- ▶ Each tablet of **Malarone®** contains 250 mg of atovaquone and 100 mg of proguanil hydrochloride.

- **UNLICENSED USE** Not licensed for treatment of non-falciparum malaria.

- **CAUTIONS** Diarrhoea or vomiting (reduced absorption of atovaquone) · efficacy not evaluated in cerebral or complicated malaria (including hyperparasitaemia, pulmonary oedema or renal failure)

- **INTERACTIONS** → Appendix 1: antimalarials

- **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · appetite decreased · cough · depression · diarrhoea · dizziness · fever · headache · nausea · skin reactions · sleep disorders · vomiting

- ▶ **Uncommon** Alopecia · anxiety · blood disorder · hyponatraemia · oral disorders · palpitations

- ▶ **Frequency not known** Hallucination · hepatic disorders · photosensitivity reaction · seizure · Stevens-Johnson syndrome · tachycardia · vasculitis

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk. See also *Pregnancy* in Malaria, prophylaxis p. 643.

- **BREAST FEEDING** Use only if no suitable alternative available.

- **RENAL IMPAIRMENT** Avoid for malaria prophylaxis (and if possible for malaria treatment) if eGFR less than 30 mL/minute/1.73m².

- **PATIENT AND CARER ADVICE** Warn travellers about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NHS restrictions Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Malarone** (GlaxoSmithKline UK Ltd)

Proguanil hydrochloride 100 mg, Atovaquone 250 mg. Malarone 250mg/100mg tablets | 12 tablet [PoM] £25.21 DT = £31.69

Chloroquine

11-May-2020

- **INDICATIONS AND DOSE**

Active rheumatoid arthritis (administered on expert advice) | Systemic and discoid lupus erythematosus (administered on expert advice)

- ▶ **BY MOUTH USING TABLETS**

- ▶ Adult: 155 mg daily; maximum 2.5 mg/kg per day

Prophylaxis of malaria

- ▶ **INITIALLY BY MOUTH USING SYRUP**

- ▶ Child 4–5 weeks (body-weight up to 4.5 kg): 25 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

- ▶ Child 6 weeks–5 months (body-weight 4.5–7 kg): 50 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

- ▶ Child 6–11 months (body-weight 8–10 kg): 75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving continued →

- ▶ Child 1-2 years (body-weight 11-14 kg): 100 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 3-4 years (body-weight 15-16.4 kg): 125 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 5-7 years (body-weight 16.5-24 kg): 150 mg once weekly, alternatively (by mouth using tablets) 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 8-13 years (body-weight 25-44 kg): 225 mg once weekly, alternatively (by mouth using tablets) 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ INITIALLY BY MOUTH USING TABLETS
- ▶ Child 14-17 years (body-weight 45 kg and above): 310 mg once weekly, alternatively (by mouth using syrup) 300 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Adult (body-weight 45 kg and above): 310 mg once weekly, alternatively (by mouth using syrup) 300 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

Treatment of non-falciparum malaria

▶ BY MOUTH

- ▶ Child: Initially 10 mg/kg (max. per dose 620 mg), then 5 mg/kg after 6-8 hours (max. per dose 310 mg), then 5 mg/kg daily (max. per dose 310 mg) for 2 days
- ▶ Adult: Initially 620 mg, then 310 mg after 6-8 hours, then 310 mg daily for 2 days, approximate total cumulative dose of 25 mg/kg of base

***P. vivax* or *P. ovale* infection during pregnancy while radical cure is postponed**

▶ BY MOUTH

- ▶ Adult: 310 mg once weekly

DOSE EQUIVALENCE AND CONVERSION

- ▶ Doses expressed as chloroquine base.
- ▶ Each tablet contains 155 mg of chloroquine base (equivalent to 250 mg of chloroquine phosphate). Syrup contains 50 mg/5 mL of chloroquine base (equivalent to 80 mg/5 mL of chloroquine phosphate).

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ With oral use in adults In active rheumatoid arthritis and systemic and discoid lupus erythematosus, to avoid excessive dosage in obese patients, the daily maximum dose should be calculated on the basis of ideal body weight.

- **UNLICENSED USE** Chloroquine doses for the treatment and prophylaxis of malaria in BNF publications may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

- ▶ In adults Ocular toxicity is unlikely if the dose of chloroquine phosphate does not exceed 4 mg/kg daily (equivalent to chloroquine base approx. 2.5 mg/kg daily).

- **CAUTIONS** Acute porphyrias p. 1120 · diabetes (may lower blood glucose) · G6PD deficiency · long-term therapy (risk of retinopathy and cardiomyopathy) · may aggravate myasthenia gravis · may exacerbate psoriasis · neurological disorders, especially epilepsy (may lower seizure threshold)—avoid for prophylaxis of malaria if history of epilepsy · severe gastro-intestinal disorders

CAUTIONS, FURTHER INFORMATION

- ▶ Monitoring for retinopathy
- ▶ In adults A review group convened by the Royal College of Ophthalmologists has updated guidelines on monitoring for chloroquine and hydroxychloroquine retinopathy (*Hydroxychloroquine and Chloroquine Retinopathy: Recommendations on Monitoring* 2020). Chloroquine

appears to be more retinotoxic than hydroxychloroquine. Monitoring recommendations for chloroquine:

- All patients planning to be on long-term treatment should receive a baseline examination (including fundus photography and spectral domain optical coherence tomography) within 6-12 months of treatment initiation;
- Annual monitoring is recommended in all patients who have taken chloroquine for greater than 1 year.

● INTERACTIONS → Appendix 1: antimalarials

● SIDE-EFFECTS

- ▶ **Rare or very rare** Cardiomyopathy · hallucination · hepatitis
- ▶ **Frequency not known** Abdominal pain · agranulocytosis · alopecia · anxiety · atrioventricular block · bone marrow disorders · confusion · corneal deposits · depression · diarrhoea · eye disorders · gastrointestinal disorder · headache · hearing impairment · hypoglycaemia · hypotension · insomnia · interstitial lung disease · movement disorders · myopathy · nausea · neuromyopathy · neutropenia · personality change · photosensitivity reaction · psychotic disorder · QT interval prolongation · seizure · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · tinnitus · tongue protrusion · vision disorders · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Side-effects which occur at doses used in the prophylaxis or treatment of malaria are generally not serious.

Overdose Chloroquine is very toxic in overdose; overdose is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

- **PREGNANCY** Benefit of use in prophylaxis and treatment in malaria outweighs risk. For rheumatoid disease, it is not necessary to withdraw an antimalarial drug during pregnancy if the disease is well controlled.

- **BREAST FEEDING** Present in breast milk and breast-feeding should be avoided when used to treat rheumatic disease. Amount in milk probably too small to be harmful when used for malaria.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution, particularly in cirrhosis.

- **RENAL IMPAIRMENT** Manufacturers advise caution.

Dose adjustments Only partially excreted by the kidneys and reduction of the dose is not required for prophylaxis of malaria except in severe impairment.

For rheumatoid arthritis and lupus erythematosus, reduce dose.

- **MONITORING REQUIREMENTS**

- ▶ In adults Manufacturer advises regular ophthalmological examination but the evidence of practical value is unsatisfactory (see *Cautions, further information* for advice of the Royal College of Ophthalmologists).

- ▶ In children Expert sources advise ophthalmic examination with long-term therapy.

- **PATIENT AND CARER ADVICE** Warn travellers going to malarious areas about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NHS restrictions Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY** Tablets can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Oral solution

CAUTIONARY AND ADVISORY LABELS 5

- ▶ **Malarivon** (Wallace Manufacturing Chemists Ltd)
Chloroquine phosphate 160 mg per 1 ml Malarivon 80mg/5ml syrup | 75 ml [POM] £30.00 DT = £30.00

Tablet

- **INTERACTIONS** → Appendix 1: antimalarials

- **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Paludrine/Avloclor** (Alliance Pharmaceuticals Ltd)
Paludrine/Avloclor tablets anti-malarial travel pack | 112 tablet [P] £13.50

Mefloquine

05-Aug-2018

- **INDICATIONS AND DOSE**

Treatment of malaria

▶ BY MOUTH

- ▶ Adult: (consult product literature)

Prophylaxis of malaria

▶ BY MOUTH

- ▶ Child (body-weight 5–15 kg): 62.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 16–24 kg): 125 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 25–44 kg): 187.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Adult (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving

- **UNLICENSED USE** Mefloquine doses in BNF Publications may differ from those in product literature.
- In children Not licensed for use in children under 5 kg body-weight and under 3 months.
- **CONTRA-INDICATIONS** Avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions · avoid for standby treatment if history of convulsions · history of blackwater fever

- **CAUTIONS** Cardiac conduction disorders · epilepsy (avoid for prophylaxis) · not recommended in infants under 3 months (5 kg) · traumatic brain injury

CAUTIONS, FURTHER INFORMATION

- ▶ Neuropsychiatric reactions Mefloquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Psychiatric symptoms such as insomnia, nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodromal for a more serious event. Adverse reactions may occur and persist up to several months after discontinuation because mefloquine has a long half-life. For a prescribing checklist, and further information on side-effects, particularly neuropsychiatric side-effects, which may be associated with the use of mefloquine for malaria prophylaxis, see the *Guide for Healthcare Professionals* provided by the manufacturer.

- **INTERACTIONS** → Appendix 1: antimalarials

SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · depression · diarrhoea · dizziness · gastrointestinal discomfort · headache · nausea · skin reactions · sleep disorders · vision disorders · vomiting
- ▶ **Frequency not known** Acute kidney injury · agranulocytosis · alopecia · aplastic anaemia · appetite decreased · arrhythmias · arthralgia · asthenia · behaviour abnormal · cardiac conduction disorders · cataract · chest pain · chills · concentration impaired · confusion · cranial nerve paralysis · delusional disorder · depersonalisation · drowsiness · dyspnoea · encephalopathy · eye disorder · fever · flushing · gait abnormal · hallucination · hearing impairment · hepatic disorders · hyperacusis · hyperhidrosis · hypertension · hypotension · leucocytosis · leucopenia · malaise · memory loss · mood altered · movement disorders · muscle complaints · muscle weakness · nephritis · nerve disorders · oedema · palpitations · pancreatitis · paraesthesia · pneumonia · pneumonitis · psychosis · seizure · self-endangering behaviour · speech disorder · Stevens-Johnson syndrome · suicidal tendencies · syncope · thrombocytopenia · tinnitus · tremor · vertigo

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to quinine.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during prophylaxis and for 3 months after stopping (teratogenicity in *animal* studies).

- **PREGNANCY** Manufacturer advises avoid (particularly in the first trimester) unless the potential benefit outweighs the risk; however, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas.

- **BREAST FEEDING** Present in milk but risk to infant minimal.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—elimination may be prolonged.

- **RENAL IMPAIRMENT** Manufacturer advises caution.

- **DIRECTIONS FOR ADMINISTRATION** Tablet may be crushed and mixed with food such as jam or honey just before administration.

- **PATIENT AND CARER ADVICE** Manufacturer advises that patients receiving mefloquine for malaria prophylaxis should be informed to discontinue its use if neuropsychiatric symptoms occur and seek immediate medical advice so that mefloquine can be replaced with an alternative antimalarial. Travellers should also be warned about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

A patient alert card should be provided.

Driving and skilled tasks Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may occur and persist up to several months after stopping mefloquine.

• NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

Proguanil hydrochloride 100 mg Paludrine 100mg tablets | 98 tablet \square £11.95 DT = £11.95

Quinine

04-Dec-2017

● INDICATIONS AND DOSE

Nocturnal leg cramps

- ▶ BY MOUTH
- ▶ Adult: 200–300 mg once daily, to be taken at bedtime

Non-falciparum malaria

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 10 mg/kg every 8 hours (max. per dose 700 mg), infused over 4 hours, given if patient is unable to take oral therapy. Change to oral chloroquine as soon as the patient's condition permits, reduce dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours

Falciparum malaria

- ▶ BY MOUTH
- ▶ Child: 10 mg/kg every 8 hours (max. per dose 600 mg) for 7 days, to be given together with or followed by either doxycycline (in children over 12 years), or clindamycin
- ▶ Adult: 600 mg every 8 hours for 5–7 days, to be given together with or followed by either doxycycline or clindamycin
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Loading dose 20 mg/kg (max. per dose 1.4 g), infused over 4 hours, the loading dose of 20 mg/kg should **not** be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by either doxycycline or clindamycin, reduce maintenance dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours

Falciparum malaria (in intensive care unit)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by either doxycycline or clindamycin, reduce maintenance dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours

DOSE EQUIVALENCE AND CONVERSION

- ▶ When using quinine for malaria, doses are valid for quinine hydrochloride, dihydrochloride, and sulfate; they are **not valid** for quinine bisulfate which contains a correspondingly smaller amount of quinine.
- ▶ Quinine (anhydrous base) 100 mg = quinine bisulfate 169 mg; quinine dihydrochloride 122 mg; quinine hydrochloride 122 mg; and quinine sulfate 121 mg. Quinine bisulfate 300 mg tablets are available but provide less quinine than 300 mg of the dihydrochloride, hydrochloride, or sulfate.

- **UNLICENSED USE** Injection not licensed.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: REMINDER OF DOSE-DEPENDENT QT-PROLONGING EFFECTS (NOVEMBER 2017)

Quinine has been associated with dose-dependent QT-interval-prolonging effects and should be used with caution in patients with risk factors for QT prolongation or in those with atrioventricular block—see Cautions for further information.

- **CONTRA-INDICATIONS** Haemoglobinuria · myasthenia gravis · optic neuritis · tinnitus
- **CAUTIONS** Atrial fibrillation (monitor ECG during parenteral treatment) · cardiac disease (monitor ECG during parenteral treatment) · conduction defects (monitor ECG during parenteral treatment) · elderly (monitor ECG during parenteral treatment) · electrolyte disturbance · G6PD deficiency · heart block (monitor ECG during parenteral treatment)
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS** Abdominal pain · agitation · agranulocytosis · angioedema · asthma · atrioventricular conduction changes · bronchospasm · cardiotoxicity · cerebral impairment · coagulation disorders · coma · confusion · death · diarrhoea · dyspnoea · fever · flushing · gastrointestinal disorder · haemoglobinuria · haemolysis · haemolytic uraemic syndrome · headache · hearing impairment · hypersensitivity · loss of consciousness · muscle weakness · myasthenia gravis aggravated · nausea · ocular toxicity · oedema · pancytopenia · photosensitivity reaction · QT interval prolongation · renal impairment · skin reactions · thrombocytopenia · tinnitus · vertigo · vision disorders · vomiting

Overdose Quinine is very toxic in overdosage; life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

For details on the management of poisoning, see Emergency treatment of poisoning p. 1430.

- **PREGNANCY** High doses are teratogenic in *first trimester*, but in malaria benefit of treatment outweighs risk.
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **HEPATIC IMPAIRMENT**
 - ▶ With oral use Manufacturer advises caution (risk of prolonged half-life).
 - Dose adjustments** ▶ With intravenous use For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.
 - ▶ With oral use Manufacturer advises dose reduction or increased dose interval.
- **RENAL IMPAIRMENT**
 - Dose adjustments** ▶ With intravenous use For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.
- **MONITORING REQUIREMENTS**
 - ▶ With intravenous use Monitor blood glucose and electrolyte concentration during parenteral treatment.

- ▶ In adults Patients taking quinine for nocturnal leg cramps should be monitored closely during the early stages for adverse effects as well as for benefit.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give continuously in Glucose 5% or Sodium Chloride 0.9%. To be given over 4 hours.

- **PRESCRIBING AND DISPENSING INFORMATION**

- ▶ With intravenous use Intravenous injection of quinine is so hazardous that it has been superseded by infusion.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for infusion

Tablet

 ▶ **Quinine (Non-proprietary)**

Quinine sulfate 200 mg Quinine sulfate 200mg tablets | 28 tablet **[PoM]** £4.65 DT = £2.25

6 Viral infection

6.1 Coronavirus

COVID-19

06-May-2020

Description of condition

COVID-19 is the syndrome caused by a novel coronavirus, SARS-CoV-2, which was originally detected late 2019 in Wuhan, Hubei Province, China. Primary transmission between people is through respiratory droplets generated by coughing and sneezing, and through contact with contaminated surfaces.

COVID-19 is predominantly a respiratory illness with early non-specific symptoms that can last 2–10 days before more specific signs or symptoms develop. The most common symptoms are fever, cough, and shortness of breath. Other symptoms, such as anxiety, delirium, agitation, fatigue, muscle aches, headache, and a loss of sense of smell may also be present. The illness varies in severity from no symptoms present in some individuals to severe pneumonia in others. Older patients and/or those with co-morbidities (such as chronic obstructive pulmonary disease, cystic fibrosis, asthma, cardiovascular disease, and diabetes), frailty, impaired immunity, or a reduced ability to cough and clear secretions are more likely to develop severe pneumonia. Patients with severe symptoms of COVID-19 may deteriorate rapidly and older patients with co-morbidities may have a higher risk of deteriorating.

Management

Medical practitioners must notify the Proper Officer at their local council or local health protection team of all suspected cases of COVID-19. For further information, see *Notifiable diseases* in *Antibacterials, principles of therapy* p. 527.

NICE have developed rapid guidelines to maximise patient safety, optimise treatment management, protect staff from infection, and make the best use of NHS resources. These guidelines provide recommendations around the provision of care during the pandemic (such as critical care in adults and systemic anticancer treatments), and for managing symptoms (including at the end of life) and suspected/confirmed pneumonia. They also include recommendations for patients with conditions that increase the risk of developing COVID-19 (such as in immunocompromised patients; those with severe asthma; cystic fibrosis; rheumatological autoimmune, inflammatory and metabolic bone disorders; or conditions treated with drugs that affect the immune response). NICE are also developing rapid evidence summaries focusing on whether certain medications (such as non-steroidal anti-inflammatory drugs) may increase the severity/length of the COVID-19 illness, and advice on the safety and efficacy of COVID-19 treatments. For further information, see NICE rapid guidelines and evidence summaries: **Coronavirus (COVID-19)** (see *Useful resources*).

NHS England and NHS Improvement have produced guidance for clinicians and NHS managers working in primary and secondary care, and community-based health, social care, mental health trusts and ambulance services. For further information, see NHS England: **Coronavirus guidance for clinicians and NHS managers** (see *Useful resources*).

PHE have also produced guidance for health professionals, the public, and those in non-clinical settings; on infection prevention and control; and sampling and diagnostics. For further information, see the PHE collection: **Coronavirus (COVID-19): guidance** (see *Useful resources*).

The MHRA have issued COVID-19 guidance for industry, in addition to information about medications and COVID-19, and guidance on medical devices (such as COVID-19 tests and testing kits). For further information, see the MHRA collection: **MHRA guidance on coronavirus (COVID-19)** (see *Useful resources*).

The UKTIS has produced an information page summarising the fetal and neonatal risks of exposure to COVID-19 treatments that have either been identified as possible options or listed as investigational medicinal products. For further information, see UKTIS: **Medications used to treat COVID-19 in pregnancy** (see *Useful resources*).

The Joint Committee on Vaccination and Immunisation have issued a statement on immunisation prioritisation during the COVID-19 pandemic (available at: www.gov.uk/government/publications/jcvi-statement-on-immunisation-prioritisation/statement-from-jcvi-on-immunisation-prioritisation).

Additional country-specific guidance is available for Northern Ireland, Scotland, and Wales (see *Useful resources*).

6.2 Hepatitis

Hepatitis

Overview

Treatment for viral hepatitis should be initiated by a specialist. The management of uncomplicated acute viral hepatitis is largely symptomatic. Early treatment of acute hepatitis C with interferon alfa p. 1008 [unlicensed indication] may reduce the risk of chronic infection.

Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. Active or passive immunisation against hepatitis A and B infections can be given.

Chronic hepatitis B

Peginterferon alfa p. 660 is an option for the initial treatment of chronic hepatitis B and may be preferable to interferon alfa. The use of peginterferon alfa and interferon alfa is limited by a response rate of 30–40% and relapse is frequent. Treatment should be discontinued if no improvement occurs after 4 months. The manufacturers of peginterferon alfa-2a and interferon alfa contraindicate use in decompensated liver disease, but low doses can be used with great caution in these patients. Although interferon alfa is contra-indicated in patients receiving immunosuppressant treatment (or who have received it recently), cautious use of peginterferon alfa-2a may be justified in some cases.

Entecavir p. 658 or tenofovir disoproxil p. 691 are options for the initial treatment of chronic hepatitis B. If the response is inadequate after 6–9 months of treatment, a change in treatment should be considered. Other drugs that are licensed for the treatment of chronic hepatitis B include adefovir dipivoxil p. 659, lamivudine p. 689, or telbivudine p. 659.

Entecavir alone, tenofovir disoproxil alone, or a combination of lamivudine with either adefovir dipivoxil or tenofovir disoproxil can be used in patients with decompensated liver disease.

If drug-resistant hepatitis B virus emerges during treatment, another antiviral drug to which the virus is sensitive should be added. Hepatitis B viruses with reduced susceptibility to lamivudine have emerged following extended therapy. Adefovir dipivoxil or tenofovir disoproxil can be given with lamivudine in lamivudine-resistant chronic hepatitis B; telbivudine or entecavir should not be used because cross-resistance can occur.

If there is no toxicity or loss in efficacy, treatment with adefovir dipivoxil, entecavir, lamivudine, telbivudine, or tenofovir disoproxil is usually continued until 6 months after adequate seroconversion has occurred. Treatment is usually continued long-term in patients with decompensated liver disease.

Tenofovir disoproxil, or a combination of tenofovir disoproxil with either emtricitabine p. 687 or lamivudine may be used with other antiretrovirals, as part of 'highly active antiretroviral therapy' in patients who require treatment for both HIV and chronic hepatitis B. If patients infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV, such as peginterferon alfa or adefovir dipivoxil. Treatment may be continued long-term, even if adequate seroconversion occurs. Management of these patients should be coordinated between HIV and hepatology specialists.

Chronic hepatitis C

Before starting treatment, the genotype of the infecting hepatitis C virus should be determined and the viral load measured as this may affect the choice and duration of treatment. A combination of ribavirin p. 662 and peginterferon alfa is used for the treatment of chronic hepatitis C. The combination of ribavirin and interferon alfa is less effective than the combination of peginterferon alfa and ribavirin. Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Ribavirin monotherapy is ineffective.

Daclatasvir is licensed for use in combination with sofosbuvir p. 665 for the treatment of chronic hepatitis C infection of genotypes 1 or 4, with or without compensated cirrhosis; the addition of ribavirin should be considered for patients with advanced liver disease or with other negative prognostic factors, such as prior treatment experience. It is

also licensed in combination with sofosbuvir and ribavirin for the treatment of chronic hepatitis C infection of genotype 3 in patients who are treatment experienced, with or without compensated cirrhosis, and in combination with peginterferon alfa and ribavirin for the treatment of chronic hepatitis C infection of genotype 4. Daclatasvir must not be given as monotherapy.

Ombitasvir with paritaprevir and ritonavir p. 662 (*Viekirax*[®]), is licensed for use in combination with dasabuvir p. 668, with or without ribavirin, for the treatment of chronic hepatitis C infection of genotype 1 in patients with or without compensated cirrhosis; it is also licensed for use in combination with ribavirin for the treatment of chronic hepatitis C infection of genotype 4 with or without compensated cirrhosis.

Ribavirin inhibits a wide range of DNA and RNA viruses. It is given by mouth for the treatment of chronic hepatitis C infection, in double therapy with peginterferon alfa, interferon alfa, or sofosbuvir, or in triple therapy with peginterferon alfa and one protease inhibitor or sofosbuvir. Ribavirin is also effective in Lassa fever [unlicensed indication].

Sofosbuvir is a pro-drug of a nucleoside inhibitor that is effective against hepatitis C virus polymerase NS5B. It is licensed for use in combination with ribavirin, with or without peginterferon alfa, for the treatment of chronic hepatitis C infection of genotypes 1, 2, 3, 4, 5, or 6 in patients with compensated liver disease. Sofosbuvir monotherapy is not recommended because it is less effective than combination therapy.

Ledipasvir is licensed for use in combination with sofosbuvir (ledipasvir with sofosbuvir p. 664), with or without ribavirin, for the treatment of chronic hepatitis C infections of genotypes 1, 3, 4, 5 or 6.

Sofosbuvir with velpatasvir and voxilaprevir p. 667 is licensed for the treatment of chronic hepatitis C of all genotypes.

6.3 Hepatitis infections

6.3a Chronic hepatitis B

Other drugs used for Chronic hepatitis B Interferon alfa, p. 1008 · Lamivudine, p. 689 · Tenofovir disoproxil, p. 691

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Entecavir

27-Apr-2019

● INDICATIONS AND DOSE

Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) not previously treated with nucleoside analogues

► BY MOUTH

► Adult: 500 micrograms once daily

Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) and lamivudine-resistance

► BY MOUTH

► Adult: 1 mg once daily, consider other treatment if inadequate response after 6 months

Chronic hepatitis B in patients with decompensated liver disease

► BY MOUTH

► Adult: 1 mg once daily

- **CAUTIONS** HIV infection—risk of HIV resistance in patients not receiving 'highly active antiretroviral therapy' · lamivudine-resistant chronic hepatitis B—risk of entecavir resistance

CAUTIONS, FURTHER INFORMATION Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

● SIDE-EFFECTS

► **Common or very common** Diarrhoea · dizziness · drowsiness · dyspepsia · fatigue · headache · insomnia · nausea · vomiting

► **Uncommon** Alopecia · rash

► **Frequency not known** Lactic acidosis

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

● **PREGNANCY** Toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **RENAL IMPAIRMENT** Consult product literature. **Dose adjustments** Reduce dose if eGFR less than 50 mL/minute/1.73 m².

● **MONITORING REQUIREMENTS** Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

● **DIRECTIONS FOR ADMINISTRATION** To be taken at least 2 hours before or 2 hours after food.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.

● **PATIENT AND CARER ADVICE** Patients or carers should be counselled on the administration of entecavir tablets and oral solution.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► **Entecavir for the treatment of chronic hepatitis B (August 2008)** NICE TA153

Entecavir, within its marketing authorisation, is recommended as an option for the treatment of people with chronic HBeAg-positive or HBeAg-negative hepatitis B in whom antiviral treatment is indicated. This guidance does not apply to people with chronic hepatitis B who also have hepatitis C, hepatitis D or HIV.

www.nice.org.uk/guidance/ta153

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

► **Baraclude** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Entecavir (as Entecavir monohydrate) 500 microgram per 1 ml Baraclude 0.05mg/ml oral solution sugar-free | 210 ml [PoM] £423.80 DT = £423.80

Tablet

► **Entecavir (Non-proprietary)**

Entecavir (as Entecavir monohydrate) 500 microgram Entecavir 500microgram tablets | 30 tablet [PoM] £26.13-£363.26 DT = £363.26
Entecavir (as Entecavir monohydrate) 1 mg Entecavir 1mg tablets | 30 tablet [PoM] £363.26 DT = £363.26

► **Baraclude** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Entecavir (as Entecavir monohydrate) 500 microgram Baraclude 0.5mg tablets | 30 tablet [PoM] £363.26 DT = £363.26
Entecavir (as Entecavir monohydrate) 1 mg Baraclude 1mg tablets | 30 tablet [PoM] £363.26 DT = £363.26

Telbivudine

● INDICATIONS AND DOSE

Chronic hepatitis B infection with compensated liver disease, evidence of viral replication, and histologically documented active liver inflammation or fibrosis, when other treatment is not appropriate

► BY MOUTH

► Adult: 600 mg once daily

- **CAUTIONS** Lamivudine-resistant chronic hepatitis B—risk of telbivudine resistance

CAUTIONS, FURTHER INFORMATION Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

- **INTERACTIONS** → Appendix 1: telbivudine
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · cough · diarrhoea · dizziness · fatigue · headache · nausea · rash
 - **Uncommon** Arthralgia · malaise · muscle complaints · nerve disorders · pain · sensation abnormal · taste altered
 - **Rare or very rare** Lactic acidosis
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT**

Dose adjustments 600 mg every 48 hours if eGFR 30–49 mL/minute/1.73 m²; 600 mg every 72 hours if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor liver function tests every 3 months and viral markers of hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).
- **PATIENT AND CARER ADVICE**

Muscle effects and peripheral neuropathy. Patients should be advised to promptly report unexplained muscle pain, tenderness, or weakness, or numbness, tingling or burning sensations.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

 - **Telbivudine for chronic hepatitis B (August 2008)** NICE TA154. Telbivudine is not recommended for the treatment of chronic hepatitis B. Patients currently receiving telbivudine can continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA154

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

► **Sebivo** (Novartis Pharmaceuticals UK Ltd)

Telbivudine **600 mg** Sebivo 600mg tablets | 28 tablet [PoM] £290.33

ANTIVIRALS > NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

683

Tenofovir alafenamide

26-Feb-2018

● INDICATIONS AND DOSE

Chronic hepatitis B (initiated by a specialist)

► BY MOUTH

► Adult: 25 mg once daily (for duration of treatment consult product literature)

- **CAUTIONS** Decompensated liver disease · HIV co-infection
- **INTERACTIONS** → Appendix 1: tenofovir alafenamide

● SIDE-EFFECTS

- **Common or very common** Abdominal distension · arthralgia · flatulence
- **Frequency not known** Hepatitis aggravated (during or following treatment) · nephrotoxicity
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in decompensated hepatic disease (no information available).
- **PRE-TREATMENT SCREENING** Manufacturer advises HIV antibody testing should be offered to those with unknown HIV-1 status before initiation of treatment.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor liver function tests at repeated intervals during treatment and for at least 6 months after last dose—recurrent hepatitis may occur on discontinuation.
- **PATIENT AND CARER ADVICE**

Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

ANTIVIRALS > NUCLEOTIDE ANALOGUES

Adefovir dipivoxil

● INDICATIONS AND DOSE

Chronic hepatitis B infection with either compensated liver disease with evidence of viral replication, and histologically documented active liver inflammation and fibrosis, when other treatment not appropriate or decompensated liver disease in combination with another antiviral for chronic hepatitis B that has no cross-resistance to adefovir

► BY MOUTH

► Adult: 10 mg once daily

- **CAUTIONS** Elderly
- **CAUTIONS, FURTHER INFORMATION** Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.
- **INTERACTIONS** → Appendix 1: adefovir
- **SIDE-EFFECTS**
 - **Common or very common** Asthenia · diarrhoea · flatulence · gastrointestinal discomfort · headache · nausea · renal impairment · skin reactions · vomiting
 - **Frequency not known** Bone fracture · bone pain · hypophosphataemia · myopathy · nephrotoxicity · osteomalacia · pancreatitis · proximal renal tubulopathy
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** No information available if eGFR less than 10 mL/minute/1.73 m².

Dose adjustments 10 mg every 48 hours if eGFR 30–50 mL/minute/1.73 m²; 10 mg every 72 hours if eGFR 10–30 mL/minute/1.73 m².

Monitoring Monitor renal function more frequently in patients with renal impairment.

● MONITORING REQUIREMENTS

- ▶ Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).
- ▶ Monitor renal function before treatment then every 3 months, more frequently in patients receiving nephrotoxic drugs.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Hepsera** (Gilead Sciences International Ltd)
Adefovir dipivoxil 10 mg Hepsera 10mg tablets | 30 tablet **[PoM]**
£252.22 DT = £252.22

IMMUNOSTIMULANTS > INTERFERONS

Peginterferon alfa

- **DRUG ACTION** Polyethylene glycol-conjugated ('pegylated') derivatives of interferon alfa (**peginterferon alfa-2a** and **peginterferon alfa-2b**) are available; pegylation increases the persistence of the interferon in the blood.

● INDICATIONS AND DOSE

PEGASYS®

Combined with ribavirin for chronic hepatitis C | Monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated | Monotherapy for chronic hepatitis B

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)

● CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION For contra-indications consult product literature.

● CAUTIONS

CAUTIONS, FURTHER INFORMATION For cautions consult product literature.

- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment and decompensated cirrhosis.
- **RENAL IMPAIRMENT** For further information on peginterferon alfa use in renal impairment consult product literature.
Dose adjustments Reduce dose in moderate to severe impairment.
Monitoring Close monitoring required in renal impairment.
- **MONITORING REQUIREMENTS** Monitoring of lipid concentration is recommended.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006 and September 2010)** NICE TA200
The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the disease has reached a moderate stage ('watchful waiting'). Peginterferon alfa alone can be used if ribavirin is contra-indicated or not tolerated.
www.nice.org.uk/guidance/ta200
- ▶ **Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010)** NICE TA200
The combination of peginterferon alfa and ribavirin should be used for treating moderate to severe chronic hepatitis C in patients aged over 18 years:
 - not previously treated with interferon alfa or peginterferon alfa;
 - treated previously with interferon alfa alone or in combination with ribavirin;
 - whose condition did not respond to peginterferon alfa alone or to a combination of peginterferon alfa and ribavirin, or responded but subsequently relapsed;
 - co-infected with HIV.
 Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa.
www.nice.org.uk/guidance/ta200

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

- ▶ **Pegasys** (Roche Products Ltd)

Interferon alfa-2a (as Peginterferon alfa-2a) 180 microgram per 1 ml Pegasys 90micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £76.51

Interferon alfa-2a (as Peginterferon alfa-2a) 270 microgram per 1 ml Pegasys 135micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £107.76 DT = £107.76

Interferon alfa-2a (as Peginterferon alfa-2a) 360 microgram per 1 ml Pegasys 180micrograms/0.5ml solution for injection pre-filled syringes | 4 pre-filled disposable injection [PoM] £497.60

hepatitis C, especially within the first 3 months of treatment and modify diabetic medication or doses when necessary;

- to be vigilant for changes in glucose tolerance and advise patients of the risk of hypoglycaemia;
 - to inform the healthcare professional in charge of the diabetic care of the patient when direct-acting antiviral therapy is initiated.
- **CAUTIONS** Hepatitis B co-infection · re-treatment following previous exposure to elbasvir with grazoprevir, or to drugs of the same classes (NS5A inhibitors or NS3/4A inhibitors other than telaprevir, simeprevir, boceprevir)—efficacy not demonstrated

- **INTERACTIONS** → Appendix 1: elbasvir · grazoprevir

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anxiety · appetite decreased · arthralgia · asthenia · constipation · depression · diarrhoea · dizziness · dry mouth · gastrointestinal discomfort · headache · insomnia · irritability · myalgia · nausea · pruritus · vomiting
- ▶ **Uncommon** Anaemia · transient ischaemic attack
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor liver function before treatment, at week 8 in all patients, at week 12 in patients receiving 16 weeks of treatment, and then as clinically indicated—consider discontinuing treatment if alanine aminotransferase (ALT) is greater than 10 times the upper limit of normal; discontinue treatment if ALT elevation is accompanied by signs or symptoms of hepatic impairment or inflammation.

● PATIENT AND CARER ADVICE

Hepatic effects Manufacturer advises that patients and their carers should consult a healthcare professional if signs and symptoms of hepatic dysfunction occur (including fatigue, weakness, lack of appetite, nausea and vomiting, jaundice or discoloured faeces).

Vomiting Manufacturer advises if vomiting occurs within 4 hours of a dose, an additional dose should be taken.

Missed doses Manufacturer advises if a dose is more than 16 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Elbasvir-grazoprevir for treating chronic hepatitis C (October 2016)** NICE TA413

Elbasvir with grazoprevir is recommended, within its marketing authorisation, as an option for treating genotype 1 or 4 chronic hepatitis C infection:

- of genotype 1a—12 weeks' treatment (consider use in combination with ribavirin for 16 weeks in patients with a baseline hepatitis C virus RNA level of more than 800 000 IU/mL or specific NS5A polymorphisms causing at least a 5-fold reduction in activity of elbasvir);
- of genotype 1b—12 weeks' treatment;
- of genotype 4—12 weeks' treatment (consider use in combination with ribavirin for 16 weeks in patients with a baseline hepatitis C virus RNA level of more than 800 000 IU/mL).

This is contingent on the manufacturer providing the drug at the same price or lower than that agreed with the Commercial Medicines Unit.

www.nice.org.uk/guidance/ta413

6.3b Chronic hepatitis C

Other drugs used for Chronic hepatitis C Interferon alfa, p. 1008 · Peginterferon alfa, p. 660

ANTIVIRALS > HCV INHIBITORS

Elbasvir with grazoprevir

31-Jul-2018

- **DRUG ACTION** Elbasvir is an HCV NS5A inhibitor and grazoprevir is an HCV NS3/4A protease inhibitor; they reduce viral load by inhibiting hepatitis C virus RNA replication.

● INDICATIONS AND DOSE

Chronic hepatitis C infection of genotypes 1 or 4 (with or without ribavirin) (initiated by a specialist)

▶ BY MOUTH

- ▶ **Adult:** 50/100 mg once daily for 12 weeks (may extend to 16 weeks in some circumstances—consult product literature)

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg elbasvir/grazoprevir.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C viruses must be monitored and managed according to current clinical guidelines.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS FOR CHRONIC HEPATITIS C: RISK OF HYPOLYCAEMIA IN PATIENTS WITH DIABETES (DECEMBER 2018)

Rapid reduction in hepatitis C viral load during direct-acting antiviral therapy for hepatitis C may improve glucose metabolism in patients with diabetes and result in symptomatic hypoglycaemia if diabetic treatment is continued at the same dose.

The MHRA advises healthcare professionals:

- to monitor glucose levels closely in patients with diabetes during direct-acting antiviral therapy for

Scottish Medicines Consortium (SMC) decisions

SMC No. 1203/17

The *Scottish Medicines Consortium* advises (January 2017) that *Zepatier*[®] (elbasvir with grazoprevir) is accepted for use within NHS Scotland for the treatment of chronic hepatitis C in adults with genotype 1a, 1b or 4; this advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Chronic hepatitis C of genotype 1 (in combination with dasabuvir, with or without ribavirin) Chronic hepatitis C of genotype 4 (in combination with ribavirin)

▶ BY MOUTH

▶ Adult: 2 tablets once daily for duration of treatment consult product literature, to be taken with food

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C viruses must be monitored and managed according to current clinical guidelines.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS FOR CHRONIC HEPATITIS C: RISK OF HYPOLYCAEMIA IN PATIENTS WITH DIABETES (DECEMBER 2018)

Rapid reduction in hepatitis C viral load during direct-acting antiviral therapy for hepatitis C may improve glucose metabolism in patients with diabetes and result in symptomatic hypoglycaemia if diabetic treatment is continued at the same dose.

The MHRA advises healthcare professionals:

- to monitor glucose levels closely in patients with diabetes during direct-acting antiviral therapy for hepatitis C, especially within the first 3 months of treatment and modify diabetic medication or doses when necessary;

- to be vigilant for changes in glucose tolerance and advise patients of the risk of hypoglycaemia;
- to inform the healthcare professional in charge of the diabetic care of the patient when direct-acting antiviral therapy is initiated.

- **CONTRA-INDICATIONS** HIV co-infection without suppressive antiretroviral therapy
- **CAUTIONS** Psychiatric disorders · retreatment—efficacy not established
- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors · ombitasvir · paritaprevir
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · asthenia · insomnia · nausea · pruritus
 - ▶ **Rare or very rare** Angioedema
 - ▶ **Frequency not known** Depression · suicidal behaviour
- **SIDE-EFFECTS, FURTHER INFORMATION** Side-effects listed are reported when ombitasvir with paritaprevir and ritonavir is used in combination with dasabuvir, with or without ribavirin.
- **CONCEPTION AND CONTRACEPTION** For women of child-bearing potential, exclude pregnancy before initiation of treatment; effective contraception should be used during treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.
- **PATIENT AND CARER ADVICE**

Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

 - ▶ **Ombitasvir with paritaprevir and ritonavir with or without dasabuvir for treating chronic hepatitis C (November 2015)** NICE TA365

Ombitasvir with paritaprevir and ritonavir with or without dasabuvir is recommended, within its marketing authorisation, as an option for treating genotype 1 or 4 chronic hepatitis C in adults, only if the manufacturer provides it with the discount agreed in the patient access scheme.

www.nice.org.uk/guidance/ta365

● UNLICENSED USE

- ▶ When used by inhalation in children Inhalation licensed for use in children (age range not specified by manufacturer).
- ▶ With intravenous use in children Intravenous preparation not licensed.

● CONTRA-INDICATIONS

- ▶ With systemic use consult product literature for specific contra-indications when ribavirin used in combination with other medicinal products · haemoglobinopathies · severe cardiac disease (in adults) · severe, uncontrolled cardiac disease in children with chronic hepatitis C · unstable or uncontrolled cardiac disease in previous 6 months (in adults)

● CAUTIONS

- ▶ When used by inhalation maintain standard supportive respiratory and fluid management therapy
- ▶ With systemic use anaemia (haemoglobin concentration should be monitored during the treatment and corrective action taken) (in adults) · cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration) · consult product literature for specific cautions when ribavirin used in combination with other medicinal products · gout (in adults) · haemolysis (haemoglobin concentration should be monitored during the treatment and corrective action taken) (in adults) · patients with a transplant—risk of rejection · risk of growth retardation in children, the reversibility of which is uncertain—if possible, consider starting treatment after pubertal growth spurt · severe dental disorders (in adults) · severe ocular disorders (in adults) · severe periodontal disorders (in adults) · severe psychiatric effects (in adults)

● INTERACTIONS → Appendix 1: ribavirin**● SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · arthritis · asthenia · behaviour abnormal · chest pain · chills · concentration impaired · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · dysphagia · dyspnoea · ear pain · eye disorders · eye inflammation · eye pain · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · hyperthyroidism · hypotension · hypothyroidism · increased risk of infection · influenza like illness · lymphadenopathy · malaise · memory loss · mood altered · muscle complaints · muscle weakness · nasal congestion · nausea · neutropenia · oral disorders · pain · palpitations · peripheral oedema · photosensitivity reaction · respiratory disorders · sensation abnormal · sexual dysfunction · skin reactions · sleep disorders · sweat changes · syncope · taste altered · thirst · throat pain · thrombocytopenia · tinnitus · tremor · vasodilation · vertigo · vision disorders · vomiting · weight decreased
- ▶ **Uncommon** Dehydration · diabetes mellitus · hallucination · hearing loss · hepatic disorders · hypertension · nerve disorders · sarcoidosis · suicidal tendencies · thyroiditis
- ▶ **Rare or very rare** Angina pectoris · angioedema · bone marrow disorders · cardiac inflammation · cerebral ischaemia · cholangitis · coma · congestive heart failure · facial paralysis · hepatic failure (discontinue) · hypersensitivity · intracranial haemorrhage · myocardial infarction · myopathy · pancreatitis · psychotic disorder · pulmonary embolism · retinopathy · seizure · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · vasculitis
- ▶ **Frequency not known** Haemolytic anaemia · homicidal ideation · nephrotic syndrome · pure red cell aplasia · renal failure · solid organ transplant rejection · tongue discolouration · ulcerative colitis

SIDE-EFFECTS, FURTHER INFORMATION Side effects listed are reported when oral ribavirin is used in combination with peginterferon alfa or interferon alfa, consult product literature for details.

● CONCEPTION AND CONTRACEPTION

- ▶ With systemic use Exclude pregnancy before treatment in females of childbearing age. Effective contraception essential during treatment and for 4 months after treatment in females and for 7 months after treatment in males of childbearing age. Routine monthly pregnancy tests recommended. Condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen).

- ▶ When used by inhalation Women planning pregnancy should avoid exposure to aerosol.
- **PREGNANCY** Avoid; teratogenicity in *animal* studies.
- ▶ When used by inhalation Pregnant women should avoid exposure to aerosol.
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** Plasma-ribavirin concentration increased.
- ▶ In adults Manufacturer advises avoid oral ribavirin unless essential if eGFR less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely.
- ▶ In children Manufacturer advises avoid oral ribavirin if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely. Manufacturer advises use intravenous preparation with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - ▶ When used by inhalation Monitor electrolytes closely. Monitor equipment for precipitation.
 - ▶ With systemic use in children Determine full blood count, platelets, electrolytes, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature). Test thyroid function before treatment and then every 3 months.
 - ▶ With oral use in children Eye examination recommended before treatment. Eye examination also recommended during treatment if pre-existing ophthalmological disorder or if decrease in vision reported—discontinue treatment if ophthalmological disorder deteriorates or if new ophthalmological disorder develops.
 - ▶ With systemic use in adults Determine full blood count, platelets, electrolytes, glucose, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature).
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include bubble-gum.
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - **NICE decisions**
 - ▶ **Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006 and September 2010)** NICE TA200
 - ▶ In adults The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the disease has reached a moderate stage ('watchful waiting').
www.nice.org.uk/guidance/ta200
 - ▶ **Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010)** NICE TA200
 - ▶ In adults The combination of peginterferon alfa and ribavirin should be used for treating moderate to severe chronic hepatitis C in patients aged over 18 years:
 - not previously treated with interferon alfa or peginterferon alfa;
 - treated previously with interferon alfa alone or in combination with ribavirin;
 - whose condition did not respond to peginterferon alfa alone or to a combination of peginterferon alfa and ribavirin, or responded but subsequently relapsed;
 - co-infected with HIV.
 Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk.

Patients receiving interferon alfa may be switched to peginterferon alfa.

www.nice.org.uk/guidance/ta200

- ▶ **Peginterferon alfa and ribavirin for chronic hepatitis C (November 2013)** NICE TA300
- ▶ In children Peginterferon alfa in combination with ribavirin is recommended (within the marketing authorisation) as an option for treating chronic hepatitis C in children.
www.nice.org.uk/guidance/ta300
- **LESS SUITABLE FOR PRESCRIBING** Ribavirin inhalation is less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

ANTIVIRALS > NUCLEOTIDE ANALOGUES

Ledipasvir with sofosbuvir

11-Jul-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, sofosbuvir p. 665.

- **DRUG ACTION** Sofosbuvir is a nucleotide analogue inhibitor and ledipasvir is an HCV inhibitor; they reduce viral load by inhibiting hepatitis C virus RNA replication.

● INDICATIONS AND DOSE

Chronic hepatitis C infection (initiated by a specialist)

▶ BY MOUTH

- ▶ Adult: 90/400 mg once daily, for duration of treatment consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose of concurrent H₂-receptor antagonist if above a dose comparable to famotidine 40 mg twice daily.
- ▶ Manufacturer advises reduce dose of concurrent proton pump inhibitor if above a dose comparable to omeprazole 20 mg; take at the same time as sofosbuvir with ledipasvir.

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg ledipasvir/sofosbuvir.

- **CAUTIONS** Retreatment following treatment failure—efficacy not established
- **INTERACTIONS** → Appendix 1: ledipasvir · sofosbuvir
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Fatigue · headache · rash
 - ▶ **Frequency not known** Angioedema · arrhythmia
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).
- **PATIENT AND CARER ADVICE**
 - ▶ Vomiting If vomiting occurs within 5 hours of administration, an additional dose should be taken.
 - ▶ **Missed doses** If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

▶ Ledipasvir–sofosbuvir for treating chronic hepatitis C (November 2015) NICE TA363

Ledipasvir with sofosbuvir is recommended as an option for treating adults with chronic hepatitis C infection:

- of genotype 1 without cirrhosis (treatment naive patients)—8 weeks' treatment
- of genotype 1 or 4 with cirrhosis (treatment naive patients)—12 weeks' treatment
- of genotype 1 or 4 without cirrhosis (or with cirrhosis but only if the person has a low risk of the disease getting worse) that has not responded adequately to previous treatment—12 weeks' treatment

In addition, ledipasvir with sofosbuvir is only recommended in patients with cirrhosis for the durations mentioned above if the following criteria are met:

- Child-Pugh class A
- platelet count of $75\,000/\text{mm}^3$ or more
- no features of portal hypertension
- no history of an HCV-associated decompensation episode
- not previously treated with an NS5A inhibitor

Patients whose treatment with ledipasvir with sofosbuvir is not recommended in this NICE guidance, but was started within the NHS before this guidance was published, should be able to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta363

Scottish Medicines Consortium (SMC) decisions

SMC No. 1030/15

The *Scottish Medicines Consortium* has advised (March 2015) that ledipasvir with sofosbuvir (*Harvoni*[®]) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C infection of genotypes 1 and 4 only.

SMC No. 1084/15

The *Scottish Medicines Consortium* has advised (September 2015) that ledipasvir with sofosbuvir (*Harvoni*[®]) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C infection of genotype 3 in patients who are ineligible for, or unable to tolerate interferon.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C viruses must be monitored and managed according to current clinical guidelines.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS FOR CHRONIC HEPATITIS C: RISK OF HYPOGLYCAEMIA IN PATIENTS WITH DIABETES (DECEMBER 2018)

Rapid reduction in hepatitis C viral load during direct-acting antiviral therapy for hepatitis C may improve glucose metabolism in patients with diabetes and result in symptomatic hypoglycaemia if diabetic treatment is continued at the same dose.

The MHRA advises healthcare professionals:

- to monitor glucose levels closely in patients with diabetes during direct-acting antiviral therapy for hepatitis C, especially within the first 3 months of treatment and modify diabetic medication or doses when necessary;
- to be vigilant for changes in glucose tolerance and advise patients of the risk of hypoglycaemia;
- to inform the healthcare professional in charge of the diabetic care of the patient when direct-acting antiviral therapy is initiated.

- **CAUTIONS** Manufacturer advises in chronic hepatitis C of genotype 1, 4, 5, or 6, only use sofosbuvir with ribavirin dual therapy in those with intolerance or contraindications to peginterferon alfa who require urgent treatment.

- **INTERACTIONS** → Appendix 1: sofosbuvir

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arthralgia · asthenia · chest pain · chills · concentration impaired · constipation · cough · depression · diarrhoea · dizziness · dry mouth · dyspnoea · fever · gastrointestinal discomfort · gastroesophageal reflux disease · headaches · influenza like illness · insomnia · irritability · memory loss · muscle complaints · nasopharyngitis · nausea · neutropenia · pain · skin reactions · vision blurred · vomiting · weight decreased
- ▶ **Frequency not known** Arrhythmia

SIDE-EFFECTS, FURTHER INFORMATION Side-effects listed are reported when sofosbuvir is used in combination with ribavirin or with ribavirin and peginterferon alfa.

- **PREGNANCY** Manufacturer advises avoid—limited information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **RENAL IMPAIRMENT** Safety and efficacy not established if eGFR less than $30\text{ mL/minute}/1.73\text{ m}^2$ —accumulation may occur.

- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

● PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► Sofosbuvir for treating chronic hepatitis C (February 2015)

NICE TA330

Sofosbuvir (*Sovaldi*®) in combination with peginterferon alfa and ribavirin is an option for treating adults with chronic hepatitis C infection:

- of genotype 1
 - of genotype 3 with cirrhosis (treatment naive patients)
 - of genotype 3 that has not adequately responded to interferon-based treatment
 - of genotype 4, 5, or 6 with cirrhosis.
- Sofosbuvir (*Sovaldi*®) in combination with ribavirin is an option for treating adults with chronic hepatitis C infection:
- of genotype 2 who are intolerant to *or* ineligible for interferon (treatment naive patients)
 - of genotype 2 that has not adequately responded to interferon-based treatment
 - of genotype 3 with cirrhosis who are intolerant to *or* ineligible for interferon (treatment naive patients)
 - of genotype 3 with cirrhosis that has not adequately responded to interferon-based treatment

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta330

► Sofosbuvir for treating chronic hepatitis C (February 2015)

NICE TA330

Sofosbuvir (*Sovaldi*®) in combination with ribavirin is not recommended for the treatment of adults with chronic hepatitis C infection of genotypes 1, 4, 5, or 6.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta330

Scottish Medicines Consortium (SMC) decisions

SMC No. 964/14

The *Scottish Medicines Consortium* has advised (June 2014) that sofosbuvir (*Sovaldi*®) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C infection of genotypes 1 to 6; its use in combination with ribavirin as dual therapy for chronic hepatitis C infection of either genotype 2 (in treatment naive patients) or genotype 3 is restricted to those who cannot use peginterferon alfa because of intolerance or contraindications.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **PATIENT AND CARER ADVICE**
Vomiting Manufacturer advises if vomiting occurs within 3 hours of administration, an additional dose should be taken.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► Sofosbuvir-velpatasvir for treating chronic hepatitis C (January 2017) NICE TA430

Sofosbuvir with velpatasvir is recommended as an option for treating chronic hepatitis C infection in adults, if the following criteria are met:

- of genotype 1, 3, 4, 5 or 6 with or without cirrhosis (previously treated or treatment naive patients);
- of genotype 2 with cirrhosis (previously treated or treatment naive patients);
- of genotype 2 without cirrhosis (treatment naive patients), only if interferon not suitable or not tolerated, or without cirrhosis (previously treated patients).

This is contingent on the manufacturer providing the drug with the discount agreed in the simple discount agreement.

Patients whose treatment was started within the NHS before this guidance was published, should continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta430

Scottish Medicines Consortium (SMC) decisions

SMC No. 1195/16

The *Scottish Medicines Consortium* has advised (November 2016) that sofosbuvir with velpatasvir (*Eplclusa*®) is accepted for restricted use within NHS Scotland for the treatment of adults with chronic hepatitis C infection of genotype 3 only.

SMC No. 1271/17

The *Scottish Medicines Consortium* has advised (October 2017) that sofosbuvir with velpatasvir (*Eplclusa*®) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C virus (HCV) infection in adults with genotype 2, 5 or 6 or decompensated cirrhosis, irrespective of chronic HCV genotype. This advice is

contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1271/17

The *Scottish Medicines Consortium* has advised (April 2018) that sofosbuvir with velpatasvir (*Eplclusa*[®]) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C virus (HCV) infection in adults with genotype 1 or 4. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

NICE decisions
▶ Sofosbuvir-velpatasvir-voxilaprevir for treating chronic hepatitis C (February 2018) NICE TA507
Sofosbuvir with velpatasvir and voxilaprevir is recommended as an option for treating adults with chronic hepatitis C infection:
 - of genotype 1 to 6 with or without compensated cirrhosis (previously treated with direct-acting antivirals)—recommended for 12 weeks, *or*
 - of genotype 3 with or without compensated cirrhosis (no treatment history with direct-acting antivirals)—recommended for 8 weeks, **and**
 - the manufacturer provides the drug at the same price or lower than that agreed with the Commercial Medicines Unit.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta507

Scottish Medicines Consortium (SMC) decisions

SMC No. 1317/18

The *Scottish Medicines Consortium* has advised (April 2018) that sofosbuvir with velpatasvir and voxilaprevir (*Vosevi*[®]) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C virus (HCV) infection in adults who:

- have failed to achieve a sustained virologic response (SVR) with a direct-acting anti-viral (DAA), **or**
- are DAA-naïve, have genotype 3 (GT3) HCV infection, with or without cirrhosis, and are suitable for treatment with an eight-week course.

This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

ANTIVIRALS > PROTEASE INHIBITORS, HEPATITIS

Glecaprevir with pibrentasvir

25-Oct-2017

• INDICATIONS AND DOSE

Chronic hepatitis C (specialist use only)

▶ BY MOUTH

- ▶ Adult: 300/120 mg once daily, for duration of treatment, consult product literature

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg glecaprevir/pibrentasvir.

IMPORTANT SAFETY INFORMATION

HEPATITIS B INFECTION

Cases of hepatitis B reactivation, sometimes fatal, have been reported in patients co-infected with hepatitis B and C viruses; manufacturer advises to assess patients for hepatitis B prior to initiation of therapy and manage according to current clinical guidelines.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS FOR CHRONIC HEPATITIS C: RISK OF HYPOGLYCAEMIA IN PATIENTS WITH DIABETES (DECEMBER 2018)

Rapid reduction in hepatitis C viral load during direct-acting antiviral therapy for hepatitis C may improve glucose metabolism in patients with diabetes and result in symptomatic hypoglycaemia if diabetic treatment is continued at the same dose.

The MHRA advises healthcare professionals:

- to monitor glucose levels closely in patients with diabetes during direct-acting antiviral therapy for hepatitis C, especially within the first 3 months of treatment and modify diabetic medication or doses when necessary;
- to be vigilant for changes in glucose tolerance and advise patients of the risk of hypoglycaemia;

- to inform the healthcare professional in charge of the diabetic care of the patient when direct-acting antiviral therapy is initiated.

- **CAUTIONS** Hepatitis B infection · post-liver transplant patients · re-treatment of patients with prior exposure to NS3/4A- or NS5A-inhibitors—efficacy not established
- **INTERACTIONS** → Appendix 1: glecaprevir · pibrentasvir
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Asthenia · diarrhoea · headache · nausea
 - ▶ **Frequency not known** Pruritus · transient ischaemic attack
- **PREGNANCY** Manufacturer advises avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment (risk of increased exposure).
- **PATIENT AND CARER ADVICE**
 - Missed doses** Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Glecaprevir-pibrentasvir for treating chronic hepatitis C (January 2018) NICE TA499**
Glecaprevir with pibrentasvir is recommended, within its marketing authorisation, as an option for treating chronic hepatitis C in adults, only if the manufacturer provides the drug at the same price or lower than that agreed with the Commercial Medicines Unit.
www.nice.org.uk/guidance/ta499

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (November 2017) that glecaprevir with pibrentasvir (*Maviret*[®]) is accepted for use within NHS Scotland for the treatment of chronic hepatitis C virus (HCV) infection in adults. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

- ▶ **Maviret** (AbbVie Ltd) ▼

Pibrentasvir 40 mg, Glecaprevir 100 mg Maviret 100mg/40mg tablets | 84 tablet **[PoM]** £12,993.66

ANTIVIRALS > OTHER**Dasabuvir**

28-Mar-2019

- **DRUG ACTION** Dasabuvir is a non-nucleoside inhibitor of hepatitis C virus polymerase NS5B, which is an essential component of the hepatitis C virus replication process.

INDICATIONS AND DOSE**Chronic hepatitis C infection of genotype 1, in combination with other antiviral drugs (ombitasvir with paritaprevir and ritonavir, with or without ribavirin)**

- ▶ **BY MOUTH**
- ▶ **Adult:** 250 mg twice daily for details of duration of treatment, consult product literature, dose to be taken in the morning and evening

IMPORTANT SAFETY INFORMATION**MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)**

A EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C viruses must be monitored and managed according to current clinical guidelines.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS FOR CHRONIC HEPATITIS C: RISK OF HYPOLYCAEMIA IN PATIENTS WITH DIABETES (DECEMBER 2018)

Rapid reduction in hepatitis C viral load during direct-acting antiviral therapy for hepatitis C may improve glucose metabolism in patients with diabetes and result in symptomatic hypoglycaemia if diabetic treatment is continued at the same dose.

The MHRA advises healthcare professionals:

- to monitor glucose levels closely in patients with diabetes during direct-acting antiviral therapy for hepatitis C, especially within the first 3 months of treatment and modify diabetic medication or doses when necessary;
- to be vigilant for changes in glucose tolerance and advise patients of the risk of hypoglycaemia;
- to inform the healthcare professional in charge of the diabetic care of the patient when direct-acting antiviral therapy is initiated.

- **CONTRA-INDICATIONS** HIV co-infection without suppressive antiretroviral therapy
 - **CAUTIONS** Retreatment—efficacy not established
 - **INTERACTIONS** → Appendix 1: dasabuvir
 - **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · asthenia · insomnia · nausea · pruritus
 - ▶ **Rare or very rare** Angioedema
 - ▶ **Frequency not known** Depression · suicidal ideation
- SIDE-EFFECTS, FURTHER INFORMATION** Side-effects listed are reported when dasabuvir is used in combination with Viekirax (ombitasvir with paritaprevir and ritonavir), with or without ribavirin.

- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in cirrhosis—monitor for signs and symptoms of hepatic decompensation and assess hepatic function (including direct bilirubin) at baseline, during the first 4 weeks of treatment and thereafter as clinically indicated, discontinue if hepatic decompensation develops; avoid in moderate to severe impairment.
- **PATIENT AND CARER ADVICE**
 - Missed doses If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - NICE decisions**
 - ▶ **Ombitasvir with paritaprevir and ritonavir with or without dasabuvir for treating chronic hepatitis C (November 2015)** NICE TA365
Dasabuvir (*Exviera*®), in combination with ombitasvir with paritaprevir and ritonavir p. 662, is recommended, within its marketing authorisation, as an option for treating genotype 1 or 4 chronic hepatitis C in adults only if the manufacturer provides it with the discount agreed in the patient access scheme.
www.nice.org.uk/guidance/ta365

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

6.4 Herpesvirus infections

Herpesvirus infections

Herpes simplex and varicella-zoster infection

The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella-zoster virus.

Herpes simplex infections

Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection.

In individuals with good immune function, mild infection of the eye (ocular herpes) and of the lips (herpes labialis or cold sores) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics. Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance.

Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

Varicella-zoster infections

Regardless of immune function and the use of any immunoglobulins, neonates with *chickenpox* should be treated with a parenteral antiviral to reduce the risk of severe

disease. Oral therapy in children is not recommended as absorption is variable. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required.

Chickenpox is more severe in adolescents and adults than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adults and adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

Pregnant women who develop severe chickenpox may be at risk of complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Those who have been exposed to chickenpox and are at special risk of complications may require prophylaxis with varicella-zoster immunoglobulin (see under Disease Specific Immunoglobulins).

In *herpes zoster* (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days. Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.

Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management.

Choice

Aciclovir p. 670 is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella-zoster and the systemic and topical treatment of herpes simplex infections of the skin and mucous membranes. It is used by mouth for severe herpetic stomatitis. Aciclovir eye ointment is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.

Famciclovir p. 672, a prodrug of penciclovir, is similar to aciclovir and is licensed for use in herpes zoster and genital herpes.

Valaciclovir p. 673 is an ester of aciclovir, licensed for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is also licensed for preventing cytomegalovirus disease following solid organ transplantation. Famciclovir or valaciclovir are suitable alternatives to aciclovir for oral lesions associated with herpes zoster. Valaciclovir once daily may reduce the risk of transmitting genital herpes to heterosexual partners—specialist advice should be sought.

Foscarnet sodium p. 676 is used for mucocutaneous herpes simplex virus infection unresponsive to aciclovir in immunocompromised patients; it is toxic and can cause renal impairment.

Inosine pranobex p. 670 has been used by mouth for herpes simplex infections; its effectiveness remains unproven.

Cytomegalovirus infection

Ganciclovir p. 674 is related to aciclovir but it is more active against cytomegalovirus (CMV); it is also much more toxic than aciclovir and should therefore be prescribed only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the *initial treatment* of CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine p. 692; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration.

Valganciclovir is licensed for prevention of cytomegalovirus disease following renal transplantation.

Letermovir p. 676 is licensed for prevention of CMV reactivation and disease in recipients of an allogeneic haematopoietic stem cell transplant who are seropositive for the human cytomegalovirus. It should be initiated by a specialist.

Valganciclovir p. 675 is an ester of ganciclovir which is licensed for the *initial treatment and maintenance treatment* of CMV retinitis in acquired immunodeficiency syndrome (AIDS) patients. Valganciclovir is also licensed for preventing CMV disease following solid organ transplantation from a cytomegalovirus-positive donor.

Cidofovir p. 674 is licensed in combination with probenecid for the specialist treatment of CMV retinitis in adult AIDS patients. It should be used only when other medicinal products are considered unsuitable.

Foscarnet sodium is also active against cytomegalovirus; it is toxic and can cause renal impairment.

See local treatment of CMV retinitis.

ANTIVIRALS > INOSINE COMPLEXES

Inosine pranobex

27-May-2020

(Inosine acedoben dimepranol)

● INDICATIONS AND DOSE

Mucocutaneous herpes simplex

▶ BY MOUTH

▶ Adult: 1 g 4 times a day for 7–14 days

Adjunctive treatment of genital warts

▶ BY MOUTH

▶ Adult: 1 g 3 times a day for 14–28 days

Subacute sclerosing panencephalitis

▶ BY MOUTH

▶ Adult: 50–100 mg/kg daily in 6 divided doses

● **CAUTIONS** History of gout · history of hyperuricaemia · history of urolithiasis

● **SIDE-EFFECTS** Arthralgia · constipation · diarrhoea · drowsiness · epigastric discomfort · fatigue · headache · insomnia · malaise · nausea · nervousness · polyuria · skin reactions · vertigo · vomiting

● **PREGNANCY** Manufacturer advises avoid.

● **RENAL IMPAIRMENT** Manufacturer advises caution; metabolised to uric acid.

● **LESS SUITABLE FOR PRESCRIBING** Inosine pranobex is less suitable for prescribing.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9

▶ **Inunovir** (KoRa Healthcare)

Inosine acedoben dimepranol 500 mg Inunovir 500mg tablets | 100 tablet **PoM** £39.50 DT = £39.50

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Aciclovir

10-Mar-2020

(Acyclovir)

● INDICATIONS AND DOSE

Herpes simplex, suppression

▶ BY MOUTH

▶ Child 12–17 years: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of

genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

- ▶ Adult: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Herpes simplex, prophylaxis in the immunocompromised

▶ BY MOUTH

▶ Child 1–23 months: 100–200 mg 4 times a day

▶ Child 2–17 years: 200–400 mg 4 times a day

▶ Adult: 200–400 mg 4 times a day

▶ BY INTRAVENOUS INFUSION

▶ Adult: 5 mg/kg every 8 hours

Herpes simplex, treatment (non-genital)

▶ BY MOUTH

▶ Adult: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Herpes simplex, treatment (non-genital) in immunocompromised or if absorption impaired

▶ BY MOUTH

▶ Adult: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Herpes simplex, treatment

▶ BY MOUTH

▶ Child 1–23 months: 100 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

▶ Child 2–17 years: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Herpes simplex, treatment, in immunocompromised or if absorption impaired

▶ BY MOUTH

▶ Child 1–23 months: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

▶ Child 2–17 years: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Genital herpes simplex, treatment of first episode

▶ BY MOUTH

▶ Adult: 200 mg 5 times a day, alternatively 400 mg 3 times a day both courses usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Genital herpes simplex, treatment of first episode, in immunocompromised or HIV-positive

▶ BY MOUTH

▶ Adult: 400 mg 5 times a day for 7–10 days (longer if new lesions appear during treatment or if healing incomplete)

Severe genital herpes simplex, treatment, initial infection | Treatment of herpes simplex in the immunocompromised

▶ BY INTRAVENOUS INFUSION

▶ Adult: Initially 5 mg/kg every 8 hours usually for 5 days, alternatively 10 mg/kg every 8 hours for at least 14 days in encephalitis (at least 21 days if also immunocompromised)—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment, higher dose to be used only if resistant organisms suspected or in simplex encephalitis

Genital herpes simplex, treatment of recurrent infection

▶ BY MOUTH

- ▶ Adult: 800 mg 3 times a day for 2 days, alternatively 200 mg 5 times a day for 5 days, alternatively 400 mg 3 times a day for 3–5 days

Genital herpes simplex, treatment of recurrent infection in immunocompromised or HIV-positive patients

▶ BY MOUTH

- ▶ Adult: 400 mg 3 times a day for 5–10 days

Varicella zoster (chickenpox), treatment | Herpes zoster (shingles), treatment

▶ BY MOUTH

- ▶ Child 1–23 months: 200 mg 4 times a day for 5 days
- ▶ Child 2–5 years: 400 mg 4 times a day for 5 days
- ▶ Child 6–11 years: 800 mg 4 times a day for 5 days
- ▶ Child 12–17 years: 800 mg 5 times a day for 7 days
- ▶ Adult: 800 mg 5 times a day for 7 days

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 5 mg/kg every 8 hours usually for 5 days

Varicella zoster (chickenpox), treatment in immunocompromised | Herpes zoster (shingles), treatment in immunocompromised

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 10 mg/kg every 8 hours usually for 5 days

Herpes zoster (shingles), treatment in immunocompromised

▶ BY MOUTH

- ▶ Child 1–23 months: 200 mg 4 times a day continued for 2 days after crusting of lesions
- ▶ Child 2–5 years: 400 mg 4 times a day continued for 2 days after crusting of lesions
- ▶ Child 6–11 years: 800 mg 4 times a day continued for 2 days after crusting of lesions
- ▶ Child 12–17 years: 800 mg 5 times a day continued for 2 days after crusting of lesions
- ▶ Adult: 800 mg 5 times a day continued for 2 days after crusting of lesions

Herpes zoster, treatment in encephalitis | Varicella zoster, treatment in encephalitis

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 10 mg/kg every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised or if severe infection

Varicella zoster (chickenpox), attenuation of infection if varicella-zoster immunoglobulin not indicated

▶ BY MOUTH

- ▶ Child: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure
- ▶ Adult: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ With intravenous use To avoid excessive dosage in obese patients parenteral dose should be calculated on the basis of ideal weight for height.

● UNLICENSED USE

- ▶ With oral use in children Tablets and suspension not licensed for suppression of herpes simplex or for treatment of herpes zoster in children (age range not specified by manufacturer).
- ▶ With oral use Aciclovir doses in BNF may differ from those in product literature. Attenuation of chickenpox is an unlicensed indication.

- **CAUTIONS** Elderly (risk of neurological reactions) • maintain adequate hydration (especially with infusion or high doses)

- **INTERACTIONS** → Appendix 1: aciclovir

● SIDE-EFFECTS▶ **Common or very common**

- ▶ With intravenous use Nausea • photosensitivity reaction • skin reactions • vomiting

- ▶ With oral use Abdominal pain • diarrhoea • dizziness • fatigue • fever • headache • nausea • photosensitivity reaction • skin reactions • vomiting

▶ **Uncommon**

- ▶ With intravenous use Anaemia • leucopenia • thrombocytopenia

▶ **Rare or very rare**

- ▶ With intravenous use Abdominal pain • agitation • angioedema • ataxia • coma • confusion • diarrhoea • dizziness • drowsiness • dysarthria • dyspnoea • encephalopathy • fatigue • fever • hallucination • headache • hepatic disorders • inflammation localised • psychosis • renal impairment • renal pain • seizure • tremor
- ▶ With oral use Agitation • anaemia • angioedema • ataxia • coma • confusion • drowsiness • dysarthria • dyspnoea • encephalopathy • hallucination • hepatic disorders • leucopenia • psychosis • renal impairment • renal pain • seizure • thrombocytopenia • tremor

▶ **Frequency not known**

- ▶ With intravenous use Crystalluria
- ▶ With oral use Alopecia • crystalluria

- **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.

- **BREAST FEEDING** Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.

- **RENAL IMPAIRMENT** Risk of neurological reactions increased. Maintain adequate hydration (especially during renal impairment).

Dose adjustments ▶ With intravenous use in adults

Use normal intravenous dose every 12 hours if eGFR 25–50 mL/minute/1.73 m² (every 24 hours if eGFR 10–25 mL/minute/1.73 m²). Consult product literature for intravenous dose if eGFR less than 10 mL/minute/1.73 m².

- ▶ With oral use in adults For *herpes zoster*, use normal oral dose every 8 hours if eGFR 10–25 mL/minute/1.73 m² (every 12 hours if eGFR less than 10 mL/minute/1.73 m²). For *herpes simplex*, use normal oral dose every 12 hours if eGFR less than 10 mL/minute/1.73 m².

- ▶ With oral use in children For *herpes zoster*, use normal oral dose every 8 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m² (every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²). For *herpes simplex*, use normal dose every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use in adults For *intravenous infusion Zovirax IV*[®], *Aciclovir IV* (Genus), give intermittently in Sodium chloride 0.9% or Sodium chloride and glucose; initially reconstitute to 25 mg/mL in water for injection or sodium chloride 0.9% then dilute to not more than 5 mg/mL with the infusion fluid; to be given over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and given over 1 hour; for *Aciclovir IV* (Hospira) dilute to not more than 5 mg/mL with infusion fluid; give over 1 hour.

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ With oral use Flavours of oral liquid preparations may include banana, or orange.

● PATIENT AND CARER ADVICE

- Medicines for Children leaflet: Aciclovir (oral) for viral infections www.medicinesforchildren.org.uk/aciclovir-oral-viral-infections-0

INDICATIONS AND DOSE

Herpes zoster infection, treatment

- BY MOUTH
- Adult: 500 mg 3 times a day for 7 days, alternatively 750 mg 1–2 times a day for 7 days

Herpes zoster infection, treatment in immunocompromised patients

- BY MOUTH
- Adult: 500 mg 3 times a day for 10 days, continue for 2 days after crusting of lesions

Genital herpes, suppression

- BY MOUTH
- Adult: 250 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Genital herpes, suppression in immunocompromised or HIV-positive patients

- BY MOUTH
- Adult: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Genital herpes infection, treatment of first episode

- BY MOUTH
- Adult: 250 mg 3 times a day for 5 days or longer if new lesions appear during treatment or if healing incomplete

Genital herpes infection, treatment of first episode in immunocompromised or HIV-positive patients

- BY MOUTH
- Adult: 500 mg twice daily for 10 days

Genital herpes infection, treatment of recurrent infection

- BY MOUTH
- Adult: 125 mg twice daily for 5 days, alternatively 1 g twice daily for 1 day

Genital herpes infection, treatment of recurrent infections in immunocompromised or HIV-positive patients

- BY MOUTH
- Adult: 500 mg twice daily for 5–10 days

Herpes simplex infection (non-genital), treatment in immunocompromised patients

- BY MOUTH
- Adult: 500 mg twice daily for 7 days

- UNLICENSED USE** Famciclovir doses in BNF may differ from those in product literature.
- SIDE-EFFECTS**
 - Common or very common** Abdominal pain · diarrhoea · dizziness · headache · nausea · skin reactions · vomiting
 - Uncommon** Angioedema · confusion · drowsiness
 - Rare or very rare** Hallucination · jaundice cholestatic · palpitations · thrombocytopenia
- PREGNANCY** Manufacturers advise avoid unless potential benefit outweighs risk.
- BREAST FEEDING** No information available—present in milk in *animal* studies.
- HEPATIC IMPAIRMENT** Manufacturer advises efficacy may be decreased in severe impairment (risk of impaired conversion to active metabolite, no information available).
- RENAL IMPAIRMENT**
 - Dose adjustments** Reduce dose; consult product literature.
- PRESCRIBING AND DISPENSING INFORMATION** Famciclovir is a pro-drug of penciclovir.

- MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Valaciclovir

● INDICATIONS AND DOSE

Herpes zoster infection, treatment

▶ BY MOUTH

- ▶ Adult: 1 g 3 times a day for 7 days

Herpes zoster infection, treatment in immunocompromised patients

▶ BY MOUTH

- ▶ Adult: 1 g 3 times a day for at least 7 days and continued for 2 days after crusting of lesions

Herpes simplex, treatment of first infective episode

▶ BY MOUTH

- ▶ Adult: 500 mg twice daily for 5 days (longer if new lesions appear during treatment or healing is incomplete)

Herpes simplex infections treatment of first episode in immunocompromised or HIV-positive patients

▶ BY MOUTH

- ▶ Adult: 1 g twice daily for 10 days

Herpes simplex, treatment of recurrent infections

▶ BY MOUTH

- ▶ Adult: 500 mg twice daily for 3–5 days

Treatment of recurrent herpes simplex infections in immunocompromised or HIV-positive patients

▶ BY MOUTH

- ▶ Adult: 1 g twice daily for 5–10 days

Herpes labialis treatment

▶ BY MOUTH

- ▶ Child 12–17 years: Initially 2 g, then 2 g after 12 hours
- ▶ Adult: Initially 2 g, then 2 g after 12 hours

Herpes simplex, suppression of infections

▶ BY MOUTH

- ▶ Adult: 500 mg daily in 1–2 divided doses, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Herpes simplex, suppression of infections in immunocompromised or HIV-positive patients

▶ BY MOUTH

- ▶ Adult: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Genital herpes, reduction of transmission (administered on expert advice)

▶ BY MOUTH

- ▶ Adult: 500 mg once daily, to be taken by the infected partner

Prevention of cytomegalovirus disease following solid organ transplantation when valganciclovir or ganciclovir cannot be used

▶ BY MOUTH

- ▶ Adult: 2 g 4 times a day usually for 90 days, preferably starting within 72 hours of transplantation

- **CAUTIONS** Elderly (risk of neurological reactions) · maintain adequate hydration (especially with high doses)
- **INTERACTIONS** → Appendix 1: valaciclovir

● SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · dizziness · headache · nausea · photosensitivity reaction · skin reactions · vomiting
- ▶ **Uncommon** Abdominal discomfort · agitation · confusion · dyspnoea · haematuria · hallucination · leucopenia · level of consciousness decreased · renal pain · thrombocytopenia · tremor
- ▶ **Rare or very rare** Angioedema · ataxia · coma · delirium · dysarthria · encephalopathy · nephrolithiasis · psychosis · renal impairment · seizure
- ▶ **Frequency not known** Microangiopathic haemolytic anaemia

SIDE-EFFECTS, FURTHER INFORMATION Neurological reactions more frequent with higher doses.

- **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution with doses of 4 g or more per day (no information available).

- **RENAL IMPAIRMENT** Maintain adequate hydration.

Dose adjustments ▶ In adults For *herpes zoster*, 1 g every 12 hours if eGFR 30–50 mL/minute/1.73 m² (1 g every 24 hours if eGFR 10–30 mL/minute/1.73 m²; 500 mg every 24 hours if eGFR less than 10 mL/minute/1.73 m²). For *treatment of herpes simplex*, 500 mg (1 g in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m². For *treatment of herpes labialis*, if eGFR 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if eGFR 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose; if eGFR less than 10 mL/minute/1.73 m², 500 mg as a single dose). For *suppression of herpes simplex*, 250 mg (500 mg in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m². For *reduction of genital herpes transmission*, 250 mg every 24 hours if eGFR less than 15 mL/minute/1.73 m². Reduce dose according to eGFR for *cytomegalovirus prophylaxis* following solid organ transplantation (consult product literature).

- ▶ In children For *treatment of herpes labialis*, if estimated glomerular filtration rate 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if estimated glomerular filtration rate 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose; if estimated glomerular filtration rate less than 10 mL/minute/1.73 m², 500 mg as a single dose).

- **PRESCRIBING AND DISPENSING INFORMATION** Valaciclovir is a pro-drug of aciclovir.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 9

▶ Valaciclovir (Non-proprietary)

Valaciclovir (as Valaciclovir hydrochloride) 500 mg Valaciclovir 500mg tablets | 10 tablet [PoM] £22.05 DT = £2.55 | 42 tablet [PoM] £78.83

▶ Valtrex (GlaxoSmithKline UK Ltd)

Valaciclovir (as Valaciclovir hydrochloride) 250 mg Valtrex 250mg tablets | 60 tablet [PoM] £123.28 DT = £123.28

6.4a Cytomegalovirus infections

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Cidofovir

20-Mar-2019

- **DRUG ACTION** Cidofovir is a selective inhibitor of human cytomegalovirus (HCMV) DNA polymerase which inhibits viral DNA synthesis and thereby suppresses HCMV replication.

● INDICATIONS AND DOSE

Cytomegalovirus retinitis in patients with AIDS (in combination with probenecid) (specialist use only)

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 5 mg/kg once weekly for 2 weeks, then maintenance 5 mg/kg every 2 weeks, maintenance treatment to be started 2 weeks after completion of induction treatment

- **CONTRA-INDICATIONS** Concomitant administration with potentially nephrotoxic drugs—discontinue potentially nephrotoxic drugs at least 7 days before starting cidofovir - patients unable to receive probenecid

- **CAUTIONS** Diabetes mellitus (increased risk of ocular hypotony) - ensure concomitant use of probenecid and Sodium Chloride 0.9%

CAUTIONS, FURTHER INFORMATION

- ▶ Probenecid and Sodium Chloride 0.9% Manufacturer advises oral probenecid and intravenous Sodium Chloride 0.9% must be administered with each cidofovir dose to prevent nephrotoxicity (consult cidofovir product literature for information on probenecid dosing and recommendations on intravenous hydration); see *Prescribing and dispensing information* for details on obtaining probenecid.

- **INTERACTIONS** → Appendix 1: cidofovir

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · asthenia · chills · diarrhoea · dyspnoea · eye inflammation · fever · headache · nausea · neutropenia · ocular hypotony · proteinuria · rash · renal failure · vomiting
- ▶ **Uncommon** Fanconi syndrome acquired
- ▶ **Frequency not known** Hearing impairment · nephrotoxicity · pancreatitis

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises intravenous sodium chloride 0.9% prehydration and concomitant oral probenecid for prevention of nephrotoxicity; consider treatment interruption, or discontinuation if changes in renal function occur—consult product literature.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises ensure effective contraception during and after treatment in women; men should be advised to use barrier contraception during and for 3 months after treatment. Cidofovir may cause impaired fertility in males—reduced testes weight and hypospermia observed in *animal* studies.

- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid (no information available).

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available).

- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance is less than or equal to 55 mL/minute or if proteinuria is greater than or equal to 100 mg/dL.

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor serum creatinine, urine protein levels, and white blood cell count before each cidofovir dose.

- ▶ Manufacturer advises regular eye examinations (increased risk of iritis, ocular hypotony, and uveitis).

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion*, dilute with 100 mL Sodium Chloride 0.9% and mix thoroughly; give at a constant rate over 1 hour via an infusion pump.

- **PRESCRIBING AND DISPENSING INFORMATION** Probenecid is available from 'special-order' manufacturers or specialist importing companies—in case of difficulties, the cidofovir manufacturer (Tillomed) advises contacting their local representative. See probenecid product literature for prescribing information for probenecid, including information on interactions.

● HANDLING AND STORAGE

Caution in handling. Manufacturer advises cidofovir should be considered a potential carcinogen and must be handled with caution (consult product literature); if contact with skin or mucous membranes occurs, wash thoroughly with water.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

▶ Cidofovir (non-proprietary) ▼

Cidofovir 75 mg per 1 mL Cidofovir 375mg/5ml concentrate for solution for infusion vials | 1 vial  

Ganciclovir

31-May-2018

● INDICATIONS AND DOSE

Prevention of cytomegalovirus disease [pre-emptive therapy in patients with drug-induced immunosuppression]

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 5 mg/kg every 12 hours for 7–14 days, then maintenance 6 mg/kg once daily, on 5 days of the week, alternatively maintenance 5 mg/kg once daily

Prevention of cytomegalovirus disease [universal prophylaxis in patients with drug-induced immunosuppression]

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 6 mg/kg once daily, on 5 days of the week, alternatively 5 mg/kg once daily

Treatment of cytomegalovirus disease [in immunocompromised patients]

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 5 mg/kg every 12 hours for 14–21 days, then maintenance 6 mg/kg once daily, on 5 days of the week, alternatively maintenance 5 mg/kg once daily, maintenance only for patients at risk of relapse; if disease progresses initial induction treatment may be repeated

- **CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) · abnormally low neutrophil count (consult product literature) · abnormally low platelet count (consult product literature)

- **CAUTIONS** History of cytopenia · potential carcinogen (including long-term carcinogenicity) · potential teratogen (including long-term teratogenicity) · radiotherapy

- **INTERACTIONS** → Appendix 1: ganciclovir

● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · anxiety · appetite decreased · arthralgia · asthenia · bone marrow disorders · chest pain · chills · confusion · constipation · cough · depression · diarrhoea · dizziness · dysphagia · dyspnoea · ear pain · eye disorders · eye inflammation · eye pain · fever · flatulence · gastrointestinal discomfort · headache · hepatic function abnormal · increased risk of infection · insomnia · leucopenia · malaise · muscle complaints ·

nausea · neutropenia · night sweats · pain · peripheral neuropathy · renal impairment · seizure · sensation abnormal · sepsis · skin reactions · taste altered · thinking abnormal · thrombocytopenia · vomiting · weight decreased

- ▶ **Uncommon** Alopecia · arrhythmia · deafness · haematuria · hypotension · infertility male · oral ulceration · pancreatitis · psychotic disorder · tremor · visual impairment
- ▶ **Rare or very rare** Agranulocytosis · hallucination

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to valganciclovir, aciclovir, or valaciclovir.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during and for at least 30 days after treatment; men with partners of childbearing potential should be advised to use barrier contraception during and for at least 90 days after treatment. Ganciclovir may cause temporary or permanent inhibition of spermatogenesis—impaired fertility observed in *animal* studies.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—teratogenicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **RENAL IMPAIRMENT**

Dose adjustments Manufacturer advises reduce dose for patients receiving mg/kg dosing if creatinine clearance less than 70 mL/minute—consult product literature.

- **MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises, for *intravenous infusion*, give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute with Water for Injections (500 mg/10 mL) then dilute requisite dose to a concentration of not more than 10 mg/mL with infusion fluid; give over 1 hour into a vein with adequate flow, preferably using a plastic cannula.

● **HANDLING AND STORAGE**

Caution in handling Ganciclovir is a potential teratogen and carcinogen. Manufacturer advises avoid inhalation of the powder or direct contact of the powder or reconstituted solution with the skin or mucous membranes; if contact occurs, wash thoroughly with soap and water; rinse eyes thoroughly with plain water.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Ganciclovir (Non-proprietary)**

Ganciclovir (as Ganciclovir sodium) 500 mg Ganciclovir 500mg powder for concentrate for solution for infusion vials | 5 vial [PoM] £115.00 (Hospital only) | 5 vial [PoM] £125.95

- ▶ **Cymevee (Chephalapharm Arzneimittel GmbH)**

Ganciclovir (as Ganciclovir sodium) 500 mg Cymevee 500mg powder for concentrate for solution for infusion vials | 5 vial [PoM] £148.83

Prevention of cytomegalovirus disease [following solid organ transplantation from a cytomegalovirus positive donor]

- ▶ **BY MOUTH**

- ▶ **Adult:** 900 mg daily for 100 days (for 100–200 days following kidney transplantation), to be started within 10 days of transplantation

DOSE EQUIVALENCE AND CONVERSION

- ▶ Oral valganciclovir 900 mg twice daily is equivalent to intravenous ganciclovir 5 mg/kg twice daily.

- **CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) · abnormally low neutrophil count (consult product literature) · abnormally low platelet count (consult product literature)

- **CAUTIONS** History of cytopenia · potential carcinogen (including long-term carcinogenicity) · potential teratogen (including long-term teratogenicity) · radiotherapy

- **INTERACTIONS** → Appendix 1: valganciclovir

● **SIDE-EFFECTS**

- ▶ **Common or very common** Anaemia · anxiety · appetite decreased · arthralgia · asthenia · bone marrow disorders · chest pain · confusion · constipation · cough · depression · diarrhoea · dizziness · dysphagia · dyspnoea · ear pain · eye disorders · eye inflammation · eye pain · flatulence · gastrointestinal discomfort · headache · hepatic function abnormal · increased risk of infection · insomnia · leucopenia · malaise · muscle complaints · nausea · neutropenia · night sweats · pain · peripheral neuropathy · renal impairment · seizure · sensation abnormal · sepsis · skin reactions · taste altered · thinking abnormal · thrombocytopenia · vomiting · weight decreased

- ▶ **Uncommon** Alopecia · arrhythmia · deafness · haematuria · hallucination · hypotension · infertility male · oral ulceration · pancreatitis · psychotic disorder · tremor · visual impairment

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to ganciclovir, aciclovir, or valaciclovir.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during and for at least 30 days after treatment; men with partners of childbearing potential should be advised to use barrier contraception during and for at least 90 days after treatment. *Ganciclovir* may cause temporary or permanent inhibition of spermatogenesis—impaired fertility observed in *animal* studies.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—teratogenicity observed with *ganciclovir* in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—*ganciclovir* present in milk in *animal* studies.

● **RENAL IMPAIRMENT**

Dose adjustments Manufacturer advises reduce dose if creatinine clearance less than 60 mL/minute—consult product literature.

- **MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).

● **PRESCRIBING AND DISPENSING INFORMATION**

Valganciclovir is a pro-drug of ganciclovir.

Flavours of oral liquid formulations may include tutti-frutti.

- **HANDLING AND STORAGE** Manufacturer advises reconstituted powder for oral solution should be stored in a refrigerator (2–8°C) for up to 49 days. Caution in handling Valganciclovir is a potential teratogen and carcinogen. Manufacturer advises caution when handling the powder, reconstituted solution, or broken tablets and avoid inhalation of powder; if contact with skin

Valganciclovir

31-May-2018

● **INDICATIONS AND DOSE**

Cytomegalovirus retinitis [induction and maintenance treatment in patients with AIDS]

- ▶ **BY MOUTH**

- ▶ **Adult:** Initially 900 mg twice daily for 21 days, then maintenance 900 mg daily, induction regimen may be repeated if retinitis progresses

or mucous membranes occurs, wash thoroughly with soap and water; rinse eyes thoroughly with plain water.

ANTIVIRALS > OTHER

Foscarnet sodium

26-May-2020

● INDICATIONS AND DOSE

Cytomegalovirus disease

- ▶ BY INTRAVENOUS INFUSION

▶ **Adult:** Initially 60 mg/kg every 8 hours for 2–3 weeks, alternatively initially 90 mg/kg every 12 hours for 2–3 weeks, then maintenance 60 mg/kg daily, then increased if tolerated to 90–120 mg/kg daily, if disease progresses on maintenance dose, repeat induction regimen

Mucocutaneous herpes simplex virus infections unresponsive to aciclovir in immunocompromised patients

- ▶ BY INTRAVENOUS INFUSION

▶ **Adult:** 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal

- **UNLICENSED USE** Licensed for CMV retinitis in AIDS patients only. Foscarnet doses in BNF may differ from those in product literature.

- **CAUTIONS** Conditions where excess sodium should be avoided · ensure adequate hydration

- **INTERACTIONS** → Appendix 1: foscarnet

● SIDE-EFFECTS

- ▶ **Common or very common** Aggression · anaemia · anxiety · appetite decreased · arrhythmias · asthenia · chest pain · chills · confusion · constipation · coordination abnormal · dehydration · depression · diarrhoea · dizziness · electrolyte imbalance · fever · gastrointestinal discomfort · genital discomfort (due to high concentrations excreted in urine) · genital ulceration (due to high concentrations excreted in urine) · haemorrhage · headache · hepatic function abnormal · hypertension · hypotension · leucopenia · malaise · muscle contractions involuntary · myalgia · nausea (reduce infusion rate) · neutropenia · numbness · oedema · palpitations · pancreatitis · paraesthesia (reduce infusion rate) · peripheral neuropathy · proteinuria · renal impairment · seizure · sepsis · skin reactions · thrombocytopenia · thrombophlebitis · tremor · urinary disorders · vomiting
- ▶ **Uncommon** Acidosis · angioedema · glomerulonephritis · nephropathy · pancytopenia
- ▶ **Frequency not known** Anaphylactoid reaction · diabetes insipidus · muscle weakness · myopathy · oesophageal ulcer · QT interval prolongation · renal pain · renal tubular acidosis · severe cutaneous adverse reactions (SCARs)
- **CONCEPTION AND CONTRACEPTION** Men should avoid fathering a child during and for 6 months after treatment.

- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

● RENAL IMPAIRMENT

- **Dose adjustments** Reduce dose; consult product literature.

● MONITORING REQUIREMENTS

- ▶ Monitor electrolytes, particularly calcium and magnesium.
- ▶ Monitor serum creatinine every second day during induction and every week during maintenance.

● DIRECTIONS FOR ADMINISTRATION

Avoid rapid infusion. For *intravenous infusion (Foscavir[®])*, give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 12 mg/mL for infusion into peripheral vein (undiluted solution *via* central venous line only); infuse over at least 1 hour (infuse doses greater than 60 mg/kg over 2 hours).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Foscavir** (Clinigen Healthcare Ltd)

Foscarnet sodium 24 mg per 1 ml Foscavir 6g/250ml solution for infusion bottles | 1 bottle [PoM] £119.85 (Hospital only)

Letermovir

02-Apr-2019

- **DRUG ACTION** Letermovir is a cytomegalovirus DNA terminase complex inhibitor that interferes with cytomegalovirus genome formation and virion maturation.

● INDICATIONS AND DOSE

Prevention of cytomegalovirus reactivation and disease [in recipients of an allogeneic haematopoietic stem cell transplant who are seropositive for the human cytomegalovirus] (initiated by a specialist)

- ▶ BY MOUTH

▶ **Adult:** 480 mg once daily for 100 days post-transplant, start within 28 days post-transplant, treatment beyond 100 days may be considered in some patients—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose to 240 mg once daily with concurrent use of ciclosporin.

- **INTERACTIONS** → Appendix 1: letermovir

● SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · nausea · vomiting
- ▶ **Uncommon** Abdominal pain · appetite decreased · fatigue · headache · muscle spasms · peripheral oedema · taste altered · vertigo

- **CONCEPTION AND CONTRACEPTION** The effect on human fertility is not known—impairment of fertility has been observed in *animal* studies.

- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate impairment in those with co-existing moderate or severe renal impairment, and in severe impairment (risk of increased exposure).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Letermovir for preventing cytomegalovirus disease after a stem cell transplant (July 2019)** NICE TA591 Letermovir (*Prevymis[®]*) is recommended, within its marketing authorisation, as an option for preventing cytomegalovirus (CMV) reactivation and disease after an allogeneic haematopoietic stem cell transplant (HSCT) in adults who are seropositive for CMV. It is recommended

only if the manufacturer provides it according to the commercial arrangement.

www.nice.org.uk/guidance/ta591

Scottish Medicines Consortium (SMC) decisions

SMC No. 1338/18

The *Scottish Medicines Consortium* has advised (March 2019) that letemovir (*Prevymis*®) is accepted for use within NHS Scotland for the prophylaxis of cytomegalovirus (CMV) reactivation and disease in adult CMV-seropositive recipients [R+] of an allogeneic haematopoietic stem cell transplant. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

6.5 HIV infection

HIV infection

19-Apr-2020

Overview

The human immunodeficiency virus (HIV) is a retrovirus that causes immunodeficiency by infecting and destroying cells of the immune system, particularly the CD4 cells. Acquired immune deficiency syndrome (AIDS) occurs when the number of CD4 cells fall to below 200 cells/microlitre; opportunistic infections and malignancies (AIDS-defining illnesses) can develop. The prognosis of HIV and AIDS has greatly improved due to more effective and better tolerated antiretroviral therapy (ART). The greatest risk to excess mortality and morbidity is delayed HIV diagnosis and treatment.

Aims of treatment

Treatment aims to achieve an undetectable viral load, to preserve immune function, to reduce the mortality and morbidity associated with chronic HIV infection, and to reduce onward transmission of HIV, whilst minimising drug toxicity. Treatment with a combination of ART aims to improve the physical and psychological well-being of infected people.

Initiation of treatment

EvGr All patients with suspected or diagnosed HIV should be reviewed promptly by a HIV specialist.

All patients diagnosed as being HIV positive should be offered immediate treatment, irrespective of CD4 cell counts. ⚡ Commitment to, and strict adherence to treatment over many years is required. Low adherence can be associated with drug resistance, progression to AIDS, and death. The treatment regimen should take into account dosing convenience, potential drug interactions, clinical symptoms, and comorbidities.

EvGr Treatment of HIV infection in *treatment-naïve* patients is initiated with a combination of two nucleoside reverse transcriptase inhibitors (NRTIs) as a backbone regimen plus *one* of the following as a third drug: an integrase inhibitor (INI), a non-nucleoside reverse transcriptase inhibitor (NNRTI), or a boosted protease inhibitor (PI).

The regimen of choice contains a backbone of emtricitabine p. 687 and either tenofovir disoproxil p. 691 or tenofovir alafenamide p. 659. An alternative backbone

regimen is abacavir p. 684 and lamivudine p. 689. The third drug of choice is either ritonavir p. 696-boosted atazanavir p. 693, or ritonavir-boosted darunavir p. 694, or dolutegravir p. 678, or bicicostat p. 698-boosted elvitegravir p. 680, or raltegravir p. 680, or rilpivirine p. 683. Efavirenz p. 681 may be used as an alternative third drug.

Patients who require treatment for both HIV and chronic hepatitis B should be treated with antivirals active against both diseases as part of fully suppressive combination ART. Regimens of choice are tenofovir disoproxil and emtricitabine, or tenofovir alafenamide p. 659 and emtricitabine. ⚡ For further information see British HIV Association guidelines for the treatment of HIV-1-positive adults with antiretroviral therapy available at www.bhiva.org/guidelines.

Switching therapy

EvGr Deterioration of the condition (including clinical, virological, and CD4 cell count changes) may require a change in therapy. The choice of an alternative regimen should be guided by factors such as the response to previous treatment, tolerability, drug-drug interactions and the possibility of drug resistance. ⚡ For further information see British HIV Association guidelines for the treatment of HIV-1-positive adults with antiretroviral therapy available at www.bhiva.org/guidelines.

HIV infection in pregnancy

EvGr Management of HIV infection in pregnancy should focus on the well-being of the women living with HIV, by ensuring that their ART regimen maximally suppresses viral replication as early as possible (if possible before conception) in order to minimise vertical transmission of HIV. Information on the teratogenic potential of most antiretroviral drugs is limited, however, all pregnant women living with HIV who conceive whilst on effective ART should continue this treatment throughout their pregnancy. All other women should start ART during their pregnancy. The recommended regimen is a NRTI backbone of either tenofovir disoproxil or abacavir with either emtricitabine or lamivudine; the third drug should be efavirenz or ritonavir-boosted atazanavir. All treatment options require careful assessment by a specialist. ⚡ For further information, including alternative ART options, see British HIV Association guidelines for the management of HIV in pregnancy and postpartum available at www.bhiva.org/guidelines.

EvGr Pregnancies in women with HIV and babies born to them should be reported prospectively to the National Study of HIV in Pregnancy and Childhood at www.ucl.ac.uk/nshpc/ and to the Antiretroviral Pregnancy Registry at www.apregistry.com. ⚡

HIV infection and breast-feeding

EvGr Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided. ⚡ For further information see British HIV Association guidelines for the management of HIV in pregnancy and postpartum available at www.bhiva.org/guidelines.

HIV infection, pre-exposure prophylaxis

The risk of acquiring HIV is increased in:

- men or transgender individuals who have unprotected anal intercourse with men;
- sexual partners of people who are HIV-positive with a detectable viral load; and
- HIV-negative heterosexual individuals who have unprotected intercourse with a HIV-positive person, and are likely to repeat this with the same person or another person with a similar status.

EvGr Emtricitabine with tenofovir disoproxil p. 689 may be appropriate for pre-exposure prophylaxis to reduce the risk

of sexually acquired HIV-1 infection in combination with safer sex practices in adults at high risk. Tenofovir disoproxil alone is an alternative for HIV-negative heterosexual individuals when emtricitabine is contra-indicated. **⚡** For further information see British HIV Association and British Association for Sexual Health and HIV guidelines on the use of HIV pre-exposure prophylaxis (PrEP) available at: www.bhiva.org/guidelines.

HIV infection, post-exposure prophylaxis

The Department of Health advises prompt prophylaxis with antiretroviral drugs [unlicensed indication] may be appropriate following exposure to HIV-contaminated material. Immediate expert advice should be sought in such cases. National guidelines on post-exposure prophylaxis for healthcare workers have been developed (by the Chief Medical Officer's Expert Advisory Group on AIDS), www.gov.uk/government/publications/eaga-guidance-on-hiv-post-exposure-prophylaxis and local ones may also be available.

⚡ Prompt prophylaxis with antiretroviral drugs [unlicensed indication] may also be appropriate following potential sexual exposure to HIV where there is a significant risk of viral transmission. The recommended treatment for post-exposure prophylaxis is emtricitabine with tenofovir disoproxil plus raltegravir for 28 days. **⚡** For further information see British Association for Sexual Health and HIV guidelines for the use of HIV post-exposure prophylaxis following sexual exposure available at www.bashh.org.

Drug treatment

Drugs that are licensed for the treatment of HIV/AIDS are listed below according to drug class.

Nucleoside reverse transcriptase inhibitors (NRTI or 'nucleoside analogue'): abacavir (ABC); emtricitabine (FTC), lamivudine (3TC); stavudine (d4T) p. 691, tenofovir alafenamide fumarate (TAF) p. 659, tenofovir disoproxil fumarate (TDF), and zidovudine (AZT) p. 692.

Non-nucleoside reverse transcriptase inhibitors (NNRTI): doravirine (DOR) p. 681, efavirenz (EFV), etravirine (ETR) p. 682, nevirapine (NVP) p. 682, and rilpivirine p. 683 (RPV).

Protease inhibitors (PI): atazanavir (ATZ), darunavir (DRV), fosamprenavir (FOS-APV) p. 695, lopinavir (LPV), ritonavir (RTV), saquinavir (SQV) p. 697, and tipranavir (TPV) p. 697.

CCR5 antagonists: maraviroc (MVC) p. 698.

Integrase inhibitors (INI): bictegravir (BIC), dolutegravir (DTG) below, elvitegravir (EVG) p. 680, and raltegravir (RAL).

Fusion inhibitors: enfuvirtide (T-20) below.

Pharmacokinetic enhancers: cobicistat p. 698 (c), and low-dose ritonavir (r). They boost the concentrations of other antiretrovirals metabolised by CYP3A4, but have no antiretroviral activity themselves.

ANTIVIRALS > HIV-FUSION INHIBITORS

Enfuvirtide

14-Jul-2018

• **DRUG ACTION** Enfuvirtide inhibits the fusion of HIV to the host cell.

• INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 90 mg twice daily

• SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · appetite decreased · asthenia · concentration impaired · conjunctivitis · diabetes mellitus · gastrooesophageal reflux disease · haematuria · hypertriglyceridaemia · increased risk of infection ·

influenza like illness · irritability · lymphadenopathy · myalgia · nasal congestion · nephrolithiasis · nightmare · numbness · pancreatitis · peripheral neuropathy · skin papilloma · skin reactions · tremor · vertigo · weight decreased

- ▶ **Frequency not known** Diarrhoea · hypersensitivity · immune reconstitution inflammatory syndrome · nausea · osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION Hypersensitivity

Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge.

Osteonecrosis Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available); increased risk of hepatic side effects in patients with chronic hepatitis B or C.
- **DIRECTIONS FOR ADMINISTRATION** For *subcutaneous injection*, reconstitute with 1.1 mL Water for Injections and allow to stand (for up to 45 minutes) to dissolve; do not shake or invert vial.
- **PATIENT AND CARER ADVICE** Hypersensitivity reactions Patients or carers should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

ELECTROLYTES: May contain Sodium

- ▶ **Fuzeon** (Roche Products Ltd)

Enfuvirtide 108 mg Fuzeon 108mg powder and solvent for solution for injection vials | 60 vial **Ⓜ** £1,081.57

ANTIVIRALS > HIV-INTEGRASE INHIBITORS

Dolutegravir

11-Jul-2018

- **DRUG ACTION** Dolutegravir is an inhibitor of HIV integrase.

• INDICATIONS AND DOSE

HIV infection without resistance to other inhibitors of HIV integrase, in combination with other antiretroviral drugs

- ▶ BY MOUTH
- ▶ Adult: 50 mg once daily

HIV infection in patients where resistance to other inhibitors of HIV integrase suspected, in combination with other antiretroviral drugs

- ▶ BY MOUTH
- ▶ Adult: 50 mg twice daily, dose to be taken with food

HIV infection in combination with other antiretroviral drugs (with concomitant carbamazepine, efavirenz, etravirine (without boosted protease inhibitors, but see also Interactions), fosphenytoin, phenobarbital, phenytoin, primidone, nevirapine, oxcarbazepine, St John's wort, rifampicin, or tipranavir)

▶ BY MOUTH

- ▶ Adult: 50 mg twice daily, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DOLUTEGRAVIR (TIVICAY[®], TRIUMEQ[®], JULUCA[®]): SIGNAL OF INCREASED RISK OF NEURAL TUBE DEFECTS; DO NOT PRESCRIBE TO WOMEN SEEKING TO BECOME PREGNANT; EXCLUDE PREGNANCY BEFORE INITIATION AND ADVISE USE OF EFFECTIVE CONTRACEPTION (JUNE 2018)

New safety recommendations have been issued while an EU review evaluates cases of neural tube defects in babies born to mothers who became pregnant while taking dolutegravir. The MHRA advises:

- dolutegravir should not be prescribed to women who are trying to become pregnant;
- pregnancy should be excluded in women of childbearing potential with pregnancy testing before starting dolutegravir;
- women of childbearing potential should be advised to use effective contraception throughout treatment with dolutegravir;
- if pregnancy is confirmed in the first trimester while a woman is taking dolutegravir, switch to an alternative treatment unless there is no suitable alternative;
- women taking dolutegravir for HIV should be advised not to stop taking their medicine without first consulting their doctor.

● **INTERACTIONS** → Appendix 1: dolutegravir

● SIDE-EFFECTS

▶ **Common or very common** Anxiety · depression · diarrhoea · dizziness · fatigue · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · sleep disorders · vomiting

▶ **Uncommon** Arthralgia · hepatic disorders · hypersensitivity · immune reconstitution inflammatory syndrome · myalgia · suicidal tendencies

SIDE-EFFECTS, FURTHER INFORMATION Hypersensitivity

Hypersensitivity reactions (including severe rash, or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, oral lesions, conjunctivitis, angioedema, eosinophilia, or raised liver enzymes) reported uncommonly. Discontinue immediately if any sign or symptoms of hypersensitivity reactions develop.

Osteonecrosis Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

● **PREGNANCY** Manufacturer advises avoid, see *Important Safety Information*.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer dolutegravir tablets.
Missed doses If a dose is more than 20 hours late on the once daily regimen (or more than 8 hours late on the twice daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (May 2014) that dolutegravir (Tivicay[®]) is accepted for use within NHS Scotland when used in combination with other anti-retroviral medicines for the treatment of HIV infected

adults. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

The *All Wales Medicines Strategy Group* has advised (October 2017) that dolutegravir (Tivicay[®]) is recommended as an option for use within NHS Wales in combination with other anti-retroviral medicinal products for the treatment of HIV infected adults. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ Tivicay (ViiV Healthcare UK Ltd)

Dolutegravir (as Dolutegravir sodium) 10 mg Tivicay 10mg tablets
| 30 tablet [PoM](#) £99.75 DT = £99.75

Dolutegravir (as Dolutegravir sodium) 25 mg Tivicay 25mg tablets
| 30 tablet [PoM](#) £249.38 DT = £249.38

Dolutegravir (as Dolutegravir sodium) 50 mg Tivicay 50mg tablets
| 30 tablet [PoM](#) £498.75 DT = £498.75

Combinations available: *Abacavir with dolutegravir and lamivudine*, p. 684 · *Lamivudine with dolutegravir*, p. 690

Dolutegravir with rilpivirine

28-Sep-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, dolutegravir p. 678, rilpivirine p. 683.

● INDICATIONS AND DOSE

HIV-1 infection (initiated by a specialist)

▶ BY MOUTH

▶ Adult: 50/25 mg once daily

DOSE EQUIVALENCE AND CONVERSION

▶ Dose expressed as x/y mg dolutegravir/rilpivirine.

- **INTERACTIONS** → Appendix 1: dolutegravir · rilpivirine

● PATIENT AND CARER ADVICE

Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and drowsiness.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2091

The *Scottish Medicines Consortium* has advised (September 2018) that dolutegravir with rilpivirine film-coated tablet (*Juluca*[®]) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 (HIV-1) infection in adults who are virologically-suppressed (HIV-1 RNA < 50 copies/mL) on a stable antiretroviral regimen for at least six months with no history of virological failure and no known or suspected resistance to any non-nucleoside reverse transcriptase inhibitor (NNRTI) or integrase inhibitor. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 2850

The *All Wales Medicines Strategy Group* has advised (December 2018) that dolutegravir with rilpivirine (*Juluca*[®]) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1 (HIV-1) infection in adults who are virologically

suppressed (HIV-1 RNA < 50 copies/ml) on a stable antiretroviral regimen for at least six months with no history of virological failure and no known or suspected resistance to any nonnucleoside reverse transcriptase inhibitor or integrase inhibitor. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Rilpivirine (as Rilpivirine hydrochloride) 25 mg, Dolutegravir (as Dolutegravir sodium) 50 mg Juluca 50mg/25mg tablets | 30 tablet (POM) £699.02

Elvitegravir

14-Jul-2018

- **DRUG ACTION** Elvitegravir is an inhibitor of HIV integrase, which is an enzyme required for viral replication.

● INDICATIONS AND DOSE

HIV infection without resistance to other inhibitors of HIV integrase, in combination with low-dose ritonavir and atazanavir or lopinavir

► BY MOUTH

► **Adult:** 85 mg once daily, take at the same time as a once daily ritonavir-boosted regimen or with the first dose of a twice daily ritonavir-boosted regimen

HIV infection without resistance to other inhibitors of HIV integrase, in combination with low-dose ritonavir and darunavir or fosamprenavir

► BY MOUTH

► **Adult:** 150 mg once daily, take with the first dose of a twice daily ritonavir-boosted regimen

- **CAUTIONS** Elderly—limited information available
- **INTERACTIONS** → Appendix 1: elvitegravir
- **SIDE-EFFECTS**
 - **Common or very common** Diarrhoea · fatigue · headache · nausea · rash · vomiting
 - **Uncommon** Depression · dizziness · drowsiness · flatulence · gastrointestinal discomfort · insomnia · paraesthesia · suicidal ideation (in patients with history of depression or psychiatric illness) · taste altered
 - **Frequency not known** Hyperglycaemia · osteonecrosis · weight increased
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use effective contraception during treatment (if using a hormonal contraceptive, it must contain norgestimate as the progestogen and at least 30 micrograms ethinylestradiol).
- **PREGNANCY** Manufacturer advises avoid unless essential—limited data available.
- **PATIENT AND CARER ADVICE**

Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. If vomiting occurs within 1 hour of taking a dose, a replacement dose should be taken.

- **MEDICINAL FORMS** No licensed medicines listed.

Combinations available: *Elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide*, p. 686 · *Elvitegravir with cobicistat, emtricitabine and tenofovir disoproxil*, p. 686

Raltegravir

08-Feb-2019

- **DRUG ACTION** Raltegravir is an inhibitor of HIV integrase.

● INDICATIONS AND DOSE

HIV-1 infection (initiated by a specialist)

► BY MOUTH USING TABLETS

► **Adult:** 400 mg twice daily, alternatively 1200 mg once daily, once daily dosing for use in patients who are treatment naive or virologically suppressed on an initial regimen of 400 mg twice daily—use 600 mg tablets only

- **CONTRA-INDICATIONS** Pre-term neonates—no information available
- **CAUTIONS** Psychiatric illness (may exacerbate underlying illness including depression) · risk factors for myopathy · risk factors for rhabdomyolysis
- **INTERACTIONS** → Appendix 1: raltegravir
- **SIDE-EFFECTS**
 - **Common or very common** Akathisia · appetite abnormal · asthenia · behaviour abnormal · depression · diarrhoea · dizziness · fever · gastrointestinal discomfort · gastrointestinal disorders · headaches · nausea · skin reactions · sleep disorders · vertigo · vomiting
 - **Uncommon** Alopecia · anaemia · anxiety · arrhythmias · arthralgia · arthritis · body fat disorder · burping · cachexia · chest discomfort · chills · cognitive disorder · concentration impaired · confusion · constipation · diabetes mellitus · drowsiness · dry mouth · dyslipidaemia · dysphonia · erectile dysfunction · feeling jittery · glossitis · gynaecomastia · haemorrhage · hepatic disorders · hot flush · hyperglycaemia · hypersensitivity · hypertension · immune reconstitution inflammatory syndrome · increased risk of infection · lipodystrophy · lymph node abscess · lymphatic abnormalities · malaise · memory loss · menopausal symptoms · mood altered · myalgia · myopathy · nasal congestion · nephritis · nephrolithiasis · nerve disorders · neutropenia · nocturia · odynophagia · oedema · osteopenia · pain · palpitations · pancreatitis acute · polydipsia · psychiatric disorder · renal cyst · renal impairment · sensation abnormal · severe cutaneous adverse reactions (SCARs) · skin papilloma · submandibular mass · suicidal tendencies · sweat changes · taste altered · tendinitis · thrombocytopenia · tinnitus · tremor · visual impairment · weight increased
 - **Frequency not known** Osteonecrosis
- **SIDE-EFFECTS, FURTHER INFORMATION** Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available), and in patients with chronic hepatitis B or C (consider interrupting or discontinuing treatment if impairment worsens; increased risk of hepatic side-effects).
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense raltegravir chewable tablets in original container (contains desiccant).
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 613/10

The *Scottish Medicines Consortium* has advised (May 2010) that raltegravir (*Isentress*®) is accepted for restricted use within NHS Scotland for the treatment of HIV-1 infection when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

SMC No. 1280/17

The *Scottish Medicines Consortium* has advised (November 2017) that raltegravir 600 mg film-coated tablets (*Isentress*[®]) are accepted for restricted use within NHS Scotland for the treatment of HIV-1 infection in adults and paediatric patients weighing at least 40 kg when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

ANTIVIRALS > NON-NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

Doravirine

28-May-2019

- **INDICATIONS AND DOSE**

HIV-1 infection in combination with other antiretroviral drugs (initiated by a specialist)

▶ BY MOUTH

- ▶ Adult: 100 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises if concurrent use of moderate inducers of CYP3A4, dabrafenib, modafinil, or telotristat ethyl is unavoidable, increase dose to 100 mg twice daily. Manufacturer advises 100 mg twice daily with rifabutin.

- **INTERACTIONS** → Appendix 1: doravirine

- **SIDE-EFFECTS**

- ▶ **Common or very common** Asthenia · diarrhoea · dizziness · drowsiness · gastrointestinal discomfort · gastrointestinal disorders · headache · hepatocellular injury · nausea · skin reactions · sleep disorders · vomiting
- ▶ **Uncommon** Anxiety · arthralgia · concentration impaired · confusion · constipation · depression · electrolyte imbalance · hypertension · malaise · memory loss · mood altered · muscle tone increased · myalgia · paraesthesia · suicidal ideation
- ▶ **Rare or very rare** Acute kidney injury · adjustment disorder · aggression · chest pain · chills · dyspnoea · hallucination · pain · rash pustular · renal disorder · thirst · tonsillar hypertrophy · urolithiasis

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).

- **PATIENT AND CARER ADVICE**

Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue, dizziness, and somnolence.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Efavirenz

- **INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs

▶ BY MOUTH USING CAPSULES

- ▶ Adult: 600 mg once daily

▶ BY MOUTH USING TABLETS

- ▶ Adult: 600 mg once daily

- **CAUTIONS** Acute porphyrias p. 1120 · elderly · history of psychiatric disorders · history of seizures

- **INTERACTIONS** → Appendix 1: efavirenz

- **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · anxiety · concentration impaired · depression · diarrhoea · dizziness · drowsiness · dyslipidaemia · fatigue · headache · movement disorders · nausea · skin reactions · sleep disorders · vomiting
- ▶ **Uncommon** Behaviour abnormal · confusion · flushing · gynaecomastia · hallucination · hepatic disorders · memory loss · mood altered · pancreatitis · psychosis · seizure · Stevens-Johnson syndrome · suicidal tendencies · thinking abnormal · tinnitus · tremor · vertigo · vision blurred
- ▶ **Rare or very rare** Delusions · photosensitivity reaction
- ▶ **Frequency not known** Immune reconstitution inflammatory syndrome · osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION **Rash** Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—usually resolves within 1 month.

CNS effects Administration at bedtime especially in first 2–4 weeks reduces CNS effects.

Abnormal hepatic function Manufacturer advises interrupt or discontinue treatment if transaminases more than 5 times the upper limit of normal.

- **PREGNANCY** Reports of neural tube defects when used in first trimester.
- **HEPATIC IMPAIRMENT** Greater risk of hepatic side-effects in chronic hepatitis B or C. Manufacturer advises avoid in severe impairment (limited information available).
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe renal failure—no information available.
- **MONITORING REQUIREMENTS** Monitor liver function if receiving other hepatotoxic drugs.
- **DIRECTIONS FOR ADMINISTRATION** For patients who cannot swallow capsules, the capsule may be opened and contents added to a small amount of food—consult product literature. No additional food should be consumed for up to 2 hours after administration of efavirenz.
- **PATIENT AND CARER ADVICE** Psychiatric disorders Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Combinations available: *Efavirenz with emtricitabine and tenofovir disoproxil*, p. 685

Etravirine

12-Jul-2018

● INDICATIONS AND DOSE

HIV infection resistant to other non-nucleoside reverse transcriptase inhibitor and protease inhibitors in combination with other antiretroviral drugs (including a boosted protease inhibitor)

▶ BY MOUTH

▶ Adult: 200 mg twice daily, to be taken after food

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120
- **INTERACTIONS** → Appendix 1: etravirine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Diabetes mellitus · diarrhoea · headache · hyperglycaemia · myocardial infarction · nausea · skin reactions · vomiting
 - ▶ **Uncommon** Angioedema · bronchospasm · dry mouth · dyslipidaemia · gynaecomastia · haematemesis · hepatic disorders · hyperhidrosis · hypersensitivity · hypersomnia · numbness · pancreatitis · sluggishness · vision blurred
 - ▶ **Rare or very rare** Severe cutaneous adverse reactions (SCARs)
 - ▶ **Frequency not known** Haemorrhagic stroke · osteonecrosis · weight increased

SIDE-EFFECTS, FURTHER INFORMATION **Hypersensitivity reactions** Rash, usually in the second week, is the most common side-effect and appears more frequently in females. Life-threatening hypersensitivity reactions reported usually during week 3–6 of treatment and characterised by rash, eosinophilia, and systemic symptoms (including fever, general malaise, myalgia, arthralgia, blistering, oral lesions, conjunctivitis, and hepatitis). Discontinue permanently if hypersensitivity reaction or severe rash develop. If rash mild or moderate (without signs of hypersensitivity reaction), may continue without interruption—usually resolves within 2 weeks.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment and in patients with hepatitis B or C (increased risk of hepatic side effects); avoid in severe impairment (no information available).
- **DIRECTIONS FOR ADMINISTRATION** Patients with swallowing difficulties may disperse tablets in a glass of water just before administration.
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).
- **PATIENT AND CARER ADVICE** Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to

seek immediate medical attention if hypersensitivity reaction or severe rash develop.

Missed doses If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Nevirapine**● INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs (initial dose)

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ **Adult:** Initially 200 mg once daily for first 14 days, initial dose titration using 'immediate-release' preparation should not exceed 28 days; if rash occurs and is not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the lower dose of the 'immediate-release' preparation for the first 14 days as for new treatment

HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: 200 mg twice daily

▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Adult: 400 mg once daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · post-exposure prophylaxis
- **CAUTIONS** Females (at greater risk of hepatic side effects) · high CD4 cell count (at greater risk of hepatic side effects)
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ **Hepatic effects** Patients with chronic hepatitis B or C, high CD4 cell count, and women are at increased risk of hepatic side effects—if plasma HIV-1 RNA detectable, manufacturer advises avoid in women with CD4 cell count greater than 250 cells/mm³ or in men with CD4 cell count greater than 400 cells/mm³ unless potential benefit outweighs risk.
- **INTERACTIONS** → Appendix 1: nevirapine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · angioedema · diarrhoea · fatigue · fever · headache · hepatic disorders · hypersensitivity · hypertransaminasaemia · nausea · skin reactions · vomiting
 - ▶ **Uncommon** Anaemia · arthralgia · myalgia · severe cutaneous adverse reactions (SCARs)
 - ▶ **Frequency not known** Eosinophilia · osteonecrosis · weight increased
- **SIDE-EFFECTS, FURTHER INFORMATION** **Hepatic effects** Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor

patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction.

Rash Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased gradually (after 14 days); Discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves.

Osteonecrosis Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

● **HEPATIC IMPAIRMENT** For *modified-release* preparations, manufacturer advises avoid (no information available). For *immediate-release* preparations, manufacturer advises caution in moderate impairment and chronic hepatitis (increased risk of hepatic side effects; consider interrupting or discontinuing treatment if hepatic function worsens); avoid in severe impairment (no information available).

● **RENAL IMPAIRMENT** Manufacturer advises avoid modified-release preparation—no information available.

● **MONITORING REQUIREMENTS**

▶ **Hepatic disease** Close monitoring of liver function required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly.

▶ **Rash** Monitor closely for skin reactions during first 18 weeks.

● **PATIENT AND CARER ADVICE**

Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop.

Missed doses If a dose is more than 8 hours late with the 'immediate-release' preparation (or more than 12 hours late with the modified-release preparation), the missed dose should not be taken and the next dose should be taken at the usual time.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

▶ **Viramune** (Boehringer Ingelheim Ltd)

Nevirapine (as Nevirapine hemihydrate) 10 mg per 1 ml Viramune 50mg/5ml oral suspension | 240 ml [PoM] £50.40

Modified-release tablet

ANTIVIRALS > NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

Nucleoside reverse transcriptase inhibitors

● **SIDE-EFFECTS**

▶ **Common or very common** Abdominal pain · anaemia (may require transfusion) · asthenia · diarrhoea · dizziness · headache · insomnia · nausea · neutropenia · skin reactions · vomiting

▶ **Uncommon** Angioedema · lactic acidosis · pancreatitis

▶ **Frequency not known** Immune reconstitution inflammatory syndrome · osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

● **PREGNANCY**

Monitoring Mitochondrial dysfunction has been reported in infants exposed to nucleoside reverse transcriptase inhibitors in utero; the main effects include haematological, metabolic, and neurological disorders; all infants whose mothers received nucleoside reverse transcriptase inhibitors during pregnancy should be monitored for relevant signs or symptoms.

● **HEPATIC IMPAIRMENT** In general, manufacturers advise caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

Rilpivirine

07-Feb-2019

● **INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy and if plasma HIV-1 RNA concentration less than or equal to 100 000 copies/mL

▶ **BY MOUTH**

▶ **Adult:** 25 mg once daily

● **CAUTIONS** Acute porphyrias p. 1120

Abacavir

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

► BY MOUTH

► Adult: 600 mg daily in 1–2 divided doses

- **CAUTIONS** HIV load greater than 100 000 copies/mL · patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%)

● **INTERACTIONS** → Appendix 1: abacavir

● SIDE-EFFECTS

- **Common or very common** Appetite decreased · fever · lethargy
 - **Rare or very rare** Severe cutaneous adverse reactions (SCARs)
 - **Frequency not known** Hypersensitivity · weight increased
- SIDE-EFFECTS, FURTHER INFORMATION** Life-threatening hypersensitivity reactions have been reported—characterised by fever or rash and possibly nausea, vomiting, diarrhoea, abdominal pain, dyspnoea, cough, lethargy, malaise, headache, and myalgia; less frequently mouth ulceration, oedema, hypotension, sore throat, acute respiratory distress syndrome, anaphylaxis, paraesthesia, arthralgia, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure; rarely myolysis. Laboratory abnormalities may include raised liver function tests and creatine kinase; symptoms usually appear in the first 6 weeks, but may occur at any time. Discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction).

- **ALLERGY AND CROSS-SENSITIVITY** Caution—increased risk of hypersensitivity reaction in presence of HLA-B*5701 allele.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; consider avoiding in moderate to severe impairment (no information available).

● **RENAL IMPAIRMENT** Manufacturer advises avoid in end-stage renal disease.

● **PRE-TREATMENT SCREENING** Test for HLA-B*5701 allele before treatment or if restarting treatment and HLA-B*5701 status not known.

● **MONITORING REQUIREMENTS** Monitor for symptoms of hypersensitivity reaction every 2 weeks for 2 months.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana, or strawberry.

● **PATIENT AND CARER ADVICE** Patients and their carers should be told the importance of regular dosing (intermittent therapy may increase the risk of sensitisation), how to recognise signs of hypersensitivity, and advised to seek immediate medical attention if symptoms develop or before re-starting treatment. Patients should be provided with an alert card and advised to keep it with them at all times.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCIPIENTS: May contain Propylene glycol

► **Ziagen** (ViiV Healthcare UK Ltd)

Abacavir (as Abacavir sulfate) 20 mg per 1 ml Ziagen 20mg/ml oral solution sugar-free | 240 ml [PoM] £55.72

► **Kivexa** (ViiV Healthcare UK Ltd)

Lamivudine 300 mg, Abacavir 600 mg Kivexa 600mg/300mg tablets | 30 tablet [PoM] £352.25 DT = £190.00

Abacavir with lamivudine and zidovudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 684, lamivudine p. 689, zidovudine p. 692.

● INDICATIONS AND DOSE

HIV infection (use only if patient is stabilised for 6–8 weeks on the individual components in the same proportions)

► BY MOUTH

► Adult: 1 tablet twice daily

● **INTERACTIONS** → Appendix 1: abacavir · lamivudine · zidovudine

● **RENAL IMPAIRMENT** Avoid *Trizivir*[®] if eGFR less than 50 mL/minute/1.73 m² (consult product literature).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

► *Trizivir* (ViiV Healthcare UK Ltd)

Lamivudine 150 mg, Abacavir (as Abacavir sulfate) 300 mg, Zidovudine 300 mg | *Trizivir* tablets | 60 tablet (PoM) £509.06

Bictegravir with emtricitabine and tenofovir alafenamide

28-Sep-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 687, tenofovir alafenamide p. 659.

● INDICATIONS AND DOSE

HIV-1 infection (initiated by a specialist)

► BY MOUTH

► Adult: 1 tablet once daily

● **INTERACTIONS** → Appendix 1: bictegravir · tenofovir alafenamide

● SIDE-EFFECTS

► **Common or very common** Depression · diarrhoea · dizziness · fatigue · headache · nausea · sleep disorders

► **Uncommon** Anaemia · angioedema · anxiety · arthralgia · flatulence · gastrointestinal discomfort · hyperbilirubinaemia · skin reactions · suicidal behaviour · vomiting

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

● **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance is less than 30 mL/minute—limited information available.

● PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2093

The *Scottish Medicines Consortium* has advised (September 2018) that bictegravir with emtricitabine and tenofovir alafenamide (*Biktarvy*[®]) is accepted for use within NHS Scotland for the treatment of adults infected with human immunodeficiency virus type 1 without present or past evidence of viral resistance to the integrase inhibitor class, emtricitabine or tenofovir. This advice is contingent upon

the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3414

The *All Wales Medicines Strategy Group* has advised (December 2018) that bictegravir with emtricitabine and tenofovir alafenamide (*Biktarvy*[®]) is recommended as an option for restricted use within NHS Wales for the treatment of adults infected with human immunodeficiency virus-1 (HIV-1) without present or past evidence of viral resistance to the integrase inhibitor class, emtricitabine or tenofovir, and who are either unsuitable for or unable to tolerate abacavir with dolutegravir and lamivudine (*Triumeq*[®]).

Bictegravir with emtricitabine and tenofovir alafenamide (*Biktarvy*[®]) is not recommended for use within NHS Wales outside of this subpopulation. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide

22-May-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 687, elvitegravir p. 680, cobicistat p. 698, tenofovir alafenamide p. 659.

● INDICATIONS AND DOSE

HIV-1 infection (specialist use only)

- ▶ BY MOUTH
- ▶ Adult: 1 tablet once daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ELVITEGRAVIR BOOSTED WITH COBICISTAT: AVOID USE IN PREGNANCY DUE TO RISK OF TREATMENT FAILURE AND MATERNAL-TO-CHILD TRANSMISSION OF HIV-1 (APRIL 2019)

Pharmacokinetic data show mean exposure of elvitegravir boosted with cobicistat (available in combination in *Genvoya*[®] and *Stribild*[®]) to be lower during the second and third trimesters of pregnancy than postpartum. Low elvitegravir exposure may be associated with an increased risk of treatment failure and an increased risk of HIV-1 transmission to the unborn child. For further information, see *Pregnancy*.

- **INTERACTIONS** → Appendix 1: cobicistat · elvitegravir · tenofovir alafenamide
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abnormal dreams · diarrhoea · dizziness · fatigue · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · vomiting
 - ▶ **Uncommon** Anaemia · angioedema · depression
 - ▶ **Frequency not known** Nephrotoxicity · osteonecrosis · weight increased
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential; if using a hormonal contraceptive, it must contain drospirenone or norgestimate as the progestogen and at least 30 micrograms ethinylestradiol.
- **PREGNANCY** Manufacturer advises not to be initiated during pregnancy due to low elvitegravir exposure; women who become pregnant during therapy should be switched to an alternative regimen.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of hepatic side-effects); avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—limited information available.
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container—contains desiccant.
- **PATIENT AND CARER ADVICE**

Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions
SMC No. 1142/16
The *Scottish Medicines Consortium* has advised (May 2016) that elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide (*Genvoya*[®]) is accepted for use within NHS Scotland for the treatment of adults and adolescents (aged 12 years and older with body weight at least 35 kg) infected with human immunodeficiency virus-

1 (HIV-1), without known mutations associated with resistance to the integrase inhibitor class, emtricitabine or tenofovir. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

The *All Wales Medicines Strategy Group* has advised (July 2016) that elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide (*Genvoya*[®]) is recommended as an option for use within NHS Wales for the treatment of adults and adolescents (aged 12 years and older with body weight at least 35 kg) infected with human immunodeficiency virus-1 (HIV-1), without known mutations associated with resistance to the integrase inhibitor class, emtricitabine or tenofovir. The recommendation applies only if the approved Wales Patient Access Scheme (WPAS) is used or where the list price is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Emtricitabine with rilpivirine and tenofovir alafenamide

05-Jun-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine above, rilpivirine p. 683, tenofovir alafenamide p. 659.

● INDICATIONS AND DOSE

HIV infection in patients with plasma HIV-1 RNA concentration of 100 000 copies/mL or less (specialist use only)

- ▶ BY MOUTH
- ▶ Adult: 1 tablet once daily

● **INTERACTIONS** → Appendix 1: rilpivirine · tenofovir alafenamide

● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · depression · diarrhoea · dizziness · drowsiness · dry mouth · fatigue · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · sleep disorders · vomiting
- ▶ **Uncommon** Anaemia · angioedema · arthralgia · immune reconstitution inflammatory syndrome
- ▶ **Frequency not known** Conjunctivitis · drug reaction with eosinophilia and systemic symptoms (DRESS) · eosinophilia · fever · osteonecrosis · QT interval prolongation · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Systemic symptoms reported with severe skin reactions include fever, blisters, conjunctivitis, angioedema, elevated liver function tests, and eosinophilia.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment (increased risk of hepatic side-effects); avoid in severe impairment (no information available).

● **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—no information available.

● PATIENT AND CARER ADVICE

Vomiting Manufacturer advises if vomiting occurs within 4 hours of taking a dose, a replacement dose should be taken.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

Emtricitabine

(FTC)

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

- ▶ BY MOUTH USING CAPSULES
- ▶ Adult: 200 mg once daily
- ▶ BY MOUTH USING ORAL SOLUTION
- ▶ Adult: 240 mg once daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ 240 mg oral solution ≡ 200 mg capsule; where appropriate the capsule may be used instead of the oral solution.

● SIDE-EFFECTS

- ▶ **Common or very common** Abnormal dreams · dyspepsia · hyperbilirubinaemia · hyperglycaemia · hypersensitivity · hypertriglyceridaemia · pain · rash pustular
- ▶ **Frequency not known** Weight increased

● HEPATIC IMPAIRMENT

Monitoring On discontinuation, monitor patients with hepatitis B (risk of exacerbation of hepatitis).

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (October 2016) that emtricitabine with rilpivirine and tenofovir alafenamide (*Odefsey*[®]) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 (HIV-1), without known mutations associated with resistance to the non-nucleoside reverse transcriptase inhibitor (NNRTI) class, tenofovir or emtricitabine, and with viral load HIV-1 RNA of 100 000 copies/mL or less.

All Wales Medicines Strategy Group (AWMSG) decisions

The *All Wales Medicines Strategy Group* has advised (November 2016) that emtricitabine with rilpivirine and tenofovir alafenamide (*Odefsey*[®]) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1, without known mutations associated with resistance to the non-nucleoside reverse transcriptase inhibitor (NNRTI) class, tenofovir or emtricitabine, and with viral load HIV-1 RNA of 100 000 copies/mL or less.

Emtricitabine with tenofovir alafenamide

05-Jun-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 687, tenofovir alafenamide p. 659.

• INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (specialist use only)

- ▶ BY MOUTH
- ▶ Adult: 200/10–200/25 mg once daily, dose is dependent on drug regimen—consult product literature

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg emtricitabine/tenofovir alafenamide.

- **INTERACTIONS** → Appendix 1: tenofovir alafenamide
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abnormal dreams · diarrhoea · dizziness · fatigue · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · vomiting
 - ▶ **Uncommon** Anaemia · arthralgia
 - ▶ **Frequency not known** Angioedema · osteonecrosis
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of hepatic side-effects).
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—limited information available.
- **PATIENT AND CARER ADVICE**
 - Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (August 2016) that emtricitabine with tenofovir alafenamide (*Descovy*[®]) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 in combination with other antiretroviral agents.

All Wales Medicines Strategy Group (AWMSG) decisions

The *All Wales Medicines Strategy Group* has advised (September 2016) that emtricitabine with tenofovir alafenamide (*Descovy*[®]) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1 in combination with other antiretroviral agents.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Emtricitabine with tenofovir disoproxil

15-Nov-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, tenofovir disoproxil p. 691, emtricitabine p. 687.

● INDICATIONS AND DOSE

HIV-1 infection (initiated by a specialist)

- ▶ BY MOUTH
- ▶ Adult: 200/245 mg once daily

Pre-exposure prophylaxis of HIV-1 infection (initiated by a specialist)

- ▶ BY MOUTH
- ▶ Adult: 200/245 mg once daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg emtricitabine/tenofovir disoproxil.

- **INTERACTIONS** → Appendix 1: tenofovir disoproxil
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (renal risk of hepatic side-effects).
- **RENAL IMPAIRMENT**
 - ▶ When used for HIV-1 infection Manufacturer advises avoid in severe impairment.
 - ▶ When used for Pre-exposure prophylaxis of HIV-1 infection Manufacturer advises avoid if creatinine clearance less than 60 mL/minute.
- **Dose adjustments**
 - ▶ When used for HIV-1 infection Manufacturer advises use normal dose every 2 days in moderate impairment.
- **DIRECTIONS FOR ADMINISTRATION** Patients with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste).
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer emtricitabine with tenofovir tablets.
 - ▶ **Missed doses** If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (April 2017) that emtricitabine with tenofovir disoproxil (*Truvada*®) is accepted for use within NHS Scotland in combination with safer sex practices for pre-exposure prophylaxis of sexually acquired HIV-1 infection in adults at high risk.

All Wales Medicines Strategy Group (AWMSG) decisions

The *All Wales Medicines Strategy Group* has advised (September 2017) that emtricitabine/tenofovir disoproxil (*Truvada*®) is not recommended for use within NHS Wales in combination with safer sex practices for pre-exposure prophylaxis to reduce the risk of sexually acquired HIV 1 infection in adults at high risk. The case for cost-effectiveness has not been proven.

Subsequent to this AWMSG recommendation, *Truvada*® has been made available in Wales and is being provided through NHS Wales from 17 July 2017 for up to three years for use as pre-exposure prophylaxis. During this time, eligible patients will receive *Truvada*® and data will be collected to assess its effectiveness at preventing HIV and address some of the concerns of AWMSG in relation to cost-effectiveness.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

● INDICATIONS AND DOSE

EPIVIR® ORAL SOLUTION

HIV infection in combination with other antiretroviral drugs

- ▶ BY MOUTH
- ▶ Adult: 150 mg every 12 hours, alternatively 300 mg once daily

EPIVIR® TABLETS

HIV infection in combination with other antiretroviral drugs

- ▶ BY MOUTH
- ▶ Adult: 150 mg every 12 hours, alternatively 300 mg once daily

ZEFFIX®

Chronic hepatitis B infection either with compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis) when first-line treatments cannot be used, or (in combination with another antiviral drug without cross-resistance to lamivudine) with decompensated liver disease

- ▶ BY MOUTH
- ▶ Adult: 100 mg once daily, patients receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection

- **CAUTIONS** Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine
- **INTERACTIONS** → Appendix 1: lamivudine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · arthralgia · cough · fever · gastrointestinal discomfort · hepatic disorders · malaise · muscle complaints · myopathy · nasal disorder
 - ▶ **Uncommon** Thrombocytopenia
 - ▶ **Rare or very rare** Paraesthesia · peripheral neuropathy · pure red cell aplasia
 - ▶ **Frequency not known** Respiratory tract infection · throat complaints
- **BREAST FEEDING** Can be used with caution in women infected with chronic hepatitis B alone, providing that adequate measures are taken to prevent hepatitis B infection in infants.
- **RENAL IMPAIRMENT**
 - ▶ **Dose adjustments** Reduce dose if eGFR less than 50 mL/minute/1.73 m²; consult product literature.
- **MONITORING REQUIREMENTS** When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral markers of hepatitis B every

3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana and strawberry.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Lamivudine with dolutegravir

30-Sep-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, lamivudine p. 689, dolutegravir p. 678.

● INDICATIONS AND DOSE

HIV-1 infection

- ▶ BY MOUTH

- ▶ Adult: 300/50 mg once daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg lamivudine/dolutegravir.

- **INTERACTIONS** → Appendix 1: dolutegravir · lamivudine

- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 50 mL/minute.

- **PATIENT AND CARER ADVICE**

Missed doses Manufacturer advises if a dose is more than 20 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2205

The *Scottish Medicines Consortium* has advised (September 2019) that lamivudine with dolutegravir (*Dovato*®) is accepted for use within NHS Scotland for the treatment of HIV-1 infection in adults and adolescents aged 12 years or older, weighing at least 40 kg, with no known or suspected resistance to the integrase inhibitor class, or lamivudine. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3659

The *All Wales Medicines Strategy Group* has advised (February 2020) that lamivudine with dolutegravir (*Dovato*®) is recommended as an option for use within NHS Wales for the treatment of HIV-1 infection in adults and adolescents above 12 years of age weighing at least 40 kg, with no known or suspected resistance to the integrase inhibitor class, or lamivudine. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

F 683

Stavudine

01-Sep-2016

(d4T)

● **INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs when no suitable alternative available and when prescribed for shortest period possible

▶ BY MOUTH

- ▶ Adult (body-weight up to 60 kg): 30 mg every 12 hours, to be taken preferably at least 1 hour before food
- ▶ Adult (body-weight 60 kg and above): 40 mg every 12 hours, to be taken preferably at least 1 hour before food

- **CAUTIONS** Excessive alcohol intake · history of pancreatitis · history of peripheral neuropathy · lactic acidosis (especially when used in combination with didanosine)—use only if alternative regimens are not suitable

CAUTIONS, FURTHER INFORMATION

- ▶ **Lactic acidosis** Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with stavudine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.
- **INTERACTIONS** → Appendix 1: stavudine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abnormal dreams · depression · drowsiness · dyspepsia · hyperlactataemia · lipotrophy · nerve disorders · paraesthesia · peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) · thinking abnormal
 - ▶ **Uncommon** Anxiety · appetite decreased · arthralgia · emotional lability · gynaecomastia · hepatic disorders · myalgia
 - ▶ **Rare or very rare** Diabetes mellitus · hyperglycaemia · muscle weakness · thrombocytopenia
- SIDE-EFFECTS, FURTHER INFORMATION** Metabolic effects may occur with stavudine; plasma lipids and blood glucose concentrations should be measured routinely.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** Risk of peripheral neuropathy.

Dose adjustments Use half normal dose every 12 hours if eGFR 25–50 mL/minute/1.73 m².

Use half normal dose every 24 hours if eGFR less than 25 mL/minute/1.73 m².

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.
- **LESS SUITABLE FOR PRESCRIBING** Stavudine (especially in combination with didanosine) is associated with a higher risk of lipotrophy and should be used only if alternative regimens are not suitable; it is considered to be less suitable for prescribing.
- **MEDICINAL FORMS** No licensed medicines listed.

F 683

Tenofovir disoproxil● **INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs | Chronic hepatitis B infection with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) | Chronic hepatitis B infection with decompensated liver disease

▶ BY MOUTH

- ▶ Adult: 245 mg once daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ 7.5 scoops of granules contains approx. 245 mg tenofovir disoproxil (as fumarate).

- **INTERACTIONS** → Appendix 1: tenofovir disoproxil
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal distension · flatulence
 - ▶ **Uncommon** Proximal renal tubulopathy
 - ▶ **Rare or very rare** Acute tubular necrosis · hepatic disorders · nephritis · nephrogenic diabetes insipidus · renal impairment
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in decompensated hepatic disease (limited information available).
- **RENAL IMPAIRMENT**
Dose adjustments *Granules:* 132 mg once daily if eGFR 30–50 mL/minute/1.73 m²; 66 mg once daily if eGFR 20–30 mL/minute/1.73 m²; 33 mg once daily if eGFR 10–20 mL/minute/1.73 m².
Tablets: 245 mg every 2 days if eGFR 30–50 mL/minute/1.73 m²; 245 mg every 3–4 days if eGFR 10–30 mL/minute/1.73 m².
Monitoring Monitor renal function—interrupt treatment if further deterioration.
- **MONITORING REQUIREMENTS**
 - ▶ Test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases.
 - ▶ When treating chronic hepatitis B with tenofovir, monitor liver function tests every 3 months and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).
- **DIRECTIONS FOR ADMINISTRATION** *Granules:* mix 1 scoop of granules with 1 tablespoon of soft food (e.g. yoghurt, apple sauce) and take immediately without chewing. Do not mix granules with liquids.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tenofovir granules.
Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Zidovudine

(Azidothymidine; AZT)

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

- ▶ BY MOUTH
- ▶ Adult: 250–300 mg twice daily

Prevention of maternal-fetal HIV transmission

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Seek specialist advice (combination therapy preferred) (consult local protocol)

HIV infection in combination with other antiretroviral drugs in patients temporarily unable to take zidovudine by mouth

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 0.8–1 mg/kg every 4 hours usually for not more than 2 weeks, dose approximating to 1.2–1.5 mg/kg every 4 hours by mouth

- **CONTRA-INDICATIONS** Abnormally low haemoglobin concentration (consult product literature) · abnormally low neutrophil counts (consult product literature)

- **CAUTIONS** Elderly · lactic acidosis · risk of haematological toxicity particularly with high dose and advanced disease · vitamin B₁₂ deficiency (increased risk of neutropenia)

CAUTIONS, FURTHER INFORMATION

- ▶ Lactic acidosis Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with zidovudine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

- **INTERACTIONS** → Appendix 1: zidovudine

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ Common or very common Leucopenia · malaise · myalgia

- ▶ Uncommon Bone marrow disorders · dyspnoea · fever · flatulence · generalised pain · myopathy · thrombocytopenia
- ▶ Rare or very rare Alertness decreased · anxiety · appetite decreased · cardiomyopathy · chest pain · chills · cough · depression · drowsiness · dyspepsia · gynaecomastia · hepatic disorders · hyperhidrosis · influenza like illness · nail discolouration · oral discolouration · paraesthesia · pure red cell aplasia · seizure · taste altered · urinary frequency increased
- ▶ Frequency not known Lipotrophy

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Weight increased

SIDE-EFFECTS, FURTHER INFORMATION Anaemia and myelosuppression

If anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment.

Lipodystrophy syndrome Metabolic effects may occur with zidovudine; plasma lipids and blood glucose concentrations should be measured routinely.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (increased risk of accumulation).

Dose adjustments Manufacturer advises consider dose reduction in moderate to severe impairment—consult product literature.

- **RENAL IMPAIRMENT**

Dose adjustments Reduce oral dose to 300–400 mg daily in divided doses or intravenous dose to 1 mg/kg 3–4 times daily if eGFR is less than 10 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor full blood count after 4 weeks of treatment, then every 3 months.

- **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use For *intermittent intravenous infusion*, dilute to a concentration of 2 mg/mL or 4 mg/mL with Glucose 5% and give over 1 hour.

- **PRESCRIBING AND DISPENSING INFORMATION** The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Atazanavir

06-May-2020

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir

- ▶ BY MOUTH
- ▶ Adult: 300 mg once daily

HIV infection in combination with other antiretroviral drugs—with cobicistat

- ▶ BY MOUTH
- ▶ Adult: 300 mg daily

- **CAUTIONS** Cardiac conduction disorders · electrolyte disturbances · predisposition to QT interval prolongation
- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors
- **SIDE-EFFECTS**
- ▶ **Uncommon** Chest pain · chronic kidney disease · depression · disorientation · drug reaction with

eosinophilia and systemic symptoms (DRESS) · gallbladder disorders · gynaecomastia · haematuria · memory loss · myopathy · nephritis tubulointerstitial · nephrolithiasis · proteinuria · syncope · torsade de pointes · urinary frequency increased

- ▶ **Rare or very rare** Gait abnormal · oedema · palpitations · QT interval prolongation · renal pain · vasodilation
- SIDE-EFFECTS, FURTHER INFORMATION** Mild to moderate rash occurs commonly, usually within the first 3 weeks of therapy. Severe rash occurs less frequently and may be accompanied by systemic symptoms. Discontinue if severe rash develops.
- **PREGNANCY** Theoretical risk of hyperbilirubinaemia in neonate if used at term.
- Monitoring** In pregnancy, monitor viral load and plasma-atazanavir concentration during third trimester.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment (no information available).
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Darunavir

693
31-Jul-2018

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy—with low-dose ritonavir

► BY MOUTH

- Adult: 600 mg twice daily, alternatively 800 mg once daily, once daily dose only to be used if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells $\times 10^6$ /litre

HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy—with cobicistat

► BY MOUTH

- Adult: 800 mg once daily, dose appropriate if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells $\times 10^6$ /litre

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—with low-dose ritonavir

► BY MOUTH

- Adult: 800 mg once daily

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—with cobicistat

► BY MOUTH

- Adult: 800 mg once daily

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● SIDE-EFFECTS

- **Uncommon** Angina pectoris · arrhythmias · burping · chest pain · concentration impaired · confusion · constipation · cough · depression · dry eye · eye erythema · feeling hot · flushing · gout · gynaecomastia · haemorrhage · herpes simplex · hyperglycaemia · hypothyroidism · leucopenia · memory loss · mood altered · muscle weakness · myocardial infarction · nail discolouration · nephrolithiasis · oral disorders · osteoporosis · pain · peripheral oedema · polydipsia · QT interval prolongation · renal impairment · sensation abnormal · sexual dysfunction · sweat changes · throat irritation · thrombocytopenia · urinary disorders · urine abnormalities · vertigo
- **Rare or very rare** Arthritis · chills · feeling abnormal · joint stiffness · musculoskeletal stiffness · palpitations · rhinorrhoea · severe cutaneous adverse reactions (SCARs) · syncope · visual impairment

SIDE-EFFECTS, FURTHER INFORMATION Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if this develops.

- **ALLERGY AND CROSS-SENSITIVITY** Use with caution in patients with sulfonamide sensitivity.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk; if required, use the twice daily dose regimen. For use with cobicistat, see darunavir with cobicistat below or darunavir with cobicistat, emtricitabine and tenofovir alafenamide p. 695.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).
- **MONITORING REQUIREMENTS** Monitor liver function before and during treatment.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

● PATIENT AND CARER ADVICE

Missed doses If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Darunavir with cobicistat

25-Jul-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, cobicistat p. 698, darunavir above.

● INDICATIONS AND DOSE

HIV infection, in combination with other antiretroviral drugs (initiated by a specialist)

► BY MOUTH

- Adult: 800/150 mg once daily, dosage should not be altered or therapy discontinued without instruction from the healthcare provider

DOSE EQUIVALENCE AND CONVERSION

- Dose expressed as x/y mg of darunavir/cobicistat.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DARUNAVIR BOOSTED WITH COBICISTAT: AVOID USE IN PREGNANCY DUE TO RISK OF TREATMENT FAILURE AND MATERNAL-TO-CHILD TRANSMISSION OF HIV-1 (JULY 2018) Pharmacokinetic data show mean exposure of darunavir boosted with cobicistat (available in combination in *Rezolsta*® and *Symtuza*®) to be lower during the second and third trimesters of pregnancy than during 6–12 weeks postpartum. Low darunavir exposure may be associated with an increased risk of treatment failure and an increased risk of HIV-1 transmission to the unborn child. For further information, see *Pregnancy*.

- **CONTRA-INDICATIONS** Treatment-experienced patients with 1 or more darunavir resistance-associated mutations, plasma HIV-RNA concentration of 100 000 copies/mL or greater, or CD4 count less than 100 cells $\times 10^6$ /litre
- **CAUTIONS** Elderly

- **INTERACTIONS** → Appendix 1: cobicistat · HIV-protease inhibitors
- **PREGNANCY** Manufacturer advises not to be initiated during pregnancy due to low darunavir exposure; women who become pregnant during therapy should be switched to an alternative regimen. Darunavir with ritonavir may be considered as an alternative.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) decisions
SMC No. 1081/15
The *Scottish Medicines Consortium* has advised (August 2015) that darunavir with cobicistat (*Rezolsta*®) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus-1 (HIV-1) infection in adults, in combination with other antiretrovirals. Genotypic testing should guide its use.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DARUNAVIR BOOSTED WITH COBICISTAT: AVOID USE IN PREGNANCY DUE TO RISK OF TREATMENT FAILURE AND MATERNAL-TO-CHILD TRANSMISSION OF HIV-1 (JULY 2018)

Pharmacokinetic data show mean exposure of darunavir boosted with cobicistat (available in combination in *Rezolsta*® and *Symtuza*®) to be lower during the second and third trimesters of pregnancy than during 6–12 weeks postpartum. Low darunavir exposure may be associated with an increased risk of treatment failure and an increased risk of HIV-1 transmission to the unborn child. For further information, see *Pregnancy*.

- **INTERACTIONS** → Appendix 1: cobicistat · HIV-protease inhibitors · tenofovir alafenamide
- **PREGNANCY** Manufacturer advises not to be initiated during pregnancy due to low darunavir exposure; women who become pregnant during therapy should be switched to an alternative regimen.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m²—no information available.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

● **NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) decisions**

SMC No. 1290/18

The *Scottish Medicines Consortium* has advised (January 2018) that darunavir with cobicistat, emtricitabine and tenofovir alafenamide (*Symtuza*®) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 (HIV-1) infection in adults and adolescents (aged 12 years and older with body weight at least 40 kg).

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 2148

The *All Wales Medicines Strategy Group* has advised (March 2018) that darunavir with cobicistat, emtricitabine and tenofovir alafenamide (*Symtuza*®) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1 (HIV-1) infection in adults and adolescents (aged 12 years and older with body weight at least 40 kg).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

693

Fosamprenavir

- **DRUG ACTION** Fosamprenavir is a pro-drug of amprenavir.

● **INDICATIONS AND DOSE****HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir**

▶ BY MOUTH

▶ Adult: 700 mg twice daily

DOSE EQUIVALENCE AND CONVERSION

▶ 700 mg fosamprenavir is equivalent to approximately 600 mg amprenavir.

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors
- **SIDE-EFFECTS**
▶ **Common or very common** Oral paraesthesia
SIDE-EFFECTS, FURTHER INFORMATION Rash may occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption—usually resolves and may respond to antihistamines.
- **PREGNANCY** Toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
Dose adjustments Manufacturer advises dose reduction to 450 mg twice daily in moderate impairment and 300 mg twice daily in severe impairment.
- **DIRECTIONS FOR ADMINISTRATION** In adults, oral suspension should be taken on an empty stomach.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include grape, bubblegum, or peppermint.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer fosamprenavir oral suspension.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

EXCIPIENTS: May contain Propylene glycol

F 693

Lopinavir with ritonavir

06-May-2020

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

- ▶ BY MOUTH USING TABLETS

▶ Adult: 400/100 mg twice daily, alternatively 800/200 mg once daily, once daily dose to be used only in adults with a HIV strain that has less than 3 mutations to protease inhibitors

- ▶ BY MOUTH USING ORAL SOLUTION

▶ Adult: 5 mL twice daily

DOSE EQUIVALENCE AND CONVERSION

▶ Oral solution contains 400 mg lopinavir, 100 mg ritonavir/5 mL (or 80 mg lopinavir, 20 mg ritonavir/mL).

- **CAUTIONS** Cardiac conduction disorders · pancreatitis · patients at high risk of cardiovascular disease · structural heart disease

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● SIDE-EFFECTS

- ▶ **Common or very common** Increased risk of infection · leucopenia · lymphadenopathy · menstrual cycle irregularities · migraine · muscle weakness · myopathy · night sweats · pain · sexual dysfunction
- ▶ **Uncommon** Atherosclerosis · atrioventricular block · cholangitis · constipation · deep vein thrombosis · haemorrhage · hyperbilirubinaemia · hypogonadism · myocardial infarction · nephritis · stomatitis · stroke · tinnitus · tremor · tricuspid valve incompetence · vasculitis · vertigo · visual impairment

SIDE-EFFECTS, FURTHER INFORMATION Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed.

- **PREGNANCY** For *tablets*, manufacturer advises only use if potential benefit outweighs risk—toxicity in *animal studies* (recommendation also supported by specialist sources). Avoid *oral solution* due to high alcohol and propylene glycol content.

- **HEPATIC IMPAIRMENT** For *oral solution*, manufacturer advises avoid due to propylene glycol content (risk of toxicity). For *tablets*, manufacturer advises avoid in severe impairment (no information available).

- **RENAL IMPAIRMENT** Avoid *oral solution* due to high propylene glycol content.

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor liver function before and during treatment.
- ▶ For *oral solution*, manufacturer advises monitor for signs of alcohol and propylene glycol toxicity (particularly in infants).

- **PRESCRIBING AND DISPENSING INFORMATION** For *oral solution*, manufacturer advises high alcohol (42% v/v) and propylene glycol content—consider total amounts from all medicines that are to be given to infants in order to avoid toxicity; caution in patients for which consumption may be harmful.

- **PATIENT AND CARER ADVICE** Oral solution tastes bitter.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 326/06

The *Scottish Medicines Consortium* has advised (November 2006) that lopinavir with ritonavir tablet (*Kaletra*®) is accepted for use within NHS Scotland in combination with other antiretrovirals for the treatment of HIV-1 infected adults and children above the age of 2 years.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

F 693

Ritonavir

06-May-2020

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (high-dose ritonavir)

- ▶ BY MOUTH

▶ Adult: Initially 300 mg every 12 hours for 3 days, increased in steps of 100 mg every 12 hours over not longer than 14 days; increased to 600 mg every 12 hours

Low-dose booster to increase effect of other protease inhibitors

- ▶ BY MOUTH

▶ Adult: 100–200 mg 1–2 times a day

- **CAUTIONS** Cardiac conduction disorders · pancreatitis · structural heart disease

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● SIDE-EFFECTS

- ▶ **Common or very common** Back pain · concentration impaired · confusion · cough · dehydration · feeling hot · flushing · gastrointestinal haemorrhage · gout · hypotension · menorrhagia · myopathy · oedema · oral paraesthesia · oropharyngeal pain · paraesthesia · peripheral coldness · pharyngitis · renal impairment · syncope · thrombocytopenia · urinary frequency increased · vision blurred
- ▶ **Uncommon** Myocardial infarction
- ▶ **Rare or very rare** Hyperglycaemia · toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed.

● PREGNANCY

Dose adjustments Only use low-dose booster to increase the effect of other protease inhibitors.

- **HEPATIC IMPAIRMENT** When used as a *low-dose booster*, manufacturer advises caution in severe impairment; avoid in decompensated liver disease. When used in *high-doses*, manufacturer advises avoid in severe impairment.

Dose adjustments Manufacturer advises consult product literature of co-administered protease inhibitor.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

- ▶ **Ritonavir (Non-proprietary)**

Ritonavir 100 mg Ritonavir 100mg tablets | 30 tablet [PoM] £16.52-£19.44 | 30 tablet [PoM] £19.44 (Hospital only)

- ▶ **Norvir (AbbVie Ltd)**

Ritonavir 100 mg Norvir 100mg tablets | 30 tablet [PoM] £19.44

Saquinavir

14-Oct-2019

- **INDICATIONS AND DOSE**

HIV infection in combination with other antiretrovirals in patients previously treated with antiretroviral therapy—with low-dose ritonavir

▶ BY MOUTH

Adult: 1 g every 12 hours

HIV infection in combination with other antiretrovirals in patients not previously treated with antiretroviral therapy—with low-dose ritonavir

▶ BY MOUTH

Adult: 500 mg every 12 hours for 7 days, then increased to 1 g every 12 hours

- **CONTRA-INDICATIONS** Bradycardia · congenital QT prolongation · electrolyte disturbances · heart failure with reduced left ventricular ejection fraction · history of symptomatic arrhythmias

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

- **SIDE-EFFECTS**

- ▶ **Common or very common** Burping · constipation · dry lips · libido decreased · lipatrophy · paraesthesia
- ▶ **Uncommon** Mucosal ulceration · renal impairment · visual impairment
- ▶ **Frequency not known** QT interval prolongation

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment (limited information available); avoid in decompensated liver disease.

- **RENAL IMPAIRMENT** Use with caution if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor ECG before starting treatment (do not initiate treatment if QT interval over 450 milliseconds); if baseline QT interval less than 450 milliseconds, monitor ECG during treatment (particularly 10 days after starting treatment in patients not previously treated with antiretroviral therapy)—discontinue if QT interval increases over 480 milliseconds, if QT interval more than 20 milliseconds above baseline, if prolongation of PR interval, or if arrhythmias occur.

- **PATIENT AND CARER ADVICE**

Arrhythmias Patients should be told how to recognise signs of arrhythmia and advised to seek medical attention if symptoms such as palpitation or syncope develop.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

06-May-2020

- **INDICATIONS AND DOSE**

HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals—with low-dose ritonavir

- ▶ BY MOUTH USING CAPSULES
- ▶ Adult: 500 mg twice daily

- **DOSE EQUIVALENCE AND CONVERSION**

- ▶ The bioavailability of tipranavir oral solution is higher than that of the capsules; the oral solution is not interchangeable with the capsules on a milligram-for-milligram basis.

- **CAUTIONS** Abnormal liver function tests and/or signs or symptoms of liver injury (consider delaying treatment if serum transaminases are greater than 5 times the upper limit of normal—consult product literature) · patients at risk of increased bleeding from trauma, surgery or other pathological conditions

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

- **SIDE-EFFECTS**

- ▶ **Uncommon** Hyperamylasaemia · hyperglycaemia · influenza like illness · renal failure · thrombocytopenia
- ▶ **Rare or very rare** Dehydration · hyperbilirubinaemia · intracranial haemorrhage
- ▶ **Frequency not known** Bleeding tendency

- **SIDE-EFFECTS, FURTHER INFORMATION** Potentially life-threatening hepatotoxicity reported. Discontinue if signs or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature).

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment (risk of increased exposure)—monitor liver function before treatment, then every two weeks for 3 months, then monthly until 48 weeks, then every 8 to 12 weeks thereafter, and discontinue if liver function worsens; avoid in moderate to severe impairment.

- **MONITORING REQUIREMENTS** Monitor liver function before treatment, then every 2 weeks for 1 month, then every 4 weeks until 24 weeks, then every 8 to 12 weeks thereafter.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include toffee and mint.

- **PATIENT AND CARER ADVICE** Patients or carers should be told to observe the oral solution for crystallisation; the bottle should be replaced if more than a thin layer of crystals form (doses should continue to be taken at the normal time until the bottle is replaced).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

ANTIVIRALS > OTHER

Maraviroc

20-May-2020

- **DRUG ACTION** Maraviroc is an antagonist of the CCR5 chemokine receptor.

● INDICATIONS AND DOSE

CCR5-tropic HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretrovirals

- ▶ BY MOUTH
- ▶ Adult: 300 mg twice daily

- **CAUTIONS** Cardiovascular disease
- **INTERACTIONS** → Appendix 1: maraviroc
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · anaemia · appetite decreased · asthenia · depression · diarrhoea · flatulence · headache · insomnia · nausea · rash
 - ▶ **Uncommon** Hyperbilirubinaemia · increased risk of infection · myopathy · postural hypotension · proteinuria · renal failure · seizure
 - ▶ **Rare or very rare** Angina pectoris · granulocytopenia · hepatic disorders · metastases · neoplasms · pancytopenia · severe cutaneous adverse reactions (SCARs)
 - ▶ **Frequency not known** Fever · hypersensitivity · immune reconstitution inflammatory syndrome · organ dysfunction · osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION **Osteonecrosis** Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

Hepatotoxicity Manufacturer advises consider discontinuation if signs or symptoms of acute hepatitis, or increased liver transaminases with systemic symptoms of hypersensitivity occur.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—*toxicity in animal studies.*
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in impairment and in patients with chronic hepatitis (increased risk of hepatic side-effects; limited information available).
- **RENAL IMPAIRMENT** If eGFR less than 80 mL/minute/1.73 m², consult product literature.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 458/08

The *Scottish Medicines Consortium* has advised (October 2008) that maraviroc (*Celsentri*®) is **not** recommended for use within NHS Scotland as the economic case was not demonstrated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

PHARMACOKINETIC ENHANCERS

Cobicistat

30-Jun-2018

● INDICATIONS AND DOSE

Pharmacokinetic enhancer used to increase the effect of atazanavir or darunavir

- ▶ BY MOUTH
- ▶ Adult: 150 mg once daily

- **INTERACTIONS** → Appendix 1: cobicistat
- **PREGNANCY** Manufacturer advises avoid unless essential. For use with darunavir, see darunavir with cobicistat p. 694 or darunavir with cobicistat, emtricitabine and tenofovir alafenamide p. 695. For use with elvitegravir, see elvitegravir with cobicistat, emtricitabine and tenofovir disoproxil p. 686 or elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide p. 686.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** No dose adjustment required; inhibits tubular secretion of creatinine; when any co-administered drug requires dose adjustment based on renal function, avoid initiating cobicistat if eGFR less than 70 mL/minute/1.73 m².
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).
- **PATIENT AND CARER ADVICE**

Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

6.6 Influenza

Influenza

Management

Oseltamivir p. 699 and zanamivir p. 700 are most effective for the treatment of influenza if started within a few hours of the onset of symptoms; they are licensed for use within 48 hours of the first symptoms. In otherwise healthy individuals they reduce the duration of symptoms by about 1–1.5 days. Oseltamivir or zanamivir can reduce the risk of complications from influenza in the elderly and in patients with chronic disease.

Oseltamivir and zanamivir are licensed for post-exposure prophylaxis of influenza when influenza is circulating in the community. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza. However, in patients with severe influenza or in those who are immunocompromised, antivirals may still be effective after this time if viral shedding continues [unlicensed use]. Oseltamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not

cover the infecting strain) to prevent influenza in an epidemic.

There is evidence that some strains of influenza A virus have reduced susceptibility to oseltamivir, but may retain susceptibility to zanamivir. Resistance to oseltamivir may be greater in severely immunocompromised patients.

Zanamivir should be reserved for patients who are severely immunocompromised, or when oseltamivir cannot be used, or when resistance to oseltamivir is suspected. For those unable to use the dry powder for inhalation, zanamivir is available as a solution that can be administered by nebuliser [unlicensed] or intravenously.

Amantadine hydrochloride p. 437 is licensed for prophylaxis and treatment of influenza A but it is no longer recommended.

Information on pandemic influenza, avian influenza, and swine influenza may be found at www.gov.uk/phe.

Immunisation against influenza is recommended for persons at high risk, and to reduce transmission of infection.

Oseltamivir in children under 1 year of age

Data on the use of oseltamivir in children under 1 year of age is limited. Furthermore, oseltamivir may be ineffective in neonates because they may not be able to metabolise oseltamivir to its active form. However, oseltamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age. The Department of Health has advised (May 2009) that during a pandemic, treatment with oseltamivir can be overseen by healthcare professionals experienced in assessing children.

ANTIVIRALS > INFLUENZA > NEURAMINIDASE INHIBITORS

Oseltamivir

10-Mar-2020

- **DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

● INDICATIONS AND DOSE

Prevention of influenza

► BY MOUTH

- Child 1-11 months: 3 mg/kg once daily for 10 days for post-exposure prophylaxis
- Child 1-12 years (body-weight 10-15 kg): 30 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 1-12 years (body-weight 15-23 kg): 45 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 1-12 years (body-weight 23-40 kg): 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 1-12 years (body-weight 40 kg and above): 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 13-17 years: 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Adult: 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

Treatment of influenza

► BY MOUTH

- Child 1-11 months: 3 mg/kg twice daily for 5 days
- Child 1-12 years (body-weight 10-15 kg): 30 mg twice daily for 5 days
- Child 1-12 years (body-weight 15-23 kg): 45 mg twice daily for 5 days
- Child 1-12 years (body-weight 23-40 kg): 60 mg twice daily for 5 days

- Child 1-12 years (body-weight 40 kg and above): 75 mg twice daily for 5 days
- Child 13-17 years: 75 mg twice daily for 5 days
- Adult: 75 mg twice daily for 5 days

Treatment of influenza, in the immunocompromised

► BY MOUTH

- Adult: 75 mg twice daily for 10 days

- **UNLICENSED USE** Not licensed for use in premature infants.
 - **INTERACTIONS** → Appendix 1: oseltamivir
 - **SIDE-EFFECTS**
 - **Common or very common** Dizziness · gastrointestinal discomfort · herpes simplex · nausea · sleep disorders · vertigo · vomiting
 - **Uncommon** Arrhythmia · consciousness impaired (in adults) · seizure · skin reactions
 - **Rare or very rare** Angioedema · anxiety · behaviour abnormal · confusion · delirium · delusions · haemorrhage · hallucination · hepatic disorders · self-injurious behaviour · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · visual impairment
 - **PREGNANCY** Although safety data are limited, oseltamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic).
 - **BREAST FEEDING** Although safety data are limited, oseltamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Oseltamivir is the preferred drug in women who are breast-feeding.
 - **RENAL IMPAIRMENT**
 - In adults Avoid for *treatment* and *prevention* if eGFR less than 10 mL/minute/1.73 m².
 - In children Avoid for *treatment* and *prevention* if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
 - **Dose adjustments** ► In adults For *treatment*, use 30 mg twice daily if eGFR 30–60 mL/minute/1.73 m² (30 mg once daily if eGFR 10–30 mL/minute/1.73 m²). For *prevention*, use 30 mg once daily if eGFR 30–60 mL/minute/1.73 m² (30 mg every 48 hours if eGFR 10–30 mL/minute/1.73 m²).
 - In children For *treatment*, use 40% of normal dose twice daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose once daily if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²). For *prevention*, use 40% of normal dose once daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose every 48 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²).
 - **DIRECTIONS FOR ADMINISTRATION** If suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration.
 - **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.
 - **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Oseltamivir for influenza (flu) www.medicinesforchildren.org.uk/oseltamivir-influenza-flu
 - **NATIONAL FUNDING/ACCESS DECISIONS**
 - **NICE decisions**
 - Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158
- Oseltamivir is **not** a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
- Oseltamivir is **not** recommended for seasonal prophylaxis against influenza.
 - When influenza is circulating in the community, oseltamivir is an option recommended (in accordance

with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)

- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.

At risk patients include those aged 65 years or older or those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/guidance/ta158

► **Oseltamivir, zanamivir, and amantadine for treatment of influenza (February 2009) NICE TA168**

Oseltamivir is **not** a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

- When influenza is circulating in the community, oseltamivir is an option recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who can start treatment within 48 hours of the onset of symptoms. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for treatment in at-risk patients living in long-term residential or nursing homes.

At risk patients include those aged over 65 years or those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;

Zanamivir

20-May-2020

- **DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

• **INDICATIONS AND DOSE**

Post-exposure prophylaxis of influenza

► BY INHALATION OF POWDER

- Child 5-17 years: 10 mg once daily for 10 days
- Adult: 10 mg once daily for 10 days

Prevention of influenza during an epidemic

► BY INHALATION OF POWDER

- Child 5-17 years: 10 mg once daily for up to 28 days
- Adult: 10 mg once daily for up to 28 days

Treatment of influenza

► BY INHALATION OF POWDER

- Child 5-17 years: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)
- Adult: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)

Treatment of influenza [complicated and potentially life-threatening, resistant to other anti-influenza medicinal products and/or other treatments, including inhaled zanamivir]

► BY INTRAVENOUS INFUSION

- Child 6 months-5 years: 14 mg/kg twice daily for 5 to 10 days
- Child 6-17 years: 12 mg/kg twice daily (max. per dose 600 mg) for 5 to 10 days
- Adult: 600 mg twice daily for 5 to 10 days

• **UNLICENSED USE**

- When used by inhalation Use of zanamivir for up to 10 days if resistance to oseltamivir suspected is an unlicensed duration.

• **CAUTIONS**

- When used by inhalation Asthma - chronic pulmonary disease - uncontrolled chronic illness

CAUTIONS, FURTHER INFORMATION

- Asthma and chronic pulmonary disease
- When used by inhalation Risk of bronchospasm—short-acting bronchodilator should be available. Avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm.

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Skin reactions
- ▶ **Uncommon** Oropharyngeal oedema · severe cutaneous adverse reactions (SCARs)
- ▶ **Rare or very rare** Face oedema
- ▶ **Frequency not known** Behaviour abnormal · delirium · hallucination · level of consciousness decreased · seizure

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intravenous use Diarrhoea · hepatocellular injury
- ▶ **Uncommon**
- ▶ When used by inhalation Bronchospasm · dehydration · dyspnoea · presyncope · throat tightness
- ▶ **Frequency not known**
- ▶ When used by inhalation Psychiatric disorder

SIDE-EFFECTS, FURTHER INFORMATION Neurological and psychiatric disorders occur more commonly in children and adolescents.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk (e.g. during a pandemic).—limited information available; *animal* studies do not indicate toxicity.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk (e.g. during a pandemic)—limited information available; present in low levels in milk in *animal* studies.

● **RENAL IMPAIRMENT**

Dose adjustments ▶ With intravenous use Manufacturer advises reduce dose if creatinine clearance less than 80 mL/minute—consult product literature for details.

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ When used by inhalation Other inhaled drugs should be administered before zanamivir.
- ▶ With intravenous use Manufacturer advises for *intermittent intravenous infusion*, give undiluted or dilute to a concentration of not less than 200 micrograms/mL with Sodium Chloride 0.9%; give over 30 minutes.

● **PRESCRIBING AND DISPENSING INFORMATION**

- ▶ When used by inhalation Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription 'SLS'.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- ▶ **Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008)** NICE TA158

Scottish Medicines Consortium (SMC) decisions
SMC No. SMC2204

- ▶ With intravenous use The *Scottish Medicines Consortium* has advised (December 2019) that zanamivir (*Dectova*[®]) is accepted for use within NHS Scotland for the treatment of complicated and potentially life-threatening influenza A or B virus infection in adult and paediatric patients aged 6 months and older when: the patient's influenza virus is known or suspected to be resistant to anti-influenza medicinal products other than zanamivir, and/or other anti-viral medicinal products for treatment of influenza, including inhaled zanamivir, are not suitable for the individual patient. Zanamivir (*Dectova*[®]) should be used in accordance with official guidance.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 4130

- ▶ With intravenous use The *All Wales Medicines Strategy Group* has advised (October 2019) that zanamivir (*Dectova*®) is recommended as an option for use within NHS Wales for the treatment of complicated and potentially life-threatening influenza A or B virus infection in adults and children (aged 6 months and older), when: the patient's influenza virus is known or suspected to be resistant to anti-influenza medicinal products other than zanamivir, and/or other anti-viral medicinal products for treatment of influenza, including inhaled zanamivir, are not suitable for the individual patient. Zanamivir (*Dectova*®) should be used in accordance with official guidance.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

6.7 Respiratory syncytial virus

Respiratory syncytial virus

Management in children

Ribavirin p. 662 is licensed for administration by inhalation for the treatment of severe bronchiolitis caused by the respiratory syncytial virus (RSV) in infants, especially when they have other serious diseases. However, there is no evidence that ribavirin produces clinically relevant benefit in RSV bronchiolitis.

Palivizumab below is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation. Palivizumab is recommended for:

- children under 9 months of age with chronic lung disease (defined as requiring oxygen for at least 28 days from birth) and who were born preterm;
 - children under 6 months of age with haemodynamically significant, acyanotic congenital heart disease who were born preterm.
- Palivizumab should be considered for:
- children under 2 years of age with severe combined immunodeficiency syndrome;
 - children under 1 year of age who require long-term ventilation;
 - children 1–2 years of age who require long-term ventilation and have an additional co-morbidity (including cardiac disease or pulmonary hypertension).

For details of the preterm age groups included in the recommendations, see *Immunisation against Infectious Disease* (2006), available at www.gov.uk/dh.

DRUGS FOR RESPIRATORY DISEASES > MONOCLONAL ANTIBODIES

Palivizumab

● **INDICATIONS AND DOSE**

Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease (under expert supervision)

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 1–23 months: 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites

Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease and undergoing cardiac bypass surgery (under expert supervision)

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 1–23 months: Initially 15 mg/kg, to be administered as soon as stable after surgery, preferably in the anterolateral thigh, then 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites

- **UNLICENSED USE** Licensed for the prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus (RSV) in children under 6 months of age (at the start of the RSV season) and born at less than 35 weeks corrected gestational age, or in children under 2 years of age who have received treatment for bronchopulmonary dysplasia in the last 6 months, or in children under 2 years of age with haemodynamically significant congenital heart disease.

- **CAUTIONS** Moderate to severe acute infection · moderate to severe febrile illness · serum-palivizumab concentration may be reduced after cardiac surgery · thrombocytopenia

● **SIDE-EFFECTS**

- ▶ **Common or very common** Apnoea
- ▶ **Uncommon** Seizure · thrombocytopenia · urticaria
- ▶ **Frequency not known** Hypersensitivity

- **ALLERGY AND CROSS-SENSITIVITY** Hypersensitivity to humanised monoclonal antibodies.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

1 Antidiuretic hormone disorders

Posterior pituitary hormones and antagonists

Posterior pituitary hormones

Diabetes insipidus

Vasopressin p. 706 (antidiuretic hormone, ADH) is used in the treatment of *pituitary* ('cranial') *diabetes insipidus* as is its analogue desmopressin p. 704. Dosage is tailored to produce a slight diuresis every 24 hours to avoid water intoxication. Treatment may be required for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus. Following a dose intramuscularly or intranasally, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of cranial diabetes insipidus. Failure to respond occurs in nephrogenic diabetes insipidus.

In *nephrogenic* and *partial pituitary diabetes insipidus* benefit may be gained from the paradoxical antidiuretic effect of thiazides.

Carbamazepine p. 327 is sometimes useful in partial pituitary diabetes insipidus [unlicensed]; it may act by sensitising the renal tubules to the action of remaining endogenous vasopressin.

Other uses

Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand's disease; it is also used to test fibrinolytic response. Desmopressin may also have a role in nocturnal enuresis.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, prior to more definitive treatment and with variable results. Terlipressin acetate, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, is used similarly.

Oxytocin p. 868, another posterior pituitary hormone, is indicated in obstetrics.

Antidiuretic hormone antagonists

Demeclocycline hydrochloride p. 597 can be used in the treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable. Demeclocycline hydrochloride is thought to act by directly blocking the renal tubular effect of antidiuretic hormone.

Tolvaptan p. 706 is a vasopressin V₂-receptor antagonist licensed for the treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion; treatment duration with tolvaptan is determined by the underlying disease and its treatment.

Rapid correction of hyponatraemia during tolvaptan therapy can cause osmotic demyelination, leading to serious neurological events; close monitoring of serum sodium concentration and fluid balance is essential.

1.1 Diabetes insipidus

Other drugs used for Diabetes insipidus Chlortalidon, p. 244

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > VASOPRESSIN AND ANALOGUES

Desmopressin

02-Dec-2019

- **DRUG ACTION** Desmopressin is an analogue of vasopressin.

● INDICATIONS AND DOSE

Diabetes insipidus, treatment

- ▶ BY MOUTH
 - ▶ Child 1-23 months: Initially 10 micrograms 2–3 times a day, adjusted according to response; usual dose 30–150 micrograms daily
 - ▶ Child 2-11 years: Initially 50 micrograms 2–3 times a day, adjusted according to response; usual dose 100–800 micrograms daily
 - ▶ Child 12-17 years: Initially 100 micrograms 2–3 times a day, adjusted according to response; usual dose 0.2–1.2 mg daily
 - ▶ Adult: Initially 100 micrograms 3 times a day; maintenance 100–200 micrograms 3 times a day; usual dose 0.2–1.2 mg daily
- ▶ BY SUBLINGUAL ADMINISTRATION
 - ▶ Child 2-17 years: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day
 - ▶ Adult: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day
- ▶ BY INTRANASAL ADMINISTRATION
 - ▶ Child 1-23 months: Initially 2.5–5 micrograms 1–2 times a day, adjusted according to response
 - ▶ Child 2-11 years: Initially 5–20 micrograms 1–2 times a day, adjusted according to response
 - ▶ Child 12-17 years: Initially 10–20 micrograms 1–2 times a day, adjusted according to response
 - ▶ Adult: 10–40 micrograms daily in 1–2 divided doses
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
 - ▶ Adult: 1–4 micrograms daily

Primary nocturnal enuresis

- ▶ BY MOUTH
 - ▶ Child 5-17 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration
 - ▶ Adult 18-65 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration
- ▶ BY SUBLINGUAL ADMINISTRATION
 - ▶ Child 5-17 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week
 - ▶ Adult 18-65 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week

Postoperative polyuria or polydipsia

- ▶ BY MOUTH
 - ▶ Adult: Dose to be adjusted according to urine osmolality

Polyuria or polydipsia after hypophysectomy

- ▶ BY SUBLINGUAL ADMINISTRATION
 - ▶ Adult: Dose to be adjusted according to urine osmolality

Idiopathic nocturnal polyuria in females

- ▶ BY SUBLINGUAL ADMINISTRATION
 - ▶ Adult: 25 micrograms daily, to be taken 1 hour before bedtime

Idiopathic nocturnal polyuria in males

- ▶ BY SUBLINGUAL ADMINISTRATION
 - ▶ Adult: 50 micrograms daily, to be taken 1 hour before bedtime

Diabetes insipidus, diagnosis (water deprivation test)

- ▶ BY INTRANASAL ADMINISTRATION
 - ▶ Adult: 20 micrograms, limit fluid intake to 500 mL from 1 hour before to 8 hours after administration
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
 - ▶ Adult: 2 micrograms for 1 dose, limit fluid intake to 500 mL from 1 hour before to 8 hours after administration

Nocturia associated with multiple sclerosis (when other treatments have failed)

- ▶ BY INTRANASAL ADMINISTRATION
 - ▶ Adult 18-65 years: 10–20 micrograms once daily, to be taken at bedtime, dose not to be repeated within 24 hours, limit fluid intake from 1 hour before to 8 hours after administration

Renal function testing

- ▶ BY INTRANASAL ADMINISTRATION
 - ▶ Adult: 40 micrograms, empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
 - ▶ Adult: 2 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

Mild to moderate haemophilia and von Willebrand's disease

- ▶ BY INTRANASAL ADMINISTRATION
 - ▶ Adult: 300 micrograms every 12 hours if required, one 150 microgram spray into each nostril, 30 minutes before surgery or when bleeding, dose may alternatively be repeated at intervals of at least 3 days, if self-administered
- ▶ BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
 - ▶ Adult: 300 nanograms/kg for 1 dose, to be administered immediately before surgery or after trauma; may be repeated at intervals of 12 hours

Fibrinolytic response testing

- ▶ BY INTRANASAL ADMINISTRATION
 - ▶ Adult: 300 micrograms, blood to be sampled after 1 hour for fibrinolytic activity, one 150 microgram spray to be administered into each nostril
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
 - ▶ Adult: 300 nanograms/kg for 1 dose, blood to be sampled after 20 minutes for fibrinolytic activity

Lumbar-puncture-associated headache

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
 - ▶ Adult: (consult product literature)

- **UNLICENSED USE**
 - ▶ In children Consult product literature for individual preparations. Oral use of *DDAVP* intravenous injection is not licensed.
 - **CONTRA-INDICATIONS** Cardiac insufficiency · conditions treated with diuretics · history of hyponatraemia · polydipsia in alcohol dependence · psychogenic polydipsia · syndrome of inappropriate ADH secretion · von Willebrand's Disease Type IIB (may result in pseudothrombocytopenia)
 - **CAUTIONS**

GENERAL CAUTIONS Asthma · avoid fluid overload · cardiovascular disease (not indicated for nocturnal enuresis or nocturia) · conditions which might be aggravated by water retention · cystic fibrosis · elderly (avoid for primary nocturnal enuresis and nocturia associated with multiple sclerosis in those over 65 years) · epilepsy · heart failure · hypertension (not indicated for nocturnal enuresis or nocturia) · migraine · nocturia—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards · nocturnal enuresis—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards

SPECIFIC CAUTIONS

 - ▶ With intranasal use should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects

CAUTIONS, FURTHER INFORMATION Elderly patients are at increased risk of hyponatraemia and renal impairment—manufacturer advises measure baseline serum sodium concentration, then monitor regularly during treatment; discontinue treatment if levels fall below the normal range. Review treatment if no therapeutic benefit after 3 months.
 - **INTERACTIONS** → Appendix 1: desmopressin
 - **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

 - ▶ **Common or very common** Hyponatraemia (on administration without restricting fluid intake) · nausea
 - ▶ **Frequency not known** Abdominal pain · aggression (in children) · allergic dermatitis · emotional disorder · fluid retention · headache · hyponatraemic seizure · vomiting · weight increased

SPECIFIC SIDE-EFFECTS

 - ▶ With intranasal use Epistaxis · nasal congestion · rhinitis
 - ▶ With intravenous use Vasodilation

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants)—increases risk of hyponatraemia.
 - **PREGNANCY** Small oxytocic effect in third trimester; increased risk of pre-eclampsia.
 - **BREAST FEEDING** Amount too small to be harmful.
 - **RENAL IMPAIRMENT** Use with caution; antidiuretic effect may be reduced.
 - **MONITORING REQUIREMENTS** In *nocturia*, periodic blood pressure and weight checks are needed to monitor for fluid overload.
 - **DIRECTIONS FOR ADMINISTRATION** *DDAVP*[®] and *Desmotabs*[®] tablets may be crushed.
 - ▶ *DDAVP*[®] intranasal solution may be diluted with Sodium Chloride 0.9% to a concentration of 10 micrograms/mL.
 - ▶ *DDAVP*[®] injection may be administered orally.
 - ▶ Desmopressin oral lyophilisates are for sublingual administration.
 - ▶ With intravenous use For *intravenous infusion (DDAVP*[®], *Octim*[®]), give intermittently in Sodium chloride 0.9%; dilute with 50 mL and give over 20 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Oral, intranasal, intravenous, subcutaneous and intramuscular doses are expressed as desmopressin acetate; sublingual doses are expressed as desmopressin base.
 - ▶ Children requiring an intranasal dose of less than 10 micrograms should be given *DDAVP*[®] intranasal solution.
 - **PATIENT AND CARER ADVICE**

Hyponatraemic convulsions Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal).

Medicines for Children leaflet: Desmopressin for bedwetting www.medicinesforchildren.org.uk/desmopressin-bedwetting-0
 - **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions
SMC No. 1218/17
The *Scottish Medicines Consortium* has advised (August 2017) that desmopressin oral lyophilisate (*Noqdirna*[®]) is accepted for restricted use within NHS Scotland for the symptomatic treatment of nocturia due to idiopathic nocturnal polyuria in patients aged 65 years and over.

All Wales Medicines Strategy Group (AWMSG) decisions
AWMSG No. 3282
The *All Wales Medicines Strategy Group* has advised (October 2017) that desmopressin acetate (*Noqdirna*[®]) is recommended for restricted use within NHS Wales for idiopathic nocturnal polyuria in adults aged over 65 years, for whom treatment options are currently limited.
 - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, spray, nasal drops

Tablet

 - ▶ **Desmopressin (Non-proprietary)**
 - ▶ **Desmopressin acetate 100 microgram** Desmopressin 100microgram tablets | 90 tablet [PoM] £76.62 DT = £63.09
 - ▶ **Desmopressin acetate 200 microgram** Desmopressin 200microgram tablets | 30 tablet [PoM] £28.50 DT = £23.52
 - ▶ **DDAVP** (Ferring Pharmaceuticals Ltd)
 - ▶ **Desmopressin acetate 100 microgram** DDAVP 0.1mg tablets | 90 tablet [PoM] £44.12 DT = £63.09
 - ▶ **Desmopressin acetate 200 microgram** DDAVP 0.2mg tablets | 90 tablet [PoM] £88.23
 - ▶ **Desmotabs** (Ferring Pharmaceuticals Ltd)
 - ▶ **Desmopressin acetate 200 microgram** Desmotabs 0.2mg tablets | 30 tablet [PoM] £29.43 DT = £23.52

Solution for injection

 - ▶ **DDAVP** (Ferring Pharmaceuticals Ltd)
 - ▶ **Desmopressin acetate 4 microgram per 1 ml** DDAVP 4micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £13.16 DT = £13.16
 - ▶ **Octim** (Ferring Pharmaceuticals Ltd)
 - ▶ **Desmopressin acetate 15 microgram per 1 ml** Octim 15micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £192.20

Spray

 - ▶ **Desmopressin (Non-proprietary)**
 - ▶ **Desmopressin acetate 10 microgram per 1 dose** Desmopressin 10micrograms/dose nasal spray | 60 dose [PoM] £23.04 DT = £17.85
 - ▶ **Desmospray** (Ferring Pharmaceuticals Ltd)
 - ▶ **Desmopressin acetate 2.5 microgram per 1 dose** Desmospray 2.5micrograms/dose nasal spray | 50 dose [X]
 - ▶ **Desmopressin acetate 10 microgram per 1 dose** Desmospray 10micrograms/dose nasal spray | 60 dose [PoM] £25.02 DT = £17.85
 - ▶ **Octim** (Ferring Pharmaceuticals Ltd)
 - ▶ **Desmopressin acetate 150 microgram per 1 dose** Octim 150micrograms/dose nasal spray | 25 dose [PoM] £576.60 DT = £576.60

Oral lyophilisate

CAUTIONARY AND ADVISORY LABELS 26

▶ **DDAVP Melt** (Ferring Pharmaceuticals Ltd)**Desmopressin (as Desmopressin acetate) 60 microgram** DDAVP Melt 60microgram oral lyophilisates sugar-free | 100 tablet [PoM] £50.53 DT = £50.53**Desmopressin (as Desmopressin acetate) 120 microgram** DDAVP Melt 120microgram oral lyophilisates sugar-free | 100 tablet [PoM] £101.07 DT = £101.07**Desmopressin (as Desmopressin acetate) 240 microgram** DDAVP Melt 240microgram oral lyophilisates sugar-free | 100 tablet [PoM] £202.14▶ **DesmoMelt** (Ferring Pharmaceuticals Ltd)**Desmopressin (as Desmopressin acetate)****120 microgram** DesmoMelt 120microgram oral lyophilisates sugar-free | 30 tablet [PoM] £30.34 DT = £30.34**Desmopressin (as Desmopressin acetate)****240 microgram** DesmoMelt 240microgram oral lyophilisates sugar-free | 30 tablet [PoM] £60.68 DT = £60.68▶ **Noqdirna** (Ferring Pharmaceuticals Ltd)**Desmopressin (as Desmopressin acetate) 25 microgram** Noqdirna 25microgram oral lyophilisates sugar-free | 30 tablet [PoM] £15.16 DT = £15.16**Desmopressin (as Desmopressin acetate)****50 microgram** Noqdirna 50microgram oral lyophilisates sugar-free | 30 tablet [PoM] £15.16 DT = £15.16**Nasal drops**▶ **DDAVP** (Ferring Pharmaceuticals Ltd)**Desmopressin acetate 100 microgram per 1 ml** DDAVP 100micrograms/ml intranasal solution | 2.5 ml [PoM] £9.72 DT = £9.72**Vasopressin**● **INDICATIONS AND DOSE****Pituitary diabetes insipidus**

▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION

▶ Adult: 5–20 units every 4 hours

Initial control of oesophageal variceal bleeding

▶ BY INTRAVENOUS INFUSION

▶ Adult: 20 units, dose to be administered over 15 minutes

● **CONTRA-INDICATIONS** Chronic nephritis (until reasonable blood nitrogen concentrations attained) · vascular disease (especially disease of coronary arteries) unless extreme caution● **CAUTIONS** Asthma · avoid fluid overload · conditions which might be aggravated by water retention · epilepsy · heart failure · hypertension · migraine● **SIDE-EFFECTS** Abdominal pain · angina pectoris · bronchospasm · cardiac arrest · chest pain · diarrhoea · flatulence · fluid imbalance · gangrene · headache · hyperhidrosis · hypertension · musculoskeletal chest pain · nausea · pallor · peripheral ischaemia · tremor · urticaria · vertigo · vomiting● **PREGNANCY** Oxytocic effect in third trimester.● **BREAST FEEDING** Not known to be harmful.● **DIRECTIONS FOR ADMINISTRATION**▶ With intravenous use For *intravenous infusion* (argipressin), give intermittently in Glucose 5%; suggested concentration 20 units/100mL given over 15 minutes.● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection**Solution for injection**▶ **Vasopressin (Non-proprietary)****Argipressin 20 unit per 1 ml** Argipressin 20units/1ml solution for injection ampoules | 10 ampoule [PoM] £754.86-£950.00 (Hospital only)**1.2 Syndrome of inappropriate antidiuretic hormone secretion****Other drugs used for Syndrome of inappropriate antidiuretic hormone secretion** Demeclocycline hydrochloride, p. 597**DIURETICS > SELECTIVE VASOPRESSIN V₂-RECEPTOR ANTAGONISTS****Tolvaptan**

14-May-2020

● **DRUG ACTION** Tolvaptan is a vasopressin V₂-receptor antagonist.● **INDICATIONS AND DOSE****JINARC[®]****Autosomal dominant polycystic kidney disease in adults with CKD stage 1 to 4 at initiation of treatment with evidence of rapidly progressing disease (initiated by a specialist)**

▶ BY MOUTH

▶ Adult: Initially 60 mg daily in 2 divided doses for at least a week, 45 mg in the morning before breakfast, and then 15 mg taken 8 hours later; increased to 90 mg daily in 2 divided doses for at least a week, 60 mg in the morning before breakfast, and then 30 mg taken 8 hours later, then increased if tolerated to 120 mg daily in 2 divided doses, 90 mg in the morning before breakfast, and then 30 mg taken 8 hours later, dose titration should be performed cautiously; patients may down-titrate to lower doses based on tolerability

DOSE ADJUSTMENTS DUE TO INTERACTIONS▶ For *Jinarc[®]*, manufacturer advises reduce dose with concurrent use of potent CYP3A4 inhibitors—if daily dose 90 mg or 120 mg, reduce to 30 mg once daily (can be further reduced to 15 mg once daily if not tolerated); if daily dose 60 mg, reduce to 15 mg once daily. Manufacturer also advises reduce dose with concurrent use of moderate CYP3A4 inhibitors or ciprofloxacin—if daily dose 120 mg, reduce to 60 mg daily (45 mg in morning and 15 mg taken 8 hours later); if daily dose 90 mg, reduce to 45 mg daily (30 mg in morning and 15 mg taken 8 hours later); if daily dose 60 mg, reduce to 30 mg daily (15 mg in morning and 15 mg taken 8 hours later).**SAMSCA[®]****Hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion (initiated in hospital or under specialist supervision)**

▶ BY MOUTH

▶ Adult: Initially 15 mg once daily, increased if necessary up to 60 mg once daily, a reduced starting dose of 7.5 mg once daily should be considered for patients at risk of overly rapid correction of serum-sodium concentration

● **CONTRA-INDICATIONS** Anuria · hypernatraemia · hypovolaemic hyponatraemia · impaired perception of thirst · volume depletion● **CAUTIONS****GENERAL CAUTIONS** Abnormal liver function tests and/or signs or symptoms of liver injury (do not initiate if the criteria for permanent discontinuation are met—consult product literature) · diabetes mellitus · patients at risk of

dehydration (ensure adequate fluid intake) · urinary outflow obstruction (increased risk of acute retention)

SPECIFIC CAUTIONS

- ▶ When used for autosomal dominant polycystic kidney disease serum-sodium abnormalities (correct before treatment initiation)
- ▶ When used for hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion patients at risk of demyelination syndromes (e.g hypoxia, alcoholism and malnutrition)

● **INTERACTIONS** → Appendix 1: tolvaptan

● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · asthenia · constipation · dehydration · diarrhoea · dizziness · dry mouth · dyspnoea · gastrointestinal discomfort · gastroesophageal reflux disease · headache · hepatic disorders · hyperglycaemia · hyponatraemia · hyperuricaemia · insomnia · muscle spasms · palpitations · polydipsia · skin reactions · thirst · urinary disorders · weight decreased
- ▶ **Frequency not known** Acute hepatic failure (cases requiring liver transplantation reported)

SIDE-EFFECTS, FURTHER INFORMATION Interrupt treatment and perform liver-function tests promptly if symptoms of hepatic impairment occur (anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, pruritus)—consult product literature.

- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment; avoid if abnormal liver-function tests and/or signs or symptoms of liver injury meet the requirements for permanent discontinuation—consult product literature.
- **RENAL IMPAIRMENT** No information available in severe impairment.

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor volume, fluid and electrolyte status (risk of dehydration); monitor electrolytes at least every 3 months during long-term therapy.
- ▶ When used for Autosomal dominant polycystic kidney disease Manufacturer advises monitor liver function tests and for symptoms of liver injury. Liver enzymes and bilirubin must be measured and reviewed before treatment initiation, monthly for 18 months, and every 3 months thereafter; interrupt treatment if abnormalities occur—consult product literature for further information including the criteria for permanent discontinuation. Manufacturer advises evaluate uric acid concentration before treatment initiation and as clinically indicated during treatment; monitor urine osmolality periodically.
- ▶ When used for Hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion Manufacturer advises monitor liver function tests and for symptoms of liver injury; interrupt treatment if abnormalities occur. Manufacturer advises monitor serum-sodium concentration no later than 6 hours after treatment initiation, then monitor serum-sodium and volume status at least every 6 hours during the first 1–2 days of treatment and until dose stabilised. If serum-sodium correction exceeds 6 mmol/litre during the first 6 hours or 8 mmol/litre in the first 6–12 hours, frequency of monitoring should be increased; interrupt or discontinue treatment if serum-sodium increases by 12 mmol/litre or greater in 24 hours or 18 mmol/litre or greater in 48 hours.

● **PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of *Jinarc*[®] has provided training materials for healthcare professionals to use prior to prescribing tolvaptan in order to minimise the risk of irreversible

hepatotoxicity and to highlight the importance of pregnancy prevention.

- **PATIENT AND CARER ADVICE** For *Jinarc*[®], morning dose to be taken 30 minutes before food, second dose can be taken with or without food. Risk minimisation materials For *Jinarc*[®], a patient brochure and alert card should be provided.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Tolvaptan for treating autosomal dominant polycystic kidney disease (October 2015)** NICE TA358
Tolvaptan (*Jinarc*[®]) is recommended as an option for the treatment of autosomal dominant polycystic kidney disease in adults if:
 - the patient has chronic kidney disease stage 2 or 3 at the start of treatment, **and**
 - there is evidence of rapidly progressing disease, **and**
 - the manufacturer provides tolvaptan with the discount agreed in the patient access scheme.
 Patients currently receiving tolvaptan (*Jinarc*[®]) whose disease does not meet the above criteria should be able to continue treatment until they and their NHS clinician consider it appropriate to stop.

2 Corticosteroid responsive conditions

CORTICOSTEROIDS

Corticosteroids, general use

13-Nov-2019

Overview

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin. Corticosteroids should be avoided or used only under specialist supervision in psoriasis.

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management

of ulcerative colitis and Crohn's disease. They are also included in locally applied creams for haemorrhoids.

Use can be made of the mineralocorticoid activity of fludrocortisone acetate p. 713 to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, there is evidence that administration of lower doses of hydrocortisone p. 713 and fludrocortisone acetate is of benefit in adrenocortical insufficiency resulting from septic shock.

Dexamethasone p. 712 and betamethasone p. 711 have little if any mineralocorticoid action and their long duration of action makes them particularly suitable for suppressing corticotropin secretion in congenital adrenal hyperplasia where the dose should be tailored to clinical response and by measurement of adrenal androgens and 17-hydroxyprogesterone. In common with all glucocorticoids their suppressive action on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most individuals a single dose of dexamethasone at night, is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the 'overnight dexamethasone suppression test' for diagnosing Cushing's syndrome.

Betamethasone and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see Prescribing in palliative care p. 28). However, a corticosteroid should not be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions, such as angioedema of the upper respiratory tract and anaphylaxis, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline/epinephrine p. 236. In such cases hydrocortisone (as sodium succinate) by intravenous injection may be required.

EvGr Corticosteroids are preferably used by inhalation in the management of asthma and chronic obstructive pulmonary disease (COPD). Systemic therapy along with bronchodilators is required for treatment of acute asthma attacks, in some very severe cases of chronic asthma, and exacerbations of COPD. **A**

Corticosteroids may also be useful in conditions such as autoimmune hepatitis, rheumatoid arthritis and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia, and some cases of the nephrotic syndrome (particularly in children) and thrombocytopenic purpura.

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus, temporal arteritis, and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose, and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see: Prescribing in Palliative Care, immunosuppression, rheumatic diseases, eye, otitis externa allergic rhinitis, and aphthous ulcers.

Side-effects

MHRA/CHM advice: Corticosteroids: rare risk of central serous chorioretinopathy with local as well as systemic administration (August 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periorcular routes. The MHRA

recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

Mineralocorticoid side effects

- hypertension
- sodium retention
- water retention
- potassium loss
- calcium loss

Mineralocorticoid side effects are most marked with fludrocortisone, but are significant with hydrocortisone, corticotropin, and tetracosactide. Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone, prednisolone, and triamcinolone.

Glucocorticoid side effects

- diabetes
- osteoporosis, which is a danger, particularly in the elderly, as it can result in osteoporotic fractures for example of the hip or vertebrae;
- in addition high doses are associated with avascular necrosis of the femoral head.
- muscle wasting (proximal myopathy) can also occur.
- corticosteroid therapy is also weakly linked with peptic ulceration and perforation.
- psychiatric reactions may also occur.

Managing side-effects

Side-effects can be minimised by using lowest effective dose for minimum period possible. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma. Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug.

For information on the cessation of oral corticosteroid treatment, see *Treatment cessation*, for systemic corticosteroids (e.g. prednisolone p. 716).

Whenever possible *local treatment* with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to *systemic treatment*.

Inhaled corticosteroids have considerably fewer systemic effects than oral corticosteroids, but adverse effects including adrenal suppression have been reported. Use of other corticosteroid therapy (including topical) or concurrent use of drugs which inhibit corticosteroid metabolism should be taken into account when assessing systemic risk.

Corticosteroids, replacement therapy

Overview

The adrenal cortex normally secretes hydrocortisone p. 713 (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of hydrocortisone and the

mineralocorticoid fludrocortisone acetate p. 713; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In *Addison's disease* or following adrenalectomy, hydrocortisone by mouth is usually required. This is given in 2 doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone acetate.

In *acute adrenocortical insufficiency*, hydrocortisone is given intravenously (preferably as sodium succinate) every 6 to 8 hours in sodium chloride intravenous infusion 0.9% p. 1101.

In *hypopituitarism*, glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required. Additional replacement therapy with levothyroxine sodium p. 816 and sex hormones should be given as indicated by the pattern of hormone deficiency.

Glucocorticoid therapy

Glucocorticoid and mineralocorticoid activity

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids). The mineralocorticoid activity of fludrocortisone acetate p. 713 is so high that its anti-inflammatory activity is of no clinical relevance.

Equivalent anti-inflammatory doses of corticosteroids

This table takes no account of mineralocorticoid effects, nor does it take account of variations in duration of action

Prednisolone 5 mg

≡ Betamethasone 750 micrograms

≡ Deflazacort 6 mg

≡ Dexamethasone 750 micrograms

≡ Hydrocortisone 20 mg

≡ Methylprednisolone 4 mg

≡ Prednisone 5 mg

≡ Triamcinolone 4 mg

The relatively high mineralocorticoid activity of hydrocortisone p. 713, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked.

Prednisolone p. 716 and prednisone have predominantly glucocorticoid activity. Prednisolone is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone p. 711 and dexamethasone p. 712 have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion (e.g. congenital adrenal hyperplasia).

Some esters of betamethasone and of beclomethasone dipropionate p. 48 (beclomethasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort p. 711 has a high glucocorticoid activity; it is derived from prednisolone.

Corticosteroids (systemic)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished) · systemic infection (unless specific therapy given)

CONTRA-INDICATIONS, FURTHER INFORMATION For further information on contra-indications associated with intra-articular, intradermal and intralesional preparations, consult product literature.

- **CAUTIONS** Congestive heart failure · diabetes mellitus (including a family history of) · diverticulitis · epilepsy · glaucoma (including a family history of or susceptibility to) · history of steroid myopathy · history of tuberculosis or X-ray changes (frequent monitoring required) · hypertension · hypothyroidism · infection (particularly untreated) · long-term use · myasthenia gravis · ocular herpes simplex (risk of corneal perforation) · osteoporosis (in children, post-menopausal women and the elderly at risk) · peptic ulcer · psychiatric reactions · recent intestinal anastomoses · recent myocardial infarction (rupture reported) · severe affective disorders (particularly if history of steroid-induced psychosis) · thromboembolic disorders · ulcerative colitis

CAUTIONS, FURTHER INFORMATION For further information on cautions associated with intra-articular, intradermal and intralesional preparations, consult product literature.

- **Elderly** Prescription potentially inappropriate (STOPP criteria):
 - if used instead of inhaled corticosteroids for maintenance therapy in moderate to severe COPD (unnecessary exposure to long-term side-effects)
 - as long-term (longer than 3 months) monotherapy for rheumatoid arthritis (risk of side-effects)
 - for treatment of osteoarthritis other than for periodic intra-articular injections for monoarticular pain (risk of side-effects)

- with concurrent NSAIDs without proton pump inhibitor prophylaxis (increased risk of peptic ulcer disease) See also Prescribing in the elderly p. 33.

• SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · behaviour abnormal · cataract subcapsular · cognitive impairment · Cushing's syndrome · electrolyte imbalance · fatigue · fluid retention · gastrointestinal discomfort · headache · healing impaired · hirsutism · hypertension · increased risk of infection · menstrual cycle irregularities · mood altered · nausea · osteoporosis · peptic ulcer · psychotic disorder · skin reactions · sleep disorders · weight increased
- ▶ **Uncommon** Adrenal suppression · alkalosis hypokalaemic · appetite increased · bone fractures · diabetic control impaired · eye disorders · glaucoma · haemorrhage · heart failure · hyperhidrosis · hypotension · leucocytosis · myopathy · osteonecrosis · pancreatitis · papilloedema · seizure · thromboembolism · tuberculosis reactivation · vertigo · vision blurred
- ▶ **Rare or very rare** Malaise · tendon rupture
- ▶ **Frequency not known** Chorioretinopathy · growth retardation (very common in children) · intracranial pressure increased with papilloedema (usually after withdrawal) · telangiectasia

SIDE-EFFECTS, FURTHER INFORMATION Adrenal

suppression During prolonged therapy with corticosteroids, particularly with systemic use, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension, or death. To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary reintroduction of corticosteroid treatment. Patients on long-term corticosteroid treatment should carry a steroid treatment card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

Infections Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. septicaemia and tuberculosis may reach an advanced stage before being recognised, and amoebiasis or strongyloidiasis may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral ocular infections may also be exacerbated.

Chickenpox Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being at risk of severe chickenpox. Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature. Passive immunisation with varicella-zoster immunoglobulin is needed for exposed non-immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment. Corticosteroids should not be stopped and dosage may need to be increased.

Measles Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin may be needed.

Psychiatric reactions Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, insomnia, irritability, mood

lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment. Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

- **PREGNANCY** The benefit of treatment with corticosteroids during pregnancy outweighs the risk. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) concluded that corticosteroids vary in their ability to cross the placenta but there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip. When administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome). Any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important. **Monitoring** Pregnant women with fluid retention should be monitored closely when given systemic corticosteroids.

- **BREAST FEEDING** The benefit of treatment with corticosteroids during breast-feeding outweighs the risk.

- **HEPATIC IMPAIRMENT** In general, manufacturers advise caution (risk of increased exposure).

- **RENAL IMPAIRMENT** Use by oral and injectable routes should be undertaken with caution.

● MONITORING REQUIREMENTS

- ▶ In children The height and weight of children receiving prolonged treatment with corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.

- **EFFECT ON LABORATORY TESTS** May suppress skin test reactions.

● TREATMENT CESSATION

- ▶ In adults Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension or death. Withdrawal can also be associated with fever, myalgia, arthralgia, rhinitis, conjunctivitis, painful itchy skin nodules and weight loss. The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. *Gradual* withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:

- received more than 40 mg prednisolone (or equivalent) daily for more than 1 week;
- been given repeat doses in the evening;
- received more than 3 weeks' treatment;
- recently received repeated courses (particularly if taken for longer than 3 weeks);
- taken a short course within 1 year of stopping long-term therapy;
- other possible causes of adrenal suppression.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse *and* who have received

treatment for 3 weeks or less *and* who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 7.5 mg daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

- In children The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. *Gradual* withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:
 - received more than 40 mg prednisolone (or equivalent) daily for more than 1 week *or* 2 mg/kg daily for 1 week *or* 1 mg/kg daily for 1 month;
 - been given repeat doses in the evening;
 - received more than 3 weeks' treatment;
 - recently received repeated courses (particularly if taken for longer than 3 weeks);
 - taken a short course within 1 year of stopping long-term therapy;
 - other possible causes of adrenal suppression.
- Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse *and* who have received treatment for 3 weeks or less *and* who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 2–2.5 mg/m² daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

• PATIENT AND CARER ADVICE

Advice for patients Patients on long-term corticosteroid treatment should carry a Steroid Treatment Card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed.

Patients should especially be advised of the following:

- **Immunosuppression** Prolonged courses of corticosteroids can increase susceptibility to infection and serious infections can go unrecognised. Unless already immune, patients are at risk of severe **chickenpox** and should avoid close contact with people who have chickenpox or shingles. Similarly, precautions should also be taken against contracting **measles**;
- **Adrenal suppression** If the corticosteroid is given for longer than 3 weeks, treatment must not be stopped abruptly. Adrenal suppression can last for a year or more after stopping treatment and the patient must mention the course of corticosteroid when receiving treatment for any illness or injury;
- **Mood and behaviour changes** Corticosteroid treatment, especially with high doses, can alter mood and behaviour early in treatment—the patient can become confused, irritable and suffer from delusion and suicidal thoughts. These effects can also occur when corticosteroid treatment is being withdrawn. Medical advice should be sought if worrying psychological changes occur;
- **Other serious effects** Serious gastro-intestinal, musculoskeletal, and ophthalmic effects which require medical help can also occur.

Steroid treatment cards Steroid treatment cards should be issued where appropriate. Consider giving a 'steroid card' to support communication of the risks associated with treatment, and specific written advice to consider corticosteroid replacement during an episode of stress, such as severe intercurrent illness or an operation, to

patients using greater than maximum licensed doses of inhaled corticosteroids. Steroid treatment cards are available for purchase from the NHS Print online ordering portal www.nhsforms.co.uk

GP practices can obtain supplies through Primary Care Support England. NHS Trusts can order supplies via the online ordering portal.

In **Scotland**, steroid treatment cards can be obtained from APS Group Scotland by emailing stockorders.dppas@apsgroup.co.uk or by fax on 0131 629 9967.

F 709

Betamethasone

28-Nov-2019

- **DRUG ACTION** Betamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

• INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders | Congenital adrenal hyperplasia

- ▶ BY MOUTH
 - ▶ Adult: Usual dose 0.5–5 mg daily
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
 - ▶ Adult: 4–20 mg, repeated up to 4 times in 24 hours

- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS** Hiccups · myocardial rupture (following recent myocardial infarction) · oedema · Stevens-Johnson syndrome
- **PREGNANCY** Readily crosses the placenta. Transient effect on fetal movements and heart rate.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For *intravenous infusion* (as sodium phosphate) (*Betnesol*[®]), give continuously or intermittently *or via* drip tubing in Glucose 5% or Sodium chloride 0.9%.
- **PATIENT AND CARER ADVICE**
 - ▶ With oral use Patient counselling is advised for betamethasone soluble tablets (steroid card).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Soluble tablet

CAUTIONARY AND ADVISORY LABELS 10, 13, 21 (not for use as mouthwash for oral ulceration)

- ▶ **Betamethasone (Non-proprietary)**
 - Betamethasone (as Betamethasone sodium phosphate) 500 microgram Betamethasone 500microgram soluble tablets sugar free sugar-free | 100 tablet [PoM] £58.15 DT = £58.15

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Betamethasone (Non-proprietary)**
 - Betamethasone (as Betamethasone sodium phosphate) 4 mg per 1 ml Betamethasone 4mg/1ml solution for injection ampoules | 5 ampoule [PoM] £30.46 DT = £30.26

F 709

Deflazacort

21-Dec-2017

- **DRUG ACTION** Deflazacort is derived from prednisolone; it has predominantly glucocorticoid activity.

• INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders

- ▶ BY MOUTH
 - ▶ Adult: Maintenance 3–18 mg daily

Suppression of inflammatory and allergic disorders (acute disorders)

- ▶ BY MOUTH
 - ▶ Adult: Initially up to 120 mg daily

continued →

Inflammatory and allergic disorders

- ▶ BY MOUTH
- ▶ Child 1 month–11 years: 0.25–1.5 mg/kg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations
- ▶ Child 12–17 years: 3–18 mg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations

- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS**
- ▶ **Uncommon** Oedema
- **HEPATIC IMPAIRMENT**
- Dose adjustments** Manufacturer advises adjust to the minimum effective dose.
- **PATIENT AND CARER ADVICE** Patient counselling is advised for deflazacort tablets (steroid card).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

CAUTIONARY AND ADVISORY LABELS 5, 10

- ▶ **Calcort** (Sanofi)
- Deflazacort 6 mg** Calcort 6mg tablets | 60 tablet (PoM) £15.82 DT = £15.82

F 709

Dexamethasone

10-Mar-2020

- **DRUG ACTION** Dexamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

INDICATIONS AND DOSE**Suppression of inflammatory and allergic disorders**

- ▶ BY MOUTH
- ▶ Adult: 0.5–10 mg daily

Mild croup

- ▶ BY MOUTH
- ▶ Child: 150 micrograms/kg for 1 dose

Severe croup (or mild croup that might cause complications)

- ▶ INITIALLY BY MOUTH
- ▶ Child: Initially 150 micrograms/kg for 1 dose, to be given before transfer to hospital, then (by mouth or by intravenous injection) 150 micrograms/kg, then (by mouth or by intravenous injection) 150 micrograms/kg after 12 hours if required

Congenital adrenal hyperplasia (under expert supervision)

- ▶ BY MOUTH
- ▶ Adult: Consult specialist for advice on dosing
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Consult specialist for advice on dosing

Overnight dexamethasone suppression test

- ▶ BY MOUTH
- ▶ Adult: 1 mg for 1 dose, to be given at night

Adjunctive treatment of bacterial meningitis (starting before or with first dose of antibacterial)

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 8.3 mg every 6 hours for 4 days

Symptom control of anorexia in palliative care

- ▶ Adult: 2–4 mg daily

Dysphagia due to obstruction by tumour in palliative care

- ▶ Adult: 8 mg daily

Dyspnoea due to bronchospasm or partial obstruction in palliative care

- ▶ Adult: 4–8 mg daily

Adjunct in the treatment of nausea and vomiting in palliative care

- ▶ BY MOUTH
- ▶ Adult: 8–16 mg daily

Headaches due to raised intracranial pressure in palliative care

- ▶ Adult: 16 mg daily for 4–5 days, then reduced to 4–6 mg daily, reduce dose if possible. To be given before 6pm to reduce the risk of insomnia

Pain due to nerve compression in palliative care

- ▶ Adult: 8 mg daily

Cerebral oedema associated with malignancy

- ▶ BY MOUTH
- ▶ Adult: 0.5–10 mg daily

Cerebral oedema

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 8–16 mg for 1 dose, then (by intramuscular injection or by intravenous injection) 5 mg every 6 hours until adequate response achieved then taper-off gradually, use the 3.8 mg/mL injection preparation for this dose

Cerebral oedema associated with malignancy

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 8.3 mg for 1 dose, then (by intramuscular injection) 3.3 mg every 6 hours as required for 2–4 days, subsequently, reduce dose gradually and stop over 5–7 days, use the 3.3 mg/mL injection preparation for this dose

UNLICENSED USE

- ▶ With intravenous use Consult product literature; not licensed for use in bacterial meningitis.

- **INTERACTIONS** → Appendix 1: corticosteroids

SIDE-EFFECTS

- ▶ With oral use Hiccups · hyperglycaemia · myocardial rupture (following recent myocardial infarction) · protein catabolism
- ▶ With parenteral use Perineal irritation (may occur following the intravenous injection of large doses of the phosphate ester)

- **PREGNANCY** Dexamethasone readily crosses the placenta.

DIRECTIONS FOR ADMINISTRATION

- ▶ With oral use in children For administration *by mouth* tablets may be dispersed in water or injection solution given by mouth.
- ▶ With intravenous use in children For *intravenous infusion* dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–20 minutes.
- ▶ With intravenous use in adults For *intravenous infusion* (*Dexamethasone*, Hospira) give continuously or intermittently or *via* drip tubing in Glucose 5% or Sodium Chloride 0.9%.

PRESCRIBING AND DISPENSING INFORMATION

Dexamethasone 3.8 mg/mL Injection has replaced dexamethasone 4 mg/mL Injection. All dosage recommendations for intravenous, intramuscular, intrarticular use or local infiltration; are given in units of dexamethasone base.

Palliative care For further information on the use of dexamethasone in palliative care, see www.medicinescomplete.com/#/content/palliative/systemic-corticosteroids.

Fludrocortisone acetate

10-Mar-2020

- **DRUG ACTION** Fludrocortisone has very high mineralocorticoid activity and insignificant glucocorticoid activity.

• **INDICATIONS AND DOSE****Neuropathic postural hypotension**

▶ BY MOUTH

▶ Adult: 100–400 micrograms daily

Mineralocorticoid replacement in adrenocortical insufficiency

▶ BY MOUTH

▶ Adult: 50–300 micrograms once daily

Adrenocortical insufficiency resulting from septic shock (in combination with hydrocortisone)

▶ BY MOUTH

▶ Adult: 50 micrograms daily

- **UNLICENSED USE** Not licensed for use in neuropathic postural hypotension.
- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS** Conjunctivitis · idiopathic intracranial hypertension · muscle weakness · thrombophlebitis
- **HEPATIC IMPAIRMENT**
Monitoring Monitor patient closely in hepatic impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 10

Fludrocortisone acetate 100 microgram Fludrocortisone 100microgram tablets | 30 tablet [PoM] £13.60 DT = £13.60

F 709

Hydrocortisone

17-Dec-2019

- **DRUG ACTION** Hydrocortisone has equal glucocorticoid and mineralocorticoid activity.

• **INDICATIONS AND DOSE****Thyrototoxic crisis (thyroid storm)**

▶ BY INTRAVENOUS INJECTION

▶ Adult: 100 mg every 6 hours, to be administered as sodium succinate

Adrenocortical insufficiency resulting from septic shock

▶ BY INTRAVENOUS INJECTION

▶ Adult: 50 mg every 6 hours, given in combination with fludrocortisone

Acute hypersensitivity reactions such as angioedema of the upper respiratory tract and anaphylaxis (adjunct to adrenaline)

▶ BY INTRAVENOUS INJECTION

▶ Adult: 100–300 mg, to be administered as sodium succinate

Corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of minor surgery under general anaesthesia

▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Adult: Initially 25–50 mg, to be administered at induction of surgery, the patient's usual oral corticosteroid dose is recommended after surgery

continued →

Corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of moderate or major surgery

- ▶ INITIALLY BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 25–50 mg, to be administered at induction of surgery (following usual oral corticosteroid dose on the morning of surgery), followed by (by intravenous injection) 25–50 mg 3 times a day for 24 hours after moderate surgery and for 48–72 hours after major surgery

Adrenocortical insufficiency in Addison's disease or following adrenalectomy

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 20–30 mg daily in 2 divided doses, the larger dose to be given in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion, the optimum daily dose is determined on the basis of clinical response

Adrenocortical insufficiency

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 100–500 mg 3–4 times a day or when required

Severe inflammatory bowel disease

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 100–500 mg 3–4 times a day or when required

Replacement in adrenocortical insufficiency

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 20–30 mg once daily, adjusted according to response, dose to be taken in the morning
- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 20–30 mg daily in divided doses, adjusted according to response

Ulcerative colitis | Proctitis | Proctosigmoiditis

- ▶ BY RECTUM USING RECTAL FOAM
- ▶ Adult: Initially 1 metered application 1–2 times a day for 2–3 weeks, then reduced to 1 metered application once daily on alternate days, to be inserted into the rectum

Acute hypersensitivity reactions | Angioedema

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child 1–5 months: Initially 25 mg 3 times a day, adjusted according to response
- ▶ Child 6 months–5 years: Initially 50 mg 3 times a day, adjusted according to response
- ▶ Child 6–11 years: Initially 100 mg 3 times a day, adjusted according to response
- ▶ Child 12–17 years: Initially 200 mg 3 times a day, adjusted according to response

Severe acute asthma | Life-threatening acute asthma

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 1 month–1 year: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 25 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- ▶ Child 2–4 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 50 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- ▶ Child 5–11 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- ▶ Child 12–17 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

- ▶ Adult: 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

DOSE EQUIVALENCE AND CONVERSION

- ▶ With oral use
- ▶ When switching from immediate-release hydrocortisone tablets to modified release *Plenadren*[®] use same total daily dose. Bioavailability of *Plenadren*[®] lower than immediate release tablets—monitor clinical response.

● CONTRA-INDICATIONS

- ▶ With rectal use Abdominal or local infection · abscess · bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses

● CAUTIONS

- ▶ With rectal use Systemic absorption may occur

● INTERACTIONS → Appendix 1: corticosteroids**● SIDE-EFFECTS**

- ▶ With oral use Dyslipidaemia · myocardial rupture (following recent myocardial infarction) · oedema
- ▶ With parenteral use Hiccups · Kaposi's sarcoma · lipomatosis · myocardial rupture (following recent myocardial infarction)

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use in children For *intravenous administration*, dilute with Glucose 5% or Sodium Chloride 0.9%. For *intermittent infusion* give over 20–30 minutes.
- ▶ With intravenous use in adults For *intravenous infusion* (*SoluCorte*[®]), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.

● PATIENT AND CARER ADVICE Patient counselling is advised for hydrocortisone tablets and injections (steroid card).**● NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) decisions**

SMC No. 848/12

- ▶ With oral use in adults The *Scottish Medicines Consortium* has advised (December 2016) that hydrocortisone modified release (*Plenadren*[®]) is **not** recommended for use within NHS Scotland for treatment of adrenal insufficiency in adults as there was insufficient evidence submitted.

● LESS SUITABLE FOR PRESCRIBING

- ▶ With intravenous use Hydrocortisone as the sodium phosphate is less suitable for prescribing as paraesthesia and pain (particularly in the perineal region) may follow intravenous injection.

● EXCEPTIONS TO LEGAL CATEGORY

- ▶ With intramuscular use or intravenous use Prescription only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Modified-release tablet

709

Methylprednisolone

11-Oct-2019

- **DRUG ACTION** Methylprednisolone exerts predominantly glucocorticoid effects with minimal mineralocorticoid effects.

● INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders | Acute oedema associated with malignancy

▶ BY MOUTH

▶ Adult: Initially 2–40 mg daily

▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Adult: Initially 10–500 mg

Treatment of graft rejection reactions

▶ BY INTRAVENOUS INFUSION

▶ Adult: Up to 1 g daily for up to 3 days

Treatment of relapse in multiple sclerosis

▶ BY MOUTH

▶ Adult: 500 mg once daily for 5 days

Treatment of relapse in multiple sclerosis (when oral steroids have failed or have not been tolerated, or in those who require hospital admission)

▶ BY INTRAVENOUS INFUSION

▶ Adult: 1 g once daily for 3–5 days

DEPO-MEDRONE®

Suppression of inflammatory and allergic disorders

▶ BY DEEP INTRAMUSCULAR INJECTION

▶ Adult: 40–120 mg, then 40–120 mg after 2–3 weeks if required, to be injected into the gluteal muscle

● UNLICENSED USE

- ▶ With intravenous use or oral use [EvGr] Not licensed for use by mouth for the treatment of multiple sclerosis relapse. Not licensed for use by intravenous infusion for the treatment of multiple sclerosis relapse for durations longer than

3 days. ⚠ Methylprednisolone doses in the BNF may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: METHYLPREDNISOLONE INJECTABLE MEDICINE CONTAINING LACTOSE (SOLU-MEDRONE® 40 MG): DO NOT USE IN PATIENTS WITH COWS' MILK ALLERGY (OCTOBER 2017)

▶ With intramuscular use or intravenous use

An EU-wide review has concluded that *Solu-Medrone*® 40 mg may contain trace amounts of milk proteins and should not be used in patients with a known or suspected allergy to cows' milk. Serious allergic reactions, including bronchospasm and anaphylaxis, have been reported in patients allergic to cows' milk proteins. If a patient's symptoms worsen or new allergic symptoms occur, administration should be stopped and the patient treated accordingly.

● CAUTIONS

- ▶ With intravenous use Rapid intravenous administration of large doses associated with cardiovascular collapse
- ▶ With systemic use Systemic sclerosis (increased incidence of scleroderma renal crisis)

● **INTERACTIONS** → Appendix 1: corticosteroids

● SIDE-EFFECTS

▶ **Common or very common**

▶ With oral use Depressed mood

▶ **Frequency not known**

- ▶ With oral use Confusion · delusions · diarrhoea · dizziness · dyslipidaemia · hallucination · hiccups · Kaposi's sarcoma · lipomatosis · myocardial rupture (following recent myocardial infarction) · oedema · schizophrenia · suicidal ideation · withdrawal syndrome
- ▶ With parenteral use Confusion · delusions · depressed mood · diarrhoea · dizziness · dyslipidaemia · hallucination · hiccups · Kaposi's sarcoma · lipomatosis · oedema · schizophrenia · suicidal thoughts · vomiting · withdrawal syndrome

● **MONITORING REQUIREMENTS** Manufacturer advises monitor blood pressure and renal function (s-creatinine) routinely in patients with systemic sclerosis—increased incidence of scleroderma renal crisis.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion* (as sodium succinate) (*Solu-Medrone*®), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially with water for injections; doses up to 250 mg should be given over at least 5 minutes, high doses over at least 30 minutes.

● **PATIENT AND CARER ADVICE** Patient counselling is advised for methylprednisolone tablets and injections (steroid card).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Prednisolone

- **DRUG ACTION** Prednisolone exerts predominantly glucocorticoid effects with minimal mineralocorticoid effects.

● **INDICATIONS AND DOSE****Acute exacerbation of chronic obstructive pulmonary disease (if increased breathlessness interferes with daily activities)**▶ **BY MOUTH**

- ▶ Adult: 30 mg daily for 7–14 days

Severe croup (before transfer to hospital) | Mild croup that might cause complications (before transfer to hospital)▶ **BY MOUTH**

- ▶ Child: 1–2 mg/kg

Mild to moderate acute asthma (when oral corticosteroid taken for more than a few days) | Severe or life-threatening acute asthma (when oral corticosteroid taken for more than a few days)▶ **BY MOUTH**

- ▶ Child 1 month–11 years: 2 mg/kg once daily (max. per dose 60 mg) for up to 3 days, longer if necessary

Mild to moderate acute asthma | Severe or life-threatening acute asthma▶ **BY MOUTH**

- ▶ Child 1 month–11 years: 1–2 mg/kg once daily (max. per dose 40 mg) for up to 3 days, longer if necessary
- ▶ Child 12–17 years: 40–50 mg daily for at least 5 days
- ▶ Adult: 40–50 mg daily for at least 5 days

Suppression of inflammatory and allergic disorders▶ **BY MOUTH**

- ▶ Adult: Initially 10–20 mg daily, dose preferably taken in the morning after breakfast, can often be reduced within a few days but may need to be continued for several weeks or months; maintenance 2.5–15 mg daily, higher doses may be needed; cushingoid side-effects increasingly likely with doses above 7.5 mg daily

▶ **BY INTRAMUSCULAR INJECTION**

- ▶ Adult: 25–100 mg 1–2 times a week, as prednisolone acetate

Suppression of inflammatory and allergic disorders (initial dose in severe disease)▶ **BY MOUTH**

- ▶ Adult: Initially up to 60 mg daily, dose preferably taken in the morning after breakfast, can often be reduced within a few days but may need to be continued for several weeks or months

Idiopathic thrombocytopenic purpura▶ **BY MOUTH**

- ▶ Adult: 1 mg/kg daily, gradually reduce dose over several weeks

Ulcerative colitis | Crohn's disease▶ **BY MOUTH**

- ▶ Adult: Initially 20–40 mg daily until remission occurs, followed by reducing doses, up to 60 mg daily, may be used in some cases, doses preferably taken in the morning after breakfast

Neuritic pain or weakness heralding rapid onset of permanent nerve damage (during reversal reactions multibacillary leprosy)▶ **BY MOUTH**

- ▶ Adult: Initially 40–60 mg daily, dose to be instituted at once

Generalised myasthenia gravis (when given on alternate days)▶ **BY MOUTH**

- ▶ Adult: Initially 10 mg once daily on alternate days, then increased in steps of 10 mg once daily on alternate days, increased to 1–1.5 mg/kg once daily on alternate days (max. per dose 100 mg)

Generalised myasthenia gravis in ventilated patients (when given on alternate days)▶ **BY MOUTH**

- ▶ Adult: Initially 1.5 mg/kg once daily on alternate days (max. per dose 100 mg)

Generalised myasthenia gravis (when giving daily)▶ **BY MOUTH**

- ▶ Adult: Initially 5 mg daily, increased in steps of 5 mg daily, maintenance 60–80 mg daily, alternatively maintenance 0.75–1 mg/kg daily, ventilated patients may be started on 1.5 mg/kg (max. 100 mg) on alternate days

Ocular myasthenia▶ **BY MOUTH**

- ▶ Adult: Usual dose 10–40 mg once daily on alternate days, reduce to minimum effective dose

Reduction in rate of joint destruction in moderate to severe rheumatoid arthritis of less than 2 years' duration▶ **BY MOUTH**

- ▶ Adult: 7.5 mg daily

Polymyalgia rheumatica▶ **BY MOUTH**

- ▶ Adult: 10–15 mg daily until remission of disease activity; maintenance 7.5–10 mg daily, reduce gradually to maintenance dose. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long term low-dose corticosteroid treatment

Giant cell (temporal) arteritis▶ **BY MOUTH**

- ▶ Adult: 40–60 mg daily until remission of disease activity, the higher dose being used if visual symptoms occur; maintenance 7.5–10 mg daily, reduce gradually to maintenance dose. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long term low-dose corticosteroid treatment

Polyarteritis nodosa | Polymyositis | Systemic lupus erythematosus▶ **BY MOUTH**

- ▶ Adult: Initially 60 mg daily, to be reduced gradually; maintenance 10–15 mg daily

Symptom control of anorexia in palliative care▶ **BY MOUTH**

- ▶ Adult: 15–30 mg daily

Pneumocystis pneumonia in moderate to severe infections associated with HIV infection

▶ BY MOUTH

- Adult: 50–80 mg daily for 5 days, the dose is then reduced to complete 21 days of treatment, corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete

Short-term prophylaxis of episodic cluster headache as monotherapy or in combination with verapamil during verapamil titration

▶ BY MOUTH

- Adult: 60–100 mg once daily for 2–5 days, then reduced in steps of 10 mg every 2–3 days until prednisolone is discontinued

Proctitis

▶ BY RECTUM USING RECTAL FOAM

- Adult: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

▶ BY RECTUM USING SUPPOSITORIES

- Adult: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

Distal ulcerative colitis

▶ BY RECTUM USING RECTAL FOAM

- Adult: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

Rectal complications of Crohn's disease

▶ BY RECTUM USING SUPPOSITORIES

- Adult: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

Rectal and rectosigmoidal ulcerative colitis | Rectal and rectosigmoidal Crohn's disease

▶ BY RECTUM USING ENEMA

- Adult: 20 mg daily for 2–4 weeks, continued if response good, to be used at bedtime

IMPORTANT SAFETY INFORMATION**SAFE PRACTICE**

▶ With systemic use

Prednisolone has been confused with propranolol; care must be taken to ensure the correct drug is prescribed and dispensed.

● CONTRA-INDICATIONS

- With rectal use Abdominal or local infection · bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses

● CAUTIONS

- With rectal use Systemic absorption may occur with rectal preparations
- With systemic use Duchenne's muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity) · systemic sclerosis (increased incidence of scleroderma renal crisis with a daily dose of 15 mg or more)

● INTERACTIONS → Appendix 1: corticosteroids**● SIDE-EFFECTS**

- With intramuscular use Diarrhoea · dizziness · hiccups · Kaposi's sarcoma · myocardial rupture (following recent myocardial infarction) · scleroderma renal crisis · vomiting
- With oral use Diarrhoea · dizziness · dyslipidaemia · lipomatosis · protein catabolism · scleroderma renal crisis

● PREGNANCY As it crosses the placenta 88% of prednisolone is inactivated.

Monitoring ▶ With systemic use Pregnant women with fluid retention should be monitored closely.

- BREAST FEEDING** Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.

Monitoring ▶ With systemic use Infant should be monitored for adrenal suppression if mother is taking a dose higher than 40 mg.

● MONITORING REQUIREMENTS

- With systemic use Manufacturer advises monitor blood pressure and renal function (s-creatinine) routinely in patients with systemic sclerosis—increased incidence of scleroderma renal crisis.

● PRESCRIBING AND DISPENSING INFORMATION

Palliative care For further information on the use of prednisolone in palliative care, see www.medicinescomplete.com/#/content/palliative/systemic-corticosteroids.

Triamcinolone acetonide

26-Nov-2019

- **DRUG ACTION** Triamcinolone exerts predominantly glucocorticoid effects with minimal mineralcorticoid effect.

● **INDICATIONS AND DOSE****Suppression of inflammatory and allergic disorders**▶ **BY DEEP INTRAMUSCULAR INJECTION**

- ▶ **Adult:** 40 mg (max. per dose 100 mg), repeated if necessary, dose given for depot effect, to be administered into gluteal muscle; repeated at intervals according to patient's response

- **CAUTIONS** High dosage (may cause proximal myopathy), avoid in chronic therapy

- **INTERACTIONS** → Appendix 1: corticosteroids

● **SIDE-EFFECTS**

- ▶ **Uncommon** Dizziness · flushing · hyperglycaemia

- **PATIENT AND CARER ADVICE** Patient counselling is advised for triamcinolone acetonide injection (steroid card).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

CAUTIONARY AND ADVISORY LABELS 10

EXCIPIENTS: May contain Benzyl alcohol

Triamcinolone acetonide 40 mg per 1 ml Kenalog Intra-articular / Intramuscular 40mg/1ml suspension for injection vials | 5 vial [PoM] £7.45 DT = £7.45

2.1 Cushing's syndrome and disease

Cushing's Syndrome

Management

Most types of *Cushing's syndrome* are treated surgically, that which occasionally accompanies carcinoma of the bronchus is not usually amenable to surgery. Metyrapone p. 719 has been found helpful in controlling the symptoms of the disease; it is also used in other forms of Cushing's syndrome to prepare the patient for surgery.

The dosages of metyrapone used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

Ketoconazole below may have a direct effect on corticotrophic tumour cells in patients with Cushing's disease. It is used under specialist supervision for treatment of endogenous Cushing's syndrome.

Other drugs used for Cushing's syndrome and disease

Pasireotide, p. 1003

ENZYME INHIBITORS**Ketoconazole**

04-Feb-2020

- **DRUG ACTION** An imidazole derivative which acts as a potent inhibitor of cortisol and aldosterone synthesis by inhibiting the activity of 17 α -hydroxylase, 11-hydroxylation steps and at higher doses the cholesterol side-chain cleavage enzyme. It also inhibits the activity of adrenal C17-20 lyase enzymes resulting in androgen synthesis inhibition, and may have a direct effect on corticotrophic tumour cells in patients with Cushing's disease.

● **INDICATIONS AND DOSE****Endogenous Cushing's syndrome (specialist use only)**▶ **BY MOUTH**

- ▶ **Adult:** Initially 400–600 mg daily in 2–3 divided doses, increased to 800–1200 mg daily; maintenance 400–800 mg daily in 2–3 divided doses, for dose titrations in patients with established dose, adjustments in adrenal insufficiency, or concomitant corticosteroid replacement therapy, consult product literature; maximum 1200 mg per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises max. dose 200 mg daily with concurrent use of cobicistat.

IMPORTANT SAFETY INFORMATION**CHMP ADVICE: KETOCONAZOLE (JULY 2013)**

The CHMP has recommended that the marketing authorisation for oral ketoconazole to treat fungal infections should be suspended. The CHMP concluded that the risk of hepatotoxicity associated with oral ketoconazole is greater than the benefit in treating fungal infections. Doctors should review patients who are being treated with oral ketoconazole for fungal infections, with a view to stopping treatment or choosing an alternative treatment. Patients with a prescription of oral ketoconazole for fungal infections should be referred back to their doctors.

Oral ketoconazole for Cushing's syndrome and topical products containing ketoconazole are not affected by this advice.

- **CONTRA-INDICATIONS** Acquired QTc prolongation · Acute porphyrias p. 1120 · avoid concomitant use of hepatotoxic drugs · congenital QTc prolongation
- **CAUTIONS** Pre-treatment liver enzymes should not exceed 2 times the normal upper limit · risk of adrenal insufficiency
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Adrenal insufficiency · diarrhoea · gastrointestinal discomfort · nausea · skin reactions · vomiting
 - ▶ **Uncommon** Allergic conditions · alopecia · angioedema · asthenia · dizziness · drowsiness · headache · thrombocytopenia
 - ▶ **Rare or very rare** Fever · hepatic disorders · taste altered
 - ▶ **Frequency not known** Alcohol intolerance · appetite abnormal · arthralgia · azoospermia · dry mouth · epistaxis · flatulence · fontanelle bulging · gynaecomastia · hot flush · insomnia · intracranial pressure increased · malaise · menstrual disorder · myalgia · nervousness · papilloedema · paraesthesia · peripheral oedema · photophobia · photosensitivity reaction · tongue discoloration
- **SIDE-EFFECTS, FURTHER INFORMATION** Potentially life-threatening hepatotoxicity reported rarely with oral use. Manufacturer advises reduce dose if hepatic enzymes increased to less than 3 times the upper limit of normal—consult product literature; discontinue permanently if hepatic enzymes at least 3 times the upper limit of normal.
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used in women of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid—teratogenic in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in breast milk.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor ECG before and one week after initiation, and then as clinically indicated thereafter.
 - ▶ Adrenal insufficiency Monitor adrenal function within one week of initiation, then regularly thereafter. When cortisol levels are normalised or close to target and effective dose established, monitor every 3–6 months as there is a risk of autoimmune disease development or exacerbation after normalisation of cortisol levels. If symptoms suggestive of adrenal insufficiency such as fatigue, anorexia, nausea, vomiting, hypotension, hyponatraemia, hyperkalaemia, and/or hypoglycaemia occur, measure cortisol levels and discontinue treatment temporarily (can be resumed thereafter at lower dose) or reduce dose and if necessary, initiate corticosteroid substitution.
 - ▶ Hepatotoxicity Monitor liver function before initiation of treatment, then weekly for 1 month after initiation, then monthly for 6 months—more frequently if dose adjusted or abnormal liver function detected.
- **PATIENT AND CARER ADVICE** Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, jaundice, abdominal pain, or dark urine develop. Patients or their carers should also be told how to recognise signs of adrenal insufficiency.

Driving and skilled tasks Dizziness and somnolence may affect the performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 5, 21

- ▶ **Ketoconazole (non-proprietary)** ▼

Ketoconazole 200 mg Ketoconazole 200mg tablets | 60 tablet [PoM] £480.00 DT = £480.00

Metyrapone

- **DRUG ACTION** Metyrapone is a competitive inhibitor of 11 β -hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. Metyrapone may be used as a test of anterior pituitary function.

INDICATIONS AND DOSE**Differential diagnosis of ACTH-dependent Cushing's syndrome (specialist supervision in hospital)**

- ▶ BY MOUTH

- ▶ Adult: 750 mg every 4 hours for 6 doses

Management of Cushing's syndrome (specialist supervision in hospital)

- ▶ BY MOUTH

- ▶ Adult: Usual dose 0.25–6 g daily, dose to be tailored to cortisol production, dose is either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed

Resistant oedema due to increased aldosterone secretion in cirrhosis, nephrotic syndrome, and congestive heart failure (with glucocorticoid replacement therapy) (specialist supervision in hospital)

- ▶ BY MOUTH

- ▶ Adult: 3 g daily in divided doses

- **CONTRA-INDICATIONS** Adrenocortical insufficiency
- **CAUTIONS** Avoid in Acute porphyrias p. 1120 · gross hypopituitarism (risk of precipitating acute adrenal failure) · hypertension on long-term administration · hypothyroidism (delayed response)
- **INTERACTIONS** → Appendix 1: metyrapone
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dizziness · headache · hypotension · nausea · sedation · vomiting
 - ▶ **Rare or very rare** Abdominal pain · adrenal insufficiency · allergic dermatitis · hirsutism
 - ▶ **Frequency not known** Alopecia · bone marrow failure · hypertension
- **PREGNANCY** Avoid (may impair biosynthesis of fetal-placental steroids).
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of delayed response).
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving).

3 Diabetes mellitus and hypoglycaemia

3.1 Diabetes mellitus

Diabetes

05-Jun-2017

Description of condition

Diabetes mellitus is a group of metabolic disorders in which persistent hyperglycaemia is caused by deficient insulin secretion or by resistance to the action of insulin. This leads to the abnormalities of carbohydrate, fat and protein metabolism that are characteristic of diabetes mellitus.

Type 1 diabetes mellitus p. 721 and Type 2 diabetes mellitus p. 723 are the two most common classifications of diabetes. Other common types of diabetes are gestational diabetes (develops during pregnancy and resolves after delivery) and secondary diabetes (may be caused by pancreatic damage, hepatic cirrhosis, or endocrine disease). Treatment with endocrine, antiviral, or antipsychotic drugs may also cause secondary diabetes.

Driving

Drivers with diabetes may be required to notify the Driver and Vehicle Licensing Agency (DVLA) of their condition depending on their treatment, the type of licence they hold, and whether they have diabetic complications (including episodes of hypoglycaemia). All drivers who are treated with insulin must inform the DVLA, with some exceptions for temporary treatment. Detailed guidance on notification requirements, eligibility to drive, and precautions required, is available from the DVLA at www.gov.uk/guidance/diabetes-mellitus-assessing-fitness-to-drive.

Advice from the DVLA

The DVLA recommends (2018) that drivers with diabetes need to be particularly careful to avoid hypoglycaemia and should be informed of the warning signs and actions to take. Drivers treated with insulin should always carry a glucose meter and blood-glucose strips when driving, and check their blood-glucose concentration no more than 2 hours before driving and every 2 hours while driving. More frequent self-monitoring may be required if, for any reason, there is a greater risk of hypoglycaemia, such as after physical activity or altered meal routine.

Blood-glucose should always be above 5 mmol/litre while driving. If blood-glucose falls to 5 mmol/litre or below, a snack should be taken. Drivers treated with insulin should ensure that a supply of fast-acting carbohydrate is always available in the vehicle. If blood-glucose is less than 4 mmol/litre, or warning signs of hypoglycaemia develop, the driver should not drive. If already driving, the driver should:

- stop the vehicle in a safe place;
- switch off the engine, remove keys from the ignition, and move from the driver's seat;
- eat or drink a suitable source of sugar;
- wait until 45 minutes after blood-glucose has returned to normal, before continuing journey.

Drivers must not drive if hypoglycaemia awareness has been lost and the DVLA must be notified; driving may resume if a medical report confirms that awareness has been regained.

Depending on the type of licence, notification and monitoring may also be necessary for drivers taking oral antidiabetic drugs, particularly those which carry a risk of hypoglycaemia (e.g. sulfonylureas, nateglinide p. 739, repaglinide p. 740).

Note: additional criteria apply for drivers of large goods or passenger carrying vehicles—consult DVLA guidance.

Alcohol

Alcohol can make the signs of hypoglycaemia less clear, and can cause delayed hypoglycaemia; specialist sources recommend that patients with diabetes should drink alcohol only in moderation, and when accompanied by food.

Oral glucose tolerance tests

The oral glucose tolerance test is used mainly for diagnosis of impaired glucose tolerance; it is **not** recommended or necessary for routine diagnostic use when severe symptoms of hyperglycaemia are present. In patients who have less severe symptoms and a blood-glucose concentration that does not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose tolerance test may be required. It is also used to establish the presence of gestational diabetes.

An oral glucose tolerance test involves measuring the blood-glucose concentration after fasting, and then 2 hours after drinking a standard anhydrous glucose drink. Anhydrous glucose may alternatively be given as the appropriate amount of *Polycal*[®] or as *Rapilose*[®] OGTT oral solution.

HbA1c measurement

Glycated haemoglobin (HbA1c) forms when red blood cells are exposed to glucose in the plasma. The HbA1c test reflects average plasma glucose over the previous 2 to 3 months and provides a good indicator of glycaemic control. Unlike the oral glucose tolerance test, an HbA1c test can be performed at any time of the day and does not require any special preparation such as fasting.

HbA1c values are expressed in *mmol of glycated haemoglobin per mol of haemoglobin (mmol/mol)*, a standardised unit specific for HbA1c created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC). HbA1c values were previously aligned to the assay used in the Diabetes Control and Complications Trial (DCCT) and expressed as a percentage.

Equivalent values

IFCC-HbA1c (mmol/mol)	DCCT-HbA1c (%)
42	6.0
48	6.5
53	7.0
59	7.5
64	8.0
69	8.5
75	9.0

Diagnosis

The HbA1c test is used for monitoring glycaemic control in both Type 1 diabetes p. 721 and Type 2 diabetes p. 723 and is now also used for diagnosis of type 2 diabetes. **EVG** HbA1c should not be used for diagnosis in those with suspected type 1 diabetes, in children, during pregnancy, or in women who are up to two months postpartum. It should also not be used for patients who have:

- had symptoms of diabetes for less than 2 months;
- a high diabetes risk and are acutely ill;
- treatment with medication that may cause hyperglycaemia;
- Acute pancreatic damage;
- end-stage chronic kidney disease;
- HIV infection.

HbA1c used for diagnosis of diabetes should be interpreted with caution in patients with abnormal haemoglobin, anaemia, altered red cell lifespan, or who have had a recent blood transfusion. 

Monitoring

EvGr HbA1c is also a reliable predictor of microvascular and macrovascular complications and mortality. Lower HbA1c is associated with a lower risk of long term vascular complications and patients should be supported to aim for an individualised HbA1c target (see Type 1 diabetes below and Type 2 diabetes p. 723).

HbA1c should usually be measured in patients with type 1 diabetes every 3 to 6 months, and more frequently if blood-glucose control is thought to be changing rapidly. Patients with type 2 diabetes should be monitored every 3 to 6 months until HbA1c and medication are stable when monitoring can be reduced to every 6 months. **⚡**

HbA1c monitoring is invalid for patients with disturbed erythrocyte turnover or for patients with a lack of, or abnormal haemoglobin. In these cases, quality-controlled plasma glucose profiles, total glycated haemoglobin estimation (if there is abnormal haemoglobin), or fructosamine estimation can be used.

Laboratory measurement of fructosamine concentration measures the glycated fraction of all plasma proteins over the previous 14 to 21 days but is a less accurate measure of glycaemic control than HbA1c.

Advanced Pharmacy Services

Patients with diabetes may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 18.

Type 1 diabetes

05-Jun-2017

Description of condition

Type 1 diabetes describes an absolute insulin deficiency in which there is little or no endogenous insulin secretory capacity due to destruction of insulin-producing beta-cells in the pancreatic islets of Langerhans. This form of the disease has an auto-immune basis in most cases, and it can occur at any age, but most commonly before adulthood.

Loss of insulin secretion results in hyperglycaemia and other metabolic abnormalities. If poorly managed, the resulting tissue damage has both short-term and long-term adverse effects on health; this can result in retinopathy, nephropathy, neuropathy, premature cardiovascular disease, and peripheral arterial disease.

Typical features in adult patients presenting with type 1 diabetes are hyperglycaemia (random plasma-glucose concentration above 11 mmol/litre), ketosis, rapid weight loss, a body mass index below 25 kg/m², age younger than 50 years, and a personal/family history of autoimmune disease (though not all features may be present).

Aims of treatment

Treatment is aimed at using insulin regimens to achieve as optimal a level of blood-glucose control as is feasible, while avoiding or reducing the frequency of hypoglycaemic episodes, in order to minimise the risk of long-term microvascular and macrovascular complications.

Disability from complications can often be prevented by early detection and active management of the disease (see Diabetic complications p. 726). **EvGr** The target for glycaemic control should be individualised for each patient, considering factors such as daily activities, aspirations, likelihood of complications, adherence to treatment, comorbidities, occupation and history of hypoglycaemia.

A target HbA1c concentration of 48 mmol/mol (6.5%) or lower is recommended in patients with type 1 diabetes. Blood-glucose concentration should be monitored at least four times a day, including before each meal and before bed.

⚡ Patients should aim for:

- **EvGr** a fasting blood-glucose concentration of 5–7 mmol/litre on waking;
- a blood-glucose concentration of 4–7 mmol/litre before meals at other times of the day;
- a blood-glucose concentration of 5–9 mmol/litre at least 90 minutes after eating;
- a blood-glucose concentration of at least 5 mmol/litre when driving. **⚡**

Overview

EvGr Type 1 diabetes requires insulin replacement, supported by active management of other cardiovascular risk factors, such as hypertension and high circulating lipids (see Diabetic complications p. 726). **⚡** Insulin replacement therapy aims to recreate normal fluctuations in circulating insulin concentrations while supporting a flexible lifestyle with minimal restrictions. Flexible insulin therapy usually involves self-injecting multiple daily doses of insulin, with doses adjusted according to planned exercise, intended food intake and other factors, including current blood-glucose, which the patient needs to test on a regular basis.

EvGr Patients who have a BMI of 25 kg/m² or above (23 kg/m² or above for patients of South Asian or related ethnicity) who wish to improve their blood-glucose control while minimising their effective insulin dose, may benefit from metformin hydrochloride p. 730 [unlicensed indication] as an addition to insulin therapy.

Dietary control is important in both type 1 and type 2 diabetes and patients should receive advice from a dietitian. Dietary advice should include information on weight control, cardiovascular risk, hyperglycaemic effects of different foods and appropriate changes in insulin doses according to food intake. Healthy eating can reduce cardiovascular risk and dietary modifications may be recommended to account for various associated features of diabetes such as excess weight and obesity, low body-weight, eating disorders, hypertension and renal failure. Patients with type 1 diabetes should be offered carbohydrate-counting training as part of a structured education programme. **⚡**

Insulin therapy in type 1 diabetes

EvGr All patients with type 1 diabetes require insulin therapy (see also **Insulin** p. 722). Treatment should be initiated and managed by clinicians with relevant expertise; there are several different types of regimens. **⚡**

Multiple daily injection basal-bolus insulin regimens

One or more separate daily injections of intermediate-acting insulin or long-acting insulin analogue as the basal insulin; alongside multiple bolus injections of short-acting insulin before meals. This regimen offers flexibility to tailor insulin therapy with the carbohydrate load of each meal.

Mixed (biphasic) regimen

One, two, or three insulin injections per day of short-acting insulin mixed with intermediate-acting insulin. The insulin preparations may be mixed by the patient at the time of injection, or a premixed product can be used.

Continuous subcutaneous insulin infusion (insulin pump)

A regular or continuous amount of insulin (usually in the form of a rapid-acting insulin analogue or soluble insulin), delivered by a programmable pump and insulin storage reservoir via a subcutaneous needle or cannula.

Recommended insulin regimens

EvGr Patients with type 1 diabetes should be offered multiple daily injection basal-bolus insulin regimens as the **first-line choice**. Twice-daily insulin detemir p. 756 should be offered as the long-acting basal insulin therapy. Once-daily insulin glargine p. 757 may be prescribed if insulin detemir is not tolerated, or if a twice-daily regimen is not acceptable to the patient. Insulin detemir may also be offered as an alternative once-daily regimen.

Patients who are using alternative basal regimens may continue if agreed targets are being achieved; other basal insulin regimens should be considered only if the recommended regimens do not deliver agreed targets. Non-basal-bolus insulin regimens (e.g. twice-daily mixed [biphasic], basal-only, or bolus-only regimens) are **not** recommended for adults with *newly diagnosed* type 1 diabetes.

A rapid-acting insulin analogue is recommended as the bolus or mealtime insulin replacement, rather than soluble human insulin or animal insulin (rarely used). The rapid-acting insulin analogue should be injected before meals—routine use after meals should be discouraged. Patients who have a strong preference for an alternative mealtime insulin should be offered their preferred insulin.

Alternatively, if a multiple daily injection basal-bolus regimen is not possible, a twice-daily mixed insulin regimen should be considered if it is preferred.

In patients who are using a twice-daily *human* insulin mixed regimen and have hypoglycaemia that affects their quality of life, a trial of a twice-daily analogue mixed insulin regimen should be considered.

Continuous subcutaneous insulin infusion (insulin pump) therapy, should only be offered to adults who suffer disabling hypoglycaemia, or, who have high HbA_{1c} concentrations (69 mmol/mol [8.5%] or above) with multiple daily injection therapy (including, if appropriate, the use of long-acting insulin analogues) despite a high level of care. Insulin pump therapy should be initiated by a specialist team. 

Insulin requirements

 The dosage of insulin must be determined individually for each patient and should be adjusted as necessary according to the results of regular monitoring of blood-glucose concentrations. 

Persistent poor glucose control, leading to erratic insulin requirements or episodes of hypoglycaemia, may be due to many factors, including adherence, injection technique, injection site problems, blood-glucose monitoring skills, lifestyle issues (including diet, exercise and alcohol intake), psychological issues, and organic causes such as renal disease, thyroid disorders, coeliac disease, Addison's disease or gastroparesis.

Infection, stress, accidental or surgical trauma can all increase the required insulin dose. Insulin requirements may be decreased (and therefore susceptibility to hypoglycaemia increased) by physical activity, intercurrent illness, reduced food intake, impaired renal function, and in certain endocrine disorders.

Risks of hypoglycaemia with insulin

 Hypoglycaemia is an inevitable adverse effect of insulin treatment, and patients should be advised of the warning signs and actions to take (for guidance on management, see Hypoglycaemia p. 762).

Impaired awareness of hypoglycaemia can occur when the ability to recognise usual symptoms is lost, or when the symptoms are blunted or no longer present. Patients' awareness of hypoglycaemia should be assessed annually using the Gold score or the Clarke score. 

An increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the patient. Impaired awareness of symptoms below 3 mmol/litre is associated with a significantly increased risk of severe hypoglycaemia. Beta-blockers can also blunt hypoglycaemic awareness, by reducing warning signs such as tremor.

Loss of warning of hypoglycaemia among insulin-treated patients can be a serious hazard, especially for drivers and those in dangerous occupations. Advice should be given in line with the Driver and Vehicle Licensing Agency (DVLA) guidance (see *Driving* under Diabetes p. 720).

 To restore the warning signs, episodes of hypoglycaemia must be minimised. Insulin regimens, doses

and blood-glucose targets should be reviewed and continuous subcutaneous insulin infusion therapy and real-time continuous blood-glucose monitoring should be considered. Patients should receive structured education to ensure they are following the principles of a flexible insulin regimen correctly, with additional education regarding avoiding and treating hypoglycaemia for those who continue to have impaired awareness. Relaxation of individualised blood-glucose targets should be avoided as a strategy to improve impaired awareness of symptoms. If recurrent severe episodes of hypoglycaemia continue despite appropriate interventions, the patient should be referred to a specialist centre. 

There is conflicting evidence regarding reports that some patients may experience loss of awareness of hypoglycaemia after transfer from animal to human insulin; clinical studies do not confirm that human insulin decreases hypoglycaemia awareness.

Manufacturers advise any switch between brands or formulation of insulin (including switching from animal to human insulin) should be done under strict supervision; a change in dose may be required.

Hypodermic equipment

 Patients should be advised on the safe disposal of lancets, single-use syringes, and needles, and should be provided with suitable disposal containers. Arrangements should be made for the suitable disposal of these containers.

Lancets, needles, syringes, and accessories are listed under Hypodermic Equipment in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 of the Scottish Drug Tariff). The drug Tariffs can be accessed online at:

- National Health Service Drug Tariff for England and Wales: www.nhs.uk/pharmacies-gp-practices-and-appliance-contractors/drug-tariff
- Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusiness.hscni.net/services/2034.htm
- Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff

Insulin

05-Jun-2017

Overview

For recommended insulin regimens see Type 1 diabetes p. 721 and Type 2 diabetes p. 723.

Insulin is a polypeptide hormone secreted by pancreatic beta-cells. Insulin increases glucose uptake by adipose tissue and muscles, and suppresses hepatic glucose release. The role of insulin is to lower blood-glucose concentrations in order to prevent hyperglycaemia and its associated microvascular, macrovascular and metabolic complications.

The natural profile of insulin secretion in the body consists of basal insulin (a low and steady secretion of background insulin that controls the glucose continuously released from the liver) and meal-time bolus insulin (secreted in response to glucose absorbed from food and drink).

Sources of insulin

Three types of insulin are available in the UK: human insulin, human insulin analogues, and animal insulin. Animal insulins are extracted and purified from animal

sources (bovine or porcine insulin). Although widely used in the past, animal insulins are no longer initiated in people with diabetes but may still be used by some adult patients who cannot, or do not wish to, change to human insulins.

Human insulins are produced by recombinant DNA technology and have the same amino acid sequence as endogenous human insulin. Human insulin analogues are produced in the same way as human insulins, but the insulin is modified to produce a desired kinetic characteristic, such as an extended duration of action or faster absorption and onset of action.

Immunological resistance to insulin is uncommon and true insulin allergy is rare. Human insulin and insulin analogues are less immunogenic than animal insulins.

Administration of insulin

Insulin is inactivated by gastro-intestinal enzymes and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin should be injected into a body area with plenty of subcutaneous fat—usually the abdomen (fastest absorption rate) or outer thighs/buttocks (slower absorption compared with the abdomen or inner thighs).

Absorption from a limb site can vary considerably (by as much as 20–40%) day-to-day, particularly in children. Local tissue reactions, changes in insulin sensitivity, injection site, blood flow, depth of injection, and the amount of insulin injected can all affect the rate of absorption. Increased blood flow around the injection site due to exercise can also increase insulin absorption.

[Evg] Lipohypertrophy can occur due to repeatedly injecting into the same small area, and can cause erratic absorption of insulin, and contribute to poor glycaemic control. Patients should be advised not to use affected areas for further injection until the skin has recovered. Lipohypertrophy can be minimised by using different injection sites in rotation. Injection sites should be checked for signs of infection, swelling, bruising, and lipohypertrophy before administration. **[A]**

Insulin preparations

Insulin preparations can be broadly categorised into three groups based on their time-action profiles: short-acting insulins (including soluble insulin and rapid-acting insulins), intermediate-acting insulins and long-acting insulins. The duration of action of each particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

Short-acting insulins

Short-acting insulins have a short duration and a relatively rapid onset of action, to replicate the insulin normally produced by the body in response to glucose absorbed from a meal. These are available as soluble insulin p. 722 (human and, bovine or porcine—both rarely used), and the rapid-acting insulin analogues (insulin aspart p. 752, insulin glulisine p. 753 and insulin lispro p. 754).

Soluble insulin

Soluble insulin is usually given subcutaneously but some preparations can be given intravenously and intramuscularly. For maintenance regimens, it is usual to inject the insulin 15 to 30 minutes before meals, depending on the insulin preparation used.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 1 and 4 hours, and a duration of action of up to 9 hours.

When injected intravenously, soluble insulin has a short half-life of only a few minutes and its onset of action is instantaneous.

Soluble insulin administered intravenously is the most appropriate form of insulin for use in diabetic emergencies e.g. Diabetic ketoacidosis p. 726 and peri-operatively.

Rapid-acting insulin

Insulin aspart, insulin glulisine, and insulin lispro have a faster onset of action (within 15 minutes) and shorter duration of action (approximately 2–5 hours) than soluble insulin, and are usually given by subcutaneous injection.

[Evg] For maintenance regimens, these insulins should ideally be injected immediately before meals. Rapid-acting insulin, administered before meals, has an advantage over short-acting soluble insulin in terms of improved glucose control, reduction of HbA_{1c}, and reduction in the incidence of severe hypoglycaemia, including nocturnal hypoglycaemia.

The routine use of *post-meal* injections of rapid-acting insulin should be avoided—when given during or after meals, they are associated with poorer glucose control, an increased risk of high postprandial-glucose concentration, and subsequent hypoglycaemia. **[A]**

Intermediate-acting insulin

Intermediate-acting insulins (isophane insulin p. 755) have an intermediate duration of action, designed to mimic the effect of endogenous basal insulin. When given by subcutaneous injection, they have an onset of action of approximately 1–2 hours, a maximal effect at 3–12 hours, and a duration of action of 11–24 hours.

Isophane insulin is a suspension of insulin with protamine; it may be given as one or more daily injections alongside separate meal-time short-acting insulin injections, or mixed with a short-acting (soluble or rapid-acting) insulin in the same syringe—for recommended insulin regimens see Type 1 diabetes p. 721 and Type 2 diabetes below. Isophane insulin may be mixed with a short-acting insulin by the patient, or a pre-mixed biphasic insulin can be supplied (biphasic isophane insulin p. 754, biphasic insulin aspart p. 755 and biphasic insulin lispro p. 755).

Biphasic insulins (biphasic isophane insulin, biphasic insulin aspart, biphasic insulin lispro) are pre-mixed insulin preparations containing various combinations of short-acting insulin (soluble insulin or rapid-acting analogue insulin) and an intermediate-acting insulin.

The percentage of short-acting insulin varies from 15% to 50%. These preparations should be administered by subcutaneous injection immediately before a meal.

Long-acting insulin

Like intermediate-acting insulins, the long-acting insulins (protamine zinc insulin, insulin zinc suspension, insulin detemir p. 756, insulin glargine p. 757, insulin degludec p. 756) mimic endogenous basal insulin secretion, but their duration of action may last up to 36 hours. They achieve a steady-state level after 2–4 days to produce a constant level of insulin.

Insulin glargine and insulin degludec are given once daily and insulin detemir is given once or twice daily according to individual requirements. The older long-acting insulins, (insulin zinc suspension and protamine zinc insulin) are now rarely prescribed.

Type 2 diabetes

10-May-2018

Description of condition

Type 2 diabetes is a chronic metabolic condition characterised by insulin resistance. Insufficient pancreatic insulin production also occurs progressively over time, resulting in hyperglycaemia.

It is commonly associated with obesity, physical inactivity, raised blood pressure, dyslipidaemia and a tendency to develop thrombosis; therefore it increases cardiovascular risk. It is associated with long-term microvascular and macrovascular complications, together with reduced quality of life and life expectancy.

Type 2 diabetes typically develops later in life but is increasingly diagnosed in children, despite previously being considered a disease of adulthood.

Aims of treatment

Treatment is aimed at minimising the risk of long-term microvascular and macrovascular complications by effectively blood-glucose control and maintenance of HbA1c at or below the target value set for each individual patient.

Overview

[EvGr] Weight loss, smoking cessation and regular exercise can help to reduce hyperglycaemia and reduce cardiovascular risk, and should be encouraged (with input from a dietitian where appropriate). For guidance on reducing cardiovascular risk, see Cardiovascular disease risk assessment and prevention p. 201. Antidiabetic drugs should be prescribed to augment lifestyle interventions, when these changes are not adequate to control blood-glucose alone.

Antidiabetic drugs

There are several classes of non-insulin antidiabetic drugs available for the treatment of type 2 diabetes. **[EvGr]** The choice of drug should be based on effectiveness, safety, tolerability and should also take into consideration the patient's comorbidities and concomitant medication. For recommended treatment regimens and the place in therapy of each drug, see *Drug treatment, antidiabetic drugs* (below).

Metformin hydrochloride p. 730 has an anti-hyperglycaemic effect, lowering both basal and postprandial blood-glucose concentrations. It does not stimulate insulin secretion and therefore, when given alone, does not cause hypoglycaemia. **[EvGr]** The dose of standard-release metformin hydrochloride should be increased gradually to minimise the risk of gastro-intestinal side effects. Modified-release metformin hydrochloride should be offered if standard treatment is not tolerated. ⬆️

The **sulfonylureas** (glibenclamide p. 748, gliclazide p. 748, glimepiride p. 748, glipizide p. 749, tolbutamide p. 749) may cause hypoglycaemia; it is more likely with long-acting sulfonylureas such as glibenclamide, which have been associated with severe, prolonged and sometimes fatal cases of hypoglycaemia. Sulfonylureas are also associated with modest weight gain, probably due to increased plasma-insulin concentrations.

Acarbose p. 729 has a poorer anti-hyperglycaemic effect than many other antidiabetic drugs, including the sulfonylureas, metformin hydrochloride, and pioglitazone p. 749.

The meglitinides, nateglinide p. 739 and repaglinide p. 740, have a rapid onset of action and short duration of activity. These drugs can be used flexibly around mealtimes and adjusted to fit around individual eating habits which may be beneficial for some patients, but generally are a less preferred option than the sulfonylureas.

The thiazolidinedione, pioglitazone, is associated with several long-term risks and its ongoing benefit to the patient should be reviewed regularly and treatment stopped if response is insufficient (see *Important safety information* under pioglitazone).

The dipeptidylpeptidase-4 inhibitors (gliptins), alogliptin p. 731, linagliptin p. 732, sitagliptin p. 733, saxagliptin p. 732, and vildagliptin p. 734, do not appear to be associated with weight gain and have less incidence of hypoglycaemia than the sulfonylureas.

The sodium glucose co-transporter 2 inhibitors, canagliflozin p. 740, dapagliflozin p. 742, and empagliflozin p. 744, may be suitable for some patients when first-line options are not appropriate. **[EvGr]** Canagliflozin and empagliflozin can be beneficial in patients with type 2

diabetes and established cardiovascular disease. ⬆️ Sodium glucose co-transporter 2 inhibitors are associated with a risk of diabetic ketoacidosis.

The glucagon-like peptide-1 receptor agonists, dulaglutide p. 735, exenatide p. 736, liraglutide p. 737 and lixisenatide p. 738, should be reserved for combination therapy when other treatment options have failed. **[EvGr]** Liraglutide has proven cardiovascular benefit and should be considered in patients with type 2 diabetes and established cardiovascular disease. ⬆️

Polycystic ovary syndrome

[EvGr] Metformin hydrochloride (initiated by a specialist) is prescribed as an insulin sensitising drug in women with polycystic ovary syndrome who are not planning pregnancy [unlicensed indication]. ⬆️ Long-term benefit or superiority over other treatment options has not been confirmed by good quality evidence. Metformin hydrochloride may improve short-term insulin sensitivity and reduce androgen concentrations, but there is insufficient supporting evidence that metformin improves weight gain, hirsutism, acne or regulation of the menstrual cycle. Treatment should only be initiated by a specialist. Metformin hydrochloride does not exert a hypoglycaemic action in non-diabetic patients except in overdose.

Drug treatment, antidiabetic drugs

[EvGr] Type 2 diabetes should initially be treated with a single oral antidiabetic drug. A target HbA1c concentration of 48 mmol/mol (6.5%) is generally recommended when type 2 diabetes is managed by diet and lifestyle alone or when combined with a single antidiabetic drug not associated with hypoglycaemia (such as metformin hydrochloride). Adults prescribed a single drug associated with hypoglycaemia (such as a sulphonylurea), or two or more antidiabetic drugs in combination, should usually aim for an HbA1c concentration of 53 mmol/mol (7.0%). Targets may differ and should be individualised and agreed with each patient.

Note: Consider relaxing the target HbA1c level on a case-by-case basis, with particular consideration for people who are older, frail, or where tight blood-glucose control is not appropriate or poses a high risk of the consequences of hypoglycaemia.

If HbA1c concentrations are poorly controlled despite treatment with a single drug (usually considered to be a rise of HbA1c to 58 mmol/mol (7.5%) or higher), the drug treatment should be intensified, alongside reinforcement of advice regarding diet, lifestyle, and adherence to drug treatment.

When two or more antidiabetic drugs are prescribed, an HbA1c concentration target of 53 mmol/mol (7.0%) is recommended for patients in which it is appropriate, but a relaxation of the target may be more appropriate in some individual cases (for example, those at high risk of the consequences of hypoglycaemia, poor life expectancy, or significant comorbidities). ⬆️

Initial treatment

[EvGr] Metformin hydrochloride is recommended as the first choice for initial treatment for all patients, due to its positive effect on weight loss, reduced risk of hypoglycaemic events and the additional long-term cardiovascular benefits associated with its use. ⬆️

If metformin is contra-indicated or not tolerated, see *Alternative non-metformin regimens* below.

First intensification of treatment

[EvGr] If metformin hydrochloride (alongside modification to diet) does not control HbA1c to below the agreed threshold, treatment should be intensified, and metformin hydrochloride combined with one of the following:

- a sulphonylurea (glibenclamide, gliclazide, glimepiride, glipizide, tolbutamide);
- Pioglitazone;

- a dipeptidylpeptidase-4 inhibitor (linagliptin, saxagliptin, sitagliptin, or vildagliptin);
- a sodium glucose co-transporter 2 inhibitor (canagliflozin, dapagliflozin or empagliflozin) only when sulfonylureas are contra-indicated or not tolerated, or if the patient is at significant risk of hypoglycaemia or its consequences. ▲

E**VG**r Elderly patients or those with renal impairment are at particular risk of hypoglycaemia; if a sulfonylurea is indicated, a shorter-acting sulfonylurea, such as gliclazide p. 748 or tolbutamide p. 749 should be prescribed. ◆

The place in therapy of alogliptin p. 731 (a dipeptidylpeptidase-4 inhibitor) is not yet known.

Second intensification of treatment

E**VG**r If dual therapy is unsuccessful, treatment should be intensified again, and one of the following triple therapy regimens prescribed:

- Metformin hydrochloride p. 730 and a dipeptidylpeptidase-4 inhibitor and a sulfonylurea;
- Metformin hydrochloride and pioglitazone p. 749 and a sulfonylurea;
- Metformin hydrochloride and a sulfonylurea and one of the sodium glucose co-transporter 2 inhibitors;
- Metformin hydrochloride and pioglitazone and a sodium glucose co-transporter 2 inhibitor (canagliflozin p. 740 or empagliflozin p. 744; note that dapagliflozin is not recommended in a triple therapy regimen with pioglitazone).

Alternatively, it may be appropriate to start **insulin**-based treatment at this stage—see *Drug treatment, insulin*. ▲

Glucagon-like peptide-1 receptor agonists

E**VG**r If triple therapy with metformin hydrochloride and two other oral drugs is tried and is not effective, not tolerated or contra-indicated, a **glucagon-like peptide-1 receptor agonist** may be prescribed as part of a triple combination regimen with metformin hydrochloride and a sulfonylurea.

These should only be prescribed for patients who have a BMI of 35 kg/m² or above (adjusted for ethnicity) **and** who also have specific psychological or medical problems associated with obesity; **or** for those who have a BMI lower than 35 kg/m² but for whom insulin therapy would have significant occupational implications **or** if the weight loss associated with glucagon-like peptide-1 receptor agonists would benefit other significant obesity-related comorbidities.

After 6 months, the drug should be reviewed and only continued if there has been a beneficial metabolic response (a reduction of at least 11 mmol/mol [1.0%] in HbA_{1c} and a weight loss of at least 3% of initial body-weight).

Insulin should only be prescribed in combination with a glucagon-like peptide-1 receptor agonist under specialist care advice and with ongoing support from a consultant-led multidisciplinary team. ▲

Alternative non-metformin regimens

E**VG**r If metformin is contra-indicated or not tolerated, initial treatment should be single therapy with:

- a sulfonylurea (glibenclamide p. 748, gliclazide, glimepiride p. 748, glipizide p. 749, or tolbutamide) (first choice) **or**
- a dipeptidyl peptidase-4 inhibitor (linagliptin p. 732, saxagliptin p. 732, sitagliptin p. 733, or vildagliptin p. 734), **or**
- Pioglitazone. ▲

The sodium glucose co-transporter 2 inhibitors

canagliflozin, dapagliflozin p. 742, or empagliflozin are also options for **monotherapy** when metformin is contra-indicated or not tolerated, only if a dipeptidylpeptidase-4 inhibitor would otherwise be prescribed and neither a sulfonylurea nor pioglitazone is appropriate.

E**VG**r Repaglinide p. 740 is also an effective alternative option for single therapy, but it has a limited role in

treatment because, should an intensification of treatment be required, it is not licensed to be used in any combination other than with metformin hydrochloride; it would therefore require a complete change of treatment in those patients who have started it due to intolerance or contra-indication to metformin. ▲

Intensification

E**VG**r If the initial single drug does not control HbA_{1c} to below the agreed threshold, treatment should be intensified and one of the following dual combinations prescribed:

- a dipeptidylpeptidase-4 inhibitor and pioglitazone;
- a dipeptidylpeptidase-4 inhibitor and a sulfonylurea; **or**
- Pioglitazone and a sulfonylurea.

If dual therapy does not provide adequate glucose control, insulin-based treatment should be considered—see *Drug treatment, insulin*. ▲

Drug treatment, insulin

E**VG**r When indicated for intensification, insulin (see also, Insulin p. 722) should be started with a structured support programme covering insulin dose titration, injection technique, self-monitoring, and knowledge of dietary effects and glucose control. Metformin hydrochloride should be continued unless it is contra-indicated or not tolerated. Other antidiabetic drugs should be reviewed and stopped if necessary.

Recommended insulin regimens include:

- human isophane insulin p. 755 injected once or twice daily, according to requirements;
- a human isophane insulin in combination with a short-acting insulin, administered either separately or as a pre-mixed (biphasic) human insulin preparation (this may be particularly appropriate if HbA_{1c} is 75 mmol/mol (9.0%) or higher);
- Insulin detemir p. 756 or insulin glargine p. 757 as an alternative to human isophane insulin. This can be preferable if a *once daily* injection would be beneficial (for example if assistance is required to inject insulin), or if recurrent symptomatic hypoglycaemic episodes are problematic, or if the patient would otherwise need twice-daily human isophane insulin injections in combination with oral glucose-lowering drugs. Also consider switching to insulin detemir or insulin glargine from human isophane insulin if significant hypoglycaemia is problematic, or in patients who cannot use the device needed to inject human isophane insulin;
- biphasic preparations (pre-mixed) that include a short-acting human *analogue* insulin (rather than short-acting human *soluble insulin*) can be preferable for patients who prefer injecting insulin immediately before a meal, or if hypoglycaemia is a problem, or if blood-glucose concentrations rise markedly after meals.

When starting insulin therapy, bedtime basal insulin should be initiated and the dose titrated against morning (fasting) glucose. Patients who are prescribed a basal insulin regimen (human isophane insulin, insulin detemir or insulin glargine) should be monitored for the need for short-acting insulin before meals (or a biphasic insulin preparation).

Patients who are prescribed a biphasic insulin should be monitored for the need for a further injection of short-acting insulin before meals or for a change to a basal-bolus regimen with human isophane insulin or insulin detemir or insulin glargine if blood-glucose control remains inadequate. ▲

Advanced Pharmacy Services

Patients with type 2 diabetes may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 18.

Diabetes and cardiovascular disease

Diabetes is a strong risk factor for cardiovascular disease.

EvGr Other risk factors for cardiovascular disease that should also be addressed are: smoking, hypertension, obesity, and dyslipidaemia. **A** Cardiovascular risk in patients with diabetes can be further reduced by the use of an ACE inhibitor (or an angiotensin-II receptor antagonist) and lipid-regulating drugs. For full guidance on the assessment and prevention of cardiovascular disease, see Cardiovascular disease risk assessment and prevention p. 201.

Diabetic nephropathy

EvGr In diabetic patients with nephropathy, blood pressure should be reduced to the lowest achievable level to slow the rate of decline of glomerular filtration rate and reduce proteinuria. Provided there are no contra-indications, all diabetic patients with nephropathy causing proteinuria or with established microalbuminuria should be treated with an ACE inhibitor or an angiotensin-II receptor antagonist, even if the blood pressure is normal. ACE inhibitors or angiotensin-II receptor antagonists should also be given as monotherapy, or combined therapy, in patients with chronic kidney disease and proteinuria, to reduce the rate of progression of chronic kidney disease. **A**

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in patients with renal impairment.

See also treatment of hypertension in diabetes in Hypertension p. 151.

Diabetic neuropathy

EvGr Optimal diabetic control is beneficial for the management of painful neuropathy. Monotherapy with antidepressant drugs, including tricyclics (such as amitriptyline hydrochloride p. 390 and imipramine hydrochloride p. 394 [unlicensed use]), duloxetine p. 385, and venlafaxine p. 386 [unlicensed use] should be considered in patients for the treatment of painful diabetic peripheral neuropathy. Antiepileptic drugs, such as pregabalin p. 341 and gabapentin p. 331, can also be considered. Opioid analgesics in combination with gabapentin can be considered if pain is not controlled with monotherapy. **A**

In *autonomic neuropathy*, diabetic diarrhoea can often be managed by tetracycline p. 600 [unlicensed use], or codeine phosphate p. 475 as the best alternative; other antidiarrhoeal preparations can also be tried. Erythromycin p. 569 (especially when given intravenously) may be beneficial for gastroparesis [unlicensed use].

In *neuropathic postural hypotension*, increased salt intake and the use of the mineralocorticoid fludrocortisone acetate p. 713 [unlicensed use] may help by increasing plasma volume, but uncomfortable oedema is a common side-effect. Fludrocortisone can also be combined with flurbiprofen p. 1203 and ephedrine hydrochloride p. 286 [both unlicensed]. Midodrine [unlicensed], an alpha agonist, may also be useful in postural hypotension.

Gustatory sweating can be treated with an antimuscarinic such as propantheline bromide p. 93; side-effects are common. See also, the management of hyperhidrosis (Hyperhidrosis p. 1331).

In some patients with *neuropathic oedema*, ephedrine hydrochloride [unlicensed use] offers effective relief.

See also the management of Erectile dysfunction p. 857.

Visual impairment

EvGr Optimal diabetic control (HbA_{1c} ideally around 7% or 53 mmol/mol) and blood pressure control (<130/80 mmHg) should be maintained to prevent onset and progression of diabetic eye disease. **A**

Diabetic ketoacidosis

Management

The management of diabetic ketoacidosis involves the replacement of fluid and electrolytes and the administration of insulin. Guidelines for the Management of Diabetic Ketoacidosis in Adults, published by the Joint British Diabetes Societies Inpatient Care Group (available at www.diabetes.org.uk/Professionals/Position-statements-reports/Specialist-care-for-children-and-adults-and-complications/The-Management-of-Diabetic-Ketoacidosis-in-Adults/), should be followed.

- To restore circulating volume if systolic blood pressure is below 90 mmHg (adjusted for age, sex, and medication as appropriate), give 500 mL **sodium chloride 0.9%** by intravenous infusion over 10–15 minutes; repeat if blood pressure remains below 90 mmHg and seek senior medical advice.
- When blood pressure is over 90 mmHg, **sodium chloride 0.9%** should be given by intravenous infusion at a rate that replaces deficit and provides maintenance; see guideline or suggested regimen.
- Include **potassium chloride** in the fluids unless anuria is suspected; adjust according to plasma-potassium concentration (measure at 60 minutes, 2 hours, and 2 hourly thereafter; measure hourly if outside the normal range).
- Start an intravenous insulin infusion: **soluble insulin** should be diluted (and **mixed thoroughly**) with **sodium chloride 0.9%** intravenous infusion to a concentration of 1 unit/mL; infuse at a fixed rate of 0.1 units/kg/hour.
- Established subcutaneous therapy with long-acting insulin analogues (insulin detemir p. 756 or insulin glargine p. 757) should be continued during treatment of diabetic ketoacidosis.
- Monitor blood-ketone and blood-glucose concentrations hourly and adjust the insulin infusion rate accordingly. Blood-ketone concentration should fall by at least 0.5 mmol/litre/hour and blood-glucose concentration should fall by at least 3 mmol/litre/hour.
- Once blood-glucose concentration falls below 14 mmol/litre, **glucose 10%** should be given by

intravenous infusion (into a large vein through a large-gauge needle) at a rate of 125 mL/hour, in addition to the **sodium chloride 0.9% infusion**.

- Continue insulin infusion until blood-ketone concentration is below 0.3 mmol/litre, blood pH is above 7.3 and the patient is able to eat and drink; ideally give subcutaneous fast-acting insulin and a meal, and stop the insulin infusion 1 hour later.

The management of hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion are usually necessary and slower rehydration may be required.

Diabetes, surgery and medical illness

05-Jun-2017

Management of diabetes during surgery

Peri-operative management of blood-glucose concentrations depends on factors including the required duration of fasting, timing of surgery (morning or afternoon), usual treatment regimen (insulin, antidiabetic drugs or diet), prior glycaemic control, other co-morbidities, and the likelihood that the patient will be capable of self-managing their diabetes in the immediate post-operative period. [EvGr](#) All patients should have emergency treatment for hypoglycaemia written on their drug chart on admission. [E](#)

Note: The following recommendations provide general guidance for the management of diabetes during surgery.

Local protocols and guidelines should be followed where they exist.

Use of insulin during surgery

Elective surgery—minor procedures in patients with good glycaemic control

[EvGr](#) Patients usually treated with insulin who have good glycaemic control (HbA1c less than 69 mmol/mol or 8.5%) and are undergoing *minor procedures*, can be managed during the operative period by adjustment of their usual insulin regimen, which should be adjusted depending on the type of insulin usually prescribed, following detailed local protocols (which should also include intravenous fluid management, monitoring and control of electrolytes and avoidance of hyperchloraemic metabolic acidosis). On the day before the surgery, the patient's usual insulin should be given as normal, other than once daily long-acting insulin analogues, which should be given at a dose reduced by 20%. [E](#)

Elective surgery—major procedures or poor glycaemic control

[EvGr](#) Patients usually treated with insulin, who are either undergoing *major procedures* (surgery requiring a long fasting period of more than one missed meal) or whose diabetes is poorly controlled, will usually require a variable rate intravenous insulin infusion (continued until the patient is eating/drinking and stabilised on their previous glucose-lowering medication).

The aim is to achieve and maintain glucose concentration within the usual target range (6–10 mmol/litre; but up to 12 mmol/litre is acceptable) by infusing a constant rate of glucose-containing fluid as a substrate, while also infusing insulin at a variable rate. Detailed local protocols should be consulted. In general, the following steps should be followed:

- on the *day before surgery*, once daily long-acting insulin analogues should be given at 80% of the usual dose; otherwise the patient's usual insulin should be given as normal;
- on the *day of surgery and throughout the intra-operative period*, once daily long-acting insulin analogues should be continued at 80% of the usual dose; all other insulin

should be stopped until the patient is eating and drinking again after surgery;

- on the *day of surgery*, start an intravenous substrate infusion of potassium chloride with glucose and sodium chloride p. 1100 (based on serum electrolytes which must be measured frequently), and infuse at a rate appropriate to the patient's fluid requirements. To prevent hypoglycaemia, this infusion must **not** be stopped while the insulin infusion is running;
- a variable rate intravenous insulin infusion of soluble human insulin p. 751 in sodium chloride 0.9% p. 1101 (made either according to locally agreed protocols or using prefilled syringes) should be given via a syringe pump at an initial infusion rate determined by bedside capillary blood-glucose measurement. Hourly blood-glucose measurement should be taken to ensure that the intravenous insulin infusion rate is correct for at least the first 12 hours; the insulin infusion rate should be adjusted according to local protocol to maintain blood-glucose concentrations within the usual target range (6–10 mmol/litre; up to 12 mmol/litre is acceptable);
- intravenous glucose 20% p. 1102 should be given if blood-glucose drops below 6 mmol/litre, and blood-glucose checked every hour, to prevent a drop below 4 mmol/litre. If blood-glucose drops below 4 mmol/litre, intravenous glucose 20% should be adjusted and blood-glucose checked every 15 minutes, until blood-glucose is above 6 mmol/litre (testing can then revert to hourly). If blood-glucose rises above 12 mmol/litre, check ketones and consider other signs of diabetic ketoacidosis (see Diabetic ketoacidosis p. 726).

Conversion back to a subcutaneous insulin should not begin until the patient can eat and drink without nausea or vomiting. Once the patient's previous insulin regimen is re-started, the usual insulin dose may require adjustment, as insulin requirements can change due to post-operative stress, infection or altered food intake.

Previous subcutaneous basal-bolus regimens, should be restarted when the first postoperative meal-time insulin dose is due (e.g. with breakfast or lunch); doses may need adjustment due to postoperative stress, infection or altered food intake. The variable rate intravenous insulin infusion and intravenous fluids should be continued until 30–60 minutes **after** the first meal-time short-acting insulin dose. If the patient was previously on a **long-acting insulin analogue**, this should have been continued throughout the operative period at 80% of the normal dose, and should now just continue at that same dose until the patient leaves hospital; only the short-acting insulin needs to be restarted as above.

Previous subcutaneous twice-daily mixed insulin regimens, should be restarted before breakfast or an evening meal (not at any other time). The variable rate intravenous insulin infusion should be maintained for 30–60 minutes after the first subcutaneous insulin dose has been given.

Patients who were **previously managed with a continuous subcutaneous insulin infusion** should be referred to a specialist team. The subcutaneous infusion should be restarted at the normal basal rate, not at bedtime, and the insulin infusion continued until the next meal bolus has been given.

Patients **not previously prescribed insulin**, who are to start a subcutaneous insulin regimen post-surgery, should have an insulin dose calculated with advice from a specialist diabetes team, considering the patient's sensitivity to insulin, degree of glycaemic control, weight, age, and the average hourly insulin dose used in the peri-operative period. [E](#)

Emergency surgery

[EvGr](#) Patients with diabetes (type 1 and 2) requiring emergency surgery, should always have their blood-glucose,

blood or urinary ketone concentration, serum electrolytes and serum bicarbonate checked before surgery. If ketones are high or bicarbonate is low, blood gases should also be checked. If ketoacidosis is present, recommendations for Diabetic ketoacidosis p. 726 should be followed immediately, and surgery delayed if possible. If there is no acidosis, intravenous fluids and an insulin infusion should be started and managed as for *major elective surgery* (above). 

Use of antidiabetic drugs during surgery

EvGr Manipulation of antidiabetic drug may not be appropriate for all surgery or for all patients; particularly when fasting time is more than one missed meal, in patients with poor glycaemic control, and when there is risk of renal injury. In these cases, a *variable rate intravenous insulin infusion* p. 751 should be used as for *major elective surgery* (above), and usual antidiabetic medication adjusted in the peri-operative period. Insulin is almost always required in medical and surgical emergencies.

When insulin is required and given during surgery, acarbose p. 729, meglitinides, sulfonylureas, pioglitazone p. 749, dipeptidyl peptidase-4 inhibitors (gliptins) and sodium glucose co-transporter 2 inhibitors should be stopped once the insulin infusion is commenced and not restarted until the patient is eating and drinking normally. Glucagon-like peptide-1 receptor agonists can be continued as normal during the insulin infusion.

If elective *minor surgical procedures* only require a short-fasting period (just one missed meal), it may be possible to adjust antidiabetic drugs to avoid a switch to a variable rate intravenous insulin infusion; normal drug treatment can continue.

In suitable cases, acarbose, nateglinide p. 739 and repaglinide p. 740 can be continued with just the dose omitted on the morning of surgery if fasting (the morning dose may be given if the patient is not fasting and surgery is in the afternoon).

Pioglitazone, **dipeptidylpeptidase-4 inhibitors (gliptins)** and **glucagon-like peptide-1 receptor agonists** can be taken as normal during the whole peri-operative period.

Sodium glucose co-transporter 2 inhibitors should be omitted on the day of surgery and not restarted until the patient is stable; their use during periods of dehydration and acute illness is associated with an increased risk of developing diabetic ketoacidosis.

Sulfonylureas are associated with hypoglycaemia in the fasted state and therefore should always be omitted on the day of surgery until the patient is eating and drinking again. Capillary blood-glucose should be checked hourly. If hyperglycaemia occurs, an appropriate dose of subcutaneous rapid-acting insulin may be given. A second dose may be given 2 hours later, and a variable rate intravenous insulin infusion considered if hyperglycaemia persists.

Metformin hydrochloride p. 730 is renally excreted; renal impairment may lead to accumulation and lactic acidosis during surgery. If only one meal will be missed during surgery, and the patient has an eGFR greater than 60 mL/minute/1.73m² and a low risk of acute kidney injury (and the procedure does not involve administration of contrast media), it may be possible to continue metformin hydrochloride throughout the peri-operative period—just the lunchtime dose should be omitted if the usual dose is prescribed three times a day.

If the patient will miss more than one meal or there is significant risk of the patient developing acute kidney injury, metformin hydrochloride should be stopped when the pre-operative fast begins. A variable rate intravenous insulin infusion should be started if the metformin hydrochloride dose is more than once daily. Otherwise insulin should only be started if blood-glucose concentration is greater than 12 mmol/litre on two consecutive occasions. Metformin

should not be recommended until the patient is eating and drinking again, and normal renal function has been assured.

There is no need to stop metformin hydrochloride after contrast medium in patients missing only one meal or who have an eGFR greater than 60 mL/minute/1.73m². If contrast medium is to be used, and eGFR is less than 60 mL/minute/1.73m², metformin should be omitted on the day of the procedure and for the following 48 hours. 

Use of antidiabetic drugs during medical illness

Manufacturers of some antidiabetic drugs recommend that they may need to be replaced temporarily with insulin during intercurrent illness when the drug is unlikely to control hyperglycaemia (such as myocardial infarction, coma, severe infection, trauma and other medical emergencies). Consult individual product literature.

Sodium glucose co-transporter 2 inhibitors are associated with increased risk of developing diabetic ketoacidosis during periods of dehydration, stress, surgery, trauma, acute medical illness or any other catabolic state, and should be used with caution during these times. The MHRA has advised (2016) that these drugs should be temporarily stopped in patients who are hospitalised for acute serious illness until the patient is medically stable.

Diabetes, pregnancy and breast-feeding

01-Aug-2017

Description of condition

Diabetes in pregnancy is associated with increased risks to the woman (such as pre-eclampsia and rapidly worsening retinopathy), and to the developing fetus, compared with pregnancy in non-diabetic women. Effective blood-glucose control before conception and throughout pregnancy reduces (but does not eliminate) the risk of adverse outcomes such as miscarriage, congenital malformation, stillbirth, and neonatal death.

Management of pre-existing diabetes

EvGr Women with pre-existing diabetes who are planning on becoming pregnant should aim to keep their HbA1c concentration below 48 mmol/mol (6.5%) if possible without causing problematic hypoglycaemia. Any reduction towards this target is likely to reduce the risk of congenital malformations in the newborn.

Women with pre-existing diabetes who are planning to become pregnant should be advised to take folic acid at the dose for women who are at high-risk of conceiving a child with a neural tube defect, see folic acid p. 1084. 

Overview

Oral antidiabetic drugs

EvGr All oral antidiabetic drugs, except metformin hydrochloride p. 730, should be discontinued before pregnancy (or as soon as an unplanned pregnancy is identified) and substituted with insulin therapy. Women with diabetes may be treated with metformin hydrochloride [unlicensed in type 1 diabetes] as an adjunct or alternative to insulin in the preconception period and during pregnancy, when the likely benefits from improved blood-glucose control outweigh the potential for harm. Metformin hydrochloride can be continued, or glibenclamide p. 748 resumed, immediately after birth and during breast-feeding for those with pre-existing Type 2 diabetes p. 723. All other antidiabetic drugs should be avoided while breast-feeding. 

Insulin

Limited evidence suggests that the rapid-acting insulin analogues (insulin aspart p. 752 and insulin lispro p. 754) can be associated with fewer episodes of hypoglycaemia, a

reduction in postprandial glucose excursions and an improvement in overall glycaemic control compared with regular human insulin.

EvGr Isophane insulin p. 755 is the first-choice for long-acting insulin during pregnancy, however in women who have good blood-glucose control before pregnancy with the long-acting insulin analogues (insulin detemir p. 756 or insulin glargine p. 757), it may be appropriate to continue using them throughout pregnancy.

Continuous subcutaneous insulin infusion p. 751 (insulin pump therapy) may be appropriate for pregnant women who have difficulty achieving glycaemic control with multiple daily injections of insulin p. 751 without significant disabling hypoglycaemia.

All women treated with insulin p. 751 during pregnancy should be aware of the risks of hypoglycaemia, particularly in the first trimester, and should be advised to always carry a fast-acting form of glucose, such as dextrose tablets or a glucose-containing drink. Pregnant women with Type 1 diabetes p. 721 should also be prescribed glucagon p. 763 for use if needed.

Women with pre-existing diabetes treated with insulin p. 751 during pregnancy are at increased risk of hypoglycaemia in the postnatal period and should reduce their insulin immediately after birth. Blood-glucose levels should be monitored carefully to establish the appropriate dose. **A**

Medication for diabetic complications

EvGr Angiotensin-converting enzyme inhibitors and angiotensin II receptor antagonists should be discontinued and replaced with an alternative antihypertensive suitable for use in pregnancy before conception or as soon as pregnancy is confirmed (see *Hypertension in pregnancy* under Hypertension p. 151). Statins should not be prescribed during pregnancy and should be discontinued before a planned pregnancy. **A**

Gestational diabetes

EvGr Women with gestational diabetes who have a fasting plasma glucose below 7 mmol/litre at diagnosis, should first attempt a change in diet and exercise alone in order to reduce blood-glucose. If blood-glucose targets are not met within 1 to 2 weeks, metformin hydrochloride p. 730 may be prescribed [unlicensed use]. Insulin p. 751 may be prescribed if metformin is contra-indicated or not acceptable, and may also be added to treatment if metformin is not effective alone.

Women who have a fasting plasma glucose above 7 mmol/litre at diagnosis should be treated with insulin immediately, with or without metformin hydrochloride, in addition to a change in diet and exercise.

Women who have a fasting plasma glucose between 6 and 6.9 mmol/litre alongside complications such as macrosomia or hydramnios should be considered for immediate insulin treatment, with or without metformin hydrochloride.

Glibenclamide p. 748 [unlicensed use] may be considered for women from 11 weeks gestation (after organogenesis) who cannot tolerate metformin, or for those in whom metformin is not effective and do not wish to have insulin therapy.

Women with gestational diabetes should discontinue hypoglycaemic treatment immediately after giving birth. **A**

BLOOD GLUCOSE LOWERING DRUGS > ALPHA GLUCOSIDASE INHIBITORS

Acarbose

06-Feb-2020

- **DRUG ACTION** Acarbose, an inhibitor of intestinal alpha glucosidases, delays the digestion and absorption of starch and sucrose; it has a small but significant effect in lowering blood glucose.

● INDICATIONS AND DOSE

Diabetes mellitus inadequately controlled by diet or by diet with oral antidiabetic drugs

▶ BY MOUTH

- ▶ **Adult:** Initially 50 mg daily, then increased to 50 mg 3 times a day for 6–8 weeks, then increased if necessary to 100 mg 3 times a day (max. per dose 200 mg 3 times a day)

- **CONTRA-INDICATIONS** Disorders of digestion or absorption · hernia (condition may deteriorate) · inflammatory bowel disease · predisposition to intestinal obstruction

- **CAUTIONS** May enhance hypoglycaemic effects of insulin and sulfonylureas (hypoglycaemic episodes may be treated with oral glucose but not with sucrose)

- **INTERACTIONS** → Appendix 1: acarbose

● SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea (may need to reduce dose) · gastrointestinal discomfort · gastrointestinal disorders

- ▶ **Uncommon** Nausea · vomiting

- ▶ **Rare or very rare** Hepatic disorders · oedema

- ▶ **Frequency not known** Acute generalised exanthematous pustulosis (AGEP) · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION Antacids containing magnesium and aluminium salts unlikely to be beneficial for treating side effects.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 25 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor liver function.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be chewed with first mouthful of food or swallowed whole with a little liquid immediately before food.

- **PATIENT AND CARER ADVICE** Antacids unlikely to be beneficial for treating side-effects. To counteract possible hypoglycaemia, patients receiving insulin or a sulfonylurea as well as acarbose need to carry glucose (not sucrose—acarbose interferes with sucrose absorption). Patients should be given advice on how to administer acarbose tablets.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Acarbose (Non-proprietary)**

Acarbose 50 mg Acarbose 50mg tablets | 90 tablet **[POM]** £14.58 DT = £14.58

Acarbose 100 mg Acarbose 100mg tablets | 90 tablet **[POM]** £25.29 DT = £25.29

BLOOD GLUCOSE LOWERING DRUGS >

BIGUANIDES

Metformin hydrochloride

26-Jul-2018

- **DRUG ACTION** Metformin exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus [monotherapy or in combination with other antidiabetic drugs (including insulin)]

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Child 10–17 years (specialist use only): Initially 500 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day
- ▶ Adult: Initially 500 mg once daily for at least 1 week, dose to be taken with breakfast, then 500 mg twice daily for at least 1 week, dose to be taken with breakfast and evening meal, then 500 mg 3 times a day, dose to be taken with breakfast, lunch and evening meal; maximum 2 g per day
- ▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- ▶ Adult: Initially 500 mg once daily, then increased if necessary up to 2 g once daily, dose increased gradually, every 10–15 days, dose to be taken with evening meal, alternatively increased to 1 g twice daily, dose to be taken with meals, alternative dose only to be used if control not achieved with once daily dose regimen. If control still not achieved then change to standard release tablets

Type 2 diabetes mellitus [reduction in risk or delay of onset]

- ▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- ▶ Adult 18–74 years: Initially 500 mg once daily, then increased if necessary up to 2 g once daily, dose increased gradually, every 10–15 days, dose to be taken with evening meal, for further information on risk factors—consult product literature

Polycystic ovary syndrome

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Adult: Initially 500 mg once daily for 1 week, dose to be taken with breakfast, then 500 mg twice daily for 1 week, dose to be taken with breakfast and evening meal, then 1.5–1.7 g daily in 2–3 divided doses

● UNLICENSED USE

- ▶ In adults [\[EvGr\]](#) Based on clinical experience of increased side-effects, maximum dose for metformin immediate-release medicines in BNF Publications differs from product licence. [\[E\]](#) Not licensed for polycystic ovary syndrome.

- **CONTRA-INDICATIONS** Acute metabolic acidosis (including lactic acidosis and diabetic ketoacidosis)

- **CAUTIONS** Risk factors for lactic acidosis

CAUTIONS, FURTHER INFORMATION

- ▶ Risk factors for lactic acidosis Manufacturer advises caution in chronic stable heart failure (monitor cardiac function), and concomitant use of drugs that can acutely impair renal function; interrupt treatment if dehydration occurs, and avoid in conditions that can acutely worsen renal function, or cause tissue hypoxia.
- ▶ Elderly Prescription potentially inappropriate (STOPP criteria) if eGFR less than 30 mL/minute/1.73 m² (risk of lactic acidosis). See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: metformin

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · appetite decreased · diarrhoea (usually transient) · gastrointestinal disorder · nausea · taste altered · vomiting
- ▶ **Rare or very rare** Hepatitis · lactic acidosis (discontinue) · skin reactions · vitamin B12 absorption decreased

SIDE-EFFECTS, FURTHER INFORMATION Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses are given. A slow increase in dose may improve tolerability.

- **PREGNANCY** Can be used in pregnancy for both pre-existing and gestational diabetes. Women with gestational diabetes should discontinue treatment after giving birth.

- **BREAST FEEDING** May be used during breast-feeding in women with pre-existing diabetes.

- **HEPATIC IMPAIRMENT** Withdraw if tissue hypoxia likely.

● RENAL IMPAIRMENT

- ▶ In adults Manufacturer advises avoid if eGFR is less than 30 mL/minute/1.73 m².

- ▶ In children Manufacturer advises avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².

Dose adjustments ▶ In children Manufacturer advises consider dose reduction in moderate impairment.

- ▶ In adults Manufacturer advises reduce dose in moderate impairment—consult product literature.

- **MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually (at least twice a year in patients with additional risk factors for renal impairment, or if deterioration suspected).

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ In adults Patients taking up to 2 g daily of the standard-release metformin may start with the same daily dose of metformin modified release; not suitable if dose of standard-release tablets more than 2 g daily.

- **PATIENT AND CARER ADVICE** Manufacturer advises that patients and their carers should be informed of the risk of lactic acidosis and told to seek immediate medical attention if symptoms such as dyspnoea, muscle cramps, abdominal pain, hypothermia, or asthenia occur.

Medicines for Children leaflet: Metformin for diabetes www.medicinesforchildren.org.uk/metformin-diabetes

● NATIONAL FUNDING/ACCESS DECISIONS

GLUCOPHAGE[®] SR

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (October 2009) that *Glucophage[®] SR* is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in adult patients who are intolerant of standard-release metformin, and in whom the prolonged-release tablet allows the use of a dose of metformin not previously tolerated, or in patients for whom a once daily preparation offers a clinically significant benefit.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Modified-release tablet

BLOOD GLUCOSE LOWERING DRUGS >

DIPEPTIDYLPEPTIDASE-4 INHIBITORS (GLIPTINS)

Alogliptin

23-Jan-2020

- **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus in combination with other antidiabetic drugs (including insulin) if existing treatment fails to achieve adequate glycaemic control

▶ BY MOUTH

- ▶ Adult: 25 mg once daily, for further information on use with other antidiabetic drugs—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Dose of concomitant sulfonylurea or insulin may need to be reduced.
- ▶ Caution with use in combination with both metformin and pioglitazone—risk of hypoglycaemia (dose of metformin or pioglitazone may need to be reduced).

- **CONTRA-INDICATIONS** Ketoacidosis

- **CAUTIONS** History of pancreatitis (not recommended in moderate to severe heart failure (limited experience))

- **INTERACTIONS** → Appendix 1: alogliptin

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · gastroesophageal reflux disease · headache · increased risk of infection · skin reactions
 - ▶ **Frequency not known** Angioedema · hepatic function abnormal · pancreatitis acute · Stevens-Johnson syndrome
- SIDE-EFFECTS, FURTHER INFORMATION** Discontinue if symptoms of acute pancreatitis occur such as persistent, severe abdominal pain.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Use with caution if eGFR less than 30 mL/minute/1.73 m².
Dose adjustments Reduce dose to 12.5 mg once daily if eGFR 30–50 mL/minute/1.73 m².
Reduce dose to 6.25 mg once daily if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Determine renal function before treatment and periodically thereafter.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Vipidia** (Takeda UK Ltd)

- Alogliptin (as Alogliptin benzoate) 6.25 mg** Vipidia 6.25mg tablets | 28 tablet [PoM] £26.60 DT = £26.60
- Alogliptin (as Alogliptin benzoate) 12.5 mg** Vipidia 12.5mg tablets | 28 tablet [PoM] £26.60 DT = £26.60
- Alogliptin (as Alogliptin benzoate) 25 mg** Vipidia 25mg tablets | 28 tablet [PoM] £26.60 DT = £26.60

Alogliptin with metformin

03-Feb-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, alogliptin p. 731, metformin hydrochloride p. 730.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either pioglitazone or insulin

- ▶ BY MOUTH
- ▶ Adult: 1 tablet twice daily, based on patient's current metformin dose

● **INTERACTIONS** → Appendix 1: alogliptin · metformin

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

▶ **Vipdomet** (Takeda UK Ltd)

Alogliptin (as Alogliptin benzoate) 12.5 mg, Metformin hydrochloride 1 gram Vipdomet 12.5mg/1000mg tablets | 56 tablet [PoM] £26.60 DT = £26.60

Linagliptin

19-Sep-2017

● **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with other antidiabetic drugs (including insulin) if existing treatment fails to achieve adequate glycaemic control

- ▶ BY MOUTH
- ▶ Adult: 5 mg once daily, for further information on use with other antidiabetic drugs—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Dose of concomitant sulfonylurea or insulin may need to be reduced.

● **INTERACTIONS** → Appendix 1: linagliptin

● SIDE-EFFECTS

- ▶ **Uncommon** Cough · nasopharyngitis
- ▶ **Rare or very rare** Angioedema · skin reactions
- ▶ **Frequency not known** Pancreatitis

SIDE-EFFECTS, FURTHER INFORMATION Discontinue if symptoms of acute pancreatitis occur such as persistent, severe abdominal pain.

● **PREGNANCY** Avoid—no information available.

● **BREAST FEEDING** Avoid—present in milk in *animal* studies.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised that linagliptin (*Trajenta*[®]) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as monotherapy when both metformin and a sulfonylurea are inappropriate (January 2013), and in combination with metformin when addition of a sulfonylurea is inappropriate (December 2011).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ **Trajenta** (Boehringer Ingelheim Ltd)

Linagliptin 5 mg Trajenta 5mg tablets | 28 tablet [PoM] £33.26 DT = £33.26

Combinations available: *Empagliflozin with linagliptin*, p. 745

Linagliptin with metformin

03-Feb-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, linagliptin above, metformin hydrochloride p. 730.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin

- ▶ BY MOUTH
- ▶ Adult: 1 tablet twice daily, based on patient's current metformin dose

● **INTERACTIONS** → Appendix 1: linagliptin · metformin

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (June 2015) that linagliptin plus metformin combination tablets (*Jentadueto*[®]) are accepted for restricted use within NHS Scotland for the treatment of adult patients with type 2 diabetes mellitus in combination with insulin, as an adjunct to diet and exercise to improve glycaemic control when a combination of insulin and metformin alone is inadequate. It is restricted to use in the treatment of patients for whom a combination of linagliptin and metformin is an appropriate choice of therapy and the fixed doses are considered appropriate.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

▶ **Jentadueto** (Boehringer Ingelheim Ltd)

Linagliptin 2.5 mg, Metformin hydrochloride 850 mg Jentadueto 2.5mg/850mg tablets | 56 tablet [PoM] £33.26 DT = £33.26

Linagliptin 2.5 mg, Metformin hydrochloride 1000 mg Jentadueto 2.5mg/1000mg tablets | 56 tablet [PoM] £33.26 DT = £33.26

Saxagliptin

25-Feb-2020

● **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with other antidiabetic drugs (including insulin) if existing treatment fails to achieve adequate glycaemic control

- ▶ BY MOUTH
- ▶ Adult: 5 mg once daily, for further information on use with other antidiabetic drugs—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Dose of concomitant sulfonylurea or insulin may need to be reduced.

● **CAUTIONS** Elderly · history of pancreatitis · moderate to severe heart failure (limited experience)

● **INTERACTIONS** → Appendix 1: saxagliptin

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · dizziness · fatigue · headache · increased risk of infection · skin reactions · vomiting
- ▶ **Uncommon** Pancreatitis
- ▶ **Rare or very rare** Angioedema
- ▶ **Frequency not known** Constipation · nausea

SIDE-EFFECTS, FURTHER INFORMATION Discontinue if symptoms of acute pancreatitis occur such as persistent, severe abdominal pain.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if patient has a history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors.
- **PREGNANCY** Avoid unless essential—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment (risk of increased exposure).
- **RENAL IMPAIRMENT** Use with caution in severe impairment.
Dose adjustments Reduce dose to 2.5 mg once daily in moderate to severe impairment.
- **MONITORING REQUIREMENTS** Determine renal function before treatment and periodically thereafter.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised that saxagliptin (*Onglyza*[®]) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as triple therapy in combination with metformin and a sulfonylurea, as an alternative to existing dipeptidyl peptidase-4 inhibitors, when treatment with metformin and a sulfonylurea is inadequate (November 2013).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Onglyza** (AstraZeneca UK Ltd)
Saxagliptin (as Saxagliptin hydrochloride) 2.5 mg Onglyza 2.5mg tablets | 28 tablet [PoM] £31.60 DT = £31.60
- Saxagliptin (as Saxagliptin hydrochloride) 5 mg Onglyza 5mg tablets | 28 tablet [PoM] £31.60 DT = £31.60

Saxagliptin with dapagliflozin

19-Jul-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, saxagliptin p. 732, dapagliflozin p. 742.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus not controlled by metformin and/or a sulfonylurea with either saxagliptin or dapagliflozin

- ▶ BY MOUTH
- ▶ Adult 18–74 years: 5/10 mg once daily
- ▶ Adult 75 years and over: Initiation not recommended

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Dose of concomitant sulfonylurea may need to be reduced.

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg saxagliptin/dapagliflozin.

- **INTERACTIONS** → Appendix 1: dapagliflozin · saxagliptin
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT**
Dose adjustments Manufacturer advises avoid if eGFR less than 60 mL/minute/1.73 m² (ineffective).
- **PATIENT AND CARER ADVICE**
Missed doses Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (July 2017) that saxagliptin with dapagliflozin 5 mg/10 mg (*Qtern*[®]) is accepted for restricted use within NHS Scotland for the treatment of patients with type 2 diabetes mellitus in

combination with metformin when the use of a sulfonylurea is inappropriate, only if:

- metformin and/or a sulfonylurea, in combination with dapagliflozin or saxagliptin, do not provide adequate glycaemic control; or
- the patient is already being treated with the free combination of dapagliflozin and saxagliptin.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Qtern** (AstraZeneca UK Ltd)
Saxagliptin (as Saxagliptin hydrochloride) 5 mg, Dapagliflozin (as Dapagliflozin propanediol monohydrate) 10 mg Qtern 5mg/10mg tablets | 28 tablet [PoM] £49.56 DT = £49.56

Saxagliptin with metformin

07-Feb-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, saxagliptin p. 732, metformin hydrochloride p. 730.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin

- ▶ BY MOUTH
- ▶ Adult: 1 tablet twice daily, based on patient's current metformin dose

- **INTERACTIONS** → Appendix 1: metformin · saxagliptin
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (June 2013) that *Komboglyze*[®] is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in patients unable to achieve adequate glycaemic control with metformin alone and when the addition of a sulfonylurea is inappropriate.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Komboglyze** (AstraZeneca UK Ltd)
Saxagliptin (as Saxagliptin hydrochloride) 2.5 mg, Metformin hydrochloride 850 mg Komboglyze 2.5mg/850mg tablets | 56 tablet [PoM] £31.60 DT = £31.60
- Saxagliptin (as Saxagliptin hydrochloride) 2.5 mg, Metformin hydrochloride 1 gram Komboglyze 2.5mg/1000mg tablets | 56 tablet [PoM] £31.60 DT = £31.60

Sitagliptin

03-Feb-2020

- **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with other antidiabetic drugs (including insulin) if existing treatment fails to achieve adequate glycaemic control

- ▶ BY MOUTH
- ▶ Adult: 100 mg once daily, for further information on use with other antidiabetic drugs—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Dose of concomitant sulfonylurea or insulin may need to be reduced.

- **CONTRA-INDICATIONS** Ketoacidosis
- **INTERACTIONS** → Appendix 1: sitagliptin

● SIDE-EFFECTS

- ▶ **Common or very common** Headache
- ▶ **Uncommon** Constipation · dizziness · skin reactions
- ▶ **Frequency not known** Angioedema · back pain · cutaneous vasculitis · interstitial lung disease · joint disorders · myalgia · pancreatitis acute · renal impairment · Stevens-Johnson syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Discontinue if symptoms of acute pancreatitis occur such as persistent, severe abdominal pain.

- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

● RENAL IMPAIRMENT

Dose adjustments Manufacturer advises reduce dose to 50 mg once daily if eGFR 30–45 mL/minute/1.73 m².

Manufacturer advises reduce dose to 25 mg once daily if eGFR less than 30 mL/minute/1.73 m².

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 607/10

The *Scottish Medicines Consortium* has advised (July 2010) that sitagliptin (*Januvia*®) is accepted for restricted use within NHS Scotland as monotherapy, to improve glycaemic control in patients with type 2 diabetes mellitus, for whom both metformin and sulfonylureas are not appropriate.

SMC No. 1083/15

The *Scottish Medicines Consortium* has advised (September 2015) that sitagliptin (*Januvia*®) is accepted for use within NHS Scotland as an add-on to insulin (with or without metformin) to improve glycaemic control in adults with type 2 diabetes mellitus.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ **Januvia** (Merck Sharp & Dohme Ltd)

Sitagliptin (as Sitagliptin phosphate) 25 mg Januvia 25mg tablets | 28 tablet [PoM] £33.26 DT = £33.26

Sitagliptin (as Sitagliptin phosphate) 50 mg Januvia 50mg tablets | 28 tablet [PoM] £33.26 DT = £33.26

Sitagliptin (as Sitagliptin phosphate) 100 mg Januvia 100mg tablets | 28 tablet [PoM] £33.26 DT = £33.26

Sitagliptin with metformin

07-Feb-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, sitagliptin p. 733, metformin hydrochloride p. 730.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or pioglitazone or insulin

- ▶ **BY MOUTH**
- ▶ **Adult:** 1 tablet twice daily

- **INTERACTIONS** → Appendix 1: metformin · sitagliptin
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (July 2008) that *Janumet*® is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus when the addition of a sulfonylurea to metformin is not appropriate; it is also accepted for use in NHS Scotland in combination with a sulfonylurea in patients inadequately controlled on maximum tolerated doses of metformin and a sulfonylurea.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

▶ **Janumet** (Merck Sharp & Dohme Ltd)
Sitagliptin (as Sitagliptin phosphate) 50 mg, Metformin hydrochloride 1 gram Janumet 50mg/1000mg tablets | 56 tablet [PoM] £33.26 DT = £33.26

Vildagliptin

11-Feb-2020

- **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with other antidiabetic drugs (including insulin) if existing treatment fails to achieve adequate glycaemic control

▶ **BY MOUTH**

▶ **Adult:** 50 mg twice daily, reduce dose to 50 mg once daily in the morning when used in dual combination with a sulfonylurea. For further information on use with other antidiabetic drugs—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

▶ Dose of concomitant sulfonylurea or insulin may need to be reduced.

- **CONTRA-INDICATIONS** Ketoacidosis
- **CAUTIONS** History of pancreatitis · manufacturer advises avoid in severe heart failure—no information available
- **INTERACTIONS** → Appendix 1: vildagliptin

● SIDE-EFFECTS

- ▶ **Common or very common** Dizziness
- ▶ **Uncommon** Arthralgia · constipation · headache · hypoglycaemia · peripheral oedema
- ▶ **Rare or very rare** Increased risk of infection
- ▶ **Frequency not known** Hepatitis · myalgia · pancreatitis · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION Pancreatitis

Discontinue if symptoms of acute pancreatitis occur, such as persistent severe abdominal pain.

Liver toxicity Rare reports of liver dysfunction; discontinue if jaundice or other signs of liver dysfunction occur.

- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT**
- ▶ **Dose adjustments** Reduce dose to 50 mg once daily if eGFR less than 50 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor liver function before treatment and every 3 months for first year and periodically thereafter.
- **PATIENT AND CARER ADVICE**
- ▶ **Liver toxicity** Patients should be advised to seek prompt medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue, and dark urine develop.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 435/07

The *Scottish Medicines Consortium* has advised (April 2008) that vildagliptin (*Galvus*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in combination with metformin when addition of a sulfonylurea is inappropriate.

SMC No. 571/09

The *Scottish Medicines Consortium* has advised (October 2009) that vildagliptin (*Galvus*®) is accepted for use within

NHS Scotland for the treatment of type 2 diabetes mellitus in combination with a sulphonylurea for those patients where the maximal dose of a sulphonylurea as monotherapy is insufficient, or if metformin is inappropriate.

SMC No. 826/12

The *Scottish Medicines Consortium* has advised (January 2013) that vildagliptin (*Galvus*®) is accepted for restricted use within NHS Scotland as monotherapy for the treatment of type 2 diabetes mellitus in adults when treatment with metformin or a sulphonylurea is inappropriate.

SMC No. 875/13

The *Scottish Medicines Consortium* has advised (December 2013) that vildagliptin (*Galvus*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in adults as triple therapy in combination with metformin and a sulphonylurea, as an alternative to existing dipeptidyl peptidase-4 inhibitors, when treatment with metformin and a sulphonylurea is inadequate.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Galvus** (Novartis Pharmaceuticals UK Ltd)

Vildagliptin 50 mg Galvus 50mg tablets | 56 tablet **[PoM]** £33.35 DT = £33.35

Vildagliptin with metformin

03-Feb-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, vildagliptin p. 734, metformin hydrochloride p. 730.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulphonylurea or insulin

- ▶ BY MOUTH
- ▶ Adult: 1 tablet twice daily, based on patient's current metformin dose

- **INTERACTIONS** → Appendix 1: metformin · vildagliptin

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 477/08

The *Scottish Medicines Consortium* has advised (July 2008) that vildagliptin with metformin (*Eucreas*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in patients unable to achieve adequate glycaemic control with metformin alone or those already treated with vildagliptin and metformin as separate tablets.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Eucreas** (Novartis Pharmaceuticals UK Ltd)

Vildagliptin 50 mg, Metformin hydrochloride 850 mg Eucreas 50mg/850mg tablets | 60 tablet **[PoM]** £35.68 DT = £35.68

Vildagliptin 50 mg, Metformin hydrochloride 1 gram Eucreas 50mg/1000mg tablets | 60 tablet **[PoM]** £35.68 DT = £35.68

BLOOD GLUCOSE LOWERING DRUGS >

GLUCAGON-LIKE PEPTIDE-1 RECEPTOR AGONISTS

Dulaglutide

11-Mar-2020

- **DRUG ACTION** Dulaglutide is a long-acting glucagon-like peptide 1 (GLP-1) receptor agonist that augments glucose-dependent insulin secretion, and slows gastric emptying.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus as monotherapy if metformin inappropriate

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 0.75 mg once weekly

Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 1.5 mg once weekly

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: GLP-1 RECEPTOR AGONISTS: REPORTS OF DIABETIC KETOACIDOSIS WHEN CONCOMITANT INSULIN WAS RAPIDLY REDUCED OR DISCONTINUED (JUNE 2019)

Serious and life-threatening cases of diabetic ketoacidosis have been reported in patients with type 2 diabetes mellitus on a combination of a glucagon-like peptide-1 (GLP-1) receptor agonist and insulin, particularly after discontinuation or rapid dose reduction of concomitant insulin. Healthcare professionals are advised that any dose reduction of insulin should be done in a stepwise manner with careful blood glucose self-monitoring, particularly when GLP-1 receptor agonist therapy is initiated. Patients should be informed of the risk factors for and signs and symptoms of diabetic ketoacidosis, and advised to seek immediate medical attention if these develop.

- **CONTRA-INDICATIONS** Severe gastro-intestinal disease—no information available
- **INTERACTIONS** → Appendix 1: dulaglutide
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Appetite decreased · atrioventricular block · burping · constipation · diarrhoea · fatigue · gastrointestinal discomfort · gastrointestinal disorders · hypoglycaemia · nausea · sinus tachycardia · vomiting
 - ▶ **Rare or very rare** Anaphylactic reaction · angioedema · pancreatitis acute (discontinue)
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HANDLING AND STORAGE** **Refrigerated storage** is usually necessary (2 °C – 8 °C). Once in use, may be stored unrefrigerated for up to 14 days at a temperature not above 30 °C.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer dulaglutide injection. Acute pancreatitis Patients should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.
 - ▶ **Missed doses** If a dose is missed, it should be administered as soon as possible only if there are at least 3 days until the next scheduled dose; if less than 3 days remain before the

next scheduled dose, the missed dose should not be taken and the next dose should be taken at the normal time.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 1110/15

The *Scottish Medicines Consortium* has advised (January 2016) that dulaglutide (*Trulicity*®) is accepted for restricted use for treating adults with type 2 diabetes to improve glycaemic control as add-on therapy in combination with other glucose-lowering medicines, when these, together with diet and exercise, do not provide adequate glycaemic control. It is restricted to use as part of a triple therapy in patients with inadequate glycaemic control on two oral anti-diabetic medicines, as an alternative GLP-1 agonist option.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Trulicity** (Eli Lilly and Company Ltd)

Dulaglutide 1.5 mg per 1 ml Trulicity 0.75mg/0.5ml solution for injection pre-filled pens | 4 pre-filled disposable injection [PoM] £73.25 DT = £73.25

Dulaglutide 3 mg per 1 ml Trulicity 1.5mg/0.5ml solution for injection pre-filled pens | 4 pre-filled disposable injection [PoM] £73.25 DT = £73.25

Exenatide

07-Feb-2020

- **DRUG ACTION** Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

• INDICATIONS AND DOSE

Type 2 diabetes mellitus in combination with metformin or a sulfonylurea, or both, or with pioglitazone, or with both metformin and pioglitazone, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination

▶ BY SUBCUTANEOUS INJECTION USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart)

▶ BY SUBCUTANEOUS INJECTION USING MODIFIED-RELEASE MEDICINES

▶ Adult: 2 mg once weekly

Type 2 diabetes mellitus in combination with basal insulin alone or with metformin or pioglitazone (or both)

▶ BY SUBCUTANEOUS INJECTION USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart)

DOSE ADJUSTMENTS DUE TO INTERACTIONS

▶ Dose of concomitant sulfonylurea may need to be reduced.

PHARMACOKINETICS

▶ Effect of *modified-release* exenatide injection (*Bydureon*®) may persist for 10 weeks after discontinuation.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: GLP-1 RECEPTOR AGONISTS: REPORTS OF DIABETIC KETOACIDOSIS WHEN CONCOMITANT INSULIN WAS RAPIDLY REDUCED OR DISCONTINUED (JUNE 2019)

Serious and life-threatening cases of diabetic ketoacidosis have been reported in patients with type 2 diabetes mellitus on a combination of a glucagon-like

peptide-1 (GLP-1) receptor agonist and insulin, particularly after discontinuation or rapid dose reduction of concomitant insulin. Healthcare professionals are advised that any dose reduction of insulin should be done in a stepwise manner with careful blood glucose self-monitoring, particularly when GLP-1 receptor agonist therapy is initiated. Patients should be informed of the risk factors for and signs and symptoms of diabetic ketoacidosis, and advised to seek immediate medical attention if these develop.

- **CONTRA-INDICATIONS** Ketoacidosis · severe gastro-intestinal disease
 - **CAUTIONS** Elderly · may cause weight loss greater than 1.5 kg weekly · pancreatitis
 - **INTERACTIONS** → Appendix 1: exenatide
 - **SIDE-EFFECTS**
 - ▶ **Common or very common** Appetite decreased · asthenia · constipation · diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders · headache · nausea · skin reactions · vomiting
 - ▶ **Uncommon** Alopecia · burping · drowsiness · hyperhidrosis · renal impairment · taste altered
 - ▶ **Frequency not known** Angioedema · pancreatitis acute
- SIDE-EFFECTS, FURTHER INFORMATION** Severe pancreatitis (sometimes fatal), including haemorrhagic or necrotising pancreatitis, has been reported rarely; discontinue permanently if diagnosed.

- **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should use effective contraception during treatment with modified-release exenatide and for 12 weeks after discontinuation.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** For *standard-release* injection, use with caution if eGFR 30–50 mL/minute/1.73 m². For *standard-release* injection, avoid if eGFR less than 30 mL/minute/1.73 m². For *modified-release* injection, avoid if eGFR less than 50 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE** Patients changing from standard-release to modified-release exenatide formulation may experience initial transient increase in blood glucose. Some oral medications should be taken at least 1 hour before or 4 hours after exenatide injection—consult product literature for details. Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek prompt medical attention if symptoms such as abdominal pain, nausea, and vomiting develop.
- **Missed doses** If a dose of the immediate-release medicine is missed, continue with the next scheduled dose—do not administer **after** a meal.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 376/07

The *Scottish Medicines Consortium* has advised (July 2007) that standard-release exenatide (*Byetta*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin or sulfonylurea (or both), as an alternative to treatment with insulin in patients where treatment with metformin or sulfonylurea (or both) at maximally tolerated doses has been inadequate, and treatment with insulin would be the next option.

SMC No. 684/11

The *Scottish Medicines Consortium* has advised (March 2011) that standard-release exenatide (*Byetta*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with

metformin and a thiazolidinedione as a third-line pre-insulin treatment option.

SMC No. 748/11

The *Scottish Medicines Consortium* has advised (January 2012) that modified-release exenatide (*Bydureon*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes as a third-line treatment option.

SMC No. 785/12

The *Scottish Medicines Consortium* has advised (June 2012) that standard-release exenatide (*Byetta*®) is accepted for use within NHS Scotland as adjunctive therapy to basal insulin with or without metformin and/or pioglitazone in patients with type 2 diabetes who have not achieved adequate glycaemic control with these agents.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Liraglutide

11-Jul-2019

- **DRUG ACTION** Liraglutide binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

● INDICATIONS AND DOSE

SAXENDA®

Adjunct in weight management [in conjunction with dietary measures and increased physical activity in individuals with a body mass index (BMI) of 30 kg/m² or more, or in individuals with a BMI of 27 kg/m² or more in the presence of at least one weight-related comorbidity]

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 0.6 mg once daily, then increased in steps of 0.6 mg, dose to be increased at intervals of at least 1 week; consider discontinuation if escalation to the next dose is not tolerated for 2 consecutive weeks. Discontinue if at least 5% of initial body-weight has not been lost after 12 weeks at maximum dose; maximum 3 mg per day

VICTOZA®

Type 2 diabetes mellitus [monotherapy (if metformin inappropriate), or in combination with other antidiabetic drugs]

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 0.6 mg once daily for at least 1 week, then increased to 1.2 mg once daily for at least 1 week, then increased if necessary to 1.8 mg once daily, for information on use with other antidiabetic drugs—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Dose of concomitant insulin or sulfonylurea may need to be reduced.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: GLP-1 RECEPTOR AGONISTS: REPORTS OF DIABETIC KETOACIDOSIS WHEN CONCOMITANT INSULIN WAS RAPIDLY REDUCED OR DISCONTINUED (JUNE 2019)

- ▶ When used for Type 2 diabetes mellitus
Serious and life-threatening cases of diabetic ketoacidosis have been reported in patients with type 2 diabetes mellitus on a combination of a glucagon-like peptide-1 (GLP-1) receptor agonist and insulin, particularly after discontinuation or rapid dose reduction of concomitant insulin. Healthcare professionals are advised that any dose reduction of insulin should be done in a stepwise manner with careful blood glucose self-monitoring, particularly when GLP-1 receptor agonist therapy is initiated. Patients should be informed of the risk factors for and signs and symptoms of diabetic ketoacidosis, and advised to seek immediate medical attention if these develop.

- **CONTRA-INDICATIONS** Diabetic gastroparesis · inflammatory bowel disease · severe congestive heart failure—no information available
- **SAXENDA®** Concomitant use with other products for weight management · elderly 75 years or over (limited information) · obesity secondary to endocrinological or eating disorders
- **VICTOZA®** Diabetic ketoacidosis
- **CAUTIONS** Thyroid disease
- **INTERACTIONS** → Appendix 1: liraglutide
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Appetite decreased · asthenia · burping · constipation · diarrhoea · dizziness · dry mouth · gallbladder disorders · gastrointestinal discomfort · gastrointestinal disorders · headache · increased risk of infection · insomnia · nausea · skin reactions · taste altered · toothache · vomiting
 - ▶ **Uncommon** Dehydration · malaise · pancreatitis · renal impairment · tachycardia
 - ▶ **Frequency not known** Angioedema · dyspnoea · hypotension · oedema · palpitations · pancreatitis acute (discontinue permanently) · thyroid disorder
- **SIDE-EFFECTS, FURTHER INFORMATION** Discontinue if symptoms of acute pancreatitis occur, such as persistent, severe abdominal pain.
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies (recommendation also supported by tertiary sources).
- **BREAST FEEDING** Manufacturer advises avoid—no information available; *animal* studies suggest that transfer into milk is low, but excretion into human milk not known (a tertiary source confirms lack of information in human lactation, but also states that risk to infants appears to be negligible. [EvdGr](#) Blood glucose monitoring of the infant should be considered). [D](#)
- **HEPATIC IMPAIRMENT**
 - **SAXENDA®** Manufacturer advises use with caution in mild to moderate impairment; avoid in severe impairment (risk of decreased exposure).
 - **VICTOZA®** Manufacturer advises avoid in severe impairment (risk of decreased exposure).
- **RENAL IMPAIRMENT**
 - **SAXENDA®** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute.
 - **VICTOZA®** Manufacturer advises avoid in end-stage renal disease.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—after first use can also be stored below 30°C and used within 1 month; keep cap on pen to protect from light.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek immediate medical attention if symptoms develop. Manufacturer advises patients and their carers should be informed of the potential risk of dehydration in relation to gastro-intestinal side-effects and advised to take precautions to avoid fluid depletion; they should also be informed of the symptoms of cholelithiasis and cholecystitis, and of increased heart rate.
- **SAXENDA® Missed doses** Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Healthcare professionals are advised that any dose reduction of insulin should be done in a stepwise manner with careful blood glucose self-monitoring, particularly when GLP-1 receptor agonist therapy is initiated. Patients should be informed of the risk factors for and signs and symptoms of diabetic ketoacidosis, and advised to seek immediate medical attention if these develop.

- **CONTRA-INDICATIONS** Diabetic ketoacidosis · severe congestive heart failure (no information available)
- **CAUTIONS** Diabetic retinopathy (in patients treated with insulin) · history of pancreatitis
- **INTERACTIONS** → Appendix 1: semaglutide
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Appetite decreased · burping · cholelithiasis · constipation · diarrhoea · dizziness · fatigue · gastrointestinal discomfort · gastrointestinal disorders · hypoglycaemia (in combination with insulin or sulfonylurea) · nausea · vomiting · weight decreased
 - ▶ **Uncommon** Taste altered
- **SIDE-EFFECTS, FURTHER INFORMATION** Discontinue if symptoms of acute pancreatitis occur, such as persistent, severe abdominal pain.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during and for at least two months after stopping treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (limited information in severe impairment).
- **RENAL IMPAIRMENT** Manufacturer advises avoid in end-stage renal disease.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—after first use can also be stored below 30°C; keep cap on pen to protect from light.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek immediate medical attention if symptoms develop.
 - **Missed doses** Manufacturer advises if a dose is more than 5 days late, the missed dose should not be taken and the next dose should be administered at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2092

The *Scottish Medicines Consortium* has advised (January 2019) that semaglutide (*Ozempic*®) is accepted for restricted use within NHS Scotland for the treatment of adults with insufficiently controlled type 2 diabetes mellitus in addition to other oral antidiabetic medicines, or as an add-on to basal insulin, as an alternative glucagon-like peptide-1 receptor agonist option.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Ozempic** (Novo Nordisk Ltd) ▼

Semaglutide 1.34 mg per 1 ml Ozempic 0.25mg/0.19ml solution for injection 1.5ml pre-filled pens | 1 pre-filled disposable injection [PoM] £73.25 DT = £73.25

Ozempic 0.5mg/0.37ml solution for injection 1.5ml pre-filled pens | 1 pre-filled disposable injection [PoM] £73.25 DT = £73.25

Ozempic 1mg/0.74ml solution for injection 3ml pre-filled pens | 1 pre-filled disposable injection [PoM] £73.25 DT = £73.25

BLOOD GLUCOSE LOWERING DRUGS > MEGLITINIDES

Nateglinide

25-Feb-2020

- **DRUG ACTION** Nateglinide stimulates insulin secretion.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus in combination with metformin when metformin alone inadequate

- ▶ **BY MOUTH**

▶ **Adult:** Initially 60 mg 3 times a day (max. per dose 180 mg), adjusted according to response, to be taken within 30 minutes before main meals

- **CONTRA-INDICATIONS** Ketoacidosis
- **CAUTIONS** Debilitated patients · elderly · malnourished patients
- **CAUTIONS, FURTHER INFORMATION** Manufacturer advises patients exposed to stress (including fever, trauma, infection or surgery) may require treatment interruption and temporary replacement with insulin to maintain glycaemic control.
- **INTERACTIONS** → Appendix 1: nateglinide
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Diarrhoea · gastrointestinal discomfort · hypoglycaemia · nausea
 - ▶ **Uncommon** Vomiting
 - ▶ **Rare or very rare** Skin reactions
 - ▶ **Frequency not known** Appetite increased · dizziness · fatigue · muscle weakness · palpitations · sweating abnormal · tremor
- **PREGNANCY** Avoid—toxicity in animal studies.
- **BREAST FEEDING** Avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment (no information available).
- **PATIENT AND CARER ADVICE**
 - **Driving and skilled tasks** Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Starlix** (Novartis Pharmaceuticals UK Ltd)

Nateglinide 60 mg Starlix 60mg tablets | 84 tablet [PoM] £26.12 DT = £26.12

Nateglinide 180 mg Starlix 180mg tablets | 84 tablet [PoM] £29.76 DT = £29.76

Repaglinide

14-Feb-2020

● **DRUG ACTION** Repaglinide stimulates insulin secretion.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate)

► BY MOUTH

► Adult: Initially 500 micrograms (max. per dose 4 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1–2 weeks; maximum 16 mg per day

Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate), if transferring from another oral antidiabetic drug

► BY MOUTH

► Adult: Initially 1 mg (max. per dose 4 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1–2 weeks; maximum 16 mg per day

● **CONTRA-INDICATIONS** Ketoacidosis

● **CAUTIONS** Debilitated patients · elderly (no information available) · malnourished patients

CAUTIONS, FURTHER INFORMATION Manufacturer advises patients exposed to stress (including fever, trauma, infection or surgery) may require treatment interruption and temporary replacement with insulin to maintain glycaemic control.

● **INTERACTIONS** → Appendix 1: repaglinide

● SIDE-EFFECTS

► **Common or very common** Abdominal pain · diarrhoea · hypoglycaemia

► **Rare or very rare** Cardiovascular disease · constipation · hepatic function abnormal · vasculitis · vision disorders · vomiting

► **Frequency not known** Acute coronary syndrome · hypoglycaemic coma · nausea · skin reactions

● **PREGNANCY** Avoid.

● **BREAST FEEDING** Avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (risk of increased exposure).

● **RENAL IMPAIRMENT** Use with caution.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Repaglinide (Non-proprietary)

Repaglinide 500 microgram Repaglinide 500microgram tablets | 30 tablet **[PoM]** £2.30-£3.33 | 90 tablet **[PoM]** £10.00 DT = £6.91

Repaglinide 1 mg Repaglinide 1mg tablets | 30 tablet **[PoM]** £2.62-£3.53 | 90 tablet **[PoM]** £10.58 DT = £7.87

Repaglinide 2 mg Repaglinide 2mg tablets | 90 tablet **[PoM]** £10.50 DT = £4.72

► **Englid** (Consilient Health Ltd)

Repaglinide 500 microgram Englid 0.5mg tablets | 30 tablet **[PoM]** £3.33 | 90 tablet **[PoM]** £9.99 DT = £6.91

Repaglinide 1 mg Englid 1mg tablets | 30 tablet **[PoM]** £3.33 | 90 tablet **[PoM]** £9.99 DT = £7.87

Repaglinide 2 mg Englid 2mg tablets | 90 tablet **[PoM]** £9.99 DT = £4.72

► **Prandin** (Novo Nordisk Ltd)

Repaglinide 500 microgram Prandin 0.5mg tablets | 30 tablet **[PoM]** £3.92

Repaglinide 1 mg Prandin 1mg tablets | 30 tablet **[PoM]** £3.92

Repaglinide 2 mg Prandin 2mg tablets | 90 tablet **[PoM]** £11.76 DT = £4.72

BLOOD GLUCOSE LOWERING DRUGS > SODIUM GLUCOSE CO-TRANSPORTER 2 INHIBITORS

Canagliflozin

17-Apr-2020

● **DRUG ACTION** Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus as monotherapy (if metformin inappropriate) | Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)

► BY MOUTH

► Adult: 100 mg once daily; increased if tolerated to 300 mg once daily if required, dose to be taken preferably before breakfast

DOSE ADJUSTMENTS DUE TO INTERACTIONS

► Manufacturer advises increase dose if tolerated to 300 mg once daily with concurrent use of rifampicin.
► Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these
- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- use canagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
- interrupt SGLT2 inhibitor treatment in patients who are hospitalised for major surgery or acute serious illnesses; treatment may be restarted once the patient's condition has stabilised

MHRA/CHM ADVICE: SGLT2 INHIBITORS: MONITOR KETONES IN BLOOD DURING TREATMENT INTERRUPTION FOR SURGICAL PROCEDURES OR ACUTE SERIOUS MEDICAL ILLNESS (MARCH 2020)

New recommendations have been issued following a European review of peri-operative diabetic ketoacidosis

in patients taking SGLT2 inhibitors. Healthcare professionals are advised to monitor ketone levels during SGLT2 inhibitor treatment interruption in patients who have been hospitalised for major surgery or acute serious illness—measurement of blood ketone levels is preferred to urine. Treatment may be restarted once ketone levels are normal and the patient's condition has stabilised.

MHRA/CHM ADVICE (UPDATED MARCH 2017): INCREASED RISK OF LOWER-LIMB AMPUTATION (MAINLY TOES)

Canagliflozin may increase the risk of lower-limb amputation (mainly toes) in patients with type 2 diabetes. Preventive foot care is important for all patients with diabetes. The MHRA has issued the following advice while clinical trials are ongoing:

- consider stopping canagliflozin if a patient develops a significant lower limb complication (e.g. skin ulcer, osteomyelitis, or gangrene)
- carefully monitor patients who have risk factors for amputation (e.g. previous amputations, existing peripheral vascular disease, or neuropathy)
- monitor all patients for signs and symptoms of water or salt loss; ensure patients stay sufficiently hydrated to prevent volume depletion in line with the manufacturer's recommendations
- advise patients to stay well hydrated, carry out routine preventive foot care, and seek medical advice promptly if they develop skin ulceration, discolouration, or new pain or tenderness
- start treatment for foot problems (e.g. ulceration, infection, or new pain or tenderness) as early as possible
- continue to follow standard treatment guidelines for routine preventive foot care for people with diabetes.

MHRA/CHM ADVICE: SGLT2 INHIBITORS: REPORTS OF FOURNIER'S GANGRENE (NECROTISING FASCIIITIS OF THE GENITALIA OR PERINEUM) (FEBRUARY 2019)

Fournier's gangrene, a rare but serious and potentially life-threatening infection, has been associated with the use of sodium-glucose co-transporter 2 (SGLT2) inhibitors. If Fournier's gangrene is suspected, stop the SGLT2 inhibitor and urgently start treatment (including antibiotics and surgical debridement).

Patients should be advised to seek urgent medical attention if they experience severe pain, tenderness, erythema, or swelling in the genital or perineal area, accompanied by fever or malaise—urogenital infection or perineal abscess may precede necrotising fasciitis.

- **CONTRA-INDICATIONS** Ketoacidosis
- **CAUTIONS** Elderly (risk of volume depletion) · elevated haematocrit · heart failure (limited experience) · hypotension · risk of volume depletion
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Volume depletion Correct hypovolaemia before starting treatment.
- **INTERACTIONS** → Appendix 1: canagliflozin
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Balanoposthitis · constipation · dyslipidaemia · hypoglycaemia (in combination with insulin or sulfonylurea) · increased risk of infection · nausea · thirst · urinary disorders · urosepsis
 - ▶ **Uncommon** Dehydration · dizziness postural · hypotension · lower limb amputations · renal failure · skin reactions · syncope
 - ▶ **Rare or very rare** Anaphylactic reaction · angioedema · diabetic ketoacidosis (discontinue immediately)
 - ▶ **Frequency not known** Fournier's gangrene (discontinue and initiate treatment promptly)

SIDE-EFFECTS, FURTHER INFORMATION Consider interrupting treatment if volume depletion occurs.

- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Avoid initiation if eGFR less than 60 mL/minute/1.73 m². Avoid if eGFR less than 45 mL/minute/1.73 m².
Dose adjustments Reduce dose to 100 mg once daily if eGFR falls persistently below 60 mL/minute/1.73 m² and existing canagliflozin treatment tolerated.
- **Monitoring** Monitor renal function at least twice a year in moderate impairment.
- **MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually thereafter, and before initiation of concomitant drugs that reduce renal function and periodically thereafter.
- **PATIENT AND CARER ADVICE** Patients should be advised to report symptoms of volume depletion including postural hypotension and dizziness. Patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Canagliflozin, dapagliflozin and empagliflozin as monotherapies for treating type 2 diabetes (May 2016)** NICE TA390

Canagliflozin (*Invokana*[®]) as monotherapy is recommended as an option for treating type 2 diabetes in adults for whom metformin is contra-indicated or not tolerated and when diet and exercise alone do not provide adequate glycaemic control, only if a dipeptidyl peptidase-4 (DPP-4) inhibitor would otherwise be prescribed, **and** a sulfonylurea or pioglitazone is not appropriate.

Patients currently receiving canagliflozin whose disease does not meet the above criteria should be able to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta390

- ▶ **Canagliflozin in combination therapy for treating type 2 diabetes (June 2014)** NICE TA315

Canagliflozin (*Invokana*[®]) in a dual therapy regimen in combination with metformin is recommended for the treatment of type 2 diabetes, only if a sulfonylurea is contra-indicated or not tolerated, **or** the patient has a significant risk of hypoglycaemia.

Canagliflozin in a triple therapy regimen is an option for the treatment of type 2 diabetes in combination with metformin and a sulfonylurea, **or** metformin and a thiazolidinedione.

Canagliflozin in combination with insulin (alone or with other antidiabetic drugs) is an option for the treatment of type 2 diabetes.

Patients currently receiving canagliflozin in a dual or triple therapy regimen that is not recommended according to the above criteria should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these
- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- use dapagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
- interrupt SGLT2 inhibitor treatment in patients who are hospitalised for major surgery or acute serious illnesses; treatment may be restarted once the patient's condition has stabilised

MHRA/CHM ADVICE: SGLT2 INHIBITORS: MONITOR KETONES IN BLOOD DURING TREATMENT INTERRUPTION FOR SURGICAL PROCEDURES OR ACUTE SERIOUS MEDICAL ILLNESS (MARCH 2020)

New recommendations have been issued following a European review of peri-operative diabetic ketoacidosis in patients taking SGLT2 inhibitors. Healthcare professionals are advised to monitor ketone levels during SGLT2 inhibitor treatment interruption in patients who have been hospitalised for major surgery or acute serious illness—measurement of blood ketone levels is preferred to urine. Treatment may be restarted once ketone levels are normal and the patient's condition has stabilised.

MHRA/CHM ADVICE: SGLT2 INHIBITORS: REPORTS OF FOURNIER'S GANGRENE (NECROTISING FASCITIS OF THE GENITALIA OR PERINEUM) (FEBRUARY 2019)

Fournier's gangrene, a rare but serious and potentially life-threatening infection, has been associated with the use of sodium-glucose co-transporter 2 (SGLT2) inhibitors. If Fournier's gangrene is suspected, stop the SGLT2 inhibitor and urgently start treatment (including antibiotics and surgical debridement).

Patients should be advised to seek urgent medical attention if they experience severe pain, tenderness, erythema, or swelling in the genital or perineal area,

accompanied by fever or malaise—urogenital infection or perineal abscess may precede necrotising fasciitis.

● CONTRA-INDICATIONS

- ▶ When used for type 1 diabetes mellitus High risk of diabetic ketoacidosis (consult product literature)
- **CAUTIONS** Elderly (risk of volume depletion) · hypotension · raised haematocrit · risk of volume depletion
- CAUTIONS, FURTHER INFORMATION**
- ▶ Volume depletion Correct hypovolaemia before starting treatment.
- **INTERACTIONS** → Appendix 1: dapagliflozin
- **SIDE-EFFECTS**
- ▶ **Common or very common** Back pain · balanoposthitis · diabetic ketoacidosis (discontinue immediately) · dizziness · dyslipidaemia · hypoglycaemia (in combination with insulin or sulfonylurea) · increased risk of infection · rash · urinary disorders
- ▶ **Uncommon** Constipation · dry mouth · genital pruritus · hypovolaemia · thirst · vulvovaginal pruritus · weight decreased
- ▶ **Rare or very rare** Angioedema · Fournier's gangrene (discontinue and initiate treatment promptly)

SIDE-EFFECTS, FURTHER INFORMATION Interrupt treatment if volume depletion occurs.

- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (risk of increased exposure, limited information available).

Dose adjustments

- ▶ When used for Type 2 diabetes mellitus Manufacturer advises initially 5 mg daily in severe impairment, increased if tolerated to 10 mg daily.
- **RENAL IMPAIRMENT** Manufacturer advises avoid initiation if eGFR less than 60 mL/minute/1.73 m² (reduced efficacy). Manufacturer advises avoid if eGFR persistently less than 45 mL/minute/1.73 m² (reduced efficacy). If eGFR less than 60 mL/minute/1.73 m² manufacturer advises monitor renal function at least 2–4 times per year.

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor renal function before treatment, and at least annually thereafter.
- ▶ When used for Type 1 diabetes mellitus Manufacturer advises patients should monitor ketone levels before starting and during treatment (blood ketone levels are preferred to urine)—consult product literature.
- **PATIENT AND CARER ADVICE** Patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Dapagliflozin in combination therapy for treating type 2 diabetes (updated November 2016) NICE TA288 Dapagliflozin (*Forxiga*®) in a dual therapy regimen in combination with metformin is recommended for the treatment of type 2 diabetes, only if the patient is at significant risk of hypoglycaemia or its consequences, or if a sulfonylurea is contra-indicated or not tolerated. Dapagliflozin in combination with insulin (alone or with other antidiabetic drugs) is an option for the treatment of type 2 diabetes.

Patients currently receiving dapagliflozin in a dual therapy regimen that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta288

- ▶ Canagliflozin, dapagliflozin and empagliflozin as monotherapies for treating type 2 diabetes (May 2016) NICE TA390

Dapagliflozin (*Forxiga*®) as monotherapy is recommended as an option for treating type 2 diabetes in adults for whom metformin is contra-indicated or not tolerated, only if a dipeptidyl peptidase-4 (DPP-4) inhibitor would otherwise be prescribed, and a sulfonylurea or pioglitazone is not appropriate.

Patients currently receiving dapagliflozin whose disease does not meet the above criteria should be able to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta390

- ▶ Dapagliflozin in triple therapy for treating type 2 diabetes (November 2016) NICE TA418

Dapagliflozin (*Forxiga*®) in a triple therapy regimen is recommended as an option for treating type 2 diabetes in adults, only in combination with metformin and a sulfonylurea.

Patients currently receiving dapagliflozin in other triple therapy regimens, whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta418

- ▶ Dapagliflozin with insulin for treating type 1 diabetes (updated February 2020) NICE TA597

Dapagliflozin (*Forxiga*®) with insulin is recommended as an option for treating type 1 diabetes in adults with a body mass index (BMI) of at least 27 kg/m², when insulin alone does not provide adequate glycaemic control despite optimal insulin therapy, only if:

- they are on insulin doses of more than 0.5 units/kg of body weight per day, and
- they have completed a structured education programme that is evidence based, quality assured, delivered by trained educators and includes information about diabetic ketoacidosis, such as:
- how to recognise its risk factors, signs and symptoms
- how and when to monitor blood ketone levels
- what actions to take for elevated blood ketones, and
- treatment is started and supervised by a consultant physician specialising in endocrinology and diabetes treatment, and haemoglobin A1c (HbA1c) levels are assessed after 6 months and regularly after this.

Stop dapagliflozin if there has not been a sustained improvement in glycaemic control (that is, a fall in HbA1c level of about 0.3% or 3 mmol/mol).

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta597

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2185

The *Scottish Medicines Consortium* has advised (September 2019) that dapagliflozin (*Forxiga*®) is accepted for use within NHS Scotland for the treatment of type 1 diabetes as an adjunct to insulin, in adults with a body mass index (BMI) of at least 27 kg/m², when insulin alone fails to achieve adequate glycaemic control.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus as monotherapy (if metformin inappropriate) | Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)

► BY MOUTH

► Adult 18–84 years: 10 mg once daily, increased to 25 mg once daily if necessary and if tolerated

► Adult 85 years and over: Initiation not recommended

DOSE ADJUSTMENTS DUE TO INTERACTIONS

► Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these
- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- use empagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
- interrupt SGLT2 inhibitor treatment in patients who are hospitalised for major surgery or acute serious illnesses; treatment may be restarted once the patient's condition has stabilised

MHRA/CHM ADVICE: SGLT2 INHIBITORS: MONITOR KETONES IN BLOOD DURING TREATMENT INTERRUPTION FOR SURGICAL PROCEDURES OR ACUTE SERIOUS MEDICAL ILLNESS (MARCH 2020)

New recommendations have been issued following a European review of peri-operative diabetic ketoacidosis in patients taking SGLT2 inhibitors. Healthcare professionals are advised to monitor ketone levels during SGLT2 inhibitor treatment interruption in patients who have been hospitalised for major surgery or acute serious illness—measurement of blood ketone levels is preferred to urine. Treatment may be restarted once ketone levels are normal and the patient's condition has stabilised.

MHRA/CHM ADVICE: SGLT2 INHIBITORS: REPORTS OF FOURNIER'S GANGRENE (NECROTISING FASCITIS OF THE GENITALIA OR PERINEUM) (FEBRUARY 2019)

Fournier's gangrene, a rare but serious and potentially life-threatening infection, has been associated with the use of sodium-glucose co-transporter 2 (SGLT2) inhibitors. If Fournier's gangrene is suspected, stop the SGLT2 inhibitor and urgently start treatment (including antibiotics and surgical debridement).

Patients should be advised to seek urgent medical attention if they experience severe pain, tenderness, erythema, or swelling in the genital or perineal area,

accompanied by fever or malaise—urogenital infection or perineal abscess may precede necrotising fasciitis.

- **CONTRA-INDICATIONS** Diabetic ketoacidosis
- **CAUTIONS** Complicated urinary tract infections—consider temporarily interrupting treatment. elderly (risk of volume depletion) · heart failure (limited experience) · hypotension · risk of volume depletion
- CAUTIONS, FURTHER INFORMATION**
- ▶ Volume depletion Manufacturer advises correct hypovolaemia before starting treatment. Consider interrupting treatment if volume depletion occurs.
- **INTERACTIONS** → Appendix 1: empagliflozin
- **SIDE-EFFECTS**
- ▶ **Common or very common** Balanoposthitis · hypoglycaemia (in combination with insulin or sulfonylurea) · increased risk of infection · skin reactions · thirst · urinary disorders · urosepsis
- ▶ **Uncommon** Hypovolaemia
- ▶ **Rare or very rare** Diabetic ketoacidosis (discontinue immediately)
- ▶ **Frequency not known** Angioedema · Fournier's gangrene (discontinue and initiate treatment promptly)
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Avoid initiation if eGFR below 60 mL/minute/1.73 m². Avoid if eGFR is persistently below 45 mL/minute/1.73 m².
Dose adjustments Reduce dose to 10 mg once daily if eGFR falls persistently below 60 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Determine renal function before treatment and before initiation of concomitant drugs that may reduce renal function, then at least annually thereafter.
- **PATIENT AND CARER ADVICE** Patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE decisions
- ▶ **Canagliflozin, dapagliflozin and empagliflozin as monotherapies for treating type 2 diabetes (May 2016)** NICE TA390
Empagliflozin (*Jardiance*®) as monotherapy is recommended as an option for treating type 2 diabetes in adults for whom metformin is contra-indicated or not tolerated and when diet and exercise alone do not provide adequate glycaemic control, only if a dipeptidyl peptidase-4 (DPP-4) inhibitor would otherwise be prescribed, **and** a sulfonylurea or pioglitazone is not appropriate.
Patients currently receiving empagliflozin whose disease does not meet the above criteria should be able to continue treatment until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta390
- ▶ **Empagliflozin in combination therapy for treating type 2 diabetes (March 2015)** NICE TA336
Empagliflozin (*Jardiance*®) in a dual therapy regimen in combination with metformin is an option for the treatment of type 2 diabetes, only if:
 - a sulfonylurea is contra-indicated or not tolerated, **or**
 - the patient is at significant risk of hypoglycaemia or its consequences.
 Empagliflozin in a triple therapy regimen is an option for the treatment of type 2 diabetes in combination with:
 - metformin and a sulfonylurea, **or**
 - metformin and a thiazolidinedione.

Empagliflozin in combination with insulin with or without other antidiabetic drugs is an option for the treatment of type 2 diabetes.

Patients currently receiving empagliflozin whose disease does not meet the above criteria should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta336

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Empagliflozin with linagliptin

11-Sep-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, empagliflozin p. 744, linagliptin p. 732.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus [not controlled by metformin and/or a sulfonylurea with either empagliflozin or linagliptin]

- ▶ **BY MOUTH**
- ▶ **Adult 18-74 years:** 10/5 mg once daily, increased to 25/5 mg once daily if necessary and if tolerated
- ▶ **Adult 75 years and over:** Initiation not recommended

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg of empagliflozin/linagliptin.

- **INTERACTIONS** → Appendix 1: empagliflozin · linagliptin
- **PATIENT AND CARER ADVICE**
Missed doses Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) decisions
SMC No. SMC1236/17
The *Scottish Medicines Consortium* has advised (August 2019) that empagliflozin with linagliptin (*Glyxambi*®) is accepted for restricted use within NHS Scotland in adults with type 2 diabetes mellitus:
 - to improve glycaemic control when metformin and/or sulphonylurea, and one of the monocomponents of *Glyxambi*® do not provide adequate glycaemic control, **or**
 - when already being treated with the free combination of empagliflozin and linagliptin.
Its use is restricted in line with previous advice on empagliflozin and linagliptin.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Glyxambi** (Boehringer Ingelheim Ltd) ▼
Linagliptin 5 mg, Empagliflozin 10 mg Glyxambi 10mg/5mg tablets | 28 tablet **[PoM]** £55.88 DT = £55.88
- Linagliptin 5 mg, Empagliflozin 25 mg** Glyxambi 25mg/5mg tablets | 28 tablet **[PoM]** £55.88 DT = £55.88

Empagliflozin with metformin

14-Feb-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, empagliflozin p. 744, metformin hydrochloride p. 730.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with other antidiabetic drugs or insulin

- ▶ BY MOUTH
- ▶ Adult 18–84 years: 5/850–5/1000 mg twice daily, based on patient's current metformin dose, increased if necessary to 12.5/850–12.5/1000 mg twice daily
- ▶ Adult 85 years and over: Initiation not recommended

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

DOSE EQUIVALENCE AND CONVERSION

- ▶ The proportions are expressed in the form "x"/"y" where "x" and "y" are the strengths in milligrams of empagliflozin and metformin respectively.

- **INTERACTIONS** → Appendix 1: empagliflozin · metformin

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 1092/15

The *Scottish Medicines Consortium* has advised (October 2015) that empagliflozin with metformin (*Synjardy*[®]) is accepted for restricted use within NHS Scotland in patients for whom a fixed dose combination of empagliflozin and metformin is an appropriate choice of therapy, or when use of a sulfonylurea is considered inappropriate.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Empagliflozin 12.5 mg, Metformin hydrochloride 1 gram Synjardy 12.5mg/1000mg tablets | 56 tablet [PoM] £36.59 DT = £36.59

Empagliflozin 5 mg, Metformin hydrochloride 1 gram Synjardy 5mg/1000mg tablets | 56 tablet [PoM] £36.59 DT = £36.59

Ertugliflozin

17-Apr-2020

- **DRUG ACTION** Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus as monotherapy (if metformin inappropriate) | Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)

- ▶ BY MOUTH
- ▶ Adult: 5 mg once daily; increased to 15 mg once daily if necessary and if tolerated, dose to be taken in the morning

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these
- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- use ertugliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
- interrupt SGLT2 inhibitor treatment in patients who are hospitalised for major surgery or acute serious illness; treatment may be restarted once the patient's condition has stabilised

MHRA/CHM ADVICE: SGLT2 INHIBITORS: MONITOR KETONES IN BLOOD DURING TREATMENT INTERRUPTION FOR SURGICAL PROCEDURES OR ACUTE SERIOUS MEDICAL ILLNESS (MARCH 2020)

New recommendations have been issued following a European review of peri-operative diabetic ketoacidosis in patients taking SGLT2 inhibitors. Healthcare professionals are advised to monitor ketone levels during SGLT2 inhibitor treatment interruption in patients who have been hospitalised for major surgery or acute serious illness—measurement of blood ketone levels is preferred to urine. Treatment may be restarted once ketone levels are normal and the patient's condition has stabilised.

MHRA/CHM ADVICE: SGLT2 INHIBITORS: REPORTS OF FOURNIER'S GANGRENE (NECROTISING FASCITIS OF THE GENITALIA OR PERINEUM) (FEBRUARY 2019)

Fournier's gangrene, a rare but serious and potentially life-threatening infection, has been associated with the use of sodium-glucose co-transporter 2 (SGLT2) inhibitors. If Fournier's gangrene is suspected, stop the SGLT2 inhibitor and urgently start treatment (including antibiotics and surgical debridement).

Patients should be advised to seek urgent medical attention if they experience severe pain, tenderness, erythema, or swelling in the genital or perineal area,

accompanied by fever or malaise—urogenital infection or perineal abscess may precede necrotising fasciitis.

- **CONTRA-INDICATIONS** Diabetic ketoacidosis
- **CAUTIONS** Dehydration · elderly (risk of volume depletion) · heart failure (limited experience) · history of hypotension
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Volume depletion Manufacturer advises correct hypovolaemia before starting treatment—consider interrupting treatment if volume depletion occurs.
- **INTERACTIONS** → Appendix 1: ertugliflozin
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Hypoglycaemia (in combination with insulin or sulfonylurea) · hypovolaemia · increased risk of infection · polydipsia · thirst · urinary disorders · vulvovaginal pruritus
 - ▶ **Rare or very rare** Diabetic ketoacidosis (discontinue immediately)
 - ▶ **Frequency not known** Fournier's gangrene (discontinue and initiate treatment promptly) · lower limb amputations · phimosis
- **SIDE-EFFECTS, FURTHER INFORMATION** Consider interrupting treatment if volume depletion occurs.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises avoid initiation if eGFR less than 60 mL/minute/1.73 m². Manufacturer advises frequent monitoring of renal function required if eGFR less than 60 mL/minute/1.73 m². Manufacturer advises avoid if eGFR is persistently less than 45 mL/minute/1.73 m².

● **MONITORING REQUIREMENTS**

- ▶ Manufacturer advises to determine renal function before treatment and periodically thereafter.
- ▶ Manufacturer advises monitor volume status and electrolytes during treatment in patients at risk of volume depletion.
- **PATIENT AND CARER ADVICE** Manufacturer advises that patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Ertugliflozin as monotherapy or with metformin for treating type 2 diabetes (March 2019)** NICE TA572 Ertugliflozin (*Steglatro*[®]) as monotherapy is recommended as an option for treating type 2 diabetes in adults for whom metformin is contra-indicated or not tolerated and when diet and exercise alone do not provide adequate glycaemic control, only if:
 - a dipeptidyl peptidase-4 (DPP-4) inhibitor would otherwise be prescribed, **and**
 - a sulfonylurea or pioglitazone is not appropriate. Ertugliflozin (*Steglatro*[®]) in a dual-therapy regimen in combination with metformin is recommended as an option for treating type 2 diabetes, only if:
 - a sulfonylurea is contra-indicated or not tolerated, **or**
 - the person is at significant risk of hypoglycaemia or its consequences.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta572

- ▶ **Ertugliflozin with metformin and a dipeptidyl peptidase-4 inhibitor for treating type 2 diabetes (June 2019)** NICE TA583 Ertugliflozin (*Steglatro*[®]) with metformin and a dipeptidyl peptidase-4 (DPP-4) inhibitor is recommended as an option for treating type 2 diabetes in adults when diet and exercise alone do not provide adequate glycaemic control, only if:
 - the disease is uncontrolled with metformin and a DPP-4 inhibitor, **and**
 - a sulfonylurea or pioglitazone is not appropriate. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta583
- **Scottish Medicines Consortium (SMC) decisions**
SMC No. SMC2102
The *Scottish Medicines Consortium* has advised (January 2019) that ertugliflozin (*Steglatro*[®]) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes as monotherapy, in patients who would otherwise receive a dipeptidyl peptidase-4 inhibitor and in whom a sulphonylurea or pioglitazone is not appropriate, and as add-on therapy.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Steglatro** (Merck Sharp & Dohme Ltd) ▼

Ertugliflozin (as Ertugliflozin L-pyroglytamic acid) 5 mg Steglatro 5mg tablets | 28 tablet [PoM] £29.40 DT = £29.40

15 mg Steglatro 15mg tablets | 28 tablet [PoM] £29.40 DT = £29.40

BLOOD GLUCOSE LOWERING DRUGS > **SULFONYLUREAS**

Sulfonylureas

- **DRUG ACTION** The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action.
- **CONTRA-INDICATIONS** Presence of ketoacidosis
- **CAUTIONS** Can encourage weight gain · elderly · G6PD deficiency
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Elderly Prescription potentially inappropriate (STOPP criteria) if prescribed a **long-acting** sulfonylurea (e.g. glibenclamide, chlorpropamide, glibenpiride) in type 2 diabetes mellitus (risk of prolonged hypoglycaemia). See also Prescribing in the elderly p. 33.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · diarrhoea · hypoglycaemia · nausea
 - ▶ **Uncommon** Hepatic disorders · vomiting
 - ▶ **Rare or very rare** Agranulocytosis · erythropenia · granulocytopenia · haemolytic anaemia · leucopenia · pancytopenia · thrombocytopenia
 - ▶ **Frequency not known** Allergic dermatitis (usually in the first 6–8 weeks of therapy) · constipation · photosensitivity reaction · skin reactions · visual impairment
- **HEPATIC IMPAIRMENT** In general, manufacturers advise avoid in severe impairment (increased risk of hypoglycaemia).
- **RENAL IMPAIRMENT** Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia. Care is required

to use the lowest dose that adequately controls blood glucose. Avoid where possible in severe renal impairment.

- **PATIENT AND CARER ADVICE** The risk of hypoglycaemia associated with sulfonylureas should be discussed with the patient, especially when concomitant glucose-lowering drugs are prescribed.

Driving and skilled tasks Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

Glibenclamide

F 747

16-Dec-2019

● INDICATIONS AND DOSE

Type 2 diabetes mellitus

► BY MOUTH USING TABLETS

- Adult: Initially 5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day
- Elderly: 2.5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

- **UNLICENSED USE** Not licensed for use in breast feeding women with pre-existing diabetes. Not licensed for use in gestational diabetes.
- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 1120
- **INTERACTIONS** → Appendix 1: sulfonylureas
- **SIDE-EFFECTS** Appetite abnormal · bone marrow disorders · epigastric discomfort · erythema nodosum · fever · gastrointestinal disorder · hyper eosinophilia · SIADH · Stevens-Johnson syndrome · taste metallic · vision disorders · weight increased
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes.
- **BREAST FEEDING** Glibenclamide can be used during breast-feeding in women with pre-existing diabetes.
- **MEDICINAL FORMS** No licensed medicines listed.

F 747

Gliclazide

10-Mar-2020

● INDICATIONS AND DOSE

Type 2 diabetes mellitus

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 40–80 mg daily, adjusted according to response, increased if necessary up to 160 mg once daily, dose to be taken with breakfast, doses higher than 160 mg to be given in divided doses; maximum 320 mg per day

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: Initially 30 mg daily, dose to be taken with breakfast, adjust dose according to response every 4 weeks (after 2 weeks if no decrease in blood glucose); maximum 120 mg per day

DOSE EQUIVALENCE AND CONVERSION

- Gliclazide modified release 30 mg may be considered to be approximately equivalent in therapeutic effect to standard formulation gliclazide 80 mg.

- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 1120
- **INTERACTIONS** → Appendix 1: sulfonylureas
- **SIDE-EFFECTS** Anaemia · angioedema · dyspepsia · gastrointestinal disorder · hypersensitivity vasculitis ·

hyponatraemia · severe cutaneous adverse reactions (SCARs)

- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** Avoid—theoretical possibility of hypoglycaemia in the infant.
- **RENAL IMPAIRMENT** If necessary, gliclazide which is principally metabolised in the liver, can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

▶ BY MOUTH

- ▶ **Adult:** Initially 2.5–5 mg daily, adjusted according to response, dose to be taken shortly before breakfast or lunch, doses up to 15 mg may be given as a single dose, higher doses to be given in divided doses; maximum 20 mg per day

- **CAUTIONS** Sulfonylureas should be avoided where possible in Acute porphyrias p. 1120 but glipizide is thought to be safe.
- **INTERACTIONS** → Appendix 1: sulfonylureas
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain upper
 - ▶ **Uncommon** Dizziness · drowsiness · tremor · vision disorders
 - ▶ **Frequency not known** Confusion · headache · hyponatraemia · malaise
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** Avoid—theoretical possibility of hypoglycaemia in the infant.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment.
Dose adjustments Manufacturer advises consider initial dose of 2.5 mg daily and conservative maintenance dosing in mild to moderate impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ Glipizide (Non-proprietary)

Glipizide 5 mg Glipizide 5mg tablets | 28 tablet [PoM] £3.34 DT = £2.53 | 56 tablet [PoM] £2.14-£6.20

▶ Minodiab (Pfizer Ltd)

Glipizide 5 mg Minodiab 5mg tablets | 28 tablet [PoM] £1.26 DT = £2.53

Tolbutamide

F 747

● INDICATIONS AND DOSE

Type 2 diabetes mellitus

▶ BY MOUTH

- ▶ **Adult:** 0.5–1.5 g daily in divided doses, dose to be taken with or immediately after meals, alternatively 0.5–1.5 g once daily, dose to be taken with or immediately after breakfast; maximum 2 g per day

- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 1120

- **INTERACTIONS** → Appendix 1: sulfonylureas

● SIDE-EFFECTS

- ▶ **Rare or very rare** Aplastic anaemia · blood disorder
- ▶ **Frequency not known** Alcohol intolerance · appetite abnormal · erythema multiforme (usually in the first 6–8 weeks of therapy) · exfoliative dermatitis (usually in the first 6–8 weeks of therapy) · fever (usually in the first 6–8 weeks of therapy) · headache · hypersensitivity (usually in the first 6–8 weeks of therapy) · paraesthesia · tinnitus · weight increased
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** The use of sulfonylureas in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.
- **RENAL IMPAIRMENT** If necessary, the short-acting drug tolbutamide can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

▶ Tolbutamide (Non-proprietary)

Tolbutamide 500 mg Tolbutamide 500mg tablets | 28 tablet [PoM] £34.88 DT = £20.66 | 112 tablet [PoM] £82.64

BLOOD GLUCOSE LOWERING DRUGS > THIAZOLIDINEDIONES

Pioglitazone

31-Mar-2020

- **DRUG ACTION** The thiazolidinedione, pioglitazone, reduces peripheral insulin resistance, leading to a reduction of blood-glucose concentration.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus (alone or combined with metformin or a sulfonylurea, or with both, or with insulin)

▶ BY MOUTH

- ▶ **Adult:** Initially 15–30 mg once daily, adjusted according to response to 45 mg once daily, in elderly patients, initiate with lowest possible dose and increase gradually; review treatment after 3–6 months and regularly thereafter

continued →

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Dose of concomitant sulphonylurea or insulin may need to be reduced.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PIOGLITAZONE CARDIOVASCULAR SAFETY (DECEMBER 2007 AND JANUARY 2011)

Incidence of heart failure is increased when pioglitazone is combined with insulin especially in patients with predisposing factors e.g. previous myocardial infarction. Patients who take pioglitazone should be closely monitored for signs of heart failure; treatment should be discontinued if any deterioration in cardiac status occurs.

Pioglitazone should not be used in patients with heart failure or a history of heart failure.

PIOGLITAZONE: RISK OF BLADDER CANCER (JULY 2011)

The European Medicines Agency has advised that there is a small increased risk of bladder cancer associated with pioglitazone use. However, in patients who respond adequately to treatment, the benefits of pioglitazone continue to outweigh the risks.

Pioglitazone should not be used in patients with active bladder cancer or a past history of bladder cancer, or in those who have uninvestigated macroscopic haematuria. Pioglitazone should be used with caution in elderly patients as the risk of bladder cancer increases with age.

Before initiating treatment with pioglitazone, patients should be assessed for risk factors of bladder cancer (including age, smoking status, exposure to certain occupational or chemotherapy agents, or previous radiation therapy to the pelvic region) and any macroscopic haematuria should be investigated. The safety and efficacy of pioglitazone should be reviewed after 3–6 months and pioglitazone should be stopped in patients who do not respond adequately to treatment.

Patients already receiving treatment with pioglitazone should be assessed for risk factors of bladder cancer and treatment should be reviewed after 3–6 months, as above.

Patients should be advised to report promptly any haematuria, dysuria, or urinary urgency during treatment.

- **CONTRA-INDICATIONS** History of heart failure · previous or active bladder cancer · uninvestigated macroscopic haematuria
- **CAUTIONS** Concomitant use with insulin (risk of heart failure) · elderly (increased risk of heart failure, fractures, and bladder cancer) · increased risk of bone fractures, particularly in women · risk factors for bladder cancer · risk factors for heart failure

CAUTIONS, FURTHER INFORMATION

- ▶ Elderly For thiazolidenediones, prescription potentially inappropriate (STOPP criteria) in patients with heart failure (risk of exacerbation).

See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: pioglitazone

● SIDE-EFFECTS

- ▶ **Common or very common** Bone fracture · increased risk of infection · numbness · visual impairment · weight increased
- ▶ **Uncommon** Bladder cancer · insomnia
- ▶ **Frequency not known** Macular oedema

SIDE-EFFECTS, FURTHER INFORMATION Rare reports of liver dysfunction; discontinue if jaundice occurs.

- **PREGNANCY** Avoid—toxicity in animal studies.
- **BREAST FEEDING** Avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

- **MONITORING REQUIREMENTS** Monitor liver function before treatment and periodically thereafter.

● PATIENT AND CARER ADVICE

Liver toxicity Patients should be advised to seek immediate medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue and dark urine develop.

● NATIONAL FUNDING/ACCESS DECISIONS**Scottish Medicines Consortium (SMC) decisions**

The *Scottish Medicines Consortium* has advised (March 2007) that the use of pioglitazone with metformin and a sulphonylurea, is accepted for restricted use within NHS Scotland for patients (especially if overweight) whose glycaemic control is inadequate despite the use of 2 oral hypoglycaemic drugs and who are unable or unwilling to take insulin; treatment should be initiated and monitored by an experienced diabetes physician.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

INSULINS

Insulins

IMPORTANT SAFETY INFORMATION

NHS NEVER EVENT: OVERDOSE OF INSULIN DUE TO ABBREVIATIONS OR INCORRECT DEVICE (JANUARY 2018)

The words 'unit' or 'international units' should **not** be abbreviated.

Specific insulin administration devices should always be used to measure insulin i.e. Insulin syringes and pens.

Insulin should **not** be withdrawn from an insulin pen or pen refill and then administered using a syringe and needle.

NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF SEVERE HARM AND DEATH DUE TO WITHDRAWING INSULIN FROM PEN DEVICES (NOVEMBER 2016)

Insulin should not be extracted from insulin pen devices.

The strength of insulin in pen devices can vary by multiples of 100 units/mL. Insulin syringes have graduations only suitable for calculating doses of standard 100 units/mL. If insulin extracted from a pen or cartridge is of a higher strength, and that is not considered in determining the volume required, it can lead to a significant and potentially fatal overdose.

● SIDE-EFFECTS

▶ **Common or very common** Oedema

▶ **Uncommon** Lipodystrophy

Overdose Overdose causes hypoglycaemia.

● PREGNANCY

Dose adjustments During pregnancy, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy.

● BREAST FEEDING

Dose adjustments During breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

● **HEPATIC IMPAIRMENT** Insulin requirements may be decreased.

● **RENAL IMPAIRMENT** The compensatory response to hypoglycaemia is impaired in renal impairment.

Dose adjustments Insulin requirements may decrease in patients with renal impairment and therefore dose reduction may be necessary.

● MONITORING REQUIREMENTS

▶ Many patients now monitor their own blood-glucose concentrations; all carers and children need to be trained to do this.

▶ Since blood-glucose concentration varies substantially throughout the day, 'normoglycaemia' cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia.

▶ In adults It is therefore best to recommend that patients should maintain a blood-glucose concentration of between 4 and 9 mmol/litre for most of the time (4–7 mmol/litre before meals and less than 9 mmol/litre after meals).

▶ In children It is therefore best to recommend that children should maintain a blood-glucose concentration of between 4 and 10 mmol/litre for most of the time (4–8 mmol/litre before meals and less than 10 mmol/litre after meals).

While accepting that on occasions, for brief periods, the blood-glucose concentration will be above these values; strenuous efforts should be made to prevent it from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be

regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.

- **DIRECTIONS FOR ADMINISTRATION** Insulin is generally given by *subcutaneous injection*; the injection site should be rotated to prevent lipodystrophy. Injection devices ('pens'), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form, but are less popular with children and carers. For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.
- **PRESCRIBING AND DISPENSING INFORMATION** Show container to patient or carer and confirm the expected version is dispensed.
Units The word 'unit' should **not** be abbreviated.
- **PATIENT AND CARER ADVICE**
Hypoglycaemia Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.
Insulin Passport Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient's current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:
3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham
OL9 9QH
Tel: 0845 610 1112
GP practices can obtain supplies through their Local Area Team stores.
NHS Trusts can order supplies from www.nhsforms.co.uk/ or by emailing nhsforms@mmm.com. Further information is available at www.npsa.nhs.uk.
Driving and skilled tasks Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

INSULINS > RAPID-ACTING

above

Insulin

(Insulin Injection; Neutral Insulin; Soluble Insulin—short acting)

● INDICATIONS AND DOSE

Diabetes mellitus

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Adult: According to requirements

Diabetic ketoacidosis | Diabetes during surgery

▶ BY INTRAVENOUS INFUSION

▶ Adult: (consult local protocol)

● **INTERACTIONS** → Appendix 1: insulins

● **SIDE-EFFECTS**

▶ **Uncommon** Skin reactions

▶ **Rare or very rare** Refraction disorder

● **DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated

bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team. Some insulin preparations are not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle—consult product literature.

- ▶ With intravenous use For *intravenous infusion* give continuously in Sodium chloride 0.9%. Adsorbed to some extent by plastic infusion set; ensure insulin is not injected into 'dead space' of injection port of the infusion bag.

● **PRESCRIBING AND DISPENSING INFORMATION** A sterile solution of insulin (i.e. bovine or porcine) or of human insulin; pH 6.6–8.0.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151** Continuous subcutaneous insulin infusion is recommended as an option in adults and children 12 years and over with type 1 diabetes:
 - who suffer repeated and unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or
 - whose glycaemic control remains inadequate (HbA_{1c} over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

- ▶ With intravenous use in adults For *intravenous infusion* give continuously in Glucose 5% or Sodium chloride 0.9%. Adsorbed to some extent by plastics of infusion set.
- ▶ With intravenous use in children For *intravenous infusion*, dilute to a concentration of 0.1–1 unit/mL with Glucose 5% or Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin.

- **PRESCRIBING AND DISPENSING INFORMATION** Insulin lispro is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151** Continuous subcutaneous insulin infusion is recommended as an option in adults and children 12 years and over with type 1 diabetes:
 - who suffer repeated and unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or
 - whose glycaemic control remains inadequate (HbA_{1c} over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on

insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

- ▶ **Humalog Junior KwikPen (Eli Lilly and Company Ltd)**
 - ▶ **Insulin lispro 100 unit per 1 ml** Humalog Junior KwikPen 100units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £29.46 DT = £29.46
- ▶ **Humalog KwikPen (Eli Lilly and Company Ltd)**
 - ▶ **Insulin lispro 100 unit per 1 ml** Humalog KwikPen 100units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £29.46 DT = £29.46
 - ▶ **Insulin lispro 200 unit per 1 ml** Humalog KwikPen 200units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £58.92 DT = £58.92

INSULINS > INTERMEDIATE-ACTING

F 751

Biphasic isophane insulin

(Biphasic Isophane Insulin Injection—intermediate acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
 - ▶ Child: According to requirements
 - ▶ Adult: According to requirements

- **INTERACTIONS** → Appendix 1: insulins

● SIDE-EFFECTS

- ▶ Rare or very rare Angioedema
- ▶ Frequency not known Hypokalaemia · weight increased

- **PRESCRIBING AND DISPENSING INFORMATION** A sterile buffered suspension of either porcine or human insulin complexed with protamine sulfate (or another suitable protamine) in a solution of insulin of the same species.

Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Humulin M3 (Eli Lilly and Company Ltd)**
 - ▶ **Insulin human (as insulin soluble human) 30 unit per 1 ml, Insulin human (as insulin isophane human) 70 unit per 1 ml** Humulin M3 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £19.08 DT = £19.08
 - ▶ Humulin M3 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £15.68 DT = £15.68
- ▶ **Humulin M3 KwikPen (Eli Lilly and Company Ltd)**
 - ▶ **Insulin human (as insulin soluble human) 30 unit per 1 ml, Insulin human (as insulin isophane human) 70 unit per 1 ml** Humulin M3 KwikPen 100units/ml suspension for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £21.70 DT = £21.70

- ▶ **Hypurin Porcine 30/70 Mix** (Wockhardt UK Ltd)
Insulin porcine (as Insulin soluble porcine) 30 unit per 1 ml, Insulin porcine (as Insulin isophane porcine) 70 unit per 1 ml Hypurin Porcine 30/70 Mix 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £51.64 DT = £51.64
 Hypurin Porcine 30/70 Mix 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £34.43 DT = £34.43
- ▶ **Insuman Comb 15** (Sanofi)
Insulin human (as Insulin soluble human) 15 unit per 1 ml, Insulin human (as Insulin isophane human) 85 unit per 1 ml Insuman Comb 15 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50 DT = £17.50
- ▶ **Insuman Comb 25** (Sanofi)
Insulin human (as Insulin soluble human) 25 unit per 1 ml, Insulin human (as Insulin isophane human) 75 unit per 1 ml Insuman Comb 25 100units/ml suspension for injection 5ml vials | 1 vial [PoM] £5.61
 Insuman Comb 25 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50 DT = £17.50
 Insuman Comb 25 100units/ml suspension for injection 3ml pre-filled SoloStar pens | 5 pre-filled disposable injection [PoM] £19.80 DT = £19.80
- ▶ **Insuman Comb 50** (Sanofi)
Insulin human (as Insulin soluble human) 50 unit per 1 ml, Insulin human (as Insulin isophane human) 50 unit per 1 ml Insuman Comb 50 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50 DT = £17.50

F 751

Isohane insulin

(Isohane Insulin Injection; Isohane Protamine Insulin Injection; Isohane Insulin (NPH)–intermediate acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: According to requirements
- ▶ Adult: According to requirements

- **INTERACTIONS** → Appendix 1: insulins
- **PREGNANCY** Recommended where longer-acting insulins are needed.
- **PRESCRIBING AND DISPENSING INFORMATION** A sterile suspension of bovine or porcine insulin or of human insulin in the form of a complex obtained by the addition of protamine sulfate or another suitable protamine.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Humulin I** (Eli Lilly and Company Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Humulin I 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £15.68 DT = £15.68
 Humulin I 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £19.08 DT = £19.08
- ▶ **Humulin I KwikPen** (Eli Lilly and Company Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Humulin I KwikPen 100units/ml suspension for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £21.70 DT = £21.70
- ▶ **Hypurin Porcine Isohane** (Wockhardt UK Ltd)
Insulin porcine (as Insulin isophane porcine) 100 unit per 1 ml Hypurin Porcine Isohane 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £51.64 DT = £51.64
 Hypurin Porcine Isohane 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £34.43 DT = £34.43
- ▶ **Insulatard** (Novo Nordisk Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £7.48 DT = £15.68
- ▶ **Insulatard InnoLet** (Novo Nordisk Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard InnoLet 100units/ml suspension for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £20.40 DT = £21.70

- ▶ **Insulatard Penfill** (Novo Nordisk Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard Penfill 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £22.90 DT = £19.08
- ▶ **Insuman Basal** (Sanofi)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insuman Basal 100units/ml suspension for injection 5ml vials | 1 vial [PoM] £5.61
 Insuman Basal 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50 DT = £19.08
- ▶ **Insuman Basal SoloStar** (Sanofi)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insuman Basal 100units/ml suspension for injection 3ml pre-filled SoloStar pens | 5 pre-filled disposable injection [PoM] £19.80 DT = £21.70

INSULINS > INTERMEDIATE-ACTING COMBINED WITH RAPID-ACTING

F 751

Biphasic insulin aspart (Intermediate-acting insulin)

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: Administer up to 10 minutes before or soon after a meal, according to requirements
- ▶ Adult: Administer up to 10 minutes before or soon after a meal, according to requirements

- **INTERACTIONS** → Appendix 1: insulins
- **SIDE-EFFECTS**
- ▶ **Uncommon** Skin reactions
- ▶ **PRESCRIBING AND DISPENSING INFORMATION** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **NovoMix 30 FlexPen** (Novo Nordisk Ltd)
Insulin aspart 30 unit per 1 ml, Insulin aspart (as Insulin aspart protamine) 70 unit per 1 ml NovoMix 30 FlexPen 100units/ml suspension for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £29.89 DT = £29.89
- ▶ **NovoMix 30 Penfill** (Novo Nordisk Ltd)
Insulin aspart 30 unit per 1 ml, Insulin aspart (as Insulin aspart protamine) 70 unit per 1 ml NovoMix 30 Penfill 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £28.79 DT = £28.79

F 751

Biphasic insulin lispro (Intermediate-acting insulin)

03-Feb-2020

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: Administer up to 15 minutes before or soon after a meal, according to requirements
- ▶ Adult: Administer up to 15 minutes before or soon after a meal, according to requirements

- **CAUTIONS** Children under 12 years (use only if benefit likely compared to soluble insulin)
- **INTERACTIONS** → Appendix 1: insulins
- **PRESCRIBING AND DISPENSING INFORMATION** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Humalog Mix25** (Eli Lilly and Company Ltd)
Insulin lispro 25 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £16.61 DT = £16.61
 Humalog Mix25 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £29.46 DT = £29.46
- ▶ **Humalog Mix25 KwikPen** (Eli Lilly and Company Ltd)
Insulin lispro 25 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 KwikPen 100units/ml suspension for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £30.98 DT = £30.98
- ▶ **Humalog Mix50** (Eli Lilly and Company Ltd)
Insulin lispro 50 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 50 unit per 1 ml Humalog Mix50 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £29.46 DT = £29.46
- ▶ **Humalog Mix50 KwikPen** (Eli Lilly and Company Ltd)
Insulin lispro 50 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 50 unit per 1 ml Humalog Mix50 KwikPen 100units/ml suspension for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £30.98 DT = £30.98

INSULINS > LONG-ACTING

Insulin degludec

08-Feb-2019

(Recombinant human insulin analogue—long acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 1-17 years: Dose to be given according to requirements
- ▶ Adult: Dose to be given according to requirements

- **INTERACTIONS** → Appendix 1: insulins
- **SIDE-EFFECTS**
 - ▶ Rare or very rare Urticaria
- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.
- **PRESCRIBING AND DISPENSING INFORMATION** Insulin degludec (*Tresiba*®) is available in strengths of 100 units/mL (allows 1-unit dose adjustment) and 200 units/mL (allows 2-unit dose adjustment)—ensure correct strength prescribed.
- **NATIONAL FUNDING/ACCESS DECISIONS**

All Wales Medicines Strategy Group (AWMSG) decisions
 AWMSG No. 3158

 - ▶ In adults The *All Wales Medicines Strategy Group* has advised (October 2016) that insulin degludec (*Tresiba*®) is recommended as an option for restricted use within NHS Wales for the treatment of diabetes mellitus in adult patients where treatment with a basal insulin analogue is considered appropriate.
 AWMSG No. 3158
 - ▶ In children The *All Wales Medicines Strategy Group* has advised (October 2016) that insulin degludec (*Tresiba*®) is **not** recommended for use within NHS Wales for the treatment of diabetes mellitus in adolescents and children from the age of 1 year.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Tresiba FlexTouch** (Novo Nordisk Ltd)
Insulin degludec 100 unit per 1 ml Tresiba FlexTouch 100units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £46.60 DT = £46.60

Insulin degludec 200 unit per 1 ml Tresiba FlexTouch 200units/ml solution for injection 3ml pre-filled pens | 3 pre-filled disposable injection [PoM] £55.92 DT = £55.92

▶ **Tresiba Penfill** (Novo Nordisk Ltd)

Insulin degludec 100 unit per 1 ml Tresiba Penfill 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £46.60 DT = £46.60

Insulin degludec with liraglutide

27-Jul-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, insulin degludec above, liraglutide p. 737.

● INDICATIONS AND DOSE

As add-on to oral antidiabetics in type 2 diabetes mellitus not controlled by oral antidiabetics alone

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 10 dose-steps once daily, adjusted according to response; maximum 50 dose-steps per day

When transferring from basal insulin in type 2 diabetes mellitus not controlled by oral antidiabetics in combination with basal insulin

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 16 dose-steps once daily, adjusted according to response; maximum 50 dose-steps per day

- **INTERACTIONS** → Appendix 1: insulins · liraglutide
- **PATIENT AND CARER ADVICE** Counselling advised on administration. Show container to patient and confirm that patient is expecting the version dispensed.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions
 The *Scottish Medicines Consortium* has advised (October 2015) that insulin degludec with liraglutide (*Xultophy*®) is accepted for restricted use within NHS Scotland for the treatment of adults with type 2 diabetes mellitus to improve glycaemic control in combination with oral glucose-lowering medicinal products when these alone or combined with a GLP-1 receptor agonist or with basal insulin do not provide adequate glycaemic control.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Xultophy** (Novo Nordisk Ltd)
Liraglutide 3.6 mg per 1 ml, Insulin degludec 100 unit per 1 ml Xultophy 100units/ml / 3.6mg/ml solution for injection 3ml pre-filled pens | 3 pre-filled disposable injection [PoM] £95.53 DT = £95.53

Insulin detemir

(Recombinant human insulin analogue—long acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 2-17 years: According to requirements
- ▶ Adult: According to requirements

- **INTERACTIONS** → Appendix 1: insulins
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Refraction disorder
- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 755 is recommended where longer-acting insulins are needed; insulin detemir may also be considered where longer-acting insulins are needed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Levemir FlexPen** (Novo Nordisk Ltd)
Insulin detemir 100 unit per 1 ml Levemir FlexPen 100units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £42.00 DT = £42.00
- ▶ **Levemir InnoLet** (Novo Nordisk Ltd)
Insulin detemir 100 unit per 1 ml Levemir InnoLet 100units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £44.85 DT = £42.00
- ▶ **Levemir Penfill** (Novo Nordisk Ltd)
Insulin detemir 100 unit per 1 ml Levemir Penfill 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £42.00 DT = £42.00

F 751

Insulin glargine

(Recombinant human insulin analogue—long acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 2-17 years: According to requirements
- ▶ Adult: According to requirements

TOUJEO®

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: According to requirements

- **INTERACTIONS** → Appendix 1: insulins
- **SIDE-EFFECTS**
- ▶ Rare or very rare Myalgia · sodium retention · taste altered
- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.
- **PRESCRIBING AND DISPENSING INFORMATION** Insulin glargine is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1. Dose adjustments and close metabolic monitoring is recommended if switching between insulin glargine preparations.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) decisions
The *Scottish Medicines Consortium* has advised that *Lantus*® preparations (April 2013) and *Toujeo*® (August 2015) are accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:
 - in those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulins
 - as a once daily insulin therapy for patients who require a carer to administer their insulin
 It is **not** recommended for routine use in patients with type 2 diabetes unless they suffer from recurrent episodes of hypoglycaemia or require assistance with their insulin injections.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Abasaglar** (Eli Lilly and Company Ltd)
Insulin glargine 100 unit per 1 ml Abasaglar 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £35.28 DT = £37.77
- ▶ **Abasaglar KwikPen** (Eli Lilly and Company Ltd)
Insulin glargine 100 unit per 1 ml Abasaglar KwikPen 100units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £35.28 DT = £37.77

- ▶ **Lantus** (Sanofi)
Insulin glargine 100 unit per 1 ml Lantus 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £37.77 DT = £37.77
Lantus 100units/ml solution for injection 3ml pre-filled SoloStar pens | 5 pre-filled disposable injection [PoM] £37.77 DT = £37.77
Lantus 100units/ml solution for injection 10ml vials | 1 vial [PoM] £27.92 DT = £27.92
- ▶ **Semglee** (Mylan) ▼
Insulin glargine 100 unit per 1 ml Semglee 100units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £29.99 DT = £37.77
- ▶ **Toujeo** (Sanofi)
Insulin glargine 300 unit per 1 ml Toujeo 300units/ml solution for injection 1.5ml pre-filled SoloStar pens | 3 pre-filled disposable injection [PoM] £32.14 DT = £32.14
- ▶ **Toujeo DoubleStar** (Sanofi)
Insulin glargine 300 unit per 1 ml Toujeo 300units/ml solution for injection 3ml pre-filled DoubleStar pens | 3 pre-filled disposable injection [PoM] £64.27 DT = £64.27

Insulin glargine with lixisenatide

07-May-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, insulin glargine above, lixisenatide p. 738.

● INDICATIONS AND DOSE

Type 2 diabetes mellitus [in combination with metformin]

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: insulins · lixisenatide
- **PRESCRIBING AND DISPENSING INFORMATION** *Suliqua*® is available in two pen strengths, providing different dosing options. To avoid medication errors, the prescriber must ensure that the correct strength and number of dose steps is prescribed. The manufacturer of *Suliqua*® has provided a healthcare professional guide and letter which includes important information on dosing.
- **PATIENT AND CARER ADVICE** Manufacturer advises check pen label before each administration to avoid medication error.
A patient guide should be provided.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) decisions
SMC No. SMC2235
The *Scottish Medicines Consortium* has advised (April 2020) that insulin glargine with lixisenatide (*Suliqua*®) is accepted for restricted use within NHS Scotland for the treatment of adults with type 2 diabetes mellitus, in combination with metformin to improve glycaemic control in patients who are uncontrolled on basal insulin and for whom a GLP-1 receptor agonist is appropriate as an add-on intensification therapy to basal insulin analogues.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Suliqua** (Sanofi) ▼
Lixisenatide 33 microgram per 1 ml, Insulin glargine 100 unit per 1 ml Suliqua 100units/ml / 33micrograms/ml solution for injection 3ml pre-filled SoloStar pens | 3 pre-filled disposable injection [PoM] £48.60 DT = £51.30
- ▶ **Lixisenatide 50 microgram per 1 ml, Insulin glargine 100 unit per 1 ml** Suliqua 100units/ml / 50micrograms/ml solution for injection 3ml pre-filled SoloStar pens | 3 pre-filled disposable injection [PoM] £67.50 DT = £67.50

3.1a Diabetes, diagnosis and monitoring

Diabetes mellitus, diagnostic and monitoring devices

Urinalysis: urinary glucose

Reagent strips are available for measuring for glucose in the urine. Tests for ketones by patients are rarely required unless they become unwell—see Blood Monitoring.

Microalbuminuria can be detected with *Micral-Test II*[®] but this should be followed by confirmation in the laboratory, since false positive results are common.

Blood glucose monitoring

Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Patients should be properly trained in the use of blood glucose monitoring systems and to take appropriate action on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen.

Self-monitoring of blood-glucose concentration is appropriate for patients with type 2 diabetes:

- who are treated with insulin;
- who are treated with oral hypoglycaemic drugs e.g. sulfonylureas, to provide information on hypoglycaemia;
- to monitor changes in blood-glucose concentration resulting from changes in lifestyle or medication, and during intercurrent illness;
- to ensure safe blood-glucose concentration during activities, including driving.

In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units.

If the patient is unwell and diabetic ketoacidosis is suspected, blood ketones should be measured according to local guidelines. Patients and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

Other drugs used for Diabetes, diagnosis and monitoring
Glucose, p. 1102

3.2 Hypoglycaemia

Hypoglycaemia

20-Apr-2020

Description of condition

Hypoglycaemia is a lower than normal blood-glucose concentration. It results from an imbalance between glucose supply, glucose utilisation, and existing insulin concentration. It can be defined as 'mild' if the episode is self-treated and 'severe' if assistance is required. For the purposes of hospital inpatients diagnosed with diabetes, anyone with a blood-glucose concentration less than 4 mmol/litre should be treated.

Hypoglycaemia is the most common side-effect of insulin and sulfonylureas in the treatment of all types of diabetes mellitus and presents a major barrier to satisfactory long-term glycaemic control. Metformin hydrochloride p. 730, pioglitazone p. 749, the dipeptidylpeptidase-4 inhibitors

(gliptins), sodium-glucose co-transporter-2 inhibitors, and glucagon-like peptide-1 receptor agonists, prescribed without insulin or sulfonylurea therapy, are unlikely to result in hypoglycaemia. Hypoglycaemia should be excluded in any person with diabetes who is acutely unwell, drowsy, unconscious, unable to co-operate, or presenting with aggressive behaviour or seizures.

Treatment of hypoglycaemia

For a quick reference resource with doses for the treatment of hypoglycaemia, see *Hypoglycaemia* in Medical emergencies in the community, inside back pages.

EvGr Adults with symptoms of hypoglycaemia who have a blood-glucose concentration greater than 4 mmol/litre, should be treated with a small carbohydrate snack such as a slice of bread or a normal meal, if due.

Any patient with a blood-glucose concentration less than 4 mmol/litre, with or without symptoms, and who is **conscious and able to swallow**, should have 15–20 g of fast-acting carbohydrate. This is available in approximately 3–4 heaped teaspoonfuls of sugar dissolved in water, 4–7 glucose tablets, or 150–200 mL of pure fruit juice. Orange juice should not be given to patients following a low-potassium diet due to chronic kidney disease, and sugar dissolved in water is not effective for patients taking acarbose which prevents the breakdown of sucrose to glucose. **EvGr** Chocolates and biscuits should be avoided if possible, because they have a lower sugar content and their high fat content may delay stomach emptying. **A** Proprietary products of fast-acting carbohydrate, as glucose 40% gel (e.g. *Glucogel*[®], *Dextrogl*[®], or *Rapilose gel*[®], see glucose p. 1102) are available for patients to keep at hand in case of hypoglycaemia; **EvGr** 2 tubes should be taken.

If necessary, repeat treatment after 10–15 minutes, up to a maximum of 3 treatments in total. Once blood-glucose concentration is above 4 mmol/litre and the patient has recovered, a snack providing a long-acting carbohydrate should be given to prevent blood glucose from falling again (e.g. two biscuits, one slice of bread, 200–300 mL of milk (not soya or other forms of 'alternative' milk, e.g. almond or coconut), or a normal carbohydrate-containing meal if due). Insulin should not be omitted if due, but the dose regimen may need review.

Hypoglycaemia which does not respond (blood-glucose concentration remains below 4 mmol/litre after 30–45 minutes or after 3 treatment cycles), should be treated with intramuscular glucagon below or glucose 10% intravenous infusion. In alcoholic patients, thiamine supplementation should be given with, or following, the administration of intravenous glucose to minimise the risk of Wernicke's encephalopathy. **E**

Glucagon is a polypeptide hormone produced by the alpha cells of the islets of Langerhans, which increases blood-glucose concentration by mobilising glycogen stored in the liver. The manufacturer advises that it is ineffective in patients whose liver glycogen is depleted, therefore should not be used in anyone who has fasted for a prolonged period or has adrenal insufficiency, chronic hypoglycaemia, or alcohol-induced hypoglycaemia. **EvGr** Glucagon may also be less effective in patients taking a sulfonylurea; in these cases, intravenous glucose will be required. **E**

EvGr In an emergency, if the patient has a decreased level of consciousness caused by hypoglycaemia, intramuscular glucagon can be given by a family member or friend who has been shown how to use it. **A****EvGr** If glucagon is not effective after 10 minutes, glucose 10% intravenous infusion should be given. **E**

Hypoglycaemia which causes **unconsciousness** is an emergency. **EvGr** Patients who are unconscious, having seizures, or who are very aggressive, should have any intravenous insulin stopped, and be treated initially with glucagon. If glucagon is unsuitable, or there is no response

after 10 minutes, glucose 10% intravenous infusion, or alternatively glucose 20% intravenous infusion should be given. **E** Glucose 50% intravenous infusion is not recommended as it is hypertonic, thus increases the risk of extravasation injury, and is viscous, making administration difficult.

EvGr A long-acting carbohydrate should be given as soon as possible once the patient has recovered and their blood-glucose concentration is above 4 mmol/litre (e.g. two biscuits, one slice of bread, 200–300 mL of milk (not soya or other forms of 'alternative' milk, e.g. almond or coconut), or a normal carbohydrate-containing meal if due). Patients who have received glucagon require a larger portion of long-acting carbohydrate to replenish glycogen stores (e.g. four biscuits, two slices of bread, 400–600 mL of milk (not soya or other forms of 'alternative' milk, e.g. almond or coconut), or a normal carbohydrate containing meal if due). Glucose 10% intravenous infusion should be given to patients who are ill by mouth.

If an insulin injection is due, it should **not** be omitted; however, a review of the usual insulin regimen may be required. Patients who self-manage their insulin pump may need to adjust their pump infusion rate. If the patient was on intravenous insulin, continue to check blood-glucose concentration every 15 minutes until above 3.5 mmol/litre, then re-start intravenous insulin after review of the dose regimen. Concurrent glucose 10% intravenous infusion should be considered. **E**

Hypoglycaemia caused by a sulfonylurea or long-acting insulin, may persist for up to 24–36 hours following the last dose, especially if there is concurrent renal impairment.

EvGr Blood-glucose monitoring should be continued for at least 24–48 hours. **E**

GLYCOGENOLYTIC HORMONES

Glucagon

23-Apr-2020

● INDICATIONS AND DOSE

Diabetic hypoglycaemia

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1 month–8 years (body-weight up to 25 kg): 500 micrograms, if no response within 10 minutes intravenous glucose must be given
- ▶ Child 9–17 years (body-weight 25 kg and above): 1 mg, if no response within 10 minutes intravenous glucose must be given
- ▶ Adult: 1 mg, if no response within 10 minutes intravenous glucose must be given

Beta-blocker poisoning (cardiogenic shock unresponsive to atropine)

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Child: 50–150 micrograms/kg (max. per dose 10 mg), to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour
- ▶ Adult: 2–10 mg, to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour

Diagnostic aid

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: (consult product literature)

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 unit of glucagon = 1 mg of glucagon.

- **UNLICENSED USE** Dose and indication for cardiogenic shock unresponsive to atropine in beta-blocker overdose not licensed.

- **CONTRA-INDICATIONS** Pheochromocytoma
- **CAUTIONS** Glucagonoma · ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency · insulinoma
- **INTERACTIONS** → Appendix 1: glucagon
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Nausea
 - ▶ **Uncommon** Vomiting
 - ▶ **Rare or very rare** Abdominal pain · hypertension · hypotension · tachycardia
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use in children When administered by *continuous intravenous infusion*, do not add to infusion fluids containing calcium—precipitation may occur.
- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Glucagon for hypoglycaemia www.medicinesforchildren.org.uk/glucacon-hypoglycaemia
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription-only medicine restriction does not apply where administration is for saving life in emergency.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
 - Powder and solvent for solution for injection**
 - ▶ **Glucagen Hypokit** (Novo Nordisk Ltd)
 Glucagon hydrochloride 1 mg Glucagen Hypokit 1mg powder and solvent for solution for injection | 1 vial [PoM] £11.52 DT = £11.52

3.2a Chronic hypoglycaemia

GLYCOGENOLYTIC HORMONES

Diazoxide

● INDICATIONS AND DOSE

Chronic intractable hypoglycaemia

▶ BY MOUTH

- ▶ **Adult:** Initially 5 mg/kg daily in 2–3 divided doses, adjusted according to response; maintenance 3–8 mg/kg daily in 2–3 divided doses

- **CAUTIONS** Aortic coarctation · aortic stenosis · arteriovenous shunt · heart failure · hyperuricaemia · impaired cardiac circulation · impaired cerebral circulation
- **INTERACTIONS** → Appendix 1: diazoxide
- **SIDE-EFFECTS** Abdominal pain · albuminuria · appetite decreased (long term use) · arrhythmia · azotaemia · cardiomegaly · cataract · constipation · diabetic hyperosmolar coma · diarrhoea · dizziness · dyspnoea · eosinophilia · extrapyramidal symptoms · fever · fluid retention · galactorrhoea · haemorrhage · headache · heart failure · hirsutism · hyperglycaemia · hyperuricaemia (long term use) · hypogammaglobulinaemia · hypotension · ileus · ketoacidosis · leucopenia · libido decreased · musculoskeletal pain · nausea · nephritic syndrome · oculozygic crisis · pancreatitis · parkinsonism · pulmonary hypertension · skin reactions · sodium retention · taste altered · thrombocytopenia · tinnitus · vision disorders · voice alteration (long term use) · vomiting
- **PREGNANCY** Use only if essential; alopecia and hypertrichosis reported in neonates with prolonged use; may inhibit uterine activity during labour.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT**
 - Dose adjustments Dose reduction may be required.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor blood pressure.

- ▶ Monitor white cell and platelet count during prolonged use.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

- ▶ **Eudemine** (RPH Pharmaceuticals AB)

Diazoxide 50 mg Eudemine 50mg tablets | 100 tablet [PoM] £72.55
DT = £72.55

Capsule

- ▶ **Proglycem** (Imported (Germany))

Diazoxide 25 mg Proglycem 25 capsules | 100 capsule [PoM] £

4 Disorders of bone metabolism

Osteoporosis

20-Oct-2017

Description of condition

Osteoporosis is a progressive bone disease characterised by low bone mass measured by bone mineral density (BMD), and microarchitectural deterioration of bone tissue. This leads to an increased risk of fragility fractures as a result. Osteoporosis is considered severe if there have been one or more fragility fractures.

Osteoporosis occurs most commonly in postmenopausal women, men over 50 years, and in patients taking long-term oral corticosteroids (glucocorticoids). Risk factors for osteoporosis include age, low body mass index (BMI), cigarette smoking, excess alcohol intake, lack of physical activity, vitamin D deficiency and low calcium intake, family history of hip fractures, a previous fracture at a site characteristic of osteoporotic fractures and early menopause. Some diseases are also known to be associated with osteoporosis such as rheumatoid arthritis and diabetes.

Aims of treatment

A combination of lifestyle changes and drug treatment aims to prevent bone fractures in patients with osteoporosis.

Lifestyle changes

[EvGr] Patients should be encouraged to increase their level of physical activity, stop smoking, maintain a normal BMI level (between 20–25 kg/m²), and reduce their alcohol intake to improve their bone health and reduce the risk of fragility fractures. **◆** For guidance on stopping smoking, see Smoking cessation p. 520.

[EvGr] Patients at risk of osteoporosis should also ensure an adequate intake of calcium and vitamin D, preferably through increasing dietary intake.

Elderly patients, especially those who are housebound or live in residential or nursing homes, are at increased risk of calcium and vitamin D deficiency and can benefit from supplements. **◆** Elderly patients also have an increased risk of falls (see Prescribing in the elderly p. 33).

Drug treatment

Postmenopausal osteoporosis

The therapeutic options for the prevention and treatment of osteoporosis in postmenopausal women are the same.

[EvGr] Oral bisphosphonates, alendronic acid p. 766 and risedronate sodium p. 769 are considered as first-line choices for most patients with postmenopausal osteoporosis due to their broad spectrum of anti-fracture efficacy. Alendronic acid and risedronate sodium have been shown to reduce occurrence of vertebral, non-vertebral and hip fractures. Intravenous bisphosphonates (ibandronic acid p. 767 or

zoledronic acid p. 771), denosumab p. 774, or raloxifene hydrochloride p. 796 are alternative options in women who are intolerant of oral bisphosphonates or in whom they are contra-indicated.

Hormone replacement therapy (HRT) is an additional option. The use of HRT for osteoporosis is generally restricted to younger postmenopausal women with menopausal symptoms who are at high risk of fractures. This is due to the risk of adverse effects such as cardiovascular disease and cancer in older postmenopausal women and women on long-term HRT therapy.

Teriparatide p. 773 is reserved for postmenopausal women with severe osteoporosis at very high risk for vertebral fractures. Its duration of treatment is limited to 24 months.

Glucocorticoid-induced osteoporosis

Glucocorticoid therapy is associated with bone loss and increased risk of fractures. The greatest rate of bone loss occurs early after initiation of glucocorticoids and increases with dose and duration of therapy. [EvGr](#) Bone-protection treatment should be started at the onset of therapy in patients who are at a high risk of fracture.

If glucocorticoid therapy is stopped, the need to continue bone-protection treatment should be reviewed. However, bone-protection treatment should be continued with long-term glucocorticoid therapy. Complex cases of glucocorticoid-induced osteoporosis should be referred to a specialist.

Women aged 70 years or over, or with a previous fragility fracture, or taking large doses of glucocorticoids (prednisolone ≥ 7.5 mg daily or equivalent) are at high risk of fractures and should be assessed for prophylactic bone-protection. Some younger patients, particularly those with a previous history of fracture or receiving high doses of glucocorticoids can also be considered for bone-protection treatment.

The therapeutic options for prophylaxis and treatment of glucocorticoid-induced osteoporosis are the same; oral bisphosphonates, alendronic acid, or risedronate sodium are first-line options. Intravenous zoledronic acid or teriparatide are alternatives in patients intolerant of oral bisphosphonates or in whom they are contra-indicated. [A](#)

Osteoporosis in men

[EvGr](#) Oral bisphosphonates, alendronic acid or risedronate sodium are recommended as first-line treatments for osteoporosis in men. Intravenous zoledronic acid or denosumab are alternatives in men who are intolerant of oral bisphosphonates or in whom they are contra-indicated; teriparatide is an additional option. [A](#)

Men having long-term androgen deprivation therapy for prostate cancer have an increased fracture risk. [EvGr](#) Fracture risk should be assessed when starting this therapy. A bisphosphonate can be offered to men with confirmed osteoporosis; denosumab is an alternative if bisphosphonates are contra-indicated or not tolerated. [A](#)

Bisphosphonates: treatment duration

[EvGr](#) There is some evidence to suggest that patients can benefit from a bisphosphonate-free period as their therapeutic effects last for some time after cessation of treatment.

Bisphosphonate treatment should be reviewed after 5 years of treatment with alendronic acid, risedronate sodium or ibandronic acid, and after 3 years of treatment with zoledronic acid. Patients over 75 years of age, or with a history of previous hip or vertebral fracture, or patients who have had one or more fragility fractures during treatment, or who are taking long-term glucocorticoid therapy can continue bisphosphonates beyond this period. [A](#)

Other drugs used for Disorders of bone metabolism
Calcitriol, p. 1144

ANABOLIC STEROIDS

Nandrolone

● INDICATIONS AND DOSE

Osteoporosis in postmenopausal women (but not recommended)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult (female): 50 mg every 3 weeks.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120
- **CAUTIONS** Cardiac impairment · diabetes mellitus · epilepsy · hypertension · migraine · skeletal metastases (risk of hypercalcaemia)
- **INTERACTIONS** → Appendix 1: nandrolone
- **SIDE-EFFECTS** Clitoris enlarged · dysphonia · hepatic disorders · hepatic neoplasm · hirsutism · hypertension · libido increased · nausea · oedema · skin reactions · sodium retention · urine flow decreased · virilism (with high doses including voice changes - sometimes irreversible)
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (discontinue treatment if hepatic function worsens or if oedema, with or without congestive heart failure, develops).
- **RENAL IMPAIRMENT** Use with caution—may cause sodium and water retention.
- **LESS SUITABLE FOR PRESCRIBING** Nandrolone injection is less suitable for prescribing.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
Solution for injection
EXCIPIENTS: May contain Arachis (peanut) oil, benzyl alcohol
▶ **Deca-Durabolin** (Aspen Pharma Trading Ltd)
Nandrolone decanoate 50 mg per 1 ml Deca-Durabolin 50mg/1ml solution for injection ampoules | 1 ampoule [PoM](#) £3.17 [CD4-2](#)

BISPHOSPHONATES

Bisphosphonates

- **DRUG ACTION** Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BISPHOSPHONATES: ATYPICAL FEMORAL FRACTURES (JUNE 2011)

Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis.

The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use.

Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture

should be considered after an assessment of the benefits and risks of continued treatment.

MHRA/CHM ADVICE: BISPHOSPHONATES: OSTEONECROSIS OF THE JAW (NOVEMBER 2009) AND INTRAVENOUS BISPHOSPHONATES: OSTEONECROSIS OF THE JAW—FURTHER MEASURES TO MINIMISE RISK (JULY 2015)

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget's disease.

Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of dental disease.

All patients with cancer and patients with poor dental status should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients should also maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms such as dental mobility, pain, or swelling, non-healing sores or discharge to a doctor and dentist during treatment.

Before prescribing an intravenous bisphosphonate, patients should be given a patient reminder card and informed of the risk of osteonecrosis of the jaw. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, and if the patient wears dentures, they should make sure their dentures fit properly. Patients should tell their doctor and dentist that they are receiving an intravenous bisphosphonate if they need dental treatment or dental surgery.

Guidance for dentists in primary care is included in *Oral Health Management of Patients Prescribed Bisphosphonates: Dental Clinical Guidance*, Scottish Dental Clinical Effectiveness Programme, April 2011 (available at www.sdcep.org.uk).

MHRA/CHM ADVICE: BISPHOSPHONATES: OSTEONECROSIS OF THE EXTERNAL AUDITORY CANAL (DECEMBER 2015)

Benign idiopathic osteonecrosis of the external auditory canal has been reported very rarely with bisphosphonate treatment, mainly in patients receiving long-term therapy (2 years or longer).

The possibility of osteonecrosis of the external auditory canal should be considered in patients receiving bisphosphonates who present with ear symptoms, including chronic ear infections, or suspected cholesteatoma.

Risk factors for developing osteonecrosis of the external auditory canal include: steroid use, chemotherapy, infection, an ear operation, or cotton-bud use.

Patients should be advised to report any ear pain, discharge from the ear, or an ear infection during treatment with a bisphosphonate.

● CAUTIONS

- ▶ With oral use in the elderly Prescription potentially inappropriate (STOPP criteria) in patients with a current or recent history of upper gastrointestinal disease or bleeding (risk of relapse/exacerbation of oesophagitis, oesophageal ulcer or oesophageal stricture). See also Prescribing in the elderly p. 33.

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · arthralgia · asthenia · constipation · diarrhoea · dizziness · dysphagia · electrolyte imbalance · eye inflammation · fever · gastritis · gastrointestinal discomfort · headache · influenza like

illness · malaise · myalgia · nausea · oesophageal ulcer (discontinue) · oesophagitis (discontinue) · pain · peripheral oedema · renal impairment · skin reactions · taste altered · vomiting

- ▶ **Uncommon** Anaphylactic reaction · angioedema · bronchospasm · oesophageal stenosis (discontinue) · osteonecrosis
- ▶ **Rare or very rare** Atypical femur fracture · Stevens-Johnson syndrome

● PATIENT AND CARER ADVICE

Atypical femoral fractures Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Osteonecrosis of the jaw During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms. **Osteonecrosis of the external auditory canal** Patients should be advised to report any ear pain, discharge from ear or an ear infection during treatment with a bisphosphonate.

F 765

20-Mar-2020

Alendronic acid

(Alendronate)

● INDICATIONS AND DOSE

Treatment of postmenopausal osteoporosis

- ▶ BY MOUTH
- ▶ Adult (female): 10 mg daily, alternatively 70 mg once weekly.

Treatment of osteoporosis in men

- ▶ BY MOUTH
- ▶ Adult (male): 10 mg daily.

Prevention and treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving hormone replacement therapy

- ▶ BY MOUTH
- ▶ Adult (female): 10 mg daily.

- **CONTRA-INDICATIONS** Abnormalities of oesophagus · hypocalcaemia · other factors which delay emptying (e.g. stricture or achalasia)
- **CAUTIONS** Active gastro-intestinal bleeding · atypical femoral fractures · duodenitis · dysphagia · exclude other causes of osteoporosis · gastritis · history (within 1 year) of ulcers · surgery of the upper gastro-intestinal tract · symptomatic oesophageal disease · ulcers · upper gastro-intestinal disorders
- **INTERACTIONS** → Appendix 1: bisphosphonates
- **SIDE-EFFECTS**
- ▶ **Common or very common** Gastrointestinal disorders · joint swelling · vertigo
- ▶ **Uncommon** Haemorrhage
- ▶ **Rare or very rare** Femoral stress fracture · oropharyngeal ulceration · photosensitivity reaction · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

- **PREGNANCY** Avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 35 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Correct disturbances of calcium and mineral metabolism (e.g. vitamin-D

deficiency, hypocalcaemia) before starting treatment. Monitor serum-calcium concentration during treatment.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole and oral solution should be swallowed as a single 100 mL dose. Doses should be taken with plenty of water while sitting or standing, on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after administration.

- **PATIENT AND CARER ADVICE** Patients or their carers should be given advice on how to administer alendronic acid tablets and oral solution. Oesophageal reactions. Patients (or their carers) should be advised to stop taking alendronic acid and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Bisphosphonates for treating osteoporosis (updated July 2019)** NICE TA464

This technology appraisal guidance should be applied clinically in conjunction with:

- NICE guideline on osteoporosis (CG146), which defines who is eligible for osteoporotic fracture risk assessment.
- NICE quality standard on osteoporosis (QS149), which defines the clinical intervention thresholds for the 10-year fracture probability of a major osteoporotic fracture, in those patients who have undergone fracture risk assessment.

Alendronic acid is recommended as an option for treating osteoporosis in patients:

- who are eligible for risk assessment as defined in the full NICE guideline and quality standard on osteoporosis, and
- who have been assessed as being at higher risk of osteoporotic fragility fracture using the methods recommended in the full NICE guideline and quality standard on osteoporosis, and
- when bisphosphonate treatment is appropriate, taking into account their risk of fracture, their risk of adverse effects from bisphosphonates, and their clinical circumstances and preferences.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta464

Scottish Medicines Consortium (SMC) decisions

SMC No. 1137/16

The *Scottish Medicines Consortium* has advised (April 2016) that alendronic acid (*Binosto*[®]) is accepted for restricted use within NHS Scotland for the treatment of postmenopausal osteoporosis where alendronic acid is the appropriate treatment choice, but the patient is unable to swallow tablets.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Oral solution

- ▶ **Alendronic acid (Non-proprietary)**
Alendronic acid 700 microgram per 1 ml Alendronic acid 70mg/100ml oral solution unit dose sugar free sugar-free | 4 unit dose [PoM] £28.58 DT = £28.58

Effervescent tablet

- ▶ **Binosto** (Internis Pharmaceuticals Ltd)
Alendronic acid (as Alendronate sodium) 70 mg Binosto 70mg effervescent tablets sugar-free | 4 tablet [PoM] £22.80 DT = £22.80

Tablet

- ▶ **Alendronic acid (Non-proprietary)**
Alendronic acid (as Alendronate sodium) 10 mg Alendronic acid 10mg tablets | 28 tablet [PoM] £7.00 DT = £2.61
Alendronic acid (as Alendronate sodium) 70 mg Alendronic acid 70mg tablets | 4 tablet [PoM] £22.80 DT = £0.92
- ▶ **Fosamax Once Weekly** (Merck Sharp & Dohme Ltd)
Alendronic acid (as Alendronate sodium) 70 mg Fosamax Once Weekly 70mg tablets | 4 tablet [PoM] £22.80 DT = £0.92

Alendronic acid with colecalciferol

The properties listed below are those particular to the combination only. For the properties of the components please consider, alendronic acid p. 766, colecalciferol p. 1145.

● INDICATIONS AND DOSE

Treatment of postmenopausal osteoporosis in women at risk of vitamin D deficiency

- ▶ BY MOUTH
- ▶ Adult (female): 1 tablet once weekly.

- **INTERACTIONS** → Appendix 1: bisphosphonates - vitamin D substances

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer alendronic acid with colecalciferol tablets.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Alendronic acid with colecalciferol (Non-proprietary)**
Colecalciferol 70 microgram, Alendronic acid (as Alendronate sodium) 70 mg Alendronic acid 70mg / Colecalciferol 70microgram tablets | 4 tablet [PoM] £22.80 DT = £22.80
- ▶ **Bentexo** (Consilient Health Ltd)
Colecalciferol 140 microgram, Alendronic acid (as Alendronate sodium) 70 mg Bentexo 70mg/5,600unit tablets | 4 tablet [PoM] £4.25
- ▶ **Fosavance** (Merck Sharp & Dohme Ltd)
Colecalciferol 70 microgram, Alendronic acid (as Alendronate sodium) 70 mg Fosavance tablets | 4 tablet [PoM] £22.80 DT = £22.80

765

Ibandronic acid

23-Mar-2020

● INDICATIONS AND DOSE

Reduction of bone damage in bone metastases in breast cancer

- ▶ INITIALLY BY MOUTH
- ▶ Adult: 50 mg daily, alternatively (by intravenous infusion) 6 mg every 3–4 weeks

Hypercalcaemia of malignancy

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 2–4 mg as a single infusion, dose to be adjusted according to serum calcium concentration

Treatment of postmenopausal osteoporosis

- ▶ INITIALLY BY MOUTH
- ▶ Adult (female): 150 mg once a month, alternatively (by intravenous injection) 3 mg every 3 months, to be administered over 15–30 seconds.

- **CONTRA-INDICATIONS**

GENERAL CONTRA-INDICATIONS Hypocalcaemia

SPECIFIC CONTRA-INDICATIONS

- ▶ With oral use Abnormalities of the oesophagus · other factors which delay emptying (e.g. stricture or achalasia)

CAUTIONS

GENERAL CAUTIONS Atypical femoral fractures

SPECIFIC CAUTIONS

- ▶ With intravenous use Cardiac disease (avoid fluid overload)
- ▶ With oral use Upper gastro-intestinal disorders

● **INTERACTIONS** → Appendix 1: bisphosphonates

SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Face oedema
- ▶ **Uncommon** Asthma exacerbated

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
 - ▶ With intravenous use Bundle branch block · cataract · increased risk of infection · joint disorder · oral disorders · osteoarthritis · parathyroid disorder · thirst
 - ▶ With oral use Acute phase reaction · gastrointestinal disorders · muscle cramps · musculoskeletal stiffness
- ▶ **Uncommon**
 - ▶ With intravenous use Acrochordon · affective disorder · altered smell sensation · anxiety · blood disorder · cardiovascular disorder · cerebrovascular disorder · cholelithiasis · cystitis · deafness · hyperaesthesia · hypothermia · injury · memory loss · migraine · muscle tone increased · myocardial ischaemia · palpitations · pelvic pain · pulmonary oedema · radiculopathy · renal cyst · sleep disorder · stridor · urinary retention · weight decreased
- ▶ **Rare or very rare**
 - ▶ With intravenous use Hypersensitivity
- ▶ **Frequency not known**
 - ▶ With oral use Oesophagitis erosive (discontinue)

PREGNANCY Avoid.

● **BREAST FEEDING** Avoid—present in milk in *animal* studies.

● **RENAL IMPAIRMENT** When used for postmenopausal osteoporosis, avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments ▶ With intravenous use When used for bone metastases, if eGFR 30–50 mL/minute/1.73 m² reduce dose to 4 mg and infuse over 1 hour; if eGFR less than 30 mL/minute/1.73 m² reduce dose to 2 mg and infuse over 1 hour.

▶ With oral use When used for bone metastases, if eGFR 30–50 mL/minute/1.73 m² reduce dose to 50 mg on alternative days; if eGFR less than 30 mL/minute/1.73 m² reduce dose to 50 mg once weekly.

● **MONITORING REQUIREMENTS** Monitor renal function and serum calcium, phosphate and magnesium.

● **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes (for most ibandronic acid tablets, 50 mg) or 1 hour (for *Bonviva*[®] tablets, 150 mg) before first food or drink (other than water) of the day, or another oral medicine; patient should stand or sit upright for at least 1 hour after taking tablet.

For *intravenous infusion* (*Bondronat*[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute requisite dose in 500 mL infusion fluid and give over 1–2 hours.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer ibandronic acid tablets. Oesophageal reactions Patients and carers should be advised to stop tablets and seek medical attention for symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn. Patient reminder card A patient reminder card should be provided to patients receiving intravenous ibandronic acid (risk of osteonecrosis of the jaw).

NATIONAL FUNDING/ACCESS DECISIONS**NICE decisions**

▶ **Bisphosphonates for treating osteoporosis (updated July 2019)** NICE TA464

This technology appraisal guidance should be applied clinically in conjunction with:

- NICE guideline on osteoporosis (CG146), which defines who is eligible for osteoporotic fracture risk assessment.
- NICE quality standard on osteoporosis (QS149), which defines the clinical intervention thresholds for the 10-year fracture probability of a major osteoporotic fracture, in those patients who have undergone fracture risk assessment.

Ibandronic acid is recommended as an option for treating osteoporosis in patients:

- who are eligible for risk assessment as defined in the full NICE guideline and quality standard on osteoporosis, **and**
- who have been assessed as being at higher risk of osteoporotic fragility fracture using the methods recommended in the full NICE guideline and quality standard on osteoporosis, **and**
- when bisphosphonate treatment is appropriate, taking into account their risk of fracture, their risk of adverse effects from bisphosphonates, and their clinical circumstances and preferences.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

F 765

Pamidronate disodium

23-Mar-2020

(Formerly called
aminohydroxypropylidenediphosphonate
disodium (APD))

● INDICATIONS AND DOSE

Hypercalcaemia of malignancy

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 15–60 mg, to be given (via cannula in a relatively large vein) as a single infusion or in divided doses over 2–4 days, dose adjusted according to serum calcium concentration; maximum 90 mg per course

Osteolytic lesions and bone pain in bone metastases associated with breast cancer or multiple myeloma

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 90 mg every 4 weeks, to be administered via cannula in a relatively large vein, dose may alternatively be administered every 3 weeks, to coincide with chemotherapy in breast cancer

Paget's disease of bone

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 30 mg every week for a 6 week course (total dose 180 mg), alternatively initially 30 mg once weekly for 1 week, then increased to 60 mg every 2 weeks (max. per dose 60 mg) for a 6 week course (total dose 210 mg), to be administered via cannula in a relatively large vein, course may be repeated every 6 months; maximum 360 mg per course

- **CAUTIONS** Atypical femoral fractures · cardiac disease (especially in elderly) · ensure adequate hydration · previous thyroid surgery (risk of hypocalcaemia)

- **INTERACTIONS** → Appendix 1: bisphosphonates

● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · chills · decreased leucocytes · drowsiness · flushing · hypertension · insomnia · paraesthesia · tetany · thrombocytopenia
- ▶ **Uncommon** Agitation · dyspnoea · hypotension · muscle cramps · seizure
- ▶ **Rare or very rare** Confusion · glomerulonephritis · haematuria · heart failure · nephritis tubulointerstitial · nephrotic syndrome · oedema · pulmonary oedema · reactivation of infections · renal disorder exacerbated · renal tubular disorder · respiratory disorders · visual hallucinations · xanthopsia
- ▶ **Frequency not known** Atrial fibrillation

SIDE-EFFECTS, FURTHER INFORMATION Oral supplements are advised to minimise potential risk of hypocalcaemia for those with mainly lytic bone metastases or multiple myeloma at risk of calcium or vitamin D deficiency (e.g. through malabsorption or lack of exposure to sunlight) and in those with Paget's disease.

- **PREGNANCY** Avoid—toxicity in animal studies.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe hepatic impairment (no information available).
- **RENAL IMPAIRMENT**

Dose adjustments Max. infusion rate 20 mg/hour. Avoid if eGFR less than 30 mL/minute/1.73 m², except in life-threatening hypercalcaemia if benefit outweighs risk.

If renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value.

● MONITORING REQUIREMENTS

- ▶ Monitor serum electrolytes, calcium and phosphate—possibility of convulsions due to electrolyte changes.
- ▶ Assess renal function before each dose.

- **DIRECTIONS FOR ADMINISTRATION** For slow intravenous infusion (*Pamidronate disodium*, Hospira, Medac, Wockhardt), give intermittently in Glucose 5% or Sodium chloride 0.9%; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium. For *Pamidronate disodium* (Medac, Hospira, Wockhardt) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL.

- **PATIENT AND CARER ADVICE** A patient reminder card should be provided (risk of osteonecrosis of the jaw). **Driving and skilled tasks** Patients should be warned against performing skilled tasks (e.g. cycling, driving or operating machinery) immediately after treatment (somnolence or dizziness can occur).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

F 765

Risedronate sodium

23-Mar-2020

● INDICATIONS AND DOSE

Paget's disease of bone

▶ BY MOUTH

- ▶ Adult: 30 mg daily for 2 months, course may be repeated if necessary after at least 2 months

Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures

▶ BY MOUTH

- ▶ Adult (female): 5 mg daily, alternatively 35 mg once weekly.

Prevention of osteoporosis (including corticosteroid-induced osteoporosis) in postmenopausal women

▶ BY MOUTH

- ▶ Adult (female): 5 mg daily.

Treatment of osteoporosis in men at high risk of fractures

▶ BY MOUTH

- ▶ Adult (male): 35 mg once weekly.

- **CONTRA-INDICATIONS** Hypocalcaemia

- **CAUTIONS** Atypical femoral fractures · oesophageal abnormalities · other factors which delay transit or emptying (e.g. stricture or achalasia) · upper gastrointestinal disorders

- **INTERACTIONS** → Appendix 1: bisphosphonates

● SIDE-EFFECTS

- ▶ **Uncommon** Gastrointestinal disorders
- ▶ **Rare or very rare** Glossitis
- ▶ **Frequency not known** Amblyopia · apnoea · chest pain · corneal lesion · dry eye · hypersensitivity · hypersensitivity vasculitis · increased risk of infection · leg cramps · liver disorder · muscle weakness · neoplasms · nocturia · tinnitus · toxic epidermal necrolysis · weight decreased

● PREGNANCY

- **AVOID FEEDING** Avoid.

● RENAL IMPAIRMENT

- **AVOID** if eGFR less than 30 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- ▶ Correct hypocalcaemia before starting.
- ▶ Correct other disturbances of bone and mineral metabolism (e.g. vitamin-D deficiency) at onset of treatment.

● DIRECTIONS FOR ADMINISTRATION

- **Swallow tablets whole** with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day **or**, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising.

● PATIENT AND CARER ADVICE

- **Patients or carers should be given advice on how to administer risedronate sodium tablets.**
- **Oesophageal reactions** Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

● NATIONAL FUNDING/ACCESS DECISIONS

● NICE decisions

- ▶ **Bisphosphonates for treating osteoporosis (updated July 2019)** NICE TA464

This technology appraisal guidance should be applied clinically in conjunction with:

- NICE guideline on osteoporosis (CG146), which defines who is eligible for osteoporotic fracture risk assessment.
- NICE quality standard on osteoporosis (QS149), which defines the clinical intervention thresholds for the 10-year fracture probability of a major osteoporotic fracture, in those patients who have undergone fracture risk assessment.

Risedronate sodium is recommended as an option for treating osteoporosis in patients:

- who are eligible for risk assessment as defined in the full NICE guideline and quality standard on osteoporosis, **and**
- who have been assessed as being at higher risk of osteoporotic fragility fracture using the methods recommended in the full NICE guideline and quality standard on osteoporosis, **and**
- when bisphosphonate treatment is appropriate, taking into account their risk of fracture, their risk of adverse effects from bisphosphonates, and their clinical circumstances and preferences.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta464

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

▶ Risedronate sodium (Non-proprietary)

Risedronate sodium 5 mg Risedronate sodium 5mg tablets | 28 tablet [PoM] £24.78 DT = £18.88

Risedronate sodium 30 mg Risedronate sodium 30mg tablets | 28 tablet [PoM] £155.28 DT = £155.28

Risedronate sodium 35 mg Risedronate sodium 35mg tablets | 4 tablet [PoM] £19.12 DT = £9.95

▶ Actonel (Warner Chilcott UK Ltd, Teva UK Ltd)

Risedronate sodium 5 mg Actonel 5mg tablets | 28 tablet [PoM] £17.99 DT = £18.88

Risedronate sodium 30 mg Actonel 30mg tablets | 28 tablet [PoM] £143.95 DT = £155.28

Risedronate sodium 35 mg Actonel Once a Week 35mg tablets | 4 tablet [PoM] £19.12 DT = £9.95

Actonel 35mg tablets | 4 tablet [PoM]  DT = £9.95

Risedronate with calcium carbonate and colecalciferol

The properties listed below are those particular to the combination only. For the properties of the components please consider, risedronate sodium p. 769, calcium carbonate p. 1107, colecalciferol p. 1145.

● INDICATIONS AND DOSE

Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures

▶ BY MOUTH

- ▶ **Adult:** 1 tablet once weekly on day 1 of the weekly cycle, followed by 1 sachet daily on days 2–6 of the weekly cycle

- **INTERACTIONS** → Appendix 1: bisphosphonates · calcium salts · vitamin D substances

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet. Granules should be stirred into a glass of water and after dissolution complete taken immediately.

- **PRESCRIBING AND DISPENSING INFORMATION** *Actonel Combi*[®] effervescent granules contain calcium carbonate 2.5 g (calcium 1 g or Ca²⁺ 25 mmol) and colecalciferol 22 micrograms (880 units)/sachet.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer risedronate with calcium carbonate and colecalciferol tablets and granules.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

F 765

● INDICATIONS AND DOSE

Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma

▶ BY MOUTH

- ▶ **Adult:** 1.6 g daily in 1–2 divided doses, then increased if necessary up to 3.2 g daily in 2 divided doses

LORON 520®

Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma

► BY MOUTH

- Adult: Initially 2 tablets daily in 1–2 divided doses, increased if necessary up to 4 tablets daily

- **CONTRA-INDICATIONS** Acute severe gastro-intestinal inflammatory conditions
- **CAUTIONS** Atypical femoral fractures · maintain adequate fluid intake during treatment · upper gastro-intestinal disorders
- **INTERACTIONS** → Appendix 1: bisphosphonates
- **SIDE-EFFECTS** Proteinuria · respiratory disorder
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 10 mL/minute/1.73 m².
Dose adjustments Max. initial dose 1200 mg daily if eGFR 30–50 mL/minute/1.73 m².
Use half normal dose if eGFR 10–30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor renal function, serum calcium and serum phosphate before and during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Avoid food for 2 hours before and 1 hour after treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids; maintain adequate fluid intake.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer sodium clodronate capsules and tablets.

- **MEDICAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

23-Mar-2020

Zoledronic acid● **INDICATIONS AND DOSE****Prevention of skeletal related events in advanced malignancies involving bone (specialist use only)**

► BY INTRAVENOUS INFUSION

- Adult: 4 mg every 3–4 weeks, calcium 500 mg daily and vitamin D 400 units daily should also be taken

Tumour-induced hypercalcaemia (specialist use only)

► BY INTRAVENOUS INFUSION

- Adult: 4 mg for 1 dose

Paget's disease of bone (specialist use only)

► BY INTRAVENOUS INFUSION

- Adult: 5 mg for 1 dose, at least 500 mg elemental calcium twice daily (with vitamin D) for at least 10 days is recommended following infusion

Osteoporosis (including corticosteroid-induced osteoporosis) in men and postmenopausal women

► BY INTRAVENOUS INFUSION

- Adult: 5 mg once yearly as a single dose, in patients with a recent low-trauma hip fracture, the dose should be given at least 2 weeks after hip fracture repair; before first infusion give 50 000–125 000 units of vitamin D

- **CAUTIONS** Atypical femoral fractures · cardiac disease (avoid fluid overload) · concomitant medicines that affect renal function
- **INTERACTIONS** → Appendix 1: bisphosphonates
- **SIDE-EFFECTS**
 - **Common or very common** Appetite decreased · chills · flushing
 - **Uncommon** Anaphylactic shock · anxiety · arrhythmias · chest pain · circulatory collapse · cough · drowsiness · dry mouth · dyspnoea · haematuria · hyperhidrosis · hypertension · hypotension · leucopenia · muscle spasms · proteinuria · respiratory disorders · sensation abnormal · sleep disorder · stomatitis · syncope · thrombocytopenia · tremor · vision blurred · weight increased
 - **Rare or very rare** Confusion · Fanconi syndrome acquired · pancytopenia
 - **Frequency not known** Acute phase reaction
- **SIDE-EFFECTS, FURTHER INFORMATION** Renal impairment and renal failure have been reported; ensure patient is hydrated before each dose and assess renal function.
- **CONCEPTION AND CONTRACEPTION** Contra-indicated in women of child-bearing potential.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe hepatic impairment (limited information available).
- **RENAL IMPAIRMENT** Avoid in tumour-induced hypercalcaemia if serum creatinine above 400 micromol/litre. Avoid in advanced malignancies involving bone if eGFR less than 30 mL/minute/1.73 m² (or if serum creatinine greater than 265 micromol/litre). Avoid in Paget's disease, treatment of postmenopausal osteoporosis and osteoporosis in men if eGFR less than 35 mL/minute/1.73 m².
Dose adjustments In advanced malignancies involving bone, if eGFR 50–60 mL/minute/1.73 m² reduce dose to 3.5 mg every 3–4 weeks; if eGFR 40–50 mL/minute/1.73 m² reduce dose to 3.3 mg every 3–4 weeks; if eGFR 30–40 mL/minute/1.73 m² reduce dose to 3 mg every 3–4 weeks; if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value.
- **MONITORING REQUIREMENTS**
 - Correct disturbances of calcium metabolism (e.g. vitamin D deficiency, hypocalcaemia) before starting. Monitor serum electrolytes, calcium, phosphate and magnesium.
 - Monitor renal function in patients at risk, such as those with pre-existing renal impairment, those of advanced age, those taking concomitant nephrotoxic drugs or diuretics, or those who are dehydrated.
- **DIRECTIONS FOR ADMINISTRATION**
 - When used for Prevention of skeletal related events in advanced malignancies involving bone or Tumour-induced hypercalcaemia For *intravenous infusion*, infuse over at least 15 minutes; administer as a single intravenous solution in a separate infusion line. If using 4 mg/5 mL concentrate for

solution for infusion or preparing a reduced dose of 4 mg/100 mL solution for infusion for patients with renal impairment, dilute requisite dose according to product literature.

- ▶ When used for Paget's disease of bone or Osteoporosis (including corticosteroid-induced osteoporosis) in men and postmenopausal women **For intravenous infusion**, give via a vented infusion line over at least 15 minutes.

- **PATIENT AND CARER ADVICE** A patient reminder card should be provided (risk of osteonecrosis of the jaw).

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

Scottish Medicines Consortium (SMC) decisions

SMC No. 29/02

The *Scottish Medicines Consortium* has advised (May 2003) that zoledronic acid (*Zometa*®) is accepted for restricted use within NHS Scotland for the prevention of skeletal related events in patients with breast cancer and multiple myeloma if prescribed by an oncologist.

SMC No. 317/06

The *Scottish Medicines Consortium* has advised (October 2006) that zoledronic acid (*Aclasta*®) is accepted for use within NHS Scotland for the treatment of Paget's disease of bone in patients for whom the use of a bisphosphonate is appropriate.

SMC No. 447/08

The *Scottish Medicines Consortium* has advised (March 2008) that zoledronic acid (*Aclasta*®) is accepted for restricted use within NHS Scotland for the treatment of osteoporosis in postmenopausal women in those for whom oral treatment options for osteoporosis are inappropriate, when initiated by a specialist.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Infusion

- ▶ **Zoledronic acid (Non-proprietary)**

CALCIUM REGULATING DRUGS > BONE RESORPTION INHIBITORS

Calcitonin (salmon)

21-Jan-2020

(Salcatonin)

● **INDICATIONS AND DOSE**

Hypercalcaemia of malignancy

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ **Adult:** 100 units every 6–8 hours (max. per dose 400 units every 6–8 hours), adjusted according to response

- ▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** Up to 10 units/kg, in severe or emergency cases, to be administered by slow intravenous infusion over at least 6 hours

Paget's disease of bone

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ **Adult:** 100 units daily, adjusted according to response for maximum 3 months (6 months in exceptional circumstances), a minimum dosage regimen of 50 units three times a week has been shown to achieve clinical and biochemical improvement

Prevention of acute bone loss due to sudden immobility

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ **Adult:** Initially 100 units daily in 1–2 divided doses, then reduced to 50 units daily at the start of mobilisation, usual duration of treatment is 2 weeks; maximum 4 weeks

- **CONTRA-INDICATIONS** Hypocalcaemia
- **CAUTIONS** History of allergy (skin test advised) · risk of malignancy—avoid prolonged use (use lowest effective dose for shortest possible time)
- **INTERACTIONS** → Appendix 1: calcitonins

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · arthralgia · diarrhoea · dizziness · fatigue · flushing · headache · musculoskeletal pain · nausea · secondary malignancy (long term use) · taste altered · vomiting
- ▶ **Uncommon** Hypersensitivity · hypertension · influenza like illness · oedema · polyuria · skin reactions · visual impairment
- ▶ **Rare or very rare** Bronchospasm · throat swelling · tongue swelling
- ▶ **Frequency not known** Hypocalcaemia · tremor
- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in *animal studies*).
- **BREAST FEEDING** Avoid; inhibits lactation in *animals*.
- **RENAL IMPAIRMENT** Use with caution.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use For *intravenous infusion*, give intermittently in Sodium chloride 0.9%. Diluted solution given without delay. Dilute in 500 mL give over at least 6 hours; glass or hard plastic containers should not be used; some loss of potency on dilution and administration.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Calcitonin (salmon) (Non-proprietary)

Calcitonin (salmon) 50 unit per 1 ml Calcitonin (salmon)

100units/1ml solution for injection ampoules | 5 ampoule [PoM]
£220.00 DT = £220.00

Calcitonin (salmon) 200 unit per 1 ml Calcitonin (salmon)
400units/2ml solution for injection vials | 1 vial [PoM] £352.00 DT =
£352.00

Strontium ranelate

06-Feb-2018

- **DRUG ACTION** Strontium ranelate stimulates bone formation and reduces bone resorption.

● INDICATIONS AND DOSE

Severe osteoporosis in men and postmenopausal women at increased risk of fractures [when other treatments are contra-indicated or not tolerated]

- ▶ BY MOUTH
- ▶ Adult: 2 g daily, dose to be taken in water and at bedtime

- **CONTRA-INDICATIONS** Cerebrovascular disease · current or previous venous thromboembolic event · ischaemic heart disease · peripheral arterial disease · temporary or permanent immobilisation · uncontrolled hypertension

- **CAUTIONS** Risk factors for cardiovascular disease—assess before and every 6–12 months during treatment · Risk factors for venous thromboembolism (discontinue in patients who become immobile)

- **INTERACTIONS** → Appendix 1: strontium

● SIDE-EFFECTS

- ▶ **Common or very common** Angioedema · arthralgia · bronchial hyperreactivity · consciousness impaired · constipation · diarrhoea · dizziness · embolism and thrombosis · gastrointestinal discomfort · gastrointestinal disorders · headache · hepatitis · hypercholesterolaemia · insomnia · memory loss · muscle complaints · myocardial infarction · nausea · pain · paraesthesia · peripheral oedema · skin reactions · vertigo · vomiting
- ▶ **Uncommon** Alopecia · confusion · dry mouth · fever · lymphadenopathy · malaise · oral disorders · seizure
- ▶ **Rare or very rare** Bone marrow failure · eosinophilia · severe cutaneous adverse reactions (SCARs)

- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal studies*.
- **BREAST FEEDING** Manufacturer advises avoid—data suggest present in human milk.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute.
- **EFFECT ON LABORATORY TESTS** Manufacturer advises may interfere with colorimetric assay of calcium in blood and urine—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Granules should be stirred into at least 30mL of water, and taken immediately at bedtime on an empty stomach; avoid food for at least 2 hours before treatment, particularly calcium-containing products e.g. milk.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer strontium ranelate granules.
Severe allergic reactions Patients should be advised to stop taking strontium ranelate and consult their doctor immediately if skin rash develops.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

CALCIUM REGULATING DRUGS > PARATHYROID HORMONES AND ANALOGUES

Teriparatide

21-Feb-2018

● INDICATIONS AND DOSE

Treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures | Treatment of corticosteroid-induced osteoporosis

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 20 micrograms daily for maximum duration of treatment 24 months (course not to be repeated)

- **CONTRA-INDICATIONS** Bone metastases · hyperparathyroidism · metabolic bone diseases · Paget's disease · pre-existing hypercalcaemia · previous radiation therapy to the skeleton · skeletal malignancies · unexplained raised alkaline phosphatase

● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · asthenia · chest pain · gastrointestinal disorders · headache · hypercholesterolaemia · hyperhidrosis · hypotension · muscle complaints · palpitations · sciatica · skin reactions · syncope · vomiting
- ▶ **Uncommon** Arthralgia · back pain · emphysema · hypercalcaemia · hyperuricaemia · nephrolithiasis · tachycardia · urinary disorders · weight increased
- ▶ **Rare or very rare** Oedema · renal impairment
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **RENAL IMPAIRMENT** Caution in moderate impairment; avoid if severe.
- **PRESCRIBING AND DISPENSING INFORMATION** Teriparatide is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Raloxifene and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (updated February 2018) NICE TA161

Teriparatide is recommended as an alternative treatment option for the secondary prevention of osteoporotic fragility fractures in postmenopausal women:

- who are unable to take alendronate and risedronate, or have a contra-indication to or are intolerant of alendronate and risedronate, or have had an unsatisfactory response to treatment with alendronate or risedronate, **and**
- who are 65 years or older and have a T-score of -4 standard deviations (SD) or below, or a T-score of -3.5 SD or below plus more than two fractures, or who are aged 55-64 years and have a T-score of -4 SD or below plus more than two fractures.

Women who are currently receiving treatment, but for whom treatment would not have been recommended, should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

- ▶ **Terosa** Gedeon Richter (UK) Ltd
Teriparatide 250 microgram per 1 ml Terosa
20micrograms/80microlitres solution for injection 2.4ml cartridge | 1 cartridge [PoM] £239.25 | 3 cartridge [PoM] £717.75 | Terosa 20micrograms/80microlitres solution for injection 2.4ml cartridge with pen | 1 cartridge [PoM] £239.25

DRUGS AFFECTING BONE STRUCTURE AND MINERALISATION > MONOCLONAL ANTIBODIES

Denosumab

27-Apr-2020

- **DRUG ACTION** Denosumab is a human monoclonal antibody that inhibits osteoclast formation, function, and survival, thereby decreasing bone resorption.

● INDICATIONS AND DOSE

PROLIA®

Osteoporosis in postmenopausal women and in men at increased risk of fractures | Bone loss associated with hormone ablation in men with prostate cancer at increased risk of fractures | Bone loss associated with long-term systemic glucocorticoid therapy in patients at increased risk of fracture

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 60 mg every 6 months, supplement with calcium and Vitamin D, to be administered into the thigh, abdomen or upper arm

XGEVA®

Prevention of skeletal related events in patients with bone metastases

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 120 mg every 4 weeks, supplementation of at least calcium 500 mg and Vitamin D 400 units daily should also be taken unless hypercalcaemia is present,

to be administered into the thigh, abdomen or upper arm

Giant cell tumour of bone that is unresectable or where surgical resection is likely to result in severe morbidity

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 120 mg every 4 weeks, give additional dose on days 8 and 15 of the first month of treatment only, supplementation of at least calcium 500 mg and Vitamin D 400 units daily should also be taken unless hypercalcaemia is present, to be administered into the thigh, abdomen or upper arm

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DENOSUMAB: ATYPICAL FEMORAL FRACTURES (FEBRUARY 2013)

Atypical femoral fractures have been reported rarely in patients receiving denosumab for the long-term treatment (2.5 or more years) of postmenopausal osteoporosis.

Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.

Discontinuation of denosumab in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

MHRA/CHM ADVICE: DENOSUMAB: MINIMISING THE RISK OF OSTEONECROSIS OF THE JAW; MONITORING FOR HYPOCALCAEMIA—UPDATED RECOMMENDATIONS (SEPTEMBER 2014) AND DENOSUMAB: OSTEONECROSIS OF THE JAW—FURTHER MEASURES TO MINIMISE RISK (JULY 2015)

Denosumab is associated with a risk of osteonecrosis of the jaw (ONJ) and with a risk of hypocalcaemia.

Osteonecrosis of the jaw Osteonecrosis of the jaw is a well-known and common side-effect in patients receiving denosumab 120 mg for cancer. Risk factors include smoking, old age, poor oral hygiene, invasive dental procedures (including tooth extractions, dental implants, oral surgery), comorbidity (including dental disease, anaemia, coagulopathy, infection), advanced cancer, previous treatment with bisphosphonates, and concomitant treatments (including chemotherapy, anti-angiogenic biologics, corticosteroids, and radiotherapy to head and neck). The following precautions are now recommended to reduce the risk of ONJ:

- Denosumab 120 mg (cancer indication)
- A dental examination and appropriate preventative dentistry before starting treatment are now recommended for all patients
- Do not start denosumab in patients with a dental or jaw condition requiring surgery, or in patients who have unhealed lesions from dental or oral surgery
- Denosumab 60 mg (osteoporosis indication)
- Check for ONJ risk factors before starting treatment. A dental examination and appropriate preventative dentistry are now recommended for patients with risk factors

All patients should be given a patient reminder card and informed of the risk of ONJ. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, if they wear dentures they should make sure their dentures fit properly before starting treatment, to maintain good oral hygiene, receive routine dental check-ups during treatment, and immediately report any oral symptoms such as dental mobility, pain, swelling, non-healing sores or discharge to a doctor and dentist. Patients should tell their doctor and dentist that they are receiving denosumab if they need dental treatment or dental surgery.

Hypocalcaemia Denosumab is associated with a risk of hypocalcaemia. This risk increases with the degree of renal impairment. Hypocalcaemia usually occurs in the

first weeks of denosumab treatment, but it can also occur later in treatment.

Plasma-calcium concentration monitoring is recommended for denosumab 120 mg (cancer indication):

- before the first dose
- within two weeks after the initial dose
- if suspected symptoms of hypocalcaemia occur
- consider monitoring more frequently in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)

Plasma-calcium concentration monitoring is recommended for denosumab 60 mg (osteoporosis indication):

- before each dose
- within two weeks after the initial dose in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)
- if suspected symptoms of hypocalcaemia occur

All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).

MHRA/CHM ADVICE: DENOSUMAB: REPORTS OF OSTEOECROSIS OF THE EXTERNAL AUDITORY CANAL (JUNE 2017)

Osteonecrosis of the external auditory canal has been reported with denosumab and this should be considered in patients who present with ear symptoms including chronic ear infections or in those with suspected cholesteatoma. Possible risk factors include steroid use and chemotherapy, with or without local risk factors such as infection or trauma. The MHRA recommends advising patients to report any ear pain, discharge from the ear, or an ear infection during denosumab treatment.

MHRA/CHM ADVICE: DENOSUMAB (XGEVA®) FOR GIANT CELL TUMOUR OF BONE: RISK OF CLINICALLY SIGNIFICANT HYPERCALCAEMIA FOLLOWING DISCONTINUATION (JUNE 2018)

Cases of clinically significant hypercalcaemia (rebound hypercalcaemia) have been reported up to 9 months after discontinuation of denosumab treatment for giant cell tumour of bone. The MHRA recommends that prescribers should monitor patients for signs and symptoms of hypercalcaemia after discontinuation, consider periodic assessment of serum calcium, re-evaluate the patient's calcium and vitamin D supplementation requirements, and advise patients to report symptoms of hypercalcaemia.

Denosumab is not recommended in patients with growing skeletons.

MHRA/CHM ADVICE: DENOSUMAB (XGEVA®) FOR ADVANCED MALIGNANCIES INVOLVING BONE: STUDY DATA SHOW NEW PRIMARY MALIGNANCIES REPORTED MORE FREQUENTLY COMPARED TO ZOLEDRONIC ACID (ZOLEDRONATE) (JUNE 2018)

A pooled analysis has shown an increased rate of new primary malignancies in patients given Xgeva® (1-year cumulative incidence 1.1%) compared with those given zoledronic acid (0.6%), when used for the prevention of skeletal-related events with advanced malignancies involving bone. No treatment-related pattern in individual cancers or cancer groupings were apparent.

- **CONTRA-INDICATIONS** Hypocalcaemia
XGEVA® Unhealed lesions from dental or oral surgery
- **CAUTIONS** Risk factors for osteonecrosis of the external auditory canal - risk factors for osteonecrosis of the jaw—consider temporary interruption of denosumab if occurs during treatment
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal discomfort · cataract · constipation · hypocalcaemia (including fatal cases) ·

increased risk of infection · pain · sciatica · second primary malignancy · skin reactions

- ▶ **Uncommon** Cellulitis (seek prompt medical attention) · hypercalcaemia (on discontinuation)
- ▶ **Rare or very rare** Atypical femur fracture · hypersensitivity · osteonecrosis
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception in women of child-bearing potential, during treatment and for at least 5 months after stopping treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies; risk of toxicity increases with each trimester.
- **BREAST FEEDING** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Increased risk of hypocalcaemia if creatinine clearance less than 30 mL/minute.
- **MONITORING REQUIREMENTS** Correct hypocalcaemia and vitamin D deficiency before starting. Monitor plasma-calcium concentration during therapy.
- **PATIENT AND CARER ADVICE**

Atypical femoral fractures Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.

Osteonecrosis of the jaw All patients should be informed to maintain good oral hygiene, receive routine dental check-ups, and immediately report any oral symptoms such as dental mobility, pain, or swelling to a doctor and dentist.

Hypocalcaemia All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).

Patient reminder card A patient reminder card should be provided (risk of osteonecrosis of the jaw).

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Denosumab for the prevention of osteoporotic fractures in postmenopausal women (October 2010)** NICE TA204
Denosumab (Prolia®) is recommended as a treatment option for the *primary prevention* of osteoporotic fragility fractures in postmenopausal women at increased risk of fractures:
 - who are unable to comply with the special instructions for administering alendronate and risedronate, or have an intolerance of, or a contra-indication to, those treatments **and**
 - who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance.
- Denosumab (Prolia®) is recommended as a treatment option for the *secondary prevention* of osteoporotic fragility fractures only in postmenopausal women at increased risk of fractures who are unable to comply with the special instructions for administering alendronate and risedronate, or have an intolerance of, or a contra-indication to, those treatments.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta204
- ▶ **Denosumab for the prevention of skeletal-related events in adults with bone metastases from solid tumours (October 2012)** NICE TA265
Denosumab (Xgeva®) is recommended for the prevention of skeletal-related events in adults with bone metastases from breast cancer and from solid tumours other than prostate if:
 - bisphosphonates would otherwise be prescribed, **and**

- the manufacturer provides denosumab with the discount agreed in the patient access scheme. Denosumab is **not** recommended for preventing skeletal-related events in adults with bone metastases from prostate cancer.

Patients with bone metastases from solid tumours currently receiving denosumab whose disease does not meet the above criteria can continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta265

Scottish Medicines Consortium (SMC) decisions

SMC No. 651/10

The *Scottish Medicines Consortium* has advised (December 2010) that denosumab (*Prolia*®) is accepted for restricted use within NHS Scotland for the treatment of osteoporosis in postmenopausal women at increased risk of fractures who have a bone mineral density T-score < -2.5 and ≥ -4.0 and for whom oral bisphosphonates are unsuitable.

- MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Romosozumab 90 mg per 1 ml Evenity 105mg/1.17ml solution for injection pre-filled pens | 2 pre-filled disposable injection [PoM] £427.75

Romosozumab

23-Apr-2020

- **DRUG ACTION** Romosozumab is a humanised monoclonal antibody that inhibits sclerostin, thereby increasing bone formation and decreasing bone resorption.

• INDICATIONS AND DOSE

Severe osteoporosis in postmenopausal women at increased risk of fractures (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION

▶ **Adult:** 210 mg once a month for 12 months, supplement with calcium and vitamin D, to be administered as two consecutive 105 mg injections at different injection sites into the thigh, abdomen or upper arm

- **CONTRA-INDICATIONS** History of myocardial infarction or stroke—discontinue if occurs during treatment · hypocalcaemia
- **CAUTIONS** Risk factors for cardiovascular disease · risk factors for osteonecrosis of the jaw—consider temporary interruption of romosozumab if occurs during treatment
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arthralgia · headache · hypersensitivity · increased risk of infection · muscle spasms · neck pain · skin reactions
 - ▶ **Uncommon** Cataract · hypocalcaemia · myocardial infarction · stroke
 - ▶ **Rare or very rare** Angioedema
 - ▶ **Frequency not known** Atypical femur fracture · cardiovascular event · osteonecrosis of jaw
- **RENAL IMPAIRMENT** Manufacturer advises monitor serum calcium concentration in patients with severe renal impairment, or in those receiving dialysis—increased risk of hypocalcaemia.
- **MONITORING REQUIREMENTS** Manufacturer advises to correct hypocalcaemia before therapy is initiated. Monitor for signs and symptoms of hypocalcaemia during therapy.
- **PRESCRIBING AND DISPENSING INFORMATION** Romosozumab is a biological medicine. Biological

5 Dopamine responsive conditions

DOPAMINERGIC DRUGS > DOPAMINE RECEPTOR AGONISTS

Dopamine-receptor agonists

Overview

Bromocriptine p. 439 is used for the treatment of galactorrhoea, and for the treatment of prolactinomas (when it reduces both plasma prolactin concentration and tumour size). Bromocriptine also inhibits the release of growth hormone and is sometimes used in the treatment of acromegaly, but somatostatin analogues (such as octreotide p. 1002) are more effective.

Cabergoline p. 440 has similar side-effects to bromocriptine, however patients intolerant of bromocriptine may be able to tolerate cabergoline (and *vice versa*).

Quinagolide p. 777 has actions and uses similar to those of ergot-derived dopamine agonists, but its side-effects differ slightly.

Suppression of lactation

Although bromocriptine and cabergoline are licensed to suppress lactation, they are **not** recommended for routine suppression (or for the relief of symptoms of postpartum pain and engorgement) that can be adequately treated with simple analgesics and breast support. If a dopamine-receptor agonist is required, cabergoline is preferred. Quinagolide is not licensed for the suppression of lactation.

Quinagolide

- **DRUG ACTION** Quinagolide is a non-ergot dopamine D₂ agonist.

● INDICATIONS AND DOSE

Hyperprolactinaemia

► BY MOUTH

- **Adult:** Initially 25 micrograms once daily for 3 days, dose to be taken at bedtime, increased in steps of 25 micrograms every 3 days; usual dose 75–150 micrograms daily, for doses higher than 300 micrograms daily increase in steps of 75–150 micrograms at intervals of not less than 4 weeks
- **UNLICENSED USE** Not licensed for the suppression of lactation.
- **CAUTIONS** Acute porphyrias p. 1120 · history of psychotic illness · history of serious mental disorders
CAUTIONS, FURTHER INFORMATION
- **Hyperprolactinemic patients** In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).
- **INTERACTIONS** → Appendix 1: dopamine receptor agonists
- **SIDE-EFFECTS**
- **Common or very common** Abdominal pain · appetite decreased · constipation · diarrhoea · dizziness · fatigue · flushing · headache · hypotension · insomnia · nasal congestion · nausea · oedema · syncope · vomiting
- **Rare or very rare** Acute psychosis · drowsiness
- **ALLERGY AND CROSS-SENSITIVITY** Quinagolide should not be used in patients with hypersensitivity to quinagolide (does not apply to hypersensitivity to ergot alkaloids).
- **CONCEPTION AND CONTRACEPTION** Advise non-hormonal contraception if pregnancy not desired.
- **PREGNANCY** Discontinue when pregnancy confirmed unless medical reason for continuing (specialist advice needed).
- **BREAST FEEDING** Suppresses lactation.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid (no information available).
- **RENAL IMPAIRMENT** Avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor blood pressure for a few days after starting treatment and following dosage increase.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks
Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.
Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.
Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.
Hypotensive reactions Hypotensive reactions can be disturbing in some patients during the first few days of treatment with dopamine-receptor agonists, particular care should be exercised when driving or operating machinery.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

6 Gonadotrophin responsive conditions

Gonadotrophins

Gonadotrophin-affecting drugs

Danazol p. 783 is licensed for the treatment of *endometriosis* and for the relief of severe pain and tenderness in *benign fibrocystic breast disease* where other measures have proved unsatisfactory. It may also be effective in the long-term management of *hereditary angioedema* [unlicensed indication].

Cetorelix p. 778 and ganirelix p. 778 are luteinising hormone releasing hormone antagonists, which inhibit the release of gonadotrophins (luteinising hormone and follicle stimulating hormone). They are used in the treatment of infertility by assisted reproductive techniques.

Gonadorelin analogues

Gonadorelin analogues are used in the treatment of endometriosis, precocious puberty, infertility, male hypersexuality with severe sexual deviation, anaemia due to uterine fibroids (together with iron supplementation), breast cancer, prostate cancer and before intra-uterine surgery. Use of luteal phase acetate and triptorelin for 3 to 4 months before surgery reduces the uterine volume, fibroid size and associated bleeding.

Breast pain (mastalgia)

Once any serious underlying cause for breast pain has been ruled out, most women will respond to reassurance and reduction in dietary fat; withdrawal of an oral contraceptive or of hormone replacement therapy may help to resolve the pain.

Mild, non-cyclical breast pain is treated with simple analgesics; moderate to severe pain, cyclical pain or symptoms that persist for longer than 6 months may require specific drug treatment.

Danazol is licensed for the relief of severe pain and tenderness in benign fibrocystic breast disease which has not responded to other treatment.

Tamoxifen p. 1005 may be a useful adjunct in the treatment of mastalgia [unlicensed indication] especially when symptoms can definitely be related to cyclic oestrogen production; it may be given on the days of the cycle when symptoms are predicted.

Treatment for breast pain should be reviewed after 6 months and continued if necessary. Symptoms recur in about 50% of women within 2 years of withdrawal of therapy but may be less severe.

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > ANTI-GONADOTROPHIN-RELEASING HORMONES

Cetrorelix

15-Jun-2018

● INDICATIONS AND DOSE

Adjunct in the treatment of female infertility (initiated under specialist supervision)

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult (female): 250 micrograms once daily, dose to be administered in the morning, starting on day 5 or 6 of ovarian stimulation with gonadotrophins (or each evening starting on day 5 of ovarian stimulation), continue throughout administration of gonadotrophin including day of ovulation induction (or evening before ovulation induction), dose to be injected into the lower abdominal wall.

● SIDE-EFFECTS

- ▶ **Common or very common** Ovarian hyperstimulation syndrome
- ▶ **Uncommon** Headache · hypersensitivity · nausea
- **PREGNANCY** Avoid in confirmed pregnancy.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution—no information available.
- **RENAL IMPAIRMENT** Avoid in moderate or severe renal impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

▶ Cetrotide (Merck Serono Ltd)

Cetrorelix (as Cetrorelix acetate) 250 microgram Cetrotide 250microgram powder and solvent for solution for injection vials | 1 vial [PoM] £27.13 DT = £27.13

Ganirelix

● INDICATIONS AND DOSE

Adjunct in the treatment of female infertility (initiated under specialist supervision)

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 250 micrograms once daily, dose to be administered in the morning (or each afternoon) starting on day 5 or day 6 of ovarian stimulation with gonadotrophins, continue throughout administration of gonadotrophins including day of ovulation induction (if administering in afternoon, give last dose in afternoon before ovulation induction), dose to be injected preferably into the upper leg (rotate injection sites to prevent lipoatrophy)

● SIDE-EFFECTS

- ▶ **Common or very common** Skin reactions
- ▶ **Uncommon** Headache · malaise · nausea
- ▶ **Rare or very rare** Dyspnoea · facial swelling · hypersensitivity
- ▶ **Frequency not known** Abdominal distension · ovarian hyperstimulation syndrome · pelvic pain
- **PREGNANCY** Avoid in confirmed pregnancy—*toxicity in animal studies.*
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment (no information available).
- **RENAL IMPAIRMENT** Avoid in moderate to severe renal impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Fyremadel (Ferring Pharmaceuticals Ltd)

Ganirelix 500 microgram per 1 ml Fyremadel 250micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] 

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GONADOTROPHIN-RELEASING HORMONES

Buserelin

27-Nov-2019

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

● INDICATIONS AND DOSE

Endometriosis

▶ BY INTRANASAL ADMINISTRATION

- ▶ Adult: 300 micrograms 3 times a day maximum duration of treatment 6 months (do not repeat), to be started on days 1 or 2 of menstruation; administer one 150 microgram spray into each nostril

Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under expert supervision)

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 200–500 micrograms once daily, increased if necessary up to 500 micrograms twice daily, starting in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually 1–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

▶ BY INTRANASAL ADMINISTRATION

- ▶ Adult: 150–300 micrograms 4 times a day, (150 micrograms equivalent to one spray), to be administered during waking hours. Start in early follicular phase (day 1) or, after exclusion of pregnancy, in the midluteal phase (day 21) and continued until down-regulation achieved (usually about 2–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

Advanced prostate cancer

▶ INITIALLY BY SUBCUTANEOUS INJECTION

- ▶ Adult: 500 micrograms every 8 hours for 7 days, then (by intranasal administration) 200 micrograms 6 times a day, (a single 100 microgram spray to be administered into each nostril)

● CONTRA-INDICATIONS

- ▶ When used for endometriosis Undiagnosed vaginal bleeding · use longer than 6 months (do not repeat)
- ▶ When used for pituitary desensitisation Undiagnosed vaginal bleeding
- **CAUTIONS** Depression · diabetes · hypertension · patients with metabolic bone disease (decrease in bone mineral density can occur) · polycystic ovarian disease

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Depression · mood altered
- ▶ **Rare or very rare** Auditory disorder · hypotension · leucopenia · pituitary tumour benign · thrombocytopenia · tinnitus
- ▶ **Frequency not known** Alopecia · anxiety · appetite change · breast abnormalities · broken nails · concentration impaired · constipation · diarrhoea · dizziness · drowsiness · dry eye · dysuria · embolism and thrombosis · fatigue · feeling of pressure behind the eyes · follicle recruitment increased · galactorrhoea · gastrointestinal discomfort · gynaecomastia · hair changes · headache · hot flush · hydronephrosis · hyperhidrosis · increased risk of fracture · lymphostasis · memory loss · menopausal symptoms · menstrual cycle irregularities · muscle weakness in legs · musculoskeletal discomfort · nausea · oedema · osteoporosis · ovarian and fallopian tube disorders · pain · painful sexual intercourse · palpitations · paraesthesia · QT interval prolongation · sexual dysfunction · shock · skin reactions · sleep disorder · testicular atrophy · thirst · tumour activation temporary · uterine leiomyoma degeneration · vision disorders · vomiting · vulvovaginal disorders · weight changes

SPECIFIC SIDE-EFFECTS

- ▶ With intranasal use Altered smell sensation · epistaxis · hoarseness · nasal irritation · taste altered

SIDE-EFFECTS, FURTHER INFORMATION During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour 'flare' may cause spinal cord compression, ureteric obstruction or increased bone pain.

- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intranasal use Avoid use of nasal decongestants before and for at least 30 minutes after treatment.
- ▶ With subcutaneous use Rotate injection site to prevent atrophy and nodule formation.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer buserelin nasal spray.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Suprecur** (Sanofi)
Buserelin (as Buserelin acetate) 1 mg per 1 ml Suprecur 5.5mg/5.5ml solution for injection vials | 2 vial **[PoM]** £33.02
- ▶ **Suprefact** (Sanofi)
Buserelin (as Buserelin acetate) 1 mg per 1 ml Suprefact 5.5mg/5.5ml solution for injection vials | 2 vial **[PoM]** £34.37

Spray

- ▶ **Suprecur** (Sanofi)
Buserelin (as Buserelin acetate) 150 microgram per 1 dose Suprecur 150micrograms/dose nasal spray | 168 dose **[PoM]** £105.16 DT = £105.16
- ▶ **Suprefact** (Sanofi)
Buserelin (as Buserelin acetate) 100 microgram per 1 dose Suprefact 100micrograms/dose nasal spray | 336 dose **[PoM]** £122.24 DT = £122.24

Goserelin

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

● INDICATIONS AND DOSE

ZOLADEX LA[®]

Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 10.8 mg every 12 weeks, to be administered into the anterior abdominal wall

ZOLADEX[®]

Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer | Advanced breast cancer | Oestrogen-receptor-positive early breast cancer

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 3.6 mg every 28 days, to be administered into the anterior abdominal wall

Endometriosis

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 3.6 mg every 28 days maximum duration of treatment 6 months (do not repeat), to be administered into the anterior abdominal wall

Endometrial thinning before intra-uterine surgery

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 3.6 mg, dose may be repeated after 28 days if uterus is large or to allow flexible surgical timing, to be administered into the anterior abdominal wall

Before surgery in women who have anaemia due to uterine fibroids

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 3.6 mg every 28 days maximum duration of treatment 3 months, to be given with supplementary iron, to be administered into the anterior abdominal wall

Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (after exclusion of pregnancy) (under expert supervision)

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 3.6 mg, dose given to achieve pituitary down-regulation (usually 1–3 weeks) then gonadotrophin is administered (stopping gonadotrophin on administration of chorionic gonadotrophin at appropriate stage of follicular development), to be administered into the anterior abdominal wall

- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding · use longer than 6 months in endometriosis (do not repeat)

- **CAUTIONS** Depression · diabetes · hypertension · patients with metabolic bone disease (decrease in bone mineral density can occur) · polycystic ovarian disease · risk of spinal cord compression in men · risk of ureteric obstruction in men

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · arthralgia · bone pain · breast abnormalities · depression · glucose tolerance impaired · gynaecomastia · headache · heart failure · hot flush · hyperhidrosis · mood altered · myocardial infarction · neoplasm complications · paraesthesia · sexual dysfunction · skin reactions · spinal cord compression · vulvovaginal disorders · weight increased
- ▶ **Uncommon** Hypercalcaemia (in women) · ureteral obstruction
- ▶ **Rare or very rare** Ovarian and fallopian tube disorders · pituitary haemorrhage · pituitary tumour · psychotic disorder
- ▶ **Frequency not known** Abdominal cramps · body hair change · constipation · diarrhoea · fatigue · hepatic function abnormal · interstitial pneumonia · muscle complaints · nausea · nervousness · peripheral oedema (when used for gynaecological conditions) · premature menopause · pulmonary embolism · QT interval prolongation · sleep disorder · uterine leiomyoma degeneration · voice alteration · vomiting · vulvovaginal infection · withdrawal bleed

SIDE-EFFECTS, FURTHER INFORMATION Tumour flare can occur when androgen deprivation therapy is initiated.

- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **MONITORING REQUIREMENTS** Men at risk of tumour 'flare' should be monitored closely during the first month of therapy for prostate cancer.

- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Implant

- ▶ **Zoladex** (AstraZeneca UK Ltd)

Goserelin (as Goserelin acetate) 3.6 mg Zoladex 3.6mg implant SafeSystem pre-filled syringes | 1 pre-filled disposable injection [PoM] £70.00 DT = £70.00

- ▶ **Zoladex LA** (AstraZeneca UK Ltd)

Goserelin (as Goserelin acetate) 10.8 mg Zoladex LA 10.8mg implant SafeSystem pre-filled syringes | 1 pre-filled disposable injection [PoM] £235.00 DT = £235.00

Leuprorelin acetate

26-May-2020

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

● INDICATIONS AND DOSE

PROSTAP 3 DCS[®]

Prostate cancer (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 11.25 mg every 3 months

Endometriosis (specialist use only)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 11.25 mg every 3 months for maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

Pre- and perimenopausal breast cancer (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 11.25 mg every 3 months, for further information on use with adjuvant treatments, consult product literature

PROSTAP SR DCS[®]

Prostate cancer (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 3.75 mg every month

Endometriosis (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 3.75 mg every month for maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

Endometrial thinning before intra-uterine surgery (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 3.75 mg for 1 dose, dose to be given as a single dose between day 3 and 5 of menstrual cycle, 5–6 weeks before surgery

Reduction of size of uterine fibroids and of associated bleeding before surgery (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 3.75 mg every month usually for 3–4 months (maximum 6 months)

Preservation of ovarian function (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 3.75 mg as a single dose 2 weeks before starting chemotherapy, followed by 3.75 mg every month for the duration of chemotherapy treatment

Pre- and perimenopausal breast cancer (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 3.75 mg every month, for further information on use with adjuvant treatments, consult product literature

STALADEX[®] 10.72MG

Prostate cancer (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 10.72 mg every 3 months, to be administered under the skin of the abdomen

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Undiagnosed vaginal bleeding

SPECIFIC CONTRA-INDICATIONS

- ▶ When used for endometriosis Use longer than 6 months (do not repeat)
- **CAUTIONS** Diabetes · family history of osteoporosis · patients with metabolic bone disease (decrease in bone mineral density can occur) · risk of spinal cord compression in men with prostate cancer · risk of ureteric obstruction in men with prostate cancer

● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · arthralgia · bone pain · breast abnormalities · depression · dizziness · fatigue · gynaecomastia · headache · hepatic disorders · hot flush · hyperhidrosis · injection site necrosis · insomnia · mood altered · muscle weakness · nausea · paraesthesia · peripheral oedema · sexual dysfunction · testicular atrophy · vulvovaginal dryness · weight change
- ▶ **Uncommon** Alopecia · diarrhoea · fever · myalgia · palpitations · visual impairment · vomiting

- ▶ **Rare or very rare** Haemorrhage
- ▶ **Frequency not known** Anaemia · glucose tolerance impaired · hypertension · hypotension · interstitial lung disease · leucopenia · paralysis · pulmonary embolism · QT interval prolongation · seizure · spinal fracture · thrombocytopenia · urinary tract obstruction

SIDE-EFFECTS, FURTHER INFORMATION In prostate cancer, during the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain.

- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- **PREGNANCY** Avoid—teratogenic in *animal* studies.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor liver function.
 - ▶ Men at risk of tumour ‘flare’ should be monitored closely during the first month of therapy.
- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Implant

- ▶ **Staladex** (Typharm Ltd)

Leuporelin (as Leuporelin acetate) 10.72 mg Staladex 10.72mg implant pre-filled syringes | 1 pre-filled disposable injection [PoM] £208.79 (Hospital only)

Powder and solvent for suspension for injection

- ▶ **Prostap 3 DCS** (Takeda UK Ltd)

Leuporelin acetate 11.25 mg Prostap 3 DCS 11.25mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £225.72 DT = £225.72

- ▶ **Prostap SR DCS** (Takeda UK Ltd)

Leuporelin acetate 3.75 mg Prostap SR DCS 3.75mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £75.24 DT = £75.24

Nafarelin

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

● INDICATIONS AND DOSE

Endometriosis

- ▶ BY INTRANASAL ADMINISTRATION

- ▶ Adult (female): 200 micrograms twice daily for maximum 6 months (do not repeat), one spray in one nostril in the morning, and one spray in the other nostril in the evening (starting on days 2–4 of menstruation).

Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under expert supervision)

- ▶ BY INTRANASAL ADMINISTRATION

- ▶ Adult: 400 micrograms twice daily, one spray in each nostril, to be started in early follicular phase (day 2) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down regulation achieved

(usually within 4 weeks) then maintained (usually for 8–12 days) during gonadotrophin administration (stopping gonadotrophin and nafarelin on administration of chorionic gonadotrophin at follicular maturity), discontinue if down-regulation not achieved within 12 weeks

- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding · use longer than 6 months in the treatment of endometriosis (do not repeat)
- **CAUTIONS** Patients with metabolic bone disease (decrease in bone mineral density can occur)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Artificial menopause · breast abnormalities · chest pain · depression · dyspnoea · emotional lability · headaches · hirsutism · hot flush · hypersensitivity · hypertension · hypotension · insomnia · myalgia · oedema · oestrogen deficiency · paraesthesia · rhinitis · seborrhoea · sexual dysfunction · skin reactions · uterine haemorrhage · vulvovaginal dryness · weight changes
 - ▶ **Uncommon** Alopecia · arthralgia · ovarian cyst (may require discontinuation)
 - ▶ **Frequency not known** Ovarian hyperstimulation syndrome · palpitations · vision blurred
- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first dose should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **DIRECTIONS FOR ADMINISTRATION** Avoid use of nasal decongestants before and for at least 30 minutes after treatment; repeat dose if sneezing occurs during or immediately after administration.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer nafarelin nasal spray.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Spray

CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Synarel** (Pfizer Ltd)

Nafarelin (as Nafarelin acetate) 200 microgram per 1 dose Synarel 200micrograms/dose nasal spray | 60 dose [PoM] £52.43 DT = £52.43

Triptorelin

26-Nov-2019

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

● INDICATIONS AND DOSE

DECAPEPTYL® SR 11.25MG

Advanced prostate cancer (specialist use only)

- ▶ BY INTRAMUSCULAR INJECTION

- ▶ Adult: 11.25 mg every 3 months

Endometriosis

- ▶ BY INTRAMUSCULAR INJECTION

- ▶ Adult: 11.25 mg every 3 months for maximum

6 months (not to be repeated), to be started during first 5 days of menstrual cycle

continued →

DECAPEPTYL® SR 22.5MG**Advanced prostate cancer (specialist use only)**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 22.5 mg every 6 months

DECAPEPTYL® SR 3MG**Advanced prostate cancer (specialist use only)**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 3 mg every 4 weeks

Endometriosis

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 3 mg every 4 weeks maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

Reduction in size of uterine fibroids

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 3 mg every 4 weeks for at least 3 months, maximum duration of treatment 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

Premenopausal breast cancer [as combination therapy] (specialist use only)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 3 mg every 4 weeks for up to 5 years, initiated 6–8 weeks before starting aromatase inhibitor—for further information, consult product literature

GONAPEPTYL DEPOT®**Advanced prostate cancer**

- ▶ BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 3.75 mg every 4 weeks

Endometriosis | Reduction in size of uterine fibroids

- ▶ BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 3.75 mg every 4 weeks maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

SALVACYL®**Male hypersexuality with severe sexual deviation**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 11.25 mg every 12 weeks

- **CONTRA-INDICATIONS** In endometriosis do not use for longer than 6 months (do not repeat) · undiagnosed vaginal bleeding

SALVACYL® Severe osteoporosis

● **CAUTIONS**

GENERAL CAUTIONS History of depression · patients with metabolic bone disease (decrease in bone mineral density can occur)

SPECIFIC CAUTIONS

- ▶ When used for breast cancer Risk factors for osteoporosis
- ▶ When used for prostate cancer Risk factors for osteoporosis · risk of spinal cord compression in men · risk of ureteric obstruction in men

SALVACYL® Increased risk of sensitivity to restored testosterone if treatment interrupted—consider administration of an antiandrogen before stopping treatment · transient increase in serum testosterone occurs on initiation—consider administration of an antiandrogen

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Anxiety · asthenia · depression · diabetes mellitus · dizziness · dry mouth · embolism · gastrointestinal discomfort · gynaecomastia · haemorrhage · headache · hot flush · hyperhidrosis · hypersensitivity · hypertension · joint disorders · menstrual cycle irregularities · mood altered · muscle complaints · nausea ·

oedema · ovarian and fallopian tube disorders · pain · painful sexual intercourse · pelvic pain · sexual dysfunction · skin reactions · sleep disorders · weight changes

- ▶ **Uncommon** Alopecia · appetite abnormal · asthma exacerbated · chills · confusion · constipation · diarrhoea · drowsiness · dyspnoea · flatulence · gout · muscle weakness · taste altered · testicular disorders · tinnitus · vertigo · vision disorders · vomiting
- ▶ **Rare or very rare** Abnormal sensation in eye · chest pain · difficulty standing · fever · hypotension · influenza like illness · musculoskeletal stiffness · nasopharyngitis · orthopnoea · osteoarthritis · QT interval prolongation
- ▶ **Frequency not known** Angioedema · malaise

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intramuscular use Bone disorders · bone fracture · breast abnormalities · glucose tolerance impaired · hyperglycaemia · musculoskeletal disorder · seborrhoea · sensation abnormal · urinary disorders · vulvovaginal disorders
- ▶ With subcutaneous use Dysuria · vulvovaginal dryness
- ▶ **Uncommon**
- ▶ With intramuscular use Broken nails · central nervous system haemorrhage · cerebral ischaemia · concentration impaired · cystocele · dry eye · fluid retention · hirsutism · hyperlipidaemia · memory impairment · myocardial ischaemia · oral ulceration · palpitations · syncope · thrombocytosis · tremor
- ▶ With subcutaneous use Paraesthesia
- ▶ **Frequency not known**
- ▶ With subcutaneous use Bone disorder · breast pain · memory loss

SIDE-EFFECTS, FURTHER INFORMATION During the initial stage increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour 'flare' may cause spinal cord compression, ureteric obstruction or increased pain.

- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

● **MONITORING REQUIREMENTS**

- ▶ When used for Prostate cancer Men at risk of tumour 'flare' should be monitored closely during the first month of therapy.

- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

● **PRESCRIBING AND DISPENSING INFORMATION**

DECAPEPTYL® SR 22.5MG Each vial includes an overage to allow accurate administration of a 22.5 mg dose.

DECAPEPTYL® SR 3MG Each vial includes an overage to allow accurate administration of 3 mg dose.

DECAPEPTYL® SR 11.25MG Each vial includes an overage to allow accurate administration of an 11.25 mg dose.

● **NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) decisions**

SMC No. SMC2186

The *Scottish Medicines Consortium* has advised (October 2019) that triptorelin (*Decapeptyl SR 3mg®*) is accepted for use within NHS Scotland as adjuvant treatment, in combination with tamoxifen or an aromatase inhibitor, of endocrine responsive early stage breast cancer in women at high risk of recurrence who are confirmed as premenopausal after completion of chemotherapy. The advice is contingent upon the continuing availability of

the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions
The *All Wales Medicines Strategy Group* has advised (March 2017) that triptorelin (*Decapeptyl[®] SR*) is recommended as an option for use within NHS Wales as an adjuvant treatment to radiotherapy and as a neoadjuvant treatment prior to radiotherapy, in patients with high-risk localised or locally advanced prostate cancer.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

- ▶ **Decapeptyl SR** (Ipsen Ltd)
Triptorelin (as Triptorelin acetate) 3 mg Decapeptyl SR 3mg powder and solvent for suspension for injection vials | 1 vial [PoM](#) £69.00 DT = £69.00
Triptorelin 11.25 mg Decapeptyl SR 11.25mg powder and solvent for suspension for injection vials | 1 vial [PoM](#) £207.00 DT = £207.00
Triptorelin (as Triptorelin embonate) 22.5 mg Decapeptyl SR 22.5mg powder and solvent for suspension for injection vials | 1 vial [PoM](#) £414.00 DT = £414.00
- ▶ **Gonapeptyl Depot** (Ferring Pharmaceuticals Ltd)
Triptorelin (as Triptorelin acetate) 3.75 mg Gonapeptyl Depot 3.75mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM](#) £81.69 DT = £81.69

6.1 Hereditary angioedema

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > ANTI-GONADOTROPHIN-RELEASING HORMONES

Danazol

08-Mar-2017

- **DRUG ACTION** Danazol inhibits pituitary gonadotrophins; it combines androgenic activity with antioestrogenic and anti-progestogenic activity.

• **INDICATIONS AND DOSE**

Endometriosis

- ▶ BY MOUTH
- ▶ Adult: 200–800 mg daily in up to 4 divided doses usually for 3–6 months, dose to be adjusted to achieve amenorrhoea, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1

Severe pain and tenderness in benign fibrocystic breast disease not responding to other treatment

- ▶ BY MOUTH
- ▶ Adult: 300 mg daily in divided doses usually for 3–6 months, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1

Hereditary angioedema

- ▶ BY MOUTH
- ▶ Adult: Initially 100–200 mg daily, dose to be reduced according to response, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1

- **UNLICENSED USE** Not licensed for use in hereditary angioedema.
- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · androgen-dependent tumours · thromboembolic disease · undiagnosed genital bleeding
- **CAUTIONS** Cardiac impairment (avoid if severe) · diabetes mellitus · elderly · epilepsy · history of thrombosis or thromboembolic disease · hypertension · lipoprotein disorder · migraine · polycythaemia
- **INTERACTIONS** → Appendix 1: danazol

- **SIDE-EFFECTS** Alopecia · aminolevulinic acid synthetase induction · anxiety · appetite increased · breast atrophy · carpal tunnel syndrome · clitoris enlarged · contact lens intolerance · cutaneous lupus erythematosus · depressed mood · dizziness · embolism and thrombosis · emotional lability · eosinophilia · epigastric pain · epilepsy exacerbated · face oedema · fatigue · fever · fluid retention · flushing · glucose tolerance impaired · haematuria · headaches · hepatic disorders · hirsutism · hypertension · idiopathic intracranial hypertension · insulin resistance · joint disorders · leucopenia · libido disorder · menstrual cycle irregularities · muscle contractions involuntary · muscle cramps · myocardial infarction · nausea · neoplasms · pain · palpitations · pancreatitis · photosensitivity reaction · polycythaemia · respiratory disorders · seborrhoea · skin reactions · speech pitch disorder · spermatogenesis reduced · splenic peliosis · tachycardia · throat pain · thrombocytopenia · tremor · vertigo · vision disorders · voice alteration · vulvovaginal disorders · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Withdraw if virilisation effects occur—may be irreversible on continued use.

- **CONCEPTION AND CONTRACEPTION** Ensure patients with amenorrhoea are not pregnant. Non-hormonal contraceptive methods should be used, if appropriate.
- **PREGNANCY** Avoid; has weak androgenic effects and virilisation of female fetus reported.
- **BREAST FEEDING** No data available but avoid because of possible androgenic effects in infant.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in marked impairment.
- **RENAL IMPAIRMENT** Caution in renal impairment (avoid if severe).
- **MONITORING REQUIREMENTS** Manufacturer advises periodic monitoring of hepatic function and haematological state (including biannual hepatic ultrasonography for treatment exceeding 6 months or repeated courses of treatment).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Capsule

- ▶ **Danazol (Non-proprietary)**
Danazol 100 mg Danazol 100mg capsules | 28 capsule [PoM](#) £18.40 DT = £10.08 [CD4-2](#)
Danazol 200 mg Danazol 200mg capsules | 56 capsule [PoM](#) £36.31-£66.20 DT = £36.32 [CD4-2](#)
- ▶ **Danol** (Sanofi)
Danol 100 mg Danol 100mg capsules | 60 capsule [PoM](#) £16.38 [CD4-2](#)
Danol 200 mg Danol 200mg capsules | 60 capsule [PoM](#) £32.43 [CD4-2](#)

7 Hypothalamic and anterior pituitary hormone related disorders

Hypothalamic and anterior pituitary hormones

Anterior pituitary hormones

Corticotrophins

Tetracosactide p. 784 (tetracosactrin), an analogue of corticotropin (ACTH), is used to test adrenocortical function; failure of the plasma cortisol concentration to rise after

administration of tetracosactide indicates adrenocortical insufficiency.

Both corticotropin and tetracosactide were formerly used as alternatives to corticosteroids in conditions such as Crohn's disease; their value was limited by the variable and unpredictable therapeutic response and by the waning of their effect with time.

Gonadotrophins

Follicle-stimulating hormone (FSH) and luteinising hormone (LH) together, or follicle-stimulating hormone alone (as in **folitropin**), are used in the treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene citrate p. 809, or in superovulation treatment for assisted conception (such as *in vitro* fertilisation).

The gonadotrophins are also occasionally used in the treatment of hypogonadotrophic hypogonadism and associated oligospermia. There is no justification for their use in primary gonadal failure.

Growth hormone

Growth hormone is used to treat deficiency of the hormone in children and in adults. In children it is used in Prader-Willi syndrome, Turner syndrome, chronic renal insufficiency, short children considered small for gestational age at birth, and short stature homeobox-containing gene (SHOX) deficiency.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, somatropin p. 788, produced using recombinant DNA technology.

Mecasermin, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency.

Hypothalamic hormones

Gonadorelin p. 785 when injected intravenously in normal subjects leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. **Gonadorelin analogues** are indicated in endometriosis and infertility and in breast and prostate cancer.

7.1 Adrenocortical function testing

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > CORTICOTROPHINS

Tetracosactide

(Tetracosactrin)

● INDICATIONS AND DOSE

Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test)

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 250 micrograms for 1 dose

Diagnosis of adrenocortical insufficiency (diagnostic 5-hour test)

- ▶ BY INTRAMUSCULAR INJECTION USING DEPOT INJECTION
- ▶ Adult: 1 mg for 1 dose

Alternative to corticosteroids in conditions such as Crohn's disease or rheumatoid arthritis (formerly used but value was limited by the variable and unpredictable therapeutic response and by the waning of effect with time)

▶ BY INTRAMUSCULAR INJECTION USING DEPOT INJECTION

- ▶ Adult: Initially 1 mg daily, alternatively initially 1 mg every 12 hours, (in acute cases), then reduced to 1 mg every 2–3 days, followed by 1 mg once weekly, alternatively 500 micrograms every 2–3 days

- **CONTRA-INDICATIONS** Acute psychosis · adrenogenital syndrome · allergic disorders · asthma · avoid injections containing benzyl alcohol in neonates · Cushing's syndrome · infectious diseases · peptic ulcer · primary adrenocortical insufficiency · refractory heart failure
- **CAUTIONS** Active infectious diseases (should not be used unless adequate disease-specific therapy is being given) · active systemic diseases (should not be used unless adequate disease-specific therapy is being given) · diabetes mellitus · diverticulitis · history of asthma · history of atopic allergy · history of eczema · history of hayfever · history of hypersensitivity · hypertension · latent amoebiasis (may become activated) · latent tuberculosis (may become activated) · myasthenia gravis · ocular herpes simplex · osteoporosis · predisposition to thromboembolic · psychological disturbances may be triggered · recent intestinal anastomosis · reduced immune response (should not be used unless adequate disease-specific therapy is being given) · ulcerative colitis

CAUTIONS, FURTHER INFORMATION

- ▶ Risk of anaphylaxis Should only be administered under medical supervision. Consult product literature.
- ▶ Hypertension Patients already receiving medication for moderate to severe hypertension must have their dosage adjusted if treatment started.
- ▶ Diabetes mellitus Patients already receiving medication for diabetes mellitus must have their dosage adjusted if treatment started.
- **SIDE-EFFECTS** Abdominal distension · abscess · adrenocortical unresponsiveness · angioedema · appetite increased · bone fractures · congestive heart failure · Cushing's syndrome · diabetes mellitus exacerbated · dizziness · dyspnoea · electrolyte imbalance · exophthalmos · fluid retention · flushing · gastrointestinal disorders · glaucoma · growth retardation · haemorrhage · headache · healing impaired · hirsutism · hyperglycaemia · hyperhidrosis · hypersensitivity (may be more severe in patients susceptible to allergies, especially asthma) · hypertension · idiopathic intracranial hypertension exacerbated · increased risk of infection · leucocytosis · malaise · menstruation irregular · muscle weakness · myopathy · nausea · osteonecrosis · osteoporosis · pancreatitis · papilloedema · pituitary unresponsiveness · posterior subcapsular cataract · protein catabolism · psychiatric disorder · seizure · skin reactions · tendon rupture · thromboembolism · vasculitis necrotising · vertigo · vomiting · weight increased
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with history of hypersensitivity to tetracosactide/corticotrophins or excipients.
- **PREGNANCY** Avoid (but may be used diagnostically if essential).
- **BREAST FEEDING** Avoid (but may be used diagnostically if essential).
- **HEPATIC IMPAIRMENT** For *depot injection*, manufacturer advises caution in cirrhosis (may enhance effect of tetracosactide therapy).
- **RENAL IMPAIRMENT** Use with caution in patients with renal impairment.

- **EFFECT ON LABORATORY TESTS** May suppress skin test reactions.

Post administration total plasma cortisol levels during 30-minute test for diagnosis of adrenocortical insufficiency might be misleading due to altered cortisol binding globulin levels in some special clinical situations including, patients on oral contraceptives, post-operative patients, critical illness, severe liver disease and nephrotic syndrome.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Synacthen** (Atnahs Pharma UK Ltd)
Tetracosactide acetate 250 microgram per 1 ml Synacthen 250micrograms/1ml solution for injection ampoules | 1 ampoule [PoM] £38.00 DT = £38.00

Suspension for injection

- EXCIPIENTS: May contain Benzyl alcohol
- ▶ **Synacthen Depot** (Atnahs Pharma UK Ltd)
Tetracosactide acetate 1 mg per 1 ml Synacthen Depot 1mg/1ml suspension for injection ampoules | 1 ampoule [PoM] £346.28 DT = £346.28

7.2 Assessment of pituitary function

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GONADOTROPHIN-RELEASING HORMONES

Gonadorelin

(Gonadotrophin-releasing hormone; GnRH; LH-RH)

● INDICATIONS AND DOSE

Assessment of pituitary function

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 100 micrograms for 1 dose

- **CAUTIONS** Pituitary adenoma
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Pain · skin reactions · swelling
 - ▶ **Rare or very rare** Abdominal discomfort · bronchospasm · dizziness · eye erythema · flushing · headache · nausea · tachycardia
 - ▶ **Frequency not known** Menorrhagia · sepsis · thrombophlebitis
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
Powder for solution for injection
 - ▶ **Gonadorelin (Non-proprietary)**
Gonadorelin (as Gonadorelin hydrochloride) 100 microgram Gonadorelin 100microgram powder for solution for injection vials | 1 vial [PoM] £75.00 (Hospital only)

7.3 Gonadotrophin replacement therapy

GONADOTROPHINS

Choriogonadotropin alfa

22-May-2020

(Human chorionic gonadotrophin)

● INDICATIONS AND DOSE

Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (female): Adjusted according to response.

- **CONTRA-INDICATIONS** Active thromboembolic disorders · ectopic pregnancy in previous 3 months · hypothalamus malignancy · mammary malignancy · ovarian enlargement or cyst (unless caused by polycystic ovarian disease) · ovarian malignancy · pituitary malignancy · undiagnosed vaginal bleeding · uterine malignancy
- **CAUTIONS** Acute porphyrias p. 1120
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · fatigue · headache · nausea · ovarian hyperstimulation syndrome · vomiting
 - ▶ **Uncommon** Breast pain · depression · diarrhoea · irritability · restlessness
 - ▶ **Rare or very rare** Rash · shock · thromboembolism

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Ovitrelle** (Merck Serono Ltd)
Choriogonadotropin alfa 500 microgram per 1 ml Ovitrelle 250micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £37.66 DT = £37.66 [CD4-2]
Ovitrelle 250micrograms/0.5ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £37.66 DT = £37.66 [CD4-2]

Follitropin alfa

22-May-2020

(Recombinant human follicle stimulating hormone)

● INDICATIONS AND DOSE

Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (female): Adjusted according to response.

Hypogonadotrophic hypogonadism

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (male): (consult product literature).

- **CONTRA-INDICATIONS** Ovarian cysts (not caused by polycystic ovarian syndrome) · ovarian enlargement (not caused by polycystic ovarian syndrome) · tumours of breast · tumours of hypothalamus · tumours of ovaries · tumours of pituitary · tumours of prostate · tumours of testes · tumours of uterus · vaginal bleeding of unknown cause
- **CAUTIONS** Acute porphyrias p. 1120 · history of tubal disease
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Acne · diarrhoea · gastrointestinal discomfort · gynaecomastia · headache · nausea · ovarian

and fallopian tube disorders · varicocele · vomiting · weight increased

- ▶ **Rare or very rare** Asthma exacerbated · thromboembolism
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **PRESCRIBING AND DISPENSING INFORMATION** Follitropin alfa is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.
- **PATIENT AND CARER ADVICE**
Conception and contraception Patients planning to conceive should be warned that there is a risk of multiple pregnancy.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Bemfola** (Gedeon Richter (UK) Ltd)

Follitropin alfa 600 unit per 1 ml Bemfola 75units/0.125ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £23.50 DT = £23.50

Follitropin alfa with lutropin alfa

22-May-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, follitropin alfa p. 785, lutropin alfa p. 787.

● INDICATIONS AND DOSE

Infertility in women with proven hypopituitarism or who have not responded to clomifene (Superovulation treatment for assisted conception (such as in vitro fertilisation))

- ▶ **BY SUBCUTANEOUS INJECTION**
- ▶ **Adult (female):** Adjusted according to response.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

ELECTROLYTES: May contain Sodium

- ▶ **Pergoveris** (Merck Serono Ltd)

Lutropin alfa 75 unit, Follitropin alfa 150 unit Pergoveris

150unit/75unit powder and solvent for solution for injection vials |

1 vial [PoM] £72.35

Follitropin delta

06-Sep-2017

- **DRUG ACTION** Follitropin delta is a recombinant human follicle stimulating hormone, which causes development of multiple mature follicles.

● INDICATIONS AND DOSE

Superovulation treatment for assisted conception (such as in vitro fertilisation) (initiated under specialist supervision)

- ▶ **BY SUBCUTANEOUS INJECTION**

- ▶ **Adult (female):** Initial dosing based on serum anti-Müllerian hormone concentration and body-weight—consult product literature.

- **CONTRA-INDICATIONS** Ovarian cysts (not caused by polycystic ovarian syndrome) · ovarian enlargement (not caused by polycystic ovarian syndrome) · tumours of breast · tumours of hypothalamus · tumours of ovaries · tumours of pituitary · tumours of uterus · vaginal bleeding of unknown cause

- **CAUTIONS** Acute porphyrias p. 1120 · history of tubal disease (increased risk of ectopic pregnancy)

● SIDE-EFFECTS

- ▶ **Common or very common** Fatigue · headache · nausea · ovarian and fallopian tube disorders · pelvic disorders · uterine pain
- ▶ **Uncommon** Abdominal discomfort · breast abnormalities · constipation · diarrhoea · dizziness · drowsiness · mood swings · vaginal haemorrhage · vomiting
- ▶ **Rare or very rare** Thromboembolism

SIDE-EFFECTS, FURTHER INFORMATION If ovarian hyperstimulation syndrome occurs, the patient should be advised to withhold hCG and avoid intercourse or use barrier contraceptive methods for at least 4 days.

- **PREGNANCY** Manufacturer advises avoid—not indicated during pregnancy.
- **BREAST FEEDING** Manufacturer advises avoid—not indicated during breastfeeding.
- **MONITORING REQUIREMENTS** Manufacturer advises regular monitoring of ovarian response with ultrasound alone, or in combination with serum estradiol levels. Frequent monitoring of follicular development is required to reduce the risk of ovarian hyperstimulation syndrome during treatment, and for at least 2 weeks after triggering of final follicular maturation—consult product literature.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer recommends the cartridge should be used with the *Rekovele*® injection pen. The first injection should be performed under direct medical supervision; self-administration should only be performed by patients who are well motivated, adequately trained and have access to expert advice.

- **PRESCRIBING AND DISPENSING INFORMATION** Follitropin delta is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage conditions outside refrigerator.

● PATIENT AND CARER ADVICE

Conception and contraception Manufacturer advises that patients planning to conceive should be warned that there is a risk of multiple pregnancy.

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

7.4 Growth hormone disorders

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GROWTH HORMONE RECEPTOR ANTAGONISTS

Pegvisomant

30-Nov-2018

● **DRUG ACTION** Pegvisomant is a genetically modified analogue of human growth hormone and is a highly selective growth hormone receptor antagonist.

● INDICATIONS AND DOSE

Treatment of acromegaly in patients with inadequate response to surgery, radiation, or both, and to treatment with somatostatin analogues (initiated by a specialist)

▶ **BY SUBCUTANEOUS INJECTION**

▶ **Adult:** Initially 80 mg for 1 dose, followed by 10 mg daily, then increased in steps of 5 mg daily, adjusted according to response; maximum 30 mg per day

● **CAUTIONS** Abnormal liver function tests and/or signs or symptoms of liver injury (further investigations may be required before treatment initiation—consult product literature) · diabetes mellitus (adjustment of antidiabetic therapy may be necessary)

● SIDE-EFFECTS

▶ **Common or very common** Arthralgia · arthritis · asthenia · constipation · diarrhoea · dizziness · drowsiness · dyslipidaemia · dyspnoea · eye pain · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · hyperglycaemia · hypertension · hypoglycaemia · influenza like illness · lipohypertrophy · myalgia · nausea · numbness · oedema · skin reactions · sleep disorders · sweat changes · tremor · vomiting · weight increased

▶ **Uncommon** Apathy · confusion · dry mouth · eye strain · feeling abnormal · healing impaired · hunger · leucocytosis · leucopenia · libido increased · memory loss · Meniere's disease · oral disorders · panic attack · polyuria · proteinuria · renal impairment · taste altered · thrombocytopenia

▶ **Frequency not known** Anger · angioedema · hepatic function abnormal · laryngospasm

SIDE-EFFECTS, FURTHER INFORMATION **Injection-site reactions** Rotate injection sites to avoid lipohypertrophy.

Abnormal hepatic function Manufacturer advises interrupt treatment if liver function tests at least 5 times the upper limit of normal or transaminase levels at least 3 times the upper limit of normal **and** blood bilirubin increased—consult product literature. Discontinue if liver injury is confirmed.

● **CONCEPTION AND CONTRACEPTION** Possible increase in female fertility.

● **PREGNANCY** Avoid.

● **BREAST FEEDING** Avoid.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available); temporary or permanent withdrawal may be needed—consult product literature.

● MONITORING REQUIREMENTS

▶ Manufacturer advises assess liver function tests before treatment initiation and monitor liver function tests during treatment—consult product literature.

▶ Manufacturer advises monitor serum IGF-1 concentrations.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (November 2017) that pegvisomant (*Somavert*[®]) is accepted for use within NHS Scotland for the treatment of patients with acromegaly who have had an inadequate response to surgery and/or radiation therapy and in whom an appropriate medical treatment with somatostatin analogues did not normalise IGF-1 [insulin-like growth factor 1] concentrations or was not tolerated. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

The *All Wales Medicines Strategy Group* has advised (November 2017) that pegvisomant (*Somavert*[®]) is recommended as an option for use within NHS Wales for the treatment of patients with acromegaly who have had an inadequate response to surgery and/or radiation therapy and in whom an appropriate medical treatment with somatostatin analogues did not normalise insulin-like growth factor-1 (IGF-1) concentrations or was not tolerated. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

▶ **Somavert** (Pfizer Ltd)

Pegvisomant 10 mg Somavert 10mg powder and solvent for solution for injection vials | 30 vial [PoM] £1,500.00 (Hospital only)

Pegvisomant 15 mg Somavert 15mg powder and solvent for solution for injection vials | 30 vial [PoM] £2,250.00 (Hospital only)

Pegvisomant 20 mg Somavert 20mg powder and solvent for solution for injection vials | 1 vial [PoM] £100.00 (Hospital only) | 30 vial [PoM] £3,000.00 (Hospital only)

Pegvisomant 25 mg Somavert 25mg powder and solvent for solution for injection vials | 30 vial [PoM] £3,750.00 (Hospital only)

Pegvisomant 30 mg Somavert 30mg powder and solvent for solution for injection vials | 30 vial [PoM] £4,500.00 (Hospital only)

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > HUMAN GROWTH HORMONES

Somatropin

25-Jul-2018

(Recombinant Human Growth Hormone)

● INDICATIONS AND DOSE

Gonadal dysgenesis (Turner syndrome)

▶ **BY SUBCUTANEOUS INJECTION**

▶ **Adult:** 1.4 mg/m² daily, alternatively 45–50 micrograms/kg daily

Deficiency of growth hormone

▶ **BY SUBCUTANEOUS INJECTION**

▶ **Adult:** Initially 150–300 micrograms daily, then increased if necessary up to 1 mg daily, dose to be increased gradually, use minimum effective dose (requirements may decrease with age)

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose formerly expressed in units; somatotropin 1 mg ≡ 3 units.

- **CONTRA-INDICATIONS** Evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting) · not to be used after renal transplantation · severe obesity in Prader-Willi syndrome · severe respiratory impairment in Prader-Willi syndrome
- **CAUTIONS** Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) · disorders of the epiphysis of the hip (monitor for limping) · history of malignant disease · hypoadrenalism (initiation or adjustment of glucocorticoid replacement therapy may be necessary) · hypothyroidism—manufacturers recommend periodic thyroid function tests but limited evidence of clinical value · initiation of treatment close to puberty not recommended in child born small for corrected gestational age · papilloedema · relative deficiencies of other pituitary hormones · resolved intracranial hypertension (monitor closely) · Silver-Russell syndrome
- **INTERACTIONS** → Appendix 1: somatotropin
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Carpal tunnel syndrome · fluid retention · headache · joint disorders · lipotrophy · myalgia · oedema · paraesthesia
 - ▶ **Uncommon** Gynaecomastia · idiopathic intracranial hypertension
 - ▶ **Rare or very rare** Hyperglycaemia · hyperinsulinism · hypothyroidism · osteonecrosis of femur · pancreatitis · slipped capital femoral epiphysis
 - ▶ **Frequency not known** Leukaemia · musculoskeletal stiffness

SIDE-EFFECTS, FURTHER INFORMATION Funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).

- **PREGNANCY** Discontinue if pregnancy occurs—no information available.
- **BREAST FEEDING** No information available. Absorption from milk unlikely.
- **DIRECTIONS FOR ADMINISTRATION** Rotate subcutaneous injection sites to prevent lipotrophy.

GENOTROPIN® PREPARATIONS Cartridges are for use with *Genotropin®* Pen device (non-NHS but available free of charge from clinics).

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE decisions**

- ▶ **Somatropin for adults with growth hormone deficiency (August 2003) NICE TA64**

Somatropin is recommended in adults **only** if the following 3 criteria are fulfilled:

- Severe growth hormone deficiency, established by an appropriate method,
- Impaired quality of life, measured by means of a specific questionnaire,
- Already receiving treatment for another pituitary hormone deficiency.

Somatropin treatment should be discontinued if the quality of life has not improved sufficiently by 9 months.

Severe growth hormone deficiency developing after linear growth is complete but before the age of 25 years should be treated with growth hormone; treatment should continue until adult peak bone mass has been achieved. Treatment for adult-onset growth hormone deficiency should be stopped only when the patient and the patient's physician consider it appropriate.

Treatment with somatotropin should be initiated and managed by a physician with expertise in growth hormone disorders; maintenance treatment can be prescribed in the community under a shared-care protocol.

www.nice.org.uk/guidance/ta64

8 Sex hormone responsive conditions

Sex hormones

22-Oct-2019

Oestrogens and HRT

Oestrogens are necessary for the development of female secondary sexual characteristics; they also stimulate myometrial hypertrophy with endometrial hyperplasia.

In terms of oestrogenic activity *natural oestrogens* (estradiol p. 799 (oestradiol), estrone (oestrone), and estriol p. 877 (oestriol)) have a more appropriate profile for hormone replacement therapy (HRT) than *synthetic oestrogens* (ethinylestradiol p. 802 (ethinylestradiol) and mestranol). Tibolone p. 803 has oestrogenic, progestogenic and weak androgenic activity.

Oestrogen therapy is given cyclically or continuously for a number of gynaecological conditions. If long-term therapy is required in women with a uterus, a progestogen should normally be added to reduce the risk of cystic hyperplasia of the endometrium (or of endometriotic foci in women who have had a hysterectomy) and possible transformation to cancer.

Oestrogens are no longer used to suppress lactation because of their association with thromboembolism.

Hormone replacement therapy

Hormone replacement therapy (HRT) with small doses of an oestrogen (together with a progestogen in women with a uterus) is appropriate for alleviating menopausal symptoms such as vaginal atrophy or vasomotor instability. Oestrogen given systemically in the perimenopausal and postmenopausal period or tibolone given in the postmenopausal period also diminish postmenopausal osteoporosis but other drugs are preferred. Menopausal atrophic vaginitis may respond to a short course of a topical vaginal oestrogen preparation used for a few weeks and repeated if necessary.

Systemic therapy with an oestrogen or drugs with oestrogenic properties alleviates the symptoms of oestrogen deficiency such as vasomotor symptoms. Tibolone combines oestrogenic and progestogenic activity with weak androgenic activity; it is given continuously, without cyclical progestogen.

HRT may be used in women with early natural or surgical menopause (before age 45 years), since they are at high risk of osteoporosis. For early menopause, HRT can be given until the approximate age of natural menopause (i.e. until age 50 years). Alternatives to HRT should be considered if osteoporosis is the main concern.

Clonidine hydrochloride p. 156 may be used to reduce vasomotor symptoms in women who cannot take an oestrogen, but clonidine hydrochloride may cause unacceptable side-effects.

HRT increases the risk of venous thromboembolism, stroke, endometrial cancer (reduced by a progestogen), breast cancer, and ovarian cancer; there is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. For details of these risks see HRT Risk table.

The Medicines and Healthcare products Regulatory Agency (MHRA) advises that HRT should only be prescribed to relieve post-menopausal symptoms that are adversely affecting quality of life and treatment should be reviewed regularly to ensure the minimum effective dose is used for the shortest duration. For osteoporosis, consider alternative treatments. HRT does not prevent coronary heart disease or protect against a decline in cognitive function and it should not be prescribed for these purposes. Experience of treating women over 65 years with HRT is limited.

For the treatment of menopausal symptoms the benefits of short-term HRT outweigh the risks in the majority of women, especially in those aged under 60 years.

For the treatment of menopausal symptoms in women with breast cancer see Breast cancer p. 994.

Risk of breast cancer

All types of *systemic* (oral or transdermal) HRT treatment increase the risk of breast cancer after 1 year of use. This risk is higher for combined oestrogen-progestogen HRT (particularly for continuous HRT preparations where both oestrogen and progestogen are taken throughout each month) than for oestrogen-only HRT, but is irrespective of the type of oestrogen or progestogen. Longer duration of HRT use (but not the age at which HRT is started) further increases risk.

Although the risk of breast cancer is lower after stopping HRT than it is during current use, the excess risk persists for more than 10 years after stopping compared with women who have never used HRT. Vaginal preparations containing low doses of oestrogen to treat local symptoms are not thought to be associated with an effect on breast cancer risk.

The MHRA advises discussing the updated information on the risk of breast cancer with women who use or are considering starting HRT, at their next routine appointment. The MHRA advises encouraging current and past HRT users to be vigilant for signs of breast cancer and to attend routine breast screening. If a decision is made to stop treatment, in the absence of contra-indications, the MHRA recommends this should be done gradually to minimise recurrence of menopausal symptoms. For more information, see estradiol p. 799, conjugated oestrogens (equine) p. 797 and the MHRA Drug Safety Update: www.gov.uk/drug-safety-update/hormone-replacement-therapy-hrt-further-information-on-the-known-increased-risk-of-breast-cancer-with-hrt-and-its-persistence-after-stopping.

Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use especially oestrogen-progestogen combined treatment, but this is not thought to be the case with tibolone p. 803.

Tibolone p. 803 has also been associated with an increased risk of breast cancer during treatment, although the extent of risk and its persistence after stopping is currently inconclusive.

Risk of endometrial cancer

The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT. In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

The risk of endometrial cancer in women who have not used HRT increases with body mass index (BMI); the increased risk of endometrial cancer in users of oestrogen-only HRT or tibolone is more apparent in women who are not overweight.

Evidence suggests an increased risk of endometrial cancer with tibolone. After 2.7 years of use (in women of average age 68 years), 1 extra case of endometrial hyperplasia and 4 extra cases of endometrial cancer were diagnosed compared with placebo users.

Risk of ovarian cancer

Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer; this excess risk disappears within a few years of stopping.

Risk of venous thromboembolism

Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use. In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

Although the level of risk of thromboembolism associated with non-oral routes of administration of HRT has not been established, it may be lower for the transdermal route.

Limited data does not suggest an increased risk of thromboembolism with tibolone compared with combined HRT or women not taking HRT.

Risk of stroke

Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.

Tibolone increases the risk of stroke about 2.2 times from the first year of treatment; risk of stroke is age-dependent and therefore the absolute risk of stroke with tibolone increases with age.

Risk of coronary heart disease

HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

There is insufficient data to draw a conclusion on the risk of coronary heart disease with tibolone.

Choice

The choice of HRT for an individual depends on an overall balance of indication, risk, and convenience. A woman with a uterus normally requires oestrogen with cyclical progestogen for the last 12 to 14 days of the cycle or a preparation which involves continuous administration of an oestrogen and a progestogen (or one which provides both oestrogenic and progestogenic activity in a single preparation). Continuous combined preparations or tibolone p. 803 are **not suitable** for use in the perimenopause or within 12 months of the last menstrual period; women who use such preparations may bleed irregularly in the early stages of treatment—if bleeding continues endometrial abnormality should be ruled out and consideration given to changing to cyclical HRT.

An oestrogen alone is suitable for continuous use in women without a uterus. However, in endometriosis, endometrial foci may remain despite hysterectomy and the addition of a progestogen should be considered in these circumstances.

An oestrogen may be given by mouth or by transdermal administration, which avoids first-pass metabolism.

Considerations in the elderly

The use of oestrogens in elderly patients is potentially inappropriate (STOPP criteria) if prescribed in patients with a history of breast cancer or venous thromboembolism (increased risk of recurrence). Oral oestrogens may be inappropriate if prescribed without concurrent progestogen in those with an intact uterus (risk of endometrial cancer).

For further information, see *STOPP/START criteria* in Prescribing in the elderly p. 33.

Surgery

Major surgery under general anaesthesia, including orthopaedic and vascular leg surgery, is a predisposing factor for venous thromboembolism and it may be prudent to stop HRT 4–6 weeks before surgery; it should be restarted only after full mobilisation. If HRT is continued or if discontinuation is not possible (e.g. in non-elective surgery), prophylaxis with unfractionated or low molecular weight heparin and graduated compression hosiery is advised.

Table 1: Summary of HRT risks and benefits* during current use and current use plus post-treatment from age of menopause up to age 69 years, per 1000 women with 5 years or 10 years use of HRT

	Risks over 5 years use (with no use or 5 years current HRT use)		Total risks up to age 69 (after no use or after 5 years HRT use ¹)		Risks over 10 years (with no use or 10 years current HRT use)		Total risks up to age 69 (after no use or after 10 years HRT use ¹)

*Menopausal symptom relief is not included in this table, but is a key benefit of HRT and will play a major part in the decision to prescribe HRT.

¹Best estimates based on relative risks of HRT use from age 50 (see DSU table 2 for relative risks). For breast cancer this includes cases diagnosed during current HRT use and diagnosed after HRT use until age 69 years; for other risks, this assumes no residual effects after stopping HRT use.

²Latest evidence suggests that transdermal HRT products have a lower risk of VTE than oral preparations.

Table 2: Detailed summary of relative and absolute risks and benefits during current use from age of menopause and up to age 69, per 1000 women with 5 years or 10 years use of HRT

Risks associated with combined estrogen–progestogen HRT

Reasons to stop HRT

Hormone replacement therapy should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg;
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment.

Ethinylestradiol

Ethinylestradiol p. 802 (ethinylloestradiol) is licensed for short-term treatment of symptoms of oestrogen deficiency, for osteoporosis prophylaxis if other drugs cannot be used and for the treatment of female hypogonadism and menstrual disorders.

Ethinylestradiol is occasionally used under **specialist supervision** for the management of *hereditary haemorrhagic telangiectasia* (but evidence of benefit is limited). It is also used licensed for the palliative treatment of prostate cancer.

Raloxifene

Raloxifene hydrochloride p. 796 is licensed for the treatment and prevention of *postmenopausal osteoporosis*; unlike hormone replacement therapy, raloxifene hydrochloride does not reduce menopausal vasomotor symptoms.

Progestogens and progesterone receptor modulators

There are two main groups of progestogen, progesterone and its analogues (dydrogesterone and medroxyprogesterone acetate p. 856) and testosterone analogues (norethisterone p. 806 and norgestrel). The newer progestogens (desogestrel p. 850, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel p. 851 is the active isomer of norgestrel and has twice its potency. Progesterone p. 808 and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

Where endometriosis requires drug treatment, it may respond to a progestogen, e.g. norethisterone, administered on a continuous basis. Danazol p. 783 and gonadorelin analogues are also available.

Although oral progestogens have been used widely for menorrhagia (see Heavy menstrual bleeding p. 796) they are relatively ineffective compared with tranexamic acid p. 117 or, particularly where dysmenorrhoea is also a factor, mefenamic acid p. 1208; the levonorgestrel-releasing intra-uterine system may be particularly useful for women also requiring contraception. Oral progestogens have also been used for severe dysmenorrhoea, but where contraception is also required in younger women the best choice is a combined oral contraceptive.

Progestogens have also been advocated for the alleviation of premenstrual symptoms, but no convincing physiological basis for such treatment has been shown.

Progestogens have been used for the prevention of miscarriage in women with a history of recurrent miscarriage

but there is no evidence of benefit and they are **not** recommended for this purpose. In pregnant women with antiphospholipid antibody syndrome who have suffered recurrent miscarriage, administration of low-dose aspirin p. 130 and a prophylactic dose of a low molecular weight heparin may decrease the risk of fetal loss (use under specialist supervision only).

Hormone replacement therapy

In women with a uterus a progestogen needs to be added to long-term oestrogen therapy for hormone replacement, to prevent cystic hyperplasia of the endometrium and possible transformation to cancer; it can be added on a cyclical or a continuous basis. Combined packs incorporating suitable progestogen tablets are available.

Oral contraception

Desogestrel p. 850, gestodene, levonorgestrel p. 851, norethisterone p. 806, and norgestimate are used in combined oral contraceptives and in progestogen-only contraceptives.

Cancer

Progestogens also have a role in neoplastic disease.

Progesterone receptor modulators

Ulipristal acetate p. 849 is a progesterone receptor modulator with a partial progesterone antagonist effect. Ulipristal acetate is used in the pre-operative treatment of moderate to severe symptoms of uterine fibroids (see *important safety information* in ulipristal acetate). Ulipristal acetate is also used as an hormonal emergency contraceptive.

Endometriosis

19-Sep-2017

Description of condition

Endometriosis is the growth of endometrial-like tissue outside the uterus. Endometriosis is a condition affecting women mainly of reproductive age and, although its exact cause is unknown, it is an oestrogen-dependent condition and is associated with menstruation. Endometriosis is typically associated with symptoms such as pelvic pain, painful periods and subfertility. Women with endometriosis report pain, which can be frequent, chronic and severe, as well as tiredness, more sick days, and a significant physical, sexual, psychological and social impact. Endometriosis is an important cause of subfertility and this can also have a significant effect on quality of life.

Women may also have endometriosis without symptoms, so it is difficult to know how common the disease is in the population. It is also unclear whether endometriosis is always progressive or can remain stable or improve with time.

Aims of treatment

The aim of treatment is to reduce the severity of symptoms, improve the quality of life, and to improve fertility if this is affected.

Drug treatment

Management options for endometriosis include drug treatment and surgery. Most drug treatments for endometriosis work by suppressing ovarian function and are contraceptive. Surgical treatment aims to remove or destroy endometriotic lesions. The choice of treatment depends on the woman's preferences and priorities in terms of pain management and fertility.

[Evg] A short trial (such as 3 months) of paracetamol or an NSAID alone or in combination should be considered for first-line management of endometriosis-related pain. If pain

relief is inadequate, consider other forms of pain management and referral for further assessment.

Hormonal treatment (with a combined oral contraceptive or a progestogen) should be offered to women with suspected, confirmed or recurrent endometriosis. The patient should be informed that hormonal treatment for endometriosis can reduce pain and has no permanent negative effect on subsequent fertility. If initial hormonal treatment for endometriosis is not effective, not tolerated or is contra-indicated, the woman should be referred to a gynaecologist or specialist endometriosis service for possible further treatment, which could include other hormonal treatments or surgery. **⚠** For use of drugs to treat neuropathic pain, see Neuropathic pain.

Surgery

EVGr Women with suspected or confirmed endometriosis should be asked about their symptoms, preferences and priorities with respect to pain and fertility, to guide surgical decision-making. For deep endometriosis involving the bowel, bladder or ureter, gonadotropin-releasing hormones given for 3 months before surgery should be considered. Excision rather than ablation should be considered to treat endometriomas, taking into account the woman's desire for fertility and her ovarian reserve. After laparoscopic excision or ablation of endometriosis, consider hormonal treatment (with, for example, a combined hormonal contraceptive), to prolong the benefits of surgery and manage symptoms.

A hysterectomy may be indicated if, for example, the woman has adenomyosis or heavy menstrual bleeding that has not responded to other treatments. **⚠**

Surgical management if fertility is a priority

EVGr If fertility is a priority, the management of endometriosis-related subfertility should have multidisciplinary involvement with input from a fertility specialist. Women with endometriosis who are trying to conceive should not be offered hormonal treatment, because it does not improve spontaneous pregnancy rates. **⚠**

Heavy menstrual bleeding

04-Jan-2019

Description of condition

Heavy menstrual bleeding, also known as menorrhagia, is excessive menstrual blood loss of 80 mL or more, or for a duration of more than 7 days, which results in the need to change menstrual products every 1–2 hours. Heavy menstrual bleeding occurs regularly, every 24–35 days.

Drug treatment

EVGr The choice of treatment should be guided by the presence or absence of fibroids (including size, number and location), polyps, endometrial pathology or adenomyosis, other symptoms (such as pressure or pain), co-morbidities, and patient preference.

In females with heavy menstrual bleeding and unidentified pathology, fibroids less than 3 cm in diameter causing no distortion of the uterine cavity, or suspected or diagnosed adenomyosis, a levonorgestrel-releasing intra-uterine system p. 851 is the first-line treatment option. Patients

should be advised that irregular menstrual bleeding can occur particularly during the first months of use and that the full benefit of treatment may take at least 6 months.

If a levonorgestrel-releasing intra-uterine system p. 851 is unsuitable, either tranexamic acid p. 117, an NSAID, a combined hormonal contraceptive, or a cyclical oral progestogen should be considered. Progestogen-only contraceptives may suppress menstruation and be beneficial to females with heavy menstrual bleeding. A non-hormonal treatment is recommended in patients actively trying to conceive.

If drug treatment is unsuccessful or declined by the patient, or if symptoms are severe, referral to a specialist for alternative drug treatment or surgery should be considered.

In females with fibroids of 3 cm or more in diameter, referral to a specialist should be considered. Treatment options include tranexamic acid, an NSAID, ulipristal acetate p. 849, a levonorgestrel-releasing intra-uterine system p. 851, a combined hormonal contraceptive, a cyclical oral progestogen, uterine artery embolisation, or surgery. Treatment choice depends on the size, number and location of the fibroids, and severity of symptoms. If drug treatment is required while investigations and definitive treatment is being organised, either tranexamic acid, or an NSAID, or both, can be given.

Intermittent ulipristal acetate can be offered to females who are not eligible for surgery and have a haemoglobin concentration of 10.2 g/100 mL (102 g/litre) or less. If the haemoglobin concentration is more than 10.2 g/100 mL (102 g/litre), ulipristal acetate may be considered. The use of ulipristal acetate is associated with a risk of rare but serious liver injury; liver function should be monitored during treatment, see *Important safety information*, and *Monitoring requirements* in ulipristal acetate. **⚠**

The effectiveness of drug treatment (excluding ulipristal acetate) for heavy menstrual bleeding may be limited in females with fibroids that are substantially greater than 3 cm in diameter. **EVGr** Treatment with a gonadotrophin-releasing hormone analogue or ulipristal acetate before hysterectomy and myomectomy should be considered if uterine fibroids are causing an enlarged or distorted uterus. **⚠**

Raloxifene hydrochloride

20-Jan-2020

• INDICATIONS AND DOSE

Treatment and prevention of postmenopausal osteoporosis

- ▶ BY MOUTH
- ▶ Adult: 60 mg once daily

Breast cancer [chemoprevention in postmenopausal women at moderate to high risk] (initiated under specialist supervision)

- ▶ BY MOUTH
- ▶ Adult: 60 mg once daily for 5 years

- **UNLICENSED USE** Not licensed for chemoprevention of breast cancer in the UK. Licensed for this indication in USA.
- **CONTRA-INDICATIONS** Cholestasis · endometrial cancer · history of venous thromboembolism · undiagnosed uterine bleeding
- **CAUTIONS** Avoid in Acute porphyrias p. 1120 · breast cancer (manufacturer advises avoid during treatment for breast cancer) · history of oestrogen-induced hypertriglyceridaemia (monitor serum triglycerides) · risk factors for stroke · risk factors for venous thromboembolism (discontinue if prolonged immobilisation)
- **INTERACTIONS** → Appendix 1: raloxifene
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Influenza · leg cramps · peripheral oedema · vasodilation
 - ▶ **Uncommon** Embolism and thrombosis
 - ▶ **Rare or very rare** Breast abnormalities · gastrointestinal discomfort · gastrointestinal disorder · headaches · nausea · rash · thrombocytopenia · vomiting
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid (risk of increased exposure).
- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Raloxifene for the primary prevention of osteoporotic fragility fractures in postmenopausal women (updated February 2018)**
NICE TA160
Raloxifene is **not** recommended as a treatment option for the primary prevention of osteoporotic fragility fractures in postmenopausal women.
Women who are currently receiving treatment, but for whom treatment would not have been recommended, should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta160
- ▶ **Raloxifene and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (updated February 2018)**
NICE TA161
Raloxifene is recommended as an alternative treatment option for the secondary prevention of osteoporotic fragility fractures in postmenopausal women:
 - who are unable to comply with the special instructions for the administration of alendronate and risedronate, or have a contra-indication to or are intolerant of alendronate and risedronate, **and**
 - have a combination of T-score, age and number of independent clinical risk factors for fracture, as indicated in the full NICE guidance.
 Women who are currently receiving treatment, but for whom treatment would not have been recommended, should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta161

20-May-2020

INDICATIONS AND DOSE**PREMARIN® TABLETS****Menopausal symptoms**

- ▶ BY MOUTH
- ▶ Adult: 0.3–1.25 mg daily continuously; with cyclical progestogen for 12–14 days of each cycle in women with a uterus

Postmenopausal osteoporosis prophylaxis

- ▶ BY MOUTH
- ▶ Adult: 0.625–1.25 mg daily continuously; with cyclical progestogen for 12–14 days of each cycle in women with a uterus

IMPORTANT SAFETY INFORMATION**MHRA/CHM ADVICE: HORMONE REPLACEMENT THERAPY (HRT): FURTHER INFORMATION ON THE KNOWN INCREASED RISK OF BREAST CANCER WITH HRT AND ITS PERSISTENCE AFTER STOPPING (SEPTEMBER 2019)**

Data from a meta-analysis of more than 100 000 women with breast cancer have confirmed that the risk of breast cancer is increased with the use of all forms of systemic HRT, except vaginal oestrogens, for longer than 1 year. Findings have shown that the risk increases further with longer duration of use, is higher for combined oestrogen-progestogen HRT than with oestrogen-only HRT, and persists for more than 10 years after stopping HRT. Healthcare professionals are advised to only prescribe HRT for the relief of postmenopausal symptoms that adversely affect quality of life, and to regularly review patients to ensure that it is used for the shortest time and at the lowest dose. Patients currently and previously on HRT should be informed of the risk and to be vigilant for signs of breast cancer; they should also be encouraged to attend breast screening appointments.

- **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) · history of breast cancer · history of venous thromboembolism · liver disease (where liver function tests have failed to return to normal) · oestrogen-dependent cancer · recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia
- **CAUTIONS** Acute porphyrias p. 1120 · diabetes (increased risk of heart disease) · factors predisposing to thromboembolism · history of breast nodules (closely monitor breast status—risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease (closely monitor breast status—risk of breast cancer) · hypophyseal tumours · increased risk of gall-bladder disease reported · migraine · migraine-like headaches · presence of antiphospholipid antibodies (increased risk of thrombotic events) · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · risk of breast cancer · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size

CAUTIONS, FURTHER INFORMATION

- ▶ Risk of breast cancer HRT use is associated with an increased risk of breast cancer—see *Important safety information*.
Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

- ▶ Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.

In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

- ▶ Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- ▶ Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

- ▶ Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT increases the risk of stroke.
- ▶ Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · arthralgia · breast abnormalities · depression · leg cramps · menstrual cycle irregularities · vaginal discharge · weight changes
- ▶ **Uncommon** Anxiety · cervical abnormalities · contact lens intolerance · dizziness · embolism and thrombosis · gallbladder disorder · gastrointestinal discomfort · headaches · hirsutism · libido disorder · mood altered · nausea · oedema · skin reactions · vulvovaginal candidiasis
- ▶ **Rare or very rare** Angioedema · asthma exacerbated · cerebrovascular insufficiency · chorea exacerbated · colitis ischaemic · epilepsy exacerbated · galactorrhoea · glucose tolerance impaired · hypocalcaemia · jaundice cholestatic · myocardial infarction · neoplasms · pancreatitis · pelvic pain · vomiting
- ▶ **Frequency not known** Endometrial hyperplasia · erythema nodosum

SIDE-EFFECTS, FURTHER INFORMATION Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. Continuous combined HRT commonly produces irregular breakthrough bleeding in the first 4–6 months of treatment. Bleeding beyond 6 months or

after a spell of amenorrhoea requires further investigation to exclude serious gynaecological pathology.

- **CONCEPTION AND CONTRACEPTION** HRT does **not** provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.
- **PREGNANCY** Manufacturer advises avoid—not indicated during pregnancy.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in acute or active disease.
- **PATIENT AND CARER ADVICE**
Information sheet The MHRA has provided a patient information sheet to aid healthcare professionals when counselling women on the risk of breast cancer with HRT use.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

BEDOL[®]

Menopausal symptoms | Osteoporosis prophylaxis

► BY MOUTH

- Adult: 2 mg daily, started on day 1–5 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

ELLESTE SOLO[®] MX

Menopausal symptoms

► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with *MX* 40, subsequently adjust according to response

Osteoporosis prophylaxis

► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with *MX* 80, subsequently adjust according to response

ELLESTE-SOLO[®] 1-MG

Menopausal symptoms

► BY MOUTH

- Adult: 1 mg daily, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

ELLESTE-SOLO[®] 2-MG

Menopausal symptoms not controlled with lower strength | Osteoporosis prophylaxis

► BY MOUTH

- Adult: 2 mg daily, started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be given with cyclical progestogen for 12–14 days of each cycle in women with a uterus

ESTRADERM MX[®]

Menopausal symptoms

► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus, initiate therapy with *MX25* for first 3 months; subsequently adjust according to response

Osteoporosis prophylaxis

► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of

each cycle in women with a uterus, initiate therapy with *MX50*; subsequently adjust according to response

ESTRADOT[®]

Menopausal symptoms

► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch twice weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with 25 patch for 3 months; subsequently adjust according to response

Osteoporosis prophylaxis

► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch twice weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with 50 patch; subsequently adjust according to response

EVOREL[®]

Menopausal symptoms | Osteoporosis prophylaxis

► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, therapy should be initiated with *Evorel* 50 patch; subsequently adjust according to response; dose may be reduced to *Evorel* 25 patch after first month if necessary for menopausal symptoms only

FEMSEVEN[®]

Menopausal symptoms | Osteoporosis prophylaxis

► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch once weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with *FemSeven* 50 patches for the first few months, subsequently adjust according to response

OESTROGEL[®]

Menopausal symptoms

► TO THE SKIN

- Adult: Apply 1.5 mg once daily continuously, increased if necessary up to 3 mg after 1 month continuously, to be applied over an area twice that of the template provided, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus

Osteoporosis prophylaxis

► TO THE SKIN

- Adult: Apply 1.5 mg once daily continuously, to be applied over an area twice that of the template provided, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus

DOSE EQUIVALENCE AND CONVERSION

► With topical use

- For *Oestrogel*[®]: 2 measures is equivalent to estradiol 1.5 mg.

PROGYNova[®]

Menopausal symptoms

► BY MOUTH

- Adult: 1–2 mg daily continuously, to be started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

IMPORTANT SAFETY INFORMATION**MHRA/CHM ADVICE: HORMONE REPLACEMENT THERAPY (HRT): FURTHER INFORMATION ON THE KNOWN INCREASED RISK OF BREAST CANCER WITH HRT AND ITS PERSISTENCE AFTER STOPPING (SEPTEMBER 2019)**

- ▶ With oral use or topical use or transdermal use Data from a meta-analysis of more than 100 000 women with breast cancer have confirmed that the risk of breast cancer is increased with the use of all forms of systemic HRT, except vaginal oestrogens, for longer than 1 year. Findings have shown that the risk increases further with longer duration of use, is higher for combined oestrogen-progestogen HRT than with oestrogen-only HRT, and persists for more than 10 years after stopping HRT. Healthcare professionals are advised to only prescribe HRT for the relief of postmenopausal symptoms that adversely affect quality of life, and to regularly review patients to ensure that it is used for the shortest time and at the lowest dose. Patients currently and previously on HRT should be informed of the risk and to be vigilant for signs of breast cancer; they should also be encouraged to attend breast screening appointments.

- **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) · history of breast cancer · history of venous thromboembolism · oestrogen-dependent cancer · recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia

- **CAUTIONS** Acute porphyrias p. 1120 · diabetes (increased risk of heart disease) · factors predisposing to thromboembolism · history of breast nodules—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease—closely monitor breast status (risk of breast cancer) · hypophyseal tumours · increased risk of gall-bladder disease · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size

CAUTIONS, FURTHER INFORMATION

- ▶ Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.

In women with a uterus using *systemic* preparations, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

- ▶ Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- ▶ Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

- ▶ Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT increases the risk of stroke.
- ▶ Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.
- ▶ Risk of breast cancer with systemic use HRT use is associated with an increased risk of breast cancer—see *Important safety information*. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

● SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Headaches · nausea · skin reactions
- ▶ **Uncommon** Hypertension

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With oral use Asthenia · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · menstrual cycle

irregularities · muscle complaints · pelvic pain · weight changes

- ▶ With transdermal use Abdominal pain · breast abnormalities · menstrual cycle irregularities · uterine disorders · vaginal discharge · weight changes

▶ Uncommon

- ▶ With oral use Anxiety · back pain · breast abnormalities · cervical abnormalities · cystitis-like symptom · depression · dizziness · embolism and thrombosis · erythema nodosum · gallbladder disorder · oedema · palpitations · peripheral vascular disease · tumour growth · visual impairment · vulvovaginal candidiasis

- ▶ With transdermal use Asthenia · breast neoplasm benign · depression · flatulence · increased risk of infection · leiomyoma · mood swings · venous thromboembolism · vertigo · vomiting

▶ Rare or very rare

- ▶ With oral use Angioedema · cerebrovascular insufficiency · chorea · contact lens intolerance · haemolytic anaemia · hepatic disorders · hirsutism · malaise · myocardial infarction · sexual dysfunction · steepening of corneal curvature · vaginal discharge · vomiting
- ▶ With transdermal use Epilepsy exacerbated · galactorrhoea · glucose tolerance impaired · libido disorder

▶ Frequency not known

- ▶ With oral use Carbohydrate metabolism change · epilepsy exacerbated · hypertriglyceridaemia · increased risk of coronary artery disease · neoplasms · pancreatitis · systemic lupus erythematosus (SLE)

SIDE-EFFECTS, FURTHER INFORMATION Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. Continuous combined HRT commonly produces irregular breakthrough bleeding in the first 4–6 months of treatment. Bleeding beyond 6 months or after a spell of amenorrhoea requires further investigation to exclude serious gynaecological pathology.

- **CONCEPTION AND CONTRACEPTION** HRT does **not** provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Avoid; adverse effects on lactation.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in acute or active disease.

● MONITORING REQUIREMENTS

- ▶ History of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer).
- ▶ The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With transdermal use Patch should be removed after 3–4 days (or once a week in case of 7-day patch) and replaced with fresh patch on slightly different site; recommended sites: clean, dry, unbroken areas of skin on

trunk below waistline; not to be applied on or near breasts or under waistband. If patch falls off in bath allow skin to cool before applying new patch.

● PATIENT AND CARER ADVICE

- ▶ With transdermal use Patient counselling is advised for estradiol patches (administration).
- ▶ With topical use Patient counselling is advised for estradiol gels (administration).

- ▶ With oral use or topical use or transdermal use The MHRA has provided a patient information sheet to aid healthcare professionals when counselling women on the risk of breast cancer with HRT use.

OESTROGEL ▶ With topical use Apply gel to clean, dry, intact skin such as arms, shoulders or inner thighs and allow to dry for 5 minutes before covering with clothing. Not to be applied on or near breasts or on vulval region. Avoid skin contact with another person (particularly male) and avoid other skin products or washing the area for at least 1 hour after application.

SANDRENA ▶ With topical use Apply gel to intact areas of skin such as lower trunk or thighs, using right and left sides on alternate days. Wash hands after application. Not to be applied on the breasts or face and avoid contact with eyes. Allow area of application to dry for 5 minutes and do not wash area for at least 1 hour.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

Ethinylestradiol (Ethinylestradiol)

22-May-2020

● **INDICATIONS AND DOSE**

Short-term treatment of symptoms of oestrogen deficiency | Osteoporosis prophylaxis if other drugs cannot be used

► **BY MOUTH**

► Adult (female): 10–50 micrograms daily for 21 days, repeated after 7-day tablet-free period, to be given with progestogen for 12–14 days per cycle in women with intact uterus.

Female hypogonadism

► **BY MOUTH**

► Adult (female): 10–50 micrograms daily usually on cyclical basis, initial oestrogen therapy should be followed by combined oestrogen and progestogen therapy.

Menstrual disorders

► **BY MOUTH**

► Adult (female): 20–50 micrograms daily from day 5 to 25 of each cycle, to be given with progestogen, added either throughout the cycle or from day 15 to 25.

Palliative treatment of prostate cancer

► **BY MOUTH**

► Adult (male): 0.15–1.5 mg daily.

- **CONTRA-INDICATIONS** Active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · Acute porphyrias p. 1120 · history of breast cancer · history of venous thromboembolism · liver disease (where liver function tests have failed to return to normal) · oestrogen-dependent cancer · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia

CONTRA-INDICATIONS, FURTHER INFORMATION

- **Hormone replacement therapy** For more information on contra-indications for hormone replacement therapy see Sex hormones p. 790
- **Combined hormonal contraception** For more information on contra-indications for ethinylestradiol in combined hormonal contraception see combined hormonal contraceptives p. 840
- **CAUTIONS** Cardiovascular disease (risk of fluid retention) · diabetes (increased risk of heart disease) · history of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of hypertriglyceridaemia (increased risk of pancreatitis) · hypophyseal tumours · increased risk of gall-bladder disease · migraine (migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · risk factors for venous thromboembolism · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size
- CAUTIONS, FURTHER INFORMATION**
- **Combined hormonal contraception** For more information on cautions for ethinylestradiol in combined hormonal contraception see combined hormonal contraceptives p. 840
- **Hormone replacement therapy** For more information on cautions for hormone replacement therapy see Sex hormones p. 790
- **INTERACTIONS** → Appendix 1: hormone replacement therapy
- **SIDE-EFFECTS** Breast abnormalities · cervical mucus increased · cholelithiasis · contact lens intolerance · depression · electrolyte imbalance · embolism and thrombosis · erythema nodosum · feminisation · fluid retention · headaches · hypertension · jaundice cholestatic · metrorrhagia · mood altered · myocardial infarction · nausea · neoplasms · skin reactions · stroke · uterine disorders · vomiting · weight change
- SIDE-EFFECTS, FURTHER INFORMATION** Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. Continuous combined HRT commonly produces irregular breakthrough bleeding in the first 4–6 months of treatment. Bleeding beyond 6 months or after a spell of amenorrhoea requires further investigation to exclude serious gynaecological pathology.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in acute or active disease.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

Tablet

► **Ethinylestradiol (Non-proprietary)**

Ethinylestradiol 2 microgram Ethinylestradiol 2microgram tablets | 100 tablet [PoM] £200.00

Ethinylestradiol 10 microgram Ethinylestradiol 10microgram tablets | 21 tablet [PoM] £200.00 DT = £200.00

Tibolone

20-Dec-2019

● INDICATIONS AND DOSE

Short-term treatment of symptoms of oestrogen deficiency (including women being treated with gonadotrophin releasing hormone analogues) | Osteoporosis prophylaxis in women at high risk of fractures when other prophylaxis contra-indicated or not tolerated

- ▶ BY MOUTH
- ▶ Adult: 2.5 mg daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · history of arterial thromboembolic disease (e.g. angina, myocardial infarction, stroke or TIA) · history of breast cancer · history of venous thromboembolism · liver disease (where liver function tests have failed to return to normal) · oestrogen-dependent cancer · thrombophilic disorder · uninvestigated or undiagnosed vaginal bleeding · untreated endometrial hyperplasia

- **CAUTIONS** Diabetes (increased risk of heart disease) · epilepsy · factors predisposing to thromboembolism · history of breast nodules—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease—closely monitor breast status (risk of breast cancer) · history of liver disease · hypertriglyceridaemia · hypophyseal tumours · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · risk of stroke

CAUTIONS, FURTHER INFORMATION

- ▶ Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **INTERACTIONS** → Appendix 1: tibolone

● SIDE-EFFECTS

- ▶ **Common or very common** Breast abnormalities · cervical dysplasia · endometrial thickening · gastrointestinal discomfort · genital abnormalities · hair growth abnormal · increased risk of infection · pelvic pain · postmenopausal haemorrhage · vaginal discharge · vaginal haemorrhage · weight increased
- ▶ **Uncommon** Oedema · skin reactions
- ▶ **Frequency not known** Arthralgia · dementia · depression · dizziness · erythema nodosum · gallbladder disorder · headaches · increased risk of ischaemic stroke · myalgia · neoplasms · vision disorders

SIDE-EFFECTS, FURTHER INFORMATION Vaginal bleeding

Investigate for endometrial cancer if bleeding continues beyond 6 months or after stopping treatment.

Reasons to withdraw treatment Withdraw treatment if signs of thromboembolic disease, abnormal liver function tests, or signs of cholestatic jaundice.

- **PREGNANCY** Avoid; toxicity in *animal* studies.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in acute disease.
- **RENAL IMPAIRMENT**
Monitoring Patients with renal impairment should be closely monitored (risk of fluid retention).
- **PRESCRIBING AND DISPENSING INFORMATION** Unsuitable for use in the premenopause (unless being treated with

gonadotrophin-releasing hormone analogue) and as (or with) an oral contraceptive.

Also unsuitable for use within 12 months of last menstrual period (may cause irregular bleeding).

If transferring from cyclical HRT, start at end of regimen; if transferring from continuous-combined HRT, start at any time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ Tibolone (Non-proprietary)

Tibolone 2.5 mg Tibolone 2.5mg tablets | 28 tablet [PoM] £10.36 DT = £7.81 | 84 tablet [PoM] £23.43-£31.08

▶ Livial (Merck Sharp & Dohme Ltd)

Tibolone 2.5 mg Livial 2.5mg tablets | 28 tablet [PoM] £10.36 DT = £7.81 | 84 tablet [PoM] £31.08

OESTROGENS COMBINED WITH PROGESTOGENS

Conjugated oestrogens with medroxyprogesterone

The properties listed below are those particular to the combination only. For the properties of the components please consider, conjugated oestrogens (equine) p. 797, medroxyprogesterone acetate p. 856.

CLINORETTE®

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

- ▶ BY MOUTH
- ▶ Adult: 1 tablet daily for 16 days, white tablets to be taken, starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 12 days, pink tablets to be taken, subsequent courses repeated without interval

ELLESTE-DUET® 1-MG

Menopausal symptoms

- ▶ BY MOUTH
- ▶ Adult: 1 tablet daily for 16 days, white tablet to be taken and started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 12 days, green tablets to be taken, subsequent courses are repeated without interval

ELLESTE-DUET® 2-MG

Menopausal symptoms | Osteoporosis prophylaxis

- ▶ BY MOUTH
- ▶ Adult: 1 tablet daily for 16 days, orange tablet to be taken, to be started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then

1 tablet daily for 12 days, grey tablet to be taken, subsequent courses are repeated without interval

ELLESTE-DUET® CONTI

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

- ▶ BY MOUTH
- ▶ Adult: 1 tablet daily continuously basis, if changing from cyclical HRT begin treatment at the end of scheduled bleed

EVOREL® CONTI

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: Apply 1 patch twice weekly continuously

EVOREL® SEQUI

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: Apply 1 patch twice weekly for 2 weeks, Evorel® 50 patch to be applied and started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), then apply 1 patch twice weekly, Evorel® Conti patch to be applied, subsequent courses are repeated without interval.

KLIIOFEM®

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

- ▶ BY MOUTH
- ▶ Adult: 1 tablet daily continuously, to be started at end of scheduled bleed if changing from cyclical HRT

KLIOVANCE®

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

- ▶ BY MOUTH
- ▶ Adult: 1 tablet daily continuously, to be started at end of scheduled bleed if changing from cyclical HRT

NOVOFEM®

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

- ▶ BY MOUTH
- ▶ Adult: 1 tablet daily for 16 days, red tablets to be taken, then 1 tablet daily for 12 days, white tablets to be taken, subsequent courses are repeated without interval; start treatment with red tablet at any time or if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progestogen phase

TRISEQUENS®

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

- ▶ BY MOUTH
- ▶ Adult: 1 tablet daily for 12 days, blue tablets to be taken, followed by 1 tablet daily for 10 days, white tablet to be taken, then 1 tablet daily for 6 days, red tablet to be taken, subsequent courses are repeated without interval

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

● PATIENT AND CARER ADVICE

EVOREL® SEQUI Patients and carers should be advised on the application of *Evorel® Sequi* patches.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Clinorette** (ReSource Medical UK Ltd)
Clinorette tablets | 84 tablet PoM £9.23
- ▶ **Elleste Duet** (Mylan)
Norethisterone acetate 1 mg, Estradiol 2 mg Elleste Duet Conti tablets | 84 tablet PoM £17.02 DT = £17.02
Elleste Duet 1mg tablets | 84 tablet PoM £9.20
Elleste Duet 2mg tablets | 84 tablet PoM £9.20
- ▶ **Evorel Sequi** (Theramex HQ UK Ltd)
Evorel Sequi patches | 8 patch PoM £11.09
- ▶ **Kliofem** (Novo Nordisk Ltd)
Norethisterone acetate 1 mg, Estradiol 2 mg Kliofem tablets | 84 tablet PoM £11.43 DT = £17.02
- ▶ **Kliovance** (Novo Nordisk Ltd)
Norethisterone acetate 500 microgram, Estradiol 1 mg Kliovance tablets | 84 tablet PoM £13.20 DT = £13.20
- ▶ **Novofem** (Novo Nordisk Ltd)
Novofem tablets | 84 tablet PoM £11.43
- ▶ **Trisequens** (Novo Nordisk Ltd)
Trisequens tablets | 84 tablet PoM £11.10

Transdermal patch

- ▶ **Evorel Conti** (Theramex HQ UK Ltd)
Estradiol 50 microgram per 24 hour, Norethisterone acetate 170 microgram per 24 hour Evorel Conti patches | 8 patch PoM £13.00 | 24 patch PoM £37.22 DT = £37.22

PROGESTOGENS

Dienogest

17-Feb-2020

- **DRUG ACTION** Dienogest is a nortestosterone derivative that has a progestogenic effect in the uterus, reducing the production of estradiol and thereby suppressing endometrial lesions.

● INDICATIONS AND DOSE

Endometriosis

- ▶ BY MOUTH
- ▶ Females of childbearing potential: 2 mg once daily, can be started on any day of cycle, dose should be taken continuously at the same time each day

- **CONTRA-INDICATIONS** Arterial disease (past or present) · cardiovascular disease (past or present) · diabetes with vascular involvement · liver tumours (past or present) · sex hormone-dependent malignancies (confirmed or suspected) · undiagnosed vaginal bleeding · venous thromboembolism (active)

- **CAUTIONS** Diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · history of depression · history of ectopic pregnancy · history of gestational diabetes · patients at risk of osteoporosis · patients at risk of venous thromboembolism

CAUTIONS, FURTHER INFORMATION

- ▶ **Immobilisation** Manufacturer advises to discontinue treatment during prolonged immobilisation. For elective surgery, treatment should be discontinued at least 4 weeks before surgery; treatment may be restarted 2 weeks after complete remobilisation.

- **INTERACTIONS** → Appendix 1: dienogest

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anxiety · asthenic conditions · breast abnormalities · depression · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · hot flush · libido loss · mood altered · nausea · ovarian cyst · pain · skin reactions · sleep disorder · vomiting · vulvovaginal disorders · weight changes

- ▶ **Uncommon** Anaemia · appetite increased · autonomic dysfunction · broken nails · circulatory system disorder · concentration impaired · constipation · dandruff · diarrhoea · dry eye · dyspnoea · genital discharge · hair changes · hyperhidrosis · hypotension · increased risk of infection · limb discomfort · muscle spasms · oedema · palpitations · pelvic pain · photosensitivity reaction · tinnitus

- ▶ **Frequency not known** Glucose tolerance impaired · insulin resistance · menstrual cycle irregularities

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises that, if contraception is required, females of childbearing potential should use non-hormonal contraception during treatment. The menstrual cycle usually returns to normal within 2 months after stopping treatment.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (no information available).

- **PATIENT AND CARER ADVICE** Manufacturer advises patients with a history of chloasma gravidarum to avoid sunlight or UV radiation exposure during treatment.
Missed doses Manufacturer advises if one or more tablets are missed, or if vomiting and/or diarrhoea occurs within 3–4 hours of taking a tablet, another tablet should be taken as soon as possible and the next dose taken at the normal time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Zalkya** (Stragen UK Ltd)
Dienogest 2 mg Zalkya 2mg tablets | 28 tablet PoM £20.68

Norethisterone

● INDICATIONS AND DOSE

Endometriosis

- ▶ BY MOUTH
- ▶ Adult: 10–15 mg daily for 4–6 months or longer, to be started on day 5 of cycle; increased to 20–25 mg daily if required, dose only increased if spotting occurs and reduced once bleeding has stopped

Dysfunctional uterine bleeding (to arrest bleeding) | Menorrhagia (to arrest bleeding)

- ▶ BY MOUTH
- ▶ Adult: 5 mg 3 times a day for 10 days

Dysfunctional uterine bleeding (to prevent bleeding) | Menorrhagia (to prevent bleeding)

- ▶ BY MOUTH
- ▶ Adult: 5 mg twice daily, to be taken from day 19 to day 26 of cycle

Dysmenorrhoea

- ▶ BY MOUTH
- ▶ Adult: 5 mg 3 times a day for 3–4 cycles, to be taken from day 5–24 of cycle

Premenstrual syndrome (but not recommended)

- ▶ BY MOUTH
- ▶ Adult: 5 mg 2–3 times a day for several cycles, to be taken from day 19–26 of cycle

Postponement of menstruation

- ▶ BY MOUTH
- ▶ Females of childbearing potential: 5 mg 3 times a day, to be started 3 days before expected onset (menstruation occurs 2–3 days after stopping)

Breast cancer

- ▶ BY MOUTH
- ▶ Adult: 40 mg daily, increased if necessary to 60 mg daily

Short-term contraception

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 200 mg, to be administered within first 5 days of cycle or immediately after parturition (duration 8 weeks). To be injected into the gluteal muscle, then 200 mg after 8 weeks if required

Contraception

- ▶ BY MOUTH
- ▶ Females of childbearing potential: 350 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 3 hours or more it should be regarded as a 'missed pill'

● **CONTRA-INDICATIONS**

GENERAL CONTRA-INDICATIONS Avoid in patients with a history of liver tumours · breast cancer (unless progestogens are being used in the management of this condition) · genital cancer (unless progestogens are being used in the management of this condition) · history during pregnancy of idiopathic jaundice · history during pregnancy of pemphigoid gestationis (non-contraceptive indications) · history during pregnancy of severe pruritus (non-contraceptive indications) · when used as a contraceptive, history of breast cancer (can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable)

SPECIFIC CONTRA-INDICATIONS

- ▶ With oral use Acute porphyrias p. 1120 · severe arterial disease · undiagnosed vaginal bleeding

● **CAUTIONS**

GENERAL CAUTIONS Asthma · cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · epilepsy · history of depression · hypertension · migraine · susceptibility to thromboembolism (particular caution with high dose)

SPECIFIC CAUTIONS

- ▶ When used for contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) anti-phospholipid antibodies
- ▶ With intramuscular use for contraception Disturbances of lipid metabolism · history during pregnancy of deterioration of atherosclerosis · history during pregnancy of pruritus · possible risk of breast cancer

CAUTIONS, FURTHER INFORMATION

- ▶ Use as a contraceptive in co-morbidities The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.
- ▶ Breast cancer risk with contraceptive use There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

- **INTERACTIONS** → Appendix 1: norethisterone

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Menstrual cycle irregularities
- ▶ **Uncommon** Breast tenderness
- ▶ **Frequency not known** Hepatic cancer · thromboembolism

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intramuscular use Dizziness · haemorrhage · headache · hypersensitivity · nausea · skin reactions · weight increased
- ▶ **Uncommon**
- ▶ With intramuscular use Abdominal distension · depressed mood
- ▶ **Frequency not known**
- ▶ With oral use Appetite change · depression · fatigue · gastrointestinal disorder · headaches · hypertension · libido disorder · nervousness · rash · weight change

● **PREGNANCY**

- ▶ With oral use Masculinisation of female fetuses and other defects reported with non-contraceptive use.

- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation. Higher doses (used in malignant conditions) may suppress lactation and alter milk composition—use lowest effective dose.

- ▶ With intramuscular use Withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment.

- **HEPATIC IMPAIRMENT** Manufacturers advise caution; avoid in severe or active disease.

- ▶ When used for breast cancer Manufacturer advises avoid.

- **RENAL IMPAIRMENT** Use with caution in non-contraceptive indications.

● **PATIENT AND CARER ADVICE**

Diarrhoea and vomiting with oral contraceptives Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery. Starting routine for oral contraceptives One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if norethisterone is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days. Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days. Contraceptives by injection Full counselling backed by *patient information leaflet* required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

Missed oral contraceptive pill The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also

use another method, such as the condom, for the next 2 days.*

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Solution for injection

- **Noristerat** (Bayer Plc)
Norethisterone enantate 200 mg per 1 ml Noristerat 200mg/1ml solution for injection ampoules | 1 ampoule [PoM] £4.05

Norethisterone 350 microgram Noriday 350microgram tablets | 84 tablet [PoM] £2.10 DT = £2.10
- **Primolut N** (Bayer Plc)
Norethisterone 5 mg Primolut N 5mg tablets | 30 tablet [PoM] £2.26 DT = £2.70
- **Utoflan** (Pfizer Ltd)
Norethisterone 5 mg Utoflan 5mg tablets | 30 tablet [PoM] £1.40 DT = £2.70 | 90 tablet [PoM] £4.21

Combinations available: *Estradiol with norethisterone*, p. 805

Progesterone

10-Aug-2018

• INDICATIONS AND DOSE

CRINONE[®] VAGINAL GEL

Infertility due to inadequate luteal phase

- BY VAGINA
- ▶ Adult: 1 applicatorful daily, to be started either after documented ovulation or on day 18–21 of cycle, in vitro fertilisation, daily application continued for 30 days after laboratory evidence of pregnancy

CYLOGEST[®] PESSARIES

Premenstrual syndrome | Post-natal depression

- BY VAGINA, OR BY RECTUM
- ▶ Adult: 200–800 mg daily, doses above 200 mg to be given in 2 divided doses, for premenstrual syndrome start on day 12–14 and continue until onset of menstruation (but not recommended); rectally if barrier methods of contraception are used, in patients who have recently given birth or in those who suffer from vaginal infection or recurrent cystitis

LUBION[®]

Supplementation of luteal phase during assisted reproductive technology (ART) treatment in women for whom vaginal preparations are inappropriate

- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 25 mg once daily from day of oocyte retrieval up to week 12 of pregnancy

LUTIGEST[®]

Luteal support as part of an Assisted Reproductive Technology (ART) treatment programme

- BY VAGINA
- ▶ Adult: 100 mg 3 times a day, to be started the day after oocyte retrieval, and continued for 30 days once pregnancy is confirmed

UTROGESTAN[®] CAPSULES

Progestogenic opposition of oestrogen HRT

- BY MOUTH
- ▶ Adult: 200 mg once daily on days 15–26 of each 28-day oestrogen HRT cycle, alternatively 100 mg once daily on days 1–25 of each 28-day oestrogen HRT cycle

UTROGESTAN[®] VAGINAL CAPSULES

Supplementation of luteal phase during assisted reproductive technology (ART) cycles

- BY VAGINA
- ▶ Adult: 1 capsule 3 times a day from day of embryo transfer until at least week 7 of pregnancy up to week 12 of pregnancy

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · avoid in patients with a history of liver tumours · breast cancer (unless progestogens are being used in the management of this condition) · genital cancer (unless progestogens are being used in the management of this condition) · history during pregnancy of idiopathic jaundice · history during pregnancy of pemphigoid gestationis · history during pregnancy of severe pruritus · history of thromboembolism · incomplete miscarriage · missed miscarriage · severe arterial disease · thrombophlebitis · undiagnosed vaginal bleeding

- **CAUTIONS** Asthma · cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · epilepsy · history of depression · hypertension · migraine · susceptibility to thromboembolism (particular caution with high dose)

• SIDE-EFFECTS

- **Common or very common**
- ▶ With oral use Headache · menstrual cycle irregularities
- ▶ With vaginal use Breast pain · drowsiness · gastrointestinal discomfort
- **Uncommon**
- ▶ With oral use Breast pain · constipation · diarrhoea · dizziness · drowsiness · jaundice cholestatic · skin reactions · vomiting
- **Rare or very rare**
- ▶ With oral use Depression · nausea
- **Frequency not known**
- ▶ With intramuscular use Alopecia · breast changes · cervical abnormalities · depression · drowsiness · fever · hirsutism · insomnia · jaundice cholestatic · menstrual cycle irregularities · nausea · oedema · protein catabolism · skin reactions · weight increased
- ▶ With rectal use Diarrhoea · flatulence
- ▶ With vaginal use Leakage of the pessary base · menstrual cycle irregularities · vulvovaginal pain

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Avoid—present in milk.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in severe impairment. For *Utrogestan[®] oral capsules*, manufacturer advises avoid in acute or active liver disease. For *Crinone[®] vaginal gel*, manufacturer advises caution in severe impairment.

- **RENAL IMPAIRMENT** Use with caution.

• DIRECTIONS FOR ADMINISTRATION

- ▶ With oral use Capsules should be taken at bedtime on an empty stomach.

• PATIENT AND CARER ADVICE

- ▶ With oral use Patient counselling is advised for progesterone capsules (administration).

● NATIONAL FUNDING/ACCESS DECISIONS

LUTIGEST[®]

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (October 2016) that progesterone (*Lutigest*[®]) is accepted for use within NHS Scotland for luteal support as part of an assisted reproductive technology (ART) treatment program for infertile women. This advice is contingent upon the continuing availability of the Patient Access Scheme (PAS) in NHS Scotland or a list price that is equivalent or lower.

LUBION[®]

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2017

The *Scottish Medicines Consortium* has advised (July 2018) that progesterone (*Lubion*[®]) is accepted for use within NHS Scotland for luteal support as part of an Assisted Reproductive Technology (ART) treatment program in infertile women who are unable to use or tolerate vaginal preparations.

UTROGESTAN[®] VAGINAL CAPSULES

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (May 2017) that micronised progesterone (*Utrogestan Vaginal*[®]) is accepted for use within NHS Scotland for supplementation of the luteal phase during Assisted Reproductive Technology cycles in women. This advice is contingent upon the continuing availability of the Patient Access Scheme in Scotland or a list price that is equivalent or lower.

● LESS SUITABLE FOR PRESCRIBING

- With vaginal use Progesterone pessaries are less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Pessary

► *Cyclogest* (L.D. Collins & Co. Ltd)

Progesterone 200 mg Cyclogest 200mg pessaries | 15 pessary [PoM] £8.95 DT = £8.95

Progesterone 400 mg Cyclogest 400mg pessaries | 15 pessary [PoM] £12.96 DT = £12.96

8.1a Anti-oestrogens

OVULATION STIMULANTS

Clomifene citrate

20-Nov-2019

(Clomiphene citrate)

- DRUG ACTION** Anti-oestrogen which induces gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin is sometimes used as an adjunct.

● INDICATIONS AND DOSE

● Female infertility due to ovulatory dysfunction

► BY MOUTH

- Adult (female): 50 mg once daily for 5 days, to be started at any time if no recent uterine bleeding or on or around the fifth day of cycle if progesterone-induced bleeding is planned or if spontaneous uterine bleeding occurs, then 100 mg once daily if required for 5 days, this second course to be given at least 30 days after the first course, only in the absence of ovulation; most patients who are going to respond will do so to first course, 3 courses should constitute adequate therapeutic trial; long-term cyclical therapy not recommended (beyond a total of 6 cycles).

IMPORTANT SAFETY INFORMATION

Manufacturer advises clomifene should not normally be used for longer than 6 cycles (possible increased risk of ovarian cancer).

- CONTRA-INDICATIONS** Abnormal uterine bleeding of undetermined cause · hormone-dependent tumours · ovarian cysts
- CAUTIONS** Ectopic pregnancy · incidence of multiple births increased (consider ultrasound monitoring) · ovarian hyperstimulation syndrome · polycystic ovary syndrome (cysts may enlarge during treatment, also risk of exaggerated response to usual doses) · uterine fibroids
- SIDE-EFFECTS** Abdominal distension · alopecia · angioedema · anxiety · breast tenderness · cataract · cerebral thrombosis · depression · disorientation · dizziness · fatigue · headache · hot flush · hypertriglyceridaemia · insomnia · jaundice cholestatic · menstrual cycle irregularities · mood altered · nausea · neoplasms · nervous system disorders · optic neuritis · ovarian and fallopian tube disorders · palpitations · pancreatitis · paraesthesia · psychosis · seizure · skin reactions · speech disorder · stroke · syncope · tachycardia · uterine disorders · vertigo · vision disorders · visual impairment (discontinue and initiate ophthalmological examination) · vomiting
- CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment.
- PREGNANCY** Possible effects on fetal development.
- BREAST FEEDING** May inhibit lactation.
- HEPATIC IMPAIRMENT** Manufacturer advises avoid in liver disease or history of liver dysfunction.
- PATIENT AND CARER ADVICE**
Conception and contraception Patients planning to conceive should be warned that there is a risk of multiple pregnancy (rarely more than twins).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet▶ **Clomifene citrate (Non-proprietary)**

Clomifene citrate 50 mg Clomifene 50mg tablets | 30 tablet **[PoM]**
 £13.33 DT = £10.15

▶ **Clomid** (Sanofi)

Clomifene citrate 50 mg Clomid 50mg tablets | 30 tablet **[PoM]**
 £10.15 DT = £10.15

8.2 Male sex hormone responsive conditions

Androgens, anti-androgens and anabolic steroids

Androgens

Androgens cause masculinisation; they may be used as replacement therapy in castrated adults and in those who are hypogonadal due to either pituitary or testicular disease. In the normal male they inhibit pituitary gonadotrophin secretion and depress spermatogenesis. Androgens also have an anabolic action which led to the development of anabolic steroids.

Androgens are useless as a treatment of impotence and impaired spermatogenesis unless there is associated hypogonadism; they should not be given until the hypogonadism has been properly investigated. Treatment should be under expert supervision.

When given to patients with hypopituitarism they can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone which will stimulate spermatogenesis as well as androgen production.

Intramuscular depot preparations of **testosterone esters** are preferred for replacement therapy. Testosterone enantate, propionate or undecanoate, or alternatively *Sustanon*[®], which consists of a mixture of testosterone esters and has a longer duration of action, may be used.

Anti-androgens**Cyproterone acetate**

Cyproterone acetate p. 812 is an anti-androgen used in the treatment of severe hypersexuality and sexual deviation in the male. It inhibits spermatogenesis and produces reversible infertility (but is not a male contraceptive); abnormal sperm forms are produced. Fully informed consent is recommended and an initial spermatogram. As hepatic tumours have been produced in *animal* studies, careful consideration should be given to the risk/benefit ratio before treatment. Cyproterone acetate is also licensed for use alone in patients with metastatic prostate cancer refractory to gonadorelin analogue therapy and has been used as an adjunct in prostatic cancer and in the treatment of acne and hirsutism in women.

Dutasteride and finasteride

Dutasteride p. 830 and finasteride p. 831 are alternatives to alpha-blockers particularly in men with a significantly enlarged prostate. Finasteride is also licensed for use with doxazosin p. 826 in the management of benign prostatic hyperplasia.

A low strength of finasteride is licensed for treating male-pattern baldness in men.

Anabolic steroids

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in women. They are

used in the treatment of some *aplastic anaemias*. Anabolic steroids have been given for osteoporosis in women but they are no longer advocated for this purpose.

The protein-building properties of anabolic steroids have not proved beneficial in the clinical setting. Their use as body builders or tonics is unjustified; some athletes abuse them.

ANDROGENS**Androgens**

- **CONTRA-INDICATIONS** Breast cancer in males · history of liver tumours · hypercalcaemia · prostate cancer
- **CAUTIONS** Cardiac impairment · diabetes mellitus · elderly · epilepsy · hypertension · ischaemic heart disease · migraine · pre-pubertal boys (fusion of epiphyses is hastened and may result in short stature)—statural growth and sexual development should be monitored · risk factors for venous thromboembolism · skeletal metastases—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored) · sleep apnoea · stop treatment or reduce dose if severe polycythaemia occurs · thrombophilia—increased risk of thrombosis · tumours—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored)
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Elderly Prescription potentially inappropriate (STOPP criteria) in the absence of primary or secondary hypogonadism (risk of androgen toxicity; no proven benefit outside of the hypogonadism indication). See also Prescribing in the elderly p. 33.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Hot flush · hypertension · polycythaemia · prostate abnormalities · skin reactions · weight increased
 - ▶ **Uncommon** Alopecia · asthenia · behaviour abnormal · depression · dizziness · dyspnoea · dysuria · gynaecomastia · headache · hyperhidrosis · insomnia · nausea · sexual dysfunction
 - ▶ **Rare or very rare** Pulmonary oil microembolism
 - ▶ **Frequency not known** Anxiety · epiphyses premature fusion · fluid retention · jaundice · oedema · oligozoospermia · paraesthesia · precocious puberty · prostate cancer · seborrhoea · sleep apnoea · urinary tract obstruction
- SIDE-EFFECTS, FURTHER INFORMATION** Stop treatment or reduce dose if severe polycythaemia occurs.

- **PREGNANCY** Avoid—causes masculinisation of female fetus.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** In general, manufacturers advise caution (increased risk of fluid retention and heart failure).
- **RENAL IMPAIRMENT** Caution—potential for fluid retention.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor haematocrit and haemoglobin before treatment, every three months for the first year, and yearly thereafter.
 - ▶ Monitor prostate and PSA in men over 45 years.
- **PATIENT AND CARER ADVICE** Androgenic effects in women Women should be advised to report any signs of virilisation e.g. deepening of the voice or hirsutism.

Testosterone

● INDICATIONS AND DOSE

Low sexual desire in postmenopausal women (administered on expert advice)

► BY TRANSDERMAL APPLICATION

- Adult: Apply 50 mg every week, the contents of a 5-g sachet or 5-g tube (containing 50 mg/5 g of testosterone) to be divided for daily dosing and applied to non-hair areas, such as the abdomen or upper thighs, over the period of 1 week

TESTAVAN[®]

Hypogonadism due to androgen deficiency in men

► BY TRANSDERMAL APPLICATION

- Adult: Apply 23 mg once daily; increased in steps of 23 mg, adjusted according to response; maximum 69 mg per day

DOSE EQUIVALENCE AND CONVERSION

- For *Testavan*[®] One pump actuation delivers 1.15 g of gel containing 23 mg of testosterone.

TESTIM[®]

Hypogonadism due to testosterone deficiency in men

► BY TRANSDERMAL APPLICATION

- Adult: Apply 50 mg once daily, subsequent application adjusted according to response; maximum 100 mg per day

DOSE EQUIVALENCE AND CONVERSION

- For *Testim*[®] One tube of 5 g contains 50 mg testosterone.

TESTOGEL[®] 16.2MG/G

Hypogonadism due to androgen deficiency in men

► BY TRANSDERMAL APPLICATION

- Adult: Apply 40.5 mg once daily; increased in steps of 20.25 mg, adjusted according to response; maximum 81 mg per day

DOSE EQUIVALENCE AND CONVERSION

- For *Testogel*[®] 16.2 mg/g One pump actuation delivers 1.25 g of gel containing 20.25 mg of testosterone.

TESTOGEL[®] 50MG/5G

Hypogonadism due to androgen deficiency in men

► BY TRANSDERMAL APPLICATION

- Adult: Apply 50 mg once daily; increased in steps of 25 mg, adjusted according to response; maximum 100 mg per day

DOSE EQUIVALENCE AND CONVERSION

- For *Testogel*[®] 50 mg/5g One sachet of 5 g contains 50 mg of testosterone.

TOSTRAN[®]

Hypogonadism due to testosterone deficiency in men

► BY TRANSDERMAL APPLICATION

- Adult: Apply 60 mg once daily, subsequent application adjusted according to response; maximum 80 mg per day

DOSE EQUIVALENCE AND CONVERSION

- For *Tostran*[®] 1 g of gel contains 20 mg testosterone.

- **UNLICENCED USE** [\[EvG\]](#) Testosterone is used for the treatment of low sexual desire in postmenopausal women, [\[E\]](#) but is not licensed for this indication.

● SIDE-EFFECTS

- **Common or very common** Hypertriglyceridaemia
- **Frequency not known** Anaemia · deep vein thrombosis · electrolyte imbalance · frontal balding (in women) · hair growth unwanted (in women) · hypertrichosis · malaise · muscle cramps · musculoskeletal pain · testicular disorder · vasodilation · voice lowered (in women)

SIDE-EFFECTS, FURTHER INFORMATION When used for low sexual desire in post-menopausal women The long-term effects of testosterone in this patient group are largely unknown, but side-effects can include growth of unwanted hair, frontal balding and deepening of the voice.

- **DIRECTIONS FOR ADMINISTRATION** Avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature.

TOSTRAN[®] Apply gel on clean, dry, intact skin of abdomen or both inner thighs, preferably in the morning. Gently rub in with a finger until dry before dressing. Wash hands with soap and water after applying gel; avoid washing application site for at least 2 hours. Not to be applied on genital area.

TESTOGEL[®] 50MG/5G Apply thin layer of gel on clean, dry, healthy skin such as shoulders, arms or abdomen, immediately after sachet is opened. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel, avoid shower or bath for at least 6 hours.

TESTIM[®] Squeeze entire content of tube on to one palm and apply as a thin layer on clean, dry, healthy skin of shoulder or upper arm, preferably in the morning after washing or bathing (if 2 tubes required use 1 per shoulder or upper arm); rub in and allow to dry before putting on clothing to cover site; wash hands with soap after application; avoid washing application site for at least 6 hours.

TESTOGEL[®] 16.2MG/G Apply thin layer of gel on clean, dry, healthy skin over right and left upper arms and shoulders. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel, and cover the site with clothing once gel dried; avoid shower or bath for at least 2 hours.

TESTAVAN[®] Manufacturer advises apply one pump actuation of gel evenly onto clean, dry, intact skin over upper arm and shoulder using the applicator, without getting any gel on the hands—repeat on opposite upper arm and shoulder if two pump actuations are required, and repeat again on initial upper arm and shoulder if three pump actuations are required. Allow to dry completely before dressing and cover application site with clothing. Wash hands with soap and water immediately if gel was touched during application; avoid shower or bath for at least 2 hours.

- **PATIENT AND CARER ADVICE** Patient or carer should be given advice on how to administer testosterone gel.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2152

The *Scottish Medicines Consortium* has advised (April 2019) that testosterone gel (*Testavan*[®]) is accepted for restricted use within NHS Scotland for the treatment of adult male hypogonadism, when testosterone deficiency has been confirmed by clinical features and biochemical tests, and in patients who require a transdermal delivery system.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Gel

CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain Butylated hydroxytoluene, propylene glycol

- **Testavan** (Ferring Pharmaceuticals Ltd)

● INDICATIONS AND DOSE

Hypogonadism

- ▶ BY SLOW INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 250 mg every 2–3 weeks; maintenance 250 mg every 3–6 weeks

Breast cancer

- ▶ BY SLOW INTRAMUSCULAR INJECTION
- ▶ Adult: 250 mg every 2–3 weeks

- **UNLICENSED USE** Not licensed for use in breast cancer.
- **SIDE-EFFECTS** Bone formation increased · circulatory system disorder · gastrointestinal disorder · gastrointestinal haemorrhage · hepatomegaly · hypercalcaemia · neoplasms · spermatogenesis abnormal

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Testosterone enantate (Non-proprietary)**
Testosterone enantate 250 mg per 1 mL Testosterone enantate 250mg/1mL solution for injection ampoules | 3 ampoule [PoM] £83.74–£87.73 DT = £85.74 [CD4-2]

Testosterone propionate

13-May-2020

● INDICATIONS AND DOSE

Androgen deficiency

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 50 mg 2–3 times a week

Delayed puberty in males

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 50 mg once weekly

Breast cancer in women

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 100 mg 2–3 times a week

- **MEDICINAL FORMS** Forms available from special-order manufacturers include: solution for injection

F 810

Testosterone undecanoate

13-May-2020

● INDICATIONS AND DOSE

Androgen deficiency

- ▶ BY MOUTH
- ▶ Adult: 120–160 mg daily for 2–3 weeks; maintenance 40–120 mg daily

Hypogonadism

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult (male): 1 g every 10–14 weeks, to be given over 2 minutes, if necessary, second dose may be given after 6 weeks to achieve rapid steady state plasma testosterone levels and then every 10–14 weeks.

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Uncommon** Diarrhoea · mood altered
- SPECIFIC SIDE-EFFECTS**
- ▶ **Uncommon**
- ▶ With intramuscular use Appetite increased · arthralgia · breast abnormalities · cardiovascular disorder · cough · dysphonia · hypercholesterolaemia · increased risk of infection · migraine · muscle complaints · musculoskeletal stiffness · night sweats · pain in extremity · snoring · testicular disorders · tremor · urinary disorders · urinary tract disorder
- ▶ **Frequency not known**
- ▶ With intramuscular use Hair growth increased · spermatogenesis reduced
- ▶ With oral use Azoospermia · fluid imbalance · gastrointestinal discomfort · hepatic function abnormal · lipid metabolism change · myalgia

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Nebido** (Bayer Plc)
Testosterone undecanoate 250 mg per 1 mL Nebido 1000mg/4mL solution for injection vials | 1 vial [PoM] £87.11 DT = £87.11 [CD4-2]

Capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

- ▶ **Restandol** (Merck Sharp & Dohme Ltd)
Testosterone undecanoate 40 mg Restandol 40mg Testocaps | 30 capsule [PoM] £8.55 [CD4-2] | 60 capsule [PoM] £17.10 DT = £17.10 [CD4-2]

8.2a Male sex hormone antagonism

ANTI-ANDROGENS

Cyproterone acetate

18-Oct-2019

● INDICATIONS AND DOSE

Hyper-sexuality in males | Sexual deviation in males

- ▶ BY MOUTH
- ▶ Adult: 50 mg twice daily, to be taken after food

Prevention of tumour flare with initial gonadorelin analogue therapy

▶ BY MOUTH

- ▶ Adult (male): 200 mg daily in 2–3 divided doses for 5–7 days before initiation of gonadorelin analogue, followed by 200 mg daily in 2–3 divided doses for 3–4 weeks after initiation of gonadorelin analogue; maximum 300 mg per day.

Long-term palliative therapy where gonadorelin analogues or orchidectomy contra-indicated, not tolerated, or where oral therapy preferred

▶ BY MOUTH

- ▶ Adult (male): 200–300 mg daily in 2–3 divided doses.

Hot flushes with gonadorelin analogue therapy or after orchidectomy

▶ BY MOUTH

- ▶ Adult (male): Initially 50 mg daily, then adjusted according to response to 50–150 mg daily in 1–3 divided doses.

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Dubin-Johnson syndrome · existing or history of thromboembolic disorders · malignant diseases (except for carcinoma of the prostate) · meningioma or history of meningioma · previous or existing liver tumours (not due to metastases from carcinoma of the prostate) · Rotor syndrome · wasting diseases (except for inoperable carcinoma of the prostate)

SPECIFIC CONTRA-INDICATIONS

- ▶ When used for hypersexuality Severe depression · severe diabetes (with vascular changes) · sickle-cell anaemia
- **CAUTIONS** Diabetes mellitus · in prostate cancer, severe depression · in prostate cancer, sickle-cell anaemia · ineffective for male hypersexuality in chronic alcoholism (relevance to prostate cancer not known)

● SIDE-EFFECTS

- ▶ **Common or very common** Depressed mood · dyspnoea · fatigue · gynaecomastia · hepatic disorders · hot flush · hyperhidrosis · nipple pain · restlessness · weight change
- ▶ **Uncommon** Skin reactions
- ▶ **Rare or very rare** Galactorrhoea · neoplasms
- ▶ **Frequency not known** Adrenocortical suppression · anaemia · azoospermia · hair changes · hypotrichosis · osteoporosis · sebaceous gland underactivity (may clear acne) · thromboembolism

SIDE-EFFECTS, FURTHER INFORMATION Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (fatalities reported, usually after several months, at dosages of 100 mg and above). If hepatotoxicity is confirmed, cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk).

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid (unless used for prostate cancer).

● MONITORING REQUIREMENTS

- ▶ Monitor blood counts initially and throughout treatment.
- ▶ Monitor adrenocortical function regularly.
- ▶ Monitor hepatic function regularly—liver function tests should be performed before and regularly during treatment and whenever symptoms suggestive of hepatotoxicity occur.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Fatigue and lassitude may impair performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 21

▶ **Cyproterone acetate (Non-proprietary)**

Cyproterone acetate 50 mg Cyproterone 50mg tablets | 56 tablet [PoM] £48.95 DT = £30.41

9 Thyroid disorders

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > THYROID STIMULATING HORMONES

Thyrotropin alfa

(Recombinant human thyroid stimulating hormone; rTSH)

- **DRUG ACTION** Thyrotropin alfa is a recombinant form of thyrotrophin (thyroid stimulating hormone).

● INDICATIONS AND DOSE

Detection of thyroid remnants and thyroid cancer in post-thyroidectomy patients, together with serum thyroglobulin testing (with or without radioiodine imaging) | To increase radio-iodine uptake for the ablation of thyroid remnant tissue in suitable post-thyroidectomy patients

▶ BY INTRAMUSCULAR INJECTION

- ▶ Adult: 900 micrograms every 24 hours for 2 doses, dose to be administered into the gluteal muscle, consult product literature for further information on indications and dose

- **CAUTIONS** Presence of thyroglobulin autoantibodies may give false negative results

● SIDE-EFFECTS

- ▶ **Common or very common** Asthenia · dizziness · headache · nausea · vomiting
- ▶ **Uncommon** Chills · diarrhoea · feeling hot · fever · flushing · hypersensitivity · influenza · influenza like illness · pain · paraesthesia · pulmonary reaction · skin reactions · taste altered
- ▶ **Rare or very rare** Atrial fibrillation · hyperthyroidism
- ▶ **Frequency not known** Arthralgia · dyspnoea · goitre · hyperhidrosis · myalgia · neoplasm complications · palpitations · residual metastases enlarged · stroke · tremor

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if previous hypersensitivity to bovine or human thyrotrophin.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection▶ **Thyrogen** (Genzyme Therapeutics Ltd)

9.1 Hyperthyroidism

Antithyroid drugs

Overview

Antithyroid drugs are used for hyperthyroidism either to prepare patients for thyroidectomy or for long-term management. In the UK carbimazole below is the most commonly used drug. Propylthiouracil p. 815 should be reserved for patients who are intolerant of carbimazole or for those who experience sensitivity reactions to carbimazole (sensitivity is not necessarily displayed to both drugs), and for whom other treatments are inappropriate. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

Over-treatment with antithyroid drugs can result in the rapid development of hypothyroidism and should be avoided particularly during pregnancy because it can cause fetal goitre.

A combination of carbimazole with levothyroxine sodium p. 816 daily, may be used in a *blocking-replacement regimen*; therapy is usually given for 18 months. The blocking-replacement regimen is **not** suitable during pregnancy.

Iodine has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide (^{131}I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

Propranolol hydrochloride p. 162 is useful for rapid relief of thyrotoxic symptoms and may be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propranolol hydrochloride has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol hydrochloride but nadolol p. 161 is also used.

Thyrotoxic crisis ('thyroid storm') requires emergency treatment with intravenous administration of fluids, propranolol hydrochloride and hydrocortisone p. 713 (as sodium succinate), as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

Antithyroid drugs in pregnancy

Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen is **not** suitable. Carbimazole is associated with congenital defects, including aplasia cutis of the neonate, therefore propylthiouracil remains the drug of choice during the first trimester of pregnancy. In the second trimester, consider switching to carbimazole because of the potential risk of hepatotoxicity with propylthiouracil. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy). See also *Important safety information* in the carbimazole below drug monograph.

Other drugs used for Hyperthyroidism Metoprolol tartrate, p. 166

ANTITHYROID DRUGS > SULFUR-CONTAINING IMIDAZOLES

Carbimazole

22-Nov-2019

● INDICATIONS AND DOSE

Hyperthyroidism

- ▶ BY MOUTH
- ▶ Adult: 15–40 mg daily continue until the patient becomes euthyroid, usually after 4 to 8 weeks, higher doses should be prescribed under specialist supervision only, then reduced to 5–15 mg daily, reduce dose gradually, therapy usually given for 12 to 18 months

Hyperthyroidism (blocking-replacement regimen) in combination with levothyroxine

- ▶ BY MOUTH
- ▶ Adult: 40–60 mg daily, therapy usually given for 18 months

DOSE EQUIVALENCE AND CONVERSION

- ▶ When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

IMPORTANT SAFETY INFORMATION

NEUTROPENIA AND AGRANULOCYTOSIS

Manufacturer advises of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

- Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.
- A white blood cell count should be performed if there is any clinical evidence of infection.
- Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.

MHRA/CHM ADVICE: CARBIMAZOLE: INCREASED RISK OF CONGENITAL MALFORMATIONS; STRENGTHENED ADVICE ON CONTRACEPTION (FEBRUARY 2019)

Carbimazole is associated with an increased risk of congenital malformations when used during pregnancy, especially in the first trimester and at high doses (daily dose of 15 mg or more).

Women of childbearing potential should use effective contraception during treatment with carbimazole. It should only be considered in pregnancy after a thorough benefit-risk assessment, and at the lowest effective dose without additional administration of thyroid hormones—close maternal, fetal, and neonatal monitoring is recommended.

MHRA/CHM ADVICE: CARBIMAZOLE: RISK OF ACUTE PANCREATITIS (FEBRUARY 2019)

Cases of acute pancreatitis have been reported during treatment with carbimazole. It should be stopped immediately and permanently if acute pancreatitis occurs.

Carbimazole should not be used in patients with a history of acute pancreatitis associated with previous treatment—re-exposure may result in life-threatening acute pancreatitis with a decreased time to onset.

- **CONTRA-INDICATIONS** Severe blood disorders
- **INTERACTIONS** → Appendix 1: carbimazole
- **SIDE-EFFECTS**
 - ▶ Rare or very rare Bone marrow disorders · haemolytic anaemia · severe cutaneous adverse reactions (SCARs) · thrombocytopenia
 - ▶ Frequency not known Agranulocytosis · alopecia · angioedema · dyspepsia · eosinophilia · fever · gastrointestinal disorder · generalised lymphadenopathy · haemorrhage · headache · hepatic disorders · insulin autoimmune syndrome · leucopenia · malaise · myopathy ·

nausea · nerve disorders · neutropenia · pancreatitis acute (discontinue permanently) · salivary gland enlargement · skin reactions · taste loss

- **CONCEPTION AND CONTRACEPTION** The MHRA advises that females of childbearing potential should use effective contraception during treatment.
- **PREGNANCY** The MHRA advises consider use only after a thorough benefit-risk assessment. See *Important Safety Information* and Antithyroid drugs p. 814 for further information.
- **BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in mild to moderate insufficiency—half-life may be prolonged; avoid in severe insufficiency.
- **PATIENT AND CARER ADVICE** Warn patient or carers to tell doctor **immediately** if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

► Carbimazole (Non-proprietary)

Carbimazole 5 mg Carbimazole 5mg tablets | 100 tablet [PoM]
£84.80 DT = £6.16

Carbimazole 10 mg Carbimazole 10mg tablets | 100 tablet [PoM]
£104.08 DT = £81.32

Carbimazole 15 mg Carbimazole 15mg tablets | 100 tablet [PoM]
£156.13 DT = £127.03

Carbimazole 20 mg Carbimazole 20mg tablets | 100 tablet [PoM]
£208.17 DT = £30.95

ANTITHYROID DRUGS > THIOURACILS

Propylthiouracil

● INDICATIONS AND DOSE

Hyperthyroidism

► BY MOUTH

- **Adult:** Initially 200–400 mg daily in divided doses until the patient becomes euthyroid, then reduced to 50–150 mg daily in divided doses, initial dose should be gradually reduced to the maintenance dose

DOSE EQUIVALENCE AND CONVERSION

- When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

- **INTERACTIONS** → Appendix 1: propylthiouracil
- **SIDE-EFFECTS**
 - **Rare or very rare** Agranulocytosis · bone marrow disorders · glomerulonephritis acute · hearing impairment · leucopenia · thrombocytopenia · vomiting
 - **Frequency not known** Alopecia · arthralgia · arthritis · encephalopathy · fever · gastrointestinal disorder · haemorrhage · headache · hepatic disorders · hypoparathyroidism · interstitial pneumonitis · lupus-like syndrome · lymphadenopathy · myopathy · nausea · nephritis · skin reactions · taste altered · vasculitis
- **SIDE-EFFECTS, FURTHER INFORMATION** Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop.
- **PREGNANCY** Propylthiouracil can be given but the blocking-replacement regimen is **not** suitable. Propylthiouracil crosses the placenta and in high doses

may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).

- **BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function.
- **MONITORING** Monitor infant's thyroid status.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased half life).
- **Dose adjustments** Manufacturer advises consider dose reduction.
- **RENAL IMPAIRMENT**
 - Dose adjustments** Use three-quarters normal dose if eGFR 10–50 mL/minute/1.73 m².
 - Use half normal dose if eGFR less than 10 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor for hepatotoxicity.
- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, or pruritus develop.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

► Propylthiouracil (Non-proprietary)

Propylthiouracil 50 mg Propylthiouracil 50mg tablets | 56 tablet [PoM] £57.58 DT = £9.67 | 100 tablet [PoM] £17.27-£115.98

VITAMINS AND TRACE ELEMENTS

Iodide with iodine

(Lugol's Solution; Aqueous Iodine Oral Solution)

● INDICATIONS AND DOSE

Thyrotoxicosis (pre-operative)

► BY MOUTH USING ORAL SOLUTION

- **Adult:** 0.1–0.3 mL 3 times a day

DOSE EQUIVALENCE AND CONVERSION

- Doses based on the use of an aqueous oral solution containing iodine 50 mg/mL and potassium iodide 100 mg/mL.

- **CAUTIONS** Not for long-term treatment
- **SIDE-EFFECTS** Conjunctivitis · depression (long term use) · erectile dysfunction (long term use) · excessive tearing · headache · hypersensitivity · increased risk of infection · influenza like illness · insomnia (long term use) · rash · salivary gland pain
- **PREGNANCY** Neonatal goitre and hypothyroidism.
- **BREAST FEEDING** Stop breast-feeding. Danger of neonatal hypothyroidism or goitre. Appears to be concentrated in milk.
- **DIRECTIONS FOR ADMINISTRATION** For oral solution, dilute well with milk or water.
- **MEDICINAL FORMS** Forms available from special-order manufacturers include: oral solution

9.2 Hypothyroidism

Thyroid hormones

Overview

Thyroid hormones are used in hypothyroidism (myxoedema), and also in diffuse non-toxic goitre, Hashimoto's thyroiditis (lymphadenoid goitre), and thyroid carcinoma. Neonatal hypothyroidism requires prompt treatment for normal development. Levothyroxine sodium below (thyroxine sodium) is the treatment of choice for maintenance therapy.

In infants and children with congenital hypothyroidism and juvenile myxoedema, the dose of levothyroxine sodium should be titrated according to clinical response, growth assessment, and measurements of plasma thyroxine and thyroid-stimulating hormone.

Liothyronine sodium p. 817 has a similar action to levothyroxine sodium but is more rapidly metabolised and has a more rapid effect. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in *severe hypothyroid states* when a rapid response is desired.

Liothyronine sodium by intravenous injection is the treatment of choice in *hypothyroid coma*. Adjunctive therapy includes intravenous fluids, hydrocortisone p. 713, and treatment of infection; assisted ventilation is often required.

Advanced Pharmacy Services

Patients with thyroid disorders may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 18.

THYROID HORMONES

Levothyroxine sodium

10-Mar-2020

(Thyroxine sodium)

● INDICATIONS AND DOSE

Hypothyroidism

► BY MOUTH

- Adult 18–49 years: Initially 50–100 micrograms once daily; adjusted in steps of 25–50 micrograms every 3–4 weeks, adjusted according to response; maintenance 100–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication
- Adult 50 years and over: Initially 25 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication

Hypothyroidism in patients with cardiac disease | Severe hypothyroidism

► BY MOUTH

- Adult: Initially 25 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication

Hyperthyroidism (blocking-replacement regimen) in combination with carbimazole

► BY MOUTH

- Adult: 50–150 micrograms daily therapy usually given for 18 months

- **CONTRA-INDICATIONS** Thyrotoxicosis
- **CAUTIONS** Cardiovascular disorders · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) · elderly · hypertension · long-standing hypothyroidism · myocardial infarction · myocardial insufficiency · panhypopituitarism (initiate corticosteroid therapy before starting levothyroxine) · predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine)

CAUTIONS, FURTHER INFORMATION

- Cardiovascular disorders Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia.
- **INTERACTIONS** → Appendix 1: thyroid hormones
- **SIDE-EFFECTS** Angina pectoris · anxiety · arrhythmias · arthralgia · diarrhoea · dyspnoea · fever · flushing · headache · hyperhidrosis · insomnia · malaise · menstruation irregular · muscle spasms · muscle weakness · oedema · palpitations · skin reactions · thyrotoxic crisis · tremor · vomiting · weight decreased

SIDE-EFFECTS, FURTHER INFORMATION Initial dosage in patients with cardiovascular disorders

If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose.

- **PREGNANCY** Levothyroxine may cross the placenta. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.
- Dose adjustments** Levothyroxine requirement may increase during pregnancy.
- Monitoring** Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine).
- **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

► Levothyroxine sodium (Non-proprietary)

Levothyroxine sodium anhydrous 12.5 microgram Levothyroxine sodium 12.5microgram tablets | 28 tablet [PoM] £12.49 DT = £8.19

Levothyroxine sodium anhydrous 25 microgram Levothyroxine sodium 25microgram tablets | 28 tablet [PoM] £3.05 DT = £1.50 | 500 tablet [PoM] £41.61–£54.46

Levothyroxine sodium 25microgram tablets lactose free | 100 tablet [PoM] [S]

Levothyroxine sodium anhydrous 50 microgram Levothyroxine sodium 50microgram tablets lactose free | 100 tablet [PoM] [S]

Levothyroxine sodium 50microgram tablets | 28 tablet [PoM] £1.50

DT = £1.19 | 1000 tablet [PoM] £42.50–£55.71

Levothyroxine sodium anhydrous 75 microgram Levothyroxine sodium 75microgram tablets | 28 tablet [PoM] £4.00 DT = £3.07

Levothyroxine sodium anhydrous 100 microgram Levothyroxine sodium 100microgram tablets lactose free | 100 tablet [PoM] [S]

Levothyroxine sodium 100microgram tablets | 28 tablet [PoM] £1.77

DT = £1.19 | 1000 tablet [PoM] £42.50–£56.07

► Eltroxin (Advanz Pharma)

Levothyroxine sodium anhydrous 25 microgram Eltroxin 25microgram tablets | 28 tablet [PoM] £2.54 DT = £1.50

Levothyroxine sodium anhydrous 50 microgram Eltroxin 50microgram tablets | 28 tablet [PoM] £1.77 DT = £1.19

Levothyroxine sodium anhydrous 100 microgram Eltroxin
100microgram tablets | 28 tablet [PoM] £1.78 DT = £1.19

Oral solution

▶ **Levothyroxine sodium (Non-proprietary)**

Levothyroxine sodium anhydrous 5 microgram per 1 ml Levothyroxine sodium 25micrograms/5ml oral solution sugar-free | 100 ml [PoM] £118.63 DT = £94.99

Levothyroxine sodium anhydrous 10 microgram per 1 ml Levothyroxine sodium 50micrograms/5ml oral solution sugar-free | 100 ml [PoM] £107.93 DT = £96.57

Levothyroxine sodium anhydrous 20 microgram per 1 ml Levothyroxine sodium 100micrograms/5ml oral solution sugar-free | 100 ml [PoM] £165.00 DT = £164.99

Levothyroxine sodium anhydrous 25 microgram per 1 ml Levothyroxine sodium 125micrograms/5ml oral solution sugar-free | 100 ml [PoM] £185.00 DT = £185.00

Capsule

▶ **Tirosint** (Imported (United States))

Levothyroxine sodium anhydrous 25 microgram Tirosint 25microgram capsules | 28 capsule [PoM] [X]

Levothyroxine sodium anhydrous 50 microgram Tirosint 50microgram capsules | 28 capsule [PoM] [X]

Levothyroxine sodium anhydrous 100 microgram Tirosint 100microgram capsules | 28 capsule [PoM] [X]

Liothyronine sodium

08-Jul-2019

(L-Tri-iodothyronine sodium)

● **INDICATIONS AND DOSE**

Hypothyroidism

▶ **BY MOUTH**

- ▶ **Adult:** Initially 10–20 micrograms daily; increased to 60 micrograms daily in 2–3 divided doses, dose should be increased gradually, smaller initial doses given for the elderly

Hypothyroid coma

▶ **BY SLOW INTRAVENOUS INJECTION**

- ▶ **Adult:** 5–20 micrograms every 12 hours, increased to 5–20 micrograms every 4 hours if required, alternatively initially 50 micrograms for 1 dose, then 25 micrograms every 8 hours, reduced to 25 micrograms twice daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ 20–25 micrograms of liothyronine sodium is equivalent to approximately 100 micrograms of levothyroxine sodium.
- ▶ Brands without a UK licence may not be bioequivalent and dose adjustment may be necessary.

● **CONTRA-INDICATIONS** Thyrotoxicosis

- **CAUTIONS** Cardiovascular disorders · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) · elderly · hypertension · long-standing hypothyroidism · myocardial infarction · myocardial insufficiency · panhypopituitarism (initiate corticosteroid therapy before starting liothyronine) · predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting liothyronine)

CAUTIONS, FURTHER INFORMATION

- ▶ Cardiovascular disorders Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia.

● **INTERACTIONS** → Appendix 1: thyroid hormones

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS Angina pectoris · anxiety · arrhythmias · diarrhoea · fever · flushing · headache · hyperhidrosis · insomnia · muscle cramps · muscle weakness · palpitations · tremor · vomiting · weight decreased

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Menstruation irregular
- ▶ With oral use Heat intolerance

SIDE-EFFECTS, FURTHER INFORMATION **Initial dosage in patients with cardiovascular disorders** If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose.

- **PREGNANCY** Does not cross the placenta in significant amounts. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.
Dose adjustments Liothyronine requirement may increase during pregnancy.

Monitoring Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of liothyronine).

- **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.
- **PRESCRIBING AND DISPENSING INFORMATION**
Switching to a different brand Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent. Pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection

Tablet

▶ **Liothyronine sodium (Non-proprietary)**

Liothyronine sodium 5 microgram Liothyronine 5microgram tablets | 28 tablet [PoM] £98.00 DT = £98.00

Liothyronine sodium 10 microgram Liothyronine 10microgram tablets | 28 tablet [PoM] £148.00 DT = £148.00

Liothyronine sodium 20 microgram Liothyronine 20microgram tablets | 28 tablet [PoM] £245.29 DT = £154.83

▶ **Cytomel** (Imported (United States))

Liothyronine sodium 25 microgram Cytomel 25microgram tablets | 100 tablet [PoM] [X]

Powder for solution for injection

▶ **Liothyronine sodium (Non-proprietary)**

Liothyronine sodium 20 microgram Liothyronine 20microgram powder for solution for injection vials | 5 vial [PoM] £1,567.50 DT = £1,567.50

1 Bladder and urinary disorders

1.1 Urinary frequency, enuresis, and incontinence

Urinary incontinence and pelvic organ prolapse in women

16-Jun-2019

Description of condition

Urinary incontinence is the involuntary leakage of urine and can range in severity and nature. It can impact the person, as well as their families and carers, and can be detrimental to an individual's physical, psychological, and social well-being. Urinary incontinence can be the result of functional abnormalities in the lower urinary tract, or due to other illnesses. It can be sub-classified into four main types: stress, urgency, mixed, and overflow incontinence.

Stress incontinence is the involuntary leakage on effort or exertion, or on sneezing or coughing, and is associated with the loss of pelvic floor support and/or damage to the urethral sphincter.

Urgency incontinence is involuntary leakage which is accompanied, or immediately preceded by a sudden compelling desire to pass urine that is difficult to delay. It is often part of a larger symptom complex known as overactive bladder syndrome. This syndrome is defined as urinary urgency, which may or may not be accompanied by urgency incontinence, but is usually associated with increased frequency and nocturia. The symptoms are thought to be caused by involuntary contractions of the detrusor muscle.

Mixed urinary incontinence is involuntary leakage associated with both urgency and stress, however, one type tends to be predominant.

Overflow incontinence is a complication of chronic urinary retention and occurs when a person cannot empty their bladder completely and it becomes over distended. This may result in continuous, or frequent loss of small quantities of urine. For further information, see Urinary retention p. 825.

Other types include continuous urinary incontinence, where there is constant leakage of urine which may be due to the severity of the persons' condition or may be due to an underlying cause, such as a fistula. Incontinence may also be situational, for example during sexual intercourse or when a person is giggling.

The main risk factor for developing any type of incontinence is older age; this is due to the physiological changes that occur with natural aging. Some other risk factors for stress incontinence include pregnancy, vaginal delivery, obesity, constipation, family history, smoking, lack of supporting tissue (such as in prolapse or hysterectomy) and use of some drugs such as ACE inhibitors (can cause cough) and alpha-adrenergic blockers (relax the bladder outlet and urethra).

Some conditions can increase detrusor muscle overactivity and therefore worsen urgency incontinence. These include conditions that affect the lower urinary tract such as; Urinary-tract infections p. 622, urinary obstruction, or oestrogen deficiency, those affecting the nervous system such as; stroke, dementia, and Parkinson's disease, and systemic conditions such as; diabetes mellitus or hypercalcaemia. Side-effects of some drugs may also increase detrusor muscle overactivity or indirectly contribute to urgency incontinence; these include cholinesterase inhibitors, drugs that cause constipation, and those with anticholinergic effects. Diuretics, alcohol, and caffeine all increase urine production and can cause polyuria, frequency, urgency, and nocturia.

Aims of treatment

Manage urinary incontinence and the symptoms of overactive bladder syndrome.

Non-drug treatment

EvGr Women with urinary incontinence should modify their fluid intake, and if their BMI is 30 kg/m² or greater, be advised to lose weight. For those with an overactive bladder, a reduction in caffeine intake should be trialled.

Absorbent products, hand-held urinals and toileting aids should not be used to treat urinary incontinence, unless the person has severe cognitive or mobility impairment that may prevent further treatment. They may be used in some women as a coping strategy whilst awaiting treatment, as an

adjunct to ongoing therapy, or as long-term management after all treatment options have been considered; their use should be reviewed at least annually. Intravaginal and intraurethral devices should only be used when required to prevent leakage at specific times, for example during exercise.

Surgical management may be an option for some women and will depend on a number of factors. Discussion around the details of the procedures and subsequent shared decision making should be carried out. [▲](#)

Urgency incontinence

EvGr Women should be offered bladder training for at least 6 weeks as first-line treatment. If frequency is a problem and satisfactory benefit from bladder training is not achieved, drug treatment for an overactive bladder should be added. [▲](#)

Stress incontinence

EvGr Women should trial supervised pelvic floor muscle training for at least 3 months, which should include at least 8 contractions performed 3 times per day. [▲](#)

Mixed incontinence

EvGr Women should trial both bladder training for at least 6 weeks and supervised pelvic floor muscle training for at least 3 months, which should include at least 8 contractions performed 3 times per day. If frequency is a problem and satisfactory benefit from bladder training is not achieved, drug treatment for an overactive bladder should be added. [▲](#)

Drug treatment

EvGr When considering drug treatment in women with incontinence exclude any possible causes, including drugs or conditions that may exacerbate incontinence or overactive bladder.

A urine dipstick test should be performed in all women presenting with incontinence to test for active infection or haematuria, and analysed along with the patients symptoms. For further information, see Urinary-tract infections p. 622. Women should be referred to a specialist if there is:

- persistent bladder or urethral pain;
- pelvic mass that is clinically benign;
- associated faecal incontinence;
- suspected neurological disease, or urogenital fistulae;
- history of previous incontinence surgery, pelvic cancer surgery or pelvic radiation therapy;
- recurrent or persistent UTI for those aged over 60; see Urinary-tract infections p. 622
- palpable bladder after voiding, or symptoms of voiding difficulty.

Urgent referral should occur in women aged 45 years or older if there is unexplained visible haematuria without UTI, or visible haematuria persisting or recurring despite successful treatment of UTI. Urgent referral is also required in women aged 60 years or older with unexplained non-visible haematuria and either dysuria or raised white cell count. [▲](#)

Urgency incontinence

EvGr An anticholinergic drug should be considered for women who have trialled bladder training, where frequency is a problem and symptoms persist. Consider the total anticholinergic load, coexisting conditions, such as cognitive impairment or poor bladder emptying, and the risk of side-effects when offering anticholinergic medicine. When prescribing an anticholinergic in those with dementia, see Dementia p. 315. Immediate release oxybutynin hydrochloride p. 821, immediate release tolterodine tartrate p. 823, or darifenacin p. 820 can be used first-line. Immediate release oxybutynin should not be used in frail, older women at risk of sudden deterioration in their physical or mental health. The lowest dose should be used and titrated upwards if necessary. *Transdermal* oxybutynin

hydrochloride p. 821 may be used in those unable to tolerate oral treatment. Mirabegron p. 824 may be used if treatment with an anticholinergic is contra-indicated, ineffective, or not tolerated, for further information, see *National funding/access decisions* in mirabegron.

Treatment should be reviewed after 4 weeks, or sooner if required. If treatment is effective review the woman again at 12 weeks, then annually thereafter, or every 6 months if the woman is over 75 years of age. If treatment has not been effective or is not tolerated an alternative anticholinergic drug can be used, the current dose adjusted or, mirabegron trialled; review again after 4 weeks. Alternative anticholinergics include, an untried first-line drug, or one of the following; fesoterodine fumarate p. 821, propiverine hydrochloride p. 822, solifenacin succinate p. 823, trospium chloride p. 824, or an *extended release* formulation of either oxybutynin hydrochloride or tolterodine tartrate. Women who have tried taking medicine for overactive bladder, but treatment has failed, should be referred to secondary care, where treatment with botulinum toxin type A p. 425 or surgical methods may be considered.

Flavoxate hydrochloride p. 821, propantheline bromide p. 93, or imipramine hydrochloride p. 394 should not be used as treatment options.

In women who have troublesome nocturia, desmopressin p. 704 may also be used. *Intravaginal* oestrogen therapy can be used in those women who are post-menopausal and have vaginal atrophy. Treatment with an intravaginal oestrogen should be reviewed at least annually to re-assess the need for continued treatment and monitor for symptoms of endometrial hyperplasia or carcinoma. [▲](#)

Stress incontinence

EvGr Duloxetine p. 385 is **not** recommended as first-line treatment for women with stress incontinence. It may be used second-line where conservative treatment including pelvic floor training has failed, and only if surgery is not appropriate or the woman prefers pharmacological treatment, but should not be offered routinely. [▲](#)

Mixed incontinence

Women with mixed urinary incontinence should be treated according to the predominant type, refer to *Urgency incontinence* or *Stress incontinence* for drug treatment options.

Pelvic organ prolapse

Pelvic organ prolapse is the symptomatic descent of part of the wall of the vagina or uterus. Symptoms can include a vaginal bulge or sensation of something coming down, urinary, bowel and sexual symptoms, and pelvic and back pain. These can all affect a woman's quality of life.

EvGr Women who present to primary care with symptoms, or an incidental finding of vaginal prolapse should be examined to rule out pelvic mass or other pathology, and a full history taken. Treatment preferences should be discussed and referral made where necessary. Women in secondary care should be considered for referral to a clinician with expertise in prolapse if experiencing incidental symptoms, or on incidental finding of vaginal prolapse. A validated pelvic floor symptom questionnaire may aid assessment and decision making.

Women should be given advice on minimising heavy lifting, preventing or treating constipation, and if their BMI is 30 kg/m² or greater, encouraged to lose weight. A programme of supervised pelvic floor muscle training for at least 16 weeks may also be tried for some women.

A vaginal oestrogen may be used for women with prolapse and signs of vaginal atrophy, an oestrogen-releasing ring may be more appropriate for those women who have cognitive or physical impairments.

A vaginal pessary may be used alone, or in conjunction with pelvic floor muscle training for those with symptomatic pelvic organ prolapse. Surgical management may be required

in women whose symptoms have not improved with non-surgical methods, or who have declined non-surgical treatment. 

Nocturnal enuresis in children

23-May-2017

Description of condition

Nocturnal enuresis is the involuntary discharge of urine during sleep, which is common in young children. Children are generally expected to be dry by a developmental age of 5 years, and historically it has been common practice to consider children for treatment only when they reach 7 years; however, symptoms may still persist in a small proportion by the age of 10 years.

Treatment

Children under 5 years

 For children under 5 years, treatment is usually unnecessary as the condition is likely to resolve spontaneously. Reassurance and advice can be useful for some families. 

Non Drug Treatment

 Initially, advice should be given on fluid intake, diet, toileting behaviour, and use of reward systems. For children who do not respond to this advice (more than 1–2 wet beds per week), an enuresis alarm should be the recommended treatment for motivated, well-supported children. Alarms in children under 7 years should be considered depending on the child's maturity, motivation and understanding of the alarm. Alarms have a lower relapse rate than drug treatment when discontinued.

Treatment using an alarm should be reviewed after 4 weeks and continued until a minimum of 2 weeks' uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months but the condition is still improving and the child remains motivated to use the alarm, it is recommended to continue the treatment. Combined treatment with desmopressin p. 704, or the use of desmopressin alone, is recommended if the initial alarm treatment is unsuccessful or it is no longer appropriate or desirable. 

Drug Treatment

 Treatment with oral or sublingual desmopressin is recommended for children over 5 years of age when alarm use is inappropriate or undesirable, or when rapid or short-term results are the priority (for example, to cover periods away from home). Desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm alone. Treatment should be assessed after 4 weeks and continued for 3 months if there are signs of response. Repeated courses of desmopressin can be used in responsive children who experience repeated recurrences of bedwetting, but should be withdrawn **gradually** at regular intervals (for 1 week every 3 months) for full reassessment.

Under specialist supervision, nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed with desmopressin alone or in combination with an antimuscarinic drug (such as oxybutynin hydrochloride p. 821 or tolterodine tartrate p. 823 [unlicensed indication]). Treatment should be continued for 3 months; the course can be repeated if necessary.

The tricyclic antidepressant imipramine hydrochloride p. 394 can be considered for children who have not responded to all other treatments and have undergone specialist assessment, however relapse is common after withdrawal and children and their carers should be aware of the dangers of overdose. Initial treatment should continue

for 3 months; further courses can be considered following a medical review every 3 months. Tricyclic antidepressants should be withdrawn gradually.

ANTIMUSCARINICS

Antimuscarinics (systemic)

- **CONTRA-INDICATIONS** Angle-closure glaucoma · gastro-intestinal obstruction · intestinal atony · myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) · paralytic ileus · pyloric stenosis · severe ulcerative colitis · significant bladder outflow obstruction · toxic megacolon · urinary retention
- **CAUTIONS** Acute myocardial infarction (in adults) · arrhythmias (may be worsened) · autonomic neuropathy · cardiac insufficiency (due to association with tachycardia) · cardiac surgery (due to association with tachycardia) · children (increased risk of side-effects) · conditions characterised by tachycardia · congestive heart failure (may be worsened) · coronary artery disease (may be worsened) · diarrhoea · elderly (especially if frail) · gastro-oesophageal reflux disease · hiatus hernia with reflux oesophagitis · hypertension · hyperthyroidism (due to association with tachycardia) · individuals susceptible to angle-closure glaucoma · prostatic hyperplasia (in adults) · pyrexia · ulcerative colitis

CAUTIONS, FURTHER INFORMATION

- ▶ **Elderly** Prescription potentially inappropriate (STOPP criteria):
 - to treat extrapyramidal side-effects of antipsychotic medications (risk of antimuscarinic toxicity)
 - with delirium or dementia (risk of exacerbation of cognitive impairment), narrow-angle glaucoma (risk of acute exacerbation of glaucoma), or chronic prostatism (risk of urinary retention)
 - if two or more antimuscarinic drugs prescribed concomitantly (risk of increased antimuscarinic toxicity)
- See also Prescribing in the elderly p. 33.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Constipation · dizziness · drowsiness · dry mouth · dyspepsia · flushing · headache · nausea · palpitations · skin reactions · tachycardia · urinary disorders · vision disorders · vomiting
 - ▶ **Rare or very rare** Angioedema · confusion (more common in elderly)
- **PATIENT AND CARER ADVICE**
 - ▶ **Driving and skilled tasks** Antimuscarinics can affect the performance of skilled tasks (e.g. driving).

ANTIMUSCARINICS > URINARY

 above

Darifenacin

13-May-2020

● INDICATIONS AND DOSE

Urinary frequency | Urinary urgency | Incontinence

▶ **BY MOUTH**

▶ **Adult:** Initially 7.5 mg once daily, increased if necessary to 15 mg after 2 weeks

● **INTERACTIONS** → Appendix 1: darifenacin

● **SIDE-EFFECTS**

▶ **Common or very common** Abdominal pain · dry eye · nasal dryness

- ▶ **Uncommon** Asthenia · bladder pain · cough · diarrhoea · dyspnoea · erectile dysfunction · flatulence · hyperhidrosis · hypertension · increased risk of infection · injury · insomnia · oedema · oral ulceration · taste altered · thinking abnormal · urinary tract disorder
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises caution.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment (risk of increased exposure).
- Dose adjustments** Manufacturer advises maximum 7.5 mg daily in moderate impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 3, 25

Fesoterodine fumarate**INDICATIONS AND DOSE****Urinary frequency | Urinary urgency | Urge incontinence**

- ▶ BY MOUTH

- ▶ Adult: 4 mg once daily, increased if necessary up to 8 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises max. 4 mg daily with concurrent use of potent inhibitors of CYP3A4; avoid concurrent use in patients who also have hepatic or renal impairment.
- ▶ For dose adjustments with concurrent use of moderate inhibitors of CYP3A4 in patients with hepatic or renal impairment, consult product literature.

- **INTERACTIONS** → Appendix 1: fesoterodine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Diarrhoea · dry eye · gastrointestinal discomfort · insomnia · throat complaints
 - ▶ **Uncommon** Cough · fatigue · gastrointestinal disorders · nasal dryness · taste altered · urinary tract infection · vertigo
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).
- Dose adjustments** Manufacturer advises increase dose cautiously in mild impairment; maximum 4 mg daily in moderate impairment.
- **RENAL IMPAIRMENT**
 - Dose adjustments** Increase dose cautiously if eGFR 30–80 mL/minute/1.73m²; max. 4 mg daily if eGFR less than 30 mL/minute/1.73m².
- **PRESCRIBING AND DISPENSING INFORMATION** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

NATIONAL FUNDING/ACCESS DECISIONS**Scottish Medicines Consortium (SMC) decisions**

SMC No. 480/08

The *Scottish Medicines Consortium* has advised (July 2008) that fesoterodine (*Toviaz*[®]) is accepted for restricted use within NHS Scotland as a second-line treatment for overactive bladder syndrome.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oxybutynin hydrochloride**INDICATIONS AND DOSE****Urinary frequency | Urinary urgency | Urinary incontinence | Neurogenic bladder instability**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE TABLETS

- ▶ Child 5–11 years: Initially 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day

- ▶ Child 12–17 years: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day

- ▶ Adult: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day

- ▶ Elderly: Initially 2.5–3 mg twice daily, increased if tolerated to 5 mg twice daily, adjusted according to response

- ▶ BY MOUTH USING MODIFIED-RELEASE TABLETS

- ▶ Child 5–17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day

continued →

- ▶ Adult: Initially 5 mg once daily, increased in steps of 5 mg every week, adjusted according to response; maximum 20 mg per day

Urinary frequency | Urinary urgency | Urinary incontinence

- ▶ BY TRANSDERMAL APPLICATION USING PATCHES
- ▶ Adult: Apply 1 patch twice weekly, patch is to be applied to clean, dry unbroken skin on abdomen, hip or buttock. Patch should be removed every 3–4 days and site replacement patch on a different area. The same area should be avoided for 7 days

Nocturnal enuresis associated with overactive bladder

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 5–17 years: 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day, last dose to be taken before bedtime
- ▶ BY MOUTH USING MODIFIED-RELEASE TABLETS
- ▶ Child 5–17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of *Lyrinel*[®] XL

- **CAUTIONS** Acute porphyrias p. 1120
 - **INTERACTIONS** → Appendix 1: oxybutynin
 - **SIDE-EFFECTS**
 - GENERAL SIDE-EFFECTS**
 - ▶ Common or very common Diarrhoea
 - SPECIFIC SIDE-EFFECTS**
 - ▶ Common or very common
 - ▶ With oral use Dry eye
 - ▶ With transdermal use Gastrointestinal discomfort · increased risk of infection
 - ▶ Uncommon
 - ▶ With oral use Abdominal discomfort · appetite decreased · dysphagia
 - ▶ With transdermal use Back pain · hot flush · injury
 - ▶ Frequency not known
 - ▶ With oral use Anxiety · arrhythmia · cognitive disorder · depressive symptom · drug dependence · gastrointestinal disorders · glaucoma · hallucination · heat stroke · hypohidrosis · mydriasis · nightmare · paranoia · photosensitivity reaction · seizure · urinary tract infection
 - **PREGNANCY** Manufacturers advise avoid unless essential—toxicity in *animal* studies.
 - **BREAST FEEDING** Manufacturers advise avoid—present in milk in *animal* studies.
 - **HEPATIC IMPAIRMENT** Manufacturer advises caution.
 - **RENAL IMPAIRMENT** Manufacturer advises caution.
 - **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With transdermal use Apply patches to clean, dry, unbroken skin on abdomen, hip or buttock, remove after every 3–4 days and site replacement patch on a different area (avoid using same area for 7 days).
 - **PRESCRIBING AND DISPENSING INFORMATION**
 - ▶ In adults The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.
 - ▶ In children The need for therapy for urinary indications should be reviewed soon after it has been commenced and then at regular intervals; a response usually occurs within 6 months but may take longer.
 - **PATIENT AND CARER ADVICE**
 - ▶ With transdermal use Patients or carers should be given advice on how to administer oxybutynin transdermal patches.
- Medicines for Children leaflet: Oxybutynin for daytime urinary symptoms www.medicinesforchildren.org.uk/oxybutynin-daytime-urinary-symptoms

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

- ▶ With transdermal use The *Scottish Medicines Consortium* has advised (August 2005) that *Kentera*[®] should be restricted for use in patients who benefit from oral oxybutynin but cannot tolerate its side-effects.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- **MONITORING REQUIREMENTS** Blood pressure should be monitored before starting treatment and regularly during

treatment, especially in patients with pre-existing hypertension.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► Mirabegron for treating symptoms of overactive bladder (June 2013) NICE TA290

Mirabegron (*Betmiga*[®]) is recommended as an option only for patients in whom antimuscarinic drugs are ineffective, contra-indicated, or not tolerated; patients currently receiving mirabegron who do not meet these criteria should have the option to continue until they and their clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta290

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

1.2 Urinary retention

Urinary retention

31-May-2017

Description of condition

Urinary retention is the inability to voluntarily urinate. It may be secondary to urethral blockage, drug treatment (such as use of antimuscarinic drugs, sympathomimetics, tricyclic antidepressants), conditions that reduce detrusor contractions or interfere with relaxation of the urethra, neurogenic causes, or it may occur postpartum or postoperatively.

Acute urinary retention is a medical emergency characterised by the abrupt development of the inability to pass urine (over a period of hours).

Chronic urinary retention is the gradual (over months or years) development of the inability to empty the bladder completely, characterised by a residual volume greater than one litre or associated with the presence of a distended or palpable bladder.

Urinary retention due to benign prostatic hyperplasia

The most common cause of urinary retention in men is benign prostatic hyperplasia. Men with an enlarged prostate can have lower urinary tract symptoms associated with obstruction, such as urinary retention (acute or chronic), frequency, urgency or nocturia.

Treatment

Treatment of urinary retention depends on the underlying condition. Catheterisation is used to relieve acute painful urinary retention or when no cause can be found. Surgical procedures or dilatation are often used to correct mechanical outflow obstructions.

Acute urinary retention

[\[EvGr\]](#) Acute retention is painful and requires immediate treatment by catheterisation. Before the catheter is removed an alpha-adrenoceptor blocker (such as alfuzosin hydrochloride below, doxazosin p. 826, tamsulosin hydrochloride p. 828, prazosin p. 827, indoramin p. 827 or terazosin p. 829) should be given for at least two days to manage acute urinary retention. [▲](#)

Chronic urinary retention

[\[EvGr\]](#) In patients with chronic urinary retention, intermittent bladder catheterisation should be offered before an indwelling catheter. Catheters may be used as a long-term

solution where persistent urinary retention is causing incontinence, infection, or renal dysfunction and a surgical solution is not feasible. [▲](#) Their use is associated with an increased risk of adverse events including recurrent urinary infections, trauma to the urethra, pain, and stone formation.

[\[EvGr\]](#) In men who have symptoms that are bothersome, drug treatment should only be offered when other conservative management options have failed. Men with moderate-to-severe symptoms should be offered an alpha-adrenoceptor blocker (alfuzosin hydrochloride, doxazosin, tamsulosin hydrochloride or terazosin). Treatment should initially be reviewed after 4–6 weeks and then every 6–12 months. [▲](#)

The parasympathomimetic bethanechol chloride p. 830 increases detrusor muscle contraction. It is licensed for acute postoperative, postpartum and neurogenic urinary retention but its use has largely been superseded by catheterisation.

Urinary retention due to benign prostatic hyperplasia

In patients with benign prostatic hyperplasia, treatment is influenced by the severity of symptoms and their effect on the patient's quality of life. [\[EvGr\]](#) Watchful waiting is suitable for men with symptoms that are not troublesome and in those who have not yet developed complications of benign prostatic hyperplasia such as renal impairment, urinary retention or recurrent infection.

The recommended treatment of benign prostatic hyperplasia is usually an alpha-adrenoceptor blocker. The alpha₁-selective adrenoceptor blockers relax smooth muscle in benign prostatic hyperplasia producing an increase in urinary flow-rate and an improvement in obstructive symptoms.

In patients with an enlarged prostate, a raised prostate specific antigen concentration, and who are considered to be at high risk of progression (such as the elderly), a 5 α -reductase inhibitor (such as finasteride p. 831 or dutasteride p. 830) should be used. A combination of an alpha-adrenoceptor blocker and a 5 α -reductase inhibitor can be offered if symptoms remain a problem.

Surgery is recommended for men with more severe symptoms that do not respond to drug therapy, or who have complications such as acute urinary retention, haematuria, renal failure, bladder calculi or recurrent urinary-tract infection. [▲](#)

Related drugs

Other drugs used for urinary retention: neostigmine p. 1188, pyridostigmine bromide p. 1188.

ALPHA-ADRENOCEPTOR BLOCKERS

Alfuzosin hydrochloride

20-May-2020

● INDICATIONS AND DOSE

Benign prostatic hyperplasia

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Adult: 2.5 mg 3 times a day; maximum 10 mg per day

► Elderly: Initially 2.5 mg twice daily, adjusted according to response; maximum 10 mg per day

► BY MOUTH USING MODIFIED-RELEASE MEDICINES

► Adult: 10 mg once daily

continued →

Acute urinary retention associated with benign prostatic hyperplasia

▶ BY MOUTH USING MODIFIED-RELEASE TABLETS

- ▶ Elderly: 10 mg once daily for 2–3 days during catheterisation and for one day after removal; max. 4 days

- **CONTRA-INDICATIONS** Avoid if history of micturition syncope · avoid if history of postural hypertension
- **CAUTIONS** Acute heart failure · cerebrovascular disease · concomitant antihypertensives (reduced dosage and specialist supervision may be required) · discontinue if angina worsens · elderly · history of QT-interval prolongation · patients undergoing cataract surgery (risk of intra-operative floppy iris syndrome)

CAUTIONS, FURTHER INFORMATION

- ▶ Elderly For alpha₁-selective adrenoceptor blockers, prescription potentially inappropriate (STOPP criteria):
 - in those with symptomatic orthostatic hypotension or micturition syncope (risk of precipitating recurrent syncope)
 - in those with persistent postural hypotension i.e. recurrent drop in systolic blood pressure \geq 20 mmHg (risk of syncope and falls). See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: alpha blockers

SIDE-EFFECTS

- ▶ **Common or very common** Asthenia · diarrhoea · dizziness · dry mouth · headache · malaise · nausea · postural hypotension · vertigo · vomiting
- ▶ **Uncommon** Abdominal pain · arrhythmias · chest pain · drowsiness · flushing · oedema · palpitations · rhinitis · skin reactions · syncope · visual impairment
- ▶ **Rare or very rare** Angina pectoris · angioedema
- ▶ **Frequency not known** Cerebral ischaemia · floppy iris syndrome · hepatic disorders · neutropenia · priapism · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.

- **HEPATIC IMPAIRMENT** For *immediate-release* preparations manufacturer advises caution in mild to moderate hepatic failure; avoid in severe hepatic failure (risk of increased half-life). For *modified-release* preparations manufacturer advises avoid in hepatic failure.

Dose adjustments For *immediate-release* preparations manufacturer advises initial dose of 2.5 mg once daily, increased to 2.5 mg twice daily according to response in mild to moderate hepatic failure.

- **RENAL IMPAIRMENT** Manufacturers advise avoid use of modified-release preparations if eGFR less than 30 mL/minute/1.73 m² as limited experience. **Dose adjustments** Initial dose 2.5 mg twice daily and adjust according to response.
- **PATIENT AND CARER ADVICE** Patient should be counselled on the first dose effect. **Driving and skilled tasks** May affect performance of skilled tasks e.g. driving.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ **Adult:** Initially 1 mg daily, dose may be doubled at intervals of 1–2 weeks according to response; usual maintenance 2–4 mg daily; maximum 8 mg per day
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ **Adult:** Initially 4 mg once daily, dose can be adjusted after 4 weeks, then increased if necessary to 8 mg once daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ Patients stabilised on immediate-release doxazosin can be transferred to the equivalent dose of modified-release doxazosin.

- **CONTRA-INDICATIONS** History of micturition syncope (in patients with benign prostatic hypertrophy) · history of postural hypotension · monotherapy in patients with overflow bladder or anuria
- **CAUTIONS** Care with initial dose (postural hypotension) · cataract surgery (risk of intra-operative floppy iris syndrome) · elderly · heart failure · pulmonary oedema due to aortic or mitral stenosis
- **INTERACTIONS** → Appendix 1: alpha blockers
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arrhythmias · asthenia · chest pain · cough · cystitis · dizziness · drowsiness · dry mouth · dyspnoea · gastrointestinal discomfort · headache · hypotension · increased risk of infection · influenza like illness · muscle complaints · nausea · oedema · pain · palpitations · skin reactions · urinary disorders · vertigo
 - ▶ **Uncommon** Angina pectoris · anxiety · appetite abnormal · arthralgia · constipation · depression · diarrhoea · gastrointestinal disorders · gout · haemorrhage · insomnia · myocardial infarction · sensation abnormal · sexual dysfunction · stroke · syncope · tinnitus · tremor · vomiting · weight increased
 - ▶ **Rare or very rare** Alopecia · bronchospasm · flushing · gynaecomastia · hepatic disorders · leucopenia · malaise · muscle weakness · thrombocytopenia · vision blurred
- ▶ **Frequency not known** Floppy iris syndrome

- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** Accumulates in milk in *animal* studies—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment (limited information available); avoid in severe impairment (no information available).
- **PATIENT AND CARER ADVICE** Patient counselling is advised for doxazosin tablets (initial dose).
Driving and skilled tasks May affect performance of skilled tasks e.g. driving.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Modified-release tablet

- ▶ **Doxadura** (Dexcel-Pharma Ltd)

Doxazosin (as Doxazosin mesilate) 4 mg Doxadura 4mg tablets | 28 tablet [PoM] £1.04 DT = £1.17

- **CONTRA-INDICATIONS** Established heart failure · history of micturition syncope (when used for benign prostatic hyperplasia) · history of postural hypotension (when used for benign prostatic hyperplasia)
- **CAUTIONS** Cataract surgery (risk of intra-operative floppy iris syndrome) · control incipient heart failure before initiating indoramin · elderly · epilepsy (convulsions in *animal* studies) · history of depression · Parkinson's disease (extrapyramidal disorders reported)

CAUTIONS, FURTHER INFORMATION

- ▶ **Elderly** For α_1 -selective adrenoceptor blockers, prescription potentially inappropriate (STOPP criteria):
 - in those with symptomatic orthostatic hypotension or micturition syncope (risk of precipitating recurrent syncope)
 - in those with persistent postural hypotension i.e. recurrent drop in systolic blood pressure ≥ 20 mmHg (risk of syncope and falls).
See also Prescribing in the elderly p. 33.
- **INTERACTIONS** → Appendix 1: alpha blockers
- **SIDE-EFFECTS**
 - ▶ **Rare or very rare** Parkinson's disease exacerbated
 - ▶ **Frequency not known** Depression · dizziness · drowsiness · dry mouth · ejaculation failure · fatigue · headache · nasal congestion · weight increased
- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** No information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 2

- ▶ **Doralese Tiltab** (Chemidex Pharma Ltd)

Indoramin (as Indoramin hydrochloride) 20 mg Doralese Tiltab 20mg tablets | 60 tablet [PoM] £11.44 DT = £11.08

Prazosin

09-Feb-2020

INDICATIONS AND DOSE**Hypertension**

- ▶ **BY MOUTH**

- ▶ **Adult:** Initially 500 micrograms 2–3 times a day for 3–7 days, the initial dose should be taken on retiring to bed at night to avoid collapse, increased to 1 mg 2–3 times a day for a further 3–7 days, then increased if necessary up to 20 mg daily in divided doses

Congestive heart failure (rarely used)

- ▶ **BY MOUTH**

- ▶ **Adult:** 500 micrograms 2–4 times a day, initial dose to be taken at bedtime, then increased to 4 mg daily in divided doses; maintenance 4–20 mg daily in divided doses

Raynaud's syndrome (but efficacy not established)

- ▶ **BY MOUTH**

- ▶ **Adult:** Initially 500 micrograms twice daily, initial dose to be taken at bedtime, dose may be increased after 3–7 days, then increased if necessary to 1–2 mg twice daily

continued →

Indoramin

05-Feb-2020

INDICATIONS AND DOSE**Hypertension**

- ▶ **BY MOUTH**

- ▶ **Adult:** Initially 25 mg twice daily, increased in steps of 25–50 mg every 2 weeks, maximum daily dose should be given in divided doses; maximum 200 mg per day

Benign prostatic hyperplasia

- ▶ **BY MOUTH**

- ▶ **Adult:** 20 mg twice daily, increased in steps of 20 mg every 2 weeks if required, increased if necessary up to 100 mg daily in divided doses
- ▶ **Elderly:** 20 mg daily may be adequate, dose to be taken at night

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required.

Benign prostatic hyperplasia

▶ BY MOUTH

- ▶ **Adult:** Initially 500 micrograms twice daily for 3–7 days, subsequent doses should be adjusted according to response, maintenance 2 mg twice daily, initiate with lowest possible dose in elderly patients

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required.

- **CONTRA-INDICATIONS** History of micturition syncope (in patients with benign prostatic hyperplasia) · history of postural hypotension · not recommended for congestive heart failure due to mechanical obstruction (e.g. aortic stenosis)

- **CAUTIONS** Cataract surgery (risk of intra-operative floppy iris syndrome) · elderly · first dose hypotension

CAUTIONS, FURTHER INFORMATION

- ▶ **Elderly** For α_1 -selective adrenoceptor blockers, prescription potentially inappropriate (STOPP criteria):
 - in those with symptomatic orthostatic hypotension or micturition syncope (risk of precipitating recurrent syncope)
 - in those with persistent postural hypotension i.e. recurrent drop in systolic blood pressure ≥ 20 mmHg (risk of syncope and falls). See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: alpha blockers

SIDE-EFFECTS

- ▶ **Common or very common** Asthenia · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · headache · nasal congestion · nausea · nervousness · oedema · palpitations · postural hypotension · sexual dysfunction · skin reactions · syncope · urinary disorders · vertigo · vision blurred · vomiting
- ▶ **Uncommon** Angina pectoris · arrhythmias · arthralgia · epistaxis · eye pain · eye redness · gastrointestinal discomfort · hyperhidrosis · paraesthesia · sleep disorders · tinnitus
- ▶ **Rare or very rare** Alopecia · fever · flushing · gynaecomastia · hallucination · hepatic function abnormal · pain · pancreatitis · vasculitis

- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

- **BREAST FEEDING** Present in milk, amount probably too small to be harmful; manufacturer advises use with caution.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available).

Dose adjustments Manufacturer advises initial dose reduction to 500 micrograms daily; increased with caution.

RENAL IMPAIRMENT

Dose adjustments Initially 500 micrograms daily in moderate to severe impairment; increased with caution.

PATIENT AND CARER ADVICE

First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patients should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.

Driving and skilled tasks May affect performance of skilled tasks e.g. driving.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

Tablet

- ▶ **Minipress** (Imported (Australia))

Prazosin (as Prazosin hydrochloride) 2 mg Minipress 2mg tablets | 100 tablet [PoM] [X]

Prazosin (as Prazosin hydrochloride) 500 microgram Hypovase 500microgram tablets | 60 tablet [PoM] £2.69 DT = £2.69

Prazosin (as Prazosin hydrochloride) 1 mg Hypovase 1mg tablets | 60 tablet [PoM] £3.46 DT = £3.46

Tamsulosin hydrochloride

09-Feb-2020

INDICATIONS AND DOSE**Benign prostatic hyperplasia**

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ **Adult:** 400 micrograms once daily

- **CONTRA-INDICATIONS** History of micturition syncope · history of postural hypotension

- **CAUTIONS** Care with initial dose (postural hypotension) · cataract surgery (risk of intra-operative floppy iris syndrome) · concomitant antihypertensives (reduced dosage and specialist supervision may be required) · elderly

CAUTIONS, FURTHER INFORMATION

- ▶ **Elderly** For α_1 -selective adrenoceptor blockers, prescription potentially inappropriate (STOPP criteria):

- in those with symptomatic orthostatic hypotension or micturition syncope (risk of precipitating recurrent syncope)

- in those with persistent postural hypotension i.e. recurrent drop in systolic blood pressure ≥ 20 mmHg (risk of syncope and falls). See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: alpha blockers

SIDE-EFFECTS

- ▶ **Common or very common** Dizziness · sexual dysfunction
- ▶ **Uncommon** Asthenia · constipation · diarrhoea · headache · nausea · palpitations · postural hypotension · rhinitis · skin reactions · vomiting
- ▶ **Rare or very rare** Angioedema · Stevens-Johnson syndrome · syncope
- ▶ **Frequency not known** Dry mouth · epistaxis · vision disorders

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.

- **RENAL IMPAIRMENT** Use with caution if eGFR less than 10 mL/minute/1.73 m².

PATIENT AND CARER ADVICE

Driving and skilled tasks May affect performance of skilled tasks e.g. driving.

- **EXCEPTIONS TO LEGAL CATEGORY** Tamsulosin hydrochloride 400 microgram capsules can be sold to the public for the treatment of functional symptoms of benign prostatic hyperplasia in men aged 45–75 years to be taken for up to 6 weeks before clinical assessment by a doctor.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

30 capsule [PoM] £19.80 DT = £19.80

Tamsulosin with solifenacin

13-May-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, tamsulosin hydrochloride p. 828, solifenacin succinate p. 823.

INDICATIONS AND DOSE**Moderate to severe urinary frequency, urgency, and obstructive symptoms associated with benign prostatic hyperplasia when monotherapy ineffective**

- BY MOUTH
- Adult (male): 1 tablet daily.

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises max. 1 *Vesomni*[®] tablet daily with concurrent use of potent inhibitors of CYP3A4; avoid concurrent use in patients who also have moderate hepatic impairment, severe renal impairment, are poor metabolisers of CYP2D6, or in patients also taking a potent inhibitor of CYP2D6.

- **INTERACTIONS** → Appendix 1: alpha blockers · solifenacin

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment (no information available).

Dose adjustments Manufacturer advises max. 1 *Vesomni*[®] tablet daily in moderate impairment.

RENAL IMPAIRMENT

Dose adjustments Max. 1 *Vesomni*[®] tablet daily if eGFR less than 30 mL/minute/1.73 m².

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 3, 25

- **Vesomni** (Astellas Pharma Ltd)
Tamsulosin hydrochloride 400 microgram, Solifenacin succinate 6 mg Vesomni 6mg/0.4mg modified-release tablets | 30 tablet [PoM] £27.62 DT = £27.62

Terazosin

21-May-2020

INDICATIONS AND DOSE**Mild to moderate hypertension**

- BY MOUTH
- Adult: 1 mg daily for 7 days, then increased if necessary to 2 mg daily, dose should be taken at bedtime; maintenance 2–10 mg once daily, doses above 20 mg rarely improve efficacy

Benign prostatic hyperplasia

- BY MOUTH
- Adult: Initially 1 mg daily, dose should be taken at bedtime, if necessary dose may be doubled at intervals of 1–2 weeks according to response; maintenance 5–10 mg daily; maximum 10 mg per day

- **CONTRA-INDICATIONS** History of micturition syncope (in benign prostatic hyperplasia) · history of postural hypotension (in benign prostatic hyperplasia)

- **CAUTIONS** Cataract surgery (risk of intra-operative floppy iris syndrome) · elderly · first dose

CAUTIONS, FURTHER INFORMATION

- First dose First dose may cause collapse due to hypotension within 30–90 minutes, therefore should be taken on retiring to bed; may also occur with rapid dose increase.
- Elderly For alpha₁-selective adrenoceptor blockers, prescription potentially inappropriate (STOPP criteria):
 - in those with symptomatic orthostatic hypotension or micturition syncope (risk of precipitating recurrent syncope)

- in those with persistent postural hypotension i.e. recurrent drop in systolic blood pressure ≥ 20 mmHg (risk of syncope and falls).
See also Prescribing in the elderly p. 33.
- **INTERACTIONS** → Appendix 1: alpha blockers
- **SIDE-EFFECTS** Angioedema · anxiety · arrhythmias · arthritis · asthenia · chest pain · conjunctivitis · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · epistaxis · fever · flatulence · gastrointestinal discomfort · gout · headache · hyperhidrosis · increased risk of infection · insomnia · joint disorders · myalgia · nasal congestion · nausea · oedema · pain · palpitations · paraesthesia · postural hypotension · sexual dysfunction · skin reactions · syncope · thrombocytopenia · tinnitus · urinary disorders · vasodilation · vertigo · vision disorders · vomiting · weight increased
- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** No information available.
- **PATIENT AND CARER ADVICE** Patient counselling is advised for terazosin tablets (initial dose).
First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.
Driving and skilled tasks May affect performance of skilled tasks e.g. driving.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

5 α -REDUCTASE INHIBITORS**Dutasteride**

11-May-2020

- **DRUG ACTION** A specific inhibitor of the enzyme 5 α -reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

● **INDICATIONS AND DOSE****Benign prostatic hyperplasia**▶ **BY MOUTH**

▶ **Adult:** 500 micrograms daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained)

- **INTERACTIONS** → Appendix 1: dutasteride
- **SIDE-EFFECTS**
- ▶ **Common or very common** Breast disorder · sexual dysfunction
- ▶ **Uncommon** Alopecia · hypertrichosis
- ▶ **Frequency not known** Angioedema · depressed mood · hypersensitivity · localised oedema · skin reactions · testicular disorders
- **CONCEPTION AND CONTRACEPTION** Dutasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).
- **MONITORING REQUIREMENTS** Manufacturer advises that patients should be regularly evaluated for prostate cancer.
- **EFFECT ON LABORATORY TESTS** May decrease serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment.
- **HANDLING AND STORAGE** Women of childbearing potential should avoid handling leaking capsules of dutasteride.
- **PATIENT AND CARER ADVICE** Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Capsule

CAUTIONARY AND ADVISORY LABELS 25

Combinations available: *Tamsulosin with dutasteride*, p. 829

Finasteride

11-May-2020

● **DRUG ACTION** A specific inhibitor of the enzyme 5 α -reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

● INDICATIONS AND DOSE

Benign prostatic hyperplasia

► BY MOUTH

- Adult: 5 mg daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained)

Androgenetic alopecia in men

► BY MOUTH

- Adult: 1 mg daily, continuous use for 3–6 months is required before benefit is seen, and effects are reversed 6–12 months after treatment is discontinued

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: RARE REPORTS OF DEPRESSION AND SUICIDAL THOUGHTS (MAY 2017)

The MHRA has received reports of depression and, in rare cases, suicidal thoughts in men taking finasteride (*Propecia*®) for male pattern hair loss; depression is also associated with *Proscar*® for benign prostatic hyperplasia. Patients should be advised to stop finasteride immediately and inform a healthcare professional if they develop depression.

- **CAUTIONS** Obstructive uropathy
- **SIDE-EFFECTS**
 - **Common or very common** Sexual dysfunction
 - **Uncommon** Breast abnormalities · skin reactions
 - **Frequency not known** Angioedema · depression · infertility male · palpitations · testicular pain
- **CONCEPTION AND CONTRACEPTION** Finasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.
- **EFFECT ON LABORATORY TESTS** Decreases serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment.
- **HANDLING AND STORAGE** Women of childbearing potential should avoid handling crushed or broken tablets of finasteride.
- **PATIENT AND CARER ADVICE** Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NHS restrictions Finasteride is not prescribable in NHS primary care for the treatment of androgenetic alopecia in men.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, powder

1.3 Urolithiasis

Renal and ureteric stones

03-Apr-2019

Description of condition

Renal and ureteric stones are crystalline calculi that may form anywhere in the upper urinary tract. They are often asymptomatic but may cause pain when they move or obstruct the flow of urine. Most stones are composed of calcium salts (calcium oxalate, calcium phosphate or both). The rest are composed of struvite, uric acid, cystine and other substances. Patients are susceptible to stone formation when there is a decrease in urine volume and/or an excess of stone forming substances in the urine.

The following are risk factors that have been associated with stone formation: dehydration, change in urine pH, males aged between 40–60 years, positive family history, obesity, urinary anatomical abnormalities, and excessive dietary intake of oxalate, urate, sodium, and animal protein. Certain diseases which alter urinary volume, pH, and concentrations of certain ions (such as calcium, phosphate, oxalate, sodium, and uric acid) may also increase the risk of stone formation. Certain drugs such as calcium or vitamin D supplements, protease inhibitors, or diuretics may also increase the risk of stone formation.

Symptoms of acute renal or ureteric stones can include an abrupt onset of severe unilateral abdominal pain radiating to the groin (known as renal colic) that may be accompanied with nausea, vomiting, haematuria, increased urinary frequency, dysuria and fever (if concomitant urinary infection is present).

Stones can pass spontaneously and will depend on a number of factors, including the size of the stone (stones greater than 6 mm have a very low chance of spontaneous passage), the location (distal ureteral stones are more likely to pass than proximal ureteral stones), and the degree of obstruction.

Aims of treatment

[EvGr] The aim of treatment is to improve the detection, clearance and prevention of renal and ureteric stones thereby reducing pain and improving quality of life. 

Non-drug treatment

[EvGr] Consider watchful waiting for asymptomatic renal stones if they are less than 5mm in diameter. If they are larger; the risk and benefit of this option should be discussed with the patient.

Options for surgical stone removal should be discussed by the specialist hospital team depending on severity of obstruction, patient factors, size and site of stone. Options include shockwave lithotripsy, percutaneous nephrolithotomy and ureteroscopy.

Consider stone analysis and measure serum calcium in patients with recurring renal or ureteric stones.

Along with maintaining a healthy lifestyle, advise patients to drink 2.5–3 litres of water a day with the addition of fresh lemon juice and to avoid carbonated drinks. Maintain a normal daily calcium intake of 700–1,200mg and salt intake of no more than 6g a day. For patients with recurrent calcium stones avoid excessive intake of oxalate-rich products, such as rhubarb, spinach, cocoa, tea, nuts, soy products, strawberries, and wheat bran. For patients with recurrent uric acid stones, avoid excessive dietary intake of urate rich products, such as liver, kidney, calf thymus, poultry skin, and certain fish (herring with skin, sardines and anchovies). 

Pain Management

[EvGr] Offer NSAIDs as first line treatment for the management of pain associated with suspected renal colic or

renal and ureteric stones. If NSAIDs are contra-indicated or not sufficiently controlling the pain, consider intravenous paracetamol. Subsequently, opioids can be used if both paracetamol and NSAIDs are contra-indicated or not sufficiently controlling the pain. Do not offer antispasmodics to patients with suspected renal colic. \blacktriangle

Medical Expulsive Therapy

EvGr Consider alpha-adrenoceptor blockers for patients with distal ureteric stones less than 10mm in diameter. Alpha-adrenoceptor blockers may also be considered as adjunctive therapy for patients having shockwave lithotripsy for ureteric stones less than 10mm. \blacktriangle

Prevention of recurrence of stones

EvGr Alongside lifestyle advice, consider potassium citrate [unlicensed] in patients with recurrent stones composed of at least 50% calcium oxalate. Thiazides [unlicensed] may be given if patients also have hypercalcaemia after restricting their sodium intake to no more than 6g a day. \blacktriangle

1.4 Urological pain

Urological pain

03-Apr-2019

Treatment

Lidocaine hydrochloride gel is a useful topical application in *urethral pain* or to relieve the discomfort of catheterisation.

For information on the management of pain in renal and ureteric stones, see Renal and ureteric stones p. 831.

Alkalinisation of urine

Alkalinisation of urine can be undertaken with potassium citrate. The alkalinising action may relieve the discomfort of *cystitis* caused by lower urinary tract infections. Sodium bicarbonate p. 1099 is used as a urinary alkalinising agent in some metabolic and renal disorders.

ALKALISING DRUGS > URINARY

Citric acid with potassium citrate

12-May-2020

● INDICATIONS AND DOSE

Relief of discomfort in mild urinary-tract infections | Alkalinisation of urine

- ▶ BY MOUTH USING ORAL SOLUTION
- ▶ Adult: 10 mL 3 times a day, diluted well with water

- **CAUTIONS** Cardiac disease · elderly
- **INTERACTIONS** → Appendix 1: potassium citrate
- **SIDE-EFFECTS** Hyperkalaemia · nausea · vomiting
- **RENAL IMPAIRMENT** Avoid in severe impairment. **Monitoring** Close monitoring required in renal impairment—high risk of hyperkalaemia.
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Potassium Citrate Mixture BP consists of potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K⁺/10 mL.

- **EXCEPTIONS TO LEGAL CATEGORY** Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 27

- ▶ **Citric acid with potassium citrate (Non-proprietary)**

Citric acid monohydrate 50 mg per 1 mL, Potassium citrate 300 mg per 1 mL Potassium citrate mixture | 200 mL \mathcal{P} £1.38 DT = £1.38

Sodium citrate

18-May-2020

● INDICATIONS AND DOSE

Bladder washouts

- ▶ Adult: (consult product literature)

Relief of discomfort in mild urinary-tract infections

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

Constipation (dose approved for use by community practitioner nurse prescribers)

- ▶ BY RECTUM
- ▶ Child 3-17 years: 5 mL for 1 dose
- ▶ Adult: 5 mL for 1 dose

MICOLETTE[®]

Constipation

- ▶ BY RECTUM
- ▶ Child 3-17 years: 5–10 mL for 1 dose
- ▶ Adult: 5–10 mL for 1 dose

MICRALAX[®]

Constipation

- ▶ BY RECTUM
- ▶ Child 3-17 years: 5 mL for 1 dose
- ▶ Adult: 5 mL for 1 dose

RELAXIT[®]

Constipation

- ▶ BY RECTUM
- ▶ Child 1 month-2 years: 5 mL for 1 dose, insert only half the nozzle length
- ▶ Child 3-17 years: 5 mL for 1 dose
- ▶ Adult: 5 mL for 1 dose

● CONTRA-INDICATIONS

- ▶ With oral use Conditions where excess sodium or glucose should be avoided (e.g. cardiac disease, hypertension, patients on a sodium-restricted diet or diabetes)
- ▶ With rectal use Acute gastro-intestinal conditions

● CAUTIONS

- ▶ With oral use Elderly
- ▶ With rectal use Debilitated patients (in adults) · sodium and water retention in susceptible individuals

- **INTERACTIONS** → Appendix 1: sodium citrate

- **SIDE-EFFECTS** Polyuria

● PREGNANCY

- ▶ With oral use Use with caution.

● RENAL IMPAIRMENT

- ▶ With oral use In patients with fluid retention, avoid antacids containing large amounts of sodium.

- **PRESCRIBING AND DISPENSING INFORMATION** Sodium citrate 300 mmol/litre (88.2 mg/mL) oral solution is licensed for use before general anaesthesia for caesarean section (available from Viridian).

- **EXCEPTIONS TO LEGAL CATEGORY** Proprietary brands of sodium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, eye drops

Granules

- ▶ **Sodium citrate (Non-proprietary)**

Sodium citrate 4 gram Cystitis Relief 4g oral granules sachets | 6 sachet [GSL] £2.38 DT = £2.38

- ▶ Brands may include CanesOasis, Cymalon (sodium citrate), Cystocalm

Oral solution

- ▶ **Sodium citrate (Non-proprietary)**

Sodium citrate 88.23 mg per 1 ml Sodium citrate 0.3M oral solution | 30 ml [POM] £4.70 DT = £4.70

Powder

- ▶ **Sodium citrate (Non-proprietary)**

Sodium citrate 1 mg per 1 ml Sodium citrate powder | 500 gram [GSL] £7.49 DT = £7.34

- ▶ **Numark** (Numark Ltd)

Sodium citrate 4 gram Numark cystitis treatment 4g oral powder sachets | 6 sachet [GSL] £1.65 DT = £1.65

Irrigation solution

- ▶ **Sodium citrate (Non-proprietary)**

Sodium citrate 3% irrigation solution 1litre bags | 1 bag [X]

Enema

- ▶ **Micolette Micro-enema** (Pinewood Healthcare)

Sodium citrate 90 mg per 1 ml Micolette Micro-enema 5ml | 12 enema [P] £4.50

- ▶ **Micralax Micro-enema** (RPH Pharmaceuticals AB)

Sodium citrate 90 mg per 1 ml Micralax Micro-enema 5ml | 12 enema [P] £4.87

- ▶ **Relaxit** (Supra Enterprises Ltd)

Sodium citrate 90 mg per 1 ml Relaxit Micro-enema 5ml | 12 enema £5.21

HEPARINOIDS

Pentosan polysulfate sodium

03-Dec-2019

- **INDICATIONS AND DOSE**

Bladder pain syndrome

- ▶ BY MOUTH

- ▶ Adult: 100 mg 3 times a day, review treatment after 6 months and discontinue if no response

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED SEPTEMBER 2019): **ELMIRON[®] (PENTOSAN POLYSULFATE SODIUM): RARE RISK OF PIGMENTARY MACULOPATHY**

Cases of pigmentary maculopathy have been reported rarely with pentosan polysulfate sodium, especially after long-term use at high doses. Healthcare professionals are advised that patients should have regular ophthalmic examinations during treatment, and to consider stopping treatment if pigmentary maculopathy develops. Patients should be advised to seek immediate medical attention if visual changes occur.

- **CONTRA-INDICATIONS** Active bleeding
- **CAUTIONS** Patients at increased risk of bleeding
- **SIDE-EFFECTS**
- ▶ **Common or very common** Alopecia · asthenia · back pain · diarrhoea · dizziness · gastrointestinal discomfort · haemorrhage · headache · increased risk of infection · nausea · pelvic pain · peripheral oedema
- ▶ **Uncommon** Amblyopia · anaemia · appetite decreased · arthralgia · constipation · depression · dyspnoea · emotional lability · eye disorders · flatulence · hyperhidrosis · hyperkinesia · insomnia · leucopenia · melanocytic naevus size increased · myalgia · oral ulceration · paraesthesia · photosensitivity reaction · skin reactions · thrombocytopenia · tinnitus · vomiting · weight changes

- ▶ **Frequency not known** Coagulation disorder · hepatic function abnormal
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—evidence of hepatic involvement in elimination.
- **RENAL IMPAIRMENT** Manufacturer advises caution—evidence of renal involvement in elimination.
- **MONITORING REQUIREMENTS** Manufacturer advises careful monitoring in patients with history of heparin or pentosan polysulfate sodium induced thrombocytopenia.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Pentosan polysulfate sodium for treating bladder pain syndrome (November 2019)** NICE TA610

Pentosan polysulfate sodium (*Elmiron[®]*) is recommended as an option for treating bladder pain syndrome with glomerulations or Hunner's lesions in adults with urinary urgency and frequency, and moderate to severe pain, only if:

- their condition has not responded to an adequate trial of standard oral treatments, **and**
- it is not offered in combination with bladder instillations, **and**
- any previous treatment with bladder instillations was not stopped because of lack of response, **and**
- it is used in secondary care, **and**
- the manufacturer provides pentosan polysulfate sodium according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta610

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2194

The *Scottish Medicines Consortium* has advised (November 2019) that pentosan polysulfate sodium (*Elmiron[®]*) is accepted for use within NHS Scotland for the treatment of bladder pain syndrome characterised by either glomerulations or Hunner's lesions in adults with moderate to severe pain, urgency and frequency of micturition. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 23

- ▶ **Fibrase** (Imported (Italy))

Pentosan polysulfate sodium 50 mg Fibrase 50mg capsules | 50 capsule [POM] [X]

Pentosan polysulfate sodium 100 mg Elmiron 100mg capsules | 90 capsule [POM] £450.00-£699.40 DT = £450.00

TERPENES

Anethol with borneol, camphene, cineole, fenchone and pinene

- **INDICATIONS AND DOSE**

Urolithiasis for the expulsion of calculi

- ▶ BY MOUTH

- ▶ Adult: 1–2 capsules 3–4 times a day, to be taken before food

- **LESS SUITABLE FOR PRESCRIBING** Preparation is less suitable for prescribing.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 25

▶ **Rowatinex** (Meadow Laboratories Ltd)

Cineole 3 mg, Anethol 4 mg, Fenchone 4 mg, Borneol 10 mg, Camphene 15 mg, Pinene 31 mg Rowatinex capsules | 50 capsule [Pm] £7.35

2 Bladder instillations and urological surgery

Bladder instillations and urological surgery

Bladder infection

Various solutions are available as irrigations or washouts.

Aqueous chlorhexidine p. 1275 can be used in the management of common infections of the bladder but it is ineffective against most *Pseudomonas spp.* Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile sodium chloride solution **0.9%** (physiological saline) p. 1101 is usually adequate and is preferred as a mechanical irrigant.

Continuous bladder irrigation with amphotericin 50 micrograms/mL p. 629 may be of value in mycotic infections in adults.

Dissolution of blood clots

Clot retention is usually treated by irrigation with sterile sodium chloride solution 0.9% but sterile sodium citrate solution for bladder irrigation 3% p. 832 may also be helpful.

Bladder cancer

Bladder instillations of doxorubicin hydrochloride p. 951 and mitomycin p. 970 are used for recurrent superficial bladder tumours. Such instillations reduce systemic side-effects; adverse effects on the bladder (e.g. micturition disorders and reduction in bladder capacity) may occur.

Instillation of epirubicin hydrochloride p. 953 is used for treatment and prophylaxis of certain forms of superficial bladder cancer; instillation of doxorubicin hydrochloride is also used for some papillary tumours.

Instillation of **BCG** (*Bacillus Calmette-Guérin* p. 1010), a live attenuated strain derived from *Mycobacterium bovis* is licensed for the treatment of primary or recurrent bladder carcinoma *in-situ* and for the prevention of recurrence following transurethral resection.

Urological surgery

Glycine 1.5% irrigation solution below is the irrigant of choice for transurethral resection of the prostate gland and bladder tumours; sterile sodium chloride solution 0.9% (physiological saline) is used for percutaneous renal surgery.

Maintenance of indwelling urinary catheters

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

ANTISEPTICS AND DISINFECTANTS**Chlorhexidine with lidocaine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 1275, lidocaine hydrochloride p. 1422.

● **INDICATIONS AND DOSE****Urethral sounding and catheterisation**

▶ BY URETHRAL APPLICATION

▶ Adult: 6–11 mL

Cystoscopy

▶ BY URETHRAL APPLICATION

▶ Adult: 11 mL, then 6–11 mL if required

Surface anaesthesia (dose approved for use by community practitioner nurse prescribers) (on doctor's advice only)

▶ BY URETHRAL APPLICATION

▶ Adult: 6–11 mL

- **INTERACTIONS** → Appendix 1: antiarrhythmics

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Gel

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

▶ **Instillagel** (ClimMed Ltd)

Chlorhexidine gluconate 500 microgram per 1 mL, Lidocaine hydrochloride 20 mg per 1 mL Instillagel gel | 60 mL [P] £10.50 DT = £10.50 | 110 mL [P] £11.00 DT = £11.00

IRRIGATING SOLUTIONS**Glycine**● **INDICATIONS AND DOSE****Bladder irrigation during urological surgery | Irrigation for transurethral resection of the prostate gland and bladder tumours**

▶ Adult: (consult product literature)

- **CAUTIONS**

CAUTIONS, FURTHER INFORMATION

- ▶ Urological surgery There is a high risk of fluid absorption from the irrigant used in endoscopic surgery within the urinary tract.
- **SIDE-EFFECTS** Cardiovascular disorder · electrolyte depletion · fluid overload · pulmonary disorder · seizure · vision blurred

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Irrigation solution▶ **Glycine (Non-proprietary)**

Glycine 1.5% irrigation solution 3litre Easyflow bags | 1 bag [X]
 Glycine 1.5% irrigation solution 1litre Flowfusor bottles | 1 bottle [X]

3 Contraception

Contraceptives, hormonal

Overview

Hormonal contraception includes combined hormonal contraception (containing an oestrogen and a progestogen) and progestogen-only contraception.

EvGr When prescribing contraception, information should be given on all available methods taking into consideration medical eligibility. This should include contraceptive effectiveness (including factors that alter efficacy), non-contraceptive benefits, health risks, and side effects to allow an informed decision to be made on the most suitable choice. **A**

In adolescents, hormonal contraception is used after menarche. When prescribing contraception for females under 16 years of age, it is considered good practice for health professionals to follow the criteria in the Department of Health Guidance (July 2004), commonly known as the Fraser Guidelines available at tinyurl.com/yy3hl2gt.

The UK Medical Eligibility Criteria for Contraceptive Use (available at www.fsrh.org) is published by the Faculty of Sexual and Reproductive Healthcare (FSRH); it categorises the risks of using contraceptive methods with pre-existing medical conditions.

Contraception in patients taking medication with teratogenic potential: FSRH (February 2018) and MHRA (May 2019) guidance

Females of childbearing potential should be advised to use highly effective contraception if they or their male partners are taking known teratogenic drugs or drugs with potential teratogenic effects. Highly effective contraception should be used both during treatment and for the recommended duration after discontinuation to avoid unintended pregnancy. Pregnancy testing should be performed before treatment initiation to exclude pregnancy and repeat testing may be required.

Methods of contraception considered to be 'highly effective' include the long-acting reversible contraceptives (LARC) copper intra-uterine device (Cu-IUD), levonorgestrel intra-uterine system (LNG-IUS) and progestogen-only implant (IMP), and male and female sterilisation. For more information see the FSRH CEU statement (www.fsrh.org/standards-and-guidance/documents/fsrh-ceu-statement-contraception-for-women-using-known/), MHRA drug safety

update (www.gov.uk/drug-safety-update/medicines-with-teratogenic-potential-what-is-effective-contraception-and-how-often-is-pregnancy-testing-needed), and the UK teratogenic information service (www.uktis.org).

Combined hormonal contraceptives

Combined hormonal contraceptives (CHC) are available as tablets (COC), transdermal patches (CTP), and vaginal rings (CVR). They are highly user-dependant methods where the failure rate if used perfectly (i.e. correctly and consistently) is less than 1%. Certain factors such as the person's weight, malabsorption (COC only), and drug interactions may contribute to contraceptive failure. Prescriptions of up to 12 months' supply for CHC initiation or continuation may be appropriate to avoid unwanted discontinuation and increased risk of pregnancy.

EvGr It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age as safer alternatives exist. **A**

CHC use may be associated with some health benefits such as:

- Reduced risk of ovarian, endometrial and colorectal cancer;
- Predictable bleeding patterns
- Reduced dysmenorrhoea and menorrhagia;
- Management of symptoms of polycystic ovary syndrome (PCOS), endometriosis and premenstrual syndrome;
- Improvement of acne;
- Reduced menopausal symptoms;
- Maintaining bone mineral density in peri-menopausal females under the age of 50 years.

The use of CHC is, however also associated with health risks. For information on these risks, and further information on the benefits, see FSRH clinical guideline: **Combined Hormonal Contraception** (see *Useful resources*).

For information on advice to give to patients on switching between CHC and other contraception, and the management of incorrect CHC use, see FSRH clinical guidance: **Combined Hormonal Contraception and Incorrect use of Combined Hormonal Contraception** (see *Useful resources*).

Preparation choice

Combined oral contraceptives (COCs) containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed 'monophasic'; those with varying amounts of the two hormones are termed 'multiphasic'.

Combined oral contraceptives usually contain ethinylestradiol as the oestrogen component; mestranol and estradiol are also used. The ethinylestradiol content of COCs range from 20–40 micrograms. **EvGr** A monophasic preparation containing 30 micrograms or less of ethinylestradiol in combination with levonorgestrel or norethisterone (to minimise cardiovascular risk), is generally used as the first line option. However, choice should be made taking into account the patients medical history, personal preference, previous contraceptive experience, and any age related considerations.

Due to potential reduced efficacy, non-oral CHC should be considered if there are concerns over absorption. In females who weigh 90 kg or more, consider non-topical options or use additional precautions with CTP. **A**

Regimen choice

[EvGr](#) Information should be given to females on both the traditional 21 day CHC regimen with a monthly withdrawal bleed during the 7 day hormone free interval (HFI), and 'tailored' CHC regimens [unlicensed use]. Tailored CHC regimens can only be used with monophasic CHC containing ethinylestradiol [unlicensed use]; they offer the choice of either a shortened, or less frequent, or no hormone free interval based on the person's preference. The following tailored regimens may be used [unlicensed use]:

- Shortened HFI: 21 days of continuous use followed by a 4 day HFI;
- Extended use (tricycling): 9 weeks of continuous use followed by a 4 or 7 day HFI;
- Flexible extended use: continuous use for 21 days or more followed by a 4 day HFI when breakthrough bleeding occurs;
- Continuous use: continuous CHC use with no HFI. 

Withdrawal bleeds do not represent physiological menstruation and there is no difference in efficacy or safety of using the traditional 21 day regimen, which mimics the natural menstrual cycle, over using extended or continuous regimens. Use of the traditional regimen may be associated

with disadvantages such as heavy or painful withdrawal bleeds, headaches, mood changes, and increased risk of incorrect use with subsequent unplanned pregnancy. [EVGr](#) Withdrawal bleeds during traditional CHC use has been reported in women who are pregnant and should therefore not be relied on as reassurance of a person's pregnancy status. [A](#)

Follow up

[EVGr](#) A review of continued medical eligibility, satisfaction and adherence, drug interactions, and consideration of alternative contraception should be undertaken annually. Body mass index and blood pressure should also be checked annually. [A](#)

Surgery

The manufacturers of CHC recommend that CHC use should be discontinued at least 4 weeks prior to major elective surgery, any surgery to the legs or pelvis, or surgery that involves prolonged immobilisation of a lower limb. An alternative method of contraception should be used to prevent unintentional pregnancy, and CHC may be recommenced 2 weeks after full remobilisation. When discontinuation is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on CHC, thromboprophylaxis should be considered.

When to seek further advice

[EVGr](#) All females should be advised to seek advice from a healthcare professional if they experience any troublesome side effects, have a significant health event, start any new medication, would like to discontinue CHC, or to discuss alternative methods at any time. For further information, see FSRH guidance **Combined Hormonal Contraception** (refer to [Useful resources](#) below). [A](#)

Progestogen-only contraceptives

Oral progestogen-only contraceptives

Oral progestogen-only preparations alter cervical mucus to prevent sperm penetration and may inhibit ovulation in some women; oral desogestrel-only preparations consistently inhibit ovulation and this is their primary mechanism of action. There is insufficient clinical trial evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives. Progestogen-only contraceptives offer a suitable alternative to combined hormonal contraceptives when oestrogens are contra-indicated (including those with venous thrombosis or a past history or predisposition to venous thrombosis, heavy smokers, those with hypertension above systolic 160 mmHg or diastolic 95 mmHg, valvular heart disease, diabetes mellitus with complications, and migraine with aura).

Parenteral progestogen-only contraceptives

Medroxyprogesterone acetate (*Depo-Provera*®), *SAYANA PRESS*® p. 856 is a long-acting progestogen given by injection; it is at least as effective as the combined oral preparations but because of its prolonged action it should never be given without *full counselling backed by the patient information leaflet*. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Troublesome bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of troublesome bleeding may be increased).

- In adolescents, medroxyprogesterone acetate (*Depo-Provera*®, *SAYANA PRESS*®) should be used only when other methods of contraception are inappropriate;
- in all women, the benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against the risks;
- in women with risk factors for osteoporosis, a method of contraception other than medroxyprogesterone acetate should be considered.

Norethisterone enantate (*Noristerat*®) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

An **etonogestrel-releasing implant** (*Nexplanon*®) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood-etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant.

Intra-uterine progestogen-only device

The progestogen-only intra-uterine systems *Mirena*®, *Jaydess*® and *Levosert*® release levonorgestrel p. 851 directly into the uterine cavity. *Mirena*® is licensed for use as a contraceptive, for the treatment of primary menorrhagia and for the prevention of endometrial hyperplasia during oestrogen replacement therapy. *Jaydess*® and *Levosert*® are licensed for contraception, and *Levosert*® is additionally licensed for the treatment of menorrhagia. These may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time.

Surgery

All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Contraceptives, non-hormonal

Contraception in patients taking medication with teratogenic potential: FSRH (February 2018) and MHRA (May 2019) guidance

Females of childbearing potential should be advised to use highly effective contraception if they or their male partners are taking known teratogenic drugs or drugs with potential teratogenic effects. Highly effective contraception should be used both during treatment and for the recommended duration after discontinuation to avoid unintended pregnancy. Pregnancy testing should be performed before treatment initiation to exclude pregnancy and repeat testing may be required.

Methods of contraception considered to be 'highly effective' include the long-acting reversible contraceptives (LARC) copper intra-uterine device (Cu-IUD), levonorgestrel intra-uterine system (LNG-IUS) and progestogen-only implant (IMP), and male and female sterilisation. For more information see the FSRH CEU statement (www.fsrh.org/standards-and-guidance/documents/fsrh-ceu-statement-contraception-for-women-using-known/), MHRA drug safety update (www.gov.uk/drug-safety-update/medicines-with-teratogenic-potential-what-is-effective-contraception-and-how-often-is-pregnancy-testing-needed), and the UK teratogenic information service (www.uktis.org).

Barrier methods

Barrier methods include condoms, diaphragms and cervical caps. Male condoms are less effective than some other contraception methods but are effective when used consistently and correctly, and provide significant protection against some sexually transmitted infections (STIs). A female condom (*Femidom*®) is also available; it is pre-lubricated with a non-spermicidal lubricant.

There is no evidence that condoms lubricated with spermicide provide additional protection against pregnancy or STIs. Diaphragms and caps must be used in conjunction with a **spermicide** and should not be removed until at least 6 hours after the last episode of intercourse.

Spermicidal contraceptives

Spermicidal contraceptives are useful additional safeguards but do **not** give adequate protection if used alone unless fertility is already significantly diminished. They have two components: a spermicide and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); high frequency use of the spermicide nonoxinol '9' p. 857 has been associated with genital lesions, which may increase the risk of acquiring these infections.

Contraceptive devices

Intra-uterine devices

The intra-uterine device (IUD) is a suitable contraceptive for women of all ages irrespective of parity; however, it is less

appropriate for those with an increased risk of pelvic inflammatory disease e.g. women under 25 years.

The most effective intra-uterine devices have at least 380 mm² of copper and have banded copper on the arms. Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper.

Fertility declines with age and therefore a copper intra-uterine device which is fitted in a woman over the age of 40, may remain in the uterus until menopause.

A frameless, copper-bearing intra-uterine device (*Gyne Fix*®) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus.

Caution with oil-based lubricants

Products such as petroleum jelly (*Vaseline*®), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

Emergency contraception

31-Aug-2017

Overview

EvGr Emergency contraception is intended for occasional use, to reduce the risk of pregnancy after unprotected sexual intercourse. It does not replace effective regular contraception.

Women who do not wish to conceive should be offered emergency contraception after unprotected sexual intercourse that has taken place on any day of a natural menstrual cycle. Emergency contraception should also be offered after unprotected intercourse from day 21 after childbirth (unless the criteria for lactational amenorrhoea are met), and from day 5 after abortion, miscarriage, ectopic pregnancy or uterine evacuation for gestational trophoblastic disease.

Emergency contraception should also be offered to women if their regular contraception has been compromised or has been used incorrectly. **A**

Emergency contraceptive methods

Copper intra-uterine devices

EvGr Insertion of a copper intra-uterine device (see intra-uterine contraceptive devices (copper) p. 848) is the most effective form of emergency contraception and should be offered (if appropriate) to all women who have had unprotected sexual intercourse and do not want to conceive. A copper intra-uterine contraceptive device can be inserted up to 120 hours (5 days) after unprotected intercourse or up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle. Antibacterial cover should be considered for copper intra-uterine contraceptive device insertion if there is a significant risk of sexually transmitted infection that could be associated with ascending pelvic infection.

A copper intra-uterine device is not known to be affected by body mass index (BMI) or body-weight or by other drugs.

A

Hormonal methods

EvGr Hormonal emergency contraceptives (includes levonorgestrel p. 851 and ulipristal acetate p. 849) should be offered as soon as possible after unprotected intercourse if a copper intra-uterine device is not appropriate or is not acceptable to the patient; either drug should be taken as soon as possible after unprotected intercourse to increase

efficacy. Hormonal emergency contraception administered after ovulation is ineffective.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 96 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal acetate is effective if taken within 120 hours (5 days) of unprotected intercourse. Ulipristal acetate has been demonstrated to be more effective than levonorgestrel for emergency contraception.

It is possible that a higher body-weight or BMI could reduce the effectiveness of oral emergency contraception, particularly levonorgestrel; if BMI is greater than 26 kg/m² or body-weight is greater than 70 kg, it is recommended that either ulipristal acetate or a double dose of levonorgestrel [unlicensed indication] (see *Emergency contraception* under levonorgestrel) is given. It is unknown which is more effective.

Ulipristal acetate should be considered as the first-line hormonal emergency contraceptive for a woman who has had unprotected intercourse 96–120 hours ago (even if she has also had unprotected intercourse within the last 96 hours). It should also be considered first line for a woman who has had unprotected sexual intercourse within the last 5 days if it is likely to have taken place during the 5 days before the estimated day of ovulation. 

Hormonal emergency contraception interactions

See Contraceptives, interactions below.

Starting hormonal contraception after emergency hormonal contraception

Emergency hormonal contraception methods do **not** provide ongoing contraception.  After taking levonorgestrel, women should start suitable hormonal contraception immediately. They must use condoms reliably or abstain from intercourse until contraception becomes effective.

Women should wait 5 days after taking ulipristal acetate before starting suitable hormonal contraception. Women must use condoms reliably or abstain from intercourse during the 5 day waiting period and also until their contraceptive method is effective. 

The copper intra-uterine device immediately provides effective ongoing contraception.

Emergency Contraception. The Faculty of Sexual and Reproductive Healthcare. Clinical guidance. March 2017. www.fsrh.org/standards-and-guidance/documents/ceu-clinical-guidance-emergency-contraception-march-2017

Contraceptives, interactions

06-Jun-2017

Overview

The effectiveness of *combined* oral contraceptives, *progestogen-only* oral contraceptives, contraceptive patches, vaginal rings, and emergency hormonal contraception can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine p. 327, eslicarbazepine acetate, nevirapine p. 682, oxcarbazepine p. 337, phenytoin p. 339, phenobarbital p. 351, primidone p. 352, ritonavir p. 696, St John's Wort, topiramate p. 348 and, above all, rifabutin p. 608 and rifampicin p. 615), and possibly also griseofulvin p. 636. A condom together with a long-acting method (such as an injectable contraceptive) may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists.

For further information on other drug interactions with hormonal contraceptives, see the *Interactions* section of the relevant drug monograph.

Combined hormonal contraceptives interactions

Women using combined hormonal contraceptive patches, vaginal rings or oral tablets who require enzyme-inducing drugs or griseofulvin should be advised to change to a reliable contraceptive method that is unaffected by enzyme-inducers, such as some parenteral progestogen-only contraceptives (medroxyprogesterone acetate p. 856 and norethisterone p. 806) or intra-uterine devices (levonorgestrel p. 851; see also Contraceptives, non-hormonal p. 838). This should be continued for the duration of treatment and for four weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed:

Short course (2 months or less) of an enzyme-inducing drug

Continuing the combined hormonal contraceptive method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug.

Long-term course (over 2 months) of an enzyme-inducing drug (except rifampicin or rifabutin) or a course of griseofulvin

Use a monophasic combined oral contraceptive at a dose of ethinylestradiol p. 802 50 micrograms or more daily [unlicensed use] and use either an extended or a 'tricycling' regimen (i.e. taking three packets of monophasic tablets without a break followed by a shortened tablet-free interval of four days [unlicensed use]); continue for the duration of treatment with the interacting drug and for four weeks after stopping.

If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use] on specialist advice, or to use additional precautions, or to change to a method unaffected by the interacting drugs.

Use of contraceptive patches and vaginal rings (including concurrent use of two patches or two vaginal rings) is not recommended for women taking enzyme-inducing drugs over a long period.

Long-term course (over 2 months) of rifampicin or rifabutin

An alternative method of contraception (such as an IUD) is **always** recommended because they are such potent enzyme-inducing drugs; the alternative method of contraception should be continued for four weeks after stopping the enzyme-inducing drug.

Antibacterials that do not induce liver enzymes

It is recommended that no additional contraceptive precautions are required when *combined* oral contraceptives, contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes, unless diarrhoea or vomiting occur. These recommendations should be discussed with the woman.

There had been concerns that some antibacterials that do not induce liver enzymes (e.g. ampicillin p. 581, doxycycline p. 597) reduce the efficacy of *combined* oral contraceptives by impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel. However, there is a lack of evidence to support this interaction.

Oral progestogen-only contraceptives interactions

Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with an interacting drug and for at least 4 weeks afterwards.

For a short course of an enzyme-inducing drug (less than two months), continuing the progestogen-only oral method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug.

Parenteral progestogen-only contraceptives interactions

Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of intramuscular norethisterone injection and intramuscular and subcutaneous medroxyprogesterone acetate injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs.

Effectiveness of the etonogestrel-releasing implant p. 855 may be reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the interacting drug and for at least 4 weeks after stopping.

For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, continued contraception with the implant may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for 4 weeks after stopping the enzyme-inducing drug.

Hormonal emergency contraception interactions

The effectiveness of levonorgestrel and ulipristal acetate p. 849 is reduced in women taking enzyme-inducing drugs or griseofulvin (and for at least 4 weeks after stopping). [EvGr](#) A copper intra-uterine device can be offered instead. If the copper intra-uterine device is declined or unsuitable, the dose of levonorgestrel should be increased (See *Dose adjustments due to interactions* under levonorgestrel). There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers. [A](#)

The effectiveness of ulipristal acetate for emergency contraception in women using drugs that increase gastric pH has not been studied. Levonorgestrel or a copper intra-uterine device should be considered as alternatives.

[EvGr](#) Hormonal contraception should not be newly initiated in a patient until five days after administration of ulipristal acetate as emergency hormonal contraception—the contraceptive effect of ulipristal acetate will be reduced. Consistent and careful use of condoms is recommended.

Ulipristal acetate can be used as emergency hormonal contraception more than once in the same cycle. [A](#) Conversely, manufacturer advises that use of levonorgestrel as emergency contraception more than once in the same cycle is not advisable due to increased risk of side-effects (such as menstrual irregularities).

[EvGr](#) Levonorgestrel should not be used (as emergency hormonal contraception) within 5 days of administration of ulipristal acetate (as emergency hormonal contraception), as the contraceptive effect of ulipristal acetate may be reduced by progestogens.

Ulipristal acetate is not recommended for use in women who have severe asthma treated by oral corticosteroids, due to the antigluccorticoid effect of ulipristal acetate. [A](#)

3.1 Contraception, combined**OESTROGENS COMBINED WITH PROGESTOGENS****Combined hormonal contraceptives**

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · gallstones · heart disease associated with pulmonary hypertension or risk of embolus · history during pregnancy of cholestatic jaundice · history during pregnancy of chorea · history during pregnancy of pemphigoid gestationis · history during pregnancy of pruritus · history of breast cancer (but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable) · history of haemolytic uraemic syndrome · migraine with aura · personal history of venous or arterial thrombosis · sclerosing treatment for varicose veins · severe or multiple risk factors for arterial disease · severe or multiple risk factors for venous thromboembolism · systemic lupus erythematosus with (or unknown) antiphospholipid antibodies · transient cerebral ischaemic attacks without headaches · undiagnosed vaginal bleeding
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · Crohn's disease · gene mutations associated with breast cancer (e.g. BRCA 1) · history of severe depression especially if induced by hormonal contraceptive · hyperprolactinaemia (seek specialist advice) · inflammatory bowel disease · migraine · personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) · risk factors for arterial disease · risk factors for venous thromboembolism · sickle-cell disease · undiagnosed breast mass

CAUTIONS, FURTHER INFORMATION

- ▶ Risk of venous thromboembolism There is an increased risk of venous thromboembolic disease in users of combined hormonal contraceptives particularly during the first year and possibly after restarting combined hormonal contraceptives following a break of four weeks or more. This risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Combined hormonal contraceptives also slightly increase the risk of *arterial* thromboembolism; however, there is no evidence to suggest that this risk varies between different preparations.

- ▶ Risk factors for venous thromboembolism Use with **caution** if any of following factors present but **avoid** if two or more factors present:
 - *family history of venous thromboembolism* in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
 - *obesity*; body mass index ≥ 30 kg/m² (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);

- *long-term immobilisation* e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
- *history of superficial thrombophlebitis*;
- *age over 35 years* (avoid if over 50 years);
- *smoking*.

Combined Hormonal Contraception and Risk of Venous Thromboembolism

Progestogen in Combined Hormonal Contraceptive	Estimated incidence per 10 000 women per year of use
Non-pregnant, not using combined hormonal contraception	2
Levonorgestrel ¹	5-7
Norgestimate ¹	5-7
Norethisterone ¹	5-7
Etonogestrel ¹	6-12
Norelgestromin ¹	6-12
Gestodene ¹	9-12
Desogestrel ¹	9-12
Drospirenone ¹	9-12
Dienogest ²	Not known—insufficient data
Nomegestrol ²	Not known—insufficient data

¹ Combined with ethinylestradiol ² Combined with estradiol

- Risk factors for arterial disease Use with **caution** if any one of following factors present but **avoid** if two or more factors present:
 - *family history of arterial disease* in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
 - *diabetes mellitus* (avoid if diabetes complications present);
 - *hypertension*; blood pressure above *systolic 140 mmHg or diastolic 90 mmHg* (avoid if blood pressure above *systolic 160 mmHg or diastolic 95 mmHg*); (in adolescents, avoid if blood pressure very high);
 - *smoking* (avoid if smoking 40 or more cigarettes daily);
 - *age over 35 years* (avoid if over 50 years);
 - *obesity* (avoid if body mass index $\geq 35 \text{ kg/m}^2$ unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
 - *migraine without aura* (avoid if *migraine with aura* (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).
- Migraine Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

Combined hormonal contraceptives should be stopped (pending investigation and treatment), if serious neurological effects occur, including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body.

• SIDE-EFFECTS

- ▶ **Common or very common** Acne · fluid retention · headaches · metrorrhagia · nausea · weight increased
- ▶ **Uncommon** Alopecia · hypertension
- ▶ **Rare or very rare** Venous thromboembolism

SIDE-EFFECTS, FURTHER INFORMATION

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years.

Cervical cancer Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years. The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- **HEPATIC IMPAIRMENT** In general, manufacturer advises caution; avoid in acute disease, severe chronic disease, or liver tumour.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With oral use Each tablet should be taken at approximately same time each day; if delayed, contraceptive protection may be lost. **21-day combined preparations**, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days. **Every day (ED) combined preparations**, 1 active tablet daily for 21 days, followed by 1 inactive tablet daily for 7 days; subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets being taken); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days.

Changing to combined preparation containing different progestogen If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately. See individual monographs for requirements of specific preparations. Changing from progestogen-only tablet If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start new brand immediately, additional precautions (barrier methods) necessary for first 7 days. Secondary amenorrhoea (exclude pregnancy) Start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for *Qlaira*®).

After childbirth (not breast-feeding) Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days (9 days for *Qlaira*®).

After abortion or miscarriage Start same day.
- **PATIENT AND CARER ADVICE**

Travel Women taking oral contraceptives or using the patch or vaginal ring are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by

appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Diarrhoea and vomiting Vomiting and severe diarrhoea can interfere with the absorption of combined oral contraceptives. The FSRH advises following the instructions for missed pills if vomiting occurs within 3 hours of taking a combined oral contraceptive or severe diarrhoea occurs for more than 24 hours. Use of non-oral contraception should be considered if diarrhoea or vomiting persist.

Missed doses The critical time for loss of contraceptive protection is when a pill is omitted at the *beginning or end* of a cycle (which lengthens the pill-free interval). If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary. If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of *everyday* (ED) pills, omitting the 7 inactive tablets). Emergency contraception is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

● INDICATIONS AND DOSE

Contraception with 28-day combined preparations | Menstrual symptoms with 28-day combined preparations

► BY MOUTH

► Females of childbearing potential: 1 active tablet daily for 26 days, followed by 1 inactive tablet daily for 2 days, to be started on day 1 of cycle with first active tablet (withdrawal bleeding may occur during the 2-day interval of inactive tablets); subsequent courses repeated without interval

● **INTERACTIONS** → Appendix 1: combined hormonal contraceptives

● SIDE-EFFECTS

- **Common or very common** Breast abnormalities · gastrointestinal discomfort · increased risk of infection · menstrual cycle irregularities
- **Uncommon** Appetite increased · cervical abnormalities · crying · depression · diarrhoea · dizziness · fatigue · haemorrhage · hot flush · hyperhidrosis · mood altered · muscle spasms · neoplasms · oedema · ovarian and fallopian tube disorders · painful sexual intercourse · pelvic disorders · sexual dysfunction · skin reactions · sleep disorders · uterine cramps · vomiting · vulvovaginal disorders · weight decreased
- **Rare or very rare** Aggression · anxiety · arterial thromboembolism · asthma · chest pain · cholecystitis chronic · concentration impaired · constipation · contact lens intolerance · dry eye · dry mouth · dyspnoea · eye swelling · fever · galactorrhoea · gastroesophageal reflux disease · genital discharge · hair changes · hypertriglyceridaemia · hypotension · lymphadenopathy · malaise · myocardial infarction · pain · palpitations · paraesthesia · seborrhoea · sensation of pressure · urinary tract pain · vascular disorders · vertigo

● DIRECTIONS FOR ADMINISTRATION

Changing to *Qlaira*® Start the first active *Qlaira*® tablet on the day after taking the last active tablet of the previous brand.

● PATIENT AND CARER ADVICE

Diarrhoea and vomiting In cases of persistent vomiting or severe diarrhoea lasting more than 12 hours in women taking *Qlaira*®, refer to product literature.

Missed doses A missed pill for a patient taking *Qlaira*® is one that is 12 hours or more late; for information on how to manage missed pills in women taking *Qlaira*®, refer to product literature.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Contraception

▶ BY VAGINA

- ▶ Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs), see Contraceptives, hormonal p. 835 for recommendations from the FSRH on 'tailored' regimens in which there is a shortened, less frequent, or no ring-free interval.

- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives

● **DIRECTIONS FOR ADMINISTRATION**

Changing method of contraception to vaginal ring
Changing from combined hormonal contraception Insert ring at the latest on the day after the usual tablet-free, patch-free, or inactive-tablet interval. If previous contraceptive used correctly, or pregnancy can reasonably be excluded, can switch to ring on any day of cycle.

Changing from progestogen-only method From an implant or intra-uterine progestogen-only device, insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, insert ring when next injection due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer vaginal ring. Counselling The presence of the ring should be checked regularly.

Missed doses**Expulsion, delayed insertion or removal, or broken vaginal ring**

If the vaginal ring is expelled for *less than 3 hours*, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

If the ring remains outside the vagina for *more than 3 hours* or if the user does not know when the ring was expelled, contraceptive protection may be reduced:

- If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
- If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

08-Feb-2019

● INDICATIONS AND DOSE

Menstrual symptoms

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Females of childbearing potential: Apply 1 patch once weekly for 3 weeks, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle, subsequent courses repeated after a 7-day patch free interval (during which withdrawal bleeding occurs)

Contraception

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Females of childbearing potential: Apply 1 patch once weekly for 3 weeks, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after a patch-free interval to start subsequent contraceptive cycle, subsequent courses repeated after a patch-free interval (during which withdrawal bleeding occurs), see Contraceptives, hormonal p. 835 for recommendations from the FSRH on 'traditional' and 'tailored' regimens in which there is a shortened, less frequent, or no patch-free interval.

- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · breast abnormalities · diarrhoea · dizziness · fatigue · gastrointestinal discomfort · increased risk of infection · malaise · menstrual cycle irregularities · mood altered · muscle spasms · skin reactions · uterine cramps · vaginal haemorrhage · vomiting · vulvovaginal disorders
- ▶ **Uncommon** Appetite increased · dyslipidaemia · insomnia · lactation disorders · oedema · photosensitivity reaction · sexual dysfunction
- ▶ **Rare or very rare** Embolism and thrombosis · gallbladder disorders · genital discharge · neoplasms · stroke · swelling
- ▶ **Frequency not known** Anger · angioedema · cervical dysplasia · colitis · contact lens intolerance · erythema nodosum · hepatic disorders · hyperglycaemia · intracranial haemorrhage · myocardial infarction · pulmonary artery thrombosis · taste altered

- **DIRECTIONS FOR ADMINISTRATION** Adhesives or bandages should not be used to hold patch in place. If no longer sticky do not reapply but use a new patch.

Changing to a transdermal combined hormonal contraceptive

Changing from combined oral contraception Apply patch on the first day of withdrawal bleeding; if no

withdrawal bleeding within 5 days of taking last *active* tablet, rule out pregnancy before applying first patch.

Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days.

Changing from progestogen-only method

- from an implant, apply first patch on the day implant removed
- from an injection, apply first patch when next injection due

- from oral progestogen, first patch may be applied on any day after stopping pill

For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

After childbirth (not breast-feeding) Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days.

After abortion or miscarriage Before 20 weeks' gestation start immediately; no additional contraception required if started immediately. After 20 weeks' gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch.

- **PATIENT AND CARER ADVICE** Patients and carers should be given advice on how to administer patches.
Travel Women using patches are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Missed doses

Delayed application or detached patch If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual 'change day'. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new 'Day 1'; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new 'Day 1'; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch 'change day' remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new 'Day 1'; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual 'change day', the day after day 28; no additional contraception is required.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 48/03

The *Scottish Medicines Consortium* has advised (September 2003) that *Evra*® patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives.

Contraception with 21-day combined preparations

► BY MOUTH

- Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after hormone-free interval, withdrawal bleeding occurs during the hormone-free interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day, see Contraceptives, hormonal p. 835 for recommendations from the FSRH on 'traditional' and 'tailored' regimens in which there is a shortened, less frequent, or no hormone-free interval.

- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

CONTRACEPTIVE DEVICES

Intra-uterine contraceptive devices (copper)

22-Apr-2020

● INDICATIONS AND DOSE

Contraception

► BY INTRA-UTERINE ADMINISTRATION

► Females of childbearing potential: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

- **CONTRA-INDICATIONS** Active trophoblastic disease (until return to normal of urine and plasma-gonadotrophin concentration) · genital malignancy · medical diathermy · pelvic inflammatory disease · post-abortion sepsis · postpartum sepsis · recent sexually transmitted infection (if not fully investigated and treated) · severe anaemia · unexplained uterine bleeding · Wilson's disease
- **CAUTIONS** Anaemia · anatomical abnormalities—seek specialist advice · anticoagulant therapy · cardiac disease—seek specialist advice · endometriosis · epilepsy (risk of seizure at time of insertion) · immunosuppression (risk of infection)—seek specialist advice · menorrhagia (progestogen intra-uterine system might be preferable) · postpartum—seek specialist advice · risk of sexually transmitted infections · severe primary dysmenorrhoea · young age
- **CAUTIONS, FURTHER INFORMATION** The Faculty of Sexual and Reproductive Healthcare advises if removal is after day 3 of the menstrual cycle, intercourse should be avoided or another method of contraception used for at least 7 days before removal of device—emergency contraception may need to be considered if recent intercourse has occurred and the intra-uterine device is removed after day 3 of the menstrual cycle.
- Sexually transmitted infections and pelvic inflammatory disease The main excess risk of pelvic infection occurs in

the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:

- they are under 25 years old *or*
- they are over 25 years old *and*
 - have a new partner *or*
 - have had more than one partner in the past year *or*
 - their regular partner has other partners.

The Faculty of Sexual and Reproductive Healthcare advises pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) to be performed in these women. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, consider appropriate prophylactic antibacterial cover. The woman should be advised to attend *as an emergency* if she experiences sustained pain during the next 20 days.

- **SIDE-EFFECTS** Device complications · epilepsy (on insertion) · haemorrhage (on insertion) · hypersensitivity · menstrual cycle irregularities · pain (on insertion—alleviated by NSAID such as ibuprofen 30 minutes before insertion) · pelvic infection exacerbated · presyncope (on insertion) · uterine injuries

SIDE-EFFECTS, FURTHER INFORMATION Advise the patient to seek medical attention promptly in case of significant symptoms—very small risk of uterine perforation, ectopic pregnancy and pelvic inflammatory disease.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if patient has a copper allergy.
- **PREGNANCY** If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Remove device; if pregnancy occurs, increased likelihood that it may be ectopic.
- **BREAST FEEDING** Not known to be harmful.
- **MONITORING REQUIREMENTS** Gynaecological examination before insertion, 6–8 weeks after insertion, then annually.
- **DIRECTIONS FOR ADMINISTRATION** The timing and technique of fitting an intra-uterine device are critical for its subsequent performance. *The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet.* Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation.
- **PRESCRIBING AND DISPENSING INFORMATION**
 - TT380® SLIMLINE** For uterine length 6.5–9 cm; replacement every 10 years.
 - LOAD® 375** For uterine length over 7 cm; replacement every 5 years.

PROGESTERONE RECEPTOR MODULATORS

Ulipristal acetate

26-May-2020

- **DRUG ACTION** Ulipristal acetate is a progesterone receptor modulator with a partial progesterone antagonist effect.

INDICATIONS AND DOSE

Pre-operative treatment of moderate to severe symptoms of uterine fibroids (initiated by a specialist)

► BY MOUTH

► Adult: 5 mg once daily for up to 3 months starting during the first week of menstruation

Intermittent treatment of moderate to severe symptoms of uterine fibroids if surgery not appropriate (initiated by a specialist)

► BY MOUTH

► Adult: 5 mg once daily for up to 3 months starting during the first week of menstruation, treatment course may be repeated if necessary; re-treatment should start no sooner than during the first week of the second menstruation following completion of the previous course; maximum 4 courses

Emergency contraception

► BY MOUTH

► Females of childbearing potential: 30 mg for 1 dose, to be taken as soon as possible after coitus, but no later than after 120 hours

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ESMYA® (ULIPRISTAL ACETATE): SUSPENSION OF THE LICENCE DUE TO RISK OF SERIOUS LIVER INJURY (MARCH 2020)

Rare but serious cases of liver injury, including hepatic failure requiring liver transplantation, have been reported worldwide in women treated with *Esmya*® for symptoms of uterine fibroids. The licence of *Esmya*® has been suspended while a safety review is carried out, following a further case of liver injury requiring transplantation despite liver function monitoring. Healthcare professionals are advised not to start *Esmya*® in new patients and to stop treatment in current patients; alternative treatment options for uterine fibroids should be considered. Liver function tests should be performed 2–4 weeks after stopping treatment, and patients advised to be vigilant for the signs and symptoms of liver injury and to seek immediate medical advice if these occur, even if 1–2 months after stopping treatment. There are currently no concerns with the use of the emergency contraceptive *ellaOne*®—see *Indications and Dose*.

- **CONTRA-INDICATIONS**

► When used for uterine fibroids Breast cancer · cervical cancer · ovarian cancer · undiagnosed vaginal bleeding · uterine cancer · vaginal bleeding not caused by uterine fibroids

- **CAUTIONS** Uncontrolled severe asthma

- **INTERACTIONS** → Appendix 1: ulipristal

- **SIDE-EFFECTS**

► **Common or very common** Back pain · breast tenderness · dizziness · fatigue · gastrointestinal discomfort · headaches · menstrual cycle irregularities · mood altered · myalgia · nausea · pelvic pain · vomiting

► **Uncommon** Anxiety · appetite disorder · chills · concentration impaired · diarrhoea · drowsiness · dry mouth · fever · flatulence · hot flush · increased risk of infection · insomnia · libido disorder · malaise · skin reactions · vision disorders · vulvovaginal disorders

► **Rare or very rare** Abnormal sensation in eye · disorientation · dry throat · eye erythema · genital pruritus

- ovarian cyst ruptured • painful sexual intercourse • syncope • taste altered • thirst • tremor • vertigo
- ▶ **Frequency not known** Hepatic disorders
- **CONCEPTION AND CONTRACEPTION** When ulipristal is given for uterine fibroids non-hormonal contraceptive methods (barrier methods or intra-uterine device) should be used both during treatment and for 12 days after stopping, if required.
- **PREGNANCY**
 - ▶ When used for Emergency contraception Limited information available—if pregnancy occurs, manufacturer advises report to the *ellaOne*® pregnancy registry.
 - ▶ When used for Uterine fibroids Manufacturer advises avoid—limited information available.
- **BREAST FEEDING**
 - ▶ When used for Emergency contraception Manufacturer advises avoid for 1 week after administration—present in milk.
 - ▶ When used for Uterine fibroids Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT**
 - ▶ When used for Emergency contraception Manufacturer advises avoid in severe impairment (no information available).
 - ▶ When used for Uterine fibroids Manufacturer advises avoid (no information available).
- **RENAL IMPAIRMENT**
 - ▶ When used for Uterine fibroids Manufacturer advises avoid in severe impairment unless patient is closely monitored—no information available.
- **MONITORING REQUIREMENTS**
 - ▶ When used for Uterine fibroids Manufacturer advises perform liver function tests before treatment initiation—do not initiate if transaminases exceed 2 times the upper limit of normal. During the first 2 treatment courses, monitor liver function monthly; for further treatment courses, perform liver function tests once before each new treatment course and when clinically indicated. At the end of each treatment course, perform liver function tests after 2–4 weeks. Discontinue treatment if serum transaminases exceed 3 times the upper limit of normal and closely monitor patient. Manufacturer advises periodic monitoring of the endometrium following repeated intermittent treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of *Esmya*® has provided a *Physician's Guide to Prescribing Esmya*®.
- **PATIENT AND CARER ADVICE**
 - ▶ When used for Emergency contraception When prescribing or supplying hormonal emergency contraception, manufacturer advises women should be told:
 - if vomiting occurs within 3 hours of taking a dose, a replacement dose should be taken;
 - that their next period may be early or late;
 - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy.
 The Faculty of Sexual and Reproductive Healthcare also advises women should be told:
 - that a barrier method of contraception needs to be used—see Emergency contraception p. 838 for further information;
 - that a pregnancy test should be performed if the next menstrual period is delayed by more than 7 days, is lighter than usual, or is associated with abdominal pain that is not typical of the woman's usual dysmenorrhoea;
 - that a pregnancy test should be performed if hormonal contraception is started soon after use of emergency contraception even if they have bleeding; bleeding associated with the contraceptive method may not represent menstruation.
 - ▶ When used for Uterine fibroids Before initiation of *Esmya*®, the MHRA advises that women are informed of the rare

risk of liver damage and the need for liver function testing. Women should also be advised to seek urgent medical attention if they develop any symptoms or signs of liver injury (such as unusual tiredness, yellowing of the skin, darkening of the urine, nausea and vomiting).

- ▶ Manufacturer advises prescribers should explain the requirement for treatment free intervals to women receiving intermittent treatment.
- ▶ When used for Uterine fibroids Manufacturer advises a patient card should be provided.
- Missed doses**
 - ▶ When used for Uterine fibroids Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Ellaone** (HRA Pharma UK Ltd)

3.4 Contraception, oral progestogen-only

Other drugs used for Contraception, oral progestogen-only Norethisterone, p. 806

PROGESTOGENS

Desogestrel

19-Jul-2018

● INDICATIONS AND DOSE

Contraception

- ▶ **BY MOUTH**
- ▶ Females of childbearing potential: 75 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 12 hours or more it should be regarded as a 'missed pill'
- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 • history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable • severe arterial disease • undiagnosed vaginal bleeding
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice • arterial disease • functional ovarian cysts • history of jaundice in pregnancy • malabsorption syndromes • past ectopic pregnancy • sex-steroid dependent cancer • systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
- CAUTIONS, FURTHER INFORMATION**
 - ▶ Other conditions The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.
- **INTERACTIONS** → Appendix 1: desogestrel
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Breast abnormalities • depressed mood • headache • libido decreased • menstrual cycle irregularities • mood altered • nausea • skin reactions • weight increased

- ▶ **Uncommon** Alopecia · contact lens intolerance · fatigue · ovarian cyst · vomiting · vulvovaginal infection
- ▶ **Rare or very rare** Erythema nodosum
- ▶ **Frequency not known** Angioedema · embolism and thrombosis · neoplasms

SIDE-EFFECTS, FURTHER INFORMATION The benefits of using progestogen-only contraceptives (POCs), such as desogestrel, should be weighed against the possible risks for each individual woman.

There is a small increase in the risk of having breast cancer diagnosed in women using a combined oral contraceptive pill (COC); this relative risk may be due to an earlier diagnosis, biological effects of the pill or a combination of both. This increased risk is related to the age of the woman using the COC rather than the duration of use and disappears gradually within 10 years after discontinuation.

The risk of breast cancer in users of POCs is possibly of similar magnitude as that associated with COCs, however the evidence is less conclusive.

Available evidence does not support an association between the use of a progestogen-only contraceptive pill and breast cancer. Any increased risk is likely to be small and reduces gradually during the 10 years after stopping; there is no excess risk 10 years after stopping. The older age at which the contraceptive is stopped appears to have a greater influence on increased risk rather than the duration of use.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in severe or active disease.

● PATIENT AND CARER ADVICE

Surgery All progestogen-only contraceptives are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Starting routine One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 12 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if desogestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days. **Diarrhoea and vomiting** Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking desogestrel, another pill should be taken as soon as possible. If a replacement pill is not taken within 12 hours of the normal time for taking desogestrel, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Missed doses The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 12 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days'.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more tablets are missed or taken more than 12 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 36/03

The *Scottish Medicines Consortium* has advised (September 2003) that *Cerazette*® should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contraindicated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- ▶ Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks' gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

Prevention of endometrial hyperplasia during oestrogen replacement therapy

- ▶ BY INTRA-UTERINE ADMINISTRATION
- ▶ Females of childbearing potential: Insert during last days of menstruation or withdrawal bleeding or at any time if amenorrhoeic; effective for 4 years

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ When used orally as an emergency contraceptive, the effectiveness of levonorgestrel is reduced in women taking enzyme-inducing drugs (and for up to 4 weeks after stopping); a copper intra-uterine device should preferably be used instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose; pregnancy should be excluded following use, and medical advice sought if pregnancy occurs.
- ▶ There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

- ▶ With the progestogen-only intra-uterine device, levonorgestrel is released close to the site of the main contraceptive action (on cervical mucus and endometrium) and therefore progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progestogen-only intra-uterine system and additional contraceptive precautions are not required.

● UNLICENSED USE

- ▶ With intra-uterine use The Faculty of Sexual and Reproductive Healthcare (FSRH) advises levonorgestrel is used as detailed below, although these situations are considered unlicensed:
 - Insertion at any time if reasonably certain the woman is not pregnant or at risk of pregnancy;
 - Additional precautions (e.g. barrier methods) for at least 7 days before replacement even if immediate replacement is intended;
 - Insertion immediately following termination of pregnancy below 24 weeks' gestation;
 - Postpartum insertions 4 weeks after delivery.
- ▶ With oral use The FSRH advises levonorgestrel is used as detailed below, although these situations are considered unlicensed:
 - Higher dose option for emergency contraception in patients with body-weight over 70 kg or BMI over 26 kg/m²;
 - Use for emergency contraception between 72–96 hours after coitus.
- ▶ With intra-uterine use or oral use in children Consult product literature for licensing status of individual preparations.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

● CONTRA-INDICATIONS

- ▶ With intra-uterine use Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration · acute cervicitis · acute malignancies affecting the blood (use with caution in remission) · acute vaginitis · distorted uterine cavity · history of breast cancer but can be considered for a woman in long-term remission who has menorrhagia and requires effective contraception · increased risk factors for pelvic infections · infected abortion during the previous three months · not suitable for emergency contraception · pelvic inflammatory disease · postpartum endometritis · unexplained uterine bleeding ·

unresolved cervical intraepithelial neoplasia · uterine or cervical malignancy

- With oral use Acute porphyrias p. 1120
- With oral use for contraception History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding

• CAUTIONS

GENERAL CAUTIONS Risk factors for ectopic pregnancy (including previous ectopic pregnancy, tubal surgery or pelvic infection)

SPECIFIC CAUTIONS

- With intra-uterine use Disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · acute venous thromboembolism (consider removal) · anaemia · anticoagulant therapy (avoid if possible) · diabetes · drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · endometriosis · epilepsy (risk of seizure at time of insertion) · fertility problems · history of pelvic inflammatory disease · increased risk of expulsion if inserted before uterine involution · jaundice (consider removal) · marked increase of blood pressure (consider removal) · migraine (consider removal) · nulliparity · severe arterial disease (consider removal) · severe cervical stenosis · severe headache (consider removal) · severe primary dysmenorrhoea · severely scarred uterus (including after endometrial resection) · young age
- With oral use for contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
- With oral use for emergency contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · past ectopic pregnancy · severe malabsorption syndromes

CAUTIONS, FURTHER INFORMATION

- With intra-uterine use The Faculty of Sexual and Reproductive Healthcare advises intercourse should be avoided or another method of contraception used for at least 7 days before removal of intra-uterine device—emergency contraception may need to be considered if recent intercourse has occurred and the intra-uterine device is removed.
- Risk of infection with intra-uterine devices
- With intra-uterine use The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
 - they are under 25 years old *or*
 - they are over 25 years old *and*
 - have a new partner *or*
 - have had more than one partner in the past year *or*
 - their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.

- Use as a contraceptive in co-morbidities
- With oral use The product literature advises caution in patients with history of thromboembolism, hypertension,

diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

MIRENA[®] 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE Advanced uterine atrophy

- **INTERACTIONS** → Appendix 1: levonorgestrel

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Gastrointestinal discomfort · headaches · menstrual cycle irregularities · nausea · skin reactions

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intra-uterine use Back pain · breast abnormalities · depression · device expulsion · hirsutism · increased risk of infection · libido decreased · nervousness · ovarian cyst · pelvic disorders · uterine haemorrhage (on insertion) · vaginal haemorrhage (on insertion) · vulvovaginal disorders · weight increased
- ▶ With oral use Breast tenderness · diarrhoea · dizziness · fatigue · haemorrhage · vomiting
- ▶ **Uncommon**
- ▶ With intra-uterine use Alopecia · endometritis · oedema · uterine rupture
- ▶ **Rare or very rare**
- ▶ With oral use Face oedema · pelvic pain
- ▶ **Frequency not known**
- ▶ With oral use Cerebrovascular insufficiency · depressed mood · diabetes mellitus · embolism and thrombosis · neoplasms · sexual dysfunction · weight changes

SIDE-EFFECTS, FURTHER INFORMATION

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

With intra-uterine use There is no evidence of an association between the levonorgestrel intra-uterine system and breast cancer. The levonorgestrel intra-uterine system should be avoided in patients with a history of breast cancer; any consideration of its use should be by a specialist in contraception and in consultation with the patients cancer specialist.

Patients should be informed about the device that has been inserted and when it should be removed or replaced (including referring them to a patient information leaflet and other sources of information).

Patients may experience irregular, prolonged or infrequent menstrual bleeding in the 3–6 months following insertion; bleeding pattern improves with time but persists in some patients.

Progestogenic side-effects resolve with time (after the first few months).

• PREGNANCY

- ▶ With oral use Not known to be harmful.
- ▶ With intra-uterine use If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Avoid; if pregnancy occurs remove intra-uterine system.

- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.

• HEPATIC IMPAIRMENT

- ▶ With intra-uterine use or oral use for Contraception Manufacturer advises avoid in liver tumour.
- ▶ With oral use for Contraception or Emergency contraception Manufacturer advises avoid in severe impairment.

- ▶ With intra-uterine use Manufacturer advises avoid in acute hepatic disease or in severe impairment (no information available)—consult product literature.
- **MONITORING REQUIREMENTS**
- ▶ With intra-uterine use Gynaecological examination before insertion, 4–6 weeks after insertion, then annually.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intra-uterine use *The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.*
- **PRESCRIBING AND DISPENSING INFORMATION**
- ▶ With intra-uterine use Levonorgestrel-releasing intra-uterine devices vary in licensed indication, duration of use and insertion technique—the MHRA recommends to prescribe and dispense by brand name to avoid inadvertent switching.
- **PATIENT AND CARER ADVICE**
- ▶ Diarrhoea and vomiting with use as an oral contraceptive Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery. Starting routine
- ▶ With oral use for Contraception One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if levonorgestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days. Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones). After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.
- ▶ With oral use for Emergency contraception When prescribing or supplying hormonal emergency contraception, manufacturer advises women should be told:
 - if vomiting occurs within 3 hours, a replacement dose should be taken;
 - that their next period may be early or late;
 - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy.
 The Faculty of Sexual and Reproductive Healthcare also advises women should be told:
 - that a barrier method of contraception needs to be used—see Emergency contraception p. 838 for further information;
 - that a pregnancy test should be performed if the next menstrual period is delayed by more than 7 days, is lighter than usual, or is associated with abdominal pain that is not typical of the woman's usual dysmenorrhoea;
 - that a pregnancy test should be performed if hormonal contraception is started soon after use of emergency contraception even if they have bleeding; bleeding associated with the contraceptive method may not represent menstruation.
- ▶ With intra-uterine use Counsel women on the signs, symptoms and risks of perforation and ectopic pregnancy.

Missed doses When used as an oral contraceptive, the following advice is recommended 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days'.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **Scottish Medicines Consortium (SMC) decisions**

- SMC No. 1299/18

- The *Scottish Medicines Consortium* has advised (February 2018) that levonorgestrel (*Kyleena*®) is accepted for use within NHS Scotland as a contraceptive device for up to 5 years.

- **All Wales Medicines Strategy Group (AWMSG) decisions**

- AWMSG No. 3582

- The *All Wales Medicines Strategy Group* has advised (September 2018) that levonorgestrel (*Kyleena*®) is recommended as an option for use within NHS Wales for contraception for up to five years.

- **EXCEPTIONS TO LEGAL CATEGORY** *Levonelle*® *One Step* can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Intra-uterine device**

- ▶ **Jaydess** (Bayer Plc) ▼

3.5 Contraception, parenteral progestogen-only

Other drugs used for Contraception, parenteral progestogen-only Norethisterone, p. 806

PROGESTOGENS

Etonogestrel

10-Mar-2020

● INDICATIONS AND DOSE

Contraception (no hormonal contraceptive use in previous month)

- ▶ BY SUBDERMAL IMPLANTATION
- ▶ Females of childbearing potential: 1 implant inserted during first 5 days of cycle, implant should be removed within 3 years of insertion

Contraception (postpartum)

- ▶ BY SUBDERMAL IMPLANTATION
- ▶ Females of childbearing potential: 1 implant to be inserted 21–28 days after delivery (delay until 28 days postpartum if breast-feeding), implant should be removed within 3 years of insertion

Contraception following abortion or miscarriage in the second trimester

- ▶ BY SUBDERMAL IMPLANTATION
- ▶ Females of childbearing potential: 1 implant to be inserted 21–28 days after abortion or miscarriage, implant should be removed within 3 years of insertion

Contraception following abortion or miscarriage in the first trimester

- ▶ BY SUBDERMAL IMPLANTATION
- ▶ Females of childbearing potential: 1 implant to be inserted within 5 days after abortion or miscarriage, implant should be removed within 3 years of insertion

Contraception (changing from other hormonal contraceptive)

- ▶ BY SUBDERMAL IMPLANTATION
- ▶ Females of childbearing potential: Implant should be removed within 3 years of insertion (consult product literature)

- **UNLICENSED USE** *Nexplanon*® not licensed for use in females outside of the age range 18–40 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED FEBRUARY 2020): *NEXPLANON*® (ETONOGESTREL) CONTRACEPTIVE IMPLANTS: NEW INSERTION SITE TO REDUCE RARE RISK OF NEUROVASCULAR INJURY AND IMPLANT MIGRATION

There have been reports of neurovascular injury and migration of *Nexplanon*® implants from the insertion site to the vasculature, including the pulmonary artery in rare cases. Correct subdermal insertion by an appropriately trained and accredited healthcare professional is recommended to reduce the risk of these events. Healthcare professionals are advised to review the updated guidance from the manufacturer and the statement from the Faculty of Sexual and Reproductive Healthcare (FSRH) on how to correctly insert the implant. Patients should be advised on how to locate the implant, informed to check this occasionally and report any concerns. An implant that cannot be palpated at its insertion site should be located and removed as soon as possible; if unable to locate implant within the arm, the MHRA recommends using chest imaging. Implants inserted at a previous site that can be palpated should not pose a risk and should only be replaced if there are issues with its location or if a routine replacement is due.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding

- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus · history of jaundice in pregnancy · malabsorption syndromes · possible risk of breast cancer · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies

- **INTERACTIONS** → Appendix 1: etonogestrel

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · alopecia · anxiety · appetite increased · breast abnormalities · depressed mood · dizziness · emotional lability · fatigue · flatulence · headaches · hot flush · increased risk of infection · influenza like illness · libido decreased · menstrual cycle irregularities · nausea · ovarian cyst · pain · skin reactions · weight changes
- ▶ **Uncommon** Arthralgia · constipation · diarrhoea · drowsiness · dysuria · fever · galactorrhoea · genital abnormalities · hypertrichosis · insomnia · myalgia · oedema · vomiting · vulvovaginal discomfort
- ▶ **Frequency not known** Abscess · angioedema · embolism and thrombosis · haemorrhage · insulin resistance · neoplasms · paraesthesia · seborrhoea

SIDE-EFFECTS, FURTHER INFORMATION The benefits of using progestogen-only contraceptives (POCs), such as etonogestrel, should be weighed against the possible risks for each individual woman.

There is a small increase in the risk of having breast cancer diagnosed in women using a combined oral contraceptive pill (COC); this relative risk may be due to an earlier diagnosis, biological effects of the pill or a combination of both. This increased risk is related to the age of the woman using the COC rather than the duration of use and disappears gradually within 10 years after discontinuation.

The risk of breast cancer in users of POCs is possibly of similar magnitude as that associated with COCs, however the evidence is less conclusive.

- **PREGNANCY** Not known to be harmful, remove implant if pregnancy occurs.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
- **DIRECTIONS FOR ADMINISTRATION** The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.
- **PATIENT AND CARER ADVICE** Full counselling backed by patient information leaflet required before administration.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Implant

- ▶ *Nexplanon* (Merck Sharp & Dohme Ltd)

Etonogestrel 68 mg Nexplanon 68mg implant | 1 device [POM]
 £83.43 DT = £83.43

Medroxyprogesterone acetate

24-May-2017

● INDICATIONS AND DOSE

Dysfunctional uterine bleeding

- ▶ BY MOUTH
- ▶ Adult: 2.5–10 mg daily for 5–10 days, repeated for 2 cycles, begin treatment on day 16–21 of cycle

Secondary amenorrhoea

- ▶ BY MOUTH
- ▶ Adult: 2.5–10 mg daily for 5–10 days, repeated for 3 cycles, begin treatment on day 16–21 of cycle

Mild to moderate endometriosis

- ▶ BY MOUTH
- ▶ Adult: 10 mg 3 times a day for 90 consecutive days, begin treatment on day 1 of cycle

Progestogenic opposition of oestrogen HRT

- ▶ BY MOUTH
- ▶ Adult: 10 mg daily for the last 14 days of each 28-day oestrogen HRT cycle

Endometrial cancer | Renal cell cancer

- ▶ BY MOUTH
- ▶ Adult: 200–600 mg daily

Breast cancer

- ▶ BY MOUTH
- ▶ Adult: 0.4–1.5 g daily

Contraception

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 150 mg, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Females of childbearing potential: 104 mg, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Long-term contraception

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 150 mg every 12 weeks, first dose to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Females of childbearing potential: 104 mg every 13 weeks, first dose to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Contraception (when patient changing from other hormonal contraceptive)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Females of childbearing potential: (consult product literature)

Hot flushes caused by long-term androgen suppression in men with prostate cancer

- ▶ BY MOUTH
- ▶ Adult: 20 mg once daily initially for 10 weeks, evaluate effect at the end of the treatment period

- **UNLICENSED USE** [\[EvGr\]](#) Medroxyprogesterone acetate is used for the treatment of hot flushes caused by long-term androgen suppression in men,  but it is not licensed for this indication.

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS

Acute porphyrias p. 1120 · severe arterial disease · undiagnosed vaginal bleeding

SPECIFIC CONTRA-INDICATIONS

- ▶ With intramuscular use or subcutaneous use History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable
- ▶ With oral use Breast cancer (unless progestogens are being used in the management of this condition) · genital cancer (unless progestogens are being used in the management of this condition) · history of liver tumours

● CAUTIONS

GENERAL CAUTIONS Possible risk of breast cancer

SPECIFIC CAUTIONS

- ▶ With intramuscular use or subcutaneous use History during pregnancy in disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus
- ▶ With oral use Asthma · cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · epilepsy · history of depression · hypertension · migraine · susceptibility to thromboembolism (particular caution with high dose)

- **INTERACTIONS** → Appendix 1: medroxyprogesterone

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · breast abnormalities · depression · dizziness · fluid retention · insomnia · menstrual cycle irregularities · nausea · sexual dysfunction · skin reactions · weight changes
- ▶ **Uncommon** Drowsiness · embolism and thrombosis · fever · galactorrhoea · hirsutism · muscle spasms · tachycardia

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With oral use Appetite increased · cervical abnormalities · constipation · fatigue · headache · hyperhidrosis · hypersensitivity · nervousness · oedema · tremor · vomiting
- ▶ With parenteral use Anxiety · asthenia · gastrointestinal discomfort · headaches · mood altered · pain · vulvovaginal infection
- ▶ **Uncommon**
- ▶ With oral use Congestive heart failure · corticoid-like effects · diabetes mellitus exacerbated · diarrhoea · dry mouth · euphoric mood · hypercalcaemia
- ▶ With parenteral use Appetite abnormal · arthralgia · hot flush · hypertension · ovarian cyst · painful sexual intercourse · uterine haemorrhage · varicose veins · vertigo · vulvovaginal disorders
- ▶ **Rare or very rare**
- ▶ With oral use Cerebral infarction · jaundice · malaise · myocardial infarction
- ▶ With parenteral use Breast cancer · lipodystrophy
- ▶ **Frequency not known**
- ▶ With oral use Adrenergic-like effects · cataract diabetic · concentration impaired · confusion · glycosuria · palpitations · visual impairment (discontinue if papilloedema or retinal vascular lesions)
- ▶ With parenteral use Hepatic disorders · osteoporosis · osteoporotic fractures · seizure

SIDE-EFFECTS, FURTHER INFORMATION

With oral use In general, side effects may be more common with high doses such as those used in malignant disease.

With parenteral use Reduction in bone mineral density is greater with increasing duration of use. The loss is mostly recovered on discontinuation.

● CONCEPTION AND CONTRACEPTION

- ▶ With intramuscular use If interval between dose is greater than 12 weeks and 5 days (in long-term contraception), rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection.

- With subcutaneous use If interval between dose is greater than 13 weeks and 7 days (in long-term contraception), rule out pregnancy before next injection.
- PREGNANCY**
 - With oral use Avoid—genital malformations and cardiac defects reported.
 - With intramuscular use or subcutaneous use Not known to be harmful.
- BREAST FEEDING** Present in milk—no adverse effects reported. Progestogen-only contraceptives do not affect lactation.
- With intramuscular use or subcutaneous use The manufacturers advise that in women who are breast-feeding, the first dose should be delayed until 6 weeks after birth; however, evidence suggests no harmful effect to infant if given earlier. The benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks.
- HEPATIC IMPAIRMENT**
 - With oral use Manufacturer advises caution; avoid in acute or active disease.
 - With intramuscular use or subcutaneous use Manufacturer advises caution; avoid in severe or active disease.
- RENAL IMPAIRMENT**
 - When used for Mild to moderate endometriosis or Progestogenic opposition of oestrogen HRT or Dysfunctional uterine bleeding or Secondary amenorrhoea Use with caution.
- PATIENT AND CARER ADVICE**
 - With intramuscular use or subcutaneous use Full counselling backed by *patient information leaflet* required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

- MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Medroxyprogesterone acetate 160 mg per 1 ml Sayana Press 104mg/0.65 ml suspension for injection pre-filled disposable devices | 1 pre-filled disposable injection [PoM] £6.90 DT = £6.90

3.6 Contraception, spermicidal

SPERMICIDALS

Nonoxinol

● INDICATIONS AND DOSE

Spermicidal contraceptive in conjunction with barrier methods of contraception such as diaphragms or caps

- ▶ BY VAGINA
- ▶ Females of childbearing potential: (consult product literature)

- SIDE-EFFECTS** Genital erosion · increased risk of HIV infection · pain · paraesthesia · skin reactions · vaginal redness

SIDE-EFFECTS, FURTHER INFORMATION High frequency use of the spermicide nonoxinol-9 has been associated with genital lesions, which may increase the risk of acquiring sexually transmitted infections.

- CONCEPTION AND CONTRACEPTION** No evidence of harm to diaphragms.
- PREGNANCY** Toxicity in *animal* studies.
- BREAST FEEDING** Present in milk in *animal* studies.

4 Erectile and ejaculatory conditions

4.1 Erectile dysfunction

Erectile dysfunction

06-Mar-2017

Description of condition

Erectile dysfunction (impotence) is the persistent inability to attain and maintain an erection that is sufficient to permit satisfactory sexual performance. It can have physical or psychological causes. Erectile dysfunction can also be a side-effect of drugs such as antihypertensives, antidepressants, antipsychotics, cytotoxic drugs and recreational drugs (including alcohol).

Risk factors for erectile dysfunction include sedentary lifestyle, obesity, smoking, hypercholesterolaemia and metabolic syndrome. Erectile dysfunction increases the risk of cardiovascular disease. All men with unexplained erectile dysfunction should be evaluated for the presence of cardiovascular risk factors and any identified risk should be addressed.

Drug treatment

[EvGr] The recommended approach for the management of erectile dysfunction is a combination of drug treatment and lifestyle changes (including regular exercise, reduction in body mass index, Smoking cessation p. 520, and reduced alcohol consumption).

An oral phosphodiesterase type-5 inhibitor is the first-line drug treatment for erectile dysfunction, regardless of the cause. **⚠** These drugs act by increasing the blood flow to

the penis. They do not initiate an erection—sexual stimulation is required.

The choice of oral phosphodiesterase type-5 inhibitor depends on the frequency of intercourse and response to treatment. **EvGr** Avanafil below, sildenafil p. 859 and vardenafil p. 861 are short-acting drugs and are suitable for occasional use as required. Tadalafil p. 860 is a longer-acting drug. It can be used as required, but can also be used as a regular lower daily dose to allow for spontaneous (rather than scheduled) sexual activity or in those who have frequent sexual activity. A patient with erectile dysfunction should receive six doses of an individual phosphodiesterase type-5 inhibitor at the maximum dose (with sexual stimulation) before being classified as a non-responder. Patients who fail to respond to the maximum dose of at least two different phosphodiesterase type-5 inhibitors should be referred to a specialist.

Intracavernosal, intraurethral or topical application of alprostadil (prostaglandin E₁) p. 862 is recommended as second-line therapy under careful medical supervision. Intracavernosal or intraurethral preparations can also be used to aid diagnosis. 

Priapism associated with alprostadil

Manufacturers advise that patients should seek medical help if a prolonged erection lasting four hours or more occurs; application of an ice pack to the upper-inner thigh (alternating between the left and right thighs every two minutes for up to ten minutes) may result in reflex opening of the venous valves.

If priapism has lasted more than six hours, treatment should not be delayed; manufacturer advises management as follows:

- Initial therapy by penile aspiration: using aseptic technique, 20–50mL of blood should be aspirated using a 19–21 gauge butterfly needle inserted into the *corpus cavernosum*; if necessary the procedure may be repeated on the opposite side;
- Lavage: if initial aspiration is unsuccessful, a second 19–21 gauge butterfly needle can be inserted into the opposite *corpus cavernosum*; sterile physiological saline can be injected through the first needle and drained through the second;
- If aspiration and lavage of are unsuccessful, intracavernosal injection of a sympathomimetic with action on alpha-adrenergic receptors can be given, with continuous monitoring of blood pressure and pulse— see phenylephrine hydrochloride p. 865 [unlicensed indication], adrenaline/epinephrine p. 864 [unlicensed indication], and metaraminol p. 865 [unlicensed indication]. Extreme **caution** is required in patients with coronary heart disease, hypertension, cerebral ischaemia and in patients taking a monoamine-oxidase inhibitor (facilities for managing hypertensive crisis should be available when administered to patients taking MAOIs);
- If necessary the sympathomimetic injections can be followed by further aspiration of blood through the same butterfly needle;
- If administration of a sympathomimetic drug is unsuccessful, urgent referral for surgical management is required.

Prescribing on the NHS

Some drug treatments for erectile dysfunction may only be prescribed on the NHS under certain circumstances; for details see the criteria listed in part XVIII B of the Drug Tariff (Part Xlb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The Drug Tariffs can be accessed online at: National Health Service Drug Tariff for England and Wales: www.nhsbsa.nhs.uk/pharmacies-gp-practices-and-appliance-contractors/drug-tariff.

Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusiness.hscni.net/services/2034.htm.

Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/.

Related drugs

Other drugs used for Erectile dysfunction: aviptadil with phentolamine mesilate p. 865.

PHOSPHODIESTERASE TYPE-5 INHIBITORS

Avanafil

13-Jan-2020

• INDICATIONS AND DOSE

Erectile dysfunction

► BY MOUTH

- Adult: Initially 100 mg, to be taken approximately 15–30 minutes before sexual activity, then adjusted according to response to 50–200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

Erectile dysfunction in patients on alpha-blocker therapy

► BY MOUTH

- Adult: Initially 50 mg, to be taken approximately 15–30 minutes before sexual activity, then adjusted according to response to 50–200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises max. 100 mg once every 48 hours with concurrent use of moderate inhibitors of CYP3A4.

- **CONTRA-INDICATIONS** Avoid if systolic blood pressure below 90 mmHg (no information available) · blood pressure >170/100 mmHg · hereditary degenerative retinal disorders · history of non-arteritic anterior ischaemic optic neuropathy · life-threatening arrhythmia in previous 6 months · mild to severe heart failure · patients in whom vasodilation or sexual activity are inadvisable · recent history of myocardial infarction · recent history of stroke · recent unstable angina

- **CAUTIONS** Active peptic ulceration · anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · bleeding disorders · cardiovascular disease · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)

CAUTIONS, FURTHER INFORMATION

- Elderly For phosphodiesterase type-5 inhibitors, prescription potentially inappropriate (STOPP criteria) in severe heart failure characterised by hypotension i.e. systolic blood pressure less than 90 mmHg, or concurrent nitrate therapy for angina (risk of cardiovascular collapse). See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: phosphodiesterase type-5 inhibitors

• SIDE-EFFECTS

- **Common or very common** Headaches · nasal complaints · vasodilation
- **Uncommon** Asthenia · dizziness · drowsiness · dyspnoea exertional · gastrointestinal discomfort · muscle complaints · nausea · pain · palpitations · respiratory disorders · vision blurred · vomiting
- **Rare or very rare** Akathisia · angina pectoris · chest pain · diarrhoea · dry mouth · emotional disorder · gastritis · genital pruritus · gout · haematuria · hypertension · increased risk of infection · influenza like illness · insomnia · penis disorder · peripheral oedema · rash · seasonal allergy · sexual dysfunction · tachycardia · urinary frequency increased · weight increased

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.
Dose adjustments Manufacturer advises use lowest effective initial dose in mild to moderate impairment and adjust according to tolerance.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE** Onset of effect may be delayed if taken with food.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 980/14

The *Scottish Medicines Consortium* has advised (September 2015) that avanafil (*Spedra*®) is **not** recommended for use within NHS Scotland, for treatment of erectile dysfunction in men as the clinical and economic analysis presented was not sufficiently robust.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 1261

The *All Wales Medicines Strategy Group* has advised (July 2015) that avanafil (*Spedra*®) is recommended as an option for use within NHS Wales for the treatment of erectile dysfunction in men.

NHS restrictions *Spedra*® is not prescribable in NHS primary care for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIIB of the Drug Tariff. The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under How to use the BNF.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ *Spedra* (A. Menarini Farmaceutica Internazionale SRL)

Avanafil 50 mg *Spedra* 50mg tablets | 4 tablet [PoM] £10.94 DT = £10.94 | 8 tablet [PoM] £19.70 DT = £19.70

Avanafil 100 mg *Spedra* 100mg tablets | 4 tablet [PoM] £14.08 DT = £14.08 | 8 tablet [PoM] £26.26 DT = £26.26

Avanafil 200 mg *Spedra* 200mg tablets | 4 tablet [PoM] £21.90 DT = £21.90 | 8 tablet [PoM] £39.40 DT = £39.40

Sildenafil

14-Jan-2020

● INDICATIONS AND DOSE

Pulmonary arterial hypertension (initiated under specialist supervision)

▶ BY MOUTH

▶ Adult: 20 mg 3 times a day

▶ BY INTRAVENOUS INJECTION

▶ Adult: 10 mg 3 times a day, use intravenous route when the oral route is not appropriate

Erectile dysfunction

▶ BY MOUTH

▶ Adult: Initially 50 mg, to be taken approximately 1 hour before sexual activity, adjusted according to response to 25–100 mg (max. per dose 100 mg) as required, to be taken as a single dose; maximum 1 dose per day

Digital ulcers [associated with systemic sclerosis]

▶ BY MOUTH

▶ Adult: 25 mg 3 times a day, increased to 50 mg 3 times a day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

▶ When used for Erectile dysfunction Manufacturer advises a starting dose of 25 mg with concurrent use of moderate and potent inhibitors of CYP3A4. Manufacturer advises if concurrent use of ritonavir is unavoidable, the max. dose should not exceed 25 mg within 48 hours.

▶ With oral use for Pulmonary arterial hypertension Manufacturer advises reduce dose to 20 mg twice daily with concurrent use of moderate inhibitors of CYP3A4.

Manufacturer advises reduce dose to 20 mg once daily with concurrent use of some potent inhibitors of CYP3A4 (avoid with ketoconazole, itraconazole and ritonavir).

▶ With intravenous use for Pulmonary arterial hypertension Manufacturer advises reduce dose to 10 mg twice daily with concurrent use of moderate inhibitors of CYP3A4. Manufacturer advises reduce dose to 10 mg once daily with concurrent use of some potent inhibitors of CYP3A4 (avoid with ketoconazole, itraconazole and ritonavir).

- **UNLICENSED USE** [EvGr] Sildenafil is used for the treatment of digital ulcer,  but is not licensed for this indication.

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS

Hereditary degenerative retinal disorders · history of non-arteritic anterior ischaemic optic neuropathy · recent history of myocardial infarction · recent history of stroke

SPECIFIC CONTRA-INDICATIONS

- ▶ When used for erectile dysfunction Avoid if systolic blood pressure below 90 mmHg (no information available) · patients in whom vasodilation or sexual activity are inadvisable · recent unstable angina
- ▶ When used for pulmonary arterial hypertension Sick-le-cell anaemia

● CAUTIONS

GENERAL CAUTIONS Active peptic ulceration · anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · autonomic dysfunction · bleeding disorders · cardiovascular disease · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)

SPECIFIC CAUTIONS

- ▶ When used for pulmonary arterial hypertension Hypotension (avoid if systolic blood pressure below 90 mmHg) · intravascular volume depletion · pulmonary veno-occlusive disease

CAUTIONS, FURTHER INFORMATION

- ▶ **Elderly** For phosphodiesterase type-5 inhibitors, prescription potentially inappropriate (STOPP criteria) in severe heart failure characterised by hypotension i.e. systolic blood pressure less than 90 mmHg, or concurrent nitrate therapy for angina (risk of cardiovascular collapse). See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: phosphodiesterase type-5 inhibitors

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · anxiety · cough · diarrhoea · dizziness · fluid retention · gastrointestinal discomfort · gastrointestinal disorders · headaches · increased risk of infection · insomnia · nasal complaints · nausea · night sweats · pain · skin reactions · tremor · vasodilation · vision disorders
- ▶ **Uncommon** Arrhythmias · chest pain · drowsiness · dry eye · dry mouth · eye discomfort · eye disorders · eye inflammation · fatigue · feeling hot · gynaecomastia · haemorrhage · hypertension · hypotension · myalgia · numbness · palpitations · sinus congestion · tinnitus · vertigo · vomiting
- ▶ **Rare or very rare** Acute coronary syndrome · arteriosclerotic retinopathy · cerebrovascular insufficiency · glaucoma · haematospermia · hearing impairment · irritability · optic neuropathy (discontinue if sudden visual impairment occurs) · oral hypoesthesia · priapism · retinal occlusion · scleral discolouration · seizure · severe cutaneous adverse reactions (SCARs) · sudden cardiac death · syncope · throat tightness
- **PREGNANCY** Use only if potential benefit outweighs risk—no evidence of harm in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).

Dose adjustments

- ▶ With intravenous use for Pulmonary arterial hypertension Manufacturer advises if usual dose not tolerated, consider dose reduction to 10 mg twice daily in mild to moderate impairment.
- ▶ With oral use for Pulmonary arterial hypertension Manufacturer advises if usual dose not tolerated, consider dose reduction to 20 mg twice daily in mild to moderate impairment.
- ▶ When used for Erectile dysfunction Manufacturer advises consider initial dose reduction to 25 mg in mild to moderate impairment; adjust according to response.

• RENAL IMPAIRMENT

Dose adjustments Use initial dose of 25 mg in erectile dysfunction if eGFR less than 30 mL/minute/1.73 m².

In pulmonary hypertension, if usual dose not tolerated, reduce *oral* dose to 20 mg twice daily and *intravenous* dose to 10 mg twice daily.

• TREATMENT CESSATION

- ▶ When used for Pulmonary arterial hypertension Consider gradual withdrawal.

• PATIENT AND CARER ADVICE

- ▶ When used for Erectile dysfunction Onset of effect may be delayed if taken with food.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (February 2010) that sildenafil tablets (*Revatio*[®]) is accepted for restricted use within NHS Scotland and should be initiated for patients with pulmonary arterial hypertension only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

The *Scottish Medicines Consortium* has advised (March 2011) that sildenafil injection (*Revatio*[®]) is accepted for restricted use within NHS Scotland for patients with pulmonary arterial hypertension who are currently prescribed oral sildenafil and are temporarily unable to take oral medicine, and should be prescribed only on the advice of specialists in the Scottish Pulmonary Vascular Unit or the Scottish Adult Congenital Cardiac Service.

NHS restrictions *Viagra*[®] is not prescribable in NHS primary care for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII B of the Drug Tariff (Part XIb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under How to use the BNF.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, pessary

Tadalafil

14-Jan-2020

• INDICATIONS AND DOSE

Pulmonary arterial hypertension (initiated under specialist supervision)

- ▶ BY MOUTH
- ▶ Adult: 40 mg once daily

Erectile dysfunction

- ▶ BY MOUTH
- ▶ Adult: Initially 10 mg (max. per dose 20 mg), to be taken at least 30 minutes before sexual activity, subsequent doses adjusted according to response, the effect of intermittent dosing may persist for longer than 24 hours, continuous daily use not recommended; maximum 1 dose per day

Erectile dysfunction; for patients who anticipate sexual activity at least twice a week

- ▶ BY MOUTH
- ▶ Adult: 5 mg once daily, reduced to 2.5 mg once daily, adjusted according to response

Benign prostatic hyperplasia

- ▶ BY MOUTH
- ▶ Adult: 5 mg once daily

• CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS

Acute myocardial infarction in past 90 days · history of non-arteritic anterior ischaemic optic neuropathy · hypotension (avoid if systolic blood pressure below 90 mmHg)

SPECIFIC CONTRA-INDICATIONS

- ▶ When used for benign prostatic hyperplasia Mild to severe heart failure · patients in whom vasodilation or sexual activity are inadvisable · recent stroke · uncontrolled arrhythmias · uncontrolled hypertension · unstable angina
- ▶ When used for erectile dysfunction Mild to severe heart failure · patients in whom vasodilation or sexual activity are inadvisable · recent stroke · uncontrolled arrhythmias · uncontrolled hypertension · unstable angina

• CAUTIONS

- ▶ When used for benign prostatic hyperplasia or erectile dysfunction Anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · cardiovascular disease · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)
- ▶ When used for pulmonary arterial hypertension Anatomical deformation of the penis · aortic and mitral valve disease ·

congestive cardiomyopathy · coronary artery disease · hereditary degenerative retinal disorders · left ventricular dysfunction · life-threatening arrhythmias · pericardial constriction · predisposition to priapism · pulmonary veno-occlusive disease · uncontrolled hypertension

CAUTIONS, FURTHER INFORMATION

- ▶ **Elderly** For phosphodiesterase type-5 inhibitors, prescription potentially inappropriate (STOPP criteria) in severe heart failure characterised by hypotension i.e. systolic blood pressure less than 90 mmHg, or concurrent nitrate therapy for angina (risk of cardiovascular collapse). See also Prescribing in the elderly p. 33.

- **INTERACTIONS** → Appendix 1: phosphodiesterase type-5 inhibitors

● SIDE-EFFECTS

- ▶ **Common or very common** Flushing · gastrointestinal discomfort · headaches · myalgia · nasal congestion · pain
- ▶ **Uncommon** Arrhythmias · chest pain · dizziness · dyspnoea · eye pain · fatigue · gastrooesophageal reflux disease · haemorrhage · hypertension · hypotension · nausea · oedema · palpitations · skin reactions · tinnitus · vision disorders · vomiting
- ▶ **Rare or very rare** Acute coronary syndrome · angioedema · cerebrovascular insufficiency · eye erythema · eye swelling · haematospermia · hyperhidrosis · memory loss · optic neuropathy (discontinue if sudden visual impairment occurs) · priapism · retinal occlusion · seizure · Stevens-Johnson syndrome · sudden cardiac death · sudden hearing loss (discontinue drug and seek medical advice) · syncope

- **PREGNANCY** Manufacturer advises avoid.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

● HEPATIC IMPAIRMENT

- ▶ When used for Pulmonary arterial hypertension Manufacturer advises caution in mild to moderate impairment (limited information available); avoid in severe impairment (no information available).
- ▶ When used for Benign prostatic hyperplasia or Erectile dysfunction Manufacturer advises caution for regular once-daily dosing (no information available), and in severe impairment for intermittent use (limited information available).

Dose adjustments

- ▶ When used for Pulmonary arterial hypertension Manufacturer advises consider initial dose reduction to 20 mg once daily in mild to moderate impairment.
- ▶ When used for Erectile dysfunction Manufacturer advises dose of 10 mg for intermittent use (no information available for higher doses).

● RENAL IMPAIRMENT

- ▶ When used for Pulmonary arterial hypertension Manufacturer advises avoid in severe impairment.
- ▶ When used for Erectile dysfunction or Benign prostatic hyperplasia Manufacturer advises avoid regular once-daily dosing in severe impairment.

Dose adjustments

- ▶ When used for Pulmonary arterial hypertension Manufacturer advises initial dose of 20 mg once daily in mild-to-moderate impairment; dose may be increased to 40 mg once daily if tolerated.
- ▶ When used for Erectile dysfunction Manufacturer advises maximum dose of 10 mg for intermittent use in severe impairment.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (July 2012) that tadalafil (*Adcirca*®) is accepted for restricted use within NHS Scotland for adults with pulmonary arterial hypertension and should be initiated only by specialists in the Scottish Pulmonary Vascular Unit or other similar

specialists. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland. **NHS restrictions** *Cialis*® is not prescribable in NHS primary care for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII B of the Drug Tariff (Part Xib of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under How to use the BNF.

● INDICATIONS AND DOSE

Erectile dysfunction

- ▶ **BY MOUTH USING TABLETS**

▶ **Adult:** Initially 10 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response, onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day

- ▶ **BY MOUTH USING ORODISPERSIBLE TABLET**

▶ **Adult:** 10 mg, to be taken approximately 25–60 minutes before sexual activity; maximum 10 mg per day

Erectile dysfunction (patients on alpha-blocker therapy)

- ▶ **BY MOUTH USING TABLETS**

▶ **Adult:** Initially 5 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response, onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day

DOSE EQUIVALENCE AND CONVERSION

▶ *Levitra*® 10 mg orodispersible tablets and *Levitra*® 10 mg film coated tablets are **not** bioequivalent.

- **CONTRA-INDICATIONS** Avoid if systolic blood pressure below 90 mmHg · hereditary degenerative retinal disorders · myocardial infarction · patients in whom vasodilation or sexual activity are inadvisable · previous history of non-arteritic anterior ischaemic optic neuropathy · recent stroke · unstable angina

- **CAUTIONS** Active peptic ulceration · anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · bleeding disorders · cardiovascular disease · elderly · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell

disease, multiple myeloma, or leukaemia) · susceptibility to prolongation of QT interval

CAUTIONS, FURTHER INFORMATION

- ▶ **Elderly** For phosphodiesterase type-5 inhibitors, prescription potentially inappropriate (STOPP criteria) in severe heart failure characterised by hypertension i.e. systolic blood pressure less than 90 mmHg, or concurrent nitrate therapy for angina (risk of cardiovascular collapse). See also Prescribing in the elderly p. 33.

● **INTERACTIONS** → Appendix 1: phosphodiesterase type-5 inhibitors

● SIDE-EFFECTS

- ▶ **Common or very common** Dizziness · flushing · gastrointestinal discomfort · headache · nasal congestion
- ▶ **Uncommon** Allergic oedema · angioedema · arrhythmias · back pain · diarrhoea · drowsiness · dry mouth · dyspnoea · eye discomfort · eye disorders · gastrointestinal disorders · malaise · muscle complaints · muscle tone increased · nausea · palpitations · sensation abnormal · sinus congestion · skin reactions · sleep disorder · tinnitus · vertigo · vision disorders · vomiting
- ▶ **Rare or very rare** Angina pectoris · anxiety · chest pain · conjunctivitis · haemorrhage · hypertension · hypotension · memory loss · myocardial infarction · photosensitivity reaction · priapism · seizure · syncope
- ▶ **Frequency not known** Haematospermia · optic neuropathy (discontinue if sudden visual impairment occurs) · QT interval prolongation · sudden hearing loss

● **HEPATIC IMPAIRMENT** For *film-coated tablets*, manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

For *orodispersible tablets*, manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

Dose adjustments For *film-coated tablets*, manufacturer advises initial dose reduction to 5 mg in mild to moderate impairment, increase according to response; max. 10 mg in moderate impairment.

For *orodispersible tablets*, manufacturer advises initial dose reduction to 5 mg using *film-coated tablets* in mild impairment, increase according to response.

● **RENAL IMPAIRMENT** Orodispersible tablets not suitable if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments Initial dose 5 mg if eGFR less than 30 mL/minute/1.73 m².

● PRESCRIBING AND DISPENSING INFORMATION

Orodispersible tablets not suitable for initiation of therapy in patients taking alpha-blockers.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (October 2011) that vardenafil orodispersible tablets (*Levitra*[®]) are accepted for restricted use within NHS Scotland for treatment of erectile dysfunction in men for whom an orodispersible tablet is an appropriate formulation.

NHS restrictions *Levitra*[®] is not prescribable in NHS primary care for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIIB of the Drug Tariff (Part XIb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under How to use the BNF.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

PROSTAGLANDINS AND ANALOGUES

Alprostadil

20-Apr-2020

● INDICATIONS AND DOSE

Erectile dysfunction (initiated under specialist supervision)

▶ BY URETHRAL APPLICATION

▶ **Adult:** Initially 250 micrograms, adjusted according to response; usual dose 0.125–1 mg; maximum 2 doses per day; maximum 7 doses per week

Aid to diagnosis of erectile dysfunction

▶ BY URETHRAL APPLICATION

▶ **Adult:** 500 micrograms for 1 dose

Erectile dysfunction

▶ TO THE SKIN

▶ **Adult:** Apply 300 micrograms, to the tip of the penis, 5–30 minutes before sexual activity; max 1 dose in 24 hours not more than 2–3 times per week

CAVERJECT[®]

Erectile dysfunction

▶ BY INTRACAVERNOSAL INJECTION

▶ **Adult:** Initially 2.5 micrograms for 1 dose (first dose), followed by 5 micrograms for 1 dose (second dose), to be given if some response to first dose, alternatively 7.5 micrograms for 1 dose (second dose), to be given if no response to first dose, then increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Erectile dysfunction associated with neurological dysfunction

▶ BY INTRACAVERNOSAL INJECTION

▶ **Adult:** Initially 1.25 micrograms for 1 dose (first dose), then 2.5 micrograms for 1 dose (second dose), then 5 micrograms for 1 dose (third dose), increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Aid to diagnosis

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: 10–20 micrograms for 1 dose (consult product literature)

Aid to diagnosis where evidence of neurological dysfunction

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: Initially 5 micrograms (max. per dose 10 micrograms) for 1 dose, (consult product literature)

CAVERJECT® DUAL CHAMBER**Erectile dysfunction**

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: Initially 2.5 micrograms for 1 dose (first dose), followed by 5 micrograms for 1 dose (second dose), to be given if some response to first dose, alternatively 7.5 micrograms for 1 dose (second dose), to be given if no response to first dose, then increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Erectile dysfunction associated with neurological dysfunction

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: Initially 1.25 micrograms for 1 dose (first dose), then 2.5 micrograms for 1 dose (second dose), then 5 micrograms for 1 dose (third dose), increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Aid to diagnosis

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: 10–20 micrograms for 1 dose (consult product literature)

Aid to diagnosis where evidence of neurological dysfunction

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: Initially 5 micrograms (max. per dose 10 micrograms) for 1 dose, (consult product literature)

VIRIDAL® DUO**Neurogenic erectile dysfunction**

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: Initially 1.25 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

Erectile dysfunction

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: Initially 2.5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

● CONTRA-INDICATIONS**GENERAL CONTRA-INDICATIONS**

Not for use in patients with penile implants or when sexual activity medically inadvisable (e.g. orthostatic hypotension, myocardial infarction, and syncope) · not for use with other agents for erectile dysfunction · predisposition to prolonged erection (as in thrombocythaemia, polycythaemia, sickle cell anaemia, multiple myeloma or leukaemia) · urethral application contra-indicated in balanitis · urethral application contra-indicated in severe curvature · urethral application contra-indicated in severe hypospadias · urethral application contra-indicated in urethral stricture · urethral application contra-indicated in urethritis

SPECIFIC CONTRA-INDICATIONS

- ▶ With topical use Balanitis · severe curvature · severe hypospadias · urethral stricture · urethritis
- **CAUTIONS** Anatomical deformations of penis (painful erection more likely)—follow up regularly to detect signs of penile fibrosis (consider discontinuation if angulation, cavernosal fibrosis or Peyronie's disease develop) · priapism (patients should be instructed to report any erection lasting 4 hours or longer) · risk factors for cardiovascular disorders · risk factors for cerebrovascular disorders
- **INTERACTIONS** → Appendix 1: alprostadil
- **SIDE-EFFECTS**
 - ▶ **Common or very common**
 - ▶ With intracavernosal use Haemorrhage · muscle spasms · penile disorders · sexual dysfunction · skin reactions
 - ▶ With topical use Balanoposthitis · genital abnormalities · penile disorders · rash · sexual dysfunction · urinary tract pain
 - ▶ With urethral use Dizziness · haemorrhage · headache · hypotension · muscle spasms · penile disorders · sexual dysfunction · urethral burning
 - ▶ **Uncommon**
 - ▶ With intracavernosal use Asthenia · balanoposthitis · dry mouth · extrasystole · hyperhidrosis · hypotension · increased risk of infection · inflammation · mydriasis · nausea · oedema · pelvic pain · peripheral vascular disease · presyncope · scrotal disorders · sensation abnormal · spermatocele · testicular disorders · urinary disorders · vascular disorders · vasodilation
 - ▶ With topical use Dizziness · hyperaesthesia · hypotension · pain in extremity · scrotal pain · syncope · urinary tract disorders
 - ▶ With urethral use Balanoposthitis · hyperhidrosis · increased risk of infection · leg pain · nausea · pelvic pain · perineal pain · peripheral vascular disease · scrotal disorders · sensation abnormal · skin reactions · spermatocele · syncope · testicular disorders · urinary disorders · vascular disorders · vasodilation
 - ▶ **Frequency not known**
 - ▶ With intracavernosal use Myocardial ischaemia · stroke
 - ▶ With intravenous use Peripheral oedema
- **CONCEPTION AND CONTRACEPTION**
 - ▶ With urethral use If partner is pregnant, barrier contraception should be used. No evidence of harm to latex condoms and diaphragms.

- ▶ With topical use Condoms should be used to avoid exposure to women of child-bearing age, pregnant or lactating women. No evidence of harm to latex condoms.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intracavernosal use The first dose of the intracavernosal injection must be given by medically trained personnel; self-administration may only be undertaken after proper training.
- ▶ With urethral use During initiation of treatment the urethral application should be used under medical supervision; self-administration may only be undertaken after proper training.
- **PATIENT AND CARER ADVICE** Patients should be instructed to report any erection lasting 4 hours or longer.
- ▶ With topical use Counsel patients that condoms should be used to avoid local reactions and exposure of alprostadil to women of childbearing age, pregnant, or lactating women.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- NHS restrictions** *Caverject*[®], *Viridal*[®] Duo, *Vitaros*[®] and *MUSE*[®] are not prescribable in NHS primary care for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII B of the Drug Tariff (Part XI B of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under *How to use BNF publications*.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

SYMPATHOMIMETICS > VASOCONSTRICTOR**Adrenaline/epinephrine**

21-May-2020

- **DRUG ACTION** Acts on both alpha and beta receptors and increases both heart rate and contractility (beta₁ effects); it can cause peripheral vasodilation (a beta₂ effect) or vasoconstriction (an alpha effect).

● **INDICATIONS AND DOSE****Priapism associated with alprostadil, if aspiration and lavage of corpora are unsuccessful (alternative to phenylephrine or metaraminol)**▶ **BY INTRACAVERNOSAL INJECTION**

- ▶ **Adult:** 10–20 micrograms every 5–10 minutes, using a 20 microgram/mL solution, **Important:** if suitable strength of adrenaline not available may be specially prepared by diluting 0.1 mL of the adrenaline 1 in 1000 (1 mg/mL) injection to 5 mL with sodium chloride 0.9%, continuously monitor blood pressure and pulse; maximum 100 micrograms per course

- **UNLICENSED USE** The use of adrenaline for the treatment of priapism is an unlicensed indication.
- **CAUTIONS** Arteriosclerosis · arrhythmias · cerebrovascular disease · cor pulmonale · diabetes mellitus · elderly · hypercalcaemia · hyperreflexia · hypertension · hyperthyroidism · hypokalaemia · ischaemic heart disease · obstructive cardiomyopathy · occlusive vascular disease · organic brain damage · phaeochromocytoma · prostate disorders · psychoneurosis · severe angina · susceptibility to angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION Cautions listed are only for non-life-threatening situations.

- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor

● **SIDE-EFFECTS**▶ **Rare or very rare** Cardiomyopathy

- ▶ **Frequency not known** Angina pectoris · angle closure glaucoma · anxiety · appetite decreased · arrhythmias · asthenia · CNS haemorrhage · confusion · dizziness · dry mouth · dyspnoea · headache · hepatic necrosis · hyperglycaemia · hyperhidrosis · hypersalivation · hypertension (increased risk of cerebral haemorrhage) · hypokalaemia · injection site necrosis · insomnia · intestinal necrosis · metabolic acidosis · mydriasis · myocardial infarction · nausea · pallor · palpitations · peripheral coldness · psychosis · pulmonary oedema (on excessive dosage or extreme sensitivity) · renal necrosis · soft tissue necrosis · tremor · urinary disorders · vomiting

- **RENAL IMPAIRMENT** Manufacturers advise use with caution in severe impairment.

- **MONITORING REQUIREMENTS** Monitor blood pressure and ECG.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Metaraminol

28-Apr-2020

● INDICATIONS AND DOSE

● Priapism (alternative to intracavernosal injections of phenylephrine and adrenaline)

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: 1 mg every 15 minutes

- **UNLICENSED USE** Use for priapism is an unlicensed indication.
- **CAUTIONS** Associated with fatal hypertensive crises · cirrhosis · coronary vascular thrombosis · diabetes mellitus · elderly · extravasation at injection site may cause necrosis · following myocardial infarction · hypercapnia · hypertension · hyperthyroidism · hypoxia · mesenteric vascular thrombosis · peripheral vascular thrombosis · Prinzmetal's variant angina · uncorrected hypovolaemia
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS**
 - ▶ Common or very common Headache · hypertension
 - ▶ Rare or very rare Skin exfoliation · soft tissue necrosis
 - ▶ Frequency not known Abscess · arrhythmias · nausea · palpitations · peripheral ischaemia
- **MONITORING REQUIREMENTS** Monitor blood pressure and rate of flow frequently.
- **DIRECTIONS FOR ADMINISTRATION** For intracavernosal injection, dilute 1 mg (0.1 mL of 10 mg/mL) metaraminol injection to 50 mL with Sodium chloride injection 0.9% and give carefully by slow injection into the corpora in 5 mL injections.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

- ▶ **Metaraminol (Non-proprietary)**
- ▶ Metaraminol (as Metaraminol tartrate) 10 mg per 1 ml Metaraminol 10mg/1ml solution for injection ampoules | 10 ampoule [PoM] £30.45

Phenylephrine hydrochloride

● INDICATIONS AND DOSE

● Priapism associated with alprostadil, if aspiration and lavage of the corpora are unsuccessful (alternative to adrenaline or metaraminol)

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: 100–200 micrograms every 5–10 minutes, dose to be administered using a 200 micrograms/mL solution; maximum 1 mg per course

- **UNLICENSED USE** Use of phenylephrine hydrochloride injection in priapism is an unlicensed indication.
- **CONTRA-INDICATIONS** Hypertension

- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS** Angle closure glaucoma · anxiety · appetite decreased · arrhythmias · asthenia · confusion · dyspnoea · headache · hypertension · hypoxia · insomnia · nausea · palpitations · peripheral ischaemia · psychosis · tremor · urinary retention · vomiting
- **DIRECTIONS FOR ADMINISTRATION** For intracavernosal injection, if suitable strength of phenylephrine injection is not available, it may be specially prepared by diluting 0.1 mL of the phenylephrine 1% (10 mg/mL) injection to 5 mL with sodium chloride 0.9%.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

▶ Phenylephrine hydrochloride (Non-proprietary)

- ▶ **Phenylephrine (as Phenylephrine hydrochloride) 50 microgram per 1 ml** Phenylephrine 500micrograms/10ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £15.00 | 10 pre-filled disposable injection [PoM] £150.00
- ▶ **Phenylephrine hydrochloride 100 microgram per 1 ml** Phenylephrine 1mg/10ml solution for injection ampoules | 10 ampoule [PoM] £40.00
- ▶ **Phenylephrine hydrochloride 10 mg per 1 ml** Phenylephrine 10mg/1ml solution for injection ampoules | 10 ampoule [PoM] £99.12
- ▶ Phenylephrine 10mg/1ml concentrate for solution for injection ampoules | 10 ampoule [PoM] £99.12

VASODILATORS > PERIPHERAL VASODILATORS

Aviptadil with phentolamine mesilate

13-Sep-2017

- **DRUG ACTION** Phentolamine is a short-acting alpha-adrenoceptor antagonist that acts directly on vascular smooth muscle, resulting in vasodilatation; aviptadil is a vasoactive intestinal polypeptide that acts as a smooth muscle relaxant.

● INDICATIONS AND DOSE

Erectile dysfunction

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: 25/2000 micrograms, frequency of injection should not exceed once daily or three times weekly, duration of erection should not exceed 1 hour

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y micrograms of aviptadil/phentolamine.

- **CONTRA-INDICATIONS** Anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · not for use with other agents for erectile dysfunction · patients for whom sexual activity is inadvisable · penile implants · predisposition to priapism (e.g. in sickle cell anaemia or trait, multiple myeloma, or leukaemia)
- **CAUTIONS** Concomitant treatment with anticoagulants (potential increased risk of bleeding) · history of psychiatric disorder or addiction (potential for abuse) · severe cardiovascular disease · severe cerebrovascular disease
- **SIDE-EFFECTS**
 - ▶ Common or very common Bruising · flushing
 - ▶ Uncommon Dizziness · haematoma · headache · palpitations · tachycardia
 - ▶ Rare or very rare Angina pectoris · myocardial infarction · penile fibrosis (following multiple injections) · penile nodules · sexual dysfunction
- **MONITORING REQUIREMENTS** Manufacturer advises monitor regularly (e.g. every 3 months), particularly in the

initial stages of self-injection therapy; careful examination of the penis is recommended to detect signs of penile fibrosis or Peyronie's disease—discontinue treatment in patients who develop penile angulation, cavernosal fibrosis, or Peyronie's disease.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises that the initial injections of *Invicorp*® must be administered by medically trained personnel; self-administration may only be undertaken after proper training.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C).
- **PATIENT AND CARER ADVICE** Manufacturer advises that patients should be instructed to report any erection lasting 4 hours or longer.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (December 2017) that aviptadil with phentolamine (*Invicorp*®) is accepted for restricted use within NHS Scotland for the symptomatic treatment of erectile dysfunction due to neurogenic, vasculogenic, psychogenic, or mixed aetiology in adult males who have failed on oral therapies (oral phosphodiesterase type-5 inhibitors) and other non-injectable formulations of erectile dysfunction medications.

All Wales Medicines Strategy Group (AWMSG) decisions

The *All Wales Medicines Strategy Group* has advised (July 2017) that aviptadil with phentolamine (*Invicorp*®) is recommended as an option for the symptomatic treatment of erectile dysfunction in adult males due to neurogenic, vasculogenic, psychogenic, or mixed aetiology that has not responded to oral phosphodiesterase type-5 inhibitor therapy.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ *Invicorp* (Evolan Pharma AB)

Aviptadil 71.43 microgram per 1 ml, Phentolamine mesilate

5.71 mg per 1 ml *Invicorp* 25micrograms/2mg/0.35ml solution for injection ampoules | 5 ampoule [POM] £47.50 DT = £47.50

been widely used as regular, daily treatment. Caution is suggested in prescribing selective serotonin re-uptake inhibitors for young adolescents with premature ejaculation, and to men who also have a depressive disorder, particularly when associated with suicidal ideation. Ejaculation delay may start a few days after the start of treatment, but it is more evident after 1 to 2 weeks, since receptor desensitisation requires time to occur.

If premature ejaculation is secondary to Erectile dysfunction p. 857, the erectile dysfunction should be treated first. ⚠

Topical anaesthetic preparations for the management of premature ejaculation are available without prescription.

Other drugs used for Premature ejaculation Lidocaine with prilocaine, p. 1425

SELECTIVE SEROTONIN RE-UP TAKE INHIBITORS

Dapoxetine

23-Oct-2019

- **DRUG ACTION** Dapoxetine is a short-acting selective serotonin re-uptake inhibitor.

INDICATIONS AND DOSE

Premature ejaculation in men who meet all the following criteria: poor control over ejaculation, a history of premature ejaculation over the past 6 months, marked distress or interpersonal difficulty as a consequence of premature ejaculation, and an intravaginal ejaculatory latency time of less than two minutes

▶ BY MOUTH

- ▶ **Adult:** Initially 30 mg, to be taken approximately 1–3 hours before sexual activity, subsequent doses adjusted according to response; review treatment after 4 weeks (or 6 doses) and at least every 6 months thereafter, not recommended for adults 65 years and over; maximum 1 dose per day; maximum 60 mg per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises max. dose 30 mg with concurrent use of moderate inhibitors of CYP3A4 except in patients verified to be extensive CYP2D6 metabolisers where manufacturer recommends max. dose 60 mg.
- ▶ Manufacturer advises avoid with concurrent use of potent inhibitors of CYP3A4 except in patients verified to be extensive CYP2D6 metabolisers where manufacturer recommends max. dose 30 mg.

- **CONTRA-INDICATIONS** History of bipolar disorder · history of mania · history of severe depression · history of syncope · postural hypotension · significant cardiac disease · uncontrolled epilepsy

- **CAUTIONS** Bleeding disorders · epilepsy (discontinue if convulsions develop) · susceptibility to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1: SSRIs

SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · asthenia · concentration impaired · constipation · diarrhoea · dizziness · drowsiness · dry mouth · gastrointestinal discomfort · gastrointestinal disorders · headache · hypotension · mood altered · nausea · paraesthesia · sexual dysfunction · sinus congestion · sleep disorders · sweat changes · syncope · tinnitus · tremor · vasodilation · vision blurred · vomiting · yawning
- ▶ **Uncommon** Akathisia · arrhythmias · behaviour abnormal · confusion · depression · eye pain · feeling abnormal · feeling hot · hypertension · level of consciousness decreased · mydriasis · pruritus · taste altered · thinking abnormal · vertigo

4.2 Premature ejaculation

Premature ejaculation

01-Aug-2017

Description of condition

Premature ejaculation is a common male sexual disorder characterised by brief ejaculatory latency, loss of control, and psychological distress.

Treatment

[\[EvGr\]](#) Non-drug treatment (including psychosexual counselling, education, and behavioural treatments) are recommended in patients for whom premature ejaculation causes few (if any) problems or in patients who prefer not to take drug treatment. These techniques can also be used in addition to a drug treatment.

For patients with life-long premature ejaculation, drug treatment is the recommended approach. ⚠ Dapoxetine below, a short-acting selective serotonin re-uptake inhibitor, is licensed to be used when required for this condition (not continuous daily use).

[\[EvGr\]](#) Other selective serotonin re-uptake inhibitors (citalopram p. 382, fluoxetine p. 383, fluvoxamine maleate p. 384, escitalopram p. 382, paroxetine p. 384, sertraline p. 385 [unlicensed indications]) and the tricyclic antidepressant clomipramine [unlicensed indication] have

SIDE-EFFECTS, FURTHER INFORMATION Discontinue if psychiatric disorder develops.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.
- **RENAL IMPAIRMENT** Use with caution if eGFR 30–80 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m².
- **PRE-TREATMENT SCREENING** Test for postural hypotension before starting treatment.
- **TREATMENT CESSATION** The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).
- **PATIENT AND CARER ADVICE**
Postural hypotension and syncope Patients should be advised to maintain hydration and to sit or lie down until prodromal symptoms such as nausea, dizziness, and sweating abate.

- **MEDICAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

5 Obstetrics

Obstetrics

20-Sep-2017

Prostaglandins and oxytocics

Prostaglandins and oxytocics are used to induce abortion or induce or augment labour and to minimise blood loss from the placental site. They include oxytocin p. 868, carbociclin p. 870, ergometrine maleate p. 869, and the prostaglandins. All induce uterine contractions with varying degrees of pain according to the strength of contractions induced.

Induction of abortion

Gemeprost p. 872, a prostaglandin administered vaginally as pessaries, is suitable for the medical induction of late therapeutic abortion; gemeprost is also used to ripen the cervix before surgical abortion, particularly in primigravidas. The prostaglandin misoprostol p. 872 is given by mouth, buccally, sublingually, or vaginally, to induce medical abortion [unlicensed indication]; intravaginal use ripens the cervix before surgical abortion [unlicensed indication]. Extra-amniotic dinoprostone is rarely used nowadays.

Pre-treatment with mifepristone p. 871 can facilitate the process of medical abortion. It sensitises the uterus to subsequent administration of a prostaglandin and, therefore, abortion occurs in a shorter time and with a lower dose of prostaglandin.

Induction and augmentation of labour

Dinoprostone is available as vaginal tablets, pessaries and vaginal gels for the induction of labour. The intravenous solution is rarely used; it is associated with more side-effects.

Oxytocin (*Syntocinon*[®]) is administered by slow intravenous infusion, using an infusion pump, to induce or augment labour, usually in conjunction with amniotomy. Uterine activity must be monitored carefully and hyperstimulation avoided. Large doses of oxytocin may result in excessive fluid retention.

Misoprostol is given orally [unlicensed route] or vaginally for the induction of labour.

NICE Guidance, Induction of labour (updated July 2008), available at www.nice.org.uk/guidance/CG70.

Prevention and treatment of haemorrhage

Bleeding due to incomplete miscarriage or abortion can be controlled with ergometrine maleate and oxytocin (*Syntometrine*[®]) given intramuscularly, the dose is adjusted according to the patient's condition and blood loss. This is commonly used before surgical evacuation of the uterus, particularly when surgery is delayed. Oxytocin and ergometrine maleate combined are more effective in early pregnancy than either drug alone.

Active management of the third stage of labour reduces the risk of postpartum haemorrhage; oxytocin is given by intramuscular injection [unlicensed] on delivery of the anterior shoulder or, at the latest, immediately after the baby is delivered. Alternatively, ergometrine maleate with oxytocin (*Syntometrine*[®]) can be given by intramuscular injection in the absence of hypertension; oxytocin alone causes less nausea, vomiting, and hypertension than when given with ergometrine maleate.

In excessive uterine bleeding, any placental products remaining in the uterus should be removed. Oxytocic drugs are used to treat postpartum haemorrhage caused by uterine atony; treatment options are as follows:

- oxytocin by slow intravenous injection, followed in severe cases by intravenous infusion of oxytocin at a rate that controls uterine atony *or*
- ergometrine by intramuscular injection *or*
- ergometrine by slow intravenous injection (use with caution—risk of hypertension) *or*
- ergometrine with oxytocin (*Syntometrine*[®]) by intramuscular injection

Carboprost p. 870 has an important role in severe postpartum haemorrhage unresponsive to ergometrine maleate and oxytocin.

Misoprostol [unlicensed] can be used in postpartum haemorrhage when oxytocin, ergometrine maleate, and carboprost are not available or are inappropriate.

Mifepristone

For termination of pregnancy, a single dose of mifepristone is followed by administration of a prostaglandin (gemeprost or misoprostol [unlicensed]).

Guidelines of the Royal College of Obstetricians and Gynaecologists (November 2011) include [unlicensed] regimens for inducing medical abortion.

Ectopic pregnancy

Systemic methotrexate p. 963 [unlicensed indication] is used for the management of ectopic pregnancy.

Myometrial relaxants

Tocolytic drugs postpone *premature labour* and they are used with the aim of reducing harm to the child. However, there is no satisfactory evidence that the use of these drugs reduces mortality. The greatest benefit is gained by using the delay to administer corticosteroid therapy or to implement other measures which improve perinatal health (including transfer to a unit with neonatal intensive care facility).

The oxytocin receptor antagonist, atosiban p. 871, is licensed for the inhibition of uncomplicated premature labour *between 24 and 33 weeks* of gestation. Atosiban may be preferable to a beta₂ agonist because it has fewer side effects. The dihydropyridine calcium-channel blocker nifedipine p. 174 also has fewer side-effects than a beta₂ agonist.

The beta₂ agonists salbutamol p. 267 and terbutaline sulfate p. 269 are licensed for inhibiting uncomplicated premature labour between 22 and 37 weeks of gestation to permit a delay in delivery of up to 48 hours. Use of high-dose short acting beta₂ agonists in obstetric indications has been associated with serious, sometimes fatal cardiovascular

events in the mother and fetus, particularly when used for a prolonged period of time. Oral therapy is no longer recommended and parenteral therapy should be restricted to a maximum duration of 48 hours, given under the supervision of a specialist, and with close monitoring.

Indometacin p. 1206, a cyclo-oxygenase inhibitor, also inhibits labour [unlicensed indication] and it can be useful in situations where a beta₂ agonist is not appropriate; however, there are concerns about neonatal complications such as transient impairment of renal function and premature closure of ductus arteriosus.

5.1 Induction of labour

Other drugs used for induction of labour Misoprostol, p. 872

OXYTOCIN AND ANALOGUES

Oxytocin

20-Apr-2020

● INDICATIONS AND DOSE

Induction of labour for medical reasons | Stimulation of labour in hypotonic uterine inertia

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 0.001–0.004 unit/minute, not to be started for at least 6 hours after administration of vaginal prostaglandin, dose increased at intervals of at least 30 minutes until a maximum of 3–4 contractions occur every 10 minutes (0.01 units/minute is often adequate) up to max. 0.02 units/minute, if regular contractions not established after a total 5 units, stop induction attempt (may be repeated next day starting again at 0.001–0.004 units/minute)

Caesarean section

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 5 units immediately after delivery

Prevention of postpartum haemorrhage after delivery of placenta

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 5 units, if infusion previously used for induction or enhancement of labour, increase rate during third stage and for next few hours
- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 10 units, can be used instead of oxytocin with ergometrine (*Syntometrine*®).

Treatment of postpartum haemorrhage

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 5 units, repeated if necessary

Treatment of severe cases of postpartum haemorrhage (following intravenous injection)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 40 units, given in 500 mL infusion fluid given at a rate sufficient to control uterine atony

Incomplete, inevitable, or missed miscarriage

- ▶ INITIALLY BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 5 units, followed by (by intravenous infusion) 0.02–0.04 unit/minute if required, the rate of infusion can be faster if necessary

- **UNLICENSED USE** Oxytocin doses in the BNF may differ from those in the product literature. Administration by intramuscular injection is an unlicensed use.

IMPORTANT SAFETY INFORMATION

Prolonged intravenous administration at high doses with large volume of fluid (which is possible in inevitable or missed miscarriage or postpartum haemorrhage) may cause water intoxication with hyponatraemia. To avoid:

manufacturer advises use electrolyte-containing diluent (i.e. not glucose), increase oxytocin concentration to reduce fluid, restrict fluid intake by mouth; monitor fluid and electrolytes.

- **CONTRA-INDICATIONS** Any condition where spontaneous labour inadvisable · any condition where vaginal delivery inadvisable · avoid intravenous injection during labour · avoid prolonged administration in oxytocin-resistant uterine inertia · avoid rapid intravenous injection (may transiently reduce blood pressure) · fetal distress (discontinue immediately if this occurs) · hypertonic uterine contractions (discontinue immediately if this occurs) · severe cardiovascular disease · severe pre-eclamptic toxemia
- **CAUTIONS** Avoid large infusion volumes and restrict fluid intake by mouth (risk of hyponatraemia and water-intoxication) · enhancement of labour—presence of borderline cephalopelvic disproportion (avoid if significant) · history of lower-uterine segment caesarean section · induction of labour—presence of borderline cephalopelvic disproportion (avoid if significant) · mild pregnancy-induced cardiac disease · mild pregnancy-induced hypertension · moderate pregnancy-induced cardiac disease · moderate pregnancy-induced hypertension · risk factors for disseminated intravascular coagulation · secondary uterine inertia · women over 35 years
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arrhythmias · headache · nausea · vomiting
 - ▶ **Rare or very rare** Dyspnoea · hypotension · rash
 - ▶ **Frequency not known** Angioedema · disseminated intravascular coagulation · electrolyte imbalance · flushing · haemorrhage · myocardial ischaemia · pulmonary oedema · QT interval prolongation · uterine rupture · water intoxication
- SIDE-EFFECTS, FURTHER INFORMATION** Avoid rapid intravenous injection (may transiently reduce blood pressure).

Uterine hyperstimulation -usually with excessive doses—may cause fetal distress, asphyxia, and death, or may lead to hypertonicity, tetanic contractions, soft-tissue damage or uterine rupture.

Overdose Placental abruption and amniotic fluid embolism reported on overdose.
- **MONITORING REQUIREMENTS**
 - ▶ Careful monitoring of fetal heart rate and uterine motility essential for dose titration.
 - ▶ Monitor for disseminated intravascular coagulation after parturition.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Syntocinon*®), give continuously in Glucose 5% or Sodium chloride 0.9%. Preferably given via a variable-speed infusion pump in a concentration appropriate to the pump; if given by drip infusion for induction or enhancement of labour, dilute 5 units in 500 mL infusion fluid or for higher doses, 10 units in 500 mL; for treatment of postpartum uterine haemorrhage dilute 40 units in 500 mL; if high doses given for prolonged period (e.g. for inevitable or missed abortion or for postpartum haemorrhage), use low volume of an electrolyte-containing infusion fluid (not Glucose 5%) given at higher concentration than for induction or enhancement of labour; close attention to patient's fluid and electrolyte status essential.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Solution for injection

▶ Oxytocin (Non-proprietary)

Oxytocin 5 unit per 1 ml Oxytocin 5units/1ml solution for injection ampoules | 5 ampoule [PoM]  (Hospital only)

Oxytocin 10 unit per 1 ml Oxytocin 10units/1ml solution for infusion ampoules | 5 ampoule [PoM] £15.00 | 10 ampoule [PoM] £20.00

Oxytocin 10units/1ml concentrate for solution for infusion ampoules | 5 ampoule [PoM] £4.55 | 10 ampoule [PoM] £9.00

Oxytocin 10units/1ml solution for injection ampoules | 5 ampoule [PoM]  (Hospital only)

▶ Syntocinon (Mylan)

Oxytocin 5 unit per 1 ml Syntocinon 5units/1ml solution for injection ampoules | 5 ampoule [PoM] £4.01 (Hospital only)

Oxytocin 10 unit per 1 ml Syntocinon 10units/1ml solution for injection ampoules | 5 ampoule [PoM] £4.53 (Hospital only)

PROSTAGLANDINS AND ANALOGUES

Dinoprostone

20-Apr-2020

● INDICATIONS AND DOSE

PROPESS[®]

Cervical ripening and induction of labour at term

▶ BY VAGINA

- ▶ Adult: 1 pessary, insert pessary (in retrieval device) high into posterior fornix and remove when cervical ripening adequate; if oxytocin necessary, remove 30 minutes before oxytocin infusion; remove if cervical ripening inadequate after 24 hours (dose not to be repeated)

PROSTIN E2[®] VAGINAL GEL

Induction of labour

▶ BY VAGINA

- ▶ Adult: 1 mg, inserted high into the posterior fornix (avoid administration into the cervical canal), followed by 1–2 mg after 6 hours if required; maximum 3 mg per course

Induction of labour (unfavourable primigravida)

▶ BY VAGINA

- ▶ Adult: 2 mg, inserted high into the posterior fornix (avoid administration into the cervical canal), followed by 1–2 mg if required, after 6 hours; maximum 4 mg per course

PROSTIN E2[®] VAGINAL TABLETS

Induction of labour

▶ BY VAGINA

- ▶ Adult: 3 mg, inserted high into the posterior fornix, followed by 3 mg after 6–8 hours, to be given if labour not established; maximum 6 mg per course

DOSE EQUIVALENCE AND CONVERSION

- ▶ *Prostin E2 Vaginal tablets* and *Vaginal Gel* are not bioequivalent.

- **CONTRA-INDICATIONS** Active cardiac disease · active pulmonary disease · avoid extra-amniotic route in cervicitis or vaginitis · fetal distress · fetal malpresentation · grand multiparas · history of caesarean section · history of difficult or traumatic delivery · history of major uterine surgery · major cephalopelvic disproportion · multiple pregnancy · placenta praevia or unexplained vaginal bleeding during pregnancy · ruptured membranes · untreated pelvic infection
- **CAUTIONS** Effect of oxytocin enhanced · history of asthma · history of epilepsy · history of glaucoma and raised intra-ocular pressure · hypertension · risk factors for disseminated intravascular coagulation · uterine rupture · uterine scarring

● SIDE-EFFECTS

- ▶ **Uncommon** Amniotic cavity infection · febrile disorders · headache · hyperbilirubinaemia neonatal · hypotension · pruritus · uterine atony · vaginal burning
- ▶ **Rare or very rare** Disseminated intravascular coagulation
- ▶ **Frequency not known** Abdominal pain · diarrhoea · genital oedema · nausea · uterine rupture · vomiting

● HEPATIC IMPAIRMENT

Manufacturer advises avoid.

● RENAL IMPAIRMENT

Manufacturers advise avoid.

● MONITORING REQUIREMENTS

- ▶ Monitor for disseminated intravascular coagulation after parturition.
- ▶ Monitor uterine activity and fetal status (particular care if history of uterine hypertony)
- ▶ Care needed in monitoring uterine activity when used in sequence following oxytocin.
- **PRESCRIBING AND DISPENSING INFORMATION Important:** Do not confuse dose of *Prostin E2[®] vaginal gel* with that of *Prostin E2[®] vaginal tablets*—not bioequivalent.
- **LESS SUITABLE FOR PRESCRIBING** Intravenous solution rarely used and is considered less suitable for prescribing. Extra-amniotic solution less commonly used and is considered less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Pessary

▶ Prostin E2 (Pfizer Ltd)

Dinoprostone 3 mg Prostin E2 3mg vaginal tablets | 8 pessary [PoM] £106.23 (Hospital only)

Vaginal gel

▶ Prostin E2 (Pfizer Ltd)

Dinoprostone 800 microgram per 1 ml Prostin E2 2mg vaginal gel | 2.5 ml [PoM] £13.28 (Hospital only)

Vaginal device

▶ Propress (Ferring Pharmaceuticals Ltd)

Dinoprostone 10 mg Propress 10mg vaginal delivery system | 5 device [PoM] £165.00

5.2 Postpartum haemorrhage

Other drugs used for Postpartum haemorrhage Oxytocin, p. 868

ERGOT ALKALOIDS

Ergometrine maleate

20-Apr-2020

● INDICATIONS AND DOSE

Postpartum haemorrhage caused by uterine atony

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 250–500 micrograms

- **CONTRA-INDICATIONS** Eclampsia · first stage of labour · induction of labour · second stage of labour · sepsis · severe cardiac disease · severe hypertension · vascular disease
- **CAUTIONS** Acute porphyrias p. 1120 · cardiac disease · hypertension · multiple pregnancy · risk of hypertension associated with intravenous administration
- **INTERACTIONS** → Appendix 1: ergometrine
- **SIDE-EFFECTS** Abdominal pain · arrhythmias · chest pain · coronary vasospasm · dizziness · dyspnoea · headache · hypertension · myocardial infarction · nausea · palpitations · pulmonary oedema · rash · tinnitus · vasoconstriction · vomiting

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in mild or moderate impairment. Manufacturer advises avoid in severe impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection▶ **Ergometrine maleate (Non-proprietary)**

Ergometrine maleate 500 microgram per 1 ml Ergometrine 500micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £15.00

Ergometrine with oxytocin

22-Apr-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergometrine maleate p. 869, oxytocin p. 868.

INDICATIONS AND DOSE**Active management of the third stage of labour | Postpartum haemorrhage caused by uterine atony**▶ **BY INTRAMUSCULAR INJECTION**

▶ Adult: 1 mL for one dose

▶ **BY INTRAVENOUS INJECTION**

▶ Adult: No longer recommended

Bleeding due to incomplete miscarriage or abortion▶ **BY INTRAMUSCULAR INJECTION**

▶ Adult: Adjusted according to response to, the patient's condition and blood loss

- **INTERACTIONS** → Appendix 1: ergometrine

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection▶ **Syntometrine** (Alliance Pharmaceuticals Ltd)

Other drugs used for Premature labour Indometacin, p. 1206 · Nifedipine, p. 174 · Salbutamol, p. 267 · Terbutaline sulfate, p. 269

OXYTOCIN RECEPTOR ANTAGONISTS

Atosiban

21-Jun-2019

● INDICATIONS AND DOSE

Uncomplicated premature labour between 24 and 33 weeks of gestation

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 6.75 mg over 1 minute, then (by intravenous infusion) 18 mg/hour for 3 hours, then (by intravenous infusion) reduced to 6 mg/hour for up to 45 hours. Maximum duration of treatment is 48 hours

- **CONTRA-INDICATIONS** Abnormal fetal heart rate · abruptio placenta · antepartum haemorrhage (requiring immediate delivery) · eclampsia · intra-uterine fetal death · intra-uterine infection · placenta praevia · premature rupture of membranes after 30 weeks' gestation · severe pre-eclampsia

- **CAUTIONS** Abnormal placental site · intra-uterine growth restriction

● **SIDE-EFFECTS**

- ▶ **Common or very common** Dizziness · headache · hot flush · hyperglycaemia · hypotension · nausea · tachycardia · vomiting
- ▶ **Uncommon** Fever · insomnia · skin reactions
- ▶ **Rare or very rare** Uterine atony · uterine haemorrhage
- ▶ **Frequency not known** Dyspnoea · pulmonary oedema

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.

- **RENAL IMPAIRMENT** No information available.

- **MONITORING REQUIREMENTS** Monitor blood loss after delivery.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Tractocile*[®] concentrate for intravenous infusion), give continuously in Glucose 5% or Sodium chloride 0.9%. Withdraw 10 mL infusion fluid from 100-mL bag and replace with 10 mL atosiban concentrate (7.5 mg/mL) to produce a final concentration of 750 micrograms/mL.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection▶ **Atosiban (Non-proprietary)**

5.4 Termination of pregnancy

PROGESTERONE RECEPTOR MODULATORS

Mifepristone

- **DRUG ACTION** Mifepristone, an antiprogesterone steroid, sensitises the myometrium to prostaglandin-induced contractions and ripens the cervix.

● **INDICATIONS AND DOSE****Cervical ripening before mechanical cervical dilatation for termination of pregnancy of up to 84 days gestation (under close medical supervision)**

- ▶ BY MOUTH
- ▶ Adult: 200 mg for 1 dose, to be taken 36-48 hours before procedure

Labour induction in fetal death in utero where prostaglandin or oxytocin inappropriate (under close medical supervision)

- ▶ BY MOUTH
- ▶ Adult: 600 mg once daily for 2 days, if labour not started within 72 hours of first dose, another method should be used

Medical termination of intra-uterine pregnancy of up to 49 days gestation (under close medical supervision)

- ▶ BY MOUTH
- ▶ Adult: 600 mg for 1 dose, dose followed 36-48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina or misoprostol 400 micrograms by mouth, alternatively 200 mg for 1 dose, dose followed 36-48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding

Medical termination of intra-uterine pregnancy of 50-63 days gestation (under close medical supervision)

- ▶ BY MOUTH
- ▶ Adult: 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36-48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding

Termination of pregnancy of 13-24 weeks gestation (in combination with a prostaglandin) (under close medical supervision)

- ▶ BY MOUTH
- ▶ Adult: 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36-48 hours later by gemeprost 1 mg by vagina every 3 hours up to max. 5 mg or misoprostol; if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended

- **CONTRA-INDICATIONS** Acute porphyrias p. 1120 · chronic adrenal failure · suspected ectopic pregnancy (use other specific means of termination) · uncontrolled severe asthma
- **CAUTIONS** Adrenal suppression (may require corticosteroid) · anticoagulant therapy · asthma (avoid if severe and uncontrolled) · existing cardiovascular disease · haemorrhagic disorders · history of endocarditis · prosthetic heart valve · risk factors for cardiovascular disease
- **INTERACTIONS** → Appendix 1: mifepristone

- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal cramps · diarrhoea · infection · nausea · pelvic inflammatory disease · uterine disorders · vaginal haemorrhage (sometimes severe) · vomiting
- ▶ **Uncommon** Hypotension
- ▶ **Rare or very rare** Angioedema · chills · dizziness · erythema nodosum · fever · headache · hot flush · malaise · skin reactions · toxic epidermal necrolysis · toxic shock syndrome · uterine rupture
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in hepatic failure (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises avoid.
- **MONITORING REQUIREMENTS** Careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension).
- **PRESCRIBING AND DISPENSING INFORMATION** Supplied to NHS hospitals and premises approved under Abortion Act 1967.
- **PATIENT AND CARER ADVICE** Patient information leaflet to be provided.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

20-Apr-2020

● **INDICATIONS AND DOSE****Cervical ripening prior to first trimester surgical abortion**

▶ BY VAGINA

- ▶ Adult: 1 mg, dose to be inserted into posterior fornix 3 hours before surgery

Second trimester abortion

▶ BY VAGINA

- ▶ Adult: 1 mg every 3 hours for maximum 5 administrations, to be inserted into posterior fornix, second course may begin 24 hours after start of treatment (if treatment fails, pregnancy should be terminated by another method)

Second trimester intra-uterine death

▶ BY VAGINA

- ▶ Adult: 1 mg every 3 hours for maximum 5 administrations only, to be inserted into posterior fornix

Medical termination of intra-uterine pregnancy of up to 49 days gestation following mifepristone | Medical termination of intra-uterine pregnancy of 50–63 days gestation following mifepristone

▶ BY VAGINA

- ▶ Adult: 1 mg

Termination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin) following mifepristone

▶ BY VAGINA

- ▶ Adult: 1 mg every 3 hours, if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended, careful monitoring of blood

pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension); maximum 5 mg per course

- **CONTRA-INDICATIONS** Placenta praevia · unexplained vaginal bleeding · uterine scarring
- **CAUTIONS** Cardiovascular insufficiency · cervicitis · obstructive airways disease · raised intra-ocular pressure · vaginitis
- **SIDE-EFFECTS** Back pain · chest pain · chills · coronary vasospasm · diarrhoea · dizziness · dyspnoea · fever · flushing · headache · hypotension · muscle weakness · myocardial infarction · nausea · palpitations · uterine pain · uterine rupture · vaginal haemorrhage · vomiting
- **RENAL IMPAIRMENT** Manufacturer advises avoid.
- **MONITORING REQUIREMENTS**
- ▶ If used in combination with mifepristone, carefully monitor blood pressure and pulse for 3 hours.
- ▶ When used for second trimester intra-uterine death, monitor for coagulopathy during treatment.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Pessary▶ **Cervagem** (Sanofi)Gemeprost 1 mg Cervagem 1mg pessaries | 5 pessary  (Hospital only)**Misoprostol**

20-Apr-2020

- **DRUG ACTION** Misoprostol is a synthetic prostaglandin analogue that acts as a potent uterine stimulant.

● **INDICATIONS AND DOSE****Termination of pregnancy following mifepristone (gestation up to 49 days)**

▶ BY MOUTH

- ▶ Adult: 400 micrograms for 1 dose, dose to be given 24–48 hours after mifepristone

Termination of pregnancy following mifepristone (gestation 50 to 63 days)

▶ INITIALLY BY VAGINA, OR BY BUCCAL ADMINISTRATION, OR BY SUBLINGUAL ADMINISTRATION

- ▶ Adult: 800 micrograms for 1 dose, dose to be given 24–48 hours after mifepristone, if abortion has not occurred 4 hours after first misoprostol dose a further dose may be given, (by mouth or by vagina) 400 micrograms for 1 dose

Termination of pregnancy following mifepristone (gestation of 9 to 13 weeks)

▶ INITIALLY BY VAGINA

- ▶ Adult: 800 micrograms for 1 dose, dose to be given 36–48 hours after mifepristone, followed by (by vagina or by mouth) 400 micrograms every 3 hours if required for a maximum of 4 doses

Termination of pregnancy following mifepristone (gestation of 13 to 24 weeks)

▶ INITIALLY BY VAGINA

- ▶ Adult: 800 micrograms for 1 dose, dose to be given 36–48 hours after mifepristone, followed by (by vagina or by mouth) 400 micrograms every 3 hours if required for a maximum of 4 doses, if abortion has not occurred 3 hours after the last dose of misoprostol, a further dose of mifepristone may be given, and misoprostol may be recommenced 12 hours later

MYSODELLE® VAGINAL DELIVERY SYSTEM**Induction of labour (specialist supervision in hospital)**

▶ BY VAGINA

- ▶ Adult: 200 micrograms for 1 dose, to be inserted (in vaginal delivery system) high into posterior fornix; if

oxytocin required, remove at least 30 minutes before oxytocin administration, for information on when to remove the delivery system—consult product literature

- **UNLICENSED USE** Misoprostol doses for termination of pregnancy may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: MISOPROSTOL VAGINAL DELIVERY SYSTEM (MYSODELLE®): REPORTS OF EXCESSIVE UTERINE CONTRACTIONS (TACHYSYSTOLE) UNRESPONSIVE TO TOCOLYTIC TREATMENT (FEBRUARY 2018)

Mysodelle® can cause excessive uterine tachysystole that may not respond to tocolytic treatment. Monitor patients closely and remove the vaginal delivery system immediately in cases of excessive or prolonged uterine contractions, at the onset of labour, or if there is clinical concern for mother or baby.

Be prepared to administer tocolytic therapy—if needed, it can be administered immediately after removal of *Mysodelle*®.

• CONTRA-INDICATIONS

MYSODELLE® VAGINAL DELIVERY SYSTEM Before 36 weeks' gestation · chorioamnionitis (unless adequate prior treatment initiated) · fetal malpresentation · placenta praevia · suspicion or evidence of fetal compromise · unexplained vaginal bleeding after 24 weeks gestation · uterine abnormality · uterine scar

• CAUTIONS

- ▶ When used for termination of pregnancy Cardiovascular disease · risk factors for cardiovascular disease
- MYSODELLE® VAGINAL DELIVERY SYSTEM** Modified Bishop score greater than 4

• SIDE-EFFECTS

- ▶ **Common or very common** Nausea · neonatal respiratory depression · rash · transient tachypnoea of the newborn · vomiting
 - ▶ **Uncommon** Genital pruritus · hypoxic-isaemic encephalopathy · uterine rupture
- **BREAST FEEDING** Manufacturer advises avoid—present in milk, and may cause diarrhoea in nursing infants. [EVG†](#) Tertiary sources state present in milk but amount probably too small to be harmful; to further reduce risk following termination of pregnancy, consider interrupting breastfeeding for 5 hours after a dose. [D](#)

• HANDLING AND STORAGE

MYSODELLE® VAGINAL DELIVERY SYSTEM Manufacturer advises store in a freezer (-10 to -25°C); no thawing required prior to use.

• PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness.

• NATIONAL FUNDING/ACCESS DECISIONS

MYSODELLE® VAGINAL DELIVERY SYSTEM

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3627

The *All Wales Medicines Strategy Group* has advised (March 2018) that misoprostol (*Mysodelle*®) is recommended as an option for use within NHS Wales for the induction of labour in women with an unfavourable cervix, from 36 weeks gestation, in whom induction is clinically indicated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

6 Vaginal and vulval conditions

Vaginal and vulval conditions

Management

Symptoms are often restricted to the vulva, but infections almost invariably involve the vagina which should also be treated. Applications to the vulva alone are likely to give only symptomatic relief without cure.

Aqueous medicated douches may disturb normal vaginal acidity and bacterial flora.

Topical anaesthetic agents give only symptomatic relief and may cause sensitivity reactions. They are indicated only in cases of pruritus where specific local causes have been excluded.

Systemic drugs are required in the treatment of infections such as gonorrhoea and syphilis.

Vaginal and vulval changes

Topical HRT for vaginal atrophy

A cream containing an oestrogen may be applied on a short-term basis to improve the vaginal epithelium in *menopausal atrophic vaginitis*. It is **important** to bear in mind that topical oestrogens should be used in the **smallest effective** amount to minimise systemic effects. Modified-release vaginal tablets and an impregnated vaginal ring are now also available.

The risk of endometrial hyperplasia and carcinoma is increased when *systemic* oestrogens are administered alone for prolonged periods. The endometrial safety of long-term or repeated use of *topical* vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

Topical oestrogens are also used in postmenopausal women before vaginal surgery for prolapse when there is epithelial atrophy.

Non-hormonal preparations for vaginal atrophy

Several non-hormonal vaginal moisturisers are available and some are prescribable on the NHS (consult Drug Tariff).

Vaginal and vulval infections

Effective specific treatments are available for the common vaginal infections.

Fungal infections

Candidal vulvitis can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. *Vaginal candidiasis* is treated primarily with antifungal pessaries or cream inserted high into the vagina (including during menstruation). Single-dose preparations offer an advantage when compliance is a problem. Local irritation may occur on application of vaginal antifungal products.

Imidazole drugs (clotrimazole p. 875, econazole nitrate p. 875, fenticonazole nitrate p. 876, and miconazole p. 876) are effective against candida in short courses of 1 to 14 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if

symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with fluconazole p. 630 or itraconazole p. 632 is also effective.

Vulvovaginal candidiasis in pregnancy

Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

Recurrent vulvovaginal candidiasis

Recurrence of vulvovaginal candidiasis is particularly likely if there are predisposing factors, such as antibacterial therapy, pregnancy, diabetes mellitus, or possibly oral contraceptive use. Reservoirs of infection may also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus as well as the gastro-intestinal tract and the bladder. The partner may also be the source of reinfection and, if symptomatic, should be treated with a topical imidazole cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis.

Other infections

Trichomonal infections commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole p. 572 or tinidazole p. 574.

Bacterial infections with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially *Bacteroides* spp. and can be used prophylactically in gynaecological surgery.

Clindamycin cream below and metronidazole gel are indicated for bacterial vaginosis.

Vaginal preparations intended to restore normal acidity may prevent recurrence of vaginal infections and permit the re-establishment of the normal vaginal flora.

The antiviral drugs aciclovir p. 670, famciclovir p. 672, and valaciclovir p. 673 can be used in the treatment of genital infection due to *herpes simplex virus*, the HSV type 2 being a major cause of genital ulceration; they have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms.

6.1 Vaginal and vulval infections

6.1a Vaginal and vulval bacterial infections

ANTIBACTERIALS > LINCOSAMIDES

Clindamycin

18-May-2020

● INDICATIONS AND DOSE

DALACIN[®] 2% CREAM

Bacterial vaginosis

▶ BY VAGINA

▶ Adult: 1 applicatorful daily for 3–7 nights, dose to be administered at night

DOSE EQUIVALENCE AND CONVERSION

▶ 1 applicatorful delivers a 5 g dose of clindamycin 2%.

● **INTERACTIONS** → Appendix 1: clindamycin

● SIDE-EFFECTS

▶ **Common or very common** Skin reactions

▶ **Frequency not known** Constipation · diarrhoea (discontinue) · dizziness · gastrointestinal discomfort · headache · increased risk of infection · nausea · vertigo · vomiting · vulvovaginal irritation

SIDE-EFFECTS, FURTHER INFORMATION Clindamycin 2% cream is poorly absorbed into the blood—low risk of systemic effects.

● CONCEPTION AND CONTRACEPTION

DALACIN[®] 2% CREAM Damages latex condoms and diaphragms.

● **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Genital system infections, antibacterial therapy p. 536.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

▶ **Dalacin** (Pfizer Ltd)

Clindamycin (as Clindamycin phosphate) 20 mg per

1 gram Dalacin 2% cream | 40 gram **[PoM]** £10.86 DT = £10.86

ANTISEPTICS AND DISINFECTANTS

Dequalinium chloride

13-Mar-2017

● **DRUG ACTION** Dequalinium chloride is a bactericidal anti-infective which causes bacterial cell death by increasing cell permeability and reducing enzyme activity.

● INDICATIONS AND DOSE

Bacterial vaginosis

▶ BY VAGINA

▶ Adult 18–55 years: 10 mg once daily for 6 days, inserted at night

● **CONTRA-INDICATIONS** Vaginal ulceration

● SIDE-EFFECTS

▶ **Common or very common** Increased risk of infection · vulvovaginal disorders

▶ **Uncommon** Haemorrhage · headache · nausea

▶ **Frequency not known** Cystitis · fever

● **CONCEPTION AND CONTRACEPTION** Does not affect efficacy of latex condoms; however, manufacturer advises avoid use of non-latex condoms and intravaginal devices—no information available.

● **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (November 2016) that dequalinium chloride (*Fluomizin[®]*) is accepted for restricted use within NHS Scotland for treatment of bacterial vaginosis in patients for whom the initial treatment is not effective or well tolerated.

All Wales Medicines Strategy Group (AWMSG) decisions

The *All Wales Medicines Strategy Group* has advised (November 2016) that dequalinium chloride (*Fluomizin[®]*) is recommended as an option for restricted use within NHS Wales for the treatment of bacterial vaginosis only after initial treatment is ineffective or not tolerated, as an alternative option to clindamycin vaginal cream.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

6.2 Vaginal atrophy

OESTROGENS

Estradiol

20-May-2020

INDICATIONS AND DOSE**ESTRING[®]****Postmenopausal urogenital conditions (not suitable for vasomotor symptoms or osteoporosis prophylaxis)**

- ▶ BY VAGINA
- ▶ Adult: To be inserted into upper third of vagina and worn continuously; replace after 3 months; max. duration of continuous treatment 2 years

VAGIFEM[®]**Improve the vaginal epithelium in menopausal atrophic vaginitis**

- ▶ BY VAGINA
- ▶ Adult: 1 tablet daily for 2 weeks, then reduced to 1 tablet twice weekly

- **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) · history of breast cancer · history of venous thromboembolism · oestrogen-dependent cancer · recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia

- **CAUTIONS** Acute porphyrias p. 1120 · diabetes (increased risk of heart disease) · factors predisposing to thromboembolism · history of breast nodules—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease—closely monitor breast status (risk of breast cancer) · hypophyseal tumours · increased risk of gall-bladder disease · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · review treatment at least annually to assess need for continued treatment · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size

CAUTIONS, FURTHER INFORMATION

- ▶ Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.
- ▶ Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- ▶ Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

- ▶ Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT increases the risk of stroke.
- ▶ Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · headaches · nausea · skin reactions · vaginal haemorrhage · vulvovaginal disorders
- ▶ **Uncommon** Hypertension · vulvovaginal fungal infection · weight increased
- ▶ **Rare or very rare** Diarrhoea · embolism and thrombosis · endometrial hyperplasia · fluid retention · genital pruritus · increased risk of ischaemic stroke · insomnia · neoplasm malignant · neoplasms · vaginismus

SIDE-EFFECTS, FURTHER INFORMATION

Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. Continuous combined HRT commonly produces irregular breakthrough bleeding in the first 4–6 months of treatment. Bleeding beyond 6 months or after a spell of amenorrhoea requires further investigation to exclude serious gynaecological pathology.

- **CONCEPTION AND CONTRACEPTION** HRT does **not** provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant. **VAGIFEM**® No evidence of damage to latex condoms and diaphragms.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Avoid; adverse effects on lactation.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in acute or active disease.

● MONITORING REQUIREMENTS

- ▶ History of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer).
- ▶ The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- ▶ For *Ovestin*® cream, 1 applicatorful contains 500 micrograms estriol; for *Blisset*® gel, 1 applicatorful contains 50 micrograms estriol; for *Invagiss*® pessary, 1 pessary contains 30 micrograms estriol.

- **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) · history of breast cancer · history of venous thromboembolism · oestrogen-dependent cancer · recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia
- **CAUTIONS** Acute porphyrias p. 1120 · diabetes (increased risk of heart disease) · factors predisposing to thromboembolism · history of breast nodules—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease—closely monitor breast status (risk of breast cancer) · hypophyseal tumours · increased risk of gall-bladder disease · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · review treatment at least annually to assess need for continued treatment · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size

CAUTIONS, FURTHER INFORMATION

- ▶ Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.
- ▶ Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- ▶ Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

- ▶ Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT increases the risk of stroke.
- ▶ Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.
- **INTERACTIONS** → Appendix 1: hormone replacement therapy
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dysuria · genital abnormalities · skin reactions · vulvovaginal disorders
 - ▶ **Uncommon** Anorectal discomfort · candida infection · headache · pelvic pain
 - ▶ **Frequency not known** Breast abnormalities · cervical mucus increased · dementia · erythema nodosum · gallbladder disorder · increased risk of coronary artery disease · increased risk of ischaemic stroke · increased risk of venous thromboembolism · nausea · neoplasms · vaginal haemorrhage · vomiting
- **CONCEPTION AND CONTRACEPTION** *Imvaggis*[®] pessary may damage latex condoms (decreases tensile strength).

OVESTIN[®] Effect on latex condoms and diaphragms not yet known.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid; adverse effects on lactation.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in acute or active disease.
- **RENAL IMPAIRMENT** Manufacturer advises caution in renal disease. Evidence for caution is unsatisfactory and many women with these conditions may stand to benefit from HRT.
- **MONITORING REQUIREMENTS**
 - ▶ Closely monitor breast status if history of breast nodules or fibrocystic disease (risk of breast cancer).
 - ▶ The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Pessary

EXCIPIENTS: May contain Butylated hydroxytoluene

- ▶ *Imvaggis* (Besins Healthcare (UK) Ltd)

Estriol 30 microgram *Imvaggis* 0.03mg pessaries | 24 pessary [PoM] £13.38

Cream

EXCIPIENTS: May contain Arachis (peanut) oil, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

- ▶ **Estriol (Non-proprietary)**

Estriol 100 microgram per 1 gram Estriol 0.01% cream | 80 gram [PoM] £5

- ▶ *Ovestin* (Aspen Pharma Trading Ltd)

Estriol 1 mg per 1 gram *Ovestin* 1mg cream | 15 gram [PoM] £4.45 DT = £4.45

Vaginal gel

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

- ▶ *Blissel* (Flynn Pharma Ltd)

Estriol 50 microgram per 1 gram *Blissel* 50micrograms/g vaginal gel with applicator | 30 gram [PoM] £18.90 DT = £18.90

Prasterone

20-May-2019

- **DRUG ACTION** Prasterone is biochemically and biologically identical to endogenous dehydroepiandrosterone (DHEA), and is converted to oestrogens and androgens.

INDICATIONS AND DOSE

Vulvar and vaginal atrophy [in postmenopausal women with moderate to severe symptoms]

- ▶ BY VAGINA USING PESSARIES

▶ **Adult:** 6.5 mg once daily, at bedtime. Treatment should be reassessed at least every 6 months

- **CONTRA-INDICATIONS** Active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · acute liver disease · acute porphyrias p. 1120 · history of breast cancer · history of liver disease (where liver function tests have failed to return to normal) · oestrogen-dependent cancer · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia · venous thromboembolism
- **CAUTIONS** Assess need for continued treatment at least every 6 months · cholelithiasis · diabetes mellitus · factors predisposing to thromboembolism · history of endometrial hyperplasia · hypertriglyceridaemia · liver disorders (discontinue if jaundice or deterioration in liver function occurs during treatment) · migraine (or migraine-like headaches) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · symptoms of

endometriosis may be exacerbated · uterine fibroids may increase in size

CAUTIONS, FURTHER INFORMATION

- **Risk of endometrial cancer** The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.

Bleeding or spotting occurring during treatment should be investigated.

For oestrogen products for vaginal application, where systemic exposure to oestrogen remains within the normal postmenopausal range, it is not recommended to add a progestogen.

- **Risk of ovarian cancer** Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- **Risk of venous thromboembolism** Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, major surgery or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

- **Risk of stroke** Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.
- **Other conditions** The product literature advises caution in other conditions including hypertension, asthma, epilepsy, otosclerosis, and systemic lupus erythematosus. Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

• SIDE-EFFECTS

- ▶ **Common or very common** Cervical abnormalities · weight change
- ▶ **Uncommon** Breast neoplasm benign · uterine polyp
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises avoid use with condoms, diaphragms or cervical caps made of latex—may damage rubber.

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

• PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 16 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Pessary

- ▶ **Intrarosa** (Theramex HQ UK Ltd) ▼

Prasterone 6.5 mg Intrarosa 6.5mg pessaries | 28 pessary [PoM] £15.94 DT = £15.94 [CD4-2]

SELECTIVE OESTROGEN RECEPTOR MODULATORS

Ospemifene

02-Oct-2019

- **DRUG ACTION** Ospemifene is a selective oestrogen receptor modulator that has an oestrogen-like effect in the vagina, increasing the cellular maturation and mucification of the vaginal epithelium.

• INDICATIONS AND DOSE

Moderate to severe symptomatic vulvar and vaginal atrophy [in post-menopausal women who are not candidates for local vaginal oestrogen therapy]

- ▶ **BY MOUTH**
- ▶ **Adult:** 60 mg once daily

- **CONTRA-INDICATIONS** Breast cancer (suspected or actively treated) · endometrial hyperplasia · history of venous thromboembolism · sex-hormone dependent malignancy (suspected or active) · unexplained vaginal bleeding

- **CAUTIONS** Risk factors for stroke · risk factors for venous thromboembolism (discontinue if prolonged immobilisation)

- **INTERACTIONS** → Appendix 1: ospemifene

• SIDE-EFFECTS

- ▶ **Common or very common** Genital discharge · hot flush · increased risk of infection · muscle spasms · skin reactions · vaginal discharge
- ▶ **Uncommon** Endometrial thickening · hypersensitivity · tongue swelling

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be advised to seek immediate medical attention if they experience symptoms of thromboembolism (such as sudden chest pain, dyspnoea or swelling of a leg).

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2170

The *Scottish Medicines Consortium* has advised (September 2019) that ospemifene (*Senshio*[®]) is accepted for use within NHS Scotland for the treatment of moderate to severe symptomatic vulvar and vaginal atrophy in post-menopausal women who are not candidates for local vaginal oestrogen therapy.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Immune system

1 Immune system disorders and transplantation

Immune response

Inflammatory bowel disease

Azathioprine p. 881, ciclosporin p. 883, mercaptopurine p. 963, and methotrexate p. 963 have a role in the treatment of inflammatory bowel disease.

Folic acid p. 1084 should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid is usually given weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

Immunosuppressant therapy

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are maintained on drug regimens, which may include antiproliferative drugs (azathioprine or mycophenolate mofetil p. 891), calcineurin inhibitors (ciclosporin or tacrolimus p. 886), corticosteroids, or sirolimus p. 885. Choice is dependent on the type of organ, time after transplantation, and clinical condition of the patient. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

Impaired immune responsiveness

Modification of tissue reactions caused by corticosteroids and other immunosuppressants may result in the rapid *spread of infection*. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced stage before being recognised— **important**: normal immunoglobulin administration should be considered as soon as possible after measles exposure, and varicella–zoster immunoglobulin (VZIG) is recommended for individuals who have significant chickenpox (varicella) exposure. Specialist advice should be sought on the use of live vaccines for those being treated with immunosuppressive drugs.

Antiproliferative immunosuppressants

Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced when allopurinol p. 1183 is given concurrently.

Mycophenolate mofetil is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine.

There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil reduces the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher.

Cyclophosphamide p. 945 is less commonly prescribed as an immunosuppressant.

Corticosteroids and other immunosuppressants

Prednisolone p. 716 is widely used in oncology. It has a marked antitumour effect in acute lymphoblastic leukaemia, Hodgkin's disease, and the non-Hodgkin lymphomas. It has a role in the palliation of symptomatic end-stage malignant disease when it may enhance appetite and produce a sense of well-being.

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

Ciclosporin a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-myelotoxic but markedly nephrotoxic. It has an important role in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease.

Tacrolimus is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects, but the incidence of neurotoxicity appears to be greater; cardiomyopathy has also been reported. Disturbance of glucose metabolism also appears to be significant.

Sirolimus is a non-calcineurin inhibiting immunosuppressant licensed for renal transplantation.

Basiliximab p. 889 is used for prophylaxis of acute rejection in allogeneic renal transplantation. It is given with ciclosporin and corticosteroid immunosuppression regimens; its use should be confined to specialist centres.

Belatacept p. 892 is a fusion protein and co-stimulation blocker that prevents T-cell activation; it is licensed for prophylaxis of graft rejection in adults undergoing renal transplantation who are seropositive for the Epstein-Barr virus. It is used with interleukin-2 receptor antagonist induction, in combination with corticosteroids and a mycophenolic acid.

Antithymocyte immunoglobulin (rabbit) below is licensed for the prophylaxis of organ rejection in renal and heart allograft recipients and for the treatment of corticosteroid-resistant allograft rejection in renal transplantation. Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

Other drugs used for Immune system disorders and transplantation Anakinra, p. 1159 · Chloroquine, p. 651 · Everolimus, p. 1034 · Hydroxychloroquine sulfate, p. 1156 · Rituximab, p. 933

IMMUNE SERA AND IMMUNOGLOBULINS > IMMUNOGLOBULINS

Antithymocyte immunoglobulin (rabbit)

28-Nov-2017

● INDICATIONS AND DOSE

Prophylaxis of organ rejection in heart allograft recipients

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 1–2.5 mg/kg daily for 3–5 days, to be given over at least 6 hours

Prophylaxis of organ rejection in renal allograft recipients

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 1–1.5 mg/kg daily for 3–9 days, to be given over at least 6 hours

Treatment of corticosteroid-resistant allograft rejection in renal transplantation

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 1.5 mg/kg daily for 7–14 days, to be given over at least 6 hours

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight.

● CONTRA-INDICATIONS Infection

● INTERACTIONS → Appendix 1: immunoglobulins

● SIDE-EFFECTS

- ▶ **Common or very common** Chills · diarrhoea · dysphagia · dyspnoea · fever · hypotension · infection · lymphopenia · myalgia · nausea · neoplasm malignant · neoplasms · neutropenia · reactivation of infection · secondary malignancy · sepsis · skin reactions · thrombocytopenia · vomiting

- ▶ **Uncommon** Cytokine release syndrome · hepatic disorders · hypersensitivity · infusion related reaction

SIDE-EFFECTS, FURTHER INFORMATION Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

● PREGNANCY Manufacturer advises use only if potential benefit outweighs risk—no information available.

● BREAST FEEDING Manufacturer advises avoid—no information available.

● MONITORING REQUIREMENTS Monitor blood count.

● DIRECTIONS FOR ADMINISTRATION For continuous intravenous infusion (Thymoglobuline®) in Glucose 5% or Sodium chloride 0.9%; reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with

infusion fluid to a total volume of 50–500 mL (usually 50 mL/vial); begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron); not to be given with unfractionated heparin and hydrocortisone in glucose infusion—precipitation reported.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

▶ Immunosuppressive therapy for kidney transplant in adults (October 2017) NICE TA481

Antithymocyte immunoglobulin (rabbit) is not recommended as an initial treatment to prevent organ rejection in adults having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA481

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for infusion

▶ Thymoglobulin (Sanofi)

Antithymocyte immunoglobulin (rabbit) 25 mg Thymoglobuline 25mg powder and solvent for solution for infusion vials | 1 vial [PoM] £158.77 (Hospital only)

IMMUNOSUPPRESSANTS > ANTIMETABOLITES

Azathioprine

13-Jun-2018

● DRUG ACTION Azathioprine is metabolised to mercaptopurine.

● INDICATIONS AND DOSE

Severe acute Crohn's disease | Maintenance of remission of Crohn's disease | Maintenance of remission of acute ulcerative colitis

▶ BY MOUTH

- ▶ Adult: 2–2.5 mg/kg daily, some patients may respond to lower doses

Rheumatoid arthritis that has not responded to other disease-modifying drugs | Severe systemic lupus erythematosus and other connective tissue disorders | Polymyositis in cases of corticosteroid resistance

▶ BY MOUTH

- ▶ Adult: Initially up to 2.5 mg/kg daily in divided doses, adjusted according to response, rarely more than 3 mg/kg daily; maintenance 1–3 mg/kg daily, consider withdrawal if no improvement within 3 months

Autoimmune conditions

▶ BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 1–3 mg/kg daily, adjusted according to response, consider withdrawal if no improvement within 3 months, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

Suppression of transplant rejection

▶ BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 1–2.5 mg/kg daily, adjusted according to response, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

Severe refractory eczema, normal or high TPMT activity

▶ BY MOUTH

- ▶ Adult: 1–3 mg/kg daily

continued →

Severe refractory eczema, intermediate TPMT activity

▶ BY MOUTH

▶ Adult: 0.5–1.5 mg/kg daily

Generalised myasthenia gravis

▶ BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Adult: Initially 0.5–1 mg/kg daily, then increased to 2–2.5 mg/kg daily, dose is increased over 3–4 weeks, azathioprine is usually started at the same time as the corticosteroid and allows a lower maintenance dose of the corticosteroid to be used, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

DOSE ADJUSTMENTS DUE TO INTERACTIONS

▶ Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

● **UNLICENSED USE** Azathioprine doses given in BNF for suppression of transplant rejection and autoimmune conditions may differ from those in product literature. Use for severe refractory eczema is unlicensed.

● **CONTRA-INDICATIONS**

▶ When used for severe refractory eczema absent thiopurine methyltransferase (TPMT) activity · very low thiopurine methyltransferase (TPMT) activity

● **CAUTIONS** Reduce dose in elderly · reduced thiopurine methyltransferase activity● **INTERACTIONS** → Appendix 1: azathioprine● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**▶ **Common or very common** Bone marrow depression (dose-related) · increased risk of infection · leucopenia · pancreatitis · thrombocytopenia▶ **Uncommon** Anaemia · hepatic disorders · hypersensitivity▶ **Rare or very rare** Agranulocytosis · alopecia · bone marrow disorders · diarrhoea · gastrointestinal disorders · neoplasms · photosensitivity reaction · pneumonitis · severe cutaneous adverse reactions (SCARs)▶ **Frequency not known** Nodular regenerative hyperplasia · sinusoidal obstruction syndrome**SPECIFIC SIDE-EFFECTS**

▶ With oral use Nausea

SIDE-EFFECTS, FURTHER INFORMATION Side-effects may require drug withdrawal.**Hypersensitivity reactions** Hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and renal dysfunction) call for immediate withdrawal.**Neutropenia and thrombocytopenia** Neutropenia is dose-dependent. Management of neutropenia and thrombocytopenia requires careful monitoring and dose adjustment.**Nausea** Nausea is common early in the course of treatment and usually resolves after a few weeks without an alteration in dose. Moderate nausea can be managed by using divided daily doses, taking doses after food, prescribing concurrent antiemetics or temporarily reducing the dose.● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in hypersensitivity to mercaptopurine.● **PREGNANCY** Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in *animal* studies. The use of azathioprine during pregnancy needs to be supervised in specialist

units. Treatment should not generally be initiated during pregnancy.

● **BREAST FEEDING** Present in milk in low concentration. No evidence of harm in small studies—use if potential benefit outweighs risk.● **HEPATIC IMPAIRMENT** Manufacturer advises caution (impaired metabolism)—monitor liver function and complete blood count more frequently in those with severe impairment.**Dose adjustments** Manufacturer advises use doses at lower end of the dose range in hepatic failure; reduce dose if hepatic or haematological toxicity occur.● **RENAL IMPAIRMENT****Dose adjustments** Reduce dose.● **PRE-TREATMENT SCREENING**

Thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

● **MONITORING REQUIREMENTS**

▶ Monitor for toxicity throughout treatment.

▶ Monitor full blood count weekly (more frequently with higher doses or if severe renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.

▶ Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment.

● **DIRECTIONS FOR ADMINISTRATION**▶ With intravenous use For *intravenous injection*, give over at least 1 minute (followed by 50 mL sodium chloride intravenous infusion). For *intravenous infusion* (Imuran®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute 50 mg with 5–15 mL Water for Injections; dilute requisite dose to a volume of 20–200 mL with infusion fluid. Intravenous injection is alkaline and very irritant, intravenous route should therefore be used **only** if oral route not feasible.● **PATIENT AND CARER ADVICE**

Bone marrow suppression Patients and their carers should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution**Tablet**

IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS

Ciclosporin

26-Nov-2019

(Cyclosporin)

- **DRUG ACTION** Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

● INDICATIONS AND DOSE

Severe acute ulcerative colitis refractory to corticosteroid treatment

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Adult: 2 mg/kg, to be given over 24 hours, dose adjusted according to blood-ciclosporin concentration and response

Severe active rheumatoid arthritis (administered on expert advice)

- ▶ BY MOUTH
- ▶ Adult: Initially 1.5 mg/kg twice daily, increased if necessary up to 2.5 mg/kg twice daily after 6 weeks, dose increases should be made gradually, for maintenance treatment, titrate dose individually to the lowest effective dose according to tolerability, treatment may be required for up to 12 weeks

Severe active rheumatoid arthritis [in combination with low-dose methotrexate, when methotrexate monotherapy has been ineffective] (administered on expert advice)

- ▶ BY MOUTH
- ▶ Adult: Initially 1.25 mg/kg twice daily, increased if necessary up to 2.5 mg/kg twice daily after 6 weeks, dose increases should be made gradually, for maintenance treatment, titrate dose individually to the lowest effective dose according to tolerability, treatment may be required for up to 12 weeks

Short-term treatment of severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

- ▶ BY MOUTH
- ▶ Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily) usual maximum duration of 8 weeks but may be used for longer under specialist supervision, if good initial response not achieved within 2 weeks, increase dose rapidly up to maximum

Short-term treatment of very severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

- ▶ BY MOUTH
- ▶ Adult: 2.5 mg/kg twice daily usual maximum duration of 8 weeks but may be used for longer under specialist supervision

Severe psoriasis where conventional therapy ineffective or inappropriate (administered on expert advice)

- ▶ BY MOUTH
- ▶ Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily), increased gradually to maximum if no improvement within 1 month, initial dose of 2.5 mg/kg twice daily justified if condition requires rapid improvement; discontinue if inadequate response after 3 months at the optimum dose; max. duration of treatment usually 1 year unless other treatments cannot be used

Organ transplantation (used alone)

- ▶ BY MOUTH
- ▶ Adult: 10–15 mg/kg, to be administered 4–12 hours before transplantation, followed by 10–15 mg/kg daily for 1–2 weeks postoperatively, then maintenance 2–6 mg/kg daily, reduce dose gradually to

maintenance. Dose should be adjusted according to blood-ciclosporin concentration and renal function; dose is lower if given concomitantly with other immunosuppressant therapy (e.g. corticosteroids); if necessary one-third corresponding oral dose can be given by intravenous infusion over 2–6 hours

Bone-marrow transplantation | Prevention and treatment of graft-versus-host disease

- ▶ INITIALLY BY INTRAVENOUS INFUSION
- ▶ Adult: 3–5 mg/kg daily, to be administered over 2–6 hours from day before transplantation to 2 weeks postoperatively, alternatively (by mouth) initially 12.5–15 mg/kg daily, then (by mouth) 12.5 mg/kg daily for 3–6 months and then tailed off (may take up to a year after transplantation)

Nephrotic syndrome

- ▶ BY MOUTH
- ▶ Adult: 5 mg/kg daily in 2 divided doses, for maintenance reduce to lowest effective dose according to proteinuria and serum creatinine measurements; discontinue after 3 months if no improvement in glomerulonephritis or glomerulosclerosis (after 6 months in membranous glomerulonephritis)

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ With oral use Manufacturer advises increase dose by 50% or switch to intravenous administration with concurrent use of octreotide.

- **UNLICENSED USE** Not licensed for use in severe acute ulcerative colitis refractory to corticosteroid treatment.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CICLOSPORIN MUST BE PRESCRIBED AND DISPENSED BY BRAND NAME (DECEMBER 2009)

Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration.

- **CONTRA-INDICATIONS** Malignancy (in non-transplant indications) · uncontrolled hypertension (in non-transplant indications) · uncontrolled infections (in non-transplant indications)
- **CAUTIONS** Elderly—monitor renal function · hyperuricaemia · in atopic dermatitis, active herpes simplex infections—allow infection to clear before starting (if they occur during treatment withdraw if severe) · in atopic dermatitis, *Staphylococcus aureus* skin infections—not absolute contra-indication providing controlled (but avoid erythromycin unless no other alternative) · in psoriasis treat, patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option) · in uveitis, Behcet's syndrome (monitor neurological status) · lymphoproliferative disorders (discontinue treatment) · malignancy
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Malignancy In psoriasis, exclude malignancies (including those of skin and cervix) before starting (biopsy any lesions not typical of psoriasis) and treat patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option); discontinue if lymphoproliferative disorder develops.
- **INTERACTIONS** → Appendix 1: ciclosporin
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

 - ▶ Common or very common Eye inflammation

SPECIFIC SIDE-EFFECTS

 - ▶ Common or very common Appetite decreased · diarrhoea · electrolyte imbalance · fatigue · fever · flushing · gastrointestinal discomfort · gingival hyperplasia · hair changes · headaches · hepatic disorders · hyperglycaemia ·

- hyperlipidaemia · hypertension · hyperuricaemia · leucopenia · muscle complaints · nausea · paraesthesia · peptic ulcer · renal impairment (renal structural changes on long-term administration) · seizure · skin reactions · tremor · vomiting
- ▶ **Uncommon** Anaemia · encephalopathy · oedema · thrombocytopenia · weight increased
 - ▶ **Rare or very rare** Gynaecomastia · haemolytic anaemia · idiopathic intracranial hypertension · menstrual disorder · multifocal motor neuropathy · muscle weakness · myopathy · pancreatitis
 - ▶ **Frequency not known** Pain in extremity · thrombotic microangiopathy
 - **PREGNANCY** Crosses placenta; manufacturer advises avoid unless potential benefit outweighs risk—*toxicity in animal studies.*
 - **BREAST FEEDING** Manufacturer advises avoid—present in milk.
 - **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (risk of increased exposure).
Dose adjustments Manufacturer advises consider dose reduction in severe impairment to maintain blood-cyclosporin concentration in target range—monitor until concentration stable.
 - **RENAL IMPAIRMENT**
Dose adjustments In non-transplant indications, manufacturer advises establishing baseline renal function before initiation of treatment; if baseline function is impaired in non-transplant indications, except nephrotic syndrome—avoid. In nephrotic syndrome, manufacturer advises initial dose should not exceed 2.5 mg/kg daily in patients with baseline renal impairment. *During treatment* for non-transplant indications, manufacturer recommends if eGFR decreases by more than 25% below baseline on more than one measurement, reduce dose by 25–50%. If the eGFR decrease from baseline exceeds 35%, further dose reduction should be considered (even if within normal range); discontinue if reduction not successful within 1 month.
 - **MONITORING REQUIREMENTS** Monitor whole blood cyclosporin concentration (though level dependent on indication—consult local treatment protocol for details). Dermatological and physical examination, including blood pressure and renal function measurements required at least twice before starting treatment for psoriasis or atopic dermatitis. Monitor liver function. Monitor serum potassium, especially in renal dysfunction (risk of hyperkalaemia). Monitor serum magnesium. Measure blood lipids before treatment and after the first month of treatment. In psoriasis and atopic dermatitis monitor serum creatinine every 2 weeks for first 3 months then every month. Investigate lymphadenopathy that persists despite improvement in atopic dermatitis. Monitor kidney function—dose dependent increase in serum creatinine and urea during first few weeks may necessitate dose reduction in transplant patients (exclude rejection if kidney transplant) or discontinuation in non-transplant patients. Monitor blood pressure—discontinue if hypertension develops that cannot be controlled by antihypertensives. In long-term management of nephrotic syndrome, perform renal biopsies at yearly intervals. In rheumatoid arthritis measure serum creatinine at least twice before treatment. During treatment, monitor serum creatinine every 2 weeks for first 3 months, then every month for a further 3 months, then every 4–8 weeks depending on the stability of the disease, concomitant medication, and concomitant diseases (or more frequently if dose increased or concomitant NSAIDs introduced or increased). Monitor hepatic function if concomitant NSAIDs given.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With oral use Mix solution with orange or apple juice, or other soft drink (to improve taste) immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. Total daily dose should be taken in 2 divided doses.
- ▶ With intravenous use For *intravenous infusion (Sandimmun®)*, give intermittently or continuously in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 50 mg in 20–100 mL; give intermittent infusion over 2–6 hours; not to be used with PVC equipment. Observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter.
- **PRESCRIBING AND DISPENSING INFORMATION**
Brand name prescribing Prescribing and dispensing of cyclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of cyclosporin, the patient should be monitored closely for changes in blood-cyclosporin concentration, serum creatinine, blood pressure, and transplant function (for transplant indications). *Sandimmun®* capsules and oral solution are available direct from Novartis for patients who cannot be transferred to a different oral preparation.
- **PATIENT AND CARER ADVICE** Patients and carers should be counselled on the administration of different formulations of cyclosporin. Manufacturer advises avoid excessive exposure to UV light, including sunlight. In psoriasis and atopic dermatitis, avoid use of UVB or PUVA.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

CAUTIONARY AND ADVISORY LABELS 11

Sirolimus

16-Nov-2017

- **DRUG ACTION** Sirolimus is a non-calcineurin inhibiting immunosuppressant.

● INDICATIONS AND DOSE

Prophylaxis of organ rejection in kidney allograft recipients

▶ BY MOUTH

- ▶ **Adult:** Initially 6 mg for 1 dose, to be given after surgery once wound has healed, then 2 mg once daily; to be given in combination with ciclosporin and corticosteroid for 2–3 months (sirolimus doses should be given 4 hours after ciclosporin), ciclosporin should then be withdrawn over 4–8 weeks (if not possible, sirolimus should be discontinued and an alternate immunosuppressive regimen used), dose to be adjusted according to whole blood-sirolimus trough concentration

DOSE EQUIVALENCE AND CONVERSION

- ▶ The 500 microgram tablet is not bioequivalent to the 1 mg and 2 mg tablets. Multiples of 500 microgram tablets should **not** be used as a substitute for other tablet strengths.

- **CAUTIONS** Hyperlipidaemia · increased susceptibility to infection (especially urinary-tract infection) · increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light)
- **INTERACTIONS** → Appendix 1: sirolimus
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · anaemia · arthralgia · ascites · constipation · diabetes mellitus · diarrhoea · dyslipidaemia · electrolyte imbalance · embolism and thrombosis · fever · haemolytic uraemic syndrome · haemorrhage · headache · healing impaired · hyperglycaemia · hypertension · increased risk of infection · leucopenia · lymphatic vessel disorders · menstrual cycle irregularities · nausea · neoplasms · neutropenia · oedema · osteonecrosis · ovarian cyst · pain · pancreatitis · pericardial effusion · proteinuria · respiratory disorders ·

sepsis · skin reactions · stomatitis · tachycardia · thrombocytopenia

- ▶ **Uncommon** Antibiotic associated colitis · focal segmental glomerulosclerosis · hepatic failure · nephrotic syndrome · pancytopenia · post transplant lymphoproliferative disorder
- ▶ **Frequency not known** Posterior reversible encephalopathy syndrome (PRES)
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment and for 12 weeks after stopping.
- **PREGNANCY** Avoid unless essential—toxicity in *animal* studies.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).
Dose adjustments Manufacturer advises maintenance dose reduction of approx. 50% in severe impairment—monitor whole blood-sirolimus trough concentration every 5–7 days until 3 consecutive measurements have shown stable blood-sirolimus concentration.
- **MONITORING REQUIREMENTS**
- ▶ Monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses).
- ▶ Manufacturer advises pre-dose ('trough') whole blood-sirolimus concentration (using **chromatographic** assay) when used with ciclosporin should be 4–12 micrograms/litre (local treatment protocols may differ); after withdrawal of ciclosporin pre-dose whole blood-sirolimus concentration should be 12–20 micrograms/litre (local treatment protocols may differ).
- ▶ Close monitoring of whole blood-sirolimus concentration required if concomitant treatment with potent inducers or inhibitors of metabolism and after discontinuing them, or if ciclosporin dose reduced significantly or stopped.
- ▶ When changing between oral solution and tablets, measurement of whole blood 'trough' sirolimus concentration after 1–2 weeks is recommended.
- ▶ Therapeutic drug monitoring assays Sirolimus whole-blood concentration is measured using either high performance liquid chromatography (HPLC) or immunoassay. Switching between different immunoassays or between an immunoassay and HPLC can lead to clinically significant differences in results and therefore incorrect dose adjustments. Adjustment to the target therapeutic dose range should be made with knowledge of the assay used and corresponding reference range.
- ▶ Monitor kidney function when given with ciclosporin; monitor lipids; monitor urine proteins.
- **DIRECTIONS FOR ADMINISTRATION** Food may affect absorption (take at the same time with respect to food). Sirolimus oral solution should be mixed with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sirolimus.
 Patients should be advised to avoid excessive exposure to UV light.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **NICE decisions**
- ▶ **Immunosuppressive therapy for kidney transplant in adults (October 2017)** NICE TA481
 Sirolimus is not recommended as an initial treatment to prevent organ rejection in adults having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their

funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA481

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCIPIENTS: May contain Ethanol

▶ Rapamune (Pfizer Ltd)

Sirolimus 1 mg per 1 ml Rapamune 1mg/ml oral solution sugar-free | 60 ml **[PoM]** £162.41 DT = £162.41

Tablet

▶ Rapamune (Pfizer Ltd)

Sirolimus 500 microgram Rapamune 0.5mg tablets | 30 tablet **[PoM]** £69.00 DT = £69.00

Sirolimus 1 mg Rapamune 1mg tablets | 30 tablet **[PoM]** £86.49 DT = £86.49

Sirolimus 2 mg Rapamune 2mg tablets | 30 tablet **[PoM]** £172.98 DT = £172.98

Tacrolimus

16-Apr-2020

- **DRUG ACTION** Tacrolimus is a calcineurin inhibitor.

• INDICATIONS AND DOSE

ADOPORT®

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

▶ BY MOUTH

- ▶ Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

▶ BY MOUTH

- ▶ Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

▶ BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

▶ BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allgraft rejection resistant to conventional immunosuppressive therapy

▶ BY MOUTH

- ▶ Adult: Seek specialist advice

ADVAGRAF®

Prophylaxis of graft rejection following liver transplantation, starting 12–18 hours after transplantation

▶ BY MOUTH

- ▶ Adult: Initially 100–200 micrograms/kg once daily, to be taken in the morning

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

▶ BY MOUTH

- ▶ Adult: Initially 200–300 micrograms/kg once daily, to be taken in the morning

Allgraft rejection resistant to conventional immunosuppressive therapy

▶ BY MOUTH

- ▶ Adult: Seek specialist advice

ENVARSUS® MODIFIED-RELEASE TABLETS

Prophylaxis of graft rejection following liver transplantation, starting within 24 hours of transplantation

▶ BY MOUTH

- ▶ Adult: Initially 110–130 micrograms/kg once daily, to be taken in the morning

Prophylaxis of graft rejection following renal transplantation, starting within 24 hours of transplantation

▶ BY MOUTH

- ▶ Adult: Initially 170 micrograms/kg once daily, to be taken in the morning

Rejection therapy

▶ BY MOUTH

- ▶ Adult: Seek specialist advice

MODIGRAF®

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

▶ BY MOUTH

- ▶ Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

▶ BY MOUTH

- ▶ Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

▶ BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

▶ BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Rejection therapy

▶ BY MOUTH

- ▶ Adult: Seek specialist advice

PROGRAF® CAPSULES

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

▶ BY MOUTH

- ▶ Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

▶ BY MOUTH

- ▶ Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

▶ BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

▶ BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy

- ▶ BY MOUTH
- ▶ Adult: Seek specialist advice

PROGRAF® INFUSION**Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation when oral route not appropriate**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 10–50 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation when oral route not appropriate

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 50–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Allograft rejection resistant to conventional immunosuppressive therapy

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Adult: Seek specialist advice (consult local protocol)

DOSE EQUIVALENCE AND CONVERSION

- ▶ For *Prograf*®: Intravenous and oral doses are **not** interchangeable due to differences in bioavailability. Follow correct dosing recommendations for the dosage form when switching formulations.

TACNI®**Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation**

- ▶ BY MOUTH
- ▶ Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy

- ▶ BY MOUTH
- ▶ Adult: Seek specialist advice

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ORAL TACROLIMUS PRODUCTS: PRESCRIBE AND DISPENSE BY BRAND NAME ONLY, TO MINIMISE THE RISK OF INADVERTENT SWITCHING BETWEEN PRODUCTS, WHICH HAS BEEN ASSOCIATED WITH REPORTS OF TOXICITY AND GRAFT REJECTION (JUNE 2012)

Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.

- *Adoport*®, *Prograf*®, *Capexion*® and *Tacni*® are immediate-release capsules that are taken twice daily, once in the morning and once in the evening;
- *Modigraf*® granules are used to prepare an immediate-release oral suspension which is taken twice daily, once in the morning and once in the evening;
- *Advagraf*® is a prolonged-release capsule that is taken once daily in the morning.

Switching between tacrolimus brands requires careful supervision and therapeutic monitoring by an appropriate specialist.

Important: *Envarsus*® is not interchangeable with other oral tacrolimus containing products; the MHRA has advised (June 2012) that oral tacrolimus products should be prescribed and dispensed by brand only.

- **CAUTIONS** Increased risk of infections · lymphoproliferative disorders · malignancies · neurotoxicity · QT-interval prolongation · UV light (avoid excessive exposure to sunlight and sunlamps)
- **INTERACTIONS** → Appendix 1: tacrolimus
- **SIDE-EFFECTS**
- **GENERAL SIDE-EFFECTS**
- ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arrhythmias · ascites · asthenic conditions · bile duct disorders · confusion · consciousness impaired · constipation · coronary artery disease · cough · depression · diabetes mellitus · diarrhoea · dizziness · dysgraphia · dyslipidaemia · dyspnoea · electrolyte imbalance · embolism and thrombosis · eye disorder · febrile disorders · fluid imbalance · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal inflammatory disorders · haemorrhage · hallucination · headache · hepatic disorders · hyperglycaemia · hyperhidrosis · hypertension · hyperuricaemia · hypotension · increased risk of infection · ischaemia · joint disorders · leucocytosis · leucopenia · metabolic acidosis · mood altered · muscle spasms · nasal complaints · nausea · nephropathy · nervous system disorder · oedema · oral disorders · pain · peripheral neuropathy · peripheral vascular disease · primary transplant dysfunction · psychiatric disorder · renal impairment · renal tubular necrosis · respiratory disorders · seizure · sensation abnormal · skin reactions · sleep disorders · temperature sensation altered · thrombocytopenia · tinnitus · tremor · urinary tract disorder · urine abnormal · vision disorders · vomiting · weight changes
- ▶ **Uncommon** Asthma · cardiac arrest · cardiomyopathy · cataract · central nervous system haemorrhage · chest discomfort · coagulation disorders · coma · dysmenorrhoea · encephalopathy · feeling abnormal · haemolytic anaemia · hearing impairment · heart failure · hypoglycaemia · hypoproteinaemia · influenza like illness · memory loss · multi organ failure · neutropenia · palpitations ·

pancreatitis · pancytopenia · paralysis · paresis · photosensitivity reaction · psychotic disorder · shock · speech disorder · stroke · ventricular hypertrophy

- ▶ **Rare or very rare** Fall · hirsutism · mobility decreased · muscle tone increased · muscle weakness · pancreatic pseudocyst · pericardial effusion · QT interval prolongation · severe cutaneous adverse reactions (SCARs) · sinusoidal obstruction syndrome · thirst · ulcer
- ▶ **Frequency not known** Agranulocytosis · neoplasm malignant · neoplasms · polyomavirus-associated nephropathy · progressive multifocal leukoencephalopathy (PML) · pure red cell aplasia

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Anaphylactoid reaction (due to excipient) · hypersensitivity

SIDE-EFFECTS, FURTHER INFORMATION Cardiomyopathy has been reported to occur primarily in children with tacrolimus blood trough concentrations much higher than the recommended maximum levels. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to macrolides.
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment.
- **PREGNANCY** Avoid unless potential benefit outweighs risk—crosses the placenta and risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia.
- **BREAST FEEDING** Avoid—present in breast milk (following systemic administration).
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **Dose adjustments** Manufacturer advises consider dose reduction in severe impairment.

● MONITORING REQUIREMENTS

- ▶ After initial dosing, and for maintenance treatment, tacrolimus doses should be adjusted according to whole-blood concentration. Monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details.
- ▶ Monitor blood pressure, ECG (for hypertrophic changes—risk of cardiomyopathy), fasting blood-glucose concentration, haematological and neurological (including visual) and coagulation parameters, electrolytes, hepatic and renal function.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion (Prograf®)*; give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute concentrate in infusion fluid to a final concentration of 4–100 micrograms/mL; give over 24 hours. Tacrolimus is incompatible with PVC.

- **PATIENT AND CARER ADVICE** Avoid excessive exposure to UV light including sunlight.

Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Immunosuppressive therapy for kidney transplant in adults (October 2017)** NICE TA481
Immediate-release tacrolimus, when used as part of an immunosuppressive regimen, is recommended as an initial option to prevent organ rejection in adults having a kidney transplant. Treatment should be started with the least expensive product, but if this is not suitable, an alternative dosage form may be given. Tacrolimus granules for oral suspension (*Modigraf®*) should be used only if the manufacturer provides it at the same price or lower than that agreed with the Commercial Medicines Unit. Patients whose treatment was started within the NHS before this

guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA481

- ▶ **Immunosuppressive therapy for kidney transplant in adults (October 2017)** NICE TA481

Prolonged-release tacrolimus is not recommended as an initial treatment to prevent organ rejection in adults having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA481

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (December 2010) that tacrolimus granules for suspension (*Modigraf®*) are accepted for restricted use within NHS Scotland in patients for whom tacrolimus is an appropriate choice of immunosuppressive therapy and where small changes (less than 500 micrograms) in dosing increments are required (such as, in paediatric patients) or in seriously ill patients who are unable to swallow tacrolimus capsules.

The *Scottish Medicines Consortium* has advised (April 2015) that tacrolimus (*Envarsus®*) is accepted for use in NHS Scotland for prophylaxis of graft rejection and treatment of rejection resistant to treatment with other immunosuppressive medicinal products in adults.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES

Canakinumab

20-Jun-2019

- **DRUG ACTION** Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding.

● INDICATIONS AND DOSE

Gouty arthritis [in patients whose condition has not responded adequately to treatment with NSAIDs or colchicine, or in those with contra-indications or intolerances to them, and in whom repeated courses of corticosteroids are inappropriate]

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 150 mg for 1 dose, in patients who respond, dose may be repeated after at least 12 weeks if symptoms recur, to be administered to the upper thigh, abdomen, upper arm or buttocks

Cryopyrin-associated periodic syndromes (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (body-weight 41 kg and above): 150 mg every 8 weeks, to be administered to the upper thigh, abdomen, upper arm or buttocks, additional doses may be considered if clinical response not achieved within 7 days—consult product literature

Tumour necrosis factor receptor associated periodic syndrome (specialist use only) | Hyperimmunoglobulin D syndrome (specialist use only) | Familial Mediterranean fever (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (body-weight 41 kg and above): 150 mg every 4 weeks, to be administered to the upper thigh, abdomen, upper arm or buttocks, a second dose may be considered if clinical response not achieved within 7 days—consult product literature

Still's disease (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 4 mg/kg every 4 weeks (max. per dose 300 mg), to be administered to the upper thigh, abdomen, upper arm or buttocks

- **CONTRA-INDICATIONS** Active severe infection · leucopenia · neutropenia
- **CAUTIONS** History of recurrent infection · latent and active tuberculosis · predisposition to infection
- CAUTIONS, FURTHER INFORMATION**
- ▶ Vaccinations Patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature for further information.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain upper · arthralgia · asthenia · dizziness · increased risk of infection · leucopenia · neutropenia · pain · proteinuria · vertigo
- ▶ **Uncommon** Gastroesophageal reflux disease
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for up to 3 months after last dose.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Consider if benefit outweighs risk—not known if present in human milk.
- **RENAL IMPAIRMENT** Limited information available but manufacturer advises no dose adjustment required.
- **PRE-TREATMENT SCREENING** Patients should be evaluated for latent and active tuberculosis before starting treatment.
- **MONITORING REQUIREMENTS**
- ▶ Manufacturer advises monitor full blood count including neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter.
- ▶ Manufacturer advises monitor for signs and symptoms of infection (including tuberculosis) during and after treatment.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C).
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should be instructed to seek medical advice if signs or symptoms suggestive of tuberculosis (including persistent cough, weight loss and subfebrile temperature) occur.
- Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and drowsiness.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Ilaris** (Novartis Pharmaceuticals UK Ltd)
Canakinumab 150 mg per 1 ml Ilaris 150mg/1ml solution for injection vials | 1 vial [PoM] £9,927.80

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES > ANTI-LYMPHOCYTE

Basiliximab

16-Nov-2017

- **DRUG ACTION** Basiliximab is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation.
- **INDICATIONS AND DOSE**
- Prophylaxis of acute rejection in allogeneic renal transplantation used in combination with ciclosporin and corticosteroid-containing immunosuppression regimens (specialist use only)**
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 20 mg, administered within 2 hours before transplant surgery, followed by 20 mg after 4 days, dose to be administered after surgery, withhold second dose if severe hypersensitivity or graft loss occurs
- **CAUTIONS** Off-label use in cardiac transplantation—increased risk of serious cardiac side-effects
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS** Anaemia · capillary leak syndrome · constipation · cytokine release syndrome · diarrhoea · dyspnoea · electrolyte imbalance · headache · heart failure · hypercholesterolaemia · hypersensitivity · hypertension · hypotension · increased risk of infection · myocardial infarction · nausea · pain · peripheral oedema · post procedural wound complication · pulmonary oedema · respiratory disorders · skin reactions · sneezing · tachycardia · weight increased
- **CONCEPTION AND CONTRACEPTION** Adequate contraception must be used during treatment and for 16 weeks after last dose.

- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Simulect*®) give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute 10 mg with 2.5 mL water for injections then dilute to at least 25 mL with infusion fluid; reconstitute 20 mg with 5 mL water for injections then dilute to at least 50 mL with infusion fluid; give over 20–30 minutes.
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - **NICE decisions**
 - ▶ **Immunosuppressive therapy for kidney transplant in adults (October 2017)** NICE TA481

Basiliximab, when used as part of an immunosuppressive regimen that includes a calcineurin inhibitor, is recommended as an initial option to prevent organ rejection in adults having a kidney transplant. The use of basiliximab with tacrolimus is outside the terms of the marketing authorisation. If this combination is prescribed, the prescriber should follow relevant professional guidance, taking full responsibility for the decision. Informed consent should be obtained and documented.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA481

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
 - **Powder and solvent for solution for injection**
 - ▶ **Simulect** (Novartis Pharmaceuticals UK Ltd)
 - **Basiliximab 10 mg** Simulect 10mg powder and solvent for solution for injection vials | 1 vial (PoM) £758.69 (Hospital only)
 - **Basiliximab 20 mg** Simulect 20mg powder and solvent for solution for injection vials | 1 vial (PoM) £842.38 (Hospital only)

Belimumab

21-May-2019

● INDICATIONS AND DOSE

Adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** 10 mg/kg every 2 weeks for 3 doses, then 10 mg/kg every 4 weeks, review treatment if no response within 6 months

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BELIMUMAB (*BENLYSTA*®): INCREASED RISK OF SERIOUS PSYCHIATRIC EVENTS SEEN IN CLINICAL TRIALS (APRIL 2019)

Clinical trials show an increased risk of depression, suicidal ideation or behaviour, or self-injury in patients with systemic lupus erythematosus on belimumab. Healthcare professionals should assess patients for these risks before starting treatment, monitor for new or worsening signs of these risks during treatment, and advise patients to seek immediate medical attention if new or worsening symptoms occur.

- **CAUTIONS** Do not initiate until active infections controlled · history or development of malignancy · predisposition to infection
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Depression · diarrhoea · fever · hypersensitivity · increased risk of infection · infusion

related reaction · leucopenia · migraine · nausea · pain in extremity

- ▶ **Uncommon** Angioedema · skin reactions · suicidal tendencies
- ▶ **Frequency not known** Progressive multifocal leukoencephalopathy (PML) · self-injurious behaviour · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related side-effects are reported commonly, including severe or life-threatening hypersensitivity and infusion reactions. Premedication with an antihistamine, with or without an antipyretic may be considered.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment and for at least 4 months after last dose.
- **PREGNANCY** Avoid unless essential.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Delay in the onset of acute hypersensitivity reactions has been observed; patients should remain under clinical supervision for several hours following at least the first 2 infusions.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Benlysta*®), give intermittently in Sodium chloride 0.9%; reconstitute with water for injections (120 mg in 1.5 mL, 400 mg in 4.8 mL) to produce a solution containing 80 mg/mL; gently swirl vial for 60 seconds, then allow to stand; swirl vial (without shaking) for 60 seconds every 5 minutes until dissolved; dilute requisite dose with infusion fluid to a final volume of 250 mL and give over 1 hour.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Belimumab for treating active autoantibody-positive systemic lupus erythematosus (June 2016)** NICE TA397

Belimumab (*Benlysta*®) is recommended as an add-on treatment option in adults with active autoantibody-positive systemic lupus erythematosus, only if all of the following criteria apply:

- there is evidence for serological disease activity (defined as positive anti-double-stranded DNA and low complement) and a Safety of Estrogen in Lupus National Assessment – Systemic Lupus Erythematosus Disease Activity Index (SELENA-SLEDAI) score of greater than or equal to 10 despite standard therapy;
- treatment with belimumab is continued after 24 weeks only if the SELENA-SLEDAI score has improved by 4 points or more;
- the manufacturer provides belimumab with the discount agreed in the patient access scheme; **and**
- under the conditions specified in the NICE managed access agreement documentation.

Patients whose treatment was started before this guidance was published should continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta397

Scottish Medicines Consortium (SMC) decisions

SMC No. 775/12

The *Scottish Medicines Consortium* has advised (May 2017) that belimumab (*Benlysta*®) is accepted for restricted use within NHS Scotland as adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy, and who have evidence of serological disease activity and a Safety of Estrogens in Lupus Erythematosus National Assessment-Systemic Lupus Erythematosus Disease Activity Index (SELENA-SLEDAI) score of 10 or greater. This advice is contingent

upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Benlysta** (GlaxoSmithKline UK Ltd) ▼

Belimumab 120 mg Benlysta 120mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £121.50 (Hospital only)

Belimumab 400 mg Benlysta 400mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £405.00 (Hospital only)

IMMUNOSUPPRESSANTS > PURINE SYNTHESIS INHIBITORS

Mycophenolate mofetil

09-Mar-2018

● INDICATIONS AND DOSE

Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and ciclosporin) (under expert supervision)

▶ BY MOUTH

Adult: 1 g twice daily, to be started within 72 hours of transplantation

▶ BY INTRAVENOUS INFUSION

Adult: 1 g twice daily for maximum 14 days, then transfer to oral therapy, to be started within 24 hours of transplantation

Prophylaxis of acute rejection in cardiac transplantation (in combination with ciclosporin and corticosteroids) (under expert supervision)

▶ BY MOUTH

Adult: 1.5 g twice daily, to be started within 5 days of transplantation

Prophylaxis of acute rejection in hepatic transplantation (in combination with ciclosporin and corticosteroids) (under expert supervision)

▶ INITIALLY BY INTRAVENOUS INFUSION

Adult: 1 g twice daily for 4 days, up to a maximum of 14 days, to be started within 24 hours of transplantation, then (by mouth) 1.5 g twice daily, the dose route should be changed as soon as is tolerated

CEPTAVA®

Renal transplantation (specialist use only)

▶ BY MOUTH

Adult: 720 mg twice daily, to be started within 72 hours of transplantation

DOSE EQUIVALENCE AND CONVERSION

▶ For *Ceptava*®: Mycophenolic acid 720 mg is approximately equivalent to mycophenolate mofetil 1 g but avoid unnecessary switching because of pharmacokinetic differences.

MYFORTIC®

Renal transplantation (specialist use only)

▶ BY MOUTH

Adult: 720 mg twice daily, to be started within 72 hours of transplantation

DOSE EQUIVALENCE AND CONVERSION

▶ For *Myfortic*®: Mycophenolic acid 720 mg is approximately equivalent to mycophenolate mofetil 1 g but avoid unnecessary switching because of pharmacokinetic differences.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: MYCOPHENOLATE MOFETIL, MYCOPHENOLIC ACID: UPDATED CONTRACEPTION ADVICE FOR MALE PATIENTS (FEBRUARY 2018)

Available clinical evidence does not indicate an increased risk of malformations or miscarriage in

pregnancies where the father was taking mycophenolate medicines, however mycophenolate mofetil and mycophenolic acid are genotoxic and a risk cannot be fully excluded; for further information, see Conception and contraception and Patient and carer advice.

- **CAUTIONS** Active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation) · children (higher incidence of side-effects may call for temporary reduction of dose or interruption) · delayed graft function · elderly (increased risk of infection, gastro-intestinal haemorrhage and pulmonary oedema) · increased susceptibility to skin cancer (avoid exposure to strong sunlight) · risk of hypogammaglobulinaemia or bronchiectasis when used in combination with other immunosuppressants

CAUTIONS, FURTHER INFORMATION

- ▶ Hypogammaglobulinaemia or bronchiectasis Measure serum immunoglobulin levels if recurrent infections develop, and consider bronchiectasis or pulmonary fibrosis if persistent respiratory symptoms such as cough and dyspnoea develop.

- **INTERACTIONS** → Appendix 1: mycophenolate

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Acidosis · alopecia · anaemia · appetite decreased · arthralgia · asthenia · bone marrow disorders · chills · constipation · cough · depression · diarrhoea · drowsiness · dyslipidaemia · dyspnoea · electrolyte imbalance · fever · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal haemorrhage · headache · hyperglycaemia · hypertension · hypotension · increased risk of infection · insomnia · leucocytosis · leucopenia · malaise · nausea · neoplasms · oedema · oral disorders · pain · pancreatitis · paraesthesia · renal impairment · respiratory disorders · seizure · sepsis · skin reactions · tachycardia · thinking abnormal · thrombocytopenia · tremor · vomiting · weight decreased
- ▶ **Uncommon** Agranulocytosis
- ▶ **Frequency not known** Endocarditis · hypogammaglobulinaemia · malignancy · meningitis · neutropenia · polyomavirus-associated nephropathy · progressive multifocal leukoencephalopathy (PML) · pure red cell aplasia

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intravenous use Hepatitis · muscle tone increased
- ▶ With oral use Anxiety · burping · confusion · dizziness · gout · hepatic disorders · hyperbilirubinaemia · hyperuricaemia · neuromuscular dysfunction · taste altered · vasodilation
- SIDE-EFFECTS, FURTHER INFORMATION** Cases of pure red cell aplasia have been reported with mycophenolate mofetil; dose reduction or discontinuation should be considered under specialist supervision.

● CONCEPTION AND CONTRACEPTION

Pregnancy prevention The MHRA advises to exclude pregnancy in females of child-bearing potential before treatment—2 pregnancy tests 8–10 days apart are recommended. Women should use at least 1 method of effective contraception before and during treatment, and for 6 weeks after discontinuation—2 methods of effective contraception are preferred. Male patients or their female partner should use effective contraception during treatment and for 90 days after discontinuation.

- **PREGNANCY** Avoid unless no suitable alternative—congenital malformations and spontaneous abortions reported.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **RENAL IMPAIRMENT** No data available in cardiac or hepatic transplant patients with renal impairment.
- **MONITORING REQUIREMENTS** Monitor full blood count every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops).
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For *intravenous infusion (CellCept®)*, give intermittently in Glucose 5%; reconstitute each 500–mg vial with 14 mL glucose 5% and dilute the contents of 2 vials in 140 mL infusion fluid; give over 2 hours.
- **PATIENT AND CARER ADVICE**

Pregnancy prevention advice The MHRA advises that prescribers should ensure that female patients understand the need to comply with the pregnancy prevention advice, and they should be informed to seek immediate medical attention if there is a possibility of pregnancy; male patients planning to conceive children should be informed of the implications of both immunosuppression and the effect of the prescribed medications on the pregnancy. Bone marrow suppression Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding.
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - **NICE decisions**
 - ▶ **Immunosuppressive therapy for kidney transplant in adults (October 2017) NICE TA481**
Mycophenolate mofetil, when used as part of an immunosuppressive regimen, is recommended as an initial option to prevent organ rejection in adults having a kidney transplant. Treatment should be started with the least expensive product, but if this is not suitable, an alternative dosage form may be given. The use of mycophenolate mofetil with tacrolimus is outside the terms of the marketing authorisation. If this combination is prescribed, the prescriber should follow relevant professional guidance, taking full responsibility for the decision. Informed consent should be obtained and documented.
Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/TA481
 - ▶ **Immunosuppressive therapy for kidney transplant in adults (October 2017) NICE TA481**
Mycophenolate sodium (*Ceptava®*, *Myfortic®*) is not recommended as an initial treatment to prevent organ rejection in adults having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

1.1 Multiple sclerosis

Multiple sclerosis

17-Dec-2019

Description of condition

Multiple sclerosis is a chronic, immune-mediated, demyelinating inflammatory condition of the central nervous system, which affects the brain, optic nerves and spinal cord, and leads to progressive severe disability.

Relapsing-remitting multiple sclerosis is the most common pattern of the disease. It is characterised by periods of exacerbation of symptoms (relapses) followed by unpredictable periods of stability (remission). The severity and frequency of relapses varies greatly between patients, but on average occur once or twice per year. This clinical pattern often develops into *secondary-progressive* multiple sclerosis, with progressive disability unrelated to relapses. Most patients develop secondary progressive disease 6–10 years after onset.

Primary-progressive multiple sclerosis follows a gradual course, with the development of symptoms that worsen over time, without relapses and remissions.

Progressive-relapsing multiple sclerosis follows a course of steadily worsening neurological function from onset, in addition to acute relapses.

Disease activity in relapsing-remitting multiple sclerosis

Active disease is defined as at least two clinically significant relapses occurring within the last 2 years. *Highly active* disease is characterised by an unchanged/increased relapse rate or by ongoing severe relapses compared with the previous year, despite treatment with interferon beta p. 895. *Rapidly-evolving severe* relapsing-remitting multiple sclerosis is defined by two or more disabling relapses in 1 year, and one or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

Aims of treatment

There is no cure for multiple sclerosis. The overall aims of treatment are to modify the course of the disease and manage symptoms, in order to improve quality of life. Treatment is aimed at reducing the frequency and duration of relapses and at preventing or slowing disability.

Drug treatment

Shared decision-making between the patient and their clinicians is particularly important in the treatment of multiple sclerosis, due to the unpredictability of the condition and the lack of evidence of long-term benefit of treatments. [EVR](#) A discussion about treatment options, disease activity, risk, and benefit should take place to ensure that treatment choices are right for the patient and their circumstances. [A](#) The choice of drug also depends on the patient's disability status, individual tolerance, disease severity and disease activity (see *Disease activity in relapsing-remitting multiple sclerosis* above). [EVR](#) Treatment should be initiated as early as possible, under the supervision of a specialist. [A](#)

Note: NHS England (May 2014) has provided guidance on the use of interferon beta, glatiramer acetate p. 897, fingolimod p. 899 and natalizumab p. 904 for the treatment of multiple sclerosis in England, see *Useful resources* below.

This Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing these treatment options. See also *National funding/access decisions*, under individual monographs for teriflunomide p. 906, dimethyl fumarate p. 898 and alemtuzumab p. 903.

Low levels of vitamin D are believed to be a risk factor for developing multiple sclerosis. Patients with diagnosed multiple sclerosis are usually given regular vitamin D after assessment of their serum levels of vitamin D, but there is insufficient evidence to support its use as a treatment for multiple sclerosis. [EvGr] Patients should not be offered vitamin D solely for the purpose of treating multiple sclerosis. [A]

Relapsing-remitting multiple sclerosis

[EvGr] Disease-modifying drugs are the recommended treatment for patients presenting with *active* relapsing-remitting multiple sclerosis. Interferon beta and glatiramer acetate may be the preferred choice for some patients, due to their established safety profile, and the long term clinical experience associated with their use. [A] Peginterferon beta-1a p. 897 requires less frequent administration and is available as an alternative to the non-pegylated interferon beta therapies.

Teriflunomide and dimethyl fumarate are treatment options for patients with *active* disease. [EvGr] They may be preferred due to their oral route of administration. [A] There is insufficient evidence for the use of either drug to treat *highly active* or *rapidly-evolving severe* relapsing-remitting multiple sclerosis.

[EvGr] More active disease may be treated with natalizumab or alemtuzumab. The MHRA has released restrictions on the use of alemtuzumab due to reports of serious cardiovascular and immune-mediated reactions, see *Important safety information* in the alemtuzumab drug monograph. Natalizumab may be preferred due to the complex safety profile associated with alemtuzumab. Natalizumab is only recommended for the treatment of *rapidly-evolving severe* relapsing-remitting multiple sclerosis.

Fingolimod is also taken by the oral route and is the recommended treatment for patients with *highly active* disease. [A] The NHS England Clinical Commissioning Policy (see *Useful resources* below) advises that fingolimod is a suitable alternative for patients receiving natalizumab who are at high risk of developing progressive multifocal leukoencephalopathy (defined as patients previously exposed to the JC virus or who are receiving immunosuppressants or who have been receiving treatment with natalizumab for more than 2 years).

Secondary progressive multiple sclerosis

Currently, only interferon beta 1b is licensed for use in secondary progressive multiple sclerosis. Interferon beta 1b reduces the risk of relapse and of short-term relapse-related disability, but does not prevent the development of permanent physical disability or retard progression once it is established. Therefore its role in secondary progressive disease is limited.

Primary progressive multiple sclerosis

Currently there are no effective disease-modifying treatments licensed for primary progressive multiple sclerosis. Interferon beta [unlicensed indication] has been used, but there is limited evidence to support its use due to the lack of a significant reduction in disability progression.

Progressive-relapsing multiple sclerosis

There are no specific treatment options for this type of multiple sclerosis. None of the currently licensed disease-modifying drugs are recommended in non-relapsing progressive disease.

Management of symptoms

Other than episodes of neurological dysfunction, chronic symptoms (such as fatigue, spasticity, visual problems, and emotional lability) produce much of the disability in multiple sclerosis. [EvGr] Smoking may increase the progression of disability in multiple sclerosis, and Smoking cessation p. 520 should be encouraged. [A]

Relapses

Suspected relapses should be referred to a specialist for diagnosis and treatment. [EvGr] Corticosteroids are recommended for reducing inflammation and accelerating recovery in acute relapses of relapsing-remitting multiple sclerosis. Oral methylprednisolone p. 715 is recommended as the first-line option. Intravenous methylprednisolone should be considered as an alternative if oral methylprednisolone has failed or is not tolerated or if hospitalisation is required. [A]

Fatigue and impaired mobility

[EvGr] Regular exercise may have beneficial effects on mobility and fatigue in patients with multiple sclerosis, and should be encouraged. Cognitive behavioural techniques for fatigue should also be considered in combination with exercise. Amantadine hydrochloride p. 437 [unlicensed indication] may be used to treat fatigue related to multiple sclerosis. Vitamin B₁₂ injections are **not** recommended as a treatment for fatigue in patients with multiple sclerosis. [A] Fampridine p. 895 is licensed for the improvement of walking in patients with multiple sclerosis who have a walking disability. [EvGr] NICE do not consider it to be a cost-effective treatment and do not recommend its use. [A]

Spasticity

Many factors may aggravate spasticity in multiple sclerosis, including constipation, infection, poor mobility aids, pressure ulcers, posture and pain. [EvGr] These causes should be managed appropriately. The first-line options for managing spasticity in multiple sclerosis are baclofen p. 1190 or gabapentin p. 331 [unlicensed indication]. They may be used cautiously in combination if the individual drugs are ineffective or if side effects prevent an increase in the dose of either drug. Tizanidine p. 1192 or dantrolene sodium p. 1417 are second-line options; benzodiazepines may be used as third-line therapy and may also be effective in treating nocturnal spasms. A 4-week trial of cannabis extract p. 1190 can be offered as adjunctive treatment for moderate to severe spasticity in multiple sclerosis if other pharmacological treatments are not effective. Treatment with cannabis extract should be initiated and supervised by a specialist. For funding/access information, see NICE clinical guideline: **Cannabis-based medicinal products** (see *Useful resources*). [A]

Oscillopsia

[EvGr] Gabapentin [unlicensed indication] is the first-line treatment for oscillopsia; memantine hydrochloride p. 320 [unlicensed indication] is the second-line option. [A]

Emotional lability

[EvGr] Amitriptyline hydrochloride p. 390 [unlicensed indication] may be used to treat emotional lability in patients with multiple sclerosis. [A]

CHOLINERGIC RECEPTOR STIMULATING DRUGS

Fampridine

29-Apr-2020

● INDICATIONS AND DOSE

Improvement of walking disability in multiple sclerosis (specialist use only)

- ▶ BY MOUTH
- Adult: 10 mg every 12 hours, discontinue treatment if no improvement within 2 weeks

- **CONTRA-INDICATIONS** History of seizures (discontinue treatment if seizures occur)
- **CAUTIONS** Atrioventricular conduction disorders · predisposition to seizures · sinoatrial conduction disorders · symptomatic cardiac rhythm disorders
- **INTERACTIONS** → Appendix 1: fampridine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anxiety · asthenia · balance impaired · constipation · dizziness · dyspepsia · dyspnoea · headache · insomnia · laryngeal pain · nausea · pain · palpitations · paraesthesia · tremor · urinary tract infection · vomiting
 - ▶ **Uncommon** Seizure · skin reactions · tachycardia
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 80 mL/minute/1.73 m².
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (pack contains a desiccant) and discard any tablets remaining 7 days after opening.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2253

The *Scottish Medicines Consortium* has advised (April 2020) that fampridine (*Fampyra*®) is accepted for use within NHS Scotland for the improvement of walking in adults with multiple sclerosis with walking disability (EDSS [expanded disability status scale] 4 to 7). This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3942

The *All Wales Medicines Strategy Group* has advised (December 2019) that fampridine (*Fampyra*®) is recommended as an option for use within NHS Wales for the improvement of walking in adult patients with multiple sclerosis with walking disability (Expanded Disability Status Scale [EDSS] 4 to 7). This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 23, 25

- ▶ **Fampyra** (Biogen Idc Ltd)

Fampridine 10 mg Fampyra 10mg modified-release tablets | 28 tablet (POM) £181.00 (Hospital only) | 56 tablet (POM) £362.00 (Hospital only)

IMMUNOSTIMULANTS > INTERFERONS

Interferon beta

22-Apr-2020

● INDICATIONS AND DOSE

AVONEX® INJECTION

For relapsing, remitting multiple sclerosis | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: (consult product literature)

AVONEX® VIAL

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: (consult product literature)

BETAFERON® INJECTION

For relapsing, remitting multiple sclerosis | For secondary progressive multiple sclerosis with active disease | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)

EXTAVIA®

For relapsing, remitting multiple sclerosis | For secondary progressive multiple sclerosis with active disease | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)

REBIF® CARTRIDGE

For relapsing, remitting multiple sclerosis | For a single demyelinating event with an active inflammatory process (if at high risk of developing multiple sclerosis)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)

REBIF® PRE-FILLED PEN AND SYRINGE

For relapsing, remitting multiple sclerosis | For a single demyelinating event with an active inflammatory process (if at high risk of developing multiple sclerosis)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Severe depressive illness
- CONTRA-INDICATIONS, FURTHER INFORMATION** Consult product literature for further information on contra-indications.
- **CAUTIONS** History of cardiac disorders · history of depressive disorders (avoid in severe depression or in those with suicidal ideation) · history of seizures · history of severe myelosuppression
- CAUTIONS, FURTHER INFORMATION** Consult product literature for further information on cautions.
- **INTERACTIONS** → Appendix 1: interferons

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · appetite decreased · arthralgia · asthenia · chills · confusion · depression · diarrhoea · fever · headaches · hypothyroidism · influenza like illness (decreasing over time) · insomnia · malaise · menstrual cycle irregularities · nausea · pain · skin reactions · vasodilation · vomiting · weight changes
- ▶ **Uncommon** Emotional lability · glomerulosclerosis · hepatic disorders · nephrotic syndrome · seizure · thrombocytopenia
- ▶ **Rare or very rare** Cardiomyopathy · dyspnoea · haemolytic uraemic syndrome · hyperthyroidism · thrombotic microangiopathy
- ▶ **Frequency not known** Anxiety · chest pain · dizziness · injection site necrosis · muscle weakness · palpitations · pulmonary arterial hypertension

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intramuscular use Muscle complaints · musculoskeletal stiffness · neuromuscular dysfunction · rhinorrhoea · sensation abnormal · sweat changes
- ▶ With subcutaneous use Anaemia · tachycardia
- ▶ **Uncommon**
- ▶ With subcutaneous use Suicide attempt
- ▶ **Rare or very rare**
- ▶ With subcutaneous use Bronchospasm · pancreatitis · thyroid disorder
- ▶ **Frequency not known**
- ▶ With intramuscular use Angioedema · arrhythmias · arthritis · congestive heart failure · hypersensitivity · neurological effects · pancytopenia · psychosis · suicide · syncope · systemic lupus erythematosus (SLE)
- ▶ With subcutaneous use Abdominal pain · abscess · capillary leak syndrome · conjunctivitis · constipation · cough aggravated · ear pain · erectile dysfunction · eye disorder · hyperhidrosis · hypertension · increased risk of infection · lupus-like syndrome · lymphadenopathy · muscle tone increased · myalgia · paraesthesia · peripheral oedema · urinary disorders · visual impairment

- **PREGNANCY** Manufacturer advises use if clinically needed—possible toxicity in *animal* studies, but limited human data do not suggest an increased risk.
- **BREAST FEEDING** Manufacturer advises suitable for use during breast feeding—amount in milk probably too small to be harmful (recommendation also supported by specialist sources).
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in decompensated liver disease.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **MONITORING REQUIREMENTS**
- ▶ **Liver Function** Manufacturer advises monitor liver function at baseline, then 1 month, 3 months and 6 months after initiation of therapy. Consider dose reduction if alanine aminotransferase (ALT) exceeds 5 times the upper limit of normal (consult product literature).
- ▶ **Thrombotic Microangiopathy** Manufacturer advises patients should be monitored for clinical features of thrombotic microangiopathy (TMA), including thrombocytopenia, new onset hypertension, fever, central nervous system symptoms (e.g. confusion and paresis), and impaired renal function. Any signs of TMA should be investigated fully and, if diagnosed, interferon beta should be stopped immediately and treatment for TMA promptly initiated (consult product literature for details).
- ▶ **Nephrotic Syndrome** Manufacturer advises patients should also be monitored for signs and symptoms of nephrotic syndrome, including oedema, proteinuria, and impaired renal function—monitor renal function periodically. If

nephrotic syndrome develops, treat promptly and consider stopping interferon beta treatment.

- ▶ **Thyroid Function** Manufacturer advises baseline thyroid function tests and repeat if signs or symptoms of thyroid dysfunction occur.
- **PRESCRIBING AND DISPENSING INFORMATION** Interferon beta is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines and Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **NICE decisions**
- ▶ **Beta interferons and glatiramer acetate for treating multiple sclerosis (June 2018)** NICE TA527
Interferon beta-1a (*Avonex*[®], *Rebif*[®]) is recommended as an option for treating multiple sclerosis, only if:
 - the person has relapsing–remitting multiple sclerosis, **and**
 - the manufacturer provides it according to the commercial arrangement.
 Interferon beta-1b (*Extavia*[®]) is recommended as an option for treating multiple sclerosis, only if:
 - the person has relapsing–remitting multiple sclerosis and has had 2 or more relapses within the last 2 years, **or**
 - the person has secondary progressive multiple sclerosis with continuing relapses, **and**
 - the manufacturer provides it according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta527

- ▶ **Beta interferons and glatiramer acetate for treating multiple sclerosis (June 2018)** NICE TA527
Interferon beta-1b (*Betaferon*[®]) is not recommended within its marketing authorisation as an option for treating multiple sclerosis.
- Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta527

NHS restrictions

NHS England Clinical Commissioning Policy NHS England (May 2014) has provided guidance on the use of interferon beta p. 895 for the treatment of multiple sclerosis in England. An NHS England Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing this treatment option, see www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

▶ **Avonex** (Biogen Idec Ltd)

Interferon beta-1a 12 mega unit per 1 ml Avonex 30micrograms/0.5ml (6million units) solution for injection pre-filled syringes | 4 pre-filled disposable injection [POM] £654.00 | 12 pre-filled disposable injection [POM] £1,962.00
Avonex 30micrograms/0.5ml (6million units) solution for injection pre-filled pens | 4 pre-filled disposable injection [POM] £654.00 | 12 pre-filled disposable injection [POM] £1,962.00

▶ **Rebif** (Merck Serono Ltd)

Interferon beta-1a 12 mega unit per 1 ml Rebif 22micrograms/0.5ml (6million units) solution for injection pre-filled syringes | 12 pre-filled disposable injection [POM] £613.52
Rebif 22micrograms/0.5ml (6million units) solution for injection 1.5ml cartridges | 4 cartridge [POM] £613.52

Rebif 8.8micrograms/0.2ml (2.4million units) solution for injection pre-filled syringes | 6 pre-filled disposable injection [PoM]  
 Rebif 22micrograms/0.5ml (6million units) solution for injection pre-filled pens | 12 pre-filled disposable injection [PoM] £613.52
Interferon beta-1a 24 mega unit per 1 ml Rebif 44micrograms/0.5ml (12million units) solution for injection pre-filled syringes | 12 pre-filled disposable injection [PoM] £813.21
 Rebif 44micrograms/0.5ml (12million units) solution for injection pre-filled pens | 12 pre-filled disposable injection [PoM] £813.21
 Rebif 44micrograms/0.5ml (12million units) solution for injection 1.5ml cartridges | 4 cartridge [PoM] £813.21

Powder and solvent for solution for injection

- ▶ **Betaferon** (Bayer Plc)
Interferon beta-1b 300 microgram Betaferon 300microgram powder and solvent for solution for injection vials | 15 vial [PoM] £596.63 (Hospital only)
- ▶ **Extavia** (Novartis Pharmaceuticals UK Ltd)
Interferon beta-1b 300 microgram Extavia 300microgram powder and solvent for solution for injection vials | 15 vial [PoM] £596.63

Peginterferon beta-1a

31-Jul-2018

- **DRUG ACTION** Peginterferon beta-1a is a polyethylene glycol-conjugated ('pegylated') derivative of interferon beta; pegylation increases the persistence of interferon in the blood.

● INDICATIONS AND DOSE

Treatment of relapsing, remitting multiple sclerosis

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Severe depression · suicidal ideation
- **CAUTIONS** History of cardiac disorders · history of depressive disorders (avoid in severe depression or in those with suicidal ideation) · history of seizures · history of severe myelospulsion
- CAUTIONS, FURTHER INFORMATION** Consult product literature for further information about cautions.
- **INTERACTIONS** → Appendix 1: peginterferon beta
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arthralgia · asthenia · chills · depression · fever · headache · hyperthermia · influenza like illness · myalgia · nausea · pain · skin reactions · vomiting
 - ▶ **Uncommon** Seizure · thrombocytopenia
 - ▶ **Rare or very rare** Glomerulosclerosis · haemolytic uraemic syndrome · injection site necrosis · nephrotic syndrome · thrombotic microangiopathy
 - ▶ **Frequency not known** Pulmonary arterial hypertension
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.
- **PREGNANCY** Do not initiate during pregnancy. Avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe hepatic impairment.
- **RENAL IMPAIRMENT** Caution in severe renal impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for signs of hepatic injury—hepatic failure has been reported rarely.
 - ▶ Thrombotic microangiopathy Patients should be monitored for clinical features of thrombotic microangiopathy (TMA), including thrombocytopenia, new onset hypertension, fever, central nervous system symptoms (e.g. confusion and paresis), and impaired renal function. Any signs of TMA should be investigated fully and, if diagnosed, interferon beta should be stopped immediately and treatment for TMA promptly initiated (consult product literature for details).
 - ▶ Nephrotic syndrome Patients should also be monitored for signs and symptoms of nephrotic syndrome, including

oedema, proteinuria, and impaired renal function—monitor renal function periodically. If nephrotic syndrome develops, treat promptly and consider stopping interferon beta treatment.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Peginterferon beta-1a for treating relapsing-remitting multiple sclerosis (February 2020)** NICE TA624
 Peginterferon beta-1a (*Plegridy*[®]) is recommended, within its marketing authorisation, as an option for treating relapsing-remitting multiple sclerosis in adults.
www.nice.org.uk/guidance/ta624

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Plegridy** (Biogen Idec Ltd)
Interferon beta-1a (as Peginterferon beta-1a) 126 microgram per 1 ml Plegridy 63micrograms/0.5ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM]  
Interferon beta-1a (as Peginterferon beta-1a) 188 microgram per 1 ml Plegridy 94micrograms/0.5ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM]  
Interferon beta-1a (as Peginterferon beta-1a) 250 microgram per 1 ml Plegridy 125micrograms/0.5ml solution for injection pre-filled pens | 2 pre-filled disposable injection [PoM] £654.00

IMMUNOSTIMULANTS > OTHER

Glatiramer acetate

13-Jul-2018

- **DRUG ACTION** Glatiramer is an immunomodulating drug comprising synthetic polypeptides.

● INDICATIONS AND DOSE

Multiple sclerosis [relapsing-remitting] (initiated under specialist supervision)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 20 mg once daily, alternatively 40 mg 3 times a week, doses to be separated by an interval of at least 48 hours

- **CAUTIONS** Cardiac disorders
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anxiety · appetite decreased · arrhythmias · asthenia · chest pain · chills · constipation · cough · depression · dyspepsia · dysphagia · dyspnoea (may occur within minutes of injection) · ear disorder · eye disorders · fever · gastrointestinal disorders · headaches · hyperhidrosis · hypersensitivity · increased risk of infection · joint disorders · local reaction · lymphadenopathy · nausea · neoplasms · neuromuscular dysfunction · oedema · oral disorders · pain · palpitations · rhinitis seasonal · skin reactions · speech disorder · syncope · taste altered · tremor · urinary disorders · vasodilation · vision disorders · vomiting · weight increased
 - ▶ **Uncommon** Abnormal dreams · abscess · alcohol intolerance · angioedema · apnoea · arthritis · breast engorgement · burping · cataract · choking sensation · cholelithiasis · cognitive disorder · confusion · cyst · dry eye · dysgraphia · dyslexia · erythema nodosum · goitre · gout · haemorrhage · hallucination · hangover · hepatic disorders · hostility · hyperlipidaemia · hyperthyroidism · hypothermia · immediate post-injection reaction · inflammation · injection site necrosis · leucocytosis · leucopenia · mood altered · movement disorders · mucous membrane disorder · muscle atrophy · nephrolithiasis · nerve disorders · paralysis · pelvic prolapse · personality disorder · post vaccination syndrome · prostatic disorder · respiratory disorders · seizure · sexual dysfunction · skin nodule · splenomegaly · stupor · suicide attempt · testicular disorder · thrombocytopenia · urinary tract disorder · urine abnormal · varicose veins · vulvovaginal disorder

- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** No information available—manufacturer advises caution.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Beta interferons and glatiramer acetate for treating multiple sclerosis (June 2018) NICE TA527**

Glatiramer acetate (*Copaxone*®) is recommended as an option for treating multiple sclerosis, only if:

- the patient has relapsing-remitting multiple sclerosis, and
- the manufacturer provides it according to the commercial arrangement. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta527

Scottish Medicines Consortium (SMC) decisions

SMC No. 1108/15

The *Scottish Medicines Consortium* has advised (December 2015) that glatiramer acetate (*Copaxone*®) is accepted for use within NHS Scotland for the treatment of relapsing forms of multiple sclerosis.

NHS restrictions

NHS England Clinical Commissioning Policy NHS England (May 2014) has provided guidance on the use of glatiramer acetate for the treatment of multiple sclerosis in England. An NHS England Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing this treatment option, see www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Glatiramer acetate 40 mg per 1 ml Copaxone 40mg/1ml solution for injection pre-filled syringes | 12 pre-filled disposable injection [PoM] £513.95 DT = £513.95

IMMUNOSUPPRESSANTS >

IMMUNOMODULATING DRUGS

Dimethyl fumarate

06-Dec-2017

- **DRUG ACTION** Dimethyl fumarate has immunomodulatory and anti-inflammatory properties.

INDICATIONS AND DOSE**SKILARENCE**®**Plaque psoriasis [moderate-to-severe] (under expert supervision)**

- ▶ **BY MOUTH**

▶ **Adult:** Initially 30 mg once daily for 1 week, dose to be taken in the evening, then increased in steps of 30 mg every week for 3 weeks, then increased in steps of 120 mg every week for 5 weeks, for further information on the dose titration and administration schedule,

advice on establishing a maintenance dose, and for dose adjustments due to side-effects, consult product literature; maximum 720 mg per day

TECFIDERA®**Multiple sclerosis [relapsing-remitting] (initiated by a specialist)**

- ▶ **BY MOUTH**

▶ **Adult:** Initially 120 mg twice daily for 7 days, then increased to 240 mg twice daily, for dose adjustments due to side effects—consult product literature

CONTRA-INDICATIONS

SKILARENCE® Do not initiate if leucocyte count below 3×10^7 /litre · do not initiate if lymphocyte count below 1×10^7 /litre · do not initiate if pathological haematological abnormalities identified · severe gastro-intestinal disorders

CAUTIONS Reduced lymphocyte count

TECFIDERA® Serious infection (do not initiate until infection resolved; consider suspending treatment if infection develops) · severe active gastro-intestinal disease

SKILARENCE® Significant infection (consider avoiding initiation until infection resolved and suspending treatment if infection develops)

INTERACTIONS → Appendix 1: dimethyl fumarate**SIDE-EFFECTS**

▶ **Common or very common** Appetite decreased · asthenia · constipation · decreased leucocytes · diarrhoea · eosinophilia · feeling hot · flatulence · gastrointestinal discomfort · headache · leucocytosis · nausea · paraesthesia

· skin reactions · vasodilation · vomiting

▶ **Uncommon** Dizziness · proteinuria

▶ **Rare or very rare** Acute lymphocytic leukaemia · pancytopenia

▶ **Frequency not known** Progressive multifocal leukoencephalopathy (PML) · renal failure

SIDE-EFFECTS, FURTHER INFORMATION Severe prolonged lymphopenia reported, and patients are exposed to a potential risk of PML. Treatment should be stopped immediately if PML is suspected.

PREGNANCY

TECFIDERA® Manufacturer advises avoid unless essential and potential benefit outweighs risk—toxicity in *animal* studies.

SKILARENCE® Manufacturer advises avoid—toxicity in *animal* studies.

BREAST FEEDING Manufacturer advises avoid.**HEPATIC IMPAIRMENT**

TECFIDERA® Manufacturer advises caution in severe impairment (no information available).

SKILARENCE® Manufacturer advises avoid in severe impairment (no information available).

RENAL IMPAIRMENT

TECFIDERA® Manufacturer advises caution in severe impairment—no information available.

SKILARENCE® Manufacturer advises avoid in severe impairment—no information available.

MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor full blood count before treatment initiation then every 3 months thereafter—consult product information for further information.
- ▶ Manufacturer advises monitor patient closely for features of progressive multifocal leukoencephalopathy (PML) (e.g. signs and symptoms of neurological dysfunction) and other opportunistic infections.
- ▶ Manufacturer advises monitor renal and hepatic function before treatment initiation and during treatment—consult product literature for further information.

- ▶ Manufacturer of *Tecfidera*® advises perform a baseline MRI as a reference and repeat as required during treatment.

● PRESCRIBING AND DISPENSING INFORMATION

SKILARENCE® The manufacturer of *Skilarence*® has provided a *Healthcare Professional Guideline*, which includes important safety information on the risk of serious infections.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be informed of the possibility of experiencing symptoms of flushing; they should also be advised to report symptoms of infection to their doctor. The MHRA recommends that patients and their carers should be counselled on the risk of progressive multifocal leukoencephalopathy and advised to seek immediate medical attention if symptoms develop.

● NATIONAL FUNDING/ACCESS DECISIONS

TECFIDERA®

NICE decisions

- ▶ **Dimethyl fumarate (*Tecfidera*®) for treating relapsing-remitting multiple sclerosis (August 2014)** NICE TA320 Dimethyl fumarate (*Tecfidera*®) is recommended for the treatment of active relapsing-remitting multiple sclerosis, only if:
 - the patient does not have highly active or rapidly evolving severe relapsing-remitting multiple sclerosis and
 - the manufacturer provides dimethyl fumarate with the discount agreed in the patient access scheme
 Patients currently receiving dimethyl fumarate whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA320

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (April 2014) that dimethyl fumarate (*Tecfidera*®) is accepted for use within NHS Scotland for the treatment of patients with relapsing remitting multiple sclerosis. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

SKILARENCE®

NICE decisions

- ▶ **Dimethyl fumarate for treating moderate-to-severe plaque psoriasis (September 2017)** NICE TA475 Dimethyl fumarate is recommended as an option for treating plaque psoriasis in adults, only if the disease:
 - is severe, as defined by a total Psoriasis Area and Severity Index (PASI) of 10 or more and a Dermatology Life Quality Index (DLQI) of more than 10, and
 - has not responded to other systemic therapies, including, ciclosporin, methotrexate and PUVA (psoralen and long-wave ultraviolet A radiation), or these options are contra-indicated or not tolerated.
 Stop dimethyl fumarate treatment at 16 weeks if the psoriasis has not responded adequately. An adequate response is defined as:
 - a 75% reduction in the PASI score (PASI 75) from when treatment started, or
 - a 50% reduction in the PASI score (PASI 50) and a 5-point reduction in DLQI from when treatment started.
 Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta475

Scottish Medicines Consortium (SMC) decisions

SMC No. 1313/18

The *Scottish Medicines Consortium* has advised (April 2018) that dimethyl fumarate (*Skilarence*®) is accepted for restricted use within NHS Scotland for the treatment of moderate-to-severe plaque psoriasis in adults in need of systemic medicinal therapy, whom other non-biologic systemic treatments (methotrexate, ciclosporin and acitretin) are not appropriate or have failed and who are considered unsuitable for biologic therapy given their current disease state or personal preference.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

- ▶ **Tecfidera** (Biogen Idec Ltd)

Dimethyl fumarate 120 mg *Tecfidera* 120mg gastro-resistant capsules | 14 capsule [PoM] £343.00

Dimethyl fumarate 240 mg *Tecfidera* 240mg gastro-resistant capsules | 56 capsule [PoM] £1,373.00

Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

- ▶ **Skilarence** (Aimrall Ltd)

Dimethyl fumarate 30 mg *Skilarence* 30mg gastro-resistant tablets | 42 tablet [PoM] £89.04 DT = £89.04

Dimethyl fumarate 120 mg *Skilarence* 120mg gastro-resistant tablets | 90 tablet [PoM] £190.80 DT = £190.80 | 180 tablet [PoM] £381.60 DT = £381.60

Fingolimod

23-Mar-2020

- **DRUG ACTION** Fingolimod is a sphingosine-1-phosphate receptor modulator, which prevents movement of lymphocytes out of lymph nodes, thereby limiting inflammation in the central nervous system.

● INDICATIONS AND DOSE

Multiple sclerosis (initiated by a specialist)

- ▶ BY MOUTH
- ▶ Adult: 500 micrograms once daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: FINGOLIMOD—NOT RECOMMENDED FOR PATIENTS AT KNOWN RISK OF CARDIOVASCULAR EVENTS. ADVICE FOR EXTENDED MONITORING FOR THOSE WITH SIGNIFICANT BRADYCARDIA OR HEART BLOCK AFTER THE FIRST DOSE AND FOLLOWING TREATMENT INTERRUPTION (JANUARY 2013)

Fingolimod is known to cause transient bradycardias and heart block after the first dose—see *Cautions, Contra-indications, and Monitoring* for further information.

MHRA/CHM ADVICE: FINGOLIMOD: NEW CONTRA-INDICATIONS IN RELATION TO CARDIAC RISK (DECEMBER 2017)

Fingolimod can cause persistent bradycardia, which can increase the risk of serious cardiac arrhythmias. New contra-indications have been introduced for patients with pre-existing cardiac disorders—see *Contra-indications* for further information.

MHRA/CHM ADVICE: MULTIPLE SCLEROSIS THERAPIES: SIGNAL OF REBOUND EFFECT AFTER STOPPING OR SWITCHING THERAPY (APRIL 2017)

A signal of rebound syndrome in multiple sclerosis patients whose treatment with fingolimod was stopped or switched to other treatments has been reported in two recently published articles. The MHRA advise to be vigilant for such events and report any suspected adverse effects relating to fingolimod, or other treatments for multiple sclerosis, via the Yellow Card Scheme, while this report is under investigation.

MHRA/CHM ADVICE: FINGOLIMOD: UPDATED ADVICE ABOUT RISK OF CANCERS AND SERIOUS INFECTIONS (DECEMBER 2017)

Fingolimod has an immunosuppressive effect and can increase the risk of skin cancers and lymphoma.

Following a recent EU review, the MHRA has recommended the following strengthened warnings:

- re-assess the benefit-risk balance of fingolimod therapy in individual patients, particularly those with additional risk factors for malignancy—either closely monitor for skin cancers or consider discontinuation on a case-by-case basis
- examine all patients for skin lesions before they start fingolimod and then re-examine at least every 6 to 12 months
- advise patients to protect themselves against UV radiation exposure and seek urgent medical advice if they notice any skin lesions
- refer patients with suspicious lesions to a dermatologist

Fingolimod has also been associated with risk of fatal fungal infections and reports of progressive multifocal leukoencephalopathy (PML)—see *Monitoring and Side effects* for further information.

MHRA/CHM ADVICE: FINGOLIMOD (GILENYA®): INCREASED RISK OF CONGENITAL MALFORMATIONS; NEW CONTRA-INDICATION DURING PREGNANCY AND IN WOMEN OF CHILDBEARING POTENTIAL NOT USING EFFECTIVE CONTRACEPTION (SEPTEMBER 2019)

An increased risk of major congenital malformations, including cardiac, renal, and musculoskeletal defects, has been associated with the use of fingolimod in pregnancy. Females of childbearing potential must use effective contraception during, and for 2 months after stopping, treatment. Healthcare professionals are advised that fingolimod is contra-indicated in pregnancy and that female patients should be informed of the risk of congenital malformations and given a pregnancy-specific patient reminder card. Pregnancy should be excluded before starting treatment, and pregnancy testing repeated at suitable intervals during treatment. Fingolimod should be stopped 2 months before planning a pregnancy. If a female taking fingolimod becomes pregnant, treatment should be stopped immediately, and the patient referred to an obstetrician for close monitoring. Exposed pregnancies should be enrolled on the pregnancy registry.

- **CONTRA-INDICATIONS** Heart failure in the previous 6 months (New York Heart Association class III/IV) · active malignancies · baseline QTc interval 500 milliseconds or greater · cerebrovascular disease (including transient ischaemic attack) in the previous 6 months · decompensated heart failure (requiring inpatient treatment) in the previous 6 months · increased risk for opportunistic infections (including immunosuppression) · myocardial infarction in the previous 6 months · second-degree Mobitz type II atrioventricular block or third-degree AV block, or sick-sinus syndrome, if the patient does not have a pacemaker · severe active infection · severe cardiac arrhythmias requiring treatment with class Ia or class III anti-arrhythmic drugs · unstable angina in the previous 6 months
- **CAUTIONS** Check varicella zoster virus status—consult product literature for further information · chronic obstructive pulmonary disease · elderly (limited information available) · history of myocardial infarction · history of symptomatic bradycardia or recurrent syncope · patients receiving anti-arrhythmic or heart-rate lowering drugs, including beta-blockers and heart rate-lowering calcium-channel blockers (seek advice from cardiologist regarding switching to alternative drugs, or appropriate monitoring if unable to switch) · pulmonary fibrosis · severe respiratory disease · severe sleep apnoea · significant QT prolongation (QTc greater than 470 milliseconds in women, or QTc greater than 450 milliseconds in men); if QTc 500 milliseconds or

greater—see Contra-indications · susceptibility to QT-interval prolongation (including electrolyte disturbances) · uncontrolled hypertension

CAUTIONS, FURTHER INFORMATION

- ▶ **Washout period** A washout period is recommended when switching treatment from some disease modifying therapies—consult product literature for further information.
- ▶ **Bradycardia and cardiac rhythm disturbance** Fingolimod may cause transient bradycardia, atrioventricular conduction delays and heart block after the first dose. Fingolimod is not recommended in patients with the cardiovascular risks listed above unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist (including monitoring advice) is sought before initiation.
- **INTERACTIONS** → Appendix 1: fingolimod
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · arthralgia · asthenia · atrioventricular block · back pain · bradycardia · cough · decreased leucocytes · depression · diarrhoea · dizziness · dyspnoea · headaches · hypertension · increased risk of infection · myalgia · neoplasms · skin reactions · vision blurred · weight decreased
 - ▶ **Uncommon** Macular oedema · nausea · seizures · thrombocytopenia
 - ▶ **Rare or very rare** Posterior reversible encephalopathy syndrome (PRES)
 - ▶ **Frequency not known** Autoimmune haemolytic anaemia · haemophagocytic lymphohistiocytosis · peripheral oedema · progressive multifocal leukoencephalopathy (PML)

SIDE-EFFECTS, FURTHER INFORMATION Basal-cell carcinoma Patients should be advised to seek medical advice if they have any signs of basal-cell carcinoma including skin nodules, patches or open sores that do not heal within weeks.

Progressive multifocal leukoencephalopathy (PML) and other opportunistic infections Patients should be advised to seek medical attention if they have any signs of PML or any other infections. Suspension of treatment should be considered if a patient develops a severe infection, taking into consideration the risk-benefit.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises females of childbearing potential should use effective contraception during treatment and for 2 months after last treatment—see *Important safety information* for further information.
- **PREGNANCY** Manufacturer advises avoid—teratogenic.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution when initiating treatment in mild to moderate impairment; avoid in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ **All patients receiving fingolimod** should be monitored at treatment initiation, (first dose monitoring—before, during and after dose), and after treatment interruption (see note below); monitoring should include:
 - ▶ **Pre-treatment**
 - an ECG and blood pressure measurement before starting
 - ▶ **During the first 6 hours of treatment**
 - continuous ECG monitoring for 6 hours
 - blood pressure and heart rate measurement every hour
 - ▶ **After 6 hours of treatment**
 - a further ECG and blood pressure measurement
 - ▶ If heart rate at the end of the 6 hour period is at its lowest since fingolimod was first administered, monitoring should be extended by at least 2 hours and until heart rate increases.
 - ▶ If post-dose bradyarrhythmia-related symptoms occur, appropriate clinical management should be initiated and monitoring should be continued until the symptoms have resolved. If pharmacological intervention is required

during the first-dose monitoring, overnight monitoring should follow, and the first-dose monitoring should then be repeated after the second dose.

- ▶ If after 6 hours, the heart rate is less than 45 beats per minute, or the ECG shows new onset second degree or higher grade AV block, or a QTc interval of 500 milliseconds or greater, monitoring should be extended (at least overnight, until side-effect resolution).
- ▶ The occurrence at any time of third degree AV block requires extended monitoring (at least overnight, until side-effect resolution).
- ▶ In case of T-wave inversion, ensure there are no associated signs or symptoms of myocardial ischaemia—if suspected seek advice from a cardiologist.

▶ Note

- ▶ First dose monitoring as above **should be repeated** in all patients whose treatment is interrupted for:
 - 1 day or more during the first 2 weeks of treatment
 - more than 7 days during weeks 3 and 4 of treatment
 - more than 2 weeks after one month of treatment
- ▶ If the treatment interruption is of shorter duration than the above, treatment should be continued with the next dose as planned.
- ▶ Manufacturer advises eye examination recommended 3–4 months after initiation of treatment (and before initiation of treatment in patients with diabetes or history of uveitis).
- ▶ Manufacturer advises skin examination for skin lesions before starting treatment and then every 6 to 12 months thereafter or as clinically indicated.
- ▶ Monitor hepatic transaminases before treatment, then every 3 months for 1 year, then periodically thereafter.
- ▶ Monitor full blood count before treatment, at 3 months, then at least yearly thereafter and if signs of infection (interrupt treatment if lymphocyte count reduced)—consult product literature.
- ▶ Monitor for signs and symptoms of haemophagocytic syndrome (including pyrexia, asthenia, hepatosplenomegaly and adenopathy—may be associated with hepatic failure and respiratory distress; also progressive cytopenia, elevated serum-ferritin concentrations, hypertriglyceridaemia, hypofibrinogenemia, coagulopathy, hepatic cytolysis, hyponatraemia)—initiate treatment immediately.
- ▶ Manufacturer advises to monitor routine MRI for lesions suggestive of progressive multifocal leukoencephalopathy (PML), particularly in patients considered at increased risk; monitor for signs and symptoms of new neurological dysfunction.

● **PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of *Gilenya*® has provided a *Prescriber's checklist*.

● PATIENT AND CARER ADVICE

Patient reminder card Patients should be given a patient reminder card.

Female patients of childbearing potential should also be given a pregnancy-specific patient reminder card.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Fingolimod for the treatment of highly active relapsing-remitting multiple sclerosis (April 2012) NICE TA254** Fingolimod is recommended as an option for the treatment of highly active relapsing-remitting multiple sclerosis in adults, only if:
 - they have an unchanged or increased relapse rate or ongoing severe relapses compared with the previous year despite treatment with interferon beta, **and**
 - the manufacturer provides fingolimod with the discount agreed as part of the patient access scheme
 Patients currently receiving fingolimod whose disease does not meet the above criteria should be able to

continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta254

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (September 2012) that fingolimod (*Gilenya*®) is accepted for restricted use within NHS Scotland as single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta, with an unchanged or increased relapse rate or ongoing severe relapses, as compared to the previous year. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland.

The *Scottish Medicines Consortium* has advised (October 2014) that fingolimod (*Gilenya*®) is accepted for restricted use within NHS Scotland as a single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis for adults with rapidly-evolving severe relapsing-remitting multiple sclerosis. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland, or a list price that is equivalent or lower.

The *Scottish Medicines Consortium* has advised (April 2015) that fingolimod (*Gilenya*®) is accepted for use within NHS Scotland as a single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis for adults with high disease activity despite treatment with at least one disease-modifying therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland, or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

The *All Wales Medicines Strategy Group* has advised (January 2017) that fingolimod (*Gilenya*®) is recommended as an option for use within NHS Wales as a single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis only in patients with rapidly-evolving severe relapsing-remitting multiple sclerosis defined by 2 or more disabling relapses in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous recent MRI, only if the manufacturer provides fingolimod with the discount agreed as part of the patient access scheme or where the list price is equivalent or lower.

NHS restrictions

NHS England Clinical Commissioning Policy NHS England (May 2014) has provided guidance on the use of fingolimod for the treatment of multiple sclerosis in England. An NHS England Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing this treatment option, see www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04/.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

Siponimod

12-Mar-2020

- **DRUG ACTION** Siponimod is a sphingosine-1-phosphate receptor modulator, which prevents movement of lymphocytes out of lymph nodes, thereby limiting inflammation in the central nervous system.

● INDICATIONS AND DOSE

Multiple sclerosis [secondary progressive, with active disease] (initiated by a specialist)

▶ BY MOUTH

- ▶ **Adult:** Initially 0.25 mg once daily on days 1 and 2, followed by 0.5 mg once daily on day 3, followed by 0.75 mg once daily on day 4, followed by 1.25 mg once daily on day 5, dose to be taken in the morning for the first 5 days; maintenance 2 mg once daily from day 6 onwards, in patients with a CYP2C9*1*3 or CYP2C9*2*3 genotype a reduced maintenance dose of 1 mg once daily is used from day 6 onwards. For dose adjustments based on lymphocyte count—consult product literature
- **CONTRA-INDICATIONS** Active malignancies · cryptococcal meningitis · decompensated heart failure (requiring inpatient treatment) in the previous 6 months · heart failure in the previous 6 months (New York Heart Association class III or IV) · immunodeficiency syndrome · macular oedema · myocardial infarction in the previous 6 months · patients homozygous for CYP2C9*3*3 genotype (poor metabolisers) · phototherapy with UV-B radiation or PUVA-phototherapy (increased risk of cutaneous neoplasms) · progressive multifocal leukoencephalopathy · second-degree Mobitz type II atrioventricular block or third-degree AV block, or sick-sinus syndrome, if the patient does not have a pacemaker · severe active infection · stroke (including transient ischaemic attack) in the previous 6 months · unstable angina pectoris in the previous 6 months
- **CAUTIONS** Administration of vaccinations (may be less effective during siponimod treatment—consult product literature for further information) · diabetes mellitus (increased risk of macular oedema) · elderly (limited information available) · exposure to sunlight (increased risk of cutaneous neoplasms) · first- or second-degree Mobitz type I atrioventricular block · heart failure (New York Heart Association class I and II) · myocardial infarction · patients receiving QT-prolonging or heart rate-lowering drugs, including beta-blockers and heart rate-lowering calcium-channel blockers (seek advice from cardiologist regarding switching to alternative drugs or appropriate monitoring) · recurrent syncope · retinal disease (increased risk of macular oedema) · risk of discontinuation effects, including disease rebound · severe sleep apnoea · significant QT prolongation (QTc greater than 500 milliseconds) · sinus bradycardia (heart rate below 55 beats per minute) · uncontrolled hypertension · uveitis (increased risk of macular oedema)
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Bradycardia and cardiac rhythm disturbance Siponimod may cause transient bradycardia, atrioventricular conduction delays and heart block after the first dose. Siponimod is not recommended in patients with a history of symptomatic bradycardia or recurrent syncope, uncontrolled hypertension, severe untreated sleep apnoea, or significant QT prolongation unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist (including monitoring advice) is sought before initiation.
- **INTERACTIONS** → Appendix 1: siponimod
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arrhythmias · asthenia · cardiac conduction disorders · diarrhoea · dizziness · headache · hypertension · increased risk of infection · lymphopenia · macular oedema · nausea · neoplasms · pain in extremity · peripheral oedema · seizure · tremor
 - ▶ **Frequency not known** Meningitis cryptococcal · vision disorders
- **ALLERGY AND CROSS-SENSITIVITY** Manufacturer advises contra-indicated in patients with hypersensitivity to peanut or soya products.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before treatment; females of childbearing potential should use effective contraception during treatment and for 10 days after last dose.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution when initiating treatment in mild to moderate impairment; avoid in severe impairment.
- **PRE-TREATMENT SCREENING** Manufacturer advises CYP2C9 genotyping before treatment initiation—consult product literature. Manufacturer advises check varicella zoster virus status in patients with unconfirmed or incomplete vaccination history. A full course of vaccination against varicella zoster is required 1 month before initiating treatment in antibody-negative patients.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises regular monitoring of heart rate, particularly during treatment initiation, and of blood pressure.
 - ▶ Manufacturer advises patients with certain pre-existing cardiac conditions should be monitored for bradycardia for 6 hours after the first dose. An ECG should be obtained before dosing and after 6 hours—consult product literature for further information.
 - ▶ Manufacturer advises monitor full blood count before initiation and periodically during treatment (reduce dosage or interrupt treatment if lymphocyte count reduced)—consult product literature.
 - ▶ Manufacturer advises monitor hepatic transaminases and bilirubin before initiation of treatment and then as clinically indicated (interrupt treatment if significant liver injury occurs).
 - ▶ Manufacturer advises eye examination recommended 3–4 months after initiation of treatment (and before initiation of treatment in patients with diabetes or history of uveitis or retinal disease).
- **PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of *Mayzent*[®] has provided a *Physician Education Pack*.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients to avoid exposure to sunlight without protection. Manufacturer advises patients should promptly report symptoms of infection.
 - ▶ **Missed doses** Manufacturer advises if a dose is missed during treatment initiation (days 1–6), the initial titration regimen should be restarted. If a maintenance dose is missed (after day 6), the missed dose should not be taken, and the next dose should be taken at the normal time. If 4 or more consecutive doses are missed, the initial titration regimen should be used to restart treatment.
 - ▶ **Driving and skilled tasks** Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness during treatment initiation.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

EXCIPIENTS: May contain Lecithin

- ▶ **Mayzent** (Novartis Pharmaceuticals UK Ltd) ▼
 - Siponimod (as Siponimod fumaric acid) 250 microgram Mayzent 0.25mg tablets | 12 tablet [PoM] £293.52 (Hospital only) | 120 tablet [PoM] £1,761.12 (Hospital only)
 - Siponimod (as Siponimod fumaric acid) 2 mg Mayzent 2mg tablets | 28 tablet [PoM] £1,643.72 (Hospital only)

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES > ANTI-LYMPHOCYTE

Anti-lymphocyte monoclonal antibodies

- **DRUG ACTION** The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

IMPORTANT SAFETY INFORMATION

All anti-lymphocyte monoclonal antibodies should be given under the supervision of an experienced specialist, in an environment where full resuscitation facilities are immediately available.

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · anaphylactic reaction · arthralgia · asthenia · conjunctivitis · constipation · cough · depression · diarrhoea · fever · headache · hypersensitivity (discontinue permanently) · increased risk of infection · infusion related reaction · leucopenia · myocardial infarction · neutropenia · night sweats · pain · thrombocytopenia · vomiting
- ▶ **Uncommon** Haemolytic anaemia · progressive multifocal leukoencephalopathy (PML)
- ▶ **Rare or very rare** Hepatitis B reactivation

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related

side-effects In rare cases infusion reactions may be fatal. Infusion-related side-effects occur predominantly during the first infusion. Patients should receive premedication before administration of anti-lymphocyte monoclonal antibodies to reduce these effects—consult product literature for details of individual regimens. The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management.

Cytokine release syndrome Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored very closely (and a slower rate of infusion considered).

- **PRE-TREATMENT SCREENING** All patients should be screened for hepatitis B before treatment.
- **MONITORING REQUIREMENTS** Patients should also be monitored for cytopenias—consult product literature for specific recommendations.

Alemtuzumab

● INDICATIONS AND DOSE

Treatment of adults with relapsing-remitting multiple sclerosis with active disease defined by clinical or imaging features

- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Adult:** (consult product literature)

- **UNLICENSED USE** Although no longer licensed for oncological and transplant indications, alemtuzumab is also available through a patient access programme for these indications.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED FEBRUARY 2020): **LEMTRADA® (ALEMTUZUMAB): UPDATED RESTRICTIONS AND STRENGTHENED MONITORING REQUIREMENTS FOLLOWING REVIEW OF SERIOUS CARDIOVASCULAR AND IMMUNE-MEDIATED REACTIONS**

Following a review of alemtuzumab by the European Medicines Agency, a revised indication, additional contra-indications (see *Contra-indications*), and strengthened monitoring requirements before, during, and after treatment have been recommended. Healthcare professionals are advised that alemtuzumab should only be used for the treatment of patients with relapsing-remitting multiple sclerosis (RRMS) that is highly active despite a full and adequate course of treatment with at least one disease-modifying agent, or in patients with rapidly evolving severe RRMS.

Healthcare professionals should monitor patients before, during, and after treatment for cardiovascular reactions and non-immune thrombocytopenia (see *Monitoring requirements*). Patients should be informed of serious cardiovascular symptoms that can occur within a few days of treatment, signs of autoimmune disorders that can occur 48 months or more after treatment, and symptoms of hepatic injury; immediate medical attention should be sought by patients if they experience any of these symptoms.

- **CONTRA-INDICATIONS** Angina (past history) · autoimmune diseases (excluding multiple sclerosis) · cervicocephalic arterial dissection (past history) · clotting abnormalities (including patients on anticoagulant therapy) · human immunodeficiency virus · hypertension (uncontrolled) · myocardial infarction (past history) · severe active infection (until complete resolution) · stroke (past history)
- **CAUTIONS** Hepatitis B carriers · hepatitis C carriers · not recommended for inactive disease · not recommended for stable disease · patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course · pretreatment before administration is required (consult product literature)
- **CAUTIONS, FURTHER INFORMATION** For full details of cautions, consult product literature.
- ▶ **Autoimmune mediated conditions** The risk of autoimmune mediated conditions may increase during treatment, including immune thrombocytopenic purpura, thyroid disorders, nephropathies, and cytopenias, and should be monitored for throughout the course of treatment (consult product literature).
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · anxiety · asthma · cytokine release syndrome · endocrine ophthalmopathy · goitre · haemorrhage · hiccups · hyperhidrosis · hyperthyroidism · hypothyroidism · influenza like illness · leucocytosis · lymphadenopathy · lymphopenia · malaise · meningitis · menstrual cycle

irregularities · multiple sclerosis exacerbated · muscle complaints · muscle weakness · neoplasms · nephropathy · oropharyngeal pain · peripheral oedema · sensation abnormal · skin reactions · stomatitis · thyroiditis · tremor · urine abnormalities · vertigo · vision disorders

► **Uncommon** Acquired haemophilia · appetite decreased · cervical dysplasia · dry mouth · dysphagia · ear pain · facial swelling · gallbladder disorders · gastrointestinal disorders · Goodpasture's syndrome · limb discomfort · musculoskeletal stiffness · nephrolithiasis · pancytopenia · pneumonitis · pressure headache · throat irritation · weight changes

► **Rare or very rare** Haemophagocytic lymphohistiocytosis
 ► **Frequency not known** Artery dissection · cerebrovascular insufficiency · hepatitis autoimmune (including fatal cases) · liver injury · myocardial ischaemia · reactivation of infections · thyroid disorder autoimmune

● **CONCEPTION AND CONTRACEPTION** Women of childbearing potential should use effective contraception during and for 4 months after treatment.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. Autoimmune thyroid disease during treatment may affect fetus (consult product literature).

● **BREAST FEEDING** Manufacturer advises avoid during and for 4 months after each treatment course unless potential benefit outweighs risk.

● **PRE-TREATMENT SCREENING** Screening patients at high risk of hepatitis B or C is recommended before treatment. All patients should be evaluated for active or latent tuberculosis before starting treatment.

● MONITORING REQUIREMENTS

● The MHRA advises to check liver, thyroid, and kidney function, urinalysis with microscopy, blood counts, and vital signs (including blood pressure, heart rate, and ECG) before infusions.

► The MHRA advises monitor blood pressure and heart rate continuously or at least once every hour during infusions—discontinue infusion if severe adverse reactions occur.

► The MHRA advises monitor patients for infusion-related reactions for at least 2 hours after infusions; patients should be informed of the risk of delayed infusion-related reactions and to seek immediate medical attention if these occur.

► The MHRA advises monitor platelet counts after treatment—consult product literature.

► For further information on monitoring, see *Important safety information*.

► HPV screening should be carried out annually in female patients.

● **PRESCRIBING AND DISPENSING INFORMATION** All patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course.

● **PATIENT AND CARER ADVICE** Patients should be provided with a patient alert card and patient guide.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► **Alemtuzumab for treating relapsing-remitting multiple sclerosis** (May 2014) NICE TA312
 Alemtuzumab (*Lemtrada*[®]) is recommended as an option, within its marketing authorisation, for treating adults with active relapsing-remitting multiple sclerosis.

www.nice.org.uk/guidance/ta312

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► **Lemtrada** (Genzyme Therapeutics Ltd) ▼

Alemtuzumab 10 mg per 1 ml Lemtrada 12mg/1.2ml concentrate for solution for infusion vials | 1 vial [PoM] £7,045.00 (Hospital only)

Alemtuzumab 30 mg per 1 ml MabCampath 30mg/1ml concentrate for solution for infusion vials | 3 vial [PoM] £792.34 (Hospital only)

F 903

Natalizumab

05-Apr-2019

● INDICATIONS AND DOSE

Highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta or glatiramer acetate, or those patients with rapidly evolving severe relapsing-remitting multiple sclerosis (initiated under specialist supervision)

► **BY INTRAVENOUS INFUSION**

► **Adult 18–65 years:** 300 mg every 4 weeks, treatment should be discontinued if no response after 6 months

● **CONTRA-INDICATIONS** Active infection · active malignancies (except cutaneous basal cell carcinoma) · immunosuppression · progressive multifocal leucoencephalopathy

● CAUTIONS

Progressive Multifocal Leucoencephalopathy Natalizumab is associated with an increased risk of opportunistic infection and progressive multifocal leucoencephalopathy (PML) caused by JC virus. The risk of developing PML increases with the presence of anti-JCV antibodies, previous use of immunosuppressant therapy, and treatment duration (especially beyond 2 years of treatment); the risk beyond 4 years of treatment is not known. Patients with all three risk factors should only be treated with natalizumab if the benefits of treatment outweigh the risks. Treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.

For information on cautions consult product literature.

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS** Acute retinal necrosis · basophil count increased · eosinophilia · hyperbilirubinaemia · JC virus granule cell neuronopathy · liver injury · meningitis herpes · nucleated red cells

SIDE-EFFECTS, FURTHER INFORMATION Progressive Multifocal Leucoencephalopathy (PML) If suspected, treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.

Liver injury Discontinue treatment if significant liver injury occurs.

Infusion-related reactions Infusion-related reactions including dizziness, nausea, urticaria, chills, vomiting and flushing have been reported either during infusion or within 1 hour after completion of infusion.

● **PREGNANCY** Avoid unless essential—toxicity in *animal* studies.

● **BREAST FEEDING** Present in milk in *animal* studies—avoid.

● PRE-TREATMENT SCREENING

Progressive Multifocal Leucoencephalopathy A magnetic resonance image (MRI) scan is recommended before starting treatment with natalizumab.

Testing for serum anti-JCV antibodies before starting treatment or in those with unknown antibody status already receiving natalizumab is recommended and should be repeated every 6 months (consult product literature for full details).

● MONITORING REQUIREMENTS

- ▶ Monitor liver function.
- ▶ Progressive Multifocal Leucoencephalopathy A magnetic resonance image (MRI) scan is recommended annually. Patients should be monitored for new or worsening neurological symptoms, and for cognitive and psychiatric signs of PML.

All patients should continue to be monitored for signs and symptoms that may be suggestive of PML for approximately 6 months following discontinuation of treatment.

- ▶ Hypersensitivity reactions Patients should be observed for hypersensitivity reactions, including anaphylaxis, during the infusion and for 1 hour after completion of the infusion.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Tysabri*®), give intermittently in Sodium chloride 0.9%; dilute 300 mg in 100 mL infusion fluid; gently invert to mix, do not shake. Use within 8 hours of dilution and give over 1 hour.

● PATIENT AND CARER ADVICE

Hypersensitivity reactions Patients should be told the importance of uninterrupted dosing, particularly in the early months of treatment (intermittent therapy may increase risk of sensitisation).

Progressive Multifocal Leucoencephalopathy Patients should be informed about the risks of PML before starting treatment with natalizumab and again after 2 years; they should be given an alert card which includes information about the symptoms of PML.

Liver toxicity Advise patients to seek immediate medical attention if symptoms such as jaundice or dark urine develop.

Alert card A patient alert card should be provided.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Natalizumab for the treatment of adults with highly active relapsing-remitting multiple sclerosis (August 2007)**
NICE TA127
Natalizumab is an option for the treatment only of rapidly evolving severe relapsing-remitting multiple sclerosis (RES). RES is defined by 2 or more disabling relapses in 1 year, and 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.
Patients whose treatment was started before this guidance was published should have the option to continue treatment, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta127

Scottish Medicines Consortium (SMC) decisions

SMC No. 329/06

The *Scottish Medicines Consortium* has advised (September 2007) that natalizumab (*Tysabri*®) is accepted for restricted use within NHS Scotland as single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis only in patients with rapidly evolving severe relapsing-remitting multiple sclerosis defined by 2 or more disabling relapses in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

NHS restrictions

NHS England Clinical Commissioning Policy NHS England (May 2014) has provided guidance on the use of natalizumab for the treatment of multiple sclerosis in England. An NHS England Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing this treatment option, see www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04/.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Ocrelizumab

● INDICATIONS AND DOSE

Multiple sclerosis (specialist use only)

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 300 mg, then 300 mg after 2 weeks; maintenance 600 mg every 6 months, the first maintenance dose should be given 6 months after the first initial dose; a minimum interval of 5 months should be maintained between each maintenance dose, for dose interruption, adjustment of infusion rate or discontinuation of treatment due to infusion-related reactions or side-effects—consult product literature

- **CONTRA-INDICATIONS** Active infection · active malignancies · severely immunocompromised patients
- **CAUTIONS** Complete required vaccinations at least 6 weeks before treatment initiation · hepatitis B reactivation
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Catarrh
 - ▶ **Frequency not known** Malignancy
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use contraception during treatment and for 12 months after the last dose.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—limited information available; monitor infants for B-cell depletion.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor for signs and symptoms of progressive multifocal leucoencephalopathy (PML) (including any new onset or worsening of neurological symptoms)—if PML is suspected, interrupt treatment; discontinue treatment permanently if PML is confirmed.
 - ▶ Manufacturer advises monitor for infusion-related reactions during the infusion and observe patients for 1 hour after completion of the infusion—if severe pulmonary symptoms occur, permanently discontinue treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Manufacturer advises to record the batch number after each administration.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for further information regarding storage conditions after preparation of the infusion.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should be advised that infusion-related reactions can occur within 24 hours of infusion.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

 - ▶ **Ocrelizumab for treating relapsing-remitting multiple sclerosis (July 2018)** NICE TA533
Ocrelizumab (*Ocrevus*®) is recommended as an option for treating relapsing-remitting multiple sclerosis in adults

with active disease defined by clinical or imaging features, only if:

- alemtuzumab is contra-indicated or otherwise unsuitable, **and**
- the manufacturer provides ocrelizumab according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta533

▶ **Ocrelizumab for treating primary progressive multiple sclerosis (June 2019) NICE TA585**

Ocrelizumab (*Ocrevus*[®]) is recommended, within its marketing authorisation, as an option for treating early primary progressive multiple sclerosis with imaging features characteristic of inflammatory activity in adults. It is recommended only if the manufacturer provides it according to the commercial arrangement.

www.nice.org.uk/guidance/ta585

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2121

The *Scottish Medicines Consortium* has advised (December 2018) that ocrelizumab (*Ocrevus*[®]) is accepted for restricted use within NHS Scotland for the treatment of relapsing remitting multiple sclerosis in adults with active disease defined by clinical or imaging features who are contra-indicated or otherwise unsuitable for alemtuzumab. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower. SMC No. SMC2223

The *Scottish Medicines Consortium* has advised (January 2020) that ocrelizumab (*Ocrevus*[®]) is accepted for use within NHS Scotland for the treatment of adults with early primary progressive multiple sclerosis (PPMS) in terms of disease duration and level of disability, and with imaging features characteristic of inflammatory activity. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Ocrevus** (Roche Products Ltd) ▼

IMMUNOSUPPRESSANTS > PYRIMIDINE SYNTHESIS INHIBITORS

Teriflunomide

25-Jul-2018

- **DRUG ACTION** Teriflunomide is a metabolite of leflunomide which has immunomodulating and anti-inflammatory properties.

● **INDICATIONS AND DOSE**

Treatment of relapsing-remitting multiple sclerosis (initiated under specialist supervision)

- ▶ BY MOUTH
- ▶ Adult: 14 mg once daily

- **CONTRA-INDICATIONS** Anaemia · leucopenia · neutropenia · serious infection · severe hypoproteinaemia · severe immunodeficiency · significantly impaired bone-marrow function · thrombocytopenia
- **CAUTIONS** Adult over 65 years · anaemia · dyspnoea—assess for interstitial lung disease and consider suspending treatment · hypoproteinaemia (avoid if severe) · impaired bone-marrow function (avoid if severe) · latent

tuberculosis · leucopenia · persistent cough—assess for interstitial lung disease and consider suspending treatment · severe infection—delay or suspend treatment until resolved · significant alcohol consumption · signs or symptoms of serious skin reactions (including ulcerative stomatitis, Stevens-Johnson syndrome, and toxic epidermal necrolysis)—discontinue treatment · switching between other immunomodulating drugs · thrombocytopenia

- **INTERACTIONS** → Appendix 1: teriflunomide

● **SIDE-EFFECTS**

▶ **Common or very common** Abdominal pain upper · alopecia · anaemia · anxiety · arthralgia · cystitis · diarrhoea · headache · hypersensitivity · hypertension · increased risk of infection · menorrhagia · myalgia · nausea · nerve disorders · neutropenia · oral disorders · pain · palpitations · sensation abnormal · skin reactions · urinary frequency increased · vomiting · weight decreased

▶ **Uncommon** Thrombocytopenia

▶ **Frequency not known** Asthenia · hepatitis acute · interstitial lung disease · nail disorder · pancreatitis · sepsis

SIDE-EFFECTS, FURTHER INFORMATION Hepatic injury

Discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.

Important: accelerated elimination procedure recommended following discontinuation due to serious adverse effects (consult product literature).

- **CONCEPTION AND CONTRACEPTION** Effective contraception essential for women of child-bearing potential during treatment and for up to 2 years after treatment. In patients undergoing treatment with teriflunomide that are planning to conceive, the accelerated elimination procedure should be used prior to conception. Use of non-oral contraception is recommended during the accelerated elimination procedure—consult product literature.

- **PREGNANCY** Avoid—toxicity in animal studies.

- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.

● **MONITORING REQUIREMENTS**

- ▶ Monitor full blood count (including differential white cell count and platelet count) before treatment and as clinically indicated during treatment.
- ▶ Monitor blood pressure before treatment and periodically thereafter.
- ▶ Hepatic monitoring Monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks thereafter or as clinically indicated (pre-existing liver disease may increase risk). Increase to weekly monitoring if alanine aminotransferase (ALT) is 2–3 times the upper limit of reference range; discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.

● **TREATMENT CESSATION**

Accelerated elimination procedures To aid drug elimination in case of serious adverse effect or before conception, stop treatment and give *either* colestyramine p. 210 or charcoal, activated p. 1438. After the accelerated elimination procedure a plasma concentration of less than 20 micrograms/litre (measured on 2 occasions at least 14 days apart) and a waiting period of one and a half months are necessary before conception.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Teriflunomide for treating relapsing-remitting multiple sclerosis (January 2014)** NICE TA303
Teriflunomide is recommended for the treatment of adults with active relapsing-remitting multiple sclerosis (normally defined as 2 clinically significant relapses in the previous 2 years), in adults who:
 - do not have highly active or rapidly evolving severe relapsing-remitting multiple sclerosis **and**
 - the manufacturer provides teriflunomide with the discount agreed in the patient access schemewww.nice.org.uk/guidance/ta303

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (March 2014) that the use of teriflunomide (*Aubagio*)[®] in NHS Scotland is restricted to use in patients with relapsing-remitting multiple sclerosis who do not have highly active disease, and only as an alternative to treatment with interferon beta or glatiramer acetate.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

Malignant disease

1 Antibody responsive malignancy

ANTINEOPLASTIC DRUGS > MONOCLONAL ANTIBODIES

Atezolizumab

08-Oct-2019

- **DRUG ACTION** Atezolizumab is a monoclonal antibody, which binds to the programmed death-ligand 1 (PD-L1), thereby reactivating the immune response to tumour cells.

● INDICATIONS AND DOSE

Urothelial carcinoma (specialist use only) | Non-small cell lung cancer (specialist use only) | Small cell lung cancer (specialist use only) | Breast cancer (specialist use only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

- **CAUTIONS** Abnormal thyroid function—manufacturer advises to consider appropriate treatment · patients may need pre-medication to minimise the development of infusion-related reactions—consult product literature

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · appetite decreased · arthralgia · ascites · asthenia · chills · cough · cystitis · cytokine release syndrome · diarrhoea · dysphagia · dyspnoea · electrolyte imbalance · euthyroid sick syndrome · eye disorders · fever · gastrointestinal disorders · goitre · hepatic disorders · hyperglycaemia · hypersensitivity · hypotension · hypothyroidism · hypoxia · increased risk of infection · influenza like illness · infusion related reaction · myalgia · myxoedema · nasal congestion · nausea · oesophageal varices · oesophageal varices haemorrhage · oropharyngeal complaints · pain · radiation pneumonitis · respiratory disorders · skin reactions · skin ulcer · throat irritation · thrombocytopenia · thyroid

disorder · thyroiditis · toxic epidermal necrolysis · ulcerative colitis · vomiting

- ▶ **Uncommon** Adrenal hypofunction · connective tissue disorders · diabetes mellitus · diabetic ketoacidosis · hyperthyroidism · ketoacidosis · meningitis · muscle abscess · myopathy · nerve disorders · pancreatitis · photophobia
- ▶ **Rare or very rare** Hypophysitis · myocarditis · nephritis · neuromuscular dysfunction · temperature regulation disorder

SIDE-EFFECTS, FURTHER INFORMATION **Immune-related reactions** Manufacturer advises most immune-related adverse reactions are reversible and managed by temporarily stopping treatment and administration of a corticosteroid—consult product literature.

Infusion-related reactions Manufacturer advises permanently discontinue treatment in patients with severe infusion reactions.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential, during treatment and for 5 months after stopping treatment. See also *Pregnancy and reproductive function* in *Cytotoxic drugs* p. 938.
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available. See also *Pregnancy and reproductive function* in *Cytotoxic drugs* p. 938.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions—consult product literature.
- **PRESCRIBING AND DISPENSING INFORMATION** Manufacturer advises to record the brand name and batch number after each administration.

All prescribers should be familiar with the *Physician Information and Management Guidelines* provided by the manufacturer.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after dilution.
- **PATIENT AND CARER ADVICE** An alert card should be provided.
Driving and skilled tasks Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of drowsiness.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Atezolizumab for untreated PD-L1-positive locally advanced or metastatic urothelial cancer when cisplatin is unsuitable (updated July 2018)** NICE TA492
Atezolizumab (*Tecentriq*)[®] is recommended for use within the Cancer Drugs Fund as an option for untreated locally advanced or metastatic urothelial carcinoma in adults, for whom cisplatin-based chemotherapy is unsuitable, only if:
 - their tumours express PD-L1 at a level of 5% or more, **and**
 - the conditions of the managed access agreement for atezolizumab are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta492

- ▶ **Atezolizumab for treating locally advanced or metastatic urothelial carcinoma after platinum-containing chemotherapy (June 2018)** NICE TA525
Atezolizumab is recommended as an option for treating locally advanced or metastatic urothelial carcinoma in

adults who have had platinum-containing chemotherapy, only if:

- atezolizumab is stopped at 2 years of uninterrupted treatment or earlier if the disease progresses, **and**
- the company provides atezolizumab with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta525

▶ **Atezolizumab for treating locally advanced or metastatic non-small-cell lung cancer after chemotherapy (May 2018)**

NICE TA520

Atezolizumab is recommended as an option for treating locally advanced or metastatic non-small-cell lung cancer (NSCLC) in adults who have had chemotherapy (and targeted treatment if they have an EGFR- or ALK-positive tumour), only if:

- atezolizumab is stopped at 2 years of uninterrupted treatment or earlier if the disease progresses, **and**
- the manufacturer provides atezolizumab with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta520

▶ **Atezolizumab in combination for treating metastatic non-squamous non-small-cell lung cancer (June 2019)** NICE TA584

Atezolizumab (*Tecentriq*[®]) plus bevacizumab, carboplatin and paclitaxel is recommended as an option for metastatic non-squamous non-small-cell lung cancer (NSCLC) in adults:

- who have not had treatment for their metastatic NSCLC before and whose PD-L1 tumour proportion score is between 0% and 49%, **or**
- when targeted therapy for epidermal growth factor receptor (EGFR)-positive or anaplastic lymphoma kinase (ALK)-positive NSCLC has failed.

It is recommended only if:

- atezolizumab and bevacizumab are stopped at 2 years of uninterrupted treatment, or earlier if there is loss of clinical benefit (for atezolizumab) or if the disease progresses (for bevacizumab), **and**
- the manufacturer provides atezolizumab and bevacizumab according to the commercial arrangements.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta584

Scottish Medicines Consortium (SMC) decisions

SMC No. 1336/18

The *Scottish Medicines Consortium* has advised (July 2018) that atezolizumab (*Tecentriq*[®]) is accepted for restricted use within NHS Scotland for the treatment of adults with locally advanced or metastatic non-small cell lung cancer after prior chemotherapy, subject to a two-year clinical stopping rule. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower. SMC No. SMC2208

The *Scottish Medicines Consortium* has advised (November 2019) that atezolizumab (*Tecentriq*[®]) is **not** recommended for use within NHS Scotland in combination with bevacizumab, paclitaxel and carboplatin, for the first-line treatment of adults with metastatic non-squamous

non-small cell lung cancer, as the clinical and economic case was not demonstrated.

SMC No. SMC2103

The *Scottish Medicines Consortium* has advised (November 2018) that atezolizumab (*Tecentriq*[®]) is **not** recommended for use within NHS Scotland as monotherapy for the treatment of adults with locally advanced or metastatic urothelial carcinoma after prior platinum-containing chemotherapy, or who are considered cisplatin ineligible, as the clinical and economic case was not demonstrated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Avelumab

18-May-2018

- **DRUG ACTION** Avelumab is a monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor, thereby potentiating an immune response to tumour cells.

• **INDICATIONS AND DOSE**

Metastatic Merkel cell carcinoma (specialist use only)

- ▶ **BY INTRAVENOUS INFUSION**

▶ **Adult:** 10 mg/kg every 2 weeks, for information on dose delay or interruption due to side-effects and infusion-related reactions—consult product literature

- **CAUTIONS** Patients should receive pre-medication to minimise the development of adverse reactions (consult product literature)
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · anaemia · appetite decreased · arthralgia · asthenia · back pain · chills · constipation · cough · diarrhoea · dizziness · dry mouth · dyspnoea · fever · headache · hypertension · hypotension · hypothyroidism · influenza like illness · infusion related reaction · lymphopenia · myalgia · nausea · nerve disorders · peripheral oedema · pneumonitis · skin reactions · vomiting · weight decreased
- ▶ **Uncommon** Adrenal insufficiency · diabetes mellitus · eosinophilia · flushing · gastrointestinal disorders · hepatic disorders · hypersensitivity · hyperthyroidism · hypopituitarism · myositis · nephritis · systemic inflammatory response syndrome · thrombocytopenia · thyroiditis · uveitis
- ▶ **Rare or very rare** Myocarditis · pancreatitis
- ▶ **Frequency not known** Endocrine disorders

SIDE-EFFECTS, FURTHER INFORMATION **Infusion-related reactions**

For treatment modifications in patients with grade 1 or 2 infusion-related reactions, consult product literature. Manufacturer advises permanently discontinue treatment in patients with grade 3 or 4 infusion-related reaction.

Immune-related reactions Most immune-related adverse reactions are reversible and managed by temporarily stopping treatment and administration of a corticosteroid—consult product literature for further information.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use effective contraception during treatment and for at least 1 month after stopping treatment.

- **PREGNANCY** Manufacturer advises avoid unless essential—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Manufacturer advises avoid during treatment and for at least 1 month after stopping treatment—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intermittent intravenous infusion* (*Bavencio*®), dilute requisite dose with Sodium Chloride 0.9%; give over 60 minutes via a separate line using a low-protein binding 0.2 micron filter.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for storage conditions after preparation of the infusion.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Avelumab for treating metastatic Merkel cell carcinoma** (April 2018) NICE TA517

Avelumab is recommended as an option for treating metastatic Merkel cell carcinoma in adults, only if they have had 1 or more lines of chemotherapy for metastatic disease.

Avelumab is recommended for use within the Cancer Drugs Fund as an option for treating metastatic Merkel cell carcinoma in adults, only if:

- they have not had chemotherapy for metastatic disease, and
- the conditions in the managed access agreement for avelumab are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta517

Scottish Medicines Consortium (SMC) decisions

SMC No. 1315/18

The *Scottish Medicines Consortium* has advised (May 2018) that avelumab (*Bavencio*®) is accepted for use within NHS Scotland as monotherapy for treating adults with metastatic Merkel cell carcinoma.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **DRUG ACTION** Bevacizumab is a monoclonal antibody that inhibits vascular endothelial growth factor.

● INDICATIONS AND DOSE

Treatment of metastatic colorectal cancer in combination with fluoropyrimidine-based chemotherapy | **First-line treatment of metastatic breast cancer in combination with paclitaxel when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate** | **First-line treatment of metastatic breast cancer in combination with capecitabine when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate (patients who have received adjuvant taxane or anthracycline-containing regimens in the previous 12 months should not be treated with bevacizumab in combination with capecitabine)** | **Advanced or metastatic renal cell carcinoma in combination with interferon alfa-2a** | **First-line treatment of unresectable advanced, metastatic or recurrent non-small cell lung cancer other than predominantly squamous cell histology (In combination with platinum-based chemotherapy)** | **First-line treatment of advanced (FIGO stages IIIB, IIIC and IV) epithelial ovarian, fallopian tube, or primary peritoneal cancer (in combination with carboplatin and paclitaxel)** | **First recurrence of platinum-sensitive epithelial ovarian, fallopian tube, or primary peritoneal cancer in patients who have not been treated previously with bevacizumab or other drugs that target vascular endothelial growth factor (in combination with carboplatin and gemcitabine)**

- ▶ BY INTRAVENOUS INFUSION

▶ Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BEVACIZUMAB AND SUNITINIB: RISK OF OSTEONECROSIS OF THE JAW (JANUARY 2011)

Treatment with bevacizumab or sunitinib may be a risk factor for the development of osteonecrosis of the jaw.

Patients treated with bevacizumab or sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk.

Dental examination and appropriate preventive dentistry should be considered before treatment with bevacizumab or sunitinib.

If possible, invasive dental procedures should be avoided in patients treated with bevacizumab or sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

- **CAUTIONS** Elective surgery (withhold treatment and avoid for at least 28 days after major surgery or until wound fully healed) · history of arterial thromboembolism · history of cardiovascular disease (increased risk of cardiovascular events, especially in the elderly) · history of hypertension (increased risk of proteinuria—discontinue if nephrotic syndrome) · increased risk of fistulas (discontinue permanently if tracheo-oesophageal or grade 4 fistula develops) · increased risk of haemorrhage · increased risk of tumour-associated haemorrhage · intra-abdominal inflammation (risk of gastro-intestinal perforation and gall bladder perforation) · uncontrolled hypertension · untreated CNS metastases
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abscess · anaemia · appetite decreased · arthralgia · asthenia · congestive heart failure · constipation · cough · decreased leucocytes · dehydration · diarrhoea · drowsiness · dysarthria · dysphonia · dyspnoea ·

electrolyte imbalance · embolism and thrombosis · eye disorders · fever · fistula · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · healing impaired · hypersensitivity · hypertension · hypoxia · increased risk of infection · infusion related reaction · mucositis · muscle weakness · myalgia · nausea · neutropenia · ovarian failure · pain · pelvic pain · peripheral neuropathy · proteinuria · rectovaginal fistula · sepsis · skin reactions · stomatitis · stroke · supraventricular tachycardia · syncope · taste altered · thrombocytopenia · vomiting · weight decreased

- ▶ **Rare or very rare** Encephalopathy · necrotising fasciitis (discontinue and initiate treatment promptly)
- ▶ **Frequency not known** Chest pain · chills · flushing · gallbladder perforation · hyperglycaemia · hypotension · nasal septum perforation · osteonecrosis of jaw · pulmonary hypertension · renal thrombotic microangiopathy
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 6 months after treatment in women.
- **PREGNANCY** Avoid—toxicity in *animal studies*. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Manufacturer advises avoid breast-feeding during and for at least 6 months after treatment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for necrotising fasciitis (usually secondary to wound healing complications, gastro-intestinal perforation or fistula formation)—discontinue and initiate treatment promptly.
 - ▶ Monitor blood pressure.
 - ▶ Monitor for congestive heart failure.
 - ▶ Monitor for posterior reversible encephalopathy syndrome (presenting as seizures, headache, altered mental status, visual disturbance or cortical blindness, with or without hypertension).
 - ▶ Consider dental check-up before initiating treatment (risk of osteonecrosis of the jaw).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007)** NICE TA118
Bevacizumab in combination with fluorouracil plus folinic acid, with or without irinotecan, is **not** recommended for the first-line treatment of metastatic colorectal cancer; see also NICE guidance Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy. www.nice.org.uk/guidance/ta118
- ▶ **Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010)** NICE TA212
Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine is **not** recommended for the treatment of metastatic colorectal cancer. www.nice.org.uk/guidance/ta212
- ▶ **Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012)** NICE TA242
Bevacizumab in combination with non-oxaliplatin (fluoropyrimidine-based) chemotherapy is **not** recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy; see also NICE guidance Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007). www.nice.org.uk/guidance/ta242

- ▶ **Bevacizumab (first-line), sorafenib (first and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced and/or metastatic renal cell carcinoma (August 2009)** NICE TA178

Bevacizumab, sorafenib, and temsirolimus are **not** recommended as first-line treatments for people with advanced and/or metastatic renal cell carcinoma. Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced and/or metastatic renal cell carcinoma.

- ▶ **Bevacizumab in combination with a taxane for the first-line treatment of metastatic breast cancer (February 2011)** NICE TA214
Bevacizumab in combination with a taxane is **not** recommended for the first-line treatment of metastatic breast cancer. www.nice.org.uk/guidance/ta214
- ▶ **Bevacizumab in combination with capecitabine for the first-line treatment of metastatic breast cancer (August 2012)** NICE TA263
Bevacizumab in combinations with capecitabine is **not** recommended within its marketing authorisation for the first-line treatment of metastatic breast cancer, that is, when treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate, or when taxanes or anthracyclines have been used as part of adjuvant treatment in the previous 12 months. www.nice.org.uk/guidance/ta263
- ▶ **Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013)** NICE TA284
Bevacizumab in combination with paclitaxel and carboplatin is **not** recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer). www.nice.org.uk/guidance/ta284
- ▶ **Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013)** NICE TA285
Bevacizumab in combination with gemcitabine and carboplatin is **not** recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents. www.nice.org.uk/guidance/ta285

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (May 2012) that bevacizumab (*Avastin*®) is **not** recommended for use within NHS Scotland for the first line treatment of patients with metastatic breast cancer in whom treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate.

The *Scottish Medicines Consortium* has advised (September 2015) that bevacizumab (*Avastin*®) is accepted for restricted use within NHS Scotland in combination with paclitaxel for the treatment of adult patients with platinum-resistant recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer who received no more than two prior chemotherapy regimens and who have not received prior therapy with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.

The *Scottish Medicines Consortium* has advised (November 2015) that bevacizumab (*Avastin*®) is accepted for restricted use within NHS Scotland in combination with carboplatin and paclitaxel for the first-line treatment

of advanced FIGO stage IV epithelial ovarian, fallopian tube, or primary peritoneal cancer.

All Wales Medicines Strategy Group (AWMSG) decisions

The *All Wales Medicines Strategy Group* has advised (September 2017) that bevacizumab (*Avastin*®) is not recommended for use within NHS Wales in combination with paclitaxel and cisplatin, or alternatively, paclitaxel and topotecan in patients who cannot receive platinum therapy, for the treatment of adults with persistent, recurrent, or metastatic carcinoma of the cervix. The case for cost-effectiveness has not been proven.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for infusion

▶ *Avastin* (Roche Products Ltd)

Bevacizumab 25 mg per 1 ml Avastin 400mg/16ml solution for infusion vials | 1 vial [PoM] £924.40 (Hospital only)
Avastin 100mg/4ml solution for infusion vials | 1 vial [PoM] £242.66 (Hospital only)

Blinatumomab

26-Feb-2020

- **DRUG ACTION** The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

● INDICATIONS AND DOSE

Relapsed or refractory Philadelphia chromosome-negative acute lymphoblastic leukaemia (initiated by a specialist)

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

Philadelphia chromosome-negative acute lymphoblastic leukaemia in complete remission with minimal residual disease (initiated by a specialist)

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Adult (body-weight 45 kg and above): (consult product literature)

- **CAUTIONS** Aphasia · brain injuries (severe) · cerebellar disease · dementia · elderly—limited information available · epilepsy · paresis · Parkinson's disease · patients may need pre-medication to minimise adverse reactions · psychosis · seizure · severe hepatic impairment · severe renal impairment · stroke

CAUTIONS, FURTHER INFORMATION

- ▶ Pre-medication Manufacturer advises pre-medication with a corticosteroid and an anti-pyretic—consult product literature.
- ▶ Neurological events There is potentially a higher risk of neurological events in patients with clinically relevant CNS pathology—manufacturer advises caution.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · anaemia · aphasia · appetite decreased · arthralgia · chest pain · chills · cognitive disorder · confusion · constipation · cough · decreased leucocytes · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · encephalopathy · facial swelling · fatigue · fever · flushing · headache · hyperglycaemia · hypersensitivity · hypertension · hypoalbuminaemia · hypotension · immune disorder · increased risk of infection · infusion related reaction · insomnia · leucocytosis · memory loss · nausea · neutropenia · oedema · pain · paraesthesia · rash · respiratory disorders · seizure · sepsis · tachycardia · thrombocytopenia · tremor · tumour lysis syndrome · vomiting · weight increased
- ▶ **Uncommon** Capillary leak syndrome · cranial nerve disorder · pancreatitis

SIDE-EFFECTS, FURTHER INFORMATION **Pancreatitis** Life-threatening or fatal cases of pancreatitis have been reported; manufacturer advises monitor for signs and symptoms of pancreatitis during treatment—temporary interruption or discontinuation may be required (consult product literature).

Cytokine release syndrome, infusion-reactions and tumour lysis syndrome Life-threatening (including fatal) cases of cytokine release syndrome and tumour lysis syndrome have been reported in patients taking blinatumomab. Manufacturer advises monitor signs and symptoms of cytokine release syndrome and infusion reactions during treatment; temporary interruption or discontinuation may be required—consult product literature.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment and for at least 48 hours after treatment in women of child-bearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 938.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available; if exposed during pregnancy, monitor infant for B-cell depletion. See also Pregnancy and reproductive function in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Manufacturer advises avoid during and for at least 48 hours after treatment—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises neurological examination prior to the initiation of treatment and continued monitoring during treatment—consult product literature.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after reconstitution and dilution.
- **PATIENT AND CARER ADVICE** A patient alert card should be provided. Educational materials should be provided to patients, carers and healthcare professionals to ensure blinatumomab is used in a safe and effective way, and to prevent the risk of medication errors and neurological events—consult product information.
Driving and skilled tasks Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of confusion, disorientation, co-ordination and balance disorders, seizures and disturbances in consciousness.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE decisions
▶ **Blinatumomab** for previously treated Philadelphia-chromosome-negative acute lymphoblastic leukaemia (June 2017) NICE TA450
Blinatumomab (*Blinicyto*®) is recommended within its marketing authorisation as an option for treating Philadelphia chromosome-negative relapsed or refractory precursor B-cell acute lymphoblastic leukaemia in adults, only if the manufacturer provides it with the discount agreed in the patient access scheme.
www.nice.org.uk/guidance/ta450
▶ **Blinatumomab** for treating acute lymphoblastic leukaemia in remission with minimal residual disease activity (July 2019) NICE TA589
Blinatumomab (*Blinicyto*®) is recommended as an option for treating Philadelphia chromosome-negative CD19-positive B-precursor acute lymphoblastic leukaemia in adults with minimal residual disease of at least 0.1%, only if:

- the disease is in first complete remission, **and**
- the manufacturer provides blinatumomab according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta589

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2234

The *Scottish Medicines Consortium* has advised (March 2020) that blinatumomab (*Blinicyto*®) is accepted for restricted use within NHS Scotland as monotherapy for the treatment of Philadelphia chromosome-negative, CD19 positive, B-precursor acute lymphoblastic leukaemia in adults who are in first complete remission with minimal residual disease greater than or equal to 0.1%. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

EXCIPIENTS: May contain Polysorbates

▶ *Blinicyto* (Amgen Ltd) ▼

Blinatumomab 38.5 microgram Blinicyto 38.5 micrograms powder for concentrate and solution for solution for infusion vials | 1 vial [PoM] £2,017.00

Brentuximab vedotin

08-May-2019

• INDICATIONS AND DOSE

CD30 positive Hodgkin lymphoma (specialist use only) | Systemic anaplastic large cell lymphoma (specialist use only) | CD30 positive cutaneous T-cell lymphoma (specialist use only)

▶ BY INTRAVENOUS INFUSION

▶ Adult: (consult product literature)

- **CAUTIONS** Elevated BMI—risk of hyperglycaemia · high tumour burden—risk of tumour lysis syndrome · rapidly proliferating tumours—risk of tumour lysis syndrome
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · alopecia · anaemia · arthralgia · back pain · chills · constipation · cough · diarrhoea · dizziness · dyspnoea · fatigue · fever · hyperglycaemia · increased risk of infection · infusion related reaction · myalgia · nausea · nerve disorders · neutropenia · skin reactions · thrombocytopenia · vomiting · weight decreased
 - ▶ **Uncommon** Anaphylactic reaction · cytomegalovirus infection reactivation · pancreatitis acute · sepsis · severe cutaneous adverse reactions (SCARs) · tumour lysis syndrome
 - ▶ **Frequency not known** Disease recurrence · gastrointestinal disorders · gastrointestinal haemorrhage · progressive multifocal leukoencephalopathy (PML) · respiratory disorders
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for 6 months after treatment in men and women.
- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in *animal* studies).
- **BREAST FEEDING** Avoid—no information available.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for symptoms of progressive multifocal leukoencephalopathy (presenting as new or worsening neurological, cognitive or behavioural signs or symptoms).

- ▶ Monitor for new or worsening abdominal pain—investigate and withhold treatment if acute pancreatitis suspected and discontinue if confirmed (fatal cases reported).
- ▶ Monitor for pulmonary toxicity—treat symptoms promptly.
- ▶ Routinely monitor hepatic function.
- ▶ Monitor for infusion-related (including anaphylactic) reactions.
- ▶ Monitor for signs of peripheral neuropathy—consult product literature for treatment adjustment.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

▶ Brentuximab vedotin for treating relapsed or refractory systemic anaplastic large cell lymphoma (October 2017) NICE TA478

Brentuximab vedotin is recommended as an option for treating relapsed or refractory systemic anaplastic large cell lymphoma in adults, only if:

- they have an Eastern Cooperative Oncology Group performance status of 0 or 1, **and**
- the manufacturer provides brentuximab vedotin according to the commercial access agreement with NHS England.

These recommendations are not intended to affect treatment that was started in the NHS before this guidance was published. Adults having treatment outside these recommendations may continue without change to the funding arrangements in place before this guidance was published, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta478

▶ Brentuximab vedotin for treating CD30-positive Hodgkin lymphoma (June 2018) NICE TA524

Brentuximab vedotin is recommended as an option for treating CD30-positive Hodgkin lymphoma in adults with relapsed or refractory disease, only if:

- they have already had autologous stem cell transplant, **or**
- they have already had at least 2 previous therapies when autologous stem cell transplant or multi-agent chemotherapy are not suitable, **and**
- the manufacturer provides brentuximab vedotin according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta524

▶ Brentuximab vedotin for treating CD30-positive cutaneous T-cell lymphoma (April 2019) NICE TA577

Brentuximab vedotin (*Adcetris*®) is recommended as an option for treating CD30-positive cutaneous T-cell lymphoma (CTCL) after at least one systemic therapy in adults, only if:

- they have mycosis fungoides stage IIB or over, primary cutaneous anaplastic large cell lymphoma or Sézary syndrome, **and**
- the manufacturer provides brentuximab vedotin according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta577

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2229

The *Scottish Medicines Consortium* has advised (January 2020) that brentuximab vedotin (*Adcetris*®) is accepted for restricted use within NHS Scotland for the treatment of

adults with advanced CD30-positive cutaneous T-cell lymphoma defined as mycosis fungoides stage IIB and above, primary cutaneous anaplastic large cell lymphoma or Sézary Syndrome, after at least one prior systemic therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

EXCIPIENTS: May contain Polysorbates

ELECTROLYTES: May contain Sodium

- ▶ **Adcetris** (Takeda UK Ltd) ▼

Brentuximab vedotin 50 mg Adcetris 50mg powder for concentrate for solution for infusion vials | 1 vial [POM] £2,500.00

Cemiplimab

12-Sep-2019

- **DRUG ACTION** Cemiplimab is a human immunoglobulin G4 monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor thereby potentiating an immune response to tumour cells.

● INDICATIONS AND DOSE

Cutaneous squamous cell carcinoma (specialist use only)

- ▶ BY INTRAVENOUS INFUSION

• Adult: 350 mg every 3 weeks, for dose interruption or discontinuation of treatment due to side-effects or infusion-related reactions—consult product literature

- **CAUTIONS** For full details consult product literature.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arthralgia · arthritis · asthenia · colitis · diarrhoea · hepatic disorders · hyperthyroidism · hypothyroidism · infusion related reaction · myalgia · pain · pneumonitis · skin reactions · stomatitis
 - ▶ **Uncommon** Adrenal insufficiency · cardiac inflammation · diabetic ketoacidosis · encephalitis · hypophysitis · immune thrombocytopenic purpura · keratitis · meningitis · muscle weakness · myasthenia gravis · nephritis · nerve disorders · nervous system disorders · Sjögren's syndrome · thyroiditis · type 1 diabetes mellitus · vasculitis
 - ▶ **Frequency not known** Encephalitis non-infective · severe cutaneous adverse reactions (SCARs)
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises females of childbearing potential should use effective contraception during treatment and for at least 4 months after the last dose. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Manufacturer advises discontinue breast-feeding during treatment and for at least 4 months after stopping—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of infusion- and immune-related side-effects—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intermittent intravenous infusion*, dilute to a concentration between 1 mg/mL and 20 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 30 minutes through a low-protein binding in-line or add-on filter (pore size 0.2–5 micron).
- **PRESCRIBING AND DISPENSING INFORMATION** Cemiplimab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on

prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.

The manufacturer of *Libtayo*® has provided a *Risk minimisation materials* document for healthcare professionals.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature about storage after preparation of the infusion.
- **PATIENT AND CARER ADVICE** Risk of immune-related side-effects A patient alert card and patient guide should be provided.
- **NATIONAL FUNDING/ACCESS DECISIONS** **NICE decisions**

- ▶ **Cemiplimab for treating metastatic or locally advanced cutaneous squamous cell carcinoma (August 2019)** NICE TA592 Cemiplimab (*Libtayo*®) is recommended for use within the Cancer Drugs Fund as an option for treating locally advanced or metastatic cutaneous squamous cell carcinoma in adults when curative surgery or curative radiotherapy is not appropriate. It is recommended only if the conditions in the managed access agreement are followed.

Treatment with cemiplimab should be continued until disease progression or for up to 24 months (whichever is sooner).

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta592

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2216

The *Scottish Medicines Consortium* has advised (February 2020) that cemiplimab (*Libtayo*®) is accepted for use within NHS Scotland on an interim basis subject to ongoing evaluation and future reassessment. It is used as monotherapy for the treatment of adults with metastatic or locally advanced cutaneous squamous cell carcinoma who are not candidates for curative surgery or curative radiation. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain L-proline, polysorbates, sucrose

- ▶ **Libtayo** (Sanofi) ▼

Cemiplimab 50 mg per 1 ml Libtayo 350mg/7ml concentrate for solution for infusion vials | 1 vial [POM] £4,650.00 (Hospital only)

Cetuximab

04-Dec-2019

● INDICATIONS AND DOSE

Treatment of wild-type RAS metastatic colorectal cancer in patients with tumours expressing epidermal growth factor receptor, as combination therapy, or as monotherapy if oxaliplatin- and irinotecan-based therapy has failed or if irinotecan is not tolerated | Treatment of locally advanced squamous cell cancer of the head and neck (in combination with radiotherapy) | Treatment of recurrent or metastatic squamous cell cancer of the head and neck (in combination with platinum-based chemotherapy)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult (initiated by a specialist): (consult product literature or local protocols)

IMPORTANT SAFETY INFORMATION

Patients must receive an antihistamine and a corticosteroid at least one hour before infusion. Resuscitation facilities should be available and treatment should be initiated by a specialist.

MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

- **CONTRA-INDICATIONS** RAS mutated colorectal tumours (or if RAS tumour status unknown)
- **CAUTIONS** Cardiopulmonary disease · cardiovascular disease · history of keratitis · pulmonary disease—discontinue if interstitial lung disease · risk factors for keratitis · severe dry eye · ulcerative keratitis (including contact lens use)
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
- ▶ **Common or very common** Appetite decreased · cytokine release syndrome · dehydration · diarrhoea · electrolyte imbalance · eye inflammation · fatigue · headache · infusion related reaction · mucositis · nausea · skin eruption · vomiting
- ▶ **Uncommon** Embolism and thrombosis · interstitial lung disease
- ▶ **Rare or very rare** Severe cutaneous adverse reactions (SCARs)
- ▶ **Frequency not known** Meningitis aseptic · superinfection of skin lesions
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Use only if potential benefit outweighs risk—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Avoid breast-feeding during and for 2 months after treatment—no information available.
- **PRE-TREATMENT SCREENING** Evidence of non-mutated (wild-type) RAS status (at exons 2, 3 and 4 of KRAS and NRAS) is required before cetuximab is initiated for the treatment of metastatic colorectal cancer, and should be

determined by an experienced laboratory using a validated test method.

- **DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Cetuximab for the treatment of locally advanced squamous cell cancer of the head and neck (June 2008) NICE TA145
Cetuximab in combination with radiotherapy is an option for the treatment of locally advanced squamous cell cancer of the head and neck in patients who have a Karnofsky performance status of 90% or greater and when all forms of platinum-based chemoradiotherapy treatment are contra-indicated.
www.nice.org.uk/guidance/ta145
- ▶ Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242
Cetuximab monotherapy or combination chemotherapy is **not** recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy.
www.nice.org.uk/guidance/ta242
- ▶ Cetuximab and panitumumab for previously untreated metastatic colorectal cancer (updated September 2017) NICE TA439
Cetuximab is recommended, within its marketing authorisation, as an option for previously untreated epidermal growth factor receptor-expressing, RAS wild-type metastatic colorectal cancer in patients in combination with:
 - 5-fluorouracil, folinic acid and oxaliplatin (FOLFOX), or
 - 5-fluorouracil, folinic acid and irinotecan (FOLFIRI).
 This advice is contingent upon the manufacturer providing cetuximab with the discount agreed in the commercial access agreement.
www.nice.org.uk/guidance/ta439
- ▶ Cetuximab for treating recurrent or metastatic squamous cell cancer of the head and neck (August 2017) NICE TA473
Cetuximab in combination with platinum-based chemotherapy is recommended as an option for treating recurrent or metastatic squamous cell cancer of the head and neck in patients only:
 - if the cancer started in the oral cavity, **and**
 - when the company provides the drug in line with the commercial access agreement with NHS England.
 Patients currently receiving cetuximab whose disease does not meet the above criteria may continue treatment until they and their clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta473

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Erbixux** (Merck Serono Ltd)
Cetuximab 5 mg per 1 ml Erbixux 100mg/20ml solution for infusion vials | 1 vial **[PoM]** £178.10 (Hospital only)
Erbixux 500mg/100ml solution for infusion vials | 1 vial **[PoM]** £890.50 (Hospital only)

Daratumumab

10-Sep-2019

● **DRUG ACTION** Daratumumab is a monoclonal antibody that binds to CD38, a cell-surface protein, resulting in tumour cell death by immune-mediated actions and apoptosis.

● INDICATIONS AND DOSE

Multiple myeloma (as monotherapy after failure of a proteasome inhibitor and an immunomodulatory agent) (specialist use only) | Multiple myeloma (in combination with lenalidomide and dexamethasone in patients who have received at least one prior therapy) (specialist use only)

► BY INTRAVENOUS INFUSION

• **Adult:** 16 mg/kg once weekly for weeks 1 to 8, for week 1, dose can alternatively be divided over 2 consecutive days, then 16 mg/kg every 2 weeks for weeks 9 to 24, then 16 mg/kg every 4 weeks for week 25 onwards until disease progression, for dose interruption or infusion rate reduction due to infusion-related reactions or side-effects—consult product literature

Multiple myeloma (in combination with bortezomib and dexamethasone in patients who have received at least one prior therapy) (specialist use only)

► BY INTRAVENOUS INFUSION

• **Adult:** 16 mg/kg once weekly for weeks 1 to 9, for week 1, dose can alternatively be divided over 2 consecutive days, then 16 mg/kg every 3 weeks for weeks 10 to 24, then 16 mg/kg every 4 weeks for week 25 onwards until disease progression, for dose interruption or infusion rate reduction due to infusion-related reactions or side-effects—consult product literature

Newly diagnosed multiple myeloma (in combination with bortezomib, melphalan and prednisone) (specialist use only)

► BY INTRAVENOUS INFUSION

• **Adult:** 16 mg/kg once weekly for weeks 1 to 6, for week 1, dose can alternatively be divided over 2 consecutive days, then 16 mg/kg every 3 weeks for weeks 7 to 54, then 16 mg/kg every 4 weeks for week 55 onwards until disease progression, for dose interruption or infusion rate reduction due to infusion-related reactions or side-effects—consult product literature

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DARATUMUMAB (DARZALEX®): RISK OF REACTIVATION OF HEPATITIS B VIRUS (AUGUST 2019)

An EU cumulative review of worldwide data has identified reports of hepatitis B virus (HBV) reactivation in patients treated with daratumumab, including several fatal cases. Healthcare professionals are advised to screen all patients for hepatitis B before starting treatment; patients with unknown serology already being treated with daratumumab should also be screened. Those with positive serology should be monitored for signs of HBV reactivation during, and for at least 6 months after, treatment; immediate medical attention should be sought if signs and symptoms of HBV reactivation develop. Daratumumab should be stopped in patients with HBV reactivation and appropriate treatment initiated, based on expert advice. Experts should be consulted before resuming daratumumab in patients with adequately controlled viral reactivation.

● **CAUTIONS** History of obstructive pulmonary disorder (consider additional post-medication—consult product literature) · patients may need pre-medication to minimise adverse reactions · risk of herpes zoster reactivation (consider antiviral prophylaxis)

CAUTIONS, FURTHER INFORMATION

► **Infusion-related reactions** Serious infusion-related reactions can occur and daratumumab should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises pre-medication with a corticosteroid, an antihistamine and an anti-pyretic and post-medication with oral corticosteroids—consult product literature. Manufacturer advises patients should be closely monitored for signs of infusion-related reactions during and after administration; in the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

► **Common or very common** Anaemia · atrial fibrillation · cough · diarrhoea · dyspnoea · fatigue · fever · headache · hypertension · increased risk of infection · infusion related reaction · lymphopenia · muscle spasms · nausea · neutropenia · peripheral neuropathy · peripheral oedema · pulmonary oedema · thrombocytopenia · vomiting

► **Uncommon** Hepatitis B reactivation

► **Rare or very rare** Anaphylactic reaction

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises treatment should be immediately interrupted if an infusion-related reaction of any grade or severity occurs—consult product literature for specific management recommendations.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential during treatment and for 3 months after stopping treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **EFFECT ON LABORATORY TESTS** Possible positive indirect Coombs test (may affect antibody screening).

● **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C; consult product literature for storage advice following dilution.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► **Daratumumab monotherapy for treating relapsed and refractory multiple myeloma (March 2018)** NICE TA510 Daratumumab (*Darzalex*®) monotherapy is recommended for use within the Cancer Drugs Fund as an option for treating relapsed and refractory multiple myeloma in adults whose previous therapy included a proteasome inhibitor and an immunomodulator, and whose disease progressed on the last therapy, only if:

- they have daratumumab after 3 previous therapies, **and**
- the conditions in the managed access agreement are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta510

► **Daratumumab with bortezomib and dexamethasone for previously treated multiple myeloma (April 2019)** NICE TA573 Daratumumab (*Darzalex*®) plus bortezomib plus dexamethasone is recommended for use within the Cancer Drugs Fund as an option for treating relapsed multiple myeloma in people who have had one previous treatment. It is recommended only if the conditions in the managed

access agreement for daratumumab plus bortezomib plus dexamethasone are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta573

Scottish Medicines Consortium (SMC) decisions

SMC No. 1205/17

The *Scottish Medicines Consortium* has advised (October 2017) that daratumumab (*Darzalex*[®]) is accepted for restricted use within NHS Scotland as monotherapy for use as a fourth-line treatment option for adults with relapsed and refractory multiple myeloma, only if a proteasome inhibitor and an immunomodulatory agent have been used as prior therapy and disease demonstrated progression on the last therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower. SMC No. SMC2180

The *Scottish Medicines Consortium* has advised (July 2019) that daratumumab (*Darzalex*[®]) is accepted for restricted use within NHS Scotland when used in combination with bortezomib and dexamethasone, for the treatment of adults with multiple myeloma who have received one prior therapy only.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polysorbates

ELECTROLYTES: May contain Sodium

► *Darzalex* (Janssen-Cilag Ltd) ▼

Daratumumab 20 mg per 1 ml Darzalex 400mg/20ml concentrate for solution for infusion vials | 1 vial [PoM] £1,440.00 (Hospital only)
Darzalex 100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £360.00 (Hospital only)

Dinutuximab beta

10-Sep-2018

- **DRUG ACTION** Dinutuximab beta is a chimeric monoclonal antibody; it specifically targets the carbohydrate moiety of disialganglioside 2, which is overexpressed on neuroblastoma cells.

● INDICATIONS AND DOSE

High-risk neuroblastoma (specialist use only)

► BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

- **CONTRA-INDICATIONS** Acute grade 3 or 4, or extensive chronic graft-versus-host disease
- **CAUTIONS** Avoid vaccinations during and for at least 10 weeks after treatment cessation (increased risk of immune stimulation and neurological toxicity) - ensure absence of systemic infection - any other infection should be controlled before treatment initiation - pre-medication must be administered to minimise the risk of infusion-related reactions and neuropathic pain

CAUTIONS, FURTHER INFORMATION

- Pre-medication Severe infusion-related reactions can occur and dinutuximab beta should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises pre-medication with an antihistamine, and to monitor closely, particularly during the first and second treatment course; discontinue immediately if reaction occurs and treat as indicated—consult product literature.

Manufacturer advises pre-medication with non-opioid analgesics, gabapentin and opioids—consult product literature.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- **Common or very common** Abdominal distension · anaemia · anxiety · appetite decreased · ascites · capillary leak syndrome · chills · cough · cytokine release syndrome · decreased leucocytes · device related infection · dizziness · dyspnoea · electrolyte imbalance · eye disorders · eye inflammation · fever · fluid imbalance · gastrointestinal disorders · haematuria · headache · heart failure · hyperhidrosis · hypersensitivity · hypertension · hypertriglyceridaemia · hypoalbuminaemia · hypotension · hypoxia · increased risk of infection · left ventricular dysfunction · muscle spasms · nausea · neutropenia · oedema · oral disorders · pain · paraesthesia · pericardial effusion · peripheral neuropathy · photosensitivity reaction · pulmonary oedema · renal impairment · respiratory disorders · seizure · sepsis · skin reactions · tachycardia · thrombocytopenia · tremor · urinary retention · urine abnormalities · vision disorders · vomiting · weight changes
- **Uncommon** Disseminated intravascular coagulation · eosinophilia · hepatocellular injury · hypovolaemic shock · intracranial pressure increased · peripheral vascular disease · posterior reversible encephalopathy syndrome (PRES)

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use contraception during and for 6 months after stopping treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

- **PREGNANCY** Manufacturer advises avoid—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

- **BREAST FEEDING** Manufacturer advises avoid during treatment and for 6 months after the last dose—no information available.

● MONITORING REQUIREMENTS

- Manufacturer advises pre-treatment evaluation of pulse oximetry, bone marrow function, liver function and renal function—consult product literature for values required for treatment initiation.
- Manufacturer advises monitor circulatory and respiratory function—risk of capillary leak syndrome.
- Manufacturer advises monitor liver function and electrolytes regularly.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.

● PATIENT AND CARER ADVICE

- **Driving and skilled tasks** Manufacturer advises patients should not use or drive machines during treatment.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- **Dinutuximab beta for treating neuroblastoma (August 2018)** NICE TA538

Dinutuximab beta (*Qarziba*[®]) is recommended as an option for treating high-risk neuroblastoma in people aged 12 months and over whose disease has at least partially responded to induction chemotherapy, followed by myeloablative therapy and stem cell transplant, only if:

- they have not already had anti-GD2 immunotherapy, **and**
- the manufacturer provides dinutuximab beta according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta538

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2105

The *Scottish Medicines Consortium* has advised (November 2018) that dinutuximab beta (*Qarziba*®) is accepted for use within NHS Scotland for the treatment of high-risk neuroblastoma in patients aged 12 months and over whose disease has at least partially responded to induction chemotherapy, followed by myeloablative therapy and stem cell transplantation, as well as patients with a history of relapsed or refractory neuroblastoma, with or without residual disease.

In patients with a history of relapsed or refractory disease and in patients who have not achieved a complete response after first line therapy, dinutuximab beta should be combined with interleukin-2.

This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion▶ *Qarziba* (EUSA Pharma Ltd) ▼

Dinutuximab beta 4.5 mg per 1 ml *Qarziba* 20mg/4.5ml concentrate for solution for infusion vials | 1 vial [PoM] £7,610.00 (Hospital only)

Durvalumab

28-May-2019

- **DRUG ACTION** Durvalumab is a human monoclonal antibody that selectively binds to programmed cell death ligand-1 (PD-L1), blocking its interaction with the programmed death-1 (PD-1) receptor and with CD80, and thereby potentiating an immune response to tumour cells.

● **INDICATIONS AND DOSE****Non-small cell lung cancer (initiated by a specialist)**

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** 10 mg/kg every 2 weeks, consult product literature for information on dose adjustments based on individual patient safety and tolerability

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS**

- ▶ **Common or very common** Cough · diarrhoea · dysphonia · dysuria · fever · flank pain · gastrointestinal discomfort · gastrointestinal disorders · hyperthyroidism · hypothyroidism · increased risk of infection · infusion related reaction · myalgia · night sweats · peripheral oedema · respiratory disorders · skin reactions · thyroiditis
- ▶ **Uncommon** Adrenal insufficiency · glomerulonephritis · hepatic disorders · myopathy · nephritis · type 1 diabetes mellitus
- ▶ **Rare or very rare** Diabetes insipidus · hypophysitis · hypopituitarism · myocarditis

SIDE-EFFECTS, FURTHER INFORMATION Immune-related

reactions Manufacturer advises that most immune-related adverse reactions resolved with appropriate management, including initiation of immunosuppressive treatment and treatment modifications—consult product literature.

Infusion-related reactions Manufacturer advises to permanently discontinue treatment in patients with severe infusion reactions.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential during treatment and for at least 3 months after stopping treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Manufacturer advises avoid—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion*, dilute to a concentration between 1 mg/mL and 15 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 60 minutes through a low-protein binding in-line filter (pore size 0.2 or 0.22 micron).
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after preparation of the infusion.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- ▶ **Durvalumab for treating locally advanced unresectable non-small-cell lung cancer after platinum-based chemoradiation (May 2019)** NICE TA578
Durvalumab (*Imfinzi*®) monotherapy is recommended for use within the Cancer Drugs Fund as an option for treating locally advanced unresectable non-small cell lung cancer in adults whose tumours express PD-L1 on at least 1% of tumour cells and whose disease has not progressed after platinum-based chemoradiation only if:
 - they have had concurrent platinum-based chemoradiation, and
 - the conditions in the managed access agreement are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta578

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2156

The *Scottish Medicines Consortium* has advised (June 2019) that durvalumab (*Imfinzi*®) is accepted for use within NHS Scotland as monotherapy for the treatment of locally advanced, unresectable non-small cell lung cancer in adults whose tumours express PD-L1 on ≥1% of tumour cells and whose disease has not progressed following platinum-based chemoradiation therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polysorbates

▶ *Imfinzi* (AstraZeneca UK Ltd) ▼

Durvalumab 50 mg per 1 ml *Imfinzi* 120mg/2.4ml concentrate for solution for infusion vials | 1 vial [PoM] £592.00
Imfinzi 500mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £2,466.00

Elotuzumab

12-Apr-2019

- **DRUG ACTION** Elotuzumab is a monoclonal antibody that targets the signalling lymphocytic activation molecule family member 7 (SLAMF7) protein, thereby activating natural killer cells and mediating myeloma cell death.

● INDICATIONS AND DOSE

Multiple myeloma in patients who have received at least one prior therapy (in combination with lenalidomide and dexamethasone) (specialist use only)

► BY INTRAVENOUS INFUSION

- Adult: 10 mg/kg every week, on days 1, 8, 15 and 22 of cycles 1 and 2, then 10 mg/kg every 2 weeks, on days 1 and 15 of subsequent cycles

- **CAUTIONS** Pre-medication must be administered to minimise the development of infusion-related reactions—consult product literature · secondary primary malignancies

CAUTIONS, FURTHER INFORMATION

- Secondary primary malignancies Manufacturer advises to monitor for the development of secondary primary malignancy before and during treatment with elotuzumab.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- **Common or very common** Chest pain · cough · deep vein thrombosis · diarrhoea · fatigue · fever · headache · hypersensitivity · increased risk of infection · infusion related reaction · lymphopenia · mood altered · night sweats · numbness · oropharyngeal pain · weight decreased
- SIDE-EFFECTS, FURTHER INFORMATION** Side-effects reported when used in combination with lenalidomide and dexamethasone or bortezomib and dexamethasone.

Infusion-related reactions Manufacturer advises for mild-to-moderate infusion reactions interrupt treatment or reduce infusion rate, and monitor closely (consult product literature); permanently discontinue therapy in severe infusion reactions.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in men and women of childbearing potential; male patients should continue effective contraceptive measures for 180 days after stopping treatment if their partner is pregnant or of childbearing potential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

- **PREGNANCY** Manufacturer advises avoid unless essential—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after preparation of the infusion.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

EXCIPIENTS: May contain Polysorbates, sucrose

- **Emplliciti** (Bristol-Myers Squibb Pharmaceuticals Ltd) ▼

Elotuzumab 300 mg Emplliciti 300mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £1,085.00

Elotuzumab 400 mg Emplliciti 400mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £1,446.00

Gemtuzumab ozogamicin

17-Oct-2018

- **DRUG ACTION** Gemtuzumab ozogamicin is a monoclonal antibody that binds to CD33-expressing tumour cells to induce cell cycle arrest and apoptotic cell death.

● INDICATIONS AND DOSE

CD33-positive acute myeloid leukaemia (specialist use only)

► BY INTRAVENOUS INFUSION

- Adult: (consult product literature)

- **CAUTIONS** Adverse-risk cytogenetics (consider benefits and risks of treatment, consult product literature) · haematopoietic stem cell transplantation (increased risk of hepatotoxicity) · pre-medication recommended to minimise adverse reactions

CAUTIONS, FURTHER INFORMATION

- Pre-medication Serious infusion-related reactions can occur and gemtuzumab ozogamicin should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises pre-medication with a corticosteroid, paracetamol and antihistamine 1 hour prior to dosing, and to take appropriate measures to help prevent the development of tumour lysis-related hyperuricaemia—consult product literature.

● SIDE-EFFECTS

- **Common or very common** Anaemia · appetite decreased · ascites · chills · constipation · decreased leucocytes · diarrhoea · dyspnoea · fatigue · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · hypotension · infection · infusion related reaction (including fatal cases) · multi organ failure · nausea · neutropenia · oedema · pancytopenia · sinusoidal obstruction syndrome · skin reactions · stomatitis · tachycardia · thrombocytopenia · tumour lysis syndrome (including fatal cases) · vomiting
- **Frequency not known** Interstitial pneumonia

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions (including fatal cases) can occur during the first 24 hours after administration. Manufacturer advises interrupt treatment immediately and treat as clinically indicated (consult product literature); permanent discontinuation should be strongly considered in patients who develop signs and symptoms of anaphylaxis.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use 2 methods of effective contraception during treatment and for at least 7 months after the last dose; male patients should use 2 methods of effective contraception during treatment and for at least 4 months after the last dose if their partner is of childbearing potential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

- **BREAST FEEDING** Manufacturer advises avoid during treatment and for at least one month after the last dose—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate-to-severe impairment—increased risk of developing hepatotoxicity; postpone treatment if serum transaminases (ALT or AST) greater than 2.5 times the upper limit of normal or total bilirubin greater than 2 times the upper limit of normal.

● MONITORING REQUIREMENTS

- Manufacturer advises monitor complete blood counts prior to each dose as well as signs and symptoms of infection,

bleeding and other effects of myelosuppression during treatment; dose interruption or discontinuation of treatment may be required—consult product literature.

- ▶ Manufacturer advises monitor for signs and symptoms of infusion-related reactions—close clinical monitoring, including pulse, blood pressure and temperature, should be performed during infusion; monitor for signs and symptoms of tumour lysis syndrome.
- ▶ Manufacturer advises monitor for signs and symptoms of hepatotoxicity (including hepatic veno-occlusive disease); liver tests should be monitored prior to each dose—consult product literature.

● **PRESCRIBING AND DISPENSING INFORMATION**

Gemtuzumab ozogamicin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after reconstitution and dilution.

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue and headache.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Gemtuzumab ozogamicin for untreated acute myeloid leukaemia (November 2018)** NICE TA545
Gemtuzumab ozogamicin (*Mylotarg*[®]), with daunorubicin and cytarabine, is recommended as an option for untreated *de novo* CD33-positive acute myeloid leukaemia (AML), except acute promyelocytic leukaemia, in people 15 years and over, only if:

- they start induction therapy when either the cytogenetic test confirms that the disease has favourable, intermediate or unknown cytogenetics (that is, because the test was unsuccessful) or when their cytogenetic test results are not yet available, **and**
- they start consolidation therapy when their cytogenetic test confirms that the disease has favourable, intermediate or unknown cytogenetics (because the test was unsuccessful), **and**
- the manufacturer provides gemtuzumab ozogamicin according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta545

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2089

The *Scottish Medicines Consortium* has advised (October 2018) that gemtuzumab ozogamicin (*Mylotarg*[®]) is accepted for restricted use within NHS Scotland as combination therapy with daunorubicin and cytarabine for the treatment of previously untreated, *de novo* CD33-positive acute myeloid leukaemia in patients aged 15 years and above with a favourable, intermediate or unknown cytogenetic profile.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Mylotarg** (Pfizer Ltd) ▼

Gemtuzumab ozogamicin 5 mg Mylotarg 5mg powder for concentrate for solution for infusion vials | 1 vial **[PoM]** £6,300.00 (Hospital only)

Inotuzumab ozogamicin

- **DRUG ACTION** Inotuzumab ozogamicin is a monoclonal antibody that binds to CD22-expressing tumour cells to induce cell cycle arrest and apoptotic cell death.

● **INDICATIONS AND DOSE**

Monotherapy for relapsed or refractory CD22-positive B cell precursor acute lymphoblastic leukaemia (under expert supervision)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Prior confirmed severe or ongoing sinusoidal obstruction syndrome

- **CAUTIONS** History of, or predisposition to QT-interval prolongation (e.g. electrolyte disturbances, concomitant use of drugs that prolong the QT interval) · patients may need pre-medication to minimise adverse reactions · patients undergoing haematopoietic stem cell transplantation (increased risk of hepatotoxicity)

CAUTIONS, FURTHER INFORMATION

- ▶ Pre-medication Manufacturer advises pre-medication with a corticosteroid, antipyretic and antihistamine prior to dosing in all patients and pre-medication to reduce uric acid levels and hydration in patients with a high tumour burden (increased risk of tumour lysis syndrome)—consult product literature.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS**

- ▶ **Common or very common** Anaemia · appetite decreased · ascites · bone marrow disorders · central nervous system haemorrhage · chills · constipation · decreased leucocytes · diarrhoea · fatigue · fever · gastrointestinal discomfort · haemorrhage · headache · hyperbilirubinaemia · hypersensitivity · hyperuricaemia · increased risk of infection · infusion related reaction · nausea · neutropenia · QT interval prolongation · sepsis · sinusoidal obstruction syndrome · stomatitis · thrombocytopenia · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises interrupt treatment if an infusion related reaction occurs; depending on the severity, discontinuation of the infusion or administration of steroids and antihistamines should be considered (consult product literature); permanently discontinue treatment in severe or life-threatening infusion reactions.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential during treatment and for at least 8 months after the last dose; male patients should use effective contraception during treatment and for at least 5 months after the last dose if their partner is of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 938.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal studies*.
- **BREAST FEEDING** Manufacturer advises avoid during treatment and for at least two months after the last dose—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution if bilirubin and transaminase levels are raised (limited information available); avoid in serious ongoing impairment.

Dose adjustments Manufacturer advises dose interruption or discontinuation according to bilirubin and transaminase levels.

- **PRE-TREATMENT SCREENING** Manufacturer advises baseline CD22 positivity of greater than 0% is required prior to initiating treatment.

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor complete blood counts prior to each dose as well as signs and symptoms of infection, bleeding and other effects of myelosuppression during treatment; dose reduction or interruption or discontinuation of treatment may be required—consult product literature.
- ▶ Manufacturer advises monitor for signs of infusion related—reactions during and for at least 1 hour after infusion; monitor for signs and symptoms of tumour lysis syndrome.
- ▶ Manufacturer advises ECG and electrolytes should be monitored prior to the start of treatment and periodically during treatment; monitor for increases in serum amylase and lipase.
- ▶ Manufacturer advises monitor for signs and symptoms of sinusoidal obstruction syndrome; liver tests should be monitored prior to and following each dose—consult product literature.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises resuscitation facilities should be available during administration.

● **PRESCRIBING AND DISPENSING INFORMATION** Inotuzumab ozogamicin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.

● **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after reconstitution and dilution.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Inotuzumab ozogamicin for treating relapsed or refractory B-cell acute lymphoblastic leukaemia (September 2018)**
NICE TA541

Inotuzumab ozogamicin (*Besponsa*®) is recommended, within its marketing authorisation, as an option for treating relapsed or refractory CD22-positive B-cell precursor acute lymphoblastic leukaemia in adults. People with relapsed or refractory Philadelphia-chromosome-positive disease should have had at least 1 tyrosine kinase inhibitor.

Inotuzumab ozogamicin is recommended only if the manufacturer provides it according to the commercial arrangement.

www.nice.org.uk/guidance/ta541

Scottish Medicines Consortium (SMC) decisions

SMC No. 1328/18

The *Scottish Medicines Consortium* has advised (June 2018) that inotuzumab ozogamicin (*Besponsa*®) is accepted for restricted use within NHS Scotland as monotherapy for the treatment of adults with relapsed or refractory CD22-positive B cell precursor acute lymphoblastic leukaemia (ALL) for whom the intent is to proceed to stem cell transplantation. Adults with Philadelphia chromosome positive relapsed or refractory B cell precursor ALL should have failed treatment with at least one tyrosine kinase inhibitor. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Besponsa** (Pfizer Ltd) ▼

Ipilimumab

13-Feb-2019

● **DRUG ACTION** Ipilimumab is a monoclonal antibody which causes T-cell activation resulting in tumour cell death.

● INDICATIONS AND DOSE

Melanoma (as monotherapy) (specialist use only)

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** 3 mg/kg every 3 weeks for 4 doses, for dose interruption or discontinuation of treatment due to immune-related side-effects—consult product literature

Melanoma (in combination with nivolumab) (specialist use only) | Advanced renal cell carcinoma (in combination with nivolumab) (specialist use only)

▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: IPIIMUMAB (YERVOY®): REPORTS OF CYTOMEGALOVIRUS (CMV) GASTROINTESTINAL INFECTION OR REACTIVATION (JANUARY 2019)

There have been post-marketing cases of gastrointestinal CMV infection or reactivation in ipilimumab-treated patients reported to have corticosteroid-refractory immune-related colitis, including fatal cases.

Patients should be advised to contact their healthcare professional immediately at the onset of symptoms of colitis. Possible causes, including infections, should be investigated; a stool infection work-up should be performed and patients screened for CMV. For patients with corticosteroid-refractory immune-related colitis, use of an additional immunosuppressive agent should only be considered if other causes are excluded using viral PCR on biopsy, and eliminating other viral, bacterial, and parasitic causes.

● **CAUTIONS** For full details consult product literature.

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · cancer pain · chills · confusion · constipation · cough · dehydration · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · eye discomfort · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hepatic disorders · hypophytitis · hypopituitarism · hypotension · hypothyroidism · influenza like illness · lethargy · lymphopenia · mucositis · muscle complaints · nausea · nerve disorders · night sweats · oedema · pain · skin reactions · vasodilation · vision disorders · vomiting · weight decreased
- ▶ **Uncommon** Adrenal hypofunction · alkalosis · allergic rhinitis · amenorrhoea · arrhythmias · arthritis · brain oedema · depression · dysarthria · eosinophilia · eye inflammation · glomerulonephritis · haemolytic anaemia · hair colour changes · hypersensitivity · hyperthyroidism · hypogonadism · increased risk of infection · infusion related reaction · libido decreased · meningitis · movement disorders · multi organ failure · muscle weakness · myopathy · nephritis autoimmune · neutropenia ·

pancreatitis · paraneoplastic syndrome · peripheral ischaemia · polymyalgia rheumatica · psychiatric disorder · pulmonary oedema · renal failure · renal tubular acidosis · respiratory disorders · sepsis · severe cutaneous adverse reactions (SCARs) · syncope · systemic inflammatory response syndrome · thrombocytopenia · tremor · tumour lysis syndrome · vascular disorders · vasculitis

► **Rare or very rare** Myasthenia gravis · proteinuria · thyroiditis

► **Frequency not known** Cytomegalovirus infection reactivation

SIDE-EFFECTS, FURTHER INFORMATION A corticosteroid can be used after starting ipilimumab, to treat immune-related reactions.

● **CONCEPTION AND CONTRACEPTION** Use effective contraception.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution if bilirubin greater than 3 times upper limit of normal range or if transaminases equal to or greater than 5 times upper limit of normal range (limited information available).

● **MONITORING REQUIREMENTS**

► Manufacturer advises monitor liver function tests and thyroid function prior to initiation of treatment and before each dose.

► Manufacturer advises monitor for signs or symptoms of immune-related side-effects and gastrointestinal perforation—consult product literature.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion*, give undiluted or dilute to a concentration of 1–4 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 90 minutes.

● **PRESCRIBING AND DISPENSING INFORMATION** Infusion-related side-effects have been reported; premedication with paracetamol and an antihistamine is recommended.

● **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C) and protect from light—consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

► **Ipilimumab** for previously treated advanced (unresectable or metastatic) melanoma (December 2012) NICE TA268
Ipilimumab (*Yervoy*®) is recommended as an option for the treatment of advanced (unresectable or metastatic) melanoma in adults who have received prior therapy, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.
www.nice.org.uk/guidance/ta268

► **Ipilimumab** for previously untreated advanced (unresectable or metastatic) melanoma (July 2014) NICE TA319
Ipilimumab (*Yervoy*®) is recommended, within its marketing authorisation, as an option for treating adults with previously untreated advanced (unresectable or metastatic) melanoma, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.
www.nice.org.uk/guidance/ta319

► **Nivolumab** in combination with ipilimumab for treating advanced melanoma (July 2016) NICE TA400
Nivolumab in combination with ipilimumab (*Yervoy*®) is recommended, within its marketing authorisation, as a treatment option for advanced (unresectable or metastatic) melanoma in adults, only if the manufacturer

provides ipilimumab with the discount agreed in the patient access scheme.

www.nice.org.uk/guidance/ta400

► **Nivolumab with ipilimumab for untreated advanced renal cell carcinoma (May 2019) NICE TA581**

Nivolumab in combination with ipilimumab (*Yervoy*®) is recommended for use within the Cancer Drugs Fund as an option for adults with untreated advanced renal cell carcinoma that is intermediate- or poor-risk as defined in the International Metastatic Renal Cell Carcinoma Database Consortium criteria. It is recommended only if the conditions in the managed access agreement for nivolumab with ipilimumab are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta581

Scottish Medicines Consortium (SMC) decisions

SMC No. 779/12

The *Scottish Medicines Consortium* has advised (April 2013) that ipilimumab (*Yervoy*®) is accepted for use within NHS Scotland for the treatment of advanced (unresectable or metastatic) melanoma in adults who have received prior therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 997/14

The *Scottish Medicines Consortium* has advised (November 2014) that ipilimumab (*Yervoy*®) is accepted for use within NHS Scotland for the first-line treatment of advanced (unresectable or metastatic) melanoma in adults. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

► **Yervoy** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Ipilimumab 5 mg per 1 ml Yervoy 50mg/10ml concentrate for solution for infusion vials | 1 vial [POM] £3,750.00 (Hospital only)
Yervoy 200mg/40ml concentrate for solution for infusion vials | 1 vial [POM] £15,000.00 (Hospital only)

Mogamulizumab

17-Apr-2020

● **DRUG ACTION** Mogamulizumab is a monoclonal antibody, which binds to the CCR4 receptor, thereby potentiating an immune response to cancer cells.

● **INDICATIONS AND DOSE**

Mycosis fungoides (initiated by a specialist) | Sézary syndrome (initiated by a specialist)

► BY INTRAVENOUS INFUSION

► **Adult:** 1 mg/kg every week on days 1, 8, 15 and 22 of the first 28-day cycle, followed by 1 mg/kg every 2 weeks on days 1 and 15 of subsequent 28-day cycles, dose to be administered within 2 days of the scheduled day, for treatment interruption or discontinuation due to side-effects and infusion-related reactions—consult product literature

● **CAUTIONS** Patients may need pre-medication to minimise infusion-related reactions · risk factors for cardiac disorders · risk of serious infection and/or viral reactivation such as hepatitis B · risk of transplant-related complications

CAUTIONS, FURTHER INFORMATION

- ▶ **Pre-medication** Manufacturer advises pre-medication with an antihistamine and an anti-pyretic—consult product literature.
- ▶ **Hepatitis B infection** Manufacturer advises patients should be tested for hepatitis B infection before treatment initiation; expert advice on measures against hepatitis B reactivation should be sought for patients with positive hepatitis B serology.
- ▶ **Transplant-related complications** Manufacturer advises patients who receive an allogeneic haematopoietic stem cell transplant within 50 days of mogamulizumab treatment are at higher risk of complications, such as severe graft-versus-host disease, and should be closely monitored.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · constipation · diarrhoea · fatigue · fever · headache · hypothyroidism · increased risk of infection · infusion related reaction · leucopenia · nausea · neutropenia · peripheral oedema · sepsis · skin reactions · stomatitis · thrombocytopenia · vomiting
 - ▶ **Uncommon** Hepatic disorders · tumour lysis syndrome
 - ▶ **Frequency not known** Cardiomyopathy · myocardial infarction · polymyositis · severe cutaneous adverse reactions (SCARs) · viral infection reactivation
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in male and female patients of childbearing potential during treatment and for at least 6 months after last treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Manufacturer advises avoid—limited information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Manufacturer advises avoid during first few days after birth—possible risk from transfer of antibodies to infant. After this time, use during breast-feeding only if clinically needed.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor electrolytes, hydration status and renal function, particularly in the first month of treatment—risk of tumour lysis syndrome.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion* (*Poteligeo*®), dilute to a concentration between 0.1 mg/mL to 3 mg/mL with Sodium Chloride 0.9%; give over at least 60 minutes through a low-protein binding 0.22 micron in-line filter. Resuscitation facilities should be available.
- **HANDLING AND STORAGE** Store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after preparation of the infusion.
- **PATIENT AND CARER ADVICE**
 - ▶ **Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polysorbates

- ▶ **Poteligeo** (Kyowa Kirin Ltd) ▼

Mogamulizumab 4 mg per 1 ml Poteligeo 20mg/5ml concentrate for solution for infusion vials | 1 vial **[PoM]** £1,329.00 (Hospital only)

Necitumumab

21-Feb-2017

- **DRUG ACTION** Necitumumab is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR).

● **INDICATIONS AND DOSE**

Locally advanced or metastatic epidermal growth factor receptor expressing squamous non-small-cell lung cancer, in patients who have not received previous chemotherapy (in combination with gemcitabine and cisplatin) (specialist use only)

▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult:** 800 mg once daily on days 1 and 8 of a 3-week cycle, for up to 6 cycles, patients whose disease has not progressed after combination therapy may continue with necitumumab monotherapy, for dose adjustments due to infusion-related reactions or skin reactions—consult product literature

- **CAUTIONS** Cardiorespiratory disorders (no information available) · history of thromboembolic events · patients may need pre-medication to minimise the development of infusion-related and skin reactions (consult product literature) · risk factors for thromboembolic events

CAUTIONS, FURTHER INFORMATION

- ▶ **Thromboembolic events** Manufacturer advises that necitumumab should not be administered to patients with multiple risk factors for thromboembolic events unless the benefits outweigh the risks. Thromboprophylaxis should be considered after assessment of a patient's risk factors.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS**

- ▶ **Common or very common** Conjunctivitis · dysuria · electrolyte imbalance · embolism and thrombosis · fever · haemorrhage · headache · hypersensitivity · hypomagnesaemia (severe) · increased risk of infection · infusion related reaction · muscle spasms · oral disorders · skin reactions · taste altered · vomiting · weight decreased

- ▶ **Frequency not known** Cardiac arrest · eyelash trichomegaly

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use effective contraception during and for 3 months after treatment.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—limited information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

- **BREAST FEEDING** Manufacturer advises avoid during treatment and for at least 4 months after the last dose—no information available.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor patients during and following each infusion for signs of hypersensitivity and infusion-related reactions; monitor electrolytes (including magnesium, potassium and calcium) prior to each infusion and after completion of treatment, until within normal limits—correct any electrolyte disturbance promptly.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises necitumumab should be given under the supervision of an experienced specialist, in an environment where full resuscitation facilities and resources for the treatment of infusion-related reactions are immediately available.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after preparation of the infusion.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be made aware of the symptoms of thromboembolism and advised to seek medical attention if they experience sudden breathlessness, chest pain, or swelling of a limb.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Necitumumab for untreated advanced or metastatic squamous non-small-cell lung cancer (September 2016)**
NICE TA411

Necitumumab (*Portrazza*®), in combination with gemcitabine and cisplatin, is **not** recommended within its marketing authorisation for adults with locally advanced or metastatic epidermal growth factor receptor (EGFR)-expressing squamous non-small-cell lung cancer that has not been treated with chemotherapy.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta411

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Portrazza** (Eli Lilly and Company Ltd) ▼

Necitumumab 16 mg per 1 ml Portrazza 800mg/50ml concentrate for solution for infusion vials | 1 vial **[Pom]** £1,450.00 (Hospital only)

Nivolumab

04-Mar-2020

- **DRUG ACTION** Nivolumab is a human immunoglobulin G4 monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor thereby potentiating an immune response to tumour cells.

● INDICATIONS AND DOSE

Melanoma (in combination with ipilimumab) (specialist use only) | Advanced renal cell carcinoma (in combination with ipilimumab) (specialist use only)

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature)

Melanoma (as monotherapy) (specialist use only) | Advanced renal cell carcinoma (as monotherapy) (specialist use only)

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 240 mg every 2 weeks, alternatively 480 mg every 4 weeks, consult product literature for information on dose adjustments based on individual patient safety and tolerability

Non-small cell lung cancer (as monotherapy) (specialist use only) | Urothelial carcinoma (as monotherapy) (specialist use only) | Squamous cell cancer of the head and neck (as monotherapy) (specialist use only) | Classical Hodgkin lymphoma (as monotherapy) (specialist use only)

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 240 mg every 2 weeks, consult product literature for information on dose adjustments based on individual patient safety and tolerability

Adjuvant treatment of melanoma (as monotherapy) (specialist use only)

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 3 mg/kg every 2 weeks, consult product literature for information on dose adjustments based on individual patient safety and tolerability

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: NIVOLUMAB (*OPDIVO*®): REPORTS OF ORGAN TRANSPLANT REJECTION (JULY 2017)

A European review of worldwide data concluded that nivolumab may increase the risk of rejection in organ transplant recipients. The MHRA recommends considering the benefit of treatment with nivolumab

versus the risk of possible organ transplant rejection for each patient.

MHRA/CHM ADVICE: NIVOLUMAB (*OPDIVO*®): REPORTS OF CYTOMEGALOVIRUS (CMV) GASTROINTESTINAL INFECTION OR REACTIVATION (OCTOBER 2019)

A European review of worldwide data identified cases suggestive of gastrointestinal CMV infection or reactivation in nivolumab-treated patients, including fatal cases.

Patients should be advised to contact their healthcare professional immediately at the onset of symptoms of colitis. Possible causes, including infections, should be investigated; a stool infection work-up should be performed and patients screened for CMV. For patients with corticosteroid-refractory immune-related colitis, use of an additional immunosuppressive agent should only be considered if other causes are excluded using viral PCR on biopsy, and eliminating other viral, bacterial, and parasitic causes.

- **CAUTIONS** May increase risk of severe graft-versus-host reaction in patients who have had prior haematopoietic stem cell transplant (particularly in those with a prior history) · patients may need pre-medication to minimise the development of infusion-related reactions
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · alopecia · anaemia · appetite decreased · arthralgia · constipation · cough · decreased leucocytes · diarrhoea · dizziness · dry mouth · dyspnoea · electrolyte imbalance · fatigue · fever · gastrointestinal disorders · haemolytic anaemia · headache · hyperglycaemia · hypersensitivity · hypertension · hyperthyroidism · hypoglycaemia · hypothyroidism · increased risk of infection · infusion related reaction · musculoskeletal discomfort · myalgia · nausea · nerve disorders · neutropenia · oedema · pain · respiratory disorders · skin reactions · stomatitis · thrombocytopenia · vomiting · weight decreased
 - ▶ **Uncommon** Adrenal insufficiency · arrhythmias · arthritis · cardiac inflammation · chest pain · connective tissue disorders · dehydration · diabetes mellitus · dry eye · eosinophilia · eye inflammation · hepatic disorders · hypophytitis · hypopituitarism · metabolic acidosis · nephritis tubulointerstitial · pancreatitis · paresis · pericardial disorders · renal impairment · thyroiditis · vision blurred
 - ▶ **Rare or very rare** Demyelination · diabetic ketoacidosis · histiocytic necrotising lymphadenitis · myasthenic syndrome · myopathy · severe cutaneous adverse reactions (SCARs) · vasculitis
 - ▶ **Frequency not known** Cytomegalovirus infection reactivation · hypoparathyroidism · meningitis aseptic · sarcoidosis · solid organ transplant rejection · tumour lysis syndrome

SIDE-EFFECTS, FURTHER INFORMATION Immune-related reactions Manufacturer advises that most immune-related adverse reactions improved or resolved with appropriate management, including initiation of corticosteroids and treatment modifications—consult product literature for further information.

Infusion-related reactions Manufacturer advises that patients with mild or moderate infusion reactions may continue treatment with close monitoring and use of pre-medication according to local guidelines; discontinue treatment if severe infusion reactions occur.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required during treatment and for at least 5 months after treatment in women of childbearing potential.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (limited information available).
- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions, cardiac and pulmonary reactions, and electrolyte disturbances before and periodically during treatment. Patients should be monitored for adverse reactions for at least 5 months after the last dose.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intermittent intravenous infusion*, give undiluted or dilute to a concentration of not less than 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 30 or 60 minutes (depending on dose—consult product literature) through an in-line filter (pore size 0.2–1.2 micron).
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for storage conditions after preparation of the infusion.
- **PATIENT AND CARER ADVICE** Patients should be provided with a patient alert card with each prescription.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

 - ▶ **Nivolumab for treating advanced (unresectable or metastatic) melanoma (February 2016)** NICE TA384
Nivolumab (*Opdivo*®) as monotherapy is recommended, within its marketing authorisation, as a treatment option for advanced (unresectable or metastatic) melanoma in adults.
www.nice.org.uk/guidance/ta384
 - ▶ **Nivolumab in combination with ipilimumab for treating advanced melanoma (July 2016)** NICE TA400
Nivolumab (*Opdivo*®) in combination with ipilimumab is recommended, within its marketing authorisation, as a treatment option for advanced (unresectable or metastatic) melanoma in adults, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.
www.nice.org.uk/guidance/ta400
 - ▶ **Nivolumab for adjuvant treatment of completely resected melanoma with lymph node involvement or metastatic disease (January 2019)** NICE TA558
Nivolumab (*Opdivo*®) is recommended for use within the Cancer Drugs Fund as an option for the adjuvant treatment of completely resected melanoma in adults with lymph node involvement or metastatic disease. It is recommended only if the conditions in the managed access agreement are followed.
Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta558
 - ▶ **Nivolumab for previously treated advanced renal cell carcinoma (updated November 2017)** NICE TA417
Nivolumab (*Opdivo*®) is recommended, within its marketing authorisation, as an option for previously treated advanced renal cell carcinoma in adults, when the manufacturer provides nivolumab in line with the commercial access agreement with NHS England.
www.nice.org.uk/guidance/ta417
 - ▶ **Nivolumab with ipilimumab for untreated advanced renal cell carcinoma (May 2019)** NICE TA581
Nivolumab (*Opdivo*®) with ipilimumab is recommended for use within the Cancer Drugs Fund as an option for adults with untreated advanced renal cell carcinoma that is

intermediate- or poor-risk as defined in the International Metastatic Renal Cell Carcinoma Database Consortium criteria. It is recommended only if the conditions in the managed access agreement for nivolumab with ipilimumab are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta581

- ▶ **Nivolumab for treating relapsed or refractory classical Hodgkin lymphoma (updated November 2017)** NICE TA462
Nivolumab (*Opdivo*®) is recommended, within its marketing authorisation, as an option for treating relapsed or refractory classical Hodgkin lymphoma in adults after autologous stem cell transplant and treatment with brentuximab vedotin, when the manufacturer provides nivolumab in line with the commercial access agreement with NHS England.

www.nice.org.uk/guidance/ta462

- ▶ **Nivolumab for previously treated squamous non-small-cell lung cancer (November 2017)** NICE TA483
Nivolumab (*Opdivo*®) is recommended for use within the Cancer Drugs Fund as an option for treating locally advanced or metastatic squamous non-small-cell lung cancer in adults after chemotherapy, only if:
 - nivolumab is stopped at 2 years of uninterrupted treatment, or earlier in the event of disease progression, **and**
 - the conditions in the managed access agreement are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta483

- ▶ **Nivolumab for previously treated non-squamous non-small-cell lung cancer (November 2017)** NICE TA484
Nivolumab (*Opdivo*®) is recommended for use within the Cancer Drugs Fund as an option for treating locally advanced or metastatic non-squamous non-small-cell lung cancer in adults after chemotherapy, only if:
 - their tumours are PD-L1 positive, **and**
 - nivolumab is stopped at 2 years of uninterrupted treatment, or earlier in the event of disease progression, **and**
 - the conditions in the managed access agreement are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta484

- ▶ **Nivolumab for treating squamous cell carcinoma of the head and neck after platinum-based chemotherapy (November 2017)** NICE TA490
Nivolumab (*Opdivo*®) is recommended for use within the Cancer Drugs Fund as an option for treating squamous cell carcinoma of the head and neck in adults whose disease has progressed on platinum-based chemotherapy, only if:
 - the disease has progressed within 6 months of having chemotherapy, **and**
 - nivolumab is stopped at 2 years of uninterrupted treatment, or earlier in the event of disease progression, **and**
 - the conditions in the managed access agreement are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option

to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta490

► **Nivolumab for treating locally advanced unresectable or metastatic urothelial cancer after platinum-containing chemotherapy (July 2018) NICE TA530**

Nivolumab (*Opdivo*®) is not recommended, within its marketing authorisation, for treating locally advanced unresectable or metastatic urothelial carcinoma in adults who have had platinum-containing therapy.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta530

Scottish Medicines Consortium (SMC) decisions

SMC No. 1144/16

The *Scottish Medicines Consortium* has advised (July 2016) that nivolumab (*Opdivo*®) is accepted for use within NHS Scotland for the treatment of locally advanced or metastatic squamous non-small cell lung cancer after prior chemotherapy in adults. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1180/16

The *Scottish Medicines Consortium* has advised (October 2016) that nivolumab (*Opdivo*®) is accepted for restricted use within NHS Scotland for the treatment of locally advanced or metastatic non-squamous non-small cell lung cancer after prior chemotherapy in adults, subject to a two-year clinical stopping rule. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1120/16

The *Scottish Medicines Consortium* has advised (August 2016) that nivolumab (*Opdivo*®) is accepted for restricted use within NHS Scotland as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adults previously untreated with ipilimumab. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1187/16

The *Scottish Medicines Consortium* has advised (November 2016) that nivolumab (*Opdivo*®) is accepted for restricted use within NHS Scotland in combination with ipilimumab for the first-line treatment of advanced (unresectable or metastatic) melanoma in adults. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. SMC2112

The *Scottish Medicines Consortium* has advised (December 2018) that nivolumab (*Opdivo*®) is accepted for use within NHS Scotland as monotherapy for the adjuvant treatment of adults with melanoma with involvement of lymph nodes or metastatic disease who have undergone complete resection. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1188/16

The *Scottish Medicines Consortium* has advised (June 2017) that nivolumab (*Opdivo*®) is accepted for use within NHS Scotland as monotherapy for treating adults with advanced renal cell carcinoma after prior therapy. The advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. SMC2153

The *Scottish Medicines Consortium* has advised (June 2019) that nivolumab (*Opdivo*®) is accepted for use within NHS Scotland in combination with ipilimumab for the first-line treatment of adults with intermediate/poor-risk advanced renal cell carcinoma.

SMC No. 1240/17

The *Scottish Medicines Consortium* has advised (July 2017) that nivolumab (*Opdivo*®) is accepted for use within NHS Scotland for the treatment of patients with relapsed or refractory classical Hodgkin lymphoma after autologous stem cell transplant and treatment with brentuximab vedotin. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1261/17

The *Scottish Medicines Consortium* has advised (September 2017) that nivolumab (*Opdivo*®) is accepted for restricted use within NHS Scotland as monotherapy, for the treatment of squamous cell cancer of the head and neck in adults progressing on or after platinum-based therapy. Treatment with nivolumab is subject to a two year clinical stopping rule. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1285/18

The *Scottish Medicines Consortium* has advised (January 2018) that nivolumab (*Opdivo*®) is **not** recommended for use within NHS Scotland as monotherapy for the treatment of locally advanced unresectable or metastatic urothelial carcinoma in adults after failure of prior platinum-containing therapy, as the economic case was not demonstrated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Obinutuzumab

03-Aug-2018

● **INDICATIONS AND DOSE**

Treatment of previously untreated chronic lymphocytic leukaemia in patients for whom full-dose fludarabine-based therapy is unsuitable due to co-morbidities

Treatment of previously untreated advanced follicular lymphoma | Treatment of follicular lymphoma in patients who did not respond or who progressed during or up to six months after treatment with rituximab or a rituximab-containing regimen

► BY INTRAVENOUS INFUSION

► Adult: (consult product literature or local protocols)

- **CONTRA-INDICATIONS** For obinutuzumab contra-indications, consult product literature.
- **CAUTIONS** For full details on the cautions of obinutuzumab, consult product literature.
- Hepatitis B infection and reactivation Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking **obinutuzumab**. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients

should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
- ▶ **Common or very common** Arrhythmias · chest pain · dyspnoea · erythema · gastrointestinal disorders · heart failure · hypertension · hyperuricaemia · lymph node pain · nasal complaints · skin reactions · squamous cell carcinoma · tumour lysis syndrome · urinary disorders · weight increased
- ▶ **Frequency not known** Acute coronary syndrome · angina pectoris · chills · dizziness · dyspnoea · flushing · hypotension · nausea · viral infection reactivation
- **CONCEPTION AND CONTRACEPTION** Use effective contraception during and for 18 months after treatment.
- **PREGNANCY** Avoid unless potential benefit outweighs risk of B-lymphocyte depletion in fetus.
- **BREAST FEEDING** Avoid breast-feeding during and for 18 months after treatment—present in milk in *animal* studies.
- **MONITORING REQUIREMENTS** Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).
- **PRESCRIBING AND DISPENSING INFORMATION** Infusion related side-effects have been reported; Patients should receive premedication with paracetamol, an antihistamine, and a corticosteroid before each dose—consult product literature for details.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Obinutuzumab in combination with chlorambucil for untreated chronic lymphocytic leukaemia (June 2015)** NICE TA343
Obinutuzumab (*Gazyvaro*®), in combination with chlorambucil, is an option for untreated chronic lymphocytic leukaemia in patients who have comorbidities that make full-dose fludarabine-based therapy unsuitable for them, only if:
 - bendamustine-based therapy is not suitable **and**
 - the manufacturer provides obinutuzumab with the discount agreed in the patient access scheme.
 Patients currently receiving obinutuzumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta343
- ▶ **Obinutuzumab with bendamustine for treating follicular lymphoma refractory to rituximab (August 2017)** NICE TA472
Obinutuzumab (*Gazyvaro*®) in combination with bendamustine followed by obinutuzumab maintenance, is recommended for use within the Cancer Drugs Fund as an option for treating adults with follicular lymphoma that did not respond or progressed during or up to six months after treatment with rituximab or a rituximab-containing regimen, only if the conditions in the managed access agreement for obinutuzumab are followed.
www.nice.org.uk/guidance/ta472
- ▶ **Obinutuzumab for untreated advanced follicular lymphoma (March 2018)** NICE TA513
Obinutuzumab (*Gazyvaro*®) is recommended as an option for untreated advanced follicular lymphoma in adults (that is, first as induction treatment with chemotherapy, then alone as maintenance therapy), only if:
 - the person has a Follicular Lymphoma International Prognostic Index (FLIPI) score of 2 or more, **and**
 - the manufacturer provides obinutuzumab with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta513

Scottish Medicines Consortium (SMC) decisions

SMC No. 1219/17

The *Scottish Medicines Consortium* has advised (March 2017) that obinutuzumab (*Gazyvaro*®) is accepted for use within NHS Scotland in combination with bendamustine followed by obinutuzumab maintenance for the treatment of patients with follicular lymphoma who did not respond or who progressed during or up to six months after treatment with rituximab or a rituximab-containing regimen. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 5MC2015

The *Scottish Medicines Consortium* has advised (September 2018) that obinutuzumab (*Gazyvaro*®) is **not** recommended for use within NHS Scotland in combination with chemotherapy followed by obinutuzumab maintenance therapy in patients achieving a response, for the treatment of patients with previously untreated advanced follicular lymphoma, as the economic case was not demonstrated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ **Gazyvaro** (Roche Products Ltd)

Obinutuzumab 25 mg per 1 ml Gazyvaro 1000mg/40ml concentrate for solution for infusion vials | 1 vial  £3,312.00 (Hospital only)

Panitumumab

04-Dec-2019

- **DRUG ACTION** Panitumumab is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR).

INDICATIONS AND DOSE

Treatment of non-mutated RAS metastatic colorectal cancer (combination therapy) | Treatment of non-mutated RAS metastatic colorectal cancer (monotherapy after failure of fluoropyrimidine-, oxaliplatin-, and irinotecan-containing chemotherapy regimens)

▶ BY INTRAVENOUS INFUSION

▶ Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SEVERE SKIN REACTIONS

Severe skin reactions have been reported very commonly in patients treated with panitumumab. Patients receiving panitumumab who have severe skin reactions or develop worsening skin reactions should be monitored for the development of inflammatory or infectious sequelae (including cellulitis, sepsis, and necrotising fasciitis). Appropriate treatment should be promptly initiated and panitumumab withheld or discontinued.

MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment

should be interrupted or discontinued if ulcerative keratitis is diagnosed.

- **CONTRA-INDICATIONS** Interstitial pulmonary disease · the combination of panitumumab with oxaliplatin-containing chemotherapy is contra-indicated in patients with mutant RAS metastatic colorectal cancer or for whom RAS status is unknown
- **CAUTIONS** History of keratitis · history of severe dry eye · history of ulcerative keratitis · pulmonary disease—discontinue if interstitial lung disease develops · risk factors for keratitis · risk factors for severe dry eye · risk factors for ulcerative keratitis (including contact lens use)
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · asthenia · chest pain · chills · constipation · cough · dehydration · diarrhoea · dizziness · dry eye · dry mouth · dyspnoea · electrolyte imbalance · embolism and thrombosis · eye discomfort · eye disorders · eye inflammation · fever · flushing · gastrointestinal discomfort · gastroesophageal reflux disease · haemorrhage · hair changes · headache · hyperglycaemia · hyperhidrosis · hypersensitivity (may be delayed) · hypertension · hypotension · increased risk of infection · insomnia · leucopenia · mucositis · nail disorders · nausea · oral disorders · pain · peripheral oedema · skin reactions · skin ulcer · tachycardia · vomiting · weight decreased
 - ▶ **Uncommon** Angioedema · cyanosis · infusion related reaction · nasal dryness · onycholysis · respiratory disorders · severe cutaneous adverse reactions (SCARs)
 - ▶ **Rare or very rare** Anaphylactic reaction
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 6 months after treatment.
- **PREGNANCY** Avoid (toxicity in *animal studies*). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Manufacturer advises avoid breastfeeding during and for 2 months after treatment.
- **PRE-TREATMENT SCREENING** Evidence of non-mutated RAS status (at exons 2, 3 and 4 of KRAS and NRAS) is required before panitumumab treatment is initiated, and should be determined by an experienced laboratory using a validated test method.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for hypomagnesaemia.
 - ▶ Monitor for hypocalcaemia.
 - ▶ Monitor for dermatological reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis (consult product literature).
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

 - ▶ **Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012)** NICE TA242
Panitumumab (*Vectibix*[®]) monotherapy is **not** recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy.
www.nice.org.uk/guidance/ta242
 - ▶ **Cetuximab and panitumumab for previously untreated metastatic colorectal cancer (updated September 2017)** NICE TA439
Panitumumab (*Vectibix*[®]) is recommended, within its marketing authorisation, as an option for previously untreated RAS wild-type metastatic colorectal cancer in adults in combination with:
 - 5-fluorouracil, folinic acid and oxaliplatin (FOLFOX), or
 - 5-fluorouracil, folinic acid and irinotecan (FOLFIRI).

This advice is contingent upon the manufacturer providing panitumumab with the discount agreed in the patient access scheme.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
Solution for infusion
ELECTROLYTES: May contain Sodium
▶ **Vectibix** (Amgen Ltd)
Panitumumab 20 mg per 1 ml Vectibix 400mg/20ml concentrate for solution for infusion vials | 1 vial [POM] £1,517.16 (Hospital only)
Vectibix 100mg/5ml concentrate for solution for infusion vials | 1 vial [POM] £379.29 (Hospital only)

Pembrolizumab

09-Mar-2020

- **DRUG ACTION** Pembrolizumab is a monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor, thereby potentiating an immune response to tumour cells.
- **INDICATIONS AND DOSE**

Melanoma (specialist use only) | Non-small cell lung cancer (as monotherapy) (specialist use only) | Urothelial carcinoma (specialist use only) | Classical Hodgkin lymphoma (specialist use only) | Head and neck squamous cell carcinoma (specialist use only)

 - ▶ **BY INTRAVENOUS INFUSION**
 - ▶ **Adult:** 200 mg every 3 weeks, alternatively 400 mg every 6 weeks, for dose adjustments due to side-effects or infusion-related reactions—consult product literature

Non-small cell lung cancer (as combination therapy) (specialist use only)

 - ▶ **BY INTRAVENOUS INFUSION**
 - ▶ **Adult:** 200 mg every 3 weeks, for dose adjustments due to side-effects or infusion-related reactions—consult product literature

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PEMBROLIZUMAB (KEYTRUDA[®]): REPORTS OF ORGAN TRANSPLANT REJECTION (JULY 2017)
A European review of worldwide data concluded that pembrolizumab may increase the risk of rejection in organ transplant recipients. The MHRA recommends considering the benefit of treatment with pembrolizumab versus the risk of possible organ transplant rejection for each patient.

- **CAUTIONS** Patients may need pretreatment to minimise the development of adverse reactions (consult product literature)
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anaemia · appetite decreased · arthralgia · arthritis · asthenia · chills · constipation · cough · cytokine release syndrome · diarrhoea · dizziness · dry mouth · dyspnoea · fever · gastrointestinal disorders · headache · hypersensitivity · hyperthyroidism · hypothyroidism · influenza like illness · infusion related reaction · myositis · nausea · oedema · pain · pneumonitis · severe cutaneous adverse reactions (SCARs) · skin reactions · taste altered · vomiting
 - ▶ **Uncommon** Adrenal insufficiency · alopecia · decreased leucocytes · dry eye · electrolyte imbalance · eosinophilia · epilepsy · hair colour changes · hepatitis · hypertension · hypophosphitis · insomnia · lethargy · myocarditis · nephritis · nerve disorders · neutropenia · pancreatitis · tenosynovitis · thrombocytopenia · thyroiditis · type 1 diabetes mellitus · uveitis
 - ▶ **Rare or very rare** Erythema nodosum · haemolytic anaemia · myasthenic syndrome · sarcoidosis

- ▶ **Frequency not known** Solid organ transplant rejection
- SIDE-EFFECTS, FURTHER INFORMATION** **Immune-related reactions** Most immune-related adverse reactions are reversible and managed by temporarily stopping treatment and administration of a corticosteroid—consult product literature for further information.

Infusion-related reactions Manufacturer advises to permanently discontinue treatment in patients with severe infusion reactions.

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment and for at least 4 months after treatment in women of childbearing potential.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C.
- **PATIENT AND CARER ADVICE** Patients should be provided with an alert card and advised to keep it with them at all times.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Pembrolizumab for treating advanced melanoma after disease progression with ipilimumab (updated September 2017)** NICE TA357
Pembrolizumab (*Keytruda*[®]) is recommended as an option for treating advanced (unresectable or metastatic) melanoma in adults only:
 - after the disease has progressed with ipilimumab and, for BRAF V600 mutation-positive disease, a BRAF or MEK inhibitor, **and**
 - the manufacturer provides pembrolizumab in line with the commercial access agreement with NHS England.www.nice.org.uk/guidance/ta357
- ▶ **Pembrolizumab for advanced melanoma not previously treated with ipilimumab (updated September 2017)** NICE TA366
Pembrolizumab (*Keytruda*[®]) is recommended as an option for treating advanced (unresectable or metastatic) melanoma that has not been previously treated with ipilimumab, in adults, only when the manufacturer provides pembrolizumab in line with the commercial access agreement with NHS England.
www.nice.org.uk/guidance/ta366
- ▶ **Pembrolizumab for adjuvant treatment of resected melanoma with high risk of recurrence (December 2018)** NICE TA553
Pembrolizumab (*Keytruda*[®]) is recommended for use within the Cancer Drugs Fund as an option for the adjuvant treatment of stage III melanoma with lymph node involvement in adults who have had complete resection. It is recommended only if the conditions in the managed access agreement for pembrolizumab are followed.
Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta553
- ▶ **Pembrolizumab for treating PD-L1-positive non-small-cell lung cancer after chemotherapy (updated September 2017)** NICE TA428
Pembrolizumab (*Keytruda*[®]) is recommended as an option for treating locally advanced or metastatic PD-L1-positive non-small-cell lung cancer in adults who have had at least one chemotherapy (and targeted treatment if they have an

epidermal growth factor receptor (EGFR)- or anaplastic lymphoma kinase (ALK)-positive tumour), only if:

- pembrolizumab is stopped at 2 years of uninterrupted treatment and no documented disease progression, **and**
 - the manufacturer provides pembrolizumab in line with the commercial access agreement with NHS England.
- Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they or their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta428
- ▶ **Pembrolizumab for untreated PD-L1-positive metastatic non-small-cell lung cancer (July 2018)** NICE TA531
Pembrolizumab (*Keytruda*[®]) is recommended as an option for untreated PD-L1-positive metastatic non-small-cell lung cancer in adults whose tumours express PD-L1 (with at least a 50% tumour proportion score) and have no epidermal growth factor receptor- or anaplastic lymphoma kinase-positive mutations, only if:
 - pembrolizumab is stopped at 2 years of uninterrupted treatment or earlier in the event of disease progression, **and**
 - the manufacturer provides pembrolizumab according to the commercial access agreement.www.nice.org.uk/guidance/ta531
 - ▶ **Pembrolizumab with pemetrexed and platinum chemotherapy for untreated, metastatic, non-squamous non-small-cell lung cancer (January 2019)** NICE TA557
Pembrolizumab (*Keytruda*[®]), with pemetrexed and platinum chemotherapy is recommended for use within the Cancer Drugs Fund, as an option for untreated, metastatic, non-squamous non-small-cell lung cancer in adults whose tumours have no epidermal growth factor receptor- or anaplastic lymphoma kinase-positive mutations. It is only recommended if:
 - pembrolizumab is stopped at 2 years of uninterrupted treatment or earlier if disease progresses, **and**
 - the manufacturer provides pembrolizumab according to the managed access agreement.
 Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta557
 - ▶ **Pembrolizumab with carboplatin and paclitaxel for untreated metastatic squamous non-small-cell lung cancer (September 2019)** NICE TA600
Pembrolizumab (*Keytruda*[®]), with carboplatin and paclitaxel, is recommended for use within the Cancer Drugs Fund as an option for untreated metastatic squamous non-small cell lung cancer in adults, only if:
 - pembrolizumab is stopped at 2 years of uninterrupted treatment, or earlier if disease progresses, **and**
 - the manufacturer provides pembrolizumab according to the managed access agreement.
 Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta600
 - ▶ **Pembrolizumab for treating locally advanced or metastatic urothelial carcinoma after platinum-containing chemotherapy (April 2018)** NICE TA519
Pembrolizumab (*Keytruda*[®]) is recommended for use within the Cancer Drugs Fund as an option for treating locally advanced or metastatic urothelial carcinoma in adults who have had platinum-containing chemotherapy, only if:

- pembrolizumab is stopped at 2 years of uninterrupted treatment or earlier in the event of disease progression, **and**
- the conditions in the managed access agreement for pembrolizumab are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta519

▶ **Pembrolizumab for untreated PD-L1-positive locally advanced or metastatic urothelial cancer when cisplatin is unsuitable (updated July 2018)** NICE TA522

Pembrolizumab (*Keytruda*®) is recommended for use within the Cancer Drugs Fund as an option for untreated locally advanced or metastatic urothelial carcinoma in adults when cisplatin-containing chemotherapy is unsuitable, only if:

- their tumours express PD-L1 with a combined positive score of 10 or more, **and**
- pembrolizumab is stopped at 2 years of uninterrupted treatment or earlier if the disease progresses, **and**
- the conditions of the managed access agreement for pembrolizumab are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta522

▶ **Pembrolizumab for treating relapsed or refractory classical Hodgkin lymphoma (September 2018)** NICE TA540

Pembrolizumab (*Keytruda*®) is **not** recommended for treating relapsed or refractory classical Hodgkin lymphoma in adults who have had autologous stem cell transplant and brentuximab vedotin.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta540

▶ **Pembrolizumab for treating relapsed or refractory classical Hodgkin lymphoma (September 2018)** NICE TA540

Pembrolizumab (*Keytruda*®) is recommended for use within the Cancer Drugs Fund as an option for treating relapsed or refractory classical Hodgkin lymphoma in adults who have had brentuximab vedotin and cannot have autologous stem cell transplant, only if:

- pembrolizumab is stopped after 2 years of treatment or earlier if the person has a stem cell transplant or the disease progresses, **and**
- the conditions in the managed access agreement for pembrolizumab are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta540

Scottish Medicines Consortium (SMC) decisions

SMC No. 1086/15

The *Scottish Medicines Consortium* has advised (November 2015) that pembrolizumab (*Keytruda*®) is accepted for use within NHS Scotland as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adults previously untreated with ipilimumab. The advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1087/15

The *Scottish Medicines Consortium* has advised (December 2016) that pembrolizumab (*Keytruda*®) is **not** recommended for use within NHS Scotland as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adults previously treated with ipilimumab as the economic case was not demonstrated.

SMC No. SMC2144

The *Scottish Medicines Consortium* has advised (May 2019) that pembrolizumab (*Keytruda*®) is accepted for use within NHS Scotland as monotherapy for the adjuvant treatment of adults with Stage III melanoma and lymph node involvement who have undergone complete resection. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1204/17

The *Scottish Medicines Consortium* has advised (January 2017) that pembrolizumab (*Keytruda*®) is accepted for restricted use within NHS Scotland for the treatment of locally advanced or metastatic non-small cell lung carcinoma (NSCLC) in adults whose tumours express programmed death ligand 1 (PD-L1) and who have received at least one prior chemotherapy regimen, subject to a two-year clinical stopping rule. The advice is contingent upon the continuing availability of pembrolizumab at the price agreed in the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1239/17

The *Scottish Medicines Consortium* has advised (July 2017) that pembrolizumab (*Keytruda*®) is accepted for restricted use within NHS Scotland as monotherapy for the first-line treatment of metastatic non-small cell lung carcinoma (NSCLC) in adults whose tumours express programmed death ligand 1 (PD-L1) with a $\geq 50\%$ tumour proportion score with no epidermal growth factor receptor or anaplastic lymphoma kinase positive tumour mutations, subject to a two-year clinical stopping rule. The advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. SMC2187

The *Scottish Medicines Consortium* has advised (September 2019) that pembrolizumab (*Keytruda*®) is accepted for restricted use within NHS Scotland in combination with carboplatin and either paclitaxel or nab-paclitaxel, for the first-line treatment of metastatic squamous non-small cell lung cancer (NSCLC) in adults whose tumours express programmed death ligand 1 (PD-L1) with a $< 50\%$ tumour proportion score (TPS), or in those whom it has not been possible to evaluate PD-L1 TPS. Treatment with pembrolizumab is subject to a two-year clinical stopping rule. The advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. SMC2207

The *Scottish Medicines Consortium* has advised (October 2019) that pembrolizumab (*Keytruda*®) is accepted for restricted use within NHS Scotland when used in combination with pemetrexed and platinum chemotherapy, for the first-line treatment of metastatic non-squamous non-small cell lung cancer (NSCLC) in adults whose tumours have no epidermal growth factor receptor or anaplastic lymphoma kinase-positive mutations, and whose tumours express programmed death ligand 1 (PD-L1) with a $< 50\%$ tumour progression score (TPS) or in whom it has not been possible to evaluate PD-L1 TPS.

Treatment with pembrolizumab is subject to a two-year clinical stopping rule. This advice is contingent upon the

continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1291/18

The *Scottish Medicines Consortium* has advised (February 2018) that pembrolizumab (*Keytruda*[®]) is accepted for restricted use within NHS Scotland as monotherapy for the treatment of locally advanced or metastatic urothelial carcinoma in adults who have received prior platinum-containing chemotherapy. Treatment with pembrolizumab is subject to a two-year clinical stopping rule. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1339/18

The *Scottish Medicines Consortium* has advised (September 2018) that pembrolizumab (*Keytruda*[®]) is **not** recommended for use within NHS Scotland as monotherapy, for the treatment of locally advanced or metastatic urothelial carcinoma in adults who are not eligible for cisplatin-containing chemotherapy and whose tumours express PD-L1 with a combined positive score (CPS) ≥ 10 , as the economic case was not demonstrated.

SMC No. 1296/18

The *Scottish Medicines Consortium* has advised (March 2018) that pembrolizumab (*Keytruda*[®]) is accepted for restricted use within NHS Scotland as monotherapy for the treatment of adults with relapsed or refractory classical Hodgkin lymphoma who have failed autologous stem cell transplant and brentuximab vedotin, or who are transplant-ineligible and have failed brentuximab vedotin. Treatment with pembrolizumab is subject to a two-year clinical stopping rule. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

CAUTIONARY AND ADVISORY LABELS 3

- ▶ *Keytruda* (Merck Sharp & Dohme Ltd) ▼

Pembrolizumab 25 mg per 1 ml *Keytruda* 100mg/4ml concentrate for solution for infusion vials | 1 vial [PoM] £2,630.00 (Hospital only)

Powder for solution for infusion

CAUTIONARY AND ADVISORY LABELS 3

- ▶ *Keytruda* (Merck Sharp & Dohme Ltd) ▼

Pembrolizumab 50 mg *Keytruda* 50mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £1,315.00 (Hospital only)

Pertuzumab

03-Jan-2019

- **DRUG ACTION** Pertuzumab is a recombinant humanised monoclonal antibody, and acts by inhibiting human epidermal growth factor receptor 2 protein (HER2) dimerisation.

● INDICATIONS AND DOSE

HER2-positive early stage breast cancer (in combination with trastuzumab and chemotherapy) | HER2-positive metastatic or locally recurrent unresectable breast cancer (in combination with trastuzumab and docetaxel) (specialist use only)

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature or local protocols)

- **CAUTIONS** Conditions that could impair left ventricular function · history of congestive heart failure · impaired left ventricular function · prior anthracycline exposure · radiotherapy to the chest area · recent myocardial infarction · serious cardiac arrhythmia · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · chills · congestive heart failure · constipation · cough · cytokine release syndrome · diarrhoea · dizziness · dyspepsia · dyspnoea · excessive tearing · fever · headache · hypersensitivity · increased risk of infection · infusion related reaction · insomnia · left ventricular dysfunction · leucopenia · mucositis · myalgia · nail disorder · nausea · neutropenia · oedema · pain · peripheral neuropathy · respiratory disorders · skin reactions · stomatitis · taste altered · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Side effects mostly described for pertuzumab in combination with trastuzumab and docetaxel.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for six months after treatment in women of childbearing potential.

- **PREGNANCY** Avoid (toxicity in *animal* studies). Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available).

- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.

● MONITORING REQUIREMENTS

- ▶ Assess for signs and symptoms of congestive heart failure (including left ventricular ejection fraction) before and during treatment—consult product literature, and withhold treatment if necessary.
- ▶ Monitor for febrile neutropenia.

- **DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Pertuzumab for the neoadjuvant treatment of HER2-positive breast cancer (December 2016)** NICE TA424
Pertuzumab (*Perjeta*[®]), in combination with trastuzumab and chemotherapy, is recommended, within its marketing authorisation, as an option for neoadjuvant treatment in adults with human epidermal growth factor receptor 2 (HER2-positive), locally advanced, inflammatory or early-stage breast cancer at high risk of recurrence, only if the manufacturer provides it with the discount agreed in the patient access scheme.

www.nice.org.uk/guidance/ta424

- ▶ **Pertuzumab with trastuzumab and docetaxel for treating HER2-positive breast cancer (March 2018)** NICE TA509
Pertuzumab (*Perjeta*[®]), in combination with trastuzumab and docetaxel, is recommended, within its marketing authorisation, for treating HER2-positive metastatic or locally recurrent unresectable breast cancer, in adults who have not had previous anti-HER2 therapy or chemotherapy for their metastatic disease, only if the manufacturer provides pertuzumab within the agreed commercial access arrangement.

www.nice.org.uk/guidance/ta509

- ▶ **Pertuzumab for adjuvant treatment of HER2-positive early stage breast cancer (March 2019)** NICE TA569
Pertuzumab (*Perjeta*[®]), with intravenous trastuzumab and chemotherapy, is recommended for the adjuvant treatment of human epidermal growth factor receptor 2 (HER2)-positive early stage breast cancer in adults, only if they have lymph node-positive disease **and** the manufacturer provides it according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta569

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2119

The *Scottish Medicines Consortium* has advised (December 2018) that pertuzumab (*Perjeta*®) is accepted for use within NHS Scotland in combination with trastuzumab and chemotherapy for the neoadjuvant treatment of adults with HER2-positive, locally advanced, inflammatory, or early stage breast cancer at high risk of recurrence. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. SMC2120

The *Scottish Medicines Consortium* has advised (January 2019) that pertuzumab (*Perjeta*®) is accepted for use within NHS Scotland in combination with trastuzumab and docetaxel, in adults with HER2-positive metastatic or locally recurrent unresectable breast cancer, who have not received previous anti-HER2 therapy or chemotherapy for their metastatic disease. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. SMC2197

The *Scottish Medicines Consortium* has advised (October 2019) that pertuzumab (*Perjeta*®) is **not** recommended for use within NHS Scotland in combination with trastuzumab and chemotherapy for the adjuvant treatment of adults with HER2-positive early breast cancer at high risk of recurrence as the clinical and economic case was not demonstrated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ *Perjeta* (Roche Products Ltd)

Pertuzumab 30 mg per 1 ml *Perjeta* 420mg/14ml concentrate for solution for infusion vials | 1 vial PoM £2,395.00 (Hospital only)

Polatuzumab vedotin

21-Apr-2020

- **DRUG ACTION** Polatuzumab vedotin is an antibody-drug conjugate that contains polatuzumab covalently linked to MMAE, a cytotoxic microtubule disrupting agent.

INDICATIONS AND DOSE

Relapsed or refractory diffuse large B-cell lymphoma (in combination with bendamustine and rituximab) (specialist use only)

- ▶ BY INTRAVENOUS INFUSION

▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Active severe infection
- **CAUTIONS** High tumour burden—risk of tumour lysis syndrome · patients may need pre-medication to minimise infusion-related reactions · peripheral neuropathy · rapidly proliferating tumours—risk of tumour lysis syndrome
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Pre-medication Manufacturer advises pre-medication with an antihistamine and antipyretic to minimise the development of infusion-related reactions—consult product literature.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · appetite decreased · arthralgia · asthenia · bone marrow disorders · chills · constipation · cough · decreased leucocytes · diarrhoea · dizziness · electrolyte imbalance · fever · gait abnormal ·

gastrointestinal discomfort · hypoalbuminaemia · increased risk of infection · infusion related reaction · nausea · neutropenia · peripheral neuropathy · pneumonitis · pruritus · sensation abnormal · sepsis · thrombocytopenia · vision blurred · vomiting · weight decreased

- ▶ **Frequency not known** Gastrointestinal toxicity · hepatic disorders · progressive multifocal leukoencephalopathy (PML) · reactivation of infection
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises females of childbearing potential should confirm pregnancy status before treatment and use effective contraception during treatment and for 9 months after last treatment; male patients should use effective contraception during treatment and for 6 months after last treatment if their partner is pregnant or of childbearing potential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938
- **BREAST FEEDING** Manufacturer advises avoid breast feeding during treatment and for at least 2 months after treatment.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe hepatic impairment. Manufacturer advises monitor liver enzymes and bilirubin levels (risk of hepatic toxicity)—consult product literature.
- **RENAL IMPAIRMENT**
 - Dose adjustments** Manufacturer advises no dose adjustment required if creatinine clearance is more than 30 mL/minute; no established dose if creatinine clearance less than 30 mL/minute—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor complete blood counts prior to each dose; more frequent monitoring may be required—consult product literature for treatment adjustment.
- **PRESCRIBING AND DISPENSING INFORMATION** Polatuzumab vedotin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.
- **HANDLING AND STORAGE** Store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage conditions after reconstitution and dilution.
- **PATIENT AND CARER ADVICE**
 - Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and other skilled tasks—increased risk of infusion-related reactions, peripheral neuropathy, fatigue, and dizziness.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

EXCIPIENTS: May contain Polysorbates, sucrose

- ▶ *Polivy* (Roche Products Ltd) ▼

Polatuzumab vedotin 140 mg *Polivy* 140mg powder for concentrate for solution for infusion vials | 1 vial PoM £11,060.00 (Hospital only)

Ramucirumab

24-Jul-2018

- **DRUG ACTION** Ramucirumab is a human monoclonal antibody that binds to the vascular endothelial growth factor receptor-2 (VEGFR-2), inhibiting VEGF-induced angiogenesis.

● INDICATIONS AND DOSE

Treatment of advanced gastric cancer or gastro-oesophageal junction adenocarcinoma, in combination with paclitaxel, in patients with disease progression after prior platinum and fluoropyrimidine chemotherapy

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 8 mg/kg on days 1 and 15 of a 28 day cycle, dose to be administered prior to paclitaxel infusion, consult product literature for dose adjustments due to side-effects and infusion-related reactions

Treatment of advanced gastric cancer, or gastro-oesophageal junction adenocarcinoma, as monotherapy, in patients with disease progression after prior platinum or fluoropyrimidine chemotherapy, and for whom treatment in combination with paclitaxel is not appropriate

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 8 mg/kg every 2 weeks, consult product literature for dose adjustments due to side-effects and infusion-related reactions

Treatment of metastatic colorectal cancer, in combination with FOLFIRI (irinotecan, fluorouracil and folinic acid), in patients with disease progression on, or after, prior therapy with bevacizumab, oxaliplatin and a fluoropyrimidine

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 8 mg/kg every 2 weeks, dose to be administered prior to FOLFIRI administration, consult product literature for dose adjustments due to side-effects and infusion-related reactions

Treatment of locally advanced or metastatic non-small cell lung cancer, in combination with docetaxel, in patients with disease progression after platinum-based chemotherapy

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 10 mg/kg on day 1 of a 21 day cycle, dose to be administered prior to docetaxel infusion, consult product literature for dose adjustments due to side-effects and infusion-related reactions

- **CAUTIONS** Elective surgery—discontinue treatment for at least 4 weeks prior to surgery · hypertension—must be controlled before initiation · impaired wound healing—discontinue treatment until wound fully healed · pretreatment is recommended to minimise the development of adverse reactions (consult product literature) · risk of bleeding

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- ▶ **Common or very common** Arterial thromboembolism · diarrhoea · electrolyte imbalance · epistaxis · gastrointestinal discomfort · gastrointestinal disorders · headache · hepatic coma · hepatic encephalopathy · hepatic pain · hypertension · hypoalbuminaemia · infusion related reaction · nephrotic syndrome · neutropenia · peripheral oedema · proteinuria · rash · thrombocytopenia
- ▶ **Frequency not known** Aneurysm · artery dissection · cardiac arrest · cerebrovascular insufficiency · haemangioma · myocardial infarction · thrombotic microangiopathy

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related hypersensitivity reactions have been reported with ramucirumab, particularly during or following the first or second infusion; if the patient experiences a grade 1 or 2

infusion-related reaction, the manufacturer advises to reduce rate of infusion by 50% and give premedication for all subsequent infusions—consult product literature. Manufacturer advises to permanently discontinue treatment in the event of a grade 3 or 4 infusion-related reaction.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment and for up to 3 months after treatment in women of childbearing potential.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises discontinue breast-feeding during treatment and for at least 3 months after treatment—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe cirrhosis, cirrhosis with hepatic encephalopathy, cirrhosis with clinically significant ascites, or hepatorenal syndrome (risk of progressive hepatic failure, no information available).
- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs of infusion-related hypersensitivity reactions; monitor blood pressure prior to each infusion; monitor for development or worsening of proteinuria during treatment—consult product literature; monitor blood counts and coagulation parameters in patients at risk of bleeding.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Cyranza[®]), give intermittently in Sodium chloride 0.9%; dilute requisite dose with infusion fluid to final volume of 250 mL and invert gently to mix. Do not exceed a rate of 25 mg/minute, and give over approximately 60 minutes via an infusion pump using a separate infusion line with a protein sparing 0.22 micron filter.

- **PRESCRIBING AND DISPENSING INFORMATION** For Cyranza[®], each 10 mL vial contains sodium 17 mg (equivalent to Na⁺ 0.74 mmol).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Ramucirumab for treating advanced gastric cancer or gastro-oesophageal junction adenocarcinoma previously treated with chemotherapy (January 2016) NICE TA378
Ramucirumab alone or in combination with paclitaxel is **not** recommended for the treatment of advanced gastric cancer or gastro-oesophageal junction adenocarcinoma previously treated with chemotherapy.

Patients whose treatment was started before this guidance was published, should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta378

- ▶ Ramucirumab for previously treated locally advanced or metastatic non-small-cell lung cancer (August 2016) NICE TA403

Ramucirumab, in combination with docetaxel, is **not** recommended for treating locally advanced or metastatic non-small-cell lung cancer in patients whose disease has progressed after platinum-based chemotherapy.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinicians consider it appropriate to stop.

Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Cyramza** (Eli Lilly and Company Ltd)

Ramucirumab 10 mg per 1 ml Cyramza 100mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £500.00 (Hospital only)
 Cyramza 500mg/50ml concentrate for solution for infusion vials | 1 vial [PoM] £2,500.00 (Hospital only)

F 903

26-Apr-2019

Rituximab

● INDICATIONS AND DOSE

Rheumatoid arthritis (specialist use only)

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 1 g, then 1 g after 2 weeks, consult product literature for information on retreatment

Non-Hodgkin's lymphoma (specialist use only) | Chronic

lymphocytic leukaemia (specialist use only) |

Granulomatosis with polyangiitis and microscopic

polyangiitis (specialist use only)

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature)

Non-Hodgkin's lymphoma (specialist use only)

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: (consult product literature)

Pemphigus vulgaris (specialist use only)

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 1 g, then 1 g after 2 weeks; maintenance 0.5 g, at months 12 and 18, and then every 6 months thereafter if needed, consult product literature for the treatment of relapse

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS

Severe infection

SPECIFIC CONTRA-INDICATIONS

- ▶ When used for granulomatosis with polyangiitis and microscopic polyangiitis, pemphigus vulgaris, or rheumatoid arthritis Severe heart failure · severe, uncontrolled heart disease

CONTRA-INDICATIONS, FURTHER INFORMATION

For full details on contra-indications, consult product literature.

● CAUTIONS

GENERAL CAUTIONS History of cardiovascular disease; exacerbation of angina, arrhythmia, and heart failure have been reported · patients receiving cardiotoxic chemotherapy; exacerbation of angina, arrhythmia, and heart failure have been reported · pre-medication recommended to minimise adverse reactions (consult product literature) · predisposition to infection · transient hypotension occurs frequently during infusion (anti-hypertensives may need to be withheld for 12 hours before infusion)

SPECIFIC CAUTIONS

- ▶ When used for granulomatosis with polyangiitis and microscopic polyangiitis, or pemphigus vulgaris *Pneumocystis jirovecii* pneumonia—consult product literature for prophylaxis requirements

CAUTIONS, FURTHER INFORMATION For full details on cautions, consult product literature or local treatment protocol.

- ▶ Hepatitis B infection and reactivation Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking **rituximab**. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients

should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- ▶ **Common or very common** Angioedema · anxiety · appetite decreased · arrhythmias · bone marrow disorders · bursitis · cancer pain · cardiac disorder · chest pain · chills · dizziness · dysphagia · dyspnoea · ear pain · electrolyte imbalance · gastrointestinal discomfort · gastrointestinal disorders · hepatitis B · hypercholesterolaemia · hyperglycaemia · hyperhidrosis · hypertension · hypotension · insomnia · lacrimation disorder · malaise · migraine · multi organ failure · muscle complaints · muscle tone increased · nausea · nerve disorders · oedema · oral disorders · osteoarthritis · respiratory disorders · sensation abnormal · sepsis · skin reactions · throat irritation · tinnitus · vasodilation · weight decreased
- ▶ **Uncommon** Asthma · coagulation disorder · heart failure · hypoxia · ischaemic heart disease · lymphadenopathy · taste altered
- ▶ **Rare or very rare** Cytokine release syndrome · facial paralysis · renal failure · Stevens-Johnson syndrome (discontinue) · toxic epidermal necrolysis (discontinue) · tumour lysis syndrome · vasculitis · vision disorders
- ▶ **Frequency not known** Epistaxis · hearing loss · hypogammaglobulinaemia · infective thrombosis · influenza like illness · irritability · muscle weakness · nasal congestion · posterior reversible encephalopathy syndrome (PRES) · psychiatric disorder · seizure · skin papilloma · tremor

SIDE-EFFECTS, FURTHER INFORMATION Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

Progressive multifocal leucoencephalopathy has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded.

- **CONCEPTION AND CONTRACEPTION** Effective contraception (in both sexes) required during and for 12 months after treatment.
- **PREGNANCY** Avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus.
- **BREAST FEEDING** Avoid breast-feeding during and for 12 months after treatment.
- **MONITORING REQUIREMENTS** For full details on monitoring requirements consult product literature.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For *intravenous infusion*, give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to 1–4 mg/mL and gently invert bag to avoid foaming; for further information, consult product literature.
- **PRESCRIBING AND DISPENSING INFORMATION** Rituximab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.
- **PATIENT AND CARER ADVICE**
 - Alert card
 - ▶ When used for Granulomatosis with polyangiitis and microscopic polyangiitis or Rheumatoid arthritis or Pemphigus vulgaris Patients should be provided with a patient alert card with each infusion.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Rituximab in combination with glucocorticoids for treating anti-neutrophil cytoplasmic antibody-associated vasculitis (March 2014)** NICE TA308
 - ▶ With intravenous use This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with glucocorticoids, is recommended as an option for inducing remission in adults with anti-neutrophil cytoplasmic antibody [ANCA]-associated vasculitis (severely active granulomatosis with polyangiitis [Wegener's] and microscopic polyangiitis), only if:
 - further cyclophosphamide treatment would exceed the maximum cumulative cyclophosphamide dose, **or**
 - cyclophosphamide is contra-indicated or not tolerated, **or**
 - the patient has not completed their family, and treatment with cyclophosphamide may materially affect their fertility, **or**
 - the disease has remained active or progressed despite a course of cyclophosphamide lasting 3–6 months **or**
 - the patient has had uroepithelial malignancy.
- www.nice.org.uk/guidance/ta308
- ▶ **Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010)** NICE TA195
 - ▶ With intravenous use This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with methotrexate, is recommended as an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or are intolerant of, other disease-modifying antirheumatic drugs (DMARDs), including at least 1 tumour necrosis factor (TNF) inhibitor. Repeat courses of rituximab should be given no more frequently than every 6 months, and should only be continued if an adequate response is achieved and maintained.
- www.nice.org.uk/guidance/ta195
- ▶ **Rituximab for the first-line treatment of stage III-IV follicular lymphoma (January 2012)** NICE TA243
 - ▶ With intravenous use This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with:
 - cyclophosphamide, vincristine and prednisolone (CVP);
 - cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP);
 - mitoxantrone, chlorambucil and prednisolone (MCP);
 - cyclophosphamide, doxorubicin, etoposide, prednisolone and interferon-alfa (CHVPi); **or**
 - chlorambucil
- is recommended as an option for the treatment of symptomatic stage III and IV follicular lymphoma in previously untreated patients.
 - www.nice.org.uk/guidance/ta243
- ▶ **Rituximab for the treatment of relapsed or refractory stage III or IV follicular non-Hodgkin's lymphoma (February 2008)** NICE TA137
 - ▶ With intravenous use This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with chemotherapy, is recommended as an option for the induction of remission in patients with relapsed stage III or IV follicular non-Hodgkin's lymphoma. Rituximab monotherapy, as maintenance therapy, is recommended as an option for the treatment of patients with relapsed stage III or IV follicular non-Hodgkin's lymphoma in remission induced with chemotherapy (with or without rituximab). Rituximab monotherapy is recommended as an option for the treatment of patients with relapsed or refractory stage III or IV follicular non-Hodgkin's lymphoma, when all

- alternative treatment options have been exhausted (that is, if there is resistance to or intolerance of chemotherapy).
 - www.nice.org.uk/guidance/ta137
- ▶ **Rituximab for the treatment of relapsed or refractory chronic lymphocytic leukaemia (July 2010)** NICE TA193
 - ▶ With intravenous use This NICE guidance was issued for rituximab by intravenous infusion. Rituximab in combination with fludarabine and cyclophosphamide is recommended as a treatment option for patients with relapsed or refractory chronic lymphocytic leukaemia except when the condition:
 - is refractory to fludarabine (that is, it has not responded to fludarabine, or has relapsed within 6 months of treatment), **or**
 - has previously been treated with rituximab, unless it was in the context of a clinical trial, at a dose lower than the dose currently licensed for chronic lymphocytic leukaemia or with chemotherapy other than fludarabine and cyclophosphamide.
 - Rituximab in combination with fludarabine and cyclophosphamide is recommended only in the context of research for patients with relapsed or refractory chronic lymphocytic leukaemia that has previously been treated with rituximab, unless rituximab has been given as specified above.
 - www.nice.org.uk/guidance/ta193
 - ▶ **Rituximab for the first-line maintenance treatment of follicular non-Hodgkin's lymphoma (June 2011)** NICE TA226
 - ▶ With intravenous use This NICE guidance was issued for rituximab by intravenous infusion. Rituximab maintenance therapy is recommended as an option for the treatment of patients with follicular non-Hodgkin's lymphoma that has responded to first-line induction therapy with rituximab in combination with chemotherapy.
 - www.nice.org.uk/guidance/ta226
 - ▶ **Rituximab for the first-line treatment of chronic lymphocytic leukaemia (July 2009)** NICE TA174
 - ▶ With intravenous use This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with fludarabine and cyclophosphamide, is recommended as an option for the first-line treatment of chronic lymphocytic leukaemia.
 - www.nice.org.uk/guidance/ta174
 - ▶ **Idelalisib for treating chronic lymphocytic leukaemia (October 2015)** NICE TA359
 - Rituximab, in combination with idelalisib, is recommended as an option for treatment in adults:
 - who have untreated chronic lymphocytic leukaemia **or**
 - who have chronic lymphocytic leukaemia when the disease has been treated but has relapsed within 24 months **and**
 - if the manufacturer provides idelalisib with the discount agreed in the simple discount agreement.
 - Patients who are already receiving idelalisib should continue treatment until they or their clinician consider it appropriate to stop.
 - www.nice.org.uk/guidance/ta359
 - ▶ **Venetoclax with rituximab for previously treated chronic lymphocytic leukaemia (February 2019)** NICE TA561
 - Venetoclax (*Venclyxto*[®]) with rituximab is recommended, within its marketing authorisation, as an option for treating chronic lymphocytic leukaemia in adults who have had at least 1 previous therapy. It is recommended only if the manufacturer provides it according to the commercial arrangement.
 - www.nice.org.uk/guidance/ta561

Scottish Medicines Consortium (SMC) decisions

SMC No. 894/13

- ▶ With intravenous use The *Scottish Medicines Consortium* has advised (August 2013) that Rituximab (*MabThera*[®]) is accepted for restricted use within NHS Scotland, in

combination with glucocorticoids for the induction of remission in adult patients with severe, active granulomatosis with polyangiitis (Wegener's) and microscopic polyangiitis. It is restricted to use in patients who have relapsed following treatment with cyclophosphamide or who are intolerant to or unable to receive cyclophosphamide.

SMC No. 975/14

- ▶ With subcutaneous use The *Scottish Medicines Consortium* has advised (June 2014) that subcutaneous rituximab (*MabThera*)[®] is accepted for restricted use within NHS Scotland, in accordance with UK licensing, except in the maintenance setting, where use is restricted to patients who have responded to induction therapy with rituximab plus chemotherapy.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **MabThera** (Roche Products Ltd)
Rituximab 119.66 mg per 1 ml MabThera 1400mg/11.7ml solution for injection vials | 1 vial **[PoM]** £1,344.65 (Hospital only)

Solution for infusion

EXCIPIENTS: May contain Polysorbates

ELECTROLYTES: May contain Sodium

Siltuximab

- **DRUG ACTION** Siltuximab is a monoclonal antibody that inhibits interleukin-6 receptor binding.

● INDICATIONS AND DOSE

Treatment of multicentric Castlemann's disease (MCD) in patients who are human immunodeficiency virus (HIV) negative and human herpesvirus-8 (HHV-8) negative

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 11 mg/kg every 3 weeks

- **CAUTIONS** Patients at increased risk of gastrointestinal perforation—promptly investigate those presenting with symptoms suggestive of gastrointestinal perforation - severe infection—withhold treatment until resolved - treat infection prior to treatment

CAUTIONS, FURTHER INFORMATION

- ▶ Hypersensitivity reactions Infusion-related side-effects are reported commonly with siltuximab; resuscitation facilities should be available during treatment.
Consult product literature for further information about siltuximab cautions.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · hypersensitivity · hypertension · hypertriglyceridaemia · increased risk of infection · infusion related reaction · localised oedema · neutropenia · renal impairment · skin reactions · thrombocytopenia · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Siltuximab therapy should be discontinued permanently in the event of a

severe infusion-related reaction, anaphylaxis, a severe allergic reaction, or the occurrence of cytokine-release syndrome. Mild to moderate infusion-related reactions may improve by temporarily reducing the rate or stopping the infusion. When restarting treatment, a reduced infusion rate and the administration of antihistamines, paracetamol, and corticosteroids may be considered. Consider discontinuation of siltuximab if more than 2 doses are delayed due to treatment-related toxicities during the first 48 weeks—for full details consult product literature.

- **CONCEPTION AND CONTRACEPTION** Women of childbearing potential should use effective contraception during and for 3 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information).
- **MONITORING REQUIREMENTS**
 - ▶ Monitor neutrophil and platelet count, and haemoglobin levels prior to each dose of siltuximab treatment for the first 12 months and thereafter prior to every third dosing cycle. Consider delaying treatment if required neutrophil, platelet, and haemoglobin levels not achieved—consult product literature for details.
 - ▶ Monitor for infection during treatment.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Sylvant*)[®], give intermittently in Glucose 5%. Allow vials to reach room temperature over approximately 30 minutes, then reconstitute each 100 mg vial with 5.2 mL of water for injection, and each 400 mg vial with 20 mL of water for injection, to produce a 20 mg/mL solution. Gently swirl without shaking to dissolve. Further dilute to 250 mL with glucose 5% and gently mix. Use within 6 hours of dilution and give over 60 minutes using an administration set lined with polyvinyl chloride or polyurethane, through a low-protein binding in-line 0.2 micron filter.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Sylvant** (Janssen-Cilag Ltd) ▼
Siltuximab 100 mg Sylvant 100mg powder for concentrate for solution for infusion vials | 1 vial **[PoM]** £415.00 (Hospital only)
Siltuximab 400 mg Sylvant 400mg powder for concentrate for solution for infusion vials | 1 vial **[PoM]** £1,661.00 (Hospital only)

Trastuzumab

15-Mar-2019

● INDICATIONS AND DOSE

Treatment of early breast cancer which overexpresses human epidermal growth factor receptor-2 (HER2) (initiated by a specialist) | Treatment of metastatic breast cancer in patients with HER2-positive tumours who have not received chemotherapy for metastatic breast cancer and in whom anthracycline treatment is inappropriate (in combination with paclitaxel or docetaxel) (initiated by a specialist) | Treatment of metastatic breast cancer in postmenopausal patients with hormone-receptor positive HER2-positive tumours not previously treated with trastuzumab (in combination with an aromatase inhibitor) (initiated by a specialist)

- ▶ BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature or local protocols)

continued →

Monotherapy for metastatic breast cancer in patients with tumours that overexpress HER2 who have received at least 2 chemotherapy regimens including, where appropriate, an anthracycline and a taxane (initiated by a specialist)

- ▶ BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: Women with oestrogen-receptor-positive breast cancer should also have received hormonal therapy (consult product literature or local protocols)

Treatment of metastatic gastric cancer in patients with HER2-positive tumours who have not received treatment for metastatic gastric cancer (in combination with capecitabine or fluorouracil and cisplatin) (initiated by a specialist)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature or local protocols)

- **CONTRA-INDICATIONS** Severe dyspnoea at rest
- **CAUTIONS** Coronary artery disease · history of hypertension · symptomatic heart failure · uncontrolled arrhythmias
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
- ▶ **Common or very common** Alopecia · anaemia · angioedema · anxiety · appetite decreased · arrhythmias · arthralgia · arthritis · asthenia · asthma · ataxia · breast abnormalities · cardiomyopathy · chest pain · chills · constipation · cough · cystitis · depression · diarrhoea · dizziness · drowsiness · dry eye · dry mouth · dyspnoea · excessive tearing · eye inflammation · fever · gastrointestinal discomfort · haemorrhage · haemorrhoids · headache · heart failure · hepatic disorders · hyperhidrosis · hypersensitivity · hypotension · increased risk of infection · influenza like illness · infusion related reaction (may be delayed) · insomnia · leucopenia · malaise · mucositis · muscle complaints · muscle tone increased · nail disorders · nausea · neuropenia · oedema · oral disorders · pain · palpitations · pancreatitis · paraesthesia · peripheral neuropathy · renal disorder · respiratory disorders · rhinorrhoea · sepsis · skin reactions · taste altered · thinking abnormal · thrombocytopenia · tremor · vasodilation · vomiting · weight decreased
- ▶ **Uncommon** Deafness · pericardial effusion
- ▶ **Rare or very rare** Paresis
- ▶ **Frequency not known** Brain oedema · cancer progression · cardiogenic shock · glomerulonephritis · hyperkalaemia · hypoproteinaemia · hypoxia · pericarditis · pulmonary fibrosis (may be delayed) · pulmonary oedema (may be delayed) · renal failure
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential during and for 7 months after treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Manufacturer advises avoid—oligohydramnios reported. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Avoid breast-feeding during treatment and for 7 months afterwards.
- **MONITORING REQUIREMENTS**
- ▶ **Cardiotoxicity** Monitor cardiac function before and during treatment—for details of monitoring and managing cardiotoxicity, consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available during administration of trastuzumab.
- **PRESCRIBING AND DISPENSING INFORMATION** When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab is **not** interchangeable with trastuzumab emtansine.

Trastuzumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Guidance on the use of trastuzumab for the treatment of advanced breast cancer (March 2002) NICE TA34** Trastuzumab in combination with paclitaxel is recommended as an option for patients with tumours expressing human epidermal growth factor receptor 2 (HER2) scored at levels of 3+ who have not received chemotherapy for metastatic breast cancer, and in whom anthracycline treatment is inappropriate. Trastuzumab monotherapy is recommended as an option for patients with tumours expressing HER2 scored at levels of 3+ who have received at least two chemotherapy regimens for metastatic breast cancer. Prior chemotherapy must have included at least an anthracycline and a taxane where these treatments are appropriate. It should also have included hormonal therapy in suitable oestrogen-receptor-positive patients. www.nice.org.uk/guidance/ta34
- ▶ **Trastuzumab for the adjuvant treatment of early-stage HER2-positive breast cancer (August 2006) NICE TA107** Trastuzumab, given at 3-week intervals for 1 year or until disease recurrence (whichever is the shorter period), is recommended as an option for women with early-stage HER2-positive breast cancer following surgery, chemotherapy (neoadjuvant or adjuvant) and radiotherapy (if applicable). www.nice.org.uk/guidance/ta107
- ▶ **Lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2 (June 2012) NICE TA257** Lapatinib or trastuzumab in combination with an aromatase inhibitor is **not** recommended for first-line treatment in postmenopausal women of metastatic hormone-receptor-positive breast cancer that overexpresses human epidermal growth factor receptor 2 (HER2). Postmenopausal women currently receiving lapatinib or trastuzumab in combination with an aromatase inhibitor for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/guidance/ta257
- ▶ **Pertuzumab with trastuzumab and docetaxel for treating HER2-positive breast cancer (March 2018) NICE TA509** Pertuzumab, in combination with trastuzumab and docetaxel, is recommended, within its marketing authorisation, for treating HER2-positive metastatic or locally recurrent unresectable breast cancer, in adults who have not had previous anti-HER2 therapy or chemotherapy for their metastatic disease, only if the manufacturer provides pertuzumab within the agreed commercial access arrangement. www.nice.org.uk/guidance/ta509
- ▶ **Trastuzumab for the treatment of HER2-positive metastatic gastric cancer (November 2010) NICE TA208** Trastuzumab in combination with cisplatin and capecitabine or fluorouracil is recommended for human epidermal growth factor receptor-2-positive metastatic adenocarcinoma of the stomach or gastro-oesophageal junction in patients who:
 - have not received treatment for metastatic disease **and**
 - have tumours expressing high levels of HER2 as defined by a positive immunohistochemistry score of 3. www.nice.org.uk/guidance/ta208

Scottish Medicines Consortium (SMC) decisions

SMC No. 928/13

The *Scottish Medicines Consortium* has advised (January 2014) that subcutaneous trastuzumab injection (*Herceptin*[®]) is accepted for restricted use within NHS Scotland for the treatment of adults with HER2 positive metastatic breast cancer and early breast cancer, when used within licensed indications excluding use in combination with an aromatase inhibitor for the treatment of postmenopausal patients with hormone-receptor positive metastatic breast cancer, not previously treated with trastuzumab.

SMC No. 623/10

The *Scottish Medicines Consortium* has advised (October 2015) that trastuzumab solution for infusion (*Herceptin*[®]) is accepted for restricted use within NHS Scotland in combination with capecitabine or fluorouracil and cisplatin for the treatment of patients with HER2 positive metastatic adenocarcinoma of the stomach or gastro-oesophageal junction, who have not received prior anti-cancer treatment for their metastatic disease. It is restricted to patients with metastatic gastric cancer whose tumours have HER2 over-expression, as determined by an accurate and validated assay.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Trastuzumab emtansine

02-Aug-2017

- **DRUG ACTION** Trastuzumab emtansine is an antibody-drug conjugate that contains trastuzumab covalently linked to DM1, a cytotoxic microtubule inhibitor.

INDICATIONS AND DOSE

Monotherapy for the treatment of HER2-positive, unresectable, locally advanced or metastatic breast cancer, in adult patients who have previously received trastuzumab and a taxane separately or in combination (initiated by a specialist) | Monotherapy for the treatment of HER2-positive, unresectable, locally advanced or metastatic breast cancer, in adult patients who have developed disease recurrence during or within 6 months of completing adjuvant therapy (initiated by a specialist)

▶ BY INTRAVENOUS INFUSION

▶ Adult: (consult product literature or local protocols)

- **CAUTIONS** Dyspnoea at rest—increased risk of pulmonary events · history of congestive heart failure · patients over 75 years · peripheral neuropathy (temporarily discontinue treatment—consult product literature) · recent history of myocardial infarction · recent history of unstable angina · risk of left ventricular dysfunction—consult product literature for specific risks with trastuzumab treatment · serious arrhythmias
 - **INTERACTIONS** → Appendix 1: monoclonal antibodies
 - **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · anaemia · arthralgia · asthenia · chills · conjunctivitis · constipation · cough · diarrhoea · dizziness · dry eye · dry mouth · dyspnoea · excessive tearing · fever · gastrointestinal discomfort · haemorrhage · headache · hypersensitivity · hypertension · hypokalaemia · infusion related reaction · insomnia · left ventricular dysfunction · leucopenia · memory loss · musculoskeletal pain · myalgia · nail disorder · nausea · neutropenia · peripheral neuropathy · peripheral oedema · skin reactions · stomatitis · taste altered · thrombocytopenia · urinary tract infection · vision blurred · vomiting
 - ▶ **Uncommon** Hepatic disorders · nodular regenerative hyperplasia · pneumonitis
 - **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during and for 6 months after stopping treatment in women and men.
 - **PREGNANCY** Manufacturer advises avoid—oligohydramnios reported with trastuzumab. See also Pregnancy and reproductive function in Cytotoxic drugs p. 938.
 - **BREAST FEEDING** Manufacturer advises avoid breast-feeding during and for 6 months after treatment.
 - **HEPATIC IMPAIRMENT** Manufacturer advises caution—consult product literature.
 - **Dose adjustments** Manufacturer advises dose reduction according to liver function tests—consult product literature.
 - **RENAL IMPAIRMENT** No information available—manufacturer advises caution in severe impairment.
 - **MONITORING REQUIREMENTS**
 - ▶ Monitor hepatic function before each dose.
 - ▶ Monitor for signs and symptoms of neurotoxicity.
 - ▶ Monitor closely for infusion-related and hypersensitivity reactions.
 - ▶ Monitor platelet count before each dose and as clinically indicated (consult product literature for treatment modification in thrombocytopenia).
 - ▶ Test cardiac function before treatment and regularly during treatment—delay or discontinue treatment in cases of left ventricular dysfunction.
 - ▶ Monitor for dyspnoea, cough, fatigue and pulmonary infiltrates—discontinue if interstitial lung disease or pneumonitis confirmed (fatal cases reported).
 - **DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available during administration of trastuzumab emtansine.
 - **PRESCRIBING AND DISPENSING INFORMATION** When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab emtansine and trastuzumab are **not** interchangeable.
 - **NATIONAL FUNDING/ACCESS DECISIONS**
 - NICE decisions**
 - ▶ Trastuzumab emtansine for treating HER2-positive advanced breast cancer after trastuzumab and a taxane (updated November 2017) NICE TA458
- Trastuzumab emtansine is recommended, within its marketing authorisation, as an option for treating human epidermal growth factor receptor 2 (HER2)-positive, unresectable, locally advanced or metastatic breast cancer

in adults who previously received trastuzumab and a taxane, separately or in combination. Patients should have either received prior therapy for locally advanced or metastatic disease or developed disease recurrence during or within 6 months of completing adjuvant therapy.

Trastuzumab emtansine is recommended only if the manufacturer provides it with the discount agreed in the patient access scheme.

www.nice.org.uk/guidance/TA458

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (April 2017) that trastuzumab emtansine (*Kadcyla*[®]) is accepted for use within NHS Scotland as monotherapy for the treatment of patients with human epidermal growth factor type 2 (HER2)-positive, unresectable locally advanced or metastatic breast cancer who previously received trastuzumab and a taxane, separately or in combination, and have either received prior therapy for locally advanced or metastatic disease or developed disease recurrence during or within six months of completing adjuvant therapy. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► *Kadcyla* (Roche Products Ltd)

Trastuzumab emtansine 100 mg *Kadcyla* 100mg powder for concentrate for solution for infusion vials | 1 vial [POM](#) £1,641.01

Trastuzumab emtansine 160 mg *Kadcyla* 160mg powder for concentrate for solution for infusion vials | 1 vial [POM](#) £2,625.62

2 Carcinoid syndrome

ENZYME INHIBITORS

Telotristat ethyl

06-Jul-2018

- **DRUG ACTION** Telotristat ethyl and its active metabolite inhibit L-tryptophan hydroxylases TPH-1 and TPH-2 which reduces the production of serotonin, thereby alleviating symptoms associated with carcinoid syndrome.

• INDICATIONS AND DOSE

Carcinoid syndrome diarrhoea (specialist use only)

► BY MOUTH

- Adult: 250 mg 3 times a day, review treatment if no response after 12 weeks

- **INTERACTIONS** → Appendix 1: telotristat ethyl

• SIDE-EFFECTS

- **Common or very common** Appetite decreased · constipation · fatigue · fever · gastrointestinal discomfort · gastrointestinal disorders · headache · peripheral oedema

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).

Dose adjustments Manufacturer advises consider dose reduction to 250 mg twice daily in mild impairment and to 250 mg once daily in moderate impairment, according to tolerability.

- **RENAL IMPAIRMENT** Manufacturer advises caution in mild-to-moderate impairment; avoid in severe impairment—no information available.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor liver function at initiation and during treatment

as clinically indicated—discontinue if liver injury suspected.

- **PATIENT AND CARER ADVICE** Manufacturer advises inform patients to report any symptoms of depression or decreased interest.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 1327/18

The *Scottish Medicines Consortium* has advised (June 2018) that telotristat ethyl (*Xermelo*[®]) is accepted for restricted use within NHS Scotland for the treatment of carcinoid syndrome diarrhoea in adults who experience an average of four or more bowel motions per day, despite receiving somatostatin analogue therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 2037

The *All Wales Medicines Strategy Group* has advised (July 2018) that telotristat ethyl (*Xermelo*[®]) is recommended as an option for restricted use within NHS Wales for the treatment of carcinoid syndrome diarrhoea in adults who are inadequately controlled by somatostatin analogue therapy and who experience an average of four or more bowel movements a day. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

3 Cytotoxic responsive malignancy

Cytotoxic drugs

27-Sep-2018

Overview

The chemotherapy of cancer is complex and should be confined to specialists in oncology. Cytotoxic drugs have both anti-cancer activity and the potential to damage normal tissue; most cytotoxic drugs are teratogenic. Chemotherapy may be given with a curative intent or it may aim to prolong life or to palliate symptoms. In an increasing number of cases chemotherapy may be combined with radiotherapy or surgery or both as either neoadjuvant treatment (initial chemotherapy aimed at shrinking the primary tumour, thereby rendering local therapy less destructive or more effective) or as adjuvant treatment (which follows definitive treatment of the primary disease, when the risk of subclinical metastatic disease is known to be high). All cytotoxic drugs cause side-effects and a balance has to be struck between likely benefit and acceptable toxicity.

Combinations of cytotoxic drugs, as continuous or pulsed cycles of treatment, are frequently more toxic than single drugs but have the advantage in certain tumours of enhanced response, reduced development of drug resistance and increased survival. However for some tumours, single-agent chemotherapy remains the treatment of choice.

Cytotoxic drugs fall into a number of classes, each with characteristic antitumour activity, sites of action, and toxicity. A knowledge of sites of metabolism and excretion is important because impaired drug handling as a result of disease is not uncommon and may result in enhanced toxicity.

Cytotoxic drug handling guidelines

- Trained personnel should reconstitute cytotoxics
- Reconstitution should be carried out in designated pharmacy areas
- Protective clothing (including gloves, gowns, and masks) should be worn
- The eyes should be protected and means of first aid should be specified
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard)
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material
- Staff exposure to cytotoxic drugs should be monitored

Intrathecal chemotherapy

A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available.

Copies, and further information may be obtained from the Department of Health and Social Care website (www.gov.uk/government/organisations/department-of-health-and-social-care).

Safe systems for cytotoxic medicines

NHS cancer networks have been established across the UK to bring together all stakeholders in all sectors of care, to work collaboratively to plan and deliver high quality cancer services for a given population. NHS cancer networks have websites containing information on local chemotherapy services and treatment.

Safe system requirements:

- cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care coordinated by a multidisciplinary team
- cytotoxic drugs should be prescribed, dispensed, and administered only in the context of a written protocol or treatment plan
- injectable cytotoxic drugs should only be dispensed if they are prepared for administration
- oral cytotoxic medicines should be dispensed with clear directions for use

Cytotoxic drugs: important safety information

Risk of incorrect dosing of oral anti-cancer medicines

The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy.

- non-specialists who prescribe or administer on-going oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity;
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital.

Cytotoxic drug doses

Doses of cytotoxic drugs are determined using a variety of different methods including body-surface area or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient's neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from some of the drug entries in this chapter. However, even where dose statements have been provided, detailed specialist literature, individual hospital chemotherapy protocols, or local cancer networks should be consulted before prescribing, dispensing, or administering cytotoxic drugs.

Prescriptions should **not** be repeated except on the instructions of a specialist.

Cytotoxic drug side-effects

Side-effects common to most cytotoxic drugs are discussed below whilst side-effects characteristic of a particular drug or class of drugs (e.g. neurotoxicity with vinca alkaloids) are mentioned in the appropriate sections. Manufacturers' product literature, hospital-trust protocols, and cancer-network protocols should be consulted for full details of side-effects associated with individual drugs and specific chemotherapy regimens.

Many side-effects of cytotoxic drugs often do not occur at the time of administration, but days or weeks later. It is therefore important that patients and healthcare professionals can identify symptoms that cause concern and can contact an expert for advice. Toxicities should be accurately recorded using a recognised scoring system such as the Common Toxicity Criteria for Adverse Events (CTCAE) developed by the National Cancer Institute.

Extravasation of intravenous drugs

A number of cytotoxic drugs will cause severe local tissue necrosis if leakage into the extravascular compartment occurs. To reduce the risk of extravasation injury it is recommended that cytotoxic drugs are administered by appropriately trained staff. See information on the prevention and management of extravasation injury.

Oral mucositis

A sore mouth is a common complication of cancer chemotherapy; it is most often associated with fluorouracil p. 961, methotrexate p. 963, and the anthracyclines. It is best to prevent the complication. Good oral hygiene (rinsing the mouth frequently and effective brushing of the teeth with a soft brush 2–3 times daily) is probably beneficial. For fluorouracil, sucking ice chips during short infusions of the drug is also helpful.

Once a sore mouth has developed, treatment is much less effective. Saline mouthwashes should be used but there is no good evidence to support the use of antiseptic or anti-inflammatory mouthwashes. In general, mucositis is self-limiting but with poor oral hygiene it can be a focus for blood-borne infection.

Tumour lysis syndrome

Tumour lysis syndrome occurs secondary to spontaneous or treatment-related rapid destruction of malignant cells. Patients at risk of tumour lysis syndrome include those with non-Hodgkin's lymphoma (especially if high grade and bulky disease), Burkitt's lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration, and renal impairment are also predisposing factors. Features include hyperkalaemia, hyperuricaemia (see below), and hyperphosphataemia with hypocalcaemia;

renal damage and arrhythmias can follow. Early identification of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

Hyperuricaemia

Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure. Allopurinol p. 1183 should be started 24 hours before treating such tumours and patients should be adequately hydrated. The dose of mercaptopurine p. 963 or azathioprine p. 881 should be reduced if allopurinol needs to be given concomitantly. Febuxostat p. 1184 may also be used and should be started 2 days before cytotoxic therapy is initiated.

Rasburicase p. 993, a recombinant urate oxidase, is licensed for hyperuricaemia in patients with haematological malignancy. It rapidly reduces plasma-uric acid concentration and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

Bone-marrow suppression

All cytotoxic drugs except vincristine sulfate p. 980 and bleomycin p. 970 cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as carmustine p. 943, lomustine p. 947, and melphalan p. 948. Peripheral blood counts must be checked before each treatment, and doses should be reduced or therapy delayed if bone-marrow has not recovered.

Cytotoxic drugs may be contra-indicated in patients with acute infection; any infection should be treated before, or when starting, cytotoxic drugs.

Fever in a neutropenic patient (neutrophil count less than 1.06×10^9 /litre) requires immediate broad-spectrum antibacterial therapy. Appropriate bacteriological investigations should be conducted as soon as possible. Patients taking cytotoxic drugs who have signs or symptoms of infection should be advised to seek prompt medical attention. All patients should initially be investigated and treated under the supervision of the appropriate oncology or haematology specialist.

In selected patients, the duration and the severity of neutropenia can be reduced by the use of recombinant human granulocyte-colony stimulating factors.

Symptomatic anaemia is usually treated with red blood cell transfusions. For guidance on the use of erythropoietins in patients with cancer, see MHRA/CHM advice and NICE guidance.

Alopecia

Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients. No pharmacological methods of preventing this are available.

Thromboembolism

Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

Cytotoxic drugs: effect on pregnancy and reproductive function

Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Exclude pregnancy before treatment with cytotoxic drugs. Contraceptive advice should be given before cytotoxic therapy begins- women of childbearing age should use effective contraception during and after treatment.

Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency).

Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

Cytotoxic drugs: nausea and vomiting

Nausea and vomiting cause considerable distress to many patients who receive chemotherapy and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Patients vary in their susceptibility to drug-induced nausea and vomiting; those affected more often include women, patients under 50 years of age, anxious patients, and those who experience motion sickness. Susceptibility also increases with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered and to the individual's susceptibility to emetogenic stimuli.

Mildly emetogenic treatment— fluorouracil p. 961, etoposide p. 974, methotrexate p. 963 (less than 100 mg/m^2 , low dose in children), the vinca alkaloids, and abdominal radiotherapy.

Moderately emetogenic treatment—the taxanes, doxorubicin hydrochloride p. 951, intermediate and low doses of cyclophosphamide p. 945, mitoxantrone p. 954, and high doses of methotrexate ($0.1 - 1.2 \text{ g/m}^2$).

Highly emetogenic treatment— cisplatin p. 973, dacarbazine p. 946, and high doses of cyclophosphamide.

Prevention of acute symptoms

For patients at *low risk of emesis*, pretreatment with dexamethasone p. 712 or lorazepam p. 355 may be used.

For patients at *high risk of emesis*, a 5HT₃-receptor antagonist, usually given by mouth in combination with dexamethasone and the neurokinin receptor antagonist aprepitant p. 453 is effective.

Prevention of delayed symptoms

For delayed symptoms associated with moderately emetogenic chemotherapy, a combination of dexamethasone and 5HT₃-receptor antagonist is effective; for highly emetogenic chemotherapy, a combination of dexamethasone and aprepitant is effective. Rolapitant p. 454 and metoclopramide hydrochloride p. 452 are also licensed for delayed chemotherapy-induced nausea and vomiting.

Prevention of anticipatory symptoms

Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam can be helpful for its amnesic, sedative, and anxiolytic effects.

For information on the treatment of nausea and vomiting, see Nausea and labyrinth disorders p. 448.

Treatment of cytotoxic-induced side-effects

Anthracycline side-effects

Anthracycline-induced cardiotoxicity

The anthracycline cytotoxic drugs are associated with dose-related, cumulative, and potentially life-threatening cardiotoxic side-effects.

Anthracycline extravasation

Local guidelines for the management of extravasation should be followed or specialist advice sought.

See further information on the prevention and management of extravasation injury.

Chemotherapy-induced mucositis and myelosuppression
Folinic acid p. 992 (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate p. 963 and thus speed recovery from methotrexate-induced mucositis or myelosuppression ('folinic acid rescue').

Folinic acid is also used in the management of methotrexate overdose, together with other measures to maintain fluid and electrolyte balance, and to manage possible renal failure.

Folinic acid does not counteract the antibacterial activity of folate antagonists such as trimethoprim p. 607.

When folinic acid and fluorouracil p. 961 are used together in metastatic colorectal cancer the response-rate improves compared to that with fluorouracil alone.

The calcium salt of levofolinic acid p. 993, a single isomer of folinic acid, is also used for rescue therapy following methotrexate administration, for cases of methotrexate overdose, and for use with fluorouracil for colorectal cancer. The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofolinic acid are also used for rescue therapy following methotrexate therapy, and for use with fluorouracil for colorectal cancer.

Urothelial toxicity

Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide p. 945 and ifosfamide p. 947; it is caused by the metabolite acrolein. Mesna p. 992 reacts specifically with this metabolite in the urinary tract, preventing toxicity. Mesna is used routinely (preferably by mouth) in patients receiving ifosfamide, and in patients receiving cyclophosphamide by the intravenous route at a high dose (e.g. more than 2g) or in those who experienced urothelial toxicity when given cyclophosphamide previously.

Anthracyclines and other cytotoxic antibiotics

Drugs in this group are widely used. Many cytotoxic antibiotics act as radiomimetics and simultaneous use of radiotherapy should be **avoided** because it may markedly increase toxicity. Daunorubicin p. 950, doxorubicin hydrochloride p. 951, epirubicin hydrochloride p. 953 and idarubicin hydrochloride p. 953 are anthracycline antibiotics. Mitoxantrone p. 954 is an anthracycline derivative.

Doxorubicin hydrochloride is available as both *conventional* and *liposomal* formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable. *Conventional* doxorubicin hydrochloride is used to treat the acute leukaemias, Hodgkin's and non-Hodgkin's lymphomas, paediatric malignancies, and some solid tumours including breast cancer.

Epirubicin hydrochloride is structurally related to doxorubicin hydrochloride and can be used to treat breast cancer.

Idarubicin hydrochloride has general properties similar to those of doxorubicin hydrochloride; it is mostly used in the treatment of haematological malignancies.

Daunorubicin also has general properties similar to those of doxorubicin hydrochloride.

Mitoxantrone is structurally related to doxorubicin hydrochloride.

Pixantrone p. 954 is licensed as monotherapy for the treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas, although the benefits of using it as a fifth-line or greater chemotherapy in refractory patients has not been established.

Bleomycin p. 970 is given intravenously or intramuscularly to treat metastatic germ cell cancer and, in some regimens, non-Hodgkin's lymphoma.

Dactinomycin is principally used to treat paediatric cancers. Its side-effects are similar to those of doxorubicin, except that cardiac toxicity is not a problem.

Mitomycin p. 970 can be given intravenously to treat gastro-intestinal, breast, non-small cell lung, and metastatic pancreatic cancers; and by bladder instillation for superficial bladder tumours. It causes delayed bone marrow toxicity.

Vinca alkaloids

The vinca alkaloids, vinblastine sulfate p. 979, vincristine sulfate p. 980, and vindesine sulfate p. 980, are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours. Vinorelbine p. 981 is a semi-synthetic vinca alkaloid. See also, role of vinorelbine in the treatment of breast cancer.

Antimetabolites

Antimetabolites are incorporated into new nuclear material or combine irreversibly with cellular enzymes, preventing normal cellular division.

Alkylating drugs

Extensive experience is available with these drugs, which are among the most widely used in cancer chemotherapy. They act by damaging DNA, thus interfering with cell replication.

Cyclophosphamide is used mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours. It is given by mouth or intravenously; it is inactive until metabolised by the liver.

Ifosfamide is related to cyclophosphamide and is given intravenously.

Melphalan p. 948 is licensed for the treatment of multiple myeloma, polycythaemia vera, childhood neuroblastoma, advanced ovarian adenocarcinoma, and advanced breast cancer. However, in practice, melphalan is rarely used for ovarian adenocarcinoma; it is no longer used for advanced breast cancer. Melphalan is also licensed for regional arterial perfusion in localised malignant melanoma of the extremities and localised soft-tissue sarcoma of the extremities.

Lomustine p. 947 is a lipid-soluble nitrosourea and the drug is given at intervals of 4 to 6 weeks.

Carmustine p. 943 has similar activity to lomustine; it is given to patients with multiple myeloma, non-Hodgkin's lymphomas, Hodgkin's disease, and brain tumours. Carmustine implants are licensed for intralesional use in adults for the treatment of recurrent glioblastoma multiforme as an adjunct to surgery. Carmustine implants are also licensed for high-grade malignant glioma as adjunctive treatment to surgery and radiotherapy.

Estramustine phosphate p. 946 is a combination of an oestrogen and chlormethine used predominantly in prostate cancer. It is given by mouth and has both an antimetabolic effect and (by reducing testosterone concentration) a hormonal effect.

Mitobronitol is occasionally used to treat chronic myeloid leukaemia; it is available on a named-patient basis from specialist importing companies.

ANTINEOPLASTIC DRUGS > ALKYLATING AGENTS

Bendamustine hydrochloride

05-Jun-2018

● INDICATIONS AND DOSE

Treatment of chronic lymphocytic leukaemia | Treatment of non-Hodgkin's lymphoma | Treatment of multiple myeloma

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BENDAMUSTINE (LEVACT[®]): INCREASED MORTALITY OBSERVED IN RECENT CLINICAL STUDIES IN OFF-LABEL USE; MONITOR FOR OPPORTUNISTIC INFECTIONS, HEPATITIS B REACTIVATION (JULY 2017)

Recent clinical trials have shown increased mortality when bendamustine was used in combination treatments outside its approved indications. In addition, a recent European review of post-marketing data has suggested that the risk of opportunistic infections for all patients receiving bendamustine treatment may be greater than previously recognised.

The MHRA recommends monitoring patients for opportunistic infections as well as cardiac, neurological, and respiratory adverse events; known carriers of hepatitis B virus (HBV) should be monitored for signs and symptoms of active HBV infection. Patients should be advised to report promptly new signs of infection; consider discontinuing bendamustine if there are signs of opportunistic infections.

- **CONTRA-INDICATIONS** Jaundice · low leucocyte count · low platelet count · major surgery less than 30 days before start of treatment · severe bone marrow suppression
- **CAUTIONS** Cardiac disorders—monitor serum potassium and ECG
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · amenorrhoea · anaemia · angina pectoris · appetite decreased · arrhythmias · cardiac disorder · chills · constipation · decreased leucocytes · dehydration · diarrhoea · dizziness · fatigue · fever · haemorrhage · headache · hepatitis B reactivation · hypersensitivity · hypertension · hypokalaemia · hypotension · increased risk of infection · insomnia · mucositis · nausea · neutropenia · pain · palpitations · respiratory disorders · skin reactions · stomatitis · thrombocytopenia · tumour lysis syndrome · vomiting
 - ▶ **Uncommon** Bone marrow disorders · heart failure · myocardial infarction · neoplasms · pericardial effusion
 - ▶ **Rare or very rare** Anticholinergic syndrome · aphonia · ataxia · circulatory collapse · drowsiness · haemolysis · hyperhidrosis · infertility · multi organ failure · nervous system disorder · paraesthesia · peripheral neuropathy · sepsis · taste altered
 - ▶ **Frequency not known** Extravasation necrosis · hepatic failure · necrosis · renal failure · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION **Secondary malignancy** Use of bendamustine is associated with an increased incidence of acute leukaemias.

Infections Serious and fatal infections are reported, including opportunistic infections such as *Pneumocystis jirovecii* pneumonia (PJP), varicella zoster virus (VZV) and cytomegalovirus (CMV)—manufacturer advises monitoring for respiratory signs and symptoms throughout treatment; patients should be advised to report new signs of infection, including fever or respiratory symptoms, promptly. Reactivation of hepatitis

B is reported in patients who are chronic carriers of the virus—manufacturer advises monitoring for signs and symptoms of active hepatitis B during treatment and for several months after stopping treatment.

- **CONCEPTION AND CONTRACEPTION** Effective contraception is required during treatment in men or women, and for 6 months after treatment in men. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Avoid (teratogenic and mutagenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available. **Dose adjustments** Manufacturer advises reduce dose by 30% in moderate impairment.
- **RENAL IMPAIRMENT** No information available on use in patients with creatinine clearance less than 10 mL/minute.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Bendamustine for the first-line treatment of chronic lymphocytic leukaemia (February 2011)** NICE TA216 Bendamustine is recommended as an option for the first-line treatment of chronic lymphocytic leukaemia (Binet stage B or C) in patients for whom fludarabine combination chemotherapy is not appropriate. www.nice.org.uk/guidance/ta216
- ▶ **Obinutuzumab with bendamustine for treating follicular lymphoma refractory to rituximab (August 2017)** NICE TA472 Bendamustine in combination with obinutuzumab followed by obinutuzumab maintenance, is recommended for use within the Cancer Drugs Fund as an option for treating adults with follicular lymphoma that did not respond or progressed during or up to 6 months after treatment with rituximab or a rituximab-containing regimen, only if the conditions in the managed access agreement for obinutuzumab are followed. www.nice.org.uk/guidance/ta472

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (April 2011) that bendamustine (Levact[®]) is accepted for use within NHS Scotland for first-line treatment of chronic lymphocytic leukaemia (Binet stage B or C) in patients for whom fludarabine combination chemotherapy is not appropriate.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion▶ **Bendamustine hydrochloride (Non-proprietary)**

Bendamustine hydrochloride 25 mg Bendamustine 25mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £65.98 | 5 vial [PoM] £277.75-£347.26 (Hospital only) | 20 vial [PoM] £1,241.14 (Hospital only)

Bendamustine hydrochloride 100 mg Bendamustine 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £23.55 (Hospital only) | 1 vial [PoM] £262.02 | 5 vial [PoM] £1,241.14-£1,379.04 (Hospital only)

Busulfan

(Busulphan)

12-Jun-2018

● INDICATIONS AND DOSE

Chronic myeloid leukaemia, induction of remission

- ▶ BY MOUTH
- ▶ Adult: 60 micrograms/kg daily (max. per dose 4 mg); maintenance 0.5–2 mg daily

Conditioning treatment before haematopoietic progenitor cell transplantation

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Adult: (consult local protocol)

Conditioning treatment before haematopoietic progenitor cell transplantation in patients who are candidates for a reduced-intensity conditioning (RIC) regimen

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult local protocol)

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ Dose may need to be calculated based on body surface area or adjusted ideal body weight in obese patients—consult product literature.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 938.

- **CAUTIONS** Avoid in Acute porphyrias p. 1120 · high dose (antiepileptic prophylaxis required) · history of seizures (antiepileptic prophylaxis required) · ineffective once in blast crisis phase · previous progenitor cell transplant (increased risk of hepatic veno-occlusive disease) · previous radiation therapy (increased risk of hepatic veno-occlusive disease) · risk of second malignancy · three or more cycles of chemotherapy (increased risk of hepatic veno-occlusive disease)

- **INTERACTIONS** → Appendix 1: alkylating agents

● SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · diarrhoea · hepatic disorders · nausea · respiratory disorders · sinusoidal obstruction syndrome · skin reactions · thrombocytopenia · vomiting
- ▶ **Uncommon** Seizure
- ▶ **Rare or very rare** Cataract · eye disorders

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**

- ▶ With intravenous use Anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · ascites · asthenia · asthma · cardiomegaly · chest pain · chills · confusion · constipation · cough · depression · dizziness · dyspnoea · dysuria · electrolyte imbalance · embolism and thrombosis · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hiccups · hyperglycaemia · hypersensitivity · hypertension · hypoalbuminaemia · hypotension · increased risk of infection · insomnia · mucositis · myalgia · nervous system disorder · neutropenia · oedema · pain · pancytopenia · pericardial effusion · pericarditis · reactivation of infections · renal disorder · renal impairment · stomatitis · vasodilation · weight increased

- ▶ With oral use Amenorrhoea (may be reversible) · azoospermia · bone marrow disorders · cardiac tamponade · delayed puberty · hyperbilirubinaemia · infertility male · leucopenia · leukaemia · menopausal symptoms · oral disorders · ovarian and fallopian tube disorders · testicular atrophy

▶ Uncommon

- ▶ With intravenous use Capillary leak syndrome · delirium · encephalopathy · hallucination · hypoxia · intracranial haemorrhage

▶ Rare or very rare

- ▶ With oral use Dry mouth · erythema nodosum · gynaecomastia · myasthenia gravis · radiation injury · Sjögren's syndrome

▶ Frequency not known

- ▶ With intravenous use Hypogonadism · ovarian failure · premature menopause · sepsis

SIDE-EFFECTS, FURTHER INFORMATION Lung toxicity
Discontinue if lung toxicity develops.

Secondary malignancy Use of busulfan is associated with an increased incidence of secondary malignancy.

- **CONCEPTION AND CONTRACEPTION** Manufacturers advise effective contraception during and for 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

- **PREGNANCY** Avoid (teratogenic in *animals*). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available)—monitor hepatic function, especially following transplant (consult product literature).

● MONITORING REQUIREMENTS

- ▶ Monitor cardiac and liver function.
- ▶ Frequent blood tests are necessary because excessive myelosuppression may result in irreversible bone-marrow aplasia.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

- ▶ **Busulfan (Non-proprietary)**

Busulfan 2 mg Busulfan 2mg tablets | 25 tablet (POM) £69.02 DT = £69.02

Solution for infusion

- ▶ **Busulfan (Non-proprietary)**

Busulfan 6 mg per 1 ml Busulfan 60mg/10ml concentrate for solution for infusion vials | 8 vial (POM) £1,529.50-£2,157.52 (Hospital only)

- ▶ **Busivex (Pierre Fabre Ltd)**

Busulfan 6 mg per 1 ml Busivex 60mg/10ml concentrate for solution for infusion ampoules | 8 ampoule (POM) £1,610.00 (Hospital only)

Carmustine

04-Mar-2020

● INDICATIONS AND DOSE

Brain tumours | Multiple myeloma | Non-Hodgkin's lymphomas | Hodgkin's disease

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

Recurrent glioblastoma multiforme as an adjunct to surgery | High-grade malignant glioma as adjunctive treatment to surgery and radiotherapy

- ▶ BY INTRALESIONAL IMPLANTATION
- ▶ Adult: (consult product literature)

- **CAUTIONS** Avoid in Acute porphyrias p. 1120
- **INTERACTIONS** → Appendix 1: alkylating agents

● SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · anaemia · ataxia · constipation · diarrhoea · dizziness · headache · nausea · seizures · vomiting

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**

- ▶ When used by implant Abdominal pain · abscess · anxiety · asthenia · chest pain · coma · confusion · conjunctival oedema · depression · diabetes mellitus · drowsiness · dysphagia · electrolyte imbalance · embolism and thrombosis · eye pain · faecal incontinence · fever · gait abnormal · haemorrhage · hallucination · healing impaired · hydrocephalus · hyperglycaemia · hypersensitivity · hypertension · hypotension · increased risk of infection · injury · insomnia · intracranial pressure increased ·

leucocytosis · memory loss · meningitis · oedema · pain · paralysis · paranoia · peripheral neuropathy · personality disorder · rash · sensation abnormal · sepsis · speech impairment · stupor · thinking abnormal · thrombocytopenia · tremor · urinary incontinence · vision disorders

- ▶ With intravenous use Acute leukaemia · appetite decreased · bone marrow depression · encephalopathy (with high doses) · hepatotoxicity · myelodysplastic syndrome (following long term use) · ocular toxicity · respiratory disorders · retinal haemorrhage · stomatitis

▶ Uncommon

- ▶ When used by implant Cerebral infarction · intracranial haemorrhage
- ▶ Rare or very rare
- ▶ With intravenous use Gynaecomastia · nephrotoxicity (cumulative) · peripheral vascular disease (with high doses)
- ▶ Frequency not known
- ▶ With intravenous use Infertility · myalgia

SIDE-EFFECTS, FURTHER INFORMATION Pulmonary toxicity

Lung infiltration, pulmonary fibrosis, pneumonitis, and interstitial lung disease have been reported with intravenous use, some of which have been fatal. These appear to be dose-related, cumulative, and may be delayed.

Hepatotoxicity Hepatotoxicity has been reported to occur with high intravenous doses, and may be delayed up to 60 days after administration; usually reversible.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HANDLING AND STORAGE** For intravenous infusion, manufacturer advises store in a refrigerator (2–8°C) and protect from light. For intralesional implant, manufacturer advises store in a freezer (–20°C)—consult product literature for further information regarding storage outside freezer.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007)** NICE TA121 Carmustine implants are an option for the treatment of newly diagnosed high-grade (Grade 3 or 4) glioma **only** for patients in whom at least 90% of the tumour has been resected. Carmustine implants should only be used within specialist centres.
www.nice.org.uk/guidance/ta121

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Implant

- ▶ **Gliadel** (Eisai Ltd)

Carmustine 7.7 mg Gliadel 7.7mg implant | 8 device **[PoM]** £5,203.00 (Hospital only)

Chlorambucil

10-Mar-2020

● INDICATIONS AND DOSE

Some lymphomas and chronic leukaemias (used either alone or in combination therapy)

- ▶ BY MOUTH
- ▶ Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 938.

- **CAUTIONS** Children with nephrotic syndrome (increased seizure risk) · history of epilepsy (increased seizure risk)
 - **INTERACTIONS** → Appendix 1: alkylating agents
 - **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · bone marrow disorders · diarrhoea · gastrointestinal disorder · leucopenia · nausea · neoplasms · neutropenia · oral ulceration · seizures · thrombocytopenia · vomiting
 - ▶ **Uncommon** Skin reactions
 - ▶ **Rare or very rare** Cystitis · fever · hepatic disorders · movement disorders · muscle twitching · peripheral neuropathy · respiratory disorders · severe cutaneous adverse reactions (SCARs) · tremor
 - ▶ **Frequency not known** Amenorrhoea · azoospermia
- SIDE-EFFECTS, FURTHER INFORMATION Secondary malignancy** Use of chlorambucil is associated with an increased incidence of acute leukaemia, particularly with prolonged use.

Skin reactions Manufacturer advises assessing continued use if rash occurs—has been reported to progress to Stevens-Johnson syndrome and toxic epidermal necrolysis.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor for signs and symptoms of toxicity.
Dose adjustments Manufacturer advises consider dose reduction in severe impairment—limited information available.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Obinutuzumab in combination with chlorambucil for untreated chronic lymphocytic leukaemia (June 2015)** NICE TA343
Obinutuzumab, in combination with chlorambucil, is an option for untreated chronic lymphocytic leukaemia in patients who have comorbidities that make full-dose fludarabine-based therapy unsuitable for them, only if:
 - bendamustine-based therapy is not suitable, **and**
 - the manufacturer provides obinutuzumab with the discount agreed in the patient access scheme.
 Patients currently receiving obinutuzumab that is not recommended according to the above criteria should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta343
- ▶ **Ofatumumab in combination with chlorambucil or bendamustine for untreated chronic lymphocytic leukaemia (June 2015)** NICE TA344
Ofatumumab in combination with chlorambucil is an option for untreated chronic lymphocytic leukaemia only if:
 - the patient is ineligible for fludarabine-based therapy, **and**

- bendamustine is not suitable, and
 - the manufacturer provides ofatumumab with the discount agreed in the patient access scheme.
- Patients currently receiving ofatumumab that is not recommended according to the above criteria should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.
- www.nice.org.uk/guidance/ta344

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Chlorambucil (Non-proprietary)**
Chlorambucil 2 mg Chlorambucil 2mg tablets | 25 tablet (PoM)
£42.87 DT = £42.87

Chlormethine

23-Aug-2019

- **DRUG ACTION** Chlormethine is an alkylating agent which inhibits rapidly proliferating cells.

● INDICATIONS AND DOSE

Mycosis fungoides (initiated by a specialist)

- ▶ TO THE SKIN
- ▶ Adult: Apply once daily, apply thinly to the affected areas, for dose adjustments due to side-effects of the skin—consult product literature

- **CAUTIONS** Avoid contact with mucous membranes
- **INTERACTIONS** → Appendix 1: chlormethine
- **SIDE-EFFECTS**
- ▶ **Common or very common** Hypersensitivity · skin infection · skin reactions · skin ulcer
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises contraception in women of child-bearing potential during treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies following systemic administration. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises apply to dry skin at least 4 hours before or 30 minutes after showering or washing. The treated area should be allowed to dry for 5 to 10 minutes.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for storage in a freezer.
- **PATIENT AND CARER ADVICE** Patients and carers should be advised to wash hands after each application and should wear nitrile gloves for each application. If non-affected areas are exposed, these areas should be washed. Occlusive dressings should not be applied over the treated area.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Gel

- EXCIPIENTS: May contain Butylated hydroxytoluene, propylene glycol
- ▶ **Ledaga** (Recordati Rare Diseases UK Ltd)
Chlormethine hydrochloride 160 microgram per 1 gram Ledaga
160micrograms/g gel | 60 gram (PoM) £1,000.00

Cyclophosphamide

10-Mar-2020

● INDICATIONS AND DOSE

Rheumatoid arthritis with severe systemic manifestations

- ▶ BY MOUTH
- ▶ Adult: 1–1.5 mg/kg daily

Severe systemic rheumatoid arthritis | Other connective tissue diseases (especially with active vasculitis)

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 0.5–1 g every 2 weeks, then reduced to 0.5–1 g every month, frequency adjusted according to clinical response and haematological monitoring. To be given with prophylactic mesna

Used, mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Adult: (consult local protocol)

- **UNLICENSED USE** Not licensed for rheumatoid arthritis with severe systemic manifestations.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 938.

- **CAUTIONS** Avoid in Acute porphyrias p. 1120 · diabetes mellitus · haemorrhagic cystitis · previous or concurrent mediastinal irradiation—risk of cardiotoxicity
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
- GENERAL SIDE-EFFECTS**
- ▶ **Common or very common** Agranulocytosis · alopecia · anaemia · asthenia · bone marrow disorders · cystitis · decreased leucocytes · fever · haemolytic uraemic syndrome · haemorrhage · hepatic disorders · immunosuppression · increased risk of infection · mucosal abnormalities · neutropenia · progressive multifocal leukoencephalopathy (PML) · reactivation of infections · sperm abnormalities · thrombocytopenia
- ▶ **Uncommon** Appetite decreased · embolism and thrombosis · flushing · hypersensitivity · ovarian and fallopian tube disorders · sepsis
- ▶ **Rare or very rare** Bladder disorders · chest pain · confusion · constipation · diarrhoea · disseminated intravascular coagulation · dizziness · eye inflammation · fluid imbalance · headache · hyponatraemia · menstrual cycle irregularities · nail discoloration · nausea · neoplasms · oral disorders · pancreatitis acute · renal failure · secondary neoplasm · seizure · severe cutaneous adverse reactions (SCARs) · SIADH · skin reactions · visual impairment · vomiting
- ▶ **Frequency not known** Abdominal pain · altered smell sensation · arrhythmias · arthralgia · ascites · cardiac inflammation · cardiogenic shock · cardiomyopathy · cough · deafness · dyspnoea · encephalopathy · excessive tearing · facial swelling · gastrointestinal disorders · heart failure · hyperhidrosis · hypoxia · infertility · influenza like illness · multi organ failure · muscle complaints · myelopathy · myocardial infarction · nasal complaints · nephropathy · nerve disorders · neuralgia · neurotoxicity · oedema · oropharyngeal pain · palpitations · pericardial effusion · peripheral ischaemia · pulmonary hypertension · pulmonary oedema · QT interval prolongation · radiation injuries · renal tubular disorder · renal tubular necrosis · respiratory disorders · rhabdomyolysis · scleroderma · sensation abnormal · sinusoidal obstruction syndrome · taste altered · testicular atrophy · tinnitus · tremor · tumour lysis syndrome · vasculitis
- SPECIFIC SIDE-EFFECTS**
- ▶ With intravenous use Infusion site necrosis · injection site necrosis

SIDE-EFFECTS, FURTHER INFORMATION Haemorrhagic cystitis A urinary metabolite of cyclophosphamide, acrolein, can cause haemorrhagic cystitis; this is a rare but serious complication that may be prevented by increasing fluid intake for 24–48 hours after intravenous injection. Mesna can also help prevent cystitis when high-dose therapy (e.g. more than 2 g intravenously) is used or when the patient is considered to be at high risk of cystitis (e.g. because of pelvic irradiation).

Secondary malignancy As with all cytotoxic therapy, treatment with cyclophosphamide is associated with an increased incidence of secondary malignancies.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

● **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

● **BREAST FEEDING** Discontinue breast-feeding during and for 36 hours after stopping treatment.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of decreased cyclophosphamide activation and increased risk of veno-occlusive liver disease).

Dose adjustments Manufacturer advises consider dose adjustment in severe impairment—consult product literature.

● **RENAL IMPAIRMENT**

Dose adjustments Reduce dose if serum creatinine concentration greater than 120 micromol/litre.

● **DIRECTIONS FOR ADMINISTRATION**

▶ With intravenous use For *intravenous infusion* (cyclophosphamide injection; *Baxter*) give via drip tubing in Glucose 5% or Sodium chloride 0.9%; reconstitute 500 mg with 25 mL sodium chloride 0.9%; reconstitute 1 g with 50 mL sodium chloride 0.9%.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution, solution for injection, solution for infusion

Tablet

CAUTIONARY AND ADVISORY LABELS 25, 27

▶ **Cyclophosphamide (Non-proprietary)**

Cyclophosphamide (as Cyclophosphamide monohydrate)

Cyclophosphamide (as Cyclophosphamide monohydrate)
2 gram Cyclophosphamide 2g powder for solution for injection vials | 1 vial [PoM] £31.64 (Hospital only)

Dacarbazine

● INDICATIONS AND DOSE

Metastatic melanoma | Soft-tissue sarcomas (combination therapy) | Hodgkin's disease (combination therapy)

▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION

▶ Adult: (consult local protocol)

● **CAUTIONS** Caution in handling—irritant to tissues

● **INTERACTIONS** → Appendix 1: alkylating agents

● SIDE-EFFECTS

▶ **Common or very common** Anaemia · appetite decreased · leucopenia · nausea · thrombocytopenia · vomiting
▶ **Uncommon** Alopecia · infection · influenza like illness · photosensitivity reaction · skin reactions
▶ **Rare or very rare** Agranulocytosis · confusion · diarrhoea · flushing · headache · hepatic disorders · lethargy · pancytopenia · paraesthesia · renal impairment · seizure · visual impairment

● **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

● **PREGNANCY** Avoid (carcinogenic and teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Avoid in severe impairment.

Dose adjustments Dose reduction may be required in combined renal and hepatic impairment.

● **RENAL IMPAIRMENT** Avoid in severe impairment.

Dose adjustments Dose reduction may be required in combined renal and hepatic impairment.

● **PRESCRIBING AND DISPENSING INFORMATION** Dacarbazine is a component of a commonly used combination for Hodgkin's disease (ABVD—doxorubicin [previously *Adriamycin*®], bleomycin, vinblastine, and dacarbazine).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

Dacarbazine (as Dacarbazine citrate) 500 mg Dacarbazine 500mg powder for solution for infusion vials | 1 vial [PoM] £37.50

Dacarbazine (as Dacarbazine citrate) 1 gram Dacarbazine 1g powder for solution for infusion vials | 1 vial [PoM] £70.00

Powder for solution for injection

▶ **Dacarbazine (Non-proprietary)**

Dacarbazine (as Dacarbazine citrate) 100 mg Dacarbazine 100mg powder for solution for injection vials | 10 vial [PoM] £90.00

Dacarbazine (as Dacarbazine citrate) 200 mg Dacarbazine 200mg powder for solution for injection vials | 10 vial [PoM] £160.00

Estramustine phosphate

13-Jul-2018

● INDICATIONS AND DOSE

Prostate cancer

▶ BY MOUTH

▶ Adult: Initially 560–840 mg daily in divided doses; maintenance 140–1400 mg daily in divided doses

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 938.

● **CONTRA-INDICATIONS** Peptic ulceration · severe cardiovascular disease · thromboembolic disorders

● **CAUTIONS** Cardiovascular disease · cerebrovascular disease · conditions which might be aggravated by fluid retention (such as epilepsy or migraine) · congestive heart failure · diabetes · hypercalcaemia · hypertension

● **INTERACTIONS** → Appendix 1: alkylating agents

● SIDE-EFFECTS

▶ **Common or very common** Anaemia · congestive heart failure · diarrhoea · embolism · fluid retention · gynaecomastia · headache · hepatic function abnormal · lethargy · leucopenia · myocardial infarction · nausea · thrombocytopenia · vomiting

- ▶ **Frequency not known** Allergic dermatitis · angioedema · confusion · depression · erectile dysfunction · hypertension · muscle weakness · myocardial ischaemia
- **CONCEPTION AND CONTRACEPTION** Men should use effective contraceptive methods during treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor hepatic function; avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **DIRECTIONS FOR ADMINISTRATION** Each dose should be taken not less than 1 hour before or 2 hours after meals and should not be taken with products containing calcium, magnesium or aluminium, including dairy products and antacid medication.
- **PATIENT AND CARER ADVICE** Patients should be given advice on how to administer estramustine capsules.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
Capsule
CAUTIONARY AND ADVISORY LABELS 5, 23

Ifosfamide

24-Jul-2019

● INDICATIONS AND DOSE

Malignant disease

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult local protocol)

- **CONTRA-INDICATIONS** Acute infection · cystitis · urinary-tract obstruction · urothelial damage
- **CAUTIONS** Avoid in Acute porphyria p. 1120 · diabetes mellitus
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · appetite decreased · bone marrow disorders · haemorrhage · hepatic disorders · infection · leucopenia · nausea · reactivation of infection · renal impairment · thrombocytopenia · vomiting
 - ▶ **Uncommon** Cardiotoxicity · diarrhoea · hypotension · oral disorders
 - ▶ **Rare or very rare** Skin reactions
- ▶ **Frequency not known** Abdominal pain · agranulocytosis · amenorrhoea · anaemia · angina pectoris · angioedema · arrhythmias · arthralgia · asterixis · behaviour abnormal · blood disorders · bone disorders · cancer progression · capillary leak syndrome · cardiac arrest · cardiomyopathy · chills · conjunctivitis · constipation · cough · deafness · delirium · delusions · disseminated intravascular coagulation · dysarthria · dyspnoea · electrolyte imbalance · embolism and thrombosis · encephalopathy · eye irritation · fatigue · fever · flushing · gait abnormal · gastrointestinal disorders · growth retardation · haemolytic anaemia · heart failure · hyperglycaemia · hyperhidrosis · hyperphosphaturia · hypertension · hypoxia · immunosuppression · infertility · malaise · mania · memory loss · metabolic acidosis · movement disorders · mucosal ulceration · multi organ failure · muscle complaints · myocardial infarction · nail disorder · neoplasms · nephritis tubulointerstitial · nephrogenic diabetes insipidus · neurotoxicity · oedema · ovarian and fallopian tube disorders · pain · pancreatitis · panic attack · peripheral neuropathy · polydipsia · premature menopause · psychiatric disorders · pulmonary hypertension · pulmonary oedema · radiation recall reaction · respiratory disorders · rhabdomyolysis · secondary malignancy ·

sensation abnormal · sepsis · severe cutaneous adverse reactions (SCARs) · SIADH · sinusoidal obstruction syndrome · sperm abnormalities · status epilepticus · tinnitus · tumour lysis syndrome · urinary disorders · vasculitis · vertigo · visual impairment

SIDE-EFFECTS, FURTHER INFORMATION **Urothelial toxicity** Mesna is routinely given with ifosfamide to reduce urothelial toxicity.

Secondary malignancy Use of ifosfamide is associated with an increased incidence of acute leukaemia.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Avoid (teratogenic and carcinogenic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Avoid if serum creatinine concentration greater than 120 micromol/litre.
- **MONITORING REQUIREMENTS** Ensure satisfactory electrolyte balance and renal function before each course (risk of tubular dysfunction, Fanconi's syndrome or diabetes insipidus if renal toxicity not treated promptly).
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
Powder for solution for injection
▶ **Ifosfamide (Non-proprietary)**

Lomustine

08-Jul-2019

- **DRUG ACTION** Lomustine is a lipid-soluble nitrosourea.

● INDICATIONS AND DOSE

Hodgkin's disease resistant to conventional therapy | Malignant melanoma | Certain solid tumours

- ▶ BY MOUTH
- ▶ Adult: 120–130 mg/m² every 6–8 weeks, dose is for when lomustine is used alone

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 938.

- **CONTRA-INDICATIONS** Coeliac disease
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Leucopenia
 - ▶ **Frequency not known** Alopecia · anaemia · apathy · appetite decreased · azotaemia · bone marrow failure (delayed) · confusion · coordination abnormal · diarrhoea · hepatic disorders · lethargy · nausea · neoplasms · neurological effects · renal disorders · renal impairment · respiratory disorders · speech impairment · stomatitis · thrombocytopenia · vision loss (irreversible) · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION** Prolonged use of lomustine is associated with an increased incidence of acute leukaemias.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Avoid in severe impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** The brand name *CCNU*[®] has been used for lomustine capsules.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Melphalan

● **INDICATIONS AND DOSE****Multiple myeloma**▶ **BY MOUTH**

▶ **Adult:** 150 micrograms/kg daily for 4 days, dose to be repeated every 6 weeks, dose may vary according to regimen

▶ **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**

▶ **Adult:** (consult product literature)

Polycythaemia vera▶ **BY MOUTH**

▶ **Adult:** Initially 6–10 mg daily for 5–7 days, then reduced to 2–4 mg daily until satisfactory response, then reduced to 2–6 mg once weekly

Localised malignant melanoma of the extremities |**Localised soft-tissue sarcoma of the extremities**▶ **BY REGIONAL ARTERIAL PERFUSION**

▶ **Adult:** (consult local protocol)

IMPORTANT SAFETY INFORMATION**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 938.

- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
- GENERAL SIDE-EFFECTS**
- ▶ **Common or very common** Alopecia · anaemia · bone marrow depression (delayed) · diarrhoea · nausea · stomatitis · thrombocytopenia · vomiting
- ▶ **Rare or very rare** Haemolytic anaemia · hepatic disorders · respiratory disorders · skin reactions
- SPECIFIC SIDE-EFFECTS**
- ▶ **Common or very common**
- ▶ With oral use Leucopenia
- ▶ With parenteral use Feeling hot · myalgia · myopathy · paraesthesia
- ▶ **Rare or very rare**
- ▶ With parenteral use Peripheral vascular disease
- SIDE-EFFECTS, FURTHER INFORMATION** **Secondary malignancy** Use of melphalan is associated with an increased incidence of acute leukaemias.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT**
- Dose adjustments** Reduce dose initially (consult product literature).

- **MONITORING REQUIREMENTS** Monitor full blood count before and throughout treatment.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection▶ **Melphalan (Non-proprietary)**

Melphalan (as Melphalan hydrochloride) 50 mg Melphalan 50mg powder and solvent for solution for injection vials | 1 vial [PoM] £137.37 (Hospital only) | 1 vial [PoM] £137.37

Tablet▶ **Melphalan (Non-proprietary)**

Melphalan 2 mg Melphalan 2mg tablets | 25 tablet [PoM] £45.38 DT = £45.38

Streptozocin

09-Oct-2018

- **DRUG ACTION** Streptozocin is an antibiotic antineoplastic nitrosourea.

● **INDICATIONS AND DOSE****Neuroendocrine tumours of pancreatic origin (specialist use only)**▶ **BY INTRAVENOUS INFUSION**

▶ **Adult:** (consult product literature)

- **CAUTIONS** Antiemetic pre-medication recommended · avoid extravasation (risk of tissue necrosis) · elderly · hyperhydration required (consult product literature)
- **INTERACTIONS** → Appendix 1: streptozocin
- **SIDE-EFFECTS**
- ▶ **Common or very common** Acute kidney injury · diarrhoea · nausea · nephropathy · renal tubular injury · urinary disorder · urine abnormalities · vomiting
- ▶ **Frequency not known** Confusion · depression · extravasation necrosis · fever · glucose tolerance impaired · hepatotoxicity · hypoalbuminaemia · lethargy
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during treatment and for 30 days after last treatment; male patients should use effective contraception during treatment and for 90 days after last treatment if their partner is of childbearing potential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- Dose adjustments** Manufacturer advises consider dose reduction.
- **RENAL IMPAIRMENT** Manufacturer advises caution—evaluate benefit/risk ratio if eGFR 30–45 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m².
- Dose adjustments** Manufacturer advises reduce dose if eGFR 46–60 mL/minute/1.73 m²—consult product literature.
- **MONITORING REQUIREMENTS**
- ▶ Manufacturer advises monitor renal function (plasma creatinine and eGFR derived from the MDRD formula) immediately before treatment initiation and 2 weeks after each course of therapy; proteinuria and serum electrolytes should also be monitored before treatment initiation and 2–4 weeks after the last cycle of treatment.
- ▶ Manufacturer advises monitor liver function tests, blood glucose levels and complete blood counts regularly.

● **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after reconstitution and dilution.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Zanosar** (Intrapharm Laboratories Ltd)
Streptozocin 1 gram Zanosar 1g powder for concentrate for solution for infusion vials | 1 vial [PoM] £570.00

Temozolomide

25-Jul-2018

● **DRUG ACTION** Temozolomide is structurally related to dacarbazine.

● **INDICATIONS AND DOSE**

Newly diagnosed glioblastoma multiforme in adults (in combination with radiotherapy) and subsequently as monotherapy | Second-line treatment of malignant glioma in adults

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 938.

● **CAUTIONS** *Pneumocystis jirovecii* pneumonia—consult product literature for monitoring and prophylaxis requirements

● **INTERACTIONS** → Appendix 1: alkylating agents

● **SIDE-EFFECTS**

▶ **Common or very common** Alopecia · anxiety · appetite decreased · arthralgia · asthenia · chills · concentration impaired · confusion · constipation · cough · decreased leucocytes · diarrhoea · dizziness · drowsiness · dysphagia · dyspnoea · emotional lability · fever · gastrointestinal discomfort · haemorrhage · headache · hearing impairment · hemiparesis · hyperglycaemia · hypersensitivity · increased risk of infection · insomnia · level of consciousness decreased · malaise · memory loss · movement disorders · muscle weakness · nausea · neutropenia · oedema · pain · peripheral neuropathy · radiation injury · seizures · sensation abnormal · skin reactions · speech impairment · stomatitis · taste altered · thrombocytopenia · tremor · urinary disorders · vision disorders · vomiting · weight changes

▶ **Uncommon** Altered smell sensation · anaemia · behaviour disorder · bone marrow disorders · cognitive impairment · condition aggravated · Cushing's syndrome · depression · diabetes insipidus · ear pain · erectile dysfunction · eye pain · gait abnormal · hallucination · hepatic disorders · hyperacusia · hyperbilirubinaemia · hypertension · hypokalaemia · intracranial haemorrhage · myalgia · myopathy · nasal congestion · nervous system disorder · palpitations · photosensitivity reaction · reactivation of infections · thirst · tinnitus · tongue discolouration · vasodilation

▶ **Rare or very rare** Neoplasms · respiratory disorders · secondary malignancy · severe cutaneous adverse reactions (SCARs)

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment. Men should avoid fathering a child during and for at least 6 months after treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

● **PREGNANCY** Avoid (teratogenic and embryotoxic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).

● **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

● **MONITORING REQUIREMENTS**

- ▶ Monitor liver function before treatment initiation, after each treatment cycle and midway through 42-day treatment cycles—consider the balance of benefits and risks of treatment if results are abnormal at any point (fatal liver injury reported).
- ▶ Monitor for myelodysplastic syndrome.
- ▶ Monitor for secondary malignancies.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Temozolomide for the treatment of recurrent malignant glioma (brain cancer) (April 2001) NICE TA23**
Temozolomide may be considered for the treatment of recurrent malignant glioma, which has not responded to first-line chemotherapy.
www.nice.org.uk/guidance/ta23
- ▶ **Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007) NICE TA121**
Temozolomide is an option for the treatment of newly diagnosed glioblastoma multiforme in patients with a WHO performance status of 0 or 1.
www.nice.org.uk/guidance/ta121

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
Capsule

CAUTIONARY AND ADVISORY LABELS 23, 25

Thiotepa

07-Feb-2019

● **INDICATIONS AND DOSE**

Conditioning treatment before haematopoietic stem cell transplantation in the treatment of haematological disease or solid tumours, in combination with other chemotherapy

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult local protocol)

● **CAUTIONS** Avoid in Acute porphyrias p. 1120

● **INTERACTIONS** → Appendix 1: alkylating agents

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · amenorrhoea · anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · azoospermia · cataract · chills · cognitive disorder · confusion · conjunctivitis · constipation · cough · cystitis · delirium · diarrhoea · dizziness · dysuria · embolism · encephalopathy · extrapyramidal symptoms · fever · gastrointestinal discomfort · gastrointestinal disorders · generalised oedema · graft versus host disease · haemorrhage · headache · hearing impairment · heart failure · hepatic disorders · hyperglycaemia · hypersensitivity · hypertension · hypopituitarism · increased risk of infection · infertility · intracranial aneurysm · intracranial haemorrhage · leucopenia · lymphoedema · menopausal symptoms · mucositis · multi organ failure · myalgia · nausea · neutropenia · ototoxicity · pain · pancytopenia · paraesthesia · psychiatric disorder · pulmonary oedema · renal impairment · respiratory disorders · secondary malignancy · seizure · sepsis · sinusoidal obstruction syndrome · skin reactions · stomatitis · thrombocytopenia · toxic shock syndrome · vision blurred · vomiting · weight increased
 - ▶ **Uncommon** Cardiomyopathy · hallucination · hypoxia · myocarditis
 - ▶ **Frequency not known** Severe cutaneous adverse reactions (SCARs)
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

- **BREAST FEEDING** Discontinue breast-feeding.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 790/12

The *Scottish Medicines Consortium* has advised (June 2012) that thiotepa (*Tepadina*[®]) is **not** recommended for use within NHS Scotland in combination with other chemotherapy as conditioning treatment in adults or children with haematological diseases, or solid tumours prior to haematopoietic stem cell transplantation.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Tepadina** (Adiene Pharma & Biotech)

Thiotepa 15 mg Tepadina 15mg powder for concentrate for solution for infusion vials | 1 vial [PoM](#) [S](#)

Thiotepa 100 mg Tepadina 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM](#) [S](#)

Treosulfan

● INDICATIONS AND DOSE

Ovarian cancer

- ▶ BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAPERITONEAL INSTILLATION
- ▶ Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 938.

- **CAUTIONS** Avoid in Acute porphyrias p. 1120
- **INTERACTIONS** → Appendix 1: alkylating agents

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · bone marrow disorders · increased risk of infection · leucopenia · nausea · skin reactions · thrombocytopenia · vomiting
- ▶ **Uncommon** Neoplasms · treatment related secondary malignancy
- ▶ **Rare or very rare** Addison's disease · cardiomyopathy · cystitis haemorrhagic · hypoglycaemia · influenza like illness · paraesthesia · respiratory disorders · scleroderma · sepsis

SPECIFIC SIDE-EFFECTS

- ▶ **Uncommon**
- ▶ With oral use Stomatitis
- ▶ **Rare or very rare**
- ▶ With intravenous use Inflammation localised

SIDE-EFFECTS, FURTHER INFORMATION Prolonged use of treosulfan is associated with an increased incidence of acute non-lymphocytic leukaemia.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 25

ANTINEOPLASTIC DRUGS > ANTHRACYCLINES AND RELATED DRUGS

Daunorubicin

21-Nov-2019

● INDICATIONS AND DOSE

Acute myelogenous leukaemia | Acute lymphocytic leukaemia

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult local protocol)

Advanced AIDS-related Kaposi's sarcoma (liposomal formulation only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Myocardial insufficiency · previous treatment with maximum cumulative doses of daunorubicin or other anthracycline · recent myocardial infarction · severe arrhythmia
- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1: anthracyclines
- **SIDE-EFFECTS** Abdominal pain · alopecia · amenorrhoea · anaemia · arrhythmias · ascites · atrioventricular block · azoospermia · bone marrow disorders · cardiac inflammation · cardiomyopathy · chills · congestive heart failure · cyanosis · death · dehydration · diarrhoea · dyspnoea · extravasation necrosis · fever · flushing · gastrointestinal disorders · haemorrhage · hepatomegaly · hyperpyrexia · hyperuricaemia · hypoxia · infection ·

ischaemic heart disease · leucopenia · mucositis · myocardial infarction · nail discolouration · nausea · nephropathy · neutropenia · oedema · pain · paraesthesia · pleural effusion · radiation injuries · shock · skin reactions · stomatitis · thrombocytopenia · thrombophlebitis · urine red · venous sclerosis · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Cardiotoxicity is cumulative and may be irreversible, however responds to treatment if detected early.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Avoid (teratogenic and carcinogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** For solution for infusion manufacturer advises caution. For powder for solution for infusion manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
Dose adjustments Manufacturer advises dose reduction according to serum bilirubin concentration—consult product literature.
- **RENAL IMPAIRMENT** Avoid in severe impairment.
Dose adjustments Reduce dose by 25% if serum creatinine 105–265 micromol/litre.
Reduce dose by 50% if serum creatinine greater than 265 micromol/litre.
- **MONITORING REQUIREMENTS** Cardiac monitoring essential.
- **PRESCRIBING AND DISPENSING INFORMATION** Daunorubicin is available as *conventional* and *liposomal* formulations. These different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are **not** interchangeable.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **DaunoXome** (Galen Ltd)
Daunorubicin (as Daunorubicin hydrochloride citrate liposomal pegylated) 2 mg per 1 ml DaunoXome 50mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £250.00

Powder for solution for infusion

- ▶ **Daunorubicin (Non-proprietary)**
Daunorubicin (as Daunorubicin hydrochloride) 20 mg Daunorubicin 20mg powder for solution for infusion vials | 10 vial [PoM] £715.00 (Hospital only)

Daunorubicin with cytarabine

24-Jan-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, daunorubicin p. 950, cytarabine p. 959.

● INDICATIONS AND DOSE

Acute myeloid leukaemia

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

- **CAUTIONS** Wilson's disease or other copper-related disorders (each vial contains 100 mg of copper gluconate, equivalent to 14 mg of elemental copper)
- **INTERACTIONS** → Appendix 1: anthracyclines · cytarabine
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Daunorubicin with cytarabine is available as a *liposomal* formulation. This is **not** interchangeable with other

daunorubicin- or cytarabine-containing preparations; such preparations differ in their licensed indications, pharmacokinetics, dosage and administration.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Liposomal cytarabine–daunorubicin for untreated acute myeloid leukaemia (December 2018)** NICE TA552
Liposomal cytarabine–daunorubicin (Vyxeos[®]) is recommended, within its marketing authorisation, as an option for untreated therapy-related acute myeloid leukaemia or acute myeloid leukaemia with myelodysplasia-related changes in adults. It is recommended only if the manufacturer provides it according to the commercial arrangement.
www.nice.org.uk/guidance/ta552

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2130

The *Scottish Medicines Consortium* has advised (March 2019) that liposomal daunorubicin with cytarabine (Vyxeos[®]) is accepted for use within NHS Scotland for the treatment of adults with newly diagnosed, therapy-related acute myeloid leukaemia (AML) or AML with myelodysplasia-related changes. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Vyxeos** (Jazz Pharmaceuticals UK)
Daunorubicin 44 mg, Cytarabine 100 mg Vyxeos liposomal 44mg/100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £4,581.00 (Hospital only)

Doxorubicin hydrochloride

21-Nov-2019

● INDICATIONS AND DOSE

Acute leukaemias | Hodgkin's lymphoma | Non-Hodgkin's lymphoma | Some solid tumours including breast cancer | Advanced soft-tissue sarcoma

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: (consult product literature)

Some papillary bladder tumours (bladder instillation) | Recurrent superficial bladder tumours (bladder instillation) | Transitional cell carcinoma (bladder instillation) | Carcinoma in situ (bladder instillation)

- ▶ BY INTRAVESICAL INSTILLATION
- ▶ Adult: (consult product literature)

CAELYX[®]

For AIDS-related Kaposi's sarcoma in patients with low CD4 count and extensive mucocutaneous or visceral disease | Advanced ovarian cancer when platinum-based chemotherapy has failed | Progressive multiple myeloma (in combination with bortezomib) in patients who have received at least one prior therapy and who have undergone or are unsuitable for bone-marrow transplantation | Monotherapy for metastatic breast cancer in patients with increased cardiac risk

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Consult product literature
- **CAUTIONS** Cardiac disease · caution in handling—irritant to tissues · consult product literature · elderly · hypertension · previous myocardial irradiation
- **INTERACTIONS** → Appendix 1: anthracyclines
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia ·

bone marrow depression · breast pain · cachexia · cardiovascular disorder · chest discomfort · chills · constipation · cough · decreased leucocytes · dehydration · depression · diarrhoea · dizziness · drowsiness · dry mouth · dysphagia · dyspnoea · dysuria · electrolyte imbalance · epistaxis · eye inflammation · fever · gastrointestinal discomfort · gastrointestinal disorders · headache · hyperhidrosis · hypersensitivity · hypertension · hyperthermia · hypotension · increased risk of infection · influenza like illness · infusion related reaction · insomnia · malaise · mucosal abnormalities · muscle complaints · muscle tone increased · muscle weakness · nail disorder · nausea · nerve disorders · neutropenia · oedema · oral disorders · pain · scrotal erythema · sensation abnormal · sepsis · skin reactions · skin ulcer · syncope · taste altered · thrombocytopenia · vasodilation · vision blurred · vomiting · weight decreased

- ▶ **Uncommon** Confusion · embolism and thrombosis
- ▶ **Rare or very rare** Secondary oral neoplasms · severe cutaneous adverse reactions (SCARs)
- ▶ **Frequency not known** Asthma · congestive heart failure · secondary malignancy · throat tightness

SIDE-EFFECTS, FURTHER INFORMATION Extravasation can cause tissue necrosis.

Cardiomyopathy Higher cumulative doses are associated with cardiomyopathy and it is usual to limit total cumulative doses to 450 mg/m².

Liposomal formulations Liposomal formulations of doxorubicin may reduce the incidence of cardiotoxicity and lower the potential for local necrosis, but infusion reactions, sometimes severe, may occur. Hand-foot syndrome (painful, macular reddening skin eruptions) occurs commonly with liposomal doxorubicin and may be dose limiting. It can occur after 2–3 treatment cycles and may be prevented by cooling hands and feet and avoiding socks, gloves, or tight-fitting footwear. It may also occur with non-liposomal formulations.

Elevated bilirubin concentrations Doxorubicin is largely excreted in the bile and an elevated bilirubin concentration is an indication for reducing the dose.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (teratogenic and toxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** For liposomal formulation, manufacturer advises caution. For solution for injection or infusion, manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- **Dose adjustments** Manufacturer advises dose reduction according to bilirubin concentration.
- **RENAL IMPAIRMENT** Consult product literature in severe impairment.
- **MONITORING REQUIREMENTS** Patients should be assessed before treatment, by echocardiography. Cardiac monitoring during treatment may assist in determining safe dosage.
- **DIRECTIONS FOR ADMINISTRATION** Conventional doxorubicin is given by injection into a fast-running infusion, commonly at 21-day intervals.
- **PRESCRIBING AND DISPENSING INFORMATION** Doxorubicin is available as conventional, liposomal and pegylated liposomal formulations. These different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are **not** interchangeable.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016)** NICE TA389

Pegylated liposomal doxorubicin hydrochloride (PLDH) monotherapy or in combination with platinum, is recommended as an option for treating recurrent ovarian cancer.

PLDH, in combination with trabectedin, is **not** recommended for treating the first recurrence of platinum-sensitive ovarian cancer.

Patients currently receiving PLDH in combination with trabectedin should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta389

- ▶ **Orlatumab in combination with doxorubicin for treating advanced soft tissue sarcoma (August 2017)** NICE TA465
- Doxorubicin, in combination with orlatumab, is recommended for use within the Cancer Drugs Fund as an option for advanced soft tissue sarcoma in patients, only if:

- they have not had any previous systemic chemotherapy for advanced soft tissue sarcoma;
- they cannot have curative treatment with surgery or their disease does not respond to radiotherapy;
- the conditions in the managed access agreement for orlatumab are followed.

www.nice.org.uk/guidance/ta465

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection

£712.49

Caelyx pegylated liposomal 20mg/10ml concentrate for solution for

infusion vials | 1 vial PoM £360.23

Epirubicin hydrochloride

18-Nov-2019

● INDICATIONS AND DOSE

Breast cancer (specialist use only) | Gastric cancer (specialist use only) | Small cell lung cancer (specialist use only) | Ovarian cancer (specialist use only) | Colorectal cancer (specialist use only) | Lymphoma (specialist use only) | Leukaemia (specialist use only) | Multiple myeloma (specialist use only)

► BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Adult: (consult product literature or local protocols)

Bladder cancer (specialist use only)

► BY INTRAVESICAL INSTILLATION

► Adult: (consult product literature or local protocols)

- **CONTRA-INDICATIONS** Bladder inflammation or contraction (when used as a bladder instillation) · catheterisation difficulties (when used as a bladder instillation) · haematuria (when used as a bladder instillation) · invasive tumours penetrating the bladder (when used as a bladder instillation) · myocardiopathy · previous treatment with maximum cumulative doses of epirubicin or other anthracycline · recent myocardial infarction · severe arrhythmia · severe myocardial insufficiency · unstable angina · urinary tract infections (when used as a bladder instillation)

- **CAUTIONS** Caution in handling—irritant to tissues

- **INTERACTIONS** → Appendix 1: anthracyclines

● SIDE-EFFECTS

► Common or very common

- With intravesical use Chemical cystitis
- With parenteral use Alopecia · amenorrhoea · anaemia · appetite decreased · arrhythmias · cardiac conduction disorders · chills · congestive heart failure · dehydration · diarrhoea · eye inflammation · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · increased risk of infection · leucopenia · malaise · mucositis · nail discolouration · nausea · neutropenia · oral disorders · skin reactions · thrombocytopenia · urine discolouration · vasodilation · vomiting

► Uncommon

- With parenteral use Asthenia · embolism and thrombosis · sepsis

► Rare or very rare

- With parenteral use Hyperuricaemia
- Frequency not known
- With parenteral use Bone marrow depression · cardiomyopathy · cardiotoxicity · photosensitivity reaction · radiation injuries · shock

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises extreme caution with cumulative doses exceeding 900 mg/m²—risk of congestive heart failure increased.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

- **PREGNANCY** Avoid (carcinogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

Dose adjustments Manufacturer advises dose reduction according to bilirubin level.

- **RENAL IMPAIRMENT**

Dose adjustments Dose reduction may be necessary in severe impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection

► **Epirubicin hydrochloride (Non-proprietary)**

► **Pharmorubicin (Pfizer Ltd)**

Epirubicin hydrochloride 2 mg per 1 ml Pharmorubicin 200mg/100ml solution for infusion Cytosafe vials | 1 vial [PoM] £386.16 (Hospital only)

Idarubicin hydrochloride

04-May-2017

● INDICATIONS AND DOSE

Acute non-lymphocytic leukaemias monotherapy

► BY MOUTH

- Adult: 30 mg/m² daily for 3 days; maximum 400 mg/m² per course

Acute non-lymphocytic leukaemia in combination therapy

► BY MOUTH

- Adult: 15–30 mg/m² daily for 3 days; maximum 400 mg/m² per course

Advanced breast cancer after failure of first-line chemotherapy (not including anthracyclines)—monotherapy

► BY MOUTH

- Adult: 45 mg/m² for 1 dose, repeat treatment every 3–4 weeks, alternatively 15 mg/m² daily for 3 consecutive days, repeat treatment every 3–4 weeks; maximum 400 mg/m² per course

Acute leukaemias | Advanced breast cancer after failure of first-line chemotherapy (not including anthracyclines)

► BY INTRAVENOUS INJECTION

- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 938.

- **CONTRA-INDICATIONS** Previous treatment with maximum cumulative dose of idarubicin or other anthracycline · recent myocardial infarction · severe arrhythmias · severe myocardial insufficiency

- **CAUTIONS** Caution in handling—irritant to tissues

- **INTERACTIONS** → Appendix 1: anthracyclines

- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- Common or very common Alopecia · anaemia · appetite decreased · arrhythmias · cardiomyopathy · chills · congestive heart failure · diarrhoea · embolism and thrombosis · fever · haemorrhage · headache · increased risk of infection · leucopenia · nausea · neutropenia · skin reactions · stomatitis · thrombocytopenia · urine red · vomiting

- ▶ **Uncommon** Dehydration · gastrointestinal disorders · hyperuricaemia · leukaemia secondary · myocardial infarction · nail discolouration · sepsis · shock · soft tissue necrosis
- ▶ **Rare or very rare** Cardiac conduction disorders · cardiac inflammation · flushing · intracranial haemorrhage
- ▶ **Frequency not known** Bone marrow disorders · tumour lysis syndrome

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intravenous use Abdominal pain · mucosal abnormalities · paraesthesia · radiation injuries
- ▶ With oral use Gastrointestinal discomfort · mucositis · radiation skin sensitivity
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Avoid (teratogenic and toxic in *animal studies*). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment. **Dose adjustments** Manufacturer advises consider dose reduction in mild to moderate impairment—consult product literature.
- **RENAL IMPAIRMENT** Avoid in severe impairment. **Dose adjustments** Reduce dose.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 25

- ▶ **Zavedos** (Pfizer Ltd)

Idarubicin hydrochloride 5 mg Zavedos 5mg capsules | 1 capsule [PoM] £41.47

Idarubicin hydrochloride 10 mg Zavedos 10mg capsules | 1 capsule [PoM] £69.12

Powder for solution for injection

- ▶ **Zavedos** (Pfizer Ltd)

Idarubicin hydrochloride 5 mg Zavedos 5mg powder for solution for injection vials | 1 vial [PoM] £87.36 (Hospital only)

Idarubicin hydrochloride 10 mg Zavedos 10mg powder for solution for injection vials | 1 vial [PoM] £174.72 (Hospital only)

Mitoxantrone

18-Nov-2019

(Mitozantrone)

● INDICATIONS AND DOSE

Metastatic breast cancer | Non-Hodgkin's lymphoma | Adult acute non-lymphocytic leukaemia | Non-resectable primary hepatocellular carcinoma

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: (consult local protocol)

- **CAUTIONS** Intrathecal administration not recommended
- **INTERACTIONS** → Appendix 1: anthracyclines
- **SIDE-EFFECTS** Abdominal pain · acute leukaemia · alopecia · amenorrhoea · anxiety · appetite decreased · arrhythmia · asthenia · bone marrow depression · confusion · constipation · diarrhoea · drowsiness · dyspnoea · fever · gastrointestinal haemorrhage · heart failure · mucositis · nail discolouration · nail dystrophy · nausea · neurological effects · paraesthesia · scleral discolouration · skin discolouration · stomatitis · thrombocytopenia · urine blue · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Cardiac examinations are recommended after a cumulative dose of 160mg/m².

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (limited information available). **Dose adjustments** Manufacturer advises consider dose reduction.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Mitoxantrone (Non-proprietary)**

Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Mitoxantrone 20mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £51.43-£121.85 (Hospital only) | 1 vial [PoM] £51.43

- ▶ **Onkotrone** (Baxter Healthcare Ltd)

Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Onkotrone 20mg/10ml solution for infusion vials | 1 vial [PoM] £103.57
Onkotrone 25mg/12.5ml solution for infusion vials | 1 vial [PoM] £129.48

Pixantrone

07-Feb-2019

● INDICATIONS AND DOSE

Treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas (monotherapy)

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Active severe infection · risk factors for severe infection
- **CAUTIONS** Active cardiovascular disease · cardiac risk factors · caution in handling—irritant to tissues · concurrent radiotherapy to the mediastinal area · history of cardiovascular disease · previous radiotherapy to the mediastinal area · previous therapy with anthracenediones · previous therapy with anthracyclines
- **INTERACTIONS** → Appendix 1: anthracyclines
- **SIDE-EFFECTS**
- ▶ **Common or very common** Alopecia · anaemia · appetite decreased · arrhythmias · asthenia · blood disorder · bundle branch block · cancer progression · cardiac disorder (during or following treatment) · chest pain · congestive heart failure · constipation · cough · decreased leucocytes · diarrhoea · drowsiness · dry mouth · dyspnoea · electrolyte imbalance · eye inflammation · fever · gastrointestinal discomfort · haemorrhage · headache · hypotension · increased risk of infection · left ventricular dysfunction · mucositis · nail disorder · nausea · neutropenia · oedema · oral disorders · pain · paraesthesia · proteinuria · secondary malignancy · skin reactions · taste altered · thrombocytopenia · urine discolouration · vascular disorders · vomiting
- ▶ **Uncommon** Anxiety · arthralgia · arthritis · bone marrow failure · chills · dizziness · dry eye · eosinophilia · hyperbilirubinaemia · hyperuricaemia · local reaction · meningitis · muscle weakness · musculoskeletal stiffness · night sweats · oesophagitis · oliguria · respiratory disorders · rhinorrhoea · septic shock · skin ulcer · sleep disorders · spontaneous penile erection · vertigo · weight decreased
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Manufacturer advises avoid—*toxicity in animal studies*. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT** No information available—manufacturer advises caution.
- **MONITORING REQUIREMENTS**
- ▶ Baseline investigations should include a full blood count, assessment of cardiac function measured by left ventricular ejection fraction, and measurement of serum concentrations of total bilirubin and total creatinine.
- ▶ Full blood count and cardiac function should be monitored throughout treatment.
- **PATIENT AND CARER ADVICE**
Photosensitivity. Photosensitivity is a theoretical risk and patients should be advised to follow sun protection strategies.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Pixantrone monotherapy for treating multiply relapsed or refractory aggressive non-Hodgkin's B-cell lymphoma (February 2014) NICE TA306**
Pixantrone (*Pixuvri*[®]) monotherapy is recommended as an option for treating adults with multiply relapsed or refractory aggressive non-Hodgkin's B-cell lymphoma in patients:
 - who have previously been treated with rituximab, **and**
 - who are receiving third- or fourth-line treatment, **and**
 - if the manufacturer provides pixantrone with the discount agreed in the patient access scheme.
 Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta306

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Pixuvri** (Servier Laboratories Ltd)

Pixantrone (as Pixantrone dimaleate) 29 mg Pixuvri 29mg powder for concentrate for solution for infusion vials | 1 vial (POM) £553.50

ANTINEOPLASTIC DRUGS > ANTIMETABOLITES

Azacitidine

14-Feb-2019

- **DRUG ACTION** Azacitidine is a pyrimidine analogue.

● INDICATIONS AND DOSE

Treatment of intermediate-2 and high-risk myelodysplastic syndromes, chronic myelomonocytic leukaemia, and acute myeloid leukaemia, in adults who are not eligible for haematopoietic stem cell transplantation

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult local protocol)

- **CONTRA-INDICATIONS** Advanced malignant hepatic tumour
- **CAUTIONS** History of severe congestive heart failure · unstable cardiac disease (consider cardiopulmonary assessment before and during treatment) · unstable pulmonary disease (consider cardiopulmonary assessment before and during treatment)
- **INTERACTIONS** → Appendix 1: azacitidine
- **SIDE-EFFECTS**
- ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arthralgia · asthenia · bone marrow

- disorders · chest pain · chills · confusion · constipation · dehydration · diarrhoea · dizziness · drowsiness · dyspnoea · fever · gastrointestinal discomfort · haemorrhage · headache · hypertension · hypokalaemia · hypotension · increased risk of infection · induration · inflammation · insomnia · intracranial haemorrhage · laryngeal pain · leucopenia · malaise · muscle complaints · nausea · neutropenia · pain · renal failure · respiratory disorders · sepsis · skin reactions · stomatitis · syncope · thrombocytopenia · vomiting · weight decreased
- ▶ **Uncommon** Hepatic coma · hepatic failure · pyoderma gangrenosum · renal tubular acidosis
- ▶ **Rare or very rare** Injection site necrosis · tumour lysis syndrome

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 3 months after treatment in men or women.
- **PREGNANCY** Avoid (toxicity in *animal studies*). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available)—monitor for adverse drug reactions.

Dose adjustments Manufacturer advises consider dose reduction—consult local protocol.

● RENAL IMPAIRMENT

Dose adjustments Delay next treatment cycle if serum-creatinine or blood urea nitrogen greater than twice baseline value and above the upper level of normal until values return to normal or baseline, and then reduce dose by 50% on the next treatment cycle.

Reduce dose by 50% on the next treatment cycle if serum-bicarbonate concentration less than 20 mmol/litre.

● MONITORING REQUIREMENTS

- ▶ Monitor liver function tests, serum creatinine, and serum bicarbonate before initiation of treatment and before each treatment cycle.
- ▶ Monitor full blood count before initiation of treatment, before each treatment cycle, and as clinically indicated.
- ▶ Monitor for bleeding.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Azacitidine for treating acute myeloid leukaemia with more than 30% bone marrow blasts (July 2016) NICE TA399**
Azacitidine (*Vidaza*[®]) is **not** recommended, within its marketing authorisation, for treating acute myeloid leukaemia with greater than 30% bone marrow blasts in patients aged 65 years or above who are not eligible for haematopoietic stem cell transplant.

Patients whose treatment was started before this guidance was published should continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta399

- ▶ **Azacitidine for the treatment of myelodysplastic syndromes, chronic myelomonocytic leukaemia and acute myeloid leukaemia (March 2011) NICE TA218**
Azacitidine (*Vidaza*[®]) is recommended in adults who are not eligible for haematopoietic stem cell transplantation and have:

- intermediate-2 and high-risk myelodysplastic syndromes according to the International Prognostic Scoring System, **or**
- chronic myelomonocytic leukaemia with 10–29% marrow blasts without myeloproliferative disorder, **or**
- acute myeloid leukaemia with 20–30% blasts and multilineage dysplasia, according to the World Health Organization classification, **and**

- if the manufacturer provides azacitidine with the discount agreed as part of the patient access scheme. www.nice.org.uk/guidance/ta218

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for suspension for injection

▶ Azacitidine (Non-proprietary)

Azacitidine 100 mg Azacitidine 100mg powder for suspension for injection vials | 1 vial [PcM] £321.00 (Hospital only)

▶ Vidaza (Celgene Ltd)

Azacitidine 100 mg Vidaza 100mg powder for suspension for injection vials | 1 vial [PcM] £321.00

Capecitabine

26-Jun-2018

- **DRUG ACTION** Capecitabine is metabolised to fluorouracil.

• INDICATIONS AND DOSE

Stage III colon cancer, adjuvant following surgery (monotherapy)

▶ BY MOUTH

▶ Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, recommended duration of treatment is 6 months, adjust dose according to tolerability—consult product literature

Stage III colon cancer, adjuvant following surgery (combination therapy)

▶ BY MOUTH

▶ Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, recommended duration of treatment is 6 months, adjust dose according to tolerability—consult product literature

Metastatic colorectal cancer (monotherapy)

▶ BY MOUTH

▶ Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

Metastatic colorectal cancer (combination therapy)

▶ BY MOUTH

▶ Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

Advanced gastric cancer (first-line treatment in combination with a platinum based regimen)

▶ BY MOUTH

▶ Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, alternatively 625 mg/m² twice daily given continuously, adjust dose according to tolerability—consult product literature

Locally advanced or metastatic breast cancer (second-line treatment as monotherapy after failure of a taxane and anthracycline regimen or where further anthracycline treatment is not indicated) | Locally advanced or metastatic breast cancer (second-line treatment, in combination with docetaxel, where previous therapy included an anthracycline)

▶ BY MOUTH

▶ Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 938.

- **CONTRA-INDICATIONS** Dihydropyrimidine dehydrogenase deficiency
- **CAUTIONS** Diabetes mellitus · diarrhoea or dehydration—consult product literature for guidance on dose modification and treatment interruption · electrolyte

disturbances · history of angina pectoris · history of arrhythmias · history of significant cardiovascular disease · nervous system disease

- **INTERACTIONS** → Appendix 1: capecitabine

• SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · appetite abnormal · asthenia · chest pain · constipation · cough · dehydration · depression · diarrhoea · dizziness · dry mouth · dyspnoea · embolism and thrombosis · eye disorders · eye inflammation · eye irritation · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hyperbilirubinaemia · increased risk of infection · insomnia · joint disorders · lethargy · malaise · nail disorder · nausea · neutropenia · oedema · pain · rhinorrhoea · sensation abnormal · skin reactions · stomatitis · taste altered · vomiting · weight decreased
- ▶ **Uncommon** Acute coronary syndrome · aphasia · arrhythmias · ascites · asthma · chills · confusion · diabetes mellitus · dysphagia · ear pain · facial swelling · haemolytic anaemia · hepatic disorders · hot flush · hydronephrosis · hypertension · hypertriglyceridaemia · hypokalaemia · hypotension · influenza like illness · ischaemic heart disease · leucopenia · libido decreased · lipoma · malnutrition · memory loss · movement disorders · muscle weakness · musculoskeletal stiffness · palpitations · pancytopenia · panic attack · peripheral coldness · peripheral neuropathy · photosensitivity reaction · pneumothorax · radiation recall reaction · sepsis · skin ulcer · syncope · thrombocytopenia · urinary disorders · vertigo · vision disorders
- ▶ **Rare or very rare** Cutaneous lupus erythematosus · encephalopathy · QT interval prolongation · severe cutaneous adverse reactions (SCARs) · vasospasm
- ▶ **Frequency not known** Cardiomyopathy · heart failure · sudden death

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

- **PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises monitor liver function in mild-to-moderate dysfunction—consult product literature for guidance on treatment interruption; avoid in severe impairment.

- **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 30 mL/minute.

Dose adjustments Reduce starting dose of 1.25 g/m² to 75% if creatinine clearance 30–50 mL/minute.

• MONITORING REQUIREMENTS

- ▶ Monitor plasma-calcium concentration.
- ▶ Monitor for eye disorders (including keratitis and corneal disorders).
- ▶ Severe skin reactions Monitor for symptoms of severe skin reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis)—permanently discontinue treatment immediately if symptoms occur.
- ▶ Hand-foot syndrome Monitor for symptoms of hand-foot syndrome—interrupt treatment if significant syndrome occurs and refer to product literature.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Bevacizumab in combination with capecitabine for the first-line treatment of metastatic breast cancer (August 2012) NICE TA263
- ▶ Bevacizumab in combinations with capecitabine is **not** recommended within its marketing authorisation for the first-line treatment of metastatic breast cancer, that is, when treatment with other chemotherapy options

including taxanes or anthracyclines is not considered appropriate, or when taxanes or anthracyclines have been used as part of adjuvant treatment in the previous 12 months.

www.nice.org.uk/guidance/ta263

- ▶ **Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010) NICE TA212** Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine is **not** recommended for the treatment of metastatic colorectal cancer.

www.nice.org.uk/guidance/ta212

- ▶ **Capecitabine for the treatment of advanced gastric cancer (July 2010) NICE TA191** Capecitabine in combination with a platinum-based regimen is recommended for the first-line treatment of inoperable advanced gastric cancer. www.nice.org.uk/guidance/ta191
- ▶ **Capecitabine and tegafur with uracil for metastatic colorectal cancer (May 2003) NICE TA61** Capecitabine or tegafur with uracil [now discontinued] (in combination with folinic acid) is an option for the first-line treatment of metastatic colorectal cancer. www.nice.org.uk/guidance/ta61
- ▶ **Capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes' C) colon cancer (April 2006) NICE TA100** Capecitabine alone or oxaliplatin combined with fluorouracil and folinic acid are options for adjuvant treatment following surgery for stage III (Dukes' C) colon cancer. www.nice.org.uk/guidance/ta100

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

▶ Capecitabine (Non-proprietary)

£265.55 DT = £225.72

Cladribine

20-Feb-2018

- **DRUG ACTION** Cladribine is a nucleoside analogue that is cytotoxic particularly to lymphocytes and monocytes, inhibiting both DNA synthesis and repair. Its effect on B- and T-lymphocytes is thought to interrupt the cascade of immune events central to multiple sclerosis.

● INDICATIONS AND DOSE

Hairy cell leukaemia (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature or local protocols)

B-cell chronic lymphocytic leukaemia (specialist use only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature or local protocols)

Highly active relapsing-remitting multiple sclerosis (specialist use only)

- ▶ BY MOUTH
- ▶ Adult: (consult product literature or local protocols)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CLADRIBINE FOR LEUKAEMIA: REPORTS OF PROGRESSIVE MULTIFOCAL ENCEPHALOPATHY (PML); STOP TREATMENT IF PML SUSPECTED (DECEMBER 2017)

The MHRA is aware of 3 confirmed cases of progressive multifocal encephalopathy (PML) that developed 6 months to several years after cladribine treatment for haematological conditions. An association between cladribine and prolonged lymphopenia has been reported.

PML should be considered in the differential diagnosis for patients with new or worsening neurological signs or symptoms. Patients should be monitored for signs and symptoms of new neurological dysfunction, and advised to seek urgent medical attention if they experience symptoms—stop treatment immediately if PML is suspected and ensure specialist investigation is received.

● CONTRA-INDICATIONS

- ▶ With oral use Active chronic hepatitis · active chronic tuberculosis · active malignancy · HIV infection · immunocompromised patients

● CAUTIONS

GENERAL CAUTIONS Acute infection · use irradiated blood only (haematology consultation advised)

SPECIFIC CAUTIONS

- ▶ With intravenous use or subcutaneous use High tumour burden—consult product literature · symptomatic or severe bone marrow depression
- ▶ With oral use No prior exposure to varicella zoster virus · prior malignancy (consider if potential benefit outweighs risk)

CAUTIONS, FURTHER INFORMATION

- ▶ Immunosuppressive effect of cladribine
- ▶ With intravenous use or subcutaneous use Cladribine has potent and prolonged myelosuppressive and immunosuppressive effects. Patients treated with cladribine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy should be considered in those at risk. Acute infections should be treated before initiating cladribine. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

- ▶ Varicella zoster virus

- ▶ With oral use Manufacturer advises vaccination prior to initiation of therapy in patients who have no history of exposure to varicella zoster virus; delay treatment for 4–6 weeks after vaccination.

- **INTERACTIONS** → Appendix 1: cladribine

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Increased risk of infection

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**

- ▶ With intravenous use Anaemia · anxiety · appetite decreased · arrhythmias · arthritis · asthenia · chest pain · chills · confusion · conjunctivitis · constipation · cough · diarrhoea · dizziness · dyspnoea · febrile neutropenia · fever · flatulence · gastrointestinal discomfort · haemolytic anaemia · headache · hyperhidrosis · hypersensitivity · insomnia · joint disorders · malaise · muscle weakness · myalgia · myocardial ischaemia · nausea · neoplasms ·

- oedema · pain · renal impairment · respiratory disorders · secondary malignancy · septic shock · skin reactions · thrombocytopenia · vomiting
- ▶ With oral use Alopecia · lymphopenia · rash
 - ▶ With subcutaneous use Anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · arthritis · asthenia · bone marrow disorders · chills · constipation · cough · diarrhoea · dizziness · dyspnoea · fever · gastrointestinal disorders · gastrointestinal pain · haemorrhage · headache · hyperhidrosis · hypotension · immunosuppression · insomnia · lymphopenia · malaise · mucositis · myalgia · myocardial ischaemia · nausea · neutropenia · oedema · pain · respiratory disorders · secondary malignancy · sepsis · skin reactions · thrombocytopenia · vomiting
 - ▶ **Uncommon**
 - ▶ With intravenous use Bone marrow disorders · hypereosinophilia · level of consciousness decreased · nerve dysfunction · neurotoxicity (with high doses) · paralysis · paraparesis · Stevens-Johnson syndrome · tumour lysis syndrome
 - ▶ With subcutaneous use Ataxia · cachexia · confusion · drowsiness · eye inflammation · haemolytic anaemia · paraesthesia · polyneuropathy
 - ▶ **Rare or very rare**
 - ▶ With intravenous use Heart failure
 - ▶ With subcutaneous use Amyloidosis · cholecystitis · depression · dysphagia · epilepsy · graft versus host disease · heart failure · hepatic failure · hypereosinophilia · pulmonary embolism · renal failure · severe cutaneous adverse reactions (SCARs) · speech disorder · tumour lysis syndrome
 - ▶ **Frequency not known**
 - ▶ With oral use Malignancy
 - **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment and for at least 6 months after the last dose in men and women of childbearing potential.
 - ▶ With oral use Manufacturer advises exclude pregnancy before each treatment course; if using a hormonal contraceptive, a barrier method should also be used for at least 4 weeks after the last dose of each course.
 - **PREGNANCY** Manufacturer advises avoid—teratogenic in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
 - **BREAST FEEDING**
 - ▶ With intravenous use or subcutaneous use Manufacturer advises avoid during treatment and for 6 months after the last dose—no information available.
 - ▶ With oral use Manufacturer advises avoid during treatment and for 1 week after the last dose—no information available.
 - **HEPATIC IMPAIRMENT**
 - ▶ With intravenous use Manufacturer advises caution (limited information available).
 - ▶ With subcutaneous use Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment (no information available).
 - ▶ With oral use Manufacturer advises avoid in moderate to severe impairment (no information available).
 - **RENAL IMPAIRMENT**
 - ▶ With subcutaneous use Manufacturer advises caution in mild impairment; avoid in moderate-to-severe impairment.
 - ▶ With oral use Manufacturer advises avoid in moderate-to-severe impairment—no information available.
 - ▶ With intravenous use Manufacturer advises caution—limited information available.
 - **PRE-TREATMENT SCREENING**
 - ▶ With oral use Manufacturer advises exclude HIV infection, active or latent tuberculosis and active or latent hepatitis before starting each treatment course—delay treatment until infection adequately treated.
 - **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor for malignancy—follow routine cancer screening guidelines.
 - ▶ Manufacturer advises monitor for progressive multifocal leucoencephalopathy—perform a baseline MRI.
 - ▶ Manufacturer advises monitor for haemolysis in patients who are or who become Coombs' positive.
 - ▶ Manufacturer advises haematological monitoring required—consult product literature.
 - ▶ With intravenous use or subcutaneous use Renal and hepatic function should be monitored periodically as clinically indicated.
 - **DIRECTIONS FOR ADMINISTRATION** *Litak*[®] for subcutaneous use only—no dilution required; manufacturer advises patients may self-administer, after appropriate training.
Leustat[®] for infusion use only.
 - **HANDLING AND STORAGE**
 - ▶ **LITAK**[®] Manufacturer advises store in a refrigerator (2–8°C).
 - ▶ **LEUSTAT**[®] Manufacturer advises store in a refrigerator (2–8°C).
 - **PATIENT AND CARER ADVICE**
 - ▶ **Driving and skilled tasks**
 - ▶ With intravenous use or subcutaneous use Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and drowsiness.
 - **NATIONAL FUNDING/ACCESS DECISIONS**
 - ▶ **NICE decisions**
 - ▶ **Cladribine for treating relapsing-remitting multiple sclerosis (December 2019)** NICE TA616
Cladribine (*Mavenclad*[®]) is recommended as an option for treating highly active multiple sclerosis in adults, only if the person has:
 - rapidly evolving severe relapsing-remitting multiple sclerosis, that is with at least:
 - two relapses in the previous year, **and**
 - one T1 gadolinium-enhancing lesion at baseline MRI or a significant increase in T2 lesion load compared with a previous MRI, **or**
 - relapsing-remitting multiple sclerosis that has responded inadequately to treatment with disease-modifying therapy, defined as one relapse in the previous year and MRI evidence of disease activity.
- Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta616
- ▶ **Scottish Medicines Consortium (SMC) decisions**
The *Scottish Medicines Consortium* has advised (February 2018) that cladribine (*Mavenclad*[®]) is accepted for restricted use within NHS Scotland for the treatment of adults with:
 - rapidly evolving severe relapsing-remitting multiple sclerosis: patients with two or more relapses in the prior year whether on treatment or not, and at least one T1 gadolinium-enhancing lesion, **or**
 - sub-optimal therapy relapsing-remitting multiple sclerosis: patients with one or more relapses in the previous year while on disease modifying therapy, and at least one T1 gadolinium-enhancing lesion or nine T2 lesions.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Litak** (Lipomed GmbH)
Cladribine 2 mg per 1 ml Litak 10mg/5ml solution for injection vials | 1 vial [PoM] £165.00 (Hospital only)

Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Leustat** (Janssen-Cilag Ltd)

Clofarabine

02-Jul-2018

● INDICATIONS AND DOSE

Relapsed or refractory acute lymphoblastic leukaemia in patients who have received at least two previous regimens

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult 18-20 years: (consult local protocol)

- **CAUTIONS** Cardiac disease

- **INTERACTIONS** → Appendix 1: clofarabine

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anxiety · appetite decreased · arthralgia · capillary leak syndrome · chills · cough · dehydration · diarrhoea · dizziness · drowsiness · dyspnoea · fatigue · feeling abnormal · feeling hot · fever · flushing · gastrointestinal discomfort · haemorrhage · headache · hearing impairment · hepatic disorders · hyperbilirubinaemia · hyperhidrosis · hypersensitivity · hypotension · increased risk of infection · irritability · mucositis · multi organ failure · myalgia · nausea · neutropenia · oedema · oral disorders · pain · paraesthesia · pericardial effusion · peripheral neuropathy · psychiatric disorder · renal impairment · respiratory disorders · sepsis · sinusoidal obstruction syndrome · skin reactions · systemic inflammatory response syndrome · tachycardia · tremor · tumour lysis syndrome · vomiting · weight decreased
- ▶ **Frequency not known** Antibiotic associated colitis · gastrointestinal disorders · hyponatraemia · pancreatitis · severe cutaneous adverse reactions (SCARs)
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in mild-to-moderate impairment; avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Clofarabine (Non-proprietary)**
Clofarabine 1 mg per 1 ml Clofarabine 20mg/20ml concentrate for solution for infusion vials | 1 vial [PoM] £1,326.18 (Hospital only)
- ▶ **Evoltra** (Sanofi) ▼
Clofarabine 1 mg per 1 ml Evoltra 20mg/20ml concentrate for solution for infusion vials | 1 vial [PoM] £1,326.18 (Hospital only)

Cytarabine

02-Dec-2019

- **DRUG ACTION** Cytarabine acts by interfering with pyrimidine synthesis.

● INDICATIONS AND DOSE

Induction of remission of acute myeloblastic leukaemia

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult local protocol)

Lymphomatous meningitis

- ▶ BY INTRATHECAL INJECTION
- ▶ Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

Not all cytarabine preparations can be given by intrathecal injection—consult product literature.

- **INTERACTIONS** → Appendix 1: cytarabine
 - **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · anaemia · appetite decreased · consciousness impaired · diarrhoea · dysarthria · dysphagia · eye disorders · eye inflammation · eye stinging · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhagic conjunctivitis (consider prophylactic corticosteroid eye drops) · hyperuricaemia · leucopenia · nausea · oral disorders · renal impairment · skin reactions · thrombocytopenia · urinary retention · vasculitis · vision disorders · vomiting
 - ▶ **Uncommon** Arthralgia · dyspnoea · headache · increased risk of infection · myalgia · nerve disorders · pain · paralysis · pericarditis · sepsis · skin ulcer · throat pain
 - ▶ **Rare or very rare** Arrhythmias
 - ▶ **Frequency not known** Acute respiratory distress syndrome (ARDS) · amenorrhoea · ataxia · azoospermia · bone marrow disorders · cardiomyopathy · cerebellar dysfunction · chest pain · coma · confusion · cytarabine syndrome · dizziness · drowsiness · haemorrhage · hepatic disorders · hyperbilirubinaemia · neurotoxicity · neurotoxicity rash · neutropenia · pancreatitis · personality change · pulmonary oedema · reticulocytopenia · rhabdomyolysis · seizure · tremor
 - **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
 - **PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
 - **BREAST FEEDING** Discontinue breast-feeding.
 - **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of CNS toxicity).
Dose adjustments Manufacturer advises dose reduction—consult product literature.
 - **MONITORING REQUIREMENTS**
 - ▶ Haematological monitoring Cytarabine is a potent myelosuppressant and requires careful haematological monitoring.
 - **PRESCRIBING AND DISPENSING INFORMATION** Cytarabine is available as *conventional* and *liposomal* formulations. These different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are **not** interchangeable.
 - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection
- Solution for injection**
- ▶ **Cytarabine (Non-proprietary)**
Cytarabine 20 mg per 1 ml Cytarabine 500mg/25ml solution for injection vials | 1 vial [PoM] £19.50

Cytarabine 100mg/5ml solution for injection vials | 5 vial [PoM] £30.00 (Hospital only)
 Cytarabine 500mg/25ml solution for injection Cytosafe vials | 1 vial [PoM] £19.50 (Hospital only)
Cytarabine 100 mg per 1 ml Cytarabine 1g/10ml solution for injection Cytosafe vials | 1 vial [PoM] £39.00 (Hospital only)
 Cytarabine 1g/10ml solution for injection vials | 1 vial [PoM] £37.05-£52.27 (Hospital only) | 1 vial [PoM] £39.00
 Cytarabine 500mg/5ml solution for injection vials | 5 vial [PoM] £89.78-£100.00 (Hospital only)
 Cytarabine 100mg/1ml solution for injection vials | 5 vial [PoM] £26.93 (Hospital only)
 Cytarabine 2g/20ml solution for injection Cytosafe vials | 1 vial [PoM] £77.50 (Hospital only)
 Cytarabine 2g/20ml solution for injection vials | 1 vial [PoM] £73.63-£103.87 (Hospital only) | 1 vial [PoM] £77.50

Combinations available: **Daurorubicin with cytarabine**, p. 951

Decitabine

31-Jul-2018

- **DRUG ACTION** Decitabine is a pyrimidine analogue.

● INDICATIONS AND DOSE

Treatment of newly diagnosed acute myeloid leukaemia in patients over 65 years of age who are not candidates for standard induction chemotherapy

- ▶ BY INTRAVENOUS INFUSION
- ▶ Elderly: (consult local protocol)

- **CAUTIONS** History of severe congestive heart failure · history of unstable cardiac disease
- **INTERACTIONS** → Appendix 1: decitabine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · diarrhoea · epistaxis · fever · headache · hypersensitivity · increased risk of infection · leucopenia · nausea · neutropenia · sepsis · stomatitis · thrombocytopenia · vomiting
 - ▶ **Uncommon** Acute febrile neutrophilic dermatosis · pancytopenia
 - ▶ **Frequency not known** Gastrointestinal disorders · interstitial lung disease
- **CONCEPTION AND CONTRACEPTION** Men must avoid fathering a child during and for 3 months after treatment.
- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance less than 30 mL/minute—no information available.

- **MEDICAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Potassium, sodium

- ▶ **Dacogen** (Janssen-Cilag Ltd)

Decitabine 50 mg Dacogen 50mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £970.86

Fludarabine phosphate

● INDICATIONS AND DOSE

Initial treatment of advanced B-cell chronic lymphocytic leukaemia (CLL) or after first line treatment in patients with sufficient bone-marrow reserves

- ▶ BY MOUTH
- ▶ Adult: 40 mg/m² for 5 days every 28 days, usually given for 6 cycles

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
 See Cytotoxic drugs p. 938.

- **CONTRA-INDICATIONS** Haemolytic anaemia
- **CAUTIONS** Increased susceptibility to skin cancer · worsening of existing skin cancer
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Immunosuppression Fludarabine has a potent and prolonged immunosuppressive effect. Patients treated with fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs. Co-trimoxazole is used to prevent pneumocystis infection.
- **INTERACTIONS** → Appendix 1: fludarabine
- **SIDE-EFFECTS**
 - **GENERAL SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · appetite decreased · asthenia · bone marrow depression (may be cumulative) · chills · cough · diarrhoea · fever · increased risk of infection · malaise · mucositis · nausea · neoplasms · nerve disorders · neutropenia · oedema · stomatitis · thrombocytopenia · vision disorders · vomiting
 - ▶ **Uncommon** Autoimmune disorder · confusion · dyspnoea · haemorrhage · respiratory disorders · tumour lysis syndrome
 - ▶ **Rare or very rare** Agitation · arrhythmia · coma · heart failure · seizure · severe cutaneous adverse reactions (SCARs)
 - **SPECIFIC SIDE-EFFECTS**
 - ▶ **Common or very common**
 - ▶ With oral use Progressive multifocal leukoencephalopathy (PML) · skin reactions · viral infection reactivation
 - ▶ With parenteral use Rash
 - ▶ **Uncommon**
 - ▶ With oral use Acquired haemophilia · crystalluria · electrolyte imbalance · haemolytic anaemia · hyperuricaemia · metabolic acidosis · renal failure
 - ▶ **Frequency not known**
 - ▶ With parenteral use Encephalopathy · intracranial haemorrhage
 - **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
 - **PREGNANCY** Avoid (embryotoxic and teratogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
 - **BREAST FEEDING** Discontinue breast-feeding.
 - **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 30 mL/minute.
 - ▶ **Dose adjustments** Reduce dose by up to 50% if creatinine clearance 30–70 mL/minute.
 - **MONITORING REQUIREMENTS**
 - ▶ Monitor for signs of haemolysis.
 - ▶ Monitor for neurological toxicity.
 - ▶ Assess creatinine clearance in patients over 65 years before treatment initiation.
 - **DIRECTIONS FOR ADMINISTRATION** Concentrate for intravenous injection or infusion must be diluted before administration (consult product literature).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Fludarabine monotherapy for the first-line treatment of chronic lymphocytic leukaemia (February 2007)** NICE TA119
Fludarabine monotherapy is **not** recommended for the first-line treatment of chronic lymphocytic leukaemia. www.nice.org.uk/guidance/ta119
- ▶ **Fludarabine for B-cell chronic lymphocytic leukaemia (September 2001)** NICE TA29
Oral fludarabine is recommended for the second-line treatment of B-cell chronic lymphocytic leukaemia in patients who have either failed, or are intolerant of, first line chemotherapy, and who would otherwise have received combination chemotherapy of either:
 - cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP)
 - cyclophosphamide, doxorubicin and prednisolone (CAP) or
 - cyclophosphamide, vincristine and prednisolone (CVP)
 Intravenous fludarabine should only be used when oral fludarabine is contra-indicated. www.nice.org.uk/guidance/ta29

Scottish Medicines Consortium (SMC) decisions

SMC No. 176/05

The *Scottish Medicines Consortium* has advised (November 2006) that fludarabine phosphate (*Fludara*®) is accepted for restricted use within NHS Scotland for the treatment of B-cell chronic lymphocytic leukaemia (CLL) in patients with sufficient bone marrow reserves. First-line treatment should only be initiated in patients with advanced disease, Rai stages III/IV (Binet stage C), or Rai stages I/II (Binet stage A/B) where the patient has disease-related symptoms or evidence of progressive disease.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Fludarabine phosphate (Non-proprietary)

Fludarabine phosphate 25 mg per 1 ml Fludarabine phosphate 50mg/2ml concentrate for solution for injection vials | 1 vial [PoM] £155.00–£156.00 (Hospital only)

Tablet

▶ Fludara (Sanofi)

Fludarabine phosphate 10 mg Fludara 10mg tablets | 15 tablet [PoM] £302.48 (Hospital only) | 20 tablet [PoM] £403.31 (Hospital only)

Powder for solution for injection

▶ Fludarabine phosphate (Non-proprietary)

Fludarabine phosphate 50 mg Fludarabine phosphate 50mg powder for solution for injection vials | 1 vial [PoM] £155.00 (Hospital only)

▶ Fludara (Sanofi)

Fludarabine phosphate 50 mg Fludara 50mg powder for solution for injection vials | 5 vial [PoM] £735.34 (Hospital only)

- **CAUTIONS** History of heart disease · partial dihydropyrimidine dehydrogenase deficiency—consult product literature
- **INTERACTIONS** → Appendix 1: fluorouracil
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Agranulocytosis · alopecia · anaemia · anal inflammation · appetite decreased · asthenia · bone marrow disorders · bronchospasm · diarrhoea · gastrointestinal disorders · haemorrhage · hand and foot syndrome (long term use) · healing impaired · immunosuppression · increased risk of infection · ischaemic heart disease · leucopenia · malaise · mucositis · nausea · neutropenia · skin reactions · stomatitis · thrombocytopenia · vomiting
 - ▶ **Uncommon** Arrhythmias · cardiac inflammation · cardiogenic shock · cardiomyopathy congestive · dehydration · dizziness · drowsiness · euphoric mood · eye disorders · eye inflammation · headache · heart failure · hepatic disorders · hypotension · movement disorders · myocardial infarction · nail discolouration · nail disorders · nerve disorders · ovulation disorder · parkinsonism · photosensitivity reaction · sepsis · spermatogenesis disorder · vision disorders
 - ▶ **Rare or very rare** Biliary sclerosis · cardiac arrest · cerebral ischaemia · cholecystitis · coma · confusion · embolism and thrombosis · encephalopathy · fever · muscle weakness · peripheral vascular disease · renal failure · seizure · speech impairment · sudden cardiac death
 - ▶ **Frequency not known** Vein discolouration
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Avoid (teratogenic). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of hyperammonaemia and hyperammonaemic encephalopathy).
Dose adjustments Manufacturer advises consider dose reduction.
- **RENAL IMPAIRMENT** Manufacturer advises caution (increased risk of hyperammonaemia and hyperammonaemic encephalopathy).
Dose adjustments Manufacturer advises consider dose reduction.
- **PRE-TREATMENT SCREENING** Manufacturer advises genotyping of the DPYD gene to identify patients at increased risk for severe toxicity—consult product literature.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor cardiac function regularly
- **HANDLING AND STORAGE** Caution in handling—irritant to tissues.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

▶ Fluorouracil (Non-proprietary)

Fluorouracil (as Fluorouracil sodium) 25 mg per 1 ml Fluorouracil 500mg/20ml solution for injection vials | 10 vial [PoM] £64.00 (Hospital only)

Fluorouracil (as Fluorouracil sodium) 50 mg per 1 ml Fluorouracil 1g/20ml solution for injection vials | 1 vial [PoM] £12.16 (Hospital only) | 1 vial [PoM] £12.80

Fluorouracil 500mg/10ml solution for injection vials | 1 vial [PoM] £6.08 (Hospital only) | 1 vial [PoM] £6.40 | 5 vial [PoM] £32.00 (Hospital only)

Fluorouracil

03-Mar-2020

● INDICATIONS AND DOSE

Treatment of some solid tumours including gastro-intestinal tract cancers and breast cancer | In combination with folinic acid in advanced colorectal cancer

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRA-ARTERIAL INFUSION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Bone marrow depression (after treatment with radiotherapy or other antineoplastic agents) · complete or near complete absence of dihydropyrimidine dehydrogenase activity (increased risk of severe, life-threatening, or fatal toxicity)—consult product literature · serious infections

Solution for infusion▶ **Fluorouracil (Non-proprietary)**

Fluorouracil (as Fluorouracil sodium) 25 mg per 1 ml Fluorouracil 2.5g/100ml solution for infusion vials | 1 vial [PoM] £32.00 (Hospital only) | 1 vial [PoM] £32.00

Fluorouracil (as Fluorouracil sodium) 50 mg per 1 ml Fluorouracil 5g/100ml solution for infusion vials | 1 vial [PoM] £60.80-£64.00 (Hospital only) | 1 vial [PoM] £64.00

Fluorouracil 2.5g/50ml solution for infusion vials | 1 vial [PoM] £30.40-£32.00 (Hospital only) | 1 vial [PoM] £32.00

Gemcitabine

03-Aug-2018

● INDICATIONS AND DOSE

First-line treatment for locally advanced or metastatic non-small cell lung cancer (as monotherapy in elderly patients and in palliative treatment; otherwise in combination with cisplatin) | Treatment of locally advanced or metastatic pancreatic cancer | Treatment of advanced or metastatic bladder cancer (in combination with cisplatin) | Treatment of locally advanced or metastatic epithelial ovarian cancer which has relapsed after a recurrence-free interval of at least 6 months following previous platinum-based therapy (in combination with carboplatin) | Treatment of metastatic breast cancer which has relapsed after previous chemotherapy including an anthracycline (in combination with paclitaxel)

▶ BY INTRAVENOUS INFUSION

▶ Adult: (consult local protocol)

● **INTERACTIONS** → Appendix 1: gemcitabine● **SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · anaemia · appetite decreased · asthenia · back pain · bone marrow depression · chills · constipation · cough · diarrhoea · drowsiness · dyspnoea · fever · haematuria · headache · hyperhidrosis · influenza like illness · insomnia · leucopenia · myalgia · nausea · neutropenia · oedema · oral disorders · proteinuria · rhinitis · skin reactions · thrombocytopenia · vomiting
- ▶ **Uncommon** Respiratory disorders
- ▶ **Rare or very rare** Capillary leak syndrome · hypotension · myocardial infarction · posterior reversible encephalopathy syndrome (PRES) · severe cutaneous adverse reactions (SCARs) · skin ulcer · thrombocytosis
- ▶ **Frequency not known** Arrhythmias · colitis ischaemic · gangrene · haemolytic uraemic syndrome · heart failure · hepatic disorders · pulmonary oedema · radiation injuries · renal failure · stroke · vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Gemcitabine should be discontinued if signs of microangiopathic haemolytic anaemia occur.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment. Men must avoid fathering a child during and for 6 months after treatment.

● **PREGNANCY** Avoid (teratogenic in animal studies). See *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (limited information available).

● **RENAL IMPAIRMENT** Manufacturer advises caution.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

▶ **Gemcitabine for the treatment of pancreatic cancer (May 2001)** NICE TA25

Gemcitabine is an option for first-line chemotherapy for patients with advanced or metastatic adenocarcinoma of the pancreas and a Karnofsky score of at least 50 [Karnofsky score is a measure of the ability to perform ordinary tasks].

Gemcitabine is **not** recommended for patients who can have potentially curative surgery. There is insufficient evidence to support its use for second-line treatment of pancreatic adenocarcinoma.

www.nice.org.uk/guidance/ta25

▶ **Gemcitabine for the treatment of metastatic breast cancer (January 2007)** NICE TA116

Gemcitabine, in combination with paclitaxel, is an option for the treatment of metastatic breast cancer **only** when docetaxel monotherapy or docetaxel plus capecitabine are also considered appropriate.

www.nice.org.uk/guidance/ta116

▶ **Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013)** NICE TA285

Bevacizumab in combination with gemcitabine and carboplatin is **not** recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.

www.nice.org.uk/guidance/ta285

▶ **Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016)** NICE TA389

Gemcitabine, in combination with carboplatin, is **not** recommended for treating the first recurrence of platinum-sensitive ovarian cancer.

Patients currently receiving gemcitabine in combination with carboplatin should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta389

▶ **Paclitaxel as albumin-bound nanoparticles with gemcitabine for untreated metastatic pancreatic cancer (September 2017)** NICE TA476

Gemcitabine with paclitaxel as albumin-bound nanoparticles (nab-paclitaxel) is recommended as an option for untreated metastatic adenocarcinoma of the pancreas in adults, only if:

- other combination chemotherapies are unsuitable and they would otherwise have gemcitabine monotherapy, **and**

- the manufacturer provides nab-paclitaxel with the discount agreed in the patient access scheme.

Patients whose treatment with nab-paclitaxel was started before this guidance was published, should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta476

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (December 2006) that gemcitabine (*Gemzar*[®]) is accepted for restricted use within NHS Scotland for the treatment of metastatic breast cancer, which has relapsed following previous chemotherapy including an anthracycline (unless contra-indicated).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion▶ **Gemcitabine (Non-proprietary)**

Gemcitabine (as Gemcitabine hydrochloride) 10 mg per 1 ml Gemcitabine 1.6g/160ml infusion bags | 1 bag [PoM] £140.00

 (Hospital only) | 1 vial [PoM] £413.51

Mercaptopurine

02-Dec-2019

(6-Mercaptopurine)● **INDICATIONS AND DOSE**

Severe acute Crohn's disease | Maintenance of remission of Crohn's disease | Ulcerative colitis

▶ **BY MOUTH**

▶ **Adult:** 1–1.5 mg/kg daily, some patients may respond to lower doses

Acute leukaemias | Chronic myeloid leukaemia

▶ **BY MOUTH USING TABLETS**

▶ **Adult:** Initially 2.5 mg/kg daily, adjusted according to response, alternatively initially 50–75 mg/m² daily, adjusted according to response

▶ **BY MOUTH USING ORAL SUSPENSION**

▶ **Adult:** Initially 25–75 mg/m² daily, adjusted according to response

DOSE ADJUSTMENTS DUE TO INTERACTIONS

▶ Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

DOSE EQUIVALENCE AND CONVERSION

▶ Mercaptopurine tablets and *Xaluprine*[®] oral suspension are **not** bioequivalent, haematological monitoring is advised when switching formulations.

- **UNLICENSED USE** Not licensed for use in severe ulcerative colitis and Crohn's disease.

IMPORTANT SAFETY INFORMATION**SAFE PRACTICE**

Mercaptopurine has been confused with mercaptamine; care must be taken to ensure the correct drug is prescribed and dispensed.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
 See Cytotoxic drugs p. 938.

- **CONTRA-INDICATIONS** Absent thiopurine methyltransferase activity
- **CAUTIONS** Reduced thiopurine methyltransferase activity
- CAUTIONS, FURTHER INFORMATION**
- ▶ Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with

absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

- **INTERACTIONS** → Appendix 1: mercaptopurine

● **SIDE-EFFECTS**

- ▶ **Common or very common** Anaemia · appetite decreased · bone marrow depression · diarrhoea · hepatic disorders · hepatotoxicity (more common at high doses) · leucopenia · nausea · oral disorders · pancreatitis · thrombocytopenia · vomiting
- ▶ **Uncommon** Arthralgia · fever · increased risk of infection · neutropenia · rash
- ▶ **Rare or very rare** Alopecia · face oedema · intestinal ulcer · neoplasms · oligozoospermia
- ▶ **Frequency not known** Photosensitivity reaction

● **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

● **PREGNANCY** Avoid (teratogenic). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).

Dose adjustments Manufacturer advises consider dose reduction.

● **RENAL IMPAIRMENT**

Dose adjustments Reduce dose.

● **PRE-TREATMENT SCREENING** Consider measuring thiopurine methyltransferase (TPMT) activity before starting mercaptopurine therapy.

● **MONITORING REQUIREMENTS** Monitor liver function.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include raspberry.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

Oral suspension

EXCIPIENTS: May contain Aspartame

▶ **Xaluprine** (Nova Laboratories Ltd)

Mercaptopurine 20 mg per 1 ml Xaluprine 20mg/ml oral suspension | 100 ml [PoM] £170.00 DT = £170.00

Methotrexate

25-Jul-2019

- **DRUG ACTION** Methotrexate inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines.

● **INDICATIONS AND DOSE****Severe Crohn's disease**▶ **BY INTRAMUSCULAR INJECTION**

▶ **Adult:** Initially 25 mg once weekly until remission induced; maintenance 15 mg once weekly

Maintenance of remission of severe Crohn's disease▶ **BY MOUTH**

▶ **Adult:** 10–25 mg once weekly

Moderate to severe active rheumatoid arthritis▶ **BY MOUTH**

▶ **Adult:** 7.5 mg once weekly, adjusted according to response; maximum 20 mg per week

continued →

Severe active rheumatoid arthritis

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 7.5 mg once weekly, then increased in steps of 2.5 mg once weekly, adjusted according to response; maximum 25 mg per week

Neoplastic diseases

- ▶ BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRA-ARTERIAL INFUSION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRATHECAL INJECTION
- ▶ Adult: (consult product literature)

Severe psoriasis unresponsive to conventional therapy (specialist use only)

- ▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 2.5–10 mg once weekly, then increased in steps of 2.5–5 mg, adjusted according to response, dose to be adjusted at intervals of at least 1 week; usual dose 7.5–15 mg once weekly, stop treatment if inadequate response after 3 months at the optimum dose; maximum 30 mg per week

- **UNLICENSED USE** Not licensed for use in severe Crohn's disease.

IMPORTANT SAFETY INFORMATION

NHS NEVER EVENT: OVERDOSE OF METHOTREXATE FOR NON-CANCER TREATMENT (JANUARY 2018)

Patients given methotrexate, by any route, for non-cancer treatment should not be given more than their intended weekly dose.

WEEKLY DOSING

Note that the dose is a **weekly** dose. To avoid error with low-dose methotrexate, it is recommended that:

- the patient is carefully advised of the **dose** and **frequency** and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

- **CONTRA-INDICATIONS** Active infection · ascites · immunodeficiency syndromes · significant pleural effusion

- **CAUTIONS** Photosensitivity—psoriasis lesions aggravated by UV radiation (skin ulceration reported) · diarrhoea · extreme caution in blood disorders (avoid if severe) · peptic ulceration · risk of accumulation in pleural effusion or ascites—drain before treatment · ulcerative colitis · ulcerative stomatitis

CAUTIONS, FURTHER INFORMATION

- ▶ **Blood count** Bone marrow suppression can occur abruptly; factors likely to increase toxicity include advanced age, renal impairment, and concomitant use with another anti-folate drug (e.g. trimethoprim). A clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy.
- ▶ **Gastro-intestinal toxicity** Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity.
- ▶ **Liver toxicity** Liver cirrhosis reported. Treatment should not be started or should be discontinued if any abnormality of liver function tests or liver biopsy is present or develops during therapy. Abnormalities can return to normal within

2 weeks after which treatment may be recommenced if judged appropriate.

- ▶ **Pulmonary toxicity** Pulmonary toxicity may be a special problem in rheumatoid arthritis (patient to seek medical attention if dyspnoea, cough or fever); monitor for symptoms at each visit—discontinue if pneumonitis suspected.
- **INTERACTIONS** → Appendix 1: methotrexate
- **SIDE-EFFECTS**
 - ▶ **Common or very common**
 - ▶ With intrathecal use Necrotising demyelinating leukoencephalopathy · neurotoxicity
 - ▶ With oral use Anaemia · appetite decreased · diarrhoea · drowsiness · fatigue · gastrointestinal discomfort · headache · increased risk of infection · leucopenia · nausea · oral disorders · respiratory disorders · skin reactions · throat ulcer · thrombocytopenia · vomiting
 - ▶ With parenteral use Anaemia · appetite decreased · chest pain · cough · diarrhoea · drowsiness · dyspnoea · fatigue · fever · gastrointestinal discomfort · headache · leucopenia · malaise · nausea · oral disorders · respiratory disorders · skin reactions · throat complaints · thrombocytopenia · vomiting
 - ▶ **Uncommon**
 - ▶ With oral use Agranulocytosis · alopecia · arthralgia · bone marrow disorders · chills · confusion · cystitis · depression · diabetes mellitus · dysuria · fever · gastrointestinal disorders · haemorrhage · healing impaired · hepatic disorders · myalgia · neoplasms · nephropathy · osteoporosis · photosensitivity reaction · rheumatoid arthritis aggravated · seizure · severe cutaneous adverse reactions (SCARs) · vasculitis · vertigo · vulvovaginal disorders
 - ▶ With parenteral use Agranulocytosis · alopecia · arthralgia · bone marrow disorders · confusion · cystitis · depression · diabetes mellitus · drug toxicity · dysuria · gastrointestinal disorders · haemorrhage · healing impaired · hepatic disorders · increased risk of infection · lipoatrophy · local reaction · myalgia · neoplasms · osteoporosis · pain · paraesthesia · photosensitivity reaction · rheumatoid arthritis aggravated · seizure · severe cutaneous adverse reactions (SCARs) · sterile abscess · vasculitis · vertigo · vulvovaginal disorders
 - ▶ **Rare or very rare**
 - ▶ With oral use Azotaemia · brain oedema · cognitive impairment · conjunctivitis · cough · dyspnoea · eosinophilia · gynaecomastia · hypotension · immune deficiency · infertility · insomnia · lymphadenopathy · meningitis aseptic · menstrual disorder · mood altered · muscle weakness · nail discoloration · neutropenia · oligozoospermia · pain · pancreatitis · paresis · pericardial disorders · pericarditis · proteinuria · psychosis · radiation injuries · renal impairment · retinopathy · sensation abnormal · sepsis · sexual dysfunction · speech impairment · stress fracture · taste metallic · telangiectasia · tinnitus · visual impairment
 - ▶ With parenteral use Apnoea · asthma-like conditions · azotaemia · conjunctivitis · embolism and thrombosis · eosinophilia · gynaecomastia · hypotension · immune deficiency · infertility · influenza like illness · insomnia · lymphadenopathy · meningism · meningitis aseptic · menstrual disorder · mood altered · muscle weakness · nail discoloration · necrosis · neutropenia · paralysis · pericardial disorders · pericarditis · proteinuria · reactivation of infection · renal impairment · retinopathy · sepsis · sexual dysfunction · sperm abnormalities · stress fracture · taste altered · telangiectasia · vision disorders
- ▶ **Frequency not known**
 - ▶ With oral use Encephalopathy
 - ▶ With parenteral use Aphasia · chills · cognitive disorder · defective oogenesis · dizziness · hemiparesis · leukoencephalopathy · metabolic change · mucositis ·

nephropathy · pancreatitis · pulmonary oedema · skin ulcer · sudden death · tinnitus

SIDE-EFFECTS, FURTHER INFORMATION Give folic acid to reduce side-effects. Folic acid decreases mucosal and gastrointestinal side-effects of methotrexate and may prevent hepatotoxicity; there is no evidence of a reduction in haematological side-effects.

Withdraw treatment if ulcerative stomatitis develops—may be first sign of gastro-intestinal toxicity.

Treatment with folic acid (as calcium folinate) may be required in acute toxicity.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men and women.
- **PREGNANCY** Avoid (teratogenic; fertility may be reduced during therapy but this may be reversible).
- **BREAST FEEDING** Discontinue breast-feeding—present in milk.
- **HEPATIC IMPAIRMENT** When used for malignancy, avoid in severe hepatic impairment—consult local treatment protocol for details. Avoid with hepatic impairment in non-malignant conditions—dose-related toxicity.
- **RENAL IMPAIRMENT** Risk of nephrotoxicity at high doses. Avoid in severe impairment.
Dose adjustments Reduce dose.

- **PRE-TREATMENT SCREENING** Exclude pregnancy before treatment.

Patients should have full blood count and renal and liver function tests before starting treatment.

● MONITORING REQUIREMENTS

- ▶ In view of reports of blood dyscrasias (including fatalities) and liver cirrhosis with low-dose methotrexate patients should:

- have full blood count and renal and liver function tests repeated every 1–2 weeks until therapy stabilised, thereafter patients should be monitored every 2–3 months.
- be advised to report all symptoms and signs suggestive of infection, especially sore throat

- ▶ Local protocols for frequency of monitoring may vary.
- ▶ Treatment with folic acid (as calcium folinate) may be required in acute toxicity.

- **PRESCRIBING AND DISPENSING INFORMATION** Folic acid following methotrexate administration helps to prevent methotrexate-induced mucositis and myelosuppression.

The licensed routes of administration for parenteral preparations vary—further information can be found in the product literature for the individual preparations.

- **PATIENT AND CARER ADVICE** Patients and their carers should be warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort and dark urine), and respiratory effects (e.g. shortness of breath).

Patients should be advised to avoid self-medication with over-the-counter aspirin or ibuprofen.

Patients should be counselled on the dose, treatment booklet, and the use of NSAIDs.

Methotrexate treatment booklets Methotrexate treatment booklets should be issued where appropriate.

In England, Wales, and Northern Ireland, they are available for purchase from:

3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham
OL9 9QH
Tel: 0845 610 1112
GP practices can obtain supplies through their Local Area Team stores.

NHS Hospitals can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com.

In Scotland, treatment booklets can be obtained by emailing stockorders.dppas@theapsgroup.com or by fax on 0131 629 9967.

These booklets include advice for adults taking oral methotrexate for inflammatory conditions, and a section for recording results of blood tests and dosage information.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

Tablet

▶ Methotrexate (Non-proprietary)

Methotrexate 2.5 mg Methotrexate 2.5mg tablets | 24 tablet [PoM] £1.29-£3.75 | 28 tablet [PoM] £3.82 DT = £2.34 | 100 tablet [PoM] £5.39-£14.10

Methotrexate 10 mg Methotrexate 10mg tablets | 100 tablet [PoM] £55.74 DT = £52.64

▶ Maxtrex (Pfizer Ltd)

Methotrexate 2.5 mg Maxtrex 2.5mg tablets | 24 tablet [PoM] £2.39 | 100 tablet [PoM] £9.96

Methotrexate 10 mg Maxtrex 10mg tablets | 100 tablet [PoM] £45.16 DT = £52.64

Solution for injection

▶ Methotrexate (Non-proprietary)

Methotrexate (as Methotrexate sodium) 2.5 mg per

1 ml Methotrexate 5mg/2ml solution for injection vials | 5 vial [PoM] £36.00 (Hospital only)

Methotrexate (as Methotrexate sodium) 25 mg per

1 ml Methotrexate 500mg/20ml solution for injection vials | 1 vial [PoM] £48.00-£726.28 (Hospital only)

Methotrexate 50mg/2ml solution for injection vials | 1 vial [PoM] £72.63 (Hospital only) | 5 vial [PoM] £35.00 (Hospital only)

Methotrexate (as Methotrexate sodium) 100 mg per

1 ml Methotrexate 1g/10ml solution for injection vials | 1 vial [PoM] £85.00 (Hospital only) | 1 vial [PoM] £80.75

▶ Methofill (Accord Healthcare Ltd)

Methotrexate 50 mg per 1 ml Methofill 12.5mg/0.25ml solution for injection pre-filled injector | 1 pre-filled disposable injection [PoM] £14.34 DT = £14.35

Methofill 22.5mg/0.45ml solution for injection pre-filled injector | 1 pre-filled disposable injection [PoM] £16.10 DT = £16.11

Methofill 30mg/0.6ml solution for injection pre-filled injector | 1 pre-filled disposable injection [PoM] £16.55 DT = £16.56

Methofill 27.5mg/0.55ml solution for injection pre-filled injector | 1 pre-filled disposable injection [PoM] £16.49 DT = £16.50

Methofill 7.5mg/0.15ml solution for injection pre-filled injector | 1 pre-filled disposable injection [PoM] £12.86 DT = £12.87

Methofill 20mg/0.4ml solution for injection pre-filled injector | 1 pre-filled disposable injection [PoM] £15.55 DT = £15.56

Methofill 10mg/0.2ml solution for injection pre-filled injector | 1 pre-filled disposable injection [PoM] £13.25 DT = £13.26

Methofill 15mg/0.3ml solution for injection pre-filled injector | 1 pre-filled disposable injection [PoM] £14.40 DT = £14.41

Methofill 17.5mg/0.35ml solution for injection pre-filled injector | 1 pre-filled disposable injection [PoM] £15.24 DT = £15.25

Methofill 25mg/0.5ml solution for injection pre-filled injector | 1 pre-filled disposable injection [PoM] £16.12 DT = £16.13

Methotrexate (as Methotrexate sodium) 50 mg per 1 ml Methofill 15mg/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £12.40

Methofill 25mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £14.24

Methofill 30mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £14.55

Methofill 10mg/0.2ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £11.25

Methofill 7.5mg/0.15ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £10.86

Methofill 17.5mg/0.35ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £13.24

Methofill 27.5mg/0.55ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £14.49

Methofill 22.5mg/0.45ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £14.10

Methofill 12.5mg/0.25ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £12.34

Methofill 20mg/0.4ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £13.55

► **Metoject PEN** (medac UK)

Methotrexate 50 mg per 1 ml Metoject PEN 27.5mg/0.55ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £16.50 DT = £16.50

Metoject PEN 17.5mg/0.35ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £15.25 DT = £15.25

Metoject PEN 30mg/0.6ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £16.56 DT = £16.56

Metoject PEN 12.5mg/0.25ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £14.35 DT = £14.35

Metoject PEN 10mg/0.2ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £13.26 DT = £13.26

Metoject PEN 25mg/0.5ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £14.41 DT = £14.41

Metoject PEN 22.5mg/0.45ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £16.11 DT = £16.11

Metoject PEN 7.5mg/0.15ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £12.87 DT = £12.87

Metoject PEN 25mg/0.5ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £16.13 DT = £16.13

Metoject PEN 20mg/0.4ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £15.56 DT = £15.56

► **Nordimet** (Nordic Pharma Ltd)

Methotrexate 25 mg per 1 ml Nordimet 15mg/0.6ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £14.92 DT = £14.92

Nordimet 20mg/0.8ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £16.06 DT = £16.06

Nordimet 22.5mg/0.9ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £16.61 DT = £16.61

Nordimet 12.5mg/0.5ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £14.85 DT = £14.85

Nordimet 10mg/0.4ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £13.77 DT = £13.77

Nordimet 17.5mg/0.7ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £15.75 DT = £15.75

Nordimet 25mg/1ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £16.64 DT = £16.64

Nordimet 7.5mg/0.3ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £13.37 DT = £13.37

► **Zlatal** (Nordic Pharma Ltd)

Methotrexate (as Methotrexate sodium) 25 mg per 1 ml Zlatal 17.5mg/0.7ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £15.75 DT = £15.75

Zlatal 10mg/0.4ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £13.77 DT = £13.77

Zlatal 25mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £16.64 DT = £16.64

Zlatal 20mg/0.8ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £16.06 DT = £16.06

Zlatal 12.5mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £14.85 DT = £14.85

Zlatal 7.5mg/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £13.37 DT = £13.37

Zlatal 22.5mg/0.9ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £16.61 DT = £16.61

Zlatal 15mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £14.92 DT = £14.92

Solution for infusion

► **Methotrexate (Non-proprietary)**

Methotrexate (as Methotrexate sodium) 100 mg per

1 ml Methotrexate 5g/50ml solution for infusion vials | 1 vial [PoM] £400.00 (Hospital only) | 1 vial [PoM] £380.00

Oral solution

► **Methotrexate (Non-proprietary)**

Methotrexate (as Methotrexate sodium) 2 mg per

1 ml Methotrexate 2mg/ml oral solution sugar free sugar-free | 35 ml [PoM] £114.00 DT = £95.00 sugar-free | 65 ml [PoM] £125.00 DT = £125.00

► **Jylamvo** (Intrapharm Laboratories Ltd)

Methotrexate (as Methotrexate sodium) 2 mg per 1 ml Jylamvo 2mg/ml oral solution sugar-free | 60 ml [PoM] £112.50

Nelarabine

24-Jul-2018

• INDICATIONS AND DOSE

T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in patients who have relapsed or who are refractory after receiving at least two previous regimens

► BY INTRAVENOUS INFUSION

► Adult: (consult local protocol)

• **CAUTIONS** Previous or concurrent craniospinal irradiation (increased risk of neurotoxicity) · previous or concurrent intrathecal chemotherapy (increased risk of neurotoxicity)

• **INTERACTIONS** → Appendix 1: nelarabine

• SIDE-EFFECTS

► **Common or very common** Abdominal pain · anaemia · appetite decreased · arthralgia · asthenia · confusion · constipation · cough · diarrhoea · dizziness · drowsiness · dyspnoea · electrolyte imbalance · fever · gait abnormal · headache · hyperbilirubinaemia · hypotension · increased risk of infection · leucopenia · memory loss · movement disorders · muscle weakness · myalgia · nausea · neutropenia · oedema · pain · peripheral neuropathy · respiratory disorders · seizures · sensation abnormal · sepsis · stomatitis · taste altered · thrombocytopenia · tremor · tumour lysis syndrome · vision blurred · vomiting

► **Rare or very rare** Rhabdomyolysis

► **Frequency not known** Progressive multifocal leukoencephalopathy (PML)

SIDE-EFFECTS, FURTHER INFORMATION If neurotoxicity occurs, treatment should be discontinued.

• **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months after treatment in men and women.

• **PREGNANCY** Avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

• **BREAST FEEDING** Discontinue breast-feeding.

• MONITORING REQUIREMENTS

► Neurotoxicity Close monitoring for neurological events is strongly recommended—discontinue if neurotoxicity occurs.

• PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling or driving).

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (April 2008) that the use of nelarabine (*Atriance*[®]) within NHS Scotland is restricted to bridging treatment before stem cell transplantation and restricted to use by haemato-oncology specialists.

• **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

Nelarabine 5 mg per 1 ml Atriance 250mg/50ml solution for infusion vials | 6 vial [PoM] £1,332.00

Pemetrexed

05-Apr-2019

● **DRUG ACTION** Pemetrexed inhibits thymidylate transferase and other folate-dependent enzymes.

● INDICATIONS AND DOSE

Treatment of unresectable malignant pleural mesothelioma which has not previously been treated with chemotherapy (in combination with cisplatin) | First-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (in combination with cisplatin) | Second-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (in combination with cisplatin) | Maintenance treatment in locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following platinum-based chemotherapy (monotherapy)

► BY INTRAVENOUS INFUSION

► Adult: (consult local protocol)

● **CAUTIONS** Diabetes · history of cardiovascular disease · prophylactic folic acid supplementation required (consult product literature) · prophylactic vitamin B₁₂ supplementation required (consult product literature)

● **INTERACTIONS** → Appendix 1: pemetrexed

● SIDE-EFFECTS

► **Common or very common** Appetite decreased · fatigue · mucositis · nausea · neuropathy sensory · oedema · pain · renal disorder · skin reactions · stomatitis · vomiting

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment. Men must avoid fathering a child during and for 6 months after treatment.

● **PREGNANCY** Avoid (toxicity in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

● **BREAST FEEDING** Discontinue breast-feeding.

● **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 45 mL/minute—no information available.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► Pemetrexed for the treatment of non-small cell lung cancer (August 2007) NICE TA124

Pemetrexed is **not** recommended for the treatment of locally advanced or metastatic non-small cell lung cancer which has previously been treated with chemotherapy. www.nice.org.uk/guidance/ta124

► Pemetrexed for the first-line treatment of non-small cell lung cancer (September 2009) NICE TA181

Pemetrexed, in combination with cisplatin, is an option for the first-line treatment of locally advanced or metastatic non-small cell lung cancer only if the histology of the tumour has been confirmed as adenocarcinoma or large-cell carcinoma.

www.nice.org.uk/guidance/ta181

► Pemetrexed maintenance treatment for non-squamous non-small cell lung cancer after pemetrexed and cisplatin (August 2016) NICE TA402

Pemetrexed (*Alimta*®) is recommended as an option for the maintenance treatment of locally advanced or metastatic non-squamous non-small cell lung cancer in patients when:

- their disease has not progressed immediately after 4 cycles of pemetrexed and cisplatin induction therapy
- their Eastern Cooperative Oncology Group performance status is 0 or 1 at the start of maintenance treatment, and,

● the manufacturer provides the drug according to the terms of the commercial access agreement as agreed with NHS England.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta402

► Pemetrexed for the maintenance treatment of non-small-cell lung cancer (updated August 2017) NICE TA190

Pemetrexed (*Alimta*®) is recommended as an option for the maintenance treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology if disease has not progressed immediately following platinum-based chemotherapy in combination with gemcitabine, paclitaxel or docetaxel.

www.nice.org.uk/guidance/ta190

► Pemetrexed for the treatment of malignant pleural mesothelioma (January 2008) NICE TA135

Pemetrexed is an option for the treatment of malignant pleural mesothelioma only in patients who have a WHO performance status of 0 or 1 [WHO performance status is a measure of the ability to perform ordinary tasks], who are considered to have advanced disease and for whom surgical resection is considered inappropriate.

www.nice.org.uk/guidance/ta135

Scottish Medicines Consortium (SMC) decisions

SMC No. 342/07

The *Scottish Medicines Consortium* has advised (September 2008) that pemetrexed (*Alimta*®) is accepted for restricted use within NHS Scotland as monotherapy for the second-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology. It is restricted for use in patients with good performance status who would otherwise be eligible for docetaxel treatment.

SMC No. 531/09

The *Scottish Medicines Consortium* has advised (February 2010) that pemetrexed (*Alimta*®) is accepted for restricted use within NHS Scotland in combination with cisplatin for the first-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology. It is restricted to patients in whom histology has been confirmed as adenocarcinoma or large cell carcinoma.

SMC No. 770/12

The *Scottish Medicines Consortium* has advised (December 2014) that pemetrexed (*Alimta*®) is accepted for use within NHS Scotland as monotherapy for the maintenance treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology in patients whose disease has not progressed immediately following platinum-based chemotherapy.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

► Pemetrexed (Non-proprietary)

Pemetrexed (as Pemetrexed disodium) 100 mg Pemetrexed 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £150.00-£185.22 (Hospital only)

Pemetrexed (as Pemetrexed disodium) 500 mg Pemetrexed 500mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £450.00-£926.10 (Hospital only)

Tegafur with gimeracil and oteracil

06-Feb-2019

- **DRUG ACTION** Tegafur is a prodrug of fluorouracil. Gimeracil inhibits the degradation of fluorouracil and oteracil decreases the activity of fluorouracil in normal gastrointestinal mucosa.

● INDICATIONS AND DOSE

Treatment of advanced gastric cancer when used in combination with cisplatin

- ▶ BY MOUTH
- ▶ Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 938.

- **CONTRA-INDICATIONS** Dihydropyrimidine dehydrogenase deficiency
- **INTERACTIONS** → Appendix 1: tegafur
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · appetite abnormal · asthenia · constipation · cough · decreased leucocytes · dehydration · diarrhoea · dizziness · dry mouth · dysphagia · dyspnoea · electrolyte imbalance · embolism and thrombosis · eye disorders · eye inflammation · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hearing impairment · hiccups · hyperbilirubinaemia · hypertension · hypoproteinaemia · hypotension · insomnia · nausea · nerve disorders · neutropenia · oral disorders · taste altered · thrombocytopenia · vision disorders · vomiting
 - ▶ **Uncommon** Aerophagia · allergic rhinitis · alopecia · angina pectoris · anxiety · aphasia · arrhythmias · ascites · breast abnormalities · burping · cerebrovascular insufficiency · chills · coagulation disorders · confusion · depression · drowsiness · dysphonia · ear discomfort · cephalopathy · eosinophilia · fever · gout · hallucination · heart failure · hemiparesis · hyperaemia · hyperglobulinaemia · hyperglycaemia · hyperlipidaemia · hypertrichosis · hypovolaemic shock · increased leucocytes · increased risk of infection · joint disorders · limb discomfort · loss of consciousness · memory loss · movement disorders · mucositis · muscle complaints · muscle weakness · myocardial infarction · nail disorders · nasal complaints · neoplasm complications · nephrotoxicity · oedema · oesophageal spasm · pain · palpitations · pancytopenia · pericardial effusion · personality disorder · renal impairment · seizure · sensation abnormal · sepsis · sexual dysfunction · skin reactions · smell altered · sweat changes · syncope · throat complaints · thrombocytosis · tremor · urinary frequency increased · vasodilation · vertigo · weight changes
 - ▶ **Rare or very rare** Acute hepatic failure · chest discomfort · feeling cold · interstitial lung disease · local swelling · malaise · multi organ failure · pancreatitis acute · photosensitivity reaction · rhabdomyolysis · severe cutaneous adverse reactions (SCARs)
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for up to 6 months after treatment.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute.
Dose adjustments Reduce dose if creatinine clearance 30–50 mL/minute—consult product literature.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 802/12

The *Scottish Medicines Consortium* has advised (September 2012) that tegafur with gimeracil and oteracil (*Teysuno*®) is accepted for restricted use within NHS Scotland for the treatment of advanced gastric cancer, when given in combination with cisplatin, in patients who are unsuitable for an anthracycline, fluorouracil, and platinum triplet first-line regimen.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 23

- ▶ **Teysuno** (Nordic Pharma Ltd)

Gimeracil 4.35 mg, Oteracil (as Oteracil potassium) 11.8 mg, Tegafur 15 mg Teysuno 15mg/4.35mg/11.8mg capsules | 126 capsule [PoM] £279.72

Gimeracil 5.8 mg, Oteracil (as Oteracil potassium) 15.8 mg, Tegafur 20 mg Teysuno 20mg/5.8mg/15.8mg capsules | 84 capsule [PoM] £248.40

Tioguanine

(Thioguanine)

● INDICATIONS AND DOSE

Acute leukaemia | Chronic myeloid leukaemia

- ▶ BY MOUTH
- ▶ Adult: 100–200 mg/m² daily, can be given at various stages of treatment in short-term cycles

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 938.

- **CONTRA-INDICATIONS** Absent thiopurine methyltransferase activity
- **CAUTIONS** Thiopurine methyltransferase status
CAUTIONS, FURTHER INFORMATION
 - ▶ Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.
 - ▶ Long-term therapy Long-term therapy is no longer recommended because of the high risk of liver toxicity.
- **INTERACTIONS** → Appendix 1: tioguanine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Bone marrow failure · gastrointestinal disorders · hepatic disorders · hyperbilirubinaemia · hyperuricaemia · hyperuricosuria · nodular regenerative hyperplasia · oesophageal varices · sinusoidal obstruction syndrome · splenomegaly · stomatitis · thrombocytopenia · uric acid nephropathy · weight increased
 - ▶ **Frequency not known** Photosensitivity reaction
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men or women.
- **PREGNANCY** Avoid (teratogenicity reported when men receiving tioguanine have fathered children). See also

Pregnancy and reproductive function in Cytotoxic drugs p. 938.

- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. **Dose adjustments** Manufacturer advises consider dose reduction.
- **RENAL IMPAIRMENT** **Dose adjustments** Reduce dose.
- **PRE-TREATMENT SCREENING** Consider measuring thiopurine methyltransferase (TPMT) activity before starting tioguanine therapy.
- **MONITORING REQUIREMENTS** Monitor liver function weekly—discontinue if liver toxicity develops.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Tablet

▶ Tioguanine (Non-proprietary)

Tioguanine 40 mg Tioguanine 40mg tablets | 25 tablet PoM
 £109.57 DT = £109.57

Trifluridine with tipiracil

06-Feb-2019

- **DRUG ACTION** Trifluridine is an antimetabolite that interferes with cancer cell DNA synthesis and inhibits cell proliferation; tipiracil is a TPase inhibitor that boosts trifluridine concentrations.

● INDICATIONS AND DOSE

Metastatic colorectal cancer, in patients previously treated with (or unsuitable for treatment with) available therapies including fluoropyrimidine-, oxaliplatin-, and irinotecan-based chemotherapies, or anti-vascular endothelial growth factor (VEGF) agents, or anti-epidermal growth factor receptor (EGFR) agents (specialist use only)

▶ BY MOUTH

- ▶ **Adult:** Initially 35 mg/m² twice daily (max. per dose 80 mg), given on days 1 to 5 and days 8 to 12 of each 28-day cycle, consult product literature for further information on dose adjustment

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 938.

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · appetite decreased · asthenia · constipation · cough · decreased leucocytes · diarrhoea · dizziness · dyspnoea · fever · flushing · gastrointestinal discomfort · headache · hyperbilirubinaemia · hypoalbuminaemia · increased leucocytes · increased risk of infection · insomnia · malaise · mucositis · nausea · neutropenia · oedema · oral disorders · peripheral neuropathy · skin reactions · taste altered · thrombocytopenia · urine abnormalities · vomiting · weight decreased
- ▶ **Uncommon** Angina pectoris · anxiety · arrhythmia · ascites · bile duct disorders · cancer pain · cataract · conjunctivitis · cystitis · dehydration · dry eye · dysphonia · ear discomfort · electrolyte imbalance · embolism and thrombosis · erythropeia · feeling of body temperature change · gastrointestinal disorders · gout · haemorrhage · hepatotoxicity · hyperglycaemia · hyperhidrosis · hypertension · hypotension · joint disorders · lethargy · menstrual disorder · muscle complaints · muscle weakness · nail disorder · neurotoxicity · oropharyngeal pain · pain · palpitations · pancreatitis acute · pancytopenia · photosensitivity reaction · pleural effusion · QT interval prolongation · renal failure · rhinorrhoea · sensation

abnormal · sensation of pressure · septic shock (including fatal cases) · syncope · urinary disorder · vertigo · vision disorders

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of child-bearing potential and in men with a partner of child-bearing potential, during treatment and for 6 months after stopping treatment. Manufacturer also advises use of an additional barrier method in women using hormonal contraceptives—effect of trifluridine with tipiracil on hormonal contraception unknown.
- **PREGNANCY** Manufacturer advises avoid unless essential—reproductive toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment (limited information available).
- **RENAL IMPAIRMENT** Manufacturer advises caution if eGFR 30–59 mL/minute/1.73 m²—monitor for haematological toxicities; manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m²—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises obtain baseline blood cell counts before and during treatment; monitor closely for myelosuppression. Manufacturer also advises monitoring for proteinuria before and during treatment.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Trifluridine with tipiracil for previously treated metastatic colorectal cancer (August 2016) NICE TA405 Trifluridine with tipiracil (*Lonsurf*[®]) is recommended, within its marketing authorisation, as an option for treating metastatic colorectal cancer in adults, only when provided by the manufacturer with the discount agreed in the patient access scheme. www.nice.org.uk/guidance/ta405

Scottish Medicines Consortium (SMC) decisions

SMC No. 1221/17

The *Scottish Medicines Consortium* has advised (February 2017) that trifluridine with tipiracil (*Lonsurf*[®]) is accepted for use within NHS Scotland for the treatment of adults with metastatic colorectal cancer who have been previously treated with, or are not considered candidates for, available therapies including fluoropyrimidine-, oxaliplatin- and irinotecan-based chemotherapies, anti-vascular endothelial growth factor agents, and anti-epidermal growth factor receptor agents.

This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

ANTINEOPLASTIC DRUGS > CYTOTOXIC ANTIBIOTICS AND RELATED SUBSTANCES

Bleomycin

● INDICATIONS AND DOSE

Squamous cell carcinoma | Metastatic germ cell cancer | Non-Hodgkin's lymphoma

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRA-ARTERIAL INJECTION, OR BY LOCAL INFILTRATION
- ▶ Adult: (consult product literature or local protocols)

- **CONTRA-INDICATIONS** Acute pulmonary infection · significantly reduced lung function
- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1: bleomycin
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · angular stomatitis · appetite decreased · chills · fever (after administration) · haemorrhage · headache · interstitial pneumonia · leucopenia · malaise · nail discolouration · nail disorder · nausea · pain · pulmonary fibrosis (dose-related) · scleroderma · skin reactions · stomatitis · vomiting · weight decreased
 - ▶ **Uncommon** Diarrhoea · dizziness · hepatocellular injury · oliguria · shock · urinary disorders · vein wall hypertrophy · venous stenosis

SIDE-EFFECTS, FURTHER INFORMATION **Progressive pulmonary fibrosis** Progressive pulmonary fibrosis is dose-related, and may occur at lower doses in the elderly. Suspicious chest X-ray changes are an indication to stop therapy with this drug.

Pulmonary toxicity Patients who have received bleomycin may be at risk of developing pulmonary toxicity if exposed to high inspired oxygen concentrations, for example peri-operatively, or during lung function testing.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Avoid (teratogenic and carcinogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938
- **BREAST FEEDING** Discontinue breast feeding.
- **RENAL IMPAIRMENT**

Dose adjustments Reduce dose by half if serum creatinine 177–354 micromol/litre; reduce dose further if serum-creatinine greater than 354 micromol/litre.
- **PRESCRIBING AND DISPENSING INFORMATION** To conform to the European Pharmacopoeia vials previously labelled as containing '15 units' of bleomycin are now labelled as containing 15 000 units. The amount of bleomycin in the vial has not changed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- ▶ **Bleo-Kyowa** (Kyowa Kirin Ltd)
Bleomycin (as Bleomycin sulfate) 15000 unit Bleo-Kyowa 15,000unit powder for solution for injection vials | 10 vial [PoM](#) £190.60

Mitomycin

04-Oct-2019

● INDICATIONS AND DOSE

Recurrent superficial bladder tumours (bladder instillation)

- ▶ BY INTRAVESICAL INSTILLATION
- ▶ Adult: (consult product literature or local protocols)

Upper gastro-intestinal cancer (specialist use only) | Breast cancer (specialist use only) | Non-small cell lung cancer (specialist use only) | Pancreatic cancer (specialist use only)

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: (consult product literature or local protocols)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: MITOMYCIN-C KYOWA® 40 MG RESTRICTED TO INTRAVESICAL ADMINISTRATION ONLY FOR TREATMENT OF SUPERFICIAL BLADDER CANCER (SEPTEMBER 2019)

Sub-visible particles, at levels above specification limits, have been observed after reconstitution of *Mitomycin-C Kyowa*® 40 mg; healthcare professionals are advised that its use has been restricted to the treatment of superficial bladder cancer via the intravesical route only.

- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1: mitomycin
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

 - ▶ **Common or very common** Bone marrow disorders · cough · cystitis · haemorrhage · leucopenia · malaise · nausea · respiratory disorders · skin reactions · thrombocytopenia · vomiting
 - ▶ **Uncommon** Alopecia · appetite decreased · diarrhoea · fever
 - ▶ **Rare or very rare** Hepatic disorders · increased risk of infection · renal disorder · sepsis
 - ▶ **Frequency not known** Anaemia · asthenia · chills · constipation · eosinophilia · erythropsenia · flushing · hypertension · lethargy · neutropenia · oedema · weight decreased

SPECIFIC SIDE-EFFECTS

 - ▶ **Common or very common**
 - ▶ With intravenous use Dyspnoea · extravasation necrosis · glomerulonephropathy · nephropathy · renal impairment
 - ▶ With intravesical use Hypersensitivity · urinary disorders · urinary tract discomfort
 - ▶ **Uncommon**
 - ▶ With intravenous use Mucositis · oral disorders
 - ▶ **Rare or very rare**
 - ▶ With intravenous use Haemolytic anaemia · heart failure · pulmonary hypertension · sinusoidal obstruction syndrome
 - ▶ With intravesical use Acute kidney injury · bladder disorders · urinary tract stenosis
 - ▶ **Frequency not known**
 - ▶ With intravenous use Abdominal discomfort · cholecystitis · injection site necrosis · neoplasms · shock · urine abnormalities · vascular pain
 - ▶ With intravesical use Pain · penile necrosis · proteinuria · pulmonary oedema · ulcer

SIDE-EFFECTS, FURTHER INFORMATION Mitomycin is usually administered at 6-weekly intervals because it causes delayed bone-marrow toxicity. Prolonged use may result in a cumulative effect.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.

- **MEDICAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- ▶ **Mitocin** (Vygoris Ltd)
Mitomycin 20 mg Mitocin 20mg powder for solution for injection vials | 1 vial [PoM] (Hospital only)
- ▶ **Mitomycin-C** (Kyowa Kirin Ltd)
Mitomycin 2 mg Mitomycin-C Kyowa 2mg powder for solution for injection vials | 10 vial [PoM] £58.83
Mitomycin 10 mg Mitomycin-C Kyowa 10mg powder for solution for injection vials | 1 vial [PoM] £21.37
Mitomycin 20 mg Mitomycin-C Kyowa 20mg powder for solution for injection vials | 1 vial [PoM] £39.94

Powder and solvent for intravesical solution

ELECTROLYTES: May contain Sodium

- ▶ **Mitomycin (Non-proprietary)**
Mitomycin 40 mg Mitomycin 40mg powder and solvent for intravesical solution vials | 1 vial [PoM] £135.00
- ▶ **Mitocin** (Vygoris Ltd)
Mitomycin 20 mg Mitocin 20mg powder and solvent for intravesical solution vials | 1 vial [PoM] (Hospital only)

Pentostatin

● INDICATIONS AND DOSE

Hairy cell leukaemia (initiated in specialist centres)

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: To be given on alternate weeks (consult product literature)

- **INTERACTIONS** → Appendix 1: pentostatin
- **SIDE-EFFECTS**
- ▶ **Common or very common** Agranulocytosis · alopecia · amenorrhoea · anaemia · angina pectoris · anxiety · appetite decreased · arrhythmias · arthritis · asthenia · asthma · atrioventricular block · blood disorder · bone disorder · bone marrow disorders · breast mass · cardiac arrest · chest pain · chills · confusion · constipation · cough · deafness · death · depersonalisation · depression · diarrhoea · dizziness · drowsiness · dry eye · dry mouth · dysarthria · dysphagia · dyspnoea · ear pain · electrolyte imbalance · embolism and thrombosis · emotional lability · eosinophilia · eye disorders · eye inflammation · eye pain · febrile neutropenia · fever · fluid imbalance · flushing · gastrointestinal discomfort · gastrointestinal disorders · gout · graft versus host disease · haemorrhage · hallucination · hangover · headaches · heart failure · hostility · hyperbilirubinaemia · hyperglycaemia · hyperhidrosis · hypersensitivity · hypertension · hypotension · increased risk of infection · influenza like illness · jaundice · joint disorders · leucopenia · lymphadenopathy · malaise · memory loss · meningism · movement disorders · muscle complaints · nausea · neoplasms · nephrolithiasis · nephropathy · nerve disorders · neurotoxicity (withhold or discontinue) · oedema · oral disorders · pain · paralysis · pericardial effusion · photosensitivity reaction · pulmonary oedema · rash (withhold if severe) · renal impairment · respiratory disorders · retinopathy · seborrhoea · seizures · sensation abnormal · sepsis · sexual dysfunction · skin reactions · sleep disorders · splenomegaly · syncope · taste altered · thinking abnormal · thrombocytopenia · tinnitus · tremor · urinary disorders · urogenital infection · vasculitis · vertigo · vision disorders · vomiting · weight changes
- ▶ **Uncommon** Angioedema · antibiotic associated colitis · capillary leak syndrome · cardiomyopathy · cystitis · haemolytic anaemia · mucositis · multi organ failure · myocardial infarction · pure red cell aplasia · transplant failure · tumour lysis syndrome
- ▶ **Rare or very rare** Dementia · pericarditis · shock · Stevens-Johnson syndrome · systemic inflammatory response syndrome

SIDE-EFFECTS, FURTHER INFORMATION Pentostatin can cause myelosuppression, immunosuppression, and a number of other side-effects that may be severe. Treatment should be withheld in patients who develop a severe rash, and withheld or discontinued in patients showing signs of neurotoxicity.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises that men should not father children during and for 6 months after treatment.
 - **PREGNANCY** Avoid (teratogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
 - **BREAST FEEDING** Discontinue breast-feeding.
 - **HEPATIC IMPAIRMENT** Manufacturer advises caution (limited information available).
 - **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 60 mL/minute.
 - **MEDICAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
- #### Powder for solution for injection
- ▶ **Nipent** (Pfizer Ltd)
Pentostatin 10 mg Nipent 10mg powder for solution for injection vials | 1 vial [PoM] £734.21 (Hospital only)

ANTINEOPLASTIC DRUGS > PLANT ALKALOIDS

Trabectedin

06-Feb-2019

● INDICATIONS AND DOSE

Treatment of advanced soft-tissue sarcoma when treatment with anthracyclines and ifosfamide has failed or is contra-indicated | Treatment of relapsed platinum-sensitive ovarian cancer (in combination with pegylated liposomal doxorubicin)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature or local protocols)

- **CONTRA-INDICATIONS** Elevated creatine phosphokinase (consult product literature)
 - **INTERACTIONS** → Appendix 1: trabectedin
 - **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · back pain · constipation · cough · dehydration · diarrhoea · dizziness · dyspnoea · fever · flushing · gastrointestinal discomfort · headache · hyperbilirubinaemia · hypersensitivity · hypokalaemia · hypotension · infection · insomnia · leucopenia · mucositis · myalgia · nausea · neutropenia · oedema · paraesthesia · peripheral neuropathy · skin reactions · stomatitis · taste altered · thrombocytopenia · vomiting · weight decreased
 - ▶ **Uncommon** Capillary leak syndrome · septic shock
 - ▶ **Rare or very rare** Hepatic failure
 - ▶ **Frequency not known** Extravasation necrosis · rhabdomyolysis
- SIDE-EFFECTS, FURTHER INFORMATION** A corticosteroid, such as dexamethasone by intravenous infusion, must be given 30 minutes before therapy for its antiemetic and hepatoprotective effects (consult product literature).
- **CONCEPTION AND CONTRACEPTION** Effective contraception recommended during and for at least 3 months after treatment in women and during and for at least 5 months after treatment in men.
 - **PREGNANCY** See *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
 - **BREAST FEEDING** Manufacturer advises avoid breast-feeding during and for 3 months after treatment.
 - **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).

Dose adjustments Manufacturer advises consider dose reduction.

- **RENAL IMPAIRMENT** Avoid monotherapy if creatinine clearance less than 30 mL/minute. Avoid combination regimens if creatinine clearance less than 60 mL/minute.

- **MONITORING REQUIREMENTS**

- ▶ Specific haematological, renal and hepatic parameters must be monitored and within certain ranges prior to starting treatment and repeated weekly during the first 2 cycles and at least once between treatments in subsequent cycles—consult product literature for full details.
- ▶ Monitor for signs and symptoms of rhabdomyolysis (including myelotoxicity, severe liver function disorder, renal failure, muscle weakness or pain)—monitor creatine phosphokinase closely and discontinue treatment (consult product literature).

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Trabectedin for the treatment of advanced soft tissue sarcoma (February 2010)** NICE TA185
Trabectedin (*Yondelis*[®]) is an option for advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed, is inappropriate or is not tolerated. The cost of trabectedin for treatment after the fifth cycle is met by the manufacturer.

www.nice.org.uk/guidance/ta185

- ▶ **Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016)** NICE TA389
Trabectedin (*Yondelis*[®]) in combination with pegylated liposomal doxorubicin hydrochloride (PLDH) is **not** recommended for treating the first recurrence of platinum-sensitive ovarian cancer.

Patients currently receiving trabectedin in combination with PLDH should have the option to continue their treatment until they or their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta389

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2210

The *Scottish Medicines Consortium* has advised (December 2019) that trabectedin (*Yondelis*[®]) is **not** recommended for use within NHS Scotland for the treatment of adults with advanced soft tissue sarcoma, after failure of anthracyclines and ifosfamide, or who are unsuited to receive these agents, as the clinical and economic case was not demonstrated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Yondelis** (Pharma Mar, S.A.)

Trabectedin 250 microgram Yondelis 0.25mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £363.00 (Hospital only)

Trabectedin 1 mg Yondelis 1mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £1,366.00 (Hospital only)

ANTINEOPLASTIC DRUGS > PLATINUM COMPOUNDS

Carboplatin

08-Mar-2019

- **INDICATIONS AND DOSE**

Advanced ovarian cancer [epithelial origin] | Small cell lung cancer | High risk seminoma (stage I) testicular germ cell tumours [adjuvant treatment]

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: platinum compounds

- **SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · anaemia · asthenia · cardiovascular disorder · constipation · diarrhoea · gastrointestinal discomfort · haemorrhage · hypersensitivity · increased risk of infection · leucopenia · mucosal abnormalities · musculoskeletal disorder · nausea · neutropenia · ototoxicity · peripheral neuropathy · reflexes decreased · respiratory disorders · sensation abnormal · skin reactions · taste altered · thrombocytopenia · urogenital disorder · vision disorders · vomiting

- ▶ **Rare or very rare** Angioedema

- ▶ **Frequency not known** Appetite decreased · bone marrow failure · chills · dehydration · embolism · encephalopathy · extravasation necrosis · fever · haemolytic uraemic syndrome · heart failure · hypertension · hyponatraemia · hypotension · injection site necrosis · malaise · pancreatitis · stomatitis · stroke · treatment related secondary malignancy · tumour lysis syndrome

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

- **PREGNANCY** Avoid (teratogenic and embryotoxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

- **BREAST FEEDING** Discontinue breast-feeding.

- **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 20 mL/minute.

Dose adjustments Reduce dose.

Monitoring Monitor haematological parameters in renal impairment.

Monitor renal function in renal impairment.

- **PRESCRIBING AND DISPENSING INFORMATION** Carboplatin can be given in an outpatient setting.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013)** NICE TA284

Bevacizumab in combination with paclitaxel and carboplatin is **not** recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer).

Patients whose treatment was started before this guidance was published should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta284

- ▶ **Bevacizumab in combination with gemcitabine and carboplatin for treating the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013)** NICE TA285
Bevacizumab in combination with gemcitabine and carboplatin is **not** recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.

Patients whose treatment was started before this guidance was published should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta285

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Carboplatin (Non-proprietary)**

Carboplatin 10 mg per 1 ml Carboplatin 50mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £20.20-£21.70 (Hospital only)

Carboplatin 150mg/15ml concentrate for solution for infusion vials | 1 vial [PoM] £56.06–£60.59 (Hospital only)
 Carboplatin 600mg/60ml concentrate for solution for infusion vials | 1 vial [PoM] £232.64–£264.53 (Hospital only)
 Carboplatin 600mg/60ml solution for infusion vials | 1 vial [PoM] £260.00 (Hospital only) | 1 vial [PoM] £260.00
 Carboplatin 450mg/45ml concentrate for solution for infusion vials | 1 vial [PoM] £166.32–£181.77 (Hospital only)
 Carboplatin 450mg/45ml solution for infusion vials | 1 vial [PoM] £197.48 (Hospital only) | 1 vial [PoM] £197.48
 Carboplatin 150mg/15ml solution for infusion vials | 1 vial [PoM] £65.83 (Hospital only) | 1 vial [PoM] £65.83
 Carboplatin 50mg/5ml solution for infusion vials | 1 vial [PoM] £22.86 (Hospital only) | 1 vial [PoM] £22.86

Cisplatin 50mg/50ml solution for infusion vials | 1 vial [PoM] £4.36–£28.11 DT = £19.50 | 1 vial [PoM] £25.37 DT = £19.50 (Hospital only)
 Cisplatin 10mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £5.36–£5.90 (Hospital only)
 Cisplatin 100mg/100ml concentrate for solution for infusion vials | 1 vial [PoM] £50.22–£55.64 DT = £29.83 (Hospital only)

Cisplatin

● INDICATIONS AND DOSE

Treatment of testicular, lung, cervical, bladder, head and neck, and ovarian cancer (alone or in combination)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

- **CAUTIONS** Cisplatin requires intensive intravenous hydration and treatment may be complicated by severe nausea and vomiting.
- **INTERACTIONS** → Appendix 1: platinum compounds
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · arrhythmias · bone marrow failure · electrolyte imbalance · extravasation necrosis · fever · leucopenia · nephrotoxicity (dose-related and potentially cumulative) · sepsis · thrombocytopenia
 - ▶ **Uncommon** Anaphylactoid reaction · ototoxicity (dose-related and potentially cumulative) · spermatogenesis abnormal
 - ▶ **Rare or very rare** Acute leukaemia · cardiac arrest · encephalopathy · myocardial infarction · nerve disorders · seizure · stomatitis
 - ▶ **Frequency not known** Alopecia · appetite decreased · asthenia · autonomic dysfunction · cardiac disorder · cerebrovascular insufficiency · deafness · dehydration · diarrhoea · haemolytic anaemia · hiccups · hyperuricaemia · infection · Lhermitte's sign · malaise · muscle spasms · myelopathy · nausea · papilloedema · pulmonary embolism · rash · Raynaud's phenomenon · renal impairment · renal tubular disorder · retinal discoloration · SIADH · taste loss · tetany · thrombotic microangiopathy · tinnitus · vision disorders · vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (teratogenic and toxic in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938).
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Avoid if possible—nephrotoxic.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor full blood count.
 - ▶ Monitor audiology.
 - ▶ Monitor plasma electrolytes.
 - ▶ Nephrotoxicity Monitoring of renal function is essential.
- **DIRECTIONS FOR ADMINISTRATION** Cisplatin is increasingly given in a day care setting.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Cisplatin (Non-proprietary)

Cisplatin 1 mg per 1 ml Cisplatin 50mg/50ml concentrate for solution for infusion vials | 1 vial [PoM] £24.50–£28.11 DT = £19.50 (Hospital only)
 Cisplatin 100mg/100ml solution for infusion vials | 1 vial [PoM] £50.22 DT = £29.83 (Hospital only) | 1 vial [PoM] £8.12 DT = £29.83

Oxaliplatin

● INDICATIONS AND DOSE

Treatment of metastatic colorectal cancer (in combination with fluorouracil and folinic acid) | Treatment of colon cancer after resection of the primary tumour (adjuvant treatment)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Peripheral neuropathy with functional impairment
- **INTERACTIONS** → Appendix 1: platinum compounds
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · chills · conjunctivitis · constipation · cough · decreased leucocytes · dehydration · depression · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · embolism and thrombosis · fever · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hiccups · hyperglycaemia · hyperhidrosis · hypersensitivity · hypertension · increased risk of infection · insomnia · meningism · mucositis · nail disorder · nausea · necrosis · nerve disorders · neutropenia · neutropenic sepsis · pain · peripheral neuropathy (dose-limiting) · sensation abnormal · skin reactions · stomatitis · taste altered · thrombocytopenia · urinary disorders · vision disorders · vomiting · weight changes
 - ▶ **Uncommon** Metabolic acidosis · nervousness · ototoxicity
 - ▶ **Rare or very rare** Acute kidney injury · acute tubular necrosis · antibiotic associated colitis · deafness · disseminated intravascular coagulation · dysarthria · haemolytic anaemia · hepatic disorders · immuno-allergic thrombocytopenia · nephritis acute interstitial · nodular regenerative hyperplasia · pancreatitis · posterior reversible encephalopathy syndrome (PRES) (with oxaliplatin combination chemotherapy) · respiratory disorders · sinusoidal obstruction syndrome · vision loss (reversible on discontinuation)
 - ▶ **Frequency not known** Autoimmune pancytopenia · chest discomfort · dysphagia · extravasation necrosis · gait abnormal · hypersensitivity vasculitis · movement disorders · muscle complaints · muscle contractions involuntary · QT interval prolongation · rhabdomyolysis · throat complaints

SIDE-EFFECTS, FURTHER INFORMATION Neurotoxicity is dose limiting.

Respiratory symptoms If unexplained respiratory symptoms occur, oxaliplatin should be discontinued until investigations exclude interstitial lung disease and pulmonary fibrosis.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for 4 months after treatment in women and 6 months after treatment in men.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 30 mL/minute.

Dose adjustments Reduce dose in mild to moderate impairment (consult product literature).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes' C) colon cancer (April 2006)** NICE TA100
Capecitabine alone or oxaliplatin combined with fluorouracil and folinic acid are options for adjuvant treatment following surgery for stage III (Dukes' C) colon cancer.
www.nice.org.uk/TA100
- ▶ **Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005)** NICE TA93
A combination of fluorouracil and folinic acid with either irinotecan or oxaliplatin are options for first-line treatment for advanced colorectal cancer.
Irinotecan alone or fluorouracil and folinic acid with oxaliplatin are options for patients who require further treatment subsequently.
www.nice.org.uk/TA93

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Oxaliplatin (Non-proprietary)

Oxaliplatin 5 mg per 1 ml Oxaliplatin 50mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £146.80-£163.78 (Hospital only) | 1 vial [PoM] £155.00

Oxaliplatin 100mg/20ml concentrate for solution for infusion vials | 1 vial [PoM] £289.50-£327.98 (Hospital only) | 1 vial [PoM] £311.00
Oxaliplatin 200mg/40ml concentrate for solution for infusion vials | 1 vial [PoM] £591.26-£655.96 (Hospital only)

ANTINEOPLASTIC DRUGS > PODOPHYLLOTOXIN DERIVATIVES

Etoposide

12-Jul-2018

● INDICATIONS AND DOSE

Small cell carcinoma of the bronchus, the lymphomas and testicular cancer

- ▶ BY MOUTH
Adult: 120–240 mg/m² daily for 5 days
- ▶ BY INTRAVENOUS INFUSION
Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 938.

- **INTERACTIONS** → Appendix 1: etoposide
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · acute leukaemia · alopecia · anaemia · appetite decreased · arrhythmia · asthenia · bone marrow depression · constipation · diarrhoea · dizziness · hepatotoxicity · hypertension · leucopenia · malaise · mucositis · myocardial infarction · nausea · neutropenia · skin reactions · thrombocytopenia · vomiting
- ▶ **Uncommon** Nerve disorders
- ▶ **Rare or very rare** Dysphagia · neurotoxicity · radiation recall reaction · respiratory disorders · seizure · severe cutaneous adverse reactions (SCARs) · taste altered · vision loss

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intravenous use Anaphylactic reaction · hypotension · infection
- ▶ With oral use Oesophagitis · stomatitis · transient systolic hypotension
- ▶ **Uncommon**
- ▶ With intravenous use Haemorrhage

- ▶ **Rare or very rare**
- ▶ With intravenous use Fever
- ▶ With oral use Drowsiness
- ▶ **FREQUENCY NOT KNOWN**
- ▶ With intravenous use Angioedema · extravasation necrosis · infertility · tumour lysis syndrome
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Avoid (teratogenic in *animal studies*). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of accumulation).
- **RENAL IMPAIRMENT**
Dose adjustments Consider dose reduction—consult local treatment protocol for details.
- **DIRECTIONS FOR ADMINISTRATION** Etoposide may be given orally or by slow intravenous infusion, the oral dose being double the intravenous dose. A preparation containing etoposide phosphate can be given by intravenous injection or infusion. Etoposide is usually given daily for 3–5 days and courses should not be repeated more frequently than at intervals of 21 days.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Etoposide (Non-proprietary)

Etoposide 20 mg per 1 ml Etoposide 100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £11.50-£16.29 (Hospital only)

Etoposide 200mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] (S) (Hospital only)

Etoposide 500mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £60.70-£81.42 (Hospital only)

Capsule

CAUTIONARY AND ADVISORY LABELS 23

▶ Vepesid (Cheplapharm Arzneimittel GmbH)

Etoposide 50 mg Vepesid 50mg capsules | 20 capsule [PoM] £99.82
Etoposide 100 mg Vepesid 100mg capsules | 10 capsule [PoM] £87.23

Powder for solution for injection

▶ Etopophos (Cheplapharm Arzneimittel GmbH)

Etoposide (as Etoposide phosphate) 100 mg Etopophos 100mg powder for solution for injection vials | 10 vial [PoM] £261.68

ANTINEOPLASTIC DRUGS > TAXANES

Cabazitaxel

11-Feb-2019

● INDICATIONS AND DOSE

Treatment of hormone refractory metastatic prostate cancer in patients who have previously been treated with a docetaxel-containing regimen (in combination with prednisone or prednisolone)

- ▶ BY INTRAVENOUS INFUSION
- ▶ **Adult:** (consult product literature or local protocols)

- **INTERACTIONS** Avoid in Acute porphyrias p. 1120
- **INTERACTIONS** → Appendix 1: taxanes
- **SIDE-EFFECTS**
- ▶ **Common or very common** Acute kidney injury · alopecia · anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · chest pain · chills · confusion · conjunctivitis · constipation · cough · cystitis · deep vein thrombosis · dehydration · diarrhoea · dizziness · dry mouth · dyspnoea · excessive tearing · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hydropnephrosis · hyperglycaemia · hypersensitivity · hypertension · hypokalaemia · hypotension · increased risk of infection · lethargy ·

leucopenia · malaise · mucositis · muscle complaints · nausea · nerve disorders · neutropenia · oedema · oropharyngeal pain · pain · pelvic pain · renal colic · renal failure (fatal cases of renal failure reported) · sensation abnormal · sepsis · skin reactions · taste altered · thrombocytopenia · tinnitus · ureteral obstruction · urinary disorders · vasodilation · vertigo · vomiting · weight decreased

▶ **Frequency not known** Respiratory disorders

● **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment (women) and for up to 6 months after treatment (men).

● **PREGNANCY** See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment. **Dose adjustments** Manufacturer advises dose reduction in mild to moderate impairment—consult product literature.

● **RENAL IMPAIRMENT** Use with caution if creatinine clearance less than 50 mL/minute.

● **MONITORING REQUIREMENTS** Monitor electrolytes—correct dehydration.

● **DIRECTIONS FOR ADMINISTRATION** Intravenous infusion incompatible with PVC.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

▶ Cabazitaxel for hormone-relapsed metastatic prostate cancer treated with docetaxel (updated August 2016) NICE TA391 Cabazitaxel (*Jevtana*®) in combination with prednisone or prednisolone is recommended as an option for treating metastatic hormone-relapsed prostate cancer in patients whose disease has progressed during or after docetaxel chemotherapy, only if the following criteria are met:

- the patient has an eastern cooperative oncology group (ECOG) performance status of 0 or 1
- the patient has had 225 mg/m² or more of docetaxel
- treatment with cabazitaxel is stopped when the disease progresses or after a maximum of 10 cycles
- the manufacturer provides cabazitaxel with the discount agreed in the patient access scheme
- NHS trusts purchase cabazitaxel in accordance with the commercial access agreement, either in vials (at a reduced price to reflect the average cost of waste per patient), or in pre-prepared intravenous infusion bags.

Patients currently receiving cabazitaxel that is not recommended according to the above criteria should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta391

Scottish Medicines Consortium (SMC) decisions

SMC No. 735/11

The *Scottish Medicines Consortium* has advised (December 2016) that cabazitaxel (*Jevtana*®) in combination with prednisone or prednisolone is accepted for restricted use within NHS Scotland for the treatment of patients with hormone refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen (patients who have received at least 225 mg/m² (three cycles) of docetaxel and have an Eastern Cooperative Oncology Group (ECOG) performance status of 0 or 1). This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Ethanol

▶ *Jevtana* (Sanofi)

Cabazitaxel 40 mg per 1 ml JEVTANA 60mg/1.5ml concentrate and solvent for solution for infusion vials | 1 vial [Pom] £3,696.00 (Hospital only)

Docetaxel

02-Aug-2018

INDICATIONS AND DOSE

Adjuvant treatment of operable node-positive and operable node-negative breast cancer (in combination with doxorubicin and cyclophosphamide) | Initial chemotherapy of locally advanced or metastatic breast cancer (with doxorubicin) | Locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline or an alkylating drug has failed (monotherapy) | Locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline has failed (with capecitabine) | Initial chemotherapy of metastatic breast cancer which overexpresses human epidermal growth factor-2 (with trastuzumab) | Locally advanced or metastatic non-small cell lung cancer where previous chemotherapy has failed | Initial chemotherapy of unresectable, locally advanced or metastatic non-small cell lung cancer (with cisplatin) | Hormone-resistant metastatic prostate cancer (in combination with prednisone or prednisolone) | Initial treatment of metastatic gastric adenocarcinoma, including adenocarcinoma of the gastro-oesophageal junction (with cisplatin and fluorouracil) | Induction treatment of locally advanced squamous cell carcinoma of the head and neck (with cisplatin and fluorouracil)

▶ BY INTRAVENOUS INFUSION

▶ Adult: (consult product literature or local protocols)

● **CAUTIONS** Avoid in Acute porphyrias p. 1120 · consult product literature

● **INTERACTIONS** → Appendix 1: taxanes

SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · alopecia · anaemia · appetite decreased · arrhythmia · arthralgia · asthenia · constipation · diarrhoea · dyspnoea · fluid imbalance · haemorrhage · hypersensitivity · hypertension · hypotension · increased risk of infection · myalgia · nail disorders · nausea · neutropenia · pain · peripheral neuropathy · sepsis · skin reactions · stomatitis · taste altered · thrombocytopenia · vomiting
- ▶ **Uncommon** Gastrointestinal disorders · heart failure
- ▶ **Frequency not known** Ascites · bone marrow depression · chest tightness · chills · cutaneous lupus erythematosus · disseminated intravascular coagulation · eye disorders · eye inflammation · fever · hearing impairment · hepatitis · hyponatraemia · loss of consciousness · multi organ failure · myocardial infarction · nail discolouration · neurotoxicity · ototoxicity · pericardial effusion · peripheral lymphoedema · peripheral oedema · pulmonary oedema · radiation injuries · renal impairment · respiratory disorders · sclerodermal-like changes · seizure · sensation abnormal · severe cutaneous adverse reactions (SCARs) · vasodilation · venous thromboembolism · vision disorders · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Pretreatment with dexamethasone by mouth is recommended for reducing fluid retention and hypersensitivity reactions.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception for men and women during treatment, and for at least 6 months after stopping treatment in men.

- **PREGNANCY** Avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate and to avoid in severe impairment. **Dose adjustments** Manufacturer advises dose reduction according to liver function tests in mild to moderate impairment —consult product literature. **Monitoring** Monitor liver function in hepatic impairment.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Docetaxel** for the treatment of hormone-refractory metastatic prostate cancer (June 2006) NICE TA101
Docetaxel is an option for hormone-refractory metastatic prostate cancer only if their Karnofsky score is at least 60% [Karnofsky score is a measure of the ability to perform ordinary tasks].
www.nice.org.uk/guidance/ta101
- ▶ **Pertuzumab with trastuzumab and docetaxel** for treating HER2-positive breast cancer (March 2018) NICE TA509
Pertuzumab, in combination with trastuzumab and docetaxel, is recommended, within its marketing authorisation, for treating HER2-positive metastatic or locally recurrent unresectable breast cancer, in adults who have not had previous anti-HER2 therapy or chemotherapy for their metastatic disease, only if the manufacturer provides pertuzumab within the agreed commercial access arrangement.
www.nice.org.uk/guidance/ta509

Scottish Medicines Consortium (SMC) decisions

SMC No. 369/07

The *Scottish Medicines Consortium* has advised (May 2007) that docetaxel (*Taxotere*[®]) in combination with cisplatin and fluorouracil is accepted for restricted use within NHS Scotland for the induction treatment of patients with unresectable locally advanced squamous cell carcinoma of the head and neck.

SMC No. 481/08

The *Scottish Medicines Consortium* has advised (July 2008) that docetaxel (*Taxotere*[®]) in combination with cisplatin and fluorouracil is accepted for restricted use within NHS Scotland for the induction treatment of patients with resectable locally advanced squamous cell carcinoma of the head and neck.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Ethanol

12-Apr-2019

- **DRUG ACTION** Paclitaxel is a member of the taxane group of drugs.

INDICATIONS AND DOSE

Treatment of ovarian cancer (advanced or residual disease following laparotomy) in combination with cisplatin (conventional paclitaxel only) | Treatment of metastatic ovarian cancer where platinum-containing therapy has failed (conventional paclitaxel only) | Treatment of locally advanced or metastatic breast cancer (in combination with other cytotoxics or alone if other cytotoxics have failed or are inappropriate) (conventional paclitaxel only) | Adjuvant treatment of node-positive breast cancer following treatment with anthracycline and cyclophosphamide (conventional paclitaxel only) | Treatment of non-small cell lung cancer (in combination with cisplatin) when surgery or radiotherapy not appropriate (conventional paclitaxel only) | Treatment of advanced AIDS-related Kaposi's sarcoma where liposomal anthracycline therapy has failed (conventional paclitaxel only) | Monotherapy of metastatic breast cancer when first-line treatment has failed and standard, anthracycline-containing therapy is not indicated (albumin-bound paclitaxel only) | In combination with gemcitabine for the first-line treatment of metastatic adenocarcinoma of the pancreas (albumin-bound paclitaxel only)

▶ BY INTRAVENOUS INFUSION

▶ Adult: (consult product literature or local protocols)

- **CAUTIONS** Avoid in Acute porphyrias p. 1120 · consult product literature · patients aged over 75 years with metastatic adenocarcinoma of the pancreas
- **INTERACTIONS** → Appendix 1: taxanes
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · bone marrow disorders · chest discomfort · chills · constipation · cough · decreased leucocytes · depression · diarrhoea · dizziness · drowsiness · dry eye · dyspnoea · electrolyte imbalance · excessive tearing · extravasation necrosis · eye inflammation · fever · fluid imbalance · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hyperpyrexia · hypertension · increased risk of infection · influenza like illness · insomnia · laryngeal pain · lymphoedema · malaise · movement disorders · mucositis · muscle complaints · nail discoloration · nail disorders · nasal complaints · nausea · nerve disorders · neutropenia · oedema · oral disorders · pain · respiratory disorders · sensation abnormal · skin reactions · taste altered · thrombocytopenia · vasodilation · vertigo · vision disorders · vomiting · weight changes
 - ▶ **Uncommon** Allergic rhinitis · breast pain · catheter related infection · dry mouth · dysphagia · ear pain · embolism and thrombosis · eye discomfort · facial swelling · gait abnormal · hepatomegaly · hoarseness · hyperglycaemia · hypoalbuminaemia · hypoglycaemia · hypotension · limb discomfort · muscle weakness · neoplasm complications · peripheral coldness · photosensitivity reaction · polydipsia · reflexes abnormal · sepsis · sweat changes · swelling · syncope · tinnitus · tremor · urinary disorders
 - ▶ **Rare or very rare** Atrioventricular block · cardiac arrest · congestive heart failure · left ventricular dysfunction · radiation injuries · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises routine premedication with a corticosteroid, an antihistamine and a histamine H₂-receptor antagonist is recommended to prevent severe hypersensitivity

reactions; hypersensitivity reactions may occur rarely despite premedication.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (toxicity in *animal studies*). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** (Consult product literature)
- **MONITORING REQUIREMENTS**
 - ▶ Cardiac monitoring should be undertaken, particularly if patients have underlying cardiac disease or previous exposure to anthracyclines.
 - ▶ Patients should be monitored for signs and symptoms of pneumonitis and sepsis.
- **PRESCRIBING AND DISPENSING INFORMATION** Paclitaxel is available as both conventional and albumin-bound formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable. Prescribers should specify the brand to be dispensed.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Guidance on the use of paclitaxel in the treatment of ovarian cancer (updated May 2005)** NICE TA55
Either paclitaxel in combination with a platinum compound (cisplatin or carboplatin) *or* a platinum compound alone are alternatives for the first-line treatment of ovarian cancer (usually following surgery). www.nice.org.uk/guidance/ta55
- ▶ **Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013)** NICE TA284
Bevacizumab in combination with paclitaxel and carboplatin is **not** recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer). www.nice.org.uk/guidance/ta284
- ▶ **Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016)** NICE TA389
Paclitaxel, in combination with platinum or as monotherapy, is recommended as an option for treating recurrent ovarian cancer. www.nice.org.uk/guidance/ta389
- ▶ **Paclitaxel as albumin-bound nanoparticles with gemcitabine for untreated metastatic pancreatic cancer (September 2017)** NICE TA476
Paclitaxel (*Abraxane*®) as albumin-bound nanoparticles (nab-paclitaxel) with gemcitabine is recommended as an option for untreated metastatic adenocarcinoma of the pancreas in adults, only if:
 - other combination chemotherapies are unsuitable and they would otherwise have gemcitabine monotherapy, **and**
 - the manufacturer provides nab-paclitaxel with the discount agreed in the patient access scheme.
 Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop. www.nice.org.uk/guidance/ta476

Scottish Medicines Consortium (SMC) decisions

SMC No. 556/09

The *Scottish Medicines Consortium* has advised (April 2010) that paclitaxel albumin (*Abraxane*®) is accepted for restricted use within NHS Scotland for the treatment of metastatic breast cancer in patients who have failed first-line treatment for metastatic disease and for whom

standard anthracycline containing therapy is not indicated; use is restricted to patients who would otherwise receive docetaxel or 3-weekly solvent-based paclitaxel as second-line treatment for metastatic breast cancer.

SMC No. 968/14

The *Scottish Medicines Consortium* has advised (February 2015) that paclitaxel albumin (*Abraxane*®) is accepted for use within NHS Scotland in combination with gemcitabine for the first-line treatment of adults with metastatic adenocarcinoma of the pancreas.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polyoxyl castor oils

▶ Paclitaxel (Non-proprietary)

Paclitaxel 6 mg per 1 ml Paclitaxel 150mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £300.52-£561.00 (Hospital only)

Paclitaxel 30mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £66.85-£120.03 (Hospital only)

Paclitaxel 100mg/16.7ml concentrate for solution for infusion vials | 1 vial [PoM] £200.35-£374.00 (Hospital only) | 1 vial [PoM] £359.72

Paclitaxel 300mg/50ml concentrate for solution for infusion vials | 1 vial [PoM] £601.03-£1,122.00 (Hospital only)

Powder for suspension for infusion

ELECTROLYTES: May contain Sodium

▶ Abraxane (Celgene Ltd)

Paclitaxel albumin 100 mg Abraxane 100mg powder for suspension for infusion vials | 1 vial [PoM] £246.00 (Hospital only)

ANTINEOPLASTIC DRUGS > TOPOISOMERASE I INHIBITORS

Irinotecan hydrochloride

15-Apr-2019

- **DRUG ACTION** Irinotecan inhibits topoisomerase I, an enzyme involved in DNA replication.

● INDICATIONS AND DOSE

Metastatic colorectal cancer in combination with fluorouracil and folinic acid or as monotherapy when treatment containing fluorouracil has failed | Treatment of epidermal growth factor receptor-expressing metastatic colorectal cancer after failure of chemotherapy that has included irinotecan (in combination with cetuximab) | First-line treatment of metastatic carcinoma of the colon or rectum (in combination with fluorouracil, folinic acid and bevacizumab) | First-line treatment of metastatic colorectal carcinoma (in combination with capecitabine with or without bevacizumab)

▶ BY INTRAVENOUS INFUSION

▶ Adult: (consult product literature or local protocols)

Metastatic adenocarcinoma of the pancreas in patients who have progressed following gemcitabine based therapy (in combination with fluorouracil and leucovorin) (specialist use only)

▶ BY INTRAVENOUS INFUSION USING LIPID FORMULATION

▶ Adult: (consult product literature or local protocols)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: *ONIVYDE*® (IRINOTECAN, LIPOSOMAL FORMULATIONS): REPORTS OF SERIOUS AND FATAL THROMBOEMBOLIC EVENTS (MARCH 2019)

Onivyde® has been associated with reports of serious thromboembolic events, such as pulmonary embolism, venous thrombosis, and arterial thromboembolism. Healthcare professionals are advised to obtain a thorough medical history to identify patients with multiple risk factors. Patients should be advised to seek medical advice immediately if signs or symptoms of thromboembolism occur, such as sudden pain and

swelling in a leg or an arm, sudden onset of coughing, chest pain or difficulty breathing.

- **CONTRA-INDICATIONS** Bowel obstruction · chronic inflammatory bowel disease
- **CAUTIONS** Raised plasma-bilirubin concentration · risk factors for cardiac disease · risk factors for pulmonary toxicity · underweight patients—increased risk of adverse events
- **INTERACTIONS** → Appendix 1: irinotecan
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · anaemia (dose-limiting) · appetite decreased · asthenia · cholinergic syndrome · constipation · decreased leucocytes · diarrhoea (delayed diarrhoea requires prompt treatment) · dizziness · dysphonia · dyspnoea · electrolyte imbalance · embolism and thrombosis · febrile neutropenia (dose-limiting) · fever · fluid imbalance · gastrointestinal discomfort · gastrointestinal disorders · hypoalbuminaemia · hypoglycaemia · hypotension · increased risk of infection · infusion related reaction · insomnia · mucositis · nausea · neutropenia (dose-limiting) · oedema · renal impairment · sepsis · stomatitis · taste altered · thrombocytopenia (dose-limiting) · vomiting · weight decreased
 - ▶ **Uncommon** Hypersensitivity · hypoxia · nail discolouration · skin reactions
 - ▶ **Frequency not known** Antibiotic associated colitis · circulatory collapse · gastrointestinal haemorrhage · hiccups · hypertension · interstitial lung disease · muscle cramps · paraesthesia · speech disorder · ulcerative colitis
- **CONCEPTION AND CONTRACEPTION** For *conventional* formulations, manufacturer advises effective contraception during treatment and for up to 1 month after treatment in women of child-bearing potential, and up to 3 months after treatment in men. For *liposomal* formulations, manufacturer advises effective contraception during treatment and for up to 1 month after treatment in women of child-bearing potential, and up to 4 months after treatment in men.
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 938.
- **BREAST FEEDING** For *conventional* formulations, manufacturer advises avoid. For *liposomal* formulations, manufacturer advises avoid until one month after the last dose—no information available.
- **HEPATIC IMPAIRMENT** For *conventional* formulations, manufacturer advises caution if bilirubin concentration 1.5–3 times the upper limit of normal (risk of decreased clearance)—monitor liver function at baseline and before each cycle; avoid if bilirubin concentration greater than 3 times the upper limit of normal (no information available for combination therapy). For *liposomal* formulations, manufacturer advises caution; avoid if bilirubin greater than 2 mg/dL, or if transaminases are greater than 2.5 times the upper limit of normal, or greater than 5 times the upper limit of normal if liver metastasis present (limited information available).
Dose adjustments For *conventional* formulations, manufacturer advises dose reduction—consult product literature.
- **RENAL IMPAIRMENT** For *conventional* formulations, manufacturer advises avoid—no information available. For *liposomal* formulations, manufacturer advises avoid in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor for respiratory symptoms in patients with risk factors for interstitial lung disease before and during treatment; monitor complete blood count weekly during treatment.

- **PRESCRIBING AND DISPENSING INFORMATION** Irinotecan is available as both *conventional* and *liposomal* formulations. These different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are **not** interchangeable.

- **PATIENT AND CARER ADVICE**

- ▶ **Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and visual disturbances within 24 hours of administration.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- ▶ **NICE decisions**

- ▶ **Pegylated liposomal irinotecan for treating pancreatic cancer after gemcitabine (April 2017)** NICE TA440

Pegylated liposomal irinotecan, in combination with fluorouracil and leucovorin, is **not** recommended for treating metastatic adenocarcinoma of the pancreas in adults whose disease has progressed after gemcitabine-based therapy.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA440

- ▶ **Scottish Medicines Consortium (SMC) decisions**

The *Scottish Medicines Consortium* has advised (March 2017) that liposomal irinotecan (Onivyde[®]) is **not** recommended for use within NHS Scotland for the treatment of metastatic adenocarcinoma of the pancreas, in combination with fluorouracil and leucovorin (folinic acid), in patients who have progressed following gemcitabine based therapy as there was insufficient evidence submitted.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- ▶ **Solution for infusion**

ELECTROLYTES: May contain Sodium

- ▶ **Irinotecan hydrochloride (Non-proprietary)**

Irinotecan hydrochloride trihydrate 20 mg per 1 ml Irinotecan 500mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £172.50-£767.36 (Hospital only)

Irinotecan 40mg/2ml concentrate for solution for infusion vials | 1 vial [PoM] £15.00-£53.00 (Hospital only) | 1 vial [PoM] £49.03-£54.84

Irinotecan 300mg/15ml concentrate for solution for infusion vials | 1 vial [PoM] £110.00-£390.00 (Hospital only) | 1 vial [PoM] £370.50-£403.34

Irinotecan 100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £48.00-£130.00 (Hospital only) | 1 vial [PoM] £120.25-£134.46

- ▶ **Campto** (Pfizer Ltd)

Irinotecan hydrochloride trihydrate 20 mg per 1 ml Campto 100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £130.00 (Hospital only)

Campto 40mg/2ml concentrate for solution for infusion vials | 1 vial [PoM] £53.00 (Hospital only)

Campto 300mg/15ml concentrate for solution for infusion vials | 1 vial [PoM] £390.00 (Hospital only)

- ▶ **Onivyde** (Servier Laboratories Ltd)

Irinotecan (as Irinotecan sucrosfate salt pegylated liposomal) 4.3 mg per 1 ml Onivyde pegylated liposomal 43mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £615.35 (Hospital only)

Topotecan

25-Jul-2018

- **DRUG ACTION** Topotecan inhibits topoisomerase I, an enzyme involved in DNA replication.

● INDICATIONS AND DOSE

Metastatic ovarian cancer when first-line or subsequent treatment has failed | Treatment of recurrent carcinoma of the cervix, after radiotherapy, and for patients with stage IVB disease (in combination with cisplatin)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature or local protocols)

Relapsed small-cell lung cancer when retreatment with the first-line regimen is considered inappropriate

- ▶ BY INTRAVENOUS INFUSION, OR BY MOUTH
- ▶ Adult: (consult product literature or local protocols)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 938.

- **INTERACTIONS** → Appendix 1: topotecan
- **SIDE-EFFECTS**
- ▶ **Common or very common** Alopecia · anaemia · appetite decreased · asthenia · colitis neutropenic · constipation · diarrhoea · fever · gastrointestinal discomfort · hyperbilirubinaemia · hypersensitivity · infection · leucopenia · malaise · mucositis · nausea · neutropenia · pancytopenia · sepsis · skin reactions · thrombocytopenia · vomiting
- ▶ **Rare or very rare** Angioedema · interstitial lung disease
- ▶ **Frequency not known** Bone marrow depression (dose-limiting) · haemorrhage
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **PREGNANCY** Avoid (teratogenicity and fetal loss in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (limited information available).
- **RENAL IMPAIRMENT** Avoid infusion if creatinine clearance less than 20 mL/minute. Avoid oral route if creatinine clearance less than 60 mL/minute.
Dose adjustments Reduce dose.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Topotecan for the treatment of recurrent and stage IVB cervical cancer (October 2009) NICE TA183**
Topotecan in combination with cisplatin is recommended as a treatment option for recurrent or stage IVB cervical cancer in patients who have not previously received cisplatin.
www.nice.org.uk/guidance/ta183
- ▶ **Topotecan for the treatment of relapsed small-cell lung cancer (November 2009) NICE TA184**
Oral topotecan is recommended as an option for treatment in patients with relapsed small-cell lung cancer only if re-treatment with the first-line regimen is not considered appropriate, and the combination of cyclophosphamide, doxorubicin and vincristine is contra-indicated. Intravenous topotecan is not recommended for people with relapsed small-cell lung cancer.
www.nice.org.uk/guidance/ta184
- ▶ **Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389**
Topotecan is **not** recommended for treating first recurrence of platinum-sensitive ovarian cancer, recurrent

platinum-resistant ovarian cancer, or platinum-refractory ovarian cancer.

Patients currently receiving topotecan should have the option to continue their treatment until they or their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta389

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (December 2007) that topotecan (*Hycamtin*[®]) is accepted for restricted use in combination with cisplatin for treatment of recurrent carcinoma of the cervix after radiotherapy and for stage IVB disease; it is restricted to patients who have not previously received cisplatin treatment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Topotecan (Non-proprietary)

Topotecan (as Topotecan hydrochloride) 1 mg per 1 ml Topotecan 4mg/4ml concentrate for solution for infusion vials | 5 vial [PoM](#) £1,453.10 (Hospital only)

Powder for solution for infusion

▶ Hycamtin (Novartis Pharmaceuticals UK Ltd)

Topotecan (as Topotecan hydrochloride) 1 mg Hycamtin 1mg powder for concentrate for solution for infusion vials | 1 vial [PoM](#) £97.65

Topotecan (as Topotecan hydrochloride) 4 mg Hycamtin 4mg powder for concentrate for solution for infusion vials | 1 vial [PoM](#) £348.76

▶ Potactasol (Actavis UK Ltd)

Topotecan (as Topotecan hydrochloride) 4 mg Potactasol 4mg powder for concentrate for solution for infusion vials | 1 vial [PoM](#) £290.00 (Hospital only)

Capsule

CAUTIONARY AND ADVISORY LABELS 25

▶ Hycamtin (Novartis Pharmaceuticals UK Ltd)

Topotecan (as Topotecan hydrochloride) 250 microgram Hycamtin 0.25mg capsules | 10 capsule [PoM](#) £75.00

Topotecan (as Topotecan hydrochloride) 1 mg Hycamtin 1mg capsules | 10 capsule [PoM](#) £360.00

ANTINEOPLASTIC DRUGS > VINCA ALKALOIDS

Vinblastine sulfate

03-Dec-2019

● INDICATIONS AND DOSE

Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)

- ▶ Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

Vinblastine is for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

- **CONTRA-INDICATIONS** Intrathecal injection **contra-indicated**.
- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1: vinca alkaloids
- **SIDE-EFFECTS**
- ▶ **Rare or very rare** Hearing impairment · nerve disorders · vestibular damage
- ▶ **Frequency not known** Abdominal pain · acute respiratory distress syndrome (ARDS) · alopecia (reversible) · anaemia · appetite decreased · asthenia · balance impaired · cancer pain · constipation · depression · diarrhoea · dizziness ·

dyspnoea · haemorrhage · headache · hypertension · ileus · increased risk of infection · leucopenia (dose-limiting) · malaise · mediastinal disorder · myalgia · myocardial infarction · nausea · nystagmus · oral blistering · pain · Raynaud's phenomenon · reflexes absent · seizure · sensation abnormal · SIADH · skin reactions · stroke · thrombocytopenia · vertigo · vomiting

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in *Cytotoxic drugs* p. 938.
- **PREGNANCY** Avoid (limited experience suggests fetal harm; teratogenic in *animal* studies). See also *Pregnancy and reproductive function* in *Cytotoxic drugs* p. 938.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in significantly impaired hepatic or biliary function.
Dose adjustments Manufacturer advises consider initial dose reduction in significantly impaired hepatic or biliary function.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Vinblastine sulfate (Non-proprietary)**
Vinblastine sulfate 1 mg per 1 ml Vinblastine 10mg/10ml solution for injection vials | 5 vial (PoM) £85.00 (Hospital only)

Vincristine sulfate

03-Dec-2019

● INDICATIONS AND DOSE

Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)

- ▶ Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

Vincristine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

- **CONTRA-INDICATIONS** Intrathecal injection **contra-indicated**.
- **CAUTIONS** Caution in handling—irritant to tissues · neuromuscular disease
- **INTERACTIONS** → Appendix 1: vinca alkaloids
- **SIDE-EFFECTS**
 - ▶ **Rare or very rare** Hypersensitivity · rash · SIADH
 - ▶ **Frequency not known** Abdominal cramps · adrenal disorder · alopecia · anaemia · appetite decreased · azotaemia · bladder atony · bronchospasm · connective tissue disorders · constipation · coronary artery disease · dehydration · diarrhoea · dizziness · dyspnoea · eighth cranial nerve damage · eye disorders · fever · gait abnormalities · gastrointestinal disorders · haemolytic anaemia · headache · hearing impairment · hypertension · hyponatraemia · hypotension · infection · leucopenia · movement disorders · muscle atrophy · myalgia · myocardial infarction · nausea · neuromuscular effects (dose-limiting) · neutropenia · oedema · oral ulceration · pain · paralysis · paresis · reflexes absent · renal disorder · secondary malignancy · sensation abnormal · sepsis · throat pain · thrombocytopenia · urinary disorders · vertigo · vestibular damage · vision loss · vomiting · weight decreased
