then review
- ▶ Child 1 month-11 years (body-weight 20-29 kg): 187.5 mg twice daily for 5 days then review
- ▶ Child 1 month-11 years (body-weight 30-40 kg): 250 mg twice daily for 5 days then review
- ▶ Child 12-17 years: 500 mg twice daily for 5 days then review

Respiratory-tract infections | Mild to moderate skin and soft-tissue infections

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 1 month-11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily
- ▶ Child 1 month-11 years (body-weight 8-11 kg): 62.5 mg twice daily
- ▶ Child 1 month-11 years (body-weight 12-19 kg): 125 mg twice daily
- ▶ Child 1 month-11 years (body-weight 20-29 kg): 187.5 mg twice daily
- ▶ Child 1 month-11 years (body-weight 30-40 kg): 250 mg twice daily
- ▶ Child 12-17 years: 250 mg twice daily usually for 7-14 days, increased to 500 mg twice daily, if required in severe infections
- ▶ Adult: 250 mg twice daily usually for 7-14 days, increased to 500 mg twice daily, if required in severe infections
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12-17 years: 500 mg once daily usually for 7-14 days, increased to 1 g once daily, if required in severe infections
- ▶ Adult: 500 mg once daily usually for 7-14 days, increased to 1 g once daily, if required in severe infections
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg every 12 hours maximum duration 5 days, switch to oral route when appropriate, to be administered into a large proximal vein

Acute exacerbation of chronic obstructive pulmonary disease

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 500 mg twice daily for 5 days
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg every 12 hours, to be administered into a large proximal vein

Acute exacerbation of bronchiectasis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 1 month-11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 7-14 days

continued →

- ▶ Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 7–14 days
- ▶ Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 7–14 days
- ▶ Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 7–14 days
- ▶ Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 7–14 days
- ▶ Child 12–17 years: 250–500 mg twice daily for 7–14 days
- ▶ Adult: 500 mg twice daily for 7–14 days

Acute cough [if systemically very unwell or at higher risk of complications] Acute sore throat

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5 days
- ▶ Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 5 days
- ▶ Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 5 days
- ▶ Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 5 days
- ▶ Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 5 days
- ▶ Child 12–17 years: 250–500 mg twice daily for 5 days
- ▶ Adult: 250–500 mg twice daily for 5 days

Acute otitis media

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5–7 days
- ▶ Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 5–7 days
- ▶ Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 5–7 days
- ▶ Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 5–7 days
- ▶ Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 5–7 days
- ▶ Child 12–17 years: 250–500 mg twice daily for 5–7 days
- ▶ Adult: 250 mg twice daily usually for 7–14 days, increased to 500 mg twice daily, if required in severe infections

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 500 mg every 12 hours maximum duration 5 days, switch to oral route when appropriate, to be administered into a large proximal vein

Prevention of pertussis

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 7 days
- ▶ Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 7 days
- ▶ Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 7 days
- ▶ Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 7 days
- ▶ Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 7 days
- ▶ Child 12–17 years: 500 mg twice daily for 7 days
- ▶ Adult: 500 mg twice daily for 7 days

Helicobacter pylori eradication [in combination with other drugs (see *Helicobacter pylori* infection p. 89)]

▶ BY MOUTH

- ▶ Adult: 500 mg twice daily for 7 days for first- and second-line eradication therapy; 10 days for third-line eradication therapy

Acute sinusitis

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5 days
- ▶ Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 5 days

- ▶ Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 5 days
- ▶ Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 5 days
- ▶ Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 5 days
- ▶ Child 12–17 years: 250 mg twice daily for 5 days, alternatively 500 mg twice daily for 5 days
- ▶ Adult: 500 mg twice daily for 5 days

- **UNLICENSED USE** [\[EvGr\]](#) Duration of treatment for acute sinusitis differs from product literature and adheres to national guidelines. [▲](#)
- ▶ With oral use in children [\[EvGr\]](#) Duration of treatment for acute otitis media differs from product literature and adheres to national guidelines. [▲](#) Tablets not licensed for use in children under 12 years; oral suspension not licensed for use in infants under 6 months.
- ▶ In adults [\[EvGr\]](#) Combination regimens and durations for *Helicobacter pylori* eradication may differ from product literature but adhere to national guidelines. [▲](#)

- **INTERACTIONS** → Appendix 1: macrolides

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Uncommon** Burping · dry mouth · muscle complaints · oral disorders · thrombocytosis · tremor
- ▶ **Frequency not known** Abnormal dreams · agranulocytosis · depersonalisation · depression · mania · myopathy · psychotic disorder · renal failure · tooth discolouration · urine discolouration

SPECIFIC SIDE-EFFECTS

▶ **Uncommon**

- ▶ With oral use Epistaxis
- ▶ With parenteral use Cardiac arrest · dyskinesia · haemorrhage · loss of consciousness · pulmonary embolism

- **PREGNANCY** Manufacturer advises avoid, particularly in the first trimester, unless potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in severe failure if renal impairment also present.

- **RENAL IMPAIRMENT** Avoid if severe hepatic impairment also present.

- ▶ With oral use in adults Avoid *Klaricid XL*[®] or clarithromycin m/r preparations if eGFR less than 30 mL/minute/1.73 m².
- ▶ With oral use in children Avoid *Klaricid XL*[®] or clarithromycin m/r preparations if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- ▶ **Dose adjustments** ▶ In adults Use half normal dose if eGFR less than 30 mL/minute/1.73 m², max. duration 14 days.
- ▶ In children Use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m², max. duration 14 days.

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use For *intravenous infusion (Klaricid[®] I.V.)*, give intermittently in Glucose 5% or Sodium Chloride 0.9%; dissolve initially in water for injections (500 mg in 10 mL) then dilute to a concentration of 2 mg/mL; give over 60 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 529, Diabetic foot infections, antibacterial therapy p. 533, Ear infections, antibacterial therapy p. 534, *Helicobacter pylori* infection p. 89, Nose infections, antibacterial therapy p. 536, Oropharyngeal infections, antibacterial therapy p. 1282, Respiratory system infections, antibacterial therapy p. 538, Skin infections, antibacterial therapy p. 540.

Medicines for Children leaflet: Clarithromycin for bacterial infections www.medicinesforchildren.org.uk/clarithromycin-bacterial-infections

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Clarithromycin Tablets may be prescribed.
Clarithromycin Oral Suspension may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 9, 21, 25

▶ Klaricid XL (Mylan)

Clarithromycin 500 mg Klaricid XL 500mg tablets | 7 tablet [PoM]
£6.72 DT = £6.72 | 14 tablet [PoM] £13.23

▶ Xetinin XL (Morningside Healthcare Ltd)

Clarithromycin 500 mg Xetinin XL 500mg tablets | 7 tablet [PoM]
£6.72 DT = £6.72 | 14 tablet [PoM] £13.23

Granules

CAUTIONARY AND ADVISORY LABELS 9, 13

▶ Klaricid (Mylan)

Clarithromycin 250 mg Klaricid Adult 250mg granules sachets | 14 sachet [PoM] £11.68 DT = £11.68

Tablet

CAUTIONARY AND ADVISORY LABELS 9

▶ Clarithromycin (Non-proprietary)

Clarithromycin 250 mg Clarithromycin 250mg tablets | 14 tablet [PoM] £10.50 DT = £1.49

Clarithromycin 500 mg Clarithromycin 500mg tablets | 14 tablet [PoM] £21.50 DT = £2.44

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9

▶ Clarithromycin (Non-proprietary)

Clarithromycin 25 mg per 1 ml Clarithromycin 125mg/5ml oral suspension | 70 ml [PoM] £4.91 DT = £3.59

Clarithromycin 50 mg per 1 ml Clarithromycin 250mg/5ml oral suspension | 70 ml [PoM] £9.88 DT = £4.94

▶ Klaricid (Mylan)

Clarithromycin 25 mg per 1 ml Klaricid Paediatric 125mg/5ml oral suspension | 70 ml [PoM] £5.26 DT = £3.59 | 100 ml [PoM] £9.04

Clarithromycin 50 mg per 1 ml Klaricid Paediatric 250mg/5ml oral suspension | 70 ml [PoM] £10.51 DT = £4.94

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

▶ Clarithromycin (Non-proprietary)

Clarithromycin 500 mg Clarithromycin 500mg powder for solution for infusion vials | 1 vial [PoM] £11.25 DT = £9.45 (Hospital only)
Clarithromycin 500mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £11.15 DT = £9.45 | 10 vial [PoM] £111.50

▶ Klaricid (Mylan)

Clarithromycin 500 mg Klaricid IV 500mg powder for solution for infusion vials | 1 vial [PoM] £9.45 DT = £9.45

increased to 500–1000 mg 4 times a day, dose increase may be used in severe infections

- ▶ Adult: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500–1000 mg 4 times a day, dose increase may be used in severe infections
- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: 12.5 mg/kg every 6 hours (max. per dose 1 g)
- ▶ Adult: 6.25 mg/kg every 6 hours, for mild infections when oral treatment not possible, increased to 12.5 mg/kg every 6 hours, dose increase may be used in severe infections

Impetigo

▶ BY MOUTH

- ▶ Child 8–17 years: 250–500 mg 4 times a day for 5–7 days
- ▶ Adult: 250–500 mg 4 times a day for 5–7 days

Cellulitis | Erysipelas

▶ BY MOUTH

- ▶ Child 8–17 years: 250–500 mg 4 times a day for 5–7 days then review
- ▶ Adult: 500 mg 4 times a day for 5–7 days then review

Prevention of recurrent cellulitis (specialist use only) | Prevention of recurrent erysipelas (specialist use only)

▶ BY MOUTH

- ▶ Adult: 250 mg twice daily

Mild diabetic foot infection

▶ BY MOUTH

- ▶ Adult: 500 mg 4 times a day for 7 days then review

Leg ulcer infection

▶ BY MOUTH

- ▶ Adult: 500 mg 4 times a day for 7 days

Community-acquired pneumonia

▶ BY MOUTH

- ▶ Child 8–17 years: 250–500 mg 4 times a day for 5 days
- ▶ Adult: 500 mg 4 times a day for 5 days

Acute cough [if systemically very unwell or at higher risk of complications] | Acute sore throat

▶ BY MOUTH

- ▶ Child 1–23 months: 125 mg 4 times a day for 5 days, alternatively 250 mg twice daily for 5 days
- ▶ Child 2–7 years: 250 mg 4 times a day for 5 days, alternatively 500 mg twice daily for 5 days
- ▶ Child 8–17 years: 250–500 mg 4 times a day for 5 days, alternatively 500–1000 mg twice daily for 5 days
- ▶ Adult: 250–500 mg 4 times a day for 5 days, alternatively 500–1000 mg twice daily for 5 days

Acute otitis media

▶ BY MOUTH

- ▶ Child 1–23 months: 125 mg 4 times a day for 5–7 days, alternatively 250 mg twice daily for 5–7 days
- ▶ Child 2–7 years: 250 mg 4 times a day for 5–7 days, alternatively 500 mg twice daily for 5–7 days
- ▶ Child 8–17 years: 250–500 mg 4 times a day for 5–7 days, alternatively 500–1000 mg twice daily for 5–7 days

Early syphilis

▶ BY MOUTH

- ▶ Adult: 500 mg 4 times a day for 14 days

Uncomplicated genital chlamydia | Non-gonococcal urethritis

▶ BY MOUTH

- ▶ Adult: 500 mg twice daily for 14 days

Chronic prostatitis

▶ BY MOUTH

- ▶ Adult: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 4 g daily in divided doses, dose increase may be used in severe infections

continued →

Erythromycin

18-May-2020

● INDICATIONS AND DOSE

Susceptible infections in patients with penicillin hypersensitivity (e.g. respiratory-tract infections (including Legionella infection), skin and oral infections, and campylobacter enteritis)

▶ BY MOUTH

- ▶ Child 1–23 months: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 250 mg 4 times a day, dose increase may be used in severe infections
- ▶ Child 2–7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500 mg 4 times a day, dose increase may be used in severe infections
- ▶ Child 8–17 years: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses,

► BY INTRAVENOUS INFUSION

- Adult: 6.25 mg/kg every 6 hours, for mild infections when oral treatment is not possible, increased to 12.5 mg/kg every 6 hours, dose increase may be used in severe infections

Prevention and treatment of pertussis

► BY MOUTH

- Child 1-23 months: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 250 mg 4 times a day, dose increase may be used in severe infections
- Child 2-7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500 mg 4 times a day, dose increase may be used in severe infections
- Child 8-17 years: 250-500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500-1000 mg 4 times a day, dose increase may be used in severe infections
- Adult: (consult local protocol)

Prevention of secondary case of diphtheria in non-immune patient

► BY MOUTH

- Adult: 500 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment

Prevention of secondary case of invasive group A streptococcal infection in penicillin allergic patients

► BY MOUTH

- Adult: 250-500 mg every 6 hours for 10 days

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease (if penicillin-allergic)

► BY MOUTH

- Adult: 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection

Rosacea

► BY MOUTH

- Adult: 500 mg twice daily courses usually last 6-12 weeks and are repeated intermittently

Acne

► BY MOUTH

- Adult: 500 mg twice daily

Gastro-intestinal stasis

► BY MOUTH

- Adult: 250-500 mg 3 times a day for up to 4 weeks, to be taken before food

► BY INTRAVENOUS INFUSION

- Adult: 3 mg/kg 3 times a day

- **UNLICENSED USE** [EvGr] Duration of treatment for acute otitis media differs from product literature and adheres to national guidelines. ⚠

- In adults [EvGr] Erythromycin is used for the prevention of recurrent cellulitis, ⚠ but the dose is not licensed for this indication. [EvGr] Erythromycin is used for the prevention of recurrent erysipelas, ⚠ but the dose is not licensed for this indication. [EvGr] Erythromycin may be used for gastro-intestinal stasis, ⚠ but it is not licensed for this indication.

- **CAUTIONS** Avoid in Acute porphyrias p. 1120

- **INTERACTIONS** → Appendix 1: macrolides

- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- Rare or very rare Hearing loss (can occur after large doses)

SPECIFIC SIDE-EFFECTS

- With oral use Cerebral impairment
- With parenteral use Atrioventricular block

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Only small amounts in milk—not known to be harmful.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **RENAL IMPAIRMENT**

- **Dose adjustments** ► In adults Max. 1.5 g daily in severe renal impairment (ototoxicity).

- In children Reduce dose in severe renal impairment (ototoxicity).

- **DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children Dilute reconstituted solution further in glucose 5% (neutralised with Sodium bicarbonate) or sodium chloride 0.9% to a concentration of 1-5 mg/mL; give over 20-60 minutes. Concentration of up to 10 mg/mL may be used in fluid-restriction if administered via a central venous catheter.

- With intravenous use in adults For *intravenous infusion* (as lactobionate), give intermittently in Glucose 5% (neutralised with sodium bicarbonate) or Sodium chloride 0.9%; dissolve initially in water for injections (1 g in 20 mL) then dilute to a concentration of 1-5 mg/mL; give over 20-60 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 529, Diabetic foot infections, antibacterial therapy p. 533, Ear infections, antibacterial therapy p. 534, Gastro-intestinal system infections, antibacterial therapy p. 535, Genital system infections, antibacterial therapy p. 536, Oropharyngeal infections, antibacterial therapy p. 1282, Respiratory system infections, antibacterial therapy p. 538, Skin infections, antibacterial therapy p. 540.

ANTIBACTERIALS > MONOBACTAMS

Aztreonam

11-May-2020

- **DRUG ACTION** Aztreonam is a monocyclic beta-lactam ('monobactam') antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including *Pseudomonas aeruginosa*, *Neisseria meningitidis*, and *Haemophilus influenzae*; it should not be used alone for 'blind' treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against *Neisseria gonorrhoeae* (but not against concurrent chlamydial infection).

● INDICATIONS AND DOSE

Gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, and *Neisseria meningitidis*

- ▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 1 g every 8 hours, alternatively 2 g every 12 hours, single doses over 1 g intravenous route only

Severe gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, *Neisseria meningitidis*, and lung infections in cystic fibrosis

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 2 g every 6–8 hours

Gonorrhoea | Cystitis

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 1 g for 1 single dose

Urinary-tract infections

- ▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 0.5–1 g every 8–12 hours

Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Adult: 75 mg 3 times a day for 28 days, doses to be administered at least 4 hours apart, subsequent courses repeated after 28-day interval without aztreonam nebuliser solution

● CAUTIONS

- ▶ When used by inhalation Haemoptysis—risk of further haemorrhage

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Dyspnoea · respiratory disorders

SPECIFIC SIDE-EFFECTS

Common or very common

- ▶ When used by inhalation Cough · haemoptysis · joint disorders · laryngeal pain · nasal complaints · rash

Rare or very rare

- ▶ With parenteral use Anaemia · asthenia · breast tenderness · chest pain · confusion · diplopia · dizziness · eosinophilia · haemorrhage · headache · hepatic disorders · hypotension · insomnia · leucocytosis · myalgia · nasal congestion · neutropenia · oral disorders · pancytopenia · paraesthesia · pseudomembranous enterocolitis · seizure · thrombocytopenia · thrombocytosis · tinnitus · vertigo · vulvovaginal candidiasis

Frequency not known

- ▶ With parenteral use Abdominal pain · angioedema · diarrhoea · nausea · skin reactions · taste altered · toxic epidermal necrolysis · vomiting

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in aztreonam hypersensitivity.

Use with caution in patients with hypersensitivity to other beta-lactam antibiotics (although aztreonam may be less likely than other beta-lactams to cause hypersensitivity in penicillin-sensitive patients).

● PREGNANCY

- ▶ With systemic use No information available; manufacturer of injection advises avoid.

- ▶ When used by inhalation No information available; manufacturer of powder for nebuliser solution advises avoid unless essential.

- **BREAST FEEDING** Amount in milk probably too small to be harmful.

● HEPATIC IMPAIRMENT

- ▶ With systemic use Manufacturer advises caution in chronic impairment with cirrhosis.

Dose adjustments ▶ With systemic use Manufacturer advises dose reduction of 20–25% for long term treatment of patients with chronic impairment with cirrhosis, especially in alcoholic cirrhosis and concomitant renal impairment.

● RENAL IMPAIRMENT

Dose adjustments ▶ With systemic use If eGFR 10–30 mL/minute/1.73 m², usual initial dose of injection, then half normal dose. If eGFR less than 10 mL/minute/1.73 m², usual initial dose of injection, then one-quarter normal dose.

● MONITORING REQUIREMENTS

- ▶ When used by inhalation Measure lung function before and after initial dose of aztreonam and monitor for bronchospasm.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For intravenous injection, give over 3–5 minutes. For intravenous infusion (Azactam[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%. Dissolve initially in water for injections (1 g per 3 mL) then dilute to a concentration of less than 20 mg/mL; to be given over 20–60 minutes.

- ▶ When used by inhalation Other inhaled drugs should be administered before aztreonam; a bronchodilator should be administered before each dose.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 753/12

The *Scottish Medicines Consortium* has advised (January 2015) that aztreonam powder for nebuliser solution (*Cayston*[®]) is accepted for restricted use within NHS Scotland when inhaled colistimethate sodium and inhaled tobramycin are not tolerated or are not providing satisfactory therapeutic benefit (measured as $\geq 2\%$ decline in forced expiratory volume in 1 second). This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for nebuliser solution

- ▶ **Cayston** (Gilead Sciences International Ltd)

Aztreonam (as Aztreonam lysine) 75 mg Cayston 75mg powder and solvent for nebuliser solution vials with Altera Nebuliser Handset | 84 vial [PoM] £2,181.53 DT = £2,181.53

Powder for solution for injection

- ▶ **Azactam** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Aztreonam 1 gram Azactam 1g powder for solution for injection vials | 1 vial [PoM] £9.40 (Hospital only)

Aztreonam 2 gram Azactam 2g powder for solution for injection vials | 1 vial [PoM] £18.82 (Hospital only)

ANTIBACTERIALS > NITROIMIDAZOLE DERIVATIVES

Metronidazole

18-May-2020

- **DRUG ACTION** Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

● INDICATIONS AND DOSE

Anaerobic infections

- ▶ BY MOUTH

- ▶ Child 1 month: 7.5 mg/kg every 12 hours usually treated for 7 days (for 10–14 days in *Clostridioides difficile* infection)
- ▶ Child 2 months–11 years: 7.5 mg/kg every 8 hours (max. per dose 400 mg) usually treated for 7 days (for 10–14 days in *Clostridioides difficile* infection)
- ▶ Child 12–17 years: 400 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridioides difficile* infection)
- ▶ Adult: 400 mg every 8 hours, alternatively 500 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridioides difficile* infection)

- ▶ BY RECTUM

- ▶ Child 1–11 months: 125 mg 3 times a day for 3 days, then 125 mg twice daily, for usual total treatment duration of 7 days
- ▶ Child 1–4 years: 250 mg 3 times a day for 3 days, then 250 mg twice daily, for usual total treatment duration of 7 days
- ▶ Child 5–9 years: 500 mg 3 times a day for 3 days, then 500 mg twice daily, for usual total treatment duration of 7 days
- ▶ Child 10–17 years: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days
- ▶ Adult: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridioides difficile* infection), to be given over 20 minutes

Moderate diabetic foot infection | Severe diabetic foot infection | Leg ulcer infection [in combination with other drugs]

- ▶ BY MOUTH
- ▶ Adult: 400 mg every 8 hours
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg every 8 hours

Cellulitis | Erysipelas

- ▶ BY MOUTH
- ▶ Child 1 month: 7.5 mg/kg every 12 hours for 7 days then review
- ▶ Child 2 months–11 years: 7.5 mg/kg every 8 hours (max. per dose 400 mg) for 7 days then review
- ▶ Child 12–17 years: 400 mg every 8 hours for 7 days then review
- ▶ Adult: 400 mg every 8 hours for 7 days then review
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg every 8 hours

Helicobacter pylori eradication [in combination with other drugs (see Helicobacter pylori infection p. 89)]

- ▶ BY MOUTH
- ▶ Adult: 400 mg twice daily for 7 days for first- and second-line eradication therapy; 10 days for third-line eradication therapy

Fistulating Crohn's disease

- ▶ BY MOUTH
- ▶ Adult: 10–20 mg/kg daily in divided doses, usual dose 400–500 mg 3 times a day usually given for 1 month but no longer than 3 months because of concerns about peripheral neuropathy

Acute diverticulitis [in combination with other drugs (see Diverticular disease and diverticulitis p. 40)]

- ▶ BY MOUTH
- ▶ Adult: 400 mg 3 times a day for 5 days then review
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg every 8 hours

Pressure sores

- ▶ BY MOUTH
- ▶ Adult: 400 mg every 8 hours for 7 days

Bacterial vaginosis (notably Gardnerella vaginalis infection)

- ▶ BY MOUTH
- ▶ Adult: 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

Bacterial vaginosis

- ▶ BY VAGINA USING VAGINAL GEL
- ▶ Adult: 1 applicatorful daily for 5 days, dose to be administered at night

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 applicatorful of vaginal gel delivers a 5 g dose of metronidazole 0.75%.

Pelvic inflammatory disease

- ▶ BY MOUTH
- ▶ Adult: 400 mg twice daily for 14 days

Acute ulcerative gingivitis

- ▶ BY MOUTH
- ▶ Child 1–2 years: 50 mg every 8 hours for 3 days
- ▶ Child 3–6 years: 100 mg every 12 hours for 3 days
- ▶ Child 7–9 years: 100 mg every 8 hours for 3 days
- ▶ Child 10–17 years: 200–250 mg every 8 hours for 3 days
- ▶ Adult: 400 mg every 8 hours for 3 days

Acute oral infections

- ▶ BY MOUTH
- ▶ Child 1–2 years: 50 mg every 8 hours for 3–7 days
- ▶ Child 3–6 years: 100 mg every 12 hours for 3–7 days
- ▶ Child 7–9 years: 100 mg every 8 hours for 3–7 days
- ▶ Child 10–17 years: 200–250 mg every 8 hours for 3–7 days
- ▶ Adult: 400 mg every 8 hours for 3–7 days

Surgical prophylaxis

▶ BY MOUTH

- ▶ Adult: 400–500 mg, to be administered 2 hours before surgery, then 400–500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)

▶ BY RECTUM

- ▶ Adult: 1 g, to be administered 2 hours before surgery, then 1 g every 8 hours if required for up to 3 doses (in high-risk procedures)

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 500 mg, to be administered up to 30 minutes before the procedure (if rectal administration inappropriate), then 500 mg every 8 hours if required for up to 3 further doses (in high-risk procedures)

Invasive intestinal amoebiasis | Extra-intestinal amoebiasis (including liver abscess)

▶ BY MOUTH

- ▶ Child 1–2 years: 200 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- ▶ Child 3–6 years: 200 mg 4 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- ▶ Child 7–9 years: 400 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- ▶ Child 10–17 years: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- ▶ Adult: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)

Urogenital trichomoniasis

▶ BY MOUTH

- ▶ Child 1–2 years: 50 mg 3 times a day for 7 days
- ▶ Child 3–6 years: 100 mg twice daily for 7 days
- ▶ Child 7–9 years: 100 mg 3 times a day for 7 days
- ▶ Child 10–17 years: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose
- ▶ Adult: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

Giardiasis

▶ BY MOUTH

- ▶ Child 1–2 years: 500 mg once daily for 3 days
- ▶ Child 3–6 years: 600–800 mg once daily for 3 days
- ▶ Child 7–9 years: 1 g once daily for 3 days
- ▶ Child 10–17 years: 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days
- ▶ Adult: 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days

Established case of tetanus

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature)

- **UNLICENSED USE** [EvGr](#) Metronidazole is used for the treatment of cellulitis, [A](#) but is not licensed for this indication. [EvGr](#) Metronidazole is used for the treatment of erysipelas, [A](#) but is not licensed for this indication.
- ▶ With systemic use in adults Metronidazole doses in the BNF may differ from those in product literature.
- [EvGr](#) Combination regimens and durations for *Helicobacter pylori* eradication may differ from product literature but adhere to national guidelines. [A](#)

● **CAUTIONS**

- ▶ With vaginal use Not recommended during menstruation - some systemic absorption may occur with vaginal gel

- **INTERACTIONS** → Appendix 1: metronidazole

● **SIDE-EFFECTS**▶ **Common or very common**

- ▶ With systemic use Dry mouth · myalgia · nausea · oral disorders · taste metallic · vomiting
- ▶ With vaginal use Pelvic discomfort · vulvovaginal candidiasis · vulvovaginal disorders

▶ **Uncommon**

- ▶ With systemic use Asthenia · headache · leucopenia (with long term or intensive therapy)
- ▶ With vaginal use Menstrual cycle irregularities · vaginal haemorrhage

▶ **Rare or very rare**

- ▶ With systemic use Agranulocytosis · angioedema · appetite decreased · ataxia · cerebellar syndrome · confusion · diarrhoea · dizziness · drowsiness · encephalopathy · epigastric pain · epileptiform seizure (with long term or intensive therapy) · flushing · hallucination · hepatic disorders · meningitis aseptic · mucositis · nerve disorders · neutropenia · pancreatitis · pancytopenia · peripheral neuropathy (with long term or intensive therapy) · psychotic disorder · seizure · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · urine dark · vision disorders

▶ **Frequency not known**

- ▶ With systemic use Depressed mood · gastrointestinal disorder · hearing impairment · taste altered · tinnitus

● **PREGNANCY**

- ▶ With systemic use Manufacturer advises avoidance of high-dose regimens; use only if potential benefit outweighs risk.

● **BREAST FEEDING**

- ▶ With systemic use Significant amount in milk; manufacturer advises avoid large single doses though otherwise compatible; may give milk a bitter taste.

● **HEPATIC IMPAIRMENT**

- ▶ With oral use or rectal use Manufacturer advises caution in hepatic encephalopathy (risk of decreased clearance).
- ▶ With intravenous use Manufacturer advises caution in severe impairment (risk of decreased clearance).

Dose adjustments ▶ With oral use or rectal use Manufacturer advises dose reduction to one-third of the daily dose in hepatic encephalopathy (dose may be given once daily).

- ▶ With intravenous use Manufacturer advises consider dose reduction in severe impairment.

● **MONITORING REQUIREMENTS**

- ▶ With systemic use Clinical and laboratory monitoring advised if treatment exceeds 10 days.

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use For *intravenous infusion*, give over 20–30 minutes.

● **PRESCRIBING AND DISPENSING INFORMATION**

For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 529, Antiprotozoal drugs p. 641, Diabetic foot infections, antibacterial therapy p. 533, Gastro-intestinal system infections, antibacterial therapy p. 535, Genital system infections, antibacterial therapy p. 536, *Helicobacter pylori* infection p. 89, Oropharyngeal infections, antibacterial therapy p. 1282, Skin infections, antibacterial therapy p. 540.

- ▶ With systemic use Metronidazole is well absorbed orally and the intravenous route is normally reserved for severe infections. Metronidazole by the rectal route is an effective alternative to the intravenous route when oral administration is not possible.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Metronidazole for bacterial infections www.medicinesforchildren.org.uk/metronidazole-bacterial-infections

● **PROFESSION SPECIFIC INFORMATION****Dental practitioners' formulary**

- ▶ With oral use Metronidazole Tablets may be prescribed. Metronidazole Oral Suspension may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

Tablet

CAUTIONARY AND ADVISORY LABELS 4, 9, 21, 25, 27

Tinidazole

- **DRUG ACTION** Tinidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; it has a longer duration of action than metronidazole.

INDICATIONS AND DOSE**Anaerobic infections**▶ **BY MOUTH**

- ▶ **Adult:** Initially 2 g, followed by 1 g daily usually for 5–6 days, alternatively 500 mg twice daily usually for 5–6 days

Bacterial vaginosis | Acute ulcerative gingivitis▶ **BY MOUTH**

- ▶ **Adult:** 2 g for 1 single dose

Abdominal surgery prophylaxis▶ **BY MOUTH**

- ▶ **Adult:** 2 g for 1 single dose, to be administered approximately 12 hours before surgery

Intestinal amoebiasis▶ **BY MOUTH**

- ▶ **Child 1 month–11 years:** 50–60 mg/kg once daily (max. per dose 2 g) for 3 days
- ▶ **Child 12–17 years:** 2 g once daily for 2–3 days
- ▶ **Adult:** 2 g once daily for 2–3 days

Amoebic involvement of liver▶ **BY MOUTH**

- ▶ **Child 1 month–11 years:** 50–60 mg/kg once daily (max. per dose 2 g) for 5 days
- ▶ **Child 12–17 years:** 1.5–2 g once daily for 3–6 days

- ▶ **Adult:** 1.5–2 g once daily for 3–6 days

Urogenital trichomoniasis | Giardiasis▶ **BY MOUTH**

- ▶ **Child 1 month–11 years:** 50–75 mg/kg (max. per dose 2 g) for 1 single dose, dose may be repeated once if necessary
- ▶ **Child 12–17 years:** 2 g for 1 single dose, dose may be repeated once if necessary
- ▶ **Adult:** 2 g for 1 single dose

Helicobacter pylori eradication▶ **BY MOUTH**

- ▶ **Adult:** (consult local protocol)

- **INTERACTIONS** → Appendix 1: tinidazole

• **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · appetite decreased · diarrhoea · headache · nausea · skin reactions · vertigo · vomiting
- ▶ **Frequency not known** Angioedema · ataxia · dizziness · fatigue · flushing · leucopenia · oral disorders · peripheral neuropathy · seizure · sensation abnormal · taste altered · tongue discolouration · urine discolouration
- **PREGNANCY** Manufacturer advises avoid in first trimester.
- **BREAST FEEDING** Present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment.
- **MONITORING REQUIREMENTS** Clinical and laboratory monitoring advised if treatment exceeds 10 days.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

ANTIBACTERIALS > PENICILLINS

Penicillins

Benzylpenicillin and phenoxymethylpenicillin

Benzylpenicillin sodium p. 577 (Penicillin G) remains an important and useful antibiotic but is inactivated by bacterial beta-lactamases. It is effective for many streptococcal (including pneumococcal), gonococcal, and meningococcal infections and also for anthrax, diphtheria, gas-gangrene, and leptospirosis. Pneumococci, meningococci, and gonococci which have decreased sensitivity to penicillin have been isolated; benzylpenicillin sodium is no longer the drug of first choice for pneumococcal meningitis. Although benzylpenicillin sodium is effective in the treatment of tetanus, metronidazole p. 572 is preferred. Benzylpenicillin is inactivated by gastric acid and absorption from the gastro-intestinal tract is low; therefore it must be given by injection.

Benzathine benzylpenicillin p. 577 is used for the treatment of early syphilis and late latent syphilis; it is given by intramuscular injection.

Phenoxymethylpenicillin p. 578 (Penicillin V) has a similar antibacterial spectrum to benzylpenicillin sodium, but is less active. It is gastric acid-stable, so is suitable for oral administration. It should not be used for serious infections because absorption can be unpredictable and plasma concentrations variable. It is indicated principally for respiratory-tract infections in children, for streptococcal tonsillitis, and for continuing treatment after one or more injections of benzylpenicillin sodium when clinical response has begun. It should not be used for meningococcal or gonococcal infections. Phenoxymethylpenicillin is used for prophylaxis against streptococcal infections following

rheumatic fever and against pneumococcal infections following splenectomy or in sickle-cell disease.

Penicillinase-resistant penicillins

Most staphylococci are now resistant to benzylpenicillin because they produce penicillinases. Flucloxacillin p. 586, however, is not inactivated by these enzymes and is thus effective in infections caused by penicillin-resistant staphylococci, which is the sole indication for its use. Flucloxacillin is acid-stable and can, therefore, be given by mouth as well as by injection. Flucloxacillin is well absorbed from the gut.

Temocillin p. 587 is active against Gram-negative bacteria and is stable against a wide range of beta-lactamases. It should be reserved for the treatment of infections caused by beta-lactamase-producing strains of Gram-negative bacteria, including those resistant to third-generation cephalosporins. Temocillin is not active against *Pseudomonas aeruginosa* or *Acinetobacter* spp.

Broad-spectrum penicillins

Ampicillin p. 581 is active against certain Gram-positive and Gram-negative organisms but is inactivated by penicillinases including those produced by *Staphylococcus aureus* and by common Gram-negative bacilli such as *Escherichia coli*. Almost all staphylococci, approx. 60% of *E. coli* strains and approx. 20% of *Haemophilus influenzae* strains are now resistant. The likelihood of resistance should therefore be considered before using ampicillin for the 'blind' treatment of infections; in particular, it should not be used for hospital patients without checking sensitivity.

Ampicillin is well excreted in the bile and urine. It is principally indicated for the treatment of exacerbations of chronic bronchitis and middle ear infections, both of which may be due to *Streptococcus pneumoniae* and *H. influenzae*, and for urinary-tract infections.

Ampicillin can be given by mouth but less than half the dose is absorbed, and absorption is further decreased by the presence of food in the gut.

Maculopapular rashes commonly occur with ampicillin (and amoxicillin p. 579) but are not usually related to true penicillin allergy. They almost always occur in patients with glandular fever; broad-spectrum penicillins should not therefore be used for 'blind' treatment of a sore throat. The risk of rash is also increased in patients with acute or chronic lymphocytic leukaemia or in cytomegalovirus infection.

Amoxicillin is a derivative of ampicillin and has a similar antibacterial spectrum. It is better absorbed than ampicillin when given by mouth, producing higher plasma and tissue concentrations; unlike ampicillin, absorption is not affected by the presence of food in the stomach. Amoxicillin is also used for the treatment of Lyme disease.

Co-amoxiclav p. 582 consists of amoxicillin with the beta-lactamase inhibitor clavulanic acid. Clavulanic acid itself has no significant antibacterial activity but, by inactivating beta-lactamases, it makes the combination active against beta-lactamase-producing bacteria that are resistant to amoxicillin. These include resistant strains of *Staph. aureus*, *E. coli*, and *H. influenzae*, as well as many *Bacteroides* and *Klebsiella* spp. Co-amoxiclav should be reserved for infections likely, or known, to be caused by amoxicillin-resistant beta-lactamase-producing strains.

A combination of ampicillin with flucloxacillin (as co-fluampicil p. 582) is available to treat infections involving either streptococci or staphylococci.

Antipseudomonal penicillins

Piperacillin, a ureidopenicillin, is only available in combination with the beta-lactamase inhibitor tazobactam. **Ticarcillin**, a carboxypenicillin, is only available in combination with the beta-lactamase inhibitor clavulanic acid. Both preparations have a broad spectrum of activity

against a range of Gram-positive and Gram-negative bacteria, and anaerobes. Piperacillin with tazobactam p. 576 has activity against a wider range of Gram-negative organisms than ticarcillin with clavulanic acid p. 576 and it is more active against *Pseudomonas aeruginosa*. These antibacterials are not active against MRSA. They are used in the treatment of septicaemia, hospital-acquired pneumonia, and complicated infections involving the urinary tract, skin and soft tissues, or intra-abdomen. For severe pseudomonal infections these antipseudomonal penicillins can be given with an aminoglycoside (e.g. gentamicin p. 545) since they have a synergistic effect.

Mecillinams

Pivmecillinam hydrochloride p. 585 has significant activity against many Gram-negative bacteria including *Escherichia coli*, klebsiella, enterobacter, and salmonellae. It is not active against *Pseudomonas aeruginosa* or enterococci. Pivmecillinam hydrochloride is hydrolysed to mecillinam, which is the active drug.

Penicillins

● **DRUG ACTION** The penicillins are bactericidal and act by interfering with bacterial cell wall synthesis. They diffuse well into body tissues and fluids, but penetration into the cerebrospinal fluid is poor except when the meninges are inflamed. They are excreted in the urine in therapeutic concentrations.

● **CAUTIONS** History of allergy

● **SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea · hypersensitivity · nausea · skin reactions · thrombocytopenia · vomiting
- ▶ **Uncommon** Antibiotic associated colitis · leucopenia
- ▶ **Rare or very rare** Agranulocytosis · angioedema · haemolytic anaemia · hepatic disorders · nephritis · tubulointerstitial · seizure · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Diarrhoea frequently occurs during oral penicillin therapy. It is most common with broad-spectrum penicillins, which can cause antibiotic-associated colitis.

● **ALLERGY AND CROSS-SENSITIVITY** The most important side-effect of the penicillins is hypersensitivity which causes rashes and anaphylaxis and can be fatal. Allergic reactions to penicillins occur in 1–10% of exposed individuals; anaphylactic reactions occur in fewer than 0.05% of treated patients. Patients with a history of atopic allergy (e.g. asthma, eczema, hay fever) are at a higher risk of anaphylactic reactions to penicillins. Individuals with a history of anaphylaxis, urticaria, or rash immediately after penicillin administration are at risk of immediate hypersensitivity to a penicillin; these individuals should not receive a penicillin. Individuals with a history of a minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind. Other beta-lactam antibiotics (including cephalosporins) can be used in these patients.

Patients who are allergic to one penicillin will be allergic to all because the hypersensitivity is related to the basic penicillin structure. Patients with a history of immediate hypersensitivity to penicillins may also react to the cephalosporins and other beta-lactam antibiotics, they should not receive these antibiotics. If a penicillin (or another beta-lactam antibiotic) is essential in an individual with immediate hypersensitivity to penicillin then specialist advice should be sought on hypersensitivity

testing or using a beta-lactam antibiotic with a different structure to the penicillin that caused the hypersensitivity.

ANTIBACTERIALS > PENICILLINS, ANTIPSEUDOMONAL WITH BETA- LACTAMASE INHIBITOR

575

Piperacillin with tazobactam

22-May-2020

● INDICATIONS AND DOSE

Hospital-acquired pneumonia | **Septicaemia** | **Complicated infections involving the urinary-tract** | **Complicated infections involving the skin** | **Complicated infections involving the soft-tissues** | **Acute exacerbation of chronic obstructive pulmonary disease** | **Acute exacerbation of bronchiectasis** | **Moderate diabetic foot infection** | **Severe diabetic foot infection** | **Leg ulcer infection**

► BY INTRAVENOUS INFUSION

► Adult: 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections

Infections in neutropenic patients

► BY INTRAVENOUS INFUSION

► Adult: 4.5 g every 6 hours

- **UNLICENSED USE** [\[EvGr\]](#) Piperacillin with tazobactam is used for the treatment of acute exacerbation of chronic obstructive pulmonary disease, [\(A\)](#) but is not licensed for this indication.

[\[EvGr\]](#) Piperacillin with tazobactam is used for the treatment of acute exacerbation of bronchiectasis, [\(A\)](#) but is not licensed for this indication.

- **CAUTIONS** High doses may lead to hypernatraemia (owing to sodium content of preparations)
 - **INTERACTIONS** → Appendix 1: penicillins
 - **SIDE-EFFECTS**
 - **Common or very common** Anaemia · candida infection · constipation · gastrointestinal discomfort · headache · insomnia
 - **Uncommon** Arthralgia · flushing · hypokalaemia · hypotension · myalgia · thrombophlebitis
 - **Rare or very rare** Epistaxis · stomatitis
 - **Frequency not known** Eosinophilia · neutropenia · pancytopenia · pneumonia eosinophilic · renal failure · thrombocytosis
 - **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk.
 - **BREAST FEEDING** Trace amount in milk, but appropriate to use.
 - **RENAL IMPAIRMENT**

Dose adjustments Max. 4.5 g every 8 hours if eGFR 20–40 mL/minute/1.73 m².

Max. 4.5 g every 12 hours if eGFR less than 20 mL/minute/1.73 m².
 - **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
 - **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially (2.25 g in 10 mL, 4.5 g in 20 mL) with water for injections, or glucose 5% (*Tazocin*[®] brand only), or sodium chloride 0.9%, then dilute to 50–150 mL with infusion fluid; give over 30 minutes.
 - **PRESCRIBING AND DISPENSING INFORMATION** Dose expressed as a combination of piperacillin and tazobactam (both as sodium salts) in a ratio of 8:1.
- For choice of antibacterial therapy, see Blood infections, antibacterial therapy p. 532, Diabetic foot infections, antibacterial therapy p. 533, Respiratory system

infections, antibacterial therapy p. 538, Skin infections, antibacterial therapy p. 540, Urinary-tract infections p. 622.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, powder for solution for infusion

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

► Piperacillin with tazobactam (Non-proprietary)

Tazobactam (as Tazobactam sodium) 250 mg, Piperacillin (as Piperacillin sodium) 2 gram Piperacillin 2g / Tazobactam 250mg powder for solution for infusion vials | 1 vial [\[PoM\]](#) £9.55 DT = £7.65 (Hospital only) | 10 vial [\[PoM\]](#) £86.40 (Hospital only)

Tazobactam (as Tazobactam sodium) 500 mg, Piperacillin (as Piperacillin sodium) 4 gram Piperacillin 4g / Tazobactam 500mg powder for solution for infusion vials | 1 vial [\[PoM\]](#) £15.75-£19.97 (Hospital only) | 1 vial [\[PoM\]](#) £12.90 | 10 vial [\[PoM\]](#) £48.00-£76.50 | 10 vial [\[PoM\]](#) £99.00 (Hospital only)

Ticarcillin with clavulanic acid

22-May-2020

● INDICATIONS AND DOSE

Infections due to *Pseudomonas* and *Proteus* spp.

► BY INTRAVENOUS INFUSION

► Adult: 3.2 g every 6–8 hours; increased if necessary to 3.2 g every 4 hours, increased frequency used for more severe infections

- **CAUTIONS** High doses may lead to hypernatraemia (owing to sodium content of preparations)
- **INTERACTIONS** → Appendix 1: clavulanate · penicillins
- **SIDE-EFFECTS** Eosinophilia · haemorrhage · hypokalaemia · thrombophlebitis
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Accumulation of electrolytes contained in preparation can occur in patients with renal failure.

Dose adjustments Reduce dose to 3.2 g every eight hours if eGFR 30–60 mL/minute/1.73 m²; 1.6 g every eight hours if eGFR 10–30 mL/minute/1.73 m²; 1.6 g every twelve hours if eGFR less than 10 mL/minute/1.73 m².
- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Timentin*[®]), give intermittently in Glucose 5%. Suggested volume (depending on dose) 100–150 mL; give over 30–40 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Dose is expressed as a combination of ticarcillin (as sodium salt) and clavulanic acid (as potassium salt) in a ratio of 15:1.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Potassium, sodium

► Timentin (GlaxoSmithKline UK Ltd)

Clavulanic acid (as Potassium clavulanate) 200 mg, Ticarcillin (as Ticarcillin sodium) 3 gram Timentin 3.2g powder for solution for infusion vials | 4 vial [\[PoM\]](#) £21.32

ANTIBACTERIALS > PENICILLINS, BETA-LACTAMASE SENSITIVE

F 575

Benzathine benzylpenicillin

24-Apr-2020

(Benzathine penicillin G)

● INDICATIONS AND DOSE

Erysipelas | Yaws | Pinta

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 1.2 million units as a single dose, outer quadrant of the gluteus maximus or Hochstetter's ventrogluteal field is the preferred site of injection

Syphilis [primary and secondary stage]

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 2.4 million units as a single dose, outer quadrant of the gluteus maximus or Hochstetter's ventrogluteal field is the preferred site of injection, if clinical symptoms recur or laboratory findings remain strongly positive—repeat treatment

Syphilis [late-stage (latent seropositive)]

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 2.4 million units once weekly for 3 weeks, outer quadrant of the gluteus maximus or Hochstetter's ventrogluteal field is the preferred site of injection

Prophylaxis of rheumatic fever [without cardiac involvement]

Prophylaxis of poststreptococcal glomerulonephritis [without cardiac involvement]

Prophylaxis of erysipelas [without cardiac involvement]

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 1.2 million units every 3–4 weeks for at least 5 years or up to 21 years of age (whichever is longer), outer quadrant of the gluteus maximus or Hochstetter's ventrogluteal field is the preferred site of injection

Prophylaxis of rheumatic fever [transient cardiac involvement]

Prophylaxis of poststreptococcal glomerulonephritis [transient cardiac involvement]

Prophylaxis of erysipelas [transient cardiac involvement]

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 1.2 million units every 3–4 weeks for at least 10 years or up to 21 years of age (whichever is longer), outer quadrant of the gluteus maximus or Hochstetter's ventrogluteal field is the preferred site of injection

Prophylaxis of rheumatic fever [persistent cardiac involvement]

Prophylaxis of poststreptococcal glomerulonephritis [persistent cardiac involvement]

Prophylaxis of erysipelas [persistent cardiac involvement]

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 1.2 million units every 3–4 weeks for at least 10 years or up to 40 years of age (whichever is longer); life-long prophylaxis may be necessary, outer quadrant of the gluteus maximus or Hochstetter's ventrogluteal field is the preferred site of injection

- **INTERACTIONS** → Appendix 1: penicillins

● SIDE-EFFECTS

- ▶ **Common or very common** Increased risk of infection
- ▶ **Uncommon** Oral disorders
- ▶ **Rare or very rare** Arthralgia · nephropathy
- ▶ **Frequency not known** Encephalopathy · Hoigne's syndrome · Jarisch-Herxheimer reaction

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients allergic to peanuts or soya (contains phospholipids from soya lecithin).

- **PREGNANCY** Manufacturer advises not known to be harmful.

- **BREAST FEEDING** Manufacturer advises present in milk in small amounts but not known to be harmful. Monitor infant for effects on the gastrointestinal flora; discontinue breast feeding if diarrhoea, candidiasis or rash in the infant occur.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in impairment (possible risk of delayed metabolism and excretion in severe impairment).

- **RENAL IMPAIRMENT** Manufacturer advises caution in impairment (possible risk of delayed metabolism and excretion in severe impairment).

Dose adjustments Manufacturer advises reduce daily dose by 25% and give as a single dose if creatinine clearance 15–59 mL/minute; reduce daily dose by 50–80% and give in 2–3 divided doses if creatinine clearance less than 15 mL/minute (maximum 1–3 million units per day).

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises observe the patient for hypersensitivity reactions for at least 30 minutes after the injection.
- ▶ Manufacturer advises monitor renal, hepatic and haematopoietic function periodically in patients on long-term treatment.

- **EFFECT ON LABORATORY TESTS** False-positive direct Coombs' test. False-positive urinary glucose. False-positive urobilinogen. False-positive urinary protein using precipitation techniques, the Folin-Ciocalteu-Lowry method, or the biuret method. False-positive urinary amino acids using the ninhydrin method. Increased levels of urinary 17-ketosteroids using the Zimmermann reaction.

- **DIRECTIONS FOR ADMINISTRATION** For *deep intramuscular injection*, manufacturer advises reconstitute with water for injection and inject slowly with low pressure. No more than 5 mL should be administered per injection site and do not administer into tissues with reduced perfusion. Avoid rubbing the injection site after the injection.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

EXCIPIENTS: May contain Lecithin, polysorbates

▶ **Benzathine benzylpenicillin (Non-proprietary)**

Benzathine benzylpenicillin 1.2 mega unit Benzathine benzylpenicillin 1.2 million unit powder and solvent for suspension for injection vials | 1 vial **[PoM]** £9.50

Benzathine benzylpenicillin 2.4 mega unit Benzathine benzylpenicillin 2.4 million unit powder and solvent for suspension for injection vials | 1 vial **[PoM]** £9.50

▶ **Extencilline** (Imported (France))

Benzathine benzylpenicillin 600000 unit Extencilline 600,000 units powder and solvent for suspension for injection vials | 50 vial **[PoM]** £

F 575

Benzylpenicillin sodium

21-May-2020

(Penicillin G)

● INDICATIONS AND DOSE

Mild to moderate susceptible infections | Throat infections

Otitis media | Pneumonia | Cellulitis

▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 0.6–1.2 g every 6 hours, dose may be increased if necessary in more serious infections (consult product literature), single doses over 1.2 g to be given by intravenous route only

continued →

Endocarditis (in combination with other antibacterial if necessary)

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1.2 g every 4 hours, increased if necessary to 2.4 g every 4 hours, dose may be increased in infections such as enterococcal endocarditis

Anthrax (in combination with other antibacterials)

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 2.4 g every 4 hours

Intrapartum prophylaxis against group B streptococcal infection

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 3 g for 1 dose, then 1.5 g every 4 hours until delivery

Meningitis | Meningococcal disease

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 2.4 g every 4 hours
- ▶ BY INTRAVENOUS INFUSION
- ▶ Neonate up to 7 days: 50 mg/kg every 12 hours.

- ▶ Neonate 7 days to 28 days: 50 mg/kg every 8 hours.

- ▶ Child: 50 mg/kg every 4–6 hours (max. per dose 2.4 g every 4 hours)

Suspected meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) prior to urgent transfer to hospital

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1–11 months: 300 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
- ▶ Child 1–9 years: 600 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
- ▶ Child 10–17 years: 1.2 g, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
- ▶ Adult: 1.2 g, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer

Suspected bacterial meningitis without non-blanching rash where patient cannot be transferred to hospital urgently

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1–11 months: 300 mg, administer as single dose prior to transfer to hospital
- ▶ Child 1–9 years: 600 mg, administer as single dose prior to transfer to hospital
- ▶ Child 10–17 years: 1.2 g, administer as single dose prior to transfer to hospital
- ▶ Adult: 1.2 g, administer as single dose prior to transfer to hospital

• UNLICENSED USE

- ▶ In adults Benzylpenicillin doses in the BNF may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

Intrathecal injection of benzylpenicillin is **not** recommended.

- **CAUTIONS** Accumulation of sodium from injection can occur with high doses
- **INTERACTIONS** → Appendix 1: penicillins

• SIDE-EFFECTS

- ▶ **Common or very common** Fever · Jarisch-Herxheimer reaction
- ▶ **Rare or very rare** Neurotoxicity · neutropenia
- ▶ **Frequency not known** Coma
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.
- **RENAL IMPAIRMENT** Accumulation of sodium from injection can occur in renal failure. High doses may cause neurotoxicity, including cerebral irritation, convulsions, or coma.
 - Dose adjustments** ▶ In adults Reduce dose—consult product literature.
 - ▶ In children Estimated glomerular filtration rate 10–50 mL/minute/1.73 m², use normal dose every 8–12 hours. Estimated glomerular filtration rate less than 10 mL/minute/1.73 m² use normal dose every 12 hours.
- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use in children Intravenous route recommended in neonates and infants. For *intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–30 minutes. Longer administration time is particularly important when using doses of 50 mg/kg (or greater) to avoid CNS toxicity.
 - ▶ With intravenous use in adults For *intravenous infusion* (*Crystapen*®), give intermittently in Glucose 5% or Sodium chloride 0.9%; suggested volume 100 mL given over 30–60 minutes. Continuous infusion not usually recommended.
- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Anthrax p. 609, Antibacterials, use for prophylaxis p. 529, Blood infections, antibacterial therapy p. 532, Cardiovascular system infections, antibacterial therapy p. 532, Central nervous system infections, antibacterial therapy p. 533, Ear infections, antibacterial therapy p. 534, Oropharyngeal infections, antibacterial therapy p. 1282, Respiratory system infections, antibacterial therapy p. 538, Skin infections, antibacterial therapy p. 540.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

 - ◻**EvG** Amoxicillin is used for the treatment of acute exacerbation of bronchiectasis, ◻ but is not licensed for this indication.
 - ◻**EvG** Amoxicillin is used for prophylaxis of recurrent urinary-tract infection, ◻ but is not licensed for this indication.
 - ◻**EvG** Combination regimens and durations for *Helicobacter pylori* eradication may differ from product literature but adhere to national guidelines. ◻
- **CAUTIONS**
 - GENERAL CAUTIONS** Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common) · maintain adequate hydration with high doses (particularly during parenteral therapy)
 - SPECIFIC CAUTIONS**
 - ▶ With intravenous use accumulation of sodium can occur with high parenteral doses
- **INTERACTIONS** → Appendix 1: penicillins
- **SIDE-EFFECTS**
 - GENERAL SIDE-EFFECTS**
 - ▶ Rare or very rare Colitis haemorrhagic · crystalluria · dizziness · hyperkinesia · hypersensitivity vasculitis · mucocutaneous candidiasis · neutropenia
 - ▶ Frequency not known Jarisch-Herxheimer reaction
 - SPECIFIC SIDE-EFFECTS**
 - ▶ Rare or very rare
 - ▶ With oral use Black hairy tongue
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Risk of crystalluria with high doses (particularly during parenteral therapy).
- ▶ With intravenous use Accumulation of sodium from injection can occur in patients with renal failure.
Dose adjustments Reduce dose in severe impairment; rashes more common.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use in adults For *intravenous infusion* (Amoxil[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes or give via drip tubing in Glucose 5% or Sodium chloride 0.9%; continuous infusion not usually recommended.
- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Anthrax p. 609, Cardiovascular system infections, antibacterial therapy p. 532, Central nervous system infections, antibacterial therapy p. 533, Ear infections, antibacterial therapy p. 534, Gastro-intestinal system infections, antibacterial therapy p. 535, *Helicobacter pylori* infection p. 89, Lyme disease p. 611, Nose infections, antibacterial therapy p. 536, Oral bacterial infections p. 537, Respiratory system infections, antibacterial therapy p. 538, Urinary-tract infections p. 622.
- ▶ In children For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 529.
- **PATIENT AND CARER ADVICE** Patient counselling is advised for Amoxicillin (Amoxil[®]) paediatric suspension (use of pipette).
Medicines for Children leaflet: Amoxicillin for bacterial infections www.medicinesforchildren.org.uk/amoxicillin-bacterial-infections-0
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary
Amoxicillin capsules may be prescribed.
Amoxicillin sachets may be prescribed as Amoxicillin Oral Powder.
Amoxicillin Oral Suspension may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

ELECTROLYTES: May contain Sodium

▶ **Amoxicillin (Non-proprietary)**

Amoxicillin (as Amoxicillin sodium) 250 mg Amoxicillin 250mg powder for solution for injection vials | 10 vial [PoM](#) £4.80 | 10 vial [PoM](#) £4.50 (Hospital only)

Amoxicillin (as Amoxicillin sodium) 500 mg Amoxicillin 500mg powder for solution for injection vials | 10 vial [PoM](#) £9.60 DT = £5.48 | 10 vial [PoM](#) £12.00 DT = £5.48 (Hospital only)

Amoxicillin (as Amoxicillin sodium) 1 gram Amoxicillin 1g powder for solution for injection vials | 1 vial [PoM](#) £1.92 | 10 vial [PoM](#) £16.50 DT = £10.96 (Hospital only)

▶ **Amoxil** (GlaxoSmithKline UK Ltd)

Amoxicillin (as Amoxicillin sodium) 500 mg Amoxil 500mg powder for solution for injection vials | 10 vial [PoM](#) £5.48 DT = £5.48

Amoxicillin (as Amoxicillin sodium) 1 gram Amoxil 1g powder for solution for injection vials | 10 vial [PoM](#) £10.96 DT = £10.96

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9

EXCIPIENTS: May contain Sucrose

▶ **Amoxicillin (Non-proprietary)**

Amoxicillin (as Amoxicillin trihydrate) 25 mg per 1 ml Amoxicillin 125mg/5ml oral suspension sugar-free | 100 ml [PoM](#) £25.00 DT = £1.40

Amoxicillin 125mg/5ml oral suspension | 100 ml [PoM](#) £25.00 DT = £1.74

Amoxicillin (as Amoxicillin trihydrate) 50 mg per 1 ml Amoxicillin 250mg/5ml oral suspension sugar-free | 100 ml [PoM](#) £35.00 DT = £1.65

Amoxicillin 250mg/5ml oral suspension | 100 ml [PoM](#) £35.00 DT = £1.93

▶ **Amoxil** (GlaxoSmithKline UK Ltd)

Amoxicillin (as Amoxicillin trihydrate) 100 mg per 1 ml Amoxil 125mg/1.25ml paediatric oral suspension | 20 ml [PoM](#) £3.18 DT = £3.18

Powder

CAUTIONARY AND ADVISORY LABELS 9, 13

▶ **Amoxicillin (Non-proprietary)**

Amoxicillin (as Amoxicillin trihydrate) 3 gram Amoxicillin 3g oral powder sachets sugar-free | 2 sachet [PoM](#) £15.00 DT = £10.36

Capsule

CAUTIONARY AND ADVISORY LABELS 9

Ampicillin

21-May-2020

● **INDICATIONS AND DOSE**

Susceptible infections (including bronchitis, urinary-tract infections, otitis media, sinusitis, uncomplicated community-acquired pneumonia, salmonellosis)

▶ **BY MOUTH**

▶ Child 1-11 months: 125 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day

▶ Child 1-4 years: 250 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day

▶ Child 5-11 years: 500 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day (max. per dose 1 g)

▶ Child 12-17 years: 500 mg 4 times a day; increased if necessary to 1 g 4 times a day, use increased dose in severe infection

▶ Adult: 0.5–1 g every 6 hours

▶ **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**

▶ Adult: 500 mg every 4–6 hours

▶ **BY INTRAMUSCULAR INJECTION**

▶ Adult: 500 mg every 4–6 hours

Endocarditis (in combination with another antibiotic if necessary) | Listerial meningitis (in combination with another antibiotic)

▶ **BY INTRAVENOUS INFUSION**

▶ Adult: 2 g every 4 hours

● **UNLICENSED USE**

▶ In adults Ampicillin doses in BNF may differ from those in product literature.

● **CAUTIONS**

GENERAL CAUTIONS Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common)

SPECIFIC CAUTIONS

▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses

● **INTERACTIONS** → Appendix 1: penicillins

● **SIDE-EFFECTS** Colitis haemorrhagic

● **PREGNANCY** Not known to be harmful.

● **BREAST FEEDING** Trace amounts in milk, but appropriate to use.

● **RENAL IMPAIRMENT**

▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

Dose adjustments ▶ In adults Reduce dose if eGFR less than 10 mL/minute/1.73 m²; rashes more common.

▶ In children If estimated glomerular filtration rate less than 10 mL/minute/1.73 m² reduce dose or frequency; rashes more common.

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With oral use Administer at least 30 minutes before food.
- ▶ With intravenous use in adults For *intravenous infusion* (Penbritin[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes *via* drip tubing in Glucose 5% or Sodium chloride 0.9%. Continuous infusion not usually recommended.

● **PATIENT AND CARER ADVICE**

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9, 23

▶ **Ampicillin (Non-proprietary)**

Ampicillin 25 mg per 1 mL Ampicillin 125mg/5ml oral suspension | 100 mL [PoM] £29.86 DT = £29.86

Ampicillin 50 mg per 1 mL Ampicillin 250mg/5ml oral suspension | 100 mL [PoM] £38.86 DT = £38.86

Capsule

CAUTIONARY AND ADVISORY LABELS 9, 23

▶ **Ampicillin (Non-proprietary)**

Ampicillin 250 mg Ampicillin 250mg capsules | 28 capsule [PoM] £20.50 DT = £20.50

Ampicillin 500 mg Ampicillin 500mg capsules | 28 capsule [PoM] £40.30 DT = £40.30

Powder for solution for injection

▶ **Ampicillin (Non-proprietary)**

Ampicillin (as Ampicillin sodium) 500 mg Ampicillin 500mg powder for solution for injection vials | 10 vial [PoM] £78.30 DT = £78.30

infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common)

- **INTERACTIONS** → Appendix 1: penicillins
- **SIDE-EFFECTS** Arthralgia · bronchospasm · coma · dyspnoea · electrolyte imbalance · eosinophilia · erythema nodosum · gastrointestinal disorder · hallucination · Jarisch-Herxheimer reaction · myalgia · purpura non-thrombocytopenic · vasculitis
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT**
Dose adjustments ▶ In adults Reduce dose if eGFR less than 10 mL/minute/1.73 m²; rashes more common.
 ▶ In children Reduce dose or frequency if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; rashes more common.
- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **PRESCRIBING AND DISPENSING INFORMATION** Dose expressed as a combination of equal parts by mass of flucloxacillin and ampicillin.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 9, 22

▶ **Co-fluampicil (Non-proprietary)**

Ampicillin (as Ampicillin trihydrate) 250 mg, Flucloxacillin (as Flucloxacillin sodium) 250 mg Co-fluampicil 250mg/250mg capsules | 28 capsule [PoM] £28.71 DT = £2.61 | 100 capsule [PoM] £9.32

ANTIBACTERIALS > PENICILLINS, BROAD-SPECTRUM WITH BETA-LACTAMASE INHIBITOR

Co-fluampicil

26-May-2020

575

● **INDICATIONS AND DOSE**

Mixed infections involving beta-lactamase-producing staphylococci

- ▶ BY MOUTH
- ▶ Child 10–17 years: 250/250 mg every 6 hours
- ▶ Adult: 250/250 mg every 6 hours

Severe mixed infections involving beta-lactamase-producing staphylococci

- ▶ BY MOUTH
- ▶ Child 10–17 years: 500/500 mg every 6 hours
- ▶ Adult: 500/500 mg every 6 hours

IMPORTANT SAFETY INFORMATION

HEPATIC DISORDERS

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Manufacturer advises:

- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin;
- flucloxacillin should be used with caution in patients with hepatic impairment;
- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials.

- **CAUTIONS** Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus

Co-amoxiclav

21-May-2020

575

● **INDICATIONS AND DOSE**

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate), including respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, and animal bites

- ▶ BY MOUTH USING TABLETS
- ▶ Child 12–17 years: 250/125 mg every 8 hours; increased to 500/125 mg every 8 hours, increased dose used for severe infection
- ▶ Adult: 250/125 mg every 8 hours; increased to 500/125 mg every 8 hours, increased dose used for severe infection
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1.2 g every 8 hours

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, and animal bites (doses for 125/31 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 1–11 months: 0.25 mL/kilogram 3 times a day, dose doubled in severe infection
- ▶ Child 1–5 years: 0.25 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day, dose doubled in severe infection

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, and animal bites (doses for 250/62 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 6–11 years: 0.15 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day, dose doubled in severe infection

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, and animal bites (doses for 400/57 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 2–23 months: 0.15 mL/kilogram twice daily, doubled in severe infection
- ▶ Child 2–6 years (body-weight 13–21 kg): 2.5 mL twice daily, doubled in severe infection
- ▶ Child 7–12 years (body-weight 22–40 kg): 5 mL twice daily, doubled in severe infection
- ▶ Child 12–17 years (body-weight 41 kg and above): 10 mL twice daily; increased if necessary to 10 mL 3 times a day, increased frequency to be used in severe infection
- ▶ Adult: 10 mL twice daily; increased if necessary to 10 mL 3 times a day, increased frequency to be used in severe infection

Acute diverticulitis

- ▶ BY MOUTH
- ▶ Adult: 500/125 mg 3 times a day for 5 days then review
- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 1.2 g every 8 hours

Moderate diabetic foot infection | Severe diabetic foot infection

- ▶ BY MOUTH USING TABLETS
- ▶ Adult: 500/125 mg every 8 hours
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1.2 g every 8 hours

Leg ulcer infection

- ▶ BY MOUTH USING TABLETS
- ▶ Adult: 500/125 mg every 8 hours for 7 days
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1.2 g every 8 hours

Cellulitis | Erysipelas

- ▶ BY MOUTH USING TABLETS
- ▶ Child 12–17 years: 250/125 mg every 8 hours, alternatively 500/125 mg every 8 hours for 5–7 days then review (review after 7 days in severe infection or if infection near the eyes or nose)
- ▶ Adult: 500/125 mg every 8 hours for 7 days then review
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1.2 g every 8 hours

Cellulitis (doses for 125/31 suspension) | Erysipelas (doses for 125/31 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 1–11 months: 0.25 mL/kilogram 3 times a day for 5–7 days then review (review after 7 days in severe infection or if infection near the eyes or nose), dose doubled in severe infection
- ▶ Child 1–5 years: 0.25 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day for 5–7 days then review (review after 7 days in severe infection or if infection near the eyes or nose), dose doubled in severe infection

Cellulitis (doses for 250/62 suspension) | Erysipelas (doses for 250/62 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 6–11 years: 0.15 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day for 5–7 days then review (review after 7 days in severe infection or if

infection near the eyes or nose), dose doubled in severe infection

Severe dental infection with spreading cellulitis | Dental infection not responding to first-line antibacterial

- ▶ BY MOUTH USING TABLETS
- ▶ Child 12–17 years: 250/125 mg every 8 hours for 5 days
- ▶ Adult: 250/125 mg every 8 hours for 5 days

Surgical prophylaxis

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1.2 g, to be administered up to 30 minutes before the procedure, then 1.2 g every 8 hours for up to 2–3 further doses in high risk procedures

Community-acquired pneumonia (doses for 125/31 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 1–11 months: 0.5 mL/kilogram 3 times a day for 5 days
- ▶ Child 1–5 years: 0.5 mL/kilogram 3 times a day for 5 days, alternatively 10 mL 3 times a day for 5 days

Community-acquired pneumonia (doses for 250/62 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 6–11 years: 0.3 mL/kilogram 3 times a day for 5 days, alternatively 10 mL 3 times a day for 5 days

Community-acquired pneumonia

- ▶ BY MOUTH USING TABLETS
- ▶ Child 12–17 years: 500/125 mg 3 times a day for 5 days
- ▶ Adult: 500/125 mg 3 times a day for 5 days
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1.2 g every 8 hours

Hospital-acquired pneumonia (doses for 125/31 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 1–11 months: 0.5 mL/kilogram 3 times a day for 5 days then review
- ▶ Child 1–5 years: 0.5 mL/kilogram 3 times a day for 5 days then review, alternatively 10 mL 3 times a day for 5 days then review

Hospital-acquired pneumonia (doses for 250/62 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 6–11 years: 0.3 mL/kilogram 3 times a day for 5 days then review, alternatively 10 mL 3 times a day for 5 days then review

Hospital-acquired pneumonia

- ▶ BY MOUTH USING TABLETS
- ▶ Child 12–17 years: 500/125 mg 3 times a day for 5 days then review
- ▶ Adult: 500/125 mg 3 times a day for 5 days then review

Acute exacerbation of bronchiectasis (doses for 125/31 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 1–11 months: 0.25 mL/kilogram 3 times a day for 7–14 days
- ▶ Child 1–5 years: 5 mL 3 times a day for 7–14 days, alternatively 0.25 mL/kilogram 3 times a day for 7–14 days

Acute exacerbation of bronchiectasis (doses for 250/62 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 6–11 years: 5 mL 3 times a day for 7–14 days, alternatively 0.15 mL/kilogram 3 times a day for 7–14 days

Acute exacerbation of bronchiectasis

- ▶ BY MOUTH USING TABLETS
- ▶ Child 12–17 years: 250/125 mg 3 times a day for 7–14 days, alternatively 500/125 mg 3 times a day for 7–14 days
- ▶ Adult: 500/125 mg 3 times a day for 7–14 days

continued →

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 1.2 g every 8 hours

Acute exacerbation of chronic obstructive pulmonary disease

- ▶ BY MOUTH USING TABLETS
- ▶ Adult: 500/125 mg 3 times a day for 5 days
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1.2 g every 8 hours

Acute sinusitis (doses for 125/31 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 1-11 months: 0.25 mL/kilogram 3 times a day for 5 days
- ▶ Child 1-5 years: 5 mL 3 times a day for 5 days, alternatively 0.25 mL/kilogram 3 times a day for 5 days

Acute sinusitis (doses for 250/62 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 6-11 years: 5 mL 3 times a day for 5 days, alternatively 0.15 mL/kilogram 3 times a day for 5 days

Acute sinusitis

- ▶ BY MOUTH USING TABLETS
- ▶ Child 12-17 years: 250/125 mg 3 times a day for 5 days, alternatively 500/125 mg 3 times a day for 5 days
- ▶ Adult: 500/125 mg 3 times a day for 5 days

Acute otitis media (doses for 125/31 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 1-11 months: 0.25 mL/kilogram 3 times a day for 5-7 days
- ▶ Child 1-5 years: 5 mL 3 times a day for 5-7 days, alternatively 0.25 mL/kilogram 3 times a day for 5-7 days

Acute otitis media (doses for 250/62 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 6-11 years: 5 mL 3 times a day for 5-7 days, alternatively 0.15 mL/kilogram 3 times a day for 5-7 days

Acute otitis media

- ▶ BY MOUTH USING TABLETS
- ▶ Child 12-17 years: 250/125 mg 3 times a day for 5-7 days, alternatively 500/125 mg 3 times a day for 5-7 days

Acute pyelonephritis (doses for 125/31 suspension) | Urinary-tract infection (catheter-associated) (doses for 125/31 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 3-11 months: 0.25 mL/kilogram 3 times a day for 7 to 10 days, dose doubled in severe infection
- ▶ Child 1-5 years: 0.25 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day for 7 to 10 days, dose doubled in severe infection

Acute pyelonephritis (doses for 250/62 suspension) | Urinary-tract infection (catheter-associated) (doses for 250/62 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 6-11 years: 0.15 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day for 7 to 10 days, dose doubled in severe infection

Acute pyelonephritis | Urinary-tract infection (catheter-associated)

- ▶ BY MOUTH USING TABLETS
- ▶ Child 12-15 years: 250/125 mg 3 times a day for 7-10 days, alternatively 500/125 mg 3 times a day for 7-10 days
- ▶ Child 16-17 years: 500/125 mg 3 times a day for 7-10 days
- ▶ Adult: 500/125 mg 3 times a day for 7-10 days
- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1.2 g every 8 hours

DOSE EQUIVALENCE AND CONVERSION

- ▶ Doses are expressed as co-amoxiclav.
- ▶ A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

- **UNLICENSED USE** Co-amoxiclav may be used as detailed below, although these situations are considered unlicensed:
 - **EVGR** treatment of acute exacerbation of bronchiectasis
 - treatment of hospital-acquired pneumonia
 - duration of treatment for acute sinusitis
 - duration of treatment for acute otitis media
 Co-amoxiclav is used for the treatment of acute diverticulitis , but is not licensed orally for this indication.
- **CONTRA-INDICATIONS** History of co-amoxiclav-associated jaundice or hepatic dysfunction · history of penicillin-associated jaundice or hepatic dysfunction
- **CAUTIONS**

GENERAL CAUTIONS Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common) · maintain adequate hydration with high doses (particularly during parental therapy)

SPECIFIC CAUTIONS

 - ▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses
- **INTERACTIONS** → Appendix 1: clavulanate · penicillins
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

 - ▶ **Common or very common** Increased risk of infection
 - ▶ **Uncommon** Dizziness · dyspepsia · headache
 - ▶ **Rare or very rare** Neutropenia
 - ▶ **Frequency not known** Colitis haemorrhagic · crystalluria · hypersensitivity vasculitis · meningitis aseptic

SPECIFIC SIDE-EFFECTS

 - ▶ With oral use Akathisia · black hairy tongue · cholangitis · Kounis syndrome

SIDE-EFFECTS, FURTHER INFORMATION Hepatic events have been reported mostly in males and elderly patients and may be associated with prolonged treatment.

Signs and symptoms usually occur during or shortly after treatment but in some cases may occur several weeks after discontinuation.
- **PREGNANCY** Manufacturer advises avoid unless essential—may be associated with an increased risk of necrotising enterocolitis in neonates.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. **Monitoring** Monitor liver function in liver disease.
- **RENAL IMPAIRMENT** Risk of crystalluria with high doses (particularly during parenteral therapy).
 - ▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

Dose adjustments ▶ With oral use in adults *Co-amoxiclav* 250/125 tablets or 500/125 tablets: if eGFR 10-30 mL/minute/1.73 m², one 250/125 strength tablet every 12 hours or one 500/125 strength tablet every 12 hours; if eGFR less than 10 mL/minute/1.73 m², one 250/125 strength tablet every 24 hours or one 500/125 strength tablet every 24 hours.

Co-amoxiclav 400/57 suspension: avoid if eGFR less than 30 mL/minute/1.73 m².

- ▶ With intravenous use in adults *Co-amoxiclav injection* (expressed as co-amoxiclav): if eGFR 10–30 mL/minute/1.73 m², 1.2 g initially, then 600 mg every 12 hours; if eGFR less than 10 mL/minute/1.73 m², 1.2 g initially, then 600 mg every 24 hours.
 - ▶ With oral use in children *Co-amoxiclav 125/31 suspension, 250/62 suspension, 250/125 tablets, or 500/125 tablets*: use normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Use the normal dose recommended for mild or moderate infections every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
 - ▶ *Co-amoxiclav 400/57 suspension*: avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
 - ▶ With intravenous use in children *Co-amoxiclav injection*: use normal initial dose and then use half normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; use normal initial dose and then use half normal dose every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use in children For *intravenous infusion*, dilute reconstituted solution to a concentration of 10 mg/mL with Sodium Chloride 0.9%; give intermittently over 30–40 minutes. For *intravenous injection*, administer over 3–4 minutes.
 - ▶ With intravenous use in adults For *intravenous infusion* (*Augmentin*®), give intermittently in Sodium chloride 0.9%. Reconstitute 600 mg initially with 10 mL water for injections, then dilute with 50 mL infusion fluid; reconstitute 1.2 g initially with 20 mL water for injections, then dilute with 100 mL infusion fluid; give over 30–40 minutes. For *intravenous injection*, administer over 3–4 minutes. *Via drip tubing in Sodium chloride 0.9%*.

- **PRESCRIBING AND DISPENSING INFORMATION** Doses are expressed as co-amoxiclav: a mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 529, Diabetic foot infections, antibacterial therapy p. 533, Ear infections, antibacterial therapy p. 534, Gastro-intestinal system infections, antibacterial therapy p. 535, Musculoskeletal system infections, antibacterial therapy p. 536, Nose infections, antibacterial therapy p. 536, Oropharyngeal infections, antibacterial therapy p. 1282, Respiratory system infections, antibacterial therapy p. 538, Skin infections, antibacterial therapy p. 540, Urinary-tract infections p. 622.

Pivmecillinam hydrochloride

22-May-2020

● **INDICATIONS AND DOSE**

Acute uncomplicated cystitis

▶ **BY MOUTH**

▶ Child (body-weight 40 kg and above): Initially 400 mg for 1 dose, then 200 mg every 8 hours to a total of 10 tablets

continued →

- ▶ Adult (body-weight 40 kg and above): Initially 400 mg for 1 dose, then 200 mg every 8 hours to a total of 10 tablets

Chronic or recurrent bacteriuria

- ▶ BY MOUTH
- ▶ Child (body-weight 40 kg and above): 400 mg every 6–8 hours
- ▶ Adult (body-weight 40 kg and above): 400 mg every 6–8 hours

Urinary-tract infections

- ▶ BY MOUTH
- ▶ Child (body-weight up to 40 kg): 5–10 mg/kg every 6 hours, alternatively 20–40 mg/kg daily in 3 divided doses

● UNLICENSED USE

- ▶ In children Not licensed for use in children under 3 months.

- **CONTRA-INDICATIONS** Carnitine deficiency · gastro-intestinal obstruction · oesophageal strictures

- **CAUTIONS** Avoid in Acute porphyrias p. 1120

- **INTERACTIONS** → Appendix 1: penicillins

● SIDE-EFFECTS

- ▶ **Common or very common** Vulvovaginal fungal infection
- ▶ **Uncommon** Dizziness · fatigue · gastrointestinal discomfort · gastrointestinal disorders · headache · oral ulceration · vertigo

- **PREGNANCY** Not known to be harmful, but manufacturer advises avoid.

- **BREAST FEEDING** Trace amount in milk, but appropriate to use.

- **MONITORING REQUIREMENTS** Liver and renal function tests required in long-term use.

- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances). False positive newborn screening results for isovaleric acidaemia may occur in neonates born to mothers receiving pivmecillinam during late pregnancy.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of fluid during meals while sitting or standing.

- **PATIENT AND CARER ADVICE** Patient counselling is advised on administration of pivmecillinam hydrochloride tablets (posture).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

● INDICATIONS AND DOSE**Infections due to beta-lactamase-producing staphylococci including otitis externa | Adjunct in pneumonia**

- ▶ BY MOUTH
- ▶ Child 1 month-1 year: 62.5–125 mg 4 times a day
- ▶ Child 2-9 years: 125–250 mg 4 times a day
- ▶ Child 10-17 years: 250–500 mg 4 times a day
- ▶ Adult: 250–500 mg 4 times a day

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 250–500 mg every 6 hours
- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 0.25–2 g every 6 hours

Impetigo

- ▶ BY MOUTH
- ▶ Child 1 month-1 year: 62.5–125 mg 4 times a day for 5–7 days
- ▶ Child 2-9 years: 125–250 mg 4 times a day for 5–7 days
- ▶ Child 10-17 years: 250–500 mg 4 times a day for 5–7 days
- ▶ Adult: 500 mg 4 times a day for 5–7 days
- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 250–500 mg every 6 hours
- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 0.25–2 g every 6 hours

Cellulitis | Erysipelas

- ▶ BY MOUTH
- ▶ Child 1 month-1 year: 62.5–125 mg 4 times a day for 5–7 days then review
- ▶ Child 2-9 years: 125–250 mg 4 times a day for 5–7 days then review
- ▶ Child 10-17 years: 250–500 mg 4 times a day for 5–7 days then review
- ▶ Adult: 0.5–1 g 4 times a day for 5–7 days then review
- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1–2 g every 6 hours

Mild diabetic foot infection

- ▶ BY MOUTH
- ▶ Adult: 0.5–1 g 4 times a day for 7 days then review

Moderate diabetic foot infection | Severe diabetic foot infection

- ▶ BY MOUTH
- ▶ Adult: 1 g 4 times a day
- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1–2 g every 6 hours

Leg ulcer infection

- ▶ BY MOUTH
- ▶ Adult: 0.5–1 g 4 times a day for 7 days
- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1–2 g every 6 hours

Endocarditis (in combination with other antibacterial if necessary)

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult (body-weight up to 85 kg): 8 g daily in 4 divided doses
- ▶ Adult (body-weight 85 kg and above): 12 g daily in 6 divided doses

Osteomyelitis

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Up to 8 g daily in 3–4 divided doses

Surgical prophylaxis

- ▶ INITIALLY BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 1–2 g, to be administered up to 30 minutes before the procedure, then (by mouth or by intramuscular injection or by slow intravenous injection or by intravenous infusion) 500 mg every 6 hours if required for up to 4 further doses in high risk procedures

Staphylococcal lung infection in cystic fibrosis

► BY MOUTH

- Child: 25 mg/kg 4 times a day (max. per dose 1 g), alternatively 100 mg/kg daily in 3 divided doses; maximum 4 g per day

Prevention of *Staphylococcus aureus* lung infection in cystic fibrosis—primary prevention

► BY MOUTH

- Child 1 month–3 years: 125 mg twice daily

Prevention of *Staphylococcus aureus* lung infection in cystic fibrosis—secondary prevention

► BY MOUTH

- Child: 50 mg/kg twice daily (max. per dose 1 g twice daily)

- **UNLICENSED USE** Flucloxacillin doses in the BNF may differ from those in product literature.

IMPORTANT SAFETY INFORMATION**HEPATIC DISORDERS**

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Manufacturer advises:

- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin
- flucloxacillin should be used with caution in patients with hepatic impairment
- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials

● **CAUTIONS**

- With intravenous use accumulation of electrolytes can occur with high doses

- **INTERACTIONS** → Appendix 1: penicillins

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- Rare or very rare Arthralgia · fever · neutropenia

SPECIFIC SIDE-EFFECTS

- Common or very common
 - With oral use Gastrointestinal disorder
- Rare or very rare
 - With oral use Eosinophilia · myalgia
- Frequency not known
 - With parenteral use Bronchospasm · coma · dyspnoea · electrolyte imbalance · erythema nodosum · hallucination · Jarisch-Herxheimer reaction · nephropathy · neurotoxicity · oral candidiasis · platelet dysfunction · purpura non-thrombocytopenic · vasculitis

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution; including in those with risk factors for hepatic reactions.

● **RENAL IMPAIRMENT**

- With intravenous use Accumulation of electrolytes can occur in patients with renal failure.

Dose adjustments ► In adults Reduce dose if eGFR less than 10 mL/minute/1.73 m².

- In children Use normal dose every 8 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

● **DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in adults For intravenous infusion (Floxapen[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%; suggested volume 100 mL given over 30–60 minutes. Via drip tubing in Glucose 5% or Sodium

chloride 0.9%; continuous infusion not usually recommended.

- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 529, Cardiovascular system infections, antibacterial therapy p. 532, Diabetic foot infections, antibacterial therapy p. 533, Ear infections, antibacterial therapy p. 534, Musculoskeletal system infections, antibacterial therapy p. 536, Respiratory system infections, antibacterial therapy p. 538, Skin infections, antibacterial therapy p. 540.

Temocillin

22-May-2020

● **INDICATIONS AND DOSE**

Septicaemia | Urinary-tract infections | Lower respiratory-tract infections caused by susceptible Gram-negative bacteria

- BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Adult: 2 g every 12 hours, alternatively 2 g every 8 hours, higher daily dose to be used in critically ill patients

- BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: (consult product literature)

- **CAUTIONS** Accumulation of sodium from injection can occur with high doses

- **INTERACTIONS** → Appendix 1: penicillins

- **SIDE-EFFECTS** Arthralgia · fever · myalgia · nervous system disorder · thrombophlebitis
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amounts in milk.
- **RENAL IMPAIRMENT** Accumulation of sodium from injection can occur in patients with renal failure.
Dose adjustments Manufacturer advises reduce usual dose to 1 g every 12 hours if creatinine clearance 30–60 mL/minute; reduce usual dose to 1 g every 24 hours if creatinine clearance 10–30 mL/minute; reduce usual dose to 1 g every 48 hours or 500 mg every 24 hours if creatinine clearance less than 10 mL/minute; no information available to recommend dose adjustments with higher daily dose for use in critically ill patients.
- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intramuscular injection*, reconstitute 1 g with 2 mL water for injections or Sodium chloride 0.9% (or 0.5 or 1% lidocaine solution, if pain is experienced at injection site). Manufacturer advises for *slow intravenous injection*, reconstitute 1 g with 10 mL water for injections or Sodium chloride 0.9%; give over 3–4 minutes. Manufacturer advises for *intermittent intravenous infusion*, give in Glucose 5% or 10% or Sodium chloride 0.9% or Ringer's solution or Lactated Ringer's solution. Reconstitute 1 g with 10 mL water for injections or infusion fluid, then dilute in up to 150 mL infusion fluid; give over 30–40 minutes. For *continuous intravenous infusion*, consult product literature.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

ELECTROLYTES: May contain Sodium

- ▶ **Negaban** (Eumedica Pharmaceuticals)

Temocillin (as Temocillin sodium) 1 gram Negaban 1g powder for solution for injection vials | 1 vial [PoM] £25.45 DT = £25.45 (Hospital only)

ANTIBACTERIALS > POLYMYXINS**Colistimethate sodium**

01-May-2020

(Colistin sulfomethate sodium)

- **DRUG ACTION** The polymyxin antibiotic, colistimethate sodium (colistin sulfomethate sodium), is active against Gram-negative organisms including *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, and *Klebsiella pneumoniae*. It is not absorbed by mouth and thus needs to be given by injection for a systemic effect.

• INDICATIONS AND DOSE**Serious infections due to selected aerobic Gram-negative bacteria in patients with limited treatment options**

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** 9 million units daily in 2–3 divided doses, an initial loading dose of 9 million units should be used in those who are critically ill, loading and maintenance doses of up to 12 million units may be required in some cases, however clinical experience is limited and safety has not been established—consult product literature for details

Management of chronic pulmonary infections due to *Pseudomonas aeruginosa* in patients with cystic fibrosis

▶ BY INHALATION OF NEBULISED SOLUTION

- ▶ **Child 2–17 years:** 1–2 million units 2–3 times a day, for specific advice on administration using nebulisers—consult product literature; maximum 6 million units per day

- ▶ **Adult:** 1–2 million units 2–3 times a day, for specific advice on administration using nebulisers—consult product literature; maximum 6 million units per day
- ▶ BY INHALATION OF POWDER
- ▶ **Adult:** 1.66 million units twice daily

- **CONTRA-INDICATIONS** Myasthenia gravis

• CAUTIONS

- ▶ When used by inhalation Severe haemoptysis—risk of further haemorrhage

- **INTERACTIONS** → Appendix 1: colistimethate

• SIDE-EFFECTS▶ **Common or very common**

- ▶ When used by inhalation Arthralgia · asthenia · asthma · balance impaired · chest discomfort · cough · dysphonia · dyspnoea · fever · haemorrhage · headache · lower respiratory tract infection · nausea · respiratory disorders · taste altered · throat complaints · tinnitus · vomiting

▶ **Uncommon**

- ▶ When used by inhalation Anxiety · appetite decreased · diarrhoea · drowsiness · ear congestion · flatulence · oral disorders · proteinuria · seizure · sputum purulent · thirst · weight change

▶ **Rare or very rare**

- ▶ With parenteral use Confusion · nephrotoxicity · presyncope · psychosis · speech slurred · visual impairment

▶ **Frequency not known**

- ▶ With parenteral use Apnoea · neurological effects · neurotoxicity · renal disorder · sensory disorder

SIDE-EFFECTS, FURTHER INFORMATION Neurotoxicity and nephrotoxicity are dose-related.**• PREGNANCY**

- ▶ When used by inhalation Clinical use suggests probably safe.
- ▶ With intravenous use Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Present in milk but poorly absorbed from gut; manufacturers advise avoid (or use only if potential benefit outweighs risk).

• HEPATIC IMPAIRMENT

- ▶ With intravenous use Manufacturer advises caution (no information available).

• RENAL IMPAIRMENT

- ▶ When used by inhalation Manufacturer advises caution.

Dose adjustments

- ▶ With intravenous use in adults Manufacturer advises reduce maintenance dose if creatinine clearance less than 50 mL/minute—consult product literature.

- ▶ **Monitoring** • With intravenous use In renal impairment, monitor plasma colistimethate sodium concentration during parenteral treatment—consult product literature. Recommended 'peak' plasma colistimethate sodium concentration (approx. 1 hour after intravenous injection or infusion) 5–15 mg/litre; pre-dose ('trough') concentration 2–6 mg/litre.

• MONITORING REQUIREMENTS

- ▶ With intravenous use Monitor renal function.
- ▶ When used by inhalation Measure lung function before and after initial dose of colistimethate sodium and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using a bronchodilator before the dose of colistimethate sodium.

• DIRECTIONS FOR ADMINISTRATION

- ▶ When used by inhalation Manufacturer advises if other treatments are being administered, they should be taken in the order recommended by the physician. For *nebulisation*, consult product literature for information on reconstitution and dilution.
- ▶ With intravenous use in adults For *intravenous infusion*, manufacturer advises following reconstitution, dilute requisite dose, usually with 50 mL Sodium Chloride 0.9%; give over 30–60 minutes.

Patients fitted with a totally implantable venous access device may tolerate an injection. For *slow intravenous injection* into a totally implantable venous access device, dilute to a concentration of 200 000 units/mL with Sodium Chloride 0.9%; give over at least 5 minutes.

● PRESCRIBING AND DISPENSING INFORMATION

Colistimethate sodium is included in some preparations for topical application.

● PATIENT AND CARER ADVICE

- ▶ When used by inhalation Patient should be advised to rinse mouth with water after each dose of dry powder inhalation. Patients or carers should be given advice on how to administer colistimethate sodium; first dose should be given under medical supervision.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness, confusion and visual disturbances.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Colistimethate sodium and tobramycin dry powders for inhalation for treating pseudomonas lung infection in cystic fibrosis (March 2013)** NICE TA276

Colistimethate sodium dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis who would benefit from continued treatment, but do not tolerate the drug in its nebulised form. The manufacturer must provide colistimethate sodium dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving colistimethate sodium dry powder for inhalation can continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta276

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Colistimethate sodium 1000000 unit Colomycin 1million unit powder for solution for injection vials | 10 vial [PoM] £18.00 DT = £18.00

Colistimethate sodium 2000000 unit Colomycin 2million unit powder for solution for injection vials | 10 vial [PoM] £32.40 DT = £32.40

▶ Promixin (Profile Pharma Ltd)

Colistimethate sodium 1000000 unit Promixin 1million unit powder for solution for injection vials | 10 vial [PoM] £37.50 DT = £18.00 (Hospital only)

Inhalation powder

▶ Colobreathe (Teva UK Ltd)

Colistimethate sodium 1662500 unit Colobreathe 1,662,500unit inhalation powder capsules | 56 capsule [PoM] £968.80 DT = £968.80

Powder for nebuliser solution

▶ Promixin (Profile Pharma Ltd)

Colistimethate sodium 1000000 unit Promixin 1million unit powder for nebuliser solution unit dose vials | 30 unit dose [PoM] £204.00 DT = £204.00

ANTIBACTERIALS > QUINOLONES

Quinolones

31-Oct-2017

MHRA/CHM advice: Systemic and inhaled fluoroquinolones (November 2018, and March 2019)

The MHRA and CHM have released important safety information regarding the use of systemic and inhaled fluoroquinolones. For restrictions and precautions, see *Important safety information* for all quinolones: ciprofloxacin p. 590, levofloxacin p. 592, moxifloxacin p. 593, and ofloxacin p. 593.

Overview

In the UK, only fluoroquinolones are available; the recommendations below therefore refer to the use of fluoroquinolones.

Ciprofloxacin is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including *Salmonella*, *Shigella*, *Campylobacter*, *Neisseria*, and *Pseudomonas*. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as *Streptococcus pneumoniae* and *Enterococcus faecalis*; it should not be used for pneumococcal pneumonia. It is active against *Chlamydia* and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin can be used for respiratory tract infections (but not for pneumococcal pneumonia), infections of the gastrointestinal system (including typhoid fever), bone and joint infections, gonorrhoea and septicæmia caused by sensitive organisms.

Ofloxacin is licensed for urinary-tract infections, lower respiratory-tract infections, gonorrhoea, and non-gonococcal urethritis and cervicitis.

Levofloxacin is active against Gram-positive and Gram-negative organisms. It has greater activity against *Pneumococci* than ciprofloxacin.

Many *Staphylococci* are resistant to quinolones and their use should be avoided in MRSA infections.

Moxifloxacin is active against Gram-positive and Gram-negative organisms. It has greater activity against Gram-positive organisms, including *Pneumococci*, than ciprofloxacin. Moxifloxacin is not active against *Pseudomonas aeruginosa* or methicillin-resistant *Staphylococcus aureus* (MRSA).

Quinolones

IMPORTANT SAFETY INFORMATION

The CSM has warned that quinolones may induce **convulsions** in patients with or without a history of convulsions; taking NSAIDs at the same time may also induce them.

TENDON DAMAGE

Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that:

- quinolones are contra-indicated in patients with a history of tendon disorders related to quinolone use;
- patients over 60 years of age are more prone to tendon damage;
- the risk of tendon damage is increased by the concomitant use of corticosteroids;
- if tendinitis is suspected, the quinolone should be discontinued immediately.

MHRA/CHM ADVICE: SYSTEMIC AND INHALED FLUOROQUINOLONES: SMALL INCREASED RISK OF AORTIC ANEURYSM AND DISSECTION; ADVICE FOR PRESCRIBING IN HIGH-RISK PATIENTS (NOVEMBER 2018)

The MHRA advises that benefit-risk should be assessed and other therapeutic options considered before using fluoroquinolones in patients at risk of aortic aneurysm and dissection. Patients (particularly the elderly and those at risk) and their carers should be informed about rare events of aortic aneurysm and dissection, and advised to seek immediate medical attention if sudden-onset severe abdominal, chest, or back pain develops.

MHRA/CHM ADVICE: FLUOROQUINOLONE ANTIBIOTICS: NEW RESTRICTIONS AND PRECAUTIONS FOR USE DUE TO VERY RARE REPORTS OF DISABLING AND POTENTIALLY LONG-LASTING OR IRREVERSIBLE SIDE EFFECTS (MARCH 2019)

Disabling, long-lasting or potentially irreversible adverse reactions affecting musculoskeletal and nervous systems have been reported very rarely with fluoroquinolone antibiotics. Healthcare professionals are advised to inform patients to stop treatment at the first signs of a serious adverse reaction, such as tendinitis or tendon rupture, muscle pain, muscle weakness, joint pain, joint swelling, peripheral neuropathy, and CNS effects, and to contact their doctor immediately. Fluoroquinolones should not be prescribed for non-severe or self-limiting infections, or non-bacterial conditions. Unless other commonly recommended antibiotics are inappropriate, fluoroquinolones should not be prescribed for some mild to moderate infections, such as acute exacerbation of chronic bronchitis and chronic obstructive pulmonary disease, and ciprofloxacin or levofloxacin should not be prescribed for uncomplicated cystitis. Fluoroquinolones should be avoided in patients who have previously had serious adverse reactions. Use of fluoroquinolones with corticosteroids should also be avoided as it may exacerbate fluoroquinolone-induced tendinitis and tendon rupture. Fluoroquinolones should be prescribed with caution in patients older than 60 years and in patients with renal impairment or solid-organ transplants as they are at a higher risk of tendon injury.

- **CONTRA-INDICATIONS** History of tendon disorders related to quinolone use

- **CAUTIONS** Can prolong the QT interval · children or adolescents (arthropathy has developed in weight-bearing joints in young *animals*) · conditions that predispose to seizures · diabetes (may affect blood glucose) · exposure to excessive sunlight and UV radiation should be avoided during treatment and for 48 hours after stopping treatment · G6PD deficiency · history of epilepsy · myasthenia gravis (risk of exacerbation) · psychiatric disorders

CAUTIONS, FURTHER INFORMATION

- ▶ Use in children Quinolones cause arthropathy in the weight-bearing joints of immature *animals* and are therefore generally not recommended in children and growing adolescents. However, the significance of this effect in humans is uncertain and in some specific circumstances use of ciprofloxacin may be justified in children.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Appetite decreased · arthralgia · asthenia · constipation (in adults) · diarrhoea · dizziness · dyspnoea · eye discomfort · eye disorders · fever · gastrointestinal discomfort · headache · muscle complaints · nausea · QT interval prolongation · skin reactions · sleep disorders · taste altered · tinnitus · vision disorders · vomiting
 - ▶ **Uncommon** Anaemia · antibiotic associated colitis · anxiety · arrhythmias · asthma · chest pain · confusion · cough (in adults) · depression · drowsiness · dry eye · eosinophilia ·

eye inflammation · flatulence · hallucination · hearing impairment · hepatic disorders · hyperhidrosis · hypersensitivity · hypotension · increased risk of infection · leucopenia · movement disorders · neutropenia · oedema · pain · palpitations · renal impairment · respiratory disorders · seizure · sensation abnormal · smell altered (in adults) · tendon disorders · thrombocytopenia · thrombocytosis · tremor · vasodilation · vertigo

- ▶ **Rare or very rare** Agranulocytosis · angioedema · arthritis · cardiac arrest (in adults) · gait abnormal · haemolytic anaemia · hyperglycaemia · hypoglycaemia · idiopathic intracranial hypertension · muscle weakness · myasthenia gravis aggravated · nephritis tubulointerstitial · pancreatitis · pancytopenia · peripheral neuropathy (sometimes irreversible) · photosensitivity reaction · polyneuropathy · psychotic disorder · self-injurious behaviour · severe cutaneous adverse reactions (SCARs) · stomatitis (in adults) · suicidal tendencies · syncope · vasculitis
 - ▶ **Frequency not known** Corneal deposits (reversible after completion of treatment) · hypoglycaemic coma · increased risk of aortic aneurysm (more common in elderly) · increased risk of aortic dissection (more common in elderly) · ligament rupture · rhabdomyolysis (in adults)
- SIDE-EFFECTS, FURTHER INFORMATION** The drug should be discontinued if neurological, psychiatric, tendon disorders or hypersensitivity reactions (including severe rash) occur. For more information regarding the safety of fluoroquinolones, please see Important Safety Information.

- **ALLERGY AND CROSS-SENSITIVITY** Use of quinolones contra-indicated in quinolone hypersensitivity.
- **PREGNANCY** Avoid in pregnancy—shown to cause arthropathy in *animal* studies; safer alternatives are available.
- **PATIENT AND CARER ADVICE** The MHRA has produced an advice sheet on serious adverse reactions affecting musculoskeletal and nervous systems associated with fluoroquinolone use, which should be provided to patients and their carers.

F 589

Ciprofloxacin

17-Apr-2020

● INDICATIONS AND DOSE

Moderate diabetic foot infection | Severe diabetic foot infection

- ▶ BY MOUTH
 - ▶ Adult: 500 mg twice daily
- ▶ BY INTRAVENOUS INFUSION
 - ▶ Adult: 400 mg every 8–12 hours, to be given over 60 minutes

Fistulating Crohn's disease

- ▶ BY MOUTH
 - ▶ Adult: 500 mg twice daily

Acute diverticulitis [in combination with metronidazole] (administered on expert advice)

- ▶ BY MOUTH
 - ▶ Adult: 500 mg twice daily for 5 days then review
- ▶ BY INTRAVENOUS INFUSION
 - ▶ Adult: 400 mg every 8–12 hours, to be given over 60 minutes

Respiratory-tract infections

- ▶ BY MOUTH
 - ▶ Adult: 500–750 mg twice daily
- ▶ BY INTRAVENOUS INFUSION
 - ▶ Adult: 400 mg every 8–12 hours, to be given over 60 minutes

Pseudomonal lower respiratory-tract infection in cystic fibrosis

- ▶ BY MOUTH
- ▶ Adult: 750 mg twice daily

Urinary-tract infections

- ▶ BY MOUTH
- ▶ Adult: 250–750 mg twice daily
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 400 mg every 8–12 hours, to be given over 60 minutes

Acute prostatitis

- ▶ BY MOUTH
- ▶ Adult: 500 mg twice daily for 14 days then carry out a clinical assessment to decide whether to continue for a further 14 days
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 400 mg every 8–12 hours

Gonorrhoea

- ▶ BY MOUTH
- ▶ Adult: 500 mg for 1 dose

Most other infections

- ▶ BY MOUTH
- ▶ Adult: Initially 500 mg twice daily; increased to 750 mg twice daily, in severe or deep-seated infection
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 400 mg every 8–12 hours, to be given over 60 minutes

Surgical prophylaxis

- ▶ BY MOUTH
- ▶ Adult: 750 mg, to be taken 60 minutes before procedure

Anthrax (treatment and post-exposure prophylaxis)

- ▶ BY MOUTH
- ▶ Adult: 500 mg twice daily
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 400 mg every 12 hours, to be given over 60 minutes

Prevention of secondary case of meningococcal meningitis

- ▶ BY MOUTH
- ▶ Child 1 month–4 years: 30 mg/kg (max. per dose 125 mg) for 1 dose
- ▶ Child 5–11 years: 250 mg for 1 dose
- ▶ Child 12–17 years: 500 mg for 1 dose
- ▶ Adult: 500 mg for 1 dose

Acute pyelonephritis | Urinary tract infection (catheter-associated)

- ▶ BY MOUTH
- ▶ Adult: 500 mg twice daily for 7 days
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 400 mg every 8–12 hours

- **UNLICENSED USE** Not licensed for use in children for prophylaxis of meningococcal meningitis.
- **CAUTIONS** Acute myocardial infarction (risk factor for QT interval prolongation) · avoid excessive alkalinity of urine (risk of crystalluria) · bradycardia (risk factor for QT interval prolongation) · congenital long QT syndrome (risk factor for QT interval prolongation) · electrolyte disturbances (risk factor for QT interval prolongation) · ensure adequate fluid intake (risk of crystalluria) · heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) · history of symptomatic arrhythmias (risk factor for QT interval prolongation)
- **INTERACTIONS** → Appendix 1: quinolones
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arthropathy (in children)
 - ▶ **Rare or very rare** Bone marrow depression · crystalluria · erythema nodosum · haematuria · intracranial pressure increased · leucocytosis · migraine · muscle tone increased · status epilepticus

- ▶ **Frequency not known** Mood altered
- **PREGNANCY** A single dose of ciprofloxacin may be used for the prevention of a secondary case of meningococcal meningitis.
- **BREAST FEEDING** Amount too small to be harmful but manufacturer advises avoid.
- **RENAL IMPAIRMENT**
 - Dose adjustments** ▶ With oral use in adults Give 250–500 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m² (every 24 hours if eGFR less than 30 mL/minute/1.73 m²).
 - ▶ With intravenous use in adults Give (200 mg over 30 minutes), 200–400 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m² (every 24 hours if eGFR less than 30 mL/minute/1.73 m²).
 - ▶ In children Reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—consult product literature.
- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 529, Anthrax p. 609, Diabetic foot infections, antibacterial therapy p. 533, Ear infections, antibacterial therapy p. 534, Eye, infections p. 1234, Gastro-intestinal system infections, antibacterial therapy p. 535, Genital system infections, antibacterial therapy p. 536, Respiratory system infections, antibacterial therapy p. 538, Urinary-tract infections p. 622.
- **PATIENT AND CARER ADVICE**
 - Medicines for Children leaflet: Ciprofloxacin for bacterial infections www.medicinesforchildren.org.uk/ciprofloxacin-bacterial-infection
 - Driving and skilled tasks** May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

Levofloxacin

17-Apr-2020

● INDICATIONS AND DOSE**Acute sinusitis**

- ▶ BY MOUTH
- ▶ Adult: 500 mg once daily for 10–14 days

Acute exacerbation of chronic obstructive pulmonary disease

- ▶ BY MOUTH
- ▶ Adult: 500 mg once daily for 5 days

Acute exacerbation of bronchiectasis

- ▶ BY MOUTH
- ▶ Adult: 500 mg 1–2 times a day for 7–14 days
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg 1–2 times a day, to be given over at least 60 minutes

Community-acquired pneumonia

- ▶ BY MOUTH
- ▶ Adult: 500 mg twice daily for 5 days
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg twice daily for 5 days, to be given over at least 60 minutes

Hospital-acquired pneumonia (administered on expert advice)

- ▶ BY MOUTH
- ▶ Adult: 500 mg 1–2 times a day for 5 days then review
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg 1–2 times a day, to be given over at least 60 minutes, use twice daily if severe infection

Urinary-tract infections

- ▶ BY MOUTH
- ▶ Adult: 500 mg once daily for 7–14 days

Complicated urinary-tract infections

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg once daily, to be given over at least 60 minutes

Prostatitis (initiated under specialist supervision)

- ▶ BY MOUTH
- ▶ Adult: 500 mg once daily for 14 or 28 days based on clinical assessment
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg once daily, to be given over at least 60 minutes

Complicated skin infections | Complicated soft-tissue infections

- ▶ BY MOUTH
- ▶ Adult: 500 mg 1–2 times a day for 7–14 days
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg 1–2 times a day, to be given over at least 60 minutes

Inhalation of anthrax (treatment and post-exposure prophylaxis)

- ▶ BY MOUTH
- ▶ Adult: 500 mg once daily for 8 weeks

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mg once daily, to be given over at least 60 minutes

Chronic pulmonary infections due to *Pseudomonas aeruginosa* in cystic fibrosis

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Adult: 240 mg twice daily for 28 days, subsequent courses repeated after 28-day interval without levofloxacin nebuliser solution

***Helicobacter pylori* eradication [in combination with other drugs (see *Helicobacter pylori* infection p. 89)]**

- ▶ BY MOUTH
- ▶ Adult: 250 mg twice daily for 7 days for second-line eradication therapy; 10 days for third-line eradication therapy

- **UNLICENSED USE** Levofloxacin may be used as detailed below, although these situations are considered unlicensed:
 - **EvGr** treatment of acute exacerbation of bronchiectasis
 - treatment of hospital-acquired pneumonia
 - duration of treatment for acute exacerbation of chronic obstructive pulmonary disease
 - duration of treatment for community-acquired pneumonia
 - eradication of *Helicobacter pylori* 
- **CAUTIONS** Risk factors for QT interval prolongation (e.g. electrolyte disturbances, acute myocardial infarction, heart failure with reduced left ventricular ejection fraction, bradycardia, congenital long QT syndrome, history of symptomatic arrhythmias)
- **INTERACTIONS** → Appendix 1: quinolones
- **SIDE-EFFECTS**
 - ▶ **Common or very common**
 - ▶ When used by inhalation Bronchial secretion changes · dysphonia · haemoptysis · weight decreased
 - ▶ **Uncommon**
 - ▶ When used by inhalation Costochondritis · hyperbilirubinaemia · joint stiffness
 - ▶ **Rare or very rare**
 - ▶ With intravenous or oral use Paranoia
 - ▶ **Frequency not known**
 - ▶ With intravenous or oral use Diarrhoea haemorrhagic
- **SIDE-EFFECTS, FURTHER INFORMATION** Systemic side-effects may occur with nebulised levofloxacin.
 - ▶ **Bronchospasm** Manufacturer advises if acute symptomatic bronchospasm occurs after receiving nebulised levofloxacin, patients may benefit from the use of a short-acting inhaled bronchodilator at least 15 minutes to 4 hours prior to subsequent doses.
- **BREAST FEEDING** Manufacturer advises avoid.
- **RENAL IMPAIRMENT**
 - ▶ **Dose adjustments** ▶ With intravenous use or oral use Usual initial dose, then use half normal dose if eGFR 20–50 mL/minute/1.73 m²; consult product literature if eGFR less than 20 mL/minute/1.73 m².
 - ▶ When used by inhalation Manufacturer advises avoid if creatinine clearance less than 20 mL/minute.
- **PATIENT AND CARER ADVICE**
 - ▶ When used by inhalation Manufacturer advises patients and carers should be given advice on how to administer levofloxacin.
 - ▶ **Missed doses** ▶ When used by inhalation Manufacturer advises if a dose is more than 4 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
 - ▶ **Driving and skilled tasks** May impair performance of skilled tasks (e.g. driving).

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

- When used by inhalation The *Scottish Medicines Consortium* has advised (August 2016) that levofloxacin (*Quinsair*[®]) is accepted for restricted use within NHS Scotland for the management of chronic pulmonary infections due to *Pseudomonas aeruginosa* in patients with cystic fibrosis, as a third-line treatment option after colistimethate sodium (first line) and tobramycin (second line). This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

- When used by inhalation The *All Wales Medicines Strategy Group* has advised (November 2016) that levofloxacin (*Quinsair*[®]) is recommended as an option for restricted use within NHS Wales as third-line therapy for the management of chronic pulmonary infections due to *Pseudomonas aeruginosa* in patients with cystic fibrosis, who do not respond to, or are intolerant of, second-line treatment with tobramycin, only if the approved Wales Patient Access Scheme (WPAS) is used or where the list price is equivalent or lower.

- MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

17-Apr-2020

● INDICATIONS AND DOSE

Urinary-tract infections

- BY MOUTH
 - Adult: 200–400 mg daily, preferably taken in the morning; increased if necessary to 400 mg twice daily, in upper urinary tract infections
- continued →

Complicated urinary-tract infection

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 200 mg daily, increased if necessary to 400 mg twice daily, dose increased for severe or complicated infections, to be given over at least 30 minutes for each 200 mg

Prostatitis

- ▶ BY MOUTH
- ▶ Adult: 200 mg twice daily for 14 or 28 days based on clinical assessment

Lower respiratory-tract infections

- ▶ BY MOUTH
- ▶ Adult: 400 mg daily, dose preferably taken in the morning, then increased if necessary to 400 mg twice daily
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 200 mg twice daily, increased to 400 mg twice daily, dose to be increased for severe or complicated infections, to be given over at least 30 minutes for each 200 mg

Skin and soft-tissue infections

- ▶ BY MOUTH
- ▶ Adult: 400 mg twice daily
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 400 mg twice daily, to be given over at least 30 minutes for each 200 mg

Uncomplicated gonorrhoea

- ▶ BY MOUTH
- ▶ Adult: 400 mg as a single dose

Uncomplicated genital chlamydial infection | Non-gonococcal urethritis

- ▶ BY MOUTH
- ▶ Adult: 400 mg daily for 7 days, dose may be taken as a single daily dose or in divided doses

Pelvic inflammatory disease

- ▶ BY MOUTH
- ▶ Adult: 400 mg twice daily for 14 days

- **CAUTIONS** Acute myocardial infarction (risk factor for QT interval prolongation) · bradycardia (risk factor for QT interval prolongation) · congenital long QT syndrome (risk factor for QT interval prolongation) · electrolyte disturbances (risk factor for QT interval prolongation) · heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) · history of symptomatic arrhythmias (risk factor for QT interval prolongation)

- **INTERACTIONS** → Appendix 1: quinolones

SIDE-EFFECTS

- **Rare or very rare** Enterocolitis · enterocolitis haemorrhagic
- ▶ **Frequency not known** Bone marrow failure · myopathy · nephritis acute interstitial

- **BREAST FEEDING** Amount probably too small to be harmful but manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **Dose adjustments** Manufacturer advises maximum 400 mg daily in hepatic failure (risk of decreased elimination).

RENAL IMPAIRMENT

- **Dose adjustments** Usual initial dose, then use half normal dose if eGFR 20–50 mL/minute/1.73 m²; 100 mg every 24 hours if eGFR less than 20 mL/minute/1.73 m²

PATIENT AND CARER ADVICE

- **Driving and skilled tasks** May affect performance of skilled tasks (e.g. driving); effects enhanced by alcohol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 6, 9, 11

ANTIBACTERIALS > SULFONAMIDES**Co-trimoxazole**

26-May-2020

- **DRUG ACTION** Sulfamethoxazole and trimethoprim are used in combination (as co-trimoxazole) because of their synergistic activity (the importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic).

INDICATIONS AND DOSE**Treatment of susceptible infections**

▶ BY MOUTH

- ▶ Child 6 weeks-5 months: 120 mg twice daily, alternatively 24 mg/kg twice daily
- ▶ Child 6 months-5 years: 240 mg twice daily, alternatively 24 mg/kg twice daily
- ▶ Child 6-11 years: 480 mg twice daily, alternatively 24 mg/kg twice daily
- ▶ Child 12-17 years: 960 mg twice daily
- ▶ Adult: 960 mg twice daily
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 960 mg every 12 hours, increased to 1.44 g every 12 hours, increased dose used in severe infection

Moderate diabetic foot infection | Severe diabetic foot infection

▶ BY MOUTH

- ▶ Adult: 960 mg twice daily
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 960 mg every 12 hours, increased if necessary to 1.44 g every 12 hours

Leg ulcer infection

▶ BY MOUTH

- ▶ Adult: 960 mg twice daily for 7 days
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 960 mg every 12 hours, increased to 1.44 g every 12 hours, increased dose used in severe infection

Hospital-acquired pneumonia

▶ BY MOUTH

- ▶ Adult: 960 mg twice daily for 5 days then review

Acute exacerbation of chronic obstructive pulmonary disease

▶ BY MOUTH

- ▶ Adult: 960 mg twice daily for 5 days
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 960 mg every 12 hours, increased if necessary to 1.44 g every 12 hours, increased dose used in severe infection

Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature)

► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Child: 120 mg/kg daily in 2–4 divided doses for 14–21 days, oral route preferred for children
- Adult: 120 mg/kg daily in 2–4 divided doses for 14–21 days

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections

► BY MOUTH

- Child: 450 mg/m² twice daily (max. per dose 960 mg twice daily) for 3 days of the week (either consecutively or on alternate days), dose regimens may vary, consult local guidelines
- Adult: 960 mg once daily, reduced if not tolerated to 480 mg once daily, alternatively 960 mg once daily on alternate days, alternate day dose to be given 3 times weekly, alternatively 960 mg twice a day on alternate days, alternate day dose to be given 3 times weekly

Acute prostatitis (initiated under specialist supervision)

► BY MOUTH

- Adult: 960 mg twice daily for 14 or 28 days based on clinical assessment

DOSE EQUIVALENCE AND CONVERSION

- 480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg.

- **UNLICENSED USE** Co-trimoxazole may be used as detailed below, although these situations are considered unlicensed:
 - treatment of *Burkholderia cepacia* infections in cystic fibrosis
 - treatment of *Stenotrophomonas maltophilia* infections
 - **[EVG]** treatment of hospital-acquired pneumonia
 - treatment of moderate diabetic foot infection
 - treatment of severe diabetic foot infection
 - treatment of leg ulcer infection **[A]**
- In children Not licensed for use in children under 6 weeks.

IMPORTANT SAFETY INFORMATION

RESTRICTIONS ON THE USE OF CO-TRIMOXAZOLE

Co-trimoxazole is the drug of choice in the prophylaxis and treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia; it is also indicated for nocardiasis, *Stenotrophomonas maltophilia* infection [unlicensed indication], and toxoplasmosis. It should only be considered for use in acute exacerbations of chronic bronchitis and infections of the urinary tract when there is bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in acute otitis media in children when there is good reason to prefer it. Co-trimoxazole is also used for the treatment of infections caused by *Burkholderia cepacia* in cystic fibrosis [unlicensed indication].

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120
- **CAUTIONS** Asthma · avoid in blood disorders (unless under specialist supervision) · avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus · elderly (increased risk of serious side-effects) · G6PD deficiency (risk of haemolytic anaemia) · maintain adequate fluid intake · predisposition to folate deficiency · predisposition to hyperkalaemia
- **INTERACTIONS** → Appendix 1: sulfonamides · trimethoprim
- **SIDE-EFFECTS**
- **Common or very common** Diarrhoea · electrolyte imbalance · fungal overgrowth · headache · nausea · skin reactions

► **Uncommon Vomiting**

- **Rare or very rare** Agranulocytosis · angioedema · aplastic anaemia · appetite decreased · arthralgia · ataxia · cough · depression · dizziness · dyspnoea · eosinophilia · fever · haemolysis · haemolytic anaemia · hallucination · hepatic disorders · hypoglycaemia · leucopenia · lung infiltration · megaloblastic anaemia · meningitis aseptic · metabolic acidosis · methaemoglobinaemia · myalgia · myocarditis allergic · nephritis tubulointerstitial · neutropenia · oral disorders · pancreatitis · peripheral neuritis · photosensitivity reaction · pseudomembranous enterocolitis · renal impairment · renal tubular acidosis · seizure · serum sickness · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · thrombocytopenia · tinnitus · uveitis · vasculitis · vertigo
- SIDE-EFFECTS, FURTHER INFORMATION** Co-trimoxazole is associated with rare but serious side effects. Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome or toxic epidermal necrolysis) develop.

- **PREGNANCY** Teratogenic risk in first trimester (trimethoprim a folate antagonist). Neonatal haemolysis and methaemoglobinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole).
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe liver disease.
- **RENAL IMPAIRMENT**
- In adults Avoid if eGFR less than 15 mL/minute/1.73 m² and if plasma-sulfamethoxazole concentration cannot be monitored.
- In children Avoid if estimated glomerular filtration rate less than 15 mL/minute/1.73 m² and if plasma-sulfamethoxazole concentration cannot be monitored.

Dose adjustments ► In adults Use half normal dose if eGFR 15–30 mL/minute/1.73 m².

► In children Use half normal dose if estimated glomerular filtration rate 15–30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
- Monitor blood counts on prolonged treatment.
- In children Plasma concentration monitoring may be required with high doses; seek expert advice.
- **DIRECTIONS FOR ADMINISTRATION**
- With intravenous use in children For intermittent *intravenous infusion*, may be further diluted in glucose 5% and 10% or sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and the required dose infused over max. 60 minutes; check container for haze or precipitant during administration. In severe fluid restriction may be given undiluted via a central venous line.
- With intravenous use in adults For *intravenous infusion* (*Septrin*[®] for infusion), give intermittently in Glucose 5% or 10% or Sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and infused over max. 60 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Co-trimoxazole is a mixture of trimethoprim and

sulfamethoxazole (sulphamethoxazole) in the proportions of 1 part to 5 parts.

For choice of antibacterial therapy, see Diabetic foot infections, antibacterial therapy p. 533, Pneumocystis pneumonia p. 637, Respiratory system infections, antibacterial therapy p. 538, Skin infections, antibacterial therapy p. 540, Urinary-tract infections p. 622.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Alcohol, propylene glycol, sulfites

ELECTROLYTES: May contain Sodium

Sulfadiazine

26-May-2020

(Sulphadiazine)

- **DRUG ACTION** Sulfadiazine is a short-acting sulphonamide with bacteriostatic activity against a broad spectrum of organisms. The importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

• INDICATIONS AND DOSE

Prevention of rheumatic fever recurrence

- BY MOUTH
- Adult (body-weight up to 30 kg): 500 mg daily
- Adult (body-weight 30 kg and above): 1 g daily

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Sulfadiazine has been confused with sulfasalazine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120
- **CAUTIONS** Asthma · avoid in blood disorders · elderly · G6PD deficiency (risk of haemolytic anaemia) · maintain adequate fluid intake · predisposition to folate deficiency
- **INTERACTIONS** → Appendix 1: sulfonamides
- **SIDE-EFFECTS**
 - Rare or very rare Haemolytic anaemia
 - Frequency not known Agranulocytosis · aplastic anaemia · appetite decreased · ataxia · back pain · blood disorders · cough · crystalluria · cyanosis · depression · diarrhoea · dizziness · drowsiness · dyspnoea · eosinophilia · erythema nodosum · fatigue · fever · haematuria · hallucination · headache · hepatic disorders · hypoglycaemia · hypoprothrombinaemia · hypothyroidism · idiopathic intracranial hypertension · insomnia · leucopenia ·

meningitis aseptic · myocarditis · nausea · nephritis tubulointerstitial · nephrotoxicity · nerve disorders · neurological effects · neutropenia · oral disorders · pancreatitis · photosensitivity reaction · pseudomembranous enterocolitis · psychosis · renal impairment · renal tubular necrosis · respiratory disorders · seizure · serum sickness-like reaction · severe cutaneous adverse reactions (SCARs) · skin reactions · systemic lupus erythematosus (SLE) · thrombocytopenia · tinnitus · vasculitis · vertigo · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrolysis) develop.

- **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment or jaundice.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment; high risk of crystalluria.
- **MONITORING REQUIREMENTS** Monitor blood counts on prolonged treatment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 9, 27

Sulfadiazine 500 mg Sulfadiazine 500mg tablets | 56 tablet [PoM] £275.84 DT = £242.18

ANTIBACTERIALS > TETRACYCLINES AND RELATED DRUGS

Tetracyclines

Overview

The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. They remain, however, the treatment of choice for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline p. 597 with either streptomycin p. 546 or rifampicin p. 615), and the spirochaete, *Borrelia burgdorferi* (See Lyme disease). They are also used in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, in exacerbations of chronic bronchitis (because of their activity against *Haemophilus influenzae*), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin p. 569).

Tetracyclines have a role in the management of methicillin-resistant *Staphylococcus aureus* (MRSA) infection.

Microbiologically, there is little to choose between the various tetracyclines, the only exception being minocycline p. 599 which has a broader spectrum; it is active against *Neisseria meningitidis* and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo. Compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

Tetracyclines

- **CAUTIONS** Myasthenia gravis (muscle weakness may be increased) · systemic lupus erythematosus (may be exacerbated)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Angioedema · diarrhoea · headache · Henoch-Schönlein purpura · hypersensitivity · nausea · pericarditis · photosensitivity reaction · skin reactions · systemic lupus erythematosus exacerbated · vomiting
 - ▶ **Rare or very rare** Appetite decreased · discolouration of thyroid gland · dysphagia · eosinophilia · fontanelle bulging (in infants) · gastrointestinal disorders · haemolytic anaemia · hepatic disorders · idiopathic intracranial hypertension · increased risk of infection · neutropenia · oral disorders · pancreatitis · pseudomembranous enterocolitis · Stevens-Johnson syndrome · thrombocytopenia
 - ▶ **Frequency not known** Dizziness · tooth discolouration
- **PREGNANCY** Should **not** be given to pregnant women; effects on skeletal development have been documented in the first trimester in *animal* studies. Administration during the second or third trimester may cause discolouration of the child's teeth, and maternal hepatotoxicity has been reported with large parental doses.
- **BREAST FEEDING** Should **not** be given to women who are breast-feeding (although absorption and therefore discolouration of teeth in the infant is probably usually prevented by chelation with calcium in milk).
- **HEPATIC IMPAIRMENT** In general, manufacturers advise caution.

above

Demeclocline hydrochloride

09-Apr-2020

● INDICATIONS AND DOSE

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

- ▶ BY MOUTH
 - ▶ Adult: 150 mg 4 times a day, alternatively 300 mg twice daily

Treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable

- ▶ BY MOUTH
 - ▶ Adult: Initially 0.9–1.2 g daily in divided doses, maintenance 600–900 mg daily

- **CAUTIONS** Photosensitivity more common than with other tetracyclines
- **INTERACTIONS** → Appendix 1: tetracyclines
- **SIDE-EFFECTS**
 - ▶ **Rare or very rare** Agranulocytosis · aplastic anaemia · hearing impairment · nephritis · severe cutaneous adverse reactions (SCARs)
 - ▶ **Frequency not known** Intracranial pressure increased · muscle weakness · nephrogenic diabetes insipidus · vision disorders
- **HEPATIC IMPAIRMENT**
 - Dose adjustments** Manufacturer advises maximum 1 g daily in divided doses.
- **RENAL IMPAIRMENT** May exacerbate renal failure and should **not** be given to patients with renal impairment.

- **PATIENT AND CARER ADVICE** Patients should be advised to avoid exposure to sunlight or sun lamps.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

Doxycycline

● INDICATIONS AND DOSE

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
 - ▶ Child 12–17 years: Initially 200 mg daily in 1–2 divided doses for 1 day, then maintenance 100 mg daily
 - ▶ Adult: Initially 200 mg daily in 1–2 divided doses for 1 day, then maintenance 100 mg daily

Severe infections (including refractory urinary-tract infections)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
 - ▶ Child 12–17 years: 200 mg daily
 - ▶ Adult: 200 mg daily

Acute sinusitis | Acute cough [if systemically very unwell or at higher risk of complications] | Community-acquired pneumonia

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
 - ▶ Child 12–17 years: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily for 5 days in total
 - ▶ Adult: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily for 5 days in total

Hospital-acquired pneumonia

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
 - ▶ Adult: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily for 5 days in total then review

Acute exacerbation of bronchiectasis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
 - ▶ Child 12–17 years: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily for 7–14 days in total
 - ▶ Adult: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily for 7–14 days in total

Acute exacerbation of chronic obstructive pulmonary disease

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
 - ▶ Adult: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily for 5 days in total, increased if necessary to 200 mg once daily, increased dose used in severe infections

Mild diabetic foot infection

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
 - ▶ Adult: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily for 7 days in total then review, increased if necessary to 200 mg once daily

Cellulitis | Erysipelas

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
 - ▶ Adult: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily for 5–7 days in total then review

continued →

Leg ulcer infection

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily for 7 days in total, increased if necessary to 200 mg once daily

Acne

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg once daily
- ▶ Adult: 100 mg once daily

Rosacea

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 100 mg once daily

Papulopustular facial rosacea (without ocular involvement)

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 40 mg once daily for 16 weeks, dose to be taken in the morning, consider discontinuing treatment if no response after 6 weeks

Early syphilis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg twice daily for 14 days
- ▶ Adult: 100 mg twice daily for 14 days

Late latent syphilis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg twice daily for 28 days
- ▶ Adult: 100 mg twice daily for 28 days

Neurosyphilis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 200 mg twice daily for 28 days

Uncomplicated genital chlamydia | Non-gonococcal urethritis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg twice daily for 7 days
- ▶ Adult: 100 mg twice daily for 7 days

Pelvic inflammatory disease

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg twice daily for 14 days
- ▶ Adult: 100 mg twice daily for 14 days

Lyme disease [erythema migrans and/or non-focal symptoms] | Lyme disease [affecting cranial nerves or peripheral nervous system] | Lyme carditis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 200 mg daily in 1-2 divided doses for 21 days

Lyme disease [affecting central nervous system]

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 400 mg daily in 1-2 divided doses for 21 days

Lyme arthritis | Acrodermatitis chronica atrophicans

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 200 mg daily in 1-2 divided doses for 28 days

Anthrax (treatment or post-exposure prophylaxis)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg twice daily
- ▶ Adult: 100 mg twice daily

Prophylaxis of malaria

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg once daily, to be started 1-2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years
- ▶ Adult: 100 mg once daily, to be started 1-2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years

Adjunct to quinine in treatment of *Plasmodium falciparum* malaria

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 200 mg daily for 7 days
- ▶ Adult: 200 mg daily for 7 days

Periodontitis (as an adjunct to gingival scaling and root planing)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 20 mg twice daily for 3 months
- ▶ Adult: 20 mg twice daily for 3 months

Rocky Mountain spotted fever

- ▶ BY MOUTH USING DISPERSIBLE TABLETS
- ▶ Adult: 100 mg twice daily, continue treatment for at least 3 days after fever subsides, minimum treatment duration is 5-7 days

- **UNLICENSED USE** Doxycycline may be used as detailed below, although these situations are considered outside the scope of its licence:
 - [Evgi](#) Duration of treatment for acute sinusitis;
 - Lyme disease [\(A\)](#);
 - treatment or post-exposure prophylaxis of anthrax;
 - malaria prophylaxis during pregnancy.
- ▶ In adults Immediate-release doxycycline may be used for the treatment of rosacea, but it is not licensed for this indication.
- **CAUTIONS** Alcohol dependence
- **INTERACTIONS** → Appendix 1: tetracyclines
- **SIDE-EFFECTS**
- ▶ **Common or very common** Dyspnoea · hypotension · peripheral oedema · tachycardia
- ▶ **Uncommon** Gastrointestinal discomfort
- ▶ **Rare or very rare** Antibiotic associated colitis · anxiety · arthralgia · flushing · intracranial pressure increased with papilloedema · Jarisch-Herxheimer reaction · myalgia · photoonycholysis · severe cutaneous adverse reactions (SCARs) · skin hyperpigmentation (long term use) · tinnitus · vision disorders
- **PREGNANCY** When travel to malarious areas is unavoidable during pregnancy, doxycycline can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks' gestation.
- **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).
- **MONITORING REQUIREMENTS** When used for periodontitis, monitor for superficial fungal infection, particularly if predisposition to oral candidiasis.
- **DIRECTIONS FOR ADMINISTRATION** Capsules and tablets should be swallowed whole with plenty of fluid, while sitting or standing. Capsules should be taken during meals.
- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Anthrax p. 609, Diabetic foot infections, antibacterial therapy p. 533, Genital system infections, antibacterial therapy p. 536, Lyme disease p. 611, Malaria, prophylaxis p. 643, Malaria, treatment p. 649, Nose infections, antibacterial therapy p. 536, Oropharyngeal infections, antibacterial therapy p. 1282, Respiratory system infections, antibacterial therapy p. 538, Skin infections, antibacterial therapy p. 540, Urinary-tract infections p. 622.
- **PATIENT AND CARER ADVICE** Counselling on administration advised. Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary
Doxycycline Capsules 100 mg may be prescribed.
Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets.
Tablets may be prescribed as Doxycycline Tablets 20 mg.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Child 12-17 years: 100 mg twice daily
- ▶ Adult: 100 mg twice daily

Acne

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Child 12-17 years: 100 mg once daily, alternatively 50 mg twice daily
- ▶ Adult: 100 mg once daily, alternatively 50 mg twice daily
- ▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- ▶ Child 12-17 years: 100 mg daily
- ▶ Adult: 100 mg daily

Prophylaxis of asymptomatic meningococcal carrier state (but no longer recommended)

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Adult: 100 mg twice daily for 5 days, minocycline treatment is usually followed by administration of rifampicin

- **CAUTIONS** Systemic lupus erythematosus

- **INTERACTIONS** → Appendix 1: tetracyclines

● **SIDE-EFFECTS**

- ▶ **Rare or very rare** Acute kidney injury · hearing impairment · respiratory disorders · tinnitus
- ▶ **Frequency not known** Alopecia · antibiotic associated colitis · arthralgia · ataxia · breast secretion · conjunctival discoloration · drug reaction with eosinophilia and systemic symptoms (DRESS) · dyspepsia · hyperbilirubinaemia · hyperhidrosis · polyarteritis nodosa · sensation abnormal · tear discoloration · tongue discoloration · vertigo

- **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).

- **MONITORING REQUIREMENTS** If treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus erythematosus—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens.

- **DIRECTIONS FOR ADMINISTRATION** Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing.

- **PATIENT AND CARER ADVICE** Counselling on administration advised (posture).

- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing (compared with other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome; it sometimes causes irreversible pigmentation).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tetracycline

17-Dec-2019

● **INDICATIONS AND DOSE****Susceptible infections (e.g. chlamydia, rickettsia, mycoplasma)**▶ **BY MOUTH**

- ▶ Child 12-17 years: 250 mg 4 times a day, increased if necessary to 500 mg 3–4 times a day, increased dose used in severe infections
- ▶ Adult: 250 mg 4 times a day, increased if necessary to 500 mg 3–4 times a day, increased dose used in severe infections

Rosacea▶ **BY MOUTH**

- ▶ Adult: 500 mg twice daily usually for 6–12 weeks (course may be repeated intermittently)

Acne▶ **BY MOUTH**

- ▶ Child 12-17 years: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer
- ▶ Adult: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer

Diabetic diarrhoea in autonomic neuropathy▶ **BY MOUTH**

- ▶ Adult: 250 mg for 2 or 3 doses

Non-gonococcal urethritis▶ **BY MOUTH**

- ▶ Child 12-17 years: 500 mg 4 times a day for 7–14 days (21 days if failure or relapse after first course)
- ▶ Adult: 500 mg 4 times a day for 7–14 days (21 days if failure or relapse after first course)

Helicobacter pylori eradication [in combination with other drugs (see Helicobacter pylori infection p. 89)]▶ **BY MOUTH**

- ▶ Adult: 500 mg 4 times a day for 7 days for first- and second-line eradication therapy; 10 days for third-line eradication therapy

- **UNLICENSED USE** Not licensed for treatment of diabetic diarrhoea in *autonomic neuropathy*. [EvGr] Tetracycline is used for the eradication of *Helicobacter pylori*,  but is not licensed for this indication.

- **INTERACTIONS** → Appendix 1: tetracyclines

● **SIDE-EFFECTS**

- ▶ **Rare or very rare** Agranulocytosis · aplastic anaemia · nephritis · renal impairment

- ▶ **Frequency not known** Gastrointestinal discomfort · toxic epidermal necrolysis

● **HEPATIC IMPAIRMENT**

Dose adjustments Manufacturer advises avoid in high doses.

- **RENAL IMPAIRMENT** May exacerbate renal failure and should **not** be given to patients with renal impairment.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of fluid while sitting or standing.

- **PATIENT AND CARER ADVICE** Counselling on administration advised.

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Tetracycline Tablets may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 7, 9, 23

▶ **Tetracycline (Non-proprietary)**

Tetracycline hydrochloride 250 mg Tetracycline 250mg tablets | 28 tablet [PoM] £6.75 DT = £4.15

Tigecycline

06-Apr-2020

● **DRUG ACTION** Tigecycline is a glycylcycline antibacterial structurally related to the tetracyclines. Tigecycline is active against Gram-positive and Gram-negative bacteria, including tetracycline-resistant organisms, and some anaerobes. It is also active against meticillin-resistant *Staphylococcus aureus* and vancomycin-resistant enterococci, but *Pseudomonas aeruginosa* and many strains of *Proteus spp* are resistant to tigecycline.

● INDICATIONS AND DOSE

Complicated skin and soft tissue infections (when other antibiotics are not suitable) | Complicated intra-abdominal infections (when other antibiotics are not suitable)

▶ BY INTRAVENOUS INFUSION

▶ Adult: Initially 100 mg, followed by 50 mg every 12 hours for 5–14 days

- **CONTRA-INDICATIONS** Diabetic foot infections
- **CAUTIONS** Cholestasis
- **INTERACTIONS** → Appendix 1: tigecycline
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abscess · appetite decreased · diarrhoea · dizziness · gastrointestinal discomfort · headache · healing impaired · hyperbilirubinaemia · hypoglycaemia · hypoproteinaemia · increased risk of infection · nausea · sepsis · skin reactions · vomiting
 - ▶ **Uncommon** Hepatic disorders · pancreatitis · thrombocytopenia · thrombophlebitis
 - ▶ **Frequency not known** Acidosis · azotaemia · hyperphosphataemia · hypofibrinogenaemia · idiopathic intracranial hypertension · photosensitivity reaction · pseudomembranous enterocolitis · severe cutaneous adverse reactions (SCARs) · tooth discolouration
- SIDE-EFFECTS, FURTHER INFORMATION** Side-effects similar to those of the tetracyclines can potentially occur.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to tetracyclines.
- **PREGNANCY** Tetracyclines should **not** be given to pregnant women; effects on skeletal development have been documented in the first trimester in *animal* studies. Administration during the second or third trimester may cause discoloration of the child's teeth, and maternal hepatotoxicity has been reported with large parenteral doses.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.

Dose adjustments Manufacturer advises dose reduction to 25 mg every 12 hours following the loading dose in severe impairment.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Tygacil®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute each vial with 5.3 mL infusion fluid to produce a 10 mg/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 30–60 minutes.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Tigecycline (Non-proprietary)**

Tigecycline 50 mg Tigecycline 50mg powder for solution for infusion vials | 10 vial [POM] £290.79 (Hospital only)

▶ **Tygacil** (Pfizer Ltd)

Tigecycline 50 mg Tygacil 50mg powder for solution for infusion vials | 10 vial [POM] £323.10 (Hospital only)

ANTIBACTERIALS > OTHER

Chloramphenicol

13-May-2020

● **DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

● INDICATIONS AND DOSE

Life threatening infections particularly those caused by Haemophilus influenzae | Typhoid fever

▶ BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Adult: 12.5 mg/kg every 6 hours, in exceptional cases dose can be doubled for severe infections such as septicaemia and meningitis, providing high doses reduced as soon as clinically indicated

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120
- **CAUTIONS** Avoid repeated courses and prolonged treatment
- **INTERACTIONS** → Appendix 1: chloramphenicol
- **SIDE-EFFECTS**
 - ▶ **Rare or very rare**
 - ▶ With parenteral use Aplastic anaemia (reversible or irreversible, with reports of resulting leukaemia)
 - ▶ **Frequency not known**
 - ▶ With oral use Bone marrow disorders · circulatory collapse · diarrhoea · enterocolitis · nausea · optic neuritis · oral disorders · ototoxicity · vomiting
 - ▶ With parenteral use Agranulocytosis · bone marrow disorders · depression · diarrhoea · dry mouth · fungal superinfection · headache · nausea · nerve disorders · thrombocytopenic purpura · urticaria · vision disorders · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION** Associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections.
- **PREGNANCY** Manufacturer advises avoid; neonatal 'grey-baby syndrome' if used in third trimester.
- **BREAST FEEDING** Manufacturer advises avoid; use another antibiotic; may cause bone-marrow toxicity in infant; concentration in milk usually insufficient to cause 'grey syndrome'.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of bone-marrow depression)—monitor plasma-chloramphenicol concentration.

Dose adjustments Manufacturer advises consider dose reduction.

Monitoring Monitor plasma-chloramphenicol concentration in hepatic impairment.
- **RENAL IMPAIRMENT** Avoid in severe renal impairment unless no alternative; dose-related depression of haematopoiesis.
- **MONITORING REQUIREMENTS**
 - ▶ Plasma concentration monitoring preferred in the elderly.
 - ▶ Recommended peak plasma concentration (approx. 2 hours after administration by mouth, intravenous injection or infusion) 10–25 mg/litre; pre-dose ('trough') concentration should not exceed 15 mg/litre.
 - ▶ Blood counts required before and periodically during treatment.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For *intravenous infusion*, give intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Chloramphenicol 250 mg Chloramphenicol 250mg capsules | 60 capsule [POM] £377.00 DT = £377.00

Daptomycin

21-Feb-2019

- **DRUG ACTION** Daptomycin is a lipopeptide antibacterial with a spectrum of activity similar to vancomycin but its efficacy against enterococci has not been established. It needs to be given with other antibacterials for mixed infections involving Gram-negative bacteria and some anaerobes.

• INDICATIONS AND DOSE

Complicated skin and soft-tissue infections caused by Gram-positive bacteria

▶ BY INTRAVENOUS INFUSION

- ▶ Child 12-23 months: 10 mg/kg once daily for up to 14 days, alternatively 12 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteraemia—duration of treatment in accordance with risk of complications in individual patients
- ▶ Child 2-6 years: 9 mg/kg once daily for up to 14 days, alternatively 12 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteraemia—duration of treatment in accordance with risk of complications in individual patients
- ▶ Child 7-11 years: 7 mg/kg once daily for up to 14 days, alternatively 9 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteraemia—duration of treatment in accordance with risk of complications in individual patients
- ▶ Child 12-17 years: 5 mg/kg once daily for up to 14 days, alternatively 7 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteraemia—duration of treatment in accordance with risk of complications in individual patients

Complicated skin and soft-tissue infections caused by Gram-positive bacteria

▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 4 mg/kg once daily for 7-14 days or longer if necessary, alternatively 6 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteraemia—duration of treatment may need to be longer than 14 days in accordance with risk of complications in individual patients

Right-sided infective endocarditis caused by *Staphylococcus aureus* (administered on expert advice)

▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 6 mg/kg once daily, duration of treatment in accordance with official recommendations

- **CAUTIONS** Obesity (limited information on safety and efficacy)
- **INTERACTIONS** → Appendix 1: daptomycin
- **SIDE-EFFECTS**
 - ▶ Common or very common Anaemia · anxiety · asthenia · constipation · diarrhoea · dizziness · fever · flatulence · gastrointestinal discomfort · headache · hypertension · hypotension · increased risk of infection · insomnia · nausea · pain · skin reactions · vomiting

- ▶ **Uncommon** Appetite decreased · arrhythmias · arthralgia · electrolyte imbalance · eosinophilia · flushing · glossitis · hyperglycaemia · muscle weakness · myalgia · myopathy · paraesthesia · renal impairment · taste altered · thrombocytosis · tremor · vertigo
- ▶ **Rare or very rare** Jaundice
- ▶ **Frequency not known** Acute generalised exanthematous pustulosis (AGEP) · antibiotic associated colitis · chills · cough · infusion related reaction · peripheral neuropathy · respiratory disorders · syncope

SIDE-EFFECTS, FURTHER INFORMATION If unexplained muscle pain, tenderness, weakness, or cramps develop during treatment, measure creatine kinase every 2 days; discontinue if unexplained muscular symptoms and creatine elevated markedly.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
 - **BREAST FEEDING** Present in milk in small amounts, but absorption from gastrointestinal tract negligible.
 - **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
 - **RENAL IMPAIRMENT**
 - ▶ In children Manufacturer advises the dosage regimen has not been established—use with caution and monitor renal function regularly.
 - ▶ In adults Manufacturer advises use only when potential benefit outweighs risk—higher risk of developing myopathy; monitor renal function regularly.
- Dose adjustments** ▶ In adults Use normal dose every 48 hours if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor plasma creatine phosphokinase (CPK) before treatment and then at least weekly during treatment; monitor CPK more frequently in patients at higher risk of developing myopathy, including those with renal impairment, taking other drugs associated with myopathy, or if CPK elevated more than 5 times upper limit of normal before treatment.
 - ▶ Manufacturer advises monitor renal function regularly during concomitant administration of potentially nephrotoxic drugs.
 - **EFFECT ON LABORATORY TESTS** Interference with assay for prothrombin time and INR—take blood sample immediately before daptomycin dose.
 - **DIRECTIONS FOR ADMINISTRATION**
 - ▶ In children For intravenous infusion, manufacturer advises give intermittently in Sodium Chloride 0.9%; reconstitute with Sodium Chloride 0.9% (350 mg in 7 mL, 500 mg in 10 mL); gently rotate vial without shaking; allow to stand for at least 10 minutes then rotate gently to dissolve; dilute requisite dose in 50 mL infusion fluid and give over 60 minutes for children aged 1-6 years and over 30 minutes for children aged 7-17 years.
 - ▶ In adults For intravenous infusion, manufacturer advises give intermittently in Sodium Chloride 0.9%; reconstitute with Sodium Chloride 0.9% (350 mg in 7 mL, 500 mg in 10 mL); gently rotate vial without shaking; allow to stand for at least 10 minutes then rotate gently to dissolve; dilute requisite dose in 50 mL infusion fluid and give over 30 minutes. For intravenous injection, give over 2 minutes.
 - **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2-8 °C)—consult product literature for further information regarding storage after reconstitution and dilution.
 - **NATIONAL FUNDING/ACCESS DECISIONS**
 - **Scottish Medicines Consortium (SMC) decisions** SMC No. 248/06
 - ▶ In adults The *Scottish Medicines Consortium* has advised (April 2006) that daptomycin (*Cubicin*[®]) is accepted for restricted use within NHS Scotland for treatment of

complicated skin and soft tissue infections in patients with known or suspected methicillin resistant *Staphylococcus aureus* infection and on the advice of local microbiologists or specialists in infectious disease.

SMC No. 449/08

- ▶ In adults The *Scottish Medicines Consortium* has advised (March 2008) that daptomycin (*Cubicin*®) is accepted for restricted use within NHS Scotland for the treatment of *Staphylococcus aureus* bacteraemia associated with right-sided endocarditis or with complicated skin and soft-tissue infections in patients with known or suspected methicillin resistant infection and on the advice of local microbiologists or specialists in infectious disease.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Daptomycin (Non-proprietary)**

Daptomycin 350 mg Daptomycin 350mg powder for solution for infusion vials | 1 vial PoM £60.00-£62.00 (Hospital only)

Daptomycin 500 mg Daptomycin 500mg powder for solution for infusion vials | 1 vial PoM £88.00-£88.57 (Hospital only)

▶ **Cubicin (Merck Sharp & Dohme Ltd)**

Daptomycin 350 mg Cubicin 350mg powder for concentrate for solution for infusion vials | 1 vial PoM £62.00 (Hospital only)

Daptomycin 500 mg Cubicin 500mg powder for concentrate for solution for infusion vials | 1 vial PoM £88.57 (Hospital only)

Fidaxomicin

11-May-2020

- **DRUG ACTION** Fidaxomicin is a macrocyclic antibacterial that is poorly absorbed from the gastro-intestinal tract, and, therefore, it should not be used to treat systemic infections.

● **INDICATIONS AND DOSE**

***Clostridioides difficile* infection**

▶ BY MOUTH

- ▶ **Adult:** 200 mg every 12 hours for 10 days, limited clinical data is available on the use of fidaxomicin in severe or life-threatening *Clostridioides difficile* infection

- **CAUTIONS** Severe or life-threatening *C. difficile* infection

- **INTERACTIONS** → Appendix 1: fidaxomicin

● **SIDE-EFFECTS**

- ▶ **Common or very common** Constipation · nausea · vomiting

- ▶ **Uncommon** Abdominal distension · appetite decreased · dizziness · dry mouth · flatulence · headache · skin reactions · taste altered

- ▶ **Frequency not known** Angioedema · dyspnoea · hypersensitivity

- **ALLERGY AND CROSS-SENSITIVITY** Use with caution in macrolide hypersensitivity.

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—limited information available.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 791/12

The *Scottish Medicines Consortium* has advised (July 2012) that fidaxomicin (*Difclir*®) is accepted for restricted use within NHS Scotland to treat the first recurrence of *C. difficile* infection, on the advice of a microbiologist or specialist in infectious diseases.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9

▶ **Difclir** (Astellas Pharma Ltd)

Fidaxomicin 200 mg Difclir 200mg tablets | 20 tablet PoM

£1,350.00 DT = £1,350.00

Fosfomycin

11-May-2020

- **DRUG ACTION** Fosfomycin, a phosphonic acid antibacterial, is active against a range of Gram-positive and Gram-negative bacteria including *Staphylococcus aureus* and Enterobacteriaceae.

● **INDICATIONS AND DOSE**

Acute uncomplicated lower urinary-tract infections

▶ BY MOUTH USING GRANULES

- ▶ **Adult:** 3 g for 1 dose

Prophylaxis of urinary-tract infections in transurethral surgical procedures

▶ BY MOUTH USING GRANULES

- ▶ **Adult:** 3 g, to be given 3 hours before surgery. Dose may be repeated once, 24 hours after surgery

Osteomyelitis when first-line treatments are inappropriate or ineffective | Hospital-acquired lower respiratory-tract infections when first-line treatments are inappropriate or ineffective

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** 12–24 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

Complicated urinary-tract infections when first-line treatment ineffective or inappropriate

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** 12–16 g daily in 2–3 divided doses (max. per dose 8 g)

Bacterial meningitis when first-line treatment ineffective or inappropriate

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** 16–24 g daily in 3–4 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

● **CAUTIONS**

- ▶ With intravenous use Cardiac insufficiency · elderly (high doses) · hyperaldosteronism · hypernatraemia · hypertension · pulmonary oedema

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · diarrhoea · headache · nausea · vomiting

- ▶ **Uncommon** Skin reactions

- ▶ **Frequency not known** Antibiotic associated colitis

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**

- ▶ With oral use Dizziness · vulvovaginal infection

- ▶ **Uncommon**

- ▶ With parenteral use Appetite decreased · dyspnoea · electrolyte imbalance · fatigue · oedema · taste altered · vertigo

- ▶ **Rare or very rare**

- ▶ With parenteral use Bone marrow disorders · eosinophilia · hepatic disorders · visual impairment

- ▶ **Frequency not known**

- ▶ With parenteral use Agranulocytosis · asthmatic attack · confusion · leucopenia · neutropenia · tachycardia · thrombocytopenia

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk.
- **RENAL IMPAIRMENT**
 - ▶ With oral use Avoid oral treatment if eGFR less than 10 mL/minute/1.73 m².
 - ▶ With intravenous use Use intravenous treatment with caution if eGFR 40–80 mL/minute/1.73 m² and consult product literature for dose if eGFR less than 40 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - ▶ With intravenous use Monitor electrolytes and fluid balance.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For intravenous infusion (*Fomicyt*®), give intermittently in Glucose 5% or 10% or Water for Injections; reconstitute each 2-g vial with 50 mL infusion fluid; give 2 g over 15 minutes.
 - ▶ With oral use Manufacturer advises granules should be taken on an empty stomach (about 2–3 hours before or after a meal), preferably before bedtime and after emptying the bladder. The granules should be dissolved into a glass of water and taken immediately.
- **PRESCRIBING AND DISPENSING INFORMATION** Doses expressed as fosfomycin base.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 1033/15

The *Scottish Medicines Consortium* has advised (March 2015) that fosfomycin (*Fomicyt*®) is accepted for restricted use within NHS Scotland; initiation should be restricted to microbiologists or infectious disease specialists.

SMC No. 1163/16

The *Scottish Medicines Consortium* has advised (September 2016) that fosfomycin trometamol (*Monuril*®) is accepted for use within NHS Scotland for the treatment of acute lower uncomplicated urinary tract infections, caused by pathogens sensitive to fosfomycin in adult and adolescent females and for prophylaxis in diagnostic and surgical transurethral procedures.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ *Fomicyt* (Kent Pharmaceuticals Ltd)

Fosfomycin (as Fosfomycin sodium) 2 gram *Fomicyt* 2g powder for solution for infusion vials | 10 vial [PoM] £150.00

Fosfomycin (as Fosfomycin sodium) 4 gram *Fomicyt* 4g powder for solution for infusion vials | 10 vial [PoM] £300.00

Granules

CAUTIONARY AND ADVISORY LABELS 9, 13, 23

EXCIPIENTS: May contain Sucrose

- ▶ *Fosfomycin (Non-proprietary)*

Fosfomycin (as Fosfomycin trometamol) 3 gram Fosfomycin 3g granules sachets | 1 sachet [PoM] £75.45 DT = £4.86

- ▶ *Monuril* (Profile Pharma Ltd)

Fosfomycin (as Fosfomycin trometamol) 3 gram *Monuril* 3g granules sachets | 1 sachet [PoM] £4.86 DT = £4.86

Fusidic acid

30-Apr-2020

- **DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

- **INDICATIONS AND DOSE**

Staphylococcal skin infection

- ▶ TO THE SKIN

▶ Child: Apply 3–4 times a day usually for 7 days

▶ Adult: Apply 3–4 times a day

- ▶ BY MOUTH USING TABLETS

▶ Child 12–17 years: 250 mg every 12 hours for 5–10 days, dose expressed as sodium fusidate

▶ Adult: 250 mg every 12 hours for 5–10 days, dose expressed as sodium fusidate

Non-bullous impetigo [in patients who are not systemically unwell or at high risk of complications]

- ▶ TO THE SKIN

▶ Child: Apply 3 times a day for 5–7 days

▶ Adult: Apply 3 times a day for 5–7 days

Penicillin-resistant staphylococcal infection including osteomyelitis | Staphylococcal endocarditis in combination with other antibacterials

- ▶ BY MOUTH USING ORAL SUSPENSION

▶ Child 1–11 months: 15 mg/kg 3 times a day

▶ Child 1–4 years: 250 mg 3 times a day

▶ Child 5–11 years: 500 mg 3 times a day

▶ Child 12–17 years: 750 mg 3 times a day

▶ Adult: 750 mg 3 times a day

- ▶ BY MOUTH USING TABLETS

▶ Child 12–17 years: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections, dose expressed as sodium fusidate

▶ Adult: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections, dose expressed as sodium fusidate

Staphylococcal infections due to susceptible organisms

- ▶ BY INTRAVENOUS INFUSION

▶ Child (body-weight up to 50 kg): 6–7 mg/kg 3 times a day, dose expressed as sodium fusidate

▶ Child (body-weight 50 kg and above): 500 mg 3 times a day, dose expressed as sodium fusidate

▶ Adult (body-weight up to 50 kg): 6–7 mg/kg 3 times a day, dose expressed as sodium fusidate

▶ Adult (body-weight 50 kg and above): 500 mg 3 times a day, dose expressed as sodium fusidate

DOSE EQUIVALENCE AND CONVERSION

- ▶ With oral use

▶ Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets.

- **CAUTIONS**

▶ With systemic use Impaired transport and metabolism of bilirubin

▶ With topical use Avoid contact of cream or ointment with eyes

CAUTIONS, FURTHER INFORMATION

▶ Avoiding resistance

▶ With topical use To avoid the development of resistance, fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital.

● **INTERACTIONS** → Appendix 1: fusidate

- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

▶ **Uncommon** Skin reactions

SPECIFIC SIDE-EFFECTS

▶ **Common or very common**

▶ With intravenous use Dizziness · drowsiness · hepatic disorders · hyperbilirubinaemia · thrombophlebitis · vascular pain (reduced if given via central vein)

▶ With oral use Diarrhoea · dizziness · drowsiness · gastrointestinal discomfort · nausea · vomiting

▶ **Uncommon**

▶ With intravenous use Appetite decreased · asthenia · headache · malaise

▶ With oral use Appetite decreased · asthenia · headache · malaise · rash pustular

▶ **Rare or very rare**

▶ With topical use Angioedema · conjunctivitis

► **Frequency not known**

- With intravenous use Agranulocytosis · anaemia · leucopenia · neutropenia · pancytopenia · renal failure · rhabdomyolysis · thrombocytopenia
- With oral use Agranulocytosis · anaemia · hepatic disorders · hyperbilirubinaemia · leucopenia · neutropenia · pancytopenia · renal failure · rhabdomyolysis · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION Elevated liver enzymes, hyperbilirubinaemia and jaundice can occur with systemic use—these effects are usually reversible following withdrawal of therapy.

● **PREGNANCY**

- With systemic use Not known to be harmful; manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING**

- With systemic use Present in milk—manufacturer advises caution.

● **HEPATIC IMPAIRMENT**

- With systemic use Manufacturer advises caution.

● **MONITORING REQUIREMENTS**

- With systemic use Manufacturer advises monitor liver function with high doses or on prolonged therapy; monitoring also advised for patients with biliary tract obstruction, those taking potentially hepatotoxic medication, or those taking concurrent medication with a similar excretion pathway.

● **DIRECTIONS FOR ADMINISTRATION**

- With intravenous use Manufacturer advises for *intravenous infusion*, give intermittently in Sodium chloride 0.9% or Glucose 5%; reconstitute each vial with 10 mL buffer solution, then add contents of vial to 500 mL infusion fluid to give a solution containing approximately 1 mg/mL. Give requisite dose via a central line over 2 hours (give over at least 6 hours if administered via a large peripheral vein).

- PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Cardiovascular system infections, antibacterial therapy p. 532, Musculoskeletal system infections, antibacterial therapy p. 536, Skin infections, antibacterial therapy p. 540.

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

- With topical use May be prescribed as Sodium Fusidate ointment.

- MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9

- **Fucidin** (LEO Pharma)

Sodium fusidate 250 mg Fucidin 250mg tablets | 10 tablet [PoM]
£6.02 DT = £6.02 | 100 tablet [PoM] £54.99

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9

- **Fucidin** (LEO Pharma)

Fusidic acid 50 mg per 1 ml Fucidin 250mg/5ml oral suspension | 90 ml [PoM] £12.11

Cream

EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol)

- **Fusidic acid (Non-proprietary)**

Fusidic acid 20 mg per 1 gram Fusidic acid 2% cream | 15 gram [PoM] £3.00 DT = £2.64 | 30 gram [PoM] £5.28 DT = £5.28

- **Fucidin** (LEO Pharma)

Fusidic acid 20 mg per 1 gram Fucidin 20mg/g cream | 15 gram [PoM] £1.92 DT = £2.64 | 30 gram [PoM] £3.59 DT = £5.28

Ointment

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), woolfat and related substances (including lanolin)

- **Fucidin** (LEO Pharma)

Sodium fusidate 20 mg per 1 gram Fucidin 20mg/g ointment | 15 gram [PoM] £2.68 DT = £2.68 | 30 gram [PoM] £4.55 DT = £4.55

Powder and solvent for solution for infusion

ELECTROLYTES: May contain Sodium

- **Fusidic acid (Non-proprietary)**

Sodium fusidate 500 mg Sodium fusidate 500mg powder and solvent for solution for infusion vials | 1 vial [PoM] £20.50–£20.90 DT = £20.70

Linezolid

18-May-2020

- **DRUG ACTION** Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including methicillin-resistant *Staphylococcus aureus* (MRSA), and glycopeptide-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is **not** active against common Gram-negative organisms; it must be given in combination with other antibacterials for mixed infections that also involve Gram-negative organisms.

● **INDICATIONS AND DOSE**

Pneumonia (when other antibacterials e.g. a glycopeptide, such as vancomycin, cannot be used) (initiated under specialist supervision) | Complicated skin and soft-tissue infections caused by Gram-positive bacteria, when other antibacterials cannot be used (initiated under specialist supervision)

- BY MOUTH

Adult: 600 mg every 12 hours usually for 10–14 days (maximum duration of treatment 28 days)

- BY INTRAVENOUS INFUSION

Adult: 600 mg every 12 hours

Cellulitis (specialist use only) | Erysipelas (specialist use only)

- BY MOUTH, OR BY INTRAVENOUS INFUSION

Adult: 600 mg every 12 hours

Moderate diabetic foot infection (specialist use only) | Severe diabetic foot infection (specialist use only) | Leg ulcer infection (specialist use only)

- BY MOUTH, OR BY INTRAVENOUS INFUSION

Adult: 600 mg every 12 hours

IMPORTANT SAFETY INFORMATION

CHM ADVICE (OPTIC NEUROPATHY)

Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
- visual function should be monitored regularly if treatment is required for longer than 28 days.

BLOOD DISORDERS

Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:

- receive treatment for more than 10–14 days;
- have pre-existing myelosuppression;
- are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
- have severe renal impairment.

If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

- **CAUTIONS** Acute confusional states · bipolar depression · carcinoid tumour · elderly (increased risk of blood disorders) · history of seizures · phaeochromocytoma · schizophrenia · thyrotoxicosis · uncontrolled hypertension

CAUTIONS, FURTHER INFORMATION

- ▶ Close observation Unless close observation and blood pressure monitoring possible, linezolid should be avoided in uncontrolled hypertension, phaeochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states.

- **INTERACTIONS** → Appendix 1: linezolid

● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · constipation · diarrhoea · dizziness · gastrointestinal discomfort · headache · hypertension · increased risk of infection · insomnia · localised pain · nausea · skin reactions · taste altered · vomiting
- ▶ **Uncommon** Arrhythmia · chills · dry mouth · eosinophilia · fatigue · gastritis · hyperhidrosis · hyponatraemia · leucopenia · neutropenia · oral disorders · pancreatitis · polyuria · renal failure · seizure · sensation abnormal · thirst · thrombocytopenia · thrombophlebitis · tinnitus · tongue discoloration · transient ischaemic attack · vision disorders · vulvovaginal disorder
- ▶ **Rare or very rare** Antibiotic associated colitis · bone marrow disorders · tooth discoloration
- ▶ **Frequency not known** Alopecia · angioedema · lactic acidosis · nerve disorders · serotonin syndrome · severe cutaneous adverse reactions (SCARs)

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).

- **RENAL IMPAIRMENT** Manufacturer advises metabolites may accumulate if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor full blood count (including platelet count) weekly.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use Infusion to be administered over 30–120 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Diabetic foot infections, antibacterial therapy p. 533, Respiratory system infections, antibacterial therapy p. 538, Skin infections, antibacterial therapy p. 540.

- **PATIENT AND CARER ADVICE** Patients should be advised to read the patient information leaflet given with linezolid.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Infusion

EXCIPIENTS: May contain Glucose

ELECTROLYTES: May contain Sodium

▶ Linezolid (Non-proprietary)

Linezolid 2 mg per 1 ml Linezolid 600mg/300ml infusion bags | 10 bag [PoM] £445.00–£541.00 (Hospital only)

▶ Zyvox (Pfizer Ltd)

Linezolid 2 mg per 1 ml Zyvox 600mg/300ml infusion bags | 10 bag [PoM] £445.00

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9, 10

EXCIPIENTS: May contain Aspartame

▶ Zyvox (Pfizer Ltd)

Linezolid 20 mg per 1 ml Zyvox 100mg/5ml granules for oral suspension | 150 ml [PoM] £222.50 DT = £222.50

Tablet

CAUTIONARY AND ADVISORY LABELS 9, 10

▶ Linezolid (Non-proprietary)

Linezolid 600 mg Linezolid 600mg tablets | 10 tablet [PoM] £239.16 DT = £327.24 (Hospital only) | 10 tablet [PoM] £82.12–£445.00 DT = £327.24

▶ Zyvox (Pfizer Ltd)

Linezolid 600 mg Zyvox 600mg tablets | 10 tablet [PoM] £445.00 DT = £327.24

Tedizolid

04-May-2020

- **DRUG ACTION** Tedizolid is an oxazolidinone antibacterial, which inhibits bacterial protein synthesis.

● INDICATIONS AND DOSE

Treatment of acute bacterial skin and skin structure infections

- ▶ BY INTRAVENOUS INFUSION, OR BY MOUTH
- ▶ **Adult:** 200 mg once daily for 6 days, patients should be switched from the intravenous to the oral route when clinically appropriate

- **CAUTIONS** Neutropenia—limited clinical experience · patients aged 75 years and over—limited clinical experience

- **INTERACTIONS** → Appendix 1: tedizolid

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · dizziness · fatigue · headache · nausea · skin reactions · vomiting
- ▶ **Uncommon** Abscess · alopecia · antibiotic associated colitis · anxiety · arthralgia · bradycardia · chills · constipation · cough · dehydration · diabetic control impaired · drowsiness · dry mouth · fever · gastrointestinal discomfort · gastrointestinal disorders · haematochezia · hyperhidrosis · hyperkalaemia · increased risk of infection · irritability · limb discomfort · lymphadenopathy · muscle spasms · nasal dryness · pain · peripheral oedema · pulmonary congestion · sensation abnormal · sleep disorders · taste altered · tremor · urine odour abnormal · vasodilation · vision blurred · vitreous floater · vulvovaginal pruritus

SPECIFIC SIDE-EFFECTS

▶ Uncommon

- ▶ With intravenous use Infusion related reaction

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception in women of childbearing potential; an additional method of contraception is advised in women taking hormonal contraceptives—effectiveness may be reduced.

- **PREGNANCY** Manufacturer advises avoid—fetal developmental toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Sivextro[®]) give intermittently in Sodium Chloride 0.9%; reconstitute each 200 mg vial with 4 mL Water for Injections, then dilute reconstituted solution in 250 mL sodium chloride 0.9%; give over approx. 1 hour.

● PATIENT AND CARER ADVICE

Optic neuropathy Although neuropathy (peripheral and optic) has not been reported in patients treated with tedizolid, manufacturer advises patients and carers are warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately; patients should be evaluated promptly, and referred to an ophthalmologist if necessary.

Missed doses Manufacturer advises that if a dose is more than 16 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Patients and carers should be counselled on the effects on driving and skilled tasks—increased risk of dizziness and fatigue.

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 1080/15

The *Scottish Medicines Consortium* has advised (August 2015) that tedizolid (*Sivextro*[®]) is accepted for restricted use within NHS Scotland as an alternative oxazolidinone antibacterial for the treatment of acute bacterial skin and skin structure infections caused by Gram-positive *Staphylococcus aureus* (specifically methicillin-resistant *Staphylococcus aureus*[MRSA] isolates), on the specific advice of local microbiologists or specialists in infectious disease.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ *Sivextro* (Merck Sharp & Dohme Ltd)
Tedizolid phosphate 200 mg Sivextro 200mg powder for concentrate for solution for infusion vials | 6 vial [PoM] £862.00

Tablet

- ▶ *Sivextro* (Merck Sharp & Dohme Ltd)
Tedizolid phosphate 200 mg Sivextro 200mg tablets | 6 tablet [PoM] £862.00

Trimethoprim

26-May-2020

● **INDICATIONS AND DOSE**

Respiratory-tract infections

- ▶ BY MOUTH
- ▶ Child 4-5 weeks: 4 mg/kg twice daily (max. per dose 200 mg)
- ▶ Child 6 weeks-5 months: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 25 mg twice daily
- ▶ Child 6 months-5 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 50 mg twice daily
- ▶ Child 6-11 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 100 mg twice daily
- ▶ Child 12-17 years: 200 mg twice daily
- ▶ Adult: 200 mg twice daily

Prophylaxis of recurrent urinary-tract infection

- ▶ BY MOUTH
- ▶ Child 4-5 weeks: 2 mg/kg once daily, dose to be taken at night
- ▶ Child 6 weeks-5 months: 2 mg/kg once daily, alternatively 12.5 mg once daily, dose to be taken at night
- ▶ Child 6 months-5 years: 2 mg/kg once daily (max. per dose 100 mg), alternatively 25 mg once daily, dose to be taken at night
- ▶ Child 6-11 years: 2 mg/kg once daily (max. per dose 100 mg), alternatively 50 mg once daily, dose to be taken at night
- ▶ Child 12-15 years: 100 mg once daily, dose to be taken at night
- ▶ Child 16-17 years: 100 mg once daily, dose to be taken at night, alternatively 200 mg for 1 dose, following exposure to a trigger
- ▶ Adult: 100 mg once daily, dose to be taken at night, alternatively 200 mg for 1 dose, following exposure to a trigger

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients who cannot tolerate co-trimoxazole (in combination with dapsone)

- ▶ BY MOUTH
- ▶ Child: 5 mg/kg every 6-8 hours
- ▶ Adult: 5 mg/kg every 6-8 hours

Acne resistant to other antibacterials

- ▶ BY MOUTH
- ▶ Adult: 300 mg twice daily

Shigellosis | Invasive salmonella infection

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

Acute diverticulitis (in combination with metronidazole)

- ▶ BY MOUTH
- ▶ Adult: 200 mg twice daily for 5 days then review

Acute prostatitis

- ▶ BY MOUTH
- ▶ Adult: 200 mg twice daily for 14 or 28 days based on clinical assessment

Acute pyelonephritis

- ▶ BY MOUTH
- ▶ Child 16-17 years: 200 mg twice daily for 14 days
- ▶ Adult: 200 mg twice daily for 14 days

Urinary-tract infection (catheter-associated)

- ▶ BY MOUTH
- ▶ Child 3-5 months: 4 mg/kg twice daily (max. per dose 200 mg) for 7-10 days, alternatively 25 mg twice daily for 7-10 days
- ▶ Child 6 months-5 years: 4 mg/kg twice daily (max. per dose 200 mg) for 7-10 days, alternatively 50 mg twice daily for 7-10 days
- ▶ Child 6-11 years: 4 mg/kg twice daily (max. per dose 200 mg) for 7-10 days, alternatively 100 mg twice daily for 7-10 days
- ▶ Child 12-15 years: 200 mg twice daily for 7-10 days
- ▶ Child 16-17 years: 200 mg twice daily for 7 days (14 days if upper urinary-tract symptoms are present)
- ▶ Adult: 200 mg twice daily for 7 days (14 days if upper urinary-tract symptoms are present)

Lower urinary-tract infection

- ▶ BY MOUTH
- ▶ Child 4-5 weeks: 4 mg/kg twice daily (max. per dose 200 mg)
- ▶ Child 6 weeks-2 months: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 25 mg twice daily
- ▶ Child 3-5 months: 4 mg/kg twice daily (max. per dose 200 mg) for 3 days, alternatively 25 mg twice daily for 3 days
- ▶ Child 6 months-5 years: 4 mg/kg twice daily (max. per dose 200 mg) for 3 days, alternatively 50 mg twice daily for 3 days
- ▶ Child 6-11 years: 4 mg/kg twice daily (max. per dose 200 mg) for 3 days, alternatively 100 mg twice daily for 3 days
- ▶ Child 12-15 years: 200 mg twice daily for 3 days
- ▶ Child 16-17 years: 200 mg twice daily for 3 days (7 days in males)
- ▶ Adult: 200 mg twice daily for 3 days (7 days in males)

- **UNLICENSED USE** [\[EvGr\]](#) Trimethoprim can be given as a single dose for the prophylaxis of recurrent urinary-tract infection following exposure to a trigger, [⚠](#) but this dosing regimen is not licensed. Not licensed for treatment of pneumocystis pneumonia. Not licensed for treatment of acne resistant to other antibacterials.

- ▶ In children Not licensed for use in children under 6 months for the prophylaxis of recurrent urinary-tract infection. Not licensed for use in children under 6 weeks.

- **CONTRA-INDICATIONS** Blood dyscrasias

- **CAUTIONS** Acute porphyrias p. 1120 · elderly · predisposition to folate deficiency

- **INTERACTIONS** → Appendix 1: trimethoprim

● **SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea · electrolyte imbalance · fungal overgrowth · headache · nausea · skin reactions · vomiting

- ▶ **Rare or very rare** Agranulocytosis · angioedema · anxiety · appetite decreased · arthralgia · behaviour abnormal · bone marrow disorders · confusion · constipation · cough · depression · dizziness · dyspnoea · eosinophilia · erythema nodosum · fever · haemolysis · haemolytic anaemia · haemorrhage · hallucination · hepatic disorders · hypoglycaemia · lethargy · leucopenia · meningitis aseptical · movement disorders · myalgia · neutropenia · oral disorders · pancreatitis · paraesthesia · peripheral neuritis · photosensitivity reaction · pseudomembranous enterocolitis · renal impairment · seizure · severe cutaneous adverse reactions (SCARs) · sleep disorders · syncope · systemic lupus erythematosus (SLE) · thrombocytopenia · tinnitus · tremor · uveitis · vasculitis · vertigo · wheezing
- ▶ **Frequency not known** Gastrointestinal disorder · megaloblastic anaemia · methaemoglobinemia
- **PREGNANCY** Teratogenic risk in first trimester (folate antagonist). Manufacturers advise avoid during pregnancy.
- **BREAST FEEDING** Present in milk—short-term use not known to be harmful.
- **RENAL IMPAIRMENT** Manufacturer advises caution in impairment.
 - Dose adjustments** ▶ In adults Manufacturer advises dose reduction to half normal dose after 3 days if eGFR 15–30 mL/minute/1.73 m². Manufacturer advises dose reduction to half normal dose if eGFR less than 15 mL/minute/1.73 m².
 - ▶ In children Manufacturer advises dose reduction to half normal dose after 3 days if estimated glomerular filtration rate 15–30 mL/minute/1.73 m². Manufacturer advises dose reduction to half normal dose if estimated glomerular filtration rate less than 15 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor blood counts with long-term use and in those with, or at risk of, folate deficiency.
 - ▶ Manufacturer advises monitor serum electrolytes in patients at risk of developing hyperkalaemia, and consider monitoring in other patients, particularly with long-term use.
 - ▶ Manufacturer advises consider monitoring renal function, particularly with long-term use.
 - ▶ Manufacturer advises monitoring of plasma-trimethoprim concentration may be considered with long-term use and under specialist advice.
- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Gastro-intestinal system infections, antibacterial therapy p. 535, Pneumocystis pneumonia p. 637, Respiratory system infections, antibacterial therapy p. 538, Urinary-tract infections p. 622.
- **PATIENT AND CARER ADVICE**

Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

Medicines for Children leaflet: Trimethoprim for bacterial infections www.medicinesforchildren.org.uk/trimethoprim-bacterial-infections
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9

▶ **Trimethoprim (Non-proprietary)**

Trimethoprim 10 mg per 1 ml Trimethoprim 50mg/5ml oral suspension sugar-free | 100 ml [PoM] £6.82 DT = £4.89

- ▶ **Monotrim** (Chemidex Pharma Ltd)
Trimethoprim 10 mg per 1 ml Monotrim 50mg/5ml oral suspension sugar-free | 100 ml [PoM] £1.77 DT = £4.89

Tablet

CAUTIONARY AND ADVISORY LABELS 9

▶ **Trimethoprim (Non-proprietary)**

Trimethoprim 100 mg Trimogal 100mg tablets | 28 tablet [PoM] £0.89 DT = £0.88

Trimethoprim 100mg tablets | 28 tablet [PoM] £1.39 DT = £0.88

Trimethoprim 200 mg Trimogal 200mg tablets | 14 tablet [PoM] £0.91 DT = £0.91

Trimethoprim 200mg tablets | 6 tablet [PoM] £2.15 DT = £0.39 |

14 tablet [PoM] £5.00 DT = £0.91

Combinations available: **Co-trimoxazole**, p. 594

ANTIMYCOBACTERIALS > RIFAMYCINS

Rifabutin

09-May-2020

● **INDICATIONS AND DOSE**

Prophylaxis of *Mycobacterium avium* complex infections in immunosuppressed patients with low CD4 count

▶ **BY MOUTH**

- ▶ Adult: 300 mg once daily, also consult product literature

Treatment of non-tuberculous mycobacterial disease, in combination with other drugs

▶ **BY MOUTH**

- ▶ Adult: 450–600 mg once daily for up to 6 months after cultures negative

Treatment of pulmonary tuberculosis, in combination with other drugs

▶ **BY MOUTH**

- ▶ Adult: 150–450 mg once daily for at least 6 months

***Helicobacter pylori* eradication [in combination with other drugs (see *Helicobacter pylori* infection p. 89)]**

▶ **BY MOUTH**

- ▶ Adult: 150 mg twice daily for 10 days for third-line eradication therapy

- **UNLICENSED USE** [EvGr] Rifabutin is used for the eradication of *Helicobacter pylori*,  but is not licensed for this indication.
- **CAUTIONS** Acute porphyrias p. 1120 · discolours soft contact lenses
- **INTERACTIONS** → Appendix 1: rifabutin
- **SIDE-EFFECTS** Agranulocytosis · anaemia · arthralgia · bronchospasm · chest pain · corneal deposits · decreased leucocytes · dyspnoea · eosinophilia · fever · haemolysis · hepatic disorders · influenza like illness · myalgia · nausea · neutropenia · pancytopenia · skin reactions · thrombocytopenia · urine discolouration · uveitis (more common following high doses or concomitant use with drugs that increase plasma concentration) · vomiting
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifamycin hypersensitivity.
- **CONCEPTION AND CONTRACEPTION** Important Rifabutin induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced; alternative family planning advice should be offered.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT**

Dose adjustments Use half normal dose if eGFR less than 30 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- ▶ **Renal function** should be checked before treatment.
- ▶ **Hepatic function** should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, hepatic function should be monitored on prolonged therapy.
- ▶ Blood counts should be monitored on prolonged therapy.
- ▶ Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months. Blood counts should also be monitored in these patients.

- **PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.

● PATIENT AND CARER ADVICE

Soft contact lenses Patients or their carers should be advised that rifabutin discolours soft contact lenses.
Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

CAUTIONARY AND ADVISORY LABELS 8, 14

- ▶ **Mycobutin** (Pfizer Ltd)

Rifabutin 150 mg Mycobutin 150mg capsules | 30 capsule [PoM]
£90.38 DT = £90.38

Rifaximin

07-Feb-2019

- **DRUG ACTION** Rifaximin is a rifamycin that is poorly absorbed from the gastro-intestinal tract, and, therefore, should not be used to treat systemic infections.

● INDICATIONS AND DOSE

Travellers' diarrhoea that is not associated with fever, bloody diarrhoea, blood or leucocytes in the stool, or 8 or more unformed stools in the previous 24 hours

- ▶ BY MOUTH

Adult: 200 mg every 8 hours for 3 days

Reduction in recurrence of hepatic encephalopathy

- ▶ BY MOUTH

Adult: 550 mg twice daily

- **CONTRA-INDICATIONS** Intestinal obstruction

- **INTERACTIONS** → Appendix 1: rifaximin

● SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · ascites · constipation · depression · dizziness · dyspnoea · gastrointestinal discomfort · gastrointestinal disorders · headaches · muscle complaints · nausea · oedema · skin reactions · vomiting
- ▶ **Uncommon** Anaemia · anxiety · appetite decreased · asthenia · balance impaired · concentration impaired · confusion · cough · diplopia · drowsiness · dry lips · dry mouth · dry throat · ear pain · fall · haematuria · hot flush · hyperhidrosis · hyperkalaemia · increased risk of infection · lymphocytosis · memory loss · muscle weakness · nasal complaints · neutropenia · oropharyngeal pain · pain · palpitations · polymenorrhoea · respiratory disorders · seizure · sensation abnormal · sleep disorders · sunburn · taste altered · urinary disorders · urine abnormalities · vertigo
- ▶ **Rare or very rare** Hypertension · hypotension

- ▶ **Frequency not known** Angioedema · syncope · thrombocytopenia · urine discolouration

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of rifamycin hypersensitivity.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Unlikely to be present in milk in significant amounts, but manufacturer advises avoid.

● HEPATIC IMPAIRMENT

- ▶ When used for hepatic encephalopathy Manufacturer advises caution in severe impairment (risk of increased exposure).

- **PRESCRIBING AND DISPENSING INFORMATION** Not recommended for diarrhoea associated with invasive organisms such as *Campylobacter* and *Shigella*.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Rifaximin for preventing episodes of overt hepatic encephalopathy (March 2015)** NICE TA337
Rifaximin (*Targaxan*®) is recommended, within its marketing authorisation, as an option for reducing the recurrence of episodes of overt hepatic encephalopathy in adults.

www.nice.org.uk/guidance/ta337

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 9 (Xifaxanta® brand only), 14

- ▶ **Targaxan** (Norgine Pharmaceuticals Ltd)

Rifaximin 550 mg Targaxan 550mg tablets | 56 tablet [PoM]
£259.23 DT = £259.23

Rifaximin 200 mg Xifaxanta 200mg tablets | 9 tablet [PoM] £15.15 DT = £15.15

2.1 Anthrax

Anthrax

Treatment and post-exposure prophylaxis

Inhalation or gastro-intestinal anthrax should be treated initially with either ciprofloxacin p. 590 or, in patients over 12 years, doxycycline p. 597 [unlicensed indication] combined with one or two other antibacterials (such as amoxicillin p. 579, benzylpenicillin sodium p. 577, chloramphenicol p. 601, clarithromycin p. 567, clindamycin p. 564, imipenem with cilastatin p. 548, rifampicin p. 615 [unlicensed indication], and vancomycin p. 562). When the condition improves and the sensitivity of the *Bacillus anthracis* strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

Cutaneous anthrax should be treated with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] for 7 days. Treatment may be switched to amoxicillin if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for *post-exposure prophylaxis*. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antibacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of *B. anthracis* is susceptible. Vaccination against anthrax may allow the duration of antibacterial prophylaxis to be shortened.

2.2 Leprosy

Leprosy

Management

Advice from a member of the Panel of Leprosy Opinion is essential for the treatment of leprosy (Hansen's disease). Details can be obtained from the Hospital for Tropical Diseases, London (telephone (020) 3456 7890).

The World Health Organization has made recommendations to overcome the problem of dapsone below resistance and to prevent the emergence of resistance to other antileprotic drugs. Drugs recommended are dapsone, rifampicin p. 615, and clofazimine below. Other drugs with significant activity against *Mycobacterium leprae* include ofloxacin p. 593, minocycline p. 599 and clarithromycin p. 567, but none of these are as active as rifampicin; at present they should be reserved as second-line drugs for leprosy.

A three-drug regimen is recommended for *multibacillary leprosy* (lepromatous, borderline-lepromatous, and borderline leprosy) and a two-drug regimen for *paucibacillary leprosy* (borderline-tuberculoid, tuberculoid, and indeterminate).

Multibacillary leprosy should be treated with a combination of rifampicin, dapsone and clofazimine for at least 2 years. Treatment should be continued unchanged during both type I (reversal) or type II (erythema nodosum leprosum) reactions. During reversal reactions neuritic pain or weakness can herald the rapid onset of permanent nerve damage. Treatment with prednisolone p. 716 should be instituted at once. Mild type II reactions may respond to aspirin. Severe type II reactions may require corticosteroids; thalidomide p. 1014 [unlicensed] is also useful in patients who have become corticosteroid dependent, but it should be used only under **specialist supervision**. Thalidomide is teratogenic and, therefore, contra-indicated in pregnancy; it must **not** be given to women of child-bearing potential unless they comply with a pregnancy prevention programme. Increased doses of clofazimine are also useful.

Paucibacillary leprosy should be treated with rifampicin and dapsone for 6 months. If treatment is interrupted the regimen should be recommenced where it was left off to complete the full course.

Neither the multibacillary nor the paucibacillary antileprosy regimen is sufficient to treat tuberculosis.

ANTIMYCOBACTERIALS > OTHER

Clofazimine

07-May-2020

● INDICATIONS AND DOSE

Multibacillary leprosy in combination with rifampicin and dapsone (3-drug regimen) (administered on expert advice)

► BY MOUTH

- Adult: 300 mg once a month, to be administered under supervision and 50 mg daily, to be self-administered, alternatively 300 mg once a month, to be administered under supervision and 100 mg once daily on alternate days, to be self-administered

Lepromatous lepra reactions (administered on expert advice)

► BY MOUTH

- Adult: 300 mg daily for max. 3 months

Severe type II (erythema nodosum leprosum) reactions (administered on expert advice)

► BY MOUTH

- Adult: 100 mg 3 times a day for one month, subsequent dose reductions are required, may take 4–6 weeks to attain full effect

- **CAUTIONS** Avoid if persistent abdominal pain and diarrhoea · may discolour soft contact lenses
 - **INTERACTIONS** → Appendix 1: clofazimine
 - **SIDE-EFFECTS** Abdominal pain · appetite decreased · dry eye · eye discolouration · fatigue · gastrointestinal disorders · hair colour changes (reversible) · headache · lymphadenopathy · nausea · photosensitivity reaction · red discolouration of body fluids · skin discolouration (including areas exposed to light) · skin reactions · splenic infarction · urine red · visual impairment · vomiting (hospitalise if persistent) · weight decreased
 - **PREGNANCY** Use with caution.
 - **BREAST FEEDING** May alter colour of milk; skin discoloration of infant.
 - **HEPATIC IMPAIRMENT** Use with caution.
 - **RENAL IMPAIRMENT** Use with caution.
 - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule
- Capsule**
CAUTIONARY AND ADVISORY LABELS 8, 14, 21
 ► Clofazimine (Non-proprietary)
 Clofazimine 50 mg Lamprene 50mg capsules | 100 capsule [PoM] 

Dapsone

05-May-2020

● INDICATIONS AND DOSE

Multibacillary leprosy in combination with rifampicin and clofazimine (3-drug regimen) | Paucibacillary leprosy in combination with rifampicin (2-drug regimen)

► BY MOUTH

- Adult (body-weight up to 35 kg): 50 mg daily, alternatively 1–2 mg/kg daily, may be self-administered
- Adult (body-weight 35 kg and above): 100 mg daily, may be self-administered

Dermatitis herpetiformis

► BY MOUTH

- Adult: (consult product literature or local protocols)

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (in combination with trimethoprim)

► BY MOUTH

- Adult: 100 mg once daily

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia

► BY MOUTH

- Adult: 100 mg daily

- **UNLICENSED USE** Not licensed for treatment of pneumocystis (*P. jirovecii*) pneumonia.
- **CAUTIONS** Anaemia (treat severe anaemia before starting) · avoid in Acute porphyrias p. 1120 · cardiac disease · G6PD deficiency · pulmonary disease · susceptibility to haemolysis
- **INTERACTIONS** → Appendix 1: dapsone
- **SIDE-EFFECTS** Agranulocytosis · appetite decreased · haemolysis · haemolytic anaemia · headache · hepatic disorders · hypoalbuminaemia · insomnia · lepra reaction · methaemoglobinemia · motor loss · nausea · peripheral neuropathy · photosensitivity reaction · psychosis · severe

cutaneous adverse reactions (SCARs) · skin reactions · tachycardia · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Side-effects are dose-related. If dapsone syndrome occurs (rash with fever and eosinophilia)—discontinue immediately (may progress to exfoliative dermatitis, hepatitis, hypoalbuminaemia, psychosis and death).

- **PREGNANCY** Folic acid p. 1084 (higher dose) should be given to mother throughout pregnancy; neonatal haemolysis and methaemoglobinaemia reported in third trimester.
- **BREAST FEEDING** Haemolytic anaemia; although significant amount in milk, risk to infant very small unless infant is G6PD deficient.
- **PATIENT AND CARER ADVICE**
Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 8

Dapsone 100 mg Dapsone 100mg tablets | 28 tablet **[PoM]** £97.39 DT = £57.37

2.3 Lyme disease

Lyme disease

14-Nov-2018

Description of condition

Lyme disease, also known as Lyme borreliosis, is an infection caused by bacteria called *Borrelia burgdorferi*. It is transmitted to humans by the bite of an infected tick. Ticks are mainly found in grassy and wooded areas including urban gardens and parks. Most tick bites do not cause Lyme disease, and the prompt and correct removal of the tick reduces the risk of infection.

Lyme disease usually presents with a characteristic erythema migrans rash. This usually becomes visible 1–4 weeks after a tick bite, but can appear from 3 days to 3 months, and last for several weeks. It may be accompanied by non-focal (non-organ related) symptoms, such as fever, swollen glands, malaise, fatigue, neck pain or stiffness, joint or muscle pain, headache, cognitive impairment, or paraesthesia.

Other signs and symptoms of Lyme disease may also appear months or years after the initial infection and are typically characterised by focal symptoms (relating to at least 1 organ system). These include neurological (affecting cranial nerves, peripheral and central nervous systems), joint (Lyme arthritis), cardiac (Lyme carditis), or skin (acrodermatitis chronica atrophicans) manifestations.

Drug treatment

[EvGr] Patients diagnosed with Lyme disease should be given treatment with an antibacterial drug; the choice of drug should be based on presenting symptoms. In patients who present with focal symptoms, a discussion with, or referral to, a specialist should be considered but should not delay treatment.

In patients presenting with *erythema migrans rash with or without non-focal symptoms*, oral doxycycline p. 597

[unlicensed indication] is recommended as first-line treatment. If doxycycline p. 597 cannot be given, oral amoxicillin p. 579 should be used as an alternative. Oral azithromycin p. 566 [unlicensed indication] should be given if both doxycycline p. 597 and amoxicillin p. 579 are unsuitable.

In patients presenting with focal symptoms of *cranial nerve or peripheral nervous system* involvement, oral doxycycline p. 597 [unlicensed indication] is recommended as first-line treatment. If doxycycline p. 597 cannot be given, oral amoxicillin p. 579 should be used as an alternative.

In patients presenting with symptoms of *central nervous system* involvement, intravenous ceftriaxone p. 556 is recommended as first-line treatment. Oral doxycycline p. 597 [unlicensed indication] should be used as an alternative if ceftriaxone p. 556 cannot be given, or when switching to oral antibacterial treatment.

In patients with symptoms of *Lyme arthritis or acrodermatitis chronica atrophicans*, oral doxycycline p. 597 [unlicensed indication] is recommended as first-line treatment. If doxycycline p. 597 cannot be given, oral amoxicillin p. 579 should be used as an alternative. Intravenous ceftriaxone p. 556 should be given if both doxycycline p. 597 and amoxicillin p. 579 are unsuitable.

In patients with symptoms of *Lyme carditis who are haemodynamically stable*, oral doxycycline p. 597 [unlicensed indication] is recommended as first-line treatment. If doxycycline p. 597 cannot be given, intravenous ceftriaxone p. 556 should be used as an alternative.

In patients with symptoms of *Lyme carditis who are haemodynamically unstable*, intravenous ceftriaxone p. 556 is recommended. Oral doxycycline p. 597 [unlicensed indication] should be given when switching to oral antibacterial treatment. **⚠**

Ongoing symptom management

[EvGr] If symptoms continue to persist or worsen after antibacterial treatment, patients should be assessed for possible alternative causes, re-infection with Lyme disease, treatment failure or non-adherence to previous antibacterial treatment, or progression to organ damage caused by Lyme disease (such as nerve palsy).

A second course of antibacterial treatment should be given to patients presenting with signs and symptoms of re-infection. In patients presenting with ongoing symptoms due to possible treatment failure, treatment with an alternative antibacterial drug should be considered. A third course of antibacterial treatment is not recommended, and further management should be discussed with a national reference laboratory or suitable specialist depending on symptoms (for example, a rheumatologist or neurologist).

Useful Resources

Lyme disease. National Institute for Health and Care Excellence. NICE guideline 95. April 2018.

www.nice.org.uk/guidance/ng95

'Be tick aware'—Toolkit for raising awareness of the potential risk posed by ticks and tick-borne disease in England. Public Health England. March 2018.

www.gov.uk/government/publications/tick-bite-risks-and-prevention-of-lyme-disease

2.4 Methicillin-resistant staphylococcus aureus

MRSA

Management

Infection from *Staphylococcus aureus* strains resistant to methicillin [now discontinued] (methicillin-resistant *Staph. aureus*, MRSA) and to flucloxacillin p. 586 can be difficult to manage. Treatment is guided by the sensitivity of the infecting strain.

Rifampicin p. 615 or fusidic acid p. 604 should not be used alone because resistance may develop rapidly. A

tetracycline alone or a combination of rifampicin and fusidic acid can be used for *skin* and *soft-tissue infections* caused by MRSA; clindamycin p. 564 alone is an alternative. A **glycopeptide** (e.g. vancomycin p. 562) can be used for severe skin and soft-tissue infections associated with MRSA; if a glycopeptide is unsuitable, linezolid p. 605 can be used on expert advice. As linezolid is **not** active against Gram-negative organisms, it can be used for mixed skin and soft-tissue infections only when other treatments are not available; linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms. A combination of a glycopeptide and fusidic acid or a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial.

Tigecycline p. 601 and daptomycin p. 602 are licensed for the treatment of complicated skin and soft-tissue infections involving MRSA.

A **tetracycline** or clindamycin can be used for *bronchiectasis* caused by MRSA. A **glycopeptide** can be used for *pneumonia* associated with MRSA; if a glycopeptide is unsuitable, linezolid can be used on expert advice. Linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms.

A **tetracycline** can be used for *urinary-tract infections* caused by MRSA; trimethoprim p. 607 or nitrofurantoin p. 625 are alternatives. A **glycopeptide** can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A **glycopeptide** can be used for *septicaemia* associated with MRSA.

See the management of *endocarditis*, *osteomyelitis*, or *septic arthritis* associated with MRSA.

Prophylaxis with vancomycin or teicoplanin p. 561 (alone or in combination with another antibacterial active against other pathogens) is appropriate for patients undergoing surgery if:

- there is a history of MRSA colonisation or infection without documented eradication;
- there is a risk that the patient's MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

See eradication of nasal carriage of MRSA in Nose p. 1265.

2.5 Tuberculosis

Tuberculosis

24-Oct-2019

Overview

Tuberculosis is a curable infectious disease caused by bacteria of the *Mycobacterium tuberculosis* complex (*M. tuberculosis*, *M. africanum*, *M. bovis* or *M. microti*) and is

spread by breathing in infected respiratory droplets from a person with infectious tuberculosis. The most common form of tuberculosis infection is in the lungs (**pulmonary**) but infection can also spread and develop in other parts of the body (**extrapulmonary**).

The initial infection with tuberculosis clears in the majority of individuals. However, in some cases the bacteria may become dormant and remain in the body with no symptoms (**latent** tuberculosis) or progress to being symptomatic (**active** tuberculosis) over the following weeks or months. In individuals with latent tuberculosis only a small proportion will develop active tuberculosis.

Many cases of tuberculosis can be prevented by public health measures and when clinical disease does occur most individuals can be cured if treated properly with the correct dose, combination and duration of treatment. Drug-resistant strains of tuberculosis are much harder to treat and significantly increase an individual's risk of long-term complications or death.

Treatment phases, overview

The standard treatment of active tuberculosis is completed in two phases—an **initial phase** using four drugs and a **continuation phase** using two drugs, in fully sensitive cases. [EvoG](#) The management of tuberculosis should be under specialist care by clinicians with training in, and experience of, the specialised care of individuals with tuberculosis. This tuberculosis service should include specialised nurses and health visitors. [A](#)

Within the UK there are two regimens recommended for the treatment of tuberculosis: **unsupervised** or **supervised**. The choice of either regimen is dependent on a risk assessment to identify if an individual needs enhanced case management.

[EvoG](#) In all phases of treatment for tuberculosis, fixed-dose combination tablets should be used, and a daily dosing schedule should be considered in active tuberculosis. [A](#)

Initial phase

[EvoG](#) As standard treatment for individuals with active tuberculosis, offer rifampicin p. 615, ethambutol hydrochloride p. 620, pyrazinamide p. 621 and isoniazid p. 621 (with pyridoxine hydrochloride p. 1141) in the initial phase of therapy; modified according to drug susceptibility testing; and continued for 2 months.

Treatment should be started without waiting for culture results if clinical signs and symptoms are consistent with a tuberculosis diagnosis; consider completing the standard treatment even if subsequent culture results are negative. [A](#)

Continuation phase

[EvoG](#) After the initial phase, offer standard continuation treatment with rifampicin and isoniazid (with pyridoxine hydrochloride) for a further 4 months in individuals with active tuberculosis without central nervous system involvement. Longer treatment for 10 months should be offered in individuals with active tuberculosis of the central nervous system, with or without spinal involvement.

Treatment should be modified according to drug susceptibility testing. [A](#)

Unsupervised treatment

The unsupervised treatment regimen is for individuals who are likely to take antituberculosis drugs reliably and willingly without supervision.

Supervised treatment

For individuals requiring supervised treatment (directly observed therapy, DOT), this is offered as part of enhanced case management. [EvoG](#) A 3 times weekly dosing schedule can be considered in individuals with tuberculosis if they require enhanced case management and daily directly observed therapy is not available. Antituberculosis

treatment dosing regimens of fewer than 3 times a week are not recommended. ▲

EvGr Directly observed therapy should be offered to individuals who:

- have a current risk or history of non-adherence;
- have previously been treated for tuberculosis;
- have a history of homelessness, drug or alcohol misuse;
- are in prison or a young offender institution, or have been in the past 5 years;
- have a major psychiatric, memory or cognitive disorder;
- are in denial of the tuberculosis diagnosis;
- have multi-drug resistant tuberculosis;
- request directly observed therapy after discussion with the clinical team;
- are too ill to self-administer treatment. ▲

Individuals with comorbidities or coexisting conditions, including the immunocompromised

EvGr Individuals with comorbidities or coexisting conditions (such as HIV, severe liver disease, chronic kidney disease, diabetes, eye disease or vision impairment, a history of alcohol or substance misuse, or who are pregnant or breastfeeding) should be managed by a specialist multidisciplinary team with experience in managing tuberculosis and the comorbidity or coexisting condition.

For individuals who are HIV-positive with active TB, treatment with the standard regimen should not routinely exceed 6 months, unless the tuberculosis has central nervous system involvement, in which case treatment should not routinely extend beyond 12 months.

Care should be taken to avoid drug interactions when co-prescribing antiretroviral and antituberculosis drugs. ▲ For further information on the management of tuberculosis in HIV infection, see British HIV Association guideline: **Management of tuberculosis in adults living with HIV** (available at www.bhiva.org/guidelines).

Extrapulmonary tuberculosis

Central nervous system tuberculosis

EvGr Individuals with central nervous system tuberculosis should be offered standard treatment with **initial phase** drugs for 2 months (see *Initial phase* for specific drugs). After completion of the initial treatment phase, standard treatment with **continuation phase** drugs should then be offered (see *Continuation phase* for specific drugs); and continued for a further 10 months. Treatment for tuberculous meningitis should be offered if clinical signs and other laboratory findings are consistent with the diagnosis, even if a rapid diagnostic test is negative.

An initial high dose of *dexamethasone* or *prednisolone* should be offered at the same time as antituberculosis treatment, then slowly withdrawn over 4–8 weeks. ▲ For additional information on corticosteroid use, see NICE clinical guideline: **Tuberculosis** (see *Useful resources*).

EvGr Referral for surgery should only be considered in individuals who have raised intracranial pressure; or have spinal TB with spinal instability or evidence of spinal cord compression. ▲

Pericardial tuberculosis

EvGr An initial high dose of oral *prednisolone* should be offered to individuals with active pericardial tuberculosis, at the same time as antituberculosis treatment, then slowly withdrawn over 2–3 weeks. ▲ For additional information on corticosteroid use, see NICE clinical guideline: **Tuberculosis** (see *Useful resources*).

Latent tuberculosis

Some individuals with latent tuberculosis are at increased risk of developing active tuberculosis (such as individuals who are HIV-positive, diabetic, injecting drug users, or receiving treatment with an anti-tumor necrosis factor alpha inhibitor). EvGr If for any reason these individuals do not

have treatment for latent tuberculosis, they should be informed of the risks and symptoms of active tuberculosis.

▲

Close contacts

EvGr Anyone aged under 65 years who is a close contact (prolonged, frequent or intense contact, for example household contacts or partners) of a person with pulmonary or laryngeal tuberculosis should be tested for latent tuberculosis. Drug treatment should be offered to all individuals aged under 65 years with evidence of latent tuberculosis, if the close contact has *suspected infectious* or *confirmed active* pulmonary or laryngeal drug-sensitive tuberculosis. ▲

Immunocompromised

EvGr Individuals who are anticipated to be, or who are currently immunocompromised, should have a risk assessment carried out to establish whether tuberculosis testing should be offered. Take into account the severity and duration of their immunocompromise and any risk factors for tuberculosis (such as country of birth or recent contact with an index case with suspected infectious or confirmed pulmonary or laryngeal tuberculosis).

Individuals who are severely immunocompromised (such as those with HIV and a CD4 count of less than 200 cells/mm³, or who have had a solid organ or allogeneic stem cell transplant) should be tested for latent tuberculosis using an appropriate method. Individuals who test positive should then be assessed for active disease, and if negative, offered treatment for latent tuberculosis. ▲ For further information on tuberculosis testing methods, see NICE clinical guideline: **Tuberculosis** (see *Useful resources*).

Healthcare workers

EvGr Any new NHS employees who are new entrants from a high incidence country should be offered appropriate testing for latent tuberculosis. Those who are not new entrants from a high incidence country, but who will be in contact with patients or clinical materials should be offered appropriate testing for latent tuberculosis if prior BCG vaccination cannot be verified. ▲ For further information on tuberculosis testing methods, see NICE clinical guideline: **Tuberculosis** (see *Useful resources*) and *Bacillus Calmette-Guérin vaccine* p. 1365.

EvGr Those who test positive should then be assessed for active disease, and if negative, offered treatment for latent tuberculosis.

For healthcare workers who are immunocompromised, follow standard advice for testing and treatment (see *Immunocompromised* above). ▲

Treatment of latent tuberculosis

EvGr For individuals aged below 65 years, including those with HIV where treatment for latent tuberculosis is indicated, offer drug treatment with either 3 months of isoniazid (with pyridoxine hydrochloride p. 1141) and rifampicin or 6 months of isoniazid (with pyridoxine hydrochloride). ▲

The choice of regimen is dependent on clinical factors, including age, risk of hepatotoxicity and possible drug interactions. EvGr Testing for HIV, hepatitis B and hepatitis C should be offered before starting antituberculosis treatment as this may affect choice of therapy.

Individuals aged 35 to 65 years should only be offered treatment if hepatotoxicity is not a concern.

For individuals aged under 35 years offer treatment with 3 months of isoniazid (with pyridoxine hydrochloride) and rifampicin if hepatotoxicity is a concern after an assessment of both liver function (including transaminase levels) and risk factors.

For individuals where interactions with rifamycins are a concern (for example, in people with HIV or who those have had a transplant), offer treatment with 6 months of isoniazid (with pyridoxine hydrochloride).

Recommended dosage for standard unsupervised 6-month treatment

Rifampicin with isoniazid and pyrazinamide	<p>Adult:</p> <ul style="list-style-type: none"> ▶ body-weight up to 40 kg 3 tablets daily for 2 months (initial phase), use <i>Rifater</i>[®] Tablets, preferably taken before breakfast; ▶ body-weight 40–49 kg 4 tablets daily for 2 months (initial phase), use <i>Rifater</i>[®] Tablets, preferably taken before breakfast; ▶ body-weight 50–64 kg 5 tablets daily for 2 months (initial phase), use <i>Rifater</i>[®] Tablets, preferably taken before breakfast; ▶ body-weight 65 kg and above 6 tablets daily for 2 months (initial phase), use <i>Rifater</i>[®] Tablets, preferably taken before breakfast
Ethambutol hydrochloride	Adult: 15 mg/kg once daily for 2 months (initial phase)
Rifampicin with isoniazid	<p>Adult:</p> <ul style="list-style-type: none"> ▶ body-weight up to 50 kg 450/300 mg daily for 4 months (continuation phase after 2-month initial phase), use <i>Rifinah</i>[®] 150/100 Tablets, preferably taken before breakfast; ▶ body-weight 50 kg and above 600/300 mg daily for 4 months (continuation phase after 2-month initial phase), use <i>Rifinah</i>[®] 300/150 Tablets, preferably taken before breakfast
<i>or</i> (if combination preparations not appropriate):	
Isoniazid	<p>Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)</p> <p>Adult: 300 mg daily for 6 months (initial and continuation phases)</p>
Rifampicin	<p>Child:</p> <ul style="list-style-type: none"> ▶ body-weight up to 50 kg 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day; ▶ body-weight 50 kg and above 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day <p>Adult:</p> <ul style="list-style-type: none"> ▶ body-weight up to 50 kg 450 mg once daily for 6 months (initial and continuation phases); ▶ body-weight 50 kg and above 600 mg once daily for 6 months (initial and continuation phases)
Pyrazinamide	<p>Child:</p> <ul style="list-style-type: none"> ▶ body-weight up to 50 kg 35 mg/kg once daily for 2 months (initial phase); maximum 1.5 g per day; ▶ body-weight 50 kg and above 35 mg/kg once daily for 2 months (initial phase); maximum 2 g per day <p>Adult:</p> <ul style="list-style-type: none"> ▶ body-weight up to 50 kg 1.5 g once daily for 2 months (initial phase); ▶ body-weight 50 kg and above 2 g once daily for 2 months (initial phase)
Ethambutol hydrochloride	<p>Child: 20 mg/kg once daily for 2 months (initial phase)</p> <p>Adult: 15 mg/kg once daily for 2 months (initial phase)</p>
<p>In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The exception is ethambutol hydrochloride p. 620 due to the risk of toxicity. Doses may also need to be recalculated to allow for weight gain in younger children. The fixed-dose combination preparations (<i>Rifater</i>[®], <i>Rifinah</i>[®]) are unlicensed for use in children. Consideration may be given to use of these preparations in older children, provided the respective dose of each drug is appropriate for the weight of the child.</p>	

Recommended dosage for intermittent supervised 6-month treatment

Isoniazid	<p>Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)</p> <p>Adult: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)</p>
Rifampicin	<p>Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)</p> <p>Adult: 600–900 mg 3 times a week for 6 months (initial and continuation phases)</p>
Pyrazinamide	<p>Child:</p> <ul style="list-style-type: none"> ▶ body-weight up to 50 kg 50 mg/kg 3 times a week (max. per dose 2 g 3 times a week) for 2 months (initial phase); ▶ body-weight 50 kg and above 50 mg/kg 3 times a week (max. per dose 2.5 g 3 times a week) for 2 months (initial phase) <p>Adult:</p> <ul style="list-style-type: none"> ▶ body-weight up to 50 kg 2 g 3 times a week for 2 months (initial phase); ▶ body-weight 50 kg and above 2.5 g 3 times a week for 2 months (initial phase)
Ethambutol hydrochloride	<p>Child: 30 mg/kg 3 times a week for 2 months (initial phase)</p> <p>Adult: 30 mg/kg 3 times a week for 2 months (initial phase)</p>
<p>In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The exception is ethambutol hydrochloride due to the risk of toxicity. Doses may also need to be recalculated to allow for weight gain in younger children. The fixed-dose combination preparations (<i>Rifater</i>[®], <i>Rifinah</i>[®]) are unlicensed for use in children. Consideration may be given to use of these preparations in older children, provided the respective dose of each drug is appropriate for the weight of the child.</p>	

Individuals with severe liver disease should be treated under the care of a specialist team. Careful monitoring of liver function is necessary in individuals with non-severe liver disease, abnormal liver function, or who misuse alcohol or drugs. [▲](#)

For advice on immunisation against tuberculosis, see *Bacillus Calmette-Guérin vaccine* p. 1365.

Treatment failure

Major causes of treatment failure include incorrect prescribing by the clinician and inadequate compliance by the infected individual. [EvdGr](#) All individuals diagnosed with tuberculosis should have an allocated case manager to help with the development of a health and social care plan, supervision of treatment, and support with the completion of treatment. Multidisciplinary tuberculosis teams should implement strategies (such as random urine tests, pill counts, home visits, health education counselling, and language appropriate reminder services) to help with adherence to, and successful completion of treatment. [▲](#)

Treatment interruptions

A break in antituberculosis treatment of at least 2 weeks (during the initial phase) or missing more than 20% of prescribed doses is classified as treatment interruption. Re-establishing treatment appropriately following interruptions is key to ensuring treatment success without relapse, drug resistance or further adverse events. [EvdGr](#) If an adverse reaction recurs upon re-introducing a particular drug, do not give that drug in future regimens and consider extending the total regimen accordingly. [▲](#)

Treatment interruptions due to drug-induced hepatotoxicity

[EvdGr](#) Following treatment interruption due to drug-induced hepatotoxicity, all potential causes of hepatotoxicity should be investigated. Once aspartate or alanine transaminase levels fall below twice the upper limit of normal, bilirubin levels have returned to the normal range, and hepatotoxic symptoms have resolved, antituberculosis therapy should be sequentially re-introduced at previous full doses over a period of no more than 10 days. Start with ethambutol hydrochloride p. 620 and either isoniazid p. 621 (with pyridoxine hydrochloride) or rifampicin below.

In individuals with severe or highly infectious tuberculosis who need to interrupt the standard regimen, consider continuing treatment with at least 2 drugs with low risk of hepatotoxicity, such as ethambutol hydrochloride and streptomycin p. 546 (with or without a fluoroquinolone antibiotic, such as levofloxacin p. 592 or moxifloxacin p. 593), with ongoing monitoring by a liver specialist. [▲](#)

Treatment interruptions due to cutaneous reactions

[EvdGr](#) If an individual with severe or highly infectious tuberculosis has a cutaneous reaction, consider continuing treatment with a combination of at least 2 drugs with low risk for causing cutaneous reactions, such as ethambutol hydrochloride and streptomycin, with monitoring by a dermatologist. [▲](#)

Drug-resistant tuberculosis

[EvdGr](#) Treatment of drug-resistant tuberculosis should be managed by a multidisciplinary team with experience in such cases, and where appropriate facilities for infection-control exist. [▲](#) The risk of resistance is minimised by ensuring therapy is administered in the correct dose and combination for the prescribed duration.

Single drug-resistant tuberculosis

[EvdGr](#) For single drug-resistance in individuals with tuberculosis with central nervous system involvement, refer to a specialist with experience in managing drug-resistant tuberculosis. [▲](#) For those without central nervous system involvement, the following treatment regimens are recommended:

Resistance to isoniazid:

- [EvdGr](#) First 2 months (initial phase): rifampicin, pyrazinamide p. 621 and ethambutol hydrochloride;
- Continue with (continuation phase): rifampicin and ethambutol hydrochloride for 7 months (up to 10 months for extensive disease). [▲](#)

Resistance to pyrazinamide:

- [EvdGr](#) First 2 months (initial phase): rifampicin, ethambutol hydrochloride and isoniazid (with pyridoxine hydrochloride);
- Continue with (continuation phase): rifampicin and isoniazid (with pyridoxine hydrochloride) for 7 months. [▲](#)

Resistance to ethambutol hydrochloride:

- [EvdGr](#) First 2 months (initial phase): rifampicin, pyrazinamide and isoniazid (with pyridoxine hydrochloride);
- Continue with (continuation phase): rifampicin and isoniazid p. 621 (with pyridoxine hydrochloride p. 1141) for 4 months. [▲](#)

Resistance to rifampicin below:

- [EvdGr](#) Offer treatment with at least 6 antituberculosis drugs to which the mycobacterium is likely to be sensitive. [▲](#)

Multi-drug resistant tuberculosis

[EvdGr](#) In multidrug-resistant tuberculosis (*resistance to isoniazid and rifampicin, with or without any other resistance*), positive cases of rifampicin resistance require treatment with at least 6 antituberculosis drugs to which the mycobacterium is likely to be sensitive. Testing for resistance to second-line drugs is recommended and treatment should be modified according to susceptibility. [▲](#)

ANTIMYCOBACTERIALS > RIFAMYCINS

Rifampicin

09-May-2020

● INDICATIONS AND DOSE

Brucellosis in combination with other antibacterials | Legionnaires disease in combination with other antibacterials | Serious staphylococcal infections in combination with other antibacterials

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Child 1-11 months: 5-10 mg/kg twice daily
- ▶ Child 1-17 years: 10 mg/kg twice daily (max. per dose 600 mg)
- ▶ Adult: 0.6-1.2 g daily in 2-4 divided doses

Endocarditis in combination with other drugs

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 0.6-1.2 g daily in 2-4 divided doses

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

- ▶ BY MOUTH
- ▶ Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
- ▶ Adult: 600-900 mg 3 times a week for 6 months (initial and continuation phases) continued →

Tuberculosis in combination with other drugs (standard unsupervised 6-month treatment)

- ▶ BY MOUTH
- ▶ Child (body-weight up to 50 kg): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day
- ▶ Child (body-weight 50 kg and above): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day
- ▶ Adult (body-weight up to 50 kg): 450 mg once daily for 6 months (initial and continuation phases)
- ▶ Adult (body-weight 50 kg and above): 600 mg once daily for 6 months (initial and continuation phases)

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, in combination with isoniazid

- ▶ BY MOUTH
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 15 mg/kg daily for 3 months; maximum 450 mg per day
- ▶ Child 1 month–11 years (body-weight 50 kg and above): 15 mg/kg daily for 3 months; maximum 600 mg per day
- ▶ Child 12–17 years (body-weight up to 50 kg): 450 mg daily for 3 months
- ▶ Child 12–17 years (body-weight 50 kg and above): 600 mg daily for 3 months
- ▶ Adult (body-weight up to 50 kg): 450 mg daily for 3 months
- ▶ Adult (body-weight 50 kg and above): 600 mg daily for 3 months

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant

- ▶ BY MOUTH
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 15 mg/kg daily for 6 months; maximum 450 mg per day
- ▶ Child 1 month–11 years (body-weight 50 kg and above): 15 mg/kg daily for 6 months; maximum 600 mg per day
- ▶ Child 12–17 years (body-weight up to 50 kg): 450 mg daily for 6 months
- ▶ Child 12–17 years (body-weight 50 kg and above): 600 mg daily for 6 months

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant and under 35 years

- ▶ BY MOUTH
- ▶ Adult 18–34 years (body-weight up to 50 kg): 450 mg daily for 6 months
- ▶ Adult 18–34 years (body-weight 50 kg and above): 600 mg daily for 6 months

Prevention of secondary case of *Haemophilus influenzae* type b disease

- ▶ BY MOUTH
- ▶ Child 1–2 months: 10 mg/kg once daily for 4 days
- ▶ Child 3 months–11 years: 20 mg/kg once daily (max. per dose 600 mg) for 4 days
- ▶ Child 12–17 years: 600 mg once daily for 4 days
- ▶ Adult: 600 mg once daily for 4 days

Prevention of secondary case of meningococcal meningitis

- ▶ BY MOUTH
- ▶ Child 1–11 months: 5 mg/kg every 12 hours for 2 days
- ▶ Child 1–11 years: 10 mg/kg every 12 hours (max. per dose 600 mg), for 2 days
- ▶ Child 12–17 years: 600 mg every 12 hours for 2 days
- ▶ Adult: 600 mg every 12 hours for 2 days

Multibacillary leprosy in combination with dapsone and clofazimine (3-drug regimen) | Paucibacillary leprosy in combination with dapsone (2-drug regimen)

- ▶ BY MOUTH
- ▶ Adult (body-weight up to 35 kg): 450 mg once a month, supervised administration

- ▶ Adult (body-weight 35 kg and above): 600 mg once a month, supervised administration

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · jaundice
- **CAUTIONS** Discolours soft contact lenses
- **INTERACTIONS** → Appendix 1: rifampicin

● **SIDE-EFFECTS**● **GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Nausea · thrombocytopenia · vomiting
- ▶ **Uncommon** Diarrhoea · leucopenia
- ▶ **Frequency not known** Abdominal discomfort · acute kidney injury · adrenal insufficiency · agranulocytosis · appetite decreased · disseminated intravascular coagulation · dyspnoea · eosinophilia · flushing · haemolytic anaemia · hepatitis · hypersensitivity · influenza · intracranial haemorrhage · menstrual disorder · muscle weakness · myopathy · oedema · pseudomembranous enterocolitis · severe cutaneous adverse reactions (SCARs) · shock · skin reactions · sputum discolouration · sweat discolouration · tear discolouration · urine discolouration · vasculitis · wheezing

● **SPECIFIC SIDE-EFFECTS**

- ▶ With intravenous use Bone pain · gastrointestinal disorder · hyperbilirubinaemia · psychotic disorder
- ▶ With oral use Psychosis

SIDE-EFFECTS, FURTHER INFORMATION Side-effects that mainly occur with intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, and acute renal failure. Discontinue if serious side-effects develop.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifamycin hypersensitivity.
- **CONCEPTION AND CONTRACEPTION** Important Effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered.
- **PREGNANCY** Manufacturers advise very high doses teratogenic in *animal* studies in first trimester; risk of neonatal bleeding may be increased in third trimester.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor liver function weekly for two weeks, then every two weeks for the next six weeks.

Dose adjustments Manufacturer advises maximum 8 mg/kg per day.

● **RENAL IMPAIRMENT**

- ▶ In children Use with caution if doses above 10 mg/kg daily.
- ▶ In adults Use with caution if dose above 600 mg daily.

● **MONITORING REQUIREMENTS**

- ▶ *Renal function* should be checked before treatment.
- ▶ *Hepatic function* should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, liver function should be monitored on prolonged therapy.
- ▶ Blood counts should be monitored in patients on prolonged therapy.
- ▶ In adults Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months. Blood counts should also be monitored in these patients.

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use in adults For *intravenous infusion* (Rifadin[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute with solvent provided then dilute with 500 mL infusion fluid; give over 2–3 hours.

- ▶ With intravenous use in children Displacement value may be significant, consult local reconstitution guidelines; reconstitute with solvent provided. May be further diluted with Glucose 5% or Sodium chloride 0.9% to a final concentration of 1.2 mg/mL. Infuse over 2–3 hours.
- **PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.
 - Flavours of syrup may include raspberry.
- ▶ With oral use in children In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children.

● PATIENT AND CARER ADVICE

Soft contact lenses Patients or their carers should be advised that rifampicin discolours soft contact lenses. Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop. Medicines for Children leaflet: Rifampicin for meningococcal prophylaxis www.medicinesforchildren.org.uk/rifampicin-meningococcal-prophylaxis Medicines for Children leaflet: Rifampicin for the treatment of tuberculosis www.medicinesforchildren.org.uk/rifampicin-treatment-tuberculosis

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

CAUTIONARY AND ADVISORY LABELS 8, 14, 23

EXCIPIENTS: May contain Sucrose

▶ Rifadin (Sanofi)

Rifampicin 20 mg per 1 ml Rifadin 100mg/5ml syrup | 120 ml [PoM](#) £4.27 DT = £4.27

Capsule

Rifampicin with isoniazid and pyrazinamide

The properties listed below are those particular to the combination only. For the properties of the components please consider, rifampicin p. 615, isoniazid p. 621, pyrazinamide p. 621.

● INDICATIONS AND DOSE

Initial unsupervised treatment of tuberculosis (in combination with ethambutol)

► BY MOUTH

- Adult (body-weight up to 40 kg): 3 tablets daily for 2 months (initial phase), use *Rifater*® Tablets, preferably taken before breakfast.
- Adult (body-weight 40–49 kg): 4 tablets daily for 2 months (initial phase), use *Rifater*® Tablets, preferably taken before breakfast.
- Adult (body-weight 50–64 kg): 5 tablets daily for 2 months (initial phase), use *Rifater*® Tablets, preferably taken before breakfast.
- Adult (body-weight 65 kg and above): 6 tablets daily for 2 months (initial phase), use *Rifater*® Tablets, preferably taken before breakfast.

DOSE EQUIVALENCE AND CONVERSION

- Tablet quantities refer to the number of *Rifater*® Tablets which should be taken. Each *Rifater*® Tablet contains isoniazid 50 mg, pyrazinamide 300 mg and rifampicin 120 mg.

- **INTERACTIONS** → Appendix 1: isoniazid · pyrazinamide · rifampicin

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

ANTIMYCOBACTERIALS > OTHER

Aminosalicylic acid

30-Apr-2020

● INDICATIONS AND DOSE

Multiple-drug resistant tuberculosis, in combination with other drugs

► BY MOUTH

- Adult: 4 g every 8 hours for a usual treatment duration of 24 months; maximum 12 g per day

Desensitisation regimen

► BY MOUTH

- Adult: (consult product literature)

- **CAUTIONS** Peptic ulcer
- **INTERACTIONS** → Appendix 1: aminosalicylic acid
- **SIDE-EFFECTS**
 - **Common or very common** Diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders · hypersensitivity · nausea · skin reactions · vestibular syndrome · vomiting
 - **Uncommon** Appetite decreased
 - **Rare or very rare** Agranulocytosis · anaemia · crystalluria · gastrointestinal haemorrhage · headache · hepatic disorders · hypoglycaemia · hypothyroidism · leucopenia · methaemoglobinemia · peripheral neuropathy · taste metallic · tendon pain · thrombocytopenia · visual impairment · weight decreased
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies (highest risk during first trimester).

- **BREAST FEEDING** Present in milk—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment due to accumulation of inactive metabolites.
- **MONITORING REQUIREMENTS**
 - Monitor for hypersensitivity reaction during the first 3 months of treatment—for desensitisation dosing regimen consult product literature.
 - Monitor liver function—discontinue immediately if signs or symptoms of hepatic toxicity (including rash, fever and gastrointestinal disturbance).
- **DIRECTIONS FOR ADMINISTRATION** Disperse granules in orange or tomato juice and take immediately (granules will not dissolve, ensure all granules are swallowed). Granules can be sprinkled on apple sauce or yoghurt for administration.
- **PATIENT AND CARER ADVICE** Patients should be advised that the skeletons of the granules may be seen in the stools. Counselling advised on administration.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant granules

CAUTIONARY AND ADVISORY LABELS 9, 25

► Granupas (Eurocept International) (b)

Aminosalicylic acid 1 gram per 1 gram Granupas gastro-resistant granules 4g sachets sugar-free | 30 sachet **[PoM]** £331.00 DT = £331.00

Bedaquiline

08-May-2020

● INDICATIONS AND DOSE

Multiple-drug resistant pulmonary tuberculosis, in combination with other drugs

► BY MOUTH

- Adult: Initially 400 mg once daily for 2 weeks, then 200 mg 3 times a week for 22 weeks, intervals of at least 48 hours between each dose, continue appropriate combination therapy after bedaquiline

- **CONTRA-INDICATIONS** QTc interval more than 500 milliseconds (derived using Fridericia's formula) · ventricular arrhythmia
- **CAUTIONS** Hypothyroidism · QTc interval (derived using Fridericia's formula) 450–500 milliseconds · risk factors for QT interval prolongation (e.g. electrolyte disturbances, heart failure, history of symptomatic arrhythmias, bradycardia, congenital long QT syndrome)
- **INTERACTIONS** → Appendix 1: bedaquiline
- **SIDE-EFFECTS**
 - **Common or very common** Arthralgia · diarrhoea · dizziness · headache · hepatic function abnormal · myalgia · nausea · QT interval prolongation · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION** If syncope occurs, obtain ECG.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- ▶ Determine serum potassium, calcium, and magnesium before starting treatment (correct if abnormal)—remeasure if QT prolongation occurs during treatment.
- ▶ Obtain ECG before starting treatment, and then at least monthly during treatment or more frequently if concomitant use with other drugs known to prolong the QT interval.
- ▶ Monitor liver function before starting treatment and then at least monthly during treatment—discontinue treatment if severe abnormalities in liver function tests.

● PATIENT AND CARER ADVICE

Missed doses If a dose is missed during the first two weeks of treatment, the missed dose should not be taken and the next dose should be taken at the usual time; if a dose is missed during weeks 3–24 of treatment, the missed dose should be taken as soon as possible and then the usual regimen resumed.

Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving)

Bedaquiline (as Bedaquiline fumarate) 100 mg Sirturo 100mg tablets | 24 tablet [PoM] £2,387.28

Capreomycin

05-May-2020

● INDICATIONS AND DOSE

Tuberculosis resistant to first-line drugs, in combination with other drugs

▶ **BY DEEP INTRAMUSCULAR INJECTION**

- ▶ **Adult:** 1 g daily (max. per dose 20 mg/kg) for 2–4 months, then reduced to 1 g 2–3 times a week

- CAUTIONS** Auditory impairment

- INTERACTIONS** → Appendix 1: capreomycin

- SIDE-EFFECTS** Eosinophilia · febrile disorders · hearing impairment · leucocytosis · leucopenia · nephrotoxicity · pain · pseudo-Bartter syndrome · skin reactions · thrombocytopenia · tinnitus · vertigo

- PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—teratogenic in *animal* studies.

- BREAST FEEDING** Manufacturer advises caution—no information available.

- RENAL IMPAIRMENT** Nephrotoxic; ototoxic.

Dose adjustments Reduce dose—consult product literature.

- MONITORING REQUIREMENTS** Monitor renal, hepatic, auditory, and vestibular function and electrolytes.

- MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection▶ **Capreomycin (Non-proprietary)**

Capreomycin (as Capreomycin sulfate) 1 gram Capreomycin 1g powder for solution for injection vials | 1 vial [PoM] £31.47

Cycloserine**● INDICATIONS AND DOSE**

Tuberculosis resistant to first-line drugs, in combination with other drugs

▶ **BY MOUTH**

- ▶ **Adult:** Initially 250 mg every 12 hours for 2 weeks, then increased if necessary up to 500 mg every 12 hours, dose to be increased according to blood concentration and response

PHARMACOKINETICS

- ▶ Cycloserine penetrates the CNS.

- CONTRA-INDICATIONS** Alcohol dependence · depression · epilepsy · psychotic states · severe anxiety
- INTERACTIONS** → Appendix 1: cycloserine
- SIDE-EFFECTS** Behaviour abnormal · coma · confusion · congestive heart failure · drowsiness · dysarthria · headache · hyperirritability · megaloblastic anaemia · memory loss · neurological effects · paraesthesia · paresis · psychosis · rash · reflexes increased · seizures · suicidal ideation · tremor · vertigo

SIDE-EFFECTS, FURTHER INFORMATION **CNS toxicity**

Discontinue or reduce dose if symptoms of CNS toxicity occur.

Rashes or allergic dermatitis Discontinue or reduce dose if rashes or allergic dermatitis develop.

- PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.
- BREAST FEEDING** Present in milk—amount too small to be harmful.
- RENAL IMPAIRMENT**
Dose adjustments Increase interval between doses if creatinine clearance less than 50 mL/minute.
Monitoring Monitor blood-cycloserine concentration if creatinine clearance less than 50 mL/minute.

● MONITORING REQUIREMENTS

- ▶ Blood concentration monitoring required especially in renal impairment or if dose exceeds 500 mg daily or if signs of toxicity; blood concentration should not exceed 30 mg/litre.
- ▶ Monitor haematological, renal, and hepatic function.

- MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 2, 8

▶ **Cycloserine (Non-proprietary)**

Cycloserine 250 mg Cycloserine 250mg capsules | 100 capsule [PoM] £442.89 DT = £442.89

Delamanid

11-May-2020

● INDICATIONS AND DOSE

Multiple-drug resistant pulmonary tuberculosis, in combination with other drugs

▶ **BY MOUTH**

- ▶ **Adult:** 100 mg twice daily for 24 weeks, continue appropriate combination therapy after delamanid

- CONTRA-INDICATIONS** QTc interval more than 500 milliseconds (derived using Fridericia's formula) · serum albumin less than 28 g/litre
- CAUTIONS** Risk factors for QT interval prolongation (e.g. electrolyte disturbances, acute myocardial infarction, heart failure with reduced left ventricular ejection fraction, severe hypertension, left ventricular hypertrophy, bradycardia, congenital long QT syndrome, history of symptomatic arrhythmias)
- INTERACTIONS** → Appendix 1: delamanid
- SIDE-EFFECTS**
▶ **Common or very common** Anxiety · appetite decreased · asthenia · chest pain · cough · depression · dyslipidaemia · dyspnoea · ear pain · electrolyte imbalance · gastrointestinal discomfort · haemoptysis · headache · hyperhidrosis · hypertension · hypotension · malaise · muscle weakness · nausea · oropharyngeal pain · osteochondrosis · pain · palpitations · peripheral neuropathy · photophobia · psychotic disorder · QT interval prolongation · reticulocytosis · sensation abnormal · skin

reactions · sleep disorders · throat irritation · tinnitus · tremor · vomiting

- **Uncommon** Aggression · atrioventricular block · balance impaired · dehydration · delusional disorder, persecutory type · dysphagia · extrasystole · hepatic function abnormal · increased risk of infection · lethargy · leucopenia · oral paraesthesia · psychiatric disorders · thrombocytopenia · urinary disorders

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
 - Monitor serum albumin and electrolytes before starting treatment and then during treatment—discontinue treatment if serum albumin less than 28 g/litre.
 - Obtain ECG before starting treatment and then monthly during treatment (more frequently if serum albumin 28–34 g/litre, or if concomitant use of potent CYP3A4 inhibitors, or if risk factors for QT interval prolongation, or if QTc interval 450–500 milliseconds in men or 470–500 milliseconds in women)—discontinue treatment if QTc interval more than 500 milliseconds (derived using Fridericia's formula).
- **HANDLING AND STORAGE** Dispense in original container (contains desiccant).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Ethambutol hydrochloride

11-May-2020

● INDICATIONS AND DOSE

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

- BY MOUTH
- Child: 20 mg/kg once daily for 2 months (initial phase)
- Adult: 15 mg/kg once daily for 2 months (initial phase)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

- BY MOUTH
- Child: 30 mg/kg 3 times a week for 2 months (initial phase)
- Adult: 30 mg/kg 3 times a week for 2 months (initial phase)

- **CONTRA-INDICATIONS** Optic neuritis · poor vision

- **CAUTIONS** Elderly · young children

CAUTIONS, FURTHER INFORMATION

- Understanding warnings Patients who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.
- **INTERACTIONS** → Appendix 1: ethambutol
- **SIDE-EFFECTS**
 - **Common or very common** Hyperuricaemia · nerve disorders · visual impairment

- **Rare or very rare** Nephritis tubulointerstitial
- **Frequency not known** Alveolitis allergic · appetite decreased · asthenia · confusion · dizziness · eosinophilia · fever · flatulence · gastrointestinal discomfort · gout · hallucination · headache · jaundice · leucopenia · nausea · nephrotoxicity · neutropenia · photosensitive lichenoid eruption · sensation abnormal · severe cutaneous adverse reactions (SCARs) · skin reactions · taste metallic · thrombocytopenia · tremor · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION** Ocular toxicity is more common where excessive dosage is used or if the patient's renal function is impaired. Early discontinuation of the drug is almost always followed by recovery of eyesight.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Amount too small to be harmful.
- **RENAL IMPAIRMENT** Risk of optic nerve damage. Should preferably be avoided in patients with renal impairment. **Dose adjustments** ► In adults If creatinine clearance less than 30 mL/minute, use 15–25 mg/kg (max. 2.5 g) 3 times a week.
 - In children If creatinine clearance less than 30 mL/minute/1.73 m², use 15–25 mg/kg (max. 2.5 g) 3 times a week.
- Monitoring** If creatinine clearance less than 30 mL/minute, monitor plasma-ethambutol concentration.
- **MONITORING REQUIREMENTS**
 - 'Peak' concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre); 'trough' (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre).
 - Renal function should be checked before treatment.
 - Visual acuity should be tested by Snellen chart before treatment with ethambutol.
 - In children In young children, routine ophthalmological monitoring recommended.
- **PRESCRIBING AND DISPENSING INFORMATION** The RCPCH and NPPG recommend that, when a liquid special of ethambutol is required, the following strength is used: 400 mg/5 mL.

● PATIENT AND CARER ADVICE

Ocular toxicity The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice.

● INDICATIONS AND DOSE

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

- ▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)
- ▶ Adult: 300 mg daily for 6 months (initial and continuation phases)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

- ▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
- ▶ Adult: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive

- ▶ INITIALLY BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child 1 month–11 years: 10 mg/kg daily (max. per dose 300 mg) for 6 months, alternatively (by mouth) 10 mg/kg daily (max. per dose 300 mg) for 3 months, to be taken in combination with rifampicin
- ▶ Child 12–17 years: 300 mg daily for 6 months, alternatively (by mouth) 300 mg daily for 3 months, to be taken in combination with rifampicin
- ▶ Adult: 300 mg daily for 6 months, alternatively (by mouth) 300 mg daily for 3 months, to be taken in combination with rifampicin

- **CONTRA-INDICATIONS** Drug-induced liver disease
- **CAUTIONS** Acute porphyrias p. 1120 · alcohol dependence · diabetes mellitus · epilepsy · history of psychosis · HIV infection · malnutrition · slow acetylator status (increased risk of side-effects)

CAUTIONS, FURTHER INFORMATION

- ▶ Peripheral neuropathy Pyridoxine hydrochloride p. 1141 should be given prophylactically in all patients from the start of treatment. Peripheral neuropathy is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, pregnancy, malnutrition and HIV infection.

- **INTERACTIONS** → Appendix 1: isoniazid

● SIDE-EFFECTS

- ▶ **Uncommon** Hepatic disorders
- ▶ **Rare or very rare** Severe cutaneous adverse reactions (SCARs)
- ▶ **Frequency not known** Agranulocytosis · alopecia · anaemia · aplastic anaemia · eosinophilia · fever · gynaecomastia · haemolytic anaemia · hyperglycaemia · lupus-like syndrome · nerve disorders · optic atrophy · pancreatitis · pellagra · psychosis · seizure · skin reactions · thrombocytopenia · vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Hepatitis more common in those aged over 35 years and those with a daily alcohol intake.

- **PREGNANCY** Not known to be harmful; prophylactic pyridoxine recommended.
- **BREAST FEEDING** Theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother. **Monitoring** In breast-feeding, monitor infant for possible toxicity.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of hepatotoxicity).

Monitoring In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months.

- **RENAL IMPAIRMENT** Risk of ototoxicity and peripheral neuropathy; prophylactic pyridoxine hydrochloride p. 1141 recommended.
- **MONITORING REQUIREMENTS**
 - ▶ *Renal function* should be checked before treatment.
 - ▶ *Hepatic function* should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.
 - ▶ In adults Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months.
- **PRESCRIBING AND DISPENSING INFORMATION**
 - ▶ With oral use in children In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The RCPCH and NPPG recommend that, when a liquid special of isoniazid is required, the following strength is used: 50 mg/5 mL.
 - ▶ In children Doses may need to be recalculated to allow for weight gain in younger children.
- **PATIENT AND CARER ADVICE**

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

2.6 Urinary tract infections

12-Feb-2019

Urinary-tract infections

Description of condition

Urinary-tract infections (UTIs) are common infections that can affect any part of the urinary tract. They occur more frequently in women, and are usually independent of any risk factor. UTIs are predominantly caused by bacteria from the gastrointestinal tract entering the urinary tract, with *Escherichia coli* being the most common cause. Infection due to *Candida albicans* is rare, but may occur in hospitalised patients who are immunocompromised or have an indwelling catheter.

Lower UTIs are associated with inflammation of the bladder (cystitis) and urethra (urethritis). In some patients infection can ascend the urinary tract and lead to an upper UTI. Upper UTIs affect the proximal part of the ureters (pyelitis) or the proximal part of the ureters and the kidneys (pyelonephritis), and can cause renal scarring, abscess or failure, and sepsis. The most common signs and symptoms of lower UTIs are dysuria, increased urinary frequency and urgency, urine that is strong smelling, cloudy or contains blood, and persistent lower abdominal pain. Upper UTIs usually present with accompanying loin pain and fever.

In pregnant women, asymptomatic bacteriuria is a risk factor for pyelonephritis and premature labour. UTIs in pregnancy have been associated with developmental delay and cerebral palsy in the infant, as well as fetal death.

Insertion of a catheter into the urinary tract increases the risk of developing a UTI, and the longer the catheter is in place for, further increases the risk of bacteriuria.

UTIs are considered recurrent after at least two episodes within 6 months, or three or more episodes within 12 months.

Acute prostatitis is an infection of the prostate gland and is usually caused by a UTI. It can occur spontaneously or after certain medical procedures and can last for several weeks. Common symptoms include sudden onset of fever, acute urinary retention or irritative voiding symptoms. Possible complications include prostatic abscess, bacteraemia, epididymitis, and pyelonephritis. Chronic prostatitis is a complication of acute prostatitis and is defined as at least 3 months of urogenital pain usually associated with lower urinary tract symptoms.

Aims of treatment

The aims of treatment are to relieve symptoms, treat the underlying infection, prevent systemic infection, and to reduce the risk of complications.

Non-drug treatment

[EvGr](#) Patients with a UTI should be advised to drink plenty of fluids to avoid dehydration, and to use self-care strategies to

reduce the risk of recurrent infections. These include wiping from front to back after defaecation, not delaying urination, and not wearing occlusive underwear.

D-mannose, cranberry or urine alkalinising products may be used as self-care treatment strategies, however the benefit of these products for the prevention and treatment of UTIs has not been established. Patients should be advised to consider the sugar content of these products. [A](#)

Drug treatment

[EvdGr](#) When prescribing antibacterial therapy the severity of symptoms, risk of developing complications, previous urine culture and susceptibility results, and previous antibacterial use should be taken into consideration.

With the exception of pregnant women, asymptomatic bacteriuria is not routinely treated with antibacterials. [A](#)

For other considerations such as for patients receiving prophylactic antibacterial therapy, switching from *intravenous* to *oral* antibacterials, and for advice to give to patients, see Antibacterials, principles of therapy p. 527.

[EvdGr](#) Reassess patients if symptoms worsen at any time, or do not start to improve within 48 hours of starting treatment.

Refer patients to hospital if they have any symptoms or signs suggestive of a more serious illness or condition.

Review choice of antibacterial when microbiological results are available, and change treatment as appropriate if susceptibility results indicate bacterial resistance.

Advise patients that paracetamol or ibuprofen can be used for pain relief. Where appropriate codeine may be used in patients with acute pyelonephritis or prostatitis. [A](#)

Lower urinary-tract infection

Non-pregnant women

[EvdGr](#) Consider a back-up antibacterial prescription for use if symptoms worsen or do not improve within 48 hours or an immediate antibacterial prescription. [A](#)

Choice of antibacterial therapy

- **Oral first line :**
 - ▶ [EvdGr](#) Nitrofurantoin p. 625, or trimethoprim p. 607 (if low risk of resistance). [A](#)
- **Oral second line** (if no improvement after at least 48 hours, or first line not suitable):
 - ▶ [EvdGr](#) Nitrofurantoin (if not used first line), fosfomycin p. 603, or pivmecillinam hydrochloride p. 585. [A](#)

Men

[EvdGr](#) An immediate antibacterial prescription should be given and a midstream urine sample obtained before treatment is taken and sent for culture and susceptibility testing. [A](#)

Choice of antibacterial therapy

- **Oral first line :**
 - ▶ [EvdGr](#) Nitrofurantoin, or trimethoprim. [A](#)
- **Oral second line** (if no improvement after at least 48 hours, or first line not suitable):
 - ▶ Consider pyelonephritis or prostatitis. See *pyelonephritis, acute*, or *prostatitis, acute* below for guidance.

Pregnant women

[EvdGr](#) An immediate antibacterial prescription should be given and a midstream urine sample obtained before treatment is taken and sent for culture and susceptibility testing. [A](#)

Choice of antibacterial therapy

- **Oral first line :**
 - ▶ [EvdGr](#) Nitrofurantoin. [A](#)
- **Oral second line** (if no improvement after at least 48 hours, or first line not suitable):
 - ▶ [EvdGr](#) Amoxicillin p. 579 (only if culture susceptible), or cefalexin p. 551. [A](#)

- **Alternative second line :**

- ▶ [EvdGr](#) Consult local microbiologist. [A](#)

- **Asymptomatic bacteriuria:**

- ▶ [EvdGr](#) Amoxicillin, cefalexin, or nitrofurantoin. [A](#)

Prostatitis, acute

[EvdGr](#) An immediate antibacterial prescription should be given and a midstream urine sample obtained before treatment is taken and sent for culture and susceptibility testing.

Refer patients to hospital if symptoms are not improving after 48 hours of treatment, or if they have any signs or symptoms suggestive of a more serious condition such as sepsis, acute urinary retention, or prostatic abscess. [A](#)

Choice of antibacterial therapy

- **Oral first line :**
 - ▶ [EvdGr](#) Ciprofloxacin p. 590, or ofloxacin p. 593.
 - ▶ Alternative first line (if unable to take fluoroquinolones): trimethoprim. [A](#)
- **Oral second line** (on specialist advice):
 - ▶ [EvdGr](#) Levofloxacin p. 592, or co-trimoxazole p. 594. [A](#)
- **Intravenous first line** (if severely unwell or unable to take oral treatment). [EvdGr](#) Antibacterials may be combined if concerned about sepsis.
 - ▶ Amikacin p. 544, ceftriaxone p. 556, cefuroxime p. 553, ciprofloxacin, gentamicin p. 545, or levofloxacin. [A](#)
- **Intravenous second line :**
 - ▶ [EvdGr](#) Consult local microbiologist. [A](#)

Pyelonephritis, acute

[EvdGr](#) An immediate antibacterial prescription should be given and a midstream urine sample obtained before treatment is taken and sent for culture and susceptibility testing.

Consider referring or seeking specialist advice for patients with acute pyelonephritis who are significantly dehydrated or are unable to take oral fluids and medicines, are pregnant, or have a higher risk of developing complications. [A](#)

Non-pregnant women and men

Choice of antibacterial therapy

- **Oral first line :**
 - ▶ [EvdGr](#) Cefalexin p. 551, or ciprofloxacin p. 590. If sensitivity known: co-amoxiclav p. 582, or trimethoprim p. 607. [A](#)
- **Intravenous first line** (if severely unwell or unable to take oral treatment). [EvdGr](#) Antibacterials may be combined if concerned about susceptibility or sepsis.
 - ▶ Amikacin p. 544, ceftriaxone p. 556, cefuroxime p. 553, ciprofloxacin, or gentamicin p. 545. Co-amoxiclav may be used if given in combination or sensitivity known. [A](#)
- **Intravenous second line :**
 - ▶ [EvdGr](#) Consult local microbiologist. [A](#)

Pregnant women

Choice of antibacterial therapy

- **Oral first line :**
 - ▶ [EvdGr](#) Cefalexin. [A](#)
- **Intravenous first line** (if severely unwell or unable to take oral treatment):
 - ▶ [EvdGr](#) Cefuroxime. [A](#)
- **Second line** or combining antibacterials if concerned about susceptibility or sepsis:
 - ▶ [EvdGr](#) Consult local microbiologist. [A](#)

Recurrent urinary-tract infection

[EvdGr](#) For patients with recurrent UTIs, refer or seek specialist advice for men, pregnant women, patients with suspected cancer, those presenting with recurrent upper UTI, and those with recurrent lower UTI with an unknown cause.

For postmenopausal women experiencing recurrent UTIs, consider a vaginal oestrogen [unlicensed indication] at the lowest effective dose if behavioural and personal hygiene measures alone are not effective or appropriate. Treatment

should be reviewed within 12 months. Oral oestrogens (hormone replacement therapy) should not be given to postmenopausal women specifically to reduce the risk of recurrent UTIs.

In non-pregnant women, consider a trial of antibacterial prophylaxis if behavioural and personal hygiene measures, and vaginal oestrogen (in postmenopausal women) are not effective or appropriate. Single-dose antibacterial prophylaxis [unlicensed indication] should be considered for use when exposed to an identifiable trigger. Daily antibacterial prophylaxis should be considered in non-pregnant women who have had no improvement after single-dose antibacterial prophylaxis, or who have no identifiable triggers.

With specialist advice, daily antibacterial prophylaxis should be considered for men and pregnant women if behavioural and personal hygiene measures alone are not effective or appropriate.

Advise patients about the risk of resistance with long-term antibacterial use, seeking medical help if symptoms of an acute UTI develop, and to return for review within 6 months.

Review the success and ongoing need of prophylaxis at least every 6 months. If antibacterial prophylaxis is stopped ensure the patient has rapid access to treatment if they develop an acute UTI. [A](#)

Women and men

Choice of antibacterial therapy

- **Oral first line** :
 - ▶ [EvGr](#) Trimethoprim, or nitrofurantoin p. 625. [A](#)
- **Oral second line** :
 - ▶ [EvGr](#) Amoxicillin p. 579 [unlicensed indication], or cefalexin. [A](#)

Catheter-associated urinary-tract infection

[EvGr](#) For people with a catheter-associated urinary-tract infection, consider removing or changing the catheter as soon as possible if it has been in place for longer than 7 days, without delaying antibacterial treatment. An immediate antibacterial prescription should be given and a urine sample obtained before treatment is taken and sent for culture and susceptibility testing.

Consider referring or seeking specialist advice for patients with a catheter-associated UTI who are significantly dehydrated or unable to take oral fluids and medicines, are pregnant, have a higher risk of developing complications, have recurrent catheter-associated UTIs, or have bacteria resistant to oral antibacterials. [A](#)

Non-pregnant women and men

Choice of antibacterial therapy

- **Oral first line** (if no upper UTI symptoms):
 - ▶ [EvGr](#) Amoxicillin (only if culture susceptible), nitrofurantoin, or trimethoprim (if low risk of resistance). [A](#)
- **Oral second line** (if no upper UTI symptoms and first-line not suitable):
 - ▶ [EvGr](#) Pivmecillinam hydrochloride p. 585. [A](#)
- **Oral first line** (upper UTI symptoms):
 - ▶ [EvGr](#) Cefalexin, ciprofloxacin, co-amoxiclav (if culture susceptible), or trimethoprim (if culture susceptible). [A](#)
- **Intravenous first line** (if severely unwell or unable to take oral treatment). [EvGr](#) Antibacterials may be combined if concerned about susceptibility or sepsis.
 - ▶ Amikacin, ceftriaxone, cefuroxime, ciprofloxacin, gentamicin, or co-amoxiclav (only in combination, unless culture results confirm susceptibility). [A](#)
- **Intravenous second line** :
 - ▶ [EvGr](#) Consult local microbiologist. [A](#)

Pregnant women

Choice of antibacterial therapy

- **Oral first line** :
 - ▶ [EvGr](#) Cefalexin. [A](#)

ANTIBACTERIALS > OTHER

Methenamine hippurate

06-Aug-2018

(Hexamine hippurate)

• INDICATIONS AND DOSE

Prophylaxis and long-term treatment of chronic or recurrent uncomplicated lower urinary-tract infections

▶ BY MOUTH

▶ Adult: 1 g every 12 hours

Prophylaxis and long-term treatment of chronic or recurrent uncomplicated lower urinary-tract infections in patients with catheters

▶ BY MOUTH

▶ Adult: 1 g every 8–12 hours

• **CONTRA-INDICATIONS** Gout · metabolic acidosis · severe dehydration

• **INTERACTIONS** → Appendix 1: methenamine

• SIDE-EFFECTS

▶ **Uncommon** Epigastric discomfort · skin reactions

• **PREGNANCY** There is inadequate evidence of safety, but it has been in wide use for many years without apparent ill consequence, however, manufacturer advises it is preferable to avoid.

• **BREAST FEEDING** Amount too small to be harmful.

• **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

• **RENAL IMPAIRMENT** Avoid if eGFR less than 10 mL/minute/1.73 m²—risk of hippurate crystalluria.

• **EFFECT ON LABORATORY TESTS** False results for urinary steroids, catecholamines and 5-hydroxyindole acetic acid can occur.

- **LESS SUITABLE FOR PRESCRIBING** Methenamine (hexamine) hippurate should **not** generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections. It is considered less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9

▶ **Methenamine hippurate (Non-proprietary)**

Methenamine hippurate 1 gram Methenamine hippurate 1g tablets | 60 tablet [P] £19.74-£23.68 DT = £19.74

▶ **Hiprex (Mylan)**

Methenamine hippurate 1 gram Hiprex 1g tablets | 60 tablet [P] £19.74 DT = £19.74

Nitrofurantoin

11-May-2020

● **INDICATIONS AND DOSE****Lower urinary-tract infections**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 3 months-11 years: 750 micrograms/kg 4 times a day for 3 days
- ▶ Child 12-15 years: 50 mg 4 times a day for 3 days (7 days in pregnant women)
- ▶ Child 16-17 years: 50 mg 4 times a day for 3 days (7 days in males and pregnant women)
- ▶ Adult: 50 mg 4 times a day for 3 days (7 days in males and pregnant women)
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12-15 years: 100 mg twice daily for 3 days (7 days in pregnant women)
- ▶ Child 16-17 years: 100 mg twice daily for 3 days (7 days in males and pregnant women)
- ▶ Adult: 100 mg twice daily for 3 days (7 days in males and pregnant women)

Urinary-tract infections (catheter-associated)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 16-17 years: 50 mg 4 times a day for 7 days, to be used if modified-release preparations are unavailable
- ▶ Adult: 50 mg 4 times a day for 7 days, to be used if modified-release preparations are unavailable
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 16-17 years: 100 mg twice daily for 7 days
- ▶ Adult: 100 mg twice daily for 7 days

Severe chronic recurrent urinary-tract infections

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg 4 times a day for 3-7 days
- ▶ Adult: 100 mg 4 times a day for 7 days, reduce dose or discontinue treatment if severe nausea occurs

Prophylaxis of recurrent urinary-tract infection

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 3 months-11 years: 1 mg/kg once daily, dose to be taken at night
- ▶ Child 12-15 years: 50-100 mg once daily, dose to be taken at night
- ▶ Child 16-17 years: 50-100 mg once daily, dose to be taken at night, alternatively 100 mg for 1 dose, following exposure to a trigger
- ▶ Adult: 50-100 mg once daily, dose to be taken at night, alternatively 100 mg for 1 dose, following exposure to a trigger

Genito-urinary surgical prophylaxis

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg twice daily on day of procedure and for 3 days after

- ▶ Adult: 100 mg twice daily on day of procedure and for 3 days after

- **UNLICENSED USE** [EvGr] Duration of treatment for lower urinary-tract infection differs from product literature and adheres to national guidelines. ⚠ See Urinary-tract infections p. 622 for further information. [EvGr] Nitrofurantoin can be given as a single dose for the prophylaxis of recurrent urinary tract infection following exposure to a trigger, ⚠ but this dosing regimen is not licensed. See Urinary-tract infections p. 622 for further information.
- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · G6PD deficiency
- **CAUTIONS** Anaemia · diabetes mellitus · electrolyte imbalance · folate deficiency · pulmonary disease · susceptibility to peripheral neuropathy · urine may be coloured yellow or brown · vitamin B deficiency
- **INTERACTIONS** → Appendix 1: nitrofurantoin
- **SIDE-EFFECTS** Agranulocytosis · alopecia · anaemia · angioedema · aplastic anaemia · appetite decreased · arthralgia · asthenia · chest pain · chills · circulatory collapse · confusion · cough · cyanosis · depression · diarrhoea · dizziness · drowsiness · dyspnoea · eosinophilia · euphoric mood · fever · granulocytopenia · haemolytic anaemia · headache · hepatic disorders · idiopathic intracranial hypertension · increased risk of infection · leucopenia · lupus-like syndrome · nausea · nerve disorders · nystagmus · pancreatitis · psychotic disorder · pulmonary hypersensitivity · pulmonary reaction (possible association with lupus erythematosus-like syndrome) · respiratory disorders · skin reactions · Stevens-Johnson syndrome · thrombocytopenia · urine discolouration · vertigo · vomiting
- **PREGNANCY** Avoid at term—may produce neonatal haemolysis.
- **BREAST FEEDING** Avoid; only small amounts in milk but enough to produce haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Risk of peripheral neuropathy; antibacterial efficacy depends on renal secretion of the drug into urinary tract.
 - ▶ In adults Avoid if eGFR less than 45 mL/minute/1.73 m²; may be used with caution if eGFR 30-44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.
 - ▶ In children Avoid if estimated glomerular filtration rate less than 45 mL/minute/1.73 m²; may be used with caution if estimated glomerular filtration rate 30-44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.
- **MONITORING REQUIREMENTS** On long-term therapy, monitor liver function and monitor for pulmonary symptoms, especially in the elderly (discontinue if deterioration in lung function).
- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances).
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Nitrofurantoin for urinary tract infections www.medicinesforchildren.org.uk/nitrofurantoin-urinary-tract-infections

- MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

3 Fungal infection

Antifungals, systemic use

Fungal infections

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. Local treatment is suitable for a number of fungal infections (genital, bladder, eye, ear, oropharynx, and skin).

Aspergillosis

Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. Voriconazole p. 635 is the treatment of choice for aspergillosis; liposomal amphotericin p. 629 is an alternative first-line treatment when voriconazole cannot be used. Caspofungin p. 628, or itraconazole p. 632, can be used in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin. Itraconazole is also used for the treatment of chronic pulmonary aspergillosis or as an adjunct in the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication]. Posaconazole p. 634 is licensed for use in patients with invasive aspergillosis who are refractory to, or intolerant of itraconazole or amphotericin.

Candidiasis

Many superficial candidal infections including infections of the skin are treated locally; widespread or intractable infection requires systemic antifungal treatment. Vaginal candidiasis may be treated with locally acting antifungals or with fluconazole p. 630 given by mouth; for resistant organisms in adults, itraconazole can be given by mouth.

Oropharyngeal candidiasis generally responds to topical therapy; fluconazole is given by mouth for unresponsive infections; it is effective and is reliably absorbed. Itraconazole may be used for infections that do not respond to fluconazole. Topical therapy may not be adequate in

immunocompromised patients and an oral triazole antifungal is preferred.

For *invasive or disseminated candidiasis*, an **echinocandin** can be used. Fluconazole is an alternative for *Candida albicans* infection in clinically stable patients who have not received an azole antifungal recently. Amphotericin is an alternative when an echinocandin or fluconazole cannot be used, however, amphotericin should be considered for the initial treatment of CNS candidiasis. Voriconazole can be used for infections caused by fluconazole-resistant *Candida* spp. when oral therapy is required, or in patients intolerant of amphotericin or an echinocandin. In refractory cases, flucytosine p. 636 can be used with intravenous amphotericin.

Cryptococcosis

Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV-positive patients, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is amphotericin by intravenous infusion and flucytosine by intravenous infusion for 2 weeks, followed by fluconazole by mouth for 8 weeks or until cultures are negative. In cryptococcosis, fluconazole is sometimes given alone as an alternative in HIV-positive patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

Histoplasmosis

Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons. Itraconazole can be used for the treatment of immunocompetent patients with indolent non-meningeal infection, including chronic pulmonary histoplasmosis. Amphotericin by intravenous infusion is used for the initial treatment of fulminant or severe infections, followed by a course of itraconazole by mouth. Following successful treatment, itraconazole can be used for prophylaxis against relapse until immunity recovers.

Skin and nail infections

Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy. Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis). Oral imidazole or triazole antifungals (particularly itraconazole) and terbinafine p. 1300 are used more frequently than griseofulvin p. 636 because they have a broader spectrum of activity and require a shorter duration of treatment.

Tinea capitis is treated systemically; additional topical application of an antifungal may reduce transmission. Griseofulvin is used for tinea capitis in adults and children; it is effective against infections caused by *Trichophyton tonsurans* and *Microsporium* spp. Terbinafine is used for tinea capitis caused by *T. tonsurans* [unlicensed indication]. The role of terbinafine in the management of *Microsporium* infections is uncertain.

Pityriasis versicolor may be treated with itraconazole by mouth if topical therapy is ineffective; fluconazole by mouth is an alternative. Oral terbinafine is **not** effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. Terbinafine and itraconazole have largely replaced griseofulvin for the systemic treatment of *onychomycosis*, particularly of the toenail; terbinafine is considered to be the drug of choice. Itraconazole can be administered as intermittent 'pulse' therapy. Topical antifungals also have a role in the treatment of onychomycosis.

Immunocompromised patients

Immunocompromised patients are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. Fluconazole is more reliably absorbed than itraconazole, but fluconazole is not effective against *Aspergillus* spp. Itraconazole is preferred in patients at risk of invasive aspergillosis. Posaconazole can be used for prophylaxis in patients who are undergoing haematopoietic stem cell transplantation or receiving chemotherapy for acute myeloid leukaemia or myelodysplastic syndrome. Micafungin p. 628 can be used for prophylaxis of candidiasis in patients undergoing haematopoietic stem cell transplantation when fluconazole, itraconazole or posaconazole cannot be used.

Amphotericin by intravenous infusion or caspofungin is used for the empirical *treatment* of serious fungal infections; caspofungin is not effective against fungal infections of the CNS.

Triazole antifungals

Triazole antifungal drugs have a role in the prevention and systemic treatment of fungal infections.

Fluconazole is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria.

Itraconazole is active against a wide range of dermatophytes. Itraconazole capsules require an acid environment in the stomach for optimal absorption. Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

Posaconazole is licensed for the treatment of invasive fungal infections unresponsive to conventional treatment.

Voriconazole is a broad-spectrum antifungal drug which is licensed for use in life-threatening infections.

Imidazole antifungals

The imidazole antifungals include clotrimazole p. 875, econazole nitrate p. 875, ketoconazole p. 718, and tioconazole p. 1299. They are used for the local treatment of vaginal candidiasis and for dermatophyte infections. Miconazole p. 1283 can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel p. 1283 and may result in significant drug interactions.

Polyene antifungals

The polyene antifungals include amphotericin p. 629 and nystatin p. 1284; neither drug is absorbed when given by mouth. Nystatin is used for oral, oropharyngeal, and perioral infections by local application in the mouth. Nystatin is also used for *Candida albicans* infection of the skin.

Amphotericin by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (*Abelcet*[®] and *AmBisome*[®]) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive.

Echinocandin antifungals

The echinocandin antifungals include anidulafungin below, caspofungin p. 628 and micafungin p. 628. They are only

active against *Aspergillus* spp. and *Candida* spp.; however, anidulafungin and micafungin are not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS.

Other antifungals

Flucytosine p. 636 is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. Flucytosine has a role in the treatment of systemic candidiasis and cryptococcal meningitis.

Griseofulvin p. 636 is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. It is the drug of choice for trichophyton infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months.

Terbinafine p. 1300 is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate.

ANTIFUNGALS > ECHINOCANDIN ANTIFUNGALS

Anidulafungin

24-Oct-2018

● INDICATIONS AND DOSE

Invasive candidiasis

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 200 mg once daily for 1 day, then 100 mg once daily

● SIDE-EFFECTS

- ▶ **Common or very common** Bronchospasm · cholestasis · diarrhoea · dyspnoea · headache · hyperglycaemia · hypertension · hypokalaemia · hypotension · nausea · seizure · skin reactions · vomiting
- ▶ **Uncommon** Abdominal pain upper · coagulation disorder · vasodilatation
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—*toxicity in animal studies.*
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—*present in milk in animal studies.*
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion (Ecalta*[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute each 100 mg with 30 mL water for injections and allow up to 5 minutes for reconstitution; dilute dose in infusion fluid to a concentration of 770 micrograms/mL; give at a rate not exceeding 1.1 mg/minute. Follow product information if using stock supplied with ethanol solvent.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ Anidulafungin (Non-proprietary)

Anidulafungin 100 mg Anidulafungin 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £299.98 DT = £296.23 (Hospital only)

▶ Ecalta (Pfizer Ltd)

Anidulafungin 100 mg Ecalta 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £299.99 DT = £296.23 (Hospital only)

Caspofungin

● INDICATIONS AND DOSE

Invasive aspergillosis | Invasive candidiasis | Empirical treatment of systemic fungal infections in patients with neutropenia

► BY INTRAVENOUS INFUSION

- Adult (body-weight up to 81 kg): 70 mg once daily for 1 day, then 50 mg once daily
- Adult (body-weight 81 kg and above): 70 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises increase dose to 70 mg daily with concurrent use of some enzyme inducers (such as carbamazepine, dexamethasone, phenytoin, and rifampicin); no dose adjustment required for patients already on 70 mg daily.

- **INTERACTIONS** → Appendix 1: caspofungin

● SIDE-EFFECTS

- **Common or very common** Arthralgia · diarrhoea · dyspnoea · electrolyte imbalance · fever · headache · hyperhidrosis · nausea · skin reactions · vomiting

- **Uncommon** Anaemia · anxiety · appetite decreased · arrhythmias · ascites · chest discomfort · coagulation disorder · congestive heart failure · constipation · cough · disorientation · dizziness · drowsiness · dry mouth · dysphagia · excessive tearing · eyelid oedema · fatigue · flatulence · fluid overload · flushing · gastrointestinal discomfort · haematuria · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · hypotension · hypoxia · induration · insomnia · laryngeal pain · leucopenia · malaise · metabolic acidosis · muscle weakness · myalgia · nasal congestion · oedema · pain · palpitations · renal impairment · respiratory disorders · sensation abnormal · taste altered · thrombocytopenia · thrombophlebitis · tremor · vision blurred

- **Frequency not known** Severe cutaneous adverse reactions (SCARs)

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.

- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** No information available for severe impairment.

Dose adjustments 70 mg on first day then 35 mg once daily in moderate impairment.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Cancidas[®]), give intermittently in Sodium chloride 0.9%. Allow vial to reach room temperature; initially reconstitute each vial with 10.5 mL water for injections, mixing gently to dissolve then dilute requisite dose in 250 mL infusion fluid (35- or 50-mg doses may be diluted in 100 mL infusion fluid if necessary); give over 60 minutes; incompatible with glucose solutions.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► Caspofungin (Non-proprietary)

Caspofungin (as Caspofungin acetate) 50 mg Caspofungin 50mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £50.25-£327.67

Caspofungin (as Caspofungin acetate) 70 mg Caspofungin 70mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £52.91-£416.78

► Cancidas (Merck Sharp & Dohme Ltd)

Caspofungin (as Caspofungin acetate) 50 mg Cancidas 50mg powder for solution for infusion vials | 1 vial [PoM] £327.67

Caspofungin (as Caspofungin acetate) 70 mg Cancidas 70mg powder for solution for infusion vials | 1 vial [PoM] £416.78

Micafungin

● INDICATIONS AND DOSE

Invasive candidiasis

► BY INTRAVENOUS INFUSION

- Adult (body-weight up to 40 kg): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate
- Adult (body-weight 40 kg and above): 100 mg once daily for at least 14 days; increased if necessary to 200 mg once daily, increase dose if response inadequate

Oesophageal candidiasis

► BY INTRAVENOUS INFUSION

- Adult (body-weight up to 40 kg): 3 mg/kg once daily
- Adult (body-weight 40 kg and above): 150 mg once daily

Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days

► BY INTRAVENOUS INFUSION

- Adult (body-weight up to 40 kg): 1 mg/kg once daily continue for at least 7 days after neutrophil count is in desirable range
- Adult (body-weight 40 kg and above): 50 mg once daily continue for at least 7 days after neutrophil count is in desirable range

- **INTERACTIONS** → Appendix 1: micafungin

- **SIDE-EFFECTS** Anaemia · anxiety · appetite decreased · arrhythmias · confusion · constipation · diarrhoea · disseminated intravascular coagulation · dizziness · drowsiness · dyspnoea · electrolyte imbalance · eosinophilia · flushing · gastrointestinal discomfort · haemolysis · haemolytic anaemia · headache · hepatic disorders · hepatic failure (potentially life-threatening) · hyperbilirubinaemia · hyperhidrosis · hypersensitivity · hypertension · hypoalbuminaemia · hypotension · insomnia · leucopenia · nausea · neutropenia · palpitations · pancytopenia · peripheral oedema · renal impairment · severe cutaneous adverse reactions (SCARs) · shock · skin reactions · taste altered · thrombocytopenia · tremor · vomiting

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in chronic impairment; avoid in severe impairment (limited information available).

- **RENAL IMPAIRMENT** Use with caution; renal function may deteriorate.

● MONITORING REQUIREMENTS

- Monitor renal function.
- Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Mycamine[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute each vial with 5 mL infusion fluid; gently rotate vial, without shaking, to dissolve; dilute requisite dose with infusion fluid to 100 mL (final concentration of 0.5–2 mg/mL); protect infusion from light; give over 60 minutes.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► Mycamine (Astellas Pharma Ltd)

Micafungin (as Micafungin sodium) 50 mg Mycamine 50mg powder for solution for infusion vials | 1 vial [PoM] £196.08

Micafungin (as Micafungin sodium) 100 mg Mycamine 100mg powder for solution for infusion vials | 1 vial [PoM] £341.00

ANTIFUNGALS > POLYENE ANTIFUNGALS

Amphotericin

(Amphotericin B)

21-Nov-2019

● INDICATIONS AND DOSE

ABELCET[®]

Severe invasive candidiasis | Severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptococcosis in HIV patients

▶ BY INTRAVENOUS INFUSION

- Adult: Test dose 1 mg, to be given over 15 minutes, then 5 mg/kg once daily for at least 14 days

AMBISOME[®]

Severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin | Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials

▶ BY INTRAVENOUS INFUSION

- Adult: Test dose 1 mg, to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

Aspergillosis

▶ BY INTRAVENOUS INFUSION

- Adult: Test dose 1 mg, to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

Visceral leishmaniasis (unresponsive to the antimonial alone)

▶ BY INTRAVENOUS INFUSION

- Adult: 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg, alternatively 3 mg/kg for 5 consecutive days, followed by 3 mg/kg after 6 days for 1 dose

FUNGIZONE[®]

Systemic fungal infections

▶ BY INTRAVENOUS INFUSION

- Adult: Test dose 1 mg, to be given over 20–30 minutes, then 250 micrograms/kg daily, gradually increased over 2–4 days, increased if tolerated to 1 mg/kg daily, max. (severe infection) 1.5 mg/kg daily or on alternate days. Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually

● UNLICENSED USE

AMBISOME[®] Use at the maximum dose of 5 mg/kg once daily is an unlicensed dose.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PARENTERAL AMPHOTERICIN B: REMINDER OF RISK OF POTENTIALLY FATAL ADVERSE REACTION IF FORMULATIONS CONFUSED (JULY 2018)

The MHRA is aware of three fatal overdoses which were caused by medication error in which *Fungizone[®]* was administered (a non-lipid-based formulation of amphotericin B) instead of a lipid-based formulation. Healthcare professionals are advised:

- when prescribing and dispensing amphotericin products, both the complete generic name and the proprietary name should be used;
- the product name and dose should be verified before administration, especially if the dose prescribed exceeds the maximum recommended dose for *Fungizone[®]*.

- **CAUTIONS** Avoid rapid infusion (risk of arrhythmias) - when given parenterally, toxicity common (close supervision necessary and close observation required for at least 30 minutes after test dose)

CAUTIONS, FURTHER INFORMATION

- ▶ **Anaphylaxis** Anaphylaxis can occur with any intravenous amphotericin product and a test dose is advisable before the first infusion; the patient should be carefully observed for at least 30 minutes after the test dose. Prophylactic antipyretics or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential).

- **INTERACTIONS** → Appendix 1: amphotericin

● **SIDE-EFFECTS**

- **Common or very common** Anaemia · appetite decreased · azotaemia · chills · diarrhoea · dyspnoea · electrolyte imbalance · fever · headache · hepatic function abnormal (discontinue) · hyposthenuria · hypotension · nausea · nephrocalcinosis · renal impairment · renal tubular acidosis · skin reactions · vomiting
- ▶ **Uncommon** Agranulocytosis · arrhythmias · flushing · gastrointestinal discomfort · hepatic disorders · leucopenia · myalgia · peripheral neuropathy · respiratory disorders · thrombocytopenia
- ▶ **Rare or very rare** Arthralgia · cardiac arrest · coagulation disorder · deafness · encephalopathy · eosinophilia · haemorrhage · heart failure · hypersensitivity · hypertension · malaise · nephrogenic diabetes insipidus · pain · pulmonary oedema non-cardiogenic · seizure · severe cutaneous adverse reactions (SCARs) · shock · tinnitus · vertigo · vision disorders · weight decreased

- **PREGNANCY** Not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk.

- **BREAST FEEDING** No information available.

- **RENAL IMPAIRMENT** Use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation.

- **MONITORING REQUIREMENTS** Hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required.

● **DIRECTIONS FOR ADMINISTRATION****ABELCET[®] Amphotericin (lipid complex)**

For *intravenous infusion*, give intermittently in Glucose 5%. Allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17-19 gauge needle) into one or more 20-mL syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute to a concentration of 1 mg/mL (2 mg/mL can be used in fluid restriction and in children); preferably give *via* an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose of 1 mg over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium chloride or other electrolyte solutions, flush existing intravenous line with glucose 5% or use separate line.

AMBISOME[®] Amphotericin (liposomal)

For *intravenous infusion* (*Ambisome[®]*), give intermittently in Glucose 5% or 10%. Reconstitute each vial with 12 mL water for injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into infusion fluid through the 5 micron filter provided to produce a final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur infuse over 2 hours (initial test dose of 1 mg over 10 minutes); an in-line filter (pore size no less than 1 micron) may be used; incompatible with sodium chloride

solutions, flush existing intravenous line with glucose 5% or 10%, or use separate line.

FUNGIZONE® Amphotericin (as sodium deoxycholate complex)

For intravenous infusion (*Fungizone®*), give intermittently in Glucose 5%. Reconstitute each vial with 10 mL water of injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in infusion fluid to a concentration of 100 micrograms/mL; pH of the glucose must not be below 4.2 (check each container—consult product literature for details of the buffer); infuse over 2–4 hours, or longer if not tolerated (initial test dose of 1 mg over 20–30 minutes); begin infusion immediately after dilution; protect from light; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used.

● **PRESCRIBING AND DISPENSING INFORMATION**

Amphotericin is available as *conventional, liposomal and lipid complex* formulations. These different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are **not** interchangeable.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for infusion

ELECTROLYTES: May contain Sodium

▶ **Abelcet** (Teva UK Ltd)

Amphotericin B (as Amphotericin B phospholipid complex) 5 mg per 1 mL Abelcet 100mg/20ml concentrate for suspension for infusion vials | 10 vial [PoM] £775.04 (Hospital only)

Powder for dispersion for infusion

EXCIPIENTS: May contain Sucrose

ELECTROLYTES: May contain Sodium

▶ **AmBisome** (Gilead Sciences International Ltd)

Amphotericin B liposomal 50 mg AmBisome 50mg powder for dispersion for infusion vials | 10 vial [PoM] £821.87 (Hospital only)

Powder for solution for infusion

EXCIPIENTS: May contain Sucrose

ELECTROLYTES: May contain Sodium

▶ **Fungizone** (Cheplapharm Arzneimittel GmbH)

Amphotericin B 50 mg Fungizone 50mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £3.88 DT = £3.88

ANTIFUNGALS > TRIAZOLE ANTIFUNGALS

Fluconazole

10-Mar-2020

● **INDICATIONS AND DOSE**

Candidal balanitis

▶ BY MOUTH

▶ Child 16–17 years: 150 mg for 1 dose

▶ Adult: 150 mg for 1 dose

Vaginal candidiasis

▶ BY MOUTH

▶ Adult: 150 mg for 1 dose

Vulvovaginal candidiasis (recurrent)

▶ BY MOUTH

▶ Adult: Initially 150 mg every 72 hours for 3 doses, then 150 mg once weekly for 6 months

Mucosal candidiasis (except genital)

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

▶ Child 1 month–11 years: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg daily (max. per dose 100 mg) for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections)

▶ Child 12–17 years: 50 mg daily for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for

14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections

▶ BY MOUTH

▶ Adult: 50 mg daily given for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14 days in atrophic oral candidiasis associated with dentures; for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections

Tinea pedis, corporis, cruris, pityriasis versicolor | Dermal candidiasis

▶ BY MOUTH

▶ Adult: 50 mg daily for 2–4 weeks (for up to 6 weeks in tinea pedis); max. duration of treatment 6 weeks

Invasive candidal infections (including candidaemia and disseminated candidiasis) and cryptococcal infections (including meningitis)

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

▶ Child: 6–12 mg/kg daily (max. per dose 800 mg), treatment continued according to response (at least 8 weeks for cryptococcal meningitis)

▶ Adult: 400 mg, dose to be given on first day, then 200–400 mg daily (max. per dose 800 mg once daily), treatment continued according to response (at least 8 weeks for cryptococcal meningitis), maximum dose for use in severe infections

Prevention of fungal infections in immunocompromised patients

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

▶ Child: 3–12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose given according to extent and duration of neutropenia

▶ Adult: 50–400 mg daily, commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose adjusted according to risk

Prevention of fungal infections in immunocompromised patients (for patients with high risk of systemic infections e.g. following bone-marrow transplantation)

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

▶ Adult: 400 mg daily, commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range

Prevention of relapse of cryptococcal meningitis in HIV-infected patients after completion of primary therapy

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

▶ Adult: 200 mg daily

● **CONTRA-INDICATIONS** Acute porphyrias p. 1120

● **CAUTIONS** Susceptibility to QT interval prolongation

● **INTERACTIONS** → Appendix 1: antifungals, azoles

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · gastrointestinal discomfort · headache · nausea · skin reactions · vomiting
- ▶ **Uncommon** Dizziness · flatulence · hepatic disorders · seizure · taste altered
- ▶ **Rare or very rare** Agranulocytosis · alopecia · dyslipidaemia · hypokalaemia · leucopenia · neutropenia · QT interval prolongation · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · torsade de pointes

SPECIFIC SIDE-EFFECTS

► Uncommon

- With parenteral use Anæmia · appetite decreased · asthenia · constipation · drowsiness · dry mouth · fever · hyperhidrosis · insomnia · malaise · myalgia · paraesthesia · vertigo

► Rare or very rare

- With parenteral use Angioedema · face oedema · tremor

► Frequency not known

- With oral use Cardio-respiratory distress · oedema

SIDE-EFFECTS, FURTHER INFORMATION If rash occurs, discontinue treatment (or monitor closely if infection invasive or systemic); severe cutaneous reactions are more likely in patients with AIDS.

- **PREGNANCY** Manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses.
- **BREAST FEEDING** Present in milk but amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—limited information available.
- **RENAL IMPAIRMENT**
Dose adjustments ► In adults Usual initial dose then halve subsequent doses if eGFR less than 50 mL/minute/1.73 m².
► In children Usual initial dose then halve subsequent doses if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor liver function with high doses or extended courses—discontinue if signs or symptoms of hepatic disease (risk of hepatic necrosis).

● **DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children For *intravenous infusion*, give over 10–30 minutes; do not exceed an infusion rate of 5–10 mL/minute.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Fluconazole for yeast and fungal infections www.medicinesforchildren.org.uk/fluconazole-yeast-and-fungal-infections

● **PROFESSION SPECIFIC INFORMATION****Dental practitioners' formulary**

Fluconazole Capsules 50 mg may be prescribed.

Fluconazole Oral Suspension 50 mg/5 mL may be prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY** Fluconazole capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg.

- **MEDICAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Infusion► **Fluconazole (Non-proprietary)**

Fluconazole 2 mg per 1 mL Fluconazole 200mg/100ml infusion bags | 5 bag [PoM] £19.45 (Hospital only) | 10 bag [PoM] £65.00 (Hospital only)

Isavuconazole

03-Mar-2020

- **DRUG ACTION** Isavuconazole is a triazole antifungal that blocks the synthesis of ergosterol, a key component of the fungal cell membrane.

● **INDICATIONS AND DOSE**

Invasive aspergillosis | mucormycosis in patients for whom amphotericin B is inappropriate

► **BY MOUTH, OR BY INTRAVENOUS INFUSION**

- Adult: Loading dose 200 mg every 8 hours for 48 hours (6 administrations in total), then maintenance 200 mg once daily, maintenance dose to be started at least 12 hours after the last loading dose; long-term treatment should be reviewed after 6-months

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · short QT syndrome

- **CAUTIONS** Elderly—limited information

- **INTERACTIONS** → Appendix 1: antifungals, azoles

- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Appetite decreased · asthenia · chest pain · delirium · diarrhoea · drowsiness · electrolyte imbalance · gastrointestinal discomfort · headache · hepatic disorders · nausea · skin reactions · thrombophlebitis
- **Uncommon** Alopecia · anaemia · arrhythmias · back pain · circulatory collapse · confusion · constipation · depression · dizziness · dyspnoea · cephalopathy · haemorrhage · hypersensitivity · hypoalbuminaemia · hypoglycaemia · hypotension · insomnia · leucopenia · malaise · malnutrition · neutropenia · palpitations · pancytopenia · paraesthesia · peripheral neuropathy · renal failure · respiratory disorders · seizures · syncope · taste altered · thrombocytopenia · vertigo · vomiting

SPECIFIC SIDE-EFFECTS

- **Common or very common**

- With intravenous use Hyperbilirubinaemia

- **Uncommon**

- With intravenous use Peripheral oedema

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions have been reported, including hypotension, dyspnoea, dizziness, paraesthesia, nausea, and headache—manufacturer advises discontinue treatment if these reactions occur.

• **PREGNANCY** Manufacturer advises avoid unless severe or life-threatening infection—toxicity in *animal* studies.

• **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

• **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available)—monitor for drug toxicity.

• DIRECTIONS FOR ADMINISTRATION

▶ With intravenous use For *intravenous infusion*, reconstitute each 200 mg with 5 mL Water for Injection; dilute dose to concentration of 0.8 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give via a 0.2–1.2 micron filter over at least 1 hour.

• HANDLING AND STORAGE

▶ With intravenous use Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for storage after reconstitution or dilution.

• PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of confusion, syncope and dizziness.

• NATIONAL FUNDING/ACCESS DECISIONS

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 2433

The *All Wales Medicines Strategy Group* has advised (January 2017) that isavuconazole (*Cresemba*®) is recommended as an option for use in adults within NHS Wales for the treatment of invasive aspergillosis, and the treatment of mucormycosis in patients for whom amphotericin B is inappropriate, only if the approved Wales Patient Access Scheme (WPAS) is used or where the list/contract price is equivalent or lower.

• **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Itraconazole

19-Feb-2020

• INDICATIONS AND DOSE

Vulvovaginal candidiasis

▶ BY MOUTH

▶ Adult: 200 mg twice daily for 1 day

Vulvovaginal candidiasis (recurrent)

▶ BY MOUTH

▶ Adult: 50–100 mg daily for 6 months

Oral or oesophageal candidiasis that has not responded to fluconazole

▶ BY MOUTH USING ORAL SOLUTION

▶ Adult: 100–200 mg twice daily for 2 weeks (continue for another 2 weeks if no response; the higher dose should not be used for longer than 2 weeks if no signs of improvement)

Oral or oesophageal candidiasis in HIV-positive or other immunocompromised patients

▶ BY MOUTH USING ORAL SOLUTION

▶ Adult: 200 mg daily in 1–2 divided doses for 1 week (continue for another week if no response)

Systemic candidiasis where other antifungal drugs inappropriate or ineffective

▶ BY MOUTH

▶ Adult: 100–200 mg once daily

▶ BY INTRAVENOUS INFUSION

▶ Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

Systemic candidiasis (invasive or disseminated) where other antifungal drugs inappropriate or ineffective

▶ BY MOUTH

▶ Adult: 200 mg twice daily

Pityriasis versicolor

▶ BY MOUTH

▶ Adult: 200 mg once daily for 7 days

Tinea pedis | Tinea manuum

▶ BY MOUTH

▶ Adult: 100 mg once daily for 30 days, alternatively 200 mg twice daily for 7 days

Tinea corporis | Tinea cruris

▶ BY MOUTH

▶ Adult: 100 mg once daily for 15 days, alternatively 200 mg once daily for 7 days

Onychomycosis

▶ BY MOUTH

▶ Adult: 200 mg once daily for 3 months, alternatively 200 mg twice daily for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses

Aspergillosis

▶ BY MOUTH

▶ Adult: 200 mg twice daily

Systemic aspergillosis where other antifungal drugs inappropriate or ineffective

▶ BY INTRAVENOUS INFUSION

▶ Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

Histoplasmosis

▶ BY MOUTH

▶ Adult: 200 mg 3 times a day for 3 days, then 200 mg 1–2 times a day

▶ BY INTRAVENOUS INFUSION

▶ Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

Systemic cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective

▶ BY MOUTH

▶ Adult: 200 mg once daily, dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 200 mg twice daily

▶ BY INTRAVENOUS INFUSION

▶ Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

Maintenance in HIV-infected patients to prevent relapse of underlying fungal infection and prophylaxis in neutropenia when standard therapy inappropriate

▶ BY MOUTH

▶ Adult: 200 mg once daily, then increased to 200 mg twice daily, dose increased only if low plasma-itraconazole concentration

Prophylaxis of deep fungal infections (when standard therapy inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic

► BY MOUTH USING ORAL SOLUTION

- Adult: 5 mg/kg daily in 2 divided doses, to be started before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers, safety and efficacy not established in elderly patients

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises max. dose 200 mg daily with concurrent use of cobicistat.

- **UNLICENSED USE** Itraconazole doses in BNF may differ from those in product literature.
- **CONTRA-INDICATIONS** Acute porphyrias p. 1120
- **CAUTIONS** Active liver disease · elderly · history of hepatotoxicity with other drugs · susceptibility to congestive heart failure
- CAUTIONS, FURTHER INFORMATION**
- Susceptibility to congestive heart failure There have been reports of heart failure associated with itraconazole. Those at risk may include patients receiving higher daily doses and longer courses, patients with cardiac disease, patients with chronic lung disease, and patients receiving treatment with calcium channel blockers. Manufacturer advises avoid in patients with ventricular dysfunction, such as history of congestive heart failure, unless the infection is serious.

- **INTERACTIONS** → Appendix 1: antifungals, azoles

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- **Common or very common** Alopecia · constipation · diarrhoea · dyspnoea · gastrointestinal discomfort · headache · heart failure · hepatic disorders · hyperbilirubinaemia · nausea · oedema · pulmonary oedema · skin reactions · vision disorders · vomiting
- **Uncommon** Hearing loss · taste altered
- **Rare or very rare** Angioedema · hypersensitivity vasculitis · hypertriglyceridaemia · pancreatitis · photosensitivity reaction · severe cutaneous adverse reactions (SCARs)
- **Frequency not known** Peripheral neuropathy (discontinue)

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- With intravenous use Chest pain · confusion · cough · dizziness · drowsiness · electrolyte imbalance · fatigue · gastrointestinal disorder · granulocytopenia · hyperglycaemia · hyperhidrosis · hypersensitivity · hypertension · hypotension · myalgia · pain · renal impairment · tachycardia · tremor · urinary incontinence
- **Uncommon**
- With intravenous use Dysphonia · numbness · thrombocytopenia
- With oral use Flatulence · increased risk of infection · menstrual disorder
- **Rare or very rare**
- With oral use Erectile dysfunction · leucopenia · sensation abnormal · serum sickness · tinnitus · urinary frequency increased

SIDE-EFFECTS, FURTHER INFORMATION Potentially life-threatening hepatotoxicity reported very rarely — discontinue if signs of hepatitis develop.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and until the next menstrual period following end of treatment.
- **PREGNANCY** Manufacturer advises use only in life-threatening situations (toxicity at high doses in *animal* studies).

- **BREAST FEEDING** Small amounts present in milk—may accumulate; manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises use only in serious or life-saving situations where potential benefit outweighs risk of hepatotoxicity.
- **RENAL IMPAIRMENT** Risk of congestive heart failure.
- With oral use Bioavailability of oral formulations possibly reduced.
- With intravenous use Use intravenous infusion with caution if eGFR 30–80 mL/minute/1.73 m²; avoid intravenous infusion if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
- Absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary).
- Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, or if history of hepatotoxicity with other drugs.
- **DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For *intravenous infusion (Sporanox®)*, give intermittently in Sodium Chloride 0.9%; dilute 250 mg in 50 mL infusion fluid and infuse only 60 mL through an in-line filter (0.2 micron) over 60 minutes.
- With oral use For *oral liquid*, do not take with food; swish around mouth and swallow, do not rinse afterwards.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.
- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop.
- With oral use Patients or carers should be given advice on how to administer itraconazole oral liquid.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for infusion

EXCIPIENTS: May contain Propylene glycol

- **Sporanox** (Janssen-Cilag Ltd)

Posaconazole

10-Nov-2017

• INDICATIONS AND DOSE

Invasive aspergillosis either refractory to, or in patients intolerant of, itraconazole or amphotericin | Fusariosis either refractory to, or in patients intolerant of, amphotericin | Chromoblastomycosis and mycetoma either refractory to, or in patients intolerant of, itraconazole | Coccidioidomycosis either refractory to, or in patients intolerant of, amphotericin, itraconazole, or fluconazole

- ▶ BY MOUTH USING ORAL SUSPENSION
 - ▶ Adult: 400 mg twice daily, to be taken with food, alternatively 200 mg 4 times a day, if unable to tolerate food
- ▶ BY MOUTH USING TABLETS, OR BY INTRAVENOUS INFUSION
 - ▶ Adult: Loading dose 300 mg twice daily on first day, then 300 mg once daily, switch from intravenous to oral route when appropriate

Oropharyngeal candidiasis (severe infection or in immunocompromised patients only)

- ▶ BY MOUTH USING ORAL SUSPENSION
 - ▶ Adult: Loading dose 200 mg on first day, then 100 mg once daily for 13 days, dose to be taken with food

Prophylaxis of invasive fungal infections in patients at high risk and undergoing high-dose immunosuppressive therapy for haematopoietic stem cell transplantation or receiving chemotherapy for acute myeloid leukaemia or myelodysplastic syndrome and expected to develop prolonged neutropenia

- ▶ BY MOUTH USING ORAL SUSPENSION
 - ▶ Adult: 200 mg 3 times a day, dose to be taken with food, for chemotherapy patients, start several days before the expected onset of neutropenia and continue for 7 days after neutrophil count rises above 500 cells/mm³
- ▶ BY MOUTH USING TABLETS, OR BY INTRAVENOUS INFUSION
 - ▶ Adult: Loading dose 300 mg twice daily on first day, then 300 mg once daily, for chemotherapy patients, start several days before the expected onset of neutropenia and continue for 7 days after neutrophil count rises above 500 cells/mm³, switch from intravenous to oral route when appropriate

DOSE EQUIVALENCE AND CONVERSION

- ▶ Posaconazole oral suspension is **not** interchangeable with tablets on a milligram-for-milligram basis.

PHARMACOKINETICS

- ▶ Posaconazole oral suspension should be taken with food (preferably a high fat meal) or nutritional supplement to ensure adequate exposure for systemic effects. Where possible, tablets should be used in preference to suspension because tablets have a higher bioavailability.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120
- **CAUTIONS** Administration by intravenous infusion, particularly by peripheral catheter—increased risk of QTc interval prolongation · body-weight over 120 kg—risk of treatment failure possibly increased · body-weight under 60 kg—risk of side effects increased · bradycardia · cardiomyopathy · history of QTc interval prolongation · symptomatic arrhythmias
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Appetite decreased · asthenia · constipation · diarrhoea · dizziness · drowsiness · dry mouth · electrolyte imbalance · gastrointestinal discomfort · gastrointestinal disorders · headache · hypertension · nausea · neutropenia · sensation abnormal · skin reactions · taste altered · vomiting

- ▶ **Uncommon** Alopecia · anaemia · aphasia · arrhythmias · burping · chest discomfort · confusion · cough · embolism and thrombosis · eosinophilia · feeling jittery · haemorrhage · hepatic disorders · hiccups · hyperglycaemia · hypoglycaemia · hypotension · leucopenia · lymphadenopathy · malaise · menstrual disorder · mucositis · nasal congestion · oedema · oral disorders · pain · palpitations · pancreatitis · peripheral neuropathy · QT interval prolongation · renal impairment · respiratory disorders · seizure · sleep disorders · splenic infarction · thrombocytopenia · tremor · vasculitis · vision disorders
- ▶ **Rare or very rare** Adrenal insufficiency · breast pain · cardiac arrest · coagulation disorder · depression · encephalopathy · haemolytic uraemic syndrome · hearing impairment · heart failure · myocardial infarction · nephritis tubulointerstitial · pancytopenia · psychotic disorder · pulmonary hypertension · renal tubular acidosis · Stevens-Johnson syndrome · stroke · sudden cardiac death · syncope

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk; toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure, limited information available).
- **RENAL IMPAIRMENT** Manufacturer advises monitor efficacy in severe impairment—variable exposure expected.
 - ▶ With intravenous use Manufacturer advises caution if eGFR less than 50 mL/minute/1.73 m²—intravenous vehicle may accumulate.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor electrolytes (including potassium, magnesium, and calcium) before and during therapy.
 - ▶ Monitor liver function before and during therapy.

• DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use Manufacturer advises for *intravenous infusion* (Noxafil[®]), give continuously in Glucose 5% or Sodium Chloride 0.9%; dilute requisite dose in infusion fluid to produce a final concentration of 1–2 mg/mL; give via a central venous catheter or peripherally inserted central catheter over approx. 90 minutes (can give a single dose via peripheral venous catheter if central access not established—dilute to a final concentration of 2 mg/mL and give over approx. 30 minutes).

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.

• HANDLING AND STORAGE

- ▶ With intravenous use Manufacturer advises store in a refrigerator (2–8 °C).

• PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and somnolence.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Noxafil** (Merck Sharp & Dohme Ltd)

Posaconazole 18 mg per 1 mL Noxafil 300mg/16.7mL concentrate for solution for infusion vials | 1 vial [POM] £211.00 (Hospital only)

Oral suspension

CAUTIONARY AND ADVISORY LABELS 3, 9, 21

- ▶ **Posaconazole (Non-proprietary)**

Voriconazole

24-Jan-2020

● **INDICATIONS AND DOSE****Invasive aspergillosis | Serious infections caused by *Scedosporium* spp., *Fusarium* spp., or invasive fluconazole-resistant *Candida* spp. (including *C. krusei*)**▶ **BY MOUTH**

- ▶ Adult (body-weight up to 40 kg): Initially 200 mg every 12 hours for 2 doses, then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours
- ▶ Adult (body-weight 40 kg and above): Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours

▶ **BY INTRAVENOUS INFUSION**

- ▶ Adult: Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours; reduced if not tolerated to 3 mg/kg every 12 hours; for max. 6 months

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ With intravenous use Manufacturer advises increase maintenance dose to 5 mg/kg every 12 hours with concurrent use of fosphenytoin, phenytoin or rifabutin.
- ▶ With oral use
Manufacturer advises increase maintenance dose with concurrent use of fosphenytoin or phenytoin; 400 mg every 12 hours for patients of body-weight 40 kg and above; 200 mg every 12 hours for patients of body-weight less than 40 kg. Manufacturer advises if concurrent use of rifabutin is unavoidable, increase maintenance dose to 350 mg every 12 hours for patients of body-weight 40 kg and above; 200 mg every 12 hours for patients of body-weight less than 40 kg.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120
- **CAUTIONS** Avoid exposure to sunlight · bradycardia · cardiomyopathy · electrolyte disturbances · history of QT interval prolongation · patients at risk of pancreatitis · symptomatic arrhythmias
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Acute kidney injury · agranulocytosis · alopecia · anaemia · anxiety · arrhythmias · asthenia · bone marrow disorders · chest pain · chills · confusion · constipation · depression · diarrhoea · dizziness · drowsiness · dyspnoea · electrolyte imbalance · eye disorders · eye inflammation · fever · gastrointestinal discomfort · haemorrhage · hallucination · headache · hepatic disorders · hypoglycaemia · hypotension · increased risk of infection · insomnia · leucopenia · muscle tone increased · nausea · neutropenia · oedema · oral disorders · pain · pulmonary oedema · respiratory disorders · seizure · sensation abnormal · skin reactions · syncope · tetany · thrombocytopenia · tremor · vision disorders · vomiting
- ▶ **Uncommon** Adrenal insufficiency · arthritis · brain oedema · duodenitis · encephalopathy · eosinophilia · gallbladder disorders · hearing impairment · hypothyroidism · influenza like illness · lymphadenopathy · lymphangitis · movement disorders · nephritis · nerve disorders · pancreatitis · parkinsonism · phototoxicity · proteinuria · pseudomembranous enterocolitis · QT interval prolongation · renal tubular necrosis · severe cutaneous adverse reactions (SCARs) · taste altered · thrombophlebitis · tinnitus · vertigo
- ▶ **Rare or very rare** Angioedema · cardiac conduction disorders · disseminated intravascular coagulation · hyperthyroidism
- ▶ **Frequency not known** Cutaneous lupus erythematosus · perioritis (more common in transplant patients) · squamous cell carcinoma (more common in presence of phototoxicity)

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Infusion related reaction
- SIDE-EFFECTS, FURTHER INFORMATION** **Hepatotoxicity** Hepatitis, cholestasis, and acute hepatic failure have been reported; risk of hepatotoxicity increased in patients with haematological malignancy. Consider treatment discontinuation if severe abnormalities in liver function tests.

Phototoxicity Phototoxicity occurs uncommonly. If phototoxicity occurs, consider treatment discontinuation; if treatment is continued, monitor for pre-malignant skin lesions and squamous cell carcinoma, and discontinue treatment if they occur.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Toxicity in *animal studies*—manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution, particularly in severe impairment (no information available).
- Dose adjustments** Manufacturer advises use usual initial loading dose then halve maintenance dose in mild to moderate cirrhosis.
- **RENAL IMPAIRMENT** Intravenous vehicle may accumulate if eGFR less than 50 mL/minute/1.73 m²—use intravenous infusion only if potential benefit outweighs risk, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required).

● **MONITORING REQUIREMENTS**

- ▶ Monitor renal function.
- ▶ Monitor liver function before starting treatment, then at least weekly for 1 month, and then monthly during treatment.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use For *intravenous infusion*, reconstitute each 200 mg with 19 mL Water for Injections or Sodium Chloride 0.9% to produce a 10 mg/mL solution; dilute dose to concentration of 0.5–5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give intermittently at a rate not exceeding 3 mg/kg/hour.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.
- **PATIENT AND CARER ADVICE** Patients and their carers should be told how to recognise symptoms of liver disorder, and advised to seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.
Patients and their carers should be advised that patients should avoid intense or prolonged exposure to direct sunlight, and to avoid the use of sunbeds. In sunlight, patients should cover sun-exposed areas of skin and use a sunscreen with a high sun protection factor. Patients should seek medical attention if they experience sunburn or a severe skin reaction following exposure to light or sun.

Patients and their carers should be advised to keep the alert card with them at all times.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

ANTIFUNGALS > OTHER

Flucytosine

20-Jan-2020

● **INDICATIONS AND DOSE**

Systemic yeast and fungal infections | Adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections

▶ BY INTRAVENOUS INFUSION

▶ **Adult:** Usual dose 200 mg/kg daily in 4 divided doses usually for not more than 7 days, alternatively 100–150 mg/kg daily in 4 divided doses, lower dose may be sufficient for extremely sensitive organisms

Cryptococcal meningitis (adjunct to amphotericin)

▶ BY INTRAVENOUS INFUSION

▶ **Adult:** 100 mg/kg daily in 4 divided doses for 2 weeks

- **UNLICENSED USE** Use in cryptococcal meningitis for 2 weeks is an unlicensed duration.

- **CAUTIONS** Blood disorders · elderly

- **INTERACTIONS** → Appendix 1: flucytosine

- **SIDE-EFFECTS** Agranulocytosis · aplastic anaemia · blood disorder · cardiotoxicity · confusion · diarrhoea · hallucination · headache · hepatic disorders · leucopenia · nausea · rash · sedation · seizure · thrombocytopenia · toxic epidermal necrolysis · ventricular dysfunction · vertigo · vomiting

- **PREGNANCY** Teratogenic in *animal* studies; manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid.

● **RENAL IMPAIRMENT**

Dose adjustments Use 50 mg/kg every 12 hours if creatinine clearance 20–40 mL/minute; use 50 mg/kg every 24 hours if creatinine clearance 10–20 mL/minute; use initial dose of 50 mg/kg if creatinine clearance less than 10 mL/minute and then adjust dose according to plasma-flucytosine concentration.

Monitoring In renal impairment liver- and kidney-function tests and blood counts required weekly.

● **MONITORING REQUIREMENTS**

- ▶ For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre).

- ▶ Liver- and kidney-function tests and blood counts required (weekly in blood disorders).

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give over 20–40 minutes.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

▶ **Ancotil (Mylan)**

Flucytosine 10 mg per 1 ml Ancotil 2.5g/250ml solution for infusion bottles | 5 bottle [\[PoM\]](#) £151.67 (Hospital only)

Griseofulvin

16-Jan-2020

● **INDICATIONS AND DOSE**

Dermatophyte infections of the skin, scalp, hair and nails where topical therapy has failed or is inappropriate

▶ BY MOUTH

- ▶ **Adult:** 500 mg daily, increased if necessary to 1 g daily, for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses

Tinea capitis caused by *Trichophyton tonsurans*

▶ BY MOUTH

- ▶ **Adult:** 1 g once daily, alternatively 1 g daily in divided doses

- **UNLICENSED USE** Griseofulvin doses in BNF may differ from those in product literature.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · systemic lupus erythematosus (risk of exacerbation)

- **INTERACTIONS** → Appendix 1: griseofulvin

● **SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea · epigastric discomfort · headache · nausea · vomiting

- ▶ **Uncommon** Appetite decreased · confusion · coordination abnormal · dizziness · drowsiness · insomnia · irritability · peripheral neuropathy · photosensitivity reaction · skin reactions · taste altered · toxic epidermal necrolysis

- ▶ **Rare or very rare** Anaemia · hepatic disorders · leucopenia · neutropenia · systemic lupus erythematosus (SLE)

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 1 month after administration to women (important: effectiveness of oral contraceptives may be reduced, additional contraceptive precautions e.g. barrier method, required). Men should avoid fathering a child during and for at least 6 months after administration

- **PREGNANCY** Avoid (fetotoxicity and teratogenicity in *animals*).

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment (risk of deterioration); avoid in severe impairment.

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks May impair performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

3.1 Pneumocystis pneumonia

Pneumocystis pneumonia

Overview

Pneumonia caused by *Pneumocystis jirovecii* (*Pneumocystis carinii*) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

Treatment**Mild to moderate disease**

Co-trimoxazole p. 594 in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

Atovaquone below is licensed for the treatment of mild to moderate pneumocystis infection in patients who cannot tolerate co-trimoxazole. A combination of dapsone p. 610 with trimethoprim p. 607 is given by mouth for the treatment of mild to moderate disease [unlicensed indication].

A combination of clindamycin p. 564 and primaquine p. 654 by mouth is used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

Severe disease

Co-trimoxazole in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isetionate below given by intravenous infusion is an alternative for patients who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion.

Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia.

Adjunctive therapy

In moderate to severe infections associated with HIV infection, prednisolone p. 716 is given by mouth for 5 days (alternatively, hydrocortisone p. 713 may be given parenterally); the dose is then reduced to complete 21 days of treatment. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

Prophylaxis

Prophylaxis against pneumocystis pneumonia should be given to all patients with a history of the infection. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised patients. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the patient has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

Co-trimoxazole by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. It is given daily or on alternate days (3 times a week); the dose may be reduced to improve tolerance.

Inhaled pentamidine isetionate is better tolerated than parenteral pentamidine isetionate. Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in patients unable to tolerate co-trimoxazole. It is effective but patients may be prone to extrapulmonary infection. Alternatively, dapsone can be used. Atovaquone has also been used for prophylaxis [unlicensed indication].

ANTIPROTOZOALS > OTHER

Atovaquone

27-May-2020

● **INDICATIONS AND DOSE**

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients intolerant of co-trimoxazole

▶ **BY MOUTH**

▶ Adult: 750 mg twice daily for 21 days, dose to be taken with food, particularly high fat food

Prophylaxis against pneumocystis pneumonia

▶ **BY MOUTH**

▶ Adult: 750 mg twice daily

- **UNLICENSED USE** Not licensed for prophylaxis against pneumocystis pneumonia.
- **CAUTIONS** Elderly · initial diarrhoea and difficulty in taking with food may reduce absorption (and require alternative therapy) · other causes of pulmonary disease should be sought and treated
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS**
- ▶ **Common or very common** Anaemia · angioedema · bronchospasm · diarrhoea · headache · hypersensitivity · hyponatraemia · insomnia · nausea · neutropenia · skin reactions · throat tightness · vomiting
- ▶ **Frequency not known** Stevens-Johnson syndrome
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in significant impairment and monitor closely—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution. **Monitoring** Monitor more closely in renal impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

CAUTIONARY AND ADVISORY LABELS 21

▶ **Atovaquone (Non-proprietary)**

Atovaquone 150 mg per 1 ml Atovaquone 750mg/5ml oral suspension sugar-free | 250 ml [PoM] £470.60

▶ **Wellvone (GlaxoSmithKline UK Ltd)**

Atovaquone 150 mg per 1 ml Wellvone 750mg/5ml oral suspension sugar-free | 226 ml [PoM] £486.37 DT = £486.37

Pentamidine isetionate

16-Mar-2020

● **INDICATIONS AND DOSE**

Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)

▶ **BY INTRAVENOUS INFUSION**

▶ Adult: 4 mg/kg once daily for at least 14 days

continued →

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Adult: 300 mg every 4 weeks, alternatively 150 mg every 2 weeks, using suitable equipment—consult product literature

Visceral leishmaniasis (specialist use only)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 3–4 mg/kg once daily on alternate days, maximum total of 10 injections, course may be repeated if necessary

Cutaneous leishmaniasis (specialist use only)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 3–4 mg/kg 1–2 times a week until condition resolves

Trypanosomiasis (specialist use only)

- ▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 4 mg/kg once daily or on alternate days for a total of 7–10 injections

- **UNLICENSED USE** Not licensed for primary prevention of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia by inhalation of nebulised solution.

- **CAUTIONS** Anaemia · bradycardia · coronary heart disease · history of ventricular arrhythmias · hyperglycaemia · hypertension · hypoglycaemia · hypokalaemia · hypomagnesaemia · hypotension · leucopenia · risk of severe hypotension following administration · thrombocytopenia

- **INTERACTIONS** → Appendix 1: pentamidine

● SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Dizziness · hypoglycaemia (can be severe and sometimes fatal) · hypotension (can be severe and sometimes fatal) · local reaction · nausea · rash · taste altered
- ▶ **Rare or very rare** QT interval prolongation
- ▶ **Frequency not known** Pancreatitis acute (can be severe and sometimes fatal)

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ When used by inhalation Cough · dyspnoea · respiratory disorders
- ▶ With parenteral use Acute kidney injury · anaemia · azotaemia · electrolyte imbalance · flushing · haematuria · hyperglycaemia · induration · leucopenia · localised pain · myopathy · syncope · thrombocytopenia · vomiting
- ▶ **Rare or very rare**
- ▶ With parenteral use Arrhythmia (can be severe and sometimes fatal) · pancreatitis (can be severe and sometimes fatal)
- ▶ **Frequency not known**
- ▶ When used by inhalation Angioedema · appetite decreased · bradycardia · fatigue · renal failure
- ▶ With parenteral use Arrhythmias · perioral hypoaesthesia · sensation abnormal · Stevens-Johnson syndrome

- **PREGNANCY** Manufacturer advises avoid unless essential.

- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

● RENAL IMPAIRMENT

Dose adjustments Reduce intravenous dose for pneumocystis pneumonia if creatinine clearance less than 10 mL/minute: in *life-threatening infection*, use 4 mg/kg once daily for 7–10 days, then 4 mg/kg on alternate days to complete course of at least 14 doses; in *less severe infection*, use 4 mg/kg on alternate days for at least 14 doses.

● MONITORING REQUIREMENTS

- ▶ Monitor blood pressure before starting treatment, during administration, and at regular intervals, until treatment concluded.
- ▶ Carry out laboratory monitoring according to product literature.

- **DIRECTIONS FOR ADMINISTRATION** Patient should be lying down when receiving drug parenterally. Direct intravenous injection should be avoided whenever possible and **never** given rapidly; intramuscular injections should be deep and preferably given into the buttock. For *intravenous infusion*, reconstitute 300 mg with 3–5 mL Water for Injections (displacement value may be significant), then dilute required dose with 50–250 mL Glucose 5% or Sodium Chloride 0.9%; give over at least 60 minutes.

Powder for injection (dissolved in water for injection) may be used for nebulisation.

- **HANDLING AND STORAGE** Pentamidine isetonate is toxic and personnel should be adequately protected during handling and administration—consult product literature.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- ▶ **Pentacarinat** (Sanofi)

Pentamidine isetonate 300 mg Pentacarinat 300mg powder for solution for injection vials | 5 vial (POM) £158.86

4 Helminth infection

Helminth infections

Specialist centres

Advice on prophylaxis and treatment of helminth infections is available from the following specialist centres:

Birmingham	(0121) 424 0357
Scotland	Contact local Infectious Diseases Unit
Liverpool	(0151) 705 3100
London	0845 155 5000 (treatment)

Threadworms

Anthelmintics are effective in threadworm (pinworms, *Enterobius vermicularis*) infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment.

Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole p. 640 is the drug of choice for treating threadworm infection in patients of all ages over 6 months. It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.

Ascaricides (common roundworm infections)

Mebendazole is effective against *Ascaris lumbricoides* and is generally considered to be the drug of choice.

Levamisole p. 640 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative when mebendazole cannot be used. It is very well tolerated.

Tapeworm infections

Taenicides

Niclosamide [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in *Taenia solium* infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel p. 641 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is as effective as niclosamide.

Hydatid disease

Cysts caused by *Echinococcus granulosus* grow slowly and asymptomatic patients do not always require treatment. Surgical treatment remains the method of choice in many situations. Albendazole below [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to *E. multilocularis* is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

Hookworms

Hookworms (ancylostomiasis, necatoriasis) live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole has a useful broad-spectrum activity, and is effective against hookworms. Albendazole [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative. Levamisole is also is also effective in children.

Schistosomides (bilharziasis)

Adult *Schistosoma haematobium* worms live in the genito-urinary veins and adult *S. mansoni* in those of the colon and mesentery. *S. japonicum* is more widely distributed in veins of the alimentary tract and portal system.

Praziquantel [unlicensed] is available from Merck Serono (*Cysticide*®) and is effective against all human schistosomes. No serious adverse effects have been reported. Of all the available schistosomides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

Filaricides

Diethylcarbamazine [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is effective against microfilariae and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions, treatment in adults and children over 1 month, is commenced with a dose of diethylcarbamazine citrate on the first day and increased gradually over 3 days. Length of treatment varies according to infection type, and usually gives a radical cure for these infections. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-

patient supervision and stopped at the first sign of cerebral involvement.

Ivermectin p. 640 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is very effective in *onchocerciasis* and it is now the drug of choice; reactions are usually slight. Diethylcarbamazine or suramin should no longer be used for *onchocerciasis* because of their toxicity.

Cutaneous larva migrans (creeping eruption)

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical tiabendazole (no commercial preparation available). Multiple infections respond to ivermectin, albendazole or **tiabendazole** (tiabendazole) by mouth [all unlicensed] (available from 'special-order' manufacturers or specialist importing companies).

Strongyloidiasis

Adult *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. Ivermectin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is the treatment of choice for chronic *Strongyloides* infection in adults and children over 5 years. Albendazole [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative given to adults and children over 2 years.

ANTHELMINTICS

Albendazole

● INDICATIONS AND DOSE

Chronic *Strongyloides* infection

- ▶ BY MOUTH
- ▶ Adult: 400 mg twice daily for 3 days, dose may be repeated after 3 weeks if necessary

Hydatid disease, in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

Hookworm infections

- ▶ BY MOUTH
- ▶ Adult: 400 mg for 1 dose

- **UNLICENSED USE** Albendazole is an unlicensed drug.

- **INTERACTIONS** → Appendix 1: albendazole

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet, oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 9

- ▶ **Eskazole** (Imported (France))
 - Albendazole 400 mg Eskazole 400mg tablets | 60 tablet [PoM] [X]

Chewable tablet

CAUTIONARY AND ADVISORY LABELS 9

- ▶ **Zentel** (Imported)
 - Albendazole 200 mg Zentel 200mg chewable tablets | 6 tablet [PoM] [X]
 - Albendazole 400 mg Zentel 400mg chewable tablets | 1 tablet [PoM] [X]

Diethylcarbamazine

● INDICATIONS AND DOSE

Wuchereria bancrofti infections | **Brugia malayi infections**

► BY MOUTH

► Adult: Initially 1 mg/kg daily on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days

Loa loa infections

► BY MOUTH

► Adult: Initially 1 mg/kg daily on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days; maximum 9 mg/kg per day

● **UNLICENSED USE** Diethylcarbamazine is an unlicensed drug.

● **MEDICINAL FORMS** No licensed medicines listed.

Ivermectin

17-May-2017

● INDICATIONS AND DOSE

Chronic Strongyloides infection

► BY MOUTH

► Adult: 200 micrograms/kg daily for 2 days

Onchocerciasis

► BY MOUTH

► Adult: 150 micrograms/kg for 1 dose, retreatment at intervals of 6 to 12 months, depending on symptoms, must be given until the adult worms die out

Scabies, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or 'Norwegian') scabies that does not respond to topical treatment alone

► BY MOUTH

► Adult: 200 micrograms/kg for 1 dose, further doses of 200 micrograms/kg may be required

● **UNLICENSED USE** Ivermectin is unlicensed.

● **INTERACTIONS** → Appendix 1: ivermectin

● **SIDE-EFFECTS**

► **Common or very common** Skin reactions

► **Frequency not known** Abnormal sensation in eye · anaemia · appetite decreased · asthenia · asthma exacerbated · chest discomfort · coma · confusion · conjunctival haemorrhage · constipation · diarrhoea · difficulty standing · difficulty walking · dizziness · drowsiness · dyspnoea · encephalopathy · eosinophilia · eye inflammation · faecal incontinence · fever · gastrointestinal discomfort · headache · hepatitis · hypotension · joint disorders · leucopenia · lymphatic abnormalities · Mazzotti reaction aggravated · myalgia · nausea · oedema · pain · psychiatric disorder · seizure · severe cutaneous adverse reactions (SCARs) · stupor · tachycardia · tremor · urinary incontinence · vertigo · vomiting

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

► **Stromectol** (Imported (France))

ivermectin 3 mg Stromectol 3mg tablets | 4 tablet [PoM](#) [S](#)

Levamisole

10-Mar-2020

● INDICATIONS AND DOSE

Roundworm infections

► BY MOUTH

► Adult: 120–150 mg for 1 dose

● **UNLICENSED USE** Not licensed.

● **CONTRA-INDICATIONS** Blood disorders

● **CAUTIONS** Epilepsy · Sjögren's syndrome

● **INTERACTIONS** → Appendix 1: levamisole

● **SIDE-EFFECTS** Arthralgia (long term use) · blood disorder (long term use) · diarrhoea · dizziness · headache · influenza like illness (long term use) · insomnia (long term use) · myalgia (long term use) · nausea · rash (long term use) · seizure (long term use) · taste altered (long term use) · vasculitis (long term use) · vomiting

● **PREGNANCY** Embryotoxic in *animal* studies, avoid if possible.

● **BREAST FEEDING** No information available.

● **HEPATIC IMPAIRMENT**

Dose adjustments Use with caution—dose adjustment may be necessary.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

CAUTIONARY AND ADVISORY LABELS 4

► **Ergamisol** (Imported (Belgium))

Levamisole (as Levamisole hydrochloride) 50 mg Ergamisol 50mg tablets | 20 tablet [PoM](#) [S](#)

Mebendazole

10-Mar-2020

● INDICATIONS AND DOSE

Threadworm infections

► BY MOUTH

► Child 6 months–17 years: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks

► Adult: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks

Whipworm infections | **Hookworm infections**

► BY MOUTH

► Child 1–17 years: 100 mg twice daily for 3 days

► Adult: 100 mg twice daily for 3 days

Roundworm infections

► BY MOUTH

► Child 1 year: 100 mg twice daily for 3 days

► Child 2–17 years: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose

► Adult: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose

Threadworm infections (dose approved for use by community practitioner nurse prescribers)

► BY MOUTH

► Child 2–17 years: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks

► Adult: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks

● **UNLICENSED USE** Not licensed for use as a single dose of 500 mg in roundworm infections.

► In children Not licensed for use in children under 2 years.

● **INTERACTIONS** → Appendix 1: mebendazole

● **SIDE-EFFECTS**

► **Common or very common** Gastrointestinal discomfort

► **Uncommon** Diarrhoea · flatulence

► **Rare or very rare** Alopecia · dizziness · hepatitis · neutropenia · seizure · severe cutaneous adverse reactions (SCARs) · skin reactions

● **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.

● **BREAST FEEDING** Amount present in milk too small to be harmful but manufacturer advises avoid.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana.
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Mebendazole for worm infections www.medicinesforchildren.org.uk/mebendazole-worm-infections
- **EXCEPTIONS TO LEGAL CATEGORY** Mebendazole tablets can be sold to the public if supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

- ▶ **Vermox** (Janssen-Cilag Ltd)
Mebendazole 20 mg per 1 ml Vermox 100mg/5ml oral suspension | 30 ml **[PoM]** £1.55 DT = £1.55

Chewable tablet

- ▶ **Vermox** (Janssen-Cilag Ltd)
Mebendazole 100 mg Vermox 100mg chewable tablets sugar-free | 6 tablet **[PoM]** £1.34 DT = £1.34

Praziquantel

● INDICATIONS AND DOSE**Tapeworm infections (*Taenia solium*)**

- ▶ BY MOUTH
- ▶ Adult: 5–10 mg/kg for 1 dose, to be taken after a light breakfast

Tapeworm infections (*Hymenolepis nana*)

- ▶ BY MOUTH
- ▶ Adult: 25 mg/kg for 1 dose, to be taken after a light breakfast

***Schistosoma haematobium* worm infections | *Schistosoma mansoni* worm infections**

- ▶ BY MOUTH
- ▶ Adult: 20 mg/kg, followed by 20 mg/kg after 4–6 hours

***Schistosoma japonicum* worm infections**

- ▶ BY MOUTH
- ▶ Adult: 20 mg/kg 3 times a day for 1 day

- **UNLICENSED USE** Praziquantel is an unlicensed drug.
- **INTERACTIONS** → Appendix 1: praziquantel

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

- ▶ **Praziquantel** (Imported (Germany))
Praziquantel 600 mg Biltricide 600mg tablets | 6 tablet **[PoM]** 
Praziquantel 150 mg Cesol 150mg tablets | 6 tablet **[PoM]** 
Praziquantel 500 mg Cysticide 500mg tablets | 90 tablet **[PoM]** 

5 Protozoal infection

Antiprotozoal drugs

Amoebicides

Metronidazole p. 572 is the drug of choice for *acute invasive amoebic dysentery* since it is very effective against vegetative forms of *Entamoeba histolytica* in ulcers. Tinidazole p. 574 is also effective. Metronidazole and tinidazole are also active against amoebae which may have migrated to the liver. Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate.

Diloxanide furoate is the drug of choice for asymptomatic patients with *E. histolytica* cysts in the faeces; metronidazole

and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For *amoebic abscesses* of the liver metronidazole is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with more than 100 mL of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

Trichomonacides

Metronidazole is the treatment of choice for *Trichomonas vaginalis* infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole may be tried.

Antigiardial drugs

Metronidazole is the treatment of choice for *Giardia lamblia* infections. Alternative treatments are tinidazole or mepacrine hydrochloride p. 527.

Leishmaniacides

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

Sodium stibogluconate p. 642, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dosage varies with different geographical regions and expert advice should be obtained. Some early non-inflamed lesions of cutaneous leishmaniasis can be treated with intralesional injections of sodium stibogluconate under specialist supervision.

Amphotericin p. 629 is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (*AmBisome*®). *Abelcet*®, a lipid formulation of amphotericin, is also likely to be effective but less information is available.

Pentamidine isetionate p. 637 has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies).

Trypanocides

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

Toxoplasmosis

Most infections caused by *Toxoplasma gondii* are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma choroiretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine p. 656 and sulfadiazine p. 596, given for several weeks (expert advice **essential**). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folic acid supplements and weekly blood counts needed). Alternative regimens use

combinations of pyrimethamine with clindamycin p. 564 or clarithromycin p. 567 or azithromycin p. 566. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus; specialist advice should be sought on management. Spiramycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) may reduce the risk of transmission of maternal infection to the fetus.

5.1 Leishmaniasis

Other drugs used for Leishmaniasis Amphotericin, p. 629 · Pentamidine isetionate, p. 637

ANTIPROTOZOALS > OTHER

Sodium stibogluconate

● INDICATIONS AND DOSE

Visceral leishmaniasis (specialist use only)

▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

▶ Adult: 20 mg/kg daily for 28 days

Cutaneous leishmaniasis (specialist use only)

▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

▶ Adult: 20 mg/kg daily for 20 days

- **CAUTIONS** Heart disease (withdraw if conduction disturbances occur) · mucocutaneous disease · predisposition to QT interval prolongation · treat intercurrent infection (e.g. pneumonia)

CAUTIONS, FURTHER INFORMATION

- ▶ Mucocutaneous disease Successful treatment of mucocutaneous leishmaniasis may induce severe inflammation around the lesions (may be life-threatening if pharyngeal or tracheal involvement)—may require corticosteroid.
- **INTERACTIONS** → Appendix 1: sodium stibogluconate
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · appetite decreased · arthralgia · diarrhoea · headache · lethargy · malaise · myalgia · nausea · vomiting
 - ▶ **Rare or very rare** Chest pain · chills · fever · flushing · haemorrhage · hyperhidrosis · jaundice · skin reactions · vertigo
 - ▶ **Frequency not known** Arrhythmias · cough · pain · pancreatitis · pneumonia · QT interval prolongation · thrombosis
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (limited information available; abnormalities in hepatic function may be expected in visceral leishmaniasis).
- **RENAL IMPAIRMENT** Avoid in significant impairment.
- **MONITORING REQUIREMENTS** Monitor ECG before and during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Intravenous injections must be given slowly over 5 minutes (to reduce risk of local thrombosis) and stopped if coughing or substernal pain occur. Injection should be filtered immediately before administration using a filter of 5 microns or less.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Pentostam** (GlaxoSmithKline UK Ltd)

Antimony pentavalent (as Sodium stibogluconate) 100 mg per 1 ml Pentostam 10g/100ml solution for injection vials | 1 vial [PoM] £66.43

5.2 Malaria

Antimalarials

20-Nov-2019

Artemether with lumefantrine

Artemether with lumefantrine p. 650 is licensed for the *treatment of acute uncomplicated falciparum malaria*.

Arteminol with piperazine

Arteminol with piperazine phosphate p. 650 is not recommended for the first-line treatment of *acute uncomplicated falciparum malaria* because there is limited experience of its use in travellers who usually reside in areas where malaria is not endemic. Piperazine has a long half-life.

Atovaquone with proguanil

Atovaquone with proguanil hydrochloride p. 651 is licensed for the *prophylaxis of falciparum malaria* (for details, see Recommended regimens for prophylaxis against malaria p. 644) and for the treatment of *acute, uncomplicated falciparum malaria*.

Chloroquine

Chloroquine p. 651 is usually used with proguanil hydrochloride p. 654 for the *prophylaxis of malaria* in areas of the world where there is little chloroquine resistance (for details, see Recommended regimens for prophylaxis against malaria p. 644).

Guidelines for malaria prevention in travellers from the United Kingdom (2019) published by Public Health England state that patients already taking hydroxychloroquine sulfate p. 1156 for another indication, and for whom chloroquine would be an appropriate antimalarial, can remain on hydroxychloroquine sulfate.

Chloroquine is **no longer recommended** for the *treatment of falciparum malaria* owing to widespread resistance, nor is it recommended if the infective species is *not known* or if the infection is *mixed*; in these cases treatment should be with quinine p. 655, atovaquone with proguanil hydrochloride p. 651, or artemether with lumefantrine. It is still recommended for the *treatment of non-falciparum malaria*.

Doxycycline

Doxycycline p. 597 is used in adults and children over 12 years as an option for the *prophylaxis of malaria* in areas of *chloroquine resistance*. Doxycycline is also used as an alternative to mefloquine p. 653 or atovaquone with proguanil hydrochloride p. 651, (for details, see Recommended regimens for prophylaxis against malaria p. 644).

Mefloquine

Mefloquine is used for the *prophylaxis of malaria* in areas of *chloroquine resistance*. Mefloquine is also used as an alternative to doxycycline or atovaquone with proguanil hydrochloride p. 651, (for details, see Recommended regimens for prophylaxis against malaria p. 644).

Mefloquine is now rarely used for the *treatment of falciparum malaria* because of increased resistance. It is rarely used for the *treatment of non-falciparum malaria* because better tolerated alternatives are available.

Mefloquine should not be used for treatment if it has been used for prophylaxis.

Primaquine

Primaquine p. 654 is used to eliminate the liver stages of *P. vivax* or *P. ovale* following chloroquine treatment.

Proguanil

Proguanil hydrochloride is usually used in combination with chloroquine or atovaquone for the prophylaxis of malaria, (for details, see Recommended regimens for prophylaxis against malaria p. 644).

Proguanil hydrochloride used alone is not suitable for the treatment of malaria; however, atovaquone with proguanil hydrochloride p. 651 is licensed for the treatment of acute uncomplicated falciparum malaria. Atovaquone with proguanil hydrochloride p. 651 is also used for the prophylaxis of falciparum malaria in areas of chloroquine resistance. Atovaquone with proguanil hydrochloride p. 651 is also used as an alternative to mefloquine or doxycycline. Atovaquone with proguanil hydrochloride p. 651 is particularly suitable for short trips to chloroquine-resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

Pyrimethamine

Pyrimethamine p. 656 should not be used alone, but is used with sulfadoxine.

Pyrimethamine with sulfadoxine can be used in the treatment of falciparum malaria with (or following) quinine.

Quinine

Quinine is used for the treatment of falciparum malaria, if the infective species is *not known*, or if the infection is mixed (for details see Malaria, treatment p. 649).

Useful resources

Recommendations on prophylaxis against malaria reflect guidelines agreed by the Advisory Committee on Malaria Prevention (ACMP), published in the Public Health England (PHE) Guidelines for malaria prevention in travellers from the United Kingdom, 2019. The advice is aimed at residents of the UK who travel to endemic areas. www.gov.uk/government/publications/malaria-prevention-guidelines-for-travellers-from-the-uk

Malaria, prophylaxis

20-Nov-2019

Prophylaxis against malaria

The recommendations on prophylaxis reflect guidelines agreed by the Advisory Committee on Malaria Prevention (ACMP), published in the Public Health England (PHE) Guidelines for malaria prevention in travellers from the United Kingdom, 2019. The advice is aimed at residents of the UK who travel to endemic areas.

For specialist centres offering advice on specific malaria-related problems, see Malaria, treatment p. 649. The choice of drug for a particular individual should take into account:

- risk of exposure to malaria
- extent of drug resistance
- efficacy of the recommended drugs
- side-effects of the drugs
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen)

For more information on choice of drug, see also Antimalarials p. 642.

Protection against bites

Prophylaxis is not absolute, and breakthrough infection can occur with any of the drugs recommended. Personal

protection against being bitten is very important and is recommended even in malaria-free areas as a preventive measure against other insect vector-borne diseases.

Mosquito nets impregnated with a pyrethroid insecticide, such as permethrin p. 1303, improves protection against insects and should be used if sleeping outdoors or in unscreened lodging; vaporised insecticides are also useful. Long sleeves and trousers worn after dusk also provide protection against bites.

Insect repellents give protection against bites, but attention to the correct application of product is required. Diethyltoluamide (DEET) 20–50% (available in various preparations including sprays and modified-release polymer formulations) is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. However, ingestion should be avoided, therefore breast-feeding mothers should wash their hands and breast tissue before handling infants. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. When sunscreen is also required, DEET should be applied after the sunscreen. DEET reduces the SPF of sunscreen, so a sunscreen of SPF 30–50 should be applied. If DEET is not tolerated or is unavailable, for alternative options, see Public Health England Guidelines for malaria prevention in travellers from the United Kingdom (see *Useful resources*).

Length of prophylaxis

Prophylaxis should generally be started before travel into an endemic area; 1 week before travel for chloroquine p. 651 and proguanil hydrochloride p. 654; 2–3 weeks before travel for mefloquine p. 653; and 1–2 days before travel for atovaquone with proguanil hydrochloride p. 651 or doxycycline p. 597. Prophylaxis should be continued for **4 weeks after leaving the area** (except for atovaquone with proguanil hydrochloride prophylaxis which should be stopped 1 week after leaving). For extensive journeys across different regions, the traveller must be protected in all areas of risk.

In those requiring long-term prophylaxis, chloroquine and proguanil hydrochloride may be used. However, there is considerable concern over the protective efficacy of the combination of chloroquine and proguanil hydrochloride in certain areas where it was previously useful. Mefloquine is licensed for use up to 1 year (although, if it is tolerated in the short term, there is no evidence of harm when it is used for up to 3 years). Doxycycline can be used for up to 2 years, and atovaquone with proguanil hydrochloride for up to 1 year. Prophylaxis with mefloquine, doxycycline, or atovaquone with proguanil hydrochloride may be considered for longer durations if it is justified by the risk of exposure to malaria. Specialist advice may be sought for long-term prophylaxis.

Return from malarial region

It is important to consider that any illness that occurs within 1 year and **especially within 3 months of return might be malaria** even if all recommended precautions against malaria were taken. Travellers should be warned of this and told that if they develop any illness after their return they should see a doctor early, and specifically mention their risk of exposure to malaria.

Epilepsy

Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In these patients, doxycycline or atovaquone with proguanil hydrochloride may be used. However doxycycline may interact with some antiepileptics and its dose may need to be adjusted, see *interactions* information for doxycycline.

Asplenia

Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

Key to recommended regimens for prophylaxis against malaria

Codes for regimens	Details of regimens for prophylaxis against malaria
-	No risk
1	Chemoprophylaxis not recommended, but avoid mosquito bites and consider malaria if fever presents
2	Chloroquine only
3	Chloroquine with proguanil
4	Atovaquone with proguanil hydrochloride or doxycycline or mefloquine

Specific recommendations

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Afghanistan	Low risk below 2000 m from May–November	1
	Very low risk below 2000 m from December–April	1
Algeria	No risk	1
Andaman and Nicobar Islands (India)	Low risk	1
Angola	High risk	4
Argentina	No risk	1
Armenia	No risk	1
Azerbaijan	Very low risk	1
Bangladesh	High risk in Chittagong Hill Tract districts (but not Chittagong city)	4
	Very low risk in Chittagong city and other areas, except Chittagong Hill Tract districts	1
Belize	Low risk in rural areas	1
	No risk in Belize district (including Belize city and islands)	-
Benin	High risk	4
Bhutan	Low risk in southern belt districts, along border with India: Chukha, Geyleg-phug, Samchi, Samdrup Jonkhar, and Shemgang	1
	No risk in areas other than those above	-
Bolivia	Low risk in Amazon basin	1
	Low risk in rural areas below 2500 m (other than above)	1
	No risk above 2500 m	-
Botswana	High risk from November–June in northern half, including Okavango Delta area	4
	Low risk from July–October in northern half, including Okavango Delta area	1
	Very low risk in southern half	1
Brazil	Low risk in Amazon basin, including city of Manaus	1
	Very low risk in areas other than those above	1
	No risk in Iguazu Falls	-
Brunei Darussalam	Very low risk	1
Burkina Faso	High risk	4
Burundi	High risk	4
Cambodia	Low risk. Mefloquine resistance widespread in western provinces bordering Thailand	1
	Very low risk in Angkor Wat and Lake Tonle Sap, including Siem Reap	1
	No risk in Phnom Penh	-
Cameroon	High risk	4
Cape Verde	Individuals travelling to Praia who are at increased risk of malaria (such as long-term travellers and those at risk of severe complications from malaria including pregnant women, infants and young children, the elderly, and asplenic individuals) should consider taking antimalarials, seek advice from a travel health advisor. Very low risk on island of Santiago (Sao Tiago) and Boa Vista	1
Central African Republic	High risk	4
Chad	High risk	4

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
China	Low risk in Yunnan and Hainan provinces	1
	Very low risk in southern and some central provinces, including Anhui, Ghuizhou, Hena, Hubei, and Jiangsu below 1500 m	1
	Very low risk in areas other than those above and below	1
	No risk in Hong Kong	-
Colombia	Low risk in rural areas below 1600 m	1
	Very low risk above 1600 m and in Cartagena	1
Comoros	High risk	4
Congo	High risk	4
Costa Rica	Low risk in Limon province, but not city of Limon (Puerto Limon)	1
	Very low risk in areas other than those above	1
Cote d'Ivoire (Ivory Coast)	High risk	4
Democratic Republic of the Congo	High risk	4
Djibouti	High risk	4
Dominican Republic	Low risk	1
	No risk in cities of Santiago and Santo Domingo	-
East Timor (Timor-Leste)	Risk present	4
Ecuador	Low risk in areas below 1500 m including coastal provinces and Amazon basin	1
	No risk in Galapagos islands or city of Guayaquil	-
Egypt	No risk	1
El Salvador	Low risk in rural areas of Santa Ana, Ahuachapán, and La Unión provinces in western part of country	1
	Very low risk in areas other than those above	1
Equatorial Guinea	High risk	4
Eritrea	High risk below 2200 m	4
	No risk in Asmara or in areas above 2200 m	-
Ethiopia	High risk below 2000 m	4
	No risk in Addis Ababa or in areas above 2000 m	-
French Guiana	Risk present (particularly in border areas) except city of Cayenne or Devil's Island (Ile du Diable)	4
	Low risk in city of Cayenne or Devil's Island (Ile du Diable)	1
Gabon	High risk	4
Gambia	High risk	4
Georgia	Very low risk from June–October in rural south east	1
	No risk from November–May in rural south east	-
Ghana	High risk	4
Guatemala	Low risk below 1500 m	1
	No risk in Guatemala City, Antigua, or Lake Atitlan and above 1500 m	-
Guinea	High risk	4
Guinea-Bissau	High risk	4
Guyana	Risk present in all interior regions	4
	Very low risk in Georgetown and coastal region	1
Haiti	Risk present	3
Honduras	Low risk below 1000 m and in Roatán and other Bay Islands	1
	No risk in San Pedro Sula or Tegucigalpa and areas above 1000 m	-
India	Risk present in states of Assam and Orissa, districts of East Godavari, Srikakulam, Vishakhapatnam, and Vizianagaram in the state of Andhra Pradesh, and districts of Balaghat, Dindori, Mandla, and Seoni in the state of Madhya Pradesh	4
	Low risk in areas other than those above or below (including Goa, Andaman and Nicobar islands)	1
	Exceptional circumstances in low risk areas (dependent on individual risk assessment)	3
	No risk in Lakshadweep islands	-

Key to recommended regimens for prophylaxis against malaria

Codes for regimens	Details of regimens for prophylaxis against malaria
-	No risk
1	Chemoprophylaxis not recommended, but avoid mosquito bites and consider malaria if fever presents
2	Chloroquine only
3	Chloroquine with proguanil
4	Atovaquone with proguanil hydrochloride or doxycycline or mefloquine

Specific recommendations

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Indonesia	High risk in Irian Jaya (Papua)	4
	Low risk in Bali, Lombok and islands of Java and Sumatra	1
	No risk in city of Jakarta	-
Indonesia (Borneo)	Low risk	1
Iran	Low risk from March–November in rural south eastern provinces and in north, along Azerbaijan border in Ardabil, and near Turkmenistan border in North Khorasan	1
	Very low risk in areas other than those above	1
Iraq	Very low risk from May–November in rural northern area below 1500 m	1
	No risk in areas other than those above	-
Kenya	High risk (except city of Nairobi)	4
	Very low risk in the highlands above 2500 m and in city of Nairobi	1
Kyrgyzstan	No risk	-
Lao People's Democratic Republic (Laos)	Low risk	1
	Very low risk in city of Vientiane	1
Liberia	High risk	4
Libya	No risk	1
Madagascar	High risk	4
Malawi	High risk	4
Malaysia	Low risk in mainland Malaysia	1
Malaysia (Borneo)	Low risk in inland areas of Sabah and in inland, forested areas of Sarawak	1
	Very low risk in areas other than those above, including coastal areas of Sabah and Sarawak	1
Mali	High risk	4
Mauritania	High risk all year in southern provinces, and from July–October in the northern provinces	4
	Low risk from November–June in the northern provinces	1
Mauritius	No risk	1
Mayotte	Risk present	4
Mexico	Very low risk	1
Mozambique	High risk	4
Myanmar	Low risk	1
Namibia	High risk all year in regions of Caprivi Strip, Kavango, and Kunene river, and from November–June in northern third of country	4
	Low risk from July–October in northern third of country, except as above in regions of Caprivi Strip, Kavango, and Kunene river	1
	Very low risk in areas other than those above	1
Nepal	Low risk below 1500 m, including the Terai district	1
	No risk in city of Kathmandu and on typical Himalayan treks	-
Nicaragua	Low risk (except Managua)	1
	Very low risk in Managua	1
Niger	High risk	4
Nigeria	High risk	4
North Korea	Very low risk in some southern areas	1

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Pakistan	Low risk below 2000 m	1
	Very low risk above 2000 m	1
Panama	Low risk east of Canal Zone	1
	Very low risk west of Canal Zone	1
	No risk in Panama City or Canal Zone itself	-
Papua New Guinea	High risk below 1800 m	4
	Very low risk above 1800 m	1
Paraguay	No risk	1
Peru	Low risk in Amazon basin along border with Brazil, particularly in Loreto province and in rural areas below 2000 m including the Amazon basin bordering Bolivia	1
	No risk in city of Lima and coastal region south of Chiclayo	-
Philippines	Low risk in rural areas below 600 m and on islands of Luzon, Mindanao, Mindoro, and Palawan	1
	No risk in cities or on islands of Boracay, Bohol, Catanduanes, Cebu, or Leyte	-
Rwanda	High risk	4
São Tomé and Príncipe	High risk	4
Saudi Arabia	Low risk in south-western provinces along border with Yemen, including below 2000 m in Asir province	1
	No risk in cities of Jeddah, Makkah (Mecca), Medina, Riyadh, or Ta'if, or above 2000 m in Asir province	-
Senegal	High risk	4
Sierra Leone	High risk	4
Singapore	No risk	1
Solomon Islands	High risk	4
Somalia	High risk	4
South Africa	Risk from September–May in low altitude areas of Mpumalanga and Limpopo, particularly those bordering Mozambique, Swaziland (Estwatinini), and Zimbabwe (including Kruger National Park)	4
	Low risk in north-east KwaZulu-Natal and in designated areas of Mpumalanga and Limpopo	1
	Very low risk in North West Province (adjacent to Molopo river) and Northern Cape Province (adjacent to Orange river)	1
South Korea	Very low risk in northern areas, in Gangwon-do and Gyeonggi-do provinces, and Incheon city (towards Demilitarized Zone)	1
South Sudan	High risk	4
Sri Lanka	No risk	1
Sudan	High risk in central and southern areas; risk also present in rest of country (except Khartoum)	4
	Very low risk in Khartoum	1
Suriname	Risk present on the French Guiana border	4
	Low risk in areas other than above and below	1
	No risk in city of Paramaribo	-
Swaziland	Risk in northern and eastern regions bordering Mozambique and South Africa, including all of Lubombo district and Big Bend, Mhlume, Simunye, and Tshaneni regions	4
	Very low risk in the areas other than those above	1
Syria	Very low risk in small, remote foci of El Hasakah	1
Tajikistan	Very low risk	1
	No risk above 2000 m	-
Tanzania	High risk below 1800 m; risk also in Zanzibar	4
	No risk above 1800 m	-
Thailand	Mefloquine resistance present. Low risk in rural forested borders with Cambodia, Laos, and Myanmar	1
	Very low risk in areas other than those above, including Kanchanaburi (Kwai Bridge)	1
	No risk in cities of Bangkok, Chiang Mai, Chiang Rai, Koh Phangan, Koh Samui, and Pattaya	-

Turkey	Very low risk	1
Uganda	High risk	4
Uzbekistan	No risk	1
Vanuatu	Risk present	4
Venezuela	Risk in all areas south of, and including, the Orinoco river and Angel Falls, rural areas of Apure, Monagas, Sucre, and Zulia states	1
	Increase in reported malaria cases between 2010 and 2017, mainly in the Bolivar state	1
	No risk in city of Caracas or on Margarita Island	-
Vietnam	Low risk in rural areas, and in southern provinces of Tay Ninh, Lam Dong, Dac Lac, Gia Lai, and Kon Tum	1
	No risk in large cities (including Ho Chi Minh City (Saigon) and Hanoi), the Red River delta, coastal areas north of Nha Trang and Phu Quoc Island	1
Western Sahara	No risk	1
Yemen	Risk below 2000 m	3
	Very low risk on Socrota Island	1
	No risk above 2000 m, including Sana'a city	1
Zambia	High risk	4
Zimbabwe	High risk all year in Zambezi valley, and from November–June in areas below 1200 m	4
	Low risk from July–October in areas below 1200 m	1
	Very low risk all year in Harare and Bulawayo	1

Pregnancy

Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, pregnant individuals must be informed about the risks and benefits of effective prophylaxis. Chloroquine and proguanil hydrochloride can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined. In the case of proguanil hydrochloride, folic acid p. 1084 (dosed as a pregnancy at 'high-risk' of neural tube defects) should be given for the length of time that it is used during pregnancy. If travelling to high risk areas or there is resistance to other drugs, mefloquine may be considered during the second or third trimester of pregnancy. Mefloquine can be used in the first trimester with caution if the benefits outweigh the risks. Doxycycline is contra-indicated during pregnancy; however, it can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks' gestation [unlicensed]. Atovaquone with proguanil hydrochloride should be avoided during pregnancy, however, it can be considered during the second and third trimesters if there is no suitable alternative. Folic acid (dosed as a pregnancy at 'high-risk' of neural tube defects) should be given for the length of time that atovaquone with proguanil hydrochloride is used during pregnancy.

Breast-feeding

Some antimalarials should be avoided when breast feeding, see individual drugs for details.

Prophylaxis is required in **breast-fed infants**; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

Anticoagulants

Travellers taking warfarin sodium p. 150 should begin chemoprophylaxis 2–3 weeks before departure and the INR should be stable before departure. It should be measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

There is relatively limited experience of chemoprophylaxis in those travellers taking direct oral anticoagulants (DOACs).

Other medical conditions

For additional information on malaria prophylaxis in patients with other medical conditions, see Public Health England Guidelines for malaria prevention in travellers from the United Kingdom (see *Useful resources*).

Emergency standby treatment

Travellers on prophylaxis and visiting remote, malarious areas should carry standby emergency treatment if they are likely to be more than 24 hours away from medical care. Standby emergency treatment should also be considered in long-term travellers living in or visiting remote, malarious

areas that may be far from appropriate medical attention; this does not replace the need to consider prophylaxis. Self-medication should be **avoided** if medical help is accessible.

In order to use standby treatment appropriately, the traveller should be provided with **written instructions** which include seeking urgent medical attention if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller due to concerns over drug resistance and to minimise drug toxicity.

Malaria prophylaxis, specific recommendations

Travellers planning journeys across continents can travel into areas that have different malaria prophylaxis recommendations. The choice of prophylaxis medication must reflect overall risk to ensure protection in all areas; it may be possible to change from one regimen to another. Those travelling to remote or little-visited areas may require expert advice. For further information see *Recommended regimens for prophylaxis against malaria*, and Public Health England Guidelines for malaria prevention in travellers from the United Kingdom (see *Useful resources*).

Important

Settled immigrants (or long-term visitors) to the UK may be unaware that **any immunity they may have acquired while living in malarious areas is lost rapidly** after migration to the UK, or that any non-malarious areas where they lived previously **may now be malarious**.

Treatment of malaria

Recommendations on the treatment of malaria reflect guidelines agreed by UK malaria specialists.

If the infective species is **not known**, or if the infection is **mixed**, initial treatment should be as for *falciparum malaria* with quinine p. 655, *Malarone*[®] (atovaquone with proguanil hydrochloride p. 651), or *Riamet*[®] (artemether with lumefantrine p. 650). *Falciparum malaria* can progress rapidly in unprotected individuals and antimalarial treatment should be considered in those with features of severe malaria and possible exposure, even if the initial blood tests for the organism are negative.

Falciparum malaria (treatment)

Falciparum malaria (malignant malaria) is caused by *Plasmodium falciparum*. In most parts of the world *P. falciparum* is now resistant to chloroquine p. 651 which should not therefore be given for treatment.

Quinine, *Malarone*[®] (atovaquone with proguanil hydrochloride), or *Riamet*[®] (artemether with lumefantrine) can be given *by mouth* if the patient can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given *by intravenous infusion* if the patient is seriously ill or unable to take tablets. Mefloquine p. 653 is now rarely used for treatment because of concerns about resistance.

Oral quinine is given by mouth for 5–7 days, together with or followed by either doxycycline p. 597 for 7 days or clindamycin p. 564 for 7 days [unlicensed].

If the parasite is likely to be sensitive, pyrimethamine with sulfadoxine as a single dose [unlicensed] may be given (instead of either clindamycin or doxycycline) together with, or after, a course of quinine.

Alternatively, *Malarone*[®] or *Riamet*[®] may be given instead of quinine. It is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after *Malarone*[®] or *Riamet*[®] treatment.

If the patient is seriously ill or unable to take tablets, or if more than 2% of red blood cell are parasitized, quinine should be given *by intravenous infusion* [unlicensed] (until patient can swallow tablets to complete the 7-day course *together with* or *followed by either* doxycycline or clindamycin).

Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous **artesunate** may be available for 'named-patient' use.

Pregnancy

Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The adult treatment doses or oral and intravenous quinine (including the loading dose) can safely be given to pregnant women. Clindamycin should be given after quinine [unlicensed indication]. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development); pyrimethamine with sulfadoxine, *Malarone*[®], and *Riamet*[®] are also best avoided until more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for 'named patient' use.

Non-falciparum malaria (treatment)

Non-falciparum malaria is usually caused by *Plasmodium vivax* and less commonly by *P. ovale* and *P. malariae*. *P. knowlesi* is also present in the Asia-Pacific region. Chloroquine is the drug of choice for the treatment of non-falciparum malaria (but chloroquine-resistant *P. vivax* has been reported in the Indonesian archipelago, the Malay Peninsula, including Myanmar, and eastward to Southern Vietnam).

For the treatment of chloroquine-resistant non-falciparum malaria, *Malarone*® [unlicensed indication], quinine, or *Riamet*® [unlicensed indication] can be used; as with chloroquine, primaquine p. 654 should be given for radical cure.

Chloroquine alone is adequate for *P. malariae* and *P. knowlesi* infections but in the case of *P. vivax* and *P. ovale*, a radical cure (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with primaquine [unlicensed] given after chloroquine, with the dose dependent on the infecting organism. For a radical cure, primaquine [unlicensed] is then given for 14 days, with the dose also dependent on the infecting organism.

Parenteral

Parenteral If the patient is unable to take oral therapy, quinine can be given by intravenous infusion [unlicensed], changed to oral chloroquine as soon as the patient's condition permits.

Pregnancy

The adult treatment doses of chloroquine can be given for non-falciparum malaria. In the case of *P. vivax* or *P. ovale*, however, the radical cure with primaquine should be **postponed** until the pregnancy is over; instead chloroquine should be continued, given weekly during the pregnancy.

ANTIPROTOZOALS > ANTIMALARIALS**Artemether with lumefantrine**

28-May-2018

● INDICATIONS AND DOSE

Treatment of acute uncomplicated falciparum malaria | Treatment of chloroquine-resistant non-falciparum malaria

▶ BY MOUTH

▶ Adult (body-weight 35 kg and above): Initially 4 tablets, followed by 4 tablets for 5 doses each given at 8, 24, 36, 48 and 60 hours (total 24 tablets over 60 hours)

● **UNLICENSED USE** Use in treatment of non-falciparum malaria is an unlicensed indication.

● **CONTRA-INDICATIONS** Family history of congenital QT interval prolongation · family history of sudden death · history of arrhythmias · history of clinically relevant bradycardia · history of congestive heart failure accompanied by reduced left ventricular ejection fraction

● **CAUTIONS** Avoid in Acute porphyrias p. 1120 · electrolyte disturbances

● **INTERACTIONS** → Appendix 1: antimalarials

● SIDE-EFFECTS

▶ **Common or very common** Abdominal pain · appetite decreased · arthralgia · asthenia · cough · diarrhoea · dizziness · gait abnormal · headache · movement disorders · myalgia · nausea · palpitations · QT interval prolongation · sensation abnormal · skin reactions · sleep disorders · vomiting

▶ **Uncommon** Drowsiness

▶ **Frequency not known** Angioedema

● **PREGNANCY** Toxicity in *animal* studies with artemether. Manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises avoid breastfeeding for at least 1 week after last dose. Present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available)—monitor ECG and plasma potassium concentration.

● **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.

Monitoring In severe renal impairment monitor ECG and plasma potassium concentration.

● **MONITORING REQUIREMENTS** Monitor patients unable to take food (greater risk of recrudescence).

● **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed just before administration.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

▶ *Riamet* (Novartis Pharmaceuticals UK Ltd)

Artemether 20 mg, Lumefantrine 120 mg Riamet tablets | 24 tablet **[POM]** £22.50

Artemimol with piperazine phosphate

18-Jun-2018

(Piperazine tetraphosphate with dihydroartemisinin)

● INDICATIONS AND DOSE

Treatment of uncomplicated falciparum malaria

▶ BY MOUTH

▶ Child 6 months–17 years (body-weight 7–12 kg): 0.5 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

▶ Child 6 months–17 years (body-weight 13–23 kg): 1 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

▶ Child 6 months–17 years (body-weight 24–35 kg): 2 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

▶ Child 6 months–17 years (body-weight 36–74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

▶ Child 6 months–17 years (body-weight 75–99 kg): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

▶ Adult (body-weight 36–74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

▶ Adult (body-weight 75–99 kg): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

● **CONTRA-INDICATIONS** Acute myocardial infarction · bradycardia · congenital long QT syndrome · electrolyte disturbances · family history of sudden death · heart failure with reduced left ventricular ejection fraction · history of symptomatic arrhythmias · left ventricular hypertrophy · risk factors for QT interval prolongation · severe hypertension

● **INTERACTIONS** → Appendix 1: antimalarials

● SIDE-EFFECTS

▶ **Common or very common** Anaemia · arrhythmias (in adults) · asthenia · conjunctivitis (in children) · eosinophilia · fever · headache (uncommon in children) · leucocytosis (in children) · leucopenia (in children) · neutropenia (in

children) · QT interval prolongation · thrombocytopenia (in children)

- ▶ **Uncommon** Abdominal pain (very common in children) · appetite decreased (very common in children) · arthralgia · cardiac conduction disorder · cough (very common in children) · diarrhoea (very common in children) · dizziness (in adults) · epistaxis (in children) · hepatic disorders · hypochromia (in children) · increased risk of infection (very common in children) · lymphadenopathy (in children) · myalgia (in adults) · nausea · rhinorrhoea (in children) · seizure · skin reactions (very common in children) · splenomegaly (in children) · stomatitis (in children) · thrombocytosis (in children) · vomiting (very common in children)

- **PREGNANCY** Teratogenic in *animal* studies—manufacturer advises use only if other antimalarials cannot be used.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in jaundice or in moderate to severe failure (no information available)—monitor ECG and plasma potassium concentration.

Monitoring Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe hepatic impairment.

- **RENAL IMPAIRMENT** No information available in moderate to severe impairment.

Monitoring Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe renal impairment.

- **MONITORING REQUIREMENTS**

- ▶ Consider obtaining ECG in all patients before third dose and 4–6 hours after third dose. If QT_c interval more than 500 milliseconds, discontinue treatment and monitor ECG for a further 24–48 hours.

- ▶ Obtain ECG as soon as possible after starting treatment then continue monitoring in those taking medicines that increase plasma-piperazine concentration, in children who are vomiting, in females, or in the elderly.

- **DIRECTIONS FOR ADMINISTRATION** Tablets to be taken at least 3 hours before and at least 3 hours after food. Tablets may be crushed and mixed with water immediately before administration.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tablets containing piperazine phosphate with arteminol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
