REDUCED RATE SUBSCRIPTION FOR INDEPENDENT COMMUNITY PHARMACISTS

Essential information to help you make the right decision

As a community pharmacist, we know you strive to provide safe and effective patient care. That's why independent community pharmacists can now benefit from a reduced rate subscription to essential resources through our trusted online medicines information platform, MedicinesComplete. Resources include:

Stockley's Drug Interactions, Stockley's Interactions Checker, Martindale: The Complete Drug Reference, Martindale's ADR Checker, British National Formulary and BNF for Children.

MedicinesComplete makes it easy for healthcare professionals to access essential medicines information at the point of care. Providing trusted evidence-based knowledge for confident decision-making and effective patient care.

BNF**BNF**
for Children

The first choice for concise medicines information

Trusted by healthcare professionals in the UK and across the world, the British National Formulary (BNF) and BNF *for Children* support confident decision-making at the point of care.

BNF and BNF *for Children* are updated monthly through the online platform MedicinesComplete and via the BNF app. In print, BNF is updated twice a year and BNF *for Children* annually. FormularyComplete enables you to create and manage your own local formulary online, built on BNF and BNF *for Children* advice.

How to access the BNF

NHS Eligible Individuals

Eligible healthcare professionals in the UK benefit from a print copy of the BNF and BNF *for Children* each September, and online access provided through MedicinesComplete and the BNF app.

- For print, refer to page ii, call 01268 495 609 or email BNF@wilmingtonhealthcare.com.
- To register as an NHS user for access through MedicinesComplete go to about.medicinescomplete.com/registration.
- Download the BNF app from your iOS or Android app store.

Access BNF and BNF *for Children* alongside other best practice and evidence-based guidance from NICE at www.evidence.nhs.uk.

Print

Buy single copies or a subscription securely online, at www.pharmpress.com/bnf
Bulk orders: call +44 (0)20 7572 2266 or email pharmpress-support@rpharms.com

Online

Subscribe through MedicinesComplete or to FormularyComplete:

or via our website www.pharmpress.com/

For all bulk orders of more than 20 copies:

Tel: +44 (0) 207 572 2266

pharmpress-support@rpharms.com

The *BNF* is available as a mobile app, online (bnf.nice.org.uk/) and also through MedicinesComplete; a PDA version is also available. In addition, *BNF* content can be integrated into a local formulary by using *BNF* on FormularyComplete; see www.bnf.org for details.

Distribution of printed BNFs

In **England**, NICE purchases print editions of the *BNF* (September editions only) for distribution within the NHS. For details of who is eligible to receive a copy and further contact details, please refer to the NICE website: www.nice.org.uk/about/what-we-do/evidence-services/british-national-formulary. If you are entitled to a shared copy of the *BNF*, please call (0)1268 495 609 or email: BNF@wilmingtonhealthcare.com.

In **Scotland**, email:
nss.psd-bnf@nhs.net

In **Wales**, email:

nwssp-primarycareservices@wales.nhs.uk

In **Northern Ireland**, email:

ni.bnf@hscni.net

About BNF content

The *BNF* is designed as a digest for rapid reference and it may not always include all the information necessary for prescribing and dispensing. Also, less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. *BNF for Children* should be consulted for detailed information on the use of medicines in children. The *BNF* should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from Medicines Information Services.

Please refer to digital versions of *BNF* for the most up-to-date content. *BNF* is published in print but interim updates are issued and published in the digital versions of *BNF*. The publishers work to ensure that the information is as accurate and up-to-date as possible at the date of publication, but knowledge and best practice in this field change regularly. *BNF*'s accuracy and currency cannot be guaranteed and neither the publishers nor the authors accept any responsibility for errors or omissions. While considerable efforts have been made to check the material in this publication, it should be treated as a guide only. Prescribers, pharmacists and other healthcare professionals are advised to check www.bnf.org/ for information about key updates and corrections.

Pharmaid

Numerous requests have been received from developing countries for *BNFs*. The Pharmaid scheme of the Commonwealth Pharmacists Association will dispatch old *BNFs* to certain Commonwealth countries. For more information on this scheme see commonwealthpharmacy.org/what-we-do/pharmaid/. If you would like to donate your copy email: admin@commonwealthpharmacy.org

Preface

The BNF is a joint publication of the British Medical Association and the Royal Pharmaceutical Society. It is published under the authority of a Joint Formulary Committee which comprises representatives of the two professional bodies, the UK Health Departments, the Medicines and Healthcare products Regulatory Agency, and a national guideline producer. The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the Group includes representatives of the British Dental Association and a representative from the UK Health Departments. The Nurse Prescribers' Advisory Group advises on the content relevant to nurses and includes representatives from different parts of the nursing community and from the UK Health Departments.

The BNF aims to provide prescribers, pharmacists, and other healthcare professionals with sound up-to-date information about the use of medicines.

The BNF includes key information on the selection, prescribing, dispensing and administration of medicines. Medicines generally prescribed in the UK are covered and those considered less suitable for prescribing are clearly identified. Little or no information is included on medicines promoted for purchase by the public.

Information on drugs is drawn from the manufacturers' product literature, medical and pharmaceutical literature, UK health departments, regulatory authorities, and professional bodies. Advice is constructed from clinical literature and reflects, as far as possible, an evaluation of the evidence from diverse sources. The BNF also takes account of authoritative national guidelines and emerging safety concerns. In addition, the editorial team receives advice on all therapeutic areas from expert clinicians; this ensures that the BNF's recommendations are relevant to practice.

The BNF is designed as a digest for rapid reference and it may not always include all the information necessary for prescribing and dispensing. Also, less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. Similarly, little or no information is included on medicines for very rare conditions. *BNF for Children* should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services, see Medicines Information Services (see inside front cover).

It is **important** to use the most recent BNF information for making clinical decisions. The print edition of the BNF is updated in March and September each year. Monthly updates are provided online via Medicines Complete and the NHS Evidence portal. The more important changes are listed under Changes; changes listed online are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies.

The BNF Publications website (www.bnf.org) includes additional information of relevance to healthcare professionals. Other digital formats of the BNF—including versions for mobile devices and integration into local formularies—are also available.

BNF Publications welcomes comments from healthcare professionals. Comments and constructive criticism should be sent to:

British National Formulary,
Royal Pharmaceutical Society,
66–68 East Smithfield
London

Acknowledgements

The Joint Formulary Committee is grateful to individuals and organisations that have provided advice and information to the *BNF*.

Contributors for this update were:

K.W. Ah-See, M.N. Badminton, A.K. Bahl, P.R.J. Barnes, D. Bilton, S.L. Bloom, M.F. Bultitude, I.F. Burgess, D.J. Burn, C.E. Dearden, D.W. Denning, P.N. Durrington, D.A.C. Elliman, P. Emery, M.D. Feher, A. Freyer, B.G. Gazzard, A.M. Geretti, N.J.L. Gittoes, P.J. Goadsby, M. Gupta, T.L. Hawkins, B.G. Higgins, S.P. Higgins, S.H.D. Jackson, A. Jones, D.M. Keeling, J.R. Kirwan, P.G. Kopelman, T.H. Lee, A. Lekkas, D.N.J. Lockwood, A.M. Lovering, M.G. Lucas, L. Luzzatto, P.D. Mason, D.A. McArthur, K.E.L. McColl, L.M. Melvin, E. Miller, R.M. Mirakian, P. Morrison, S.M.S. Nasser, C. Nelson-Piercy, J.M. Neuberger, D.J. Nutt, R. Patel, W.J. Penny, A.B. Provan, A.S.C. Rice, D.J. Rowbotham, J.W. Sander, J.A.T. Sandoe, M. Schacter, S.E. Slater, J. Soar, S.C.E. Sporton, M.D. Stewart, S. Thomas, J.P. Thompson, A.D. Weeks, A. Wilcock, A.P.R. Wilson.

Expert advice on the management of oral and dental conditions was kindly provided by M. Addy, P. Coulthard, A. Crighton, M.A.O. Lewis, J.G. Meechan, N.D. Robb, C. Scully, R.A. Seymour, R. Welbury, and J.M. Zakrzewska. S. Kaur provided valuable advice on dental prescribing policy.

Valuable advice has been provided by the following expert groups: Advisory Committee on Malaria Prevention, Association of British Neurologists, British Association of Dermatologists' Therapy & Guidelines Sub-committee, British Geriatrics Society, British Paediatric Neurology Association, British Society of Gastroenterology, British Society for Paediatric Endocrinology and Diabetes, British Society of Paediatric Gastroenterology, Hepatology and Nutrition, College of Mental Health Pharmacy, Faculty of Sexual and Reproductive Healthcare, Neonatal and Paediatric Pharmacists Group, Royal College of Anaesthetists, Royal College of Obstetricians and Gynaecologists, Royal College of Paediatrics and Child Health, Royal College of Physicians, Royal College of Psychiatrists, Society for Endocrinology, Vascular Society.

The MHRA have provided valuable assistance.

Correspondents in the pharmaceutical industry have provided information on new products and commented on products in the *BNF*.

Numerous doctors, pharmacists, nurses, and others have sent comments and suggestions.

The *BNF* team are grateful for the support and access to in-house expertise at Pharmaceutical Press and acknowledge the assistance of K. Baxter, A. Naylor, J. Macdonald, N. Potter and their teams.

T. Ali, J. Chen, R. Gupta, E. Kim, O. Komolafe, E. Olaoke, A. Paul, D. Usop provided considerable assistance during the production of this update of the *BNF*.

This edition of the *BNF* carries a rainbow in recognition of the work and dedication of all frontline healthcare workers throughout the COVID-19 pandemic.

How BNF Publications are constructed

Overview

The BNF is an independent professional publication that addresses the day-to-day prescribing information needs of healthcare professionals. Use of this resource throughout the health service helps to ensure that medicines are used safely, effectively, and appropriately.

Hundreds of changes are made between print editions, and are published monthly in a number of digital formats. The most clinically significant updates are listed under Changes p. xvi.

The BNF is unique in bringing together authoritative, independent guidance on best practice with clinically validated drug information. Validation of information follows a standardised process, reviewing emerging evidence, best-practice guidelines, and advice from a network of clinical experts. Where the evidence base is weak, further validation is undertaken through a process of peer review. The process and its governance are outlined in greater detail in the sections that follow.

Joint Formulary Committee

The Joint Formulary Committee (JFC) is responsible for the content of the BNF. The JFC includes pharmacy, medical, nursing and lay representatives; there are also representatives from the Medicines and Healthcare products Regulatory Agency (MHRA), the UK Health Departments, and a national guideline producer. The JFC decides on matters of policy and reviews amendments to the BNF in the light of new evidence and expert advice.

Dental Advisory Group

The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the group includes representatives from the British Dental Association and a representative from the UK Health Departments.

Nurse Prescribers' Advisory Group

The Nurse Prescribers' Advisory Group oversees the list of drugs approved for inclusion in the Nurse Prescribers' Formulary; the group includes representatives from a range of nursing disciplines and stakeholder organisations.

Expert advisers

The BNF uses about 60 expert clinical advisers (including doctors, pharmacists, nurses, and dentists) throughout the UK to help with clinical content. The role of these expert advisers is to review existing text and to comment on amendments drafted by the clinical writers. These clinical experts help to ensure that the BNF remains reliable by:

- commenting on the relevance of the text in the context of best clinical practice in the UK;
- checking draft amendments for appropriate interpretation of any new evidence;
- providing expert opinion in areas of controversy or when reliable evidence is lacking;
- providing independent advice on drug interactions, prescribing in hepatic impairment, renal impairment, pregnancy, breast-feeding, children, the elderly, palliative care, and the emergency treatment of poisoning.

In addition to consulting with regular advisers, the BNF calls on other clinical specialists for specific developments when particular expertise is required.

The BNF works closely with a number of expert bodies that produce clinical guidelines. Drafts or pre-publication copies of guidelines are often received for comment and assimilation into the BNF.

Editorial team

BNF clinical writers have all worked as pharmacists or possess a pharmacy degree and a further, relevant post-graduate qualification, and have a sound understanding of how drugs are used in clinical practice. As a team, the clinical writers are responsible for editing, maintaining, and updating BNF content. They follow a systematic prioritisation process in response to updates to the evidence base in order to ensure the most clinically important topics are reviewed as quickly as possible. In parallel the team of clinical writers undertakes a process of rolling revalidation, aiming to review all of the content in the BNF over a 3- to 4-year period.

Amendments to the text are drafted when the clinical writers are satisfied that any new information is reliable and relevant. A set of standard criteria define when content is referred to expert advisers, the Joint Formulary Committee or other advisory groups, or submitted for peer review.

Clinical writers prepare the text for publication and undertake a number of validation checks on the knowledge at various stages of the production process.

Sources of BNF information

The BNF uses a variety of sources for its information; the main ones are shown below.

Summaries of product characteristics

The BNF reviews summaries of product characteristics (SPCs) of all new products as well as revised SPCs for existing products. The SPCs are the principal source of product information and are carefully processed. Such processing involves:

- verifying the approved names of all relevant ingredients including 'non-active' ingredients (the BNF is committed to using approved names and descriptions as laid down by the Human Medicine Regulations 2012);
- comparing the indications, cautions, contra-indications, and side-effects with similar existing drugs. Where these are different from the expected pattern, justification is sought for their inclusion or exclusion;
- seeking independent data on the use of drugs in pregnancy and breast-feeding;
- incorporating the information into the BNF using established criteria for the presentation and inclusion of the data;
- checking interpretation of the information by a second clinical writer before submitting to a content manager; changes relating to doses receive a further check;
- identifying potential clinical problems or omissions and seeking further information from manufacturers or from expert advisers;
- constructing, with the help of expert advisers, a comment on the role of the drug in the context of similar drugs.

Much of this processing is applicable to the following sources as well.

Literature

Clinical writers monitor core medical and pharmaceutical journals. Research papers and reviews relating to drug therapy are carefully processed. When a difference between the advice in the BNF and the paper is noted, the new information is assessed for reliability (using tools based on SIGN methodology) and relevance to UK clinical practice. If necessary, new text is drafted and discussed with expert advisers and the Joint Formulary Committee. The BNF enjoys a close working relationship with a number of national information providers.

In addition to the routine process, which is used to identify 'triggers' for changing the content, systematic literature searches are used to identify the best quality evidence available to inform an update. Clinical writers receive training in critical appraisal, literature evaluation, and search strategies.

Consensus guidelines

The advice in the BNF is checked against consensus guidelines produced by expert bodies. The quality of the guidelines is assessed using adapted versions of the AGREE II tool. A number of bodies make drafts or pre-publication copies of the guidelines available to the BNF; it is therefore possible to ensure that a consistent message is disseminated. The BNF routinely processes guidelines from the National Institute for Health and Care Excellence (NICE), the All Wales Medicines Strategy Group (AWMSG), the Scottish Medicines Consortium (SMC), and the Scottish Intercollegiate Guidelines Network (SIGN).

Reference sources

Textbooks and reference sources are used to provide background information for the review of existing text or for the construction of new text. The BNF team works closely with the editorial team that produces *Martindale: The Complete Drug Reference*. The BNF has access to *Martindale* information resources and each team

keeps the other informed of significant developments and shifts in the trends of drug usage.

Peer review

Although every effort is made to identify the most robust data available, inevitably there are areas where the evidence base is weak or contradictory. While the BNF has the valuable support of expert advisers and the Joint Formulary Committee, the recommendations made may be subject to a further level of scrutiny through peer review to ensure they reflect best practice.

Content for peer review is posted on bnf.org and interested parties are notified via a number of channels, including the BNF e-newsletter.

Statutory information

The BNF routinely processes relevant information from various Government bodies including Statutory Instruments and regulations affecting the Prescriptions only Medicines Order. Official compendia such as the British Pharmacopoeia and its addenda are processed routinely to ensure that the BNF complies with the relevant sections of the Human Medicines Regulations 2012.

The BNF maintains close links with the Home Office (in relation to controlled drug regulations) and the Medicines and Healthcare products Regulatory Agency (including the British Pharmacopoeia Commission). Safety warnings issued by the Commission on Human Medicines (CHM) and guidelines on drug are issued by the UK health departments are processed as a matter of routine.

Relevant professional statements issued by the Royal Pharmaceutical Society are included in the BNF as are guidelines from bodies such as the Royal College of General Practitioners.

Medicines and devices

NHS Prescription Services (from the NHS Business Services Authority) provides non-clinical, categorical information (including prices) on the medicines and devices included in the BNF.

Comments from readers

Readers of the BNF are invited to send in comments. Numerous letters and emails are received by the BNF team. Such feedback helps to ensure that the BNF provides practical and clinically relevant information. Many changes in the presentation and scope of the BNF have resulted from comments sent in by users.

Comments from industry

Close scrutiny of BNF by the manufacturers provides an additional check and allows them an opportunity to raise issues about BNF's presentation of the role of various drugs; this is yet another check on the balance of BNF's advice. All comments are looked at with care and, where necessary, additional information and expert advice are sought.

Market research

Market research is conducted at regular intervals to gather feedback on specific areas of development.

Assessing the evidence

From January 2016, recommendations made in BNF publications have been evidence graded to reflect the strength of the recommendation. The addition of evidence grading is to support clinical decision making based on the best available evidence.

The BNF aims to revalidate all content over a rolling 3- to 4-year period and evidence grading will be applied to recommendations as content goes through the revalidation process. Therefore, initially, only a small number of recommendations will have been graded.

Grading system

The BNF has adopted a five level grading system from A to E, based on the former SIGN grading system. This grade is displayed next to the recommendation within the text.

Evidence used to make a recommendation is assessed for validity using standardised methodology tools based on AGREE II and assigned a level of evidence. The recommendation is then given a grade that is extrapolated from the level of evidence, and an assessment of the body of evidence and its applicability.

Evidence assigned a level 1- or 2- score has an unacceptable level of bias or confounding and is not used to form recommendations.

Levels of evidence

- **Level 1++**
High quality meta-analyses, systematic reviews of randomised controlled trials (RCTs), or RCTs with a very low risk of bias.
- **Level 1+**
Well-conducted meta-analyses, systematic reviews, or RCTs with a low risk of bias.
- **Level 1-**
Meta-analyses, systematic reviews, or RCTs with a high risk of bias.
- **Level 2++**
High quality systematic reviews of case control or cohort studies; or high quality case control or cohort studies with a very low risk of confounding or bias and a high probability that the relationship is causal.
- **Level 2+**
Well-conducted case control or cohort studies with a low risk of confounding or bias and a moderate probability that the relationship is causal.
- **Level 2-**
Case control or cohort studies with a high risk of confounding or bias and a significant risk that the relationship is not causal.
- **Level 3**
Non-analytic studies, e.g. case reports, case series.
- **Level 4**
Expert advice or clinical experience from respected authorities.

Grades of recommendation

- **Grade A: High strength**
NICE-accredited guidelines; or guidelines that pass AGREE II assessment; or at least one meta-analysis, systematic review, or RCT rated as 1++, and directly applicable to the target population; or a body of evidence consisting principally of studies rated as 1+, directly applicable to the target population, and demonstrating overall consistency of results.
- **Grade B: Moderate strength**
A body of evidence including studies rated as 2++, directly applicable to the target population, and demonstrating overall consistency of results; or extrapolated evidence from studies rated as 1++ or 1+.
- **Grade C: Low strength**
A body of evidence including studies rated as 2+, directly applicable to the target population and demonstrating overall consistency of results; or extrapolated evidence from studies rated as 2++.
- **Grade D: Very low strength**
Evidence level 3; or extrapolated evidence from studies rated as 2+; or tertiary reference source created by a transparent, defined methodology, where the basis for recommendation is clear.
- **Grade E: Practice point**
Evidence level 4.

How to use BNF Publications in print

How to use the BNF

This edition of the BNF continues to display the fundamental change to the structure of the content that was first shown in BNF 70. The changes were made to bring consistency and clarity to BNF content, and to the way that the content is arranged within print and digital products, increasing the ease with which information can be found.

For reference, the most notable changes to the structure of the content include:

- Drug monographs – where possible, all information that relates to a single drug is contained within its drug monograph, moving information previously contained in the prescribing notes. Drug monographs have also changed structurally: additional sections have been added, ensuring greater regularity around where information is located within the publication.
- Drug class monographs – where substantial amounts of information are common to all drugs within a drug class (e.g. macrolides p. 565), a drug class monograph has been created to contain the common information.
- Medicinal forms – categorical information about marketed medicines, such as price and pack size, continues to be sourced directly from the Dictionary of Medicines and Devices provided by the NHS Business Services Authority. However, clinical information curated by the BNF team has been clearly separated from the categorical pricing and pack size information and is included in the relevant section of the drug monograph.
- Section numbering – the BNF section numbering has been removed. This section numbering tied the content to a rigid structure and enforced the retention of defunct classifications, such as mercurial diuretics, and hindered the relocation of drugs where therapeutic use had altered. It also caused constraints between the BNF and BNF *for Children*, where drugs had different therapeutic uses in children.
- Appendix 4 – the content has been moved to individual drug monographs. The introductory notes have been replaced with a new guidance section, Guidance on intravenous infusions p. 16.

Introduction

In order to achieve the safe, effective, and appropriate use of medicines, healthcare professionals must be able to use the BNF effectively, and keep up to date with significant changes in the BNF that are relevant to their clinical practice. This *How to Use the BNF* is key in reinforcing the details of the new structure of the BNF to all healthcare professionals involved with prescribing, monitoring, supplying, and administering medicines, as well as supporting the learning of students training to join these professions.

Structure of the BNF

This BNF edition continues to broadly follow the high-level structure of earlier editions of the BNF (i.e. those published before BNF 70):

Front matter, comprising information on how to use the BNF, the significant content changes in each edition, and guidance on various prescribing matters (e.g. prescription writing, the use of intravenous drugs, particular considerations for special patient populations).

Chapters, containing drug monographs describing the uses, doses, safety issues and other considerations involved in the use of drugs; drug class monographs; and treatment summaries, covering guidance on the selection of drugs. Monographs and treatment summaries are divided into chapters based on specific aspects of medical care, such as Chapter 5, Infections, or Chapter 16, Emergency treatment

of poisoning; or drug use related to a particular system of the body, such as Chapter 2, Cardiovascular.

Within each chapter, content is organised alphabetically by therapeutic use (e.g. Airways disease, obstructive), with the treatment summaries first, (e.g. asthma), followed by the monographs of the drugs used to manage the conditions discussed in the treatment summary. Within each therapeutic use, the drugs are organised alphabetically by classification (e.g. Antimuscarinics, Beta₂-agonist bronchodilators) and then alphabetically within each classification (e.g. Acclidinium bromide, Glycopyrronium bromide, Ipratropium bromide).

Appendices, covering interactions, borderline substances, cautionary and advisory labels, and woundcare.

Back matter, covering the lists of medicines approved by the NHS for Dental and Nurse Practitioner prescribing, proprietary and specials manufacturers' contact details, and the index. Yellow cards are also included, to facilitate the reporting of adverse events, as well as quick reference guides for life support and key drug doses in medical emergencies, for ease of access.

Navigating the BNF

The contents page provides the high-level layout of information within the BNF; and in addition, each chapter begins with a small contents section, describing the therapeutic uses covered within that chapter. Once in a chapter, location is guided by the side of the page showing the chapter number (the *thumbnail*), alongside the chapter title. The top of the page includes the therapeutic use (the *running head*) alongside the page number.

Once on a page, visual cues aid navigation: treatment summary information is in black type, with therapeutic use titles similarly styled in black, whereas the use of colour indicates drug-related information, including drug classification titles, drug class monographs, and drug monographs.

Although navigation is possible by browsing, primarily access to the information is via the index, which covers the titles of drug class monographs, drug monographs, and treatment summaries. The index also includes the names of branded medicines and other topics of relevance, such as abbreviations, guidance sections, tables, and images.

Content types

Treatment summaries

Treatment summaries are of three main types;

- an overview of delivering a drug to a particular body system (e.g. Skin conditions, management p. 1285)
- a comparison between a group or groups of drugs (e.g. beta-adrenoceptor blockers (systemic) p. 159)
- an overview of the drug management or prophylaxis of common conditions intended to facilitate rapid appraisal of options (e.g. Hypertension p. 151, or Malaria, prophylaxis p. 643).

In order to select safe and effective medicines for individual patients, information in the treatment summaries must be used in conjunction with other prescribing details about the drugs and knowledge of the patient's medical and drug history.

Monographs

Overview

In earlier editions (i.e. before BNF 70), a systemically administered drug with indications for use in different body systems was split across the chapters relating to those body systems. So, for example, codeine phosphate p. 475 was found in chapter 1, for its antitoxicity effects and chapter 4 for its analgesic effects. However, the monograph in chapter

1 contained only the dose and some selected safety precautions.

Now, all of the information for the systemic use of a drug is contained within one monograph, so codeine phosphate p. 475 is now included in chapter 4. This carries the advantage of providing all of the information in one place, so the user does not need to flick back and forth across several pages to find all of the relevant information for that drug. Cross references are included in chapter 1, where the management of diarrhoea is discussed, to the drug monograph to assist navigation.

Where drugs have systemic and local uses, for example, chloramphenicol, and the considerations around drug use are markedly different according to the route of administration, the monograph is split, as with earlier editions, into the relevant chapters.

This means that the majority of drugs are still placed in the same chapters and sections as earlier editions, and although there may be some variation in order, all of the relevant information will be easier to locate.

One of the most significant changes to the monograph structure is the increased granularity, with a move from around 9 sections to over 20 sections; sections are only included when relevant information has been identified. The following information describes these sections and their uses in more detail.

Nomenclature

Monograph titles follow the convention of recommended international non-proprietary names (iNNS), or, in the absence of a iNNS, British Approved Names. Relevant synonyms are included below the title and, in some instances a brief description of the drug action is included. Over future editions these drug action statements will be rolled out for all drugs.

In some monographs, immediately below the nomenclature or drug action, there are a number of cross references or flags used to signpost the user to any additional information they need to consider about a drug. This is most common for drugs formulated in combinations, where users will be signposted to the monographs for the individual ingredients (e.g. senna with ispaghula husk p. 68) or for drugs that are related to a drug class monograph (see Drug class monographs, below).

Indication and dose

User feedback has highlighted that one of the main uses of the BNF is identifying indications and doses of drugs. Therefore, indication and dose information has been promoted to the top of the monograph and highlighted by a coloured panel to aid quick reference.

The indication and dose section is more highly structured than in earlier editions, giving greater clarity around which doses should be used for which indications and by which route. In addition, if the dose varies with a specific preparation or formulation, that dosing information has been moved out of the preparations section and in to the indication and dose panel, under a heading of the preparation name.

Doses are either expressed in terms of a definite frequency (e.g. 1 g 4 times daily) or in the total daily dose format (e.g. 6 g daily in 3 divided doses); the total daily dose should be divided into individual doses (in the second example, the patient should receive 2 g 3 times daily).

Doses for specific patient groups (e.g. the elderly) may be included if they are different to the standard dose. Doses for children can be identified by the relevant age range and may vary according to their age or body-weight.

In earlier editions of the BNF, age ranges and weight ranges overlapped. For clarity and to aid selection of the correct dose, wherever possible these age and weight ranges now do not overlap. When interpreting age ranges it is important to understand that a patient is considered to be 64 up until the point of their 65th birthday, meaning that an age

range of adult 18 to 64 is applicable to a patient from the day of their 18th birthday until the day before their 65th birthday. All age ranges should be interpreted in this way. Similarly, when interpreting weight ranges, it should be understood that a weight of up to 30 kg is applicable to a patient up to, but not including, the point that they tip the scales at 30 kg and a weight range of 35 to 59 kg is applicable to a patient as soon as they tip the scales at 35 kg right up until, but not including, the point that they tip the scales at 60 kg. All weight ranges should be interpreted in this way.

In all circumstances, it is important to consider the patient in question and their physical condition, and select the dose most appropriate for the individual.

Other information relevant to Indication and dose

The dose panel also contains, where known, an indication of **pharmacokinetic considerations** that may affect the choice of dose, and **dose equivalence** information, which may aid the selection of dose when switching between drugs or preparations.

The BNF includes **unlicensed use** of medicines when the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience. When the BNF recommends an unlicensed medicine or the 'off-label' use of a licensed medicine, this is shown below the indication and dose panel in the unlicensed use section.

Minimising harm and drug safety

The drug chosen to treat a particular condition should minimise the patient's susceptibility to adverse effects and, where co-morbidities exist, have minimal detrimental effects on the patient's other diseases. To achieve this, the *Contra-indications*, *Cautions* and *Side-effects* of the relevant drug should be reviewed.

The information under *Cautions* can be used to assess the risks of using a drug in a patient who has co-morbidities that are also included in the *Cautions* for that drug—if a safer alternative cannot be found, the drug may be prescribed while monitoring the patient for adverse-effects or deterioration in the co-morbidity. *Contra-indications* are far more restrictive than *Cautions* and mean that the drug should be avoided in a patient with a condition that is *contra-indicated*.

The impact that potential side-effects may have on a patient's quality of life should also be assessed. For instance, in a patient who has difficulty sleeping, it may be preferable to avoid a drug that frequently causes insomnia.

The *Important safety advice* section in the BNF, delineated by a coloured outline box, highlights important safety concerns, often those raised by regulatory authorities or guideline producers. Safety warnings issued by the Commission on Human Medicines (CHM) or Medicines and Healthcare products Regulatory Agency (MHRA) are found here.

Drug selection should aim to minimise drug interactions. If it is necessary to prescribe a potentially serious combination of drugs, patients should be monitored appropriately. The mechanisms underlying drug interactions are explained in Appendix 1, followed by details of drug interactions.

Use of drugs in specific patient populations

Drug selection should aim to minimise the potential for drug accumulation, adverse drug reactions, and exacerbation of pre-existing hepatic or renal disease. If it is necessary to prescribe drugs whose effect is altered by hepatic or renal disease, appropriate drug dose adjustments should be made, and patients should be monitored adequately. The general principles for prescribing are outlined under *Prescribing in hepatic impairment* p. 23, and *Prescribing in renal impairment* p. 23. Information about drugs that should be avoided or used with caution in hepatic disease or renal impairment can be found in drug monographs under *Hepatic impairment* and *Renal impairment* (e.g. fluconazole p. 630).

Typical layout of a monograph and associated medicinal forms

1 Class Monographs and drug monographs

In most cases, all information that relates to an individual drug is contained in its drug monograph and there is no symbol. Class monographs have been created where substantial amounts of information are common to all drugs within a drug class, these are indicated by a flag symbol in a circle: 

Drug monographs with a corresponding class monograph are indicated by a tab with a flag symbol: 

The page number of the corresponding class monograph is indicated within the tab. For further information, see How to use BNF Publications

2 Drug classifications

Used to inform users of the class of a drug and to assist in finding other drugs of the same class. May be based on pharmacological class (e.g. opioids) but can also be associated with the use of the drug (e.g. cough suppressants)

3 Review date

The date of last review of the content

4 Specific preparation name

If the dose varies with a specific preparation or formulation it appears under a heading of the preparation name

Class monograph 1

CLASSIFICATION 2

 1234

Drug monograph 1

 01-Jun-2016

(Synonym) another name by which a drug may be known

- **DRUG ACTION** how a drug exerts its effect in the body

● **INDICATIONS AND DOSE**

Indications are the clinical reasons a drug is used. The dose of a drug will often depend on the indications

Indication

- ▶ **ROUTE**
- ▶ **Age groups:** [Child/Adult/Elderly]
Dose and frequency of administration (max. dose)

SPECIFIC PREPARATION NAME 4

Indication

- ▶ **ROUTE**
- ▶ **Age groups:** [Child/Adult/Elderly]
Dose and frequency of administration (max. dose)

DOSE ADJUSTMENTS DUE TO INTERACTIONS dosing information when used concurrently with other drugs

DOSES AT EXTREMES OF BODY-WEIGHT dosing information for patients who are overweight or underweight

DOSE EQUIVALENCE AND CONVERSION information around the bioequivalence between formulations of the same drug, or equivalent doses of drugs that are members of the same class

PHARMACOKINETICS how the body affects a drug (absorption, distribution, metabolism, and excretion)

POTENCY a measure of drug activity expressed in terms of the concentration required to produce an effect of given intensity

- **UNLICENSED USE** describes the use of medicines outside the terms of their UK licence (off-label use), or use of medicines that have no licence for use in the UK

IMPORTANT SAFETY INFORMATION

Information produced and disseminated by drug regulators often highlights serious risks associated with the use of a drug, and may include advice that is mandatory

- **CONTRA-INDICATIONS** circumstances when a drug should be avoided
- **CAUTIONS** details of precautions required
- **INTERACTIONS** when one drug changes the effects of another drug; the mechanisms underlying drug interactions are explained in Appendix 1
- **SIDE-EFFECTS** listed in order of frequency, where known, and arranged alphabetically
- **ALLERGY AND CROSS-SENSITIVITY** for drugs that carry an increased risk of hypersensitivity reactions
- **CONCEPTION AND CONTRACEPTION** potential for a drug to have harmful effects on an unborn child when prescribing for a woman of childbearing age or for a man trying to father a child; information on the effect of drugs on the efficacy of latex condoms or diaphragms

- **PREGNANCY** advice on the use of a drug during pregnancy
- **BREAST FEEDING** EvGr advice on the use of a drug during breast feeding A 5
- **HEPATIC IMPAIRMENT** advice on the use of a drug in hepatic impairment
- **RENAL IMPAIRMENT** advice on the use of a drug in renal impairment
- **PRE-TREATMENT SCREENING** covers one off tests required to assess the suitability of a patient for a particular drug
- **MONITORING REQUIREMENTS** specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index
- **EFFECTS ON LABORATORY TESTS** for drugs that can interfere with the accuracy of seemingly unrelated laboratory tests
- **TREATMENT CESSATION** specifies whether further monitoring or precautions are advised when the drug is withdrawn
- **DIRECTIONS FOR ADMINISTRATION** practical information on the preparation of intravenous drug infusions; general advice relevant to other routes of administration
- **PRESCRIBING AND DISPENSING INFORMATION** practical information around how a drug can be prescribed and dispensed including details of when brand prescribing is necessary
- **HANDLING AND STORAGE** includes information on drugs that can cause adverse effects to those who handle them before they are taken by, or administered to, a patient; advice on storage conditions
- **PATIENT AND CARER ADVICE** for drugs with a special need for counselling
- **PROFESSION SPECIFIC INFORMATION** provides details of the restrictions certain professions such as dental practitioners or nurse prescribers need to be aware of when prescribing on the NHS
- **NATIONAL FUNDING/ACCESS DECISIONS** details of NICE Technology Appraisals, SMC advice and AWMSG advice
- **LESS SUITABLE FOR PRESCRIBING** preparations that are considered by the Joint Formulary Committee to be less suitable for prescribing
- **EXCEPTION TO LEGAL CATEGORY** advice and information on drugs which may be sold without a prescription under specific conditions

● **MEDICINAL FORMS**

Form

CAUTIONARY AND ADVISORY LABELS if applicable
 EXCIPIENTS clinically important but not comprehensive [consult manufacturer information for full details]
 ELECTROLYTES if clinically significant quantities occur

► **Preparation name** (Manufacturer/Non-proprietary)
Drug name and strength pack sizes PoM 6 Prices

Combinations available this indicates a combination preparation is available and a cross reference page number is provided to locate this preparation

6 **Evidence grading**

Evidence grading to reflect the strengths of recommendations will be applied as content goes through the revalidation process. A five level evidence grading system based on the former SIGN grading system has been adopted. The grades A B C D E are displayed next to the recommendations within the text, and are preceded by the symbol: EvGr

For further information, see How BNF Publications are constructed

6 **Legal categories**

PoM This symbol has been placed against those preparations that are available only on a prescription issued by an appropriate practitioner. For more detailed information see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition)

CD1 CD2 CD3 CD4-1 CD4-2 CD5 These symbols indicate that the preparations are subject to the prescription requirements of the Misuse of Drugs Act

For regulations governing prescriptions for such preparations, see Controlled Drugs and Drug Dependence

Not all monographs include all possible sections; sections are only included when relevant information has been identified

Similarly, drug selection should aim to minimise harm to the fetus, nursing infant, and mother. The infant should be monitored for potential side-effects of drugs used by the *mother during pregnancy or breast-feeding*. The general principles for prescribing are outlined under Prescribing in pregnancy p. 27 and Prescribing in breast-feeding p. 27. The Treatment Summaries provide guidance on the drug treatment of common conditions that can occur during pregnancy and breast-feeding (e.g. Asthma, acute p. 254). Information about the use of specific drugs during pregnancy and breast-feeding can be found in their drug monographs under *Pregnancy*, and *Breast-feeding* (e.g. fluconazole p. 630).

A section, *Conception and contraception*, containing information around considerations for females of childbearing potential or men who might father a child (e.g. isotretinoin p. 1337) has been included.

Administration and monitoring

When selecting the most appropriate drug, it may be necessary to screen the patient for certain genetic markers or metabolic states. This information is included within a section called *Pre-treatment screening* (e.g. abacavir p. 684). This section covers one-off tests required to assess the suitability of a patient for a particular drug.

Once the drug has been selected, it needs to be given in the most appropriate manner. A *Directions for administration* section contains the information about intravenous administration previously located in Appendix 4. This provides practical information on the preparation of intravenous drug infusions, including compatibility of drugs with standard intravenous infusion fluids, method of dilution or reconstitution, and administration rates. In addition, general advice relevant to other routes of administration is provided within this section (e.g. fentanyl p. 479).

After selecting and administering the most appropriate drug by the most appropriate route, patients should be monitored to ensure they are achieving the expected benefits from drug treatment without any unwanted side-effects. The *Monitoring* section specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index (e.g. theophylline p. 288). Monitoring may, in certain cases, be affected by the impact of a drug on laboratory tests (e.g. hydroxocobalamin p. 1085), and this information is included in *Effects on laboratory tests*.

In some cases, when a drug is withdrawn, further monitoring or precautions may be advised (e.g. clonidine hydrochloride p. 156): these are covered under *Treatment cessation*.

Choice and supply

The prescriber and the patient should agree on the health outcomes that the patient desires and on the strategy for achieving them (see *Taking Medicines to Best Effect*). Taking the time to explain to the patient (and carers) the rationale and the potential adverse effects of treatment may improve adherence. For some medicines there is a special need for counselling (e.g. appropriate posture during administration of doxycycline p. 597); this is shown in *Patient and carer advice*.

Other information contained in the latter half of the monograph also helps prescribers and those dispensing medicines choose medicinal forms (by indicating information such as flavour or when branded products may not be interchangeable (e.g. diltiazem hydrochloride p. 169), assess the suitability of a drug for prescribing, understand the NHS funding status for a drug (e.g. sildenafil p. 859), or assess when a patient may be able to purchase a drug without prescription (e.g. loperamide hydrochloride p. 71).

Medicinal forms

In the BNF, preparations follow immediately after the monograph for the drug that is their main ingredient.

In earlier editions, when a particular preparation had safety information, dose advice or other clinical information specific to the product, it was contained within the preparations section. This information has been moved to the relevant section in the main body of the monograph under a heading of the name of the specific medicinal form (e.g. peppermint oil p. 52).

The medicinal forms (formerly preparations) section provides information on the type of formulation (e.g. tablet), the amount of active drug in a solid dosage form, and the concentration of active drug in a liquid dosage form. The legal status is shown for prescription-only medicines and controlled drugs, as well as pharmacy medicines and medicines on the general sales list. Practitioners are reminded, by a statement under the heading of "Medicinal Forms" that not all products containing a specific drug ingredient may be similarly licensed. To be clear on the precise licensing status of specific medicinal forms, practitioners should check the product literature for the particular product being prescribed or dispensed.

Details of all medicinal forms available on the dm+d for each drug in BNF Publications appears online on MedicinesComplete. In print editions, due to space constraints, only certain branded products are included in detail. Where medicinal forms are listed they should not be inferred as equivalent to the other brands listed under the same form heading. For example, all the products listed under a heading of "Modified release capsule" will be available as modified release capsules, however, the brands listed under that form heading may have different release profiles, the available strengths may vary and/or the products may have different licensing information. As with earlier editions of the BNF, practitioners must ensure that the particular product being prescribed or dispensed is appropriate.

As medicinal forms are derived from dm+d data, some drugs may appear under names derived from that data; this may vary slightly from those in previous BNF versions, e.g. sodium acid phosphate, is now sodium dihydrogen phosphate anhydrous.

Patients should be prescribed a preparation that complements their daily routine, and that provides the right dose of drug for the right indication and route of administration. When dispensing liquid preparations, a sugar-free preparation should always be used in preference to one containing sugar. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries.

In earlier editions, the BNF only included excipients and electrolyte information for proprietary medicines. This information is now covered at the level of the dose form (e.g. tablet). It is not possible to keep abreast of all of the generic products available on the UK market, and so this information serves as a reminder to the healthcare professional that, if the presence of a particular excipient is of concern, they should check the product literature for the particular product being prescribed or dispensed.

Cautionary and advisory labels that pharmacists are recommended to add when dispensing are included in the medicinal forms section. Details of these labels can be found in Appendix 3, Guidance for cautionary and advisory labels p. 1670. As these labels have now been applied at the level of the dose form, a full list of medicinal products with their relevant labels would be extensive. This list has therefore been removed, but the information is retained within the monograph.

In the case of compound preparations, the prescribing information for all constituents should be taken into account.

Prices in the BNF

Basic NHS **net prices** are given in the BNF to provide an indication of relative cost. Where there is a choice of suitable

preparations for a particular disease or condition the relative cost may be used in making a selection. Cost-effective prescribing must, however, take into account other factors (such as dose frequency and duration of treatment) that affect the total cost. The use of more expensive drugs is justified if it will result in better treatment of the patient, or a reduction of the length of an illness, or the time spent in hospital.

Prices are regularly updated using the Drug Tariff and proprietary price information published by the NHS dictionary of medicines and devices (dm+d, www.nhsbsa.nhs.uk/pharmacies-gp-practices-and-appliance-contractors/dictionary-medicines-and-devices-dmd). The weekly updated dm+d data (including prices) can be accessed using the dm+d browser of the NHS Business Services Authority (apps.nhsbsa.nhs.uk/DMDBrowser/DMDBrowser.do). Prices have been calculated from the net cost used in pricing NHS prescriptions and generally reflect whole dispensing packs. Prices for extemporaneously prepared preparations are not provided in the BNF as prices vary between different manufacturers. In Appendix 4, prices stated are per dressing or bandage.

BNF prices are not suitable for quoting to patients seeking private prescriptions or contemplating over-the-counter purchases because they do not take into account VAT, professional fees, and other overheads.

A fuller explanation of costs to the NHS may be obtained from the Drug Tariff. Separate drug tariffs are applicable to England and Wales (www.ppa.org.uk/ppa/edt_intro.htm), Scotland (www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/), and Northern Ireland (www.hscbusiness.hscni.net/services/2034.htm); prices in the different tariffs may vary.

Drug class monographs

In earlier editions of the BNF, information relating to a class of drugs sharing the same properties (e.g. tetracyclines p. 597), was contained within the prescribing notes. In the updated structure, drug class monographs have been created to contain the common information; this ensures such information is easier to find, and has a more regularised structure.

For consistency and ease of use, the class monograph follows the same structure as a drug monograph. Class monographs are indicated by the presence of a flag  (e.g. beta-adrenoceptor blockers (systemic) p. 159). If a drug monograph has a corresponding class monograph, that needs to be considered in tandem, in order to understand the full information about a drug, the monograph is also indicated by a flag  1234 (e.g. metoprolol tartrate p. 166). Within this flag, the page number of the drug class monograph is provided (e.g. 1234), to help navigate the user to this information. This is particularly useful where occasionally, due to differences in therapeutic use, the drug monograph may not directly follow the drug class monograph (e.g. sotalol hydrochloride p. 115).

Evidence grading

The BNF has adopted a five level evidence grading system (see How BNF Publications are constructed p. viii). Recommendations that are evidence graded can be identified by a symbol appearing immediately before the recommendation. The evidence grade is displayed at the end of the recommendation.

Other content

Nutrition

Appendix 2, Borderline substances p. 1638, includes tables of ACBS-approved enteral feeds and nutritional supplements based on their energy and protein content. There are separate tables for specialised formulae for specific clinical conditions. Classified sections on foods for special diets and nutritional supplements for metabolic diseases are also included.

Wound dressings

A table on wound dressings in Appendix 4, Wound management products and elasticated garments p. 1673, allows an appropriate dressing to be selected based on the appearance and condition of the wound. Further information about the dressing can be found by following the cross-reference to the relevant classified section in the Appendix.

Advanced wound contact dressings have been classified in order of increasing absorbency.

Other useful information

Finding significant changes in the BNF

- **Changes**, provides a list of significant changes, dose changes, classification changes, new names, and new preparations that have been incorporated into the BNF, as well as a list of preparations that have been discontinued and removed from the BNF. Changes listed online are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies. So many changes are made for each update of the BNF, that not all of them can be accommodated in the *Changes* section. We encourage healthcare professionals to regularly review the prescribing information on drugs that they encounter frequently;
- **Changes to the Dental Practitioners' Formulary**, are located at the end of the Dental List;
- **E-newsletter**, the BNF & BNFC e-newsletter service is available free of charge. It alerts healthcare professionals to details of significant changes in the clinical content of these publications and to the way that this information is delivered. Newsletters also review clinical case studies, provide tips on using these publications effectively, and highlight forthcoming changes to the publications. To sign up for e-newsletters go to www.bnf.org.

Using other sources for medicines information

The BNF is designed as a digest for rapid reference. Less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. *BNF for Children* should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services.

Changes

Monthly updates are provided online via Medicines Complete and the NHS Evidence portal. The changes listed below are cumulative (from one print edition to the next).

Significant changes

Significant changes that appear in the print edition of BNF 80 (September 2020–March 2021):

- Adrenaline/epinephrine auto-injectors p. 236 (*Emerade*®): all strengths of auto-injector pens have been recalled from patients due to failure to activate. Healthcare professionals are advised to ensure that patients who have previously been prescribed an *Emerade*®150, 300 or 500 microgram pen are supplied with a prescription for an alternative brand—see the MHRA website for full details [MHRA/CHM advice] (updated June 2020).
- Adrenaline/epinephrine pre-filled auto-injector p. 236 (*Emerade*®): update on failure to activate [MHRA/CHM advice] (updated April 2020).
- Alemtuzumab p. 903 (*Lenrada*®): updated restrictions and strengthened monitoring requirements following review of serious cardiovascular and immune-mediated reactions [MHRA/CHM advice].
- Antimicrobial stewardship p. 20: new guidance.
- Baricitinib p. 1166 (*Olumiant*®): risk of venous thromboembolism [MHRA/CHM advice].
- Benzodiazepines: reminder of risk of potentially fatal respiratory depression [MHRA/CHM advice] (advice in alprazolam, chlordiazepoxide hydrochloride, clobazam, clonazepam, diazepam, flurazepam, loprazolam, lorazepam, lormetazepam, midazolam, nitrazepam, oxazepam, temazepam; see example in diazepam p. 360).
- Canagliflozin p. 740 (SGLT2 inhibitors): monitor ketones in blood during treatment interruption for surgical procedures or acute serious medical illness [MHRA/CHM advice].
- Cannabidiol p. 326 with clobazam for treating seizures associated with Dravet syndrome [NICE guidance].
- Cannabidiol p. 326 with clobazam for treating seizures associated with Lennox–Gastaut syndrome [NICE guidance].
- Cardiovascular disease risk assessment and prevention p. 201: updated guidance.
- Cladribine p. 957 for treating relapsing–remitting multiple sclerosis [NICE guidance].
- COVID-19 p. 656: new guidance incorporating a collection of resources.
- Dapagliflozin p. 742 (SGLT2 inhibitors): monitor ketones in blood during treatment interruption for surgical procedures or acute serious medical illness [MHRA/CHM advice].
- Dapagliflozin p. 742 with insulin for treating type 1 diabetes [NICE guidance].
- Diabetic foot infections, antibacterial therapy p. 533: new guidance on management.
- Diverticular disease and diverticulitis p. 40: updated guidance on management.
- Domperidone p. 451 for nausea and vomiting: lack of efficacy in children; reminder of contra-indications in adults and adolescents [MHRA/CHM advice].
- Empagliflozin p. 744 (SGLT2 inhibitors): monitor ketones in blood during treatment interruption for surgical procedures or acute serious medical illness [MHRA/CHM advice].
- Ertugliflozin p. 746 (SGLT2 inhibitors): monitor ketones in blood during treatment interruption for surgical procedures or acute serious medical illness [MHRA/CHM advice].
- Etonogestrel p. 855 (*Nexplanon*®) contraceptive implants: new insertion site to reduce rare risk of neurovascular injury and implant migration [MHRA/CHM advice].
- Gastro-intestinal system infections, antibacterial therapy p. 535: updated guidance for acute diverticulitis.
- Hypertension p. 151: updated guidance on management.
- Hypoglycaemia p. 762: updated guidance on management.
- Immunisation schedule p. 1364: changes to infant schedule for pneumococcal polysaccharide conjugate vaccine in-line with Public Health England recommendations.
- Ingenol mebutate gel p. 1349 (*Picato*®): suspension of the licence due to risk of skin malignancy [MHRA/CHM advice].
- Lenalidomide p. 1011 with rituximab for previously treated follicular lymphoma [NICE guidance].
- Lusutrombopag p. 1092 for treating thrombocytopenia in people with chronic liver disease needing a planned invasive procedure [NICE guidance].
- Malaria, prophylaxis p. 643: updated country recommendations in the recommended regimens for prophylaxis against malaria in-line with Public Health England.
- Malaria, prophylaxis p. 643: updated guidance in-line with Public Health England recommendations.
- Medicines optimisation p. 18: new guidance.
- Modafinil p. 514: potential risk of congenital malformations during pregnancy [MHRA/CHM advice].
- Multiple sclerosis p. 893 and Nausea and labyrinth disorders p. 448: updated guidance for use of cannabis-based medicinal products.
- Nurse Prescribers' Formulary: list of medicinal preparations updated with indications for use by Community Practitioner Nurse Prescribers and links to BNF monographs. For further information, see How to use the NPF in the Nurse Prescribers' Formulary (NPF) p. 1699.
- Olaparib p. 1063 for maintenance treatment of relapsed platinum-sensitive ovarian, fallopian tube or peritoneal cancer [NICE guidance].
- Ondansetron p. 455: small increased risk of oral clefts following use in the first 12 weeks of pregnancy [MHRA/CHM advice].
- Opioids: reminder of risk of potentially fatal respiratory depression [MHRA/CHM advice] (advice in alfentanil, buprenorphine, codeine phosphate, diamorphine hydrochloride, dihydrocodeine tartrate, dipipanone hydrochloride, fentanyl, hydromorphone hydrochloride, meptazinol, methadone hydrochloride, morphine, oxycodone hydrochloride, pentazocine, pethidine hydrochloride, remifentanil, sufentanil, tapentadol, tramadol hydrochloride; see example in morphine p. 484).
- Osimertinib p. 1049 for untreated EGFR mutation-positive non-small-cell lung cancer [NICE guidance].
- Pain, Chronic p. 461: new guidance on management.
- Palbociclib p. 1050 with fulvestrant for treating hormone receptor-positive, HER2-negative, advanced breast cancer [NICE guidance].
- Patiromer calcium p. 1117 for treating hyperkalaemia [NICE guidance].
- Peginterferon beta-1a p. 897 for treating relapsing–remitting multiple sclerosis [NICE guidance].
- Pneumococcal vaccine p. 1372: updated guidance in-line with Public Health England recommendations.
- Poisoning, emergency treatment p. 1430: updated guidance on the management of beta-blockers poisoning in-line with TOXBASE recommendations.
- Poisoning, emergency treatment p. 1430: updated guidance on the management of paracetamol poisoning in-line with TOXBASE recommendations.
- Skin infections, antibacterial therapy p. 540: new guidance for management of leg ulcer infection.

- Skin infections, antibacterial therapy p. 540: updated guidance for management of cellulitis and erysipelas.
- Skin infections, antibacterial therapy p. 540: updated guidance on management of impetigo.
- Sodium valproate p. 344: updated Pregnancy Prevention Programme [MHRA/CHM advice].
- Tofacitinib p. 1167 (*Xeljanz*[®]): new measures to minimise risk of venous thromboembolism and of serious and fatal infections [MHRA/CHM advice].
- Tuberculosis p. 612: updated guidance on management.
- Ulipristal acetate p. 849 (*Esmya*[®]): suspension of the licence due to risk of serious liver injury [MHRA/CHM advice].
- Upadacitinib p. 1169 (*Rinvoq*[®] ▼): advice for venous thromboembolism [MHRA/CHM advice].
- Valproic acid p. 372: updated Pregnancy Prevention Programme [MHRA/CHM advice].
- Yellow fever vaccine p. 1378: updated guidance in-line with Public Health England recommendations.

Dose changes

Changes in dose statements that appear in the print edition of BNF 80 (September 2020—March 2021):

- Benzoin tincture, compound p. 313 [updated child age range].
- Betamethasone with clioquinol p. 1314 [updated child age range].
- Co-fluampicil p. 582 [update to dosing information].
- Ergotamine tartrate with caffeine hydrate and cyclizine hydrochloride p. 500 [addition of max. courses per month].
- Eucalyptus with menthol p. 313 [frequency of dosing].
- Fluocinolone acetonide with clioquinol p. 1316 [updated dosing frequency].
- *Fostair*[®]NEXThaler 100/6 (beclometasone with formoterol p. 272) [dosing for maintenance and reliever therapy added].
- Glucagon p. 763 [update to age ranges for hypoglycaemia].
- Paracetamol with buclizine hydrochloride and codeine phosphate p. 498 [child age ranges].
- Sodium fluoride p. 1277 [updating dosing for prophylaxis of dental caries].

New preparations

New preparations that appear in the print edition of BNF 80 (September 2020—March 2021):

- *Ampres*[®] [chloroprocaine hydrochloride p. 1421].
- Benzathine benzylpenicillin p. 577.
- *Beovu*[®] [brolocizumab p. 1254].
- *Combisal*[®]25/50 [fluticasone with salmeterol p. 277].
- *Combisal*[®]25/125 [fluticasone with salmeterol p. 277].
- *Combisal*[®]25/250 [fluticasone with salmeterol p. 277].
- *Cytotect*[®] [cytomegalovirus immunoglobulin p. 1357].
- *Evenity*[®] [romosozumab p. 776].
- *Fusacomb* 50/250 *Easyhaler*[®] [fluticasone with salmeterol p. 277].
- *Fusacomb* 50/500 *Easyhaler*[®] [fluticasone with salmeterol p. 277].
- *Mayzent*[®] [siponimod p. 902].
- *Mulpleo*[®] [lusutrombopag p. 1092].
- *Polivy*[®] [polatuzumab vedotin p. 931].
- *Poteligeo*[®] [mogamulizumab p. 921].
- *Rinvoq*[®] [upadacitinib p. 1169].
- *Staladex*[®] [leuprorelin acetate p. 780].
- Strontium ranelate p. 773.
- *Ultomiris*[®] [ravulizumab p. 1078].
- *Zalkya*[®] [dienogest p. 806].

Guidance on prescribing

General guidance

Medicines should be prescribed only when they are necessary, and in all cases the benefit of administering the medicine should be considered in relation to the risk involved. This is particularly important during pregnancy, when the risk to both mother and fetus must be considered. It is important to discuss treatment options carefully with the patient to ensure that the patient is content to take the medicine as prescribed. In particular, the patient should be helped to distinguish the adverse effects of prescribed drugs from the effects of the medical disorder. When the beneficial effects of the medicine are likely to be delayed, the patient should be advised of this.

For guidance on medicines optimisation, see Medicines optimisation p. 18.

Never Events Never events are serious and avoidable medical errors for which there should be preventative measures in place to stop their occurrence.

The NHS Never Events policy and framework can be viewed at: improvement.nhs.uk/documents/2265/Revised_Never_Events_policy_and_framework_FINAL.pdf.

For never events related to single drugs or drug classes, BNF Publications contain information within the monographs, in the important safety information section.

Prescribing competency framework The Royal Pharmaceutical Society has published a Prescribing Competency Framework that includes a common set of competencies that form the basis for prescribing, regardless of professional background. The competencies have been developed to help healthcare professionals to be safe and effective prescribers, with the aim of supporting patients to get the best outcomes from their medicines. It is available at www.rpharms.com/resources/frameworks/prescribers-competency-framework.

Biological medicines

Biological medicines are medicines that are made by or derived from a biological source using biotechnology processes, such as recombinant DNA technology. The size and complexity of biological medicines, as well as the way they are produced, may result in a degree of natural variability in molecules of the same active substance, particularly in different batches of the medicine. This variation is maintained within strict acceptable limits. Examples of biological medicines include insulins and monoclonal antibodies. **EvGr** Biological medicines must be prescribed by brand name and the brand name specified on the prescription should be dispensed in order to avoid inadvertent switching. Automatic substitution of brands at the point of dispensing is not appropriate for biological medicines. **⚠**

Biosimilar medicines

A **biosimilar medicine** is a biological medicine that is highly similar and clinically equivalent (in terms of quality, safety, and efficacy) to an existing biological medicine that has already been authorised in the European Union (known as the reference biological medicine or originator medicine). The active substance of a biosimilar medicine is similar, but not identical, to the originator biological medicine. Once the patent for a biological medicine has expired, a biosimilar medicine may be authorised by the European Medicines Agency (EMA). A biosimilar medicine is not the same as a generic medicine, which contains a simpler molecular structure that is identical to the originator medicine.

Therapeutic equivalence **EvGr** Biosimilar medicines should be considered to be therapeutically equivalent to the originator biological medicine within their authorised indications. **⚠** Biosimilar medicines are usually licensed for all the indications of the originator biological medicine, but this depends on the evidence submitted to the EMA for authorisation and must be scientifically justified on the basis of demonstrated or extrapolated equivalence.

Prescribing and dispensing The choice of whether to prescribe a biosimilar medicine or the originator biological medicine rests with the clinician in consultation with the patient. **EvGr** Biological medicines (including biosimilar medicines) must be prescribed by brand name and the brand name specified on the prescription should be dispensed in order to avoid inadvertent switching. Automatic substitution of brands at the point of dispensing is not appropriate for biological medicines. **⚠**

Safety monitoring Biosimilar medicines are subject to a black triangle status (**▼**) at the time of initial authorisation.

EvGr It is important to report suspected adverse reactions using the Yellow Card Scheme (see Adverse reactions to drugs p. 12). For all biological medicines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine. **⚠**

UK Medicines Information centres have developed a validated tool to determine potential safety issues associated with all new medicines. These 'in-use product safety assessment reports' will be published for new biosimilar medicines as they become available, see www.sps.nhs.uk/home/medicines/.

National funding/access decisions The Department of Health has confirmed that, in England, NICE can decide to apply the same remit, and the resulting technology appraisal guidance, to relevant biosimilar medicines which appear on the market subsequent to their originator biological medicine. In other circumstances, where a review of the evidence for a particular biosimilar medicine is necessary, NICE will consider producing an evidence summary (see *Evidence summary: new medicines*, www.nice.org.uk/about/what-we-do/our-programmes/nice-advice/evidence-summaries-new-medicines).

National information In England, see www.nice.org.uk/Media/Default/About/what-we-do/NICE-guidance/NICE-technology-appraisals/biosimilars-statement.pdf.

In Northern Ireland, see niformulary.hscni.net/managed-entry/biosimilars/.

In Scotland, see www.scottishmedicines.org.uk/About_SMC/Policy_statements/Biosimilar_Medicines.

In Wales, see www.wales.nhs.uk/sites3/Documents/814/BIOSIMILARS-ABUHBpositionStatement%5BNov2015%5D.pdf.

Availability The following drugs are available as a biosimilar medicine:

- Adalimumab p. 1170
- Bevacizumab p. 909
- Enoxaparin sodium p. 142
- Epoetin alfa p. 1073
- Epoetin zeta p. 1075
- Etanercept p. 1175
- Filgrastim p. 1089
- Follitropin alfa p. 785
- Infliximab p. 1179
- Insulin glargine p. 757
- Insulin lispro p. 754
- Rituximab p. 933
- Somatropin p. 788

2 Guidance on prescribing

- Teriparatide p. 773
- Trastuzumab p. 935

Complementary and alternative medicine

An increasing amount of information on complementary and alternative medicine is becoming available. The scope of the BNF is restricted to the discussion of conventional medicines but reference is made to complementary treatments if they affect conventional therapy (e.g. interactions with St John's wort). Further information on herbal medicines is available at www.mhra.gov.uk.

Abbreviation of titles

In general, titles of drugs and preparations should be written in full. Unofficial abbreviations should not be used as they may be misinterpreted.

Non-proprietary titles

Where non-proprietary ('generic') titles are given, they should be used in prescribing. This will enable any suitable product to be dispensed, thereby saving delay to the patient and sometimes expense to the health service. The only exception is where there is a demonstrable difference in clinical effect between each manufacturer's version of the formulation, making it important that the patient should always receive the same brand; in such cases, the brand name or the manufacturer should be stated. Non-proprietary titles should not be invented for the purposes of prescribing generically since this can lead to confusion, particularly in the case of compound and modified-release preparations. Titles used as headings for monographs may be used freely in the United Kingdom but in other countries may be subject to restriction.

Many of the non-proprietary titles used in this book are titles of monographs in the European Pharmacopoeia, British Pharmacopoeia, or British Pharmaceutical Codex 1973. In such cases the preparations must comply with the standard (if any) in the appropriate publication, as required by the Human Medicines Regulations 2012.

Proprietary titles

Names followed by the symbol[®] are or have been used as proprietary names in the United Kingdom. These names may in general be applied only to products supplied by the owners of the trade marks.

Marketing authorisation and BNF advice

In general the *doses*, *indications*, *cautions*, *contra-indications*, and *side-effects* in the BNF reflect those in the manufacturers' data sheets or Summaries of Product Characteristics (SPCs) which, in turn, reflect those in the corresponding marketing authorisations (formerly known as Product Licences). The BNF does not generally include proprietary medicines that are not supported by a valid Summary of Product Characteristics or when the marketing authorisation holder has not been able to supply essential information. When a preparation is available from more than one manufacturer, the BNF reflects advice that is the most clinically relevant regardless of any variation in the marketing authorisations. Unlicensed products can be obtained from 'special-order' manufacturers or specialist importing companies.

Where an unlicensed drug is included in the BNF, this is indicated in the unlicensed use section of the drug monograph. When the BNF suggests a use that is outside the terms defined by the licence ('off-label' use), this too is indicated. Unlicensed or off-label use may be necessary if the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience.

The doses stated in the BNF are intended for general guidance and represent, unless otherwise stated, the usual

range of doses that are generally regarded as being suitable for adults.

Prescribing unlicensed medicines

Prescribing medicines outside the recommendations of their marketing authorisation alters (and probably increases) the prescriber's professional responsibility and potential liability. The prescriber should be able to justify and feel competent in using such medicines, and also inform the patient or the patient's carer that the prescribed medicine is unlicensed.

Oral syringes

An **oral syringe** is supplied when oral liquid medicines are prescribed in doses other than multiples of 5 mL. The oral syringe is marked in 0.5 mL divisions from 1 to 5 mL to measure doses of less than 5 mL (other sizes of oral syringe may also be available). It is provided with an adaptor and an instruction leaflet. The 5-mL *spoon* is used for doses of 5 mL (or multiples thereof).

Important To avoid inadvertent intravenous administration of oral liquid medicines, only an appropriate oral or enteral syringe should be used to measure an oral liquid medicine (if a medicine spoon or graduated measure cannot be used); these syringes should not be compatible with intravenous or other parenteral devices. Oral or enteral syringes should be clearly labelled 'Oral' or 'Enteral' in a large font size; it is the healthcare practitioner's responsibility to label the syringe with this information if the manufacturer has not done so.

Excipients

Branded oral liquid preparations that do not contain *fructose*, *glucose*, or *sucrose* are described as 'sugar-free' in the BNF. Preparations containing hydrogenated glucose syrup, mannitol, maltitol, sorbitol, or xylitol are also marked 'sugar-free' since there is evidence that they do not cause dental caries. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries. Sugar-free preparations should be used whenever possible.

Where information on the presence of *aspartame*, *gluten*, *sulfites*, *tartrazine*, *arachis (peanut) oil* or *sesame oil* is available, this is indicated in the BNF against the relevant preparation.

Information is provided on selected excipients in skin preparations, in vaccines, and on *selected preservatives* and *excipients* in eye drops and injections.

The presence of *benzyl alcohol* and *polyoxyl castor oil* (polyethoxylated castor oil) in injections is indicated in the BNF. Benzyl alcohol has been associated with a fatal toxic syndrome in preterm neonates, and therefore, parenteral preparations containing the preservative should not be used in neonates. Polyoxyl castor oils, used as vehicles in intravenous injections, have been associated with severe anaphylactoid reactions.

The presence of *propylene glycol* in oral or parenteral medicines is indicated in the BNF; it can cause adverse effects if its elimination is impaired, e.g. in renal failure, in neonates and young children, and in slow metabolisers of the substance. It may interact with disulfiram p. 518 and metronidazole p. 572.

The *lactose* content in most medicines is too small to cause problems in most lactose-intolerant patients. However in severe lactose intolerance, the lactose content should be determined before prescribing. The amount of lactose varies according to manufacturer, product, formulation, and strength.

Important In the absence of information on excipients in the BNF and in the product literature (available at www.medicines.org.uk/emc), contact the manufacturer (see Index of Manufacturers) if it is essential to check details.

Extemporaneous preparation

A product should be dispensed extemporaneously only when no product with a marketing authorisation is available. The BP direction that a preparation must be *freshly prepared* indicates that it must be made not more than 24 hours before it is issued for use. The direction that a preparation should be *recently prepared* indicates that deterioration is likely if the preparation is stored for longer than about 4 weeks at 15–25°C.

The term **water** used without qualification means either potable water freshly drawn direct from the public supply and suitable for drinking or freshly boiled and cooled purified water. The latter should be used if the public supply is from a local storage tank or if the potable water is unsuitable for a particular preparation (Water for injections).

Drugs and driving

Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.gov.uk/government/organisations/driver-and-vehicle-licensing-agency.

A new offence of driving, attempting to drive, or being in charge of a vehicle, with certain specified controlled drugs in excess of specified limits, came into force on 2nd March 2015. This offence is an addition to the existing rules on drug impaired driving and fitness to drive, and applies to two groups of drugs—commonly abused drugs, including amfetamines, cannabis, cocaine, and ketamine p. 1415, and drugs used mainly for medical reasons, such as opioids and benzodiazepines. Anyone found to have any of the drugs (including related drugs, for example, apomorphine hydrochloride p. 438) above specified limits in their blood will be guilty of an offence, whether their driving was impaired or not. This also includes prescribed drugs which metabolise to those included in the offence, for example, selegiline hydrochloride p. 447. However, the legislation provides a statutory “medical defence” for patients taking drugs for medical reasons in accordance with instructions, *if their driving was not impaired*—it continues to be an offence to drive if actually impaired. Patients should therefore be advised to continue taking their medicines as prescribed, and when driving, to carry suitable evidence that the drug was prescribed, or sold, to treat a medical or dental problem, and that it was taken according to the instructions given by the prescriber, or information provided with the medicine (e.g. a repeat prescription form or the medicine's patient information leaflet). Further information is available from the Department for Transport at www.gov.uk/government/collections/drug-driving.

Patents

In the BNF, certain drugs have been included notwithstanding the existence of actual or potential patent rights. In so far as such substances are protected by Letters Patent, their inclusion in this Formulary neither conveys, nor implies, licence to manufacture.

Health and safety

When handling chemical or biological materials particular attention should be given to the possibility of allergy, fire, explosion, radiation, or poisoning. Substances such as corticosteroids, some antimicrobials, phenothiazines, and many cytotoxics, are irritant or very potent and should be handled with caution. Contact with the skin and inhalation of dust should be avoided.

Safety in the home

Patients must be warned to keep all medicines out of the reach of children. All solid dose and all oral and external liquid preparations must be dispensed in a reclosable *child-resistant container* unless:

- the medicine is in an original pack or patient pack such as to make this inadvisable;
- the patient will have difficulty in opening a child-resistant container;
- a specific request is made that the product shall not be dispensed in a child-resistant container;
- no suitable child-resistant container exists for a particular liquid preparation.

All patients should be advised to dispose of *unwanted medicines* by returning them to a supplier for destruction.

Labelling of prescribed medicines

There is a legal requirement for the following to appear on the label of any prescribed medicine:

- name of the patient;
- name and address of the supplying pharmacy;
- date of dispensing;
- name of the medicine;
- directions for use of the medicine;
- precautions relating to the use of the medicine.

The Royal Pharmaceutical Society recommends that the following also appears on the label:

- the words ‘Keep out of the sight and reach of children’;
- where applicable, the words ‘Use this medicine only on your skin’.

A pharmacist can exercise professional skill and judgement to amend or include more appropriate wording for the name of the medicine, the directions for use, or the precautions relating to the use of the medicine.

Non-proprietary names of compound preparations

Non-proprietary names of **compound preparations** which appear in the BNF are those that have been compiled by the British Pharmacopoeia Commission or another recognised body; whenever possible they reflect the names of the active ingredients.

Prescribers should avoid creating their own compound names for the purposes of generic prescribing; such names do not have an approved definition and can be misinterpreted.

Special care should be taken to avoid errors when prescribing compound preparations; in particular the hyphen in the prefix ‘co-’ should be retained.

Special care should also be taken to avoid creating generic names for **modified-release** preparations where the use of these names could lead to confusion between formulations with different lengths of action.

EEA and Swiss prescriptions

Pharmacists can dispense prescriptions issued by doctors and dentists from the European Economic Area (EEA) or Switzerland (except prescriptions for controlled drugs in Schedules 1, 2, or 3, or for drugs without a UK marketing authorisation). Prescriptions should be written in ink or otherwise so as to be indelible, should be dated, should state the name of the patient, should state the address of the prescriber, should contain particulars indicating whether the prescriber is a doctor or dentist, and should be signed by the prescriber.

Security and validity of prescriptions

The Councils of the British Medical Association and the Royal Pharmaceutical Society have issued a joint statement on the security and validity of prescriptions.

In particular, prescription forms should:

- not be left unattended at reception desks;
- not be left in a car where they may be visible; and
- when not in use, be kept in a locked drawer within the surgery and at home.

Where there is any doubt about the authenticity of a prescription, the pharmacist should contact the prescriber. If this is done by telephone, the number should be obtained from the directory rather than relying on the information on the prescription form, which may be false.

Patient group direction (PGD)

In most cases, the most appropriate clinical care will be provided on an individual basis by a prescriber to a specific individual patient. However, a Patient Group Direction for supply and administration of medicines by other healthcare professionals can be used where it would benefit patient care without compromising safety.

A Patient Group Direction is a written direction relating to the supply and administration (or administration only) of a licensed prescription-only medicine (including some Controlled Drugs in specific circumstances) by certain classes of healthcare professionals; the Direction is signed by a doctor (or dentist) and by a pharmacist. Further information on Patient Group Directions is available in Health Service Circular HSC 2000/026 (England), HDL (2001) 7 (Scotland), and WHC (2000) 116 (Wales); see also the Human Medicines Regulations 2012.

NICE, Scottish Medicines Consortium and All Wales Medicines Strategy Group

Advice issued by the National Institute for Health and Care Excellence (NICE), the Scottish Medicines Consortium (SMC) and the All Wales Medicines Strategy Group (AWMSG) is included in the BNF when relevant. Details of the advice together with updates can be obtained from: www.nice.org.uk, www.scottishmedicines.org.uk and www.awmsg.org.

Specialised commissioning decisions

NHS England develops specialised commissioning policies that define access to specialised services for particular groups of patients to ensure consistency in access to treatments nationwide. For further information, see www.england.nhs.uk/specialised-commissioning-document-library/routinely-commissioned-policies/.

Prescription writing

Shared care

In its guidelines on responsibility for prescribing (circular EL (91) 127) between hospitals and general practitioners, the Department of Health has advised that legal responsibility for prescribing lies with the doctor who signs the prescription.

Requirements

Prescriptions should be written legibly in ink or otherwise so as to be indelible (it is permissible to issue carbon copies of NHS prescriptions as long as they are signed in ink), should be dated, should state the name and address of the patient, the address of the prescriber, an indication of the type of prescriber, and should be signed in ink by the prescriber (computer-generated facsimile signatures do not meet the legal requirement). The age and the date of birth of the patient should preferably be stated, and it is a legal requirement in the case of prescription-only medicines to state the age for children under 12 years. These recommendations are acceptable for **prescription-only medicines**. Prescriptions for controlled drugs have additional legal requirements.

Wherever appropriate the prescriber should state the current weight of the child to enable the dose prescribed to be checked. Consideration should also be given to including the dose per unit mass e.g. mg/kg or the dose per m² body-surface area e.g. mg/m² where this would reduce error. The following should be noted:

- The strength or quantity to be contained in capsules, lozenges, tablets etc. should be stated by the prescriber. In particular, strength of liquid preparations should be clearly stated (e.g. 125 mg/5 mL).
- The unnecessary use of decimal points should be avoided, e.g. 3 mg, not 3.0 mg. Quantities of 1 gram or more should be written as 1 g etc. Quantities less than 1 gram should be written in milligrams, e.g. 500 mg, not 0.5 g. Quantities less than 1 mg should be written in micrograms, e.g. 100 micrograms, not 0.1 mg. When decimals are unavoidable a zero should be written in front of the decimal point where there is no other figure, e.g. 0.5 mL, not .5 mL. Use of the decimal point is acceptable to express a range, e.g. 0.5 to 1 g.
- 'Micrograms' and 'nanograms' should **not** be abbreviated. Similarly 'units' should **not** be abbreviated.
- The term 'millilitre' (ml or mL) is used in medicine and pharmacy, and cubic centimetre, c.c., or cm³ should not be used. (The use of capital 'L' in mL is a printing convention throughout the BNF; both 'mL' and 'ml' are recognised SI abbreviations).
- Dose and dose frequency should be stated; in the case of preparations to be taken 'as required' a **minimum dose interval** should be specified. Care should be taken to ensure children receive the correct dose of the active drug. Therefore, the dose should normally be stated in terms of the mass of the active drug (e.g. '125 mg 3 times daily'); terms such as '5 mL' or '1 tablet' should be avoided except for compound preparations. When doses other than multiples of 5 mL are prescribed for *oral liquid preparations* the dose-volume will be provided by means of an **oral syringe**, (except for preparations intended to be measured with a pipette). Suitable quantities:
 - Elixirs, Linctuses, and Paediatric Mixtures (5-mL dose), 50, 100, or 150 mL
 - Adult Mixtures (10 mL dose), 200 or 300 mL
 - Ear Drops, Eye drops, and Nasal Drops, 10 mL (or the manufacturer's pack)
 - Eye Lotions, Gargles, and Mouthwashes, 200 mL
- The names of drugs and preparations should be written clearly and **not** abbreviated, using approved titles **only**;

avoid creating generic titles for modified-release preparations.

- The quantity to be supplied may be stated by indicating the number of days of treatment required in the box provided on NHS forms. In most cases the exact amount will be supplied. This does not apply to items directed to be used as required—if the dose and frequency are not given then the quantity to be supplied needs to be stated. When several items are ordered on one form the box can be marked with the number of days of treatment provided the quantity is added for any item for which the amount cannot be calculated.
- Although directions should preferably be in **English without abbreviation**, it is recognised that some Latin abbreviations are used.

Sample prescription

Pharmacy Stamp	Age 1yr 3mths	Title, Forename, Surname & Address Master Peter Patient
	Date 2/4/2010	Flat 1 50 Stanhope Street Newtown TE22 1ST
Please don't stamp over age box		
Number of days' treatment N.B. Ensure dose is stated	5

Signature of prescriber 		Date 02/07/11
For dispenser No. of Prescribers on form	Anyborough Health Authority Dr D O Good 345543 7 High Street Anytown KB1 CD2 Tel: 0111 222 333	
NHS		FP10NC0105

Prescribing by dentists

Until new prescribing arrangements are in place for NHS prescriptions, dentists should use form FP10D (GP14 in Scotland, WP10D in Wales) to prescribe only those items listed in the Dental Practitioners' Formulary. The Human Medicines Regulations 2012 does not set any limitations upon the number and variety of substances which the dentist may administer to patients in the surgery or may order by private prescription—provided the relevant legal requirements are observed the dentist may use or order whatever is required for the clinical situation. There is no statutory requirement for the dentist to communicate with a patient's medical practitioner when prescribing for dental use. There are, however, occasions when this would be in the patient's interest and such communication is to be encouraged. For legal requirements relating to prescriptions

of Controlled Drugs, see Controlled drugs and drug dependence p. 8.

Computer-issued prescriptions

For computer-issued prescriptions the following advice, based on the recommendations of the Joint GP Information Technology Committee, should also be noted:

- 1 The computer must print out the date, the patient's surname, one forename, other initials, and address, and may also print out the patient's title and date of birth. The age of children under 12 years and of adults over 60 years must be printed in the box available; the age of children under 5 years should be printed in years and months. A facility may also exist to print out the age of patients between 12 and 60 years.
- 2 The doctor's name must be printed at the bottom of the prescription form; this will be the name of the doctor responsible for the prescription (who will normally sign it). The doctor's surgery address, reference number, and Primary Care Trust (PCT), Health Board in Scotland, Local Health Board in Wales) are also necessary. In addition, the surgery telephone number should be printed.
- 3 When prescriptions are to be signed by general practitioner registrars, assistants, locums, or deputising doctors, the name of the doctor printed at the bottom of the form must still be that of the responsible principal.
- 4 Names of medicines must come from a dictionary held in the computer memory, to provide a check on the spelling and to ensure that the name is written in full. The computer can be programmed to recognise both the non-proprietary and the proprietary name of a particular drug and to print out the preferred choice, but must not print out both names. For medicines not in the dictionary, separate checks are required—the user must be warned that no check was possible and the entire prescription must be entered in the lexicon.
- 5 The dictionary may contain information on the usual doses, formulations, and pack sizes to produce standard predetermined prescriptions for common preparations, and to provide a check on the validity of an individual prescription on entry.
- 6 The prescription must be printed in English without abbreviation; information may be entered or stored in abbreviated form. The dose must be in numbers, the frequency in words, and the quantity in numbers in brackets, thus: 40 mg four times daily (112). It must also be possible to prescribe by indicating the length of treatment required.
- 7 The BNF recommendations should be followed as listed above.
- 8 Checks may be incorporated to ensure that all the information required for dispensing a particular drug has been filled in. For instructions such as 'as directed' and 'when required', the maximum daily dose should normally be specified.
- 9 Numbers and codes used in the system for organising and retrieving data must never appear on the form.
- 10 Supplementary warnings or advice should be written in full, should not interfere with the clarity of the prescription itself, and should be in line with any warnings or advice in the BNF; numerical codes should not be used.
- 11 A mechanism (such as printing a series of nonspecific characters) should be incorporated to cancel out unused space, or wording such as 'no more items on this prescription' may be added after the last item. Otherwise the doctor should delete the space manually.
- 12 To avoid forgery the computer may print on the form the number of items to be dispensed (somewhere separate from the box for the pharmacist). The number of items per form need be limited only by the ability of the printer to produce clear and well-demarcated instructions with sufficient space for each item and a spacer line before each fresh item.
- 13 Handwritten alterations should only be made in exceptional circumstances—it is preferable to print out a new prescription. Any alterations must be made in the doctor's own handwriting and countersigned; computer records should be updated to fully reflect any alteration. Prescriptions for drugs used for contraceptive purposes (but which are not promoted as contraceptives) may need to be marked in handwriting with the symbol ♀, (or endorsed in another way to indicate that the item is prescribed for contraceptive purposes).
- 14 Prescriptions for controlled drugs can be printed from the computer, but the prescriber's signature must be handwritten (See Controlled Drugs and Drug Dependence; the prescriber may use a date stamp).
- 15 The strip of paper on the side of the FP10SS (GP10SS in Scotland, WP10SS in Wales) may be used for various purposes but care should be taken to avoid including confidential information. It may be advisable for the patient's name to appear at the top, but this should be preceded by 'confidential'.
- 16 In rural dispensing practices prescription requests (or details of medicines dispensed) will normally be entered in one surgery. The prescriptions (or dispensed medicines) may then need to be delivered to another surgery or location; if possible the computer should hold up to 10 alternatives.
- 17 Prescription forms that are reprinted or issued as a duplicate should be labelled clearly as such.

Emergency supply of medicines

Emergency supply requested by member of the public

Pharmacists are sometimes called upon by members of the public to make an emergency supply of medicines. The Human Medicines Regulations 2012 allows exemptions from the Prescription Only requirements for emergency supply to be made by a person lawfully conducting a retail pharmacy business provided:

- a) that the pharmacist has interviewed the person requesting the prescription-only medicine and is satisfied:
 - i) that there is immediate need for the prescription-only medicine and that it is impracticable in the circumstances to obtain a prescription without undue delay;
 - ii) that treatment with the prescription-only medicine has on a previous occasion been prescribed for the person requesting it;
 - iii) as to the dose that it would be appropriate for the person to take;
- b) that no greater quantity shall be supplied than will provide 5 days' treatment of phenobarbital p. 351, *phenobarbital sodium*, or Controlled Drugs in Schedules 4 or 5 (doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation) or 30 days' treatment for other prescription-only medicines, except when the prescription-only medicine is:
 - i) insulin, an ointment or cream, or a preparation for the relief of asthma in an aerosol dispenser when the smallest pack can be supplied;
 - ii) an oral contraceptive when a full cycle may be supplied;
 - iii) an antibiotic in liquid form for oral administration when the smallest quantity that will provide a full course of treatment can be supplied;
- c) that an entry shall be made by the pharmacist in the prescription book stating:
 - i) the date of supply;
 - ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
 - iii) the name and address of the patient;
 - iv) the nature of the emergency;
- d) that the container or package must be labelled to show:
 - i) the date of supply;
 - ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
 - iii) the name of the patient;
 - iv) the name and address of the pharmacy;
 - v) the words 'Emergency supply';
 - vi) the words 'Keep out of the reach of children' (or similar warning);
- e) that the prescription-only medicine is not a substance specifically excluded from the emergency supply provision, and does not contain a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 351 or *phenobarbital sodium* for the treatment of epilepsy: for details see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition). Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation.

Emergency supply requested by prescriber

Emergency supply of a prescription-only medicine may also be made at the request of a doctor, a dentist, a supplementary prescriber, a community practitioner nurse prescriber, a nurse, pharmacist, or optometrist independent prescriber, or a doctor or dentist from the European Economic Area or Switzerland, provided:

- a) that the pharmacist is satisfied that the prescriber by reason of some emergency is unable to furnish a prescription immediately;
- b) that the prescriber has undertaken to furnish a prescription within 72 hours;
- c) that the medicine is supplied in accordance with the directions of the prescriber requesting it;
- d) that the medicine is not a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 351 or *phenobarbital sodium* for the treatment of epilepsy: for details see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition); (Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation).
- e) that an entry shall be made in the prescription book stating:
 - i) the date of supply;
 - ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
 - iii) the name and address of the practitioner requesting the emergency supply;
 - iv) the name and address of the patient;
 - v) the date on the prescription;
 - vi) when the prescription is received the entry should be amended to include the date on which it is received.

Royal Pharmaceutical Society's guidelines

1. The pharmacist should consider the medical consequences of not supplying a medicine in an emergency.
2. If the pharmacist is unable to make an emergency supply of a medicine the pharmacist should advise the patient how to obtain essential medical care.

For conditions that apply to supplies made at the request of a patient see *Medicines, Ethics and Practice*, London Pharmaceutical Press, (always consult latest edition).

Controlled drugs and drug dependence

Regulations and classification

The Misuse of Drugs Act, 1971 as amended prohibits certain activities in relation to 'Controlled Drugs', in particular their manufacture, supply, and possession (except where permitted by the 2001 Regulations or under licence from the Secretary of State). The penalties applicable to offences involving the different drugs are graded broadly according to the *harmfulness attributable to a drug when it is misused* and for this purpose the drugs are defined in the following three classes:

- **Class A** includes: alfentanil p. 1413, cocaine, diamorphine hydrochloride p. 477 (heroin), dipipanone hydrochloride, fentanyl p. 479, lysergide (LSD), methadone hydrochloride p. 524, 3, 4-methylenedioxyamfetamine (MDMA, 'ecstasy'), morphine p. 484, opium, oxycodone hydrochloride p. 487, pethidine hydrochloride p. 490, phencyclidine, remifentanyl p. 1414, and class B substances when prepared for injection.
- **Class B** includes: oral amfetamines, barbiturates, cannabis, *Sativex*[®], codeine phosphate p. 475, dihydrocodeine tartrate p. 477, ethylmorphine, glutethimide, ketamine p. 1415, nabilone p. 450, pentazocine, phenmetrazine, and pholcodine p. 312.
- **Class C** includes: certain drugs related to the amfetamines such as benzfetamine and chlorphentermine, buprenorphine p. 468, mazindol, meprobamate, pemoline, pipradrol, most benzodiazepines, tramadol hydrochloride p. 491, zaleplon, zolpidem tartrate, zopiclone, androgenic and anabolic steroids, clenbuterol, chorionic gonadotrophin (HCG), non-human chorionic gonadotrophin, somatotropin, somatrem, somatropin p. 788, gabapentin p. 331, and pregabalin.

The Misuse of Drugs (Safe Custody) Regulations 1973 as amended details the storage and safe custody requirements for Controlled Drugs.

The Misuse of Drugs Regulations 2001 (and subsequent amendments) defines the classes of person who are authorised to supply and possess Controlled Drugs while acting in their professional capacities and lays down the conditions under which these activities may be carried out. In the 2001 regulations, drugs are divided into five Schedules, each specifying the requirements governing such activities as import, export, production, supply, possession, prescribing, and record keeping which apply to them.

- **Schedule 1** includes drugs not used medicinally such as hallucinogenic drugs (e.g. LSD), ecstasy-type substances, raw opium, and cannabis. A Home Office licence is generally required for their production, possession, or supply. A Controlled Drug register must be used to record details of any Schedule 1 Controlled Drugs received or supplied by a pharmacy.
- **Schedule 2** includes opiates (e.g. diamorphine hydrochloride p. 477 (heroin), morphine p. 484, methadone hydrochloride p. 524, oxycodone hydrochloride p. 487, pethidine hydrochloride p. 490), major stimulants (e.g. amfetamines), quinalbarbitone (secobarbital), cocaine, ketamine p. 1415, and cannabis-based products for medicinal use in humans. Schedule 2 Controlled Drugs are subject to the full Controlled Drug requirements relating to prescriptions, safe custody (except for quinalbarbitone (secobarbital) and some liquid preparations), and the need to keep a Controlled Drug register, (unless exempted in Schedule 5). Possession, supply and procurement is authorised for pharmacists and other classes of persons named in the 2001 Regulations.

- **Schedule 3** includes the barbiturates (except secobarbital, now Schedule 2), buprenorphine p. 468, gabapentin p. 331, mazindol, meprobamate, midazolam p. 356, pentazocine, phentermine, pregabalin, temazepam p. 509, and tramadol hydrochloride p. 491. They are subject to the special prescription requirements. Safe custody requirements do apply, except for any 5,5 disubstituted barbituric acid (e.g. phenobarbital), gabapentin p. 331, mazindol, meprobamate, midazolam p. 356, pentazocine, phentermine, pregabalin, tramadol hydrochloride p. 491, or any stereoisomeric form or salts of the above. Records in registers do not need to be kept (although there are requirements for the retention of invoices for 2 years).
- **Schedule 4** includes in Part I drugs that are subject to minimal control, such as benzodiazepines (except temazepam p. 509 and midazolam p. 356, which are in Schedule 3), non-benzodiazepine hypnotics (zaleplon, zolpidem tartrate, and zopiclone) and *Sativex*[®]. Part II includes androgenic and anabolic steroids, clenbuterol, chorionic gonadotrophin (HCG), non-human chorionic gonadotrophin, somatotropin, somatrem, and somatropin p. 788. Controlled drug prescription requirements do not apply and Schedule 4 Controlled Drugs are not subject to safe custody requirements. Records in registers do not need to be kept (except in the case of *Sativex*[®]).
- **Schedule 5** includes preparations of certain Controlled Drugs (such as codeine, pholcodine p. 312 or morphine p. 484) which due to their low strength, are exempt from virtually all Controlled Drug requirements other than retention of invoices for two years.

Since the Responsible Pharmacist Regulations were published in 2008, standing operation procedures for the management of Controlled Drugs, are required in registered pharmacies.

The Health Act 2006 introduced the concept of the 'accountable officer' with responsibility for the management of Controlled Drugs and related governance issues in their organisation. Most recently, in 2013 The Controlled Drugs (Supervision of Management and Use) Regulations were published to ensure good governance concerning the safe management and use of Controlled Drugs in England and Scotland.

Prescriptions

Preparations in Schedules 1, 2, 3, 4 and 5 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are identified throughout the BNF and BNF *for children* using the following symbols:

CD1	for preparations in Schedule 1
CD2	for preparations in Schedule 2
CD3	for preparations in Schedule 3
CD4-1	for preparations in Schedule 4 (Part I)
CD4-2	for preparations in Schedule 4 (Part II)
CD5	for preparations in Schedule 5

The principal legal requirements relating to medical prescriptions are listed below (see also Department of Health Guidance at www.gov.uk/dh).

Prescription requirements Prescriptions for Controlled Drugs that are subject to prescription requirements (all preparations in Schedules 2 and 3) must be indelible, must be *signed* by the prescriber, include the *date* on which they were signed, and specify the prescriber's *address* (must be

within the UK). A machine-written prescription is acceptable, but the prescriber's signature must be handwritten. Advanced electronic signatures can be accepted for Schedule 2 and 3 Controlled Drugs where the Electronic Prescribing Service (EPS) is used. All prescriptions for Controlled Drugs that are subject to the prescription requirements must always state:

- the name and address of the patient (use of a PO Box is not acceptable);
- in the case of a preparation, the form (the dosage form e.g. tablets must be included on a Controlled Drugs prescription irrespective of whether it is implicit in the proprietary name e.g. *MST Continus*, or whether only one form is available), and, where appropriate, the strength of the preparation (when more than one strength of a preparation exists the strength required must be specified); to avoid ambiguity, where a prescription requests multiple strengths of a medicine, each strength should be prescribed separately (i.e. separate dose, total quantity, etc);
- for liquids, the total volume in millilitres (in both words and figures) of the preparation to be supplied; for dosage units (tablets, capsules, ampoules), state the total number (in both words and figures) of dosage units to be supplied (e.g. 10 tablets [of 10 mg] rather than 100 mg total quantity);
- the dose, which must be clearly defined (i.e. the instruction 'one as directed' constitutes a dose but 'as directed' does not); it is not necessary that the dose is stated in both words and figures;
- the words 'for dental treatment only' if issued by a dentist.

A pharmacist is **not** allowed to dispense a Controlled Drug unless all the information required by law is given on the prescription. In the case of a prescription for a Controlled Drug in Schedule 2 or 3, a pharmacist can amend the prescription *if* it specifies the total quantity only in words or in figures or if it contains minor typographical errors, provided that such amendments are indelible and clearly attributable to the pharmacist (e.g. name, date, signature and GPhC registration number). The prescription should be marked with the date of supply at the time the Controlled Drug supply is made.

The Department of Health and the Scottish Government have issued a strong recommendation that the maximum quantity of Schedule 2, 3 or 4 Controlled Drugs prescribed should not exceed 30 days; exceptionally, to cover a justifiable clinical need and after consideration of any risk, a prescription can be issued for a longer period, but the reasons for the decision should be recorded on the patient's notes.

A prescription for a Controlled Drug in Schedules 2, 3, or 4 is valid for 28 days from the date stated thereon (the prescriber may forward-date the prescription; the start date may also be specified in the body of the prescription). Schedule 5 prescriptions are valid for 6 months from the appropriate date.

Medicines that are not Controlled Drugs should not be prescribed on the same form as a Schedule 2 or 3 Controlled Drug.

See sample prescription:

Pharmacy Stamp	Age 70yrs 1mth D.o.B 2/6/1941	Title, Forename, Surname & Address SMITH John 22 Bridge Street Anytown KB1 5SX

Instalments and repeatable prescriptions Prescriptions for Schedule 2 or 3 Controlled Drugs can be dispensed by instalments. An instalment prescription must have an instalment direction including both the dose and the instalment amount specified separately on the prescription, and it must also state the interval between each time the medicine can be supplied.

The first instalment must be dispensed within 28 days of the appropriate day (i.e. date of signing unless the prescriber indicates a date before which the Controlled Drug should not be dispensed) and the remainder should be dispensed in accordance with the instructions on the prescription. The prescription must be marked with the date of each supply. The instalment direction is a legal requirement and needs to be complied with, however, for certain situations (e.g. if a pharmacy is closed on the day an instalment is due) the Home Office has approved specific wording which provides pharmacists some flexibility for supply. For details, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition) or see Home Office approved wording for instalment prescribing (Circular 027/2015), available at www.gov.uk/.

Repeatable prescriptions are prescriptions which contain a direction that they can be dispensed more than once (e.g. repeat × 3). Only Schedule 4 and 5 Controlled Drugs are permitted on repeatable prescriptions.

Private prescriptions Private prescriptions for Controlled Drugs in Schedules 2 and 3 must be written on specially designated forms which are provided by local NHS England area teams in England (form FP10PCD), local NHS Health Boards in Scotland (form PPCD) and Wales (form W10PCD); in addition, prescriptions must specify the *prescriber's identification number* (or a NHS prescriber code in Scotland).

Prescriptions to be supplied by a pharmacist in hospital are exempt from the requirements for private prescriptions.

Dependence and misuse

The most common drugs of addiction are **crack cocaine** and **opioids**, particularly **diamorphine hydrochloride p. 477 (heroin)**. For arrangements for prescribing of diamorphine hydrochloride, dipipanone, or cocaine for addicts, see *Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts* below.

Along with traditional stimulants, such as amphetamine and cocaine, there has been an emerging use of methamphetamine and a range of psychoactive substances with stimulant, depressant or hallucinogenic properties such as lysergide (lysergic acid diethylamide, LSD), ketamine or gamma-hydroxybutyrate (sodium oxybate, GHB).

Benzodiazepines and z-drugs (i.e. zopiclone p. 512, zolpidem tartrate p. 512) have their own potential for misuse and dependence and are often taken in combination with opiates or stimulants.

Cannabis-based products for medicinal use are Schedule 2 Controlled Drugs and can be prescribed only by clinicians listed on the Specialist Register of the General Medical Council. Cannabis with no approved medicinal use is a Schedule 1 Controlled Drug and cannot be prescribed. It remains the most frequently used illicit drug by young people and dependence can develop in around 10% of users. Cannabis use can exacerbate depression and it may cause an acute short-lived toxic psychosis which resolves with cessation, however paranoid symptoms may persist in chronic users; withdrawal symptoms can occur in some users and these can contribute to sleep problems, agitation and risk of self-harm.

Supervised consumption

Supervised consumption is not a legal requirement under the 2001 Regulations. Nevertheless, when supervised consumption is directed on the prescription, the Department of Health recommends that any deviation from the prescriber's intended method of supply should be documented and the justification for this recorded.

Individuals prescribed opioid substitution therapy can take their daily dose under the supervision of a doctor, nurse, or pharmacist during the dose stabilisation phase (usually the first 3 months of treatment), after a relapse or period of instability, or if there is a significant increase in the dose of methadone. Supervised consumption should continue (in accordance with local protocols) until the prescriber is confident that the patient is compliant with their treatment. It is good practice for pharmacists to alert the prescriber when a patient has missed consecutive daily doses.

Prescribing drugs likely to cause dependence or misuse

The prescriber has three main responsibilities:

- To avoid creating dependence by introducing drugs to patients without sufficient reason. In this context, the proper use of the morphine-like drugs is well understood. The dangers of other Controlled Drugs are less clear because recognition of dependence is not easy and its effects, and those of withdrawal, are less obvious.
- To see that the patient does not gradually increase the dose of a drug, given for good medical reasons, to the point where dependence becomes more likely. This tendency is seen especially with hypnotics and anxiolytics. The prescriber should keep a close eye on the amount prescribed to prevent patients from accumulating stocks. A minimal amount should be prescribed in the first instance, or when seeing a patient for the first time.
- To avoid being used as an unwitting source of supply for addicts and being vigilant to methods for obtaining

medicines. Methods include visiting more than one doctor, fabricating stories, and forging prescriptions.

Patients under temporary care should be given only small supplies of drugs unless they present an unequivocal letter from their own doctor. Doctors should also remember that their own patients may be attempting to collect prescriptions from other prescribers, especially in hospitals. It is sensible to reduce dosages steadily or to issue weekly or even daily prescriptions for small amounts if it is apparent that dependence is occurring.

Prescribers are responsible for the security of prescription forms once issued to them. The stealing and misuse of prescription forms could be minimised by the following precautions:

- records of serial numbers received and issued should be retained for at least three years;
- blank prescriptions should never be pre-signed;
- prescription forms should not be left unattended and should be locked in a secure drawer, cupboard, or carrying case when not in use;
- doctors', dentists' and surgery stamps should be kept in a secure location separate from the prescription forms;
- alterations are best avoided but if any are made and the prescription is to be used, best practice is for the prescriber to cross out the error, initial and date the error, then write the correct information;
- if an error made in a prescription cannot be corrected, best practice for the prescriber is to put a line through the script and write 'spoiled' on the form, or destroy the form and start writing a new prescription;
- prescribers and pharmacists dispensing drugs prone to abuse should ensure compliance with all relevant legal requirements specially when dealing with prescriptions for Controlled Drugs (see *Prescription requirements and Instalments* above);
- at the time of dispensing, prescriptions should be stamped with the pharmacy stamp and endorsed by the pharmacist or pharmacy technician with what has been supplied; where loss or theft is suspected, the police should be informed immediately.

Travelling abroad

Prescribed drugs listed in Schedule 4 Part II (CD Anab) for self-administration and Schedule 5 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are not subject to export or import licensing. A personal import/export licence is required for patients travelling abroad with Schedules 2, 3, or 4 Part I (CD Benz) and Part II (CD Anab) Controlled Drugs if, they are carrying more than 3 months' supply or are travelling for 3 calendar months or more. A Home Office licence is required for any amount of a Schedule 1 Controlled Drug imported into the UK for personal use regardless of the duration of travel. Further details can be obtained at www.gov.uk/guidance/controlled-drugs-licences-fees-and-returns or from the Home Office by contacting DFLU.ie@homeoffice.gsi.gov.uk. In cases of emergency, telephone (020) 7035 6330.

Applications for obtaining a licence must be supported by a cover letter signed by the prescribing doctor or drug worker, which must confirm:

- the patient's name and address;
- the travel itinerary;
- the names of the prescribed Controlled Drug(s), doses and total amounts to be carried.

Applications for licences should be sent to the Home Office, Drugs & Firearms Licensing Unit, Fry Building, 2 Marsham Street, London, SW1P 4DF.

Alternatively, completed application forms can be emailed to DFLU.ie@homeoffice.gsi.gov.uk. A minimum of 10 days should be allowed for processing the application.

Patients travelling for less than 3 months or carrying less than 3 months supply of Controlled Drugs do not require a

personal export/import licence, but are advised to carry a cover letter signed by the prescribing doctor or drug worker. Those travelling for more than 3 months are advised to make arrangements to have their medication prescribed by a practitioner in the country they are visiting.

Doctors who want to take Controlled Drugs abroad while accompanying patients may similarly be issued with licences. Licences are not normally issued to doctors who want to take Controlled Drugs abroad solely in case a family emergency should arise.

Personal export/import licences do not have any legal status outside the UK and are issued only to comply with the Misuse of Drugs Act 2001 and to facilitate passage through UK Customs and Excise control. For clearance in the country to be visited it is necessary to approach that country's consulate in the UK.

Notification of patients receiving structured drug treatment for substance dependence

In **England**, doctors should report cases where they are providing structured drug treatment for substance dependence to their local National Drug Treatment Monitoring System (NDTMS) Team. General information about NDTMS can be found at www.gov.uk/government/collections/alcohol-and-drug-misuse-prevention-and-treatment-guidance.

Enquiries about NDTMS, and how to submit data, should initially be directed to:

- EvidenceApplicationteam@phe.gov.uk

In **Scotland**, doctors should report cases to the Substance Drug Misuse Database. General information about the Scottish Drug Misuse Database can be found in www.isdscotland.org/Health-Topics/Drugs-and-Alcohol-Misuse/Drugs-Misuse/Scottish-Drug-Misuse-Database/. Enquiries about reporting can be directed to:

- nss.isdsubstancemisuse@nhs.net

In **Northern Ireland**, the Misuse of Drugs (Notification of and Supply to Addicts) (Northern Ireland) Regulations 1973 require doctors to send particulars of persons whom they consider to be addicted to certain Controlled Drugs to the Chief Medical Officer of the Ministry of Health and Social Services. The Northern Ireland contact is:

Public Health Information & Research Branch
Department of Health,
Annexe 2,
Castle Buildings,
Stormont,
Belfast
BT4 3SQ

Tel: 028 9052 2340
phirb@health-ni.gov.uk

Public Health Information & Research Branch also maintains the Northern Ireland Drug Misuse Database (NIDMD) which collects detailed information on those presenting for treatment, on drugs misused and injecting behaviour; participation is not a statutory requirement.

In **Wales**, doctors should report cases where they are providing structured drug treatment for substance dependence on the Welsh National Database for Substance Misuse; enquiries should be directed to: substancemisuse-queries@wales.nhs.uk.

Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts

The Misuse of Drugs (Supply to Addicts) Regulations 1997 require that **only** medical practitioners who hold a special licence issued by the Home Secretary (or Scottish Government's Chief Medical Officer) may prescribe, administer, or supply diamorphine hydrochloride p. 477, dipipanone, or cocaine for *the treatment of drug addiction*. Medical prescribers, pharmacists independent prescribers,

nurses independent prescribers and supplementary prescribers do not require a special licence for prescribing diamorphine hydrochloride p. 477, dipipanone, or cocaine for patients (including addicts) for relieving pain from organic disease or injury.

Adverse reactions to drugs

Yellow card scheme

Any drug may produce unwanted or unexpected adverse reactions. Rapid detection and recording of adverse drug reactions is of vital importance so that unrecognised hazards are identified promptly and appropriate regulatory action is taken to ensure that medicines are used safely. Healthcare professionals and coroners are urged to report suspected adverse drug reactions directly to the Medicines and Healthcare products Regulatory Agency (MHRA) through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/yellowcard. Alternatively, prepaid Yellow Cards for reporting are available from the address below and are also bound in the inside back cover of the *BNF*.

Send Yellow Cards to:

FREEPOST YELLOW CARD

(No other address details required).

Tel: 0800 731 6789

Suspected adverse drug reactions to any therapeutic agent should be reported, including drugs (*self-medication* as well as those *prescribed*), blood products, vaccines, radiographic contrast media, complementary and herbal products. For biosimilar medicines and vaccines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine or vaccine.

Suspected adverse drug reactions should be reported through the Yellow Card Scheme at www.mhra.gov.uk/yellowcard. Yellow Cards can be used for reporting suspected adverse drug reactions to medicines, vaccines, herbal or complementary products, whether self-medicated or prescribed. This includes suspected adverse drug reactions associated with misuse, overdose, medication errors or from use of unlicensed and off-label medicines. Yellow Cards can also be used to report medical device incidents, defective medicines, and suspected fake medicines.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well recognised, or if other drugs have been given at the same time. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs.

A freephone service is available to all parts of the UK for advice and information on suspected adverse drug reactions; contact the National Yellow Card Information Service at the MHRA on 0800 731 6789. Outside office hours a telephone-answering machine will take messages.

The following Yellow Card Centres can be contacted for further information:

Yellow Card Centre Northwest

2nd Floor, 70 Pembroke Place, Liverpool, L69 3GF

Tel: (0151) 794 8117

YCCNorthwest@rlbuht.nhs.net

Yellow Card Centre Wales

All Wales Therapeutics and Toxicology Centre, Academic Building, University Hospital Llandough, Penlan Road, Penarth, Vale of Glamorgan, CF64 2XX

Tel: (029) 20716900

awttc@wales.nhs.net

Yellow Card Centre Northern & Yorkshire

Regional Drug and Therapeutics Centre, 16/17 Framlington Place, Newcastle upon Tyne, NE2 4AB

Tel: (0191) 213 7855

Yellow Card Centre West Midlands

City Hospital, Dudley Road, Birmingham, B18 7QH

Yellow Card Centre Scotland

CARDS, Royal Infirmary of Edinburgh, 51 Little France Crescent, Old Dalkeith Road, Edinburgh, EH16 4SA

Tel: (0131) 242 2919

YCCScotland@luht.scot.nhs.uk

The MHRA's database facilitates the monitoring of adverse drug reactions. More detailed information on reporting and a list of products currently under additional monitoring can be found on the MHRA website: www.mhra.gov.uk.

MHRA Drug Safety Update *Drug Safety Update* is a monthly newsletter from the MHRA and the Commission on Human Medicines (CHM); it is available at www.gov.uk/drug-safety-update.

Self-reporting

Patients and their carers can also report suspected adverse drug reactions to the MHRA. Reports can be submitted directly to the MHRA through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/yellowcard, by telephone on 0800 100 3352, or by downloading the Yellow Card form from www.mhra.gov.uk. Alternatively, patient Yellow Cards are available from pharmacies and GP surgeries. Information for patients about the Yellow Card Scheme is available in other languages at www.mhra.gov.uk/yellowcard.

Prescription-event monitoring

In addition to the MHRA's Yellow Card Scheme, an independent scheme monitors the safety of new medicines using a different approach. The Drug Safety Research Unit identifies patients who have been prescribed selected new medicines and collects data on clinical events in these patients. The data are submitted on a voluntary basis by general practitioners on green forms. More information about the scheme and the Unit's educational material is available from www.dsru.org.

Newer drugs and vaccines

Only limited information is available from clinical trials on the safety of new medicines. Further understanding about the safety of medicines depends on the availability of information from routine clinical practice.

The black triangle symbol identifies newly licensed medicines that require additional monitoring by the European Medicines Agency. Such medicines include new active substances, biosimilar medicines, and medicines that the European Medicines Agency consider require additional monitoring. The black triangle symbol also appears in the Patient Information Leaflets for relevant medicines, with a brief explanation of what it means. Products usually retain a black triangle for 5 years, but this can be extended if required.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. For medicines showing the black triangle symbol, the MHRA asks that **all** suspected reactions (including those considered not to be serious) are reported through the Yellow Card Scheme. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well recognised, or if other drugs have been given at the same time.

Established drugs and vaccines

Healthcare professionals and coroners are asked to report all suspected reactions to established drugs (including over-the-counter, herbal, and unlicensed medicines and medicines used off-label) and vaccines that are **serious, medically significant, or result in harm**. Serious reactions include those that are fatal, life-threatening, disabling,

incapacitating, or which result in or prolong hospitalisation, or a congenital abnormality; they should be reported even if the effect is well recognised. Examples include anaphylaxis, blood disorders, endocrine disturbances, effects on fertility, haemorrhage from any site, renal impairment, jaundice, ophthalmic disorders, severe CNS effects, severe skin reactions, reactions in pregnant women, and any drug interactions. Reports of serious adverse reactions are required to enable comparison with other drugs of a similar class. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs.

For established drugs there is no need to report well-known, relatively minor side-effects, such as dry mouth with tricyclic antidepressants or constipation with opioids.

Medication errors

Adverse drug reactions where harm occurs as a result of a medication error are reportable as a Yellow Card or through the local risk management systems into the National Reporting and Learning System (NRLS). If reported to the NRLS, these will be shared with the MHRA. If the NRLS is not available and harm occurs, report using a Yellow Card.

Adverse reactions to medical devices

Suspected adverse reactions to medical devices including dental or surgical materials, intra-uterine devices, and contact lens fluids should be reported. Information on reporting these can be found at: www.mhra.gov.uk.

Side-effects in the BNF

The *BNF* includes clinically relevant side-effects for most drugs; an exhaustive list is not included for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). Where causality has not been established, side-effects in the manufacturers' literature may be omitted from the *BNF*.

Recognising that hypersensitivity reactions (including anaphylactic and anaphylactoid reactions) can occur with virtually all drugs, this effect is not generally listed, unless the drug carries an increased risk of such reactions or specific management advice is provided by the manufacturer. Administration site reactions have been omitted from the *BNF* (e.g. pain at injection site). The *BNF* also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes). Drugs that are applied locally or topically carry a theoretical or low risk of systemic absorption and therefore systemic side-effects for these drugs are not listed in the *BNF* unless they are associated with a high risk to patient safety. Infections are a known complication of treatment with drugs that affect the immune system (e.g. corticosteroids or immunosuppressants); this side-effect is listed in the *BNF* as 'increased risk of infection'. Symptoms of drug withdrawal reactions are not individually listed, but are collectively termed 'withdrawal syndrome'. Side-effects are generally listed alphabetically in order of frequency. In the product literature the frequency of side-effects is generally described as follows:

Description of the frequency of side-effects	
<i>Very common</i>	greater than 1 in 10
<i>Common</i>	1 in 100 to 1 in 10
<i>Uncommon</i> [formerly 'less commonly' in BNF publications]	1 in 1000 to 1 in 100
<i>Rare</i>	1 in 10 000 to 1 in 1000
<i>Very rare</i>	less than 1 in 10 000
<i>Frequency not known</i>	frequency is not defined by product literature or the side-effect has been reported from post-marketing surveillance data

For consistency, the terms used to describe side-effects are standardised using a defined vocabulary across all of the drug monographs in the *BNF* (e.g. postural hypotension is used for the term orthostatic hypotension).

Special problems

Delayed drug effects Some reactions (e.g. cancers, chloroquine retinopathy, and retroperitoneal fibrosis) may become manifest months or years after exposure. Any suspicion of such an association should be reported directly to the MHRA through the Yellow Card Scheme.

The elderly Particular vigilance is required to identify adverse reactions in the elderly.

Congenital abnormalities When an infant is born with a congenital abnormality or there is a malformed aborted fetus doctors are asked to consider whether this might be an adverse reaction to a drug and to report all drugs (including self-medication) taken during pregnancy.

Children Particular vigilance is required to identify and report adverse reactions in children, including those resulting from the unlicensed use of medicines; **all** suspected reactions should be reported directly to the MHRA through the Yellow Card Scheme (see also Adverse Drug Reactions in Children).

Prevention of adverse reactions

Adverse reactions may be prevented as follows:

- never use any drug unless there is a good indication. If the patient is pregnant do not use a drug unless the need for it is imperative;
- allergy and idiosyncrasy are important causes of adverse drug reactions. Ask if the patient had previous reactions to the drug or formulation;
- ask if the patient is already taking other drugs including self-medication drugs, health supplements, complementary and alternative therapies; interactions may occur;
- age and hepatic or renal disease may alter the metabolism or excretion of drugs, so that much smaller doses may be needed. Genetic factors may also be responsible for variations in metabolism, and therefore for the adverse effect of the drug; notably of isoniazid p. 621 and the tricyclic antidepressants;
- prescribe as few drugs as possible and give very clear instructions to the elderly or any patient likely to misunderstand complicated instructions;
- whenever possible use a familiar drug; with a new drug, be particularly alert for adverse reactions or unexpected events;
- consider if excipients (e.g. colouring agents) may be contributing to the adverse reaction. If the reaction is minor, a trial of an alternative formulation of the same drug may be considered before abandoning the drug;
- warn the patient if serious adverse reactions are liable to occur.

Drug allergy (suspected or confirmed)

Suspected drug allergy is any reaction caused by a drug with clinical features compatible with an immunological mechanism. All drugs have the potential to cause adverse drug reactions, but not all of these are allergic in nature. A reaction is more likely to be caused by drug allergy if:

- The reaction occurred while the patient was being treated with the drug, or
- The drug is known to cause this pattern of reaction, or
- The patient has had a similar reaction to the same drug or drug-class previously.

A suspected reaction is less likely to be caused by a drug allergy if there is a possible non-drug cause or if there are only gastro-intestinal symptoms present.

The following signs, allergic patterns and timing of onset can be used to help decide whether to suspect drug allergy:

Immediate, rapidly-evolving reactions (onset usually less than 1 hour after drug exposure)

- Anaphylaxis, with erythema, urticaria or angioedema, and hypotension and/or bronchospasm. See also Antihistamines, allergen immunotherapy and allergic emergencies p. 291
- Urticaria or angioedema without systemic features
- Exacerbation of asthma e.g. with non-steroidal anti-inflammatory drugs (NSAIDs)

Non-immediate reactions, without systemic involvement (onset usually 6–10 days after first drug exposure or 3 days after second exposure)

- Cutaneous reactions, e.g. widespread red macules and/or papules, or, fixed drug eruption (localised inflamed skin)

Non-immediate reactions, with systemic involvement (onset may be variable, usually 3 days to 6 weeks after first drug exposure, depending on features, or 3 days after second exposure)

- Cutaneous reactions with systemic features, e.g. drug reaction with eosinophilia and systemic signs (DRESS) or drug hypersensitivity syndrome (DHS), characterised by widespread red macules, papules or erythroderma, fever, lymphadenopathy, liver dysfunction or eosinophilia
- Toxic epidermal necrolysis or Stevens–Johnson syndrome
- Acute generalised exanthematous pustulosis (AGEP)

EVGr Suspected drug allergy information should be clearly and accurately documented in clinical notes and prescriptions, and shared among all healthcare professionals. Patients should be given information about which drugs and drug-classes to avoid and encouraged to share their drug allergy status.

If a drug allergy is suspected, consider stopping the suspected drug and advising the patient or carer to avoid this drug in future. Symptoms of the acute reaction should be treated, in hospital if severe. Patients presenting with a suspected anaphylactic reaction, or a severe or non-immediate cutaneous reaction, should be referred to a specialist drug allergy service. Patients presenting with a suspected drug allergic reaction or anaphylaxis to NSAIDs, and local and general anaesthetics may also need to be referred to a specialist drug allergy service, e.g. in cases of anaphylactoid reactions or to determine future treatment options. Patients presenting with a suspected drug allergic reaction or anaphylaxis associated with beta-lactam antibiotics should be referred to a specialist drug allergy service if their disease or condition can only be treated by a beta-lactam antibiotic or they are likely to need beta-lactam antibiotics frequently in the future (e.g. immunodeficient patients). **⚠** For further information see Drug allergy: diagnosis and management. NICE Clinical Guideline 183 (September 2014) www.nice.org.uk/guidance/cg183.

Oral side-effects of drugs

Drug-induced disorders of the mouth may be due to a local action on the mouth or to a systemic effect manifested by oral changes. In the latter case urgent referral to the patient's medical practitioner may be necessary.

Oral mucosa Medicaments left in contact with or applied directly to the oral mucosa can lead to inflammation or ulceration; the possibility of allergy should also be borne in mind.

Aspirin tablets p. 130 allowed to dissolve in the sulcus for the treatment of toothache can lead to a white patch followed by ulceration.

Flavouring agents, particularly **essential oils**, may sensitise the skin, but mucosal swelling is not usually prominent.

The oral mucosa is particularly vulnerable to ulceration in patients treated with cytotoxic drugs, e.g. methotrexate p. 963. Other drugs capable of causing oral ulceration include **ACE inhibitors, gold, nicorandil p. 225, NSAIDs, pancreatin p. 103, penicillamine p. 1158, proguanil hydrochloride p. 654, and protease inhibitors.**

Erythema multiforme or Stevens–Johnson syndrome may follow the use of a wide range of drugs including **antibacterials, antiretrovirals, sulfonamide derivatives, and anticonvulsants**; the oral mucosa may be extensively ulcerated, with characteristic target lesions on the skin. Oral lesions of toxic epidermal necrolysis have been reported with a similar range of drugs.

Lichenoid eruptions are associated with **ACE inhibitors, NSAIDs, methyldopa p. 157, chloroquine p. 651, oral antidiabetics, thiazide diuretics, and gold.**

Candidiasis can complicate treatment with **antibacterials and immunosuppressants** and is an occasional side-effect of **corticosteroid inhalers.**

Teeth and jaw *Brown staining* of the teeth frequently follows the use of chlorhexidine mouthwash, spray or gel p. 1275, but can readily be removed by polishing. **Iron** salts in liquid form can stain the enamel black. Superficial staining has been reported rarely with co-amoxiclav suspension p. 582.

Intrinsic staining of the teeth is most commonly caused by **tetracyclines**. They will affect the teeth if given at any time from about the fourth month *in utero* until the age of twelve years; they are contra-indicated during pregnancy, in breast-feeding women, and in children under 12 years. All tetracyclines can cause permanent, unsightly staining in children, the colour varying from yellow to grey.

Excessive ingestion of **fluoride** leads to *dental fluorosis* with mottling of the enamel and areas of hypoplasia or pitting; fluoride supplements occasionally cause mild mottling (white patches) if the dose is too large for the child's age (taking into account the fluoride content of the local drinking water and of toothpaste).

The risk of *osteonecrosis of the jaw* is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget's disease. All patients receiving bisphosphonates should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients with cancer receiving bevacizumab p. 909 or sunitinib p. 1057 may also be at risk of osteonecrosis of the jaw.

Periodontium *Gingival overgrowth* (gingival hyperplasia) is a side-effect of phenytoin p. 339 and sometimes of ciclosporin p. 883 or of nifedipine p. 174 (and some other calcium-channel blockers).

Thrombocytopenia may be drug related and may cause bleeding at the gingival margins, which may be spontaneous or may follow mild trauma (such as toothbrushing).

Salivary glands The most common effect that drugs have on the salivary glands is to *reduce flow* (xerostomia). Patients with a persistently dry mouth may have poor oral hygiene;

they are at an increased risk of dental caries and oral infections (particularly candidiasis). Many drugs have been implicated in xerostomia, particularly **antimuscarinics** (anticholinergics), **antidepressants** (including tricyclic antidepressants, and selective serotonin re-uptake inhibitors), **alpha-blockers**, **antihistamines**, **antipsychotics**, **baclofen p. 1190**, **bupropion hydrochloride p. 521**, **clonidine hydrochloride p. 156**, **5HT₁ agonists**, **opioids**, and **tizanidine p. 1192**. Excessive use of **diuretics** can also result in xerostomia. Some drugs (e.g. clozapine p. 414, neostigmine p. 1188) can *increase saliva production* but this is rarely a problem unless the patient has associated difficulty in swallowing. Pain in the salivary glands has been reported with some **antihypertensives** (e.g. clonidine hydrochloride p. 156, methyldopa p. 157) and with **vinca alkaloids**. Swelling of the salivary glands can occur with **iodides**, **antithyroid drugs**, **phenothiazines**, and **sulfonamides**.

Taste There can be *decreased* taste acuity or *alteration* in taste sensation. Many drugs are implicated, including amiodarone hydrochloride p. 112, **calcitonin**, **ACE inhibitors**, carbimazole p. 814, clarithromycin p. 567, **gold**, griseofulvin p. 636, **lithium salts**, metformin hydrochloride p. 730, metronidazole p. 572, penicillamine p. 1158, phenindione p. 150, propafenone hydrochloride p. 111, **protease inhibitors**, terbinafine p. 1300, and zopiclone p. 512.

Defective medicines

During the manufacture or distribution of a medicine an error or accident may occur whereby the finished product does not conform to its specification. While such a defect may impair the therapeutic effect of the product and could adversely affect the health of a patient, it should **not** be confused with an Adverse Drug Reaction where the product conforms to its specification.

The Defective Medicines Report Centre assists with the investigation of problems arising from licensed medicinal products thought to be defective and co-ordinates any necessary protective action. Reports on suspect defective medicinal products should include the brand or the non-proprietary name, the name of the manufacturer or supplier, the strength and dosage form of the product, the product licence number, the batch number or numbers of the product, the nature of the defect, and an account of any action already taken in consequence. The Centre can be contacted at:

The Defective Medicines Report Centre
Medicines and Healthcare products Regulatory Agency,
151 Buckingham Palace Road, London, SW1W 9SZ
Tel: (020) 3080 6574
dmrc@mhra.gsi.gov.uk

Guidance on intravenous infusions

Intravenous additives policies

A local policy on the addition of drugs to intravenous fluids should be drawn up by a multi-disciplinary team and issued as a document to the members of staff concerned.

Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards.

The information that follows should be read in conjunction with local policy documents.

Guidelines

- Drugs should only be added to infusion containers when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.
- In general, only one drug should be added to any infusion container and the components should be compatible. Ready-prepared solutions should be used whenever possible. Drugs should not normally be added to blood products, mannitol, or sodium bicarbonate. Only specially formulated additives should be used with fat emulsions or amino-acid solutions.
- Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.
- Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).
- The infusion container should be labelled with the patient's name, the name and quantity of additives, and the date and time of addition (and the new expiry date or time). Such additional labelling should not interfere with information on the manufacturer's label that is still valid. When possible, containers should be retained for a period after use in case they are needed for investigation.
- It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

Problems

Microbial contamination The accidental entry and subsequent growth of micro-organisms converts the infusion fluid pathway into a potential vehicle for infection with micro-organisms, particularly species of *Candida*, *Enterobacter*, and *Klebsiella*. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should therefore be used in preference to making extemporaneous additions to infusion containers on wards etc. However, when this is necessary strict aseptic procedure should be followed.

Incompatibility Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or precipitation may occur, but in many instances there is no visual indication of incompatibility. Interaction may take place at any point in the infusion fluid pathway, and the potential for incompatibility is increased when more than one substance is added to the infusion fluid.

Common incompatibilities Precipitation reactions are numerous and varied and may occur as a result of pH, concentration changes, 'salting-out' effects, complexation or other chemical changes. Precipitation or other particle formation must be avoided since, apart from lack of control of dosage on administration, it may initiate or exacerbate adverse effects. This is particularly important in the case of drugs which have been implicated in either thrombophlebitis

(e.g. diazepam) or in skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and certain cytotoxic drugs). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin). It is considered undesirable to mix beta-lactam antibiotics, such as semi-synthetic penicillins and cephalosporins, with proteinaceous materials on the grounds that immunogenic and allergenic conjugates could be formed.

A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates. The breakdown products of dacarbazine have been implicated in adverse effects.

Blood Because of the large number of incompatibilities, drugs should not normally be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextrans (rouleaux formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (inactivated). If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

Intravenous fat emulsions These may break down with coalescence of fat globules and separation of phases when additions such as antibacterials or electrolytes are made, thus increasing the possibility of embolism. Only specially formulated products such as *Vitlipid N*[®] may be added to appropriate intravenous fat emulsions.

Other infusions Infusions that frequently give rise to incompatibility include amino acids, mannitol, and sodium bicarbonate.

Bactericides Bactericides such as chlorocresol 0.1% or phenylmercuric nitrate 0.001% are present in some injection solutions. The total volume of such solutions added to a container for infusion on one occasion should not exceed 15 mL.

Method

Ready-prepared infusions should be used whenever available. **Potassium chloride** is usually available in concentrations of 20, 27, and 40 mmol/litre in sodium chloride intravenous infusion (0.9%), glucose intravenous infusion (5%) or sodium chloride and glucose intravenous infusion. **Lidocaine hydrochloride** is usually available in concentrations of 0.1 or 0.2% in glucose intravenous infusion (5%).

When addition is required to be made extemporaneously, any product reconstitution instructions such as those relating to concentration, vehicle, mixing, and handling precautions should be strictly followed using an aseptic technique throughout. Once the product has been reconstituted, addition to the infusion fluid should be made immediately in order to minimise microbial contamination and, with certain products, to prevent degradation or other formulation change which may occur; e.g. reconstituted ampicillin injection degrades rapidly on standing, and also may form polymers which could cause sensitivity reactions. It is also important in certain instances that an infusion fluid of specific pH be used (e.g. **furosemide** injection requires dilution in infusions of pH greater than 5.5).

When drug additions are made it is important to mix thoroughly; additions should not be made to an infusion container that has been connected to a giving set, as mixing is hampered. If the solutions are not thoroughly mixed a concentrated layer of the additive may form owing to

differences in density. **Potassium chloride** is particularly prone to this 'layering' effect when added without adequate mixing to infusions packed in non-rigid infusion containers; if such a mixture is administered it may have a serious effect on the heart.

A time limit between addition and completion of administration must be imposed for certain admixtures to guarantee satisfactory drug potency and compatibility. For admixtures in which degradation occurs without the formation of toxic substances, an acceptable limit is the time taken for 10% decomposition of the drug. When toxic substances are produced stricter limits may be imposed. Because of the risk of microbial contamination a maximum time limit of 24 hours may be appropriate for additions made elsewhere than in hospital pharmacies offering central additive service.

Certain injections must be protected from light during continuous infusion to minimise oxidation, e.g. dacarbazine and sodium nitroprusside.

Dilution with a small volume of an appropriate vehicle and administration using a motorised infusion pump is advocated for preparations such as unfractionated heparin where strict control over administration is required. In this case the appropriate dose may be dissolved in a convenient volume (e.g. 24–48 mL) of sodium chloride intravenous infusion (0.9%).

Information provided in the BNF

The BNF gives information about preparations given by three methods:

- continuous infusion;
- intermittent infusion;
- addition via the drip tubing.

Drugs for **continuous infusion** must be diluted in a large volume infusion. Penicillins and cephalosporins are not usually given by continuous infusion because of stability problems and because adequate plasma and tissue concentrations are best obtained by intermittent infusion.

Where it is necessary to administer them by continuous infusion, detailed literature should be consulted.

Drugs that are both compatible and clinically suitable may be given by **intermittent infusion** in a relatively small volume of infusion over a short period of time, e.g. 100 mL in 30 minutes. The method is used if the product is incompatible or unstable over the period necessary for continuous infusion; the limited stability of ampicillin or amoxicillin in large volume glucose or lactate infusions may be overcome in this way.

Intermittent infusion is also used if adequate plasma and tissue concentrations are not produced by continuous infusion as in the case of drugs such as dacarbazine, gentamicin, and ticarcillin.

An in-line burette may be used for intermittent infusion techniques in order to achieve strict control over the time and rate of administration, especially for infants and children and in intensive care units. Intermittent infusion may also make use of the 'piggy-back' technique provided that no additions are made to the primary infusion. In this method the drug is added to a small secondary container connected to a Y-type injection site on the primary infusion giving set; the secondary solution is usually infused within 30 minutes.

Addition via the drip tubing is indicated for a number of cytotoxic drugs in order to minimise extravasation. The preparation is added aseptically via the rubber septum of the injection site of a fast-running infusion. In general, drug preparations intended for a bolus effect should be given directly into a separate vein where possible. Failing this, administration may be made via the drip tubing provided that the preparation is compatible with the infusion fluid when given in this manner.

Drugs given by intravenous infusion The BNF includes information on addition to *Glucose intravenous infusion* 5 and 10%, and *Sodium chloride intravenous infusion* 0.9%. Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with *Sodium chloride and glucose intravenous infusion*. Infusion of a large volume of hypotonic solution should be avoided therefore care should be taken if water for injections is used. The information relates to the proprietary preparations indicated; for other preparations suitability should be checked with the manufacturer.

Medicines optimisation

Overview

Medicines are the most common intervention in healthcare for the prevention, treatment and/or management of many illnesses. As life expectancy increases and as the population ages, more people are living with several long-term conditions that are being managed with an increasing number of medicines. Medicines use can be complex and how patients can take their medicines safely and effectively is a challenge for the health service.

Multimorbidity (the presence of 2 or more long-term conditions) is associated with a greater use of health services, higher mortality, higher treatment burden (due to polypharmacy or multiple appointments), and reduced quality of life. The risk of patients suffering harm from their medicines increases with polypharmacy, and treatment regimens (including non-pharmacological treatments) can very easily become burdensome for patients with multimorbidity and can lead to care becoming fragmented and uncoordinated. Prescribers should consider the risks and benefits of treatments recommended from guidance for single health conditions, as the evidence for these recommendations is regularly drawn from patients without multimorbidity and who are taking fewer prescribed regular medicines. The management of risk factors for future disease can also be a major treatment burden for patients with multimorbidity and should be taken into consideration. Medicines optimisation encompasses many aspects of medicines use and helps to ensure that they are taken as intended, thus supporting the management of long-term conditions, multimorbidities, and appropriate polypharmacy. Through the adoption of a patient-focused approach to safe and effective medicines use, medicines optimisation changes the way patients are supported to get the best possible outcomes from their medicines. The use of shared decision-making informed by the best available evidence to guide decisions, ensures all patients have the opportunity to be involved in decisions about their medicines, taking into account their needs, preferences and values.

To reduce the risk of harm, ensure patients taking multiple medicines are receiving the most appropriate treatments for their needs, and to manage the spend on medicines, the Department of Health and Social Care are reviewing over-prescribing in the NHS.

Optimisation tools

Medicines optimisation includes aspects of care such as clinical assessment, clinical audits, disease prevention, health education, individual reviews and monitoring, and risk management. Having effective processes and systems in place can minimise the risk of preventable medicines-related problems (such as interactions with other medicines or comorbidities, and side-effects). Health and social care organisations should consider the use of multiple methods for identifying medicines-related patient safety incidents; learning from these incidents is important for guiding practice and minimising patient harm.

When optimising patient care, areas of intervention to consider include: deprescribing; medicines reconciliation, reviews and repeat prescribing; problematic polypharmacy; reducing medication waste and errors; and self-management plans. Self-management plans can be patient or health professional led and vary in their content depending on the individual needs of the patient, with the aim of supporting both their involvement and empowerment in managing their condition.

Medication reviews involve a structured critical examination of a patient's medicines to optimise treatment, minimise the number of medication-related problems, and reduce waste.

These should be led by an appropriate health professional with effective communication skills, technical knowledge in the processes for managing medicines, and therapeutic knowledge on medicines use. Reviews can be carried out in different care settings, such as Primary Care Networks utilising pharmacists within the GP practice. For further information on review services available from community pharmacists, such as the 'New Medicines Service' and 'Medicines Use Review', see *Advanced pharmacy services*. To support the medicines optimisation agenda, The Royal Pharmaceutical Society have produced good practice guidance for health professionals, which details four guiding principles for medicines optimisation. These are:

- Aim to understand the patient's experience;
- Evidence-based choice of medicines;
- Ensure medicines use is as safe as possible;
- Make medicines optimisation part of routine practice.

For further guidance around medicines optimisation and tools to use, NHS England have compiled useful links as part of **RightCare**; NICE have produced guidelines on **Medicines optimisation, Medicines adherence, and Multimorbidity**; and the Scottish Government have produced a guideline on **Polypharmacy**, see *Useful resources*.

Advanced Pharmacy Services Advanced Services are provided as part of the NHS Community Pharmacy Contractual Framework, and include services such as the New Medicines Service and Medicines Use Review service. These services are provided by accredited community pharmacists, with the aim of targeting specific patients to help manage their medicines more effectively, improve adherence, and reduce medicines wastage.

New Medicines Service The New Medicines Service (NMS) provides education and support to patients who are newly prescribed a medicine to manage a long-term condition. The service is split into three stages; patient engagement, intervention and follow-up. As of 2018, this service is available for patients living in England who have either been prescribed a new medicine for one of the following conditions – asthma, chronic obstructive pulmonary disease (COPD), type 2 diabetes or hypertension, or have been prescribed a new antiplatelet or anticoagulant. Patients can be offered the service by prescriber referral, or opportunistically by the community pharmacy. For further information, see: psnc.org.uk/services-commissioning/advanced-services/nms/.

Medicines Use Review The Medicines Use Review (MUR) service consists of structured adherence-centred reviews with patients on multiple medicines, particularly those receiving medicines for long-term conditions. The service is undertaken periodically, not usually more than once a year, and can also be prompted when an adherence issue is identified during the dispensing service. The pharmacist providing the MUR service must ensure that at least 70% of all MURs undertaken in a year are for patients who fall within the two national target groups. The national target groups for MURs in England are:

- patients taking high-risk medicines (NSAIDs, anticoagulants (including low molecular weight heparin), antiplatelets, or diuretics);
- patients recently discharged from hospital who have had changes made to their medicines while they were in hospital.

For further information, see: psnc.org.uk/services-commissioning/advanced-services/murs/.

Wales, Northern Ireland, and Scotland have variations on this service, including different national target groups.

In Wales, see: www.cpwales.org.uk/Contract-support-and-IT/Advanced-Services.aspx.

In Northern Ireland, see: www.hscbusiness.hscni.net/services/2427.htm.

In Scotland, see: www.cps.scot.nhs-services/core/medicines-care-review/.

Communication

As health professionals from various disciplines and specialties may be caring for the same patient at the same time, good communication is required between health professionals in order to avoid fragmentation of care.

Medication reviews may be carried out by health professionals other than the prescriber, therefore the prescriber should be informed of the review and its outcome—particularly if difficulties with adherence were discussed and further review is required.

There is a greater risk of poor communication and unintended medication changes when patients transfer between different care providers (such as when a person is admitted to or discharged from hospital). To support high-quality care when moving from one care setting to another, relevant information about medicines should be shared with patients, their family members/carers (if appropriate), and between health and social care practitioners using robust and transparent processes. Information should be securely shared between health and social care practitioners ideally within 24 hours of patient transfer.

Good communication between health professionals and patients, and their family members/carers (if appropriate) is needed for shared decision-making and supporting adherence. Information about their condition and possible treatments should be provided in a format that meets a patient's (and carer's) individual needs and preferences. The use of patient decision aids during consultations can help support a shared decision-making approach, and ensure patients and their family members/carers (where appropriate) are able to make well-informed choices that are consistent with their values and preferences.

For further guidance around communication between health professionals and patients (and carers), NICE have produced guidelines on **Medicines optimisation**, **Medicines adherence**, and **Supporting adult carers** (see *Useful resources*).

Organisations such as the 'NHS Specialist Pharmacy Service' help support medicines optimisation across the NHS by joining health professionals together through online networks (e.g. Regional Medicines Optimisation Committees and the English Deprescribing Network). This is available at: www.sps.nhs.uk/home/networks/.

Antimicrobial stewardship

Overview

Effective antimicrobials are required for preventive and curative measures, protecting patients from potentially fatal diseases, and ensuring that complex procedures can be provided at low risk of infection. Antimicrobial resistance (AMR) is the loss of antimicrobial effectiveness, and although it evolves naturally, this process is accelerated by the inappropriate or incorrect use of antimicrobials. Direct consequences of infection with resistant microorganisms can be severe and affect all areas of health, such as prolonged illnesses and hospital stays, increased costs and mortality, and reduced protection for patients undergoing operations or procedures. AMR is an international problem with an increasing prevalence that has consequences for the whole of society. The UK Government has recognised AMR as a significant area of concern and have committed global action to address this as a priority. For information and resources on the UK's plans for AMR, see the Public Health England (PHE) collection: **Antimicrobial resistance** (www.gov.uk/government/collections/antimicrobial-resistance-amr-information-and-resources).

Antimicrobial stewardship (AMS) refers to an organisational or healthcare system-wide approach to promoting and monitoring judicious use of antimicrobials to preserve their future effectiveness. Addressing AMR through improving stewardship is a national medicines optimisation priority, led by NHS England and supported by PHE. AMR can be managed by a combination of interventions that address:

- A political commitment to prioritise AMR;
- Monitoring antimicrobial use and resistance in microbes;
- Development of new drugs, treatments, and diagnostics;
- Individuals' behaviour relating to infection prevention and control, antimicrobial use, and AMR;
- Healthcare professionals' prescribing decisions.

Guidance for organisations (commissioners and providers)

Commissioners (clinical commissioning groups and local authorities) and providers (e.g. hospitals, GPs, out-of-hours services, dentists, and social enterprises) of health or social care services should establish an AMS programme, taking into account the resources needed to support AMS across all care settings. An AMS programme should take into consideration monitoring and evaluating antimicrobial prescribing, regular feedback to individual prescribers, education and training for health and social care staff, and integrating audits into existing quality improvement programmes.

Commissioners should work collaboratively to provide consistent information and advice to the public and health professionals that reduces inappropriate antimicrobial demand and use, and limits the spread of infection. Local authority public health teams should ensure that information and resources (such as posters, leaflets and digital resources) are made available through multiple routes to provide a coordinated system of information. Information should include simple and practical steps such as scrupulous personal and safe food hygiene practices.

Organisations should involve lead health and social care staff in establishing processes for developing, reviewing, updating, and implementing local antimicrobial guidelines in line with national guidance and informed by local prescribing data and resistance patterns.

Organisations should also consider establishing processes for reviewing national horizon scanning to plan for the availability of new antimicrobials and to use an existing local

decision-making group to consider the introduction of new antimicrobials locally.

Guidance for health and social care staff

Health and social care staff should assist with the implementation of local or national guidelines and recognise the significance of them for AMS.

Health professionals should be familiar with current AMS campaigns and programmes. For further information, see PHE and Health Education England's e-learning session **All Our Health: Antimicrobial Resistance** (portal.e-lfh.org.uk/Component/Details/571263), PHE guidance **Health matters: antimicrobial resistance** (www.gov.uk/government/publications/health-matters-antimicrobial-resistance), and the PHE campaigns **Antibiotic Guardian** (antibioticguardian.com/) and **Keep Antibiotics Working** (campaignresources.phe.gov.uk/resources/campaigns/58-keep-antibiotics-working).

Health professionals should be aware of resources and services that can help individuals minimise infections such as travel vaccination clinics, screening programmes, sexual health services, immunisation programmes, and other local referral pathways or schemes. The benefits of good hygiene, vaccination, and other preventative measures to reduce the risk of acquiring infections should be discussed with individuals, and individuals referred to further information or services if necessary.

Those involved in providing care should be educated about the standard principles of infection prevention and control. They should be trained in hand decontamination, the use of personal protective equipment, and the safe use and disposal of sharps. For further information, see NICE guideline: **Healthcare-associated infections** (see *Useful resources*).

Guidance on antimicrobial prescribing

National antimicrobial prescribing and stewardship competencies have been developed to improve the quality of antimicrobial treatment and stewardship. For further information, see Antimicrobial Resistance and Healthcare Associated Infections and PHE guidance: **Antimicrobial prescribing and stewardship competencies** (see *Useful resources*).

National toolkits to support the implementation of AMS best practice include the Royal College of General Practitioners' **TARGET antibiotics toolkit** (www.rcgp.org.uk/TARGETantibiotics) for primary care, and PHE's **Start smart - then focus** (www.gov.uk/government/publications/antimicrobial-stewardship-start-smart-then-focus) for secondary care, and **Dental antimicrobial stewardship: toolkit** (www.gov.uk/guidance/dental-antimicrobial-stewardship-toolkit) for dentists.

Clinical syndrome-specific guidance and advice to help slow the development of AMR have been developed by NICE, in collaboration with PHE, and are available at www.nice.org.uk/.

Considerations for antimicrobial prescribing When deciding whether or not to prescribe an antimicrobial, undertake a clinical assessment and consider the risk of AMR for individual patients and the population as a whole. An immediate antimicrobial prescription for a patient who is likely to have a self-limiting condition is not recommended. Document in the patient's records (electronically wherever possible) the decisions related to antimicrobial use, including the plan as discussed with the patient, and their family and/or carers (if appropriate), and reason for prescribing/not prescribing an antimicrobial.

In hospital, microbiological samples should be taken before initiating an antimicrobial for patients with suspected infection. In primary care, consider taking microbiological samples when prescribing an antimicrobial for patients with recurrent or persistent infections. The choice of antimicrobial should be reviewed when microbiological

results are available. For non-severe infections, consider taking microbiological samples before making a decision about prescribing an antimicrobial, providing it is safe to withhold treatment until the results are available.

Follow local or national guidelines on prescribing the shortest effective course and most appropriate dose and route of administration. Review intravenous antimicrobials within 48 hours (taking into account response to treatment and microbiological results) and consider stepping down to oral antimicrobials where possible. If prescribing outside of local or national guidelines, document in the patient's records the reasons for the decision.

Patients on antimicrobial treatment should be appropriately monitored to reduce side-effects and be assessed on the continued need for treatment. Repeat antimicrobial prescriptions are not recommended, unless needed for a particular clinical condition or indication. Avoid issuing a repeat prescription for longer than 6 months without review.

Advice for patients and their family and/or carers

Prescribers, primary care and community pharmacy teams should provide patients with resources educating them about not asking for antimicrobials as a preventive measure against becoming ill or as a stand-by measure, unless the patient has a specific condition or a specific risk that requires antimicrobial prophylaxis.

Prescribers should discuss with patients, and their family and/or carers (if appropriate) the likely nature of the condition, their views on antimicrobials, benefits and harms of antimicrobial prescribing, and why prescribing an antimicrobial may not always be the best option.

Information should be provided about what to do if their symptoms worsen or if problems arise as a result of treatment. Written information should be provided if needed.

If antimicrobial treatment is not the most appropriate option, prescribers should advise patients, and their family and/or carers (if appropriate) about other options (as appropriate), such as self-care with over-the-counter preparations, back-up (delayed) prescribing, or other non-pharmacological interventions. Prescribers, primary care and community pharmacy teams should verbally emphasise and provide written advice about managing self-limiting infections.

If antimicrobials are prescribed or supplied, prescribers, primary care and community pharmacy teams should provide patients with verbal and written information on the correct use of antimicrobials. Advice should encourage people to:

- Take, or use antimicrobials only when recommended by a suitably qualified health professional;
- Obtain antimicrobials only from a health professional;
- Take, or use antimicrobials as instructed (right dose for the duration specified and via the right route);
- Return any unused antimicrobials to a pharmacy for safe disposal.

Prescribing in children

Overview

For detailed advice on medicines used for children, consult *BNF for Children*.

Children, and particularly neonates, differ from adults in their response to drugs. Special care is needed in the neonatal period (first 28 days of life) and doses should always be calculated with care. At this age, the risk of toxicity is increased by reduced drug clearance and differing target organ sensitivity.

Whenever possible, intramuscular injections should be **avoided** in children because they are painful.

Where possible, medicines for children should be prescribed within the terms of the marketing authorisation (product licence). However, many children may require medicines not specifically licensed for paediatric use.

Although medicines cannot be promoted outside the limits of the licence, the Human Medicines Regulations 2012 does not prohibit the use of unlicensed medicines. It is recognised that the informed use of unlicensed medicines or of licensed medicines for unlicensed applications ('off-label' use) is often necessary in paediatric practice.

Adverse drug reactions in children

Suspected adverse drug reactions in children and young adults under 18 years should be reported through the Yellow Card Scheme. Yellow cards can be used for reporting suspected adverse drug reactions to medicines, vaccines, herbal or complementary products, whether self-medicated or prescribed. This includes suspected adverse drug reactions associated with misuse, overdose, medication errors or from use of unlicensed and off-label medicines. Yellow Cards can also be used to report medical device incidents, defective medicines, and suspected fake medicines.

Report all suspected adverse drug reactions that are:

- **serious, medically significant or result in harm.** Serious events are fatal, life-threatening, a congenital abnormality, disabling or incapacitating, or resulting in hospitalisation;
- associated with **newer drugs and vaccines**; the most up to date list of black triangle medicines is available at: www.mhra.gov.uk/blacktriangle

If in doubt whether to report a suspected adverse drug reaction, please complete a Yellow Card.

The identification and reporting of adverse reactions to drugs in children and neonates is particularly important because:

- the action of the drug and its pharmacokinetics in children (especially in the very young) may be different from that in adults;
- drugs may not have been extensively tested in children;
- many drugs are not specifically licensed for use in children and are used either 'off-label' or as unlicensed products;
- drugs may affect the way a child grows and develops or may cause delayed adverse reactions which do not occur in adults;
- suitable formulations may not be available to allow precise dosing in children or they may contain excipients that should be used with caution in children;
- the nature and course of illnesses and adverse drug reactions may differ between adults and children.

Even if reported through the British Paediatric Surveillance Unit's Orange Card Scheme, any identified suspected adverse drug reactions should also be submitted to the Yellow Card Scheme.

Adverse drug reactions where harm occurs as a result of a medication error are reportable as a Yellow Card or through the local risk management systems into the National

Reporting and Learning System (NRLS). If reported to the NRLS, these will be shared with the MHRA. If the NRLS is not available and harm occurs, report using a Yellow Card.

Prescription writing

Prescriptions should be written according to the guidelines in Prescription Writing. Inclusion of age is a legal requirement in the case of prescription-only medicines for children under 12 years of age, but it is preferable to state the age for **all** prescriptions for children.

It is particularly important to state the strengths of capsules or tablets. Although liquid preparations are particularly suitable for children, they may contain sugar which encourages dental decay. Sugar-free medicines are preferred for long-term treatment.

Many children are able to swallow tablets or capsules and may prefer a solid dose form; involving the child and parents in choosing the formulation is helpful.

When a prescription for a liquid oral preparation is written and the dose ordered is smaller than 5 mL an **oral syringe** will be supplied. Parents should be advised not to add any medicines to the infant's feed, since the drug may interact with the milk or other liquid in it; moreover the ingested dosage may be reduced if the child does not drink all the contents.

Parents must be warned to keep **all** medicines out of reach of children.

Rare paediatric conditions

Information on substances such as *biotin* and *sodium benzoate* used in rare metabolic conditions is included in *BNF for Children*; further information can be obtained from:

Alder Hey Children's Hospital
Drug Information Centre, Liverpool, L12 2AP
Tel: (0151) 252 5381

Great Ormond Street Hospital for Children
Pharmacy, Great Ormond St, London, WC1N 3JH
Tel: (020) 7405 9200

Dosage in children

Children's doses in the BNF are stated in the individual drug entries.

Doses are generally based on body-weight (in kilograms) or specific age ranges. In the BNF and *BNF for Children*, the term neonate is used to describe a newborn infant aged 0–28 days. The terms child or children are used generically to describe the entire range from infant to adolescent (1 month–17 years). An age range is specified when the dose information applies to a narrower age range than a child from 1 month–17 years.

Dose calculation

Many children's doses are standardised by **weight** (and therefore require multiplying by the body-weight in kilograms to determine the child's dose); occasionally, the doses have been standardised by **body surface area** (in m²). These methods should be used rather than attempting to calculate a child's dose on the basis of doses used in adults. For most drugs the adult maximum dose should not be exceeded. For example if the dose is stated as 8 mg/kg (max. 300 mg), a child weighing 10 kg should receive 80 mg but a child weighing 40 kg should receive 300 mg (rather than 320 mg).

Young children may require a higher dose per kilogram than adults because of their higher metabolic rates. Other problems need to be considered. For example, calculation by body-weight in the overweight child may result in much higher doses being administered than necessary; in such

cases, dose should be calculated from an ideal weight, related to height and age.

Body surface area (BSA) estimates are sometimes preferable to body-weight for calculation of paediatric doses since many physiological phenomena correlate better with body surface area. Body surface area can be estimated from weight. For more information, refer to *BNF for Children*. Where the dose for children is not stated, prescribers should consult *BNF for Children* or seek advice from a medicines information centre.

Prescribing in hepatic impairment

Overview

Liver disease may alter the response to drugs in several ways as indicated below, and drug prescribing should be kept to a minimum in all patients with severe liver disease. The main problems occur in patients with jaundice, ascites, or evidence of encephalopathy.

Impaired drug metabolism

Metabolism by the liver is the main route of elimination for many drugs, but hepatic reserve is large and liver disease has to be severe before important changes in drug metabolism occur. Routine liver-function tests are a poor guide to the capacity of the liver to metabolise drugs, and in the individual patient it is not possible to predict the extent to which the metabolism of a particular drug may be impaired. A few drugs, e.g. rifampicin p. 615 and fusidic acid p. 604, are excreted in the bile unchanged and can accumulate in patients with intrahepatic or extrahepatic obstructive jaundice.

Hypoproteinaemia

The hypoalbuminaemia in severe liver disease is associated with reduced protein binding and increased toxicity of some highly protein-bound drugs such as phenytoin p. 339 and prednisolone p. 716.

Reduced clotting

Reduced hepatic synthesis of blood-clotting factors, indicated by a prolonged prothrombin time, increases the

Dose frequency

Antibacterials are generally given at regular intervals throughout the day. Some flexibility should be allowed in children to avoid waking them during the night. For example, the night-time dose may be given at the child's bedtime.

Where new or potentially toxic drugs are used, the manufacturers' recommended doses should be carefully followed.

sensitivity to oral anticoagulants such as warfarin sodium p. 150 and phenindione p. 150.

Hepatic encephalopathy

In severe liver disease many drugs can further impair cerebral function and may precipitate hepatic encephalopathy. These include all sedative drugs, opioid analgesics, those diuretics that produce hypokalaemia, and drugs that cause constipation.

Fluid overload

Oedema and ascites in chronic liver disease can be exacerbated by drugs that give rise to fluid retention e.g. NSAIDs and corticosteroids.

Hepatotoxic drugs

Hepatotoxicity is either dose-related or unpredictable (idiosyncratic). Drugs that cause dose-related toxicity may do so at lower doses in the presence of hepatic impairment than in individuals with normal liver function, and some drugs that produce reactions of the idiosyncratic kind do so more frequently in patients with liver disease. These drugs should be avoided or used very carefully in patients with liver disease.

Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in the BNF.

Prescribing in renal impairment

Issues encountered in renal impairment

The use of drugs in patients with reduced renal function can give rise to problems for several reasons:

- reduced renal excretion of a drug or its metabolites may cause toxicity;
- sensitivity to some drugs is increased even if elimination is unimpaired;
- many side-effects are tolerated poorly by patients with renal impairment;
- some drugs are not effective when renal function is reduced.

Many of these problems can be avoided by reducing the dose or by using alternative drugs.

If even mild renal impairment is considered likely on clinical grounds, renal function should be checked before prescribing any drug which requires dose modification.

General guidance

Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug monograph in the BNF.

When both efficacy and toxicity are closely related to plasma-drug concentration, recommended regimens should be regarded only as a guide to initial treatment; subsequent doses must be adjusted according to clinical response and plasma-drug concentration.

Dose recommendations are based on the severity of renal impairment. The total daily maintenance dose of a drug can

be reduced either by reducing the size of the individual doses or by increasing the interval between doses.

For some drugs, although the size of the maintenance dose is reduced it is important to give a loading dose if an immediate effect is required. This is because it takes about five times the half-life of the drug to achieve steady-state plasma concentrations. Because the plasma half-life of drugs excreted by the kidney is prolonged in renal impairment it can take many doses for the reduced dosage to achieve a therapeutic plasma concentration.

For information and advice on the prevention, detection, and management of acute kidney injury, see NICE clinical guideline: **Acute Kidney Injury** (www.nice.org.uk/guidance/ng148).

Important: dosage adjustment advice in the BNF Clinical laboratories routinely report renal function in adults based on *estimated glomerular filtration rate* (eGFR) normalised to a body surface area of 1.73 m²—this is derived from either the Chronic Kidney Disease Epidemiology Collaboration (CKD-EPI) formula or the Modification of Diet in Renal Disease (MDRD) formula.

However, in product literature, the effects of renal impairment on drug elimination is usually stated in terms of *creatinine clearance* as a surrogate for GFR.

The information on dosage adjustment in the BNF is usually expressed in terms of eGFR. Exceptions to the use of eGFR include toxic drugs, in elderly patients and in patients at extremes of muscle mass (see *Estimating renal function in patients at extremes of muscle mass* and *Estimating renal function in elderly patients*, below) where calculation of CrCl is recommended. Although these two measures of renal function are not interchangeable, for most drugs and for most adult patients of average build and height, eGFR (rather than CrCl) can be used to determine dosage adjustments.

MHRA/CHM advice: Prescribing medicines in renal impairment: using the appropriate estimate of renal function to avoid the risk of adverse drug reactions (October 2019)

For cases where creatinine clearance (CrCl), calculated using the Cockcroft and Gault formula, should be used to determine renal dose adjustments, see *Important: dosage adjustment advice in the BNF*, above. In addition, the MHRA advises that CrCl should be used as an estimate of renal function for direct-acting oral anticoagulants (DOACs), and drugs with a narrow therapeutic index that are mainly renally excreted.

If dose adjustment based on CrCl is important and no advice is provided in the relevant BNF drug monograph, prescribers should consult product literature.

Renal function and drug dosing should be reassessed in situations where eGFR and/or CrCl change rapidly, such as in patients with acute kidney injury (AKI).

Nephrotoxic drugs Nephrotoxic drugs should, if possible, be avoided in patients with renal disease because the consequences of nephrotoxicity are likely to be more serious when renal reserve is already reduced. During intercurrent illness the risk of acute kidney injury is increased in patients with an eGFR of less than 60 mL/min/1.73 m²; potentially nephrotoxic or renally excreted drugs may require dose reduction or temporary discontinuation.

Renal replacement therapy and transplantation For prescribing in patients who have received a renal transplant or who are on renal replacement therapy (peritoneal dialysis or haemodialysis), consult specialist literature.

Estimating renal function

Direct measure of Glomerular filtration rate (GFR) using plasma or urinary clearance is considered the best overall index of renal function. However, this is difficult to do in practice.

As an alternative, the *estimated* Glomerular filtration rate (eGFR) based on serum creatinine is used to assess renal function. Creatinine clearance (CrCl) is also used as an estimate of GFR.

Various equations for estimating glomerular filtration rate exist, however there is no compelling evidence to support the superiority of any given method for drug dosing in all patient populations or clinical situations. There is also insufficient evidence to provide *definitive* guidance about dosage adjustment of all drugs in patients with reduced renal function. Therefore, an understanding of drug pharmacokinetics is necessary in order to make appropriate dosing decisions.

Using serum creatinine to derive eGFR has a number of limitations; serum creatinine levels are dependent on muscle mass and diet, therefore estimates should be interpreted with caution in certain individuals (such as the elderly, body builders, amputees, in muscle-wasting disorders and vegans)—estimates will be higher or lower than the true value. Creatinine-derived measurements are also **not** useful in periods of rapidly changing renal function or in patients with AKI.

Estimated glomerular filtration rate Chronic Kidney Disease Epidemiology Collaboration (CKD-EPI) formula The CKD-EPI formula is the recommended method for estimating GFR and calculating drug doses in **most** patients with renal impairment.

CKD-EPI is adjusted for body surface area (BSA) and utilises serum creatinine, age, sex and race as variables. Clinical laboratories should use the CKD-EPI formula to routinely report eGFR.

CKD-EPI equation

$$\text{eGFR (mL/min/1.73 m}^2\text{)} = 141 \times \min(\text{S}_{\text{Cr}}/\text{K}, 1)^{\alpha} \times \max(\text{S}_{\text{Cr}}/\text{K}, 1)^{1.209} \times 0.993^{\text{Age}} [\times 1.018 \text{ if female}]$$

[x 1.159 if black]

Where:

- S_{Cr} = serum creatinine in mg/dL;
- K = 0.7 for females and 0.9 for males;
- α = -0.329 for females and -0.411 for males;
- min(S_{Cr}/K, 1) indicates the minimum of S_{Cr}/K or 1;
- max(S_{Cr}/K, 1) indicates the maximum of S_{Cr}/K or 1.

Modification of Diet in Renal disease (MDRD) The MDRD formula, like CKD-EPI, is expressed in terms of body surface area. It is less accurate than the CKD-EPI formula when eGFR is greater than 60 mL/min/1.73 m². It also overestimates GFR in elderly patients.

Estimated creatinine clearance Cockcroft and Gault The Cockcroft and Gault formula is the preferred method for estimating renal function or calculating drug doses in patients with renal impairment who are elderly or at extremes of muscle mass (see below); it provides an estimate of CrCl (which is not equivalent to eGFR).

$$\text{Estimated Creatinine Clearance in mL/minute} = \frac{(140 - \text{Age}) \times \text{Weight} \times \text{Constant}}{\text{Serum creatinine}}$$

- Age in years
- Weight in kilograms (use ideal body weight where fat is likely to be the major contributor to body mass)
- Serum creatinine in micromol/litre
- Constant = 1.23 for men; 1.04 for women

Estimating renal function in patients at extremes of muscle mass In patients at both extremes of muscle mass, eGFR should be interpreted with caution. Reduced muscle mass will lead to overestimation of GFR and increased muscle mass will lead to underestimation of the GFR.

Creatinine clearance or absolute glomerular filtration rate should be used to adjust drug doses in patients with a BMI less than 18 kg/m² or greater than 40 kg/m².

Ideal body weight should be used to calculate the CrCl. Where the patient's actual body weight is less than their ideal body weight, actual body weight should be used instead.

The absolute glomerular filtration rate is determined by removing the normalisation for BSA from the eGFR using the following formula:

GFR (Absolute) = eGFR × (individual's body surface area / 1.73)

The ideal body weight is calculated as follows:

Ideal body weight (kilograms) = Constant + 0.91 (Height - 152.4)

Where:

- Constant = 50 for men; 45.5 for women
- Height in centimetres

Estimating renal function in elderly patients The Cockcroft and Gault formula is the preferred method for estimating renal function in elderly patients aged 75 years and over.

Chronic kidney disease

Classification of chronic kidney disease using GFR and ACR categories Chronic kidney disease is classified using a combination of GFR and albumin:creatinine ratio (ACR). A decreased GFR and an increased ACR is associated with an increased risk of adverse outcomes.

For example, a person with an eGFR of 25 ml/min/1.73 m² and an ACR of 15 mg/mmol has a CKD classification of G4A2.

Advanced Pharmacy Services Patients with renal impairment may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 18.

Classification of chronic kidney disease using GFR and ACR categories

GFR and ACR categories and risk of adverse outcomes			ACR categories (mg/mmol), description and range		
			<3 Normal to mild increase	3–30 Moderate increase	>30 Severe increase
			A1	A2	A3
GFR categories (ml/min/1.73m ²), description and range	≥90 Normal or high	G1	No CKD in the absence of markers of kidney damage		
	60–89 Mild reduction relative to normal range for a young adult	G2			
	45–59 Mild-moderate reduction	G3a			
	30–44 Moderate-severe reduction	G3b			
	15–29 Severe reduction	G4			
	<15 Kidney failure	G5			
			 Increasing risk		
Abbreviations: ACR, albumin:creatinine ratio; CKD, chronic kidney disease; GFR, glomerular filtration rate

Prescribing in pregnancy

Overview

Drugs can have harmful effects on the embryo or fetus at any time during pregnancy. It is important to bear this in mind when prescribing for a woman of *childbearing age* or for men *trying to father* a child.

During the *first trimester* drugs can produce congenital malformations (teratogenesis), and the period of greatest risk is from the third to the eleventh week of pregnancy. During the *second and third trimesters* drugs can affect the growth or functional development of the fetus, or they can have toxic effects on fetal tissues.

Drugs given shortly before term or during labour can have adverse effects on labour or on the neonate after delivery. Not all the damaging effects of intra-uterine exposure to drugs are obvious at birth, some may only manifest later in life. Such late-onset effects include malignancy, e.g. adenocarcinoma of the vagina after puberty in females exposed to diethylstilbestrol in the womb, and adverse effects on intellectual, social, and functional development. The BNF and *BNF for Children* identify drugs which:

- may have harmful effects in pregnancy and indicate the trimester of risk
- are not known to be harmful in pregnancy

The information is based on human data, but information from *animal* studies has been included for some drugs when its omission might be misleading. Maternal drug doses may require adjustment during pregnancy due to changes in maternal physiology but this is beyond the scope of the *BNF* and *BNF for Children*.

Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the BNF and *BNF for Children*.

Important

Drugs should be prescribed in pregnancy only if the expected benefit to the mother is thought to be greater than the risk to the fetus, and all drugs should be avoided if possible during the first trimester. Drugs which have been extensively used in pregnancy and appear to be usually safe should be prescribed

in preference to new or untried drugs; and the smallest effective dose should be used. Few drugs have been shown conclusively to be teratogenic in humans, but no drug is safe beyond all doubt in early pregnancy. Screening procedures are available when there is a known risk of certain defects.

Absence of information does not imply safety. It should be noted that the BNF and *BNF for Children* provide independent advice and may not always agree with the product literature.

Information on drugs and pregnancy is also available from the UK Teratology Information Service. www.uktis.org
Tel: 0344 892 0909 (09.00–17:00 Monday to Friday; urgent enquiries only outside these hours).

MHRA/CHM advice: Medicines with teratogenic potential: what is effective contraception and how often is pregnancy testing needed? (March 2019)

Guidance is available on contraceptive methods and frequency of pregnancy testing to reduce inadvertent exposures during pregnancy in a woman taking a medicine of teratogenic potential. When using these medicines, a woman should be advised of the risks and encouraged to use the most effective contraceptive method taking into account her personal circumstances. The likelihood of pregnancy should be assessed before each prescription of a medicine with known teratogenic potential, by performing a pregnancy test if required. If pregnancy cannot be excluded, the decision to start or continue treatment will depend on individual circumstances, such as the urgency for treatment and alternative treatment options. If feasible, treatment with a medicine with teratogenic potential should be delayed until pregnancy has been excluded by a repeat test.

Information on pregnancy testing and contraception for pregnancy prevention during treatment with medicines of teratogenic potential is available at: www.gov.uk/drug-safety-update/medicines-with-teratogenic-potential-what-is-effective-contraception-and-how-often-is-pregnancy-testing-needed#download-print-and-use-new-table

Prescribing in breast-feeding

Overview

Breast-feeding is beneficial; the immunological and nutritional value of breast milk to the infant is greater than that of formula feeds.

Although there is concern that drugs taken by the mother might affect the infant, there is very little information on this. In the absence of evidence of an effect, the potential for harm to the infant can be inferred from:

- the amount of drug or active metabolite of the drug delivered to the infant (dependent on the pharmacokinetic characteristics of the drug in the mother);
- the efficiency of absorption, distribution, and elimination of the drug by the infant (infant pharmacokinetics);
- the nature of the effect of the drug on the infant (pharmacodynamic properties of the drug in the infant).

The amount of drug transferred in breast milk is rarely sufficient to produce a discernible effect on the infant. This applies particularly to drugs that are poorly absorbed and need to be given parenterally. However, there is a theoretical possibility that a small amount of drug present in breast milk can induce a hypersensitivity reaction.

A clinical effect can occur in the infant if a pharmacologically significant quantity of the drug is present in milk. For some drugs (e.g. fluvastatin p. 215), the ratio between the

concentration in milk and that in maternal plasma may be high enough to expose the infant to adverse effects. Some infants, such as those born prematurely or who have jaundice, are at a slightly higher risk of toxicity. Some drugs inhibit the infant's sucking reflex (e.g. phenobarbital p. 351) while others can affect lactation (e.g. bromocriptine p. 439).

The BNF identifies drugs:

- that should be used with caution or are contra-indicated in breast-feeding;
- that can be given to the mother during breast-feeding because they are present in milk in amounts which are too small to be harmful to the infant;
- that might be present in milk in significant amount but are not known to be harmful.

Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the BNF.

Important

For many drugs insufficient evidence is available to provide guidance and it is advisable to administer only essential drugs to a mother during breast-feeding. Because of the inadequacy of information on drugs in breast-feeding, absence of information does not imply safety.

Prescribing in palliative care

Overview

Palliative care is an approach that improves the quality of life of patients and their families facing life-threatening illness, through the prevention and relief of suffering by means of early identification and impeccable assessment and treatment of pain and other problems, physical, psychosocial, and spiritual. Careful assessment of symptoms and needs of the patient should be undertaken by a multidisciplinary team.

Specialist palliative care is available in most areas as day hospice care, home-care teams (often known as Macmillan teams), in-patient hospice care, and hospital teams. Many acute hospitals and teaching centres now have consultative, hospital-based teams.

Hospice care of terminally ill patients has shown the importance of symptom control and psychosocial support of the patient and family. Families should be included in the care of the patient if they wish.

Many patients wish to remain at home with their families. Although some families may at first be afraid of caring for the patient at home, support can be provided by community nursing services, social services, voluntary agencies and hospices together with the general practitioner. The family may be reassured by the knowledge that the patient will be admitted to a hospital or hospice if the family cannot cope.

Drug treatment The number of drugs should be as few as possible, for even the taking of medicine may be an effort. Oral medication is usually satisfactory unless there is severe nausea and vomiting, dysphagia, weakness, or coma, when parenteral medication may be necessary.

Pain

Pain management in palliative care is focused on achieving control of pain by administering the right drug in the right dose at the right time. Analgesics can be divided into three broad classes: non-opioid (paracetamol p. 465, NSAID), opioid (e.g. codeine phosphate p. 475 'weak', morphine p. 484 'strong') and adjuvant (e.g. antidepressants, antiepileptics). Drugs from the different classes are used alone or in combination according to the type of pain and response to treatment. Analgesics are more effective in preventing pain than in the relief of established pain; it is important that they are given regularly.

Paracetamol or a NSAID given regularly will often be sufficient to manage mild pain. If non-opioid analgesics alone are not sufficient, then an opioid analgesic alone or in combination with a non-opioid analgesic at an adequate dosage, may be helpful in the control of moderate pain. Codeine phosphate or tramadol hydrochloride p. 491 can be considered for moderate pain. If these preparations do not control the pain then morphine is the most useful opioid analgesic. Alternatives to morphine, including transdermal buprenorphine p. 468, transdermal fentanyl p. 479, hydromorphone hydrochloride p. 483, methadone hydrochloride p. 524, or oxycodone hydrochloride p. 487, should be initiated by those with experience in palliative care. Initiation of an opioid analgesic should not be delayed by concern over a theoretical likelihood of psychological dependence (addiction).

Bone metastases In addition to the above approach, radiotherapy, **bisphosphonates**, and radioactive isotopes of strontium chloride (*Metastron*[®] available from GE Healthcare) may be useful for pain due to bone metastases.

Neuropathic pain Patients with **neuropathic pain** may benefit from a trial of a tricyclic antidepressant. An antiepileptic may be added or substituted if pain persists; gabapentin p. 331 and pregabalin p. 341 are licensed for neuropathic pain. Ketamine p. 1415 is sometimes used under

specialist supervision for neuropathic pain that responds poorly to opioid analgesics. Pain due to nerve compression may be reduced by a corticosteroid such as dexamethasone p. 712, which reduces oedema around the tumour, thus reducing compression. Nerve blocks or regional anaesthesia techniques (including the use of epidural and intrathecal catheters) can be considered when pain is localised to a specific area.

Pain management with opioids

Oral route Treatment with morphine p. 484 is given by mouth as immediate-release or modified-release preparations. During the titration phase the initial dose is based on the previous medication used, the severity of the pain, and other factors such as presence of renal impairment, increasing age, or frailty. The dose is given either as an immediate-release preparation 4-hourly or as a modified-release preparation 12-hourly, in addition to rescue doses. If pain occurs between regular doses of morphine ('breakthrough pain'), an additional dose ('rescue dose') of immediate-release morphine should be given. An additional dose should also be given 30 minutes before an activity that causes pain, such as wound dressing. The standard dose of a strong opioid for breakthrough pain is usually one-tenth to one-sixth of the regular 24-hour dose, repeated every 2–4 hours as required (up to hourly may be needed if pain is severe or in the last days of life). Review pain management if rescue analgesic is required frequently (twice daily or more). Each patient should be assessed on an individual basis. Formulations of fentanyl p. 479 that are administered nasally, buccally or sublingually are also licensed for breakthrough pain.

When adjusting the dose of morphine, the number of rescue doses required and the response to them should be taken into account; increments of morphine should not exceed one-third to one-half of the total daily dose every 24 hours. Thereafter, the dose should be adjusted with careful assessment of the pain, and the use of adjuvant analgesics should also be considered. Upward titration of the dose of morphine stops when either the pain is relieved or unacceptable adverse effects occur, after which it is necessary to consider alternative measures.

Morphine immediate-release 30mg 4-hourly (or modified-release 100 mg 12-hourly) is usually adequate for most patients; some patients require morphine immediate-release up to 200mg 4-hourly (or modified-release 600 mg 12-hourly), occasionally more is needed.

Once their pain is controlled, patients started on 4-hourly immediate-release morphine can be transferred to the same total 24-hour dose of morphine given as the modified-release preparation for 12-hourly or 24-hourly administration. The first dose of the modified-release preparation is given with, or within 4 hours of, the last dose of the immediate-release preparation. For preparations suitable for 12-hourly or 24-hourly administration see modified-release preparations under morphine. Increments should be made to the dose, not to the frequency of administration. The patient must be monitored closely for efficacy and side-effects, particularly constipation, and nausea and vomiting. A suitable laxative should be prescribed routinely.

Oxycodone hydrochloride p. 487 can be used in patients who require an opioid but cannot tolerate morphine. If the patient is already receiving an opioid, oxycodone hydrochloride should be started at a dose equivalent to the current analgesic (see below). Oxycodone hydrochloride immediate-release preparations can be given for breakthrough pain.

Equivalent doses of opioid analgesics.

This table is only an **approximate** guide (doses may not correspond with those given in clinical practice); patients should be carefully monitored after any change in medication and dose titration may be required.

Analgesic/Route	Dose
Codeine: PO	100 mg
Diamorphine: IM, IV, SC	3 mg
Dihydrocodeine: PO	100 mg
Hydromorphone: PO	2 mg
Morphine: PO	10 mg
Morphine: IM, IV, SC	5 mg
Oxycodone: PO	6.6 mg
Tramadol: PO	100 mg

PO = by mouth; IM = intramuscular; IV = intravenous; SC = subcutaneous

Parenteral route The equivalent parenteral dose of morphine p. 484 (subcutaneous, intramuscular, or intravenous) is about half of the oral dose. If the patient becomes unable to swallow, generally morphine is administered as a continuous subcutaneous infusion (for details, see Continuous Subcutaneous Infusions below). Diamorphine hydrochloride p. 477 is sometimes preferred, because being more soluble, it can be given in a smaller volume. The equivalent subcutaneous dose of diamorphine hydrochloride is about one-third of the oral dose of morphine.

If the patient can resume taking medicines by mouth, then oral morphine may be substituted for subcutaneous infusion of morphine or diamorphine hydrochloride, see table above of approximate equivalent doses of morphine and diamorphine hydrochloride. The infusion is discontinued when the first oral dose of morphine is given.

Rectal route Morphine p. 484 is also available for rectal administration as suppositories; alternatively oxycodone hydrochloride suppositories p. 487 can be obtained on special order.

Transdermal route Transdermal preparations of fentanyl p. 479 and buprenorphine p. 468 are available, they are not suitable for acute pain or in patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Prescribers should ensure that they are familiar with the correct use of transdermal preparations, see under buprenorphine and fentanyl (inappropriate use has caused fatalities). Immediate-release morphine p. 484 can be given for breakthrough pain.

The following 24-hour oral doses of morphine p. 484 are considered to be *approximately* equivalent to the buprenorphine and fentanyl patches shown, however when switching due to possible opioid-induced hyperalgesia, reduce the calculated equivalent dose of the new opioid by one-quarter to one-half.

Buprenorphine patches are *approximately* equivalent to the following 24-hour doses of oral morphine

morphine salt 12 mg daily	≡ buprenorphine '5' patch
morphine salt 24 mg daily	≡ buprenorphine '10' patch
morphine salt 36 mg daily	≡ buprenorphine '15' patch
morphine salt 48 mg daily	≡ buprenorphine '20' patch
morphine salt 84 mg daily	≡ buprenorphine '35' patch
morphine salt 126 mg daily	≡ buprenorphine '52.5' patch
morphine salt 168 mg daily	≡ buprenorphine '70' patch

Formulations of transdermal patches are available as 72-hourly, 96-hourly and 7-day patches, for further information see buprenorphine p. 468. Conversion ratios vary and these figures are a guide only. Morphine equivalences for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral morphine.

72-hour Fentanyl patches are *approximately* equivalent to the following 24-hour doses of oral morphine

morphine salt 30 mg daily	≡ fentanyl '12' patch
morphine salt 60 mg daily	≡ fentanyl '25' patch
morphine salt 120 mg daily	≡ fentanyl '50' patch
morphine salt 180 mg daily	≡ fentanyl '75' patch
morphine salt 240 mg daily	≡ fentanyl '100' patch

Fentanyl equivalences in this table are for patients on well-tolerated opioid therapy for long periods; for patients who are opioid naive or who have been stable on oral morphine or other immediate release opioid for only several weeks, see Transdermal Route. Conversion ratios vary and these figures are a guide only. Morphine equivalences for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral morphine.

Symptom control

Several recommendations in this section involve unlicensed indications or routes.

Anorexia Anorexia may be helped by prednisolone p. 716 or dexamethasone p. 712.

Bowel colic and excessive respiratory secretions Bowel colic and excessive respiratory secretions may be reduced by a subcutaneous injection of hyoscine hydrobromide p. 458, hyoscine butylbromide p. 92, or glycopyrronium bromide p. 260. These antimuscarinics are generally given every 4 hours when required, but hourly use is occasionally necessary, particularly in excessive respiratory secretions. If symptoms persist, they can be given regularly via a continuous infusion device. Care is required to avoid the discomfort of dry mouth.

Capillary bleeding Capillary bleeding can be treated with tranexamic acid p. 117 by mouth; treatment is usually discontinued one week after the bleeding has stopped, or, if necessary, it can be continued at a reduced dose. Alternatively, gauze soaked in tranexamic acid 100 mg/mL p. 117 or adrenaline/epinephrine solution 1 mg/mL (1 in 1000) p. 236 can be applied to the affected area. Vitamin K may be useful for the treatment and prevention of bleeding associated with prolonged clotting in liver disease. In severe chronic cholestasis, absorption of vitamin K may be impaired; either parenteral or water-soluble oral vitamin K (see phytomenadione p. 1150 and menadiol sodium phosphate p. 1150) should be considered.

Constipation Constipation is a common cause of distress and is almost invariable after administration of an opioid

analgesic. It should be prevented if possible by the regular administration of laxatives; a faecal softener with a peristaltic stimulant (e.g. co-danthramer p. 66) or lactulose solution p. 60 with a senna preparation p. 67 should be used. Methylnaltrexone bromide p. 68 is licensed for the treatment of opioid-induced constipation.

Convulsions Patients with cerebral tumours or uraemia may be susceptible to convulsions. Prophylactic treatment with phenytoin p. 339 or carbamazepine p. 327 should be considered. When oral medication is no longer possible, diazepam p. 360 given rectally, or phenobarbital p. 351 by injection is continued as prophylaxis. For the use of midazolam p. 356 by subcutaneous infusion using a continuous infusion device see below.

Dry mouth Dry mouth may be relieved by good mouth care and measures such as chewing sugar-free gum, sucking ice or pineapple chunks, or the use of artificial saliva, dry mouth associated with candidiasis can be treated by oral preparations of nystatin p. 1284 or miconazole p. 876, alternatively, fluconazole p. 630 can be given by mouth. Dry mouth may be caused by certain medications including opioids, antimuscarinic drugs (e.g. hyoscine), antidepressants and some antiemetics; if possible, an alternative preparation should be considered.

Dysphagia A corticosteroid such as dexamethasone p. 712 may help, temporarily, if there is an obstruction due to tumour. See also *Dry mouth*, above.

Dyspnoea Breathlessness at rest may be relieved by regular oral morphine p. 484 in carefully titrated doses. Diazepam p. 360 may be helpful for dyspnoea associated with anxiety. A corticosteroid, such as dexamethasone p. 712, may also be helpful if there is bronchospasm or partial obstruction.

Fungating tumours Fungating tumours can be treated by regular dressing and antibacterial drugs; systemic treatment with metronidazole p. 572 is often required to reduce malodour but topical metronidazole p. 572 is also used.

Gastro-intestinal pain The pain of bowel colic may be reduced by loperamide hydrochloride p. 71. Hyoscine hydrobromide p. 458 may also be helpful, given sublingually as *Kwells*[®] tablets. Subcutaneous injections of hyoscine butylbromide p. 92, hyoscine hydrobromide p. 458, and glycopyrronium bromide p. 260 can also be used to treat bowel colic.

Gastric distension pain due to pressure on the stomach may be helped by a preparation incorporating an antacid with an antilutulent and a prokinetic such as domperidone p. 451 before meals.

Hiccup Hiccup due to gastric distension may be helped by a preparation incorporating an antacid with an antilutulent. If this fails, metoclopramide hydrochloride p. 452 by mouth or by subcutaneous or intramuscular injection can be added; if this also fails, baclofen p. 1190, or nifedipine p. 174, or chlorpromazine hydrochloride p. 402 can be tried.

Insomnia Patients with advanced cancer may not sleep because of discomfort, cramps, night sweats, joint stiffness, or fear. There should be appropriate treatment of these problems before hypnotics are used. Benzodiazepines, such as temazepam p. 509, may be useful.

Intractable cough Intractable cough may be relieved by moist inhalations or by regular administration of oral morphine p. 484. Methadone hydrochloride linctus p. 524 should be avoided because it has a long duration of action and tends to accumulate.

Muscle spasm The pain of muscle spasm can be helped by a muscle relaxant such as diazepam p. 360 or baclofen p. 1190.

Nausea and vomiting Nausea and vomiting are common in patients with advanced cancer. Ideally, the cause should be determined before treatment with an antiemetic is started. A

prokinetic antiemetic may be a preferred choice for first-line therapy.

Nausea and vomiting may occur with opioid therapy particularly in the initial stages but can be prevented by giving an antiemetic such as haloperidol p. 404 or metoclopramide hydrochloride p. 452. An antiemetic is usually necessary only for the first 4 or 5 days and therefore combined preparations containing an opioid with an antiemetic are not recommended because they lead to unnecessary antiemetic therapy (and associated side-effects when used long-term).

Metoclopramide hydrochloride p. 452 has a prokinetic action and is used by mouth for nausea and vomiting associated with gastritis, gastric stasis, and functional bowel obstruction. Drugs with antimuscarinic effects antagonise prokinetic drugs and, if possible, should not be used concurrently.

Haloperidol p. 404 is used by mouth for most metabolic causes of vomiting (e.g. hypercalcaemia, renal failure). Cyclizine p. 449 is given by mouth. It is used for nausea and vomiting due to mechanical bowel obstruction, raised intracranial pressure, and motion sickness.

Levomepromazine p. 460 is used as an antiemetic; it is given by mouth or by subcutaneous injection at bedtime. For the dose by subcutaneous infusion see below. Dexamethasone p. 712 by mouth can be used as an adjunct.

Antiemetic therapy should be reviewed every 24 hours; it may be necessary to substitute the antiemetic or to add another one.

For the administration of antiemetics by subcutaneous infusion using a continuous infusion device, see below.

For the treatment of nausea and vomiting associated with cancer chemotherapy see Cytotoxic drugs p. 938.

Pruritus Pruritus, even when associated with obstructive jaundice, often responds to simple measures such as application of emollients. In the case of obstructive jaundice, further measures include administration of colestyramine p. 210.

Raised intracranial pressure Headache due to raised intracranial pressure often responds to a high dose of a corticosteroid, such as dexamethasone p. 712 and should be given before 6 p.m. to reduce the risk of insomnia.

Restlessness and confusion Restlessness and confusion may require treatment with an antipsychotic, e.g. haloperidol p. 404 or levomepromazine p. 460, by mouth or by subcutaneous injection, both repeated every 2 hours if required. The dose and frequency is adjusted according to the level of patient distress and the response. A regular maintenance dose should also be considered, given twice daily either by mouth or by subcutaneous injection; alternatively use a continuous infusion device. Levomepromazine is licensed to treat pain in palliative care—this use is reserved for distressed patients with severe pain unresponsive to other measures (seek specialist advice).

Continuous subcutaneous infusions

Although drugs can usually be administered by mouth to control the symptoms of advanced cancer, the parenteral route may sometimes be necessary. Repeated administration of intramuscular injections can be difficult in a cachectic patient. This has led to the use of portable continuous infusion devices, such as syringe drivers, to give a *continuous subcutaneous infusion*, which can provide good control of symptoms with little discomfort or inconvenience to the patient.

Indications for the **parenteral route** are:

- the patient is unable to take medicines by mouth owing to *nausea and vomiting, dysphagia, severe weakness, or coma*
- there is *malignant bowel obstruction* in patients for whom further surgery is inappropriate (avoiding the need for

an intravenous infusion or for insertion of a nasogastric tube)

- occasionally when the patient *does not wish* to take regular medication by mouth.

Syringe driver rate settings Staff using syringe drivers should be **adequately trained** and different rate settings should be **clearly identified** and **differentiated**; incorrect use of syringe drivers is a common cause of medication errors.

Bowel colic and excessive respiratory secretions Hyoscine hydrobromide p. 458 effectively reduces respiratory secretions and bowel colic and is sedative (but occasionally causes paradoxical agitation).

Hyoscine butylbromide p. 92 is used for bowel colic and for excessive respiratory secretions, and is less sedative than hyoscine hydrobromide.

Glycopyrronium bromide p. 260 may also be used to treat bowel colic or excessive respiratory secretions.

Confusion and restlessness Haloperidol p. 404 has little sedative effect.

Levomopromazine p. 460 has a sedative effect.

Midazolam p. 356 is a sedative and an antiepileptic that may be used in addition to an antipsychotic drug in a very restless patient. Midazolam is also used for myoclonus.

Convulsions If a patient has previously been receiving an antiepileptic drug or has a primary or secondary cerebral tumour or is at risk of convulsion (e.g. owing to uraemia) antiepileptic medication should not be stopped. Midazolam p. 356 is the benzodiazepine antiepileptic of choice for *continuous subcutaneous infusion*.

Nausea and vomiting Haloperidol p. 404 and levomopromazine p. 460 can both be given as a *subcutaneous infusion* but sedation can limit the dose of levomopromazine. Cyclizine is particularly likely to precipitate if mixed with diamorphine or other drugs (see under Mixing and Compatibility, below)

Metoclopramide hydrochloride p. 452 can cause skin reactions.

Octreotide p. 1002, which stimulates water and electrolyte absorption and inhibits water secretion in the small bowel, can be used by subcutaneous infusion to reduce intestinal secretions and to reduce vomiting due to bowel obstruction.

Pain control Diamorphine hydrochloride p. 477 is the preferred opioid since its high solubility permits a large dose to be given in a small volume (see under Mixing and Compatibility, below). The table shows approximate equivalent doses of morphine p. 484 and diamorphine hydrochloride.

Mixing and compatibility The general principle that injections should be given into separate sites (and should not be mixed) does not apply to the use of syringe drivers in palliative care. Provided that there is evidence of compatibility, selected injections can be mixed in syringe drivers. Not all types of medication can be used in a subcutaneous infusion. In particular, chlorpromazine hydrochloride p. 402, prochlorperazine p. 407, and diazepam p. 360 are **contra-indicated** as they cause skin reactions at the injection site; to a lesser extent cyclizine p. 449 and levomopromazine p. 460 also sometimes cause local irritation.

In theory injections dissolved in water for injections are more likely to be associated with pain (possibly owing to their hypotonicity). The use of physiological saline (sodium chloride 0.9% p. 1101) however increases the likelihood of precipitation when more than one drug is used; moreover subcutaneous infusion rates are so slow (0.1–0.3 mL/hour) that pain is not usually a problem when water is used as a diluent.

Compatibility with diamorphine Diamorphine can be given by *subcutaneous infusion* in a strength of up to 250 mg/mL; up to a strength of 40 mg/mL either *water for injections* or *physiological saline* (sodium chloride 0.9%) is a suitable diluent—above that strength only *water for injections* is used (to avoid precipitation).

The following can be mixed with *diamorphine*:

- **Cyclizine**, may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.
- **Dexamethasone**, special care is needed to avoid precipitation of dexamethasone when preparing it.
- **Haloperidol**, mixtures of haloperidol and diamorphine are likely to precipitate after 24 hours if haloperidol concentration is above 2 mg/mL.
- **Hyoscine butylbromide**
- **Hyoscine hydrobromide**
- **Levomopromazine**
- **Metoclopramide**, under some conditions infusions containing metoclopramide become discoloured; such solutions should be discarded.
- **Midazolam**

Subcutaneous infusion solution should be monitored regularly both to check for precipitation (and discolouration) and to ensure that the infusion is running at the correct rate.

Problems encountered with syringe drivers The following are problems that may be encountered with syringe drivers and the action that should be taken:

- if the subcutaneous infusion runs *too quickly* check the rate setting and the calculation;
- if the subcutaneous infusion runs *too slowly* check the start button, the battery, the syringe driver, the cannula, and make sure that the injection site is not inflamed;
- if there is an *injection site reaction* make sure that the site does not need to be changed—firmness or swelling at the site of injection is not in itself an indication for change, but pain or obvious inflammation is.

Equivalent doses of morphine sulfate and diamorphine hydrochloride given over 24 hours

These equivalences are *approximate only* and should be adjusted according to response

ORAL MORPHINE	PARENTERAL MORPHINE	PARENTERAL DIAMORPHINE
Oral morphine sulfate over 24 hours	Subcutaneous infusion of morphine sulfate over 24 hours	Subcutaneous infusion of diamorphine hydrochloride over 24 hours
30 mg	15 mg	10 mg
60 mg	30 mg	20 mg
90 mg	45 mg	30 mg
120 mg	60 mg	40 mg
180 mg	90 mg	60 mg
240 mg	120 mg	80 mg
360 mg	180 mg	120 mg
480 mg	240 mg	160 mg
600 mg	300 mg	200 mg
780 mg	390 mg	260 mg
960 mg	480 mg	320 mg
1200 mg	600 mg	400 mg

If breakthrough pain occurs give a subcutaneous (preferable) or intramuscular injection equivalent to one-tenth to one-sixth of the total 24-hour subcutaneous infusion dose. It is kinder to give an intermittent bolus injection *subcutaneously*—absorption is smoother so that the risk of adverse effects at peak absorption is avoided (an even better method is to use a subcutaneous butterfly needle). To minimise the risk of infection no individual subcutaneous infusion solution should be used for longer than 24 hours.

Prescribing in the elderly

Overview

Old people, especially the very old, require special care and consideration from prescribers. *Medicines for Older People*, a component document of the National Service Framework for Older People (Department of Health. National Service Framework for Older People. London: Department of Health, March 2001), describes how to maximise the benefits of medicines and how to avoid excessive, inappropriate, or inadequate consumption of medicines by older people.

Appropriate prescribing

Elderly patients often receive multiple drugs for their multiple diseases. This greatly increases the risk of drug interactions as well as adverse reactions, and may affect compliance. The balance of benefit and harm of some medicines may be altered in the elderly. Therefore, elderly patients' medicines should be reviewed regularly and medicines which are not of benefit should be stopped. Non-pharmacological measures may be more appropriate for symptoms such as headache, sleeplessness, and light-headedness when associated with social stress as in widowhood, loneliness, and family dispersal. In some cases prophylactic drugs are inappropriate if they are likely to complicate existing treatment or introduce unnecessary side-effects, especially in elderly patients with poor prognosis or with poor overall health. However, elderly patients should not be denied medicines which may help them, such as anticoagulants or antiplatelet drugs for atrial fibrillation, antihypertensives, statins, and drugs for osteoporosis.

STOPP/START criteria STOPP/START criteria are evidence-based criteria used to review medication regimens in elderly people. STOPP (Screening Tool of Older Persons' potentially inappropriate Prescriptions) aims to reduce the incidence of medicines-related adverse events from potentially inappropriate prescribing and polypharmacy. START (Screening Tool to Alert to Right Treatment) can be used to prevent omissions of indicated, appropriate medicines in older patients with specific conditions. For STOPP criteria related to single drugs or drug classes, BNF Publications contain information within the monographs, in the cautions section. Where criteria relate to a drug class without a class monograph, information is outlined in the relevant treatment summaries. START criteria are not included within the monographs, however further information can be found in:

- Gallagher, P. et al. (2008). STOPP (Screening Tool of Older Persons' Prescriptions) and START (Screening Tool to Alert Doctors to Right Treatment): Consensus Validation. *Int J Clin Pharmacol Ther* 46(2):72-83.
- O'Mahony, D. et al. (2015). STOPP/START criteria for potentially inappropriate prescribing in older people: version 2. *Age Ageing* 44(2):213-8.

Form of medicine

Frail elderly patients may have difficulty swallowing tablets; if left in the mouth, ulceration may develop. They should always be encouraged to take their tablets or capsules with enough fluid, and whilst in an upright position to avoid the possibility of oesophageal ulceration. It can be helpful to discuss with the patient the possibility of taking the drug as a liquid if available.

Manifestations of ageing

In the very old, manifestations of normal ageing may be mistaken for disease and lead to inappropriate prescribing. In addition, age-related muscle weakness and difficulty in maintaining balance should not be confused with neurological disease. Disorders such as light-headedness not

associated with postural or postprandial hypotension are unlikely to be helped by drugs.

Sensitivity

The nervous system of elderly patients is more sensitive to many commonly used drugs, such as opioid analgesics, benzodiazepines, antipsychotics, and antiparkinsonian drugs, all of which must be used with caution. Similarly, other organs may also be more susceptible to the effects of drugs such as anti-hypertensives and NSAIDs.

Pharmacokinetics

Pharmacokinetic changes can markedly increase the tissue concentration of a drug in the elderly, especially in debilitated patients. The most important effect of age is reduced renal clearance. Many aged patients thus *excrete drugs slowly*, and are *highly susceptible to nephrotoxic drugs*. Acute illness can lead to rapid reduction in renal clearance, especially if accompanied by dehydration. Hence, a patient stabilised on a drug with a narrow margin between the therapeutic and the toxic dose (e.g. digoxin p. 116) can rapidly develop adverse effects in the aftermath of a myocardial infarction or a respiratory-tract infection. The hepatic metabolism of lipid soluble drugs is reduced in elderly patients because there is a reduction in liver volume. This is important for drugs with a narrow therapeutic window.

Adverse reactions

Adverse reactions often present in the elderly in a vague and non-specific fashion. *Confusion* is often the presenting symptom (caused by almost any of the commonly used drugs). Other common manifestations are *constipation* (with antimuscarinics and many tranquilisers) and *postural hypotension and falls* (with diuretics and many psychotropics).

Hypnotics

Many hypnotics with long half-lives have serious hangover effects, including drowsiness, unsteady gait, slurred speech, and confusion. Hypnotics with short half-lives should be used but they too can present problems. Short courses of hypnotics are occasionally useful for helping a patient through an acute illness or some other crisis but every effort must be made to avoid dependence. Benzodiazepines impair balance, which can result in falls.

Diuretics

Diuretics are overprescribed in old age and should **not** be used on a long-term basis to treat simple gravitational oedema which will usually respond to increased movement, raising the legs, and support stockings. A few days of diuretic treatment may speed the clearing of the oedema but it should rarely need continued drug therapy.

NSAIDs

Bleeding associated with aspirin and other NSAIDs is more common in the elderly who are more likely to have a fatal or serious outcome. NSAIDs are also a special hazard in patients with cardiac disease or renal impairment which may again place older patients at particular risk. Owing to the *increased susceptibility of the elderly to the side-effects of NSAIDs* the following recommendations are made:

- for *osteoarthritis, soft-tissue lesions, and back pain*, first try measures such as weight reduction (if obese), warmth, exercise, and use of a walking stick;
- for *osteoarthritis, soft-tissue lesions, back pain, and pain in rheumatoid arthritis*, paracetamol p. 465 should be used first and can often provide adequate pain relief;

- alternatively, a low-dose NSAID (e.g. ibuprofen p. 1203 up to 1.2 g daily) may be given;
- for pain relief when either drug is inadequate, paracetamol in a full dose plus a low-dose NSAID may be given;
- if necessary, the NSAID dose can be increased or an opioid analgesic given with paracetamol p. 465;
- do not give two NSAIDs at the same time.

Prophylaxis of NSAID-induced peptic ulcers may be required if continued NSAID treatment is necessary, see Peptic ulcer disease p. 76.

Other drugs

Other drugs which commonly cause adverse reactions are *antiparkinsonian drugs*, *antihypertensives*, *psychotropics*, and digoxin p. 116. The usual maintenance dose of digoxin in very old patients is 125 micrograms daily (62.5 micrograms in those with renal disease); lower doses are often inadequate but toxicity is common in those given 250 micrograms daily. Drug-induced blood disorders are much more common in the elderly. Therefore drugs with a tendency to cause bone marrow depression (e.g. co-trimoxazole p. 594, mianserin hydrochloride p. 389) should be avoided unless there is no acceptable alternative.

The elderly generally require a lower maintenance dose of warfarin sodium p. 150 than younger adults; once again, the outcome of bleeding tends to be more serious.

Guidelines

Always consider whether a drug is indicated at all.

Limit range It is a sensible policy to prescribe from a limited range of drugs and to be thoroughly familiar with their effects in the elderly.

Reduce dose Dosage should generally be substantially lower than for younger patients and it is common to start with about 50% of the adult dose. Some drugs (e.g. long-acting antidiabetic drugs such as glibenclamide p. 748) should be avoided altogether.

Review regularly Review repeat prescriptions regularly. In many patients it may be possible to stop some drugs, provided that clinical progress is monitored. It may be necessary to reduce the dose of some drugs as renal function declines.

Simplify regimens Elderly patients benefit from simple treatment regimens. Only drugs with a clear indication should be prescribed and whenever possible given once or twice daily. In particular, regimens which call for a confusing array of dosage intervals should be avoided.

Explain clearly Write full instructions on every prescription (including repeat prescriptions) so that containers can be properly labelled with full directions. Avoid imprecisions like 'as directed'. Child-resistant containers may be unsuitable.

Repeats and disposal Instruct patients what to do when drugs run out, and also how to dispose of any that are no longer necessary. Try to prescribe matching quantities. If these guidelines are followed most elderly people will cope adequately with their own medicines. If not then it is essential to enrol the help of a third party, usually a relative or a friend.

Drugs and sport

Anti-doping

UK Anti-Doping, the national body responsible for the UK's anti-doping policy, advises that athletes are personally responsible should a prohibited substance be detected in their body. Information regarding the use of medicines in sport is available from:

UK Anti-doping
Fleetbank House
2-6 Salisbury Square
London
EC4Y 8AE
(020) 7842 3450
ukad@ukad.org.uk
www.ukad.org.uk

Information about the prohibited status of specific medications based on the current World Anti-Doping Agency Prohibited List is available from Global Drug Reference Online: www.globaldro.com/UK/search

General Medical Council's advice

Doctors who prescribe or collude in the provision of drugs or treatment with the intention of improperly enhancing an individual's performance in sport contravene the GMC's guidance, and such actions would usually raise a question of a doctor's continued registration. This does not preclude the provision of any care or treatment where the doctor's intention is to protect or improve the patient's health.

Prescribing in dental practice

General guidance

Advice on the drug management of dental and oral conditions has been integrated into the main text. For ease of access, guidance on such conditions is usually identified by means of a relevant heading (e.g. Dental and Orofacial Pain) in the appropriate sections of the BNF. The following is a list of topics of particular relevance to dentists.

- Prescribing by dentists, see Prescription writing p. 5
- Oral side-effects of drugs, see Adverse reactions to drugs p. 12
- Medical emergencies in dental practice, see below
- Medical problems in dental practice, see below

Drug management of dental and oral conditions

Dental and orofacial pain

- Neuropathic pain p. 505
- Non-opioid analgesics and compound analgesic preparations, see Analgesics p. 462
- Opioid analgesics, see Analgesics p. 462
- Non-steroidal anti-inflammatory drugs p. 1193

Oral infections

- Bacterial infections, see Antibacterials, principles of therapy p. 527
 - Phenoxymethylpenicillin p. 578
 - Broad-spectrum penicillins (amoxicillin p. 579 and ampicillin p. 581)
 - Cephalosporins (cefalexin p. 551 and cefradine p. 552)
 - Tetracyclines p. 596
 - Macrolides (clarithromycin p. 567, erythromycin p. 569 and azithromycin p. 566)
 - Clindamycin p. 564
 - Metronidazole p. 572
 - Fusidic acid p. 604

Fungal infections, see Antifungals, systemic use p. 626

- Local treatment, see Oropharyngeal fungal infections p. 1283
- Systemic treatment, see Antifungals, systemic use p. 626

Viral infections

- Herpetic gingivostomatitis, local treatment, see Oropharyngeal viral infections p. 1284
- Herpetic gingivostomatitis, systemic treatment, see Oropharyngeal viral infections p. 1284 and Herpesvirus infections p. 669
- Herpes labialis, see Skin infections p. 1294

Anaesthetics, anxiolytics and hypnotics

- Sedation, anaesthesia, and resuscitation in dental practice p. 1399
- Hypnotics, see Hypnotics and anxiolytics p. 506
- Sedation for dental procedures, see Hypnotics and anxiolytics p. 506
- Anaesthesia (local) p. 1417

Minerals

- Fluoride imbalance p. 1277

Oral ulceration and inflammation p. 1278

Mouthwashes, gargles and dentifrices, see

Mouthwashes and other preparations for oropharyngeal use p. 1275

Dry mouth, see Treatment of dry mouth p. 1273

Aromatic inhalations, see Aromatic inhalations, cough preparations and systemic nasal decongestants p. 311

Nasal decongestants, see Aromatic inhalations, cough preparations and systemic nasal decongestants p. 311

Dental Practitioners' Formulary p. 1697

Medical emergencies in dental practice

This section provides guidelines on the management of the more common medical emergencies which may arise in dental practice. Dentists and their staff should be familiar with standard resuscitation procedures, but in all circumstances it is advisable to summon medical assistance as soon as possible. See also **algorithm** of the procedure for Cardiopulmonary resuscitation p. 236.

The drugs referred to in this section include:

- Adrenaline/epinephrine Injection, adrenaline 1 in 1000, (adrenaline 1 mg/mL as acid tartrate), 1 mL amps p. 236
- Aspirin Dispersible Tablets 300 mg p. 130
- Glucagon Injection, glucagon (as hydrochloride), 1- unit vial (with solvent) p. 763
- Glucose p. 1102 (for administration by mouth)
- Glyceryl trinitrate Spray p. 232
- Midazolam Oromucosal Solution p. 356
- Oxygen
- Salbutamol Aerosol Inhalation, salbutamol 100 micrograms/metered inhalation p. 267

Adrenal insufficiency

Adrenal insufficiency may follow prolonged therapy with corticosteroids and can persist for years after stopping. A patient with adrenal insufficiency may become hypotensive under the stress of a dental visit (important: see individual monographs for details of corticosteroid cover before dental surgical procedures under general anaesthesia).

Management

- Lay the patient flat
- Give **oxygen**
- Transfer patient urgently to hospital

Anaphylaxis

A severe allergic reaction may follow oral or parenteral administration of a drug. Anaphylactic reactions in dentistry may follow the administration of a drug or contact with substances such as latex in surgical gloves. In general, the more rapid the onset of the reaction the more profound it tends to be. Symptoms may develop within minutes and rapid treatment is essential.

Anaphylactic reactions may also be associated with *additives* and *excipients* in foods and medicines. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens (including those for topical application, particularly if they are intended for use in the mouth or for application to the nasal mucosa).

Symptoms and signs

- Paraesthesia, flushing, and swelling of face
- Generalised itching, especially of hands and feet
- Bronchospasm and laryngospasm (with wheezing and difficulty in breathing)
- Rapid weak pulse together with fall in blood pressure and pallor; finally cardiac arrest

Management

First-line treatment includes securing the airway, restoration of blood pressure (laying the patient flat and raising the feet, or in the recovery position if unconscious or nauseous and at risk of vomiting), and administration of adrenaline/epinephrine injection p. 236. This is given **intramuscularly** in a dose of 500 micrograms (0.5 mL adrenaline injection 1 in 1000); a dose of 300 micrograms (0.3 mL adrenaline injection 1 in 1000) may be appropriate for immediate self-administration. The dose is repeated if necessary at 5-minute intervals according to blood pressure,

pulse, and respiratory function. **Oxygen** administration is also of primary importance. Arrangements should be made to transfer the patient to hospital urgently.

Asthma

Patients with asthma may have an attack while at the dental surgery. Most attacks will respond to 2 puffs of the patient's short-acting beta₂ agonist inhaler such as salbutamol 100 micrograms/puff p. 267; further puffs are required if the patient does not respond rapidly. If the patient is unable to use the inhaler effectively, further puffs should be given through a large-volume spacer device (or, if not available, through a plastic or paper cup with a hole in the bottom for the inhaler mouthpiece). If the response remains unsatisfactory, or if further deterioration occurs, then the patient should be transferred urgently to hospital. Whilst awaiting transfer, **oxygen** should be given with salbutamol 5 mg or terbutaline sulfate 10 mg by nebuliser p. 269; if a nebuliser is unavailable, then 2–10 puffs of salbutamol 100 micrograms/metered inhalation should be given (preferably by a large-volume spacer), and repeated every 10–20 minutes if necessary. If asthma is part of a more generalised anaphylactic reaction, an intramuscular injection of adrenaline/epinephrine p. 236 (as detailed under Anaphylaxis) should be given. Patients with severe chronic asthma or whose asthma has deteriorated previously during a dental procedure may require an increase in their prophylactic medication before a dental procedure. This should be discussed with the patient's medical practitioner and may include increasing the dose of inhaled or oral corticosteroid.

Cardiac emergencies

If there is a history of *angina* the patient will probably carry glyceryl trinitrate spray or tablets p. 232 (or isosorbide dinitrate tablets p. 233) and should be allowed to use them. Hospital admission is not necessary if symptoms are mild and resolve rapidly with the patient's own medication. See also Coronary Artery Disease below.

Arrhythmias may lead to a sudden reduction in cardiac output with loss of consciousness. Medical assistance should be summoned. For advice on pacemaker interference, see also Pacemakers below.

The pain of *myocardial infarction* is similar to that of angina but generally more severe and more prolonged. For general advice see also Coronary Artery Disease below.

Symptoms and signs of myocardial infarction:

- Progressive onset of severe, crushing pain across front of chest; pain may radiate towards the shoulder and down arm, or into neck and jaw
- Skin becomes pale and clammy
- Nausea and vomiting are common
- Pulse may be weak and blood pressure may fall
- Breathlessness

Initial management of myocardial infarction:

Call immediately for medical assistance and an ambulance, as appropriate.

Allow the patient to rest in the position that feels most comfortable; in the presence of breathlessness this is likely to be sitting position, whereas the syncopal patient should be laid flat; often an intermediate position (dictated by the patient) will be most appropriate. **Oxygen** may be administered.

Sublingual glyceryl trinitrate p. 232 may relieve pain. Intramuscular injection of drugs should be avoided because absorption may be too slow (particularly when cardiac output is reduced) and pain relief is inadequate. Intramuscular injection also increases the risk of local bleeding into the muscle if the patient is given a thrombolytic drug.

Reassure the patient as much as possible to relieve further anxiety. If available, aspirin p. 130 in a single dose of 300 mg should be given. A note (to say that aspirin has been given) should be sent with the patient to the hospital. For further details on the initial management of myocardial infarction, see Management of ST-Segment Elevation Myocardial Infarction.

If the patient collapses and loses consciousness attempt standard resuscitation measures. See also **algorithm** of the procedure for Cardiopulmonary resuscitation p. 236.

Epileptic seizures

Patients with epilepsy must continue with their normal dosage of anticonvulsant drugs when attending for dental treatment. It is not uncommon for epileptic patients not to volunteer the information that they are epileptic but there should be little difficulty in recognising a tonic-clonic (grand mal) seizure.

Symptoms and signs

- There may be a brief warning (but variable)
- Sudden loss of consciousness, the patient becomes rigid, falls, may give a cry, and becomes cyanotic (tonic phase)
- After 30 seconds, there are jerking movements of the limbs; the tongue may be bitten (clonic phase)
- There may be frothing from mouth and urinary incontinence
- The seizure typically lasts a few minutes; the patient may then become flaccid but remain unconscious. After a variable time the patient regains consciousness but may remain confused for a while

Management

During a convulsion try to ensure that the patient is not at risk from injury but make no attempt to put anything in the mouth or between the teeth (in mistaken belief that this will protect the tongue). Give **oxygen** to support respiration if necessary.

Do not attempt to restrain convulsive movements. After convulsive movements have subsided place the patient in the coma (recovery) position and check the airway.

After the convulsion the patient may be confused ('post-ictal confusion') and may need reassurance and sympathy. The patient should not be sent home until fully recovered. Seek medical attention or transfer the patient to hospital if it was the first episode of epilepsy, or if the convulsion was atypical, prolonged (or repeated), or if injury occurred. Medication should only be given if convulsive seizures are prolonged (convulsive movements lasting 5 minutes or longer) or repeated rapidly.

Midazolam oromucosal solution p. 356 can be given by the buccal route in adults as a single dose of 10 mg [unlicensed]. For further details on the management of status epilepticus, including details of paediatric doses of midazolam, see Drugs used in status epilepticus (Epilepsy p. 321).

Focal seizures similarly need very little active management (in an automatism only a minimum amount of restraint should be applied to prevent injury). Again, the patient should be observed until post-ictal confusion has completely resolved.

Hypoglycaemia

Insulin-treated diabetic patients attending for dental treatment under local anaesthesia should inject insulin and eat meals as normal. If food is omitted the blood glucose will fall to an abnormally low level (hypoglycaemia). Patients can often recognise the symptoms themselves and this state responds to sugar in water or glucose tablets. Children may not have such prominent changes but may appear unduly lethargic.

Symptoms and signs

Hypoglycaemia should be excluded in any person with diabetes who is acutely unwell, drowsy, unconscious, unable to co-operate, or presenting with aggressive behaviour or seizures. Symptoms of hypoglycaemia in the young include shakiness, pounding heart, sweatiness, headache, drowsiness, and difficulty concentrating. In young children, behavioural changes such as irritability, agitation, quietness, and tantrums, may be prominent.

Management of adults

EvGr Any patient with a blood-glucose concentration less than 4 mmol/litre, with or without symptoms, and who is **conscious and able to swallow**, should have 15–20 g of fast-acting carbohydrate. This is available in approximately 3–4 heaped teaspoonfuls of sugar dissolved in water, 4–7 glucose tablets, or 150–200 mL pure fruit juice. Orange juice should not be given to patients following a low-potassium diet due to chronic kidney disease, and sugar dissolved in water will not be effective in patients taking acarbose. **EvGr** Proprietary products of fast-acting carbohydrate, as glucose 40% gel (e.g. *Glucogel*[®], or *Rapilose gel*[®]) are also available; **EvGr** 2 tubes should be taken.

If necessary, repeat treatment after 10–15 minutes, up to a maximum of 3 treatments in total. Once blood-glucose concentration is above 4 mmol/litre and the patient has recovered, a snack providing a long-acting carbohydrate should be given to prevent blood-glucose concentration from falling again (e.g. two biscuits, one slice of bread, 200–300 mL milk (not soya or other forms of 'alternative' milk, e.g. almond or coconut), or a normal carbohydrate-containing meal if due).

If hypoglycaemia is unresponsive, or the oral route cannot be used, intramuscular glucagon 1 mg p. 763 should be given. Once blood-glucose concentration is above 4 mmol/litre and the patient has recovered, a snack providing a long-acting carbohydrate should be given. Patients who have received glucagon require a larger portion of long-acting carbohydrate to replenish glycogen stores (e.g. four biscuits, two slices of bread, 400–600 mL of milk (not soya or other forms of 'alternative' milk, e.g. almond or coconut) or a normal carbohydrate containing meal if due).

Glucagon may be less effective in patients taking a sulfonylurea or under the influence of alcohol; in these cases, intravenous glucose 10% will be required. If glucagon is unsuitable or ineffective after 10 minutes, the patient should be transferred urgently to hospital. **EvGr** The patient must also be admitted to hospital if hypoglycaemia is caused by an oral antidiabetic drug.

Management of children

EvGr Non-severe hypoglycaemia in children who are **able to swallow**, should be treated with 10–20 g of fast-acting carbohydrate by mouth, preferably in liquid form, which may be taken more easily. Oral glucose solutions p. 1102 should not be used if consciousness is reduced as this could be dangerous (risk of choking). 10–20 g is available from approximately 2–4 teaspoonfuls of sugar added to a cup of water, or 3–6 glucose tablets. **EvGr**

Blood-glucose concentrations should rise within 5–15 minutes; **EvGr** if hypoglycaemia persists after 15 minutes, repeat the fast-acting glucose p. 1102. As symptoms improve or normoglycaemia is restored, a long-acting carbohydrate snack (e.g. two biscuits, one banana) or a meal, can be given to prevent blood-glucose concentration from falling again. **EvGr**

EvGr Severe hypoglycaemia may be treated with concentrated oral glucose solution, as long as the child is **conscious and able to swallow**. **EvGr** Proprietary products of fast-acting carbohydrate, as glucose 40% gel (e.g. *Glucogel*[®], *Dextrogl*[®], or *Rapilose gel*[®]) are available for use in severe hypoglycaemia.

EvGr If hypoglycaemia is unresponsive, or the oral route cannot be used, intramuscular glucagon p. 763 should be given. Children aged 8 years and under *or* who weigh less than 25 kg should be given 500 micrograms; children aged 9 years and above *or* who weigh 25 kg and over should be given 1 mg of glucagon p. 763. As symptoms improve or normoglycaemia is restored, and the child is sufficiently awake, a long-acting carbohydrate snack (e.g. two biscuits, one banana) or a meal should be given. **EvGr**

EvGr Glucagon may be less effective in patients taking a sulfonylurea or under the influence of alcohol; in these cases, intravenous glucose 10% will be required. **EvGr** If glucagon p. 763 is unsuitable or ineffective after 10 minutes, the child should be transferred urgently to hospital. **EvGr** The child must also be admitted to hospital if hypoglycaemia is caused by an oral antidiabetic drug.

Syncope

Insufficient blood supply to the brain results in loss of consciousness. The commonest cause is a vasovagal attack or simple faint (syncope) due to emotional stress.

Symptoms and signs

- Patient feels faint
- Low blood pressure
- Pallor and sweating
- Yawning and slow pulse
- Nausea and vomiting
- Dilated pupils
- Muscular twitching

Management

- Lay the patient as flat as is reasonably comfortable and, in the absence of associated breathlessness, raise the legs to improve cerebral circulation
- Loosen any tight clothing around the neck
- Once consciousness is regained, give sugar in water or a cup of sweet tea

Other possible causes Postural hypotension can be a consequence of rising abruptly or of standing upright for too long; antihypertensive drugs predispose to this. When rising, susceptible patients should take their time. Management is as for a vasovagal attack.

Under stressful circumstances, some patients hyperventilate. This gives rise to feelings of faintness but does not usually result in syncope. In most cases reassurance is all that is necessary; rebreathing from cupped hands or a bag may be helpful but calls for careful supervision.

Adrenal insufficiency or arrhythmias are other possible causes of syncope.

Medical problems in dental practice

Individuals presenting at the dental surgery may also suffer from an unrelated medical condition; this may require modification to the management of their dental condition. If the patient has systemic disease or is taking other medication, the matter may need to be discussed with the patient's general practitioner or hospital consultant.

Allergy

Patients should be asked about any history of allergy; those with a history of atopic allergy (asthma, eczema, hay fever, etc.) are at special risk. Those with a history of a severe allergy or of anaphylactic reactions are at high risk—it is essential to confirm that they are not allergic to any medication, or to any dental materials or equipment (including latex gloves). See also Anaphylaxis above.

Arrhythmias

Patients, especially those who suffer from heart failure or who have sustained a myocardial infarction, may have irregular cardiac rhythm. Atrial fibrillation is a common arrhythmia even in patients with normal hearts and is of

little concern except that dentists should be aware that such patients may be receiving anticoagulant therapy. The patient's medical practitioner should be asked whether any special precautions are necessary. Premedication (e.g. with temazepam p. 509) may be useful in some instances for very anxious patients.

See also Cardiac emergencies above, and Dental Anaesthesia (Anaesthesia (local) p. 1417).

Cardiac prostheses

For an account of the risk of infective endocarditis in patients with prosthetic heart valves, see Infective Endocarditis below. For advice on patients receiving anticoagulants, see Thromboembolic disease below.

Coronary artery disease

Patients are vulnerable for at least 4 weeks following a myocardial infarction or following any sudden increase in the symptoms of angina. It would be advisable to check with the patient's medical practitioner before commencing treatment. See also Cardiac Emergencies above.

Treatment with low-dose aspirin (75 mg daily), clopidogrel p. 131, or dipyridamole p. 132 should not be stopped routinely nor should the dose be altered before dental procedures.

A Working Party of the British Society for Antimicrobial Chemotherapy has not recommended antibiotic prophylaxis for patients following coronary artery bypass surgery.

Cyanotic heart disease

Patients with cyanotic heart disease are at risk in the dental chair, particularly if they have pulmonary hypertension. In such patients a syncopal reaction increases the shunt away from the lungs, causing more hypoxia which worsens the syncopal reaction—a vicious circle that may prove fatal. The advice of the cardiologist should be sought on any patient with congenital cyanotic heart disease. Treatment in hospital is more appropriate for some patients with this condition.

Hypertension

Patients with hypertension are likely to be receiving antihypertensive drugs. Their blood pressure may fall dangerously low under general anaesthesia, see also under Dental Anaesthesia (Anaesthesia (local) p. 1417).

Immunosuppression and indwelling intraperitoneal catheters

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

Infective endocarditis

While almost any dental procedure can cause bacteraemia, there is no clear association with the development of infective endocarditis. Routine daily activities such as tooth brushing also produce a bacteraemia and may present a greater risk of infective endocarditis than a single dental procedure.

Antibacterial prophylaxis and chlorhexidine mouthwash p. 1275 are **not** recommended for the prevention of endocarditis in patients undergoing dental procedures. Such prophylaxis may expose patients to the adverse effects of

antimicrobials when the evidence of benefit has not been proven.

Reduction of oral bacteraemia Patients at risk of endocarditis including those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis, should be advised to maintain the highest possible standards of oral hygiene in order to reduce the:

- need for dental extractions or other surgery;
- chances of severe bacteraemia if dental surgery is needed;
- possibility of 'spontaneous' bacteraemia.

Postoperative care Patients at risk of endocarditis including those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis, should be warned to report to the doctor or dentist any unexplained illness that develops after dental treatment.

Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

Patients on anticoagulant therapy

For general advice on dental surgery in patients receiving oral anticoagulant therapy see Thromboembolic Disease below.

Joint prostheses

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

Pacemakers

Pacemakers prevent asystole or severe bradycardia. Some ultrasonic scalers, electronic apex locators, electro-analgesic devices, and electrocautery devices interfere with the normal function of pacemakers (including shielded pacemakers) and should not be used. The manufacturer's literature should be consulted whenever possible. If severe bradycardia occurs in a patient fitted with a pacemaker, electrical equipment should be switched off and the patient placed supine with the legs elevated. If the patient loses consciousness and the pulse remains slow or is absent, cardiopulmonary resuscitation may be needed. Call immediately for medical assistance and an ambulance, as appropriate.

A Working Party of the British Society for Antimicrobial Chemotherapy does not recommend antibacterial prophylaxis for patients with pacemakers.

Thromboembolic disease

Patients receiving a **heparin** or an oral anticoagulant such as warfarin sodium p. 150, acenocoumarol p. 150

(nicoumalone), phenindione p. 150, apixaban p. 133, dabigatran etexilate p. 146 or rivaroxaban p. 137 may be liable to excessive bleeding after extraction of teeth or other dental surgery. Often dental surgery can be delayed until the anticoagulant therapy has been completed.

For a patient requiring long-term therapy with warfarin sodium p. 150, the patient's medical practitioner should be consulted and the International Normalised Ratio (INR) should be assessed 72 hours before the dental procedure.

This allows sufficient time for dose modification if necessary. In those with an unstable INR (including those who require weekly monitoring of their INR, or those who have had some INR measurements greater than 4.0 in the last 2 months), the INR should be assessed within 24 hours of the dental procedure. Patients requiring minor dental procedures (including extractions) who have an INR below 4.0 may continue warfarin sodium p. 150 without dose adjustment. There is no need to check the INR for a patient requiring a non-invasive dental procedure.

If it is necessary to remove several teeth, a single extraction should be done first; if this goes well further teeth may be extracted at subsequent visits (two or three at a time). Measures should be taken to minimise bleeding during and after the procedure. This includes the use of sutures and a haemostatic such as oxidised cellulose, collagen sponge or resorbable gelatin sponge. Scaling and root planing should initially be restricted to a limited area to assess the potential for bleeding.

For a patient on long-term warfarin sodium p. 150, the advice of the clinician responsible for the patient's anticoagulation should be sought if:

- the INR is unstable, or if the INR is greater than 4.0;
- the patient has thrombocytopenia, haemophilia, or other disorders of haemostasis, or suffers from liver impairment, alcoholism, or renal failure;
- the patient is receiving antiplatelet drugs, cytotoxic drugs or radiotherapy.

Intramuscular injections are *contra-indicated* in patients taking anticoagulants with an INR above the therapeutic range, and in those with any disorder of haemostasis. In patients taking anticoagulants who have a stable INR within the therapeutic range, intramuscular injections should be avoided if possible; if an intramuscular injection is necessary, the patient should be informed of the increased risk of localised bleeding and monitored carefully.

A local anaesthetic containing a vasoconstrictor should be given by infiltration, or by intraligamentary or mental nerve injection if possible. If regional nerve blocks cannot be avoided the local anaesthetic should be given cautiously using an aspirating syringe.

Drugs which have potentially serious interactions with anticoagulants include aspirin and other NSAIDs, carbamazepine p. 327, imidazole and triazole antifungals (including miconazole p. 876), erythromycin p. 569, clarithromycin p. 567, and metronidazole p. 572; for details of these and other interactions with anticoagulants, see Appendix 1 (dabigatran etexilate, heparins, phenindione, rivaroxaban, and coumarins).

Although studies have failed to demonstrate an interaction, common experience in anticoagulant clinics is that the INR can be altered following a course of an oral broad-spectrum antibiotic, such as ampicillin p. 581 or amoxicillin p. 579. Information on the treatment of patients who take anticoagulants is available at www.npsa.nhs.uk/patientsafety/alerts-and-directives/alerts/anticoagulant.

Liver disease

Liver disease may alter the response to drugs and drug prescribing should be kept to a minimum in patients with severe liver disease. Problems are likely mainly in patients with *jaundice*, *ascites*, or evidence of *encephalopathy*.

For guidance on prescribing for patients with hepatic impairment, see Prescribing in hepatic impairment p. 23. Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in the BNF.

Renal impairment

The use of drugs in patients with reduced renal function can give rise to many problems. Many of these problems can be avoided by reducing the dose or by using alternative drugs. Special care is required in renal transplantation and immunosuppressed patients; if necessary such patients should be referred to specialists.

For guidance on prescribing in patients with renal impairment, see Prescribing in renal impairment p. 23. Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug in the BNF.

Pregnancy

Drugs taken during pregnancy can be harmful to the fetus and should be prescribed only if the expected benefit to the mother is thought to be greater than the risk to the fetus; all drugs should be avoided if possible during the first trimester. For guidance on prescribing in pregnancy, see Prescribing in pregnancy p. 27. Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the BNF.

Breast-feeding

Some drugs taken by the mother whilst breast-feeding can be transferred to the breast milk, and may affect the infant. For guidance on prescribing in breast-feeding, see Prescribing in breast-feeding p. 27. Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the BNF.

1 Chronic bowel disorders

1.1 Coeliac disease

Coeliac disease

25-Jul-2016

Description of condition

Coeliac disease is an autoimmune condition which is associated with chronic inflammation of the small intestine. Dietary proteins known as gluten, which are present in wheat, barley and rye, activate an abnormal immune response in the intestinal mucosa, which can lead to malabsorption of nutrients.

Aims of treatment

The management of coeliac disease is aimed at eliminating symptoms (such as diarrhoea, bloating and abdominal pain) and reducing the risk of complications, including those resulting from malabsorption.

Non-drug treatment

EvGr The only effective treatment for coeliac disease is a strict, life-long, gluten-free diet. A range of gluten-free products is available for prescription (see *Borderline substances*). 

Drug treatment

EvGr Patients who have coeliac disease are at an increased risk of malabsorption of key nutrients (such as calcium and vitamin D). Their risk of osteoporosis and the need for active treatment of bone disease should form part of the ongoing management of coeliac disease. Supplementation of key nutrients may be required if dietary intake is insufficient.

Patients who have coeliac disease should be advised **not** to self-medicate with over-the-counter vitamins or mineral supplements. Initiation of supplementation should involve a discussion with a member of the patient's healthcare team in order to identify the individual needs of the patient and to allow for appropriate ongoing monitoring.

Confirmed cases of refractory coeliac disease should be referred to a specialist centre. Treatment with prednisolone

p. 716 can be considered for initial management while awaiting specialist advice.

Coeliac disease: recognition, assessment and management. National Institute for Health and Care Excellence. Clinical guideline 20. September 2015. www.nice.org.uk/guidance/ng20

1.2 Diverticular disease and diverticulitis

Diverticular disease and diverticulitis

20-Feb-2020

Description of condition

Diverticulosis is an asymptomatic condition characterised by the presence of diverticula (small pouches protruding from the walls of the large intestine). Its prevalence is difficult to determine but it is age dependent, with the majority of patients aged 40 years and over.

Diverticular disease is a condition where diverticula are present with symptoms such as abdominal tenderness and/or mild, intermittent lower abdominal pain with constipation, diarrhoea, or occasional large rectal bleeds. Symptoms of diverticular disease may overlap with other conditions such as Irritable bowel syndrome p. 51, colitis (bowel inflammation related to Crohn's disease p. 41, Ulcerative colitis p. 43, ischaemia or microscopic colitis), and malignancy.

Acute diverticulitis occurs when diverticula suddenly become inflamed or infected. Signs and symptoms include constant lower abdominal pain (usually severe) together with features such as fever, a sudden change in bowel habits and significant rectal bleeding, lower abdominal tenderness, or a palpable abdominal mass. **Complicated acute diverticulitis** refers to diverticulitis associated with complications such as abscess, bowel perforation and peritonitis, fistula, intestinal obstruction, haemorrhage, or

sepsis. For further information on signs and symptoms of acute diverticulitis or complicated acute diverticulitis, see NICE clinical guideline: **Diverticular disease** (see *Useful resources*).

Aims of treatment

Treatment aims to relieve symptoms of diverticular disease, improve quality of life, manage episodes of acute diverticulitis, and reduce the risk of recurrence and complications.

Non drug management

EvGr Patients and their family and/or carers, where appropriate, should be provided with information about diet and lifestyle changes, the course of the disease and likelihood of progression, symptoms and symptom management, investigations and treatment options, and when and how to seek further medical advice.

Patients with diverticulosis or diverticular disease should be advised to eat a healthy, balanced diet including whole grains, fruit and vegetables. In patients with constipation and on a low fibre diet, a gradual increase of dietary fibre may minimise flatulence and bloating. Patients increasing dietary fibre should be advised to drink an adequate amount of fluid, especially if dehydration is a risk. Advice should also be given about the benefits of exercise, weight loss (if overweight or obese), and Smoking cessation p. 520, in reducing the risk of symptomatic disease and acute diverticulitis.

Patients with diverticular disease should also be informed that it may take several weeks for the benefits of increasing fibre in their diet to be achieved and that if a high-fibre diet is tolerated, it should be continued for life.

In patients with complicated acute diverticulitis, emergency or elective surgical management may be required. **A** For information on surgical management, see NICE clinical guideline: **Diverticular disease** (see *Useful resources*).

Drug treatment

Diverticulosis

EvGr As diverticulosis is an asymptomatic condition, specific treatments are not recommended. Bulk-forming laxatives can be considered for patients with constipation. **A**

Diverticular disease

EvGr Antibacterials are not recommended for patients with diverticular disease.

Bulk-forming laxatives should be considered when a high-fibre diet is unsuitable, or for patients with persistent constipation or diarrhoea.

Consider the use of simple analgesia such as paracetamol p. 465 in patients with ongoing abdominal pain, and antispasmodics in those with abdominal cramps. Non-steroidal anti-inflammatory drugs and opioid analgesics are not recommended as their use may increase the risk of diverticular perforation.

For patients with persistent symptoms or symptoms that do not respond to treatment, consider an alternative diagnosis. **A**

Acute diverticulitis

EvGr Offer simple analgesia such as paracetamol to patients with acute diverticulitis who are systemically well. Consider a watchful waiting and a no antibacterial prescribing strategy, and advise patients to re-present if symptoms persist or worsen. **A**

For guidance on antibacterial management, see *Diverticulitis, acute* in Gastro-intestinal system infections, antibacterial therapy p. 535.

EvGr Patients with persistent or worsening symptoms should be reassessed in primary care and considered for referral to hospital for further assessment.

Refer patients with suspected complicated acute diverticulitis and uncontrolled abdominal pain for same-day hospital assessment. Those presenting with significant rectal bleeding should be referred to hospital urgently.

Treatment with aminosalicylates or prophylactic antibacterials are not recommended to prevent recurrent acute diverticulitis. **A**

Useful Resources

Diverticular disease: diagnosis and management. National Institute for Health and Care Excellence. NICE guideline 147. November 2019.

www.nice.org.uk/guidance/ng147

1.3 Inflammatory bowel disease

Inflammatory bowel disease

Chronic inflammatory bowel diseases include Crohn's disease below and Ulcerative colitis p. 43.

Drugs used in chronic bowel disorders

Aminosalicylates

Sulfasalazine p. 47 is a combination of 5-aminosalicylic acid ('5-ASA') and sulfapyridine; sulfapyridine acts only as a carrier to the colonic site of action but still causes side-effects. In the newer aminosalicylates, mesalazine p. 45 (5-aminosalicylic acid), balsalazine sodium p. 44 (a pro-drug of 5-aminosalicylic acid) and olsalazine sodium p. 47 (a dimer of 5-aminosalicylic acid which cleaves in the lower bowel), the sulfonamide-related side-effects of sulfasalazine are avoided, but 5-aminosalicylic acid alone can still cause side-effects including blood disorders and lupus-like syndrome also seen with sulfasalazine.

Drugs affecting the immune response

Folic acid p. 1084 should be given to reduce the possibility of methotrexate p. 963 toxicity [unlicensed indication]. Folic acid is usually given once weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

Cytokine modulators

Infliximab p. 1179, adalimumab p. 1170, and golimumab p. 1177 are monoclonal antibodies which inhibit the pro-inflammatory cytokine, tumour necrosis factor alpha. They should be used under specialist supervision.

Crohn's disease

20-Dec-2016

Description of condition

Crohn's disease is a chronic, inflammatory bowel disease that mainly affects the gastro-intestinal tract. It is characterised by thickened areas of the gastro-intestinal wall with inflammation extending through all layers, deep ulceration and fissuring of the mucosa, and the presence of granulomas; affected areas may occur in any part of the gastro-intestinal tract, interspersed with areas of relatively normal tissue. Crohn's disease may present as recurrent attacks, with acute exacerbations combined with periods of remission or less active disease. Symptoms depend on the site of disease but may include abdominal pain, diarrhoea, fever, weight loss and rectal bleeding.

Complications of Crohn's disease include intestinal strictures, abscesses in the wall of the intestine or adjacent structures, fistulae, anaemia, malnutrition, colorectal and small bowel cancers, and growth failure and delayed puberty in children. Crohn's disease may also be associated with extra-intestinal manifestation: the most common are arthritis and abnormalities of the joints, eyes, liver and skin.

Crohn's disease is also a cause of secondary osteoporosis and those at greatest risk should be monitored for osteopenia and assessed for the risk of fractures.

Fistulating Crohn's disease

Fistulating Crohn's disease is a complication that involves the formation of a fistula between the intestine and adjacent structures, such as perianal skin, bladder, and vagina. It occurs in about one quarter of patients, mostly when the disease involves the ileocolonic area.

Aims of treatment

Treatment is largely directed at the induction and maintenance of remission and the relief of symptoms. Active treatment of acute Crohn's disease should be distinguished from preventing relapse. The aims of drug treatment are to reduce symptoms and maintain or improve quality of life, while minimising toxicity related to drugs over both the short and long term.

In fistulating Crohn's disease, surgery and medical treatment aim to close and maintain closure of the fistula.

Non-drug treatment

EvGr In addition to drug treatment, management options for Crohn's disease include Smoking cessation p. 520 and attention to nutrition, which plays an important role in supportive care. Surgery may be considered in certain patients with early disease limited to the distal ileum and in severe or chronic active disease. **A**

Drug treatment

Treatment of acute disease

Monotherapy

EvGr A corticosteroid (either prednisolone p. 716 or methylprednisolone p. 715 or intravenous hydrocortisone p. 713), is used to induce remission in patients with a first presentation or a single inflammatory exacerbation of Crohn's disease in a 12-month period.

In patients with distal ileal, ileocaecal or right-sided colonic disease, in whom a conventional corticosteroid is unsuitable or contra-indicated, budesonide p. 48 may be considered. Budesonide is less effective but may cause fewer side-effects than other corticosteroids, as systemic exposure is limited. Aminosalicylates (such as sulfasalazine p. 47 and mesalazine p. 45) are an alternative option in these patients. They are less effective than a corticosteroid or budesonide, but may be preferred because they have fewer side-effects. Aminosalicylates and budesonide are not appropriate for severe presentations or exacerbations. **A**

Add-on treatment

EvGr Add on treatment is prescribed if there are two or more inflammatory exacerbations in a 12-month period, or the corticosteroid dose cannot be reduced.

Azathioprine p. 881 or mercaptopurine p. 963 [unlicensed indications] can be added to a corticosteroid or budesonide to induce remission. In patients who cannot tolerate azathioprine or mercaptopurine or in whom thiopurine methyltransferase (TPMT) activity is deficient, methotrexate p. 963 can be added to a corticosteroid.

Under specialist supervision, the tumour necrosis factor- α inhibitors adalimumab p. 1170 and infliximab p. 1179 are options for the treatment of severe, active Crohn's disease, following inadequate response to conventional therapies or in those who are intolerant of or have contra-indications to conventional therapy. Vedolizumab p. 50 is recommended for moderate to severely active Crohn's disease when therapy with adalimumab or infliximab is unsuccessful, is contra-indicated or not tolerated. Ustekinumab p. 1164 is recommended for moderate to severely active Crohn's disease when conventional therapy or therapy with adalimumab or infliximab is unsuccessful, is contra-indicated or not tolerated. See also *National*

funding/access decisions for adalimumab, infliximab, ustekinumab p. 1164, and vedolizumab.

Adalimumab and infliximab can be used as monotherapy or combined with an immunosuppressant although there is uncertainty about the comparative effectiveness and long-term side-effects of therapy. **A**

Maintenance of remission

EvGr Patients who choose not to receive maintenance treatment during remission should be made aware of the symptoms that may suggest a relapse (most frequently unintended weight loss, abdominal pain, diarrhoea and general ill-health). For those who choose not to receive maintenance treatment during remission, a suitable follow up plan should be agreed upon and information provided on how to access healthcare if a relapse should occur.

Azathioprine or mercaptopurine [unlicensed indications] as monotherapy can be used to maintain remission when previously used with a corticosteroid to induce remission. They may also be used in patients who have not previously received these drugs (particularly those with adverse prognostic factors such as early age of onset, perianal disease, corticosteroid use at presentation, and severe presentations). Methotrexate can be used to maintain remission only in patients who required methotrexate to induce remission, or who are intolerant of or are not suitable for azathioprine or mercaptopurine for maintenance. Corticosteroids or budesonide should not be used. **A**

Maintaining remission following surgery

EvGr Azathioprine in combination with up to 3 months' postoperative metronidazole p. 572 [unlicensed indication] should be considered to maintain remission in patients with ileocolonic Crohn's disease who have had complete macroscopic resection within the previous 3 months. Azathioprine alone should be considered for patients who cannot tolerate metronidazole p. 572. **A** Aminosalicylates are no longer recommended due to the lack of clinical efficacy. NICE do not consider mercaptopurine to be a cost-effective treatment and do not recommend its use.

EvGr Biologic therapies should no longer be used to maintain remission after complete macroscopic resection of ileocolonic Crohn's disease because of limited evidence. Budesonide should also not be used in these patients. **A**

Other treatments

EvGr Loperamide hydrochloride p. 71 or codeine phosphate p. 475 can be used to manage diarrhoea associated with Crohn's disease in those who do not have colitis. **A** Colestyramine p. 210 is licensed for the relief of diarrhoea associated with Crohn's disease. See also *Diarrhoea (acute)* p. 70.

Fistulating Crohn's disease

Perianal fistulae are the most common occurrence in patients with fistulating Crohn's disease. **EvGr** Treatment may not be necessary for simple, asymptomatic perianal fistulae. When fistulae are symptomatic, local drainage and surgery may be required in conjunction with the medical therapy.

Metronidazole p. 572 or ciprofloxacin p. 590 [unlicensed indications], alone or in combination, can improve symptoms of fistulating Crohn's disease but complete healing occurs rarely. Metronidazole p. 572 is usually given for 1 month, but no longer than 3 months because of concerns about peripheral neuropathy. Other antibacterials should be given if specifically indicated (e.g. in sepsis associated with fistulae and perianal disease) and for managing bacterial overgrowth in the small bowel.

Either azathioprine p. 881 or mercaptopurine p. 963 [unlicensed indications] is used to control the inflammation in fistulating Crohn's disease and they are continued for maintenance.

Infliximab p. 1179 is recommended for patients with active fistulating Crohn's disease who have not responded to

conventional therapy (including antibacterials, drainage and immunosuppressive treatments), or who are intolerant of or have contra-indications to conventional therapy. Infliximab should be used after ensuring that all sepsis is actively draining.

Abscess drainage, fistulotomy, and seton insertion may be appropriate, particularly before infliximab treatment.

Azathioprine, mercaptopurine, or infliximab should be continued as maintenance treatment for at least one year.

For the management of non-perianal fistulating Crohn's disease (including entero-gynaecological and enterovesical fistulae) surgery is the only recommended approach. [⚡](#)

Useful Resources

Crohn's disease: management. National Institute for Health and Care Excellence. Clinical guideline 129. May 2019. www.nice.org.uk/guidance/ng129

Ulcerative colitis

20-Feb-2017

Description of condition

Ulcerative colitis is a chronic inflammatory condition, characterised by diffuse mucosal inflammation—it has a relapsing-remitting pattern. It is a life-long disease that is associated with significant morbidity. It most commonly presents between the ages of 15 and 25 years, although diagnosis can be made at any age.

The pattern of inflammation is continuous, extending from the rectum upwards to a varying degree. Inflammation of the rectum is referred to as **proctitis**, and inflammation of the rectum and sigmoid colon as **proctosigmoiditis**. **Left-sided colitis** refers to disease involving the colon distal to the splenic flexure. **Extensive colitis** affects the colon proximal to the splenic flexure, and includes pan-colitis, where the whole colon is involved. Common symptoms of active disease or relapse include bloody diarrhoea, an urgent need to defaecate, and abdominal pain.

Complications associated with ulcerative colitis include an increased risk of colorectal cancer, secondary osteoporosis, venous thromboembolism, and toxic megacolon.

Aims of treatment

Treatment is focussed on treating active disease to manage symptoms and to induce and maintain remission.

Drug treatment

Overview

Management of ulcerative colitis is dependent on factors such as clinical severity, extent of disease, and patient preference. Clinical and laboratory investigations are used to determine the extent and severity of disease and to guide treatment. Severity is classified as mild, moderate or severe by using the Truelove and Witts' Severity Index to assess bowel movements, heart rate, erythrocyte sedimentation rate and the presence of pyrexia, melaena or anaemia—see the NICE guideline for Ulcerative Colitis for further information (see *Useful resources*).

[EvGr](#) The extent of disease should be considered when choosing the route of administration for aminosalicylates and corticosteroids; whether oral treatment, topical treatment or both are to be used. If the inflammation is distal, a rectal preparation is adequate but if the inflammation is extended, systemic medication is required. Either suppositories or enemas can be offered, taking into account the patient's preferences. [⚡](#)

[EvGr](#) Rectal foam preparations and suppositories can be used when patients have difficulty retaining liquid enemas.

Diarrhoea associated with ulcerative colitis is sometimes treated with anti-diarrhoeal drugs (such as loperamide hydrochloride p. 71 or codeine phosphate p. 475) on the advice of a specialist; however their use is contra-indicated

in acute ulcerative colitis as they can increase the risk of toxic megacolon.

A macrogol-containing osmotic laxative (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 61) may be useful for proximal faecal loading in proctitis. [⚡](#)

Oral aminosalicylates for the treatment of ulcerative colitis are available in different preparations and release forms. [EvGr](#) The preparation and dosing schedule should be chosen taking into account the delivery characteristics and suitability for the patient. When used to maintain remission, single daily doses of oral aminosalicylates can be more effective than multiple daily dosing, but may result in more side-effects.

The duration of corticosteroid course (usually 4 to 8 weeks) depends on the corticosteroid chosen. [⚡](#)

Treatment of acute mild-to-moderate ulcerative colitis Proctitis

[EvGr](#) A topical aminosalicylate is recommended as first-line treatment for patients with a mild-to-moderate initial presentation or inflammatory exacerbation of proctitis. If remission is not achieved within 4 weeks, adding an oral aminosalicylate should be considered. If response remains inadequate, consider addition of a topical or an oral corticosteroid for 4 to 8 weeks.

Monotherapy with an oral aminosalicylate can be considered for patients who prefer not to use enemas or suppositories, although this may not be as effective. If remission is not achieved within 4 weeks, adding a topical or an oral corticosteroid for 4 to 8 weeks should be considered.

A topical or an oral corticosteroid for 4 to 8 weeks should be considered for patients in whom aminosalicylates are unsuitable. [⚡](#)

Proctosigmoiditis and left-sided ulcerative colitis

[EvGr](#) A topical aminosalicylate is recommended as first-line treatment for patients with a mild-to-moderate initial presentation or inflammatory exacerbation of proctosigmoiditis or left-sided ulcerative colitis. If remission is not achieved within 4 weeks, consider adding a high-dose oral aminosalicylate, or switching to a high-dose oral aminosalicylate and 4 to 8 weeks of a topical corticosteroid. If response remains inadequate, stop topical treatment and offer an oral aminosalicylate and 4 to 8 weeks of an oral corticosteroid.

Monotherapy with a high-dose oral aminosalicylate can be considered for patients who prefer not to use enemas or suppositories, although this may not be as effective. If remission is not achieved within 4 weeks, an oral corticosteroid for 4 to 8 weeks in addition to the high-dose aminosalicylate should be offered.

A topical or an oral corticosteroid for 4 to 8 weeks should be considered for patients in whom aminosalicylates are unsuitable. [⚡](#)

Extensive ulcerative colitis

[EvGr](#) A topical aminosalicylate and a high-dose oral aminosalicylate are recommended as first-line treatment for patients with a mild-to-moderate initial presentation or inflammatory exacerbation of extensive ulcerative colitis. If remission is not achieved within 4 weeks, stop topical aminosalicylate treatment and offer a high-dose oral aminosalicylate and 4 to 8 weeks of an oral corticosteroid. An oral corticosteroid for 4 to 8 weeks should be considered for patients in whom aminosalicylates are unsuitable. [⚡](#)

Treatment of acute moderate-to-severe ulcerative colitis

[EvGr](#) The biological drugs adalimumab p. 1170, golimumab p. 1177, infliximab p. 1179, vedolizumab p. 50, and the Janus kinase inhibitor tofacitinib p. 1167 can be used to treat moderate-to-severe active ulcerative colitis following an inadequate response to conventional treatment options, or if conventional treatment options are not tolerated or contra-indicated. Treatment with these agents is continued into the

maintenance phase, if effective and tolerated. See *National funding/access decisions* for infliximab p. 1179, adalimumab p. 1170, golimumab p. 1177, vedolizumab p. 50, and tofacitinib p. 1167. 

Treatment of acute severe ulcerative colitis

Acute severe ulcerative colitis of any extent can be life-threatening and is regarded as a medical emergency.  Immediate hospital admission is required for treatment.

Intravenous corticosteroids (such as hydrocortisone p. 713 or methylprednisolone p. 715) should be given to induce remission in patients with acute severe ulcerative colitis (at first presentation or an exacerbation) while assessing the need for surgery. If intravenous corticosteroids are contra-indicated, declined or cannot be tolerated, then intravenous ciclosporin p. 883 [unlicensed indication] or surgery should be considered. A combination of intravenous ciclosporin with intravenous corticosteroids, or surgery is second line therapy for patients who have little or no improvement within 72 hours of starting intravenous corticosteroids or whose symptoms worsen despite treatment.

Infliximab p. 1179 can be used to treat acute exacerbations of severely active ulcerative colitis if ciclosporin p. 883 is contra-indicated or clinically inappropriate. 

 In patients who experience an initial response to steroids followed by deterioration, stool cultures should be taken to exclude the presence of pathogens; cytomegalovirus activation should be considered. 

Maintaining remission in mild, moderate or severe ulcerative colitis

 To reduce the chances of relapse occurring, maintenance therapy with an aminosalicylate is recommended in most patients. Corticosteroids are **not** suitable for maintenance treatment because of their side-effects.

After a mild-to-moderate inflammatory exacerbation of *proctitis* or *proctosigmoiditis*, a rectal aminosalicylate can be started alone or in combination with an oral aminosalicylate, administered daily or as part of an intermittent regimen (such as twice to three times weekly or the first seven days of each month). An oral aminosalicylate can be used alone in patients who prefer not to use enemas or suppositories, although this may not be as effective.

A low-dose of oral aminosalicylate is given to maintain remission in patients after a mild-to-moderate inflammatory exacerbation of left-sided or extensive ulcerative colitis.

When used to maintain remission, single daily doses of oral aminosalicylates can be more effective than multiple daily dosing, but may result in more side-effects.

Oral azathioprine p. 881 or mercaptopurine p. 963 [unlicensed indications] can be considered to maintain remission, if there has been two or more inflammatory exacerbations in a 12-month period that required treatment with systemic corticosteroids, or if remission is not maintained by aminosalicylates, or following a single acute severe episode. 

There is no evidence to support the use of methotrexate p. 963 to induce or maintain remission in ulcerative colitis, though its use is common in clinical practice.

Biological drugs and Janus Kinase inhibitors for maintaining remission of ulcerative colitis

 Treatment with these agents is continued into the maintenance phase, if effective and tolerated in acute disease. See also *National funding/access decisions* for adalimumab p. 1170, golimumab p. 1177, infliximab p. 1179, vedolizumab p. 50, and tofacitinib p. 1167. 

Non-drug treatment

 Surgery may be necessary as emergency treatment for severe ulcerative colitis that does not respond to drug treatment. Patients can also choose to have elective surgery

for unresponsive or frequently relapsing disease that is affecting their quality of life.

AMINOSALICYLATES

Aminosalicylates

● SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · cough · diarrhoea · dizziness · fever · gastrointestinal discomfort · headache · leucopenia · nausea · skin reactions · vomiting
- ▶ **Uncommon** Alopecia · depression · dyspnoea · myalgia · photosensitivity reaction · thrombocytopenia
- ▶ **Rare or very rare** Agranulocytosis · bone marrow disorders · cardiac inflammation · hepatitis · neutropenia · pancreatitis · peripheral neuropathy · renal impairment · respiratory disorders
- ▶ **Frequency not known** Angioedema · eosinophilia · haemolytic anaemia · nephritis tubulointerstitial · oligozoospermia (reversible) · ulcerative colitis aggravated

SIDE-EFFECTS, FURTHER INFORMATION A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in salicylate hypersensitivity.

● RENAL IMPAIRMENT

Monitoring Renal function should be monitored more frequently in renal impairment.

- **MONITORING REQUIREMENTS** Renal function should be monitored before starting an oral aminosalicylate, at 3 months of treatment, and then annually during treatment.

● PATIENT AND CARER ADVICE

Blood disorders Patients receiving aminosalicylates, and their carers, should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise that occurs during treatment.

 F above

Balsalazide sodium

29-Apr-2020

● INDICATIONS AND DOSE

Treatment of mild to moderate ulcerative colitis, acute attack

- ▶ **BY MOUTH**
- ▶ **Adult:** 2.25 g 3 times a day until remission occurs or for up to maximum of 12 weeks

Maintenance of remission of ulcerative colitis

- ▶ **BY MOUTH**
- ▶ **Adult:** 1.5 g twice daily (max. per dose 3 g), adjusted according to response; maximum 6 g per day

- **CAUTIONS** History of asthma
- **INTERACTIONS** → Appendix 1: balsalazide
- **SIDE-EFFECTS** Blood disorder · cholelithiasis · lupus-like syndrome
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Diarrhoea may develop in the infant. **Monitoring** Monitor breast-fed infants for diarrhoea.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Mesalazine

29-Apr-2020

● **INDICATIONS AND DOSE****DOSE EQUIVALENCE AND CONVERSION**

There is no evidence to show that any one oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary.

ASACOL[®] MR 400MG TABLETS**Treatment of mild to moderate ulcerative colitis, acute attack**

- ▶ BY MOUTH
- ▶ Child 12-17 years: 800 mg 3 times a day
- ▶ Adult: 2.4 g daily in divided doses

Maintenance of remission of ulcerative colitis and Crohn's ileo-colitis

- ▶ BY MOUTH
- ▶ Child 12-17 years: 400–800 mg 2–3 times a day
- ▶ Adult: 1.2–2.4 g daily in divided doses

ASACOL[®] MR 800MG TABLETS**Treatment of mild to moderate ulcerative colitis, acute attack**

- ▶ BY MOUTH
- ▶ Adult: 2.4–4.8 g daily in divided doses

Maintenance of remission of ulcerative colitis

- ▶ BY MOUTH
- ▶ Adult: Up to 2.4 g once daily, alternatively up to 2.4 g daily in divided doses

Maintenance of remission of Crohn's ileo-colitis

- ▶ BY MOUTH
- ▶ Adult: Up to 2.4 g daily in divided doses

ASACOL[®] FOAM ENEMA**Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectosigmoid region**

- ▶ BY RECTUM
- ▶ Adult: 1 g daily for 4–6 weeks, to be administered into the rectum

Treatment of acute attack of mild to moderate ulcerative colitis, affecting the descending colon

- ▶ BY RECTUM
- ▶ Adult: 2 g once daily for 4–6 weeks, to be administered into the rectum

ASACOL[®] SUPPOSITORIES**Treatment of acute attack of mild to moderate ulcerative colitis and maintenance of remission**

- ▶ BY RECTUM
- ▶ Adult: 0.75–1.5 g daily in divided doses, last dose to be administered at bedtime

MEZAVANT[®] XL**Treatment of mild to moderate ulcerative colitis, acute attack**

- ▶ BY MOUTH
- ▶ Adult: 2.4 g once daily, increased if necessary to 4.8 g once daily, review treatment at 8 weeks

Maintenance of remission of ulcerative colitis

- ▶ BY MOUTH
- ▶ Adult: 2.4 g once daily

UCTASA[®]**Treatment of mild to moderate ulcerative colitis, acute attack**

- ▶ BY MOUTH
- ▶ Adult: 2.4–4.8 g once daily, alternatively 2.4–4.8 g daily in divided doses, dose over 2.4 g daily in divided doses only

Maintenance of remission of ulcerative colitis and Crohn's ileo-colitis

- ▶ BY MOUTH
- ▶ Adult: 1.2–2.4 g once daily, alternatively daily in divided doses

PENTASA[®] GRANULES**Treatment of mild to moderate ulcerative colitis, acute attack**

- ▶ BY MOUTH
- ▶ Child 5-17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
- ▶ Child 5-17 years (body-weight 40 kg and above): 1–2 g twice daily, total daily dose may alternatively be given in 3–4 divided doses
- ▶ Adult: Up to 4 g once daily, alternatively up to 4 g daily in 2–4 divided doses

Maintenance of remission of ulcerative colitis

- ▶ BY MOUTH
- ▶ Child 5-17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- ▶ Child 5-17 years (body-weight 40 kg and above): 2 g once daily
- ▶ Adult: 2 g once daily

PENTASA[®] RETENTION ENEMA**Treatment of acute attack of mild to moderate ulcerative colitis or maintenance of remission**

- ▶ BY RECTUM
- ▶ Adult: 1 g once daily, dose to be administered at bedtime

Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectosigmoid region

- ▶ BY RECTUM
- ▶ Child 12-17 years: 1 g once daily, dose to be administered at bedtime

• UNLICENSED USE

- ▶ With oral use in children *Asacol*® (all preparations) not licensed for use in children under 18 years. *Pentasa*® granules and *Salofalk*® tablets and granules not licensed for use in children under 6 years.
- ▶ With rectal use in children *Salofalk*® rectal foam no dose recommendations for children (age range not specified by manufacturer).

• CONTRA-INDICATIONS

- ▶ With oral use Blood clotting abnormalities

- **CAUTIONS** Elderly - maintain adequate fluid intake - pulmonary disease

- **INTERACTIONS** → Appendix 1: mesalazine

• SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- ▶ **Rare or very rare** Cholestasis exacerbated - drug fever - flatulence - nephritis

SPECIFIC SIDE-EFFECTS

- ▶ **Rare or very rare**

- ▶ With rectal use Constipation

- **PREGNANCY** Negligible quantities cross placenta.

- **BREAST FEEDING** Diarrhoea reported in breast-fed infants, but negligible amounts of mesalazine detected in breast milk.

Monitoring Monitor breast-fed infant for diarrhoea.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

• RENAL IMPAIRMENT

- ▶ In adults Use with caution. Avoid if eGFR less than 20 mL/minute/1.73 m².
- ▶ In children Use with caution. Avoid if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

• DIRECTIONS FOR ADMINISTRATION**PENTASA® TABLETS** Tablets may be halved, quartered, or dispersed in water, but should not be chewed.**PENTASA® GRANULES** Granules should be placed on tongue and washed down with water or orange juice without chewing.

- ▶ In children Contents of one sachet should be weighed and divided immediately before use; discard any remaining granules.

SALOFALK® GRANULES Granules should be placed on tongue and washed down with water without chewing.

- **PRESCRIBING AND DISPENSING INFORMATION** There is no evidence to show that any one oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary.

Flavours of granule formulations of *Salofalk*® may include vanilla.

- **PATIENT AND CARER ADVICE** If it is necessary to switch a patient to a different brand of mesalazine, the patient should be advised to report any changes in symptoms. Some products may require special administration advice; patients and carers should be informed.

Sulfasalazine

29-Apr-2020

(Sulphasalazine)

- **INDICATIONS AND DOSE**

- ▶ **Treatment of acute attack of mild to moderate and severe ulcerative colitis | Active Crohn's disease**

- ▶ BY MOUTH

- ▶ Adult: 1–2 g 4 times a day until remission occurs, corticosteroids may also be given, if necessary

- ▶ BY RECTUM

- ▶ Adult: 0.5–1 g twice daily, administered alone or in conjunction with oral therapy, morning and night after a bowel movement

- ▶ **Maintenance of remission of mild to moderate and severe ulcerative colitis**

- ▶ BY MOUTH

- ▶ Adult: 500 mg 4 times a day

- ▶ BY RECTUM

- ▶ Adult: 0.5–1 g twice daily, administered alone or in conjunction with oral therapy, morning and night after a bowel movement

- ▶ **Active rheumatoid arthritis (administered on expert advice)**

- ▶ BY MOUTH

- ▶ Adult: Initially 500 mg daily, increased in steps of 500 mg every week, increased to 2–3 g daily in divided doses, enteric coated tablets to be administered

IMPORTANT SAFETY INFORMATION**SAFE PRACTICE**

Sulfasalazine has been confused with sulfadiazine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CAUTIONS** Acute porphyrias p. 1120 · G6PD deficiency · history of allergy · history of asthma · maintain adequate fluid intake · risk of haematological toxicity · risk of hepatic toxicity · slow acetylator status

- **INTERACTIONS** → Appendix 1: sulfasalazine

- **SIDE-EFFECTS**

- ▶ **Common or very common** Insomnia · stomatitis · taste altered · tinnitus · urine abnormalities
- ▶ **Uncommon** Face oedema · seizure · vasculitis · vertigo
- ▶ **Frequency not known** Anaemia · appetite decreased · ataxia · cyanosis · encephalopathy · haematuria · hallucination · hepatic failure · hypoprotrombinaemia ·

lymphadenopathy · macrocytosis · meningitis aseptica · methaemoglobinemia · nephrotic syndrome · parotitis · periorbital oedema · pseudomembranous enterocolitis · serum sickness · severe cutaneous adverse reactions (SCARs) · smell disorders · systemic lupus erythematosus (SLE) · yellow discolouration of body fluids

SIDE-EFFECTS, FURTHER INFORMATION Incidence of side-effects increases with higher doses.

Blood disorders Haematological abnormalities occur usually in the first 3 to 6 months of treatment—discontinue if these occur.

- **PREGNANCY** Theoretical risk of neonatal haemolysis in third trimester; adequate folate supplements should be given to mother.
- **BREAST FEEDING** Small amounts in milk (1 report of bloody diarrhoea); theoretical risk of neonatal haemolysis especially in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Risk of toxicity, including crystalluria, in moderate impairment—ensure high fluid intake. Avoid in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Blood disorders Close monitoring of full blood counts (including differential white cell count and platelet count) is necessary initially, and at monthly intervals during the first 3 months.
 - ▶ Renal function Although the manufacturer recommends renal function tests in rheumatic diseases, evidence of practical value is unsatisfactory.
 - ▶ Liver function Liver function tests should be performed at monthly intervals for first 3 months.
- **PATIENT AND CARER ADVICE** Contact lenses Some soft contact lenses may be stained.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Ulcerative colitis affecting sigmoid colon and rectum

▶ BY RECTUM

- ▶ Adult: 1 metered application once daily for up to 8 weeks

DOSE EQUIVALENCE AND CONVERSION

- ▶ For *Budenofalk*[®] rectal foam: 1 metered application is equivalent to budesonide 2 mg.

CORTIMENT®**Induction of remission of mild-to-moderate active ulcerative colitis**

- ▶ BY MOUTH
- ▶ Adult: 9 mg once daily for up to 8 weeks, dose to be taken in the morning

ENTOCORT® CAPSULES**Active microscopic colitis**

- ▶ BY MOUTH
- ▶ Adult: 9 mg once daily, to be taken in the morning

Mild to moderate Crohn's disease affecting the ileum or ascending colon

- ▶ BY MOUTH
- ▶ Adult: 9 mg once daily for up to 8 weeks; reduce dose for the last 2–4 weeks of treatment, to be taken in the morning

ENTOCORT® ENEMA**Ulcerative colitis involving rectal and recto-sigmoid disease**

- ▶ BY RECTUM
- ▶ Adult: 1 enema daily for 4 weeks, to be administered at bedtime

JORVEZA®**Eosinophilic oesophagitis (initiated by a specialist)**

- ▶ BY MOUTH
- ▶ Adult: 1 mg twice daily for 6 weeks; treatment may be extended to up to 12 weeks if required, to be taken after food

- **CAUTIONS** Autoimmune hepatitis

- **INTERACTIONS** → Appendix 1: corticosteroids

● SIDE-EFFECTS

- ▶ **Common or very common**

- ▶ With oral use Muscle twitching · oedema · oral disorders
- ▶ With rectal use Diarrhoea · gastrointestinal disorders

- **HEPATIC IMPAIRMENT** For *Budenofalk*® manufacturer advises avoid in cirrhosis (risk of increased exposure, limited information available).

JORVEZA® Manufacturer advises avoid (no information available).

● RENAL IMPAIRMENT

JORVEZA® Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).

- **MONITORING REQUIREMENTS** Manufacturer advises when used in autoimmune hepatitis, liver function tests should be monitored every 2 weeks for 1 month, then at least every 3 months.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With oral use Granules should be placed on tongue and washed down with water without chewing.

JORVEZA® Manufacturer advises the tablet should be placed on the tip of the tongue, gently pressed against the roof of the mouth to dissolve, and the dissolved material swallowed with saliva as the tablet disintegrates. Patients should avoid eating, drinking or performing oral hygiene for at least 30 minutes after taking the tablet. Oral solutions, sprays or chewable tablets should be avoided for at least 30 minutes before and after taking the tablet.

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ With oral use Flavours of granule formulations may include lemon.

ENTOCORT® CAPSULES

- ▶ With oral use Dispense modified-release capsules in original container (contains desiccant).

● PATIENT AND CARER ADVICE

- ▶ With oral use Patients or carers should be given advice on how to administer budesonide granules.

JORVEZA® Manufacturer advises patients or carers should be given advice on how to administer orodispersible tablets.

● NATIONAL FUNDING/ACCESS DECISIONS**CORTIMENT®**

Scottish Medicines Consortium (SMC) decisions The *Scottish Medicines Consortium* has advised (October 2016) that budesonide (*Cortiment*®) is accepted for restricted use within NHS Scotland for induction of remission of mild-to-moderate active ulcerative colitis where aminosalicylate treatment is not sufficient, and only if patients present with active left-sided disease and/or proctosigmoiditis who are not suitable for oral prednisolone, as an alternative to budesonide rectal formulations or off-label oral budesonide.

BUDENOFALK® CAPSULES

Scottish Medicines Consortium (SMC) decisions The *Scottish Medicines Consortium* has advised (May 2015) that *Budenofalk*® gastro-resistant capsules are accepted for restricted use within NHS Scotland for the treatment of autoimmune hepatitis in non-cirrhotic patients who are intolerant of conventional oral corticosteroids (prednisolone) with severe corticosteroid-related side effects (actual or anticipated) such as psychosis, poorly controlled diabetes or osteoporosis.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

1 IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES, ANTI-LYMPHOCYTE

Vedolizumab

25-Jul-2018

● **DRUG ACTION** Vedolizumab is a monoclonal antibody that binds specifically to the $\alpha_4\beta_7$ integrin, which is expressed on gut homing T helper lymphocytes and causes a reduction in gastrointestinal inflammation.

● INDICATIONS AND DOSE

Moderate to severe active ulcerative colitis in patients who have had an inadequate response with, lost response to, or are intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor (under expert supervision)

▶ BY INTRAVENOUS INFUSION

● **Adult:** Initially 300 mg, then 300 mg after 2 weeks, followed by 300 mg after 4 weeks, followed by 300 mg every 8 weeks, dose to be given over 30 minutes, if treatment is interrupted or response decreases, dosing frequency may be increased—consult product literature; review treatment if no response within 10 weeks of initial dose

Moderate to severe active Crohn's disease in patients who have had an inadequate response with, lost response to, or are intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor (under expert supervision)

▶ BY INTRAVENOUS INFUSION

● **Adult:** Initially 300 mg, then 300 mg after 2 weeks, followed by 300 mg after 4 weeks, followed by 300 mg every 8 weeks, dose to be given over 30 minutes, if no response is observed, an additional dose of 300 mg may be given 10 weeks after initial dose; if treatment is interrupted or response decreases, dosing frequency may be increased—consult product literature; review treatment if no response within 14 weeks of initial dose

● **CONTRA-INDICATIONS** Severe active infection

● **CAUTIONS** Controlled chronic severe infection · history of recurring severe infection · previous treatment with natalizumab (wait at least 12 weeks between natalizumab use and initiation of vedolizumab unless potential benefit outweighs risk) · previous treatment with rituximab

CAUTIONS, FURTHER INFORMATION

▶ **Risk of infection** Patients must be screened for tuberculosis before starting treatment; if latent tuberculosis is diagnosed, appropriate treatment must be initiated prior to vedolizumab treatment; if tuberculosis is diagnosed during treatment, discontinue vedolizumab until infection is resolved.

Patients should be brought up to date with current immunisation schedule before initiating treatment.

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

● **Common or very common** Arthralgia · constipation · cough · fatigue · fever · gastrointestinal discomfort · gastrointestinal disorders · headache · hypertension · increased risk of infection · muscle spasms · muscle weakness · nasal congestion · nausea · night sweats · oropharyngeal pain · pain · paraesthesia · skin reactions

▶ **Uncommon** Chills · feeling cold

▶ **Frequency not known** Hypersensitivity · infusion related reaction

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related and hypersensitivity reactions have been reported. Patients should be observed continuously during each infusion for signs and symptoms of acute hypersensitivity reactions; they should also be observed for 2 hours after the initial two infusions, and for 1 hour after subsequent

infusions. Discontinue treatment if a severe infusion-related or other severe reaction occurs and initiate appropriate treatment (e.g. adrenaline and antihistamines); if a mild to moderate infusion-related reaction occurs, interrupt infusion or reduce infusion rate and initiate appropriate treatment (if reaction subsides the infusion may be continued)—consider pretreatment with an antihistamine, hydrocortisone, and/or paracetamol prior to subsequent infusions in patients who experience mild to moderate infusion-related reactions.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required during and for at least 18 weeks after treatment.

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

● MONITORING REQUIREMENTS

▶ **Manufacturer advises monitor closely for infection before, during and after treatment—potential increased risk of opportunistic infection.**

▶ **Manufacturer advises monitor for new onset or worsening neurological signs and symptoms (withhold treatment if progressive multifocal leukoencephalopathy (PML) is suspected).**

● **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Entyvio*®), give intermittently in Sodium chloride 0.9%; allow vial to reach room temperature then reconstitute with 4.8 mL of water for injection (using a syringe with a 21–25 gauge needle); gently swirl vial for at least 15 seconds, do not shake vigorously or invert; allow to stand for up to 20 minutes (gently swirl vial if needed), leave for an additional 10 minutes if not dissolved; gently invert vial three times, withdraw 5 mL of reconstituted solution (using a syringe with a 21–25 gauge needle), and add to 250 mL of infusion fluid; gently mix and give over 30 minutes.

● **PATIENT AND CARER ADVICE** Patients should be provided with a patient alert card.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

▶ **Vedolizumab for treating moderately to severely active Crohn's disease after prior therapy (August 2015)** NICE TA352 Vedolizumab (*Entyvio*®) is recommended as an option for the treatment of moderate to severe active Crohn's disease only if:

- a tumour necrosis factor alpha inhibitor has failed (that is, the disease has responded inadequately or has lost response to treatment), or
- a tumour necrosis factor alpha inhibitor cannot be tolerated or is contra-indicated, and
- the manufacturer provides vedolizumab with the discount agreed in the patient access scheme.

Vedolizumab should be given as a planned course of treatment until treatment fails, or surgery is needed, or until 12 months after starting treatment, whichever is the shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta352

▶ **Vedolizumab for treating moderately to severely active ulcerative colitis (June 2015)** NICE TA342 Vedolizumab (*Entyvio*®) is recommended, within its marketing authorisation, as an option for treating

moderately to severely active ulcerative colitis in adults only if the manufacturer provides vedolizumab with the document agreed in the patient access scheme.

Vedolizumab should be given until treatment fails, or surgery is needed. At 12 months after the start of treatment, patients should be reassessed to see whether treatment should continue. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

www.nice.org.uk/guidance/ta342

Scottish Medicines Consortium (SMC) decisions

SMC No. 1064/15

The *Scottish Medicines Consortium* has advised (July 2015) that vedolizumab (*Entyvio*®) is accepted for restricted use within NHS Scotland for the treatment of adults with moderately to severely active Crohn's disease who have had an inadequate response with, lost response to, or were intolerant to a tumour necrosis factor alpha inhibitor. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1045/15

The *Scottish Medicines Consortium* has advised (May 2015) that vedolizumab (*Entyvio*®) is accepted for use within NHS Scotland for the treatment of adults with moderately to severely active ulcerative colitis who have had an inadequate response with, lost response to, or were intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

1.4 Irritable bowel syndrome

Irritable bowel syndrome

24-Feb-2016

Description of condition

Irritable bowel syndrome (IBS) is a common, chronic, relapsing, and often life-long condition, mainly affecting people aged between 20 and 30 years. It is more common in women. Symptoms include abdominal pain or discomfort, disordered defaecation (either diarrhoea, or constipation with straining, urgency, and incomplete evacuation), passage of mucus, and bloating. Symptoms are usually relieved by defaecation. Obtaining an accurate clinical diagnosis of IBS prior to treatment is crucial.

Aims of treatment

The treatment of IBS is focused on symptom control, in order to improve quality of life.

Non-drug treatment

EvGr Diet and lifestyle changes are important for effective self-management of IBS. Patients should be encouraged to increase physical activity, and advised to eat regularly, without missing meals or leaving long gaps between meals. Dietary advice should also include, limiting fresh fruit consumption to no more than 3 portions per day. The fibre intake of patients with IBS should be reviewed. If an increase in dietary fibre is required, soluble fibre such as ispaghula

husk p. 58, or foods high in soluble fibre such as oats, are recommended. Intake of insoluble fibre (e.g. bran) and 'resistant starch' should be reduced or discouraged as they may exacerbate symptoms. Fluid intake (mostly water) should be increased to at least 8 cups each day and the intake of caffeine, alcohol and fizzy drinks reduced. The artificial sweetener sorbitol should be avoided in patients with diarrhoea. Where probiotics are being used, continue for at least 4 weeks while monitoring the effect.

If a patient's symptoms persist following lifestyle and dietary advice, single food avoidance and exclusion diets may be an option under the supervision of a dietitian or medical specialist. **Ad**

Drug treatment

EvGr The choice of drug treatment depends on the nature and severity of the symptoms. Many drug treatment options for IBS are available over-the-counter.

Antispasmodic drugs (such as alverine citrate p. 93, mebeverine hydrochloride p. 93 and peppermint oil p. 52) can be taken in addition to dietary and lifestyle changes. A laxative (excluding lactulose p. 60 as it may cause bloating) can be used to treat constipation. Patients who have not responded to laxatives from the different classes and who have had constipation for at least 12 months, can be treated with linaclotide p. 52. Loperamide hydrochloride p. 71 is the first-line choice of anti-motility drug for relief of diarrhoea. Patients with IBS should be advised how to adjust their dose of laxative or anti-motility drug according to stool consistency, with the aim of achieving a soft, well-formed stool. **Ad** See Constipation p. 57, for information on other drugs used for chronic constipation.

EvGr A low-dose tricyclic antidepressant, such as amitriptyline hydrochloride p. 390 [unlicensed indication], can be used for abdominal pain or discomfort as a second-line option in patients who have not responded to antispasmodics, anti-motility drugs, or laxatives. A selective serotonin reuptake inhibitor may be considered in those who do not respond to a tricyclic antidepressant [unlicensed indication].

Psychological intervention can be offered to patients who have no relief of IBS symptoms after 12 months of drug treatment. **Ad**

1.5 Short bowel syndrome**Short bowel syndrome**

31-Aug-2016

Description of condition

Patients with a shortened bowel due to large surgical resection (with or without stoma formation) may require medical management to ensure adequate absorption of nutrients and fluid. Absorption of oral medication is also often impaired.

Aims of treatment

The management of short bowel syndrome focuses on ensuring adequate nutrition and drug absorption, thereby reducing the risk of complications resulting from these effects.

Drug treatment

Nutritional deficiencies

EvGr Patients with a short bowel may require replacement of vitamins and minerals depending on the extent and position of the bowel resection. Deficiencies in vitamins A, B₁₂, D, E, and K, essential fatty acids, zinc, and selenium can occur.

Hypomagnesaemia is common and is treated with oral or intravenous magnesium supplementation (see Magnesium imbalance p. 1111), though administration of oral magnesium may cause diarrhoea. Occasionally the use of oral alfacalcidol p. 1144 and correction of sodium depletion may be useful. Nutritional support can range from oral supplements to parenteral nutrition, depending on the severity of intestinal failure. **A**

Diarrhoea and high output stomas

Diarrhoea is common in short bowel syndrome and can be due to multiple factors. **EvGr** The use of oral rehydration salts can be considered in order to promote adequate hydration. Oral intake influences the volume of stool passed, so reducing food intake will lessen diarrhoea, but will also exacerbate the problems of undernutrition. A patient may require parenteral nutrition to allow them to eat less, if the extent of diarrhoea is unacceptable.

Pharmacological treatment may be necessary, with the choice of drug depending on the potential for side-effects and the degree of resection. **A**

Antimotility drugs

EvGr Loperamide hydrochloride p. 71 and codeine phosphate p. 475 reduce intestinal motility and thus exert antidiarrhoeal actions. Loperamide hydrochloride is preferred as it is not sedative and does not cause dependence or fat malabsorption. High doses of loperamide hydrochloride [unlicensed] may be required in patients with a short bowel due to disrupted enterohepatic circulation and rapid gastrointestinal transit time. If the desired response is not obtained with loperamide hydrochloride, codeine phosphate may be added to therapy.

Co-phenotrope p. 71 has traditionally been used alone or in combination with other medications to help decrease faecal output. Co-phenotrope crosses the blood-brain barrier and can produce central nervous system side-effects, which may limit its use; the potential for dependence and anticholinergic effects may also restrict its use. **A**

Colestyramine

EvGr In patients with an intact colon and less than 100 cm of ileum resected, colestyramine p. 210 can be used to bind the unabsorbed bile salts and reduce diarrhoea. When colestyramine is given to these patients, it is important to monitor for evidence of fat malabsorption (steatorrhoea) or fat-soluble vitamin deficiencies. **A**

Antisecretory drugs

EvGr Drugs that reduce gastric acid secretion reduce jejunosomy output. Omeprazole p. 85 is readily absorbed in the duodenum and upper small bowel, but if less than 50 cm of jejunum remains, it may need to be given intravenously. Use of a proton pump inhibitor alone does not eliminate the need for further intervention for fluid control (such as antimotility agents, intravenous fluids, or oral rehydration salts).

Octreotide [unlicensed indication] reduces ileostomy diarrhoea and large volume jejunosomy output by inhibiting multiple pro-secretory substances. There is insufficient evidence to establish its role in the management of short bowel syndrome. **A**

Growth factors

Growth factors can be used to facilitate intestinal adaptation after surgery in patients with short bowel syndrome, thus enhancing fluid, electrolyte, and micronutrient absorption.

Teduglutide below is an analogue of endogenous human glucagon-like peptide 2 (GLP-2) which is licensed for use in the management of short bowel syndrome. It may be

considered after a period of stabilisation following surgery, during which intravenous fluids and nutritional support should have been optimised.

Drug absorption

For *Prescribing in patients with stoma*, see Stoma care p. 105.

EvGr Many drugs are incompletely absorbed by patients with a short bowel and may need to be prescribed in much higher doses than usual (such as levothyroxine, warfarin, oral contraceptives, and digoxin) or may need to be given intravenously. **A**

Several factors can alter the absorption of drugs taken by mouth in patients with a compromised gastrointestinal system. The most important factors are the length of intestine available for drug absorption, and which section has been removed. The small intestine, with its large surface area and high blood flow, is the most important site of drug absorption. The larger the amount of the small intestine that has been removed, the higher the possibility that drug absorption will be affected. Other factors, such as gastric emptying and gastric transit time, also affect drug handling.

EvGr Enteric-coated and modified-release preparations are unsuitable for use in patients with short bowel syndrome, particularly in patients with an ileostomy, as there may not be sufficient release of the active ingredient.

Dosage forms with quick dissolution (soluble tablets) should be used. Uncoated tablets and liquid formulations may also be suitable. **A** **EvGr** Before prescribing liquid formulations, prescribers should consider the osmolality, excipient content and volume required. Hyperosmolar liquids and some excipients (such as sorbitol) can result in fluid loss. The calorie density of oral supplements should also be considered, as it will influence the volume to be taken. **E**

Other drugs used for Short bowel syndrome Cimetidine, p. 79

AMINO ACIDS AND DERIVATIVES

Teduglutide

29-Apr-2020

• **DRUG ACTION** Teduglutide is an analogue of human glucagon-like peptide-2 (GLP-2), which preserves mucosal integrity by promoting growth and repair of the intestine.

• INDICATIONS AND DOSE

Short bowel syndrome (initiated under specialist supervision)

► BY SUBCUTANEOUS INJECTION

► Adult: 0.05 mg/kg once daily, dose to be administered to alternating quadrants of the abdomen; alternatively the thigh can be used, for optimal injection volume per body weight, consult product literature. Review treatment after 6 months

• **CONTRA-INDICATIONS** Active or suspected malignancy · history of gastro-intestinal malignancy (in previous 5 years)

• **CAUTIONS** Abrupt withdrawal of parenteral support (reduce gradually with concomitant monitoring of fluid status) · cardiac insufficiency · cardiovascular disease · colo-rectal polyps · hypertension

• SIDE-EFFECTS

► **Common or very common** Anxiety · appetite decreased · congestive heart failure · cough · dyspnoea · fluid imbalance · gallbladder disorders · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal stoma complication · headache · influenza like illness · insomnia · nausea · pancreatitis · peripheral oedema · respiratory tract infection · vomiting

► **Uncommon** Syncope

54 Constipation and bowel cleansing

- **ALLERGY AND CROSS-SENSITIVITY** Manufacturer advises caution in patients with tetracycline hypersensitivity.
- **PREGNANCY** [EvGr](#) Specialist sources indicate use if necessary—no human data available. [◊](#)
- **BREAST FEEDING** Manufacturer advises avoid—toxicity in animal studies.
- **RENAL IMPAIRMENT**
Dose adjustments Manufacturer advises use half the daily dose in moderate or severe impairment and end-stage renal disease.
- **MONITORING REQUIREMENTS** Manufacturer advises monitoring of small bowel function, gall bladder, bile ducts and pancreas during treatment.
- **TREATMENT CESSATION** Caution when discontinuing treatment—risk of dehydration.
- **PATIENT AND CARER ADVICE** Patients with cardiovascular disease should seek medical attention if they notice sudden weight gain, swollen ankles or dyspnoea—may indicate increased fluid absorption.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2225

The *Scottish Medicines Consortium* has advised (February 2020) that teduglutide (*Revestive*®) is accepted for use within NHS Scotland for the treatment of adults with short bowel syndrome. Patients should be stable following a period of intestinal adaptation after surgery. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- Child 10–17 years: 0.5–1 sachet, given at 8 a.m. the day before the procedure and 0.5–1 sachet, given between 2 and 4 p.m. the day before the procedure

- Adult: 1 sachet, given 8 a.m. the day before the procedure and 1 sachet, given between 2 and 4 p.m. the day before the procedure, use half the dose in frail elderly patients

- **CONTRA-INDICATIONS** Acute intestinal or gastric ulceration · acute severe colitis · gastric retention · gastro-intestinal obstruction · gastro-intestinal perforation · toxic megacolon

- **CAUTIONS** Debilitated · elderly · hypovolaemia (should be corrected before administration of bowel cleansing preparations) · patients with fluid and electrolyte disturbances

CAUTIONS, FURTHER INFORMATION Adequate hydration should be maintained during treatment.

- **INTERACTIONS** → Appendix 1: bowel cleansing preparations

• SIDE-EFFECTS

- **Common or very common** Gastrointestinal discomfort · nausea · vomiting

- **Uncommon** Dehydration · dizziness · electrolyte imbalance · headache

SIDE-EFFECTS, FURTHER INFORMATION Abdominal pain is usually transient and can be reduced by taking preparation more slowly.

- **PREGNANCY** Use with caution.

- **BREAST FEEDING** Use with caution.

• RENAL IMPAIRMENT

- In adults Avoid if eGFR less than 30 mL/minute/1.73 m²—risk of hypermagnesaemia.

- In children Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—risk of hypermagnesaemia.

- **MONITORING REQUIREMENTS** Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.

- **DIRECTIONS FOR ADMINISTRATION** One sachet should be reconstituted with 200 mL of hot water; the solution should be allowed to cool for approx. 30 minutes before drinking.

• PRESCRIBING AND DISPENSING INFORMATION

Reconstitution of one sachet containing 11.57 g magnesium carbonate and 17.79 g anhydrous citric acid produces a solution containing magnesium citrate with 118 mmol Mg²⁺.

Flavours of oral powders may include lemon and lime.

- **PATIENT AND CARER ADVICE** Low residue or fluid only diet (e.g. water, fruit squash, clear soup, black tea or coffee) recommended before procedure (according to prescriber's advice) and copious intake of clear fluids recommended until procedure. Patient or carers should be given advice on how to administer oral powder.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

(Polyethylene glycols)

● INDICATIONS AND DOSE

MOVIPREP®

Bowel cleansing [before any procedure requiring a clean bowel]

► BY MOUTH

- Adult: 1 litre daily for 2 doses; first dose of reconstituted solution taken on the evening before procedure and the second dose on the morning of procedure, alternatively 2 litres daily for 1 dose; reconstituted solution to be taken on the evening before the procedure, or on the morning of the procedure, treatment should be completed at least 1 hour before clinical procedures conducted without general anaesthesia, and at least 2 hours before clinical procedures conducted under general anaesthesia

PLENVU®

Bowel cleansing [before any procedure requiring a clean bowel]

► BY MOUTH

- Adult: 500 mL daily for 2 doses; first dose of reconstituted solution taken on the evening before procedure and the second dose on the morning of procedure, alternatively 1 litre daily in 2 divided doses, reconstituted solution to be taken either on the evening before the procedure, or in the morning of the procedure—separate doses by at least 1 hour, treatment should be completed at least 1 hour before clinical procedures conducted without general anaesthesia, and at least 2 hours before clinical procedures conducted under general anaesthesia

- **CONTRA-INDICATIONS** Disorders of gastric emptying · G6PD deficiency · gastrointestinal obstruction · gastrointestinal perforation · ileus · toxic megacolon
- **CAUTIONS** Debilitated patients · dehydration (correct before administration) · impaired consciousness · impaired gag reflex or possibility of regurgitation or aspiration · moderate-to-severe cardiac impairment · patients at risk of arrhythmia (including those with thyroid disease or electrolyte imbalance) · severe acute inflammatory bowel disease
- **INTERACTIONS** → Appendix 1: bowel cleansing preparations
- **SIDE-EFFECTS**
 - **Common or very common** Chills · dehydration · dizziness · fever · gastrointestinal discomfort · headaches · hunger · malaise · nausea · sleep disorder · thirst · vomiting
 - **Uncommon** Arrhythmias · asthenia · drowsiness · dry mouth · dry throat · dysphagia · electrolyte imbalance · hot flush · pain · palpitations · temperature sensation altered
 - **Frequency not known** Flatulence · hyponatraemic seizure
- **SIDE-EFFECTS, FURTHER INFORMATION** Abdominal pain is usually transient and can be reduced by taking preparation more slowly.
- **PREGNANCY** Manufacturer advises use only if essential—no or limited information available.
- **BREAST FEEDING** Manufacturer advises use only if essential—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Manufacturer advises consider monitoring baseline and post-treatment electrolytes, renal function and ECG as appropriate, in debilitated patients, those with significant renal impairment, arrhythmia, or at risk of electrolyte imbalance.

● DIRECTIONS FOR ADMINISTRATION

PLENVU® Manufacturer advises the contents of the single sachet for Dose 1 should be made up to 500 mL with water and taken over 30 minutes; the contents of the 2 sachets (A and B) for Dose 2 should be made up to 500 mL with water and taken over 30 minutes. Each dose should be followed by 500 mL of clear fluid taken over 30 minutes.

MOVIPREP® Manufacturer advises one pair of sachets (A and B) should be made up to 1 litre with water and taken over 1–2 hours; 1 litre of other clear fluid should also be taken during treatment.

● PRESCRIBING AND DISPENSING INFORMATION

PLENVU® Dose 1 (single sachet) when reconstituted up to 500 mL with water provides Na⁺ 160.9 mmol, K⁺ 13.3 mmol, Cl⁻ 47.6 mmol; Dose 2 (sachets A and B) when reconstituted up to 500 mL with water provides Na⁺ 297.6 mmol, K⁺ 16.1 mmol, Cl⁻ 70.9 mmol.

MOVIPREP® 1 pair of sachets (A+B) when reconstituted up to 1 litre with water provides Na⁺ 181.6 mmol (Na⁺ 56.2 mmol absorbable), K⁺ 14.2 mmol, Cl⁻ 59.8 mmol.

- **PATIENT AND CARER ADVICE** Manufacturer advises solid food should not be taken during treatment until procedure completed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

2.2 Constipation

Constipation

06-Jun-2017

Description of condition

Constipation is defaecation that is unsatisfactory because of infrequent stools, difficult stool passage, or seemingly incomplete defaecation. It can occur at any age and is commonly seen in women, the elderly, and during pregnancy.

It is important for those who complain of constipation to understand that bowel habit can vary considerably in frequency without doing harm. Some people erroneously consider themselves constipated if they do not have a bowel movement each day.

New onset constipation, especially in patients over 50 years of age, or accompanying symptoms such as anaemia, abdominal pain, weight loss, or overt or occult blood in the stool should provoke urgent investigation because of the risk of malignancy or other serious bowel disorder. In those patients with secondary constipation caused by a drug, the drug should be reviewed.

Overview

EvGr In all patients with constipation, an increase in dietary fibre, adequate fluid intake and exercise is advised. Diet should be balanced and contain whole grains, fruits and vegetables. Fibre intake should be increased gradually (to minimise flatulence and bloating). The effects of a high-fibre diet may be seen in a few days although it can take as long as 4 weeks. Adequate fluid intake is important (particularly with a high-fibre diet or fibre supplements), but can be difficult for some people (for example, the frail or elderly). Fruits high in fibre and sorbitol, and fruit juices high in sorbitol, can help prevent and treat constipation. **A**

Misconceptions about bowel habits have led to excessive laxative use. Laxative abuse may lead to hypokalaemia. Before prescribing laxatives it is important to be sure that the patient is constipated and that the constipation is not secondary to an underlying undiagnosed complaint.

Laxatives

Bulk-forming laxatives

Bulk-forming laxatives include bran, ispaghula husk p. 58, methylcellulose p. 59 and sterculia p. 59. They are of particular value in adults with small hard stools if fibre cannot be increased in the diet. Onset of action is up to 72 hours. Symptoms of flatulence, bloating, and cramping may be exacerbated. Adequate fluid intake must be maintained to avoid intestinal obstruction.

Methylcellulose, ispaghula husk and sterculia may be used in patients who cannot tolerate bran. Methylcellulose also acts as a faecal softener.

Stimulant laxatives

Stimulant laxatives include bisacodyl p. 65, sodium picosulfate p. 68, and members of the anthraquinone group (senna p. 67, co-danthramer p. 66 and co-danthrusate p. 66). Stimulant laxatives increase intestinal motility and often cause abdominal cramp; manufacturer advises they should be avoided in intestinal obstruction.

The use of co-danthramer and co-danthrusate is limited to constipation in terminally ill patients because of potential carcinogenicity (based on animal studies) and evidence of genotoxicity.

Docusate sodium p. 65 is believed to act as both a stimulant laxative and as a faecal softener (below). Glycerol suppositories act as a lubricant and as a rectal stimulant by virtue of the mildly irritant action of glycerol.

Faecal softeners

Faecal softeners are claimed to act by decreasing surface tension and increasing penetration of intestinal fluid into the faecal mass. Docusate sodium and glycerol suppositories p. 67 have softening properties. Enemas containing arachis oil p. 64 (ground-nut oil, peanut oil) lubricate and soften impacted faeces and promote a bowel movement. Liquid paraffin p. 65 has also been used as a lubricant for the passage of stools but manufacturer advises that it should be used with caution because of its adverse effects, which include anal seepage and the risks of granulomatous disease of the gastro-intestinal tract or of lipoid pneumonia on aspiration.

Osmotic laxatives

Osmotic laxatives increase the amount of water in the large bowel, either by drawing fluid from the body into the bowel or by retaining the fluid they were administered with. Lactulose p. 60 is a semi-synthetic disaccharide which is not absorbed from the gastro-intestinal tract. It produces an osmotic diarrhoea of low faecal pH, and discourages the proliferation of ammonia-producing organisms. It is therefore useful in the treatment of hepatic encephalopathy. Macrogols (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 61) are inert polymers of ethylene glycol which sequester fluid in the bowel; giving fluid with macrogols may reduce the dehydrating effect sometimes seen with osmotic laxatives.

Other drugs used in constipation

Linaclotide p. 52 is a guanylate cyclase-C receptor agonist that is licensed for the treatment of moderate to severe irritable bowel syndrome associated with constipation. It increases intestinal fluid secretion and transit, and decreases visceral pain.

Prucalopride p. 64 is a selective serotonin 5HT₄-receptor agonist with prokinetic properties. It is licensed for the treatment of chronic constipation in adults, when other laxatives have failed to provide an adequate response.

Bowel cleansing preparations

Bowel cleansing preparations are used before colonic surgery, colonoscopy or radiological examination to ensure the bowel is free of solid contents; examples include macrogol 3350 with anhydrous sodium sulfate, potassium chloride, sodium bicarbonate and sodium chloride p. 55, citric acid with magnesium carbonate p. 54, magnesium citrate with sodium picosulfate p. 56 and sodium acid phosphate with sodium phosphate p. 63. Bowel cleansing treatments are not treatments for constipation.

Management

Short-duration constipation

EvGr In the management of short-duration constipation (where dietary measures are ineffective) treatment should be started with a bulk-forming laxative, ensuring adequate fluid intake. If stools remain hard, add or switch to an osmotic laxative. If stools are soft but difficult to pass or the person complains of inadequate emptying, a stimulant laxative should be added. **A**

Opioid-induced constipation

See also *Constipation* under Prescribing in palliative care p. 28. **EvGr** In patients with opioid-induced constipation, an osmotic laxative (or docusate sodium to soften the stools) and a stimulant laxative is recommended. Bulk-forming laxatives should be avoided.

Naloxegol p. 69 is recommended for the treatment of opioid-induced constipation when response to other laxatives is inadequate. **A**

Methylnaltrexone bromide p. 68 is licensed for the treatment of opioid-induced constipation when response to other laxatives is inadequate. Manufacturer advises that in patients receiving palliative care, methylnaltrexone bromide should be used as an adjunct to existing laxative therapy.

Faecal impaction

The treatment of faecal impaction depends on the stool consistency. **EvGr** In patients with hard stools, a high dose of an oral macrogol (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride) may be considered. In those with soft stools, or with hard stools after a few days treatment with a macrogol, an oral stimulant laxative should be started or added to the previous treatment. If the response to oral laxatives is inadequate, for soft stools consider rectal administration of bisacodyl, and for hard stools rectal administration of glycerol alone, or glycerol plus bisacodyl. Alternatively, a docusate sodium or sodium citrate enema p. 832 may be tried.

If the response is still insufficient, a sodium acid phosphate with sodium phosphate or arachis oil retention enema may be necessary. For hard faeces it can be helpful to give the arachis oil enema p. 64 overnight before giving a sodium acid phosphate with sodium phosphate p. 63 or sodium citrate p. 832 enema the following day. Enemas may need to be repeated several times to clear hard impacted faeces. **A**

Chronic constipation

EvGr In the management of chronic constipation, treatment should be started with a bulk-forming laxative, whilst ensuring good hydration. If stools remain hard, add or change to an osmotic laxative such as a macrogol. Lactulose p. 60 is an alternative if macrogols are not effective, or not tolerated. If the response is inadequate, a stimulant laxative can be added. The dose of laxative should be adjusted gradually to produce one or two soft, formed stools per day.

If at least two laxatives (from different classes) have been tried at the highest tolerated recommended doses for at least 6 months, the use of prucalopride p. 64 (in women only) should be considered. If treatment with prucalopride is not effective after 4 weeks, the patient should be re-examined and the benefit of continuing treatment reconsidered.

Laxatives can be slowly withdrawn when regular bowel movements occur without difficulty, according to the frequency and consistency of the stools. If a combination of laxatives has been used, reduce and stop one laxative at a time; if possible, the stimulant laxative should be reduced first. However, it may be necessary to also adjust the dose of the osmotic laxative to compensate. **A**

Constipation in pregnancy and breast-feeding

EvGr If dietary and lifestyle changes fail to control constipation in pregnancy, fibre supplements in the form of bran or wheat are likely to help women experiencing constipation in pregnancy, and raise no serious concerns about side-effects to the mother or fetus.

A bulk-forming laxative is the first choice during pregnancy if fibre supplements fail. An osmotic laxative, such as lactulose, can also be used. Bisacodyl p. 65 or senna p. 67 may be suitable if a stimulant effect is necessary but use of senna should be avoided near term or if there is a history of unstable pregnancy. Stimulant laxatives are more effective than bulk-forming laxatives but are more likely to cause side-effects (diarrhoea and abdominal discomfort), reducing their acceptability to patients. Docusate sodium p. 65 and glycerol suppositories p. 67 can also be used.

A bulk-forming laxative is the first choice during breast-feeding, if dietary measures fail. Lactulose or a macrogol may be used if stools remain hard. As an alternative, a short course of a stimulant laxative such as bisacodyl or senna can be considered. **A**

Constipation in children

Early identification of constipation and effective treatment can improve outcomes for children. Without early diagnosis and treatment, an acute episode of constipation can lead to anal fissure and become chronic.

EvGr The first-line treatment for children with constipation requires the use of a laxative in combination with dietary modification or with behavioural interventions. Diet modification alone is not recommended as first-line treatment.

In children an increase in dietary fibre, adequate fluid intake, and exercise is advised. Diet should be balanced and contain fruits, and vegetables, high-fibre bread, baked beans, and wholegrain breakfast cereals. Unprocessed bran (which may cause bloating and flatulence and reduces the absorption of micronutrients) is **not** recommended.

If faecal impaction is not present (or has been treated), the child should be treated promptly with a laxative. A macrogol (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 61) is preferred as first-line management. If the response is inadequate, add a stimulant laxative or change to a stimulant laxative if the first-line therapy is not tolerated. If stools remain hard, lactulose or another laxative with softening effects, such as docusate sodium can be added.

In children with chronic constipation, laxatives should be continued for several weeks after a regular pattern of bowel movements or toilet training is established. The dose of laxatives should then be tapered gradually, over a period of months, according to response. Some children may require laxative therapy for several years.

A shorter duration of laxative treatment may be possible in some children with a short history of constipation.

Laxatives should be administered at a time that produces an effect that is likely to fit in with the child's toilet routine. **A**

Faecal impaction in children

EvGr Treatment of faecal impaction may initially increase symptoms of soiling and abdominal pain. In children over 1 year of age with faecal impaction, an oral preparation containing a macrogol (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride) is used to clear faecal mass and to establish and maintain soft well-formed stools, using an escalating dose regimen depending on symptoms and response. If disimpaction does not occur after 2 weeks, a stimulant laxative can be added or if stools are hard, used in combination with an osmotic laxative such as lactulose. Long-term regular use of laxatives is essential to maintain well-formed stools and prevent recurrence of faecal impaction; intermittent use may provoke relapses. **A**

LAXATIVES > BULK-FORMING LAXATIVES**Ispaghula husk**

09-Mar-2020

- **DRUG ACTION** Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

● **INDICATIONS AND DOSE****Constipation**▶ **BY MOUTH**

- ▶ Child 1 month-5 years: 2.5–5 mL twice daily, dose to be taken only when prescribed by a doctor, as half or whole level spoonful in water, preferably after meals, morning and evening
- ▶ Child 6–11 years: 2.5–5 mL twice daily, dose to be given as a half or whole level spoonful in water, preferably after meals, morning and evening
- ▶ Child 12–17 years: 1 sachet twice daily, dose to be given in water preferably after meals, morning and evening
- ▶ Adult: 1 sachet twice daily, dose to be given in water preferably taken after food, morning and evening

Constipation (dose approved for use by community practitioner nurse prescribers)

▶ BY MOUTH

- ▶ Child 6–11 years: 2.5–5 mL twice daily, dose to be given as a half or whole level spoonful in water, preferably after meals, morning and evening
- ▶ Child 12–17 years: 1 sachet twice daily, dose to be given in water preferably after meals, morning and evening
- ▶ Adult: 1 sachet twice daily, dose to be given in water preferably taken after food, morning and evening

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 sachet equivalent to 2 level 5 mL spoonfuls.

- **CONTRA-INDICATIONS** Colonic atony · faecal impaction · intestinal obstruction · reduced gut motility · sudden change in bowel habit that has persisted more than two weeks · undiagnosed rectal bleeding
- **CAUTIONS** Adequate fluid intake should be maintained to avoid oesophageal or intestinal obstruction
- **SIDE-EFFECTS** Abdominal distension · bronchospasm · conjunctivitis · gastrointestinal disorders · hypersensitivity · rhinitis · skin reactions
- **DIRECTIONS FOR ADMINISTRATION** Dose to be taken with at least 150 mL liquid.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of soluble granules formulations may include plain, lemon, or orange.
- **HANDLING AND STORAGE** Ispaghula husk contains potent allergens. Individuals exposed to the product (including those handling the product) can develop hypersensitivity reactions such as rhinitis, conjunctivitis, bronchospasm and in some cases, anaphylaxis.
- **PATIENT AND CARER ADVICE** Manufacturer advises that preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed. Patients and their carers should be advised that the full effect may take some days to develop and should be given advice on how to administer Ispaghula husk.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Sterculia

10-Mar-2020

- **DRUG ACTION** Sterculia is a bulk-forming laxative. It relieves constipation by increasing faecal mass which stimulates peristalsis.

INDICATIONS AND DOSE**Constipation**

▶ BY MOUTH

- ▶ Child 6–11 years: 0.5–1 sachet 1–2 times a day, alternatively, half to one heaped 5-mL spoonful once or twice a day; washed down without chewing with plenty of liquid after meals
- ▶ Child 12–17 years: 1–2 sachets 1–2 times a day, alternatively, one to two heaped 5-mL spoonfuls once or twice a day; washed down without chewing with plenty of liquid after meals
- ▶ Adult: 1–2 sachets 1–2 times a day, alternatively, one to two heaped 5-mL spoonfuls once or twice a day; washed down without chewing with plenty of liquid after meals

- **CONTRA-INDICATIONS** Colonic atony · difficulty swallowing · faecal impaction · intestinal obstruction
- **CAUTIONS** Adequate fluid intake should be maintained to avoid oesophageal or intestinal obstruction
CAUTIONS, FURTHER INFORMATION It may be necessary to supervise elderly or debilitated patients or those with intestinal narrowing or decreased motility to ensure adequate fluid intake.
- **SIDE-EFFECTS** Diarrhoea · gastrointestinal discomfort · gastrointestinal disorders · nausea

- **DIRECTIONS FOR ADMINISTRATION** May be mixed with soft food (e.g. yoghurt) before swallowing, followed by plenty of liquid.
- **PATIENT AND CARER ADVICE** Patients and their carers should be advised that the full effect may take some days to develop. Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Granules

CAUTIONARY AND ADVISORY LABELS 25, 27

Granules▶ **Normacol Plus** (Forum Health Products Ltd)

Frangula 80 mg per 1 gram, Sterculia 620 mg per 1 gram Normacol Plus granules 7g sachets | 60 sachet [GSL] £7.12 DT = £7.12
 Normacol Plus granules | 500 gram [GSL] £8.45 DT = £8.45

LAXATIVES > OSMOTIC LAXATIVES**Lactulose**

10-Mar-2020

INDICATIONS AND DOSE**Constipation**

▶ BY MOUTH

- ▶ Child 1–11 months: 2.5 mL twice daily, adjusted according to response
- ▶ Child 1–4 years: 2.5–10 mL twice daily, adjusted according to response
- ▶ Child 5–17 years: 5–20 mL twice daily, adjusted according to response
- ▶ Adult: Initially 15 mL twice daily, adjusted according to response

Hepatic encephalopathy (portal systemic encephalopathy)

▶ BY MOUTH

- ▶ Adult: Adjusted according to response to 30–50 mL 3 times a day, subsequently adjusted to produce 2–3 soft stools per day

Constipation (dose approved for use by community practitioner nurse prescribers)

▶ BY MOUTH

- ▶ Child 1–11 months: 2.5 mL twice daily, adjusted according to response
- ▶ Child 1–4 years: 5 mL twice daily, adjusted according to response
- ▶ Child 5–10 years: 10 mL twice daily, adjusted according to response
- ▶ Child 11–17 years: Initially 15 mL twice daily, adjusted according to response
- ▶ Adult: Initially 15 mL twice daily, adjusted according to response

PHARMACOKINETICS

- ▶ Lactulose may take up to 48 hours to act.

UNLICENSED USE

- ▶ In adults Lactulose doses in the BNF may differ from those in product literature.

- **CONTRA-INDICATIONS** Galactosaemia · gastro-intestinal obstruction · gastro-intestinal perforation · risk of gastro-intestinal perforation

- **CAUTIONS** Lactose intolerance

SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · diarrhoea · flatulence · nausea · vomiting

- ▶ **Uncommon** Electrolyte imbalance

- **PREGNANCY** Not known to be harmful.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Lactulose for constipation
www.medicinesforchildren.org.uk/lactulose-constipation

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution▶ **Lactulose (Non-proprietary)**

Lactulose 666.667 mg per 1 ml Lactulose 10g/15ml oral solution 15ml sachets sugar free sugar-free | 10 sachet [P] £2.51 DT = £2.51
 Lactulose 10g/15ml oral solution 15ml sachets sugar free unflavoured sugar-free | 10 sachet [P] £2.50 DT = £2.51

Lactulose 10g/15ml oral solution 15ml sachets sugar free plum sugar-free | 10 sachet [P] £2.60 DT = £2.51

Lactulose 680 mg per 1 ml Lactulose 3.1–3.7g/5ml oral solution | 300 ml [P] £1.37–£5.50 | 500 ml [P] £6.50 DT = £2.90

▶ **Duphalac** (Mylan)

Lactulose 680 mg per 1 ml Duphalac 3.35g/5ml oral solution | 200 ml [P] £1.92 | 300 ml [P] £2.88 | 500 ml [P] £4.80 DT = £2.90

Macrogol 3350

21-Aug-2017

INDICATIONS AND DOSE**Chronic constipation**

▶ BY MOUTH

- ▶ Adult: 2 sachets once daily usually for up to 2 weeks, dose to be taken preferably in the morning

PHARMACOKINETICS

- ▶ Onset of action 24–48 hours.

- **CONTRA-INDICATIONS** Ileus · intestinal obstruction · intestinal perforation · risk of intestinal perforation · severe inflammatory bowel disease · toxic megacolon

SIDE-EFFECTS

- ▶ **Common or very common** Flatulence · gastrointestinal discomfort · nausea · vomiting

- ▶ **Uncommon** Anaemia · angioedema · appetite disorder · dehydration · dizziness · fatigue · hiccups · hypertension ·

hypoglycaemia · hypothyroidism · increased risk of infection · local swelling · migraine · muscle twitching · neuritis · oedema · pain · pelvic pain · sinus congestion · skin reactions · tachycardia · taste altered

- **PREGNANCY** Limited data, but manufacturer advises no effects anticipated as systemic exposure is negligible.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises contents of each sachet to be dissolved in half a glass (approx. 100 mL) of water just before administration.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride

18-Apr-2018

● INDICATIONS AND DOSE

Chronic constipation (dose for 'paediatric' sachets) |

Prevention of faecal impaction (dose for 'paediatric' sachets)

▶ BY MOUTH

- ▶ Child 2-5 years: 1 sachet daily, adjust dose to produce regular soft stools; maximum 4 sachets per day
- ▶ Child 6-11 years: 2 sachets daily, adjust dose to produce regular soft stools; maximum 4 sachets per day

Faecal impaction (dose for 'paediatric' sachets)

▶ BY MOUTH

- ▶ Child 5-11 years: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be taken over a 12-hour period, after disimpaction, switch to maintenance laxative therapy; maximum 12 sachets per day

Chronic constipation (dose for 'half-strength' sachets)

▶ BY MOUTH

- ▶ Child 12-17 years: 2-6 sachets daily in divided doses usually for up to 2 weeks; maintenance 2-4 sachets daily
- ▶ Adult: 2-6 sachets daily in divided doses usually for up to 2 weeks; maintenance 2-4 sachets daily

Faecal impaction (dose for 'half-strength' sachets)

▶ BY MOUTH

- ▶ Child 12-17 years: 8 sachets on first day, then increased in steps of 4 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 16 sachets per day
- ▶ Adult: 8 sachets on first day, then increased in steps of 4 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 16 sachets per day

Chronic constipation (dose for 'full-strength' sachets)

▶ BY MOUTH

- ▶ Child 12-17 years: 1-3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1-2 sachets daily
- ▶ Adult: 1-3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1-2 sachets daily

Faecal impaction (dose for 'full-strength' sachets)

▶ BY MOUTH

- ▶ Child 12-17 years: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to

maintenance laxative therapy if required; maximum 8 sachets per day

- ▶ Adult: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ Each 'paediatric' sachet contains 6.563 g of macrogol 3350; each 'half-strength' sachet contains 6.563 g of macrogol 3350; each 'full-strength' sachet contains 13.125 g of macrogol 3350.

MOVICOL[®] READY TO TAKE SACHETS

Chronic constipation

▶ BY MOUTH

- ▶ Child 12-17 years: 1-3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1-2 sachets daily
- ▶ Adult: 1-3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1-2 sachets daily

Faecal impaction

▶ BY MOUTH

- ▶ Child 12-17 years: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period; patients should also take an additional 1 litre of fluid daily, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day
- ▶ Adult: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period; patients should also take an additional 1 litre of fluid daily, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day

MOVICOL[®] LIQUID

Chronic constipation

▶ BY MOUTH

- ▶ Child 12-17 years: 25 mL 1-3 times a day usually for up to 2 weeks; maintenance 25 mL 1-2 times a day
- ▶ Adult: 25 mL 1-3 times a day usually for up to 2 weeks; maintenance 25 mL 1-2 times a day

VISTAPREP[®] ORAL POWDER

Bowel cleansing before colonoscopy

▶ BY MOUTH

- ▶ Adult: 3-4 litres, reconstituted solution taken over 4 hours, generally on the day of procedure; alternatively, it can be taken on the evening before procedure *or* started on the evening before procedure and completed on the morning of procedure

● UNLICENSED USE

- ▶ In children Macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride may be used as detailed below, although these situations are considered outside the scope of its licence:

-  dose for chronic constipation/prevention of faecal impaction in children aged 6 years ;
-  dose titration schedule for faecal impaction in children aged 12-17 years .

- ▶ In adults Macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride may be used as detailed below, although this is considered outside the scope of its licence:  dose titration schedule for faecal impaction .

- **CONTRA-INDICATIONS** Intestinal obstruction · intestinal perforation · paralytic ileus · severe inflammatory conditions of the intestinal tract (including Crohn's disease, ulcerative colitis and toxic megacolon) · use of 'paediatric' sachets for faecal impaction in impaired

cardiovascular function (no information available) (in children)

VISTAPREP® ORAL POWDER Impaired consciousness · impaired swallowing reflex · moderate-to-severe heart failure—limited safety information available · risk of regurgitation or aspiration · severe dehydration—limited safety information available

- **CAUTIONS** Cardiovascular impairment (should not take more than 2 'full-strength' sachets or 4 'half-strength' sachets in any one hour) · impaired consciousness (with high doses) · impaired gag reflex (with high doses) · reflux oesophagitis (with high doses)

VISTAPREP® ORAL POWDER Chronic inflammatory bowel disease · elderly · heart rhythm abnormalities · reflux oesophagitis

- **SIDE-EFFECTS** Electrolyte imbalance (discontinue if symptoms occur) · flatulence · gastrointestinal discomfort · nausea · vomiting
- **PREGNANCY** Manufacturers advise may be used—limited data available.

● HEPATIC IMPAIRMENT

VISTAPREP® ORAL POWDER Manufacturer advises avoid (limited information available).

● RENAL IMPAIRMENT

- ▶ In children Manufacturers advise avoid use of 'paediatric' sachets for faecal impaction—no information available.

VISTAPREP® ORAL POWDER Manufacturer advises avoid—limited safety information available.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturers advise dissolve contents of each 'half-strength' sachet of oral powder in 62.5 mL of water, and each 'full-strength' sachet of oral powder in 125 mL of water; after reconstitution the solution should be kept in a refrigerator—for further information consult product literature.
- ▶ In children Manufacturers advise dissolve contents of each 'paediatric' sachet of oral powder in 62.5 mL of water; after reconstitution the solution should be kept in a refrigerator—for further information consult product literature.

MOVICOL® LIQUID Manufacturer advises dilute 25 mL of oral concentrate with 100 mL of water; after dilution the solution should be discarded if unused after 24 hours.

VISTAPREP® ORAL POWDER Manufacturer advises dissolve the contents of each sachet in 1 L water; if not consumed immediately, the reconstituted solution should be kept in a refrigerator and discarded if unused after 48 hours.

- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on how to take the oral powder and oral solution.

Medicines for Children leaflet: Movicol for constipation

www.medicinesforchildren.org.uk/movicol-constipation

VISTAPREP® ORAL POWDER Manufacturer advises treatment can be stopped if bowel motions become watery and clear.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Magnesium hydroxide

09-Mar-2020

● INDICATIONS AND DOSE

Constipation

▶ BY MOUTH

- ▶ Child 3-11 years: 5–10 mL as required, dose to be given mixed with water at bedtime
- ▶ Child 12-17 years: 30–45 mL as required, dose to be given mixed with water at bedtime
- ▶ Adult: 30–45 mL as required, dose to be given mixed with water at bedtime

- **CONTRA-INDICATIONS** Acute gastro-intestinal conditions
- **CAUTIONS** Debilitated patients · elderly

- **INTERACTIONS** → Appendix 1: magnesium
- **HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.
- **RENAL IMPAIRMENT** Increased risk of toxicity in renal impairment.
Dose adjustments Avoid or reduce dose.
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Magnesium Hydroxide Mixture, BP consists of an aqueous suspension containing about 8% hydrated magnesium oxide.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
Oral suspension
 - ▶ **Magnesium hydroxide (Non-proprietary)**
Magnesium hydroxide 79 mg per 1 ml Magnesium hydroxide 7.45-8.35% oral suspension BP | 500 ml [GS] £5.31
 - ▶ **Magnesium hydroxide 80 mg per 1 ml** Magnesium hydroxide 8% oral suspension | 500 ml [GS] £8.05 DT = £8.05

Sodium acid phosphate with sodium phosphate

17-Mar-2020

● INDICATIONS AND DOSE

Constipation (using Phosphates Enema BP Formula B) | Bowel evacuation before abdominal radiological procedures, endoscopy, and surgery (using Phosphates Enema BP Formula B)

- ▶ BY RECTUM
 - ▶ Child 3-6 years: 45-65 mL once daily
 - ▶ Child 7-11 years: 65-100 mL once daily
 - ▶ Child 12-17 years: 100-128 mL once daily
 - ▶ Adult: 128 mL daily

Constipation, using Phosphates Enema BP Formula B (dose approved for use by community practitioner nurse prescribers)

- ▶ BY RECTUM
 - ▶ Child 3-17 years: Reduced according to body-weight
 - ▶ Adult: 128 mL daily

Constipation, using Phosphates Enema (Clean Ready-to-Use) (dose approved for use by community practitioner nurse prescribers)

- ▶ BY RECTUM
 - ▶ Child 3-11 years: On doctor's advice only
 - ▶ Child 12-17 years: 118 mL
 - ▶ Adult: 118 mL

FLEET® READY-TO-USE ENEMA

Constipation | Bowel evacuation before abdominal radiological procedures | Bowel evacuation before endoscopy | Bowel evacuation before surgery

- ▶ BY RECTUM
 - ▶ Adult: 118 mL

FLEET® PHOSPHO-SODA

Bowel evacuation before colonic surgery | Bowel evacuation before colonoscopy | Bowel evacuation before radiological examination

- ▶ BY MOUTH
 - ▶ Adult: 45 mL twice daily, each dose must be diluted with half a glass (120 mL) of cold water, followed by one full glass (240 mL) of cold water, timing of doses dependent on the time of the procedure, for morning procedure, the first dose should be taken at 7 a.m. and second at 7 p.m. on day before the procedure.; for afternoon procedure, first dose should be taken at 7 p.m. on day before and second dose at 7 a.m. on day of the procedure

PHARMACOKINETICS

- ▶ For *Fleet® Phospho-soda*: onset of action is within half to 6 hours of first dose.

● CONTRA-INDICATIONS

- ▶ With oral use Acute severe colitis · ascites · congestive cardiac failure · gastric retention · gastro-intestinal obstruction · gastro-intestinal perforation · toxic megacolon
- ▶ With rectal use conditions associated with increased colonic absorption · gastro-intestinal obstruction · inflammatory bowel disease

● CAUTIONS

- ▶ With oral use Cardiac disease · colitis · debilitated patients · elderly · fluid and electrolyte disturbances · hypovolaemia (should be corrected before administration)
- ▶ With rectal use Ascites · congestive heart failure · debilitated patients · elderly · fluid and electrolyte disturbances · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: bowel cleansing preparations

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Chills · gastrointestinal discomfort · nausea · vomiting
- ▶ **Uncommon** Dehydration
- ▶ **Rare or very rare** Electrolyte imbalance · metabolic acidosis

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
 - ▶ With oral use Asthenia · chest pain · dizziness · headache
- ▶ **Rare or very rare**
 - ▶ With oral use Allergic dermatitis · arrhythmia · hypotension · loss of consciousness · muscle cramps · myocardial infarction · nephrocalcinosis · paraesthesia · renal impairment · tetany
 - ▶ With rectal use Pain

● PREGNANCY

- ▶ With oral use Caution.

● BREAST FEEDING

- ▶ With oral use Caution.

● RENAL IMPAIRMENT

- ▶ With oral use Avoid if eGFR less than 60 mL/minute/1.73 m².
- ▶ With rectal use Use with caution.

● MONITORING REQUIREMENTS

- ▶ With oral use Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.

● DIRECTIONS FOR ADMINISTRATION

- **FLEET® PHOSPHO-SODA** Copious intake of water or other clear fluids (e.g. clear soup, strained fruit juice without pulp, black tea or coffee) recommended until midnight before morning procedure and until 8 a.m. before afternoon procedure. At least one glass (approx 240 mL) of water or other clear fluid should also be taken immediately before each dose.
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Phosphates Enema BP Formula B consists of sodium dihydrogen phosphate dihydrate 12.8 g, disodium phosphate dodecahydrate 10.24 g, purified water, freshly boiled and cooled, to 128 mL.

● PATIENT AND CARER ADVICE

- **FLEET® PHOSPHO-SODA** Intake of solid food should be stopped for at least 6 hours before starting treatment and until procedure completed.

Patients or carers should be advised that adequate hydration should be maintained during treatment.

Patients or carers should be given advice on administration of *Fleet® Phospho-soda* oral solution.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

LAXATIVES > SELECTIVE 5-HT₄ RECEPTOR AGONISTS

Prucalopride

10-Mar-2020

- **DRUG ACTION** A selective serotonin 5HT₄-receptor agonist with prokinetic properties.

● INDICATIONS AND DOSE

Chronic constipation when other laxatives fail to provide an adequate response

- ▶ BY MOUTH

▶ **Adult:** 2 mg once daily, review treatment if no response after 4 weeks

▶ **Elderly:** Initially 1 mg once daily, increased if necessary to 2 mg once daily, review treatment if no response after 4 weeks

- **CONTRA-INDICATIONS** Crohn's disease · intestinal obstruction · intestinal perforation · toxic megacolon · ulcerative colitis

- **CAUTIONS** History of arrhythmias · history of ischaemic heart disease

● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · diarrhoea · dizziness · fatigue · gastrointestinal discomfort · gastrointestinal disorders · headache · nausea · vomiting
- ▶ **Uncommon** Anorectal haemorrhage · fever · malaise · palpitations · tremor · urinary frequency increased

SIDE-EFFECTS, FURTHER INFORMATION Side-effects generally occur at the start of treatment and are usually transient.

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment.

- **PREGNANCY** Manufacturer advises avoid—limited data available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (risk of increased exposure, limited information available).

Dose adjustments Manufacturer advises initial dose of 1 mg once daily in severe impairment; if tolerated this may be increased to 2 mg once daily.

● RENAL IMPAIRMENT

Dose adjustments Manufacturer recommends a reduced dose of 1 mg daily if eGFR less than 30 mL/minute/1.73 m².

● PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises that dizziness and fatigue may initially affect ability to drive or operate machinery.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Prucalopride for the treatment of chronic constipation in women (December 2010)** NICE TA211

Prucalopride (*Resolor®*) is recommended as an option for the treatment of chronic constipation in women for whom treatment with at least 2 laxatives from different classes, at the highest tolerated recommended doses for at least 6 months, has failed to provide adequate relief and invasive treatment for constipation is being considered. If treatment with prucalopride is not effective after 4 weeks, the patient should be re-examined and the benefit of continuing treatment reconsidered.

Prucalopride should only be prescribed by a clinician with experience of treating chronic constipation, after careful review of the patient's previous courses of laxative treatments.

www.nice.org.uk/guidance/ta211

Scottish Medicines Consortium (SMC) decisions

SMC No. 653/10

The *Scottish Medicines Consortium* has advised (July 2011) that prucalopride (*Resolor®*) is not recommended for use within NHS Scotland for the symptomatic treatment of chronic constipation of women in whom laxatives fail to provide adequate relief.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Resolor** (Shire Pharmaceuticals Ltd)

Prucalopride (as Prucalopride succinate) 1 mg Resolor 1mg

tablets | 28 tablet [P_oM] £38.69 DT = £38.69

Prucalopride (as Prucalopride succinate) 2 mg Resolor 2mg

tablets | 28 tablet [P_oM] £59.52 DT = £59.52

LAXATIVES > SOFTENING LAXATIVES

Arachis oil

09-Mar-2020

● INDICATIONS AND DOSE

To soften impacted faeces

- ▶ BY RECTUM

▶ **Adult:** 130 mL as required

- **CONTRA-INDICATIONS** Inflammatory bowel disease (except under medical supervision)

- **CAUTIONS** Hypersensitivity to soya · intestinal obstruction

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to arachis oil or peanuts.

- **DIRECTIONS FOR ADMINISTRATION** Warm enema in warm water before use.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Enema

- ▶ **Arachis oil (Non-proprietary)**

Arachis oil 1 ml per 1 ml Arachis oil 130ml enema | 1 enema [P]

£47.50 DT = £47.50

Docusate sodium

16-Mar-2020

(Diocyl sodium sulphosuccinate)

● INDICATIONS AND DOSE

Chronic constipation

- ▶ BY MOUTH
- ▶ Child 6–23 months: 12.5 mg 3 times a day, adjusted according to response, use paediatric oral solution
- ▶ Child 2–11 years: 12.5–25 mg 3 times a day, adjusted according to response, use paediatric oral solution
- ▶ Child 12–17 years: Up to 500 mg daily in divided doses, adjusted according to response
- ▶ Adult: Up to 500 mg daily in divided doses, adjusted according to response

▶ BY RECTUM

- ▶ Child 12–17 years: 120 mg for 1 dose
- ▶ Adult: 120 mg for 1 dose

Adjunct in abdominal radiological procedures

▶ BY MOUTH

- ▶ Adult: 400 mg, to be administered with barium meal

▶ BY RECTUM

- ▶ Adult: 120 mg for 1 dose

PHARMACOKINETICS

- ▶ With oral use or rectal use
- ▶ Oral preparations act within 1–2 days; response to rectal administration usually occurs within 20 minutes.

● UNLICENSED USE

- ▶ With oral use in children *Adult oral solution and capsules* not licensed for use in children under 12 years.

● CONTRA-INDICATIONS

- ▶ Avoid in intestinal obstruction

● CAUTIONS

- ▶ Do not give with liquid paraffin · excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia

- ▶ With rectal use rectal preparations not indicated if haemorrhoids or anal fissure

● INTERACTIONS

- ▶ → Appendix 1: docusate sodium

● SIDE-EFFECTS

- ▶ Rare or very rare
- ▶ With oral use Abdominal cramps · nausea · rash

● PREGNANCY

- ▶ Not known to be harmful—manufacturer advises caution.

● BREAST FEEDING

- ▶ With oral use Manufacturer advises caution—present in milk following oral administration.

- ▶ With rectal use Rectal administration not known to be harmful.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With oral use in children For administration *by mouth*, solution may be mixed with milk or squash.

● MEDICINAL FORMS

- ▶ There can be variation in the licensing of different medicines containing the same drug.

Oral solution

- ▶ **Docusate sodium (Non-proprietary)**
- ▶ Docusate sodium 2.5 mg per 1 ml Docusate 12.5mg/5ml oral solution sugar free sugar-free | 300 ml P £8.96 DT = £8.96
- ▶ Docusate sodium 10 mg per 1 ml Docusate 50mg/5ml oral solution sugar free sugar-free | 300 ml P £9.19 DT = £9.19
- ▶ **Docusol** (Typharm Ltd)
- ▶ Docusate sodium 2.5 mg per 1 ml Docusol Paediatric 12.5mg/5ml oral solution sugar-free | 125 ml P £4.46

Enema

- ▶ **Norgalax** (Essential Pharma Ltd)
- ▶ Docusate sodium 12 mg per 1 gram Norgalax 120mg/10g enema | 6 enema P £28.00 DT = £28.00

Capsule

- ▶ **Diocyl** (UCB Pharma Ltd)
- ▶ Docusate sodium 100 mg Diocyl 100mg capsules | 30 capsule P £2.09 DT = £2.09 | 100 capsule P £6.98

Combinations available: *Co-danthrusate*, p. 66

Liquid paraffin

01-May-2020

● INDICATIONS AND DOSE

Constipation

- ▶ BY MOUTH
- ▶ Adult: 10–30 mL daily if required, to be administered at night

● CAUTIONS

- ▶ Avoid prolonged use

● SIDE-EFFECTS

- ▶ Anal irritation · contact dermatitis · granuloma · pneumonia lipoid · rectal discharge of drug

● PATIENT AND CARER ADVICE

- ▶ Oral emulsion should not be taken immediately before going to bed.

● MEDICINAL FORMS

- ▶ There can be variation in the licensing of different medicines containing the same drug.

Liquid

- ▶ **Liquid paraffin (Non-proprietary)**
- ▶ Liquid paraffin 1 ml per 1 ml Liquid paraffin liquid | 150 ml P £1.37–£1.50 DT = £1.37

LAXATIVES > STIMULANT LAXATIVES

Bisacodyl

16-Mar-2020

● INDICATIONS AND DOSE

Constipation

- ▶ BY MOUTH
- ▶ Child 4–17 years: 5–20 mg once daily, adjusted according to response, dose to be taken at night
- ▶ Adult: 5–10 mg once daily; increased if necessary up to 20 mg once daily, dose to be taken at night

▶ BY RECTUM

- ▶ Child 2–17 years: 5–10 mg once daily, adjusted according to response
- ▶ Adult: 10 mg once daily, dose to be taken in the morning

Bowel clearance before radiological procedures and surgery

▶ INITIALLY BY MOUTH

- ▶ Adult: 10 mg twice daily, dose to be taken in the morning and evening on the day before procedure and (by rectum) 10 mg, to be administered 1–2 hours before procedure the following day

Constipation (dose approved for use by community practitioner nurse prescribers)

▶ BY MOUTH

- ▶ Child 4–17 years: 5–20 mg once daily, adjusted according to response, dose to be taken at night (on doctor's advice only)
- ▶ Adult: 5–10 mg once daily; increased if necessary up to 20 mg once daily, dose to be taken at night

▶ BY RECTUM

- ▶ Child 4–9 years: 5 mg once daily, adjusted according to response
- ▶ Child 10–17 years: 10 mg once daily, dose to be taken in the morning
- ▶ Adult: 10 mg once daily, dose to be taken in the morning

PHARMACOKINETICS

- ▶ Tablets act in 10–12 hours; suppositories act in 20–60 minutes.

● UNLICENSED USE

- ▶ With rectal use in children EvGr Bisacodyl may be used in children aged under 10 years for the management of constipation, A but the higher dose option is not licensed in this age group.
- ▶ With oral use in children EvGr Bisacodyl may be used in children for the management of constipation, A but the higher dose option is not licensed.

- **CONTRA-INDICATIONS** Acute abdominal conditions · acute inflammatory bowel disease · intestinal obstruction · severe dehydration
- **CAUTIONS** Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia · prolonged use may harm intestinal function · risk of electrolyte imbalance with prolonged use
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Gastrointestinal discomfort · nausea
 - ▶ **Uncommon** Haematochezia · vomiting
 - ▶ **Rare or very rare** Angioedema · colitis · dehydration
- **PREGNANCY** May be suitable for constipation in pregnancy, if a stimulant effect is necessary.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, suppository

Gastro-resistant tablet

Co-danthramer

16-Mar-2020

● **INDICATIONS AND DOSE****Constipation in palliative care (standard strength capsules)**▶ **BY MOUTH USING CAPSULES**

- ▶ Child 6-11 years: 1 capsule once daily, dose should be taken at night
- ▶ Child 12-17 years: 1-2 capsules once daily, dose should be taken at night
- ▶ Adult: 1-2 capsules once daily, dose should be taken at night

Constipation in palliative care (strong capsules)▶ **BY MOUTH USING CAPSULES**

- ▶ Child 12-17 years: 1-2 capsules once daily, dose should be given at night
- ▶ Adult: 1-2 capsules once daily, dose should be given at night

Constipation in palliative care (standard strength suspension)▶ **BY MOUTH USING ORAL SUSPENSION**

- ▶ Child 2-11 years: 2.5-5 mL once daily, dose should be taken at night
- ▶ Child 12-17 years: 5-10 mL once daily, dose should be taken at night
- ▶ Adult: 5-10 mL once daily, dose should be taken at night

Constipation in palliative care (strong suspension)▶ **BY MOUTH USING ORAL SUSPENSION**

- ▶ Child 12-17 years: 5 mL once daily, dose should be taken at night
- ▶ Adult: 5 mL once daily, dose should be taken at night

DOSE EQUIVALENCE AND CONVERSION

- ▶ Co-danthramer (standard strength) capsules contain dantron 25 mg with poloxamer '188' 200 mg per capsule.
- ▶ Co-danthramer (standard strength) oral suspension contains dantron 25 mg with poloxamer '188' 200 mg per 5 mL.
- ▶ Co-danthramer **strong** capsules contain dantron 37.5 mg with poloxamer '188' 500 mg.
- ▶ Co-danthramer **strong** oral suspension contains dantron 75 mg with poloxamer '188' 1 g per 5 mL.
- ▶ Co-danthramer suspension 5 mL = one co-danthramer capsule, **but** strong co-danthramer suspension 5 mL = two strong co-danthramer capsules.

- **CONTRA-INDICATIONS** Acute abdominal conditions · acute inflammatory bowel disease · intestinal obstruction · severe dehydration

- **CAUTIONS** Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia · may cause local irritation · *rodent* studies indicate potential carcinogenic risk

CAUTIONS, FURTHER INFORMATION

- ▶ Local irritation Avoid prolonged contact with skin (incontinent patients or infants wearing nappies—risk of irritation and excoriation).
- **SIDE-EFFECTS** Abdominal cramps · asthenia · gastrointestinal disorders · hypermagnesaemia · skin reactions · urine red
- **PREGNANCY** Manufacturers advise avoid—limited information available.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **PRESCRIBING AND DISPENSING INFORMATION**

Palliative care For further information on the use of co-danthramer in palliative care, see www.medicinescomplete.com/#/content/palliative/stimulant-laxatives.

Senna with ispaghula husk

23-Apr-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, senna p. 67, ispaghula husk p. 58.

● INDICATIONS AND DOSE

Constipation

► BY MOUTH

- Child 12-17 years: 5–10 g once daily, to be taken at night, up to 2–3 times a week
- Adult: 5–10 g once daily, to be taken at night, up to 2–3 times a week

DOSE EQUIVALENCE AND CONVERSION

- 5 g equivalent to one level spoonful of granules.

- **PREGNANCY** Manufacturer advises avoid during first trimester. To be used only intermittently and only if dietary and lifestyle changes fail.
- **DIRECTIONS FOR ADMINISTRATION** Take at night with at least 150 mL liquid.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Granules

CAUTIONARY AND ADVISORY LABELS 25

EXCIPIENTS: May contain Saccharose

- **Manevac** (Mylan)

Senna fruit 124 mg per 1 gram, Ispaghula 542 mg per 1 gram Manevac granules | 400 gram [P] £9.50 DT = £9.50

Sodium picosulfate

10-Mar-2020

(Sodium picosulphate)

- **DRUG ACTION** Sodium picosulfate is a stimulant laxative. After metabolism in the colon it stimulates the mucosa thereby increasing the motility of the large intestine.

● INDICATIONS AND DOSE

Constipation

► BY MOUTH

- Child 1 month-3 years: 2.5–10 mg once daily, adjusted according to response
- Child 4-17 years: 2.5–20 mg once daily, adjusted according to response
- Adult: 5–10 mg once daily, dose to be taken at bedtime

Constipation (dose approved for use by community practitioner nurse prescribers)

► BY MOUTH

- Child 1 month-3 years: 250 micrograms/kg once daily (max. per dose 5 mg), adjusted according to response, (on doctor's advice only); dose to be taken at night
- Child 4-10 years: 2.5–5 mg once daily, adjusted according to response, (on doctor's advice only); dose to be taken at night
- Child 11-17 years: 5–10 mg once daily, adjusted according to response, dose to be taken at night
- Adult: 5–10 mg once daily, dose to be taken at night

PHARMACOKINETICS

- Onset of action 6–12 hours.

- **UNLICENSED USE** Sodium picosulfate doses in BNF Publications adhere to national guidelines and may differ from those in product literature.
- **CONTRA-INDICATIONS** Intestinal obstruction · undiagnosed abdominal pain
- **INTERACTIONS** → Appendix 1: sodium picosulfate
- **SIDE-EFFECTS**
 - **Common or very common** Diarrhoea · gastrointestinal discomfort
 - **Uncommon** Dizziness · nausea · vomiting

- **Frequency not known** Angioedema · skin reactions · syncope

SIDE-EFFECTS, FURTHER INFORMATION Prolonged or excessive use can cause diarrhoea and related effects such as hypokalaemia.

- **PREGNANCY** Manufacturer states evidence limited but not known to be harmful.
- **BREAST FEEDING** [EvGr] Specialist sources indicate suitable for use in breast-feeding in infants over 1 month—not known to be present in milk. [D]
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Sodium picosulfate for constipation www.medicinesforchildren.org.uk/sodium-picosulfate-constipation

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

OPIOID RECEPTOR ANTAGONISTS

Methylnaltrexone bromide

03-Mar-2020

- **DRUG ACTION** Methylnaltrexone bromide is a peripherally acting opioid-receptor antagonist. It therefore blocks the gastro-intestinal (constipating) effects of opioids without altering their central analgesic effects.

● INDICATIONS AND DOSE

Opioid-induced constipation in patients with chronic pain (except palliative care patients with advanced illness)

► BY SUBCUTANEOUS INJECTION

- Adult: 12 mg once daily if required, to be given as 4–7 doses weekly

Adjunct to other laxatives in opioid-induced constipation in palliative care

► BY SUBCUTANEOUS INJECTION

- Adult (body-weight up to 38 kg): 150 micrograms/kg once daily on alternate days for maximum duration of treatment 4 months, two consecutive doses may be given 24 hours apart if no response to treatment on the preceding day
- Adult (body-weight 38–61 kg): 8 mg once daily on alternate days for maximum duration of treatment 4 months, two consecutive doses may be given 24 hours apart if no response to treatment on the preceding day
- Adult (body-weight 62–114 kg): 12 mg once daily on alternate days for maximum duration of treatment 4 months, two consecutive doses may be given 24 hours apart if no response to treatment on the preceding day
- Adult (body-weight 115 kg and above): 150 micrograms/kg once daily on alternate days for maximum duration of treatment 4 months, two consecutive doses may be given 24 hours apart if no response to treatment on the preceding day

PHARMACOKINETICS

- May act within 30–60 minutes.

- **CONTRA-INDICATIONS** Acute surgical abdominal conditions · gastro-intestinal obstruction
- **CAUTIONS** Diverticular disease (when active) · faecal impaction · gastro-intestinal tract lesions (known or

suspected) · patients with colostomy · patients with peritoneal catheter

● SIDE-EFFECTS

▶ **Common or very common** Abdominal pain · diarrhoea · dizziness · gastrointestinal disorders · nausea · opioid withdrawal-like syndrome · vomiting

Overdose Symptoms of overdosage include orthostatic hypotension.

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity at high doses in *animal* studies.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (no information available).

● RENAL IMPAIRMENT

Dose adjustments If eGFR less than 30 mL/minute/1.73 m², reduce dose as follows: body-weight under 62 kg, 75 micrograms/kg on alternate days; body-weight 62–114 kg, 8 mg on alternate days; body-weight over 114 kg, 75 micrograms/kg on alternate days.

- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site.

● PRESCRIBING AND DISPENSING INFORMATION

Palliative care For further information on the use of methylnaltrexone in palliative care, see www.medicinescomplete.com/#/content/palliative/opioid-antagonists-therapeutic-target-outside-the-cns.

- **HANDLING AND STORAGE** Protect from light.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Relistor** (Bausch & Lomb UK Ltd)

Methylnaltrexone bromide 20 mg per 1 ml Relistor 12mg/0.6ml solution for injection vials | 1 vial **[PoM]** £21.05 | 7 vial **[PoM]** £147.35

Naldemedine

07-May-2020

- **DRUG ACTION** Naldemedine is a peripherally acting opioid receptor antagonist. It therefore decreases the constipating effects of opioids without altering their central analgesic effects.

● INDICATIONS AND DOSE

Opioid-induced constipation [previous treatment with a laxative]

▶ BY MOUTH

▶ Adult: 200 micrograms once daily

- **CONTRA-INDICATIONS** Increased risk of recurrent obstruction (risk of gastro-intestinal perforation) · known or suspected gastro-intestinal obstruction (risk of gastro-intestinal perforation)

- **CAUTIONS** Conditions with impaired integrity of the gastro-intestinal wall (risk of gastro-intestinal perforation) · treatment initiation in patients aged 75 years and over (limited information available)

CAUTIONS, FURTHER INFORMATION

- ▶ Disruptions to blood-brain barrier Manufacturer advises caution in patients with clinically important disruptions to the blood-brain barrier (e.g. advanced Alzheimer's disease, active multiple sclerosis, primary brain malignancies)—risk of opioid withdrawal or reduced analgesia.
- ▶ Cardiovascular disorders Safety and efficacy has not been established in patients with these conditions.

- **INTERACTIONS** → Appendix 1: naldemedine

● SIDE-EFFECTS

▶ **Common or very common** Diarrhoea · gastrointestinal discomfort · nausea · vomiting

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—*animal* studies do not indicate toxicity; risk of opioid withdrawal in fetus.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies; theoretical risk of opioid withdrawal in breast-fed neonate.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (no information available).

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers to report severe, persistent or worsening gastro-intestinal effects (such as abdominal pain) to their prescriber. Manufacturer advises patients and carers should be counselled on the risk of opioid withdrawal syndrome and to seek medical advice if this occurs.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2242

The *Scottish Medicines Consortium* has advised (April 2020) that naldemedine (*Rizmoic*[®]) is accepted for use within NHS Scotland for the treatment of opioid-induced constipation in adults who have previously been treated with a laxative.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Naloxegol

01-Mar-2019

- **DRUG ACTION** Naloxegol is a peripherally acting opioid receptor antagonist. It therefore decreases the constipating effects of opioids without altering their central analgesic effects.

● INDICATIONS AND DOSE

Opioid-induced constipation when response to laxatives inadequate

▶ BY MOUTH

▶ Adult: 25 mg once daily, to be taken in the morning

DOSE ADJUSTMENTS DUE TO INTERACTIONS

▶ Manufacturer advises reduce initial dose to 12.5 mg daily with concurrent use of moderate inhibitors of CYP3A4, increasing to 25 mg daily if well tolerated.

- **CONTRA-INDICATIONS** Gastro-intestinal or peritoneum malignancy (risk of gastro-intestinal perforation) · known or suspected gastro-intestinal obstruction · patients at risk of recurrent gastro-intestinal obstruction · recurrent or advanced ovarian cancer (risk of gastro-intestinal perforation) · vascular endothelial growth factor (VEGF) inhibitor treatment (risk of gastro-intestinal perforation)

- **CAUTIONS** Alzheimer's disease (advanced) · cardiovascular disease · CNS metastases · congestive heart failure (symptomatic) · Crohn's disease · diverticulitis (active or recurrent) · multiple sclerosis (active) · peptic ulcer disease (severe) · primary brain malignancies · QT interval over 500 milliseconds · recent history of myocardial infarction (within 6 months)

CAUTIONS, FURTHER INFORMATION

- ▶ Disruptions to blood-brain barrier Manufacturer advises caution in patients with clinically important disruptions to the blood-brain barrier (e.g. advanced Alzheimer's disease, active multiple sclerosis, primary brain malignancies)—risk of uptake into the CNS.
- ▶ Cardiovascular disorders Safety and efficacy has not been established in patients with these conditions.

- **INTERACTIONS** → Appendix 1: naloxegol

● SIDE-EFFECTS

▶ **Common or very common** Abdominal pain · diarrhoea · flatulence · headache · hyperhidrosis · nasopharyngitis · nausea · vomiting

▶ **Uncommon** Withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises that gastrointestinal side-effects typically occur shortly after initiation of treatment — consider reducing the dose.

● **PREGNANCY** Manufacturer advises avoid—limited data available but toxicity at high doses in *animal* studies; theoretical risk of opioid withdrawal in fetus.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies and theoretical risk of opioid withdrawal in breast-fed infants.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (no information available).

● RENAL IMPAIRMENT

Dose adjustments Manufacturer advises lower initial dose in moderate to severe impairment—initially 12.5 mg daily, increase to 25 mg if well tolerated.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablets can be crushed, mixed with 120 mL of water and taken immediately if patients are unable to swallow tablets whole. The mixture may be administered via a nasogastric tube, if required.

● **PATIENT AND CARER ADVICE** Manufacturer advises patients report severe, persistent or worsening gastro-intestinal effects (such as abdominal pain) to their prescriber.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

▶ **Naloxegol for treating opioid-induced constipation (July 2015)** NICE TA345

Naloxegol (*Moventig*®) is recommended as a possible treatment for opioid induced constipation in patients whose response to laxatives is inadequate.

3 Diarrhoea

Diarrhoea (acute)

01-Aug-2017

Description of condition

Diarrhoea is the abnormal passing of loose or liquid stools, with increased frequency, increased volume, or both. Acute diarrhoea is that which lasts less than 14 days, but symptoms usually improve within 2–4 days. It can result from infection, as a side-effect of a drug, or as an acute symptom of a chronic gastro-intestinal disorder (such as inflammatory bowel disease p. 41 or Irritable bowel syndrome p. 51). It may also result from the accumulation of non-absorbed osmotically active solutes in the gastro-intestinal lumen (e.g. in lactase deficiency) or from the gastro-intestinal effects of secretory stimuli (other than the enterotoxins from an infection). It may also occur when intestinal motility or morphology is altered.

Prompt investigation is required to identify or exclude any serious underlying cause if the patient has any red flag symptoms such as unexplained weight loss, rectal bleeding, persistent diarrhoea, a systemic illness, has received recent hospital treatment or antibiotic treatment, or following foreign travel (other than to Western Europe, North America, Australia or New Zealand).

Aims of treatment

The priority of acute diarrhoea treatment, as in gastro-enteritis, is the prevention or reversal of fluid and electrolyte depletion and the management of dehydration when it is present. This is particularly important in infants, frail and elderly patients, when excessive water and electrolyte loss and dehydration can be life-threatening.

Treatment

Most episodes of acute diarrhoea will settle spontaneously without the need for any medical treatment. **[EvGr]** Oral rehydration therapy (ORT, such as sodium hydrogen citrate with glucose, potassium chloride and sodium chloride p. 1103; potassium chloride with sodium chloride p. 1101; potassium chloride with rice powder, sodium chloride and sodium citrate p. 1104) is the mainstay of treatment for acute diarrhoea to prevent or correct diarrhoea dehydration and to maintain the appropriate fluid intake once rehydration is achieved—see Fluids and electrolytes p. 1096.

However, in patients with severe dehydration and in those unable to drink, immediate admission to hospital and urgent replacement treatment with an intravenous rehydration fluid is recommended—see Fluids and electrolytes p. 1096.

The antimotility drug loperamide hydrochloride p. 71 is usually considered to be the standard treatment when rapid control of symptoms is required. It can also be used for mild-to-moderate travellers' diarrhoea (e.g. where toilet amenities are limited or unavailable) but should be avoided in bloody or suspected inflammatory diarrhoea (febrile patients) and in cases of significant abdominal pain (which also suggests inflammatory diarrhoea).

Loperamide hydrochloride is also the first-line treatment for patients with faecal incontinence (unlicensed indication) after the underlying cause of incontinence has been addressed. **[A]**

Racecadotril is licensed as an adjunct to rehydration for the symptomatic treatment of uncomplicated acute diarrhoea in adults and children over 3 months.

There is insufficient evidence to recommend adsorbent preparations (such as kaolin) in acute diarrhoea.

Antibacterial drugs for acute diarrhoea

[EvGr] Ciprofloxacin p. 590 is occasionally used for prophylaxis against travellers' diarrhoea, but routine use is **not** recommended. **[A]** See also Gastro-intestinal system infections, antibacterial therapy p. 535.

02-Jul-2018

● INDICATIONS AND DOSE

Adjunct to rehydration in acute diarrhoea

- ▶ BY MOUTH
- ▶ Child 4–8 years: 1 tablet 3 times a day
- ▶ Child 9–11 years: 1 tablet 4 times a day
- ▶ Child 12–15 years: 2 tablets 3 times a day
- ▶ Child 16–17 years: Initially 4 tablets, followed by 2 tablets every 6 hours until diarrhoea controlled
- ▶ Adult: Initially 4 tablets, followed by 2 tablets every 6 hours until diarrhoea controlled

Control of faecal consistency after colostomy or ileostomy

- ▶ BY MOUTH
- ▶ Child 4–8 years: 1 tablet 3 times a day
- ▶ Child 9–11 years: 1 tablet 4 times a day
- ▶ Child 12–15 years: 2 tablets 3 times a day
- ▶ Child 16–17 years: Initially 4 tablets, then 2 tablets 4 times a day
- ▶ Adult: Initially 4 tablets, then 2 tablets 4 times a day

- **CONTRA-INDICATIONS** Gastro-intestinal obstruction · intestinal atony · myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) · paralytic ileus · prostatic enlargement (in adults) · pyloric stenosis · severe ulcerative colitis · significant bladder outflow obstruction · toxic megacolon · urinary retention

- **CAUTIONS** Presence of subclinical doses of atropine may give rise to atropine side-effects in susceptible individuals or in overdosage · young children are particularly susceptible to **overdosage**; symptoms may be delayed and observation is needed for at least 48 hours after ingestion

- **INTERACTIONS** → Appendix 1: atropine · opioids

- **SIDE-EFFECTS** Abdominal discomfort · angioedema · angle closure glaucoma · appetite decreased · cardiac disorder · depression · dysuria · fever · gastrointestinal disorders · malaise · mucosal dryness · mydriasis · restlessness · vision disorders

- **PREGNANCY** Manufacturer advises caution.

- **BREAST FEEDING** May be present in milk.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in jaundice.

- **DIRECTIONS FOR ADMINISTRATION** For administration by mouth tablets may be crushed.

- **PRESCRIBING AND DISPENSING INFORMATION** A mixture of diphenoxylate hydrochloride and atropine sulfate in the mass proportions 100 parts to 1 part respectively.

- **EXCEPTIONS TO LEGAL CATEGORY** Co-phenotrope 2.5/0.025 can be sold to the public for adults and children over 16 years (provided packs do not contain more than 20 tablets) as an adjunct to rehydration in acute diarrhoea (max. daily dose 10 tablets).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

▶ Co-phenotrope (Non-proprietary)

Atropine sulfate 25 microgram, Diphenoxylate hydrochloride 2.5 mg Lomotil 2.5mg/25microgram tablets | 100 tablet (POM)  

Kaolin with morphine

● INDICATIONS AND DOSE

Acute diarrhoea

- ▶ BY MOUTH
- ▶ Adult: 10 mL every 6 hours, dose to be given in water

- **CONTRA-INDICATIONS** Acute abdomen · delayed gastric emptying · heart failure secondary to chronic lung disease · phaeochromocytoma

- **CAUTIONS** Cardiac arrhythmias · pancreatitis · severe cor pulmonale

- **INTERACTIONS** → Appendix 1: kaolin · opioids

- **BREAST FEEDING** Therapeutic doses unlikely to affect infant.

- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged, and increased cerebral sensitivity occurs.

- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Kaolin and Morphine Mixture, BP consists of light kaolin or light kaolin (natural) 20%, sodium bicarbonate 5%, and chloroform and morphine tincture 4% in a suitable vehicle. Contains anhydrous morphine 550–800 micrograms/10 mL.

- **LESS SUITABLE FOR PRESCRIBING** Kaolin and Morphine Mixture, BP (Kaolin and Morphine Oral Suspension) is less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

▶ Kaolin with morphine (Non-proprietary)

Morphine hydrochloride 91.6 mg per 1 litre, Sodium bicarbonate 50 gram per 1 litre, Kaolin light 200 gram per 1 litre, Chloroform 5 ml per 1 litre Kaolin and Morphine mixture | 200 ml  £1.71 DT = £1.71 

Loperamide hydrochloride

10-Mar-2020

● INDICATIONS AND DOSE

Symptomatic treatment of acute diarrhoea

- ▶ BY MOUTH
- ▶ Child 4–7 years: 1 mg 3–4 times a day for up to 3 days only
- ▶ Child 8–11 years: 2 mg 4 times a day for up to 5 days
- ▶ Child 12–17 years: Initially 4 mg, followed by 2 mg for up to 5 days, dose to be taken after each loose stool; usual dose 6–8 mg daily; maximum 16 mg per day
- ▶ Adult: Initially 4 mg, followed by 2 mg for up to 5 days, dose to be taken after each loose stool; usual dose 6–8 mg daily; maximum 16 mg per day

Chronic diarrhoea

- ▶ BY MOUTH
- ▶ Adult: Initially 4–8 mg daily in divided doses, adjusted according to response; maintenance up to 16 mg daily in 2 divided doses

Faecal incontinence

- ▶ BY MOUTH
- ▶ Adult: Initially 500 micrograms daily, adjusted according to response, maximum daily dose to be given in divided doses; maximum 16 mg per day

Pain of bowel colic in palliative care

- ▶ BY MOUTH
- ▶ Adult: 2–4 mg 4 times a day

- **UNLICENSED USE**

- ▶ In children *Capsules* not licensed for use in children under 8 years.

- ▶ In adults Use for faecal incontinence is an unlicensed indication.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: REPORTS OF SERIOUS CARDIAC ADVERSE REACTIONS WITH HIGH DOSES OF LOPERAMIDE ASSOCIATED WITH ABUSE OR MISUSE (SEPTEMBER 2017)

Serious cardiovascular events (such as QT prolongation, torsades de pointes, and cardiac arrest), including fatalities, have been reported in association with large overdoses of loperamide.

Healthcare professionals are reminded that if symptoms of overdose occur, naloxone can be given as an antidote. The duration of action of loperamide is longer than that of naloxone (1–3 hours), so repeated treatment with naloxone might be indicated; patients should be monitored closely for at least 48 hours to detect possible CNS depression.

Pharmacists should remind patients not to take more than the recommended dose on the label.

- **CONTRA-INDICATIONS** Active ulcerative colitis · antibiotic-associated colitis · bacterial enterocolitis · conditions where abdominal distension develops · conditions where inhibition of peristalsis should be avoided
- **CAUTIONS** Not recommended for children under 12 years (in children)
- **INTERACTIONS** → Appendix 1: loperamide
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Gastrointestinal disorders · headache · nausea
 - ▶ **Uncommon** Dizziness · drowsiness · dry mouth · gastrointestinal discomfort · skin reactions · vomiting
 - ▶ **Rare or very rare** Angioedema · consciousness impaired · coordination abnormal · fatigue · miosis · muscle tone increased · severe cutaneous adverse reactions (SCARs) · urinary retention
- **PREGNANCY** Manufacturers advise avoid—no information available.
- **BREAST FEEDING** Amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—risk of reduced first pass metabolism leading to central nervous system toxicity.
- **PRESCRIBING AND DISPENSING INFORMATION**

Palliative care ▶ In adults For further information on the use of loperamide in palliative care, see www.medicinescomplete.com/#/content/palliative/loperamide.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Loperamide for diarrhoea www.medicinesforchildren.org.uk/loperamide-diarrhoea
- **EXCEPTIONS TO LEGAL CATEGORY** Loperamide can be sold to the public, for use in adults and children over 12 years, provided it is licensed and labelled for the treatment of acute diarrhoea.
 - ▶ In adults Loperamide can be sold to the public, provided it is licensed and labelled for the treatment of acute diarrhoea associated with irritable bowel syndrome (after initial diagnosis by a doctor) in adults over 18 years of age.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

4 Disorders of gastric acid and ulceration

4.1 Dyspepsia

Dyspepsia

31-Oct-2019

Description of condition

Dyspepsia describes a range of upper gastro-intestinal symptoms, which are typically present for 4 or more weeks. Symptoms include but are not limited to upper abdominal pain or discomfort, heartburn, gastric reflux, bloating, nausea and/or vomiting. Symptoms can be attributed to an underlying cause (e.g. Gastro-oesophageal reflux disease p. 88, Peptic ulcer disease p. 76, gastro-oesophageal malignancy, or side effects from drugs), but the majority of patients are likely to have functional dyspepsia, where an underlying cause cannot be identified and endoscopy findings are normal. Uninvestigated dyspepsia describes symptoms in patients who have not had an endoscopy.

Dyspepsia symptoms in pregnancy are commonly due to gastro-oesophageal reflux disease (GORD), for management see *GORD in pregnancy* in Gastro-oesophageal reflux disease p. 88.

Aims of treatment

The aim of treatment is to manage symptoms, and where possible, to treat the underlying cause of dyspepsia.

Non-drug treatment

EVGr Lifestyle measures, such as healthy eating, weight loss (if obese), avoiding any trigger foods, eating smaller meals, eating the evening meal 3–4 hours before going to bed, raising the head of the bed, Smoking cessation p. 520, and reducing alcohol consumption may improve symptoms. Assess the patient for stress, anxiety, or depression, as these conditions may exacerbate symptoms.

Urgent endoscopic investigation is required for patients with dysphagia, significant acute gastrointestinal bleeding, or in those aged 55 years and over with unexplained weight loss and symptoms of upper abdominal pain, reflux or dyspepsia. **A**

Drug treatment

EVGr Drugs that may cause dyspepsia, such as alpha-blockers, antimuscarinics, aspirin, benzodiazepines, beta-blockers, bisphosphonates, calcium-channel blockers, corticosteroids, nitrates, non-steroidal anti-inflammatory drugs (NSAIDs), theophyllines, and tricyclic antidepressants, should be reviewed. The lowest effective dose should be used and if possible, stopped.

Antacids and/or alginates may be used for short-term symptom control, but long-term, continuous use is not recommended. **A**

Initial management

Uninvestigated dyspepsia

EVGr A proton pump inhibitor should be taken for 4 weeks. Patients with dyspepsia should be tested for *Helicobacter pylori* (*H. pylori*) infection, and treated if positive. **A** Public Health England recommends that patients who are at high risk for *H. pylori* infection should be tested for *H. pylori* first, or in parallel with a course of proton pump inhibitor. For treatment regimens, see *Helicobacter pylori* infection p. 89.

Functional dyspepsia

EVGr Patients should be tested for *H. pylori* infection and treated if positive. See *Helicobacter pylori* infection p. 89 for testing and management of *H. pylori* infection. In patients not infected with *H. pylori*, a proton pump inhibitor or a histamine₂-receptor antagonist (H₂-receptor antagonist) should be taken for 4 weeks. **A**

Follow up management

Uninvestigated and functional dyspepsia

EVGr For patients with refractory dyspepsia symptoms, new alarm symptoms should be assessed and alternative diagnoses should be considered. The patient's adherence to initial management should be checked and lifestyle advice reinforced.

If symptoms persist or recur following initial management, a proton pump inhibitor or H₂-receptor antagonist therapy should be used at the lowest dose needed to control symptoms. The patient may use the treatment on an 'as-needed' basis.

In patients with uninvestigated dyspepsia taking an NSAID and unable to stop the drug, consider reducing the NSAID dose and using long-term gastro-protection with acid suppression therapy, or switching to an alternative to the NSAID, such as paracetamol p. 465 or a selective cyclooxygenase (COX)-2 inhibitor (but see *Cardiovascular Events* under Non-steroidal anti-inflammatory drugs p. 1193).

In patients with uninvestigated dyspepsia taking aspirin and unable to stop the drug, consider switching from aspirin to an alternative antiplatelet drug.

Patients treated with *H. pylori* eradication therapy do not require routine retesting. **A** There are specific situations where retesting may be appropriate, see *Retesting for Helicobacter pylori*, under *Helicobacter pylori* infection p. 89.

EVGr If retesting is positive, second-line eradication therapy should be prescribed.

An annual review should be performed for patients with dyspepsia to assess their symptoms and treatment. A 'step

down' approach, or stopping treatment, should be encouraged if possible and clinically appropriate. A return to self-treatment with antacid and/or alginate therapy may be appropriate.

Referral to a specialist for further investigations should occur in patients of any age with gastro-oesophageal symptoms that are unexplained or non-responsive to treatment, or in patients with *H. pylori* infection that has not responded to second-line eradication therapy—see *Helicobacter pylori* infection p. 89. **A**

Useful Resources

ANTACIDS

Antacids

Overview

Antacids (usually containing aluminium or magnesium compounds) can often relieve symptoms in *ulcer dyspepsia* and in *non-erosive gastro-oesophageal reflux*; they are also sometimes used in functional (non-ulcer) dyspepsia but the evidence of benefit is uncertain. Antacids are best given when symptoms occur or are expected, usually between meals and at bedtime, although additional doses may be required. Conventional doses of liquid magnesium-aluminium antacids promote ulcer healing, but less well than antisecretory drugs; proof of a relationship between healing and neutralising capacity is lacking. Liquid preparations are more effective than tablet preparations.

Aluminium- and magnesium-containing antacids (e.g. aluminium hydroxide, magnesium carbonate p. 75, co-magaldrox p. 74 and magnesium trisilicate p. 75), being relatively insoluble in water, are long-acting if retained in the stomach. They are suitable for most antacid purposes. Magnesium-containing antacids tend to be laxative whereas aluminium-containing antacids may be constipating; antacids containing both magnesium and aluminium may reduce these colonic side-effects. Aluminium accumulation does not appear to be a risk if renal function is normal.

The acid-neutralising capacity of preparations that contain more than one antacid may be the same as simpler preparations. Complexes such as **hydrotalcite** confer no special advantage.

Sodium bicarbonate p. 1099 should no longer be prescribed alone for the relief of dyspepsia but it is present as an ingredient in many indigestion remedies. However, it retains a place in the management of urinary-tract disorders and acidosis.

Bismuth-containing antacids (unless chelates) are not recommended because absorbed bismuth can be neurotoxic, causing encephalopathy; they tend to be constipating.

Calcium-containing antacids can induce rebound acid secretion: with modest doses the clinical significance is doubtful, but prolonged high doses also cause hypercalcaemia and alkalosis, and can precipitate the milk-alkali syndrome.

Simeticone

Simeticone p. 76 (activated dimeticone) is added to an antacid as an antifoaming agent to relieve flatulence. These preparations may be useful for the relief of hiccup in palliative care.

Alginates

Alginates taken in combination with an antacid increases the viscosity of stomach contents and can protect the oesophageal mucosa from acid reflux. Some alginate-containing preparations form a viscous gel ('raft') that floats on the surface of the stomach contents, thereby reducing symptoms of reflux.

The amount of additional ingredient or antacid in individual preparations varies widely, as does their sodium content, so that preparations may not be freely interchangeable.

ANTACIDS > ALGINATE

Alginic acid

● INDICATIONS AND DOSE

MAALOX[®]

Dyspepsia

► BY MOUTH

- Child 14-17 years: 10-20 mL, to be taken 20-60 minutes after meals, and at bedtime or when required
- Adult: 10-20 mL, to be taken 20-60 minutes after meals, and at bedtime or when required

MUCOGEL[®]

Dyspepsia

► BY MOUTH

- Child 12-17 years: 10-20 mL 3 times a day, to be taken 20-60 minutes after meals, and at bedtime, or when required
- Adult: 10-20 mL 3 times a day, to be taken 20-60 minutes after meals, and at bedtime, or when required

- **INTERACTIONS** → Appendix 1: antacids · magnesium

● SIDE-EFFECTS

- **Uncommon** Constipation · diarrhoea
- **Rare or very rare** Electrolyte imbalance
- **Frequency not known** Abdominal pain · hyperalbuminaemia

- **RENAL IMPAIRMENT** There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).

- **PRESCRIBING AND DISPENSING INFORMATION** Co-magaldrox is a mixture of aluminium hydroxide and magnesium hydroxide; the proportions are expressed in the form x/y where x and y are the strengths in milligrams per unit dose of magnesium hydroxide and aluminium hydroxide respectively.

MAALOX® Maalox® suspension is low in sodium.
MUCOGEL® Mucogel® suspension is low in sodium.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

- ▶ **Maalox** (Sanofi)
 Aluminium hydroxide 35 mg per 1 ml, Magnesium hydroxide 40 mg per 1 ml | Maalox 175mg/200mg/5ml oral suspension sugar-free | 250 ml (GSL) £2.33 DT = £2.33
- ▶ **Mucogel** (Chemidex Pharma Ltd)
 Magnesium hydroxide 39 mg per 1 ml, Aluminium hydroxide gel dried 44 mg per 1 ml | Mucogel oral suspension sugar-free | 500 ml (GSL) £2.99 DT = £2.99

Co-simalcite

17-Apr-2020

● INDICATIONS AND DOSE

Dyspepsia

- ▶ BY MOUTH
- ▶ Child 8–11 years: 5 mL, to be taken between meals and at bedtime
- ▶ Child 12–17 years: 10 mL, to be taken between meals and at bedtime
- ▶ Adult: 10 mL, to be taken between meals and at bedtime

- **CONTRA-INDICATIONS** Infants · neonates

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Aluminium-containing antacids Aluminium-containing antacids should not be used in neonates and infants because accumulation may lead to increased plasma-aluminium concentrations.
- **RENAL IMPAIRMENT**
- ▶ In adults There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).
- ▶ In children Aluminium-containing antacids should not be used in children with renal impairment, because accumulation may lead to increased plasma-aluminium concentrations.
Dose adjustments Antacids containing magnesium salts should be avoided or used at a reduced dose because there is an increased risk of toxicity.
- **PRESCRIBING AND DISPENSING INFORMATION** *Altacite Plus*® is low in Na⁺.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

- ▶ **Altacite Plus** (Peckforton Pharmaceuticals Ltd)
 Simeticone 25 mg per 1 ml, Hydroalcite 100 mg per 1 ml | Altacite Plus oral suspension sugar-free | 100 ml (P) £4.00 sugar-free | 500 ml (P) £5.20 DT = £5.20

Simeticone with aluminium hydroxide and magnesium hydroxide

04-May-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, simeticone p. 76.

● INDICATIONS AND DOSE

Dyspepsia

- ▶ BY MOUTH
- ▶ Child 12–17 years: 5–10 mL 4 times a day, to be taken after meals and at bedtime, or when required

- ▶ Adult: 5–10 mL 4 times a day, to be taken after meals and at bedtime, or when required

- **INTERACTIONS** → Appendix 1: antacids

● SIDE-EFFECTS

- ▶ **Uncommon** Constipation · diarrhoea
- ▶ **Rare or very rare** Electrolyte imbalance
- ▶ **Frequency not known** Abdominal pain · hyperalumaemia

- **RENAL IMPAIRMENT** There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

- ▶ **Maalox Plus** (Sanofi)
 Simeticone 5 mg per 1 ml, Magnesium hydroxide 39 mg per 1 ml, Aluminium hydroxide gel dried 44 mg per 1 ml | Maalox Plus oral suspension sugar-free | 250 ml (GSL) £2.91

ANTACIDS > MAGNESIUM

Magnesium carbonate

● INDICATIONS AND DOSE

Dyspepsia

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Adult: 10 mL 3 times a day, dose to be taken in water

- **CONTRA-INDICATIONS** Hypophosphataemia
- **INTERACTIONS** → Appendix 1: antacids
- **SIDE-EFFECTS** Diarrhoea
- **HEPATIC IMPAIRMENT** In patients with fluid retention, avoid antacids containing large amounts of sodium. Avoid antacids containing magnesium salts in hepatic coma if there is a risk of renal failure.
- **RENAL IMPAIRMENT** Magnesium carbonate mixture has a high sodium content; avoid in patients with fluid retention.
Dose adjustments Avoid or use at a reduced dose; increased risk of toxicity.
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Aromatic Magnesium Carbonate Mixture, BP consists of light magnesium carbonate 3%, sodium bicarbonate 5%, in a suitable vehicle containing aromatic cardamom tincture.

- **MEDICINAL FORMS** No licensed medicines listed.

Magnesium trisilicate

● INDICATIONS AND DOSE

Dyspepsia

- ▶ BY MOUTH USING CHEWABLE TABLETS
- ▶ Adult: 1–2 tablets as required

- **CONTRA-INDICATIONS** Hypophosphataemia
- **INTERACTIONS** → Appendix 1: antacids
- **SIDE-EFFECTS** Diarrhoea · nephrolithiasis (long term use)
- **HEPATIC IMPAIRMENT** Avoid in hepatic coma; risk of renal failure.
- **RENAL IMPAIRMENT**
Dose adjustments Avoid or used at a reduced dose (increased risk of toxicity).
- **MEDICINAL FORMS** No licensed medicines listed.

Magnesium trisilicate with magnesium carbonate and sodium bicarbonate

22-Apr-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, magnesium trisilicate p. 75, magnesium carbonate p. 75, sodium bicarbonate p. 1099.

INDICATIONS AND DOSE

Dyspepsia

BY MOUTH

- Child 5–11 years: 5–10 mL 3 times a day, alternatively as required, dose to be made up with water
- Child 12–17 years: 10–20 mL 3 times a day, alternatively as required, dose to be made up with water
- Adult: 10–20 mL 3 times a day, alternatively as required, dose to be made up with water

- CONTRA-INDICATIONS** Hypophosphataemia · Severe renal failure
- CAUTIONS** Heart failure · hypermagnesaemia · hypertension · metabolic alkalosis · respiratory alkalosis
- INTERACTIONS** → Appendix 1: antacids · sodium bicarbonate
- HEPATIC IMPAIRMENT** In patients with fluid retention avoid antacids containing large amounts of sodium. Avoid antacids containing magnesium salts in hepatic coma if there is a risk of renal failure.
- RENAL IMPAIRMENT** Magnesium trisilicate and magnesium carbonate mixtures have high sodium content; avoid in patients with fluid retention.
- PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Magnesium Trisilicate Mixture, BP consists of 5% each of magnesium trisilicate, light magnesium carbonate, and sodium bicarbonate in a suitable vehicle with a peppermint flavour.

- MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

- Magnesium trisilicate with magnesium carbonate and sodium bicarbonate (Non-proprietary)
Magnesium carbonate light 50 mg per 1 mL, Magnesium trisilicate 50 mg per 1 mL, Sodium bicarbonate 50 mg per 1 mL Magnesium trisilicate oral suspension | 200 mL [GSL] £1.65 DT = £1.65

ANTIFOAMING DRUGS

Simeticone

(Activated dimeticone)

- DRUG ACTION** Simeticone (activated dimeticone) is an antifoaming agent.

INDICATIONS AND DOSE

DENTINOX[®]

Colic | Wind pains

BY MOUTH

- Child 1 month–1 year: 2.5 mL, to be taken with or after each feed; may be added to bottle feed; maximum 6 doses per day

INFACOL[®]

Colic | Wind pains

BY MOUTH

- Child 1 month–1 year: 0.5–1 mL, to be taken before feeds

PRESCRIBING AND DISPENSING INFORMATION

DENTINOX[®] The brand name *Dentinox[®]* is also used for other preparations including teething gel.

PATIENT AND CARER ADVICE

INFACOL[®] Patients or carers should be given advice on use of the *Infacol[®]* dropper.

LESS SUITABLE FOR PRESCRIBING

INFACOL[®] *Infacol[®]* is less suitable for prescribing (evidence of benefit in infantile colic uncertain).

DENTINOX[®] *Dentinox[®]* colic drops are less suitable for prescribing (evidence of benefit in infantile colic uncertain).

- MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

Infacol (Teva UK Ltd)

Simeticone 40 mg per 1 mL Infacol 40mg/ml oral suspension sugar-free | 55 mL [GSL] £3.20 DT = £3.20 sugar-free | 85 mL [GSL] £4.66 DT = £4.66

Oral drops

Dentinox Infant (Dendron Ltd)

Simeticone 8.4 mg per 1 mL Dentinox Infant colic drops | 100 mL [GSL] £2.01 DT = £2.01

Combinations available: *Co-simalcite*, p. 75 · *Simeticone with aluminium hydroxide and magnesium hydroxide*, p. 75

4.2 Gastric and duodenal ulceration

Peptic ulcer disease

31-Oct-2019

Description of condition

Peptic ulcer disease includes gastric or duodenal ulceration, which is a breach in the epithelium of the gastric or duodenal mucosa. The main symptom of peptic ulcer disease is upper abdominal pain but other less common symptoms include nausea, indigestion, heartburn, loss of appetite, weight loss and a bloated feeling. Non-steroidal anti-inflammatory drugs p. 1193 (NSAIDs) use and *Helicobacter pylori* (*H. pylori*) infection are the most common causes of peptic ulcer disease. Smoking, alcohol consumption, and stress may also contribute to the development of peptic ulcer disease.

NSAIDs may have an additive effect if there is co-existent *H. pylori* infection, further increasing the risk of peptic ulceration. The risk of upper gastro-intestinal side-effects varies between individual NSAIDs and is influenced by the dose and duration of use. For recommendations on individual NSAID choice, see under *NSAIDs and gastro-intestinal events* in Non-steroidal anti-inflammatory drugs p. 1193.

Complications of peptic ulcer disease include gastric outlet obstruction and potentially life-threatening gastro-intestinal perforation and haemorrhage. Patients at high risk of developing gastro-intestinal complications with an NSAID include those with a history of complicated peptic ulcer, or those with more than 2 of the following risk factors:

- age over 65 years;
- high dose NSAIDs;
- other drugs that increase the risk of gastro-intestinal adverse-effects (e.g. anticoagulants, corticosteroids, selective serotonin reuptake inhibitors);
- serious co-morbidity (e.g. cardiovascular disease, hypertension, diabetes, renal or hepatic impairment);
- heavy smoker;
- excessive alcohol consumption;
- previous adverse reaction to NSAIDs;
- prolonged requirement for NSAIDs.

Aims of treatment

The aims of treatment are to promote ulcer healing, manage symptoms, treat *H. pylori* infection if detected and reduce the risk of ulcer complications and recurrence.

Non-drug treatment

EVGr Lifestyle measures, such as healthy eating, weight loss (if obese), avoiding trigger foods, eating smaller meals, eating the evening meal 3–4 hours before going to bed, raising the head of the bed, smoking cessation, and reducing alcohol consumption may improve symptoms. Assess the patient for stress, anxiety, or depression, as these conditions may exacerbate symptoms.

Urgent endoscopic investigation is required for patients with dysphagia, significant acute gastrointestinal bleeding, or in those aged 55 years and over with unexplained weight loss and symptoms of upper abdominal pain, reflux or dyspepsia. **⚠**

Initial management

EVGr Drugs that induce peptic ulcers, such as NSAIDs, aspirin, bisphosphonates, immunosuppressive agents (e.g. corticosteroids), potassium chloride, selective serotonin reuptake inhibitors (SSRIs) and recreational drugs such as crack cocaine should be reviewed and stopped, if clinically appropriate. Antacids and/or alginates may be used for short-term symptom control, but long-term, continuous use is not recommended. **⚠**

The treatment strategy in peptic ulcer disease can vary depending on whether a patient has *H. pylori* infection, or has recently taken NSAIDs.

EVGr The patient should be tested for *H. pylori* infection.

⚠ See *Testing for Helicobacter pylori* in *Helicobacter pylori* infection p. 89.

EVGr In patients who have tested positive for *H. pylori* and have no history of NSAID use, *Helicobacter pylori* infection p. 89 infection should be eradicated.

If the ulcer is associated with NSAID use, a proton pump inhibitor or H₂-receptor antagonist should be used for 8 weeks, followed by *Helicobacter pylori* infection p. 89 eradication treatment if the patient has tested positive for *H. pylori*.

In patients who have tested negative for *H. pylori* and have no history of NSAID use, a proton pump inhibitor or histamine₂-receptor antagonist (H₂-receptor antagonist) should be used for 4–8 weeks. **⚠**

Follow-up management

EVGr Patients with peptic ulcers (gastric or duodenal) who tested positive for *H. pylori* should be reviewed 6–8 weeks after starting eradication treatment and re-tested, depending on the size of the lesion. Patients with a gastric ulcer who tested positive for *H. pylori* should also have a repeat endoscopy 6–8 weeks after treatment to confirm ulcer healing, depending on the size of the lesion.

If the ulcer is healed and the patient is to continue taking NSAIDs, the potential harm from NSAID treatment should be discussed. The need for NSAIDs should be reviewed at least every 6 months, and use on a limited, 'as-needed' basis trialled. Consider reducing the dose, substituting the NSAID with paracetamol p. 465, or use of an alternative analgesic or low dose ibuprofen.

In patients with previous ulceration, for whom NSAID continuation is necessary, or those at high risk of gastrointestinal side effects, consider a cyclo-oxygenase (COX)-2 inhibitor instead of a standard NSAID (but see *Cardiovascular Events* under Non-steroidal anti-inflammatory drugs p. 1193). Gastro-protection with acid suppression therapy should always be co-prescribed. A proton pump inhibitor is the preferred choice for gastro-protection; other options include a H₂-receptor antagonist or misoprostol, but the side effects of misoprostol limit its use.

If symptoms recur after initial treatment, a proton pump inhibitor may be taken at the lowest dose possible to control symptoms. Treatment should be used on an 'as-needed' basis with patients managing their own symptoms.

In cases where there are persistent symptoms or an unhealed ulcer, the patient's adherence to initial management should be checked and lifestyle advice reinforced. Other causes, such as malignancy, failure to detect *H. pylori*, inadvertent NSAID use, other ulcer-inducing medication, and rare causes such as Zollinger-Ellison syndrome or Crohn's disease should be considered.

Switching to an alternative acid suppression therapy, e.g. H₂-receptor antagonists p. 78 may be beneficial if the response to proton pump inhibitor therapy is inadequate.

Referral to a specialist for investigations and management should occur in refractory or recurrent peptic ulcer cases with gastro-oesophageal symptoms that are unexplained, or non-responsive to treatment.

Patients with peptic ulcer disease who are on long-term treatment should receive an annual review of their symptoms and treatment. A step down approach, or stopping treatment, should be encouraged if possible and clinically appropriate. **⚠**

ANTACIDS

Bismuth subsalicylate

26-Nov-2019

● INDICATIONS AND DOSE

***Helicobacter pylori* eradication [in combination with other drugs (see *Helicobacter pylori* infection p. 89)]**

▶ BY MOUTH

▶ Adult: 525 mg 4 times a day for 7 days for first- and second-line eradication therapy; 10 days for third-line eradication therapy

● **UNLICENSED USE** **EVGr** Bismuth subsalicylate is used for the eradication of *Helicobacter pylori*, **⚠** but is not licensed for this indication.

● **CONTRA-INDICATIONS** Children under 16 years (risk of Reye's syndrome)

● **CAUTIONS** Blood clotting disorders · gout

● **INTERACTIONS** → Appendix 1: bismuth

● **SIDE-EFFECTS**

▶ **Common or very common** Black faeces · black tongue

Overdose The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Bismuth overdose may present as acute encephalopathy with confusion, myoclonus, tremor, dysarthria and gait disturbances. Gastrointestinal disturbances, skin reactions, discolouration of mucous membranes and renal impairment may also be present.

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or other salicylates.

● **PREGNANCY** Manufacturer advises avoid unless essential—no information available.

● **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

CAUTIONARY AND ADVISORY LABELS 12

- ▶ **Pepto-Bismol** (Procter & Gamble (Health & Beauty Care) Ltd)
Bismuth subsalicylate 17.5 mg per 1 ml Pepto-Bismol 17.5mg/1ml oral suspension sugar-free | 120 ml  

Chewable tablet

CAUTIONARY AND ADVISORY LABELS 12, 24

- ▶ **Pepto-Bismol** (Procter & Gamble (Health & Beauty Care) Ltd)
Bismuth subsalicylate 262.5 mg Pepto-Bismol 262.5mg chewable tablets sugar-free | 12 tablet  

GASTROPROTECTIVE COMPLEXES AND CHELATORS

Chelates and complexes

Overview

Sucralfate below may act by protecting the mucosa from acid-pepsin attack in gastric and duodenal ulcers. It is a complex of aluminium hydroxide and sulfated sucrose but has minimal antacid properties.

Sucralfate

• INDICATIONS AND DOSE

Benign gastric ulceration | Benign duodenal ulceration

▶ BY MOUTH

- ▶ Child 15-17 years: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4-6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day
- ▶ Adult: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4-6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day

Chronic gastritis

▶ BY MOUTH

- ▶ Adult: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4-6 weeks or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day

Prophylaxis of stress ulceration in child under intensive care

▶ BY MOUTH

- ▶ Child 15-17 years: 1 g 6 times a day; maximum 8 g per day

Prophylaxis of stress ulceration

▶ BY MOUTH

- ▶ Adult: 1 g 6 times a day; maximum 8 g per day

• UNLICENSED USE

- ▶ In children Tablets not licensed for prophylaxis of stress ulceration.

- **CAUTIONS** Patients under intensive care (**Important:** reports of bezoar formation)

CAUTIONS, FURTHER INFORMATION

- ▶ Bezoar formation Following reports of bezoar formation associated with sucralfate, caution is advised in seriously ill patients, especially those receiving concomitant enteral feeds or those with predisposing conditions such as delayed gastric emptying.

- **INTERACTIONS** → Appendix 1: sucralfate

• SIDE-EFFECTS

- ▶ **Common or very common** Constipation

- ▶ **Uncommon** Dry mouth · nausea
- ▶ **Rare or very rare** Bezoar · rash
- ▶ **Frequency not known** Back pain · bone disorders · diarrhoea · dizziness · drowsiness · encephalopathy · flatulence · headache · vertigo

- **PREGNANCY** No evidence of harm; absorption from gastro-intestinal tract negligible.

- **BREAST FEEDING** Amount probably too small to be harmful.

- **RENAL IMPAIRMENT** Use with caution; aluminium is absorbed and may accumulate.

- **DIRECTIONS FOR ADMINISTRATION** Administration of sucralfate and enteral feeds should be separated by 1 hour and for administration by *mouth*, sucralfate should be given 1 hour before meals. *Oral suspension* blocks fibre-bore feeding tubes. Crushed *tablets* may be dispersed in water.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include aniseed and caramel.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 5

▶ Sucralfate (imported)

Sucralfate 1 gram Sulcrate 1g tablets | 100 tablet 

Carafate 1g tablets | 100 tablet 

Oral suspension

CAUTIONARY AND ADVISORY LABELS 5

▶ Sucralfate (Non-proprietary)

Sucralfate 100 mg per 1 ml Carafate 1g/10ml oral suspension

sugar-free | 420 ml  

Sucralfate 200 mg per 1 ml Sucralfate 1g/5ml oral suspension sugar free sugar-free | 200 ml  £73.75

H₂-RECEPTOR ANTAGONISTS

H₂-receptor antagonists

Overview

Histamine H₂-receptor antagonists heal *gastric and duodenal ulcers* by reducing gastric acid output as a result of histamine H₂-receptor blockade; they are also used to relieve symptoms of *gastro-oesophageal reflux disease*. H₂-receptor antagonists should not normally be used for *Zollinger-Ellison syndrome* because proton pump inhibitors are more effective.

Treatment with a H₂-receptor antagonist has not been shown to be beneficial in haematemesis and melaena, but prophylactic use reduces the frequency of bleeding from *gastroduodenal erosions in hepatic coma*, and possibly in other conditions requiring intensive care. H₂-receptor antagonists also reduce the risk of *acid aspiration* in obstetric patients at delivery (Mendelson's syndrome).

H₂-receptor antagonists

- **CAUTIONS** Signs and symptoms of gastric cancer (in adults)

CAUTIONS, FURTHER INFORMATION

- ▶ Gastric cancer
- ▶ In adults H₂-receptor antagonists might mask symptoms of gastric cancer; particular care is required in patients presenting with 'alarm features' in such cases gastric malignancy should be ruled out before treatment.

• SIDE-EFFECTS

- ▶ **Common or very common** Constipation · diarrhoea · dizziness · fatigue · headache · myalgia · skin reactions

- ▶ **Uncommon** Confusion · depression · erectile dysfunction · gynaecomastia · hallucination · hepatic disorders · leucopenia · nausea · tachycardia
- ▶ **Rare or very rare** Agranulocytosis · alopecia · arthralgia · atrioventricular block · fever · galactorrhoea · pancytopenia · thrombocytopenia · vasculitis

Cimetidine

● INDICATIONS AND DOSE

Benign duodenal ulceration

▶ BY MOUTH

- ▶ **Adult:** 400 mg twice daily for at least 4 weeks, to be taken with breakfast and at night, alternatively 800 mg once daily for at least 4 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg once daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

Benign gastric ulceration

▶ BY MOUTH

- ▶ **Adult:** 400 mg twice daily for 6 weeks, to be taken with breakfast and at night, alternatively 800 mg daily for 6 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg once daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

NSAID-associated ulceration

▶ BY MOUTH

- ▶ **Adult:** 400 mg twice daily for 8 weeks, to be taken with breakfast and at night, alternatively 800 mg daily for 8 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

Reflux oesophagitis

▶ BY MOUTH

- ▶ **Adult:** 400 mg 4 times a day for 4–8 weeks

Prophylaxis of stress ulceration

▶ BY MOUTH

- ▶ **Adult:** 200–400 mg every 4–6 hours

Gastric acid reduction in obstetrics

▶ BY MOUTH

- ▶ **Adult:** Initially 400 mg, to be administered at start of labour, then increased if necessary up to 400 mg every 4 hours, do not use syrup in prophylaxis of acid aspiration; maximum 2.4 g per day

Gastric acid reduction during surgical procedures

▶ BY MOUTH

- ▶ **Adult:** 400 mg, to be given 90–120 minutes before induction of general anaesthesia

Short-bowel syndrome

▶ BY MOUTH

- ▶ **Adult:** 400 mg twice daily, adjusted according to response, to be taken with breakfast and at bedtime

To reduce degradation of pancreatic enzyme supplements

▶ BY MOUTH

- ▶ **Adult:** 0.8–1.6 g daily in 4 divided doses, dose to be taken 1–1½ hours before meals

- **INTERACTIONS** → Appendix 1: H2 receptor antagonists
- **SIDE-EFFECTS**
- ▶ **Rare or very rare** Anaphylactic reaction · aplastic anaemia · nephritis tubulointerstitial · pancreatitis · sinus bradycardia
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Significant amount present in milk—not known to be harmful but manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Increased risk of confusion.
Dose adjustments Reduce dose.
- **RENAL IMPAIRMENT** Occasional risk of confusion.
Dose adjustments Reduce dose to 200 mg 4 times daily if eGFR 30–50 mL/minute/1.73 m².
Reduce dose to 200 mg 3 times daily if eGFR 15–30 mL/minute/1.73 m².
Reduce dose to 200 mg twice daily if eGFR less than 15 mL/minute/1.73 m².
- **EXCEPTIONS TO LEGAL CATEGORY** Cimetidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks' supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity (max. single dose 200 mg, max. daily dose 800 mg), and for the prophylactic management of nocturnal heartburn (single night-time dose 100 mg).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Ranitidine

F 78

● INDICATIONS AND DOSE

Benign gastric ulceration | Duodenal ulceration

▶ BY MOUTH

- ▶ Child 1-5 months: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
- ▶ Child 6 months-2 years: 2–4 mg/kg twice daily
- ▶ Child 3-11 years: 2–4 mg/kg twice daily (max. per dose 150 mg)
- ▶ Child 12-17 years: 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night
- ▶ Adult: 150 mg twice daily for 4–8 weeks, alternatively 300 mg once daily for 4–8 weeks, dose to be taken at night

Chronic episodic dyspepsia

▶ BY MOUTH

- ▶ Adult: 150 mg twice daily for 6 weeks, alternatively 300 mg once daily for 6 weeks, dose to be taken at night

NSAID-associated gastric ulceration

▶ BY MOUTH

- ▶ Adult: 150 mg twice daily for up to 8 weeks, alternatively 300 mg once daily for up to 8 weeks, dose to be taken at night

NSAID-associated duodenal ulcer

▶ BY MOUTH

- ▶ Adult: 300 mg twice daily for 4 weeks, to achieve a higher healing rate

Prophylaxis of NSAID-associated gastric ulcer |

Prophylaxis of NSAID-associated duodenal ulcer

▶ BY MOUTH

- ▶ Adult: 300 mg twice daily

Gastro-oesophageal reflux disease

▶ BY MOUTH

- ▶ Adult: 150 mg twice daily for up to 8 weeks or if necessary 12 weeks, alternatively 300 mg once daily for up to 8 weeks or if necessary 12 weeks, dose to be taken at night

Moderate to severe gastro-oesophageal reflux disease

▶ BY MOUTH

- ▶ Adult: 600 mg daily in 2–4 divided doses for up to 12 weeks

Long-term treatment of healed gastro-oesophageal reflux disease

▶ BY MOUTH

- ▶ Adult: 150 mg twice daily

Gastric acid reduction (prophylaxis of acid aspiration) in obstetrics

▶ BY MOUTH

- ▶ Adult: 150 mg, dose to be given at onset of labour, then 150 mg every 6 hours

Gastric acid reduction (prophylaxis of acid aspiration) in surgical procedures

▶ INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 50 mg, to be given 45–60 minutes before induction of anaesthesia, intravenous injection diluted to 20 mL and given over at least 2 minutes, alternatively (by mouth) 150 mg, to be given 2 hours before induction of anaesthesia and also when possible on the preceding evening

Prophylaxis of stress ulceration

▶ INITIALLY BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 50 mg every 8 hours, dose to be diluted to 20 mL and given over at least 2 minutes, then (by mouth) 150 mg twice daily, may be given when oral feeding commences

Reflux oesophagitis and other conditions where gastric acid reduction is beneficial

▶ BY MOUTH

- ▶ Child 1-5 months: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
- ▶ Child 6 months-2 years: 2-4 mg/kg twice daily
- ▶ Child 3-11 years: 2-4 mg/kg twice daily (max. per dose 150 mg); increased to up to 5 mg/kg twice daily (max. per dose 300 mg), dose increase for severe gastro-oesophageal disease
- ▶ Child 12-17 years: 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night, then increased if necessary to 300 mg twice daily for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease, alternatively increased if necessary to 150 mg 4 times a day for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease

Conditions where reduction of gastric acidity is beneficial and oral route not available

▶ BY INTRAMUSCULAR INJECTION

- ▶ Adult: 50 mg every 6-8 hours

▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 50 mg, dose to be diluted to 20 mL and given over at least 2 minutes; may be repeated every 6-8 hours

● UNLICENSED USE

- ▶ In children *Oral* preparations not licensed for use in children under 3 years.
- ▶ In adults Doses given for prophylaxis of NSAID-associated gastric or duodenal ulcer, and prophylaxis of stress ulceration, are not licensed.

● INTERACTIONS → Appendix 1: H2 receptor antagonists

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ Rare or very rare Bone marrow depression · bradycardia · breast conditions · dyskinesia · nephritis acute interstitial · pancreatitis acute · vision blurred
- ▶ Frequency not known Dyspnoea

SPECIFIC SIDE-EFFECTS

- ▶ Rare or very rare
 - ▶ With parenteral use Anaphylactic shock · cardiac arrest
- PREGNANCY Manufacturer advises avoid unless essential, but not known to be harmful.

● BREAST FEEDING Significant amount present in milk, but not known to be harmful.

● RENAL IMPAIRMENT

Dose adjustments ▶ In adults Use half normal dose if eGFR less than 50 mL/minute/1.73 m².

▶ In children Use half normal dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

● DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Zantac[®]), give intermittently in Glucose 5% or Sodium Chloride 0.9%.● PATIENT AND CARER ADVICE In fat malabsorption syndrome, give oral doses 1-2 hours before food to enhance effects of pancreatic enzyme replacement. Medicines for Children leaflet: Ranitidine for acid reflux www.medicinesforchildren.org.uk/ranitidine-acid-reflux

● EXCEPTIONS TO LEGAL CATEGORY Ranitidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks' supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink (max. single dose 75 mg, max. daily dose 300 mg).

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, infusion

Tablet

▶ Ranitidine (Non-proprietary)

Ranitidine (as Ranitidine hydrochloride) 150 mg Ranitidine 150mg tablets | 60 tablet [PoM] £8.99 DT = £1.54

Ranitidine (as Ranitidine hydrochloride) 300 mg Ranitidine 300mg tablets | 30 tablet [PoM] £6.80 DT = £1.55

Solution for injection

▶ Ranitidine (Non-proprietary)

Ranitidine (as Ranitidine hydrochloride) 25 mg per 1 ml Ranitidine 50mg/2ml solution for injection ampoules | 5 ampoule [PoM] £2.69-£49.00 DT = £3.30

▶ Zantac (GlaxoSmithKline UK Ltd)

Ranitidine (as Ranitidine hydrochloride) 25 mg per 1 ml Zantac 50mg/2ml solution for injection ampoules | 5 ampoule [PoM] £2.82 DT = £3.30

Ranitidine (as Ranitidine hydrochloride) 15 mg per

1 ml Ranitidine 75mg/5ml oral solution sugar free sugar-free | 100 ml [PoM] £2.20-£2.30 sugar-free | 300 ml [PoM] £21.55 DT = £5.15

Ranitidine (as Ranitidine hydrochloride) 30 mg per

1 ml Ranitidine 150mg/5ml oral solution sugar free sugar-free | 150 ml [PoM] £5.50-£7.65 DT = £7.65

▶ Zantac (GlaxoSmithKline UK Ltd)

Ranitidine (as Ranitidine hydrochloride) 15 mg per 1 ml Zantac 150mg/10ml syrup sugar-free | 300 ml [PoM] £20.76 DT = £5.15

PROSTAGLANDINS AND ANALOGUES**Misoprostol**

20-Apr-2020

- DRUG ACTION Misoprostol is a synthetic prostaglandin analogue that has antisecretory and protective properties, promoting healing of gastric and duodenal ulcers.

● INDICATIONS AND DOSE

CYTOTEC[®]

Benign gastric ulcer | Benign duodenal ulcer | NSAID-induced peptic ulcer

▶ BY MOUTH

- ▶ Adult: 400 micrograms twice daily, alternatively 200 micrograms 4 times a day continued for at least 4 weeks or may be continued for up to 8 weeks if required, dose to be taken with breakfast (or main meals) and at bedtime

Prophylaxis of NSAID-induced peptic ulcer

▶ BY MOUTH

- ▶ Adult: 200 micrograms 2-4 times a day

● CAUTIONS

CYTOTEC[®] Conditions where hypotension might precipitate severe complications (e.g. cerebrovascular disease, cardiovascular disease) · conditions which predispose to diarrhoea (e.g. inflammatory bowel disease)

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ Common or very common Nausea · rash · vomiting
- ▶ Uncommon Uterine rupture

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common** Constipation · diarrhoea · dizziness · flatulence · gastrointestinal discomfort · headache
- ▶ **Uncommon** Fever · haemorrhage · menstrual cycle irregularities · postmenopausal haemorrhage · uterine cramps
- ▶ **Frequency not known** Chills

SIDE-EFFECTS, FURTHER INFORMATION Diarrhoea may occasionally be severe and require withdrawal, reduced by giving single doses not exceeding 200 micrograms and by avoiding magnesium-containing antacids.

● **CONCEPTION AND CONTRACEPTION**

CYTOTEC[®] Manufacturer advises do not use in women of childbearing potential unless pregnancy has been excluded; patients must use effective contraception during treatment, and be informed of the risks of taking misoprostol if pregnant.

● **PREGNANCY**

CYTOTEC[®] Manufacturer advises avoid—induces uterine contractions, and associated with abortion and birth defects; teratogenic in first trimester.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk, and may cause diarrhoea in nursing infants. [EVR](#) Tertiary sources state present in milk but amount probably too small to be harmful; to further reduce risk following termination of pregnancy, consider interrupting breastfeeding for 5 hours after a dose. [D](#)

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks Manufacturer advises patients should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Misoprostol 200 microgram Cytotec 200microgram tablets | 60 tablet [POM](#) £10.03 DT = £10.03

PROTON PUMP INHIBITORS**Proton pump inhibitors****Overview**

Proton pump inhibitors are effective short-term treatments for *gastric and duodenal ulcers*; they are also used in combination with antibacterials for the eradication of *Helicobacter pylori* (see specific regimens). Following endoscopic treatment of severe peptic ulcer bleeding, an intravenous, high-dose proton pump inhibitor reduces the risk of rebleeding and the need for surgery. Proton pump inhibitors can be used for the treatment of *dyspepsia* and *gastro-oesophageal reflux disease*.

Proton pump inhibitors are also used for the prevention and treatment of NSAID-associated ulcers. In patients who need to continue NSAID treatment after an ulcer has healed, the dose of proton pump inhibitor should normally not be reduced because asymptomatic ulcer deterioration may occur.

A proton pump inhibitor can be used to reduce the degradation of pancreatic enzyme supplements in patients with cystic fibrosis. They can also be used to control excessive secretion of gastric acid in *Zollinger–Ellison syndrome*; high doses are often required.

Proton pump inhibitors

- **DRUG ACTION** Proton pump inhibitors inhibit gastric acid secretion by blocking the hydrogen-potassium adenosine triphosphatase enzyme system (the 'proton pump') of the gastric parietal cell.

IMPORTANT SAFETY INFORMATION

MHRA ADVICE: PROTON PUMP INHIBITORS (PPIS): VERY LOW RISK OF SUBACUTE CUTANEOUS LUPUS ERYTHEMATOSUS (SEPTEMBER 2015)

Very infrequent cases of subacute cutaneous lupus erythematosus (SCLE) have been reported in patients taking PPIs. Drug-induced SCLE can occur weeks, months or even years after exposure to the drug.

If a patient treated with a PPI develops lesions—especially in sun-exposed areas of the skin—and it is accompanied by arthralgia:

- advise them to avoid exposing the skin to sunlight;
- consider SCLE as a possible diagnosis;
- consider discontinuing PPI treatment unless it is imperative for a serious acid-related condition; a patient who develops SCLE with a particular PPI may be at risk of the same reaction with another;
- in most cases, symptoms resolve on PPI withdrawal; topical or systemic steroids might be necessary for treatment of SCLE only if there are no signs of remission after a few weeks or months.

- **CAUTIONS** Can increase the risk of fractures (particularly when used at high doses for over a year in the elderly) · may increase the risk of gastro-intestinal infections (including *Clostridioides difficile* infection) · may mask the symptoms of gastric cancer (in adults) · patients at risk of osteoporosis

CAUTIONS, FURTHER INFORMATION

- ▶ Risk of osteoporosis Patients at risk of osteoporosis should maintain an adequate intake of calcium and vitamin D, and if necessary, receive other preventative therapy.
- ▶ Gastric cancer
- ▶ In adults Particular care is required in those presenting with 'alarm features', in such cases gastric malignancy should be ruled out before treatment.
- ▶ Elderly Prescription potentially inappropriate (STOPP criteria) for uncomplicated peptic ulcer disease or erosive peptic oesophagitis at full therapeutic dosage for longer than 8 weeks (dose reduction or earlier discontinuation indicated). See also Prescribing in the elderly p. 33.
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · constipation · diarrhoea · dizziness · dry mouth · gastrointestinal disorders · headache · insomnia · nausea · skin reactions · vomiting
- ▶ **Uncommon** Arthralgia · bone fractures · confusion · depression · drowsiness · leucopenia · malaise · myalgia · paraesthesia · peripheral oedema · thrombocytopenia · vertigo · vision disorders
- ▶ **Rare or very rare** Agranulocytosis · alopecia · gynaecomastia · hallucination · hepatic disorders · hyperhidrosis · hyponatraemia · nephritis tubulointerstitial · pancytopenia · photosensitivity reaction · severe cutaneous adverse reactions (SCARs) · stomatitis · taste altered
- ▶ **Frequency not known** Hypomagnesaemia (more common after 1 year of treatment, but sometimes after 3 months of treatment) · subacute cutaneous lupus erythematosus
- **MONITORING REQUIREMENTS** Measurement of serum-magnesium concentrations should be considered before and during prolonged treatment with a proton pump inhibitor, especially when used with other drugs that cause hypomagnesaemia or with digoxin.

- **PRESCRIBING AND DISPENSING INFORMATION** A proton pump inhibitor should be prescribed for appropriate indications at the lowest effective dose for the shortest period; the need for long-term treatment should be reviewed periodically.

F 82

Esomeprazole

26-Nov-2019

● INDICATIONS AND DOSE

Peptic ulcer disease

- ▶ BY MOUTH
- ▶ Adult: 20 mg once daily for 4–8 weeks

NSAID-associated gastric ulcer

- ▶ BY MOUTH
- ▶ Adult: 20 mg once daily for 4–8 weeks
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 20 mg daily continue until oral administration possible, injection to be given over at least 3 minutes

Prophylaxis of NSAID-associated gastric ulcer in patients with an increased risk of gastroduodenal complications who require continued NSAID treatment

- ▶ BY MOUTH
- ▶ Adult: 20 mg daily

Prophylaxis of NSAID-associated gastric or duodenal ulcer

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 20 mg daily continue until oral administration possible, injection to be given over at least 3 minutes

Gastro-oesophageal reflux disease (in the presence of erosive reflux oesophagitis)

- ▶ BY MOUTH
- ▶ Child 1–11 years (body-weight 10–19 kg): 10 mg once daily for 8 weeks
- ▶ Child 1–11 years (body-weight 20 kg and above): 10–20 mg once daily for 8 weeks
- ▶ Child 12–17 years: Initially 40 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed or symptoms persist; maintenance 20 mg daily
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 40 mg daily continue until oral administration possible, injection to be given over at least 3 minutes

Severe oesophagitis

- ▶ BY MOUTH
- ▶ Adult: 40 mg once daily for 8 weeks, continue as maintenance treatment if appropriate

Severe oesophagitis, refractory to initial treatment

- ▶ BY MOUTH
- ▶ Adult: 40 mg twice daily

Gastro-oesophageal reflux disease (in the absence of oesophagitis)

- ▶ BY MOUTH
- ▶ Child 1–11 years (body-weight 10 kg and above): 10 mg once daily for up to 8 weeks
- ▶ Child 12–17 years: 20 mg once daily for up to 4 weeks
- ▶ Adult: 20 mg once daily 4 or 8 weeks, then 20 mg daily if required
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 20 mg once daily continue until oral administration is possible, injection to be given over at least 3 minutes

Uninvestigated dyspepsia

- ▶ BY MOUTH
- ▶ Adult: 20 mg once daily for 4 weeks

Zollinger–Ellison syndrome

- ▶ BY MOUTH
- ▶ Adult: Initially 40 mg twice daily, adjusted according to response; usual dose 80–160 mg daily, daily doses above 80 mg should be given in 2 divided doses

Severe peptic ulcer bleeding (following endoscopic treatment)

- ▶ INITIALLY BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 80 mg, to be given over 30 minutes, then (by continuous intravenous infusion) 8 mg/hour for 72 hours, then (by mouth) 40 mg once daily for 4 weeks

Helicobacter pylori eradication [in combination with other drugs (see Helicobacter pylori infection p. 89)]

- ▶ BY MOUTH
- ▶ Adult: 20 mg twice daily for 7 days for first- and second-line eradication therapy; 10 days for third-line eradication therapy

- **UNLICENSED USE** Tablets and capsules not licensed for use in children 1–11 years.

- ▶ In adults [EUGr](#) Combination regimens and durations for *Helicobacter pylori* eradication may differ from product literature but adhere to national guidelines. [A](#) See Helicobacter pylori infection p. 89 for further information. Esomeprazole may be used as detailed below, although these situations are considered outside the scope of its licence:

- [EUGr](#) treatment of peptic ulcer disease, [A](#) see Peptic ulcer disease p. 76 for further information;
- [EUGr](#) treatment of severe oesophagitis, refractory to initial treatment, [A](#) see Gastro-oesophageal reflux disease p. 88 for further information;
- [EUGr](#) treatment of uninvestigated dyspepsia, [A](#) see Dyspepsia p. 72 for further information.

- ▶ With oral use in adults [EUGr](#) Duration of treatment of gastro-oesophageal reflux disease (in the absence of oesophagitis) differs from product literature but adheres to national guidelines. [A](#) See Gastro-oesophageal reflux disease p. 88 for further information.

- **INTERACTIONS** → Appendix 1: proton pump inhibitors

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Uncommon** Encephalopathy
- ▶ **Rare or very rare** Aggression · agitation · bronchospasm · increased risk of infection · muscle weakness

SPECIFIC SIDE-EFFECTS

- ▶ **Rare or very rare**
- ▶ With parenteral use Renal failure
- ▶ **Frequency not known**
- ▶ With parenteral use Electrolyte imbalance · vitamin B12 deficiency
- **PREGNANCY** Manufacturer advises caution—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
 - Dose adjustments** ▶ With oral use in adults Manufacturer advises max. 20 mg daily in severe impairment.
 - ▶ With intravenous use in adults Manufacturer advises for gastro-oesophageal reflux disease, max. 20 mg daily in severe impairment.
 - ▶ With intravenous use in adults Manufacturer advises for bleeding ulcers, by intravenous infusion, initially 80 mg, then 4 mg/hour for 72 hours in severe impairment.
 - ▶ In children Manufacturer advises in children 1–11 years, max. 10 mg daily in severe impairment. Manufacturer advises in children 12–17 years, max. 20 mg daily in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe renal insufficiency.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use in adults For intravenous infusion (*Nexium*®), give continuously or intermittently in Sodium

Chloride 0.9%; reconstitute 40–80 mg with up to 100 mL infusion fluid; for intermittent infusion, give requisite dose over 10–30 minutes; stable for 12 hours in Sodium Chloride 0.9%.

- ▶ With oral use Do not chew or crush capsules; swallow whole or mix capsule contents in water and drink within 30 minutes. Do not crush or chew tablets; swallow whole or disperse in water and drink within 30 minutes. Disperse the contents of each sachet of gastro-resistant granules in approx. 15 mL water. Stir and leave to thicken for a few minutes; stir again before administration and use within 30 minutes; rinse container with 15 mL water to obtain full dose. For administration through a gastric tube, consult product literature.

● PATIENT AND CARER ADVICE

- ▶ With oral use Counselling on administration of gastro-resistant capsules, tablets, and granules advised.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Omeprazole

26-Nov-2019

INDICATIONS AND DOSE***Helicobacter pylori* eradication [in combination with other drugs (see *Helicobacter pylori* infection p. 89)]**

▶ BY MOUTH

- ▶ Adult: 20–40 mg twice daily for 7 days for first- and second-line eradication therapy; 10 days for third-line eradication therapy

Benign gastric ulceration

▶ BY MOUTH

- ▶ Adult: 20 mg once daily for 8 weeks, increased if necessary to 40 mg once daily, in severe or recurrent cases

Duodenal ulceration

▶ BY MOUTH

- ▶ Adult: 20 mg once daily for 4 weeks, increased if necessary to 40 mg once daily, in severe or recurrent cases

Prevention of relapse in gastric ulcer

▶ BY MOUTH

- ▶ Adult: 20 mg once daily, increased if necessary to 40 mg once daily

Prevention of relapse in duodenal ulcer

▶ BY MOUTH

- ▶ Adult: 20 mg once daily, dose may range between 10–40 mg daily

NSAID-associated duodenal ulcer | NSAID-associated gastric ulcer | NSAID-associated gastroduodenal erosions

▶ BY MOUTH

- ▶ Adult: 20 mg once daily for 4 weeks, continued for a further 4 weeks if not fully healed

Prophylaxis in patients with a history of NSAID-associated duodenal ulcer who require continued NSAID treatment | Prophylaxis in patients with a history of NSAID-associated gastric ulcer who require continued NSAID treatment | Prophylaxis in patients with a history of NSAID-associated gastroduodenal lesions who require continued NSAID treatment

Prophylaxis in patients with a history of NSAID-associated duodenal ulcer who require continued NSAID treatment | Prophylaxis in patients with a history of NSAID-associated gastric ulcer who require continued NSAID treatment | Prophylaxis in patients with a history of NSAID-associated gastroduodenal lesions who require continued NSAID treatment

▶ BY MOUTH

- ▶ Adult: 20 mg once daily

Zollinger–Ellison syndrome

▶ BY MOUTH

- ▶ Adult: Initially 60 mg once daily; usual dose 20–120 mg daily, total daily doses greater than 80 mg should be given in 2 divided doses

▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 60 mg once daily, adjusted according to response, total daily doses greater than 60 mg should be given in 2 divided doses, injection to be given over 5 minutes, infusion to be given over 20–30 minutes

Gastro-oesophageal reflux disease

▶ BY MOUTH

- ▶ Adult: 20 mg once daily for 4 or 8 weeks

Severe oesophagitis

▶ BY MOUTH

- ▶ Adult: 40 mg once daily for 8 weeks, continue as maintenance treatment if appropriate

Severe oesophagitis, refractory to initial treatment

▶ BY MOUTH

- ▶ Adult: 40 mg twice daily

Acid reflux disease (long-term management)

▶ BY MOUTH

- ▶ Adult: 10 mg once daily, increased to 20 mg once daily, dose only increased if symptoms return

Functional dyspepsia

▶ BY MOUTH

- ▶ Adult: 10 mg once daily for 4 weeks

Uninvestigated dyspepsia

▶ BY MOUTH

- ▶ Adult: 20 mg once daily for 4 weeks

Treatment and prevention of benign gastric ulcers | Treatment and prevention of duodenal ulcers | Treatment and prevention of NSAID-associated ulcers | Treatment and prevention of gastro-oesophageal reflux disease

Treatment and prevention of benign gastric ulcers | Treatment and prevention of duodenal ulcers | Treatment and prevention of NSAID-associated ulcers | Treatment and prevention of gastro-oesophageal reflux disease

▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 40 mg once daily until oral administration possible, injection to be given over 5 minutes, infusion to be given over 20–30 minutes

Major peptic ulcer bleeding (following endoscopic treatment)

▶ INITIALLY BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 80 mg, to be given over 40–60 minutes, then (by continuous intravenous infusion) 8 mg/hour for 72 hours, subsequent dose then changed to oral therapy

UNLICENSED USE

- ▶ With oral use [EvgR](#) Duration of treatment for gastro-oesophageal reflux disease differs from product literature and adheres to national guidelines. [⚡](#) See Gastro-oesophageal reflux disease p. 88 for further information.

Omeprazole may be used as detailed below, although these situations are considered outside the scope of its licence:

- **EvGr** treatment of severe oesophagitis, refractory to initial treatment, **▲** see Gastro-oesophageal reflux disease p. 88 for further information;
- **EvGr** treatment of functional and uninvestigated dyspepsia, **▲** see Dyspepsia p. 72 for further information;
- treatment of major peptic ulcer bleeding (following endoscopic treatment).
- **INTERACTIONS** → Appendix 1: proton pump inhibitors
- **SIDE-EFFECTS**
 - ▶ **Rare or very rare** Aggression · agitation · bronchospasm · encephalopathy · gastrointestinal candidiasis · muscle weakness
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **HEPATIC IMPAIRMENT**
 - Dose adjustments Not more than 20 mg daily should be needed.
- **DIRECTIONS FOR ADMINISTRATION** For administration by mouth, swallow whole, or disperse *Losec MUPS*[®] tablets in water, or mix capsule contents or *Losec MUPS*[®] tablets with fruit juice or yoghurt. Preparations consisting of an e/c tablet within a capsule should **not** be opened.
 - ▶ With intravenous use For *continuous or intermittent intravenous infusion*, reconstitute each 40 mg vial with infusion fluid and dilute to 100 mL with Glucose 5% or Sodium Chloride 0.9%; for *intermittent infusion* give 40 mg over 20–30 minutes; stable for 6 hours in Glucose 5% or 12 hours in Sodium Chloride 0.9%.
- **PATIENT AND CARER ADVICE**
 - ▶ With oral use Counselling on administration advised.
- **PROFESSION SPECIFIC INFORMATION**
 - Dental practitioners' formulary Gastro-resistant omeprazole capsules may be prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY**
 - ▶ With oral use Omeprazole 10 mg tablets can be sold to the public for the short-term relief of reflux-like symptoms (e.g. heartburn) in adults over 18 years, max. daily dose 20 mg for max. 4 weeks, and a pack size of 28 tablets.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

4.3 Gastro-oesophageal reflux disease

Gastro-oesophageal reflux disease

31-Oct-2019

Description of condition

Gastro-oesophageal reflux disease (GORD) is usually a chronic condition where there is reflux of gastric contents (particularly acid, bile, and pepsin) back into the oesophagus, causing symptoms of heartburn and acid regurgitation. Less common symptoms such as chest pain, hoarseness, cough, wheezing, asthma and dental erosions

can also occur if acid reflux reaches the oropharynx and/or respiratory tract.

GORD can be classified as non-erosive when a person has symptoms of GORD but the endoscopy is normal or erosive oesophagitis when oesophageal inflammation and mucosal erosions are seen at endoscopy.

Certain factors may contribute to the risk of developing GORD. These include consumption of trigger and fatty foods, pregnancy, hiatus hernia, family history of GORD, increased intra-gastric pressure from straining and coughing, stress, anxiety, obesity, drug side-effects, smoking and alcohol consumption.

Complications of GORD include oesophageal inflammation (oesophagitis), ulceration, haemorrhage and stricture formation, anaemia due to chronic blood loss, aspiration pneumonia, and Barrett's oesophagus.

Aims of treatment

The aim of treatment is to manage the symptoms of GORD and reduce the risk of recurrence and complications associated with the disease.

Non-drug treatment

[EvGr] Lifestyle measures, such as healthy eating, weight loss (if obese), avoiding trigger foods, eating smaller meals, eating the evening meal 3–4 hours before going to bed, raising the head of the bed, Smoking cessation p. 520, and reducing alcohol consumption may improve symptoms. Assess the patient for stress and anxiety as these conditions may exacerbate symptoms.

Urgent endoscopic investigation is required for patients with dysphagia, significant acute gastrointestinal bleeding, or in those aged 55 years and over with unexplained weight loss and symptoms of upper abdominal pain, reflux or dyspepsia. Endoscopy can be considered to diagnose Barrett's oesophagus if the patient has GORD. Patient preference and individual risk factors should be taken into account. (A)

Drug treatment**Initial management**

[EvGr] Drugs that may cause or exacerbate the symptoms of GORD, such as alpha-blockers, anticholinergics, benzodiazepines, beta-blockers, bisphosphonates, calcium-channel blockers, corticosteroids, non-steroidal anti-inflammatory drugs (NSAIDs), nitrates, theophyllines, and tricyclic antidepressants should be reviewed. The lowest effective dose should be used and if appropriate, stopped.

Long term continuous use of antacids is not recommended for the treatment of GORD.

Patients with uninvestigated symptoms which suggest GORD should be managed as uninvestigated Dyspepsia p. 72.

In patients with an endoscopy confirmed diagnosis of GORD, a proton pump inhibitor (PPI), should be offered for 4 or 8 weeks. (A) If there is no response to a PPI, then offer a histamine₂-receptor antagonist (H₂-receptor antagonist).

[EvGr] Severe oesophagitis should be treated with a PPI for 8 weeks, taking into consideration patient preference and factors such as underlying health conditions and possible interactions with other drugs. (A)

Follow up management

[EvGr] For patients with refractory GORD, new alarm symptoms should be assessed and alternate diagnoses considered. Other options include prescribing a further course of the initial PPI dose for 1 month, double the initial PPI dose for 1 month or the addition of a H₂-receptor antagonist at bedtime for nocturnal symptoms or for short term use. The patient's adherence to initial management should also be checked and lifestyle advice reinforced.

For patients diagnosed with GORD in whom symptoms recur after initial treatment, a PPI should be given at the

lowest dose that can achieve symptom control and self management on an “as-needed” basis should be discussed.

If treatment for severe oesophagitis fails, a higher dose of the same PPI should be used or switching to another PPI should be considered taking into account patient preference, tolerability, underlying health conditions and possible interactions with other drugs.

For patients with severe oesophagitis that fail to respond to long term maintenance PPI therapy a clinical review and switching to another PPI can be considered and/or specialist advice can be sought.

Patients with severe oesophagitis or who have had dilatation of an oesophageal stricture should remain on long-term PPI therapy taking into consideration the factors mentioned above. [↩](#)

GORD in pregnancy

[EvGr](#) Heartburn and acid reflux are symptoms of Dyspepsia p. 72 in pregnancy commonly caused by GORD. Dietary and lifestyle advice should be given as first-line management. If this approach fails to control symptoms, an antacid or an alginate can be used. If this is ineffective or symptoms are severe omeprazole p. 85 or ranitidine p. 80 (unlicensed) may help to control symptoms. [↩](#)

4.4 Helicobacter pylori infection

Helicobacter pylori infection

31-Oct-2019

Description of condition

Helicobacter pylori (*H. pylori*) infection is one of the most common causes of peptic ulcer disease, with 95% of duodenal and 70–80% of gastric ulcers associated with it. The use of non-steroidal anti-inflammatory drugs (NSAIDs) may have an additive effect if there is co-existent *H. pylori* infection, further increasing the risk of peptic ulceration and bleeding. *H. pylori* is also associated with acute and chronic gastritis, gastric cancer, and gastric mucosa associated lymphoid tissue (MALT) lymphoma.

Aims of treatment

Treatment aims to eradicate *H. pylori*, reduce the risk of peptic ulcer disease, ulcer bleeding and gastric malignancy, and the recurrence of gastritis and peptic ulcers.

Testing for *Helicobacter pylori*

[EvGr](#) The presence of *H. pylori* should be confirmed before starting eradication treatment (‘test and treat’ strategy). [↩](#)

Testing for *H. pylori* is recommended in the following patients in line with Public Health England (PHE) Guidance:

- Patients with uncomplicated dyspepsia and no alarm symptoms who are unresponsive to lifestyle changes and antacids, following a single one month treatment course with a proton pump inhibitor;
- Patients considered to be at high risk of *H. pylori* infection (such as older people, individuals of North African ethnicity, and those living in a known high risk area) should be tested for *H. pylori* infection first, or in parallel with a course of a proton pump inhibitor;

- Previously untested patients with a history of peptic ulcers or bleeds;
- Prior to initiating NSAIDs in patients with a prior history of peptic ulcers or bleeds;
- Patients with unexplained iron-deficiency anaemia after endoscopic investigation has excluded malignancy, and other causes have been investigated.

EvGr The urea (13C) breath test p. 91, Stool *Helicobacter* Antigen Test (SAT), or laboratory-based serology where its performance has been locally validated, are recommended for the diagnosis of gastro-duodenal infection with *H. pylori*.

⬆️ PHE advise that the urea (13C) breath test and SAT should not be performed within 2 weeks of treatment with a proton pump inhibitor or within 4 weeks of antibacterial treatment, as this can lead to false negatives.

EvGr Office based serological tests for *H. pylori* are not recommended due to their inadequate performance. ⬆️

Retesting for *Helicobacter pylori*

EvGr In patients with functional dyspepsia, routine retesting after *H. pylori* eradication is not recommended. Retesting may be considered in patients who would value the information. ⬆️

PHE recommend retesting in the following circumstances:

- If compliance is poor, or there are high local resistance rates;
- The patient has persistent symptoms and the initial test was performed within 2 weeks of treatment with a proton pump inhibitor, or within 4 weeks of antibacterial treatment;
- In patients with an associated peptic ulcer, MALT lymphoma, or after resection of an early gastric carcinoma;
- Patients taking aspirin without concomitant treatment with a proton pump inhibitor;
- Patients with severe persistent or recurrent symptoms, particularly if not typical of gastro-oesophageal reflux disease.

Retesting should be performed at least 4 weeks (ideally 8 weeks) after treatment. In patients requiring gastric acid suppression H₂-receptor antagonists p. 78 should be used.

EvGr The urea (13C) breath test should be used for retesting. ⬆️

Drug treatment

Treatment of *H. pylori* usually involves a triple-therapy regimen that comprises a proton pump inhibitor **and** 2 antibacterials. PHE advise that the choice of antibacterials should take into consideration the patient's antibacterial treatment history, as each additional course of clarithromycin, metronidazole, or quinolone increases the risk of resistance.

EvGr Consider referral to a specialist in patients who remain *H. pylori* positive after second-line eradication therapy. ⬆️ PHE also advise that patients should be referred for an endoscopy, culture and susceptibility testing if the choice of antibacterial treatment is reduced due to hypersensitivity, there are known high local resistance rates, or patients have previously received treatment with clarithromycin, metronidazole, and a quinolone.

PHE advise that if diarrhoea develops, *Clostridioides difficile* infection should be considered and the need for treatment reviewed.

EvGr The importance of adherence to treatment should be discussed and emphasised to the patient. ⬆️

Choice of treatment regimen

No penicillin allergy

- **Oral first line for 7 days:**

EvGr A proton pump inhibitor, plus amoxicillin p. 579, and *either* clarithromycin p. 567 or metronidazole p. 572 (treatment choice should take into account previous treatment with clarithromycin or metronidazole). ⬆️

- **Oral second line for 7 days** (if ongoing symptoms after first line treatment):

EvGr A proton pump inhibitor, plus amoxicillin, and *either* clarithromycin or metronidazole (whichever was not used first line). ⬆️

- **Oral alternative second line for 7 days** (for patients who have received previous treatment with clarithromycin and metronidazole):

EvGr A proton pump inhibitor, plus amoxicillin, and tetracycline p. 600 [unlicensed] (or, if a tetracycline cannot be used, levofloxacin p. 592 [unlicensed]). ⬆️

- **Oral third line for 10 days on specialist advice only** in line with PHE Guidance:

A proton pump inhibitor, plus bismuth subsalicylate p. 77 [unlicensed], and *either* 2 antibacterials from those mentioned above not previously used, or rifabutin p. 608 [unlicensed], or furazolidone [unlicensed].

Penicillin allergy

- **Oral first line for 7 days:**

EvGr A proton pump inhibitor, plus clarithromycin, and metronidazole. ⬆️

- **Oral alternative first line for 7 days** (for patients previously treated with clarithromycin):

EvGr A proton pump inhibitor, plus bismuth subsalicylate [unlicensed], plus metronidazole, and tetracycline [unlicensed]. ⬆️

- **Oral second line for 7 days** (if ongoing symptoms after first line treatment in patients who have **not** received previous treatment with a fluoroquinolone):

EvGr A proton pump inhibitor, plus metronidazole, and levofloxacin [unlicensed]. ⬆️

- **Oral alternative second line for 7 days** (in patients who have received previous treatment with a fluoroquinolone):

EvGr A proton pump inhibitor, plus bismuth subsalicylate [unlicensed], plus metronidazole, and tetracycline [unlicensed]. ⬆️

- **Oral third line for 10 days on specialist advice only** in line with PHE Guidance:

A proton pump inhibitor, plus bismuth subsalicylate [unlicensed], and *either* rifabutin [unlicensed] or furazolidone [unlicensed].

For any advice, consult a local microbiologist or the *Helicobacter* Reference Laboratory at: www.gov.uk/guidance/gbru-reference-and-diagnostic-services.

For additional information on the management of patients with *H. pylori* infection and peptic ulcer disease or dyspepsia, see Peptic ulcer disease p. 76 and Dyspepsia p. 72.

DIAGNOSTIC AGENTS

Urea (13C)

● INDICATIONS AND DOSE

Diagnosis of gastro-duodenal *Helicobacter pylori* infection

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Soluble tablet

- ▶ **Pylobactell** (Torbet Laboratories Ltd)
Urea [13-C] 100 mg Pylobactell breath test kit | 1 kit [PoM] £20.75 DT = £20.75

Powder

- ▶ **Helicobacter Test INFAI** (INFAI UK Ltd)
Urea [13-C] 75 mg Helicobacter Test INFAI breath test kit sugar-free | 1 kit [PoM] £21.70 DT = £21.70 sugar-free | 50 kit [PoM] £955.00

Tablet

- ▶ **Diabact UBT** (HFA Healthcare Products Ltd)
Urea [13-C] 50 mg diabact UBT 50mg tablets | 1 tablet [PoM] £21.25 DT = £21.25 | 10 tablet [PoM] £78.75 (Hospital only)

5 Food allergy

Food allergy

15-Dec-2016

Description of condition

Food allergy is an adverse immune response to a food, commonly associated with cutaneous and gastro-intestinal reactions, and less frequently associated with respiratory reactions and anaphylaxis. It is distinct from food intolerance which is non-immunological. Cow's milk, hen's eggs, soy, wheat, peanuts, tree nuts, fish, and shellfish are the most common allergens. Cross-reactivity between similar foods can occur (e.g. allergy to other mammalian milk in patients with cow's milk allergy).

Management of food allergy

[EvGr] Allergy caused by specific foods should be managed by strict avoidance of the causal food. Sodium cromoglicate p. 285 is licensed as an adjunct to dietary avoidance in patients with food allergy. Educating patients about appropriate nutrition, food preparation, and the risks of accidental exposure is recommended, such as food and drinks to avoid, ensuring adequate nutritional intake, and interpreting food labels. ⚠

Drug treatment

[EvGr] There is low quality evidence to support the use of antihistamines to treat acute, **non-life-threatening** symptoms (such as flushing and urticaria) if accidental ingestion of allergenic food has occurred (see *Antihistamines*, under Antihistamines, allergen immunotherapy and allergic emergencies p. 291). Chlorphenamine maleate p. 297 is licensed for the symptomatic control of food allergy. In case of food-induced anaphylaxis, adrenaline/epinephrine p. 236 is the first-line immediate treatment (see also *Allergic emergencies*, under Antihistamines, allergen immunotherapy and allergic emergencies p. 291). Patients who are at risk of anaphylaxis should be trained to use self-injectable adrenaline/epinephrine. ⚠

6 Gastro-intestinal smooth muscle spasm

Antispasmodics

Antimuscarinics

The intestinal smooth muscle relaxant properties of antimuscarinic and other antispasmodic drugs may be useful in *irritable bowel syndrome*.

Antimuscarinics (formerly termed 'anticholinergics') reduce intestinal motility. They can be used for the management of *irritable bowel syndrome*.

Antimuscarinics that are used for gastro-intestinal smooth muscle spasm include the tertiary amines atropine sulfate p. 1229 and dicycloverine hydrochloride below and the quaternary ammonium compounds propantheline bromide p. 93 and hyoscine butylbromide p. 92. The quaternary ammonium compounds are less lipid soluble than atropine sulfate and are less likely to cross the blood-brain barrier; they are also less well absorbed from the gastro-intestinal tract.

Dicycloverine hydrochloride has a much less marked antimuscarinic action than atropine sulfate and may also have some direct action on smooth muscle. Hyoscine butylbromide is advocated as a gastro-intestinal antispasmodic, but it is poorly absorbed; the injection is useful in endoscopy and radiology. Atropine sulfate and the belladonna alkaloids are outmoded treatments, any clinical virtues being outweighed by atropinic side-effects.

Other indications for antimuscarinic drugs include arrhythmias, asthma and airways disease, motion sickness, parkinsonism, urinary incontinence, mydriasis and cycloplegia, premedication, and as an antidote to organophosphorus poisoning.

Other antispasmodics

Alverine citrate p. 93, mebeverine hydrochloride p. 93, and peppermint oil p. 52 are believed to be direct relaxants of intestinal smooth muscle and may relieve pain in *irritable bowel syndrome*. They have no serious adverse effects but, like all antispasmodics, should be avoided in paralytic ileus.

ANTIMUSCARINICS

820

Dicycloverine hydrochloride
(Dicyclomine hydrochloride)

23-Apr-2020

● INDICATIONS AND DOSE

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

- ▶ BY MOUTH
- ▶ Child 6-23 months: 5–10 mg 3–4 times a day, dose to be taken 15 minutes before feeds
- ▶ Child 2-11 years: 10 mg 3 times a day
- ▶ Child 12-17 years: 10–20 mg 3 times a day
- ▶ Adult: 10–20 mg 3 times a day

- **CONTRA-INDICATIONS** Child under 6 months
- **INTERACTIONS** → Appendix 1: dicycloverine
- **SIDE-EFFECTS** Appetite decreased · fatigue · thirst
- **PREGNANCY** Not known to be harmful; manufacturer advises use only if essential.
- **BREAST FEEDING** Avoid—present in milk; apnoea reported in infant.
- **EXCEPTIONS TO LEGAL CATEGORY** Dicycloverine hydrochloride can be sold to the public provided that max. single dose is 10 mg and max. daily dose is 60 mg.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

- ▶ **Dicycloverine hydrochloride (Non-proprietary)**
Dicycloverine hydrochloride 2 mg per 1 ml Dicycloverine 10mg/5ml oral solution | 120 ml [PoM] £196.36 DT = £174.40

Tablet

- ▶ **Dicycloverine hydrochloride (Non-proprietary)**
Dicycloverine hydrochloride 10 mg Dicycloverine 10mg tablets | 100 tablet [PoM] £221.82 DT = £220.26
Dicycloverine hydrochloride 20 mg Dicycloverine 20mg tablets | 84 tablet [PoM] £234.11 DT = £232.91

Dicycloverine hydrochloride with aluminium hydroxide, magnesium oxide and simeticone

28-Apr-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, dicycloverine hydrochloride p. 91, simeticone p. 76.

• INDICATIONS AND DOSE

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

- ▶ BY MOUTH
- ▶ Child 12-17 years: 10–20 mL every 4 hours as required
- ▶ Adult: 10–20 mL every 4 hours as required

- **INTERACTIONS** → Appendix 1: antacids · dicycloverine

- **SIDE-EFFECTS** Anticholinergic syndrome

- **RENAL IMPAIRMENT** There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

- ▶ **Kolanticon** (Peckforton Pharmaceuticals Ltd)
Dicycloverine hydrochloride 500 microgram per 1 ml, Simeticone 4 mg per 1 ml, Magnesium oxide light 20 mg per 1 ml, Aluminium hydroxide dried 40 mg per 1 ml Kolanticon gel sugar-free | 200 ml [P] £4.00 sugar-free | 500 ml [P] £6.00

Hyoscine butylbromide

13-Mar-2017

• INDICATIONS AND DOSE

Symptomatic relief of gastro-intestinal or genito-urinary disorders characterised by smooth muscle spasm

- ▶ BY MOUTH
- ▶ Child 6-11 years: 10 mg 3 times a day
- ▶ Child 12-17 years: 20 mg 4 times a day
- ▶ Adult: 20 mg 4 times a day

Irritable bowel syndrome

- ▶ BY MOUTH
- ▶ Adult: 10 mg 3 times a day; increased if necessary up to 20 mg 4 times a day

Acute spasm | Spasm in diagnostic procedures

- ▶ INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 20 mg, then (by intramuscular injection or by slow intravenous injection) 20 mg after 30 minutes if required, dose may be repeated more frequently in endoscopy; maximum 100 mg per day

Excessive respiratory secretions in palliative care

- ▶ BY MOUTH
- ▶ Child 1 month-1 year: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
- ▶ Child 2-4 years: 5 mg 3–4 times a day
- ▶ Child 5-11 years: 10 mg 3–4 times a day
- ▶ Child 12-17 years: 10–20 mg 3–4 times a day
- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child 1 month-4 years: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
- ▶ Child 5-11 years: 5–10 mg 3–4 times a day
- ▶ Child 12-17 years: 10–20 mg 3–4 times a day
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 20 mg every 4 hours if required, adjusted according to response to up to 20 mg every 1 hour
- ▶ BY SUBCUTANEOUS INFUSION
- ▶ Adult: 20–120 mg/24 hours

Bowel colic in palliative care

- ▶ BY MOUTH
- ▶ Child 1 month-1 year: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
- ▶ Child 2-4 years: 5 mg 3–4 times a day
- ▶ Child 5-11 years: 10 mg 3–4 times a day
- ▶ Child 12-17 years: 10–20 mg 3–4 times a day
- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child 1 month-4 years: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
- ▶ Child 5-11 years: 5–10 mg 3–4 times a day
- ▶ Child 12-17 years: 10–20 mg 3–4 times a day
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 20 mg every 4 hours if required, adjusted according to response to up to 20 mg every 1 hour
- ▶ BY SUBCUTANEOUS INFUSION
- ▶ Adult: 60–300 mg/24 hours

PHARMACOKINETICS

- ▶ Administration by mouth is associated with poor absorption.

• UNLICENSED USE

- ▶ In children *Tablets* not licensed for use in children under 6 years. *Injection* not licensed for use in children (age range not specified by manufacturer).

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: HYOSCINE BUTYLBROMIDE (*BUSCOPAN*[®]) INJECTION: RISK OF SERIOUS ADVERSE EFFECTS IN PATIENTS WITH UNDERLYING CARDIAC DISEASE (FEBRUARY 2017)

The MHRA advises that hyoscine butylbromide injection can cause serious adverse effects including tachycardia, hypotension, and anaphylaxis; several reports have noted that anaphylaxis is more likely to be fatal in patients with underlying coronary heart disease. Hyoscine butylbromide injection is contra-indicated in patients with tachycardia and should be used with caution in patients with cardiac disease; the MHRA recommends that these patients are monitored and that resuscitation equipment and trained personnel are readily available.

• CONTRA-INDICATIONS

- ▶ With intramuscular use or intravenous use or subcutaneous use Tachycardia

- **INTERACTIONS** → Appendix 1: hyoscine

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Dyspnoea

SPECIFIC SIDE-EFFECTS

- ▶ With parenteral use Feeling hot · hypotension · mydriasis · sweat changes

- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Amount too small to be harmful.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With oral use in children For administration by *mouth*, injection solution may be used; content of ampoule may be stored in a refrigerator for up to 24 hours after opening.
 - ▶ With intravenous use in children For *intravenous injection*, may be diluted with Glucose 5% or Sodium Chloride 0.9%; give over at least 1 minute.
- **PRESCRIBING AND DISPENSING INFORMATION**

Palliative care For further information on the use of hyoscine butylbromide in palliative care, see www.medicinescomplete.com/#/content/palliative/hyoscine-butylbromide.
- **EXCEPTIONS TO LEGAL CATEGORY** Hyoscine butylbromide tablets can be sold to the public for medically confirmed irritable bowel syndrome, provided single dose does not exceed 20 mg, daily dose does not exceed 80 mg, and pack does not contain a total of more than 240 mg.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection

- ▶ **Buscopan** (Sanofi)
Hyoscine butylbromide 20 mg per 1 ml Buscopan 20mg/1ml solution for injection ampoules | 10 ampoule [PoM] £2.92 DT = £2.92

Tablet

- ▶ **Buscopan** (Sanofi)
Hyoscine butylbromide 10 mg Buscopan 10mg tablets | 56 tablet [PoM] £3.00 DT = £3.00 | 100 tablet [PoM] £5.35

Propantheline bromide

● INDICATIONS AND DOSE

Adult enuresis | Hyperhidrosis | Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

- ▶ BY MOUTH
 - ▶ Adult: 15 mg 3 times a day, dose to be taken at least one hour before food and 30 mg, dose to be taken at bedtime; maximum 120 mg per day

- **INTERACTIONS** → Appendix 1: propantheline
- **SIDE-EFFECTS** Arrhythmias · bronchial secretion decreased · mydriasis
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** May suppress lactation.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises caution.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

- CAUTIONARY AND ADVISORY LABELS 23
- ▶ **Pro-Banthine** (Kyowa Kirin Ltd)
Propantheline bromide 15 mg Pro-Banthine 15mg tablets | 112 tablet [PoM] £20.74 DT = £20.74

ANTISPASMODICS

Alverine citrate

19-May-2020

● INDICATIONS AND DOSE

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm | Dysmenorrhoea

- ▶ BY MOUTH
 - ▶ Child 12-17 years: 60–120 mg 1–3 times a day
 - ▶ Adult: 60–120 mg 1–3 times a day

- **CONTRA-INDICATIONS** Intestinal obstruction · paralytic ileus
- **SIDE-EFFECTS** Dizziness · dyspnoea · headache · jaundice (reversible on discontinuation) · nausea · skin reactions · wheezing
- **PREGNANCY** Manufacturer advises avoid—limited information available
- **BREAST FEEDING** Manufacturer advises avoid—limited information available.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

- ▶ **Alverine citrate (Non-proprietary)**
 - Alverine citrate 60 mg Alverine 60mg capsules | 100 capsule [PoM] £10.50-£19.49 DT = £11.26
 - Alverine citrate 120 mg Alverine 120mg capsules | 60 capsule [PoM] £23.29 DT = £23.29
- ▶ **Audmonal** (Teva UK Ltd)
 - Alverine citrate 60 mg Audmonal 60mg capsules | 100 capsule [P] £14.80 DT = £11.26
 - Alverine citrate 120 mg Audmonal Forte 120mg capsules | 60 capsule [P] £17.75 DT = £23.29
- ▶ **Spasmonal** (Mylan)
 - Alverine citrate 60 mg Spasmonal 60mg capsules | 20 capsule [P] £3.29 | 100 capsule [P] £16.45 DT = £11.26
 - Alverine citrate 120 mg Spasmonal Forte 120mg capsules | 60 capsule [P] £19.42 DT = £23.29

Mebeverine hydrochloride

12-Feb-2019

● INDICATIONS AND DOSE

Adjunct in gastro-intestinal disorders characterised by smooth muscle spasm

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
 - ▶ Child 10-17 years: 135–150 mg 3 times a day, dose preferably taken 20 minutes before meals
 - ▶ Adult: 135–150 mg 3 times a day, dose preferably taken 20 minutes before meals

Irritable bowel syndrome

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
 - ▶ Child 12-17 years: 200 mg twice daily
 - ▶ Adult: 200 mg twice daily

● UNLICENSED USE

- ▶ In children *Tablets* and *modified-release capsules* not licensed for use in children.
- **CONTRA-INDICATIONS** Paralytic ileus
- **SIDE-EFFECTS** Angioedema · face oedema · skin reactions
- **PREGNANCY** Not known to be harmful—manufacturers advise avoid.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on the timing of administration of mebeverine hydrochloride tablets and oral suspension.

Medicines for Children leaflet: Mebeverine for intestinal spasms www.medicinesforchildren.org.uk/mebeverine-intestinal-spasms

EXCEPTIONS TO LEGAL CATEGORY

- In adults Mebeverine hydrochloride can be sold to the public for symptomatic relief of irritable bowel syndrome provided that max. single dose is 135 mg and max. daily dose is 405 mg; for uses other than symptomatic relief of irritable bowel syndrome provided that max. single dose is 100 mg and max. daily dose is 300 mg.

- MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Oral suspension

Mebeverine hydrochloride (Non-proprietary)

Mebeverine hydrochloride (as Mebeverine pamoate) 10 mg per 1 ml Mebeverine 50mg/5ml oral suspension sugar free sugar-free | 300 ml [PoM] £187.00 DT = £187.00

7 Liver disorders and related conditions

7.1 Biliary disorders

Cholestasis

01-May-2017

Description of condition

Cholestasis is an impairment of bile formation and/or bile flow, which may clinically present with fatigue, pruritus, dark urine, pale stools and, in its most overt form, jaundice and signs of fat soluble vitamin deficiencies.

Treatment of cholestatic pruritus

Several drugs are used to relieve cholestatic pruritus, even if evidence to support their use is limited.

[EvGr] Colestyramine p. 210 is the drug of choice for treating cholestatic pruritus. It is an anion-exchange resin that is not absorbed from the gastro-intestinal tract. It relieves pruritus by forming an insoluble complex in the intestine with bile acids and other compounds—the reduction of serum bile acid levels reduces excess deposition in the dermal tissue with a resultant decrease in pruritus. ⚠

[EvGr] Ursodeoxycholic acid p. 96 has a small and variable impact on cholestatic pruritus. ⚠

[EvGr] Rifampicin p. 615 [unlicensed indication] can be used as an alternative treatment for pruritus, but should be used with caution in patients with pre-existing liver disease because of possible hepatotoxicity. ⚠

[EvGr] Where previous therapy has proved ineffective or was not tolerated, other drugs including sertraline p. 385

[unlicensed indication] and naltrexone hydrochloride p. 519 [unlicensed indication], may be used to treat cholestatic pruritus. However, their use is limited due to significant side-effects. ⚠

Intrahepatic cholestasis in pregnancy

[EvGr] Ursodeoxycholic acid is effective for the treatment of pruritus associated with intrahepatic cholestasis in pregnancy. ⚠

Intrahepatic cholestasis usually occurs in late pregnancy and is associated with adverse fetal outcomes. [EvGr] There is no evidence that ursodeoxycholic acid used in late pregnancy affects birth weight in the infant or the risk of preterm delivery. There is limited data about the effect of fetal exposure during the first trimester. ⚠

Gallstones

01-May-2017

Description of condition

Gallstones (cholelithiasis) occur when hard mineral or fatty deposits form in the gallbladder. Gallstone disease is a general term that describes the presence of one or more stones in the gallbladder or in the bile duct, and the symptoms and complications that they may cause.

The majority of patients with gallstones remain asymptomatic. When the stones irritate the gallbladder or block part of the biliary system, the patient can experience symptoms such as pain, or infection and inflammation that if left untreated, can lead to severe complications such as biliary colic, acute cholecystitis, cholangitis, pancreatitis, and obstructive jaundice.

Non-drug treatment

[EvGr] Asymptomatic gallbladder stones do not need to be treated unless symptoms develop.

The definitive treatment of symptomatic gallstones (and all bile duct stones) is surgical removal by laparoscopic cholecystectomy. ⚠

Drug treatment

[EvGr] Analgesia should be offered to control pain symptoms. Paracetamol p. 465 or a nonsteroidal anti-inflammatory drug (see Non-steroidal anti-inflammatory drugs p. 1193) is recommended for intermittent mild-to-moderate pain. Intramuscular diclofenac sodium p. 1198 can be given for severe pain or, if not suitable, an intramuscular opioid (such as morphine p. 484 or pethidine hydrochloride p. 490). ⚠

Although ursodeoxycholic acid p. 96 has been used for the management of gallstone disease, there is no evidence to support its use.

Useful Resources

Gallstone disease: diagnosis and management. National Institute for Health and Care Excellence. Clinical guideline 188. October 2014. www.nice.org.uk/guidance/cg188

Inborn errors of primary bile acid synthesis

27-Apr-2018

Description of condition

Inborn errors of primary bile acid synthesis are a group of diseases in which the liver does not produce enough primary bile acids due to enzyme deficiencies. These acids are the main components of the bile, and include cholic acid and chenodeoxycholic acid.

Treatment

Cholic acid below is licensed for the treatment of inborn errors in primary bile acid synthesis due to an inborn deficiency of two specific liver enzymes. It acts by replacing some of the missing bile acids, therefore relieving the symptoms of the disease.

Chenodeoxycholic acid below is licensed for the treatment of inborn errors of primary bile acid synthesis due to a deficiency of one specific enzyme in the bile acid synthesis pathway when presenting as cerebrotendinous xanthomatosis.

Ursodeoxycholic acid p. 96 [unlicensed indication] has been used to treat inborn errors of primary bile acid synthesis, but there is an absence of evidence to recommend its use.

Primary biliary cholangitis

30-May-2017

Description of condition

Primary biliary cholangitis (or primary biliary cirrhosis) is a chronic cholestatic disease which develops due to progressive destruction of small and intermediate bile ducts within the liver, subsequently evolving to fibrosis and cirrhosis.

Treatment

[EvGr] Ursodeoxycholic acid p. 96 is recommended for the management of primary biliary cholangitis, including those with asymptomatic disease. It slows disease progression, but the effect on overall survival is uncertain. Liver transplantation can be considered in patients with advanced primary biliary cholangitis. **[d]**

BILE ACIDS

Chenodeoxycholic acid

05-Apr-2018

● INDICATIONS AND DOSE

Cerebrotendinous xanthomatosis (specialist use only)

► BY MOUTH

- Adult: Initially 750 mg daily in 3 divided doses, increased if necessary up to 1000 mg daily in divided doses

- **CONTRA-INDICATIONS** Non-functioning gall bladder · radio-opaque stones
- **INTERACTIONS** → Appendix 1: chenodeoxycholic acid
- **SIDE-EFFECTS** Constipation
- **PREGNANCY** Manufacturer advises avoid—fetotoxicity reported in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises monitor—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises monitor—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises to monitor serum cholestanol levels and/or urine bile alcohols every 3 months during the initiation of therapy and dose adjustment, and then at least annually; liver function should also be monitored during initiation of therapy and then at least annually; additional or more frequent investigations may need to be undertaken to monitor therapy during periods of fast growth or concomitant disease.
- **DIRECTIONS FOR ADMINISTRATION** For administration by *mouth* in patients who are unable to swallow capsules and/or need to take a dose below 250 mg, manufacturer advises to add capsule contents to sodium bicarbonate

solution 8.4%—for further information, consult product literature.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

► Chenodeoxycholic acid (non-proprietary) ▼

Chenodeoxycholic acid 250 mg Chenodeoxycholic acid 250mg capsules | 100 capsule **[PoM]** £14,000.00 DT = £9,999.99

Cholic acid

12-Jul-2018

- **DRUG ACTION** Cholic acid is the predominant primary bile acid in humans, which can be used to provide a source of bile acid in patients with inborn deficiencies in bile acid synthesis.

● INDICATIONS AND DOSE

Inborn errors of primary bile acid synthesis (initiated by a specialist)

► BY MOUTH

- Adult: Usual dose 5–15 mg/kg daily; increased in steps of 50 mg daily in divided doses if required, dose to be given with food at the same time each day; Usual maximum 500 mg/24 hours

- **INTERACTIONS** → Appendix 1: cholic acid
- **SIDE-EFFECTS** Cholelithiasis (long term use) · diarrhoea · pruritus
- SIDE-EFFECTS, FURTHER INFORMATION** Patients presenting with pruritus and/or persistent diarrhoea should be investigated for potential overdose by a serum and/or urine bile acid assay.
- **PREGNANCY** Limited data available—not known to be harmful, manufacturer advises continue treatment. **Monitoring** Manufacturer advises monitor patient parameters more frequently in pregnancy.
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution and stop treatment if there are signs of severe hepatic failure—limited information available (no experience with impairment from causes not related to inborn errors of primary bile acid synthesis). **Dose adjustments** Manufacturer advises adjust dose as the degree of impairment improves during treatment.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor serum and/or urine bile-acid concentrations every 3 months for the first year, then every 6 months for three years, then annually; monitor liver function tests at the same or greater frequency.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises capsules may be opened and the content added to infant formula, juice, fruit compote, or yoghurt for administration.
- **PATIENT AND CARER ADVICE** Counselling advised on administration.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Obeticholic acid

15-May-2018

- **DRUG ACTION** Obeticholic acid is a selective farnesoid X receptor agonist, which decreases circulating bile acid.

● INDICATIONS AND DOSE

Primary biliary cholangitis in combination with ursodeoxycholic acid when response to ursodeoxycholic acid has been inadequate, or as monotherapy in patients intolerant of ursodeoxycholic acid

► BY MOUTH

- Adult: Initially 5 mg once daily for 6 months, then increased to 10 mg once daily if necessary and if tolerated, for dose adjustments due to severe pruritus, consult product literature

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: OBETICHOLIC ACID (OCALIVA®): RISK OF SERIOUS LIVER INJURY IN PATIENTS WITH PRE-EXISTING MODERATE OR SEVERE HEPATIC IMPAIRMENT; REMINDER TO ADJUST DOSING ACCORDING TO LIVER FUNCTION MONITORING (APRIL 2018)

The MHRA is aware of reports of serious liver injuries and deaths in patients with primary biliary cholangitis with pre-existing moderate or severe liver impairment who were not adequately dose-adjusted. Follow dose reduction and monitoring advice in these patients to reduce the risk of serious liver injury; for further information, see *Hepatic impairment* and *Monitoring*.

- **CONTRA-INDICATIONS** Complete biliary obstruction
- **INTERACTIONS** → Appendix 1: obeticholic acid
- **SIDE-EFFECTS**
 - **Common or very common** Arthralgia · constipation · dizziness · fatigue · fever · gastrointestinal discomfort · oropharyngeal pain · palpitations · peripheral oedema · skin reactions
 - **Frequency not known** Hepatic failure
- **PREGNANCY**
 - **Dose adjustments** No evidence of harm but manufacturer advises avoid.
- **BREAST FEEDING** Not known to be harmful but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment or decompensated cirrhosis (risk of increased exposure).
 - **Dose adjustments** Manufacturer advises initial dose reduction to 5 mg once weekly in moderate to severe impairment or decompensated cirrhosis; titrate dose according to alkaline phosphatase and/or total bilirubin level—consult product literature.
- **MONITORING REQUIREMENTS** Manufacturer advises assess hepatic status before treatment initiation and then monitor for progression of primary biliary cholangitis with laboratory and clinical assessment to evaluate the need for dose reduction; patients at an increased risk of hepatic decompensation, including those with laboratory evidence of worsening liver function and/or progression to cirrhosis, should be monitored more closely.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

 - **Obeticholic acid for treating primary biliary cholangitis (April 2017)** NICE TA443
Obeticholic acid (Ocaliva®) is recommended as an option for treating primary biliary cholangitis, in combination with ursodeoxycholic acid when response to ursodeoxycholic acid is inadequate, or as monotherapy when ursodeoxycholic acid is not tolerated and only if the manufacturer provides obeticholic acid with the discount agreed in the patient access scheme. Response to obeticholic acid should be assessed after 12 months and

treatment continued only if there is evidence of clinical benefit.

www.nice.org.uk/guidance/ta443

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (June 2017) that obeticholic acid (Ocaliva®) is accepted for use within NHS Scotland for the treatment of primary biliary cholangitis in combination with ursodeoxycholic acid when response to ursodeoxycholic acid is inadequate, or as monotherapy when ursodeoxycholic acid is not tolerated. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

Ursodeoxycholic acid

05-May-2020

● INDICATIONS AND DOSE

Dissolution of gallstones

► BY MOUTH

- Adult: 8–12 mg/kg once daily, dose to be taken at bedtime, alternatively 8–12 mg/kg daily in 2 divided doses for up to 2 years; treatment is continued for 3–4 months after stones dissolve

Primary biliary cirrhosis

► BY MOUTH

- Adult: 12–16 mg/kg daily in 3 divided doses for 3 months, then 12–16 mg/kg once daily, dose to be taken at bedtime

Gall reflux gastritis

► BY MOUTH

- Adult (body-weight 47 kg and above): 250 mg once daily for 10–14 days, dose to be taken at bedtime

- **CONTRA-INDICATIONS** Acute inflammation of the gall bladder · frequent episodes of biliary colic · inflammatory diseases and other conditions of the colon, liver or small intestine which interfere with enterohepatic circulation of bile salts · non-functioning gall bladder · radio-opaque stones
- **INTERACTIONS** → Appendix 1: ursodeoxycholic acid
- **SIDE-EFFECTS**
 - **Common or very common** Diarrhoea · pale faeces
 - **Rare or very rare** Abdominal pain upper · cholelithiasis calcification · hepatic cirrhosis exacerbated · skin reactions
 - **Frequency not known** Nausea · vomiting
- **PREGNANCY** No evidence of harm but manufacturer advises avoid.
- **BREAST FEEDING** Not known to be harmful but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Avoid in chronic liver disease (but used in primary biliary cirrhosis).
- **MONITORING REQUIREMENTS** In primary biliary cirrhosis, monitor liver function every 4 weeks for 3 months, then every 3 months.
- **PATIENT AND CARER ADVICE** Patients should be given dietary advice (including avoidance of excessive cholesterol and calories).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

8 Obesity

Obesity

01-Jun-2016

Description of condition

Obesity is directly linked to many health problems including cardiovascular disease, type 2 diabetes, fatty liver disease, gallstones, and gastro-oesophageal reflux disease. It is also linked to psychological and psychiatric morbidities.

In adults, obesity is generally classified as a body mass index (BMI) of $\geq 30 \text{ kg/m}^2$, though BMI should be interpreted with caution as it is not a direct measure of adiposity, particularly in patients who are very muscular or have muscle weakness or atrophy.

Waist circumference should also be considered as it may provide an indication of total body fat and a risk of obesity-related health problems. Men with a waist circumference $\geq 94 \text{ cm}$ ($\geq 90 \text{ cm}$ for Asian men), and women with a waist circumference of $\geq 80 \text{ cm}$ are at increased risk of obesity-related health problems. A waist circumference of $\geq 102 \text{ cm}$ in men and $\geq 88 \text{ cm}$ in women indicates a very high risk of obesity-related health problems.

Aims of treatment

Management should be aimed at modest, sustainable weight loss and maintenance of a healthy weight, to reduce the risk factors associated with obesity.

Overview

EvGr Obesity should be managed in an appropriate setting by staff who have been trained in the management of obesity. Patients should be monitored for changes in weight, as well as changes in blood pressure and blood lipids, and for other associated conditions.

An initial assessment should consider potential underlying causes (e.g. hypothyroidism) and a review of the appropriateness of current medications which are known to cause weight gain, e.g. atypical antipsychotics, beta-adrenoceptor blocking drugs, insulin (when used in the treatment of type 2 diabetes), lithium carbonate, lithium citrate, sodium valproate, sulphonylureas, thiazolidinediones, and tricyclic antidepressants. \blacktriangle

Lifestyle changes

EvGr Patients should be encouraged to engage in a sustainable weight management programme which includes strategies to change behaviour, increase physical activity, and improve diet and eating behaviour. \blacktriangle

Drug treatment

EvGr Drug treatment should **never** be used as the sole element of treatment and should be used as part of an overall weight management plan. An anti-obesity drug should be considered only for those with a BMI of $\geq 30 \text{ kg/m}^2$, in whom diet, exercise and behaviour changes fail to achieve a realistic reduction in weight. In the presence of associated risk factors, it may be appropriate to prescribe an anti-obesity drug to individuals with a BMI of $\geq 28 \text{ kg/m}^2$. A vitamin and mineral supplement may also be considered if there is concern about inadequate micronutrient intake, particularly for vulnerable groups such as in the elderly and younger patients.

The effect of management should be monitored on a regular basis with reinforcement of supporting lifestyle advice. Rates of weight loss may be slower in patients with type 2 diabetes, so less strict goals than in those without diabetes may be appropriate.

Orlistat p. 99, is the only drug currently available in the UK that is recommended specifically for the management of obesity; it acts by reducing the absorption of dietary fat.

Orlistat is licensed for use as an adjunct in the management of obesity in patients with a BMI of $\geq 30 \text{ kg/m}^2$, or, in individuals with a BMI of $\geq 28 \text{ kg/m}^2$ in the presence of other risk factors. Treatment with orlistat may also be used to maintain weight loss rather than to continue to lose weight. Discontinuation of treatment with orlistat should be considered after 12 weeks if weight loss has not exceeded 5% since the start of treatment. \blacktriangle

Drugs which produce a feeling of satiety (such as methylcellulose p. 59 and sterculia p. 59 [unlicensed indications]) have been used in an attempt to control appetite, but there is little evidence for their efficacy. Various centrally acting appetite suppressants, including stimulants and serotonergic drugs (such as dexfenfluramine, fenfluramine, sibutramine, and rimonabant), have been used in the management of obesity but have been withdrawn or are no longer recommended due to serious safety concerns or their addictive potential.

Surgery

EvGr Bariatric surgery may be considered for patients who have a BMI of $\geq 40 \text{ kg/m}^2$ (Obesity III, morbid obesity), or between $35\text{--}39.9 \text{ kg/m}^2$ (Obesity II) and a significant disease (such as type 2 diabetes or high blood pressure) which could be improved with weight loss, and if all appropriate non-surgical measures have been tried but clinically beneficial weight loss has not been achieved or maintained. \blacktriangle

ANTIDEPRESSANTS > SEROTONIN AND NORADRENALINE RE-UPTAKE INHIBITORS

Naltrexone with bupropion

10-Sep-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, bupropion hydrochloride p. 521, naltrexone hydrochloride p. 519.

● INDICATIONS AND DOSE

Adjunct in obesity (in conjunction with dietary measures and increased physical activity in individuals with a body mass index (BMI) of 30 kg/m^2 or more or in individuals with a BMI of 27 kg/m^2 or more in the presence of one or more weight related co-morbidity)

- ▶ BY MOUTH
- ▶ Adult 18-75 years: Initially 1 tablet daily for 7 days, then increased to 1 tablet twice daily for 7 days, then increased to 3 tablets daily in divided doses for 7 days, two tablets to be taken in the morning, and one tablet to be taken in the evening, then maintenance 2 tablets twice daily, review treatment after 16 weeks and then annually

DOSE EQUIVALENCE AND CONVERSION

- ▶ Each tablet contains 8 mg naltrexone with 90 mg bupropion.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: NALTREXONE/BUPROPION (MYSIMBA[®]): RISK OF ADVERSE REACTIONS THAT COULD AFFECT ABILITY TO DRIVE (AUGUST 2019)

An EU cumulative review of worldwide data has found naltrexone with bupropion to be commonly associated with dizziness or somnolence, and rarely with loss of

consciousness or seizure. These can affect the ability of patients to drive, operate machinery, or perform dangerous tasks, particularly at the start of treatment or during the dose titration phase. Healthcare professionals are advised to inform patients of these adverse effects and to avoid such tasks until they are resolved.

- **CONTRA-INDICATIONS** Uncontrolled hypertension
- **CAUTIONS** History of mania · hypertension
- **INTERACTIONS** → Appendix 1: bupropion · naltrexone
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises avoid in moderate-to-severe impairment—limited information available.
- **PRESCRIBING AND DISPENSING INFORMATION** Prescribers should consult the *Mysimba*® *Physician Prescribing Checklist* provided by the manufacturer, before initiation of treatment.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

 - ▶ **Naltrexone–bupropion for managing overweight and obesity (December 2017)** NICE TA494

Naltrexone–bupropion is not recommended within its marketing authorisation for managing overweight and obesity in adults alongside a reduced-calorie diet and increased physical activity.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta494

9 Rectal and anal disorders

Other drugs used for Rectal and anal disorders Diltiazem hydrochloride, p. 169

9.1 Anal fissures

Anal fissure

31-Aug-2016

Description of condition

An anal fissure is a tear or ulcer in the lining of the anal canal, immediately within the anal margin. Clinical features of anal fissure include bleeding and persistent pain on defecation, and a linear split in the anal mucosa.

Aims of treatment

The aim of treatment is to relieve pain and promote healing of the fissure.

Drug treatment

Acute anal fissure

[EvGr] Initial management of acute anal fissures (present for less than 6 weeks) should focus on ensuring that stools are soft and easily passed. Bulk-forming laxatives (such as ispaghula husk p. 58) are recommended and an osmotic laxative (such as lactulose p. 60) can be considered as an alternative—see also Constipation p. 57, for further information about these laxatives. Short-term use of a topical preparation containing a local anaesthetic (such as lidocaine hydrochloride p. 1422) or a simple analgesic (such as paracetamol p. 465 or ibuprofen p. 1203) may be offered for prolonged burning pain following defecation. If these measures are inadequate, the patient should be referred for specialist treatment in hospital. 

Chronic anal fissure

EvGr Chronic anal fissures (present for 6 weeks or longer), and associated pain, may be treated with glyceryl trinitrate rectal ointment 0.4% or 0.2% p. 232 [unlicensed] (available from Special-order manufacturers p. 1710 or specialist importing companies). Limited evidence suggests that the strength used does not influence the effectiveness, but that the higher strength potentially increases the incidence of side-effects. Healing rates with topical glyceryl trinitrate are marginally superior to placebo, but the incidence of headache as an adverse effect is quite high (about 20-30% of patients). Recurrence of the fissure after treatment is common.

As an alternative to glyceryl trinitrate rectal ointment, chronic anal fissure may also be treated with topical diltiazem hydrochloride 2% p. 169 [unlicensed] or nifedipine 0.2-0.5% p. 174 [unlicensed] (available from Special-order manufacturers p. 1710 or specialist importing companies), which have a lower incidence of adverse effects than topical glyceryl trinitrate. Oral nifedipine [unlicensed indication] and oral diltiazem hydrochloride [unlicensed indication] may be as effective as topical treatment, but the incidence of adverse effects are likely to be higher and topical preparations are preferred.

Patients who do not respond to first-line treatment may be referred to a specialist for local injection of botulinum toxin type A [unlicensed indication]. **A**

Non-drug treatment

EvGr Surgery is an effective option for the management of chronic anal fissure in adults but is generally reserved for those who do not respond to drug treatment. **A**

9.2 Haemorrhoids

Haemorrhoids

01-Dec-2016

Description of condition

Haemorrhoids, or piles, are abnormal swellings of the vascular mucosal anal cushions around the anus. Internal haemorrhoids arise above the dentate line and are usually painless unless they become strangulated. External haemorrhoids originate below the dentate line and can be itchy or painful. Women are predisposed to developing haemorrhoids during pregnancy.

Aims of treatment

The aims of treatment are to reduce the symptoms (pain, bleeding and swelling), promote healing, and prevent recurrence.

Non-drug treatment

EvGr Stools should be kept soft and easy to pass (to minimise straining) by increasing dietary fibre and fluid intake. Advice about perianal hygiene is helpful to aid healing and reduce irritation and itching. **A**

Drug treatment

EvGr If constipation is reported, it should be treated. A bulk-forming laxative can be prescribed (see Constipation p. 57)

A simple analgesic such as paracetamol p. 465 can be used for pain relief. Opioid analgesics should be avoided as they can cause constipation, and NSAIDs should be avoided if rectal bleeding is present. **A**

Topical preparations that contain a combination of local anaesthetics, corticosteroids, astringents, lubricants, and antiseptics are available—see *Related drugs* below. **EvGr** They can offer symptomatic relief of local pain and itching but evidence does not suggest that any preparation is more effective than any other.

Topical preparations containing local anaesthetics (lidocaine, benzocaine, cinchocaine and pramocaine) should only be used for a few days as they may cause sensitisation of the anal skin. Local anaesthetics can be absorbed through the rectal mucosa (with a theoretical risk of systemic side effects) and very rarely may cause increased irritation; therefore excessive application should be avoided. **A**

Topical preparations combining corticosteroids with local anaesthetics and soothing agents are available for the management of haemorrhoids. They may ameliorate local perianal inflammation, but no data suggest that they actually reduce haemorrhoidal swelling, bleeding, or protrusion.

EvGr Topical corticosteroids are suitable for occasional short-term use (no more than 7 days) after exclusion of infections (such as perianal streptococcal infection, *herpes simplex* or perianal thrush). Long-term use of corticosteroid creams can cause ulceration or permanent damage due to thinning of the perianal skin and should be avoided. **A** Continuous or excessive use carries a risk of adrenal suppression and systemic corticosteroid effects.

EvGr Recurrent symptoms, should be referred to secondary care for further investigation and management.

Treatments available from *specialists* include rubber band ligation, injection sclerotherapy (using phenol in oil p. 102), infrared coagulation/photocoagulation, bipolar diathermy and direct-current electrotherapy, haemorrhoidectomy, stapled haemorrhoidectomy, and haemorrhoidal artery ligation. **A**

Pregnancy

EvGr Bulk forming laxatives are not absorbed, and are therefore safe for use in pregnant women (see Pregnancy, under Constipation p. 57). **A** No topical haemorrhoidal preparations are licensed for use during pregnancy.

EvGr If treatment with a topical haemorrhoidal preparation is required, a soothing preparation containing simple, soothing products (**not** local anaesthetics or corticosteroids) can be considered. **A**

10 Reduced exocrine secretions

Exocrine pancreatic insufficiency

14-Dec-2016

Description of condition

Exocrine pancreatic insufficiency is characterised by reduced secretion of pancreatic enzymes into the duodenum.

The main clinical manifestations are maldigestion and malnutrition, associated with low circulating levels of micronutrients, fat-soluble vitamins and lipoproteins. Patients also present with gastro-intestinal symptoms such as diarrhoea, abdominal cramps and steatorrhoea.

Exocrine pancreatic insufficiency can result from chronic pancreatitis, cystic fibrosis, obstructive pancreatic tumours, coeliac disease, Zollinger-Ellison syndrome, and gastro-intestinal or pancreatic surgical resection.

Aims of treatment

The aim of treatment is to relieve gastro-intestinal symptoms and to achieve a normal nutritional status.

Drug treatment

Pancreatic enzyme replacement therapy with pancreatin below is the mainstay of treatment for exocrine pancreatic insufficiency.

Pancreatin contains the three main groups of digestive enzymes: lipase, amylase and protease. These enzymes respectively digest fats, carbohydrates and proteins into their basic components so that they can be absorbed and utilised by the body. [EvGr] Pancreatin should be administered with meals and snacks. The dose should be adjusted, as necessary, to the lowest effective dose according to the symptoms of maldigestion and malabsorption. ⚠

Fibrosing colonopathy has been reported in patients with cystic fibrosis taking high dose pancreatic enzyme replacement therapy (in excess of 10 000 units/kg/day of lipase). Possible risk factors are gender (in children, boys are at greater risk than girls), more severe cystic fibrosis, and concomitant use of laxatives. The peak age for developing fibrosing colonopathy is between 2 and 8 years. Manufacturers of *Pancrease HL*[®] and *Nutrizym 22*[®] recommend that the total dose of pancreatin used in patients with cystic fibrosis should not usually exceed 10 000 units/kg/day of lipase. Manufacturers of pancreatin recommend that if a patient taking pancreatin develops new abdominal symptoms (or any change in existing abdominal symptoms) the patient should be reviewed to exclude the possibility of colonic damage.

There is limited evidence that acid suppression may improve the effectiveness of pancreatin. [EvGr] Acid-suppressing drugs (proton pump inhibitors or H₂-receptor antagonists) may be trialled in patients who continue to experience symptoms despite high doses of pancreatin.

Levels of fat-soluble vitamins and micronutrients (such as zinc and selenium) should be routinely assessed and supplementation advised whenever necessary. ⚠

Pancreatin preparations

Preparation	Protease units	Amylase units	Lipase units
Creon [®] 10 000 capsule, e/c granules	600	8000	10 000
Creon [®] Micro e/c granules (per 100 mg)	200	3600	5000
Pancrex [®] granules (per gram)	300	4000	5000
Pancrex V [®] capsule, powder	430	9000	8000
Pancrex V '125' capsule, powder	160	3300	2950
Pancrex V [®] e/c tablet	110	1700	1900
Pancrex V [®] Forte e/c tablet	330	5000	5600
Pancrex V [®] powder (per gram)	1400	30 000	25 000

Higher-strength pancreatin preparations

Preparation	Protease units	Amylase units	Lipase units
Creon [®] 25 000 capsule, e/c pellets	1000	18 000	25 000
Creon [®] 40000 capsule, e/c granules	1600	25 000	40 000
Nutrizym 22 [®] capsule, e/c minitables	1100	19 800	22 000
Pancrease HL [®] capsule, e/c minitables	1250	22 500	25 000

Non-drug treatment

[EvGr] Dietary advice should be provided. Food intake should be distributed between three main meals per day, and two or three snacks. Food that is difficult to digest should be avoided, such as legumes (peas, beans, lentils) and high-fibre foods. Alcohol should be avoided completely. Reduced fat diets are not recommended. ⚠

Medium-chain triglycerides (see MCT oil, in *Borderline substances*), which are directly absorbed by the intestinal mucosa, were thought to be useful in some patients. However evidence has shown that MCT-enriched preparations offer no advantage over a normal balanced diet.

PANCREATIC ENZYMES

Pancreatin

16-Mar-2020

- **DRUG ACTION** Supplements of pancreatin are given to compensate for reduced or absent exocrine secretion. They assist the digestion of starch, fat, and protein.

• INDICATIONS AND DOSE

CREON[®] 10000

Pancreatic insufficiency

- ▶ BY MOUTH
- ▶ Child: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
- ▶ Adult: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

CREON[®] 25000

Pancreatic insufficiency

- ▶ BY MOUTH
- ▶ Child 2-17 years: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

continued →

- ▶ **Adult:** Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

CREON[®] 40000**Pancreatic insufficiency**

- ▶ **BY MOUTH**
- ▶ **Child 2–17 years:** Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
- ▶ **Adult:** Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

CREON[®] MICRO**Pancreatic insufficiency**

- ▶ **BY MOUTH**
- ▶ **Child:** Initially 100 mg, for administration advice, see *Directions for administration*
- ▶ **Adult:** Initially 100 mg, for administration advice, see *Directions for administration*

DOSE EQUIVALENCE AND CONVERSION

- ▶ For *Creon[®] Micro*: 100 mg granules = one measured scoopful (scoop supplied with product).

NUTRIZYM 22[®] GASTRO-RESISTANT CAPSULES**Pancreatic insufficiency**

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 1–2 capsules, dose to be taken with meals and 1 capsule as required, dose to be taken with snacks, doses should be swallowed whole or contents taken with water, or mixed with acidic fluid or soft food (then swallowed immediately without chewing)

PANCREASE HL[®]**Pancreatic insufficiency**

- ▶ **BY MOUTH**
- ▶ **Child 15–17 years:** Initially 1–2 capsules, dose to be taken during each meal and 1 capsule, to be taken with snacks, all doses either taken whole or contents mixed with slightly acidic liquid or soft food (then swallowed immediately without chewing)
- ▶ **Adult:** Initially 1–2 capsules, dose to be taken during each meal and 1 capsule, to be taken with snacks, all doses either taken whole or contents mixed with slightly acidic liquid or soft food (then swallowed immediately without chewing)

PANCREX[®] V**Pancreatic insufficiency**

- ▶ **BY MOUTH**
- ▶ **Child 1–11 months:** 1–2 capsules, contents of capsule to be mixed with feeds
- ▶ **Child 1–17 years:** 2–6 capsules, dose to be taken with each meal either swallowed whole or sprinkled on food
- ▶ **Adult:** 2–6 capsules, dose to be taken with each meal either swallowed whole or sprinkled on food

PANCREX[®] V POWDER**Pancreatic insufficiency**

- ▶ **BY MOUTH**
- ▶ **Child:** 0.5–2 g, to be taken before or with meals, washed down or mixed with milk or water
- ▶ **Adult:** 0.5–2 g, to be taken before or with meals, washed down or mixed with milk or water

- **CAUTIONS** Can irritate the perioral skin and buccal mucosa if retained in the mouth · excessive doses can cause perioral irritation

- **INTERACTIONS** → Appendix 1: pancreatin

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal distension · constipation · nausea · vomiting
- ▶ **Uncommon** Skin reactions
- ▶ **Frequency not known** Fibrosing colonopathy
- **PREGNANCY** Not known to be harmful.

- **DIRECTIONS FOR ADMINISTRATION** Pancreatin is inactivated by gastric acid therefore manufacturer advises pancreatin preparations are best taken with food (or immediately before or after food). Since pancreatin is inactivated by heat, excessive heat should be avoided if preparations are mixed with liquids or food; manufacturer advises the resulting mixtures should not be kept for more than one hour and any left-over food or liquid containing pancreatin should be discarded. Enteric-coated preparations deliver a higher enzyme concentration in the duodenum (provided the capsule contents are swallowed whole without chewing). Manufacturer advises gastro-resistant granules should be mixed with slightly acidic soft food or liquid such as apple juice, and then swallowed immediately without chewing. Capsules containing enteric-coated granules can be opened and the granules administered in the same way. For infants, *Creon[®] Micro* granules can be mixed with a small amount of milk on a spoon and administered immediately—granules should not be added to the baby's bottle. Manufacturer advises *Pancrex[®] V* powder may be administered via nasogastric tube or gastrostomy tube—consult local and national official guidelines.

● PRESCRIBING AND DISPENSING INFORMATION

Preparations may contain pork pancreatin—consult product literature.

- **HANDLING AND STORAGE** Hypersensitivity reactions have occasionally occurred in those handling the powder.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on administration. It is important to ensure adequate hydration at all times in patients receiving higher-strength pancreatin preparations. Medicines for Children leaflet: Pancreatin for pancreatic insufficiency www.medicinesforchildren.org.uk/pancreatin-pancreatic-insufficiency

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

11 Stoma care

Stoma care

24-Feb-2016

Description of condition

A stoma is an artificial opening on the abdomen to divert flow of faeces or urine into an external pouch located outside of the body. This procedure may be temporary or permanent. Colostomy and ileostomy are the most common forms of stoma but a gastrostomy, jejunostomy, duodenostomy or caecostomy may also be performed. Understanding the type and extent of surgical intervention in each patient is crucial in managing the patient's pharmaceutical needs correctly.

Overview

Prescribing for patients with stoma calls for special care due to modifications in drug delivery, resulting in a higher risk of sub-optimal absorption. The following is a brief account of some of the main points to be borne in mind.

Enteric-coated and modified-release medicines are **unsuitable**, particularly in patients with an ileostomy, as there may not be sufficient release of active ingredient. Soluble tablets, liquids, capsules or uncoated tablets are more suitable due to their quicker dissolution. When a solid-dose form such as a capsule or a tablet is given, the contents of the ostomy bag should be checked for any remnants.

Preparations containing sorbitol as an excipient should be avoided, due to its laxative side effects.

Analgesics

Opioid analgesics may cause troublesome constipation in colostomy patients. When a non-opioid analgesic is required, paracetamol is usually suitable. Anti-inflammatory analgesics may cause gastric irritation and bleeding; faecal output should be monitored for traces of blood.

Antacids

The tendency to diarrhoea from magnesium salts or constipation from aluminium or calcium salts may be increased in patients with stoma.

Antisecretory drugs

The gastric acid secretion often increases stoma output. Proton pump inhibitors and somatostatin analogues (octreotide p. 1002 and lanreotide p. 1001) are often used to reduce this risk.

Antidiarrhoeal drugs

Loperamide hydrochloride p. 71 and codeine phosphate p. 475 reduce intestinal motility and decrease water and sodium output from an ileostomy. Loperamide hydrochloride circulates through the enterohepatic circulation, which is disrupted in patients with a short bowel; high doses of loperamide hydrochloride may be required. Codeine phosphate can be added if response with loperamide hydrochloride alone is inadequate.

Digoxin

Patients with a stoma are particularly susceptible to hypokalaemia if taking digoxin p. 116, due to fluid and sodium depletion. Potassium supplements or a potassium-sparing diuretic may be advisable with monitoring for early signs of toxicity.

Diuretics

Diuretics should be used with caution in patients with an ileostomy or with urostomy as they may become excessively dehydrated and potassium depletion may easily occur. It is usually advisable to use a potassium-sparing diuretic.

Iron preparations

Iron preparations may cause loose stools and sore skin in these patients. If this is troublesome and if iron is definitely indicated, an intramuscular iron preparation should be used. Modified-release preparations should be avoided for the reasons given above.

Laxatives

Laxatives should not be used in patients with an ileostomy where possible as they may cause rapid and severe loss of water and electrolytes.

Colostomy patients may suffer from constipation and whenever possible should be treated by increasing fluid intake or dietary fibre. Bulk-forming drugs can be tried. If they are insufficient, as small a dose as possible of a stimulant laxative such as senna p. 67 can be used with caution.

Potassium supplements

Liquid formulations are preferred to modified-release formulations. The daily dose should be split to avoid osmotic diarrhoea.

Care of stoma

Patients and their carers are usually given advice about the use of cleansing agents, protective creams, lotions, deodorants, or sealants whilst in hospital, either by the surgeon or by stoma care nurses. Voluntary organisations offer help and support to patients with stoma.

1 Arrhythmias

Arrhythmias

06-May-2020

Overview

Management of an arrhythmia requires precise diagnosis of the type of arrhythmia, and electrocardiography is essential; underlying causes such as heart failure require appropriate treatment.

For recommendations on the management of acute myocardial injury and its cardiac complications in adults with known or suspected COVID-19 but without known pre-existing cardiovascular disease, see NICE rapid guidelines: **Acute myocardial injury** (available at: www.nice.org.uk/guidance/ng171). For further information on COVID-19, see COVID-19 p. 656.

Ectopic beats

If ectopic beats are spontaneous and the patient has a normal heart, treatment is rarely required and reassurance to the patient will often suffice. If they are particularly troublesome, beta-blockers are sometimes effective and may be safer than other suppressant drugs.

Atrial fibrillation

Treatment of patients with atrial fibrillation aims to reduce symptoms and prevent complications, especially stroke. All patients with atrial fibrillation should be assessed for their risk of stroke and thromboembolism. Atrial fibrillation can be managed by either controlling the ventricular rate ('rate control') or by attempting to restore and maintain sinus rhythm ('rhythm control'). At any stage if treatment fails to control symptoms, or, if symptoms reoccur after cardioversion and specialised management is required, referral should be made within 4 weeks. If drug treatment fails to control the symptoms of atrial fibrillation or is unsuitable, ablation strategies can be considered. Review anticoagulation, stroke, and bleeding risk at least annually in all patients with atrial fibrillation.

Acute presentation

All patients with life-threatening haemodynamic instability caused by new-onset atrial fibrillation should undergo emergency electrical cardioversion without delaying to

achieve anticoagulation. In patients presenting acutely but without life-threatening haemodynamic instability, rate or rhythm control can be offered if the onset of arrhythmia is less than 48 hours; rate control is preferred if onset is more than 48 hours or uncertain. Consideration of pharmacological or electrical cardioversion should be based on clinical circumstances. If pharmacological cardioversion has been agreed, intravenous amiodarone hydrochloride p. 112, or alternatively flecainide acetate p. 110, can be used (amiodarone hydrochloride is preferred if there is structural heart disease). If urgent rate control is required, a beta-blocker or verapamil hydrochloride p. 175 can be given intravenously.

Cardioversion

Sinus rhythm can be restored by electrical cardioversion, or pharmacological cardioversion with an oral or intravenous antiarrhythmic drug e.g. flecainide acetate or amiodarone hydrochloride. If atrial fibrillation has been present for more than 48 hours, electrical cardioversion is preferred and should not be attempted until the patient has been fully anticoagulated for at least 3 weeks; if this is not possible, parenteral anticoagulation should be commenced, and a left atrial thrombus ruled out immediately before cardioversion; oral anticoagulation should be given after cardioversion and continued for at least 4 weeks; prior to cardioversion, offer rate control as appropriate.

Drug treatment

Rate control is the preferred first-line drug treatment strategy for atrial fibrillation except in patients with new-onset atrial fibrillation, atrial flutter suitable for an ablation strategy, atrial fibrillation with a reversible cause, or if rhythm control is more suitable based on clinical judgement. Ventricular rate can be controlled with a standard beta-blocker (not sotalol hydrochloride p. 115) or a rate-limiting calcium channel blocker such as diltiazem hydrochloride p. 169 [unlicensed indication], or verapamil hydrochloride as monotherapy. Choice of drug should be based on individual symptoms, heart rate, comorbidities, and patient preference. Digoxin p. 116 is usually only effective for controlling the ventricular rate at rest, and should therefore only be used as monotherapy in predominantly sedentary patients with non-paroxysmal atrial fibrillation. When a single drug fails to adequately control the ventricular rate, a combination of two drugs including a beta-blocker, digoxin, or diltiazem hydrochloride can be used. If symptoms are not controlled

with a combination of two drugs, a rhythm-control strategy should be considered. If ventricular function is diminished, the combination of a beta-blocker (that is licensed for use in heart failure) and digoxin is preferred. Digoxin is also used when atrial fibrillation is accompanied by congestive heart failure.

If drug treatment is required to maintain sinus rhythm ('rhythm control') post-cardioversion, a standard beta-blocker is used. If a standard beta-blocker is not appropriate or is ineffective, consider an oral anti-arrhythmic drug such as sotalol hydrochloride, flecainide acetate, propafenone hydrochloride p. 111, or amiodarone hydrochloride; dronedarone p. 113 may be considered in paroxysmal or persistent atrial fibrillation (see NICE guidance). If necessary, amiodarone hydrochloride can be started 4 weeks before and continuing for up to 12 months after electrical cardioversion to increase success of the procedure, and to maintain sinus rhythm. Flecainide acetate or propafenone hydrochloride should not be given when there is known ischaemic or structural heart disease. Consider amiodarone hydrochloride in patients with left ventricular impairment or heart failure.

Paroxysmal atrial fibrillation

In symptomatic paroxysmal atrial fibrillation, ventricular rhythm is controlled with a standard beta-blocker. Alternatively, if symptoms persist or a standard beta-blocker is not appropriate, an oral anti-arrhythmic drug such as dronedarone (see NICE guidance), sotalol hydrochloride, flecainide acetate, propafenone hydrochloride, or amiodarone hydrochloride can be given (see also Paroxysmal supraventricular tachycardia and Supraventricular arrhythmias). In selected patients with infrequent episodes of symptomatic paroxysmal atrial fibrillation, sinus rhythm can be restored using the 'pill-in-the-pocket' approach; this involves the patient taking oral flecainide acetate or propafenone hydrochloride to self-treat an episode of atrial fibrillation when it occurs.

Stroke prevention

All patients with atrial fibrillation should be assessed for their risk of stroke and the need for thromboprophylaxis; this needs to be balanced with the patient's risk of bleeding; a NICE guideline (NICE clinical guideline 180 (June 2014). Atrial fibrillation: The management of atrial fibrillation) recommends using the CHA₂DS₂-VASc assessment tool for stroke risk and the HAS-BLED tool for bleeding risk prior to and during anticoagulation. Risk factors for stroke taken into account by CHA₂DS₂-VASc include prior ischaemic stroke, transient ischaemic attacks, or thromboembolic events, heart failure, left ventricular systolic dysfunction, vascular disease, diabetes, hypertension, females, and patients over 65 years. Patients with a very low risk of stroke (CHA₂DS₂-VASc score of 0 for men or 1 for women) do not require an antithrombotic for stroke prevention. Parenteral anticoagulation should be offered to patients with new-onset atrial fibrillation who are receiving subtherapeutic or no anticoagulation therapy until assessment is made, and appropriate anticoagulation is started. Oral anticoagulation should be offered to patients with confirmed diagnosis of atrial fibrillation in whom sinus rhythm has not been successfully restored within 48 hours of onset, patients who have had, or are at high risk of recurrence of atrial fibrillation such as those with structural heart disease, prolonged history of atrial fibrillation (more than 12 months), a history of failed attempts at cardioversion, and patients whom the risk of stroke outweighs the risk of bleeding. Anticoagulation treatment should not be withheld solely because of the risk of falls, and choice of treatment should be based on clinical features and patient preferences. Oral anticoagulation may be with a vitamin K antagonist (e.g. warfarin sodium p. 150), or in non-valvular atrial fibrillation with apixaban p. 133, dabigatran etexilate p. 146, edoxaban p. 135, or rivaroxaban p. 137. Anticoagulants are also indicated during

cardioversion procedures. Aspirin p. 130 is less effective than warfarin sodium at preventing emboli; the modest benefit is offset by the risk of bleeding, and aspirin should not be offered as monotherapy solely for stroke prevention in atrial fibrillation. If anticoagulant treatment is contra-indicated or not tolerated, left atrial appendage occlusion can be considered.

Atrial flutter

Like atrial fibrillation, treatment options for atrial flutter involve either controlling the ventricular rate or attempting to restore and maintain sinus rhythm. However, atrial flutter generally responds less well to drug treatment than atrial fibrillation.

Control of the ventricular rate is usually an interim measure pending restoration of sinus rhythm. Ventricular rate can be controlled by administration of a beta-blocker, diltiazem hydrochloride p. 169 [unlicensed indication], or verapamil hydrochloride p. 175; an intravenous beta-blocker or verapamil hydrochloride is preferred for rapid control. Digoxin p. 116 can be added if rate control remains inadequate, and may be particularly useful in those with heart failure.

Conversion to sinus rhythm can be achieved by electrical cardioversion (by cardiac pacing or direct current), pharmacological cardioversion, or catheter ablation. If the duration of atrial flutter is unknown, or it has lasted for over 48 hours, cardioversion should not be attempted until the patient has been fully anticoagulated for at least 3 weeks; if this is not possible, parenteral anticoagulation should be commenced and a left atrial thrombus ruled out immediately before cardioversion; oral anticoagulation should be given after cardioversion and continued for at least 4 weeks.

Direct current cardioversion is usually the treatment of choice when rapid conversion to sinus rhythm is necessary (e.g. when atrial flutter is associated with haemodynamic compromise); catheter ablation is preferred for the treatment of recurrent atrial flutter. There is a limited role for anti-arrhythmic drugs as their use is not always successful. Flecainide acetate p. 110 or propafenone hydrochloride p. 111 can slow atrial flutter, resulting in 1:1 conduction to the ventricles, and should therefore be prescribed in conjunction with a ventricular rate controlling drug such as a beta-blocker, diltiazem hydrochloride [unlicensed indication], or verapamil hydrochloride. Amiodarone hydrochloride p. 112 can be used when other drug treatments are contra-indicated or ineffective.

All patients should be assessed for their risk of stroke and the need for thromboprophylaxis; the choice of anticoagulant is based on the same criteria as for atrial fibrillation.

Paroxysmal supraventricular tachycardia

This will often terminate spontaneously or with reflex vagal stimulation such as a Valsalva manoeuvre, immersing the face in ice-cold water, or carotid sinus massage; such manoeuvres should be performed with ECG monitoring.

If the effects of reflex vagal stimulation are transient or ineffective, or if the arrhythmia is causing severe symptoms, intravenous adenosine p. 114 should be given. If adenosine is ineffective or contra-indicated, intravenous verapamil hydrochloride is an alternative, but it should be avoided in patients recently treated with beta-blockers.

Failure to terminate paroxysmal supraventricular tachycardia with reflex vagal stimulation or drug treatment may suggest an arrhythmia of atrial origin, such as focal atrial tachycardia or atrial flutter.

Treatment with direct current cardioversion is needed in haemodynamically unstable patients or when the above measures have failed to restore sinus rhythm (and an alternative diagnosis has not been found).

Recurrent episodes of paroxysmal supraventricular tachycardia can be treated by catheter ablation, or prevented with drugs such as diltiazem hydrochloride, verapamil hydrochloride, beta-blockers including sotalol hydrochloride p. 115, flecainide acetate or propafenone hydrochloride.

Arrhythmias after myocardial infarction

In patients with a paroxysmal tachycardia or rapid irregularity of the pulse it is best not to administer an anti-arrhythmic until an ECG record has been obtained. Bradycardia, particularly if complicated by hypotension, should be treated with an intravenous dose of atropine sulfate p. 1404 the dose may be repeated if necessary. If there is a risk of asystole, or if the patient is unstable and has failed to respond to atropine sulfate, adrenaline/epinephrine p. 236 should be given by intravenous infusion, and the dose adjusted according to response.

For further advice, refer to the most recent recommendations of the Resuscitation Council (UK) available at www.resus.org.uk.

Ventricular tachycardia

Pulseless ventricular tachycardia or ventricular fibrillation should be treated with immediate defibrillation (see Cardiopulmonary resuscitation).

Patients with unstable sustained ventricular tachycardia, who continue to deteriorate with signs of hypotension or reduced cardiac output, should receive direct current cardioversion to restore sinus rhythm. If this fails, intravenous amiodarone hydrochloride should be administered and direct current cardioversion repeated.

Patients with sustained ventricular tachycardia who are haemodynamically stable can be treated with intravenous anti-arrhythmic drugs. Amiodarone hydrochloride is the preferred drug. Flecainide acetate, propafenone hydrochloride, and, although less effective, lidocaine hydrochloride p. 109 have all been used. If sinus rhythm is not restored, direct current cardioversion or pacing should be considered. Catheter ablation is an alternative if cessation of the arrhythmia is not urgent. Non-sustained ventricular tachycardia can be treated with a beta-blocker.

All patients presenting with ventricular tachycardia should be referred to a specialist. Following restoration of sinus rhythm, patients who remain at high risk of cardiac arrest will require maintenance therapy. Most patients will be treated with an implantable cardioverter defibrillator. Beta-blockers or sotalol hydrochloride (in place of a standard beta-blocker), or amiodarone hydrochloride (in combination with a standard beta-blocker), can be used in addition to the device in some patients; alternatively, they can be used alone when use of an implantable cardioverter defibrillator is not appropriate.

Torsade de pointes

Torsade de pointes is a form of ventricular tachycardia associated with a long QT syndrome (usually drug-induced, but other factors including hypokalaemia, severe bradycardia, and genetic predisposition are also implicated). Episodes are usually self-limiting, but are frequently recurrent and can cause impairment or loss of consciousness. If not controlled, the arrhythmia can progress to ventricular fibrillation and sometimes death. Intravenous infusion of magnesium sulfate p. 1112 is usually effective. A beta-blocker (but not sotalol hydrochloride) and atrial (or ventricular) pacing can be considered. Anti-arrhythmics can further prolong the QT interval, thus worsening the condition.

Anti-arrhythmic drugs

Anti-arrhythmic drugs can be classified clinically into those that act on supraventricular arrhythmias (e.g. verapamil hydrochloride), those that act on both supraventricular and ventricular arrhythmias (e.g. amiodarone hydrochloride),

and those that act on ventricular arrhythmias (e.g. lidocaine hydrochloride).

Anti-arrhythmic drugs can also be classified according to their effects on the electrical behaviour of myocardial cells during activity (the Vaughan Williams classification) although this classification is of less clinical significance:

- Class I: membrane stabilising drugs (e.g. lidocaine, flecainide)
- Class II: beta-blockers
- Class III: amiodarone; sotalol (also Class II)
- Class IV: calcium-channel blockers (includes verapamil but not dihydropyridines)

The negative inotropic effects of anti-arrhythmic drugs tend to be additive. Therefore special care should be taken if two or more are used, especially if myocardial function is impaired. Most drugs that are effective in countering arrhythmias can also provoke them in some circumstances; moreover, hypokalaemia enhances the arrhythmogenic (pro-arrhythmic) effect of many drugs.

Supraventricular arrhythmias

Adenosine p. 114 is usually the treatment of choice for terminating paroxysmal supraventricular tachycardia. As it has a very short duration of action (half-life only about 8 to 10 seconds, but prolonged in those taking dipyrindamole p. 132), most side-effects are short lived. Unlike verapamil hydrochloride p. 175, adenosine can be used after a beta-blocker. Verapamil hydrochloride may be preferable to adenosine in asthma.

Oral administration of a **cardiac glycoside** (such as digoxin p. 116) slows the ventricular response in cases of atrial fibrillation and atrial flutter. However, intravenous infusion of digoxin is rarely effective for rapid control of ventricular rate. Cardiac glycosides are contra-indicated in supraventricular arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome).

Verapamil hydrochloride is usually effective for supraventricular tachycardias. An initial intravenous dose (**important**: serious beta-blocker interaction hazard) may be followed by oral treatment; hypotension may occur with large doses. It should not be used for tachyarrhythmias where the QRS complex is wide (i.e. broad complex) unless a supraventricular origin has been established beyond reasonable doubt. It is also contra-indicated in atrial fibrillation or atrial flutter associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome). It should not be used in children with arrhythmias without specialist advice; some supraventricular arrhythmias in childhood can be accelerated by verapamil hydrochloride with dangerous consequences.

Intravenous administration of a **beta-blocker** such as esmolol hydrochloride p. 166 or propranolol hydrochloride p. 162, can achieve rapid control of the ventricular rate.

Drugs for both supraventricular and ventricular arrhythmias include amiodarone hydrochloride p. 112, **beta-blockers**, disopyramide p. 110, flecainide acetate p. 110, **procanamide** (available from 'special-order' manufacturers or specialist importing companies), and propafenone hydrochloride p. 111.

Supraventricular and ventricular arrhythmias

Amiodarone hydrochloride is used in the treatment of arrhythmias, particularly when other drugs are ineffective or contra-indicated. It can be used for paroxysmal supraventricular, nodal and ventricular tachycardias, atrial fibrillation and flutter, and ventricular fibrillation. It can also be used for tachyarrhythmias associated with Wolff-Parkinson-White syndrome. It should be initiated only under hospital or specialist supervision. Amiodarone hydrochloride may be given by intravenous infusion as well as by mouth, and has the advantage of causing little or no myocardial depression. Unlike oral amiodarone

hydrochloride, intravenous amiodarone hydrochloride acts relatively rapidly.

Intravenous injection of amiodarone hydrochloride can be used in cardiopulmonary resuscitation for ventricular fibrillation or pulseless tachycardia unresponsive to other interventions.

Amiodarone hydrochloride has a very long half-life (extending to several weeks) and only needs to be given once daily (but high doses can cause nausea unless divided). Many weeks or months may be required to achieve steady-state plasma-amiodarone concentration; this is particularly important when drug interactions are likely.

Beta-blockers act as anti-arrhythmic drugs principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. Sotalol hydrochloride p. 115 has a role in the management of ventricular arrhythmias.

Disopyramide can be given by intravenous injection to control arrhythmias after myocardial infarction (including those not responding to lidocaine hydrochloride p. 109), but it impairs cardiac contractility. Oral administration of disopyramide is useful, but it has an antimuscarinic effect which limits its use in patients susceptible to angle-closure glaucoma or with prostatic hyperplasia.

Flecainide acetate belongs to the same general class as lidocaine hydrochloride and may be of value for serious symptomatic ventricular arrhythmias. It may also be indicated for junctional re-entry tachycardias and for paroxysmal atrial fibrillation. However, it can precipitate serious arrhythmias in a small minority of patients (including those with otherwise normal hearts).

Propafenone hydrochloride is used for the prophylaxis and treatment of ventricular arrhythmias and also for some supraventricular arrhythmias. It has complex mechanisms of action, including weak beta-blocking activity (therefore caution is needed in obstructive airways disease—contra-indicated if severe).

Drugs for supraventricular arrhythmias include adenosine, **cardiac glycosides**, and verapamil hydrochloride. Drugs for ventricular arrhythmias include lidocaine hydrochloride.

Mexiletine and procainamide are both available from 'special-order' manufacturers or specialist importing companies. Mexiletine can be used for life-threatening ventricular arrhythmias; procainamide is given by intravenous injection to control ventricular arrhythmias.

Ventricular arrhythmias

Intravenous lidocaine hydrochloride can be used for the treatment of ventricular tachycardia in haemodynamically stable patients, and ventricular fibrillation and pulseless ventricular tachycardia in cardiac arrest refractory to defibrillation, however it is no longer the anti-arrhythmic drug of first choice.

Drugs for both supraventricular and ventricular arrhythmias include amiodarone hydrochloride, **beta-blockers**, disopyramide, flecainide acetate, **procainamide** (available from 'special-order' manufacturers or specialist importing companies), and propafenone hydrochloride.

Mexiletine is available from 'special-order' manufacturers or specialist importing companies for treatment of life-threatening ventricular arrhythmias.

Advanced Pharmacy Services

Patients with an arrhythmia may be eligible for the New Medicines Service / Medicine Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 18.

Lidocaine hydrochloride

11-Dec-2019

(Lignocaine hydrochloride)

● INDICATIONS AND DOSE

Cardiopulmonary resuscitation (as an alternative if amiodarone is not available)

▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 1 mg/kg, do not exceed 3 mg/kg over the first hour

Ventricular arrhythmias, especially after myocardial infarction in patients without gross circulatory impairment

▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: 100 mg, to be given as a bolus dose over a few minutes, followed immediately by (by intravenous infusion) 4 mg/minute for 30 minutes, then (by intravenous infusion) 2 mg/minute for 2 hours, then (by intravenous infusion) 1 mg/minute, reduce concentration further if infusion continued beyond 24 hours (ECG monitoring and specialist advice for infusion), following intravenous injection lidocaine has a short duration of action (lasting for 15–20 minutes). If an intravenous infusion is not immediately available the initial intravenous injection of 100 mg can be repeated if necessary once or twice at intervals of not less than 10 minutes

Ventricular arrhythmias, especially after myocardial infarction in lighter patients or those whose circulation is severely impaired

▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: Initially 50 mg, to be given as a bolus dose over a few minutes, followed immediately by (by intravenous infusion) 4 mg/minute for 30 minutes, then (by intravenous infusion) 2 mg/minute for 2 hours, then (by intravenous infusion) 1 mg/minute, reduce concentration further if infusion continued beyond 24 hours (ECG monitoring and specialist advice for infusion), following intravenous injection lidocaine has a short duration of action (lasting for 15–20 minutes). If an intravenous infusion is not immediately available the initial intravenous injection of 50 mg can be repeated if necessary once or twice at intervals of not less than 10 minutes

- **CONTRA-INDICATIONS** All grades of atrioventricular block · severe myocardial depression · sino-atrial disorders
- **CAUTIONS** Acute porphyrias p. 1120 (consider infusion with glucose for its anti-porphyrinogenic effects) · congestive cardiac failure (consider lower dose) · post cardiac surgery (consider lower dose)
- **INTERACTIONS** → Appendix 1: antiarrhythmics
- **SIDE-EFFECTS** Anxiety · arrhythmias · atrioventricular block · cardiac arrest · circulatory collapse · confusion · dizziness · drowsiness · euphoric mood · headache · hypotension (may lead to cardiac arrest) · loss of consciousness · methaemoglobinaemia · muscle twitching · myocardial contractility decreased · nausea · neurological effects · nystagmus · pain · psychosis · respiratory disorders · seizure · sensation abnormal · temperature sensation altered · tinnitus · tremor · vision blurred · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Methaemoglobinaemia Methylthionium chloride is licensed for the acute symptomatic treatment of drug-induced methaemoglobinaemia.

- **PREGNANCY** Crosses the placenta but not known to be harmful in *animal* studies—use if benefit outweighs risk.
- **BREAST FEEDING** Present in milk but amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).
Dose adjustments Manufacturer advises slower infusion rate.
- **RENAL IMPAIRMENT** Possible accumulation of lidocaine and active metabolite; caution in severe impairment.
- **MONITORING REQUIREMENTS** Monitor ECG and have resuscitation facilities available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection▶ **Lidocaine hydrochloride (Non-proprietary)**

Flecainide acetate

14-May-2020

● **INDICATIONS AND DOSE**

Supraventricular arrhythmias (initiated under direction of hospital consultant)

▶ BY MOUTH

- ▶ Adult: Initially 50 mg twice daily, increased if necessary up to 300 mg daily

Ventricular arrhythmias (initiated under direction of hospital consultant)

▶ BY MOUTH

- ▶ Adult: Initially 100 mg twice daily for 3–5 days, maximum 400 mg daily reserved for rapid control or in heavily built patients; for maintenance, reduce to the lowest dose that controls the arrhythmia

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose by half with concurrent use of amiodarone.

- **CONTRA-INDICATIONS** Abnormal left ventricular function · atrial conduction defects (unless pacing rescue available) · bundle branch block (unless pacing rescue available) · distal block (unless pacing rescue available) · haemodynamically significant valvular heart disease ·

heart failure · history of myocardial infarction and either asymptomatic ventricular ectopics or asymptomatic non-sustained ventricular tachycardia · long-standing atrial fibrillation where conversion to sinus rhythm not attempted · second-degree or greater AV block (unless pacing rescue available) · sinus node dysfunction (unless pacing rescue available)

- **CAUTIONS** Atrial fibrillation following heart surgery · elderly (accumulation may occur) · patients with pacemakers (especially those who may be pacemaker dependent because stimulation threshold may rise appreciably)
- **INTERACTIONS** → Appendix 1: antiarrhythmics
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arrhythmias · asthenia · dizziness · dyspnoea · fever · oedema · vision disorders
 - ▶ **Uncommon** Alopecia · appetite decreased · constipation · diarrhoea · flatulence · gastrointestinal discomfort · nausea · skin reactions · vomiting
 - ▶ **Rare or very rare** Anxiety · confusion · corneal deposits · depression · drowsiness · flushing · hallucination · headache · hepatic disorders · hyperhidrosis · inflammation · insomnia · memory loss · movement disorders · peripheral neuropathy · photosensitivity reaction · respiratory disorders · seizure · sensation abnormal · syncope · tinnitus · tremor · vertigo
 - ▶ **Frequency not known** Altered pacing threshold · atrioventricular block · cardiac arrest · chest pain · heart failure · hypotension · palpitations · QT interval prolongation
- **PREGNANCY** Used in pregnancy to treat maternal and fetal arrhythmias in specialist centres; toxicity reported in *animal* studies; infant hyperbilirubinaemia also reported.
- **BREAST FEEDING** Significant amount present in milk but not known to be harmful.
- **HEPATIC IMPAIRMENT**
Dose adjustments Avoid or reduce dose in severe impairment.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce initial oral dose to max. 100 mg daily if eGFR less than 35 mL/minute/1.73 m².

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Propafenone hydrochloride

03-Feb-2020

● INDICATIONS AND DOSE

Ventricular arrhythmias (specialist supervision in hospital) | Paroxysmal supraventricular tachyarrhythmias which include paroxysmal atrial flutter or fibrillation and paroxysmal re-entrant tachycardias involving the AV node or accessory pathway, where standard therapy ineffective or contra-indicated (specialist supervision in hospital)

▶ BY MOUTH

- ▶ **Adult:** Initially 150 mg 3 times a day, dose to be taken after food, monitor ECG and blood pressure, if QRS interval prolonged by more than 20%, reduce dose or discontinue until ECG returns to normal limits;

ANTIARRHYTHMICS > CLASS III

Amiodarone hydrochloride

30-Mar-2020

● INDICATIONS AND DOSE

Treatment of arrhythmias, particularly when other drugs are ineffective or contra-indicated (including paroxysmal supraventricular, nodal and ventricular tachycardias, atrial fibrillation and flutter, ventricular fibrillation, and tachyarrhythmias associated with Wolff-Parkinson-White syndrome) (initiated in hospital or under specialist supervision)

▶ BY MOUTH

▶ Adult: 200 mg 3 times a day for 1 week, then reduced to 200 mg twice daily for a further week, followed by maintenance dose, usually 200 mg daily or the minimum dose required to control arrhythmia

▶ BY INTRAVENOUS INFUSION

▶ Adult: Initially 5 mg/kg, to be given over 20–120 minutes with ECG monitoring, subsequent infusions given if necessary according to response; maximum 1.2 g per day

Ventricular fibrillation or pulseless ventricular tachycardia refractory to defibrillation (for cardiopulmonary resuscitation)

▶ INITIALLY BY INTRAVENOUS INJECTION

▶ Adult: Initially 300 mg, dose to be considered after administration of adrenaline, dose should be given from a pre-filled syringe or diluted in 20 mL Glucose 5%, then (by intravenous injection) 150 mg if required, followed by (by intravenous infusion) 900 mg/24 hours

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SOFOSBUVIR WITH DACLATASVIR; SOFOSBUVIR AND LEDIPASVIR (MAY 2015); SIMEPREVIR WITH SOFOSBUVIR (AUGUST 2015): RISK OF SEVERE BRADYCARDIA AND HEART BLOCK WHEN TAKEN WITH AMIODARONE

Avoid concomitant use unless other antiarrhythmics cannot be given.

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Avoid in severe conduction disturbances (unless pacemaker fitted) · avoid in sinus node disease (unless pacemaker fitted) · iodine sensitivity · sino-atrial heart block (except in cardiac arrest) · sinus bradycardia (except in cardiac arrest) · thyroid dysfunction

SPECIFIC CONTRA-INDICATIONS

- ▶ With intravenous use Avoid bolus injection in cardiomyopathy · avoid bolus injection in congestive heart failure · avoid in circulatory collapse · avoid in severe arterial hypotension · avoid in severe respiratory failure

● CAUTIONS

GENERAL CAUTIONS Acute porphyrias p. 1120 · conduction disturbances (in excessive dosage) · elderly · heart failure · hypokalaemia · severe bradycardia (in excessive dosage)

SPECIFIC CAUTIONS

- ▶ With intravenous use moderate and transient fall in blood pressure (circulatory collapse precipitated by rapid administration or overdosage) · severe hepatocellular toxicity

CAUTIONS, FURTHER INFORMATION

- ▶ Elderly Prescription potentially inappropriate (STOPP criteria) as first-line antiarrhythmic therapy in supraventricular tachyarrhythmias (higher risk of side-effects than beta-blockers, digoxin, verapamil or diltiazem). See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: antiarrhythmics

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmias · hepatic disorders · hyperthyroidism · nausea · respiratory disorders · skin reactions
- ▶ **Rare or very rare** Bronchospasm (in patients with severe respiratory failure) · headache · idiopathic intracranial hypertension · nerve disorders · SIADH
- ▶ **Frequency not known** Angioedema · confusion · delirium · pancreatitis · severe cutaneous adverse reactions (SCARs)

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
 - ▶ With oral use Constipation · corneal deposits · hypothyroidism · movement disorders · photosensitivity reaction · sleep disorders · taste altered · vomiting
 - ▶ With parenteral use Hypotension (following rapid injection)
- ▶ **Uncommon**
 - ▶ With oral use Cardiac conduction disorders · dry mouth · myopathy (usually reversible on discontinuation) · peripheral neuropathy (usually reversible on discontinuation)
- ▶ **Rare or very rare**
 - ▶ With oral use Alopecia · aplastic anaemia · epididymo-orchitis · erectile dysfunction · haemolytic anaemia · pulmonary haemorrhage · thrombocytopenia · vertigo
- ▶ With parenteral use Hot flush · hyperhidrosis
- ▶ **Frequency not known**
 - ▶ With oral use Altered smell sensation · appetite decreased · parkinsonism · vasculitis
 - ▶ With parenteral use Agranulocytosis · libido decreased · neutropenia

SIDE-EFFECTS, FURTHER INFORMATION Corneal

microdeposits Patients taking amiodarone may develop corneal microdeposits (reversible on withdrawal of treatment). However, if vision is impaired or if optic neuritis or optic neuropathy occur, amiodarone must be stopped to prevent blindness and expert advice sought.

Thyroid function Amiodarone contains iodine and can cause disorders of thyroid function; both hypothyroidism and hyperthyroidism can occur. Hypothyroidism can be treated with replacement therapy without withdrawing amiodarone if it is essential; careful supervision is required.

Hepatotoxicity Amiodarone is also associated with hepatotoxicity and treatment should be discontinued if severe liver function abnormalities or clinical signs of liver disease develop.

Pulmonary toxicity Pneumonitis should always be suspected if new or progressive shortness of breath or cough develops in a patient taking amiodarone.

- **PREGNANCY** Possible risk of neonatal goitre; use only if no alternative.
- **BREAST FEEDING** Avoid; present in milk in significant amounts; theoretical risk of neonatal hypothyroidism from release of iodine.
- **MONITORING REQUIREMENTS**
 - ▶ Thyroid function tests should be performed before treatment and then every 6 months. Clinical assessment of thyroid function alone is unreliable. Thyroxine (T4) may be raised in the absence of hyperthyroidism; therefore triiodothyronine (T3), T4, and thyroid-stimulating hormone (thyrotrophin, TSH) should all be measured. A raised T3 and T4 with a very low or undetectable TSH concentration suggests the development of thyrotoxicosis.
 - ▶ Liver function tests required before treatment and then every 6 months.
 - ▶ Serum potassium concentration should be measured before treatment.
 - ▶ Chest x-ray required before treatment.
 - ▶ If concomitant use of amiodarone with sofosbuvir and daclatasvir, simeprevir and sofosbuvir, or sofosbuvir and

ledipasvir cannot be avoided because other anti-arrhythmics are not tolerated or contra-indicated, patients should be closely monitored, particularly during the first weeks of treatment. Patients at high risk of bradycardia should be monitored continuously for 48 hours in an appropriate clinical setting after starting concomitant treatment. Patients who have stopped amiodarone within the last few months and need to start sofosbuvir and daclatasvir, simeprevir and sofosbuvir, or sofosbuvir and ledipasvir should be monitored.

- With intravenous use ECG monitoring and resuscitation facilities must be available. Monitor liver transaminases closely.

• DIRECTIONS FOR ADMINISTRATION

- With intravenous use For *intravenous infusion (Cordarone X[®])*, give continuously or intermittently in Glucose 5%. Suggested initial infusion volume 250 mL given over 20–120 minutes; for repeat infusions up to 1.2 g in max. 500 mL; should not be diluted to less than 600 micrograms/mL. See cardio-pulmonary resuscitation for details of infusion in extreme emergency. Incompatible with Sodium Chloride infusion fluids; avoid equipment containing the plasticizer di-2-ethylhexphthalate (DEHP).
- With oral use For administration *by mouth*, tablets may be crushed and dispersed in water; injection solution should **not** be given orally (irritant).

- PATIENT AND CARER ADVICE** Because of the possibility of phototoxic reactions, patients should be advised to shield the skin from light during treatment and for several months after discontinuing amiodarone; a wide-spectrum sunscreen to protect against both long-wave ultraviolet and visible light should be used.

If taking amiodarone with concomitant sofosbuvir and daclatasvir, simeprevir and sofosbuvir, or sofosbuvir and ledipasvir, patients and their carers should be told how to recognise signs and symptoms of bradycardia and heart block and advised to seek immediate medical attention if symptoms such as shortness of breath, light-headedness, palpitations, fainting, unusual tiredness or chest pain develop.

- MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 11

Dronedarone

- DRUG ACTION** Dronedarone is a multi-channel blocking anti-arrhythmic drug.

• INDICATIONS AND DOSE

Maintenance of sinus rhythm after cardioversion in clinically stable patients with paroxysmal or persistent atrial fibrillation, when alternative treatments are unsuitable (initiated under specialist supervision)

- BY MOUTH
- Adult: 400 mg twice daily

- CONTRA-INDICATIONS** Atrial conduction defects · bradycardia · complete bundle branch block · distal block · existing or previous heart failure or left ventricular systolic dysfunction · haemodynamically unstable patients · liver toxicity associated with previous amiodarone use · lung toxicity associated with previous amiodarone use · permanent atrial fibrillation · prolonged QT interval · second- or third- degree AV block · sick sinus syndrome (unless pacemaker fitted) · sinus node dysfunction
- CAUTIONS** Coronary artery disease · correct hypokalaemia and hypomagnesaemia before starting and during treatment

- INTERACTIONS** → Appendix 1: antiarrhythmics

• SIDE-EFFECTS

- Common or very common** Asthenia · bradycardia · congestive heart failure · diarrhoea · gastrointestinal discomfort · nausea · QT interval prolongation · skin reactions · vomiting
- Uncommon** Photosensitivity reaction · respiratory disorders · taste altered
- Rare or very rare** Hepatic disorders · vasculitis

SIDE-EFFECTS, FURTHER INFORMATION **Liver injury** Liver injury including life-threatening acute liver failure reported rarely; discontinue treatment if 2 consecutive alanine aminotransferase concentrations exceed 3 times upper limit of normal.

Heart failure New onset or worsening heart failure reported. If heart failure or left ventricular systolic dysfunction develops, discontinue treatment.

Pulmonary toxicity Interstitial lung disease, pneumonitis and pulmonary fibrosis reported. Investigate if symptoms such as dyspnoea or dry cough develop and discontinue if confirmed.

- PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.
- RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
- MONITORING REQUIREMENTS**
- Ongoing monitoring should occur under specialist supervision.
- Monitor for heart failure.
- Perform ECG at least every 6 months—consider discontinuation if atrial fibrillation reoccurs.
- Measure serum creatinine before treatment and 7 days after initiation—if raised, measure again after a further 7 days and consider discontinuation if creatinine continues to rise.
- Monitor liver function before treatment, 1 week and 1 month after initiation of treatment, then monthly for 6 months, then every 3 months for 6 months and periodically thereafter.

• PATIENT AND CARER ADVICE

Heart failure Patients or their carers should be told how to recognise signs of heart failure and advised to seek prompt

medical attention if symptoms such as weight gain, dependent oedema, or dyspnoea develop or worsen. Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as abdominal pain, anorexia, nausea, vomiting, fever, malaise, itching, dark urine, or jaundice develop.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Dronedarone for the treatment of non-permanent atrial fibrillation (updated December 2012)** NICE TA197
Dronedarone (*Multaq*[®]) is an option for the maintenance of sinus rhythm after successful cardioversion in paroxysmal or persistent atrial fibrillation which is not controlled by first-line therapy (usually including beta-blockers), and after alternative options have been considered in patients:
 - who have at least 1 of the following cardiovascular risk factors: hypertension requiring drugs of at least 2 different classes, diabetes mellitus, previous transient ischaemic attack, stroke or systemic embolism, left atrial diameter of 50 mm or greater, or age 70 years or older, and
 - who do not have left ventricular systolic dysfunction nor a history of, or current, heart failure.
 Patients who do not meet the above criteria who are currently receiving dronedarone should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta197

ANTIARRHYTHMICS > OTHER

Adenosine

20-Jan-2020

● INDICATIONS AND DOSE

Rapid reversion to sinus rhythm of paroxysmal supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome) Used to aid to diagnosis of broad or narrow complex supraventricular tachycardias

▶ BY RAPID INTRAVENOUS INJECTION

- ▶ Adult: Initially 6 mg, administer into central or large peripheral vein and give over 2 seconds, cardiac monitoring required, followed by 12 mg after 1–2 minutes if required, then 12 mg after 1–2 minutes if required, increments should not be given if high level AV block develops at any particular dose

Rapid reversion to sinus rhythm of paroxysmal supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome) in patients with a heart transplant | Aid to diagnosis of broad or narrow complex supraventricular tachycardias in patients with a heart transplant

▶ BY RAPID INTRAVENOUS INJECTION

- ▶ Adult: Initially 3 mg, administer into a central or large peripheral vein and give over 2 seconds, followed by

6 mg after 1–2 minutes if required, then 12 mg after 1–2 minutes if required, patients with a heart transplant are very sensitive to the effects of adenosine

Used in conjunction with radionuclide myocardial perfusion imaging in patients who cannot exercise adequately or for whom exercise is inappropriate

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

- **UNLICENSED USE** Adenosine doses in the BNF may differ from those in the product literature.
- **CONTRA-INDICATIONS** Asthma · chronic obstructive lung disease · decompensated heart failure · long QT syndrome · second- or third-degree AV block and sick sinus syndrome (unless pacemaker fitted) · severe hypotension
- **CAUTIONS** Atrial fibrillation · atrial fibrillation with accessory pathway (conduction down anomalous pathway may increase) · atrial flutter · atrial flutter with accessory pathway (conduction down anomalous pathway may increase) · autonomic dysfunction · bundle branch block · first-degree AV block · heart transplant · left main coronary artery stenosis · left to right shunt · pericardial effusion · pericarditis · QT-interval prolongation · recent myocardial infarction · severe heart failure · stenotic carotid artery disease with cerebrovascular insufficiency · stenotic valvular heart disease · uncorrected hypovolaemia
- **INTERACTIONS** → Appendix 1: antiarrhythmics
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal discomfort · arrhythmias · atrioventricular block · chest discomfort · chest pain (discontinue) · dizziness · dry mouth · dyspnoea · flushing · headache · hypotension (discontinue if severe) · pain · paraesthesia · throat discomfort
 - ▶ **Uncommon** Asthenia · back discomfort · bradycardia (discontinue if asystole or severe bradycardia occur) · hyperhidrosis · limb discomfort · nervousness · taste metallic
 - ▶ **Rare or very rare** Drowsiness · nasal congestion · nipple tenderness · respiratory disorders · respiratory failure (discontinue) · tinnitus · tremor · urinary urgency · vision blurred
 - ▶ **Frequency not known** Apnoea · cardiac arrest · loss of consciousness · nausea · seizure · syncope · vomiting
- **PREGNANCY** Large doses may produce fetal toxicity; manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** No information available—unlikely to be present in milk owing to short half-life.
- **MONITORING REQUIREMENTS** Monitor ECG and have resuscitation facilities available.
- **DIRECTIONS FOR ADMINISTRATION** For *rapid intravenous injection* give over 2 seconds into central or large peripheral vein followed by rapid Sodium Chloride 0.9% flush; injection solution may be diluted with Sodium Chloride 0.9% if required.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

Solution for injection

ELECTROLYTES: May contain Sodium

▶ Adenosine (Non-proprietary)

Adenosine 3 mg per 1 ml Adenosine 6mg/2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM]  (Hospital only)

Adenosine 6mg/2ml solution for injection vials | 5 vial [PoM] £20.00 (Hospital only) | 6 vial [PoM] £26.70-£29.24 (Hospital only)

Adenosine 12mg/4ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM]  (Hospital only)

- ▶ **Adenocor** (Sanofi)
Adenosine 3 mg per 1 ml Adenocor 6mg/2ml solution for injection vials | 6 vial [PoM] £6.45 (Hospital only)

Solution for infusion

ELECTROLYTES: May contain Sodium

Adenosine 3 mg per 1 ml Adenosine 30mg/10ml solution for infusion vials | 5 vial [PoM] £30.00 (Hospital only) | 6 vial [PoM] £70.00-£85.57 (Hospital only)
- ▶ **Adenoscan** (Sanofi)
Adenosine 3 mg per 1 ml Adenoscan 30mg/10ml solution for infusion vials | 6 vial [PoM] £16.05

Vernakalant

15-Jul-2019

- **DRUG ACTION** Vernakalant is an anti-arrhythmic drug that blocks potassium and sodium channels in the atria, thereby restoring normal heart rhythm.

● **INDICATIONS AND DOSE****Rapid conversion of recent onset atrial fibrillation to sinus rhythm (specialist supervision in hospital)**

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 3 mg/kg (max. per dose 339 mg), followed by 2 mg/kg (max. per dose 226 mg), if conversion to sinus rhythm does not occur within 15 minutes after the end of initial infusion, maximum 5 mg/kg per 24 hours; maximum 565 mg per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ Doses expressed as vernakalant hydrochloride.

- **CONTRA-INDICATIONS** Acute coronary syndrome within the last 30 days · baseline QT interval 440 milliseconds or greater · congestive heart failure with left ventricular ejection fraction \leq 35% · heart failure (New York Heart Association class III/IV) · second- or third-degree heart block (unless pacemaker fitted) · severe aortic stenosis · severe bradycardia · sinus node dysfunction · systolic blood pressure less than 100 mmHg
- **CAUTIONS** Haemodynamically stable patients with congestive heart failure (increased risk of hypotension and ventricular arrhythmia) · patients receiving oral anti-arrhythmics (class I or III) (risk of atrial flutter) · valvular heart disease (increased incidence of ventricular arrhythmia)

- **INTERACTIONS** → Appendix 1: antiarrhythmics

● **SIDE-EFFECTS**

- ▶ **Common or very common** Arrhythmias · cough · dizziness · feeling hot · headache · hypotension · nasal complaints · nausea · oral disorders · sensation abnormal · skin reactions · sweat changes · taste altered · vomiting
 - ▶ **Uncommon** Altered smell sensation · cardiac conduction disorders · cardiogenic shock · chest discomfort · choking sensation · defaecation urgency · diarrhoea · drowsiness · dry mouth · dyspnoea · excessive tearing · eye irritation · fatigue · malaise · pain in extremity · pallor · palpitations · QT interval prolongation · suffocation feeling · syncope · throat irritation · vasodilation · visual impairment
- SIDE-EFFECTS, FURTHER INFORMATION** Discontinue and initiate appropriate treatment if hypotension, bradycardia, ECG changes, or a sudden drop in blood pressure or heart rate occur.

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises caution—no information available.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor blood pressure and ECG during and for at least 15 minutes after completion of the infusion.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intermittent intravenous infusion* in patients with body-

weight up to and including 100 kg, dilute to a concentration of 4 mg/mL with 100 mL of Glucose 5% or Sodium Chloride 0.9% or Lactated Ringer's Solution; give over 10 minutes. Manufacturer advises for *intermittent intravenous infusion* in patients with body-weight more than 100 kg, dilute to a concentration of 4 mg/mL with 120 mL of Glucose 5% or Sodium Chloride 0.9% or Lactated Ringer's Solution; give over 10 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of *Brinavess*® has provided a *Pre-infusion Checklist* and a *Healthcare Professional Card*.
- **PATIENT AND CARER ADVICE** Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

▶ **Vernakalant (Non-proprietary)**

Vernakalant hydrochloride 20 mg per 1 ml Brinavess 500mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £290.00 (Hospital only)

NON-SELECTIVE**

P 159

Sotalol hydrochloride

12-Dec-2019

● **INDICATIONS AND DOSE**

Symptomatic non-sustained ventricular tachyarrhythmias | Prophylaxis of paroxysmal atrial tachycardia or fibrillation, paroxysmal AV re-entrant tachycardias (both nodal and involving accessory pathways), and paroxysmal supraventricular tachycardia after cardiac surgery | Maintenance of sinus rhythm following cardioversion of atrial fibrillation or flutter

▶ BY MOUTH

- ▶ Adult: Initially 80 mg daily in 1–2 divided doses, then increased to 160–320 mg daily in 2 divided doses, dose to be increased gradually at intervals of 2–3 days

Life-threatening arrhythmias including ventricular tachyarrhythmias

▶ BY MOUTH

- ▶ Adult: Initially 80 mg daily in 1–2 divided doses, then increased to 160–320 mg daily in 2 divided doses, dose to be increased gradually at intervals of 2–3 days, higher doses of 480–640 mg daily may be required for life-threatening ventricular arrhythmias (under specialist supervision)

IMPORTANT SAFETY INFORMATION

Sotalol may prolong the QT interval, and it occasionally causes life threatening ventricular arrhythmias (**important**: manufacturer advises particular care is required to avoid hypokalaemia in patients taking sotalol—electrolyte disturbances, particularly hypokalaemia and hypomagnesaemia should be corrected before sotalol started and during use).

Manufacturer advises reduce dose or discontinue if corrected QT interval exceeds 550 msec.

- **CONTRA-INDICATIONS** Long QT syndrome (congenital or acquired) · torsade de pointes
- **CAUTIONS** Diarrhoea (severe or prolonged)
- **INTERACTIONS** → Appendix 1: beta blockers, non-selective
- **SIDE-EFFECTS**
- ▶ **Common or very common** Anxiety · arrhythmia · chest pain · dyspepsia · fever · flatulence · hearing impairment · mood altered · muscle spasms · oedema · palpitations · sexual

dysfunction · taste altered · torsade de pointes (increased risk in females)

- **BREAST FEEDING** Water soluble beta-blockers such as sotalol are present in breast milk in greater amounts than other beta blockers.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 10 mL/minute.
Dose adjustments Manufacturer advises use half normal dose if creatinine clearance 30–60 mL/minute; use one-quarter normal dose if creatinine clearance 10–30 mL/minute.
- **MONITORING REQUIREMENTS** Measurement of corrected QT interval, and monitoring of ECG and electrolytes required; correct hypokalaemia, hypomagnesaemia, or other electrolyte disturbances.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

CARDIAC GLYCOSIDES

Cardiac glycosides

Digoxin-specific antibody

Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (see further information, under Poisoning, emergency treatment p. 1430). Digoxin-specific antibody fragments p. 1440 are indicated for the treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular arrhythmias or bradyarrhythmias unresponsive to atropine sulfate p. 1404 and when measures beyond the withdrawal of digoxin below and correction of any electrolyte abnormalities are considered necessary.

Digoxin

Digoxin is most useful for controlling ventricular response in persistent and permanent atrial fibrillation and atrial flutter. Digoxin also has a role in heart failure.

For management of atrial fibrillation the maintenance dose of digoxin can usually be determined by the ventricular rate at rest, which should not usually be allowed to fall persistently below 60 beats per minute.

Digoxin is now rarely used for rapid control of heart rate (see management of supraventricular arrhythmias). Even with intravenous administration, response may take many hours; persistence of tachycardia is therefore not an indication for exceeding the recommended dose. The intramuscular route is **not** recommended.

In patients with heart failure who are in sinus rhythm a loading dose is not required, and a satisfactory plasma-digoxin concentration can be achieved over a period of about a week.

Digoxin has a long half-life and maintenance doses need to be given only once daily (although higher doses may be

divided to avoid nausea); renal function is the most important determinant of digoxin dosage.

Unwanted effects depend both on the concentration of digoxin in the plasma and on the sensitivity of the conducting system or of the myocardium, which is often increased in heart disease. It can sometimes be difficult to distinguish between toxic effects and clinical deterioration because symptoms of both are similar. The plasma concentration alone cannot indicate toxicity reliably, but the likelihood of toxicity increases progressively through the range 1.5 to 3 micrograms/litre for digoxin. Digoxin should be used with special care in the elderly, who may be particularly susceptible to digitalis toxicity.

Regular monitoring of plasma-digoxin concentration during maintenance treatment is not necessary unless problems are suspected. Hypokalaemia predisposes the patient to digitalis toxicity; it is managed by giving a potassium-sparing diuretic or, if necessary, potassium supplementation.

If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management. Digoxin-specific antibody fragments are available for reversal of life-threatening overdose.

Digoxin

28-Apr-2020

- **DRUG ACTION** Digoxin is a cardiac glycoside that increases the force of myocardial contraction and reduces conductivity within the atrioventricular (AV) node.

• INDICATIONS AND DOSE

Rapid digitalisation, for atrial fibrillation or flutter

▶ BY MOUTH

- ▶ Adult: 0.75–1.5 mg in divided doses, dose to be given over 24 hours, reduce dose in the elderly

Maintenance, for atrial fibrillation or flutter

▶ BY MOUTH

- ▶ Adult: Maintenance 125–250 micrograms daily, dose according to renal function and initial loading dose, reduce dose in the elderly

Heart failure (for patients in sinus rhythm)

▶ BY MOUTH

- ▶ Adult: 62.5–125 micrograms once daily, reduce dose in the elderly

Emergency loading dose, for atrial fibrillation or flutter

▶ INITIALLY BY INTRAVENOUS INFUSION

- ▶ Adult: Loading dose 0.75–1 mg, to be given over at least 2 hours, then (by mouth) maintenance, loading dose is rarely necessary, maintenance dose to be started on the day following the loading dose, reduce dose in the elderly

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose by half with concurrent use of amiodarone, dronedarone and quinine.

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose may need to be reduced if digoxin (or another cardiac glycoside) has been given in the preceding 2 weeks.
- ▶ When switching from intravenous to oral route may need to increase dose by 20–33% to maintain the same plasma-digoxin concentration.

- **UNLICENSED USE** Digoxin doses in the BNF may differ from those in product literature.
- **CONTRA-INDICATIONS** Constrictive pericarditis (unless to control atrial fibrillation or improve systolic dysfunction—but use with caution) · hypertrophic cardiomyopathy (unless concomitant atrial fibrillation and heart failure—but use with caution) · intermittent complete heart block · myocarditis · second degree AV block · supraventricular

arrhythmias associated with accessory conducting pathways e.g. Wolff-Parkinson-White syndrome (although can be used in infancy) · ventricular tachycardia or fibrillation

- **CAUTIONS** Hypercalcaemia (risk of digitalis toxicity) · hypokalaemia (risk of digitalis toxicity) · hypomagnesaemia (risk of digitalis toxicity) · hypoxia (risk of digitalis toxicity) · recent myocardial infarction · severe respiratory disease · sick sinus syndrome · thyroid disease

CAUTIONS, FURTHER INFORMATION

- ▶ **Elderly** Prescription potentially inappropriate (STOPP criteria):
 - in heart failure with normal systolic ventricular function (no clear evidence of benefit)
 - at a long-term dose greater than 125 micrograms daily if eGFR less than 30 mL/minute/1.73 m² (risk of digoxin toxicity if plasma levels not measured)
 See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: digoxin

● SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmias · cardiac conduction disorder · cerebral impairment · diarrhoea · dizziness · eosinophilia · nausea · skin reactions · vision disorders · vomiting
- ▶ **Uncommon** Depression
- ▶ **Rare or very rare** Appetite decreased · asthenia · confusion · gastrointestinal disorders · gynaecomastia · headache · malaise · psychosis · thrombocytopenia

Overdose If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management.

● PREGNANCY

Dose adjustments May need dosage adjustment.

- **BREAST FEEDING** Amount too small to be harmful.

● RENAL IMPAIRMENT

Dose adjustments Reduce dose.

Monitoring Monitor plasma-digoxin concentration in renal impairment.

● MONITORING REQUIREMENTS

- ▶ For plasma-digoxin concentration assay, blood should be taken at least 6 hours after a dose.
- ▶ Monitor serum electrolytes and renal function. Toxicity increased by electrolyte disturbances.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use Avoid rapid intravenous administration (risk of hypertension and reduced coronary flow). For *intravenous infusion* (Lanoxin[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of not more than 62.5 micrograms/mL. To be given over at least 2 hours.
- ▶ With oral use For oral administration, oral solution must **not** be diluted.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for digoxin elixir (use pipette).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

2 Bleeding disorders

Antifibrinolytic drugs and haemostatics

Overview

Fibrin dissolution can be impaired by the administration of tranexamic acid below, which inhibits fibrinolysis. It can be used to prevent bleeding or to treat bleeding associated with excessive fibrinolysis (e.g. in surgery, dental extraction, obstetric disorders, and traumatic hyphaema) and in the management of menorrhagia. Tranexamic acid may also be used in hereditary angioedema, epistaxis, and in thrombolytic overdose.

Desmopressin p. 704 is used in the management of mild to moderate haemophilia and von Willebrand's disease. It is also used for fibrinolytic response testing.

Etamsylate reduces capillary bleeding in the presence of a normal number of platelets; it does not act by fibrin stabilisation, but probably by correcting abnormal adhesion. Etamsylate is less effective than other treatments in the management of heavy menstrual bleeding and its use is no longer recommended.

ANTIHAEMORRHAGICS > ANTIFIBRINOLYTICS

Tranexamic acid

10-Mar-2020

● INDICATIONS AND DOSE

Local fibrinolysis

▶ BY MOUTH

- ▶ Adult: 1–1.5 g 2–3 times a day, alternatively 15–25 mg/kg 2–3 times a day

▶ INITIALLY BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 0.5–1 g 2–3 times a day, to be administered at a rate not exceeding 100 mg/minute, followed by (by continuous intravenous infusion) 25–50 mg/kg if required, dose to be given over 24 hours

Menorrhagia

▶ BY MOUTH

- ▶ Adult: 1 g 3 times a day for up to 4 days, to be initiated when menstruation has started; maximum 4 g per day

Hereditary angioedema

▶ BY MOUTH

- ▶ Adult: 1–1.5 g 2–3 times a day, for short-term prophylaxis of hereditary angioedema, tranexamic acid is started several days before planned procedures which may trigger an acute attack of hereditary angioedema (e.g. dental work) and continued for 2–5 days afterwards

Epistaxis

▶ BY MOUTH

- ▶ Adult: 1 g 3 times a day for 7 days

continued →

General fibrinolysis

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 1 g every 6–8 hours, alternatively 15 mg/kg every 6–8 hours, dose to be given at a rate not exceeding 100 mg/minute

Prevention and treatment of significant haemorrhage following trauma

- ▶ INITIALLY BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: Loading dose 1 g to be given over 10 minutes, treatment should commence within 8 hours of injury, followed by (by intravenous infusion) 1 g to be given over 8 hours

- **UNLICENSED USE** Use of tranexamic acid by continuous intravenous infusion for treatment of local fibrinolysis is an unlicensed route of administration.

[EvGr] Not licensed for prevention and treatment of significant haemorrhage following trauma. 

- **CONTRA-INDICATIONS** Fibrinolytic conditions following disseminated intravascular coagulation (unless predominant activation of fibrinolytic system with severe bleeding) · history of convulsions · thromboembolic disease

- **CAUTIONS** Irregular menstrual bleeding (establish cause before initiating therapy) · massive haematuria (avoid if risk of ureteric obstruction) · patients receiving oral contraceptives (increased risk of thrombosis)

CAUTIONS, FURTHER INFORMATION ▶ Menorrhagia Before initiating treatment for menorrhagia, exclude structural or histological causes or fibroids causing distortion of uterine cavity.

- **INTERACTIONS** → Appendix 1: tranexamic acid

SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea (reduce dose) · nausea · vomiting
- ▶ **Uncommon** Allergic dermatitis
- ▶ **Rare or very rare** Colour vision change (discontinue) · embolism and thrombosis
- ▶ **Frequency not known** Seizure (more common at high doses) · visual impairment (discontinue)

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Hypotension · malaise (on rapid intravenous injection)
- **PREGNANCY** No evidence of teratogenicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.
- **BREAST FEEDING** Small amount present in milk—antifibrinolytic effect in infant unlikely.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose—consult product literature for details.
- **MONITORING REQUIREMENTS** Regular liver function tests in long-term treatment of hereditary angioedema.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Cyklokapron®), give continuously in Glucose 5% or Sodium chloride 0.9%.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

- ▶ **Tranexamic acid (Non-proprietary)**
Tranexamic acid 500 mg Tranexamic acid 500mg tablets | 60 tablet **[PoM]** £32.10 DT = £6.20
- ▶ **Cyklokapron** (Mylan)
Tranexamic acid 500 mg Cyklokapron 500mg tablets | 60 tablet **[PoM]** £14.30 DT = £6.20

Solution for injection

- ▶ **Tranexamic acid (Non-proprietary)**
Tranexamic acid 100 mg per 1 ml Tranexamic acid 500mg/5ml solution for injection ampoules | 5 ampoule **[PoM]** £7.50 DT = £7.50 (Hospital only) | 10 ampoule **[PoM]** £15.47 DT = £15.47 (Hospital only)
- ▶ **Cyklokapron** (Pfizer Ltd)
Tranexamic acid 100 mg per 1 ml Cyklokapron 500mg/5ml solution for injection ampoules | 10 ampoule **[PoM]** £15.47 DT = £15.47

ANTIHAEMORRHAGICS > HAEMOSTATICS**Emicizumab**

09-May-2018

- **DRUG ACTION** Emicizumab is a monoclonal antibody that bridges activated factor IX and factor X to restore function of missing activated factor VIII, which is needed for haemostasis.

INDICATIONS AND DOSE**Prophylaxis of haemorrhage in haemophilia A (initiated by a specialist)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 3 mg/kg once weekly for 4 weeks, then maintenance 1.5 mg/kg once weekly, alternatively maintenance 3 mg/kg every 2 weeks, alternatively maintenance 6 mg/kg every 4 weeks

- **CAUTIONS** Concomitant bypassing agent · risk factors for thrombotic microangiopathy

CAUTIONS, FURTHER INFORMATION

- ▶ Concomitant bypassing agent Manufacturer advises discontinue bypassing agents the day before starting emicizumab; if a bypassing agent is required—consult product literature.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arthralgia · diarrhoea · fever · headache · myalgia
 - ▶ **Uncommon** Cavernous sinus thrombosis · embolism and thrombosis · skin necrosis · thrombotic microangiopathy
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 6 months after treatment in women of childbearing potential.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **EFFECT ON LABORATORY TESTS** Manufacturer advises to avoid intrinsic pathway clotting-based laboratory tests or use with caution as results may be misinterpreted—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises max. 2 mL per injection site; rotate injection site and avoid skin that is tender, damaged or scarred. Patients or their caregivers may self-administer *Hemlibra*® after appropriate training.
- **PRESCRIBING AND DISPENSING INFORMATION** Emicizumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.
- **PATIENT AND CARER ADVICE**

Missed doses Manufacturer advises if a dose is missed, the missed dose may be taken up to a day before the next scheduled dose. The next dose should then be taken on the usual scheduled dosing day.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Hemlibra** (Roche Products Ltd) ▼
Emicizumab 30 mg per 1 ml Hemlibra 30mg/1ml solution for injection vials | 1 vial **[PoM]** £2,415.30

Emicizumab 150 mg per 1 ml Hemlibra 150mg/1ml solution for injection vials | 1 vial [PoM] £12,076.50
 Hemlibra 105mg/0.7ml solution for injection vials | 1 vial [PoM] £8,453.55
 Hemlibra 60mg/0.4ml solution for injection vials | 1 vial [PoM] £4,830.60

2.1 Coagulation factor deficiencies

BLOOD AND RELATED PRODUCTS > COAGULATION PROTEINS

Dried prothrombin complex (Human prothrombin complex)

30-Jan-2020

● INDICATIONS AND DOSE

Treatment and peri-operative prophylaxis of haemorrhage in patients with congenital deficiency of factors II, VII, IX, or X if purified specific coagulation factors not available | Treatment and peri-operative prophylaxis of haemorrhage in patients with acquired deficiency of factors II, VII, IX, or X (e.g. during warfarin treatment)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult haematologist)

Major bleeding in patients on warfarin following phythomenadione (initiated under specialist supervision)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 25–50 units/kg

- **CONTRA-INDICATIONS** History of heparin induced thrombocytopenia · myocardial infarction within the last 3 months (no information available) · unstable angina within the last 3 months (no information available)
- **CAUTIONS** Disseminated intravascular coagulation · history of myocardial infarction or coronary heart disease · postoperative use · risk of thrombosis · vaccination against hepatitis A and hepatitis B may be required
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Embolism and thrombosis
 - ▶ **Uncommon** Anxiety · device thrombosis · haemorrhage · hepatic function abnormal · hypertension · respiratory disorders
 - ▶ **Frequency not known** Cardiac arrest · chills · circulatory collapse · disseminated intravascular coagulation · dyspnoea · heparin-induced thrombocytopenia · hypotension · nausea · skin reactions · tachycardia · tremor
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of thromboembolic complications).
Monitoring Monitor closely in hepatic impairment (risk of thromboembolic complications).
- **PRESCRIBING AND DISPENSING INFORMATION** Dried prothrombin complex is prepared from human plasma by a suitable fractionation technique, and contains factor IX, together with variable amounts of factors II, VII, and X.
Available from CSL Behring (*Beriplex*® P/N), Octapharma (*Octaplex*®).
- **MEDICINAL FORMS** No licensed medicines listed.

Factor VIIa (recombinant) (Eptacog alfa (activated))

30-Jan-2020

● INDICATIONS AND DOSE

Treatment and prophylaxis of haemorrhage in patients with haemophilia A or B with inhibitors to factors VIII or IX, acquired haemophilia, factor VII deficiency, or Glanzmann's thrombasthenia

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: (consult haematologist)

- **CAUTIONS** Disseminated intravascular coagulation · risk of thrombosis
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Embolism and thrombosis · fever · hepatic disorders · intestinal ischaemia · skin reactions
 - ▶ **Rare or very rare** Angina pectoris · cerebrovascular insufficiency · coagulation disorders · headache · myocardial infarction · nausea · peripheral ischaemia
 - ▶ **Frequency not known** Angioedema · flushing

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

Factor VIII fraction, dried (Human coagulation factor VIII, dried)

05-Feb-2020

● INDICATIONS AND DOSE

Treatment and prophylaxis of haemorrhage in congenital factor VIII deficiency (haemophilia A), acquired factor VIII deficiency | Von Willebrand's disease

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Adult: (consult haematologist)

- **CAUTIONS** Risk of intravascular haemolysis after large or frequently repeated doses in patients with blood groups A, B, or AB (in products containing isoagglutinins) · vaccination against hepatitis A and hepatitis B may be required (consult product literature)
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Angioedema · cardiac discomfort · chills · flushing · headache · hypersensitivity · hypotension · lethargy · nausea · paraesthesia · restlessness · skin reactions · tachycardia · vomiting · wheezing
 - ▶ **Rare or very rare** Fever
- **MONITORING REQUIREMENTS** Monitor for development of factor VIII inhibitors.

- **PRESCRIBING AND DISPENSING INFORMATION** Dried factor VIII fraction is prepared from human plasma by a suitable fractionation technique; it may also contain varying amounts of von Willebrand factor. *Optivate*[®], *Fanhd*[®], and *Octanate*[®] are not indicated for use in von Willebrand's disease.

Recombinant human coagulation factor VIII including octocog alfa, moroctocog alfa, and simoctocog alfa are not indicated for use in von Willebrand's disease.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Factor IX fraction, dried

30-Jan-2020

● **INDICATIONS AND DOSE**

Treatment and prophylaxis of haemorrhage in congenital factor IX deficiency (haemophilia B)

- BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION
- Adult: (consult haematologist)

- **CONTRA-INDICATIONS** Disseminated intravascular coagulation

- **CAUTIONS** Risk of thrombosis—principally with low purity products - vaccination against hepatitis A and hepatitis B may be required (consult product literature)

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · back pain · dyspnoea · hypersensitivity · nausea · sensation abnormal · skin reactions · vasodilation
- ▶ **Rare or very rare** Angioedema · cardiac discomfort · chills · disseminated intravascular coagulation · embolism and thrombosis · headache · hypotension · lethargy · myocardial infarction · tachycardia · vomiting · wheezing
- ▶ **Frequency not known** Nephrotic syndrome
- ▶ **PRESCRIBING AND DISPENSING INFORMATION** Dried factor IX fraction is prepared from human plasma by a suitable fractionation technique; it may also contain clotting factors II, VII, and X.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Nonacog alfa 2000 unit BeneFIX 2,000unit powder and solvent for solution for infusion vials | 1 vial [PoM](#) £1,214.40 (Hospital only)

Nonacog alfa 3000 unit BeneFIX 3,000unit powder and solvent for solution for infusion vials | 1 vial [PoM](#) £1,821.60 (Hospital only)

Factor XIII fraction, dried

30-Jan-2020

(Human fibrin-stabilising factor, dried)

● INDICATIONS AND DOSE

Congenital factor XIII deficiency

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: (consult haematologist)

- **CAUTIONS** Vaccination against hepatitis A and hepatitis B may be required

● SIDE-EFFECTS

- ▶ **Rare or very rare** Anaphylactoid reaction · dyspnoea · skin reactions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

▶ **Fibrogammin P** (CSL Behring UK Ltd)

Factor XIII 250 unit Fibrogammin 250unit powder and solvent for solution for injection vials | 1 vial [PoM](#) £106.58

Factor XIII 1250 unit Fibrogammin 1,250unit powder and solvent for solution for injection vials | 1 vial [PoM](#) £532.90

Fibrinogen, dried

30-Jan-2020

(Human fibrinogen)

● INDICATIONS AND DOSE

Treatment of haemorrhage in congenital hypofibrinogenaemia or afibrinogenaemia

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: (consult haematologist)

- **CAUTIONS** Risk of thrombosis · vaccination against hepatitis A and hepatitis B may be required

● SIDE-EFFECTS

- ▶ **Common or very common** Fever · thromboembolism
- ▶ **Frequency not known** Chest pain · chills · cough · dyspnoea · nausea · skin reactions · tachycardia · vomiting
- **PREGNANCY** Manufacturer advises not known to be harmful—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **PRESCRIBING AND DISPENSING INFORMATION** Fibrinogen is prepared from human plasma.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Riastap** (CSL Behring UK Ltd)

Fibrinogen 1 gram Riastap 1g powder for solution for infusion vials | 1 vial [PoM](#) £400.00

Protein C concentrate

30-Jan-2020

● INDICATIONS AND DOSE

Congenital protein C deficiency

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: (consult haematologist)

- **CAUTIONS** Hypersensitivity to heparins · vaccination against hepatitis A and hepatitis B may be required

● SIDE-EFFECTS

- ▶ **Rare or very rare** Dizziness · fever · skin reactions
- ▶ **Frequency not known** Haemothorax · hyperhidrosis · restlessness
- **PRESCRIBING AND DISPENSING INFORMATION** Protein C is prepared from human plasma.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

▶ **Ceptrotin** (Baxalta UK Ltd)

Protein C 500 unit Ceptrotin 500unit powder and solvent for solution for injection vials | 1 vial [PoM](#) £2,000.00

Protein C 1000 unit Ceptrotin 1000unit powder and solvent for solution for injection vials | 1 vial [PoM](#) £1,000.00

Factor VIII inhibitor bypassing factor

30-Jan-2020

● INDICATIONS AND DOSE

Treatment and prophylaxis of haemorrhage in patients with congenital factor VIII deficiency (haemophilia A) and factor VIII inhibitors | Treatment of haemorrhage in non-haemophilic patients with acquired factor VIII inhibitors

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: (consult haematologist)

- **CONTRA-INDICATIONS** Disseminated intravascular coagulation
- **CAUTIONS** Risk of thrombosis · vaccination against hepatitis A and hepatitis B may be required
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dizziness · headache · hypersensitivity · hypotension · skin reactions
 - ▶ **Frequency not known** Abdominal discomfort · anamnestic reaction · angioedema · chest discomfort · chills · cough · diarrhoea · disseminated intravascular coagulation · drowsiness · dyspnoea · embolism and thrombosis · fever · flushing · hypertension · ischaemic stroke · malaise · myocardial infarction · nausea · paraesthesia · respiratory disorders · restlessness · tachycardia · taste altered · vomiting
- **PRESCRIBING AND DISPENSING INFORMATION** Preparations with factor VIII inhibitor bypassing activity are prepared from human plasma.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
 - Powder and solvent for solution for injection**
 - ▶ **FEIBA Imuno** (Baxalta UK Ltd)
Factor VIII inhibitor bypassing fraction 500 unit FEIBA 500unit powder and solvent for solution for injection vials | 1 vial [PoM] £390.00
 - Powder and solvent for solution for infusion**
 - ▶ **FEIBA Imuno** (Baxalta UK Ltd)
Factor VIII inhibitor bypassing fraction 1000 unit FEIBA 1,000unit powder and solvent for solution for infusion vials | 1 vial [PoM] £780.00

BLOOD AND RELATED PRODUCTS > PLASMA PRODUCTS

Fresh frozen plasma

30-Jan-2020

- **INDICATIONS AND DOSE**
 - Replacement of coagulation factors or other plasma proteins where their concentration or functional activity is critically reduced**
 - ▶ BY INTRAVENOUS INFUSION
 - ▶ Adult: (consult haematologist)
 - Major bleeding in patients on warfarin following phytonadione (if dried prothrombin complex is unavailable)**
 - ▶ Adult: 15 mL/kilogram
- **CONTRA-INDICATIONS** Avoid use as a volume expander · IgA deficiency with confirmed antibodies to IgA
- **CAUTIONS** Cardiac decompensation · pulmonary oedema · risk of thrombosis · severe protein S deficiency (avoid products with low protein S activity e.g. *OctaplasLG*[®]) · vaccination against hepatitis A and hepatitis B may be required
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Skin reactions
 - ▶ **Uncommon** Fever · hypersensitivity · hypoxia · nausea · sensation abnormal · vomiting
 - ▶ **Rare or very rare** Abdominal pain · anxiety · arrhythmias · back pain · cardiac arrest · chest discomfort · chills · circulatory collapse · citrate toxicity · dizziness · dyspnoea · flushing · haemolytic anaemia · haemorrhage · hyperhidrosis · hypertension · hypotension · localised oedema · malaise · procedural complications · pulmonary oedema · respiratory disorders · thromboembolism
- **PRESCRIBING AND DISPENSING INFORMATION** Fresh frozen plasma is prepared from the supernatant liquid obtained by centrifugation of one donation of whole blood.
 - ▶ A preparation of solvent/detergent treated human plasma (frozen from pooled donors is available from Octapharma (*OctaplasLG*[®])).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Infusion

- ▶ **OctaplasLG** (Octapharma Ltd)
Human plasma proteins 57.5 mg per 1 ml OctaplasLG Blood Group A infusion 200ml bags | 1 bag [PoM] £75.00
OctaplasLG Blood Group B infusion 200ml bags | 1 bag [PoM] £75.00

OctaplasLG Blood Group O infusion 200ml bags | 1 bag [PoM] £75.00

2.2 Subarachnoid haemorrhage

CALCIUM-CHANNEL BLOCKERS

F 168

Nimodipine

14-Feb-2020

- **DRUG ACTION** Nimodipine is a dihydropyridine calcium-channel blocker.
- **INDICATIONS AND DOSE**
 - Prevention of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage**
 - ▶ BY MOUTH
 - ▶ Adult: 60 mg every 4 hours, to be started within 4 days of aneurysmal subarachnoid haemorrhage and continued for 21 days
 - Treatment of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage**
 - ▶ BY INTRAVENOUS INFUSION
 - ▶ Adult (body-weight up to 70 kg): Initially up to 0.5 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter
 - ▶ Adult (body-weight 70 kg and above): Initially 1 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter

Treatment of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage in patients with unstable blood pressure

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially up to 0.5 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Nimodipine has been confused with amlodipine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CONTRA-INDICATIONS** Unstable angina · within 1 month of myocardial infarction
- **CAUTIONS** Cerebral oedema · hypotension · severely raised intracranial pressure
- **INTERACTIONS** → Appendix 1: calcium channel blockers
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Thrombocytopenia · vasodilation
 - ▶ **Rare or very rare** Bradycardia · ileus

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk.
- **HEPATIC IMPAIRMENT**
 - ▶ With oral use Manufacturer advises consider avoiding in severe impairment.
 - Dose adjustments** ▶ With oral use Manufacturer advises dose reduction, if used in severe impairment.
- **RENAL IMPAIRMENT**
 - Monitoring** ▶ With intravenous use Manufacturer advises monitor renal function closely in renal impairment.
- **DIRECTIONS FOR ADMINISTRATION** Avoid concomitant administration of nimodipine infusion and tablets.
 - ▶ With oral use For administration *by mouth*, tablets may be crushed or halved but are light sensitive—administer immediately.
 - ▶ With intravenous use For *intravenous infusion*, give via drip tubing in Glucose 5% or Sodium chloride 0.9%. Not to be added to infusion container; administer via an infusion pump through a Y-piece into a central catheter; incompatible with polyvinyl chloride giving sets or containers; protect infusion from light.
 - ▶ With intravenous use Polyethylene, polypropylene, or glass apparatus should be used.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
 - Solution for infusion**
 - ▶ **Nimotop** (Bayer Plc)
Nimodipine 200 microgram per 1 ml Nimotop 0.02% solution for infusion 50ml vials | 1 vial [PoM] £13.60 (Hospital only)
 - Tablet**
 - ▶ **Nimotop** (Bayer Plc)
Nimodipine 30 mg Nimotop 30mg tablets | 100 tablet [PoM] £40.00 DT = £40.00
- **CAUTIONS** Avoid abrupt withdrawal when used for primary pulmonary hypertension (risk of rebound pulmonary hypertension) · extreme caution in coronary artery disease · haemorrhagic diathesis · pulmonary veno-occlusive disease · reconstituted solution highly alkaline—avoid extravasation (irritant to tissues) · risk of pulmonary oedema (dose titration for pulmonary hypertension should be in hospital)
- **INTERACTIONS** → Appendix 1: epoprostenol
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anxiety · arrhythmias · arthralgia · chest discomfort · diarrhoea · flushing · haemorrhage · headache · intracranial haemorrhage · nausea · pain · rash · sepsis · vomiting
 - ▶ **Uncommon** Dry mouth · hyperhidrosis
 - ▶ **Rare or very rare** Fatigue · hyperthyroidism · intravenous catheter occlusion · local infection · pallor
 - ▶ **Frequency not known** Ascites · pulmonary oedema (avoid chronic use if occurs during dose titration) · spleen abnormalities
- **PREGNANCY** Use if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Anticoagulant monitoring required when given with anticoagulants.
- **TREATMENT CESSATION** Avoid abrupt withdrawal when used for primary pulmonary hypertension (risk of rebound pulmonary hypertension).
- **DIRECTIONS FOR ADMINISTRATION** Directions for administration vary depending on the preparation used—consult product literature.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

PROSTAGLANDINS AND ANALOGUES

Epoprostenol

20-Apr-2020

(Prostacyclin)

- **DRUG ACTION** Epoprostenol is a prostaglandin and a potent vasodilator. It is also a powerful inhibitor of platelet aggregation.

● **INDICATIONS AND DOSE**

Inhibition of platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated | Treatment of primary pulmonary hypertension resistant to other treatments, usually with oral anti-coagulation (initiated by a specialist)

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

PHARMACOKINETICS

- ▶ Short half-life of approximately 3 minutes, therefore it must be administered by continuous intravenous infusion.

- **CONTRA-INDICATIONS** Severe left ventricular dysfunction

3.2 Thromboembolism

Venous thromboembolism

26-Jul-2018

Overview

Venous thromboembolism includes deep-vein thrombosis and pulmonary embolism and occurs as a result of thrombus formation in a vein.

Venous thromboembolism prophylaxis

EVGr All patients should undergo a risk assessment to identify their risk of venous thromboembolism and bleeding on admission to hospital. **⬠** Commonly used risk assessment tools can be found at www.nice.org.uk/guidance/ng89/resources. Patients considered to be at high risk of venous thromboembolism include those who are anticipated to have a substantial reduction in mobility, those with obesity, malignant disease, history of venous thromboembolism, thrombophilic disorder, and patients over 60 years of age. Pregnancy and the postpartum period are also risk factors for venous thromboembolism.

There are two methods of thromboprophylaxis: mechanical and pharmacological. Options for mechanical prophylaxis are anti-embolism stockings that provide graduated compression and produce a calf pressure of 14–15 mmHg, and intermittent pneumatic compression.

EVGr Anti-embolism stockings should be worn day and night until the patient is sufficiently mobile; they should not be offered to patients admitted with acute stroke or those with conditions such as peripheral arterial disease, peripheral neuropathy, severe leg oedema, or local conditions (e.g. gangrene, dermatitis).

When using pharmacological prophylaxis, in most cases, it should start as soon as possible or within 14 hours of admission. Patients with risk factors for bleeding (e.g. acute stroke, thrombocytopenia, acquired or untreated inherited bleeding disorders) should *only* receive pharmacological prophylaxis when their risk of venous thromboembolism outweighs their risk of bleeding. Patients receiving anticoagulant therapy who are at high risk of venous thromboembolism should be considered for prophylaxis if their anticoagulant therapy is interrupted, for example during the peri-operative period. **⬠**

For full guidance on prophylaxis of venous thromboembolism, see NICE guideline 89 (www.nice.org.uk/guidance/ng89).

Surgical patients

EVGr To reduce the risk of venous thromboembolism in surgical patients, regional anaesthesia over general anaesthesia should be used if possible.

Mechanical prophylaxis (e.g. anti-embolism stockings or intermittent pneumatic compression) should be offered to patients with major trauma, or undergoing cranial, abdominal, bariatric, thoracic, maxillofacial, ear, nose, and throat, cardiac or elective spinal surgery. Prophylaxis should continue until the patient is sufficiently mobile or discharged from hospital (or for 30 days in spinal injury, elective spinal surgery or cranial surgery). **⬠** Choice of mechanical prophylaxis depends on factors such as the type of surgery, suitability for the patient, and their condition.

EVGr Pharmacological prophylaxis should be considered in patients undergoing general or orthopaedic surgery when the risk of venous thromboembolism outweighs the risk of bleeding. **⬠** The choice of prophylaxis will depend on the type of surgery, suitability for the patient, and local policy.

EVGr A low molecular weight heparin is suitable in all types of general and orthopaedic surgery; heparin (unfractionated) p. 143 is preferred in patients with renal impairment. Fondaparinux sodium p. 136 is an option for patients

undergoing abdominal, bariatric, thoracic or cardiac surgery, or for patients with lower limb immobilisation or fragility fractures of the pelvis, hip or proximal femur.

Pharmacological prophylaxis in general surgery should usually continue for at least 7 days post-surgery, or until sufficient mobility has been re-established. Pharmacological prophylaxis should be extended to 28 days after major cancer surgery in the abdomen, and to 30 days in spinal surgery.

Mechanical prophylaxis with intermittent pneumatic compression should be considered when pharmacological prophylaxis is contra-indicated in patients undergoing lower limb amputation, or those with major trauma or fragility fractures of the pelvis, hip or proximal femur.

Patients undergoing an *elective hip replacement* should be given thromboprophylaxis with either a low molecular weight heparin administered for 10 days followed by low-dose aspirin p. 130 for a further 28 days, or a low molecular weight heparin administered for 28 days in combination with anti-embolism stockings until discharge, or rivaroxaban p. 137. If these options are unsuitable, apixaban p. 133 or dabigatran etexilate p. 146 can be considered as alternatives. If pharmacological prophylaxis is contra-indicated, anti-embolism stockings can be used until discharge.

Patients undergoing an *elective knee replacement* should be given thromboprophylaxis with either low-dose aspirin p. 130 for 14 days, or a low molecular weight heparin administered for 14 days in combination with anti-embolism stockings until discharge, or rivaroxaban. If these options are unsuitable, apixaban or dabigatran etexilate can be considered as alternatives. If pharmacological prophylaxis is contra-indicated, intermittent pneumatic compression can be used until the patient is mobile. **⬠**

Medical patients

The choice of prophylaxis will depend on the medical condition, suitability for the patient, and local policy. **EVGr** Acutely ill medical patients who are at high risk of venous thromboembolism should be offered pharmacological prophylaxis. Patients should be given either a low molecular weight heparin as a first-line option, or fondaparinux sodium as an alternative, for a minimum of 7 days. Patients with renal impairment should be given either a low molecular weight heparin or heparin (unfractionated) and the dose should be adjusted as necessary.

Mechanical prophylaxis can be considered when pharmacological prophylaxis is contra-indicated; their use should be continued until the patient is sufficiently mobile. In patients admitted with acute stroke, mechanical prophylaxis with intermittent pneumatic compression should be considered, as anti-embolism stockings are unsuitable in these patients; their use should be started within 3 days of the acute stroke and continued for 30 days, or until the patient is sufficiently mobile or discharged from hospital. **⬠**

Thromboprophylaxis in pregnancy

EVGr All pregnant women (who are not in active labour), or women who have given birth, had a miscarriage or termination of pregnancy during the past 6 weeks, with a risk of venous thromboembolism that outweighs the risk of bleeding should be considered for pharmacological prophylaxis with a low molecular weight heparin during hospital admission. In pregnant women, prophylaxis should be continued until there is no longer a risk of venous thromboembolism, or until discharge from hospital. Women who have given birth, had a miscarriage or termination of pregnancy during the past 6 weeks, should start thromboprophylaxis with a low molecular weight heparin 4–8 hours after the event, unless contra-indicated, and continue for a minimum of 7 days.

Additional mechanical prophylaxis should be considered for women who are likely to be immobilised or have significantly reduced mobility and continued until the woman is sufficiently mobile or discharged from hospital.

Intermittent pneumatic compression should be used as the first-line option and anti-embolism stockings as an alternative. [A](#)

Edoxaban

Edoxaban p. 135, an inhibitor of factor Xa, can be given orally for the treatment and prophylaxis of venous thromboembolism, although, it should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolectomy. Duration of therapy should be determined by balancing the benefit of treatment with the bleeding risk; shorter duration of treatment (at least 3 months) should be based on transient risk factors i.e. recent surgery, trauma, immobilisation, and longer durations should be based on permanent risk factors or idiopathic deep-vein thrombosis or pulmonary embolism.

Treatment of venous thromboembolism

For the initial treatment of deep-vein thrombosis and pulmonary embolism a low molecular weight heparin is used; alternatively, heparin (unfractionated) p. 143 is given as an intravenous loading dose, followed by continuous intravenous infusion (using an infusion pump) or (for deep-vein thrombosis only) by intermittent subcutaneous injection. Intermittent intravenous injection of heparin (unfractionated) is no longer recommended. An oral anticoagulant (usually warfarin sodium p. 150 is started at the same time as unfractionated or low molecular weight heparin (the heparin needs to be continued for at least 5 days and until the INR is ≥ 2 for at least 24 hours). Laboratory monitoring for heparin (unfractionated), preferably on a daily basis, is essential; determination of the activated partial thromboplastin time (APTT) is the most widely used measure (for heparin (unfractionated)). A low molecular weight heparin or, in some circumstances, heparin (unfractionated) is also used in regimens for the management of myocardial infarction and unstable angina.

Treatment of venous thromboembolism in pregnancy

Heparins are used for the management of venous thromboembolism in pregnancy because they do not cross the placenta. Low molecular weight heparins are preferred because they have a lower risk of osteoporosis and of heparin-induced thrombocytopenia. Low molecular weight heparins are eliminated more rapidly in pregnancy, requiring alteration of the dosage regimen for drugs such as dalteparin sodium p. 140, enoxaparin sodium p. 142, and tinzaparin sodium p. 144. Treatment should be stopped at the onset of labour and advice sought from a specialist on continuing therapy after birth.

Extracorporeal circuits

Heparin (unfractionated) is also used in the maintenance of extracorporeal circuits in cardiopulmonary bypass and haemodialysis.

Haemorrhage

If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate p. 1440 is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

Advanced Pharmacy Services

Patients with, or at risk of venous thromboembolism may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services in Medicines optimisation* p. 18.

Stroke

Overview

Stroke is associated with a significant risk of morbidity and mortality. Patients presenting with acute symptoms should be immediately transferred to hospital for accurate diagnosis of stroke type, and urgent initiation of appropriate treatment; patients should be managed by a specialist multidisciplinary stroke team.

The following section gives an overview of the initial and long-term management of transient ischaemic attack, ischaemic stroke, and intracerebral haemorrhage.

Transient ischaemic attack

[EvGr](#) Patients suspected of having a transient ischaemic attack should immediately receive aspirin p. 130. Patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor, should receive a suitable alternative antiplatelet. Following a confirmed diagnosis, patients should receive treatment for secondary prevention (see Long-term Management, under Ischaemic Stroke). [A](#)

Ischaemic stroke

Initial management

[EvGr](#) Alteplase p. 230 is recommended in the treatment of acute ischaemic stroke if it can be administered within 4.5 hours of symptom onset and if intracranial haemorrhage has been excluded by appropriate imaging techniques. It should be given by medical staff experienced in the administration of thrombolytics and the treatment of acute stroke, preferably within a specialist stroke centre. Provided that intracranial haemorrhage has been excluded, treatment with aspirin should be initiated as soon as possible within 24 hours of symptom onset; a proton pump inhibitor should be considered for patients with a history of dyspepsia associated with aspirin. Patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor, should receive an alternative antiplatelet.

Anticoagulants are not recommended as an alternative to antiplatelet drugs in acute ischaemic stroke in patients who are in sinus rhythm. However, parenteral anticoagulants may be indicated in patients who are symptomatic of, or at high risk of developing, deep vein thrombosis or pulmonary embolism. [A](#)

Warfarin sodium p. 150 should not be given in the acute phase of an ischaemic stroke.

[EvGr](#) Patients with a disabling ischaemic stroke and atrial fibrillation should receive aspirin for 2 weeks before being considered for anticoagulant treatment. Patients already receiving anticoagulation for a prosthetic heart valve who experience a disabling ischaemic stroke and are at significant risk of haemorrhagic transformation, should have their anticoagulant treatment stopped for 7 days and substituted with aspirin.

Treatment of hypertension in the acute phase of ischaemic stroke can result in reduced cerebral perfusion, and should therefore only be instituted in the event of a hypertensive emergency, or in those patients considered for thrombolysis. [A](#)

Long-term management

[EvGr](#) Patients should receive long-term treatment following a transient ischaemic attack or an ischaemic stroke to reduce the risk of further cardiovascular events.

Following a *transient ischaemic attack* or an *ischaemic stroke* (not associated with atrial fibrillation), long-term treatment with clopidogrel p. 131 [unlicensed in transient ischaemic attack] is recommended. If clopidogrel is contraindicated or not tolerated, patients can receive modified-release dipyridamol p. 132 in combination with aspirin; if

both aspirin and clopidogrel are contra-indicated or not tolerated, then modified-release dipyridamole alone is recommended; if both modified-release dipyridamole and clopidogrel are contra-indicated or not tolerated, then aspirin alone is recommended.

Patients with ischaemic stroke or transient ischaemic attack associated with atrial fibrillation should be reviewed for long-term anticoagulant treatment (for stroke, see also Initial Management under Ischaemic Stroke).

Anticoagulants are not routinely recommended in the long-term prevention of recurrent stroke, except when atrial fibrillation or other indications (such as a cardiac source of embolism, cerebral venous thrombosis or arterial dissection) are present.

A high-intensity statin (such as atorvastatin p. 215), should be initiated 48 hours after stroke symptom onset in patients not already taking a statin, irrespective of the patient's serum-cholesterol concentration. See Dyslipidaemias p. 208 for further information. Patients with acute stroke who are already taking a statin can continue statin treatment.

Following the acute phase of ischaemic stroke, blood pressure should be measured and treatment initiated to achieve a target blood pressure of <130/80 mmHg. Beta-blockers should not be used in the management of hypertension following a stroke, unless they are indicated for a co-existing condition.

All patients should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight, alcohol intake, and Smoking cessation p. 520. 

Intracerebral haemorrhage

Initial Management

 Surgical intervention may be required following intracerebral haemorrhage to remove the haematoma and relieve intracranial pressure.

Patients presenting within 6 hours of symptom onset should be given rapid blood pressure lowering therapy if they have a systolic blood pressure between 150 and 220 mmHg and they do not fit any exclusion criteria. A systolic blood pressure target of 130 to 140 mmHg should be aimed to be attained within 1 hour of starting treatment and maintained for at least 7 days. Rapid blood pressure lowering should also be considered for patients presenting beyond 6 hours of symptom onset or who have a systolic blood pressure greater than 220 mmHg.

Rapid blood pressure lowering should not be given to patients who have an underlying structural cause, have a score on the Glasgow Coma Scale of below 6, are going to have early neurosurgery to evacuate the haematoma or have a massive haematoma with a poor expected prognosis.

Patients taking anticoagulants should have this treatment stopped and reversed. Anticoagulant therapy has, however, been used in patients with intracerebral haemorrhage who are symptomatic of deep vein thrombosis or pulmonary embolism; placement of a caval filter is an alternative in this situation. 

Long-term management

 Specialist advice should be sought for patients with atrial fibrillation and those at a high risk of ischaemic stroke or cardiac ischaemic events as aspirin and anticoagulant therapy are not normally recommended following an intracerebral haemorrhage. Blood pressure should be measured and treatment initiated where appropriate, taking care to avoid hypoperfusion. Statins should be avoided following intracerebral haemorrhage, however they can be used with caution when the risk of a vascular event outweighs the risk of further haemorrhage. 

Advanced Pharmacy Services

Patients at risk of, or patients with a history of stroke or transient ischaemic attack, may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 18.

www.nice.org.uk/guidance/ng128

Oral anticoagulants

Overview

The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the thrombus consists of a fibrin web enmeshed with platelets and red cells.

Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin.

Coumarins and phenindione

The oral anticoagulants warfarin sodium p. 150, acenocoumarol p. 150 and phenindione p. 150, antagonise the effects of vitamin K, and take at least 48 to 72 hours for the anticoagulant effect to develop fully; warfarin sodium is the drug of choice. If an immediate effect is required, unfractionated or low molecular weight heparin must be given concomitantly.

These oral anticoagulants should not be used in cerebral artery thrombosis or peripheral artery occlusion as first-line therapy; aspirin p. 130 is more appropriate for reduction of risk in transient ischaemic attacks. Unfractionated or a low molecular weight heparin (see under Parenteral anticoagulants p. 127) is usually preferred for the prophylaxis of venous thromboembolism in patients undergoing surgery; alternatively, warfarin sodium can be continued in selected patients currently taking long-term warfarin sodium and who are at high risk of thromboembolism (seek expert advice).

Dose

The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.

Target INR

The following indications and target INRs for adults for warfarin take into account recommendations of the British Society for Haematology guidelines on oral anticoagulation with warfarin—fourth edition. *Br J Haematol* 2011; **154**: 311–324:

An INR which is within 0.5 units of the target value is generally satisfactory; larger deviations require dosage adjustment. Target values (rather than ranges) are now recommended.

INR 2.5 for:

- treatment of deep-vein thrombosis or pulmonary embolism (including those associated with antiphospholipid syndrome or for recurrence in patients no longer receiving warfarin sodium)
- atrial fibrillation
- cardioversion—target INR should be achieved at least 3 weeks before cardioversion and anticoagulation should continue for at least 4 weeks after the procedure (higher target values, such as an INR of 3, can be used for up to

4 weeks before the procedure to avoid cancellations due to low INR)

- dilated cardiomyopathy
- mitral stenosis or regurgitation in patients with either atrial fibrillation, a history of systemic embolism, a left atrial thrombus, or an enlarged left atrium
- bioprosthetic heart valves in the mitral position (treat for 3 months), or in patients with a history of systemic embolism (treat for at least 3 months), or with a left atrial thrombus at surgery (treat until clot resolves), or with other risk factors (e.g. atrial fibrillation or a low ventricular ejection fraction)
- acute arterial embolism requiring embolectomy (consider long-term treatment)
- myocardial infarction
- INR 3.5 for:
- recurrent deep-vein thrombosis or pulmonary embolism in patients currently receiving anticoagulation and with an INR above 2;

Mechanical prosthetic heart valves:

- the recommended target INR depends on the type and location of the valve, and patient-related risk factors
- consider increasing the INR target or adding an antiplatelet drug, if an embolic event occurs whilst anticoagulated at the target INR.

Duration

The risks of thromboembolism recurrence and anticoagulant-related bleeding should be considered when deciding the duration of anticoagulation.

The following durations of warfarin sodium for the treatment of deep-vein thrombosis and pulmonary embolism reflect the recommendations of the British Society for Haematology (Guidelines on Oral Anticoagulation with Warfarin—fourth edition. *Br J Haematol* 2011; **154**: 311–324):

- 6 weeks for isolated calf-vein deep-vein thrombosis
- 3 months for venous thromboembolism provoked by surgery or other transient risk factor (e.g. combined oral contraceptive use, pregnancy, plaster cast)
- at least 3 months for unprovoked proximal deep-vein thrombosis or pulmonary embolism; long-term anticoagulation may be required.

Haemorrhage

The main adverse effect of all oral anticoagulants is haemorrhage. Checking the INR and omitting doses when appropriate is essential; if the anticoagulant is stopped but not reversed, the INR should be measured 2–3 days later to ensure that it is falling. The cause of an elevated INR should be investigated. The following recommendations (which take into account the recommendations of the British Society for Haematology Guidelines on Oral Anticoagulation with Warfarin—fourth edition. *Br J Haematol* 2011; **154**: 311–324) are based on the result of the INR and whether there is major or minor bleeding; the recommendations apply to adults taking warfarin:

- Major bleeding—stop warfarin sodium; give phytomenadione p. 1150 (vitamin K₁) by slow intravenous injection; give dried prothrombin complex p. 119 (factors II, VII, IX, and X); if dried prothrombin complex unavailable, fresh frozen plasma can be given but is less effective; recombinant factor VIIa is not recommended for emergency anticoagulation reversal
- INR >8.0, minor bleeding—stop warfarin sodium; give phytomenadione (vitamin K₁) by slow intravenous injection; repeat dose of phytomenadione if INR still too high after 24 hours; restart warfarin sodium when INR <5.0
- INR >8.0, no bleeding—stop warfarin sodium; give phytomenadione (vitamin K₁) by mouth using the intravenous preparation orally [unlicensed use]; repeat

dose of phytomenadione if INR still too high after 24 hours; restart warfarin when INR <5.0

- INR 5.0–8.0, minor bleeding—stop warfarin sodium; give phytomenadione (vitamin K₁) by slow intravenous injection; restart warfarin sodium when INR <5.0
- INR 5.0–8.0, no bleeding—withhold 1 or 2 doses of warfarin sodium and reduce subsequent maintenance dose
- Unexpected bleeding at therapeutic levels—always investigate possibility of underlying cause e.g. unsuspected renal or gastro-intestinal tract pathology

Peri-operative anticoagulation

Warfarin sodium should usually be stopped 5 days before elective surgery; phytomenadione (vitamin K₁) by mouth (using the intravenous preparation orally [unlicensed use]) should be given the day before surgery if the INR is ≥ 1.5 . If haemostasis is adequate, warfarin sodium can be resumed at the normal maintenance dose on the evening of surgery or the next day.

Patients stopping warfarin sodium prior to surgery who are considered to be at high risk of thromboembolism (e.g. those with a venous thromboembolic event within the last 3 months, atrial fibrillation with previous stroke or transient ischaemic attack, or mitral mechanical heart valve) may require interim therapy ('bridging') with a low molecular weight heparin (using treatment dose). The low molecular weight heparin should be stopped at least 24 hours before surgery; if the surgery carries a high risk of bleeding, the low molecular weight heparin should not be restarted until at least 48 hours after surgery.

Patients on warfarin sodium p. 150 who require emergency surgery that can be delayed for 6–12 hours can be given intravenous phytomenadione p. 1150 (vitamin K₁) to reverse the anticoagulant effect. If surgery cannot be delayed, dried prothrombin complex p. 119 can be given in addition to intravenous phytomenadione (vitamin K₁) and the INR checked before surgery.

Combined anticoagulant and antiplatelet therapy

Existing antiplatelet therapy following an acute coronary syndrome or percutaneous coronary intervention should be continued for the necessary duration according to the indication being treated. The addition of warfarin sodium, when indicated (e.g. for venous thromboembolism or atrial fibrillation) should be considered following an assessment of the patient's risk of bleeding and discussion with a cardiologist. The duration of treatment with dual therapy (e.g. aspirin p. 130 and warfarin sodium) or triple therapy (e.g. aspirin with clopidogrel p. 131 and warfarin sodium) should be kept to a minimum where possible. The risk of bleeding with aspirin and warfarin sodium dual therapy is lower than with clopidogrel and warfarin sodium. Depending on the indications being treated and the patient's risk of thromboembolism, it may be possible to withhold antiplatelet therapy until warfarin sodium therapy is complete, or *vice versa* (on specialist advice) in order to reduce the length of time on dual or triple therapy.

Advanced Pharmacy Services

Patients taking oral anticoagulants may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 18.

Parenteral anticoagulants

Overview

The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the

thrombus consists of a fibrin web enmeshed with platelets and red cells.

Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin.

Heparin

Heparin initiates anticoagulation rapidly but has a short duration of action. It is often referred to as 'standard' or heparin (unfractionated) p. 143 to distinguish it from the **low molecular weight heparins**, which have a longer duration of action. Although a low molecular weight heparin is generally preferred for routine use, heparin (unfractionated) can be used in those at high risk of bleeding because its effect can be terminated rapidly by stopping the infusion.

Low molecular weight heparins

Low molecular weight heparins (dalteparin sodium p. 140, enoxaparin sodium p. 142, and tinzaparin sodium p. 144) are usually preferred over heparin (unfractionated) in the *prevention of Venous thromboembolism* p. 124 because they are as effective and they have a lower risk of heparin-induced thrombocytopenia. The standard prophylactic regimen does not require anticoagulant monitoring. The duration of action of low molecular weight heparins is longer than that of heparin (unfractionated) and *once-daily subcutaneous* administration is possible for some indications, making them convenient to use.

Low molecular weight heparins are generally preferred over heparin (unfractionated) in the *treatment of deep vein thrombosis and pulmonary embolism*, and are also used in the treatment of myocardial infarction, unstable coronary artery disease (see under *Acute coronary syndromes* p. 226) and for the prevention of clotting in extracorporeal circuits.

Dalteparin sodium and tinzaparin sodium (only 20 000 unit/mL syringe) are also licensed for the extended treatment and prophylaxis of venous thromboembolism in patients with solid tumours; treatment is recommended for a duration of 6 months. Treatment should be initiated by healthcare professionals experienced in the treatment of venous thromboembolism.

Heparinoids

Danaparoid sodium p. 139 is a heparinoid used for prophylaxis of deep-vein thrombosis in patients undergoing general or orthopaedic surgery. Providing there is no evidence of cross-reactivity, it also has a role in patients who develop heparin-induced thrombocytopenia.

Argatroban

An oral anticoagulant can be given with argatroban monohydrate p. 145, but it should only be started once thrombocytopenia has substantially resolved.

Hirudins

Bivalirudin, a hirudin analogue, is a thrombin inhibitor which is licensed for unstable angina or non-ST-segment elevation myocardial infarction in patients planned for urgent or early intervention, and as an anticoagulant for patients undergoing percutaneous coronary intervention (including patients with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention—see also *Management of ST-segment elevation myocardial infarction (STEMI) in Acute coronary syndromes* p. 226).

Heparin flushes

The use of heparin flushes should be kept to a minimum. For maintaining patency of peripheral venous catheters, sodium chloride injection 0.9% is as effective as heparin flushes. The

role of heparin flushes in maintaining patency of arterial and central venous catheters is unclear.

Epoprostenol

Epoprostenol (prostacyclin) can be given to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated. It is also licensed for the treatment of primary pulmonary hypertension resistant to other treatment, usually with oral anticoagulation; it should be initiated by specialists in pulmonary hypertension. Epoprostenol is a potent vasodilator. It has a short half-life of approximately 3 minutes and therefore it must be administered by continuous intravenous infusion.

Fondaparinux

Fondaparinux sodium is a synthetic pentasaccharide that inhibits activated factor X.

Other drugs used for Thromboembolism Streptokinase, p. 230

ANTIDOTES AND CHELATORS

Andexanet alfa

11-Sep-2019

- **DRUG ACTION** Andexanet alfa is a recombinant form of human factor X_a protein which binds specifically to apixaban or rivaroxaban, thereby reversing their anticoagulant effects.

● INDICATIONS AND DOSE

Reversal of apixaban or rivaroxaban in life-threatening or uncontrolled bleeding (specialist supervision in hospital)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

- **CAUTIONS** Risk of thrombosis
CAUTIONS, FURTHER INFORMATION Manufacturer advises to consider re-starting anticoagulant therapy as soon as medically appropriate to reduce the risk of thrombosis.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Back pain · cerebrovascular insufficiency · chest discomfort · cough · dizziness postural · dry mouth · dyspnoea · feeling hot · fever · flushing · gastrointestinal discomfort · headache · hyperhidrosis · muscle spasms · nausea · palpitations · peripheral coldness · skin reactions · taste altered
 - ▶ **Uncommon** Cardiac arrest · embolism and thrombosis · iliac artery occlusion · myocardial infarction
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises discontinue breast-feeding—no information available.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature about storage after reconstitution.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

EXCIPIENTS: May contain Polysorbates, sucrose

- ▶ **Andexanet alfa (non-proprietary)** ▼

Andexanet alfa 200 mg Ondexxya 200mg powder for solution for infusion vials | 4 vial [PoM] £11,100.00 (Hospital only)

Idarucizumab

03-Mar-2020

● **DRUG ACTION** Idarucizumab is a humanised monoclonal antibody fragment that binds specifically to dabigatran and its metabolites, thereby reversing the anticoagulant effect.

● INDICATIONS AND DOSE

Rapid reversal of dabigatran for emergency procedures, or in life-threatening or uncontrolled bleeding (specialist supervision in hospital)

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 5 g, followed by 5 g if required

● **CAUTIONS** Risk of thrombosis

CAUTIONS, FURTHER INFORMATION Manufacturer advises to consider re-starting anticoagulant therapy as soon as medically appropriate to reduce the risk of thrombosis. Dabigatran can be re-started 24 hours after administration of idarucizumab; other anticoagulant therapy can be started at any time.

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises that one dose of *Praxbind*[®] is administered as either two consecutive intravenous infusions, each given over 5–10 minutes, or as a bolus injection.

● **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 1178/16

The *Scottish Medicines Consortium* has advised (September 2016) that idarucizumab (*Praxbind*[®]) is accepted for use within NHS Scotland for adults treated with dabigatran etexilate when rapid reversal of its anticoagulant effects is required for emergency surgery/urgent procedures or in life-threatening or uncontrolled bleeding.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polysorbates, sorbitol

ELECTROLYTES: May contain Sodium

▶ *Praxbind* (Boehringer Ingelheim Ltd) ▼

Idarucizumab 50 mg per 1 ml Praxbind 2.5g/50ml solution for infusion vials | 2 vial (PoM) £2,400.00 (Hospital only)

ANTI-THROMBOTIC DRUGS > ANTIPLATELET DRUGS

Antiplatelet drugs

12-Jan-2018

Overview

Antiplatelet drugs decrease platelet aggregation and inhibit thrombus formation in the arterial circulation, because in faster-flowing vessels, thrombi are composed mainly of platelets with little fibrin.

EvGr Use of aspirin p. 130 in primary prevention of cardiovascular disease, in patients with or without diabetes, or hypertension, is not recommended. Long-term use of low-dose aspirin is recommended in patients with established cardiovascular disease (secondary prevention); ⚠ unduly high blood pressure must be controlled before aspirin is given. If the patient is at a high risk of gastro-intestinal bleeding, a proton pump inhibitor can be added. For full guidance on the assessment and prevention of cardiovascular disease risk, see Cardiovascular disease risk assessment and prevention p. 201.

Aspirin is given following coronary bypass surgery. It is also used in atrial fibrillation, for intermittent claudication,

for stable angina and acute coronary syndromes, for use following placement of coronary stents and for use in stroke.

Clopidogrel p. 131 is used for the prevention of atherothrombotic events in patients with a history of symptomatic ischaemic disease (e.g. ischaemic stroke).

EvGr In patients with non-ST elevation acute coronary syndromes, clopidogrel, should be given for three months in addition to long-term low-dose aspirin. In patients with ST elevation acute coronary syndromes, clopidogrel, should be given up to four weeks in addition to long-term low-dose aspirin. ⚠

Clopidogrel is also used, in combination with low-dose aspirin, for the prevention of atherothrombotic and thromboembolic events in patients with atrial fibrillation (and at least one risk factor for a vascular event), and for whom warfarin sodium p. 150 is unsuitable.

Use of clopidogrel with aspirin increases the risk of bleeding. Clopidogrel monotherapy may be an alternative when aspirin is contra-indicated, for example in patients with aspirin hypersensitivity, or when aspirin is not tolerated despite the addition of a proton pump inhibitor.

Dipyridamole p. 132 is used by mouth as an adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves. Modified-release preparations are licensed for secondary prevention of ischaemic stroke and transient ischaemic attacks.

Prasugrel p. 228, in combination with aspirin, is licensed for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention; the combination is usually given for up to 12 months.

Ticagrelor p. 228, in combination with aspirin, is licensed for the prevention of atherothrombotic events in patients with acute coronary syndrome; the combination is usually given for up to 12 months.

Cangrelor p. 222, in combination with aspirin, is licensed for the reduction of thrombotic cardiovascular events in patients with coronary artery disease undergoing percutaneous coronary intervention (PCI) who have not received treatment with oral clopidogrel, prasugrel or ticagrelor prior to the procedure and in whom oral therapy with these drugs is not suitable. Cangrelor is to be used under expert supervision only.

Antiplatelet drugs and coronary stents

Patients selected for percutaneous coronary intervention, with the placement of a coronary stent, will require dual antiplatelet therapy with aspirin and either cangrelor, clopidogrel, prasugrel, or ticagrelor [unlicensed]. Aspirin therapy should continue indefinitely. **EvGr** Following percutaneous coronary intervention in patients with stable angina, clopidogrel is recommended in addition to aspirin for at least 1 month after placement of a bare-metal stent, and for at least 6 months if a drug-eluting stent is used. ⚠ Clopidogrel should not be discontinued prematurely in patients with a drug-eluting stent—there is an increased risk of stent thrombosis as a result of the eluted drug slowing the re-endothelialisation process. Patients considered to be at high-risk of developing late stent thrombosis with a drug-eluting stent may require a longer duration of treatment with clopidogrel combined with aspirin. Prasugrel or ticagrelor are alternatives to clopidogrel in certain patients undergoing percutaneous coronary intervention.

Glycoprotein IIb/IIIa inhibitors

Glycoprotein IIb/IIIa inhibitors prevent platelet aggregation by blocking the binding of fibrinogen to receptors on platelets. Abciximab is a monoclonal antibody which binds to glycoprotein IIb/IIIa receptors and to other related sites; it is licensed as an adjunct to heparin (unfractionated) p. 143 and aspirin for the prevention of ischaemic complications in high-risk patients undergoing percutaneous transluminal coronary intervention. Abciximab should be used once only (to avoid additional risk

of thrombocytopenia). Eptifibatid p. 223 (in combination with heparin (unfractionated) and aspirin) and tirofiban p. 223 (in combination with heparin (unfractionated), aspirin, and clopidogrel) also inhibit glycoprotein IIb/IIIa receptors; they are licensed for use to prevent early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction. Tirofiban is also licensed for use in combination with heparin (unfractionated), aspirin, and clopidogrel, for the reduction of major cardiovascular events in patients with ST-segment elevation myocardial infarction intended for primary percutaneous coronary intervention. Abciximab, eptifibatid and tirofiban should be used by specialists only.

Epoprostenol p. 123 is also used to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated.

Advanced Pharmacy Services

Patients taking antiplatelet drugs may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 18.

Aspirin

(Acetylsalicylic Acid)

03-Mar-2020

● INDICATIONS AND DOSE

Cardiovascular disease (secondary prevention)

- ▶ BY MOUTH
- ▶ Adult: 75 mg daily

Management of unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI) | Management of ST-segment elevation myocardial infarction (STEMI)

- ▶ BY MOUTH
- ▶ Adult: 300 mg, chewed or dispersed in water

Suspected transient ischaemic attack

- ▶ BY MOUTH
- ▶ Adult: 300 mg once daily until diagnosis established

Transient ischaemic attack (long-term treatment in combination with dipyridamole) | Ischaemic stroke not associated with atrial fibrillation (in combination with dipyridamole if clopidogrel contra-indicated or not tolerated) | Ischaemic stroke not associated with atrial fibrillation (used alone if clopidogrel and dipyridamole contra-indicated or not tolerated)

- ▶ BY MOUTH
- ▶ Adult: 75 mg once daily

Acute ischaemic stroke

- ▶ BY MOUTH
- ▶ Adult: 300 mg once daily for 14 days, to be initiated 24 hours after thrombolysis or as soon as possible within 48 hours of symptom onset in patients not receiving thrombolysis

Atrial fibrillation following a disabling ischaemic stroke (before being considered for anticoagulant treatment)

- ▶ BY MOUTH
- ▶ Adult: 300 mg once daily for 14 days

Following disabling ischaemic stroke in patients receiving anticoagulation for a prosthetic heart valve and who are at significant risk of haemorrhagic transformation

- ▶ BY MOUTH
- ▶ Adult: 300 mg once daily, anticoagulant treatment stopped for 7 days and to be substituted with aspirin

Following coronary by-pass surgery

- ▶ BY MOUTH
- ▶ Adult: 75–300 mg daily

Mild to moderate pain | Pyrexia

- ▶ BY MOUTH
- ▶ Adult: 300–900 mg every 4–6 hours as required; maximum 4 g per day
- ▶ BY RECTUM
- ▶ Adult: 450–900 mg every 4 hours; maximum 3.6 g per day

Acute migraine

- ▶ BY MOUTH
- ▶ Adult: 900 mg for 1 dose, to be taken as soon as migraine symptoms develop

Prevention of pre-eclampsia in women at moderate or high risk

- ▶ BY MOUTH
- ▶ Adult: 75–150 mg once daily from 12 weeks gestation until the birth of the baby

Mild to moderate pain (dose approved for use by community practitioner nurse prescribers) | Pyrexia (dose approved for use by community practitioner nurse prescribers)

- ▶ BY MOUTH
- ▶ Child 16–17 years: 300–600 mg every 4–6 hours as required, maximum 2.4 g per day without doctor's advice
- ▶ Adult: 300–600 mg every 4–6 hours as required, maximum 2.4 g per day without doctor's advice

● UNLICENSED USE

- ▶ With oral use in adults [\[EvGr\]](#) Aspirin is used to prevent pre-eclampsia in women at moderate or high risk, [\[A\]](#) but is not licensed for this indication.

- **CONTRA-INDICATIONS** Active peptic ulceration · bleeding disorders · children under 16 years (risk of Reye's syndrome) · haemophilia · previous peptic ulceration (analgesic dose) · severe cardiac failure (analgesic dose)

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Reye's syndrome Owing to an association with Reye's syndrome, manufacturer advises aspirin-containing preparations should not be given to children under 16 years, unless specifically indicated, e.g. for Kawasaki disease.
- **CAUTIONS** Allergic disease · anaemia · asthma · dehydration · elderly · G6PD deficiency · preferably avoid during fever or viral infection in children (risk of Reye's syndrome) · previous peptic ulceration (but manufacturers may advise avoidance of low-dose aspirin in history of peptic ulceration) · thyrotoxicosis · uncontrolled hypertension
- CAUTIONS, FURTHER INFORMATION**
- ▶ Elderly Prescription potentially inappropriate (STOPP criteria):
 - at long-term doses greater than 160 mg daily (increased risk of bleeding, no evidence for increased efficacy)
 - with a past history of peptic ulcer disease without concomitant proton pump inhibitor use (risk of recurrent peptic ulcer)
 - with concurrent significant bleeding risk, such as uncontrolled severe hypertension, bleeding diathesis or recent non-trivial spontaneous bleeding (high risk of bleeding)
 - when used with clopidogrel as secondary stroke prevention unless the patient has a coronary stent(s) inserted in the previous 12 months, or concurrent acute coronary syndrome, or has a high grade symptomatic carotid arterial stenosis (no evidence of added benefit over clopidogrel monotherapy)
 - when used with vitamin K antagonists, direct thrombin inhibitors or factor Xa inhibitors in patients with chronic atrial fibrillation (no added benefit from aspirin) See also Prescribing in the elderly p. 33.
- **INTERACTIONS** → Appendix 1: aspirin

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Rare or very rare** Asthmatic attack · bronchospasm

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
 - ▶ With oral use Dyspepsia · haemorrhage
- ▶ **Uncommon**
 - ▶ With oral use Dyspnoea · rhinitis · severe cutaneous adverse reactions (SCARs) · skin reactions
- ▶ **Rare or very rare**
 - ▶ With oral use Aplastic anaemia · erythema nodosum · gastrointestinal haemorrhage (severe) · granulocytosis · haemorrhagic vasculitis · intracranial haemorrhage · menorrhagia · nausea · thrombocytopenia · vomiting
- ▶ **Frequency not known**
 - ▶ With oral use Fluid retention · gastrointestinal disorders · headache · hearing loss · hepatic failure · hyperuricaemia · iron deficiency anaemia · renal impairment · sodium retention · tinnitus · vertigo

Overdose The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning.

For specific details on the management of poisoning, see Aspirin, under Emergency treatment of poisoning p. 1430.

- **ALLERGY AND CROSS-SENSITIVITY** Aspirin is **contra-indicated** in history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria, or rhinitis have been precipitated by aspirin or any other NSAID.

- **PREGNANCY** Use antiplatelet doses with caution during third trimester; impaired platelet function and risk of haemorrhage; delayed onset and increased duration of labour with increased blood loss; avoid analgesic doses if possible in last few weeks (low doses probably not harmful); high doses may be related to intra-uterine growth restriction, teratogenic effects, closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of newborn; kernicterus may occur in jaundiced neonates.

- **BREAST FEEDING** Avoid—possible risk of Reye's syndrome; regular use of high doses could impair platelet function and produce hypoprothrombinaemia in infant if neonatal vitamin K stores low.

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in mild-to-moderate impairment; avoid in severe impairment.

- **RENAL IMPAIRMENT** Use with caution; avoid in severe impairment; sodium and water retention; deterioration in renal function; increased risk of gastro-intestinal bleeding.

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ In adults BP directs that when no strength is stated the 300 mg strength should be dispensed, and that when soluble aspirin tablets are prescribed, dispersible aspirin tablets shall be dispensed.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Aspirin Dispersible Tablets 300 mg may be prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Gastro-resistant tablet

Clopidogrel

30-Apr-2019

● INDICATIONS AND DOSE

Prevention of atherothrombotic events in percutaneous coronary intervention (adjunct with aspirin) in patients not already on clopidogrel

▶ BY MOUTH

- ▶ Adult: Loading dose 300 mg, to be taken prior to the procedure, alternatively loading dose 600 mg, higher dose may produce a greater and more rapid inhibition of platelet aggregation

Transient ischaemic attack for patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor | Acute ischaemic stroke for patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor

▶ BY MOUTH

- ▶ Adult: 75 mg once daily

Prevention of atherothrombotic events in peripheral arterial disease or within 35 days of myocardial infarction, or within 6 months of ischaemic stroke

▶ BY MOUTH

- ▶ Adult: 75 mg once daily

continued →

Prevention of atherothrombotic events in acute coronary syndrome without ST-segment elevation (given with aspirin)

- ▶ BY MOUTH
- ▶ Adult: Initially 300 mg, then 75 mg daily for up to 12 months

Prevention of atherothrombotic events in acute myocardial infarction with ST-segment elevation (given with aspirin)

- ▶ BY MOUTH
- ▶ Adult 18–75 years: Initially 300 mg, then 75 mg for at least 4 weeks
- ▶ Adult 76 years and over: 75 mg daily for at least 4 weeks

Prevention of atherothrombotic and thromboembolic events in patients with atrial fibrillation and at least one risk factor for a vascular event (with aspirin) and for whom warfarin is unsuitable

- ▶ BY MOUTH
- ▶ Adult: 75 mg once daily

- **UNLICENSED USE** 600 mg loading dose prior to percutaneous coronary intervention is an unlicensed dose. Use in transient ischaemic attack or acute ischaemic stroke, in patients with aspirin hypersensitivity or intolerant of aspirin, is unlicensed.

● **CONTRA-INDICATIONS** Active bleeding

- **CAUTIONS** Discontinue 7 days before elective surgery if antiplatelet effect not desirable · patients at risk of increased bleeding from trauma, surgery, or other pathological conditions

CAUTIONS, FURTHER INFORMATION

- ▶ **Elderly** Prescription potentially inappropriate (STOPP criteria) with concurrent significant bleeding risk, such as uncontrolled severe hypertension, bleeding diathesis or recent non-trivial spontaneous bleeding (high risk of bleeding). See also Prescribing in the elderly p. 33.
- **INTERACTIONS** → Appendix 1: clopidogrel

● **SIDE-EFFECTS**

- **Common or very common** Diarrhoea · gastrointestinal discomfort · haemorrhage · skin reactions
- ▶ **Uncommon** Constipation · dizziness · eosinophilia · gastrointestinal disorders · headache · intracranial haemorrhage · leucopenia · nausea · paraesthesia · thrombocytopenia · vomiting
- ▶ **Rare or very rare** Acquired haemophilia · agranulocytosis · anaemia · angioedema · arthralgia · arthritis · bone marrow disorders · confusion · fever · glomerulonephritis · gynaecomastia · hallucination · hepatic disorders · hypersensitivity · hypotension · myalgia · neutropenia · pancreatitis · respiratory disorders · severe cutaneous adverse reactions (SCARs) · stomatitis · taste altered · ulcerative colitis · vasculitis · vertigo · wound haemorrhage
- ▶ **Frequency not known** Kounis syndrome
- **ALLERGY AND CROSS-SENSITIVITY** Caution with history of hypersensitivity reactions to thienopyridines (e.g. prasugrel).
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment in patients with an increased risk of bleeding—limited information available; avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- ▶ **Clopidogrel and modified-release dipyridamole for the prevention of occlusive vascular events (December 2010)** NICE TA210

The guidance applies to patients who have had an occlusive vascular event, or who have established peripheral arterial disease. The guidance does not apply to patients who have had, or are at risk of, stroke associated with atrial fibrillation, or who need prophylaxis for occlusive events following coronary revascularisation or carotid artery procedures.

Clopidogrel monotherapy is recommended as an option to prevent occlusive vascular events in patients who have had:

- an ischaemic stroke, or who have peripheral arterial disease or multivascular disease, **or**
- a myocardial infarction, only if aspirin is contra-indicated or not tolerated.

www.nice.org.uk/guidance/ta210

Scottish Medicines Consortium (SMC) decisions

SMC No. 88/04

The *Scottish Medicines Consortium* has advised (March 2004) that clopidogrel (*Plavix*®) is accepted for restricted use within NHS Scotland for the treatment of confirmed acute coronary syndrome (without ST-segment elevation), in combination with aspirin. Clopidogrel should be initiated in hospital inpatients **only**.

SMC No. 390/07

The *Scottish Medicines Consortium* has advised (August 2007) that clopidogrel (*Plavix*®) is accepted for restricted use within NHS Scotland for patients with ST-segment elevation acute myocardial infarction in combination with aspirin; treatment with clopidogrel is restricted to 4 weeks **only**.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet▶ **Clopidogrel (Non-proprietary)**

Clopidogrel 75 mg Clopidogrel 75mg tablets | 28 tablet **[PoM]**
£35.31 DT = £1.48 | 30 tablet **[PoM]** £1.59-£36.95

▶ **Plavix (Sanofi)**

Clopidogrel 75 mg Plavix 75mg tablets | 30 tablet **[PoM]** £35.64
Clopidogrel (as Clopidogrel hydrogen sulfate) 300 mg Plavix 300mg tablets | 30 tablet **[PoM]** £142.54 DT = £142.54

Dipyridamole

14-Feb-2019

● **INDICATIONS AND DOSE**

Secondary prevention of ischaemic stroke (not associated with atrial fibrillation) and transient ischaemic attacks (used alone or with aspirin) | Adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 200 mg twice daily, to be taken preferably with food

Adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 300–600 mg daily in 3–4 divided doses

Myocardial imaging—diagnostic use only

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: (consult product literature)

- **CAUTIONS** Aortic stenosis · coagulation disorders · heart failure · hypotension · left ventricular outflow obstruction · may exacerbate migraine · myasthenia gravis (risk of

exacerbation) · rapidly worsening angina · recent myocardial infarction

CAUTIONS, FURTHER INFORMATION

- ▶ **Elderly** Prescription potentially inappropriate (STOPP criteria) with concurrent significant bleeding risk, such as uncontrolled severe hypertension, bleeding diathesis or recent non-trivial spontaneous bleeding (high risk of bleeding). See also Prescribing in the elderly p. 33.

● **INTERACTIONS** → Appendix 1: dipyridamole

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Angina pectoris · diarrhoea · dizziness · headache · hot flush · hypotension · myalgia · nausea · skin reactions · vomiting
- ▶ **Frequency not known** Angioedema

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
 - ▶ With intravenous use Arrhythmias · paraesthesia
 - ▶ **Uncommon**
 - ▶ With intravenous use Abdominal pain · respiratory disorders
 - ▶ **Rare or very rare**
 - ▶ With intravenous use Cardiac arrest · cardiac death · cerebrovascular insufficiency · seizure
 - ▶ **Frequency not known**
 - ▶ With intravenous use Atrioventricular block · oedema · syncope
 - ▶ With oral use Bronchospasm · haemorrhage · tachycardia · thrombocytopenia

● **PREGNANCY** Not known to be harmful.

● **BREAST FEEDING** Manufacturers advise use only if essential—small amount present in milk.

● **PRESCRIBING AND DISPENSING INFORMATION** Modified-release capsules should be dispensed in original container (pack contains a desiccant) and any capsules remaining should be discarded 6 weeks after opening.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Clopidogrel and modified-release dipyridamole for the prevention of occlusive vascular events (December 2010)**
NICE TA210

The guidance applies to patients who have had an occlusive vascular event, or who have established peripheral arterial disease. The guidance does not apply to patients who have had, or are at risk of, stroke associated with atrial fibrillation, or who need prophylaxis for occlusive events following coronary revascularisation or carotid artery procedures.

Modified-release dipyridamole, in combination with aspirin, is recommended as an option to prevent occlusive vascular events in patients who have had:

- a transient ischaemic attack, **or**
- an ischaemic stroke, only if clopidogrel is contra-indicated or not tolerated.

Modified-release dipyridamole monotherapy is recommended as an option to prevent occlusive vascular events in patients who have had:

- an ischaemic stroke, only if aspirin and clopidogrel are contra-indicated or not tolerated, **or**
- a transient ischaemic attack, only if aspirin is contra-indicated or not tolerated.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta210

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

▶ Dipyridamole (Non-proprietary)

Dipyridamole 10 mg per 1 ml Dipyridamole 50mg/5ml oral suspension sugar-free | 150 ml [PoM](#) £39.40 DT = £39.40

Dipyridamole 40 mg per 1 ml Dipyridamole 200mg/5ml oral suspension sugar-free | 150 ml [PoM](#) £133.53 DT = £133.53

Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

▶ Attia (Dr Reddy's Laboratories (UK) Ltd)

Dipyridamole 200 mg Attia 200mg modified-release capsules | 60 capsule [PoM](#) £13.15 DT = £13.15

Dipyridamole 100 mg Dipyridamole 100mg tablets | 84 tablet [PoM](#) £12.50 DT = £5.58

Dipyridamole with aspirin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dipyridamole p. 132, aspirin p. 130.

● INDICATIONS AND DOSE

Secondary prevention of ischaemic stroke and transient ischaemic attacks

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 25/200 mg twice daily

● **INTERACTIONS** → Appendix 1: aspirin · dipyridamole

● **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (pack contains a desiccant) and discard any capsules remaining 6 weeks after opening.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 21, 25, 32

▶ Molita (Dr Reddy's Laboratories (UK) Ltd)

Aspirin 25 mg, Dipyridamole 200 mg Molita 200mg/25mg modified-release capsules | 60 capsule [PoM](#) £13.50 DT = £13.50

ANTITHROMBOTIC DRUGS > FACTOR XA INHIBITORS

Apixaban

11-Jul-2019

- **DRUG ACTION** Apixaban is a direct inhibitor of activated factor X (factor Xa).

● INDICATIONS AND DOSE

Prophylaxis of venous thromboembolism following knee replacement surgery

- ▶ BY MOUTH
- ▶ Adult: 2.5 mg twice daily for 10–14 days, to be started 12–24 hours after surgery

Prophylaxis of venous thromboembolism following hip replacement surgery

- ▶ BY MOUTH
- ▶ Adult: 2.5 mg twice daily for 32–38 days, to be started 12–24 hours after surgery

continued →

Treatment of deep-vein thrombosis | Treatment of pulmonary embolism

▶ BY MOUTH

- ▶ Adult: Initially 10 mg twice daily for 7 days, then maintenance 5 mg twice daily

Prophylaxis of recurrent deep-vein thrombosis |**Prophylaxis of recurrent pulmonary embolism**

▶ BY MOUTH

- ▶ Adult: 2.5 mg twice daily, following completion of 6 months anticoagulant treatment

Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and at least one risk factor (such as previous stroke or transient ischaemic attack, symptomatic heart failure, diabetes mellitus, hypertension, or age 75 years and over)

▶ BY MOUTH

- ▶ Adult: 5 mg twice daily, reduce dose to 2.5 mg twice daily in patients with at least two of the following characteristics: age 80 years and over, body-weight less than 61 kg, or serum creatinine 133 micromol/litre and over

DOSE EQUIVALENCE AND CONVERSION

- ▶ For information on changing from, or to, other anticoagulants, consult product literature.

IMPORTANT SAFETY INFORMATION**MHRA/CHM ADVICE: DIRECT-ACTING ORAL ANTICOAGULANTS (DOACs): INCREASED RISK OF RECURRENT THROMBOTIC EVENTS IN PATIENTS WITH ANTIPHOSPHOLIPID SYNDROME (JUNE 2019)**

A clinical trial has shown an increased risk of recurrent thrombotic events associated with rivaroxaban compared with warfarin, in patients with antiphospholipid syndrome and a history of thrombosis. There may be a similar risk associated with other DOACs. Healthcare professionals are advised that DOACs are not recommended in patients with antiphospholipid syndrome, particularly high-risk patients who test positive for all three antiphospholipid tests—lupus anticoagulant, anticardiolipin antibodies, and anti-beta₂ glycoprotein I antibodies. Continued treatment should be reviewed in these patients to determine if appropriate, and switching to a vitamin K antagonist such as warfarin should be considered.

- **CONTRA-INDICATIONS** Active, clinically significant bleeding · antiphospholipid syndrome (increased risk of recurrent thrombotic events) · risk factors for major bleeding

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ Risk factors for major bleeding Manufacturer advises avoid in conditions with significant risk factors for major bleeding, including current or recent gastrointestinal ulceration, malignant neoplasms at high risk of bleeding, recent brain or spinal injury, recent brain, spinal or ophthalmic surgery, recent intracranial haemorrhage, known or suspected oesophageal varices, arteriovenous malformations, vascular aneurysms or major intraspinal or intracerebral vascular abnormalities.
- **CAUTIONS** Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—monitor neurological signs and wait 20–30 hours after apixaban dose before removing catheter and do not give next dose until at least 5 hours after catheter removal) · prosthetic heart valve (efficacy not established) · risk of bleeding

CAUTIONS, FURTHER INFORMATION

- ▶ Elderly For factor Xa inhibitors, prescription potentially inappropriate (STOPP criteria):
 - with concurrent significant bleeding risk, such as uncontrolled severe hypertension, bleeding diathesis or recent non-trivial spontaneous bleeding (high risk of bleeding)

- for first deep venous thrombosis without continuing provoking risk factors (e.g. thrombophilia) for greater than 6 months (no proven added benefit)
- for first pulmonary embolus without continuing provoking risk factors for greater than 12 months (no proven added benefit)
- as part of dual therapy with an antiplatelet agent in patients with stable coronary, cerebrovascular or peripheral arterial disease, without a clear indication for anticoagulant therapy (no added benefit)
- if eGFR less than 15 ml/min/1.73 m² (risk of bleeding) See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: apixaban

● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · haemorrhage · nausea · skin reactions

- ▶ **Uncommon** CNS haemorrhage · hypotension · post procedural haematoma · thrombocytopenia · wound complications

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment (or if hepatic transaminases greater than 2 times the upper limit of normal, or if bilirubin is equal or greater than 1.5 times the upper limit of normal); avoid in severe impairment or impairment associated with coagulopathy and clinically relevant bleeding risk.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 15 mL/minute—no information available. When used for *prophylaxis of venous thromboembolism following knee or hip replacement surgery, prophylaxis of recurrent deep-vein thrombosis or pulmonary embolism, and treatment of deep-vein thrombosis or pulmonary embolism*, use with caution if creatinine clearance 15–29 mL/minute.

Dose adjustments When used for *prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation*, reduce dose to 2.5 mg twice daily if serum-creatinine 133 micromol/litre and over is associated with age 80 years and over or body-weight less than 61 kg; reduce dose to 2.5 mg twice daily if creatinine clearance 15–29 mL/minute.

● MONITORING REQUIREMENTS

- ▶ Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.

- ▶ No routine anticoagulant monitoring required (INR tests are unreliable).

- **PRESCRIBING AND DISPENSING INFORMATION** Duration of treatment should be determined by balancing the benefit of treatment with the bleeding risk; shorter duration of treatment (at least 3 months) should be based on transient risk factors i.e recent surgery, trauma, immobilisation.

Apixaban should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolectomy.

- **PATIENT AND CARER ADVICE** Patients should be provided with an alert card and advised to keep it with them at all times.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Apixaban for the prevention of venous thromboembolism after total hip or knee replacement in adults (January 2012)**
NICE TA245
Apixaban (*Eliquis*®) is an option for the prevention of venous thromboembolism in adults after elective hip or knee replacement surgery.
www.nice.org.uk/guidance/ta245
- ▶ **Apixaban for preventing stroke and systemic embolism in people with non-valvular atrial fibrillation (February 2013)**
NICE TA275
Apixaban (*Eliquis*®) is an option for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation in accordance with its licensed indication; with one or more of the following risk factors:
 - previous stroke or transient ischaemic attack
 - symptomatic heart failure
 - age ≥75 years
 - diabetes mellitus
 - hypertension.
 The risks and benefits of apixaban compared to warfarin, dabigatran etexilate, and rivaroxaban should be discussed with the patient.
www.nice.org.uk/guidance/ta275
- ▶ **Apixaban for the treatment and secondary prevention of deep vein thrombosis and/or pulmonary embolism (June 2015)**
NICE TA341
Apixaban (*Eliquis*®) is an option for the treatment and prevention of recurrent deep vein thrombosis and pulmonary embolism in adults.
www.nice.org.uk/guidance/ta341

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Eliquis** (Bristol-Myers Squibb Pharmaceuticals Ltd)
Apixaban 2.5 mg Eliquis 2.5mg tablets | 10 tablet [PoM] £9.50 | 20 tablet [PoM] £19.00 | 60 tablet [PoM] £57.00 DT = £57.00
Apixaban 5 mg Eliquis 5mg tablets | 28 tablet [PoM] £26.60 | 56 tablet [PoM] £53.20 DT = £53.20

Edoxaban

11-Jul-2019

- **DRUG ACTION** Edoxaban is a direct and reversible inhibitor of activated factor X (factor Xa), which prevents conversion of prothrombin to thrombin and prolongs clotting time, thereby reducing the risk of thrombus formation.

● INDICATIONS AND DOSE

Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation, in patients with at least one risk factor (such as congestive heart failure, hypertension, aged 75 years and over, diabetes mellitus, previous stroke or transient ischaemic attack)

- ▶ BY MOUTH
- ▶ Adult (body-weight up to 61 kg): 30 mg once daily
- ▶ Adult (body-weight 61 kg and above): 60 mg once daily

Treatment of deep-vein thrombosis | Prophylaxis of recurrent deep-vein thrombosis | Treatment of pulmonary embolism | Prophylaxis of recurrent pulmonary embolism

- ▶ BY MOUTH
- ▶ Adult (body-weight up to 61 kg): 30 mg once daily, duration of treatment adjusted according to risk factors—consult product literature, treatment should follow initial use of parenteral anticoagulant for at least 5 days
- ▶ Adult (body-weight 61 kg and above): 60 mg once daily, duration of treatment adjusted according to risk

factors—consult product literature), treatment should follow initial use of parenteral anticoagulant for at least 5 days

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises max. dose of 30 mg once daily with concurrent ciclosporin, dronedarone, erythromycin, or ketoconazole.

DOSE EQUIVALENCE AND CONVERSION

- ▶ For information on changing from, or to, other anticoagulants, consult product literature.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIRECT-ACTING ORAL ANTICOAGULANTS (DOACS): INCREASED RISK OF RECURRENT THROMBOTIC EVENTS IN PATIENTS WITH ANTIPHOSPHOLIPID SYNDROME (JUNE 2019)

A clinical trial has shown an increased risk of recurrent thrombotic events associated with rivaroxaban compared with warfarin, in patients with antiphospholipid syndrome and a history of thrombosis. There may be a similar risk associated with other DOACs. Healthcare professionals are advised that DOACs are not recommended in patients with antiphospholipid syndrome, particularly high-risk patients who test positive for all three antiphospholipid tests—lupus anticoagulant, anticardiolipin antibodies, and anti-beta₂ glycoprotein I antibodies. Continued treatment should be reviewed in these patients to determine if appropriate, and switching to a vitamin K antagonist such as warfarin should be considered.

- **CONTRA-INDICATIONS** Active bleeding · antiphospholipid syndrome (increased risk of recurrent thrombotic events) · arteriovenous malformations · current or recent gastrointestinal ulceration · hepatic disease (associated with coagulopathy and clinically relevant bleeding risk) · known or suspected oesophageal varices · major intraspinal or intracerebral vascular abnormalities · presence of malignant neoplasms at high risk of bleeding · recent brain or spinal injury · recent brain, spinal or ophthalmic surgery · recent intracranial haemorrhage · uncontrolled severe hypertension · vascular aneurysms
- CONTRA-INDICATIONS, FURTHER INFORMATION**
- ▶ Risk for major bleeding · Edoxaban treatment is contraindicated in patients with significant risk factors for major bleeding, these include those listed above.
- **CAUTIONS** Moderate to severe mitral stenosis (safety and efficacy not established) · prosthetic heart valve (safety and efficacy not established) · risk of bleeding · surgery
- CAUTIONS, FURTHER INFORMATION**
- ▶ Surgery Manufacturer recommends to discontinue treatment at least 24 hours before a surgical procedure; the risk of bleeding should be weighed against the urgency of the intervention—consult product literature.
- ▶ Elderly For factor Xa inhibitors, prescription potentially inappropriate (STOPP criteria):
 - with concurrent significant bleeding risk, such as uncontrolled severe hypertension, bleeding diathesis or recent non-trivial spontaneous bleeding (high risk of bleeding)
 - for first deep venous thrombosis without continuing provoking risk factors (e.g. thrombophilia) for greater than 6 months (no proven added benefit)
 - for first pulmonary embolus without continuing provoking risk factors for greater than 12 months (no proven added benefit)
 - as part of dual therapy with an antiplatelet agent in patients with stable coronary, cerebrovascular or peripheral arterial disease, without a clear indication for anticoagulant therapy (no added benefit)
 - if eGFR less than 15 ml/min/1.73 m² (risk of bleeding)
 See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: edoxaban
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · haemorrhage · nausea · skin reactions
 - ▶ **Uncommon** CNS haemorrhage
- **SIDE-EFFECTS, FURTHER INFORMATION** Should a bleeding complication arise in a patient receiving edoxaban, the manufacturer recommends to delay the next dose or treatment should be discontinued as appropriate.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment, or if liver transaminases greater than 2 times the upper limit of normal, or total bilirubin 1.5 times the upper limit of normal or greater; avoid in severe impairment or hepatic disease associated with coagulopathy and clinically relevant bleeding risk.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 15 mL/minute.
 - **Dose adjustments** Manufacturer advises use a dose of 30 mg once daily if creatinine clearance 15–50 mL/minute.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor renal function before treatment and when clinically indicated during treatment; monitor hepatic function before treatment and repeat periodically if treatment duration longer than 1 year.
 - ▶ Manufacturer advises monitor for signs of mucosal bleeding and anaemia in patients at increased risk; treatment should be stopped if severe bleeding occurs.
 - ▶ No routine anticoagulant monitoring required (INR tests are unreliable).
- **PATIENT AND CARER ADVICE** Patients should be provided with an alert card and advised to keep it with them at all times.
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - **NICE decisions**
 - ▶ Edoxaban for treating and preventing deep vein thrombosis and pulmonary embolism (August 2015) NICE TA354 Edoxaban (*Lixiana*®) is recommended as an option for treating and preventing recurrent deep vein thrombosis and pulmonary embolism. www.nice.org.uk/guidance/ta354
 - ▶ Edoxaban for preventing stroke and systemic embolism in people with non-valvular atrial fibrillation (September 2015) NICE TA355 Edoxaban (*Lixiana*®) is an option for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation, with one or more of the following risk factors:
 - previous stroke or transient ischaemic attack
 - congestive heart failure
 - age ≥ 75 years
 - diabetes mellitus

Fondaparinux sodium

21-May-2018

- **DRUG ACTION** Fondaparinux sodium is a synthetic pentasaccharide that inhibits activated factor X.

● **INDICATIONS AND DOSE****Prophylaxis of venous thromboembolism in patients after undergoing major orthopaedic surgery of the hip or leg, or abdominal surgery**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** Initially 2.5 mg, dose to be given 6 hours after surgery, then 2.5 mg once daily

Prophylaxis of venous thromboembolism in medical patients immobilised because of acute illness

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** 2.5 mg once daily

Treatment of superficial-vein thrombosis

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult (body-weight 50 kg and above):** 2.5 mg once daily for at least 30 days (max. 45 days if high risk of thromboembolic complications), treatment should be stopped 24 hours before surgery and restarted at least 6 hours post operatively

Treatment of unstable angina and non-ST-segment elevation myocardial infarction

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner), treatment should be stopped 24 hours before coronary artery bypass graft surgery (where possible) and restarted 48 hours post operatively

Treatment of ST-segment elevation myocardial infarction

- ▶ INITIALLY BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ **Adult:** Initially 2.5 mg daily for the first day, then (by subcutaneous injection) 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner), treatment should be stopped 24 hours before coronary artery bypass graft surgery (where possible) and restarted 48 hours post operatively

Treatment of deep-vein thrombosis and pulmonary embolism

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult (body-weight up to 50 kg):** 5 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR ≥ 2 for at least 24 hours)
- ▶ **Adult (body-weight 50–100 kg):** 7.5 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR ≥ 2 for at least 24 hours)
- ▶ **Adult (body-weight 101 kg and above):** 10 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR ≥ 2 for at least 24 hours)

- **CONTRA-INDICATIONS** Active bleeding · bacterial endocarditis
- **CAUTIONS** Active gastro-intestinal ulcer disease · bleeding disorders · brain surgery · elderly patients · low body-weight · ophthalmic surgery · recent intracranial haemorrhage · risk of catheter thrombus during percutaneous coronary intervention · spinal or epidural anaesthesia (risk of spinal haematoma—avoid if using treatment doses) · spinal surgery
- **INTERACTIONS** → Appendix 1: fondaparinux
- **SIDE-EFFECTS**
- ▶ **Common or very common** Anaemia · haemorrhage

- ▶ **Uncommon** Chest pain · coagulation disorder · dyspnoea · fever · hepatic function abnormal · nausea · oedema · platelet abnormalities · skin reactions · thrombocytopenia · vomiting · wound secretion
- ▶ **Rare or very rare** Anxiety · confusion · constipation · cough · diarrhoea · dizziness · drowsiness · fatigue · gastritis · gastrointestinal discomfort · genital oedema · headache · hyperbilirubinaemia · hypersensitivity · hypokalaemia · hypotension · leg pain · post procedural infection · syncope · vasodilation · vertigo
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs possible risk—no information available.
- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT**
 - ▶ When used for Venous thromboembolism, unstable angina, non-ST-segment elevation myocardial infarction and ST-segment elevation myocardial infarction Manufacturer advises caution in severe impairment (increased risk of bleeding complications).
 - ▶ When used for Superficial-vein thrombosis Manufacturer advises avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT** Increased risk of bleeding in renal impairment.
 - ▶ When used for treatment of acute coronary syndromes or prophylaxis of venous thromboembolism and treatment of superficial-vein thrombosis Avoid if eGFR less than 20 mL/minute/1.73 m².
 - ▶ When used for treatment of venous thromboembolism Use with caution if eGFR 30–50 mL/minute/1.73 m², avoid if eGFR less than 30 mL/minute/1.73 m².
- **Dose adjustments**
 - ▶ When used for prophylaxis of venous thromboembolism and treatment of superficial-vein thrombosis Reduce dose to 1.5 mg daily if eGFR 20–50 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Arixtra[®]), give intermittently in Sodium chloride 0.9%. For ST-segment elevation myocardial infarction, add requisite dose to 25–50 mL infusion fluid and give over 1–2 minutes.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Fondaparinux sodium (Non-proprietary)

Fondaparinux sodium 5 mg per 1 ml Fondaparinux sodium 2.5mg/0.5ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £62.79 DT = £62.79

Fondaparinux sodium 12.5 mg per 1 ml Fondaparinux sodium 5mg/0.4ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £110.70 DT = £116.53

Fondaparinux sodium 10mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £110.70 DT = £116.53

Fondaparinux sodium 7.5mg/0.6ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £110.70 DT = £116.53

▶ Arixtra (Aspen Pharma Trading Ltd)

Fondaparinux sodium 5 mg per 1 ml Arixtra 2.5mg/0.5ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £62.79 DT = £62.79 (Hospital only)

Arixtra 1.5mg/0.3ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £62.79 DT = £62.79 (Hospital only)

Fondaparinux sodium 12.5 mg per 1 ml Arixtra 7.5mg/0.6ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £116.53 DT = £116.53 (Hospital only)

Arixtra 5mg/0.4ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £116.53 DT = £116.53 (Hospital only)

Arixtra 10mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £116.53 DT = £116.53 (Hospital only)

Rivaroxaban

05-Nov-2019

- **DRUG ACTION** Rivaroxaban is a direct inhibitor of activated factor X (factor Xa).

● INDICATIONS AND DOSE

Prophylaxis of venous thromboembolism following knee replacement surgery

- ▶ BY MOUTH
- ▶ Adult: 10 mg once daily for 2 weeks, to be started 6–10 hours after surgery

Prophylaxis of venous thromboembolism following hip replacement surgery

- ▶ BY MOUTH
- ▶ Adult: 10 mg once daily for 5 weeks, to be started 6–10 hours after surgery

Treatment of deep-vein thrombosis | Treatment of pulmonary embolism

- ▶ BY MOUTH
- ▶ Adult: Initially 15 mg twice daily for 21 days, then maintenance 20 mg once daily, to be taken with food, for duration of treatment, consult product literature

Prophylaxis of recurrent deep-vein thrombosis |

Prophylaxis of recurrent pulmonary embolism

- ▶ BY MOUTH
- ▶ Adult: 10 mg once daily, following completion of at least 6 months of anticoagulant treatment, to be taken with food, consider 20 mg once daily in those at high risk of recurrence (such as complicated comorbidities, or previous recurrence with rivaroxaban 10 mg once daily)

Prophylaxis of stroke and systemic embolism in patients with non-valvular atrial fibrillation and with at least one of the following risk factors: congestive heart failure, hypertension, previous stroke or transient ischaemic attack, age ≥ 75 years, or diabetes mellitus

- ▶ BY MOUTH
- ▶ Adult: 20 mg once daily, to be taken with food

Prophylaxis of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers (in combination with aspirin alone or aspirin and clopidogrel)

- ▶ BY MOUTH
- ▶ Adult: 2.5 mg twice daily usual duration 12 months

Prophylaxis of atherothrombotic events in patients with coronary artery disease or symptomatic peripheral artery disease at high risk of ischaemic events (in combination with aspirin)

- ▶ BY MOUTH
- ▶ Adult: 2.5 mg twice daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ For information on changing from, or to, other anticoagulants—consult product literature.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIRECT-ACTING ORAL ANTICOAGULANTS (DOACs): INCREASED RISK OF RECURRENT THROMBOTIC EVENTS IN PATIENTS WITH ANTIPHOSPHOLIPID SYNDROME (JUNE 2019)

A clinical trial has shown an increased risk of recurrent thrombotic events associated with rivaroxaban compared with warfarin, in patients with antiphospholipid syndrome and a history of thrombosis. There may be a similar risk associated with other DOACs. Healthcare professionals are advised that DOACs are not recommended in patients with antiphospholipid syndrome, particularly high-risk patients who test positive for all three antiphospholipid tests—lupus anticoagulant, anticardiolipin antibodies, and anti-beta₂ glycoprotein I antibodies. Continued treatment should be reviewed in these patients to determine if appropriate,

and switching to a vitamin K antagonist such as warfarin should be considered.

MHRA/CHM ADVICE: RIVAROXABAN (XARELTO®): REMINDER THAT 15 MG AND 20 MG TABLETS SHOULD BE TAKEN WITH FOOD (JULY 2019)

The MHRA has received a small number of reports suggesting a lack of efficacy (thromboembolic events) in patients taking 15 mg or 20 mg rivaroxaban tablets on an empty stomach. Healthcare professionals are advised to remind patients to take rivaroxaban 15 mg or 20 mg tablets with food. In those who have difficulty swallowing, these tablets can be crushed and mixed with water or apple puree immediately before, and followed by food immediately after, ingestion.

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS

Active bleeding · antiphospholipid syndrome (increased risk of recurrent thrombotic events) · malignant neoplasms at high risk of bleeding · oesophageal varices · recent brain surgery · recent gastro-intestinal ulcer · recent intracranial haemorrhage · recent ophthalmic surgery · recent spine surgery · significant risk of major bleeding · vascular aneurysm

SPECIFIC CONTRA-INDICATIONS

- ▶ When used for prophylaxis of atherothrombotic events following an acute coronary syndrome Previous stroke · transient ischaemic attack
- ▶ When used for prophylaxis of atherothrombotic events in patients with coronary artery disease or symptomatic peripheral artery disease Previous stroke (no information available—consult product literature)

● CAUTIONS

GENERAL CAUTIONS Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—monitor neurological signs and wait at least 18 hours after rivaroxaban dose before removing catheter and do not give next dose until at least 6 hours after catheter removal) · bronchiectasis · elderly · prosthetic heart valve (efficacy not established) · risk of bleeding · rivaroxaban should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolectomy · severe hypertension · vascular retinopathy

SPECIFIC CAUTIONS

- ▶ When used for prophylaxis of atherothrombotic events following an acute coronary syndrome Body-weight less than 60 kg
- ▶ When used for prophylaxis of atherothrombotic events in patients with coronary artery disease or symptomatic peripheral artery disease Body-weight less than 60 kg

CAUTIONS, FURTHER INFORMATION

- ▶ Elderly For factor Xa inhibitors, prescription potentially inappropriate (STOPP criteria):
 - with concurrent significant bleeding risk, such as uncontrolled severe hypertension, bleeding diathesis or recent non-trivial spontaneous bleeding (high risk of bleeding)
 - for first deep venous thrombosis without continuing provoking risk factors (e.g. thrombophilia) for greater than 6 months (no proven added benefit)
 - for first pulmonary embolus without continuing provoking risk factors for greater than 12 months (no proven added benefit)
 - as part of dual therapy with an antiplatelet agent in patients with stable coronary, cerebrovascular or peripheral arterial disease, without a clear indication for anticoagulant therapy (no added benefit)
 - if eGFR less than 15 mL/min/1.73 m² (risk of bleeding) See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: rivaroxaban

● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · asthenia · constipation · diarrhoea · dizziness · fever · gastrointestinal discomfort · haemorrhage · headache · hypotension · menorrhagia · nausea · oedema · pain in extremity · post procedural anaemia · renal impairment · skin reactions · vomiting · wound complications
- ▶ **Uncommon** Angioedema · dry mouth · hepatic disorders · hypersensitivity · intracranial haemorrhage · malaise · syncope · tachycardia · thrombocytopenia · thrombocytosis
- ▶ **Rare or very rare** Severe cutaneous adverse reactions (SCARs) · vascular pseudoaneurysm
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in hepatic disease with coagulopathy and clinically-relevant bleeding risk including patients with moderate to severe cirrhosis.
- **RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance 15–29 mL/minute; avoid if creatinine clearance less than 15 mL/minute. Use with caution if concomitant use of drugs that increase plasma-rivaroxaban concentration (consult product literature).
Dose adjustments
 - ▶ When used for Treatment of deep-vein thrombosis or pulmonary embolism Following the first 21 days of treatment for deep-vein thrombosis or pulmonary embolism, the usual dose of 20 mg once daily can be given, but manufacturer advises consider reducing to 15 mg once daily if creatinine clearance 15–49 mL/minute and the risk of bleeding outweighs the risk of recurrent deep-vein thrombosis or pulmonary embolism.
 - ▶ When used for Prophylaxis of recurrent deep-vein thrombosis or pulmonary embolism When the recommended dose is 20 mg once daily, manufacturer advises consider reducing to 15 mg once daily if creatinine clearance 15–49 mL/minute and the risk of bleeding outweighs the risk of recurrent deep-vein thrombosis or pulmonary embolism.
 - ▶ When used for Prophylaxis of stroke and systemic embolism in patients with non-valvular atrial fibrillation Manufacturer advises reduce dose to 15 mg once daily if creatinine clearance 15–49 mL/minute.
- **MONITORING REQUIREMENTS**
 - ▶ Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
 - ▶ No routine anticoagulant monitoring required (INR tests are unreliable).
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed and mixed with water or apple puree just before administration.
- **PRESCRIBING AND DISPENSING INFORMATION** Low-dose rivaroxaban, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers. Treatment should be started as soon as possible after the patient has been stabilised following the acute coronary event, at the earliest 24 hours after admission to hospital, and at the time when parenteral anticoagulation therapy would normally be discontinued; the usual duration of treatment is 12 months.
- **PATIENT AND CARER ADVICE** Patients should be provided with an alert card and advised to keep it with them at all times.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Rivaroxaban for the prevention of venous thromboembolism after total hip or total knee replacement in adults (April 2009)** NICE TA170

Rivaroxaban (*Xarelto*[®]) is an option for the prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery.

www.nice.org.uk/guidance/ta170

- ▶ **Rivaroxaban for the prevention of stroke and systemic embolism in people with atrial fibrillation (May 2012)** NICE TA256

Rivaroxaban (*Xarelto*[®]) is an option for the prevention of stroke and systemic embolism (in accordance with its licensed indication) in patients with non-valvular atrial fibrillation and with at least one of the following risk factors:

- previous stroke or transient ischaemic attack
- congestive heart failure
- age ≥ 75 years
- diabetes mellitus
- hypertension

The risks and benefits of rivaroxaban compared with warfarin should be discussed with the patient.

www.nice.org.uk/guidance/ta256

- ▶ **Rivaroxaban for the treatment of deep-vein thrombosis and prevention of recurrent deep-vein thrombosis and pulmonary embolism (July 2012)** NICE TA261

Rivaroxaban (*Xarelto*[®]) is an option for the treatment of deep-vein thrombosis and prevention of recurrent deep-vein thrombosis and pulmonary embolism in adults after diagnosis of acute deep-vein thrombosis.

www.nice.org.uk/guidance/ta261

- ▶ **Rivaroxaban for treating pulmonary embolism and preventing recurrent venous thromboembolism (June 2013)** NICE TA287
- Rivaroxaban (*Xarelto*[®]) is an option for treating pulmonary embolism and preventing recurrent deep-vein thrombosis and pulmonary embolism in adults.

www.nice.org.uk/guidance/ta287

- ▶ **Rivaroxaban for preventing adverse outcomes after acute management of acute coronary syndrome (March 2015)** NICE TA335

Rivaroxaban (*Xarelto*[®]) is an option within its marketing authorisation, in combination with aspirin plus clopidogrel or aspirin alone, for preventing atherothrombotic events in patients who have had an acute coronary syndrome with elevated cardiac biomarkers.

The patient's risk of bleeding should be carefully assessed before treatment is initiated and the risks and benefits of rivaroxaban in combination with aspirin plus clopidogrel or with aspirin alone, compared with aspirin plus clopidogrel or aspirin alone should be discussed with the patient.

A decision on continuation of treatment should be taken no later than 12 months after starting treatment.

www.nice.org.uk/guidance/ta335

- ▶ **Rivaroxaban for preventing atherothrombotic events in people with coronary or peripheral artery disease (October 2019)** NICE TA607

Rivaroxaban (*Xarelto*[®]) plus aspirin is recommended within its marketing authorisation, as an option for preventing atherothrombotic events in adults with coronary artery disease or symptomatic peripheral artery disease who are at high risk of ischaemic events.

www.nice.org.uk/guidance/ta607

Scottish Medicines Consortium (SMC) decisions

SMC No. 519/08

The *Scottish Medicines Consortium* has advised (December 2008) that rivaroxaban (*Xarelto*[®]) is accepted for use within NHS Scotland for the prevention of venous

thromboembolism in adults undergoing elective hip or knee replacement surgery.

SMC No. 756/12

The *Scottish Medicines Consortium* has advised (February 2012) that rivaroxaban (*Xarelto*[®]) is accepted for restricted use within NHS Scotland for the prevention of stroke and systemic embolism in adults with non-valvular atrial fibrillation with one or more risk factors, such as congestive heart failure, hypertension, age ≥ 75 years, diabetes mellitus, prior stroke or transient ischaemic attack. Its use is restricted to patients with poor INR control despite compliance with coumarin anticoagulant therapy, or to patients who are allergic to, or unable to tolerate, a coumarin anticoagulant.

SMC No. 755/12

The *Scottish Medicines Consortium* has advised (February 2012) that rivaroxaban (*Xarelto*[®]) is accepted for use within NHS Scotland for the treatment of deep-vein thrombosis (DVT), and prevention of recurrent DVT and pulmonary embolism following an acute DVT in adults.

SMC No. 852/13

The *Scottish Medicines Consortium* has advised (March 2013) that rivaroxaban (*Xarelto*[®]) is accepted for use within NHS Scotland for the treatment of pulmonary embolism (PE), and prevention of recurrent deep-vein thrombosis and PE in adults.

SMC No. SMC2128

The *Scottish Medicines Consortium* has advised (February 2019) that rivaroxaban (*Xarelto*[®]) is accepted for restricted use within NHS Scotland in combination with acetylsalicylic acid for the prevention of atherothrombotic events in adults with stable coronary artery disease that does not require dual antiplatelet therapy.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

ANTITHROMBOTIC DRUGS > HEPARINOIDS

Danaparoid sodium

21-Jun-2019

● INDICATIONS AND DOSE

Prevention of deep-vein thrombosis in general or orthopaedic surgery

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 750 units twice daily for 7–10 days, initiate treatment before operation, with last pre-operative dose 1–4 hours before surgery

Thromboembolic disease in patients with history of heparin-induced thrombocytopenia

- ▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult (body-weight up to 55 kg): Initially 1250 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days
- ▶ Adult (body-weight 55–89 kg): Initially 2500 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days

continued →

▶ **Adult** (body-weight 90 kg and above): Initially 3750 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days

● **CONTRA-INDICATIONS** Active peptic ulcer (unless this is the reason for operation) · acute bacterial endocarditis · diabetic retinopathy · epidural anaesthesia (with treatment doses) · haemophilia and other haemorrhagic disorders · recent cerebral haemorrhage · severe uncontrolled hypertension · spinal anaesthesia (with treatment doses) · thrombocytopenia (unless patient has heparin-induced thrombocytopenia)

● **CAUTIONS** Antibodies to heparins (risk of antibody-induced thrombocytopenia) · body-weight over 90 kg · recent bleeding · risk of bleeding

● **INTERACTIONS** → Appendix 1: danaparoid

● **SIDE-EFFECTS**

▶ **Common or very common** Haemorrhage · heparin-induced thrombocytopenia · skin reactions · thrombocytopenia

▶ **Uncommon** Post procedural haematoma

▶ **Rare or very rare** Anastomotic haemorrhage

● **PREGNANCY** Manufacturer advises avoid—limited information available but not known to be harmful.

● **BREAST FEEDING** Amount probably too small to be harmful but manufacturer advises avoid.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment with impaired haemostasis—increased risk of bleeding; avoid in severe hepatic failure unless patient has heparin-induced thrombocytopenia and no alternative available.

● **RENAL IMPAIRMENT** Use with caution in moderate impairment. Avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available.

Monitoring Increased risk of bleeding in renal impairment, monitor anti-Factor Xa activity.

● **MONITORING REQUIREMENTS** Monitor anti factor Xa activity in patients with body-weight over 90 kg.

● **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, give continuously in Glucose 5% or Sodium chloride 0.9%.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Danaparoid sodium (Non-proprietary)**

Danaparoid sodium 1250 unit per 1 ml Danaparoid sodium 750units/0.6ml solution for injection ampoules | 10 ampoule **POM** £599.99 | 10 ampoule **POM** £599.99 (Hospital only)

ANTITHROMBOTIC DRUGS > HEPARINS

Heparins

● **CONTRA-INDICATIONS** Acute bacterial endocarditis · after major trauma · Avoid injections containing benzyl alcohol in neonates · epidural anaesthesia with treatment doses · haemophilia or other haemorrhagic disorders · peptic ulcer · recent cerebral haemorrhage · recent surgery to eye · recent surgery to nervous system · spinal anaesthesia with treatment doses · thrombocytopenia (including history of heparin-induced thrombocytopenia)

● **CAUTIONS** Elderly · severe hypertension

● **SIDE-EFFECTS**

▶ **Common or very common** Haemorrhage · heparin-induced thrombocytopenia · skin reactions · thrombocytopenia · thrombocytosis

▶ **Uncommon** CNS haemorrhage

▶ **Rare or very rare** Alopecia · hyperkalaemia · osteoporosis (following long term use) · priapism

▶ **Frequency not known** Hypoadosteronism

SIDE-EFFECTS, FURTHER INFORMATION Haemorrhage If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

Heparin-induced thrombocytopenia Clinically important heparin-induced thrombocytopenia is immune-mediated and can be complicated by thrombosis. Signs of heparin-induced thrombocytopenia include a 30% reduction of platelet count, thrombosis, or skin allergy. If heparin-induced thrombocytopenia is strongly suspected or confirmed, the heparin should be stopped and an alternative anticoagulant, such as danaparoid, should be given. Ensure platelet counts return to normal range in those who require warfarin.

Hyperkalaemia Inhibition of aldosterone secretion by unfractionated or low molecular weight heparin can result in hyperkalaemia; patients with diabetes mellitus, chronic renal failure, acidosis, raised plasma potassium or those taking potassium-sparing drugs seem to be more susceptible. The risk appears to increase with duration of therapy.

● **ALLERGY AND CROSS-SENSITIVITY** Hypersensitivity to unfractionated or low molecular weight heparin.

● **MONITORING REQUIREMENTS**

▶ Heparin-induced thrombocytopenia Platelet counts should be measured just before treatment with unfractionated or low molecular weight heparin, and regular monitoring of platelet counts may be required if given for longer than 4 days. See the British Society for Haematology's Guidelines on the diagnosis and management of heparin-induced thrombocytopenia: second edition. *Br J Haematol* 2012; **159**: 528–540.

▶ Hyperkalaemia Plasma-potassium concentration should be measured in patients at risk of hyperkalaemia before starting the heparin and monitored regularly thereafter, particularly if treatment is to be continued for longer than 7 days.

F above

Dalteparin sodium

08-Feb-2019

● **INDICATIONS AND DOSE**

FRAGMIN®

Treatment of deep-vein thrombosis | Treatment of pulmonary embolism

▶ BY SUBCUTANEOUS INJECTION

▶ **Adult:** 200 units/kg daily (max. per dose 18 000 units) until adequate oral anticoagulation with vitamin K antagonist established (at least 5 days of combined treatment is usually required)

Treatment of deep-vein thrombosis (in patients at increased risk of haemorrhage) | Treatment of pulmonary embolism (in patients at increase risk of haemorrhage)

▶ BY SUBCUTANEOUS INJECTION

▶ **Adult:** 100 units/kg twice daily until adequate oral anticoagulation with vitamin K antagonist established (at least 5 days of combined treatment is usually required)

Unstable coronary artery disease

▶ BY SUBCUTANEOUS INJECTION

▶ **Adult:** 120 units/kg every 12 hours (max. per dose 10 000 units twice daily) for 5–8 days

Prevention of clotting in extracorporeal circuits

- ▶ TO THE DEVICE AS A FLUSH
- ▶ Adult: (consult product literature)

FRAGMIN® GRADUATED SYRINGES**Unstable coronary artery disease (including non-ST-segment-elevation myocardial infarction)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 120 units/kg every 12 hours (max. per dose 10 000 units twice daily) for up to 8 days

Patients with unstable coronary artery disease (including non-ST-segment-elevation myocardial infarction) awaiting angiography or revascularisation and having already had 8 days treatment with dalteparin

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (body-weight up to 70 kg and male): 5000 units every 12 hours until the day of the procedure (max. 45 days).
- ▶ Adult (body-weight up to 80 kg and female): 5000 units every 12 hours until the day of the procedure (max. 45 days).
- ▶ Adult (body-weight 70 kg and above and male): 7500 units every 12 hours until the day of the procedure (max. 45 days).
- ▶ Adult (body-weight 80 kg and above and female): 7500 units every 12 hours until the day of the procedure (max. 45 days).

FRAGMIN® SINGLE-DOSE SYRINGES**Prophylaxis of deep-vein thrombosis in surgical patients—moderate risk**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 2500 units for 1 dose, dose to be given 1–2 hours before surgery, then 2500 units every 24 hours

Prophylaxis of deep-vein thrombosis in surgical patients—high risk

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 2500 units for 1 dose, dose to be administered 1–2 hours before surgery, followed by 2500 units after 8–12 hours, then 5000 units every 24 hours, alternatively initially 5000 units for 1 dose, dose to be given on the evening before surgery, followed by 5000 units after 24 hours, then 5000 units every 24 hours

Prophylaxis of deep-vein thrombosis in medical patients

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 5000 units every 24 hours

Treatment of deep-vein thrombosis | Treatment of pulmonary embolism

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (body-weight up to 46 kg): 7500 units once daily until adequate oral anticoagulation with vitamin K antagonist established (at least 5 days of combined treatment is usually required)
- ▶ Adult (body-weight 46–56 kg): 10 000 units once daily until adequate oral anticoagulation with vitamin K antagonist established (at least 5 days of combined treatment is usually required)
- ▶ Adult (body-weight 57–68 kg): 12 500 units once daily until adequate oral anticoagulation with vitamin K antagonist established (at least 5 days of combined treatment is usually required)
- ▶ Adult (body-weight 69–82 kg): 15 000 units once daily until adequate oral anticoagulation with vitamin K antagonist established (at least 5 days of combined treatment is usually required)
- ▶ Adult (body-weight 83 kg and above): 18 000 units once daily until adequate oral anticoagulation with vitamin K antagonist established (at least 5 days of combined treatment is usually required)

Extended treatment of venous thromboembolism and prevention of recurrence in patients with solid tumours

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (body-weight 40–45 kg): 7500 units once daily for 30 days, then 7500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- ▶ Adult (body-weight 46–56 kg): 10 000 units once daily for 30 days, then 7500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- ▶ Adult (body-weight 57–68 kg): 12 500 units once daily for 30 days, then 10 000 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- ▶ Adult (body-weight 69–82 kg): 15 000 units once daily for 30 days, then 12 500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- ▶ Adult (body-weight 83–98 kg): 18 000 units once daily for 30 days, then 15 000 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- ▶ Adult (body-weight 99 kg and above): 18 000 units once daily for 30 days, then 18 000 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature

Treatment of venous thromboembolism in pregnancy

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (body-weight up to 50 kg): 5000 units twice daily, use body-weight in early pregnancy to calculate the dose
- ▶ Adult (body-weight 50–69 kg): 6000 units twice daily, use body-weight in early pregnancy to calculate the dose
- ▶ Adult (body-weight 70–89 kg): 8000 units twice daily, use body-weight in early pregnancy to calculate the dose
- ▶ Adult (body-weight 90 kg and above): 10 000 units twice daily, use body-weight in early pregnancy to calculate the dose

- **UNLICENSED USE** Not licensed for treatment of venous thromboembolism in pregnancy.
- **INTERACTIONS** → Appendix 1: low molecular-weight heparins
- **SIDE-EFFECTS** Epidural haematoma · prosthetic cardiac valve thrombosis
- **PREGNANCY** Not known to be harmful, low molecular weight heparins do not cross the placenta. Multidose vial contains benzyl alcohol—manufacturer advises avoid.
- **BREAST FEEDING** Due to the relatively high molecular weight and inactivation in the gastro-intestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible, however manufacturers advise avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (increased risk of bleeding complications).
- **Dose adjustments** Manufacturer advises consider dose reduction in severe impairment.
- **RENAL IMPAIRMENT** Use of unfractionated heparin may be preferable.
- **Dose adjustments** Risk of bleeding may be increased—dose reduction may be required.

● MONITORING REQUIREMENTS

- ▶ For monitoring during treatment of deep-vein thrombosis and of pulmonary embolism, blood should be taken 3–4 hours after a dose (recommended plasma concentration of anti-Factor Xa 0.5–1 unit/mL); monitoring not required for once-daily treatment regimen and not generally necessary for twice-daily regimen.
- ▶ Routine monitoring of anti-Factor Xa activity is not usually required during treatment with dalteparin, but may be necessary in patients at increased risk of bleeding (e.g. in renal impairment and those who are underweight or overweight).

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 683/11

The *Scottish Medicines Consortium* has advised (March 2011) that dalteparin (*Fragmin*®) is accepted for restricted use within NHS Scotland as extended treatment of symptomatic venous thromboembolism (VTE) and prevention of its recurrence in patients with solid tumours, if initiated by healthcare professionals experienced in the treatment of VTE.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

- ▶ **Fragmin** (Pfizer Ltd)

Dalteparin sodium 10000 unit per 1 ml Fragmin 10,000units/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £28.23 DT = £28.23

Fragmin 10,000units/1ml solution for injection ampoules | 10 ampoule [PoM] £51.22 DT = £51.22

Dalteparin sodium 12500 unit per 1 ml Fragmin 2,500units/0.2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £18.58 DT = £18.58

Dalteparin sodium 25000 unit per 1 ml Fragmin 18,000units/0.72ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £50.82 DT = £50.82

Fragmin 15,000units/0.6ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £42.34 DT = £42.34

Fragmin 5,000units/0.2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £28.23 DT = £28.23

Fragmin 12,500units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £35.29 DT = £35.29

Fragmin 7,500units/0.3ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £42.34 DT = £42.34

Fragmin 100,000units/4ml solution for injection vials | 1 vial [PoM] £48.66 DT = £48.66

Fragmin 10,000units/0.4ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £28.23 DT = £28.23

140

Enoxaparin sodium

25-Oct-2019

● INDICATIONS AND DOSE

Treatment of venous thromboembolism in pregnancy

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (body-weight up to 50 kg): 40 mg twice daily, dose based on early pregnancy body-weight
- ▶ Adult (body-weight 50–69 kg): 60 mg twice daily, dose based on early pregnancy body-weight
- ▶ Adult (body-weight 70–89 kg): 80 mg twice daily, dose based on early pregnancy body-weight
- ▶ Adult (body-weight 90 kg and above): 100 mg twice daily, dose based on early pregnancy body-weight

Prophylaxis of deep-vein thrombosis, especially in surgical patients—moderate risk

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 20 mg for 1 dose, dose to be given approximately 2 hours before surgery, then 20 mg every 24 hours

Prophylaxis of deep-vein thrombosis, especially surgical patients—high risk (e.g. orthopaedic surgery)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 40 mg for 1 dose, dose to be given 12 hours before surgery, then 40 mg every 24 hours

Prophylaxis of deep-vein thrombosis in medical patients

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 40 mg every 24 hours

Treatment of deep-vein thrombosis in uncomplicated patients with low risk of recurrence | Treatment of pulmonary embolism in uncomplicated patients with low risk of recurrence

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 1.5 mg/kg every 24 hours until adequate oral anticoagulation established

Treatment of deep-vein thrombosis in patients with risk factors such as obesity, cancer, recurrent VTE, or proximal thrombosis | Treatment of pulmonary embolism in patients with risk factors such as obesity, symptomatic pulmonary embolism, cancer, or recurrent VTE

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 1 mg/kg every 12 hours until adequate oral anticoagulation established

Treatment of acute ST-segment elevation myocardial infarction (patients not undergoing percutaneous coronary intervention)

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult 18–74 years: Initially 30 mg, followed by (by subcutaneous injection) 1 mg/kg for 1 dose, then (by subcutaneous injection) 1 mg/kg every 12 hours (max. per dose 100 mg) for up to 8 days, maximum dose applies for the first two subcutaneous doses only
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult 75 years and over: 750 micrograms/kg every 12 hours (max. per dose 75 mg), maximum dose applies for the first two doses only

Treatment of acute ST-segment elevation myocardial infarction (patients undergoing percutaneous coronary intervention)

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult 18–74 years: Initially 30 mg, followed by (by subcutaneous injection) 1 mg/kg for 1 dose, then (by subcutaneous injection) 1 mg/kg every 12 hours (max. per dose 100 mg) for up to 8 days, maximum dose applies for the first two subcutaneous doses only, then (by intravenous injection) 300 micrograms/kg for 1 dose, dose to be given at the time of procedure if the last subcutaneous dose was given more than 8 hours previously
- ▶ INITIALLY BY SUBCUTANEOUS INJECTION
- ▶ Adult 75 years and over: 750 micrograms/kg every 12 hours (max. per dose 75 mg), maximum dose applies for the first two doses only, then (by intravenous injection) 300 micrograms/kg for 1 dose, dose to be given at the time of procedure if the last subcutaneous dose was given more than 8 hours previously

Unstable angina | Non-ST-segment-elevation myocardial infarction

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 1 mg/kg every 12 hours usually for 2–8 days (minimum 2 days)

Prevention of clotting in extracorporeal circuits

- ▶ TO THE DEVICE AS A FLUSH
- ▶ Adult: (consult product literature)

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 mg equivalent to 100 units.

- **UNLICENSED USE** Not licensed for treatment of venous thromboembolism in pregnancy.

- **CAUTIONS** Low body-weight (increased risk of bleeding)
- **INTERACTIONS** → Appendix 1: low molecular-weight heparins
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Haemorrhagic anaemia · headache · hypersensitivity
 - ▶ **Uncommon** Hepatic disorders · injection site necrosis
 - ▶ **Rare or very rare** Cutaneous vasculitis · eosinophilia
- **PREGNANCY** Not known to be harmful, low molecular weight heparins do not cross the placenta. Multidose vial contains benzyl alcohol—avoid.
- **BREAST FEEDING** Manufacturer advises suitable for use during breast feeding—passage into breast milk and absorption by the nursing infant considered to be negligible due to the relatively high molecular weight of enoxaparin and inactivation in the gastro-intestinal tract.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** Risk of bleeding increased; use of unfractionated heparin may be preferable. Manufacturer advises avoid if creatinine clearance less than 15 mL/minute.

Dose adjustments Manufacturer advises reduce dose if creatinine clearance 15–30 mL/minute—consult product literature for details.
- **MONITORING REQUIREMENTS** Routine monitoring of anti-Factor Xa activity is not usually required during treatment with enoxaparin, but may be necessary in patients at increased risk of bleeding (e.g. in renal impairment and those who are underweight or overweight).
- **DIRECTIONS FOR ADMINISTRATION** When administered in conjunction with a thrombolytic, enoxaparin should be given between 15 minutes before and 30 minutes after the start of thrombolytic therapy.
- **PRESCRIBING AND DISPENSING INFORMATION** Enoxaparin sodium is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

▶ Arovi (ROVI Biotech Ltd) ▼

Enoxaparin sodium 100 mg per 1 ml Arovi 20mg/0.2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £15.65 DT = £20.86

Inhixa 150mg/1ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £99.91 DT = £99.91

F 140

05-May-2017

Heparin (unfractionated)

● INDICATIONS AND DOSE

Treatment of mild to moderate pulmonary embolism |

Treatment of unstable angina | Treatment of acute peripheral arterial occlusion

▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ **Adult:** Loading dose 5000 units, alternatively (by intravenous injection) loading dose 75 units/kg, followed by (by continuous intravenous infusion) 18 units/kg/hour, laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly

Treatment of severe pulmonary embolism

▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ **Adult:** Loading dose 10 000 units, followed by (by continuous intravenous infusion) 18 units/kg/hour, laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly

Treatment of deep-vein thrombosis

▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ **Adult:** Loading dose 5000 units, alternatively (by intravenous injection) loading dose 75 units/kg, followed by (by continuous intravenous infusion) 18 units/kg/hour, alternatively (by subcutaneous injection) 15 000 units every 12 hours, laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly

Thromboprophylaxis in medical patients

▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** 5000 units every 8–12 hours

Thromboprophylaxis in surgical patients

▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** 5000 units for 1 dose, to be taken 2 hours before surgery, then 5000 units every 8–12 hours

Thromboprophylaxis during pregnancy

▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** 5000–10 000 units every 12 hours, to be administered with monitoring, **Important:** prevention of prosthetic heart-valve thrombosis in pregnancy calls for **specialist management**

Haemodialysis

▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ **Adult:** Initially 1000–5000 units, followed by (by continuous intravenous infusion) 250–1000 units/hour

Prevention of clotting in extracorporeal circuits

▶ TO THE DEVICE AS A FLUSH

- ▶ **Adult:** (consult product literature)

continued →

To maintain patency of catheters, cannulas, other indwelling intravenous infusion devices

▶ TO THE DEVICE AS A FLUSH

- Adult: 10–200 units, to be flushed through every 4–8 hours, not for therapeutic use

- **INTERACTIONS** → Appendix 1: heparin (unfractionated)
- **SIDE-EFFECTS** Adrenal insufficiency · hypokalaemia · rebound hyperlipidaemia
- **PREGNANCY** Does not cross the placenta; maternal osteoporosis reported after prolonged use; multidose vials may contain benzyl alcohol—some manufacturers advise avoid.
- **BREAST FEEDING** Not excreted into milk due to high molecular weight.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; consider avoiding in severe impairment (increased risk of bleeding complications).
Dose adjustments Manufacturer advises consider dose reduction if used in severe impairment.
- **RENAL IMPAIRMENT**
Dose adjustments Risk of bleeding increased in severe impairment—dose may need to be reduced.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give continuously in Glucose 5% or Sodium chloride 0.9%; administration with a motorised pump is advisable.
- **PRESCRIBING AND DISPENSING INFORMATION** Doses listed take into account the guidelines of the British Society for Haematology.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection

Tinzaparin sodium

06-Aug-2018

● **INDICATIONS AND DOSE**

INNOHEP® 10,000 UNITS/ML

Prophylaxis of deep-vein thrombosis (general surgery)

▶ BY SUBCUTANEOUS INJECTION

- Adult: 3500 units for 1 dose, dose to be given 2 hours before surgery, then 3500 units every 24 hours

Prophylaxis of deep-vein thrombosis (orthopaedic surgery)

▶ BY SUBCUTANEOUS INJECTION

- Adult: Initially 50 units/kg for 1 dose, dose to be given 2 hours before surgery, then 50 units/kg every 24 hours, alternatively initially 4500 units for 1 dose, dose to be given 12 hours before surgery, then 4500 units every 24 hours

Prevention of clotting in extracorporeal circuits

▶ TO THE DEVICE AS A FLUSH

- Adult: (consult product literature)

INNOHEP® 20,000 UNITS/ML

Extended treatment of venous thromboembolism and prevention of recurrence in patients with active cancer

▶ BY SUBCUTANEOUS INJECTION

- Adult: 175 units/kg once daily for 6 months; the benefit of continued treatment beyond 6 months should be evaluated

Treatment of deep-vein thrombosis | Treatment of pulmonary embolism

▶ BY SUBCUTANEOUS INJECTION

- Adult: 175 units/kg once daily until adequate oral anticoagulation established, treatment regimens do not require anticoagulation monitoring

Treatment of venous thromboembolism in pregnancy

▶ BY SUBCUTANEOUS INJECTION

- Adult: 175 units/kg once daily, dose based on early pregnancy body-weight, treatment regimens do not require anticoagulation monitoring

- **UNLICENSED USE** Not licensed for the treatment of venous thromboembolism in pregnancy.
- **INTERACTIONS** → Appendix 1: low molecular-weight heparins
- **SIDE-EFFECTS**
▶ **Common or very common** Anaemia
▶ **Rare or very rare** Angioedema · Stevens-Johnson syndrome
- **PREGNANCY** Not known to be harmful, low molecular weight heparins do not cross the placenta. Vials contain benzyl alcohol—manufacturer advises avoid.
- **BREAST FEEDING** Due to the relatively high molecular weight of tinzaparin and inactivation in the gastrointestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible; however manufacturer advise avoid.
- **RENAL IMPAIRMENT** Risk of bleeding may be increased. Unfractionated heparin may be preferable. Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m².
Monitoring In renal impairment monitoring of anti-Factor Xa may be required if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Routine monitoring of anti-Factor Xa activity is not usually required during treatment

with tinzaparin, but may be necessary in patients at increased risk of bleeding (e.g. in renal impairment and those who are underweight or overweight).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol, sulfites

• Innohep (LEO Pharma)

Tinzaparin sodium 10000 unit per 1 ml Innohep 20,000units/2ml solution for injection vials | 10 vial [PoM] £105.66 DT = £105.66
Tinzaparin sodium 20000 unit per 1 ml Innohep 18,000units/0.9ml solution for injection pre-filled syringes | 6 pre-filled disposable injection [PoM] £64.25 | 10 pre-filled disposable injection [PoM] £107.08 DT = £107.08
 Innohep 40,000units/2ml solution for injection vials | 1 vial [PoM] £34.20 DT = £34.20
 Innohep 14,000units/0.7ml solution for injection pre-filled syringes | 6 pre-filled disposable injection [PoM] £49.98 | 10 pre-filled disposable injection [PoM] £83.30 DT = £83.30
 Innohep 10,000units/0.5ml solution for injection pre-filled syringes | 6 pre-filled disposable injection [PoM] £35.70 | 10 pre-filled disposable injection [PoM] £59.50 DT = £59.50

ANTITHROMBOTIC DRUGS > THROMBIN INHIBITORS, DIRECT

Argatroban monohydrate

21-Aug-2018

• INDICATIONS AND DOSE

Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment

► INITIALLY BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: Initially 2 micrograms/kg/minute, dose to be adjusted according to activated partial thromboplastin time, (by intravenous infusion) increased to up to 10 micrograms/kg/minute maximum duration of treatment 14 days

Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment (for dose in cardiac surgery, percutaneous coronary intervention, or critically ill patients)

► BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: (consult product literature)

Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment (when initiating concomitant warfarin treatment)

► BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: Reduced to 2 micrograms/kg/minute, dose should be temporarily reduced and INR measured after 4–6 hours; warfarin should be initiated at intended maintenance dose (do not give loading dose of warfarin); consult product literature for further details

- **CAUTIONS** Bleeding disorders · diabetic retinopathy · gastro-intestinal ulceration · immediately after lumbar puncture · major surgery (especially of brain, spinal cord, or eye) · risk of bleeding · severe hypertension · spinal anaesthesia

- **INTERACTIONS** → Appendix 1: argatroban

• SIDE-EFFECTS

- **Common or very common** Anaemia · haemorrhage · nausea · skin reactions
- **Uncommon** Alopecia · appetite decreased · arrhythmias · cardiac arrest · confusion · constipation · deafness · diarrhoea · dizziness · dysphagia · dyspnoea · fatigue · fever · gastritis · headache · hepatic disorders · hiccups · hyperbilirubinaemia · hyperhidrosis · hypertension · hypoglycaemia · hyponatraemia · hypotension · hypoxia · increased risk of infection · leucopenia · muscle tone

decreased · muscle weakness · myalgia · myocardial infarction · pain · pericardial effusion · peripheral ischaemia · peripheral oedema · pleural effusion · renal failure · shock · speech disorder · stroke · syncope · thrombocytopenia · tongue disorder · visual impairment · vomiting · wound secretion

- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment—monitor aPTT; avoid in severe impairment or in patients with impairment undergoing percutaneous coronary intervention.
Dose adjustments Manufacturer advises reduce initial dose to 0.5 micrograms/kg/minute in moderate impairment; adjust dose according to aPTT and as clinically indicated—consult product literature.
- **MONITORING REQUIREMENTS** Determine activated partial thromboplastin time 2 hours after start of treatment, then 2 or 4 hours after infusion rate altered (consult product literature), and at least once daily thereafter.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion (Exembol - Ready to use[®])*, manufacturer advises administer 1 mg/mL solution via a syringe driver. For *intravenous infusion (Exembol - Multidose[®])*, manufacturer advises give continuously in Glucose 5%, Sodium chloride 0.9% or Sodium lactate intravenous infusion compound; dilute to a concentration of 1 mg/mL prior to use.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Ethanol

► Argatroban monohydrate (Non-proprietary)

Argatroban monohydrate 1 mg per 1 ml Argatroban 50mg/50ml solution for infusion vials | 1 vial [PoM] £49.69 (Hospital only)
 ► **Exembol** (Mitsubishi Tanabe Pharma Europe Ltd)
Argatroban monohydrate 1 mg per 1 ml Exembol 50mg/50ml solution for infusion vials | 4 vial [PoM] £198.80 (Hospital only)
Argatroban monohydrate 100 mg per 1 ml Exembol Multidose 250mg/2.5ml concentrate for solution for infusion vials | 1 vial [PoM] [X]

Bivalirudin

08-Feb-2019

- **DRUG ACTION** Bivalirudin, a hirudin analogue, is a thrombin inhibitor.

• INDICATIONS AND DOSE

Unstable angina or non-ST-segment elevation myocardial infarction in patients planned for urgent or early intervention (in addition to aspirin and clopidogrel)

► INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 100 micrograms/kg, then (by intravenous infusion) 250 micrograms/kg/hour (for up to 72 hours in medically managed patients)

Unstable angina or non-ST-segment elevation myocardial infarction (in addition to aspirin and clopidogrel) in patients proceeding to percutaneous coronary intervention or coronary artery bypass surgery without cardiopulmonary bypass

► INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 100 micrograms/kg for 1 dose, then (by intravenous injection) 500 micrograms/kg for 1 dose, then (by intravenous infusion) 1.75 mg/kg/hour for duration of procedure; (by intravenous infusion) reduced to 250 micrograms/kg/hour for 4–12 hours as necessary following percutaneous coronary intervention, for patients proceeding to coronary artery bypass surgery with cardiopulmonary continued →

bypass, discontinue intravenous infusion 1 hour before procedure and treat with unfractionated heparin

Anticoagulation in patients undergoing percutaneous coronary intervention including patients with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention (in addition to aspirin and clopidogrel)

▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: Initially 750 micrograms/kg, followed immediately by (by intravenous infusion) 1.75 mg/kg/hour during procedure and for up to 4 hours after procedure, then (by intravenous infusion) reduced to 250 micrograms/kg/hour for a further 4–12 hours if necessary

- **CONTRA-INDICATIONS** Bleeding (active) · bleeding disorders · hypertension (severe) · subacute bacterial endocarditis
- **CAUTIONS** Brachytherapy procedures · previous exposure to lepirudin (theoretical risk from lepirudin antibodies)
- **INTERACTIONS** → Appendix 1: bivalirudin
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Procedural complications · skin reactions
 - ▶ **Uncommon** Anaemia · headache · hypersensitivity · hypotension · nausea · shock · thrombocytopenia
 - ▶ **Rare or very rare** Arrhythmias · cardiac tamponade · chest pain · compartment syndrome · dyspnoea · embolism and thrombosis · intracranial haemorrhage · pain · vascular disorders · vomiting
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
 - ▶ **Dose adjustments**
 - ▶ When used for percutaneous coronary intervention Reduce rate of infusion to 1.4 mg/kg/hour if eGFR 30–60 mL/minute/1.73 m² and monitor blood clotting parameters.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Angiox*[®]), give continuously in Glucose 5% or Sodium chloride 0.9%. Reconstitute each 250-mg vial with 5 mL water for injections then withdraw 5 mL and dilute to 50 mL with infusion fluid.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

 - ▶ Bivalirudin for the treatment of ST-segment elevation myocardial infarction (July 2011) NICE TA230 Bivalirudin (*Angiox*[®]) in combination with aspirin and clopidogrel is recommended for the treatment of adults with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention. www.nice.org.uk/guidance/ta230

Scottish Medicines Consortium (SMC) decisions

SMC No. 516/08
The *Scottish Medicines Consortium* has advised (December 2008) that bivalirudin (*Angiox*[®]) is accepted for restricted use within NHS Scotland for adults with acute coronary syndromes planned for urgent or early intervention who would have been considered for treatment with unfractionated heparin in combination with a glycoprotein IIb/IIIa inhibitor; it should not be used as an alternative to heparin alone.
SMC No. 638/10
The *Scottish Medicines Consortium* has advised (September 2010) that bivalirudin (*Angiox*[®]) is accepted for restricted use within NHS Scotland as an anticoagulant in adults undergoing percutaneous coronary intervention

who would have been considered for treatment with unfractionated heparin in combination with a glycoprotein IIb/IIIa inhibitor; it should not be used as an alternative to heparin alone.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Bivalirudin (Non-proprietary)**

Bivalirudin 250 mg Bivalirudin 250mg powder for concentrate for solution for infusion vials | 1 vial (POM) £175.00 (Hospital only) | 5 vial (POM) £875.00 (Hospital only)

Dabigatran etexilate

11-Jul-2019

- **DRUG ACTION** Dabigatran etexilate is a direct thrombin inhibitor with a rapid onset of action.

● **INDICATIONS AND DOSE**

Prophylaxis of venous thromboembolism following total knee replacement surgery

▶ BY MOUTH

- ▶ Adult 18–74 years: 110 mg, to be taken 1–4 hours after surgery, followed by 220 mg once daily for 10 days, to be taken on the first day after surgery
- ▶ Adult 75 years and over: 75 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 10 days, to be taken on the first day after surgery

Prophylaxis of venous thromboembolism following total knee replacement surgery in patients receiving concomitant treatment with amiodarone or verapamil

▶ BY MOUTH

- ▶ Adult 18–74 years: 75 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 10 days, to be taken on the first day after surgery
- ▶ Adult 75 years and over: 75 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 10 days, to be taken on the first day after surgery

Prophylaxis of venous thromboembolism following total hip replacement surgery

▶ BY MOUTH

- ▶ Adult 18–74 years: 110 mg, to be taken 1–4 hours after surgery, followed by 220 mg once daily for 28–35 days, to be taken on the first day after surgery
- ▶ Adult 75 years and over: 75 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 28–35 days, to be taken on the first day after surgery

Prophylaxis of venous thromboembolism following total hip replacement surgery in patients receiving concomitant treatment with amiodarone or verapamil

▶ BY MOUTH

- ▶ Adult 18–74 years: 75 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 28–35 days, to be taken on the first day after surgery
- ▶ Adult 75 years and over: 75 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 28–35 days, to be taken on the first day after surgery

Treatment of deep-vein thrombosis | Treatment of pulmonary embolism | Prophylaxis of recurrent deep-vein thrombosis | Prophylaxis of recurrent pulmonary embolism

▶ BY MOUTH

- ▶ Adult 18–74 years: 150 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant
- ▶ Adult 75–79 years: 110–150 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant
- ▶ Adult 80 years and over: 110 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant

Treatment of deep-vein thrombosis in patients with moderate renal impairment | Treatment of deep-vein thrombosis in patients at increased risk of bleeding | Treatment of pulmonary embolism in patients with moderate renal impairment | Treatment of pulmonary embolism in patients at increased risk of bleeding | Prophylaxis of recurrent deep-vein thrombosis in patients with moderate renal impairment | Prophylaxis of recurrent deep-vein thrombosis in patients at increased risk of bleeding | Prophylaxis of recurrent pulmonary embolism in patients with moderate renal impairment | Prophylaxis of recurrent pulmonary embolism in patients at increased risk of bleeding

► BY MOUTH

- Adult: 110–150 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant

Treatment of deep-vein thrombosis in patients receiving concomitant treatment with verapamil | Treatment of pulmonary embolism in patients receiving concomitant treatment with verapamil | Prophylaxis of recurrent deep-vein thrombosis in patients receiving concomitant treatment with verapamil | Prophylaxis of recurrent pulmonary embolism in patients receiving concomitant treatment with verapamil

► BY MOUTH

- Adult: 110 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant

Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age \geq 75 years, diabetes mellitus, or hypertension

► BY MOUTH

- Adult 18–74 years: 150 mg twice daily
- Adult 75–79 years: 110–150 mg twice daily
- Adult 80 years and over: 110 mg twice daily

Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age \geq 75 years, diabetes mellitus, or hypertension in patients receiving concomitant treatment with verapamil

► BY MOUTH

- Adult: 110 mg twice daily

Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age \geq 75 years, diabetes mellitus, or hypertension, in patients at increased risk of bleeding | Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age \geq 75 years, diabetes mellitus, or hypertension, in patients with moderate renal impairment

► BY MOUTH

- Adult: 110–150 mg twice daily

DOSE EQUIVALENCE AND CONVERSION

- For information on changing from, or to, other anticoagulants, consult product literature.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIRECT-ACTING ORAL ANTICOAGULANTS (DOACS): INCREASED RISK OF RECURRENT THROMBOTIC EVENTS IN PATIENTS WITH ANTIPHOSPHOLIPID SYNDROME (JUNE 2019) A clinical trial has shown an increased risk of recurrent thrombotic events associated with rivaroxaban compared with warfarin, in patients with antiphospholipid syndrome and a history of thrombosis. There may be a similar risk associated with other DOACs. Healthcare professionals are advised that DOACs are not

recommended in patients with antiphospholipid syndrome, particularly high-risk patients who test positive for all three antiphospholipid tests—lupus anticoagulant, anticardiolipin antibodies, and anti-beta₂ glycoprotein I antibodies. Continued treatment should be reviewed in these patients to determine if appropriate, and switching to a vitamin K antagonist such as warfarin should be considered.

- **CONTRA-INDICATIONS** Active bleeding · antiphospholipid syndrome (increased risk of recurrent thrombotic events) · do not use as anticoagulant for prosthetic heart valve · malignant neoplasms · oesophageal varices · recent brain surgery · recent gastro-intestinal ulcer · recent intracranial haemorrhage · recent ophthalmic surgery · recent spine surgery · significant risk of major bleeding · vascular aneurysm
- **CAUTIONS** Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—give initial dose at least 2 hours after catheter removal and monitor neurological signs) · bacterial endocarditis · bleeding disorders · body-weight less than 50 kg · elderly · gastritis · gastro-oesophageal reflux · oesophagitis · recent biopsy · recent major trauma · thrombocytopenia
- **CAUTIONS, FURTHER INFORMATION**
 - Elderly For direct thrombin inhibitors, prescription potentially inappropriate (STOPP criteria):
 - with concurrent significant bleeding risk, such as uncontrolled severe hypertension, bleeding diathesis or recent non-trivial spontaneous bleeding (high risk of bleeding)
 - for first deep venous thrombosis without continuing provoking risk factors (e.g. thrombophilia) for greater than 6 months (no proven added benefit)
 - for first pulmonary embolus without continuing provoking risk factors for greater than 12 months (no proven added benefit)
 - as part of dual therapy with an antiplatelet agent in patients with stable coronary, cerebrovascular or peripheral arterial disease, without a clear indication for anticoagulant therapy (no added benefit)
 - if eGFR less than 30 mL/min/1.73 m² (risk of bleeding) See also Prescribing in the elderly p. 33.
- **INTERACTIONS** → Appendix 1: dabigatran
- **SIDE-EFFECTS**
 - Common or very common Hepatic function abnormal
 - Uncommon Anaemia · diarrhoea · haemorrhage · hyperbilirubinaemia · nausea · post procedural complications · vomiting · wound complications
 - Rare or very rare Angioedema · dysphagia · gastrointestinal discomfort · gastrointestinal disorders · intracranial haemorrhage · post procedural drainage · skin reactions · thrombocytopenia · wound drainage
 - Frequency not known Bronchospasm
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment; consider avoiding in those with liver enzymes greater than 2 times the upper limit of normal (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute.
 - **Dose adjustments** When used for *prophylaxis of venous thromboembolism following knee or hip replacement surgery*, reduce initial dose to 75 mg and subsequent doses to 150 mg once daily if creatinine clearance 30–50 mL/minute; consider reducing dose to 75 mg once daily if creatinine clearance 30–50 mL/minute and patient receiving concomitant treatment with verapamil.

When used for *treatment of deep-vein thrombosis and pulmonary embolism, prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism, prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation*, consider reduced dose of 110–150 mg twice daily if creatinine clearance 30–50 mL/minute, based on individual assessment of thromboembolic risk and risk of bleeding.

Monitoring In renal impairment monitor renal function at least annually (manufacturer recommends Cockcroft and Gault formula to calculate creatinine clearance).

● MONITORING REQUIREMENTS

- ▶ Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
- ▶ No routine anticoagulant monitoring required (INR tests are unreliable).
- ▶ Assess renal function (manufacturer recommends Cockcroft and Gault formula to calculate creatinine clearance) before treatment in all patients and at least annually in elderly.

● **DIRECTIONS FOR ADMINISTRATION** When given concomitantly with amiodarone or verapamil, doses should be taken at the same time.

● **PRESCRIBING AND DISPENSING INFORMATION** Dabigatran etexilate, is given orally for prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery; it is also licensed for the treatment of deep-vein thrombosis and pulmonary embolism, and prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism in adults. Duration of treatment should be determined by balancing the benefit of treatment with the bleeding risk; shorter duration of treatment (at least 3 months) should be based on transient risk factors i.e. recent surgery, trauma, immobilisation, and longer duration of treatment should be based on permanent risk factors, or idiopathic deep-vein thrombosis or pulmonary embolism.

● **PATIENT AND CARER ADVICE** Patients should be provided with an alert card and advised to keep it with them at all times.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Dabigatran etexilate for the prevention of venous thromboembolism after hip or knee replacement surgery in adults (September 2008) NICE TA157
Dabigatran etexilate (*Pradaxa*[®]) is an option for the prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery. www.nice.org.uk/guidance/ta157
- ▶ Dabigatran etexilate for the prevention of stroke and systemic embolism in atrial fibrillation (March 2012) NICE TA249
Dabigatran etexilate (*Pradaxa*[®]) is an option for the prevention of stroke and systemic embolism in patients with non-valvular atrial fibrillation and with one or more of the following risk factors:
 - previous stroke, transient ischaemic attack, or systemic embolism
 - left ventricular ejection fraction <40%
 - symptomatic heart failure of New York Heart Association (NYHA) class 2 or above
 - age ≥ 75 years
 - age ≥ 65 years in patients with diabetes mellitus, coronary artery disease, or hypertension
 The risks and benefits of dabigatran compared to warfarin should be discussed with the patient. www.nice.org.uk/guidance/ta249
- ▶ Dabigatran etexilate for the treatment and secondary prevention of deep vein thrombosis and/or pulmonary embolism (December 2014) NICE TA327
Dabigatran etexilate (*Pradaxa*[®]) is recommended, within its marketing authorisation, as an option for treating and

for preventing recurrent deep vein thrombosis and pulmonary embolism in adults.

www.nice.org.uk/guidance/ta327

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

ANTITHROMBOTIC DRUGS > TISSUE PLASMINOGEN ACTIVATORS

F 229

Urokinase

15-Nov-2019

● INDICATIONS AND DOSE

Deep-vein thrombosis (thromboembolic occlusive vascular disease)

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 4400 units/kg, to be given over 10–20 minutes, followed by 100 000 units/hour for 2–3 days

Pulmonary embolism (thromboembolic occlusive vascular disease)

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 4400 units/kg, to be given over 10–20 minutes, followed by 4400 units/kg/hour for 12 hours

Occlusive peripheral arterial disease (thromboembolic occlusive vascular disease)

▶ BY INTRA-ARTERIAL INFUSION

- ▶ Adult: (consult product literature)

Occluded central venous catheters (blocked by fibrin clots)

▶ BY INTRAVENOUS INJECTION

- ▶ Adult: Inject directly into occluded catheter, to be dissolved in sodium chloride 0.9% to a concentration of 5000 units/mL; use a volume sufficient to fill the catheter lumen; leave for 20–60 minutes then aspirate the lysate; repeat if necessary

Occluded arteriovenous haemodialysis shunts (blocked by fibrin clots)

▶ BY INTRAVENOUS INFUSION, OR BY INTRA-ARTERIAL INFUSION

- ▶ Adult: (consult product literature)

SYNER-KINASE[®]

Deep-vein thrombosis (thromboembolic occlusive vascular disease)

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 4400 units/kg, to be given over 10 minutes, dose to be made up in 15 mL sodium chloride 0.9%, followed by 4400 units/kg/hour for 12–24 hours

Pulmonary embolism (thromboembolic occlusive vascular disease)

▶ INITIALLY BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 4400 units/kg, to be given over 10 minutes, dose to be made up in 15 mL sodium chloride 0.9%, followed by (by intravenous infusion) 4400 units/kg/hour for 12 hours, alternatively (by intra-arterial injection) initially 15 000 units/kg, to be injected into pulmonary artery, subsequent doses

adjusted according to response; maximum 3 doses per day

Occlusive peripheral arterial disease

- ▶ BY INTRA-ARTERIAL INFUSION
- ▶ Adult: (consult product literature)

Occluded intravenous catheters and cannulas (blocked by fibrin clots)

- ▶ BY INTRA-ARTERIAL INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 5000–25 000 units, to be injected directly into catheter or cannula, dose dissolved in suitable volume of sodium chloride 0.9% to fill the catheter or cannula lumen; leave for 20–60 minutes then aspirate the lysate; repeat if necessary

- **INTERACTIONS** → Appendix 1: urokinase
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Artery dissection · embolism and thrombosis · stroke
 - ▶ **Uncommon** Renal failure
 - ▶ **Rare or very rare** Vascular pseudoaneurysm
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment.

Dose adjustments Manufacturer advises consider dose reduction in mild to moderate impairment.
- **RENAL IMPAIRMENT**

Dose adjustments Dose reduction may be required.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Syner-KINASE[®]), give continuously or intermittently in Sodium chloride 0.9%.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- ▶ **Syner-KINASE** (Syner-Med (Pharmaceutical Products) Ltd)
 - Urokinase 10000 unit** Syner-KINASE 10,000unit powder for solution for injection vials | 1 vial [PoM] £35.95 (Hospital only)
 - Urokinase 25000 unit** Syner-KINASE 25,000unit powder for solution for injection vials | 1 vial [PoM] £45.95 (Hospital only)
 - Urokinase 100000 unit** Syner-KINASE 100,000unit powder for solution for injection vials | 1 vial [PoM] £112.95 (Hospital only)
 - Urokinase 250000 unit** Syner-KINASE 250,000unit powder for solution for injection vials | 1 vial [PoM] (Hospital only)
 - Urokinase 500000 unit** Syner-KINASE 500,000unit powder for solution for injection vials | 1 vial [PoM] (Hospital only)

ANTITHROMBOTIC DRUGS > VITAMIN K ANTAGONISTS

Vitamin K antagonists

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

A EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

- **CONTRA-INDICATIONS** Avoid use within 48 hours postpartum · haemorrhagic stroke · significant bleeding
- **CAUTIONS** Bacterial endocarditis (use only if warfarin otherwise indicated) · conditions in which risk of bleeding is increased · history of gastrointestinal bleeding · hyperthyroidism · hypothyroidism · peptic ulcer · postpartum (delay warfarin until risk of haemorrhage is

low—usually 5–7 days after delivery) · recent ischaemic stroke · recent surgery · uncontrolled hypertension

CAUTIONS, FURTHER INFORMATION

- ▶ Elderly Prescription potentially inappropriate (STOPP criteria):
 - with concurrent significant bleeding risk, such as uncontrolled severe hypertension, bleeding diathesis or recent non-trivial spontaneous bleeding (high risk of bleeding)
 - as part of dual therapy with an antiplatelet agent in patients with stable coronary, cerebrovascular or peripheral arterial disease, without a clear indication for anticoagulant therapy (no added benefit)
 - for first deep venous thrombosis without continuing provoking risk factors (e.g. thrombophilia) for longer than 6 months (no proven added benefit)
 - for first pulmonary embolus without continuing provoking risk factors for longer than 12 months (no proven added benefit)

See also Prescribing in the elderly p. 33.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Haemorrhage
 - ▶ **Rare or very rare** Alopecia · nausea · vomiting
 - ▶ **Frequency not known** Blue toe syndrome · CNS haemorrhage · diarrhoea · fever · haemothorax · jaundice · pancreatitis · skin necrosis (increased risk in patients with protein C or protein S deficiency) · skin reactions
- **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should be warned of the danger of teratogenicity.
- **PREGNANCY** Should not be given in the first trimester of pregnancy. Warfarin, acenocoumarol, and phenindione cross the placenta with risk of congenital malformations, and placental, fetal, or neonatal haemorrhage, especially during the last few weeks of pregnancy and at delivery. Therefore, if at all possible, they should be avoided in pregnancy, especially in the first and third trimesters (difficult decisions may have to be made, particularly in women with prosthetic heart valves, atrial fibrillation, or with a history of recurrent venous thrombosis or pulmonary embolism). Stopping these drugs before the sixth week of gestation may largely avoid the risk of fetal abnormality.
- **HEPATIC IMPAIRMENT** In general, manufacturers advise caution in mild to moderate impairment; avoid in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.
 - ▶ It is essential that the INR be determined daily or on alternate days in early days of treatment, then at longer intervals (depending on response), then up to every 12 weeks.
 - ▶ Change in patient's clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing.
- **PATIENT AND CARER ADVICE** Anticoagulant treatment booklets should be issued to all patients or their carers; these booklets include advice for patients on anticoagulant treatment, an alert card to be carried by the patient at all times, and a section for recording of INR results and dosage information. In **England, Wales, and Northern Ireland**, they are available for purchase from: 3M Security Print and Systems Limited Gorse Street, Chadderton Oldham OL9 9QH Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores. NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@spsl.uk.com.

In **Scotland**, treatment booklets and starter information packs can be obtained by emailing stockorders.DPPAS@apsgroup.co.uk or by fax on (0131) 6299 967

Electronic copies of the booklets and further advice are also available at www.npsa.nhs.uk/nrls/alerts-and-directives/alerts/anticoagulant.

F 149

Acenocoumarol

11-Sep-2018

(Nicoumalone)

● INDICATIONS AND DOSE

Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation | Prophylaxis after insertion of prosthetic heart valve | Prophylaxis and treatment of venous thrombosis and pulmonary embolism | Transient ischaemic attacks

► BY MOUTH

► **Adult:** Initially 2–4 mg once daily for 2 days, alternatively initially 6 mg on day 1, then 4 mg on day 2; maintenance 1–8 mg daily, adjusted according to response, dose to be taken at the same time each day, lower doses may be required in patients over 65 years, severe heart failure with hepatic congestion, and malnutrition

● **CAUTIONS** Patients over 65 years

● **INTERACTIONS** → Appendix 1: coumarins

● SIDE-EFFECTS

► **Rare or very rare** Appetite decreased · liver injury · skin necrosis haemorrhagic (increased risk in patients with protein C or protein S deficiency) · vasculitis

● **BREAST FEEDING** Risk of haemorrhage; increased by vitamin K deficiency—manufacturer recommends prophylactic vitamin K for the infant (consult product literature).

● HEPATIC IMPAIRMENT

Dose adjustments Manufacturer advises consider dose reduction in mild to moderate impairment.

● **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.

● **PATIENT AND CARER ADVICE** Anticoagulant card to be provided.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

Warfarin sodium

10-Oct-2016

● INDICATIONS AND DOSE

Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation | Prophylaxis after insertion of prosthetic heart valve | Prophylaxis and treatment of venous thrombosis and pulmonary embolism | Transient ischaemic attacks

► BY MOUTH

► **Adult:** Initially 5–10 mg, to be taken on day 1; subsequent doses dependent on the prothrombin time, reported as INR (international normalised ratio), a lower induction dose can be given over 3–4 weeks in patients who do not require rapid anticoagulation, elderly patients to be given a lower induction dose; maintenance 3–9 mg daily, to be taken at the same time each day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: WARFARIN: REPORTS OF CALCIPHYLAXIS (JULY 2016)

An EU-wide review has concluded that on rare occasions, warfarin use may lead to calciphylaxis—patients should be advised to consult their doctor if they develop a painful skin rash; if calciphylaxis is diagnosed, appropriate treatment should be started and consideration should be given to stopping treatment with warfarin. The MHRA has advised that calciphylaxis is most commonly observed in patients with known risk factors such as end-stage renal disease, however cases have also been reported in patients with normal renal function.

● **INTERACTIONS** → Appendix 1: coumarins

● **SIDE-EFFECTS** Calciphylaxis · hepatic function abnormal

● **PREGNANCY** Babies of mothers taking warfarin at the time of delivery need to be offered immediate prophylaxis with intramuscular phytonadione (vitamin K₂).

● **BREAST FEEDING** Not present in milk in significant amounts and appears safe. Risk of haemorrhage which is increased by vitamin K deficiency.

● **RENAL IMPAIRMENT** Use with caution in mild to moderate impairment.

Monitoring In severe renal impairment, monitor INR more frequently.

● **PATIENT AND CARER ADVICE** Anticoagulant card to be provided.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

4 Blood pressure conditions

4.1 Hypertension

Hypertension

10-Oct-2019

Description of condition

Hypertension is defined as persistently raised arterial blood pressure and is one of the most important treatable causes of premature morbidity and mortality. It is a major risk factor for stroke, myocardial infarction, heart failure, chronic kidney disease, cognitive decline and premature death. Hypertension is more common in advancing age, in women aged between 65–74 years and in people of black African or African-Caribbean origin. Other risk factors include social deprivation, lifestyle factors, anxiety, and emotional stress.

Aims of treatment

Treatment aims to reduce the risk of cardiovascular morbidity and mortality, including myocardial infarction and stroke, by lowering blood pressure.

Non-drug treatment

[EvGr] In patients with suspected or diagnosed hypertension, offer lifestyle advice and support to enable patients to make healthy lifestyle changes.

Give advice about the benefits of regular exercise, a healthy diet, low dietary sodium intake, and reduced alcohol intake (if excessive) as these changes can reduce blood pressure.

Discourage excessive consumption of coffee and other caffeine-rich products, and offer advice to help smokers to stop smoking (see Smoking cessation p. 520). **[A]**

Hypertension thresholds for treatment

Recommendations on the management of hypertension and blood pressure thresholds are from the *National Institute for Health and Care Excellence (NICE)—Hypertension in adults: diagnosis and management guidelines (NG136, August 2019)*, and *Scottish Intercollegiate Guidelines Network (SIGN)—A national clinical guideline: Risk estimation and the prevention of cardiovascular disease (SIGN 149, June 2017)*. These recommendations differ slightly. Recommendations are based on NICE guidelines, and differences with SIGN (2017) have been highlighted.

For blood pressure thresholds, targets, and the management of hypertension in renal, diabetic or pregnant hypertensive patients, see *Hypertension in renal disease*, *Hypertension in diabetes*, and *Hypertension in pregnancy*.

[EvGr] Patients presenting with a blood pressure of 140/90 mmHg or higher when measured in a clinic setting, should be offered ambulatory blood pressure monitoring (ABPM), or home blood pressure monitoring if ABPM is unsuitable, to confirm the diagnosis and stage of hypertension. **[A]**

Stage 1 hypertension is a clinic blood pressure of between 140/90 mmHg and 160/100 mmHg, and ambulatory daytime average or home blood pressure average of 135/85 mmHg or higher.

[EvGr] Discuss treatment options with patients aged under 80 years who have stage 1 hypertension if they have one or more of the following: target-organ damage (for example left ventricular hypertrophy, chronic kidney disease or hypertensive retinopathy), established cardiovascular disease, renal disease, diabetes, or a 10 year cardiovascular risk $\geq 10\%$.

Consider antihypertensive drug treatment in addition to lifestyle advice for adults aged under 60 with stage 1 hypertension and an estimated 10 year cardiovascular risk $\geq 10\%$.

Consider antihypertensive drug treatment in addition to lifestyle advice for patients aged over 80 years with a clinic blood pressure of over 150/90 mmHg.

For patients aged under 40 years with stage 1 hypertension consider seeking specialist advice for evaluation of secondary causes of hypertension.

SIGN (2017) recommend antihypertensive drug treatment be offered to patients at high cardiovascular risk or with evidence of cardiovascular disease, and a sustained clinic systolic blood pressure over 140 mmHg and/or diastolic blood pressure over 90 mmHg regardless of age. For information about cardiovascular disease risk assessment, see Cardiovascular disease risk assessment and prevention p. 201. SIGN (2017) also recommend antihypertensive drug treatment should be offered to patients who have had a haemorrhagic or ischaemic stroke, or transient ischaemic attack even when their baseline blood pressure is at a level that would be considered conventionally normotensive. **[A]**

Stage 2 hypertension is a clinic blood pressure of between 160/100 mmHg and 180/120 mmHg, and ambulatory daytime average or home blood pressure average of 150/95 mmHg or higher.

[EvGr] Treat all patients who have stage 2 hypertension, regardless of age. **[A]**

Severe hypertension is a clinic systolic blood pressure of 180 mmHg or higher, or a clinic diastolic blood pressure of 120 mmHg or higher.

[EvGr] Treat severe hypertension promptly (see *Same-day specialist referral*). **[A]**

Same-day specialist referral

[EvGr] If a patient has severe hypertension but no symptoms or signs indicating same-day referral (see *below*), carry out investigations for target organ damage as soon as possible. If target organ damage is identified, consider starting antihypertensive drug treatment immediately, without waiting for the results of ambulatory or home blood pressure monitoring. If no target organ damage is identified, repeat clinic blood pressure measurement within 7 days.

Refer patients for specialist assessment, carried out on the same day, if they have a clinic blood pressure of 180/120 mmHg and higher with signs of retinal haemorrhage or papilloedema (accelerated hypertension), or life-threatening symptoms for example new onset confusion, chest pain, signs of heart failure, or acute kidney injury.

Refer patients for specialist assessment, carried out on the same day, if they have suspected pheochromocytoma (for example labile or postural hypotension, headache, palpitations, pallor, abdominal pain, or diaphoresis). **[A]**

Assessment of cardiovascular risk

EvGr Cardiovascular risk should be estimated and assessed for all patients with confirmed hypertension using clinic blood pressure measurements. In these patients, glycated haemoglobin, electrolytes, creatinine, estimated glomerular filtration rate, total and HDL cholesterol should be measured, tests for the presence of proteinuria, haematuria, and hypertensive retinopathy undertaken, and a 12-lead ECG performed.

Aspirin reduces the risk of cardiovascular events and myocardial infarction, however high blood pressure must be controlled before aspirin is given. Unless contra-indicated, aspirin is recommended for all patients with established cardiovascular disease. **▲**

For full guidance on the risk assessment and prevention of cardiovascular disease, see Cardiovascular disease risk assessment and prevention p. 201.

Hypertension targets for treatment

For blood pressure thresholds, targets, and the management of hypertension in renal, diabetic or pregnant hypertensive patients, see *Hypertension in renal disease*, *Hypertension in diabetes*, and *Hypertension in pregnancy*.

EvGr A target clinic blood pressure below 140/90 mmHg is suggested for patients aged over 80 years; whilst a target clinic blood pressure below 150/90 mmHg is suggested for patients aged over 80 years. For ambulatory or home blood pressure monitoring (during the patient's waking hours), a target average of below 135/85 mmHg is suggested for patients aged under 80 years; whilst a target average of below 145/85 mmHg is suggested for patients aged over 80 years. SIGN (2017) instead recommend a target clinic blood pressure below 140/90 mmHg regardless of age, whilst patients with high cardiovascular risk and target organ damage should aim for a clinic blood pressure below 135/85 mmHg. These figures are a general guide and may be adapted depending on tolerability, especially in the frail or elderly. **▲**

Drugs for hypertension

A single antihypertensive drug is often inadequate in the management of hypertension and additional antihypertensive drugs are usually added in a step-wise manner until control is achieved. **EvGr** Clinicians should ensure antihypertensive drugs are titrated to the optimum or maximum tolerated dose at each step of treatment along with support and discussions around adherence throughout treatment. Response to drug treatment may be affected by age and ethnicity.

Discuss treatment options, preferences for treatment and individual cardiovascular disease risk with the patient. Continue to offer lifestyle advice and support (see *Non drug treatment*), whether or not they choose to start antihypertensive drug treatment.

Clinical judgement should be used for all patients with frailty or multimorbidity when starting antihypertensive drug treatment.

For women with diagnosed hypertension who are considering pregnancy or who are pregnant or breastfeeding, manage hypertension in line with the recommendations in the *Hypertension in pregnancy* section.

If an angiotensin-converting enzyme (ACE) inhibitor is not tolerated, for example because of cough, offer an angiotensin II receptor blocker (ARB) to treat hypertension.

The use of an ACE inhibitor with an ARB is not recommended in the treatment of hypertension.

When choosing antihypertensive drug treatment for adults of black African or African-Caribbean family origin, consider an ARB, in preference to an ACE inhibitor.

If a calcium channel blocker is not tolerated, for example because of oedema, offer a thiazide-like diuretic to treat hypertension.

If starting or changing diuretic treatment for hypertension, offer a thiazide-like diuretic such as indapamide p. 178 in preference to conventional thiazide diuretics, for example bendroflumethiazide p. 177 or hydrochlorothiazide p. 178. Continue current treatment in patients with hypertension who already have stable, well-controlled blood pressure whilst on bendroflumethiazide or hydrochlorothiazide. **▲**

For blood pressure thresholds, targets, and the management of hypertension in renal and diabetic patients, see *Hypertension in renal disease* and *Hypertension in diabetes*.

Isolated systolic hypertension

EvGr Offer patients with isolated systolic hypertension (systolic blood pressure of 160 mmHg or more) the same treatment as patients with both raised systolic and diastolic blood pressure. **▲**

Hypertension with type 2 diabetes in all patients (any age or origin), or hypertension without type 2 diabetes in those aged 55 years or below and not of black African or African-Caribbean origin

EvGr Step 1: Offer an ACE inhibitor or ARB.

Step 2: In addition to an ACE inhibitor or ARB, add in a calcium channel blocker or thiazide-like diuretic. Offer a thiazide-like diuretic if there is evidence of heart failure. **▲** For full guidance on the management of chronic heart failure, see *Chronic heart failure* p. 204.

EvGr Step 3: Offer an ACE inhibitor or ARB, a calcium channel blocker and a thiazide-like diuretic.

Step 4: Before considering further treatment for a person with resistant hypertension, confirm elevated clinic blood pressure measurements using ambulatory or home blood pressure recordings, assess for postural hypotension and discuss adherence. If further treatment is required, consider seeking specialist advice, or the addition of low dose spironolactone [unlicensed indication] if potassium is 4.5 mmol/litre or less; or an alpha blocker or a beta blocker if potassium is greater than 4.5 mmol/litre.

When using further diuretic therapy for step 4 treatment of resistant hypertension, monitor blood sodium, potassium and renal function within 1 month of starting treatment and repeat as needed thereafter.

Seek specialist advice if blood pressure remains uncontrolled despite taking optimal tolerated doses of 4 drugs. **▲**

Hypertension without type 2 diabetes in patients aged 55 and over, or all ages of black African or African-Caribbean origin patients without type 2 diabetes

EvGr Step 1: Offer a calcium channel blocker.

Step 2: In addition to a calcium channel blocker offer an ACE inhibitor, ARB or a thiazide-like diuretic.

Step 3: Offer an ACE inhibitor or ARB, a calcium channel blocker and a thiazide-like diuretic.

Step 4: Before considering further treatment for a person with resistant hypertension, confirm elevated clinic blood pressure measurements using ambulatory or home blood pressure recordings, assess for postural hypotension and discuss adherence. If further treatment is required, consider seeking specialist advice, or consider low dose spironolactone [unlicensed indication] if potassium is 4.5 mmol/litre or less; or an alpha blocker or a beta blocker if potassium is greater than 4.5 mmol/litre.

When using further diuretic therapy for step 4 treatment of resistant hypertension, monitor blood sodium, potassium, and renal function within 1 month of starting treatment and repeat as needed thereafter.

Seek specialist advice if blood pressure remains uncontrolled despite taking optimal tolerated doses of 4 drugs. **▲**

Hypertension in diabetes

EVGr Hypertension in diabetic patients should be treated aggressively with lifestyle modification and drug treatment. Lowering blood pressure in patients with diabetes reduces the risk of macrovascular and microvascular complications.

Hypertension in type 1 diabetes

EVGr In **type 1 diabetes**, aim for a clinic blood pressure of 135/85 mmHg or less unless the adult with type 1 diabetes has albuminuria or 2 or more features of metabolic syndrome, in which case it should be 130/80 mmHg or less.

If drug treatment is required start a trial of a renin-angiotensin system blocking drug as first-line treatment for hypertension in adults with type 1 diabetes. Potential side effects should not prevent the use of a particular class of drug in order to control blood pressure, unless the side effects become symptomatic or otherwise clinically significant. In particular:

- selective beta-blockers should not be avoided where indicated for adults on insulin;
- low-dose thiazides may be used in combination with beta-blockers;
- calcium channel blockers (use only long-acting preparations). ⚡

Hypertension in type 2 diabetes

Recommendations on the management of hypertension and blood pressure thresholds are from the *National Institute for Health and Care Excellence (NICE)—Hypertension in adults: diagnosis and management guidelines (NG136, August 2019)*, *Scottish Intercollegiate Guidelines Network (SIGN)—A national clinical guideline: Risk estimation and the prevention of cardiovascular disease (SIGN 149, June 2017)*, and *Scottish Intercollegiate Guidelines Network (SIGN)—A national clinical guideline: the management of diabetes (SIGN 116, updated November 2017)*. These recommendations differ slightly. Recommendations are based on NICE guidelines, and differences with SIGN (2017) have been highlighted.

EVGr SIGN (June 2017) recommend that regardless of age, patients with high cardiovascular disease risk should be offered antihypertensive drug treatment if clinic systolic blood pressure is above 140 mmHg. Antihypertensive drug treatment should also be considered even if clinic systolic blood pressure is below 140 mmHg, with treatment targeted at individuals thought to be at greatest risk of complications.

In type 2 diabetic patients with hypertension, NICE recommend a clinic blood pressure below 140/90 mmHg in those aged under 80 years, and below 150/90 mmHg in those aged 80 years and over. SIGN (November 2017) recommend a clinic blood pressure of 130/80 mmHg. SIGN (June 2017) recommend a clinic blood pressure below 135/85 mmHg regardless of age if the patient has established cardiovascular disease. ⚡

For the management of hypertension in patients with type 2 diabetes, see **Hypertension with type 2 diabetes in all patients (any age or origin)**, or **hypertension without type 2 diabetes in those aged 55 years or below and not of black African or African-Caribbean origin in *Drugs for hypertension***.

Hypertension in renal disease

Recommendations on the management of hypertension and blood pressure thresholds are from the *National Institute for Health and Care Excellence (NICE)—Hypertension in adults: diagnosis and management guidelines (NG136, August 2019)*, and *Scottish Intercollegiate Guidelines Network (SIGN)—A national clinical guideline: Risk estimation and the prevention of cardiovascular disease (SIGN 149 June 2017)*. These recommendations differ slightly. Recommendations are based on NICE guidelines, and differences with SIGN (2017) have been highlighted.

EVGr SIGN (2017) recommend that all people with stage 3 or higher chronic kidney disease, or micro- or macroalbuminuria, or who are on dialysis should be offered blood pressure-lowering treatment.

A target clinic blood pressure below 140/90 mmHg is suggested in patients with renal disease (chronic kidney disease). A blood pressure below 130/80 mmHg is advised in patients with chronic kidney disease and diabetes, or if urine albumin to creatinine ratio (ACR) exceeds 70 mg/mmol). SIGN (2017) recommend a blood pressure below 135/85 mmHg should be considered in patients with established cardiovascular disease and chronic kidney disease.

If possible, offer treatment with drugs taken only once a day. ⚡ For guidance on the choice of antihypertensive agent in patients with chronic kidney disease, see NICE clinical guideline: **Chronic kidney disease in adults** (see *Useful resources*).

Hypertension in pregnancy

Hypertensive disorders during pregnancy affect approximately 8% to 10% of all pregnant women and the complications can be associated with significant morbidity and mortality to the mother and baby. Hypertension can exist before pregnancy or it can be diagnosed in the first 20 weeks of gestation (known as chronic hypertension), it can occur as new-onset of hypertension after 20 weeks gestation (gestational hypertension) or it can occur after 20 weeks gestation with features of multi-organ involvement (pre-eclampsia). **EVGr** Pregnant women with chronic hypertension, gestational hypertension or pre-eclampsia should be referred to a specialist. ⚡ Symptoms of pre-eclampsia include severe headache, problems with vision, severe pain below ribs, vomiting and sudden swelling of hands, feet or face accompanied with significant proteinuria and blood pressure greater than 140/90 mmHg.

EVGr Pregnant women are at high risk of developing pre-eclampsia if they have chronic kidney disease, diabetes mellitus, autoimmune disease, chronic hypertension, or if they have had hypertension during a previous pregnancy; these women are advised to take aspirin p. 130 [unlicensed indication] from week 12 of pregnancy until the baby is born. Women with more than one moderate risk factor for developing pre-eclampsia (first pregnancy, greater than 40 years of age, pregnancy interval of greater than 10 years, BMI above 35 kg/m² at first visit, multiple pregnancy, or family history of pre-eclampsia) are also advised to take aspirin [unlicensed indication] from week 12 of pregnancy until the baby is born.

Pregnant women with chronic hypertension who are already receiving antihypertensive treatment should be referred to a specialist and have their drug therapy reviewed. Stop ACE inhibitors, ARBs, thiazide or thiazide-like diuretics due to an increased risk of congenital abnormalities.

Women with pre-eclampsia, gestational or chronic hypertension who present with a sustained blood pressure of 140/90 mmHg or higher should be offered antihypertensive treatment. First-line treatment is with oral labetalol hydrochloride p. 160 to achieve a target blood pressure of less than 135/85 mmHg. If labetalol is unsuitable, consider nifedipine modified-release [unlicensed] p. 174 and if nifedipine and labetalol are both unsuitable consider methyldopa p. 157 [unlicensed].

Women with a blood pressure of greater than 160/110 mmHg who require critical care during pregnancy or after birth should receive immediate treatment with either oral or intravenous labetalol hydrochloride, intravenous hydralazine hydrochloride p. 192, or oral nifedipine modified-release to achieve a target blood pressure of 135/85 mmHg or less.

Give intravenous magnesium sulfate p. 1112 to women in a critical care setting with severe hypertension or severe pre-

eclampsia or if they have or have previously had an eclamptic fit. Consider intravenous magnesium sulfate in severe pre-eclampsia if birth is planned within 24 hours.

In women with pre-eclampsia where early birth is considered likely within 7 days, consider a course of antenatal corticosteroids for fetal lung maturation.

Appropriate antihypertensive treatment should be continued if required after birth (with dose adjustment according to blood pressure).

Women who have been managed with methyldopa during pregnancy should discontinue treatment within 2 days of the birth and switch to an alternative antihypertensive.

Post-birth, advise women with hypertension that the need to take antihypertensives does not prevent them from breastfeeding should they wish to do so, although very low levels of antihypertensive medicines can pass into breast milk and most medicines are not tested in pregnant or breastfeeding women. For women who decide to breastfeed, offer enalapril maleate p. 180 first-line to treat hypertension during the post-natal period, and monitor maternal renal function and serum potassium. In women of black African or African-Caribbean family origin consider nifedipine or amlodipine p. 168 first line. If blood pressure is not controlled with a single drug consider a combination of nifedipine (or amlodipine) and enalapril. If this combination is not tolerated or ineffective consider either adding labetalol hydrochloride or atenolol p. 164 to the combination treatment or swapping one of the medicines being used for atenolol or labetalol. Blood pressure monitoring should be considered in babies born to mothers taking antihypertensives who are breastfeeding, and women should be advised to monitor their babies for any adverse reactions for example: drowsiness, lethargy, pallor, cold peripheries or poor feeding).

Women with hypertension in the postnatal period who are not and do not plan to breastfeed should be treated the same way as patients in the section *Drugs for hypertension*.

Following birth, women remaining on antihypertensives should have their treatment reviewed 2 weeks after the birth. Women treated for hypertension during pregnancy should have a medical review 6-8 weeks after birth with their GP or specialist. 

Advanced Pharmacy Services

Patients with hypertension may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 18.

Antihypertensive drugs

Vasodilator antihypertensive drugs

Vasodilators have a potent hypotensive effect, especially when used in combination with a beta-blocker and a thiazide. **Important:** see Hypertension (hypertensive crises) for a warning on the hazards of a very rapid fall in blood pressure.

Hydralazine hydrochloride p. 192 is given by mouth as an adjunct to other antihypertensives for the treatment of resistant hypertension but is rarely used; when used alone it causes tachycardia and fluid retention.

Sodium nitroprusside p. 193 [unlicensed] is given by intravenous infusion to control severe hypertensive emergencies when parenteral treatment is necessary.

Minoxidil p. 192 should be reserved for the treatment of severe hypertension resistant to other drugs. Vasodilatation is accompanied by increased cardiac output and tachycardia and the patients develop fluid retention. For this reason the addition of a beta-blocker and a diuretic (usually furosemide p. 241, in high dosage) are mandatory. Hypertrichosis is troublesome and renders this drug unsuitable for females.

Prazosin p. 827, doxazosin p. 826, and terazosin p. 829 have alpha-blocking and vasodilator properties.

Ambrisentan p. 195, bosentan p. 195, iloprost p. 197, macitentan p. 196, sildenafil p. 859, and tadalafil p. 860 are licensed for the treatment of pulmonary arterial hypertension and should be used under specialist supervision. Epoprostenol p. 123 can be used in patients with primary pulmonary hypertension resistant to other treatments. Bosentan is also licensed to reduce the number of new digital ulcers in patients with systemic sclerosis and ongoing digital ulcer disease. Riociguat p. 196 is licensed for the treatment of pulmonary arterial hypertension and chronic thromboembolic pulmonary hypertension; it should be used under specialist supervision.

Sitaxentan has been withdrawn from the market because the benefit of treatment does not outweigh the risk of severe hepatotoxicity.

Centrally acting antihypertensive drugs

Methyldopa p. 157 is a centrally acting antihypertensive; it may be used for the management of hypertension in pregnancy.

Clonidine hydrochloride p. 156 has the disadvantage that sudden withdrawal of treatment may cause severe rebound hypertension.

Moxonidine p. 157, a centrally acting drug, is licensed for mild to moderate essential hypertension. It may have a role when thiazides, calcium-channel blockers, ACE inhibitors, and beta-blockers are not appropriate or have failed to control blood pressure.

Adrenergic neurone blocking drugs

Adrenergic neurone blocking drugs prevent the release of noradrenaline from postganglionic adrenergic neurones. These drugs do not control supine blood pressure and may cause postural hypotension. For this reason they have largely fallen from use, but may be necessary with other therapy in resistant hypertension.

Guanethidine monosulfate, which also depletes the nerve endings of noradrenaline, is licensed for rapid control of blood pressure, however alternative treatments are preferred.

Alpha-adrenoceptor blocking drugs

Prazosin has post-synaptic alpha-blocking and vasodilator properties and rarely causes tachycardia. It may, however, reduce blood pressure rapidly after the first dose and should be introduced with caution. Doxazosin, indoramin p. 827, and terazosin have properties similar to those of prazosin.

Alpha-blockers can be used with other antihypertensive drugs in the treatment of resistant hypertension.

Prostatic hyperplasia

Alfuzosin hydrochloride p. 825, doxazosin, indoramin, prazosin, tamsulosin hydrochloride p. 828, and terazosin are indicated for benign prostatic hyperplasia.

Drugs affecting the renin-angiotensin system

Angiotensin-converting enzyme inhibitors

Angiotensin-converting enzyme inhibitors (ACE inhibitors) inhibit the conversion of angiotensin I to angiotensin II. They have many uses and are generally well tolerated. The main indications of ACE inhibitors are shown below.

Heart failure

ACE inhibitors are used in all grades of heart failure, usually combined with a beta-blocker. Potassium supplements and potassium-sparing diuretics should be discontinued before introducing an ACE inhibitor because of the risk of hyperkalaemia. However, a low dose of spironolactone p. 206 may be beneficial in severe heart failure and can be used with an ACE inhibitor provided serum potassium is monitored carefully. Profound first-dose hypotension may occur when ACE inhibitors are introduced to patients with heart failure who are already taking a high dose of a loop diuretic (e.g. furosemide p. 241 80 mg daily or more). Temporary withdrawal of the loop diuretic reduces the risk, but may cause severe rebound pulmonary oedema. Therefore, for patients on high doses of loop diuretics, the ACE inhibitor may need to be initiated under specialist supervision. An ACE inhibitor can be initiated in the community in patients who are receiving a low dose of a diuretic or who are not otherwise at risk of serious hypotension; nevertheless, care is required and a very low dose of the ACE inhibitor is given initially.

Hypertension

An ACE inhibitor may be the most appropriate initial drug for hypertension in younger Caucasian patients; Afro-Caribbean patients, those aged over 55 years, and those with primary aldosteronism respond less well. ACE inhibitors are particularly indicated for hypertension in patients with type 1 diabetes with nephropathy. They may reduce blood pressure very rapidly in some patients particularly in those receiving diuretic therapy.

Diabetic nephropathy

ACE inhibitors have a role in the management of diabetic nephropathy.

Prophylaxis of cardiovascular events

ACE inhibitors are used in the early and long-term management of patients who have had a myocardial infarction. ACE inhibitors may also have a role in preventing cardiovascular events.

Initiation under specialist supervision

ACE inhibitors should be initiated under specialist supervision and with careful clinical monitoring in those with severe heart failure or in those:

- receiving multiple or high-dose diuretic therapy (e.g. more than 80 mg of furosemide daily or its equivalent);
- receiving concomitant angiotensin-II receptor antagonist or aliskiren;
- with hypovolaemia;
- with hyponatraemia (plasma-sodium concentration below 130 mmol/litre);
- with hypotension (systolic blood pressure below 90 mmHg);
- with unstable heart failure;

- receiving high-dose vasodilator therapy;
- known renovascular disease.

Renal effects

Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if features mentioned below present); hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function and the dose may need to be reduced. Although ACE inhibitors now have a specialised role in some forms of renal disease, including chronic kidney disease, they also occasionally cause impairment of renal function which may progress and become severe in other circumstances (at particular risk are the elderly). A specialist should be involved if renal function is significantly reduced as a result of treatment with an ACE inhibitor.

Concomitant treatment with NSAIDs increases the risk of renal damage, and potassium-sparing diuretics (or potassium-containing salt substitutes) increase the risk of hyperkalaemia.

In patients with severe bilateral renal artery stenosis (or severe stenosis of the artery supplying a single functioning kidney), ACE inhibitors reduce or abolish glomerular filtration and are likely to cause severe and progressive renal failure. They are therefore not recommended in patients known to have these forms of critical renovascular disease.

ACE inhibitor treatment is unlikely to have an adverse effect on overall renal function in patients with severe unilateral renal artery stenosis and a normal contralateral kidney, but glomerular filtration is likely to be reduced (or even abolished) in the affected kidney and the long-term consequences are unknown.

ACE inhibitors are therefore best avoided in patients with known or suspected renovascular disease, unless the blood pressure cannot be controlled by other drugs. If ACE inhibitors are used, they should be initiated only under specialist supervision and renal function should be monitored regularly.

ACE inhibitors should also be used with particular caution in patients who may have undiagnosed and clinically silent renovascular disease. This includes patients with peripheral vascular disease or those with severe generalised atherosclerosis.

ACE inhibitors in combination with other drugs

See also, *Concomitant use of drugs affecting the renin-angiotensin system*, below.

Concomitant diuretics

ACE inhibitors can cause a very rapid fall in blood pressure in volume-depleted patients; treatment should therefore be initiated with very low doses. If the dose of diuretic is greater than 80 mg furosemide or equivalent, the ACE inhibitor should be initiated under close supervision and in some patients the diuretic dose may need to be reduced or the diuretic discontinued at least 24 hours beforehand (may not be possible in heart failure—risk of pulmonary oedema). If high-dose diuretic therapy cannot be stopped, close observation is recommended after administration of the first dose of ACE inhibitor, for at least 2 hours or until the blood pressure has stabilised.

Combination products

Products incorporating an ACE inhibitor with a thiazide diuretic or a calcium-channel blocker are available for the management of hypertension. Use of these combination products should be reserved for patients whose blood pressure has not responded adequately to a single antihypertensive drug and who have been stabilised on the individual components of the combination in the same proportions.

Angiotensin-II receptor antagonists

Azilsartan medoxomil p. 186, candesartan cilexetil p. 186, eprosartan p. 187, irbesartan p. 187, losartan potassium p. 187, olmesartan medoxomil p. 188, telmisartan p. 189, and valsartan p. 190 are angiotensin-II receptor antagonists with many properties similar to those of the ACE inhibitors. However, unlike ACE inhibitors, they do not inhibit the breakdown of bradykinin and other kinins, and thus are less likely to cause the persistent dry cough which can complicate ACE inhibitor therapy. They are therefore a useful alternative for patients who have to discontinue an ACE inhibitor because of persistent cough.

An angiotensin-II receptor antagonist may be used as an alternative to an ACE inhibitor in the management of heart failure or diabetic nephropathy. Candesartan cilexetil and valsartan are also licensed as adjuncts to ACE inhibitors under specialist supervision, in the management of heart failure when other treatments are unsuitable.

Renal effects

Angiotensin-II receptor antagonists should be used with caution in renal artery stenosis (see also Renal effects under Angiotensin-converting enzyme inhibitors, above).

Renin inhibitor

Aliskiren is a renin inhibitor that is licensed for the treatment of hypertension.

Concomitant use of drugs affecting the renin-angiotensin system

Combination therapy with two drugs affecting the renin-angiotensin system (ACE inhibitors, angiotensin-II receptor antagonists, and aliskiren p. 191 is not recommended due to an increased risk of hyperkalaemia, hypotension, and renal impairment, compared to use of a single drug. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor with an angiotensin-II receptor antagonist. There is some evidence that the benefits of combination use of an ACE inhibitor with candesartan or valsartan may outweigh the risks in selected patients with heart failure for whom other treatments are unsuitable, however, the concomitant use of this combination, together with an aldosterone antagonist or a potassium-sparing diuretic is not recommended.

For patients currently taking combination therapy, the need for continued combined therapy should be reviewed. If combination therapy is considered essential, it should be carried out under specialist supervision, with close monitoring of blood pressure, renal function, and electrolytes (particularly potassium); monitoring should be considered at the start of treatment, then monthly, and also after any change in dose or during intercurrent illness.

Other drugs used for Hypertension Amiloride hydrochloride, p. 243 · Chlortalidone, p. 244 · Cotriamterizide, p. 245 · Metolazone, p. 245 · Torasemide, p. 242 · Triamterene with chlortalidone, p. 244 · Xipamide, p. 245

ANTIHYPERTENSIVES, CENTRALLY ACTING

Clonidine hydrochloride

15-Jan-2020

● INDICATIONS AND DOSE

Hypertension

► BY MOUTH

- Adult: Initially 50–100 micrograms 3 times a day, increase dose every second or third day, usual maximum dose 1.2 mg daily

Prevention of recurrent migraine | Prevention of vascular headache | Menopausal symptoms, particularly flushing and vasomotor conditions

► BY MOUTH

- Adult: Initially 50 micrograms twice daily for 2 weeks, then increased if necessary to 75 micrograms twice daily
- **UNLICENSED USE** Clonidine may also be used for Tourette syndrome and sedation—unlicensed indications.
- **CONTRA-INDICATIONS** Severe bradyarrhythmia secondary to second- or third-degree AV block or sick sinus syndrome
- **CAUTIONS** Cerebrovascular disease · constipation · heart failure · history of depression · mild to moderate bradyarrhythmia · polynuropathy · Raynaud's syndrome or other occlusive peripheral vascular disease
CAUTIONS, FURTHER INFORMATION
- Elderly For centrally-acting antihypertensives, prescription potentially inappropriate (STOPP criteria), unless clear intolerance of, or lack of efficacy with, other classes of antihypertensives (generally less well tolerated by older people).
See also Prescribing in the elderly p. 33.
- **INTERACTIONS** → Appendix 1: clonidine
- **SIDE-EFFECTS**
- **Common or very common** Constipation · depression · dizziness · dry mouth · fatigue · headache · nausea · postural hypotension · salivary gland pain · sedation · sexual dysfunction · sleep disorders · vomiting
- **Uncommon** Delusions · hallucination · malaise · paraesthesia · Raynaud's phenomenon · skin reactions
- **Rare or very rare** Alopecia · atrioventricular block · dry eye · gynaecomastia · intestinal pseudo-obstruction · nasal dryness
- **Frequency not known** Accommodation disorder · arrhythmias · confusion
- **PREGNANCY** May lower fetal heart rate. Avoid oral use unless potential benefit outweighs risk. Avoid using injection.
- **BREAST FEEDING** Avoid—present in milk.
- **RENAL IMPAIRMENT**
Dose adjustments Use with caution in severe impairment—reduce initial dose and increase gradually.
- **TREATMENT CESSATION** In hypertension, must be withdrawn gradually to avoid severe rebound hypertension.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.
- **LESS SUITABLE FOR PRESCRIBING** Clonidine is less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

Tablet

CAUTIONARY AND ADVISORY LABELS 3, 8

► Clonidine hydrochloride (Non-proprietary)

Clonidine hydrochloride 25 microgram Clonidine 25microgram tablets | 112 tablet [POM] £14.44 DT = £4.58

► Catapres (Boehringer Ingelheim Ltd)

Clonidine hydrochloride 100 microgram Catapres 100microgram tablets | 100 tablet [POM] £8.04 DT = £8.04

Oral solution

► Clonidine hydrochloride (Non-proprietary)

Clonidine hydrochloride 10 microgram per 1 ml Clonidine 50micrograms/5ml oral solution sugar-free | 100 ml [POM] £86.69 DT = £85.73

Methyldopa

20-Jan-2020

● INDICATIONS AND DOSE

Hypertension

► BY MOUTH

- Adult: Initially 250 mg 2–3 times a day, dose should be increased gradually at intervals of at least 2 days; maximum 3 g per day
- Elderly: Initially 125 mg twice daily, dose should be increased gradually; maximum 2 g per day

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · depression · paraganglioma · pheochromocytoma

- **CAUTIONS** History of hepatic impairment

CAUTIONS, FURTHER INFORMATION

- **Elderly** For centrally-acting antihypertensives, prescription potentially inappropriate (STOPP criteria), unless clear intolerance of, or lack of efficacy with, other classes of antihypertensives (generally less well tolerated by older people).

See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: methyldopa

- **SIDE-EFFECTS** Abdominal distension · amenorrhoea · angina pectoris · angioedema · arthralgia · asthenia · atrioventricular block · bone marrow failure · bradycardia · breast enlargement · cardiac inflammation · carotid sinus syndrome · cerebrovascular insufficiency · choreoathetosis · cognitive impairment · constipation · depression · diarrhoea · dizziness · dry mouth · eosinophilia · facial paralysis · fever · gastrointestinal disorders · granulocytopenia · gynaecomastia · haemolytic anaemia · headache · hepatic disorders · hyperprolactinaemia · lactation disorder · leucopenia · lupus-like syndrome · myalgia · nasal congestion · nausea · nightmare · oedema · pancreatitis · paraesthesia · parkinsonism · postural hypotension · psychiatric disorder · psychosis · sedation · sexual dysfunction · sialadenitis · skin reactions · thrombocytopenia · tongue burning · tongue discoloration · toxic epidermal necrolysis · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Side-effects are minimised if the daily dose is kept below 1g; discontinue permanently if fever or hepatic disorders occur.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in active disease.

- **RENAL IMPAIRMENT** Increased sensitivity to hypotensive and sedative effect.

Dose adjustments Start with small dose.

- **MONITORING REQUIREMENTS** Monitor blood counts and liver-function before treatment and at intervals during first 6–12 weeks or if unexplained fever occurs.

- **EFFECT ON LABORATORY TESTS** Interference with laboratory tests. Positive direct Coombs' test in up to 20% of patients (may affect blood cross-matching).

● PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

Moxonidine

16-Jan-2020

● INDICATIONS AND DOSE

Mild to moderate essential hypertension

► BY MOUTH

- **Adult:** 200 micrograms once daily for 3 weeks, dose to be taken in the morning, then increased if necessary to 400 micrograms daily in 1–2 divided doses (max. per dose 400 micrograms), maximum daily dose to be given in 2 divided doses; maximum 600 micrograms per day

- **CONTRA-INDICATIONS** Bradycardia · second- or third-degree AV block · severe heart failure · sick sinus syndrome · sino-atrial block

- **CAUTIONS** First-degree AV block · moderate heart failure · severe coronary artery disease · unstable angina

CAUTIONS, FURTHER INFORMATION

- **Elderly** For centrally-acting antihypertensives, prescription potentially inappropriate (STOPP criteria), unless clear intolerance of, or lack of efficacy with, other classes of antihypertensives (generally less well tolerated by older people).

See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: moxonidine

● SIDE-EFFECTS

- **Common or very common** Asthenia · diarrhoea · dizziness · drowsiness · dry mouth · dyspepsia · headache · insomnia · nausea · pain · skin reactions · vertigo · vomiting
- **Uncommon** Angioedema · bradycardia · nervousness · oedema · syncope · tinnitus

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Present in milk—manufacturer advises avoid.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments Max. single dose 200 micrograms and max. daily dose 400 micrograms if eGFR 30–60 mL/minute/1.73 m².

- **TREATMENT CESSATION** Avoid abrupt withdrawal (if concomitant treatment with beta-blocker has to be stopped, discontinue beta-blocker first, then moxonidine after a few days).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

BETA-ADRENOCEPTOR BLOCKERS

2

Cardiovascular system

Beta-adrenoceptor blocking drugs

13-Dec-2019

Overview

Beta-adrenoceptor blocking drugs (beta-blockers) block the beta-adrenoceptors in the heart, peripheral vasculature, bronchi, pancreas, and liver.

Many beta-blockers are now available and in general they are all equally effective. There are, however, differences between them, which may affect choice in treating particular diseases or individual patients.

Intrinsic sympathomimetic activity (ISA, partial agonist activity) represents the capacity of beta-blockers to stimulate as well as to block adrenergic receptors. Celiprolol hydrochloride p. 165, pindolol p. 161, acebutolol p. 163, and oxprenolol hydrochloride have intrinsic sympathomimetic activity; they tend to cause less bradycardia than the other beta-blockers and may also cause less coldness of the extremities.

Some beta-blockers are lipid soluble and some are water soluble. Water-soluble beta-blockers (such as atenolol p. 164, celiprolol hydrochloride, nadolol p. 161, and sotalolol hydrochloride p. 115) are less likely to enter the brain, and may therefore cause less sleep disturbance and nightmares. Water-soluble beta-blockers are excreted by the kidneys and dosage reduction is often necessary in renal impairment.

Beta-blockers with a relatively short duration of action have to be given two or three times daily. Many of these are, however, available in modified-release formulations so that administration once daily is adequate for hypertension. For angina twice-daily treatment may sometimes be needed even with a modified-release formulation. Some beta-blockers, such as atenolol, bisoprolol fumarate p. 165, celiprolol hydrochloride, and nadolol, have an intrinsically longer duration of action and need to be given only once daily.

Beta-blockers slow the heart and can depress the myocardium; they are contra-indicated in patients with second- or third-degree heart block. Beta-blockers should also be avoided in patients with worsening unstable heart failure; care is required when initiating a beta-blocker in those with stable heart failure.

Labetalol hydrochloride p. 160, celiprolol hydrochloride, carvedilol p. 160, and nebivolol p. 167 are beta-blockers that have, in addition, an arteriolar vasodilating action, by diverse mechanisms, and thus lower peripheral resistance. There is no evidence that these drugs have important advantages over other beta-blockers in the treatment of hypertension.

Beta-blockers can precipitate bronchospasm and should therefore usually be avoided in patients with a history of asthma. When there is no suitable alternative, it may be necessary for a patient with well-controlled asthma, or chronic obstructive pulmonary disease (without significant reversible airways obstruction), to receive treatment with a beta-blocker for a co-existing condition (e.g. heart failure or following myocardial infarction). In this situation, a cardioselective beta-blocker should be selected and initiated at a low dose by a specialist; the patient should be closely monitored for adverse effects. Atenolol, bisoprolol fumarate, metoprolol tartrate p. 166, nebivolol, and (to a lesser extent) acebutolol, have less effect on the beta₂(bronchial) receptors and are, therefore, relatively *cardioselective*, but they are not *cardiospecific*. They have a lesser effect on airways resistance but are not free of this side-effect.

Beta-blockers are also associated with fatigue, coldness of the extremities (may be less common with those with ISA), and sleep disturbances with nightmares (may be less common with the water-soluble beta-blockers).

Beta-blockers can affect carbohydrate metabolism, causing hypoglycaemia or hyperglycaemia in patients with or without diabetes; they can also interfere with metabolic and autonomic responses to hypoglycaemia, thereby masking symptoms such as tachycardia. However, beta-blockers are not contra-indicated in diabetes, although the cardioselective beta-blockers may be preferred. Beta-blockers should be avoided altogether in those with frequent episodes of hypoglycaemia. Beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or in those at high risk of developing diabetes.

Hypertension

The mode of action of beta-blockers in hypertension is not understood, but they reduce cardiac output, alter baroreceptor reflex sensitivity, and block peripheral adrenoceptors. Some beta-blockers depress plasma renin secretion. It is possible that a central effect may also partly explain their mode of action.

Beta-blockers are effective for reducing blood pressure but other antihypertensives are usually more effective for reducing the incidence of stroke, myocardial infarction, and cardiovascular mortality, especially in the elderly. Other antihypertensives are therefore preferred for routine initial treatment of uncomplicated hypertension.

In general, the dose of a beta-blocker does not have to be high.

Beta-blockers can be used to control the pulse rate in patients with *phaeochromocytoma*. However, they should never be used alone as beta-blockade without concurrent alpha-blockade may lead to a hypertensive crisis. For this reason phenoxybenzamine hydrochloride p. 193 should always be used together with the beta-blocker.

Angina

By reducing cardiac work beta-blockers improve exercise tolerance and relieve symptoms in patients with *angina* (see management of stable angina and acute coronary syndromes for further details). As with hypertension there is no good evidence of the superiority of any one drug, although occasionally a patient will respond better to one beta-blocker than to another. There is some evidence that sudden withdrawal may cause an exacerbation of angina and therefore gradual reduction of dose is preferable when beta-blockers are to be stopped. There is a risk of precipitating heart failure when beta-blockers and verapamil are used together in established ischaemic heart disease.

Myocardial infarction

For specific comments see management of ST-segment elevation myocardial infarction and non-ST-segment elevation myocardial infarction.

Several studies have shown that some beta-blockers can reduce the recurrence rate of *myocardial infarction*. However, uncontrolled heart failure, hypotension, bradyarrhythmias, and obstructive airways disease render beta-blockers unsuitable in some patients following a myocardial infarction. Atenolol and metoprolol tartrate may reduce early mortality after intravenous and subsequent oral administration in the acute phase, while acebutolol, metoprolol tartrate, propranolol hydrochloride p. 162, and timolol maleate p. 163 have protective value when started in the early convalescent phase. The evidence relating to other beta-blockers is less convincing; some have not been tested in trials of secondary prevention.

Arrhythmias

Beta-blockers act as *anti-arrhythmic drugs* principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. They can be

used in conjunction with digoxin to control the ventricular response in atrial fibrillation, especially in patients with thyrotoxicosis. Beta-blockers are also useful in the management of supraventricular tachycardias, and are used to control those following myocardial infarction.

Esmolol hydrochloride p. 166 is a relatively cardioselective beta-blocker with a very short duration of action, used intravenously for the short-term treatment of supraventricular arrhythmias, sinus tachycardia, or hypertension, particularly in the peri-operative period. It may also be used in other situations, such as acute myocardial infarction, when sustained beta-blockade might be hazardous.

Sotalol hydrochloride p. 115, a non-cardioselective beta-blocker with additional class III anti-arrhythmic activity, is used for prophylaxis in paroxysmal supraventricular arrhythmias. It also suppresses ventricular ectopic beats and non-sustained ventricular tachycardia. It has been shown to be more effective than lidocaine in the termination of spontaneous sustained ventricular tachycardia due to coronary disease or cardiomyopathy. However, it may induce torsade de pointes in susceptible patients.

Heart failure

Beta-blockers may produce benefit in heart failure by blocking sympathetic activity. Bisoprolol fumarate p. 165 and carvedilol p. 160 reduce mortality in any grade of stable heart failure; nebivolol p. 167 is licensed for stable mild to moderate heart failure in patients over 70 years. Ideally, treatment should be initiated by those experienced in the management of heart failure.

Thyrotoxicosis

Beta-blockers are used in pre-operative preparation for thyroidectomy. Administration of propranolol hydrochloride p. 162 can reverse clinical symptoms of *thyrotoxicosis* within 4 days. Routine tests of increased thyroid function remain unaltered. The thyroid gland is rendered less vascular thus making surgery easier.

Other uses

Beta-blockers have been used to alleviate some symptoms of *anxiety*; probably patients with palpitation, tremor, and tachycardia respond best. Beta-blockers are also used in the *prophylaxis of migraine*. Betaxolol p. 1243, levobunolol hydrochloride p. 1244, and timolol maleate p. 163 are used topically in *glaucoma*.

Beta-adrenoceptor blockers (systemic)

● **CONTRA-INDICATIONS** Asthma · cardiogenic shock · hypotension · marked bradycardia · metabolic acidosis · phaeochromocytoma (apart from specific use with alpha-blockers) · Prinzmetal's angina · second-degree AV block · severe peripheral arterial disease · sick sinus syndrome · third-degree AV block · uncontrolled heart failure

CONTRA-INDICATIONS, FURTHER INFORMATION

● **Bronchospasm** Beta-blockers, including those considered to be cardioselective, should usually be avoided in patients with a history of asthma, bronchospasm or a history of obstructive airways disease. However, when there is no alternative, a cardioselective beta-blocker can be given to these patients with caution and under specialist supervision. In such cases the risk of inducing bronchospasm should be appreciated and appropriate precautions taken.

● **CAUTIONS** Diabetes · first-degree AV block · history of obstructive airways disease (introduce cautiously) · myasthenia gravis · portal hypertension (risk of

deterioration in liver function) · psoriasis · symptoms of hypoglycaemia may be masked · symptoms of thyrotoxicosis may be masked

CAUTIONS, FURTHER INFORMATION

- ▶ **Elderly** Prescription potentially inappropriate (STOPP criteria):
 - in combination with verapamil or diltiazem (risk of heart block)
 - with bradycardia (heart rate less than 50 beats per minute), type II heart block or complete heart block (risk of complete heart block, asystole)
 - in diabetes mellitus patients with frequent hypoglycaemic episodes (risk of suppressing hypoglycaemic symptoms)
 - if prescribed a **non-selective** beta-blocker (including topical beta-blockers) in a history of asthma requiring treatment (risk of increased bronchospasm)
- See also Prescribing in the elderly p. 33.

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal discomfort · bradycardia · confusion · depression · diarrhoea · dizziness · dry eye (reversible on discontinuation) · dyspnoea · erectile dysfunction · fatigue · headache · heart failure · nausea · paraesthesia · peripheral coldness · peripheral vascular disease · rash (reversible on discontinuation) · sleep disorders · syncope · visual impairment · vomiting
- ▶ **Uncommon** Atrioventricular block · bronchospasm
- ▶ **Rare or very rare** Hallucination

SIDE-EFFECTS, FURTHER INFORMATION With administration by intravenous injection, excessive bradycardia can occur and may be countered with **intravenous injection** of atropine sulfate.

Overdose Therapeutic overdoses with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. With administration by intravenous injection, excessive bradycardia can occur and may be countered with intravenous injection of atropine sulfate.

For details on the management of poisoning, see Beta-blockers, under Emergency treatment of poisoning.

- **ALLERGY AND CROSS-SENSITIVITY** Caution is advised in patients with a history of hypersensitivity—may increase sensitivity to allergens and result in more serious hypersensitivity response. Furthermore beta-adrenoceptor blockers may reduce response to adrenaline (epinephrine).
- **PREGNANCY** Beta-blockers may cause intra-uterine growth restriction, neonatal hypoglycaemia, and bradycardia; the risk is greater in severe hypertension.
- **BREAST FEEDING** With systemic use in the mother, infants should be monitored as there is a risk of possible toxicity due to beta-blockade. However, the amount of most beta-blockers present in milk is too small to affect infants.
- **MONITORING REQUIREMENTS** Monitor lung function (in patients with a history of obstructive airway disease).
- **TREATMENT CESSATION** Avoid abrupt withdrawal especially in ischaemic heart disease. Sudden cessation of a beta-blocker can cause a rebound worsening of myocardial ischaemia and therefore gradual reduction of dose is preferable when beta-blockers are to be stopped.

BETA-ADRENOCEPTOR BLOCKERS >**ALPHA- AND BETA-ADRENOCEPTOR BLOCKERS****Carvedilol**

10-Mar-2020

INDICATIONS AND DOSE**Hypertension**

▶ BY MOUTH

- ▶ Adult: Initially 12.5 mg once daily for 2 days, then increased to 25 mg once daily; increased if necessary up to 50 mg daily, dose to be increased at intervals of at least 2 weeks and can be given as a single dose or in divided doses
- ▶ Elderly: Initially 12.5 mg daily, initial dose may provide satisfactory control

Angina

▶ BY MOUTH

- ▶ Adult: Initially 12.5 mg twice daily for 2 days, then increased to 25 mg twice daily

Adjunct to diuretics, digoxin, or ACE inhibitors in symptomatic chronic heart failure

▶ BY MOUTH

- ▶ Adult: Initially 3.125 mg twice daily, dose to be taken with food, then increased to 6.25 mg twice daily, then increased to 12.5 mg twice daily, then increased to 25 mg twice daily, dose should be increased at intervals of at least 2 weeks up to the highest tolerated dose, max. 25 mg twice daily in patients with severe heart failure or body-weight less than 85 kg; max. 50 mg twice daily in patients over 85 kg

- **CONTRA-INDICATIONS** Acute or decompensated heart failure requiring intravenous inotropes

- **INTERACTIONS** → Appendix 1: beta blockers, non-selective

SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · asthma · dyspepsia · eye irritation · fluid imbalance · genital oedema · hypercholesterolaemia · hyperglycaemia · hypoglycaemia · increased risk of infection · oedema · postural hypotension · pulmonary oedema · renal impairment · urinary disorders · weight increased
- ▶ **Uncommon** Alopecia · angina pectoris · constipation · hyperhidrosis · skin reactions
- ▶ **Rare or very rare** Dry mouth · hypersensitivity · leucopenia · nasal congestion · severe cutaneous adverse reactions (SCARs) · thrombocytopenia

- **PREGNANCY** Information on the safety of carvedilol during pregnancy is lacking. If carvedilol is used close to delivery, infants should be monitored for signs of alpha-blockade (as well as beta-blockade).

- **BREAST FEEDING** Infants should be monitored as there is a risk of possible toxicity due to alpha-blockade (in addition to beta-blockade).

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.

Dose adjustments Manufacturer advises dose adjustment may be required in moderate impairment.

- **MONITORING REQUIREMENTS** Monitor renal function during dose titration in patients with heart failure who also have renal impairment, low blood pressure, ischaemic heart disease, or diffuse vascular disease.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

Labetalol hydrochloride

10-Mar-2020

INDICATIONS AND DOSE**Controlled hypotension in anaesthesia**

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: (consult product literature or local protocols)

Hypertension of pregnancy

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 20 mg/hour, then increased if necessary to 40 mg/hour after 30 minutes, then increased if necessary to 80 mg/hour after 30 minutes, then increased if necessary to 160 mg/hour after 30 minutes, adjusted according to response; Usual maximum 160 mg/hour

▶ BY MOUTH

- ▶ Adult: Use dose for hypertension

Hypertension following myocardial infarction

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 15 mg/hour, then increased to up to 120 mg/hour, dose to be increased gradually

Hypertensive emergencies

▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 50 mg, to be given over at least 1 minute, then 50 mg every 5 minutes if required until a satisfactory response occurs; maximum 200 mg per course

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 2 mg/minute until a satisfactory response is achieved, then discontinue; usual dose 50–200 mg

Hypertension

▶ BY MOUTH

- ▶ Adult: Initially 100 mg twice daily, dose to be increased at intervals of 14 days; usual dose 200 mg twice daily, increased if necessary up to 800 mg daily in 2 divided doses, to be taken with food, higher doses to be given in 3–4 divided doses; maximum 2.4 g per day
- ▶ Elderly: Initially 50 mg twice daily, dose to be increased at intervals of 14 days; usual dose 200 mg twice daily, increased if necessary up to 800 mg daily in 2 divided doses, to be taken with food, higher doses to be given in 3–4 divided doses; maximum 2.4 g per day

▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 50 mg, dose to be given over at least 1 minute, then 50 mg after 5 minutes if required; maximum 200 mg per course

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 2 mg/minute until a satisfactory response is achieved, then discontinue; usual dose 50–200 mg

- **CAUTIONS** Liver damage

- **INTERACTIONS** → Appendix 1: beta blockers, non-selective

SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Drug fever · ejaculation failure · hypersensitivity · urinary disorders
- ▶ **Rare or very rare** Hepatic disorders · systemic lupus erythematosus (SLE) · toxic myopathy · tremor
- ▶ **Frequency not known** Alopecia · cyanosis · hyperhidrosis · hyperkalaemia · interstitial lung disease · lethargy · muscle cramps · nasal congestion · peripheral oedema · postural hypotension · psychosis · skin reactions · thrombocytopenia

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Fever · hypoglycaemia masked · thyrotoxicosis masked
- ▶ With oral use Photosensitivity reaction
- **PREGNANCY** The use of labetalol in maternal hypertension is not known to be harmful, except possibly in the first trimester. If labetalol is used close to delivery, infants should be monitored for signs of alpha-blockade (as well as beta blockade).
- **BREAST FEEDING** Infants should be monitored as there is a risk of possible toxicity due to alpha-blockade (in addition to beta-blockade).
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of slow metabolism).
Dose adjustments Manufacturer advises consider dose reduction.
- **RENAL IMPAIRMENT**
Dose adjustments Dose reduction may be required.
- **MONITORING REQUIREMENTS**
- ▶ Liver damage Severe hepatocellular damage reported after both short-term and long-term treatment. Appropriate laboratory testing needed at first symptom of liver dysfunction and if laboratory evidence of damage (or if jaundice) labetalol should be stopped and not restarted.
- **EFFECT ON LABORATORY TESTS** Interferes with laboratory tests for catecholamines.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give intermittently in Glucose 5% or Sodium chloride and glucose. Dilute to a concentration of 1 mg/mL; suggested volume 200 mL; adjust rate with in-line burette. Avoid upright position during and for 3 hours after intravenous administration.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

● **INDICATIONS AND SELE****Thyrotoxicosis (adjunct)**

- ▶ BY MOUTH
- ▶ Adult: 10–40 mg 3–4 times a day

Thyrotoxic crisis

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 1 mg, to be given over 1 minute, dose may be repeated if necessary at intervals of 2 minutes, maximum total dose is 5 mg in anaesthesia; maximum 10 mg per course

Hypertension

- ▶ BY MOUTH
- ▶ Adult: Initially 80 mg twice daily, dose should be increased at weekly intervals as required; maintenance 160–320 mg daily

Prophylaxis of variceal bleeding in portal hypertension

- ▶ BY MOUTH
- ▶ Adult: Initially 40 mg twice daily, then increased to 80 mg twice daily (max. per dose 160 mg twice daily), dose to be adjusted according to heart rate

Phaeochromocytoma (only with an alpha-blocker) in preparation for surgery

- ▶ BY MOUTH
- ▶ Adult: 60 mg daily for 3 days before surgery

Phaeochromocytoma (only with an alpha-blocker) in patients unsuitable for surgery

- ▶ BY MOUTH
- ▶ Adult: 30 mg daily

Angina

- ▶ BY MOUTH
- ▶ Adult: Initially 40 mg 2–3 times a day; maintenance 120–240 mg daily

Hypertrophic cardiomyopathy | Anxiety tachycardia

- ▶ BY MOUTH
- ▶ Adult: 10–40 mg 3–4 times a day

Anxiety with symptoms such as palpitation, sweating and tremor

- ▶ BY MOUTH
- ▶ Adult: 40 mg once daily, then increased if necessary to 40 mg 3 times a day

Prophylaxis after myocardial infarction

- ▶ BY MOUTH
- ▶ Adult: Initially 40 mg 4 times a day for 2–3 days, then 80 mg twice daily, start treatment 5 to 21 days after infarction

Essential tremor

- ▶ BY MOUTH
- ▶ Adult: Initially 40 mg 2–3 times a day; maintenance 80–160 mg daily

Migraine prophylaxis

- ▶ BY MOUTH
- ▶ Adult: 80–240 mg daily in divided doses

Arrhythmias

- ▶ BY MOUTH
- ▶ Adult: 10–40 mg 3–4 times a day
- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 1 mg, to be given over 1 minute, dose may be repeated if necessary at intervals of 2 minutes, maximum 10 mg per course (5 mg in anaesthesia)

IMPORTANT SAFETY INFORMATION**SAFE PRACTICE**

Propranolol has been confused with prednisolone; care must be taken to ensure the correct drug is prescribed and dispensed.

- **INTERACTIONS** → Appendix 1: beta blockers, non-selective
- **SIDE-EFFECTS**
- ▶ **Rare or very rare** Alopecia · memory loss · mood altered · neuromuscular dysfunction · postural hypotension · psychosis · skin reactions · thrombocytopenia
- ▶ **Frequency not known** Hypoglycaemia
- Overdose** Severe overdosages with propranolol may cause cardiovascular collapse, CNS depression, and convulsions.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of hepatic encephalopathy; risk of increased half-life).
- Dose adjustments** ▶ With oral use Manufacturer advises consider dose reduction.
- **RENAL IMPAIRMENT**
- Dose adjustments** Manufacturer advises caution; dose reduction may be required.
- **PRESCRIBING AND DISPENSING INFORMATION** Modified-release preparations can be used for once daily administration.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

F 159

Timolol maleate

31-Jul-2019

● **INDICATIONS AND DOSE****Hypertension**

▶ BY MOUTH

- ▶ Adult: Initially 10 mg daily in 1–2 divided doses, then increased if necessary up to 60 mg daily, doses to be increased gradually. Doses above 30 mg daily given in divided doses, usual maintenance 10–30 mg daily; maximum 60 mg per day

Angina

▶ BY MOUTH

- ▶ Adult: Initially 5 mg twice daily, then increased in steps of 10 mg daily (max. per dose 30 mg twice daily), to be increased every 3–4 days

Prophylaxis after myocardial infarction

▶ BY MOUTH

- ▶ Adult: Initially 5 mg twice daily for 2 days, then increased if tolerated to 10 mg twice daily

Migraine prophylaxis

▶ BY MOUTH

- ▶ Adult: 10–20 mg daily in 1–2 divided doses

- **INTERACTIONS** → Appendix 1: beta blockers, non-selective

● **SIDE-EFFECTS**

- ▶ Rare or very rare Arthralgia · retroperitoneal fibrosis · skin reactions
- ▶ Frequency not known Cyanosis · drowsiness · dyspepsia · psychosis · vertigo

- **BREAST FEEDING** Manufacturer advises avoidance.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

Dose adjustments Manufacturer advises consider dose reduction.

● **RENAL IMPAIRMENT**

Dose adjustments Manufacturer advises caution—dose reduction may be required.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 8

- ▶ **Timolol maleate (Non-proprietary)**
Timolol maleate 10 mg Timolol 10mg tablets | 30 tablet [PoM] £39.89 DT = £39.89

Timolol with amiloride and hydrochlorothiazide

The properties listed below are those particular to the combination only. For the properties of the components please consider, timolol maleate above, amiloride hydrochloride p. 243, hydrochlorothiazide p. 178.

● **INDICATIONS AND DOSE****Hypertension**

- ▶ BY MOUTH
- ▶ Adult: 1–2 tablets daily

- **INTERACTIONS** → Appendix 1: beta blockers, non-selective · potassium-sparing diuretics · thiazide diuretics

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 8

- ▶ **Timolol with amiloride and hydrochlorothiazide (Non-proprietary)**
Amiloride hydrochloride 2.5 mg, Timolol maleate 10 mg, Hydrochlorothiazide 25 mg Timolol 10mg / Amiloride 2.5mg / Hydrochlorothiazide 25mg tablets | 28 tablet [PoM] £29.87

Timolol with bendroflumethiazide

The properties listed below are those particular to the combination only. For the properties of the components please consider, timolol maleate above, bendroflumethiazide p. 177.

● **INDICATIONS AND DOSE****Hypertension**

- ▶ BY MOUTH
- ▶ Adult: 1–2 tablets daily; maximum 4 tablets per day

- **INTERACTIONS** → Appendix 1: beta blockers, non-selective · thiazide diuretics

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 8

Atenolol**● INDICATIONS AND DOSE****Hypertension**

- ▶ BY MOUTH
- ▶ Adult: 25–50 mg daily, higher doses are rarely necessary

Angina

- ▶ BY MOUTH
- ▶ Adult: 100 mg daily in 1–2 divided doses

Arrhythmias

- ▶ BY MOUTH
- ▶ Adult: 50–100 mg daily
- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 2.5 mg every 5 minutes if required, to be given at a rate of 1 mg/minute, treatment course may be repeated every 12 hours if required; maximum 10 mg per course
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 150 micrograms/kg every 12 hours if required, to be given over 20 minutes

Migraine prophylaxis

- ▶ BY MOUTH
- ▶ Adult: 50–200 mg daily in divided doses

Early intervention within 12 hours of myocardial infarction

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: 5–10 mg, to be given at a rate of 1 mg/minute, followed by (by mouth) 50 mg after 15 minutes, then (by mouth) 50 mg after 12 hours, then (by mouth) 100 mg after 12 hours, then (by mouth) 100 mg once daily

- **UNLICENSED USE** Use of atenolol for migraine prophylaxis is an unlicensed indication.

IMPORTANT SAFETY INFORMATION**SAFE PRACTICE**

Atenolol has been confused with amlodipine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **INTERACTIONS** → Appendix 1: beta blockers, selective
- **SIDE-EFFECTS**
- ▶ **Common or very common** Gastrointestinal disorder
- ▶ **Rare or very rare** Alopecia · dry mouth · hepatic disorders · mood altered · postural hypotension · psychosis · skin reactions · thrombocytopenia
- ▶ **Frequency not known** Hypersensitivity · lupus-like syndrome
- **BREAST FEEDING** Water soluble beta-blockers such as atenolol are present in breast milk in greater amounts than other beta-blockers.
- **RENAL IMPAIRMENT**
Dose adjustments ▶ With oral use Max. 50 mg daily if eGFR 15–35 mL/minute/1.73 m²; max. 25 mg daily or 50 mg on alternate days if eGFR less than 15 mL/minute/1.73 m².
 ▶ With intravenous use Max. 10 mg on alternate days if eGFR 15–35 mL/minute/1.73 m²; max. 10 mg every 4 days if eGFR less than 15 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Tenormin*®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Suggested infusion time 20 minutes.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection

Bisoprolol fumarate

07-Jun-2018

● INDICATIONS AND DOSE

Hypertension | Angina

▶ BY MOUTH

- ▶ **Adult:** 5–10 mg once daily; maximum 20 mg per day

Adjunct in heart failure

▶ BY MOUTH

- ▶ **Adult:** Initially 1.25 mg once daily for 1 week, dose to be taken in the morning, then increased if tolerated to 2.5 mg once daily for 1 week, then increased if tolerated to 3.75 mg once daily for 1 week, then increased if tolerated to 5 mg once daily for 4 weeks, then increased if tolerated to 7.5 mg once daily for 4 weeks, then increased if tolerated to 10 mg once daily; maximum 10 mg per day

- **CONTRA-INDICATIONS** Acute or decompensated heart failure requiring intravenous inotropes · sino-atrial block
- **CAUTIONS** Ensure heart failure not worsening before increasing dose
- **INTERACTIONS** → Appendix 1: beta blockers, selective
- **SIDE-EFFECTS**
▶ **Common or very common** Constipation
▶ **Uncommon** Muscle cramps · muscle weakness · postural hypotension
▶ **Rare or very rare** Allergic rhinitis · alopecia · auditory disorder · conjunctivitis · flushing · hepatitis · hypersensitivity · pruritus
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
Dose adjustments
▶ When used for angina or hypertension Manufacturer advises consider maximum dose of 10 mg once daily in severe impairment—consult product literature.
▶ When used for heart failure Manufacturer advises caution when titrating dose (no information available).
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose if eGFR less than 20 mL/minute/1.73 m² (max. 10 mg daily).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

F 159

Co-tenidone

● INDICATIONS AND DOSE

Hypertension

▶ BY MOUTH

- ▶ **Adult:** 50/12.5 mg daily, alternatively increased if necessary to 100/25 mg daily, doses higher than 50 mg atenolol rarely necessary

DOSE EQUIVALENCE AND CONVERSION

- ▶ A mixture of atenolol and chlortalidone in mass proportions corresponding to 4 parts of atenolol and 1 part chlortalidone.

- **INTERACTIONS** → Appendix 1: beta blockers, selective · thiazide diuretics
- **SIDE-EFFECTS**
▶ **Common or very common** Gastrointestinal disorder · glucose tolerance impaired
▶ **Rare or very rare** Alopecia · hepatic disorders · mood altered · neutropenia · psychosis

- ▶ **Frequency not known** Lupus-like syndrome
- ▶ **PREGNANCY** Avoid. Diuretics not used to treat hypertension in pregnancy.
- ▶ **BREAST FEEDING** Atenolol present in milk in greater amounts than some other beta-blockers. Possible toxicity due to beta-blockade—monitor infant. Large doses of chlorthalidone may suppress lactation.
- ▶ **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m²—consider alternative treatment.

- ▶ **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 8

Chlorthalidone 25 mg, Atenolol 100 mg Tenoretic 100mg/25mg tablets | 28 tablet [PoM] £10.36 DT = £1.82

Esmolol hydrochloride

F 159

INDICATIONS AND DOSE

Short-term treatment of supraventricular arrhythmias (including atrial fibrillation, atrial flutter, sinus tachycardia) | Tachycardia and hypertension in peri-operative period

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 50–200 micrograms/kg/minute, consult product literature for details of dose titration and doses during peri-operative period

- **INTERACTIONS** → Appendix 1: beta blockers, selective

SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · appetite decreased · concentration impaired · drowsiness · hyperhidrosis
- ▶ **Uncommon** Arrhythmias · chills · constipation · costochondritis · dry mouth · dyspepsia · fever · flushing · nasal congestion · oedema · pain · pallor · pulmonary oedema · respiratory disorders · seizure · skin reactions · speech disorder · taste altered · thinking abnormal · urinary retention
- ▶ **Rare or very rare** Cardiac arrest · extravasation necrosis · thrombophlebitis
- ▶ **Frequency not known** Angioedema · coronary vasospasm · hyperkalaemia · metabolic acidosis

- **BREAST FEEDING** Manufacturer advises avoidance.

- **RENAL IMPAIRMENT** Manufacturer advises caution.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection▶ **Esmolol hydrochloride (Non-proprietary)**

F 159

INDICATIONS AND DOSE**Hypertension**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Initially 100 mg daily, increased if necessary to 200 mg daily in 1–2 divided doses, high doses are rarely required; maximum 400 mg per day
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 200 mg once daily

Angina

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 50–100 mg 2–3 times a day
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 200–400 mg daily

Arrhythmias

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Usual dose 50 mg 2–3 times a day, then increased if necessary up to 300 mg daily in divided doses
- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: Up to 5 mg, dose to be given at a rate of 1–2 mg/minute, then up to 5 mg after 5 minutes if required, total dose of 10–15 mg

Migraine prophylaxis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 100–200 mg daily in divided doses
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 200 mg daily

Hyperthyroidism (adjunct)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 50 mg 4 times a day

In surgery

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: Initially 2–4 mg, given at induction or to control arrhythmias developing during anaesthesia, then 2 mg, repeated if necessary; maximum 10 mg per course

Early intervention within 12 hours of infarction

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 5 mg every 2 minutes, to a max. of 15 mg, followed by (by mouth) 50 mg every 6 hours for 48 hours, to be taken 15 minutes after intravenous injection; (by mouth) maintenance 200 mg daily in divided doses

- **INTERACTIONS** → Appendix 1: beta blockers, selective

SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Constipation · palpitations · postural disorders
- ▶ **Uncommon** Chest pain · drowsiness · dystrophic skin lesion · hyperhidrosis · muscle cramps · oedema · skin reactions · weight increased
- ▶ **Rare or very rare** Alopecia · arrhythmia · conjunctivitis · dry mouth · eye irritation · gangrene · hepatitis · rhinitis · sexual dysfunction · thrombocytopenia

SPECIFIC SIDE-EFFECTS

- ▶ **Uncommon**
- ▶ With intravenous use Cardiogenic shock · concentration impaired
- ▶ **Rare or very rare**
- ▶ With intravenous use Anxiety · arthralgia · atrioventricular block exacerbated · memory loss · photosensitivity reaction · taste altered · tinnitus
- ▶ With oral use Alertness decreased · arthritis · auditory disorder · personality disorder
- ▶ **Frequency not known**
- ▶ With oral use Peyronie's disease · retroperitoneal fibrosis

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (bioavailability may be increased in patients with liver cirrhosis).

Dose adjustments Manufacturer advises consider dose reduction in severe impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 8

- **Metoprolol tartrate (Non-proprietary)**

Metoprolol tartrate 50 mg Metoprolol 50mg tablets | 28 tablet [PoM] £4.35 DT = £3.63 | 56 tablet [PoM] £7.26

Metoprolol tartrate 100 mg Metoprolol 100mg tablets | 28 tablet [PoM] £4.62 DT = £3.46 | 56 tablet [PoM] £6.92

Solution for injection

- **Betaloc** (Recordati Pharmaceuticals Ltd)

Metoprolol tartrate 1 mg per 1 ml Betaloc I.V. 5mg/5ml solution for injection ampoules | 5 ampoule [PoM] £5.02 (Hospital only)

Nebivolol

● INDICATIONS AND DOSE

Essential hypertension

- BY MOUTH

- **Adult:** 5 mg daily
- **Elderly:** Initially 2.5 mg daily, then increased if necessary to 5 mg daily

Hypertension in patient with renal impairment

- BY MOUTH

- **Adult:** Initially 2.5 mg once daily, then increased if necessary to 5 mg once daily

Adjunct in stable mild to moderate heart failure

- BY MOUTH

- **Adult 70 years and over:** Initially 1.25 mg once daily for 1–2 weeks, then increased if tolerated to 2.5 mg once daily for 1–2 weeks, then increased if tolerated to 5 mg once daily for 1–2 weeks, then increased if tolerated to 10 mg once daily

- **CONTRA-INDICATIONS** Acute or decompensated heart failure requiring intravenous inotropes
- **INTERACTIONS** → Appendix 1: beta blockers, selective
- **SIDE-EFFECTS**
 - **Common or very common** Constipation · oedema · postural hypertension
 - **Uncommon** Dyspepsia · flatulence · skin reactions
- **BREAST FEEDING** Manufacturers advise avoidance.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid (limited information available).
- **RENAL IMPAIRMENT** Manufacturer advises avoid in heart failure if serum creatinine greater than 250 micromol/litre.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 8

- **Nebivolol (Non-proprietary)**

Nebivolol (as Nebivolol hydrochloride) 2.5 mg Nebivolol 2.5mg tablets | 28 tablet [PoM] £69.84 DT = £11.80

Nebivolol (as Nebivolol hydrochloride) 5 mg Nebivolol 5mg tablets | 28 tablet [PoM] £9.23 DT = £3.04

Nebivolol (as Nebivolol hydrochloride) 10 mg Nebivolol 10mg tablets | 28 tablet [PoM] £27.92 DT = £27.36

- **Nebilet** (A. Menarini Farmaceutica Internazionale SRL)

Nebivolol (as Nebivolol hydrochloride) 5 mg Nebilet 5mg tablets | 28 tablet [PoM] £9.23 DT = £3.04

CALCIUM-CHANNEL BLOCKERS

Calcium-channel blockers

Overview

Calcium-channel blockers differ in their predilection for the various possible sites of action and, therefore, their therapeutic effects are disparate, with much greater variation than those of beta-blockers. There are important differences between verapamil hydrochloride p. 175, diltiazem hydrochloride p. 169, and the dihydropyridine calcium-channel blockers (amlodipine p. 168, felodipine p. 171, lacidipine p. 172, lercanidipine hydrochloride p. 172, nicardipine hydrochloride p. 173, nifedipine p. 174, and nimodipine p. 122). [Evgri](#) Calcium channel blockers, with the exception of amlodipine, should be avoided in heart failure as they can further depress cardiac function and exacerbate symptoms. [E](#) For further guidance on the management of heart failure, see Chronic heart failure p. 204. With the exception of amlodipine, they can also increase mortality after myocardial infarction in patients with left ventricular dysfunction and pulmonary congestion.

Verapamil hydrochloride is used for the treatment of angina, hypertension, and arrhythmias. It is a highly negatively inotropic calcium channel-blocker and it reduces cardiac output, slows the heart rate, and may impair atrioventricular conduction. It may precipitate heart failure, exacerbate conduction disorders, and cause hypotension at high doses and should **not** be used with beta-blockers. Constipation is the most common side-effect.

Nifedipine relaxes vascular smooth muscle and dilates coronary and peripheral arteries. It has more influence on vessels and less on the myocardium than does verapamil hydrochloride, and unlike verapamil hydrochloride has no anti-arrhythmic activity. It rarely precipitates heart failure because any negative inotropic effect is offset by a reduction in left ventricular work.

Nicardipine hydrochloride has similar effects to those of nifedipine and may produce less reduction of myocardial contractility. Amlodipine and felodipine also resemble nifedipine and nicardipine hydrochloride in their effects and do not reduce myocardial contractility and they do not produce clinical deterioration in heart failure. They have a longer duration of action and can be given once daily. Nifedipine, nicardipine hydrochloride, amlodipine, and felodipine are used for the treatment of angina or hypertension. All are valuable in forms of angina associated with coronary vasospasm. Side-effects associated with vasodilatation such as flushing and headache (which become less obtrusive after a few days), and ankle swelling (which may respond only partially to diuretics) are common.

Intravenous nicardipine hydrochloride is licensed for the treatment of acute life-threatening hypertension, for example in the event of malignant arterial hypertension or hypertensive encephalopathy; aortic dissection, when a short-acting beta-blocker is not suitable, or in combination with a beta-blocker when beta-blockade alone is not effective; severe pre-eclampsia, when other intravenous anti-hypertensives are not recommended or are contra-indicated; and for treatment of postoperative hypertension.

Lacidipine and lercanidipine hydrochloride have similar effects to those of nifedipine and nicardipine hydrochloride; they are indicated for hypertension only.

Nimodipine is related to nifedipine but the smooth muscle relaxant effect preferentially acts on cerebral arteries. Its use is confined to prevention and treatment of vascular spasm following aneurysmal subarachnoid haemorrhage.

Diltiazem hydrochloride is effective in most forms of angina; the longer-acting formulation is also used for hypertension. It may be used in patients for whom beta-blockers are contra-indicated or ineffective. It has a less

negative inotropic effect than verapamil hydrochloride and significant myocardial depression occurs rarely. Nevertheless because of the risk of bradycardia it should be used with caution in association with beta-blockers.

Unstable angina

Calcium-channel blockers do not reduce the risk of myocardial infarction in unstable angina. The use of diltiazem hydrochloride or verapamil hydrochloride should be reserved for patients resistant to treatment with beta-blockers.

Calcium-channel blockers

● **DRUG ACTION** Calcium-channel blockers (less correctly called 'calcium-antagonists') interfere with the inward displacement of calcium ions through the slow channels of active cell membranes. They influence the myocardial cells, the cells within the specialised conducting system of the heart, and the cells of vascular smooth muscle. Thus, myocardial contractility may be reduced, the formation and propagation of electrical impulses within the heart may be depressed, and coronary or systemic vascular tone may be diminished.

CAUTIONS

Elderly Prescription potentially inappropriate (STOPP criteria) with persistent postural hypotension i.e. recurrent drop in systolic blood pressure ≥ 20 mmHg (risk of syncope and falls).

See also Prescribing in the elderly p. 33.

SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · dizziness · drowsiness · flushing · headache · nausea · palpitations · peripheral oedema · skin reactions · tachycardia · vomiting
- ▶ **Uncommon** Angioedema · depression · erectile dysfunction · gingival hyperplasia · myalgia · paraesthesia · syncope

Overdose Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation. For details on the management of poisoning, see Calcium-channel blockers, under Emergency treatment of poisoning

● **HEPATIC IMPAIRMENT** In general, manufacturers advise caution (risk of increased exposure).

● **TREATMENT CESSATION** There is some evidence that sudden withdrawal of calcium-channel blockers may be associated with an exacerbation of myocardial ischaemia.

above

Amlodipine

03-Mar-2020

● **DRUG ACTION** Amlodipine is a dihydropyridine calcium-channel blocker.

INDICATIONS AND DOSE

Prophylaxis of angina

BY MOUTH

- ▶ **Adult:** Initially 5 mg once daily; maximum 10 mg per day

Hypertension

BY MOUTH

- ▶ **Adult:** Initially 5 mg once daily; maximum 10 mg per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ Tablets from various suppliers may contain different salts (e.g. amlodipine besilate, amlodipine maleate, and amlodipine mesilate) but the strength is expressed

in terms of amlodipine (base); tablets containing different salts are considered interchangeable.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Amlodipine has been confused with nimodipine and atenolol; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CONTRA-INDICATIONS** Cardiogenic shock · significant aortic stenosis · unstable angina
- **INTERACTIONS** → Appendix 1: calcium channel blockers
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Asthenia · constipation · diarrhoea · dyspepsia · dyspnoea · gastrointestinal disorders · joint disorders · muscle cramps · oedema · vision disorders
 - ▶ **Uncommon** Alopecia · anxiety · arrhythmias · chest pain · cough · dry mouth · gynaecomastia · hyperhidrosis · hypotension · insomnia · malaise · mood altered · numbness · pain · rhinitis · taste altered · tinnitus · tremor · urinary disorders · weight changes
 - ▶ **Rare or very rare** Confusion · hepatic disorders · hyperglycaemia · hypersensitivity · leucopenia · muscle tone increased · myocardial infarction · pancreatitis · peripheral neuropathy · photosensitivity reaction · Stevens-Johnson syndrome · thrombocytopenia · vasculitis
 - ▶ **Frequency not known** Extrapyramidal symptoms · pulmonary oedema
- **PREGNANCY** No information available—manufacturer advises avoid, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT**

Dose adjustments Manufacturer advises initiate at low dose and titrate slowly (limited information available).
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be dispersed in water.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

▶ Amlodipine (Non-proprietary)

Amlodipine 1 mg per 1 ml Amlodipine 5mg/5ml oral solution sugar-free | 150 ml [PoM](#) £75.78 DT = £75.78

Amlodipine 2 mg per 1 ml Amlodipine 10mg/5ml oral solution sugar-free | 150 ml [PoM](#) £115.73 DT = £115.73

Oral suspension

▶ Amlodipine (Non-proprietary)

Amlodipine 1 mg per 1 ml Amlodipine 5mg/5ml oral suspension sugar-free | 150 ml [PoM](#) £70.00 DT = £70.00

Tablet

▶ Amlodipine (Non-proprietary)

Amlodipine 2.5 mg Amlodipine 2.5mg tablets | 28 tablet [PoM](#) £4.50

Amlodipine 5 mg Amlodipine 5mg tablets | 28 tablet [PoM](#) £9.99 DT = £0.84 | 500 tablet [PoM](#) £9.87-£14.82

Amlodipine 10 mg Amlodipine 10mg tablets | 28 tablet [PoM](#) £14.07 DT = £0.86 | 500 tablet [PoM](#) £10.17-£15.54

▶ **Istin** (Upjohn UK Ltd)

Amlodipine 5 mg Istin 5mg tablets | 28 tablet [PoM](#) £11.08 DT = £0.84

Amlodipine 10 mg Istin 10mg tablets | 28 tablet [PoM](#) £16.55 DT = £0.86

Combinations available: **Olmесartan with amlodipine**, p. 189 · **Olmесartan with amlodipine and hydrochlorothiazide**, p. 189

Amlodipine with valsartan

The properties listed below are those particular to the combination only. For the properties of the components please consider, amlodipine p. 168, valsartan p. 190.

● INDICATIONS AND DOSE

Hypertension in patients stabilised on the individual components in the same proportions

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists - calcium channel blockers

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Exforge** (Novartis Pharmaceuticals UK Ltd)
Amlodipine (as Amlodipine besilate) 5 mg, Valsartan 80 mg Exforge 5mg/80mg tablets | 28 tablet [PoM] £20.11 DT = £20.11
- ▶ **Amlodipine (as Amlodipine besilate) 10 mg, Valsartan 160 mg** Exforge 10mg/160mg tablets | 28 tablet [PoM] £26.51 DT = £26.51
- ▶ **Amlodipine (as Amlodipine besilate) 5 mg, Valsartan 160 mg** Exforge 5mg/160mg tablets | 28 tablet [PoM] £26.51 DT = £26.51

Diltiazem hydrochloride

14-Feb-2020

● INDICATIONS AND DOSE

Prophylaxis and treatment of angina

- ▶ BY MOUTH
- ▶ Adult: Initially 60 mg 3 times a day, adjusted according to response; maximum 360 mg per day
- ▶ Elderly: Initially 60 mg twice daily, adjusted according to response; maximum 360 mg per day

Chronic anal fissure

- ▶ BY RECTUM USING CREAM, OR BY RECTUM USING OINTMENT
- ▶ Adult: Apply twice daily until pain stops. Max. duration of use 8 weeks, apply to the anal canal, using 2% topical preparation
- ▶ BY MOUTH
- ▶ Adult: 60 mg twice daily until pain stops. Max. duration of use 8 weeks

ADIZEM-SR® CAPSULES

Mild to moderate hypertension

- ▶ BY MOUTH
- ▶ Adult: 120 mg twice daily, dose form not appropriate for initial dose titration

Angina

- ▶ BY MOUTH
- ▶ Adult: Initially 90 mg twice daily; increased if necessary to 180 mg twice daily, dose form not appropriate for initial dose titration in the elderly

ADIZEM-XL®

Angina | Mild to moderate hypertension

- ▶ BY MOUTH
- ▶ Adult: Initially 240 mg once daily, increased if necessary to 300 mg once daily
- ▶ Elderly: Initially 120 mg once daily, increased if necessary up to 300 mg once daily

ANGITIL® SR

Angina | Mild to moderate hypertension

- ▶ BY MOUTH
- ▶ Adult: Initially 90 mg twice daily; increased if necessary to 120–180 mg twice daily

ANGITIL® XL

Angina | Mild to moderate hypertension

- ▶ BY MOUTH
- ▶ Adult: Initially 240 mg once daily; increased if necessary to 300 mg once daily, dose form not appropriate for initial dose titration in the elderly

DILCARDIA® SR

Angina | Mild to moderate hypertension

- ▶ BY MOUTH
- ▶ Adult: Initially 90 mg twice daily; increased if necessary to 180 mg twice daily
- ▶ Elderly: Initially 60 mg twice daily; increased if necessary to 90 mg twice daily

DILZEM® SR

Angina | Mild to moderate hypertension

- ▶ BY MOUTH
- ▶ Adult: Initially 90 mg twice daily; increased if necessary up to 180 mg twice daily
- ▶ Elderly: Initially 60 mg twice daily; increased if necessary up to 180 mg twice daily

DILZEM® XL

Angina | Mild to moderate hypertension

- ▶ BY MOUTH
- ▶ Adult: Initially 180 mg once daily; increased if necessary to 360 mg once daily
- ▶ Elderly: Initially 120 mg once daily; increased if necessary to 360 mg once daily

SLOZEM®

Angina | Mild to moderate hypertension

- ▶ BY MOUTH
- ▶ Adult: Initially 240 mg once daily; increased if necessary to 360 mg once daily
- ▶ Elderly: Initially 120 mg once daily; increased if necessary to 360 mg once daily

TILDIEM RETARD®

Mild to moderate hypertension

- ▶ BY MOUTH
- ▶ Adult: Initially 90–120 mg twice daily; increased if necessary to 360 mg daily in divided doses
- ▶ Elderly: Initially 120 mg once daily; increased if necessary to 120 mg twice daily

Angina

- ▶ BY MOUTH
- ▶ Adult: Initially 90–120 mg twice daily; increased if necessary to 480 mg daily in divided doses
- ▶ Elderly: Up to 120 mg twice daily, dose form not appropriate for initial dose titration

TILDIEM® LA

Angina | Mild to moderate hypertension

- ▶ BY MOUTH
- ▶ Adult: Initially 200 mg once daily, to be taken with or before food, increased if necessary to 300–400 mg once daily; maximum 500 mg per day
- ▶ Elderly: Initially 200 mg once daily, increased if necessary to 300 mg once daily

VIAZEM® XL

Angina | Mild to moderate hypertension

- ▶ BY MOUTH
- ▶ Adult: Initially 180 mg once daily, adjusted according to response to 240 mg once daily; maximum 360 mg per day
- ▶ Elderly: Initially 120 mg once daily, adjusted according to response

continued →

ZEMTARD®**Angina**

▶ BY MOUTH

- ▶ Adult: 180–300 mg once daily, increased if necessary to 480 mg once daily
- ▶ Elderly: Initially 120 mg once daily, increased if necessary to 480 mg once daily

Mild to moderate hypertension

▶ BY MOUTH

- ▶ Adult: 180–300 mg once daily, increased if necessary to 360 mg once daily
- ▶ Elderly: Initially 120 mg once daily, increased if necessary to 360 mg once daily

- **UNLICENSED USE**  Diltiazem is used for the treatment of chronic anal fissures,  but it is not licensed for this indication.

● **CONTRA-INDICATIONS**

- ▶ With systemic use Acute porphyrias p. 1120 · cardiogenic shock · heart failure (with reduced ejection fraction) · left ventricular failure with pulmonary congestion · second- or third-degree AV block (unless pacemaker fitted) · severe bradycardia · sick sinus syndrome · significant aortic stenosis

CONTRA-INDICATIONS, FURTHER INFORMATION

Systemic absorption following rectal use is unknown, therefore consider the possibility of contra-indications listed for systemic use.

● **CAUTIONS**

- ▶ With systemic use Bradycardia (avoid if severe) · first degree AV block · prolonged PR interval · significantly impaired left ventricular function

CAUTIONS, FURTHER INFORMATION Systemic absorption following rectal use is unknown, therefore consider the possibility of cautions listed for systemic use.

- ▶ Elderly Prescription potentially inappropriate (STOPP criteria) in patients with NYHA Class III or IV heart failure (may worsen heart failure). See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: calcium channel blockers

● **SIDE-EFFECTS**

- **Common or very common** Cardiac conduction disorders · constipation · gastrointestinal discomfort · malaise
- ▶ **Uncommon** Arrhythmias · diarrhoea · insomnia · nervousness · postural hypotension
- ▶ **Rare or very rare** Dry mouth
- ▶ **Frequency not known** Cardiac arrest · congestive heart failure · extrapyramidal symptoms · fever · gynaecomastia · hepatitis · hyperglycaemia · hyperhidrosis · mood altered · photosensitivity reaction · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Systemic absorption following rectal use is unknown, therefore consider the possibility of side-effects listed for oral use.

Overdose ▶ With oral use In overdose, diltiazem has a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole.

● **PREGNANCY**

- ▶ With systemic use Avoid.

● **BREAST FEEDING**

- ▶ With systemic use Significant amount present in milk—no evidence of harm but avoid unless no safer alternative.

● **HEPATIC IMPAIRMENT**

Dose adjustments ▶ With systemic use In general, manufacturers advise initial dose reduction to 60 mg twice daily (or 120 mg daily if using a once daily formulation), increased gradually as required.

TILDIEM RETARD® For treatment of angina, dose form not appropriate for initial titration; manufacturer advises maximum 120 mg twice daily.

For mild to moderate hypertension, manufacturer advises initial dose reduction to 120 mg once daily; maximum 120 mg twice daily.

ANGITIL® SR Dose form not appropriate for initial dose titration.

ADIZEM-SR® CAPSULES Dose form not appropriate for initial dose titration.

DILCARDIA® SR Dose form not appropriate for initial titration; manufacturer advises maximum 90 mg twice daily in hypertension.

ANGITIL® XL Dose form not appropriate for initial dose titration.

TILDIEM® LA Manufacturer advises initial dose 200 mg daily; maximum 300 mg daily.

● **RENAL IMPAIRMENT**

Dose adjustments ▶ With systemic use Start with smaller dose.

TILDIEM RETARD® Dose for mild to moderate hypertension—initially 120 mg once a day; increased if necessary to 120 mg twice a day.

For treatment of angina, dose form not appropriate for initial titration; up to 120 mg twice a day may be required.

ADIZEM-XL® Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

DILZEM® XL Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

ZEMTARD® Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

DILCARDIA® SR Dose for angina and mild to moderate hypertension—initially 60 mg twice a day; maximum 90 mg twice a day.

ANGITIL® XL Dose form not appropriate for initial dose titration.

SLOZEM® Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

TILDIEM® LA Dose for angina and mild to moderate hypertension—initially 200 mg daily; increased if necessary to 300 mg daily.

VIAZEM® XL Dose for angina and mild to moderate hypertension—initially 120 mg once daily, adjusted according to response.

● **PRESCRIBING AND DISPENSING INFORMATION**

- ▶ With systemic use The standard formulations containing 60 mg diltiazem hydrochloride are licensed as generics and there is no requirement for brand name dispensing. Although their means of formulation has called for the strict designation 'modified-release', their duration of action corresponds to that of tablets requiring administration more frequently. Different versions of modified-release preparations containing more than 60 mg diltiazem hydrochloride may not have the same clinical effect. To avoid confusion between these different formulations of diltiazem, prescribers should specify the brand to be dispensed.

● **PATIENT AND CARER ADVICE**

TILDIEM RETARD® Tablet membrane may pass through gastro-intestinal tract unchanged, but being porous has no effect on efficacy.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

F 168

Felodipine

24-Feb-2020

- **DRUG ACTION** Felodipine is a dihydropyridine calcium-channel blocker.

INDICATIONS AND DOSE**Prophylaxis of angina**▶ **BY MOUTH**

- ▶ **Adult:** Initially 5 mg once daily; increased if necessary to 10 mg once daily, to be taken in the morning
- ▶ **Elderly:** Initially 2.5 mg once daily; increased if necessary to 10 mg once daily, to be taken in the morning

Hypertension▶ **BY MOUTH**

- ▶ **Adult:** Initially 5 mg once daily; usual maintenance 5–10 mg once daily, to be taken in the morning, doses above 20 mg daily rarely needed
- ▶ **Elderly:** Initially 2.5 mg daily; usual maintenance 5–10 mg once daily, to be taken in the morning, doses above 20 mg daily rarely needed

- **CONTRA-INDICATIONS** Cardiac outflow obstruction · significant cardiac valvular obstruction (e.g. aortic stenosis) · uncontrolled heart failure · unstable angina · within 1 month of myocardial infarction

- **CAUTIONS** Predisposition to tachycardia · severe left ventricular dysfunction

CAUTIONS, FURTHER INFORMATION Manufacturer advises discontinue if ischaemic pain occurs or existing pain worsens shortly after initiating treatment.

- **INTERACTIONS** → Appendix 1: calcium channel blockers

SIDE-EFFECTS▶ **Uncommon** Fatigue

- ▶ **Rare or very rare** Arthralgia · gingivitis · hypersensitivity vasculitis · photosensitivity reaction · sexual dysfunction · urinary frequency increased

- **PREGNANCY** Avoid; toxicity in *animal* studies; may inhibit labour.

- **BREAST FEEDING** Present in milk but amount probably too small to be harmful.

HEPATIC IMPAIRMENT

Dose adjustments Manufacturer advises consider dose reduction.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

▶ **Felodipine (Non-proprietary)**

Felodipine 5 mg Vascalpha 5mg modified-release tablets | 28 tablet **[PoM]** £1.99 DT = £4.21

Combinations available: **Ramipril with felodipine**, p. 185

F 168**Lacidipine**

14-Feb-2020

- **DRUG ACTION** Lacidipine is a dihydropyridine calcium-channel blocker.

INDICATIONS AND DOSE**Hypertension**▶ **BY MOUTH**

- ▶ **Adult:** Initially 2 mg daily; increased if necessary to 4 mg daily, then increased if necessary to 6 mg daily, dose increases should occur at intervals of 3–4 weeks, to be taken preferably in the morning

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · aortic stenosis · avoid within 1 month of myocardial infarction · cardiogenic shock · unstable angina
- **CAUTIONS** Cardiac conduction abnormalities · poor cardiac reserve
- **INTERACTIONS** → Appendix 1: calcium channel blockers
- **SIDE-EFFECTS**
- **Common or very common** Abdominal discomfort · asthenia · polyuria
- ▶ **Uncommon** Ischaemic heart disease
- ▶ **Rare or very rare** Muscle cramps · tremor
- **PREGNANCY** Manufacturer advises avoid; may inhibit labour.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT

Dose adjustments Manufacturer advises consider dose reduction if hypotension occurs.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet▶ **Lacidipine (Non-proprietary)**

Lacidipine 2 mg Lacidipine 2mg tablets | 28 tablet **[PoM]** £6.85 DT = £2.19

Lacidipine 4 mg Lacidipine 4mg tablets | 28 tablet **[PoM]** £6.85 DT = £2.25

Lacidipine 6 mg Lacidipine 6mg tablets | 28 tablet **[PoM]** £5.75

F 168**Lercanidipine hydrochloride**

14-Feb-2020

- **DRUG ACTION** Lercanidipine is a dihydropyridine calcium-channel blocker.

INDICATIONS AND DOSE**Mild to moderate hypertension**▶ **BY MOUTH**

- ▶ **Adult:** Initially 10 mg once daily; increased if necessary to 20 mg daily, dose can be adjusted after 2 weeks

- **CONTRA-INDICATIONS** Aortic stenosis · uncontrolled heart failure · unstable angina · within 1 month of myocardial infarction
- **CAUTIONS** Left ventricular dysfunction · sick sinus syndrome (if pacemaker not fitted)
- **INTERACTIONS** → Appendix 1: calcium channel blockers
- **SIDE-EFFECTS**
- ▶ **Rare or very rare** Angina pectoris · asthenia · chest pain · diarrhoea · dyspepsia · urinary disorders
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

Nicardipine hydrochloride

14-Feb-2020

- **DRUG ACTION** Nicardipine is a dihydropyridine calcium-channel blocker.

● INDICATIONS AND DOSE

Prophylaxis of angina

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- **Adult:** Initially 20 mg 3 times a day, then increased to 30 mg 3 times a day, dose increased after at least 3 days; usual dose 60–120 mg daily

Mild to moderate hypertension

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- **Adult:** Initially 20 mg 3 times a day, then increased to 30 mg 3 times a day, dose increased after at least 3 days; usual dose 60–120 mg daily

Life-threatening hypertension (specialist use only) | Post-operative hypertension (specialist use only)

► BY CONTINUOUS INTRAVENOUS INFUSION

- **Adult:** Initially 3–5 mg/hour for 15 minutes, increased in steps of 0.5–1 mg every 15 minutes, adjusted according to response, maximum rate 15 mg/hour, reduce dose gradually when target blood pressure achieved; maintenance 2–4 mg/hour
- **Elderly:** Initially 1–5 mg/hour, then adjusted in steps of 500 micrograms/hour after 30 minutes, adjusted according to response, maximum rate 15 mg/hour

Life-threatening hypertension in patients with hepatic or renal impairment (specialist use only) | Postoperative hypertension in patients with hepatic or renal impairment (specialist use only)

► BY CONTINUOUS INTRAVENOUS INFUSION

- **Adult:** Initially 1–5 mg/hour, then adjusted in steps of 500 micrograms/hour after 30 minutes, adjusted according to response, maximum rate 15 mg/hour

Acute life-threatening hypertension in pregnancy (specialist use only)

► BY CONTINUOUS INTRAVENOUS INFUSION

- **Adult:** Initially 1–5 mg/hour, then adjusted in steps of 500 micrograms/hour after 30 minutes, adjusted according to response, usual maximum rate 4 mg/hour in treatment of pre-eclampsia (maximum rate 15 mg/hour)

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS

Acute porphyria p. 1120 · cardiogenic shock · significant or advanced aortic stenosis · unstable or acute attacks of angina

SPECIFIC CONTRA-INDICATIONS

- With intravenous use avoid within 8 days of myocardial infarction · compensatory hypertension
- With oral use avoid within 1 month of myocardial infarction

● CAUTIONS

GENERAL CAUTIONS Congestive heart failure · elderly · increased risk of serious hypotension · ischaemic heart disease · pulmonary oedema · significantly impaired left ventricular function · stroke

SPECIFIC CAUTIONS

- With intravenous use Elevated intracranial pressure · portal hypertension

CAUTIONS, FURTHER INFORMATION Manufacturer advises discontinue if ischaemic pain occurs or existing pain worsens within 30 minutes of initiating treatment or increasing dose.

- **INTERACTIONS** → Appendix 1: calcium channel blockers

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Hypotension

- **Frequency not known** Pulmonary oedema · thrombocytopenia

SPECIFIC SIDE-EFFECTS

- With intravenous use Atrioventricular block · hepatic disorders · ischaemic heart disease · paralytic ileus
- With oral use Abdominal distress · angina pectoris exacerbated · asthenia · dyspnoea · feeling hot · hepatic function abnormal · insomnia · nervous system disorder · renal impairment · tinnitus · urinary frequency increased

SIDE-EFFECTS, FURTHER INFORMATION

Systemic hypotension and reflex tachycardia with rapid reduction of blood pressure may occur — during intravenous use consider stopping infusion or decreasing dose by half.

- **PREGNANCY** May inhibit labour. Not to be used in multiple pregnancy (twins or more) unless there is no other acceptable alternative. Toxicity in *animal* studies. Risk of severe maternal hypotension and fatal fetal hypoxia—avoid excessive decrease in blood pressure. For treatment of acute life-threatening hypertension only.

- **BREAST FEEDING** Manufacturer advises avoid—present in breast milk.

● HEPATIC IMPAIRMENT

Dose adjustments ► With oral use Manufacturer advises consider using lowest initial dose and extending dosing interval according to individual response.

- With intravenous use See Indications and dose section.

● RENAL IMPAIRMENT

Dose adjustments ► With oral use Consider using lowest initial dose and extending dosing interval according to individual response.

- With intravenous use Use with caution—use lower initial dose.

- **MONITORING REQUIREMENTS** Monitor blood pressure and heart rate at least every 5 minutes during intravenous infusion, and then until stable, and continue monitoring for at least 12 hours after end of infusion.

- **DIRECTIONS FOR ADMINISTRATION** Intravenous nicardipine should only be administered under the supervision of a specialist and in a hospital or intensive care setting in which patients can be closely monitored.

For *intravenous infusion* give continuously in Glucose 5%; dilute dose in infusion fluid to a final concentration of 100–200 micrograms/mL (undiluted solution *via* central venous line only) and give *via* volumetric infusion pump or syringe driver; protect from light; to minimise peripheral venous irritation, change site of infusion every 12 hours; risk of adsorption on to plastic of infusion set in the presence of saline solutions; incompatible with bicarbonate or alkaline solutions—consult product literature.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for infusion

- **Nicardipine hydrochloride (Non-proprietary)**

Nicardipine hydrochloride 1 mg per 1 mL Nicardipine 10mg/10ml solution for injection ampoules | 5 ampoule [PoM](#) £50.00

Nicardipine hydrochloride 2.5 mg per 1 mL Cardene I.V. 25mg/10ml solution for infusion ampoules | 10 ampoule [PoM](#) [X](#)

Capsule

- **Nicardipine hydrochloride (Non-proprietary)**

Nicardipine hydrochloride 20 mg Nicardipine 20mg capsules | 56 capsule [PoM](#) £8.38 DT = £7.65

Nicardipine hydrochloride 30 mg Nicardipine 30mg capsules | 56 capsule [PoM](#) £9.73 DT = £9.56

- **Cardene** (Astellas Pharma Ltd)

Nicardipine hydrochloride 20 mg Cardene 20mg capsules | 56 capsule [PoM](#) £6.00 DT = £7.65

Nicardipine hydrochloride 30 mg Cardene 30mg capsules | 56 capsule [PoM](#) £6.96 DT = £9.56

Nifedipine

F 168
10-Mar-2020

● INDICATIONS AND DOSE

Raynaud's syndrome

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Initially 5 mg 3 times a day, then adjusted according to response to 20 mg 3 times a day

Angina prophylaxis (not recommended)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Initially 5 mg 3 times a day, then adjusted according to response to 20 mg 3 times a day

Postponement of premature labour

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Initially 20 mg, followed by 10–20 mg 3–4 times a day, adjusted according to uterine activity

Hiccup in palliative care

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 10 mg 3 times a day

Chronic anal fissure

- ▶ BY RECTUM USING OINTMENT
- ▶ Adult: Apply 2–3 times a day until pain stops. Max. duration of use 8 weeks, apply to anal canal, using 0.2%–0.5% topical preparation
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 20 mg twice daily until pain stops. Max. duration of use 8 weeks

ADIPINE[®] MR**Hypertension | Angina prophylaxis**

- ▶ BY MOUTH
- ▶ Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

ADIPINE[®] XL**Hypertension | Angina prophylaxis**

- ▶ BY MOUTH
- ▶ Adult: 30 mg daily, increased if necessary up to 90 mg daily

CORACTEN[®] SR**Hypertension | Angina prophylaxis**

- ▶ BY MOUTH
- ▶ Adult: Initially 10 mg twice daily, increased if necessary up to 40 mg twice daily

CORACTEN[®] XL**Hypertension | Angina prophylaxis**

- ▶ BY MOUTH
- ▶ Adult: Initially 30 mg daily, increased if necessary up to 90 mg daily

FORTIPINE[®] LA 40**Hypertension | Angina prophylaxis**

- ▶ BY MOUTH
- ▶ Adult: Initially 40 mg once daily, increased if necessary to 80 mg daily in 1–2 divided doses

NIFEDIPRESS[®] MR**Hypertension | Angina prophylaxis**

- ▶ BY MOUTH
- ▶ Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

TENSIPINE[®] MR**Hypertension | Angina prophylaxis**

- ▶ BY MOUTH
- ▶ Adult: Initially 10 mg twice daily, adjusted according to response to 40 mg twice daily

VALNI[®] XL**Severe hypertension | Prophylaxis of angina**

- ▶ BY MOUTH
- ▶ Adult: 30 mg once daily, increased if necessary up to 90 mg once daily

● UNLICENSED USE

- ▶ With systemic use Not licensed for use in postponing premature labour.

EvGr Nifedipine is used for the treatment of chronic anal fissure, **EvE** but is not licensed for this indication.

● CONTRA-INDICATIONS

- ▶ With systemic use Acute attacks of angina · cardiogenic shock · significant aortic stenosis · unstable angina · within 1 month of myocardial infarction

CONTRA-INDICATIONS, FURTHER INFORMATION

Systemic absorption following rectal use is unknown, therefore consider the possibility of contra-indications listed for systemic use.

● CAUTIONS

- ▶ With systemic use Diabetes mellitus · elderly · heart failure · ischaemic pain · poor cardiac reserve · severe hypotension · short-acting formulations are not recommended for angina or long-term management of hypertension (their use may be associated with large variations in blood pressure and reflex tachycardia) · significantly impaired left ventricular function (heart failure deterioration observed)

CAUTIONS, FURTHER INFORMATION Systemic absorption following rectal use is unknown, therefore consider the possibility of cautions listed for systemic use.

- ▶ Ischaemic pain Manufacturer advises discontinue if ischaemic pain occurs or existing pain worsens shortly after initiating treatment.

VALNI[®] XL Dose form not appropriate for use where there is a history of oesophageal or gastro-intestinal obstruction, decreased lumen diameter of the gastro-intestinal tract, inflammatory bowel disease, or ileostomy after proctocolectomy.

- **INTERACTIONS** → Appendix 1: calcium channel blockers

● **SIDE-EFFECTS**

- ▶ **Common or very common** Constipation · malaise · oedema · vasodilation
- ▶ **Uncommon** Allergic oedema · anxiety · chills · diarrhoea · dry mouth · epistaxis · gastrointestinal discomfort · gastrointestinal disorders · hypotension · joint disorders · laryngeal oedema · migraine · muscle complaints · nasal congestion · pain · sleep disorders · tremor · urinary disorders · vertigo · vision disorders
- ▶ **Rare or very rare** Appetite decreased · burping · cardiovascular disorder · fever · hyperhidrosis · mood altered · sensation abnormal
- ▶ **Frequency not known** Agranulocytosis · bezoar · cerebral ischaemia · chest pain · dysphagia · dyspnoea · eye pain · gingival disorder · gynaecomastia (following long term use) · hepatic disorders · hyperglycaemia · ischaemic heart disease · leucopenia · myasthenia gravis aggravated · photoallergic reaction · pulmonary oedema · telangiectasia · toxic epidermal necrolysis · weight decreased

SIDE-EFFECTS, FURTHER INFORMATION Systemic absorption following rectal use is unknown therefore consider the possibility of side-effects listed for oral use.

● **PREGNANCY**

- ▶ With systemic use May inhibit labour; manufacturer advises avoid before week 20, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension. Use only if other treatment options are not indicated or have failed.

● **BREAST FEEDING**

- ▶ With systemic use Amount too small to be harmful but manufacturers advise avoid.

● **HEPATIC IMPAIRMENT**

- ▶ With oral use For *once-daily* preparations, manufacturers advise dose form not appropriate (owing to the duration of action of the formulation).

Dose adjustments ▶ With oral use Manufacturer advises consider dose reduction in severe impairment.

● DIRECTIONS FOR ADMINISTRATION

FORTIPINE® LA 40 Take with or just after food, or a meal.

- **PRESCRIBING AND DISPENSING INFORMATION** Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of nifedipine, prescribers should specify the brand to be dispensed.

Palliative care For further information on the use of nifedipine in palliative care, see www.medicinescomplete.com/#/content/palliative/nifedipine.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral drops

Verapamil hydrochloride

14-Feb-2020

● INDICATIONS AND DOSE

Treatment of supraventricular arrhythmias

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: 40–120 mg 3 times a day

▶ BY SLOW INTRAVENOUS INJECTION

▶ Adult: 5–10 mg, to be given over 2 minutes, preferably with ECG monitoring

▶ Elderly: 5–10 mg, to be given over 3 minutes, preferably with ECG monitoring

Paroxysmal tachyarrhythmias

▶ BY SLOW INTRAVENOUS INJECTION

▶ Adult: Initially 5–10 mg, followed by 5 mg after 5–10 minutes if required, to be given over 2 minutes, preferably with ECG monitoring

▶ Elderly: Initially 5–10 mg, followed by 5 mg after 5–10 minutes if required, to be given over 3 minutes, preferably with ECG monitoring

Angina

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: 80–120 mg 3 times a day

Hypertension

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: 240–480 mg daily in 2–3 divided doses

Prophylaxis of cluster headache (initiated under specialist supervision)

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: 240–960 mg daily in 3–4 divided doses

HALF SECURON® SR

Hypertension (in patients new to verapamil)

▶ BY MOUTH

▶ Adult: Initially 120 mg daily, increased if necessary up to 480 mg daily, doses above 240 mg daily as 2 divided doses

Hypertension

▶ BY MOUTH

▶ Adult: 240 mg daily, increased if necessary up to 480 mg daily, doses above 240 mg daily as 2 divided doses

Angina

▶ BY MOUTH

▶ Adult: 240 mg twice daily, may sometimes be reduced to once daily

Prophylaxis after myocardial infarction where beta-blockers not appropriate

▶ BY MOUTH

▶ Adult: 360 mg daily in divided doses, started at least 1 week after infarction, given as either 240 mg in the morning and 120 mg in the evening or 120 mg 3 times daily

SECURON® SR

Hypertension (in patients new to verapamil)

● UNLICENSED USE

- ▶ With oral use Prophylaxis of cluster headaches is an unlicensed indication.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · atrial flutter or fibrillation associated with accessory conducting pathways (e.g. Wolff-Parkinson-White-syndrome) · bradycardia · cardiogenic shock · heart failure (with reduced ejection fraction) · history of significantly impaired left ventricular function (even if controlled by therapy) · hypotension · second- and third-degree AV block · sick sinus syndrome · sino-atrial block

- **CAUTIONS** Acute phase of myocardial infarction (avoid if bradycardia, hypotension, left ventricular failure) · first-degree AV block · neuromuscular disorders

CAUTIONS, FURTHER INFORMATION

- ▶ Elderly Prescription potentially inappropriate (STOPP criteria) in patients with NYHA Class III or IV heart failure (may worsen heart failure). See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: calcium channel blockers

● SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Hypotension
- ▶ **Frequency not known** Atrioventricular block · extrapyramidal symptoms · gynaecomastia · Stevens-Johnson syndrome · vertigo

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intravenous use Bradycardia
- ▶ **Frequency not known**
- ▶ With intravenous use Cardiac arrest · hepatic impairment · hyperhidrosis · myocardial contractility decreased · nervousness · seizure

- ▶ With oral use Abdominal discomfort · alopecia · arrhythmias · arthralgia · constipation · erythromelalgia · fatigue · galactorrhoea · heart failure · ileus · muscle weakness · tinnitus · tremor

Overdose In overdose, verapamil has a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole.

- **PREGNANCY** May reduce uterine blood flow with fetal hypoxia. Manufacturer advises avoid in first trimester unless absolutely necessary. May inhibit labour.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT**
Dose adjustments ▶ With oral use Manufacturer advises dose reduction.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Modified-release tablet**CAUTIONARY AND ADVISORY LABELS 25**▶ **Half Securon** (Mylan)

Solution for injection▶ **Securon** (Mylan)

Verapamil hydrochloride 2.5 mg per 1 ml Securon IV 5mg/2ml solution for injection ampoules | 5 ampoule [PoM] £5.41

Oral solution▶ **Verapamil hydrochloride (Non-proprietary)**

Verapamil hydrochloride 8 mg per 1 ml Verapamil 40mg/5ml oral solution sugar-free | 150 ml [PoM] £44.92 DT = £41.00

DIURETICS > THIAZIDES AND RELATED DIURETICS**Thiazides and related diuretics** ➔

- **CONTRA-INDICATIONS** Addison's disease · hypercalcaemia · hyponatraemia · refractory hypokalaemia · symptomatic hyperuricaemia

- **CAUTIONS** Diabetes · gout · hyperaldosteronism · malnourishment · nephrotic syndrome · systemic lupus erythematosus

CAUTIONS, FURTHER INFORMATION

- ▶ Existing conditions Thiazides and related diuretics can exacerbate diabetes, gout, and systemic lupus erythematosus.
- ▶ Potassium loss Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus

greater with thiazides than with an equipotent dose of a loop diuretic.

Hypokalaemia is dangerous in severe cardiovascular disease and in patients also being treated with cardiac glycosides. Often the use of potassium-sparing diuretics avoids the need to take potassium supplements.

Potassium supplements or potassium-sparing diuretics are seldom necessary when thiazides are used in the routine treatment of hypertension.

In hepatic failure, hypokalaemia caused by diuretics can precipitate encephalopathy, particularly in alcoholic cirrhosis.

- ▶ **Elderly** Lower initial doses of diuretics should be used in the elderly because they are particularly susceptible to the side-effects. The dose should then be adjusted according to renal function. Diuretics should not be used continuously on a long-term basis to treat simple gravitational oedema (which will usually respond to increased movement, raising the legs, and support stockings).

Prescription potentially inappropriate (STOPP criteria):

- with current significant hypokalaemia (serum potassium less than 3 mmol/L), hyponatraemia (serum sodium less than 130 mmol/L) or hypercalcaemia (corrected serum calcium greater than 2.65 mmol/L)—hypokalaemia, hyponatraemia and hypercalcaemia can be precipitated by a thiazide diuretic
- with a history of gout (gout can be precipitated by a thiazide diuretic)

See also Prescribing in the elderly p. 33.

• SIDE-EFFECTS

- ▶ **Common or very common** Alkalosis hypochloreaemic · constipation · diarrhoea · dizziness · dry mouth · electrolyte imbalance · erectile dysfunction · fatigue · headache · hyperglycaemia · hyperuricaemia · nausea · postural hypotension · skin reactions
- ▶ **Uncommon** Agranulocytosis · aplastic anaemia · leucopenia · pancreatitis · photosensitivity reaction · thrombocytopenia · vomiting
- ▶ **Rare or very rare** Paraesthesia

- **PREGNANCY** Thiazides and related diuretics should not be used to treat gestational hypertension. They may cause neonatal thrombocytopenia, bone marrow suppression, jaundice, electrolyte disturbances, and hypoglycaemia; placental perfusion may also be reduced. Stimulation of labour, uterine inertia, and meconium staining have also been reported.

- **HEPATIC IMPAIRMENT** In general, manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

- **RENAL IMPAIRMENT** Thiazides and related diuretics are ineffective if eGFR is less than 30 mL/minute/1.73 m² and should be avoided. Metolazone remains effective if eGFR is less than 30 mL/minute/1.73 m² but is associated with a risk of excessive diuresis.

Monitoring Electrolytes should be monitored in renal impairment.

- **MONITORING REQUIREMENTS** Electrolytes should be monitored, particularly with high doses and long-term use.

Bendroflumethiazide

(Bendrofluazide)

• INDICATIONS AND DOSE

Oedema

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 5–10 mg once daily or on alternate days, dose to be taken in the morning, then maintenance 5–10 mg 1–3 times a week

Hypertension

- ▶ **BY MOUTH**
- ▶ **Adult:** 2.5 mg daily, dose to be taken in the morning, higher doses are rarely necessary

- **INTERACTIONS** → Appendix 1: thiazide diuretics
- **SIDE-EFFECTS** Blood disorder · cholestasis · gastrointestinal disorder · gout · neutropenia · pneumonitis · pulmonary oedema · severe cutaneous adverse reactions (SCARs)
- **BREAST FEEDING** The amount present in milk is too small to be harmful. Large doses may suppress lactation.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

▶ Bendroflumethiazide (Non-proprietary)

Bendroflumethiazide 2.5 mg Bendroflumethiazide 2.5mg tablets | 28 tablet **[PoM]** £0.76 DT = £0.76 | 500 tablet **[PoM]** £21.85

Bendroflumethiazide 5 mg Bendroflumethiazide 5mg tablets | 28 tablet **[PoM]** £1.54 DT = £0.88

▶ **Neo-Naclax** (Advanz Pharma)
Bendroflumethiazide 2.5 mg Neo-Naclax 2.5mg tablets | 28 tablet **[PoM]** £0.33 DT = £0.76

Combinations available: *Timolol with bendroflumethiazide*, p. 163

Co-amlozide

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrochlorothiazide p. 178.

• INDICATIONS AND DOSE

Hypertension

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 2.5/25 mg daily, increased if necessary up to 5/50 mg daily

Congestive heart failure

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 2.5/25 mg daily; increased if necessary up to 10/100 mg daily, reduce dose for maintenance if possible

Oedema and ascites in cirrhosis of the liver

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 5/50 mg daily; increased if necessary up to 10/100 mg daily, reduce dose for maintenance if possible

DOSE EQUIVALENCE AND CONVERSION

- ▶ A mixture of amloride hydrochloride and hydrochlorothiazide in the mass proportions of 1 part amloride hydrochloride to 10 parts hydrochlorothiazide.

- **CONTRA-INDICATIONS** Anuria · hyperkalaemia
- **CAUTIONS** Diabetes mellitus · elderly
- **INTERACTIONS** → Appendix 1: potassium-sparing diuretics · thiazide diuretics

- **SIDE-EFFECTS** Angina pectoris · appetite abnormal · arrhythmias · arthralgia · asthenia · chest pain · confusion · constipation · depression · diarrhoea · dizziness · drowsiness · dyspnoea · electrolyte imbalance · erectile dysfunction · flatulence · flushing · gastrointestinal discomfort · gastrointestinal haemorrhage · gout · headache · hiccups · hyperhidrosis · insomnia · malaise · muscle cramps · nasal congestion · nausea · nervousness · pain · paraesthesia · postural hypotension · renal impairment · skin reactions · stupor · syncope · taste unpleasant · urinary disorders · vertigo · visual impairment · vomiting
- **BREAST FEEDING** Avoid—no information regarding amiloride component available. Amount of hydrochlorothiazide in milk probably too small to be harmful. Large doses of hydrochlorothiazide may suppress lactation.
- **RENAL IMPAIRMENT** Manufacturers advise avoid in severe impairment.
Monitoring Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).
- **MONITORING REQUIREMENTS** Monitor electrolytes.

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet▶ **Co-amilofide (Non-proprietary)**

Amiloride hydrochloride 2.5 mg, Hydrochlorothiazide 25 mg Co-amilofide 2.5mg/25mg tablets | 28 tablet [PoM] £12.14 DT = £8.64

Amiloride hydrochloride 5 mg, Hydrochlorothiazide 50 mg Co-amilofide 5mg/50mg tablets | 28 tablet [PoM] £2.81 DT = £1.87

▶ **Moduretic (Merck Sharp & Dohme Ltd)**

Amiloride hydrochloride 5 mg, Hydrochlorothiazide 50 mg Moduretic 5mg/50mg tablets | 28 tablet [PoM] £1.29 DT = £1.87

Hydrochlorothiazide

03-Dec-2018

INDICATIONS AND DOSE

Indications listed in combination monographs (available in the UK only in combination with other drugs)

- ▶ BY MOUTH
- ▶ Adult: Doses listed in combination monographs

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: HYDROCHLOROTHIAZIDE: RISK OF NON-MELANOMA SKIN CANCER, PARTICULARLY IN LONG-TERM USE (NOVEMBER 2018)

The MHRA advises healthcare professionals to:

- inform patients taking hydrochlorothiazide-containing products of the cumulative, dose-dependent increased risk of non-melanoma skin cancer, particularly in long-term use, and advise patients to regularly check for and report any new or changed skin lesions or moles;
- advise patients to limit exposure to sunlight and UV rays and use adequate sun protection;
- reconsider the use of hydrochlorothiazide in patients who have had previous skin cancer;
- examine all suspicious moles or skin lesions (potentially including histological examination of biopsies).

● **INTERACTIONS** → Appendix 1: thiazide diuretics

SIDE-EFFECTS

- ▶ **Uncommon** Appetite decreased · epigastric discomfort · fever · gastrointestinal spasm · glycosuria · haemolytic anaemia · insomnia · jaundice cholestatic · muscle cramps · nephritis tubulointerstitial · pulmonary oedema · renal

impairment · respiratory disorders · sialadenitis · toxic epidermal necrolysis · vasculitis · vision disorders

- ▶ **Frequency not known** Basal cell carcinoma (particularly in long term use) · cutaneous lupus erythematosus · restlessness · squamous cell carcinoma (particularly in long term use)

● **MEDICINAL FORMS** Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

Combinations available: *Enalapril with hydrochlorothiazide*, p. 181 · *Irbesartan with hydrochlorothiazide*, p. 187 · *Lisinopril with hydrochlorothiazide*, p. 182 · *Losartan with hydrochlorothiazide*, p. 188 · *Oltmesartan with amlodipine and hydrochlorothiazide*, p. 189 · *Oltmesartan with hydrochlorothiazide*, p. 189 · *Quinapril with hydrochlorothiazide*, p. 184 · *Telmisartan with hydrochlorothiazide*, p. 190 · *Timolol with amiloride and hydrochlorothiazide*, p. 163 · *Valsartan with hydrochlorothiazide*, p. 191

Indapamide

F 176

- **DRUG ACTION** Indapamide is a thiazide-like diuretic with antihypertensive effects. At lower doses, vasodilatation is more prominent than diuresis; the diuretic effect becomes more apparent with higher doses.

INDICATIONS AND DOSE**Essential hypertension**

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: 2.5 mg daily, dose to be taken in the morning

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Adult: 1.5 mg daily, dose to be taken preferably in the morning

● **CAUTIONS** Acute porphyrias p. 1120

● **INTERACTIONS** → Appendix 1: thiazide diuretics

SIDE-EFFECTS

- ▶ **Common or very common** Hypersensitivity
- ▶ **Rare or very rare** Angioedema · arrhythmias · haemolytic anaemia · hepatic disorders · renal failure · severe cutaneous adverse reactions (SCARs) · vertigo
- ▶ **Frequency not known** Hepatic encephalopathy · QT interval prolongation · syncope · systemic lupus erythematosus exacerbated · vision disorders

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to sulfonamides.

● **BREAST FEEDING** Present in milk—manufacturer advises avoid.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Modified-release tablet

- ▶ **Natrilix** (Servier Laboratories Ltd)
Indapamide hemihydrate 2.5 mg Natrilix 2.5mg tablets | 30 tablet **PoM** £3.40 | 60 tablet **PoM** £6.80

Combinations available: **Perindopril arginine with indapamide**, p. 183

DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM > ACE INHIBITORS

Angiotensin-converting enzyme inhibitors

- **CONTRA-INDICATIONS** The combination of an ACE inhibitor with aliskiren is contra-indicated in patients with an eGFR less than 60 mL/minute/1.73 m² · the combination of an ACE inhibitor with aliskiren is contra-indicated in patients with diabetes mellitus
- **CAUTIONS** Afro-Caribbean patients (may respond less well to ACE inhibitors) · concomitant diuretics · diabetes (may lower blood glucose) · first dose hypotension (especially in patients taking high doses of diuretics, on a low-sodium diet, on dialysis, dehydrated, or with heart failure) · peripheral vascular disease or generalised atherosclerosis (risk of clinically silent renovascular disease) · primary aldosteronism (patients may respond less well to ACE inhibitors) · the risk of agranulocytosis is possibly increased in collagen vascular disease (blood counts recommended) · use with care (or avoid) in those with a history of idiopathic or hereditary angioedema · use with care in patients with hypertrophic cardiomyopathy · use with care in patients with severe or symptomatic aortic stenosis (risk of hypotension)
- **CAUTIONS, FURTHER INFORMATION**
- ▶ Anaphylactoid reactions To prevent anaphylactoid reactions, ACE inhibitors should be avoided during dialysis with high-flux polyacrylonitrile membranes and during low-density lipoprotein apheresis with dextran sulfate; they should also be withheld before desensitisation with wasp or bee venom.
- ▶ Elderly Prescription potentially inappropriate (STOPP criteria):
 - with hyperkalaemia
 - with persistent postural hypotension i.e. recurrent drop in systolic blood pressure \geq 20 mmHg (risk of syncope and falls)
 See also Prescribing in the elderly p. 33.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · angina pectoris · angioedema (may be delayed; more common in Afro-Caribbean patients) · arrhythmias · asthenia · chest pain · constipation · cough · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · electrolyte imbalance · gastrointestinal discomfort · headache · hypotension · myalgia · nausea · palpitations · paraesthesia · renal impairment · rhinitis · skin reactions · sleep disorder · syncope · taste altered · tinnitus · vertigo · vomiting
- ▶ **Uncommon** Arthralgia · confusion · eosinophilia · erectile dysfunction · fever · haemolytic anaemia · hyperhidrosis · myocardial infarction · pancreatitis · peripheral oedema · photosensitivity reaction · respiratory disorders · stroke
- ▶ **Rare or very rare** Agranulocytosis · hepatitis · leucopenia · neutropenia · pancytopenia · Stevens-Johnson syndrome · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION In light of reports of cholestatic jaundice, hepatitis, fulminant hepatic necrosis, and hepatic failure, ACE inhibitors should be discontinued if marked elevation of hepatic enzymes or jaundice occur.

- **ALLERGY AND CROSS-SENSITIVITY** ACE inhibitors are contra-indicated in patients with hypersensitivity to ACE inhibitors (including angioedema).
- **PREGNANCY** ACE inhibitors should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; skull defects and oligohydramnios have also been reported.
- **BREAST FEEDING** Information on the use of ACE inhibitors in breast-feeding is limited.
- **RENAL IMPAIRMENT**
Dose adjustments Use with caution, starting with low dose, and adjust according to response. Hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function and the dose may need to be reduced.
- **MONITORING REQUIREMENTS** Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if side effects mentioned are present).
- **DIRECTIONS FOR ADMINISTRATION** For hypertension the first dose should preferably be given at bedtime.

F above

Captopril

10-Mar-2020

● **INDICATIONS AND DOSE****Hypertension**▶ **BY MOUTH**

- ▶ **Adult:** Initially 12.5–25 mg twice daily, then increased if necessary up to 150 mg daily in 2 divided doses, doses to be increased at intervals of at least 2 weeks, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken
- ▶ **Elderly:** Initially 6.25 mg twice daily, then increased if necessary up to 150 mg daily in 2 divided doses, doses to be increased at intervals of at least 2 weeks, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken

Essential hypertension if used in volume depletion, cardiac decompensation, or renovascular hypertension▶ **BY MOUTH**

- ▶ **Adult:** Initially 6.25–12.5 mg for 1 dose (under close medical supervision), then 6.25–12.5 mg twice daily; increased if necessary up to 100 mg daily in 1–2 divided doses, doses to be increased at intervals of at least 2 weeks, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken

Heart failure▶ **BY MOUTH**

- ▶ **Adult** (under close medical supervision): Initially 6.25–12.5 mg 2–3 times a day, then increased if tolerated to up to 150 mg daily in divided doses, dose to be increased gradually at intervals of at least 2 weeks

Short-term treatment within 24 hours of onset of myocardial infarction in clinically stable patients▶ **BY MOUTH**

- ▶ **Adult:** Initially 6.25 mg, then increased to 12.5 mg after 2 hours, followed by 25 mg after 12 hours; increased if tolerated to 50 mg twice daily for 4 weeks continued →

Prophylaxis of symptomatic heart failure after myocardial infarction in clinically stable patients with asymptomatic left ventricular dysfunction (starting 3–16 days after infarction) (under close medical supervision)

► BY MOUTH

- Adult: Initially 6.25 mg daily, then increased to 12.5 mg 3 times a day for 2 days, then increased if tolerated to 25 mg 3 times a day, then increased if tolerated to 75–150 mg daily in 2–3 divided doses, doses exceeding 75 mg per day to be increased gradually

Diabetic nephropathy in type 1 diabetes mellitus

► BY MOUTH

- Adult: 75–100 mg daily in divided doses

- **CAUTIONS** Children (efficacy and safety not fully established)

- **INTERACTIONS** → Appendix 1: ACE inhibitors

● **SIDE-EFFECTS**

- **Common or very common** Insomnia · peptic ulcer
- **Uncommon** Appetite decreased · flushing · malaise · pallor · Raynaud's phenomenon
- **Rare or very rare** Anaemia · aplastic anaemia · autoimmune disorder · cardiac arrest · cardiogenic shock · cerebrovascular insufficiency · depression · gynaecomastia · hepatic disorders · hypoglycaemia · lymphadenopathy · nephrotic syndrome · oral disorders · proteinuria · urinary disorders · vision blurred

- **BREAST FEEDING** Avoid in first few weeks after delivery, particularly in preterm infants—risk of profound neonatal hypotension; can be used in mothers breast-feeding older infants if essential but monitor infant's blood pressure.

● **RENAL IMPAIRMENT**

- Dose adjustments** Reduce dose; max. initial dose 50 mg if eGFR above 40 mL/minute/1.73 m²; max. initial dose 25 mg daily (do not exceed 100 mg daily) if eGFR 20–40 mL/minute/1.73 m²; max. initial dose 12.5 mg daily (do not exceed 75 mg daily) if eGFR 10–20 mL/minute/1.73 m²; max. initial dose 6.25 mg daily (do not exceed 37.5 mg daily) if eGFR less than 10 mL/minute/1.73 m².

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

Tablet

Enalapril maleate

10-Mar-2020

● **INDICATIONS AND DOSE**

Hypertension

► BY MOUTH

- Adult: Initially 5 mg once daily, lower initial doses may be required when used in addition to diuretic or in renal impairment; maintenance 20 mg once daily; maximum 40 mg per day

Heart failure

► BY MOUTH

- Adult (under close medical supervision): Initially 2.5 mg once daily, increased if tolerated to 10–20 mg twice daily, dose to be increased gradually over 2–4 weeks

Prevention of symptomatic heart failure in patients with asymptomatic left ventricular dysfunction

► BY MOUTH

- Adult (under close medical supervision): Initially 2.5 mg once daily, increased if tolerated to 10–20 mg twice daily, dose to be increased gradually over 2–4 weeks

- **INTERACTIONS** → Appendix 1: ACE inhibitors

● **SIDE-EFFECTS**

- **Common or very common** Depression · hypersensitivity · vision blurred
- **Uncommon** Anaemia · appetite decreased · asthma · bone marrow disorders · flushing · gastrointestinal disorders · hoarseness · hypoglycaemia · malaise · muscle cramps · nervousness · proteinuria · rhinorrhoea · sleep disorders · throat pain
- **Rare or very rare** Autoimmune disorder · gynaecomastia · hepatic disorders · lymphadenopathy · oral disorders · Raynaud's phenomenon · toxic epidermal necrolysis
- **Frequency not known** Arthritis · leucocytosis · myositis · serositis · SIADH · vasculitis

- **BREAST FEEDING** Avoid in first few weeks after delivery, particularly in preterm infants—risk of profound neonatal hypotension; can be used in mothers breast-feeding older infants if essential but monitor infant's blood pressure.

- **HEPATIC IMPAIRMENT** Enalapril is a prodrug.

● **RENAL IMPAIRMENT**

Dose adjustments Max. initial dose 2.5 mg daily if eGFR less than 30 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed and suspended in water immediately before use.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

► **Enalapril maleate (Non-proprietary)**

Enalapril with hydrochlorothiazide

F 179

The properties listed below are those particular to the combination only. For the properties of the components please consider, enalapril maleate p. 180, hydrochlorothiazide p. 178.

● INDICATIONS AND DOSE

Mild to moderate hypertension in patients stabilised on the individual components in the same proportions

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

● **INTERACTIONS** → Appendix 1: ACE inhibitors · thiazide diuretics

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Enalapril with hydrochlorothiazide (Non-proprietary)**
Hydrochlorothiazide 12.5 mg, Enalapril maleate 20 mg Enalapril 20mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet **[PoM]** £20.00 DT = £19.99
- ▶ **Innozide** (Merck Sharp & Dohme Ltd)
Hydrochlorothiazide 12.5 mg, Enalapril maleate 20 mg Innozide 20mg/12.5mg tablets | 28 tablet **[PoM]** £13.90 DT = £19.99

Fosinopril sodium

23-Jul-2018

● INDICATIONS AND DOSE

Hypertension

- ▶ BY MOUTH
- ▶ Adult: Initially 10 mg daily for 4 weeks, then increased if necessary up to 40 mg daily, doses over 40 mg not shown to increase efficacy

Congestive heart failure (adjunct) (under close medical supervision)

- ▶ BY MOUTH
- ▶ Adult: Initially 10 mg once daily, then increased if tolerated to 40 mg once daily, doses to be increased gradually

● **INTERACTIONS** → Appendix 1: ACE inhibitors

● SIDE-EFFECTS

- ▶ **Common or very common** Eye disorder · increased risk of infection · mood altered · oedema · pain · sexual dysfunction · urinary disorder · visual impairment
- ▶ **Frequency not known** Appetite abnormal · arthritis · balance impaired · behaviour abnormal · cardiac arrest · cardiac conduction disorder · cerebrovascular insufficiency · depression · dysphagia · dysphonia · ear pain · flatulence · flushing · gout · haemorrhage · hypertensive crisis · lymphadenopathy · memory loss · muscle weakness · oral disorders · prostatic disorder · tremor · weight changes

● **BREAST FEEDING** Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

● **HEPATIC IMPAIRMENT** Fosinopril is a prodrug. Manufacturer advises caution (risk of increased exposure).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

- ▶ **Fosinopril sodium (Non-proprietary)**
Fosinopril sodium 10 mg Fosinopril 10mg tablets | 28 tablet **[PoM]** £6.78 DT = £5.21
- Fosinopril sodium 20 mg Fosinopril 20mg tablets | 28 tablet **[PoM]** £7.00 DT = £3.56

Imidapril hydrochloride

● INDICATIONS AND DOSE

Essential hypertension

- ▶ BY MOUTH
- ▶ Adult: Initially 5 mg daily, increased if necessary to 10 mg daily, dose to be taken before food, doses to be increased at intervals of at least 3 weeks; maximum 20 mg per day
- ▶ Elderly: Initially 2.5 mg daily, increased if necessary to 10 mg daily, dose to be taken before food, doses to be increased at intervals of at least 3 weeks

Essential hypertension in patients with heart failure, angina or cerebrovascular disease

- ▶ BY MOUTH
- ▶ Adult: Initially 2.5 mg daily, increased if necessary to 10 mg daily, dose to be taken before food, dose to be increased at intervals of at least 3 weeks; maximum 20 mg per day

● **INTERACTIONS** → Appendix 1: ACE inhibitors

● SIDE-EFFECTS

- ▶ **Uncommon** Cerebrovascular disorder · increased risk of infection · joint swelling · limb pain · oedema
- ▶ **Rare or very rare** Anaemia
- ▶ **BREAST FEEDING** Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.
- ▶ **HEPATIC IMPAIRMENT** Imidapril is a prodrug. Manufacturer advises caution (risk of increased exposure).
Dose adjustments Manufacturer advises initial dose of 2.5 mg daily.
- ▶ **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
Dose adjustments Initial dose 2.5 mg daily if eGFR 30–80 mL/minute/1.73 m².

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Tanatril** (Mitsubishi Tanabe Pharma Europe Ltd)
Imidapril hydrochloride 5 mg Tanatril 5mg tablets | 28 tablet **[PoM]** £6.40 DT = £6.40
- Imidapril hydrochloride 10 mg Tanatril 10mg tablets | 28 tablet **[PoM]** £7.22 DT = £7.22
- Imidapril hydrochloride 20 mg Tanatril 20mg tablets | 28 tablet **[PoM]** £8.67 DT = £8.67

Lisinopril

10-Mar-2020

● INDICATIONS AND DOSE

Hypertension

- ▶ BY MOUTH
- ▶ Adult: Initially 10 mg once daily; usual maintenance 20 mg once daily; maximum 80 mg per day

Hypertension, when used in addition to diuretic, in cardiac decompensation or in volume depletion

- ▶ BY MOUTH
- ▶ Adult: Initially 2.5–5 mg once daily; usual maintenance 20 mg once daily; maximum 80 mg per day

Short-term treatment following myocardial infarction in haemodynamically stable patients—systolic blood pressure over 120 mmHg

- ▶ BY MOUTH
- ▶ Adult: Initially 5 mg, taken within 24 hours of myocardial infarction, followed by 5 mg, to be taken 24 hours after initial dose, then 10 mg, to be taken 24 hours after second dose, then 10 mg once daily for 6 weeks (or continued if heart failure), continued →

temporarily reduce maintenance dose to 5 mg and if necessary 2.5 mg daily if systolic blood pressure 100 mmHg or less during treatment; withdraw if prolonged hypotension occurs during treatment (systolic blood pressure less than 90 mmHg for more than 1 hour)

Short-term treatment following myocardial infarction in haemodynamically stable patients—systolic blood pressure 100–120 mmHg

► BY MOUTH

- Adult: Initially 2.5 mg once daily, maintenance 5 mg once daily, increase to maintenance dose only after at least 3 days of the initial dose, should not be started after myocardial infarction if systolic blood pressure less than 100 mmHg, temporarily reduce maintenance dose to 2.5 mg daily if systolic blood pressure 100 mmHg or less during treatment; withdraw if prolonged hypotension occurs (systolic blood pressure less than 90 mmHg for more than 1 hour)

Renal complications of diabetes mellitus

► BY MOUTH

- Adult: Initially 2.5–5 mg once daily, adjusted according to response; usual dose 10–20 mg once daily

Heart failure (adjunct) (under close medical supervision)

► BY MOUTH

- Adult: Initially 2.5 mg once daily; increased in steps of up to 10 mg at least every 2 weeks; maximum 35 mg per day

- **INTERACTIONS** → Appendix 1: ACE inhibitors

● **SIDE-EFFECTS**

- **Common or very common** Postural disorders
- **Uncommon** Hallucination · mood altered · Raynaud's phenomenon
- **Rare or very rare** Anaemia · autoimmune disorder · azotaemia · bone marrow depression · gynaecomastia · hepatic disorders · hypersensitivity · hypoglycaemia · lymphadenopathy · olfactory nerve disorder · SIADH · sinusitis · toxic epidermal necrolysis
- **Frequency not known** Depressive symptom · leucocytosis · vasculitis
- **BREAST FEEDING** Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

● **RENAL IMPAIRMENT**

Dose adjustments Max. initial doses 5–10 mg daily if eGFR 30–80 mL/minute/1.73 m² (max. 40 mg daily); 2.5–5 mg daily if eGFR 10–30 mL/minute/1.73 m² (max. 40 mg daily); 2.5 mg daily if eGFR less than 10 mL/minute/1.73 m².

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

► **Lisinopril (Non-proprietary)**

Lisinopril 1 mg per 1 mL Lisinopril 5mg/5ml oral solution sugar-free | 150 mL [PoM](#) £154.11 DT = £154.11

Tablet

Perindopril arginine

● **INDICATIONS AND DOSE**

Hypertension

► BY MOUTH

- Adult: Initially 5 mg once daily for 1 month, dose to be taken in the morning, then, adjusted according to response; maximum 10 mg per day
- Elderly: Initially 2.5 mg once daily for 1 month, dose to be taken in the morning, then, adjusted according to response; maximum 10 mg per day

Hypertension, if used in addition to diuretic, or in cardiac decompensation or volume depletion

► BY MOUTH

- Adult: Initially 2.5 mg once daily for 1 month, dose to be taken in the morning, then, adjusted according to response; maximum 10 mg per day

Symptomatic heart failure (adjunct) (under close medical supervision)

► BY MOUTH

- Adult: Initially 2.5 mg once daily for 2 weeks, then increased if tolerated to 5 mg once daily, dose to be taken in the morning

Prophylaxis of cardiac events following myocardial infarction or revascularisation in stable coronary artery disease

► BY MOUTH

- Adult: Initially 5 mg once daily for 2 weeks, then increased if tolerated to 10 mg once daily, dose to be taken in the morning
- Elderly: Initially 2.5 mg once daily for 1 week, then increased if tolerated to 5 mg once daily for 1 week, then increased if tolerated to 10 mg once daily, dose to be taken in the morning

- **INTERACTIONS** → Appendix 1: ACE inhibitors

● **SIDE-EFFECTS**

- **Common or very common** Muscle cramps · visual impairment
- **Uncommon** Fall · hypoglycaemia · malaise · mood altered · vasculitis
- **Rare or very rare** Cholestasis

- **HEPATIC IMPAIRMENT** Perindopril is a prodrug.
- **RENAL IMPAIRMENT**
Dose adjustments Max. initial dose 2.5 mg once daily if eGFR 30–60 mL/minute/1.73 m²; 2.5 mg once daily on alternate days if eGFR 15–30 mL/minute/1.73 m².
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 22

F 179

Quinapril**● INDICATIONS AND DOSE****Essential hypertension**

- ▶ BY MOUTH
- ▶ Adult: Initially 10 mg once daily; maintenance 20–40 mg daily in up to 2 divided doses; maximum 80 mg per day
- ▶ Elderly: Initially 2.5 mg once daily; maintenance 20–40 mg daily in up to 2 divided doses; maximum 80 mg per day

Essential hypertension if used in addition to diuretic

- ▶ BY MOUTH
- ▶ Adult: Initially 2.5 mg once daily; maintenance 20–40 mg daily in up to 2 divided doses; maximum 80 mg per day

Heart failure (adjunct) (under close medical supervision)

- ▶ BY MOUTH
- ▶ Adult: Initially 2.5 mg daily, increased if tolerated to 10–20 mg daily in 1–2 divided doses, doses to be increased gradually; maximum 40 mg per day

- **INTERACTIONS** → Appendix 1: ACE inhibitors

● SIDE-EFFECTS

- ▶ **Common or very common** Back pain · increased risk of infection · insomnia

- ▶ **Uncommon** Depression · dry throat · gastrointestinal disorders · generalised oedema · nervousness · proteinuria · transient ischaemic attack · vasodilation · vision disorders
- ▶ **Rare or very rare** Balance impaired · glossitis
- ▶ **Frequency not known** Arthritis · hypersensitivity · jaundice · cholestatic · leucocytosis · pulmonary oedema · serositis · toxic epidermal necrolysis · vasculitis necrotising
- **BREAST FEEDING** Avoid in the first few weeks after delivery, particularly in preterm infants, due to the risk of profound neonatal hypotension; if essential, may be used in mothers breast-feeding older infants—the infant's blood pressure should be monitored.
- **HEPATIC IMPAIRMENT** Quinapril is a prodrug. Manufacturer advises caution when used in combination with a diuretic.
- **RENAL IMPAIRMENT**
Dose adjustments Max. initial dose 2.5 mg once daily if eGFR less than 40 mL/minute/1.73 m².

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Ramipril

● **INDICATIONS AND DOSE****Hypertension**▶ **BY MOUTH**

▶ Adult: Initially 1.25–2.5 mg once daily, increased if necessary up to 10 mg once daily, dose to be increased at intervals of 2–4 weeks

Symptomatic heart failure (adjunct) (under close medical supervision)▶ **BY MOUTH**

▶ Adult: Initially 1.25 mg once daily, increased if tolerated to 10 mg daily, preferably taken in 2 divided doses, increase dose gradually at intervals of 1–2 weeks

Prophylaxis after myocardial infarction in patients with clinical evidence of heart failure (started at least 48 hours after infarction)▶ **BY MOUTH**

▶ Adult: Initially 2.5 mg twice daily for 3 days, then increased to 5 mg twice daily

Prophylaxis after myocardial infarction in patients with clinical evidence of heart failure (started at least 48 hours after infarction) when initial dose not tolerated▶ **BY MOUTH**

▶ Adult: 1.25 mg twice daily for 2 days, then increased to 2.5 mg twice daily, then increased to 5 mg twice daily, withdraw treatment if dose cannot be increased to 2.5 mg twice daily

Prevention of cardiovascular events in patients with atherosclerotic cardiovascular disease or with diabetes mellitus and at least one additional risk factor for cardiovascular disease▶ **BY MOUTH**

▶ Adult: Initially 2.5 mg once daily for 1–2 weeks, then increased to 5 mg once daily for a further 2–3 weeks, then increased to 10 mg once daily

Nephropathy (consult product literature)▶ **BY MOUTH**

▶ Adult: Initially 1.25 mg once daily for 2 weeks, then increased to 2.5 mg once daily for a further 2 weeks, then increased if tolerated to 5 mg once daily

- **INTERACTIONS** → Appendix 1: ACE inhibitors

● **SIDE-EFFECTS**

- ▶ **Common or very common** Gastrointestinal disorders · increased risk of infection · muscle spasms
- ▶ **Uncommon** Anxiety · appetite decreased · asthma exacerbated · depressed mood · flushing · libido decreased · myocardial ischaemia · nasal congestion · proteinuria aggravated · vision disorders
- ▶ **Rare or very rare** Conjunctivitis · hearing impairment · hepatic disorders · hypoperfusion · movement disorders · onycholysis · oral disorders · tremor · vascular stenosis · vasculitis
- ▶ **Frequency not known** Altered smell sensation · bone marrow failure · cerebrovascular insufficiency · concentration impaired · enanthema · gynaecomastia · hypersensitivity · Raynaud's phenomenon · SIADH · toxic epidermal necrolysis

- **BREAST FEEDING** Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

- **HEPATIC IMPAIRMENT** Ramipril is a prodrug. Manufacturer advises caution.

Dose adjustments Manufacturer advises maximum 2.5 mg daily.

- **RENAL IMPAIRMENT**

Dose adjustments Max. daily dose 5 mg if eGFR 30–60 mL/minute/1.73 m²; max. initial dose 1.25 mg once daily (do not exceed 5 mg daily) if eGFR less than 30 mL/minute/1.73 m².

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution▶ **Ramipril (Non-proprietary)**

Trandolapril

179

05-Aug-2018

INDICATIONS AND DOSE**Mild to moderate hypertension**

- ▶ BY MOUTH
- ▶ Adult: Initially 500 micrograms once daily; increased to 1–2 mg once daily, dose to be increased at intervals of 2–4 weeks; maximum 4 mg per day

Prophylaxis after myocardial infarction in patients with left ventricular dysfunction (starting as early as 3 days after infarction)

- ▶ BY MOUTH
- ▶ Adult: Initially 500 micrograms once daily, then increased to up to 4 mg once daily, doses to be increased gradually

INTERACTIONS → Appendix 1: ACE inhibitors**SIDE-EFFECTS**

- ▶ **Uncommon** Feeling abnormal · gastrointestinal disorders · hot flush · increased risk of infection · insomnia · libido decreased · malaise · muscle spasms · pain · rhinorrhoea
- ▶ **Rare or very rare** Anaemia · anxiety · appetite abnormal · azotaemia · cerebrovascular insufficiency · depression · enzyme abnormality · eye disorder · eye inflammation · gout · haemorrhage · hallucination · hyperbilirubinaemia · hyperglycaemia · hypersensitivity · hyperuricaemia · migraine · movement disorders · myocardial ischaemia · oedema · osteoarthritis · platelet disorder · throat irritation · urinary disorders · vascular disorders · visual impairment · white blood cell disorder

- ▶ **Frequency not known** Atrioventricular block · cardiac arrest · jaundice · proteinuria · toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION If symptomatic hypotension develops during titration, do not increase dose further; if possible, reduce dose of any adjunctive treatment and if this is not effective or feasible, reduce dose of trandolapril.

- **BREAST FEEDING** Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

- **HEPATIC IMPAIRMENT** Trandolapril is a prodrug. Manufacturer advises caution.

Dose adjustments Manufacturer advises initiate under close supervision and adjust dose according to blood pressure response in severe impairment.

RENAL IMPAIRMENT

Dose adjustments Max. 2 mg daily if eGFR less than 10 mL/minute/1.73 m².

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Capsule▶ **Trandolapril (Non-proprietary)**

Trandolapril 500 microgram Trandolapril 500microgram capsules | 14 capsule PoM £1.68 DT = £1.68

Trandolapril 1 mg Trandolapril 1mg capsules | 28 capsule PoM £20.20 DT = £20.20

Trandolapril 2 mg Trandolapril 2mg capsules | 28 capsule PoM £2.94 DT = £2.57

Trandolapril 4 mg Trandolapril 4mg capsules | 28 capsule PoM £13.39 DT = £13.39

DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM > ANGIOTENSIN II RECEPTOR ANTAGONISTS

Angiotensin II receptor antagonists

- **CONTRA-INDICATIONS** The combination of an angiotensin-II receptor antagonist with aldiskiren is contra-indicated in patients with an eGFR less than 60 mL/minute/1.73 m². The combination of an angiotensin-II receptor antagonist with aldiskiren is contra-indicated in patients with diabetes mellitus

- **CAUTIONS** Afro-Caribbean patients—particularly those with left ventricular hypertrophy (may not benefit from an angiotensin-II receptor antagonist) · aortic or mitral valve stenosis · elderly (lower initial doses may be appropriate) · hypertrophic cardiomyopathy · patients with a history of angioedema · patients with primary aldosteronism (may not benefit from an angiotensin-II receptor antagonist) · renal artery stenosis

CAUTIONS, FURTHER INFORMATION

- ▶ Elderly Prescription potentially inappropriate (STOPP criteria):
 - with hyperkalaemia

- with persistent postural hypotension i.e. recurrent drop in systolic blood pressure ≥ 20 mmHg (risk of syncope and falls)

See also Prescribing in the elderly p. 33.

• SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · asthenia · back pain · cough · diarrhoea · dizziness · headache · hyperkalaemia · hypotension · nausea · postural hypotension (more common in patients with intravascular volume depletion, e.g. those taking high-dose diuretics) · renal impairment · vertigo · vomiting
- ▶ **Uncommon** Angioedema · myalgia · skin reactions · thrombocytopenia
- ▶ **Rare or very rare** Arthralgia · hepatic function abnormal
- **PREGNANCY** Angiotensin-II receptor antagonists should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; neonatal skull defects and oligohydramnios have also been reported.
- **BREAST FEEDING** Information on the use of angiotensin-II receptor antagonists in breast-feeding is limited. They are not recommended in breast-feeding and alternative treatment options, with better established safety information during breast-feeding, are available.
- **HEPATIC IMPAIRMENT** In general, manufacturers advise caution in mild to moderate impairment (limited information available); avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT**
Dose adjustments Use with caution, starting with low dose, and adjust according to response.
- **MONITORING REQUIREMENTS** Monitor plasma-potassium concentration, particularly in the elderly and in patients with renal impairment.

185

Azilsartan medoxomil

05-Jun-2018

• INDICATIONS AND DOSE

Hypertension

▶ BY MOUTH

- ▶ Adult 18-74 years: Initially 40 mg once daily, increased if necessary to 80 mg once daily
- ▶ Adult 75 years and over: Initially 20-40 mg once daily, increased if necessary to 80 mg once daily

Hypertension with intravascular volume depletion

▶ BY MOUTH

- ▶ Adult: Initially 20-40 mg daily, increased if necessary to 80 mg daily

- **CAUTIONS** Heart failure
- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists
- **SIDE-EFFECTS**
- ▶ **Uncommon** Hyperuricaemia · muscle spasms · peripheral oedema
- **HEPATIC IMPAIRMENT**
Dose adjustments Manufacturer advises consider initial dose of 20 mg in mild to moderate impairment.
Monitoring Manufacturer advises monitor closely in mild to moderate hepatic impairment (limited information available).
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

Candesartan cilexetil

29-Jul-2019

• INDICATIONS AND DOSE

Hypertension

▶ BY MOUTH

- ▶ Adult: Initially 8 mg once daily, increased if necessary up to 32 mg once daily, doses to be increased at intervals of 4 weeks; usual dose 8 mg once daily

Hypertension with intravascular volume depletion

▶ BY MOUTH

- ▶ Adult: Initially 4 mg once daily, increased if necessary up to 32 mg daily, doses to be increased at intervals of 4 weeks; usual dose 8 mg once daily

Heart failure with impaired left ventricular systolic function when ACE inhibitors are not tolerated | Heart failure with impaired left ventricular systolic function in conjunction with an ACE inhibitor (under expert supervision)

▶ BY MOUTH

- ▶ Adult: Initially 4 mg once daily, increased at intervals of at least 2 weeks to 'target' dose of 32 mg once daily or to maximum tolerated dose; maximum 32 mg per day

Migraine prophylaxis

▶ BY MOUTH

- ▶ Adult: 16 mg once daily

- **UNLICENSED USE** **[EvGr]** Candesartan is used for migraine prophylaxis, \blacklozenge but is not licensed for this indication.
- **CONTRA-INDICATIONS** Cholestasis
- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists
- **SIDE-EFFECTS**
- ▶ **Common or very common** Increased risk of infection
- ▶ **Rare or very rare** Agranulocytosis · hepatitis · hyponatraemia · leucopenia · neutropenia
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment or cholestasis.
Dose adjustments Manufacturer advises initial dose reduction to 4 mg once daily in mild to moderate impairment; adjust according to response.
- **RENAL IMPAIRMENT** Use with caution if eGFR less than 15 mL/minute/1.73 m²—limited experience.
Dose adjustments Initially 4 mg daily.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Losartan potassium

03-Aug-2018

● INDICATIONS AND DOSE

Diabetic nephropathy in type 2 diabetes mellitus

- ▶ BY MOUTH
- ▶ Adult 18-75 years: Initially 50 mg once daily for several weeks, then increased if necessary to 100 mg once daily
- ▶ Adult 76 years and over: Initially 25 mg once daily for several weeks, then increased if necessary to 100 mg once daily

continued →

Chronic heart failure when ACE inhibitors are unsuitable or contra-indicated

- ▶ BY MOUTH
- ▶ Adult: Initially 12.5 mg once daily, increased if tolerated to up to 150 mg once daily, doses to be increased at weekly intervals

Hypertension (including reduction of stroke risk in hypertension with left ventricular hypertrophy)

- ▶ BY MOUTH
- ▶ Adult 18-75 years: Initially 50 mg once daily for several weeks, then increased if necessary to 100 mg once daily
- ▶ Adult 76 years and over: Initially 25 mg once daily for several weeks, then increased if necessary to 100 mg once daily

Hypertension with intravascular volume depletion

- ▶ BY MOUTH
- ▶ Adult 18-75 years: Initially 25 mg once daily for several weeks, then increased if necessary up to 100 mg once daily

- **CAUTIONS** Severe heart failure
- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · hypoglycaemia · postural disorders
 - ▶ **Uncommon** Angina pectoris · constipation · drowsiness · dyspnoea · oedema · palpitations · sleep disorder
 - ▶ **Rare or very rare** Atrial fibrillation · hepatitis · hypersensitivity · paraesthesia · stroke · syncope · vasculitis
 - ▶ **Frequency not known** Depression · erectile dysfunction · hyponatraemia · influenza like illness · malaise · migraine · pancreatitis · photosensitivity reaction · rhabdomyolysis · taste altered · tinnitus · urinary tract infection
- **HEPATIC IMPAIRMENT**
 - ▶ **Dose adjustments** Manufacturer advises consider dose reduction if history of impairment (risk of increased plasma concentrations).
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include berry-citrus.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

- ▶ **Losartan potassium (Non-proprietary)**
 - ▶ **Losartan potassium 12.5 mg** Losartan 12.5mg tablets | 28 tablet **[PoM]** £30.00 DT = £5.19

Telmisartan

INDICATIONS AND DOSE

Hypertension

- ▶ BY MOUTH
- ▶ Adult: Initially 20–40 mg once daily for at least 4 weeks, increased if necessary up to 80 mg once daily

Prevention of cardiovascular events in patients with established atherosclerotic cardiovascular disease, or type 2 diabetes mellitus with target-organ damage

- ▶ BY MOUTH
- ▶ Adult: 80 mg once daily

- **CONTRA-INDICATIONS** Biliary obstructive disorders · cholestasis
- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Anaemia · arrhythmias · chest pain · cystitis · depression · dyspnoea · flatulence · gastrointestinal discomfort · hyperhidrosis · increased risk of infection · insomnia · muscle spasms · sciatica · syncope
 - ▶ **Rare or very rare** Anxiety · drowsiness · dry mouth · eosinophilia · hypoglycaemia · influenza like illness · interstitial lung disease · liver disorder · pain in extremity · sepsis · taste altered · tendon pain · visual impairment
- **HEPATIC IMPAIRMENT**
Dose adjustments Manufacturer advises maximum 40 mg daily in mild to moderate impairment.
- **RENAL IMPAIRMENT**
Dose adjustments Manufacturer advises initial dose of 20 mg once daily in severe impairment.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM > RENIN INHIBITORS

Aliskiren

27-Mar-2019

● **DRUG ACTION** Renin inhibitors inhibit renin directly; renin converts angiotensinogen to angiotensin I.● **INDICATIONS AND DOSE****Essential hypertension either alone or in combination with other antihypertensives**

- ▶ BY MOUTH
- ▶ Adult: 150 mg once daily, increased if necessary to 300 mg once daily

● **CONTRA-INDICATIONS** Concomitant treatment with an ACE inhibitor or an angiotensin-II receptor antagonist in patients with an eGFR less than 60 mL/minute/1.73 m² · concomitant treatment with an ACE inhibitor or an angiotensin-II receptor antagonist in patients with

diabetes mellitus · hereditary angioedema · idiopathic angioedema

- **CAUTIONS** Combination treatment with an ACE inhibitor · combination treatment with an angiotensin-II receptor antagonist · concomitant use of diuretics (first doses may cause hypotension—initiate with care) · history of angioedema · moderate to severe congestive heart failure · patients at risk of renal impairment · salt depletion (first doses may cause hypotension—initiate with care) · volume depletion (first doses may cause hypotension—initiate with care)

● **CAUTIONS, FURTHER INFORMATION**

- ▶ Concomitant use of drugs affecting the renin-angiotensin system Combination therapy with two drugs affecting the renin-angiotensin system (ACE inhibitors, angiotensin-II receptor antagonists, and aliskiren) is not recommended due to an increased risk of hyperkalaemia, hypotension, and renal impairment, compared to use of a single drug. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor with an angiotensin-II receptor antagonist. There is some evidence that the benefits of combination use of an ACE inhibitor with candesartan or valsartan may outweigh the risks in selected patients with heart failure for whom other treatments are unsuitable, however, the concomitant use of this combination, together with an aldosterone antagonist or a potassium-sparing diuretic is not recommended. For patients currently taking combination therapy, the need for continued combined therapy should be reviewed. If combination therapy is considered essential, it should be carried out under specialist supervision, with close monitoring of blood pressure, renal function, and electrolytes (particularly potassium); monitoring should be considered at the start of treatment, then monthly, and also after any change in dose or during intercurrent illness.

- **INTERACTIONS** → Appendix 1: aliskiren

● **SIDE-EFFECTS**

- ▶ **Common or very common** Arthralgia · diarrhoea · dizziness · electrolyte imbalance
- ▶ **Uncommon** Cough · oral disorder · palpitations · peripheral oedema · renal impairment · severe cutaneous adverse reactions (SCARs) · skin reactions
- ▶ **Rare or very rare** Angioedema · hypersensitivity
- ▶ **Frequency not known** Dyspnoea · hepatic disorders · nausea · vertigo · vomiting

SIDE-EFFECTS, FURTHER INFORMATION If diarrhoea is severe or persistent discontinue treatment.

- **PREGNANCY** Manufacturer advises avoid—no information available; other drugs acting on the renin-angiotensin system have been associated with fetal malformations and neonatal death.
 - **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.
 - **RENAL IMPAIRMENT** Avoid if eGFR is less than 30 mL/minute/1.73 m²—no information available. Use with caution in renal artery stenosis—no information available.
- Monitoring** Monitor plasma-potassium concentration in renal impairment.

- **MONITORING REQUIREMENTS** Monitor patients with a history of angioedema closely during treatment.

● **NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) decisions**

SMC No. 462/08

The *Scottish Medicines Consortium* has advised (February 2010) that aliskiren (*Rasilez*®) is **not** recommended for use within NHS Scotland for the treatment of essential hypertension as the economic case was not demonstrated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet**CAUTIONARY AND ADVISORY LABELS 21**

- ▶ **Rasilez** (Noden Pharma DAC)

Aliskiren (as Aliskiren hemifumarate) 150 mg Rasilez 150mg tablets | 28 tablet [PoM](#) £28.51 DT = £28.51

VASODILATORS > VASODILATOR ANTIHYPERTENSIVES

Hydralazine hydrochloride

04-Feb-2020

- **INDICATIONS AND DOSE**

Moderate to severe hypertension (adjunct)

- ▶ **BY MOUTH**

- ▶ **Adult:** Initially 25 mg twice daily, increased if necessary up to 50 mg twice daily

Heart failure (with long acting nitrate) (initiated in hospital or under specialist supervision)

- ▶ **BY MOUTH**

- ▶ **Adult:** Initially 25 mg 3–4 times a day, subsequent doses to be increased every 2 days if necessary; usual maintenance 50–75 mg 4 times a day

Hypertensive emergencies (including during pregnancy) | Hypertension with renal complications

- ▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult:** Initially 200–300 micrograms/minute; usual maintenance 50–150 micrograms/minute

- ▶ **BY SLOW INTRAVENOUS INJECTION**

- ▶ **Adult:** 5–10 mg, to be diluted with 10 mL sodium chloride 0.9%; dose may be repeated after 20–30 minutes

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · cor pulmonale · dissecting aortic aneurysm · high output heart failure · idiopathic systemic lupus erythematosus · myocardial insufficiency due to mechanical obstruction · severe tachycardia

- **CAUTIONS** Cerebrovascular disease · coronary artery disease (may provoke angina, avoid after myocardial infarction until stabilised) · occasionally blood pressure reduction too rapid even with low parental doses

- **INTERACTIONS** → Appendix 1: hydralazine

- **SIDE-EFFECTS**

- ▶ **Common or very common** Angina pectoris · diarrhoea · dizziness · flushing · gastrointestinal disorders · headache · hypotension · joint disorders · lupus-like syndrome (after long-term therapy with over 100 mg daily (or less in women and in slow acetylator individuals)) · myalgia · nasal congestion · nausea · palpitations · tachycardia · vomiting
- ▶ **Rare or very rare** Acute kidney injury · agranulocytosis · anaemia · anxiety · appetite decreased · conjunctivitis · depression · dyspnoea · eosinophilia · eye disorders · fever · glomerulonephritis · haematuria · haemolytic anaemia · hallucination · heart failure · hepatic disorders · leucocytosis · leucopenia · lymphadenopathy · malaise · nerve disorders · neutropenia · oedema · pancytopenia · paradoxical pressor response · paraesthesia · pleuritic pain · proteinuria · skin reactions · splenomegaly · thrombocytopenia · urinary retention · vasculitis · weight decreased

SIDE-EFFECTS, FURTHER INFORMATION The incidence of side-effects is lower if the dose is kept below 100mg daily, but systemic lupus erythematosus should be suspected if there is unexplained weight loss, arthritis, or any other unexplained ill health.

- **PREGNANCY** Neonatal thrombocytopenia reported, but risk should be balanced against risk of uncontrolled maternal hypertension. Manufacturer advises avoid before third trimester.

- **BREAST FEEDING** Present in milk but not known to be harmful.

Monitoring Monitor infant in breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of accumulation).

Dose adjustments Manufacturer advises adjust dose or dosing interval according to clinical response.

- **RENAL IMPAIRMENT**

Dose adjustments Reduce dose if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Manufacturer advises test for antinuclear factor and for proteinuria every 6 months and check acetylator status before increasing dose above 100 mg daily, but evidence of clinical value unsatisfactory.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Apresoline[®]) give continuously in Sodium chloride 0.9%. Suggested infusion volume 500 mL.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

Minoxidil

01-May-2020

- **INDICATIONS AND DOSE**

Severe hypertension, in addition to a diuretic and a beta-blocker

- ▶ **BY MOUTH**

- ▶ **Adult:** Initially 5 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg, increased at intervals of at least 3 days; maximum 100 mg per day
- ▶ **Elderly:** Initially 2.5 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg, increased at intervals of at least 3 days; maximum 100 mg per day

- **CONTRA-INDICATIONS** Phaeochromocytoma

- **CAUTIONS** Acute porphyrias p. 1120 · after myocardial infarction (until stabilised) · angina

- **INTERACTIONS** → Appendix 1: minoxidil

- **SIDE-EFFECTS**

- ▶ **Common or very common** Fluid retention · hair changes · oedema · pericardial disorders · pericarditis · tachycardia
- ▶ **Rare or very rare** Leucopenia · skin reactions · Stevens-Johnson syndrome · thrombocytopenia
- ▶ **Frequency not known** Angina pectoris · breast tenderness · gastrointestinal disorder · pleural effusion · sodium retention · weight increased
- **PREGNANCY** Avoid—possible toxicity including reduced placental perfusion. Neonatal hirsutism reported.

- **BREAST FEEDING** Present in milk but not known to be harmful.
- **RENAL IMPAIRMENT** Use with caution in significant impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

4.1b Hypertensive crises

Other drugs used for Hypertensive crises Hydralazine hydrochloride, p. 192 · Labetalol hydrochloride, p. 160

VASODILATORS > VASODILATOR ANTIHYPERTENSIVES

Sodium nitroprusside

06-Feb-2020

- **INDICATIONS AND DOSE**

Hypertensive emergencies

► BY INTRAVENOUS INFUSION

► **Adult:** Initially 0.5–1.5 micrograms/kg/minute, adjusted in steps of 500 nanograms/kg/minute every 5 minutes, usual dose 0.5–8 micrograms/kg/minute, use lower doses if already receiving other antihypertensives, stop if response unsatisfactory with max. dose in 10 minutes, lower initial dose of 300 nanograms/kg/minute has been used

Maintenance of blood pressure at 30–40% lower than pretreatment diastolic blood pressure

► BY INTRAVENOUS INFUSION

► **Adult:** 20–400 micrograms/minute, use lower doses for patients being treated with other antihypertensives

Controlled hypotension in anaesthesia during surgery

► BY INTRAVENOUS INFUSION

► **Adult:** Up to 1.5 micrograms/kg/minute

Acute or chronic heart failure

► BY INTRAVENOUS INFUSION

► **Adult:** Initially 10–15 micrograms/minute, increased every 5–10 minutes as necessary; usual dose 10–200 micrograms/minute normally for max. 3 days

- **UNLICENSED USE** Not licensed for use in the UK.

- **CONTRA-INDICATIONS** Compensatory hypertension · impaired cerebral circulation · Leber's optic atrophy · severe vitamin B₁₂ deficiency

- **CAUTIONS** Elderly · hyponatraemia · hypothermia · hypothyroidism · ischaemic heart disease

- **INTERACTIONS** → Appendix 1: nitroprusside

- **SIDE-EFFECTS** Abdominal pain · anaemia · arrhythmias · chest discomfort · cyanide toxicity · dizziness · flushing · headache · hyperhidrosis · hypothyroidism · hypovolaemia · ileus · intracranial pressure increased · methaemoglobinaemia · muscle twitching · nausea · palpitations · rash · thiocyanate toxicity

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects associated with over rapid reduction in blood pressure: Headache, dizziness, nausea, retching, abdominal pain, perspiration, palpitation, anxiety, retrosternal discomfort—reduce infusion rate if any of these side-effects occur.

Overdose Side-effects caused by excessive plasma concentration of the cyanide metabolite include tachycardia, sweating, hyperventilation, arrhythmias, marked metabolic acidosis (discontinue and give antidote, see cyanide in Emergency treatment of poisoning p. 1430).

- **PREGNANCY** Avoid prolonged use—potential for accumulation of cyanide in fetus.
- **BREAST FEEDING** No information available. Caution advised due to thiocyanate metabolite.
- **HEPATIC IMPAIRMENT** Use with caution. Avoid in hepatic failure—cyanide or thiocyanate metabolites may accumulate.
- **RENAL IMPAIRMENT** Avoid prolonged use—cyanide or thiocyanate metabolites may accumulate.
- **MONITORING REQUIREMENTS** Monitor blood pressure (including intra-arterial blood pressure) and blood-cyanide concentration, and if treatment exceeds 3 days, also blood thiocyanate concentration.
- **TREATMENT CESSATION** Avoid sudden withdrawal—terminate infusion over 15–30 minutes.

• **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion* in Glucose 5%, infuse via infusion device to allow precise control. For further details, consult product literature. Protect infusion from light.

• **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

4.1c Pulmonary hypertension

Other drugs used for Pulmonary hypertension

Epoprostenol, p. 123 · Sildenafil, p. 859 · Tadalafil, p. 860

ANTITHROMBOTIC DRUGS > ANTIPLATELET DRUGS

Selexipag

23-May-2018

• **DRUG ACTION** Selexipag is a selective prostacyclin (IP) receptor agonist.

• **INDICATIONS AND DOSE**

Pulmonary arterial hypertension either as combination therapy (if insufficiently controlled with an endothelin receptor antagonist and/or a phosphodiesterase type-5 inhibitor), or as monotherapy (initiated under specialist supervision)

▶ **BY MOUTH**

▶ **Adult:** Initially 200 micrograms twice daily, increased in steps of 200 micrograms twice daily at weekly intervals up to the highest tolerated dose, usual maintenance 200–1600 micrograms twice daily, initial dose and first dose after each dose increase should be taken in the evening; maximum 3200 micrograms per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

▶ Manufacturer advises reduce dose frequency to once daily with concurrent use of clopidogrel or moderate CYP2C8 inhibitors.

• **CONTRA-INDICATIONS** Cerebrovascular event (within the last 3 months) · congenital or acquired valvular defects with myocardial function disorders (not related to pulmonary hypertension) · decompensated cardiac failure (unless under close medical supervision) · myocardial infarction (within last 6 months) · severe arrhythmias · severe coronary heart disease · unstable angina

• **CAUTIONS** Elderly (limited information available)

• **INTERACTIONS** → Appendix 1: selexipag

• **SIDE-EFFECTS**

▶ **Common or very common** Abdominal pain · anaemia · appetite decreased · arthralgia · diarrhoea · flushing · headache · hyperthyroidism · hypotension · myalgia · nasal congestion · nasopharyngitis · nausea · pain · skin reactions · vomiting · weight decreased

▶ **Uncommon** Sinus tachycardia

• **PREGNANCY** Manufacturer advises avoid—no information available.

• **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

• **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment (risk of increased exposure); avoid in severe impairment (no information available).

Dose adjustments Manufacturer advises initial dose reduction to 200 micrograms once daily in moderate

impairment, increased in steps of 200 micrograms once daily at weekly intervals up to the highest tolerated dose.

• **RENAL IMPAIRMENT** Manufacturer advises caution with dose titration in severe impairment.

• **PATIENT AND CARER ADVICE**

Missed doses Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time; if a dose is missed for 3 days or more, treatment should be restarted at a lower dose and then increased—consult product literature.

• **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 1235/17

The *Scottish Medicines Consortium* has advised (updated May 2018) that selexipag (*Uptravi*®) is accepted for restricted use within NHS Scotland for the long-term treatment of pulmonary arterial hypertension in adults with WHO functional class III, as combination therapy in patients insufficiently controlled with an endothelin receptor antagonist and a phosphodiesterase type-5 inhibitor, and who should be considered for treatment with inhaled iloprost. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 700

The *All Wales Medicines Strategy Group* has advised (June 2018) that selexipag (*Uptravi*®) is recommended as an option for restricted use within NHS Wales as a triple combination therapy for the treatment of pulmonary arterial hypertension (PAH) in adults with WHO functional class (FC) III who are insufficiently controlled on dual therapy with an endothelin receptor antagonist and a phosphodiesterase type-5 inhibitor. Selexipag (*Uptravi*®) is not recommended for use within NHS Wales outside of this sub-population. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

• **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

ENDOTHELIN RECEPTOR ANTAGONISTS

Ambrisentan

20-May-2020

● INDICATIONS AND DOSE

Pulmonary arterial hypertension (initiated under specialist supervision)

▶ BY MOUTH

- Adult: 5 mg once daily, increased if necessary to 10 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises max. dose 5 mg daily and close monitoring with concurrent use of ciclosporin.

- **CONTRA-INDICATIONS** Idiopathic pulmonary fibrosis
- **CAUTIONS** Not to be initiated in significant anaemia · pulmonary veno-occlusive disease
- **INTERACTIONS** → Appendix 1: ambrisentan
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anaemia · asthenia · constipation · diarrhoea · dizziness · epistaxis · flushing · headaches · hypersensitivity · increased risk of infection · nasal congestion · nausea · palpitations · skin reactions · syncope · tinnitus · vision disorders · vomiting
 - ▶ **Uncommon** Hepatic disorders · sudden hearing loss
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment and ensure effective contraception during treatment. Monthly pregnancy tests advised.
- **PREGNANCY** Avoid (teratogenic in *animal studies*).
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment or if baseline serum transaminases exceed 3 times the upper limit of normal.
- **RENAL IMPAIRMENT** Use with caution if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - ▶ Monitor haemoglobin concentration or haematocrit after 1 month and 3 months of starting treatment, and periodically thereafter (reduce dose or discontinue treatment if significant decrease in haemoglobin concentration or haematocrit observed).
 - ▶ Monitor liver function before treatment, and monthly thereafter—discontinue if liver enzymes raised significantly or if symptoms of liver impairment develop.
- **PATIENT AND CARER ADVICE** Alert card A patient alert card should be provided.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions
SMC No. 511/08

The *Scottish Medicines Consortium* has advised (November 2008) that ambrisentan (*Volibris*®) is accepted for restricted use within NHS Scotland for the treatment of patients with pulmonary arterial hypertension (PAH) classified as WHO functional class II and III, to improve exercise capacity, when prescribed by specialists in the Scottish Pulmonary Vascular Unit or similar specialists.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Pulmonary arterial hypertension (initiated under specialist supervision)

▶ BY MOUTH

- Adult: Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily (max. per dose 250 mg); maximum 500 mg per day

Systemic sclerosis with ongoing digital ulcer disease (to reduce number of new digital ulcers)

▶ BY MOUTH

- Adult: Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120
- **CAUTIONS** Not to be initiated if systemic systolic blood pressure is below 85 mmHg · pulmonary veno-occlusive disease
- **INTERACTIONS** → Appendix 1: bosentan
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · diarrhoea · flushing · gastroesophageal reflux disease · headache · nasal congestion · palpitations · skin reactions · syncope
 - ▶ **Uncommon** Hepatic disorders · leucopenia · neutropenia · thrombocytopenia
 - ▶ **Rare or very rare** Angioedema
 - ▶ **Frequency not known** Vision blurred
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during administration (hormonal contraception not considered effective). Monthly pregnancy tests advised.
- **PREGNANCY** Avoid (teratogenic in *animal studies*).
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate-to-severe impairment or if baseline serum transaminases exceed 3 times the upper limit of normal.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor haemoglobin before and during treatment (monthly for first 4 months, then 3-monthly).
 - ▶ Monitor liver function before treatment, and monthly intervals during treatment, and 2 weeks after dose increase (reduce dose or suspend treatment if liver enzymes raised significantly)—discontinue if symptoms of liver impairment.
- **TREATMENT CESSATION** Avoid abrupt withdrawal—withdraw treatment gradually.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet▶ **Bosentan (Non-proprietary)**

Bosentan (as Bosentan monohydrate) 62.5 mg Bosentan 62.5mg tablets | 56 tablet [PoM] £112.50 (Hospital only) | 56 tablet [PoM] £1,359.19-£1,510.21

Bosentan (as Bosentan monohydrate) 125 mg Bosentan 125mg tablets | 56 tablet [PoM] £112.50 (Hospital only) | 56 tablet [PoM] £1,359.19-£1,510.21

▶ **Tracleer** (Actelion Pharmaceuticals UK Ltd)

Bosentan (as Bosentan monohydrate) 62.5 mg Tracleer 62.5mg tablets | 56 tablet [PoM] £1,510.21

Bosentan (as Bosentan monohydrate) 125 mg Tracleer 125mg tablets | 56 tablet [PoM] £1,510.21

Macitentan

20-May-2020

● INDICATIONS AND DOSE

Pulmonary arterial hypertension (initiated under specialist supervision)

- ▶ BY MOUTH
- ▶ Adult: 10 mg daily

- **CONTRA-INDICATIONS** Severe anaemia
- **CAUTIONS** Patients over 75 years · pulmonary veno-occlusive disease
- **INTERACTIONS** → Appendix 1: macitentan
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · headache · increased risk of infection · nasal congestion
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before treatment and ensure effective contraception during and for one month after stopping treatment. Monthly pregnancy tests advised.
- **PREGNANCY** Toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment or if hepatic transaminases are greater than 3 times the upper limit of normal.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment and avoid in patients undergoing dialysis (no information available).
 - ▶ **Monitoring** In renal impairment consider monitoring blood pressure (risk of hypotension).
- **MONITORING REQUIREMENTS**
 - ▶ Monitor liver function before treatment, then monthly thereafter (discontinue if unexplained persistent raised serum transaminases or signs of hepatic injury—can restart on advice on hepatologist if liver function tests return to normal and no hepatic injury).
 - ▶ Monitor haemoglobin concentration before treatment and then as indicated.
- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as dark urine, nausea, vomiting, fatigue, abdominal pain, or pruritus develop.
 - ▶ Patient card should be provided.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions
SMC No. 952/14
The *Scottish Medicines Consortium* has advised (April 2014) that macitentan (*Opsumit*[®]) should be initiated and prescribed only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

GUANYLATE CYCLASE STIMULATORS

Riociguat

20-Nov-2019

● INDICATIONS AND DOSE

Chronic thromboembolic pulmonary hypertension that is recurrent or persistent following surgery, or is inoperable (initiated under specialist supervision) | Monotherapy or in combination with an endothelin receptor antagonist for idiopathic or hereditary pulmonary arterial hypertension, or pulmonary arterial hypertension associated with connective tissue disease (initiated under specialist supervision)

- ▶ BY MOUTH
- ▶ **Adult:** Initially 1 mg 3 times a day for 2 weeks, increased in steps of 0.5 mg 3 times a day, dose to be increased every 2 weeks, increased to up to 2.5 mg 3 times a day (max. per dose 2.5 mg 3 times a day), increase up to maximum dose only if systolic blood pressure \geq 95 mmHg and no signs of hypotension, if treatment interrupted for 3 or more days, restart at 1 mg three times daily for 2 weeks and titrate as before, during titration, reduce dose by 0.5 mg three times daily if systolic blood pressure falls below 95 mmHg and patient shows signs of hypotension

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises consider initial dose of 0.5 mg 3 times daily in those stable on a strong multi-pathway cytochrome P450 and P-glycoprotein (P-gp)/breast cancer resistance protein (BCRP) inhibitor.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PULMONARY HYPERTENSION ASSOCIATED WITH IDIOPATHIC INTERSTITIAL PNEUMONIAS (PH-IIP) (AUGUST 2016)

Interim results from a terminated study to investigate the efficacy and safety of riociguat in patients with symptomatic PH-IIP, showed increased mortality and increased risk of serious adverse events in the riociguat group compared with the placebo group. The MHRA has advised that use of riociguat is contra-indicated in these patients and that existing treatment for this unauthorised indication should be discontinued.

- **CONTRA-INDICATIONS** History of serious haemoptysis · previous bronchial artery embolisation · pulmonary hypertension associated with idiopathic interstitial pneumonias · pulmonary veno-occlusive disease
- **CAUTIONS** Autonomic dysfunction · elderly (risk of hypotension) · hypotension (do not initiate if systolic blood pressure below 95 mmHg) · hypovolaemia · severe left ventricular outflow obstruction
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Smoking Smoking cessation advised (response possibly reduced); dose adjustment may be necessary if smoking started or stopped during treatment.
- **INTERACTIONS** → Appendix 1: riociguat
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · constipation · diarrhoea · dizziness · dysphagia · gastroenteritis · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hypotension · nasal congestion · nausea · palpitations · peripheral oedema · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment. Monthly pregnancy tests advised.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment (no information available).
Dose adjustments Manufacturer advises cautious dose titration in moderate impairment.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m²—limited information available.
Dose adjustments Titrate dose cautiously—risk of hypotension.
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed and mixed with water or soft foods and swallowed immediately.
- **PATIENT AND CARER ADVICE** Smoking cessation advised (response possibly reduced).
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 1001/14

The *Scottish Medicines Consortium* has advised (December 2014) that riociguat (*Adempas*®) is accepted for restricted use within NHS Scotland for the treatment of chronic thromboembolic pulmonary hypertension in adults for whom a phosphodiesterase type-5 inhibitor is inappropriate, not tolerated, or ineffective, and should only be prescribed by specialists in the Scottish Pulmonary Vascular Unit. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower. SMC No. 1056/15

The *Scottish Medicines Consortium* has advised (July 2015) that riociguat (*Adempas*®) is accepted for restricted use within NHS Scotland for the treatment of pulmonary arterial hypertension in adults as specific monotherapy as an alternative treatment option to endothelin receptor antagonist monotherapy and should only be prescribed by specialists in the Scottish Pulmonary Vascular Unit or by similar specialists. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

PROSTAGLANDINS AND ANALOGUES

Iloprost

20-Apr-2020

● INDICATIONS AND DOSE

Idiopathic or familial pulmonary arterial hypertension (initiated under specialist supervision)

▶ BY INHALATION OF NEBULISED SOLUTION

- ▶ **Adult:** Initially 2.5 micrograms for 1 dose, increased to 5 micrograms for 1 dose, increased if tolerated to 5 micrograms 6–9 times a day, adjusted according to response; reduced if not tolerated to 2.5 micrograms 6–9 times a day, reduce to lower maintenance dose if high dose not tolerated

Severe Raynaud's phenomenon in patients with progressive trophic disorders

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 0.5 nanogram/kg/minute for 30 minutes, then increased, if tolerated, in steps of 0.5 nanogram/kg/minute every 30 minutes (max. per dose 2 nanograms/kg/minute); usual dose 1.5–2 nanograms/kg/minute given over 6 hours daily for 5 days, repeat cycles should take place at intervals of at least 4 weeks (preferably 6–12 weeks)

Severe chronic lower limb ischaemia

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 0.5 nanogram/kg/minute for 30 minutes, then increased, if tolerated, in steps of 0.5 nanogram/kg/minute every 30 minutes (max. per dose 2 nanograms/kg/minute); usual dose 0.5–2 nanograms/kg/minute given over 6 hours daily for up to 4 weeks

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS

Conditions which increase risk of haemorrhage · congenital or acquired valvular defects with myocardial function disorders (not related to pulmonary hypertension) · decompensated heart failure (unless under close medical supervision) · severe arrhythmias · severe coronary heart disease · unstable angina · within 3 months of cerebrovascular events · within 6 months of myocardial infarction

SPECIFIC CONTRA-INDICATIONS

- ▶ When used by inhalation Pulmonary veno-occlusive disease · systolic blood pressure below 85 mmHg · unstable pulmonary hypertension with advanced right heart failure
- ▶ With intravenous use acute or chronic congestive heart failure (NYHA II-IV) · pulmonary oedema

● CAUTIONS

GENERAL CAUTIONS Hypotension

SPECIFIC CAUTIONS

- ▶ When used by inhalation Acute pulmonary infection · chronic obstructive pulmonary disease · severe asthma
- ▶ With intravenous use Significant heart disease

- **INTERACTIONS** → Appendix 1: iloprost

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Cough · diarrhoea · dizziness · dyspnoea · haemorrhage · hypotension · nausea · pain · palpitations · syncope · vomiting
- ▶ **Uncommon** Taste altered · thrombocytopenia

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ When used by inhalation Chest discomfort · headache · oral disorders · rash · tachycardia · throat complaints · vasodilation
- ▶ With intravenous use Angina pectoris · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · bradypnea · chills · confusion · drowsiness · feeling hot · fever · flushing · gastrointestinal discomfort · headaches · hyperhidrosis · muscle complaints · sensation abnormal · thirst · vertigo
- ▶ **Uncommon**
- ▶ With intravenous use Asthma · cerebrovascular insufficiency · constipation · depression · dry mouth · dysphagia · dysuria · embolism and thrombosis · eye discomfort · hallucination · heart failure · hepatic impairment · myocardial infarction · pruritus · pulmonary oedema · renal pain · seizure · tetany · tremor · vision blurred
- ▶ **Frequency not known**
- ▶ When used by inhalation Respiratory disorders

- **PREGNANCY**
 - ▶ When used by inhalation Use if potential benefit outweighs risk.
 - ▶ With intravenous use Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).
 - Dose adjustments** ▶ When used by inhalation Manufacturer advises initial dose reduction to 2.5 micrograms at intervals of 3–4 hours (max. 6 times daily), adjusted according to response—consult product literature.
 - ▶ With intravenous use Manufacturer advises initial dose reduction in severe impairment, consider half the normal dose.
- **MONITORING REQUIREMENTS**
 - ▶ With intravenous use Manufacturer advises monitor blood pressure and heart rate at the start of the infusion and at every dose increase.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For *intravenous infusion* dilute to a concentration of 200 nanograms/mL with Glucose 5% or Sodium Chloride 0.9%; alternatively, may be diluted to a concentration of 2 micrograms/mL and given via syringe driver.
 - ▶ When used by inhalation To minimise accidental exposure use only with nebulisers listed in product literature in a well ventilated room.
- **PRESCRIBING AND DISPENSING INFORMATION**
 - ▶ When used by inhalation Delivery characteristics of nebuliser devices may vary—only switch devices under medical supervision.
 - ▶ With intravenous use Concentrate for infusion available on a named patient basis from Bayer Schering in 0.5 mL and 1 mL ampoules.
- **HANDLING AND STORAGE** Manufacturer advises avoid contact with skin and eyes.
- **PATIENT AND CARER ADVICE**
 - Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 219/05

The *Scottish Medicines Consortium* has advised (December 2005) that iloprost (*Ventavis*[®]) is accepted for restricted use within NHS Scotland in patients in whom bosentan is ineffective or not tolerated, and should only be prescribed by specialists in the Scottish Pulmonary Vascular Unit.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Ethanol

▶ Iloprost (Non-proprietary)

Iloprost (as Iloprost trometamol) 100 microgram per 1 mL Iloprost 100micrograms/1ml solution for infusion ampoules | 1 ampoule [PoM] 

Iloprost 50micrograms/0.5ml concentrate for solution for infusion ampoules | 1 ampoule [PoM] £75.00 (Hospital only) | 5 ampoule [PoM] £300.00 (Hospital only)

4.2 Hypotension and shock

Sympathomimetics

Inotropic sympathomimetics

Shock

Shock is a medical emergency associated with a high mortality. The underlying causes of shock such as haemorrhage, sepsis, or myocardial insufficiency should be corrected. The profound hypotension of shock must be treated promptly to prevent tissue hypoxia and organ failure. Volume replacement is essential to correct the hypovolaemia associated with haemorrhage and sepsis but may be detrimental in cardiogenic shock. Depending on haemodynamic status, cardiac output may be improved by the use of sympathomimetic inotropes such as adrenaline/epinephrine p. 236, dobutamine p. 235 or dopamine hydrochloride p. 199. In septic shock, when fluid replacement and inotropic support fail to maintain blood pressure, the vasoconstrictor noradrenaline/norepinephrine p. 200 may be considered. In cardiogenic shock peripheral resistance is frequently high and to raise it further may worsen myocardial performance and exacerbate tissue ischaemia.

The use of sympathomimetic inotropes and vasoconstrictors should preferably be confined to the intensive care setting and undertaken with invasive haemodynamic monitoring.

See also advice on the management of anaphylactic shock in Antihistamines, allergen immunotherapy and allergic emergencies p. 291.

Vasoconstrictor sympathomimetics

Vasoconstrictor sympathomimetics raise blood pressure transiently by acting on alpha-adrenergic receptors to constrict peripheral vessels. They are sometimes used as an emergency method of elevating blood pressure where other measures have failed.

The danger of vasoconstrictors is that although they raise blood pressure they also reduce perfusion of vital organs such as the kidney.

Spinal and epidural anaesthesia may result in sympathetic block with resultant hypotension. Management may include intravenous fluids (which are usually given prophylactically), oxygen, elevation of the legs, and injection of a pressor drug such as ephedrine hydrochloride p. 286. As well as constricting peripheral vessels ephedrine hydrochloride also accelerates the heart rate (by acting on beta receptors). Use is made of this dual action of ephedrine hydrochloride to manage associated bradycardia (although intravenous injection of atropine sulfate p. 1404 may also be required if bradycardia persists).

SYMPATHOMIMETICS > INOTROPIC

Dopamine hydrochloride

- **DRUG ACTION** Dopamine is a cardiac stimulant which acts on beta₁ receptors in cardiac muscle, and increases contractility with little effect on rate.

● INDICATIONS AND DOSE

Cardiogenic shock in infarction or cardiac surgery

► BY INTRAVENOUS INFUSION

- Adult: Initially 2–5 micrograms/kg/minute

- **CONTRA-INDICATIONS** Phaeochromocytoma · tachyarrhythmia
- **CAUTIONS** Correct hypovolaemia · hypertension (may raise blood pressure) · hyperthyroidism · low dose in shock due to acute myocardial infarction
- **INTERACTIONS** → Appendix 1: sympathomimetics, inotropic
- **SIDE-EFFECTS** Angina pectoris · anxiety · arrhythmias · azotaemia · cardiac conduction disorder · dyspnoea · gangrene · headache · hypertension · mydriasis · nausea · palpitations · piloerection · polyuria · tremor · vasoconstriction · vomiting
- **PREGNANCY** No evidence of harm in *animal studies*—manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** May suppress lactation—not known to be harmful.
- **DIRECTIONS FOR ADMINISTRATION** Dopamine concentrate for intravenous infusion to be diluted before use.
For *intravenous infusion* give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to max. concentration of 3.2 mg/mL; incompatible with bicarbonate.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for infusion

► Dopamine hydrochloride (Non-proprietary)

Dopamine hydrochloride 40 mg per 1 mL Dopamine 200mg/5ml solution for infusion ampoules | 5 ampoule [PoM] £20.00 (Hospital only) | 5 ampoule [PoM] £20.00 | 10 ampoule [PoM] £9.04

Dopamine 200mg/5ml concentrate for solution for infusion ampoules | 10 ampoule [PoM] [X]

Dopamine hydrochloride 160 mg per 1 mL Dopamine 800mg/5ml solution for infusion ampoules | 10 ampoule [PoM] [X]

SYMPATHOMIMETICS > VASOCONSTRICTOR

Metaraminol

28-Apr-2020

● INDICATIONS AND DOSE

Emergency treatment of acute hypotension

► INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 0.5–5 mg, then (by intravenous infusion) 15–100 mg, adjusted according to response

Acute hypotension

► BY INTRAVENOUS INFUSION

- Adult: 15–100 mg, adjusted according to response

- **CAUTIONS** Cirrhosis · coronary vascular thrombosis · diabetes mellitus · elderly · extravasation at injection site may cause necrosis · following myocardial infarction · hypercapnia · hypertension · hyperthyroidism · hypoxia · mesenteric vascular thrombosis · peripheral vascular thrombosis · Prinzmetal's variant angina · uncorrected hypovolaemia

CAUTIONS, FURTHER INFORMATION

- Hypertensive response Metaraminol has a longer duration of action than noradrenaline, and an excessive vasopressor response may cause a prolonged rise in blood pressure.
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS**
 - Common or very common Headache · hypertension
 - Rare or very rare Skin exfoliation · soft tissue necrosis
- Frequency not known Abscess · arrhythmias · nausea · palpitations · peripheral ischaemia
- **PREGNANCY** May reduce placental perfusion—manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS** Monitor blood pressure and rate of flow frequently.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give continuously or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Suggested volume 500 mL.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

► Metaraminol (Non-proprietary)

Metaraminol (as Metaraminol tartrate) 10 mg per 1 mL Metaraminol 10mg/1ml solution for injection ampoules | 10 ampoule [PoM] £30.45

Midodrine hydrochloride

01-Apr-2016

- **DRUG ACTION** Midodrine hydrochloride is a pro-drug of desglymidodrine. Desglymidodrine is a sympathomimetic agent, which acts on peripheral alpha-adrenergic receptors to increase arterial resistance, resulting in an increase in blood pressure.

● INDICATIONS AND DOSE

Severe orthostatic hypotension due to autonomic dysfunction when corrective factors have been ruled out and other forms of treatment are inadequate

► BY MOUTH

- Adult: Initially 2.5 mg 3 times a day, increased if necessary up to 10 mg 3 times a day, dose to be increased at weekly intervals, according to blood pressure measurements; usual maintenance 10 mg 3 times a day, avoid administration at night; the last daily dose should be taken at least 4 hours before bedtime

- **CONTRA-INDICATIONS** Aortic aneurysm · blood vessel spasm · bradycardia · cardiac conduction disturbances · cerebrovascular occlusion · congestive heart failure · hypertension · hyperthyroidism · myocardial infarction · narrow-angle glaucoma · phaeochromocytoma · proliferative diabetic retinopathy · serious obliterative blood vessel disease · serious prostate disorder · urinary retention
- **CAUTIONS** Atherosclerotic cardiovascular disease (especially with symptoms of intestinal angina or claudication of the legs) · autonomic dysfunction · elderly (manufacturer recommends cautious dose titration) · prostate disorders
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS**
 - Common or very common Chills · flushing · gastrointestinal discomfort · headache · nausea · paraesthesia · piloerection

- scalp pruritus · skin reactions · stomatitis · supine hypertension (dose-dependent) · urinary disorders
 - ▶ **Uncommon** Anxiety · arrhythmias · irritability · sleep disorders
 - ▶ **Rare or very rare** Hepatic function abnormal · palpitations
 - ▶ **Frequency not known** Confusion · diarrhoea · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises that treatment must be stopped if supine hypertension is not controlled by reducing the dose.
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment in women of childbearing potential.
 - **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
 - **BREAST FEEDING** Manufacturer advises avoid—no information available.
 - **RENAL IMPAIRMENT** Manufacturer advises avoid in severe or acute impairment.
 - **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises measure hepatic and renal function before treatment and at regular intervals during treatment.
 - ▶ Manufacturer advises regular monitoring of supine and standing blood pressure due to the risk of hypertension in the supine position.
 - **PATIENT AND CARER ADVICE** Manufacturer advises that patients report symptoms of supine hypertension (such as chest pain, palpitations, shortness of breath, headache and blurred vision) immediately. The risk of supine hypertension at night can be reduced by raising the head of the bed.
 - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet▶ **Midodrine hydrochloride (Non-proprietary)**

Midodrine hydrochloride 2.5 mg Midodrine 2.5mg tablets | 100 tablet [PoM](#) £67.26 DT = £55.05

Midodrine hydrochloride 5 mg Midodrine 5mg tablets | 100 tablet [PoM](#) £94.98 DT = £75.05

▶ **Bramox** (Brancaster Pharma Ltd)

Midodrine hydrochloride 2.5 mg Bramox 2.5mg tablets | 100 tablet [PoM](#) £55.05 DT = £55.05

Midodrine hydrochloride 5 mg Bramox 5mg tablets | 100 tablet [PoM](#) £75.05 DT = £75.05

Noradrenaline/norepinephrine 13-May-2020● **INDICATIONS AND DOSE****Acute hypotension [initial and on-going treatment]**▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult:** Initially 0.16–0.33 mL/minute, adjusted according to response, dose applies to a solution containing noradrenaline 40 micrograms(base)/mL only; dilute the 1 mg/mL concentrate for infusion for this solution—consult product literature

On-going treatment of acute hypotension [with escalating dose requirements]▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult** (body-weight 50 kg and above): Use the 0.08 mg/mL or 0.16 mg/mL solution for infusion (consult product literature)

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 mg of noradrenaline base is equivalent to 2 mg of noradrenaline acid tartrate. **Doses expressed as the base.**

IMPORTANT SAFETY INFORMATION**ASSOCIATION OF NORADRENALINE/NOREPINEPHRINE 0.08 MG/ML (4 MG IN 50 ML) AND 0.16 MG/ML (8 MG IN 50 ML) SOLUTION FOR INFUSION WITH POTENTIAL RISK OF MEDICATION ERRORS**

Healthcare professionals should be aware of the differences in strength and presentation between noradrenaline/norepinephrine products—manufacturer advises noradrenaline 0.08 mg/mL solution for infusion and noradrenaline 0.16 mg/mL solution for infusion must **not** be diluted before use and should only be used for the on-going treatment of patients already established on noradrenaline therapy, whose dose requirements are clinically confirmed to be escalating.

- **CONTRA-INDICATIONS** Hypertension
- **CAUTIONS** Coronary vascular thrombosis · diabetes mellitus · elderly · extravasation at injection site may cause necrosis · following myocardial infarction · hypercapnia · hyperthyroidism · hypoxia · mesenteric vascular thrombosis · peripheral vascular thrombosis · Prinzmetal's variant angina · uncorrected hypovolaemia
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS** Acute glaucoma · anxiety · arrhythmias · asthenia · cardiomyopathy · confusion · dyspnoea · extravasation necrosis · gangrene · headache · heart failure · hypovolaemia · hypoxia · injection site necrosis · insomnia · ischaemia · myocardial contractility increased · nausea · palpitations · peripheral ischaemia · psychotic disorder · respiratory failure · tremor · urinary retention · vomiting
- **PREGNANCY** Manufacturer advises use if potential benefit outweighs risk—may reduce placental perfusion and induce fetal bradycardia.
- **MONITORING REQUIREMENTS** Monitor blood pressure and rate of flow frequently.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion using a solution containing noradrenaline 40 micrograms (base)/mL, manufacturer advises give continuously in Glucose 5% or Sodium Chloride and Glucose via a controlled infusion device. For administration via syringe pump, dilute 2 mg (2 mL of 1 mg/mL concentrate for infusion) noradrenaline base with 48 mL infusion fluid. For administration via drip counter dilute 20 mg (20 mL of 1 mg/mL concentrate for infusion) noradrenaline base with 480 mL infusion fluid; give through a central venous catheter; incompatible with alkalis.
- **PRESCRIBING AND DISPENSING INFORMATION** For a period of time, preparations on the UK market may be described as either noradrenaline base or noradrenaline acid tartrate; doses in the BNF are expressed as the base.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Solution for infusion▶ **Noradrenaline/norepinephrine (Non-proprietary)**

Noradrenaline (as Noradrenaline acid tartrate) 80 microgram per 1 mL Noradrenaline (base) 4mg/50ml solution for infusion vials | 10 vial [PoM](#) [N](#)

Noradrenaline (as Noradrenaline acid tartrate) 1 mg per 1 mL Noradrenaline (base) 4mg/4ml concentrate for solution for infusion ampoules | 10 ampoule [PoM](#) £58.00

- Noradrenaline (base) 4mg/4ml solution for infusion ampoules | 5 ampoule [PoM] £22.00 (Hospital only)
- Noradrenaline (base) 2mg/2ml solution for infusion ampoules | 5 ampoule [PoM] £12.00 (Hospital only)
- Noradrenaline (base) 8mg/8ml concentrate for solution for infusion ampoules | 10 ampoule [PoM] £116.00
- **Sinora** (Sintetica Ltd)
Noradrenaline (as Noradrenaline acid tartrate) 80 microgram per 1 ml Sinora 4mg/50ml solution for infusion vials | 1 vial [PoM] £9.97
 - **Noradrenaline (as Noradrenaline acid tartrate) 160 microgram per 1 ml** Sinora 8mg/50ml solution for infusion vials | 1 vial [PoM] £14.22

- Phenylephrine hydrochloride 100 microgram per 1 ml** Phenylephrine 1mg/10ml solution for injection ampoules | 10 ampoule [PoM] £40.00
- Phenylephrine hydrochloride 10 mg per 1 ml** Phenylephrine 10mg/1ml solution for injection ampoules | 10 ampoule [PoM] £99.12

5 Cardiovascular risk assessment and prevention

Cardiovascular disease risk assessment and prevention

29-Nov-2019

Phenylephrine hydrochloride

• INDICATIONS AND DOSE

Acute hypotension

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 2–5 mg, followed by 1–10 mg, after at least 15 minutes if required
- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 100–500 micrograms, repeated as necessary after at least 15 minutes
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially up to 180 micrograms/minute, reduced to 30–60 micrograms/minute, adjusted according to response

- **CONTRA-INDICATIONS** Hypertension · severe hyperthyroidism
- **CAUTIONS** Coronary disease · coronary vascular thrombosis · diabetes · elderly · extravasation at injection site may cause necrosis · following myocardial infarction · hypercapnia · hyperthyroidism · hypoxia · mesenteric vascular thrombosis · peripheral vascular thrombosis · Prinzmetal's variant angina · susceptibility to angle-closure glaucoma · uncorrected hypovolaemia
- **CAUTIONS, FURTHER INFORMATION**
- Hypertensive response. Phenylephrine has a longer duration of action than noradrenaline (norepinephrine), and an excessive vasopressor response may cause a prolonged rise in blood pressure.
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS** Angina pectoris · arrhythmias · cardiac arrest · dizziness · dyspnoea · flushing · glucose tolerance impaired · headache · hyperhidrosis · hypersalivation · hypotension · intracranial haemorrhage · metabolic change · mydriasis · palpitations · paraesthesia · peripheral coldness · pulmonary oedema · soft tissue necrosis · syncope · urinary disorders · vomiting
- **PREGNANCY** Avoid if possible; malformations reported following use in first trimester; fetal hypoxia and bradycardia reported in late pregnancy and labour.
- **MONITORING REQUIREMENTS** Contra-indicated in hypertension—monitor blood pressure and rate of flow frequently.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion give intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute 10 mg in 500 mL infusion fluid.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, eye drops

Solution for injection

- **Phenylephrine hydrochloride (Non-proprietary)**
Phenylephrine (as Phenylephrine hydrochloride) 50 microgram per 1 ml Phenylephrine 500micrograms/10ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £15.00 | 10 pre-filled disposable injection [PoM] £150.00

Description of condition

Cardiovascular disease (CVD) is a term that describes a group of disorders of the heart and blood vessels caused by atherosclerosis and thrombosis, which includes coronary heart disease, stroke, peripheral arterial disease, and aortic disease.

The risk of CVD is greater in men, patients with a family history of CVD, and in certain ethnic backgrounds such as South Asians. CVD risk is also greater in patients aged over 50 years and increases with age; patients aged 85 years and over are at particularly high risk. CVD has several important and potentially modifiable risk factors such as hypertension, abnormal lipids, obesity, diabetes mellitus, and psychosocial factors such as depression, anxiety, and social isolation. Low physical activity, poor diet, smoking, and excessive alcohol intake are also modifiable risk factors.

Aims of treatment

The overall aim of treatment is to prevent the occurrence of a cardiovascular event by reducing modifiable risk factors through lifestyle changes and drug management.

Cardiovascular disease risk assessment

Recommendations on cardiovascular disease (CVD) risk assessment are from the *National Institute for Health and Care Excellence (NICE)—Cardiovascular disease: risk assessment and reduction, including lipid modification guideline (CG181, 2016)*, and *Scottish Intercollegiate Guidelines Network (SIGN)—Risk estimation and the prevention of cardiovascular disease guideline (SIGN 149, 2017)*. SIGN 149 uses risk assessment strategies outlined by the *Joint British Society (JBS)—Joint British Societies' consensus recommendations for the prevention of cardiovascular disease (2014)*. Recommendations where NICE and SIGN differ have been highlighted.

^[Evgri] NICE (2016) recommend that for primary prevention of CVD in primary care, a systematic approach be used to identify those who are likely to be at high risk. Patients should be prioritised based on an estimate of their CVD risk using risk factors already recorded in their medical records, before a full formal risk assessment. Priority for a full formal risk assessment should be given to patients with an estimated 10-year risk of 10% or more. Patients aged over 40 years should have their estimate of CVD risk reviewed on an ongoing basis. SIGN (2017) instead recommend that CVD risk assessments are offered at least every 5 years to all patients aged 40 years and over with no history of CVD, familial hypercholesterolaemia, chronic kidney disease or diabetes and who are not receiving treatment to reduce blood pressure or lipids. As well as to patients with a first-degree relative who has premature atherosclerotic CVD or familial dyslipidaemia, regardless of their age.

Risk assessment with a calculator is not required in patients who are at increased or high risk of CVD. This includes those with established CVD, chronic kidney disease

stage 3 or higher (eGFR <60 mL/minute/1.73 m²), albuminuria, or familial hypercholesterolaemia. In addition to these patients, NICE (2016) do not recommend the use of a risk calculator in patients with other hereditary disorders of lipid metabolism, or type 1 diabetes mellitus. Whereas SIGN (2017) do not recommend the use of a risk calculator in patients with diabetes mellitus aged 40 years and over, and in those aged under 40 years with diabetes mellitus who have either had it for more than 20 years, present with target organ damage (such as proteinuria, albuminuria, proliferative retinopathy, or autonomic neuropathy), or have other significantly elevated cardiovascular risk factors. 

Risk calculators

Cardiovascular risk assessment calculators are used to predict the approximate likelihood of a cardiovascular event occurring over a given period of time.  Standard risk scores may be underestimated in patients with additional risk due to existing conditions or medications that can cause dyslipidaemia (e.g. antipsychotics, corticosteroids, or immunosuppressants). CVD risk may also be underestimated in patients who are already taking antihypertensives or lipid-regulating drugs, or who have recently stopped smoking. Interpretation of risk scores as well as the need for further management of risk factors in those who fall below the CVD risk threshold, should always reflect informed clinical judgement. 

QRISK[®] 2 and JBS3

QRISK[®] 2 and JBS3 risk calculators are used to assess CVD risk for patients in England and Wales. Both tools assess cardiovascular risk of coronary heart disease (angina and myocardial infarction), stroke, and transient ischaemic attack. This is based on lipid profile, systolic blood pressure, gender, age, ethnicity, smoking status, BMI, chronic kidney disease (stage 4 or above), diabetes mellitus, atrial fibrillation, treated hypertension, rheumatoid arthritis, social deprivation, or a family history of premature CVD.

The QRISK[®] 2 risk calculator (www.qrisk.org/) is recommended by NICE clinical guideline 181, and the JBS3 risk calculator (www.jbs3risk.com/pages/risk_calculator.htm) is endorsed by the Joint British Society.

QRISK[®] 3 is an updated version of the QRISK[®] 2 risk calculator. It considers additional risk factors such as chronic kidney disease (stage 3 or above), migraine, corticosteroid use, systemic lupus erythematosus, atypical antipsychotics use, severe mental illness, erectile dysfunction, and a measure of systolic blood pressure variability.

The JBS3 calculator is not only able to estimate short term (10-year) risk, but also lifetime risk of CVD events. Patients with a 10-year risk of CVD of less than 10% may benefit from an assessment of their lifetime risk using the JBS3 tool, and a discussion on the impact of lifestyle interventions and, if necessary, drug therapy.

ASSIGN

The ASSIGN cardiovascular risk assessment calculator is tailored to the Scottish population and uses factors such as age, sex, smoking, systolic blood pressure, lipid profile, family history of premature CVD, diabetes mellitus, rheumatoid arthritis, and social deprivation to estimate cardiovascular risk.  Other risk factors not included in this CVD risk assessment calculator (such as ethnicity, BMI, atrial fibrillation, psychological wellbeing, and physical inactivity) should also be taken into account when assessing and managing the patient's overall CVD risk.

SIGN (2017) recommend that asymptomatic patients without established CVD (or other conditions that are automatically associated with a high CVD risk) should be considered at high risk if they are assessed as having a 20% or more risk of a first cardiovascular event within 10 years.

The online calculator tool can be found at www.assign-score.com/estimate-the-risk/. Full details can be found in the SIGN 149 clinical guideline (see *Useful resources*).

Cardiovascular disease prevention

Recommendations on cardiovascular disease (CVD) prevention are from the *National Institute for Health and Care Excellence (NICE)—Cardiovascular disease: risk assessment and reduction, including lipid modification guideline (CG181, 2016)*, and *Scottish Intercollegiate Guidelines Network (SIGN)—Risk estimation and the prevention of cardiovascular disease guideline (SIGN 149, 2017)*. SIGN 149 uses strategies outlined by the *Joint British Society (JBS)—Joint British Societies' consensus recommendations for the prevention of cardiovascular disease (2014)*. Recommendations where NICE and SIGN differ have been highlighted.

 All patients at any risk of CVD should be advised to make lifestyle modifications that may include beneficial changes to diet (such as increasing fruit and vegetable consumption, reducing saturated fat and dietary salt intake), increasing physical exercise, weight management, reducing alcohol consumption, and Smoking cessation p. 520. An annual review should be considered to discuss lifestyle modification, medication adherence and risk factors. The frequency of review may be tailored to the individual.

Further preventative measures with drug treatment should be taken in individuals with a high risk of developing CVD (primary prevention), and to prevent recurrence of events in those with established CVD (secondary prevention). 

Primary prevention

Antiplatelet therapy

 Aspirin p. 130 is not recommended for *primary prevention* of CVD due to the limited benefit gained versus risk of side-effects such as bleeding. 

Antihypertensive therapy

 Antihypertensive drug treatment should be offered to patients who are at high risk of CVD and have a sustained elevated systolic blood pressure over 140 mmHg and/or diastolic blood pressure over 90 mmHg. For further guidance on prescribing antihypertensive drugs in patients without symptomatic CVD and for specific groups at high cardiovascular risk, see Hypertension p. 151. 

Lipid-lowering therapy

 A statin is recommended as the lipid-lowering drug of choice for primary prevention of CVD. All modifiable risk factors, comorbidities and secondary causes of dyslipidaemia (e.g. uncontrolled diabetes mellitus, hepatic disease, nephrotic syndrome, excessive alcohol consumption, and hypothyroidism) should be managed before starting treatment with a statin. Factors such as polypharmacy, frailty, and comorbidities should be taken into account before starting statin therapy.

NICE (2016) recommend low-dose atorvastatin p. 215 for patients who have a 10% or greater 10-year risk of developing CVD (using the QRISK2 calculator), and for patients with chronic kidney disease. Low-dose atorvastatin p. 215 should be considered in all patients with type 1 diabetes mellitus, and be offered to patients with type 1 diabetes who are either aged over 40 years, have had diabetes for more than 10 years, have established nephropathy, or have other CVD risk factors. Patients aged 85 years and over may also benefit from low-dose atorvastatin p. 215 to reduce their risk of non-fatal myocardial infarction. SIGN (2017) recommend low-dose atorvastatin p. 215 for patients who are considered to be at high risk of CVD and not on dialysis.

Patients taking statins should have an annual medication review to discuss medication adherence, lifestyle modification, CVD risk factors, and non-fasting, non-HDL cholesterol concentration (if testing deemed appropriate). Total cholesterol, HDL-cholesterol, and non-HDL-cholesterol concentrations should be checked 3 months after starting treatment with a high-intensity statin. For statin intensity categorisation, see Dyslipidaemias p. 208.

Aiming for a reduction in non-HDL-cholesterol concentration of greater than 40% is recommended. If this is not achieved, adherence to drug treatment should be checked and lifestyle modifications optimised. In patients deemed to be at a higher risk due to comorbidities, risk score, or clinical judgement, an increase in the statin dose should be considered. NICE (2016) recommend that the use of higher doses in those with chronic kidney disease with an eGFR less than 30ml/minute/1.73 m² should be discussed with a renal specialist.

Specialist advice should be sought regarding treatment options in patients at high risk of CVD who are intolerant of three different statins.

SIGN (2017) recommend that ezetimibe p. 210 and bile acid sequestrants such as colestyramine p. 210 and colestipol hydrochloride p. 209 only be considered for primary prevention in patients with an elevated cardiovascular risk in whom statin therapy is contra-indicated, and in patients with familial hypercholesterolaemia. However, NICE (2016) recommend that ezetimibe p. 210 be considered for primary hypercholesterolaemia in line with National funding/access decisions for ezetimibe p. 210, and do not recommend bile acid sequestrants.

Although fibrates are not routinely recommended for primary prevention of CVD, SIGN (2017) recommend that they be considered in patients with a combination of high CVD risk, marked hypertriglyceridaemia and low HDL-cholesterol concentration.

If cholesterol remains above the target concentration despite other tolerated lipid-lowering therapy in patients at high risk of vascular events, the use of PCSK9 inhibitors, such as alirocumab p. 219 and evolocumab p. 219 should be considered. [▲](#)

Lipid-lowering therapy recommendations from Joint British Societies' consensus (2014), NICE Clinical guideline 181 (2016), and SIGN Clinical guideline 149 (2017) all differ in certain respects for prevention of CVD in patients with diabetes mellitus—see individual guidelines for further details.

For further information on lipid-lowering therapy and familial hypercholesterolaemia, see Dyslipidaemias p. 208.

Secondary prevention

Antiplatelet therapy

[EvGr](#) Antiplatelet therapy with low-dose daily aspirin p. 130 should be offered to patients with established atherosclerotic disease. Alternatively, clopidogrel p. 131 can be considered in patients who are intolerant to aspirin or in whom it is contra-indicated.

Clopidogrel p. 131 or a combination of dipyridamole with aspirin p. 133 should be considered to prevent recurrence of stroke and other vascular events in all patients with a history of stroke or transient ischaemic attack who are in sinus rhythm. [▲](#) For further information, see Stroke p. 125.

Antihypertensive therapy

[EvGr](#) Antihypertensive drug treatment is recommended in patients with established CVD and a sustained elevated systolic blood pressure over 140 mmHg and/or diastolic blood pressure over 90 mmHg. For further guidance on prescribing antihypertensive drugs in patients with CVD, see Hypertension p. 151. [▲](#)

Lipid-lowering therapy

[EvGr](#) A statin is recommended as the lipid-lowering drug of choice for secondary prevention of CVD. Factors such as polypharmacy, frailty, and comorbidities should be taken into account before starting statin therapy.

Treatment with high-dose atorvastatin p. 215 should be offered to patients with established atherosclerotic CVD. However, a lower dose can be used if the patient is at an increased risk of side-effects or drug interactions. NICE (2016) recommend that low-dose atorvastatin p. 215 be offered to patients with established CVD and chronic kidney disease.

High-dose simvastatin p. 217 is generally avoided due to the risk of myopathy, unless the patient has been stable on this regimen for at least one year. [▲](#) Furthermore, the MHRA advise that high-dose simvastatin p. 217 only be considered for patients who have not achieved their treatment goals with lower doses and have severe hypercholesterolaemia and high risk of cardiovascular complications; benefits should outweigh risks.

[EvGr](#) Patients taking statins should have an annual medication review to discuss medication adherence, lifestyle modification, CVD risk factors, and non-fasting, non-HDL-cholesterol concentrations (if testing deemed appropriate). Total cholesterol, HDL-cholesterol, and non-HDL-cholesterol concentrations should be checked 3 months after starting treatment with a high-intensity statin. Patients who are stable on a low or medium-intensity statin should discuss the benefits and risks of switching to a high-intensity statin at their next medication review. For statin intensity categorisation, see Dyslipidaemias p. 208.

Aiming for a reduction in non-HDL-cholesterol concentration of greater than 40% is recommended. [▲](#) JBS3 instead recommend a target non-HDL-cholesterol concentration below 2.5 mmol/litre. [EvGr](#) If these targets are not achieved, adherence to drug treatment should be checked and lifestyle modifications optimised. In patients judged to be at a higher risk because of comorbidities, risk score, or clinical judgement, an increase in the statin dose (if started on less than maximum atorvastatin p. 215 dose) should be considered. NICE (2016) recommend that the use of higher doses in those with chronic kidney disease with an eGFR less than 30ml/minute/1.73 m² be discussed with a renal specialist.

Specialist advice should be sought regarding treatment options in patients with existing CVD who are intolerant of three different statins.

If LDL-cholesterol remains inadequately controlled, SIGN (2017) recommend that ezetimibe p. 210 and bile acid sequestrants such as colestyramine p. 210 and colestipol hydrochloride p. 209, can be considered for use in combination with a statin at the maximum tolerated dose. However, NICE (2016) do not recommend bile acid sequestrants for the secondary prevention of CVD.

Although fibrates are not routinely recommended for secondary prevention of CVD, SIGN (2017) recommend that they be considered in patients with both marked hypertriglyceridaemia and low HDL-cholesterol concentrations. [▲](#)

For further information on lipid-lowering therapy and familial hypercholesterolaemia, see Dyslipidaemias p. 208.

Psychological risk factors

[EvGr](#) Psychological treatment should be considered in patients with mood and anxiety disorders and comorbid CVD; complex patients may require referral to mental health services for assessment and delivery of high-intensity or specialist treatments. Selective serotonin re-uptake inhibitors (SSRIs) should be considered for treatment in patients with depression and coronary heart disease. [▲](#) For guidance on prescribing of antidepressant drugs see Antidepressant drugs p. 376.

Advanced Pharmacy Services

Patients with or at risk of cardiovascular disease, may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services in Medicines optimisation* p. 18.

6 Heart failure

Chronic heart failure

23-Oct-2018

Description of condition

Heart failure is a progressive clinical syndrome caused by structural or functional abnormalities of the heart, resulting in reduced cardiac output. It is characterised by symptoms such as shortness of breath, persistent coughing or wheezing, ankle swelling, reduced exercise tolerance, and fatigue. These symptoms may be accompanied by signs such as elevated jugular venous pressure, pulmonary crackles, and pulmonary oedema.

The risk of heart failure is greater in men, smokers and diabetic patients, and increases with age.

The most common cause of heart failure is coronary heart disease, however, patients of African or Afro-Caribbean origin are more likely to develop heart failure secondary to hypertension. In addition to coronary heart disease, heart failure often co-exists with other co-morbidities such as chronic kidney disease, atrial fibrillation, hypertension, dyslipidaemia, obesity, diabetes mellitus, and chronic obstructive pulmonary disease. Patients with co-morbidities have a worse prognosis, and the presence of atrial fibrillation or chronic kidney disease affects the management of heart failure in these patients. Complications of heart failure include chronic kidney disease, atrial fibrillation, depression, cachexia, sexual dysfunction, and sudden cardiac death.

Heart failure can be defined as either having a reduced or preserved ejection fraction. Both conditions present with signs and symptoms of heart failure. In heart failure with reduced ejection fraction, the left ventricle loses its ability to contract normally and therefore presents with an ejection fraction of less than 40%. In heart failure with preserved ejection fraction, the left ventricle loses its ability to relax normally therefore the ejection fraction is normal or only mildly reduced.

The New York Heart Association (NYHA) functional classification tool is used to define the progression of chronic heart failure according to severity of symptoms and limitation to physical activity. Heart failure is considered to be stable or chronic when symptoms remain unchanged for at least one month despite optimal management.

Aims of treatment

The aims of treatment are to reduce mortality, relieve symptoms, improve exercise tolerance, and reduce the incidence of acute exacerbations.

Non-drug treatment

EvGr Patients with heart failure should be advised to make lifestyle changes to reduce the risk of progression of their heart failure and associated co-morbidities. These include Smoking cessation p. 520, reducing alcohol consumption, increasing physical exercise if appropriate, weight control, and dietary changes such as increasing fruit and vegetable consumption and reducing saturated fat intake. Patients should be encouraged to weigh themselves daily at a set time

of day and to report any weight gain of more than 1.5–2.0 kg in 2 days to their GP or heart failure specialist. Salt and fluid intake should only be restricted if these are high, and a salt intake of less than 6 g per day is advised. Patients with dilutional hyponatraemia should only restrict their fluid intake. Salt substitutes containing potassium should be avoided to reduce the risk of hyperkalaemia.

Contraception and pregnancy should be discussed with women of childbearing potential and heart failure. Advice from a heart failure specialist and an obstetrician should be sought if pregnancy occurs or is being considered.

Patients should be given the opportunity to join a personalised rehabilitation programme including education, psychological support, and exercise when appropriate.

Implantable cardioverter defibrillators and cardiac resynchronisation therapy are treatment options recommended in patients with heart failure and a reduced ejection fraction of less than 35%. If symptoms remain severe and unresponsive despite optimal drug treatment, specialist referral should be considered. **⚡**

Drug treatment

EvGr The treatment of heart failure should include management of symptoms, risk factors and underlying causes and complications. Patients should have their medication reviewed, and any drugs that may cause or worsen their heart failure should be stopped if appropriate.

Vaccination against pneumococcal disease, and annual influenza vaccination is recommended. **⚡**

Chronic heart failure with reduced ejection fraction

EvGr Rate-limiting calcium-channel blockers (verapamil hydrochloride p. 175, and diltiazem hydrochloride p. 169) and short-acting dihydropyridines (e.g. nifedipine p. 174, or nicardipine hydrochloride p. 173) should be avoided in patients who have heart failure with reduced ejection fraction as these drugs reduce cardiac contractility. Patients with heart failure and angina may safely be treated with amlodipine p. 168.

Diuretics are recommended for the relief of breathlessness and oedema in patients with fluid retention. Loop diuretics such as furosemide p. 241, bumetanide p. 240, or torasemide p. 242 are usually the diuretics of choice. Thiazide diuretics may only be of benefit in patients with mild fluid retention and an eGFR greater than 30 mL/minute/1.73 m². Diuretic doses should be titrated according to clinical response and adjusted if needed following the initiation of subsequent heart failure treatments, to minimise the risk of dehydration, renal impairment or hypotension. If symptoms persist despite optimal titration, advice from a heart failure specialist should be sought.

An angiotensin-converting enzyme (ACE) inhibitor (e.g. perindopril, ramipril p. 184, captopril p. 179, enalapril maleate p. 180, lisinopril p. 181, quinapril p. 183 or fosinopril sodium p. 181) and a beta-blocker licensed for heart failure (e.g. bisoprolol fumarate p. 165, carvedilol p. 160, or nebivolol p. 167) should be given as first-line treatment to reduce morbidity and mortality. Treatment with a beta-blocker should not be withheld because of age or the presence of diabetes, chronic obstructive pulmonary disease, peripheral vascular disease, erectile dysfunction, or interstitial pulmonary disease. Patients who are already taking a beta-blocker for co-morbidities (e.g. angina or hypertension) and whose condition is stable should be switched to a beta-blocker licensed for heart failure. Clinical judgement should be used when deciding whether to start an ACE inhibitor or beta blocker first. The additional drug should only be initiated when the patient is stable on their existing treatment. Treatment should be initiated at a low dose and slowly titrated up to the maximum tolerated dose. An angiotensin II receptor blocker (ARB) licensed for heart failure (e.g. candesartan cilexetil p. 186, losartan potassium

p. 187, or valsartan p. 190) can be considered if ACE inhibitors are not tolerated.

If heart failure symptoms persist or worsen despite optimal first-line treatment, an aldosterone antagonist such as spironolactone p. 206 or eplerenone below should be offered as add-on therapy unless contra-indicated (e.g. due to hyperkalaemia or renal impairment). Hydralazine hydrochloride p. 192 combined with a nitrate can be considered under the advice of a heart failure specialist in patients who are intolerant of both ACE inhibitors and ARBs (in particular those of African or Caribbean origin with moderate to severe heart failure).

If symptoms persist despite optimal treatment, advice from a heart failure specialist should be sought on the use of amiodarone hydrochloride p. 112, digoxin p. 116, sacubitril with valsartan p. 207, or ivabradine p. 225.

For patients in sinus rhythm, digoxin is recommended as add-on therapy in worsening or severe heart failure despite optimal treatment. Although digoxin does not reduce mortality, it may decrease symptoms and hospitalisation due to acute exacerbations. Routine monitoring of serum levels is not recommended in patients with heart failure.

Anticoagulation should also be considered for patients in sinus rhythm with heart failure if they have a history of thromboembolism, left ventricular aneurysm or intracardiac thrombus. **▶** For guidance in patients with atrial fibrillation see Arrhythmias p. 106.

Monitoring drug treatment

EVGr When initiating ACE inhibitors, ARBs and aldosterone antagonists, serum potassium and sodium, renal function, and blood pressure should be checked prior to starting treatment, 1–2 weeks after starting treatment, and at each dose increment. Once the target, or maximum tolerated dose is achieved, treatment should be monitored monthly for 3 months and then at least every 6 months, and if the patient becomes acutely unwell.

When initiating beta blockers, heart rate, blood pressure and symptom control should be assessed at the start of treatment and after each dose change.

In patients with chronic kidney disease, lower doses and slower dose titrations of ACE inhibitors, ARBs, aldosterone antagonists and digoxin should be considered. Advice from a renal specialist should be considered where appropriate. **▶**

Chronic heart failure with preserved ejection fraction

EVGr Patients with heart failure and preserved ejection fraction should be managed under the care of a heart failure specialist. For the relief of fluid retention symptoms, a low to medium dose loop diuretic should be prescribed. If the patient fails to respond to treatment, advice from a heart failure specialist should be sought. **▶**

Advanced heart failure

Breathlessness is a common symptom in advanced heart failure and may occur even with optimal management and in the absence of clinical pulmonary oedema. **EVGr** Long-term oxygen therapy is not recommended in advanced heart failure, although it may be considered in patients with heart failure and additional co-morbidities that would benefit from oxygen therapy such as chronic obstructive pulmonary disease. **▶**

Advanced Pharmacy Services

Patients with heart failure may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 18.

DIURETICS > POTASSIUM-SPARING DIURETICS > ALDOSTERONE ANTAGONISTS

Co-flumactone

The properties listed below are those particular to the combination only. For the properties of the components please consider, spironolactone p. 206.

● INDICATIONS AND DOSE

Congestive heart failure

▶ BY MOUTH

- ▶ Adult: Initially 100/100 mg daily; maintenance 25/25–200/200 mg daily, maintenance dose not recommended because spironolactone generally given in lower dose

- **INTERACTIONS** → Appendix 1: aldosterone antagonists · thiazide diuretics

- **LESS SUITABLE FOR PRESCRIBING** Co-flumactone tablets are less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ Aldactide (Pfizer Ltd)

Hydroflumethiazide 25 mg, Spironolactone 25 mg Aldactide 25 tablets | 100 tablet **PoM** £20.23 DT = £20.23

Hydroflumethiazide 50 mg, Spironolactone 50 mg Aldactide 50 tablets | 28 tablet **PoM** £10.70 | 100 tablet **PoM** £38.23 DT = £38.23

Eplerenone

● INDICATIONS AND DOSE

Adjunct in stable patients with left ventricular ejection fraction ≤40% with evidence of heart failure, following myocardial infarction (start therapy within 3–14 days of event) | Adjunct in chronic mild heart failure with left ventricular ejection fraction ≤30%

▶ BY MOUTH

- ▶ Adult: Initially 25 mg daily, then increased to 50 mg daily, increased within 4 weeks of initial treatment

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises max. dose 25 mg daily with concurrent use of amiodarone or moderate inhibitors of CYP3A4.

- **CONTRA-INDICATIONS** Hyperkalaemia

- **CAUTIONS** Elderly

CAUTIONS, FURTHER INFORMATION

- ▶ Elderly For aldosterone antagonists, prescription potentially inappropriate (STOPP criteria) with concurrent potassium-conserving drugs without monitoring of serum potassium (risk of dangerous hyperkalaemia). See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: aldosterone antagonists

● SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmias · asthenia · constipation · cough · diarrhoea · dizziness · dyslipidaemia ·

electrolyte imbalance · headache · insomnia · muscle spasms · nausea · pain · renal impairment · skin reactions · syncope · vomiting

- ▶ **Uncommon** Angioedema · arterial thrombosis · cholecystitis · eosinophilia · flatulence · gynaecomastia · hyperhidrosis · hypothyroidism · increased risk of infection · malaise · numbness · postural hypotension

- **PREGNANCY** Manufacturer advises caution—no information available.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (no information available).

- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments Initially 25 mg on alternate days if eGFR 30–60 mL/minute/1.73 m², adjust dose according to serum-potassium concentration—consult product literature.

Monitoring Increased risk of hyperkalaemia in renal impairment—close monitoring required.

- **MONITORING REQUIREMENTS** Monitor plasma-potassium concentration before treatment, during initiation, and when dose changed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

Spirolactone

10-Mar-2020

● INDICATIONS AND DOSE

Oedema | Ascites in cirrhosis of the liver

▶ BY MOUTH

- ▶ Adult: 100–400 mg daily, adjusted according to response

Malignant ascites

▶ BY MOUTH

- ▶ Adult: Initially 100–200 mg daily, then increased if necessary to 400 mg daily, maintenance dose adjusted according to response

Nephrotic syndrome

▶ BY MOUTH

- ▶ Adult: 100–200 mg daily

Oedema in congestive heart failure

▶ BY MOUTH

- ▶ Adult: Initially 100 mg daily, alternatively initially 25–200 mg daily, dose may be taken as a single dose or divided doses, maintenance dose adjusted according to response

Moderate to severe heart failure (adjunct)

▶ BY MOUTH

- ▶ Adult: Initially 25 mg once daily, then adjusted according to response to 50 mg once daily

Resistant hypertension (adjunct)

▶ BY MOUTH

- ▶ Adult: 25 mg once daily

Primary hyperaldosteronism in patients awaiting surgery

▶ BY MOUTH

- ▶ Adult: 100–400 mg daily, may be used for long-term maintenance if surgery inappropriate, use lowest effective dose

- **UNLICENSED USE** Resistant hypertension (adjunct) unlicensed indication.

- **CONTRA-INDICATIONS** Addison's disease · anuria · hyperkalaemia

- **CAUTIONS** Acute porphyrias p. 1120 · elderly · potential metabolic products carcinogenic in *rodents*

CAUTIONS, FURTHER INFORMATION

- ▶ Elderly For aldosterone antagonists, prescription potentially inappropriate (STOPP criteria) with concurrent potassium-conserving drugs without monitoring of serum potassium (risk of dangerous hyperkalaemia).

See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: aldosterone antagonists

- **SIDE-EFFECTS** Acidosis hyperchloraemic · acute kidney injury · agranulocytosis · alopecia · breast neoplasm benign · breast pain · confusion · dizziness · electrolyte imbalance · gastrointestinal disorder · gynaecomastia · hepatic function abnormal · hyperkalaemia (discontinue) · hypertrichosis · leg cramps · leucopenia · libido disorder · malaise · menstrual disorder · nausea · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia

- **PREGNANCY** Use only if potential benefit outweighs risk—feminisation of male fetus in *animal* studies.

- **BREAST FEEDING** Metabolites present in milk, but amount probably too small to be harmful.

- **RENAL IMPAIRMENT** Avoid in acute renal insufficiency or severe impairment.

Monitoring Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).

- **MONITORING REQUIREMENTS** Monitor electrolytes—discontinue if hyperkalaemia occurs (in *severe heart failure* monitor potassium and creatinine 1 week after initiation and after any dose increase, monthly for first 3 months, then every 3 months for 1 year, and then every 6 months).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM > ANGIOTENSIN II RECEPTOR ANTAGONISTS

Sacubitril with valsartan

06-Feb-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, valsartan p. 190.

- **DRUG ACTION** Sacubitril (a prodrug) inhibits the breakdown of natriuretic peptides resulting in varied effects including increased diuresis, natriuresis, and vasodilation.

● INDICATIONS AND DOSE

Symptomatic chronic heart failure with reduced ejection fraction (in patients not currently taking an ACE inhibitor or angiotensin II receptor antagonist, or stabilised on low doses of either of these agents)

► BY MOUTH

- Adult: Initially 24/26 mg twice daily for 3–4 weeks, increased if tolerated to 49/51 mg twice daily for 3–4 weeks, then increased if tolerated to 97/103 mg twice daily

Symptomatic chronic heart failure with reduced ejection fraction (in patients currently stabilised on an ACE inhibitor or angiotensin II receptor antagonist)

► BY MOUTH

- Adult: Initially 49/51 mg twice daily for 2–4 weeks, increased if tolerated to 97/103 mg twice daily, consider a starting dose of 24/26 mg if systolic blood pressure less than 110 mmHg

DOSE EQUIVALENCE AND CONVERSION

- *Entresto*[®] tablets contain sacubitril and valsartan; the proportions are expressed in the form x/y where x and y are the strength in milligrams of sacubitril and valsartan respectively. Valsartan, in this formulation, is more bioavailable than other tablet formulations—26 mg, 51 mg, and 103 mg valsartan is equivalent to 40 mg, 80 mg and 160 mg, respectively. Furthermore, note that the 24/26 mg, 49/51 mg and 97/103 mg strengths are sometimes referred to as a total of both drug strengths, that is, 50 mg, 100 mg and 200 mg, respectively.

- **CONTRA-INDICATIONS** Concomitant use with an ACE inhibitor (do not initiate until at least 36 hours after discontinuing ACE inhibitor—risk of angioedema) - concomitant use with an angiotensin II receptor antagonist - systolic blood pressure less than 100 mmHg
- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists - sacubitril
- **SIDE-EFFECTS**
 - **Common or very common** Anaemia · asthenia · cough · diarrhoea · dizziness · electrolyte imbalance · gastritis · headache · hypoglycaemia · hypotension · nausea · renal impairment · syncope · vertigo
 - **Uncommon** Angioedema · skin reactions
- **PREGNANCY** Manufacturer advises avoid—toxicity with sacubitril in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment or if hepatic transaminases exceed 2 times the upper limit of normal (limited information available); avoid in severe impairment, biliary cirrhosis or cholestasis (no information available).
Dose adjustments Manufacturer advises initial dose reduction to 24/26 mg twice daily in moderate impairment or if hepatic transaminases exceed 2 times the upper limit of normal.

● RENAL IMPAIRMENT

Dose adjustments Manufacturer recommends a starting dose of 24/26 mg twice daily if eGFR less than 30 mL/minute/1.73m². Also consider this starting dose if eGFR 30 to 60 mL/minute/1.73m².

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Sacubitril valsartan for treating symptomatic chronic heart failure with reduced ejection fraction (April 2016)** NICE TA388 Sacubitril valsartan (*Entresto*[®]) is recommended as an option for treating symptomatic chronic heart failure with reduced ejection fraction, only in adults:

- with New York Heart Association class II to IV symptoms, **and**
- a left ventricular ejection fraction of 35% or less, **and**
- who are already taking a stable dose of an ACE inhibitor or angiotensin II receptor antagonist.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta388

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

PHOSPHODIESTERASE TYPE-3 INHIBITORS

Enoximone

10-Mar-2020

- **DRUG ACTION** Enoximone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

● INDICATIONS AND DOSE

Congestive heart failure where cardiac output reduced and filling pressures increased

► BY SLOW INTRAVENOUS INJECTION

- Adult: Initially 0.5–1 mg/kg, rate not exceeding 12.5 mg/minute, then 500 micrograms/kg every 30 minutes until satisfactory response or total of 3 mg/kg given; maintenance, initial dose of up to 3 mg/kg may be repeated every 3–6 hours as required

► BY INTRAVENOUS INFUSION

- Adult: Initially 90 micrograms/kg/minute, dose to be given over 10–30 minutes, followed by 5–20 micrograms/kg/minute, dose to be given as either a continuous or intermittent infusion; maximum 24 mg/kg per day

- **CAUTIONS** Heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction

● SIDE-EFFECTS

- **Common or very common** Headache · hypotension · insomnia
- **Uncommon** Arrhythmias · diarrhoea · dizziness · nausea · vomiting
- **Rare or very rare** Chills · fever · fluid retention · myalgia · oliguria · urinary retention
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises caution—no information available.

- **RENAL IMPAIRMENT**
Dose adjustments Consider dose reduction.
- **MONITORING REQUIREMENTS** Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.
- **DIRECTIONS FOR ADMINISTRATION** Incompatible with glucose solutions. Use only plastic containers or syringes; crystal formation if glass used. Avoid extravasation.
For *intravenous infusion* (Perfan[®]), give continuously or intermittently in Sodium chloride 0.9% or Water for injections; dilute to a concentration of 2.5 mg/mL.
- **PRESCRIBING AND DISPENSING INFORMATION** Sustained haemodynamic benefit has been observed after administration of phosphodiesterase type-3 inhibitors, but there is no evidence of any beneficial effect on survival.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
Solution for injection
EXCIPIENTS: May contain Alcohol, propylene glycol
▶ **Perfan** (Carinopharm GmbH)
Enoximone 5 mg per 1 ml Perfán 100mg/20ml solution for injection ampoules | 10 ampoule (PoM) (Hospital only)

Milrinone

27-Jan-2020

- **DRUG ACTION** Milrinone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

● INDICATIONS AND DOSE

Short-term treatment of severe congestive heart failure unresponsive to conventional maintenance therapy (not immediately after myocardial infarction) | Acute heart failure, including low output states following heart surgery

- ▶ **INITIALLY BY INTRAVENOUS INJECTION**
- ▶ **Adult:** Initially 50 micrograms/kg, given over 10 minutes, followed by (by intravenous infusion) 375–750 nanograms/kg/minute usually given following surgery for up to 12 hours or in congestive heart failure for 48–72 hours; maximum 1.13 mg/kg per day

- **CONTRA-INDICATIONS** Severe hypovolaemia
- **CAUTIONS** Correct hypokalaemia · heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arrhythmia supraventricular (increased risk in patients with pre-existing arrhythmias) · arrhythmias · headache · hypotension
 - ▶ **Uncommon** Angina pectoris · chest pain · hypokalaemia · thrombocytopenia · tremor
 - ▶ **Rare or very rare** Anaphylactic shock · bronchospasm · skin eruption
 - ▶ **Frequency not known** Renal failure
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose and monitor response if eGFR less than 50 mL/minute/1.73 m²—consult product literature for details.
- **MONITORING REQUIREMENTS** Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.
- **DIRECTIONS FOR ADMINISTRATION** Avoid extravasation.

For *intravenous injection*, may be given either undiluted or diluted before use.

For *intravenous infusion* (Primacor[®]), give continuously in Glucose 5% or Sodium chloride 0.9%; dilute to a suggested concentration of 200 micrograms/mL.

- **PRESCRIBING AND DISPENSING INFORMATION** Sustained haemodynamic benefit has been observed after administration of phosphodiesterase type-3 inhibitors, but there is no evidence of any beneficial effect on survival.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion
Solution for infusion
 - ▶ **Milrinone (Non-proprietary)**

 - ▶ **Primacor** (Sanofi)
Milrinone 1 mg per 1 ml Primacor 10mg/10ml solution for injection ampoules | 10 ampoule (PoM) £199.06

7 Hyperlipidaemia

Dyslipidaemias

23-Mar-2018

Hypercholesterolaemia and hypertriglyceridaemia

Statins are the drugs of first choice for treating hypercholesterolaemia and moderate hypertriglyceridaemia. Severe hypercholesterolaemia or hypertriglyceridaemia not adequately controlled with a maximal dose of a statin may require the use of an additional lipid-regulating drug such as ezetimibe p. 210; such treatment should generally be supervised by a specialist.

A number of conditions, some familial, are characterised by very high LDL-cholesterol concentration, high triglyceride concentration, or both. Although statins are more effective than other lipid-regulating drugs at lowering LDL-cholesterol concentration, they are less effective than fibrates in reducing triglyceride concentration. Fenofibrate p. 212 may be added to statin therapy if triglycerides remain high even after the LDL-cholesterol concentration has been reduced adequately.

Familial hypercholesterolaemia

Patients with familial hypercholesterolaemia are at high risk of premature coronary heart disease. [EvGr](#) Lifelong lipid-modifying therapy and advice on lifestyle changes should be offered to all patients with familial hypercholesterolaemia.

A high-intensity statin, defined as the dose at which a reduction in LDL-cholesterol of greater than 40% is achieved, is recommended as first-line therapy in all patients with familial hypercholesterolaemia. The dose of the statin should be titrated to achieve a reduction in LDL-cholesterol concentration of greater than 50% from baseline.

Patients with primary *heterozygous familial hypercholesterolaemia* who have contra-indications to, or are intolerant of, statins, can be considered for treatment with ezetimibe as monotherapy. A combination of a statin and ezetimibe is recommended if the maximum tolerated dose of a statin alone fails to provide adequate control of LDL-cholesterol, or a switch to an alternative statin is being considered. Treatment with a fibrate or a bile acid sequestrant (such as colestyramine p. 210 or colestipol hydrochloride p. 209) can be considered under specialist advice, in patients for whom statins or ezetimibe are inappropriate.

The combination of a statin with a fibrate carries an increased risk of muscle-related side-effects (including rhabdomyolysis) and should be used under specialist

supervision. The concomitant administration of gemfibrozil with a statin increases the risk of rhabdomyolysis considerably—this combination should not be used.

Alirocumab p. 219 and evolocumab p. 219 can be considered for patients with primary heterozygous familial hypercholesterolaemia whose LDL-cholesterol has not been adequately controlled on maximum tolerated lipid-lowering therapy. See National funding/access decisions information for alicumab p. 219 and evolocumab p. 219.

The prescribing of drug therapy in *homozygous familial hypercholesterolaemia* should be undertaken in a specialist centre.

Reduction in low-density lipoprotein cholesterol

Therapy intensity	Drug	Daily dose (reduction in LDL cholesterol)		
High-intensity	Atorvastatin	20 mg (43%)		
		40 mg (49%)		
		80 mg (55%)		
	Rosuvastatin	10 mg (43%)		
		20 mg (48%)		
		40 mg (53%)		
	Simvastatin	80 mg (42%)		
		Medium-intensity	Atorvastatin	10 mg (37%)
			Fluvastatin	80 mg (33%)
Rosuvastatin	5 mg (38%)			
Simvastatin	20 mg (32%)			
Low-intensity	Fluvastatin	20 mg (21%)		
		40 mg (27%)		
	Pravastatin	10 mg (20%)		
		20 mg (24%)		
		40 mg (29%)		
	Simvastatin	10 mg (27%)		

Advice from the MHRA: there is an increased risk of myopathy associated with high-dose (80 mg) simvastatin. The 80 mg dose should be considered only in patients with severe hypercholesterolaemia and high risk of cardiovascular complications who have not achieved their treatment goals on lower doses, when the benefits are expected to outweigh the potential risks.

Other drugs used for Hyperlipidaemia Inositol nicotinate, p. 247

LIPID MODIFYING DRUGS > BILE ACID SEQUESTRANTS

Bile acid sequestrants

- **DRUG ACTION** Bile acid sequestrants act by binding bile acids, preventing their reabsorption; this promotes hepatic conversion of cholesterol into bile acids; the resultant increased LDL-receptor activity of liver cells increases the clearance of LDL-cholesterol from the plasma.
- **CAUTIONS** Interference with the absorption of fat-soluble vitamins (supplements of vitamins A, D, K, and folic acid may be required when treatment is prolonged).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Constipation · gastrointestinal discomfort · headache · nausea · vomiting
 - ▶ **Uncommon** Appetite decreased · diarrhoea · gastrointestinal disorders

- **PREGNANCY** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.
- **BREAST FEEDING** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.

Colesevelam hydrochloride

04-Feb-2020

● INDICATIONS AND DOSE

Primary hypercholesterolaemia as an adjunct to dietary measures [monotherapy]

- ▶ **BY MOUTH**
- ▶ **Adult:** 3.75 g daily in 1–2 divided doses; maximum 4.375 g per day

Primary hypercholesterolaemia as an adjunct to dietary measures [in combination with a statin] | Primary and familial hypercholesterolaemia [in combination with ezetimibe, either with or without a statin]

- ▶ **BY MOUTH**
- ▶ **Adult:** 2.5–3.75 g daily in 1–2 divided doses, may be taken at the same time as the statin and ezetimibe

Bile acid malabsorption

- ▶ **BY MOUTH**
- ▶ **Adult:** 1.25–3.75 g daily in 2–3 divided doses

- **UNLICENSED USE** Colesevelam is used for the treatment of bile acid malabsorption, but is not licensed for this indication.
- **CONTRA-INDICATIONS** Biliary obstruction · bowel obstruction
- **CAUTIONS** Gastro-intestinal motility disorders · inflammatory bowel disease · major gastro-intestinal surgery
- **INTERACTIONS** → Appendix 1: colesevelam
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Dysphagia · myalgia
 - ▶ **Rare or very rare** Pancreatitis
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in hepatic failure (no information available).
- **MONITORING REQUIREMENTS** Patients receiving ciclosporin should have their blood-ciclosporin concentration monitored before, during, and after treatment with colesevelam.
- **PATIENT AND CARER ADVICE** Patient counselling on administration is advised for colesevelam hydrochloride tablets (avoid other drugs at same time).
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Colestyramine

(Cholestyramine)● **INDICATIONS AND DOSE**

Hyperlipidaemias, particularly type IIa, in patients who have not responded adequately to diet and other appropriate measures | Primary prevention of coronary heart disease in men aged 35–59 years with primary hypercholesterolaemia who have not responded to diet and other appropriate measures

▶ **BY MOUTH**

- ▶ Adult: Initially 4 g daily, increased in steps of 4 g every week; increased to 12–24 g daily in 1–4 divided doses, adjusted according to response; maximum 36 g per day

Pruritus associated with partial biliary obstruction and primary biliary cirrhosis

▶ **BY MOUTH**

- ▶ Adult: 4–8 g once daily

Diarrhoea associated with Crohn's disease, ileal resection, vagotomy, diabetic vagal neuropathy, and radiation

▶ **BY MOUTH**

- ▶ Adult: Initially 4 g daily, increased in steps of 4 g every week; increased to 12–24 g daily in 1–4 divided doses, adjusted according to response, if no response within 3 days an alternative therapy should be initiated; maximum 36 g per day

Accelerated elimination of teriflunomide

▶ **BY MOUTH**

- ▶ Adult: 8 g 3 times a day for 11 days; reduced to 4 g 3 times a day, dose should only be reduced if not tolerated

Accelerated elimination of leflunomide (washout procedure)

▶ **BY MOUTH**

- ▶ Adult: 8 g 3 times a day for 11 days

- **CONTRA-INDICATIONS** Complete biliary obstruction (not likely to be effective)

- **INTERACTIONS** → Appendix 1: colestyramine

● **SIDE-EFFECTS**

- ▶ **Uncommon** Bleeding tendency · hypoprotrombinaemia · night blindness · osteoporosis · skin reactions · tongue irritation · vitamin deficiencies

- **DIRECTIONS FOR ADMINISTRATION** The contents of each sachet should be mixed with at least 150 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, and pulpy fruits with a high moisture content.

- **PATIENT AND CARER ADVICE** Patient counselling on administration is advised for colestyramine powder (avoid other drugs at same time).

LIPID MODIFYING DRUGS > CHOLESTEROL

ABSORPTION INHIBITORS

Ezetimibe

08-Feb-2019

- **DRUG ACTION** Ezetimibe inhibits the intestinal absorption of cholesterol. If used alone, it has a modest effect on lowering LDL-cholesterol, with little effect on other lipoproteins.

● **INDICATIONS AND DOSE**

Adjunct to dietary measures and statin treatment in primary hypercholesterolaemia | Adjunct to dietary measures and statin in homozygous familial hypercholesterolaemia | Primary hypercholesterolaemia (if statin inappropriate or not tolerated) | Adjunct to dietary measures in homozygous sitosterolaemia

▶ **BY MOUTH**

- ▶ Adult: 10 mg daily

- **INTERACTIONS** → Appendix 1: ezetimibe

● **SIDE-EFFECTS**

- ▶ **Common or very common** Asthenia · diarrhoea · gastrointestinal discomfort · gastrointestinal disorders
- ▶ **Uncommon** Appetite decreased · arthralgia · chest pain · cough · hot flush · hypertension · muscle complaints · nausea · pain
- ▶ **Frequency not known** Constipation · depression · dizziness · dyspnoea · hepatitis · myopathy · pancreatitis · paraesthesia · skin reactions · thrombocytopenia
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

● Ezetimibe for treating primary heterozygous-familial and non-familial hypercholesterolaemia (February 2016) NICE TA385 This guidance should be used with NICE's guidelines on cardiovascular disease: risk assessment and reduction, including lipid modification and familial hypercholesterolaemia: identification and management

(see, Cardiovascular disease risk assessment and prevention p. 201 and Dyslipidaemias p. 208).

Ezetimibe, alone, is recommended as an option for the treatment of primary (heterozygous-familial or non-familial) hypercholesterolaemia in adults in whom initial statin therapy is contra-indicated, or who are intolerant of initial statin therapy.

Ezetimibe, in combination with initial statin therapy, is also recommended as an option for the treatment of primary (heterozygous-familial or non-familial) hypercholesterolaemia in adults when:

- serum total or low-density lipoprotein (LDL) cholesterol concentration is not appropriately controlled either after appropriate dose titration of initial statin therapy or because dose titration is limited by intolerance to the initial statin therapy, **and**
- a change from initial statin therapy to an alternative statin is being considered.

When prescribing ezetimibe in combination with a statin, ezetimibe should be prescribed on the basis of lowest acquisition cost.

www.nice.org.uk/guidance/ta385

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ Ezetimibe (Non-proprietary)

Ezetimibe 10 mg Ezetimibe 10mg tablets | 28 tablet **[PoM]** £26.31 DT = £1.65

Ezetimibe 10 mg Ezetrol 10mg tablets | 28 tablet **[PoM]** £26.31 DT = £1.65

Combinations available: *Simvastatin with ezetimibe*, p. 218

LIPID MODIFYING DRUGS > FIBRATES

Bezafibrate

15-Jan-2020

- **DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

● INDICATIONS AND DOSE

Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
 - ▶ Adult: 200 mg 3 times a day
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
 - ▶ Adult: 400 mg once daily, modified-release dose form is not appropriate in patients with renal impairment

- **CONTRA-INDICATIONS** Gall bladder disease · hypoalbuminaemia · nephrotic syndrome · photosensitivity to fibrates

- **CAUTIONS** Correct hypothyroidism before initiating treatment · risk factors for myopathy

- **INTERACTIONS** → Appendix 1: fibrates

● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · gastrointestinal disorder
- ▶ **Uncommon** Acute kidney injury · alopecia · cholestasis · constipation · diarrhoea · dizziness · erectile dysfunction · gastrointestinal discomfort · headache · muscle complaints · muscle weakness · nausea · photosensitivity reaction · skin reactions
- ▶ **Rare or very rare** Cholelithiasis · depression · insomnia · interstitial lung disease · pancreatitis · pancytopenia · paraesthesia · peripheral neuropathy · rhabdomyolysis (increased risk in renal impairment) · severe cutaneous adverse reactions (SCARs) · thrombocytopenic purpura

- **PREGNANCY** Manufacturers advise avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in significant impairment (except in fatty liver disease).
- **RENAL IMPAIRMENT** Avoid *immediate-release* preparations if eGFR less than 15 mL/minute/1.73 m². Avoid *modified-release* preparations if eGFR less than 60 mL/minute/1.73 m².
Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.
Dose adjustments Reduce dose to 400 mg daily if eGFR 40–60 mL/minute/1.73 m².
Reduce dose to 200 mg every 1–2 days if eGFR 15–40 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Consider monitoring of liver function and creatine kinase when fibrates used in combination with a statin.
- **PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Ciprofibrate

15-Jan-2020

- **DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

● INDICATIONS AND DOSE

Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia

- ▶ BY MOUTH
 - ▶ Adult: 100 mg daily

- **CONTRA-INDICATIONS** Gall bladder disease · hypoalbuminaemia · nephrotic syndrome · photosensitivity to fibrates

- **CAUTIONS** Correct hypothyroidism before initiating treatment · risk factors for myopathy

- **INTERACTIONS** → Appendix 1: fibrates

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · diarrhoea · dizziness · drowsiness · fatigue · gastrointestinal discomfort · headache · myalgia · nausea · skin reactions · vertigo · vomiting
- ▶ **Frequency not known** Cholelithiasis · erectile dysfunction · hepatic disorders · leucopenia · myopathy · photosensitivity reaction · respiratory disorders ·

rhabdomyolysis (increased risk in renal impairment) · thrombocytopenia

- **PREGNANCY** Manufacturers advise avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in mild-to-moderate impairment; avoid in severe impairment
- **RENAL IMPAIRMENT** Avoid in severe impairment. Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.
Dose adjustments Reduce dose to 100 mg on alternate days in moderate impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Liver function tests recommended every 3 months for first year (discontinue treatment if significantly raised).
 - ▶ Consider monitoring liver function and creatine kinase when fibrates used in combination with a statin.
- **PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ Ciprofibrate (Non-proprietary)

Ciprofibrate 100 mg Ciprofibrate 100mg tablets | 28 tablet PoM
£134.21 DT = £122.53

Fenofibrate

15-Jan-2020

- **DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

● INDICATIONS AND DOSE

Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia | Adjunct to statin in mixed hyperlipidaemia if triglycerides and HDL-cholesterol inadequately controlled in patients at high cardiovascular risk

- ▶ **BY MOUTH USING CAPSULES**
- ▶ Adult: Initially 200 mg daily, then increased if necessary to 267 mg daily, maximum 200 mg daily with concomitant statin, 267 mg capsules not appropriate for initial dose titration
- ▶ **BY MOUTH USING TABLETS**
- ▶ Adult: 160 mg daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises max. dose 200 mg daily with concurrent use of a statin.

- **CONTRA-INDICATIONS** Gall bladder disease · pancreatitis (unless due to severe hypertriglyceridaemia) · photosensitivity to fibrates · photosensitivity to ketoprofen
- **CAUTIONS** Correct hypothyroidism before initiating treatment · risk factors for myopathy
- **INTERACTIONS** → Appendix 1: fibrates
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · diarrhoea · flatulence · nausea · vomiting
 - ▶ **Uncommon** Cholelithiasis · embolism and thrombosis · headache · muscle complaints · muscle weakness ·

myopathy · pancreatitis · sexual dysfunction · skin reactions

- ▶ **Rare or very rare** Alopecia · hepatic disorders · photosensitivity reaction
- ▶ **Frequency not known** Fatigue · interstitial lung disease · rhabdomyolysis (increased risk in renal impairment) · severe cutaneous adverse reactions (SCARs)
- **PREGNANCY** Avoid—embryotoxicity in *animal* studies.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid —no information available.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution in mild-to-moderate impairment; avoid if eGFR less than 30 mL/minute/1.73 m². Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.
Dose adjustments Manufacturer advises max. 67 mg daily if eGFR 30–59 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Manufacturer advises monitor hepatic transaminases every 3 months during the first 12 months of treatment and periodically thereafter—discontinue treatment if levels increase to more than 3 times the upper limit of normal; monitor serum creatinine levels during the first 3 months of treatment and periodically thereafter—interrupt treatment if creatinine level is 50% above the upper limit of normal.
- **PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

LIPID MODIFYING DRUGS > NICOTINIC ACID DERIVATIVES

Acipimox

● INDICATIONS AND DOSE

Adjunct or alternative treatment in hyperlipidaemias of types IIb and IV in patients who have not responded adequately to other lipid-regulating drugs such as a statin or fibrate, and lifestyle changes (including diet, exercise, and weight reduction)

► BY MOUTH

- Adult: 250 mg 2–3 times a day

- **CONTRA-INDICATIONS** Peptic ulcer

● SIDE-EFFECTS

- **Common or very common** Asthenia · gastrointestinal discomfort · headache · skin reactions · vasodilation
- **Uncommon** Angioedema · arthralgia · feeling hot · malaise · myalgia · myositis · nausea
- **Frequency not known** Bronchospasm · diarrhoea · dry eye · eye disorder · eyes gritty

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

- **Dose adjustments** Reduce dose to 250 mg 1–2 times daily if eGFR 30–60 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor hepatic and renal function.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 21

- **Olbetam** (Pfizer Ltd)

Acipimox 250 mg Olbetam 250mg capsules | 90 capsule [PoM] £46.33 DT = £46.33

Nicotinic acid

07-Feb-2020

- **DRUG ACTION** In doses of 1.5 to 3 g daily, it lowers both cholesterol and triglyceride concentrations by inhibiting synthesis; it also increases HDL-cholesterol.

● INDICATIONS AND DOSE

Adjunct to statin in dyslipidaemia or used alone if statin not tolerated

► BY MOUTH

- Adult: (consult product literature)

- **CONTRA-INDICATIONS** Active peptic ulcer disease · arterial bleeding

- **CAUTIONS** Acute myocardial infarction · diabetes mellitus · gout · history of peptic ulceration · unstable angina

- **INTERACTIONS** → Appendix 1: nicotinic acid

- **SIDE-EFFECTS** Angioedema · arrhythmias · asthenia · burping · cough aggravated · diarrhoea · dizziness · dyspnoea · flushing · gastrointestinal disorders · gout · hepatic disorders · hyperhidrosis · hypotension · insomnia ·

macular oedema · migraine · myalgia · myopathy · nausea · nervousness · oedema · palpitations · paraesthesia · respiratory disorders · skin reactions · syncope · tongue oedema · vision blurred · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Prostaglandin-mediated flushing is common, typically within an hour of dosing and lasting for 15–30 minutes (particularly with the initial doses). Taking after a meal or taking aspirin before dosing minimises flushing.

- **PREGNANCY** No information available—manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Present in milk—avoid.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment. Discontinue if severe abnormalities in liver function tests. **Monitoring** Manufacturer advises monitor liver function in mild to moderate hepatic impairment.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution—no information available.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, modified-release tablet, capsule

Capsule

- ▶ **Solgar Niacin** (Solgar Vitamin and Herb)
- ▶ **Nicotinic acid 500 mg** Solgar Niacin 500mg capsules | 100 capsule 

LIPID MODIFYING DRUGS > STATINS

Statins

- **DRUG ACTION** Statins competitively inhibit 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase, an enzyme involved in cholesterol synthesis, especially in the liver.
- **CAUTIONS** Elderly · high alcohol intake · history of liver disease · hypothyroidism · known genetic polymorphisms—consult product literature · patients at increased risk of muscle toxicity, including myopathy or rhabdomyolysis (e.g. those with a personal or family history of muscular disorders, previous history of muscular toxicity and a high alcohol intake)
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ **Muscle effects** Muscle toxicity can occur with all statins, however the likelihood increases with higher doses and in certain patients (see below). Statins should be used with caution in patients at increased risk of muscle toxicity, including those with a personal or family history of muscular disorders, previous history of muscular toxicity, a high alcohol intake, renal impairment or hypothyroidism.

In patients at increased risk of muscle effects, a statin should not usually be started if the baseline creatine kinase concentration is more than 5 times the upper limit of normal (some patients may present with an extremely elevated baseline creatine kinase concentration, for example because of a physical occupation or rigorous exercise—specialist advice should be sought regarding consideration of statin therapy in these patients).
 - ▶ **Hypothyroidism** Hypothyroidism should be managed adequately before starting treatment with a statin.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Asthenia · constipation · diarrhoea · dizziness · flatulence · gastrointestinal discomfort · headache · myalgia · nausea · sleep disorders · thrombocytopenia
 - ▶ **Uncommon** Alopecia · hepatic disorders · memory loss · pancreatitis · paraesthesia · sexual dysfunction · skin reactions · vomiting
- ▶ **Rare or very rare** Myopathy · peripheral neuropathy · tendinopathy
- ▶ **Frequency not known** Depression · diabetes mellitus (in those at risk) · interstitial lung disease
- **SIDE-EFFECTS, FURTHER INFORMATION** **Muscle effects**

The risk of myopathy, myositis, and rhabdomyolysis associated with statin use is rare. Although myalgia has been reported commonly in patients receiving statins, muscle toxicity truly attributable to statin use is rare. When a statin is suspected to be the cause of myopathy, and creatine kinase concentration is markedly elevated or if muscular symptoms are severe, treatment should be discontinued. If symptoms resolve and creatine kinase concentrations return to normal, the statin should be reintroduced at a lower dose and the patient monitored closely. Statins should not be discontinued if there is an increase in the blood-glucose concentration as the benefits continue to outweigh the risks.

Interstitial lung disease

If patients develop symptoms such as dyspnoea, cough, and weight loss, they should seek medical attention.
- **CONCEPTION AND CONTRACEPTION** Adequate contraception is required during treatment and for 1 month afterwards.
- **PREGNANCY** Statins should be avoided in pregnancy (discontinue 3 months before attempting to conceive) as congenital anomalies have been reported and the decreased synthesis of cholesterol possibly affects fetal development.
- **HEPATIC IMPAIRMENT** In general, manufacturers advise caution (risk of increased exposure); avoid in active disease or unexplained persistent elevations in serum transaminases.
- **MONITORING REQUIREMENTS**
 - ▶ Before starting treatment with statins, at least one full lipid profile (non-fasting) should be measured, including total cholesterol, HDL-cholesterol, non-HDL-cholesterol (calculated as total cholesterol minus HDL-cholesterol), and triglyceride concentrations, thyroid-stimulating hormone, and renal function should also be assessed.
 - ▶ **Liver function** There is little information available on a rational approach to liver-function monitoring; however, NICE suggests that liver enzymes should be measured before treatment, and repeated within 3 months and at 12 months of starting treatment, unless indicated at other times by signs or symptoms suggestive of hepatotoxicity (NICE clinical guideline 181 (July 2014)). **Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease.** Those with serum transaminases that are raised, but less than 3 times the upper limit of the reference range, should **not** be routinely excluded from statin therapy. Those with serum transaminases of more than 3 times the upper limit of the reference range should discontinue statin therapy.
 - ▶ **Creatine kinase** Before initiation of statin treatment, creatine kinase concentration should be measured in patients who have had persistent, generalised, unexplained muscle pain (whether associated or not with previous lipid-regulating drugs); if the concentration is more than 5 times the upper limit of normal, a repeat measurement should be taken after 7 days. If the repeat concentration remains above 5 times the upper limit, statin treatment should not be started; if concentrations are still raised but less than 5 times the upper limit, the statin should be started at a lower dose.
 - ▶ **Diabetes** Patients at high risk of diabetes mellitus should have fasting blood-glucose concentration or HbA_{1c} checked before starting statin treatment, and then repeated after 3 months.

● PRESCRIBING AND DISPENSING INFORMATION

Patient decision aid Taking a statin to reduce the risk of coronary heart disease and stroke. National Institute for Health and Care Excellence. November 2014.

www.nice.org.uk/about/what-we-do/our-programmes/nice-guidance/nice-guidelines/shared-decision-making

- **PATIENT AND CARER ADVICE** Advise patients to report promptly unexplained muscle pain, tenderness, or weakness.

Atorvastatin

● INDICATIONS AND DOSE

Primary hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures | Combined (mixed) hyperlipidaemia in patients who have not responded adequately to diet and other appropriate measures

▶ BY MOUTH

- ▶ Adult: Usual dose 10 mg once daily; increased if necessary up to 80 mg once daily, dose to be increased at intervals of at least 4 weeks

Heterozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures | Homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures

▶ BY MOUTH

- ▶ Adult: Initially 10 mg once daily, then increased to 40 mg once daily, dose to be increased at intervals of at least 4 weeks; maximum 80 mg per day

Primary prevention of cardiovascular events in patients at high risk of a first cardiovascular event

▶ BY MOUTH

- ▶ Adult: 20 mg once daily, dose can be increased if necessary

Secondary prevention of cardiovascular events

▶ BY MOUTH

- ▶ Adult: 80 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises if concurrent use of ciclosporin is unavoidable, max. dose cannot exceed 10 mg daily.
- ▶ Manufacturer advises max. dose 40 mg daily when combined with anion-exchange resin for heterozygous familial hypercholesterolaemia.
- ▶ Manufacturer advises max. dose 20 mg daily with concurrent use of elbasvir with grazoprevir.
- ▶ Manufacturer advises max. dose 20 mg daily with concurrent use of letermovir without ciclosporin.
- ▶ Manufacturer advises max. dose 20 mg daily with concurrent use of sofosbuvir with velpatasvir and voxilaprevir.

- **UNLICENSED USE** EvGr Not licensed for secondary prevention of cardiovascular events. Starting dose of 20 mg once daily is not licensed for the primary prevention of cardiovascular events. A

- **CAUTIONS** Haemorrhagic stroke

- **INTERACTIONS** → Appendix 1: statins

● SIDE-EFFECTS

- ▶ **Common or very common** Epistaxis · hyperglycaemia · hypersensitivity · joint disorders · laryngeal pain · muscle complaints · nasopharyngitis · pain
- ▶ **Uncommon** Appetite decreased · burping · chest pain · fever · hypoglycaemia · malaise · numbness · peripheral oedema · taste altered · tinnitus · vision disorders · weight increased
- ▶ **Rare or very rare** Angioedema · gynaecomastia · hearing loss · severe cutaneous adverse reactions (SCARs)

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

● RENAL IMPAIRMENT

Dose adjustments In chronic kidney disease, for primary and secondary prevention of cardiovascular events [unlicensed starting dose in primary prevention; unlicensed in secondary prevention], initially 20 mg once daily, increased if necessary (on specialist advice if eGFR < 30 mL/minute/1.73 m²); max. 80 mg once daily.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for atorvastatin tablets (muscle effects).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

● INDICATIONS AND DOSE**Adjunct to diet for primary hypercholesterolaemia or combined (mixed) hyperlipidaemias in patients who have not responded adequately to dietary control**

- ▶ BY MOUTH
- ▶ Adult: 10–40 mg daily, dose to be taken at night, dose to be adjusted at intervals of at least 4 weeks

Prevention of cardiovascular events in patients with previous myocardial infarction or unstable angina | Adjunct to diet to prevent cardiovascular events in patients with hypercholesterolaemia

- ▶ BY MOUTH
- ▶ Adult: 40 mg daily, dose to be taken at night

Reduction of hyperlipidaemia in patients receiving immunosuppressive therapy following solid-organ transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 20 mg daily, then increased if necessary up to 40 mg daily, dose to be taken at night, close medical supervision is required if dose is increased to maximum dose

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose by half with concurrent use of ombitasvir with paritaprevir and ritonavir.
- ▶ Manufacturer advises max. 20 mg daily with concurrent use of glecaprevir with pibrentasvir.
- ▶ Manufacturer advises max. 40 mg daily with concurrent use of sofosbuvir with velpatasvir and voxilaprevir.

- **INTERACTIONS** → Appendix 1: statins
- **SIDE-EFFECTS**
- ▶ **Uncommon** Hair abnormal · scalp abnormal · urinary disorders · vision disorders
- **BREAST FEEDING** Manufacturer advises avoid—small amount of drug present in breast milk.
- **HEPATIC IMPAIRMENT**
Dose adjustments Manufacturer advises initial dose reduction to 10 mg daily; adjust according to response.
- **RENAL IMPAIRMENT**
Dose adjustments Manufacturer advises initial dose of 10 mg once daily in moderate to severe impairment.
- **PATIENT AND CARER ADVICE** Patient counselling is advised for pravastatin tablets (muscle effects).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet▶ **Pravastatin sodium (Non-proprietary)**

- Pravastatin sodium 10 mg Pravastatin 10mg tablets | 28 tablet [PoM] £2.68 DT = £0.95

● INDICATIONS AND DOSE**Primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures**

- ▶ BY MOUTH
- ▶ Adult 18–69 years: Initially 5–10 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks
- ▶ Adult (patients of Asian origin): Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks.
- ▶ Adult 70 years and over: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks

Primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures and who have risk factors for myopathy or rhabdomyolysis

▶ BY MOUTH

- ▶ Adult: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks

Severe primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients with high cardiovascular risk who have not responded adequately to diet and other appropriate measures (specialist use only)

▶ BY MOUTH

- ▶ Adult 18–69 years: Initially 5–10 mg once daily, then increased if necessary up to 40 mg once daily, dose to be increased gradually at intervals of at least 4 weeks
- ▶ Adult (patients of Asian origin): Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks.
- ▶ Adult 70 years and over: Initially 5 mg once daily, then increased if necessary up to 40 mg once daily, dose to be increased gradually at intervals of at least 4 weeks

Severe primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients with high cardiovascular risk who have not responded adequately to diet and other appropriate measures, and who have risk factors for myopathy or rhabdomyolysis (specialist use only)

▶ BY MOUTH

- ▶ Adult: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks

Prevention of cardiovascular events in patients at high risk of a first cardiovascular event

▶ BY MOUTH

- ▶ Adult 18–69 years: 20 mg once daily
- ▶ Adult (patients of Asian origin): Initially 5 mg once daily, then increased if tolerated to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks.
- ▶ Adult 70 years and over: Initially 5 mg once daily, then increased if tolerated to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks

Prevention of cardiovascular events in patients at high risk of a first cardiovascular event and with risk factors for myopathy or rhabdomyolysis

▶ BY MOUTH

- ▶ Adult: Initially 5 mg once daily, then increased if tolerated to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises initially 5 mg daily with concurrent use of bezafibrate, ciprofibrate, and fenofibrate—40 mg dose is contra-indicated.
- ▶ Manufacturer advises initially 5 mg daily with concurrent use of clopidogrel—max. dose 20 mg daily.
- ▶ Manufacturer advises initially 5 mg daily with concurrent use of simvastatin—max. dose 10 mg daily.
- ▶ Manufacturer advises max. dose 5 mg daily with concurrent ombitasvir, paritaprevir, and ritonavir given with dasabuvir, but max. 10 mg daily with

concurrent ombitasvir, paritaprevir, and ritonavir given without dasabuvir.

- ▶ Manufacturer advises max. dose 10 mg daily with concurrent use of sofosbuvir with velpatasvir, or elbasvir with grazoprevir.
- ▶ Manufacturer advises reduce dose by half with concurrent use of teriflunomide.
- ▶ Manufacturer advises max. 5 mg daily with concurrent use of glecaprevir with pibrentasvir.

● **INTERACTIONS** → Appendix 1: statins

● **SIDE-EFFECTS**

- ▶ Rare or very rare Arthralgia · gynaecomastia · haematuria · polyneuropathy
- ▶ Frequency not known Cough · dyspnoea · oedema · proteinuria · Stevens-Johnson syndrome · tendon disorders

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments Initially 5 mg once daily (do not exceed 20 mg daily) if eGFR 30–60 mL/minute/1.73 m².

● **MONITORING REQUIREMENTS** Manufacturer advises consider routine monitoring of renal function when using 40 mg daily dose.

● **PATIENT AND CARER ADVICE** Patient counselling is advised for rosuvastatin tablets (muscle effects).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Simvastatin

● **INDICATIONS AND DOSE**

Primary hypercholesterolaemia, or combined (mixed) hyperlipidaemia in patients who have not responded adequately to diet and other appropriate measures

▶ BY MOUTH

- ▶ Adult: 10–20 mg once daily, then increased if necessary up to 80 mg once daily, adjusted at intervals of at least 4 weeks, dose to be taken at night; 80 mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications

Homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures

▶ BY MOUTH

- ▶ Adult: Initially 40 mg once daily, then increased if necessary up to 80 mg once daily, adjusted at intervals of at least 4 weeks, dose to be taken at night; 80 mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications

continued →

Prevention of cardiovascular events in patients with atherosclerotic cardiovascular disease or diabetes mellitus**► BY MOUTH**

Adult: Initially 20–40 mg once daily, increased if necessary up to 80 mg once daily, adjusted at intervals of at least 4 weeks, dose to be taken at night; 80 mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises max. 10 mg daily with concurrent use of bezafibrate or ciprofibrate.
- Manufacturer advises max. 20 mg daily with concurrent use of amiodarone, amlodipine, or ranolazine.
- Manufacturer advises reduce dose with concurrent use of some moderate inhibitors of CYP3A4 (max. 20 mg daily with verapamil and diltiazem).
- Manufacturer advises max. 40 mg daily with concurrent use of lomitapide or ticagrelor.
- Manufacturer advises max. 20 mg daily with concurrent use of elbasvir with grazoprevir.

● **INTERACTIONS** → Appendix 1: statins

● SIDE-EFFECTS

► Rare or very rare Acute kidney injury · anaemia · muscle cramps

► Frequency not known Cognitive impairment

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **RENAL IMPAIRMENT** Doses above 10 mg daily should be used with caution if eGFR less than 30 mL/minute/1.73 m².

● **PATIENT AND CARER ADVICE** Patient counselling is advised for simvastatin tablets/oral suspension (muscle effects).

● **EXCEPTIONS TO LEGAL CATEGORY** Simvastatin 10 mg tablets can be sold to the public to reduce risk of first coronary event in individuals at moderate risk of coronary heart disease (approx. 10–15 % risk of major event in 10 years), max. daily dose 10 mg and pack size of 28 tablets; treatment should form part of a programme to reduce risk of coronary heart disease.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

EXCIPIENTS: May contain Propylene glycol

LIPID MODIFYING DRUGS > OTHER

Alirocumab

26-Feb-2020

● **DRUG ACTION** Alirocumab binds to a pro-protein involved in the regulation of LDL receptors on liver cells; receptor numbers are increased, which results in increased uptake of LDL-cholesterol from the blood.

● **INDICATIONS AND DOSE**

Primary hypercholesterolaemia or mixed dyslipidaemia in patients who have not responded adequately to other appropriate measures [in combination with a statin, or with a statin and other lipid-lowering therapies, or with other lipid-lowering therapies or alone if a statin contraindicated or not tolerated] | Established atherosclerotic cardiovascular disease [in combination with the maximum tolerated dose of a statin with or without other lipid-lowering therapies, or with other lipid-lowering therapies or alone if a statin contra-indicated or not tolerated]

▶ BY SUBCUTANEOUS INJECTION

● **Adult:** Initially 75 mg every 2 weeks; increased if necessary to 150 mg every 2 weeks, alternatively 300 mg every 4 weeks, patients requiring an LDL-C reduction of greater than 60% may be initiated on 150 mg every 2 weeks or 300 mg every 4 weeks, dose adjustments should be made at 4 to 8 weekly intervals

● **SIDE-EFFECTS**

▶ **Common or very common** Nasal complaints · oropharyngeal pain · pulmonary reaction · skin reactions

▶ **Rare or very rare** Hypersensitivity · hypersensitivity vasculitis

● **PREGNANCY** Manufacturer advises avoid unless clinical condition requires treatment—maternal toxicity in *animal* studies.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in severe impairment—no information available.

● **RENAL IMPAIRMENT** Manufacturer advises use with caution in severe impairment—no information available.

● **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage outside refrigerator.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

▶ Alirocumab for treating primary hypercholesterolaemia and mixed dyslipidaemia (June 2016) NICE TA393
Alirocumab (*Praluent*[®]) is recommended as an option for treating primary hypercholesterolaemia or mixed dyslipidaemia, only if:

- low-density lipoprotein cholesterol (LDL-C) concentrations are persistently above the thresholds specified in the NICE documentation, **and**
- the manufacturer provides alicumab with the discount agreed in the patient access scheme.

Patients whose treatment was started before this guidance was published should continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta393

Scottish Medicines Consortium (SMC) decisions

SMC No. 1147/16

The *Scottish Medicines Consortium* has advised (August 2016) that alicumab (*Praluent*[®]) is accepted for restricted use within NHS Scotland for treatment of primary hypercholesterolaemia or mixed dyslipidaemia (alone or in combination with other lipid lowering therapies, as specified within it's licence), for specialist use only and only in patients at high cardiovascular risk as follows:

- patients with heterozygous familial hypercholesterolaemia (HeFH) and LDL-C ≥ 5.0 mmol/L, for primary prevention of cardiovascular events, **or**
- patients with HeFH and LDL-C ≥ 3.5 mmol/L, for secondary prevention of cardiovascular events, **or**
- patients at high risk due to previous cardiovascular events and LDL-C ≥ 4.0 mmol/L, **or**
- patients with recurrent/polyvascular disease and LDL-C ≥ 3.5 mmol/L

This advice is contingent upon the continuing availability of the Patient Access Scheme (PAS) in NHS Scotland or a list price that is equivalent or lower.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Polysorbates

▶ **Praluent** (Sanofi) ▼

Alirocumab 75 mg per 1 ml Praluent 75mg/1ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £168.00 | 2 pre-filled disposable injection [PoM] £336.00 DT = £336.00

Alirocumab 150 mg per 1 ml Praluent 150mg/1ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £168.00 | 2 pre-filled disposable injection [PoM] £336.00 DT = £336.00

Evolocumab

08-Feb-2019

● **DRUG ACTION** Evolocumab binds to a pro-protein involved in the regulation of LDL receptors on liver cells; receptor numbers are increased, which results in increased uptake of LDL-cholesterol from the blood.

● **INDICATIONS AND DOSE**

Primary hypercholesterolaemia or mixed dyslipidaemia in patients who have not responded adequately to other appropriate measures (in combination with a statin, or with a statin and other lipid-lowering therapies, or with other lipid-lowering therapies or alone if a statin contraindicated or not tolerated) | Established atherosclerotic cardiovascular disease (in combination with the maximum tolerated dose of a statin with or without other lipid-lowering therapies, or with other lipid-lowering therapies or alone if a statin contra-indicated or not tolerated)

▶ BY SUBCUTANEOUS INJECTION

● **Adult:** 140 mg every 2 weeks, alternatively 420 mg every month, to be administered into the thigh, abdomen or upper arm

Homozygous familial hypercholesterolaemia (in combination with other lipid-lowering therapies)

▶ BY SUBCUTANEOUS INJECTION

● **Adult:** Initially 420 mg every month; increased if necessary to 420 mg every 2 weeks, if inadequate response after 12 weeks of treatment, to be administered into the thigh, abdomen or upper arm

Homozygous familial hypercholesterolaemia in patients on apheresis (in combination with other lipid-lowering therapies)

▶ BY SUBCUTANEOUS INJECTION

● **Adult:** 420 mg every 2 weeks, to correspond with apheresis schedule, to be administered into the thigh, abdomen or upper arm

● **SIDE-EFFECTS**

▶ **Common or very common** Arthralgia · back pain · increased risk of infection · nausea · skin reactions

▶ **Rare or very rare** Angioedema

● **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (risk of reduced efficacy; no information available in severe impairment).
- **RENAL IMPAIRMENT** Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m²—no information available.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for further information regarding storage outside refrigerator.
- **PATIENT AND CARER ADVICE** Patients and their carers should be given training in subcutaneous injection technique.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

▶ Evolocumab for treating primary hypercholesterolaemia and mixed dyslipidaemia (June 2016) NICE TA394

Evolocumab (*Repatha*[®]) is recommended as an option for treating primary hypercholesterolaemia or mixed dyslipidaemia, only if:

- it is given at a dose of 140 mg every 2 weeks, **and**
- low-density lipoprotein cholesterol (LDL-C) concentrations are persistently above the thresholds specified in the NICE documentation, **and**
- the manufacturer provides evolocumab with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta394

Scottish Medicines Consortium (SMC) decisions

SMC No. 1148/16

The *Scottish Medicines Consortium* has advised (February 2017) that evolocumab (*Repatha*[®]) is accepted for restricted use within NHS Scotland for the treatment of primary hypercholesterolaemia (heterozygous familial hypercholesterolaemia and non-familial) or mixed dyslipidaemia (alone or in combination with other lipid lowering therapies, as specified within its license), for specialist use only when administered at a dose of 140 mg every 2 weeks and only in patients at high cardiovascular risk as follows:

- patients with heterozygous familial hypercholesterolaemia (HeFH) and LDL-C 5 mmol/L or greater for primary prevention of cardiovascular events, **or**
- patients with HeFH and LDL-C 3.5 mmol/L or greater for secondary prevention of cardiovascular events, **or**
- patients with high risk due to previous cardiovascular events and LDL-C 4 mmol/L or greater, **or**
- patients with recurrent/polyvascular disease and LDL-C 3.5 mmol/L or greater.

This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ *Repatha SureClick* (Amgen Ltd) ▼

Evolocumab 140 mg per 1 ml *Repatha SureClick* 140mg/1ml solution for injection pre-filled pens | 2 pre-filled disposable injection [PoM] £340.20 DT = £340.20

Lomitapide

15-Jan-2020

- **DRUG ACTION** Lomitapide, an inhibitor of microsomal triglyceride transfer protein (MTP), reduces lipoprotein secretion and circulating concentrations of lipoprotein-borne lipids such as cholesterol and triglycerides.

● INDICATIONS AND DOSE

Adjunct to dietary measures and other lipid-regulating drugs with or without low-density lipoprotein apheresis in homozygous familial hypercholesterolaemia (under expert supervision)

▶ BY MOUTH

- ▶ **Adult:** Initially 5 mg daily for 2 weeks, dose to be taken at least 2 hours after evening meal, then increased if necessary to 10 mg daily, for at least 4 weeks, then increased to 20 mg daily for at least 4 weeks, then increased in steps of 20 mg daily, adjusted at intervals of at least 4 weeks; maximum 60 mg per day

- **CONTRA-INDICATIONS** Significant or chronic bowel disease

- **CAUTIONS** Concomitant use of hepatotoxic drugs · lomitapide can interfere with the absorption of fat-soluble nutrients and supplementation of vitamin E and fatty acids is required · patients over 65 years

- **INTERACTIONS** → Appendix 1: lomitapide

● SIDE-EFFECTS

- ▶ **Common or very common** Aerophagia · appetite abnormal · asthenia · burping · constipation · diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · hepatic disorders · increased risk of infection · muscle complaints · nausea · skin reactions · vomiting · weight decreased
- ▶ **Uncommon** Anaemia · chest pain · chills · dehydration · drowsiness · dry mouth · eye swelling · fever · gait abnormal · hyperhidrosis · joint disorders · malaise · pain in extremity · paraesthesia · throat lesion · upper-airway cough syndrome · vertigo

- ▶ **Frequency not known** Alopecia

SIDE-EFFECTS, FURTHER INFORMATION Reduce dose if serum transaminases raised during treatment (consult product literature).

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before treatment and ensure effective contraception used.

- **PREGNANCY** Avoid—teratogenicity and embryotoxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment, or if unexplained persistent abnormal liver function tests.

Dose adjustments Manufacturer advises max. 40 mg daily in mild impairment.

- **RENAL IMPAIRMENT**

Dose adjustments Max. 40 mg daily in end-stage renal disease.

- **MONITORING REQUIREMENTS**

- ▶ Monitor liver function tests before treatment, then at least monthly and before each dose increase for first year, then at least every 3 months and before each dose increase thereafter.
- ▶ Screen for hepatic steatosis and fibrosis before treatment, then annually thereafter.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Omega-3-acid ethyl esters

15-Jan-2020

● INDICATIONS AND DOSE

Adjunct to diet and statin in type IIb or III hypertriglyceridaemia | Adjunct to diet in type IV hypertriglyceridaemia

▶ BY MOUTH

▶ Adult: Initially 2 capsules daily, dose to be taken with food, increased if necessary to 4 capsules daily

Adjunct in secondary prevention in those who have had a myocardial infarction in the preceding 3 months

▶ BY MOUTH

▶ Adult: 1 capsule daily, dose to be taken with food

- **CAUTIONS** Anticoagulant treatment (bleeding time increased) · haemorrhagic disorders
- **INTERACTIONS** → Appendix 1: omega-3-acid ethyl esters
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Burping · constipation · diarrhoea · gastrointestinal discomfort · gastrointestinal disorders · nausea · vomiting
 - ▶ **Uncommon** Dizziness · gout · haemorrhage · headache · hyperglycaemia · hypotension · skin reactions · taste altered
 - ▶ **Rare or very rare** Liver disorder
- **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions
The *Scottish Medicines Consortium* has advised (November 2002) that omega-3-acid ethyl esters are **not** recommended for use within NHS Scotland for the treatment of hypertriglyceridaemia.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

Volanesorsen

08-Oct-2019

- **DRUG ACTION** Volanesorsen is an antisense oligonucleotide which inhibits the formation of the apolipoprotein apoC-III, thereby lowering serum triglycerides.

● INDICATIONS AND DOSE

Familial chylomicronaemia syndrome (specialist use only)

▶ BY SUBCUTANEOUS INJECTION

▶ Adult: Initially 285 mg once weekly for 3 months, then reduced to 285 mg every 2 weeks, review and adjust dosing based on serum triglycerides—consult product literature

- **CONTRA-INDICATIONS** Chronic or unexplained thrombocytopenia (platelet count less than 140×10^9 /litre)
- **CAUTIONS** Body-weight less than 70 kg (increased risk of thrombocytopenia)
- **INTERACTIONS** → Appendix 1: volanesorsen
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arthritis · asthenia · chills · cough · diabetes mellitus · diarrhoea · dizziness · dry mouth · dyspnoea · eosinophilia · facial swelling · feeling hot · fever · gastrointestinal discomfort · haemorrhage · headaches · hot flush · hypersensitivity · hypertension · immunisation reaction · influenza like illness · insomnia · joint disorders · leucopenia · malaise · muscle complaints · myositis · nasal congestion · nausea · numbness · oedema · oral disorders · pain · polymyalgia rheumatica · proteinuria · skin reactions · sweat changes · syncope · throat oedema · thrombocytopenia · tremor · vision blurred · vomiting · wheezing
 - ▶ **Frequency not known** Nephrotoxicity
- **PREGNANCY** Manufacturer advises avoid—limited information; *animal* studies do not indicate toxicity.
- **BREAST FEEDING** Manufacturer advises avoid—present in very low levels in milk in *animal* studies.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor platelet count before treatment and then at least every 2 weeks during treatment.
 - ▶ Manufacturer advises monitor liver function, erythrocyte sedimentation rate, and urine dipstick every 3 months during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises administer injection into the upper thigh or abdomen, or upper arm (if not self-administered). Patients may self-administer *Waylivra*® after appropriate training in subcutaneous injection technique.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2°C–8°C) and protect from light—consult product literature about storage outside refrigerator.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients should immediately report any signs of bleeding, neck stiffness, or atypical severe headache.

Missed doses Manufacturer advises if a dose is more than 48 hours late, the missed dose should be omitted and the next dose given at the normal time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

8 Myocardial ischaemia

Stable angina

Description of condition

Stable angina is characterised by predictable chest pain or pressure, often precipitated by physical exertion or emotional stress causing an increase in myocardial oxygen demand. Although pain typically occurs in the front of the chest, it may also radiate to the neck, shoulders, jaw or arms; the pain is relieved with rest. Stable angina usually results from atherosclerotic plaques in the coronary arteries that restrict blood flow and oxygen supply to the heart; it can lead to cardiovascular complications such as stroke, unstable angina, myocardial infarction, and sudden cardiac death. For information about *unstable angina* and *myocardial infarction*, see Acute coronary syndromes.

Prinzmetal's or vasospastic angina is a rare form of angina caused by narrowing or occlusion of proximal coronary arteries due to spasm, in which pain is experienced at rest rather than during activity.

Aims of treatment

Antianginal drug therapy and revascularisation aims to prevent or minimise angina symptoms, in order to improve quality of life and long-term morbidity and mortality. The aim of drug therapy for secondary prevention is to minimise the risk of cardiovascular events such as myocardial infarction and stroke.

Drug treatment

Antianginal drug therapy

EvGr Acute attacks of stable angina should be managed with sublingual glyceryl trinitrate p. 232, which can also be used as a preventative measure immediately before performing activities that are known to bring on an attack.

For long-term prevention of chest pain in patients with stable angina, a beta-blocker (such as atenolol p. 164, bisoprolol fumarate p. 165, metoprolol tartrate p. 166 or propranolol hydrochloride p. 162) should be given as first-line therapy. A rate-limiting calcium-channel blocker (such as verapamil hydrochloride p. 175 or diltiazem hydrochloride p. 169) should be considered as an alternative if beta-blockers are contra-indicated, for example in patients with Prinzmetal's angina or decompensated heart failure. Dihydropyridine derivative calcium-channel blockers (such as amlodipine p. 168) may be effective in patients with Prinzmetal's angina.

If a beta-blocker alone fails to control symptoms adequately, a combination of a beta-blocker and a calcium-channel blocker should be considered. If this combination is not appropriate due to intolerance of, or contra-indication to, either beta-blockers or calcium-channel blockers, NICE CG126 recommends to consider addition of either a long-acting nitrate, ivabradine p. 225, nicorandil p. 225, or ranolazine p. 224.

A long-acting nitrate, ivabradine p. 225, nicorandil p. 225, or ranolazine p. 224, should also be considered as monotherapy in patients who cannot tolerate beta-blockers and calcium-channel blockers, if both are contra-indicated, or when they both fail to adequately control angina symptoms.

Response to treatment should be assessed every 2–4 weeks following initiation or change of drug therapy; drug doses should be titrated to the maximum tolerated effective dose.

If a combination of two drugs at a maximum therapeutic dose fails to control angina symptoms, patients should be considered for referral to a specialist. **⚠**

Secondary prevention of cardiovascular events

All patients with angina are assumed to be at high-risk for cardiovascular events. The occurrence of cardiovascular events can be prevented by management of cardiovascular risk factors through lifestyle changes (such as smoking cessation, weight management, increased physical activity), psychological support, and drug treatment.

EvGr All patients with stable angina due to atherosclerotic disease should be given long-term treatment with low-dose aspirin p. 130 and a statin. Treatment with an ACE inhibitor should also be considered, particularly if the patient has diabetes. **⚠** See also *Secondary prevention in Cardiovascular disease risk assessment and prevention* p. 201 for further information.

Non-drug treatment

EvGr Revascularisation by coronary artery bypass graft or percutaneous coronary intervention should be considered for patients with stable angina who remain symptomatic whilst on optimal drug therapy. **⚠** See also *Antiplatelet drugs and coronary stents in Antiplatelet drugs* p. 129.

Advanced Pharmacy Services

Patients with stable angina may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 18.

ANTITHROMBOTIC DRUGS > ANTIPLATELET DRUGS

Cangrelor

16-Feb-2016

- **DRUG ACTION** Cangrelor is a direct P2Y₁₂ platelet receptor antagonist that blocks adenosine diphosphate induced platelet activation and aggregation.

● INDICATIONS AND DOSE

In combination with aspirin for the reduction of thrombotic cardiovascular events in patients with coronary artery disease undergoing percutaneous coronary intervention (PCI) who have not received an oral P2Y₁₂ inhibitor (e.g. clopidogrel, prasugrel, ticagrelor) prior to the PCI procedure and in whom oral therapy with a P2Y₁₂ inhibitor is not suitable (under expert supervision)

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 30 micrograms/kg, to be given as a bolus dose, followed immediately by (by intravenous infusion) 4 micrograms/kg/minute, start treatment before percutaneous coronary intervention and continue infusion for at least 2 hours or for the duration of intervention if longer; maximum duration of infusion 4 hours

- **CONTRA-INDICATIONS** Active bleeding · history of stroke · history of transient ischaemic attack · patients at increased risk of bleeding (e.g. impaired haemostasis, irreversible

coagulation disorders, major surgery or trauma, uncontrolled severe hypertension)

- **CAUTIONS** Disease states associated with increased bleeding risk
- **INTERACTIONS** → Appendix 1: cangrelor
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dyspnoea · haemorrhage · skin reactions
 - ▶ **Uncommon** Cardiac tamponade · haemodynamic instability · renal impairment · retroperitoneal haemorrhage (including fatal cases)
 - ▶ **Rare or very rare** Anaemia · haematoma infection · intracranial haemorrhage · menorrhagia · skin neoplasm haemorrhage · stroke · thrombocytopenia · vascular pseudoaneurysm · wound haemorrhage
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises potential risk to infant —no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe renal impairment—increased risk of bleeding.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous bolus injection and intravenous infusion*, reconstitute each 50 mg vial with 5 mL of water for injection and gently swirl, do not shake vigorously. Withdraw 5 mL of reconstituted solution, add to 250 mL of either Sodium Chloride 0.9% or Glucose 5% and mix thoroughly. The bolus injection and infusion should be administered from the infusion solution.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ Kengrexal (Chiesi Ltd)

Cangrelor (as Cangrelor tetrasodium) 50 mg Kengrexal 50mg powder for concentrate for solution for injection / infusion vials | 10 vial [PoM] £2,500.00 (Hospital only)

ANTITHROMBOTIC DRUGS > GLYCOPROTEIN IIB/IIIA INHIBITORS

Eptifibatide

26-Jun-2019

● INDICATIONS AND DOSE

In combination with aspirin and unfractionated heparin for the prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction and with last episode of chest pain within 24 hours (specialist use only)

- ▶ **INITIALLY BY INTRAVENOUS INJECTION**
- ▶ **Adult:** Initially 180 micrograms/kg, then (by intravenous infusion) 2 micrograms/kg/minute for up to 72 hours (up to 96 hours if percutaneous coronary intervention during treatment)

- **CONTRA-INDICATIONS** Abnormal bleeding within 30 days · haemorrhagic diathesis · history of haemorrhagic stroke · increased INR · increased prothrombin time · intracranial disease · major surgery or severe trauma within 6 weeks · severe hypertension · stroke within last 30 days · thrombocytopenia
- **CAUTIONS** Discontinue if emergency cardiac surgery necessary · discontinue if intra-aortic balloon pump necessary · discontinue if thrombolytic therapy necessary · risk of bleeding —discontinue immediately if uncontrolled serious bleeding
- **INTERACTIONS** → Appendix 1: eptifibatide
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arrhythmias · atrioventricular block · cardiac arrest · congestive heart failure ·

haemorrhage · hypotension · intracranial haemorrhage · procedural complications · shock

- ▶ **Uncommon** Cerebral ischaemia · thrombocytopenia
- ▶ **Rare or very rare** Rash
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in significant impairment (increased risk of bleeding complications, limited information available).
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
Dose adjustments Reduce infusion to 1 microgram/kg/minute if eGFR 30–50 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - ▶ Measure baseline prothrombin time, activated partial thromboplastin time, platelet count, haemoglobin, haematocrit and serum creatinine.
 - ▶ Monitor haemoglobin, haematocrit and platelets within 6 hours after start of treatment, then at least once daily.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Eptifibatide 2 mg per 1 mL Integrilin 20mg/10ml solution for injection vials | 1 vial [PoM] £13.61 (Hospital only)

Solution for infusion

▶ Eptifibatide (Non-proprietary)

Eptifibatide 750 microgram per 1 mL Eptifibatide 75mg/100ml solution for infusion vials | 1 vial [PoM] (Hospital only)

▶ Integrilin (GlaxoSmithKline UK Ltd)

Eptifibatide 750 microgram per 1 mL Integrilin 75mg/100ml solution for infusion vials | 1 vial [PoM] £42.79 (Hospital only)

Tirofiban

10-Oct-2019

● INDICATIONS AND DOSE

In combination with unfractionated heparin, aspirin, and clopidogrel for prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction (NSTEMI) and with last episode of chest pain within 12 hours (with angiography planned for 4–48 hours after diagnosis) (initiated under specialist supervision)

- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Adult:** Initially 400 nanograms/kg/minute for 30 minutes, then 100 nanograms/kg/minute for at least 48 hours (continue during and for 12–24 hours after percutaneous coronary intervention), maximum duration of treatment 108 hours

In combination with unfractionated heparin, aspirin, and clopidogrel for prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction (NSTEMI) and with last episode of chest pain within 12 hours (with angiography within 4 hours of diagnosis) (initiated under specialist supervision)

- ▶ **INITIALLY BY INTRAVENOUS INJECTION**
- ▶ **Adult:** 25 micrograms/kg, to be given over 3 minutes at start of percutaneous coronary intervention, then (by intravenous infusion) 150 nanograms/kg/minute for 12–24 hours, maximum duration of treatment 48 hours continued →

In combination with unfractionated heparin, aspirin, and clopidogrel for reduction of major cardiovascular events in patients with ST-segment elevation myocardial infarction (STEMI) intended for primary percutaneous coronary intervention (PCI) (initiated under specialist supervision)

▶ INITIALLY BY INTRAVENOUS INJECTION

▶ Adult: 25 micrograms/kg, to be given over 3 minutes at start of percutaneous coronary intervention, then (by intravenous infusion) 150 nanograms/kg/minute for 12–24 hours, maximum duration of treatment 48 hours

- **CONTRA-INDICATIONS** Abnormal bleeding within 30 days · history of haemorrhagic stroke · history of intracranial disease · increased INR · increased prothrombin time · severe hypertension · stroke within 30 days · thrombocytopenia
- **CAUTIONS** Active peptic ulcer (within 3 months) · acute pericarditis · anaemia · aortic dissection · cardiogenic shock · discontinue if intra-aortic balloon pump necessary · discontinue if thrombolytic therapy necessary · discontinue immediately if serious or uncontrollable bleeding occurs · discontinue if emergency cardiac surgery necessary · elderly · faecal occult blood · haematuria · haemorrhagic retinopathy · low body-weight · major surgery within 3 months (avoid if within 6 weeks) · organ biopsy or lithotripsy within last 2 weeks · puncture of non-compressible vessel within 24 hours · risk of bleeding (within 3 months) · severe heart failure · severe trauma within 3 months (avoid if within 6 weeks) · traumatic or protracted cardiopulmonary resuscitation within last 2 weeks · uncontrolled severe hypertension · vasculitis
- **INTERACTIONS** → Appendix 1: tirofiban
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Ecchymosis · fever · haemorrhage · headache · nausea · thrombocytopenia
 - ▶ **Frequency not known** Intracranial haemorrhage
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate hepatic failure; avoid in severe hepatic failure (no information available).
- **RENAL IMPAIRMENT** Increased risk of bleeding.
Dose adjustments Use half normal dose if eGFR less than 30 mL/minute/1.73 m².
Monitoring Monitor carefully if eGFR less than 60 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor platelet count, haemoglobin and haematocrit before treatment, 2–6 hours after start of treatment and then at least once daily.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Aggrastat®), give continuously in Glucose 5% or Sodium chloride 0.9%. Withdraw 50 mL infusion fluid from 250 mL bag and replace with 50 mL tirofiban concentrate (250 micrograms/mL) to give a final concentration of 50 micrograms/mL.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

▶ **Aggrastat** (Corveio UK Ltd)

PIPERAZINE DERIVATIVES

Ranolazine

26-May-2020

● INDICATIONS AND DOSE

As adjunctive therapy in the treatment of stable angina in patients inadequately controlled or intolerant of first-line antianginal therapies

▶ BY MOUTH

▶ Adult: Initially 375 mg twice daily for 2–4 weeks, then increased to 500 mg twice daily, then adjusted according to response to 750 mg twice daily; reduced if not tolerated to 375–500 mg twice daily

- **CAUTIONS** Body-weight less than 60 kg · elderly · moderate to severe congestive heart failure · QT interval prolongation
- **INTERACTIONS** → Appendix 1: ranolazine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Asthenia · constipation · headache · vomiting
 - ▶ **Uncommon** Anxiety · appetite decreased · confusion · cough · dehydration · dizziness postural · drowsiness · dry mouth · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · hallucination · hot flush · hypotension · insomnia · joint swelling · muscle cramps · muscle weakness · pain in extremity · peripheral oedema · QT interval prolongation · sensation abnormal · skin reactions · syncope · tinnitus · tremor · urinary disorders · urine discolouration · vertigo · vision disorders · weight decreased
 - ▶ **Rare or very rare** Acute kidney injury · altered smell sensation · angioedema · consciousness impaired · coordination abnormal · erectile dysfunction · gait abnormal · hearing impairment · hyponatraemia · memory loss · oral hypoesthesia · pancreatitis · peripheral coldness
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment (risk of increased exposure).
Dose adjustments Manufacturer advises careful dose titration in mild impairment.
- **RENAL IMPAIRMENT** Use with caution if eGFR 30–80 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE** Patient alert card to be provided.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) decisions
The *Scottish Medicines Consortium* has advised (November 2012) that ranolazine (*Ranexa*®) is **not** recommended for use within NHS Scotland.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

SELECTIVE SINUS NODE I_F INHIBITORS

Ivabradine

02-Sep-2018

● INDICATIONS AND DOSE

Treatment of angina in patients in normal sinus rhythm

▶ BY MOUTH

- Adult 18–74 years: Initially 2.5–5 mg twice daily for 3–4 weeks, then increased if necessary up to 7.5 mg twice daily, dose to be increased gradually; reduced if not tolerated to 2.5–5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute, discontinue treatment if no improvement in symptoms within 3 months
- Adult 75 years and over: Initially 2.5 mg twice daily for 3–4 weeks, then increased if necessary up to 7.5 mg twice daily, dose to be increased gradually; reduced if not tolerated to 2.5–5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute, discontinue treatment if no improvement in symptoms within 3 months

Mild to severe chronic heart failure

▶ BY MOUTH

- Adult 18–74 years: Initially 5 mg twice daily for 2 weeks, then increased if necessary to 7.5 mg twice daily; reduced if not tolerated to 2.5–5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute
- Adult 75 years and over: Initially 2.5 mg twice daily for 2 weeks, then increased if necessary up to 7.5 mg twice daily, dose to be increased gradually; reduced if not tolerated to 2.5–5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce initial dose to 2.5 mg twice daily with concurrent use of moderate CYP3A4 inhibitors (except diltiazem, erythromycin and verapamil where concurrent use is contra-indicated).

- **CONTRA-INDICATIONS** Acute myocardial infarction · cardiogenic shock · congenital QT syndrome · do not initiate for angina if heart rate below 70 beats per minute · do not initiate for chronic heart failure if heart rate below 75 beats per minute · immediately after cerebrovascular accident · patients dependent on pacemaker · second- and third-degree heart block · severe hypotension · sick-sinus syndrome · sino-atrial block · unstable angina · unstable or acute heart failure

- **CAUTIONS** Atrial fibrillation or other arrhythmias (treatment ineffective) · elderly · in angina, consider stopping if there is no or limited symptom improvement after 5 months · intraventricular conduction defects · mild to moderate hypotension (avoid if severe) · retinitis pigmentosa

- **INTERACTIONS** → Appendix 1: ivabradine

● **SIDE-EFFECTS**

- ▶ **Common or very common** Arrhythmias · atrioventricular block · dizziness · headache · hypertension · vision disorders
- ▶ **Uncommon** Abdominal pain · angioedema · constipation · diarrhoea · eosinophilia · hyperuricaemia · hypotension · muscle cramps · nausea · QT interval prolongation · skin reactions · syncope · vertigo

- **PREGNANCY** Manufacturer advises avoid—*toxicity* in animal studies.

- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises use with caution if eGFR less than 15 mL/minute/1.73 m²—no information available.

● **MONITORING REQUIREMENTS**

- ▶ Monitor regularly for atrial fibrillation (consider benefits and risks of continued treatment if atrial fibrillation occurs).
- ▶ Monitor for bradycardia, especially after any dose increase, and discontinue if resting heart rate persistently below 50 beats per minute or continued symptoms of bradycardia despite dose reduction.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- ▶ **Ivabradine for the treatment of chronic heart failure (November 2012)** NICE TA267

Ivabradine, in combination with standard therapy including a beta-blocker (unless contra-indicated or not tolerated), an ACE inhibitor, and an aldosterone antagonist, is an option for treating mild to severe stable chronic heart failure in patients who:

- have a left ventricular ejection fraction of $\leq 35\%$, and
- are in sinus rhythm with a heart rate of ≥ 75 beats per minute

Ivabradine should be initiated only by a heart failure specialist after 4 weeks of stable optimal standard therapy; monitoring and dose titration should be carried out by a heart failure specialist, or a GP with special interest in heart failure, or by a heart failure specialist nurse.

www.nice.org.uk/guidance/ta267

Scottish Medicines Consortium (SMC) decisions

SMC No. 805/12

The *Scottish Medicines Consortium* has advised (October 2012) that ivabradine (*Procoralan*®) is accepted for restricted use within NHS Scotland in accordance with its licensed indication for heart failure only if resting heart rate remains ≥ 75 beats per minute despite optimal standard therapy.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

8.1 Acute coronary syndromes

Acute coronary syndromes

06-May-2020

Overview

Acute coronary syndromes encompass a spectrum of conditions which include unstable angina, and myocardial infarction with or without ST-segment elevation. Patients with different acute coronary syndromes may present similarly; definitive diagnosis is made on the basis of clinical presentation, ECG changes, and measurement of biochemical cardiac markers.

For recommendations on the management of acute myocardial injury and its cardiac complications in adults with known or suspected COVID-19 but without known pre-existing cardiovascular disease, see NICE rapid guidelines: **Acute myocardial injury** (available at: www.nice.org.uk/guidance/ng171). For further information on COVID-19, see COVID-19 p. 656.

Unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI)

These are related acute coronary syndromes that fall between the classifications of stable angina and ST-segment elevation myocardial infarction (STEMI). They usually occur as a result of atheromatous plaque rupture, and are often characterised by stable angina that suddenly worsens, recurring or prolonged angina at rest, or new onset of severe

angina. Patients with unstable angina have no evidence of myocardial necrosis, whereas in NSTEMI, myocardial necrosis (less significant than with STEMI) will be evident. There is a risk of progression to STEMI or sudden death, particularly in patients who experience pain at rest.

Management of unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI)

These conditions are managed similarly; the aims of management are to provide supportive care and pain relief during the acute attack and to prevent further cardiac events and death. For advice on the management of patients with acute ST-segment elevation myocardial infarction (STEMI), see below.

Initial management

Oxygen should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hyperoxia should be avoided and particular care is required in patients with chronic obstructive airways disease.

Nitrates are used to relieve ischaemic pain. If sublingual glyceryl trinitrate p. 232 is not effective, intravenous or buccal glyceryl trinitrate or intravenous isosorbide dinitrate p. 233 is given. If pain continues, diamorphine hydrochloride p. 477 or morphine p. 484 can be given by slow intravenous injection; an antiemetic such as metoclopramide hydrochloride p. 452 should also be given.

Aspirin p. 130 (chewed or dispersed in water) is given for its antiplatelet effect. If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel p. 131 should also be given. Prasugrel p. 228 is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see NICE guidance). Ticagrelor p. 228 is also an alternative to clopidogrel (see NICE guidance). Patients should also receive either heparin (unfractionated) p. 143, a **low molecular weight heparin**, or fondaparinux sodium p. 136.

Patients without contra-indications should receive **beta-blockers** which should be continued indefinitely. In patients without left ventricular dysfunction and in whom beta-blockers are inappropriate, diltiazem hydrochloride p. 169 or verapamil hydrochloride p. 175 can be given.

The glycoprotein IIb/IIIa inhibitors eptifibatide p. 223 (in combination with heparin (unfractionated) and aspirin) and tirofiban p. 223 (in combination with heparin (unfractionated), aspirin, and clopidogrel) can be used for unstable angina or for NSTEMI in patients at a high risk of either myocardial infarction or death.

In intermediate- and high-risk patients, abciximab or eptifibatide (in combination with heparin (unfractionated) and aspirin), or tirofiban (in combination with heparin (unfractionated), aspirin, and clopidogrel) can also be used in patients undergoing percutaneous coronary intervention, to reduce the immediate risk of vascular occlusion. In intermediate- and high-risk patients in whom early intervention is planned, bivalirudin p. 145 can be considered as an alternative to the combination of a glycoprotein IIb/IIIa inhibitor plus a heparin.

Revascularisation procedures are often appropriate for patients with unstable angina or NSTEMI; see Antiplatelet drugs p. 129 for the use of antiplatelet drugs in patients undergoing coronary stenting.

Long-term management

The need for long-term angina treatment or for coronary angiography should be assessed. Most patients will require standard angina treatment to prevent recurrence of symptoms.

ST-segment elevation myocardial infarction (STEMI)

This is an acute coronary syndrome where atheromatous plaque rupture leads to thrombosis and myocardial ischaemia, with irreversible necrosis of the heart muscle, often leading to long-term complications. STEMI can also

occasionally occur as a result of coronary spasm or embolism, arteritis, spontaneous thrombosis, or sudden severe elevation in blood pressure.

Management of ST-segment elevation myocardial infarction (STEMI)

These notes give an overview of the initial and long-term management of myocardial infarction with ST segment elevation (STEMI). For advice on the management of non-ST-segment elevation myocardial infarction (NSTEMI) and unstable angina, see above. The aims of management of STEMI are to provide supportive care and pain relief, to promote reperfusion and to reduce mortality. Oxygen, nitrates, and diamorphine hydrochloride or morphine can provide initial support and pain relief; aspirin and percutaneous coronary intervention or thrombolytics promote reperfusion; anticoagulants help to reduce re-occlusion and systemic embolisation; long-term use of aspirin, beta-blockers, ACE inhibitors, and statins help to reduce mortality further.

Local guidelines for the management of myocardial infarction should be followed where they exist.

Initial management

Oxygen should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hyperoxia should be avoided and particular care is required in patients with chronic obstructive airways disease.

The pain (and anxiety) of myocardial infarction is managed with slow intravenous injection of diamorphine hydrochloride or morphine; an antiemetic such as metoclopramide hydrochloride (or, if left ventricular function is not compromised, cyclizine p. 449) by intravenous injection should also be given.

Aspirin (chewed or dispersed in water) is given for its antiplatelet effect. If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel, should also be given. Prasugrel, is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see NICE guidance). Ticagrelor, is also an alternative to clopidogrel (see NICE guidance).

Patency of the occluded artery can be restored by percutaneous coronary intervention or by giving a **thrombolytic drug**, unless contra-indicated. Percutaneous coronary intervention is the preferred method; a **glycoprotein IIb/IIIa inhibitor** can be used to reduce the risk of immediate vascular occlusion in intermediate- and high-risk patients. Patients undergoing percutaneous coronary intervention should also receive either heparin (unfractionated) or a low molecular weight heparin (e.g. enoxaparin sodium p. 142); bivalirudin is an alternative to the combination of a glycoprotein IIb/IIIa inhibitor plus a heparin (see also NICE guidance). In patients who cannot be offered percutaneous coronary intervention within 90 minutes of diagnosis, a thrombolytic drug should be administered along with either heparin (unfractionated) (for maximum 2 days), a low molecular weight heparin (e.g. enoxaparin sodium p. 142), or fondaparinux sodium p. 136. See use of antiplatelet drugs in patients undergoing coronary stenting in Antiplatelet drugs p. 129.

Patients who do not receive reperfusion therapy (with percutaneous coronary intervention or a thrombolytic) should be treated with either fondaparinux sodium, enoxaparin sodium, or heparin (unfractionated) p. 143. Prescribers should consult product literature and local protocols (where they exist) for details of anticoagulant dose and duration.

Nitrates are used to relieve ischaemic pain. If sublingual glyceryl trinitrate p. 232 is not effective, intravenous glyceryl trinitrate or isosorbide dinitrate p. 233 is given.

Early administration of some **beta-blockers** has been shown to be of benefit and should be given to patients without contra-indications.

ACE inhibitors, and angiotensin-II receptor antagonists if an ACE inhibitor cannot be used, are also of benefit to patients who have no contra-indications; in hypertensive and normotensive patients treatment with an ACE inhibitor, or an angiotensin-II receptor antagonist, can be started within 24 hours of the myocardial infarction and continued for at least 5–6 weeks (see below for long-term treatment).

All patients should be closely monitored for hyperglycaemia; those with diabetes or raised blood-glucose concentration should receive insulin p. 751.

Long-term management

Long-term management following STEMI involves the use of several drugs which should ideally be started before the patient is discharged from hospital.

Aspirin p. 130 should be given to all patients, unless contra-indicated. The addition of clopidogrel p. 131 has been shown to reduce morbidity and mortality. Prasugrel p. 228 or ticagrelor p. 228 are alternatives to clopidogrel in certain patients. For those intolerant of clopidogrel, and who are at low risk of bleeding, the combination of warfarin sodium p. 150 and aspirin should be considered. In those intolerant of both aspirin and clopidogrel, warfarin sodium alone can be used. Warfarin sodium should be continued for those who are already being treated for another indication, such as atrial fibrillation, with the addition of aspirin if there is a low risk of bleeding. The combination of aspirin with clopidogrel or warfarin sodium increases the risk of bleeding. Low-dose rivaroxaban p. 137, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following STEMI—see Prevention of cardiovascular events. For details of antiplatelet drug duration following coronary stenting—see also Antiplatelet drugs and coronary stents in Antiplatelet drugs p. 129.

Beta-blockers should be given to all patients in whom they are not contra-indicated. Acebutolol p. 163, metoprolol tartrate p. 166, propranolol hydrochloride p. 162 and timolol maleate p. 163 are suitable; for patients with left ventricular dysfunction, carvedilol p. 160, bisoprolol fumarate p. 165, or long-acting metoprolol tartrate may be appropriate. Diltiazem hydrochloride p. 169 [unlicensed] or verapamil hydrochloride p. 175 can be considered if a beta-blocker cannot be used; however, they are contra-indicated in those with left ventricular dysfunction. Other calcium-channel blockers have no place in routine long-term management after a myocardial infarction.

An **ACE inhibitor** should be considered for all patients, especially those with evidence of left ventricular dysfunction. If an ACE inhibitor cannot be used, an angiotensin-II receptor antagonist may be used for patients with heart failure. A relatively high dose of either the ACE inhibitor or angiotensin-II receptor antagonist may be required to produce benefit.

Nitrates are used for patients with angina.

Eplerenone p. 205 is licensed for use following a myocardial infarction in those with left ventricular dysfunction and evidence of heart failure.

See also the role of **statins** in preventing recurrent cardiovascular events in Dyslipidaemias p. 208.

Prevention of cardiovascular events

Patients with stable angina, unstable angina, or NSTEMI should be given advice and treatments to reduce their cardiovascular risk. The importance of life-style changes, especially stopping smoking, should be emphasised. Aspirin should be given indefinitely. Antihypertensive treatment should be initiated if appropriate, and a **statin** should also be given.

In patients with stable angina, addition of an **ACE inhibitor** should be considered for patients with diabetes (and should be continued if indicated for a co-morbidity).

In patients with unstable angina or NSTEMI, clopidogrel is given, in combination with aspirin, for up to 12 months—most benefit occurs during the first 3 months. Prasugrel or ticagrelor are alternatives to clopidogrel in certain patients. An ACE inhibitor should also be given.

Low-dose rivaroxaban, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers.

Advanced Pharmacy Services

Patients with a history of acute coronary syndrome may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 18.

Other drugs used for Acute coronary syndromes

Captopril, p. 179 · Dalteparin sodium, p. 140 · Lisinopril, p. 181 · Perindopril arginine, p. 182 · Perindopril erbumine, p. 183 · Ramipril, p. 184 · Trandolapril, p. 185 · Valsartan, p. 190

ANTITHROMBOTIC DRUGS > ANTIPLATELET DRUGS

Prasugrel

24-Jul-2018

● INDICATIONS AND DOSE

In combination with aspirin for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention

▶ BY MOUTH

- ▶ Adult 18–74 years (body-weight up to 60 kg): Initially 60 mg for 1 dose, then 5 mg once daily usually for up to 12 months
- ▶ Adult 18–74 years (body-weight 60 kg and above): Initially 60 mg for 1 dose, then 10 mg once daily usually for up to 12 months
- ▶ Adult 75 years and over: Initially 60 mg for 1 dose, then 5 mg once daily usually for up to 12 months

Patients undergoing coronary angiography within 48 hours of admission for unstable angina or NSTEMI

▶ BY MOUTH

- ▶ Adult: Loading dose 60 mg, not to be administered until the time of percutaneous coronary intervention in order to minimise the risk of bleeding, maintenance dose of 10 mg or 5 mg daily should then be selected as appropriate based on age and weight

- **CONTRA-INDICATIONS** Active bleeding · history of stroke or transient ischaemic attack
- **CAUTIONS** Body-weight less than 60 kg · discontinue at least 7 days before elective surgery if antiplatelet effect not desirable · elderly · patients at increased risk of bleeding (e.g. from recent trauma, surgery, gastro-intestinal bleeding, or active peptic ulcer disease)
- **INTERACTIONS** → Appendix 1: prasugrel
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · haemorrhage · skin reactions
 - ▶ **Rare or very rare** Thrombocytopenia
- **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with history of hypersensitivity reactions to thienopyridines (e.g. clopidogrel).

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment (increased risk of bleeding, limited information available); avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT** Use with caution—increased risk of bleeding.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Prasugrel with percutaneous coronary intervention for treating acute coronary syndromes (July 2014) NICE TA317 Prasugrel 10 mg in combination with aspirin is recommended as an option, within its marketing authorisation, for preventing atherothrombotic events in adults with acute coronary syndrome (unstable angina (UA), non-ST segment elevation myocardial infarction (NSTEMI) or ST segment elevation myocardial infarction (STEMI)) having primary or delayed percutaneous coronary intervention.

www.nice.org.uk/guidance/ta317

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (September 2009) that prasugrel (*Efient*®), in combination with aspirin, be accepted for restricted use within NHS Scotland for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention who are eligible to receive the 10 mg dose of prasugrel.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ Prasugrel (Non-proprietary)

Prasugrel 5 mg Prafisia 5mg tablets | 28 tablet [PoM] £47.56 DT = £19.30

Prasugrel 5mg tablets | 28 tablet [PoM] £47.56 DT = £19.30

Prasugrel 10 mg Prasugrel 10mg tablets | 28 tablet [PoM] £47.56 DT = £5.97

Prafisia 10mg tablets | 28 tablet [PoM] £47.56 DT = £5.97

▶ Efient (Daiichi Sankyo UK Ltd)

Prasugrel 5 mg Efient 5mg tablets | 28 tablet [PoM] £47.56 DT = £19.30

Prasugrel 10 mg Efient 10mg tablets | 28 tablet [PoM] £47.56 DT = £5.97

Ticagrelor

19-Oct-2018

- **DRUG ACTION** Ticagrelor is a P2Y₁₂ receptor antagonist that prevents ADP-mediated P2Y₁₂ dependent platelet activation and aggregation.

● INDICATIONS AND DOSE

Prevention of atherothrombotic events in patients with acute coronary syndrome [in combination with aspirin]

▶ BY MOUTH

- ▶ Adult: Initially 180 mg for 1 dose, then 90 mg twice daily usually for up to 12 months

Prevention of atherothrombotic events in patients with a history of myocardial infarction and a high risk of an atherothrombotic event [in combination with aspirin]

▶ BY MOUTH

- ▶ Adult: 60 mg twice daily, extended treatment may be started without interruption after the initial 12-month therapy for acute coronary syndrome. Treatment may also be initiated up to 2 years from the myocardial infarction, or within 1 year after stopping previous ADP receptor inhibitor treatment. There are limited data on the efficacy and safety of extended treatment beyond 3 years

- **CONTRA-INDICATIONS** Active bleeding · history of intracranial haemorrhage
- **CAUTIONS** Asthma · bradycardia (unless pacemaker fitted) · chronic obstructive pulmonary disease · discontinue 5 days before elective surgery if antiplatelet effect not desirable · history of hyperuricaemia · patients at increased risk of bleeding (e.g. from recent trauma, surgery, gastro-intestinal bleeding, or coagulation disorders) · second- or third-degree AV block (unless pacemaker fitted) · sick sinus syndrome (unless pacemaker fitted)
- **INTERACTIONS** → Appendix 1: ticagrelor
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Constipation · diarrhoea · dizziness · dyspepsia · dyspnoea · gout · gouty arthritis · haemorrhage · headache · hyperuricaemia · hypotension · nausea · skin reactions · syncope · vertigo
 - ▶ **Uncommon** Angioedema · confusion · intracranial haemorrhage · tumour haemorrhage
 - ▶ **Frequency not known** Thrombotic thrombocytopenic purpura
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment (limited information available); avoid in severe impairment (no information available).
- **MONITORING REQUIREMENTS** Manufacturer advises monitor renal function 1 month after initiation in patients with acute coronary syndrome.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Ticagrelor for the treatment of acute coronary syndromes (October 2011)** NICE TA236
Ticagrelor, in combination with low-dose aspirin, is recommended for up to 12 months as a treatment option in adults with acute coronary syndromes, that is, people:
 - with ST-segment elevation myocardial infarction—defined as ST elevation or new left bundle branch block on electrocardiogram—that cardiologists intend to treat with primary percutaneous coronary intervention, **or**
 - with non-ST-segment elevation myocardial infarction (NSTEMI), **or**
 - admitted to hospital with unstable angina—defined as ST or T wave changes on electrocardiogram suggestive of ischaemia plus one of the characteristics defined below. Before ticagrelor is continued beyond the initial treatment, the diagnosis of unstable angina should first be confirmed, ideally by a cardiologist. Characteristics to be used in defining treatment with ticagrelor for unstable angina are:
 - age 60 years or older;
 - previous myocardial infarction or previous coronary artery bypass grafting;
 - coronary artery disease with stenosis of 50% or more in at least two vessels;
 - previous ischaemic stroke;
 - previous transient ischaemic attack, carotid stenosis of at least 50%, or cerebral revascularisation;
 - diabetes mellitus;
 - peripheral arterial disease, **or**
 - chronic renal dysfunction (creatinine clearance less than 60 mL/minute/1.73 m²).

www.nice.org.uk/guidance/ta236

- ▶ **Ticagrelor for preventing atherothrombotic events after myocardial infarction (December 2016)** NICE TA420
Ticagrelor, in combination with aspirin, is recommended within its marketing authorisation as an option for preventing atherothrombotic events in adults who had a myocardial infarction and who are at high risk of a further

event. Treatment should be stopped when clinically indicated or at a maximum of 3 years.

www.nice.org.uk/guidance/ta420

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Orodispersible tablet

ANTITHROMBOTIC DRUGS > TISSUE PLASMINOGEN ACTIVATORS

Fibrinolytic drugs

Overview

The value of thrombolytic drugs for the treatment of *myocardial infarction* has been established. Streptokinase p. 230 and alteplase p. 230 have been shown to reduce mortality. Reteplase and tenecteplase p. 231 are also licensed for acute myocardial infarction. Thrombolytic drugs are indicated for any patient with acute myocardial infarction for whom the benefit is likely to outweigh the risk of treatment. Trials have shown that the benefit is greatest in those with ECG changes that include ST segment elevation (especially in those with anterior infarction) and in patients with bundle branch block. Patients should not be denied thrombolytic treatment on account of age alone because mortality in the elderly is high and the reduction in mortality is the same as in younger patients. Alteplase should be given within 6–12 hours of symptom onset, reteplase and streptokinase within 12 hours of symptom onset, but ideally all should be given within 1 hour; use after 12 hours requires specialist advice. Tenecteplase should be given as early as possible and usually within 6 hours of symptom onset.

Alteplase, streptokinase and urokinase p. 148 can be used for other thromboembolic disorders such as deep-vein thrombosis and pulmonary embolism. Alteplase is also used for acute ischaemic stroke.

Urokinase is also licensed to restore the patency of occluded intravenous catheters and cannulas blocked with fibrin clots.

Fibrinolytics

- **DRUG ACTION** Fibrinolytic drugs act as thrombolytics by activating plasminogen to form plasmin, which degrades fibrin and so breaks up thrombi.
- **CONTRA-INDICATIONS** Acute pancreatitis · aneurysm · aortic dissection · arteriovenous malformation · bacterial endocarditis · bleeding diatheses · coagulation defects · coma · heavy vaginal bleeding · history of cerebrovascular disease (especially recent events or with any residual disability) · neoplasm with risk of haemorrhage · oesophageal varices · pericarditis · recent gastro-intestinal ulceration · recent haemorrhage · recent surgery (including dental extraction) · recent trauma · severe hypertension
- **CAUTIONS** Conditions in which thrombolysis might give rise to embolic complications such as enlarged left atrium with atrial fibrillation (risk of dissolution of clot and subsequent embolisation) · elderly · external chest compression · hypertension · risk of bleeding (including that from venepuncture or invasive procedures)

● SIDE-EFFECTS

- ▶ **Common or very common** Anaphylactic reaction · angina pectoris · cardiac arrest · cardiogenic shock · chills · CNS haemorrhage · ecchymosis · fever · haemorrhage · haemorrhagic stroke · heart failure · hypotension · ischaemia recurrent (when used in myocardial infarction) · nausea · pericarditis · pulmonary oedema · vomiting
- ▶ **Uncommon** Aphasia · mitral valve incompetence · myocardial rupture · pericardial disorders · reperfusion arrhythmia (when used in myocardial infarction) · seizure

SIDE-EFFECTS, FURTHER INFORMATION Serious bleeding calls for discontinuation of the thrombolytic and may require administration of coagulation factors and antifibrinolytic drugs.

- **PREGNANCY** Thrombolytic drugs can possibly lead to premature separation of the placenta in the first 18 weeks of pregnancy. There is also a risk of maternal haemorrhage throughout pregnancy and post-partum, and also a theoretical risk of fetal haemorrhage throughout pregnancy.
- **HEPATIC IMPAIRMENT** Manufacturers advise avoid in severe impairment.

F 229

Alteplase

15-Nov-2019

(rt-PA; Tissue-type plasminogen activator)

● INDICATIONS AND DOSE

Acute myocardial infarction, accelerated regimen

- ▶ **INITIALLY BY INTRAVENOUS INJECTION**
- ▶ **Adult** (body-weight up to 65 kg): Initially 15 mg, to be initiated within 6 hours of symptom onset, followed by (by intravenous infusion) 0.75 mg/kg, to be given over 30 minutes, then (by intravenous infusion) 0.5 mg/kg, to be given over 60 minutes, maximum total dose of 100 mg administered over 90 minutes
- ▶ **Adult** (body-weight 65 kg and above): Initially 15 mg, to be initiated within 6 hours of symptom onset, followed by (by intravenous infusion) 50 mg, to be given over 30 minutes, then (by intravenous infusion) 35 mg, to be given over 60 minutes, maximum total dose of 100 mg administered over 90 minutes

Acute myocardial infarction

- ▶ **INITIALLY BY INTRAVENOUS INJECTION**
- ▶ **Adult:** Initially 10 mg, to be initiated within 6–12 hours of symptom onset, followed by (by intravenous infusion) 50 mg, to be given over 60 minutes, then (by intravenous infusion) 10 mg for 4 infusions, each 10 mg infusion dose to be given over 30 minutes, total dose of 100 mg over 3 hours; maximum 1.5 mg/kg in patients less than 65 kg

Pulmonary embolism

- ▶ **INITIALLY BY INTRAVENOUS INJECTION**
- ▶ **Adult:** Initially 10 mg, to be given over 1–2 minutes, followed by (by intravenous infusion) 90 mg, to be given over 2 hours, maximum 1.5 mg/kg in patients less than 65 kg

Acute ischaemic stroke (under specialist neurology physician only)

- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Adult** 18–79 years: Initially 900 micrograms/kg (max. per dose 90 mg), treatment **must** begin within 4.5 hours of symptom onset, to be given over 60 minutes, the initial 10% of dose is to be administered by intravenous injection and the remainder by intravenous infusion

ACTILYSE CATHFLO®

Thrombolytic treatment of occluded central venous access devices (including those used for haemodialysis)

- ▶ **BY INTRAVENOUS INJECTION**
- ▶ **Adult:** (consult product literature)

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS

Recent delivery

SPECIFIC CONTRA-INDICATIONS

- ▶ When used for acute ischaemic stroke Convulsion accompanying stroke · history of stroke in patients with diabetes · hyperglycaemia · hypoglycaemia · severe stroke · stroke in last 3 months
- **INTERACTIONS** → Appendix 1: alteplase
- **SIDE-EFFECTS**
- ▶ **Uncommon** Haemothorax
- ▶ **Rare or very rare** Agitation · confusion · delirium · depression · epilepsy · psychosis · speech disorder
- ▶ **Frequency not known** Brain oedema (caused by reperfusion)
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to gentamicin (residue from manufacturing process).

● MONITORING REQUIREMENTS

- ▶ When used for acute ischaemic stroke Monitor for intracranial haemorrhage, and monitor blood pressure (antihypertensive recommended if systolic above 180 mmHg or diastolic above 105 mmHg).

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Actilyse®), give intermittently or continuously in Sodium chloride 0.9%; dissolve in water for injections to a concentration of 1 mg/mL or 2 mg/mL and infuse intravenously; alternatively dilute the solution further in the infusion fluid to a concentration of not less than 200 micrograms/mL; not to be infused in glucose solution.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Alteplase for treating acute ischaemic stroke (September 2012)** NICE TA264
Alteplase (Actilyse®) is recommended for the treatment of acute ischaemic stroke in adults in accordance with its licensed indication if:
 - treatment is started as early as possible within 4.5 hours of onset of stroke symptoms, **and**
 - intracranial haemorrhage has been excluded by appropriate imaging techniques.www.nice.org.uk/guidance/ta264

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Powder and solvent for solution for injection

- ▶ **Actilyse** (Boehringer Ingelheim Ltd)
Alteplase 10 mg Actilyse 10mg powder and solvent for solution for injection vials | 1 vial **[PoM]** £172.80
- Alteplase 20 mg** Actilyse 20mg powder and solvent for solution for injection vials | 1 vial **[PoM]** £259.20

Powder and solvent for solution for infusion

Streptokinase

23-Jan-2020

● INDICATIONS AND DOSE

Acute myocardial infarction

- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Adult:** 1 500 000 units, to be initiated within 12 hours of symptom onset, dose to be given over 60 minutes

Deep-vein thrombosis | Central retinal venous or arterial thrombosis

- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Adult:** 250 000 units, dose to be given over 30 minutes, then 100 000 units every 1 hour for 12 hours for central retinal venous or arterial thrombosis, or for 72 hours for deep-vein thrombosis

Pulmonary embolism

► BY INTRAVENOUS INFUSION

- Adult: 250 000 units, dose to be given over 30 minutes, then 100 000 units every 1 hour for 24 hours, alternatively 1 500 000 units, dose to be given over 1–2 hours

Occlusive peripheral arterial disease

► BY INTRAVENOUS INFUSION

- Adult: 250 000 units, dose to be given over 30 minutes, then 100 000 units every 1 hour for up to 5 days

► BY INTRA-ARTERIAL INFUSION

- Adult: (consult product literature)

- **CAUTIONS** Cavernous pulmonary disease · recent streptococcal infections
- **INTERACTIONS** → Appendix 1: streptokinase
- **SIDE-EFFECTS**
 - **Common or very common** Arrhythmias · asthenia · diarrhoea · epigastric pain · headache · malaise · pain
 - **Uncommon** Respiratory arrest · splenic rupture
 - **Rare or very rare** Arthritis · eye inflammation · hypersensitivity · nephritis · nerve disorders · neurological effects · pulmonary oedema non-cardiogenic (caused by reperfusion) · shock · vasculitis
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if previous allergic reaction to either streptokinase or anistreplase (no longer available). Prolonged persistence of antibodies to streptokinase and anistreplase (no longer available) can reduce the effectiveness of subsequent treatment; therefore, streptokinase should not be used again beyond 4 days of first administration of either streptokinase or anistreplase.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion*, give continuously or intermittently; reconstitute with sodium chloride 0.9%, then dilute further with Glucose 5% or Sodium Chloride 0.9% or Compound Sodium Lactate after reconstitution.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

NITRATES**Nitrates****Overview**

Nitrates have a useful role in *angina*. Although they are potent coronary vasodilators, their principal benefit follows from a reduction in venous return which reduces left ventricular work. Unwanted effects such as flushing, headache, and postural hypotension may limit therapy, especially when *angina* is severe or when patients are unusually sensitive to the effects of nitrates.

Sublingual glyceryl trinitrate p. 232 is one of the most effective drugs for providing rapid symptomatic relief of *angina*, but its effect lasts only for 20 to 30 minutes; the 300-microgram tablet is often appropriate when glyceryl trinitrate is first used. The *aerosol* spray provides an alternative method of rapid relief of symptoms for those who find difficulty in dissolving sublingual preparations. Duration of action may be prolonged by *transdermal* preparations (but tolerance may develop).

Isosorbide dinitrate p. 233 is active *sublingually* and is a more stable preparation for those who only require nitrates infrequently. It is also effective by mouth for prophylaxis; although the effect is slower in onset, it may persist for several hours. Duration of action of up to 12 hours is claimed for *modified-release* preparations. The activity of isosorbide dinitrate may depend on the production of active metabolites, the most important of which is isosorbide mononitrate p. 234. Isosorbide mononitrate itself is also licensed for *angina* prophylaxis; *modified-release* formulations (for once daily administration) are available.

Glyceryl trinitrate or isosorbide dinitrate may be tried by *intravenous injection* when the sublingual form is ineffective in patients with chest pain due to myocardial infarction or severe ischaemia. Intravenous injections are also useful in the treatment of congestive heart failure.

Nitrates

- **CONTRA-INDICATIONS** Aortic stenosis · cardiac tamponade · constrictive pericarditis · hypertrophic cardiomyopathy · hypotensive conditions · hypovolaemia · marked anaemia · mitral stenosis · raised intracranial pressure due to cerebral haemorrhage · raised intracranial pressure due to head trauma · toxic pulmonary oedema
- **CAUTIONS** Heart failure due to obstruction · hypothermia · hypothyroidism · hypoxaemia · malnutrition · metal-containing transdermal systems should be removed before magnetic resonance imaging procedures, cardioversion, or diathermy · recent history of myocardial infarction · susceptibility to angle-closure glaucoma · tolerance · ventilation and perfusion abnormalities
- **CAUTIONS, FURTHER INFORMATION**
 - Tolerance Many patients on long-acting or transdermal nitrates rapidly develop tolerance (with reduced therapeutic effects). Reduction of blood-nitrate concentrations to low levels for 4 to 12 hours each day usually maintains effectiveness in such patients. If tolerance is suspected during the use of transdermal patches they should be left off for 8–12 hours (usually overnight) in each 24 hours; in the case of *modified-release* tablets of isosorbide dinitrate (and conventional

formulations of isosorbide mononitrate), the second of the two daily doses should be given after about 8 hours rather than after 12 hours. Conventional formulations of isosorbide mononitrate should not usually be given more than twice daily unless small doses are used; modified-release formulations of isosorbide mononitrate should only be given once daily, and used in this way do not produce tolerance.

- ▶ **Elderly** Prescription potentially inappropriate (STOPP criteria) if prescribed a **long-acting** nitrate with persistent postural hypotension i.e. recurrent drop in systolic blood pressure ≥ 20 mmHg (risk of syncope and falls). See also Prescribing in the elderly p. 33.

● SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmias · asthenia · cerebral ischaemia · dizziness · drowsiness · flushing · headache · hypotension · nausea · vomiting

- ▶ **Uncommon** Circulatory collapse · diarrhoea · skin reactions · syncope

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in nitrate hypersensitivity.

- **BREAST FEEDING** No information available—manufacturers advise use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** In general, manufacturers advise caution in severe impairment.

- **RENAL IMPAIRMENT** Manufacturers advise use with caution in severe impairment.

- **MONITORING REQUIREMENTS** Monitor blood pressure and heart rate during intravenous infusion.

- **TREATMENT CESSATION** Avoid abrupt withdrawal.

F 231

Glyceryl trinitrate

27-Jul-2018

● INDICATIONS AND DOSE

Prophylaxis of angina

- ▶ BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS
- ▶ Adult: 1 tablet, to be administered prior to activity likely to cause angina

Treatment of angina

- ▶ BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS
- ▶ Adult: 1 tablet, dose may be repeated at 5 minute intervals if required; if symptoms have not resolved after 3 doses, medical attention should be sought

Prophylaxis of angina

- ▶ BY SUBLINGUAL ADMINISTRATION USING AEROSOL SPRAY
- ▶ Adult: 400–800 micrograms, to be administered under the tongue and then close mouth prior to activity likely to cause angina

Treatment of angina

- ▶ BY SUBLINGUAL ADMINISTRATION USING AEROSOL SPRAY
- ▶ Adult: 400–800 micrograms, to be administered under the tongue and then close mouth, dose may be repeated at 5 minute intervals if required; if symptoms have not resolved after 3 doses, medical attention should be sought

Control of hypertension and myocardial ischaemia during and after cardiac surgery | Induction of controlled hypotension during surgery | Congestive heart failure | Unstable angina

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 10–200 micrograms/minute (max. per dose 400 micrograms/minute), adjusted according to response, consult product literature for recommended starting doses specific to indication

Anal fissure

- ▶ BY RECTUM USING OINTMENT

- ▶ Adult: Apply 2.5 centimetres every 12 hours until pain stops. Max. duration of use 8 weeks, apply to anal canal, 2.5 cm of ointment contains 1.5 mg of glyceryl trinitrate

DEPONIT[®]

Prophylaxis of angina

- ▶ BY TRANSDERMAL APPLICATION

- ▶ Adult: One '5' or one '10' patch to be applied to lateral chest wall, upper arm, thigh, abdomen, or shoulder; increase to two '10' patches every 24 hours if necessary, to be replaced every 24 hours, siting replacement patch on different area

MINITRAN[®]

Prophylaxis of angina

- ▶ BY TRANSDERMAL APPLICATION

- ▶ Adult: One '5' patch to be applied to chest or upper arm; replace every 24 hours, siting replacement patch on different area, dose to be adjusted according to response

Maintenance of venous patency ('5' patch only)

- ▶ BY TRANSDERMAL APPLICATION

- ▶ Adult: (consult product literature)

NITRO-DUR[®]

Prophylaxis of angina

- ▶ BY TRANSDERMAL APPLICATION

- ▶ Adult: One '0.2mg/h' patch to be applied to chest or outer upper arm and replaced every 24 hours, siting replacement patch on different area, dose adjusted according to response; maximum 15 mg per day

PERCUTOL[®]

Prophylaxis of angina

- ▶ TO THE SKIN

- ▶ Adult: Usual dose 1–2 inches every 3–4 hours as required, to be measured on to *Applirule*[®] and applied (usually to chest, arm, or thigh) without rubbing in and secured with surgical tape, approx. 800 micrograms/hour absorbed from 1 inch of ointment.

Prophylaxis of angina (to determine dose)

- ▶ TO THE SKIN

- ▶ Adult: ½ inch to be administered on first day then increased by ½ inch/day until headache occurs, then reduced by ½ inch, to be measured on to *Applirule*[®] and applied (usually to chest, arm, or thigh) without rubbing in and secured with surgical tape, approx. 800 micrograms/hour absorbed from 1 inch of ointment.

TRANSIDERM-NITRO[®]

Prophylaxis of angina

- ▶ BY TRANSDERMAL APPLICATION

- ▶ Adult: One '5' or one '10' patch to be applied to lateral chest wall and replaced every 24 hours, siting replacement patch on different area, max. two '10' patches daily

Prophylaxis of phlebitis and extravasation ('5' patch only)

- ▶ BY TRANSDERMAL APPLICATION

- ▶ Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: nitrates

● SIDE-EFFECTS

▶ Uncommon

- ▶ With parenteral use Cardiac disorder · cyanosis
- ▶ With rectal use Anorectal disorder · anorectal haemorrhage · gastrointestinal discomfort
- ▶ With sublingual use Cyanosis

- ▶ **Rare or very rare**
- ▶ With parenteral or sublingual use Methaemoglobinaemia · respiratory disorder · restlessness
- ▶ With topical use Dyspnoea
- ▶ **Frequency not known**
- ▶ With parenteral use Hyperhidrosis
- ▶ With rectal use Vertigo
- ▶ With sublingual use Tongue blistering
- ▶ With transdermal use Palpitations
- **PREGNANCY** Not known to be harmful.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use For *intravenous infusion* (Nitrocline[®], Nitronal[®]), give continuously in Glucose 5% or Sodium Chloride 0.9%. For Nitrocline[®], suggested infusion concentration 100 micrograms/mL; incompatible with polyvinyl chloride infusion containers such as Vialflex[®] or Steriflex[®]; use glass or polyethylene containers or give via a syringe pump.
- ▶ With intravenous use Glass or polyethylene apparatus is preferable; loss of potency will occur if PVC is used. Glyceryl trinitrate 1 mg/ml to be diluted before use or given undiluted with syringe pump. Glyceryl trinitrate 5 mg/ml to be diluted before use.
- **PRESCRIBING AND DISPENSING INFORMATION**
- ▶ With sublingual use Glyceryl trinitrate tablets are available in strengths of 300-, 500- and 600-micrograms—manufacturer advises tablets should be supplied in glass containers of not more than 100 tablets, closed with a foil-lined cap, and containing no cotton wool wadding; they should be discarded after 8 weeks in use.
- **PATIENT AND CARER ADVICE** Rectal ointment should be discarded 8 weeks after first opening.
- ▶ **PERCUTOL[®]** Patients or carers should be given advice on how to administer glyceryl trinitrate ointment.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- ▶ **Scottish Medicines Consortium (SMC) decisions**
- ▶ With rectal use The *Scottish Medicines Consortium* has advised (February 2008) that glyceryl trinitrate 0.4% ointment (*Rectogesic[®]*) is **not** recommended for use within NHS Scotland for the relief of pain associated with chronic anal fissure.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion, ointment

Solution for infusion

EXCIPIENTS: May contain Ethanol, propylene glycol

▶ Glyceryl trinitrate (Non-proprietary)

Glyceryl trinitrate 1 mg per 1 ml Glyceryl trinitrate 50mg/50ml solution for infusion vials | 1 vial [PoM](#) £15.90

Glyceryl trinitrate 5 mg per 1 ml Glyceryl trinitrate 50mg/10ml solution for infusion ampoules | 5 ampoule [PoM](#) £64.90 (Hospital only)

Glyceryl trinitrate 25mg/5ml solution for infusion ampoules | 5 ampoule [PoM](#) £32.45 (Hospital only)

▶ Nitrocline (Forum Health Products Ltd)

Glyceryl trinitrate 1 mg per 1 ml Nitrocline 10mg/10ml solution for infusion ampoules | 10 ampoule [PoM](#) £58.75 (Hospital only)

▶ Nitronal (Intrapharm Laboratories Ltd)

Glyceryl trinitrate 1 mg per 1 ml Nitronal 5mg/5ml solution for infusion ampoules | 10 ampoule [PoM](#) £18.04
Nitronal 50mg/50ml solution for infusion vials | 1 vial [PoM](#) £14.76

Isosorbide dinitrate

● INDICATIONS AND DOSE

Prophylaxis and treatment of angina

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: 30–120 mg daily in divided doses

▶ BY INTRAVENOUS INFUSION

▶ Adult: 2–10 mg/hour, increased if necessary up to 20 mg/hour

▶ BY SUBLINGUAL ADMINISTRATION USING AEROSOL SPRAY

▶ Adult: 1–3 sprays, to be administered under tongue whilst holding breath, allow a 30 second interval between each dose

Left ventricular failure

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: 40–160 mg daily in divided doses, increased if necessary up to 240 mg daily in divided doses

▶ BY INTRAVENOUS INFUSION

▶ Adult: Initially 2–10 mg/hour, increased if necessary up to 20 mg/hour

Prophylaxis of angina

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Adult: 40 mg daily in 1–2 divided doses, increased if necessary to 60–80 mg daily in 2–3 divided doses

● INTERACTIONS → Appendix 1: nitrates

● SIDE-EFFECTS

▶ Common or very common

▶ With oral use Peripheral oedema

▶ Rare or very rare

▶ With oral use Angioedema · angle closure glaucoma · hypoventilation · hypoxia · pituitary haemorrhage · Stevens-Johnson syndrome

- **PREGNANCY** May cross placenta—manufacturers advise avoid unless potential benefit outweighs risk.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Isoket* 0.05%[®], *Isoket* 0.1%[®]), give continuously in Glucose 5% or Sodium chloride 0.9%. Adsorbed to some extent by polyvinyl chloride infusion containers; preferably use glass or polyethylene containers or give via a syringe pump; *Isoket* 0.05%[®] can alternatively be administered undiluted using a syringe pump with a glass or rigid plastic syringe. Glass or polyethylene infusion apparatus is preferable; loss of potency if PVC used.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Modified-release tablet

SYMPATHOMIMETICS > INOTROPIC**Dobutamine**

- **DRUG ACTION** Dobutamine is a cardiac stimulant which acts on beta₁ receptors in cardiac muscle, and increases contractility.

INDICATIONS AND DOSE

Inotropic support in infarction, cardiac surgery, cardiomyopathies, septic shock, cardiogenic shock, and during positive end expiratory pressure ventilation

- ▶ BY INTRAVENOUS INFUSION
 - ▶ Adult: Usual dose 2.5–10 micrograms/kg/minute, adjusted according to response, alternatively 0.5–40 micrograms/kg/minute

Cardiac stress testing

- ▶ BY INTRAVENOUS INFUSION
 - ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Pheochromocytoma
- **CAUTIONS** Acute heart failure · acute myocardial infarction · arrhythmias · correct hypercapnia before starting and during treatment · correct hypovolaemia before starting and during treatment · correct hypoxia before starting and during treatment · correct metabolic acidosis before starting and during treatment · diabetes mellitus · elderly · extravasation may cause tissue necrosis · extreme caution or avoid in marked obstruction of cardiac ejection (such as idiopathic hypertrophic subaortic stenosis) · hyperthyroidism · ischaemic heart disease · occlusive vascular disease · severe hypotension · susceptibility to angle-closure glaucoma · tachycardia · tolerance may develop with continuous infusions longer than 72 hours
- **INTERACTIONS** → Appendix 1: sympathomimetics, inotropic
- **SIDE-EFFECTS**
 - ▶ Common or very common Arrhythmias · bronchospasm · chest pain · dyspnoea · eosinophilia · fever · headache · inflammation localised · ischaemic heart disease · nausea · palpitations · platelet aggregation inhibition (on prolonged administration) · skin reactions · urinary urgency · vasoconstriction
 - ▶ Uncommon Myocardial infarction
 - ▶ Rare or very rare Atrioventricular block · cardiac arrest · coronary vasospasm · hypertension exacerbated · hypokalaemia · hypotension exacerbated
 - ▶ Frequency not known Anxiety · cardiomyopathy · feeling hot · myoclonus · paraesthesia · tremor
- **PREGNANCY** No evidence of harm in *animal* studies—manufacturers advise use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.

- **MONITORING REQUIREMENTS** Monitor serum-potassium concentration.
- **DIRECTIONS FOR ADMINISTRATION** Dobutamine injection should be diluted before use or given undiluted with syringe pump. Dobutamine concentrate for intravenous infusion should be diluted before use.
For *intravenous infusion*, give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of 0.5–1 mg/mL and give via an infusion pump; give higher concentration (max. 5 mg/mL) through central venous catheter; incompatible with bicarbonate and other strong alkaline solutions.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for infusion

EXCIPIENTS: May contain Sulfites

▶ **Dobutamine (Non-proprietary)**

Dobutamine (as Dobutamine hydrochloride) 5 mg per 1 ml Dobutamine 250mg/50ml solution for infusion vials | 1 vial **[POM]** £7.50

Dobutamine (as Dobutamine hydrochloride) 12.5 mg per 1 ml Dobutamine 250mg/20ml concentrate for solution for infusion ampoules | 5 ampoule **[POM]** £12.00-£29.25 | 10 ampoule **[POM]** £52.50

8.1a Cardiac arrest

Cardiopulmonary resuscitation**Overview**

The algorithm for cardiopulmonary resuscitation (Life support algorithm (image), inside back pages) reflects the most recent recommendations of the Resuscitation Council (UK); this has been reproduced with the kind permission of the Resuscitation Council (UK). The guidelines are available at www.resus.org.uk.

Cardiac arrest can be associated with ventricular fibrillation, pulseless ventricular tachycardia, asystole, and pulseless electrical activity (electromechanical dissociation). Adrenaline/epinephrine below 1 in 10000 (100 micrograms/mL) is recommended by intravenous injection repeated every 3–5 minutes if necessary. Administration through a central line results in a faster response than peripheral administration, however placement of a central line must not interfere with chest compressions; drugs administered peripherally must be followed by a flush of at least 20 mL Sodium Chloride 0.9% injection to aid entry into the central circulation. Intravenous injection of amiodarone hydrochloride p. 112 should be considered after adrenaline/epinephrine to treat ventricular fibrillation or pulseless ventricular tachycardia in cardiac arrest refractory to defibrillation. An additional dose of amiodarone hydrochloride can be given if necessary, followed by an intravenous infusion of amiodarone hydrochloride. Lidocaine hydrochloride p. 109, is an alternative if amiodarone hydrochloride is not available. Atropine sulfate p. 1404 is no longer recommended in the treatment of asystole or pulseless electrical activity.

During cardiopulmonary arrest if intravenous access cannot be obtained, the intraosseous route can be used instead. Drug administration via the endotracheal route is no longer recommended.

For the management of acute anaphylaxis, see allergic emergencies under Antihistamines, allergen immunotherapy and allergic emergencies p. 291.

SYMPATHOMIMETICS > VASOCONSTRICTOR**Adrenaline/epinephrine**

21-May-2020

- **DRUG ACTION** Acts on both alpha and beta receptors and increases both heart rate and contractility (beta₁ effects); it can cause peripheral vasodilation (a beta₂ effect) or vasoconstriction (an alpha effect).

INDICATIONS AND DOSE**Cardiopulmonary resuscitation**

▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 1 mg every 3–5 minutes as required, a 1 in 10 000 (100 micrograms/mL) solution is recommended

Acute hypotension

▶ BY CONTINUOUS INTRAVENOUS INFUSION

- ▶ Neonate: Initially 100 nanograms/kg/minute, adjusted according to response, higher doses up to 1.5 micrograms/kg/minute have been used in acute hypotension.

- ▶ Child: Initially 100 nanograms/kg/minute, adjusted according to response, higher doses up to 1.5 micrograms/kg/minute have been used in acute hypotension

Emergency treatment of acute anaphylaxis (under expert supervision) | Angioedema (if laryngeal oedema is present) (under expert supervision)

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 1 month–5 years: 150 micrograms, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, suitable syringe to be used for measuring small volume; injected preferably into the anterolateral aspect of the middle third of the thigh
- ▶ Child 6–11 years: 300 micrograms, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, to be injected preferably into the anterolateral aspect of the middle third of the thigh
- ▶ Child 12–17 years: 500 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, 300 micrograms (0.3 mL) to be administered if child small or prepubertal
- ▶ Adult: 500 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function

Acute anaphylaxis when there is doubt as to the adequacy of the circulation (specialist use only) | Angioedema (if laryngeal oedema is present) (specialist use only)

▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 50 micrograms, using 0.5 mL of the dilute 1 in 10 000 adrenaline injection, dose to be repeated according to response, if multiple doses required, adrenaline should be given as a slow intravenous infusion stopping when a response has been obtained

Control of bradycardia in patients with arrhythmias after myocardial infarction, if there is a risk of asystole, or if the patient is unstable and has failed to respond to atropine

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 2–10 micrograms/minute, adjusted according to response

EMERADE[®] 150 MICROGRAMS**Acute anaphylaxis (for self-administration)—product recalled, see Important Safety Information**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
- ▶ Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

EMERADE[®] 300 MICROGRAMS**Acute anaphylaxis (for self-administration)—product recalled, see Important Safety Information**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required
- ▶ Adult (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

EMERADE[®] 500 MICROGRAMS**Acute anaphylaxis (for self-administration)—product recalled, see Important Safety Information**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 12–17 years: 500 micrograms, then 500 micrograms after 5–15 minutes as required
- ▶ Adult: 500 micrograms, then 500 micrograms after 5–15 minutes as required

EPIPEN[®] AUTO-INJECTOR 0.3MG**Acute anaphylaxis (for self-administration)**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child (body-weight 26 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required
- ▶ Adult: 300 micrograms, then 300 micrograms after 5–15 minutes as required

EPIPEN[®] JR AUTO-INJECTOR 0.15MG**Acute anaphylaxis (for self-administration)**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
- ▶ Child (body-weight 15–25 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

JEXT[®] 150 MICROGRAMS**Acute anaphylaxis (for self-administration)**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
- ▶ Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

JEXT[®] 300 MICROGRAMS**Acute anaphylaxis (for self-administration)**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child (body-weight 31 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required
- ▶ Adult (body-weight 31 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

● UNLICENSED USE

- ▶ With intramuscular use for acute anaphylaxis in children Auto-injectors delivering 150-microgram dose of adrenaline may not be licensed for use in children with body-weight under 15 kg.

- ▶ With intravenous use for acute hypotension in children Adrenaline 1 in 1000 (1 mg/mL) solution is not licensed for intravenous administration.

IMPORTANT SAFETY INFORMATION**SAFE PRACTICE**

Intravenous route should be used with **extreme care** by specialists only.

MHRA/CHM ADVICE: ADRENALINE AUTO-INJECTORS: UPDATED ADVICE AFTER EUROPEAN REVIEW (AUGUST 2017)

Following a European review of all adrenaline auto-injectors approved in the EU, the MHRA recommend that 2 adrenaline auto-injectors are prescribed, which patients should carry at all times. This is particularly important for patients with allergic asthma, who are at increased risk of a severe anaphylactic reaction. Patients with allergies and their carers should be trained to use the particular auto-injector they have been prescribed and encouraged to practise using a trainer device. Patients are advised to check the expiry date of the adrenaline auto-injectors and obtain replacements before they expire.

MHRA/CHM ADVICE: CLASS 2 MEDICINES RECALL: EMERADE[®] 150 MICROGRAMS (MARCH 2020); EMERADE[®] 300 MICROGRAMS (APRIL 2020); EMERADE[®] 500 MICROGRAMS (MAY 2020) SOLUTION FOR INJECTION IN PRE-FILLED SYRINGES

The MHRA has advised that all unexpired batches of *Emerade[®]* 150 microgram, 300 microgram, and 500 microgram auto-injector pens are being recalled from patients due to an error in one component of the auto-injector believed to cause the failure of some pens to activate. Healthcare professionals are advised to identify these patients and review their adrenaline prescription. Patients and their carers should immediately be informed that a prescription for a suitable alternative brand of adrenaline auto-injector is required. They should be advised to return their current *Emerade[®]* pen(s) to a pharmacy once they have two pens of an alternative brand in their possession. Returned pens should be quarantined in pharmacies and returned to the supplier using the supplier's approved process. This advice also applies to *Emerade[®]* auto-injector pens that are kept in emergency anaphylaxis kits (e.g. in dental surgeries or schools). For patients who have been prescribed *Emerade[®]* 500 microgram auto-injector pens, the MHRA advises that *EpiPen[®]* or *Jext[®]* 300 microgram (maximum strength) pens will be a suitable replacement, based on results from a bioavailability study. The MHRA has produced a Patient Letter on the *Emerade[®]* recall for each strength of auto-injector which should be provided to patients and their carers. Healthcare professionals are reminded to follow existing advice on the use of adrenaline auto-injectors—see *Prescribing and dispensing information*. For the latest safety alerts, see the MHRA website.

- **CAUTIONS** Arteriosclerosis (in adults) · arrhythmias · cerebrovascular disease · cor pulmonale · diabetes mellitus · elderly · hypercalcaemia · hyperreflexia · hypertension · hyperthyroidism · hypokalaemia · ischaemic heart disease · obstructive cardiomyopathy · occlusive vascular disease · organic brain damage · phaeochromocytoma · prostate disorders · psychoneurosis · severe angina · susceptibility to angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION Cautions listed are only for non-life-threatening situations.

- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor

- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ Rare or very rare Cardiomyopathy

- ▶ **Frequency not known** Angina pectoris · angle closure glaucoma · anxiety · appetite decreased · arrhythmias · asthenia · CNS haemorrhage · confusion · dizziness · dry mouth · dyspnoea · headache · hepatic necrosis · hyperglycaemia · hyperhidrosis · hypersalivation · hypertension (increased risk of cerebral haemorrhage) · hypokalaemia · injection site necrosis · insomnia · intestinal necrosis · metabolic acidosis · mydriasis · myocardial infarction · nausea · pallor · palpitations · peripheral coldness · psychosis · pulmonary oedema (on excessive dosage or extreme sensitivity) · renal necrosis · soft tissue necrosis · tremor · urinary disorders · vomiting
- SPECIFIC SIDE-EFFECTS**
- ▶ With intramuscular use Muscle necrosis · necrotising fasciitis · peripheral ischaemia
- ▶ With intravenous use Hemiplegia · muscle rigidity
- **PREGNANCY** May reduce placental perfusion and cause tachycardia, cardiac irregularities, and extrasystoles in fetus. Can delay second stage of labour. Manufacturers advise use only if benefit outweighs risk.
- **BREAST FEEDING** Present in milk but unlikely to be harmful as poor oral bioavailability.
- **RENAL IMPAIRMENT** Manufacturers advise use with caution in severe impairment.
- **MONITORING REQUIREMENTS** Monitor blood pressure and ECG.
- **DIRECTIONS FOR ADMINISTRATION**
- Acute hypotension
- ▶ With intravenous use in children For *continuous intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9% and give through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. *Neonatal intensive care*, dilute 3 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 100 nanograms/kg/minute; infuse through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. These infusions are usually made up with adrenaline 1 in 1000 (1 mg/mL) solution.
- Cardiopulmonary resuscitation
- ▶ With intravenous use in adults Administration through a central line results in a faster response than peripheral administration, however placement of a central line must not interfere with chest compressions; drugs administered peripherally must be followed by a flush of at least 20 mL Sodium Chloride 0.9% injection to aid entry into the central circulation.
- **PRESCRIBING AND DISPENSING INFORMATION**
- ▶ With intramuscular use It is important, in acute anaphylaxis where intramuscular injection might still succeed, time should not be wasted seeking intravenous access. Great vigilance is needed to ensure that the *correct strength* of adrenaline injection is used; anaphylactic shock kits need to make a *very clear distinction* between the 1 in 10 000 strength and the 1 in 1000 strength. Patients with severe allergy should be instructed in the self-administration of adrenaline by intramuscular injection. Packs for self-administration need to be **clearly labelled with instructions** on how to administer adrenaline (intramuscularly, preferably at the midpoint of the outer thigh, through light clothing if necessary) so that in the case of rapid collapse someone else is able to give it. It is important to ensure individuals at risk and their carers understand that:
 - two injection devices should be carried at all times to treat symptoms until medical assistance is available; if, after the first injection, the individual does not start to feel better, the second injection should be given 5 to 15 minutes after the first;
 - an ambulance should be called after every administration, even if symptoms improve;
- the individual should lie down with their legs raised (unless they have breathing difficulties, in which case they should sit up) and should not be left alone.
- Adrenaline for administration by intramuscular injection is available in 'auto-injectors' (e.g. *Emerade*[®]—product recalled, see *Important Safety Information*, *EpiPen*[®], or *Jext*[®]), pre-assembled syringes fitted with a needle suitable for very rapid administration (if necessary by a bystander or a healthcare provider if it is the only preparation available); injection technique is device specific.
- To ensure patients receive the auto-injector device that they have been trained to use, prescribers should specify the brand to be dispensed. If switching between brands, patients should receive full training in use of the new auto-injector device.
- Licensed doses differ between brands of adrenaline auto-injectors. Adrenaline bioavailability has the potential to be influenced by a number of factors including formulation, propulsive force of the device and needle length—consult product literature for further information.
- **PATIENT AND CARER ADVICE**
- ▶ With intramuscular use Individuals at considerable risk of anaphylaxis need to carry (or have available) adrenaline at all times and the patient, or their carers, need to be *instructed in advance* when and how to inject it.
- ▶ With intramuscular use The MHRA has produced an advice sheet on the use of adrenaline auto-injectors, which should be provided to patients and their carers. Medicines for Children leaflet: Adrenaline auto-injector for anaphylaxis www.medicinesforchildren.org.uk/adrenaline-auto-injector-anaphylaxis-0
- JEXT[®] 300 MICROGRAMS** 1.1 mL of the solution remains in the auto-injector device after use.
- JEXT[®] 150 MICROGRAMS** 1.25 mL of the solution remains in the auto-injector device after use.
- EPIPEN[®] JR AUTO-INJECTOR 0.15MG** 1.7 mL of the solution remains in the auto-injector device after use.
- EMERADE[®] 150 MICROGRAMS** 0.35 mL of the solution remains in the auto-injector device after use.
- EPIPEN[®] AUTO-INJECTOR 0.3MG** 1.7 mL of the solution remains in the auto-injector device after use.
- EMERADE[®] 500 MICROGRAMS** No solution remains in the auto-injector device after use.
- EMERADE[®] 300 MICROGRAMS** 0.2 mL of the solution remains in the auto-injector device after use.
- **EXCEPTIONS TO LEGAL CATEGORY**
- ▶ With intramuscular use POM restriction does not apply to the intramuscular administration of up to 1 mg of adrenaline injection 1 in 1000 (1 mg/mL) for the emergency treatment of anaphylaxis.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

controlled blood pressure currently taking bendroflumethiazide can continue treatment.

Chlortalidone, a thiazide-related compound, has a longer duration of action than the thiazides and may be given on alternate days to control oedema. It is also useful if acute retention is liable to be precipitated by a more rapid diuresis or if patients dislike the altered pattern of micturition caused by other diuretics. Chlortalidone can also be used under close supervision for the treatment of ascites due to cirrhosis in stable patients.

Xipamide p. 245 and indapamide are chemically related to chlortalidone. Indapamide is claimed to lower blood pressure with less metabolic disturbance, particularly less aggravation of diabetes mellitus.

Metolazone p. 245 is particularly effective when combined with a loop diuretic (even in renal failure); profound diuresis can occur and the patient should therefore be monitored carefully.

The thiazide diuretics benzthiazide, clopamide, hydrochlorothiazide, and hydroflumethiazide do not offer any significant advantage over other thiazides and related diuretics.

Loop diuretics

Loop diuretics are used in pulmonary oedema due to left ventricular failure; intravenous administration produces relief of breathlessness and reduces pre-load sooner than would be expected from the time of onset of diuresis. Loop diuretics are also used in patients with chronic heart failure. Diuretic-resistant oedema (except lymphoedema and oedema due to peripheral venous stasis or calcium-channel blockers) can be treated with a loop diuretic combined with a thiazide or related diuretic (e.g. bendroflumethiazide or metolazone).

If necessary, a loop diuretic can be added to antihypertensive treatment to achieve better control of blood pressure in those with resistant hypertension, or in patients with impaired renal function or heart failure.

Loop diuretics can exacerbate diabetes (but hyperglycaemia is less likely than with thiazides) and gout. If there is an enlarged prostate, urinary retention can occur, although this is less likely if small doses and less potent diuretics are used initially.

Furosemide p. 241 and bumetanide p. 240 are similar in activity; both act within 1 hour of oral administration and diuresis is complete within 6 hours so that, if necessary, they can be given twice in one day without interfering with sleep. Following intravenous administration furosemide has a peak effect within 30 minutes. The diuresis associated with these drugs is dose related.

Toraseamide p. 242 has properties similar to those of furosemide and bumetanide, and is indicated for oedema and for hypertension.

Potassium-sparing diuretics and aldosterone antagonists

Amiloride hydrochloride p. 243 and triamterene p. 244 on their own are weak diuretics. They cause retention of potassium and are therefore given with thiazide or loop diuretics as a more effective alternative to potassium supplements. See compound preparations with thiazides or loop diuretics.

Potassium supplements must **not** be given with potassium-sparing diuretics. Administration of a potassium sparing diuretic to a patient receiving an ACE inhibitor or an angiotensin-II receptor antagonist can also cause severe hyperkalaemia.

Aldosterone antagonists

Spironolactone p. 206 potentiates thiazide or loop diuretics by antagonising aldosterone; it is a potassium-sparing diuretic. Spironolactone is of value in the treatment of oedema and ascites caused by cirrhosis of the liver;

9 Oedema

Diuretics

Overview

Thiazides are used to relieve oedema due to chronic heart failure and, in lower doses, to reduce blood pressure.

Loop diuretics are used in pulmonary oedema due to left ventricular failure and in patients with chronic heart failure.

Combination diuretic therapy may be effective in patients with oedema resistant to treatment with one diuretic. Vigorous diuresis, particularly with loop diuretics, may induce acute hypotension; rapid reduction of plasma volume should be avoided.

Thiazides and related diuretics

Thiazides and related compounds are moderately potent diuretics; they inhibit sodium reabsorption at the beginning of the distal convoluted tubule. They act within 1 to 2 hours of oral administration and most have a duration of action of 12 to 24 hours; they are usually administered early in the day so that the diuresis does not interfere with sleep.

In the management of *hypertension* a low dose of a thiazide produces a maximal or near-maximal blood pressure lowering effect, with very little biochemical disturbance.

Higher doses cause more marked changes in plasma potassium, sodium, uric acid, glucose, and lipids, with little advantage in blood pressure control. Chlortalidone p. 244 and indapamide p. 178 are the preferred diuretics in the management of hypertension. Thiazides also have a role in chronic heart failure.

Bendroflumethiazide p. 177 can be used for mild or moderate heart failure; it is licensed for the treatment of hypertension but is no longer considered the first-line diuretic for this indication, although patients with stable and

furosemide can be used as an adjunct. Low doses of spironolactone are beneficial in moderate to severe heart failure and when used in resistant hypertension [unlicensed indication].

Spironolactone is also used in primary hyperaldosteronism (Conn's syndrome). It is given before surgery or if surgery is not appropriate, in the lowest effective dose for maintenance.

Eplerenone p. 205 is licensed for use as an adjunct in left ventricular dysfunction with evidence of heart failure after a myocardial infarction; it is also licensed as an adjunct in chronic mild heart failure with left ventricular systolic dysfunction.

Potassium supplements must **not** be given with aldosterone antagonists

Potassium-sparing diuretics with other diuretics

Although it is preferable to prescribe thiazides and potassium-sparing diuretics separately, the use of fixed combinations may be justified if compliance is a problem. Potassium-sparing diuretics are not usually necessary in the routine treatment of hypertension, unless hypokalaemia develops.

Other diuretics

Mannitol p. 243 is an osmotic diuretic that can be used to treat cerebral oedema and raised intra-ocular pressure.

Mercurial diuretics are effective but are now almost never used because of their nephrotoxicity.

The carbonic anhydrase inhibitor acetazolamide p. 1244 is a weak diuretic and is little used for its diuretic effect. It is used for prophylaxis against mountain sickness [unlicensed indication] but is not a substitute for acclimatisation.

Eye drops of dorzolamide p. 1246 and brinzolamide p. 1245 inhibit the formation of aqueous humour and are used in glaucoma.

Diuretics with potassium

Many patients on diuretics do not need potassium supplements. For many of those who do, the amount of potassium in combined preparations may not be enough, and for this reason their use is to be discouraged.

Diuretics with potassium and potassium-sparing diuretics should **not** usually be given together. Diuretics and potassium supplements should be prescribed separately for children.

Advanced Pharmacy Services

Patients taking diuretics may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 18.

Other drugs used for Oedema Diamorphine hydrochloride, p. 477

DIURETICS > LOOP DIURETICS

Loop diuretics

- **DRUG ACTION** Loop diuretics inhibit reabsorption from the ascending limb of the loop of Henlé in the renal tubule and are powerful diuretics.
- **CONTRA-INDICATIONS** Anuria · comatose and precomatose states associated with liver cirrhosis · renal failure due to nephrotoxic or hepatotoxic drugs · severe hypokalaemia · severe hyponatraemia
- **CAUTIONS** Can exacerbate diabetes (but hyperglycaemia less likely than with thiazides) · can exacerbate gout · hypotension should be corrected before initiation of treatment · hypovolaemia should be corrected before

initiation of treatment · urinary retention can occur in prostatic hyperplasia

CAUTIONS, FURTHER INFORMATION

- ▶ **Elderly** Lower initial doses of diuretics should be used in the elderly because they are particularly susceptible to the side-effects. The dose should then be adjusted according to renal function. Diuretics should not be used continuously on a long-term basis to treat simple gravitational oedema (which will usually respond to increased movement, raising the legs, and support stockings).

Prescription potentially inappropriate (STOPP criteria):

- as a first-line treatment for hypertension (safer, more effective alternatives available)
 - for treatment of hypertension with concurrent urinary incontinence (may exacerbate incontinence)
 - for dependent ankle oedema without evidence of heart failure, liver failure, nephrotic syndrome or renal failure (leg elevation and/or compression hosiery usually more appropriate)
- See also Prescribing in the elderly p. 33.
- ▶ **Potassium loss** Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic. Hypokalaemia is dangerous in severe cardiovascular disease and in patients also being treated with cardiac glycosides. Often the use of potassium-sparing diuretics avoids the need to take potassium supplements. In hepatic failure, hypokalaemia caused by diuretics can precipitate encephalopathy, particularly in alcoholic cirrhosis.
 - ▶ **Urinary retention** If there is an enlarged prostate, urinary retention can occur, although this is less likely if small doses and less potent diuretics are used initially; an adequate urinary output should be established before initiating treatment.

● SIDE-EFFECTS

- ▶ **Common or very common** Dizziness · electrolyte imbalance · fatigue · headache · metabolic alkalosis · muscle spasms · nausea
- ▶ **Uncommon** Diarrhoea
- ▶ **Rare or very rare** Bone marrow depression · photosensitivity reaction
- ▶ **Frequency not known** Deafness (more common in renal impairment) · leucopenia · paraesthesia · rash · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · tinnitus (more common with rapid intravenous administration, and in renal impairment) · vomiting
- **HEPATIC IMPAIRMENT** Hypokalaemia induced by loop diuretics may precipitate hepatic encephalopathy and coma—potassium-sparing diuretics can be used to prevent this. Diuretics can increase the risk of hypomagnesaemia in alcoholic cirrhosis, leading to arrhythmias.
- **RENAL IMPAIRMENT** High doses or rapid intravenous administration can cause tinnitus and deafness. **Dose adjustments** High doses of loop diuretics may occasionally be needed in renal impairment.
- **MONITORING REQUIREMENTS** Monitor electrolytes during treatment.

▶ above

Bumetanide

● INDICATIONS AND DOSE

Oedema

- ▶ **BY MOUTH**
- ▶ **Adult:** 1 mg, dose to be taken in the morning, then 1 mg after 6–8 hours if required

- ▶ Elderly: 500 micrograms daily, this lower dose may be sufficient in elderly patients

Oedema, severe cases

- ▶ BY MOUTH
- ▶ Adult: Initially 5 mg daily, increased in steps of 5 mg every 12–24 hours, adjusted according to response

- **INTERACTIONS** → Appendix 1: loop diuretics
- **SIDE-EFFECTS**
- ▶ **Common or very common** Dehydration · hypotension · skin reactions
- ▶ **Uncommon** Breast pain · chest discomfort · ear pain · vertigo
- ▶ **Rare or very rare** Hearing impairment
- ▶ **Frequency not known** Arthralgia · encephalopathy · gastrointestinal discomfort · gynaecomastia · hyperglycaemia · hyperuricaemia · muscle cramps · musculoskeletal pain (with high doses in renal failure)
- **PREGNANCY** Bumetanide should not be used to treat gestational hypertension because of the maternal hypovolaemia associated with this condition.
- **BREAST FEEDING** No information available. May inhibit lactation.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Oral solution

- ▶ **Bumetanide (Non-proprietary)**
Bumetanide 200 microgram per 1 ml Bumetanide 1mg/5ml oral solution sugar-free | 150 ml [PoM] £198.00 DT = £198.00

Tablet

- ▶ **Bumetanide (Non-proprietary)**
Bumetanide 1 mg Bumetanide 1mg tablets | 28 tablet [PoM] £7.35 DT = £2.45
- Bumetanide 5 mg Bumetanide 5mg tablets | 28 tablet [PoM] £9.81 DT = £9.76

Combinations available: *Amiloride with bumetanide*, p. 244

Co-amifrofruse

02-Jul-2018

● INDICATIONS AND DOSE

Oedema

- ▶ BY MOUTH
- ▶ Adult: 2.5/20–10/80 mg daily, dose to be taken in the morning

DOSE EQUIVALENCE AND CONVERSION

- ▶ A mixture of amiloride hydrochloride and furosemide (frusemide) in the mass proportions of 1 part amiloride hydrochloride to 8 parts furosemide (frusemide).

- **CONTRA-INDICATIONS** Addison's disease · anuria · comatose or precomatose states associated with liver cirrhosis · dehydration · hyperkalaemia · hypovolaemia · renal failure · severe hypokalaemia · severe hyponatraemia
- **CAUTIONS** Correct hypovolaemia before using in oliguria · diabetes mellitus · elderly · gout · hepatorenal syndrome · hypoproteinaemia · hypotension · impaired micturition · prostatic enlargement
- **INTERACTIONS** → Appendix 1: loop diuretics · potassium-sparing diuretics
- **PREGNANCY** Not used to treat hypertension in pregnancy.
- **BREAST FEEDING** Manufacturers advise avoid—no information regarding amiloride component available. Amount of furosemide in milk too small to be harmful. Furosemide may inhibit lactation.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in hepatic cirrhosis with renal impairment.

- **RENAL IMPAIRMENT** Risk of hyperkalaemia in renal impairment but may need higher doses. Avoid if eGFR less than 30 mL/minute/1.73 m².
- Monitoring** Monitor plasma-potassium concentration.
- **MONITORING REQUIREMENTS** Monitor electrolytes.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

▶ Co-amifrofruse (Non-proprietary)

Amiloride hydrochloride 2.5 mg, Furosemide 20 mg Co-amifrofruse 2.5mg/20mg tablets | 28 tablet [PoM] £12.86 DT = £8.58 | 56 tablet [PoM] £17.16–£25.72

Amiloride hydrochloride 5 mg, Furosemide 40 mg Co-amifrofruse 5mg/40mg tablets | 28 tablet [PoM] £7.94 DT = £5.29 | 56 tablet [PoM] £10.58–£15.88

Amiloride hydrochloride 10 mg, Furosemide 80 mg Co-amifrofruse 10mg/80mg tablets | 28 tablet [PoM] £23.38 DT = £15.52

F 240

10-Mar-2020

Furosemide

(Frusemide)

● INDICATIONS AND DOSE

Oedema

- ▶ BY MOUTH
- ▶ Adult: Initially 40 mg daily, dose to be taken in the morning, then maintenance 20–40 mg daily
- ▶ INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 20–50 mg, then (by intramuscular injection or by intravenous injection or by intravenous infusion) increased in steps of 20 mg every 2 hours if required, doses greater than 50 mg given by intravenous infusion only; maximum 1.5 g per day

Resistant oedema

- ▶ BY MOUTH
- ▶ Adult: 80–120 mg daily
- ▶ INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 20–50 mg, then (by intramuscular injection or by intravenous injection or by intravenous infusion) increased in steps of 20 mg every 2 hours if required, doses greater than 50 mg given by intravenous infusion only; maximum 1.5 g per day

Resistant hypertension

- ▶ BY MOUTH
- ▶ Adult: 40–80 mg daily
- ▶ INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 20–50 mg, then (by intramuscular injection or by intravenous injection or by intravenous infusion) increased in steps of 20 mg every 2 hours if required, doses greater than 50 mg given by intravenous infusion only; maximum 1.5 g per day

- **CAUTIONS** Hepatorenal syndrome · hypoproteinaemia may reduce diuretic effect and increase risk of side-effects
- **INTERACTIONS** → Appendix 1: loop diuretics

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Agranulocytosis · aplastic anaemia · auditory disorder (more common with rapid intravenous administration, and in renal impairment) · diabetes mellitus · eosinophilia · fever · gout · haemolytic anaemia · hepatic encephalopathy · malaise · mucosal reaction · nephritis tubulointerstitial ·

pancreatitis acute · shock · skin eruption · tetany · vasculitis

SPECIFIC SIDE-EFFECTS

- ▶ With oral use Acute kidney injury · hepatic disorders · metabolic acidosis · psychiatric disorder · urinary disorders
- ▶ With parenteral use Acute urinary retention · cholestasis
- **PREGNANCY** Furosemide should not be used to treat gestational hypertension because of the maternal hypovolaemia associated with this condition.
- **BREAST FEEDING** Amount too small to be harmful. May inhibit lactation.
- **DIRECTIONS FOR ADMINISTRATION** Intravenous administration rate should not usually exceed 4 mg/minute however single doses of up to 80 mg may be administered more rapidly; a lower rate of infusion may be necessary in renal impairment. For *intravenous infusion (Lasix®)*, give continuously in Sodium chloride 0.9%; infusion pH must be above 5.5; glucose solutions are unsuitable.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- ▶ **Xipamide 20 mg** Diurexan 20mg tablets | 140 tablet (Pom) £19.46 DT = £19.46

10 Vascular disease

Peripheral vascular disease

Classification and management

Peripheral vascular disease can be either occlusive (e.g. *intermittent claudication*) in which occlusion of the peripheral arteries is caused by atherosclerosis, or vasospastic (e.g. *Raynaud's syndrome*). Peripheral arterial occlusive disease is associated with an increased risk of cardiovascular events; this risk is reduced by measures such as Smoking cessation p. 520, effective control of blood pressure, regulating blood lipids, optimising glycaemic control in diabetes, taking aspirin p. 130 in a dose of 75 mg daily, and possibly weight reduction in obesity. Exercise training can improve symptoms of intermittent claudication; revascularisation procedures may be appropriate.

Naftidrofuryl oxalate p. 247 can alleviate symptoms of intermittent claudication and improve pain-free walking distance in moderate disease. Patients taking naftidrofuryl oxalate should be assessed for improvement after 3–6 months.

Cilostazol below is licensed for use in intermittent claudication to improve walking distance in patients without peripheral tissue necrosis who do not have pain at rest; use is restricted to second-line treatment where lifestyle modifications and other appropriate interventions have failed to improve symptoms. Cilostazol should be initiated by those experienced in the management of intermittent claudication. Patients receiving cilostazol should be assessed for improvement after 3 months; consider discontinuation of treatment if there is no clinically relevant improvement in walking distance.

Inositol nicotinate p. 247 and pentoxifylline p. 248 are not established as being effective for the treatment of intermittent claudication.

Intravenous iloprost p. 197 is a treatment option for critical limb ischaemia in patients unsuitable for surgery.

Management of *Raynaud's syndrome* includes avoidance of exposure to cold and Smoking cessation p. 520. More severe symptoms may require vasodilator treatment, which is most often successful in primary Raynaud's syndrome. Nifedipine p. 174 is useful for reducing the frequency and severity of vasospastic attacks. Alternatively, naftidrofuryl oxalate may produce symptomatic improvement; inositol nicotinate (a nicotinic acid derivative) may also be considered. Pentoxifylline, prazosin p. 827, and moxislyte p. 247 are not established as being effective for the treatment of Raynaud's syndrome.

Vasodilator therapy is not established as being effective for *chilblains*.

Advanced Pharmacy Services

Patients with peripheral vascular disease may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 18.

ANTITHROMBOTIC DRUGS > ANTIPLATELET DRUGS

Cilostazol

13-Nov-2019

- **INDICATIONS AND DOSE**

Intermittent claudication in patients without rest pain and no peripheral tissue necrosis

▶ BY MOUTH

▶ **Adult:** 100 mg twice daily, to be taken 30 minutes before food, cilostazol should be initiated by those experienced in the management of intermittent claudication, patients receiving cilostazol should be assessed for improvement after 3 months; consider discontinuation of treatment if there is no clinically relevant improvement in walking distance

DOSE ADJUSTMENTS DUE TO INTERACTIONS

▶ Manufacturer advises reduce dose to 50 mg twice daily with concurrent use of potent inhibitors of CYP3A4, potent inhibitors of CYP2C19, omeprazole and erythromycin.

- **CONTRA-INDICATIONS** Active peptic ulcer · congestive heart failure · coronary intervention in previous 6 months · haemorrhagic stroke in previous 6 months · history of severe tachyarrhythmia · myocardial infarction in previous 6 months · poorly controlled hypertension · predisposition to bleeding · proliferative diabetic retinopathy · prolongation of QT interval · unstable angina · ventricular arrhythmia

- **CAUTIONS** Atrial fibrillation · atrial flutter · atrial or ventricular ectopy · diabetes mellitus (higher risk of intraocular bleeding) · stable coronary disease · surgery

- **INTERACTIONS** → Appendix 1: cilostazol

- **SIDE-EFFECTS**

- ▶ **Common or very common** Appetite decreased · arrhythmias · diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders · headache · increased risk of infection · nausea · oedema · palpitations · skin reactions · vomiting

- ▶ **Uncommon** Anaemia · anxiety · congestive heart failure · cough · dyspnoea · haemorrhage · hyperglycaemia · hypotension · sleep disorders · syncope

- ▶ **Rare or very rare** Renal impairment · thrombocytosis

- ▶ **Frequency not known** Agranulocytosis · bone marrow disorders · conjunctivitis · fever · granulocytopenia · hepatic disorders · hot flush · hypertension · intracranial haemorrhage · leucopenia · paresis · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · tinnitus · urinary frequency increased

- **PREGNANCY** Avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate-to-severe impairment—no information available.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 25 mL/minute/1.73 m².

- **PATIENT AND CARER ADVICE**

Blood disorders Patients should be advised to report any unexplained bleeding, bruising, sore throat, or fever.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ Cilostazol, naftidrofuryl oxalate, pentoxifylline and inositol nicotinate for the treatment of intermittent claudication in people with peripheral arterial disease (May 2011) NICE TA223 Cilostazol is **not** recommended for the treatment of intermittent claudication in patients with peripheral arterial disease; patients currently receiving this treatment

should have the option to continue until they and their clinician consider it appropriate to stop.

Respiratory system, drug delivery

13-Nov-2019

Inhalation

This route delivers the drug directly to the airways; the dose required is smaller than when given by mouth and side-effects are reduced.

Inhaler devices

These include *pressurised metered-dose inhalers*, *breath-actuated inhalers*, and *dry powder inhalers*. Many patients can be taught to use a pressurised metered-dose inhaler effectively but some patients, particularly the elderly and children, find them difficult to use. *Spacer devices* can help such patients because they remove the need to co-ordinate actuation with inhalation. Dry powder inhalers may be useful in adults and children over 5 years who are unwilling or unable to use a pressurised metered-dose inhaler. Alternatively, breath-actuated inhalers are suitable for adults and older children provided they can use the device effectively.

EVGr In adults with stable asthma, a pressurised metered-dose inhaler with or without a spacer is as effective as any other hand-held inhaler; a dry-powder inhaler may still be preferred. A spacer should always be used if the patient is on a high dose of inhaled corticosteroid.

In adults with mild or moderate acute asthma attacks, a pressurised metered-dose inhaler with a spacer is at least as effective as nebulisation. **⚠**

On changing from a pressurised metered-dose inhaler to a dry powder inhaler, patients may notice a lack of sensation in the mouth and throat previously associated with each actuation. Coughing may also occur.

EVGr The patient should be instructed carefully on the use of the inhaler. It is important to check that the inhaler continues to be used correctly because inadequate inhalation technique may be mistaken for a lack of response to the drug. The number and different types of inhalers given to a patient should be minimised. To help reduce confusion and ensure patients receive inhalers they have been given training for, specify brand and inhaler when prescribing. **⚠**

For more information on delivery systems used in the management of COPD, see Chronic obstructive pulmonary disease p. 256.

MHRA/CHM advice: Pressurised metered dose inhalers (pMDI): risk of airway obstruction from aspiration of loose objects (July 2018) The MHRA have received reports of patients who have inhaled objects into the back of the throat—in some cases objects were aspirated, causing airway obstruction. Patients should be reminded to remove the mouthpiece cover fully, shake the device and check that both the outside and inside of the mouthpiece are clear and undamaged before inhaling

a dose, and to store the inhaler with the mouthpiece cover on.

Spacer devices

Spacer devices remove the need for coordination between actuation of a pressurised metered-dose inhaler and inhalation. The spacer device reduces the velocity of the aerosol and subsequent impact on the oropharynx and allows more time for evaporation of the propellant so that a larger proportion of the particles can be inhaled and deposited in the lungs. Spacer devices are particularly useful for patients with poor inhalation technique, for children, for patients requiring high doses of inhaled corticosteroids, for nocturnal asthma, and for patients prone to candidiasis with inhaled corticosteroids. It is important to prescribe a spacer device that is compatible with the metered-dose inhaler, see devices below. Spacer devices should not be regarded as interchangeable; patients should be advised not to switch between spacer devices.

Use and care of spacer devices

Patients should inhale from the spacer device as soon as possible after actuation because the drug aerosol is very short-lived; single-dose actuation is recommended. Tidal breathing is as effective as single breaths. The device should be cleaned once a month by washing in mild detergent and then allowed to dry in air without rinsing; the mouthpiece should be wiped clean of detergent before use. Some manufacturers recommend more frequent cleaning, but this should be avoided since any electrostatic charge may affect drug delivery. Spacer devices should be replaced every 6–12 months.

Respiratory drug delivery, nebulisers

Solutions for nebulisation used in severe or life-threatening asthma attacks are administered over 5–10 minutes from a nebuliser, usually driven by oxygen.

EVGr Patients with a severe attack of asthma should preferably have oxygen during nebulisation since beta₂ agonists can increase arterial hypoxaemia. However, the absence of supplemental oxygen should not delay treatment. **⚠**

A nebuliser converts a solution of a drug into an aerosol for inhalation. It is used to deliver higher doses of drug to the airways than is usual with standard inhalers. The main indications for use of a nebuliser are to deliver:

- a beta₂ agonist or ipratropium bromide p. 261 to a patient with an *acute exacerbation* of asthma or of chronic obstructive pulmonary disease;
- a beta₂ agonist, corticosteroid, or ipratropium bromide on a *regular basis* to a patient with severe asthma or reversible airways obstruction when the patient is unable to use other inhalational devices;
- an antibiotic (such as colistimethate sodium p. 588) or a mucolytic to a patient with cystic fibrosis;

- Budesonide p. 273 or adrenaline/epinephrine p. 236 to a child with severe croup;
- Pentamidine isetionate p. 637 for the prophylaxis and treatment of pneumocystis pneumonia.

Before prescribing a nebuliser, a home trial should preferably be undertaken to monitor response for up to 2 weeks on standard treatment and up to 2 weeks on nebulised treatment. If prescribed, patients must:

- have clear instructions from a doctor, specialist nurse, physiotherapist, or pharmacist on the use of the nebuliser (including maintenance and cleaning) and on peak-flow monitoring;
- be instructed not to treat acute attacks at home without also seeking help;
- have regular follow up by a doctor, specialist nurse or physiotherapist after about 1 month and annually thereafter.

The proportion of a nebuliser solution that reaches the lungs depends on the type of nebuliser and although it can be as high as 30%, it is more frequently close to 10% and sometimes below 10%. The remaining solution is left in the nebuliser as residual volume or is deposited in the mouthpiece and tubing. The extent to which the nebulised solution is deposited in the airways or alveoli depends on the droplet size, pattern of breath inhalation, and condition of the lung. Droplets with a mass median diameter of 1–5 microns are deposited in the airways and are therefore appropriate for asthma, whereas a particle size of 1–2 microns is needed for alveolar deposition of pentamidine isetionate p. 637 to combat pneumocystis infection. The type of nebuliser is therefore chosen according to the deposition required and according to the viscosity of the solution.

Jet nebulisers

Jet nebulisers are more widely used than ultrasonic nebulisers. Most jet nebulisers require an optimum gas flow rate of 6–8 litres/minute and in hospital can be driven by piped air or oxygen; in acute asthma the nebuliser should be driven by oxygen. Domiciliary oxygen cylinders do not provide an adequate flow rate therefore an electrical compressor is required for domiciliary use.

For patients at risk of hypercapnia, such as those with chronic obstructive pulmonary disease, oxygen can be dangerous and the nebuliser should be driven by air. If oxygen is required, it should be given simultaneously by nasal cannula.

Tubing

The Department of Health has reminded users of the need to use the correct grade of tubing when connecting a nebuliser to a medical gas supply or compressor.

Ultrasonic nebulisers

Ultrasonic nebulisers produce an aerosol by ultrasonic vibration of the drug solution and therefore do not require a gas flow; they are not suitable for the nebulisation of some drugs, such as domase alfa p. 308 and nebulised suspensions.

Nebuliser diluent

Nebulisation may be carried out using an undiluted nebuliser solution or it may require dilution beforehand. The usual diluent is sterile sodium chloride 0.9% (physiological saline).

In England and Wales nebulisers and compressors are not available on the NHS (but they are free of VAT); some nebulisers (but not compressors) are available on form GP10A in Scotland (for details consult Scottish Drug Tariff).

Oral

The oral route is used when administration by inhalation is not possible. Systemic side-effects occur more frequently when a drug is given orally rather than by inhalation. Drugs given by mouth for the treatment of asthma include

corticosteroids, theophylline p. 288, and leukotriene receptor antagonists.

Parenteral

EvGr Drugs such as beta₂ agonists, corticosteroids, and aminophylline p. 287 can be given by injection in severe acute and life-threatening asthma when administration by nebulisation is inadequate or inappropriate. If the patient is being treated in the community, urgent transfer to hospital should be arranged. **A**

Peak flow meters

When used in addition to symptom-based monitoring, peak flow monitoring has not been proven to improve asthma control in either adults or children, however measurement of peak flow may be of benefit in adult patients who are 'poor perceivers' and hence slow to detect deterioration in their asthma, and for those with more severe asthma.

When peak flow meters are used, patients must be given clear guidelines as to the action they should take if their peak flow falls below a certain level. Patients can be encouraged to adjust some of their own treatment (within specified limits) according to changes in peak flow rate.

Peak flow charts should be issued to patients where appropriate, and are available to purchase from:

3M Security Print and Systems Limited, Gorse Street, Chadderton, Oldham, OL9 9QH. Tel: 0845 610 1112

GP practices can obtain supplies through their Area Team stores.

NHS Hospitals can order supplies from www.nhsforms.co.uk/ or by emailing nhsforms@mmm.com.

In Scotland, peak flow charts can be obtained by emailing stockorders.dppas@apsgroup.co.uk.

NICE decisions

Inhaler devices for children under 5 years with chronic asthma (August 2000) NICE TA10

When selecting inhaler devices for children under 5 years with chronic asthma, a child's needs and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

- corticosteroid and bronchodilator therapy should be delivered by pressurised metered-dose inhaler and spacer device, with a facemask if necessary;
- if this is not effective, and depending on the child's condition, nebulised therapy may be considered and, in children over 3 years, a dry powder inhaler may also be considered.

www.nice.org.uk/TA10

Inhaler devices for children 5–15 years with chronic asthma (March 2002) NICE TA38

When selecting inhaler devices for children between 5–15 years with chronic asthma, a child's needs, ability to develop and maintain effective technique, and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

- corticosteroid therapy should be routinely delivered by a pressurised metered-dose inhaler and spacer device;
- for other inhaled drugs, particularly bronchodilators, choice should be made from a wider range of devices after careful consideration;
- children and their carers should be trained in the use of the chosen device; suitability of the device should be reviewed at least annually. Inhaler technique and compliance should be monitored.

www.nice.org.uk/TA38

1 Airways disease, obstructive

Asthma, chronic

06-May-2020

Description of condition

Asthma is a common chronic inflammatory condition of the airways, associated with airway hyperresponsiveness and variable airflow obstruction. The most frequent symptoms of asthma are cough, wheeze, chest tightness, and breathlessness. Asthma symptoms vary over time and in intensity and can gradually or suddenly worsen, provoking an acute asthma attack that, if severe, may require hospitalisation.

Asthma-COPD overlap syndrome (ACOS) is characterised by persistent airflow limitation displaying features of both asthma and COPD.

Aims of treatment

The aim of treatment is to achieve control of asthma. Complete control of asthma is defined as no daytime symptoms, no night-time awakening due to asthma, no asthma attacks, no need for rescue medication, no limitations on activity including exercise, normal lung function (in practical terms forced expiratory volume in 1 second (FEV₁) and/or peak expiratory flow (PEF) > 80% predicted or best), and minimal side-effects from treatment. In clinical practice, patients may choose to balance the aims of asthma management against the potential side-effects or inconvenience of taking medication necessary to achieve perfect control.

Lifestyle changes

EvGr Weight loss in overweight patients may lead to an improvement in asthma symptoms. Patients with asthma and parents of children with asthma should be advised about the dangers of smoking, to themselves and to their children, and be offered appropriate support to stop smoking. **▲** For further information, see Smoking cessation p. 520.

EvGr Breathing exercise programmes (including physiotherapist-taught methods and audiovisual programmes), can be offered to adults as an adjuvant to drug treatment to improve quality of life and reduce symptoms. **▲**

Management

EvGr A stepwise approach aims to stop symptoms quickly and to improve peak flow. Treatment should be started at the level most appropriate to initial severity of asthma. The aim is to achieve early control and to maintain it by stepping up treatment as necessary and decreasing treatment when control is good. Before initiating a new drug or adjusting treatment, consider whether the diagnosis is correct, check adherence and inhaler technique, and eliminate trigger factors for acute attacks.

A self-management programme comprising of a written personalised action plan and education should be offered to all patients with asthma (and/or their family or carers), and should be supported with regular review by a healthcare professional. **▲**

For information on devices used in the management of asthma, see Respiratory system, drug delivery p. 249.

Recommendations on the management of chronic asthma from the *National Institute for Health and Care Excellence (NICE)—Asthma: diagnosis, monitoring and chronic asthma management guidelines (NG80, November 2017)*, and *British Thoracic Society (BTS) and Scottish Intercollegiate Guidelines Network (SIGN)—British guideline on the management of asthma (SIGN 158, July 2019)* differ significantly.

Recommendations in BNF publications are based on NICE guidelines, and differences with BTS/SIGN (2019) have been highlighted.

For information on the management of patients during the COVID-19 pandemic, see COVID-19 p. 656.

Adult

NICE (2017) treatment recommendations for adults apply to patients aged 17 years and over. BTS/SIGN (2019) treatment recommendations for adults apply to patients aged over 12 years.

Intermittent reliever therapy

EvGr Start an inhaled short-acting beta₂ agonist (such as salbutamol p. 267 or terbutaline sulfate p. 269), to be used as required in all patients with asthma. For those with infrequent short-lived wheeze, occasional use of reliever therapy may be the only treatment required. Patients using more than one short-acting beta₂ agonist inhaler device a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma. **▲**

Regular preventer (maintenance) therapy

NICE (2017) define inhaled corticosteroid (ICS) doses for adults as low, moderate, or high. BTS/SIGN (2019) instead define ICS doses for adults as low, medium or high (refer to individual guidelines for ICS dosing information).

EvGr A low-dose of ICS should be started as maintenance therapy in patients who present with any one of the following features: using an inhaled short-acting beta₂ agonist three times a week or more, symptomatic three times a week or more, or waking at night due to asthma symptoms at least once a week. BTS/SIGN (2019) also recommend initiation in patients who have had an asthma attack in the last 2 years, and starting an ICS at a dose appropriate to the severity of asthma.

BTS/SIGN (2019) recommend that inhaled corticosteroids (except ciclesonide p. 276) should initially be taken twice daily, however the same total daily dose taken once a day, can be considered in patients with milder disease if good or complete control of asthma is established. The dose of ICS should be adjusted over time to the lowest effective dose at which control of asthma is maintained.

BTS/SIGN (2019) recommend the prescribing of inhalers by brand. **▲**

Initial add-on therapy

EvGr If asthma is uncontrolled on a low-dose of ICS as maintenance therapy, a leukotriene receptor antagonist (LTRA—such as montelukast p. 284) should be offered in addition to the ICS, and the response to treatment reviewed in 4 to 8 weeks.

BTS/SIGN (2019) instead recommend a long-acting beta₂ agonist (LABA—such as salmeterol p. 266 or formoterol fumarate p. 264) as initial add-on therapy to low-dose ICS if asthma is uncontrolled. This can be given as either a fixed-dose ICS and LABA regimen, or a MART regimen (Maintenance And Reliever Therapy—a combination of an ICS and a fast-acting LABA such as formoterol in a single inhaler, see beclometasone with formoterol p. 272 and budesonide with formoterol p. 274). Combination inhalers containing both a LABA and an ICS are recommended to improve adherence, and ensure that the LABA is not taken alone without the ICS.

BTS/SIGN (2019) also recommend that a MART regimen should be considered in patients with a history of asthma attacks on a medium-dose ICS alone, or on a fixed-dose ICS and LABA regimen. **▲**

Additional controller therapies

EvGr If asthma is uncontrolled on a low-dose of ICS and a LTRA as maintenance therapy, a LABA in combination with the ICS should be offered with or without continued LTRA treatment, depending on the response achieved from the LTRA.

If asthma remains uncontrolled, offer to change the ICS and LABA maintenance therapy to a MART regimen, with a low-dose of ICS as maintenance. See beclometasone with formoterol p. 272 and budesonide with formoterol p. 274.

If asthma remains uncontrolled on a MART regimen with a low-dose of ICS as maintenance with or without a LTRA, consider increasing to a moderate-dose of ICS (either continuing a MART regimen, or changing to a fixed-dose regimen of an ICS and a LABA with a short-acting beta₂ agonist as reliever therapy).

If asthma is still uncontrolled in patients on a moderate-dose of ICS as maintenance with a LABA (either as a MART or a fixed-dose regimen), with or without a LTRA, consider the following options:

- Increasing the ICS dose to a high-dose as maintenance (this should only be offered as part of a fixed-dose regimen with a short-acting beta₂ agonist used as reliever therapy), or
- A trial of an additional drug, for example, a long-acting muscarinic receptor antagonist (such as tiotropium p. 262) or modified-release theophylline p. 288, or
- Seeking advice from an asthma specialist.

BTS/SIGN (2019) instead recommend that if the patient is gaining some benefit from addition of a LABA but control remains inadequate, the LABA should be continued and either the dose of ICS be increased to a medium-dose (if not already on this dose), or a LTRA be added.

If there is no response to the LABA, consider discontinuing it and either increasing the dose of the ICS to a medium-dose (if not already on this dose), or adding in a LTRA.

BTS/SIGN (2019) recommend that all patients whose asthma is not adequately controlled on recommended initial add-on therapy or additional controller therapies, should be referred for specialist asthma care. [▲](#)

High-dose ICS and further add-on treatment (specialist therapies)

[EvGr](#) Under specialist care, BTS/SIGN (2019) recommend that if asthma control remains inadequate on a medium-dose of ICS, plus a LABA or LTRA, the following interventions can be considered:

- Increasing the ICS to a high-dose—with high doses of ICS via a pressurised metered dose inhaler (pMDI) a spacer should be used, or
- Adding a LTRA (if not already tried), or modified-release theophylline p. 288, or tiotropium p. 262.

If a trial of a further add-on treatment is ineffective, stop the drug (or in the case of increased dose of ICS, reduce to the original dose). [▲](#)

Continuous or frequent use of oral corticosteroids (specialist therapies)

[EvGr](#) Under specialist care, BTS/SIGN (2019) recommend adding a regular oral corticosteroid (prednisolone p. 716) at the lowest dose to provide adequate control in patients with very severe asthma uncontrolled on a high-dose ICS, and who have also tried (or are still receiving) a LABA, LTRA, tiotropium p. 262, or modified-release theophylline p. 288. [▲](#)

For information on the general use and side effects of corticosteroids, see Corticosteroids, general use p. 707. For information on the cessation of oral corticosteroid treatment, see *Treatment cessation* for systemic corticosteroids (such as prednisolone).

Monoclonal antibodies and immunosuppressants (specialist therapies)

[EvGr](#) Under specialist initiation, BTS/SIGN (2019) recommend that monoclonal antibodies such as omalizumab p. 282 (for severe persistent allergic asthma), mepolizumab p. 281, benralizumab p. 281 and reslizumab p. 283 (in adults for severe eosinophilic asthma), and immunosuppressants such as methotrexate p. 963 [unlicensed], may be considered in patients with severe asthma to achieve control and reduce the use of oral corticosteroids. [▲](#) See *National*

funding/access decisions for omalizumab p. 282, mepolizumab p. 281, reslizumab p. 283, and benralizumab.

Child aged over 5 years

For children aged over 5 years, NICE (2017) treatment recommendations for children apply to children aged 5–16 years, and adult treatment recommendations apply to those aged 17 years and over. Whereas, for children aged over 5 years, BTS/SIGN (2019) treatment recommendations for children apply to children aged 5–12 years, and adult treatment recommendations apply to those aged over 12 years.

Intermittent reliever therapy

[EvGr](#) Start an inhaled short-acting beta₂ agonist (such as salbutamol p. 267 or terbutaline sulfate p. 269), to be used as required in all children with asthma. For those with infrequent short-lived wheeze, occasional use of reliever therapy may be the only treatment required. Children using more than one short-acting beta₂ agonist inhaler device a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma. [▲](#)

Regular preventer (maintenance) therapy

NICE (2017) define inhaled corticosteroid (ICS) doses for children (aged 5–16 years) as paediatric low, moderate, or high. BTS/SIGN (2019) instead define ICS doses for children (aged 5–12 years) as very low, low, or medium, and for children aged over 12 years as low, medium or high (refer to individual guidelines for ICS dosing information).

[EvGr](#) A paediatric low-dose of ICS should be started as maintenance therapy in children who present with any one of the following features: using an inhaled short-acting beta₂ agonist three times a week or more, symptomatic three times a week or more, or waking at night due to asthma symptoms at least once a week.

BTS/SIGN (2019) instead recommend starting a very low-dose (child aged 5–12 years) or a low-dose (child aged over 12 years) of ICS in children presenting with any one of the following features: using an inhaled short-acting beta₂ agonist three times a week or more, symptomatic three times a week or more, waking at night due to asthma symptoms at least once a week, or have had an asthma attack in the last 2 years, and starting an ICS at a dose appropriate to the severity of asthma.

BTS/SIGN (2019) recommend that inhaled corticosteroids (except ciclesonide p. 276) should initially be taken twice daily, however the same total daily dose taken once a day, can be considered in patients with milder disease if good or complete control of asthma is established. The dose of ICS should be adjusted over time to the lowest effective dose at which control of asthma is maintained.

BTS/SIGN (2019) recommend the prescribing of inhalers by brand. [▲](#)

Initial add-on therapy

[EvGr](#) If asthma is uncontrolled on a paediatric low-dose of ICS as maintenance therapy, consider a leukotriene receptor antagonist (LTRA—such as montelukast p. 284) in addition to the ICS, and review the response to treatment in 4 to 8 weeks.

BTS/SIGN (2019) instead recommend a long-acting beta₂ agonist (LABA—such as salmeterol p. 266 or formoterol fumarate p. 264) as initial add-on therapy to low-dose ICS if asthma is uncontrolled in children aged over 12 years. This can be given as either a fixed-dose ICS and LABA regimen, or a MART regimen (Maintenance And Reliever Therapy—a combination of an ICS and a fast-acting LABA such as formoterol in a single inhaler, see budesonide with formoterol p. 274). Combination inhalers containing both a LABA and an ICS are recommended to improve adherence, and ensure that the LABA is not taken alone without the ICS.

BTS/SIGN (2019) also recommend that a MART regimen should be considered in children aged over 12 years with a

history of asthma attacks on a medium-dose ICS alone, or on a fixed-dose ICS and LABA regimen.

In children aged 5–12 years, BTS/SIGN (2019) recommend the addition of either a LABA or a LTRA, as initial add-on therapy to very low-dose ICS if asthma is uncontrolled. [A](#)

Additional controller therapies

[Evgri](#) If asthma is uncontrolled on a paediatric low-dose of ICS and a LTRA as maintenance therapy, consider discontinuation of the LTRA and initiation of a LABA in combination with the ICS.

If asthma remains uncontrolled on a paediatric low-dose of ICS and a LABA as maintenance therapy, consider changing to a MART regimen (Maintenance And Reliever Therapy—a combination of an ICS and fast-acting LABA such as formoterol in a single inhaler) with a paediatric low-dose of ICS as maintenance. See budesonide with formoterol p. 274 [not licensed in all age groups].

If asthma remains uncontrolled on a MART regimen with a paediatric low-dose of ICS as maintenance, consider increasing to a paediatric moderate-dose of ICS (either continuing a MART regimen, or changing to a fixed-dose regimen of an ICS and a LABA with a short-acting beta₂ agonist as reliever therapy).

If asthma is still uncontrolled on a paediatric moderate-dose of ICS as maintenance with a LABA (either as a MART or a fixed-dose regimen), consider seeking advice from an asthma specialist and the following options:

- Increasing the ICS dose to a paediatric high-dose as maintenance (this should only be offered as part of a fixed-dose regimen with a short-acting beta₂ agonist as reliever therapy), or
- A trial of an additional drug, such as modified-release theophylline p. 288.

BTS/SIGN (2019) instead recommend that in children aged 5–12 years who are gaining some benefit from the addition of a LABA or a LTRA but control remains inadequate, continue the LABA or LTRA and *either* increase the dose of the ICS to a low-dose (if not already on this dose), or add a LTRA or LABA (whichever is not being used).

In children aged over 12 years, BTS/SIGN (2019) recommend continuing the LABA and *either* increasing the ICS dose to a medium-dose (if not already on this dose), or adding a LTRA.

If there is no response to the LABA, consider discontinuing it and *either* increasing the dose of ICS to a low-dose (child aged 5–12 years) or medium-dose (child aged over 12 years) if not already on this dose, or adding a LTRA.

BTS/SIGN (2019) recommend that all patients whose asthma is not adequately controlled on recommended initial add-on therapy or additional controller therapies, should be referred for specialist asthma care. [A](#)

High-dose ICS and further add-on treatment (specialist therapies)

[Evgri](#) Under specialist care, BTS/SIGN (2019) recommend that if control remains inadequate on a low-dose (child aged 5–12 years) or medium-dose (child aged over 12 years) of ICS, plus a LABA or LTRA, the following interventions should be considered:

- Increasing the ICS to a medium-dose (child aged 5–12 years) or high-dose (child aged over 12 years)—with ICS via a pressurised metered dose inhaler (pMDI) a spacer should be used, or
- Adding a LTRA (if not already tried), or modified-release theophylline p. 288, or tiotropium p. 262 (in children over 12 years).

If a trial of a further add-on treatment is ineffective, stop the drug (or in the case of increased dose of ICS, reduce to the original dose). [A](#)

Continuous or frequent use of oral corticosteroids (specialist therapies)

[Evgri](#) Under specialist care, BTS/SIGN (2019) recommend adding a regular oral corticosteroid (prednisolone p. 716) at

the lowest dose to provide adequate control in children with very severe asthma uncontrolled on a high-dose ICS, and who have also tried (or are still receiving) a LABA, LTRA, tiotropium p. 262 (child over 12 years), or modified-release theophylline p. 288. [A](#)

For information on the general use and side effects of corticosteroids, see Corticosteroids, general use p. 707. For information on the cessation of oral corticosteroid treatment, see *Treatment cessation* for systemic corticosteroids (such as prednisolone).

Monoclonal antibodies and immunosuppressants (specialist therapies)

[Evgri](#) Under specialist initiation, BTS/SIGN (2019) recommend that monoclonal antibodies such as omalizumab p. 282 (child over 6 years for severe persistent allergic asthma), and immunosuppressants such as methotrexate p. 963 [unlicensed] can be considered in children with severe asthma to achieve control and reduce the use of oral corticosteroids. [A](#) See *National funding/access decisions* for omalizumab p. 282.

Child aged under 5 years

Intermittent reliever therapy

[Evgri](#) A short-acting beta₂ agonist (such as salbutamol p. 267) as reliever therapy should be offered to children aged under 5 years with suspected asthma. A short-acting beta₂ agonist should be used for symptom relief alongside maintenance treatment.

Children using more than one short-acting beta₂ agonist inhaler device a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma. [A](#)

Regular preventer (maintenance) therapy

NICE (2017) define inhaled corticosteroid (ICS) doses for children aged under 5 years as paediatric low or moderate. BTS/SIGN (2019) instead define ICS doses for children aged under 5 years as very low (refer to individual guidelines for ICS dosing information).

[Evgri](#) Consider an 8-week trial of a paediatric moderate-dose of ICS in children presenting with any of the following features: asthma-related symptoms three times a week or more, experiencing night-time awakening at least once a week, or suspected asthma that is uncontrolled with a short-acting beta₂ agonist alone.

After 8 weeks, stop ICS treatment and continue to monitor the child's symptoms:

- If symptoms did not resolve during the trial period, review whether an alternative diagnosis is likely;
- If symptoms resolved then reoccurred within 4 weeks of stopping ICS treatment, restart the ICS at a paediatric low-dose as first-line maintenance therapy;
- If symptoms resolved but reoccurred beyond 4 weeks after stopping ICS treatment, repeat the 8-week trial of a paediatric moderate-dose of ICS.

BTS/SIGN (2019) instead recommend starting a very low-dose of ICS as initial regular preventer therapy in children presenting with any one of the following features: using an inhaled short-acting beta₂ agonist three times a week or more, symptomatic three times a week or more, or waking at night due to asthma symptoms at least once a week. In children unable to take an ICS, a leukotriene receptor antagonist (LTRA— such as montelukast p. 284) may be used as an alternative.

BTS/SIGN (2019) recommend the prescribing of inhalers by brand. [A](#)

Initial add-on therapy

[Evgri](#) If suspected asthma is uncontrolled in children aged under 5 years on a paediatric low-dose of ICS as maintenance therapy, consider a leukotriene receptor antagonist (LTRA— such as montelukast p. 284) in addition to the ICS.

If suspected asthma is uncontrolled in children aged under 5 years on a paediatric low-dose of ICS and a LTRA as maintenance therapy, stop the LTRA and refer the child to an asthma specialist. [▲](#)

Decreasing treatment

EvGr Consider decreasing maintenance therapy when a patient's asthma has been controlled with their current maintenance therapy for at least three months. When deciding which drug to decrease first and at what rate, the severity of asthma, the side-effects of treatment, duration on current dose, the beneficial effect achieved, and the patient's preference should be considered. Patients should be regularly reviewed when decreasing treatment.

Patients should be maintained at the lowest possible dose of ICS. Reductions should be considered every three months, decreasing the dose by approximately 25–50% each time. Reduce the dose slowly as patients deteriorate at different rates. Only consider stopping ICS treatment completely for people who are using a paediatric or adult low-dose ICS alone as maintenance therapy and are symptom-free. [▲](#)

Exercise-induced asthma

EvGr For most patients, exercise-induced asthma is an illustration of poorly controlled asthma and regular treatment including an ICS should therefore be reviewed. If exercise is a specific problem in patients already taking an ICS who are otherwise well controlled, consider adding either a LTRA, a long-acting beta₂ agonist, sodium cromoglicate p. 285 or nedocromil sodium p. 285, or theophylline p. 288. An inhaled short-acting beta₂ agonist used immediately before exercise is the drug of choice. [▲](#)

Pregnancy

EvGr Women with asthma should be closely monitored during pregnancy. It is particularly important that asthma is well controlled during pregnancy; when this is achieved there is little or no increased risk of adverse maternal or fetal complications.

Women should be counselled about the importance and safety of taking their asthma medication during pregnancy to maintain good control. Women who smoke should be advised about the dangers to themselves and to their baby and be offered appropriate support to stop smoking. [▲](#) For further information, see Smoking cessation p. 520.

EvGr Short-acting beta₂ agonists, LABAs, oral and inhaled corticosteroids, sodium cromoglicate p. 285 and nedocromil sodium p. 285, and oral and intravenous theophylline p. 288 (with appropriate monitoring) can be used as normal during pregnancy. There is limited information on use of a LTRA during pregnancy, however, where indicated to achieve adequate control, they should not be withheld. [▲](#)

Advanced Pharmacy Services

Patients with asthma may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 18.

Asthma, acute

07-Oct-2019

Description of condition

Acute asthma is the progressive worsening of asthma symptoms, including breathlessness, wheeze, cough, and chest tightness. An acute exacerbation is marked by a reduction in baseline objective measures of pulmonary function, such as peak expiratory flow rate and FEV₁.

Most asthma attacks severe enough to require hospitalisation develop relatively slowly over a period of six hours or more. In children, intermittent wheezing attacks are usually triggered by viral infections and response to asthma medication may be inconsistent. Low birth weight and/or prematurity may be risk factors for recurrent wheeze.

Aims of treatment

The aim of treatment is to relieve airflow obstruction and prevent future relapses. Early treatment is most advantageous.

Levels of severity

Adults

EvGr An acute exacerbation of asthma should be correctly differentiated from poor asthma control and its severity categorised in order to be appropriately treated. The categories are described as follows: [▲](#)

Moderate acute asthma

- Increasing symptoms;
- Peak flow > 50–75% best or predicted;
- No features of acute severe asthma.

Severe acute asthma

Any one of the following:

- Peak flow 33–50% best or predicted;
- Respiratory rate ≥ 25/min;
- Heart rate ≥ 110/min;
- Inability to complete sentences in one breath.

Life-threatening acute asthma

Any one of the following, in a patient with severe asthma:

- Peak flow < 33% best or predicted;
- Arterial oxygen saturation (SpO₂) < 92%;
- Partial arterial pressure of oxygen (PaO₂) < 8 kPa;
- Normal partial arterial pressure of carbon dioxide (PaCO₂) (4.6–6.0 kPa);
- Silent chest;
- Cyanosis;
- Poor respiratory effort;
- Arrhythmia;
- Exhaustion;
- Altered conscious level;
- Hypotension.

Near-fatal acute asthma

- Raised PaCO₂ and/or the need for mechanical ventilation with raised inflation pressures.

Children

EvGr An acute exacerbation of asthma should be correctly differentiated from poor asthma control and its severity categorised in order to be appropriately treated. The categories are described as follows: [▲](#)

Moderate acute asthma

- Able to talk in sentences;
- Arterial oxygen saturation (SpO₂) ≥ 92%;
- Peak flow ≥ 50% best or predicted;

- Heart rate \leq 140/minute in children aged 1–5 years; heart rate \leq 125/minute in children aged over 5 years;
- Respiratory rate \leq 40/minute in children aged 1–5 years; respiratory rate \leq 30/minute in children aged over 5 years.

Severe acute asthma

- Can't complete sentences in one breath or too breathless to talk or feed;
- SpO₂ $<$ 92%;
- Peak flow 33–50% best or predicted;
- Heart rate $>$ 140/minute in children aged 1–5 years; heart rate $>$ 125/minute in children aged over 5 years;
- Respiratory rate $>$ 40/minute in children aged 1–5 years; respiratory rate $>$ 30/minute in children aged over 5 years.

Life-threatening acute asthma

Any one of the following in a child with severe asthma:

- SpO₂ $<$ 92%;
- Peak flow $<$ 33% best or predicted;
- Silent chest;
- Cyanosis;
- Poor respiratory effort;
- Hypotension;
- Exhaustion;
- Confusion.

Management in adults

EvGr Patients with moderate acute asthma should be treated at home or in primary care according to response to treatment, while patients with **severe or life-threatening** acute asthma should start treatment as soon as possible and be referred to hospital immediately following initial assessment. Hospital referral may also be warranted in other cases, such as failure to respond to initial treatment, social circumstances, or concomitant disease.

Supplementary oxygen should be given to all hypoxaemic patients with severe acute asthma to maintain an SpO₂ level between 94–98%. Do not delay if pulse oximetry is unavailable.

First-line treatment for acute asthma is a high-dose inhaled short-acting beta₂ agonist (salbutamol p. 267 or terbutaline sulfate p. 269) given as soon as possible. If the response to an initial dose of short-acting beta₂ agonist is poor, consider continuous nebulisation with an appropriate nebuliser. Intravenous beta₂ agonists are reserved for those patients in whom inhaled therapy cannot be used reliably.

In all cases of acute asthma, patients should be prescribed an adequate dose of oral prednisolone p. 716. Continue usual inhaled corticosteroid use during oral corticosteroid treatment. Parenteral hydrocortisone p. 713 or intramuscular methylprednisolone p. 715 are alternatives in patients who are unable to take oral prednisolone. **⚠**

For information on the general use and side effects of corticosteroids, see Corticosteroids, general use p. 707. For information on the cessation of oral corticosteroid treatment, see *Treatment cessation* for systemic corticosteroids (such as prednisolone).

EvGr Nebulised ipratropium bromide p. 261 may be combined with a nebulised beta₂ agonist in patients with severe or life-threatening acute asthma, or in those with a poor initial response to beta₂ agonist therapy to provide greater bronchodilation. **⚠**

There is some evidence that magnesium sulfate p. 1112 has bronchodilator effects. **EvGr** A single intravenous dose of magnesium sulfate may be considered in patients with severe acute asthma (peak flow $<$ 50% best or predicted) who have not had a good initial response to inhaled bronchodilator therapy [unlicensed use]. **⚠** In an acute asthma attack, intravenous aminophylline p. 287 is not likely to produce any additional bronchodilation compared to standard therapy with inhaled bronchodilators and corticosteroids. However, in some patients with near-fatal or life-threatening acute asthma with a poor response to initial therapy, intravenous aminophylline may provide some

benefit. **EvGr** Magnesium sulfate by intravenous infusion or aminophylline should only be used after consultation with senior medical staff. **⚠**

Management in children aged 2 years and over

EvGr Children with **severe or life-threatening** acute asthma should start treatment as soon as possible and be referred to hospital immediately following initial assessment. Supplementary high flow oxygen (via a tight-fitting face mask or nasal cannula) should be given to all children with life-threatening acute asthma or SpO₂ $<$ 94% to achieve normal saturations of 94–98%.

First-line treatment for acute asthma is an inhaled short-acting beta₂ agonist (salbutamol or terbutaline sulfate) given as soon as possible. The dose given should be individualised according to severity and adjusted based on response. Discontinue long-acting beta₂ agonist use if a short-acting beta₂ agonist is given more than 4 hourly. Seek medical attention if symptoms are not controlled with 10 puffs of salbutamol via a spacer; give additional bronchodilator doses whilst awaiting medical attention if symptoms are severe.

In all cases of acute asthma, children should be prescribed an adequate dose of oral prednisolone. Treatment for up to 3 days is usually sufficient, but the length of the course should be tailored to the number of days necessary to bring about recovery. Repeat the dose in children who vomit and consider the intravenous route in those who are unable to retain oral medication. It is considered good practice that inhaled corticosteroids are continued at their usual maintenance dose whilst receiving additional treatment for the attack, but they should not be used as a replacement for the oral corticosteroid. **⚠**

For information on the general use and side effects of corticosteroids, see Corticosteroids, general use p. 707. For information on the cessation of oral corticosteroid treatment, see *Treatment cessation* for systemic corticosteroids (such as prednisolone p. 716).

EvGr Nebulised ipratropium bromide p. 261 can be combined with beta₂ agonist treatment for children with a poor initial response to beta₂ agonist therapy to provide greater bronchodilation. Consider adding magnesium sulfate [unlicensed use] p. 1112 to each nebulised salbutamol p. 267 and ipratropium bromide in the first hour in children with a short duration of severe acute asthma symptoms presenting with an oxygen saturation less than 92%.

Children with continuing severe acute asthma despite frequent nebulised beta₂ agonists and ipratropium bromide plus oral corticosteroids, and those with life-threatening features, need urgent review by a specialist with a view to transfer to a high dependency unit or paediatric intensive care unit (PICU) to receive second-line intravenous therapies.

In children who respond poorly to first-line treatments, intravenous magnesium sulfate [unlicensed use] may be considered as first-line intravenous treatment. In a severe asthma attack where the child has not responded to initial inhaled therapy, early addition of a single bolus dose of intravenous salbutamol may be an option. Continuous intravenous infusion of salbutamol, administered under specialist supervision with continuous ECG and electrolyte monitoring, should be considered in children with unreliable inhalation or severe refractory asthma. Aminophylline p. 287 may be considered in children with severe or life-threatening acute asthma unresponsive to maximal doses of bronchodilators and corticosteroids. **⚠**

Children aged under 2 years

EvGr Acute asthma treatment for all children aged under 2 years should be given in the hospital setting. Treatment of children aged under 1 year should be under the direct guidance of a respiratory paediatrician.

For moderate and severe acute asthma attacks, immediate treatment with oxygen via a tight-fitting face mask or nasal prongs should be given to achieve normal SpO₂ saturations of 94–98%. Trial an inhaled short-acting beta₂ agonist and if response is poor, combine nebulised ipratropium bromide to each nebulised beta₂ agonist dose. Consider oral prednisolone daily for up to 3 days, early in the management of severe asthma attacks.

In children not responsive to first-line treatments or have life-threatening features, discuss management with a senior paediatrician or the PICU team. **A**

Follow up in all cases

EVGr Episodes of acute asthma may be a failure of preventative therapy, review is required to prevent further episodes. A careful history should be taken to establish the reason for the asthma attack. Inhaler technique should be checked and regular treatment should be reviewed. Patients should be given a written asthma action plan aimed at preventing relapse, optimising treatment, and preventing delay in seeking assistance in future attacks. It is essential that the patient's GP practice is informed within 24 hours of discharge from the emergency department or hospital following an asthma attack, and the patient be reviewed by their GP within 2 working days. Patients who have had a near-fatal asthma attack should be kept under specialist supervision indefinitely. A respiratory specialist should follow up all patients admitted with a severe asthma attack for at least one year after the admission. **A**

Advanced Pharmacy Services

Patients with asthma may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 18.

Useful Resources

Chronic obstructive pulmonary disease

06-May-2020

Description of condition

Chronic obstructive pulmonary disease (COPD) is a common, largely preventable and treatable disease, characterised by persistent respiratory symptoms and airflow limitation that is usually progressive and not fully reversible. Airflow limitation is due to a combination of small airways disease (obstructive bronchiolitis) and parenchymal destruction (emphysema). Symptoms of COPD include dyspnoea, wheeze, chronic cough, and regular sputum production.

The main risk factor for development and exacerbations of COPD is tobacco smoking. Other risk factors include environmental pollution and occupational exposures, genetic factors (such as hereditary alpha-1 antitrypsin deficiency), and poor lung growth during childhood. Complications of COPD include cor pulmonale, depression, anxiety, type 2 respiratory failure, and secondary polycythaemia.

Asthma-COPD overlap syndrome (ACOS) is characterised by persistent airflow limitation that displays features of both asthma and COPD.

Aims of treatment

The primary aim of treatment is to reduce symptoms and exacerbations and improve quality of life.

Management of stable COPD:

For information on the management of patients during the COVID-19 pandemic, see COVID-19 p. 656.

Non-drug treatment

EVGr Patients who are smokers should be encouraged to stop smoking and be offered help to do so. For further information, see Smoking cessation p. 520.

All patients should receive care delivered by a multidisciplinary team. Pulmonary rehabilitation should be offered to appropriate patients, including those who view themselves as being functionally disabled by COPD. Pulmonary rehabilitation programmes should be tailored to the patient's individual needs, and include physical training, disease education, and nutritional, psychological and behavioural intervention.

Patients with excessive sputum production should be taught active cycle of breathing techniques, and how to use positive expiratory pressure devices by a physiotherapist.

Refer patients with a BMI that is abnormal or changing over time for dietetic input, and be attentive to changes in weight in the elderly.

Interventional procedures including surgery may be deemed appropriate following a respiratory review and input from the multidisciplinary team. **A**

Vaccinations

EVGr All patients should be offered the pneumococcal vaccine and annual influenza vaccine p. 1392. **A**

Inhaled treatment

EVGr The choice of inhaler device should be based on the patient's preference and ability to use the inhaler. When prescribing an inhaler, patients should be trained on how to use the device and be able to demonstrate satisfactory inhaler technique, and continue to have their inhaler technique regularly assessed. Where appropriate a spacer can be provided. Nebulised treatment should be considered for patients with distressing or disabling breathlessness despite maximal use of inhalers, and continued if an improvement is seen in symptoms, ability to undertake activities of daily living, exercise capacity, or lung function.

A For information on devices used in the management of COPD, see Respiratory system, drug delivery p. 249.

Initial management for all patients

EVGr For initial empirical treatment, offer a short-acting bronchodilator as required to relieve breathlessness and exercise limitation. This can either be a short-acting beta₂ agonist (SABA) or a short-acting muscarinic antagonist (SAMA).

Before considering step-up treatment options, ensure that COPD is confirmed spirometrically, relevant vaccinations are given, non-drug treatment options have been optimised including smoking cessation, and that a short-acting bronchodilator is being used. **A**

Step-up treatment for patients without asthmatic features or features suggesting steroid responsiveness

EVGr In patients who continue to be breathless or have exacerbations, offer a long-acting beta₂ agonist (LABA) and a long-acting muscarinic antagonist (LAMA). Discontinue SAMA treatment if a LAMA is given. Treatment with a SABA as required may be continued in all stages of COPD.

In patients on a LAMA and LABA who have a severe exacerbation (requiring hospitalisation) or at least two moderate exacerbations (requiring systemic corticosteroids and/or antibacterial treatment) within a year, consider the addition of an inhaled corticosteroid (ICS)—triple therapy. If an ICS is given, review at least annually and document the reason for continuation.

In patients on a LAMA and LABA whose day-to-day symptoms continue to adversely impact their quality of life, consider trialling the addition of an ICS for 3 months. If symptoms have improved, continue triple therapy and

review at least annually. If there has been no improvement, step back down to a LAMA and LABA combination. [▲](#)

Step-up treatment for patients with asthmatic features or features suggesting steroid responsiveness

[EvGr](#) In patients who continue to be breathless or have exacerbations, consider treatment with a long-acting beta₂ agonist (LABA) and an inhaled corticosteroid (ICS). If an ICS is given, review annually documenting the reason for continuation.

In patients on a LABA and ICS who have a severe exacerbation (requiring hospitalisation) or at least two moderate exacerbations (requiring systemic corticosteroids and/or antibacterial treatment) within a year, or who continue to have day-to-day symptoms adversely impacting their quality of life, add a long-acting muscarinic antagonist (LAMA)—triple therapy. Discontinue SAMA treatment if a LAMA is given. Treatment with a SABA as required may be continued in all stages of COPD. [▲](#)

Prophylactic antibiotics

[EvGr](#) After considering if respiratory specialist input is required, consider azithromycin p. 566 [unlicensed] prophylaxis to reduce the risk of exacerbations in patients who are non-smokers, have had all other treatment options optimised, and who continue to either have prolonged or frequent (4 or more per year) exacerbations with sputum production, or exacerbations resulting in hospitalisation. Ensure sputum culture and sensitivity testing, a CT scan of the thorax (to rule out other lung pathologies), a baseline ECG (to rule out QT prolongation), and LFTs are performed before offering prophylaxis. Review treatment after the first 3 months, then at least 6 monthly thereafter; only continue if benefits outweigh risks. [▲](#)

Other treatments

[EvGr](#) Roflumilast p. 286 is recommended as add-on treatment to bronchodilator therapy in patients with severe COPD with chronic bronchitis (respiratory specialist initiation only), see *National funding/access decisions for roflumilast*. For guidance and the national funding access decision for roflumilast in Scotland, refer to the *Scottish Medicines Consortium*.

Consider mucolytic treatment in patients with chronic cough productive of sputum; only continue if symptomatic improvement is seen. Antitussive treatment should not be used in the management of stable COPD.

Modified-release theophylline p. 288 should only be used after a trial of short-acting and long-acting bronchodilators, or if the patient is unable to use inhaled treatment.

Be alert to the presence of anxiety or depression in patients, and manage accordingly. [▲](#)

For information on oxygen therapy in COPD patients, see Oxygen p. 258.

For guidance on the management of COPD patients with cor pulmonale and/or pulmonary hypertension, see NICE guideline: **Chronic obstructive pulmonary disease in over 16s** (see *Useful resources*).

Management of exacerbations of COPD:

For information on the management of patients during the COVID-19 pandemic, see COVID-19 p. 656.

[EvGr](#) Together with the patient, action plans should be created for those at risk of exacerbations. In patients who have had an exacerbation within the last year, a short course of antibacterials (non-macrolide if on prophylactic azithromycin) and oral corticosteroids should be kept at home. Patients should understand and be confident with when and how to take these medicines, and to report having taken them to their healthcare professional. Patients may continue prophylactic azithromycin during an acute exacerbation.

Action plans may also include information on adjusting the short-acting bronchodilator dose, and a cognitive

behavioural plan to manage symptoms of anxiety and associated breathlessness. [▲](#)

For guidance on assessing the need for hospital referral, see NICE guideline: **Chronic obstructive pulmonary disease in over 16s** (see *Useful resources*).

For guidance on antibacterial treatment in acute exacerbations of COPD, see *Chronic obstructive pulmonary disease, acute exacerbations* in Respiratory system infections, antibacterial therapy p. 538.

Non-drug treatment:

[EvGr](#) Where appropriate consider physiotherapy using positive expiratory pressure devices to help with sputum clearance. [▲](#)

Drug treatment

[EvGr](#) Give short-acting inhaled bronchodilators, usually at higher doses than the patient's maintenance treatment through a nebuliser or hand-held device to manage breathlessness. The choice should be dependant on the dose required, the patient's ability to use the device, and resources available to supervise administration. Withhold LAMA treatment if a SAMA is given.

In the absence of significant contra-indications in patients that present to hospital with an exacerbation, use a short course of prednisolone p. 716 along with other therapies. Consider a short course for patients in the community experiencing an exacerbation with a significant increase in breathlessness that interferes with daily activities. Consider osteoporosis prophylaxis for patients who require frequent courses of oral corticosteroids.

Long-term oral corticosteroid treatment is not usually recommended, however in some patients this may need to be continued when withdrawal following an exacerbation is not possible; the lowest dose possible should be used. Monitor patients for osteoporosis and give them appropriate prophylaxis. Start prophylaxis without monitoring for osteoporosis in patients aged over 65 years. [▲](#)

For information on the general use and side effects of corticosteroids, see Corticosteroids, general use p. 707. For information on the cessation of oral corticosteroid treatment, see *Treatment cessation for systemic corticosteroids* (such as prednisolone).

[EvGr](#) Aminophylline p. 287 should only be used as add-on treatment when there is an inadequate response to nebulised bronchodilators; ensure therapeutic drug monitoring is performed and that previous oral theophylline use is considered to avoid toxicity.

If necessary, oxygen should be given to ensure oxygen saturation of arterial blood levels are kept within the target range for the patient. For further information, see Oxygen p. 258.

For patients with persistent hypercapnic ventilatory failure, use non-invasive ventilation (NIV) if patients experience exacerbations despite the optimisation of medical treatment. If deemed necessary, invasive ventilation for COPD exacerbations should be given in an intensive care unit. Doxapram should only be given when NIV is inappropriate or unavailable in the clinical setting. [▲](#)

Advanced Pharmacy Services

Patients with chronic obstructive pulmonary disease may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services in Medicines optimisation* p. 18.

Oxygen

29-Sep-2019

Overview

Oxygen should be regarded as a drug. It is prescribed for hypoxaemic patients to increase alveolar oxygen tension and decrease the work of breathing. The concentration of oxygen required depends on the condition being treated; the administration of an inappropriate concentration of oxygen can have serious or even fatal consequences.

Oxygen is probably the most common drug used in medical emergencies. It should be prescribed initially to achieve a normal or near-normal oxygen saturation; in most acutely ill patients with a normal or low arterial carbon dioxide ($P_a\text{CO}_2$), oxygen saturation should be 94–98% oxygen saturation. However, in some clinical situations such as cardiac arrest and carbon monoxide poisoning it is more appropriate to aim for the highest possible oxygen saturation until the patient is stable. A lower target of 88–92% oxygen saturation is indicated for patients at risk of hypercapnic respiratory failure.

High concentration oxygen therapy is safe in uncomplicated cases of conditions such as pneumonia, pulmonary thromboembolism, pulmonary fibrosis, shock, severe trauma, sepsis, or anaphylaxis. In such conditions low arterial oxygen ($P_a\text{O}_2$) is usually associated with low or normal arterial carbon dioxide ($P_a\text{CO}_2$), and therefore there is little risk of hypoventilation and carbon dioxide retention.

In acute severe asthma, the arterial carbon dioxide ($P_a\text{CO}_2$) is usually subnormal but as asthma deteriorates it may rise steeply (particularly in children). These patients usually require high concentrations of oxygen and if the arterial carbon dioxide ($P_a\text{CO}_2$) remains high despite other treatment, intermittent positive-pressure ventilation needs to be considered urgently.

Low concentration oxygen therapy (controlled oxygen therapy) is reserved for patients at risk of hypercapnic respiratory failure, which is more likely in those with:

- chronic obstructive pulmonary disease (COPD);
- advanced cystic fibrosis;
- severe non-cystic fibrosis bronchiectasis;
- severe kyphoscoliosis or severe ankylosing spondylitis;
- severe lung scarring caused by tuberculosis;
- musculoskeletal disorders with respiratory weakness, especially if on home ventilation;
- an overdose of opioids, benzodiazepines, or other drugs causing respiratory depression.

[EvGr] Until blood gases can be measured, initial oxygen should be given using a controlled concentration of 24% or 28%, titrated towards a target oxygen saturation of 88–92% or the level specified on the patient's *oxygen alert card* if available. **[A]** The aim is to provide the patient with enough oxygen to achieve an acceptable arterial oxygen tension without worsening carbon dioxide retention and respiratory acidosis.

[EvGr] Patients with COPD and other at-risk conditions who have had an episode of hypercapnic respiratory failure, should be given a 24% or 28% Venturi mask and an oxygen alert card endorsed with the oxygen saturations required during previous exacerbations. Patients and their carers should be instructed to show the card to emergency healthcare providers in the event of an exacerbation. **[A]**

The oxygen alert card template is available at www.brit-thoracic.org.uk.

Domiciliary oxygen

Oxygen should only be prescribed for use in the home after careful evaluation in hospital by respiratory experts. Patients should be advised of the risks of continuing to smoke when receiving oxygen therapy, including the risk of fire. Smoking cessation therapy p. 520 should be recommended before home oxygen prescription. **[EvGr]** In patients with COPD, it should only be provided if the patient has stopped smoking. **[A]**

Air travel

Some patients with arterial hypoxaemia require supplementary oxygen for air travel. The patient's requirement should be discussed with the airline before travel.

Long-term oxygen therapy

Long-term administration of oxygen (usually at least 15 hours daily) improves survival in COPD patients with more severe hypoxaemia. **[EvGr]** The need for oxygen should be assessed in COPD patients with an FEV₁ less than 30% predicted (consider assessment if FEV₁ is 30–45%), cyanosis, polycythaemia, peripheral oedema, raised JVP, and when oxygen saturation levels are 92% or less breathing air. **[A]**

Assessment for long-term oxygen therapy requires measurement of arterial blood gas tensions. Measurements should be taken on 2 occasions at least 3 weeks apart to demonstrate clinical stability. Long-term oxygen therapy should be considered for patients with:

- **[EvGr]** COPD with $P_a\text{O}_2 < 7.3$ kPa when stable and who do not smoke (minimum of 15 hours per day);
 - COPD with $P_a\text{O}_2$ 7.3–8 kPa when stable and do not smoke, and also have either secondary polycythaemia, peripheral oedema, or evidence of pulmonary hypertension (minimum of 15 hours per day); **[A]**
 - severe chronic asthma with $P_a\text{O}_2 < 7.3$ kPa or persistent disabling breathlessness;
 - interstitial lung disease with $P_a\text{O}_2 < 8$ kPa and in patients with $P_a\text{O}_2 > 8$ kPa with disabling dyspnoea;
 - cystic fibrosis when $P_a\text{O}_2 < 7.3$ kPa or if $P_a\text{O}_2$ 7.3–8 kPa in the presence of secondary polycythaemia, nocturnal hypoxaemia, pulmonary hypertension, or peripheral oedema;
 - pulmonary hypertension, without parenchymal lung involvement when $P_a\text{O}_2 < 8$ kPa;
 - neuromuscular or skeletal disorders, after specialist assessment;
 - obstructive sleep apnoea despite continuous positive airways pressure therapy, after specialist assessment;
 - pulmonary malignancy or other terminal disease with disabling dyspnoea;
 - heart failure with daytime $P_a\text{O}_2 < 7.3$ kPa when breathing air or with nocturnal hypoxaemia;
 - paediatric respiratory disease, after specialist assessment.
- Increased respiratory depression is seldom a problem in patients with stable respiratory failure treated with low concentrations of oxygen although it may occur during exacerbations; patients and relatives should be warned to call for medical help if drowsiness or confusion occur.

[EvGr] A risk assessment should be carried out for all COPD patients being considered for long-term oxygen therapy and if treatment is given, should be reviewed at least annually. Offer smoking cessation advice, treatment and specialist referral for people who smoke or smokers living with the patient with COPD. Do not offer long-term oxygen therapy to patients who continue to smoke despite being offered smoking cessation interventions. **[A]**

Short-burst oxygen therapy

Oxygen is occasionally prescribed for short-burst (intermittent) use for episodes of breathlessness not relieved by other treatment in patients with interstitial lung disease, heart failure, and in palliative care. It is important, however,

that the patient does not rely on oxygen instead of obtaining medical help or taking more specific treatment. Short-burst oxygen therapy can be used to improve exercise capacity and recovery; it should only be continued if there is proven improvement in breathlessness or exercise tolerance. **EvG** It is not recommended for COPD patients who have mild or no hypoxaemia at rest. **A**

Ambulatory oxygen therapy

Ambulatory oxygen is prescribed for patients on long-term oxygen therapy who need to be away from home on a regular basis. Patients who are not on long-term oxygen therapy can be considered for ambulatory oxygen therapy if there is evidence of exercise-induced oxygen desaturation and of improvement in blood oxygen saturation and exercise capacity with oxygen. Ambulatory oxygen therapy is not recommended for patients with heart failure, COPD with mild or no hypoxaemia at rest, or those who smoke.

Oxygen therapy equipment

Under the NHS oxygen may be supplied as **oxygen cylinders**. Oxygen flow can be adjusted as the cylinders are equipped with an oxygen flow meter with 'medium' (2 litres/minute) and 'high' (4 litres/minute) settings. Oxygen delivered from a cylinder should be passed through a humidifier if used for long periods.

Oxygen concentrators are more economical for patients who require oxygen for long periods, and in England and Wales can be ordered on the NHS on a regional tendering basis. A concentrator is recommended for a patient who requires oxygen for more than 8 hours a day (or 21 cylinders per month). Exceptionally, if a higher concentration of oxygen is required the output of 2 oxygen concentrators can be combined using a 'Y' connection.

A nasal cannula is usually preferred for long-term oxygen therapy from an oxygen concentrator. It can, however, produce dermatitis and mucosal drying in sensitive individuals.

Giving oxygen by nasal cannula allows the patient to talk, eat, and drink, but the concentration of oxygen is not controlled; this may not be appropriate for acute respiratory failure. When oxygen is given through a nasal cannula at a rate of 1–2 litres/minute the inspiratory oxygen concentration is usually low, but it varies with ventilation and can be high if the patient is underventilating.

Arrangements for supplying oxygen

The following oxygen services may be ordered in England and Wales:

- emergency oxygen;
- short-burst (intermittent) oxygen therapy;
- long-term oxygen therapy;
- ambulatory oxygen.

The type of oxygen service (or combination of services) should be ordered on a Home Oxygen Order Form (HOOF); the amount of oxygen required (hours per day) and flow rate should be specified. The clinician will determine the appropriate equipment to be provided. Special needs or preferences should be specified on the HOOF.

The clinician should obtain the patient or carers consent, to pass on the patient's details to the supplier, the fire brigade, and other relevant organisations. The supplier will contact the patient to make arrangements for delivery, installation, and maintenance of the equipment. The supplier will also train the patient or carer to use the equipment.

The clinician should send the HOOF to the supplier who will continue to provide the service until a revised HOOF is received, or until notified that the patient no longer requires the home oxygen service.

- East of England, North East: BOC Medical: Tel: 0800 136 603 Fax: 0800 169 9989

- South West: Air Liquide: Tel: 0808 202 2229 Fax: 0191 497 4340
- London, East Midlands, North West: Air Liquide: Tel: 0500 823 773 Fax: 0800 781 4610
- Yorkshire and Humberside, West Midlands, Wales: Air Products: Tel: 0800 373 580 Fax: 0800 214 709
- South East Coast, South Central: Dolby Vivisol: Tel: 08443 814 402 Fax: 0800 781 4610

In **Scotland** refer the patient for assessment by a respiratory consultant. If the need for a concentrator is confirmed the consultant will arrange for the provision of a concentrator through the Common Services Agency. Prescribers should complete a Scottish Home Oxygen Order Form (SHOOF) and email it to Health Facilities Scotland. Health Facilities Scotland will then liaise with their contractor to arrange the supply of oxygen. Further information can be obtained at: www.dolbyvivisol.com/services/healthcare-professionals/.

In **Northern Ireland** oxygen concentrators and cylinders should be prescribed on form HS21; oxygen concentrators are supplied by a local contractor. Prescriptions for oxygen cylinders and accessories can be dispensed by pharmacists contracted to provide domiciliary oxygen services.

Croup

Management

Mild croup is largely self-limiting, but treatment with a single dose of a corticosteroid (e.g. dexamethasone p. 712) by mouth may be of benefit.

More severe croup (or mild croup that might cause complications) calls for hospital admission; a single dose of a corticosteroid (e.g. dexamethasone or prednisolone p. 716 by mouth) should be administered before transfer to hospital. In hospital, dexamethasone (by mouth or by injection) or budesonide p. 273 (by nebulisation) will often reduce symptoms; the dose may need to be repeated after 12 hours if necessary.

For severe croup not effectively controlled with corticosteroid treatment, nebulised adrenaline/epinephrine p. 236 solution 1 in 1000 (1 mg/mL) should be given with close clinical monitoring; the effects of nebulised adrenaline/epinephrine last 2–3 hours and the child needs to be monitored carefully for recurrence of the obstruction.

Other drugs used for Airways disease, obstructive

Dupilumab, p. 1323

ANTIMUSCARINICS

Antimuscarinics (inhaled) **G**

09-Feb-2016

- **CAUTIONS** Bladder outflow obstruction · paradoxical bronchospasm · prostatic hyperplasia · susceptibility to angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION

- ▶ **Elderly** Prescription potentially inappropriate (STOPP criteria) with a history of narrow-angle glaucoma (may exacerbate glaucoma) or bladder outflow obstruction (may cause urinary retention). See also Prescribing in the elderly p. 33.
- **SIDE-EFFECTS**
- ▶ **Common or very common** Arrhythmias · cough · dizziness · dry mouth · headache · nausea
- ▶ **Uncommon** Constipation · dysphonia · glaucoma · palpitations · skin reactions · stomatitis · urinary disorders · vision blurred

Acclidinium bromide

17-Mar-2020

● INDICATIONS AND DOSE

Maintenance treatment of chronic obstructive pulmonary disease

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 375 micrograms twice daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ Each 375 microgram inhalation of acclidinium bromide delivers 322 micrograms of acclidinium.

- **CAUTIONS** Arrhythmia (when newly diagnosed within last 3 months) · heart failure (hospitalisation with moderate or severe heart failure within last 12 months) · myocardial infarction within last 6 months · unstable angina
- **INTERACTIONS** → Appendix 1: acclidinium
- **SIDE-EFFECTS**
 - ▶ Common or very common Diarrhoea · nasopharyngitis
 - ▶ Uncommon Angioedema
 - ▶ Rare or very rare Hypersensitivity
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises use only if potential benefits outweigh risks.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on appropriate inhaler technique.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

- ▶ **Eklira** (AstraZeneca UK Ltd) ▼
Acclidinium bromide 375 microgram per 1 dose Eklira
322micrograms/dose Genuair | 60 dose [PoM] £32.50 DT = £32.50

Acclidinium bromide with formoterol

16-Mar-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, acclidinium bromide above, formoterol fumarate p. 264.

● INDICATIONS AND DOSE

Maintenance treatment of chronic obstructive pulmonary disease

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 1 inhalation twice daily

- **CAUTIONS** Convulsive disorders · phaeochromocytoma
- **INTERACTIONS** → Appendix 1: acclidinium · beta₂ agonists
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on appropriate inhaler technique.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

259

Ipratropium bromide

25-Jul-2018

• INDICATIONS AND DOSE

Reversible airways obstruction

- ▶ BY INHALATION OF AEROSOL
- ▶ Child 1 month–5 years: 20 micrograms 3 times a day
- ▶ Child 6–11 years: 20–40 micrograms 3 times a day
- ▶ Child 12–17 years: 20–40 micrograms 3–4 times a day

Reversible airways obstruction, particularly in chronic obstructive pulmonary disease

- ▶ BY INHALATION OF AEROSOL
- ▶ Adult: 20–40 micrograms 3–4 times a day
- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Adult: 250–500 micrograms 3–4 times a day

Acute bronchospasm

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Child 1 month–5 years: 125–250 micrograms as required; maximum 1 mg per day
- ▶ Child 6–11 years: 250 micrograms as required; maximum 1 mg per day
- ▶ Child 12–17 years: 500 micrograms as required, doses higher than max. can be given under medical supervision; maximum 2 mg per day
- ▶ Adult: 500 micrograms as required, doses higher than max. can be given under medical supervision; maximum 2 mg per day

Severe or life-threatening acute asthma

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Child 1 month–11 years: 250 micrograms every 20–30 minutes for the first 2 hours, then 250 micrograms every 4–6 hours as required
- ▶ Child 12–17 years: 500 micrograms every 4–6 hours as required
- ▶ Adult: 500 micrograms every 4–6 hours as required

PHARMACOKINETICS

- ▶ The maximal effect of inhaled ipratropium occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

- **UNLICENSED USE** [EvG] The dose of ipratropium for severe or life-threatening acute asthma is unlicensed. ⚠ *Inhalvent*® not licensed for use in children under 6 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PRESSURISED METERED DOSE INHALERS (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)

See Respiratory system, drug delivery p. 249.

- **CAUTIONS** Avoid spraying near eyes · cystic fibrosis
- CAUTIONS, FURTHER INFORMATION**
- ▶ Glaucoma *Acute angle-closure glaucoma* has been reported with nebulised ipratropium, particularly when given with nebulised salbutamol (and possibly other beta₂ agonists); care needed to protect the patient's eyes from nebulised drug or from drug powder.
- **INTERACTIONS** → Appendix 1: ipratropium
- **SIDE-EFFECTS**
- ▶ **Common or very common** Gastrointestinal motility disorder · throat complaints

- ▶ **Uncommon** Corneal oedema · diarrhoea · eye disorders · eye pain · respiratory disorders · vision disorders · vomiting
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to atropine or its derivatives.
- **PREGNANCY** Manufacturer advises only use if potential benefit outweighs the risk.
- **BREAST FEEDING** No information available—manufacturer advises only use if potential benefit outweighs risk.
- **DIRECTIONS FOR ADMINISTRATION** If dilution of ipratropium bromide nebuliser solution is necessary use only sterile sodium chloride 0.9%.
- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on appropriate administration technique and warned against accidental contact with the eye (due to risk of ocular complications).
- Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and vision disorders.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Nebuliser liquid

▶ Ipratropium bromide (Non-proprietary)

Ipratropium bromide 250 microgram per 1 ml Ipratropium bromide 500micrograms/2ml nebuliser liquid unit dose vials | 20 unit dose [PoM] £3.76 DT = £3.16

Ipratropium bromide 250micrograms/1ml nebuliser liquid unit dose vials | 20 unit dose [PoM] £5.71 DT = £5.71

Ipratropium 250micrograms/1ml nebuliser liquid Steri-Neb unit dose vials | 20 unit dose [PoM] £6.99 DT = £5.71

Ipratropium 500micrograms/2ml nebuliser liquid Steri-Neb unit dose vials | 20 unit dose [PoM] £15.99 DT = £3.16

▶ **Atrovent UDV** (Boehringer Ingelheim Ltd)

Ipratropium bromide 250 microgram per 1 ml Atrovent 500micrograms/2ml nebuliser liquid UDVs | 20 unit dose [PoM] £4.87 DT = £3.16

Atrovent 250micrograms/1ml nebuliser liquid UDVs | 20 unit dose [PoM] £4.14 DT = £5.71

Pressurised inhalation

▶ **Atrovent** (Boehringer Ingelheim Ltd)

Ipratropium bromide 20 microgram per 1 dose Atrovent 20micrograms/dose inhaler CFC free | 200 dose [PoM] £5.56 DT = £5.56

▶ **Inhalvent** (Alissa Healthcare Research Ltd)

Ipratropium bromide 20 microgram per 1 dose Inhalvent 20micrograms/dose inhaler | 200 dose [PoM] £5.56 DT = £5.56

Ipratropium with salbutamol

16-Mar-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, ipratropium bromide above, salbutamol p. 267.

• INDICATIONS AND DOSE

Bronchospasm in chronic obstructive pulmonary disease

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Adult: 0.5/2.5 mg 3–4 times a day

- **INTERACTIONS** → Appendix 1: beta₂ agonists · ipratropium
- **PRESCRIBING AND DISPENSING INFORMATION** A mixture of ipratropium bromide and salbutamol (as sulphate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of ipratropium and salbutamol respectively.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Nebuliser liquid

- ▶ **Combivent** (Boehringer Ingelheim Ltd)
Ipratropium bromide 200 microgram per 1 ml, Salbutamol (as Salbutamol sulfate) 1 mg per 1 ml Combivent nebuliser liquid 2.5ml UDVs | 60 unit dose [PoM] £24.10 DT = £24.10
- ▶ **Ipramol** (Teva UK Ltd)
Ipratropium bromide 200 microgram per 1 ml, Salbutamol (as Salbutamol sulfate) 1 mg per 1 ml Ipramol nebuliser solution 2.5ml Steri-Neb unit dose vials | 60 unit dose [PoM] £23.83 DT = £24.10

Tiotropium

08-Jun-2018

INDICATIONS AND DOSE

Maintenance treatment of chronic obstructive pulmonary disease

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 1 capsule once daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ For *Spiriva*[®] inhalation powder, 1 capsule contains a metered dose of 18 micrograms tiotropium; for *Braltus*[®] inhalation powder, 1 capsule contains a metered dose of 13 micrograms tiotropium.
- ▶ The delivered dose of *Spiriva*[®] and *Braltus*[®] inhalation powder products are the same (10 micrograms); no dose adjustment is necessary when switching between brands.

SPIRIVA RESPIMAT[®]

Maintenance treatment of chronic obstructive pulmonary disease | Severe asthma [add-on to inhaled corticosteroid (at least 800 micrograms budesonide daily or equivalent) and at least 1 controller in patients who have suffered one or more severe exacerbations in the last year]

- ▶ BY INHALATION
- ▶ Adult: 5 micrograms once daily

Severe asthma [add-on to inhaled corticosteroid (over 400 micrograms budesonide daily or equivalent) and 1 controller, or inhaled corticosteroid (200–400 micrograms budesonide daily or equivalent) and 2 controllers, in patients who have suffered one or more severe exacerbations in the last year]

- ▶ BY INHALATION
- ▶ Child 6–11 years: 5 micrograms once daily

Severe asthma [add-on to inhaled corticosteroid (over 800 micrograms budesonide daily or equivalent) and 1 controller, or inhaled corticosteroid (400–800 micrograms budesonide daily or equivalent) and 2 controllers, in patients who have suffered one or more severe exacerbations in the last year]

- ▶ BY INHALATION
- ▶ Child 12–17 years: 5 micrograms once daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ For *Spiriva Respimat*[®]: 2 puffs of inhalation solution is equivalent to 5 micrograms tiotropium.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BRALTUS[®] (TIOTROPIUM): RISK OF INHALATION OF CAPSULE IF PLACED IN THE MOUTHPIECE OF THE INHALER (MAY 2018)

The MHRA have received reports of patients who have inhaled a *Braltus*[®] capsule from the mouthpiece into the back of the throat, resulting in coughing and risking aspiration or airway obstruction. Patients should be trained in the correct use of their inhaler and told to store capsules in the screw-top bottle provided (never in the inhaler) and to always check the mouthpiece is clear before inhaling.

Pharmacists dispensing *Braltus*[®] capsules should remind patients always to read the instructions for use in the package leaflet and that they must never place a capsule directly into the mouthpiece.

MHRA/CHM ADVICE: PRESSURISED METERED DOSE INHALERS (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)

See Respiratory system, drug delivery p. 249.

- **CAUTIONS** Arrhythmia (unstable, life-threatening or requiring intervention in the previous 12 months) · heart failure (hospitalisation for moderate to severe heart failure in the previous 12 months) · myocardial infarction in the previous 6 months

- **INTERACTIONS** → Appendix 1: tiotropium

SIDE-EFFECTS

- ▶ **Uncommon** Gastrointestinal disorders · increased risk of infection · taste altered
- ▶ **Rare or very rare** Bronchospasm · dysphagia · epistaxis · insomnia · oral disorders
- ▶ **Frequency not known** Dehydration · joint swelling · skin ulcer

- **PREGNANCY** Manufacturer advises avoid—limited data available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises use only if potential benefit outweighs risk if creatinine clearance less than or equal to 50 mL/minute—plasma-tiotropium concentration raised.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on appropriate inhaler technique and reminded that the powder inhalation capsules are not for oral administration; for *Braltus*[®], see also *Important safety Information*.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 1028/15

The *Scottish Medicines Consortium* has advised (August 2015) that tiotropium (*Spiriva Respimat*[®]) is accepted for use within NHS Scotland as add-on maintenance bronchodilator treatment in adults with asthma who are currently treated with the maintenance combination of inhaled corticosteroids (≥800 micrograms budesonide/day or equivalent) and long-acting beta₂-agonists and who experienced one or more severe exacerbations in the previous year.

SMC No. 411/07

The *Scottish Medicines Consortium* has advised (December 2017) that tiotropium (*Spiriva Respimat*[®]) is accepted for use within NHS Scotland as a maintenance bronchodilator treatment to relieve symptoms of patients with chronic obstructive pulmonary disease.

SMC No. SMC2118

The *Scottish Medicines Consortium* has advised (January 2019) that tiotropium (*Spiriva Respimat*[®]) is accepted for use within NHS Scotland as add-on maintenance bronchodilator treatment in patients aged 6 years and older with severe asthma who experienced one or more severe asthma exacerbations in the preceding year.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 1882

The *All Wales Medicines Strategy Group* has advised (December 2018) that tiotropium (*Spiriva Respimat*[®]) is recommended as an option for use within NHS Wales as add-on maintenance bronchodilator treatment in patients aged 6 years and older with severe asthma who experienced one or more severe asthma exacerbations in the preceding year.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

- ▶ **Braltus** (Teva UK Ltd)
Tiotropium (as Tiotropium bromide) 10 microgram Braltus 10microgram inhalation powder capsules with Zonda inhaler | 30 capsule [PoM] £25.80 DT = £25.80

P 259

Umeclidinium

16-Mar-2020

● INDICATIONS AND DOSE

Maintenance treatment of chronic obstructive pulmonary disease

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 55 micrograms once daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ Each 65 microgram inhalation of umeclidinium bromide delivers 55 micrograms of umeclidinium.

- **CAUTIONS** Cardiac disorders (particularly cardiac rhythm disorders)

- **INTERACTIONS** → Appendix 1: umeclidinium

● SIDE-EFFECTS

- ▶ **Uncommon** Taste altered
- ▶ **Rare or very rare** Eye pain

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on appropriate inhaler technique.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

- ▶ **Increase Ellipta** (GlaxoSmithKline UK Ltd) ▼
Umeclidinium bromide 65 microgram per 1 dose Increase Ellipta 55micrograms/dose dry powder inhaler | 30 dose [PoM] £27.50 DT = £27.50

Combinations available: **Fluticasone with umeclidinium and vilanterol**, p. 279

Umeclidinium with vilanterol

16-Mar-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, umeclidinium above.

● INDICATIONS AND DOSE

Maintenance treatment of chronic obstructive pulmonary disease

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 1 inhalation once daily

- **CAUTIONS** Arrhythmias · cardiovascular disease · diabetes (risk of hyperglycaemia and ketoacidosis) · hypertension · hyperthyroidism · hypokalaemia · susceptibility to QT-interval prolongation

CAUTIONS, FURTHER INFORMATION

- ▶ Hypokalaemia Potentially serious hypokalaemia may result from beta₂ agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, diuretics, and by hypoxia.
- **INTERACTIONS** → Appendix 1: beta₂ agonists · umeclidinium
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Constipation · dry mouth · headache · oropharyngeal pain · sinusitis
 - ▶ **Uncommon** Arrhythmias · dysphonia · palpitations · taste altered · tremor
 - ▶ **Rare or very rare** Bronchospasm paradoxical · glaucoma · urinary disorders · vision blurred
- **MONITORING REQUIREMENTS**
 - ▶ In severe asthma, plasma-potassium concentration should be monitored (risk of hypokalaemia).
 - ▶ In patients with diabetes, monitor blood glucose (risk of hyperglycaemia and ketoacidosis, especially when beta₂ agonist given intravenously).
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on appropriate inhaler technique.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

- ▶ **Umeclidinium with vilanterol (non-proprietary)** ▼
Vilanterol (as Vilanterol trifenate) 22 microgram per 1 dose, Umeclidinium bromide 65 microgram per 1 dose Umeclidinium bromide 65micrograms/dose / Vilanterol 22micrograms/dose dry powder inhaler | 30 dose [PoM] DT = £32.50
- ▶ **Anoro Ellipta** (GlaxoSmithKline UK Ltd) ▼
Vilanterol (as Vilanterol trifenate) 22 microgram per 1 dose, Umeclidinium bromide 65 microgram per 1 dose Anoro Ellipta 55micrograms/dose / 22micrograms/dose dry powder inhaler | 30 dose [PoM] £32.50 DT = £32.50

BETA₂-ADRENOCEPTOR AGONISTS, SELECTIVEBeta₂-adrenoceptor agonists, selective

12-Feb-2016

● **CAUTIONS** Arrhythmias · cardiovascular disease · diabetes (risk of hyperglycaemia and ketoacidosis, especially with intravenous use) · hypertension · hyperthyroidism · hypokalaemia · susceptibility to QT-interval prolongation

CAUTIONS, FURTHER INFORMATION

▶ **Hypokalaemia** Potentially serious hypokalaemia may result from beta₂ agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, diuretics, and by hypoxia.

● **SIDE-EFFECTS**

▶ **Common or very common** Arrhythmias · dizziness · headache · hypokalaemia (with high doses) · nausea · palpitations · tremor

▶ **Uncommon** Hyperglycaemia · myocardial ischaemia

▶ **Rare or very rare** Bronchospasm paradoxical (sometimes severe)

● **PREGNANCY** Women planning to become pregnant should be counselled about the importance of taking their asthma medication regularly to maintain good control.

● **MONITORING REQUIREMENTS**

▶ In severe asthma, plasma-potassium concentration should be monitored (risk of hypokalaemia).

▶ In patients with diabetes, monitor blood glucose (risk of hyperglycaemia and ketoacidosis, especially when beta₂ agonist given intravenously).

● **PATIENT AND CARER ADVICE**

▶ When used by inhalation The **dose**, the frequency, and the maximum number of inhalations in 24 hours of the beta₂ agonist should be **stated explicitly** to the patient or their carer. The patient or their carer should be advised to seek medical advice when the prescribed dose of beta₂ agonist fails to provide the usual degree of symptomatic relief because this usually indicates a worsening of the asthma and the patient may require a prophylactic drug. Patients or their carers should be advised to follow manufacturers' instructions on the care and cleansing of inhaler devices.

BETA₂-ADRENOCEPTOR AGONISTS, SELECTIVE > LONG-ACTING

above

Bambuterol hydrochloride

05-Jun-2018

● **DRUG ACTION** Bambuterol is a pro-drug of terbutaline.

● **INDICATIONS AND DOSE**

Asthma (patients who have previously tolerated beta₂-agonists) | Other conditions associated with reversible airways obstruction (patients who have previously tolerated beta₂-agonists)

▶ **BY MOUTH**

▶ **Adult:** 20 mg once daily, dose to be taken at bedtime

Asthma (patients who have not previously tolerated beta₂-agonists) | Other conditions associated with reversible airways obstruction (patients who have not previously tolerated beta₂-agonists)

▶ **BY MOUTH**

▶ **Adult:** Initially 10 mg once daily for 1–2 weeks, then increased if necessary to 20 mg once daily, dose to be taken at bedtime

● **INTERACTIONS** → Appendix 1: beta₂ agonists

● **SIDE-EFFECTS**

▶ **Common or very common** Anxiety · behaviour abnormal · muscle cramps · sleep disorder

▶ **Frequency not known** Akathisia · angioedema · bronchospasm · circulatory collapse · hypersensitivity · hypotension · skin reactions

● **PREGNANCY** Manufacturer advises avoid—no information available.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment or cirrhosis (risk of unpredictable conversion to terbutaline; direct terbutaline use preferred).

● **RENAL IMPAIRMENT**

Dose adjustments Reduce initial dose by half if eGFR less than 50 mL/minute/1.73 m².

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ **Bambec** (AstraZeneca UK Ltd)

above

Formoterol fumarate

25-Nov-2019

(Eformoterol fumarate)

● **INDICATIONS AND DOSE**

Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy | Nocturnal asthma in patients requiring long-term regular bronchodilator therapy | Prophylaxis of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy | Chronic asthma in patients who regularly use an inhaled corticosteroid

▶ **BY INHALATION OF POWDER**

▶ **Child 6–11 years:** 12 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose

▶ **Child 12–17 years:** 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose

▶ **Adult:** 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily

▶ **BY INHALATION OF AEROSOL**

▶ **Child 12–17 years:** 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose

▶ **Adult:** 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily

Chronic obstructive pulmonary disease

▶ **BY INHALATION OF POWDER**

▶ **Adult:** 12 micrograms twice daily

▶ **BY INHALATION OF AEROSOL**

▶ **Adult:** 12 micrograms twice daily (max. per dose 24 micrograms), for symptom relief additional doses may be taken to maximum daily dose; maximum 48 micrograms per day

PHARMACOKINETICS

▶ At recommended inhaled doses, the duration of action of formoterol is about 12 hours.

OXIS®

Chronic asthma

▶ BY INHALATION OF POWDER

- ▶ Child 6–17 years: 6–12 micrograms 1–2 times a day (max. per dose 12 micrograms), occasionally doses up to the maximum daily may be needed, reassess treatment if additional doses required on more than 2 days a week; maximum 48 micrograms per day
- ▶ Adult: 6–12 micrograms 1–2 times a day, increased if necessary up to 24 micrograms twice daily (max. per dose 36 micrograms), occasionally doses up to the maximum daily may be needed, reassess treatment if additional doses required on more than 2 days a week; maximum 72 micrograms per day

Relief of bronchospasm

▶ BY INHALATION OF POWDER

- ▶ Child 6–17 years: 6–12 micrograms
- ▶ Adult: 6–12 micrograms

Prophylaxis of exercise-induced bronchospasm

▶ BY INHALATION OF POWDER

- ▶ Child 6–17 years: 6–12 micrograms, dose to be taken before exercise
- ▶ Adult: 12 micrograms, dose to be taken before exercise

Chronic obstructive pulmonary disease

▶ BY INHALATION OF POWDER

- ▶ Adult: 12 micrograms 1–2 times a day (max. per dose 24 micrograms), for symptom relief additional doses up to maximum daily dose can be taken; maximum 48 micrograms per day

IMPORTANT SAFETY INFORMATION**CHM ADVICE**

To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta₂ agonist (formoterol) should:

- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;
- not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used;
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

MHRA/CHM ADVICE: PRESSURISED METERED DOSE INHALERS (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)

See Respiratory system, drug delivery p. 249.

- **CAUTIONS** High doses of beta₂ agonists can be dangerous in some children
- **INTERACTIONS** → Appendix 1: beta₂ agonists
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Muscle cramps
 - ▶ **Uncommon** Angina pectoris · bronchospasm · skin reactions · sleep disorder · taste altered
 - ▶ **Rare or very rare** Anxiety · QT interval prolongation
- **PREGNANCY** Inhaled drugs for asthma can be taken as normal during pregnancy.
- **BREAST FEEDING** Inhaled drugs for asthma can be taken as normal during breast-feeding.
- **PATIENT AND CARER ADVICE** Advise patients not to exceed prescribed dose, and to follow manufacturer's directions; if a previously effective dose of inhaled formoterol fails to provide adequate relief, a doctor's advice should be

obtained as soon as possible. Patients should be advised to report any deterioration in symptoms following initiation of treatment with a long-acting beta₂ agonist. Patient or carer should be given advice on how to administer formoterol fumarate inhalers.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Salmeterol

● INDICATIONS AND DOSE

Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy | Nocturnal asthma in patients requiring long-term regular bronchodilator therapy | Prevention of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy | Chronic asthma only in patients who regularly use an inhaled corticosteroid (not for immediate relief of acute asthma)

- ▶ BY INHALATION OF AEROSOL, OR BY INHALATION OF POWDER
- ▶ Child 5-11 years: 50 micrograms twice daily
- ▶ Child 12-17 years: 50 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 100 micrograms twice daily
- ▶ Adult: 50 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 100 micrograms twice daily

Chronic obstructive pulmonary disease

- ▶ BY INHALATION OF AEROSOL, OR BY INHALATION OF POWDER
- ▶ Adult: 50 micrograms twice daily

PHARMACOKINETICS

- ▶ At recommended inhaled doses, the duration of action of salmeterol is about 12 hours.

- **UNLICENSED USE** *Neovent*[®] not licensed for use in children under 12 years.

IMPORTANT SAFETY INFORMATION

CHM ADVICE

To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta₂ agonist (salmeterol) should:

- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;
- not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used;
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

MHRA/CHM ADVICE: PRESSURISED METERED DOSE INHALERS (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)

See Respiratory system, drug delivery p. 249.

- **CAUTIONS** High doses of beta₂ agonists can be dangerous in some children
- **INTERACTIONS** → Appendix 1: beta₂ agonists
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Muscle cramps
 - ▶ **Uncommon** Nervousness · skin reactions
 - ▶ **Rare or very rare** Arthralgia · bronchospasm · chest pain · insomnia · oedema · oropharyngeal irritation
- **PREGNANCY** Inhaled drugs for asthma can be taken as normal during pregnancy.
- **BREAST FEEDING** Inhaled drugs for asthma can be taken as normal during breast-feeding.
- **PATIENT AND CARER ADVICE** Advise patients that salmeterol should **not** be used for relief of acute attacks, not to exceed prescribed dose, and to follow manufacturer's directions; if a previously effective dose of inhaled salmeterol fails to provide adequate relief, a doctor's advice should be obtained as soon as possible. Patients should be advised to report any deterioration in symptoms following initiation of treatment with a long-acting beta₂ agonist.
 Medicines for Children leaflet: Salmeterol inhaler for asthma www.medicinesforchildren.org.uk/salmeterol-inhaler-asthma

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

- ▶ **Serevent Accuhaler** (GlaxoSmithKline UK Ltd)
Salmeterol (as Salmeterol xinafoate) 50 microgram per 1 dose Serevent 50micrograms/dose Accuhaler | 60 dose [PoM] £35.11 DT = £35.11

Pressurised inhalation

- ▶ **Neovent** (Kent Pharmaceuticals Ltd)
Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose Neovent 25micrograms/dose inhaler CFC free | 120 dose [PoM] £29.26 DT = £29.26
- ▶ **Serevent Evohaler** (GlaxoSmithKline UK Ltd)
Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose Serevent 25micrograms/dose Evohaler | 120 dose [PoM] £29.26 DT = £29.26

25-Jul-2018

● INDICATIONS AND DOSE

Asthma | Other conditions associated with reversible airways obstruction

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 4 mg 3–4 times a day, maximum single dose 8 mg (but unlikely to provide much extra benefit or to be tolerated), inhalation route preferred over oral route, use elderly dose for sensitive patients
- ▶ Elderly: Initially 2 mg 3–4 times a day, maximum single dose 8 mg (but unlikely to provide much extra benefit or to be tolerated), inhalation route preferred over oral route
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 500 micrograms every 4 hours if required
- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 250 micrograms, repeated if necessary, injection to be diluted to a concentration of 50 micrograms/mL, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 5 micrograms/minute, adjusted according to response and heart rate, usual dose 3–20 micrograms/minute, higher doses may be required, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably
- ▶ BY INHALATION OF AEROSOL
- ▶ Adult: 100–200 micrograms, up to 4 times a day for persistent symptoms
- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Adult: 2.5–5 mg, repeated up to 4 times daily or more frequently in severe cases

Prophylaxis of allergen- or exercise-induced bronchospasm

- ▶ BY INHALATION OF AEROSOL
- ▶ Adult: 200 micrograms

Acute asthma

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 1–23 months: 5 micrograms/kg for 1 dose, dose to be administered over 5 minutes, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
- ▶ Child 2–17 years: 15 micrograms/kg (max. per dose 250 micrograms) for 1 dose, dose to be administered over 5 minutes, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

Moderate, severe, or life-threatening acute asthma

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Child 1 month–4 years: 2.5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
- ▶ Child 5–11 years: 2.5–5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

- ▶ Child 12–17 years: 5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
- ▶ Adult: 5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

Moderate and severe acute asthma

- ▶ BY INHALATION OF AEROSOL
- ▶ Child: 2–10 puffs, each puff is to be inhaled separately, repeat every 10–20 minutes or when required, give via large volume spacer (and a close-fitting face mask in children under 3 years), each puff is equivalent to 100 micrograms
- ▶ Adult: 2–10 puffs, each puff is to be inhaled separately, repeat every 10–20 minutes or when required, give via large volume spacer, each puff is equivalent to 100 micrograms

Exacerbation of reversible airways obstruction (including nocturnal asthma) | Prophylaxis of allergen- or exercise-induced bronchospasm

- ▶ BY INHALATION OF AEROSOL
- ▶ Child: 100–200 micrograms, up to 4 times a day for persistent symptoms
- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 1 month–1 year: 100 micrograms/kg 3–4 times a day (max. per dose 2 mg), inhalation route preferred over oral route
- ▶ Child 2–5 years: 1–2 mg 3–4 times a day, inhalation route preferred over oral route
- ▶ Child 6–11 years: 2 mg 3–4 times a day, inhalation route preferred over oral route
- ▶ Child 12–17 years: 2–4 mg 3–4 times a day, inhalation route preferred over oral route

Uncomplicated premature labour (between 22 and 37 weeks of gestation) (specialist supervision in hospital)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 10 micrograms/minute, rate increased gradually according to response at 10-minute intervals until contractions diminish then increase rate slowly until contractions cease (maximum rate 45 micrograms/minute), maintain rate for 1 hour after contractions have stopped, then gradually reduce by 50% every 6 hours, maximum duration 48 hours

PHARMACOKINETICS

- ▶ At recommended inhaled doses, the duration of action of salbutamol is about 3 to 5 hours.

EASYHALER® SALBUTAMOL

Acute bronchospasm

- ▶ BY INHALATION OF POWDER
- ▶ Adult: Initially 100–200 micrograms, increased if necessary to 400 micrograms; maximum 800 micrograms per day

Prophylaxis of allergen- or exercise-induced bronchospasm

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 200 micrograms

SALBULIN NOVOLIZER®

Acute bronchospasm

- ▶ BY INHALATION OF POWDER
- ▶ Adult: Initially 100–200 micrograms, up to 800 micrograms daily for persistent symptoms

Prophylaxis of allergen- or exercise-induced bronchospasm

- ▶ BY INHALATION OF POWDER
- ▶ Adult: 200 micrograms

continued →

VENTOLIN ACCUHALER®

Acute bronchospasm

▶ BY INHALATION OF POWDER

▶ Adult: Initially 200 micrograms, up to 4 times daily for persistent symptoms

Prophylaxis of allergen- or exercise-induced bronchospasm

▶ BY INHALATION OF POWDER

▶ Adult: 200 micrograms

- **UNLICENSED USE** Syrup and tablets not licensed for use in children under 2 years. Injection and solution for intravenous infusion not licensed for use in children under 12 years. Administration of undiluted salbutamol injection through a central venous catheter is not licensed.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PRESSURISED METERED DOSE INHALERS (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)

See Respiratory system, drug delivery p. 249.

● **CONTRA-INDICATIONS**

- ▶ When used for uncomplicated premature labour under specialist supervision Abruptio placenta · antepartum haemorrhage · cord compression · eclampsia · history of cardiac disease · intra-uterine fetal death · intra-uterine infection · placenta praevia · pulmonary hypertension · severe pre-eclampsia · significant risk factors for myocardial ischaemia · threatened miscarriage

● **CAUTIONS**

GENERAL CAUTIONS High doses of beta₂ agonists can be dangerous in some children

SPECIFIC CAUTIONS

- ▶ With intravenous use mild to moderate pre-eclampsia (when used for uncomplicated premature labour) · suspected cardiovascular disease (should be assessed by a cardiologist before initiating therapy for uncomplicated premature labour)

- **INTERACTIONS** → Appendix 1: beta₂ agonists

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Muscle cramps
- ▶ **Rare or very rare** Akathisia · vasodilation
- ▶ **Frequency not known** Metabolic change

SPECIFIC SIDE-EFFECTS▶ **Uncommon**

- ▶ When used by inhalation Oral irritation · throat irritation
- ▶ With parenteral use Pulmonary oedema
- ▶ **Frequency not known**
- ▶ With parenteral use Lactic acidosis (with high doses) · vomiting

- **BREAST FEEDING** Inhaled drugs for asthma can be taken as normal during breast-feeding.

- **MONITORING REQUIREMENTS** In uncomplicated premature labour it is important to monitor blood pressure, pulse rate (should not exceed 120 beats per minute), ECG (discontinue treatment if signs of myocardial ischaemia develop), blood glucose and lactate concentrations, and the patient's fluid and electrolyte status (avoid over-hydration—discontinue drug immediately and initiate diuretic therapy if pulmonary oedema occurs).

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use in children For *continuous intravenous infusion*, dilute to a concentration of 200 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%. If fluid-restricted, can be given undiluted through central venous catheter [unlicensed]. For *intravenous injection*, dilute to a concentration of 50 micrograms/mL with Glucose 5%, Sodium Chloride 0.9%, or Water for injections.

- ▶ When used by inhalation For *nebulisation*, dilute nebuliser solution with a suitable volume of sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; salbutamol and ipratropium bromide solutions are compatible and can be mixed for nebulisation.

- ▶ With intravenous use in adults For *bronchodilation by continuous intravenous infusion*, dilute to a concentration of 200 micrograms/mL with glucose 5% or sodium chloride 0.9%. For *premature labour by continuous intravenous infusion*, dilute with glucose 5% to a concentration of 200 micrograms/mL for use in a syringe pump or for other infusion methods (preferably via controlled infusion device), dilute to a concentration of 20 micrograms/mL; close attention to patient's fluid and electrolyte status essential.

- **PATIENT AND CARER ADVICE** For *inhalation by aerosol or dry powder*, advise patients and carers not to exceed prescribed dose and to follow manufacturer's directions; if a previously effective dose of inhaled salbutamol fails to provide at least 3 hours relief, a doctor's advice should be obtained as soon as possible. For *inhalation by nebuliser*, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution. Terbutaline sulfate● **INDICATIONS AND DOSE****Asthma | Other conditions associated with reversible airways obstruction**

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 2.5 mg 3 times a day for 1–2 weeks, then increased to up to 5 mg 3 times a day, use by inhalation preferred over by mouth
- ▶ **BY SUBCUTANEOUS INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
- ▶ **Adult:** 250–500 micrograms up to 4 times a day, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
- ▶ **BY CONTINUOUS INTRAVENOUS INFUSION**
- ▶ **Adult:** 90–300 micrograms/hour for 8–10 hours, to be administered as a solution containing 3–5 micrograms/mL, high doses require close monitoring, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
- ▶ **BY INHALATION OF POWDER**
- ▶ **Adult:** 500 micrograms up to 4 times a day, for persistent symptoms
- ▶ **BY INHALATION OF NEBULISED SOLUTION**
- ▶ **Adult:** 5–10 mg 2–4 times a day, additional doses may be necessary in severe acute asthma

Acute asthma

- ▶ **BY SUBCUTANEOUS INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
- ▶ **Child 2–14 years:** 10 micrograms/kg up to 4 times a day (max. per dose 300 micrograms), reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
- ▶ **Child 15–17 years:** 250–500 micrograms up to 4 times a day, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
- ▶ **BY CONTINUOUS INTRAVENOUS INFUSION**
- ▶ **Child:** Loading dose 2–4 micrograms/kg, then 1–10 micrograms/kg/hour, dose to be adjusted according to response and heart rate, close monitoring is required for doses above 10 micrograms/kg/hour, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

Moderate, severe, or life-threatening acute asthma

- ▶ **BY INHALATION OF NEBULISED SOLUTION**
- ▶ **Child 1 month–4 years:** 5 mg, repeat every 20–30 minutes or when required, give by oxygen-driven nebuliser if available
- ▶ **Child 5–11 years:** 5–10 mg, repeat every 20–30 minutes or when required, give by oxygen-driven nebuliser if available
- ▶ **Child 12–17 years:** 10 mg, repeat every 20–30 minutes or when required, give by oxygen-driven nebuliser if available
- ▶ **Adult:** 10 mg, repeat every 20–30 minutes or when required, give by oxygen-driven nebuliser if available

Exacerbation of reversible airways obstruction (including nocturnal asthma) | Prevention of exercise-induced bronchospasm

- ▶ **BY INHALATION OF POWDER**
- ▶ **Child 5–17 years:** 500 micrograms up to 4 times a day, for occasional use only
- ▶ **BY MOUTH**
- ▶ **Child 1 month–6 years:** 75 micrograms/kg 3 times a day (max. per dose 2.5 mg), administration by mouth is not recommended
- ▶ **Child 7–14 years:** 2.5 mg 2–3 times a day, administration by mouth is not recommended
- ▶ **Child 15–17 years:** Initially 2.5 mg 3 times a day, then increased if necessary to 5 mg 3 times a day, administration by mouth is not recommended

Uncomplicated premature labour (between 22 and 37 weeks of gestation) (specialist supervision in hospital)

- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Adult:** Initially 5 micrograms/minute for 20 minutes, then increased in steps of 2.5 micrograms/minute every 20 minutes until contractions have ceased (more than 10 micrograms/minute should **seldom** be given—20 micrograms/minute should **not** be exceeded), continue for 1 hour, then reduced in steps of 2.5 micrograms/minute every 20 minutes to lowest dose that maintains suppression (maximum total duration 48 hours)

PHARMACOKINETICS

- ▶ At recommended inhaled doses, the duration of action of terbutaline is about 3 to 5 hours.

- **UNLICENSED USE** Tablets not licensed for use in children under 7 years. Injection not licensed for use in children under 2 years.

● **CONTRA-INDICATIONS**

- ▶ When used for uncomplicated premature labour · Abruptio placentae · antepartum haemorrhage · cord compression · eclampsia · history of cardiac disease · intra-uterine fetal

death · intra-uterine infection · placenta praevia · pulmonary hypertension · severe pre-eclampsia · significant risk factors for myocardial ischaemia · threatened miscarriage

- **CAUTIONS** High doses of beta₂ agonists can be dangerous in some children · mild to moderate pre-eclampsia (when used for uncomplicated premature labour) · suspected cardiovascular disease (should be assessed by a cardiologist before initiating therapy for uncomplicated premature labour)
- **INTERACTIONS** → Appendix 1: beta₂ agonists
- **SIDE-EFFECTS**
 - GENERAL SIDE-EFFECTS**
 - ▶ **Common or very common** Hypotension · muscle spasms
 - ▶ **Rare or very rare** Vasodilation
 - ▶ **Frequency not known** Angioedema · anxiety · behaviour abnormal · bronchospasm · circulatory collapse · oral irritation · skin reactions · sleep disorder · throat irritation
 - SPECIFIC SIDE-EFFECTS**
 - ▶ **Uncommon**
 - ▶ With parenteral use Pulmonary oedema
 - ▶ **Rare or very rare**
 - ▶ With parenteral use Lactic acidosis
 - ▶ **Frequency not known**
 - ▶ With parenteral use Akathisia · bleeding tendency
 - **PREGNANCY** Inhaled drugs for asthma can be taken as normal during pregnancy.
 - **BREAST FEEDING** Inhaled drugs for asthma can be taken as normal during breast-feeding.
 - **MONITORING REQUIREMENTS** In uncomplicated premature labour it is important to monitor blood pressure, pulse rate (should not exceed 120 beats per minute), ECG (discontinue treatment if signs of myocardial ischaemia develop), blood glucose and lactate concentrations, and the patient's fluid and electrolyte status (avoid over-hydration—discontinue drug immediately and initiate diuretic therapy if pulmonary oedema occurs).
 - **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use in children For *continuous intravenous infusion*, dilute to a concentration of 5 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; if fluid-restricted, dilute to a concentration of 100 micrograms/mL.
 - ▶ When used by inhalation For *nebulisation*, dilute nebuliser solution with sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; terbutaline and ipratropium bromide solutions are compatible and may be mixed for nebulisation.
 - ▶ With intravenous use in adults For *bronchodilation by continuous intravenous infusion*, dilute 1.5–2.5 mg with 500 mL glucose 5% or sodium chloride 0.9% and give over 8–10 hours. For *premature labour by continuous intravenous infusion*, dilute in glucose 5% and give via controlled infusion device preferably a syringe pump; if syringe pump available dilute to a concentration of 100 micrograms/mL; if syringe pump not available dilute to a concentration of 10 micrograms/mL; close attention to patient's fluid and electrolyte status essential.
 - **PATIENT AND CARER ADVICE**
 - ▶ When used by inhalation For *inhalation by dry powder*, advise patients and carers not to exceed prescribed dose and to follow manufacturer's directions; if a previously effective dose of inhaled terbutaline fails to provide at least 3 hours relief, a doctor's advice should be obtained as soon as possible. For *inhalation by nebuliser*, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution.

CORTICOSTEROIDS

Corticosteroids (inhaled)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

● SIDE-EFFECTS

- ▶ **Common or very common** Headache · oral candidiasis · pneumonia (in patients with COPD) · taste altered · voice alteration
- ▶ **Uncommon** Anxiety · bronchospasm paradoxical · cataract · vision blurred
- ▶ **Rare or very rare** Adrenal suppression · behaviour abnormal · glaucoma · growth retardation (in children) · sleep disorder

SIDE-EFFECTS, FURTHER INFORMATION Systemic absorption may follow inhaled administration particularly if high doses are used or if treatment is prolonged. Therefore also consider the side-effects of systemic corticosteroids.

Candidiasis The risk of oral candidiasis can be reduced by using a spacer device with the corticosteroid inhaler; rinsing the mouth with water after inhalation of a dose may also be helpful. An anti-fungal oral suspension or oral gel can be used to treat oral candidiasis without discontinuing corticosteroid therapy.

Paradoxical bronchospasm The potential for paradoxical bronchospasm (calling for discontinuation and alternative therapy) should be borne in mind. Mild bronchospasm may be prevented by inhalation of a short-acting beta₂ agonist beforehand (or by transfer from an aerosol inhalation to a dry powder inhalation).

- **PREGNANCY** Inhaled drugs for asthma can be taken as normal during pregnancy.

- **BREAST FEEDING** Inhaled corticosteroids for asthma can be taken as normal during breast-feeding.
- **MONITORING REQUIREMENTS**
 - ▶ In children The height and weight of children receiving prolonged treatment with inhaled corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Inhaled corticosteroids for the treatment of chronic asthma in children under 12 years (November 2007) NICE TA131**
For children under 12 years with chronic asthma in whom treatment with an inhaled corticosteroid is considered appropriate, the least costly product that is suitable for an individual child (taking into consideration NICE TAs 38 and 10), within its marketing authorisation, is recommended. For children under 12 years with chronic asthma in whom treatment with an inhaled corticosteroid and a long-acting beta₂ agonist is considered appropriate, the following apply:
 - the use of a combination inhaler within its marketing authorisation is recommended as an option;
 - the decision to use a combination inhaler or two agents in separate inhalers should be made on an individual basis, taking into consideration therapeutic need and the likelihood of treatment adherence;
 - if a combination inhaler is chosen, then the least costly inhaler that is suitable for the individual child is recommended.

www.nice.org.uk/guidance/ta131

- ▶ **Inhaled corticosteroids for the treatment of chronic asthma in adults and children over 12 years (March 2008) NICE TA138**
For adults and children over 12 years with chronic asthma in whom treatment with an inhaled corticosteroid is considered appropriate, the least costly product that is suitable for an individual (taking into consideration NICE TAs 38 and 10), within its marketing authorisation is recommended. For adults and children over 12 years with chronic asthma in whom treatment with an inhaled corticosteroid and a long-acting beta₂ agonist is considered appropriate, the following apply:
 - the use of a combination inhaler within its marketing authorisation is recommended as an option;
 - the decision to use a combination inhaler or two agents in separate inhalers should be made on an individual basis, taking into consideration therapeutic need, and the likelihood of treatment adherence;
 - if a combination inhaler is chosen, then the least costly inhaler that is suitable for the individual is recommended.

Beclometasone dipropionate (Beclomethasone dipropionate)

15-May-2020

- **INDICATIONS AND DOSE**

Prophylaxis of asthma

- ▶ BY INHALATION OF POWDER
 - ▶ Child 5–11 years: 100–200 micrograms twice daily, dose to be adjusted as necessary
 - ▶ Child 12–17 years: 200–400 micrograms twice daily; increased if necessary up to 800 micrograms twice daily, dose to be adjusted as necessary
 - ▶ Adult: 200–400 micrograms twice daily; increased if necessary up to 800 micrograms twice daily, dose to be adjusted as necessary

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose adjustments may be required for some inhaler devices, see under individual preparations.

CLENIL MODULITE®
Prophylaxis of asthma

- ▶ BY INHALATION OF AEROSOL
 - ▶ Child 2–11 years: 100–200 micrograms twice daily
 - ▶ Child 12–17 years: 200–400 micrograms twice daily, adjusted according to response; increased if necessary up to 1 mg twice daily
 - ▶ Adult: 200–400 micrograms twice daily, adjusted according to response; increased if necessary up to 1 mg twice daily

KELHALE®
Prophylaxis of asthma

- ▶ BY INHALATION OF AEROSOL
 - ▶ Adult: 50–200 micrograms twice daily; increased if necessary up to 400 micrograms twice daily

POTENCY

- ▶ *Kelhale*® has extra-fine particles and is more potent than traditional beclometasone dipropionate CFC-containing inhalers.

QVAR® PREPARATIONS
Prophylaxis of asthma

- ▶ BY INHALATION OF AEROSOL
 - ▶ Child 5–11 years: 50–100 micrograms twice daily
 - ▶ Child 12–17 years: 50–200 micrograms twice daily; increased if necessary up to 400 micrograms twice daily
 - ▶ Adult: 50–200 micrograms twice daily; increased if necessary up to 400 micrograms twice daily

POTENCY

- ▶ *Qvar*® has extra-fine particles, is more potent than traditional beclometasone dipropionate CFC-containing inhalers and is approximately twice as potent as *Clenil Modulite*®.

SOPROBEC®
Prophylaxis of asthma

- ▶ BY INHALATION OF AEROSOL
 - ▶ Child: 100 micrograms twice daily; increased if necessary up to 400 micrograms daily in 2–4 divided doses
 - ▶ Adult: 200 micrograms twice daily, adjusted according to response; increased if necessary up to 2 mg daily in 2–4 divided doses

- **UNLICENSED USE**

- ▶ In children *Easyhaler*® *Beclometasone Dipropionate* is not licensed for use in children. *Clenil Modulite*® 200 and 250 are not licensed for use in children.

IMPORTANT SAFETY INFORMATION
MHRA/CHM ADVICE (JULY 2008)

Beclometasone dipropionate CFC-free pressurised metered-dose inhalers (*Qvar*® and *Clenil Modulite*®) are **not** interchangeable and should be prescribed by brand name; *Qvar*® has extra-fine particles, is more potent than traditional beclometasone dipropionate CFC-containing inhalers, and is approximately twice as potent as *Clenil Modulite*®.

MHRA/CHM ADVICE: PRESSURISED METERED DOSE INHALERS (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)

See Respiratory system, drug delivery p. 249.

- **INTERACTIONS** → Appendix 1: corticosteroids

- **SIDE-EFFECTS**

- ▶ **Common or very common** Throat irritation

- ▶ **Rare or very rare** Wheezing

- **PRESCRIBING AND DISPENSING INFORMATION** The MHRA has advised (July 2008) that beclometasone dipropionate CFC-free inhalers should be prescribed by brand name. Pressurised metered-doses inhalers with extra-fine particles (*Qvar*® and *Kelhale*®) are more potent than, and

not interchangeable with, traditional CFC-containing and CFC-free inhalers (*Clenil Modulite*[®] and *Soprobec*[®]).

KELHALE[®] Manufacturer advises when switching a patient with well-controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of *Kelhale*[®] should be prescribed for 200–250 micrograms of budesonide and for 100 micrograms of fluticasone propionate; the dose of *Kelhale*[®] should be adjusted according to response, up to a maximum of 800 micrograms daily. Manufacturer advises when switching a patient with poorly-controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of *Kelhale*[®] should be prescribed for 100 micrograms of budesonide or fluticasone propionate; the dose of *Kelhale*[®] should be adjusted according to response, up to a maximum of 800 micrograms daily.

QVAR[®] **PREPARATIONS** When switching a patient with well-controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of *Qvar*[®] should be prescribed for 200–250 micrograms of beclomethasone dipropionate or budesonide and for 100 micrograms of fluticasone propionate. When switching a patient with poorly controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of *Qvar*[®] should be prescribed for 100 micrograms of beclomethasone dipropionate, budesonide, or fluticasone propionate; the dose of *Qvar*[®] should be adjusted according to response.

- **PATIENT AND CARER ADVICE** Steroid card should be issued with high doses of inhaled beclomethasone dipropionate. Medicines for Children leaflet: Beclomethasone inhaler for asthma prevention (prophylaxis) www.medicinesforchildren.org.uk/beclomethasone-inhaler-asthma-prevention-prophylaxis-0

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Clenil Modulite[®] 50 micrograms/metered inhalation may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Beclomethasone dipropionate 250 microgram per 1 dose Soprobec 250micrograms/dose inhaler | 200 dose [PoM] £12.22 DT = £16.29

Beclomethasone with formoterol

14-May-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, beclomethasone dipropionate p. 271, formoterol fumarate p. 264.

● INDICATIONS AND DOSE

FOSTAIR NEXTHALER[®] 100/6

Asthma maintenance therapy

- ▶ BY INHALATION OF POWDER

- ▶ Adult: 1–2 inhalations twice daily; maximum 4 inhalations per day

Asthma, maintenance and reliever therapy

- ▶ BY INHALATION OF POWDER

- ▶ Adult: Maintenance 1 inhalation twice daily; 1 inhalation as required, for relief of symptoms; maximum 8 inhalations per day

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 50% of predicted

- ▶ BY INHALATION OF POWDER

- ▶ Adult: 2 inhalations twice daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ For inhalation of powder, when switching patients from other beclomethasone dipropionate formulations with non-extrafine particle size distribution to *Fostair NEXThaler*[®], the dose should be adjusted according to response.

- ▶ 1 inhalation is equivalent to 100 micrograms beclomethasone dipropionate and 6 micrograms formoterol fumarate.

FOSTAIR NEXTHALER[®] 200/6

Asthma maintenance therapy

- ▶ BY INHALATION OF POWDER

- ▶ Adult: 2 inhalations twice daily; maximum 4 inhalations per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ For inhalation of powder, when switching patients from other beclomethasone dipropionate formulations with non-extrafine particle size distribution to *Fostair NEXThaler*[®], the dose should be adjusted according to response.

- ▶ 1 inhalation is equivalent to 200 micrograms beclomethasone dipropionate and 6 micrograms formoterol fumarate.

FOSTAIR[®] 100/6

Asthma maintenance therapy

- ▶ BY INHALATION OF AEROSOL

- ▶ Adult: 1–2 inhalations twice daily; maximum 4 inhalations per day

Asthma, maintenance and reliever therapy

► BY INHALATION OF AEROSOL

- Adult: Maintenance 1 inhalation twice daily; 1 inhalation as required, for relief of symptoms; maximum 8 inhalations per day

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 50% of predicted

► BY INHALATION OF AEROSOL

- Adult: 2 inhalations twice daily

DOSE EQUIVALENCE AND CONVERSION

- For inhalation of aerosol, when switching patients from other beclometasone dipropionate and formoterol fumarate inhalers, dose should be adjusted according to response—100 micrograms of beclometasone dipropionate extrafine in *Fostair*[®] is equivalent to 250 micrograms of beclometasone dipropionate in a non-extrafine formulation.
- 1 inhalation is equivalent to 100 micrograms beclometasone dipropionate and 6 micrograms formoterol fumarate.

FOSTAIR[®] 200/6**Asthma maintenance therapy**

► BY INHALATION OF AEROSOL

- Adult: 2 inhalations twice daily; maximum 4 inhalations per day

DOSE EQUIVALENCE AND CONVERSION

- For inhalation of aerosol, when switching patients from other beclometasone dipropionate and formoterol fumarate inhalers, dose should be adjusted according to response—100 micrograms of beclometasone dipropionate extrafine in *Fostair*[®] is equivalent to 250 micrograms of beclometasone dipropionate in a non-extrafine formulation.
- 1 inhalation is equivalent to 200 micrograms beclometasone dipropionate and 6 micrograms formoterol fumarate.

IMPORTANT SAFETY INFORMATION**MHRA/CHM ADVICE (JULY 2008)**

Fostair[®] contains extra-fine particles of beclometasone dipropionate and is more potent than traditional beclometasone dipropionate CFC-free inhalers. The dose of beclometasone dipropionate in *Fostair*[®] should be lower than non-extra-fine formulations of beclometasone dipropionate and will need to be adjusted to the individual needs of the patient.

- **INTERACTIONS** → Appendix 1: beta₂ agonists · corticosteroids
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer beclometasone with formoterol aerosol for inhalation. With high doses, a steroid card should be supplied.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

▶ BY INHALATION OF POWDER

- ▶ Child 12–17 years: Maintenance 2 puffs daily in 1–2 divided doses, increased if necessary to 2 puffs twice daily; 1 puff as required for relief of symptoms, increased if necessary up to 6 puffs as required, max. 8 puffs per day; up to 12 puffs daily can be used for a limited time but medical assessment is recommended
- ▶ Adult: Maintenance 2 puffs daily in 1–2 divided doses, increased if necessary to 2 puffs twice daily; 1 puff as required for relief of symptoms, increased if necessary up to 6 puffs as required, max. 8 puffs per day; up to 12 puffs daily can be used for a limited time but medical assessment is recommended

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 70% of predicted (post bronchodilator)

▶ BY INHALATION OF POWDER

- ▶ Adult: 2 puffs twice daily

SYMBICORT 400/12 TURBOHALER®**Asthma, maintenance therapy**

▶ BY INHALATION OF POWDER

- ▶ Child 12–17 years: Initially 1 puff twice daily; reduced to 1 puff daily, dose reduced only if control is maintained
- ▶ Adult: Initially 1 puff twice daily, increased if necessary up to 2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 70% of predicted (post bronchodilator)

▶ BY INHALATION OF POWDER

- ▶ Adult: 1 puff twice daily

SYMBICORT® 200/6 PRESSURISED INHALER**Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 70% of predicted (post bronchodilator)**

▶ BY INHALATION OF AEROSOL

- ▶ Adult: 2 inhalations twice daily

- **INTERACTIONS** → Appendix 1: beta₂ agonists - corticosteroids

- **PATIENT AND CARER ADVICE** Patient counselling is advised for budesonide with formoterol inhalation (administration).

With high doses, a steroid card should be supplied.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

- ▶ In adults The *Scottish Medicines Consortium* has advised (June 2007) that budesonide/formoterol 100 micrograms/6 micrograms and 200 micrograms/6 micrograms (*Symbicort*® SMART®) is accepted for use within NHS Scotland, in adults, for regular treatment of asthma where use of a combination (inhaled corticosteroid and a long-acting β₂ agonist) is appropriate; *Symbicort* is taken as regular maintenance treatment and as needed in response to symptoms.
- ▶ In children The *Scottish Medicines Consortium* has advised (June 2017) that budesonide/formoterol 100 micrograms/6 micrograms and 200 micrograms/6 micrograms (*Symbicort*® SMART®) is accepted for use within NHS Scotland for regular treatment of asthma where use of a combination (inhaled corticosteroid and a long-acting β₂ adrenoceptor agonist) is appropriate: patients already adequately controlled on both or patients not adequately controlled with inhaled corticosteroids and “as needed” short-acting β₂ adrenoceptor agonists. This advice relates to the extension of the license for *Symbicort* maintenance and reliever therapy (SMART®) to adolescents aged 12 years and over.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Fluticasone

● INDICATIONS AND DOSE

Prophylaxis of asthma

▶ BY INHALATION OF POWDER

- ▶ Child 5-15 years: Initially 50-100 micrograms twice daily (max. per dose 200 micrograms twice daily), dose to be adjusted as necessary
- ▶ Child 16-17 years: Initially 100-500 micrograms twice daily (max. per dose 1 mg twice daily), dose may be increased according to severity of asthma. Doses above 500 micrograms twice daily initiated by a specialist
- ▶ Adult: Initially 100-500 micrograms twice daily (max. per dose 1 mg twice daily), dose may be increased according to severity of asthma. Doses above 500 micrograms twice daily initiated by a specialist

▶ BY INHALATION OF AEROSOL

- ▶ Child 4-15 years: Initially 50-100 micrograms twice daily (max. per dose 200 micrograms twice daily), dose to be adjusted as necessary
- ▶ Child 16-17 years: Initially 100-500 micrograms twice daily (max. per dose 1 mg twice daily), dose may be increased according to severity of asthma. Doses above 500 micrograms twice daily initiated by a specialist
- ▶ Adult: Initially 100-500 micrograms twice daily (max. per dose 1 mg twice daily), dose may be increased according to severity of asthma. Doses above 500 micrograms twice daily initiated by a specialist

▶ BY INHALATION OF NEBULISED SUSPENSION

- ▶ Child 4-15 years: 1 mg twice daily
- ▶ Child 16-17 years: 0.5-2 mg twice daily
- ▶ Adult: 0.5-2 mg twice daily

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer fluticasone with formoterol aerosol inhalation.

With high doses, a steroid card should be provided.

● NATIONAL FUNDING/ACCESS DECISIONS**Scottish Medicines Consortium (SMC) decisions**

SMC No. 736/11

The *Scottish Medicines Consortium* has advised (October 2012) that fluticasone propionate with formoterol fumarate metered dose inhaler (*Flutiform*®) is accepted for use within NHS Scotland for the regular treatment of asthma where the use of a combination product (an inhaled corticosteroid and a long-acting beta₂ agonist) is appropriate:

- for patients not adequately controlled with inhaled corticosteroids and 'as required' inhaled short-acting beta₂ agonist, or
 - for patients already adequately controlled on both an inhaled corticosteroid and a long-acting beta₂ agonist.
- SMC No. SMC2178
- ▶ In children The *Scottish Medicines Consortium* has advised (June 2019) that fluticasone propionate with formoterol fumarate (*Flutiform*®) is accepted for use within NHS Scotland for the regular treatment of asthma in children aged 5 to 12 years where the use of a combination product (an inhaled corticosteroid and a long-acting beta₂ agonist) is appropriate:
 - for patients not adequately controlled with inhaled corticosteroids and 'as required' inhaled short-acting beta₂ agonist, or
 - for patients already adequately controlled on both an inhaled corticosteroid and a long-acting beta₂ agonist.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Fluticasone with vilanterol

27-Jul-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluticasone p. 276.

● **INDICATIONS AND DOSE**

RELVAR ELLIPTA[®] 184 MICROGRAMS/22 MICROGRAMS

Prophylaxis of asthma

▶ BY INHALATION OF POWDER

▶ Child 12–17 years: 1 inhalation once daily

▶ Adult: 1 inhalation once daily

RELVAR ELLIPTA[®] 92 MICROGRAMS/22 MICROGRAMS

Prophylaxis of asthma

▶ BY INHALATION OF POWDER

▶ Child 12–17 years: 1 inhalation once daily

▶ Adult: 1 inhalation once daily

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 70% of predicted

▶ BY INHALATION OF POWDER

▶ Adult: 1 inhalation once daily

● **INTERACTIONS** → Appendix 1: beta₂ agonists · corticosteroids

● **SIDE-EFFECTS**

▶ **Common or very common** Abdominal pain · arthralgia · back pain · bone fracture · cough · dysphonia · fever · increased risk of infection · muscle spasms · oropharyngeal pain

▶ **Uncommon** Vision blurred

▶ **Rare or very rare** Angioedema · anxiety

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution. **Dose adjustments** Manufacturer advises maximum dose of 92 microgram/22 microgram once daily in moderate to severe impairment.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer fluticasone with vilanterol powder for inhalation.

A steroid card should be provided.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

- ▶ In adults The *Scottish Medicines Consortium* has advised (April 2014) that fluticasone furoate/vilanterol (*Relvar Ellipta*®) is accepted for restricted use within NHS Scotland in patients with severe chronic obstructive pulmonary disease with a forced expiratory volume in 1 second (FEV₁) less than 50% of the predicted normal value.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

ENZYMЕ INHIBITORS

Human alpha₁-proteinase inhibitor

17-Aug-2017

- **DRUG ACTION** Human alpha₁-proteinase inhibitor is a normal plasma constituent; it inhibits neutrophil elastase (an enzyme released in response to inflammation) in the lungs.

- **INDICATIONS AND DOSE**

Progression of emphysema in patients with severe alpha₁-proteinase inhibitor deficiency, despite optimal treatment with other standard therapies (specialist use only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 60 mg/kg once weekly

- **CONTRA-INDICATIONS** IgA deficiency with confirmed antibodies against IgA—increased risk of severe hypersensitivity reactions

- **CAUTIONS** Consider vaccination against hepatitis A and hepatitis B · hypersensitivity reactions · IgA deficiency (without known antibodies to IgA)—increased risk of hypersensitivity reactions

CAUTIONS, FURTHER INFORMATION

- ▶ Hypersensitivity reactions Hypersensitivity reactions may occur, even in patients who have previously tolerated treatment. Manufacturer advises close monitoring, including vital signs, during the first infusions. If a reaction occurs, manufacturer advises to decrease the rate of infusion or discontinue treatment; if symptoms improve promptly after stopping, the infusion may be resumed at a slower infusion rate.

- **SIDE-EFFECTS**

- ▶ **Common or very common** Dizziness · headache · nausea
- ▶ **Uncommon** Asthenia · confusion · flushing · hypersensitivity · hypotension · sensation abnormal · skin reactions · syncope · tachycardia · throat oedema
- ▶ **Rare or very rare** Chest pain · chills · fever · hyperhidrosis
- ▶ **Frequency not known** Eye swelling · facial swelling · lip swelling · lymph node pain

- **PREGNANCY** Manufacturer advises caution—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **PRESCRIBING AND DISPENSING INFORMATION**

Manufacturer advises to record the brand name and batch number after each administration (in case of transmission of infective agents).

- **PATIENT AND CARER ADVICE** Manufacturer advises patients receiving treatment at home should receive appropriate training regarding self-administration, and be informed of the signs of hypersensitivity reactions.
- Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (August 2016) that human alpha₁-proteinase inhibitor (*Respreeza*®) is not recommended for use within NHS Scotland for maintenance treatment, to slow the progression of emphysema in adults with documented severe alpha₁-proteinase inhibitor deficiency. The manufacturer did not present a sufficiently robust clinical or economic analysis.

All Wales Medicines Strategy Group (AWMSG) decisions

The *All Wales Medicines Strategy Group* has advised (March 2017) that human alpha₁-proteinase inhibitor (*Respreeza*®) is **not** recommended for use within NHS Wales for maintenance treatment, to slow the progression of emphysema in adults with documented severe alpha₁-proteinase inhibitor deficiency. The case for clinical and cost-effectiveness has not been proven.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for infusion

ELECTROLYTES: May contain Sodium

Human alpha₁-proteinase inhibitor 1 gram Respreeza 1000mg powder and solvent for solution for infusion vials | 1 vial [POM] £220.00

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES**Benralizumab**

27-Mar-2019

- **DRUG ACTION** Benralizumab is a humanised monoclonal antibody that interferes with interleukin-5 receptor binding, thereby reducing the survival of eosinophils and basophils.

INDICATIONS AND DOSE**Severe eosinophilic asthma (specialist use only)**

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 30 mg every 4 weeks for the first 3 doses, then maintenance 30 mg every 8 weeks, to be administered into the thigh, abdomen or upper arm

PHARMACOKINETICS

- ▶ The half-life of benralizumab is approx. 15 days.

- **CAUTIONS** Pre-existing helminth infection
- CAUTIONS, FURTHER INFORMATION**
 - ▶ Helminth infection Manufacturer advises to treat pre-existing helminth infections before starting benralizumab—if patient becomes infected during therapy and does not respond to anti-helminth treatment, discontinue benralizumab until infection is resolved.
- **SIDE-EFFECTS**
 - ▶ Common or very common Fever · headache · hypersensitivity (may be delayed) · increased risk of infection · skin reactions
 - ▶ Frequency not known Anaphylactic reaction
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—limited data available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to take the syringe out of the refrigerator at least 30 minutes before administration, and to avoid injecting into areas of the skin that are tender, bruised, erythematous, or hardened—consult product literature for further information.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be instructed to seek medical advice if their asthma remains uncontrolled or if symptoms worsen after initiation of treatment.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ Benralizumab for treating severe eosinophilic asthma (updated September 2019) NICE TA565 Benralizumab (*Fasenra*®), as an add-on therapy, is recommended as an option for treating severe eosinophilic

asthma that is inadequately controlled in adults despite maintenance therapy with high-dose inhaled corticosteroids and long-acting beta-agonists, only if:

- the patient has agreed to and followed the optimised standard treatment plan, **and**
- the blood eosinophil count has been recorded as 300 cells per microlitre or more and the patient has had 4 or more exacerbations needing systemic corticosteroids in the previous 12 months, or has had continuous oral corticosteroids of at least the equivalent of prednisolone 5 mg per day over the previous 6 months (that is, the patient is eligible for mepolizumab), **or**
- the blood eosinophil count has been recorded as 400 cells per microlitre or more with 3 or more exacerbations needing systemic corticosteroids in the past 12 months (that is, the patient is eligible for reslizumab).

Benralizumab is recommended only if the manufacturer provides it according to the commercial arrangement.

At 12 months stop benralizumab if the asthma has not responded adequately **or** continue benralizumab if the asthma has responded adequately and assess response each year.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta565

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2155

The *Scottish Medicines Consortium* has advised (June 2019) that benralizumab (*Fasenra*®) is accepted for restricted use within NHS Scotland as an add-on maintenance treatment in adults with severe eosinophilic asthma inadequately controlled despite high-dose inhaled corticosteroids plus long-acting beta-agonists. It is restricted to patients with blood eosinophils ≥ 150 cells/microlitre, and either ≥ 4 prior asthma exacerbations needing systemic corticosteroids in the previous 12 months or treatment with continuous oral corticosteroids over the previous 6 months. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Fasenra** (AstraZeneca UK Ltd) ▼

Benralizumab 30 mg per 1 ml Fasenra 30mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [POM] £1,955.00

Mepolizumab

09-Oct-2019

- **DRUG ACTION** Mepolizumab is a humanised anti-interleukin-5 (anti-IL-5) monoclonal antibody; it reduces the production and survival of eosinophils.

INDICATIONS AND DOSE**Add on treatment for severe refractory eosinophilic asthma (under expert supervision)**

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 100 mg every 4 weeks

- **CAUTIONS** Helminth infection
- CAUTIONS, FURTHER INFORMATION**
 - ▶ Helminth infections Manufacturer advises pre-existing helminth infections should be treated before initiation of therapy; if patients become infected during treatment and do not respond to anti-helminth treatment, consider treatment interruption.

● SIDE-EFFECTS

▶ **Common or very common** Abdominal pain upper · administration related reaction · back pain · eczema · fever · headache · hypersensitivity · increased risk of infection · nasal congestion

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—limited data available.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises injection is given into the thigh, abdomen, or upper arm. Patients may self-administer *Nucala*® pre-filled devices into the thigh or abdomen after appropriate training in preparation and administration.

● PRESCRIBING AND DISPENSING INFORMATION

Mepolizumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines and Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.

● PATIENT AND CARER ADVICE

Asthma Patients and their carers should be advised to seek medical advice if their asthma remains uncontrolled or worsens after initiation of treatment.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

▶ **Mepolizumab for treating severe refractory eosinophilic asthma (January 2017)** NICE TA431

Mepolizumab (*Nucala*®), as an add-on to optimised standard therapy, is recommended as an option for treating severe refractory eosinophilic asthma in adults, only if:

- the blood eosinophil count is 300 cells/microlitre or more in the previous 12 months, **and**
- the person has agreed to and followed the optimised standard treatment plan **and** has had 4 or more asthma exacerbations requiring systemic corticosteroids in the previous 12 months **or** had continuous oral corticosteroids of at least the equivalent of prednisolone 5 mg per day over the previous 6 months, **and**
- the manufacturer provides mepolizumab with the discount agreed in the patient access scheme.

At 12 months of treatment:

- stop mepolizumab if the asthma has not responded adequately, **or**
- continue treatment if the asthma has responded adequately and assess response each year.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta431

Scottish Medicines Consortium (SMC) decisions

SMC No. 1149/16

The *Scottish Medicines Consortium* has advised (June 2016) that mepolizumab (*Nucala*®) is accepted for restricted use within NHS Scotland as an add-on treatment for severe refractory eosinophilic asthma in adults who have eosinophils of at least 150 cells/microlitre ($0.15 \times 10^9/L$) at initiation of treatment and have had at least four asthma exacerbations in the preceding year or are receiving maintenance treatment with oral corticosteroids. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Omalizumab

27-Mar-2020

● INDICATIONS AND DOSE

Prophylaxis of severe persistent allergic asthma

▶ BY SUBCUTANEOUS INJECTION

▶ **Adult:** Dose according to immunoglobulin E concentration and body-weight (consult product literature)

Add-on therapy for chronic spontaneous urticaria in patients who have had an inadequate response to H₁ antihistamine treatment

▶ BY SUBCUTANEOUS INJECTION

▶ **Adult:** 300 mg every 4 weeks

● **CAUTIONS** Autoimmune disease · susceptibility to helminth infection—discontinue if infection does not respond to anthelmintic

● SIDE-EFFECTS

▶ **Common or very common** Headache · skin reactions

▶ **Uncommon** Cough · diarrhoea · dizziness · drowsiness · dyspepsia · fatigue · flushing · increased risk of infection · influenza like illness · limb swelling · nausea · paraesthesia · photosensitivity reaction · postural hypotension · respiratory disorders · syncope · weight increased

▶ **Rare or very rare** Angioedema · hypersensitivity · systemic lupus erythematosus (SLE)

▶ **Frequency not known** Alopecia · eosinophilic granulomatosis with polyangiitis · immune thrombocytopenic purpura · joint disorders · lymphadenopathy · myalgia

SIDE-EFFECTS, FURTHER INFORMATION Eosinophilic granulomatosis with polyangiitis (Churg-Strauss syndrome)

Churg-Strauss syndrome has occurred rarely in patients given omalizumab; the reaction is usually associated with the reduction of oral corticosteroid therapy. Churg-Strauss syndrome can present as eosinophilia, vasculitic rash, cardiac complications, worsening pulmonary symptoms, or peripheral neuropathy.

Hypersensitivity reactions Hypersensitivity reactions can also occur immediately following treatment with omalizumab or sometimes more than 24 hours after the first injection.

● **PREGNANCY** Manufacturer advises avoid unless essential—crosses the placenta.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available).

● **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Omalizumab for severe persistent allergic asthma (April 2013)** NICE TA278
Omalizumab is recommended as an option for treating severe persistent confirmed allergic IgE-mediated asthma as an add-on to optimised standard therapy in patients aged 6 years and over:

- who need continuous or frequent treatment with oral corticosteroids (defined as 4 or more courses in the previous year), **and**
- only if the manufacturer makes omalizumab available with the discount agreed in the patient access scheme. Optimised standard therapy is defined as a full trial of and, if tolerated, documented compliance with inhaled high-dose corticosteroids, long-acting beta₂ agonists, leukotriene receptor antagonists, theophyllines, oral corticosteroids, and smoking cessation if clinically appropriate.

Patients currently receiving omalizumab whose disease does not meet the criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta278

- ▶ **Omalizumab for previously treated chronic spontaneous urticaria (June 2015)** NICE TA339

Omalizumab is an option as add-on therapy for the treatment of severe chronic spontaneous urticaria in patients 12 years and over, only if:

- the severity of the condition is assessed objectively, for example, using a weekly urticaria activity score of 28 or more,
- the patient's condition has not responded to standard treatment with H₁-antihistamines and leukotriene receptor antagonists,
- omalizumab is stopped at or before the fourth dose if the condition has not responded,
- omalizumab is stopped at the end of a course of treatment (6 doses) if the condition has responded and is restarted only if the condition relapses,
- omalizumab is administered under the management of a secondary care specialist in dermatology, immunology or allergy,
- the manufacturer provides omalizumab with the discount agreed in the patient access scheme.

Patients currently receiving omalizumab whose disease does not meet the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta339

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (January 2015) that omalizumab (*Xolair*[®]) is accepted for restricted use within NHS Scotland for the treatment of chronic spontaneous urticaria in patients aged 12 years and over, who have had an inadequate response to combination therapy with H₁-antihistamines, leukotriene receptor antagonists and H₂-antihistamines, used according to current treatment guidelines.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Xolair** (Novartis Pharmaceuticals UK Ltd)

Omalizumab 150 mg per 1 ml Xolair 150mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £256.15 DT = £256.15

Xolair 75mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £128.07 DT = £128.07

Reslizumab

01-Nov-2017

- **DRUG ACTION** Reslizumab is a humanised monoclonal antibody that interferes with interleukin-5 receptor binding, thereby reducing the survival and activity of eosinophils.

● INDICATIONS AND DOSE

- **Severe eosinophilic asthma (adjunctive therapy when inadequately controlled by high-dose corticosteroids plus another standard treatment) (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

PHARMACOKINETICS

- ▶ The half-life of reslizumab is approx. 24 days.

- **CAUTIONS** Hypersensitivity reactions · pre-existing helminth infection

CAUTIONS, FURTHER INFORMATION

- ▶ Helminth infection Manufacturer advises to treat pre-existing helminth infections before starting reslizumab—consider temporarily discontinuing reslizumab if patient becomes infected during therapy and does not respond to anti-helminth treatment.
- ▶ Hypersensitivity reactions Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur and manufacturer advises to monitor closely during treatment and for at least 20 minutes after completion of infusion; in the event of a hypersensitivity reaction, treatment should be permanently discontinued.

● SIDE-EFFECTS

- ▶ **Uncommon** Anaphylactic reaction · myalgia
- ▶ **Frequency not known** Secondary malignancy
- **PREGNANCY** Manufacturer advises avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid during first few days after birth—risk of transfer of antibodies to infant cannot be excluded; present in milk in *animal studies*.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, manufacturer advises give intermittently in Sodium chloride 0.9%; administer over 20–50 minutes through an in-line 0.2 micron filter.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after preparation of infusion.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be instructed to seek medical advice if their asthma remains uncontrolled or if symptoms worsen after initiation of treatment.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Reslizumab for treating severe eosinophilic asthma (October 2017)** NICE TA479

Reslizumab, as an add-on therapy, is recommended as an option for the treatment of severe eosinophilic asthma that is inadequately controlled in adults despite maintenance therapy with high-dose inhaled corticosteroids plus another drug, only if:

- the blood eosinophil count has been recorded as 400 cells per microlitre or more, **and**
- the person has had 3 or more severe asthma exacerbations needing systemic corticosteroids in the past 12 months, **and**
- the manufacturer provides reslizumab with the discount agreed in the patient access scheme.

At 12 months, stop reslizumab if the asthma has not responded adequately or continue reslizumab if the asthma has responded adequately and assess response each year.

Patients whose treatment was started within the NHS before this guidance was published should have the option

to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta479

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (December 2017) that reslizumab (*Cinquaero*[®]) is **not** recommended for use within NHS Scotland as add-on therapy in adults with severe eosinophilic asthma inadequately controlled with high-dose inhaled corticosteroids plus another medicinal product for maintenance treatment, as the economic case was not demonstrated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Montelukast

18-Mar-2020

• INDICATIONS AND DOSE

Prophylaxis of asthma

► BY MOUTH

- Child 6 months–5 years: 4 mg once daily, dose to be taken in the evening
- Child 6–14 years: 5 mg once daily, dose to be taken in the evening
- Child 15–17 years: 10 mg once daily, dose to be taken in the evening
- Adult: 10 mg once daily, dose to be taken in the evening

Symptomatic relief of seasonal allergic rhinitis in patients with asthma

► BY MOUTH

- Child 15–17 years: 10 mg once daily, dose to be taken in the evening
- Adult: 10 mg once daily, dose to be taken in the evening

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: MONTELUKAST (*SINGULAIR*[®]): REMINDER OF THE RISK OF NEUROPSYCHIATRIC REACTIONS (SEPTEMBER 2019)

Healthcare professionals are advised to be alert for neuropsychiatric reactions, including speech impairment and obsessive-compulsive symptoms, in adults, adolescents, and children taking montelukast. The risks and benefits of continuing treatment should be evaluated if these reactions occur. Patients should be advised to read the list of neuropsychiatric reactions in the information leaflet and seek immediate medical attention if they occur.

- **INTERACTIONS** → Appendix 1: montelukast
- **SIDE-EFFECTS**
 - **Common or very common** Diarrhoea · fever · gastrointestinal discomfort · headache · nausea · skin reactions · upper respiratory tract infection · vomiting
 - **Uncommon** Akathisia · anxiety · arthralgia · asthenia · behaviour abnormal · depression · dizziness · drowsiness · dry mouth · haemorrhage · irritability · malaise · muscle complaints · oedema · seizure · sensation abnormal · sleep disorders
 - **Rare or very rare** Angioedema · concentration impaired · disorientation · eosinophilic granulomatosis with polyangiitis · erythema nodosum · hallucination · hepatic

disorders · memory loss · palpitations · psychiatric disorders · pulmonary eosinophilia · speech disorder · suicidal tendencies · tremor

SIDE-EFFECTS, FURTHER INFORMATION Eosinophilic granulomatosis with polyangiitis (Churg-Strauss syndrome) has occurred very rarely in association with the use of montelukast; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. Prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or peripheral neuropathy.

- **PREGNANCY** Manufacturer advises avoid unless essential. There is limited evidence for the safe use of montelukast during pregnancy; however, it can be taken as normal in women who have shown a significant improvement in asthma not achievable with other drugs before becoming pregnant.
- **BREAST FEEDING** Manufacturer advises avoid unless essential.
- **DIRECTIONS FOR ADMINISTRATION** Granules may be swallowed or mixed with cold, soft food (not liquid) and taken immediately.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of chewable tablet formulations may include cherry.
- **PATIENT AND CARER ADVICE** Administration Patients or carers should be given advice on how to administer montelukast granules. Risk of neuropsychiatric reactions The MHRA advises patients and carers to seek medical attention if changes in speech or behaviour occur—see also *Important safety information*. Medicines for Children leaflet: Montelukast for asthma www.medicinesforchildren.org.uk/montelukast-asthma

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

● INDICATIONS AND DOSE

Prophylaxis of asthma

- ▶ BY INHALATION OF AEROSOL
- ▶ Child 5–17 years: Initially 4 mg 4 times a day, when control achieved may be possible to reduce to twice daily
- ▶ Adult: Initially 4 mg 4 times a day, when control achieved may be possible to reduce to twice daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ 2 puffs = 4 mg.

● UNLICENSED USE

- ▶ In children Not licensed for use in children under 6 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PRESSURISED METERED DOSE INHALERS (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)

See Respiratory system, drug delivery p. 249.

● SIDE-EFFECTS

- ▶ **Common or very common** Bronchospasm · cough · gastrointestinal discomfort · headache · nausea · taste altered · vomiting
 - ▶ **Frequency not known** Pharyngitis · throat irritation
- SIDE-EFFECTS, FURTHER INFORMATION** If paradoxical bronchospasm occurs, a fast-acting inhaled bronchodilator such as salbutamol or terbutaline should be used to control symptoms; treatment with nedocromil should be discontinued.

- **PREGNANCY** Inhaled drugs can be taken as normal during pregnancy.

- **BREAST FEEDING** Inhaled drugs can be taken as normal during breast-feeding.

- **TREATMENT CESSATION** Withdrawal should be done gradually over a period of one week—symptoms of asthma may recur.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of inhalers may include mint.

- **PATIENT AND CARER ADVICE** Regular use is necessary. Patient counselling is advised for Nedocromil aerosol for inhalation (administration).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Pressurised inhalation

CAUTIONARY AND ADVISORY LABELS 8

- ▶ **Tilade** (Sanofi)

Sodium cromoglicate

21-May-2020

(Sodium cromoglycate)

● INDICATIONS AND DOSE

Prophylaxis of asthma

- ▶ BY INHALATION OF AEROSOL
- ▶ Child 5–17 years: Initially 10 mg 4 times a day, additional dose may also be taken before exercise, increased if necessary to 10 mg 6–8 times a day; maintenance 5 mg 4 times a day, 5 mg is equivalent to 1 puff
- ▶ Adult: Initially 10 mg 4 times a day, additional dose may also be taken before exercise, increased if necessary to 10 mg 6–8 times a day; maintenance 5 mg 4 times a day, 5 mg is equivalent to 1 puff

Food allergy (in conjunction with dietary restriction)

- ▶ BY MOUTH
- ▶ Child 2–13 years: Initially 100 mg 4 times a day for 2–3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals
- ▶ Child 14–17 years: Initially 200 mg 4 times a day for 2–3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals
- ▶ Adult: Initially 200 mg 4 times a day for 2–3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PRESSURISED METERED DOSE INHALERS (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)

See Respiratory system, drug delivery p. 249.

● CAUTIONS

- ▶ When used by inhalation Discontinue if eosinophilic pneumonia occurs

● SIDE-EFFECTS

- ▶ When used by inhalation Cough · headache · pneumonia eosinophilic · rhinitis · throat irritation
 - ▶ With oral use Arthralgia · nausea · rash
- SIDE-EFFECTS, FURTHER INFORMATION** When used by inhalation, if paradoxical bronchospasm occurs, a short-acting beta₂-agonist should be used to control symptoms; treatment with sodium cromoglicate should be discontinued.

- **PREGNANCY** Not known to be harmful.

- ▶ When used by inhalation Can be taken as normal during pregnancy.

- **BREAST FEEDING** Unlikely to be present in milk.

- ▶ When used by inhalation Can be taken as normal during breast-feeding.

● TREATMENT CESSATION

- ▶ When used by inhalation Withdrawal of sodium cromoglicate should be done gradually over a period of one week—symptoms of asthma may recur.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With oral use Capsules may be swallowed whole or the contents dissolved in hot water and diluted with cold water before taking.

● PATIENT AND CARER ADVICE

- ▶ With oral use Patient counselling is advised for sodium cromoglicate capsules (administration).
- ▶ When used by inhalation Patient counselling is advised for sodium cromoglicate pressurised inhalation (administration).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Capsule

CAUTIONARY AND ADVISORY LABELS 22

PHOSPHODIESTERASE TYPE-4 INHIBITORS

Roflumilast

14-Jan-2020

- **DRUG ACTION** Roflumilast is a phosphodiesterase type-4 inhibitor with anti-inflammatory properties.

● **INDICATIONS AND DOSE**

Adjunct to bronchodilators for the maintenance treatment of patients with severe chronic obstructive pulmonary disease associated with chronic bronchitis and a history of frequent exacerbations

▶ **BY MOUTH**

- ▶ **Adult:** Initially 250 micrograms once daily for 28 days, then maintenance 500 micrograms once daily

- **CONTRA-INDICATIONS** Cancer (except basal cell carcinoma) · concomitant treatment with immunosuppressive drugs (except short-term systemic corticosteroids) · history of depression associated with suicidal ideation or behaviour · moderate to severe cardiac failure · severe acute infectious disease · severe immunological disease

- **CAUTIONS** History of psychiatric illness (discontinue if new or worsening psychiatric symptoms occur) · latent infection (such as tuberculosis, viral hepatitis, herpes infection)

- **INTERACTIONS** → Appendix 1: roflumilast

● **SIDE-EFFECTS**

- **Common or very common** Appetite decreased · diarrhoea · gastrointestinal discomfort · headache · insomnia · nausea · weight decreased

- ▶ **Uncommon** Anxiety · asthenia · back pain · dizziness · gastrointestinal disorders · malaise · muscle complaints · muscle weakness · palpitations · skin reactions · tremor · vertigo · vomiting

- ▶ **Rare or very rare** Angioedema · constipation · depression · gynaecomastia · haematochezia · respiratory tract infection · suicidal tendencies · taste altered

- **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should use effective contraception.

- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

- **MONITORING REQUIREMENTS** Monitor body-weight.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should be instructed to report changes in behaviour or mood and any suicidal ideation. **Patient card** Patients should be given a patient card before starting treatment and advised to record body-weight at regular intervals.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- ▶ **Roflumilast for treating chronic obstructive pulmonary disease (July 2017) NICE TA461**
Roflumilast (*Daxas*®), as an add-on to bronchodilator therapy, is recommended as an option for treating severe chronic obstructive pulmonary disease in patients with chronic bronchitis, only if:
 - the disease is severe, defined as a forced expiratory volume in one second (FEV₁) after a bronchodilator of less than 50% of predicted normal, **and**
 - the person has had two or more exacerbations in the previous 12 months despite triple inhaled therapy with a long-acting muscarinic antagonist, a long-acting beta-2 agonist and an inhaled corticosteroid.
 Treatment with roflumilast should be started by a specialist in respiratory medicine.

Patients currently receiving roflumilast whose disease does not meet the above criteria should be able to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta461

Scottish Medicines Consortium (SMC) decisions

SMC No. 635/10

The *Scottish Medicines Consortium* has advised (September 2017) that roflumilast (*Daxas*®) is not recommended for use within NHS Scotland for maintenance treatment of severe chronic obstructive pulmonary disease (forced expiratory volume in one second [FEV₁] after a bronchodilator of less than 50% predicted) associated with chronic bronchitis in adults with a history of frequent exacerbations as add on to bronchodilator treatment as there was insufficient evidence submitted and the economic case was not demonstrated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Daxas** (AstraZeneca UK Ltd) ▼

SYMPATHOMIMETICS >VASOCONSTRICTOR

Ephedrine hydrochloride

04-Dec-2019

● **INDICATIONS AND DOSE**

Reversal of hypotension from spinal or epidural anaesthesia

▶ **BY SLOW INTRAVENOUS INJECTION**

- ▶ **Adult:** 3–6 mg every 3–4 minutes (max. per dose 9 mg), adjusted according to response, injection solution to contain ephedrine hydrochloride 3 mg/ml; maximum 30 mg per course

Reversible airways obstruction▶ **BY MOUTH**

- ▶ **Adult:** 15–60 mg 3 times a day

Neuropathic oedema▶ **BY MOUTH**

- ▶ **Adult:** 30–60 mg 3 times a day

● **UNLICENSED USE**

- ▶ With oral use Not licensed for neuropathic oedema.

● **CAUTIONS**

GENERAL CAUTIONS Diabetes mellitus · elderly · hypertension · hyperthyroidism · ischaemic heart disease · prostatic hypertrophy (risk of acute urinary retention)

SPECIFIC CAUTIONS

- ▶ With intravenous use Susceptibility to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Anxiety · headache · insomnia · nausea

- ▶ **Frequency not known** Tremor

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**

▶ With intravenous use Arrhythmias · asthenia · confusion · depression · dyspnoea · hyperhidrosis · irritability · palpitations · vomiting

- ▶ **Rare or very rare**

- ▶ With intravenous use Acute urinary retention
- ▶ With oral use Myocardial infarction

- ▶ **Frequency not known**
- ▶ With intravenous use Acute angle closure glaucoma · angina pectoris · appetite decreased · cardiac arrest · dizziness · hypokalaemia · intracranial haemorrhage · psychotic disorder · pulmonary oedema
- ▶ With oral use Arrhythmias · circulation impaired · dry mouth · enuresis · hypertension · sedation
- **PREGNANCY**
- ▶ With oral use Manufacturer advises avoid.
- ▶ With intravenous use Increased fetal heart rate reported with parenteral ephedrine.
- **BREAST FEEDING** Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.
- **RENAL IMPAIRMENT** Use with caution.
- **LESS SUITABLE FOR PRESCRIBING**
- ▶ With oral use Ephedrine tablets are less suitable and less safe for use as a bronchodilator than the selective beta₂ agonists.
- **EXCEPTIONS TO LEGAL CATEGORY**
- ▶ With oral use For exceptions relating to ephedrine tablets see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

Tablet

▶ Ephedrine hydrochloride (Non-proprietary)

Ephedrine hydrochloride 15 mg Ephedrine hydrochloride 15mg tablets | 28 tablet [PoM](#) | £114.24 DT = £76.30

Ephedrine hydrochloride 30 mg Ephedrine hydrochloride 30mg tablets | 28 tablet [PoM](#) | £172.94 DT = £115.61

Solution for injection

Ephedrine hydrochloride 3 mg per 1 ml Ephedrine 30mg/10ml solution for injection ampoules | 10 ampoule [PoM](#) | £107.44

Ephedrine 30mg/10ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM](#) | £7.59–£9.50 | 12 pre-filled disposable injection [PoM](#) | £114.00

Ephedrine hydrochloride 30 mg per 1 ml Ephedrine 30mg/1ml solution for injection ampoules | 10 ampoule [PoM](#) | £52.50–£69.62 DT = £69.62

XANTHINES

Aminophylline

18-Mar-2020

● INDICATIONS AND DOSE

Severe acute asthma in patients not previously treated with theophylline

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Child: 5 mg/kg (max. per dose 500 mg), to be followed by intravenous infusion
- ▶ Adult: 250–500 mg (max. per dose 5 mg/kg), to be followed by intravenous infusion

Severe acute asthma

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 1 month–11 years: 1 mg/kg/hour, adjusted according to plasma-theophylline concentration
- ▶ Child 12–17 years: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration
- ▶ Adult: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration
- ▶ Elderly: 300 micrograms/kg/hour, adjusted according to plasma-theophylline concentration

Severe acute exacerbation of chronic obstructive pulmonary disease in patients not previously treated with theophylline

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 250–500 mg (max. per dose 5 mg/kg), to be followed by intravenous infusion

Severe acute exacerbation of chronic obstructive pulmonary disease

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration
- ▶ Elderly: 300 micrograms/kg/hour, adjusted according to plasma-theophylline concentration

Chronic asthma

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child (body-weight 40 kg and above): Initially 225 mg twice daily for 1 week, then increased if necessary to 450 mg twice daily, adjusted according to plasma-theophylline concentration

Reversible airway obstruction

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult (body-weight 40 kg and above): Initially 225 mg twice daily for 1 week, then increased if necessary to 450 mg twice daily, adjusted according to plasma-theophylline concentration

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Dose adjustment may be necessary if smoking started or stopped during treatment.

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal weight for height.

PHARMACOKINETICS

- ▶ Aminophylline is a stable mixture or combination of theophylline and ethylenediamine; the ethylenediamine confers greater solubility in water.
- ▶ Theophylline is metabolised in the liver. The plasma-theophylline concentration is increased in heart failure, hepatic impairment, and in viral infections. The plasma-theophylline concentration is decreased in smokers, and by alcohol consumption. Differences in the half-life of aminophylline are important because the toxic dose is close to the therapeutic dose.

PHYLLOCONTIN CONTINUS® FORTE

Reversible airways obstruction

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: Initially 350 mg twice daily for 1 week, then increased if necessary to 700 mg twice daily, increase dose according to plasma-theophylline concentration

● UNLICENSED USE

- ▶ In children Aminophylline injection not licensed for use in children under 6 months.

- **CAUTIONS** Arrhythmias following rapid intravenous injection · cardiac arrhythmias or other cardiac disease · elderly (increased plasma-theophylline concentration) · epilepsy · fever · hypertension · peptic ulcer · risk of hypokalaemia · thyroid disorder

- **INTERACTIONS** → Appendix 1: aminophylline

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Headache · nausea · palpitations · seizure (more common when given too rapidly by intravenous injection)

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Abdominal pain · anxiety · arrhythmia (more common when given too rapidly by intravenous injection) · confusion · delirium · diarrhoea · dizziness · electrolyte imbalance · gastrointestinal haemorrhage · gastrooesophageal reflux disease · hyperthermia ·

hyperventilation · hypotension (more common when given too rapidly by intravenous injection) · insomnia · mania · metabolic disorder · pain · skin reactions · tachycardia (more common when given too rapidly by intravenous injection) · thirst · tremor · vertigo · visual impairment · vomiting

- ▶ With oral use Arrhythmias · central nervous system stimulation · epigastric discomfort

SIDE-EFFECTS, FURTHER INFORMATION Potentially serious hypokalaemia may result from beta₂-agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

Overdose Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

For specific details on the management of poisoning, see *Theophylline*, under Emergency treatment of poisoning p. 1430.

- **ALLERGY AND CROSS-SENSITIVITY** Allergy to ethylenediamine can cause urticaria, erythema, and exfoliative dermatitis.
- **PREGNANCY** Neonatal irritability and apnoea have been reported. Theophylline can be taken as normal during pregnancy as it is particularly important that asthma should be well controlled during pregnancy.
- **BREAST FEEDING** Present in milk—irritability in infant reported; modified-release preparations preferable. Theophylline can be taken as normal during breastfeeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of reduced clearance).
Dose adjustments ▶ With oral use Manufacturer advises consider dose reduction.
▶ With intravenous use Manufacturer advises maintenance dose reduction—consult product literature.
- **MONITORING REQUIREMENTS**
 - ▶ Aminophylline is monitored therapeutically in terms of plasma-theophylline concentrations.
 - ▶ Measurement of plasma-theophylline concentration may be helpful and is **essential** if a loading dose of intravenous aminophylline is to be given to patients who are already taking theophylline, because serious side-effects such as convulsions and arrhythmias can occasionally precede other symptoms of toxicity.
 - ▶ In most individuals, a plasma-theophylline concentration of 10–20 mg/litre (55–110 micromol/litre) is required for satisfactory bronchodilation, although a lower plasma-theophylline concentration of 5–15 mg/litre may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.
 - ▶ If aminophylline is given intravenously, a blood sample should be taken 4–6 hours after starting treatment.
 - ▶ With oral use Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should usually be taken 4–6 hours after an oral dose of a modified-release preparation (sampling times may vary—consult local guidelines).
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For *intravenous injection*, give **very slowly** over at least 20 minutes (with close monitoring).

- ▶ With intravenous use in children For *intravenous infusion*, dilute to a concentration of 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%.
- ▶ With intravenous use in adults For *intravenous infusion*, give continuously in Glucose 5% or Sodium Chloride 0.9%.
- ▶ With intramuscular use Aminophylline is too irritant for intramuscular use.

- **PRESCRIBING AND DISPENSING INFORMATION** Patients taking oral theophylline or aminophylline should not normally receive a loading dose of intravenous aminophylline.

Consider intravenous aminophylline for treatment of severe and life-threatening acute asthma only after consultation with senior medical staff.

Modified release The rate of absorption from modified-release preparations can vary between brands. If a prescription for a modified-release oral aminophylline preparation does not specify a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient.

PHYLLOCONTIN CONTINUS[®] FORTE

- ▶ With oral use *Phyllocontin Continus[®] Forte* tablets are for smokers and other patients where theophylline half-life is shorter.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for injection

▶ Aminophylline (Non-proprietary)

Theophylline

27-Apr-2020

● INDICATIONS AND DOSE

UNIPHYLLIN CONTINUS[®]

Chronic asthma

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Child 2-11 years: 9 mg/kg every 12 hours (max. per dose 200 mg), dose may be increased in some children with chronic asthma; increased to 10–16 mg/kg every 12 hours (max. per dose 400 mg), may be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in patients whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily requirement may be added as single evening or morning dose
- ▶ Child 12-17 years: 200 mg every 12 hours, adjusted according to response to 400 mg every 12 hours, may be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in patients whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily requirement may be added as single evening or morning dose

Reversible airways obstruction | Severe acute asthma | Chronic asthma**► BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Adult: 200 mg every 12 hours, adjusted according to response to 400 mg every 12 hours, may be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in patients whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily requirement may be added as single evening or morning dose

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Dose adjustment may be necessary if smoking started or stopped during treatment.

PHARMACOKINETICS

- Theophylline is metabolised in the liver. The plasma-theophylline concentration is increased in heart failure, hepatic impairment, and in viral infections. The plasma-theophylline concentration is decreased in smokers, and by alcohol consumption. Differences in the half-life of theophylline are important because the toxic dose is close to the therapeutic dose.

- CAUTIONS** Cardiac arrhythmias or other cardiac disease · elderly (increased plasma-theophylline concentration) · epilepsy · fever · hypertension · peptic ulcer · risk of hypokalaemia · thyroid disorder

CAUTIONS, FURTHER INFORMATION

- Elderly Prescription potentially inappropriate (STOPP criteria) as monotherapy for COPD (safer and more effective alternatives available; risk of adverse effects due to narrow therapeutic index). See also Prescribing in the elderly p. 33.
- INTERACTIONS** → Appendix 1: theophylline

- SIDE-EFFECTS** Anxiety · arrhythmias · diarrhoea · dizziness · gastrointestinal discomfort · gastroesophageal reflux disease · headache · hyperuricaemia · nausea · palpitations · seizure · skin reactions · sleep disorders · tremor · urinary disorders · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Potentially serious hypokalaemia may result from beta₂-agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

Overdose Theophylline in overdose can cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

For details on the management of poisoning, see Theophylline, under Emergency treatment of poisoning p. 1430.

- PREGNANCY** Neonatal irritability and apnoea have been reported. Theophylline can be taken as normal during pregnancy as it is particularly important that asthma should be well controlled during pregnancy.
- BREAST FEEDING** Present in milk—irritability in infant reported; modified-release preparations preferable. Theophylline can be taken as normal during breast-feeding.
- HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).
Dose adjustments Manufacturer advises consider dose reduction.

● MONITORING REQUIREMENTS

- In most individuals, a plasma-theophylline concentration of 10–20 mg/litre (55–110 micromol/litre) is required for satisfactory bronchodilation, although a lower plasma-theophylline concentration of 5–15 mg/litre may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.
- Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should usually be taken 4–6 hours after an oral dose of a modified-release preparation (sampling times may vary—consult local guidelines).

POCKETPEAK[®] LOW RANGE

Range 50–400 litres/minute.
Compliant to standard EN ISO 23747:2007 except for scale range.

nSpiire Pocket Peak peak flow meter low range (nSpiire Health Ltd)
1 device • NHS indicative price = £6.53 • Drug Tariff (Part IXa) price = £6.50

Peak flow meters: standard range

● STANDARD RANGE PEAK FLOW METERS

AIRZONE[®]

Range 60–720 litres/minute.
Conforms to standard EN ISO 23747:2007.

AirZone peak flow meter standard range (Clement Clarke International Ltd)
1 device • NHS indicative price = £4.69 • Drug Tariff (Part IXa) price = £4.50

MEDI[®] STANDARD RANGE

Range 60–800 litres/minute.
Conforms to standard EN ISO 23747:2007.

Medi peak flow meter standard range (Medicareplus International Ltd)
1 device • NHS indicative price = £4.50 • Drug Tariff (Part IXa) price = £4.50

MICROPEAK[®]

Range 60–900 litres/minute.
Conforms to standard EN ISO 23747:2007.

MicroPeak peak flow meter standard range (Micro Medical Ltd)
1 device • NHS indicative price = £6.50 • Drug Tariff (Part IXa) price = £4.50

MINI-WRIGHT[®] STANDARD RANGE

Range 60–800 litres/minute.
Conforms to standard EN ISO 23747:2007.

Mini-Wright peak flow meter standard range (Clement Clarke International Ltd)
1 device • NHS indicative price = £7.08 • Drug Tariff (Part IXa) price = £4.50

PIKO-1[®]

Range 15–999 litres/minute.
Conforms to standard EN ISO 23747:2007.

nSpiire PiKo-1 peak flow meter standard range (nSpiire Health Ltd)
1 device • NHS indicative price = £9.50 • Drug Tariff (Part IXa) price = £4.50

PINNACLE[®]

Range 60–900 litres/minute.
Conforms to standard EN ISO 23747:2007.

Fyne Dynamics Pinnacle peak flow meter standard range (Fyne Dynamics Ltd)
1 device • NHS indicative price = £6.50 • Drug Tariff (Part IXa) price = £4.50

POCKETPEAK[®] STANDARD RANGE

Range 60–800 litres/minute.
Conforms to standard EN ISO 23747:2007.

nSpiire Pocket Peak peak flow meter standard range (nSpiire Health Ltd)
1 device • NHS indicative price = £6.53 • Drug Tariff (Part IXa) price = £4.50

VITALOGRAPH[®]

Range 50–800 litres/minute.
Conforms to standard EN ISO 23747:2007.

Vitalograph peak flow meter standard range (Vitalograph Ltd)
1 device • NHS indicative price = £4.83 • Drug Tariff (Part IXa) price = £4.50

Spacers

● SPACERS

A2A SPACER[®]

For use with all pressurised (aerosol) inhalers.

A2A Spacer (Clement Clarke International Ltd)
1 device • NHS indicative price = £4.15 • Drug Tariff (Part IXa)

A2A Spacer with medium mask (Clement Clarke International Ltd)
1 device • NHS indicative price = £6.68 • Drug Tariff (Part IXa)

A2A Spacer with small mask (Clement Clarke International Ltd)
1 device • NHS indicative price = £6.68 • Drug Tariff (Part IXa)

ABLE SPACER[®]

Small-volume device. For use with all pressurised (aerosol) inhalers.

Able Spacer (Clement Clarke International Ltd)
1 device • NHS indicative price = £4.39 • Drug Tariff (Part IXa)

Able Spacer with medium mask (Clement Clarke International Ltd)
1 device • NHS indicative price = £7.16 • Drug Tariff (Part IXa)

Able Spacer with small mask (Clement Clarke International Ltd)
1 device • NHS indicative price = £7.16 • Drug Tariff (Part IXa)

AEROCHAMBER PLUS®

Medium-volume device. For use with all pressurised (aerosol) inhalers.

AeroChamber Plus (Trudell Medical UK Ltd)
1 device • NHS indicative price = £4.99 • Drug Tariff (Part IXa)

AeroChamber Plus with adult mask (Trudell Medical UK Ltd)
1 device • NHS indicative price = £8.33 • Drug Tariff (Part IXa)

AeroChamber Plus with child mask (Trudell Medical UK Ltd)
1 device • NHS indicative price = £8.33 • Drug Tariff (Part IXa)

AeroChamber Plus with infant mask (Trudell Medical UK Ltd)
1 device • NHS indicative price = £8.33 • Drug Tariff (Part IXa)

BABYHALER®

For paediatric use with *Flixotide*®, and *Ventolin*® inhalers.

● **PRESCRIBING AND DISPENSING INFORMATION**

Not available for NHS prescription.

Babyhaler (GlaxoSmithKline UK Ltd)
1 device • No NHS indicative price available • Drug Tariff (Part IXa)

HALERAID®

Device to place over pressurised (aerosol) inhalers to aid when strength in hands is impaired (e.g. in arthritis). For use with *Flixotide*®, *Seretide*®, *Serevent*®, and *Ventolin*® inhalers.

● **PRESCRIBING AND DISPENSING INFORMATION**

Not available for NHS prescription.

Haleraid-120 (GlaxoSmithKline UK Ltd)
1 device • No NHS indicative price available • Drug Tariff (Part IXa)

Haleraid-200 (GlaxoSmithKline UK Ltd)
1 device • No NHS indicative price available • Drug Tariff (Part IXa)

OPTICHAMBER®

For use with all pressurised (aerosol) inhalers.

OptiChamber (Respironics (UK) Ltd)
1 device • NHS indicative price = £4.28 • Drug Tariff (Part IXa)

OPTICHAMBER® **DIAMOND**

For use with all pressurised (aerosol) inhalers.

OptiChamber Diamond (Respironics (UK) Ltd)
1 device • NHS indicative price = £4.49 • Drug Tariff (Part IXa)

OptiChamber Diamond with large LiteTouch mask 5 years-adult (Respironics (UK) Ltd)
1 device • NHS indicative price = £7.49 • Drug Tariff (Part IXa)

OptiChamber Diamond with medium LiteTouch mask 1-5 years (Respironics (UK) Ltd)
1 device • NHS indicative price = £7.49 • Drug Tariff (Part IXa)

OptiChamber Diamond with small LiteTouch mask 0-18 months (Respironics (UK) Ltd)
1 device • NHS indicative price = £7.49 • Drug Tariff (Part IXa)

POCKET CHAMBER®

Small volume device. For use with all pressurised (aerosol) inhalers.

Pocket Chamber (nSpiire Health Ltd)
1 device • NHS indicative price = £4.18 • Drug Tariff (Part IXa)

Pocket Chamber with adult mask (nSpiire Health Ltd)
1 device • NHS indicative price = £9.75 • Drug Tariff (Part IXa)

Pocket Chamber with child mask (nSpiire Health Ltd)
1 device • NHS indicative price = £9.75 • Drug Tariff (Part IXa)

Pocket Chamber with infant mask (nSpiire Health Ltd)
1 device • NHS indicative price = £9.75 • Drug Tariff (Part IXa)

Pocket Chamber with teenager mask (nSpiire Health Ltd)
1 device • NHS indicative price = £9.75 • Drug Tariff (Part IXa)

SPACE CHAMBER PLUS®

For use with all pressurised (aerosol) inhalers.

Space Chamber Plus (Medical Developments International Ltd)
1 device • NHS indicative price = £4.26 • Drug Tariff (Part IXa)

Space Chamber Plus with large mask (Medical Developments International Ltd)
1 device • NHS indicative price = £6.98 • Drug Tariff (Part IXa)

Space Chamber Plus with medium mask (Medical Developments International Ltd)
1 device • NHS indicative price = £6.98 • Drug Tariff (Part IXa)

Space Chamber Plus with small mask (Medical Developments International Ltd)
1 device • NHS indicative price = £6.98 • Drug Tariff (Part IXa)

VOLUMATIC®

Large-volume device. For use with *Clenil Modulite*®, *Flixotide*®, *Seretide*®, *Serevent*®, and *Ventolin*® inhalers.

Volumatic (GlaxoSmithKline UK Ltd)
1 device • NHS indicative price = £3.88 • Drug Tariff (Part IXa)

Volumatic with paediatric mask (GlaxoSmithKline UK Ltd)
1 device • NHS indicative price = £6.83 • Drug Tariff (Part IXa)

VORTEX®

Medium-volume device. For use with all pressurised (aerosol) inhalers.

2 Allergic conditions

Antihistamines, allergen immunotherapy and allergic emergencies

28-Feb-2020

Antihistamines

All antihistamines are of potential value in the treatment of nasal allergies, particularly seasonal allergic rhinitis (hayfever), and they may be of some value in vasomotor rhinitis. They reduce rhinorrhoea and sneezing but are usually less effective for nasal congestion. Antihistamines are used topically in the eye, in the nose, and on the skin.

Oral antihistamines are also of some value in preventing urticaria and are used to treat urticarial rashes, pruritus, and insect bites and stings; they are also used in drug allergies. Injections of chlorphenamine maleate p. 297 or promethazine hydrochloride p. 301 are used as an adjunct to adrenaline/epinephrine p. 236 in the emergency treatment of anaphylaxis and angioedema. Antihistamines (including cinnarizine p. 457, cyclizine p. 449, and promethazine teoclate p. 458) may also have a role in nausea and vomiting. Buclizine is included as an anti-emetic in a preparation for migraine. Antihistamines may also have a role in occasional insomnia.

All older antihistamines cause sedation but alimemazine tartrate p. 297 and **promethazine** may be more sedating whereas chlorphenamine maleate and cyclizine may be less so. This sedating activity is sometimes used to manage the pruritus associated with some allergies. There is little evidence that any one of the older, 'sedating' antihistamines is superior to another and patients vary widely in their response.

Non-sedating antihistamines such as acrivastine p. 293, bilastine p. 293, cetirizine hydrochloride p. 294, desloratadine p. 294 (an active metabolite of loratadine p. 296), fexofenadine hydrochloride p. 295 (an active metabolite of terfenadine), levocetirizine hydrochloride p. 295 (an isomer of cetirizine hydrochloride), loratadine and mizolastine p. 296 cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

Considerations in the elderly

The use of first-generation antihistamines in elderly patients is potentially inappropriate (STOPP criteria) as safer, less toxic antihistamines are widely available.

For further information, see *STOPP/START criteria* in Prescribing in the elderly p. 33.

Allergen immunotherapy

Immunotherapy using allergen vaccines containing house dust mite, animal dander (cat or dog), or extracts of grass and tree pollen can reduce symptoms of asthma and allergic rhinoconjunctivitis. A vaccine containing extracts of wasp and bee venom is used to reduce the risk of severe anaphylaxis and systemic reactions in individuals with hypersensitivity to wasp and bee stings. An oral preparation of grass pollen extract (*Grazax*[®]) is also licensed for disease-modifying treatment of grass pollen-induced rhinitis and conjunctivitis. Those requiring immunotherapy must be referred to a hospital specialist for accurate diagnosis, assessment, and treatment.

Omalizumab p. 282 is a monoclonal antibody that binds to immunoglobulin E (IgE). It is used as additional therapy in individuals with proven IgE-mediated sensitivity to inhaled allergens, whose severe persistent allergic asthma cannot be controlled adequately with high dose inhaled corticosteroid together with a long-acting beta₂ agonist. Omalizumab should be initiated by physicians in specialist centres experienced in the treatment of severe persistent asthma. Omalizumab is also indicated as add-on therapy for the treatment of chronic spontaneous urticaria in patients who have had an inadequate response to H₁ antihistamine treatment.

Anaphylaxis and allergic emergencies

Anaphylaxis

Anaphylaxis is a severe, life-threatening, generalised or systemic hypersensitivity reaction. It is characterised by the rapid onset of respiratory and/or circulatory problems and is usually associated with skin and mucosal changes; prompt treatment is required. Patients with pre-existing asthma, especially poorly controlled asthma, are at particular risk of life-threatening reactions. Insect stings are a recognised risk (in particular wasp and bee stings). Latex and certain foods, including eggs, fish, cow's milk protein, peanuts, sesame, shellfish, soy, and tree nuts may also precipitate anaphylaxis (see Food allergy p. 91). Medicinal products particularly associated with anaphylaxis include blood products, vaccines, hyposensitising (allergen) preparations, antibacterials, aspirin and other NSAIDs, and neuromuscular blocking drugs. In the case of drugs, anaphylaxis is more likely after parenteral administration; resuscitation facilities must always be available for injections associated with special risk. Anaphylactic reactions may also be associated with *additives and excipients* in foods and medicines. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens.

Treatment of anaphylaxis

Adrenaline/epinephrine provides physiological reversal of the immediate symptoms associated with hypersensitivity reactions such as *anaphylaxis* and *angioedema*.

First-line treatment includes:

- securing the airway, restoration of blood pressure (laying the patient flat and raising the legs, or in the recovery position if unconscious or nauseous and at risk of vomiting);
- administering adrenaline/epinephrine (by **intramuscular** injection in a dose of 500 micrograms (a dose of 300 micrograms may be appropriate for *immediate self-administration*); the dose should be repeated if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function. Patients receiving beta-blockers require special consideration);
- administering high-flow **oxygen** and **intravenous fluids** is also of primary importance;
- administering an antihistamine, such as chlorphenamine maleate, by slow intravenous injection or intramuscular

injection is a useful adjunctive treatment, given after adrenaline.

- Administering an intravenous corticosteroid such as hydrocortisone p. 713 (preferably as sodium succinate) is of secondary value in the initial management of anaphylaxis because the onset of action is delayed for several hours, but should be given to prevent further deterioration in severely affected patients.

Continuing respiratory deterioration requires further treatment with **bronchodilators** including inhaled or intravenous salbutamol p. 267, inhaled ipratropium bromide p. 261, intravenous aminophylline p. 287, or intravenous magnesium sulfate p. 1112 [unlicensed indication] (as for acute severe asthma); in addition to oxygen, assisted respiration and possibly emergency tracheotomy may be necessary.

When a patient is so ill that there is doubt about the adequacy of the circulation, the initial injection of adrenaline/epinephrine may need to be given as a *dilute solution by the intravenous route*.

Cardiopulmonary arrest may follow an anaphylactic reaction; resuscitation should be started immediately.

On discharge, patients should be considered for further treatment with an oral antihistamine and an oral corticosteroid for up to 3 days to reduce the risk of further reaction. Patients should be instructed to return to hospital if symptoms recur and to contact their general practitioner for follow-up.

Patients who are suspected of having had an anaphylactic reaction should be referred to a specialist for specific allergy diagnosis. Avoidance of the allergen is the principal treatment; if appropriate, an adrenaline/epinephrine auto-injector should be given for self-administration or a replacement supplied.

Intramuscular adrenaline (epinephrine)

The *intramuscular route* is the *first choice route* for the administration of adrenaline/epinephrine p. 236 in the management of anaphylaxis. Adrenaline/epinephrine is best given as an intramuscular injection into the anterolateral aspect of the middle third of the thigh; it has a rapid onset of action after intramuscular administration and in the shocked patient its absorption from the intramuscular site is faster and more reliable than from the subcutaneous site.

Patients with severe allergy should be instructed in the self-administration of adrenaline/epinephrine by intramuscular injection.

Prompt injection of adrenaline/epinephrine is of paramount importance. The adrenaline/epinephrine doses recommended for the emergency treatment of anaphylaxis by appropriately trained healthcare professionals are based on the revised recommendations of the Working Group of the Resuscitation Council (UK).

The MHRA/CHM have released important safety information regarding the use of adrenaline auto-injectors. For further information, see *Important safety information* for adrenaline/epinephrine.

Intravenous adrenaline (epinephrine)

Intravenous adrenaline/epinephrine should be given only by those experienced in its use, in a setting where patients can be carefully monitored.

When the patient is severely ill and there is real doubt about the adequacy of the circulation and absorption after intramuscular injection, adrenaline/epinephrine can be given by **slow intravenous injection** repeated according to response; if multiple doses are required, adrenaline/epinephrine should be given as a **slow** intravenous infusion *stopping when a response has been obtained*.

It is important that, where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.

The intravenous route is also used for *cardiac resuscitation*.

Angioedema

Angioedema is dangerous if *laryngeal oedema* is present. In this circumstance adrenaline/epinephrine injection and oxygen should be given as described under **Anaphylaxis**; antihistamines and corticosteroids should also be given. Tracheal intubation may be necessary.

Hereditary angioedema

The treatment of hereditary angioedema should be under specialist supervision. Unlike allergic angioedema, adrenaline/epinephrine, corticosteroids, and antihistamines should not be used for the treatment of acute attacks, including attacks involving laryngeal oedema, as they are ineffective and may delay appropriate treatment—intubation may be necessary. The administration of C1-esterase inhibitor p. 304, an endogenous complement blocker derived from human plasma, (in fresh frozen plasma or in partially purified form) can terminate acute attacks of *hereditary angioedema*; it can also be used for short-term prophylaxis before dental, medical or surgical procedures. Conestat alfa p. 304 and icatibant p. 305 are licensed for the treatment of acute attacks of hereditary angioedema in adults with C1-esterase inhibitor deficiency.

Tranexamic acid p. 117 and danazol p. 783 [unlicensed indication] are used for short-term and long-term prophylaxis of hereditary angioedema. Short-term prophylaxis with tranexamic acid or danazol is started several days before planned procedures (e.g. dental work) and continued for 2–5 days afterwards. Danazol should be avoided in children because of its androgenic effects.

Dose of intramuscular injection of adrenaline (epinephrine) for the emergency treatment of anaphylaxis by healthcare professionals

Age	Dose	Volume of adrenaline
▶ Child 1 month–5 years	150 micrograms	0.15 mL 1 in 1000 (1 mg/mL) adrenaline ¹
▶ Child 6–11 years	300 micrograms	0.3 mL 1 in 1000 (1 mg/mL) adrenaline
▶ Child 12–17 years	500 micrograms	0.5 mL 1 in 1000 (1 mg/mL) adrenaline ²
▶ Adult	500 micrograms	0.5 mL 1 in 1000 (1 mg/mL) adrenaline

These doses may be repeated several times if necessary at 5-minute intervals according to blood pressure, pulse and respiratory function.

1. Use suitable syringe for measuring small volume
2. 300 micrograms (0.3 mL) if child is small or prepubertal

ANTIHISTAMINES > NON-SEDATING**Acrivastine**

19-Mar-2020

INDICATIONS AND DOSE

Symptomatic relief of allergy such as hayfever, chronic idiopathic urticaria

▶ BY MOUTH

- ▶ Child 12–17 years: 8 mg 3 times a day
- ▶ Adult: 8 mg 3 times a day

● **CONTRA-INDICATIONS** Avoid in Acute porphyrias p. 1120 - elderly

● **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

SIDE-EFFECTS

- ▶ **Common or very common** Drowsiness · dry mouth
- ▶ **Frequency not known** Dizziness · rash

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as acrivastine cause less sedation and psychomotor impairment than the older antihistamines,

but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to triprolidine.
- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **RENAL IMPAIRMENT** Avoid in severe impairment.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

- ▶ **Benadryl Allergy Relief** (McNeil Products Ltd)
Acrivastine 8 mg Benadryl Allergy Relief 8mg capsules | 24 capsule (P) £5.45 | 48 capsule (P) £9.91

Bilastine

12-Mar-2020

INDICATIONS AND DOSE

Symptomatic relief of allergic rhinoconjunctivitis and urticaria

▶ BY MOUTH

- ▶ Child 12–17 years: 20 mg once daily
- ▶ Adult: 20 mg once daily

● **CONTRA-INDICATIONS** Avoid in Acute porphyrias p. 1120

● **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

SIDE-EFFECTS

- ▶ **Common or very common** Drowsiness · headache
- ▶ **Uncommon** Anxiety · appetite increased · asthenia · bundle branch block · diarrhoea · dry mouth · dyspnoea · fever · gastritis · gastrointestinal discomfort · insomnia · nasal complaints · nausea · oral herpes · pre-existing condition improved · pruritus · QT interval prolongation · sinus arrhythmia · thirst · tinnitus · vertigo · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as bilastine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

● **PREGNANCY** Avoid—limited information available. Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

● **BREAST FEEDING** Avoid—no information available. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

● **DIRECTIONS FOR ADMINISTRATION** Take tablet 1 hour before or 2 hours after food or fruit juice.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer bilastine tablets.
Driving and skilled tasks Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 23

- ▶ **Ixatzen** (A. Menarini Farmaceutica Internazionale SRL)

Bilastine 20 mg Ixatzen 20mg tablets | 30 tablet [PoM] £6.00 DT = £6.00

Cetirizine hydrochloride

● **INDICATIONS AND DOSE****Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria, atopic dermatitis**

▶ BY MOUTH

- ▶ Child 2-5 years: 2.5 mg twice daily
- ▶ Child 6-11 years: 5 mg twice daily
- ▶ Child 12-17 years: 10 mg once daily
- ▶ Adult: 10 mg once daily

- **CAUTIONS** Epilepsy

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

● **SIDE-EFFECTS**

- ▶ **Uncommon** Agitation · asthenia · diarrhoea · malaise · paraesthesia · skin reactions
 - ▶ **Rare or very rare** Aggression · angioedema · confusion · depression · hallucination · hepatic function abnormal · insomnia · movement disorders · oculogyration · oedema · seizure · syncope · tachycardia · taste altered · thrombocytopenia · tic · tremor · urinary disorders · vision disorders · weight increased
 - ▶ **Frequency not known** Abdominal pain · appetite increased · dizziness · drowsiness · dry mouth · headache · memory loss · nausea · pharyngitis · suicidal ideation · vertigo
- SIDE-EFFECTS, FURTHER INFORMATION** Non-sedating antihistamines such as cetirizine hydrochloride cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

● **RENAL IMPAIRMENT**

- ▶ In adults Avoid if eGFR less than 10 mL/minute/1.73 m².
- ▶ In children Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

Dose adjustments ▶ In adults Use half normal dose if eGFR 30–50 mL/minute/1.73 m². Use half normal dose and reduce dose frequency to alternate days if eGFR 10–30 mL/minute/1.73 m².

- ▶ In children Use half normal dose if estimated glomerular filtration rate 30–50 mL/minute/1.73 m². Use half normal dose and reduce dose frequency to alternate days if estimated glomerular filtration rate 10–30 mL/minute/1.73 m².

Fexofenadine hydrochloride

13-Mar-2020

• INDICATIONS AND DOSE

Symptomatic relief of seasonal allergic rhinitis

▶ BY MOUTH

- ▶ Child 6-11 years: 30 mg twice daily
- ▶ Child 12-17 years: 120 mg once daily
- ▶ Adult: 120 mg once daily

Symptomatic relief of chronic idiopathic urticaria

▶ BY MOUTH

- ▶ Child 12-17 years: 180 mg once daily
- ▶ Adult: 180 mg once daily

PHARMACOKINETICS

- ▶ Fexofenadine is a metabolite of terfenadine.

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

• SIDE-EFFECTS

- ▶ **Common or very common** Dizziness · drowsiness · headache · nausea
- ▶ **Uncommon** Fatigue
- ▶ **Frequency not known** Diarrhoea · nervousness · palpitations · skin reactions · sleep disorders · tachycardia

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as fexofenadine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

• PATIENT AND CARER ADVICE

Driving and skilled tasks Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 5

▶ Fexofenadine hydrochloride (Non-proprietary)

Fexofenadine hydrochloride 120 mg Fexofenadine 120mg tablets | 30 tablet [PoM] £6.23 DT = £2.12

Fexofenadine hydrochloride 180 mg Fexofenadine 180mg tablets | 30 tablet [PoM] £7.89 DT = £3.18

▶ Telfast (Sanofi)

Fexofenadine hydrochloride 30 mg Telfast 30mg tablets | 60 tablet [PoM] £5.46 DT = £5.46

Fexofenadine hydrochloride 120 mg Telfast 120mg tablets | 30 tablet [PoM] £5.99 DT = £2.12

Fexofenadine hydrochloride 180 mg Telfast 180mg tablets | 30 tablet [PoM] £7.58 DT = £3.18

Levocetirizine hydrochloride

24-May-2017

• INDICATIONS AND DOSE

Symptomatic relief of allergy such as hay fever, urticaria

▶ BY MOUTH

- ▶ Child 6-17 years: 5 mg once daily
- ▶ Adult: 5 mg once daily

PHARMACOKINETICS

- ▶ Levocetirizine is an isomer of cetirizine.

- **CONTRA-INDICATIONS** Avoid in Acute porphyrias p. 1120

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

• SIDE-EFFECTS

- ▶ **Common or very common** Asthenia · constipation (in children) · drowsiness · dry mouth
- ▶ **Uncommon** Abdominal pain
- ▶ **Frequency not known** Aggression · agitation · angioedema · appetite increased · arthralgia · depression · diarrhoea (very common in children) · dizziness · dyspnoea · hallucination · hepatitis · myalgia · nausea · oedema · palpitations · paraesthesia · seizure · skin reactions · sleep disorders (very common in children) · suicidal ideation · syncope · tachycardia · taste altered · tremor · urinary disorders · vertigo · vision disorders · vomiting · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as levocetirizine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

• RENAL IMPAIRMENT

- ▶ In adults Avoid if eGFR less than 10 mL/minute/1.73 m².
- ▶ In children Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

Dose adjustments ▶ In adults 5 mg on alternate days if eGFR 30-50 mL/minute/1.73 m². 5 mg every 3 days if eGFR 10-30 mL/minute/1.73 m².

- ▶ In children Reduce dose frequency to alternate days if estimated glomerular filtration rate 30-50 mL/minute/1.73 m². Reduce dose frequency to every 3 days if estimated glomerular filtration rate 10-30 mL/minute/1.73 m².

• PATIENT AND CARER ADVICE

Driving and skilled tasks Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

▶ Xyzal (UCB Pharma Ltd)

Levocetirizine dihydrochloride 500 microgram per 1 ml Xyzal 0.5mg/ml oral solution sugar-free | 200 ml [PoM] £6.00 DT = £6.00

Tablet

- ▶ **Levocetirizine hydrochloride (Non-proprietary)**
Levocetirizine dihydrochloride 5 mg Levocetirizine 5mg tablets | 30 tablet [PoM] £4.39 DT = £4.21
- ▶ **Xyzal** (UCB Pharma Ltd)
Levocetirizine dihydrochloride 5 mg Xyzal 5mg tablets | 30 tablet [PoM] £4.39 DT = £4.21

Loratadine

25-Mar-2020

● **INDICATIONS AND DOSE**

Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria

- ▶ **BY MOUTH**
- ▶ Child 2-11 years (body-weight up to 31 kg): 5 mg once daily
- ▶ Child 2-11 years (body-weight 31 kg and above): 10 mg once daily
- ▶ Child 12-17 years: 10 mg once daily
- ▶ Adult: 10 mg once daily

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

● **SIDE-EFFECTS**

- **Common or very common** Drowsiness · nervousness (in children)
- ▶ **Uncommon** Appetite increased · headache (very common in children) · insomnia
- ▶ **Rare or very rare** Alopecia · angioedema · dizziness · dry mouth · fatigue (very common in children) · gastritis · hepatic function abnormal · nausea · palpitations · rash · seizure · tachycardia

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as loratadine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (risk of increased exposure).
Dose adjustments Manufacturer advises initial dose reduction to alternate days in severe impairment.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Loratadine for allergy symptoms www.medicinesforchildren.org.uk/loratadine-allergy-symptoms

Driving and skilled tasks Although drowsiness is rare, nevertheless patients and their carers should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

● **PROFESSION SPECIFIC INFORMATION****Dental practitioners' formulary**

Loratadine 10 mg tablets may be prescribed.
Loratadine syrup 5 mg/5 mL may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCIPIENTS: May contain Propylene glycol

▶ **Loratadine (Non-proprietary)**

Loratadine 1 mg per 1 ml Loratadine 5mg/5ml oral solution | 100 ml [PoM] £1.90 DT = £1.90
Loratadine 5mg/5ml oral solution sugar-free | 100 ml [PoM] £2.85

Tablet

- ▶ **Loratadine (Non-proprietary)**
Loratadine 10 mg Loratadine 10mg tablets | 30 tablet [PoM] DT = £0.95
- ▶ **Clarityn (Loratadine)** (Bayer Plc)
Loratadine 10 mg Clarityn Allergy 10mg tablets | 60 tablet [P] £8.85

Mizolastine

12-Mar-2020

● **INDICATIONS AND DOSE**

Symptomatic relief of allergy such as hay fever, urticaria

- ▶ **BY MOUTH**
- ▶ Child 12-17 years: 10 mg once daily
- ▶ Adult: 10 mg once daily

- **CONTRA-INDICATIONS** Cardiac disease · susceptibility to QT-interval prolongation

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

● **SIDE-EFFECTS**

- ▶ **Common or very common** Appetite increased · asthenia · diarrhoea · dizziness · drowsiness · dry mouth · gastrointestinal discomfort · headache · nausea · weight increased
- ▶ **Uncommon** Anxiety · arrhythmias · arthralgia · depression · myalgia · palpitations
- ▶ **Rare or very rare** Hypersensitivity
- ▶ **Frequency not known** Asthma exacerbated · bronchospasm · QT interval prolongation

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as mizolastine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in significant impairment.

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks Although drowsiness is rare, nevertheless patients and their carers should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

▶ **Mizollen** (Sanofi)

Mizolastine 10 mg Mizollen 10mg modified-release tablets | 30 tablet [PoM] £6.92 DT = £6.92

Rupatadine

29-Apr-2019

- **DRUG ACTION** Rupatadine is a second generation non-sedating antihistamine.

● **INDICATIONS AND DOSE**

Symptomatic relief of allergic rhinitis and urticaria

- ▶ **BY MOUTH USING TABLETS**
- ▶ Child 12-17 years: 10 mg once daily
- ▶ Adult: 10 mg once daily

- **CAUTIONS** Elderly—limited information available · history of QT-interval prolongation · predisposition to arrhythmia · uncorrected hypokalaemia
- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Asthenia · dizziness · drowsiness · dry mouth · headache
 - ▶ **Uncommon** Appetite increased · arthralgia · back pain · concentration impaired · constipation · cough · diarrhoea · dry throat · eosinophilia (in children) · epistaxis · fever · gastrointestinal discomfort · increased risk of infection · irritability · malaise · myalgia · nasal dryness · nausea · neutropenia (in children) · night sweats (in children) · oropharyngeal pain · skin reactions · thirst · vomiting · weight increased
 - ▶ **Rare or very rare** Palpitations · tachycardia
- **SIDE-EFFECTS, FURTHER INFORMATION** Non-sedating antihistamines such as rupatadine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.
- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises avoid—no information available.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet▶ **Rupatadine (Non-proprietary)**

Rupatadine (as Rupatadine fumarate) 10 mg Rupatadine 10mg tablets | 30 tablet **[PoM]** £36.00 DT = £35.25

ANTIHISTAMINES > SEDATING**Alimemazine tartrate**

25-Oct-2019

(Trimeprazine tartrate)● **INDICATIONS AND DOSE****Urticaria | Pruritus**▶ **BY MOUTH**

- ▶ Child 2-4 years: 2.5 mg 3-4 times a day
- ▶ Child 5-11 years: 5 mg 3-4 times a day
- ▶ Child 12-17 years: 10 mg 2-3 times a day, in severe cases up to maximum daily dose has been used; maximum 100 mg per day
- ▶ Adult: 10 mg 2-3 times a day, in severe cases up to maximum daily dose has been used; maximum 100 mg per day
- ▶ Elderly: 10 mg 1-2 times a day

- **CONTRA-INDICATIONS** Epilepsy · hepatic dysfunction · history of narrow angle glaucoma · hypothyroidism · myasthenia gravis · Parkinson's disease · phaeochromocytoma · prostatic hypertrophy (in adults) · renal dysfunction
- **CAUTIONS** Cardiovascular diseases (due to tachycardia-inducing and hypotensive effects of phenothiazines) · elderly · exposure to sunlight should be avoided during treatment with high doses · pyloroduodenal obstruction · urinary retention · volume depleted patients who are more susceptible to orthostatic hypotension

- **INTERACTIONS** → Appendix 1: antihistamines, sedating
- **SIDE-EFFECTS** Agitation · agranulocytosis · amenorrhoea · atrioventricular block · autonomic dysfunction · bile thrombus · consciousness impaired · drug fever · dry mouth · eosinophilia · erectile dysfunction · eye disorder · galactorrhoea · gynaecomastia · hepatic disorders · hyperprolactinaemia · hyperthermia · hypotension · insomnia · leucopenia (on prolonged high dose) · movement disorders · muscle rigidity · nasal congestion · neuroleptic malignant syndrome · pallor · parkinsonism · photosensitivity reaction · postural hypotension (more common in the elderly or in volume depletion) · QT interval prolongation · respiratory depression · seizure · skin reactions · tardive dyskinesia (more common after long term high doses) · tremor · ventricular fibrillation (increased risk with hypokalaemia and cardiac disease) · ventricular tachycardia (increased risk with hypokalaemia and cardiac disease)

SIDE-EFFECTS, FURTHER INFORMATION Drowsiness may diminish after a few days.

Patients on high dosage may develop photosensitivity and should avoid exposure to direct sunlight.

Children and elderly patients are more susceptible to side-effects.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Avoid.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

Hydroxyzine hydrochloride

19-Mar-2020

- **DRUG ACTION** Hydroxyzine is a sedating antihistamine which exerts its actions by antagonising the effects of histamine.

● INDICATIONS AND DOSE

Pruritus

► BY MOUTH

- Child 6 months–5 years: 5–15 mg daily in divided doses, dose adjusted according to weight; maximum 2 mg/kg per day
- Child 6–17 years (body-weight up to 40 kg): Initially 15–25 mg daily in divided doses, dose increased as necessary, adjusted according to weight; maximum 2 mg/kg per day
- Child 6–17 years (body-weight 40 kg and above): Initially 15–25 mg daily in divided doses, increased if necessary to 50–100 mg daily in divided doses, dose adjusted according to weight
- Adult: Initially 25 mg daily, dose to be taken at night; increased if necessary to 25 mg 3–4 times a day
- Elderly: Initially 25 mg daily, dose to be taken at night; increased if necessary to 25 mg twice daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: RISK OF QT-INTERVAL PROLONGATION AND TORSADE DE POINTES (APRIL 2015)

Following concerns of heart rhythm abnormalities, the safety and efficacy of hydroxyzine has been reviewed by the European Medicines Agency. The review concludes that hydroxyzine is associated with a small risk of QT-interval prolongation and torsade de pointes; these events are most likely to occur in patients who have risk factors for QT prolongation, e.g. concomitant use of drugs that prolong the QT-interval, cardiovascular disease, family history of sudden cardiac death, significant electrolyte imbalance (low plasma-potassium or plasma-magnesium concentrations), or significant bradycardia. To minimise the risk of such adverse effects, the following dose restrictions have been made and new cautions and contra-indications added:

- Hydroxyzine is contra-indicated in patients with prolonged QT-interval or who have risk factors for QT-interval prolongation;
- Avoid use in the elderly due to increased susceptibility to the side-effects of hydroxyzine;

- Consider the risks of QT-interval prolongation and torsade de pointes before prescribing to patients taking drugs that lower heart rate or plasma-potassium concentration;
 - In children with body-weight up to 40 kg, the maximum daily dose is 2 mg/kg;
 - In adults, the maximum daily dose is 100 mg;
 - In the elderly, the maximum daily dose is 50 mg (if use of hydroxyzine cannot be avoided);
 - The lowest effective dose for the shortest period of time should be prescribed.
- **CONTRA-INDICATIONS** Acquired or congenital QT interval prolongation · predisposition to QT interval prolongation
- CONTRA-INDICATIONS, FURTHER INFORMATION**
- ▶ QT interval prolongation Risk factors for QT interval prolongation include significant electrolyte imbalance, bradycardia, cardiovascular disease, and family history of sudden cardiac death.
- **CAUTIONS** Bladder outflow obstruction · breathing problems · cardiovascular disease · children · decreased gastrointestinal motility · dementia · elderly · epilepsy · hypertension · hyperthyroidism · myasthenia gravis · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · stenosing peptic ulcer · susceptibility to angle-closure glaucoma · urinary retention
- CAUTIONS, FURTHER INFORMATION** Elderly patients are particularly susceptible to side-effects; manufacturers advise avoid or reduce dose. Children have an increased susceptibility to side-effects, particularly CNS effects.
- **INTERACTIONS** → Appendix 1: antihistamines, sedating
- **SIDE-EFFECTS**
- ▶ **Rare or very rare** Severe cutaneous adverse reactions (SCARs) · skin reactions
 - ▶ **Frequency not known** Agranulocytosis · alopecia · anticholinergic syndrome · anxiety · appetite decreased · arrhythmias · asthenia · blood disorder · bronchial secretion viscosity increased · chest tightness · chills · coma · concentration impaired · confusion · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · dry throat · dyskinesia (on discontinuation) · epigastric pain · fever · flushing · gastrointestinal disorders · haemolytic anaemia · hallucination · headache · hepatic function abnormal · hyperhidrosis · hypotension · irritability · labyrinthitis · leucopenia · malaise · menstruation irregular · movement disorders · myalgia · nasal congestion · nausea · palpitations · paraesthesia · QT interval prolongation · respiratory disorders · respiratory tract dryness · seizure (with high doses) · sexual dysfunction · sleep disorders · speech slurred · taste bitter · thrombocytopenia · tinnitus · tremor (with high doses) · urinary disorders · vertigo · vision disorders · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION** Paradoxical stimulation may occur rarely, especially with high doses or in the elderly. Drowsiness may diminish after a few days of treatment.
- **ALLERGY AND CROSS-SENSITIVITY** Manufacturer advises hydroxyzine should be avoided in patients with previous hypersensitivity to cetirizine or other piperazine derivatives, and aminophylline.
- **PREGNANCY** Manufacturers advise avoid—toxicity in animal studies with higher doses. Use in the latter part of the third trimester may cause irritability, paradoxical excitability, and tremor in the neonate.
- **BREAST FEEDING** Manufacturer advises avoid—expected to be present in milk but effect unknown.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment (increased risk of accumulation); avoid in severe impairment.

Dose adjustments Manufacturer advises dose reduction of 33% in mild to moderate impairment.

• **RENAL IMPAIRMENT**

Dose adjustments Manufacturers advise reduce daily dose by half in moderate to severe renal impairment.

- **EFFECT ON LABORATORY TESTS** May interfere with methacholine test—manufacturer advises stop treatment 96 hours prior to test. May interfere with skin testing for allergy—manufacturer advises stop treatment one week prior to test.

• **PATIENT AND CARER ADVICE**

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 2

▶ **Hydroxyzine hydrochloride (Non-proprietary)**

Hydroxyzine hydrochloride 10 mg Hydroxyzine 10mg tablets | 84 tablet [PoM] £2.10 DT = £1.20

Hydroxyzine hydrochloride 25 mg Hydroxyzine 25mg tablets | 28 tablet [PoM] £1.91 DT = £1.71

▶ **Atarax** (Alliance Pharmaceuticals Ltd)

Hydroxyzine hydrochloride 10 mg Atarax 10mg tablets | 84 tablet [PoM] £1.20 DT = £1.20

Hydroxyzine hydrochloride 25 mg Atarax 25mg tablets | 28 tablet [PoM] £0.62 DT = £1.71

Ketotifen

13-May-2020

• **INDICATIONS AND DOSE**

Allergic rhinitis

▶ **BY MOUTH**

- ▶ Child 3–17 years: 1 mg twice daily
- ▶ Adult: 1 mg twice daily, increased if necessary to 2 mg twice daily, to be taken with food

Allergic rhinitis in readily sedated patients

▶ **BY MOUTH**

- ▶ Adult: Initially 0.5–1 mg once daily, dose to be taken at night

- **CONTRA-INDICATIONS** Avoid in Acute porphyrias p. 1120

- **CAUTIONS** Epilepsy · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · susceptibility to angle-closure glaucoma · urinary retention

- **INTERACTIONS** → Appendix 1: antihistamines, sedating

• **SIDE-EFFECTS**

- ▶ **Common or very common** Anxiety · insomnia · irritability
- ▶ **Uncommon** Cystitis · dizziness · dry mouth · skin reactions
- ▶ **Rare or very rare** Hepatitis · sedation · seizure · Stevens-Johnson syndrome · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Drowsiness is a

significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving or cycling); sedating effects enhanced by alcohol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Promethazine hydrochloride

28-Nov-2019

● INDICATIONS AND DOSE

Symptomatic relief of allergy such as hay fever and urticaria | Insomnia associated with urticaria and pruritus

▶ BY MOUTH

- ▶ Child 2-4 years: 5 mg twice daily, alternatively 5-15 mg once daily, dose to be taken at night
- ▶ Child 5-9 years: 5-10 mg twice daily, alternatively 10-25 mg once daily, dose to be taken at night
- ▶ Child 10-17 years: 10-20 mg 2-3 times a day, alternatively 25 mg once daily, dose to be taken at night, increased if necessary to 25 mg twice daily
- ▶ Adult: 10-20 mg 2-3 times a day

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 25-50 mg (max. per dose 100 mg)

Emergency treatment of anaphylactic reactions

▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 25-50 mg, to be administered as a solution containing 2.5 mg/mL in water for injections; maximum 100 mg per course

Sedation (short-term use)

▶ BY MOUTH

- ▶ Child 2-4 years: 15-20 mg
 - ▶ Child 5-9 years: 20-25 mg
 - ▶ Child 10-17 years: 25-50 mg
 - ▶ Adult: 25-50 mg
- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 25-50 mg

Nausea | Vomiting | Vertigo | Labyrinthine disorders | Motion sickness

▶ BY MOUTH

- ▶ Child 2-4 years: 5 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
- ▶ Child 5-9 years: 10 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
- ▶ Child 10-17 years: 20-25 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
- ▶ Adult: 20-25 mg, to be taken at bedtime on night before travel, repeat following morning if necessary

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN (APRIL 2009)

Children under 6 years should not be given over-the-counter cough and cold medicines containing promethazine.

● CAUTIONS

GENERAL CAUTIONS Epilepsy · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · severe coronary artery disease · susceptibility to angle-closure glaucoma · urinary retention

SPECIFIC CAUTIONS

- ▶ With intravenous use Avoid extravasation with intravenous injection

- **INTERACTIONS** → Appendix 1: antihistamines, sedating

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS Arrhythmia · blood disorder · confusion · dizziness · drowsiness · dry mouth · headache · hypotension · jaundice · movement disorders · palpitations · photosensitivity reaction · urinary retention · vision blurred

SPECIFIC SIDE-EFFECTS

- ▶ With oral use Agranulocytosis · angle closure glaucoma · anticholinergic syndrome · anxiety · insomnia · leucopenia · nasal congestion · nausea · rash · seizure · thrombocytopenia · tinnitus · tremor · vomiting
- ▶ With parenteral use Appetite decreased · epigastric discomfort · fatigue · haemolytic anaemia · hypersensitivity · muscle spasms · nightmare · restlessness · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION Elderly patients are more susceptible to anticholinergic side-effects.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **RENAL IMPAIRMENT** Use with caution.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

VACCINES > ALLERGEN-TYPE VACCINES**Bee venom extract**

28-Apr-2020

● INDICATIONS AND DOSE**Hypersensitivity to bee venom**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION**DESENSITISING VACCINES**

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:

- seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
 - hypersensitivity to wasp and bee venoms.
- Manufacturer advises desensitising vaccines should generally be avoided or used with particular care in patients with asthma.

- **CONTRA-INDICATIONS** Consult product literature
- **CAUTIONS** Consult product literature
- **INTERACTIONS** → Appendix 1: bee venom extract
- **SIDE-EFFECTS**

SIDE-EFFECTS, FURTHER INFORMATION Life-threatening hypersensitivity reactions can occur. Cardiopulmonary resuscitation must be immediately available. Manufacturer advises monitoring for at least 1 hour after injection.

- **PREGNANCY** Avoid.
- **PRESCRIBING AND DISPENSING INFORMATION** Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Pharmalgen®** for the treatment of bee and wasp venom allergy (February 2012) NICE TA246
Pharmalgen® is an option for the treatment of IgE-mediated bee and wasp venom allergy in those who have had:
 - a severe systemic reaction to bee or wasp venom, **or**
 - a moderate systemic reaction to bee or wasp venom and who have a raised baseline serum-tryptase concentration, a high risk of future stings, or anxiety about future stings.

Treatment with *Pharmalgen®* should be initiated and monitored in a specialist centre experienced in venom immunotherapy.

Grass pollen extract

28-Apr-2020

● INDICATIONS AND DOSE**Treatment of seasonal allergic hay fever due to grass pollen in patients who have failed to respond to anti-allergy drugs**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)

Treatment of seasonal allergic hay fever due to grass pollen in patients who have failed to respond to anti-allergy drugs (initiated under specialist supervision)

- ▶ BY MOUTH
- ▶ Adult: 1 tablet daily, treatment to be started at least 4 months before start of pollen season and continue for up to 3 years

IMPORTANT SAFETY INFORMATION**DESENSITISING VACCINES**

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:

- seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
 - hypersensitivity to wasp and bee venoms.
- Manufacturer advises desensitising vaccines should generally be avoided or used with particular care in patients with asthma.

- **CONTRA-INDICATIONS** Consult product literature
- **CAUTIONS** Consult product literature
- **INTERACTIONS** → Appendix 1: grass pollen extract
- **SIDE-EFFECTS**

SIDE-EFFECTS, FURTHER INFORMATION Hypersensitivity reactions to immunotherapy can be life-threatening; bronchospasm usually develops within 1 hour and anaphylaxis within 30 minutes of injection. Therefore, cardiopulmonary resuscitation must be immediately available and patients need to be monitored for at least 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), **even when mild**, the patient should be observed until these have resolved completely.

- **PREGNANCY** Should be avoided in pregnant women—consult product literature.
- **MONITORING REQUIREMENTS** The first dose of grass pollen extract (*Grazax®*) should be taken under medical supervision and the patient should be monitored for 20–30 minutes.
- **DIRECTIONS FOR ADMINISTRATION** Oral lyophilisates should be placed under the tongue and allowed to disperse. Advise patient not to swallow for 1 minute, or eat or drink for 5 minutes after taking the tablet. The first should be taken under medical supervision and the patient should be monitored for 20–30 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Each set of allergen extracts usually contains vials for the

administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

● PATIENT AND CARER ADVICE

- ▶ With oral use Patients or carers should be given advice on how to administer oral lyophilisates.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Pollinex Grasses + Rye** (Allergy Therapeutics (UK) Ltd)
Pollinex Grasses + Rye suspension for injection treatment and extension course vials | 4 vial [PoM](#) £450.00

2.1 Angioedema

Other drugs used for Angioedema Adrenaline/epinephrine, p. 236

DRUGS USED IN HEREDITARY ANGIOEDEMA > COMPLEMENT REGULATORY PROTEINS

C1-esterase inhibitor

19-Mar-2020

● INDICATIONS AND DOSE

BERINERT®

Acute attacks of hereditary angioedema (under expert supervision)

▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Adult: 20 units/kg

Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures (under expert supervision)

▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Adult: 1000 units for 1 dose, to be administered less than 6 hours before procedure

CINRYZE®

Acute attacks of hereditary angioedema (under expert supervision)

▶ BY SLOW INTRAVENOUS INJECTION

▶ Adult: 1000 units for 1 dose, dose may be repeated if necessary after 60 minutes (or sooner for patients experiencing laryngeal attacks or if treatment initiation is delayed)

Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures (under expert supervision)

▶ BY SLOW INTRAVENOUS INJECTION

▶ Adult: 1000 units for 1 dose, to be administered up to 24 hours before procedure

Long-term prophylaxis of severe, recurrent attacks of hereditary angioedema where acute treatment is inadequate, or when oral prophylaxis is inadequate or not tolerated (under expert supervision)

▶ BY SLOW INTRAVENOUS INJECTION

▶ Adult: 1000 units every 3–4 days, interval between doses to be adjusted according to response

● **CAUTIONS** Vaccination against hepatitis A and hepatitis B may be required

● SIDE-EFFECTS

▶ **Rare or very rare** Dizziness · dyspnoea · flushing · headache · hypersensitivity · hypertension · hypotension · nausea · tachycardia · thrombosis (with high doses) · urticaria

● **PREGNANCY** Manufacturer advises avoid unless essential.

● **PRESCRIBING AND DISPENSING INFORMATION** C1-esterase inhibitor is prepared from human plasma.

● NATIONAL FUNDING/ACCESS DECISIONS

CINRYZE®

All Wales Medicines Strategy Group (AWMSG) decisions

The *All Wales Medicines Strategy Group* has advised (October 2017) that C1-esterase inhibitor (*Cinryze*®) is recommended as an option for use within NHS Wales for the treatment and pre-procedure prevention of angioedema attacks in adults with hereditary angioedema (HAE); routine prevention of angioedema attacks in adults with severe and recurrent attacks of HAE, who are intolerant to or insufficiently protected by oral prevention

treatments, or patients who are inadequately managed with repeated acute treatment.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Conestat alfa

20-Feb-2019

● INDICATIONS AND DOSE

Acute attacks of hereditary angioedema in patients with C1-esterase inhibitor deficiency

▶ BY SLOW INTRAVENOUS INJECTION

▶ Adult (body-weight up to 84 kg): 50 units/kg for 1 dose, to be administered over 5 minutes, dose may be repeated if necessary; maximum 2 doses per day

▶ Adult (body-weight 84 kg and above): 4200 units for 1 dose, to be administered over 5 minutes, dose may be repeated if necessary; maximum 2 doses per day

● **CONTRA-INDICATIONS** Rabbit allergy

● SIDE-EFFECTS

▶ **Common or very common** Headache

▶ **Uncommon** Abdominal discomfort · diarrhoea · nausea · oral paraesthesia · paraesthesia · throat irritation · urticaria · vertigo

● **PREGNANCY** Use only if potential benefit outweighs risk—toxicity in *animal* studies.

● **BREAST FEEDING** Use only if potential benefit outweighs risk—no information available.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 745/11

The *Scottish Medicines Consortium* has advised (August 2018) that conestat alfa (*Ruconest*®) is accepted for use within NHS Scotland for the treatment of acute angioedema attacks in adults and adolescents with hereditary angioedema due to C1 esterase inhibitor deficiency. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 786

The *All Wales Medicines Strategy Group* has advised (November 2018) that conestat alfa (*Ruconest*®) is recommended as an option for use within NHS Wales for the treatment of acute angioedema attacks in adults and adolescents with hereditary angioedema due to C1 esterase inhibitor deficiency. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ **Ruconest** (Pharming Group N.V.)

Conestat alfa 2100 unit Ruconest 2,100unit powder for solution for injection vials | 1 vial [PoM] £750.00

DRUGS USED IN HEREDITARY ANGIOEDEMA > KALLIKREIN INHIBITORS

Lanadelumab

05-Nov-2019

● **DRUG ACTION** Lanadelumab is a humanised monoclonal antibody which inhibits plasma kallikrein activity, thereby limiting the production of bradykinin, a potent vasodilator associated with angioedema attacks in patients with hereditary angioedema.

● INDICATIONS AND DOSE

Prevention of recurrent attacks of hereditary angioedema (initiated under specialist supervision)

► BY SUBCUTANEOUS INJECTION

► **Adult:** 300 mg every 2 weeks, reduced to 300 mg every 4 weeks, in those stable and attack free—consult product literature

● **CONTRA-INDICATIONS** Not a treatment for acute attacks of angioedema—initiate individualised treatment for breakthrough attacks

● SIDE-EFFECTS

► **Common or very common** Dizziness · hypersensitivity · myalgia · oral disorders · skin reactions

● **PREGNANCY** Manufacturer advises preferable to avoid—limited or no information available; *animal* studies do not indicate toxicity.

● **BREAST FEEDING** Manufacturer advises avoid during first few days after birth—possible risk from transfer of antibodies to infant. After this time, use during breast-feeding only if clinically needed.

● **EFFECT ON LABORATORY TESTS** Manufacturer advises may increase activated partial thromboplastin time (aPTT) due to an interaction with the aPTT assay—consult product literature.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to withdraw dose from the vial into a syringe with an 18 gauge needle and inject, using a suitable gauge needle, into the abdomen, thigh, or upper outer arm within 2 hours—consult product literature for further information. *Takhzyro*[®] may be self-administered or administered by a carer after appropriate training in subcutaneous injection technique.

● PRESCRIBING AND DISPENSING INFORMATION

Lanadelumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines and Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.

● **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.

● PATIENT AND CARER ADVICE

Self-administration Manufacturer advises patients and their carers should be given training in subcutaneous injection technique if appropriate.

Missed doses Manufacturer advises if a dose is missed, it should be taken as soon as possible ensuring at least 10 days between doses.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► Lanadelumab for preventing recurrent attacks of hereditary angioedema (October 2019) NICE TA606
Lanadelumab (*Takhzyro*[®]) is recommended as an option for preventing recurrent attacks of hereditary angioedema in patients aged 12 years and older, only if:

- they are eligible for preventive C1-esterase inhibitor treatment, in line with NHS England's commissioning policy, that is, they are having 2 or more clinically significant attacks per week over 8 weeks despite oral preventive therapy, or oral therapy is contra-indicated or not tolerated, **and**
- the lowest dosing frequency of lanadelumab is used in line with the summary of product characteristics, that is, when the condition is in a stable, attack-free phase, **and**
- the manufacturer provides it according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they (or their carers) and their NHS clinician consider it appropriate to stop.

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2206

The *Scottish Medicines Consortium* has advised (December 2019) that lanadelumab (*Takhzyro*[®]) is accepted for restricted use within NHS Scotland for the routine prevention of recurrent attacks of hereditary angioedema (HAE) in patients aged 12 years and older with HAE type I or II, who would otherwise be considered for long-term prophylaxis treatment with C1-esterase inhibitor. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Polysorbates

► Lanadelumab (non-proprietary) ▼

► **Lanadelumab 150 mg per 1 ml** *Takhzyro* 300mg/2ml solution for injection vials | 1 vial [PoM] £12,420.00 (Hospital only)

DRUGS USED IN HEREDITARY ANGIOEDEMA > SELECTIVE BRADYKININ B₂ ANTAGONISTS

Icatibant

13-Jun-2018

● INDICATIONS AND DOSE

Acute attacks of hereditary angioedema in patients with C1-esterase inhibitor deficiency

► BY SUBCUTANEOUS INJECTION

► **Adult:** 30 mg for 1 dose, then 30 mg after 6 hours if required, then 30 mg after 6 hours if required; maximum 3 doses per day

- **CAUTIONS** Ischaemic heart disease · stroke
- **INTERACTIONS** → Appendix 1: icatibant
- **SIDE-EFFECTS**
 - **Common or very common** Dizziness · fever · headache · nausea · skin reactions
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid for 12 hours after administration.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 476/08

The *Scottish Medicines Consortium* has advised (March 2012) that icatibant (*Firazyr*[®]) is accepted for use within NHS Scotland for the symptomatic treatment of acute attacks of hereditary angioedema (HAE) in adults with C1-esterase-inhibitor deficiency. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3293

The *All Wales Medicines Strategy Group* has advised (June 2018) that icatibant acetate (*Firazyr*[®]) is recommended as an option for use within NHS Wales for the symptomatic treatment of acute attacks of hereditary angioedema (HAE) in adults, adolescents and children aged 2 years and older, with C1 esterase-inhibitor deficiency. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Firazyr** (Shire Pharmaceuticals Ltd)

Icatibant (as icatibant acetate) 10 mg per 1 ml Firazyr 30mg/3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £1,395.00

3 Conditions affecting sputum viscosity

Carbocisteine 375 mg Mucodyne 375mg capsules | 120 capsule [PoM] £18.98 DT = £4.78

Erdosteine

18-Mar-2020

- **INDICATIONS AND DOSE**

Symptomatic treatment of acute exacerbations of chronic bronchitis

▶ BY MOUTH

▶ Adult: 300 mg twice daily for up to 10 days

- **CAUTIONS** History of peptic ulceration (may disrupt the gastric mucosal barrier)
 - **SIDE-EFFECTS**
 - ▶ **Common or very common** Epigastric pain · taste altered
 - ▶ **Uncommon** Allergic dermatitis · angioedema · common cold · diarrhoea · dyspnoea · headache · nausea · vomiting
 - **PREGNANCY** Manufacturer advises avoid—no information available.
 - **BREAST FEEDING** Manufacturer advises avoid—no information available.
 - **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate hepatic failure; avoid in severe hepatic failure.
- Dose adjustments** Manufacturer advises max. 300 mg daily in mild to moderate hepatic failure.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 25 mL/minute/1.73 m²—no information available.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 415/07

The *Scottish Medicines Consortium* (November 2007) has advised that erdosteine (*Erdotin*[®]) is not recommended for use within NHS Scotland for the symptomatic treatment of acute exacerbations of chronic bronchitis as the economic case was not demonstrated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

▶ **Erdotin** (Galen Ltd)

Erdosteine 300 mg Erdotin 300mg capsules | 20 capsule [PoM] £5.00 DT = £5.00

3.1 Cystic fibrosis

Cystic fibrosis

06-May-2020

Description of condition

Cystic fibrosis is a genetic disorder affecting the lungs, pancreas, liver, intestine, and reproductive organs. The main clinical signs are pulmonary disease, with recurrent infections and the production of copious viscous sputum, and malabsorption due to pancreatic insufficiency. Other complications include hepatobiliary disease, osteoporosis, cystic fibrosis-related diabetes, and distal intestinal obstruction syndrome.

Aims of treatment

The aim of treatment includes preventing and managing lung infections, loosening and removing thick, sticky mucus from the lungs, preventing or treating intestinal obstruction, and providing sufficient nutrition and hydration.

Lung function is a key predictor of life expectancy in people with cystic fibrosis and optimising lung function is a major aim of care.

Non-drug treatment

Specialist physiotherapists should assess patients with cystic fibrosis and provide advice on airway clearance, nebuliser use, musculoskeletal disorders, physical activity, and urinary incontinence. The importance of airway clearance techniques should be discussed with patients and their parents or carers and appropriate training provided. Patients should be advised that regular exercise improves both lung function and overall fitness.

Drug treatment

Treatment for cystic fibrosis lung disease is based on the prevention of lung infection and the maintenance of lung function. [EvGr](#) In patients with cystic fibrosis, who have clinical evidence of lung disease, the frequency of routine review should be based on their clinical condition, but adults should be reviewed at least every 3 months. More frequent review is required immediately after diagnosis. [A](#)

For information on the management of patients during the COVID-19 pandemic, see COVID-19 p. 656.

Mucolytics

[EvGr](#) Patients with cystic fibrosis who have evidence of lung disease should be offered a mucolytic. Dornase alfa p. 308 is the first choice mucolytic. If there is an inadequate response, dornase alfa and hypertonic sodium chloride p. 289, or hypertonic sodium chloride alone should be considered.

Mannitol dry powder for inhalation p. 310 is recommended as an option when dornase alfa p. 308 is unsuitable (because of ineligibility, intolerance, or inadequate response), when lung function is rapidly declining, and if other osmotic drugs are not considered appropriate (see mannitol National funding/access decisions p. 310). [A](#)

Lumacaftor with ivacaftor p. 309 is not recommended for treating cystic fibrosis within its marketing authorisation (see lumacaftor with ivacaftor National funding/access decisions p. 309).

Pulmonary infection

Staphylococcus aureus

[EvGr](#) Patients who are not taking prophylaxis and have a new *Staphylococcus aureus* infection can be given an oral anti-*Staph. aureus* antibacterial, if they are clinically well. If they are clinically unwell and have pulmonary disease, oral or intravenous (depending on infection severity) broad-spectrum antibacterials with activity against *Staph. aureus* should be given (consult local protocol).

A long-term antibacterial should be considered to suppress chronic *Staph. aureus* respiratory infections in patients whose pulmonary disease is stable. In patients with chronic *Staph. aureus* respiratory infections who become clinically unwell with pulmonary disease, oral or intravenous (depending on infection severity) broad-spectrum antibacterials with activity against *Staph. aureus* should be given. In those patients with new evidence of **meticillin-resistant *Staphylococcus aureus* (MRSA)** respiratory infection (with or without pulmonary exacerbation), specialist microbiological advice should be sought.

Antibacterials should not be routinely used to suppress chronic MRSA in patients with stable pulmonary disease.

If a patient with cystic fibrosis and chronic MRSA respiratory infection becomes unwell with a pulmonary exacerbation or shows a decline in pulmonary function, specialist microbiological advice should be sought. [A](#)

Pseudomonas aeruginosa

[EvGr](#) If a patient with cystic fibrosis develops a new *Pseudomonas aeruginosa* infection, eradication therapy with a course of oral antibacterial should be started (by intravenous injection, if they are clinically unwell), in combination with an inhaled antibacterial. An extended course of oral and inhaled antibacterial should follow (consult local protocol).

If eradication therapy is not successful, sustained treatment with an inhaled antibacterial should be offered. Nebulised colistimethate sodium p. 588 should be considered as first-line treatment (but see also colistimethate sodium by dry powder inhalation National funding/access decisions p. 588).

In patients with **chronic *Ps. aeruginosa*** infection (when treatment has not eradicated the infection) who become clinically unwell with pulmonary exacerbations, an oral antibacterial or a combination of two intravenous antibacterial drugs of different classes (depending on infection severity) should be used. Changing antibacterial regimens should be considered to treat exacerbations (consult local protocol).

Nebulised aztreonam p. 571, nebulised tobramycin, or tobramycin dry powder for inhalation p. 546 (see tobramycin National funding/access decisions p. 546) should be considered for those who are deteriorating despite regular inhaled colistimethate sodium p. 588. [A](#)

Burkholderia cepacia complex

[EvGr](#) Patients who develop a new *Burkholderia cepacia* complex infection, should be given eradication therapy with a combination of intravenous antibacterial drugs (specialist microbiological advice should be sought on the choice of antibacterials). [A](#) There is no evidence to support using antibacterials to suppress **chronic *Burkholderia cepacia*** complex infection in patients with cystic fibrosis who have stable pulmonary status.

[EvGr](#) Specialist microbiological advice should be sought for patients with chronic *Burkholderia cepacia* complex infection (when treatment has not eradicated the infection) and who become clinically unwell with a pulmonary disease exacerbation.

An inhaled antibacterial should be considered for those who have chronic *Burkholderia cepacia* complex infection and declining pulmonary status; treatment should be stopped if there is no observed benefit. [A](#)

Haemophilus influenzae

[EvGr](#) *Haemophilus influenzae* infection in the absence of clinical evidence of pulmonary infection should be treated with an appropriate oral antibacterial drug. In those who are unwell with clinical evidence of pulmonary infection, an appropriate antibacterial should be given by mouth or intravenously depending on the severity of the illness (consult local protocol). [A](#)

Non-tuberculous mycobacteria

EvGr Non-tuberculous mycobacterial eradication therapy should be considered for patients with cystic fibrosis who are clinically unwell and whose pulmonary disease has not responded to other recommended treatments. Specialist microbiological advice should be sought on the choice of antibacterial and on the duration of treatment. **A**

Aspergillus fumigatus complex

EvGr Treatment with an antifungal drug should only be considered to suppress **chronic Aspergillus fumigatus** complex respiratory infection in patients with declining pulmonary status. Specialist microbiological advice should be sought on the choice of antifungal drug. **A**

Unidentified infections

EvGr An oral or intravenous (depending on the exacerbation severity) broad-spectrum antibacterial should be used for patients who have a pulmonary disease exacerbation and no clear cause. If a causative pathogen is identified, an appropriate treatment should be selected (consult local protocol). **A**

Immunomodulatory drugs

EvGr Long-term treatment with azithromycin p. 566 [unlicensed indication], at an immunomodulatory dose, should be offered to patients with deteriorating lung function or repeated pulmonary exacerbations. In those patients with continued deterioration in lung function or continuing pulmonary exacerbations, long-term azithromycin should be discontinued and the use of an oral corticosteroid considered. **A**

Nutrition and exocrine pancreatic insufficiency

EvGr The cystic fibrosis specialist dietitian should offer advice on optimal nutrition.

Pancreatin p. 103 should be offered to patients with exocrine pancreatic insufficiency. Dose should be adjusted as needed to minimise any symptoms or signs of malabsorption (see Exocrine pancreatic insufficiency p. 103). An acid-suppressing drug, such as an H₂ receptor antagonist or a proton pump inhibitor [unlicensed indications] can be considered for patients who have persistent symptoms or signs of malabsorption.

A short-term trial of an appetite stimulant (for example up to 3 months) [unlicensed indication] can be considered in adult patients if attempts to increase calorie intake are not effective. **A**

Distal intestinal obstruction syndrome

EvGr Oral or intravenous fluids should be offered to ensure adequate hydration for patients with distal intestinal obstruction syndrome. Meglumine amidotrizoate with sodium amidotrizoate solution (orally or via an enteral tube) should be considered as first-line treatment for distal intestinal obstruction syndrome. An iso-osmotic polyethylene glycol and electrolyte solution (macrogols) (orally or via an enteral tube) can be considered as a second-line treatment. Surgery is a last resort, if prolonged treatment with a polyethylene glycol solution is not effective. Suspected distal intestinal obstruction syndrome should be managed in a specialist cystic fibrosis centre. **A**

Liver disease

EvGr If liver function blood tests are abnormal in patients with cystic fibrosis, ursodeoxycholic acid p. 96 [unlicensed indication] can be given until liver function is restored. **A**

Bone mineral density

EvGr Patients should be monitored for cystic fibrosis-related low bone mineral density. **A**

Cystic fibrosis-related diabetes

EvGr Patients should be monitored for cystic fibrosis-related diabetes. **A**

MUCOLYTICS**Dornase alfa**

18-Mar-2020

(Phosphorylated glycosylated recombinant human deoxyribonuclease 1 (rDNase))

● **DRUG ACTION** Dornase alfa is a genetically engineered version of a naturally occurring human enzyme which cleaves extracellular deoxyribonucleic acid (DNA).

● INDICATIONS AND DOSE**Management of cystic fibrosis patients with a forced vital capacity (FVC) of greater than 40% of predicted to improve pulmonary function**

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Adult: 2500 units once daily, administered by jet nebuliser, patients over 21 years may benefit from twice daily dosage

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dornase alfa 1000 units is equivalent to 1 mg

- **SIDE-EFFECTS** Chest pain · conjunctivitis · dyspepsia · dysphonia · dyspnoea · fever · increased risk of infection · skin reactions
- **PREGNANCY** No evidence of teratogenicity; manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount probably too small to be harmful—manufacturer advises caution.
- **DIRECTIONS FOR ADMINISTRATION** Dornase alfa is administered by inhalation using a jet nebuliser, usually once daily at least 1 hour before physiotherapy; however, alternate-day therapy may be as effective as daily treatment.
 For use undiluted with jet nebulisers only; ultrasonic nebulisers are unsuitable.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Nebuliser liquid

▶ **Pulmozyme** (Roche Products Ltd)

Dornase alfa 1 mg per 1 ml Pulmozyme 2.5mg nebuliser liquid 2.5ml ampoules | 30 ampoule **[PoM]** £496.43 DT = £496.43

Ivacaftor

20-Mar-2020

● **DRUG ACTION** Ivacaftor is a cystic fibrosis transmembrane conductance regulator (CFTR) protein potentiator that increases chloride transport in the abnormal CFTR protein.

● INDICATIONS AND DOSE**Cystic fibrosis (specialist use only)**

- ▶ BY MOUTH
- ▶ Adult: 150 mg every 12 hours

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose to 150 mg twice a week with concurrent use of potent inhibitors of CYP3A4.
- ▶ Manufacturer advises reduce dose to 150 mg once daily with concurrent use of moderate inhibitors of CYP3A4.

● **CONTRA-INDICATIONS** Organ transplantation (no information available)

● **INTERACTIONS** → Appendix 1: ivacaftor

● SIDE-EFFECTS

- ▶ **Common or very common** Breast abnormalities · diarrhoea · dizziness · ear discomfort · headache · ototoxicity · rash · tympanic membrane hyperaemia
- ▶ **Uncommon** Gynaecomastia

- ▶ **Frequency not known** Hepatic function abnormal

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises interrupt treatment if transaminase levels more than 5 times the upper limit of normal *or* transaminase levels more than 3 times the upper limit of normal **and** blood bilirubin more than twice the upper limit of normal—consult product literature.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (limited information available).
Dose adjustments Manufacturer advises reduce dose to 150 mg once daily in moderate impairment; in severe impairment reduce starting dose to 150 mg on alternate days, adjust dosing interval according to clinical response and tolerability.

- **RENAL IMPAIRMENT** Caution in severe impairment.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor liver function before treatment, every 3 months during the first year of treatment, then annually thereafter (more frequent monitoring should be considered in patients with a history of transaminase elevations).
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken with fat-containing food.

- **PRESCRIBING AND DISPENSING INFORMATION** Ivacaftor should be prescribed by a physician experienced in the treatment of cystic fibrosis.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer ivacaftor tablets.
Driving and skilled tasks Manufacturer advises that patients and their carers should be counselled on the effects on driving and skilled tasks—increased risk of dizziness.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (December 2016) that ivacaftor (*Kalydeco*®) is **not** recommended for use within NHS Scotland for the treatment of patients with cystic fibrosis aged 18 years and above who have an R117H mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene, as insufficient clinical and economic evidence was submitted.

All Wales Medicines Strategy Group (AWMSG) decisions

The *All Wales Medicines Strategy Group* has advised (October 2017) that ivacaftor (*Kalydeco*®) is recommended for restricted use within NHS Wales for the treatment of adults with cystic fibrosis (CF) who have an R117H mutation in the CF transmembrane conductance regulator (CFTR) gene. This recommendation will apply only when people are treated in line with the relevant Welsh clinical access policy **and** only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

I Lumacaftor with ivacaftor

19-Mar-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, ivacaftor p. 308.

● INDICATIONS AND DOSE

Cystic fibrosis (specialist use only)

- ▶ **BY MOUTH USING TABLETS**
- ▶ **Adult:** 400/250 mg every 12 hours
- DOSE ADJUSTMENTS DUE TO INTERACTIONS**
- ▶ Manufacturer advises reduce initial dose to 200/125 mg daily for the first week in those also taking a potent inhibitor of CYP3A4.
- DOSE EQUIVALENCE AND CONVERSION**
- ▶ Dose expressed as x/y mg of lumacaftor/ivacaftor.

- **CAUTIONS** Forced expiratory volume in 1 second (FEV₁) less than 40% of the predicted normal value—additional monitoring recommended at initiation of treatment · pulmonary exacerbation—no information available
- **INTERACTIONS** → Appendix 1: ivacaftor · lumacaftor
- **SIDE-EFFECTS**
- ▶ **Common or very common** Breast abnormalities · diarrhoea · dizziness · ear discomfort · flatulence · gastrointestinal discomfort · headache · menstrual cycle irregularities · nausea · ototoxicity · rash · tympanic membrane hyperaemia · vomiting
- ▶ **Uncommon** Gynaecomastia · hepatic encephalopathy · hepatitis cholestatic · hypertension
- SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises interrupt treatment if transaminase levels more than 5 times the upper limit of normal *or* transaminase levels more than 3 times the upper limit of normal **and** blood bilirubin more than twice the upper limit of normal—consult product literature.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (risk of increased exposure).
Dose adjustments Manufacturer advises dose reduction of evening dose to 200/125 mg in moderate impairment; in severe impairment, dose reduction to 200/125 mg every 12 hours is advised.
- **PRE-TREATMENT SCREENING** If the patient's genotype is unknown, a validated genotyping method should be performed to confirm the presence of the F508del mutation on both alleles of the CFTR gene before starting treatment.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor blood pressure periodically during treatment.
- **EFFECT ON LABORATORY TESTS** False positive urine screening tests for tetrahydrocannabinol have been reported—manufacturer advises consider alternative confirmatory method.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken with fat-containing food.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tablets.
Missed doses Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- NICE decisions**
- ▶ **Lumacaftor with ivacaftor for treating cystic fibrosis homozygous for the F508del mutation (July 2016)** NICE TA398
Lumacaftor with ivacaftor (*Orkambi*®) is **not** recommended, within its marketing authorisation, for treating cystic fibrosis in patients aged 12 years and older who are homozygous for the F508del mutation in the

cystic fibrosis transmembrane conductance regulator (CFTR) gene.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they (or their carers) and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta398

Scottish Medicines Consortium (SMC) decisions

SMC No. 1136/16

The *Scottish Medicines Consortium* has advised (May 2016) that lumacaftor with ivacaftor (*Orkambi*[®]) is **not** recommended within NHS Scotland for the treatment of cystic fibrosis in patients aged 12 years and older who are homozygous for the F508del mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene, as the economic case was not demonstrated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Mannitol

21-Feb-2019

● INDICATIONS AND DOSE

Treatment of cystic fibrosis as an add-on therapy to standard care

- ▶ **BY INHALATION OF POWDER**

▶ **Adult:** Maintenance 400 mg twice daily, an initiation dose must be carried out under medical supervision, for details of the initiation dose regimen, consult product literature

- **CONTRA-INDICATIONS** Bronchial hyperresponsiveness to inhaled mannitol · impaired lung function (forced expiratory volume in 1 second < 30% of predicted) · non-CF bronchiectasis
- **CAUTIONS** Asthma · haemoptysis
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Chest discomfort · condition aggravated · cough · haemoptysis · headache · respiratory disorders · throat complaints · vomiting
 - ▶ **Uncommon** Abdominal pain upper · appetite decreased · asthma · burping · cold sweat · cystic fibrosis related diabetes · dehydration · diarrhoea · dizziness · dysphonia · dyspnoea · ear pain · fatigue · fever · gastrointestinal disorders · hypoxia · increased risk of infection · influenza like illness · insomnia · joint disorders · malaise · morbid thoughts · nausea · odynophagia · oral disorders · pain · rhinorrhoea · skin reactions · sputum discolouration · urinary incontinence
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid.
- **PRE-TREATMENT SCREENING** Patients must be assessed for bronchial hyperresponsiveness to inhaled mannitol before starting the therapeutic dose regimen; an initiation dose assessment must be carried out under medical supervision—for details of the initiation dose regimen, consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** The dose should be administered 5–15 minutes after a bronchodilator and before physiotherapy; the second daily dose should be taken 2–3 hours before bedtime.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer mannitol inhalation powder.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Mannitol dry powder for inhalation for treating cystic fibrosis (November 2012)** NICE TA266

Mannitol (*Bronchitol*[®]) dry powder for inhalation is recommended as an option for treating cystic fibrosis in adults:

- who cannot use dornase alfa (rhDNase) because of ineligibility, intolerance or inadequate response to rhDNase, **and**
- whose lung function is rapidly declining (forced expiratory volume in 1 second decline greater than 2% annually), **and**
- for whom other osmotic agents are not considered appropriate.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta266

Scottish Medicines Consortium (SMC) decisions

SMC No. 837/13

The *Scottish Medicines Consortium* has advised (December 2013) that mannitol (*Bronchitol*[®]) is accepted for restricted use within NHS Scotland for the treatment of cystic fibrosis in adults as an add-on therapy to best standard of care. Mannitol is restricted to patients who are not currently using dornase alfa due to lack of response, intolerance, or ineligibility and have rapidly declining lung function and in whom other osmotic agents are considered unsuitable.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

- ▶ **Osmohale** (Mawdsley-Brooks & Company Ltd)

Tezacaftor with ivacaftor

19-Mar-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, ivacaftor p. 308.

● INDICATIONS AND DOSE

Cystic fibrosis (in combination with ivacaftor) (specialist use only)

- ▶ **BY MOUTH**

▶ **Adult:** 100/150 mg, to be taken in the morning and, *Ivacaftor* 150 mg to be taken in the evening

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ With concurrent use of potent CYP3A4 inhibitors, manufacturer advises reduce dose to 100/150 mg tezacaftor/ivacaftor twice a week, taken approximately 3–4 days apart; the evening dose of ivacaftor should not be taken.

- ▶ With concurrent use of moderate CYP3A4 inhibitors, manufacturer advises reduce dose to 100/150 mg tezacaftor/ivacaftor every other morning, with ivacaftor 150 mg taken in the mornings alternate to tezacaftor/ivacaftor; the evening dose of ivacaftor should not be taken.

DOSE EQUIVALENCE AND CONVERSION

- ▶ Combination dose expressed as x/y mg of tezacaftor/ivacaftor.

- **INTERACTIONS** → Appendix 1: ivacaftor · tezacaftor
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · breast abnormalities · diarrhoea · dizziness · ear discomfort · headache · nausea · ototoxicity · rash · tympanic membrane hyperaemia
 - ▶ **Uncommon** Gynaecomastia
 - ▶ **Frequency not known** Hepatic function abnormal
- **SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises interrupt treatment if transaminase levels more than 5 times the upper limit of normal or transaminase levels more than 3 times the upper limit of normal and blood bilirubin more than twice the upper limit of normal—consult product literature.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (risk of increased exposure).
Dose adjustments Manufacturer advises omit evening dose of ivacaftor in moderate to severe impairment; in severe impairment, adjust dosing interval according to clinical response and tolerability.
- **PATIENT AND CARER ADVICE**
Missed doses Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2183

The *Scottish Medicines Consortium* has advised (August 2019) that tezacaftor with ivacaftor (*Symkevi*[®]) is **not** recommended for use within NHS Scotland for the treatment of cystic fibrosis in patients aged 12 years and older who are homozygous for the F508del mutation or who are heterozygous for the F508del mutation and have one of the following mutations in the cystic fibrosis transmembrane conductance regulator (CFTR) gene: P67L, R117C, L206W, R352Q, A455E, D579G, 711+3A→G, S945L, S977F, R1070W, D1152H, 2789+5G→A, 3272-26A→G, and 3849+10kbC→T, as the clinical and economic case was not demonstrated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

4 Cough and congestion

Aromatic inhalations, cough preparations and systemic nasal decongestants

Aromatic inhalations in adults

Inhalations containing volatile substances such as eucalyptus oil are traditionally used and although the vapour

may contain little of the additive it encourages deliberate inspiration of warm moist air which is often comforting in bronchitis; boiling water should not be used owing to the risk of scalding. In practice, inhalations are also used for the relief of nasal obstruction in acute rhinitis or sinusitis.

Cough preparations in adults

Cough suppressants

Cough may be a symptom of an underlying disorder, such as asthma, gastro-oesophageal reflux disease, or rhinitis, which should be addressed before prescribing cough suppressants. Cough may be a side-effect of another drug, such as an ACE inhibitor, or it can be associated with smoking or environmental pollutants. Cough can also have a significant habit component. When there is no identifiable cause, cough suppressants may be useful, for example if sleep is disturbed. They may cause sputum retention and this may be harmful in patients with chronic bronchitis and bronchiectasis.

There is some evidence to suggest that codeine phosphate p. 475 provides no benefit for symptoms of acute cough. Codeine phosphate is also constipating and can cause dependence; **dextromethorphan** and pholcodine p. 312 have fewer side-effects.

Sedating antihistamines are used as the cough suppressant component of many compound cough preparations on sale to the public; all tend to cause drowsiness which may reflect their main mode of action.

Palliative care

Diamorphine hydrochloride p. 477 and methadone hydrochloride p. 524 have been used to control distressing cough in terminal lung cancer although morphine p. 484 is now preferred. In other circumstances they are contra-indicated because they induce sputum retention and ventilatory failure as well as causing opioid dependence. Methadone hydrochloride linctus should be avoided because it has a long duration of action and tends to accumulate.

Demulcent and expectorant cough preparations

Demulcent cough preparations contain soothing substances such as syrup or glycerol and some patients believe that such preparations relieve a dry irritating cough. Preparations such as **simple linctus** have the advantage of being harmless and inexpensive; **paediatric simple linctus** is particularly useful in children.

Expectorants are claimed to promote expulsion of bronchial secretions, but there is no evidence that any drug can specifically facilitate expectoration.

[EvGr] An over-the-counter cough medicine containing the expectorant guaifenesin may be used for acute cough; there is some evidence to suggest it may reduce symptoms. **⚠**

Compound preparations are on sale to the public for the treatment of cough and colds but should not be used in children under 6 years; the rationale for some is dubious. Care should be taken to give the correct dose and to not use more than one preparation at a time.

Nasal decongestants, systemic

Nasal decongestants for administration by mouth may not be as effective as preparations for local application but they do not give rise to rebound nasal congestion on withdrawal. Pseudoephedrine hydrochloride p. 1267 is available over the counter; it has few sympathomimetic effects.

Aromatic inhalations in children

The use of strong aromatic decongestants (applied as rubs or to pillows) is not advised for infants under the age of 3 months. Carers of young infants in whom nasal obstruction with mucus is a problem can readily be taught appropriate techniques of suction aspiration but sodium chloride 0.9% p. 1101 given as nasal drops is preferred; administration before feeds may ease feeding difficulties caused by nasal congestion.

Cough preparations in children

The use of over-the-counter cough suppressants containing codeine phosphate should be avoided in children under 12 years and in children of any age known to be CYP2D6 ultra-rapid metabolisers. Cough suppressants containing similar opioid analgesics such as dextromethorphan and pholcodine are not generally recommended in children and should be avoided in children under 6 years; dextromethorphan should be avoided in children under 12 years.

MHRA/CHM advice (March 2008 and February 2009)

Children under 6 years should not be given over-the-counter cough and cold medicines containing the following ingredients:

- brompheniramine, chlorphenamine maleate p. 297, triphenhydramine, doxylamine, promethazine, or diphenhydramine (antihistamines);
- dextromethorphan or pholcodine (cough suppressants);
- guaifenesin or ippecacuanha (expectorants);
- phenylephrine hydrochloride p. 201, pseudoephedrine hydrochloride, ephedrine hydrochloride p. 1266, oxymetazoline, or xylometazoline hydrochloride p. 1267 (decongestants).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to five days or less. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

COUGH AND COLD PREPARATIONS > COUGH SUPPRESSANTS

Pholcodine

● INDICATIONS AND DOSE

Dry cough

▶ BY MOUTH USING LINCTUS

- ▶ Child 6–11 years: 2–5 mg 3–4 times a day
- ▶ Child 12–17 years: 5–10 mg 3–4 times a day
- ▶ Adult: 5–10 mg 3–4 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN
Children under 6 years should not be given over-the-counter cough and cold medicines containing pholcodine (cough suppressant).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to 5 days or less. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

- **CONTRA-INDICATIONS** Bronchiectasis · bronchiolitis (in children) · chronic bronchitis · chronic obstructive pulmonary disease (in adults) · patients at risk of respiratory failure
- **CAUTIONS** Asthma · chronic cough · persistent cough · productive cough
- **INTERACTIONS** → Appendix 1: pholcodine
- **SIDE-EFFECTS** Agitation · confusion · constipation · dizziness · drowsiness · gastrointestinal disorder · nausea · skin reactions · sputum retention · vomiting

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in hepatic failure.
- **RENAL IMPAIRMENT** Use with caution in renal impairment. Avoid in severe renal impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Pholcodine is not generally recommended for children.
Flavours of oral liquid formulations may include orange.

When prepared extemporaneously, the BP states Pholcodine Linctus, BP consists of pholcodine 5 mg/5 mL in a suitable flavoured vehicle, containing citric acid monohydrate 1% and Pholcodine Linctus, Strong, BP consists of pholcodine 10 mg/5 mL in a suitable flavoured vehicle, containing citric acid monohydrate 2%

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

5 Idiopathic pulmonary fibrosis

Other drugs used for Idiopathic pulmonary fibrosis

Nintedanib, p. 1048

ANTIFIBROTICS

Pirfenidone

28-Apr-2020

- **DRUG ACTION** The exact mechanism of action of pirfenidone is not yet understood, but it is believed to slow down the progression of idiopathic pulmonary fibrosis by exerting both antifibrotic and anti-inflammatory properties.

● INDICATIONS AND DOSE

Treatment of mild to moderate idiopathic pulmonary fibrosis (initiated under specialist supervision)

▶ BY MOUTH

- ▶ Adult: Initially 267 mg 3 times a day for 7 days, then increased to 534 mg 3 times a day for 7 days, then increased to 801 mg 3 times a day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Caution with concomitant use with ciprofloxacin—reduce dose of pirfenidone to 534 mg three times daily with high-dose ciprofloxacin (750 mg twice daily).

● CAUTIONS

- ▶ **Photosensitivity** Avoid exposure to direct sunlight—if photosensitivity reaction or rash occurs, dose adjustment or treatment interruption may be required (consult product literature).
- ▶ **Treatment interruption** If treatment is interrupted for 14 consecutive days or more, the initial 2 week titration regimen should be repeated; if treatment is interrupted for less than 14 consecutive days, the dose can be resumed at the previous daily dose without titration.

- **INTERACTIONS** → Appendix 1: pirfenidone

● **SIDE-EFFECTS**

- ▶ **Common or very common** Appetite decreased · arthralgia · asthenia · constipation · cough · diarrhoea · dizziness · drowsiness · dyspnoea · gastrointestinal discomfort · gastrointestinal disorders · headache · hot flush · increased risk of infection · insomnia · musculoskeletal chest pain · myalgia · nausea · photosensitivity reaction · skin reactions · sunburn · taste altered · vomiting · weight decreased
- ▶ **Uncommon** Angioedema
- ▶ **Rare or very rare** Agranulocytosis

SIDE-EFFECTS, FURTHER INFORMATION Gastrointestinal side-effects may require dose reduction or treatment interruption—consult product literature.

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment (risk of increased exposure); avoid in severe impairment (no information available).

- **RENAL IMPAIRMENT** Avoid use if eGFR less than 30 mL/minute/1.73 m².

● **MONITORING REQUIREMENTS**

- ▶ Monitor for weight loss.
- ▶ Test liver function before treatment, then at monthly intervals for the next 6 months, and then every 3 months thereafter; review if abnormal liver function tests—dose reduction, treatment interruption or discontinuation may be required (consult product literature).

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks Dizziness or malaise may affect performance of skilled tasks (e.g. driving).

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

▶ Pirfenidone for treating idiopathic pulmonary fibrosis

(February 2018) NICE TA504

Pirfenidone (*Esbriet*[®]) is recommended as an option for

treating idiopathic pulmonary fibrosis in adults only if:

- the patient has a forced vital capacity (FVC) between 50% and 80% predicted, **and**
- the manufacturer provides pirfenidone with the discount agreed in the patient access scheme, **and**
- treatment is stopped if there is evidence of disease progression (an absolute decline of 10% or more in predicted FVC within any 12-month period).

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta504

Scottish Medicines Consortium (SMC) decisions

SMC No. 835/13

The *Scottish Medicines Consortium* has advised (August 2013) that pirfenidone (*Esbriet*[®]) is accepted for restricted use within NHS Scotland for the treatment of mild to moderate idiopathic pulmonary fibrosis. Pirfenidone is restricted for use in patients with a predicted forced vital capacity less than or equal to 80%, and only whilst pirfenidone is available at the price agreed in the patient access scheme.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

6 Respiratory depression, respiratory distress syndrome and apnoea

Respiratory stimulants

Overview

Respiratory stimulants (analeptic drugs) have a limited place in the treatment of ventilatory failure in patients with chronic obstructive pulmonary disease. They are effective only when given by intravenous injection or infusion and have a short duration of action. Their use has largely been replaced by ventilatory support including nasal intermittent positive pressure ventilation. However, occasionally when ventilatory support is contra-indicated and in patients with hypercapnic respiratory failure who are becoming drowsy or comatose, respiratory stimulants in the short term may arouse patients sufficiently to co-operate and clear their secretions.

Respiratory stimulants can also be harmful in respiratory failure since they stimulate non-respiratory as well as respiratory muscles. They should only be given under **expert supervision** in hospital and must be combined with active

physiotherapy. There is at present no oral respiratory stimulant available for long-term use in chronic respiratory failure.

RESPIRATORY STIMULANTS

Doxapram hydrochloride

28-Jun-2018

• INDICATIONS AND DOSE

Postoperative respiratory depression

▶ INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: Initially 1–1.5 mg/kg, to be administered over at least 30 seconds, repeated if necessary after intervals of one hour, alternatively (by intravenous infusion) 2–3 mg/minute, adjusted according to response

Acute respiratory failure

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 1.5–4 mg/minute, adjusted according to response, to be given concurrently with oxygen and whenever possible monitor with frequent measurement of blood gas tensions

- **CONTRA-INDICATIONS** Cerebral oedema · cerebrovascular accident · coronary artery disease · epilepsy and other convulsive disorders · hyperthyroidism · physical obstruction of respiratory tract · severe hypertension · status asthmaticus
- **CAUTIONS** Give with beta₂ agonist in bronchoconstriction · give with oxygen in severe irreversible airways obstruction or severely decreased lung compliance (because of increased work load of breathing) · hypertension · impaired cardiac reserve · pheochromocytoma
- **INTERACTIONS** → Appendix 1: doxapram
- **SIDE-EFFECTS** Arrhythmias · chest discomfort · confusion · cough · dizziness · dyspnoea · fever · flushing · hallucination · headache · hyperhidrosis · movement disorders · nausea · neuromuscular dysfunction · oral disorders · perineal warmth · reflexes abnormal · respiratory disorders · seizure · urinary disorders · vomiting
- **PREGNANCY** No evidence of harm, but manufacturer advises avoid unless benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution.
- **MONITORING REQUIREMENTS** Frequent arterial blood gas and pH measurements are necessary during treatment to ensure correct dosage.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

1 Dementia

Dementia

14-Sep-2018

Description of condition

Dementia is a progressive clinical syndrome characterised by a range of cognitive and behavioural symptoms that can include memory loss, problems with reasoning and communication, a change in personality, and a reduced ability to carry out daily activities such as washing or dressing. Alzheimer's disease is the most common type of dementia; other common types of dementia include vascular dementia (due to cerebrovascular disease), dementia with Lewy bodies, mixed dementia, and frontotemporal dementia.

Aims of treatment

The aim of treatment is to promote independence, maintain function, and manage symptoms of dementia.

Non-drug treatment

EvGr Patients with all types of *mild-to-moderate* dementia presenting with **cognitive symptoms** should be given the opportunity to participate in a structured group cognitive stimulation programme. Group reminiscence therapy (use of life stories to improve psychological well-being), and cognitive rehabilitation or occupational therapy to support daily functional ability, should also be considered. **A**

Management of cognitive symptoms

EvGr Some commonly prescribed drugs are associated with increased antimuscarinic (anticholinergic) burden, and therefore cognitive impairment; their use should be minimised. **A** Drugs with antimuscarinic effects include some antidepressants (e.g. amitriptyline hydrochloride p. 390, paroxetine p. 384), antihistamines (e.g. chlorpheniramine maleate p. 297, promethazine hydrochloride p. 301), antipsychotics (e.g. olanzapine p. 416, quetiapine p. 419), and urinary antispasmodics (e.g. solifenacin succinate p. 823, tolterodine tartrate p. 823).

Alzheimer's disease

EvGr In newly diagnosed patients, drug treatment should only be initiated under the advice of a specialist clinician experienced in the management of Alzheimer's disease.

In patients with *mild-to-moderate* Alzheimer's disease, monotherapy with donepezil hydrochloride p. 316, galantamine p. 317, or rivastigmine p. 318 (acetylcholinesterase inhibitors) are first-line treatment options. If acetylcholinesterase inhibitors are not tolerated or contra-indicated, memantine hydrochloride p. 320 is a suitable alternative in patients with *moderate* Alzheimer's disease. Memantine hydrochloride is the drug of choice in patients with *severe* Alzheimer's disease.

In patients already receiving an acetylcholinesterase inhibitor to treat Alzheimer's disease, the addition of memantine hydrochloride should be considered if they develop *moderate* or *severe* disease; in this case, memantine hydrochloride can be initiated in primary care without advice from a specialist clinician. **A**

In patients with *moderate* Alzheimer's disease, discontinuing acetylcholinesterase inhibitor treatment can cause a substantial worsening in cognitive function; **EvGr** treatment discontinuation should not be based on disease severity alone. **A**

Non-Alzheimer's dementia

EvGr Donepezil hydrochloride [unlicensed indication] or rivastigmine [unlicensed indication] should be given to patients with *mild-to-moderate* dementia with Lewy bodies; galantamine [unlicensed indication] can be considered only if treatment with both donepezil hydrochloride or rivastigmine is not tolerated. Donepezil hydrochloride [unlicensed indication] or rivastigmine [unlicensed indication] can also be considered in patients with *severe* dementia with Lewy bodies. Memantine hydrochloride [unlicensed indication] can be considered as an alternative in patients with dementia with Lewy bodies in whom acetylcholinesterase inhibitors are contra-indicated or not tolerated.

Acetylcholinesterase inhibitors [unlicensed indication] or memantine hydrochloride [unlicensed indication] should only be considered in patients with vascular dementia if they have suspected co-morbid Alzheimer's disease, Parkinson's disease dementia, or dementia with Lewy bodies.

Acetylcholinesterase inhibitors and memantine hydrochloride are **not** recommended in patients with frontotemporal dementia or cognitive impairment caused by multiple sclerosis. [A](#)

For management of Parkinson's disease dementia see Parkinson's disease p. 429.

Management of non-cognitive symptoms

Agitation, aggression, distress and psychosis

[EvGr](#) Patients with dementia should be offered psychosocial and environmental interventions such as counselling and management of pain and delirium to reduce distress.

Antipsychotic drugs should only be offered to patients with dementia if they are either at risk of harming themselves or others, or experiencing agitation, hallucinations or delusions that are causing them severe distress. [A](#) The CHM/MHRA has reported (2009) an increased risk of stroke and a small increased risk of death when antipsychotic drugs are used in elderly patients with dementia. The balance of risks and benefits should be carefully assessed, including any previous history of stroke or transient ischaemic attack and any risk factors for cerebrovascular disease such as hypertension, diabetes, smoking, and atrial fibrillation.

[EvGr](#) Antipsychotic drugs should be used at the lowest effective dose and for the shortest time possible, with a regular review at least every 6 weeks. [A](#)

In patients who have dementia with Lewy bodies or Parkinson's disease dementia, antipsychotic drugs can worsen the motor features of the condition, and in some cases cause severe antipsychotic sensitivity reactions. See also management of psychotic symptoms in Parkinson's disease p. 429.

Depression and anxiety

[EvGr](#) Psychological treatments (e.g. cognitive behavioural therapy (CBT), multisensory stimulation, relaxation, or animal-assisted therapies) should be considered for patients with *mild-to-moderate* dementia who have mild to moderate depression or anxiety; antidepressants should be reserved for pre-existing severe mental health problems. [A](#)

Sleep disturbances

[EvGr](#) Patients should be offered non-drug treatment approaches to manage sleep problems and insomnia, including sleep hygiene education, exposure to daylight, and increasing exercise and activity. [A](#)

ANTICHOLINESTERASES > CENTRALLY ACTING

Donepezil hydrochloride

25-Jul-2018

- **DRUG ACTION** Donepezil is a reversible inhibitor of acetylcholinesterase.

• INDICATIONS AND DOSE

Mild to moderate dementia in Alzheimer's disease

► BY MOUTH

- Adult: Initially 5 mg once daily for one month, then increased if necessary up to 10 mg daily, doses to be given at bedtime

- **CAUTIONS** Asthma · chronic obstructive pulmonary disease · sick sinus syndrome · supraventricular conduction abnormalities · susceptibility to peptic ulcers

CAUTIONS, FURTHER INFORMATION

- **Elderly** For acetylcholinesterase inhibitors, prescription potentially inappropriate (STOPP criteria) in patients with a known history of persistent bradycardia (heart rate less than 60 beats per minute), heart block, recurrent unexplained syncope, or concurrent treatment with drugs that reduce heart rate (risk of cardiac conduction failure, syncope and injury).

See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: anticholinesterases, centrally acting

• SIDE-EFFECTS

- **Common or very common** Aggression · agitation · appetite decreased · common cold · diarrhoea · dizziness · fatigue · gastrointestinal disorders · hallucination · headache · injury · muscle cramps · nausea · pain · skin reactions · sleep disorders · syncope · urinary incontinence · vomiting
- **Uncommon** Bradycardia · gastrointestinal haemorrhage · hypersalivation · seizure
- **Rare or very rare** Cardiac conduction disorders · extrapyramidal symptoms · hepatic disorders · neuroleptic malignant syndrome · rhabdomyolysis

SIDE-EFFECTS, FURTHER INFORMATION Dose should be started low and increased if tolerated and necessary.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure in mild to moderate impairment; no information available in severe impairment).

Dose adjustments Manufacturer advises dose escalation should be performed according to individual tolerability in mild to moderate impairment.

- **DIRECTIONS FOR ADMINISTRATION** Donepezil orodispersible tablet should be placed on the tongue, allowed to disperse, and swallowed.

- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer donepezil hydrochloride orodispersible tablets.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer's disease (updated June 2018)** NICE TA217

The three acetylcholinesterase (AChE) inhibitors donepezil, galantamine, and rivastigmine as monotherapies are recommended as options for managing mild to moderate Alzheimer's disease under all of the conditions specified below and in recommendation 1.5.5 of the NICE guideline on dementia.

If prescribing an AChE inhibitor (donepezil, galantamine, or rivastigmine), treatment should normally be started with the drug with the lowest acquisition cost (taking into account required daily dose and the price per dose once shared care has started). However, an alternative AChE inhibitor could be prescribed if it is considered appropriate when taking into account adverse event profile, expectations about adherence, medical comorbidity, possibility of drug interactions and dosing profiles.

Healthcare professionals should not rely solely on assessment scales to determine the severity of Alzheimer's disease when the patient has learning or other disabilities, or other communication difficulties.

Oral solution

► Donepezil hydrochloride (Non-proprietary)

Donepezil hydrochloride 1 mg per 1 ml Donepezil 1mg/ml oral solution sugar free sugar-free | 150 ml (PoM) £53.73 DT = £50.99

Orodispersible tablet▶ **Donepezil hydrochloride (Non-proprietary)**

Donepezil hydrochloride 5 mg Donepezil 5mg orodispersible tablets sugar free sugar-free | 28 tablet [PoM] £9.26-£50.87 DT = £9.26

Donepezil hydrochloride 10 mg Donepezil 10mg orodispersible tablets sugar free sugar-free | 28 tablet [PoM] £10.42-£71.31 DT = £10.42

▶ **Aricept Evess** (Eisai Ltd)

Donepezil hydrochloride 5 mg Aricept Evess 5mg orodispersible tablets sugar-free | 28 tablet [PoM] £59.85 DT = £9.26

Donepezil hydrochloride 10 mg Aricept Evess 10mg orodispersible tablets sugar-free | 28 tablet [PoM] £83.89 DT = £10.42

Tablet▶ **Donepezil hydrochloride (Non-proprietary)**

Donepezil hydrochloride 5 mg Donepezil 5mg tablets | 28 tablet [PoM] £59.85 DT = £0.98

Donepezil hydrochloride 10 mg Donepezil 10mg tablets | 28 tablet [PoM] £83.89 DT = £1.22

▶ **Aricept** (Eisai Ltd)

Donepezil hydrochloride 5 mg Aricept 5mg tablets | 28 tablet [PoM] £59.85 DT = £0.98

Donepezil hydrochloride 10 mg Aricept 10mg tablets | 28 tablet [PoM] £83.89 DT = £1.22

Galantamine

25-Jul-2018

- **DRUG ACTION** Galantamine is a reversible inhibitor of acetylcholinesterase and it also has nicotinic receptor agonist properties.

● **INDICATIONS AND DOSE****Mild to moderately severe dementia in Alzheimer's disease**▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- ▶ **Adult:** Initially 4 mg twice daily for 4 weeks, increased to 8 mg twice daily for at least 4 weeks; maintenance 8–12 mg twice daily

▶ **BY MOUTH USING MODIFIED-RELEASE CAPSULES**

- ▶ **Adult:** Initially 8 mg once daily for 4 weeks, increased to 16 mg once daily for at least 4 weeks; maintenance 16–24 mg daily

- **CAUTIONS** Avoid in gastro-intestinal obstruction · avoid in urinary outflow obstruction · avoid whilst recovering from bladder surgery · avoid whilst recovering from gastro-intestinal surgery · cardiac disease · chronic obstructive pulmonary disease · congestive heart failure · electrolyte disturbances · history of seizures · history of severe asthma · pulmonary infection · sick sinus syndrome · supra-ventricular conduction abnormalities · susceptibility to peptic ulcers · unstable angina

CAUTIONS, FURTHER INFORMATION

- ▶ **Elderly** For acetylcholinesterase inhibitors, prescription potentially inappropriate (STOPP criteria) in patients with a known history of persistent bradycardia (heart rate less than 60 beats per minute), heart block, recurrent unexplained syncope or concurrent treatment with drugs that reduce heart rate (risk of cardiac conduction failure, syncope and injury).

See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: anticholinesterases, centrally acting

● **SIDE-EFFECTS**

- ▶ **Common or very common** Appetite decreased · arrhythmias · asthenia · depression · diarrhoea · dizziness · drowsiness · fall · gastrointestinal discomfort · hallucinations · headache · hypertension · malaise · muscle spasms · nausea · skin reactions · syncope · tremor · vomiting · weight decreased
- ▶ **Uncommon** Atrioventricular block · dehydration · flushing · hyperhidrosis · hypersomnia · hypotension · muscle weakness · palpitations · paraesthesia · seizure · taste altered · tinnitus · vision blurred

- ▶ **Rare or very rare** Hepatitis · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises increasing dose according to response and tolerability.

Serious skin reactions Serious skin reactions (including Stevens-Johnson syndrome and acute generalized exanthematous pustulosis) have been reported—manufacturer advises discontinuation at the first appearance of skin rash.

- **PREGNANCY** Use with caution—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment (risk of increased plasma concentrations); avoid in severe impairment (no information available).

Dose adjustments Manufacturer advises for *immediate-release* preparations in moderate impairment, initially 4 mg once daily (preferably in the morning) for at least 7 days, then 4 mg twice daily for at least 4 weeks; maximum 8 mg twice daily.

Manufacturer advises for *modified-release* preparations in moderate impairment, initially 8 mg on alternate days (preferably in the morning) for 7 days, then 8 mg once daily for 4 weeks; maximum 16 mg daily.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 9 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE** Manufacturer recommends that patients are warned of the signs of serious skin reactions; they should be advised to stop taking galantamine immediately and seek medical advice if symptoms occur.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- ▶ **Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer's disease (updated June 2018)** NICE TA217

The three acetylcholinesterase (AChE) inhibitors donepezil, galantamine, and rivastigmine as monotherapies are recommended as options for managing mild to moderate Alzheimer's disease under all of the conditions specified below and in recommendation 1.5.5 of the NICE guideline on dementia.

If prescribing an AChE inhibitor (donepezil, galantamine, or rivastigmine), treatment should normally be started with the drug with the lowest acquisition cost (taking into account required daily dose and the price per dose once shared care has started). However, an alternative AChE inhibitor could be prescribed if it is considered appropriate when taking into account adverse event profile, expectations about adherence, medical comorbidity, possibility of drug interactions and dosing profiles.

Healthcare professionals should not rely solely on assessment scales to determine the severity of Alzheimer's disease when the patient has learning or other disabilities, or other communication difficulties.

Rivastigmine

26-Jul-2018

- **DRUG ACTION** Rivastigmine is a reversible non-competitive inhibitor of acetylcholinesterases.

● INDICATIONS AND DOSE

Mild to moderate dementia in Alzheimer's disease

▶ BY MOUTH

- ▶ **Adult:** Initially 1.5 mg twice daily, increased in steps of 1.5 mg twice daily, dose to be increased at intervals of at least 2 weeks according to response and tolerance; usual dose 3–6 mg twice daily (max. per dose 6 mg twice daily), if treatment interrupted for more than several days, retitrate from 1.5 mg twice daily

▶ BY TRANSDERMAL APPLICATION USING PATCHES

- ▶ **Adult:** Apply 4.6 mg/24 hours daily for at least 4 weeks, increased if tolerated to 9.5 mg/24 hours daily for a further 6 months, then increased if necessary to 13.3 mg/24 hours daily, increase to 13.3 mg/24 hours patch if well tolerated and cognitive deterioration or functional decline demonstrated; use caution in patients with body-weight less than 50 kg, if treatment interrupted for more than 3 days, retitrate from 4.6 mg/24 hours patch

Mild to moderate dementia in Parkinson's disease

▶ BY MOUTH

- ▶ **Adult:** Initially 1.5 mg twice daily, increased in steps of 1.5 mg twice daily, dose to be increased at intervals of at least 2 weeks according to response and tolerance; usual dose 3–6 mg twice daily (max. per dose 6 mg twice daily), if treatment interrupted for more than several days, retitrate from 1.5 mg twice daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ When switching from oral to transdermal therapy, patients taking 3–6 mg by mouth daily should initially switch to 4.6 mg/24 hours patch, then titrate as above. Patients taking 9 mg by mouth daily should switch to 9.5 mg/24 hours patch if oral dose stable and well tolerated; if oral dose not stable or well tolerated, patients should switch to 4.6 mg/24 hours patch, then titrate as above. Patients taking 12 mg by mouth daily should switch to 9.5 mg/24 hours patch. The first patch should be applied on the day following the last oral dose

- **CAUTIONS** Bladder outflow obstruction · conduction abnormalities · duodenal ulcers · gastric ulcers · history of asthma · history of chronic obstructive pulmonary disease · history of seizures · risk of fatal overdose with patch administration errors · sick sinus syndrome · susceptibility to ulcers

CAUTIONS, FURTHER INFORMATION

- ▶ **Elderly** For acetylcholinesterase inhibitors, prescription (potentially inappropriate (STOPP criteria) in patients with a known history of persistent bradycardia (heart rate less than 60 beats per minute), heart block, recurrent unexplained syncope or concurrent treatment with drugs that reduce heart rate (risk of cardiac conduction failure, syncope and injury).

See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: anticholinesterases, centrally acting
- **SIDE-EFFECTS**
- GENERAL SIDE-EFFECTS**
- ▶ **Common or very common** Anxiety · appetite decreased · arrhythmias · asthenia · dehydration · depression · diarrhoea · dizziness · drowsiness · fall · gastrointestinal discomfort · headache · hyperhidrosis · hypersalivation · hypertension · movement disorders · nausea · skin reactions · syncope · tremor · urinary incontinence · urinary tract infection · vomiting · weight decreased
- ▶ **Uncommon** Aggression · atrioventricular block
- ▶ **Rare or very rare** Pancreatitis · seizure
- ▶ **Frequency not known** Hepatitis

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With oral use Confusion · gait abnormal · hallucinations · malaise · parkinsonism · sleep disorders
- ▶ **Uncommon**
- ▶ With oral use Hypotension
- ▶ With transdermal use Gastric ulcer
- ▶ **Rare or very rare**
- ▶ With oral use Angina pectoris · gastrointestinal disorders · gastrointestinal haemorrhage
- ▶ **Frequency not known**
- ▶ With transdermal use Hallucination · nightmare

SIDE-EFFECTS, FURTHER INFORMATION Dose should be started low and increased according to response if tolerated.

Treatment should be interrupted if dehydration resulting from prolonged vomiting or diarrhoea occurs and withheld until resolution—reiterate dose if necessary.

Transdermal administration is less likely to cause side-effects.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure; no information available in severe impairment).

Dose adjustments Manufacturer advises cautious dose titration according to individual tolerability.

RENAL IMPAIRMENT

Dose adjustments Titrate according to individual tolerability.

- **MONITORING REQUIREMENTS** Monitor body-weight.

DIRECTIONS FOR ADMINISTRATION

- ▶ With transdermal use Apply patches to clean, dry, non-hairy, non-irritated skin on back, upper arm, or chest, removing after 24 hours and siting a replacement patch on a different area (avoid using the same area for 14 days).

PATIENT AND CARER ADVICE

EXELON® PATCHES Advise patients and carers of patch administration instructions, particularly to remove the previous day's patch before applying the new patch—consult product literature.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer's disease (updated June 2018)** NICE TA217

The three acetylcholinesterase (AChE) inhibitors donepezil, galantamine, and rivastigmine as monotherapies are recommended as options for managing mild to moderate Alzheimer's disease under all of the conditions specified below and in recommendation 1.5.5 of the NICE guideline on dementia.

If prescribing an AChE inhibitor (donepezil, galantamine, or rivastigmine), treatment should normally be started with the drug with the lowest acquisition cost (taking into account required daily dose and the price per dose once shared care has started). However, an alternative AChE inhibitor could be prescribed if it is considered appropriate when taking into account adverse

event profile, expectations about adherence, medical comorbidity, possibility of drug interactions and dosing profiles.

DOPAMINERGIC DRUGS > NMDA RECEPTOR ANTAGONISTS

Memantine hydrochloride

08-Apr-2019

- **DRUG ACTION** Memantine is a glutamate receptor antagonist.

● INDICATIONS AND DOSE

Moderate to severe dementia in Alzheimer's disease

► BY MOUTH

- Adult: Initially 5 mg once daily, then increased in steps of 5 mg every week; usual maintenance 20 mg daily; maximum 20 mg per day

Oscillopsia in multiple sclerosis

► BY MOUTH

- Adult: Initially 10 mg daily, then increased to 40 mg daily, over 1 week; increased if necessary to 60 mg daily, over 1 week, on specialist advice only

- **UNLICENSED USE**  Memantine hydrochloride is used for oscillopsia in multiple sclerosis,  but is not licensed for this indication.

- **CAUTIONS** Epilepsy · history of convulsions · risk factors for epilepsy

- **INTERACTIONS** → Appendix 1: memantine

● SIDE-EFFECTS

- **Common or very common** Balance impaired · constipation · dizziness · drowsiness · dyspnoea · headache · hypersensitivity · hypertension

- **Uncommon** Confusion · embolism and thrombosis · fatigue · fungal infection · hallucination · heart failure · vomiting

- **Rare or very rare** Seizure

- **Frequency not known** Hepatitis · pancreatitis · psychotic disorder

- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 5 mL/minute/1.73 m².

Dose adjustments Reduce dose to 10 mg daily if eGFR 30–49 mL/minute/1.73 m², if well tolerated after at least 7 days dose can be increased in steps to 20 mg daily; reduce dose to 10 mg daily if eGFR 5–29 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION** For oral solution, manufacturer advises solution should be dosed onto a spoon or into a glass of water. For soluble tablets, manufacturer advises drink resulting solution immediately when dissolved in water.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer's disease (updated June 2018) NICE TA217

Memantine monotherapy is recommended as an option for managing Alzheimer's disease for people with:

- moderate Alzheimer's disease who are intolerant of or have a contra-indication to AChE inhibitors, or
- severe Alzheimer's disease.

Treatment should be under the conditions specified in recommendation 1.5.5 in the NICE guideline on dementia.

Healthcare professionals should not rely solely on assessment scales to determine the severity of Alzheimer's disease when the patient has learning or other disabilities, or other communication difficulties.

2 Epilepsy and other seizure disorders

Epilepsy

26-May-2017

Epilepsy control

The object of treatment is to prevent the occurrence of seizures by maintaining an effective dose of one or more antiepileptic drugs. Careful adjustment of doses is necessary, starting with low doses and increasing gradually until seizures are controlled or there are significant adverse effects.

When choosing an antiepileptic drug, the presenting epilepsy syndrome should first be considered. If the syndrome is not clear, the seizure type should determine the choice of treatment. Concomitant medication, co-morbidity, age, and sex should also be taken into account.

The dosage frequency is often determined by the plasma-drug half-life, and should be kept as low as possible to encourage adherence with the prescribed regimen. Most antiepileptics, when used in the usual dosage, can be given twice daily. Lamotrigine p. 334, perampanel p. 338, phenobarbital p. 351, and phenytoin p. 339, which have long half-lives, can be given once daily at bedtime. However, with large doses, some antiepileptics may need to be given more frequently to avoid adverse effects associated with high peak plasma-drug concentration.

Management

When monotherapy with a first-line antiepileptic drug has failed, monotherapy with a second drug should be tried; the diagnosis should be checked before starting an alternative drug if the first drug showed lack of efficacy. The change from one antiepileptic drug to another should be cautious, slowly withdrawing the first drug only when the new regimen has been established. Combination therapy with two or more antiepileptic drugs may be necessary, but the concurrent use of antiepileptic drugs increases the risk of adverse effects and drug interactions. If combination therapy does not bring about worthwhile benefits, revert to the regimen (monotherapy or combination therapy) that provided the best balance between tolerability and efficacy. A single antiepileptic drug should be prescribed wherever possible.

MHRA/CHM advice: Antiepileptic drugs: updated advice on switching between different manufacturers' products (November 2017)

The CHM has reviewed spontaneous adverse reactions received by the MHRA and publications that reported potential harm arising from switching of antiepileptic drugs in patients previously stabilised on a branded product to a generic. The CHM concluded that reports of loss of seizure control and/or worsening of side-effects around the time of switching between products could be explained as chance associations, but that a causal role of switching could not be ruled out in all cases. The following guidance has been issued to help minimise risk:

- Different antiepileptic drugs vary considerably in their characteristics, which influences the risk of whether switching between different manufacturers' products of a particular drug may cause adverse effects or loss of seizure control;
- Antiepileptic drugs have been divided into three risk-based categories to help healthcare professionals decide whether it is necessary to maintain continuity of supply of a specific manufacturer's product. These categories are listed below;
- If it is felt desirable for a patient to be maintained on a specific manufacturer's product this should be prescribed either by specifying a brand name, or by using the generic

drug name and name of the manufacturer (otherwise known as the Marketing Authorisation Holder);

- This advice relates only to antiepileptic drug use for treatment of epilepsy; it does not apply to their use in other indications (e.g. mood stabilisation, neuropathic pain);
- Please report on a Yellow Card any suspected adverse reactions to antiepileptic drugs;
- Dispensing pharmacists should ensure the continuity of supply of a particular product when the prescription specifies it. If the prescribed product is unavailable, it may be necessary to dispense a product from a different manufacturer to maintain continuity of treatment of that antiepileptic drug. Such cases should be discussed and agreed with both the prescriber and patient (or carer);
- Usual dispensing practice can be followed when a specific product is not stated.

Category 1

Carbamazepine p. 327, phenobarbital, phenytoin, primidone p. 352. For these drugs, doctors are advised to ensure that their patient is maintained on a specific manufacturer's product.

Category 2

Clobazam p. 353, clonazepam p. 354, eslicarbazepine acetate p. 329, lamotrigine, oxcarbazepine p. 337, perampanel, rufinamide p. 342, topiramate p. 348, valproate, zonisamide p. 350. For these drugs, the need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient and/or carer taking into account factors such as seizure frequency, treatment history, and potential implications to the patient of having a breakthrough seizure. Non-clinical factors as for Category 3 drugs should also be considered.

Category 3

Brivaracetam p. 325, ethosuximide p. 330, gabapentin p. 331, lacosamide p. 333, levetiracetam p. 336, pregabalin p. 341, tiagabine p. 347, vigabatrin p. 349. For these drugs, it is usually unnecessary to ensure that patients are maintained on a specific manufacturer's product as therapeutic equivalence can be assumed, however, other factors are important when considering whether switching is appropriate. Differences between alternative products (e.g. product name, packaging, appearance, and taste) may be perceived negatively by patients and/or carers, and may lead to dissatisfaction, anxiety, confusion, dosing errors, and reduced adherence. In addition, difficulties for patients with co-morbid autism, mental health problems, or learning disability should also be considered.

Antiepileptic hypersensitivity syndrome

Antiepileptic hypersensitivity syndrome is a rare but potentially fatal syndrome associated with some antiepileptic drugs (**carbamazepine, lacosamide, lamotrigine, oxcarbazepine, phenobarbital, phenytoin, primidone, and rufinamide**); rarely cross-sensitivity occurs between some of these antiepileptic drugs. Some other antiepileptics (**eslicarbazepine, stiripentol, and zonisamide**) have a theoretical risk. The symptoms usually start between 1 and 8 weeks of exposure; fever, rash, and lymphadenopathy are most commonly seen. Other systemic signs include liver dysfunction, haematological, renal, and pulmonary abnormalities, vasculitis, and multi-organ failure. If signs or symptoms of hypersensitivity syndrome occur, the drug should be withdrawn immediately, the patient must not be re-exposed, and expert advice should be sought.

Risk of suicidal thoughts and behaviour

The MHRA has advised (August 2008) that all antiepileptic drugs are associated with a small increased risk of suicidal thoughts and behaviour. Symptoms may occur as early as one week after starting treatment. Patients should be

advised to seek medical advice if they develop any mood changes, distressing thoughts, or feelings about suicide or harming themselves, and should be referred for appropriate treatment if necessary.

Interactions

Interactions between antiepileptics are complex and may increase toxicity without a corresponding increase in antiepileptic effect. Interactions are usually caused by hepatic enzyme induction or inhibition; displacement from protein binding sites is not usually a problem. These interactions are highly variable and unpredictable.

Withdrawal

Antiepileptic drugs should be withdrawn under specialist supervision. Avoid abrupt withdrawal, particularly of barbiturates and benzodiazepines, because this can precipitate severe rebound seizures. Reduction in dosage should be gradual and, in the case of barbiturates, withdrawal of the drug may take months.

The decision to withdraw antiepileptic drugs from a seizure-free patient, and its timing, is often difficult and depends on individual circumstances. Even in patients who have been seizure-free for several years, there is a significant risk of seizure recurrence on drug withdrawal. In patients receiving several antiepileptic drugs, only one drug should be withdrawn at a time.

Driving

If a driver has a seizure (of any type) they must stop driving immediately and inform the Driver and Vehicle Licensing Agency (DVLA)

Patients who have had a first unprovoked epileptic seizure or a single isolated seizure must not drive for 6 months; driving may then be resumed, provided the patient has been assessed by a specialist as fit to drive and investigations do not suggest a risk of further seizures.

Patients with established epilepsy may drive a motor vehicle provided they are not a danger to the public and are compliant with treatment and follow up. To continue driving, these patients must be seizure-free for at least one year (or have a pattern of seizures established for one year where there is no influence on their level of consciousness or the ability to act); also, they must not have a history of unprovoked seizures.

Note: additional criteria apply for drivers of large goods or passenger carrying vehicles—consult DVLA guidance.

Patients who have had a *seizure while asleep* are not permitted to drive for one year from the date of each seizure, unless:

- a history or pattern of sleep seizures occurring **only** ever while asleep has been established over the course of at least one year from the date of the first sleep seizure; or
- an established pattern of purely asleep seizures can be demonstrated over the course of three years if the patient has previously had seizures whilst awake (or awake and asleep).

The DVLA recommends that patients should not drive during medication changes or withdrawal of antiepileptic drugs, and for 6 months after their last dose. If a seizure occurs due to a prescribed change or withdrawal of epilepsy treatment, the patient will have their driving license revoked for 1 year; relicensing may be considered earlier if treatment has been reinstated for 6 months and no further seizures have occurred.

Pregnancy

Women of child-bearing potential should discuss with a specialist the impact of both epilepsy, and its treatment, on the outcome of pregnancy.

There is an increased risk of teratogenicity associated with the use of antiepileptic drugs (especially if used during the first trimester and particularly if the patient takes two or more antiepileptic drugs). Valproate is associated with the

highest risk of serious developmental disorders (up to 30–40% risk) and congenital malformations (approx. 10% risk). Valproate must **not** be used in females of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met and alternative treatments are ineffective or not tolerated; during pregnancy, it must not be used for epilepsy, unless it is the only possible treatment. There is also an increased risk of teratogenicity with phenytoin, primidone, phenobarbital, lamotrigine, and carbamazepine. Topiramate carries an increased risk of congenital malformations (including cleft palate, hypospadias, and anomalies involving various body systems) if taken in the first trimester of pregnancy. There is not enough evidence to establish the risk of teratogenicity with other antiepileptic drugs.

Prescribers should also consider carefully the choice of antiepileptic therapy in pre-pubescent girls who may later become pregnant. Women of child-bearing potential who take antiepileptic drugs should be given advice about the need for an effective contraception method to avoid unplanned pregnancy—for further information, see *Conception and contraception* in the individual drug monographs. Some antiepileptic drugs can reduce the efficacy of hormonal contraceptives, and the efficacy of some antiepileptics may be affected by hormonal contraceptives.

Women who want to become pregnant should be referred to a specialist for advice in advance of conception. For some women, the severity of seizure or the seizure type may not pose a serious threat, and drug withdrawal may be considered; therapy may be resumed after the first trimester. If treatment with antiepileptic drugs must continue throughout pregnancy, then monotherapy is preferable at the lowest effective dose.

Once an unplanned pregnancy is discovered it is usually too late for changes to be made to the treatment regimen; the risk of harm to the mother and fetus from convulsive seizures outweighs the risk of continued therapy. The likelihood of a woman who is taking antiepileptic drugs having a baby with no malformations is at least 90%, and it is important that women do not stop taking essential treatment because of concern over harm to the fetus. To reduce the risk of neural tube defects, folate supplementation is advised before conception and throughout the first trimester. In the case of sodium valproate p. 344 and valproic acid p. 372 an urgent consultation is required to reconsider the benefits and risks of valproate therapy.

The concentration of antiepileptic drugs in the plasma can change during pregnancy. Doses of phenytoin, carbamazepine, and lamotrigine should be adjusted on the basis of plasma-drug concentration monitoring; the dose of other antiepileptic drugs should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. Plasma-drug concentration monitoring during pregnancy is also useful to check compliance. Additionally, in patients taking topiramate or levetiracetam, it is recommended that fetal growth should be monitored. Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol.

Routine injection of vitamin K at birth minimises the risk of neonatal haemorrhage associated with antiepileptics. Withdrawal effects in the newborn may occur with some antiepileptic drugs, in particular benzodiazepines and phenobarbital.

Epilepsy and Pregnancy Register

All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

Breast-feeding

Women taking antiepileptic monotherapy should generally be encouraged to breast-feed; if a woman is on combination therapy or if there are other risk factors, such as premature birth, specialist advice should be sought.

All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones. Infants should also be monitored for adverse effects associated with the antiepileptic drug particularly with newer antiepileptics, if the antiepileptic is readily transferred into breast-milk causing high infant serum-drug concentrations (e.g. ethosuximide, lamotrigine, primidone, and zonisamide), or if slower metabolism in the infant causes drugs to accumulate (e.g. phenobarbital and lamotrigine). Serum-drug concentration monitoring should be undertaken in breast-fed infants if suspected adverse reactions develop; if toxicity develops it may be necessary to introduce formula feeds to limit the infant's drug exposure, or to wean the infant off breast-milk altogether.

Primidone, phenobarbital, and the benzodiazepines are associated with an established risk of drowsiness in breast-fed babies and caution is required.

Withdrawal effects may occur in infants if a mother suddenly stops breast-feeding, particularly if she is taking phenobarbital, primidone, or lamotrigine.

Focal seizures with or without secondary generalisation

Carbamazepine p. 327 and lamotrigine p. 334 are first-line options for treating newly diagnosed focal seizures; oxcarbazepine p. 337, sodium valproate p. 344 and levetiracetam p. 336 may be used if carbamazepine or lamotrigine are unsuitable or not tolerated. If monotherapy is unsuccessful with two of these first-line antiepileptic drugs, adjunctive treatment may be considered. Options for adjunctive treatment include carbamazepine, clobazam p. 353, gabapentin p. 331, lamotrigine, levetiracetam, oxcarbazepine, sodium valproate, or topiramate p. 348. If adjunctive treatment is ineffective or not tolerated, a tertiary epilepsy specialist should be consulted who may consider eslicarbazepine acetate p. 329, lacosamide p. 333, phenobarbital p. 351, phenytoin p. 339, pregabalin p. 341, tiagabine p. 347, vigabatrin p. 349 and zonisamide p. 350.

Generalised seizures**Tonic-clonic seizures**

Sodium valproate is the first-line treatment for newly diagnosed generalised tonic-clonic seizures (except in female patients who are premenopausal, see *Valproate* below). Lamotrigine is the alternative choice if sodium valproate is not suitable, but may exacerbate myoclonic seizures. In those with established epilepsy with generalised tonic-clonic seizures only, lamotrigine or sodium valproate may be prescribed as the first-line treatment. Carbamazepine and oxcarbazepine may also be considered in newly diagnosed and established tonic-clonic seizures, but may exacerbate myoclonic and absence seizures. Clobazam, lamotrigine, levetiracetam, sodium valproate or topiramate may be used as adjunctive treatment if monotherapy is ineffective or not tolerated.

Absence seizures

Ethosuximide p. 330, or sodium valproate (except in female patients who are premenopausal, see *Valproate* below), are the drugs of choice in absence seizures and syndromes; lamotrigine is a suitable alternative when ethosuximide and sodium valproate are unsuitable, ineffective or not tolerated. Sodium valproate should be used as the first choice if there is a high risk of generalised tonic-clonic seizures. A combination of any two of these drugs may be used if monotherapy is ineffective. Clobazam, clonazepam p. 354, levetiracetam, topiramate or zonisamide may be considered by a tertiary epilepsy specialist if adjunctive treatment fails.

Carbamazepine, gabapentin, oxcarbazepine, phenytoin, pregabalin, tiagabine and vigabatrin are not recommended in absence seizures or syndromes.

Myoclonic seizures

Myoclonic seizures (myoclonic jerks) occur in a variety of syndromes, and response to treatment varies considerably. Sodium valproate is the drug of choice in newly diagnosed myoclonic seizures (except in female patients who are premenopausal, see *Valproate* below); topiramate and levetiracetam are alternative options if sodium valproate is unsuitable but consideration should be given to the less favourable side-effect profile of topiramate. A combination of two of these drugs may be used if monotherapy is ineffective or not tolerated. If adjunctive treatment fails, a tertiary epilepsy specialist should be consulted and may consider clobazam, clonazepam, zonisamide or piracetam p. 424. Carbamazepine, gabapentin, oxcarbazepine, phenytoin, pregabalin, tiagabine and vigabatrin are not recommended for the treatment of myoclonic seizures.

Sodium valproate and levetiracetam are effective in treating the generalised tonic-clonic seizures that coexist with myoclonic seizures in idiopathic generalised epilepsy.

Atonic and tonic seizures

Atonic and tonic seizures are usually seen in childhood, in specific epilepsy syndromes, or associated with cerebral damage or mental retardation. They may respond poorly to the traditional drugs. Sodium valproate is the drug of choice (except in female patients who are premenopausal, see *Valproate* below); lamotrigine can be added as adjunctive treatment. If adjunctive treatment is ineffective or not tolerated, a tertiary epilepsy specialist should be consulted, and may consider rufinamide p. 342 or topiramate. Carbamazepine, gabapentin, oxcarbazepine, pregabalin, tiagabine or vigabatrin are not recommended in atonic and tonic seizures.

Epilepsy syndromes

Some drugs are licensed for use in particular epilepsy syndromes. The epilepsy syndromes are specific types of epilepsy that are characterised according to a number of features including seizure type, age of onset, and EEG characteristics. For more information on epilepsy syndromes in children see *BNF for children*.

Dravet syndrome

A tertiary specialist should be involved in decisions regarding treatment of Dravet syndrome. Sodium valproate (except in pregnancy or females of childbearing potential, see *Valproate* below) or topiramate are first-line treatment options in children with Dravet syndrome. Clobazam or stiripentol p. 347 may be considered as adjunctive treatment in children and adults if first-line treatments are ineffective or not tolerated. Carbamazepine, gabapentin, lamotrigine, oxcarbazepine, phenytoin, pregabalin, tiagabine, and vigabatrin should not be used as they may exacerbate myoclonic seizures.

Lennox-Gastaut syndrome

A tertiary specialist should be involved in decisions regarding treatment of Lennox-Gastaut syndrome. Sodium valproate is the first-line drug for treating children with Lennox-Gastaut syndrome (except in pregnancy or females of childbearing potential, see *Valproate* below); lamotrigine can be used as adjunctive treatment in children and adults if sodium valproate is unsuitable, ineffective or not tolerated. If adjunctive treatment is ineffective or not tolerated, rufinamide and topiramate may be considered by tertiary specialists. Carbamazepine, gabapentin, oxcarbazepine, pregabalin, tiagabine, and vigabatrin should not be used. Felbamate [unlicensed] may be used in tertiary specialist centres when all other treatment options have failed.

Antiepileptic drugs

Carbamazepine and related antiepileptics

Carbamazepine is a drug of choice for simple and complex focal seizures and is a first-line treatment option for generalised tonic-clonic seizures. It can be used as adjunctive treatment for focal seizures when monotherapy has been ineffective. It is essential to initiate carbamazepine therapy at a low dose and build this up slowly. Carbamazepine may exacerbate tonic, atonic, myoclonic and absence seizures and is therefore not recommended if these seizures are present.

Oxcarbazepine is licensed as monotherapy or adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures. It can also be considered for the treatment of primary generalised tonic-clonic seizures [unlicensed]. Oxcarbazepine is not recommended in tonic, atonic, absence or myoclonic seizures due to the risk of seizure exacerbation.

Eslicarbazepine acetate p. 329 is licensed for adjunctive treatment in adults with focal seizures with or without secondary generalisation.

Ethosuximide

Ethosuximide p. 330 is a first-line treatment option for absence seizures. It may also be prescribed as adjunctive treatment for absence seizures when monotherapy is ineffective. Ethosuximide is also licensed for myoclonic seizures.

Gabapentin and pregabalin

Gabapentin p. 331 and pregabalin p. 341 are used for the treatment of focal seizures with or without secondary generalisation. They are not recommended if tonic, atonic, absence or myoclonic seizures are present. Both are also licensed for the treatment of neuropathic pain. Pregabalin is licensed for the treatment of generalised anxiety disorder.

Lamotrigine

Lamotrigine p. 334 is an antiepileptic drug recommended as a first-line treatment for focal seizures and primary and secondary generalised tonic-clonic seizures. It is also licensed for typical absence seizures in children (but efficacy may not be maintained in all children) and is an unlicensed treatment option in adults if first-line treatments have been unsuccessful. Lamotrigine can also be used as adjunctive treatment in atonic or tonic seizures if first-line treatment has failed [unlicensed]. Myoclonic seizures may be exacerbated by lamotrigine and it can cause serious rashes especially in children; dose recommendations should be adhered to closely.

Lamotrigine is used either as sole treatment or as an adjunct to treatment with other antiepileptic drugs. Valproate increases plasma-lamotrigine concentration, whereas the enzyme-inducing antiepileptics reduce it; care is therefore required in choosing the appropriate initial dose and subsequent titration. When the potential for interaction is not known, treatment should be initiated with lower doses, such as those used with valproate.

Levetiracetam and brivaracetam

Levetiracetam p. 336 is used for monotherapy and adjunctive treatment of focal seizures with or without secondary generalisation, and for adjunctive treatment of myoclonic seizures in patients with juvenile myoclonic epilepsy and primary generalised tonic-clonic seizures. Levetiracetam may be prescribed alone and in combination for the treatment of myoclonic seizures, and under specialist supervision for absence seizures [both unlicensed].

Brivaracetam p. 325 is used as adjunctive therapy in the treatment of partial-onset seizures with or without secondary generalisation.

Phenobarbital and primidone

Phenobarbital p. 351 is effective for tonic-clonic and focal seizures but may be sedative in adults. It may be tried for

atypical absence, atonic, and tonic seizures. Rebound seizures may be a problem on withdrawal.

Primidone p. 352 is largely converted to phenobarbital and this is probably responsible for its antiepileptic action. A low initial dose of primidone is essential.

Phenytoin

Phenytoin p. 339 is licensed for tonic-clonic and focal seizures but may exacerbate absence or myoclonic seizures and should be avoided if these seizures are present. It has a narrow therapeutic index and the relationship between dose and plasma-drug concentration is non-linear; small dosage increases in some patients may produce large increases in plasma concentration with acute toxic side-effects. Similarly, a few missed doses or a small change in drug absorption may result in a marked change in plasma-drug concentration. Monitoring of plasma-drug concentration improves dosage adjustment.

When only parenteral administration is possible, fosphenytoin sodium p. 330, a pro-drug of phenytoin, may be convenient to give. Unlike phenytoin (which should only be given intravenously), fosphenytoin sodium may also be given by intramuscular injection.

Rufinamide

Rufinamide p. 342 is licensed for the adjunctive treatment of seizures in Lennox-Gastaut syndrome. It may be considered by a tertiary specialist for the treatment of refractory tonic or atonic seizures [unlicensed].

Topiramate
