Levamisole

10-Mar-2020

INDICATIONS AND DOSE

Roundworm infections

- ► BY MOUTH
- ▶ Adult: 120-150 mg for 1 dose
- UNLICENSED USE Not licensed.
- CONTRA-INDICATIONS Blood disorders
- CAUTIONS Epilepsy · Sjögren's syndrome
 INTERACTIONS → Appendix 1: levamisole
- SIDE-EFFECTS Arthralgia (long term use) blood disorder (long term use) diarrhoea dizziness headache influenza like illness (long term use) insomnia (long term use) myalgia (long term use) nausea rash (long term use) seizure (long term use) taste altered (long term use) vasculitis (long term use) vomiting
- PREGNANCY Embryotoxic in animal studies, avoid if possible.
- BREAST FEEDING No information available.
- HEPATIC IMPAIRMENT

Dose adjustments Use with caution—dose adjustment may be necessary.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

CAUTIONARY AND ADVISORY LABELS 4

► Ergamisol (Imported (Belgium))

Levamisole (as Levamisole hydrochloride) 50 mg Ergamisol 50mg tablets | 20 tablet | PoM | Sal

Mebendazole

10-Nov-2021

INDICATIONS AND DOSE

Threadworm infections

- ► BY MOUTH
- Child 6 months-17 years: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks
- Adult: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks

Whipworm infections | Hookworm infections

- ► BY MOUTH
- ▶ Child 1-17 years: 100 mg twice daily for 3 days
- Adult: 100 mg twice daily for 3 days

Roundworm infections

- ► BY MOUTH
- ▶ Child 1 year: 100 mg twice daily for 3 days
- Child 2-17 years: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose
- Adult: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose

Threadworm infections (dose approved for use by community practitioner nurse prescribers)

- ► BY MOUT
- Child 2-17 years: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks
- Adult: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks
- UNLICENSED USE Not licensed for use as a single dose of 500 mg in roundworm infections.
- In children Not licensed for use in children under 2 years.
- INTERACTIONS → Appendix 1: mebendazole
- SIDE-FEECTS
- ► Common or very common Gastrointestinal discomfort
- ► Uncommon Diarrhoea flatulence

- ▶ Rare or very rare Alopecia · dizziness · hepatitis · neutropenia · seizure · severe cutaneous adverse reactions (SCARs) · skin reactions
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Amount present in milk too small to be harmful but manufacturer advises avoid.
- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include banana.
- PATIENT AND CARER ADVICE

Medicines for Children leaflet: Mebendazole for worm infections www.medicinesforchildren.org.uk/medicines/mebendazole-forworm-infections/

- EXCEPTIONS TO LEGAL CATEGORY Mebendazole tablets can be sold to the public if supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

Vermox (Janssen-Cilag Ltd)

Mebendazole 20 mg per 1 ml Vermox 100mg/5ml oral suspension | 30 ml [PoM] £1.55 DT = £1.55

Chewable tablet

Vermox (Janssen-Cilag Ltd)

Mebendazole 100 mg Vermox 100mg chewable tablets sugar-free | 6 tablet PoM £1.34 DT = £1.34

Praziquantel

• INDICATIONS AND DOSE

Tapeworm infections (Taenia solium)

► BY MOUTH

 Adult: 5-10 mg/kg for 1 dose, to be taken after a light breakfast

Tapeworm infections (Hymenolepis nana)

- ► BY MOUTH
- Adult: 25 mg/kg for 1 dose, to be taken after a light breakfast

Schistosoma haematobium worm infections | Schistosoma mansoni worm infections

- ► BY MOUTH
- ▶ Adult: 20 mg/kg, followed by 20 mg/kg after 4-6 hours

Schistosoma japonicum worm infections

- ► BY MOUTH
- Adult: 20 mg/kg 3 times a day for 1 day
- UNLICENSED USE Praziquantel is an unlicensed drug.
- INTERACTIONS → Appendix 1: praziquantel
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

► Praziguantel (Non-proprietary)

Praziquantel 150 mg Cesol 150mg tablets | 6 tablet PoM 🖫
Praziquantel 600 mg Biltricide 600mg tablets | 6 tablet PoM 🖫

Cysticide (Imported (Germany))

Praziquantel 500 mg Cysticide 500mg tablets | 90 tablet PoM 🖫

5 Protozoal infection

Antiprotozoal drugs

Amoebicides

Metronidazole p. 590 is the drug of choice for *acute invasive amoebic dysentery* since it is very effective against vegetative forms of *Entamoeba histolytica* in ulcers. Tinidazole is also effective. Metronidazole and tinidazole are also active against amoebae which may have migrated to the liver. Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate.

Diloxanide furoate is the drug of choice for asymptomatic patients with *E. histolytica* cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For amoebic abscesses of the liver metronidazole is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with more than 100 mL of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

Trichomonacides

Metronidazole is the treatment of choice for *Trichomonas vaginalis* infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole may be tried.

Antigiardial drugs

Metronidazole is the treatment of choice for *Giardia lamblia* infections. Alternative treatments are tinidazole or mepacrine hydrochloride p. 540.

Leishmaniacides

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

Sodium stibogluconate, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dosage varies with different geographical regions and expert advice should be obtained. Some early non-inflamed lesions of cutaneous leishmaniasis can be treated with intralesional injections of sodium stibogluconate under specialist supervision.

Amphotericin B p. 647 is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin B (AmBisome®). Abelcet®, a lipid formulation of amphotericin B, is also likely to be effective but less information is available.

Pentamidine isetionate p. 657 has been used in antimonyresistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed] (available from 'specialorder' manufacturers or specialist importing companies).

Malaria 661

Trypanocides

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

Toxoplasmosis

Most infections caused by Toxoplasma gondii are selflimiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma choroidoretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine p. 674 and sulfadiazine p. 614, given for several weeks (expert advice essential). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folinic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin p. 581 or clarithromycin p. 584 or azithromycin p. 583. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus; specialist advice should be sought on management. Spiramycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) may reduce the risk of transmission of maternal infection to the fetus.

5.1 Malaria

Malaria, prophylaxis

05-Aug-2021

Prophylaxis against malaria

The recommendations on prophylaxis reflect guidelines agreed by the Advisory Committee on Malaria Prevention (ACMP), published in the PHE Guidelines for malaria prevention in travellers from the United Kingdom, 2021. The advice is aimed at residents of the UK who travel to endemic

For specialist centres offering advice on specific malariarelated problems, see Malaria, treatment p. 667.

The choice of drug for a particular individual should take into account:

- risk of exposure to malaria
- · extent of drug resistance
- · efficacy of the recommended drugs
- · side-effects of the drugs
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen)

For guidance on risk assessment when advising on malaria prevention, see PHE: **Guidelines for malaria prevention in travellers from the United Kingdom** (see *Useful resources*).

Protection against bites

Prophylaxis is not absolute, and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important and is recommended even in malaria-free areas as a preventive measure against other insect vector-borne diseases. Mosquito bed nets impregnated with a pyrethroid insecticide (such as permethrin p. 1329), improve protection and should be used unless sleeping in a well screened room, or the room is fitted with functioning air conditioning and sufficiently well sealed into which mosquitoes cannot enter; vaporised insecticides are also useful. Long sleeves, long trousers, and socks worn after sunset also provide protection against bites.

Insect repellents give protection against bites, but attention to the correct application of product is required. Diethyltoluamide (DEET) is available in various preparations, including sprays and modified-release formulations, A 50% DEET-based insect repellent is recommended as the first choice; there is no further increase in duration of protection beyond a DEET concentration of 50%. DEET is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. However, ingestion should be avoided, therefore breast-feeding mothers should wash their hands and breast tissue before handling infants. When sunscreen is also required, DEET should be applied after the sunscreen. DEET reduces the SPF of sunscreen, so a sunscreen of SPF 30-50 should be applied. For alternative options if DEET is not tolerated or is unavailable, see PHE: Guidelines for malaria prevention in travellers from the United Kingdom (see Useful resources).

Length of prophylaxis

Prophylaxis should generally be started before travel into an endemic area; 1 week before travel for chloroquine p. 669 and proguanil hydrochloride p. 672; 2–3 weeks before travel for mefloquine p. 671; and 1–2 days before travel for atovaquone with proguanil hydrochloride p. 669 or doxycycline p. 616. Prophylaxis should be continued for 4 weeks after leaving the area (except for atovaquone with proguanil hydrochloride prophylaxis which should be stopped 1 week after leaving). For extensive journeys across different regions, the traveller must be protected in all areas of rick.

In those requiring long-term prophylaxis, chloroquine and proguanil hydrochloride may be used. However, there is considerable concern over the protective efficacy of the combination of chloroquine and proguanil hydrochloride in certain areas where it was previously useful. Mefloquine is licensed for use up to 1 year (although, if it is tolerated in the short term, there is no evidence of harm when it is used for up to 3 years). Doxycycline can be used for up to 2 years, and atovaquone with proguanil hydrochloride for up to 1 year. Prophylaxis with mefloquine, doxycycline, or atovaquone with proguanil hydrochloride may be considered for longer durations if it is justified by the risk of exposure to malaria. Specialist advice may be sought for long-term prophylaxis.

Return from malarial region

It is important to consider that any illness that occurs within 1 year and **especially within 3 months of return** might be malaria, even if all recommended precautions against malaria were taken. Travellers should be warned of this and told that if they develop any illness after their return they should see a doctor early, and specifically mention their risk of exposure to malaria.

Malaria is a notifiable disease in England, Northern Ireland, and Wales. For further information, see *Notifiable diseases* in Antibacterials, principles of therapy p. 540.

Epilepsy

Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In these patients, doxycycline or atovaquone with proguanil hydrochloride may be used. However doxycycline may interact with some antiepileptics and its dose may need to be adjusted, see *interactions* information for doxycycline.

Asplenia

Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

Pregnancy

Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, pregnant individuals must be informed about the risks and benefits of effective

Key to recommended regimens for prophylaxis against malaria		
Codes for regimens	Details of regimens for prophylaxis against malaria	
-	No risk	
1	Chemoprophylaxis not recommended, but avoid mosquito bites and consider malaria if fever presents	
2	Chloroquine only	
3	Chloroquine with proguanil	
4	Atoyaquone with proguanil hydrochloride or doxycycline or mefloquine	

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Afghanistan	Low risk below 2000 m from May-November	1
	Very low risk below 2000 m from December-April	1
Algeria	No risk	1
Andaman and Nicobar Islands (India)	Low risk	1
Angola	High risk	4
Argentina	No risk	1
Azerbaijan	Very low risk	1
Bangladesh	High risk in Chittagong Hill Tract districts (but not Chittagong city)	4
	Very low risk in Chittagong city and other areas, except Chittagong Hill Tract districts	1
Belize	Low risk in rural areas	1
	No risk in Belize district (including Belize city and islands)	-
Benin	High risk	4
Bhutan	Low risk in southern belt districts, along border with India: Chukha, Geyleg-phug, Samchi, Samdrup Jonkhar, and Shemgang	1
	No risk in areas other than those above	-
Bolivia	Low risk in Amazon basin	1
	Low risk in rural areas below 2500 m (other than above)	1
	No risk above 2500 m	-
Botswana	High risk from November-June in northern half, including Okavango Delta area	4
	Low risk from July-October in northern half, including Okavango Delta area	1
	Very low risk in southern half	1
Brazil	Low risk in Amazon basin, including city of Manaus	1
	Very low risk in areas other than those above	1
	No risk in Iguaçu Falls	-
Brunei Darussalam	Very low risk	1
Burkina Faso	High risk	4
Burundi	High risk	4
Cambodia	Low risk. Mefloquine resistance widespread in western provinces bordering Thailand	1
	Very low risk in Angkor Wat and Lake Tonle Sap, including Siem Reap	1
	No risk in Phnom Penh	-
Cameroon	High risk	4
Cape Verde	Very low risk on island of Santiago (Sao Tiago) and Boa Vista	1
Central African Republic	High risk	4
Chad	High risk	4
China	Low risk in Yunnan and Hainan provinces	1
	Very low risk in southern and some central provinces, including Anhui, Ghuizhou, Hena, Hubei, and Jiangsu below 1500 m	1
	Very low risk in areas other than those above and below	1
	No risk in Hong Kong	-

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Colombia	Low risk in rural areas below 1600 m	1
	Very low risk above 1600 m and in Cartagena	1
Comoros	High risk	4
Congo	High risk	4
Costa Rica	Low risk in Limon province, but not city of Limon (Puerto Limon)	1
	Very low risk in areas other than those above	1
Cote d'Ivoire (Ivory Coast)	High risk	4
Democratic Republic of the Congo	High risk	4
Djibouti	High risk	4
Dominican Republic	Low risk	1
	No risk in cities of Santiago and Santo Domingo	-
East Timor (Timor-Leste)	Low risk	1
Ecuador	Low risk in areas below 1500 m including coastal provinces and Amazon basin	1
	No risk in Galapagos islands or city of Guayaquil	-
Egypt	No risk	1
El Salvador	No risk	1
Equatorial Guinea	High risk	4
Eritrea	High risk below 2200 m	4
E i i i i i	No risk in Asmara or in areas above 2200 m	
Eswatini	Risk present in the northern and eastern regions bordering Mozambique and South Africa, including all the Lubombo district and Big Bend, Mhlume, Simunye and Tshaneni regions	4
	Very low risk in areas other than those above	1
Ethiopia	High risk below 2000 m	4
,	No risk in Addis Ababa or in areas above 2000 m	-
French Guiana	Risk present (particularly in border areas) except city of Cayenne or Devil's Island (Ile du Diable)	4
	Low risk in city of Cayenne or Devil's Island (Ile du Diable)	1
Gabon	High risk	4
Gambia	High risk	4
Georgia	Very low risk from June-October in rural south east	1
	No risk from November-May in rural south east	-
Ghana	High risk	4
Guatemala	Low risk below 1500 m	1
	No risk in Guatemala City, Antigua, or Lake Atitlan and above 1500 m	-
Guinea	High risk	4
Guinea-Bissau	High risk	4
Guyana	Risk present in all interior regions	4
dayana	Very low risk in Georgetown and coastal region	1
Haiti	Risk present	3
Honduras	Low risk below 1000 m and in Roatán and other Bay Islands	1
Honduras	No risk in San Pedro Sula and Tegucigalpa and areas above 1000 m	1
India	Risk present in states of Assam and Orissa, districts of East Godavari, Srikakulam, Vishakhapatnam, and Vizianagaram in the state of Andhra Pradesh, and districts of Balaghat, Dindori, Mandla, and Seoni in the state of Madhya Pradesh	4
	Low risk in areas other than those above or below (including Goa, Andaman and Nicobar islands)	1
	Exceptional circumstances in low risk areas (dependent on individual risk assessment)	3
	No risk in Lakshadweep islands	-
Indonesia	High risk in Irian Jaya (Papua)	4
	Low risk in Bali, Lombok and islands of Java and Sumatra	1
	No risk in city of Jakarta	-

	Low risk from July-October in areas below 1200 m	1
	Very low risk all year in Harare and Bulawayo	1

prophylaxis. Chloroquine and proguanil hydrochloride can be given during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined. In the case of proguanil hydrochloride, folic acid p. 1112 (dosed as a pregnancy at 'high-risk' of neural tube defects) should be given for the length of time that it is used during pregnancy. If travelling to high risk areas or there is resistance to other drugs, mefloquine may be considered during the second or third trimester of pregnancy. Mefloquine can be used in the first trimester with caution if the benefits outweigh the risks. Doxycycline is contraindicated during pregnancy; however, it can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks' gestation [unlicensed]. Atoyaquone with proguanil hydrochloride should be avoided during pregnancy, however, it can be considered during the second and third trimesters if there is no suitable alternative. Folic acid (dosed as a pregnancy at 'high-risk' of neural tube defects) should be given for the length of time that atovaquone with proguanil hydrochloride is used during pregnancy.

Breast-feeding

Some antimalarials should be avoided when breast feeding, see individual drug monographs for details.

Prophylaxis is required in **breast-fed infants**; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

Anticoagulants

Travellers taking warfarin sodium p. 155 should begin chemoprophylaxis 2–3 weeks before departure and the INR should be stable before departure. It should be measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

There is relatively limited experience of chemoprophylaxis in those travellers taking direct oral anticoagulants (DOACs).

Other medical conditions

For additional information on malaria prophylaxis in patients with other medical conditions, see PHE: **Guidelines**

for malaria prevention in travellers from the United Kingdom (see *Useful resources*). Patients already taking hydroxychloroquine sulfate p. 1190 for another indication, and for whom chloroquine p. 669 would be an appropriate antimalarial, can remain on hydroxychloroquine sulfate.

Emergency standby treatment

Travellers on prophylaxis and visiting remote, malarious areas should carry standby emergency treatment if they are likely to be more than 24 hours away from medical care. Standby emergency treatment should also be considered in long-term travellers living in or visiting remote, malarious areas that may be far from appropriate medical attention; this does not replace the need to consider prophylaxis. Self-medication should be **avoided** if medical help is accessible.

In order to use standby treatment appropriately, the traveller should be provided with written instructions which include seeking urgent medical attention if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller due to concerns over drug resistance and to minimise drug toxicity.

Malaria prophylaxis, specific recommendations

Travellers planning journeys across continents can travel into areas that have different malaria prophylaxis recommendations. The choice of prophylaxis medication must reflect overall risk to ensure protection in all areas; it may be possible to change from one regimen to another. Those travelling to remote or little-visited areas may require expert advice. For further information see Recommended regimens for prophylaxis against malaria, and PHE:

Guidelines for malaria prevention in travellers from the

United Kingdom (see Useful resources).

Malaria 667

BNF 84

Some countries not listed in *Recommended regimens for prophylaxis against malaria* may experience occasional instances of malaria transmission. For further guidance, see the National Travel Health Network and Centre (nathnac.net/) or TRAVAX (www.travax.nhs.uk/).

Important

Settled immigrants (or long-term visitors) in the UK may be unaware that any immunity they may have acquired while living in malarious areas is lost rapidly after migration to the UK, or that any non-malarious areas where they lived previously may now be malarious.

Treatment of malaria

Malaria is a notifiable disease in England, Northern Ireland, and Wales. For further information, see *Notifiable diseases* in Antibacterials, principles of therapy p. 540.

The recommendations on treatment reflect UK malaria treatment guidelines 2016, agreed by UK malaria specialists. They are aimed for residents of the UK and for use in a nonendemic setting.

Expert advice must be sought in all patients suspected to have malaria. If malaria is diagnosed in a returned traveller, other members of the family or travelling group should be advised that they may have shared the same exposure risk and they should seek medical attention if they develop symptoms.

If the infective species is **not known**, or if the infection is **mixed** and includes falciparum parasites, initial treatment should be as for *falciparum malaria*.

Falciparum malaria

Falciparum malaria is caused by *Plasmodium falciparum*. Patients with falciparum malaria should usually be admitted

to hospital initially due to the risk of rapid deterioration even after starting treatment.

Artemisinin combination therapy is recommended for the treatment of uncomplicated *P. falciparum* malaria. Artemether with lumefantrine p. 668 is the drug of choice; artenimol with piperaquine phosphate p. 668 is a suitable alternative. Oral quinine p. 673 or atovaquone with proguanil hydrochloride p. 669 can be used if an artemisinin combination therapy is not available. Quinine is highly effective but poorly-tolerated in prolonged treatment and should be used in combination with an additional drug, usually oral doxycycline p. 616 (or clindamycin p. 581 [unlicensed] in pregnant women and young children).

Severe or complicated falciparum malaria should be managed in a high dependency unit or intensive care setting. Intravenous artesunate (available for 'named-patient' use from infectious disease units or specialist tropical disease centres) is indicated in all patients with severe or complicated falciparum malaria, or those at high-risk of developing severe disease (such as if more than 2% of red blood cells are parasitized), or if the patient is unable to take oral treatment. Following a minimum of 24 hours of intravenous artesunate treatment, and when the patient has improved and is able take oral treatment, a full course of artemisinin combination therapy should be given. A full course of oral quinine with doxycycline (or clindamycin [unlicensed]), or atovaquone with proguanil hydrochloride are suitable alternatives.

Treatment of severe or complicated falciparum malaria should not be delayed whilst obtaining artesunate. Quinine by intravenous infusion [unlicensed] should be given if artesunate is not immediately available; it should be continued until the patient can take oral quinine to complete a full course. Oral doxycycline (or clindamycin [unlicensed]) should also be given when the patient can swallow.

In most parts of the world, *P. falciparum* is now resistant to chloroquine p. 669 which should not therefore be used for treatment. Mefloquine p. 671 is also no longer recommended for treatment because of concerns about adverse effects and non-completion of courses.

Specialist advice should be sought when considering the use of pyrimethamine with sulfadoxine as an alternative drug in combination with quinine.

Preanancy

Falciparum malaria in pregnancy carries a higher risk of severe disease; it requires prompt treatment by specialists in hospital and close observation. Uncomplicated falciparum malaria in the second and third trimesters of pregnancy should be treated with artemether with lumefantrine p. 668. Quinine with clindamycin [unlicensed indication] can be used in all trimesters. Quinine can increase the risk of uterine contractions and hypoglycemia.

Severe or complicated falciparum malaria is associated with a high risk of fatality, pregnancy loss, and complications. Due to efficacy, treatment with intravenous artesunate in any trimester of pregnancy is preferred; intravenous quinine (with clindamycin) can be used as an alternative.

Non-falciparum malaria

Non-falciparum malaria is usually caused by *Plasmodium vivax* and less commonly by *P. ovale, P. malariae*, and *P. knowlesi. P. knowlesi* is present in the Asia-Pacific region.

Either an artemisinin combination therapy (such as artemether with lumefantrine p. 668 or artenimol with piperaquine phosphate p. 668) or chloroquine can be used for the treatment of non-falciparum malaria. Chloroquineresistant *P. vivax* has been reported in the Indonesian archipelago, the Malay Peninsula, including Myanmar, and eastward to Southern Vietnam. Chloroquine can still be used for treatment of non-falciparum malaria from these regions with appropriate follow-up, however artemisinin combination therapy may be preferred.

ertion

Chloroquine alone is adequate for *P. malariae* and *P. knowlesi* infections but in the case of *P. vivax* and *P. ovale*, a *radical cure* (to destroy parasites in the liver and thus prevent relapses) is required. For a radical cure, primaquine p. 672 [unlicensed] is given with chloroquine treatment; the dose is dependent on the infecting organism. Patients should be screened for G6PD deficiency before initiating primaquine treatment, as primaquine may cause haemolysis in G6PD deficient individuals.

Severe or complicated non-falciparum malaria should be treated with parenteral **artesunate** or quinine [unlicensed] as for treatment of severe or complicated falciparum malaria.

Pregnancy

Chloroquine can be given for non-falciparum malaria treatment throughout pregnancy. Artemisinin combination therapy can be used in the second and third trimesters, and quinine may be used in the first trimester if there is concern about chloroquine-resistant *P. vivax*. In the case of *P. vivax* or *P. ovale* however, the radical cure with primaquine should be **postponed** until the pregnancy (and breast-feeding) is over; instead weekly chloroquine prophylaxis should be continued until delivery or completion of breast-feeding.

ANTIPROTOZOALS > ANTIMALARIALS

Artemether with lumefantrine

INDICATIONS AND DOSE

Treatment of acute uncomplicated falciparum malaria | Treatment of chloroquine-resistant non-falciparum malaria

- ► BY MOUTH
- Adult (body-weight 35 kg and above): Initially 4 tablets, followed by 4 tablets for 5 doses each given at 8, 24, 36, 48 and 60 hours (total 24 tablets over 60 hours)
- UNLICENSED USE Use in treatment of non-falciparum malaria is an unlicensed indication.
- CONTRA-INDICATIONS Family history of congenital QT interval prolongation · family history of sudden death history of arrhythmias · history of clinically relevant bradycardia · history of congestive heart failure accompanied by reduced left ventricular ejection fraction
- CAUTIONS Avoid in Acute porphyrias p. 1150 electrolyte disturbances (correct before and during treatment)
- INTERACTIONS → Appendix 1: antimalarials
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · appetite decreased · arthralgia · asthenia · cough · diarrhoea · dizziness · gait abnormal · headache · movement disorders · myalgia · nausea · palpitations · QT interval prolongation · sensation abnormal · skin reactions · sleep disorders · vomiting
- ► Uncommon Drowsiness
- ▶ Frequency not known Angioedema
- PREGNANCY Toxicity in animal studies with artemether.
 Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid breastfeeding for at least 1 week after last dose. Present in milk in *animal* studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (no information available)—monitor ECG and plasma potassium concentration.
- RENAL IMPAIRMENT [EVG] Caution in severe impairment (limited information available)—monitor ECG and plasma potassium concentration. ♠
- MONITORING REQUIREMENTS Monitor patients unable to take food (greater risk of recrudescence).

- DIRECTIONS FOR ADMINISTRATION Manufacturer advises tablets may be crushed just before administration.
- PATIENT AND CARER ADVICE

Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving).

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

INDICATIONS AND DOSE

Treatment of uncomplicated falciparum malaria

► BY MOUTH

09-Sen-2021

- Child 6 months-17 years (body-weight 7-12 kg): 0.5 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Child 6 months-17 years (body-weight 13-23 kg): 1 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Child 6 months-17 years (body-weight 24-35 kg): 2 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Child 6 months-17 years (body-weight 36-74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- ► Child 6 months-17 years (body-weight 75-99 kg): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Adult (body-weight 36-74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Adult (body-weight 75-99 kg): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- CONTRA-INDICATIONS Acute myocardial infarction bradycardia congenital long QT syndrome electrolyte disturbances family history of sudden death heart failure with reduced left ventricular ejection fraction history of symptomatic arrhythmias left ventricular hypertrophy risk factors for QT interval prolongation severe hypertension
- INTERACTIONS → Appendix 1: antimalarials
- SIDE-EFFECTS
- ► Common or very common Anaemia · arrhythmias (in adults) · asthenia · conjunctivitis (in children) · eosinophilia · fever · headache (uncommon in children) · leucocytosis (in children) · leucopenia (in children) · neutropenia (in children) · QT interval prolongation · thrombocytopenia (in children)
- ▶ Uncommon Abdominal pain (very common in children) appetite decreased (very common in children) arthralgia cardiac conduction disorder cough (very common in children) diarrhoea (very common in children) dizziness (in adults) epistaxis (in children) hepatic disorders hypochromia (in children) increased risk of infection (very common in children) lymphadenopathy (in children) myalgia (in adults) nausea rhinorrhoea (in children) seizure skin reactions (very common in children) splenomegaly (in children) stomatitis (in

Malaria 669

- children) thrombocytosis (in children) vomiting (very common in children)
- PREGNANCY Teratogenic in animal studies—manufacturer advises use only if other antimalarials cannot be used.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies
- HEPATIC IMPAIRMENT Manufacturer advises caution in jaundice or in moderate to severe failure (no information available)—monitor ECG and plasma potassium concentration
- RENAL IMPAIRMENT EVG: Caution in moderate to severe impairment (no information available)—monitor ECG and plasma potassium concentration.
- MONITORING REQUIREMENTS
- Consider obtaining ECG in all patients before third dose and 4–6 hours after third dose. If QT_c interval more than 500 milliseconds, discontinue treatment and monitor ECG for a further 24–48 hours.
- Obtain ECG as soon as possible after starting treatment then continue monitoring in those taking medicines that increase plasma-piperaquine concentration, in children who are vomiting, in females, or in the elderly.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises tablets to be taken at least 3 hours before and at least 3 hours after food. Tablets may be crushed and mixed with water immediately before administration.
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer tablets containing piperaquine phosphate with artenimol.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected [using 250 mg/100 mg tablets]

- ► BY MOUTH
- Adult (body-weight 40 kg and above): 1 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving

Prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected [using 62.5 mg/25 mg tablets]

- ► BY MOUTH
- Adult (body-weight 30-39 kg): 3 tablets once daily, to be started 1-2 days before entering endemic area and continued for 1 week after leaving

Treatment of acute uncomplicated falciparum malaria [using 250 mg/100 mg tablets] | Treatment of nonfalciparum malaria [using 250 mg/100 mg tablets]

- ► BY MOUTH
- Adult: 4 tablets once daily for 3 days

DOSE EQUIVALENCE AND CONVERSION

- Each 250 mg/100 mg tablet contains 250 mg of atovaquone and 100 mg of proguanil hydrochloride.
- Each 62.5 mg/25 mg tablet contains 62.5 mg of atovaquone and 25 mg of proguanil hydrochloride.
- UNLICENSED USE Not licensed for treatment of nonfalciparum malaria.

- CAUTIONS Diarrhoea or vomiting (reduced absorption of atovaquone) - efficacy not evaluated in cerebral or complicated malaria (including hyperparasitaemia, pulmonary oedema or renal failure)
- INTERACTIONS → Appendix 1: antimalarials
- SIDE-EFFECTS
- ► Common or very common Abdominal pain appetite decreased cough depression diarrhoea dizziness fever headache nausea skin reactions sleep disorders vomiting
- ► Uncommon Alopecia · anxiety · blood disorder · hyponatraemia · oral disorders · palpitations
- Frequency not known Hallucination hepatic disorders photosensitivity reaction seizure Stevens-Johnson syndrome tachycardia vasculitis
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk. See also *Pregnancy* in Malaria, prophylaxis p. 661.
- BREAST FEEDING Use only if no suitable alternative available.
- RENAL IMPAIRMENT EVGT Avoid for malaria prophylaxis (and if possible for malaria treatment) if creatinine clearance less than 30 mL/minute, see p. 21.
- PATIENT AND CARER ADVICE Warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.
- NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

- ► BY MOUTH USING TABLETS
- Child (body-weight up to 6 kg): 38.75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child (body-weight 6-9 kg): 77.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child (body-weight 10-15 kg): 116.25 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child (body-weight 16-24 kg): 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child (body-weight 25-44 kg): 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child (body-weight 45 kg and above): 310 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Adult (body-weight 25-44 kg): 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Adult (body-weight 45 kg and above): 310 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

Treatment of non-falciparum malaria

- ► BY MOUTH
- Child: Initially 10 mg/kg (max. per dose 620 mg), then 5 mg/kg after 6-8 hours (max. per dose 310 mg), then 5 mg/kg daily (max. per dose 310 mg) for 2 days
- Adult: Initially 620 mg, then 310 mg after 6-8 hours, then 310 mg daily for 2 days, approximate total cumulative dose of 25 mg/kg of base

P. vivax or P. ovale infection during pregnancy while radical cure is postponed

- ► BY MOUTH
- Adult: 310 mg once weekly

DOSE EQUIVALENCE AND CONVERSION

- ▶ Doses expressed as chloroquine base.
- Each tablet contains 155 mg of chloroquine base (equivalent to 250 mg of chloroquine phosphate).
 Syrup contains 50 mg/5 mL of chloroquine base (equivalent to 80 mg/5 mL of chloroquine phosphate).

DOSES AT EXTREMES OF BODY-WEIGHT

 With oral use in adults In active rheumatoid arthritis and systemic and discoid lupus erythematosus, to avoid excessive dosage in obese patients, the daily maximum dose should be calculated on the basis of ideal body weight. UNLICENSED USE Chloroquine doses for the treatment and prophylaxis of malaria in BNF Publications may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

In adults

Ocular toxicity is unlikely if the dose of chloroquine phosphate does not exceed 4 mg/kg daily (equivalent to chloroquine base approx. 2.5 mg/kg daily).

MHRA/CHM ADVICE: HYDROXYCHLOROQUINE, CHLOROQUINE: INCREASED RISK OF CARDIOVASCULAR EVENTS WHEN USED WITH MACROLIDE ANTIBIOTICS; REMINDER OF PSYCHIATRIC REACTIONS (FEBRUARY 2022)

An observational study has shown that co-administration of azithromycin with hydroxychloroquine in patients with rheumatoid arthritis was associated with an increased risk of cardiovascular events (including angina or chest pain and heart failure) and mortality. Healthcare professionals are reminded to consider the benefits and risks of co-prescribing systemic macrolides with chloroquine because of its similar safety profile to hydroxychloroquine. If such use cannot be avoided, caution is recommended in patients with risk factors for cardiac events and they should be advised to seek urgent medical attention if any signs or symptoms develop.

A European safety review has reported that psychiatric reactions associated with chloroquine (including rare cases of suicidal behaviour) typically occurred within the first month of treatment; events have been reported in patients with no history of psychiatric disorders. Healthcare professionals are reminded to be vigilant for psychiatric reactions, and counsel patients and carers to seek medical advice if any new or worsening mental health symptoms develop.

- CAUTIONS Acute porphyrias p. 1150 · diabetes (may lower blood glucose) · G6PD deficiency · long-term therapy (risk of retinopathy and cardiomyopathy) · may aggravate myasthenia gravis · may exacerbate psoriasis · neurological disorders, especially epilepsy (may lower seizure threshold)—avoid for prophylaxis of malaria if history of epilepsy · severe gastro-intestinal disorders
- INTERACTIONS → Appendix 1: antimalarials
- SIDE-EFFECTS
- ▶ Rare or very rare Cardiomyopathy hallucination hepatitis
- ▶ Frequency not known Abdominal pain · agranulocytosis · alopecia · anxiety · atrioventricular block · behaviour abnormal · bone marrow disorders · concentration impaired · confusion · corneal deposits · delusions · depression · diarrhoea · eye disorders · gastrointestinal disorder · headache · hearing impairment · hypoglycaemia · hypotension · interstitial lung disease · mania · movement disorders · myopathy · nausea · neuromyopathy · neutropenia · photosensitivity reaction · psychiatric disorder · psychosis · QT interval prolongation · seizure · severe cutaneous adverse reactions (SCARs) · skin reactions · sleep disorders · suicidal behaviour · thrombocytopenia · tinnitus · tongue protrusion · vision disorders · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Side-effects which occur at doses used in the prophylaxis or treatment of malaria are generally not serious.

Overdose Chloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

 PREGNANCY Benefit of use in prophylaxis and treatment in malaria outweighs risk. For rheumatoid disease, it is not necessary to withdraw an antimalarial drug during pregnancy if the disease is well controlled.

- BREAST FEEDING Present in breast milk and breastfeeding should be avoided when used to treat rheumatic disease. Amount in milk probably too small to be harmful when used for malaria.
- HEPATIC IMPAIRMENT Manufacturer advises caution, particularly in cirrhosis.
- RENAL IMPAIRMENT Manufacturers advise caution.
 Dose adjustments Only partially excreted by the kidneys and reduction of the dose is not required for prophylaxis of malaria except in severe impairment.

For rheumatoid arthritis and lupus erythematosus, reduce dose.

MONITORING REQUIREMENTS

- In adults A review group convened by the Royal College of Ophthalmologists has updated guidelines on monitoring for chloroquine and hydroxychloroquine retinopathy (Hydroxychloroquine and Chloroquine Retinopathy: Recommendations on Monitoring 2020). Chloroquine appears to be more retinotoxic than hydroxychloroquine. Annual monitoring (including fundus autofluorescence and spectral domain optical coherence tomography) is recommended in all patients who have taken chloroquine for longer than 1 year.
- In children Expert sources advise ophthalmic examination with long-term therapy.
- PATIENT AND CARER ADVICE Warn travellers going to malarious areas about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.

- EXCEPTIONS TO LEGAL CATEGORY Tablets can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

INDICATIONS AND DOSE

Treatment of malaria

- ▶ BY MOUTH
- Adult: (consult product literature)

Prophylaxis of malaria

- ► BY MOUTH
- Child (body-weight 5-15 kg): 62.5 mg once weekly, dose to be started 2-3 weeks before entering endemic area and continued for 4 weeks after leaving
- Child (body-weight 16-24 kg): 125 mg once weekly, dose to be started 2-3 weeks before entering endemic area and continued for 4 weeks after leaving
- Child (body-weight 25-44 kg): 187.5 mg once weekly, dose to be started 2-3 weeks before entering endemic area and continued for 4 weeks after leaving
- Child (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- Adult (body-weight 25-44 kg): 187.5 mg once weekly, dose to be started 2-3 weeks before entering endemic area and continued for 4 weeks after leaving
- Adult (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2-3 weeks before entering endemic area and continued for 4 weeks after leaving
- UNLICENSED USE Mefloquine doses in BNF Publications may differ from those in product literature.
- In children Not licensed for use in children under 5 kg body-weight and under 3 months.
- CONTRA-INDICATIONS Avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions - avoid for standby treatment if history of convulsions history of blackwater fever
- CAUTIONS Cardiac conduction disorders epilepsy (avoid for prophylaxis) - infants less than 3 months (limited experience) - not recommended in infants under 5 kg traumatic brain injury

CAUTIONS, FURTHER INFORMATION

- Neuropsychiatric reactions Mefloquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Psychiatric symptoms such as insomnia, nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodromal for a more serious event. Adverse reactions may occur and persist up to several months after discontinuation because mefloquine has a long half-life. For a prescribing checklist, and further information on side-effects, particularly neuropsychiatric side-effects, which may be associated with the use of mefloquine for malaria prophylaxis, see the Guide for Healthcare Professionals provided by the manufacturer.

- ALLERGY AND CROSS-SENSITIVITY EVG: Contra-indicated in patients with hypersensitivity to quinine.
- CONCEPTION AND CONTRACEPTION Manufacturer advises adequate contraception during prophylaxis and for 3 months after stopping (teratogenicity in animal studies).
- PREGNANCY Manufacturer advises avoid (particularly in the first trimester) unless the potential benefit outweighs the risk; however, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas.
- BREAST FEEDING Present in milk but risk to infant minimal.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment—elimination may be prolonged.
- RENAL IMPAIRMENT Manufacturer advises caution.
- DIRECTIONS FOR ADMINISTRATION Expert sources advise tablet may be crushed and mixed with food such as jam or honey just before administration.
- PATIENT AND CARER ADVICE Manufacturer advises that patients receiving mefloquine for malaria prophylaxis should be informed to discontinue its use if neuropsychiatric symptoms occur and seek immediate medical advice so that mefloquine can be replaced with an alternative antimalarial. Travellers should also be warned about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

A patient alert card should be provided.

Driving and skilled tasks Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may occur and persist up to several months after stopping mefloquine.

• NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 10, 21, 27

Lariam (Neon Healthcare Ltd)

Primaquine

05-Aug-2020

• INDICATIONS AND DOSE

Adjunct in the treatment of non-falciparum malaria caused by *Plasmodium vivax* infection

- ► BY MOUTH
- Adult: 30 mg daily for 14 days

Adjunct in the treatment of non-falciparum malaria caused by *Plasmodium ovale* infection

- ► BY MOUTH
- Adult: 15 mg daily for 14 days

Adjunct in the treatment of non-falciparum malaria caused by *Plasmodium vivax* infection in patients with mild GGPD deficiency (administered on expert advice) | Adjunct in the treatment of non-falciparum malaria caused by *Plasmodium ovale* infection in patients with mild GGPD deficiency (administered on expert advice)

- ► BY MOUTH
- Adult: 45 mg once weekly for 8 weeks

Treatment of mild to moderate pneumocystis infection (in combination with clindamycin)

- ► BY MOUTH
- Adult: 30 mg daily, this combination is associated with considerable toxicity
- UNLICENSED USE Not licensed.
- CAUTIONS G6PD deficiency · systemic diseases associated with granulocytopenia (e.g. rheumatoid arthritis, lupus erythematosus)
- INTERACTIONS → Appendix 1: antimalarials
- SIDE-EFFECTS Arrhythmia · dizziness · gastrointestinal discomfort · haemolytic anaemia (in G6PD deficiency) · leucopenia · methaemoglobinaemia (in NADH methaemoglobin reductase deficiency) · nausea · QT interval prolongation · skin reactions · vomiting
- PREGNANCY Risk of neonatal haemolysis and methaemoglobinaemia in third trimester.
- BREAST FEEDING No information available; theoretical risk of haemolysis in G6PD-deficient infants.
- PRE-TREATMENT SCREENING Before starting primaquine, blood should be tested for glucose-6-phosphate dehydrogenase (G6PD) activity since the drug can cause haemolysis in G6PD-deficient patients. Specialist advice should be obtained in G6PD deficiency.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Proguanil hydrochloride

04-Aug-2020

• INDICATIONS AND DOSE

Prophylaxis of malaria ► BY MOUTH

- Child (body-weight up to 6 kg): 25 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child (body-weight 6-9 kg): 50 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child (body-weight 10-15 kg): 75 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child (body-weight 16-24 kg): 100 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child (body-weight 25-44 kg): 150 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving

- Child (body-weight 45 kg and above): 200 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Adult (body-weight 25-44 kg): 150 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Adult (body-weight 45 kg and above): 200 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- UNLICENSED USE Proguanil doses in BNF Publications may differ from those in product literature.
- INTERACTIONS → Appendix 1: antimalarials
- SIDE-EFFECTS Alopecia · angioedema · bone marrow disorders · cholestasis · constipation · diarrhoea · fever · gastric disorder · megaloblastic anaemia · oral disorders · skin reactions · vasculitis
- PREGNANCY Benefit of prophylaxis in malaria outweighs risk. Adequate folate supplements should be given to mother.
- BREAST FEEDING Amount in milk probably too small to be harmful when used for malaria prophylaxis.

RENAL IMPAIRMENT

Dose adjustments ► In children Use half normal dose if estimated glomerular filtration rate 20–60 mL/minute/1.73m². Use one-quarter normal dose on alternate days if estimated glomerular filtration rate 10–20 mL/minute/1.73m². Use one-quarter normal dose once weekly if estimated glomerular filtration rate less than 10 mL/minute/1.73m²; increased risk of haematological toxicity in severe impairment.

In adults 100 mg once daily if eGFR

- 20–60 mL/minute/1.73m². 50 mg on alternate days if eGFR 10–20 mL/minute/1.73m². 50 mg once weekly if eGFR less than 10 mL/minute/1.73m²; increased risk of haematological toxicity in severe impairment.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises tablet may be crushed and mixed with food such as milk, jam, or honey just before administration.
- PATIENT AND CARER ADVICE Warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

• NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.

- EXCEPTIONS TO LEGAL CATEGORY Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

Paludrine (Alliance Pharmaceuticals Ltd)
Proguanil hydrochloride 100 mg Paludrine 100mg tablets |
98 tablet | P | £11.95 DT = £11.95

Quinine

27-Jul-2020

• INDICATIONS AND DOSE

Nocturnal leg cramps

- ► BY MOUTH
- Adult: 200–300 mg once daily, to be taken at bedtime

Non-falciparum malaria

- **▶** BY INTRAVENOUS INFUSION
- Adult: 10 mg/kg every 8 hours (max. per dose 700 mg), infused over 4 hours, given if patient is unable to take oral therapy. Change to oral chloroquine as soon as the patient's condition permits, reduce dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours

Falciparum malaria

- ► BY MOUTH
- Child: 10 mg/kg every 8 hours (max. per dose 600 mg) for 7 days, to be given together with or followed by either doxycycline (in children over 12 years), or clindamycin
- Adult: 600 mg every 8 hours for 5-7 days, to be given together with or followed by either doxycycline or clindamycin
- ► BY INTRAVENOUS INFUSION
- Adult: Loading dose 20 mg/kg (max. per dose 1.4 g), infused over 4 hours, the loading dose of 20 mg/kg should not be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by either doxycycline or clindamycin, reduce maintenance dose to 5-7 mg/kg if parenteral treatment is required for more than 48 hours

Falciparum malaria (in intensive care unit)

- ► BY INTRAVENOUS INFUSION
- Adult: Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by either doxycycline or clindamycin, reduce maintenance dose to 5-7 mg/kg if parenteral treatment is required for more than 48 hours

DOSE EQUIVALENCE AND CONVERSION

- When using quinine for malaria, doses are valid for quinine hydrochloride, dihydrochloride, and sulfate; they are not valid for quinine bisulfate which contains a correspondingly smaller amount of quinine.
- Quinine (anhydrous base) 100 mg = quinine bisulfate 169 mg; quinine dihydrochloride 122 mg; quinine hydrochloride 122 mg; and quinine sulfate 121 mg. Quinine bisulfate 300 mg tablets are available but provide less quinine than 300 mg of the dihydrochloride, hydrochloride, or sulfate.
- UNLICENSED USE Injection not licensed.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: REMINDER OF DOSE-DEPENDENT QT-PROLONGING EFFECTS (NOVEMBER 2017)

Quinine has been associated with dose-dependent QT-interval-prolonging effects and should be used with caution in patients with risk factors for QT prolongation or in those with atrioventricular block—see Cautions for further information.

- CONTRA-INDICATIONS Haemoglobinuria myasthenia gravis optic neuritis tinnitus
- CAUTIONS Atrial fibrillation (monitor ECG during parenteral treatment) cardiac disease (monitor ECG during parenteral treatment) conduction defects (monitor ECG during parenteral treatment) elderly (monitor ECG during parenteral treatment) electrolyte disturbance -

G6PD deficiency · heart block (monitor ECG during parenteral treatment)

- INTERACTIONS → Appendix 1: antimalarials
- SIDE-EFFECTS Abdominal pain a agitation a agranulocytosis angioedema asthma atrioventricular conduction changes bronchospasm cardiotoxicity cerebral impairment coagulation disorders coma confusion death diarrhoea dyspnoea fever flushing gastrointestinal disorder haemoglobinuria haemolysis haemolytic uraemic syndrome headache hearing impairment hypersensitivity loss of consciousness muscle weakness myasthenia gravis aggravated nausea ocular toxicity oedema pancytopenia photosensitivity reaction QT interval prolongation renal impairment skin reactions thrombocytopenia tinnitus vertigo vision disorders vomiting

Overdose Quinine is very toxic in overdosage; lifethreatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

For details on the management of poisoning, see Emergency treatment of poisoning p. 1473.

- PREGNANCY High doses are teratogenic in first trimester, but in malaria benefit of treatment outweighs risk.
- BREAST FEEDING Present in milk but not known to be harmful
- HEPATIC IMPAIRMENT
- With oral use Manufacturer advises caution (risk of prolonged half-life).

Dose adjustments ➤ With intravenous use For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.

 With oral use Manufacturer advises dose reduction or increased dose interval.

RENAL IMPAIRMENT

Dose adjustments • With intravenous use For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.

- MONITORING REQUIREMENTS
- With intravenous use Monitor blood glucose and electrolyte concentration during parenteral treatment.
- In adults Patients taking quinine for nocturnal leg cramps should be monitored closely during the early stages for adverse effects as well as for benefit.
- DIRECTIONS FOR ADMINISTRATION
- With intravenous use in adults For intravenous infusion, expert sources advise give continuously in Glucose 5% or Sodium Chloride 0.9%. To be given over 4 hours.
- PRESCRIBING AND DISPENSING INFORMATION
- With intravenous use Intravenous injection of quinine is so hazardous that it has been superseded by infusion.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for infusion

Tablet

► Quinine (Non-proprietary)

Quinine sulfate 200 mg Quinine sulfate 200mg tablets | 28 tablet PoM £2.90 DT = £1.62

5.2 Toxoplasmosis

ANTIPROTOZOALS

Pyrimethamine

13-Jan-2022

• INDICATIONS AND DOSE

Toxoplasmosis in pregnancy (in combination with sulfadiazine and folinic acid)

- ► BY MOUTH
- Adult: 50 mg once daily until delivery
- CAUTIONS History of seizures—avoid large loading doses predisposition to folate deficiency
- INTERACTIONS → Appendix 1: antimalarials
- SIDE-EFFECTS
- ► Common or very common Anaemia · diarrhoea · dizziness · headache · leucopenia · nausea · skin reactions · thrombocytopenia · vomiting
- ► Uncommon Fever
- ► Rare or very rare Abdominal pain · oral ulceration · pancytopenia · pneumonia eosinophilic · seizure
- PREGNANCY Theoretical teratogenic risk in first trimester (folate antagonist). Adequate folate supplements should be given to the mother.
- BREAST FEEDING Significant amount in milk—avoid administration of other folate antagonists to infant. Avoid breast-feeding during toxoplasmosis treatment.
- HEPATIC IMPAIRMENT Manufacturer advises caution (limited information available).
 Dose adjustments Manufacturer advises consider dose reduction
- RENAL IMPAIRMENT Manufacturer advises caution.
- MONITORING REQUIREMENTS Blood counts required with prolonged treatment.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension Tablet
 - ► Daraprim (GlaxoSmithKline UK Ltd)

 Pyrimethamine 25 mg Daraprim 25mg tablets | 30 tablet PoM

 £13.00 DT = £13.00

6 Viral infection

6.1 Coronavirus

COVID-19

19-May-2022

Description of condition

COVID-19 is the syndrome caused by a novel coronavirus, SARS-CoV-2, which was originally detected late 2019 in Wuhan, Hubei Province, China. SARS-CoV-2 is primarily transmitted between people through respiratory particles, direct human contact, and contact with contaminated surfaces. A person can be infected when respiratory particles are inhaled, or come into contact with the eyes, nose or mouth.

COVID-19 is predominantly a respiratory illness with a range of symptoms of varying severity. Common symptoms include fever, a new continuous cough, loss or change in sense of smell or taste, loss of appetite, nausea or vomiting, diarrhoea, shortness of breath, fatigue, muscle aches, headache, sore throat, and nasal congestion or rhinorrhea. Atypical symptoms such as delirium and reduced mobility may present in elderly and immunocompromised

individuals, often without a fever. COVID-19 infection varies in severity from asymptomatic or mild upper respiratory tract infection in some individuals, to severe pneumonia and critical disease in others. Patients with COVID-19 may deteriorate rapidly, and life-threatening complications include thromboembolic events, cardiac disease, acute kidney injury, sepsis, septic shock, and acute respiratory and multi-organ failure. Individuals who are older, male, from deprived areas, or from black, Asian and minority ethnic groups are at higher risk of severe disease and death. The risk also increases in pregnancy and in those with obesity, certain underlying co-morbidities, frailty, impaired immunity, or a reduced ability to cough and clear secretions.

After acute infection with COVID-19, individuals may experience prolonged symptoms that persist for more than 4 weeks (known as 'long COVID'). For guidance on the management of 'long COVID', see NICE, SIGN and the Royal College of General Practitioners (RCGP) COVID-19 rapid guideline: Managing the long-term effects of COVID-19 (available at: www.nice.org.uk/guidance/ng188).

COVID-19 vaccination significantly reduces the risk of infection, hospitalisation, and death. However, fully vaccinated individuals can still become infected with SARS-CoV-2. For information on vaccination against COVID-19, see COVID-19 vaccines p. 1397.

Management

COVID-19 is a notifiable disease in the UK. For further information, see *Notifiable diseases* in Antibacterials, principles of therapy p. 540.

For guidance on infection prevention and control, and sampling and diagnostics, see the UKHSA collection: Coronavirus (COVID-19): guidance (available at: www.gov. uk/government/collections/coronavirus-covid-19-list-of-guidance).

Recommendations on the management of COVID-19 reflect NICE—Managing COVID-19 rapid guideline (NG191, v23.1 April 2022). For the most up to date guidance, see www.nice.org.uk/guidance/ng191.

Drug treatment

Individuals with COVID-19 have an increased risk of venous thromboembolism (VTE). For guidance on the prophylaxis and management of VTE, see NICE rapid guideline: Managing COVID-19 (see *Useful resources*) and SIGN rapid guideline: Prevention and management of venous thromboembolism in patients with COVID-19 (available at: www.sign.ac.uk/our-guidelines/prevention-and-management-of-venous-thromboembolism-in-covid-19/).

Dexamethasone p. 743 should be offered to patients with COVID-19 who need supplemental oxygen, or who have a level of hypoxia that requires supplemental oxygen but are unable to have or tolerate it. If dexamethasone is unsuitable or unavailable, either hydrocortisone p. 744 or prednisolone p. 747 can be used.

Tocilizumab p. 1195 should be offered to hospitalised patients with COVID-19 who are having or have completed a course of corticosteroids, unless corticosteroids are unsuitable, and who meet the eligibility criteria. If tocilizumab is unsuitable or unavailable, sarilumab [unlicensed] may be considered.

Other available treatment options for COVID-19 include antivirals (such as remdesivir p. 677, or molnupiravir p. 676, or nirmatrelvir with ritonavir p. 677), or SARS-CoV-2 neutralising monoclonal antibodies (such as sotrovimab p. 676).

Antibacterials are not recommended for preventing or treating pneumonia if it is likely to be caused by SARS-CoV-2, another virus, or a fungal infection. Empirical antibacterials should be started if a secondary bacterial infection is suspected in patients with COVID-19. For guidance on the management of suspected or confirmed

bacterial pneumonia, see Respiratory system infections, antibacterial therapy p. 551.

Antifungals should only be offered for treatment of COVID-19-associated pulmonary aspergillosis (CAPA) if diagnosis is confirmed, or CAPA is suspected and a multidisciplinary team or local protocols support starting treatment.

For further guidance on the management of non-hospitalised patients at risk of severe disease and hospitalised patients, see NICE rapid guideline: Managing COVID-19 (see Useful resources), NHS England: Rapid Clinical Policy development: COVID-19 (available at: www.england.nhs.uk/coronavirus/clinical-policy/), and MHRA: Coronavirus (COVID-19) Alerts and Registration (available at: www.cas.mhra.gov.uk/Help/CoronavirusAlerts.aspx).

For guidance on the management of COVID-19 infection in pregnancy, including therapies that should be offered to pregnant or postpartum females with COVID-19, see Royal College of Obstetricians and Gynaecologists, Royal College of Midwives, Royal College of Paediatrics and Child Health, PHE and Public Health Scotland guidance: Coronavirus (COVID-19) infection and pregnancy (available at: www.rcog.org.uk/en/guidelines-research-services/guidelines/coronavirus-pregnancy/).

For information on the fetal and neonatal risks of exposure to COVID-19 treatments, see UK Teratology Information Service (UKTIS): Medications used to treat COVID-19 in pregnancy (available at: www.medicinesinpregnancy.org/bumps/monographs/MEDICATIONS-USED-TO-TREAT-COVID-19-IN-PREGNANCY/).

For breastfeeding advice on drugs that may be used for COVID-19, see UK Drugs in Lactation Advisory Service (UKDILAS) guidance on the Specialist Pharmacy Service website (available at: www.sps.nhs.uk/articles/breastfeeding-with-covid-19-infection/).

Management of COVID-19 symptoms

Patients with a cough should be encouraged to avoid lying on their backs, if possible, because this may make coughing less effective. Cough should be initially managed using simple non-drug measures (such as honey). For cough that is distressing in a patient with COVID-19, consider short-term use of a cough suppressant (such as codeine phosphate or morphine).

Patients with fever should be advised to drink fluids regularly to avoid dehydration, and to take antipyretics (such as paracetamol or ibuprofen) as appropriate (whilst both fever and other symptoms that antipyretics would help treat are present).

Reversible causes of breathlessness (such as pulmonary oedema, pulmonary embolism, chronic obstructive pulmonary disorder, and asthma) should be identified and treated accordingly. When other significant medical pathology has been excluded or further investigation is inappropriate, non-drug management (such as relaxation and breathing techniques, and changing body positioning) may help to manage breathlessness as part of supportive care. If hypoxia is the likely cause of breathlessness, consider a trial of oxygen therapy if appropriate.

Reversible causes of anxiety should be addressed by discussing the patient's concerns. Consider a trial of a benzodiazepine (such as lorazepam) to manage anxiety or agitation.

Reversible causes of delirium should be assessed—see NICE guideline: **Delirium: prevention, diagnosis and management** (available at: www.nice.org.uk/guidance/cg103).

For further guidance on the management of COVID-19 symptoms, and for information on end of life care, see NICE rapid guideline: Managing COVID-19 (see *Useful resources*).

Useful Resources

COVID-19 rapid guideline: managing COVID-19. National Institute for Health and Care Excellence, NICE guideline 191. April 2022.

www.nice.org.uk/guidance/ng191

ANTIVIRALS > SARS-COV-2 NEUTRALISING MONOCLONAL ANTIBODIES

Sotrovimab

 DRUG ACTION Sotrovimab is an engineered human immunoglobulin monoclonal antibody that binds to the spike protein receptor binding domain of SARS-CoV-2, which prevents the virus from entering human cells.

• INDICATIONS AND DOSE

COVID-19 in patients who do not require oxygen supplementation and are at an increased risk of severe **COVID-19 infection**

- ► BY INTRAVENOUS INFUSION
- Adult (body-weight 40 kg and above): 500 mg as a single dose, to be initiated as soon as possible after diagnosis and within 5 days of symptom onset
- SIDE-EFFECTS
- ► Common or very common Bronchospasm hypersensitivity infusion related reaction · skin reactions
- PREGNANCY Evgr Use only if potential benefit outweighs risk—no information available.
- BREAST FEEDING Specialist sources indicate use with caution-no information available. Large molecular weight suggests limited excretion into milk. Monitor breast-fed infants for adequate feeding and hypersensitivity
- DIRECTIONS FOR ADMINISTRATION FOR For intravenous. infusion (Xevudy®), dilute in 50 mL or 100 mL Glucose 5% or Sodium Chloride 0.9% and administer over 30 minutes through an in-line 0.2 micron filter.
- PRESCRIBING AND DISPENSING INFORMATION Sotrovimab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.

NHS England Interim Clinical Commissioning Policy: Antivirals or neutralising monoclonal antibodies for nonhospitalised patients with COVID-19 (available at: www.england.nhs.uk/coronavirus/publication/interim-clinicalcommissioning-policy-neutralising-monoclonal-antibodies-orantivirals-for-non-hospitalised-patients-with-covid-19/).

- HANDLING AND STORAGE Store in a refrigerator (2°C-8°C) and protect from light—consult product literature about storage after dilution.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polysorbates

▶ Sotrovimab (non-proprietary)

Sotrovimab 62.5 mg per 1 ml Xevudy 500mg/8ml concentrate for solution for infusion vials | 1 vial Pom £2,209.00 (Hospital only)

ANTIVIRALS > OTHER

Molnupiravir

18-Mar-2022

• DRUG ACTION Molnupiravir (a prodrug) is a ribonucleoside analogue that increases the number of mutations in viral RNA thus preventing multiplication of the virus.

INDICATIONS AND DOSE

Mild to moderate COVID-19 [with at least 1 risk factor for developing severe illness1

- ► BY MOUTH
- Adult: 800 mg twice daily for 5 days, treatment to be started as soon as possible after diagnosis and within 5 days of symptom onset

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: COVID-19 ANTIVIRALS: REPORTING TO THE UK COVID-19 ANTIVIRALS PREGNANCY REGISTRY (FEBRUARY 2022)

The safety of COVID-19 antiviral treatment, such as molnupiravir, during pregnancy has not been established. The MHRA, in collaboration with the UK Teratology Information Service (UKTIS), is operating the UK COVID-19 Antivirals Pregnancy Registry to collect information about and enable follow-up of reported exposures to COVID-19 antivirals in pregnancy; it is also collecting information on the outcomes of pregnancies. where conception occurred during or shortly after paternal exposure to antiviral treatment.

Healthcare professionals in England, Scotland, and Wales (as well as patients and their partners) are advised to report exposure to molnupiravir during pregnancy or around the time of conception, or of partners on molnupiravir around the time of conception. Healthcare professionals in Northern Ireland cannot currently report on behalf of a pregnant female or their partner but should encourage them to self-report. Since exposure can occur in very early pregnancy before pregnancy is recognised, healthcare professionals are advised to report (or to encourage patients to selfreport), even if some time has passed since the end of molnupiravir treatment.

An exposed pregnancy should be reported by telephone to UKTIS-for more information, see the UKTIS Registry website (available at:

www.medicinesinpregnancy.org/bumps/COVID-19-Antivirals-Pregnancy-Registry/).

- SIDE-EFFECTS
- ► Common or very common Diarrhoea · dizziness · headache ·
- ▶ Uncommon Skin reactions · vomiting
- CONCEPTION AND CONTRACEPTION [EVGr] Females of childbearing potential should use effective contraception during treatment and for 4 days after last treatment.
- PREGNANCY EVGr Avoid—toxicity in animal studies. See also Important safety information.
- BREAST FEEDING EVGT Avoid during treatment and for 4 days after last treatment—no information available.
- PATIENT AND CARER ADVICE

Missed doses If a dose is more than 10 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 9

 Molnupiravir (non-proprietary) Molnupiravir 200 mg Lagevrio 200mg capsules 40 capsule PoM ((Hospital only)

Nirmatrelyir with ritonavir

(PF-07321332 with ritonavir)

The properties listed below are those particular to the combination only. For the properties of the components please consider, ritonavir p. 714.

17-Mar-2022

 DRUG ACTION Nirmatrelvir is a peptidomimetic inhibitor of coronavirus 3C-like protease which prevents multiplication of SARS-CoV-2. Ritonavir inhibits CYP3Amediated metabolism of nirmatrelyir thereby increasing the plasma concentration of nirmatrelvir.

INDICATIONS AND DOSE

COVID-19 in patients who do not require oxygen supplementation and are at an increased risk of severe **COVID-19 infection**

- ▶ BY MOUTH
- Adult: 300 mg (two pink tablets) and 100 mg (one white tablet) twice daily for 5 days, to be initiated as soon as possible after SARS-CoV-2 positive result and within 5 days of symptom onset, for each dose, nirmatrelvir (pink tablets) and ritonavir (white tablet) to be taken together

IMPORTANT SAFFTY INFORMATION

MHRA/CHM ADVICE: COVID-19 ANTIVIRALS: REPORTING TO THE **UK COVID-19 ANTIVIRALS PREGNANCY REGISTRY (FEBRUARY** 2022)

The safety of COVID-19 antiviral treatment, such as nirmatrelvir with ritonavir, during pregnancy has not been established. The MHRA, in collaboration with the UK Teratology Information Service (UKTIS), is operating the UK COVID-19 Antivirals Pregnancy Registry to collect information about and enable follow-up of reported exposures to COVID-19 antivirals in pregnancy; it is also collecting information on the outcomes of pregnancies, where conception occurred during or shortly after paternal exposure to antiviral treatment.

Healthcare professionals in England, Scotland, and Wales (as well as patients and their partners) are advised to report exposure to nirmatrelvir with ritonavir during pregnancy or around the time of conception, or of partners on nirmatrelvir with ritonavir around the time of conception. Healthcare professionals in Northern Ireland cannot currently report on behalf of a pregnant female or their partner but should encourage them to self-report. Since exposure can occur in very early pregnancy before pregnancy is recognised, healthcare professionals are advised to report (or to encourage patients to self-report), even if some time has passed since the end of nirmatrelvir with ritonavir treatment.

An exposed pregnancy should be reported by telephone to UKTIS-for more information, see the UKTIS Registry website (available at: www.medicinesinpregnancy.org/bumps/COVID-19-Antivirals-Pregnancy-Registry/).

• CAUTIONS Hepatitis · liver enzyme abnormalities · preexisting liver diseases · uncontrolled or undiagnosed HIV-1

CAUTIONS, FURTHER INFORMATION

- ► HIV-1 infection FVGr As nirmatrelyir is co-administered with ritonavir, there may be a risk of developing resistance to HIV protease inhibitors in patients with uncontrolled or undiagnosed HIV-1 infection.
- INTERACTIONS → Appendix 1: HIV-protease inhibitors nirmatrolvir
- SIDE-FFFFCTS
- ► Common or very common Diarrhoea · taste altered · vomiting

- CONCEPTION AND CONTRACEPTION EVGr Effectiveness of combined hormonal contraceptives may be reduced; alternative contraceptive methods or an additional barrier method is recommended during treatment and until completion of one menstrual cycle after stopping treatment.
- PREGNANCY EvGr Avoid. (M) See also Important safety information
- BREAST FEEDING EvGr Avoid during treatment and for 7 days after last treatment.
- HEPATIC IMPAIRMENT EVGT Avoid in severe impairment (no information available). (M
- RENAL IMPAIRMENT EVGT Caution in moderate impairment; avoid in severe impairment (increased exposure).

Dose adjustments EvGr Reduce dose to 150 mg nirmatrelvir (one pink tablet) and 100 mg ritonavir (one white tablet) twice daily in moderate impairment.

• PATIENT AND CARER ADVICE

Missed doses If a dose is more than 8 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Form unstated

CAUTIONARY AND ADVISORY LABELS 9

► Nirmatrelvir with ritonavir (non-proprietary) ▼

Paxlovid 150mg/100mg tablets | 30 tablet Pom S

Remdesivir

• DRUG ACTION Remdesivir is an RNA polymerase inhibitor that disrupts the production of viral RNA, preventing multiplication of SARS-CoV-2.

INDICATIONS AND DOSE

COVID-19 in patients hospitalised with pneumonia and requiring low-flow supplemental oxygen (under close medical supervision)

- ► BY INTRAVENOUS INFUSION
- Adult: Loading dose 200 mg daily for 1 dose, then maintenance 100 mg once daily for up to 5 days in total, treatment should be initiated within 10 days of initial COVID-19 symptoms, consider stopping treatment if no improvement after 48 hours, course may be repeated if readmitted with COVID-19-consult interim clinical commissioning policy for further details (see Prescribing and dispensing information)

COVID-19 in immunocompromised patients hospitalised with pneumonia (under close medical supervision)

- ► BY INTRAVENOUS INFUSION
- Adult: Loading dose 200 mg daily for 1 dose, then maintenance 100 mg once daily for up to 10 days in total following a multidisciplinary assessment, consider stopping treatment if no improvement after 48 hours, course may be repeated if readmitted with COVID-19—consult interim clinical commissioning policy for further details (see Prescribing and dispensing information)

COVID-19 in patients at increased risk of progression to severe illness (under close medical supervision)

- ► BY INTRAVENOUS INFUSION
- Adult: Loading dose 200 mg daily for 1 dose, then maintenance 100 mg once daily for 3 days in total, treatment should be initiated within 7 days of initial COVID-19 symptoms

 UNLICENSED USE EVG Remdesivir is used in the doses provided in the BNF for the treatment of COVID-19, but these may differ from those licensed.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: COVID-19 ANTIVIRALS: REPORTING TO THE UK COVID-19 ANTIVIRALS PREGNANCY REGISTRY (FEBRUARY 2022)

The safety of COVID-19 antiviral treatment, such as remdesivir, during pregnancy has not been established. The MHRA, in collaboration with the UK Teratology Information Service (UKTIS), is operating the UK COVID-19 Antivirals Pregnancy Registry to collect information about and enable follow-up of reported exposures to COVID-19 antivirals in pregnancy; it is also collecting information on the outcomes of pregnancies, where conception occurred during or shortly after paternal exposure to antiviral treatment.

Healthcare professionals in England, Scotland, and Wales (as well as patients and their partners) are advised to report exposure to remdesivir during pregnancy or around the time of conception, or of partners on remdesivir around the time of conception. Healthcare professionals in Northern Ireland cannot currently report on behalf of a pregnant female or their partner but should encourage them to self-report. Since exposure can occur in very early pregnancy before pregnancy is recognised, healthcare professionals are advised to report (or to encourage patients to self-report), even if some time has passed since the end of remdesivir treatment.

An exposed pregnancy should be reported by telephone to UKTIS—for more information, see the UKTIS Registry website (available at: www.medicinesinpregnancy.org/bumps/COVID-19-Antivirals-Pregnancy-Registry/).

- INTERACTIONS → Appendix 1: remdesivir
- SIDE-EFFECTS
- ► Common or very common Headache · nausea · rash
- Rare or very rare Hypersensitivity · infusion related reaction
- ► Frequency not known Sinus bradycardia

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises slower infusion rates, with a maximum infusion time of up to 120 minutes, to prevent signs and symptoms of hypersensitivity. If significant hypersensitivity occurs, discontinue immediately.

- CONCEPTION AND CONTRACEPTION Manufacturer advises females of childbearing potential should use effective contraception during treatment.
- PREGNANCY Evgr Avoid unless potential benefit outweighs risk—no information available.
 See also Important safety information.
- BREAST FEEDING Specialist sources indicate use with caution—limited information. Minimal oral absorption expected, but monitor breast-fed infants for adverse reactions such as diarrhoea, rash, hypotension, liver and renal impairment (increased risk of accumulation due to long half-life).
- HEPATIC IMPAIRMENT Manufacturer advises caution (no information available)—treatment should not be started if ALT is ≥5 times the upper limit of normal. If ALT increases during treatment, remdesivir may need to be withheld, consult product literature for further information.
- RENAL IMPAIRMENT Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m²— Veklury[®] formulation excipient (sulfobutylether beta cyclodextrin sodium) may accumulate. See p. 21.

MONITORING REQUIREMENTS

- ► Manufacturer advises monitor liver function at baseline and periodically during treatment as indicated.
- Manufacturer advises monitor eGFR at baseline and periodically during treatment as indicated—severe renal toxicity in *animal* studies.
- DIRECTIONS FOR ADMINISTRATION Every For intravenous infusion, reconstitute each vial with 19 mL Water for Injections, then dilute in Sodium Chloride 0.9%; give over 30–120 minutes. ♠ For further information on dilution and infusion rates—consult product literature.
- PRESCRIBING AND DISPENSING INFORMATION NHS
 England Interim Clinical Commissioning Policy: Remdesivir
 for patients hospitalised due to COVID-19 (adults and
 children 12 years and older) (available at: www.england.nhs.
 uk/coronavirus/documents/interim-clinical-commissioning policy-remdesivir-for-patients-hospitalised-due-to-covid 19-adults-and-adolescents-12-years-and-older/).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

EXCIPIENTS: May contain Sulfobutylether beta cyclodextrin sodium

► Veklury (Gilead Sciences Ltd)

Remdesivir 100 mg Veklury 100mg powder for concentrate for solution for infusion vials | 1 vial Pom £340.00 (Hospital only)

6.2 Hepatitis

Hepatitis

26-May-2021

Overview

Acute infectious hepatitis is a notifiable disease in the UK. For further information, see *Notifiable diseases* in Antibacterials, principles of therapy p. 540.

Treatment for viral hepatitis should be initiated by a specialist. The management of uncomplicated acute viral hepatitis usually involves symptomatic supportive care. Early treatment of acute hepatitis C may reduce the risk of chronic infection and progression of liver disease. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. Active or passive immunisation against hepatitis A and B infections is available, see Hepatitis A vaccine p. 1401 and Hepatitis B vaccine p. 1402.

Chronic hepatitis B

Treatment of chronic hepatitis B infection should be initiated by a specialist.

EVGF Entecavir p. 679, peginterferon alfa p. 680, tenofovir alafenamide p. 679, and tenofovir disoproxil p. 709 are options for the treatment of chronic hepatitis B infection.

Entecavir and tenofovir disoproxil can be used in patients with decompensated liver disease.

Other drugs licensed for the treatment of chronic hepatitis B infection include adefovir dipivoxil p. 680 and lamivudine p. 708.

Evor If drug-resistance emerges during treatment, consider switching to, or adding another antiviral drug to which the virus is sensitive; ensure the antiviral drug does not share cross-resistance. A Hepatitis B viruses with reduced susceptibility to lamivudine have emerged following extended therapy.

Duration of treatment is dependent on several factors including response (e.g. viral suppression, antigen loss, seroconversion), patient characteristics (e.g. liver disease), and treatment tolerability. [EVGT] Treatment is usually continued long-term in patients with decompensated liver disease.

For information on the treatment of HIV and chronic hepatitis B co-infection, see HIV infection p. 694.

Chronic hepatitis C

Treatment of chronic hepatitis C infection should be initiated by a specialist. Before starting treatment, the genotype of the infecting hepatitis C virus should be determined and the viral load measured as this may affect the choice and duration of treatment. Evg1 All patients with chronic hepatitis C infection should be assessed for treatment with direct-acting antiviral agents.

Sofosbuvir p. 684 in combination with ribavirin (with or without peginterferon alfa), sofosbuvir with velpatasvir p. 685 (with or without ribavirin), sofosbuvir with velpatasvir and voxilaprevir p. 685, and glecaprevir with pibrentasvir p. 685 are licensed for the treatment of chronic hepatitis C infection of all genotypes.

Ledipasvir with sofosbuvir p. 683 (with or without ribavirin) is licensed for the treatment of chronic hepatitis C infection of genotypes 1, 3, 4, 5, or 6.

Elbasvir with grazoprevir p. 681 (with or without ribavirin) is licensed for the treatment of chronic hepatitis C infection of genotypes 1 or 4.

Other drugs licensed for the treatment of chronic hepatitis C infection include ribavirin p. 682 in combination with peginterferon alfa, or peginterferon alfa as monotherapy if ribavirin is contra-indicated or not tolerated.

6.3 Hepatitis infections

6.3a Chronic hepatitis B

Other drugs used for Chronic hepatitis B Lamivudine, p. 708 · Tenofovir disoproxil, p. 709

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Entecavir

11-Aug-2021

• INDICATIONS AND DOSE

Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) not previously treated with nucleoside analogues

- ► BY MOUTH
- Adult: 500 micrograms once daily

Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) and lamivudine-resistance

- ► BY MOUTH
- Adult: 1 mg once daily, consider other treatment if inadequate response after 6 months

Chronic hepatitis B in patients with decompensated liver disease

- ► BY MOUTH
- Adult: 1 mg once daily
- CAUTIONS HIV infection—risk of HIV resistance in patients not receiving 'highly active antiretroviral therapy' ·lamivudine-resistant chronic hepatitis B—risk of entecavir resistance

CAUTIONS, FURTHER INFORMATION Manufacturer advises review treatment and consider discontinuation if deterioration in liver function occurs (risk of lactic acidosis)—consult product literature.

- SIDE-EFFECTS
- ► Common or very common Diarrhoea · dizziness · drowsiness · dyspepsia · fatigue · headache · insomnia · nausea · vomiting
- ► Uncommon Alopecia · rash

- ► Frequency not known Lactic acidosis
- CONCEPTION AND CONTRACEPTION Effective contraception required during treatment.
- PREGNANCY Toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- RENAL IMPAIRMENT

Dose adjustments EvGr Reduce dose if creatinine clearance less than 50 mL/minute (consult product literature). See p. 21.

- MONITORING REQUIREMENTS Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3-6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises to be taken at least 2 hours before or 2 hours after food.
- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include orange.
- PATIENT AND CARER ADVICE Patients or carers should be counselled on the administration of entecavir tablets and oral solution.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

- ► Entecavir for the treatment of chronic hepatitis B (August 2008) NICE TA153 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Oral solution

next dose should be taken at the normal time.

Adefovir dipivoxil

18-Aug-2021

• INDICATIONS AND DOSE

Chronic hepatitis B infection with either compensated liver disease with evidence of viral replication, and histologically documented active liver inflammation and fibrosis, when other treatment not appropriate or decompensated liver disease in combination with another antiviral for chronic hepatitis B that has no cross-resistance to adefovir

- ► BY MOUTH
- Adult: 10 mg once daily
- CAUTIONS Elderly

CAUTIONS, FURTHER INFORMATION Manufacturer advises review treatment and consider discontinuation if deterioration in liver function occurs (risk of lactic acidosis)—consult product literature.

- INTERACTIONS → Appendix 1: adefovir
- SIDE-EFFECTS
- ► Common or very common Asthenia · diarrhoea · flatulence · gastrointestinal discomfort · headache · nausea · renal impairment · skin reactions · yomiting
- Frequency not known Bone fracture · bone pain · hypophosphataemia · myopathy · nephrotoxicity · osteomalacia · pancreatitis · proximal renal tubulopathy
- CONCEPTION AND CONTRACEPTION Effective contraception required during treatment.
- PREGNANCY Toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- RENAL IMPAIRMENT Ever Caution if creatinine clearance less than 30 mL/minute (use only if potential benefit outweighs risk, limited information available); no information available if creatinine clearance less than 10 mL/minute. ♠

Dose adjustments Evg: 10 mg every 48 hours if creatinine clearance 30–50 mL/minute; 10 mg every 72 hours if creatinine clearance 10–30 mL/minute. See p. 21.

- MONITORING REQUIREMENTS
- Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).
- Monitor renal function before treatment then every 3 months, more frequently in patients receiving nephrotoxic drugs.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

► Hepsera (Gilead Sciences Ltd)

Adefovir dipivoxil 10 mg Hepsera 10mg tablets | 30 tablet PoM

NICE decisions

- Peginterferon alfa and ribavirin for the treatment of chronic hepatitis C (September 2010) NICE TA200 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

► Pegasys (Aspire Pharma Ltd)

Interferon alfa-2a (as Peginterferon alfa-2a) 180 microgram per 1 ml Pegasys 90micrograms/0.ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £76.51
Interferon alfa-2a (as Peginterferon alfa-2a) 270 microgram per 1 ml Pegasys 135micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £107.76 DT ±107.76 Interferon alfa-2a (as Peginterferon alfa-2a) 360 microgram per 1 ml Pegasys 130micrograms/0.5ml solution for injection pre-filled syringes | 4 pre-filled disposable injection [PoM] £497.60

6.3b Chronic hepatitis C

Other drugs used for Chronic hepatitis C Peginterferon alfa, p. 680

ANTIVIRALS > HCV INHIBITORS

Elbasvir with grazoprevir

31-Aug-2020

 DRUG ACTION Elbasvir is an HCV NS5A inhibitor and grazoprevir is an HCV NS3/4A protease inhibitor; they reduce viral load by inhibiting hepatitis C virus RNA replication.

INDICATIONS AND DOSE

Chronic hepatitis C infection of genotypes 1 or 4 (with or without ribavirin) (initiated by a specialist)

- ► BY MOUTH
- Adult: 50/100 mg once daily for 12 weeks (may extend to 16 weeks in some circumstances—consult product literature)

DOSE EQUIVALENCE AND CONVERSION

Dose expressed as x/y mg elbasvir/grazoprevir.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C viruses must be monitored and managed according to current clinical guidelines.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS FOR CHRONIC HEPATITIS C: RISK OF HYPOGLYCAEMIA IN PATIENTS WITH DIABETES (DECEMBER 2018)

Rapid reduction in hepatitis C viral load during directacting antiviral therapy for hepatitis C may improve glucose metabolism in patients with diabetes and result in symptomatic hypoglycaemia if diabetic treatment is continued at the same dose.

The MHRA advises healthcare professionals:

- to monitor glucose levels closely in patients with diabetes during direct-acting antiviral therapy for hepatitis C, especially within the first 3 months of treatment and modify diabetic medication or doses when necessary;
- to be vigilant for changes in glucose tolerance and advise patients of the risk of hypoglycaemia;
- to inform the healthcare professional in charge of the diabetic care of the patient when direct-acting antiviral therapy is initiated.
- CAUTIONS Hepatitis B co-infection · re-treatment following previous exposure to elbasvir with grazoprevir, or to drugs of the same classes (NS5A inhibitors or NS3/4A inhibitors other than telaprevir, simeprevir, boceprevir) efficacy not demonstrated
- INTERACTIONS → Appendix 1: elbasvir · grazoprevir
- SIDE-EFFECTS
 - ► Common or very common Alopecia · anxiety · appetite decreased · arthralgia · asthenia · constipation · depression · diarrhoea · dizziness · dry mouth · gastrointestinal discomfort · headache · insomnia · irritability · myalgia · nausea · pruritus · vomiting
 - ▶ Uncommon Anaemia transient ischaemic attack
 - PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
 - BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
 - HEPATIC IMPAIRMENT Manufacturer advises avoid in moderate to severe impairment.
 - MONITORING REQUIREMENTS Manufacturer advises monitor liver function before treatment, at week 8 in all patients, at week 12 in patients receiving 16 weeks of treatment, and then as clinically indicated—consider discontinuing treatment if alanine aminotransferase (ALT) is greater than 10 times the upper limit of normal; discontinue treatment if ALT elevation is accompanied by signs or symptoms of hepatic impairment or inflammation.

PATIENT AND CARER ADVICE

Hepatic effects Manufacturer advises that patients and their carers should consult a healthcare professional if signs and symptoms of hepatic dysfunction occur (including fatigue, weakness, lack of appetite, nausea and vomiting, jaundice or discoloured faeces).

Vomiting Manufacturer advises if vomiting occurs within 4 hours of a dose, an additional dose should be taken.

Missed doses Manufacturer advises if a dose is more than 16 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Ribavirin (Tribavirin)

20-Nov-2020

• INDICATIONS AND DOSE

Bronchiolitis

- ► BY INHALATION OF AEROSOL, OR BY INHALATION OF NEBULISED SOLUTION
- Child 1-23 months: Inhale a solution containing 20 mg/mL for 12-18 hours for at least 3 days, maximum of 7 days, to be administered via small particle aerosol generator

Life-threatening RSV, parainfluenza virus, and adenovirus infection in immunocompromised children (administered on expert advice)

- ► BY INTRAVENOUS INFUSION
- Child: 33 mg/kg for 1 dose, to be administered over 15 minutes, then 16 mg/kg every 6 hours for 4 days, then 8 mg/kg every 8 hours for 3 days

COPEGUS ® TABLETS

Chronic hepatitis C (in combination with direct acting antivirals, or interferon alfa 2a, or peginterferon alfa 2a with or without direct acting antivirals)

- ► BY MOUTH
- Adult (body-weight up to 75 kg): 400 mg, dose to be taken in the morning and 600 mg, dose to be taken in the evening
- Adult (body-weight 75 kg and above): 600 mg twice daily

Chronic hepatitis C (in combination with peginterferon alfa 2b with or without direct acting antivirals)

- ► BY MOUTH
- Adult (body-weight up to 65 kg): 400 mg twice daily
- Adult (body-weight 65-80 kg): 400 mg, to be taken in the morning and 600 mg, to be taken in the evening
- Adult (body-weight 81-105 kg): 600 mg twice daily
- Adult (body-weight 106 kg and above): 600 mg, to be taken in the morning and 800 mg, to be taken in the evening

Chronic hepatitis C genotype 2 or 3 (not previously treated), or patients infected with HIV and hepatitis C (in combination with peginterferon alfa)

- BY MOUT
- Adult: Usual dose 400 mg twice daily

REBETOL® CAPSULES

Chronic hepatitis C (in combination with interferon alfa 2b, or peginterferon alfa 2b with or without boceprevir)

- ▶ BY MOUTH
- Adult (body-weight up to 65 kg): 400 mg twice daily
- Adult (body-weight 65-80 kg): 400 mg, dose to be taken in the morning and 600 mg, dose to be taken in the evening
- Adult (body-weight 81-104 kg): 600 mg twice daily
- Adult (body-weight 105 kg and above): 600 mg, dose to be taken in the morning and 800 mg, dose to be taken in the evening

REBETOL® ORAL SOLUTION

Chronic hepatitis C (in combination with interferon alfa 2b, or peginterferon alfa 2b with or without boceprevir)

- ▶ BY MOUTH
- Adult (body-weight up to 65 kg): 400 mg twice daily
- Adult (body-weight 65-80 kg): 400 mg, dose to be taken in the morning and 600 mg, dose to be taken in the evening
- Adult (body-weight 81-104 kg): 600 mg twice daily
- Adult (body-weight 105 kg and above): 600 mg, dose to be taken in the morning and 800 mg, dose to be taken in the evening

• UNLICENSED USE

- When used by inhalation in children Inhalation licensed for use in children (age range not specified by manufacturer).
 - With intravenous use in children Intravenous preparation not licensed.

• CONTRA-INDICATIONS

With systemic use Consult product literature for specific contra-indications when ribavirin used in combination with other medicinal products · haemoglobinopathies · severe cardiac disease (in adults) · severe, uncontrolled cardiac disease in children with chronic hepatitis C · unstable or uncontrolled cardiac disease in previous 6 months (in adults)

CAUTIONS

- When used by inhalation Maintain standard supportive respiratory and fluid management therapy
- With systemic use Anaemia (haemoglobin concentration should be monitored during the treatment and corrective action taken) (in adults) · cardiac disease (assessment including ECG recommended before and during treatment-discontinue if deterioration) · consult product literature for specific cautions when ribavirin used in combination with other medicinal products · gout (in adults) · haemolysis (haemoglobin concentration should be monitored during the treatment and corrective action taken) (in adults) · patients with a transplant-risk of rejection · risk of growth retardation in children, the reversibility of which is uncertain-if possible, consider starting treatment after pubertal growth spurt · severe dental disorders (in adults) · severe ocular disorders (in adults) · severe periodontal disorders (in adults) · severe psychiatric effects (in adults)
- INTERACTIONS → Appendix 1: ribavirin

SIDE-EFFECTS

- ▶ Uncommon Dehydration · diabetes mellitus · hallucination · hearing loss · hepatic disorders · hypertension · nerve disorders · sarcoidosis · suicidal behaviours · thyroiditis
- ▶ Rare or very rare Angina pectoris · angioedema · bone marrow disorders · cardiac inflammation · cerebral ischaemia · cholangitis · coma · congestive heart failure · facial paralysis · hepatic failure (discontinue) · hypersensitivity · intracranial haemorrhage · myocardial infarction · myopathy · pancreatitis · psychotic disorder · pulmonary embolism · retinopathy · seizure · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · vasculitis
- Frequency not known Haemolytic anaemia · homicidal ideation · nephrotic syndrome · pure red cell aplasia · renal failure · solid organ transplant rejection · tongue discolouration · ulcerative colitis

SIDE-EFFECTS, FURTHER INFORMATION Side effects listed are reported when oral ribavirin is used in combination with peginterferon alfa or interferon alfa, consult product literature for details.

CONCEPTION AND CONTRACEPTION

- With systemic use Exclude pregnancy before treatment in females of childbearing age. Effective contraception essential during treatment and for 4 months after treatment in females and for 7 months after treatment in males of childbearing age. Routine monthly pregnancy tests recommended. Condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen).
- When used by inhalation Women planning pregnancy should avoid exposure to aerosol.
- PREGNANCY Avoid; teratogenicity in animal studies.
- When used by inhalation Pregnant women should avoid exposure to aerosol.
- BREAST FEEDING Avoid—no information available.
- RENAL IMPAIRMENT Plasma-ribavirin concentration increased.
- In adults Manufacturer advises avoid oral ribavirin unless essential if eGFR less than 50 mL/minute/1.73 m² monitor haemoglobin concentration closely.
- In children Manufacturer advises avoid oral ribavirin if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely. Manufacturer advises use intravenous preparation with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

• MONITORING REQUIREMENTS

- When used by inhalation Monitor electrolytes closely.
 Monitor equipment for precipitation.
- With systemic use Determine full blood count, platelets, electrolytes, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature).
- With systemic use in children Test thyroid function before treatment and then every 3 months.
- With oral use in children Eye examination recommended before treatment. Eye examination also recommended

during treatment if pre-existing ophthalmological disorder or if decrease in vision reported—discontinue treatment if ophthalmological disorder deteriorates or if new ophthalmological disorder develops.

- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include bubble-gum.
- NATIONAL FUNDING/ACCESS DECISIONS

ANTIVIRALS > NUCLEOTIDE ANALOGUES

Ledipasvir with sofosbuvir

09-Nov-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, sofosbuvir p. 684.

 DRUG ACTION Sofosbuvir is a nucleotide analogue inhibitor and ledipasvir is an HCV inhibitor; they reduce viral load by inhibiting hepatitis C virus RNA replication.

• INDICATIONS AND DOSE

Chronic hepatitis C infection (initiated by a specialist)

► BY MOUTH

 Adult: 90/400 mg once daily, for duration of treatment consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose of concurrent H₂receptor antagonist if above a dose comparable to
 famotidine 40 mg twice daily.
- Manufacturer advises reduce dose of concurrent proton pump inhibitor if above a dose comparable to omeprazole 20 mg; take at the same time as sofosbuvir with ledinasvir.

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg ledipasvir/sofosbuvir.
- CAUTIONS Retreatment following treatment failure efficacy not established
- INTERACTIONS → Appendix 1: ledipasvir sofosbuvir
- SIDE-EFFECTS
- ► Common or very common Fatigue headache rash
- ► Frequency not known Angioedema arrhythmia Stevens-Johnson syndrome
- PRESCRIBING AND DISPENSING INFORMATION Dispense in original container (contains desiccant).

PATIENT AND CARER ADVICE

Vomiting If vomiting occurs within 5 hours of administration, an additional dose should be taken. Missed doses If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

 NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with directacting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF **HEPATITIS B REACTIVATION (JANUARY 2017)**

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C viruses must be monitored and managed according to current clinical guidelines.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS FOR CHRONIC HEPATITIS C: RISK OF HYPOGLYCAEMIA IN PATIENTS WITH DIABETES (DECEMBER 2018)

Rapid reduction in hepatitis C viral load during directacting antiviral therapy for hepatitis C may improve glucose metabolism in patients with diabetes and result in symptomatic hypoglycaemia if diabetic treatment is continued at the same dose.

The MHRA advises healthcare professionals:

• to monitor glucose levels closely in patients with diabetes during direct-acting antiviral therapy for hepatitis C, especially within the first 3 months of treatment and modify diabetic medication or doses when necessary;

BNF 84

- to be vigilant for changes in glucose tolerance and advise patients of the risk of hypoglycaemia;
- to inform the healthcare professional in charge of the diabetic care of the patient when direct-acting antiviral therapy is initiated.
- CAUTIONS Manufacturer advises in chronic hepatitis C of genotype 1, 4, 5, or 6, only use sofosbuvir with ribavirin dual therapy in those with intolerance or contraindications to peginterferon alfa who require urgent treatment.
- INTERACTIONS → Appendix 1: sofosbuvir
- SIDE-EFFECTS
- ► Common or very common Alopecia · anaemia · anxiety · appetite decreased · arthralgia · asthenia · chest pain · chills concentration impaired · constipation · cough · depression · diarrhoea · dizziness · dry mouth · dyspnoea · fever · gastrointestinal discomfort · gastrooesophageal reflux disease · headaches · influenza like illness · insomnia irritability · memory loss · muscle complaints · nasopharyngitis · nausea · neutropenia · pain · skin reactions · vision blurred · vomiting · weight decreased
- Frequency not known Arrhythmia · hepatitis B reactivation · Stevens-Johnson syndrome

SIDE-EFFECTS, FURTHER INFORMATION Side-effects listed are reported when sofosbuvir is used in combination with ribavirin or with ribavirin and peginterferon alfa.

- PREGNANCY Manufacturer advises avoid—limited information available.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- RENAL IMPAIRMENT See p. 21. EvGr Caution if eGFR less than 30 mL/minute/1.73 m² (accumulation may occur: limited information available).
- PRESCRIBING AND DISPENSING INFORMATION Dispense in original container (contains desiccant).
- PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

6.4 Herpesvirus infections

Herpesvirus infections

07-Sep-2020

Herpes simplex infections

Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1.

Ever Topical antiviral treatment is not routinely recommended in immunocompetent individuals with uncomplicated infection of the lips (herpes labialis or cold sores) or herpetic gingivostomatitis. However, some patients may find application of a topical antiviral drug helpful when used from the onset of the prodromal phase. Oral paracetamol p. 477 and/or ibuprofen p. 1232 may be given to relieve pain and fever. Other preparations that may be considered for symptom relief include topical anaesthetics or analgesics, and mouthwashes. Oral antiviral treatment may be considered in patients with severe, frequent or persistent oral infection.

Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth.

Individuals suspected of having ocular herpes simplex infection should be referred for urgent, same-day specialist referral; treatment should not be initiated whilst awaiting review. If same-day review is not possible, specialist advice should be sought, which may include topical antiviral treatment in primary care. Some optometrists with appropriate expertise and training can initiate topical antiviral treatment in certain suspected cases.

Refer or seek specialist advice for treatment of herpes simplex infection in pregnancy.

Varicella-zoster infections

Chickenpox is an acute disease caused by the varicella-zoster virus. [EvG] Specialist advice on the management of chickenpox (varicella) in neonates should be sought due to the higher risk of severe disease and complications. Chickenpox in otherwise healthy children is usually self-limiting and complications are rare; antiviral treatment is not routinely recommended.

Chickenpox is more severe in adolescents (aged 14 years and over) and adults than in children; antiviral treatment started within 24 hours of the onset of rash may be considered, particularly for those with severe infection or at risk of complications. Specialist advice should be sought on the diagnosis and management of chickenpox in immunocompromised patients.

Pregnant women who develop severe chickenpox may be at risk of complications, especially varicella pneumonia.

EvGr Immediate specialist advice should be sought for the treatment of chickenpox during pregnancy.

Public Health England advise that individuals at high risk of severe chickenpox (neonates, infants, pregnant women, or immunocompromised patients) who have been exposed to the varicella-zoster virus, may require post-exposure prophylaxis with varicella-zoster immunoglobulin p. 1390 or an antiviral [unlicensed] to reduce the impact of chickenpox infection, and risk of complications (such as pneumonitis). For further information, see Varicella-zoster immunoglobulin in Immunoglobulins p. 1383.

Shingles (herpes zoster) is a viral infection of an individual nerve and the skin surface affected by the nerve. The infection is caused by the reactivation of the varicella-zoster virus, the same virus that causes chickenpox. [vvr] Oral antiviral treatment should be offered to patients with shingles who are immunocompromised, have non-truncal involvement (e.g. neck, limbs, perineum), or to those with

27-Apr-2022

moderate to severe pain or rash. Consider oral antiviral treatment for patients aged over 50 years to reduce the risk of post-herpetic neuralgia. Treatment with the antiviral should be started within 72 hours of the onset of rash. Immunocompromised patients with severe or widespread infection, or severely immunocompromised patients, or patients with shingles in the ophthalmic distribution of the trigeminal nerve, should be admitted to hospital or specialist advice should be sought. (A)

Chronic pain which persists after the rash has healed (post-herpetic neuralgia) requires specific management. For further information, see Neuropathic pain p. 516.

The risk and incidence of varicella-zoster infections can be reduced through vaccination of selected individuals. For further information, see Varicella-zoster vaccines p. 1415.

Drug choice

Aciclovir below is active against herpesviruses but does not eradicate them. Ever Uses of aciclovir include systemic treatment of varicella-zoster and the systemic and topical treatment of herpes simplex infections of the skin and mucous membranes. Aciclovir eye ointment is licensed for herpes simplex infections of the eye.

Ever Famciclovir p. 689, a prodrug of penciclovir, is similar to aciclovir and may be used in the treatment of herpes zoster and genital herpes.

Valaciclovir p. 690 is an ester of aciclovir, which may be used in the treatment of herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); (a) it is also licensed for preventing cytomegalovirus disease following solid organ transplantation.

Intravenous foscarnet sodium p. 693 is licensed for mucocutaneous herpes simplex virus infection unresponsive to aciclovir in immunocompromised patients. Oral inosine pranobex below is also licensed for mucocutaneous infections due to the herpes simplex virus.

Cytomegalovirus infection

Cytomegalovirus (CMV) is a member of the herpesvirus group. In immunocompetent patients, CMV infection is often asymptomatic and self-limiting therefore treatment is not always required. In immunocompromised patients, such as those with AIDS and transplant recipients, the infection manifests more severely causing diseases associated with greater morbidity and mortality.

Drugs licensed for use in the management of CMV disease include ganciclovir p. 691 (related to aciclovir), cidofovir p. 690, foscarnet sodium, letermovir p. 693, valaciclovir, and valganciclovir p. 692 (an ester of ganciclovir). There is a possibility of ganciclovir resistance in those who repeatedly have a poor treatment response or when viral excretion continues despite treatment.

ANTIVIRALS > INOSINE COMPLEXES

Inosine pranobex

27-Apr-2021

(Inosine acedoben dimepranol)

• INDICATIONS AND DOSE

Mucocutaneous herpes simplex

- ► BY MOUTH
- ▶ Adult: 1 g 4 times a day for 7-14 days

Adjunctive treatment of genital warts

- ► BY MOUTH
- Adult: 1 g 3 times a day for 14-28 days

Subacute sclerosing panencephalitis

- ► BY MOUTH
- Adult: 50–100 mg/kg daily in 6 divided doses

- CAUTIONS History of gout history of hyperuricaemia history of urolithiasis
- SIDE-EFFECTS Arthralgia · constipation · diarrhoea · drowsiness · epigastric discomfort · fatigue · headache · insomnia · malaise · nausea · nervousness · polyuria · skin reactions · vertigo · vomiting
- PREGNANCY Manufacturer advises avoid.
- RENAL IMPAIRMENT Manufacturer advises caution; metabolised to uric acid.
- LESS SUITABLE FOR PRESCRIBING Inosine pranobex is less suitable for prescribing.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

INDICATIONS AND DOSE

Herpes simplex, treatment (non-genital)

- ► BY MOUTH
- Adult: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Herpes simplex, treatment (non-genital) in immunocompromised or if absorption impaired

- ► BY MOUT
- Adult: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Herpes simplex, treatment in encephalitis

- ► BY INTRAVENOUS INFUSION
- Adult: 10 mg/kg every 8 hours for at least 14 days (at least 21 days if also immunocompromised)—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment

Herpes simplex, treatment in the immunocompromised

- ► BY INTRAVENOUS INFUSION
- Adult: 5 mg/kg every 8 hours usually for 5 days, alternatively 10 mg/kg every 8 hours usually for 5 days, higher dose to be used only if resistant organisms suspected

Herpes simplex, suppression

- ► BY MOUTH
- Adult: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation)

Herpes simplex, prophylaxis in the immunocompromised

- ► BY MOUTH
- Adult: 200-400 mg 4 times a day
- ► BY INTRAVENOUS INFUSION
- Adult: 5 mg/kg every 8 hours

Varicella zoster (chickenpox), treatment | Herpes zoster (shingles), treatment

- ► BY MOUTH
- Adult: 800 mg 5 times a day for 7 days
- ► BY INTRAVENOUS INFUSION
- Adult: 5 mg/kg every 8 hours usually for 5 days

continued →

Varicella zoster (chickenpox), treatment in encephalitis | Herpes zoster (shingles), treatment in encephalitis

- ► BY INTRAVENOUS INFUSION
- Adult: 10 mg/kg every 8 hours given for 10–14 days, possibly longer if also immunocompromised or if severe infection

Varicella zoster (chickenpox), treatment in immunocompromised

- ► BY INTRAVENOUS INFUSION
- Adult: 10 mg/kg every 8 hours usually for 5 days

Herpes zoster (shingles), treatment in immunocompromised

- ► BY MOUTH
- Adult: 800 mg 5 times a day continued for 2 days after crusting of lesions
- ► BY INTRAVENOUS INFUSION
- Adult: 10 mg/kg every 8 hours usually for 5 days

Varicella zoster (chickenpox), attenuation of infection if varicella-zoster immunoglobulin not indicated

- ► BY MOUTH
- Adult: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure

Genital herpes simplex, treatment of first episode

- ► BY MOUTH
- Adult: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete), alternatively 400 mg 3 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Genital herpes simplex, treatment of first episode, in immunocompromised or HIV-positive

- ▶ BY MOUTH
- Adult: 400 mg 5 times a day for 7-10 days (longer if new lesions appear during treatment or if healing incomplete)

Severe genital herpes simplex, treatment, initial infection

- ► BY INTRAVENOUS INFUSION
- Adult: 5 mg/kg every 8 hours usually for 5 days, alternatively 10 mg/kg every 8 hours usually for 5 days, higher dose to be used only if resistant organisms suspected

Genital herpes simplex, treatment of recurrent infection

- ► BY MOUTH
- Adult: 800 mg 3 times a day for 2 days, alternatively 200 mg 5 times a day for 5 days, alternatively 400 mg 3 times a day for 3-5 days

Genital herpes simplex, treatment of recurrent infection in immunocompromised or HIV-positive patients

- ► BY MOUTH
- ▶ Adult: 400 mg 3 times a day for 5-10 days

DOSES AT EXTREMES OF BODY-WEIGHT

 With intravenous use To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal weight for height.

UNLICENSED USE

- With intravenous use Intravenous infusion not licensed for herpes zoster.
- With oral use Attenuation of chickenpox is an unlicensed indication.
- With systemic use Aciclovir doses in BNF Publications may differ from those in product literature.
- CAUTIONS Elderly (risk of neurological reactions) maintain adequate hydration (especially with infusion or high doses)
- INTERACTIONS → Appendix 1: aciclovir
- SIDE-EFFECTS
- ► Common or very common
- With intravenous use Nausea · photosensitivity reaction · skin reactions · vomiting

- With oral use Abdominal pain · diarrhoea · dizziness · fatigue · fever · headache · nausea · photosensitivity reaction · skin reactions · vomiting
- ▶ Uncommon
- With intravenous use Anaemia · leucopenia · thrombocytopenia
- ► Rare or very rare
- With intravenous use Abdominal pain agitation angioedema ataxia coma confusion diarrhoea dizziness drowsiness dysarthria dyspnoea encephalopathy fatigue fever hallucination headache hepatic disorders inflammation localised psychosis renal impairment renal pain seizure tremor
- With oral use Agitation anaemia angioedema ataxia coma confusion drowsiness dysarthria dyspnoea encephalopathy hallucination hepatic disorders leucopenia psychosis renal impairment renal pain seizure thrombocytopenia tremor
- ► Frequency not known
- With intravenous use Crystalluria
- ▶ With oral use Alopecia · crystalluria
- **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.
- BREAST FEEDING Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.
- RENAL IMPAIRMENT Risk of neurological reactions increased. Maintain adequate hydration (especially during renal impairment).

Dose adjustments • With intravenous use Use normal intravenous dose every 12 hours if eGFR 25–50 mL/minute/1.73 m² (every 24 hours if eGFR 10–25 mL/minute/1.73 m²). Consult product literature for intravenous dose if eGFR less than 10 mL/minute/1.73 m². • With oral use For herpes zoster, use normal oral dose every 8 hours if eGFR 10–25 mL/minute/1.73 m² (every 12 hours if eGFR less than 10 mL/minute/1.73 m²). For herpes

simplex, use normal oral dose every 12 hours if eGFR less

than 10 mL/minute/1.73 m². • DIRECTIONS FOR ADMINISTRATION

▶ With intravenous use For intravenous infusion Zovirax IV®, Aciclovir IV (Genus), give intermittently in Sodium chloride 0.9% or Sodium chloride and glucose; initially reconstitute to 25 mg/mL in water for injection or sodium chloride 0.9% then dilute to not more than 5 mg/mL with the infusion fluid; to be given over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and given over 1 hour; for Aciclovir IV (Hospira) dilute to not more than 5 mg/mL with infusion fluid; give over 1 hour.

PRESCRIBING AND DISPENSING INFORMATION

- With oral use Flavours of oral liquid preparations may include banana, or orange.
- When used for Herpes simplex, suppression Interrupt therapy every 6-12 months to reassess recurrence frequency consider restarting after two or more recurrences.

PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary • With oral use Aciclovir Tablets 200 mg or 800 mg may be prescribed. Aciclovir Oral Suspension 200 mg/5mL may be prescribed.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Famciclovir

27-Apr-2021

• INDICATIONS AND DOSE

Herpes zoster infection, treatment

► BY MOUTH

 Adult: 500 mg 3 times a day for 7 days, alternatively 750 mg 1-2 times a day for 7 days

Herpes zoster infection, treatment in immunocompromised patients

► BY MOUTH

Adult: 500 mg 3 times a day for 10 days, continue for 2 days after crusting of lesions

Genital herpes, suppression

► BY MOUTH

 Adult: 250 mg twice daily, therapy to be interrupted every 6-12 months to reassess recurrence frequency consider restarting after two or more recurrences

Genital herpes, suppression in immunocompromised or HIV-positive patients

► BY MOUTH

 Adult: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency consider restarting after two or more recurrences

Genital herpes infection, treatment of first episode

► BY MOUTH

 Adult: 250 mg 3 times a day for 5 days or longer if new lesions appear during treatment or if healing incomplete

Genital herpes infection, treatment of first episode in immunocompromised or HIV-positive patients

▶ BY MOUT

Adult: 500 mg twice daily for 10 days

Genital herpes infection, treatment of recurrent infection

► BY MOUTH

 Adult: 125 mg twice daily for 5 days, alternatively 1 g twice daily for 1 day

Genital herpes infection, treatment of recurrent infections in immunocompromised or HIV-positive patients

► BY MOUTH

▶ Adult: 500 mg twice daily for 5–10 days

Herpes simplex infection (non-genital), treatment in immunocompromised patients

▶ BY MOUTH

Adult: 500 mg twice daily for 7 days

- UNLICENSED USE Famciclovir doses in BNF may differ from those in product literature.
- INTERACTIONS → Appendix 1: famciclovir
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · diarrhoea · dizziness · headache · nausea · skin reactions · vomiting
- ▶ Uncommon Angioedema · confusion · drowsiness
- ➤ Rare or very rare Hallucination · jaundice cholestatic · palpitations · thrombocytopenia
- PREGNANCY Manufacturers advise avoid unless potential benefit outweighs risk.
- BREAST FEEDING No information available—present in milk in *animal* studies.
- HEPATIC IMPAIRMENT Manufacturer advises efficacy may be decreased in severe impairment (risk of impaired conversion to active metabolite, no information available).
- RENAL IMPAIRMENT

Dose adjustments EvGr Reduce dose (consult product literature).

 PRESCRIBING AND DISPENSING INFORMATION Famciclovir is a pro-drug of penciclovir.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Valaciclovir

09-Jun-2020

• INDICATIONS AND DOSE

Herpes zoster infection, treatment

► BY MOUTH

Adult: 1 g 3 times a day for 7 days

Herpes zoster infection, treatment in immunocompromised patients

► BY MOUTH

 Adult: 1 g 3 times a day for at least 7 days and continued for 2 days after crusting of lesions

Herpes simplex, treatment of first infective episode

▶ BY MOUTH

 Adult: 500 mg twice daily for 5 days (longer if new lesions appear during treatment or healing is incomplete)

Herpes simplex infections treatment of first episode in immunocompromised or HIV-positive patients

► BY MOUTH

Adult: 1 g twice daily for 10 days

Herpes simplex, treatment of recurrent infections

► BY MOUTH

Adult: 500 mg twice daily for 3-5 days

Treatment of recurrent herpes simplex infections in immunocompromised or HIV-positive patients

▶ BY MOUTH

▶ Adult: 1 g twice daily for 5-10 days

Herpes labialis treatment

► BY MOUTH

Adult: Initially 2 g, then 2 g after 12 hours

Herpes simplex, suppression of infections

▶ BY MOUTH

 Adult: 500 mg daily in 1-2 divided doses, therapy to be interrupted every 6-12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Herpes simplex, suppression of infections in immunocompromised or HIV-positive patients

► BY MOUTH

 Adult: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency consider restarting after two or more recurrences

Genital herpes, reduction of transmission (administered on expert advice)

► BY MOUTH

 Adult: 500 mg once daily, to be taken by the infected partner

Prevention of cytomegalovirus disease following solid organ transplantation when valganciclovir or ganciclovir cannot be used

► BY MOUTH

- Adult: 2 g 4 times a day usually for 90 days, preferably starting within 72 hours of transplantation
- CAUTIONS Elderly (risk of neurological reactions) maintain adequate hydration (especially with high doses)
- INTERACTIONS → Appendix 1: valaciclovir
- SIDE-EFFECTS
- ► Common or very common Diarrhoea · dizziness · headache · nausea · photosensitivity reaction · skin reactions · vomiting
- Uncommon Abdominal discomfort agitation confusion dyspnoea haematuria hallucination leucopenia level of consciousness decreased renal pain thrombocytopenia tremor
- ▶ Rare or very rare Angioedema · ataxia · coma · delirium · dysarthria · encephalopathy · nephrolithiasis · psychosis · renal impairment · seizure
- Frequency not known Microangiopathic haemolytic anaemia

SIDE-EFFECTS, FURTHER INFORMATION Neurological reactions more frequent with higher doses.

- PREGNANCY Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.
- BREAST FEEDING Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution with doses of 4 g or more per day (no information available).
- RENAL IMPAIRMENT Maintain adequate hydration.
 Dose adjustments For herpes zoster, 1 g every 12 hours if eGFR 30–50 mL/minute/1.73 m² (1 g every 24 hours if eGFR 10–30 mL/minute/1.73 m²; 500 mg every 24 hours if eGFR less than 10 mL/minute/1.73 m²).

For treatment of herpes simplex, 500 mg (1 g in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than $30 \text{ mL/minute/}1.73 \text{ m}^2$.

For treatment of herpes labialis, if eGFR 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if eGFR 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose; if eGFR less than 10 mL/minute/1.73 m², 500 mg as a single dose).

For suppression of herpes simplex, 250 mg (500 mg in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m².

For reduction of genital herpes transmission, 250 mg every 24 hours if eGFR less than 15 mL/minute/1.73 m².

Reduce dose according to eGFR for *cytomegalovirus prophylaxis* following solid organ transplantation (consult product literature).

- PRESCRIBING AND DISPENSING INFORMATION Valaciclovir is a pro-drug of aciclovir.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

6.4a Cytomegalovirus infections

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Cidofovir

20-Mar-2019

 DRUG ACTION Cidofovir is a selective inhibitor of human cytomegalovirus (HCMV) DNA polymerase which inhibits viral DNA synthesis and thereby suppresses HCMV replication.

INDICATIONS AND DOSE

Cytomegalovirus retinitis in patients with AIDS (in combination with probenecid) (specialist use only)

► BY INTRAVENOUS INFUSION

- Adult: Initially 5 mg/kg once weekly for 2 weeks, then maintenance 5 mg/kg every 2 weeks, maintenance treatment to be started 2 weeks after completion of induction treatment
- CONTRA-INDICATIONS Concomitant administration with potentially nephrotoxic drugs—discontinue potentially

nephrotoxic drugs at least 7 days before starting cidofovir patients unable to receive probenecid

 CAUTIONS Diabetes mellitus (increased risk of ocular hypotony) - ensure concomitant use of probenecid and Sodium Chloride 0.9%

CAUTIONS, FURTHER INFORMATION

- Probenecid and Sodium Chloride 0.9% Manufacturer advises oral probenecid and intravenous Sodium Chloride 0.9% must be administered with each cidofovir dose to prevent nephrotoxicity (consult cidofovir product literature for information on probenecid dosing and recommendations on intravenous hydration); see *Prescribing and dispensing information* for details on obtaining probenecid.
- INTERACTIONS → Appendix 1: cidofovir
- SIDE-EFFECTS
- ► Common or very common Alopecia · asthenia · chills · diarrhoea · dyspnoea · eye inflammation · fever · headache · nausea · neutropenia · ocular hypotony · proteinuria · rash · renal failure · vomiting
- ▶ Uncommon Fanconi syndrome acquired
- ► Frequency not known Hearing impairment nephrotoxicity pancreatitis

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises intravenous sodium chloride 0.9% prehydration and concomitant oral probenecid for prevention of nephrotoxicity; consider treatment interruption, or discontinuation if changes in renal function occur—consult product literature.

- CONCEPTION AND CONTRACEPTION Manufacturer advises ensure effective contraception during and after treatment in women; men should be advised to use barrier contraception during and for 3 months after treatment. Cidofovir may cause impaired fertility in males—reduced testes weight and hypospermia observed in animal studies.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid (no information available).
- HEPATIC IMPAIRMENT Manufacturer advises caution (no information available).
- RENAL IMPAIRMENT Manufacturer advises avoid if creatinine clearance is less than or equal to 55 mL/minute or if proteinuria is greater than or equal to 100 mg/dL. See p. 21.
- MONITORING REQUIREMENTS
- Manufacturer advises monitor serum creatinine, urine protein levels, and white blood cell count before each cidofovir dose.
- Manufacturer advises regular eye examinations (increased risk of iritis, ocular hypotony, and uveitis).
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises for intravenous infusion, dilute with 100 mL Sodium Chloride 0.9% and mix thoroughly; give at a constant rate over 1 hour via an infusion pump.
- PRESCRIBING AND DISPENSING INFORMATION Probenecid
 is available from 'special-order' manufacturers or
 specialist importing companies—in case of difficulties, the
 cidofovir manufacturer (Tillomed) advises contacting their
 local representative. See probenecid product literature for
 prescribing information for probenecid, including
 information on interactions.

HANDLING AND STORAGE

Caution in handling Manufacturer advises cidofovir should be considered a potential carcinogen and must be handled with caution (consult product literature); if contact with skin or mucous membranes occurs, wash thoroughly with water. MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

▶ Cidofovir (non-proprietary)

Cidofovir 75 mg per 1 ml Cidofovir 375mg/5ml concentrate for solution for infusion vials | 1 vial PoM 🖫

Ganciclovir

15-Dec-2020

• INDICATIONS AND DOSE

Prevention of cytomegalovirus disease [pre-emptive therapy in patients with drug-induced immunosuppression]

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 5 mg/kg every 12 hours for 7-14 days, then maintenance 6 mg/kg once daily, on 5 days of the week, alternatively maintenance 5 mg/kg once daily

Prevention of cytomegalovirus disease [universal prophylaxis in patients with drug-induced immunosuppression]

- ► BY INTRAVENOUS INFUSION
- Adult: 6 mg/kg once daily, on 5 days of the week, alternatively 5 mg/kg once daily

Treatment of cytomegalovirus disease [in immunocompromised patients]

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 5 mg/kg every 12 hours for 14–21 days, then maintenance 6 mg/kg once daily, on 5 days of the week, alternatively maintenance 5 mg/kg once daily, maintenance only for patients at risk of relapse; if disease progresses initial induction treatment may be repeated
- CONTRA-INDICATIONS Abnormally low haemoglobin count (consult product literature) - abnormally low neutrophil count (consult product literature) - abnormally low platelet count (consult product literature)
- CAUTIONS History of cytopenia · potential carcinogen (including long-term carcinogenicity) · potential teratogen (including long-term teratogenicity) · radiotherapy
- INTERACTIONS → Appendix 1: ganciclovir
- SIDE-FFFFCTS
- ➤ Common or very common Anaemia · anxiety · appetite decreased · arthralgia · asthenia · bone marrow disorders · chest pain · chills · confusion · constipation · cough · depression · diarrhoea · dizziness · dysphagia · dyspnoea · ear pain · eye disorders · eye inflammation · eye pain · fever · flatulence · gastrointestinal discomfort · headache · hepatic function abnormal · increased risk of infection · insomnia · leucopenia · malaise · muscle complaints · nausea · neutropenia · night sweats · pain · peripheral neuropathy · renal impairment · seizure · sensation abnormal · sepsis · skin reactions · taste altered · thinking abnormal · thrombocytopenia · vomiting · weight decreased
- ► Uncommon Alopecia · arrhythmia · deafness · haematuria · hypotension · infertility male · oral ulceration · pancreatitis · psychotic disorder · tremor · visual impairment
- ▶ Rare or very rare Agranulocytosis hallucination
- ALLERGY AND CROSS-SENSITIVITY Ever Contra-indicated in patients hypersensitive to valganciclovir. Caution in patients hypersensitive to aciclovir, valaciclovir, or famciclovir. ♠
- CONCEPTION AND CONTRACEPTION Manufacturer advises women of childbearing potential should use effective contraception during and for at least 30 days after treatment; men with partners of childbearing potential should be advised to use barrier contraception during and for at least 90 days after treatment. Ganciclovir may cause

temporary or permanent inhibition of spermatogenesis—impaired fertility observed in *animal* studies.

- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—teratogenicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- RENAL IMPAIRMENT

Dose adjustments Manufacturer advises reduce dose for patients receiving mg/kg dosing if creatinine clearance less than 70 mL/minute—consult product literature. See p. 21.

- MONITORING REQUIREMENTS Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises, for intravenous infusion, give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute with Water for Injections (500 mg/10 mL) then dilute requisite dose to a concentration of not more than 10 mg/mL with infusion fluid; give over 1 hour into a vein with adequate flow, preferably using a plastic cannula.
- HANDLING AND STORAGE
 Caution in handling Ganciclovir is a potential teratogen and carcinogen. Manufacturer advises avoid inhalation of the powder or direct contact of the powder or reconstituted solution with the skin or mucous membranes; if contact occurs, wash thoroughly with soap and water; rinse eyes thoroughly with plain water.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

► Ganciclovir (Non-proprietary)

Ganciclovir (as Ganciclovir sodium) 500 mg Ganciclovir 500mg powder for concentrate for solution for infusion vials | 5 vial PoM £115.00-£125.95 (Hospital only) | 5 vial PoM £125.95

Cymevene (Neon Healthcare Ltd)

Ganciclovir (as Ganciclovir sodium) 500 mg Cymevene 500mg powder for concentrate for solution for infusion vials | 5 vial PoM £148.83 (Hospital only)

Valganciclovir

06-Aug-2021

• INDICATIONS AND DOSE

Cytomegalovirus retinitis [induction and maintenance treatment in patients with AIDS]

► BY MOUTH

 Adult: Initially 900 mg twice daily for 21 days, then maintenance 900 mg daily, induction regimen may be repeated if retinitis progresses

Prevention of cytomegalovirus disease [following solid organ transplantation from a cytomegalovirus positive donor]

- ► BY MOUTH
- Adult: 900 mg daily for 100 days (for 100–200 days following kidney transplantation), to be started within 10 days of transplantation
- DOSE EQUIVALENCE AND CONVERSION
- Oral valganciclovir 900 mg twice daily is equivalent to intravenous ganciclovir 5 mg/kg twice daily.
- CONTRA-INDICATIONS Abnormally low haemoglobin count (consult product literature) - abnormally low neutrophil count (consult product literature) - abnormally low platelet count (consult product literature)
- CAUTIONS History of cytopenia · potential carcinogen (including long-term carcinogenicity) · potential teratogen (including long-term teratogenicity) · radiotherapy
- INTERACTIONS → Appendix 1: valganciclovir

SIDE-EFFECTS

- ▶ Common or very common Anaemia · anxiety · appetite decreased · arthralgia · asthenia · bone marrow disorders · chest pain · confusion · constipation · cough · depression · diarrhoea · dizziness · dysphagia · dyspnoea · ear pain · eye disorders · eye inflammation · eye pain · flatulence · gastrointestinal discomfort · headache · hepatic function abnormal · increased risk of infection · insomnia · leucopenia · malaise · muscle complaints · nausea · neutropenia · night sweats · pain · peripheral neuropathy · renal impairment · seizure · sensation abnormal · sepsis · skin reactions · taste altered · thinking abnormal · thrombocytopenia · vomiting · weight decreased
- Uncommon Alopecia · arrhythmia · deafness · haematuria · hallucination · hypotension · infertility male · oral ulceration · pancreatitis · psychotic disorder · tremor · visual impairment
- ALLERGY AND CROSS-SENSITIVITY Ever Contra-indicated in patients hypersensitive to ganciclovir. Caution in patients hypersensitive to aciclovir, valaciclovir, or famciclovir.
- CONCEPTION AND CONTRACEPTION Manufacturer advises
 women of childbearing potential should use effective
 contraception during and for at least 30 days after
 treatment; men with partners of childbearing potential
 should be advised to use barrier contraception during and
 for at least 90 days after treatment. Ganciclovir may cause
 temporary or permanent inhibition of spermatogenesis—
 impaired fertility observed in animal studies.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—teratogenicity observed with ganciclovir in animal studies.
- BREAST FEEDING Manufacturer advises avoid—ganciclovir present in milk in animal studies.
- RENAL IMPAIRMENT

Dose adjustments Manufacturer advises reduce dose if creatinine clearance less than 60 mL/minute—consult product literature. See p. 21.

- MONITORING REQUIREMENTS Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).
- PRESCRIBING AND DISPENSING INFORMATION
 Valganciclovir is a pro-drug of ganciclovir.
 Flavours of oral liquid formulations may include tuttifutti
- HANDLING AND STORAGE Manufacturer advises
 reconstituted powder for oral solution should be stored in
 a refrigerator (2–8°C) for up to 49 days.
 Caution in handling Valganciclovir is a potential teratogen
 and carcinogen. Manufacturer advises caution when
 handling the powder, reconstituted solution, or broken
 tablets and avoid inhalation of powder; if contact with skin
 or mucous membranes occurs, wash thoroughly with soap
 and water; rinse eyes thoroughly with plain water.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

ANTIVIRALS > OTHER

Foscarnet sodium

27-Apr-2021

INDICATIONS AND DOSE

Cytomegalovirus disease ► BY INTRAVENOUS INFUSION

 Adult: Initially 60 mg/kg every 8 hours for 2-3 weeks, alternatively initially 90 mg/kg every 12 hours for 2-3 weeks, then maintenance 60 mg/kg daily, then

increased if tolerated to 90–120 mg/kg daily, if disease progresses on maintenance dose, repeat induction regimen

Mucocutaneous herpes simplex virus infections unresponsive to aciclovir in immunocompromised patients

- ► BY INTRAVENOUS INFUSION
- Adult: 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal
- UNLICENSED USE Licensed for CMV retinitis in AIDS patients only. Foscarnet doses in BNF may differ from those in product literature.
- CAUTIONS Conditions where excess sodium should be avoided ensure adequate hydration
- INTERACTIONS → Appendix 1: foscarnet
- SIDE-EFFECTS
- ► Common or very common Aggression · anaemia · anxiety · appetite decreased · arrhythmias · asthenia · chest pain · chills · confusion · constipation · coordination abnormal · dehydration · depression · diarrhoea · dizziness · electrolyte imbalance · fever · gastrointestinal discomfort · genital discomfort (due to high concentrations excreted in urine). genital ulceration (due to high concentrations excreted in urine) · haemorrhage · headache · hepatic function abnormal · hypertension · hypotension · leucopenia · malaise · muscle contractions involuntary · myalgia · nausea (reduce infusion rate) · neutropenia · numbness · oedema · palpitations · pancreatitis · paraesthesia (reduce infusion rate) · peripheral neuropathy · proteinuria · renal impairment · seizure · sepsis · skin reactions · thrombocytopenia · thrombophlebitis · tremor · urinary disorders · vomiting
- Uncommon Acidosis · angioedema · glomerulonephritis · nephropathy · pancytopenia
- Frequency not known Anaphylactoid reaction diabetes insipidus · muscle weakness · myopathy · oesophageal ulcer · QT interval prolongation · renal pain · renal tubular acidosis · severe cutaneous adverse reactions (SCARs)
- CONCEPTION AND CONTRACEPTION Men should avoid fathering a child during and for 6 months after treatment.
- PREGNANCY Manufacturer advises avoid.
- BREAST FEEDING Avoid—present in milk in animal studies.
- RENAL IMPAIRMENT Manufacturer advises caution.
 Dose adjustments Manufacturer advises dose reduction (consult product literature).
- MONITORING REQUIREMENTS
- $\,\blacktriangleright\,$ Monitor electrolytes, particularly calcium and magnesium.
- Monitor serum creatinine every second day during induction and every week during maintenance.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Foscavir®), manufacturer advises give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 12 mg/mL for infusion into peripheral vein (undiluted solution via central venous line only);

infuse over at least 1 hour (infuse doses greater than 60 mg/kg over 2 hours).

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

► Foscavir (Clinigen Healthcare Ltd)

Foscarnet sodium 24 mg per 1 ml Foscavir 6g/250ml solution for infusion bottles | 1 bottle Fom £119.85 (Hospital only)

Letermovir

31-Aug-2020

 DRUG ACTION Letermovir is a cytomegalovirus DNA terminase complex inhibitor that interferes with cytomegalovirus genome formation and virion maturation.

• INDICATIONS AND DOSE

Prevention of cytomegalovirus reactivation and disease [in recipients of an allogeneic haematopoietic stem cell transplant who are seropositive for the human cytomegalovirus] (initiated by a specialist)

- ▶ BY MOUTH
- Adult: 480 mg once daily for 100 days post-transplant, start within 28 days post-transplant, treatment beyond 100 days may be considered in some patients—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose to 240 mg once daily with concurrent use of ciclosporin.
- INTERACTIONS → Appendix 1: letermovir
- SIDE-EFFECTS
- ► Common or very common Diarrhoea · nausea · vomiting
- ► Uncommon Abdominal pain · appetite decreased · fatigue · headache · muscle spasms · peripheral oedema · taste altered · vertigo
- CONCEPTION AND CONTRACEPTION The effect on human fertility is not known—impairment of fertility has been observed in animal studies.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies
- BREAST FEEDING Manufacturer advises avoid—present in milk in *animal* studies.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in moderate impairment in those with co-existing moderate or severe renal impairment, and in severe impairment (risk of increased exposure).
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- ► Letermovir for preventing cytomegalovirus disease after a stem cell transplant (July 2019) NICE TA591 Recommended Scottish Medicines Consortium (SMC) decisions
- Letermovir (Prevymis[®]) for prophylaxis of cytomegalovirus (CMV) reactivation and disease in adult CMV-seropositive recipients [R+] of an allogeneic haematopoietic stem cell transplant (March 2019) SMC No. 1338/18 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

6.5 HIV infection

HIV infection

15-Nov-2021

Overview

The human immunodeficiency virus (HIV) is a retrovirus that causes immunodeficiency by infecting and destroying cells of the immune system, particularly the CD4 cells. Acquired immune deficiency syndrome (AIDS) occurs when the number of CD4 cells fall to below 200 cells/microlitre; opportunistic infections and malignancies (AIDS-defining illnesses) can develop. The prognosis of HIV and AIDS has greatly improved due to more effective and better tolerated antiretroviral therapy (ART). The greatest risk to excess mortality and morbidity is delayed HIV diagnosis and treatment.

Aims of treatment

Treatment aims to achieve an undetectable viral load, to preserve immune function, to reduce the mortality and norbidity associated with chronic HIV infection, and to reduce onward transmission of HIV, whilst minimising drug toxicity. Treatment with a combination of ART aims to improve the physical and psychological well-being of infected people.

Initiation of treatment

EvGr All patients with suspected or diagnosed HIV should be reviewed promptly by a HIV specialist.

All patients diagnosed as being HIV positive should be offered immediate treatment, irrespective of CD4 cell counts. Commitment to, and strict adherence to treatment over many years is required. Low adherence can be associated with drug resistance, progression to AIDS, and death. The treatment regimen should take into account dosing convenience, potential drug interactions, clinical symptoms, and comorbidities.

Ever Treatment of HIV infection in treatment-naive patients is initiated with a combination of two nucleoside reverse transcriptase inhibitors (NRTIs) as a backbone regimen plus one of the following as a third drug: an integrase inhibitor (INI), a non-nucleoside reverse transcriptase inhibitor (NNRTI), or a boosted protease inhibitor (PI).

The regimen of choice contains a backbone of emtricitabine p. 706 and either tenofovir disoproxil p. 709 or tenofovir alafenamide p. 679. An alternative backbone regimen is abacavir p. 702 and lamivudine p. 708. The third drug of choice is either atazanavir p. 711 or darunavir p. 712 both boosted with ritonavir p. 714, or dolutegravir p. 696, or elvitegravir p. 698 boosted with cobicistat p. 715, or raltegravir p. 698, or rilpivirine p. 701. Efavirenz p. 699 may be used as an alternative third drug.

Patients who require treatment for both HIV and chronic hepatitis B should be treated with antivirals active against both diseases as part of fully suppressive combination ART. Regimens of choice are tenofovir disoproxil and emtricitabine, or tenofovir alafenamide p. 679 and emtricitabine. For further information see British HIV Association guidelines for the treatment of HIV-1-positive adults with antiretroviral therapy available at www.bhiva.org/guidelines.

Switching therapy

Evor Deterioration of the condition (including clinical, virological, and CD4 cell count changes) may require a change in therapy. The choice of an alternative regimen should be guided by factors such as the response to previous treatment, tolerability, drug-drug interactions and the possibility of drug resistance. A For further information

see British HIV Association guidelines for the treatment of HIV-1-positive adults with antiretroviral therapy available at www.bhiva.org/guidelines.

HIV infection in pregnancy

[EvGr] Management of HIV infection in pregnancy should focus on the well-being of the women living with HIV, by ensuring that their ART regimen maximally suppresses viral replication as early as possible (if possible before conception) in order to minimise vertical transmission of HIV. Information on the teratogenic potential of most antiretroviral drugs is limited, however, all pregnant women living with HIV who conceive whilst on effective ART should continue this treatment throughout their pregnancy. All other women should start ART during their pregnancy. The recommended regimen is a NRTI backbone of either tenofovir disoproxil or abacavir with either emtricitabine or lamivudine: the third drug should be efavirenz or atazanavir boosted with ritonavir. All treatment options require careful assessment by a specialist. A For further information, including alternative ART options, see British HIV Association guidelines for the management of HIV in pregnancy and postpartum available at www.bhiva.org/

Evgr Pregnancies in women with HIV and babies born to them should be reported prospectively to the National Study of HIV in Pregnancy and Childhood at www.ucl.ac.uk/nshpc/and to the Antiretroviral Pregnancy Registry at www.apregistry.com. (A)

HIV infection and breast-feeding

EvGr Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided. For further information see British HIV Association guidelines for the management of HIV in pregnancy and postpartum available at www.bhiva.org/guidelines.

HIV infection, pre-exposure prophylaxis

The risk of acquiring HIV is increased in:

- men or transgender individuals who have unprotected anal intercourse with men;
- sexual partners of people who are HIV-positive with a detectable viral load; and
- HIV-negative heterosexual individuals who have unprotected intercourse with a HIV-positive person, and are likely to repeat this with the same person or another person with a similar status.

EvGr Emtricitabine with tenofovir disoproxil p. 707 may be appropriate for pre-exposure prophylaxis to reduce the risk of sexually acquired HIV-1 infection in combination with safer sex practices in adults at high risk. Tenofovir disoproxil alone is an alternative for HIV-negative heterosexual individuals when emtricitabine is contra-indicated. For further information see British HIV Association and British Association for Sexual Health and HIV guidelines on the use of HIV pre-exposure prophylaxis (PrEP) available at: www.bhiva.org/guidelines.

HIV infection, post-exposure prophylaxis

The Department of Health advises prompt prophylaxis with antiretroviral drugs [unlicensed indication] may be appropriate following exposure to HIV-contaminated material. Immediate expert advice should be sought in such cases. National guidelines on post-exposure prophylaxis for healthcare workers have been developed (by the Chief Medical Officer's Expert Advisory Group on AIDS), www.gov. uk/government/publications/eaga-guidance-on-hiv-post-exposure-prophylaxis and local ones may also be available.

Evgr Prompt prophylaxis with antiretroviral drugs [unlicensed indication] may also be appropriate following potential sexual exposure to HIV where there is a significant risk of viral transmission. The recommended treatment for

post-exposure prophylaxis is emtricitabine with tenofovir disoproxil plus raltegravir for 28 days. For further information see British Association for Sexual Health and HIV guidelines for the use of HIV post-exposure prophylaxis following sexual exposure available at www.bashh.org.

Drug treatment

Drugs that are licensed for the treatment of HIV/AIDS are listed below according to drug class.

Nucleoside reverse transcriptase inhibitors (NRTI or 'nucleoside analogue'): abacavir (ABC); emtricitabine (FTC), lamivudine (3TC); tenofovir alafenamide fumarate (TAF) p. 679, tenofovir disoproxil fumarate (TDF), and zidovudine (AZT) p. 710.

Non-nucleoside reverse transcriptase inhibitors (NNRTI): doravirine (DOR) p. 699, efavirenz (EFV), etravirine (ETR) p. 700, nevirapine (NVP) p. 700, and rilpivirine (RPV) p. 701.

Protease inhibitors (PI): atazanavir (ATZ), darunavir (DRV), fosamprenavir (FOS-APV) p. 713, lopinavir (LPV), ritonavir (RTV), saquinavir (SQV), and tipranavir (TPV) p. 715.

CCR5 antagonists: maraviroc (MVC) p. 715.

Integrase inhibitors (INI): bictegravir (BIC), cabotegravir (CAB) p. 696, dolutegravir (DTG) p. 696, elvitegravir (EVG) p. 698, and raltegravir (RAL).

Fusion inhibitors: enfuvirtide (T-20) below. **Attachment inhibitors:** fostemsavir below (FTR).

Pharmacokinetic enhancers: cobicistat (c) p. 715, and low-dose ritonavir (r). They boost the concentrations of other antiretrovirals metabolised by CYP3A4.

ANTIVIRALS > HIV-ATTACHMENT INHIBITORS

Fostemsavir

16-Nov-2021

 DRUG ACTION Fostemsavir is a prodrug of temsavir which inhibits the attachment of HIV to the host cell

• INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs for resistant infection

- ► BY MOUTH
- Adult: 600 mg twice daily
- CAUTIONS Risk factors for QT-interval prolongation
- INTERACTIONS → Appendix 1: fostemsavir
- SIDE-EFFECTS
- ► Common or very common Central nervous system immune reconstitution inflammatory response · diarrhoea · dizziness · drowsiness · fatigue · flatulence · gastrointestinal discomfort · headache · immune reconstitution inflammatory syndrome · insomnia · myalgia · nausea · skin reactions · taste altered · vomiting
- PREGNANCY Evgr Avoid—limited information available.
- HEPATIC IMPAIRMENT EVGT Caution in patients with chronic hepatitis B or C (increased risk of severe hepatic side-effects)—monitor liver function.
- PATIENT AND CARER ADVICE

Driving and skilled tasks Patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of headache, dizziness, and somnolence.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

► Rukobia (ViiV Healthcare UK Ltd) ▼

Fostemsavir 600 mg Rukobia 600mg modified-release tablets | 60 tablet | PoM £2,900.00

ANTIVIRALS > HIV-FUSION INHIBITORS

Enfuvirtide

04-Sen-2020

 DRUG ACTION Enfuvirtide inhibits the fusion of HIV to the host cell

• INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens

- BY SUBCUTANEOUS INJECTION
 Adult: 90 mg twice daily
- SIDE-EFFECTS
- ➤ Common or very common Anxiety · appetite decreased · asthenia · concentration impaired · conjunctivitis · diabetes mellitus · gastrooesophageal reflux disease · haematuria · hypertriglyceridaemia · increased risk of infection · influenza like illness · irritability · lymphadenopathy · myalgia · nasal congestion · nephrolithiasis · nightmare · numbness · pancreatitis · peripheral neuropathy · skin papilloma · skin reactions · tremor · vertigo · weight decreased
- ► Frequency not known Diarrhoea · hypersensitivity · immune reconstitution inflammatory syndrome · nausea · osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION Hypersensitivity

Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge.

Osteonecrosis Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
- HEPATIC IMPAIRMENT Manufacturer advises caution (no information available); increased risk of hepatic side effects in patients with chronic hepatitis B or C.
- DIRECTIONS FOR ADMINISTRATION For subcutaneous injection, manufacturer advises reconstitute with 1.1 mL Water for Injections and allow to stand (for up to 45 minutes) to dissolve; do not shake or invert vial.
- PATIENT AND CARER ADVICE

Hypersensitivity reactions Patients or carers should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

ELECTROLYTES: May contain Sodium

► Fuzeon (Roche Products Ltd)

Enfuvirtide 108 mg Fuzeon 108mg powder and solvent for solution for injection vials | 60 vial |PoM| £1,081.57 (Hospital only)

ANTIVIRALS > HIV-INTEGRASE INHIBITORS

Cabotegravir

04-Feh-2022

DRUG ACTION Cabotegravir is an inhibitor of HIV integrase.

• INDICATIONS AND DOSE

HIV-1 infection [oral lead-in therapy, in combination with rilpivirine] (specialist use only)

- BY MOUTH
- Adult: 30 mg once daily for approximately 1 month (at least 28 days) then, if tolerated, switch to intramuscular treatment with cabotegravir and rilpivirine at month 2, for oral dose recommendations if cabotegravir injection and rilpivirine injection are missed—consult product literature

HIV-1 infection [in combination with rilpivirine prolongedrelease injection] (specialist use only)

- ► BY INTRAMUSCULAR INJECTION
- Adult: Initially 600 mg for 1 dose at month 2, to be started on the last day of oral lead-in therapy with cabotegravir and rilpivirine, then maintenance 400 mg every month from month 3 onwards, maintenance injections may be administered up to 7 days before or after the scheduled dose. Cabotegravir and rilpivirine injections to be administered into separate gluteal muscle sites, for dose recommendations if switching to 2-monthly maintenance injections, or if injections are missed-consult product literature, alternatively initially 600 mg for 2 doses at months 2 and 3, to be started on the last day of oral lead-in therapy with cabotegravir and rilpivirine, then maintenance 600 mg every 2 months from month 5 onwards, the injection at month 3 and maintenance injections may be administered up to 7 days before or after the scheduled dose. Cabotegravir and rilpivirine injections to be administered into separate gluteal muscle sites, for dose recommendations if switching to monthly maintenance injections, or if injections are missedconsult product literature
- CAUTIONS Co-infection with hepatitis B or C ⋅ risk factors for virological failure

CAUTIONS, FURTHER INFORMATION

- Risk factors for virological failure EvGT Use with caution in patients with HIV-1 subtype A6/A1 or BMI of 30 kg/m² or more, if treatment history uncertain and pre-treatment resistance analyses absent. ♠
- INTERACTIONS → Appendix 1: cabotegravir
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ➤ Common or very common Anxiety · asthenia · depression · diarrhoea · dizziness · feeling hot · fever · flatulence · gastrointestinal discomfort · headache · malaise · myalgia · nausea · skin reactions · sleep disorders · vomiting · weight increased
- ▶ Uncommon Drowsiness hepatotoxicity

SPECIFIC SIDE-EFFECTS

- With intramuscular use Pancreatitis
- PREGNANCY
- With oral use Evgr Avoid unless potential benefit outweighs risk—no information available.
- With intramuscular use Evgr Avoid unless potential benefit outweighs risk—may remain in systemic circulation for up to 12 months or longer after last prolonged-release injection.
- BREAST FEEDING
- With oral use EvGr Avoid—present in milk in animal studies.

- ▶ With intramuscular use Ever Avoid—may be present in milk for up to 12 months or longer after last prolonged-release injection. ♠
- HEPATIC IMPAIRMENT EVG: Caution in severe impairment (no information available).
- MONITORING REQUIREMENTS EVGT Monitor liver function—discontinue treatment if hepatotoxicity develops.
- TREATMENT CESSATION
- With intramuscular use Evgr May remain in circulation for up to 12 months or longer; start an alternative regimen no later than 1 month after monthly regimen or 2 months after 2-monthly regimen. ♠
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer cabotegravir tablets.
 Missed doses If an oral dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. If vomiting occurs within 4 hours of taking an oral dose, a replacement dose should be taken.

Driving and skilled tasks Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue, dizziness and somnolence.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

► Cabotegravir with rilpivirine for treating HIV-1 (January 2022)

NICE TA757 Recommended

Scottish Medicines Consortium (SMC) decisions

- Cabotegravir (Vocabria®) prolonged-release injection in combination with rilpivirine prolonged-release injection, for the treatment of HIV-1 infection in adults who are virologically suppressed (plasma HIV-1 RNA concentration less than 50 copies/mL) on a stable antiretroviral regimen without present or past evidence of viral resistance to, and no prior virological failure with agents of the NNRTI and INI class (October 2021) SMC No. SMC2376 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Prolonged-release suspension for injection EXCIPIENTS: May contain Polysorbates

Cabotegravir 30 mg Vocabria 30mg tablets | 30 tablet PoM £638.57 (Hospital only)

Dolutegravir

12-Nov-2021

DRUG ACTION Dolutegravir is an inhibitor of HIV integrase.

• INDICATIONS AND DOSE

HIV infection without resistance to other inhibitors of HIV integrase [in combination with other antiretroviral drugs] (specialist use only)

- **▶** BY MOUTH USING TABLETS
- Adult: 50 mg once daily
- ► BY MOUTH USING DISPERSIBLE TABLETS
- Adult: 30 mg once daily

HIV infection in patients with resistance to other inhibitors of HIV integrase [in combination with other antiretroviral drugs] (specialist use only)

- **▶** BY MOUTH USING TABLETS
- Adult: 50 mg twice daily, dose to be taken with food

- ▶ BY MOUTH USING DISPERSIBLE TABLETS
- Adult: 30 mg twice daily, dose to be taken with food HIV infection [in combination with other antiretroviral drugs (with concomitant carbamazepine, efavirenz, etravirine (without boosted protease inhibitors, but see also Interactions), fosphenytoin, phenobarbital, phenytoin, primidone, nevirapine, oxcarbazepine, St John's wort, rifampicin, or tipranavir)] (specialist use only)
- ► BY MOUTH USING TABLETS
- Adult: 50 mg twice daily, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected
- ► BY MOUTH USING DISPERSIBLE TABLETS
- Adult: 30 mg twice daily, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected

DOSE EQUIVALENCE AND CONVERSION

 Tivicay[®] film-coated tablets and Tivicay[®] dispersible tablets are not bioequivalent. Follow correct dosing recommendations for the dosage form when switching formulations.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DOLUTEGRAVIR (TIVICAY®, TRIUMEQ®, JULUCA®): UPDATED ADVICE ON INCREASED RISK OF NEURAL TUBE DEFECTS (OCTOBER 2020)

The MHRA has updated its safety recommendations based on an ongoing European review evaluating cases of neural tube defects in babies born to mothers who became pregnant during dolutegravir treatment that found a smaller increased risk than previously thought, almost comparable to other HIV drugs.

Healthcare professionals are advised to counsel women of childbearing potential on the possible risk of neural tube defects with dolutegravir, including consideration of effective contraceptive measures. The benefits and risks of continuing treatment in women who are trying to become pregnant should be discussed with the patient. If pregnancy is confirmed in the first trimester during treatment, the benefits and risks of continuing dolutegravir versus switching to another antiretroviral regimen should also be discussed, considering the gestational age and the critical time period of neural tube defect development.

- INTERACTIONS → Appendix 1: dolutegravir
- SIDE-EFFECTS
- Common or very common Anxiety · depression · diarrhoea · dizziness · fatigue · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · sleep disorders · vomiting
- ▶ Uncommon Arthralgia · hepatic disorders · hypersensitivity
 · immune reconstitution inflammatory syndrome · myalgia
 · suicidal behaviours

${\tt SIDE-EFFECTS}, {\tt FURTHER\,INFORMATION}\ \ {\bf Hypersensitivity}$

Hypersensitivity reactions (including severe rash, or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, oral lesions, conjunctivitis, angioedema, eosinophilia, or raised liver enzymes) reported uncommonly. Discontinue immediately if any sign or symptoms of hypersensitivity reactions develop.

Osteonecrosis Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

 PREGNANCY EVGT Specialist sources indicate dolutegravir may be considered from 6 weeks' gestation if expected benefit outweighs risk—see Important Safety Information. Higher dose folic acid is recommended due to increased risk of neural tube defects—see Prevention of neural tube defects (in those in the high-risk group who wish to become pregnant or who are at risk of becoming pregnant) in folic acid p. 1112.

- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment—no information available.
- DIRECTIONS FOR ADMINISTRATION EVER Tivicay®
 dispersible tablets may be dispersed in water and given
 within 30 minutes, or swallowed whole one at a time. Do
 not chew, cut, or crush. ♠
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer dolutegravir film-coated tablets and dispersible tablets.
 Missed doses If a dose is more than 20 hours late on the once-daily regimen (or more than 8 hours late on the twice-daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time. Driving and skilled tasks Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.
- NATIONAL FUNDING/ACCESS DECISIONS

Elvitegravir

17-May-2019

 DRUG ACTION Elvitegravir is an inhibitor of HIV integrase, which is an enzyme required for viral replication.

• INDICATIONS AND DOSE

HIV infection without resistance to other inhibitors of HIV integrase, in combination with low-dose ritonavir and atazanavir or lopinavir

- ► BY MOUTH
- Adult: 85 mg once daily, take at the same time as a once daily ritonavir-boosted regimen or with the first dose of a twice daily ritonavir-boosted regimen

HIV infection without resistance to other inhibitors of HIV integrase, in combination with low-dose ritonavir and darunavir or fosamprenavir

- ► BY MOUTH
- Adult: 150 mg once daily, take with the first dose of a twice daily ritonavir-boosted regimen
- CAUTIONS Elderly—limited information available
- INTERACTIONS → Appendix 1: elvitegravir
- SIDE-EFFECTS
- ➤ Common or very common Diarrhoea · fatigue · headache · nausea · rash · vomiting
- Uncommon Depression · dizziness · drowsiness · flatulence · gastrointestinal discomfort · insomnia · paraesthesia · suicidal ideation (in patients with history of depression or psychiatric illness) · taste altered
- Frequency not known Hyperglycaemia · osteonecrosis · weight increased

- CONCEPTION AND CONTRACEPTION Manufacturer advises women of child-bearing potential should use effective contraception during treatment (if using a hormonal contraceptive, it must contain norgestimate as the progestogen and at least 30 micrograms ethinylestradiol).
- PREGNANCY Manufacturer advises avoid unless essential—limited data available.
- PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. If vomiting occurs within 1 hour of taking a dose, a replacement dose should be taken.

• MEDICINAL FORMS No licensed medicines listed.

Combinations available: Elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide, p. 704 · Elvitegravir with cobicistat, emtricitabine and tenofovir disoproxil, p. 705

Raltegravir

10-Nov-2020

• DRUG ACTION Raltegravir is an inhibitor of HIV integrase.

INDICATIONS AND DOSE

HIV-1 infection (initiated by a specialist)

- ► BY MOUTH USING TABLETS
- Adult: 400 mg twice daily, alternatively 1200 mg once daily, once daily dosing for use in patients who are treatment naive or virologically suppressed on an initial regimen of 400 mg twice daily—use 600 mg tablets only
- CONTRA-INDICATIONS Pre-term neonates—no information available
- CAUTIONS Psychiatric illness (may exacerbate underlying illness including depression) · risk factors for myopathy · risk factors for rhabdomyolysis
- INTERACTIONS → Appendix 1: raltegravir
- SIDE-EFFECTS
 - ► Common or very common Akathisia · appetite abnormal · asthenia · behaviour abnormal · depression · diarrhoea · dizziness · fever · gastrointestinal discomfort · gastrointestinal disorders · headaches · nausea · skin reactions · sleep disorders · vertigo · vomiting
 - ▶ Uncommon Alopecia · anaemia · anxiety · arrhythmias · arthralgia · arthritis · body fat disorder · burping · cachexia · chest discomfort · chills · cognitive disorder · concentration impaired · confusion · constipation · diabetes mellitus · drowsiness · dry mouth · dyslipidaemia · dysphonia · erectile dysfunction · feeling jittery · glossitis · gynaecomastia · haemorrhage · hepatic disorders · hot flush · hyperglycaemia · hypersensitivity · hypertension · immune reconstitution inflammatory syndrome · increased risk of infection · lipodystrophy · lymph node abscess · lymphatic abnormalities · malaise · memory loss · menopausal symptoms · mood altered · myalgia · myopathy nasal congestion · nephritis · nephrolithiasis · nerve disorders · neutropenia · nocturia · odynophagia · oedema · osteopenia · pain · palpitations · pancreatitis acute · polydipsia · psychiatric disorder · renal cyst · renal impairment · sensation abnormal · severe cutaneous adverse reactions (SCARs) · skin papilloma · submandibular mass · suicidal behaviours · sweat changes · taste altered · tendinitis · thrombocytopenia · tinnitus · tremor · visual impairment · weight increased
 - ► Frequency not known Osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia.

- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (no information available), and in patients with chronic hepatitis B or C (consider interrupting or discontinuing treatment if impairment worsens; increased risk of hepatic side-effects).
- PRESCRIBING AND DISPENSING INFORMATION Dispense raltegravir chewable tablets in original container (contains desiccant).
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- ► Raltegravir (Isentress®) for the treatment of HIV in adults (May 2010) SMC No. 613/10 Recommended with restrictions
- ► Raltegravir 600 mg film-coated tablets (Isentress®) in combination with other anti-retroviral medicinal products for the treatment of human immunodeficiency virus (HIV-1) infection in adults and paediatric patients weighing at least 40 kg (November 2017) SMC No. 1280/17 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

ANTIVIRALS > NON-NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

Doravirine

30-Mar-2021

INDICATIONS AND DOSE

HIV-1 infection in combination with other antiretroviral drugs (initiated by a specialist)

- ► BY MOUTH
- Adult: 100 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ► Manufacturer advises if concurrent use of moderate inducers of CYP3A4, dabrafenib, modafinil, or telotristat ethyl is unavoidable, increase dose to 100 mg twice daily. Manufacturer advises 100 mg twice daily with rifabutin.
- INTERACTIONS → Appendix 1: NNRTIs
- SIDE-FFFFCTS
- ► Common or very common Asthenia · diarrhoea · dizziness · drowsiness · gastrointestinal discomfort · gastrointestinal disorders · headache · hepatocellular injury · nausea · skin reactions · sleep disorders · vomiting
- ► Uncommon Anxiety · arthralgia · concentration impaired · confusion · constipation · depression · electrolyte imbalance · hypertension · malaise · memory loss · mood altered · muscle tone increased · myalgia · paraesthesia · suicidal ideation
- ▶ Rare or very rare Acute kidney injury adjustment disorder · aggression · chest pain · chills · dyspnoea · hallucination · pain · rash pustular · renal disorder · thirst · tonsillar hypertrophy · urolithiases
- PREGNANCY Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (no information available).

PATIENT AND CARER ADVICE

Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should he taken at the normal time

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue. dizziness, and somnolence.

NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

► Doravirine (Pifeltro®) in combination with other antiretroviral medicinal products, for the treatment of adults infected with human immunodeficiency virus-1 (HIV-1) without past or present evidence of resistance to the non-nucleoside reverse transcriptase inhibitor (NNRTI) class (March 2021) SMC No. SMC2332 Recommended

All Wales Medicines Strategy Group (AWMSG) decisions

- ► Doravirine (Pifeltro®) in combination with other antiretroviral medicinal products, for the treatment of adults infected with HIV-1 without past or present evidence of resistance to the NNRTI class (September 2020) AWMSG No. 3109 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

CAUTIONARY AND ADVISORY LABELS 25, 3

▶ Pifeltro (Merck Sharp & Dohme (UK) Ltd) ▼ Doravirine 100 mg Pifeltro 100mg tablets | 30 tablet Pom £471.41

Combinations available: Lamivudine with tenofovir disoproxil and doravirine, p. 709

Ffavirenz

27-Anr-2021

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral

- ► BY MOUTH USING CAPSULES
- Adult: 600 mg once daily
- ► BY MOUTH USING TABLETS
- Adult: 600 mg once daily
- CAUTIONS Acute porphyrias p. 1150 · elderly · history of psychiatric disorders · history of seizures · risk of OT interval prolongation
- INTERACTIONS → Appendix 1: NNRTIs
- SIDE-EFFECTS
- ► Common or very common Abdominal pain anxiety concentration impaired · depression · diarrhoea · dizziness · drowsiness · dyslipidaemia · fatigue · headache · movement disorders · nausea · skin reactions · sleep disorders · vomiting
- ▶ Uncommon Behaviour abnormal confusion flushing gynaecomastia · hallucination · hepatic disorders · memory loss · mood altered · pancreatitis · psychosis · seizure · Stevens-Johnson syndrome · suicidal behaviours · thinking abnormal · tinnitus · tremor · vertigo · vision blurred
- ▶ Rare or very rare Delusions photosensitivity reaction
- ▶ Frequency not known Immune reconstitution inflammatory syndrome · osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION Rash, usually in the first 2 weeks, is the most common side-effect: discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate. may continue without interruption—usually resolves within 1 month.

CNS effects Administration at bedtime especially in first 2-4 weeks reduces CNS effects.

Abnormal hepatic function Manufacturer advises interrupt or discontinue treatment if transaminases more than 5 times the upper limit of normal.

- PREGNANCY Reports of neural tube defects when used in first trimester.
- HEPATIC IMPAIRMENT Greater risk of hepatic side-effects in chronic hepatitis B or C. Manufacturer advises avoid in severe impairment (limited information available).
- RENAL IMPAIRMENT Manufacturer advises caution in severe renal failure—no information available.
- MONITORING REQUIREMENTS Monitor liver function if receiving other hepatotoxic drugs.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises for patients who cannot swallow capsules, the capsule may be opened and contents added to a small amount of food consult product literature. No additional food should be consumed for up to 2 hours after administration of efavirenz.

PATIENT AND CARER ADVICE

Psychiatric disorders Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

CAUTIONARY AND ADVISORY LABELS 23

► Efavirenz (Non-proprietary)

Efavirenz 600 mg Efavirenz 600mg tablets | 30 tablet PoM £23.97-£452.94 (Hospital only)

Combinations available: *Efavirenz with emtricitabine and tenofovir disoproxil*, p. 704

Etravirine

15-Oct-2021

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (including a boosted protease inhibitor) in patients previously treated with antiretrovirals (initiated by a specialist)

- ► BY MOUTH
- Adult: 200 mg twice daily, to be taken after food
- CONTRA-INDICATIONS Acute porphyrias p. 1150
- CAUTIONS Elderly
- INTERACTIONS → Appendix 1: NNRTIs
- SIDE-EFFECTS
- ➤ Common or very common Anaemia · anxiety · appetite decreased · asthenia · constipation · diabetes mellitus · diarrhoea · drowsiness · dry mouth · dyslipidaemia · dyspnoea exertional · gastrointestinal discomfort · gastrointestinal disorders · headache · hyperglycaemia · hypersensitivity · hypertension · memory loss · myocardial infarction · nausea · peripheral neuropathy · renal failure · sensation abnormal · skin reactions · sleep disorders · stomatitis · sweat changes · thrombocytopenia · vision blurred · vomiting
- ► Uncommon Angina pectoris · angioedema · atrial fibrillation · bronchospasm · concentration impaired · confusion · gynaecomastia · haematemesis · hepatic disorders · immune reconstitution inflammatory syndrome · pancreatitis · seizure · syncope · tremor · vertigo
- ▶ Rare or very rare Haemorrhagic stroke severe cutaneous adverse reactions (SCARs) • Stevens-Johnson syndrome (especially in children and adolescents)
- ► Frequency not known Osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION Hypersensitivity reactions Rash, usually in the second week, is the most common side-effect and appears more frequently in

females. Life-threatening hypersensitivity reactions reported usually during week 3–6 of treatment and characterised by rash, eosinophilia, and systemic symptoms (including fever, general malaise, myalgia, arthralgia, blistering, oral lesions, conjunctivitis, and hepatitis). Discontinue permanently if hypersensitivity reaction or severe rash develop. If rash mild or moderate (without signs of hypersensitivity reaction), may continue without interruption—usually resolves within 2 weeks.

- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate impairment and in patients with hepatitis B or C (increased risk of hepatic side effects); avoid in severe impairment (no information available).
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises patients with swallowing difficulties may disperse tablets in a glass of water just before administration.
- PRESCRIBING AND DISPENSING INFORMATION Dispense in original container (contains desiccant).

PATIENT AND CARER ADVICE

Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develop.

Vomiting If vomiting occurs 4 hours after taking tablets, no additional dose should be taken and the next dose should be taken at the usual time.

Missed doses If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Etravirine 200 mg Intelence 200mg tablets | 60 tablet PoM £301.27 (Hospital only)

Nevirapine

27-Anr-2021

• INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (initial dose)

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 200 mg once daily for first 14 days, initial dose titration using 'immediate-release' preparation should not exceed 28 days; if rash occurs and is not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the lower dose of the 'immediate-release' preparation for the first 14 days as for new treatment

HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 200 mg twice daily
- ► BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 400 mg once daily

- CONTRA-INDICATIONS Acute porphyrias p. 1150 postexposure prophylaxis
- CAUTIONS Females (at greater risk of hepatic side effects)
 high CD4 cell count (at greater risk of hepatic side effects)
 CAUTIONS, FURTHER INFORMATION
- Hepatic effects Patients with chronic hepatitis B or C, high CD4 cell count, and women are at increased risk of hepatic side effects—if plasma HIV-1 RNA detectable, manufacturer advises avoid in women with CD4 cell count greater than 250 cells/mm³ or in men with CD4 cell count greater than 400 cells/mm³ unless potential benefit outweighs risk.
- INTERACTIONS → Appendix 1: NNRTIs
- SIDE-EFFECTS
- Common or very common Abdominal pain · angioedema · diarrhoea · fatigue · fever · headache · hepatic disorders · hypersensitivity · hypertransaminasaemia · nausea · skin reactions · vomiting
- ► Uncommon Anaemia · arthralgia · myalgia · severe cutaneous adverse reactions (SCARs)
- ► Frequency not known Eosinophilia · osteonecrosis · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Hepatic effects
Potentially life-threatening hepatotoxicity including fatal
fulminant hepatitis reported usually in first 6 weeks;
discontinue permanently if abnormalities in liver function
tests accompanied by hypersensitivity reaction (rash,
fever, arthralgia, myalgia, lymphadenopathy, hepatitis,
renal impairment, eosinophilia, granulocytopenia);
suspend if severe abnormalities in liver function tests but
no hypersensitivity reaction—discontinue permanently if
significant liver function abnormalities recur; monitor
patient closely if mild to moderate abnormalities in liver

Rash Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased gradually (after 14 days); Discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves.

function tests with no hypersensitivity reaction.

Osteonecrosis Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

- HEPATIC IMPAIRMENT For modified-release preparations, manufacturer advises avoid (no information available). For immediate-release preparations, manufacturer advises caution in moderate impairment and chronic hepatitis (increased risk of hepatic side effects; consider interrupting or discontinuing treatment if hepatic function worsens); avoid in severe impairment (no information available).
- RENAL IMPAIRMENT Manufacturer advises avoid modifiedrelease preparation—no information available.
- MONITORING REQUIREMENTS
- Hepatic disease Close monitoring of liver function required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly.
- Rash Monitor closely for skin reactions during first 18 weeks.
- PATIENT AND CARER ADVICE

Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop.

Missed doses. If a dose is more than 8 hours late with the

Missed doses If a dose is more than 8 hours late with the 'immediate-release' preparation (or more than 12 hours late with the modified-release preparation), the missed

dose should not be taken and the next dose should be taken at the usual time

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

► Viramune (Boehringer Ingelheim Ltd)

Rilpivirine

04-Feb-2022

INDICATIONS AND DOSE

HIV-1 infection [in combination with other antiretroviral drugs] (specialist use only)

- ► BY MOUTH
- Adult: 25 mg once daily, dose to be taken with food HIV-1 infection [oral lead-in therapy, in combination with cabotegravir] (specialist use only)
- ► BY MOUTH
- Adult: 25 mg once daily for approximately 1 month (at least 28 days) with food then, if tolerated, switch to intramuscular treatment with cabotegravir and rilpivirine at month 2, for oral dose recommendations if cabotegravir injection and rilpivirine injection are missed—consult product literature

HIV-1 infection [in combination with cabotegravir prolonged-release injection] (specialist use only)

- ► BY INTRAMUSCULAR INJECTION
- Adult: Initially 900 mg for 1 dose at month 2, to be started on the last day of oral lead-in therapy with cabotegravir and rilpivirine, then maintenance 600 mg every month from month 3 onwards, maintenance injections may be administered up to 7 days before or after the scheduled dose. Cabotegravir and rilpivirine injections to be administered into separate gluteal muscle sites, for dose recommendations if switching to 2-monthly maintenance injections, or if injections are missed-consult product literature, alternatively initially 900 mg for 2 doses at months 2 and 3, to be started on the last day of oral lead-in therapy with cabotegravir and rilpivirine, then maintenance 900 mg every 2 months from month 5 onwards, the injection at month 3 and maintenance injections may be administered up to 7 days before or after the scheduled dose. Cabotegravir and rilpivirine injections to be administered into separate gluteal muscle sites, for dose recommendations if switching to monthly maintenance injections, or if injections are missedconsult product literature
- CAUTIONS Acute porphyrias p. 1150 ⋅ co-infection with hepatitis B or C ⋅ risk factors for virological failure CAUTIONS, FURTHER INFORMATION
- Risk factors for virological failure EvGr Use with caution in patients with HIV-1 subtype A6/A1 or BMI of 30 kg/m² or more, if treatment history uncertain and pre-treatment resistance analyses absent. ♠
- INTERACTIONS → Appendix 1: NNRTIs

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

► Common or very common Depression · dizziness · drowsiness · gastrointestinal discomfort · headache · nausea · sleep disorders · vomiting

SPECIFIC SIDE-EFFECTS

- ► Common or very common
- With intramuscular use Anxiety · asthenia · diarrhoea · feeling hot · fever · flatulence · malaise · myalgia · skin reactions · weight increased
- ▶ With oral use Appetite decreased dry mouth fatigue rash
- Uncommor
- With intramuscular use Hepatotoxicity
- With oral use Immune reconstitution inflammatory syndrome
- ► Frequency not known
- With intramuscular use Pancreatitis
- PREGNANCY
- With oral use Ever Use only if potential benefit outweighs risk—no toxicity observed in animal studies. If used, monitoring of viral load is recommended.
- With intramuscular use EvGr Avoid unless potential benefit outweighs risk—no information available. May remain in systemic circulation for up to 4 years after last prolongedrelease injection. If used, monitoring of viral load is recommended. ♠
- BREAST FEEDING
- With oral use EvGr Avoid—present in milk in animal studies. ♠
- ▶ With intramuscular use EvGr Avoid—may be present in milk for up to 4 years after last prolonged-release injection. ◆
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate impairment (limited information available); avoid in severe impairment (no information available).
- RENAL IMPAIRMENT Manufacturer advises caution in severe impairment.
- MONITORING REQUIREMENTS [EVGT] Monitor liver function in patients with hepatitis C—limited information available.
- TREATMENT CESSATION
- With intramuscular use EvGr May remain in circulation for up to 4 years; start an alternative regimen no later than 1 month after monthly regimen or 2 months after 2-monthly regimen.
- HANDLING AND STORAGE Store rilpivirine prolongedrelease injection (*Rekambys*[®]) in a refrigerator (2°C to 8° C)—may be stored unopened at room temperature (below 25°C) for up to 6 hours before use.
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer rilpivirine tablets.
 Missed doses If an oral dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. If vomiting occurs within 4 hours of taking an oral dose, a replacement dose should be taken.

Driving and skilled tasks Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue, dizziness and someolence

Combinations available: Dolutegravir with rilpivirine, p. 697 · Emtricitabine with rilpivirine and tenofovir alafenamide, p. 706 · Emtricitabine with rilpivirine and tenofovir disoproxil, p. 706

ANTIVIRALS > NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

Nucleoside reverse transcriptase inhibitors

- SIDE-EFFECTS
- ➤ Common or very common Abdominal pain · anaemia (may require transfusion) · asthenia · diarrhoea · dizziness · fever · flatulence · headache · insomnia · nausea · neutropenia · skin reactions · vomiting
- ▶ Uncommon Angioedema · pancreatitis
- ▶ Rare or very rare Lactic acidosis
- Frequency not known Immune reconstitution inflammatory syndrome - osteonecrosis - weight increased SIDE-EFFECTS, FURTHER INFORMATION Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.
- PREGNANCY

Monitoring Mitochondrial dysfunction has been reported in infants exposed to nucleoside reverse transcriptase inhibitors in utero; the main effects include haematological, metabolic, and neurological disorders; all infants whose mothers received nucleoside reverse transcriptase inhibitors during pregnancy should be monitored for relevant signs or symptoms.

 HEPATIC IMPAIRMENT In general, manufacturers advise caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

F above

Abacavir

28-Apr-2021

• INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

- ► BY MOUTH
- ▶ Adult: 600 mg daily in 1–2 divided doses
- CAUTIONS HIV load greater than 100 000 copies/mL
 patients at high risk of cardiovascular disease
- INTERACTIONS → Appendix 1: NRTIs
- SIDE-EFFECTS
- ► Common or very common Appetite decreased lethargy
- Rare or very rare Severe cutaneous adverse reactions (SCARs)
 - ► Frequency not known Hypersensitivity

 SIDE-EFFECTS, FURTHER INFORMATION Life-threatening
 hypersensitivity reactions have been reportedcharacterised by fever or rash and possibly nausea,
 vomiting, diarrhoea, abdominal pain, dyspnoea, cough,
 lethargy, malaise, headache, and myalgia; less frequently

mouth ulceration, oedema, hypotension, sore throat,

acute respiratory distress syndrome, anaphylaxis, paraesthesia, arthralgia, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure; rarely myolysis. Laboratory abnormalities may include raised liver function tests and creatine kinase; symptoms usually appear in the first 6 weeks, but may occur at any time. Discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction).

- ALLERGY AND CROSS-SENSITIVITY EVGT Caution—increased risk of hypersensitivity reaction in presence of HLA-B*5701 allele.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild impairment; consider avoiding in moderate to severe impairment (no information available).
- RENAL IMPAIRMENT Manufacturer advises avoid in endstage renal disease.
- PRE-TREATMENT SCREENING Test for HLA-B*5701 allele before treatment or if restarting treatment and HLA-B*5701 status not known.
- MONITORING REQUIREMENTS Monitor for symptoms of hypersensitivity reaction every 2 weeks for 2 months.
- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include banana, or strawberry.
- PATIENT AND CARER ADVICE Patients and their carers should be told the importance of regular dosing (intermittent therapy may increase the risk of sensitisation), how to recognise signs of hypersensitivity, and advised to seek immediate medical attention if symptoms develop or before re-starting treatment.

Patients should be provided with an alert card and advised to keep it with them at all times.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide

22-Oct-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 706, elvitegravir p. 698, cobicistat p. 715, tenofovir alafenamide p. 679.

INDICATIONS AND DOSE

HIV-1 infection (specialist use only)

- ► BY MOUTH
- Adult: 1 tablet once daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ELVITEGRAVIR BOOSTED WITH COBICISTAT: AVOID USE IN PREGNANCY DUE TO RISK OF TREATMENT FAILURE AND MATERNAL-TO-CHILD TRANSMISSION OF HIV-1 (APRIL 2019) Pharmacokinetic data show mean exposure of elvitegravir boosted with cobicistat (available in combination in Genvoya® and Stribild®) to be lower during the second and third trimesters of pregnancy than postpartum. Low elvitegravir exposure may be associated with an increased risk of treatment failure and an increased risk of HIV-1 transmission to the unborn child. For further information, see Pregnancy.

- INTERACTIONS → Appendix 1: cobicistat · elvitegravir · NRTIs · tenofovir alafenamide
- SIDE-EFFECTS
- ► Common or very common Abnormal dreams · diarrhoea · dizziness · fatigue · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · vomiting
- ► Uncommon Anaemia depression suicidal behaviours
- ► Frequency not known Nephrotoxicity · osteonecrosis · weight increased
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception in women of childbearing potential; if using a hormonal contraceptive, it must contain drospirenone or norgestimate as the progestogen and at least 30 micrograms ethinylestradiol.
- PREGNANCY Manufacturer advises not to be initiated during pregnancy due to low elvitegravir exposure; women

who become pregnant during therapy should be switched to an alternative regimen.

- HEPATIC IMPAIRMENT Manufacturer advises caution (increased risk of hepatic side-effects); avoid in severe impairment (no information available).
- RENAL IMPAIRMENT Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—limited information available. See p. 21.
- PRESCRIBING AND DISPENSING INFORMATION Dispense in original container—contains desiccant.

PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

INDICATIONS AND DOSE

EPIVIR ® **ORAL SOLUTION**

HIV infection in combination with other antiretroviral drugs

- ► BY MOUT
- Adult: 150 mg every 12 hours, alternatively 300 mg once daily

EPIVIR® TABLETS

HIV infection in combination with other antiretroviral drugs

- ▶ BY MOUTH
- Adult: 150 mg every 12 hours, alternatively 300 mg once daily

ZEFFIX ®

Chronic hepatitis B infection either with compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis) when first-line treatments cannot be used, or (in combination with another antiviral drug without cross-resistance to lamivudine) with decompensated liver disease

- ► BY MOUTH
- Adult: 100 mg once daily, patients receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection
- CAUTIONS Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine
- INTERACTIONS → Appendix 1: NRTIs
- SIDE-EFFECTS
- ➤ Common or very common Alopecia arthralgia cough gastrointestinal discomfort hepatic disorders malaise muscle complaints myopathy nasal disorder
- ► Uncommon Thrombocytopenia
- Rare or very rare Paraesthesia · peripheral neuropathy · pure red cell aplasia
- ▶ Frequency not known Respiratory tract infection throat complaints
- BREAST FEEDING Can be used with caution in women infected with chronic hepatitis B alone, providing that adequate measures are taken to prevent hepatitis B infection in infants.
- RENAL IMPAIRMENT

Dose adjustments EvGr Reduce dose if creatinine clearance less than 50 mL/minute (consult product literature). See p. 21.

 MONITORING REQUIREMENTS When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral markers of hepatitis B every 3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include banana and strawberry.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

- HEPATIC IMPAIRMENT Manufacturer advises caution in decompensated hepatic disease (limited information available).

RENAL IMPAIRMENT

Dose adjustments Ever Granules: 132 mg once daily if creatinine clearance 30–50 mL/minute; 66 mg once daily if creatinine clearance 20–30 mL/minute; 33 mg once daily if creatinine clearance 10–20 mL/minute (limited information available; consult product literature).

Tablets: 245 mg every 2 days if creatinine clearance 30–50 mL/minute; 245 mg every 3–4 days if creatinine clearance 10–30 mL/minute (limited information available; consult product literature). ♠

See p. 21.

MONITORING REQUIREMENTS

- ► Test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases.
- ▶ When treating chronic hepatitis B with tenofovir, monitor liver function tests every 3 months and viral markers for hepatitis B every 3-6 months during treatment (continue monitoring for at least 1 year after discontinuation recurrent hepatitis may occur on discontinuation).
- DIRECTIONS FOR ADMINISTRATION Granules: Manufacturer advises mix 1 scoop of granules with 1 tablespoon of soft food (e.g. yoghurt, apple sauce) and take immediately without chewing. Do not mix granules with liquids.
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer tenofovir granules. Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

- Tenofovir disoproxil for the treatment of chronic hepatitis B (July 2009) NICE TA173 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Zidovudine

02-Sep-2021

(Azidothymidine: AZT)

• INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

- ▶ BY MOUTH
- Adult: 250-300 mg twice daily

Prevention of maternal-fetal HIV transmission

- ► BY MOUTH, OR BY INTRAVENOUS INFUSION
- Adult: Seek specialist advice (combination therapy preferred) (consult local protocol)

HIV infection in combination with other antiretroviral drugs in patients temporarily unable to take zidovudine by mouth

- ► BY INTRAVENOUS INFUSION
- ▶ Adult: 0.8-1 mg/kg every 4 hours usually for not more than 2 weeks, dose approximating to 1.2-1.5 mg/kg every 4 hours by mouth

- CONTRA-INDICATIONS Abnormally low haemoglobin concentration (consult product literature) · abnormally low neutrophil counts (consult product literature)
- CAUTIONS Elderly · lactic acidosis · risk of haematological toxicity particularly with high dose and advanced disease. vitamin B₁₂ deficiency (increased risk of neutropenia) CAUTIONS, FURTHER INFORMATION
- Lactic acidosis Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with zidovudine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Manufacturer advises discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.
- INTERACTIONS → Appendix 1: NRTIs
- SIDE-EFFECTS
- ► Common or very common Leucopenia · malaise · myalgia
- ▶ Uncommon Bone marrow disorders · dyspnoea · generalised pain · myopathy · thrombocytopenia
- Rare or very rare Alertness decreased anxiety appetite decreased · cardiomyopathy · chest pain · chills · cough depression · drowsiness · dyspepsia · gynaecomastia · hepatic disorders · hyperhidrosis · influenza like illness · nail discolouration · oral discolouration · paraesthesia · pure red cell aplasia · seizure · taste altered · urinary frequency increased
- ► Frequency not known Lipoatrophy

SIDE-EFFECTS, FURTHER INFORMATION Anaemia and myelosuppression If anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment.

Lipodystrophy syndrome Metabolic effects may occur with zidovudine; plasma lipids and blood glucose concentrations should be measured routinely.

• HEPATIC IMPAIRMENT Manufacturer advises caution in moderate to severe impairment (increased risk of accumulation).

Dose adjustments Manufacturer advises consider dose reduction in moderate to severe impairment—consult product literature.

RENAL IMPAIRMENT

Dose adjustments See p. 21.

EvGr Reduce oral dose to 100 mg 3-4 times daily (300-400 mg daily) or intravenous dose to 1 mg/kg 3-4 times daily if creatinine clearance is less than 10 mL/minute.

- MONITORING REQUIREMENTS Monitor full blood count after 4 weeks of treatment, then every 3 months.
- DIRECTIONS FOR ADMINISTRATION
- With intravenous use For intermittent intravenous infusion, manufacturer advises dilute to a concentration of 2 mg/mL or 4 mg/mL with Glucose 5% and give over 1 hour.
- PRESCRIBING AND DISPENSING INFORMATION The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

Retrovir (ViiV Healthcare UK Ltd)

Zidovudine 10 mg per 1 ml Retrovir IV 200mg/20ml concentrate for solution for infusion vials | 5 vial Pom £52.48 (Hospital only)

Oral solution

Zidovudine with lamivudine

29-Jul-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, zidovudine p. 710, lamivudine p. 708.

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

- ► BY MOUTH
- Adult: 1 tablet twice daily
- INTERACTIONS → Appendix 1: NRTIs
- RENAL IMPAIRMENT EVGT Avoid if creatinine clearance less than 50 mL/minute (consult product literature). See p. 21.
- DIRECTIONS FOR ADMINISTRATION

COMBIVIR TABLETS Manufacturer advises tablets may be crushed and mixed with semi-solid food or liquid just before administration.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

Zidovudine with lamivudine (Non-proprietary)

Lamivudine 150 mg, Zidovudine 300 mg Zidovudine 300mg / Lamivudine 150mg tablets | 60 tablet PoM £240.10-£255.10 DT = £300.12 (Hospital only)

Combivir (ViiV Healthcare UK Ltd) Lamivudine 150 mg, Zidovudine 300 mg Combivir 150mg/300mg tablets | 60 tablet [PoM] £300.12 DT = £300.12 (Hospital only)

ANTIVIRALS > PROTEASE INHIBITORS, HIV

Protease inhibitors

- CONTRA-INDICATIONS Acute porphyrias p. 1150
- CAUTIONS Haemophilia (increased risk of bleeding)
- SIDE-EFFECTS
- ► Common or very common Anaemia · angioedema · anxiety · appetite abnormal · arthralgia · asthenia · diabetes mellitus · diarrhoea · dizziness · dyslipidaemia · fever · gastrointestinal discomfort · gastrointestinal disorders · headache · hepatic disorders · hypersensitivity · hypertension · muscle complaints · nausea · neutropenia · oral ulceration · pancreatitis · peripheral neuropathy · seizure · skin reactions · sleep disorders · syncope · taste altered · thrombocytopenia · urinary frequency increased · vomiting
- Uncommon Alopecia · drowsiness · dry mouth · dyspnoea · hyperglycaemia · immune reconstitution inflammatory syndrome · malaise · myocardial infarction · osteonecrosis · weight increased
- ▶ Rare or very rare Stevens-Johnson syndrome
- HEPATIC IMPAIRMENT In general, manufacturers advise use with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

Atazanavir

F above

15-Dec-2020

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir

- ▶ BY MOUTH
- Adult: 300 mg once daily

HIV infection in combination with other antiretroviral drugs-with cobicistat

- ► BY MOUTH
- Adult: 300 mg once daily
- CAUTIONS Cardiac conduction disorders electrolyte disturbances predisposition to QT interval prolongation
- INTERACTIONS → Appendix 1: HIV-protease inhibitors

SIDE-FFFFCTS

- ▶ Uncommon Chest pain · chronic kidney disease · depression · disorientation · drug reaction with eosinophilia and systemic symptoms (DRESS) · gallbladder disorders · gynaecomastia · haematuria · memory loss · myopathy · nephritis tubulointerstitial · nephrolithiasis · proteinuria · torsade de pointes
- ▶ Rare or very rare Gait abnormal · oedema · palpitations · QT interval prolongation · renal pain · vasodilation SIDE-EFFECTS, FURTHER INFORMATION Mild to moderate rash occurs commonly, usually within the first 3 weeks of therapy. Severe rash occurs less frequently and may be accompanied by systemic symptoms. Discontinue if severe rash develops.
- PREGNANCY EvGr Theoretical risk of hyperbilirubinaemia in neonate if used at term. For use with cobicistat, see atazanavir with cobicistat below.

Monitoring In pregnancy, monitor viral load and plasma-atazanavir concentration during third trimester.

- HEPATIC IMPAIRMENT Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment (no information available).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.
 Capsule

Darunavir

15-Dec-2020

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy-with low-dose ritonavir

- ▶ BY MOUTH
- Adult: 600 mg twice daily, alternatively 800 mg once daily, once daily dose only to be used if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than $100 \text{ cells} \times 10^6 / \text{ litre}$

HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy-with cobicistat

- ► BY MOUTH
- Adult: 800 mg once daily, dose appropriate if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells \times 10⁶/litre

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy-with low-dose ritonavir

► BY MOUTH

Adult: 800 mg once daily

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy-with cobicistat

- ► BY MOUTH
- Adult: 800 mg once daily
- INTERACTIONS → Appendix 1: HIV-protease inhibitors
- ▶ Uncommon Angina pectoris arrhythmias burping chest pain · concentration impaired · confusion · constipation · cough · depression · dry eye · eye erythema · feeling hot · flushing • gout • gynaecomastia • haemorrhage • herpes simplex · hypothyroidism · leucopenia · memory loss · mood altered · muscle weakness · nail discolouration · nephrolithiasis · oral disorders · osteoporosis · pain · peripheral oedema · polydipsia · OT interval prolongation · renal impairment · sensation abnormal · sexual dysfunction · sweat changes · throat irritation · urinary disorders · urine abnormalities · vertigo
- ► Rare or very rare Arthritis · chills · feeling abnormal · joint stiffness · musculoskeletal stiffness · palpitations · rhinorrhoea · severe cutaneous adverse reactions (SCARs) · visual impairment

SIDE-EFFECTS, FURTHER INFORMATION Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if this develops.

 ALLERGY AND CROSS-SENSITIVITY EvGr Use with caution in patients with sulfonamide sensitivity.

- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk; if required, use the twice daily dose regimen. For use with cobicistat, see darunavir with cobicistat below or darunavir with cobicistat, emtricitabine and tenofovir alafenamide p. 713.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).
- MONITORING REQUIREMENTS Monitor liver function before and during treatment.
- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include strawberry.
- PATIENT AND CARER ADVICE

Vomiting FVGr If vomiting occurs more than 4 hours after a dose is taken, the missed dose should not be taken and the next dose should be taken at the normal time. Missed doses EvGr If a dose is more than 6 hours late on the twice-daily regimen (or more than 12 hours late on the once-daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time. (M)

Darunavir with cobicistat

The properties listed below are those particular to the combination only. For the properties of the components please consider, cobicistat p. 715, darunavir above.

INDICATIONS AND DOSE

HIV infection, in combination with other antiretroviral drugs (initiated by a specialist)

- ► BY MOUTH
- Adult: 800/150 mg once daily

DOSE EQUIVALENCE AND CONVERSION

▶ Dose expressed as x/y mg of darunavir/cobicistat.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DARUNAVIR BOOSTED WITH COBICISTAT: AVOID USE IN PREGNANCY DUE TO RISK OF TREATMENT FAILURE AND MATERNAL-TO-CHILD TRANSMISSION OF HIV-1 (JULY 2018) Pharmacokinetic data show mean exposure of darunavir boosted with cobicistat (available in combination in

Rezolsta® and Symtuza®) to be lower during the second and third trimesters of pregnancy than during 6-12 weeks postpartum. Low darunavir exposure may be associated with an increased risk of treatment failure and an increased risk of HIV-1 transmission to the unborn child. For further information, see *Pregnancy*.

- CONTRA-INDICATIONS Treatment-experienced patients with 1 or more darunavir resistance-associated mutations, plasma HIV-RNA concentration of 100 000 copies/mL or greater, or CD4 count less than 100 cells x 10⁶/litre
- CAUTIONS Elderly
- INTERACTIONS → Appendix 1: cobicistat HIV-protease inhibitors
- PREGNANCY Manufacturer advises not to be initiated during pregnancy due to low darunavir exposure; women who become pregnant during therapy should be switched to an alternative regimen. Darunavir with ritonavir may be considered as an alternative.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

 Darunavir/cobicistat (Rezolsta®) in combination with other antiretroviral medicinal products for the treatment of human immunodeficiency virus-1 (HIV-1) infection in adults aged 18 years or older. Genotypic testing should guide its use (August 2015) SMC No. 1081/15 Recommended

All Wales Medicines Strategy Group (AWMSG) decisions

- Darunavir with cobicistat (Rezolsta®) in combination with other antiretroviral medicinal products for the treatment of human immunodeficiency virus-1 (HIV-1) infection in adults and adolescents (aged 12 years and older with body weight at least 40 kg) (November 2020) AWMSG No. 3779 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Fosamprenavir

03-Aug-2020

• DRUG ACTION Fosamprenavir is a pro-drug of amprenavir.

• INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir

► BY MOUTH

Adult: 700 mg twice daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ 700 mg fosamprenavir is equivalent to approximately 600 mg amprenavir.
- INTERACTIONS → Appendix 1: HIV-protease inhibitors
- SIDE-EFFECTS
- ► Common or very common Oral paraesthesia

 SIDE-EFFECTS, FURTHER INFORMATION Rash may occur,

sually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption—usually resolves and may respond to antihistamines.

- PREGNANCY Toxicity in animal studies; manufacturer advises use only if potential benefit outweighs risk.
- HEPATIC IMPAIRMENT Manufacturer advises caution.
 Dose adjustments Manufacturer advises dose reduction to 450 mg twice daily in moderate impairment and 300 mg twice daily in severe impairment.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises in adults, oral suspension should be taken on an empty stomach.
- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include grape, bubblegum, or peppermint.

 PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer fosamprenavir oral suspension.

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

► Telzir (ViiV Healthcare UK Ltd) Fosamprenavir (as Fosamprenavir calcium) 700 mg Telzir 700mg tablets | 60 tablet PoM £258.97 (Hospital only)

F 711

Lopinavir with ritonavir

21-Dec-2021

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

- **▶** BY MOUTH USING TABLETS
- Adult: 400/100 mg twice daily, alternatively 800/200 mg once daily, once daily dose to be used only in adults with a HIV strain that has less than 3 mutations to protease inhibitors
- **▶** BY MOUTH USING ORAL SOLUTION
- Adult: 5 mL twice daily

DOSE EQUIVALENCE AND CONVERSION

- ► Oral solution contains 400 mg lopinavir, 100 mg ritonavir/5 mL (or 80 mg lopinavir, 20 mg ritonavir/mL).
- CAUTIONS Cardiac conduction disorders pancreatitis patients at high risk of cardiovascular disease · structural heart disease
- INTERACTIONS → Appendix 1: HIV-protease inhibitors
- SIDE-EFFECTS
- ► Common or very common Increased risk of infection leucopenia · lymphadenopathy · menstrual cycle irregularities · migraine · muscle weakness · myopathy · night sweats · pain · sexual dysfunction
- ► Uncommon Atherosclerosis · atrioventricular block · cholangitis · constipation · deep vein thrombosis · haemorrhage · hyperbilirubinaemia · hypogonadism · nephritis · stomatitis · stroke · tinnitus · tremor · tricuspid valve incompetence · vasculitis · vertigo · visual impairment
 - SIDE-EFFECTS, FURTHER INFORMATION Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed.
- PREGNANCY For tablets, manufacturer advises only use if potential benefit outweighs risk—toxicity in animal studies (recommendation also supported by specialist sources). Avoid oral solution due to high alcohol and propylene glycol content.
- HEPATIC IMPAIRMENT For oral solution, manufacturer advises avoid due to propylene glycol content (risk of toxicity). For tablets, manufacturer advises avoid in severe impairment (no information available).
- RENAL IMPAIRMENT EVGT Avoid oral solution due to high propylene glycol content.
- MONITORING REQUIREMENTS
- ▶ Manufacturer advises monitor liver function before and during treatment.
- ▶ For oral solution, manufacturer advises monitor for signs of alcohol and propylene glycol toxicity (particularly in
- PRESCRIBING AND DISPENSING INFORMATION For oral solution, manufacturer advises high alcohol (42 % v/v) and propylene glycol content—consider total amounts from all medicines that are to be given to infants in order to avoid toxicity; caution in patients for which consumption may be harmful.
- PATIENT AND CARER ADVICE Oral solution tastes bitter.

NATIONAL FUNDING/ACCESS DECISIONS

Ritonavir

• INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (high-dose ritonavir)

- ► BY MOUTH
- Adult: Initially 300 mg every 12 hours for 3 days, increased in steps of 100 mg every 12 hours over not longer than 14 days; increased to 600 mg every 12 hours

Low-dose booster to increase effect of other protease inhibitors

- ► BY MOUTH
- ▶ Adult: 100-200 mg 1-2 times a day
- CAUTIONS Cardiac conduction disorders pancreatitis structural heart disease
- INTERACTIONS → Appendix 1: HIV-protease inhibitors
- SIDE-EFFECTS
- ► Common or very common Back pain · concentration impaired · confusion · cough · dehydration · feeling hot · flushing · gastrointestinal haemorrhage · gout · hypotension · menorrhagia · myopathy · oedema · oral paraesthesia · oropharyngeal pain · paraesthesia · peripheral coldness · pharyngitis · renal impairment · vision blurred
- ▶ Rare or very rare Toxic epidermal necrolysis SIDE-EFFECTS, FURTHER INFORMATION Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated - discontinue if pancreatitis diagnosed.
- PREGNANCY

Dose adjustments Only use low-dose booster to increase the effect of other protease inhibitors.

• HEPATIC IMPAIRMENT When used as a low-dose booster, manufacturer advises caution in severe impairment; avoid in decompensated liver disease. When used in high-doses, manufacturer advises avoid in severe impairment. Dose adjustments Manufacturer advises consult product literature of co-administered protease inhibitor.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tipranavir

05-Jun-2020

• INDICATIONS AND DOSE

HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals-with low-dose ritonavir

- ► BY MOUTH USING CAPSULES
- Adult: 500 mg twice daily
- CAUTIONS Abnormal liver function tests and/or signs or symptoms of liver injury (consider delaying treatment if serum transaminases are greater than 5 times the upper limit of normal—consult product literature) · patients at risk of increased bleeding from trauma, surgery or other pathological conditions
- INTERACTIONS → Appendix 1: HIV-protease inhibitors
- SIDE-EFFECTS
- Uncommon Hyperamylasaemia · influenza like illness · renal failure
- Rare or very rare Dehydration · hyperbilirubinaemia · intracranial haemorrhage
- Frequency not known Bleeding tendency SIDE-EFFECTS, FURTHER INFORMATION Potentially lifethreatening hepatotoxicity reported. Discontinue if signs or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature).
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild impairment (risk of increased exposure)—monitor liver function before treatment, then every two weeks for 3 months, then monthly until 48 weeks, then every 8 to 12 weeks thereafter, and discontinue if liver function worsens; avoid in moderate to severe impairment.
- MONITORING REQUIREMENTS Monitor liver function before treatment, then every 2 weeks for 1 month, then every 4 weeks until 24 weeks, then every 8 to 12 weeks thereafter.
- MEDICINAL FORMS No licensed medicines listed.

ANTIVIRALS > OTHER

Maraviroc

31-Aug-2020

DRUG ACTION Maraviroc is an antagonist of the CCR5 chemokine receptor.

• INDICATIONS AND DOSE

CCR5-tropic HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretrovirals

- ► BY MOUTH
- Adult: 300 mg twice daily
- CAUTIONS Cardiovascular disease
- INTERACTIONS → Appendix 1: maraviroc

SIDE-EFFECTS

- ► Common or very common Abdominal pain · anaemia · appetite decreased · asthenia · depression · diarrhoea · flatulence · headache · insomnia · nausea · rash
- ► Uncommon Hyperbilirubinaemia · increased risk of infection · myopathy · postural hypotension · proteinuria · renal failure · seizure
- ▶ Rare or very rare Angina pectoris · granulocytopenia · hepatic disorders · metastases · neoplasms · pancytopenia · severe cutaneous adverse reactions (SCARs)
- ▶ Frequency not known Fever hypersensitivity immune reconstitution inflammatory syndrome • organ dysfunction • osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION Osteonecrosis

Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

Hepatotoxicity Manufacturer advises consider discontinuation if signs or symptoms of acute hepatitis, or increased liver transaminases with systemic symptoms of hypersensitivity occur.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in impairment and in patients with chronic hepatitis (increased risk of hepatic side-effects; limited information available).
- RENAL IMPAIRMENT If eGFR less than 80 mL/minute/1.73 m², consult product literature.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Maraviroc (Celsentri®) for treatment-experienced adult patients infected with only CCR5-tropic HIV-1 detectable (October 2008) SMC No. 458/08 Not recommended

£519.14 DT = £519.14 (Hospital only)

PHARMACOKINETIC ENHANCERS

Cobicistat

06-Aug-2021

INDICATIONS AND DOSE

Pharmacokinetic enhancer used to increase the effect of atazanavir or darunavir

- ► BY MOUTH
- Adult: 150 mg once daily
- INTERACTIONS → Appendix 1: cobicistat
- PREGNANCY EvGr Not to be initiated during pregnancy.
 ♠ For use with atazanavir, see atazanavir with cobicistat p. 711. For use with darunavir, see darunavir with cobicistat p. 712 or darunavir with cobicistat, emtricitabine and tenofovir alafenamide p. 713. For use with elvitegravir, see elvitegravir with cobicistat, emtricitabine and tenofovir disoproxil p. 705 or elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide p. 704.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment—no information available.
- RENAL IMPAIRMENT EvGr No dose adjustment required; inhibits tubular secretion of creatinine; when any coadministered drug requires dose adjustment based on renal function, avoid initiating cobicistat if creatinine clearance less than 70 mL/minute. ♠ See p. 21.

- PRESCRIBING AND DISPENSING INFORMATION Dispense in original container (contains desiccant).
- PATIENT AND CARER ADVICE

Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

6.6 Influenza

Influenza

29-Nov-2021

Description of condition

Influenza is a highly infectious, acute respiratory infection caused by influenza viruses, of which there are three types (A, B, and C). Influenza A is more virulent and occurs more frequently; influenza B presents a milder course of disease but still has the potential to cause outbreaks; and influenza C causes mild or asymptomatic disease, similar to the common cold. Types A and B can be further categorised into subtypes depending on their principle H and N antigens. Transmission occurs via droplets, aerosols, or direct contact with respiratory secretions from an infected person, and the usual incubation period is 1–3 days.

Symptoms usually appear suddenly and may include chills, fever, headache, extreme fatigue, and myalgia. Dry cough, sore throat and nasal congestion may also be present.

Complications are usually respiratory in nature and may include bronchitis, secondary bacterial pneumonia, or otitis media (in children); non-respiratory complications are rarer, and may be cardiac or neurological in nature.

Although influenza is usually self-limiting with recovery occurring within 2–7 days, it can be severe in some patients. Influenza is classified as uncomplicated or complicated, with the latter described as either requiring hospitalisation, having signs or symptoms of a lower respiratory-tract infection, central nervous system involvement, or exacerbation of an underlying condition. The risk of more serious illness is greater for those in at-risk groups, such as children aged under 6 months; pregnant females (including females up to 2 weeks post-partum); adults aged over 65 years; patients with long-term conditions such as respiratory, renal, hepatic, neurological or cardiac disease, diabetes mellitus, or morbid obesity (BMI \geq 40 kg/m²); or those with severe immunosuppression.

For further information on at-risk groups, see Public Health England (PHE) guidance on use of antiviral agents for the treatment and prophylaxis of seasonal influenza (see *Useful resources*).

Other types of influenza include pandemic influenza, avian influenza, and swine influenza. For information and guidance on their management, see www.gov.uk/government/collections/pandemic-flu-public-health-response, www.gov.uk/government/collections/avian-influenza-guidance-data-and-analysis, and www.gov.uk/guidance/swine-influenza.

Aims of treatment

The management of influenza aims to reduce the duration and severity of illness, reduce the risk of complications, and to prevent infection.

Management

The antivirals oseltamivir p. 718 and zanamivir p. 719 are used for both treatment and post-exposure prophylaxis of influenza, although there is evidence that some strains of influenza are more likely to develop resistance to oseltamivir. In general, the risk of developing oseltamivir resistance is considered to be greater for influenza A(H1N1) pdm09 compared to other strains (such as influenza A(H3N2) and influenza B), with the risk of resistance being higher in patients who are severely immunosuppressed. Specialist advice regarding the management of influenza for individual patients can be obtained from local infection specialists. where required. Additional advice can also be obtained from PHE's regional public health virologist and Respiratory Virus Unit. A consultant microbiologist or virologist can be consulted for advice on the resistance risk of individual influenza subtypes, and information on the dominant circulating strain can be found in PHE's weekly influenza reports at: www.gov.uk/government/collections/weekly-nationalflu-reports.

Amantadine hydrochloride is not recommended for the treatment or post-exposure prophylaxis of influenza A.

Treatment of suspected or confirmed influenza

Where treatment with oseltamivir is indicated, it should be started as soon as possible, ideally within 48 hours of symptom onset. There is evidence to suggest that the risk of mortality may be reduced even if treatment is started up to 5 days after symptom onset; treatment initiation beyond 48 hours of onset is unlicensed and clinical judgement should be used. Where treatment with inhaled zanamivir is indicated, it should also be started as soon as possible, ideally within 48 hours (36 hours in children) of symptom onset; treatment initiation beyond this time is unlicensed and clinical judgement should be used. Where treatment with intravenous zanamivir is indicated, it should be commenced as soon as possible and within 6 days of symptom onset.

Uncomplicated influenza

Patients with uncomplicated influenza are usually managed in the community or accident and emergency departments. All patients should be advised about the symptoms of complicated influenza and to seek medical attention if their condition worsens.

For patients who are otherwise healthy (excluding pregnant females), no antiviral treatment is usually needed. For those considered to be at serious risk of developing complications, offer oseltamivir.

For patients in an at-risk group (including pregnant females but excluding those who are severely immunosuppressed), offer oseltamivir—do not wait for laboratory test results to treat. For pregnant females who meet additional criteria for requiring zanamivir first-line, treatment should be discussed with a local infection specialist. For further information, see PHE guidance on use of antiviral agents for the treatment and prophylaxis of seasonal influenza (see Useful resources).

For severely immunosuppressed patients, consider the subtype of influenza causing the infection, or if not yet known, take into account the current dominant circulating strain. Offer oseltamivir first-line unless the strain has a higher risk for oseltamivir resistance, in which case inhaled zanamivir should be offered. For patients unable to use inhaled zanamivir due to underlying severe respiratory disease or inability to use the device (including children under 5 years), offer oseltamivir and assess response to therapy.

For patients with suspected or confirmed oseltamivir resistant influenza, offer inhaled zanamivir. For patients unable to use inhaled zanamivir, consider intravenous zanamivir [unlicensed indication].

Complicated influenza

All patients should be tested and treated, often in hospital—do not wait for laboratory test results to treat. For patients who are not severely immunosuppressed, oseltamivir should be offered first-line. If there is a risk of reduced gastrointestinal absorption, or if initial oseltamivir treatment is unsuccessful, offer inhaled zanamivir. For pregnant females who meet additional criteria for requiring zanamivir first-line, treatment should be discussed with a local infection specialist. For further information, see PHE guidance on use of antiviral agents for the treatment and prophylaxis of seasonal influenza (see Useful resources).

For severely immunosuppressed patients, consider the dominant circulating strain of influenza to guide treatment. Offer oseltamivir first-line unless the strain has a higher risk for developing oseltamivir resistance, in which case inhaled zanamivir should be offered.

For patients with suspected or confirmed oseltamivir resistant influenza, offer inhaled zanamivir.

For patients unable to use inhaled zanamivir, or for those with severe complicated illness such as multi-organ failure, consider intravenous zanamivir p. 719.

Post-exposure prophylaxis

Contacts in an at-risk group who are not adequately protected through vaccination (either due to infection by a different circulating strain or exposure within 14 days post-vaccination), should be offered prophylaxis following exposure to a person in the same household or residential setting with influenza-like illness (when influenza is circulating). Certain populations that are susceptible to localised outbreaks (such as those in care homes, prisons or detention centres), may be considered for antiviral prophylaxis regardless of vaccination status. For information on prophylaxis in these settings, refer to individual guidelines available at: www.gov.uk/government/collections/seasonal-influenza-guidance-data-and-analysis.

Prophylaxis should be started as soon as possible following exposure—ideally within 48 hours for oseltamivir p. 718 and 36 hours for inhaled zanamivir. Initiation beyond these times is unlicensed and specialist advice should be sought.

For patients in an at-risk group (including pregnant females but excluding severely immunosuppressed patients and children aged under 5 years), offer oseltamivir first-line regardless of the risk for resistance of the circulating or index case strain. For pregnant females who meet additional criteria for requiring zanamivir first-line, treatment should be discussed with a local infection specialist. For patients exposed to a strain with suspected or confirmed oseltamivir resistance, offer inhaled zanamivir.

For severely immunosuppressed patients (excluding children aged under 5 years), offer oseltamivir if the risk for oseltamivir resistance is low. However, if the risk for oseltamivir resistance is high, suspected or confirmed, offer inhaled zanamivir. For patients at higher risk of oseltamivir resistance who are unable to use inhaled zanamivir (due to underlying severe respiratory disease or inability to use the device), offer oseltamivir and advise patients to seek immediate medical attention if symptoms develop subsequently. For patients exposed to suspected or confirmed oseltamivir resistant influenza who are unable to use inhaled zanamivir, specialist advice should be sought and patients monitored closely for influenza-like illness, with arrangements made for prompt treatment if symptoms develop.

For children aged under 5 years in an at-risk group (including severely immunosuppressed children), offer oseltamivir first-line regardless of the risk of resistance for the circulating or index case strain. However, if the child is exposed to suspected or confirmed oseltamivir resistant influenza, monitor closely for influenza-like illness and promptly commence treatment if symptoms develop (see *Treatment of suspected or confirmed influenza*); seek specialist advise if the child is severely immunosuppressed.

Influenza 717

Specialist advice is available through local health protection teams and public health virologists.

For further information, see PHE guidance on use of antiviral agents for the treatment and prophylaxis of seasonal influenza (see *Useful resources*).

For information on vaccination against influenza, see Influenza vaccine p. 1404.

Useful Resources

Recommendations reflect *PHE guidance on use of antiviral agents for the treatment and prophylaxis of seasonal influenza*. Public Health England. September 2019.

Other drugs used for Influenza Amantadine hydrochloride, p. 450

ANTIVIRALS > INFLUENZA > CAP-DEPENDENT ENDONUCLEASE INHIBITORS

Baloxavir marboxil

12-Jan-2022

 DRUG ACTION Baloxavir marboxil (a pro-drug of baloxavir) reduces replication of influenza A and B viruses by inhibiting viral cap-dependent endonuclease.

• INDICATIONS AND DOSE

Post-exposure prophylaxis of influenza

- ► BY MOUT
- Child 12-17 years (body-weight up to 79 kg): 40 mg for 1 dose, to be taken as soon as possible within 48 hours following exposure
- Child 12-17 years (body-weight 80 kg and above): 80 mg for 1 dose, to be taken as soon as possible within 48 hours following exposure
- Adult (body-weight up to 79 kg): 40 mg for 1 dose, to be taken as soon as possible within 48 hours following exposure
- Adult (body-weight 80 kg and above): 80 mg for 1 dose, to be taken as soon as possible within 48 hours following exposure

Treatment of influenza

- ► BY MOUTH
- Child 12-17 years (body-weight up to 79 kg): 40 mg for 1 dose, to be taken as soon as possible within 48 hours of symptom onset
- Child 12-17 years (body-weight 80 kg and above): 80 mg for 1 dose, to be taken as soon as possible within 48 hours of symptom onset
- Adult (body-weight up to 79 kg): 40 mg for 1 dose, to be taken as soon as possible within 48 hours of symptom onset
- Adult (body-weight 80 kg and above): 80 mg for 1 dose, to be taken as soon as possible within 48 hours of symptom onset
- INTERACTIONS → Appendix 1: baloxavir marboxil
- SIDE-EFFECTS
- ► Uncommon Urticaria
- ► Frequency not known Angioedema
- PREGNANCY EvGr Avoid—limited information available.
- BREAST FEEDING EVGT Avoid—present in milk in animal studies.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

ANTIVIRALS > INFLUENZA > NEURAMINIDASE INHIBITORS

Oseltamivir

10-Nov-2021

 DRUG ACTION Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

INDICATIONS AND DOSE

Prevention of influenza

- ► BY MOUTH
- Child 1-11 months: 3 mg/kg once daily for 10 days for post-exposure prophylaxis
- Child 1-12 years (body-weight up to 15 kg): 30 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks (or up to 12 weeks if immunocompromised) during an epidemic
- Child I-12 years (body-weight 16-23 kg): 45 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks (or up to 12 weeks if immunocompromised) during an epidemic
- Child I-12 years (body-weight 24-40 kg): 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks (or up to 12 weeks if immunocompromised) during an epidemic
- Child 1-12 years (body-weight 41 kg and above): 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks (or up to 12 weeks if immunocompromised) during an epidemic
- Child 13-17 years (body-weight 24-40 kg): 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks (or up to 12 weeks if immunocompromised) during an epidemic
- Child 13-17 years (body-weight 41 kg and above): 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks (or up to 12 weeks if immunocompromised) during an epidemic
- Adult (body-weight 24-40 kg): 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks (or up to 12 weeks if immunocompromised) during an epidemic
- Adult (body-weight 41 kg and above): 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks (or up to 12 weeks if immunocompromised) during an epidemic

Treatment of influenza

- ► BY MOUTH
- Child 1-11 months: 3 mg/kg twice daily for 5 days (10 days if immunocompromised)
- Child 1-12 years (body-weight 10-15 kg): 30 mg twice daily for 5 days (10 days if immunocompromised)
- Child 1-12 years (body-weight 16-23 kg): 45 mg twice daily for 5 days (10 days if immunocompromised)
- Child 1-12 years (body-weight 24-40 kg): 60 mg twice daily for 5 days (10 days if immunocompromised)
- Child 1-12 years (body-weight 41 kg and above): 75 mg twice daily for 5 days (10 days if immunocompromised)
- Child 13-17 years (body-weight 24-40 kg): 60 mg twice daily for 5 days (10 days if immunocompromised)
- Child 13-17 years (body-weight 41 kg and above): 75 mg twice daily for 5 days (10 days if immunocompromised)
- Adult (body-weight 24-40 kg): 60 mg twice daily for 5 days (10 days if immunocompromised)
- Adult (body-weight 41 kg and above): 75 mg twice daily for 5 days (10 days if immunocompromised)

UNLICENSED USE

- In children Public Health England advises oseltamivir is used in the doses provided in BNF for Children for the prevention of influenza in children 1–12 years of age weighing less than 10 kg, but these are not licensed.
- INTERACTIONS → Appendix 1: oseltamivir
- SIDE-EFFECTS
- ► Common or very common Dizziness · gastrointestinal discomfort · herpes simplex · nausea · sleep disorders · vertigo · vomiting
- ► Uncommon Arrhythmia · consciousness impaired (in adults) · seizure · skin reactions
- ► Rare or very rare Angioedema · anxiety · behaviour abnormal · confusion · delirium · delusions · haemorrhage · hallucination · hepatic disorders · self-injurious behaviour · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · visual impairment
- PREGNANCY Although safety data are limited, oseltamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic).
- BREAST FEEDING Although safety data are limited, oseltamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Oseltamivir is the preferred drug in women who are breast-feeding.

RENAL IMPAIRMENT

- In adults Avoid for treatment and prevention if eGFR less than 10 mL/minute/1.73 m².
- ▶ In children Avoid for *treatment* and *prevention* if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

 Dose adjustments ▶ In adults For *treatment*, use 30 mg twice daily if eGFR 30–60 mL/minute/1.73 m² (30 mg once daily if eGFR 10–30 mL/minute/1.73 m²). For *prevention*, use 30 mg once daily if eGFR 30–60 mL/minute/1.73 m² (30 mg every 48 hours if eGFR 10–30 mL/minute/1.73 m²).
- ▶ In children For *treatment*, use 40% of normal dose twice daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose once daily if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²). For *prevention*, use 40% of normal dose once daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose every 48 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²).
- DIRECTIONS FOR ADMINISTRATION If suspension not available, manufacturer advises capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration.
- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include tutti-frutti.

Public Health England advises that oseltamivir oral suspension should be reserved for children under the age of 1 year. Children over 1 year of age, adults with swallowing difficulties, and those receiving nasogastric oseltamivir, should use capsules which can be opened and mixed into an appropriate sugary liquid.

28-Oct-2020

 DRUG ACTION Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

• INDICATIONS AND DOSE

Post-exposure prophylaxis of influenza

- ► BY INHALATION OF POWDER
- ▶ Child 5-17 years: 10 mg once daily for 10 days
- Adult: 10 mg once daily for 10 days

Prevention of influenza during an epidemic

- ► BY INHALATION OF POWDER
- Child 5-17 years: 10 mg once daily for up to 28 days
- Adult: 10 mg once daily for up to 28 days

Treatment of influenza

- ► BY INHALATION OF POWDER
- ▶ Child 5-17 years: 10 mg twice daily for 5 days
- Adult: 10 mg twice daily for 5 days

Treatment of influenza [complicated and potentially lifethreatening, resistant to other treatments, and/or other treatments are unsuitable] | Treatment of influenza [uncomplicated, resistant to other treatments, and inhaled formulation unsuitable]

- ► BY INTRAVENOUS INFUSION
- Child 6 months-5 years: 14 mg/kg twice daily for 5 to 10 days
- Child 6-17 years: 12 mg/kg twice daily (max. per dose 600 mg) for 5 to 10 days
- Adult: 600 mg twice daily for 5 to 10 days

UNLICENSED USE

 With intravenous use Public Health England advises intravenous zanamivir may be used for the treatment of uncomplicated influenza, but it is not licensed for this indication.

CAUTIONS

 When used by inhalation Asthma · chronic pulmonary disease · uncontrolled chronic illness

CAUTIONS, FURTHER INFORMATION

- Asthma and chronic pulmonary disease
- When used by inhalation Risk of bronchospasm—shortacting bronchodilator should be available. Avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Skin reactions
- ▶ Uncommon Oropharyngeal oedema
- ► Rare or very rare Face oedema severe cutaneous adverse reactions (SCARs)
- ► Frequency not known Behaviour abnormal · delirium · hallucination · level of consciousness decreased · seizure SPECIFIC SIDE-EFFECTS
- ► Common or very common
- With intravenous use Diarrhoea · hepatocellular injury
- ► Uncommon
- When used by inhalation Bronchospasm · dehydration · dyspnoea · presyncope · throat tightness
- ► Frequency not known
- When used by inhalation Psychiatric disorder SIDE-EFFECTS, FURTHER INFORMATION Neurological and psychiatric disorders occur more commonly in children and adolescents.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk (e.g. during a pandemic)—limited information available; animal studies do not indicate toxicity.
- BREAST FEEDING Manufacturer advises use only if potential benefit outweighs risk (e.g. during a pandemic) limited information available; present in low levels in milk in animal studies.
- RENAL IMPAIRMENT

Dose adjustments ➤ With intravenous use Manufacturer advises reduce dose if creatinine clearance less than 80 mL/minute—consult product literature for details. See p. 21.

• DIRECTIONS FOR ADMINISTRATION

- When used by inhalation Manufacturer advises other inhaled drugs should be administered before zanamivir.
- With intravenous use Manufacturer advises for intermittent intravenous infusion, give undiluted or dilute to a concentration of not less than 200 micrograms/mL with Sodium Chloride 0.9%; give over 30 minutes.
- PRESCRIBING AND DISPENSING INFORMATION
- When used by inhalation Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription 'SLS'.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

6.7 Respiratory syncytial virus

Respiratory syncytial virus

Management in children

Ribavirin p. 682 is licensed for administration by inhalation for the treatment of severe bronchiolitis caused by the respiratory syncytial virus (RSV) in infants, especially when they have other serious diseases. However, there is no evidence that ribavirin produces clinically relevant benefit in RSV bronchiolitis.

Palivizumab below is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation. Palivizumab is recommended for:

- children under 9 months of age with chronic lung disease (defined as requiring oxygen for at least 28 days from birth) and who were born preterm;
- children under 6 months of age with haemodynamically significant, acyanotic congenital heart disease who were born preterm.

Palivizumab should be considered for:

- children under 2 years of age with severe combined immunodeficiency syndrome;
- children under 1 year of age who require long-term ventilation;
- children 1–2 years of age who require long-term ventilation and have an additional co-morbidity (including cardiac disease or pulmonary hypertension).

For details of the preterm age groups included in the recommendations, see *Immunisation against Infectious Disease* (2006), available at www.gov.uk/dh.

MONOCLONAL ANTIBODIES

Palivizumah

14-Dec-2020

• INDICATIONS AND DOSE

Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease (under expert supervision)

- **▶** BY INTRAMUSCULAR INJECTION
- Child 1-23 months: 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered

during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites

Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease and undergoing cardiac bypass surgery (under expert supervision)

- ► BY INTRAMUSCULAR INJECTION
- Child 1-23 months: Initially 15 mg/kg, to be administered as soon as stable after surgery, preferably in the anterolateral thigh, then 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites
- UNLICENSED USE Licensed for the prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus (RSV) in children under 6 months of age (at the start of the RSV season) and born at less than 35 weeks corrected gestational age, or in children under 2 years of age who have received treatment for bronchopulmonary dysplasia in the last 6 months, or in children under 2 years of age with haemodynamically significant congenital heart disease.
- CAUTIONS Moderate to severe acute infection · moderate to severe febrile illness · serum-palivizumab concentration may be reduced after cardiac surgery · thrombocytopenia
- SIDE-EFFECTS
- ► Common or very common Apnoea
- ▶ Uncommon Seizure thrombocytopenia urticaria
- ► Frequency not known Hypersensitivity
- ALLERGY AND CROSS-SENSITIVITY PHE advises avoid if previous anaphylactic reaction to another humanised monoclonal antibody.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Antidiuretic hormone disorders

Posterior pituitary hormones and antagonists 14-Sen-2020

Posterior pituitary hormones

Diabetes insipidus

Vasopressin p. 724 (antidiuretic hormone, ADH) is used in the treatment of pituitary ('cranial') diabetes insipidus as is its analogue desmopressin p. 722. Dosage is tailored to produce a slight diuresis every 24 hours to avoid water intoxication. Treatment may be required for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus. Following a dose intramuscularly or intranasally, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of cranial diabetes insipidus. Failure to respond occurs in nephrogenic diabetes insipidus.

In nephrogenic and partial pituitary diabetes insipidus benefit may be gained from the paradoxical antidiuretic effect of thiazides.

Carbamazepine p. 336 is sometimes useful in partial pituitary diabetes insipidus [unlicensed]; it may act by sensitising the renal tubules to the action of remaining endogenous vasopressin. The MHRA/CHM have released important safety information on the use of antiepileptic drugs and the risk of suicidal thoughts and behaviour. For further information, see Epilepsy p. 330.

Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand's

disease; it is also used to test fibrinolytic response. Desmopressin may also have a role in nocturnal enuresis.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, prior to more definitive treatment and with variable results. Terlipressin acetate, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, is used similarly.

Oxytocin p. 888, another posterior pituitary hormone, is indicated in obstetrics.

Antidiuretic hormone antagonists

Demeclocycline hydrochloride p. 615 can be used in the treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable. Demeclocycline hydrochloride is thought to act by directly blocking the renal tubular effect of antidiuretic hormone.

Tolvaptan p. 724 is a vasopressin V2-receptor antagonist licensed for the treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion; treatment duration with tolvaptan is determined by the underlying disease and its treatment.

Rapid correction of hyponatraemia during tolvaptan therapy can cause osmotic demyelination, leading to serious neurological events; close monitoring of serum sodium concentration and fluid balance is essential.

Diabetes insipidus

Other drugs used for Diabetes insipidus Chlortalidone, p. 250

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > VASOPRESSIN AND

ANALOGUES

Desmopressin

26-0ct-2021

DRUG ACTION Desmopressin is an analogue of vasopressin.

• INDICATIONS AND DOSE

Diabetes insipidus, treatment

- ► BY MOUTH
- Child 1-23 months: Initially 10 micrograms 2-3 times a day, adjusted according to response; usual dose 30-150 micrograms daily
- Child 2-11 years: Initially 50 micrograms 2-3 times a day, adjusted according to response; usual dose 100-800 micrograms daily
- Child 12-17 years: Initially 100 micrograms 2-3 times a day, adjusted according to response; usual dose 0.2-1.2 mg daily
- Adult: Initially 100 micrograms 3 times a day; maintenance 100–200 micrograms 3 times a day; usual dose 0.2–1.2 mg daily
- ► BY SUBLINGUAL ADMINISTRATION
- Child 2-17 years: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day
- Adult: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day
- ► BY INTRANASAL ADMINISTRATION
- ► Child 1-23 months: Initially 2.5-5 micrograms 1-2 times a day, adjusted according to response
- Child 2-11 years: Initially 5-20 micrograms 1-2 times a day, adjusted according to response
- Child 12-17 years: Initially 10-20 micrograms 1-2 times a day, adjusted according to response
- ▶ Adult: 10-40 micrograms daily in 1-2 divided doses
- ► BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 1-4 micrograms daily

Primary nocturnal enuresis

- ► BY MOUTH
- Child 5-17 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration
- Adult 18-65 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration
- ► BY SUBLINGUAL ADMINISTRATION
- Child 5-17 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week
- Adult 18-65 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week

Postoperative polyuria or polydipsia

- ► BY MOUTH
- Adult: Dose to be adjusted according to urine osmolality

Polyuria or polydipsia after hypophysectomy

- ► BY SUBLINGUAL ADMINISTRATION
- Adult: Dose to be adjusted according to urine osmolality

Idiopathic nocturnal polyuria in females

- ► BY SUBLINGUAL ADMINISTRATION
- Adult: 25 micrograms daily, to be taken 1 hour before bedtime

Idiopathic nocturnal polyuria in males

- ► BY SUBLINGUAL ADMINISTRATION
- Adult: 50 micrograms daily, to be taken 1 hour before bedtime

Diabetes insipidus, diagnosis (water deprivation test)

- ► BY INTRANASAL ADMINISTRATION
- Adult: 20 micrograms, limit fluid intake to 500 mL from 1 hour before to 8 hours after administration
- ► BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- Adult: 2 micrograms for 1 dose, limit fluid intake to 500 mL from 1 hour before to 8 hours after administration

Nocturia associated with multiple sclerosis (when other treatments have failed)

- ► BY INTRANASAL ADMINISTRATION
- Adult 18-65 years: 10-20 micrograms once daily, to be taken at bedtime, dose not to be repeated within 24 hours, limit fluid intake from 1 hour before to 8 hours after administration

Renal function testing

- ► BY INTRANASAL ADMINISTRATION
- Adult: 40 micrograms, empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload
- ► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: 2 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

Mild to moderate haemophilia and von Willebrand's

- ► BY INTRANASAL ADMINISTRATION
- Adult: 300 micrograms every 12 hours if required, one 150 microgram spray into each nostril, 30 minutes before surgery or when bleeding, dose may alternatively be repeated at intervals of at least 3 days, if self-administered
- ▶ BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- Adult: 300 nanograms/kg for 1 dose, to be administered immediately before surgery or after trauma; may be repeated at intervals of 12 hours

Fibrinolytic response testing

- ► BY INTRANASAL ADMINISTRATION
- Adult: 300 micrograms, blood to be sampled after 1 hour for fibrinolytic activity, one 150 microgram spray to be administered into each nostril
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
- Adult: 300 nanograms/kg for 1 dose, blood to be sampled after 20 minutes for fibrinolytic activity

Lumbar-puncture-associated headache

- ► BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS
- Adult: (consult product literature)

6

UNLICENSED USE

- In children Consult product literature for individual preparations. Oral use of DDAVP intravenous injection is not licensed.
- CONTRA-INDICATIONS Cardiac insufficiency · conditions treated with diuretics · history of hyponatraemia · polydipsia in alcohol dependence · psychogenic polydipsia · syndrome of inappropriate ADH secretion · von Willebrand's Disease Type IIB (may result in pseudothrombocytopenia)
- CAUTIONS Avoid fluid overload · cardiovascular disease (not indicated for nocturia associated with multiple sclerosis) · conditions which might be aggravated by water retention · cystic fibrosis · elderly (avoid for primary nocturnal enuresis and nocturia associated with multiple sclerosis in those over 65 years) · epilepsy · hypertension (not indicated for nocturia associated with multiple sclerosis) · nocturia—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards · nocturnal enuresis—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards returnal enuresis—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards

CAUTIONS, FURTHER INFORMATION Elderly patients are at increased risk of hyponatraemia and renal impairment—manufacturer advises measure baseline serum sodium concentration, then monitor regularly during treatment; discontinue treatment if levels fall below the normal range. Review treatment if no therapeutic benefit after 3 months.

- INTERACTIONS → Appendix 1: desmopressin
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Hyponatraemia (on administration without restricting fluid intake) nausea
- Frequency not known Abdominal pain · aggression (in children) · allergic dermatitis · emotional disorder · fluid retention · headache · hyponatraemic seizure · vomiting · weight increased

SPECIFIC SIDE-EFFECTS

- ▶ With intranasal use Epistaxis nasal congestion rhinitis
- With intravenous use Vasodilation

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants)—increases risk of hyponatraemia.

- PREGNANCY Small oxytocic effect in third trimester; increased risk of pre-eclampsia.
- BREAST FEEDING Amount too small to be harmful.
- RENAL IMPAIRMENT Ever Caution; antidiuretic effect may be reduced.
- MONITORING REQUIREMENTS In nocturia, periodic blood pressure and weight checks are needed to monitor for fluid overload.
- DIRECTIONS FOR ADMINISTRATION Desmopressin oral lyophilisates are for sublingual administration.
 Expert sources advise DDAVP® and Desmotabs® tablets

Expert sources advise *DDAVP*® and *Desmotabs*® tablets may be crushed.

Expert sources advise $DDAVP^{\otimes}$ intranasal solution may be diluted with Sodium Chloride 0.9% to a concentration of 10 micrograms/mL.

Expert sources advise *DDAVP* injection may be administered orally.

- With intravenous use For intravenous infusion (DDAVP®, Octim®), give intermittently in Sodium chloride 0.9%; dilute with 50 mL and give over 20 minutes.
- PRESCRIBING AND DISPENSING INFORMATION Oral, intranasal, intravenous, subcutaneous and intramuscular doses are expressed as desmopressin acetate; sublingual doses are expressed as desmopressin base.

Children requiring an intranasal dose of less than 10 micrograms should be given *DDAVP*® intranasal solution.

PATIENT AND CARER ADVICE

Hyponatraemic convulsions Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal).

Vasopressin

05-Oct-2021

(Antidiuretic hormone (ADH))

 DRUG ACTION Vasopressin is an endogenous hormone with a direct antidiuretic effect on the kidney; it is given in the synthetic form of argipressin.

• INDICATIONS AND DOSE

Pituitary diabetes insipidus

- ► BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- Adult: 5–20 units every 4 hours, dose expressed as argipressin

Initial control of oesophageal variceal bleeding

- ► BY INTRAVENOUS INFUSION
- Adult: 20 units, dose to be administered over 15 minutes, dose expressed as argipressin

DOSE EQUIVALENCE AND CONVERSION

- ► Argipressin 1 unit is equivalent to vasopressin 1 unit.
- CONTRA-INDICATIONS Chronic nephritis (until reasonable blood nitrogen concentrations attained) · vascular disease (especially disease of coronary arteries) unless extreme caution
- CAUTIONS Asthma · avoid fluid overload · conditions which might be aggravated by water retention · epilepsy · heart failure · hypertension · migraine
- SIDE-EFFECTS Abdominal pain · angina pectoris · bronchospasm · cardiac arrest · chest pain · diarrhoea · flatulence · fluid imbalance · gangrene · headache · hyperhidrosis · hypertension · musculoskeletal chest pain · nausea · pallor · peripheral ischaemia · tremor · urticaria · vertigo · vomiting
- PREGNANCY Oxytocic effect in third trimester.
- BREAST FEEDING Not known to be harmful.
- DIRECTIONS FOR ADMINISTRATION
- With intravenous use For intravenous infusion (argipressin), manufacturer advises give intermittently in Glucose 5%; suggested concentration 20 units/100mL given over 15 minutes.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

► Vasopressin (Non-proprietary)

1.2 Syndrome of inappropriate antidiuretic hormone secretion

Other drugs used for Syndrome of inappropriate antidiuretic hormone secretion Demeclocycline hydrochloride, p. 615

DIURETICS > SELECTIVE VASOPRESSIN V₂-RECEPTOR ANTAGONISTS

Tolvaptan

20-Apr-2022

 DRUG ACTION Tolvaptan is a vasopressin V₂-receptor antagonist.

INDICATIONS AND DOSE

HNADC

Autosomal dominant polycystic kidney disease in adults with CKD stage 1 to 4 at initiation of treatment with evidence of rapidly progressing disease (initiated by a specialist)

- ▶ BY MOUTH
- Adult: Initially 60 mg daily in 2 divided doses for at least a week, 45 mg in the morning before breakfast, and then 15 mg taken 8 hours later; increased to 90 mg daily in 2 divided doses for at least a week, 60 mg in the morning before breakfast, and then 30 mg taken 8 hours later, then increased if tolerated to 120 mg daily in 2 divided doses, 90 mg in the morning before breakfast, and then 30 mg taken 8 hours later, dose titration should be performed cautiously; patients may down-titrate to lower doses based on tolerability

DOSE ADJUSTMENTS DUE TO INTERACTIONS

For Jinarc[®], manufacturer advises reduce dose with concurrent use of potent CYP3A4 inhibitors—if daily dose 90 mg or 120 mg, reduce to 30 mg once daily (can be further reduced to 15 mg once daily if not tolerated); if daily dose 60 mg, reduce to 15 mg once daily. Manufacturer also advises reduce dose with concurrent use of moderate CYP3A4 inhibitors or ciprofloxacin—if daily dose 120 mg, reduce to 60 mg daily (45 mg in morning and 15 mg taken 8 hours later); if daily dose 90 mg, reduce to 45 mg daily (30 mg in morning and 15 mg taken 8 hours later); if daily dose 60 mg, reduce to 30 mg daily (15 mg in morning and 15 mg taken 8 hours later).

SAMSCA

Hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion (initiated in hospital or under specialist supervision)

- ► BY MOUTH
- Adult: Initially 15 mg once daily, increased if necessary up to 60 mg once daily, a reduced starting dose of 7.5 mg once daily should be considered for patients at risk of overly rapid correction of serum-sodium concentration
- CONTRA-INDICATIONS Anuria · hypernatraemia · hypovolaemic hyponatraemia · impaired perception of thirst · volume depletion
- CAUTIONS

GENERAL CAUTIONS Abnormal liver function tests and/or signs or symptoms of liver injury (do not initiate if the criteria for permanent discontinuation are met—consult product literature) - diabetes mellitus - patients at risk of

dehydration (ensure adequate fluid intake) · urinary outflow obstruction (increased risk of acute retention)

- When used for autosomal dominant polycystic kidney disease Serum-sodium abnormalities (correct before treatment initiation)
- When used for hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion Patients at risk of demyelination syndromes (e.g hypoxia, alcoholism and malnutrition)
- INTERACTIONS → Appendix 1: tolvaptan
- SIDE-EFFECTS

BNF 84

- ➤ Common or very common Appetite decreased · asthenia · constipation · dehydration · diarrhoea · dizziness · dry mouth · dyspnoea · gastrointestinal discomfort · gastrooesophageal reflux disease · gout · headache · hepatic disorders · hyperglycaemia · hyperuricaemia · insomnia · muscle spasms · palpitations · polydipsia · skin reactions · thirst · urinary disorders · weight decreased
- ► Frequency not known Acute hepatic failure (cases requiring liver transplantation reported)
 - SIDE-EFFECTS, FURTHER INFORMATION Interrupt treatment and perform liver-function tests promptly if symptoms of hepatic impairment occur (anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, pruritus)—consult product literature.
- PREGNANCY Avoid—toxicity in animal studies.
- BREAST FEEDING Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment; avoid if abnormal liver-function tests and/or signs or symptoms of liver injury meet the requirements for permanent discontinuation—consult product literature.
- RENAL IMPAIRMENT No information available in severe impairment. [EvG: For Jinarc[®], discontinue if progression to CKD stage 5. ♠
- MONITORING REQUIREMENTS
- Manufacturer advises monitor volume, fluid and electrolyte status (risk of dehydration); monitor electrolytes at least every 3 months during long-term therapy.
- When used for Autosomal dominant polycystic kidney disease Manufacturer advises monitor liver function tests and for symptoms of liver injury. Liver enzymes and bilirubin must be measured and reviewed before treatment initiation, monthly for 18 months, and every 3 months thereafter; interrupt treatment if abnormalities occur—consult product literature for further information including the criteria for permanent discontinuation. Manufacturer advises evaluate uric acid concentration before treatment initiation and as clinically indicated during treatment; monitor urine osmolality periodically.
- When used for Hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion. Manufacturer advises monitor liver function tests and for symptoms of liver injury; interrupt treatment if abnormalities occur. Manufacturer advises monitor serum-sodium concentration no later than 6 hours after treatment initiation, then monitor serum-sodium and volume status at least every 6 hours during the first 1–2 days of treatment and until dose stabilised. If serum-sodium correction exceeds 6 mmol/litre during the first 6 hours or 8 mmol/litre in the first 6–12 hours, frequency of monitoring should be increased; interrupt or discontinue treatment if serum-sodium increases by 12 mmol/litre or greater in 24 hours or 18 mmol/litre or greater in 48 hours.
- PRESCRIBING AND DISPENSING INFORMATION The manufacturer of Jinarc[®] has provided training materials for healthcare professionals to use prior to prescribing

- tolvaptan in order to minimise the risk of irreversible hepatotoxicity and to highlight the importance of pregnancy prevention.
- PATIENT AND CARER ADVICE For Jinarc®, morning dose to be taken 30 minutes before food, second dose can be taken with or without food.
- Risk minimisation materials For *Jinarc*[®], a patient brochure and alert card should be provided.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

2 Bone metabolism disorders

Osteoporosis

03-Feb-2021

Description of condition

Osteoporosis is a progressive bone disease characterised by low bone mass measured by bone mineral density (BMD), and microarchitectural deterioration of bone tissue. This leads to an increased risk of fragility fractures (fractures resulting from low-level trauma). Osteoporosis is considered severe if there have been one or more fragility fractures.

Osteoporosis occurs most commonly in postmenopausal women, men over 50 years, and in patients taking long-term oral corticosteroids (glucocorticoids). Other risk factors for osteoporosis include increasing age, vitamin D deficiency and low calcium intake, lack of physical activity, low body mass index (BMI), cigarette smoking, excess alcohol intake, parental history of hip fractures, a previous fracture at a site characteristic of osteoporotic fractures, and early menopause. Some diseases are also known to be associated with osteoporosis such as rheumatoid arthritis and diabetes. Certain medications may also increase the risk of fracture in some patients, through mechanisms such as induction of liver enzymes which interfere with vitamin D metabolism.

Aims of treatment

A combination of lifestyle changes and drug treatment aims to prevent fragility fractures in patients with osteoporosis.

Lifestyle changes

EvGr Patients should be encouraged to increase their level of physical activity, stop smoking, maintain a normal BMI level (between 20–25 kg/m²), and reduce their alcohol intake to improve their bone health and reduce the risk of fragility fractures. For guidance on stopping smoking, see Smoking cessation p. 531.

Evgr Patients at risk of osteoporosis should also ensure an adequate intake of calcium and vitamin D. Calcium should preferably be obtained through increasing dietary intake;

supplements may be used if necessary. A daily dietary supplement of vitamin D may be considered for those at increased risk of deficiency.

Elderly patients, especially those who are housebound or live in residential or nursing homes, are at high risk of vitamin D deficiency and may benefit from calcium and vitamin D treatment. (*) Elderly patients also have an increased risk of falls (see Prescribing in the elderly p. 29).

Drug treatment

Evgr Choice of treatment is generally determined by the spectrum of anti-fracture effects across skeletal sites, patient preference and suitability.

Some recommendations on the management of osteoporosis fuideline Group (NOGG)—Clinical guideline for the prevention and treatment of osteoporosis (July 2019), and Scottish Intercollegiate Guidelines Network (SIGN)—Management of osteoporosis and the prevention of fragility fractures (SIGN 142, January 2021) differ. Recommendations in BNF publications are based on the NOGG guideline, and differences with SIGN (2021) have been highlighted.

Postmenopausal osteoporosis

Evor The oral bisphosphonates alendronic acid p. 728 and risedronate sodium p. 730 are considered as first-line options for most patients with postmenopausal osteoporosis due to their broad spectrum of anti-fracture efficacy. Alendronic acid and risedronate sodium have been shown to reduce occurrence of vertebral, non-vertebral and hip fractures. SIGN (2021) also recommend that ibandronic acid p. 729 may be considered as an alternative oral bisphosphonate. Parenteral bisphosphonates or denosumab p. 734 are alternative options for women who are intolerant of oral bisphosphonates or in whom they are unsuitable, with raloxifene hydrochloride p. 814 or strontium ranelate p. 733 as additional alternative options.

Hormone replacement therapy (HRT) may also be considered as an additional alternative option, but its use is generally restricted to younger postmenopausal women with menopausal symptoms who are at high risk of fractures. This is due to the risk of adverse effects such as cardiovascular disease and cancer in older postmenopausal women and women on long-term HRT therapy. SIGN (2021) also recommend tibolone p. 819 as an option in younger postmenopausal women, particularly those with menopausal symptoms.

Teriparatide p. 734 is reserved for postmenopausal women with severe osteoporosis at very high risk of fractures, particularly vertebral fractures. SIGN (2021) also recommend romosozumab p. 736 as an option for postmenopausal women with severe osteoporosis who have previously experienced a fragility fracture and are at imminent risk of another (within 24 months). In postmenopausal women with at least one severe or two moderate low-trauma vertebral fractures, teriparatide or romosozumab are recommended over oral bisphosphonates.

Glucocorticoid-induced osteoporosis

Glucocorticoid treatment is strongly associated with bone loss and increased risk of fractures. The greatest rate of bone loss occurs early after initiation of glucocorticoids and increases with the dose and duration of therapy. Evgr Bone-protection treatment should be started at the onset of glucocorticoid treatment in patients who are at high risk of a fracture.

Women aged \geq 70 years, OR with a previous fragility fracture, OR who are taking large doses of glucocorticoids (prednisolone \geq 7.5 mg daily or equivalent) should be considered for bone-protection treatment. Men aged \geq 70 years with a previous fragility fracture, OR who are taking large doses of glucocorticoids, should also be considered for treatment. For some premenopausal women and younger men (particularly those with a previous history

of fracture or who are receiving large doses of glucocorticoids), bone-protection treatment may be appropriate. SIGN (2021) recommends that bone-protection treatment should be considered in all men and women taking large doses of glucocorticoids (prednisolone ≥7.5 mg daily or equivalent) for 3 months or longer.

The oral bisphosphonates alendronic acid or risedronate sodium are first-line treatment options. Zoledronic acid p. 732, denosumab or teriparatide are alternative options in patients intolerant of oral bisphosphonates or in whom they are unsuitable.

If glucocorticoid treatment is stopped, the need to continue bone-protection treatment should be reviewed. However, bone-protection treatment should be continued with long-term glucocorticoid treatment. Complex cases of glucocorticoid-induced osteoporosis should be referred to a specialist.

Osteoporosis in men

Every The oral bisphosphonates alendronic acid or risedronate sodium are recommended as first-line treatments for osteoporosis in men. Zoledronic acid or denosumab are alternatives in men who are intolerant of oral bisphosphonates or in whom they are unsuitable; teriparatide or strontium ranelate are additional alternative options.

Men having androgen deprivation therapy for prostate cancer have an increased fracture risk. [EvGr] Fracture risk assessment should be considered when starting this therapy. A bisphosphonate can be offered to men with confirmed osteoporosis; denosumab may be considered as an alternative if bisphosphonates are unsuitable or not tolerated. (A)

Bisphosphonates: treatment duration

Evor Some patients may benefit from a bisphosphonate-free period as their therapeutic effects last for some time after cessation of treatment, although there is limited evidence to support this.

Bisphosphonate treatment should be reviewed after 5 years of treatment with alendronic acid, risedronate sodium or ibandronic acid, and after 3 years of treatment with zoledronic acid. Based on fracture-risk assessment, continuation beyond this period can generally be recommended for patients who are over 75 years of age, have a history of previous hip or vertebral fracture, have had one or more fragility fractures during treatment, or who are taking long-term glucocorticoid treatment. Due to limited evidence, recommendations on duration are based on limited extension studies in postmenopausal women. There is no evidence for treatment beyond 10 years; management of these patients should be on a case-by-case basis with specialist input as appropriate.

ANABOLIC STEROIDS

Nandrolone

22-Jul-2021

• INDICATIONS AND DOSE

Osteoporosis in postmenopausal women (but not recommended)

- ► BY DEEP INTRAMUSCULAR INJECTION
- Adult (female): 50 mg every 3 weeks.
- CONTRA-INDICATIONS Acute porphyrias p. 1150
- CAUTIONS Cardiac impairment · diabetes mellitus · epilepsy · hypertension · migraine · skeletal metastases (risk of hypercalcaemia)
- INTERACTIONS → Appendix 1: nandrolone
- SIDE-EFFECTS Clitoris enlarged · dysphonia · hepatic disorders · hepatic neoplasm · hirsutism · hypertension · libido increased · nausea · oedema · skin reactions · sodium retention · urine flow decreased · virilism (with high doses including voice changes sometimes irreversible)
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (discontinue treatment if hepatic function worsens or if oedema, with or without congestive heart failure, develops).
- RENAL IMPAIRMENT [EVG] Use with caution (increased risk of fluid retention and heart failure).
- LESS SUITABLE FOR PRESCRIBING Nandrolone injection is less suitable for prescribing.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Arachis (peanut) oil, benzyl alcohol

➤ Deca-Durabolin (Aspen Pharma Trading Ltd)

Nandrolone decanoate 50 mg per 1 ml Deca-Durabolin 50mg/1ml solution for injection ampoules | 1 ampoule PoM £3.17 DT = £3.17 (CD4-2)

BISPHOSPHONATES

Bisphosphonates

 DRUG ACTION Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of hone turnover

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BISPHOSPHONATES: ATYPICAL FEMORAL FRACTURES (JUNE 2011)

Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis.

The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use.

Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

MHRA/CHM ADVICE: BISPHOSPHONATES: OSTEONECROSIS OF THE JAW (NOVEMBER 2009) AND INTRAVENOUS BISPHOSPHONATES: OSTEONECROSIS OF THE JAW-FURTHER MEASURES TO MINIMISE RISK (ULIV 2015)

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for

patients receiving oral bisphosphonates for osteoporosis or Paget's disease.

Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of dental disease.

All patients with cancer and patients with poor dental status should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients should also maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms such as dental mobility, pain, or swelling, non-healing sores or discharge to a doctor and dentist during treatment.

Before prescribing an intravenous bisphosphonate, patients should be given a patient reminder card and informed of the risk of osteonecrosis of the jaw. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, and if the patient wears dentures, they should make sure their dentures fit properly. Patients should tell their doctor and dentist that they are receiving an intravenous bisphosphonate if they need dental treatment or dental surgery.

Guidance for dentists in primary care is included in Oral Health Management of Patients at Risk of Medication-related Osteonecrosis of the Jaw: Dental Clinical Guidance, Stotish Dental Clinical Effectiveness Programme, March 2017 (available at www.sdcep.org.uk/published-guidance/medication-related-osteonecrosis-of-the-jaw/).

MHRA/CHM ADVICE: BISPHOSPHONATES: OSTEONECROSIS OF THE EXTERNAL AUDITORY CANAL (DECEMBER 2015)

Benign idiopathic osteonecrosis of the external auditory canal has been reported very rarely with bisphosphonate treatment, mainly in patients receiving long-term therapy (2 years or longer).

The possibility of osteonecrosis of the external auditory canal should be considered in patients receiving bisphosphonates who present with ear symptoms, including chronic ear infections, or suspected cholesteatoma.

Risk factors for developing osteonecrosis of the external auditory canal include: steroid use, chemotherapy, infection, an ear operation, or cottonbud use.

Patients should be advised to report any ear pain, discharge from the ear, or an ear infection during treatment with a bisphosphonate.

CAUTIONS

- Elderly with oral use Prescription potentially inappropriate (STOPP criteria) in patients with a current or recent history of upper gastrointestinal disease or bleeding (risk of relapse/exacerbation of oesophagitis, oesophageal ulcer or oesophageal stricture). See also Prescribing in the elderly p. 29.
- SIDE-EFFECTS
- ► Common or very common Alopecia · anaemia · appetite decreased · arthralgia · asthenia · chills · constipation · diarrhoea · dizziness · dysphagia · electrolyte imbalance · eye inflammation · fever · gastritis · gastrointestinal discomfort · headache · influenza like illness · malaise · myalgia · nausea · oesophageal ulcer (discontinue) · oesophagitis (discontinue) · pain · peripheral oedema · renal impairment · skin reactions · taste altered · vomiting
- ► Uncommon Anaphylactic reaction angioedema bronchospasm oesophageal stenosis (discontinue) osteonecrosis

► Rare or very rare Atypical femur fracture • Stevens-Johnson syndrome

PATIENT AND CARER ADVICE

Atypical femoral fractures Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Osteonecrosis of the jaw During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms. Osteonecrosis of the external auditory canal Patients should be advised to report any ear pain, discharge from ear or an ear infection during treatment with a bisphosphonate.

F 727

Alendronic acid

21-Jul-2021

INDICATIONS AND DOSE

Treatment of postmenopausal osteoporosis

- ► BY MOUTH
- Adult (female): 10 mg daily, alternatively 70 mg once weekly.

Treatment of osteoporosis in men

- ► BY MOUTH
- Adult (male): 10 mg daily.

Prevention and treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving hormone replacement therapy

- ▶ BY MOUTH
- Adult (female): 10 mg daily.
- CONTRA-INDICATIONS Abnormalities of oesophagus hypocalcaemia - other factors which delay emptying (e.g. stricture or achalasia)
- CAUTIONS Active gastro-intestinal bleeding · atypical femoral fractures · duodenitis · dysphagia · exclude other causes of osteoporosis · gastritis · history (within 1 year) of ulcers · surgery of the upper gastro-intestinal tract · symptomatic oesophageal disease · ulcers · upper gastro-intestinal disorders
- INTERACTIONS → Appendix 1: bisphosphonates
- SIDE-EFFECTS
- ► Common or very common Gastrointestinal disorders joint swelling vertigo
- ► Uncommon Haemorrhage
- ▶ Rare or very rare Femoral stress fracture · oropharyngeal ulceration · photosensitivity reaction · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

- PREGNANCY Avoid.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- RENAL IMPAIRMENT EvGr Avoid if creatinine clearance less than 35 mL/minute. ♠ See p. 21.
- MONITORING REQUIREMENTS Correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting treatment.
 Monitor serum-calcium concentration during treatment.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises tablets should be swallowed whole and oral solution should be swallowed as a single 100 mL dose. Doses should be taken with plenty of water while sitting or standing, on

- an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after administration.
- PATIENT AND CARER ADVICE Patients or their carers should be given advice on how to administer alendronic acid tablets and oral solution.

Oesophageal reactions Patients (or their carers) should be advised to stop taking alendronic acid and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

• INDICATIONS AND DOSE

Reduction of bone damage in bone metastases in breast

- ► INITIALLY BY MOUTH
- Adult: 50 mg daily, alternatively (by intravenous infusion) 6 mg every 3-4 weeks

Hypercalcaemia of malignancy

- ► BY INTRAVENOUS INFUSION
- Adult: 2-4 mg as a single infusion, dose to be adjusted according to serum calcium concentration

Treatment of postmenopausal osteoporosis

- ► INITIALLY BY MOUTH
- Adult (female): 150 mg once a month, alternatively (by intravenous injection) 3 mg every 3 months, to be administered over 15–30 seconds.

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Hypocalcaemia SPECIFIC CONTRA-INDICATIONS

- With oral use Abnormalities of the oesophagus · other factors which delay emptying (e.g. stricture or achalasia)
- CAUTIONS

GENERAL CAUTIONS Atypical femoral fractures
SPECIFIC CAUTIONS

- ▶ With intravenous use Cardiac disease (avoid fluid overload)
- ▶ With oral use Upper gastro-intestinal disorders
- INTERACTIONS → Appendix 1: bisphosphonates
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Acute phase reaction
- ► Uncommon Asthma exacerbated
- ► Rare or very rare Face oedema

SPECIFIC SIDE-EFFECTS

- ► Common or very common
- With intravenous use Bundle branch block · cataract · increased risk of infection · joint disorder · oral disorders · osteoarthritis · parathyroid disorder · thirst
- With oral use Gastrointestinal disorders muscle cramps musculoskeletal stiffness
- ► Uncommon
- With intravenous use Acrochordon · affective disorder · altered smell sensation · anxiety · blood disorder · cardiovascular disorder · creebrovascular disorder · cholelithiasis · cystitis · deafness · hyperaesthesia · hypothermia · injury · memory loss · migraine · muscle tone increased · myocardial ischaemia · palpitations · pelvic pain · pulmonary oedema · radiculopathy · renal cyst · sleep disorder · stridor · thrombophlebitis · urinary retention · weight decreased
- ► Rare or very rare
- With intravenous use Anaphylactic shock

- ► Frequency not known
- With oral use Oesophagitis erosive (discontinue)
- PREGNANCY Avoid.
- BREAST FEEDING Avoid—present in milk in animal studies.
- RENAL IMPAIRMENT EVG: When used for postmenopausal osteoporosis, avoid if creatinine clearance less than 30 mL/minute.

Dose adjustments See p. 21.

- ▶ With intravenous use EvG! When used for bone metastases, if creatinine clearance 30–49 mL/minute reduce dose to 4 mg; if creatinine clearance less than 30 mL/minute reduce dose to 2 mg. Dilute requisite dose in 500 mL infusion fluid and give over 1 hour. ♠⟩
- ▶ With oral use EvGr When used for bone metastases, if creatinine clearance 30–49 mL/minute reduce dose to 50 mg on alternative days; if creatinine clearance less than 30 mL/minute reduce dose to 50 mg once weekly. ♠
- MONITORING REQUIREMENTS Monitor renal function and serum calcium, phosphate and magnesium.
- DIRECTIONS FOR ADMINISTRATION Manufacturers advise tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes (for most ibandronic acid tablets, 50 mg) or 1 hour (for Bonviva® tablets, 150 mg) before first food or drink (other than water) of the day, or another oral medicine; patient should stand or sit upright for at least 1 hour after taking tablet.

For intravenous infusion (Bondronat®), manufacturer advises give intermittently in Glucose 5% or Sodium chloride 0.9%; for hypercalcaemia of malignancy, dilute requisite dose in 500 mL infusion fluid and give over 2 hours. For the reduction of bone damage in bone metastases, dilute requisite dose in 100 mL infusion fluid and give over at least 15 minutes.

- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer ibandronic acid tablets. Oesophageal reactions Patients and carers should be advised to stop tablets and seek medical attention for symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.
 Patient reminder card A patient reminder card should be provided to patients receiving intravenous ibandronic acid (risk of osteonecrosis of the jaw).

Pamidronate disodium

21-Jul-2021

(Formerly called aminohydroxypropylidenediphosphonate disodium (APD))

• INDICATIONS AND DOSE

Hypercalcaemia of malignancy

- ► BY INTRAVENOUS INFUSION
- Adult: 15–60 mg, to be given (via cannula in a relatively large vein) as a single infusion or in divided doses over 2–4 days, dose adjusted according to serum calcium concentration; maximum 90 mg per course

Osteolytic lesions and bone pain in bone metastases associated with breast cancer or multiple myeloma

- ► BY INTRAVENOUS INFUSION
- Adult: 90 mg every 4 weeks, to be administered via cannula in a relatively large vein, dose may alternatively be administered every 3 weeks, to coincide with chemotherapy in breast cancer

Paget's disease of bone

- ► BY INTRAVENOUS INFUSION
- Adult: 30 mg every week for a 6 week course (total dose 180 mg), alternatively initially 30 mg once weekly for 1 week, then increased to 60 mg every 2 weeks (max. per dose 60 mg) for a 6 week course (total dose 210 mg), to be administered via cannula in a relatively large vein, course may be repeated every 6 months; maximum 360 mg per course
- CAUTIONS Atypical femoral fractures · cardiac disease (especially in elderly) · ensure adequate hydration · previous thyroid surgery (risk of hypocalcaemia)
- ullet INTERACTIONS ullet Appendix 1: bisphosphonates
- SIDE-EFFECTS
- ► Common or very common Decreased leucocytes drowsiness flushing hypertension insomnia paraesthesia tetany thrombocytopenia
- ► Uncommon Agitation dyspnoea hypotension muscle cramps seizure
- ▶ Rare or very rare Confusion · glomerulonephritis · haematuria · heart failure · nephritis tubulointerstitial · nephrotic syndrome · oedema · pulmonary oedema · reactivation of infections · renal disorder exacerbated · renal tubular disorder · respiratory disorders · visual hallucinations · xanthopsia
- ▶ Frequency not known Atrial fibrillation

SIDE-EFFECTS, FURTHER INFORMATION Oral supplements are advised to minimise potential risk of hypocalcaemia for those with mainly lytic bone metastases or multiple myeloma at risk of calcium or vitamin D deficiency (e.g. through malabsorption or lack of exposure to sunlight) and in those with Paget's disease.

- PREGNANCY Avoid—toxicity in animal studies.
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe hepatic impairment (no information available).
- RENAL IMPAIRMENT

Dose adjustments Ever Max. infusion rate 20 mg/hour. Avoid if creatinine clearance less than 30 mL/minute, except in life-threatening hypercalcaemia if benefit outweighs risk. (*) See p. 21.

Evor If renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value.

- MONITORING REQUIREMENTS
- Monitor serum electrolytes, calcium and phosphate possibility of convulsions due to electrolyte changes.
- ► Assess renal function before each dose.
- DIRECTIONS FOR ADMINISTRATION For slow intravenous infusion (Pamidronate disodium, Hospira, Medac, Wockhardt), manufacturer advises give intermitently in Glucose 5% or Sodium chloride 0.9%; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium. For Pamidronate disodium (Medac, Hospira, Wockhardt), manufacturer advises dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL.
- PATIENT AND CARER ADVICE A patient reminder card should be provided (risk of osteonecrosis of the jaw).
 Driving and skilled tasks Patients should be warned against performing skilled tasks (e.g. cycling, driving or operating machinery) immediately after treatment (somnolence or dizziness can occur).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Pamidronate disodium (Non-proprietary)

Pamidronate disodium 3 mg per 1 ml Pamidronate disodium 15mg/5ml solution for infusion vials | 1 vial [PoM] £27.50 (Hospital only) | 5 vial [PoM] £149.15 (Hospital only) | 8 midronate disodium 30mg/10ml solution for infusion vials | 1 vial [PoM] £55.00-£59.66 (Hospital only)

Pamidronate disodium 60mg/20ml solution for infusion vials | 1 vial | PoM | £110.00 (Hospital only)

Pamidronate disodium 90mg/30ml solution for infusion vials | 1 vial Pom £165.00 (Hospital only)

Pamidronate disodium 9 mg per 1 ml Pamidronate disodium 90mg/10ml solution for infusion vials | 1 vial Pom £170.45 (Hospital only)

F 727

Risedronate sodium

21-Jul-2021

INDICATIONS AND DOSE

Paget's disease of bone

▶ BY MOUTH

 Adult: 30 mg daily for 2 months, course may be repeated if necessary after at least 2 months

Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures

► BY MOUTH

BNF 84

 Adult (female): 5 mg daily, alternatively 35 mg once weekly.

Prevention of osteoporosis (including corticosteroidinduced osteoporosis) in postmenopausal women

- ► BY MOUTE
- Adult (female): 5 mg daily.

Treatment of osteoporosis in men at high risk of fractures

- ▶ BY MOUTH
- Adult (male): 35 mg once weekly.
- CONTRA-INDICATIONS Hypocalcaemia
- CAUTIONS Atypical femoral fractures · oesophageal abnormalities · other factors which delay transit or emptying (e.g. stricture or achalasia) · upper gastrointestinal disorders
- INTERACTIONS → Appendix 1: bisphosphonates
- SIDE-EFFECTS
- ► Uncommon Gastrointestinal disorders
- ► Rare or very rare Glossitis
- Frequency not known Amblyopia apnoea chest pain corneal lesion dry eye hypersensitivity hypersensitivity vasculitis increased risk of infection leg cramps liver disorder muscle weakness neoplasms nocturia tinnitus toxic epidermal necrolysis weight decreased
- PREGNANCY Avoid.
- BREAST FEEDING Avoid.
- RENAL IMPAIRMENT EVGT Avoid if creatinine clearance less than 30 mL/minute. (**) See p. 21.
- MONITORING REQUIREMENTS
- ► Correct hypocalcaemia before starting.
- Correct other disturbances of bone and mineral metabolism (e.g. vitamin-D deficiency) at onset of treatment.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day or, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising.
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer risedronate sodium tablets

Oesophageal reactions Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Bisphosphonates for treating osteoporosis (updated July 2019) NICE TA464 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

► Risedronate sodium (Non-proprietary)

Risedronate sodium 5 mg Risedronate sodium 5mg tablets | 28 tablet PoM £24.78 DT = £18.88

Risedronate sodium 30 mg Risedronate sodium 30mg tablets | 28 tablet PoM £155.28 DT = £155.28

Risedronate sodium 35 mg Risedronate sodium 35mg tablets | 4 tablet | PoM | £19.12 DT = £1.28

► Actonel (Accord Healthcare Ltd, Teva UK Ltd)

Risedronate sodium 5 mg Actonel 5mg tablets | 28 tablet PoM
£17.99 DT = £18.88

Risedronate sodium 35 mg Actonel Once a Week 35mg tablets | 4 tablet [PoM] £19.12 DT = £1.28 Actonel 35mg tablets | 4 tablet [PoM] [★] DT = £1.28

Risedronate with calcium carbonate and colecalciferol

09-Nov-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, risedronate sodium p. 730, calcium carbonate p. 1138, colecalciferol p. 1179.

INDICATIONS AND DOSE

Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures

- BY MOUTH
- Adult: 1 tablet once weekly on day 1 of the weekly cycle, followed by 1 sachet daily on days 2–6 of the weekly cycle
- INTERACTIONS → Appendix 1: bisphosphonates calcium salts vitamin D substances
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet. Manufacturer advises granules should be stirred into a glass of water and after dissolution complete taken immediately.
- PRESCRIBING AND DISPENSING INFORMATION Actonel Combi® effervescent granules contain calcium carbonate 2.5 g (calcium 1 g or Ca²⁺ 25 mmol) and colecalciferol 22 micrograms (880 units)/sachet.
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer risedronate with calcium carbonate and colecalciferol tablets and granules.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Form unstated

► Actonel Combi (Theramex HQ UK Ltd)
Actonel Combi 35mg tablets and 1000mg/880unit effervescent granules sachets | 4 week supply PoM £19.12

05-Aug-2021

Sodium clodronate

Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma

- ► BY MOUTH
- ► Adult: 1.6 g daily in 1-2 divided doses, then increased if necessary up to 3.2 g daily in 2 divided doses

OPON 520 ®

Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma

- ► BY MOUTH
- Adult: Initially 2 tablets daily in 1–2 divided doses, increased if necessary up to 4 tablets daily
- CONTRA-INDICATIONS Acute severe gastro-intestinal inflammatory conditions
- CAUTIONS Atypical femoral fractures maintain adequate fluid intake during treatment • upper gastro-intestinal disorders

- INTERACTIONS → Appendix 1: bisphosphonates
- SIDE-EFFECTS Proteinuria · respiratory disorder
- PREGNANCY Avoid.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- RENAL IMPAIRMENT Manufacturer advises avoid if creatinine clearance less than 10 mL/minute.
 Dose adjustments See p. 21.

Manufacturer advises reduce dose to 1200 mg daily if creatinine clearance 30–50 mL/minute (consult product literature).

Manufacturer advises use half normal dose if creatinine clearance 10–30 mL/minute.

- MONITORING REQUIREMENTS Monitor renal function, serum calcium and serum phosphate before and during treatment.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises avoid food or fluids (other than plain water) for 2 hours before and 1 hour after treatment, particularly calciumcontaining products e.g. milk; also avoid iron and mineral supplements and antacids; maintain adequate fluid intake.
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer sodium clodronate capsules and tablets.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Zoledronic acid

F 727 20-Jul-2021

• INDICATIONS AND DOSE

Prevention of skeletal related events in advanced malignancies involving bone (specialist use only)

- **▶** BY INTRAVENOUS INFUSION
- Adult: 4 mg every 3-4 weeks, calcium 500 mg daily and vitamin D 400 units daily should also be taken

Tumour-induced hypercalcaemia (specialist use only)

- ► BY INTRAVENOUS INFUSION ► Adult: 4 mg for 1 dose
- Adult: 4 mg for 1 dose

Paget's disease of bone (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: 5 mg for 1 dose, at least 500 mg elemental calcium twice daily (with vitamin D) for at least 10 days is recommended following infusion

Osteoporosis (including corticosteroid-induced osteoporosis) in men and postmenopausal women

- ► BY INTRAVENOUS INFUSION
- Adult: 5 mg once yearly as a single dose, in patients with a recent low-trauma hip fracture, the dose should be given at least 2 weeks after hip fracture repair; before first infusion give 50 000–125 000 units of vitamin D

Fracture prevention in osteopenia [hip or femoral neck]

- ► BY INTRAVENOUS INFUSION
- Elderly (female): 5 mg once every 18 months as a single dose

- UNLICENSED USE Ever Zoledronic acid is used for fracture prevention in women with osteopenia, but is not licensed for this indication.
- CAUTIONS Atypical femoral fractures · cardiac disease (avoid fluid overload) · concomitant medicines that affect renal function
- INTERACTIONS → Appendix 1: bisphosphonates
- SIDE-EFFECTS
- ► Common or very common Flushing
- Uncommon Anaphylactic shock anxiety arrhythmias chest pain circulatory collapse cough drowsiness dry mouth dyspnoea haematuria hyperhidrosis hypertension hypotension leucopenia muscle spasms proteinuria respiratory disorders sensation abnormal sleep disorder stomatitis syncope thrombocytopenia tremor vision blurred weight increased
- Rare or very rare Confusion · Fanconi syndrome acquired · pancytopenia
- Frequency not known Acute phase reaction
 SIDE-EFFECTS, FURTHER INFORMATION Renal impairment and renal failure have been reported; ensure patient is hydrated before each dose and assess renal function.
- **CONCEPTION AND CONTRACEPTION** Contra-indicated in women of child-bearing potential.
- PREGNANCY Avoid—toxicity in animal studies.
- BREAST FEEDING Avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe hepatic impairment (limited information available).
- RENAL IMPAIRMENT EVGr Avoid in tumour-induced hypercalcaemia if serum creatinine above 400 micromol/litre. Avoid in advanced malignancies involving bone if creatinine clearance less than 30 mL/minute (or if serum creatinine greater than 265 micromol/litre). Avoid in Paget's disease, treatment of postmenopausal osteoporosis and osteoporosis in men if creatinine clearance less than 35 mL/minute. Dose adjustments **EvGr** In advanced malignancies involving bone, if creatinine clearance 50-60 mL/minute reduce dose to 3.5 mg every 3-4 weeks; if creatinine clearance 40-50 mL/minute reduce dose to 3.3 mg every 3-4 weeks; if creatinine clearance 30-40 mL/minute reduce dose to 3 mg every 3-4 weeks; if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value. M See p. 21.

MONITORING REQUIREMENTS

- Correct disturbances of calcium metabolism (e.g. vitamin D deficiency, hypocalcaemia) before starting. Monitor serum electrolytes, calcium, phosphate and magnesium.
- Monitor renal function in patients at risk, such as those with pre-existing renal impairment, those of advanced age, those taking concomitant nephrotoxic drugs or diuretics, or those who are dehydrated.
- DIRECTIONS FOR ADMINISTRATION
- When used for Prevention of skeletal related events in advanced malignancies involving bone or Tumour-induced hypercalcaemia For intravenous infusion, infuse over at least 15 minutes; administer as a single intravenous solution in a separate infusion line. If using 4 mg/5 mL concentrate for solution for infusion or preparing a reduced dose of 4 mg/100 mL solution for infusion for patients with renal impairment, dilute requisite dose according to product literature.
- When used for Paget's disease of bone or Osteoporosis (including corticosteroid-induced osteoporosis) in men and postmenopausal women For intravenous infusion, give via a vented infusion line over at least 15 minutes.
- PATIENT AND CARER ADVICE A patient reminder card should be provided (risk of osteonecrosis of the jaw).

CALCIUM REGULATING DRUGS > BONE

RESORPTION INHIBITORS

Calcitonin (salmon)

01-Jun-2021

(Salcatonin)

• INDICATIONS AND DOSE

Hypercalcaemia of malignancy

- ► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: 100 units every 6-8 hours (max. per dose 400 units every 6-8 hours), adjusted according to response
- ► BY INTRAVENOUS INFUSION
- Adult: Up to 10 units/kg, in severe or emergency cases, to be administered by slow intravenous infusion over at least 6 hours

Paget's disease of bone

- ► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: 100 units daily, adjusted according to response for maximum 3 months (6 months in exceptional

circumstances), a minimum dosage regimen of 50 units three times a week has been shown to achieve clinical and biochemical improvement

Prevention of acute bone loss due to sudden immobility

- ► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: Initially 100 units daily in 1-2 divided doses, then reduced to 50 units daily at the start of mobilisation, usual duration of treatment is 2 weeks; maximum 4 weeks
- CONTRA-INDICATIONS Hypocalcaemia
- CAUTIONS History of allergy (skin test advised) · risk of malignancy—avoid prolonged use (use lowest effective dose for shortest possible time)
- INTERACTIONS → Appendix 1: calcitonins

SIDE-EFFECTS

- Common or very common Abdominal pain · arthralgia · diarrhoea · dizziness · fatigue · flushing · headache · musculoskeletal pain · nausea · secondary malignancy (long term use) · taste altered · vomiting
- ► Uncommon Hypersensitivity hypertension influenza like illness • oedema • polyuria • skin reactions • visual impairment
- ► Rare or very rare Bronchospasm throat swelling tongue swelling
- ▶ Frequency not known Hypocalcaemia · tremor
- PREGNANCY Avoid unless potential benefit outweighs risk (toxicity in animal studies).
- BREAST FEEDING Avoid; inhibits lactation in animals.
- RENAL IMPAIRMENT Ever Use with caution in end-stage renal disease (reduced renal metabolism; limited information available).

• DIRECTIONS FOR ADMINISTRATION

- With intravenous use For intravenous infusion, manufacturer advises give intermittently in Sodium Chloride 0.9%.
 Diluted solution given without delay. Dilute in 500 mL give over at least 6 hours; glass or hard plastic containers should not be used.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Calcitonin (salmon) (Non-proprietary)

Calcitonin (salmon) 100 unit per 1 ml Calcitonin (salmon) 100units/1ml solution for injection ampoules | 5 ampoule PoM 5220 00 DT = 5220 00

Calcitonin (salmon) 200 unit per 1 ml Calcitonin (salmon) 400units/2ml solution for injection vials | 1 vial Pom £352.00

Strontium ranelate

09-0ct-2020

 DRUG ACTION Strontium ranelate stimulates bone formation and reduces bone resorption.

• INDICATIONS AND DOSE

Severe osteoporosis in men and postmenopausal women at increased risk of fractures [when other treatments are contra-indicated or not tolerated] (initiated by a specialist)

- ► BY MOUTH
- Adult: 2 g once daily, dose to be taken in water and at bedtime
- CONTRA-INDICATIONS Cerebrovascular disease · current or previous venous thromboembolic event · ischaemic heart disease · peripheral arterial disease · temporary or permanent immobilisation · uncontrolled hypertension

 CAUTIONS Risk factors for cardiovascular disease—assess before and every 6–12 months during treatment · Risk factors for venous thromboembolism (discontinue in patients who become immobile)

CAUTIONS, FURTHER INFORMATION

- Risk of cardiovascular events Manufacturer advises treatment should be stopped if ischaemic heart disease, peripheral arterial disease, or cerebrovascular disease develops, or if hypertension is uncontrolled.
- INTERACTIONS → Appendix 1: strontium
- SIDE-EFFECTS
- ► Common or very common Angioedema · arthralgia · bronchial hyperreactivity · consciousness impaired · constipation · diarrhoea · dizziness · embolism and thrombosis · gastrointestinal discomfort · gastrointestinal disorders · headache · hepatitis · hypercholesterolaemia · insomnia · memory loss · muscle complaints · myocardial infarction · nausea · pain · paraesthesia · peripheral oedema · skin reactions · vertigo · vomiting
- ► **Uncommon** Alopecia · confusion · dry mouth · fever · lymphadenopathy · malaise · oral disorders · seizure
- Rare or very rare Bone marrow failure · eosinophilia · severe cutaneous adverse reactions (SCARs)
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—data suggest present in human milk.
- RENAL IMPAIRMENT Manufacturer advises avoid if creatinine clearance less than 30 mL/minute. See p. 21.
- EFFECT ON LABORATORY TESTS Manufacturer advises may interfere with colorimetric assay of calcium in blood and urine—consult product literature.
- DIRECTIONS FOR ADMINISTRATION Granules should be stirred into at least 30mL of water, and taken immediately at bedtime on an empty stomach; avoid food for at least 2 hours before treatment, particularly calcium-containing products e.g. milk.
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer strontium ranelate granules.

Severe allergic reactions Patients should be advised to stop taking strontium ranelate and consult their doctor immediately if skin rash develops.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Granules

EXCIPIENTS: May contain Aspartame

► Strontium ranelate (Non-proprietary)

Strontium ranelate 2 gram Strontium ranelate 2g granules sachets sugar free sugar-free | 28 sachet | PoM | £149.91 DT = £149.91

CALCIUM REGULATING DRUGS > PARATHYROID HORMONES AND ANALOGUES

Teriparatide

01-Jun-2021

• INDICATIONS AND DOSE

Treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures | Treatment of corticosteroid-induced osteoporosis

- ► BY SUBCUTANEOUS INJECTION
- Adult: 20 micrograms daily for maximum duration of treatment 24 months (course not to be repeated)
- CONTRA-INDICATIONS Bone metastases · hyperparathyroidism · metabolic bone diseases · Paget's disease · pre-existing hypercalcaemia · previous radiation therapy to the skeleton · skeletal malignancies · unexplained raised alkaline phosphatase

SIDE-EFFECTS

- ► Common or very common Anaemia · asthenia · chest pain · depression · dizziness · dyspnoea · gastrointestinal disorders · headache · hypercholesterolaemia · hyperhidrosis · hypotension · muscle complaints · nausea · pain · palpitations · sciatica · syncope · vertigo · vomiting
- ▶ Uncommon Arthralgia · emphysema · hypercalcaemia · hyperuricaemia · nephrolithiasis · tachycardia · urinary disorders · weight increased
- ▶ Rare or very rare Oedema · renal impairment · urticaria generalised
- PREGNANCY Avoid.
- BREAST FEEDING Avoid.
- RENAL IMPAIRMENT Ever Caution in moderate impairment; avoid if severe.
- PRESCRIBING AND DISPENSING INFORMATION Teriparatide
 is a biological medicine. Biological medicines must be
 prescribed and dispensed by brand name, see Biological
 medicines and Biosimilar medicines, under Guidance on
 prescribing p. 1.

DRUGS AFFECTING BONE STRUCTURE AND MINERALISATION > MONOCLONAL ANTIBODIES

Denosumab

04-Nov-2020

 DRUG ACTION Denosumab is a human monoclonal antibody that inhibits osteoclast formation, function, and survival, thereby decreasing bone resorption.

• INDICATIONS AND DOSE

PROLIA ®

Osteoporosis in postmenopausal women and in men at increased risk of fractures | Bone loss associated with hormone ablation in men with prostate cancer at increased risk of fractures | Bone loss associated with long-term systemic glucocorticoid therapy in patients at increased risk of fracture

- ► BY SUBCUTANEOUS INJECTION
- Adult: 60 mg every 6 months, supplement with calcium and Vitamin D, to be administered into the thigh, abdomen or upper arm

Bone metabolism disorders 735

XGEVA ®

BNF 84

Prevention of skeletal related events in patients with hone metastases

- **▶** BY SUBCUTANEOUS INJECTION
- Adult: 120 mg every 4 weeks, supplementation of at least calcium 500 mg and Vitamin D 400 units daily should also be taken unless hypercalcaemia is present, to be administered into the thigh, abdomen or upper

Giant cell tumour of bone that is unresectable or where surgical resection is likely to result in severe morbidity

- ► BY SUBCUTANEOUS INJECTION
- Adult: 120 mg every 4 weeks, give additional dose on days 8 and 15 of the first month of treatment only, supplementation of at least calcium 500 mg and Vitamin D 400 units daily should also be taken unless hypercalcaemia is present, to be administered into the thigh, abdomen or upper arm

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DENOSUMAB: ATYPICAL FEMORAL FRACTURES (FEBRUARY 2013)

Atypical femoral fractures have been reported rarely in patients receiving denosumab for the long-term treatment (2.5 or more years) of postmenopausal osteoporosis

Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.

Discontinuation of denosumab in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

MHRA/CHM ADVICE: DENOSUMAB: MINIMISING THE RISK OF OSTEONECROSIS OF THE JAW: MONITORING FOR HYPOCAL CAEMIA-LIPDATED RECOMMENDATIONS (SEPTEMBER 2014) AND DENOSUMAB: OSTEONECROSIS OF THE JAW-FURTHER MEASURES TO MINIMISE RISK (JULY 2015)

Denosumab is associated with a risk of osteonecrosis of the jaw (ONJ) and with a risk of hypocalcaemia.

Osteonecrosis of the jaw Osteonecrosis of the jaw is a well-known and common side-effect in patients receiving denosumab 120 mg for cancer. Risk factors include smoking, old age, poor oral hygiene, invasive dental procedures (including tooth extractions, dental implants, oral surgery), comorbidity (including dental disease, anaemia, coagulopathy, infection), advanced cancer, previous treatment with bisphosphonates, and concomitant treatments (including chemotherapy, antiangiogenic biologics, corticosteroids, and radiotherapy to head and neck). The following precautions are now recommended to reduce the risk of ONJ:

Denosumab 120 mg (cancer indication)

- A dental examination and appropriate preventative dentistry before starting treatment are now recommended for all patients
- Do not start denosumab in patients with a dental or jaw condition requiring surgery, or in patients who have unhealed lesions from dental or oral surgery

Denosumab 60 mg (osteoporosis indication)

· Check for ONJ risk factors before starting treatment. A dental examination and appropriate preventative dentistry are now recommended for patients with risk factors

All patients should be given a patient reminder card and informed of the risk of ONI. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, if they wear dentures they should make sure their dentures fit properly before starting treatment, to maintain good oral hygiene, receive routine dental check-ups during treatment, and immediately report any oral symptoms such as dental

mobility, pain, swelling, non-healing sores or discharge to a doctor and dentist. Patients should tell their doctor and dentist that they are receiving denosumab if they need dental treatment or dental surgery.

Hypocalcaemia Denosumab is associated with a risk of hypocalcaemia. This risk increases with the degree of renal impairment. Hypocalcaemia usually occurs in the first weeks of denosumab treatment, but it can also occur later in treatment.

Plasma-calcium concentration monitoring is recommended for denosumab 120 mg (cancer indication):

- before the first dose
- · within two weeks after the initial dose
- if suspected symptoms of hypocalcaemia occur
- consider monitoring more frequently in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)

Plasma-calcium concentration monitoring is recommended for denosumab 60 mg (osteoporosis indication):

- · before each dose
- within two weeks after the initial dose in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)
- if suspected symptoms of hypocalcaemia occur All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers. toes, or around the mouth).

MHRA/CHM ADVICE: DENOSUMAB: REPORTS OF OSTEONECROSIS OF THE EXTERNAL AUDITORY CANAL (JUNE 2017)

Osteonecrosis of the external auditory canal has been reported with denosumab and this should be considered in patients who present with ear symptoms including chronic ear infections or in those with suspected cholesteatoma. Possible risk factors include steroid use and chemotherapy, with or without local risk factors such as infection or trauma. The MHRA recommends advising patients to report any ear pain, discharge from the ear, or an ear infection during denosumab treatment.

MHRA/CHM ADVICE: DENOSUMAB (XGEVA®) FOR GIANT CELL TUMOUR OF BONE: RISK OF CLINICALLY SIGNIFICANT HYPERCALCAEMIA FOLLOWING DISCONTINUATION (JUNE 2018)

Cases of clinically significant hypercalcaemia (rebound hypercalcaemia) have been reported up to 9 months after discontinuation of denosumab treatment for giant cell tumour of bone. The MHRA recommends that prescribers should monitor patients for signs and symptoms of hypercalcaemia after discontinuation. consider periodic assessment of serum calcium, reevaluate the patient's calcium and vitamin D supplementation requirements, and advise patients to report symptoms of hypercalcaemia.

Denosumab is not recommended in patients with growing skeletons.

MHRA/CHM ADVICE: DENOSUMAB (XGEVA®) FOR ADVANCED MALIGNANCIES INVOLVING BONE: STUDY DATA SHOW NEW PRIMARY MALIGNANCIES REPORTED MORE FREQUENTLY COMPARED TO ZOLEDRONIC ACID (ZOLEDRONATE) (JUNE 2018)

A pooled analysis has shown an increased rate of new primary malignancies in patients given Xgeva® (1-year cumulative incidence 1.1%) compared with those given zoledronic acid (0.6%), when used for the prevention of skeletal-related events with advanced malignancies involving bone. No treatment-related pattern in individual cancers or cancer groupings were apparent.

MHRA/CHM ADVICE: DENOSUMAB 60 MG (*PROLIA*®): INCREASED RISK OF MULTIPLE VERTEBRAL FRACTURES AFTER STOPPING OR DELAYING ONGOING TREATMENT (AUGUST 2020)

Cases of multiple vertebral fractures have been reported in patients within 18 months of discontinuation or interruption of ongoing denosumab 60 mg treatment for osteoporosis. The MHRA advises healthcare professionals not to discontinue denosumab without a specialist review, and to evaluate patients' individual risk and benefit factors before initiating treatment, particularly in those at increased risk of vertebral fractures (such as patients with previous vertebral fracture). Healthcare professionals should re-evaluate the need for continued treatment periodically based on expected benefits and potential risks of treatment on an individual basis, particularly after 5 or more years of use.

- CONTRA-INDICATIONS Hypocalcaemia
 XGEVA
 Unhealed lesions from dental or oral surgery
- CAUTIONS Risk factors for osteonecrosis of the external auditory canal · risk factors for osteonecrosis of the jaw consider temporary interruption of denosumab if occurs during treatment

PROLIA ®

 When used for osteoporosis in postmenopausal women Rebound increase in bone turnover on discontinuation (increased risk of fracture)

CAUTIONS, FURTHER INFORMATION

- Rebound increase in bone turnover on discontinuation
- When used for osteoporosis in postmenopausal women EvGr Following discontinuation, transition to an alternative antiresorptive therapy should be considered to prevent rebound increase in bone turnover, bone loss and increased fracture risk.
- INTERACTIONS → Appendix 1: denosumab
- SIDE-EFFECTS
- Common or very common Abdominal discomfort · cataract · constipation · hypocalcaemia (including fatal cases) · increased risk of infection · pain · sciatica · second primary malignancy · skin reactions
- Uncommon Cellulitis (seek prompt medical attention) hypercalcaemia (on discontinuation)
- Rare or very rare Atypical femur fracture · hypersensitivity
 osteonecrosis
- CONCEPTION AND CONTRACEPTION Ensure effective contraception in women of child-bearing potential, during treatment and for at least 5 months after stopping treatment
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies; risk of toxicity increases with each trimester.
- BREAST FEEDING Manufacturer advises avoid.
- RENAL IMPAIRMENT Increased risk of hypocalcaemia if creatinine clearance less than 30 mL/minute, see p. 21.
- MONITORING REQUIREMENTS Correct hypocalcaemia and vitamin D deficiency before starting. Monitor plasmacalcium concentration during therapy.
- PATIENT AND CARER ADVICE

Atypical femoral fractures Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.

Osteonecrosis of the jaw All patients should be informed to maintain good oral hygiene, receive routine dental checkups, and immediately report any oral symptoms such as dental mobility, pain, or swelling to a doctor and dentist. Hypocalcaemia All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).

Patient reminder card A patient reminder card should be provided (risk of osteonecrosis of the jaw).

PROLIA ®

Missed doses

- ▶ When used for osteoporosis in postmenopausal women Ever Treatment should be given within 1 month of scheduled date. ♠
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Denosumab for the prevention of osteoporotic fractures in postmenopausal women (October 2010) NICE TA204
 Recommended with restrictions
- Denosumab for the prevention of skeletal-related events in adults with bone metastases from solid tumours (October 2012) NICE TA265 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ► Denosumab (*Prolia* ®) for osteoporosis in postmenopausal women at increased risk of fractures (December 2010) SMC No. 651/10 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10 EXCIPIENTS: May contain Sorbitol

- ► Prolia (Amgen Ltd)
- Denosumab 60 mg per 1 ml Prolia 60mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection Pom £183.00 DT = £183.00
- ➤ Xgeva (Amgen Ltd)
 Denosumab 70 mg per 1 ml Xgeva 120mg/1.7ml solution for injection vials | 1 vial PoM £309.86 DT = £309.86

Romosozumab

03-Dec-2020

 DRUG ACTION Romosozumab is a humanised monoclonal antibody that inhibits sclerostin, thereby increasing bone formation and decreasing bone resorption.

• INDICATIONS AND DOSE

Severe osteoporosis in postmenopausal women at increased risk of fractures (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 210 mg once a month for 12 months, supplement with calcium and vitamin D, to be administered as two consecutive 105 mg injections at different injection sites into the thigh, abdomen or upper arm
- CONTRA-INDICATIONS History of myocardial infarction or stroke—discontinue if occurs during treatment.
 hypocalcaemia
- CAUTIONS Risk factors for cardiovascular disease · risk factors for osteonecrosis of the jaw—consider temporary interruption of romosozumab if occurs during treatment
- SIDE-EFFECTS
- ► Common or very common Arthralgia headache hypersensitivity increased risk of infection muscle spasms neck pain skin reactions
- Uncommon Cataract · hypocalcaemia · myocardial infarction · stroke
- ▶ Rare or very rare Angioedema
- ► Frequency not known Atypical femur fracture cardiovascular event osteonecrosis of jaw
- RENAL IMPAIRMENT Manufacturer advises monitor serum calcium concentration in patients with severe renal impairment, or in those receiving dialysis—increased risk of hypocalcaemia.
- MONITORING REQUIREMENTS Manufacturer advises to correct hypocalcaemia before therapy is initiated. Monitor for signs and symptoms of hypocalcaemia during therapy.

PRESCRIBING AND DISPENSING INFORMATION

Romosozumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

The manufacturer of Evenity® has provided a Prescriber Guide.

 HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2-8°C) and protect from light—consult product literature for further information regarding storage outside the refrigerator.

PATIENT AND CARER ADVICE

Atypical femoral fractures Manufacturer advises patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment.

Osteonecrosis of the jaw Manufacturer advises patients should be informed to maintain good oral hygiene, receive routine dental check-ups, and immediately report any oral symptoms such as dental mobility, pain, or swelling. Hypocalcaemia Manufacturer advises patients should be advised to report symptoms of hypocalcaemia.

Patients should receive a package leaflet and patient alert card.

3 Corticosteroid responsive conditions

CORTICOSTEROIDS

Corticosteroids, general use

22-Mar-2022

Overview

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective, corticosteroids are used topically for the treatment of inflammatory conditions of the skin. Corticosteroids should be avoided or used only under specialist supervision in psoriasis.

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn's disease. They are also included in locally applied creams for haemorrhoids.

Use can be made of the mineralocorticoid activity of fludrocortisone acetate p. 744 to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, there is evidence that administration of lower doses of hydrocortisone p. 744 and fludrocortisone acetate is of benefit in adrenal insufficiency resulting from septic shock.

Dexamethasone p. 743 and betamethasone p. 742 have little if any mineralocorticoid action and their long duration of action makes them particularly suitable for suppressing corticotropin secretion in congenital adrenal hyperplasia where the dose should be tailored to clinical response and by measurement of adrenal androgens and 17-hydroxyprogesterone. In common with all glucocorticoids their suppressive action on the hypothalamic- pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most individuals a single dose of dexamethasone at night, is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the 'overnight dexamethasone suppression test' for

diagnosing Cushing's syndrome.

Betamethasone and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see Prescribing in palliative care p. 25). However, a corticosteroid should not be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

Corticosteroids are no longer recommended for the routine emergency treatment of anaphylaxis. For guidance on the management of anaphylaxis, see Antihistamines, allergen immunotherapy and allergic emergencies p. 299.

Evgr Corticosteroids are preferably used by inhalation in the management of asthma and chronic obstructive pulmonary disease (COPD). Systemic therapy along with bronchodilators is required for treatment of acute asthma attacks, in some very severe cases of chronic asthma, and exacerbations of COPD. (A)

Corticosteroids may also be useful in conditions such as autoimmune hepatitis, rheumatoid arthritis and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia, and some cases of the nephrotic syndrome (particularly in children) and thrombocytopenic purpura.

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus, temporal arteritis, and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose, and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see: Prescribing in palliative care, immunosuppression, rheumatic diseases, eye, otitis externa, allergic rhinitis, and aphthous ulcers.

Side-effects

MHRA/CHM advice: Corticosteroids: rare risk of central serous chorioretinopathy with local as well as systemic administration (August 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider

referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

Mineralocorticoid side effects

- hypertension
- sodium retentionwater retention
- potassium loss
- calcium loss

Mineralocorticoid side effects are most marked with fludrocortisone, but are significant with hydrocortisone, corticotropin, and tetracosactide. Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone, prednisolone, and triamcinolone.

Glucocorticoid side effects

- diabetes
- osteoporosis, which is a danger, particularly in the elderly, as it can result in osteoporotic fractures for example of the hip or vertebrae
- in addition high doses are associated with avascular necrosis of the femoral head
- muscle wasting (proximal myopathy) can also occur
 corticosteroid therapy is also weakly linked with peptic ulceration and perforation
- psychiatric reactions may also occur

Managing side-effects

Side-effects can be minimised by using the lowest effective dose for the minimum period possible. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma. Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug.

For information on the cessation of oral corticosteroid treatment, see *Treatment cessation*, for systemic corticosteroids (e.g. prednisolone p. 747).

Whenever possible *local treatment* with creams, intraarticular injections, inhalations, eye-drops, or enemas should be used in preference to *systemic treatment*.

Inhaled corticosteroids have considerably fewer systemic effects than oral corticosteroids, but adverse effects including adrenal suppression have been reported. Use of other corticosteroid therapy (including topical) or concurrent use of drugs which inhibit corticosteroid metabolism should be taken into account when assessing systemic risk.

For guidance on the management of adrenal insufficiency and adrenal crisis (acute adrenal insufficiency), see Adrenal insufficiency below.

Adrenal insufficiency

22-Mar-2022

Description of condition

Adrenal insufficiency occurs as a result of inadequate production of steroid hormones in the adrenal cortex of the adrenal glands. Glucocorticoids (e.g. cortisol) and mineralocorticoids (e.g. aldosterone) are the two main groups of steroid hormones produced by the adrenal cortex; their production is primarily regulated by the hypothalamic-pituitary-adrenal (HPA) axis and renin-angiotensin system, respectively. These hormones affect a number of body

systems such as those involved in metabolic activity, water and electrolyte balance, and the body's response to stress. Symptoms of adrenal insufficiency can be mild, non-specific, and may include fatigue, gastrointestinal upset, anorexia, weight loss, musculoskeletal symptoms, salt cravings, and dizziness or syncope due to hypotension.

Adrenal insufficiency is classified as either primary, secondary, or tertiary, and results from disorders that affect the adrenal cortex (e.g. Addison's disease, congenital adrenal hyperplasia), the anterior pituitary gland (e.g. pituitary tumour or subarachnoid haemorrhage), or the hypothalamus (e.g. HPA axis suppression), respectively.

Some drugs can also cause adrenal insufficiency, with the systemic use of glucocorticoids being the most common cause due to suppression of the HPA axis. If glucocorticoids are stopped or decreased too quickly after prolonged use, endogenous glucocorticoid production may not be sufficient to meet the body's needs. Some patients on glucocorticoid therapy (oral, inhaled, topical, intranasal, and intraarticular) are at particular risk of adrenal insufficiency. For further information on those at risk, see The Society for Endocrinology Steroid Emergency Card Working Group and Specialist Pharmacy Services guidance: Exogenous steroids, adrenal insufficiency and adrenal crisis-who is at risk and how should they be managed safely (see Useful resources).

Adrenal insufficiency can lead to adrenal crisis (acute adrenal insufficiency) if not identified and treated. Adrenal crisis can also occur in patients at risk of adrenal insufficiency when glucocorticoid levels are insufficient, such as when exogenous glucocorticoids have been omitted, delayed, or given at inadequate doses. This may occur particularly during times of increased need (e.g. surgery, infection, or trauma) as patients are unable to mount a stress response by increasing endogenous glucocorticoid production. Life-threatening symptoms such as severe dehydration, hypotension, hypovolaemic shock, altered consciousness, seizures, stroke, or cardiac arrest may develop; if left untreated, adrenal crisis may lead to death or permanent disability.

NHS Improvement Patient Safety Alert: Steroid Emergency Card to support early recognition and treatment of adrenal crisis in adults (August 2020)

A patient-held Steroid Emergency Card has been developed for patients with adrenal insufficiency and steroid dependence who are at risk of adrenal crisis. It aims to support healthcare staff with the early recognition of patients at risk of adrenal crisis and the emergency treatment of adrenal crisis. All eligible patients should be issued a Steroid Emergency Card. Providers that treat patients with acute physical illness or trauma, or who may require emergency treatment, elective surgery, or other invasive procedures, should establish processes to check for risk of adrenal crisis and confirm if the patient has a Steroid Emergency Card. For further information, see NHS Improvement Patient Safety Alert: Steroid Emergency Card to support early recognition and treatment of adrenal crisis in adults (available at: www.england.nhs.uk/publication/ national-patient-safety-alert-steroid-emergency-card-to-supportearly-recognition-and-treatment-of-adrenal-crisis-in-adults/).

The Steroid Treatment Card is unaffected by the introduction of the Steroid Emergency Card. For further information on the Steroid Emergency Card and Steroid Treatment Card, see *Patient and Carer advice* in drug monographs.

Aims of treatment

Treatment aims to reduce symptoms, reduce the risk of complications such as adrenal crisis, and to improve overall quality of life.

Management of adrenal insufficiency

BNF 84

Recommendations on the management of adrenal insufficiency are from the Royal College of Physicians Patient Safety Committee and Society for Endocrinology Clinical Committee—Guidance for the prevention and emergency management of adult patients with adrenal insufficiency (July 2020).

If adrenal crisis (acute adrenal insufficiency) is suspected, prompt treatment should be given without delay. For further information, see *Adrenal Crisis*.

Adrenal insufficiency is treated by physiological glucocorticoid replacement with mainly hydrocortisone p. 744 (most similar to cortisol), prednisolone, and rarely dexamethasone. Patients with primary adrenal insufficiency usually also require mineralocorticoid replacement with fludrocortisone acetate p. 744 due to aldosterone deficiency.

Some patients, usually those with secondary or tertiary adrenal insufficiency, including treatment with exogenous steroids or other drugs (such as some antifungals and antiretroviral medication), may have a suboptimal cortisol response but do not require maintenance glucocorticoid replacement.

Glucocorticoid replacement during stress

All patients with adrenal insufficiency and patients considered to be at risk of adrenal insufficiency should be educated on the importance of 'stress' glucocorticoid doses (increased doses) for the prevention of adrenal crisis during times of stress (e.g. surgical or invasive procedures), in order to maintain cortisol levels as close to the physiological concentration as possible. Patients with adrenal insufficiency who do not usually require maintenance glucocorticoids should still be advised of the likely need for glucocorticoid replacement during times of stress.

In patients with adrenal insufficiency and intercurrent illness, 'sick day rules' should be followed. For patients who are unwell with moderate intercurrent illness (e.g. fever or infection requiring antibacterials), the patient's daily glucocorticoid dose should generally be doubled. Patients with adrenal insufficiency on long-acting hydrocortisone preparations should switch to short-acting, more rapidly absorbed preparations during an intercurrent illness. For severe intercurrent illness (e.g. persistent vomiting from gastrointestinal viral illnesses), intramuscular or intravenous hydrocortisone should be given. Patients with adrenal insufficiency are at higher risk of glucocorticoid deficiency if they are vomiting or have diarrhoea. Patients with established adrenal insufficiency and their family/carers should be provided with a hydrocortisone emergency injection kit, be trained in the administration of intramuscular hydrocortisone, and advised to go to hospital if vomiting or diarrhoeal illness persist.

For further information on the management of patients who are undergoing surgery or an invasive procedure, or those with intercurrent illness, see the Royal College of Physicians Patient Safety Committee and Society for Endocrinology Clinical Committee: Guidance for the prevention and emergency management of adult patients with adrenal insufficiency (see Useful resources).

For information on glucocorticoid cover during stress and sick day rules for patients on exogenous steroids who are at an increased risk of adrenal insufficiency, see the Society for Endocrinology Steroid Emergency Card Working Group and Specialist Pharmacy Services guidance: Exogenous steroids, adrenal insufficiency and adrenal crisis-who is at risk and how should they be managed safely (see Useful resources).

Management of adrenal crisis

Recommendations on the management of adrenal crisis are from the Royal College of Physicians Patient Safety Committee and Society for Endocrinology Clinical Committee—Guidance

for the prevention and emergency management of adult patients with adrenal insufficiency (July 2020).

Adrenal crisis (acute adrenal insufficiency) is a medical emergency. All patients who are considered to be at risk of, or suspected of having adrenal crisis should be treated immediately, especially pregnant women; investigations can be initiated once the patient is clinically stable. There is no adverse consequence of initiating a life-saving bolus dose of hydrocortisone treatment.

Treatment involves prompt glucocorticoid replacement with hydrocortisone p. 744, and rehydration using a crystalloid fluid (e.g. sodium chloride 0.9%). For patients usually on fludrocortisone, high-dose hydrocortisone has sufficient mineralocorticoid effect to cover this.

Particular care is required in patients with diabetes insipidus and adrenal insufficiency related to hypothalamic-pituitary disease who are treated with desmopressin, as they are at risk of uncontrolled diabetes insipidus if doses of desmopressin are omitted or hyponatraemia if excess fluid is given.

All patients should be referred to an endocrinologist for advice on ongoing treatment and education around 'sick day rules' prior to hospital discharge.

Useful Resources

Guidance for the prevention and emergency management of adult patients with adrenal insufficiency. Royal College of Physicians Patient Safety Committee and Society for Endocrinology Clinical Committee. July 2020.

Glucocorticoid therapy

Glucocorticoid and mineralocorticoid activity

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids). The mineralocorticoid activity of fludrocortisone acetate p. 744 is so high that its anti-inflammatory activity is of no clinical relevance.

Equivalent anti-inflammatory doses of corticosteroids

This table takes no account of mineralocorticoid effects, nor does it take account of variations in duration of action

Prednisolone 5 mg

- Betamethasone 750 micrograms
- Deflazacort 6 mg
- Dexamethasone 750 micrograms
- ≡ Hydrocortisone 20 mg
- Methylprednisolone 4 mg
- Prednisone 5 mg
- ≡ Triamcinolone 4 mg

The relatively high mineralocorticoid activity of hydrocortisone p. 744, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency

management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked.

Prednisolone p. 747 and prednisone have predominantly glucocorticoid activity. Prednisolone is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone p. 742 and dexamethasone p. 743 have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion (e.g. congenital adrenal hyperplasia).

Some esters of betamethasone and of beclometasone dipropionate p. 45 (beclomethasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort p. 742 has a high glucocorticoid activity; it is derived from prednisolone.

Corticosteroids (systemic)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

NHS IMPROVEMENT PATIENT SAFETY ALERT: STEROID EMERGENCY CARD TO SUPPORT EARLY RECOGNITION AND TREATMENT OF ADRENAL CRISIS IN ADULTS (AUGUST 2020)

A patient-held **Steroid Emergency Card** has been developed for patients with adrenal insufficiency and steroid dependence who are at risk of adrenal crisis. It aims to support healthcare staff with the early recognition of patients at risk of adrenal crisis and the emergency treatment of adrenal crisis. All eligible patients should be issued a Steroid Emergency Card. Providers that treat patients with acute physical illness or trauma, or who may require emergency treatment, elective surgery, or other invasive procedures, should establish processes to check for risk of adrenal crisis and confirm if the patient has a Steroid Emergency Card.

PAEDIATRIC STEROID TREATMENT CARD FOR CHILDREN WITH ADRENAL INSUFFICIENCY (NOVEMBER 2020)

The British Society for Paediatric Endocrinology and Diabetes (BSPED) has developed a Paediatric Steroid Treatment Card which should be issued to children with adrenal insufficiency and steroid dependence. The card includes a management summary for the emergency treatment of adrenal crisis and can be issued by any healthcare professional managing such patients. The

BSPED Paediatric Steroid Treatment Card is available at: www.endocrinology.org/adrenal-crisis.

- CONTRA-INDICATIONS Avoid injections containing benzyl alcohol in neonates · avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished) · systemic infection (unless specific therapy given)
 - CONTRA-INDICATIONS, FURTHER INFORMATION For further information on contra-indications associated with intra-articular, intradermal and intralesional preparations, consult product literature.
- CAUTIONS Congestive heart failure · diabetes mellitus (including a family history of) · diverticulitis · epilepsy · glaucoma (including a family history of or susceptibility to) · history of steroid myopathy · history of tuberculosis or X-ray changes (frequent monitoring required) · hypertension · hypothyroidism · infection (particularly untreated) · long-term use · myasthenia gravis · ocular herpes simplex (risk of corneal perforation) · osteoporosis (in children) · osteoporosis (post-menopausal women and the elderly at risk) · peptic ulcer · psychiatric reactions · recent intestinal anastomoses · recent myocardial infarction (rupture reported) · severe affective disorders (particularly if history of steroid-induced psychosis) · thromboembolic disorders · ulcerative colitis

CAUTIONS, FURTHER INFORMATION For further information on cautions associated with intra-articular, intradermal and intralesional preparations, consult product literature.

- Elderly Prescription potentially inappropriate (STOPP criteria):
 - if used instead of inhaled corticosteroids for maintenance therapy in moderate to severe COPD (unnecessary exposure to long-term side-effects)
 - as long-term (longer than 3 months) monotherapy for rheumatoid arthritis (risk of side-effects)
 - for treatment of osteoarthritis other than for periodic intra-articular injections for monoarticular pain (risk of side-effects)
 - with concurrent NSAIDs without proton pump inhibitor prophylaxis (increased risk of peptic ulcer disease)
 See also Prescribing in the elderly p. 29.

SIDE-EFFECTS

- Common or very common Anxiety · behaviour abnormal · cataract subcapsular · cognitive impairment · Cushing's syndrome · electrolyte imbalance · fatigue · fluid retention · gastrointestinal discomfort · headache · healing impaired · hirsutism · hypertension · increased risk of infection · menstrual cycle irregularities · mood altered · nausea · osteoporosis · peptic ulcer · psychotic disorder · skin reactions · sleep disorders · weight increased
- ▶ Uncommon Adrenal suppression · alkalosis hypokalaemic appetite increased · bone fractures · diabetic control impaired · eye disorders · glaucoma · haemorrhage · heart failure · hyperhidrosis · leucocytosis · myopathy · osteonecrosis · pancreatitis · papilloedema · seizure · thromboembolism · tuberculosis reactivation · vertigo · vision blurred
- ▶ Rare or very rare Malaise tendon rupture
- Frequency not known Chorioretinopathy · growth retardation (very common in children) · intracranial pressure increased with papilloedema (usually after withdrawal) · telangiectasia

SIDE-EFFECTS, FURTHER INFORMATION Adrenal suppression During prolonged therapy with corticosteroids, particularly with systemic use, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension, or death. To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any

significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary reintroduction of corticosteroid treatment.

Infections Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. septicaemia and tuberculosis may reach an advanced stage before being recognised, and amoebiasis or strongyloidiasis may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral ocular infections may also be exacerbated.

Chickenpox Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being at risk of severe chickenpox. Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature. Passive immunisation with varicellazoster immunoglobulin is needed for exposed non-immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment. Corticosteroids should not be stopped and dosage may need to be increased.

Measles Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin may be needed.

Psychiatric reactions Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment. Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

- PREGNANCY The benefit of treatment with corticosteroids during pregnancy outweighs the risk. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) concluded that corticosteroids vary in their ability to cross the placenta but there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip. When administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome). Any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important. Monitoring Pregnant women with fluid retention should be monitored closely when given systemic corticosteroids.
- BREAST FEEDING The benefit of treatment with corticosteroids during breast-feeding outweighs the risk.
- HEPATIC IMPAIRMENT In general, manufacturers advise caution (risk of increased exposure).

RENAL IMPAIRMENT In general, manufacturers advise caution

MONITORING REQUIREMENTS

- In children The height and weight of children receiving prolonged treatment with corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.
- EFFECT ON LABORATORY TESTS May suppress skin test reactions.

TREATMENT CESSATION

- In adults Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension or death. Withdrawal can also be associated with fever, myalgia, arthralgia, rhinitis, conjunctivitis, painful itchy skin nodules and weight loss. The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. *Gradual* withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:
- received more than 40 mg prednisolone (or equivalent) daily for more than 1 week;
- · been given repeat doses in the evening;
- received more than 3 weeks' treatment:
- recently received repeated courses (particularly if taken for longer than 3 weeks);
- taken a short course within 1 year of stopping long-term therapy;
- other possible causes of adrenal suppression.
 Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse and who have received treatment for 3 weeks or less and who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 7.5 mg daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

- In children The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a caseby-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. Gradual withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:
 - received more than 40 mg prednisolone (or equivalent) daily for more than 1 week or 2 mg/kg daily for 1 week or 1 mg/kg daily for 1 month;
 - · been given repeat doses in the evening;
 - · received more than 3 weeks' treatment;
 - recently received repeated courses (particularly if taken for longer than 3 weeks);
 - taken a short course within 1 year of stopping long-term therapy;
 - · other possible causes of adrenal suppression.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse *and* who have received treatment for 3 weeks or less *and* who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 2–2.5 mg/m² daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

PATIENT AND CARER ADVICE

Advice for patients A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed. Patients should especially be advised of

potential side-effects including adrenal suppression, immunosuppression, and psychiatric reactions (for further details, see *Side-effects*, *further information*).

Steroid Treatment Card Steroid Treatment Cards should be issued where appropriate to support communication of the risks associated with treatment and to record details of the prescriber, drug, dosage, and duration of treatment. Steroid treatment cards are available for purchase from the NHS Print online ordering portal www.nhsforms.co.uk.

GP practices can obtain supplies through Primary Care Support England. NHS Trusts can order supplies via the online ordering portal.

In **Scotland**, steroid treatment cards can be obtained from APS Group Scotland by emailing stockorders.dppas@apsgroup.co.uk or by fax on 0131 629 9967.

Steroid Emergency Card

- In adults Steroid Emergency Cards should be issued to patients with adrenal insufficiency and steroid dependence for whom missed doses, illness, or surgery puts them at risk of adrenal crisis. The Royal College of Physicians and the Society for Endocrinology advise that the following patients are considered at risk of adrenal insufficiency and should be given a Steroid Emergency Card:
 - those with primary adrenal insufficiency;
 - those with adrenal insufficiency due to hypopituitarism requiring corticosteroid replacement;
 - those taking corticosteroids at doses equivalent to, or exceeding, prednisolone 5 mg daily for 4 weeks or longer across all routes of administration (oral, topical, inhaled, intranasal, or intra-articular);
 - those taking corticosteroids at doses equivalent to, or exceeding, prednisolone 40 mg daily for longer than 1 week, or repeated short oral courses;
 - those taking a course of oral corticosteroids within 1 year of stopping long-term therapy.

The card includes a management summary for the emergency treatment of adrenal crisis and can be issued by any healthcare professional managing such patients.

Steroid Emergency Cards are available for purchase from the NHS Print online ordering portal www.nhsforms.co.uk or Primary Care Support England (PCSE) online. Paediatric Steroid Treatment Card for children with adrenal insufficiency

In children The British Society for Paediatric Endocrinology and Diabetes (BSPED) has developed a Paediatric Steroid Treatment Card which should be issued to children with adrenal insufficiency and steroid dependence. The card includes a management summary for the emergency treatment of adrenal crisis and can be issued by any healthcare professional managing such patients. The BSPED Paediatric Steroid Treatment Card is available at: www.endocrinology.org/adrenal-crisis.

F 740

Betamethasone

08-Mar-2022

 DRUG ACTION Betamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

• INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders | Congenital adrenal hyperplasia

- ► BY MOUTH
- ▶ Adult: Usual dose 0.5–5 mg daily
- ► BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION. OR BY INTRAVENOUS INFUSION
- ▶ Adult: 4-20 mg, repeated up to 4 times in 24 hours
- INTERACTIONS → Appendix 1: corticosteroids

• SIDE-EFFECTS Hiccups • myocardial rupture (following recent myocardial infarction) • oedema • Stevens-Johnson syndrome

PREGNANCY

 With systemic use Readily crosses the placenta. Transient effect on fetal movements and heart rate.

DIRECTIONS FOR ADMINISTRATION

- With intravenous use For intravenous infusion (as sodium phosphate, give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Soluble tablet

CAUTIONARY AND ADVISORY LABELS 10, 13, 21 (not for use as mouthwash for oral ulceration)

► Betamethasone (Non-proprietary)

Deflazacort

08-Mar-2022

 DRUG ACTION Deflazacort is derived from prednisolone; it has predominantly glucocorticoid activity.

• INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders

► BY MOUTH

Adult: Maintenance 3–18 mg daily

Suppression of inflammatory and allergic disorders (acute disorders)

► BY MOUTH

Adult: Initially up to 120 mg daily

Inflammatory and allergic disorders

- ► BY MOUTH
- Child 1 month-11 years: 0.25-1.5 mg/kg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations
- Child 12-17 years: 3-18 mg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations
- INTERACTIONS → Appendix 1: corticosteroids
- SIDE-EFFECTS
- ▶ Uncommon Oedema
- ► Frequency not known Hypotension
- HEPATIC IMPAIRMENT

Dose adjustments Manufacturer advises adjust to the minimum effective dose.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

► Calcort (Sanofi)

Deflazacort 6 mg Calcort 6mg tablets | 60 tablet PoM £15.82 DT = £15.82

F 740

17-May-2022

• DRUG ACTION Dexamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

• INDICATIONS AND DOSE

Dexamethasone

Suppression of inflammatory and allergic disorders

- Adult: 0.5-10 mg daily

Mild croup

- ► BY MOUTH
- Child: 150 micrograms/kg for 1 dose

Severe croup (or mild croup that might cause complications)

- ► INITIALLY BY MOUTH
- ▶ Child: Initially 150 micrograms/kg for 1 dose, to be given before transfer to hospital, then (by mouth or by intravenous injection) 150 micrograms/kg, then (by mouth or by intravenous injection) 150 micrograms/kg after 12 hours if required

Congenital adrenal hyperplasia (under expert supervision)

- ► BY MOUTH
- Adult: Consult specialist for advice on dosing
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: Consult specialist for advice on dosing

Overnight dexamethasone suppression test

- Adult: 1 mg for 1 dose, to be given at night

Adjunctive treatment of suspected bacterial meningitis (starting before or with first dose of antibacterial)

- ► BY INTRAVENOUS INJECTION
- Adult: 10 mg every 6 hours continued for 4 days in patients with pneumococcal meningitis, discontinue treatment if another cause of meningitis is suspected or confirmed

Symptom control of anorexia in palliative care

▶ Adult: 2-4 mg daily

Dysphagia due to obstruction by tumour in palliative care Adult: 8 mg daily

Dyspnoea due to bronchospasm or partial obstruction in palliative care

▶ Adult: 4-8 mg daily

Adjunct in the treatment of nausea and vomiting in palliative care

- ► BY MOUTH
- ▶ Adult: 8-16 mg daily

Headaches due to raised intracranial pressure in palliative care

Adult: 16 mg daily for 4-5 days, then reduced to 4-6 mg daily, reduce dose if possible. To be given before 6pm to reduce the risk of insomnia

Pain due to nerve compression in palliative care

Adult: 8 mg daily

Cerebral oedema associated with brain tumours

- ▶ BY MOUTH
- ▶ Adult: 0.5-10 mg daily
- ► INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 8.3 mg for 1 dose, then (by intramuscular injection) 3.3 mg every 6 hours until symptoms subside, subsequently, dose may be reduced after 2-4 days and then gradually discontinued over 5-7 days

Life-threatening cerebral oedema

- ► BY INTRAVENOUS INJECTION
- Adult: Initially 41.5 mg, then 6.6 mg every 2 hours for 3 days, then 3.3 mg every 2 hours for 1 day, then 3.3 mg every 4 hours for 4 days, then reduced in steps of 3.3 mg daily, continue dose reduction to discontinue over the following 7-10 days or change to oral dexamethasone maintenance if required

COVID-19 requiring supplemental oxygen

- ► BY MOUTH, OR BY INTRAVENOUS INJECTION
- Adult: 6 mg once daily for 10 days, or until the day of discharge if this is sooner
- UNLICENSED USE EVGr Dexamethasone is used for the treatment of suspected bacterial meningitis, (A) but is not licensed for this indication.
- INTERACTIONS → Appendix 1: corticosteroids
- SIDE-EFFECTS
- ▶ With oral use Hiccups hyperglycaemia hypotension myocardial rupture (following recent myocardial infarction) · protein catabolism
- With parenteral use Hypotension perineal irritation (may occur following the intravenous injection of large doses of the phosphate ester)
- PREGNANCY Dexamethasone readily crosses the placenta.

DIRECTIONS FOR ADMINISTRATION

- ▶ With oral use in children For administration by mouth tablets may be dispersed in water or injection solution given by mouth.
- With intravenous use in children For intravenous infusion dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15-20 minutes.
- ▶ With intravenous use in adults For intravenous infusion (Dexamethasone, Hospira) give continuously or intermittently or via drip tubing in Glucose 5% or Sodium Chloride 0.9%.

PRESCRIBING AND DISPENSING INFORMATION

Dexamethasone 3.8 mg/mL Injection has replaced dexamethasone 4 mg/mL Injection. All dosage recommendations for intravenous, intramuscular, intrarticular use or local infiltration; are given in units of dexamethasone base.

Palliative care For further information on the use of dexamethasone in palliative care, see www.medicinescomplete.com/#/content/palliative/systemic-

Fludrocortisone acetate

08-Mar-2022

 DRUG ACTION Fludrocortisone has very high mineralocorticoid activity and insignificant glucocorticoid activity.

• INDICATIONS AND DOSE

Neuropathic postural hypotension

► BY MOUTH

Adult: 100–400 micrograms daily

Mineralocorticoid replacement in adrenocortical insufficiency

► BY MOUTH

▶ Adult: 50–300 micrograms once daily

Adrenocortical insufficiency resulting from septic shock (in combination with hydrocortisone)

► BY MOUTH

Adult: 50 micrograms daily

- UNLICENSED USE Not licensed for use in neuropathic postural hypotension.
- INTERACTIONS → Appendix 1: corticosteroids
- SIDE-EFFECTS Conjunctivitis · idiopathic intracranial hypertension · muscle weakness · thrombophlebitis
- HEPATIC IMPAIRMENT

Monitoring Monitor patient closely in hepatic impairment.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

F 74017-May-2022

Hydrocortisone

 DRUG ACTION Hydrocortisone has equal glucocorticoid and mineralocorticoid activity.

INDICATIONS AND DOSE

Thyrotoxic crisis (thyroid storm)

- ► BY INTRAVENOUS INJECTION
- Adult: 100 mg every 6 hours, to be administered as sodium succinate

Adrenocortical insufficiency resulting from septic shock

- **▶** BY INTRAVENOUS INJECTION
- Adult: 50 mg every 6 hours, given in combination with fludrocortisone

Acute hypersensitivity reactions such as angioedema of the upper respiratory tract and anaphylaxis (adjunct to adrenaline)

- ► BY INTRAVENOUS INJECTION
- Adult: 100–300 mg, to be administered as sodium succinate

Corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of minor surgery under general anaesthesia

- ► BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: Initially 25–50 mg, to be administered at induction of surgery, the patient's usual oral corticosteroid dose is recommenced after surgery

Corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of moderate or major surgery

- ► INITIALLY BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFLISION
- Adult: Initially 25–50 mg, to be administered at induction of surgery (following usual oral corticosteroid dose on the morning of surgery), followed by (by intravenous injection) 25–50 mg 3 times a day for 24 hours after moderate surgery and for 48–72 hours after major surgery

Adrenocortical insufficiency in Addison's disease or following adrenalectomy

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 20–30 mg daily in 2 divided doses, the larger dose to be given in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion, the optimum daily dose is determined on the basis of clinical response

Adrenal crisis

BNF 84

- ► INITIALLY BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- Adult: Initially 100 mg, then (by continuous intravenous infusion) 200 mg every 24 hours, diluted in Glucose 5%, alternatively (by intramuscular injection or by intravenous injection) 50 mg every 6 hours, dose increased to 100 mg every 6 hours in patients who are severely obese

Severe inflammatory bowel disease

- ► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFLISION
- Adult: 100-500 mg 3-4 times a day or when required

Replacement in adrenocortical insufficiency

- ► BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 20-30 mg once daily, adjusted according to response, dose to be taken in the morning
- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 20-30 mg daily in divided doses, adjusted according to response

Acute hypersensitivity reactions | Angioedema

- ► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS
- Child 1-5 months: Initially 25 mg 3 times a day, adjusted according to response
- Child 6 months-5 years: Initially 50 mg 3 times a day, adjusted according to response
- Child 6-11 years: Initially 100 mg 3 times a day, adjusted according to response
- Child 12-17 years: Initially 200 mg 3 times a day, adjusted according to response

Severe acute asthma | Life-threatening acute asthma

- ► BY INTRAVENOUS INJECTION
- Child 1 month-1 year: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 25 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- Child 2-4 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 50 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- Child 5-11 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- Child 12-17 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- Adult: 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

COVID-19 requiring supplemental oxygen [when dexamethasone cannot be used or is unavailable]

- ► BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: 50 mg every 8 hours for 10 days, or until the day of discharge if this is sooner; may be continued for up to 28 days in patients with septic shock

DOSE EQUIVALENCE AND CONVERSION

- With oral use
- When switching from immediate-release hydrocortisone tablets to modified release Plenadren[®] use same total daily dose. Bioavailability of Plenadren[®] lower than immediate release tablets—monitor clinical response.
- INTERACTIONS → Appendix 1: corticosteroids
- SIDE-EFFECTS
- With oral use Dyslipidaemia · hypotension · myocardial rupture (following recent myocardial infarction) · oedema

 With parenteral use Hiccups · Kaposi's sarcoma · lipomatosis · myocardial rupture (following recent myocardial infarction)

DIRECTIONS FOR ADMINISTRATION

- With intravenous use in children For intravenous administration, dilute with Glucose 5% or Sodium Chloride 0.9%. For intermittent infusion give over 20–30 minutes.
- With intravenous use in adults For intravenous infusion (SoluCortef®), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.
 - PRESCRIBING AND DISPENSING INFORMATION
- When used for Asthma For choice of therapy, see Asthma, acute p. 260 and Asthma, chronic p. 256.
- NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- ► Hydrocortisone (Plenadren®) for the treatment of adrenal insufficiency in adults (December 2016) SMC No. 848/12 Not recommended
- LESS SUITABLE FOR PRESCRIBING
- With intravenous use Hydrocortisone as the sodium phosphate is less suitable for prescribing as paraesthesia and pain (particularly in the perineal region) may follow intravenous injection.
- EXCEPTIONS TO LEGAL CATEGORY
- With intramuscular use or intravenous use Prescription only medicine restriction does not apply where administration is for saving life in emergency.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension. oral solution

Methylprednisolone

 DRUG ACTION Methylprednisolone exerts predominantly glucocorticoid effects with minimal mineralcorticoid effects.

• INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders | Cerebral oedema associated with malignancy

- ► BY MOUTH
- ▶ Adult: Initially 2-40 mg daily
- ► BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: Initially 10–500 mg

Treatment of graft rejection reactions

► BY INTRAVENOUS INFUSION

Adult: Up to 1 g daily for up to 3 days
 Treatment of relapse in multiple sclerosis

► BY MOUTH

Adult: 500 mg once daily for 5 days

Treatment of relapse in multiple sclerosis (when oral steroids have failed or have not been tolerated, or in those who require hospital admission)

► BY INTRAVENOUS INFUSION

▶ Adult: 1 g once daily for 3-5 days

DEPO-MEDRONE®

Suppression of inflammatory and allergic disorders

- ► BY DEEP INTRAMUSCULAR INJECTION
- Adult: 40-120 mg, then 40-120 mg after 2-3 weeks if required, to be injected into the gluteal muscle
- UNLICENSED USE
- With intravenous use or oral use EvGr Not licensed for use by mouth for the treatment of multiple sclerosis relapse. Not licensed for use by intravenous infusion for the treatment of multiple sclerosis relapse for durations longer than 3 days. Methylprednisolone doses in the BNF may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: METHYLPREDNISOLONE INJECTABLE MEDICINE CONTAINING LACTOSE (SOLU-MEDRONE® 40 MG): DO NOT USE IN PATIENTS WITH COWS' MILK ALLERGY (OCTOBER 2017)

▶ With intramuscular use or intravenous use

An EU-wide review has concluded that <code>Solu-Medrone®</code> 40 mg may contain trace amounts of milk proteins and should not be used in patients with a known or suspected allergy to cows' milk. Serious allergic reactions, including bronchospasm and anaphylaxis, have been reported in patients allergic to cows' milk proteins. If a patient's symptoms worsen or new allergic symptoms occur, administration should be stopped and the patient treated accordingly.

MHRA/CHM ADVICE: SOLU-MEDRONE® 40 MG
(METHYL PREDNISOLONE AS SODIUM SUCCINATE): CHANGE FROM
LACTOSE-CONTAINING TO A LACTOSE-FREE FORMULATION—RISK
OF SERIOUS ALLERGIC REACTIONS IF FORMULATIONS ARE
CONFUSED (NOVEMBER 2020)

With intramuscular use or intravenous use

Solu-Medrone® 40 mg powder and solvent for solution for injection has been reformulated to a lactose-free preparation in which the lactose is replaced with sucrose. There is a risk of serious allergic reactions if the new lactose-free preparation is confused with the lactose-containing preparation. Healthcare professionals should take extra care to ensure that patients who have been treated with the lactose-free preparation do not inadvertently receive the lactosecontaining preparation. They should also be aware of the transition to the lactose-free preparation in their respective practices, and the precautionary measures taken by the manufacturer to differentiate between the packaging and labelling of the old (lactose-containing) and new (lactose-free) formulations to help avoid potential medication errors. Prescribers are advised to ensure patients who are allergic to cow's milk proteins and require the new lactose-free formulation are prescribed Solu-Medrone® injection 40 mg lactose free or methylprednisolone injection 40 mg lactose free.

CAUTIONS

- With intravenous use Rapid intravenous administration of large doses associated with cardiovascular collapse
- With systemic use Systemic sclerosis (increased incidence of scleroderma renal crisis)
- INTERACTIONS → Appendix 1: corticosteroids
- SIDE-EFFECTS
- ► Common or very common
- With oral use Depressed mood
- ► Frequency not known
- With oral use Confusion · delusions · diarrhoea · dizziness · dyslipidaemia · hallucination · hiccups · hypotension · Kaposi's sarcoma · lipomatosis · myocardial rupture (following recent myocardial infarction) · oedema · schizophrenia · suicidal ideation · withdrawal syndrome
- With parenteral use Confusion · delusions · depressed mood · diarrhoea · dizziness · dyslipidaemia · hallucination · hiccups · hypotension · Kaposi's sarcoma · lipomatosis · oedema · schizophrenia · suicidal thoughts · vomiting · withdrawal syndrome
- MONITORING REQUIREMENTS Manufacturer advises monitor blood pressure and renal function (s-creatinine) routinely in patients with systemic sclerosis—increased incidence of scleroderma renal crisis.
- DIRECTIONS FOR ADMINISTRATION
- ▶ With intravenous use For intravenous infusion (as sodium succinate) (Solu-Medrone®), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially with water for injections; doses up to 250 mg should be given over at least 5 minutes, high doses over at least 30 minutes.
- PRESCRIBING AND DISPENSING INFORMATION

• INDICATIONS AND DOSE

Acute exacerbation of chronic obstructive pulmonary disease (if increased breathlessness interferes with daily activities)

- ► BY MOUTH
- Adult: 30 mg daily for 7-14 days

Severe croup (before transfer to hospital) | Mild croup that might cause complications (before transfer to hospital)

- ► BY MOUTH
- Child: 1-2 mg/kg

Mild to moderate acute asthma (when oral corticosteroid taken for more than a few days) | Severe or lifethreatening acute asthma (when oral corticosteroid taken for more than a few days)

- ► BY MOUTH
- Child 1 month-11 years: 2 mg/kg once daily (max. per dose 60 mg) for up to 3 days, longer if necessary

Mild to moderate acute asthma | Severe or life-threatening acute asthma

- ► BY MOUTH
- Child 1 month-11 years: 1-2 mg/kg once daily (max. per dose 40 mg) for up to 3 days, longer if necessary
- ► Child 12-17 years: 40-50 mg daily for at least 5 days
- ► Adult: 40–50 mg daily for at least 5 days

Suppression of inflammatory and allergic disorders

- ► BY MOUTH
- Adult: Initially 10–20 mg daily, dose preferably taken in the morning after breakfast, can often be reduced within a few days but may need to be continued for several weeks or months; maintenance 2.5–15 mg daily, higher doses may be needed; cushingoid sideeffects increasingly likely with doses above 7.5 mg daily

Suppression of inflammatory and allergic disorders (initial dose in severe disease)

- ► BY MOUTH
- Adult: Initially up to 60 mg daily, dose preferably taken in the morning after breakfast, can often be reduced within a few days but may need to be continued for several weeks or months

Idiopathic thrombocytopenic purpura

- ▶ BY MOUTH
- Adult: 1 mg/kg daily, gradually reduce dose over several weeks

Ulcerative colitis | Crohn's disease

- ► BY MOUTH
- Adult: Initially 20–40 mg daily until remission occurs, followed by reducing doses, up to 60 mg daily, may be used in some cases, doses preferably taken in the morning after breakfast

Neuritic pain or weakness heralding rapid onset of permanent nerve damage (during reversal reactions multibacillary leprosy)

- ► BY MOUTH
- Adult: Initially 40–60 mg daily, dose to be instituted at once

Generalised myasthenia gravis (when given on alternate days)

- ► BY MOUTH
- Adult: Initially 10 mg once daily on alternate days, then increased in steps of 10 mg once daily on alternate days, increased to 1-1.5 mg/kg once daily on alternate days (max. per dose 100 mg)

Generalised myasthenia gravis in ventilated patients (when given on alternate days)

- ► BY MOUTH
- Adult: Initially 1.5 mg/kg once daily on alternate days (max. per dose 100 mg)

Generalised myasthenia gravis (when giving daily)

- BY MOUTH
- Adult: Initially 5 mg daily, increased in steps of 5 mg daily. maintenance 60–80 mg daily, alternatively maintenance 0.75–1 mg/kg daily, ventilated patients may be started on 1.5 mg/kg (max. 100 mg) on alternate days

Ocular myasthenia

- ► BY MOUTH
- Adult: Usual dose 10–40 mg once daily on alternate days, reduce to minimum effective dose

Reduction in rate of joint destruction in moderate to severe rheumatoid arthritis of less than 2 years' duration

- ► BY MOUTH
- Adult: 7.5 mg daily

Polymyalgia rheumatica

- ► BY MOUTH
- Adult: 10-15 mg daily until remission of disease activity; maintenance 7.5-10 mg daily, reduce gradually to maintenance dose. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long term low-dose corticosteroid treatment

Giant cell (temporal) arteritis

- ► BY MOUTH
- Adult: 40-60 mg daily until remission of disease activity, the higher dose being used if visual symptoms occur; maintenance 7.5-10 mg daily, reduce gradually to maintenance dose. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long term low-dose corticosteroid treatment continued ⇒

Polyarteritis nodosa | Polymyositis | Systemic lupus erythematosus

- ► BY MOUTH
- Adult: Initially 60 mg daily, to be reduced gradually; maintenance 10–15 mg daily

Symptom control of anorexia in palliative care

- ► BY MOUTH
- ▶ Adult: 15-30 mg daily

Pneumocystis pneumonia in moderate to severe infections associated with HIV infection

- ► BY MOUTH
- Adult: 50-80 mg daily for 5 days, the dose is then reduced to complete 21 days of treatment, corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24-72 hours afterwards. The corticosteroid should be withdrawn before antipneumocystis treatment is complete

Short-term prophylaxis of episodic cluster headache as monotherapy or in combination with verapamil during verapamil titration

- ► BY MOUTH
- Adult: 60–100 mg once daily for 2–5 days, then reduced in steps of 10 mg every 2–3 days until prednisolone is discontinued

Proctitis

- ► BY RECTUM USING RECTAL FOAM
- Adult: 1 metered application 1-2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone
- ► BY RECTUM USING SUPPOSITORIES
- Adult: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

Distal ulcerative colitis

- ► BY RECTUM USING RECTAL FOAM
- Adult: 1 metered application 1-2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

Rectal complications of Crohn's disease

- ► BY RECTUM USING SUPPOSITORIES
- Adult: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

Rectal and rectosigmoidal ulcerative colitis | Rectal and rectosigmoidal Crohn's disease

- ► BY RECTUM USING ENEMA
- Adult: 20 mg daily for 2-4 weeks, continued if response good, to be used at bedtime

COVID-19 requiring supplemental oxygen [when dexamethasone cannot be used or is unavailable]

- ▶ BY MOUTH
- Adult: 40 mg once daily for 10 days, or until the day of discharge if this is sooner

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

With systemic use

Prednisolone has been confused with propranolol; care must be taken to ensure the correct drug is prescribed and dispensed.

CONTRA-INDICATIONS

- With rectal use Abdominal or local infection · bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses
- CAUTIONS
- With rectal use Systemic absorption may occur with rectal preparations

- With systemic use Duchenne's muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity) - systemic sclerosis (increased incidence of scleroderma renal crisis with a daily dose of 15 mg or more)
- INTERACTIONS → Appendix 1: corticosteroids
- SIDE-EFFECTS
- With oral use Diarrhoea · dizziness · dyslipidaemia · lipomatosis · protein catabolism · scleroderma renal crisis
- PREGNANCY As it crosses the placenta 88% of prednisolone is inactivated.
- **Monitoring** With systemic use Pregnant women with fluid retention should be monitored closely.
- BREAST FEEDING Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.
 Monitoring > With systemic use Infant should be monitored for adrenal suppression if mother is taking a dose higher than 40 mg.

MONITORING REQUIREMENTS

 With systemic use Manufacturer advises monitor blood pressure and renal function (s-creatinine) routinely in patients with systemic sclerosis—increased incidence of scleroderma renal crisis.

PRESCRIBING AND DISPENSING INFORMATION

 When used for Asthma For choice of therapy, see Asthma, acute p. 260 and Asthma, chronic p. 256.

Palliative care For further information on the use of prednisolone in palliative care, see www.medicinescomplete.com/#/content/palliative/systemic-corticosteroids.

F 740

Triamcinolone acetonide

09-Mar-2022

• DRUG ACTION Triamcinolone exerts predominantly glucocorticoid effects with minimal mineralcorticoid

INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders

- **▶** BY DEEP INTRAMUSCULAR INJECTION
- Adult: 40 mg (max. per dose 100 mg), repeated if necessary, dose given for depot effect, to be administered into gluteal muscle; repeated at intervals according to patient's response
- CAUTIONS High dosage (may cause proximal myopathy), avoid in chronic therapy
- INTERACTIONS → Appendix 1: corticosteroids
- SIDE-EFFECTS
- ▶ Uncommon Dizziness flushing hyperglycaemia hypotension
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

CAUTIONARY AND ADVISORY LABELS 10 EXCIPIENTS: May contain Benzyl alcohol

Kenalog (Bristol-Myers Squibb Pharmaceuticals Ltd) Triamcinolone acetonide 40 mg per 1 ml Kenalog Intra-articular / Intramuscular 40mg/1ml suspension for injection vials | 5 vial Pom £7.45 DT = £7.45

3.1 Cushing's syndrome and disease

Cushing's syndrome

07-Apr-2021

Management

Cushing's syndrome results from chronic exposure to excess cortisol; exogenous corticosteroid use is the most common cause. Endogenous causes include adrenocorticotrophic hormone (ACTH)-secreting pituitary tumours (Cushing's disease), cortisol-secreting adrenal tumours, and rarely, ectopic ACTH-secreting tumours. Most types of endogenous Cushing's syndrome are treated surgically.

Metyrapone p. 750 is licensed for the management of Cushing's syndrome.

Ketoconazole below is licensed for the treatment of endogenous Cushing's syndrome.

Other drugs used for Cushing's syndrome and disease Pasireotide, p. 1026

ENZYME INHIBITORS

Ketoconazole

04-Feb-2020

 DRUG ACTION An imidazole derivative which acts as a potent inhibitor of cortisol and aldosterone synthesis by inhibiting the activity of 17α -hydroxylase, 11-hydroxylation steps and at higher doses the cholesterol side-chain cleavage enzyme. It also inhibits the activity of adrenal C17-20 lyase enzymes resulting in androgen synthesis inhibition, and may have a direct effect on corticotropic tumour cells in patients with Cushing's

INDICATIONS AND DOSE

Endogenous Cushing's syndrome (specialist use only)

- ▶ Adult: Initially 400-600 mg daily in 2-3 divided doses, increased to 800-1200 mg daily; maintenance 400-800 mg daily in 2-3 divided doses, for dose titrations in patients with established dose, adjustments in adrenal insufficiency, or concomitant corticosteroid replacement therapy, consult product literature; maximum 1200 mg per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

▶ Manufacturer advises max. dose 200 mg daily with concurrent use of cobicistat.

IMPORTANT SAFETY INFORMATION

CHMP ADVICE: KETOCONAZOLE (JULY 2013)

The CHMP has recommended that the marketing authorisation for oral ketoconazole to treat fungal infections should be suspended. The CHMP concluded that the risk of hepatotoxicity associated with oral ketoconazole is greater than the benefit in treating fungal infections. Doctors should review patients who are being treated with oral ketoconazole for fungal infections, with a view to stopping treatment or choosing an alternative treatment. Patients with a prescription of oral ketoconazole for fungal infections should be referred back to their doctors.

Oral ketoconazole for Cushing's syndrome and topical products containing ketoconazole are not affected by this advice.

- CONTRA-INDICATIONS Acquired QTc prolongation · Acute porphyrias p. 1150 · avoid concomitant use of hepatotoxic drugs · congenital QTc prolongation
- CAUTIONS Pre-treatment liver enzymes should not exceed 2 times the normal upper limit · risk of adrenal insufficiency
- INTERACTIONS → Appendix 1: antifungals, azoles
- SIDE-EFFECTS
- ► Common or very common Adrenal insufficiency · diarrhoea · gastrointestinal discomfort · nausea · skin reactions ·
- ▶ Uncommon Allergic conditions · alopecia · angioedema · asthenia · dizziness · drowsiness · headache · thrombocytopenia
- ▶ Rare or very rare Fever hepatic disorders taste altered
- ► Frequency not known Alcohol intolerance appetite abnormal · arthralgia · azoospermia · dry mouth · epistaxis · flatulence · fontanelle bulging · gynaecomastia · hot flush ·

insomnia · intracranial pressure increased · malaise · menstrual disorder · myalgia · nervousness · papilloedema · paraesthesia · peripheral oedema · photophobia · photosensitivity reaction · tongue discolouration SIDE-EFFECTS, FURTHER INFORMATION Potentially lifethreatening hepatotoxicity reported rarely with oral use. Manufacturer advises reduce dose if hepatic enzymes increased to less than 3 times the upper limit of normal consult product literature; discontinue permanently if hepatic enzymes at least 3 times the upper limit of normal.

- CONCEPTION AND CONTRACEPTION Effective contraception must be used in women of child-bearing
- PREGNANCY Manufacturer advises avoid—teratogenic in animal studies.
- BREAST FEEDING Manufacturer advises avoid—present in hreast milk
- HEPATIC IMPAIRMENT Manufacturer advises avoid.
- MONITORING REQUIREMENTS
- ▶ Monitor ECG before and one week after initiation, and then as clinically indicated thereafter.
- ▶ Adrenal insufficiency Monitor adrenal function within one week of initiation, then regularly thereafter. When cortisol levels are normalised or close to target and effective dose established, monitor every 3-6 months as there is a risk of autoimmune disease development or exacerbation after normalisation of cortisol levels. If symptoms suggestive of adrenal insufficiency such as fatigue, anorexia, nausea, vomiting, hypotension, hyponatraemia, hyperkalaemia, and/or hypoglycaemia occur, measure cortisol levels and discontinue treatment temporarily (can be resumed thereafter at lower dose) or reduce dose and if necessary, initiate corticosteroid substitution.
- ▶ Hepatotoxicity Monitor liver function before initiation of treatment, then weekly for 1 month after initiation, then monthly for 6 months-more frequently if dose adjusted or abnormal liver function detected.
- PATIENT AND CARER ADVICE Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, jaundice, abdominal pain, or dark urine develop. Patients or their carers should also be told how to recognise signs of adrenal insufficiency. Driving and skilled tasks Dizziness and somnolence may
- affect the performance of skilled tasks (e.g. driving). MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available

from special-order manufacturers include: oral suspension **Tablet**

CAUTIONARY AND ADVISORY LABELS 2, 5, 21

 Ketoconazole (non-proprietary) Ketoconazole 200 mg Ketoconazole 200mg tablets 60 tablet [PoM] £480.00-£515.00 DT = £497.50

Metyrapone

14-Dec-2020

 DRUG ACTION Metyrapone is a competitive inhibitor of 11β -hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. Metyrapone may be used as a test of anterior pituitary function.

• INDICATIONS AND DOSE

Differential diagnosis of ACTH-dependent Cushing's syndrome (specialist supervision in hospital)

- ► BY MOUTH
- Adult: 750 mg every 4 hours for 6 doses

Management of Cushing's syndrome (specialist supervision in hospital)

- ▶ BY MOUTH
- ▶ Adult: Usual dose 0.25-6 g daily, dose to be tailored to cortisol production, dose is either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed

Resistant oedema due to increased aldosterone secretion in cirrhosis, nephrotic syndrome, and congestive heart failure (with glucocorticoid replacement therapy) (specialist supervision in hospital)

- ► BY MOUTH
- Adult: 3 g daily in divided doses
- CONTRA-INDICATIONS Adrenocortical insufficiency
- CAUTIONS Avoid in Acute porphyrias p. 1150 · gross hypopituitarism (risk of precipitating acute adrenal failure) hypertension on long-term administration hypothyroidism (delayed response)
- INTERACTIONS → Appendix 1: metyrapone
- SIDE-EFFECTS
- ► Common or very common Dizziness · headache · hypotension · nausea · sedation · vomiting
- ▶ Rare or very rare Abdominal pain · adrenal insufficiency · allergic dermatitis · hirsutism
- ► Frequency not known Alopecia · bone marrow failure · hypertension
- PREGNANCY Avoid (may impair biosynthesis of fetalplacental steroids).
- BREAST FEEDING Avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution (risk of delayed response).
- PATIENT AND CARER ADVICE Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Cansule

CAUTIONARY AND ADVISORY LABELS 21

 Metopirone (HRA Pharma UK & Ireland Ltd) Metyrapone 250 mg Metopirone 250mg capsules 100 capsule Pom £363.66 DT = £363.66

Osilodrostat

DRUG ACTION Osilodrostat is a potent inhibitor of 11 β hydroxylase, the enzyme that catalyses the last step of cortisol synthesis in the adrenal gland, thereby lowering cortisol levels.

INDICATIONS AND DOSE

Endogenous Cushing's syndrome (under expert supervision)

- ► BY MOUTH
- Adult: 2 mg twice daily, increased, if tolerated, in steps of 1-2 mg initially, no more frequently than once every 1-2 weeks, adjusted according to response; usual maintenance 2-7 mg twice daily (max. per dose 30 mg twice daily), for dose reduction or treatment interruption due to low cortisol levels or OT-interval prolongation—consult product literature
- Adult (patients of Asian origin): 1 mg twice daily, increased, if tolerated, in steps of 1-2 mg initially, no more frequently than once every 1-2 weeks, adjusted according to response; usual maintenance 2-7 mg twice daily (max. per dose 30 mg twice daily), for dose reduction or treatment interruption due to low cortisol levels or QT-interval prolongation—consult product literature.

- CAUTIONS Patients of Asian origin (increased bioavailability) risk factors for QT-interval prolongation
- INTERACTIONS → Appendix 1: osilodrostat
- SIDE-EFFECTS
- ➤ Common or very common Abdominal pain · adrenal hypofunction · appetite decreased · diarrhoea · dizziness · fatigue · headache · hirsutism · hypokalaemia · hypotension · malaise · nausea · oedema · QT interval prolongation · skin reactions · syncope · tachycardia · vomiting
- CONCEPTION AND CONTRACEPTION Evgr Females of childbearing potential should use effective contraception during treatment and for at least 1 week after last treatment.
- PREGNANCY EVGr Avoid—toxicity in animal studies.
- BREAST FEEDING Ever Discontinue breast-feeding during treatment and for at least 1 week after last treatment—no information available.
- HEPATIC IMPAIRMENT Ever Caution (limited information available)—consider more frequent monitoring of adrenal function during dose titration.
 Dose adjustments Ever In moderate impairment, a starting

bose of 1 mg twice daily is recommended. In severe impairment, a starting dose of 1 mg once daily in the evening, increased initially to 1 mg twice daily, is recommended.

MONITORING REQUIREMENTS

- ▶ Evgr Measure cortisol levels every 1–2 weeks until adequate response maintained, and as clinically indicated thereafter, with additional monitoring during periods of increased cortisol demand. Dose reduction or treatment interruption may be required—consult product literature.
- Obtain ECG prior to treatment, within the first week, and as clinically indicated thereafter; monitor more frequently if risk factors for QT-interval prolongation are present. If the QTc interval exceeds 480 milliseconds prior to or during treatment, cardiology consultation is recommended. Dose reduction or treatment interruption may be required—consult product literature.
- Monitor electrolyte concentrations periodically during treatment.
- PATIENT AND CARER ADVICE Patients and carers should be counselled on the signs and symptoms of hypocortisolism.
 Driving and skilled tasks Patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness and fatigue.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

4 Diabetes mellitus and hypoglycaemia

4.1 Diabetes mellitus

Diabetes

05-Jun-2017

Description of condition

Diabetes mellitus is a group of metabolic disorders in which persistent hyperglycaemia is caused by deficient insulin secretion or by resistance to the action of insulin. This leads to the abnormalities of carbohydrate, fat and protein metabolism that are characteristic of diabetes mellitus.

Type 1 diabetes p. 752 and Type 2 diabetes p. 755 are the two most common classifications of diabetes. Other common types of diabetes are gestational diabetes (develops during pregnancy and resolves after delivery, see Diabetes, pregnancy and breast-feeding p. 760) and secondary diabetes (may be caused by pancreatic damage, hepatic cirrhosis, or endocrine disease). Treatment with endocrine, antiviral, or antipsychotic drugs may also cause secondary diabetes.

Driving

Drivers with diabetes may be required to notify the Driver and Vehicle Licensing Agency (DVLA) of their condition depending on their treatment, the type of licence they hold, and whether they have diabetic complications (including episodes of hypoglycaemia). All drivers who are treated with insulin must inform the DVLA, with some exceptions for temporary treatment. Detailed guidance on notification requirements, eligibility to drive, and precautions required, is available from the DVLA at www.gov.uk/guidance/diabetes-mellitus-assessing-fitness-to-drive.

Advice from the DVLA

The DVLA recommends (2018) that drivers with diabetes need to be particularly careful to avoid hypoglycaemia and should be informed of the warning signs and actions to take. Drivers treated with insulin should always carry a glucose meter and blood-glucose strips when driving, and check their blood-glucose concentration no more than 2 hours before driving and every 2 hours while driving. More frequent self-monitoring may be required if, for any reason, there is a greater risk of hypoglycaemia, such as after physical activity or altered meal routine.

Blood-glucose should always be above 5 mmol/litre while driving. If blood-glucose falls to 5 mmol/litre or below, a snack should be taken. Drivers treated with insulin should ensure that a supply of fast-acting carbohydrate is always available in the vehicle. If blood-glucose is less than 4 mmol/litre, or warning signs of hypoglycaemia develop, the driver should not drive. If already driving, the driver should:

- stop the vehicle in a safe place;
- switch off the engine, remove keys from the ignition, and move from the driver's seat;
- eat or drink a suitable source of sugar;
- wait until 45 minutes after blood-glucose has returned to normal, before continuing journey.

Drivers must not drive if hypoglycaemia awareness has been lost and the DVLA must be notified; driving may resume if a medical report confirms that awareness has been regained.

Depending on the type of licence, notification and monitoring may also be necessary for drivers taking oral antidiabetic drugs, particularly those which carry a risk of hypoglycaemia (e.g. sulfonylureas, nateglinide, repaglinide p. 772).

Note: additional criteria apply for drivers of large goods or passenger carrying vehicles—consult DVLA guidance.

Alcohol

Alcohol can make the signs of hypoglycaemia less clear, and can cause delayed hypoglycaemia; specialist sources recommend that patients with diabetes should drink alcohol only in moderation, and when accompanied by food.

Oral glucose tolerance tests

The oral glucose tolerance test is used mainly for diagnosis of impaired glucose tolerance; it is **not** recommended or necessary for routine diagnostic use when severe symptoms of hyperglycaemia are present. In patients who have less severe symptoms and a blood-glucose concentration that does not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose tolerance test may be required. It is also used to establish the presence of gestational diabetes.

An oral glucose tolerance test involves measuring the bloodglucose concentration after fasting, and then 2 hours after drinking a standard anhydrous glucose drink. Anhydrous glucose may alternatively be given as the appropriate amount of *Polycal*® or as *Rapilose*® OGTT oral solution.

HbA1c measurement

Glycated haemoglobin (HbA1c) forms when red blood cells are exposed to glucose in the plasma. The HbA1c test reflects average plasma glucose over the previous 2 to 3 months and provides a good indicator of glycaemic control. Unlike the oral glucose tolerance test, an HbA1c test can be performed at any time of the day and does not require any special preparation such as fasting.

HbA1c values are expressed in mmol of glycated haemoglobin per mol of haemoglobin (mmol/mol), a standardised unit specific for HbA1c created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC). HbA1c values were previously aligned to the assay used in the Diabetes Control and Complications Trial (DCCT) and expressed as a percentage.

Equivalent values	
IFCC-HbA1c (mmol/mol)	DCCT-HbA1c (%)
42	6.0
48	6.5
53	7.0
59	7.5
64	8.0
69	8.5
75	9.0

Diagnosis

The HbA1c test is used for monitoring glycaemic control in both Type 1 diabetes below and Type 2 diabetes p. 755 and is now also used for diagnosis of type 2 diabetes. [EvGr HbA1c should not be used for diagnosis in those with suspected type 1 diabetes, in children, during pregnancy, or in women who are up to two months postpartum. It should also not be used for patients who have:

- had symptoms of diabetes for less than 2 months;
- a high diabetes risk and are acutely ill;
- treatment with medication that may cause hyperglycaemia;
- · acute pancreatic damage;
- · end-stage chronic kidney disease;
- · HIV infection.

HbA1c used for diagnosis of diabetes should be interpreted with caution in patients with abnormal haemoglobin, anaemia, altered red cell lifespan, or who have had a recent blood transfusion.

Monitoring

EvGr HbA1c is also a reliable predictor of microvascular and macrovascular complications and mortality. Lower HbA1c is associated with a lower risk of long term vascular complications and patients should be supported to aim for an individualised HbA1c target (see Type 1 diabetes below and Type 2 diabetes p. 755).

HbA1c should usually be measured in patients with type 1 diabetes every 3 to 6 months, and more frequently if blood-glucose control is thought to be changing rapidly. Patients with type 2 diabetes should be monitored every 3 to 6 months until HbA1c and medication are stable when monitoring can be reduced to every 6 months.

HbA1c monitoring is invalid for patients with disturbed erythrocyte turnover or for patients with a lack of, or abnormal haemoglobin. In these cases, quality-controlled plasma glucose profiles, total glycated haemoglobin

estimation (if there is abnormal haemoglobin), or fructosamine estimation can be used.

Laboratory measurement of fructosamine concentration measures the glycated fraction of all plasma proteins over the previous 14 to 21 days but is a less accurate measure of glycaemic control than HbA1c.

Advanced Pharmacy Services

Patients with diabetes may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 16.

Type 1 diabetes

11-Aug-2021

Description of condition

Type 1 diabetes describes an absolute insulin deficiency in which there is little or no endogenous insulin secretory capacity due to destruction of insulin-producing beta-cells in the pancreatic islets of Langerhans. This form of the disease has an auto-immune basis in most cases, and it can occur at any age, but most commonly before adulthood.

Loss of insulin secretion results in hyperglycaemia and other metabolic abnormalities. If poorly managed, the resulting tissue damage has both short-term and long-term adverse effects on health; this can result in retinopathy, nephropathy, neuropathy, premature cardiovascular disease, and peripheral arterial disease.

Typical features in adult patients presenting with type 1 diabetes are hyperglycaemia (random plasma-glucose concentration above 11 mmol/litre), ketosis, rapid weight loss, a body mass index below 25 kg/m², age younger than 50 years, and a personal/family history of autoimmune disease (though not all features may be present).

Aims of treatment

Treatment is aimed at using insulin regimens to achieve as optimal a level of blood-glucose control as is feasible, while avoiding or reducing the frequency of hypoglycaemic episodes, in order to minimise the risk of long-term microvascular and macrovascular complications.

Disability from complications can often be prevented by early detection and active management of the disease (see Diabetic complications p. 757). [EvG] The target for glycaemic control should be individualised for each patient, considering factors such as daily activities, aspirations, likelihood of complications, adherence to treatment, comorbidities, occupation and history of hypoglycaemia.

Aim for a target HbA1c concentration of 48 mmol/mol (6.5%) or lower in patients with type 1 diabetes. Blood-glucose concentration should be monitored at least four times a day, including before each meal and before bed. A Patients should aim for:

- EvGr a fasting blood-glucose concentration of 5-7 mmol/litre on waking;
- a blood-glucose concentration of 4–7 mmol/litre before meals at other times of the day;
- a blood-glucose concentration of 5–9 mmol/litre at least 90 minutes after eating;
- a blood-glucose concentration above 5 mmol/litre when driving, as recommended by the Driver and Vehicle Licensing Agency (DVLA).

Overview

Evor Type 1 diabetes requires insulin replacement, supported by active management of other cardiovascular risk factors, such as hypertension and high circulating lipids (see Diabetic complications p. 757). Insulin replacement therapy aims to recreate normal fluctuations in circulating insulin concentrations while supporting a flexible lifestyle

with minimal restrictions. Flexible insulin therapy usually involves self-injecting multiple daily doses of insulin, with

involves self-injecting multiple daily doses of insulin, with doses adjusted according to planned exercise, intended food intake and other factors, including current blood-glucose, which the patient needs to test on a regular basis.

BNF 84

Evgr In patients who have a BMI of 25 kg/m² or above (23 kg/m² or above for patients of South Asian or related ethnicity) who wish to improve their blood-glucose control while minimising their effective insulin dose, consider metformin hydrochloride p. 761 [unlicensed indication] as an addition to insulin therapy.

Dietary control is important in both type 1 and type 2 diabetes and patients should receive advice from a dietitian. Dietary advice should include information on weight control, cardiovascular risk, hyperglycaemic effects of different foods and appropriate changes in insulin doses according to food intake. Healthy eating can reduce cardiovascular risk and dietary modifications may be recommended to account for various associated features of diabetes such as excess weight and obesity, low body-weight, disordered eating, hypertension and renal failure. Patients with type 1 diabetes should be offered carbohydrate-counting training as part of a structured education programme. (A)

Insulin therapy in type 1 diabetes

Ever All patients with type 1 diabetes require insulin therapy (see also Insulin p. 754). Treatment should be initiated and managed by clinicians with relevant expertise; there are several different types of regimens. (A)

Multiple daily injection basal-bolus insulin regimens

One or more separate daily injections of intermediate-acting insulin or long-acting insulin analogue as the basal insulin; alongside multiple bolus injections of short-acting insulin before meals. This regimen offers flexibility to tailor insulin therapy with the carbohydrate load of each meal.

Mixed (biphasic) regimen

One, two, or three insulin injections per day of short-acting insulin mixed with intermediate-acting insulin. The insulin preparations may be mixed by the patient at the time of injection, or a premixed product can be used.

Continuous subcutaneous insulin infusion (insulin pump) A regular or continuous amount of insulin (usually in the form of a rapid-acting insulin analogue or soluble insulin), delivered by a programmable pump and insulin storage reservoir via a subcutaneous needle or cannula.

Recommended insulin regimens

Ever Patients with type 1 diabetes should be offered multiple daily injection basal-bolus insulin regimens as the first line choice. Twice-daily insulin detemir p. 787 should be offered as the long-acting basal insulin therapy, unless the patient is already meeting their agreed treatment goals on another insulin regimen. Once-daily insulin glargine p. 787 (100 units/ml) may be prescribed if insulin detemir is not tolerated, or if a twice-daily regimen is not acceptable to the patient. Insulin degludee p. 786 may also be offered as an alternative once-daily regimen if there is particular concern about nocturnal hypoglycaemia. A once-daily ultra-long acting insulin (such as insulin degludec, or insulin glargine 300 units/ml) may be offered as an alternative for patients who need help with injection administration from a carer or healthcare professional.

Other basal insulin regimens should be considered only if the recommended regimens do not deliver agreed treatment goals. Non-basal-bolus insulin regimens (e.g. twice-daily mixed [biphasic], basal-only, or bolus-only regimens) are **not** recommended for adults with *newly diagnosed* type 1 diabetes.

A rapid-acting insulin analogue is recommended as the mealtime insulin replacement, rather than soluble human insulin or animal insulin (rarely used). The rapid-acting insulin analogue should be injected before meals—routine

use after meals should be discouraged. Patients who have a strong preference for an alternative mealtime insulin should be offered their preferred insulin.

Alternatively, if a multiple daily injection basal–bolus regimen is not possible, a twice-daily mixed insulin regimen should be considered if it is preferred.

In patients who are using a twice-daily human mixed insulin regimen and have hypoglycaemia that affects their quality of life, a trial of a twice-daily analogue mixed insulin regimen should be considered.

Continuous subcutaneous insulin infusion (insulin pump) therapy, should only be offered to patients who suffer disabling hypoglycaemia while attempting to achieve their target HbA1c concentration, or, who have high HbA1c concentrations (69 mmol/mol [8.5%] or above) with multiple daily injection therapy (including, if appropriate, the use of long-acting insulin analogues) despite a high level of care. Insulin pump therapy should be initiated by a specialist team.

Insulin requirements

Ever The dosage of insulin must be determined individually for each patient and should be adjusted as necessary according to the results of regular monitoring of blood-glucose concentrations.

Persistent poor glucose control, leading to erratic insulin requirements or episodes of hypoglycaemia, may be due to many factors, including adherence, injection technique, injection site problems, blood-glucose monitoring skills, lifestyle issues (including diet, exercise and alcohol intake), psychological issues, and organic causes such as renal disease, thyroid disorders, coeliac disease, Addison's disease or gastroparesis. These factors should be considered before changes are made to a previously optimised regimen.

Infection, stress, accidental or surgical trauma can all increase the required insulin dose. Insulin requirements may be decreased (and therefore susceptibility to hypoglycaemia increased) by physical activity, intercurrent illness, reduced food intake, impaired renal function, and in certain endocrine disorders.

Risks of hypoglycaemia with insulin

Ever Hypoglycaemia is an inevitable adverse effect of insulin treatment, and patients should be advised of the warning signs and actions to take (for guidance on management, see Hypoglycaemia p. 792).

Impaired awareness of hypoglycaemia can occur when the ability to recognise usual symptoms is lost, or when the symptoms are blunted or no longer present. Patients' awareness of hypoglycaemia should be assessed annually using the Gold score or the Clarke score.

An increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the patient. Impaired awareness of symptoms below 3 mmol/litre is associated with a significantly increased risk of severe hypoglycaemia. Beta-blockers can also blunt hypoglycaemic awareness, by reducing warning signs such as tremor.

Loss of warning of hypoglycaemia among insulin-treated patients can be a serious hazard, especially for drivers and those in dangerous occupations. Advice should be given in line with the Driver and Vehicle Licensing Agency (DVLA) guidance (see *Driving* under Diabetes p. 751).

Evgr To restore the warning signs, episodes of hypoglycaemia must be minimised. Insulin regimens, doses and blood-glucose targets should be reviewed and continuous subcutaneous insulin infusion therapy and real-time continuous blood-glucose monitoring should be considered. Patients should receive structured education to ensure they are following the principles of a flexible insulin regimen correctly, with additional education regarding avoiding and treating hypoglycaemia for those who continue to have impaired awareness. Relaxation of individualised blood-glucose targets should be avoided as a strategy to improve impaired hypoglycaemia awareness. If recurrent

severe episodes of hypoglycaemia continue despite appropriate interventions, the patient should be referred to a specialist centre.

There is conflicting evidence regarding reports that some patients may experience loss of awareness of hypoglycaemia after transfer from animal to human insulin; clinical studies do not confirm that human insulin decreases hypoglycaemia awareness.

Manufacturers advise any switch between brands or formulation of insulin (including switching from animal to human insulin) should be done under strict supervision; a change in dose may be required.

Hypodermic equipment

Evgr Patients should be advised on the safe disposal of lancets, single-use syringes, and needles, and should be provided with suitable disposal containers. Arrangements should be made for the suitable disposal of these containers.

Lancets, needles, syringes, and accessories are listed under Hypodermic Equipment in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 of the Scottish Drug Tariff). The Drug Tariffs can be access online at:

- National Health Service Drug Tariff for England and Wales: www.nhsbsa.nhs.uk/pharmacies-gp-practices-and-appliance-contractors/drug-tariff
- Health and Personal Social Services for Northern Ireland Drug Tariff:

www.hscbusiness.hscni.net/services/2034.htm

Type 1 diabetes in adults: diagnosis and management. National Institute for Health and Care Excellence. Clinical guideline NG17. August 2015, updated July 2021. www.nice.org.uk/guidance/ng17

Insulin

16-Sep-2021

Overview

For recommended insulin regimens see Type 1 diabetes p. 752 and Type 2 diabetes p. 755.

Insulin is a polypeptide hormone secreted by pancreatic beta-cells. Insulin increases glucose uptake by adipose tissue and muscles, and suppresses hepatic glucose release. The role of insulin is to lower blood-glucose concentrations in order to prevent hyperglycaemia and its associated microvascular, macrovascular and metabolic complications.

The natural profile of insulin secretion in the body consists of basal insulin (a low and steady secretion of background insulin that controls the glucose continuously released from the liver) and meal-time bolus insulin (secreted in response to glucose absorbed from food and drink).

Sources of insulin

Three types of insulin are available in the UK: human insulin, human insulin analogues, and animal insulin. Animal insulins are extracted and purified from animal sources (bovine or porcine insulin). Although widely used in the past, animal insulins are no longer initiated in people with diabetes but may still be used by some adult patients who cannot, or do not wish to, change to human insulins.

Human insulins are produced by recombinant DNA technology and have the same amino acid sequence as endogenous human insulin. Human insulin analogues are produced in the same way as human insulins, but the insulin is modified to produce a desired kinetic characteristic, such

as an extended duration of action or faster absorption and onset of action.

Immunological resistance to insulin is uncommon and true insulin allergy is rare. Human insulin and insulin analogues are less immunogenic than animal insulins.

Administration of insulin

Insulin is inactivated by gastro-intestinal enzymes and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin should be injected into a body area with plenty of subcutaneous fat—usually the abdomen (fastest absorption rate) or outer thighs/buttocks (slower absorption compared with the abdomen or inner thighs).

Absorption from a limb site can vary considerably (by as much as 20–40%) day-to-day, particularly in children. Local tissue reactions, changes in insulin sensitivity, injection site, blood flow, depth of injection, and the amount of insulin injected can all affect the rate of absorption. Increased blood flow around the injection site due to exercise can also increase insulin absorption.

Evgr Lipohypertrophy can occur due to repeatedly injecting into the same small area, and can cause erratic absorption of insulin, and contribute to poor glycaemic control. Patients should be advised not to use affected areas for further injection until the skin has recovered. Lipohypertrophy can be minimised by using different injection sites in rotation. Injection sites should be checked for signs of infection, swelling, bruising, and lipohypertrophy before administration.

Insulin preparations

Insulin preparations can be broadly categorised into three groups based on their time-action profiles: short-acting insulins (including soluble insulin and rapid-acting insulins), intermediate-acting insulins and long-acting insulins. The duration of action of each particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

Short-acting insulins

Short-acting insulins have a short duration and a relatively rapid onset of action, to replicate the insulin normally produced by the body in response to glucose absorbed from a meal. These are available as soluble Insulin above (human and, bovine or porcine—both rarely used), and the rapidacting insulin analogues (insulin aspart p. 783, insulin glulisine p. 784 and insulin lispro p. 784).

Soluble insulin

Soluble insulin is usually given subcutaneously but some preparations can be given intravenously and intramuscularly. For maintenance regimens, it is usual to inject the insulin 15 to 30 minutes before meals, depending on the insulin preparation used.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 1 and 4 hours, and a duration of action of up to 9 hours.

When injected intravenously, soluble insulin has a short half-life of only a few minutes and its onset of action is instantaneous.

Soluble insulin administered intravenously is the most appropriate form of insulin for use in diabetic emergencies e.g. diabetic ketoacidosis and peri-operatively.

Rapid-actina insulin

Insulin aspart, insulin glulisine, and insulin lispro have a faster onset of action (within 15 minutes) and shorter duration of action (approximately 2–5 hours) than soluble insulin, and are usually given by subcutaneous injection.

Evgr For maintenance regimens, these insulins should ideally be injected immediately before meals. Rapid-acting insulin, administered before meals, has an advantage over short-acting soluble insulin in terms of improved glucose control, reduction of HbA1c, and reduction in the incidence

of severe hypoglycaemia, including nocturnal hypoglycaemia.

The routine use of *post-meal* injections of rapid-acting insulin should be avoided—when given during or after meals, they are associated with poorer glucose control, an increased risk of high postprandial-glucose concentration, and subsequent hypoglycaemia. (A)

Intermediate-acting insulin

Intermediate-acting insulins (isophane insulin p. 785) have an intermediate duration of action, designed to mimic the effect of endogenous basal insulin. When given by subcutaneous injection, they have an onset of action of approximately 1–2 hours, a maximal effect at 3–12 hours, and a duration of action of 11–24 hours.

Isophane insulin is a suspension of insulin with protamine; it may be given as one or more daily injections alongside separate meal-time short-acting insulin injections, or mixed with a short-acting (soluble or rapidacting) insulin in the same syringe—for recommended insulin regimens see Type 1 diabetes p. 752 and Type 2 diabetes below. Isophane insulin may be mixed with a short-acting insulin by the patient, or a pre-mixed biphasic insulin can be supplied (biphasic isophane insulin p. 785, biphasic insulin aspart p. 786 and biphasic insulin lispro p. 786).

Biphasic insulins (biphasic isophane insulin, biphasic insulin aspart, biphasic insulin lispro) are pre-mixed insulin preparations containing various combinations of short-acting insulin (soluble insulin or rapid-acting analogue insulin) and an intermediate-acting insulin.

The percentage of short-acting insulin varies from 15% to 50%. These preparations should be administered by subcutaneous injection immediately before a meal.

Long-acting insulin

Like intermediate-acting insulins, the long-acting insulins (protamine zinc insulin, insulin zinc suspension, insulin detemir p. 787, insulin glargine p. 787, insulin degludec p. 786) mimic endogenous basal insulin secretion, but their duration of action may last up to 36 hours. They achieve a steady-state level after 2–4 days to produce a constant level of insulin.

Insulin glargine and insulin degludec are given once daily and insulin detemir is given once or twice daily according to individual requirements. The older long-acting insulins, (insulin zinc suspension and protamine zinc insulin) are now rarely prescribed.

Type 2 diabetes

05-Feb-2021

Description of condition

Type 2 diabetes is a chronic metabolic condition characterised by insulin resistance. Insufficient pancreatic insulin production also occurs progressively over time, resulting in hyperglycaemia.

It is commonly associated with obesity, physical inactivity, raised blood pressure, dyslipidaemia and a tendency to develop thrombosis; therefore it increases cardiovascular risk. It is associated with long-term microvascular and macrovascular complications, together with reduced quality of life and life expectancy.

Type 2 diabetes typically develops later in life but is increasingly diagnosed in children, despite previously being considered a disease of adulthood.

Aims of treatment

Treatment is aimed at minimising the risk of long-term microvascular and macrovascular complications by effective blood-glucose control and maintenance of HbAlc at or below the target value set for each individual patient.

Overview

EvGr Weight loss, smoking cessation and regular exercise can help to reduce hyperglycaemia and reduce cardiovascular risk, and should be encouraged (with input from a dietitian where appropriate). For guidance on reducing cardiovascular risk, see Cardiovascular disease risk assessment and prevention p. 206. Antidiabetic drugs should be prescribed to augment lifestyle interventions, when these changes are not adequate to control blood-glucose alone.

Antidiabetic drugs

There are several classes of non-insulin antidiabetic drugs available for the treatment of type 2 diabetes. [Ever] The choice of drug should be based on effectiveness, safety, tolerability and should also take into consideration the patient's comorbidities and concomitant medication. For recommended treatment regimens and the place in therapy of each drug, see *Drug treatment, antidiabetic drugs* (below).

Metformin hydrochloride p. 761 has an anti-hyperglycaemic effect, lowering both basal and postprandial blood-glucose concentrations. It does not stimulate insulin secretion and therefore, when given alone, does not cause hypoglycaemia. Ever The dose of standard-release metformin hydrochloride should be increased gradually to minimise the risk of gastro-intestinal side effects. Modified-release metformin hydrochloride should be offered if standard treatment is not tolerated. (A)

The **sulfonylureas** (glibenclamide, gliclazide p. 779, glimepiride p. 779, glipizide p. 780, tolbutamide p. 780) may cause hypoglycaemia; it is more likely with long-acting sulfonylureas such as glibenclamide, which have been associated with severe, prolonged and sometimes fatal cases of hypoglycaemia. Sulfonylureas are also associated with modest weight gain, probably due to increased plasmainsulin concentrations.

Acarbose p. 761 has a poorer anti-hyperglycaemic effect than many other antidiabetic drugs, including the sulfonylureas, metformin hydrochloride, and pioglitazone p. 780.

The meglitinides, nateglinide and repaglinide p. 772, have a rapid onset of action and short duration of activity. These drugs can be used flexibly around mealtimes and adjusted to fit around individual eating habits which may be beneficial for some patients, but generally are a less preferred option than the sulfonvlureas.

The thiazolidinedione, pioglitazone, is associated with several long-term risks and its ongoing benefit to the patient should be reviewed regularly and treatment stopped if response is insufficient (see *Important safety information* under pioglitazone).

The dipeptidylpeptidase-4 inhibitors (gliptins), alogliptin p. 763, linagliptin p. 764, sitagliptin p. 765, saxagliptin p. 764, and vildagliptin p. 766, do not appear to be associated with weight gain and have less incidence of hypoglycaemia than the sulfonylureas.

The sodium glucose co-transporter 2 inhibitors, canagliflozin p. 772, dapagliflozin p. 774, and empagliflozin p. 775, may be suitable for some patients when first-line options are not appropriate. Ever Canagliflozin and empagliflozin can be beneficial in patients with type 2 diabetes and established cardiovascular disease. Sodium glucose co-transporter 2 inhibitors are associated with a risk of diabetic ketoacidosis.

The glucagon-like peptide-1 receptor agonists, dulaglutide p. 767, exenatide p. 768, liraglutide p. 769 and lixisenatide p. 770, should be reserved for combination therapy when other treatment options have failed. [EVGT] Liraglutide has proven cardiovascular benefit and should be considered in patients with type 2 diabetes and established cardiovascular disease.

Drug treatment, antidiabetic drugs

EvGr Type 2 diabetes should initially be treated with a single oral antidiabetic drug. A target HbA1c concentration of 48 mmol/mol (6.5%) is generally recommended when type 2 diabetes is managed by diet and lifestyle alone or when combined with a single antidiabetic drug not associated with hypoglycaemia (such as metformin hydrochloride). Adults prescribed a single drug associated with hypoglycaemia (such as a sulphonylurea), or two or more antidiabetic drugs in combination, should usually aim for an HbA1c concentration of 53 mmol/mol (7.0%). Targets may differ and should be individualised and agreed with each patient.

Note: EvG: Consider relaxing the target HbAlc level on a case-by-case basis, with particular consideration for people who are older, frail, or where tight blood-glucose control is not appropriate or poses a high risk of the consequences of hypoglycaemia.

If HbA1c concentrations are poorly controlled despite treatment with a single drug (usually considered to be a rise of HbA1c to 58 mmol/mol (7.5%) or higher), the drug treatment should be intensified, alongside reinforcement of advice regarding diet, lifestyle, and adherence to drug treatment.

When two or more antidiabetic drugs are prescribed, an HbAlc concentration target of 53 mmol/mol (7.0%) is recommended for patients in which it is appropriate, but a relaxation of the target may be more appropriate in some individual cases (for example, those at high risk of the consequences of hypoglycaemia, poor life expectancy, or significant comorbidities).

Initial treatment

EvGr Metformin hydrochloride is recommended as the first choice for initial treatment for all patients, due to its positive effect on weight loss, reduced risk of hypoglycaemic events and the additional long-term cardiovascular benefits associated with its use.

If metformin is contra-indicated or not tolerated, see Alternative non-metformin regimens below.

First intensification of treatment

Ever If metformin hydrochloride (alongside modification to diet) does not control HbA1c to below the agreed threshold, treatment should be intensified, and metformin hydrochloride combined with one of the following:

- a sulfonylurea (glibenclamide, gliclazide, glimepiride, glipizide, tolbutamide);
- · Pioglitazone;
- a dipeptidylpeptidase-4 inhibitor (linagliptin, saxagliptin, sitagliptin, or vildagliptin);
- a sodium glucose co-transporter 2 inhibitor (canagliflozin, dapagliflozin or empagliflozin) only when sulfonylureas are contra-indicated or not tolerated, or if the patient is at significant risk of hypoglycaemia or its consequences.

Ever Elderly patients or those with renal impairment are at particular risk of hypoglycaemia; if a sulfonylurea is indicated, a shorter-acting sulfonylurea, such as gliclazide or tolbutamide should be prescribed. (£)

The place in therapy of alogliptin (a dipeptidylpeptidase-4 inhibitor) is not yet known.

Second intensification of treatment

Ever If dual therapy is unsuccessful, treatment should be intensified again, and one of the following triple therapy regimens prescribed:

- Metformin hydrochloride and a dipeptidylpeptidase-4 inhibitor and a sulfonylurea;
- Metformin hydrochloride and pioglitazone and a sulfonylurea;
- Metformin hydrochloride and a sulfonylurea and one of the sodium glucose co-transporter 2 inhibitors;
- Metformin hydrochloride and pioglitazone and a sodium glucose co-transporter 2 inhibitor (canagliflozin p. 772 or

empagliflozin p. 775; note that dapagliflozin is not recommended in a triple therapy regimen with pioglitazone).

Alternatively, it may be appropriate to start **insulin**-based treatment at this stage—see *Drug treatment*, *insulin*.

Glucagon-like peptide-1 receptor agonists

Ever If triple therapy with metformin hydrochloride p. 761 and two other oral drugs is tried and is not effective, not tolerated or contra-indicated, a **glucagon-like peptide-1 receptor agonist** may be prescribed as part of a triple combination regimen with metformin hydrochloride and a sulfonylurea.

These should only be prescribed for patients who have a BMI of 35 kg/m²or above (adjusted for ethnicity) and who also have specific psychological or medical problems associated with obesity; or for those who have a BMI lower than 35 kg/m² but for whom insulin therapy would have significant occupational implications or if the weight loss associated with glucagon-like peptide-1 receptor agonists would benefit other significant obesity-related

After 6 months, the drug should be reviewed and only continued if there has been a beneficial metabolic response (a reduction of at least 11 mmol/mol [1.0%] in HbA1c and a weight loss of at least 3% of initial body-weight).

Insulin should only be prescribed in combination with a glucagon-like peptide-1 receptor agonist under specialist care advice and with ongoing support from a consultant-led multidisciplinary team.

Alternative non-metformin regimens

EvGr If metformin is contra-indicated or not tolerated, initial treatment should be single therapy with:

- a sulfonylurea (glibenclamide, gliclazide p. 779, glimepiride p. 779, glipizide p. 780, or tolbutamide p. 780) (first choice), or
- a dipeptidyl peptidase-4 inhibitor (linagliptin p. 764, saxagliptin p. 764, sitagliptin p. 765, or vildagliptin p. 766), or
- Pioglitazone p. 780. (A)

The sodium glucose co-transporter 2 inhibitors canagliflozin, dapagliflozin p. 774, or empagliflozin are also options for monotherapy when metformin is contraindicated or not tolerated, only if a dipeptidylpeptidase-4 inhibitor would otherwise be prescribed and neither a sulfonylurea nor pioglitazone is appropriate.

EVGr Repaglinide p. 772 is also an effective alternative option for single therapy, but it has a limited role in treatment because, should an intensification of treatment be required, it is not licensed to be used in any combination other than with metformin hydrochloride; it would therefore require a complete change of treatment in those patients who have started it due to intolerance or contra-indication to metformin. (A)

Intensification

EvGr If the initial single drug does not control HbA1c to below the agreed threshold, treatment should be intensified and one of the following dual combinations prescribed:

- a dipeptidylpeptidase-4 inhibitor and pioglitazone;
- a dipeptidylpeptidase-4 inhibitor and a sulfonylurea; or
- Pioglitazone and a sulfonylurea.

If dual therapy does not provide adequate glucose control, insulin-based treatment should be considered—see *Drug treatment*, *insulin*.

Drug treatment, insulin

Ever When indicated for intensification, insulin (see also, Insulin p. 754) should be started with a structured support programme covering insulin dose titration, injection technique, self-monitoring, and knowledge of dietary effects and glucose control. Metformin hydrochloride should be continued unless it is contra-indicated or not tolerated.

Other antidiabetic drugs should be reviewed and stopped if necessary.

Recommended insulin regimens include:

- human isophane insulin p. 785 injected once or twice daily, according to requirements:
- a human isophane insulin in combination with a shortacting insulin, administered either separately or as a premixed (biphasic) human insulin preparation (this may be particularly appropriate if HbA1c is 75 mmol/mol (9.0%) or higher);
- Insulin detemir p. 787 or insulin glargine p. 787 as an alternative to human isophane insulin. This can be preferable if a once daily injection would be beneficial (for example if assistance is required to inject insulin), or if recurrent symptomatic hypoglycaemic episodes are problematic, or if the patient would otherwise need twice-daily human isophane insulin injections in combination with oral glucose-lowering drugs. Also consider switching to insulin detemir or insulin glargine from human isophane insulin if significant hypoglycaemia is problematic, or in patients who cannot use the device needed to inject human isophane insulin;
- biphasic preparations (pre-mixed) that include a shortacting human analogue insulin (rather than short-acting human soluble insulin) can be preferable for patients who prefer injecting insulin immediately before a meal, or if hypoglycaemia is a problem, or if blood-glucose concentrations rise markedly after meals.

When starting insulin therapy, bedtime basal insulin should be initiated and the dose titrated against morning (fasting) glucose. Patients who are prescribed a basal insulin regimen (human isophane insulin, insulin detemir or insulin glargine) should be monitored for the need for short-acting insulin before meals (or a biphasic insulin preparation).

Patients who are prescribed a biphasic insulin should be monitored for the need for a further injection of short-acting insulin before meals or for a change to a basal-bolus regimen with human isophane insulin or insulin detemir or insulin glargine if blood-glucose control remains inadequate.

Advanced Pharmacy Services

Patients with type 2 diabetes may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Medicines optimisation p. 16.

Diabetic complications

15-Dec-2021

See also

Diabetes p. 751 Type 1 diabetes p. 752 Type 2 diabetes p. 755 Diabetic foot infections, antibacterial therapy p. 546. For guidance on other diabetic foot problems, see NICE guideline **Diabetic foot problems** (available at: www.nice.org.uk/guidance/ng19).

Diabetes and cardiovascular disease

Diabetes is a strong risk factor for cardiovascular disease.

For Other risk factors for cardiovascular disease that should also be addressed are: smoking, hypertension, obesity, and dyslipidaemia. Cardiovascular risk in patients with diabetes can be further reduced by the use of an ACE inhibitor (or an angiotensin-II receptor antagonist) and lipid-regulating drugs. For full guidance on the assessment and prevention of cardiovascular disease, see Cardiovascular disease risk assessment and prevention p. 206.

Diabetic nephropathy

[EvGr] In diabetic patients with nephropathy, blood pressure should be reduced to the lowest achievable level to slow the rate of decline of glomerular filtration rate and reduce proteinuria. Provided there are no contra-indications, all diabetic patients who have confirmed nephropathy with an albumin:creatinine ratio (ACR) of 3 mg/mmol or more should be treated with an ACE inhibitor or an angiotensin-II receptor antagonist, even if the blood pressure is normal. In patients with chronic kidney disease (CKD) and proteinuria, ACE inhibitors or angiotensin-II receptor antagonists should be given as monotherapy to reduce the rate of progression of CKD. For patients with type 2 diabetes and CKD who are already on an ACE inhibitor or angiotensin-II receptor antagonist, add on therapy with a sodium glucose cotransporter 2 inhibitor should be offered if the ACR is over 30mg/mmol; for patients with an ACR of 3-30mg/mmol, add on therapy should be considered. (A)

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in patients with renal impairment.

See also treatment of hypertension in diabetes in Hypertension p. 155.

Diabetic neuropathy

Optimal diabetic control is beneficial for the management of painful neuropathy. [Evg.] However, acute painful diabetic neuropathy can occur in patients with type 1 diabetes who have a rapid improvement in blood glucose control. This is usually self-limiting and simple analgesics (such as paracetamol p. 477) along with other measures (such as bed cradles) are recommended as first line treatments. If the response is inadequate, other treatment options for painful diabetic neuropathy should be considered. Simple analgesia may be continued until the effects of additional treatments have been established.

Monotherapy with antidepressant drugs, including tricyclics (such as amitriptyline hydrochloride p. 404 and imipramine hydrochloride p. 408 [unlicensed use]), duloxetine p. 399, and venlafaxine p. 400 [unlicensed use] should be considered in patients for the treatment of painful diabetic peripheral neuropathy. Antiepileptic drugs, such as pregabalin p. 353 and gabapentin p. 343, can also be considered. Opioid analgesics in combination with gabapentin can be considered if pain is not controlled with monotherapy.

In autonomic neuropathy, diabetic diarrhoea can often be managed by tetracycline p. 619 [unlicensed use], or codeine phosphate p. 487 as the best alternative; other antidiarrhoeal preparations can also be tried. Erythromycin p. 587 (especially when given intravenously) may be beneficial for gastroparesis [unlicensed use].

In *neuropathic postural hypotension*, increased salt intake and the use of the mineralcorticoid fludrocortisone acetate p. 744 [unlicensed use] may help by increasing plasma volume, but uncomfortable oedema is a common side-effect. Fludrocortisone can also be combined with flurbiprofen p. 1231 and ephedrine hydrochloride p. 294 [both unlicensed]. Midodrine [unlicensed], an alpha agonist, may also be useful in postural hypotension.

Gustatory sweating can be treated with an antimuscarinic such as propantheline bromide p. 92; side-effects are common. See also, the management of hyperhidrosis (Hyperhidrosis p. 1358).

In some patients with *neuropathic oedema*, ephedrine hydrochloride [unlicensed use] offers effective relief. See also the management of Erectile dysfunction p. 878.

Visual impairment

Ever Optimal diabetic and blood pressure control should be maintained to prevent onset and progression of diabetic eye disease, & see Hypertension p. 155, Type 1 diabetes p. 752, and Type 2 diabetes p. 755 for target thresholds.

Diabetic hyperglycaemic emergencies

26-Aug-2021

Description of condition

Diabetic ketoacidosis (DKA) and the hyperosmolar hyperglycamic state ((HHS), previously referred to as hyperosmolar non-ketotic (HONK) coma) are medical emergencies with significant morbidity and mortality. HHS has a higher mortality than DKA.

The major precipitating factor for both DKA and HHS is infection. Other precipitating factors for DKA include discontinuation of or inadequate insulin therapy, acute illness such as myocardial infarction and pancreatitis, new onset of diabetes, or stress (e.g. trauma, surgery); and for HHS, these include inadequate insulin or oral antidiabetic therapy, acute illness in a patient with known diabetes, or

DKA develops rapidly (within hours), and mainly occurs in individuals with type 1 diabetes, with around a third of cases occurring in those with type 2 diabetes. Unlike DKA, HHS can take days to develop and consequently the dehydration and metabolic disturbances are more severe at presentation. HHS typically occurs in the elderly, but can also occur in younger adults and adolescents, often as the initial presentation of type 2 diabetes.

DKA is characterised by **hyperglycaemia** (blood glucose above 11 mmol/L or known diabetes mellitus), **ketonaemia** (capillary or blood ketone above 3 mmol/L or significant ketonuria of 2+ or more), and **acidosis** (bicarbonate less than 15 mmol/L and/or venous pH less than 7.3). Common signs and symptoms of DKA include dehydration due to polydipsia and polyuria, weight loss, excessive tiredness, nausea, vomiting, abdominal pain, Kussmaul respiration (rapid and deep respiration) with acetone breath, and reduced consciousness.

Characteristic features of HHS are hypovolaemia, marked hyperglycaemia (blood glucose above 30 mmol/L without significant hyperketonaemia or acidosis), and hyperosmolality (osmolality above 320 mosmol/kg); however, a mixed picture of DKA and HHS may occur. Common signs and symptoms of HHS include dehydration due to polyuria and polydipsia, weakness, weight loss, tachycardia, dry mucous membranes, poor skin turgor, hypotension, acute cognitive impairment, and in severe cases, shock.

Aims of treatment

The treatment of DKA aims to restore circulatory volume, correct electrolyte imbalance and hyperglycaemia, clear ketones and suppress ketogenesis, identify and treat any precipitating causes, and prevent complications.

The treatment of HHS aims to correct fluid and electrolyte losses, hyperosmolality and hyperglycaemia, identify and treat any underlying or precipitating causes, and prevent complications.

Diabetic ketoacidosis

Individuals with suspected DKA should be diagnosed promptly and managed intensively—the diabetes specialist team should be involved as soon as possible after admission to hospital (ideally within 24 hours). Those who are elderly, pregnant, aged 18–25 years, have heart or renal failure, or other serious comorbidities, require specialist input.

The initial drug management of DKA involves intravenous fluid replacement, followed by intravenous insulin; patients who normally take long-acting insulin should continue their usual dose(s) throughout treatment. Potassium replacement and glucose administration may also be required to prevent subsequent hypokalaemia and hypoglycaemia, depending on potassium levels and blood glucose concentrations, respectively.

For further information on the management of DKA, see JBDS guideline: **The management of diabetic ketoacidosis** in adults (see *Useful resources*).

Hyperosmolar hyperglycaemic state

Individuals with suspected HHS should be diagnosed promptly and managed intensively—the diabetes specialist team should be involved as soon as possible after admission to hospital. All patients should be reviewed promptly by a senior clinician familiar with the treatment of HHS.

The initial drug management of HHS involves intravenous fluid replacement, followed by intravenous insulin. For patients with significant ketonaemia or ketonuria, insulin can be started earlier. Potassium should be replaced or omitted as required.

For further information on the management of HHS, see JBDS guideline: The management of the hyperosmolar hyperglycaemic state (HHS) in adults with diabetes (see Useful resources).

Diabetes, surgery and medical illness

16-Sep-2021

Management of diabetes during surgery

Peri-operative management of blood-glucose concentrations depends on factors including the required duration of fasting, timing of surgery (morning or afternoon), usual treatment regimen (insulin, antidiabetic drugs or diet), prior glycaemic control, other co-morbidities, and the likelihood that the patient will be capable of self-managing their diabetes in the immediate post-operative period. [EVG] All patients should have emergency treatment for hypoglycaemia written on their drug chart on admission.

Note: The following recommendations provide general guidance for the management of diabetes during surgery. Local protocols and guidelines should be followed where they exist.

Use of insulin during surgery Elective surgery—minor procedures in patients with good glycaemic control

EvGr Patients usually treated with insulin who have good glycaemic control (HbA1c less than 69 mmol/mol or 8.5 %) and are undergoing minor procedures, can be managed during the operative period by adjustment of their usual insulin regimen, which should be adjusted depending on the type of insulin usually prescribed, following detailed local protocols (which should also include intravenous fluid management. monitoring and control of electrolytes and avoidance of hyperchloraemic metabolic acidosis). On the day before the surgery, the patient's usual insulin should be given as normal, other than once daily long-acting insulin analogues, which should be given at a dose reduced by 20 %.

Elective surgery—major procedures or poor glycaemic control [EvGr] Patients usually treated with insulin, who are either undergoing major procedures (surgery requiring a long fasting period of more than one missed meal) or whose diabetes is poorly controlled, will usually require a variable rate intravenous insulin infusion (continued until the patient is eating/drinking and stabilised on their previous glucose-lowering medication).

The aim is to achieve and maintain glucose concentration within the usual target range (6-10 mmol/litre; but up to 12 mmol/litre is acceptable) by infusing a constant rate of glucose-containing fluid as a substrate, while also infusing insulin at a variable rate. Detailed local protocols should be consulted. In general, the following steps should be

- on the day before surgery, once daily long-acting insulin analogues should be given at 80 % of the usual dose; otherwise the patient's usual insulin should be given as
- on the day of surgery and throughout the intra-operative period, once daily long-acting insulin analogues should be continued at 80 % of the usual dose; all other insulin should be stopped until the patient is eating and drinking again after surgery;
- on the day of surgery, start an intravenous substrate infusion of potassium chloride with glucose and sodium chloride p. 1130 (based on serum electrolytes which must be measured frequently), and infuse at a rate appropriate to the patient's fluid requirements. To prevent hypoglycaemia, this infusion must **not** be stopped while the insulin infusion is running;
- a variable rate intravenous insulin infusion of soluble human insulin p. 782 in sodium chloride 0.9 % p. 1131 (made either according to locally agreed protocols or using prefilled syringes) should be given via a syringe pump at an initial infusion rate determined by bedside capillary bloodglucose measurement. Hourly blood-glucose measurement should be taken to ensure that the intravenous insulin infusion rate is correct for at least the first 12 hours; the insulin infusion rate should be adjusted according to local protocol to maintain blood-glucose concentrations within the usual target range (6-10 mmol/litre; up to 12 mmol/litre is acceptable);
- intravenous glucose 20 % p. 1132 should be given if bloodglucose drops below 6 mmol/litre, and blood-glucose checked every hour, to prevent a drop below 4 mmol/litre. If blood-glucose drops below 4 mmol/litre, intravenous glucose 20 % should be adjusted and blood-glucose checked every 15 minutes, until blood-glucose is above 6 mmol/litre (testing can then revert to hourly). If bloodglucose rises above 12 mmol/litre, check ketones and consider other signs of diabetic ketoacidosis.

Conversion back to a subcutaneous insulin should not begin until the patient can eat and drink without nausea or vomiting. Once the patient's previous insulin regimen is restarted, the usual insulin dose may require adjustment, as

insulin requirements can change due to post-operative stress, infection or altered food intake.

Previous subcutaneous basal-bolus regimens, should be restarted when the first postoperative meal-time insulin dose is due (e.g. with breakfast or lunch); doses may need adjustment due to postoperative stress, infection or altered food intake. The variable rate intravenous insulin infusion and intravenous fluids should be continued until 30-60 minutes after the first meal-time short-acting insulin dose. If the patient was previously on a long-acting insulin analogue, this should have been continued throughout the operative period at 80 % of the normal dose, and should now just continue at that same dose until the patient leaves hospital; only the short-acting insulin needs to be restarted

Previous subcutaneous twice-daily mixed insulin regimens, should be restarted before breakfast or an evening meal (not at any other time). The variable rate intravenous insulin infusion should be maintained for 30-60 minutes after the first subcutaneous insulin dose has been given.

Patients who were previously managed with a continuous subcutaneous insulin infusion should be referred to a specialist team. The subcutaneous infusion should be restarted at the normal basal rate, not at bedtime, and the insulin infusion continued until the next meal bolus has been given.

Patients not previously prescribed insulin, who are to start a subcutaneous insulin regimen post-surgery, should have an insulin dose calculated with advice from a specialist diabetes team, considering the patient's sensitivity to insulin, degree of glycaemic control, weight, age, and the average hourly insulin dose used in the peri-operative period. (E)

Emergency surgery

FyGr Patients with diabetes (type 1 and 2) requiring emergency surgery, should always have their blood-glucose. blood or urinary ketone concentration, serum electrolytes and serum bicarbonate checked before surgery. If ketones are high or bicarbonate is low, blood gases should also be checked. If ketoacidosis is present, recommendations for diabetes ketoacidosis should be followed immediately, and surgery delayed if possible. If there is no acidosis, intravenous fluids and an insulin infusion should be started and managed as for *major elective surgery* (above).

Use of antidiabetic drugs during surgery

[EvGr] Manipulation of antidiabetic drug may not be appropriate for all surgery or for all patients; particularly when fasting time is more than one missed meal, in patients with poor glycaemic control, and when there is risk of renal injury. In these cases, a variable rate intravenous insulin infusion p. 782 should be used as for major elective surgery (above), and usual antidiabetic medication adjusted in the peri-operative period. Insulin is almost always required in medical and surgical emergencies.

When insulin is required and given during surgery, acarbose p. 761, meglitinides, sulfonylureas, pioglitazone p. 780, dipeptidyl peptidase-4 inhibitors (gliptins) and sodium glucose co-transporter 2 inhibitors should be stopped once the insulin infusion is commenced and not restarted until the patient is eating and drinking normally. Glucagon-like peptide-1 receptor agonists can be continued as normal during the insulin infusion.

If elective minor surgical procedures only require a shortfasting period (just one missed meal), it may be possible to adjust antidiabetic drugs to avoid a switch to a variable rate intravenous insulin infusion; normal drug treatment can continue

In suitable cases, acarbose, nateglinide and repaglinide p. 772 can be continued with just the dose omitted on the morning of surgery if fasting (the morning dose may be given if the patient is not fasting and surgery is in the afternoon).

Pioglitazone, **dipeptidylpeptidase-4 inhibitors (gliptins)** and **glucagon-like peptide-1 receptor agonists** can be taken as normal during the whole peri-operative period.

Sodium glucose co-transporter 2 inhibitors should be omitted on the day of surgery and not restarted until the patient is stable; their use during periods of dehydration and acute illness is associated with an increased risk of developing diabetic ketoacidosis.

Sulfonylureas are associated with hypoglycaemia in the fasted state and therefore should always be omitted on the day of surgery until the patient is eating and drinking again. Capillary blood-glucose should be checked hourly. If hyperglycaemia occurs, an appropriate dose of subcutaneous rapid-acting insulin may be given. A second dose may be given 2 hours later, and a variable rate intravenous insulin infusion considered if hyperglycaemia persists.

Metformin hydrochloride p. 761 is renally excreted; renal impairment may lead to accumulation and lactic acidosis during surgery. If only one meal will be missed during surgery, and the patient has an eGFR greater than 60 mL/minute/1.73m² and a low risk of acute kidney injury (and the procedure does not involve administration of contrast media), it may be possible to continue metformin hydrochloride throughout the peri-operative period—just the lunchtime dose should be omitted if the usual dose is prescribed three times a day.

If the patient will miss more than one meal or there is significant risk of the patient developing acute kidney injury, metformin hydrochloride should be stopped when the prepartive fast begins. A variable rate intravenous insulin infusion should be started if the metformin hydrochloride dose is more than once daily. Otherwise insulin should only be started if blood-glucose concentration is greater than 12 mmol/litre on two consecutive occasions. Metformin should not be recommenced until the patient is eating and drinking again, and normal renal function has been assured.

There is no need to stop metformin hydrochloride after contrast medium in patients missing only one meal or who have an eGFR greater than 60 mL/minute/1.73m². If contrast medium is to be used, and eGFR is less than 60 mL/minute/1.73m², metformin should be omitted on the day of the procedure and for the following 48 hours. **(£)**

Use of antidiabetic drugs during medical illness

Manufacturers of some antidiabetic drugs recommend that they may need to be replaced temporarily with insulin during intercurrent illness when the drug is unlikely to control hyperglycaemia (such as myocardial infarction, coma, severe infection, trauma and other medical emergencies). Consult individual product literature.

Sodium glucose co-transporter 2 inhibitors are associated with increased risk of developing diabetic ketoacidosis during periods of dehydration, stress, surgery, trauma, acute medical illness or any other catabolic state, and should be used with caution during these times. The MHRA has advised (2016) that these drugs should be temporarily stopped in patients who are hospitalised for acute serious illness until the patient is medically stable.

Diabetes, pregnancy and breast-feeding

Description of condition

Diabetes in pregnancy is associated with increased risks to the woman (such as pre-eclampsia and rapidly worsening retinopathy), and to the developing fetus, compared with pregnancy in non-diabetic women. Effective blood-glucose control before conception and throughout pregnancy reduces (but does not eliminate) the risk of adverse outcomes such as miscarriage, congenital malformation, stillbirth, and neonatal death.

Management of pre-existing diabetes

EvGr Women with pre-existing diabetes who are planning on becoming pregnant should aim to keep their HbA1c concentration below 48 mmol/mol (6.5%) if possible without causing problematic hypoglycaemia. Any reduction towards this target is likely to reduce the risk of congenital malformations in the newborn.

Women with pre-existing diabetes who are planning to become pregnant should be advised to take folic acid at the dose for women who are at high-risk of conceiving a child with a neural tube defect, see folic acid p. 1112. (A)

Overview

Oral antidiabetic drugs

Ever All oral antidiabetic drugs, except metformin hydrochloride p. 761, should be discontinued before pregnancy (or as soon as an unplanned pregnancy is identified) and substituted with insulin therapy. Women with diabetes may be treated with metformin hydrochloride p. 761 as an adjunct or alternative to insulin in the preconception period and during pregnancy when the likely benefits from improved blood-glucose control outweigh the potential for harm. Metformin hydrochloride p. 761 can be continued immediately after birth and during breast-feeding for those with pre-existing Type 2 diabetes p. 755. All other antidiabetic drugs should be avoided while breast-feeding.

Insulin

Limited evidence suggests that the rapid-acting insulin analogues (insulin aspart p. 783 and insulin lispro p. 784) can be associated with fewer episodes of hypoglycaemia, a reduction in postprandial glucose excursions and an improvement in overall glycaemic control compared with regular human insulin.

Ever Isophane insulin p. 785 is the first-choice for longacting insulin during pregnancy, however in women who have good blood-glucose control before pregnancy with the long-acting insulin analogues (insulin detemir p. 787 or insulin glargine p. 787), it may be appropriate to continue using them throughout pregnancy.

Continuous subcutaneous insulin infusion p. 782 (insulin pump therapy) may be appropriate for pregnant women who have difficulty achieving glycaemic control with multiple daily injections of insulin p. 782 without significant disabling hypoglycaemia.

All women treated with insulin p. 782 during pregnancy should be aware of the risks of hypoglycaemia, particularly in the first trimester, and should be advised to always carry a fast-acting form of glucose, such as dextrose tablets or a glucose-containing drink. Pregnant women with Type 1 diabetes p. 752 should also be prescribed glucagon p. 793 for use if needed

Women with pre-existing diabetes treated with insulin p. 782 during pregnancy are at increased risk of hypoglycaemia in the postnatal period and should reduce their insulin immediately after birth. Blood-glucose levels should be monitored carefully to establish the appropriate dose.

Medication for diabetic complications

Ever Angiotensin-converting enzyme inhibitors and angiotensin II receptor antagonists should be discontinued and replaced with an alternative antihypertensive suitable for use in pregnancy before conception or as soon as pregnancy is confirmed (see *Hypertension in pregnancy* under Hypertension p. 155). Statins should not be prescribed during pregnancy and should be discontinued before a planned pregnancy.

Gestational diabetes

04-Apr-2022

EvGr Women with gestational diabetes who have a fasting plasma glucose below 7 mmol/litre at diagnosis, should first

attempt a change in diet and exercise alone in order to reduce blood-glucose. If blood-glucose targets are not met within 1 to 2 weeks, metformin hydrochloride below may be prescribed. Insulin p. 782 may be prescribed if metformin is contra-indicated or not acceptable, and may also be added to treatment if metformin is not effective alone.

Women who have a fasting plasma glucose above 7 mmol/litre at diagnosis should be treated with insulin p. 782 immediately, with or without metformin hydrochloride below, in addition to a change in diet and exercise.

Women who have a fasting plasma glucose between 6 and 6.9 mmol/litre alongside complications such as macrosomia or hydramnios should be considered for immediate insulin p. 782 treatment, with or without metformin hydrochloride below.

Women with gestational diabetes should discontinue hypoglycaemic treatment immediately after giving birth.

BLOOD GLUCOSE LOWERING DRUGS > ALPHA **GLUCOSIDASE INHIBITORS**

Acarbose

13-Jul-2021

• DRUG ACTION Acarbose, an inhibitor of intestinal alpha glucosidases, delays the digestion and absorption of starch and sucrose; it has a small but significant effect in lowering blood glucose.

INDICATIONS AND DOSE

Diabetes mellitus inadequately controlled by diet or by diet with oral antidiabetic drugs

- ► BY MOUTH
- Adult: Initially 50 mg daily, then increased to 50 mg 3 times a day for 6-8 weeks, then increased if necessary to 100 mg 3 times a day (max. per dose 200 mg 3 times
- CONTRA-INDICATIONS Disorders of digestion or absorption · hernia (condition may deteriorate) · inflammatory bowel disease · predisposition to intestinal obstruction
- CAUTIONS May enhance hypoglycaemic effects of insulin and sulfonylureas (hypoglycaemic episodes may be treated with oral glucose but not with sucrose)
- INTERACTIONS → Appendix 1: acarbose
- SIDE-EFFECTS
- ► Common or very common Diarrhoea (may need to reduce dose) · gastrointestinal discomfort · gastrointestinal disorders
- ► Uncommon Nausea · vomiting
- ▶ Rare or very rare Hepatic disorders · oedema
- ► Frequency not known Acute generalised exanthematous pustulosis (AGEP) · thrombocytopenia SIDE-EFFECTS, FURTHER INFORMATION Antacids containing magnesium and aluminium salts unlikely to be beneficial for treating side effects.
- PREGNANCY Avoid.
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment.
- RENAL IMPAIRMENT [EVGr] Avoid if creatinine clearance less than 25 mL/minute. (M) See p. 21.
- MONITORING REQUIREMENTS Monitor liver function.

- DIRECTIONS FOR ADMINISTRATION Manufacturer advises tablets should be chewed with first mouthful of food or swallowed whole with a little liquid immediately before
- PATIENT AND CARER ADVICE Antacids unlikely to be beneficial for treating side-effects. To counteract possible hypoglycaemia, patients receiving insulin or a sulfonylurea as well as acarbose need to carry glucose (not sucrose—acarbose interferes with sucrose absorption). Patients should be given advice on how to administer acarbose tablets.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.
 - Acarbose (Non-proprietary)

Acarbose 50 mg Acarbose 50mg tablets | 90 tablet Pom £14.58 DT = £14.58

Acarbose 100 mg Acarbose 100mg tablets | 90 tablet Poml £38.84 DT = £25.29

BLOOD GLUCOSE LOWERING DRUGS > BIGUANIDES

Metformin hydrochloride

22-Anr-2022

• DRUG ACTION Metformin exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

INDICATIONS AND DOSE

Type 2 diabetes mellitus [monotherapy or in combination with other antidiabetic drugs (including insulin)]

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ► Child 10-17 years (specialist use only): Initially 500 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2-3 divided doses; maximum 2 g per day
- Adult: Initially 500 mg once daily for at least 1 week, dose to be taken with breakfast, then 500 mg twice daily for at least 1 week, dose to be taken with breakfast and evening meal, then 500 mg 3 times a day, dose to be taken with breakfast, lunch and evening meal; maximum 2 g per day
- ► BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: Initially 500 mg once daily, then increased if necessary up to 2 g once daily, dose increased gradually, every 10-15 days, dose to be taken with evening meal, alternatively increased to 1 g twice daily, dose to be taken with meals, alternative dose only to be used if control not achieved with once daily dose regimen. If control still not achieved then change to standard release tablets

Type 2 diabetes mellitus [reduction in risk or delay of

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult 18-74 years: Initially 500 mg once daily, then increased if necessary up to 2 g once daily, dose increased gradually, every 10-15 days, dose to be taken with evening meal, for further information on risk factors—consult product literature

Polycystic ovary syndrome

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult (initiated by a specialist): Initially 500 mg once daily for 1 week, dose to be taken with breakfast, then 500 mg twice daily for 1 week, dose to be taken with breakfast and evening meal, then 1.5-1.7 g daily in 2-3 divided doses
- UNLICENSED USE FVGI Metformin is used in the doses provided in BNF publications for the treatment of type 2

diabetes mellitus, **(E)** but these may differ from those licensed

Evgr Metformin is used for the treatment of polycystic ovary syndrome, (E) but is not licensed for this indication.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: METFORMIN IN PREGNANCY: STUDY SHOWS NO SAFETY CONCERNS (MARCH 2022)

European and CHM reviews of data from a large cohort study of Finnish population registries did not identify any safety issues with the use of metformin during pregnancy. Product literature for single-ingredient metformin preparations was subsequently updated to permit its use as an adjunct or alternative to insulin during pregnancy and the periconception period, if clinically indicated.

- CONTRA-INDICATIONS Acute metabolic acidosis (including lactic acidosis and diabetic ketoacidosis)
- CAUTIONS Risk factors for lactic acidosis
 CAUTIONS, FURTHER INFORMATION
- Risk factors for lactic acidosis Manufacturer advises caution in chronic stable heart failure (monitor cardiac function), and concomitant use of drugs that can acutely impair renal function; interrupt treatment if dehydration occurs, and avoid in conditions that can acutely worsen renal function, or cause tissue hypoxia.
- ► Elderly Prescription potentially inappropriate (STOPP criteria) if eGFR less than 30 mL/minute/1.73 m² (risk of lactic acidosis). See also Prescribing in the elderly p. 29.
- INTERACTIONS → Appendix 1: metformin
- SIDE-EFFECTS
- ➤ Common or very common Abdominal pain · appetite decreased · diarrhoea (usually transient) · gastrointestinal disorder · nausea · taste altered · vomiting
- ▶ Rare or very rare Hepatitis · lactic acidos is (discontinue) · skin reactions · vitamin B12 absorption decreased

 SIDE-EFFECTS, FURTHER INFORMATION Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses are given. A slow increase in dose may improve tolerability.
- PREGNANCY EVGT Can be used in pregnancy for both preexisting and gestational diabetes. Women with gestational diabetes should discontinue treatment after giving birth.
 A See also Important safety information.
- BREAST FEEDING Ever May be used during breast-feeding in women with pre-existing diabetes.
- HEPATIC IMPAIRMENT Withdraw if tissue hypoxia likely.
- RENAL IMPAIRMENT See p. 21.
- In adults Manufacturer advises avoid if eGFR is less than 30 mL/minute/1.73 m².
- In children Manufacturer advises avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².

Dose adjustments In children Manufacturer advises consider dose reduction in moderate impairment.

- ▶ In adults Manufacturer advises reduce dose in moderate impairment—consult product literature.
- MONITORING REQUIREMENTS Determine renal function before treatment and at least annually (at least twice a year in patients with additional risk factors for renal impairment, or if deterioration suspected).
- PRESCRIBING AND DISPENSING INFORMATION
- When used for Type 2 diabetes mellitus in adults The maximum dose for metformin immediate-release medicines in the BNF differs from product licence and is based on clinical experience. Patients taking up to 2 g daily of the standardrelease metformin may start with the same daily dose of

- metformin modified release; not suitable if dose of standard-release tablets more than 2 g daily.
- PATIENT AND CARER ADVICE Manufacturer advises that
 patients and their carers should be informed of the risk of
 lactic acidosis and told to seek immediate medical
 attention if symptoms such as dyspnoea, muscle cramps,
 abdominal pain, hypothermia, or asthenia occur.

BLOOD GLUCOSE LOWERING DRUGS > DIPEPTIDYLPEPTIDASE-4 INHIBITORS (GLIPTINS)

Alogliptin

27-Apr-2022

 DRUG ACTION Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

INDICATIONS AND DOSE

Type 2 diabetes mellitus in combination with other antidiabetic drugs (including insulin) if existing treatment fails to achieve adequate glycaemic control

- ► BY MOUTH
- Adult: 25 mg once daily, for further information on use with other antidiabetic drugs—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Dose of concomitant sulfonylurea or insulin may need to be reduced.
- Caution with use in combination with both metformin and pioglitazone—risk of hypoglycaemia (dose of metformin or pioglitazone may need to be reduced).
- CAUTIONS History of pancreatitis not recommended in moderate to severe heart failure (limited experience)

- INTERACTIONS → Appendix 1: dipeptidylpeptidase-4 inhibitors
- SIDE-FFFFCTS
- ► Common or very common Abdominal pain gastrooesophageal reflux disease headache increased risk of infection skin reactions
- ► Frequency not known Angioedema · hepatic function abnormal · pancreatitis acute · Stevens-Johnson syndrome SIDE-EFFECTS, FURTHER INFORMATION Discontinue if symptoms of acute pancreatitis occur such as persistent, severe abdominal pain.
- ALLERGY AND CROSS-SENSITIVITY Evg: Contra-indicated if history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors.
- PREGNANCY Manufacturer advises avoid—no information available.
- BREAST FEEDING Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment—no information available.
- RENAL IMPAIRMENT

Dose adjustments EvGr Reduce dose to 12.5 mg once daily if creatinine clearance 30–50 mL/minute. Reduce dose to 6.25 mg once daily if creatinine clearance less than 30 mL/minute. (N)

- See p. 21.

 MONITORING REQUIREMENTS Determine renal function before treatment and periodically thereafter.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

Vipidia (Takeda UK Ltd)

Linagliptin

27-Apr-2022

 DRUG ACTION Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

INDICATIONS AND DOSE

Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with other antidiabetic drugs (including insulin) if existing treatment fails to achieve adequate glycaemic control

 Adult: 5 mg once daily, for further information on use with other antidiabetic drugs—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Dose of concomitant sulfonylurea or insulin may need to be reduced.
- CAUTIONS History of pancreatitis
- INTERACTIONS → Appendix 1: dipeptidylpeptidase-4 inhibitors
- SIDE-EFFECTS
- ▶ Uncommon Cough · nasopharyngitis
- ▶ Rare or very rare Angioedema · skin reactions
- Frequency not known Pancreatitis
 SIDE-EFFECTS, FURTHER INFORMATION Discontinue if symptoms of acute pancreatitis occur such as persistent, severe abdominal pain.
- PREGNANCY Avoid—no information available.
- BREAST FEEDING Avoid—present in milk in animal studies.

Saxagliptin with dapagliflozin 25-Aug-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, saxagliptin p. 764, dapagliflozin p. 774.

• INDICATIONS AND DOSE

Type 2 diabetes mellitus not controlled by metformin and/or a sulfonylurea with either saxagliptin or dapagliflozin

- ► BY MOUTH
- Adult 18-74 years: 5/10 mg once daily
- Adult 75 years and over: Initiation not recommended

DOSE ADJUSTMENTS DUE TO INTERACTIONS

 Dose of concomitant sulfonylurea may need to be reduced.

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg saxagliptin/dapagliflozin.
- INTERACTIONS → Appendix 1: dipeptidylpeptidase-4 inhibitors • sodium glucose co-transporter 2 inhibitors
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate impairment; avoid in severe impairment.
- RENAL IMPAIRMENT

Dose adjustments Manufacturer advises avoid if eGFR less than 60 mL/minute/1.73 m² (ineffective).

PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Saxagliptin/dapagliflozin (Qtern®) in adults with type 2 diabetes mellitus: to improve glycaemic control when metformin and/or sulfonylurea and one of the monocomponents of Qtern® do not provide adequate glycaemic control; when already being treated with the free combination of dapagliflozin and saxagliptin (July 2017) SMC No. 1255/17 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.
 - Otern (AstraZeneca UK Ltd)

Saxagliptin (as Saxagliptin hydrochloride) 5 mg, Dapagliflozin (as Dapagliflozin propanediol monohydrate) 10 mg Qtern 5mg/10mg tablets | 28 tablet PoM £49.56 DT = £49.56

Saxagliptin with metformin

25-Aug-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, saxagliptin p. 764, metformin hydrochloride p. 761.

INDICATIONS AND DOSE

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonvlurea or insulin

- ▶ BY MOUTH
- Adult: 1 tablet twice daily, based on patient's current metformin dose
- INTERACTIONS → Appendix 1: dipeptidylpeptidase-4 inhibitors · metformin
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Saxagliptin with metformin (Komboglyze®) as an adjunct to diet and exercise to improve glycaemic control in adults with type 2 diabetes mellitus inadequately controlled on their maximally tolerated dose of metformin alone or those already being treated with the combination of saxagliptin and metformin as separate tablets (June 2013) SMC No. 870/13 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Komboglyze (AstraZeneca UK Ltd)

Saxagliptin (as Saxagliptin hydrochloride) 2.5 mg, Metformin hydrochloride 850 mg Komboglyze 2.5mg/850mg tablets | 56 tablet [PoM] £31.60 DT = £31.60

▶ Janumet (Merck Sharp & Dohme (UK) Ltd) Sitagliptin (as Sitagliptin phosphate) 50 mg, Metformin hydrochloride 1 gram Janumet 50mg/1000mg tablets | 56 tablet [PoM] £33.26 DT = £33.26

Vildagliptin

27-Apr-2022

 DRUG ACTION Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

INDICATIONS AND DOSE

Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with other antidiabetic drugs (including insulin) if existing treatment fails to achieve adequate glycaemic control

- BY MOUTH
- Adult: 50 mg twice daily, reduce dose to 50 mg once daily in the morning when used in dual combination with a sulfonylurea. For further information on use with other antidiabetic drugs—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Dose of concomitant sulfonylurea or insulin may need to be reduced.
- CAUTIONS History of pancreatitis · manufacturer advises avoid in severe heart failure—no information available
- INTERACTIONS → Appendix 1: dipeptidylpeptidase-4 inhibitors
- SIDE-EFFECTS
- ► Common or very common Dizziness
- ► **Uncommon** Arthralgia · constipation · headache · hypoglycaemia · peripheral oedema
- ▶ Rare or very rare Increased risk of infection
- ► Frequency not known Hepatitis · myalgia · pancreatitis · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION Pancreatitis

Discontinue if symptoms of acute pancreatitis occur, such as persistent severe abdominal pain.

Liver toxicity Rare reports of liver dysfunction; discontinue if jaundice or other signs of liver dysfunction occur.

- PREGNANCY Avoid—toxicity in animal studies.
- BREAST FEEDING Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises avoid.
- RENAL IMPAIRMENT

Dose adjustments EvGr Reduce dose to 50 mg once daily if creatinine clearance less than 50 mL/minute. See p. 21.

- MONITORING REQUIREMENTS Monitor liver function before treatment and every 3 months for first year and periodically thereafter.
- PATIENT AND CARER ADVICE

Liver toxicity Patients should be advised to seek prompt medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue, and dark urine develop.

BLOOD GLUCOSE LOWERING DRUGS

GLUCAGON-LIKE PEPTIDE-1 RECEPTOR AGONISTS

Dulaglutide

17-Feb-2022

 DRUG ACTION Dulaglutide is a long-acting glucagon-like peptide 1 (GLP-1) receptor agonist that augments glucosedependent insulin secretion, and slows gastric emptying.

• INDICATIONS AND DOSE

Type 2 diabetes mellitus as monotherapy [if metformin inappropriate]

- ► BY SUBCUTANEOUS INJECTION
- Adult: 0.75 mg once weekly

Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs [if existing treatment fails to achieve adequate glycaemic control]

- ► BY SUBCUTANEOUS INJECTION
- Adult: 1.5 mg once weekly; increased if necessary to 3 mg once weekly after at least 4 weeks, then increased if necessary to 4.5 mg once weekly after another 4 weeks, a starting dose of 0.75 mg once weekly may be considered for potentially vulnerable patients; maximum 4.5 mg per week

DOSE ADJUSTMENTS DUE TO INTERACTIONS

 Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: GLP-1 RECEPTOR AGONISTS: REPORTS OF DIABETIC KETOACIDOSIS WHEN CONCOMITANT INSILI IN WAS **RAPIDLY REDUCED OR DISCONTINUED (JUNE 2019)** Serious and life-threatening cases of diabetic ketoacidosis have been reported in patients with type 2 diabetes mellitus on a combination of a glucagon-like peptide-1 (GLP-1) receptor agonist and insulin, particularly after discontinuation or rapid dose reduction of concomitant insulin. Healthcare professionals are advised that any dose reduction of insulin should be done in a stepwise manner with careful blood glucose self-monitoring, particularly when GLP-1 receptor agonist therapy is initiated. Patients should be informed of the risk factors for and signs and symptoms of diabetic ketoacidosis, and advised to seek immediate medical attention if these develop.

- CONTRA-INDICATIONS Severe gastro-intestinal disease no information available
- INTERACTIONS → Appendix 1: glucagon-like peptide-1 receptor agonists
- SIDE-EFFECTS
- ► Common or very common Appetite decreased atrioventricular block burping constipation diarrhoea fatigue gastrointestinal discomfort gastrointestinal disorders hypoglycaemia nausea sinus tachycardia vomiting
- ▶ Uncommon Dehydration gallbladder disorders
- ► Rare or very rare Anaphylactic reaction angioedema pancreatitis acute (discontinue)
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid— no information available.
- RENAL IMPAIRMENT EVGT Avoid if eGFR less than 15 mL/minute/1.73 m² (limited information available), see p. 21.
- PRESCRIBING AND DISPENSING INFORMATION Dulaglutide
 is a biological medicine. Biological medicines must be
 prescribed and dispensed by brand name, see Biological
 medicines and Biosimilar medicines, under Guidance on
 prescribing p. 1; record the brand name and batch number
 after each administration.
- HANDLING AND STORAGE Refrigerated storage is usually necessary (2 °C – 8 °C). Once in use, may be stored unrefrigerated for up to 14 days at a temperature not above 30 °C.
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer dulaglutide injection.
 Acute pancreatitis Patients should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.
 - Dehydration Patients should be informed of the potential risk of dehydration in relation to gastro-intestinal side-effects and advised to take precautions to avoid fluid depletion.

Missed doses If a dose is missed, it should be administered as soon as possible only if there are at least 3 days until the next scheduled dose; if less than 3 days remain before the next scheduled dose, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Dulaglutide (Trulicity®) for use in adults with type 2 diabetes mellitus to improve glycaemic control as add-on therapy in combination with other glucose-lowering medicinal products including insulin, when these, together with diet and exercise, do not provide adequate glycaemic control (January 2016) SMC No. 1110/15 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

£73.25 DT = £73.25

Dulaglutide 6 mg per 1 ml Trulicity 3mg/0.5ml solution for injection pre-filled pens | 4 pre-filled disposable injection PoM £73.25 DT = £73.25

Dulaglutide 9 mg per 1 ml Trulicity 4.5mg/0.5ml solution for injection pre-filled pens | 4 pre-filled disposable injection PoM £73.25 DT = £73.25

Exenatide

29-Sep-2021

 DRUG ACTION Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

• INDICATIONS AND DOSE

Type 2 diabetes mellitus in combination with metformin or a sulfonylurea, or both, or with pioglitazone, or with both metformin and pioglitazone, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination

- ► BY SUBCUTANEOUS INJECTION USING IMMEDIATE-RELEASE
- Adult: Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart)
- ► BY SUBCUTANEOUS INJECTION USING MODIFIED-RELEASE MEDICINES
- Adult: 2 mg once weekly

Type 2 diabetes mellitus in combination with basal insulin alone or with metformin or pioglitazone (or both)

- ► BY SUBCUTANEOUS INJECTION USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart)

DOSE ADJUSTMENTS DUE TO INTERACTIONS

 Dose of concomitant sulfonylurea may need to be reduced.

PHARMACOKINETICS

 Effect of modified-release exenatide injection (Bydureon®) may persist for 10 weeks after discontinuation.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: GLP-1 RECEPTOR AGONISTS: REPORTS OF DIABETIC KETOACIDOSIS WHEN CONCOMITANT INSULIN WAS RAPIDLY REDUCED OR DISCONTINUED (JUNE 2019)
Serious and life-threatening cases of diabetic ketoacidosis have been reported in patients with type 2 diabetes mellitus on a combination of a glucagon-like peptide-1 (GLP-1) receptor agonist and insulin, particularly after discontinuation or rapid dose reduction of concomitant insulin. Healthcare professionals are

advised that any dose reduction of insulin should be done in a stepwise manner with careful blood glucose self-monitoring, particularly when GLP-1 receptor agonist therapy is initiated. Patients should be informed of the risk factors for and signs and symptoms of diabetic ketoacidosis, and advised to seek immediate medical attention if these develop.

- CONTRA-INDICATIONS Ketoacidosis · severe gastrointestinal disease
- CAUTIONS Elderly · may cause weight loss greater than 1.5 kg weekly · pancreatitis
- INTERACTIONS → Appendix 1: glucagon-like peptide-1 receptor agonists
- SIDE-EFFECTS
- Common or very common Appetite decreased · asthenia · constipation · diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders · headache · nausea · skin reactions · vomiting
- Uncommon Alopecia · burping · drowsiness · hyperhidrosis · renal impairment · taste altered
- Frequency not known Angioedema pancreatitis acute
 SIDE-EFFECTS, FURTHER INFORMATION Severe pancreatitis (sometimes fatal), including haemorrhagic or necrotising pancreatitis, has been reported rarely; discontinue permanently if diagnosed.
- CONCEPTION AND CONTRACEPTION Women of childbearing age should use effective contraception during treatment with modified-release exenatide and for 12 weeks after discontinuation.
- PREGNANCY Avoid—toxicity in animal studies.
- BREAST FEEDING Avoid—no information available.
- RENAL IMPAIRMENT EvGr For immediate-release injection, use with caution if creatinine clearance 30–50 mL/minute; avoid if creatinine clearance less than 30 mL/minute. For modified-release injection, avoid if eGFR less than 30 mL/minute/1.73 m². (N) See p. 21.
- PATIENT AND CARER ADVICE Patients or their carers should be given advice on how to administer exenatide injection. Patients changing from standard-release to modified-release exenatide formulation may experience initial transient increase in blood glucose. Some oral medications should be taken at least 1 hour before or 4 hours after exenatide injection—consult product literature for details. Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek prompt medical attention if symptoms such as abdominal pain, nausea, and vomiting develop.

Missed doses If a dose of the immediate-release medicine is missed, continue with the next scheduled dose—do not administer **after** a meal.

NATIONAL FUNDING/ACCESS DECISIONS

Liraglutide

07-Nov-2021

DRUG ACTION Liraglutide binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

• INDICATIONS AND DOSE

SAXENDA ®

Adjunct in weight management [in conjunction with dietary measures and increased physical activity in individuals with a body mass index (BMI) of 30 kg/m² or more, or in individuals with a BMI of 27 kg/m² or more in the presence of at least one weight-related comorbidity]

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 0.6 mg once daily, then increased in steps of 0.6 mg, dose to be increased at intervals of at least 1 week up to a maintenance dose of 3 mg once daily or the maximum tolerated dose has been reached. Consider discontinuation if escalation to the next dose is not tolerated for 2 consecutive weeks. Discontinue if at least 5% of initial body-weight has not been lost after 12 weeks at maximum dose; maximum 3 mg per day

VICTOZA®

Type 2 diabetes mellitus [monotherapy (if metformin inappropriate), or in combination with other antidiabetic drugs]

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 0.6 mg once daily for at least 1 week, then increased to 1.2 mg once daily for at least 1 week, then increased if necessary to 1.8 mg once daily, for information on use with other antidiabetic drugs consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

 Dose of concomitant insulin or sulfonylurea may need to be reduced.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: GLP-1 RECEPTOR AGONISTS: REPORTS OF DIABETIC KETOACIDOSIS WHEN CONCOMITANT INSULIN WAS RAPIDLY REDUCED OR DISCONTINUED (JUNE 2019)

• When used for Type 2 diabetes mellitus Serious and life-threatening cases of diabetic ketoacidosis have been reported in patients with type 2 diabetes mellitus on a combination of a glucagon-like peptide-1 (GLP-1) receptor agonist and insulin, particularly after discontinuation or rapid dose reduction of concomitant insulin. Healthcare professionals are advised that any dose reduction of insulin should be done in a stepwise manner with careful blood glucose self-monitoring, particularly when GLP-1 receptor agonist therapy is initiated. Patients should be informed of the risk factors for and signs and symptoms of diabetic ketoacidosis, and advised to seek immediate medical attention if these develop.

• CONTRA-INDICATIONS Diabetic gastroparesis inflammatory bowel disease

SAXENDA Concomitant use with other products for weight management • elderly 75 years or over (limited information) • obesity secondary to endocrinological or eating disorders

VICTOZA ® Diabetic ketoacidosis

- CAUTIONS Severe congestive heart failure (no information available) thyroid disease
- INTERACTIONS → Appendix 1: glucagon-like peptide-1 receptor agonists
- SIDE-EFFECTS
- ▶ Common or very common Appetite decreased asthenia burping constipation diarrhoea dizziness dry mouth gallbladder disorders gastrointestinal discorders headache increased risk of infection insomnia nausea skin reactions taste altered toothache vomiting
- ► **Uncommon** Dehydration malaise pancreatitis renal impairment tachycardia
- Frequency not known Angioedema · dyspnoea · hypotension · oedema · palpitations · pancreatitis acute (discontinue permanently) · thyroid disorder
 SIDE-EFFECTS, FURTHER INFORMATION Discontinue if symptoms of acute pancreatitis occur, such as persistent, severe abdominal pain.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies (recommendation also supported by tertiary sources).
- BREAST FEEDING Manufacturer advises avoid—no information available; animal studies suggest that transfer into milk is low, but excretion into human milk not known (a tertiary source confirms lack of information in human lactation, but also states that risk to infants appears to be negligible. [EvGr] Blood glucose monitoring of the infant should be considered) .
- HEPATIC IMPAIRMENT

SAXENDA [®] Manufacturer advises use with caution in mild to moderate impairment; avoid in severe impairment (risk of decreased exposure).

VICTOZA [®] Manufacturer advises avoid in severe impairment (risk of decreased exposure).

RENAL IMPAIRMENT

SAXENDA ® Manufacturer advises avoid if creatinine clearance less than 30 mL/minute. See p. 21.
VICTOZA ® Manufacturer advises avoid in end-stage renal disease.

- PRESCRIBING AND DISPENSING INFORMATION Liraglutide is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8°C)—after first use can also be stored below 30°C and used within 1 month; keep cap on pen to protect from light.
- PATIENT AND CARER ADVICE Patients and their carers should be given advice on how to administer liraglutide injection. Patients and their carers should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek immediate medical attention if symptoms develop. Patients and their carers should be informed of the potential risk of dehydration in relation to gastrointestinal side-effects and advised to take precautions to avoid fluid depletion; they should also be informed of the symptoms of cholelithiasis and cholecystitis, and of increased heart rate.

SAXENDA®

Missed doses Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Patients and carers should be cautioned on the effects of driving and performance of skilled tasks—increased risk of dizziness, particularly during first 3 months of treatment.

NATIONAL FUNDING/ACCESS DECISIONS

Combinations available: *Insulin degludec with liraglutide*, p. 787

Lixisenatide

29-Sep-2021

 DRUG ACTION Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

• INDICATIONS AND DOSE

Type 2 diabetes mellitus in combination with oral antidiabetic drugs (e.g. metformin, pioglitazone, or a sulfonylurea) or basal insulin, or both, when adequate glycaemic control has not been achieved with these drugs

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 10 micrograms once daily for 14 days, then increased to 20 micrograms once daily, dose to be taken within 1 hour before the first meal of the day or the evening meal

DOSE ADJUSTMENTS DUE TO INTERACTIONS

 Dose of concomitant sulfonylurea or insulin may need to be reduced.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: GLP-1 RECEPTOR AGONISTS: REPORTS OF DIABETIC KETOACIDOSIS WHEN CONCOMITANT INSULIN WAS RAPIDLY REDUCED OR DISCONTINUED (JUNE 2019)

Serious and life-threatening cases of diabetic ketoacidosis have been reported in patients with type 2 diabetes mellitus on a combination of insulin and the glucagon-like peptide-1 (GLP-1) receptor agonist exenatide, liraglutide, or dulaglutide, particularly after discontinuation or rapid dose reduction of concomitant insulin. The MHRA has not currently received any UK reports of diabetic ketoacidosis with the GLP-1 receptor agonists lixisenatide and semaglutide but this risk cannot be excluded. Healthcare professionals are advised

that any dose reduction of insulin should be done in a stepwise manner with careful blood glucose selfmonitoring, particularly when GLP-1 receptor agonist therapy is initiated. Patients should be informed of the risk factors for and signs and symptoms of diabetic ketoacidosis, and advised to seek immediate medical attention if these develop.

- CONTRA-INDICATIONS Ketoacidosis · severe gastrointestinal disease
- CAUTIONS History of pancreatitis
- INTERACTIONS → Appendix 1: glucagon-like peptide-1 receptor agonists
- SIDE-EFFECTS
- ► Common or very common Back pain · cystitis · diarrhoea · dizziness · drowsiness · dyspepsia · headache · increased risk of infection · nausea · yomiting
- ► Uncommon Urticaria
- Frequency not known Pancreatitis acute
 SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises discontinue if symptoms of acute pancreatitis occur, such as persistent, severe abdominal pain.
- CONCEPTION AND CONTRACEPTION Women of childbearing age should use effective contraception.
- PREGNANCY Avoid—toxicity in animal studies.
- BREAST FEEDING Avoid—no information available.
- RENAL IMPAIRMENT EvG: Avoid if creatinine clearance less than 30 mL/minute (no information available). See p. 21.
- PATIENT AND CARER ADVICE Patients or their carers should
 be given advice on how to administer lixisenatide
 injection. Some oral medications should be taken at least
 1 hour before or 4 hours after lixisenatide injection—
 consult product literature for details.
 Missed doses If a dose is missed, inject within 1 hour
 before the next meal—do not administer after a meal.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- ➤ Lixisenatide (Lyxumia®) for the treatment of adults with type 2 diabetes mellitus to achieve glycaemic control in combination with oral glucose-lowering medicinal products and/or basal insulin when these, together with diet and exercise, do not provide adequate glycaemic control (September 2013) SMC No. 903/13 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

► Lyxumia (Sanofi)

Lixisenatide 50 microgram per 1 ml Lyxumia 10micrograms/0.2ml solution for injection 3ml pre-filled pens | 1 pre-filled disposable injection Pom £31.67 DT = £31.67

Lixisenatide 100 microgram per 1 ml Lyxumia 20micrograms/0.2ml solution for injection 3ml pre-filled pens | 2 pre-filled disposable injection PoM £57.93 DT = £57.93

Combinations available: *Insulin glargine with lixisenatide*, p. 788

Semaglutide

16-Feb-2021

 DRUG ACTION Semaglutide binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppress glucagon secretion, and slow gastric emptying.

• INDICATIONS AND DOSE

Type 2 diabetes mellitus [monotherapy (if metformin inappropriate) or in combination with other antidiabetic drugs]

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 0.25 mg once weekly for 4 weeks, then increased to 0.5 mg once weekly for at least 4 weeks, then increased if necessary to 1 mg once weekly, for information on use with other antidiabetic drugs consult product literature
- ► BY MOUTH
- Adult: Initially 3 mg once daily for 1 month, then increased to 7 mg once daily for at least 1 month, then increased if necessary to 14 mg once daily, dose to be taken on an empty stomach, for information on use with other antidiabetic drugs—consult product literature, one 14 mg tablet should be used to achieve a 14 mg dose; use of two 7 mg tablets to achieve a 14 mg dose has not been studied and is therefore not recommended; maximum 14 mg per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

 Manufacturer advises dose of concomitant insulin or sulfonylurea may need to be reduced.

DOSE EQUIVALENCE AND CONVERSION

 Oral semaglutide 14 mg once daily is comparable to subcutaneous semaglutide 0.5 mg once weekly. Due to the high pharmacokinetic variability of oral semaglutide, the effect of switching between oral and subcutaneous semaglutide cannot easily be predicted.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: GLP-1 RECEPTOR AGONISTS: REPORTS OF DIABETIC KETOACIDOSIS WHEN CONCOMITANT INSULIN WAS RAPIDLY REDUCED OR DISCONTINUED (JUNE 2019)

Serious and life-threatening cases of diabetic ketoacidosis have been reported in patients with type 2 diabetes mellitus on a combination of insulin and the glucagon-like peptide-1 (GLP-1) receptor agonist exenatide, liraglutide, or dulaglutide, particularly after discontinuation or rapid dose reduction of concomitant insulin. The MHRA has not currently received any UK reports of diabetic ketoacidosis with the GLP-1 receptor agonists lixisenatide and semaglutide but this risk cannot be excluded. Healthcare professionals are advised that any dose reduction of insulin should be done in a stepwise manner with careful blood glucose selfmonitoring, particularly when GLP-1 receptor agonist therapy is initiated. Patients should be informed of the risk factors for and signs and symptoms of diabetic ketoacidosis, and advised to seek immediate medical attention if these develop.

- CONTRA-INDICATIONS Diabetic ketoacidosis
- CAUTIONS Diabetic retinopathy (in patients treated with insulin) · history of pancreatitis · severe congestive heart failure (no information available)
- INTERACTIONS → Appendix 1: glucagon-like peptide-1 receptor agonists
- SIDE-EFFECTS
- Common or very common Appetite decreased · burping · cholelithiasis · constipation · diarrhoea · dizziness · fatigue · gastrointestinal discorders · hypoglycaemia (in combination with insulin or sulfonylurea) · nausea · yomiting · weight decreased

- ► Uncommon Pancreatitis acute taste altered

 SIDE-EFFECTS, FURTHER INFORMATION Discontinue if
 symptoms of acute pancreatitis occur, such as persistent,
 severe abdominal pain.
- CONCEPTION AND CONTRACEPTION Manufacturer advises women of childbearing potential should use effective contraception during and for at least two months after stopping treatment.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution (limited information in severe impairment).
- RENAL IMPAIRMENT Manufacturer advises avoid in endstage renal disease.
- DIRECTIONS FOR ADMINISTRATION
- With oral use Manufacturer advises tablets should be taken whole on an empty stomach, with a sip of water (up to half a glass, equivalent to 120 mL). Patients should wait at least 30 minutes after a dose before eating, drinking, or taking other oral medicines—intake with food or large volumes of water decreases the absorption of semaglutide.
- PRESCRIBING AND DISPENSING INFORMATION Semaglutide is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.
- HANDLING AND STORAGE
- With subcutaneous use Manufacturer advises store injection pens in a refrigerator (2–8°C)—after first use can also be stored below 30°C; keep cap on pen to protect from light.
- PATIENT AND CARER ADVICE Patients and their carers should be given advice on how to administer semaglutide tablets and injection.

Acute pancreatitis Patients and their carers should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek immediate medical attention if symptoms develop.

Missed doses > With subcutaneous use If a dose is more than 5 days late, the missed dose should not be taken and the next dose should be administered at the normal time.

- With oral use If a dose is missed, the missed dose should not be taken and the next dose should be taken at the normal time
- NATIONAL FUNDING/ACCESS DECISIONS

BLOOD GLUCOSE LOWERING DRUGS >

Repaglinide

04-Jun-2021

• DRUG ACTION Repaglinide stimulates insulin secretion.

INDICATIONS AND DOSE

Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate)

- ► BY MOUTH
- Adult: Initially 500 micrograms (max. per dose 4 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1-2 weeks; maximum 16 mg per day

Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate), if transferring from another oral antidiabetic drug

- ► BY MOUTH
- Adult: Initially 1 mg (max. per dose 4 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1-2 weeks; maximum 16 mg per day
- CONTRA-INDICATIONS Ketoacidosis
- CAUTIONS Debilitated patients elderly (no information available) malnourished patients

CAUTIONS, FURTHER INFORMATION Manufacturer advises patients exposed to stress (including fever, trauma, infection or surgery) may require treatment interruption and temporary replacement with insulin to maintain glycaemic control.

- INTERACTIONS → Appendix 1: meglitinides
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · diarrhoea · hypoglycaemia
- ► Rare or very rare Cardiovascular disease · constipation · hepatic function abnormal · vasculitis · vision disorders · vomiting
- ► Frequency not known Acute coronary syndrome hypoglycaemic coma · nausea · skin reactions
- PREGNANCY Avoid.
- BREAST FEEDING Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment (risk of increased exposure).
- RENAL IMPAIRMENT EVGT Use with caution.
- PATIENT AND CARER ADVICE

Driving and skilled tasks Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Canagliflozin

22-Feb-2022

 DRUG ACTION Reversibly inhibits sodium-glucose cotransporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

• INDICATIONS AND DOSE

Type 2 diabetes mellitus as monotherapy (if metformin inappropriate) | Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)

- ► BY MOUTH
- Adult: 100 mg once daily; increased if tolerated to 300 mg once daily if required, dose to be taken preferably before breakfast

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises increase dose if tolerated to 300 mg once daily with concurrent use of rifampicin.
- ► Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these
- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- use canagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
- interrupt SGLT2 inhibitor treatment in patients who are hospitalised for major surgery or acute serious

illnesses; treatment may be restarted once the patient's condition has stabilised

MHRA/CHM ADVICE: SGLT2 INHIBITORS: MONITOR KETONES IN BLOOD DURING TREATMENT INTERRUPTION FOR SURGICAL PROCEDURES OR ACUTE SERIOUS MEDICAL ILLNESS (MARCH 2020)

New recommendations have been issued following a European review of peri-operative diabetic ketoacidosis in patients taking SGLT2 inhibitors. Healthcare professionals are advised to monitor ketone levels during SGLT2 inhibitor treatment interruption in patients who have been hospitalised for major surgery or acute serious illness—measurement of blood ketone levels is preferred to urine. Treatment may be restarted once ketone levels are normal and the patient's condition has stabilised.

MHRA/CHM ADVICE (UPDATED MARCH 2017): INCREASED RISK OF LOWER-LIMB AMPUTATION (MAINLY TOES)

Canagliflozin may increase the risk of lower-limb amputation (mainly toes) in patients with type 2 diabetes. Preventive foot care is important for all patients with diabetes. The MHRA has issued the following advice while clinical trials are ongoing:

- consider stopping canagliflozin if a patient develops a significant lower limb complication (e.g. skin ulcer, osteomyelitis, or gangrene)
- carefully monitor patients who have risk factors for amputation (e.g. previous amputations, existing peripheral vascular disease, or neuropathy)
- monitor all patients for signs and symptoms of water or salt loss; ensure patients stay sufficiently hydrated to prevent volume depletion in line with the manufacturer's recommendations
- advise patients to stay well hydrated, carry out routine preventive foot care, and seek medical advice promptly if they develop skin ulceration, discolouration, or new pain or tenderness
- start treatment for foot problems (e.g. ulceration, infection, or new pain or tenderness) as early as nossible
- continue to follow standard treatment guidelines for routine preventive foot care for people with diabetes.

MHRA/CHM ADVICE: SGLT2 INHIBITORS: REPORTS OF FOURNIER'S GANGRENE (NECROTISING FASCIITIS OF THE GENITALIA OR PERINEUM) (FEBRUARY 2019)

Fournier's gangrene, a rare but serious and potentially life-threatening infection, has been associated with the use of sodium-glucose co-transporter 2 (SGLT2) inhibitors. If Fournier's gangrene is suspected, stop the SGLT2 inhibitor and urgently start treatment (including antibiotics and surgical debridement).

Patients should be advised to seek urgent medical attention if they experience severe pain, tenderness, erythema, or swelling in the genital or perineal area, accompanied by fever or malaise—urogenital infection or perineal abscess may precede necrotising fasciitis.

- CONTRA-INDICATIONS Diabetic ketoacidosis
- CAUTIONS Elderly (risk of volume depletion) · elevated haematocrit · hypotension · risk of volume depletion
 CAUTIONS, FURTHER INFORMATION
- Volume depletion Correct hypovolaemia before starting treatment.
- INTERACTIONS → Appendix 1: sodium glucose cotransporter 2 inhibitors
- SIDE-EFFECTS
- Common or very common Balanoposthitis constipation dyslipidaemia hypoglycaemia (in combination with insulin or sulfonylurea) increased risk of infection nausea thirst urinary disorders urosepsis

- ► Uncommon Dehydration dizziness postural hypotension • lower limb amputations • renal failure • skin reactions • syncope
- ▶ Rare or very rare Anaphylactic reaction · angioedema · diabetic ketoacidosis (discontinue immediately)
- Frequency not known Fournier's gangrene (discontinue and initiate treatment promptly)
 SIDE-EFFECTS, FURTHER INFORMATION Consider interrupting treatment if volume depletion occurs.
- PREGNANCY Avoid—toxicity in animal studies.
- BREAST FEEDING Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment—no information available.
- RENAL IMPAIRMENT EVGT Caution if eGFR less than 60 mL/minute/1.73 m². Avoid initiation when baseline eGFR less than 30 mL/minute/1.73 m². ★

 Dose adjustments EvGT Limit dose to 100 mg once daily when eGFR less than 60 mL/minute/1.73 m²; consider addition of other hypoglycaemic agents if further glycaemic control needed. If eGFR falls to less than 30 mL/minute/1.73 m² during treatment, continue with 100 mg once daily. ♠ See p. 21.
- MONITORING REQUIREMENTS Ever Determine renal function before treatment and at least annually thereafter, and before initiation of concomitant drugs that reduce renal function and periodically thereafter.
- PATIENT AND CARER ADVICE Patients should be advised to report symptoms of volume depletion including postural hypotension and dizziness. Patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.

Canagliflozin with metformin

23-Jul-202

The properties listed below are those particular to the combination only. For the properties of the components please consider, canagliflozin p. 772, metformin hydrochloride p. 761.

• INDICATIONS AND DOSE

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with insulin or other antidiabetic drugs

- ► BY MOUTH
- Adult: 1 tablet twice daily, dose based on patient's current metformin dose, daily dose of metformin should not exceed 2 g
- DOSE ADJUSTMENTS DUE TO INTERACTIONS
- Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.
- INTERACTIONS → Appendix 1: metformin · sodium glucose co-transporter 2 inhibitors

- RENAL IMPAIRMENT EVG: Avoid if eGFR less than 60 mL/minute/1.73 m² (consult product literature). See p. 21.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Canagliflozin plus metformin (Vokanamet[®]) in adults aged 18 years and older with type 2 diabetes mellitus as an adjunct to diet and exercise to improve glycaemic control (January 2015) SMC No. 1019/14 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Dapagliflozin

20-Apr-2022

 DRUG ACTION Reversibly inhibits sodium-glucose cotransporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

INDICATIONS AND DOSE

Type 2 diabetes mellitus [as monotherapy if metformin inappropriate] | Type 2 diabetes mellitus [in combination with insulin or other antidiabetic drugs] | Symptomatic chronic heart failure with reduced ejection fraction | Chronic kidney disease

- ► BY MOUTH
- Adult: 10 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

 Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced (risk of hypoglycaemia)—consult product literature.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these
- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- use dapagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased

- insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
- interrupt SGLT2 inhibitor treatment in patients who are hospitalised for major surgery or acute serious illnesses; treatment may be restarted once the patient's condition has stabilised

MHRA/CHM ADVICE: SGLT2 INHIBITORS: MONITOR KETONES IN BLOOD DURING TREATMENT INTERRUPTION FOR SURGICAL PROCEDURES OR ACUTE SERIOUS MEDICAL ILLNESS (MARCH 2020)

New recommendations have been issued following a European review of peri-operative diabetic ketoacidosis in patients taking SGLT2 inhibitors. Healthcare professionals are advised to monitor ketone levels during SGLT2 inhibitor treatment interruption in patients who have been hospitalised for major surgery or acute serious illness—measurement of blood ketone levels is preferred to urine. Treatment may be restarted once ketone levels are normal and the patient's condition has stabilised.

MHRA/CHM ADVICE: SGLT2 INHIBITORS: REPORTS OF FOURNIER'S GANGRENE (NECROTISING FASCIITIS OF THE GENITALIA OR PERINEUM) (FEBRUARY 2019)

Fournier's gangrene, a rare but serious and potentially life-threatening infection, has been associated with the use of sodium-glucose co-transporter 2 (SGLT2) inhibitors. If Fournier's gangrene is suspected, stop the SGLT2 inhibitor and urgently start treatment (including antibiotics and surgical debridement).

Patients should be advised to seek urgent medical attention if they experience severe pain, tenderness, erythema, or swelling in the genital or perineal area, accompanied by fever or malaise—urogenital infection or perineal abscess may precede necrotising fasciitis.

MHRA/CHM ADVICE: FORXIGA® (DAPAGLIFLOZIN) 5 MG SHOULD NO LONGER BE USED FOR THE TREATMENT OF TYPE 1 DIABETES MELLITUS (NOVEMBER 2021)

Dapagliflozin 5 mg is no longer authorised for the treatment of patients with type 1 diabetes mellitus (T1DM) and should no longer be used in this population. Discontinuation of dapagliflozin in patients with T1DM must be made by or in consultation with a physician specialised in diabetes care as soon as clinically practical. After stopping dapagliflozin, frequent blood glucose monitoring is recommended, and the insulin dose should be increased carefully to minimise the risk of hypoglycaemia.

- CONTRA-INDICATIONS Diabetic ketoacidosis
- CAUTIONS Elderly (risk of volume depletion) · hypotension · raised haematocrit · risk of volume depletion

CAUTIONS, FURTHER INFORMATION

- Volume depletion Correct hypovolaemia before starting treatment
- INTERACTIONS → Appendix 1: sodium glucose cotransporter 2 inhibitors
- SIDE-EFFECTS
- ➤ Common or very common Back pain · balanoposthitis · diabetic ketoacidosis (discontinue immediately) · dizziness · dyslipidaemia · hypoglycaemia (in combination with insulin or sulfonylurea) · increased risk of infection · rash · urinary disorders
- ► Uncommon Constipation · dry mouth · genital pruritus · hypovolaemia · thirst · vulvovaginal pruritus · weight decreased

- Rare or very rare Angioedema · Fournier's gangrene (discontinue and initiate treatment promptly)
 SIDE-EFFECTS, FURTHER INFORMATION Interrupt treatment if volume depletion occurs.
- PREGNANCY Avoid—toxicity in animal studies.
- BREAST FEEDING Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT [EVG] Caution in severe impairment (risk of increased exposure; limited information available).

Dose adjustments Ever Initially 5 mg daily in severe impairment, increased if tolerated to 10 mg daily.

- RENAL IMPAIRMENT See p. 21. Evg. Avoid initiation if eGFR less than 15 mL/minute/1.73 m². (M)
- When used for type 2 diabetes mellitus EvGr Consider additional antidiabetic drugs with dapagliflozin if eGFR less than 45 mL/minute/1.73 m² (reduced efficacy).
- PATIENT AND CARER ADVICE Patients should be informed
 of the signs and symptoms of diabetic ketoacidosis, see
 MHRA advice.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

 inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these

- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- use empagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with natients
- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
- interrupt SGLT2 inhibitor treatment in patients who are hospitalised for major surgery or acute serious illnesses; treatment may be restarted once the patient's condition has stabilised

MHRA/CHM ADVICE: SGLT2 INHIBITORS: MONITOR KETONES IN BLOOD DURING TREATMENT INTERRUPTION FOR SURGICAL PROCEDURES OR ACUTE SERIOUS MEDICAL ILLNESS (MARCH 2020)

New recommendations have been issued following a European review of peri-operative diabetic ketoacidosis in patients taking SGLT2 inhibitors. Healthcare professionals are advised to monitor ketone levels during SGLT2 inhibitor treatment interruption in patients who have been hospitalised for major surgery or acute serious illness—measurement of blood ketone levels is preferred to urine. Treatment may be restarted once ketone levels are normal and the patient's condition has stabilised.

MHRA/CHM ADVICE: SGLT2 INHIBITORS: REPORTS OF FOURNIER'S GANGRENE (NECROTISING FASCIITIS OF THE GENITALIA OR PERINEUM) (FEBRUARY 2019)

Fournier's gangrene, a rare but serious and potentially life-threatening infection, has been associated with the use of sodium-glucose co-transporter 2 (SGLT2) inhibitors. If Fournier's gangrene is suspected, stop the SGLT2 inhibitor and urgently start treatment (including antibiotics and surgical debridement).

Patients should be advised to seek urgent medical attention if they experience severe pain, tenderness, erythema, or swelling in the genital or perineal area, accompanied by fever or malaise—urogenital infection or perineal abscess may precede necrotising fasciitis.

- CONTRA-INDICATIONS Diabetic ketoacidosis
- CAUTIONS Complicated urinary tract infections—consider temporarily interrupting treatment • elderly • hypotension • risk of volume depletion

CAUTIONS, FURTHER INFORMATION

- Volume depletion Ever Correct hypovolaemia before starting treatment. Consider interrupting treatment if volume depletion occurs.
- Elderly Evg Increased risk of volume depletion in patients aged 75 years and older; initiation not recommended in patients aged 85 years and older (limited information available). ♠
- INTERACTIONS → Appendix 1: sodium glucose cotransporter 2 inhibitors
- SIDE-EFFECTS
- ► Common or very common Balanoposthitis · constipation · hypoglycaemia (in combination with insulin or sulfonylurea) · hypovolaemia (more common in elderly) · increased risk of infection · skin reactions · thirst · urinary disorders · urosepsis
- ► Uncommon Angioedema
- Rare or very rare Diabetic ketoacidosis (discontinue immediately)

- ► Frequency not known Fournier's gangrene (discontinue and initiate treatment promptly)
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—present in milk in *animal* studies.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment—no information available.
- RENAL IMPAIRMENT
- ▶ When used for type 2 diabetes mellitus EvG Avoid initiation if eGFR below 60 mL/minute/1.73 m². Avoid if eGFR is persistently below 45 mL/minute/1.73 m². ♠
- ► When used for symptomatic chronic heart failure with reduced ejection fraction EvGr Avoid if eGFR below 20 mL/minute/1.73 m². ♠

Dose adjustments

- ▶ When used for type 2 diabetes mellitus EvGr Reduce dose to 10 mg once daily if eGFR falls persistently below 60 mL/minute/1.73 m². ♦ See p. 21.
- MONITORING REQUIREMENTS Determine renal function before treatment and before initiation of concomitant drugs that may reduce renal function, then at least annually thereafter.

Ertugliflozin

22-Feb-2022

 DRUG ACTION Reversibly inhibits sodium-glucose cotransporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

INDICATIONS AND DOSE

Type 2 diabetes mellitus as monotherapy (if metformin inappropriate) | Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)

- ► BY MOUTH
- Adult: 5 mg once daily; increased to 15 mg once daily if necessary and if tolerated, dose to be taken in the morning

DOSE ADJUSTMENTS DUE TO INTERACTIONS

 Manufacturer advises dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these
- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- use ertugliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved

 interrupt SGLT2 inhibitor treatment in patients who are hospitalised for major surgery or acute serious illnesses; treatment may be restarted once the patient's condition has stabilised

MHRA/CHM ADVICE: SGLT2 INHIBITORS: MONITOR KETONES IN BLOOD DURING TREATMENT INTERRUPTION FOR SURGICAL PROCEDURES OR ACUTE SERIOUS MEDICAL ILLNESS (MARCH 2020)

New recommendations have been issued following a European review of peri-operative diabetic ketoacidosis in patients taking SGLT2 inhibitors. Healthcare professionals are advised to monitor ketone levels during SGLT2 inhibitor treatment interruption in patients who have been hospitalised for major surgery or acute serious illness—measurement of blood ketone levels is preferred to urine. Treatment may be restarted once ketone levels are normal and the patient's condition has stabilised.

MHRA/CHM ADVICE: SGLT2 INHIBITORS: REPORTS OF FOURNIER'S GANGRENE (NECROTISING FASCIITIS OF THE GENITALIA OR PERINEUM) (FEBRUARY 2019)

Fournier's gangrene, a rare but serious and potentially life-threatening infection, has been associated with the use of sodium-glucose co-transporter 2 (SGLT2) inhibitors. If Fournier's gangrene is suspected, stop the SGLT2 inhibitor and urgently start treatment (including antibiotics and surgical debridement).

Patients should be advised to seek urgent medical attention if they experience severe pain, tenderness, erythema, or swelling in the genital or perineal area, accompanied by fever or malaise—urogenital infection or perineal abscess may precede necrotising fasciitis.

- CONTRA-INDICATIONS Diabetic ketoacidosis
- CAUTIONS Dehydration elderly (risk of volume depletion)
 history of hypotension

CAUTIONS, FURTHER INFORMATION

- Volume depletion Manufacturer advises correct hypovolaemia before starting treatment—consider interrupting treatment if volume depletion occurs.
- INTERACTIONS → Appendix 1: sodium glucose cotransporter 2 inhibitors
- SIDE-EFFECTS
- Common or very common Hypoglycaemia (in combination with insulin or sulfonylurea) - hypovolaemia - increased risk of infection - polydipsia - thirst - urinary disorders vulvovaginal pruritus
- Rare or very rare Diabetic ketoacidosis (discontinue immediately)
- ► Frequency not known Fournier's gangrene (discontinue and initiate treatment promptly) · lower limb amputations · phimosis

 ${\small \begin{array}{c} {\bf SIDE\text{-}EFFECTS,\,FURTHER\,INFORMATION\,\,\,Consider}\\ interrupting\,treatment\,if\,volume\,depletion\,occurs. \end{array}}$

- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—present in milk in *animal* studies.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment (no information available).
- RENAL IMPAIRMENT EVGT Avoid initiation if eGFR less than 60 mL/minute/1.73 m². Frequent monitoring of renal function required if eGFR less than 60 mL/minute/1.73 m². Avoid if eGFR is persistently less than 45 mL/minute/1.73 m². ♠ See p. 21.
- MONITORING REQUIREMENTS
- Manufacturer advises to determine renal function before treatment and periodically thereafter.

- Manufacturer advises monitor volume status and electrolytes during treatment in patients at risk of volume depletion.
- PATIENT AND CARER ADVICE Manufacturer advises that patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- ► Ertugliflozin as monotherapy or with metformin for treating type 2 diabetes (March 2019) NICE TA572 Recommended with restrictions
- ► Ertugliflozin with metformin and a dipeptidyl peptidase-4 inhibitor for treating type 2 diabetes (June 2019) NICE TA583 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Ertugliflozin (Steglatro®) in adults with type 2 diabetes mellitus as an adjunct to diet and exercise to improve glycaemic control: as monotherapy in patients for whom the use of metformin is considered inappropriate due to intolerance or contra-indications; in addition to other medicinal products for the treatment of diabetes (January 2019) SMC No. SMC2102 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

Steglatro (Merck Sharp & Dohme (UK) Ltd) ▼ Ertugliflozin (as Ertugliflozin L-pyroglutamic acid) 5 mg Steglatro 5mg tablets | 28 tablet [PoM] £29.40 DT = £29.40 Ertugliflozin (as Ertugliflozin L-pyroglutamic acid) 15 mg Steglatro 15mg tablets | 28 tablet [PoM] £29.40 DT = £29.40

BLOOD GLUCOSE LOWERING DRUGS > SULFONYLUREAS

Sulfonylureas

- DRUG ACTION The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action.
- CONTRA-INDICATIONS Presence of ketoacidosis
- CAUTIONS Can encourage weight gain elderly G6PD deficiency

CAUTIONS, FURTHER INFORMATION

- Elderly Prescription potentially inappropriate (STOPP criteria) if prescribed a long-acting sulfonylurea (e.g. glibenclamide, chlorpropamide, glimepiride) in type 2 diabetes mellitus (risk of prolonged hypoglycaemia).
 See also Prescribing in the elderly p. 29.
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · diarrhoea · hypoglycaemia · nausea
- ▶ Uncommon Hepatic disorders · vomiting
- Rare or very rare Agranulocytosis · erythropenia · granulocytopenia · haemolytic anaemia · leucopenia · pancytopenia · thrombocytopenia
- ► Frequency not known Allergic dermatitis (usually in the first 6–8 weeks of therapy) constipation photosensitivity reaction skin reactions visual impairment
- HEPATIC IMPAIRMENT In general, manufacturers advise avoid in severe impairment (increased risk of hypoglycaemia).
- RENAL IMPAIRMENT Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia. Care is required to use the lowest dose that adequately controls blood glucose. Avoid where possible in severe renal impairment.

• PATIENT AND CARER ADVICE The risk of hypoglycaemia associated with sulfonylureas should be discussed with the patient, especially when concomitant glucose-lowering drugs are prescribed.

Driving and skilled tasks Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

F 778

Gliclazide

10-Mar-2020

• INDICATIONS AND DOSE

Type 2 diabetes mellitus

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Initially 40–80 mg daily, adjusted according to response, increased if necessary up to 160 mg once daily, dose to be taken with breakfast, doses higher than 160 mg to be given in divided doses; maximum 320 mg per day
- ► BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: Initially 30 mg daily, dose to be taken with breakfast, adjust dose according to response every 4 weeks (after 2 weeks if no decrease in blood glucose); maximum 120 mg per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ Gliclazide modified release 30 mg may be considered to be approximately equivalent in therapeutic effect to standard formulation gliclazide 80 mg.
- CONTRA-INDICATIONS Avoid where possible in Acute porphyrias p. 1150
- INTERACTIONS → Appendix 1: sulfonylureas
- SIDE-EFFECTS Anaemia · angioedema · dyspepsia · gastrointestinal disorder · hypersensitivity vasculitis · hyponatraemia · severe cutaneous adverse reactions
- PREGNANCY The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- BREAST FEEDING Avoid—theoretical possibility of hypoglycaemia in the infant.
- RENAL IMPAIRMENT If necessary, gliclazide which is principally metabolised in the liver, can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

Glimepiride

F 778 27-Feb-2020

INDICATIONS AND DOSE

Type 2 diabetes mellitus ▶ BY MOUTH

- Adult: Initially 1 mg daily, adjusted according to response, then increased in steps of 1 mg every 1-2 weeks, increased to 4 mg daily, dose to be taken shortly before or with first main meal, the daily dose may be increased further, in exceptional circumstances; maximum 6 mg per day
- CAUTIONS
- Porphyria Sulfonylureas should be avoided where possible in Acute porphyrias p. 1150 but glimepiride is thought to be safe.
- INTERACTIONS → Appendix 1: sulfonylureas
- SIDE-EFFECTS
- ▶ Rare or very rare Gastrointestinal discomfort hypersensitivity vasculitis
- ▶ Frequency not known Drug cross-reactivity
- PREGNANCY The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- BREAST FEEDING Avoid—theoretical possibility of hypoglycaemia in the infant.
- MONITORING REQUIREMENTS Manufacturer recommends regular hepatic and haematological monitoring but limited evidence of clinical value.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral

Tablet

Glimepiride (Non-proprietary)

Tolbutamide

• INDICATIONS AND DOSE Type 2 diabetes mellitus

► BY MOUTH

- Adult: 0.5-1.5 g daily in divided doses, dose to be taken with or immediately after meals, alternatively 0.5-1.5 g once daily, dose to be taken with or immediately after breakfast; maximum 2 g per day
- CONTRA-INDICATIONS Avoid where possible in Acute porphyrias p. 1150
- INTERACTIONS → Appendix 1: sulfonylureas
- SIDE-EFFECTS
- ► Rare or very rare Aplastic anaemia · blood disorder
- Frequency not known Alcohol intolerance · appetite abnormal · erythema multiforme (usually in the first 6-8 weeks of therapy) · exfoliative dermatitis (usually in the first 6-8 weeks of therapy) · fever (usually in the first 6-8 weeks of therapy) · headache · hypersensitivity (usually in the first 6-8 weeks of therapy) · paraesthesia · tinnitus · weight increased
- PREGNANCY The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.

- BREAST FEEDING The use of sulfonylureas in breastfeeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.
- RENAL IMPAIRMENT If necessary, the short-acting drug tolbutamide can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension Tablet

► Tolbutamide (Non-proprietary)

Tolbutamide 500 mg Tolbutamide 500mg tablets | 28 tablet PoM £41.80 DT = £35.33

BLOOD GLUCOSE LOWERING DRUGS

THIAZOLIDINEDIONES

Pioglitazone

31-Mar-2020

 DRUG ACTION The thiazolidinedione, pioglitazone, reduces peripheral insulin resistance, leading to a reduction of blood-glucose concentration.

INDICATIONS AND DOSE

Type 2 diabetes mellitus (alone or combined with metformin or a sulfonylurea, or with both, or with insulin)

- ► BY MOUTH
- Adult: Initially 15–30 mg once daily, adjusted according to response to 45 mg once daily, in elderly patients, initiate with lowest possible dose and increase gradually; review treatment after 3–6 months and regularly thereafter

DOSE ADJUSTMENTS DUE TO INTERACTIONS

 Dose of concomitant sulfonylurea or insulin may need to be reduced.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PIOGLITAZONE CARDIOVASCULAR SAFETY (DECEMBER 2007 AND JANUARY 2011)

Incidence of heart failure is increased when pioglitazone is combined with insulin especially in patients with predisposing factors e.g. previous myocardial infarction. Patients who take pioglitazone should be closely monitored for signs of heart failure; treatment should be discontinued if any deterioration in cardiac status occurs.

Pioglitazone should not be used in patients with heart failure or a history of heart failure.

PIOGLITAZONE: RISK OF BLADDER CANCER (JULY 2011)

The European Medicines Agency has advised that there is a small increased risk of bladder cancer associated with pioglitazone use. However, in patients who respond adequately to treatment, the benefits of pioglitazone continue to outweigh the risks.

Pioglitazone should not be used in patients with active bladder cancer or a past history of bladder cancer, or in those who have uninvestigated macroscopic haematuria. Pioglitazone should be used with caution in elderly patients as the risk of bladder cancer increases with age.

Before initiating treatment with pioglitazone, patients should be assessed for risk factors of bladder cancer (including age, smoking status, exposure to certain occupational or chemotherapy agents, or previous radiation therapy to the pelvic region) and any macroscopic haematuria should be investigated. The safety and efficacy of pioglitazone should be reviewed after 3–6 months and pioglitazone should be stopped in patients who do not respond adequately to treatment.

Patients already receiving treatment with pioglitazone should be assessed for risk factors of bladder cancer and

treatment should be reviewed after 3–6 months, as above.

Patients should be advised to report promptly any haematuria, dysuria, or urinary urgency during treatment.

- CONTRA-INDICATIONS History of heart failure previous or active bladder cancer • uninvestigated macroscopic haematuria
- CAUTIONS Concomitant use with insulin (risk of heart failure) · elderly (increased risk of heart failure, fractures, and bladder cancer) · increased risk of bone fractures, particularly in women · risk factors for bladder cancer · risk factors for heart failure

CAUTIONS, FURTHER INFORMATION

 Elderly For thiazolidenediones, prescription potentially inappropriate (STOPP criteria) in patients with heart failure (risk of exacerbation).

See also Prescribing in the elderly p. 29.

- INTERACTIONS → Appendix 1: pioglitazone
- SIDE-EFFECTS
- ➤ Common or very common Bone fracture increased risk of infection • numbness • visual impairment • weight increased
- ▶ Uncommon Bladder cancer insomnia
- ► Frequency not known Macular oedema

SIDE-EFFECTS, FURTHER INFORMATION Rare reports of liver dysfunction; discontinue if jaundice occurs.

- PREGNANCY Avoid—toxicity in animal studies.
- BREAST FEEDING Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises avoid.
- MONITORING REQUIREMENTS Monitor liver function before treatment and periodically thereafter.
- PATIENT AND CARER ADVICE

Liver toxicity Patients should be advised to seek immediate medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue and dark urine develop.

NATIONAL FUNDING/ACCESS DECISIONS

INSULINS

Insulins

IMPORTANT SAFETY INFORMATION

NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF SEVERE HARM AND DEATH DUE TO WITHDRAWING INSULIN FROM PEN DEVICES (NOVEMBER 2016)
Insulin should not be extracted from insulin pen devices.

The strength of insulin in pen devices can vary by multiples of 100 units/mL. Insulin syringes have graduations only suitable for calculating doses of standard 100 units/mL. If insulin extracted from a pen or cartridge is of a higher strength, and that is not considered in determining the volume required, it can lead to a significant and potentially fatal overdose.

NHS NEVER EVENT: OVERDOSE OF INSULIN DUE TO ABBREVIATIONS OR INCORRECT DEVICE (JANUARY 2018)

The words 'unit' or 'international units' should **not** be abbreviated.

Specific insulin administration devices should always be used to measure insulin i.e. insulin syringes and pens. Insulin should **not** be withdrawn from an insulin pen

Insulin should **not** be withdrawn from an insulin pen or pen refill and then administered using a syringe and needle

MHRA/CHM ADVICE: INSULINS (ALL TYPES): RISK OF CUTANEOUS AMYLOIDOSIS AT INJECTION SITE (SEPTEMBER 2020)

A European review concluded that injection of insulin (all types) can lead to deposits of amyloid protein under the skin (cutaneous amyloidosis) at the injection site. Insulin-derived cutaneous amyloidosis interferes with insulin absorption, and administration of insulin at an affected site may affect glycaemic control. The MHRA advises healthcare professionals should consider cutaneous amyloidosis as a differential diagnosis to lipodystrophy when patients present with subcutaneous lumps at an insulin injection site. Patients should be reminded to rotate injection sites within the same body region to reduce or prevent the risk of cutaneous amyloidosis and other skin reactions. Patients should also be advised that injecting into an affected 'lumpy' area may reduce the effectiveness of insulin. Those currently injecting into a 'lumpy' area should contact their doctor before changing injection site due to the risk of hypoglycaemia; blood glucose should be closely monitored after changing injection site, and dose adjustment of insulin or other antidiabetic medication may be required.

- SIDE-EFFECTS
- ► Common or very common Oedema
- ▶ Uncommon Lipodystrophy
- Frequency not known Cutaneous amyloidosis
 Overdose Overdose causes hypoglycaemia.
- PREGNANCY

Dose adjustments During pregnancy, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy.

BREAST FEEDING

Dose adjustments During breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

- HEPATIC IMPAIRMENT Insulin requirements may be decreased.
- MONITORING REQUIREMENTS
- Many patients now monitor their own blood-glucose concentrations; all carers and children need to be trained to do this.
- Since blood-glucose concentration varies substantially throughout the day, 'normoglycaemia' cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia.
- In adults It is therefore best to recommend that patients should maintain a blood-glucose concentration of between 4 and 9 mmol/litre for most of the time (4–7 mmol/litre before meals and less than 9 mmol/litre after meals).
- In children It is therefore best to recommend that children should maintain a blood-glucose concentration of between 4 and 10 mmol/litre for most of the time (4–8 mmol/litre before meals and less than 10 mmol/litre after meals).

While accepting that on occasions, for brief periods, the blood-glucose concentration will be above these values; strenuous efforts should be made to prevent it from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.

- DIRECTIONS FOR ADMINISTRATION Insulin is generally given by subcutaneous injection; the injection site should be rotated to prevent lipodystrophy and cutaneous amyloidosis. Injection devices ('pens'), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form, but are less popular with children and carers.
- PRESCRIBING AND DISPENSING INFORMATION Show container to patient or carer and confirm the expected version is dispensed.
- Units The word 'unit' should **not** be abbreviated.

PATIENT AND CARER ADVICE

Hypoglycaemia Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed

on how to avoid it; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

Insulin Passport Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient's current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:

3M Security Print and Systems Limited Gorse Street, Chadderton Oldham

OL9 9OH

Tel: 0845 610 1112

 $\ensuremath{\mathsf{GP}}$ practices can obtain supplies through their Local Area Team stores.

NHS Trusts can order supplies from www.nhsforms.co.uk/. Further information is available at www.england.nhs.uk/improvement-hub/publication/safe-use-of-insulin-and-you/. Driving and skilled tasks Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

INSULINS > RAPID-ACTING

F 781

Insulin

(Insulin Injection; Neutral Insulin; Soluble Insulin short acting)

• INDICATIONS AND DOSE

Diabetes mellitus

- ► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: According to requirements

Diabetic ketoacidosis | Diabetes during surgery

- ► BY INTRAVENOUS INFUSION
- Adult: (consult local protocol)
- INTERACTIONS → Appendix 1: insulin
- SIDE-EFFECTS
- ► Uncommon Skin reactions
- ► Rare or very rare Refraction disorder
- DIRECTIONS FOR ADMINISTRATION Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team. Some insulin preparations are not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle—consult product literature.
- With intravenous use For intravenous infusion give continuously in Sodium chloride 0.9%. Adsorbed to some extent by plastic infusion set; ensure insulin is not injected into 'dead space' of injection port of the infusion bag.
- PRESCRIBING AND DISPENSING INFORMATION A sterile solution of insulin (i.e. bovine or porcine) or of human insulin; pH 6.6–8.0.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

- ► Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Insulin aspart

F 781 28-Jul-2020

(Recombinant human insulin analogue-short acting)

INDICATIONS AND DOSE

FIASP®

Diahetes mellitus

- **▶** BY SUBCUTANEOUS INJECTION
- ► Child 1-17 years: Administer immediately before meals or when necessary shortly after meals, according to requirements
- Adult: Administer immediately before meals or when necessary shortly after meals, according to
- ► BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION
- ▶ Child 1-17 years: According to requirements
- Adult: According to requirements

NOVORAPID ®

Diabetes mellitus

- **▶** BY SUBCUTANEOUS INJECTION
- Child: Administer immediately before meals or when necessary shortly after meals, according to requirements
- Adult: Administer immediately before meals or when necessary shortly after meals, according to requirements

- ▶ BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION
- ▶ Child: According to requirements
- Adult: According to requirements

PHARMACOKINETICS

► Fiasp® and NovoRapid® are **not** interchangeable due to differences in bioavailability; Fiasp® has a quicker onset of action and shorter duration.

UNLICENSED USE

- In children Not licensed for use in children under 1 year.
- INTERACTIONS → Appendix 1: insulin
- SIDE-EFFECTS
- ► Common or very common Skin reactions
- ▶ Uncommon Refraction disorder
 - PREGNANCY Not known to be harmful—may be used during pregnancy.
 - BREAST FEEDING Not known to be harmful—may be used during lactation.
- DIRECTIONS FOR ADMINISTRATION Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.

Manufacturer advises for intravenous infusion of Fiasp® give continuously in Glucose 5% or Sodium Chloride 0.9%; dilute to 0.5-1 unit/mL with infusion fluid.

Manufacturer advises for intravenous infusion of NovoRapid®, give continuously in Glucose 5% or Sodium Chloride 0.9%; dilute to 0.05-1 unit/mL with infusion fluid; adsorbed to some extent by plastics of infusion set.

 PRESCRIBING AND DISPENSING INFORMATION Insulin aspart is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1. Dose adjustments and close metabolic monitoring is recommended if switching between insulin aspart preparations.

 NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

► Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151 Recommended

Scottish Medicines Consortium (SMC) decisions

- ► Insulin aspart (Fiasp®) for the treatment of diabetes mellitus in adults (April 2017) SMC No. 1227/17 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Fiasp (Novo Nordisk Ltd)

Insulin aspart 100 unit per 1 ml Fiasp 100units/ml solution for injection 10ml vials | 1 vial Pom £14.08 DT = £14.08

INSULINS > INTERMEDIATE-ACTING

Biphasic isophane insulin

05-Oct-2021

(Biphasic Isophane Insulin Injection-intermediate acting)

• INDICATIONS AND DOSE

Diahetes mellitus

- ► BY SUBCUTANEOUS INJECTION
- Child: According to requirements
- Adult: According to requirements
- INTERACTIONS → Appendix 1: insulin
- SIDE-EFFECTS
- ▶ Rare or very rare Angioedema
- ► Frequency not known Hypokalaemia weight increased
- PRESCRIBING AND DISPENSING INFORMATION A sterile buffered suspension of either porcine or human insulin complexed with protamine sulfate (or another suitable protamine) in a solution of insulin of the same species.

Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

INSULINS > LONG-ACTING

F 781

Insulin degludec

22-0ct-2020

(Recombinant human insulin analogue—long acting)

• INDICATIONS AND DOSE

Diabetes mellitus

- ► BY SUBCUTANEOUS INJECTION
- Child 1-17 years: Dose to be given according to requirements
- Adult: Dose to be given according to requirements
- INTERACTIONS → Appendix 1: insulin
- SIDE-EFFECTS
- ▶ Rare or very rare Urticaria
- PREGNANCY Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.
- PRESCRIBING AND DISPENSING INFORMATION Insulin degludec (Tresiba®) is available in strengths of 100 units/mL (allows 1-unit dose adjustment) and 200 units/mL (allows 2-unit dose adjustment)—ensure correct strength prescribed.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

All Wales Medicines Strategy Group (AWMSG) decisions

- Insulin degludec (Tresiba®) for treatment of diabetes mellitus in adult patients where treatment with a basal insulin analogue is considered appropriate (October 2016) AWMSG No. 3158 Recommended with restrictions
- ► Insulin degludec (Tresiba®) for treatment of diabetes mellitus in adolescents and children from the age of 1 year where treatment with a basal insulin analogue is considered appropriate (October 2016) AWMSG No. 3158 Not recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Tresiba FlexTouch (Novo Nordisk Ltd) Insulin degludec 100 unit per 1 ml Tresiba FlexTouch 100units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection PoM £46.60 DT = £46.60

Insulin degludec 200 unit per 1 ml Tresiba FlexTouch 200units/ml solution for injection 3ml pre-filled pens | 3 pre-filled disposable injection Poml £55.92 DT = £55.92

➤ Tresiba Penfill (Novo Nordisk Ltd)
Insulin degludec 100 unit per 1 ml Tresiba Penfill 100units/ml solution for injection 3ml cartridges | 5 cartridge PoM £46.60 DT = 546.60

Insulin degludec with liraglutide

22-Oct-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, insulin degludec p. 786, liraglutide p. 769.

• INDICATIONS AND DOSE

As add-on to oral antidiabetics in type 2 diabetes mellitus not controlled by oral antidiabetics alone

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 10 dose-steps once daily, adjusted according to response; maximum 50 dose-steps per day

When transferring from basal insulin in type 2 diabetes mellitus not controlled by oral antidiabetics in combination with basal insulin

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 16 dose-steps once daily, adjusted according to response; maximum 50 dose-steps per day
- INTERACTIONS → Appendix 1: glucagon-like peptide-1 receptor agonists · insulin
- PATIENT AND CARER ADVICE Counselling advised on administration. Show container to patient and confirm that patient is expecting the version dispensed.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- ▶ Insulin degludec/liraglutide (*Xultophy®*) for treatment of adults with type 2 diabetes mellitus to improve glycaemic control in combination with oral glucose-lowering medicinal products when these alone or combined with a GLP-1 receptor agonist or with basal insulin do not provide adequate glycaemic control (October 2015) SMC No. 1088/15 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Xultophy (Novo Nordisk Ltd)

Liraglutide 3.6 mg per 1 ml, Insulin degludec 100 unit per 1 ml Xultophy 100units/ml / 3.6mg/ml solution for injection 3ml prefilled pens | 3 pre-filled disposable injection [PoM] £95.53 DT = £95.53

- **Diabetes mellitus**
- ► BY SUBCUTANEOUS INJECTION
 ► Adult: According to requirements
- .
- INTERACTIONS → Appendix 1: insulin
- SIDE-EFFECTS
- ▶ Rare or very rare Myalgia · sodium retention · taste altered
- PREGNANCY Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.
- PRESCRIBING AND DISPENSING INFORMATION Insulin glargine is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1. Dose adjustments and close metabolic monitoring is recommended if switching between insulin glargine preparations.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Insulin glargine (Lantus®) for the treatment of diabetes mellitus in adults, adolescents and children aged 2 years and above (April 2013) SMC No. 860/13 Recommended with restrictions
- ► Insulin glargine (Toujeo®) for the treatment of type 1 or type 2 diabetes mellitus in adults aged 18 years and above (September 2015) SMC No. 1078/15 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Insulin glargine (Non-proprietary)
Insulin glargine 100 unit per 1 ml Abasaglar Tempo Pen
100nnits/ml solution for injection 3ml pre-filled pens | 5 pre-filled
disposable injection [PoM] NOT = 534.75

► Abasaglar (Eli Lilly and Company Ltd) Insulin glargine 100 unit per 1 ml Abasaglar 100 units/ml solution for injection 3ml cartridges | 5 cartridge PoM £35.28 DT = £34.75

► Lantus (Sanofi)

Insulin glargine 100 unit per 1 ml Lantus 100units/ml solution for injection 3ml cartridges | 5 cartridge [№M] £34.75 DT = £34.75 Lantus 100units/ml solution for injection 3ml pre-filled SoloStar pens | 5 pre-filled disposable injection [№M] £34.75 DT = £34.75 Lantus 100units/ml solution for injection 10ml vials | 1 vial [№M] £25.69 DT = £25.69

Semglee (Viatris UK Healthcare Ltd) ▼ Insulin glargine 100 unit per 1 ml Semglee 100units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM 579 99 NT = \$73.4.75

Toujeo (Sanofi

Insulin glargine 300 unit per 1 ml Toujeo 300units/ml solution for injection 1.5ml pre-filled SoloStar pens | 3 pre-filled disposable injection Fom £32.14 DT = £32.14

► Touieo DoubleStar (Sanofi)

Insulin glargine 300 unit per 1 ml Toujeo 300units/ml solution for injection 3ml pre-filled DoubleStar pens | 3 pre-filled disposable injection Pom £64.27 DT = £64.27

Insulin glargine with lixisenatide

09-Nov-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, insulin glargine p. 787, lixisenatide p. 770.

• INDICATIONS AND DOSE

Type 2 diabetes mellitus [in combination with metformin]

- ► BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature)
- INTERACTIONS → Appendix 1: glucagon-like peptide-1 receptor agonists · insulin
- PRESCRIBING AND DISPENSING INFORMATION Suliqua[®] is available in two pen strengths, providing different dosing options. To avoid medication errors, the prescriber must ensure that the correct strength and number of dose steps is prescribed. The manufacturer of Suliqua[®] has provided a healthcare professional guide and letter which includes important information on dosing.
- PATIENT AND CARER ADVICE Manufacturer advises check pen label before each administration to avoid medication error.

A patient guide should be provided.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Insulin glargine with lixisenatide (Suliqua®) in combination with metformin for the treatment of adults with type II diabetes mellitus (T2DM), to improve glycaemic control when this has not been provided by metformin alone or metformin combined with another oral glucose-lowering medicinal product or with basal insulin (April 2020) SMC No. SMC2235 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

► Suliqua (Sanofi)

Lixisenatide 33 microgram per 1 ml, Insulin glargine 100 unit per 1 ml Suliqua 100units/ml / 33micrograms/ml solution for injection 3ml pre-filled SoloStar pens | 3 pre-filled disposable injection PoM £48.60 DT = £48.60

Lixisenatide 50 microgram per 1 ml, Insulin glargine 100 unit per 1 ml Suliqua 100units/ml / 50micrograms/ml solution for injection 3ml pre-filled SoloStar pens | 3 pre-filled disposable injection PoM 675 0 DT = 667 50

4.1a Diabetes, diagnosis and monitoring

Diabetes mellitus, diagnostic and monitoring devices

Urinalysis: urinary glucose

Reagent strips are available for measuring for glucose in the urine. Tests for ketones by patients are rarely required unless they become unwell—see Blood Monitoring.

Microalbuminuria can be detected with Micral- $Test II^{\otimes}$ but this should be followed by confirmation in the laboratory, since false positive results are common.

Blood glucose monitoring

Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Patients should be properly trained in the use of blood glucose monitoring systems and to take appropriate action on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen.

Self-monitoring of blood-glucose concentration is appropriate for patients with type 2 diabetes:

- · who are treated with insulin:
- who are treated with oral hypoglycaemic drugs e.g. sulfonylureas, to provide information on hypoglycaemia;
- to monitor changes in blood-glucose concentration resulting from changes in lifestyle or medication, and during intercurrent illness;
- to ensure safe blood-glucose concentration during activities, including driving.

In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units.

If the patient is unwell and diabetic ketoacidosis is suspected, blood **ketones** should be measured according to local guidelines. Patients and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

4.2 Hypoglycaemia

Hypoglycaemia

17-Jun-2021

Description of condition

Hypoglycaemia is a lower than normal blood-glucose concentration. It results from an imbalance between glucose supply, glucose utilisation, and existing insulin concentration. It can be defined as 'mild' if the episode is self-treated and 'severe' if assistance is required. For the purposes of hospital inpatients diagnosed with diabetes, anyone with a blood-glucose concentration less than 4 mmol/litre should be treated.

Hypoglycaemia is the most common side-effect of insulin and sulfonylureas in the treatment of all types of diabetes mellitus and presents a major barrier to satisfactory longterm glycaemic control. Metformin hydrochloride p. 761, pioglitazone p. 780, the dipeptidylpeptidase-4 inhibitors (gliptins), sodium-glucose co-transporter-2 inhibitors, and glucagon-like peptide-1 receptor agonists, prescribed without insulin or sulfonylurea therapy, are unlikely to result in hypoglycaemia. Hypoglycaemia should be excluded in any person with diabetes who is acutely unwell, drowsy, unconscious, unable to co-operate, or presenting with aggressive behaviour or seizures.

Treatment of hypoglycaemia

For a quick reference resource with doses for the treatment of hypoglycaemia, see Hypoglycaemia in Medical emergencies in the community p. 1842.

EvGr Adults with symptoms of hypoglycaemia who have a blood-glucose concentration greater than 4 mmol/litre, should be treated with a small carbohydrate snack such as a slice of bread or a normal meal, if due.

Any patient with a blood-glucose concentration less than 4 mmol/litre, with or without symptoms, and who is conscious and able to swallow, should be treated with a fast-acting carbohydrate by mouth. Fast-acting carbohydrates include Lift® glucose liquid (previously Glucojuice®), glucose tablets, glucose 40% gels (e.g. Glucogel®, Dextrogel®, or Rapilose®), pure fruit juice, and sugar (sucrose) dissolved in an appropriate volume of water. Oral glucose formulations p. 1132 are preferred as absorption occurs more quickly. Orange juice should not be given to patients following a low-potassium diet due to chronic kidney disease, and sugar dissolved in water is not effective for patients taking acarbose which prevents the breakdown of sucrose to glucose. (E) EVGT Chocolates and biscuits should be avoided if possible, as they have a lower sugar content and their high fat content may delay stomach emptying.

EvGr If necessary, repeat treatment after 15 minutes, up to a maximum of 3 treatments in total. Once blood-glucose concentration is above 4 mmol/litre and the patient has recovered, a snack providing a long-acting carbohydrate should be given to prevent blood glucose from falling again (e.g. two biscuits, one slice of bread, 200-300 mL of milk (not soya or other forms of 'alternative' milk, e.g. almond or coconut), or a normal carbohydrate-containing meal if due). Insulin should not be omitted if due, but the dose regimen may need review.

Hypoglycaemia which does not respond (blood-glucose concentration remains below 4 mmol/litre after 30–45 minutes or after 3 treatment cycles), should be treated with intramuscular glucagon below or glucose 10% intravenous infusion. In alcoholic patients, thiamine supplementation should be given with, or following, the administration of intravenous glucose to minimise the risk of Wernicke's encephalopathy. (£)

Glucagon is a polypeptide hormone produced by the alpha cells of the islets of Langerhans, which increases blood-glucose concentration by mobilising glycogen stored in the liver. The manufacturer advises that it is ineffective in patients whose liver glycogen is depleted, therefore should not be used in anyone who has fasted for a prolonged period or has adrenal insufficiency, chronic hypoglycaemia, or alcohol-induced hypoglycaemia. [EVGT] Glucagon may also be less effective in patients taking a sulfonylurea; in these cases, intravenous glucose will be required.

Ever In an emergency, if the patient has a decreased level of consciousness caused by hypoglycaemia, intramuscular glucagon can be given by a family member or friend who has been shown how to use it. (A) EVER If glucagon is not effective after 10 minutes, glucose 10% intravenous infusion should be given. (E)

Hypoglycaemia which causes unconsciousness is an emergency. [EvGF] Patients who are unconscious, having seizures, or who are very aggressive, should have any intravenous insulin stopped, and be treated initially with glucagon. If glucagon is unsuitable, or there is no response after 10 minutes, glucose 10% intravenous infusion, or alternatively glucose 20% intravenous infusion should be given. © Glucose 50% intravenous infusion is not recommended as it is hypertonic, thus increases the risk of extravasation injury, and is viscous, making administration difficult.

Ever A long-acting carbohydrate should be given as soon as possible once the patient has recovered and their blood-glucose concentration is above 4 mmol/litre (e.g. two biscuits, one slice of bread, 200–300 mL of milk (not soya or other forms of 'alternative' milk, e.g. almond or coconut), or a normal carbohydrate-containing meal if due). Patients who have received glucagon require a larger portion of long-acting carbohydrate to replenish glycogen stores (e.g. four biscuits, two slices of bread, 400–600 mL of milk (not soya or other forms of 'alternative' milk, e.g. almond or coconut), or a normal carbohydrate containing meal if due). Glucose 10% intravenous infusion should be given to patients who are nil by mouth.

If an insulin injection is due, it should **not** be omitted; however, a review of the usual insulin regimen may be required. Patients who self-manage their insulin pump may need to adjust their pump infusion rate. If the patient was on intravenous insulin, continue to check blood-glucose concentration every 15 minutes until above 3.5 mmol/litre, then re-start intravenous insulin after review of the dose regimen. Concurrent glucose 10% intravenous infusion should be considered.

Hypoglycaemia caused by a sulfonylurea or long-acting insulin, may persist for up to 24–36 hours following the last dose, especially if there is concurrent renal impairment.

Ever Blood-glucose monitoring should be continued for at least 24–48 hours.

GLYCOGENOLYTIC HORMONES

Glucagon

10-Nov-2021

INDICATIONS AND DOSE

Diabetic hypoglycaemia

- ► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Child 1 month-8 years (body-weight up to 25 kg):
 500 micrograms, if no response within 10 minutes intravenous glucose must be given
- Child 9-17 years (body-weight 25 kg and above): 1 mg, if no response within 10 minutes intravenous glucose must be given
- Adult: 1 mg, if no response within 10 minutes intravenous glucose must be given

Severe hypotension, heart failure or cardiogenic shock due to acute overdosage of beta-blockers

- ► INITIALLY BY INTRAVENOUS INJECTION
- Child: 50-150 micrograms/kg (max. per dose 10 mg), administered over 1-2 minutes, followed by (by intravenous infusion) 50 micrograms/kg/hour, titrated according to response
- Adult: 5-10 mg, administered over 1-2 minutes, followed by (by intravenous infusion)
 50-150 micrograms/kg/hour, titrated according to response

Diagnostic aid

- ► BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ► Adult: (consult product literature)

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 unit of glucagon = 1 mg of glucagon.
- UNLICENSED USE TOXBASE advises glucagon is used for the treatment of severe hypotension, heart failure or cardiogenic shock due to acute overdosage of betablockers, but it is not licensed for this indication.
 CONTRA-INDICATIONS Phaeochromocytoma
- CAUTIONS Glucagonoma · ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency · insulinoma
- INTERACTIONS → Appendix 1: glucagon
- SIDE-EFFECTS
- ► Common or very common Nausea
- ▶ Uncommon Vomiting
- ► Rare or very rare Abdominal pain hypertension hypotension tachycardia
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion, TOXBASE advises reconstituted solution may be used undiluted or diluted in Glucose 5%.
 Incompatibility For intravenous infusion, expert sources advise do not add to infusion fluids containing calcium precipitation may occur.
- PATIENT AND CARER ADVICE

Medicines for Children leaflet: Glucagon for hypoglycaemia www.medicinesforchildren.org.uk/medicines/glucagon-forhypoglycaemia/

- EXCEPTIONS TO LEGAL CATEGORY Prescription-only medicine restriction does not apply where administration is for saving life in emergency.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

► GlucaGen Hypokit (Novo Nordisk Ltd)

Glucagon hydrochloride 1 mg GlucaGen Hypokit 1 mg powder and solvent for solution for injection | 1 vial PoM £11.52 DT = £11.52

4.2a Chronic hypoglycaemia

GLYCOGENOLYTIC HORMONES

Diazoxide

17-May-2021

INDICATIONS AND DOSE

Chronic intractable hypoglycaemia

► BY MOUTH

- Adult: Initially 5 mg/kg daily in 2-3 divided doses, adjusted according to response; maintenance 3-8 mg/kg daily in 2-3 divided doses
- CAUTIONS Aortic coarctation · aortic stenosis · arteriovenous shunt · heart failure · hyperuricaemia · impaired cardiac circulation · impaired cerebral circulation
- INTERACTIONS → Appendix 1: diazoxide
- SIDE-EFFECTS Abdominal pain · albuminuria · appetite decreased (long term use) · arrhythmia · azotaemia · cardiomegaly · cataract · constipation · diabetic hyperosmolar coma · diarrhoea · dizziness · dyspnoea · eosinophilia · extrapyramidal symptoms · fever · fluid retention · galactorrhoea · haemorrhage · headache · heart failure · hirsutism · hyperglycaemia · hyperuricaemia (long term use) · hypogammaglobulinaemia · hypotension · ileus · ketoacidosis · leucopenia · libido decreased · musculoskeletal pain · nausea · nephritic syndrome · oculogyric crisis · pancreatitis · parkinsonism · pulmonary hypertension · skin reactions · sodium retention · taste altered · thrombocytopenia · tinnitus · vision disorders · voice alteration (long term use) · vomiting
- PREGNANCY Use only if essential; alopecia and hypertrichosis reported in neonates with prolonged use; may inhibit uterine activity during labour.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- RENAL IMPAIRMENT

Dose adjustments EvGr Dose reduction may be required.

- MONITORING REQUIREMENTS
- ► Monitor blood pressure.
- Monitor white cell and platelet count during prolonged use.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

► Eudemine (RPH Pharmaceuticals AB)

DT = £72.55

Capsule

Diazoxide (Non-proprietary)

Diazoxide 25 mg Proglycem 25 capsules | 100 capsule PoM 🖫

5 Dopamine responsive conditions

DOPAMINERGIC DRUGS > DOPAMINE RECEPTOR AGONISTS

Dopamine-receptor agonists

Overview

Bromocriptine p. 452 is used for the treatment of galactorrhoea, and for the treatment of prolactinomas (when

it reduces both plasma prolactin concentration and tumour size). Bromocriptine also inhibits the release of growth hormone and is sometimes used in the treatment of acromegaly, but somatostatin analogues (such as octreotide p. 1025) are more effective.

Cabergoline p. 453 has similar side-effects to bromocriptine, however patients intolerant of bromocriptine may be able to tolerate cabergoline (and *vice versa*).

Quinagolide below has actions and uses similar to those of ergot-derived dopamine agonists, but its side-effects differ slightly.

Suppression of lactation

Although bromocriptine and cabergoline are licensed to suppress lactation, they are **not** recommended for routine suppression (or for the relief of symptoms of postpartum pain and engorgement) that can be adequately treated with simple analgesics and breast support. If a dopamine-receptor agonist is required, cabergoline is preferred. Quinagolide is not licensed for the suppression of lactation.

Quinagolide

19-Apr-2021

 DRUG ACTION Quinagolide is a non-ergot dopamine D₂ agonist.

INDICATIONS AND DOSE

Hyperprolactinaemia

- ► BY MOUTH
- Adult: Initially 25 micrograms once daily for 3 days, dose to be taken at bedtime, increased in steps of 25 micrograms every 3 days; usual dose 75–150 micrograms daily, for doses higher than 300 micrograms daily increase in steps of 75–150 micrograms at intervals of not less than 4 weeks
- UNLICENSED USE Not licensed for the suppression of lactation.
- CAUTIONS Acute porphyrias p. 1150 · history of psychotic illness · history of serious mental disorders
 CAUTIONS, FURTHER INFORMATION
- Hyperprolactinemic patients In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).
- INTERACTIONS → Appendix 1: dopamine receptor agonists
- SIDE-EFFECTS
- Common or very common Abdominal pain · appetite decreased · constipation · diarrhoea · dizziness · fatigue · flushing · headache · hypotension · insomnia · nasal congestion · nausea · oedema · syncope · vomiting
- ▶ Rare or very rare Acute psychosis · drowsiness
- CONCEPTION AND CONTRACEPTION Advise non-hormonal contraception if pregnancy not desired.
- PREGNANCY Discontinue when pregnancy confirmed unless medical reason for continuing (specialist advice needed).
- BREAST FEEDING Suppresses lactation.
- HEPATIC IMPAIRMENT Manufacturer advises avoid (no information available).
- RENAL IMPAIRMENT EVGr Avoid (no information available).
- MONITORING REQUIREMENTS Monitor blood pressure for a few days after starting treatment and following dosage increase.

PATIENT AND CARER ADVICE

Driving and skilled tasks

BNF 84

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can be disturbing in some patients during the first few days of treatment with dopamine-receptor agonists, particular care should be exercised when driving or operating machinery.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

6 Gonadotrophin responsive conditions

Gonadotrophins

Gonadotrophin-affecting drugs

Danazol is licensed for the treatment of *endometriosis* and for the relief of severe pain and tenderness in *benign fibrocystic breast disease* where other measures have proved unsatisfactory. It may also be effective in the long-term management of *hereditary angioedema*[unlicensed indication].

Cetrorelix below and ganirelix below are luteinising hormone releasing hormone antagonists, which inhibit the release of gonadotrophins (luteinising hormone and follicle stimulating hormone). They are used in the treatment of infertility by assisted reproductive techniques.

Gonadorelin analogues

Gonadorelin analogues are used in the treatment of endometriosis, precocious puberty, infertility, male hypersexuality with severe sexual deviation, anaemia due to uterine fibroids (together with iron supplementation), breast cancer, prostate cancer and before intra-uterine surgery. Use of leuprorelin acetate and triptorelin for 3 to 4 months before surgery reduces the uterine volume, fibroid size and associated bleeding.

Breast pain (mastalgia)

Once any serious underlying cause for breast pain has been ruled out, most women will respond to reassurance and reduction in dietary fat; withdrawal of an oral contraceptive or of hormone replacement therapy may help to resolve the pain.

Mild, non-cyclical breast pain is treated with simple analgesics; moderate to severe pain, cyclical pain or symptoms that persist for longer than 6 months may require specific drug treatment.

Danazol is licensed for the relief of severe pain and tenderness in benign fibrocystic breast disease which has not responded to other treatment.

Tamoxifen p. 1028 may be a useful adjunct in the treatment of mastalgia [unlicensed indication] especially when symptoms can definitely be related to cyclic oestrogen production; it may be given on the days of the cycle when symptoms are predicted.

Treatment for breast pain should be reviewed after 6 months and continued if necessary. Symptoms recur in about 50% of women within 2 years of withdrawal of therapy but may be less severe.

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > ANTI-GONADOTROPHINRELEASING HORMONES

Cetrorelix

22-Apr-2021

• INDICATIONS AND DOSE

Adjunct in the treatment of female infertility (initiated under specialist supervision)

- **▶** BY SUBCUTANEOUS INJECTION
- Adult (female): 250 micrograms once daily, dose to be administered in the morning, starting on day 5 or 6 of ovarian stimulation with gonadotrophins (or each evening starting on day 5 of ovarian stimulation), continue throughout administration of gonadotrophin including day of ovulation induction (or evening before ovulation induction), dose to be injected into the lower abdominal wall.

SIDE-EFFECTS

- Common or very common Ovarian hyperstimulation syndrome
- ▶ Uncommon Headache · hypersensitivity · nausea
- PREGNANCY Avoid in confirmed pregnancy.
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT Manufacturer advises use with caution—no information available.
- RENAL IMPAIRMENT Ever Use with caution in mild to moderate impairment; avoid in severe impairment (no information available).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

Cetrotide (Merck Serono Ltd)

Cetrorelix (as Cetrorelix acetate) 250 microgram Cetrotide 250microgram powder and solvent for solution for injection vials | 1 vial PoM £27.13 DT = £27.13

Ganirelix

22-Apr-2021

INDICATIONS AND DOSE

Adjunct in the treatment of female infertility (initiated under specialist supervision)

- **▶** BY SUBCUTANEOUS INJECTION
- Adult: 250 micrograms once daily, dose to be administered in the morning (or each continued →

afternoon) starting on day 5 or day 6 of ovarian stimulation with gonadotrophins, continue throughout administration of gonadotrophins including day of ovulation induction (if administering in afternoon, give last dose in afternoon before ovulation induction), dose to be injected preferably into the upper leg (rotate injection sites to prevent lipoatrophy)

- SIDE-FFFFCTS
- ► Common or very common Skin reactions
- ▶ Uncommon Headache · malaise · nausea
- Rare or very rare Dyspnoea · facial swelling · hypersensitivity
- ► Frequency not known Abdominal distension ovarian hyperstimulation syndrome • pelvic pain
- PREGNANCY Avoid in confirmed pregnancy—toxicity in animal studies.
- BREAST FEEDING Avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in moderate to severe impairment (no information available).
- RENAL IMPAIRMENT EVGr Avoid in moderate to severe renal impairment (no information available).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Fyremadel (Ferring Pharmaceuticals Ltd)
Ganirelix 500 microgram per 1 ml Fyremadel
250micrograms/0.5ml solution for injection pre-filled syringes | 1 prefilled disposable injection [₱ǝM] SQ (Hospital only)

Relugolix with estradiol and norethisterone acetate

12-Oct-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 815, norethisterone p. 823.

 DRUG ACTION Relugolix is a non-peptide gonadotropinreleasing hormone (GnRH) receptor antagonist that prevents follicular growth and development, thereby reducing production of oestrogen and progesterone.
 Relugolix is combined with the oestrogen estradiol to reduce symptoms related to lowered levels of oestrogen, and the progestogen norethisterone to counteract estradiol-induced endometrial hyperplasia.

• INDICATIONS AND DOSE

Moderate to severe uterine fibroids

- ► BY MOUTH
- Adult: 1 tablet once daily, dose to be taken at around the same time each day, starting within 5 days of the onset of menstrual bleeding, consider discontinuing treatment when patient enters menopause
- CONTRA-INDICATIONS Osteoporosis
- CAUTIONS History of depression (discontinue if severe depression recurs) · risk factors for osteoporosis (dual Xray absorptiometry (DXA) scan recommended before starting)
- INTERACTIONS → Appendix 1: estradiol · norethisterone · relugolix
- SIDE-EFFECTS
- ► Common or very common Alopecia · breast cyst · dyspepsia · hot flush · irritability · libido decreased · menstrual cycle irregularities · sweat changes · uterine haemorrhage
- ▶ Uncommon Uterine myoma expulsion
- ▶ Frequency not known Bone loss embolism and thrombosis • uterine leiomyoma prolapse
- CONCEPTION AND CONTRACEPTION Evgr Ryeqo[®] inhibits ovulation and provides adequate contraception when used

for at least 1 month at the recommended dose. Effective non-hormonal contraception is recommended for the first month after initiation of treatment and for 7 days following 2 or more consecutive missed doses. Patients should not take other hormonal contraceptives while being treated with $Ryeqo^{\odot}$. Ovulation returns rapidly after discontinuing $Ryeqo^{\odot}$. An alternative method of contraception should start immediately after discontinuing treatment. (\Re)

- PREGNANCY Evgr Avoid—relugolix showed embryotoxicity in animal studies.
- BREAST FEEDING Evg: Avoid during treatment and for 2 weeks following last treatment—relugolix present in milk in animal studies.
- MONITORING REQUIREMENTS [EVG: A dual X-ray absorptiometry (DXA) scan is recommended after 1 year of treatment.
- PATIENT AND CARER ADVICE Advise patients to contact their doctor if they experience mood changes and depressive symptoms during treatment.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

ablet

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GONADOTROPHIN-

RELEASING HORMONES

Buserelin

04-Sep-2020

 DRUG ACTION Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

• INDICATIONS AND DOSE

Endometriosis

- ► BY INTRANASAL ADMINISTRATION
- Adult: 300 micrograms 3 times a day maximum duration of treatment 6 months (do not repeat), to be started on days 1 or 2 of menstruation; administer one 150 microgram spray into each nostril

Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under expert supervision)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 200-500 micrograms once daily, increased if necessary up to 500 micrograms twice daily, starting in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually 1-3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)
- ► BY INTRANASAL ADMINISTRATION
- Adult: 150-300 micrograms 4 times a day, (150 micrograms equivalent to one spray), to be administered during waking hours. Start in early follicular phase (day 1) or, after exclusion of pregnancy, in the midluteal phase (day 21) and continued until down-regulation achieved (usually

about 2–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

Advanced prostate cancer

- ► INITIALLY BY SUBCUTANEOUS INJECTION
- Adult: 500 micrograms every 8 hours for 7 days, then (by intranasal administration) 200 micrograms 6 times a day, (a single 100 microgram spray to be administered into each nostril)

CONTRA-INDICATIONS

- When used for endometriosis Undiagnosed vaginal bleeding use longer than 6 months (do not repeat)
- When used for pituitary desensitisation Undiagnosed vaginal bleeding
- CAUTIONS Depression diabetes hypertension patients with metabolic bone disease (decrease in bone mineral density can occur) polycystic ovarian disease

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Depression mood altered
- ► Rare or very rare Auditory disorder · hypotension · leucopenia · pituitary tumour benign · thrombocytopenia · tinnitus
- ► Frequency not known Alopecia · anxiety · appetite change · breast abnormalities · broken nails · concentration impaired · constipation · diarrhoea · dizziness · drowsiness · dry eye · dysuria · embolism and thrombosis · fatigue · feeling of pressure behind the eyes · follicle recruitment increased · galactorrhoea · gastrointestinal discomfort · gynaecomastia · hair changes · headache · hot flush · hydronephrosis · hyperhidrosis · increased risk of fracture · lymphostasis · memory loss · menopausal symptoms · menstrual cycle irregularities · muscle weakness in legs · musculoskeletal discomfort · nausea · oedema · osteoporosis · ovarian and fallopian tube disorders · pain · painful sexual intercourse · palpitations · paraesthesia · QT interval prolongation · sexual dysfunction · shock · skin reactions · sleep disorder · testicular atrophy · thirst · tumour activation temporary · uterine leiomyoma degeneration · vision disorders · vomiting · vulvovaginal disorders · weight changes

SPECIFIC SIDE-FEFFCTS

- With intranasal use Altered smell sensation · epistaxis · hoarseness · nasal irritation · taste altered SIDE-EFFECTS, FURTHER INFORMATION During the initial stage (1-2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour 'flare' may cause spinal cord compression, ureteric obstruction or increased bone pain.
- CONCEPTION AND CONTRACEPTION Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- PREGNANCY Avoid.
- BREAST FEEDING Avoid.
- DIRECTIONS FOR ADMINISTRATION
- With intranasal use Manufacturer advises avoid use of nasal decongestants before and for at least 30 minutes after treatment.
- With subcutaneous use Rotate injection site to prevent atrophy and nodule formation.
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer buserelin nasal spray.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Goserelin

24-Jul-2020

 DRUG ACTION Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

• INDICATIONS AND DOSE

ZOLADEX LA®

Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer

- ► BY SUBCUTANEOUS INJECTION
- Adult: 10.8 mg every 12 weeks, to be administered into the anterior abdominal wall

ZOLADEX G

Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer | Advanced breast cancer | Oestrogen-receptor-positive early breast cancer

- **▶** BY SUBCUTANEOUS INJECTION
- Adult: 3.6 mg every 28 days, to be administered into the anterior abdominal wall

Endometriosis

- ► BY SUBCUTANEOUS INJECTION
- Adult: 3.6 mg every 28 days maximum duration of treatment 6 months (do not repeat), to be administered into the anterior abdominal wall

Endometrial thinning before intra-uterine surgery

- ► BY SUBCUTANEOUS INJECTION
- Adult: 3.6 mg, dose may be repeated after 28 days if uterus is large or to allow flexible surgical timing, to be administered into the anterior abdominal wall

Before surgery in women who have anaemia due to uterine fibroids

- ► BY SUBCUTANEOUS INJECTION
- Adult: 3.6 mg every 28 days maximum duration of treatment 3 months, to be given with supplementary iron, to be administered into the anterior abdominal wall continued →

Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (after exclusion of pregnancy) (under expert supervision)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 3.6 mg, dose given to achieve pituitary downregulation (usually 1–3 weeks) then gonadotrophin is administered (stopping gonadotrophin on administration of chorionic gonadotrophin at appropriate stage of follicular development), to be administered into the anterior abdominal wall
- CONTRA-INDICATIONS Undiagnosed vaginal bleeding · use longer than 6 months in endometriosis (do not repeat)
- CAUTIONS Depression · diabetes · hypertension · patients with metabolic bone disease (decrease in bone mineral density can occur) · polycystic ovarian disease · risk of spinal cord compression in men · risk of ureteric obstruction in men
- SIDE-FFFFCTS
- ► Common or very common Alopecia · arthralgia · bone pain · breast abnormalities · depression · glucose tolerance impaired · gynaecomastia · headache · heart failure · hot flush · hyperhidrosis · mood altered · myocardial infarction · neoplasm complications · paraesthesia · sexual dysfunction · skin reactions · spinal cord compression · vulvovaginal disorders · weight increased
- Uncommon Hypercalcaemia (in women) · ureteral obstruction
- ▶ Rare or very rare Ovarian and fallopian tube disorders pituitary haemorrhage pituitary tumour psychotic disorder
- ► Frequency not known Abdominal cramps · body hair change · constipation · diarrhoea · fatigue · hepatic function abnormal · interstitial pneumonia · muscle complaints · nausea · nervousness · peripheral oedema (when used for gynaecological conditions) · premature menopause · pulmonary embolism · QT interval prolongation · sleep disorder · uterine leiomyoma degeneration · voice alteration · vomiting · vulvovaginal infection · withdrawal

SIDE-EFFECTS, FURTHER INFORMATION Tumour flare can occur when androgen deprivation therapy is initiated.

- CONCEPTION AND CONTRACEPTION Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- PREGNANCY Avoid.
- BREAST FEEDING Avoid.
- MONITORING REQUIREMENTS Men at risk of tumour 'flare' should be monitored closely during the first month of therapy for prostate cancer.
- DIRECTIONS FOR ADMINISTRATION Rotate injection site to prevent atrophy and nodule formation.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Leuprorelin acetate

26-Feh-2021

 DRUG ACTION Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

• INDICATIONS AND DOSE

PROSTAP 3 DCS®

Prostate cancer (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 11.25 mg every 3 months

Endometriosis (specialist use only)

- ► BY INTRAMUSCULAR INJECTION
- Adult: 11.25 mg every 3 months for maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

Pre- and perimenopausal breast cancer (specialist use only)

- **▶** BY SUBCUTANEOUS INJECTION
- Adult: 11.25 mg every 3 months, for further information on use with adjuvant treatments, consult product literature

PROSTAP SR DCS®

Prostate cancer (specialist use only)

- ► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: 3.75 mg every month

Endometriosis (specialist use only)

- ► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: 3.75 mg every month for maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

Endometrial thinning before intra-uterine surgery (specialist use only)

- ► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: 3.75 mg for 1 dose, dose to be given as a single dose between day 3 and 5 of menstrual cycle,
 5-6 weeks before surgery

Reduction of size of uterine fibroids and of associated bleeding before surgery (specialist use only)

- ► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR
- Adult: 3.75 mg every month usually for 3-4 months (maximum 6 months)

Preservation of ovarian function (specialist use only)

- ► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: Initially 3.75 mg as a single dose 2 weeks before starting chemotherapy, followed by 3.75 mg every month for the duration of chemotherapy treatment

Pre- and perimenopausal breast cancer (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 3.75 mg every month, for further information on use with adjuvant treatments, consult product literature

STALADEX ® 10.72MG

Prostate cancer (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 10.72 mg every 3 months, to be administered under the skin of the abdomen

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Undiagnosed vaginal bleeding

SPECIFIC CONTRA-INDICATIONS

- When used for endometriosis Use longer than 6 months (do not repeat)
- CAUTIONS Diabetes · family history of osteoporosis · patients with metabolic bone disease (decrease in bone mineral density can occur) · risk of spinal cord compression in men with prostate cancer · risk of ureteric obstruction in men with prostate cancer
- SIDE-EFFECTS
- ► Common or very common Appetite decreased · arthralgia · bone pain · breast abnormalities · depression · dizziness · fatigue · gynaecomastia · headache · hepatic disorders · hot flush · hyperhidrosis · injection site necrosis · insomnia · mood altered · muscle weakness · nausea · paraesthesia · peripheral oedema · sexual dysfunction · testicular atrophy · vulvovaginal dryness · weight change
- ► Uncommon Alopecia · diarrhoea · fever · myalgia · palpitations · visual impairment · vomiting
- ► Rare or very rare Haemorrhage
- Frequency not known Anaemia · glucose tolerance impaired · hypertension · hypotension · interstitial lung disease · leucopenia · paralysis · pulmonary embolism · QT interval prolongation · seizure · spinal fracture · thrombocytopenia · urinary tract obstruction
 - SIDE-EFFECTS, FURTHER INFORMATION In prostate cancer, during the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour 'flare' may cause spinal cord compression, ureteric obstruction or increased bone pain.
- CONCEPTION AND CONTRACEPTION Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- PREGNANCY Avoid—teratogenic in animal studies.
- BREAST FEEDING Avoid.
- MONITORING REQUIREMENTS
- ▶ Monitor liver function.
- ► Monitor prostate-specific antigen serum levels.
- DIRECTIONS FOR ADMINISTRATION Rotate injection site to prevent atrophy and nodule formation.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Leuprorelin acetate (Prostap® DCS) as adjuvant treatment in combination with tamoxifen or an aromatase inhibitor, of endocrine responsive early stage breast cancer in pre- and perimenopausal women at higher risk of disease recurrence (February 2021) SMC No. SMC2319 Recommended
- Leuprorelin acetate (Prostap® DCS) as treatment in pre- and perimenopausal women with advanced breast cancer suitable for hormonal manipulation (February 2021) SMC No. SMC2320 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Nafarelin

04-Aug-2020

 DRUG ACTION Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

• INDICATIONS AND DOSE

Endometriosis

- ► BY INTRANASAL ADMINISTRATION
- Adult (female): 200 micrograms twice daily for maximum 6 months (do not repeat), one spray in one nostril in the morning, and one spray in the other nostril in the evening (starting on days 2–4 of menstruation).

Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under expert supervision)

- ► BY INTRANASAL ADMINISTRATION
- Adult: 400 micrograms twice daily, one spray in each nostril, to be started in early follicular phase (day 2) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down regulation achieved (usually within 4 weeks) then maintained (usually for 8–12 days) during gonadotrophin administration (stopping gonadotrophin and nafarelin on administration of chorionic gonadotrophin at follicular maturity), discontinue if down-regulation not achieved within 12 weeks
- CONTRA-INDICATIONS Undiagnosed vaginal bleeding · use longer than 6 months in the treatment of endometriosis (do not repeat)
- CAUTIONS Patients with metabolic bone disease (decrease in bone mineral density can occur)
- SIDE-EFFECTS
- ➤ Common or very common Artificial menopause · breast abnormalities · chest pain · depression · dyspnoea · emotional lability · headaches · hirsutism · hot flush · hypersensitivity · hypertension · hypotension · insomnia · myalgia · oedema · oestrogen deficiency · paraesthesia · rhinitis · seborrhoea · sexual dysfunction · skin reactions · uterine haemorrhage · vulvovaginal dryness · weight changes
- Uncommon Alopecia · arthralgia · ovarian cyst (may require discontinuation)
- ► Frequency not known Ovarian hyperstimulation syndrome palpitations vision blurred
- CONCEPTION AND CONTRACEPTION Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first dose should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- PREGNANCY Avoid.
- BREAST FEEDING Avoid.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises avoid use of nasal decongestants before and for at least 30 minutes after treatment; repeat dose if sneezing occurs during or immediately after administration.
- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer nafarelin nasal spray.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Triptorelin

04-Mar-2

DRUG ACTION Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

• INDICATIONS AND DOSE

DECAPEPTYL® SR 11.25MG

Advanced prostate cancer (specialist use only)

► BY INTRAMUSCULAR INJECTION

Adult: 11.25 mg every 3 months

Endometriosis

- ► BY INTRAMUSCULAR INJECTION
- Adult: 11.25 mg every 3 months for maximum
 6 months (not to be repeated), to be started during first
 5 days of menstrual cycle

DECAPEPTYL® SR 22.5MG

Advanced prostate cancer (specialist use only)

► BY INTRAMUSCULAR INJECTION ► Adult: 22.5 mg every 6 months

DECAPEPTYL® SR 3MG

Advanced prostate cancer (specialist use only)

BY INTRAMUSCULAR INJECTIONAdult: 3 mg every 4 weeks

Endometriosis

- ► BY INTRAMUSCULAR INJECTION
- Adult: 3 mg every 4 weeks maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

Reduction in size of uterine fibroids

- ► BY INTRAMUSCULAR INJECTION
- Adult: 3 mg every 4 weeks for at least 3 months, maximum duration of treatment 6 months (not to be repeated), to be started during first 5 days of menstrual

Premenopausal breast cancer [as combination therapy] (specialist use only)

- ► BY INTRAMUSCULAR INJECTION
- Adult: 3 mg every 4 weeks for up to 5 years, initiated 6-8 weeks before starting aromatase inhibitor—for further information, consult product literature

GONAPEPTYL DEPOT®

Advanced prostate cancer

- ► BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- Adult: 3.75 mg every 4 weeks

Endometriosis | Reduction in size of uterine fibroids

- ► BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- Adult: 3.75 mg every 4 weeks maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

SALVACYL®

Male hypersexuality with severe sexual deviation

- ► BY INTRAMUSCULAR INJECTION
- Adult: 11.25 mg every 12 weeks
- CONTRA-INDICATIONS In endometriosis do not use for longer than 6 months (do not repeat) · undiagnosed vaginal bleeding

SALVACYL ® Severe osteoporosis

CAUTIONS

GENERAL CAUTIONS History of depression · patients with metabolic bone disease (decrease in bone mineral density can occur)

SPECIFIC CAUTIONS

- ▶ When used for breast cancer Risk factors for osteoporosis
- When used for male hypersexuality with severe sexual deviation Risk factors for osteoporosis
- When used for prostate cancer Risk factors for osteoporosis risk of spinal cord compression in men risk of ureteric obstruction in men

SALVACYL Increased risk of sensitivity to restored testosterone if treatment interrupted—consider administration of an anti-androgen before stopping treatment transient increase in serum testosterone occurs on initiation—consider administration of an anti-androgen

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Anxiety · asthenia · depression · diabetes mellitus · dizziness · dry mouth · embolism · gastrointestinal discomfort · gynaecomastia · haemorrhage · headache · hot flush · hyperhidrosis · hypersensitivity · hypertension · joint disorders · menstrual cycle irregularities · mood altered · muscle complaints · nausea · oedema · ovarian and fallopian tube disorders · pain · painful sexual intercourse · pelvic pain · sexual dysfunction · skin reactions · sleep disorders · weight changes

Hypothalamic and anterior pituitary hormone related disorders

Hypothalamic and anterior pituitary hormones

26-Mar-2021

Anterior pituitary hormones

Corticotrophins

Tetracosactide p. 802 (tetracosactrin), an analogue of corticotropin (ACTH), is used to test adrenocortical function; failure of the plasma cortisol concentration to rise after administration of tetracosactide indicates adrenal insufficiency. For guidance on the management of adrenal insufficiency, see Adrenal insufficiency p. 738.

Both corticotropin and tetracosactide were formerly used as alternatives to corticosteroids in conditions such as Crohn's disease; their value was limited by the variable and unpredictable therapeutic response and by the waning of their effect with time.

Gonadotrophins

Follicle-stimulating hormone (FSH) and luteinising hormone (LH) together, or follicle-stimulating hormone alone (as in **follitropin**), are used in the treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene citrate p. 826, or in superovulation treatment for assisted conception (such as in vitro fertilisation).

The gonadotrophins are also occasionally used in the treatment of hypogonadotrophic hypogonadism and associated oligospermia. There is no justification for their use in primary gonadal failure.

Growth hormone

Growth hormone is used to treat deficiency of the hormone in children and in adults. In children it is used in Prader-Willi syndrome, Turner syndrome, chronic renal insufficiency, short children considered small for gestational age at birth, and short stature homeobox-containing gene (SHOX) deficiency.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, somatropin p. 806, produced using recombinant DNA technology.

Mecasermin, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency.

Hypothalamic hormones

Gonadorelin p. 802 when injected intravenously in normal subjects leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. Gonadorelin analogues are indicated in endometriosis and infertility and in breast and prostate

7.1 Adrenocortical function testing

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > CORTICOTROPHINS

Tetracosactide

22-Apr-2021

(Tetracosactrin)

• INDICATIONS AND DOSE

Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test)

- ▶ BY INTRAVENOUS INJECTION. OR BY INTRAMUSCULAR INTECTION
- Adult: 250 micrograms for 1 dose

Diagnosis of adrenocortical insufficiency (diagnostic

- ▶ BY INTRAMUSCULAR INJECTION USING DEPOT INJECTION
- Adult: 1 mg for 1 dose

Alternative to corticosteroids in conditions such as Crohn's disease or rheumatoid arthritis (formerly used but value was limited by the variable and unpredictable therapeutic response and by the waning of effect with

- ► BY INTRAMUSCULAR INJECTION USING DEPOT INJECTION
- Adult: Initially 1 mg daily, alternatively initially 1 mg every 12 hours, (in acute cases), then reduced to 1 mg every 2-3 days, followed by 1 mg once weekly, alternatively 500 micrograms every 2-3 days
- CONTRA-INDICATIONS Acute psychosis adrenogenital syndrome • allergic disorders • asthma • avoid injections containing benzyl alcohol in neonates · Cushing's syndrome · infectious diseases · peptic ulcer · primary adrenocortical insufficiency · refractory heart failure
- CAUTIONS Active infectious diseases (should not be used) unless adequate disease-specific therapy is being given) . active systemic diseases (should not be used unless adequate disease-specific therapy is being given) · diabetes mellitus · diverticulitis · history of asthma · history of atopic allergy · history of eczema · history of hayfever · history of hypersensitivity · hypertension · latent amoebiasis (may become activated) · latent tuberculosis (may become activated) · myasthenia gravis · ocular herpes simplex · osteoporosis · predisposition to thromboembolism · pscyhological disturbances may be triggered · recent intestinal anastomosis · reduced immune response (should not be used unless adequate diseasespecific therapy is being given) · ulcerative colitis

CAUTIONS, FURTHER INFORMATION

- Risk of anaphylaxis Should only be administered under medical supervision. Consult product literature.
- Hypertension Patients already receiving medication for moderate to severe hypertension must have their dosage adjusted if treatment started.
- Diabetes mellitus Patients already receiving medication for diabetes mellitus must have their dosage adjusted if treatment started.
- SIDE-EFFECTS Abdominal distension abscess adrenocortical unresponsiveness · angioedema · appetite increased · bone fractures · congestive heart failure · Cushing's syndrome · diabetes mellitus exacerbated · dizziness · dyspnoea · electrolyte imbalance · exophthalmos · fluid retention · flushing · gastrointestinal disorders · glaucoma · growth retardation · haemorrhage · headache · healing impaired · hirsutism · hyperglycaemia · hyperhidrosis · hypersensitivity (may be more severe in patients susceptible to allergies, especially asthma).

hypertension · idiopathic intracranial hypertension exacerbated · increased risk of infection · leucocytosis · malaise · menstruation irregular · muscle weakness · myopathy · nausea · osteonecrosis · osteoporosis · pancreatitis · papilloedema · pituitary unresponsiveness · posterior subcapsular cataract · protein catabolism · psychiatric disorder • seizure • skin reactions • tendon rupture • thromboembolism • vasculitis necrotising • vertigo · vomiting · weight increased

- ALLERGY AND CROSS-SENSITIVITY EVGF Contra-indicated in patients with history of hypersensitivity to tetracosactide/corticotrophins or excipients.
- PREGNANCY Avoid (but may be used diagnostically if essential).
- BREAST FEEDING Avoid (but may be used diagnostically if
- HEPATIC IMPAIRMENT For depot injection, manufacturer advises caution in cirrhosis (may enhance effect of tetracosactide therapy).
- RENAL IMPAIRMENT EvGr Use with caution in renal failure. (M)
- EFFECT ON LABORATORY TESTS May suppress skin test reactions.

Post administration total plasma cortisol levels during 30-minute test for diagnosis of adrenocotical insufficiency might be misleading due to altered cortisol binding globulin levels in some special clinical situations including, patients on oral contraceptives, post-operative patients, critical illness, severe liver disease and nephrotic syndrome.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Lutropin alfa 75 unit, Follitropin alfa 150 unit Pergoveris 150unit/75unit powder and solvent for solution for injection vials | 1 vial PoM £72.35

Follitropin delta

06-Sep-2017

 DRUG ACTION Follitropin delta is a recombinant human follicle stimulating hormone, which causes development of multiple mature follicles.

• INDICATIONS AND DOSE

Superovulation treatment for assisted conception (such as in vitro fertilisation) (initiated under specialist supervision)

- ► BY SUBCUTANEOUS INJECTION
- Adult (female): Initial dosing based on serum anti-Müllerian hormone concentration and body-weight consult product literature.
- CONTRA-INDICATIONS Ovarian cysts (not caused by polycystic ovarian syndrome) ovarian enlargement (not caused by polycystic ovarian syndrome) tumours of breast tumours of hypothalamus tumours of ovaries tumours of pituitary tumours of uterus vaginal bleeding of unknown cause
- CAUTIONS Acute porphyrias p. 1150 · history of tubal disease (increased risk of ectopic pregnancy)
- SIDE-EFFECTS
- ► Common or very common Fatigue · headache · nausea · ovarian hyperstimulation syndrome · pelvic disorders · uterine pain
- ➤ Uncommon Abdominal discomfort · breast abnormalities · constipation · diarrhoea · dizziness · drowsiness · mood swings · vaginal haemorrhage · vomiting
 - SIDE-EFFECTS, FURTHER INFORMATION If ovarian hyperstimulation syndrome occurs, the patient should be advised to withhold hCG and avoid intercourse or use barrier contraceptive methods for at least 4 days.
- PREGNANCY Manufacturer advises avoid—not indicated during pregnancy.
- BREAST FEEDING Manufacturer advises avoid—not indicated during breastfeeding.
- MONITORING REQUIREMENTS Manufacturer advises regular monitoring of ovarian response with ultrasound alone, or in combination with serum estradiol levels.
 Frequent monitoring of follicular development is required to reduce the risk of ovarian hyperstimulation syndrome during treatment, and for at least 2 weeks after triggering of final follicular maturation—consult product literature.
- DIRECTIONS FOR ADMINISTRATION Manufacturer recommends the cartridge should be used with the

Rekovelle® injection pen. The first injection should be performed under direct medical supervision; self-administration should only be performed by patients who are well motivated, adequately trained and have access to expert advice.

- PRESCRIBING AND DISPENSING INFORMATION Follitropin delta is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage conditions outside refrigerator.

PATIENT AND CARER ADVICE

Conception and contraception Manufacturer advises that patients planning to conceive should be warned that there is a risk of multiple pregnancy.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Netwoelle (Ferring Pharmaceuticals Ltd) ▼ Follitropin delta 33.33 microgram per 1 ml Rekovelle 36micrograms/1.08ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £354.94 Rekovelle 72micrograms/2.16 ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £709.89 Rekovelle 12micrograms/0.36ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £118.31

Lutropin alfa

22-May-2020

(Recombinant human luteinising hormone)

INDICATIONS AND DOSE

Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene (in conjunction with follicle-stimulating hormone) | Superovulation treatment for assisted conception (such as in vitro fertilisation) (in conjunction with follicle-stimulating hormone)

- ► BY SUBCUTANEOUS INJECTION
- Adult (female): Adjusted according to response.
- CONTRA-INDICATIONS Mammary carcinoma · ovarian carcinoma · ovarian enlargement or cyst (unless caused by polycystic ovarian disease) · tumours of hypothalamus · tumours of pituitary · undiagnosed vaginal bleeding · uterine carcinoma
- CAUTIONS Acute porphyrias p. 1150
- SIDE-EFFECTS
- ► Common or very common Breast pain · diarrhoea · gastrointestinal discomfort · headache · nausea · ovarian and fallopian tube disorders · pelvic pain · vomiting
- ▶ Rare or very rare Thromboembolism
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

Lutropin alfa 75 unit Luveris 75unit powder and solvent for solution for injection vials | 1 vial PoM £31.38

Menotrophin

06-0ct-2020

INDICATIONS AND DOSE

Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)

- ► BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- Adult (female): Adjusted according to response.

Hypogonadotrophic hypogonadism

- ► BY DEEP INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- Adult (male): (consult product literature).
- CONTRA-INDICATIONS Ovarian cysts (not caused by polycystic ovarian syndrome) ovarian enlargement (not caused by polycystic ovarian syndrome) tumours of breast tumours of hypothalamus tumours of ovaries tumours of pituitary tumours of prostate tumours of testes tumours of uterus vaginal bleeding of unknown cause
- CAUTIONS Acute porphyrias p. 1150 · history of tubal disease
- SIDE-EFFECTS
- ➤ Common or very common Gastrointestinal discomfort · headache · nausea · ovarian and fallopian tube disorders · pelvic pain · uterine pain
- ► Uncommon Breast abnormalities diarrhoea dizziness fatigue hot flush vomiting
- ► Rare or very rare Skin reactions
- ► Frequency not known Arthralgia · pain · thromboembolism · vision disorder
- PREGNANCY Avoid.
- BREAST FEEDING Avoid.
- PRESCRIBING AND DISPENSING INFORMATION Menotrophin is purified extract of human post-menopausal urine containing follicle-stimulating hormone (FSH) and luteinising hormone (LH) in a ratio of 1:1
- PATIENT AND CARER ADVICE

Conception and contraception Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

7.4 Growth hormone disorders

PITUITARY AND HYPOTHALAMIC HORMONES
AND ANALOGUES > GROWTH HORMONE
RECEPTOR ANTAGONISTS

Pegvisomant

08-Apr-2021

 DRUG ACTION Pegvisomant is a genetically modified analogue of human growth hormone and is a highly selective growth hormone receptor antagonist.

• INDICATIONS AND DOSE

Treatment of acromegaly in patients with inadequate response to surgery, radiation, or both, and to treatment with somatostatin analogues (initiated by a specialist)

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 80 mg for 1 dose, followed by 10 mg daily, then increased in steps of 5 mg daily, adjusted according to response; maximum 30 mg per day
- CAUTIONS Abnormal liver function tests and/or signs or symptoms of liver injury (further investigations may be required before treatment initiation—consult product literature) · diabetes mellitus (adjustment of antidiabetic therapy may be necessary)
- SIDE-EFFECTS
- ➤ Common or very common Arthralgia · arthritis · asthenia · constipation · diarrhoea · dizziness · drowsiness · dyslipidaemia · dyspnoea · eye pain · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · hyperglycaemia · hypertension · hypoglycaemia · influenza like illness · lipohypertrophy · myalgia · nausea · numbness · oedema · skin reactions · sleep disorders · sweat changes · tremor · vomiting · weight increased

- ► Uncommon Apathy · confusion · dry mouth · eye strain · feeling abnormal · healing impaired · hunger · leucocytosis · leucopenia · libido increased · memory loss · Meniere's disease · oral disorders · panic attack · polyuria · proteinuria · renal impairment · taste altered · thrombocytopenia
- ► Frequency not known Anger · angioedema · hepatic function abnormal · larvngospasm

SIDE-EFFECTS, FURTHER INFORMATION Injection-site reactions Rotate injection sites to avoid lipohypertrophy.

Abnormal hepatic function Manufacturer advises interrupt treatment if liver function tests at least 5 times the upper limit of normal *or* transaminase levels at least 3 times the upper limit of normal **and** blood bilirubin increased—consult product literature. Discontinue if liver injury is confirmed.

- CONCEPTION AND CONTRACEPTION Possible increase in female fertility.
- PREGNANCY Avoid.
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT Manufacturer advises caution (no information available); temporary or permanent withdrawal may be needed—consult product literature.
- MONITORING REQUIREMENTS
- Manufacturer advises assess liver function tests before treatment initiation and monitor liver function tests during treatment—consult product literature.
- Manufacturer advises monitor serum IGF-I concentrations.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

Pegvisomant (Somavert®) for the treatment of adult patients with acromegaly who have had an inadequate response to surgery and/or radiation therapy and in whom an appropriate medical treatment with somatostatin analogues did not normalize insulin-like growth factor type 1 (IGF-1) concentrations or was not tolerated (November 2017) SMC No. 158/05 Recommended

All Wales Medicines Strategy Group (AWMSG) decisions

- Pegvisomant (Somavert®) for the treatment of adult patients with acromegaly who have had an inadequate response to surgery and/or radiation therapy and in whom an appropriate medical treatment with somatostatin analogues did not normalise insulin-like growth factor-1 (IGF-1) concentrations or was not tolerated (November 2017) AWMSG No. 3545 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > HUMAN GROWTH HORMONES

Somatropin

12-Apr-2021

(Recombinant Human Growth Hormone)

INDICATIONS AND DOSE

Gonadal dysgenesis (Turner syndrome)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 1.4 mg/m² daily, alternatively 45–50 micrograms/kg daily

Deficiency of growth hormone

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 150-300 micrograms daily, then increased if necessary up to 1 mg daily, dose to be increased gradually, use minimum effective dose (requirements may decrease with age)

DOSE EQUIVALENCE AND CONVERSION

- Dose formerly expressed in units; somatropin 1 mg ≡ 3 units.
- CONTRA-INDICATIONS Evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting) · not to be used after renal transplantation · severe obesity in Prader-Willi syndrome · severe respiratory impairment in Prader-Willi syndrome
- CAUTIONS Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) · disorders of the epiphysis of the hip (monitor for limping) · history of malignant disease · hypoadrenalism (initiation or adjustment of glucocorticoid replacement therapy may be necessary) · initiation of treatment close to puberty not recommended in child born small for corrected gestational age · papilloedema · resolved intracranial hypertension (monitor closely) · risk of hypothyroidism—manufacturers recommend periodic thyroid function tests · Silver-Russell syndrome
- INTERACTIONS → Appendix 1: somatropin
- SIDE-EFFECTS
- ► Common or very common Carpal tunnel syndrome fluid retention headache joint disorders lipoatrophy myalgia oedema paraesthesia
- Uncommon Gynaecomastia idiopathic intracranial hypertension
- ► Rare or very rare Hyperglycaemia hyperinsulinism hypothyroidism osteonecrosis of femur pancreatitis slipped capital femoral epiphysis
- ▶ Frequency not known Leukaemia · musculoskeletal stiffness

SIDE-EFFECTS, FURTHER INFORMATION Funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).

- PREGNANCY Discontinue if pregnancy occurs—no information available.
- BREAST FEEDING No information available. Absorption from milk unlikely.
- DIRECTIONS FOR ADMINISTRATION Rotate subcutaneous injection sites to prevent lipoatrophy.
- PRESCRIBING AND DISPENSING INFORMATION Somatropin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

8 Sex hormone responsive conditions

Sex hormones

01-Feb-2022

Oestrogens and HRT

Oestrogens are necessary for the development of female secondary sexual characteristics; they also stimulate myometrial hypertrophy with endometrial hyperplasia.

In terms of oestrogenic activity natural oestrogens (estradiol p. 815 (oestradiol), estrone (oestrone), and estriol p. 898 (oestriol)) have a more appropriate profile for hormone replacement therapy (HRT) than synthetic oestrogens (ethinylestradiol p. 819 (ethinyloestradiol) and mestranol). Tibolone p. 819 has oestrogenic, progestogenic and weak androgenic activity.

Oestrogen therapy is given cyclically or continuously for a number of gynaecological conditions. If long-term therapy is required in women with a uterus, a progestogen should normally be added to reduce the risk of cystic hyperplasia of the endometrium (or of endometriotic foci in women who have had a hysterectomy) and possible transformation to cancer.

Oestrogens are no longer used to suppress lactation because of their association with thromboembolism.

Hormone replacement therapy

Hormone replacement therapy (HRT) with small doses of an oestrogen (together with a progestogen in women with a uterus) is appropriate for alleviating menopausal symptoms such as vaginal atrophy or vasomotor instability. Oestrogen given systemically in the perimenopausal and postmenopausal period or tibolone given in the postmenopausal period also diminish postmenopausal osteoporosis but other drugs are preferred; for further information, see Osteoporosis p. 725. Menopausal atrophic vaginitis may respond to a short course of a topical vaginal oestrogen preparation used for a few weeks and repeated if necessary.

Systemic therapy with an oestrogen or drugs with oestrogenic properties alleviates the symptoms of oestrogen deficiency such as vasomotor symptoms. Tibolone combines oestrogenic and progestogenic activity with weak androgenic activity; it is given continuously, without cyclical progestogen.

HRT may be used in women with early natural or surgical menopause (before age 45 years), since they are at high risk of osteoporosis. For early menopause, HRT can be given until the approximate age of natural menopause (i.e. until age 50 years). Alternatives to HRT should be considered if osteoporosis is the main concern.

Clonidine hydrochloride p. 161 may be used to reduce vasomotor symptoms in women who cannot take an oestrogen, but clonidine hydrochloride may cause unacceptable side-effects.

HRT increases the risk of venous thromboembolism, stroke, endometrial cancer (reduced by a progestogen), breast cancer, and ovarian cancer; there is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. For details of these risks see HRT Risk table.

The Medicines and Healthcare products Regulatory Agency (MHRA) advises that HRT should only be prescribed to relieve post-menopausal symptoms that are adversely affecting quality of life and treatment should be reviewed regularly to ensure the minimum effective dose is used for the shortest duration. For osteoporosis, consider alternative treatments. HRT does not prevent coronary heart disease or protect against a decline in cognitive function and it should

not be prescribed for these purposes. Experience of treating women over 65 years with HRT is limited.

For the treatment of menopausal symptoms the benefits of short-term HRT outweigh the risks in the majority of women, especially in those aged under 60 years.

For the treatment of menopausal symptoms in women with breast cancer see Breast cancer p. 1017.

Risk of breast cancer

All types of systemic (oral or transdermal) HRT treatment increase the risk of breast cancer after 1 year of use. This risk is higher for combined oestrogen-progestogen HRT (particularly for continuous HRT preparations where both oestrogen and progestogen are taken throughout each month) than for oestrogen-only HRT, but is irrespective of the type of oestrogen or progestogen. Longer duration of HRT use (but not the age at which HRT is started) further increases risk.

Although the risk of breast cancer is lower after stopping HRT than it is during current use, the excess risk persists for more than 10 years after stopping compared with women who have never used HRT. Vaginal preparations containing low doses of oestrogen to treat local symptoms are not thought to be associated with an effect on breast cancer risk.

The MHRA advises discussing the updated information on the risk of breast cancer with women who use or are considering starting HRT, at their next routine appointment. The MHRA advises encouraging current and past HRT users to be vigilant for signs of breast cancer and to attend routine breast screening. If a decision is made to stop treatment, in the absence of contra-indications, the MHRA recommends this should be done gradually to minimise recurrence of menopausal symptoms. For more information, see estradiol p. 815, conjugated oestrogens (equine) p. 814 and the MHRA Drug Safety Update: www.gov.uk/drug-safety-update/hormone-replacement-therapy-hrt-further-information-on-the-known-increased-risk-of-breast-cancer-with-hrt-and-its-persistence-after-stooping.

Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use especially oestrogen-progestogen combined treatment, but this is not thought to be the case with tibolone p. 819.

Tibolone p. 819 has also been associated with an increased risk of breast cancer during treatment, although the extent of risk and its persistence after stopping is currently inconclusive.

Risk of endometrial cancer

The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT. In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

The risk of endometrial cancer in women who have not used HRT increases with body mass index (BMI); the increased risk of endometrial cancer in users of oestrogenonly HRT or tibolone is more apparent in women who are not overweight.

Evidence suggests an increased risk of endometrial cancer with tibolone. After 2.7 years of use (in women of average age 68 years), 1 extra case of endometrial hyperplasia and 4 extra cases of endometrial cancer were diagnosed compared with placebo users.

Risk of ovarian cancer

Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer; this excess risk disappears within a few years of stopping.

Risk of venous thromboembolism

Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use. In women who

have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bedrest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

Although the level of risk of thromboembolism associated with non-oral routes of administration of HRT has not been established, it may be lower for the transdermal route.

Limited data does not suggest an increased risk of thromboembolism with tibolone compared with combined HRT or women not taking HRT.

Risk of stroke

Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.

Tibolone increases the risk of stroke about 2.2 times from the first year of treatment; risk of stroke is age-dependent and therefore the absolute risk of stroke with tibolone increases with age.

Table 1: Summary of HRT risks and benefits* during current use and current use plus post-treatment from age of menopause up to age 69 years, per 1000 women with 5 years or 10 years use of HRT

^{*}Menopausal symptom relief is not included in this table, but is a key benefit of HRT and will play a major part in the decision to prescribe HRT.

[†]Best estimates based on relative risks of HRT use from age 50 (see DSU table 2 for relative risks). For breast cancer this includes cases diagnosed during current HRT use and diagnosed after HRT use until age 69 years; for other risks, this assumes no residual effects after stopping HRT use.

Statest evidence suggests that transdermal HRT products have a lower risk of VTE than oral preparations.

^{*} Background incidence from: Hospital Admissions in England (HES) for stroke and VTE; placebo arms of Women's Health Initiative (WHI) trial for coronary heart disease (CHD) and fracture; the International Agency Research on Cancer (IARC) for ovarian cancer and endometrial cancer; and from Office for National Statistics (ONS) for England for 2015, calculated for never-users in the Collaborative Group on Hormonal Factors in Breast Cancer meta-analysis for breast cancer.

NS=non-significant difference.

[†] Best estimate and range based on relative risk and 95% confidence intervals (CI).

[‡] Risk ratios and 95% CI from: meta-analysis of prospective observational studies for breast cancer (95% CI not available); meta-analyses of RCTs and observational studies for endometrial cancer, ovarian cancer and VTE; meta-analyses of randomised controlled trials (RCTs) for stroke; and from WHI trial for CHD and fracture risk.

[§] Latest evidence suggests that transdermal HRT products have a lower risk of VTE than oral preparations.

Menopausal symptom relief is not included in this table but is a key benefit of HRT and will play a major part in the decision to prescribe HRT.

Risk of coronary heart disease

HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

There is insufficient data to draw a conclusion on the risk of coronary heart disease with tibolone.

Choice

The choice of HRT for an individual depends on an overall balance of indication, risk, and convenience. A woman with a uterus normally requires oestrogen with cyclical progestogen for the last 12 to 14 days of the cycle or a preparation which involves continuous administration of an oestrogen and a progestogen (or one which provides both oestrogenic and progestogenic activity in a single preparation). Continuous combined preparations or tibolone p. 819 are **not suitable** for use in the perimenopause or within 12 months of the last menstrual period; women who use such preparations may bleed irregularly in the early stages of treatment—if bleeding continues endometrial abnormality should be ruled out and consideration given to changing to cyclical HRT.

An oestrogen alone is suitable for continuous use in women without a uterus. However, in endometriosis, endometrial foci may remain despite hysterectomy and the addition of a progestogen should be considered in these circumstances.

An oestrogen may be given by mouth or by transdermal administration, which avoids first-pass metabolism.

Considerations in the elderly

The use of oestrogens in elderly patients is potentially inappropriate (STOPP criteria) if prescribed in patients with a history of breast cancer or venous thromboembolism (increased risk of recurrence). Oral oestrogens may be inappropriate if prescribed without concurrent progestogen in those with an intact uterus (risk of endometrial cancer).

For further information, see *STOPP/START criteria* in Prescribing in the elderly p. 29.

Surgery

Major surgery under general anaesthesia, including orthopaedic and vascular leg surgery, is a predisposing factor for venous thromboembolism and it may be prudent to stop HRT 4-6 weeks before surgery; it should be restarted only after full mobilisation. If HRT is continued or if discontinuation is not possible (e.g. in non-elective surgery), prophylaxis with unfractionated or low molecular weight heparin and graduated compression hosiery is advised.

Reasons to stop HRT

Hormone replacement therapy should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain:
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg.
- · prolonged immobility after surgery or leg injury;

 detection of a risk factor which contra-indicates treatment

Ethinylestradiol

Ethinylestradiol p. 819 (ethinyloestradiol) is licensed for short-term treatment of symptoms of oestrogen deficiency, for osteoporosis prophylaxis if other drugs cannot be used and for the treatment of female hypogonadism and menstrual disorders.

Ethinylestradiol is occasionally used under **specialist supervision** for the management of *hereditary haemorrhagic telangiectasia* (but evidence of benefit is limited). It is also used licensed for the palliative treatment of prostate cancer.

Raloxifene

Raloxifene hydrochloride p. 814 is licensed for the treatment and prevention of *postmenopausal osteoporosis*; unlike hormone replacement therapy, raloxifene hydrochloride does not reduce menopausal vasomotor symptoms.

Progestogens and progesterone receptor modulators

There are two main groups of progestogen, progesterone and its analogues (dydrogesterone and medroxyprogesterone acetate p. 876) and testosterone analogues (norethisterone p. 823 and norgestrel). The newer progestogens (desogestrel p. 871, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel p. 872 is the active isomer of norgestrel and has twice its potency. Progesterone p. 825 and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

Where endometriosis requires drug treatment, it may respond to a progestogen, e.g. norethisterone, administered on a continuous basis. Danazol and gonadorelin analogues are also licensed for endometriosis.

Although oral progestogens have been used widely for menorrhagia (see Heavy menstrual bleeding p. 813) they are relatively ineffective compared with tranexamic acid p. 118 or, particularly where dysmenorrhoea is also a factor, mefenamic acid p. 1238; the levonorgestrel-releasing intrauterine system may be particularly useful for women also requiring contraception. Oral progestogens have also been used for severe dysmenorrhoea, but where contraception is also required in younger women the best choice is a combined oral contraceptive.

Progestogens have also been advocated for the alleviation of premenstrual symptoms, but no convincing physiological basis for such treatment has been shown.

Evgr Vaginal micronised progesterone (Utrogestan®) [unlicensed] is used for the prevention of miscarriage and should be offered following vaginal bleeding in women with an intra-uterine pregnancy confirmed by a scan, if they have previously had a miscarriage. If a fetal heartbeat is confirmed, continue progesterone until 16 completed weeks of pregnancy. ♠ In pregnant women with antiphospholipid antibody syndrome who have suffered recurrent miscarriage, administration of low-dose aspirin p. 133 and a prophylactic dose of a low molecular weight heparin may decrease the risk of fetal loss (use under specialist supervision only).

Hormone replacement therapy

In women with a uterus a progestogen needs to be added to long-term oestrogen therapy for hormone replacement, to prevent cystic hyperplasia of the endometrium and possible transformation to cancer; it can be added on a cyclical or a continuous basis. Combined packs incorporating suitable progestogen tablets are available.

Oral contraception

Desogestrel p. 871, gestodene, levonorgestrel p. 872, norethisterone p. 823, and norgestimate are used in

BNF 84

combined oral contraceptives and in progestogen-only contracentives.

Cancer

Progestogens also have a role in neoplastic disease.

Progesterone receptor modulators

Ulipristal acetate p. 870 is a progesterone receptor modulator with a partial progesterone antagonist effect. Intermittent ulipristal acetate can be used to treat moderate to severe symptoms of uterine fibroids in premenopausal women where surgery and uterine artery embolisation are unsuitable, or have failed. Ulipristal acetate is also used as a hormonal emergency contraceptive.

Endometriosis

19-Sep-2017

Description of condition

Endometriosis is the growth of endometrial-like tissue outside the uterus. Endometriosis is a condition affecting women mainly of reproductive age and, although its exact cause is unknown, it is an oestrogen-dependent condition and is associated with menstruation. Endometriosis is typically associated with symptoms such as pelvic pain, painful periods and subfertility. Women with endometriosis report pain, which can be frequent, chronic and severe, as well as tiredness, more sick days, and a significant physical, sexual, psychological and social impact. Endometriosis is an important cause of subfertility and this can also have a significant effect on quality of life.

Women may also have endometriosis without symptoms, so it is difficult to know how common the disease is in the population. It is also unclear whether endometriosis is always progressive or can remain stable or improve with time.

Aims of treatment

The aim of treatment is to reduce the severity of symptoms. improve the quality of life, and to improve fertility if this is affected.

Drug treatment

Management options for endometriosis include drug treatment and surgery. Most drug treatments for endometriosis work by suppressing ovarian function and are contraceptive. Surgical treatment aims to remove or destroy endometriotic lesions. The choice of treatment depends on the woman's preferences and priorities in terms of pain management and fertility.

EvGr A short trial (such as 3 months) of paracetamol or an NSAID alone or in combination should be considered for first-line management of endometriosis-related pain. If pain relief is inadequate, consider other forms of pain management and referral for further assessment.

Hormonal treatment (with a combined oral contraceptive or a progestogen) should be offered to women with suspected, confirmed or recurrent endometriosis. The patient should be informed that hormonal treatment for endometriosis can reduce pain and has no permanent negative effect on subsequent fertility. If initial hormonal treatment for endometriosis is not effective, not tolerated or is contra-indicated, the woman should be referred to a gynaecologist or specialist endometriosis service for possible further treatment, which could include other hormonal treatments or surgery. A For use of drugs to treat neuropathic pain, see Neuropathic pain.

Surgery

EvGr Women with suspected or confirmed endometriosis should be asked about their symptoms, preferences and priorities with respect to pain and fertility, to guide surgical decision-making. For deep endometriosis involving the bowel, bladder or ureter, gonadotropin-releasing hormones given for 3 months before surgery should be considered. Excision rather than ablation should be considered to treat endometriomas, taking into account the woman's desire for fertility and her ovarian reserve. After laparoscopic excision or ablation of endometriosis, consider hormonal treatment (with, for example, a combined hormonal contraceptive), to prolong the benefits of surgery and manage symptoms.

A hysterectomy may be indicated if, for example, the woman has adenomyosis or heavy menstrual bleeding that has not responded to other treatments.

Surgical management if fertility is a priority

EVGr If fertility is a priority, the management of endometriosis-related subfertility should have multidisciplinary involvement with input from a fertility specialist. Women with endometriosis who are trying to conceive should not be offered hormonal treatment, because it does not improve spontaneous pregnancy rates. (A)

Heavy menstrual bleeding

11-Jun-2021

Description of condition

Heavy menstrual bleeding, also known as menorrhagia, is excessive menstrual blood loss of 80 mL or more, and/or for a duration of more than 7 days, which results in the need to change menstrual products every 1-2 hours. Heavy menstrual bleeding occurs regularly, every 24-35 days.

Drug treatment

EvGr The choice of treatment should be guided by the presence or absence of fibroids (including size, number and location), polyps, endometrial pathology or adenomyosis, other symptoms (such as pressure or pain), co-morbidities, and patient preference.

In females with heavy menstrual bleeding and unidentified pathology, fibroids less than 3 cm in diameter causing no distortion of the uterine cavity, or suspected or diagnosed adenomyosis, a levonorgestrel-releasing intra-uterine system p. 872 is the first-line treatment option. Patients should be advised that irregular menstrual bleeding can occur particularly during the first months of use and that the full benefit of treatment may take at least 6 months.

If a levonorgestrel-releasing intra-uterine system p. 872 is unsuitable, either tranexamic acid p. 118, an NSAID, a combined hormonal contraceptive, or a cyclical oral progestogen should be considered. Progestogen-only contraceptives may suppress menstruation and be beneficial to females with heavy menstrual bleeding. A non-hormonal treatment is recommended in patients actively trying to conceive.

If drug treatment is unsuccessful or declined by the patient, or if symptoms are severe, referral to a specialist for alternative drug treatment or surgery should be considered.

In females with fibroids of 3 cm or more in diameter. referral to a specialist should be considered. Treatment options include tranexamic acid, an NSAID, a levonorgestrel-releasing intra-uterine system p. 872, a combined hormonal contraceptive, a cyclical oral

progestogen, ulipristal acetate p. 870, uterine artery embolisation, or surgery. Treatment choice depends on the size, number and location of the fibroids, and severity of symptoms. If drug treatment is required while investigations and definitive treatment is being organised, either tranexamic acid, or an NSAID, or both, can be given. Intermittent ulipristal acetate can be offered to treat moderate to severe symptoms of uterine fibroids in premenopausal women where surgery and uterine artery embolisation are unsuitable, or have failed.

The effectiveness of drug treatment for heavy menstrual bleeding may be limited in females with fibroids that are substantially greater than 3 cm in diameter. Treatment with a gonadotrophin-releasing hormone analogue before hysterectomy and myomectomy should be considered if uterine fibroids are causing an enlarged or distorted uterus.

- Adult: 0.3-1.25 mg daily continuously; with cyclical progestogen for 12-14 days of each cycle in women with a uterus

Postmenopausal osteoporosis prophylaxis

- ► BY MOUTH
- Adult: 0.625-1.25 mg daily continuously; with cyclical progestogen for 12-14 days of each cycle in women with a uterus

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: HORMONE REPLACEMENT THERAPY (HRT): FURTHER INFORMATION ON THE KNOWN INCREASED RISK OF BREAST CANCER WITH HRT AND ITS PERSISTENCE AFTER STOPPING (SEPTEMBER 2019)

Data from a meta-analysis of more than 100 000 women with breast cancer have confirmed that the risk of breast cancer is increased with the use of all forms of systemic HRT, except vaginal oestrogens, for longer than 1 year. Findings have shown that the risk increases further with longer duration of use, is higher for combined oestrogen-progestogen HRT than with oestrogen-only HRT, and persists for more than 10 years after stopping HRT. Healthcare professionals are advised to only prescribe HRT for the relief of postmenopausal symptoms that adversely affect quality of life, and to regularly review patients to ensure that it is used for the shortest time and at the lowest dose. Patients currently and previously on HRT should be informed of the risk and to be vigilant for signs of breast cancer; they should also be encouraged to attend breast screening appointments.

 CONTRA-INDICATIONS Active arterial thromboembolic disease (e.g. angina or myocardial infarction) - history of breast cancer - history of venous thromboembolism - liver disease (where liver function tests have failed to return to normal) - oestrogen-dependent cancer - recent arterial thromboembolic disease (e.g. angina or myocardial infarction) - thrombophilic disorder - undiagnosed vaginal bleeding - untreated endometrial hyperplasia

• CAUTIONS Acute porphyrias p. 1150 · diabetes (increased risk of heart disease) · factors predisposing to thromboembolism · history of breast nodules (closely monitor breast status—risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease (closely monitor breast status—risk of breast cancer) · hypophyseal tumours · increased risk of gall · bladder disease reported · migraine · migraine · like headaches · presence of antiphospholipid antibodies (increased risk of thrombotic events) · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · risk of breast cancer · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size

CAUTIONS, FURTHER INFORMATION

 Risk of breast cancer HRT use is associated with an increased risk of breast cancer—see Important safety information

Radiological detection of breast cancer can be made more difficult as mammographic density can increase with

 Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogenonly HRT.

In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

- Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

- Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke.
 Combined HRT or oestrogen-only HRT increases the risk of stroke.
- Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older
- INTERACTIONS → Appendix 1: hormone replacement therapy
- SIDE-EFFECTS
- ► Common or very common Alopecia arthralgia breast abnormalities depression leg cramps menstrual cycle irregularities vaginal discharge weight changes
- ► Uncommon Anxiety · cervical abnormalities · contact lens intolerance · dizziness · embolism and thrombosis · gallbladder disorder · gastrointestinal discomfort · headaches · hirsutism · libido disorder · mood altered · nausea · oedema · skin reactions · vulvovaginal candidiasis
- ► Rare or very rare Angioedema · asthma exacerbated · cerebrovascular insufficiency · chorea exacerbated · colitis ischaemic · epilepsy exacerbated · galactorrhoea · glucose

- tolerance impaired \cdot hypocalcaemia \cdot jaundice cholestatic \cdot myocardial infarction \cdot neoplasms \cdot pancreatitis \cdot pelvic pain \cdot vomiting
- ► Frequency not known Endometrial hyperplasia · erythema nodosum

SIDE-EFFECTS, FURTHER INFORMATION Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. Continuous combined HRT commonly produces irregular breakthrough bleeding in the first 4–6 months of treatment. Bleeding beyond 6 months or after a spell of amenorrhoea requires further investigation to exclude serious gynaecological pathology.

- CONCEPTION AND CONTRACEPTION HRT does not provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.
- PREGNANCY Manufacturer advises avoid—not indicated during pregnancy.
- BREAST FEEDING Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- HEPATIC IMPAIRMENT Manufacturer advises caution; avoid in acute or active disease.
- PATIENT AND CARER ADVICE

INDICATIONS AND DOSE

BEDOL®

Menopausal symptoms | Osteoporosis prophylaxis

► BY MOUTH

Adult: 2 mg daily, started on day 1-5 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12-14 days of each cycle in women with a uterus continued →

FLLESTE SOLO® MX

Menopausal symptoms

- ► BY TRANSDERMAL APPLICATION
- Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with MX 40. subsequently adiust according to response

Osteoporosis prophylaxis

- ► BY TRANSDERMAL APPLICATION
- Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with MX 80, subsequently adjust according to response

ELLESTE-SOLO® 1-MG

Menopausal symptoms

- ► BY MOUTH
- Adult: 1 mg daily, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

ELLESTE-SOLO® 2-MG

Menopausal symptoms not controlled with lower strength | Osteoporosis prophylaxis

- ► RV MOUTE
- Adult: 2 mg daily, started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be given with cyclical progestogen for 12–14 days of each cycle in women with a uterus

ESTRADERM MX®

Menopausal symptoms

- ► BY TRANSDERMAL APPLICATION
- Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus, initiate therapy with MX25 for first 3 months; subsequently adjust according to response

Osteoporosis prophylaxis

- ► BY TRANSDERMAL APPLICATION
- Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus, initiate therapy with MX50; subsequently adjust according to response

ESTRADOT ®

Menopausal symptoms

- ► BY TRANSDERMAL APPLICATION
- Adult: Apply 1 patch twice weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with 25 patch for 3 months; subsequently adjust according to response

Osteoporosis prophylaxis

- ► BY TRANSDERMAL APPLICATION
- Adult: Apply 1 patch twice weekly continuously, to be used with cyclical progestogen for 12-14 days of each cycle in women with a uterus, initiate therapy with 50 patch; subsequently adjust according to response

EVOREL®

Menopausal symptoms | Osteoporosis prophylaxis

- ► BY TRANSDERMAL APPLICATION
- Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, therapy should be initiated with Evorel 50 patch; subsequently adjust according to response; dose may be reduced to Evorel 25 patch after first month if necessary for menopausal symptoms only

FEMSEVEN®

Menopausal symptoms | Osteoporosis prophylaxis

- ► BY TRANSDERMAL APPLICATION
- Adult: Apply 1 patch once weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with FemSeven 50 patches for the first few months, subsequently adjust according to response

LENZETTO ®

Menopausal symptoms

- ► BY TRANSDERMAL APPLICATION
- Adult: Initially 1 spray daily, applied to the dry and healthy skin of the forearm, or alternatively the inner thigh, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, dose increase should be made only after at least 4 weeks of continuous treatmentIncreased if necessary to 2 sprays daily (max. per dose 3 sprays daily)

OESTROGEL®

Menopausal symptoms

- ► TO THE SKIN
- Adult: Apply 1.5 mg once daily continuously, increased if necessary up to 3 mg after 1 month continuously, to be applied over a large area, to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus. If switching from cyclical HRT, start at end of regimen; otherwise start at any time

Osteoporosis prophylaxis

- ► TO THE SKIN
- Adult: Apply 1.5 mg once daily continuously, to be applied over a large area, to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus. If switching from cyclical HRT, start at end of regimen; otherwise start at any time

DOSE EQUIVALENCE AND CONVERSION

 For Oestrogel[®]: 2 measures is equivalent to estradiol 1.5 mg.

PROGYNOVA ®

Menopausal symptoms

- ► BY MOUTH
- Adult: 1-2 mg daily continuously, to be started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12-14 days of each cycle in women with a uterus

Osteoporosis prophylaxis

- ► BY MOUTH
- Adult: 2 mg daily continuously, to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

PROGYNOVA ® TS

Menopausal symptoms | Osteoporosis prophylaxis

- ► BY TRANSDERMAL APPLICATION
- Adult: Apply 1 patch once weekly continuously, alternatively apply 1 patch once weekly for 3 weeks, followed by a 7-day patch-free interval (cyclical), to be

used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with *Progynova TS* 50, subsequently adjust according to response, women receiving *Progynova TS* 100 patches for menopausal symptoms may continue with this strength for osteoporosis prophylaxis

SANDRENA®

Menopausal symptoms

- ► TO THE SKIN
- Adult: Apply 1 mg once daily, to be applied over area 1-2 times size of hand; with cyclical progestogen for 12-14 days of each cycle in women with a uterus, dose may be adjusted after 2-3 cycles to lowest effective dose; usual dose 0.5-1.5 mg daily

ZUMENON®

Menopausal symptoms

► BY MOUTH

Adult: Initially 1 mg daily, to be started on day 1 of menstruation (or any time if cycles have ceased or are infrequent), increased if necessary to 2 mg daily, to be taken with a cyclical progestogen for 12–14 days of each cycle in women with a uterus

Osteoporosis prophylaxis

- ► BY MOUTH
- Adult: 2 mg daily, to be taken with a cyclical progestogen for 12–14 days of each cycle in women with a uterus

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: HORMONE REPLACEMENT THERAPY (HRT): FURTHER INFORMATION ON THE KNOWN INCREASED RISK OF BREAST CANCER WITH HRT AND ITS PERSISTENCE AFTER STOPPING (SEPTEMBER 2019)

Data from a meta-analysis of more than 100 000 women with breast cancer have confirmed that the risk of breast cancer is increased with the use of all forms of systemic HRT, except vaginal oestrogens, for longer than 1 year. Findings have shown that the risk increases further with longer duration of use, is higher for combined oestrogen-progestogen HRT than with oestrogen-only HRT, and persists for more than 10 years after stopping HRT. Healthcare professionals are advised to only prescribe HRT for the relief of postmenopausal symptoms that adversely affect quality of life, and to regularly review patients to ensure that it is used for the shortest time and at the lowest dose. Patients currently and previously on HRT should be informed of the risk and to be vigilant for signs of breast cancer; they should also be encouraged to attend breast screening appointments.

- CONTRA-INDICATIONS Active arterial thromboembolic disease (e.g. angina or myocardial infarction) · history of breast cancer · history of venous thromboembolism · oestrogen-dependent cancer · recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia
- CAUTIONS Acute porphyrias p. 1150 · diabetes (increased risk of heart disease) · factors predisposing to thromboembolism · history of breast nodules—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease—closely monitor breast status (risk of breast cancer) · hypophyseal tumours · increased risk of gall -bladder disease · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · symptoms of

endometriosis may be exacerbated \cdot uterine fibroids may increase in size

CAUTIONS, FURTHER INFORMATION

 Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogenonly HRT.

In women with a uterus using *systemic* preparations, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

- Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

- Risk of stroke Nisk of stroke increases with age, therefore older women have a greater absolute risk of stroke.
 Combined HRT or oestrogen-only HRT increases the risk of stroke.
- Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women
- Risk of breast cancer with systemic use HRT use is associated with an increased risk of breast cancer—see Important safety information. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.
- INTERACTIONS → Appendix 1: hormone replacement therapy

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ➤ Common or very common Headaches · nausea · skin reactions
- ▶ Uncommon Hypertension

SPECIFIC SIDE-EFFECTS

- ► Common or very common
- With oral use Asthenia · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · menstrual cycle irregularities · muscle complaints · pelvic pain · weight changes
- With transdermal use Abdominal pain · breast abnormalities
 · menstrual cycle irregularities · uterine disorders · vaginal discharge · weight changes
- ▶ Uncommon
- With oral use Anxiety · back pain · breast abnormalities · cervical abnormalities · cystitis-like symptom · depression · dizziness · embolism and thrombosis · erythema nodosum · gallbladder disorder · oedema · palpitations · peripheral vascular disease · tumour growth · visual impairment · vulvovaginal candidiasis
- With transdermal use Asthenia · breast neoplasm benign · depression · flatulence · increased risk of infection ·

leiomyoma · mood swings · venous thromboembolism · vertigo · vomiting

- Rare or very rare
- ▶ With oral use Angioedema · cerebrovascular insufficiency · chorea · contact lens intolerance · haemolytic anaemia · hepatic disorders · hirsutism · malaise · myocardial infarction · sexual dysfunction · steepening of corneal curvature · vaginal discharge · vomiting
- With transdermal use Epilepsy exacerbated · galactorrhoea · glucose tolerance impaired · libido disorder
- Frequency not known
- ▶ With oral use Carbohydrate metabolism change epilepsy exacerbated · hypertriglyceridaemia · increased risk of coronary artery disease · neoplasms · pancreatitis · systemic lupus erythematosus (SLE)

SIDE-EFFECTS, FURTHER INFORMATION Cyclical HRT (where a progestogen is taken for 12-14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. Continuous combined HRT commonly produces irregular breakthrough bleeding in the first 4-6 months of treatment. Bleeding beyond 6 months or after a spell of amenorrhoea requires further investigation to exclude serious gynaecological pathology.

- CONCEPTION AND CONTRACEPTION HRT does not provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.
- PREGNANCY Not known to be harmful.
- BREAST FEEDING Avoid; adverse effects on lactation.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in acute or active disease.
- MONITORING REQUIREMENTS
- ► History of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer).
- The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.
- DIRECTIONS FOR ADMINISTRATION
- With transdermal use Manufacturer advises patch should be removed after 3-4 days (or once a week in case of 7-day patch) and replaced with fresh patch on slightly different site; recommended sites: clean, dry, unbroken areas of skin on trunk below waistline; not to be applied on or near breasts or under waistband. If patch falls off in bath allow skin to cool before applying new patch.
- PATIENT AND CARER ADVICE
- With transdermal use Patient counselling is advised for estradiol patches and spray (administration).
- With topical use Patient counselling is advised for estradiol gels (administration). Information sheet
- With oral use or topical use or transdermal use. The MHRA has provided a patient information sheet to aid healthcare professionals when counselling women on the risk of breast cancer with HRT use.

LENZETTO

With transdermal use Apply to dry, healthy skin of the inner forearm or alternatively the inner thigh and allow to dry for 2 minutes before covering with clothing. Avoid skin contact with another person (particularly children) or pets and avoid washing the area for at least 1 hour after application. If a sunscreen is needed, apply at least 1 hour before Lenzetto ®.

SANDRENA® > With topical use Apply gel to intact areas of skin such as lower trunk or thighs, using right and left sides on alternate days. Wash hands after application. Not to be applied on the breasts or face and avoid contact with eyes. Allow area of application to dry for 5 minutes and do not wash area for at least 1 hour.

OESTROGEL® > With topical use Apply gel to clean, dry, intact skin such as arms, shoulders or inner thighs and allow to dry for 5 minutes before covering with clothing. Not to be applied on or near breasts or on vulval region. Avoid skin contact with another person (particularly male) and avoid other skin products or washing the area for at least 1 hour after application.

Ethinylestradiol

22-May-2020

(Ethinyloestradiol) • INDICATIONS AND DOSE

Short-term treatment of symptoms of oestrogen deficiency | Osteoporosis prophylaxis if other drugs cannot be used

- ► BY MOUTH
- Adult (female): 10-50 micrograms daily for 21 days, repeated after 7-day tablet-free period, to be given with progestogen for 12-14 days per cycle in women with intact uterus.

Female hypogonadism

- ▶ BY MOUTH
- Adult (female): 10–50 micrograms daily usually on cyclical basis, initial oestrogen therapy should be followed by combined oestrogen and progestogen therapy.

Menstrual disorders

- ► BY MOUTH
- Adult (female): 20–50 micrograms daily from day 5 to 25 of each cycle, to be given with progestogen, added either throughout the cycle or from day 15 to 25.

Palliative treatment of prostate cancer

- ► BY MOUTH
- Adult (male): 0.15-1.5 mg daily.
- CONTRA-INDICATIONS Active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) Acute porphyrias p. 1150 · history of breast cancer · history of venous thromboembolism · liver disease (where liver function tests have failed to return to normal) · oestrogen-dependent cancer · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia

CONTRA-INDICATIONS, FURTHER INFORMATION

- Combined hormonal contraception For more information on contra-indications for ethinylestradiol in contraception see combined hormonal contraceptive preparations containing ethinylestradiol.
- Hormone replacement therapy For more information on contra-indications for hormone replacement therapy see Sex hormones p. 808
- CAUTIONS Cardiovascular disease (risk of fluid retention) diabetes (increased risk of heart disease) · history of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of hypertriglyceridaemia (increased risk of pancreatitis) · hypophyseal tumours · increased risk of gall-bladder disease · migraine (migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · risk factors for venous thromboembolism · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size

CAUTIONS, FURTHER INFORMATION

- Combined hormonal contraception For more information on cautions for ethinylestradiol in contraception see combined hormonal contraceptive preparations containing ethinylestradiol.
- Hormone replacement therapy For more information on cautions for hormone replacement therapy see Sex hormones p. 808
- INTERACTIONS → Appendix 1: hormone replacement therapy
- SIDE-EFFECTS Breast abnormalities · cervical mucus increased · cholelithiasis · contact lens intolerance · depression · electrolyte imbalance · embolism and thrombosis · erythema nodosum · feminisation · fluid retention · headaches · hypertension · jaundice cholestatic · metrorrhagia · mood altered · myocardial infarction · nausea · neoplasms · skin reactions · stroke · uterine disorders · vomiting · weight change

SIDE-EFFECTS, FURTHER INFORMATION Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. Continuous combined HRT commonly produces irregular breakthrough bleeding in the first 4–6 months of treatment. Bleeding beyond 6 months or after a spell of amenorrhoea requires further investigation to exclude serious gynaecological pathology.

- PREGNANCY Not known to be harmful.
- BREAST FEEDING Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- HEPATIC IMPAIRMENT Manufacturer advises caution; avoid in acute or active disease.
- MEDICINAL FORMS Forms available from special-order manufacturers include: tablet, capsule, oral suspension

Tibolone

09-Sep-2021

INDICATIONS AND DOSE

Short-term treatment of symptoms of oestrogen deficiency (including women being treated with gonadotrophin releasing hormone analogues) |
Osteoporosis prophylaxis in women at high risk of fractures when other prophylaxis contra-indicated or not tolerated

- ► BY MOUTH
- Adult: 2.5 mg daily

- CONTRA-INDICATIONS Acute porphyrias p. 1150 · history of arterial thromboembolic disease (e.g. angina, myocardial infarction, stroke or TIA) · history of breast cancer · history of venous thromboembolism · liver disease (where liver function tests have failed to return to normal) · oestrogen-dependent cancer · thrombophilic disorder · uninvestigated or undiagnosed vaginal bleeding · untreated endometrial hyperplasia
- CAUTIONS Diabetes (increased risk of heart disease) epilepsy · factors predisposing to thromboembolism · history of breast nodules—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease—closely monitor breast status (risk of breast cancer) · hypertriglyceridaemia · hypophyseal tumours · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · risk of stroke
- INTERACTIONS → Appendix 1: tibolone
- SIDE-EFFECTS
- ▶ Common or very common Breast abnormalities · cervical dysplasia · endometrial thickening · gastrointestinal discomfort · genital abnormalities · hair growth abnormal increased risk of infection · pelvic pain · postmenopausal haemorrhage · vaginal discharge · vaginal haemorrhage · weight increased
- ▶ Uncommon Oedema · skin reactions
- Frequency not known Arthralgia · dementia · depression · dizziness · erythema nodosum · gallbladder disorder · headaches · increased risk of ischaemic stroke · myalgia · neoplasms · vision disorders

SIDE-EFFECTS, FURTHER INFORMATION Vaginal bleeding Investigate for endometrial cancer if bleeding continues beyond 6 months or after stopping treatment.

Reasons to withdraw treatment Withdraw treatment if signs of thromboembolic disease, abnormal liver function tests, or signs of cholestatic jaundice.

- PREGNANCY Avoid; toxicity in animal studies.
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT Manufacturer advises caution; avoid in acute disease.
- RENAL IMPAIRMENT EVGT Caution (risk of fluid retention).
- PRESCRIBING AND DISPENSING INFORMATION Unsuitable for use in the premenopause (unless being treated with gonadotrophin-releasing hormone analogue) and as (or with) an oral contraceptive.

Also unsuitable for use within 12 months of last menstrual period (may cause irregular bleeding).

If transferring from cyclical HRT, start at end of regimen; if transferring from continuous-combined HRT, start at any time.

Estradiol 1 mg, Progesterone 100 mg Bijuve 1mg/100mg capsules 28 capsule PoM £8.14 | 84 capsule PoM £24.42

PROGESTOGENS

Dienogest

• DRUG ACTION Dienogest is a nortestosterone derivative that has a progestogenic effect in the uterus, reducing the production of estradiol and thereby suppressing endometriotic lesions.

INDICATIONS AND DOSE

Endometriosis

- ► BY MOUTH
- Females of childbearing potential: 2 mg once daily, can be started on any day of cycle, dose should be taken continuously at the same time each day
- CONTRA-INDICATIONS Arterial disease (past or present) cardiovascular disease (past or present) · diabetes with vascular involvement · liver tumours (past or present) · sex hormone-dependent malignancies (confirmed or suspected) · undiagnosed vaginal bleeding · venous thromboembolism (active)
- CAUTIONS Diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · history of depression history of ectopic pregnancy · history of gestational diabetes · patients at risk of osteoporosis · patients at risk of venous thromboembolism

CALITIONS, FURTHER INFORMATION

- Immobilisation Manufacturer advises to discontinue treatment during prolonged immobilisation. For elective surgery, treatment should be discontinued at least 4 weeks before surgery: treatment may be restarted 2 weeks after complete remobilisation.
- INTERACTIONS → Appendix 1: dienogest
- SIDE-EFFECTS
- ► Common or very common Alopecia · anxiety · asthenic conditions · breast abnormalities · depression · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · hot flush · libido loss · mood altered · nausea · ovarian cyst · pain · skin reactions · sleep disorder · vomiting · vulvovaginal disorders · weight changes
- ▶ **Uncommon** Anaemia · appetite increased · autonomic dysfunction · broken nails · circulatory system disorder · concentration impaired · constipation · dandruff · diarrhoea · dry eye · dyspnoea · genital discharge · hair changes · hyperhidrosis · hypotension · increased risk of infection · limb discomfort · muscle spasms · oedema · palpitations · pelvic pain · photosensitivity reaction · tinnitus
- ► Frequency not known Glucose tolerance impaired insulin resistance · menstrual cycle irregularities
- CONCEPTION AND CONTRACEPTION Manufacturer advises that, if contraception is required, females of childbearing potential should use non-hormonal contraception during treatment. The menstrual cycle usually returns to normal within 2 months after stopping treatment.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment (no information available).
- PATIENT AND CARER ADVICE Manufacturer advises patients with a history of chloasma gravidarum to avoid sunlight or UV radiation exposure during treatment. Missed doses Manufacturer advises if one or more tablets are missed, or if vomiting and/or diarrhoea occurs within 3-4 hours of taking a tablet, another tablet should be taken as soon as possible and the next dose taken at the normal time.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Zalkya (Stragen UK Ltd)

Dienogest 2 mg Zalkya 2mg tablets | 28 tablet PoM £20.68 DT = £20.68

Norethisterone

08-Nov-2021

INDICATIONS AND DOSE **Endometriosis**

► BY MOUTH

▶ Adult: 10–15 mg daily for 4–6 months or longer, to be

started on day 5 of cycle; increased to 20-25 mg daily if required, dose only increased if spotting occurs and reduced once bleeding has stopped

Dysfunctional uterine bleeding (to arrest bleeding) Menorrhagia (to arrest bleeding)

- ► BY MOUTH
- Adult: 5 mg 3 times a day for 10 days

Dysfunctional uterine bleeding (to prevent bleeding) Menorrhagia (to prevent bleeding)

- Adult: 5 mg twice daily, to be taken from day 19 to day 26 of cycle

Dysmenorrhoea

- ► BY MOUTH
- Adult: 5 mg 3 times a day for 3-4 cycles, to be taken from day 5-24 of cycle

Premenstrual syndrome (but not recommended)

- ► BY MOUTH
- ➤ Adult: 5 mg 2-3 times a day for several cycles, to be taken from day 19-26 of cycle

Postponement of menstruation

- ► BY MOUTH
- Females of childbearing potential: 5 mg 3 times a day, to be started 3 days before expected onset (menstruation occurs 2-3 days after stopping)

Breast cancer

- ► BY MOUTH
- Adult: 40 mg daily, increased if necessary to 60 mg daily

Short-term contraception

- **▶** BY DEEP INTRAMUSCULAR INJECTION
- Females of childbearing potential: 200 mg, to be administered within first 5 days of cycle or immediately after parturition (duration 8 weeks). To be injected into the gluteal muscle, then 200 mg after 8 weeks if required

Contraception

- ► BY MOUTH
- Females of childbearing potential: 350 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 3 hours or more it should be regarded as a 'missed pill'

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Acute porphyrias p. 1150current breast cancer (unless progestogens are being used in the management of this condition) · history during pregnancy of idiopathic jaundice (non-contraceptive indications) · history during pregnancy of pemphigoid gestationis (non-contraceptive indications) · history during pregnancy of severe pruritus (non-contraceptive indications)

SPECIFIC CONTRA-INDICATIONS

 With oral use History of thromboembolism (noncontraceptive indications) • undiagnosed vaginal bleeding (non-contraceptive indications)

CAUTIONS

GENERAL CAUTIONS Cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · history of breast cancer—seek specialist advice before use · hypertension · liver tumours—seek specialist advice before use · migraine · multiple risk factors for cardiovascular disease—seek specialist advice before intramuscular use · positive antiphospholipid antibodies · rheumatoid arthritis · risk factors for venous thromboembolism · systemic lupus erythematosus

SPECIFIC CAUTIONS

- With intramuscular use Cervical cancer
- When used for contraception History of stroke (including transient ischaemic attack)—seek specialist advice before intramuscular use · ischaemic heart disease—seek specialist advice before intramuscular use · undiagnosed vaginal bleeding—seek specialist advice before intramuscular use
- With oral use for contraception Malabsorption syndromes CAUTIONS, FURTHER INFORMATION
- Breast cancer risk with contraceptive use There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogenonly contraceptive pill; this relative risk may be due to an

earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

- INTERACTIONS → Appendix 1: norethisterone
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Menstrual cycle irregularities
- ► Uncommon Breast tenderness
- Frequency not known Hepatic cancer · thromboembolism
 SPECIFIC SIDE-EFFECTS
- ► Common or very common
- With intramuscular use Dizziness · haemorrhage · headache · hypersensitivity · nausea · skin reactions · weight increased
- ▶ Uncommon
- With intramuscular use Abdominal distension · depressed mood
- ► Frequency not known
- With oral use Appetite change · depression · fatigue · gastrointestinal disorder · headaches · hypertension · libido disorder · nervousness · rash · weight change
- PREGNANCY
- With oral use Masculinisation of female fetuses and other defects reported with non-contraceptive use.
- BREAST FEEDING Progestogen-only contraceptives do not affect lactation. Higher doses (used in malignant conditions) may suppress lactation and alter milk composition—use lowest effective dose.
- With intramuscular use Withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment.
- HEPATIC IMPAIRMENT Manufacturers advise caution; avoid in severe or active disease.
- When used for breast cancer Manufacturer advises avoid.
- RENAL IMPAIRMENT
- ▶ With oral use EvGr Use with caution. ♠
- PATIENT AND CARER ADVICE
- Diarrhoea and vomiting with oral contraceptives Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.
- Starting routine for oral contraceptives One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if norethisterone is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.
- Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).
- After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.
- Contraceptives by injection Full counselling backed by patient information leaflet required before administration likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of

treatment but there is no evidence of permanent infertility.

Missed doses

BNF 84

Missed oral contraceptive pill The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.'

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Progesterone

09-Feb-2022

• INDICATIONS AND DOSE

CRINONE ® VAGINAL GEL

Supplementation of luteal phase in infertility (under expert supervision)

- ► BY VAGINA
- Adult: 1 applicatorful daily, start either after documented ovulation or on day 18-21 of cycle

Adjunct in in-vitro fertilisation [when mainly tubal, idiopathic, or endometriosis related infertility is associated with normal ovulatory cycles] (under expert supervision)

- ► BY VAGINA
- Adult: 1 applicatorful daily, dose to be inserted preferably in the morning, start from the day of embryo transfer and continue for a total of 30 days once pregnancy is confirmed

CYCLOGEST ® PESSARIES

Premenstrual syndrome | Post-natal depression

- ► BY VAGINA, OR BY RECTUM
- Adult: 200–800 mg daily, doses above 200 mg to be given in 2 divided doses, for premenstrual syndrome start on day 12–14 and continue until onset of menstruation (but not recommended); rectally if barrier methods of contraception are used, in patients who have recently given birth or in those who suffer from vaginal infection or recurrent cystitis

Supplementation of luteal phase during assisted reproductive technology (ART) treatment (under expert supervision)

► BY VAGINA

 Adult: 400 mg twice daily, start at oocyte retrieval, and continue for 38 days once pregnancy is confirmed

LUBION ®

Supplementation of luteal phase during assisted reproductive technology (ART) treatment in women for whom vaginal preparations are inappropriate

- ► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: 25 mg once daily from day of oocyte retrieval up to week 12 of pregnancy

LUTIGEST®

Supplementation of luteal phase during assisted reproductive technology (ART) treatment (under expert supervision)

- ► RV VΔGINΔ
- Adult: 100 mg 3 times a day, start the day after oocyte retrieval, and continue for 30 days once pregnancy is confirmed

UTROGESTAN® CAPSULES

Progestogenic opposition of oestrogen HRT

- ▶ BY MOUTH
- Adult: 200 mg once daily on days 15–26 of each 28-day oestrogen HRT cycle, alternatively 100 mg once daily on days 1–25 of each 28-day oestrogen HRT cycle

UTROGESTAN® VAGINAL CAPSULES

Supplementation of luteal phase during assisted reproductive technology (ART) cycles

- ► BY VAGINA
- Adult: 200 mg 3 times a day from day of embryo transfer until at least week 7 of pregnancy up to week 12 of pregnancy

Threatened miscarriage [with vaginal bleeding and previous miscarriage] (initiated by a specialist)

- BY VAGINA
- Adult: 400 mg twice daily from when intra-uterine pregnancy is confirmed until week 16 of pregnancy if fetal heartbeat confirmed, offer a repeat scan within 2 weeks if fetal heartbeat is not seen on an initial scan

UNLICENSED USE

UTROGESTAN® VAGINAL CAPSULES EVGT Progesterone is used in the prevention of threatened miscarriage, a but is not licensed for this indication.

- CONTRA-INDICATIONS Acute porphyrias p. 1150 · breast cancer · genital cancer · history during pregnancy of idiopathic jaundice · history during pregnancy of pemphigoid gestationis · history during pregnancy of severe pruritus · history of thromboembolism · missed miscarriage · thrombophlebitis · undiagnosed vaginal bleeding
- CAUTIONS Conditions that may worsen with fluid retention - diabetes (progestogens can decrease glucose tolerance—monitor patient closely) - history of depression - migraine - risk factors for thromboembolism

SIDE-EFFECTS

- ► Common or very common
- ▶ With oral use Headache menstrual cycle irregularities
- With vaginal use Breast pain · drowsiness · gastrointestinal discomfort
- ▶ Uncommon
- With oral use Breast pain · constipation · diarrhoea · dizziness · drowsiness · jaundice cholestatic · skin reactions · vomiting
- ► Rare or very rare
- ▶ With oral use Depression nausea

23-Nov-2020

► Frequency not known

- With intramuscular use Alopecia · breast changes · cervical abnormalities · depression · drowsiness · fever · hirsutism · insomnia · jaundice cholestatic · menstrual cycle irregularities · nausea · oedema · protein catabolism · skin reactions · weight increased
- ▶ With rectal use Diarrhoea flatulence
- With vaginal use Leakage of the pessary base · menstrual cycle irregularities · vulvovaginal pain
- ALLERGY AND CROSS-SENSITIVITY For Utrogestan® oral and vaginal capsules, manufacturer advises contra-indicated in patients with hypersensitivity to soy or peanut products contains soya lecithin.
- PREGNANCY Not known to be harmful.
- BREAST FEEDING Avoid—present in milk.
- HEPATIC IMPAIRMENT Manufacturer advises caution; avoid in severe impairment. For Utrogestan® oral capsules, manufacturer advises avoid in acute or active liver disease. For Crinone® vaginal gel, manufacturer advises caution in severe impairment.
- RENAL IMPAIRMENT Ever Caution (risk of fluid retention; no information available).
- DIRECTIONS FOR ADMINISTRATION
- With oral use Manufacturer advises capsules should be taken at bedtime on an empty stomach.
- PATIENT AND CARER ADVICE
- With oral use Patient counselling is advised for progesterone capsules (administration).
- NATIONAL FUNDING/ACCESS DECISIONS

LUTIGEST [®] For full details see funding body website

Combinations available: Estradiol with progesterone, p. 823

8.1a Anti-oestrogens

OVULATION STIMULANTS

Clomifene citrate

(Clomiphene citrate)

 DRUG ACTION Anti-oestrogen which induces gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin is sometimes used as an adjunct.

• INDICATIONS AND DOSE

Female infertility due to ovulatory dysfunction

- ► BY MOUTH
- Adult (female): 50 mg once daily for 5 days, to be started at any time if no recent uterine bleeding or on or around the fifth day of cycle if progestogen-induced bleeding is planned or if spontaneous uterine bleeding occurs, then 100 mg once daily if required for 5 days, this second course to be given at least 30 days after the first course, only in the absence of ovulation; most patients who are going to respond will do so to first course, 3 courses should constitute adequate therapeutic trial; long-term cyclical therapy not recommended (beyond a total of 6 cycles).

IMPORTANT SAFETY INFORMATION

Manufacturer advises clomifene should not normally be used for longer than 6 cycles (possible increased risk of ovarian cancer).

- CONTRA-INDICATIONS Abnormal uterine bleeding of undetermined cause · hormone-dependent tumours · ovarian cysts
- CAUTIONS Ectopic pregnancy · incidence of multiple births increased · ovarian hyperstimulation syndrome · polycystic ovary syndrome (cysts may enlarge during treatment, also risk of exaggerated response to usual doses) · uterine fibroids
- SIDE-EFFECTS Abdominal distension · alopecia · angioedema · anxiety · breast tenderness · cataract · cerebral thrombosis · depression · disorientation · dizziness · fatigue · headache · hot flush · hypertriglyceridaemia · insomnia · jaundice cholestatic · menstrual cycle irregularities · mood altered · nausea · neoplasms · nervous system disorders · optic neuritis · ovarian and fallopian tube disorders · palpitations · pancreatitis · paraesthesia · psychosis · seizure · skin reactions · speech disorder · stroke · syncope · tachycardia · uterine disorders · vertigo · vision disorders · visual impairment (discontinue and initiate ophthalmological examination) · vomiting
- CONCEPTION AND CONTRACEPTION Exclude pregnancy before treatment.
- PREGNANCY Possible effects on fetal development.
- BREAST FEEDING May inhibit lactation.

 HEPATIC IMPAIRMENT Manufacturer advises avoid in liver disease or history of liver dysfunction.

PATIENT AND CARER ADVICE

Conception and contraception Patients planning to conceive should be warned that there is a risk of multiple pregnancy (*rarely* more than twins).

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

8.2 Male sex hormone responsive conditions

Androgens, anti-androgens and

14-Aug-2020

Androgens

anabolic steroids

Androgens cause masculinisation; they may be used as replacement therapy in castrated adults and in those who are hypogonadal due to either pituitary or testicular disease. In the normal male they inhibit pituitary gonadotrophin secretion and depress spermatogenesis. Androgens also have an anabolic action which led to the development of anabolic steroids.

Androgens are useless as a treatment of impotence and impaired spermatogenesis unless there is associated hypogonadism; they should not be given until the hypogonadism has been properly investigated. Treatment should be under expert supervision.

When given to patients with hypopituitarism they can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone which will stimulate spermatogenesis as well as androgen production.

Intramuscular depot preparations of **testosterone esters** are preferred for replacement therapy. Testosterone enantate, propionate or undecanoate, or alternatively *Sustanon*, which consists of a mixture of testosterone esters and has a longer duration of action, may be used.

Anti-androgens

Cyproterone acetate

Cyproterone acetate p. 830 is an anti-androgen used in the treatment of severe hypersexuality and sexual deviation in the male. It inhibits spermatogenesis and produces reversible infertility (but is not a male contraceptive); abnormal sperm forms are produced. Fully informed consent is recommended and an initial spermatogram. As hepatic tumours have been produced in *animal* studies, careful consideration should be given to the risk/benefit ratio before treatment. Cyproterone acetate is also licensed for use alone in patients with metastatic prostate cancer refractory to gonadorelin analogue therapy, and has been used as an adjunct in prostatic cancer and in the treatment of acne and hirsutism in women.

The MHRA/CHM have released important safety information on the use of cyproterone acetate and risk of meningioma. For further information, see *Important safety information* for cyproterone acetate.

Dutasteride and finasteride

Dutasteride p. 849 and finasteride p. 850 are alternatives to alpha-blockers particularly in men with a significantly enlarged prostate. Finasteride is also licensed for use with doxazosin p. 845 in the management of benign prostatic hyperplasia.

A low strength of finasteride is licensed for treating malepattern baldness in men.

Anabolic steroids

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in women. They are used in the treatment of some *aplastic anaemias*. Anabolic steroids have been given for osteoporosis in women but they are no longer advocated for this purpose.

The protein-building properties of anabolic steroids have not proved beneficial in the clinical setting. Their use as body builders or tonics is unjustified; some athletes abuse them

ANDROGENS

Androgens

- CONTRA-INDICATIONS Breast cancer in males history of liver tumours hypercalcaemia prostate cancer
- CAUTIONS Cardiac impairment · diabetes mellitus · elderly · epilepsy · hypertension · ischaemic heart disease · migraine · pre-pubertal boys (fusion of epiphyses is hastened and may result in short stature)—statural growth and sexual development should be monitored · risk factors for venous thromboembolism · skeletal metastases—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored) · sleep apnoea · stop treatment or reduce dose if severe polycythaemia occurs · thrombophilia—increased risk of thrombosis · tumours—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored)

 CAUTIONS. FURTHER INFORMATION
- Elderly Prescription potentially inappropriate (STOPP criteria) in the absence of primary or secondary hypogonadism (risk of androgen toxicity; no proven benefit outside of the hypogonadism indication).
 See also Prescribing in the elderly p. 29.
- SIDE-EFFECTS
- ► Common or very common Hot flush · hypertension · polycythaemia · prostate abnormalities · skin reactions · weight increased
- ▶ Uncommon Alopecia · asthenia · behaviour abnormal · depression · dizziness · dyspnoea · dysuria · gynaecomastia · headache · hyperhidrosis · insomnia · nausea · sexual dysfunction
- ▶ Rare or very rare Pulmonary oil microembolism
- ► Frequency not known Anxiety · epiphyses premature fusion · fluid retention · jaundice · oedema · oligozoospermia · paraesthesia · precocious puberty · prostate cancer · seborrhoea · sleep apnoea · urinary tract obstruction SIDE-EFFECTS, FURTHER INFORMATION Stop treatment or reduce dose if severe polycythaemia occurs.
- PREGNANCY Avoid—causes masculinisation of female fetus.
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT In general, manufacturers advise caution (increased risk of fluid retention and heart failure).
- RENAL IMPAIRMENT In general, manufacturers advise caution (increased risk of fluid retention and heart failure).

MONITORING REQUIREMENTS

- Monitor haematocrit and haemoglobulin before treatment, every three months for the first year, and yearly thereafter
- ▶ Monitor prostate and PSA in men over 45 years.

• PATIENT AND CARER ADVICE

Androgenic effects in women Women should be advised to report any signs of virilisation e.g. deepening of the voice or hirsutism.

Testosterone

F 827

• INDICATIONS AND DOSE

Low sexual desire in postmenopausal women (administered on expert advice)

- ► BY TRANSDERMAL APPLICATION
- Adult: Apply 50 mg every week, the contents of a 5-g sachet or 5-g tube (containing 50 mg/5 g of testosterone) to be divided for daily dosing and applied to non-hair areas, such as the abdomen or upper thighs, over the period of 1 week

TESTAVAN'

Hypogonadism due to androgen deficiency in men

- ► BY TRANSDERMAL APPLICATION
- Adult: Apply 23 mg once daily; increased in steps of 23 mg, adjusted according to response; maximum 69 mg per day

DOSE EQUIVALENCE AND CONVERSION

 For Testavan[®]: one pump actuation delivers 1.15 g of gel containing 23 mg of testosterone.

TESTIM ®

Hypogonadism due to testosterone deficiency in men

- ► BY TRANSDERMAL APPLICATION
- Adult: Apply 50 mg once daily, subsequent application adjusted according to response; maximum 100 mg per day

DOSE EQUIVALENCE AND CONVERSION

► For *Testim* [®]: one tube of 5 g contains 50 mg testosterone.

TESTOGEL® 16.2MG/G

Hypogonadism due to androgen deficiency in men

- ► BY TRANSDERMAL APPLICATION
- Adult: Apply 40.5 mg once daily; increased in steps of 20.25 mg, adjusted according to response; maximum 81 mg per day

DOSE EQUIVALENCE AND CONVERSION

► For *Testogel*[®] 16.2 mg/g: one pump actuation delivers 1.25 g of gel containing 20.25 mg of testosterone.

TESTOGEL® 50MG/5G

Hypogonadism due to androgen deficiency in men

- ► BY TRANSDERMAL APPLICATION
- Adult: Apply 50 mg once daily; increased in steps of 25 mg, adjusted according to response; maximum 100 mg per day

DOSE EQUIVALENCE AND CONVERSION

► For *Testogel* • 50 mg/5 g: one sachet of 5 g contains 50 mg of testosterone.

TOSTRAN®

Hypogonadism due to testosterone deficiency in men

- ► BY TRANSDERMAL APPLICATION
- Adult: Apply 60 mg once daily, subsequent application adjusted according to response; maximum 80 mg per day

DOSE EQUIVALENCE AND CONVERSION

► For *Tostran*®: 1 g of gel contains 20 mg testosterone.

- UNLICENSED USE Ever Testosterone is used for the treatment of low sexual desire in postmenopausal women, (È) but is not licensed for this indication.
- SIDE-EFFECTS
- ► Common or very common Hypertriglyceridaemia
- ► Frequency not known Anaemia · deep vein thrombosis · electrolyte imbalance · frontal balding (in women) · hair growth unwanted (in women) · hypertrichosis · malaise · muscle cramps · musculoskeletal pain · testicular disorder · vasodilation · voice lowered (in women)

SIDE-EFFECTS, FURTHER INFORMATION When used for low sexual desire in post-menopausal women The long-term effects of testosterone in this patient group are largely unknown, but side-effects can include growth of unwanted hair, frontal balding and deepening of the voice.

 DIRECTIONS FOR ADMINISTRATION Manufacturer advises avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature.

TESTOGEL ** 50MG/56 Manufacturer advises apply thin layer of gel on clean, dry, healthy skin such as shoulders, arms or abdomen, immediately after sachet is opened. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel, avoid shower or bath for at least 6 hours.

TOSTRAN® Manufacturer advises apply gel on clean, dry, intact skin of abdomen or both inner thighs, preferably in the morning. Gently rub in with a finger until dry before dressing. Wash hands with soap and water after applying gel; avoid washing application site for at least 2 hours. Not to be applied on genital area.

TESTIM Manufacturer advises squeeze entire content of tube on to one palm and apply as a thin layer on clean, dry, healthy skin of shoulder or upper arm, preferably in the morning after washing or bathing (if 2 tubes required use 1 per shoulder or upper arm); rub in and allow to dry before putting on clothing to cover site; wash hands with soap after application; avoid washing application site for at least 6 hours.

TESTOGEL [®] **16.2MG/G** Apply thin layer of gel on clean, dry, healthy skin over right and left upper arms and shoulders. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel, and cover the site with clothing once gel dried; avoid shower or bath for at least 2 hours.

TESTAVAN Manufacturer advises apply one pump actuation of gel evenly onto clean, dry, intact skin over upper arm and shoulder using the applicator, without getting any gel on the hands—repeat on opposite upper arm and shoulder if two pump actuations are required, and repeat again on initial upper arm and shoulder if three pump actuations are required. Allow to dry completely before dressing and cover application site with clothing. Wash hands with soap and water immediately if gel was touched during application; avoid shower or bath for at least? hours

- PATIENT AND CARER ADVICE Patient or carer should be given advice on how to administer testosterone gel.
- NATIONAL FUNDING/ACCESS DECISIONS

ANTI-ANDROGENS

Cyproterone acetate

01-Dec-2020

• INDICATIONS AND DOSE

Hyper-sexuality in males | Sexual deviation in males

► BY MOUTH

Adult: 50 mg twice daily, to be taken after food

Prevention of tumour flare with initial gonadorelin analogue therapy

- ► BY MOUTH
- Adult (male): 200 mg daily in 2-3 divided doses for 5-7 days before initiation of gonadorelin analogue, followed by 200 mg daily in 2-3 divided doses for 3-4 weeks after initiation of gonadorelin analogue; maximum 300 mg per day.

Long-term palliative therapy where gonadorelin analogues or orchidectomy contra-indicated, not tolerated, or where oral therapy preferred

- ▶ BY MOUTH
- ▶ Adult (male): 200-300 mg daily in 2-3 divided doses.

Hot flushes with gonadorelin analogue therapy or after orchidectomy

- ► BY MOUTH
- Adult (male): Initially 50 mg daily, then adjusted according to response to 50–150 mg daily in 1–3 divided doses.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CYPROTERONE ACETATE: NEW ADVICE TO MINIMISE RISK OF MENINGIOMA (JUNE 2020)

Cyproterone acetate has been associated with an overall rare, but cumulative dose-dependent, increased risk of meningioma (single and multiple), mainly at doses of 25 mg/day and higher. Healthcare professionals are advised to monitor patients for meningiomas, and to permanently discontinue treatment if diagnosed. Use of cyproterone acetate, including co-cyprindiol, for all indications is contra-indicated in those with meningioma or a history of meningioma. Treatment with high doses of cyproterone acetate for any indication, except prostate cancer, should be restricted to when alternative treatments or interventions are unavailable or considered inappropriate.

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Dubin-Johnson syndrome-existing or history of thromboembolic disorders • malignant diseases (except for carcinoma of the prostate) • meningioma or history of meningioma • previous or existing liver tumours (not due to metastases from carcinoma of the prostate) • Rotor syndrome • wasting diseases (except for inoperable carcinoma of the prostate) • SPECIFIC CONTRA-INDICATIONS

SPECIFIC CONTRA-INDICATIONS

- When used for hypersexuality Severe depression · severe diabetes (with vascular changes) · sickle-cell anaemia
- CAUTIONS Diabetes mellitus · in prostate cancer, severe depression · in prostate cancer, sickle-cell anaemia · ineffective for male hypersexuality in chronic alcoholism (relevance to prostate cancer not known)
- INTERACTIONS → Appendix 1: anti-androgens
- SIDE-EFFECTS
- ➤ Common or very common Depressed mood · dyspnoea · fatigue · gynaecomastia · hepatic disorders · hot flush · hyperhidrosis · nipple pain · restlessness · weight change

- ► Uncommon Skin reactions
- Rare or very rare Galactorrhoea meningioma (increased risk with increasing cumulative dose) neoplasms
- Frequency not known Adrenocortical suppression anaemia · azoospermia · hair changes · hypotrichosis · osteoporosis · sebaceous gland underactivity (may clear acne) · thromboembolism

SIDE-EFFECTS, FURTHER INFORMATION Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (fatalities reported, usually after several months, at dosages of 100 mg and above). If hepatotoxicity is confirmed, cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk).

- HEPATIC IMPAIRMENT Manufacturer advises avoid (unless used for prostate cancer).
- MONITORING REQUIREMENTS
- ▶ Monitor blood counts initially and throughout treatment.
- Monitor adrenocortical function regularly.
- Monitor hepatic function regularly—liver function tests should be performed before and regularly during treatment and whenever symptoms suggestive of hepatotoxicity occur.

PATIENT AND CARER ADVICE

Driving and skilled tasks Fatigue and lassitude may impair performance of skilled tasks (e.g. driving).

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Thyrotropin alfa

02-Dec-2020

(Recombinant human thyroid stimulating hormone: rhTSH)

 DRUG ACTION Thyrotropin alfa is a recombinant form of thyrotrophin (thyroid stimulating hormone).

INDICATIONS AND DOSE

Detection of thyroid remnants and thyroid cancer in postthyroidectomy patients, together with serum thyroglobulin testing (with or without radioiodine imaging) | To increase radio-iodine uptake for the ablation of thyroid remnant tissue in suitable postthyroidectomy patients

- ► BY INTRAMUSCULAR INJECTION
- Adult: 900 micrograms every 24 hours for 2 doses, dose to be administered into the gluteal muscle, consult product literature for further information on indications and dose
- CAUTIONS Presence of thyroglobulin autoantibodies may give false negative results
- SIDE-EFFECTS
- ► Common or very common Asthenia · dizziness · headache · nausea · vomiting
- Uncommon Chills · diarrhoea · feeling hot · fever · flushing · hypersensitivity · influenza · influenza like illness · pain · paraesthesia · pulmonary reaction · skin reactions · taste altered
- ▶ Rare or very rare Atrial fibrillation hyperthyroidism
- ▶ Frequency not known Arthralgia · dyspnoea · goitre · hyperhidrosis · myalgia · neoplasm complications · palpitations · residual metastases enlarged · stroke · tremor
- ALLERGY AND CROSS-SENSITIVITY Evg: Contra-indicated if previous hypersensitivity to bovine or human thyrotrophin.
- PREGNANCY Avoid.
- BREAST FEEDING Avoid.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Thyrotropin alfa 900 microgram Thyrogen 900microgram powder for solution for injection vials | 2 vial PoM £583.04

9.1 Hyperthyroidism

Hyperthyroidism

09-Dec-2019

Description of condition

Hyperthyroidism results from the excessive production and secretion of thyroid hormones leading to thyrotoxicosis (an excess of circulating thyroid hormones). Signs and symptoms of hyperthyroidism include a goitre, hyperactivity, disturbed sleep, fatigue, palpitations, anxiety, heat intolerance, increased appetite with unintentional weight loss, and diarrhoea. Complications include Graves' orbitopathy, thyroid storm (thyrotoxic crisis), pregnancy complications, reduced bone mineral density, heart failure, and atrial fibrillation. Risk factors include smoking, a family history of thyroid disease, co-existent autoimmune conditions, and low iodine intake.

Primary hyperthyroidism refers to when the condition arises from the thyroid gland rather than due to a pituitary or hypothalamic disorder. It is mainly caused by Graves' disease (an autoimmune disorder mediated by antibodies that stimulate the thyroid-stimulating hormone (TSH) receptor). Other causes include toxic nodular goitre (autonomously functioning thyroid nodules that secrete excess thyroid hormone), or drug-induced thyrotoxicosis.

Primary hyperthyroidism is more common in females than males and can be classified as either overt or subclinical; both of which may or may not be symptomatic. Overt hyperthyroidism is characterised by TSH levels below the reference range and free thyroxine (FT4) and/or free tri-

iodothyronine (FT3) levels above the reference range. In subclinical hyperthyroidism, TSH is suppressed but FT4 and FT3 are within the reference range.

Thyrotoxicosis can also occur without hyperthyroidism; this is usually transient, and can occur due to excess intake of levothyroxine or over-the-counter supplements containing thyroid hormone, or thyroiditis.

Aims of treatment

Treatment aims to alleviate symptoms, align thyroid function tests within or close to the reference range, and to reduce the risk of long-term complications.

Non-drug treatment

Evgr Radioactive iodine or surgery (such as total thyroidectomy or hemithyroidectomy) may be considered by specialists in the management of Graves' disease or toxic nodular goitre. Whilst awaiting these treatments, antithyroid drugs should be offered to control hyperthyroidism, see *Graves' disease* and *Toxic nodular goitre* in *Primary hyperthyroidism*.

Primary Hyperthyroidism

Evgr Patients with symptoms of thyroid storm should be treated as a medical emergency. Refer patients urgently to an endocrinologist if a pituitary or hypothalamic disorder is suspected, and refer or discuss with an endocrinologist all patients with new-onset hyperthyroidism (base urgency on clinical judgement). If malignancy is suspected, refer patients using a suspected cancer pathway.

Explain to patients, and their family or carers if appropriate, that:

- Some patients may feel well even when their thyroid function tests are outside the reference range;
- Even when they have no symptoms, treatment may be advised to reduce the risk of long-term complications;
- Symptoms may lag behind treatment changes for several weeks to months.

Consider antithyroid drugs alongside supportive treatment (for example, beta-blockers) for patients with hyperthyroidism awaiting specialist assessment and further treatment. Carbimazole p. 832 is the recommended choice of antithyroid drug, with propylthiouracil p. 833 considered for those in whom carbimazole is unsuitable. For further information, see *Graves' disease* and *Toxic nodular goitre*.

Before starting antithyroid drugs, check full blood count and liver function tests.

The MHRA/CHM have released important safety information regarding the use of carbimazole p. 832 and the risk of acute pancreatitis. For further information, see *Important safety information* for carbimazole p. 832.

For guidance on follow up and monitoring of hyperthyroidism, see NICE guideline: **Thyroid disease** (see *Useful resources*).

Graves' disease

Ever Under specialist care, radioactive iodine is recommended as first-line definitive treatment unless it is unsuitable or remission is likely to be achieved with antithyroid drugs. For patients in whom an antithyroid drug is likely to achieve remission (such as in mild and uncomplicated cases), a choice of either carbimazole p. 832 or radioactive iodine should be offered. Carbimazole p. 832 should be offered as first-line definitive treatment if radioactive iodine and surgery are unsuitable treatment options.

Offer carbimazole p. 832 as a 12–18 month course using either a block and replace regimen (combination of fixed high-dose carbimazole with levothyroxine sodium p. 835), or a titration regimen (dose based on thyroid function tests), and review the need for further treatment. If patients have persistent or relapsed hyperthyroidism despite antithyroid drug treatment, consider radioactive iodine or surgery.

Consider propylthiouracil for patients who experience sideeffects to carbimazole below, are pregnant or are trying to conceive within the following 6 months, or have a history of pancreatitis.

If agranulocytosis develops during antithyroid treatment, stop and do not restart treatment.

Toxic nodular goitre

Evor Under specialist care, radioactive iodine is recommended as first-line definitive treatment for patients with hyperthyroidism secondary to multiple nodules; offer total thyroidectomy or life-long antithyroid drugs if radioactive iodine is unsuitable. For patients with hyperthyroidism secondary to a single nodule, offer radioactive iodine or surgery (hemithyroidectomy) as first-line definitive treatment; if these options are unsuitable, offer life-long antithyroid drugs. Consider treatment with a titration regimen of carbimazole below when offering life-long antithyroid drugs.

Consider propylthiouracil for patients who experience side-effects to carbimazole, are pregnant or are trying to conceive within the following 6 months, or have a history of pancreatitis.

If agranulocytosis develops during antithyroid treatment, stop and do not restart treatment.

Subclinical hyperthyroidism

[EvGr] For patients who have 2 TSH readings lower than 0.1 mIU/litre at least 3 months apart and evidence of thyroid disease or symptoms of thyrotoxicosis, consider seeking specialist advice.

Consider measuring TSH every 6 months for patients with untreated subclinical hyperthyroidism. For further information on monitoring in subclinical hyperthyroidism, see NICE guideline: **Thyroid disease** (see *Useful resources*).

Thyrotoxicosis without hyperthyroidism

EvGr Transient thyrotoxicosis without hyperthyroidism usually only needs supportive treatment (for example, betablockers).

Hyperthyroidism in pregnancy

Evor Females with hyperthyroidism who are planning a pregnancy should be referred to an endocrinologist and advised to use effective contraception until specialist advice has been sought; advise patients to seek immediate medical advice if pregnancy is suspected or confirmed. All pregnant females should be referred urgently to a specialist. If there is uncertainty whether current antithyroid drug treatment should be continued or changed, or if the patient has adrenergic symptoms (such as tremor or tachycardia), seek urgent advice from an endocrinologist whilst awaiting specialist assessment. Pregnant females with severe signs and symptoms of hyperthyroidism (such as thyroid storm) should be admitted to hospital. Females who have recently received radioactive iodine should be advised to avoid becoming pregnant for at least 6 months after treatment.

The MHRA/CHM have released important safety information regarding the use of carbimazole below, with strengthened advice on contraception due to an increased risk of congenital malformations. For further information, see Conception and contraception, Pregnancy, and Important safety information for carbimazole below.

Useful Resources

Thyroid disease: assessment and management. National Institute for Health and Care Excellence. NICE guideline 145. November 2019, updated February 2020.

www.nice.org.uk/guidance/ng145

Other drugs used for Hyperthyroidism Metoprolol tartrate, p. 171 · Nadolol, p. 166 · Propranolol hydrochloride, p. 166

ANTITHYROID DRUGS > SULFUR-CONTAINING IMIDAZOLES

Carbimazole

02-Sep-2020

• INDICATIONS AND DOSE

Hyperthyroidism

► BY MOUTH

 Adult: 15–40 mg daily continue until the patient becomes euthyroid, usually after 4 to 8 weeks, higher doses should be prescribed under specialist supervision only, then reduced to 5–15 mg daily, reduce dose gradually, therapy usually given for 12 to 18 months

Hyperthyroidism (blocking-replacement regimen) in combination with levothyroxine

- ► BY MOUTH
- Adult: 40–60 mg daily, therapy usually given for 18 months

DOSE EQUIVALENCE AND CONVERSION

 When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

IMPORTANT SAFETY INFORMATION

NEUTROPENIA AND AGRANULOCYTOSIS

Manufacturer advises of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

- Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.
- A white blood cell count should be performed if there is any clinical evidence of infection.
- Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.

MHRA/CHM ADVICE: CARBIMAZOLE: INCREASED RISK OF CONGENITAL MALFORMATIONS; STRENGTHENED ADVICE ON CONTRACEPTION (FERRILARY 2019)

Carbimazole is associated with an increased risk of congenital malformations when used during pregnancy, especially in the first trimester and at high doses (daily dose of 15 mg or more).

Women of childbearing potential should use effective contraception during treatment with carbimazole. It should only be considered in pregnancy after a thorough benefit-risk assessment, and at the lowest effective dose without additional administration of thyroid hormones—close maternal, fetal, and neonatal monitoring is recommended.

MHRA/CHM ADVICE: CARBIMAZOLE: RISK OF ACUTE PANCREATITIS (FEBRUARY 2019)

Cases of acute pancreatitis have been reported during treatment with carbimazole. It should be stopped immediately and permanently if acute pancreatitis occurs.

Carbimazole should not be used in patients with a history of acute pancreatitis associated with previous treatment—re-exposure may result in life-threatening acute pancreatitis with a decreased time to onset.

- CONTRA-INDICATIONS Severe blood disorders
- INTERACTIONS → Appendix 1: carbimazole
- SIDE-EFFECTS
- ▶ Rare or very rare Bone marrow disorders · haemolytic anaemia · severe cutaneous adverse reactions (SCARs) · thrombocytopenia
- Frequency not known Agranulocytosis · alopecia · angioedema · dyspepsia · eosinophilia · fever · gastrointestinal disorder · generalised lymphadenopathy · haemorrhage · headache · hepatic disorders · insulin autoimmune syndrome · leucopenia · malaise · myopathy ·

nausea • nerve disorders • neutropenia • pancreatitis acute (discontinue permanently) • salivary gland enlargement • skin reactions • taste loss

- CONCEPTION AND CONTRACEPTION The MHRA advises that females of childbearing potential should use effective contraception during treatment.
- PREGNANCY The MHRA advises consider use only after a thorough benefit-risk assessment. See *Important Safety Information* for further information.
- BREAST FEEDING Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used.
- HEPATIC IMPAIRMENT Manufacturer advises use with caution in mild to moderate insufficiency—half-life may be prolonged; avoid in severe insufficiency.
- PATIENT AND CARER ADVICE Warn patient or carers to tell doctor immediately if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

► Carbimazole (Non-proprietary)

Carbimazole 5 mg Carbimazole 5 mg tablets | 100 tablet \boxed{PoM} £12.35 DT = £2.68

Carbimazole 10 mg Carbimazole 10mg tablets | 100 tablet PoM £81.32 DT = £81.32

Carbimazole 15 mg Carbimazole 15mg tablets | 100 tablet PoM £127.03 DT = £127.03

Carbimazole 20 mg Carbimazole 20mg tablets | 100 tablet PoM £208.17 DT = £4.53

ANTITHYROID DRUGS > THIOURACILS

Propylthiouracil

18-Aug-2021

• INDICATIONS AND DOSE

Hyperthyroidism

► BY MOUTH

Adult: Initially 200-400 mg daily in divided doses until
the patient becomes euthyroid, then reduced to
50-150 mg daily in divided doses, initial dose should
be gradually reduced to the maintenance dose

DOSE EQUIVALENCE AND CONVERSION

- When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.
- INTERACTIONS → Appendix 1: propylthiouracil
- SIDE-EFFECTS
- ▶ Rare or very rare Agranulocytosis bone marrow disorders glomerulonephritis acute hearing impairment leucopenia thrombocytopenia vomiting
- ► Frequency not known Alopecia · arthralgia · arthritis · encephalopathy · fever · gastrointestinal disorder · haemorrhage · headache · hepatic disorders · hypoprothrombinaemia · interstitial pneumonitis · lupuslike syndrome · lymphadenopathy · myopathy · nausea · nephritis · skin reactions · taste altered · vasculitis SIDE-EFFECTS, FURTHER INFORMATION Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop.
- PREGNANCY Propylthiouracil can be given but the blocking-replacement regimen is not suitable.
 Propylthiouracil crosses the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest

- dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).
- BREAST FEEDING Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function.
 Monitoring Monitor infant's thyroid status.
- HEPATIC IMPAIRMENT Manufacturer advises caution (risk of increased half life).
 Dose adjustments Manufacturer advises consider dose
- reduction.

RENAL IMPAIRMENT

Dose adjustments See p. 21.

EvGr Use three-quarters normal dose if eGFR 10–50 mL/minute/1.73 m².

Use half normal dose if eGFR less than 10 mL/minute/1.73 m².

- MONITORING REQUIREMENTS Monitor for hepatotoxicity.
- PATIENT AND CARER ADVICE Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, or pruritus develop.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

► Propylthiouracil (Non-proprietary)

Propylthiouracil 25 mg Propylthiouracil 25mg tablets |
28 tablet [PoM] £27.65-£36.99 DT = £32.32

Indide with indine

(Lugol's Solution; Aqueous Iodine Oral Solution)

• INDICATIONS AND DOSE

Thyrotoxicosis (pre-operative)

- ► BY MOUTH USING ORAL SOLUTION
- ▶ Adult: 0.1–0.3 mL 3 times a day

DOSE EQUIVALENCE AND CONVERSION

- Doses based on the use of an aqueous oral solution containing iodine 50 mg/mL and potassium iodide 100 mg/mL.
- CAUTIONS Not for long-term treatment
- SIDE-EFFECTS Conjunctivitis · depression (long term use) · erectile dysfunction (long term use) · excessive tearing · headache · hypersensitivity · increased risk of infection · influenza like illness · insomnia (long term use) · rash · salivary gland pain
- PREGNANCY Neonatal goitre and hypothyroidism.
- BREAST FEEDING Stop breast-feeding. Danger of neonatal hypothyroidism or goitre. Appears to be concentrated in milk.
- **DIRECTIONS FOR ADMINISTRATION** For oral solution, dilute well with milk or water.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Oral solution

CAUTIONARY AND ADVISORY LABELS 27

9.2 Hypothyroidism

Hypothyroidism

09-Dec-2019

Description of condition

Hypothyroidism results from the underproduction and secretion of thyroid hormones. Signs and symptoms of hypothyroidism include fatigue, weight gain, constipation, menstrual irregularities, depression, dry skin, intolerance to the cold, and reduced body and scalp hair. Complications include dyslipidaemia, coronary heart disease, heart failure, impaired fertility, pregnancy complications, impaired concentration and/or memory, and rarely myxoedema coma (which is a life-threatening medical emergency).

Primary hypothyroidism refers to when the condition arises from the thyroid gland and may be caused by iodine deficiency, autoimmune disease (such as Hashimoto's thyroiditis), radiotherapy, surgery or drugs, rather than due to a pituitary or hypothalamic disorder (secondary hypothyroidism).

Primary hypothyroidism is more common in females than males and can be classified as either overt or subclinical; both of which may or may not be symptomatic. Overt hypothyroidism is characterised by thyroid stimulating hormone (TSH) levels above the reference range and free thyroxine (FT4) levels below the reference range. In subclinical hypothyroidism, TSH levels are above the reference range but FT4 and free tri-iodothyronine (FT3) levels are within the reference range. In pregnancy, it is defined as overt based on elevated TSH levels (using trimester-specific reference ranges) regardless of FT4 levels.

Aims of treatment

The aims of treatment are to alleviate symptoms, align thyroid function tests within or close to the reference range, and to reduce the risk of long-term complications.

Management of primary hypothyroidism

EvGr Explain to patients, and their family or carers if appropriate, that:

- Some patients may feel well even when their thyroid function tests are outside the reference range;
- Even when they have no symptoms, treatment may be advised to reduce the risk of long-term complications;
- Symptoms may lag behind treatment changes for several weeks to months.

Overt hypothyroidism

Ever Offer levothyroxine sodium p. 835 as first-line treatment and aim to maintain thyroid-stimulating hormone (TSH) levels within the reference range. If symptoms persist, even after achieving normal TSH levels, consider adjusting the dose to achieve optimal well-being whilst avoiding doses that cause TSH suppression or thyrotoxicosis.

For patients whose TSH level was very high before starting treatment or who have had a prolonged period of untreated disease, the TSH level can take up to 6 months to return to the reference range.

Consider measuring TSH levels every 3 months until a stable level has been achieved, then yearly thereafter. Monitoring free thyroxine (FT4) should also be considered in those who continue to be symptomatic.

Due to the uncertainty around the long-term adverse effects and the insufficient evidence of benefit over

levothyroxine monotherapy, the use of natural thyroid extract is not recommended. Liothyronine (either alone or in combination with levothyroxine) is not routinely recommended for the same reasons. NHS England's specialist pharmacy service have produced guidance on the prescribing of liothyronine, for further information see: www.sps.nhs.uk/articles/updated-rmoc-guidance-prescribing-of-liothyronine/. (A)

Subclinical hypothyroidism

Ever When considering whether to start treatment for subclinical hypothyroidism, take into account features suggesting underlying thyroid disease.

For patients who have a TSH level of 10 mIU/L or higher on 2 separate occasions 3 months apart, consider levothyroxine sodium p. 835. If symptoms persist, even after achieving normal TSH levels, consider adjusting the dose to achieve optimal well-being whilst avoiding doses that cause TSH suppression or thyrotoxicosis.

For patients whose TSH level was very high before starting treatment or who have had a prolonged period of untreated disease, the TSH level can take up to 6 months to return to the reference range.

For patients in whom treatment is started, consider measuring TSH levels every 3 months until a stable level has been achieved, then yearly thereafter. Monitoring free thyroxine (FT4) should also be considered in those who continue to be symptomatic.

For symptomatic patients aged under 65 years with a TSH level above the reference range, but lower than 10 mlU/L on 2 separate occasions 3 months apart, consider a 6-month trial of levothyroxine sodium p. 835. If symptoms do not improve after starting levothyroxine, re-measure TSH and if the level remains elevated, adjust the dose. If symptoms persist when serum TSH is within the reference range, consider stopping levothyroxine and follow the recommendations on Monitoring untreated subclinical hypothyroidism and monitoring after stopping treatment in the NICE guideline: Thyroid disease (see Useful resources).

Management of secondary hypothyroidism

Evgr If secondary hypothyroidism is suspected, refer the patient urgently to an endocrinologist to assess the underlying cause.

Hypothyroidism in pregnancy

Ever Refer all females with hypothyroidism who are planning a pregnancy or are pregnant, to an endocrinologist. For those planning a pregnancy and whose thyroid function tests (TFTs) are not within range, advise delaying conception until stabilised on levothyroxine sodium p. 835 treatment. If there is any uncertainty about treatment initiation or dosing, discuss this with an endocrinologist whilst awaiting review.

TFTs may produce misleading results in pregnancy and trimester-related reference ranges should be used. If pregnancy is confirmed, urgently measure TFTs; discuss the initiation, or changes to levothyroxine sodium p. 835 treatment and TFT monitoring with an endocrinologist whilst awaiting review, to reduce the risk of obstetric and neonatal complications.

Useful Resources

Thyroid disease: assessment and management. National Institute for Health and Care Excellence. NICE guideline 145. November 2019, updated February 2020 www.nice.org.uk/guidance/ng145

THYROID HORMONES

Levothyroxine sodium

08-Jun-2021

(Thyroxine sodium)

INDICATIONS AND DOSE

Primary hypothyroidism

- ▶ BY MOUTH
- Adult: Initially 1.6 micrograms/kg once daily, adjusted according to response, round dose to the nearest 25 micrograms, dose to be taken preferably 30-60 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication
- ► Elderly: Initially 25–50 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50-200 micrograms once daily, dose to be taken preferably 30-60 minutes before breakfast, caffeinecontaining liquids (e.g. coffee, tea), or other medication

Primary hypothyroidism in patients with cardiac disease

- ▶ BY MOUTH
- Adult: Initially 25–50 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50-200 micrograms once daily, dose to be taken preferably 30-60 minutes before breakfast, caffeinecontaining liquids (e.g. coffee, tea), or other medication

Hyperthyroidism (blocking-replacement regimen) in combination with carbimazole

- ▶ BY MOUTH
- Adult: 50-150 micrograms daily therapy usually given for 18 months
- UNLICENSED USE EVGT Levothyroxine is used in the doses provided in the BNF for the treatment of primary hypothyroidism, A but these may differ from those licensed.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: LEVOTHYROXINE: NEW PRESCRIBING ADVICE FOR PATIENTS WHO EXPERIENCE SYMPTOMS ON SWITCHING BETWEEN DIFFERENT LEVOTHYROXINE PRODUCTS (MAY 2021)

A small proportion of patients treated with levothyroxine report symptoms, often consistent with thyroid dysfunction, when switching between different tablet formulations of levothyroxine. Healthcare professionals are advised that if a patient reports symptoms after changing to a different tablet of levothyroxine, a thyroid function test should be considered; if a patient is persistently symptomatic, whether they are biochemically euthyroid or have evidence of abnormal thyroid function, consistently prescribing a specific levothyroxine tablet known to be well tolerated by the patient should be considered. If symptoms or poor control of thyroid function persist despite adhering to a specific tablet, consider prescribing levothyroxine in an oral solution formulation.

- CONTRA-INDICATIONS Thyrotoxicosis
- CAUTIONS Cardiovascular disorders · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) • elderly • hypertension • long-standing hypothyroidism · myocardial infarction · myocardial insufficiency · panhypopituitarism (initiate corticosteroid therapy before starting levothyroxine). predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine)

CALITIONS, FURTHER INFORMATION

- Cardiovascular disorders Baseline ECG is valuable because changes induced by hypothyroidism can be confused with
- INTERACTIONS → Appendix 1: thyroid hormones
- SIDE-EFFECTS Angina pectoris anxiety arrhythmias arthralgia · diarrhoea · dyspnoea · fever · flushing · headache · hyperhidrosis · insomnia · malaise · menstruation irregular · muscle spasms · muscle weakness · oedema · palpitations · skin reactions · thyrotoxic crisis · tremor · vomiting · weight decreased

SIDE-EFFECTS, FURTHER INFORMATION Initial dosage in patients with cardiovascular disorders If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1-2 days and start again at a lower

 PREGNANCY Levothyroxine may cross the placenta. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.

Dose adjustments Levothyroxine requirement may increase during pregnancy.

Monitoring Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine).

- BREAST FEEDING Amount too small to affect tests for neonatal hypothyroidism.
- MONITORING REQUIREMENTS
- When used for Primary hypothyroidism [EvGr] Consider measuring thyroid stimulating hormone (TSH) level every three months until stabilised (two similar measurements within the reference range, 3 months apart), then yearly thereafter. Consider measuring free thyroxine (FT4) if symptoms of hypothyroidism persist after starting levothyroxine.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Liothyronine sodium

08-Jul-2019

(L-Tri-iodothyronine sodium)

INDICATIONS AND DOSE

Hypothyroidism

- ► BY MOUTH
- Adult: Initially 10–20 micrograms daily; increased to 60 micrograms daily in 2–3 divided doses, dose should be increased gradually, smaller initial doses given for the elderly

Hypothyroid coma

- ► BY SLOW INTRAVENOUS INJECTION
- Adult: 5–20 micrograms every 12 hours, increased to 5–20 micrograms every 4 hours if required, alternatively initially 50 micrograms for 1 dose, then 25 micrograms every 8 hours, reduced to 25 micrograms twice daily

DOSE EQUIVALENCE AND CONVERSION

- 20–25 micrograms of liothyronine sodium is equivalent to approximately 100 micrograms of levothyroxine sodium.
- Brands without a UK licence may not be bioequivalent and dose adjustment may be necessary.
- CONTRA-INDICATIONS Thyrotoxicosis
- CAUTIONS Cardiovascular disorders · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) · elderly · hypertension · long-standing hypothyroidism · myocardial infarction · myocardial insufficiency · panhypopituitarism (initiate corticosteroid therapy before starting liothyronine) · predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting liothyronine)

CAUTIONS, FURTHER INFORMATION

- Cardiovascular disorders Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia.
- INTERACTIONS → Appendix 1: thyroid hormones
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS Angina pectoris · anxiety · arrhythmias · diarrhoea · fever · flushing · headache · hyperhidrosis · insomnia · muscle cramps · muscle weakness · palpitations · tremor · vomiting · weight decreased

SPECIFIC SIDE-EFFECTS

- With intravenous use Menstruation irregular
- With oral use Heat intolerance

SIDE-EFFECTS, FURTHER INFORMATION Initial dosage in patients with cardiovascular disorders If metabolism increases too rapidly (causing diarrhoea, nervousness,

- rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose
- PREGNANCY Does not cross the placenta in significant amounts. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.

Dose adjustments Liothyronine requirement may increase during pregnancy.

- Monitoring Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of liothyronine).
- BREAST FEEDING Amount too small to affect tests for neonatal hypothyroidism.
- PRESCRIBING AND DISPENSING INFORMATION

Switching to a different brand Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent. Pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection

Tablet

► Liothyronine sodium (Non-proprietary)

Liothyronine sodium 5 microgram Liothyronine 5microgram tablets | 28 tablet [№] £100.94 DT = £99.47 Liothyronine sodium 10 microgram Liothyronine 10microgram tablets | 28 tablet [№] £152.44 DT = £148.00 Liothyronine sodium 20 microgram Liothyronine 20microgram tablets | 28 tablet [№] £245.29 DT = £63.08 Liothyronine sodium 25 microgram Cytomel 25microgram tablets | 100 tablet [№] [%]

Powder for solution for injection

► Liothyronine sodium (Non-proprietary)

Liothyronine sodium 20 microgram Liothyronine 20microgram powder for solution for injection vials | 5 vial PoM £1,567.50 DT = £1,567.50

Capsule

► Liothyronine sodium (Non-proprietary)

Liothyronine sodium 5 microgram Liothyronine 5microgram capsules | 28 capsule PoM £55.00

Liothyronine sodium 10 microgram Liothyronine 10microgram capsules | 28 capsule PoM £65.00

Liothyronine sodium 20 microgram Liothyronine 20microgram capsules | 28 capsule PoM £55.00

Bladder and urinary disorders

1.1 Urinary frequency, enuresis, and incontinence

Urinary incontinence and pelvic organ prolapse in women 16-Jun-2019

Description of condition

Urinary incontinence is the involuntary leakage of urine and can range in severity and nature. It can impact the person, as well as their families and carers, and can be detrimental to an individual's physical, psychological, and social wellbeing. Urinary incontinence can be the result of functional abnormalities in the lower urinary tract, or due to other illnesses. It can be sub-classified into four main types: stress, urgency, mixed, and overflow incontinence.

Stress incontinence is the involuntary leakage on effort or exertion, or on sneezing or coughing, and is associated with the loss of pelvic floor support and/or damage to the urethral

Urgency incontinence is involuntary leakage which is accompanied, or immediately preceded by a sudden compelling desire to pass urine that is difficult to delay. It is often part of a larger symptom complex known as overactive bladder syndrome. This syndrome is defined as urinary urgency, which may or may not be accompanied by urgency incontinence, but is usually associated with increased frequency and nocturia. The symptoms are thought to be caused by involuntary contractions of the detrusor muscle.

Mixed urinary incontinence is involuntary leakage associated with both urgency and stress, however, one type tends to be predominant.

Overflow incontinence is a complication of chronic urinary retention and occurs when a person cannot empty their bladder completely and it becomes over distended. This may

result in continuous, or frequent loss of small quantities of urine. For further information, see Urinary retention p. 844.

Other types include continuous urinary incontinence, where there is constant leakage of urine which may be due to the severity of the persons' condition or may be due to an underlying cause, such as a fistula. Incontinence may also be situational, for example during sexual intercourse or when a person is giggling.

The main risk factor for developing any type of incontinence is older age; this is due to the physiological changes that occur with natural aging. Some other risk factors for stress incontinence include pregnancy, vaginal delivery, obesity, constipation, family history, smoking, lack of supporting tissue (such as in prolapse or hysterectomy) and use of some drugs such as ACE inhibitors (can cause cough) and alpha-adrenergic blockers (relax the bladder outlet and urethra).

Some conditions can increase detrusor muscle overactivity and therefore worsen urgency incontinence. These include conditions that affect the lower urinary tract such as; Urinary-tract infections p. 641, urinary obstruction, or oestrogen deficiency, those affecting the nervous system such as: stroke, dementia, and Parkinson's disease, and systemic conditions such as; diabetes mellitus or hypercalcaemia. Side-effects of some drugs may also increase detrusor muscle overactivity or indirectly contribute to urgency incontinence; these include cholinesterase inhibitors, drugs that cause constipation, and those with anticholinergic effects. Diuretics, alcohol, and caffeine all increase urine production and can cause polyuria, frequency, urgency, and nocturia.

Aims of treatment

Manage urinary incontinence and the symptoms of overactive bladder syndrome.

Non-drug treatment

EvGr Women with urinary incontinence should modify their fluid intake, and if their BMI is 30 kg/m² or greater, be advised to lose weight. For those with an overactive bladder, a reduction in caffeine intake should be trialled.

Absorbent products, hand-held urinals and toileting aids should not be used to treat urinary incontinence, unless the person has severe cognitive or mobility impairment that may prevent further treatment. They may be used in some women as a coping strategy whilst awaiting treatment, as an adjunct to ongoing therapy, or as long-term management after all treatment options have been considered; their use should be reviewed at least annually. Intravaginal and intraurethral devices should only be used when required to prevent leakage at specific times, for example during exercise.

Surgical management may be an option for some women and will depend on a number of factors. Discussion around the details of the procedures and subsequent shared decision making should be carried out.

Urgency incontinence

Ever Women should be offered bladder training for at least 6 weeks as first-line treatment. If frequency is a problem and satisfactory benefit from bladder training is not achieved, drug treatment for an overactive bladder should be added.

Stress incontinence

EvGr Women should trial supervised pelvic floor muscle training for at least 3 months, which should include at least 8 contractions performed 3 times per day.

Mixed incontinence

EvGr Women should trial both bladder training for at least 6 weeks and supervised pelvic floor muscle training for at least 3 months, which should include at least 8 contractions performed 3 times per day. If frequency is a problem and satisfactory benefit from bladder training is not achieved, drug treatment for an overactive bladder should be added.

Drug treatment

Ever When considering drug treatment in women with incontinence exclude any possible causes, including drugs or conditions that may exacerbate incontinence or overactive bladder.

A urine dipstick test should be performed in all women presenting with incontinence to test for active infection or haematuria, and analysed along with the patients symptoms. For further information, see Urinary-tract infections p. 641. Women should be referred to a specialist if there is:

- persistent bladder or urethral pain;
- · pelvic mass that is clinically benign;
- associated faecal incontinence;
- suspected neurological disease, or urogenital fistulae;
- history of previous incontinence surgery, pelvic cancer surgery or pelvic radiation therapy;
- recurrent or persistant UTI for those aged over 60; see Urinary-tract infections p. 641
- Evgr palpable bladder after voiding, or symptoms of voiding difficulty.

Urgent referral should occur in women aged 45 years or older if there is unexplained visible haematuria without UTI, or visible haematuria persisting or recurring despite successful treatment of UTI. Urgent referral is also required in women aged 60 years or older with unexplained non-visible haematuria and either dysuria or raised white cell count.

Urgency incontinence

Ever An anticholinergic drug should be considered for women who have trialled bladder training, where frequency is a problem and symptoms persist. Consider the total anticholinergic load, coexisting conditions, such as cognitive impairment or poor bladder emptying, and the risk of side-effects when offering anticholinergic medicine. When prescribing an anticholinergic in those with dementia, see Dementia p. 325. Immediate release oxybutynin hydrochloride p. 841, immediate release tolterodine tartrate

p. 842, or darifenacin p. 840 can be used first-line. Immediate release oxybutynin should not be used in frail, older women at risk of sudden deterioration in their physical or mental health. The lowest dose should be used and titrated upwards if necessary. *Transdermal* oxybutynin hydrochloride p. 841 may be used in those unable to tolerate oral treatment. Mirabegron p. 843 may be used if treatment with an anticholinergic is contra-indicated, ineffective, or not tolerated, for further information, see *National funding/access decisions* in mirabegron.

Treatment should be reviewed after 4 weeks, or sooner if required. If treatment is effective review the woman again at 12 weeks, then annually thereafter, or every 6 months if the woman is over 75 years of age. If treatment has not been effective or is not tolerated an alternative anticholinergic drug can be used, the current dose adjusted or, mirabegron trialled; review again after 4 weeks. Alternative anticholinergics include, an untried first-line drug, or one of the following; fesoterodine fumarate p. 840, propiverine hydrochloride p. 842, solifenacin succinate p. 842, trospium chloride p. 843, or an extended release formulation of either oxybutynin hydrochloride or tolterodine tartrate. Women who have tried taking medicine for overactive bladder, but treatment has failed, should be referred to secondary care, where treatment with botulinum toxin type A p. 440 or surgical methods may be considered.

Flavoxate hydrochloride p. 840, propantheline bromide p. 92, or imipramine hydrochloride p. 408 should not be used as treatment options.

In women who have troublesome nocturia, desmopressin p. 722 may also be used. *Intravaginal* oestrogen therapy can be used in those women who are post-menopausal and have vaginal atrophy. Treatment with an intravaginal oestrogen should be reviewed at least annually to re-assess the need for continued treatment and monitor for symptoms of endometrial hyperplasia or carcinoma.

Stress incontinence

Ever Duloxetine p. 399 is **not** recommended as first-line treatment for women with stress incontinence. It may be used second-line where conservative treatment including pelvic floor training has failed, and only if surgery is not appropriate or the woman prefers pharmacological treatment, but should not be offered routinely.

Mixed incontinence

Women with mixed urinary incontinence should be treated according to the predominant type, refer to *Urgency incontinence* or *Stress incontinence* for drug treatment options.

Pelvic organ prolapse

Pelvic organ prolapse is the symptomatic descent of part of the wall of the vagina or uterus. Symptoms can include a vaginal bulge or sensation of something coming down, urinary, bowel and sexual symptoms, and pelvic and back pain. These can all affect a woman's quality of life.

Evgr Women who present to primary care with symptoms, or an incidental finding of vaginal prolapse should be examined to rule out pelvic mass or other pathology, and a full history taken. Treatment preferences should be discussed and referral made where necessary. Women in secondary care should be considered for referral to a clinician with expertise in prolapse if experiencing incidental symptoms, or on incidental finding of vaginal prolapse. A validated pelvic floor symptom questionnaire may aid assessment and decision making.

Women should be given advice on minimising heavy lifting, preventing or treating constipation, and if their BMI is 30 kg/m² or greater, encouraged to lose weight. A programme of supervised pelvic floor muscle training for at least 16 weeks may also be tried for some women.

A vaginal oestrogen may be used for women with prolapse and signs of vaginal atrophy, an oestrogen-releasing ring

may be more appropriate for those women who have cognitive or physical impairments.

A vaginal pessary may be used alone, or in conjunction with pelvic floor muscle training for those with symptomatic pelvic organ prolapse. Surgical management may be required in women whose symptoms have not improved with nonsurgical methods, or who have declined non-surgical treatment.

Nocturnal enuresis in children

Description of condition

Nocturnal enuresis is the involuntary discharge of urine during sleep, which is common in young children. Children are generally expected to be dry by a developmental age of 5 years, and historically it has been common practice to consider children for treatment only when they reach 7 years; however, symptoms may still persist in a small proportion by the age of 10 years.

Treatment

Children under 5 years

EvGr For children under 5 years, treatment is usually unnecessary as the condition is likely to resolve spontaneously. Reassurance and advice can be useful for some families. (A)

Non Drug Treatment

[EvGr] Initially, advice should be given on fluid intake, diet, toileting behaviour, and use of reward systems. For children who do not respond to this advice (more than 1-2 wet beds per week), an enuresis alarm should be the recommended treatment for motivated, well-supported children. Alarms in children under 7 years should be considered depending on the child's maturity, motivation and understanding of the alarm. Alarms have a lower relapse rate than drug treatment when discontinued.

Treatment using an alarm should be reviewed after 4 weeks and continued until a minimum of 2 weeks' uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months but the condition is still improving and the child remains motivated to use the alarm, it is recommended to continue the treatment. Combined treatment with desmopressin p. 722, or the use of desmopressin alone, is recommended if the initial alarm treatment is unsuccessful or it is no longer appropriate or desirable.

Drug Treatment

EvGr Treatment with oral or sublingual desmopressin is recommended for children over 5 years of age when alarm use is inappropriate or undesirable, or when rapid or shortterm results are the priority (for example, to cover periods away from home). Desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm alone. Treatment should be assessed after 4 weeks and continued for 3 months if there are signs of response. Repeated courses of desmopressin can be used in responsive children who experience repeated recurrences of bedwetting, but should be withdrawn gradually at regular intervals (for 1 week every 3 months) for full reassessment.

Under specialist supervision, nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed with desmopressin alone or in combination with an antimuscarinic drug (such as oxybutynin hydrochloride p. 841 or tolterodine tartrate p. 842 [unlicensed indication]). Treatment should be continued for 3 months; the course can be repeated if necessary.

The tricyclic antidepressant imipramine hydrochloride p. 408 can be considered for children who have not responded to all other treatments and have undergone specialist assessment, however relapse is common after withdrawal and children and their carers should be aware of the dangers of overdose. Initial treatment should continue for 3 months; further courses can be considered following a medical review every 3 months. Tricyclic antidepressants should be withdrawn gradually.

ANTIMUSCARINICS

Antimuscarinics (systemic)

- CONTRA-INDICATIONS Angle-closure glaucoma · gastrointestinal obstruction · intestinal atony · myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) · paralytic ileus · pyloric stenosis · severe ulcerative colitis · significant bladder outflow obstruction · toxic megacolon · urinary
- CAUTIONS Acute myocardial infarction (in adults) arrhythmias (may be worsened) · autonomic neuropathy · cardiac insufficiency (due to association with tachycardia). cardiac surgery (due to association with tachycardia) . children (increased risk of side-effects) · conditions characterised by tachycardia · congestive heart failure (may be worsened) · coronary artery disease (may be worsened) · diarrhoea · elderly (especially if frail) · gastrooesophageal reflux disease · hiatus hernia with reflux oesophagitis · hypertension · hyperthyroidism (due to association with tachycardia) · individuals susceptible to angle-closure glaucoma · prostatic hyperplasia · pyrexia · ulcerative colitis

CALITIONS, FURTHER INFORMATION

- ► Elderly Prescription potentially inappropriate (STOPP
 - to treat extrapyramidal side-effects of antipsychotic medications (risk of antimuscarinic toxicity)
 - · with delirium or dementia (risk of exacerbation of cognitive impairment), narrow-angle glaucoma (risk of acute exacerbation of glaucoma), or chronic prostatism (risk of urinary retention)
 - if two or more antimuscarinic drugs prescribed concomitantly (risk of increased antimuscarinic toxicity) See also Prescribing in the elderly p. 29.

- ► Common or very common Constipation · dizziness · drowsiness · dry mouth · dyspepsia · flushing · headache · nausea · palpitations · skin reactions · tachycardia · urinary disorders · vision disorders · vomiting
- ▶ Rare or very rare Angioedema confusion (more common in elderly)

PATIENT AND CARER ADVICE

Driving and skilled tasks Antimuscarinics can affect the performance of skilled tasks (e.g. driving).

ANTIMUSCARINICS > URINARY

Darifenacin

F 839

INDICATIONS AND DOSE

Urinary frequency | Urinary urgency | Incontinence

- ► BY MOUTH
- Adult: Initially 7.5 mg once daily, increased if necessary to 15 mg after 2 weeks
- INTERACTIONS → Appendix 1: darifenacin
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · dry eye · nasal dryness
- Uncommon Asthenia · bladder pain · cough · diarrhoea · dyspnoea · erectile dysfunction · flatulence · hyperhidrosis · hypertension · increased risk of infection · injury · insomnia · oedema · oral ulceration · taste altered · thinking abnormal · urinary tract disorder
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Present in milk in animal studies manufacturer advises caution.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate impairment; avoid in severe impairment (risk of increased exposure).
 - **Dose adjustments** Manufacturer advises maximum 7.5 mg daily in moderate impairment.
- PRESCRIBING AND DISPENSING INFORMATION The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 3, 25

Fesoterodine fumarate

03-Aug-2021

• INDICATIONS AND DOSE

Urinary frequency | Urinary urgency | Urge incontinence

► BY MOUTH

 Adult: 4 mg once daily, increased if necessary up to 8 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises max. 4 mg daily with concurrent use of potent inhibitors of CYP3A4; avoid concurrent use in patients who also have hepatic or renal impairment.
- For dose adjustments with concurrent use of moderate inhibitors of CYP3A4 in patients with hepatic or renal impairment, consult product literature.
- INTERACTIONS → Appendix 1: fesoterodine
- SIDE-EFFECTS
- ► Common or very common Diarrhoea · dry eye · gastrointestinal discomfort · insomnia · throat complaints
- ► Uncommon Cough · fatigue · gastrointestinal disorders · nasal dryness · taste altered · urinary tract infection · vertigo
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—no information available.

- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).
 - Dose adjustments Manufacturer advises increase dose cautiously in mild impairment; maximum 4 mg daily in moderate impairment.
- RENAL IMPAIRMENT EVGT Use with caution. ♠

 Dose adjustments EvGT Increase dose cautiously if eGFR 30-80 mL/minute/1.73 m²; max. 4 mg daily if eGFR less than 30 mL/minute/1.73 m². ♠ See p. 21.
- PRESCRIBING AND DISPENSING INFORMATION The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Fesoterodine fumarate (Toviaz®) for treatment of the symptoms of increased urinary frequency (and/or urgency incontinence) that may occur in patients with overactive bladder (OAB) syndrome (July 2008) SMC No. 480/08 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Oxybutynin hydrochloride

10-Nov-2021

• INDICATIONS AND DOSE

Urinary frequency | Urinary urgency | Urinary incontinence | Neurogenic bladder instability

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ► Child 5-11 years: Initially 2.5-3 mg twice daily, increased to 5 mg 2-3 times a day
- Child 12-17 years: Initially 5 mg 2-3 times a day, increased if necessary up to 5 mg 4 times a day
- Adult: Initially 5 mg 2-3 times a day, increased if necessary up to 5 mg 4 times a day
- Elderly: Initially 2.5–3 mg twice daily, increased if tolerated to 5 mg twice daily, adjusted according to response
- ► BY MOUTH USING MODIFIED-RELEASE TABLETS
- Child 5-17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response: maximum 15 mg per day
- Adult: Initially 5 mg once daily, increased in steps of 5 mg every week, adjusted according to response; maximum 20 mg per day

Urinary frequency | Urinary urgency | Urinary incontinence

- ▶ BY TRANSDERMAL APPLICATION USING PATCHES
- Adult: Apply 1 patch twice weekly, patch is to be applied to clean, dry unbroken skin on abdomen, hip or buttock. Patch should be removed every 3–4 days and site replacement patch on a different area. The same area should be avoided for 7 days

Nocturnal enuresis associated with overactive bladder

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 5-17 years: 2.5-3 mg twice daily, increased to 5 mg 2-3 times a day, last dose to be taken before bedtime
- ► BY MOUTH USING MODIFIED-RELEASE TABLETS
- Child 5-17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day

DOSE EQUIVALENCE AND CONVERSION

- Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of Lyrinel[®] XL
- CAUTIONS Acute porphyrias p. 1150
- INTERACTIONS → Appendix 1: oxybutynin
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Diarrhoea
 - SPECIFIC SIDE-EFFECTS
- ► Common or very common
- ▶ With oral use Dry eve
- With transdermal use Gastrointestinal discomfort · increased risk of infection
- ► Uncommon
- With oral use Abdominal discomfort · appetite decreased · dysphagia
- ▶ With transdermal use Back pain hot flush injury
- ► Frequency not known
- With oral use Anxiety · arrhythmia · cognitive disorder · depressive symptom · drug dependence · gastrointestinal disorders · glaucoma · hallucination · heat stroke · hypohidrosis · mydriasis · nightmare · paranoia · photosensitivity reaction · seizure · urinary tract infection
- PREGNANCY Manufacturers advise avoid unless essential—toxicity in animal studies.
- BREAST FEEDING Manufacturers advise avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution.
- RENAL IMPAIRMENT Manufacturer advises caution.

DIRECTIONS FOR ADMINISTRATION

 With transdermal use Manufacturer advises apply patches to clean, dry, unbroken skin on abdomen, hip or buttock; remove after every 3-4 days and site replacement patch on a different area (avoid using same area for 7 days).

PRESCRIBING AND DISPENSING INFORMATION

- ▶ In adults The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.
- In children The need for therapy for urinary indications should be reviewed soon after it has been commenced and then at regular intervals; a response usually occurs within 6 months but may take longer.

• PATIENT AND CARER ADVICE

 With transdermal use Patients or carers should be given advice on how to administer oxybutynin transdermal natches

• INDICATIONS AND DOSE

Urinary frequency, urgency and incontinence associated with overactive bladder

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 15 mg 1-2 times a day, increased if necessary up to 15 mg 3 times a day
- ▶ BY MOUTH USING MODIFIED-RELEASE CAPSULES
- Adult: 30 mg once daily

Urinary frequency, urgency and incontinence associated with neurogenic bladder instability

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 15 mg 3 times a day
- INTERACTIONS → Appendix 1: propiverine
- SIDE-EFFECTS
- ► Common or very common Abdominal pain fatigue
- ► Uncommon Taste altered tremor
- ► Rare or very rare Restlessness
- ► Frequency not known Hallucination
- PREGNANCY Manufacturer advises avoid (restriction of skeletal development in animals).
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment (no information available).
- RENAL IMPAIRMENT EVGT Use with caution. (*)

 Dose adjustments EvGT Max. daily dose 30 mg if creatinine clearance less than 30 mL/minute. (*) See p. 21.
- PRESCRIBING AND DISPENSING INFORMATION The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solifenacin succinate

23-Jul-2020

• INDICATIONS AND DOSE

Urinary frequency | Urinary urgency | Urinary incontinence

- ► BY MOUTH
- Adult: 5 mg once daily, increased if necessary to 10 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises maximum 5 mg once daily with concurrent use of potent inhibitors of CYP3A4; avoid concurrent use in patients who also have moderate hepatic impairment or severe renal impairment.
- CAUTIONS Susceptibility to QT-interval prolongation
- INTERACTIONS → Appendix 1: solifenacin

SIDE-FFFFCTS

- ► Common or very common Gastrointestinal discomfort
- ► Uncommon Cystitis · dry eye · dry throat · fatigue · gastrointestinal disorders · nasal dryness · peripheral oedema · taste altered · urinary tract infection
- ► Rare or very rare Hallucination
- Frequency not known Anaphylactic reaction appetite decreased - arrhythmias - delirium - dysphonia - glaucoma hyperkalaemia - liver disorder - muscle weakness - QT interval prolongation - renal impairment
- PREGNANCY Manufacturer advises caution—no information available.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate impairment (risk of increased half-life); avoid in severe impairment (no information available).
 Dose adjustments Manufacturer advises maximum 5 mg once daily in moderate impairment.
- RENAL IMPAIRMENT Manufacturer advises caution in severe impairment.

Dose adjustments See p. 21.

Manufacturer advises maximum 5 mg once daily if creatinine clearance 30 mL/minute or less.

- DIRECTIONS FOR ADMINISTRATION Manufacturer advises for oral suspension, doses should be followed by a glass of water—ingestion with food or other drinks may lead to the release of solifenacin in the mouth, causing a bitter taste and numbness in the mouth.
- PRESCRIBING AND DISPENSING INFORMATION The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

Solifenacin succinate (Non-proprietary)

BETA₃-ADRENOCEPTOR AGONISTS

Mirabegron

05-Aug-2021

INDICATIONS AND DOSE

Urinary frequency, urgency, and urge incontinence

- ► BY MOUTH
- Adult: 50 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

▶ Manufacturer advises reduce dose to 25 mg once daily in patients with mild hepatic impairment continued → with concurrent use of potent inhibitors of CYP3A4; avoid in moderate impairment.

- Manufacturer advises reduce dose to 25 mg once daily if eGFR 30-89 mL/minute/1.73 m² with concurrent use of potent inhibitors of CYP3A4; avoid if eGFR less than 30 mL/minute/1.73 m².
- CONTRA-INDICATIONS Severe uncontrolled hypertension (systolic blood pressure ≥180 mmHg or diastolic blood pressure ≥110 mmHg)
- CAUTIONS History of QT-interval prolongation stage 2 hypertension
- INTERACTIONS → Appendix 1: mirabegron
- SIDE-EFFECTS
- ► Common or very common Arrhythmias · constipation · diarrhoea · dizziness · headache · increased risk of infection · nausea
- ► Uncommon Cystitis · dyspepsia · gastritis · joint swelling · palpitations · skin reactions · vulvovaginal pruritus
- ▶ Rare or very rare Angioedema eyelid oedema hypersensitivity vasculitis hypertensive crisis lip swelling urinary retention
- ▶ Frequency not known Insomnia
- CONCEPTION AND CONTRACEPTION Contraception advised in women of child-bearing potential.
- PREGNANCY Avoid—toxicity in animal studies.
- BREAST FEEDING Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate impairment (risk of increased exposure); avoid in severe impairment (no information available).
 Dose adjustments Manufacturer advises dose reduction to 25 mg once daily in moderate impairment.
- RENAL IMPAIRMENT [EVGT] Avoid if eGFR less than 15 mL/minute/1.73 m² (no information available).
 Dose adjustments [EVGT] Reduce dose to 25 mg once daily if eGFR 15-29 mL/minute/1.73 m².
 ♠ See p. 21.
- MONITORING REQUIREMENTS Blood pressure should be monitored before starting treatment and regularly during treatment, especially in patients with pre-existing hypertension.

1.2 Urinary retention

Urinary retention

31-May-2017

Description of condition

Urinary retention is the inability to voluntarily urinate. It may be secondary to urethral blockage, drug treatment (such as use of antimuscarinic drugs, sympathomimetics, tricyclic antidepressants), conditions that reduce detrusor contractions or interfere with relaxation of the urethra, neurogenic causes, or it may occur postpartum or postoperatively.

Acute urinary retention is a medical emergency characterised by the abrupt development of the inability to pass urine (over a period of hours).

Chronic urinary retention is the gradual (over months or years) development of the inability to empty the bladder completely, characterised by a residual volume greater than one litre or associated with the presence of a distended or palpable bladder.

Urinary retention due to benign prostatic hyperplasia

The most common cause of urinary retention in men is benign prostatic hyperplasia. Men with an enlarged prostate can have lower urinary tract symptoms associated with obstruction, such as urinary retention (acute or chronic), frequency, urgency or nocturia.

Treatment

Treatment of urinary retention depends on the underlying condition. Catheterisation is used to relieve acute painful urinary retention or when no cause can be found. Surgical procedures or dilatation are often used to correct mechanical outflow obstructions.

Acute urinary retention

EvGr Acute retention is painful and requires immediate treatment by catheterisation. Before the catheter is removed an alpha-adrenoceptor blocker (such as alfuzosin hydrochloride p. 845, doxazosin p. 845, tamsulosin hydrochloride p. 847, prazosin p. 847, indoramin p. 846 or terazosin p. 849) should be given for at least two days to manage acute urinary retention .

Chronic urinary retention

ln patients with chronic urinary retention, intermittent bladder catheterisation should be offered before an indwelling catheter. Catheters may be used as a long-term solution where persistent urinary retention is causing incontinence, infection, or renal dysfunction and a surgical solution is not feasible. Their use is associated with an increased risk of adverse events including recurrent urinary infections, trauma to the urethra, pain, and stone formation.

Evgr In men who have symptoms that are bothersome, drug treatment should only be offered when other conservative management options have failed. Men with moderate-to-severe symptoms should be offered an alpha-adrenoceptor blocker (alfuzosin hydrochloride, doxazosin, tamsulosin hydrochloride or terazosin). Treatment should initially be reviewed after 4–6 weeks and then every 6–12 months. (A)

The parasympathomimetic bethanechol chloride p. 849 increases detrusor muscle contraction. It is licensed for acute postoperative, postpartum and neurogenic urinary retention but its use has largely been superseded by catheterisation.

Urinary retention due to benign prostatic hyperplasia

In patients with benign prostatic hyperplasia, treatment is influenced by the severity of symptoms and their effect on the patient's quality of life. [EVG] Watchful waiting is suitable for men with symptoms that are not troublesome and in those who have not yet developed complications of benign prostatic hyperplasia such as renal impairment, urinary retention or recurrent infection.

The recommended treatment of benign prostatic hyperplasia is usually an alpha-adrenoceptor blocker. The alpha₁-selective adrenoceptor blockers relax smooth muscle in benign prostatic hyperplasia producing an increase in urinary flow-rate and an improvement in obstructive symptoms.

In patients with an enlarged prostate, a raised prostate specific antigen concentration, and who are considered to be at high risk of progression (such as the elderly), a 5α -reductase inhibitor (such as finasteride p. 850 or dutasteride p. 849) should be used. A combination of an alpha-adrenoceptor blocker and a 5α -reductase inhibitor can be offered if symptoms remain a problem.

Surgery is recommended for men with more severe symptoms that do not respond to drug therapy, or who have complications such as acute urinary retention, haematuria, renal failure, bladder calculi or recurrent urinary-tract infection.

Related drugs

Other drugs used for urinary retention: neostigmine p. 1218, pyridostigmine bromide p. 1218.

ALPHA-ADRENOCEPTOR BLOCKERS

Alfuzosin hydrochloride

27-Jul-2021

• INDICATIONS AND DOSE

Benign prostatic hyperplasia

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 2.5 mg 3 times a day; maximum 10 mg per day
- Elderly: Initially 2.5 mg twice daily, adjusted according to response; maximum 10 mg per day
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 10 mg once daily

Acute urinary retention associated with benign prostatic hyperplasia

- ▶ BY MOUTH USING MODIFIED-RELEASE TABLETS
- Elderly: 10 mg once daily for 2-3 days during catheterisation and for one day after removal; max.
 4 days
- CONTRA-INDICATIONS Avoid if history of micturition syncope • avoid if history of postural hypotension
- CAUTIONS Acute heart failure · cerebrovascular disease · concomitant antihypertensives (reduced dosage and specialist supervision may be required) · discontinue if angina worsens · elderly · history of QT-interval prolongation · patients undergoing cataract surgery (risk of intra-operative floppy iris syndrome)

CAUTIONS, FURTHER INFORMATION

- Elderly For alpha₁-selective adrenoceptor blockers, prescription potentially inappropriate (STOPP criteria):
 - in those with symptomatic orthostatic hypotension or micturition syncope (risk of precipitating recurrent syncope)
 - in those with persistent postural hypotension i.e. recurrent drop in systolic blood pressure ≥ 20 mmHg (risk of syncope and falls).

See also Prescribing in the elderly p. 29.

- INTERACTIONS → Appendix 1: alpha blockers
- SIDE-EFFECTS
- ► Common or very common Asthenia · diarrhoea · dizziness · dry mouth · headache · malaise · nausea · postural hypotension · vertigo · vomiting
- ► Uncommon Abdominal pain · arrhythmias · chest pain · drowsiness · flushing · oedema · palpitations · rhinitis · skin reactions · syncope · visual impairment
- ▶ Rare or very rare Angina pectoris · angioedema
- ► Frequency not known Cerebral ischaemia · floppy iris syndrome · hepatic disorders · neutropenia · priapism · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to

- lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.
- HEPATIC IMPAIRMENT For immediate-release preparations manufacturer advises caution in mild to moderate hepatic failure; avoid in severe hepatic failure (risk of increased half-life). For modified-release preparations manufacturer advises avoid in hepatic failure.
- **Dose adjustments** For *immediate-release* preparations manufacturer advises initial dose of 2.5 mg once daily, increased to 2.5 mg twice daily according to response in mild to moderate hepatic failure.
- RENAL IMPAIRMENT [EVG] Avoid use of modified-release preparations if creatinine clearance less than 30 mL/minute as limited experience. ♠ See p. 21.

 Dose adjustments [EVG] For immediate-release preparations, initial dose 2.5 mg twice daily and adjust according to response. ♠
- PATIENT AND CARER ADVICE Patient should be counselled on the first dose effect.

Driving and skilled tasks May affect performance of skilled tasks e.g. driving.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

INDICATIONS AND DOSE

Hypertension

- ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 1 mg once daily for 1-2 weeks, then increased to 2 mg once daily, then increased if necessary to 4 mg once daily; maximum 16 mg per day
- ► BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: Initially 4 mg once daily, dose can be adjusted after 4 weeks, then increased if necessary to 8 mg once daily

Benign prostatic hyperplasia

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 1 mg daily, dose may be doubled at intervals of 1–2 weeks according to response; usual maintenance 2–4 mg daily; maximum 8 mg per day
- ► BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: Initially 4 mg once daily, dose can be adjusted after 4 weeks, then increased if necessary to 8 mg once daily continued →

DOSE EQUIVALENCE AND CONVERSION

- Patients stabilised on immediate-release doxazosin can be transferred to the equivalent dose of modifiedrelease doxazosin.
- CONTRA-INDICATIONS History of micturition syncope (in patients with benign prostatic hypertrophy) - history of postural hypotension - monotherapy in patients with overflow bladder or anuria
- CAUTIONS Care with initial dose (postural hypotension) cataract surgery (risk of intra-operative floppy iris syndrome) - elderly - heart failure - pulmonary oedema due to aortic or mitral stenosis
- INTERACTIONS → Appendix 1: alpha blockers
- SIDE-EFFECTS
- ➤ Common or very common Arrhythmias · asthenia · chest pain · cough · cystitis · dizziness · drowsiness · dry mouth · dyspnoea · gastrointestinal discomfort · headache · hypotension · increased risk of infection · influenza like illness · muscle complaints · nausea · oedema · pain · palpitations · skin reactions · urinary disorders · vertigo
- ▶ Uncommon Angina pectoris · anxiety · appetite abnormal · arthralgia · constipation · depression · diarrhoea · gastrointestinal disorders · gout · haemorrhage · insomnia · myocardial infarction · sensation abnormal · sexual dysfunction · stroke · syncope · tinnitus · tremor · vomiting · weight increased
- ▶ Rare or very rare Alopecia bronchospasm flushing gynaecomastia hepatic disorders leucopenia malaise muscle weakness thrombocytopenia vision blurred
- ▶ Frequency not known Floppy iris syndrome
- PREGNANCY No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
- BREAST FEEDING Accumulates in milk in animal studies manufacturer advises avoid.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment (limited information available); avoid in severe impairment (no information available).
- PATIENT AND CARER ADVICE Patient counselling is advised for doxazosin tablets (initial dose).
 Driving and skilled tasks May affect performance of skilled tasks e.g. driving.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

• INDICATIONS AND DOSE

Hypertension

- ► BY MOUTH
- Adult: Initially 25 mg twice daily, increased in steps of 25–50 mg every 2 weeks, maximum daily dose should be given in divided doses; maximum 200 mg per day

Benign prostatic hyperplasia

- ► BY MOUTH
- Adult: 20 mg twice daily, increased in steps of 20 mg every 2 weeks if required, increased if necessary up to 100 mg daily in divided doses
- Elderly: 20 mg daily may be adequate, dose to be taken at night

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required.
- CONTRA-INDICATIONS Established heart failure · history micturition syncope (when used for benign prostatic hyperplasia) · history of postural hypotension (when used for benign prostatic hyperplasia)
- CAUTIONS Cataract surgery (risk of intra-operative floppy iris syndrome) control incipient heart failure before initiating indoramin elderly epilepsy (convulsions in animal studies) history of depression Parkinson's disease (extrapyramidal disorders reported)

CAUTIONS, FURTHER INFORMATION

- Elderly For alpha₁-selective adrenoceptor blockers, prescription potentially inappropriate (STOPP criteria):
- in those with symptomatic orthostatic hypotension or micturition syncope (risk of precipitating recurrent syncope)
- in those with persistent postural hypotension i.e. recurrent drop in systolic blood pressure ≥ 20 mmHg (risk of syncope and falls).

See also Prescribing in the elderly p. 29.

- INTERACTIONS → Appendix 1: alpha blockers
- SIDE-EFFECTS
- ▶ Rare or very rare Parkinson's disease exacerbated
- ► Frequency not known Depression dizziness drowsiness dry mouth ejaculation failure fatigue headache nasal congestion weight increased
- PREGNANCY No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
- BREAST FEEDING No information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution.
- RENAL IMPAIRMENT EVGT Use with caution.
- PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 2

- ► Indoramin (Non-proprietary)
- Indoramin (as Indoramin hydrochloride) 20 mg Indoramin 20mg tablets | 56 tablet PoM £10.65-£69.05 | 60 tablet PoM £74.08 DT = £73.98
- ► Doralese Tiltab (Chemidex Pharma Ltd)
 Indoramin (as Indoramin hydrochloride) 20 mg Doralese Tiltab
 20mg tablets | 60 tablet PoM £11.44 DT = £73.98

Prazosin

05-May-2021

• INDICATIONS AND DOSE

Hypertension

- ► BY MOUTH
- Adult: Initially 500 micrograms 2-3 times a day for 3-7 days, the initial dose should be taken on retiring to bed at night to avoid collapse, increased to 1 mg 2-3 times a day for a further 3-7 days, then increased if necessary up to 20 mg daily in divided doses

Congestive heart failure (rarely used)

- ▶ BY MOUTH
- Adult: 500 micrograms 2-4 times a day, initial dose to be taken at bedtime, then increased to 4 mg daily in divided doses; maintenance 4-20 mg daily in divided doses

Raynaud's syndrome (but efficacy not established)

- ► BY MOUTH
- Adult: Initially 500 micrograms twice daily, initial dose to be taken at bedtime, dose may be increased after 3-7 days, then increased if necessary to 1-2 mg twice daily

Benign prostatic hyperplasia

- ► BY MOUTH
- Adult: Initially 500 micrograms twice daily for 3-7 days, subsequent doses should be adjusted according to response, maintenance 2 mg twice daily, initiate with lowest possible dose in elderly patients

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required.
- CONTRA-INDICATIONS History of micturition syncope (in patients with benign prostatic hyperplasia) · history of postural hypotension · not recommended for congestive heart failure due to mechanical obstruction (e.g. aortic stenosis)
- CAUTIONS Cataract surgery (risk of intra-operative floppy iris syndrome) elderly first dose hypotension

CAUTIONS, FURTHER INFORMATION

- Elderly For alpha₁-selective adrenoceptor blockers, prescription potentially inappropriate (STOPP criteria):
 - in those with symptomatic orthostatic hypotension or micturition syncope (risk of precipitating recurrent syncope)
 - in those with persistent postural hypotension i.e. recurrent drop in systolic blood pressure ≥ 20 mmHg (risk of syncope and falls).

See also Prescribing in the elderly p. 29.

- INTERACTIONS → Appendix 1: alpha blockers
- SIDE-EFFECTS
- ► Common or very common Asthenia · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · headache · nasal congestion · nausea · nervousness · oedema · palpitations · postural hypotension · sexual dysfunction · skin reactions · syncope · urinary disorders · vertigo · vision blurred · vomiting

- ► Uncommon Angina pectoris · arrhythmias · arthralgia · epistaxis · eye pain · eye redness · gastrointestinal discomfort · hyperhidrosis · paraesthesia · sleep disorders · tinnitus
- ▶ Rare or very rare Alopecia · fever · flushing · gynaecomastia · hallucination · hepatic function abnormal · pain · pancreatitis · vasculitis
- PREGNANCY No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
- BREAST FEEDING Present in milk, amount probably too small to be harmful; manufacturer advises use with caution.
- HEPATIC IMPAIRMENT Manufacturer advises caution (no information available).

Dose adjustments Manufacturer advises initial dose reduction to 500 micrograms daily; increased with caution.

RENAL IMPAIRMENT

Dose adjustments Manufacturer advises initial dose reduction to 500 micrograms daily in moderate to severe impairment; increase with caution.

PATIENT AND CARER ADVICE

First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patients should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely. Driving and skilled tasks May affect performance of skilled tasks e.g. driving.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

5α-REDUCTASE INHIBITORS

Dutasteride

02-Sep-2020

 DRUG ACTION A specific inhibitor of the enzyme 5αreductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

• INDICATIONS AND DOSE

Benign prostatic hyperplasia

- ► BY MOUTH
- Adult: 500 micrograms daily, review treatment at 3-6 months and then every 6-12 months (may require several months treatment before benefit is obtained)
- INTERACTIONS → Appendix 1: dutasteride
- SIDE-EFFECTS
- ► Common or very common Breast disorder sexual dysfunction
- ▶ Uncommon Alopecia · hypertrichosis
- ► Frequency not known Angioedema · depressed mood · hypersensitivity · localised oedema · skin reactions · testicular disorders

- CONCEPTION AND CONTRACEPTION Dutasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).
- MONITORING REQUIREMENTS Manufacturer advises that patients should be regularly evaluated for prostate cancer.
- EFFECT ON LABORATORY TESTS May decrease serum concentration of prostate cancer markers such as prostatespecific antigen; reference values may need adjustment.
- HANDLING AND STORAGE Women of childbearing potential should avoid handling leaking capsules of dutasteride.
- PATIENT AND CARER ADVICE Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Finasteride

04-Sep-2020

 DRUG ACTION A specific inhibitor of the enzyme 5αreductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

• INDICATIONS AND DOSE

Benign prostatic hyperplasia

- ► BY MOUTH
- Adult: 5 mg daily, review treatment at 3-6 months and then every 6-12 months (may require several months treatment before benefit is obtained)

Androgenetic alopecia in men

- ► BY MOUTH
- Adult: 1 mg daily, continuous use for 3–6 months is required before benefit is seen, and effects are reversed 6–12 months after treatment is discontinued

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: RARE REPORTS OF DEPRESSION AND SUICIDAL THOUGHTS (MAY 2017)

The MHRA has received reports of depression and, in rare cases, suicidal thoughts in men taking finasteride ($Propecia^{\oplus}$) for male pattern hair loss; depression is also associated with $Proscar^{\oplus}$ for benign prostatic hyperplasia. Patients should be advised to stop finasteride immediately and inform a healthcare professional if they develop depression.

- CAUTIONS Obstructive uropathy
- SIDE-EFFECTS
- ► Common or very common Sexual dysfunction
- ▶ Uncommon Breast abnormalities skin reactions
- ▶ Frequency not known Angioedema · depression · infertility male · palpitations · testicular pain

- CONCEPTION AND CONTRACEPTION Finasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.
- EFFECT ON LABORATORY TESTS Decreases serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment.
- HANDLING AND STORAGE Women of childbearing potential should avoid handling crushed or broken tablets of finasteride.
- PATIENT AND CARER ADVICE Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge.
- NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Finasteride is not prescribable in NHS primary care for the treatment of androgenetic alopecia in men.

1.3 Urolithiasis

Description of condition

Renal and ureteric stones

03-Apr-2019

Renal and ureteric stones are crystalline calculi that may form anywhere in the upper urinary tract. They are often asymptomatic but may cause pain when they move or obstruct the flow of urine. Most stones are composed of calcium salts (calcium oxalate, calcium phosphate or both). The rest are composed of struvite, uric acid, cystine and other substances. Patients are susceptible to stone formation when there is a decrease in urine volume and/or an excess of stone forming substances in the urine.

The following are risk factors that have been associated with stone formation: dehydration, change in urine pH, males aged between 40–60 years, positive family history, obesity, urinary anatomical abnormalities, and excessive dietary intake of oxalate, urate, sodium, and animal protein. Certain diseases which alter urinary volume, pH, and concentrations of certain ions (such as calcium, phosphate, oxalate, sodium, and uric acid) may also increase the risk of stone formation. Certain drugs such as calcium or vitamin D supplements, protease inhibitors, or diuretics may also increase the risk of stone formation.

Symptoms of acute renal or ureteric stones can include an abrupt onset of severe unilateral abdominal pain radiating to the groin (known as renal colic) that may be accompanied with nausea, vomiting, haematuria, increased urinary frequency, dysuria and fever (if concomitant urinary infection is present).

Stones can pass spontaneously and will depend on a number of factors, including the size of the stone (stones greater than 6 mm have a very low chance of spontaneous passage), the location (distal ureteral stones are more likely

to pass than proximal ureteral stones), and the degree of obstruction.

Aims of treatment

EvGr The aim of treatment is to improve the detection, clearance and prevention of renal and ureteric stones thereby reducing pain and improving quality of life.

Non-drug treatment

EvGr Consider watchful waiting for asymptomatic renal stones if they are less than 5mm in diameter. If they are larger; the risk and benefit of this option should be discussed with the patient.

Options for surgical stone removal should be discussed by the specialist hospital team depending on severity of obstruction, patient factors, size and site of stone. Options include shockwave lithotripsy, percutaneous nephrolithotomy and ureteroscopy.

Consider stone analysis and measure serum calcium in patients with recurring renal or ureteric stones.

Along with maintaining a healthy lifestyle, advise patients to drink 2.5–3 litres of water a day with the addition of fresh lemon juice and to avoid carbonated drinks. Maintain a normal daily calcium intake of 700–1,200mg and salt intake of no more than 6g a day. For patients with recurrent calcium stones avoid excessive intake of oxalate-rich products, such as rhubarb, spinach, cocoa, tea, nuts, soy products, strawberries, and wheat bran. For patients with recurrent uric acid stones, avoid excessive dietary intake of urate rich products, such as liver, kidney, calf thymus, poultry skin, and certain fish (herring with skin, sardines and anchovies).

Pain Management

Ever Offer NSAIDs as first line treatment for the management of pain associated with suspected renal colic or renal and ureteric stones. If NSAIDs are contra-indicated or not sufficiently controlling the pain, consider intravenous paracetamol. Subsequently, opioids can be used if both paracetamol and NSAIDs are contra-indicated or not sufficiently controlling the pain. Do not offer antispasmodics to patients with suspected renal colic.

Medical Expulsive Therapy

Ever Consider alpha-adrenoceptor blockers for patients with distal ureteric stones less than 10mm in diameter. Alpha-adrenoceptor blockers may also be considered as adjunctive therapy for patients having shockwave lithotripsy for ureteric stones less than 10mm. (A)

Prevention of recurrence of stones

Ever Alongside lifestyle advice, consider potassium citrate [unlicensed] in patients with recurrent stones composed of at least 50% calcium oxalate. Thiazides [unlicensed] may be given if patients also have hypercalciuria after restricting their sodium intake to no more than 6g a day.

1.4 Urological pain

Urological pain

03-Apr-2019

Treatment

Lidocaine hydrochloride gel is a useful topical application in *urethral pain* or to relieve the discomfort of catheterisation.

For information on the management of pain in renal and ureteric stones, see Renal and ureteric stones p. 850.

Alkalinisation of urine

Alkalinisation of urine can be undertaken with potassium citrate. The alkalinising action may relieve the discomfort of

cystitis caused by lower urinary tract infections. Sodium bicarbonate p. 1128 is used as a urinary alkalinising agent in some metabolic and renal disorders.

ALKALISING DRUGS > URINARY

Citric acid with potassium citrate

1-Dec-2021

INDICATIONS AND DOSE

Relief of discomfort in mild urinary-tract infections | Alkalinisation of urine

- ► BY MOUTH USING ORAL SOLUTION
- Adult: 10 mL 3 times a day, diluted well with water
- CAUTIONS Cardiac disease elderly
- INTERACTIONS → Appendix 1: potassium citrate
- SIDE-EFFECTS Hyperkalaemia · nausea · vomiting
- RENAL IMPAIRMENT EVGT Consider avoiding (risk of hyperkalaemia).
- PRESCRIBING AND DISPENSING INFORMATION When prepared extemporaneously, the BP states Potassium Citrate Mixture BP consists of potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, doublestrength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K*/10 mL.
- EXCEPTIONS TO LEGAL CATEGORY Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Oral solution

HEPARINOIDS

Pentosan polysulfate sodium

05-Oct-2021

• INDICATIONS AND DOSE

Bladder pain syndrome

- ► BY MOUTH
- Adult: 100 mg 3 times a day, review treatment after 6 months and discontinue if no response

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED SEPTEMBER 2019): *ELMIRON* © (PENTOSAN POLYSULFATE SODIUM): RARE RISK OF PIGMENTARY MACULOPATHY

Cases of pigmentary maculopathy have been reported rarely with pentosan polysulfate sodium, especially after long-term use at high doses. Healthcare professionals are advised that patients should have regular ophthalmic examinations during treatment, and to consider stopping treatment if pigmentary maculopathy develops. Patients should be advised to seek immediate medical attention if visual changes occur.

- CONTRA-INDICATIONS Active bleeding
- CAUTIONS Patients at increased risk of bleeding
- SIDE-EFFECTS
- Common or very common Alopecia · asthenia · back paindiarrhoea · dizziness · gastrointestinal discomfort · haemorrhage · headache · increased risk of infection · nausea · pelvic pain · peripheral oedema
- ▶ Uncommon Amblyopia · anaemia · appetite decreased · arthralgia · constipation · depression · dyspnoea · emotional lability · eye disorders · flatulence · hyperhidrosis · hyperkinesia · insomnia · leucopenia · melanocytic naevus size increased · myalgia · oral ulceration · paraesthesia · photosensitivity reaction · skin reactions · thrombocytopenia · tinnitus · vomiting · weight changes
- ▶ Frequency not known Coagulation disorder hepatic function abnormal
- PREGNANCY Manufacturer advises avoid—no information available.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution evidence of hepatic involvement in elimination.
- RENAL IMPAIRMENT Manufacturer advises caution evidence of renal involvement in elimination.
- MONITORING REQUIREMENTS Manufacturer advises careful monitoring in patients with history of heparin or pentosan polysulfate sodium induced thrombocytopenia.
- NATIONAL FUNDING/ACCESS DECISIONS

Bladder instillations and 2 urological surgery

Bladder instillations and urological surgery

19-Jul-2020

Bladder infection

Chlorhexidine solution below given as bladder irrigation is licensed for the management of common infections of the bladder in patients with an indwelling urinary catheter. Chlorhexidine has broad spectrum activity against many Gram-positive and Gram-negative bacteria but it is ineffective against most Pseudomonas spp. Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning on micturition (in which case they should be discontinued). Sterile sodium chloride solution 0.9% (physiological saline) p. 1131 is licensed for use as a routine mechanical irrigant to flush out debris, small blood clots, or tissue in catheters.

Continuous bladder irrigation with amphotericin B (Fungizone®) 50 micrograms/mL p. 647 is licensed to treat some fungal infections (e.g. candiduria).

Bladder cancer

Bladder instillations of doxorubicin hydrochloride p. 975 and mitomycin p. 994 are licensed for the management of superficial bladder tumours. Such instillations reduce systemic side-effects; adverse effects on the bladder (e.g. micturition disorders and reduction in bladder capacity) may occur. Instillation of epirubicin hydrochloride p. 977 is also licensed for the treatment and prophylaxis of certain forms of superficial bladder cancer.

Instillation of BCG (Bacillus Calmette-Guérin p. 1032), a live attenuated strain derived from Mycobacterium bovis, is

licensed for the treatment of primary or recurrent bladder carcinoma in-situ and for the prevention of recurrence following transurethral resection.

Urological surgery

Glycine irrigation solution 1.5% p. 854 is licensed for use in transurethral surgical procedures such as prostatic resection; EvGr sterile sodium chloride solution 0.9% (physiological saline) is used for irrigation in percutaneous renal surgery (e.g. nephrolithotomy, ureteroscopy).

Other drugs used for Bladder instillations and urological surgery Sodium citrate, p. 851

ANTISEPTICS AND DISINFECTANTS

3 Contraception

Contraceptives, hormonal

05-May-2022

Overview

Hormonal contraception includes combined hormonal contraception (containing an oestrogen and a progestogen) and progestogen-only contraception.

FSRH have produced guidance to support healthcare professionals on the use of contraception and provision of contraception services during the COVID-19 pandemic, available at: www.fsrh.org/fsrh-and-covid-19-resources-and-information-for-srh/.

Evor When prescribing contraception, information should be given on all available methods taking into consideration medical eligibility. This should include contraceptive effectiveness (including factors that alter efficacy), non-contraceptive benefits, health risks, and side-effects to allow an informed decision to be made on the most suitable choice. (A)

In adolescents, hormonal contraception is used after menarche. When prescribing contraception for females aged under 16 years, it is considered good practice for health professionals to follow the criteria commonly known as the Fraser Guidelines, available at: www.fsrh.org/standards-and-guidance/documents/cec-ceu-guidance-young-people-mar-2010/.

For information on contraceptive use in specific populations such as young people, overweight or obese individuals, individuals with eating disorders, and after pregnancy, see FSRH guidance available at: www.fsrh.org/standards-and-guidance/fsrh-guidelines-and-statements/contraception-for-specific-populations/.

For the UK Medical Eligibility Criteria for Contraceptive Use, which includes information on risk categorisation for patients with pre-existing medical conditions, see FSRH guidance available at: www.fsrh.org/standards-and-guidance/uk-medical-eligibility-criteria-for-contraceptive-use-ukmec/.

For information on switching methods of contraception, see FSRH Clinical Effectiveness Unit (CEU) guidance: Switching or Starting Methods of Contraception (see Useful resources).

Contraception in patients taking medication with teratogenic potential: FSRH (February 2018) and MHRA (March 2019) guidance

Females of childbearing potential should be advised to use highly effective contraception if they or their male partners are taking known teratogenic drugs or drugs with potential teratogenic effects. Highly effective contraception should be used both during treatment and for the recommended duration after discontinuation to avoid unintended pregnancy. Pregnancy testing should be performed before treatment initiation to exclude pregnancy and repeat testing may be required.

Methods of contraception considered to be 'highly effective' include male and female sterilisation, and the long-acting reversible contraceptives (LARC)—copper intrauterine device (Cu-IUD), levonorgestrel intra-uterine system (LNG-IUS) and progestogen-only implant (IMP). Females using the IMP must not take any interacting drugs that could reduce contraceptive effectiveness; for further information see Contraceptives, interactions p. 859.

For further guidance, see the FSRH CEU statement (www.fsrh.org/standards-and-guidance/documents/fsrh-ceu-statement-contraception-for-women-using-known/), MHRA drug safety update (www.gov.uk/drug-safety-update/medicines-with-teratogenic-potential-what-is-effective-contraception-and-how-often-is-pregnancy-testing-needed), and the UK teratogenic information service (www.uktis.org).

Combined hormonal contraceptives

Combined hormonal contraceptives (CHC) are available as tablets (COC), transdermal patches (CTP), and vaginal rings (CVR). They are highly user-dependant methods where the failure rate if used perfectly (i.e. correctly and consistently) is less than 1%. Certain factors such as the person's weight, malabsorption (COC only), and drug interactions may contribute to contraceptive failure. Prescriptions of up to 12 months' supply for CHC initiation or continuation may be

appropriate to avoid unwanted discontinuation and increased risk of pregnancy.

Ever It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age as safer alternatives exist.

CHC use may be associated with some health benefits such as:

- Reduced risk of ovarian, endometrial and colorectal cancer:
- Predictable bleeding patterns;
- · Reduced dysmenorrhoea and menorrhagia;
- Management of symptoms of polycystic ovary syndrome (PCOS), endometriosis and premenstrual syndrome;
- Improvement of acne;
- · Reduced menopausal symptoms;
- Maintaining bone mineral density in peri-menopausal females under the age of 50 years.

However, the use of CHC is also associated with health risks. For information on these risks, and further information on the benefits, see FSRH clinical guideline: **Combined Hormonal Contraception** (see *Useful resources*).

For information on advice to give to patients on the management of incorrect CHC use, see FSRH clinical guidance: Incorrect use of Combined Hormonal Contraception (see Useful resources).

Preparation choice

Combined oral contraceptives (COCs) containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed 'monophasic'; those with varying amounts of the two hormones are termed 'multiphasic'.

Combined oral contraceptives usually contain ethinylestradiol as the oestrogen component; mestranol and estradiol are also used. The ethinylestradiol content of COCs range from 20–40 micrograms. [EvG] A monophasic preparation containing 30 micrograms or less of ethinylestradiol in combination with levonorgestrel or norethisterone (to minimise cardiovascular risk), is generally used as the first line option. However, choice should be made taking into account the patients medical history, personal preference, previous contraceptive experience, and any age related considerations.

Due to potential reduced efficacy, non-oral CHC should be considered if there are concerns over absorption. In females who weigh 90 kg or more, consider non-topical options or use additional precautions with CTP.

Regimen choice

Ever Information should be given to females on both the traditional 21 day CHC regimen with a monthly withdrawal bleed during the 7 day hormone free interval (HFI), and 'tailored' CHC regimens [unlicensed use]. Tailored CHC regimens can only be used with monophasic CHC containing ethinylestradiol [unlicensed use]; they offer the choice of either a shortened, or less frequent, or no hormone free interval based on the person's preference.

The following tailored regimens may be used [unlicensed usel:

- Shortened HFI: 21 days of continuous use followed by a 4 day HFI;
- 4 day HFI;
 Extended use (tricycling): 9 weeks of continuous use followed by a 4 or 7 day HFI;
- Flexible extended use: continuous use for 21 days or more followed by a 4 day HFI when breakthrough bleeding occurs:
- Continuous use: continuous CHC use with no HFI. Withdrawal bleeds do not represent physiological menstruation and there is no difference in efficacy or safety of using the traditional 21 day regimen, which mimics the natural menstrual cycle, over using extended or continuous regimens. Use of the traditional regimen may be associated

with disadvantages such as heavy or painful withdrawal bleeds, headaches, mood changes, and increased risk of incorrect use with subsequent unplanned pregnancy. [EVGF] Withdrawal bleeds during traditional CHC use has been reported in females who are pregnant and should therefore not be relied on as reassurance of a person's pregnancy status. (A)

Follow up

EvGr A review of continued medical eligibility, satisfaction and adherence, drug interactions, and consideration of alternative contraception should be undertaken annually. Body mass index and blood pressure should also be checked annually.

Surgery

EVST CHC use should be discontinued at least 4 weeks prior to major elective surgery, any surgery to the legs or pelvis, or surgery that involves prolonged immobilisation of a lower limb. An alternative method of contraception should be used to prevent unintentional pregnancy, and CHC may be recommenced 2 weeks after full remobilisation. When discontinuation is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on CHC, thromboprophylaxis should be considered.

When to seek further advice

Evor All females should be advised to seek advice from a healthcare professional if they experience any troublesome side-effects, have a significant health event, start any new medication, would like to discontinue CHC, or to discuss alternative methods at any time. For further information, see FSRH guidance Combined Hormonal Contraception (see Useful resources).

Progestogen-only contraceptives

Progestogen-only contraceptive options are available in oral, injectable, subdermal, and intra-uterine form. Some forms are highly user-dependent (e.g. oral tablet), whilst others rely on timely re-administration (e.g. depot injection); the failure rate if used perfectly (i.e. correctly and consistently) is less than 1%. The primary mechanism of action differs between contraceptive options, however progestogenic effects leading to contraceptive action include changes to the cervical mucus affecting sperm penetration, endometrial changes affecting implantation, and ovulation suppression (to varying degrees).

Oral progestogen-only contraceptives

Oral progestogen-only preparations contain either levonorgestrel p. 872, norethisterone p. 823, or desogestrel p. 871. Evgr Oral progestogens may suppress ovulation to varying extents, for example, up to 60% of cycles are anovulatory in females using a levonorgestrel pill, whereas ovulation is suppressed in up to 97% of cycles in females taking a desogestrel pill. As ovulation is suppressed more consistently with desogestrel, it may have benefits over levonorgestrel and norethisterone, such as improving symptoms of dysmenorrhoea. There is however, insufficient evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives. Prescriptions of up to 12 months' supply at initial and subsequent visits may be appropriate. Follow-up should be tailored on a case by case basis with the advice to return if any problems arise. (A)

For further information on progestogen-only pills, see FSRH guidance: **Progestogen-only Pills** (see *Useful resources*).

Parenteral progestogen-only contraceptives

Parenteral long-acting progestogens include the injections medroxyprogesterone acetate p. 876 and norethisterone enantate, and the implant etonogestrel p. 875. These are long-acting reversible contraceptive options that work primarily by suppressing ovulation along with other

progestogenic effects. [EVG] As they often lead to amenorrhoea or reduced bleeding, they may benefit those with menstrual problems (such as heavy bleeding or dysmenorrhoea). (A)

Injections

The failure rate for injectable progestogen-only contraception during the first year is approximately only 0.2% with perfect use (used consistently and correctly), the failure rate with typical use (includes incorrect/inconsistent use) is approximately 6%. The typical failure rates are higher compared to other long-acting methods and may be due to the relative frequency of repeat injections.

Evsr Depot medroxyprogesterone acetate is administered every 13 weeks. Its use is associated with a small loss of bone mineral density, which largely recovers after discontinuation. However, due to the concerns and uncertainties around bone-loss the following is advised regarding its use:

- Females aged under 18 years may use depot medroxyprogesterone acetate after all options have been discussed and are considered unsuitable or unacceptable.
- In all females, although there is no definitive upper duration limit, use should be reviewed every 2 years and continuation benefits and risks discussed.
- Females aged 50 years and over should switch to another contraceptive method; if they do not wish to discontinue use, continuation may be considered following a discussion of the benefits and risks.
- In females with significant risk factors for osteoporosis, other methods of contraception should be considered.

Patients should be informed that there can be a delayed return of fertility of up to 1 year after discontinuation of depot medroxyprogesterone acetate. However, patients who discontinue use and do not wish to conceive, should be advised to start an alternative contraceptive method before or at the time of their next scheduled injection.

Norethisterone enantate is less commonly used in the UK.

[vor] It is used for short-term contraception (duration of 8 weeks) for females whose partners undergo a vasectomy until the vasectomy is effective, and after rubella immunisation.

For further information on progestogen-only injections including dosing interval of repeat injections and management of side-effects, see FSRH guidance: Progestogen-only Injectable Contraception (see *Useful resources*).

Implant

Evis The etonogestrel implant p. 875 is inserted subdermally and provides highly effective contraception for up to 3 years. The contraceptive failure rate for both perfect and typical use is approximately 0.05% in the first year of use. Routine follow-up during implant use, removal or replacement is not generally required, however patients should be advised to see their healthcare professional if the implant cannot be felt or problematic bleeding occurs.

For further information on progestogen-only implant, see FSRH guidance: **Progestogen-only Implant** (see *Useful resources*).

Intra-uterine progestogen-only systems

Intra-uterine systems (IUS) containing levonorgestrel p. 872 are long-acting reversible contraceptive options that have a licensed duration of use that ranges from 3–10 years depending on the system used. A foreign-body effect may be a contributing factor to the contraceptive action, in addition to progestogenic effects. Ovulation is not suppressed in the majority of females (over 75%) who use an IUS. An IUS releasing 20mcg/24hour of levonorgestrel may also have health benefits such as improving pain associated with dysmenorrhoea, endometriosis or adenomyosis.

FSRH CEU have issued recommendations on the management of pain and anxiety associated with insertion of

intra-uterine contraception, available at: www.fsrh.org/news/fsrh-statement-pain-associated-with-insertion-of-intrauterine/.

EVGF Patients should be advised to seek medical advice if they develop symptoms of pelvic infection, pain, abnormal bleeding, non-palpable threads or they can feel the stem of the IUS. (A)

For further information on progestogen-only IUS, see FSRH guidance: **Intra-uterine Contraception** (see *Useful resources*).

Surgery

In accordance with the UK Medical Eligibility Criteria for Contraceptive Use, progestogen-only pills, injections, implants, and intra-uterine systems are suitable for use as contraceptives in females undergoing surgery. For further information, see FSRH guidance: UK Medical Eligibility Criteria for Contraceptive Use (available at: www.fsrh.org/standards-and-guidance/uk-medical-eligibility-criteria-for-contraceptive-use-ukmec/).

Contraceptives, non-hormonal

)5-Jan-2022

Contraception in patients taking medication with teratogenic potential: FSRH (February 2018) and MHRA (March 2019) guidance

Females of childbearing potential should be advised to use highly effective contraception if they or their male partners are taking known teratogenic drugs or drugs with potential teratogenic effects. Highly effective contraception should be used both during treatment and for the recommended duration after discontinuation to avoid unintended

pregnancy. Pregnancy testing should be performed before treatment initiation to exclude pregnancy and repeat testing may be required.

Methods of contraception considered to be 'highly effective' include male and female sterilisation, and the long-acting reversible contraceptives (LARC)—copper intrauterine device (Cu-IUD), levonorgestrel intra-uterine system (LNG-IUS) and progestogen-only implant (IMP). Females using the IMP must not take any interacting drugs that could reduce contraceptive effectiveness; for further information, see Contraceptives, interactions p. 859.

For further guidance, see the FSRH Clinical Effectiveness Unit (CEU) statement (www.fsrh.org/standards-and-guidance/documents/fsrh-ceu-statement-contraception-for-women-using-known/), MHRA drug safety update (www.gov.uk/drug-safety-update/medicines-with-teratogenic-potential-what-is-effective-contraception-and-how-often-is-pregnancy-testing-needed), and the UK teratogenic information service (www.uktis.org).

Barrier methods

Barrier methods include condoms (male and female), diaphragms and cervical caps. Male condoms are less effective than some other contraception methods but are effective when used consistently and correctly, and provide significant protection against some sexually transmitted infections (STIs). Female condoms are also available; they are pre-lubricated with a non-spermicidal lubricant.

There is no evidence that condoms lubricated with spermicide provide additional protection against pregnancy or STIs. [EvGr] Diaphragms and caps must be used in conjunction with a **spermicide** and should not be removed until at least 6 hours after the last episode of intercourse.

Spermicidal contraceptives

Spermicidal contraceptives are useful additional safeguards but do **not** give adequate protection if used alone. They have two components: a spermicide and a vehicle for its delivery (e.g. vaginal gel). Ever They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); (A) high frequency use of the spermicide nonoxinol '9' p. 877 has been associated with genital lesions, which may increase the risk of acquiring these infections.

Contraceptive devices

Intra-uterine devices

Evsī The intra-uterine device (IUD) is a suitable contraceptive for women of all ages irrespective of parity;

• however they may be unsuitable in women with certain conditions such as those with pelvic inflammatory disease or unexplained vaginal bleeding. The UK Medical Eligibility Criteria for Contraceptive Use (published by FSRH) provides guidance on safe use of contraceptive methods including restrictions for intra-uterine devices; full guidance is available at www.fsrh.org/standards-and-guidance/uk-medicaleligibility-criteria-for-contraceptive-use-ukmec/.

Ever Fertility declines with age and therefore a copper intra-uterine device which is fitted in a woman over the age of 40, may remain in the uterus until menopause.

The most effective intra-uterine devices have at least 380 mm² of copper and have banded copper on the transverse arms. Other smaller devices have been introduced to minimise side-effects.

FSRH CEU have issued recommendations on the management of pain and anxiety associated with insertion of intra-uterine contraception, available at: www.fsrh.org/news/fsrh-statement-pain-associated-with-insertion-of-intrauterine/.

Caution with oil-based lubricants

Products such as petroleum jelly (Vaseline®), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms, contraceptive diaphragms and caps made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

Emergency contraception

05-Jan-2022

Overview

Ever Emergency contraception is intended for occasional use, to reduce the risk of pregnancy after unprotected sexual intercourse (UPSI). It does not replace effective regular contraception.

Females of childbearing potential who do not wish to conceive should be offered emergency contraception after UPSI that has taken place on any day of a natural menstrual cycle. Emergency contraception should also be offered after UPSI from day 21 after childbirth (unless the criteria for lactational amenorrhoea are met), and from day 5 after abortion, miscarriage, ectopic pregnancy or uterine evacuation for gestational trophoblastic disease.

Emergency contraception should also be offered to females whose regular contraception has been compromised or has been used incorrectly.

Emergency contraceptive methods

Copper intra-uterine devices

Ever Insertion of a copper intra-uterine device (see intrauterine contraceptive devices (copper) p. 868) is the most effective form of emergency contraception and should be offered (if appropriate) to all females who have had UPSI and do not wish to conceive. A copper intra-uterine contraceptive device can be inserted up to 120 hours (5 days) after the first UPSI in a natural menstrual cycle, or up to 5 days after the earliest estimated date of ovulation (i.e. within the minimum period before implantation), whichever is later. For information on the use of copper intra-uterine devices as emergency contraception in women using hormonal contraception, see FSRH guideline: Emergency Contraception (see Useful resources).

Antibacterial cover may be considered for copper intrauterine contraceptive device insertion if there is a significant risk of sexually transmitted infection that could be associated with ascending pelvic infection.

A copper intra-uterine device is not known to be affected by body mass index (BMI) or body-weight or by other drugs.

For further information on the use of copper intra-uterine devices as emergency contraception, see FSRH guideline:

Emergency Contraception (see Useful resources).

FSRH Clinical Effectiveness Unit have issued recommendations on the management of pain and anxiety associated with insertion of intra-uterine contraception, available at: www.fsrh.org/news/fsrh-statement-pain-associated-with-insertion-of-intrauterine/.

Hormonal methods

levor Oral hormonal emergency contraceptives (includes levonorgestrel p. 872 and ulipristal acetate p. 870) should be offered as soon as possible if a copper intra-uterine device is not appropriate or is not acceptable to the patient and there has been UPSI within the last 5 days; either drug should be taken as soon as possible to increase efficacy. Oral emergency contraception administered after ovulation is ineffective.

Levonorgestrel is effective if taken within 72 hours (3 days) of UPSI and may also be used between 72 and 96 hours after UPSI [unlicensed use], but efficacy decreases with time. Ulipristal acetate is effective if taken within 120 hours

(5 days) of UPSI. Ulipristal acetate has been demonstrated to be more effective than levonorgestrel for emergency contraception.

There is the possibility that a higher body-weight or BMI could reduce the effectiveness of oral emergency contraception, particularly levonorgestrel. If the patient's BMI is greater than 26 kg/m² or their body-weight is greater than 70 kg, it is recommended that either ulipristal acetate or a double dose of levonorgestrel [unlicensed indication] is given (see *Emergency contraception* under levonorgestrel). It is unknown which is more effective.

Ulipristal acetate should be considered as the first-line oral emergency contraceptive for females who have had UPSI within the last 96–120 hours (even if they have also had additional instances of UPSI within the last 96 hours). It should also be considered first line for females who have had UPSI within the last 5 days if it is likely to have taken place during the 5 days before the estimated day of oxulation.

Levonorgestrel may be considered for oral emergency contraception in females on a regular combined hormonal contraceptive who have missed contraception within the first week of restarting their contraceptive. See the FSRH guideline: **Emergency Contraception** (see Useful resources) for further information.

Ulipristal acetate and levonorgestrel can be used as oral emergency contraception more than once in the same cycle.

Note that the manufacturer of levonorgestrel advises that there may be an increased risk of side-effects (such as menstrual irregularities) with repeated administration of levonorgestrel as emergency contraception more than once in the same cycle.

For further information on the use of oral hormonal methods as emergency contraception, see the FSRH guideline: **Emergency Contraception** (see Useful resources).

Hormonal emergency contraception interactions See Contraceptives, interactions below.

Starting hormonal contraception after hormonal emergency contraception

The copper intra-uterine device immediately provides effective ongoing contraception, whereas oral hormonal emergency contraception methods do **not**.

Ever After taking levonorgestrel, females should start suitable hormonal contraception immediately. They must use condoms reliably or abstain from intercourse until contraception becomes effective.

Females should wait 5 days after taking ulipristal acetate before starting suitable hormonal contraception; they must use condoms reliably or abstain from intercourse during the 5 day waiting period and also until their contraceptive method is effective. However, hormonal contraception can be started immediately in females who are on a regular combined hormonal contraceptive who have missed contraception within the first week of restarting after a scheduled hormone-free interval, and have taken ulipristal acetate as emergency contraception; they must use condoms reliably or abstain from intercourse for 7 days until contraception becomes effective. A For further information on delaying versus immediately restarting combined hormonal contraception after taking ulipristal acetate, see the FSRH Clinical Effectiveness Unit statement: Response to recent publication (available at: www.fsrh.org/ standards-and-guidance/documents/fsrh-ceu-statementresponse-to-recent-publication-regarding/).

Contraceptives, interactions

05-May-2022

Overview

The effectiveness of *combined* oral contraceptives, *progestogen-only* oral contraceptives, contraceptive patches, vaginal rings, and emergency hormonal contraception can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine p. 336, eslicarbazepine acetate, nevirapine p. 700, oxcarbazepine p. 349, phenytoin p. 351, phenobarbital p. 365, primidone p. 366, ritonavir p. 714, St John's wort, topiramate p. 361 and, above all, rifabutin p. 627 and rifampicin p. 634), and possibly also griseofluvin p. 655. A condom together with a long-acting method (such as an injectable contraceptive) may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists.

For further information on other drug interactions with hormonal contraceptives, see the *Interactions* section of the relevant drug monograph.

Combined hormonal contraceptives interactions

Women using combined hormonal contraceptive patches, vaginal rings or oral tablets who require enzyme-inducing drugs or griseofulvin should be advised to change to a reliable contraceptive method that is unaffected by enzyme-inducers, such as some parenteral progestogen-only contraceptives (medroxyprogesterone acetate p. 876 and norethisterone p. 823) or intra-uterine devices (levonorgestrel p. 872; see also Contraceptives, non-hormonal p. 857). This should be continued for the duration of treatment and for four weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed:

Short course (2 months or less) of an enzyme-inducing drug Continuing the combined hormonal contraceptive method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug.

Long-term course (over 2 months) of an enzyme-inducing drug (except rifampicin or rifabutin) or a course of griseofulvin Use a monophasic combined oral contraceptive at a dose of ethinylestradiol 50 micrograms or more daily p. 819 [unlicensed use] and use either an extended or a 'tricycling' regimen (i.e. taking three packets of monophasic tablets without a break followed by a shortened tablet-free interval of four days [unlicensed use]); continue for the duration of treatment with the interacting drug and for four weeks after stopping

If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use] on specialist advice, or to use additional precautions, or to change to a method unaffected by the interacting drugs.

Use of contraceptive patches and vaginal rings (including concurrent use of two patches or two vaginal rings) is not recommended for women taking enzyme-inducing drugs over a long period.

Long-term course (over 2 months) of rifampicin or rifabutin
An alternative method of contraception (such as an IUD) is
always recommended because they are such potent enzymeinducing drugs; the alternative method of contraception
should be continued for four weeks after stopping the
enzyme-inducing drug.

Antibacterials that do not induce liver enzymes

Due to anecdotal reports of contraceptive failures, there had been concerns that some antibacterials that do not induce liver enzymes (e.g. ampicillin p. 599, doxycycline p. 616) reduce the efficacy of *combined* oral contraceptives by

impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel. However, there is a lack of evidence to support this interaction. It is recommended by the Faculty of Sexual and Reproductive Healthcare (FSRH) that no additional contraceptive precautions are required when combined oral contraceptives, contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes, unless diarrhoea or vomiting occur when using combined oral contraceptives. These recommendations should be discussed with the woman, who should also be advised that guidance in patient information leaflets may differ.

Oral progestogen-only contraceptives interactions

Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with an interacting drug and for at least 4 weeks afterwards.

For a short course of an enzyme-inducing drug (less than two months), continuing the progestogen-only oral method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug.

Parenteral progestogen-only contraceptives interactions Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of intramuscular norethisterone injection and intramuscular and subcutaneous

medroxyprogesterone acetate injections is not affected by enzyme-inducing drugs and they may be continued as

normal during courses of these drugs.

Effectiveness of the etonogestrel-releasing implant p. 875 may be reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the interacting drug and for at least 4 weeks after stopping.

For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, continued contraception with the implant may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for 4 weeks after stopping the enzyme-inducing drug.

Hormonal emergency contraception interactions

The effectiveness of levonorgestrel and ulipristal acetate p. 870 could be reduced in women taking enzyme-inducing drugs or griseofulvin (and for at least 4 weeks after stopping). [vor] A copper intra-uterine device can be offered instead. If the copper intra-uterine device is declined or unsuitable, the dose of levonorgestrel should be increased (See Dose adjustments due to interactions under levonorgestrel). There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

The effectiveness of ulipristal acetate for emergency contraception in women using drugs that increase gastric pH has not been studied. Levonorgestrel or a copper intrauterine device should be considered as alternatives.

Ever Hormonal contraception should not be newly initiated in a patient until five days after administration of ulipristal acetate as emergency hormonal contraception—the contraceptive effect of ulipristal acetate will be reduced. Consistent and careful use of condoms is recommended. Women on a regular combined oral contraceptive may be able to restart regular contraception immediately after administration of ulipristal acetate as emergency hormonal contraception. For further information, see Starting hormonal contraception after emergency hormonal contraception under Emergency contraceptive methods in Emergency contraception p. 858.

When a progestogen (including levonorgestrel for emergency contraception) is given 7 days before, or 5 days after administration of ulipristal acetate p. 870 as emergency hormonal contraception, the contraceptive effect of ulipristal acetate may be reduced.

3.1 Contraception, combined

OESTROGENS COMBINED WITH PROGESTOGENS

Combined hormonal contraceptives

• CONTRA-INDICATIONS Acute porphyrias p. 1150 • atrial fibrillation · benign hepatocellular adenoma · Budd-Chiari syndrome · cardiomyopathy with impaired cardiac function · complicated congenital heart diease · complicated valvular heart disease · current breast cancer · hepatocellular carcinoma · hypertension (blood pressure systolic 160 mmHg or diastolic 100 mmHg or higher) . hypertensive retinopathy · ischaemic heart disease · known thrombogenic mutations (e.g. factor V Leiden, prothrombin mutation, protein S, protein C and antithrombin deficiencies) . less than 3 weeks postpartum in non-breastfeeding women with other risk factors for venous thromboembolism · less than 6 weeks postpartum in breastfeeding women · major surgery with prolonged immobilisation · migraine with aura · peripheral vascular disease with intermittent claudication · positive antiphospholipid antibodies · previous or current venous thrombosis · smoking in patients aged 35 years and over (15 or more cigarettes daily) • stroke • systemic lupus erythematosus with antiphospholipid antibodies · transient ischaemic attack

CAUTIONS

GENERAL CAUTIONS Carrier of breast cancer gene mutations e.g. BRCA1, BRCA2—seek specialist advice before use · cervical intraepithelial neoplasia or cancer · cholestasis during pregnancy · cholestasis with previous use of combined hormonal contraception—seek specialist advice before use · focal nodular hyperplasia · gallbladder disease—if medically treated or current, seek specialist advice before use · history of breast cancer—seek specialist advice before use · history of negative mood changes induced by hormonal contraceptive (a product containing an alternative progestogen may be tried) · inflammatory bowel disease · organ transplantation—when complicated, seek specialist advice before use · personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) · prolactinoma—seek specialist advice before use · risk factors for cardiovascular disease · risk factors for venous thromboembolism · sickle-cell disease · undiagnosed mass or breast symptoms during combined hormonal contraception treatment-if symptoms exist prior to initiation, seek specialist advice before use · undiagnosed vaginal bleeding · viral hepatitis during

combined hormonal contraception treatment—if condition exists prior to initiation, seek specialist advice before use

SPECIFIC CAUTIONS

▶ With oral use Bariatric surgery with body mass index 30 kg/m² to 34 kg/m² (possible reduction in contraceptive efficacy)—if body mass index ≥ 35 kg/m², seek specialist advice before use · severe diarrhoea (possible reduction in contraceptive efficacy) · vomiting (possible reduction in contraceptive efficacy)

CAUTIONS, FURTHER INFORMATION

- Risk of venous thromboembolism There is an increased risk of venous thromboembolic disease in users of combined hormonal contraceptives particularly during the first year and possibly after restarting combined hormonal contraceptives following a break of four weeks or more. This risk is smaller than that associated with pregnancy and the postpartum period. In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen and oestrogen dose.
- Risk factors for venous thromboembolism Use with caution if any of following factors present and avoid or seek specialist advice if multiple risk factors present (for risk factors where treatment with combined hormonal contraceptives should be avoided, see Contra-indications)
- Age 40 years and older—if 50 years and older, seek specialist advice before use;
- 6 weeks to 6 months postpartum in breastfeeding women;
- 3 to 6 weeks postpartum in non-breastfeeding women in the absence of additional risk factors for venous thromboembolism—if 3 to 6 weeks postpartum with risk factors, or if less than 3 weeks postpartum without risk factors, seek specialist advice before use;
- Smoking if age under 35 years, or if 35 years and older and have stopped smoking at least 1 year ago—if 35 years and older smoking less than 15 cigarettes a day or stopped smoking less than 1 year ago, seek specialist advice before use:
- Obesity with body mass index 30 kg/m² to 34 kg/m²—if body mass index ≥ 35 kg/m², seek specialist advice before use:
- *History of hypertension during pregnancy* in currently normotensive women;
- Family history of venous thromboembolism in a firstdegree relative aged 45 years and older—if first-degree relative is under 45 years, seek specialist advice before use;
- Major surgery without prolonged immobilsation;
- Long-term immobility (e.g. wheelchair use, debilitating illness)—seek specialist advice before use;
- · Superficial venous thrombosis;
- Uncomplicated valvular heart disease;
- Uncomplicated congenital heart disease;
- Cardiomyopathy with normal cardiac function;
- · Long QT syndrome;
- Systemic lupus erythematosus with no antiphospholipid antibodies;
- High altitudes: women travelling above 4500 m or 14500 feet for more than 1 week should consider alternative contraceptive methods (risk of thrombosis).

Combined Hormonal Contraception and Risk of		
Venous Thromboembolism

	Nomegestrol ²	Not known-insufficient data
	1 cambinad	ial 2 cambinad with actualial

- ¹ Combined with ethinylestradiol ² Combined with estradiol
- Risk of cardiovascular disease Combined hormonal contraceptives also slightly increase the risk of cardiovascular disease such as myocardial infarction and ischaemic stroke; risk appears to be greater with higher oestrogen doses.
 - Risk factors for cardiovascular disease Use with caution if any one of following factors present but avoid or seek specialist advice if multiple risk factors present (for risk factors where treatment with combined hormonal contraceptives should be avoided, see Contra-indications)
 - Age 40 years and older—if 50 years and older, seek specialist advice before use;
 - Smoking if age under 35 years, or if 35 years and older and have stopped smoking at least 1 year ago—if 35 years and older smoking less than 15 cigarettes a day, or stopped smoking less than 1 year ago, seek specialist advice before use;
 - Hypertension if adequately controlled or if blood pressure systolic 140–159 mmHg or diastolic 90–99 mmHg, seek specialist advice before use;
 - History of hypertension during pregnancy in currently normotensive women;
 - Dyslipidaemias;
 - Non-migrainous headache (mild or severe) during combined hormonal contraceptive use:
 - Migraine without aura prior to initiation of combined hormonal contraceptives—if migraine without aura occurs during combined hormonal contraceptive use or when history of migraine with aura is 5 or more years ago, seek specialist advice;
 - Idiopathic intracranial hypertension
 - Uncomplicated valvular heart disease;
 - Uncomplicated congenital heart disease;
 - Cardiomyopathy with normal cardiac function;
 - Long QT syndrome;
 - Diabetes mellitus—if vascular disease present, seek specialist advice before use;
 - Rheumatoid arthritis;
 - Systemic lupus erythematosus without antiphospholipid antibodies.

SIDE-EFFECTS

- ► Common or very common Acne · fluid retention · headaches · metrorrhagia · nausea · weight increased
- ► Uncommon Alopecia · hypertension
- ▶ Rare or very rare Venous thromboembolism

SIDE-EFFECTS, FURTHER INFORMATION

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women taking the

combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years.

Cervical cancer Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years. The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium.

- PREGNANCY Not known to be harmful.
- BREAST FEEDING Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- HEPATIC IMPAIRMENT In general, manufacturer advises caution; avoid in acute disease, severe chronic disease, or liver tumour
- DIRECTIONS FOR ADMINISTRATION
- With oral use Each tablet should be taken at approximately same time each day; if delayed, contraceptive protection may be lost. FSRH advises if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days; for estradiol-containing preparations, additional precautions (barrier methods) necessary for 7 days (9 days for Qlaira®) if started after day 1 of cycle. Changing to combined preparation containing different progestogen
- With oral use FSRH advises if previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately. Consult product literature for requirements of specific preparations.
- Changing from progestogen-only tablet
- With oral use FSRH advises if previous contraceptive used correctly, or pregnancy can reasonably be excluded, start new brand immediately, additional precautions (barrier methods) necessary for first 7 days (9 days for Qlaira[®]).
 Secondary amenorrhoea (exclude pregnancy)
- With oral use FSRH advises start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for *Qlaira*[®]).
 - After childbirth (not breast-feeding)
- With oral use FSRH advises start 3 weeks after childbirth except on specialist advice in the absence of additional risk factors for thromboembolism, or 6 weeks after childbirth in the presence of additional risk factors for thromboembolism (increased risk of thrombosis if started earlier); additional precautions (barrier methods) necessary for first 7 days (9 days for Qlaira®). After abortion, miscarriage, ectopic pregnancy or gestational trophoblastic disease
- With oral use FSRH advises additional contraceptive precautions (barrier methods) required for 7 days if started after day 5 following treatment; for estradiol-containing preparations, additional contraceptive precautions (barrier methods) required for 7 days (9 days for Qlaira®) if started after day 1 following treatment.

PATIENT AND CARER ADVICE

Travel Women taking oral contraceptives or using the patch or vaginal ring are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Diarrhoea and vomiting

• With oral use Vomiting and severe diarrhoea can interfere with the absorption of combined oral contraceptives. The FSRH advises following the instructions for missed pills if vomiting occurs within 3 hours of taking a combined oral contraceptive or severe diarrhoea occurs for more than 24 hours. Use of non-oral contraception should be considered if diarrhoea or vomiting persist.
Missed doses

 With oral use The critical time for loss of contraceptive protection is when a pill is omitted at the beginning or end of a cycle (which lengthens the pill-free interval). If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary. If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pilltaking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of everyday) (ED) pills, omitting the 7 inactive tablets). Emergency contraception is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

Ethinylestradiol with etonogestrel

4-Mar-2021

• INDICATIONS AND DOSE

Menstrual symptoms

- ► BY VAGINA
- Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs)

Contraception

- ► BY VAGINA
- Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs), see Contraceptives, hormonal p. 854 for recommendations from the FSRH on 'tailored' regimens in which there is a shortened, less frequent, or no ring-free interval.
- INTERACTIONS → Appendix 1: combined hormonal contraceptives • ethinylestradiol • etonogestrel
- DIRECTIONS FOR ADMINISTRATION

Changing from combined hormonal contraception to vaginal ring Manufacturer advises insert ring at the latest on the day after the usual tablet-free, patch-free, or inactive-tablet interval. If previous contraceptive used correctly, or pregnancy can reasonably be excluded, can switch to ring on any day of cycle.

Changing from progestogen-only method to vaginal ring From an implant or intra-uterine progestogen-only device, manufacturer advises insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, insert ring when next injection due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days

 PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer vaginal ring.
 Counselling The presence of the ring should be checked regularly.

Missed doses

Expulsion, delayed insertion or removal, or broken vaginal ring if the vaginal ring is expelled for *less than 3 hours*, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

If the ring remains outside the vagina for *more than* 3 *hours* or if the user does not know when the ring was expelled, contraceptive protection may be reduced:

- If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
- If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

If the ring breaks during use, remove it and insert a new ring immediately, additional precautions (barrier methods) should be used for the first 7 days of the new cycle

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Ethinylestradiol with norelgestromin

14-Mar-202

• INDICATIONS AND DOSE

Menstrual symptoms

- ► BY TRANSDERMAL APPLICATION
- Females of childbearing potential: Apply 1 patch once weekly for 3 weeks, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle, subsequent courses repeated after a 7-day patch free interval (during which withdrawal bleeding occurs)

Contraception

- ► BY TRANSDERMAL APPLICATION
- Females of childbearing potential: Apply 1 patch once weekly for 3 weeks, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after a patch-free interval to start subsequent contraceptive cycle, subsequent courses repeated after a patch-free interval (during which withdrawal bleeding occurs), see Contraceptives, hormonal p. 854 for recommendations from the FSRH on 'traditional' and 'tailored' regimens in which there is a shortened, less frequent, or no patch-free interval.
- CAUTIONS Body-weight 90 kg and above (possible reduction in contraceptive efficacy)
- INTERACTIONS → Appendix 1: combined hormonal contraceptives • ethinylestradiol

SIDE-FEFECTS

- ► Common or very common Anxiety · breast abnormalities · diarrhoea · dizziness · fatigue · gastrointestinal discomfort · increased risk of infection · malaise · menstrual cycle irregularities · mood altered · muscle spasms · skin reactions · uterine cramps · vaginal haemorrhage · vomiting · vulvovaginal disorders
- ► Uncommon Appetite increased · dyslipidaemia · insomnia · lactation disorders · oedema · photosensitivity reaction · sexual dysfunction
- Rare or very rare Embolism and thrombosis gallbladder disorders genital discharge neoplasms stroke swelling

- ► Frequency not known Anger angioedema cervical dysplasia • colitis • contact lens intolerance • erythema nodosum • hepatic disorders • hyperglycaemia • intracranial haemorrhage • myocardial infarction • pulmonary artery thrombosis • taste altered
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises adhesives or bandages should not be used to hold patch in place. If no longer sticky do not reapply but use a new patch.

Changing to a transdermal combined hormonal contraceptive Changing from combined oral contraception Manufacturer advises apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last *active* tablet, rule out pregnancy before applying first patch. Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days.

Changing from progestogen-only method

Manufacturer advises

- from an implant, apply first patch on the day implant removed
- from an injection, apply first patch when next injection due
- from oral progestogen, first patch may be applied on any day after stopping pill

For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

After childbirth (not breast-feeding) Manufacturer advises start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days.

After abortion or miscarriage Manufacturer advises before 20 weeks' gestation start immediately; no additional contraception required if started immediately. After 20 weeks' gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch.

 PATIENT AND CARER ADVICE Patients and carers should be given advice on how to administer patches.
 Travel Women using patches are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Missed doses

Delayed application or detached patch If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual 'change day'. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new 'Day 1'; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new 'Day 1'; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch 'change day' remains the same and no additional contraception is required:
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new 'Day 1'; additional non-hormonal

contraception should be used for the first 7 days of the new cycle

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual 'change day', the day after day 28; no additional contraception is required.

Ethinylestradiol with norgestimate

5-Mar-2021

INDICATIONS AND DOSE

Menstrual symptoms with 21-day combined preparations

▶ BY MOUTH

Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day

Contraception with 21-day combined preparations

- ▶ BY MOUTH
- Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after hormonefree interval, withdrawal bleeding occurs during the hormone-free interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day, see Contraceptives, hormonal p. 854 for recommendations from the FSRH on 'traditional' and 'tailored' regimens in which there is a shortened, less frequent, or no hormone-free interval.
- INTERACTIONS → Appendix 1: combined hormonal contraceptives • ethinylestradiol

SIDE-EFFECTS

- ► Common or very common Anxiety · asthenic conditions · breast abnormalities · chest pain · constipation · depression · diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders · genital discharge · hypersensitivity · increased risk of infection · insomnia · menstrual cycle irregularities · mood altered · muscle complaints · oedema · pain · skin reactions · vomiting
- Uncommon Appetite abnormal · cervical dysplasia · dry eye · dyspnoea · embolism and thrombosis · hirsutism · hot flush · libido disorder · ovarian cyst · palpitations · paraesthesia · syncope · visual impairment · vulvovaginal disorders · weight changes
- ▶ Rare or very rare Hepatic disorders pancreatitis photosensitivity reaction sweat changes tachycardia vertigo
- ► Frequency not known Angioedema · contact lens intolerance · dyslipidaemia · erythema nodosum · neoplasms · seizure · suppressed lactation
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

CONTRACEPTIVE DEVICES

Intra-uterine contraceptive devices (copper) 24-Nov-2020

INDICATIONS AND DOSE

Contraception

- ► BY INTRA-UTERINE ADMINISTRATION
- Females of childbearing potential: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen;

consider this if there is severe pain following insertion and perform an ultrasound.

- CONTRA-INDICATIONS Active trophoblastic disease (until return to normal of urine and plasma-gonadotrophin concentration) · genital malignancy · medical diathermy · pelvic inflammatory disease · post-abortion sepsis · postpartum sepsis · recent sexually transmitted infection (if not fully investigated and treated) · severe anaemia · unexplained uterine bleeding · Wilson's disease
- CAUTIONS Anaemia · anatomical abnormalities—seek specialist advice · anticoagulant therapy · cardiac disease—seek specialist advice · endometriosis · epilepsy (risk of seizure at time of insertion) · immunosuppression (risk of infection)—seek specialist advice · menorrhagia (progestogen intra-uterine system might be preferable) · postpartum—seek specialist advice · risk of sexually transmitted infections · severe primary dysmenorrhoea · young age

cautions, Further information The Faculty of Sexual and Reproductive Healthcare advises if removal is after day 3 of the menstrual cycle, intercourse should be avoided or another method of contraception used for at least 7 days before removal of device—emergency contraception may need to be considered if recent intercourse has occurred and the intra-uterine device is removed after day 3 of the menstrual cycle.

- Sexually transmitted infections and pelvic inflammatory disease The main excess risk of pelvic infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
 - they are under 25 years old or
 - they are over 25 years old and
 - have a new partner or
 - have had more than one partner in the past year or
 - their regular partner has other partners.

The Faculty of Sexual and Reproductive Healthcare advises pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) be performed in these women. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, consider appropriate prophylactic antibacterial cover. The woman should be advised to attend *as an emergency* if she experiences sustained pain during the next 20 days.

- SIDE-EFFECTS Abdominal pain lower anaemia back pain device complications menstrual cycle irregularities pelvic inflammatory disease uterine injuries
- ALLERGY AND CROSS-SENSITIVITY EVGF Contra-indicated if patient has a copper allergy.
- PREGNANCY If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Remove device; if pregnancy occurs, increased likelihood that it may be ectopic.
- BREAST FEEDING Not known to be harmful.
- MONITORING REQUIREMENTS Gynaecological examination before insertion, 6–8 weeks after insertion, then annually.
- DIRECTIONS FOR ADMINISTRATION The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet.
- PRESCRIBING AND DISPENSING INFORMATION

PROGESTERONE RECEPTOR MODULATORS

Ulipristal acetate

13-Apr-2021

 DRUG ACTION Ulipristal acetate is a synthetic, selective progesterone receptor modulator with a partial progesterone antagonist effect.

• INDICATIONS AND DOSE

Emergency contraception

- ▶ BY MOUTH
- Females of childbearing potential: 30 mg for 1 dose, to be taken as soon as possible after coitus, but no later than after 120 hours

Uterine fibroids (under expert supervision)

- ► BY MOUTH
- Adult: 5 mg daily for up to 3 months, starting during the first week of menstruation, treatment course may be repeated if necessary; re-treatment should start no sooner than during the first week of the second menstruation following completion of the previous course; maximum 4 courses

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ULIPRISTAL ACETATE 5 MG (*ESMYA* ®): FURTHER RESTRICTIONS DUE TO RISK OF SERIOUS LIVER INJURY (FEBRUARY 2021)

Rare but serious cases of liver injury and hepatic failure requiring liver transplantation have been reported worldwide in women treated with *Esmya* for symptoms of uterine fibroids. Its licence was temporarily suspended in March 2020 to allow a further review of these risks. Although the temporary suspension has been lifted, further restrictions have been introduced.

Healthcare professionals are advised that <code>Esmya®</code> should only be used for intermittent treatment of moderate to severe uterine fibroid symptoms before menopause and when surgical procedures (including uterine fibroid embolisation) are not suitable or have failed. If considered to be appropriate therapy, the risks and benefits of <code>Esmya®</code> should be discussed with patients before prescribing so that they can make an informed decision about treatment options. Liver function should be monitored before, during, and after treatment courses (see <code>Monitoring requirements</code>); <code>Esmya®</code> should not be used in those with an underlying liver disorder. Patients should be advised to stop therapy and seek immediate medical advice if any signs of liver damage develop.

There are currently no concerns with the use of the emergency contraceptive $\emph{ellaOne}^{@}-$ see $\emph{Indications and dose}.$

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Breast cancer · cervical cancer · ovarian cancer · severe asthma controlled by oral glucocorticoids · undiagnosed vaginal bleeding · uterine cancer

SPECIFIC CONTRA-INDICATIONS

- When used for uterine fibroids Vaginal bleeding not caused by uterine fibroids
- INTERACTIONS → Appendix 1: ulipristal
- SIDE-EFFECTS
- ► Common or very common Asthenia · breast abnormalities · dizziness · endometrial thickening · gastrointestinal discomfort · headaches · hot flush · menstrual cycle irregularities · mood altered · myalgia · nausea · ovarian and fallopian tube disorders · pain · pelvic pain · skin reactions · vertigo · vomiting · weight increased
- ▶ Uncommon Alopecia · anxiety · appetite disorder · chills · concentration impaired · constipation · diarrhoea · drowsiness · dry mouth · fever · flatulence · genital abnormalities · hyperhidrosis · increased risk of infection · insomnia · libido disorder · malaise · oedema · urinary incontinence · vision disorders · vulvovaginal disorders
- Rare or very rare Abnormal sensation in eye disorientation dry throat epistaxis eye erythema painful sexual intercourse syncope taste altered thirst tremer.
- ► Frequency not known Angioedema · hepatic disorders
- CONCEPTION AND CONTRACEPTION
- When used for Uterine fibroids EvGr Non-hormonal contraceptive methods should be used during treatment and for 12 days after stopping, if required.
- PREGNANCY
- ▶ When used for Emergency contraception Ever Limited information available—if pregnancy occurs, report to the ellaOne® pregnancy registry.
- When used for Uterine fibroids EvGr Avoid—limited information available. ♠

BREAST FEEDING

- ► When used for Emergency contraception EvGr Avoid for 1 week after administration—present in milk. ♠
- When used for Uterine fibroids Evgr Avoid—present in milk but no further information available.
- HEPATIC IMPAIRMENT
- When used for Emergency contraception Evg. Avoid in severe impairment—no information available.
- When used for Uterine fibroids EvGr Avoid—risk of increased exposure. ♠
- RENAL IMPAIRMENT
- When used for Uterine fibroids EvGr Avoid in severe impairment unless patient is closely monitored—no information available.

MONITORING REQUIREMENTS

▶ When used for Uterine fibroids [vor] Perform liver function tests before treatment initiation—do not initiate if serum transaminases exceed 2 times the upper limit of normal. During the first 2 treatment courses, monitor liver function monthly; for further treatment courses, perform liver function tests once before each new treatment course and when clinically indicated. At the end of each treatment course, perform liver function tests after 2-4 weeks. Discontinue treatment if serum transaminases exceed 3 times the upper limit of normal and closely monitor patient. Periodically monitor the endometrium following repeated intermittent treatment. (♣)

PATIENT AND CARER ADVICE

- When used for Emergency contraception When prescribing or supplying hormonal emergency contraception, women should be told:
 - if vomiting occurs within 3 hours of taking a dose, a replacement dose should be taken;
 - that their next period may be early or late;
 - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy.

The Faculty of Sexual and Reproductive Healthcare also advises women should be told:

- that a barrier method of contraception needs to be used—see Emergency contraception p. 858 for further information;
- that a pregnancy test should be performed if the next menstrual period is delayed by more than 7 days, is lighter than usual, or is associated with abdominal pain that is not typical of the woman's usual dysmenorrhoea;
- that a pregnancy test should be performed if hormonal contraception is started soon after use of emergency contraception even if they have bleeding; bleeding associated with the contraceptive method may not represent menstruation.
- When used for Uterine fibroids Prescribers should explain to patients the requirement for treatment-free intervals—see also Important safety information.
 Patient card
- When used for Uterine fibroids A patient card should be provided.

Missed doses

When used for Uterine fibroids If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks

- When used for Emergency contraception Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

3.4 Contraception, oral progestogen-only

Other drugs used for Contraception, oral progestogenonly Norethisterone, p. 823

PROGESTOGENS

Desogestrel

18-Jan-2022

INDICATIONS AND DOSE

Contraception

- ► BY MOUTH
- Females of childbearing potential: 75 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 12 hours or more it should be regarded as a 'missed pill'
- CONTRA-INDICATIONS Acute porphyrias p. 1150 · current breast cancer
- CAUTIONS Cardiac dysfunction · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · history of breast cancer—seek specialist advice before use · history of stroke (including transient ischaemic attack) · history of venous thromboembolism · ischaemic heart disease · liver tumours—seek specialist advice before use · malabsorption states · migraine with aura · multiple risk factors for cardiovascular disease · positive antiphospholipid antibodies · rheumatoid arthritis · systemic lupus erythematosus · undiagnosed vaginal bleeding
- INTERACTIONS → Appendix 1: desogestrel

SIDE-EFFECTS

- ➤ Common or very common Breast abnormalities · depressed mood · headache · libido decreased · menstrual cycle irregularities · mood altered · nausea · skin reactions · weight increased
- ► Uncommon Alopecia · contact lens intolerance · fatigue · ovarian cyst · vomiting · vulvovaginal infection
- ▶ Rare or very rare Erythema nodosum
- ► Frequency not known Angioedema embolism and thrombosis neoplasms

SIDE-EFFECTS, FURTHER INFORMATION The benefits of using progestogen-only contraceptives (POCs), such as desogestrel, should be weighed against the possible risks for each individual woman.

There is a small increase in the risk of having breast cancer diagnosed in women using a combined oral contraceptive pill (COC); this relative risk may be due to an earlier diagnosis, biological effects of the pill or a combination of both. This increased risk is related to the age of the woman using the COC rather than the duration of use and disappears gradually within 10 years after discontinuation.

The risk of breast cancer in users of POCs is possibly of similar magnitude as that associated with COCs, however the evidence is less conclusive.

Available evidence does not support an association between the use of a progestegen-only contraceptive pill and breast cancer. Any increased risk is likely to be small and reduces gradually during the 10 years after stopping; there is no excess risk 10 years after stopping. The older age at which the contraceptive is stopped appears to have a greater influence on increased risk rather than the duration of use.

- ALLERGY AND CROSS-SENSITIVITY Every Feanolla[®], Lovima[®] and Moonia[®] tablets contra-indicated in patients with hypersensitivity or allergy to peanuts or soya.
- PREGNANCY Not known to be harmful.
- BREAST FEEDING Progestogen-only contraceptives do not affect lactation.
- HEPATIC IMPAIRMENT Manufacturer advises caution; avoid in severe or active disease.

• PATIENT AND CARER ADVICE

Surgery All progestogen-only contraceptives are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Starting routine One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 12 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if desogestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days. Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking desogestrel, another pill should be taken as soon as possible. If a replacement pill is not taken within 12 hours of the normal time for taking desogestrel, or in cases of persistent vomiting or very severe diarrhoea,

additional precautions should be used during illness and for 2 days after recovery.

Missed doses The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 12 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days'.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more tablets are missed or taken more than 12 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

Levonorgestrel

13-Anr-2021

• INDICATIONS AND DOSE

Emergency contraception

► BY MOUTH

Females of childbearing potential: 1.5 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours and no later than after 72 hours (may also be used between 72–96 hours after coitus but efficacy decreases with time), alternatively 3 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours and no later than after 72 hours (may also be used between 72–96 hours after coitus but efficacy decreases with time). Higher dose should be considered for patients with body-weight over 70 kg or BMI over 26 kg/m²

Contraception

- ► BY MOUTH
- Females of childbearing potential: 30 micrograms daily starting on day 1 of the cycle then continuously, dose is to be taken at the same time each day, if

administration delayed for 3 hours or more it should be regarded as a "missed pill"

JAYDESS ® 13.5MG INTRA-UTERINE DEVICE

Contraception

- ► BY INTRA-UTERINE ADMINISTRATION
- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks' gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 3 years

KYLEENA® 19.5MG INTRA-UTERINE DEVICE

Contraception

- ▶ BY INTRA-UTERINE ADMINISTRATION
- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks' gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

LEVOSERT® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Contraception | Menorrhagia

- ► BY INTRA-UTERINE ADMINISTRATION
- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks' gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 6 years when used for contraception and for 5 years when used for menorrhagia

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Contraception | Menorrhagia

- ► BY INTRA-UTERINE ADMINISTRATION
- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks' gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

Prevention of endometrial hyperplasia during oestrogen replacement therapy

- ► BY INTRA-UTERINE ADMINISTRATION
- Females of childbearing potential: Insert during last days of menstruation or withdrawal bleeding or at any time if amenorrhoeic; effective for 4 years

DOSE ADJUSTMENTS DUE TO INTERACTIONS

▶ When used orally as an emergency contraceptive, the effectiveness of levonorgestrel could be reduced in women taking enzyme-inducing drugs (and for up to 4 weeks after stopping); a copper intra-uterine device should preferably be used instead. If the copper intrauterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose; pregnancy should be excluded following use, and medical advice sought if pregnancy occurs.

UNLICENSED USE

- ▶ With intra-uterine use The Faculty of Sexual and Reproductive Healthcare (FSRH) advises levonorgestrel is used as detailed below, although these situations are considered unlicensed:
 - Insertion at any time if reasonably certain the woman is not pregnant or at risk of pregnancy;
 - · Additional precautions (e.g. barrier methods) for at least 7 days before replacement even if immediate replacement is intended:
 - Insertion immediately following termination of pregnancy below 24 weeks' gestation;
 - Postpartum insertions 4 weeks after delivery.
- ▶ With oral use The FSRH advises levonorgestrel is used as detailed below, although these situations are considered unlicensed:
 - Higher dose option for emergency contraception in patients with body-weight over 70 kg or BMI over $26 \,\mathrm{kg/m^2}$;
 - Use for emergency contraception between 72-96 hours after coitus.
- With intra-uterine use or oral use in children Consult product literature for licensing status of individual preparations.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION-UPDATED INFORMATION ON RISK FACTORS

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps):
- · pain or increased bleeding after insertion which continues for more than a few weeks:
- sudden changes in periods:
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Current breast cancer (use with caution for emergency contraception)

SPECIFIC CONTRA-INDICATIONS

 With intra-uterine use Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration) · acute malignancies affecting the blood (use with caution in remission) . not suitable for emergency contraception · pelvic inflammatory disease · post-abortion sepsis · postpartum sepsis · recent sexually

- transmitted infection (if not fully investigated and treated) · unexplained uterine bleeding · uterine or cervical malignancy
- With oral use Acute porphyrias p. 1150

GENERAL CAUTIONS Cardiac disease—seek specialist advice for intra-uterine insertion · diabetes · history of breast cancer—seek specialist advice before use · history of stroke (including transient ischaemic attack) · history of venous thromboembolism · ischaemic heart disease · migraine · multiple risk factors for cardiovascular disease · positive antiphospholipid antibodies · rheumatoid arthritis · systemic lupus erythematosus

SPECIFIC CAUTIONS

- ▶ With intra-uterine use Anatomical abnormalities—seek specialist advice before use · cervical intraepithelial neoplasia · epilepsy (risk of seizure at time of insertion) · immunosuppression (risk of infection)-seek specialist advice before use · postpartum—seek specialist advice before use · risk of sexually transmitted infections · young
- With oral use Malabsorption states
- With oral use for contraception Undiagnosed vaginal bleeding CAUTIONS, FURTHER INFORMATION
- With intra-uterine use The Faculty of Sexual and Reproductive Healthcare advises intercourse should be avoided or another method of contraception used for at least 7 days before removal of intra-uterine deviceemergency contraception may need to be considered if recent intercourse has occurred and the intra-uterine device is removed.
- Sexually transmitted infections and pelvic inflammatory disease
- With intra-uterine use The main excess risk of pelvic infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
 - they are under 25 years old or
 - they are over 25 years old and
 - have a new partner or
 - have had more than one partner in the past year or their regular partner has other partners.

The Faculty of Sexual and Reproductive Healthcare advises pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, Neisseria gonorrhoeae) be performed in these women. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE **DEVICE** Advanced uterine atrophy

- INTERACTIONS → Appendix 1: levonorgestrel
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

► Common or very common Gastrointestinal discomfort • headaches · menstrual cycle irregularities · nausea · skin reactions

SPECIFIC SIDE-EFFECTS

- ► Common or very common
- With intra-uterine use Back pain · breast abnormalities · depression · device expulsion · hirsutism · increased risk of infection · libido decreased · nervousness · ovarian cyst · pelvic disorders · uterine haemorrhage (on insertion) · vaginal haemorrhage (on insertion) · vulvovaginal disorders · weight increased
- With oral use Breast tenderness · diarrhoea · dizziness · fatigue · haemorrhage · vomiting
- ▶ Uncommon
- ▶ With intra-uterine use Alopecia endometritis oedema uterine rupture
- ► Rare or very rare
- ▶ With oral use Face oedema pelvic pain

► Frequency not known

 With oral use Cerebrovascular insufficiency · depressed mood · diabetes mellitus · embolism and thrombosis · neoplasms · sexual dysfunction · weight changes

SIDE-EFFECTS, FURTHER INFORMATION

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

With intra-uterine use There is no evidence of an association between the levonorgestrel intra-uterine system and breast cancer. The levonorgestrel intra-uterine system should be avoided in patients with a history of breast cancer; any consideration of it's use should be by a specialist in contraception and in consultation with the patients cancer specialist.

Patients should be informed about the device that has been inserted and when it should be removed or replaced (including refering them to a patient information leaflet and other sources of information).

Patients may experience irregular, prolonged or infrequent menstrual bleeding in the 3-6 months following insertion; bleeding pattern improves with time but persists in some patients.

Progestogenic side-effects resolve with time (after the first few months).

PREGNANCY

- With oral use Not known to be harmful.
- With intra-uterine use If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Avoid; if pregnancy occurs remove intra-uterine system.
- BREAST FEEDING Progestogen-only contraceptives do not affect lactation
- HEPATIC IMPAIRMENT
- With intra-uterine use or oral use for Contraception Manufacturer advises avoid in liver tumour.
- With oral use for Contraception or Emergency contraception Manufacturer advises avoid in severe impairment.
- With intra-uterine use Manufacturer advises avoid in acute hepatic disease or in severe impairment (no information available)—consult product literature.
- MONITORING REQUIREMENTS
- With intra-uterine use Gynaecological examination before insertion, 4–6 weeks after insertion, then annually.
- DIRECTIONS FOR ADMINISTRATION
- With intra-uterine use The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.
- PRESCRIBING AND DISPENSING INFORMATION
- With intra-uterine use Levonorgestrel-releasing intrauterine devices vary in licensed indication, duration of use and insertion technique—the MHRA recommends to prescribe and dispense by brand name to avoid inadvertent switching.
- PATIENT AND CARER ADVICE

Diarrhoea and vomiting with use as an oral contraceptive Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or

- very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

 Starting routine
- With oral use for Contraception One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if levonorgestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days. Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

- With oral use for Emergency contraception When prescribing or supplying hormonal emergency contraception, manufacturer advises women should be told:
 - if vomiting occurs within 3 hours, a replacement dose should be taken;
 - that their next period may be early or late;
 - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy.

The Faculty of Sexual and Reproductive Healthcare also advises women should be told:

- that a barrier method of contraception needs to be used—see Emergency contraception p. 858 for further information:
- that a pregnancy test should be performed if the next menstrual period is delayed by more than 7 days, is lighter than usual, or is associated with abdominal pain that is not typical of the woman's usual dysmenorrhoea;
- that a pregnancy test should be performed if hormonal contraception is started soon after use of emergency contraception even if they have bleeding; bleeding associated with the contraceptive method may not represent menstruation.
- With intra-uterine use Counsel women on the signs, symptoms and risks of perforation and ectopic pregnancy. Missed doses When used as an oral contraceptive, the following advice is recommended 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days'.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken

NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

(September 2018) AWMSG No. 3582 Recommended

Levonorgestrel (*Kyleena*®) for contraception for up to 5 years (February 2018) SMC No. 1299/18 Recommended

All Wales Medicines Strategy Group (AWMSG) decisions ► Levonorgestrel (Kyleena®) for contraception for up to 5 years

 EXCEPTIONS TO LEGAL CATEGORY Levonelle® One Step can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society. MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

3.5 Contraception, parenteral progestogen-only

Other drugs used for Contraception, parenteral progestogen-only Norethisterone, p. 823

PROGESTOGENS Etonogestrel

11-Mar-2021

INDICATIONS AND DOSE Contraception [no hormonal contraceptive use in previous month]

month]

- ► BY SUBDERMAL IMPLANTATION
- Females of childbearing potential: 1 implant, which can be left in place for up to 3 years, when inserted during the first 5 days of cycle, no additional contraceptive precautions are needed, when inserted at any other time, additional precautions (e.g. barrier methods) advised for next 7 days

Contraception [postpartum]

- ► BY SUBDERMAL IMPLANTATION
- Females of childbearing potential: 1 implant, which can be left in place for up to 3 years, when inserted within 20 days after delivery (or up to 6 months postpartum if fully breast-feeding and amenorrhoeic), no additional contraceptive precautions are needed, when inserted at any other time, additional precautions (e.g. barrier methods) advised for next 7 days

Contraception [following abortion or miscarriage]

- ► BY SUBDERMAL IMPLANTATION
- Females of childbearing potential: 1 implant, which can be left in place for up to 3 years, when inserted within 5 days after abortion or miscarriage, no additional contraceptive precautions are needed, when inserted at any other time, additional precautions (e.g. barrier methods) advised for next 7 days

Contraception [changing from other hormonal contraceptive]

- ► BY SUBDERMAL IMPLANTATION
- Females of childbearing potential: 1 implant, which can be left in place for up to 3 years, consult product literature for advice on when to insert and additional contraceptive precautions
- UNLICENSED USE The FSRH advises that the etonogestrel implant is used as detailed below, although these situations are considered unlicensed:
 - females outside the age range of 18-40 years;
 - postpartum insertions within 20 days after delivery (or up to 6 months postpartum if fully breast-feeding and amenorrhoeic);
 - insertion within 5 days after abortion or miscarriage in the second trimester.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED FEBRUARY 2020): NEXPLANON® (ETONOGESTREL) CONTRACEPTIVE IMPLANTS: NEW INSERTION SITE TO REDUCE RARE RISK OF NEUROVASCULAR INJURY AND IMPLANT MIGRATION

There have been reports of neurovascular injury and migration of Nexplanon® implants from the insertion site to the vasculature, including the pulmonary artery in rare cases. Correct subdermal insertion by an appropriately trained and accredited healthcare professional is recommended to reduce the risk of these events. Healthcare professionals are advised to review the updated guidance from the manufacturer and the statement from the Faculty of Sexual and Reproductive Healthcare (FSRH) on how to correctly insert the implant. Patients should be advised on how to locate the implant, informed to check this occasionally and report any concerns. An implant that cannot be palpated at its insertion site should be located and removed as soon as possible; if unable to locate implant within the arm, the MHRA recommends using chest imaging. Implants inserted at a previous site that can be palpated should not pose a risk and should only be replaced if there are issues with its location or if a routine replacement is due.

- CONTRA-INDICATIONS Acute porphyrias p. 1150 current breast cancer
- CAUTIONS Cardiac dysfunction · cervical cancer · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · history of breast cancer—seek specialist advice before use · history of stroke (including transient ischaemic attack) · history of venous thromboembolism · ischaemic heart disease · liver tumours—seek specialist advice before use · migraine · multiple risk factors for cardiovascular disease · positive antiphospholipid antibodies · rheumatoid arthritis · systemic lupus erythematosus · undiagnosed vaginal bleeding—seek specialist advice before use
- INTERACTIONS → Appendix 1: etonogestrel
- SIDE-EFFECTS
- ➤ Common or very common Abdominal pain · alopecia · anxiety · appetite increased · breast abnormalities · depressed mood · dizziness · emotional lability · fatigue · flatulence · headaches · hot flush · increased risk of infection · influenza like illness · libido decreased ·

menstrual cycle irregularities · nausea · ovarian cyst · pain · skin reactions · weight changes

- Uncommon Arthralgia · constipation · diarrhoea · drowsiness · dysuria · fever · galactorrhoea · genital abnormalities · hypertrichosis · insomnia · myalgia · oedema · vomiting · vulvovaginal discomfort
- ▶ Frequency not known Abscess · angioedema · embolism and thrombosis · haemorrhage · insulin resistance · neoplasms · paraesthesia · seborrhoea

SIDE-EFFECTS, FURTHER INFORMATION The benefits of using progestogen-only contraceptives (POCs), such as etonogestrel, should be weighed against the possible risks for each individual woman.

There is a small increase in the risk of having breast cancer diagnosed in women using a combined oral contraceptive pill (COC); this relative risk may be due to an earlier diagnosis, biological effects of the pill or a combination of both. This increased risk is related to the age of the woman using the COC rather than the duration of use and disappears gradually within 10 years after discontinuation.

The risk of breast cancer in users of POCs is possibly of similar magnitude as that associated with COCs, however the evidence is less conclusive.

- PREGNANCY Not known to be harmful, remove implant if pregnancy occurs.
- BREAST FEEDING Progestogen-only contraceptives do not affect lactation.
- DIRECTIONS FOR ADMINISTRATION The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.
- PATIENT AND CARER ADVICE Full counselling backed by patient information leaflet required before administration.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

£83.43 DT = £83.43

Medroxyprogesterone acetate

08-Nov-2021

• INDICATIONS AND DOSE

Dysfunctional uterine bleeding

- ► BY MOUTH
- ► Adult: 2.5–10 mg daily for 5–10 days, repeated for 2 cycles, begin treatment on day 16–21 of cycle

Secondary amenorrhoea

- ► BY MOUTH
- Adult: 2.5-10 mg daily for 5-10 days, repeated for 3 cycles, begin treatment on day 16-21 of cycle

Mild to moderate endometriosis

- ► BY MOUTH
- Adult: 10 mg 3 times a day for 90 consecutive days, begin treatment on day 1 of cycle

Progestogenic opposition of oestrogen HRT

- ▶ BY MOUTH
- Adult: 10 mg daily for the last 14 days of each 28-day oestrogen HRT cycle

Endometrial cancer | Renal cell cancer

- Endometria
 ► BY MOUTH
- Adult: 200-600 mg daily

Breast cancer

- ► BY MOUTH
- Adult: 0.4–1.5 g daily

Contraception

- **▶** BY DEEP INTRAMUSCULAR INJECTION
- Females of childbearing potential: 150 mg, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)
- ▶ BY SUBCUTANEOUS INJECTION
- Females of childbearing potential: 104 mg, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Long-term contraception

- ► BY DEEP INTRAMUSCULAR INJECTION
- Females of childbearing potential: 150 mg every 12 weeks, first dose to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)
- ► BY SUBCUTANEOUS INJECTION
- Females of childbearing potential: 104 mg every
 13 weeks, first dose to be administered within first
 5 days of cycle or within 5 days postpartum (delay until
 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Contraception (when patient changing from other hormonal contraceptive)

- **▶** BY SUBCUTANEOUS INJECTION
- Females of childbearing potential: (consult product literature)

Hot flushes caused by long-term androgen suppression in men with prostate cancer

- ▶ BY MOUTH
- Adult: 20 mg once daily initially for 10 weeks, evaluate effect at the end of the treatment period
- UNLICENSED USE EVGT Medroxyprogesterone acetate is used for the treatment of hot flushes caused by long-term androgen suppression in men, but it is not licensed for this indication.

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Acute porphyrias p. 1150 current breast cancer (unless progestogens are being used in the management of this condition)

SPECIFIC CONTRA-INDICATIONS

- With oral use History of thromboembolism · undiagnosed vaginal bleeding
- CAUTIONS

GENERAL CAUTIONS Cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · history of breast cancer—seek specialist advice before use · hypertension · liver tumours—seek specialist advice before use · migraine · positive antiphospholipid antibodies · rheumatoid arthritis · risk factors for thromboembolism · systemic lupus erythematosus

SPECIFIC CAUTIONS

- With intramuscular use or subcutaneous use Cervical cancerhistory of stroke (including transient ischaemic attack)—seek specialist advice before use · history of venous thromboembolism · ischaemic heart disease—seek specialist advice before use · multiple risk factors for cardiovascular disease—seek specialist advice before use · undiagnosed vaginal bleeding—seek specialist advice before use
- ▶ With oral use History of depression
- INTERACTIONS → Appendix 1: medroxyprogesterone

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Alopecia · breast abnormalities · depression · dizziness · fluid retention · insomnia · menstrual cycle irregularities · nausea · sexual dysfunction · skin reactions · weight changes
- ► Uncommon Drowsiness embolism and thrombosis fevergalactorrhoea • hirsutism • muscle spasms • tachycardia SPECIFIC SIDE-EFFECTS
- ► Common or very common
- With oral use Appetite increased · cervical abnormalities · constipation · fatigue · headache · hyperhidrosis · hypersensitivity · nervousness · oedema · tremor · vomiting
- With parenteral use Anxiety · asthenia · gastrointestinal discomfort · headaches · mood altered · pain · vulvovaginal infection
- ► Uncommon
- With oral use Congestive heart failure · corticoid-like effects · diabetes mellitus exacerbated · diarrhoea · dry mouth · euphoric mood · hypercalcaemia
- With parenteral use Appetite abnormal · arthralgia · hot flush · hypertension · ovarian cyst · painful sexual intercourse · uterine haemorrhage · varicose veins · vertigo · vulvovaginal disorders
- Rare or very rare
- With oral use Cerebral infarction jaundice malaise myocardial infarction
- ▶ With parenteral use Breast cancer · lipodystrophy
- ► Frequency not known
- With oral use Adrenergic-like effects · cataract diabetic · concentration impaired · confusion · glycosuria · palpitations · visual impairment (discontinue if papilloedema or retinal vascular lesions)
- With parenteral use Hepatic disorders · osteoporosis · osteoporotic fractures · seizure

SIDE-EFFECTS, FURTHER INFORMATION

With oral use In general, side effects may be more common with high doses such as those used in malignant disease.

With parenteral use Reduction in bone mineral density is greater with increasing duration of use. The loss is mostly recovered on discontinuation.

CONCEPTION AND CONTRACEPTION

- With intramuscular use If interval between dose is greater than 12 weeks and 5 days (in long-term contraception), rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection.
- With subcutaneous use If interval between dose is greater than 13 weeks and 7 days (in long-term contraception), rule out pregnancy before next injection.

PREGNANCY

- With oral use Avoid—genital malformations and cardiac defects reported.
- With intramuscular use or subcutaneous use Not known to be harmful.
- BREAST FEEDING Present in milk—no adverse effects reported. Progestogen-only contraceptives do not affect lactation.
- With intramuscular use or subcutaneous use. The
 manufacturers advise that in women who are breastfeeding, the first dose should be delayed until 6 weeks after
 birth; however, evidence suggests no harmful effect to
 infant if given earlier. The benefits of using
 medroxyprogesterone acetate in breast-feeding women
 outweigh any risks.
- HEPATIC IMPAIRMENT
- With oral use Manufacturer advises caution; avoid in acute or active disease.
- With intramuscular use or subcutaneous use Manufacturer advises caution; avoid in severe or active disease.

RENAL IMPAIRMENT

With oral use EvGr Use with caution.

PATIENT AND CARER ADVICE

- With intramuscular use or subcutaneous use Full counselling backed by patient information leaflet required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

3.6 Contraception, spermicidal

SPERMICIDALS

Nonoxinol

INDICATIONS AND DOSE

Spermicidal contraceptive in conjunction with barrier methods of contraception such as diaphragms or caps

- BY VAGIN
- Females of childbearing potential: (consult product literature)
- SIDE-EFFECTS Genital erosion · increased risk of HIV infection · pain · paraesthesia · skin reactions · vaginal redness

SIDE-EFFECTS, FURTHER INFORMATION High frequency use of the spermicide nonoxinol-9 has been associated with genital lesions, which may increase the risk of acquiring sexually transmitted infections.

- CONCEPTION AND CONTRACEPTION No evidence of harm to diaphragms.
- PREGNANCY Toxicity in animal studies.
- BREAST FEEDING Present in milk in animal studies.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

EXCIPIENTS: May contain Hydroxybenzoates (parabens), propylene glycol, sorbic acid

► Gygel (Marlborough Pharmaceuticals Ltd) Nonoxinol-9 20 mg per 1 ml Gygel 2% contraceptive jelly 81 gram [GSL] £11.00 DT = £11.00

Erectile and ejaculatory conditions

4.1 Erectile dysfunction

Erectile dysfunction

06-Mar-2017

Description of condition

Erectile dysfunction (impotence) is the persistent inability to attain and maintain an erection that is sufficient to permit satisfactory sexual performance. It can have physical or psychological causes. Erectile dysfunction can also be a sideeffect of drugs such as antihypertensives, antidepressants, antipsychotics, cytotoxic drugs and recreational drugs (including alcohol).

Risk factors for erectile dysfunction include sedentary lifestyle, obesity, smoking, hypercholesterolaemia and metabolic syndrome. Erectile dysfunction increases the risk of cardiovascular disease. All men with unexplained erectile dysfunction should be evaluated for the presence of cardiovascular risk factors and any identified risk should be addressed.

Drug treatment

[EvGr] The recommended approach for the management of erectile dysfunction is a combination of drug treatment and lifestyle changes (including regular exercise, reduction in body mass index, Smoking cessation p. 531, and reduced alcohol consumption).

An oral phosphodiesterase type-5 inhibitor is the first-line drug treatment for erectile dysfunction, regardless of the cause. A These drugs act by increasing the blood flow to the penis. They do not initiate an erection—sexual stimulation is required.

The choice of oral phosphodiesterase type-5 inhibitor depends on the frequency of intercourse and response to treatment. Ever Avanafil below, sildenafil p. 879 and vardenafil p. 882 are short-acting drugs and are suitable for occasional use as required. Tadalafil p. 880 is a longer-acting drug. It can be used as required, but can also be used as a regular lower daily dose to allow for spontaneous (rather than scheduled) sexual activity or in those who have frequent sexual activity. A patient with erectile dysfunction should receive six doses of an individual phosphodiesterase type-5 inhibitor at the maximum dose (with sexual stimulation) before being classified as a non-responder. Patients who fail to respond to the maximum dose of at least two different phosphodiesterase type-5 inhibitors should be referred to a specialist.

Intracavernosal, intraurethral or topical application of alprostadil (prostaglandin E₁) p. 882 is recommended as second-line therapy under careful medical supervision. Intracavernosal or intraurethral preparations can also be used to aid diagnosis. (A)

Priapism associated with alprostadil

Manufacturers advise that patients should seek medical help if a prolonged erection lasting four hours or more occurs; application of an ice pack to the upper-inner thigh (alternating between the left and right thighs every two

minutes for up to ten minutes) may result in reflex opening of the venous valves.

If priapism has lasted more than six hours, treatment should not be delayed; manufacturer advises management as

- Initial therapy by penile aspiration: using aseptic technique, 20-50mL of blood should be aspirated using a 19-21 gauge butterfly needle inserted into the corpus cavernosum; if necessary the procedure may be repeated on the opposite side:
- Lavage: if initial aspiration is unsuccessful, a second 19–21 gauge butterfly needle can be inserted into the opposite corpus cavernosum; sterile physiological saline can be injected through the first needle and drained through the second:
- If aspiration and lavage of are unsuccessful, intracavernosal injection of a sympathomimetic with action on alpha-adrenergic receptors can be given, with continuous monitoring of blood pressure and pulse— see phenylephrine hydrochloride p. 885 [unlicensed indication], adrenaline/epinephrine p. 884 [unlicensed indication], and metaraminol p. 885 [unlicensed indication]. Extreme caution is required in patients with coronary heart disease, hypertension, cerebral ischaemia and in patients taking a monoamine-oxidase inhibitor (facilities for managing hypertensive crisis should be available when administered to patients taking MAOIs);
- If necessary the sympathomimetic injections can be followed by further aspiration of blood through the same butterfly needle:
- · If administration of a sympathomimetic drug is unsuccessful, urgent referral for surgical management is

Prescribing on the NHS

Some drug treatments for erectile dysfunction may only be prescribed on the NHS under certain circumstances; for details see the criteria listed in part XVIIIB of the Drug Tariff (Part XIb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The Drug Tariffs can be accessed online at: National Health Service Drug Tariff for England and Wales: www.nhsbsa.nhs.uk/pharmacies-gp-practices-andappliance-contractors/drug-tariff.

Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusiness.hscni.net/services/2034.htm. Scottish Drug Tariff: www.isdscotland.org/Health-Topics/ Prescribing-and-Medicines/Scottish-Drug-Tariff/.

Related drugs

Other drugs used for Erectile dysfunction: aviptadil with phentolamine mesilate p. 886.

PHOSPHODIESTERASE TYPE-5 INHIBITORS

Avanafil

10-Aug-2021

INDICATIONS AND DOSE **Erectile dysfunction**

► BY MOUTH

Adult: Initially 100 mg, to be taken approximately 15-30 minutes before sexual activity, then adjusted according to response to 50-200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

Erectile dysfunction in patients on alpha-blocker therapy

► BY MOUTH

Adult: Initially 50 mg, to be taken approximately 15-30 minutes before sexual activity, then adjusted according to response to 50-200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises max. 100 mg once every 48 hours with concurrent use of moderate inhibitors of CYP3A4.
- CONTRA-INDICATIONS Avoid if systolic blood pressure below 90 mmHg (no information available) blood pressure >170/100 mmHg hereditary degenerative retinal disorders history of non-arteritic anterior ischaemic optic neuropathy life-threatening arrhythmia in previous 6 months mild to severe heart failure patients in whom vasodilation or sexual activity are inadvisable recent history of myocardial infarction recent history of stroke recent unstable angina
- CAUTIONS Active peptic ulceration · anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · bleeding disorders · cardiovascular disease · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)

CAUTIONS, FURTHER INFORMATION

- Elderly For phosphodiesterase type-5 inhibitors, prescription potentially inappropriate (STOPP criteria) in severe heart failure characterised by hypotension i.e. systolic blood pressure less than 90 mmHg, or concurrent nitrate therapy for angina (risk of cardiovascular collapse). See also Prescribing in the elderly p. 29.
- INTERACTIONS → Appendix 1: phosphodiesterase type-5 inhibitors
- SIDE-EFFECTS
- ► Common or very common Headaches nasal complaints vasodilation
- Uncommon Asthenia · dizziness · drowsiness · dyspnoea exertional · gastrointestinal discomfort · muscle complaints · nausea · pain · palpitations · respiratory disorders · vision blurred · vomiting
- Rare or very rare Akathisia · angina pectoris · chest pain · diarrhoea · dry mouth · emotional disorder · gastritis · genital pruritus · gout · haematuria · hypertension · increased risk of infection · influenza like illness · insomnia · penis disorder · peripheral oedema · rash · seasonal allergy · sexual dysfunction · tachycardia · urinary frequency increased · weight increased
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment.
 Dose adjustments Manufacturer advises use lowest
 - **Dose adjustments** Manufacturer advises use lowest effective initial dose in mild to moderate impairment and adjust according to tolerance.
- RENAL IMPAIRMENT EvGr Avoid if creatinine clearance less than 30 mL/minute. (M) See p. 21.
- PATIENT AND CARER ADVICE Onset of effect may be delayed if taken with food.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

 Avanafil (Spedra®) for the treatment of erectile dysfunction (ED) in adult men (September 2015) SMC No. 980/14 Not recommended

All Wales Medicines Strategy Group (AWMSG) decisions

Avanafil (Spedra®) for the treatment of erectile dysfunction in adult men (July 2015) AWMSG No. 1261 Recommended NHS restrictions Spedra® is not prescribable in NHS primary care for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIB of the Drug Tariff. The prescription must be endorsed 'SLS'. For more information see Prices in the BNF, under How to use the BNF. MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Table

➤ Spedra (A. Menarini Farmaceutica Internazionale SRL)

Avanafil 50 mg Spedra 50mg tablets | 4 tablet PoM £10.94 DT = £10.94 | 8 tablet PoM £19.70 DT = £19.70

Avanafil 100 mg Spedra 100mg tablets | 4 tablet PoM £14.08 DT = £14.08 | 8 tablet PoM £26.26 DT = £26.26

Avanafil 200 mg Spedra 200mg tablets | 4 tablet PoM £21.90 DT = £21.90 | 8 tablet PoM £39.40 DT = £39.40

Sildenafil

12-Aug-2021

INDICATIONS AND DOSE

Pulmonary arterial hypertension (initiated under specialist supervision)

- ► BY MOUTH
- Adult: 20 mg 3 times a day
- ► BY INTRAVENOUS INJECTION
- Adult: 10 mg 3 times a day, use intravenous route when the oral route is not appropriate

Erectile dysfunction

- ► BY MOUTH
- Adult: Initially 50 mg, to be taken approximately 1 hour before sexual activity, adjusted according to response to 25-100 mg (max. per dose 100 mg) as required, to be taken as a single dose; maximum 1 dose per day

Digital ulcers [associated with systemic sclerosis]

- ► BY MOUTH
- Adult: 25 mg 3 times a day, increased to 50 mg 3 times a day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- When used for Erectile dysfunction Manufacturer advises a starting dose of 25 mg with concurrent use of moderate and potent inhibitors of CYP3A4. Manufacturer advises if concurrent use of ritonavir is unavoidable, the max. dose should not exceed 25 mg within 48 hours.
- ▶ With oral use for Pulmonary arterial hypertension
 Manufacturer advises reduce dose to 20 mg twice daily
 with concurrent use of moderate inhibitors of CYP3A4.
 Manufacturer advises reduce dose to 20 mg once daily with
 concurrent use of some potent inhibitors of CYP3A4 (avoid
 with ketoconazole, itraconazole and ritonavir).
- ▶ With intravenous use for Pulmonary arterial hypertension Manufacturer advises reduce dose to 10 mg twice daily with concurrent use of moderate inhibitors of CYP3A4. Manufacturer advises reduce dose to 10 mg once daily with concurrent use of some potent inhibitors of CYP3A4 (avoid with ketoconazole, itraconazole and ritonavir).
- UNLICENSED USE EVG: Sildenafil is used for the treatment of digital ulcer, (a) but is not licensed for this indication.
- CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Hereditary degenerative retinal disorders - history of non-arteritic anterior ischaemic optic neuropathy - recent history of myocardial infarction - recent history of stroke

SPECIFIC CONTRA-INDICATIONS

- When used for erectile dysfunction Avoid if systolic blood pressure below 90 mmHg (no information available) patients in whom vasodilation or sexual activity are inadvisable - recent unstable angina
- When used for pulmonary arterial hypertension Sickle-cell anaemia

CAUTIONS

GENERAL CAUTIONS Active peptic ulceration - anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) - autonomic dysfunction - bleeding disorders - cardiovascular disease - left ventricular

outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)

SPECIFIC CAUTIONS

 When used for pulmonary arterial hypertension Hypotension (avoid if systolic blood pressure below 90 mmHg) intravascular volume depletion - pulmonary venoocclusive disease

CAUTIONS, FURTHER INFORMATION

- Elderly For phosphodiesterase type-5 inhibitors, prescription potentially inappropriate (STOPP criteria) in severe heart failure characterised by hypotension i.e. systolic blood pressure less than 90 mmHg, or concurrent nitrate therapy for angina (risk of cardiovascular collapse). See also Prescribing in the elderly p. 29.
- INTERACTIONS → Appendix 1: phosphodiesterase type-5 inhibitors
- SIDE-EFFECTS
- ► Common or very common Alopecia · anaemia · anxiety · cough · diarrhoea · dizziness · fluid retention · gastrointestinal discomfort · gastrointestinal disorders · headaches · increased risk of infection · insomnia · nasal complaints · nausea · night sweats · pain · skin reactions · tremor · vasodilation · vision disorders
- ► Uncommon Arrhythmias · chest pain · drowsiness · dry eye · dry mouth · eye discomfort · eye disorders · eye inflammation · fatigue · feeling hot · gynaecomastia · haemorrhage · hypertension · hypotension · myalgia · numbness · palpitations · sinus congestion · tinnitus · vertigo · vomiting
- ▶ Rare or very rare Acute coronary syndrome arteriosclerotic retinopathy · cerebrovascular insufficiency · glaucoma · haematospermia · hearing impairment · irritability · optic neuropathy (discontinue if sudden visual impairment occurs) · oral hypoaesthesia · priapism · retinal occlusion · scleral discolouration · seizure · severe cutaneous adverse reactions (SCARs) · sudden cardiac death · syncope · throat tightness
- PREGNANCY Use only if potential benefit outweighs risk no evidence of harm in animal studies.
- BREAST FEEDING Manufacturer advises avoid—no information available
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).

Dose adjustments

- With intravenous use for Pulmonary arterial hypertension Manufacturer advises if usual dose not tolerated, consider dose reduction to 10 mg twice daily in mild to moderate impairment.
- With oral use for Pulmonary arterial hypertension Manufacturer advises if usual dose not tolerated, consider dose reduction to 20 mg twice daily in mild to moderate impairment.
- When used for Erectile dysfunction Manufacturer advises consider initial dose reduction to 25 mg in mild to moderate impairment; adjust according to response.
- RENAL IMPAIRMENT

Dose adjustments

- ▶ When used for Erectile dysfunction Ever Consider initial dose of 25 mg if creatinine clearance less than 30 mL/minute. ♠ See p. 21.
- ► With oral use for Pulmonary arterial hypertension Ever If usual dose not tolerated, consider dose reduction to 20 mg twice daily. ♠
- With intravenous use for Pulmonary arterial hypertension Ever If usual dose not tolerated, consider dose reduction to 10 mg twice daily.
- TREATMENT CESSATION
- When used for Pulmonary arterial hypertension Consider gradual withdrawal.

PATIENT AND CARER ADVICE

- When used for Erectile dysfunction Onset of effect may be delayed if taken with food.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Sildenafil tablets (Revatio[®]) for the treatment of pulmonary arterial hypertension (February 2010) SMC No. 596/10
 Recommended with restrictions
- Sildenafil injection (Revatio®) for the treatment of pulmonary arterial hypertension (PAH) in patients who are unable to take sildenafil orally (March 2011) SMC No. 688/11 Recommended with restrictions

NHS restrictions

- → With oral use Viagra® is not prescribable in NHS primary care for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIB of the Drug Tariff (Part XIb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see Prices in the BNF, under How to use the BNF.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tadalafil

28-May-2021

INDICATIONS AND DOSE

Pulmonary arterial hypertension (initiated under specialist supervision)

- ► BY MOUTH
- Adult: 40 mg once daily

Erectile dysfunction

- ► BY MOUTH
- Adult: Initially 10 mg (max. per dose 20 mg), to be taken at least 30 minutes before sexual activity, subsequent doses adjusted according to response, the effect of intermittent dosing may persist for longer than 24 hours, continuous daily use not recommended; maximum 1 dose per day

Erectile dysfunction; for patients who anticipate sexual activity at least twice a week

- ► BY MOUTH
- Adult: 5 mg once daily, reduced to 2.5 mg once daily, adjusted according to response

Benign prostatic hyperplasia

- ► BY MOUTH
- Adult: 5 mg once daily

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Acute myocardial infarction in past 90 days - history of non-arteritic anterior ischaemic optic neuropathy - hypotension (avoid if systolic blood pressure below 90 mmHg)

SPECIFIC CONTRA-INDICATIONS

When used for benign prostatic hyperplasia or erectile dysfunction
Mild to severe heart failure · patients in whom vasodilation
or sexual activity are inadvisable · recent stroke ·
uncontrolled arrhythmias · uncontrolled hypertension ·
unstable angina

CAUTIONS

- When used for benign prostatic hyperplasia or erectile dysfunction Anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · cardiovascular disease · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)
- When used for pulmonary arterial hypertension Anatomical deformation of the penis · aortic and mitral valve disease · congestive cardiomyopathy · coronary artery disease · hereditary degenerative retinal disorders · left ventricular dysfunction · life-threatening arrhythmias · pericardial constriction · predisposition to priapism · pulmonary veno-occlusive disease · uncontrolled hypertension
 CAUTIONS · FURTHER INFORMATION
- Elderly For phosphodiesterase type-5 inhibitors, prescription potentially inappropriate (STOPP criteria) in severe heart failure characterised by hypotension i.e. systolic blood pressure less than 90 mmHg, or concurrent nitrate therapy for angina (risk of cardiovascular collapse).
 See also Prescribing in the elderly p. 29.
- INTERACTIONS → Appendix 1: phosphodiesterase type-5 inhibitors

SIDE-EFFECTS

- ► Common or very common Flushing gastrointestinal discomfort headaches myalgia nasal congestion pain
- Uncommon Arrhythmias · chest pain · dizziness · dyspnoea · eye pain · fatigue · gastrooesophageal reflux disease · haemorrhage · hypertension · hypotension · nausea · oedema · palpitations · skin reactions · tinnitus · vision disorders · vomiting
- ▶ Rare or very rare Acute coronary syndrome angioedema cerebrovascular insufficiency eye erythema eye swelling haematospermia hyperhidrosis memory loss optic neuropathy (discontinue if sudden visual impairment occurs) priapism retinal occlusion seizure Stevens-Johnson syndrome sudden cardiac death sudden hearing loss (discontinue drug and seek medical advice) syncope
- PREGNANCY Manufacturer advises avoid.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT

- When used for Pulmonary arterial hypertension Manufacturer advises caution in mild to moderate impairment (limited information available); avoid in severe impairment (no information available).
- When used for Benign prostatic hyperplasia or Erectile dysfunction Manufacturer advises caution for regular oncedaily dosing (no information available), and in severe impairment for intermittent use (limited information available).

Dose adjustments

- When used for Pulmonary arterial hypertension Manufacturer advises consider initial dose reduction to 20 mg once daily in mild to moderate impairment.
- When used for Erectile dysfunction Manufacturer advises dose of 10 mg for intermittent use (no information available for higher doses).

RENAL IMPAIRMENT

- When used for Pulmonary arterial hypertension EvGr Avoid in severe impairment.
- When used for Erectile dysfunction or Benign prostatic hyperplasia Ever Avoid regular once-daily dosing in severe impairment.

Dose adjustments

- ▶ When used for Pulmonary arterial hypertension [vor Initial dose of 20 mg once daily in mild-to-moderate impairment; dose may be increased to 40 mg once daily if tolerated. ♦ When used for Erectile dysfunction [vor Maximum dose of 10 mg for intermittent use in severe impairment. ♦
- NATIONAL FUNDING/ACCESS DECISIONS

Vardenafil

12-Aug-2021

INDICATIONS AND DOSE

Erectile dysfunction

- ► BY MOUTH USING TABLETS
- Adult: Initially 10 mg (max. per dose 20 mg), to be taken approximately 25-60 minutes before sexual activity, subsequent doses adjusted according to response, onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day
- ► BY MOUTH USING ORODISPERSIBLE TABLET
- Adult: 10 mg, to be taken approximately
 25–60 minutes before sexual activity; maximum 10 mg

Erectile dysfunction (patients on alpha-blocker therapy)

- ► BY MOUTH USING TABLETS
- Adult: Initially 5 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response, onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day

DOSE EQUIVALENCE AND CONVERSION

- ► Levitra [®] 10 mg orodispersible tablets and Levitra [®] 10 mg film coated tablets are **not** bioequivalent.
- CONTRA-INDICATIONS Avoid if systolic blood pressure below 90 mmHg · hereditary degenerative retinal disorders · myocardial infarction · patients in whom vasodilation or sexual activity are inadvisable · previous history of nonarteritic anterior ischaemic optic neuropathy · recent stroke · unstable angina
- CAUTIONS Active peptic ulceration · anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · bleeding disorders · cardiovascular disease · elderly · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia) · susceptibility to prolongation of QT interval

CAUTIONS, FURTHER INFORMATION

- Elderly For phosphodiesterase type-5 inhibitors, prescription potentially inappropriate (STOPP criteria) in severe heart failure characterised by hypotension i.e. systolic blood pressure less than 90 mmHg, or concurrent nitrate therapy for angina (risk of cardiovascular collapse).
 See also Prescribing in the elderly p. 29.

- SIDE-EFFECTS

impairment.

- ➤ Common or very common Dizziness · flushing · gastrointestinal discomfort · headache · nasal congestion
- Uncommon Allergic oedema · angioedema · arrhythmias · back pain · diarrhoea · drowsiness · dry mouth · dyspnoea · eye discomfort · eye disorders · gastrointestinal disorders · malaise · muscle complaints · muscle tone increased · nausea · palpitations · sensation abnormal · sinus congestion · skin reactions · sleep disorder · tinnitus · vertigo · vision disorders · vomiting
- Rare or very rare Angina pectoris anxiety chest pain conjunctivitis - haemorrhage - hypertension - hypotension memory loss - myocardial infarction - photosensitivity reaction - priapism - seizure - syncope
- ► Frequency not known Haematospermia · optic neuropathy (discontinue if sudden visual impairment occurs) · QT interval prolongation · sudden hearing loss
- HEPATIC IMPAIRMENT For film-coated tablets, manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
 For orodispersible tablets, manufacturer advises caution in mild impairment; avoid in moderate to severe

Dose adjustments For *film-coated tablets*, manufacturer advises initial dose reduction to 5 mg in mild to moderate impairment, increase according to response; max. 10 mg in moderate impairment.

For *orodispersible tablets*, manufacturer advises initial dose reduction to 5 mg using *film-coated tablets* in mild impairment, increase according to response.

RENAL IMPAIRMENT

Dose adjustments EvGr Consider initial dose of 5 mg if creatinine clearance less than 30 mL/minute; *orodispersible tablets* not suitable for initial doses. See p. 21.

PRESCRIBING AND DISPENSING INFORMATION
 Orodispersible tablets not suitable for initiation of therapy in patients taking alpha-blockers.

PROSTAGLANDINS AND ANALOGUES

Alprostadil

20-Jul-2020

• INDICATIONS AND DOSE

Erectile dysfunction (initiated under specialist supervision)

- ► BY URETHRAL APPLICATION
- Adult: Initially 250 micrograms, adjusted according to response; usual dose 0.125-1 mg; maximum 2 doses per day; maximum 7 doses per week

Aid to diagnosis of erectile dysfunction

- **▶** BY URETHRAL APPLICATION
- Adult: 500 micrograms for 1 dose

Erectile dysfunction

- ► TO THE SKIN
- Adult: Apply 300 micrograms, to the tip of the penis, 5-30 minutes before sexual activity; max 1 dose in 24 hours not more than 2-3 times per week

CAVERJECT ®

Erectile dysfunction

- ► BY INTRACAVERNOSAL INJECTION
- Adult: Initially 2.5 micrograms for 1 dose (first dose). followed by 5 micrograms for 1 dose (second dose), to be given if some response to first dose, alternatively 7.5 micrograms for 1 dose (second dose), to be given if no response to first dose, then increased in steps of 5-10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5-20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Erectile dysfunction associated with neurological dysfunction

- ► BY INTRACAVERNOSAL INJECTION
- Adult: Initially 1.25 micrograms for 1 dose (first dose), then 2.5 micrograms for 1 dose (second dose), then 5 micrograms for 1 dose (third dose), increased in steps of 5-10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5-20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Aid to diagnosis

- ► BY INTRACAVERNOSAL INJECTION
- ▶ Adult: 10-20 micrograms for 1 dose (consult product

Aid to diagnosis where evidence of neurological dysfunction

- ► BY INTRACAVERNOSAL INJECTION
- Adult: Initially 5 micrograms (max. per dose 10 micrograms) for 1 dose, (consult product literature)

CAVERJECT ® **DUAL CHAMBER**

Erectile dysfunction

- ▶ BY INTRACAVERNOSAL INJECTION
- Adult: Initially 2.5 micrograms for 1 dose (first dose), followed by 5 micrograms for 1 dose (second dose), to be given if some response to first dose, alternatively 7.5 micrograms for 1 dose (second dose), to be given if no response to first dose, then increased in steps of 5-10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5-20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Erectile dysfunction associated with neurological dysfunction

- ▶ BY INTRACAVERNOSAL INJECTION
- Adult: Initially 1.25 micrograms for 1 dose (first dose), then 2.5 micrograms for 1 dose (second dose), then 5 micrograms for 1 dose (third dose), increased in steps of 5-10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5-20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Aid to diagnosis

- ► BY INTRACAVERNOSAL INJECTION
- ▶ Adult: 10-20 micrograms for 1 dose (consult product literature)

Aid to diagnosis where evidence of neurological dysfunction

- ► BY INTRACAVERNOSAL INJECTION
- Adult: Initially 5 micrograms (max. per dose 10 micrograms) for 1 dose, (consult product literature)

VIRIDAL® DUO Neurogenic erectile dysfunction

- ► BY INTRACAVERNOSAL INJECTION
- Adult: Initially 1.25 micrograms, increased in steps of 2.5-5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10-20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

Erectile dysfunction

- ► BY INTRACAVERNOSAL INJECTION
- Adult: Initially 2.5 micrograms, increased in steps of 2.5-5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10-20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Not for use in patients with penile implants or when sexual activity medically inadvisable (e.g. orthostatic hypotension, myocardial infarction, and syncope) · not for use with other agents for erectile dysfunction · predisposition to prolonged erection (as in thrombocythaemia, polycythaemia, sickle cell anaemia, multiple myeloma or leukaemia) · urethral application contra-indicated in balanitis · urethral application contra-indicated in severe curvature • urethral application contra-indicated in severe hypospadia • urethral application contra-indicated in urethral stricture. urethral application contra-indicated in urethritis SPECIFIC CONTRA-INDICATIONS

- With topical use Balanitis · severe curvature · severe hypospadia · urethral stricture · urethritis
- CAUTIONS Anatomical deformations of penis (painful erection more likely)-follow up regularly to detect signs of penile fibrosis (consider discontinuation if angulation, cavernosal fibrosis or Peyronie's disease develop). priapism (patients should be instructed to report any erection lasting 4 hours or longer) · risk factors for cardiovascular disorders · risk factors for cerebrovascular disorders

- INTERACTIONS → Appendix 1: alprostadil
- SIDE-FFFFCTS

GENERAL SIDE-EFFECTS

► Common or very common Balanoposthitis • hypotension • penile disorders · sexual dysfunction

SPECIFIC SIDE-EFFECTS

- ► Common or very common
- ▶ With intracavernosal use Haemorrhage muscle spasms skin reactions
- ▶ With topical use Genital abnormalities rash urinary tract
- With urethral use Dizziness · haemorrhage · headache · muscle spasms · urethral burning
- ▶ With intracavernosal use Asthenia · dry mouth · extrasystole · hyperhidrosis · increased risk of infection · inflammation · mydriasis · nausea · oedema · pelvic pain · peripheral vascular disease · presyncope · scrotal disorders · sensation abnormal · spermatocele · testicular disorders · urinary disorders · vascular disorders · vasodilation
- With topical use Dizziness · hyperaesthesia · pain in extremity · scrotal pain · syncope · urinary tract disorders
- ▶ With urethral use Hyperhidrosis increased risk of infection leg pain · nausea · pelvic pain · perineal pain · peripheral vascular disease · scrotal disorders · sensation abnormal · skin reactions · spermatocele · syncope · testicular disorders · urinary disorders · vascular disorders · vasodilation
- ► Frequency not known
- ▶ With intracavernosal use Myocardial ischaemia stroke
- CONCEPTION AND CONTRACEPTION
- With urethral use If partner is pregnant, barrier contraception should be used. No evidence of harm to latex condoms and diaphragms.
- With topical use Condoms should be used to avoid exposure to women of child-bearing age, pregnant or lactating women. No evidence of harm to latex condoms.
- DIRECTIONS FOR ADMINISTRATION
- With intracavernosal use Manufacturer advises the first dose of the intracavernosal injection must be given by medically trained personnel; self-administration may only be undertaken after proper training.
- With urethral use Manufacturer advises during initiation of treatment the urethral application should be used under medical supervision; self-administration may only be undertaken after proper training.
- PATIENT AND CARER ADVICE Patients should be instructed to report any erection lasting 4 hours or longer.
- With topical use Counsel patients that condoms should be used to avoid local reactions and exposure of alprostadil to women of childbearing age, pregnant, or lactating women.
- NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Caverject®, Viridal® Duo, Vitaros® and MUSE® are not prescribable in NHS primary care for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIB of the Drug Tariff (Part XIb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see Prices in the BNF, under How to use BNF publications.

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

SYMPATHOMIMETICS > VASOCONSTRICTOR

Adrenaline/epinephrine

 DRUG ACTION Acts on both alpha and beta receptors and increases both heart rate and contractility (beta₁ effects); it can cause peripheral vasodilation (a beta2 effect) or vasoconstriction (an alpha effect).

• INDICATIONS AND DOSE

Priapism associated with alprostadil, if aspiration and lavage of corpora are unsuccessful (alternative to phenylephrine or metaraminol)

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: 10-20 micrograms every 5-10 minutes, using a 20 microgram/mL solution, Important: if suitable strength of adrenaline not available may be specially prepared by diluting 0.1 mL of the adrenaline 1 in 1000 (1 mg/mL) injection to 5 mL with sodium chloride 0.9%, continuously monitor blood pressure and pulse; maximum 100 micrograms per course
- HNI ICENSED HSE
- When used for priapism The use of adrenaline is an unlicensed indication.
- CAUTIONS Arteriosclerosis arrhythmias cerebrovascular disease · cor pulmonale · diabetes mellitus · elderly · hypercalcaemia · hyperreflexia · hypertension · hyperthyroidism · hypokalaemia · ischaemic heart disease · obstructive cardiomyopathy · occlusive vascular disease · organic brain damage · phaeochromocytoma · prostate disorders · psychoneurosis · severe angina · susceptibility to angle-closure glaucoma

CAUTIONS. FURTHER INFORMATION Cautions listed are only for non-life-threatening situations.

 INTERACTIONS → Appendix 1: sympathomimetics, vasoconstrictor

SIDE-EFFECTS

- ▶ Rare or very rare Cardiomyopathy
- Frequency not known Angina pectoris · angle closure glaucoma · anxiety · appetite decreased · arrhythmias · asthenia · CNS haemorrhage · confusion · dizziness · dry mouth · dyspnoea · headache · hepatic necrosis · hyperglycaemia · hyperhidrosis · hypersalivation · hypertension (increased risk of cerebral haemorrhage) · hypokalaemia · injection site necrosis · insomnia · intestinal necrosis · metabolic acidosis · mydriasis · myocardial infarction · nausea · pallor · palpitations · peripheral coldness · psychosis · pulmonary oedema (on excessive dosage or extreme sensitivity) · renal necrosis · soft tissue necrosis · tremor · urinary disorders · vomiting
- RENAL IMPAIRMENT Manufacturers advise use with caution in severe impairment.
- MONITORING REQUIREMENTS Monitor blood pressure and ECG.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection.

VASODILATORS > PERIPHERAL VASODILATORS

Aviptadil with phentolamine mesilate

6-0ct-2020

 DRUG ACTION Phentolamine is a short-acting alphaadrenoceptor antagonist that acts directly on vascular smooth muscle, resulting in vasodilatation; aviptadil is a vasoactive intestinal polypeptide that acts as a smooth muscle relaxant.

• INDICATIONS AND DOSE

Erectile dysfunction

- ► BY INTRACAVERNOSAL INJECTION
- Adult: 25/2000 micrograms, frequency of injection should not exceed once daily or three times weekly, duration of erection should not exceed 1 hour

DOSE EQUIVALENCE AND CONVERSION

- ► Dose expressed as *x/y* micrograms of aviptadil/phentolamine.
- CONTRA-INDICATIONS Anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) - not for use with other agents for erectile dysfunction - patients for whom sexual activity is inadvisable - penile implants - predisposition to priapism (e.g. in sickle cell anaemia or trait, multiple myeloma, or leukaemia)
- CAUTIONS Concomitant treatment with anticoagulants (potential increased risk of bleeding) · history of psychiatric disorder or addiction (potential for abuse) · severe cardiovascular disease · severe cerebrovascular disease
- SIDE-EFFECTS
- ► Common or very common Bruising flushing
- Uncommon Dizziness · haematoma · headache · palpitations · tachycardia
- ▶ Rare or very rare Angina pectoris myocardial infarction penile fibrosis (following multiple injections) penile nodules sexual dysfunction
- MONITORING REQUIREMENTS Manufacturer advises monitor regularly (e.g. every 3 months), particularly in the initial stages of self-injection therapy; careful examination of the penis is recommended to detect signs of penile fibrosis or Peyronie's disease—discontinue treatment in patients who develop penile angulation, cavernosal fibrosis, or Peyronie's disease.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises that the initial injections of *Invicorp* must be administered by medically trained personnel; selfadministration may only be undertaken after proper training.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8°C).
- PATIENT AND CARER ADVICE Manufacturer advises that patients should be instructed to report any erection lasting 4 hours or longer.
- NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

 Aviptadil/phentolamine mesilate (Invicorp®) for the symptomatic treatment of erectile dysfunction in adult males due to neurogenic, vasculogenic, psychogenic, or mixed aetiology (December 2017) SMC No. 1284/17 Recommended with restrictions

All Wales Medicines Strategy Group (AWMSG) decisions

- Aviptadil/phentolamine mesilate (Invicorp®) for the symptomatic treatment of erectile dysfunction in adult males due to neurogenic, vasculogenic, psychogenic, or mixed aetiology (July 2017) AWMSG No. 3435 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Invicorp (Evolan Pharma AB)
Aviptadil 71.43 microgram per 1 ml, Phentolamine mesilate
5.71 mg per 1 ml Invicorp 25micrograms/2mg/0.35ml solution for injection ampoules | 5 ampoule PoM £47.50 DT = £47.50

4.2 Premature ejaculation

Premature ejaculation

01-Aug-2017

Description of condition

Premature ejaculation is a common male sexual disorder characterised by brief ejaculatory latency, loss of control, and psychological distress.

Treatment

EvGr Non-drug treatment (including psychosexual counselling, education, and behavioural treatments) are recommended in patients for whom premature ejaculation causes few (if any) problems or in patients who prefer not to take drug treatment. These techniques can also be used in addition to a drug treatment.

For patients with life-long premature ejaculation, drug treatment is the recommended approach. Dapoxetine p. 887, a short-acting selective serotonin re-uptake inhibitor, is licensed to be used when required for this condition (not continuous daily use).

Evgr Other selective serotonin re-uptake inhibitors (citalopram p. 396, fluoxetine p. 397, fluvoxamine maleate p. 398, escitalopram p. 397, paroxetine p. 398, sertraline p. 399, [unlicensed indications]) and the tricyclic antidepressant clomipramine [unlicensed indication] have been widely used as regular, daily treatment. Caution is suggested in prescribing selective serotonin re-uptake inhibitors for young adolescents with premature ejaculation, and to men who also have a depressive disorder, particularly when associated with suicidal ideation. Ejaculation delay may start a few days after the start of treatment, but it is more evident after 1 to 2 weeks, since receptor desensitisation requires time to occur.

If premature ejaculation is secondary to Erectile dysfunction p. 878, the erectile dysfunction should be treated first.

Topical anaesthetic preparations for the management of premature ejaculation are available without prescription.

Other drugs used for Premature ejaculation Lidocaine with prilocaine, p. 1468

SELECTIVE SEROTONIN RE-UPTAKE INHIBITORS

Dapoxetine

19-Jul-2021

 DRUG ACTION Dapoxetine is a short-acting selective serotonin re-uptake inhibitor.

INDICATIONS AND DOSE

Premature ejaculation in men who meet all the following criteria: poor control over ejaculation, a history of premature ejaculation over the past 6 months, marked distress or interpersonal difficulty as a consequence of premature ejaculation, and an intravaginal ejaculatory latency time of less than two minutes

- ▶ BY MOUTH
- Adult: Initially 30 mg, to be taken approximately 1-3 hours before sexual activity, subsequent doses adjusted according to response; review treatment after 4 weeks (or 6 doses) and at least every 6 months thereafter, not recommended for adults 65 years and over: maximum 1 dose per day; maximum 60 mg per

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises max. dose 30 mg with concurrent use of moderate inhibitors of CYP3A4 except in patients verified to be extensive CYP2D6 metabolisers where manufacturer recommends max. dose 60 mg.
- Manufacturer advises avoid with concurrent use of potent inhibitors of CYP3A4 except in patients verified to be extensive CYP2D6 metabolisers where manufacturer recommends max. dose 30 mg.
- CONTRA-INDICATIONS History of bipolar disorder history of mania · history of severe depression · history of syncope · postural hypotension · significant cardiac disease · uncontrolled epilepsy
- CAUTIONS Bleeding disorders epilepsy (discontinue if convulsions develop) · susceptibility to angle-closure glaucoma
- INTERACTIONS → Appendix 1: SSRIs
- ► Common or very common Anxiety asthenia concentration impaired · constipation · diarrhoea · dizziness · drowsiness · dry mouth · gastrointestinal discomfort · gastrointestinal disorders · headache · hypotension · mood altered · nausea · paraesthesia · sexual dysfunction · sinus congestion · sleep disorders · sweat changes · syncope · tinnitus · tremor · vasodilation · vision blurred · vomiting · yawning
- ► Uncommon Akathisia arrhythmias behaviour abnormal confusion · depression · eye pain · feeling abnormal · feeling hot · hypertension · level of consciousness decreased · mydriasis · pruritus · taste altered · thinking abnormal · vertigo
 - SIDE-EFFECTS, FURTHER INFORMATION Discontinue if psychiatric disorder develops.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in moderate to severe impairment.
- RENAL IMPAIRMENT EVGT Use with caution if creatinine clearance 30-80 mL/minute; avoid if creatinine clearance less than 30 mL/minute (limited information available).
- PRE-TREATMENT SCREENING Test for postural hypotension before starting treatment.
- TREATMENT CESSATION The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

PATIENT AND CARER ADVICE

Postural hypotension and syncope Patients should be advised to maintain hydration and to sit or lie down until prodromal symptoms such as nausea, dizziness, and sweating abate.

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Gynaecological conditions 5.1 Polycystic ovary syndrome

Polycystic ovary syndrome

20-Sen-2021

Description of condition

Polycystic ovary syndrome (PCOS) is one of the most common endocrine disorders affecting females of childbearing potential. Clinical features may include ovulation disorders, polycystic ovarian morphology, and hyperandrogenism (with the clinical manifestations of acne, hirsutism and oligomenorrhoea). Complications of PCOS include cardiovascular disease, obstructive sleep apnoea, psychological disorders (such as anxiety and depression), infertility, endometrial cancer, pregnancy complications (such as gestational diabetes and pre-eclampsia), and metabolic disorders (such as insulin resistance and type 2 diabetes).

Aims of treatment

Treatment aims to manage the clinical features of PCOS and prevent the development of complications.

Non-drug treatment

EvGr Lifestyle modifications are recommended first line in the management of PCOS; healthy eating, regular physical exercise and maintaining a healthy weight should be encouraged. For females who are overweight or obese, weight loss advice should be offered or referral to a dietician considered, as weight loss may achieve menstrual regularity and reduce insulin resistance, hyperandrogenism, and the risk of type 2 diabetes and cardiovascular disease. For further information on weight management, see Obesity p. 97. Cardiovascular disease risk factors should be assessed (noting that conventional cardiovascular risk calculators have not been validated in females with PCOS) and managed appropriately; specialist referral is required if dyslipidaemia requires treatment. A For further information, see Cardiovascular disease risk assessment and prevention p. 206.

Drug treatment

[EvGr] Combined oral contraceptives [unlicensed] are commonly used in PCOS for the treatment of acne, hirsutism, and menstrual irregularity in females who are not planning a pregnancy. Alternative treatment options for menstrual irregularities include a cyclical progestogen [unlicensed] or a levonorgestrel intra-uterine system [unlicensed]. A For the management of acne in females with PCOS, see Acne p. 1361.

EvGr Treatment with insulin-sensitising drugs, such as metformin, should only be initiated by a specialist. Metformin hydrochloride p. 761 can be considered for

females with PCOS who have impaired glucose tolerance or are already undergoing lifestyle modifications with no improvement in impaired glucose tolerance [unlicensed indication]. Metformin hydrochloride may improve short-term insulin sensitivity and reduce androgen concentrations, but there is limited supporting evidence on the long-term benefits.

For the management of infertility, consider referral for fertility treatment.

In females with PCOS who are pregnant or are considering a pregnancy, consider referral for gestational diabetes screening, and whether any changes to drug treatment(s) are required.

6 Obstetrics

Obstetrics

07-Jan-2022

Prostaglandins and oxytocics

Prostaglandins and oxytocics are used to induce abortion, or induce or augment labour, and to minimise blood loss from the placental site. They include oxytocin below, carbetocin p. 891, ergometrine maleate p. 890, and the prostaglandins. All induce uterine contractions with varying degrees of force, frequency, and duration.

Induction of abortion

Evor Pre-treatment with mifepristone p. 892 can facilitate the process of medical abortion. (a) It sensitises the uterus to subsequent administration of a prostaglandin and, therefore, abortion occurs in a shorter time and with a lower dose of prostaglandin.

Evor The prostaglandin misoprostol p. 893 is given by mouth, buccally, sublingually, or vaginally, to induce medical abortion following sequential use with mifepristone; it is also used for cervical priming before surgical abortion.

Gemeprost p. 893, a prostaglandin administered vaginally as pessaries, is licensed for the medical induction of abortion in the second trimester of pregnancy; it is also licensed to soften and dilate the cervix before surgical abortion in early pregnancy.

Induction of labour

Ever If a pharmacological method of induction is considered suitable, offer dinoprostone p. 889 or misoprostol for women with a Bishop score of 6 or less.

For women with a Bishop score of more than 6, oxytocin may be offered in conjunction with amniotomy. (a) Uterine activity must be monitored carefully and hyperstimulation avoided. Large doses of oxytocin may result in excessive fluid retention.

Evgr Mifepristone [unlicensed] followed by either misoprostol [unlicensed] or dinoprostone [unlicensed] can be given for the induction of labour following intra-uterine fetal death in women with no uterine scarring.

Prevention and treatment of haemorrhage

Ever Active management of the third stage of labour reduces the risk of postpartum haemorrhage. Prophylactic oxytocin is given by intramuscular injection [unlicensed] on delivery of the anterior shoulder or, at the latest, immediately after the baby is delivered. Ergometrine with oxytocin p. 890 given intramuscularly may be an option in the absence of hypertension or other contra-indications. Oxytocin alone causes less nausea, vomiting, and hypertension than when given with ergometrine maleate.

Evgr Oxytocic drugs are used to treat postpartum haemorrhage caused by uterine atony; treatment options include oxytocin, ergometrine maleate, or a combination of

ergometrine with oxytocin p. 890. Carboprost p. 891, and misoprostol [unlicensed] are alternative options.

Ectopic pregnancy

EvGr Systemic methotrexate [unlicensed] is used for the management of ectopic pregnancy.

Myometrial relaxants

Tocolytic drugs postpone premature labour and they are used with the aim of reducing harm to the child. The greatest benefit is gained by using the delay to administer corticosteroid therapy or to implement other measures which improve perinatal health (including transfer to a unit with neonatal intensive care facility).

Evgr Women between 24 and 33 weeks of gestation who have intact membranes and are in suspected or diagnosed premature labour can be given nifedipine p. 178 [unlicensed indication] for tocolysis. An oxytocin receptor antagonist (such as atosiban p. 891) is an alternative if nifedipine is contra-indicated or unsuitable.

The beta₂ agonists salbutamol p. 273 and terbutaline sulfate p. 275 are no longer recommended for inhibiting uncomplicated premature labour. (a) Use of high-dose short acting beta₂ agonists in obstetric indications has been associated with serious, sometimes fatal cardiovascular events in the mother and fetus, particularly when used for a prolonged period of time.

6.1 Induction of labour

Other drugs used for Induction of labour Misoprostol, p. 893

OXYTOCIN AND ANALOGUES

Oxytocin

25-Mar-2021

INDICATIONS AND DOSE

Induction of labour for medical reasons | Stimulation of labour in hypotonic uterine inertia

► BY INTRAVENOUS INFUSION

Adult: Initially 0.001–0.004 unit/minute, not to be started for at least 6 hours after administration of vaginal prostaglandin, dose increased at intervals of at least 30 minutes until a maximum of 3–4 contractions occur every 10 minutes (0.01 units/minute is often adequate) up to max. 0.02 units/minute, if regular contractions not established after a total 5 units, stop

induction attempt (may be repeated next day starting again at 0.001–0.004 units/minute)

Caesarean section

- ► BY SLOW INTRAVENOUS INJECTION
- Adult: 5 units immediately after delivery

Prevention of postpartum haemorrhage after delivery of placenta

- ► BY SLOW INTRAVENOUS INJECTION
- Adult: 5 units, if infusion previously used for induction or enhancement of labour, increase rate during third stage and for next few hours
- ► BY INTRAMUSCULAR INJECTION
- Adult: 10 units, can be used instead of oxytocin with ergometrine (Syntometrine[®]).

Treatment of postpartum haemorrhage

- ► BY SLOW INTRAVENOUS INJECTION
- Adult: 5 units, repeated if necessary

Treatment of severe cases of postpartum haemorrhage (following intravenous injection)

- ► BY INTRAVENOUS INFUSION
- Adult: 40 units, given in 500 mL infusion fluid given at a rate sufficient to control uterine atony

Incomplete, inevitable, or missed miscarriage

- ► INITIALLY BY SLOW INTRAVENOUS INJECTION
- Adult: 5 units, followed by (by intravenous infusion) 0.02-0.04 unit/minute if required, the rate of infusion can be faster if necessary
- UNLICENSED USE Oxytocin doses in the BNF may differ from those in the product literature. Administration by intramuscular injection is an unlicensed use.

IMPORTANT SAFETY INFORMATION

Prolonged intravenous administration at high doses with large volume of fluid (which is possible in inevitable or missed miscarriage or postpartum haemorrhage) may cause water intoxication with hyponatraemia. To avoid: manufacturer advises use electrolyte-containing diluent (i.e. not glucose), increase oxytocin concentration to reduce fluid, restrict fluid intake by mouth; monitor fluid and electrolytes.

● CONTRA-INDICATIONS Any condition where spontaneous labour inadvisable · any condition where vaginal delivery inadvisable · avoid intravenous injection during labour avoid prolonged administration in oxytocin-resistant uterine inertia · avoid rapid intravenous injection (may transiently reduce blood pressure) · fetal distress (discontinue immediately if this occurs) · hypertonic uterine contractions (discontinue immediately if this occurs) · severe cardiovascular disease · severe preeclamptic toxaemia

CAUTIONS

GENERAL CAUTIONS Avoid large infusion volumes and restrict fluid intake by mouth (risk of hyponatraemia and water-intoxication) · cardiovascular disease

SPECIFIC CAUTIONS

- ▶ When used for induction of labour for medical reasons or for stimulation of labour in hypotonic uterine inertia History of lower-uterine segment caesarean section mild pregnancy-induced cardiac disease mild pregnancy-induced hypertension moderate pregnancy-induced cardiac disease moderate pregnancy-induced hypertension presence of borderline cephalopelvic disproportion (avoid if significant) risk factors for disseminated intravascular coagulation secondary uterine inertia women over 35 years
- INTERACTIONS → Appendix 1: oxytocin
- SIDE-FFFFCTS
- ➤ Common or very common Arrhythmias · headache · nausea · vomiting

- ▶ Rare or very rare Dyspnoea hypotension rash
- Frequency not known Angioedema · disseminated intravascular coagulation · electrolyte imbalance · flushing · haemorrhage · myocardial ischaemia · pulmonary oedema · QT interval prolongation · uterine rupture · water intoxication

SIDE-EFFECTS, FURTHER INFORMATION Avoid rapid intravenous injection (may transiently reduce blood pressure).

Uterine hyperstimulation -usually with excessive doses—may cause fetal distress, asphyxia, and death, or may lead to hypertonicity, tetanic contractions, soft-tissue damage or uterine rupture.

Overdose Placental abruption and amniotic fluid embolism reported on overdose.

- MONITORING REQUIREMENTS
- Careful monitoring of fetal heart rate and uterine motility essential for dose titration.
- Monitor for disseminated intravascular coagulation after parturition.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Syntocinon®), manufacturer advises give continuously in Glucose 5% or Sodium chloride 0.9%. Preferably given via a variable-speed infusion pump in a concentration appropriate to the pump; if given by drip infusion for induction or enhancement of labour, dilute 5 units in 500 mL. infusion fluid or for higher doses, 10 units in 500 mL. EvGr For treatment of postpartum uterine haemorrhage dilute 40 units in 500 mL infusion fluid. ♠ If high doses given for prolonged period (e.g. for inevitable or missed abortion or for postpartum haemorrhage), manufacturer advises use low volume of an electrolyte-containing infusion fluid (not Glucose 5%) given at higher concentration than for induction or enhancement of labour; close attention to patient's fluid and electrolyte status essential.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Solution for injection

Oxytocin (Non-proprietary)

Oxytocin 5 unit per 1 ml Oxytocin 5 units/1ml solution for injection ampoules | 5 ampoule PoM £4.00 (Hospital only) | 10 ampoule PoM £8.03

Oxytocin 10 unit per 1 ml Oxytocin 10units/1ml solution for infusion ampoules | 5 ampoule | FoM| £15.00 | 10 ampoule | FoM| £20.00 Oxytocin 10units/1ml concentrate for solution for infusion ampoules | 5 ampoule | FoM| £4.55 | 10 ampoule | FoM| £9.00-£9.90 Oxytocin 10units/1ml solution for injection ampoules | 5 ampoule | FoM| £4.55 | (Hospital only)

Syntocinon (Viatris UK Healthcare Ltd)

Oxytocin 5 unit per 1 ml Syntocinon 5units/1ml solution for injection ampoules | 5 ampoule [PoM] £4.01 (Hospital only) Oxytocin 10 unit per 1 ml Syntocinon 10units/1ml solution for injection ampoules | 5 ampoule [PoM] £4.53 (Hospital only)

PROSTAGLANDINS AND ANALOGUES

Dinoprostone

24-Jun-2021

INDICATIONS AND DOSE

PROPESS®

Cervical ripening and induction of labour at term

- ► BY VAGINA
- Adult: 1 pessary, insert pessary (in retrieval device) high into posterior fornix and remove when cervical ripening adequate; if oxytocin necessary, remove 30 minutes before oxytocin infusion; remove if cervical ripening inadequate after 24 hours (dose not to be repeated)

PROSTIN F2 ® VAGINAL GEL

Induction of labour

- ► BY VAGINA
- Adult: 1 mg, inserted high into the posterior fornix (avoid administration into the cervical canal), followed by 1-2 mg after 6 hours if required; maximum 3 mg per course

Induction of labour (unfavourable primigravida)

► BY VAGINA

 Adult: 2 mg, inserted high into the posterior fornix (avoid administration into the cervical canal), followed by 1-2 mg if required, after 6 hours; maximum 4 mg per course

PROSTIN E2 ® VAGINAL TABLETS

Induction of labour

- ► BY VAGINA
- Adult: 3 mg, inserted high into the posterior fornix, followed by 3 mg after 6–8 hours, to be given if labour not established; maximum 6 mg per course

DOSE EQUIVALENCE AND CONVERSION

- Prostin E2 Vaginal tablets and Vaginal Gel are not bioequivalent.
- CONTRA-INDICATIONS Active cardiac disease · active pulmonary disease · avoid extra-amniotic route in cervicitis or vaginitis · fetal distress · fetal malpresentation · grand multiparas · history of caesarean section · history of difficult or traumatic delivery · history of major uterine surgery · major cephalopelvic disproportion · multiple pregnancy · placenta praevia or unexplained vaginal bleeding during pregnancy · ruptured membranes · untreated pelvic infection
- CAUTIONS Effect of oxytocin enhanced history of asthma history of epilepsy history of glaucoma and raised intraocular pressure • hypertension • risk factors for disseminated intravascular coagulation • uterine rupture • uterine scarring
- SIDE-EFFECTS
- Uncommon Amniotic cavity infection · febrile disorders · headache · hyperbilirubinaemia neonatal · hypotension · pruritus · uterine atony · vaginal burning
- ► Frequency not known Abdominal pain · diarrhoea · disseminated intravascular coagulation · genital oedema · nausea · uterine rupture · vomiting
- HEPATIC IMPAIRMENT Manufacturer advises avoid.
- RENAL IMPAIRMENT EVGT Avoid.
- MONITORING REQUIREMENTS
- Monitor for disseminated intravascular coagulation after parturition.
- Monitor uterine activity and fetal status (particular care if history of uterine hypertony)
- Care needed in monitoring uterine activity when used in sequence following oxytocin.
- PRESCRIBING AND DISPENSING INFORMATION Important:
 Do not confuse dose of Prostin E2®vaginal gel with that of Prostin E2®vaginal tablets—not bioequivalent.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Pessary

6.2 Postpartum haemorrhage

Other drugs used for Postpartum haemorrhage Oxytocin, p. 888

ERGOT ALKALOIDS

Ergometrine maleate

01-Jun-2021

• INDICATIONS AND DOSE

Postpartum haemorrhage caused by uterine atony

- ► BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION
- Adult: 250-500 micrograms
- CONTRA-INDICATIONS Eclampsia · first stage of labour · induction of labour · second stage of labour · sepsis · severe cardiac disease · severe hypertension · vascular disease
- CAUTIONS Acute porphyrias p. 1150 · cardiac disease · hypertension · multiple pregnancy
- INTERACTIONS → Appendix 1: ergometrine
- SIDE-EFFECTS Abdominal pain arrhythmias chest pain coronary vasospasm dizziness dyspnoea headache hypertension myocardial infarction nausea palpitations pulmonary oedema rash tinnitus vasoconstriction vomiting
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- RENAL IMPAIRMENT Manufacturer advises caution in mild or moderate impairment. Manufacturer advises avoid in severe impairment.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Ergometrine maleate (Non-proprietary)

Ergometrine maleate 500 microgram per 1 ml Ergometrine 500micrograms/1ml solution for injection ampoules | 10 ampoule Pom £15.00-£22.00

Ergometrine with oxytocin

22-Apr-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergometrine maleate above, oxytocin p. 888.

• INDICATIONS AND DOSE

Active management of the third stage of labour | Postpartum haemorrhage caused by uterine atony

- ► BY INTRAMUSCULAR INJECTION
- ▶ Adult: 1 mL for one dose
- ► BY INTRAVENOUS INJECTION
- Adult: No longer recommended

Bleeding due to incomplete miscarriage or abortion

- ► BY INTRAMUSCULAR INJECTION
 - Adult: Adjusted according to response to, the patient's condition and blood loss
- INTERACTIONS → Appendix 1: ergometrine oxytocin

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Syntometrine (Alliance Pharmaceuticals Ltd) Ergometrine maleate 500 microgram per 1 ml, Oxytocin 5 unit per 1 ml Syntometrine 500micrograms/1ml solution for injection ampoules | 5 ampoule | PoM | £7.87

OXYTOCIN AND ANALOGUES

Carbetocin

24-May-2021

• INDICATIONS AND DOSE

Prevention of uterine atony after caesarean section

- ► BY SLOW INTRAVENOUS INJECTION
- Adult: 100 micrograms for 1 dose, to be given over 1 minute, administer as soon as possible after delivery, preferably before removal of placenta
- CONTRA-INDICATIONS Eclampsia epilepsy pre-eclampsia
- CAUTIONS Asthma · cardiovascular disease (avoid if severe) · hyponatraemia · migraine
- SIDE-FFFFCTS
- ► Common or very common Chest pain · chills · dizziness · dyspnoea · feeling hot · flushing · headache · hypotension · nausea · pain · pruritus · taste metallic · tremor · vomiting
- ► Frequency not known Hyperhidrosis · tachycardia
- HEPATIC IMPAIRMENT Manufacturer advises avoid in hepatic disease.
- RENAL IMPAIRMENT Manufacturer advises avoid.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Carbetocin (Pabal®) for the prevention of uterine atony following delivery of the infant by Caesarean section under epidural or spinal anaesthesia (January 2018) SMC No. 309/06 Not recommended

PROSTAGLANDINS AND ANALOGUES

Carboprost

08-Nov-2021

• INDICATIONS AND DOSE

Postpartum haemorrhage due to uterine atony in patients unresponsive to ergometrine and oxytocin

- ► BY DEEP INTRAMUSCULAR INJECTION
- Adult: 250 micrograms, repeated if necessary, to be given at intervals of not less than 15 minutes. Total dose should not exceed 2 mg (8 doses)
- CONTRA-INDICATIONS Cardiac disease pulmonary disease untreated pelvic infection
- CAUTIONS Excessive dosage may cause uterine rupture history of anaemia history of asthma history of cardiovascular disease history of diabetes history of epilepsy history of glaucoma history of hypertension history of hypotension history of jaundice history of pulmonary disease history of raised intra-ocular pressure uterine scars
- SIDE-EFFECTS
- ► Common or very common Chills · cough · diarrhoea · headache · nausea · uterine disorders · vasodilation · vomiting

- ▶ Uncommon Abdominal pain upper asthma back pain breast tenderness chest discomfort dizziness drowsiness dry mouth dyspnoea eye pain haemorrhage hiccups hyperhidrosis hypertension increased risk of infection movement disorders muscle complaints paraesthesia pelvic pain respiratory disorders septic shock sleep disorder syncope tachycardia taste altered tinnitus uterine injuries vertigo vision blurred
- ▶ Frequency not known Anxiety · asthenia · blepharospasm · choking sensation · palpitations · rash · thirst · throat complaints · thyrotoxic crisis
- HEPATIC IMPAIRMENT Manufacturer advises avoid in active hepatic disease.
- RENAL IMPAIRMENT Manufacturer advises avoid.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Hemabate (Pfizer Ltd)

Carboprost (as Carboprost trometamol) 250 microgram per 1 ml Hemabate 250micrograms/1ml solution for injection ampoules 10 ampoule PoM £182.01 (Hospital only)

6.3 Premature labour

Other drugs used for Premature labour Nifedipine, p. 178 · Salbutamol, p. 273 · Terbutaline sulfate, p. 275

OXYTOCIN RECEPTOR ANTAGONISTS

Atosiban

24-May-2021

• INDICATIONS AND DOSE

Uncomplicated premature labour between 24 and 33 weeks of gestation

- ► INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 6.75 mg over 1 minute, then (by intravenous infusion) 18 mg/hour for 3 hours, then (by intravenous infusion) reduced to 6 mg/hour for up to 45 hours. Maximum duration of treatment is 48 hours
- CONTRA-INDICATIONS Abnormal fetal heart rate · abruptio placenta · antepartum haemorrhage (requiring immediate delivery) · eclampsia · intra-uterine fetal death · intra-uterine infection · placenta praevia · premature rupture of membranes after 30 weeks' gestation · severe preeclampsia
- CAUTIONS Intra-uterine growth restriction
- SIDE-EFFECTS
- ► Common or very common Dizziness · headache · hot flush · hyperglycaemia · hypotension · nausea · tachycardia · vomiting
- ▶ Uncommon Fever insomnia skin reactions
- ▶ Rare or very rare Uterine atony uterine haemorrhage
- ► Frequency not known Dyspnoea pulmonary oedema
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.
- MONITORING REQUIREMENTS Monitor blood loss after delivery.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Tractocile® concentrate for intravenous infusion), manufacturer advises give continuously in Glucose 5% or Sodium chloride 0.9%. Withdraw 10 mL infusion fluid from 100-mL bag and replace with 10 mL atosiban concentrate (7.5 mg/mL) to produce a final concentration of 750 micrograms/mL.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Atosiban (Non-proprietary)

6.4 Termination of pregnancy

PROGESTERONE RECEPTOR MODULATORS

Mifepristone

07-Feb-2022

• DRUG ACTION Mifepristone, an antiprogestogenic steroid, sensitises the myometrium to prostaglandin-induced contractions and ripens the cervix.

INDICATIONS AND DOSE

Cervical ripening before mechanical cervical dilatation for termination of pregnancy of up to 84 days gestation (under close medical supervision)

- ► BY MOUTH
- Adult: 200 mg for 1 dose, to be taken 36-48 hours before procedure

Induction of labour in intra-uterine fetal death in women without uterine scarring (under close medical supervision)

- ► BY MOUTH
- Adult: 200 mg for 1 dose, dose followed by dinoprostone or misoprostol, given in accordance with national protocols

Medical termination of intra-uterine pregnancy of up to 49 days gestation (under close medical supervision)

- ► BY MOUTH
- Adult: 600 mg for 1 dose, dose followed 36-48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina or misoprostol 400 micrograms by mouth, alternatively 200 mg for 1 dose, dose followed 36-48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding

Medical termination of intra-uterine pregnancy of 50-63 days gestation (under close medical supervision)

- ► BY MOUTH
- Adult: 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36-48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding

Termination of pregnancy of 13-24 weeks gestation (in combination with a prostaglandin) (under close medical supervision)

- ► BY MOUTH
- Adult: 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36-48 hours later by gemeprost 1 mg by vagina every 3 hours up to max. 5 mg or misoprostol: if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended
- UNLICENSED USE EVGr Mifepristone is used in the doses provided in the BNF for the induction of labour in intrauterine fetal death in women without uterine scarring (A), but these may differ from those licensed.
- CONTRA-INDICATIONS Acute porphyrias p. 1150 · chronic adrenal failure · suspected ectopic pregnancy (use other specific means of termination) · uncontrolled severe asthma
- CAUTIONS Adrenal suppression (may require corticosteroid) · anticoagulant therapy · asthma (avoid if severe and uncontrolled) · existing cardiovascular disease · haemorrhagic disorders · history of endocarditis · prosthetic heart valve · risk factors for cardiovascular disease
- INTERACTIONS → Appendix 1: mifepristone
- SIDE-EFFECTS
- Common or very common Abdominal cramps · diarrhoea · infection · nausea · pelvic inflammatory disease · uterine disorders · vaginal haemorrhage (sometimes severe) ·
- ► Uncommon Hypotension
- Rare or very rare Angioedema · chills · dizziness · erythema nodosum · fever · headache · hot flush · malaise · skin reactions · toxic epidermal necrolysis · toxic shock syndrome · uterine rupture
- HEPATIC IMPAIRMENT Manufacturer advises avoid in hepatic failure (no information available).
- RENAL IMPAIRMENT EVGT Avoid in renal failure (no information available).
- MONITORING REQUIREMENTS Careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension).
- PRESCRIBING AND DISPENSING INFORMATION Supplied to NHS hospitals and premises approved under Abortion Act
- PATIENT AND CARER ADVICE Patient information leaflet to be provided.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

CAUTIONARY AND ADVISORY LABELS 10

- Mifepristone (Non-proprietary) Mifepristone 200 mg Mifepristone 200mg tablets | 1 tablet PoM £10.14 | 30 tablet Pom £190.60 (Hospital only)

 Medabon Combipack tablets | 1 pack Pom £17.00 (Hospital only)

PROSTAGLANDINS AND ANALOGUES

Gemeprost

28-May-2021

INDICATIONS AND DOSE

Cervical ripening prior to first trimester surgical abortion

- ► BY VAGINA
- Adult: 1 mg, dose to be inserted into posterior fornix 3 hours before surgery

Second trimester abortion

- ► BY VAGINA
- Adult: 1 mg every 3 hours for maximum 5 administrations, to be inserted into posterior fornix, second course may begin 24 hours after start of treatment (if treatment fails, pregnancy should be terminated by another method)

Second trimester intra-uterine death

- ► BY VAGINA
- Adult: 1 mg every 3 hours for maximum 5 administrations only, to be inserted into posterior fornix

Medical termination of intra-uterine pregnancy of up to 49 days gestation following mifepristone | Medical termination of intra-uterine pregnancy of 50-63 days gestation following mifepristone

- ► BY VAGINA
- Adult: 1 mg

Termination of pregnancy of 13-24 weeks gestation (in combination with a prostaglandin) following mifepristone

- ► BY VAGINA
- Adult: 1 mg every 3 hours, if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended, careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension); maximum 5 mg per course

- CONTRA-INDICATIONS Placenta praevia unexplained vaginal bleeding uterine scarring
- CAUTIONS Cardiovascular insufficiency cervicitis obstructive airways disease raised intra-ocular pressure vaginitis
- SIDE-EFFECTS Back pain · chest pain · chills · coronary vasospasm · diarrhoea · dizziness · dyspnoea · fever · flushing · headache · hypotension · muscle weakness · myocardial infarction · nausea · palpitations · uterine pain · uterine rupture · vaginal haemorrhage · vomiting
- RENAL IMPAIRMENT Manufacturer advises avoid.
- MONITORING REQUIREMENTS
- If used in combination with mifepristone, carefully monitor blood pressure and pulse for 3 hours.
 - When used for second trimester intra-uterine death, monitor for coagulopathy during treatment.
 - MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Pessary

► Cervagem (Sanofi)

Gemeprost 1 mg Cervagem 1mg pessaries | 5 pessary PoM 및

(Hospital only)

Misoprostol

08-Dec-2021

 DRUG ACTION Misoprostol is a synthetic prostaglandin analogue that acts as a potent uterine stimulant.

INDICATIONS AND DOSE

Termination of pregnancy following mifepristone (gestation up to 49 days)

- ▶ BY MOUT
- Adult: 400 micrograms for 1 dose, dose to be given 24–48 hours after mifepristone

Termination of pregnancy following mifepristone (gestation 50 to 63 days)

- ► INITIALLY BY VAGINA, OR BY BUCCAL ADMINISTRATION, OR BY SUBLINGUAL ADMINISTRATION
- Adult: 800 micrograms for 1 dose, dose to be given 24–48 hours after mifepristone, if abortion has not occurred 4 hours after first misoprostol dose a further dose may be given, (by mouth or by vagina) 400 micrograms for 1 dose

Termination of pregnancy following mifepristone (gestation of 9 to 1.3 weeks)

- ► INITIALLY BY VAGINA
- Adult: 800 micrograms for 1 dose, dose to be given 36-48 hours after mifepristone, followed by (by vagina or by mouth) 400 micrograms every 3 hours if required for a maximum of 4 doses

Termination of pregnancy following mifepristone (gestation of 13 to 24 weeks)

- ► INITIALLY BY VAGINA
- Adult: 800 micrograms for 1 dose, dose to be given 36-48 hours after mifepristone, followed by (by vagina or by mouth) 400 micrograms every 3 hours if required for a maximum of 4 doses, if abortion has not occurred 3 hours after the last dose of misoprostol, a further dose of mifepristone may be given, and misoprostol may be recommenced 12 hours later

NGUSTA (

Induction of labour (specialist supervision in hospital)

- ► BY MOUTH
- Adult: 25 micrograms every 2 hours, alternatively 50 micrograms every 4 hours, to be given in accordance with local protocols; maximum 200 micrograms per day
- UNLICENSED USE Misoprostol doses for termination of pregnancy may differ from those in product literature.

CONTRA-INDICATIONS

ANGUSTA Active labour · fetal malpresentation · placenta praevia · suspicion or evidence of fetal compromise · unexplained vaginal bleeding after 24 weeks gestation · uterine abnormality · uterine scar

CAUTIONS

 When used for termination of pregnancy Cardiovascular disease · risk factors for cardiovascular disease
 ANGUSTA® Before 37 weeks' gestation (limited information available) · chorioamnionitis · modified Bishop score greater than 6 (limited information available)

- INTERACTIONS → Appendix 1: misoprostol
- SIDE-EFFECTS
- ► Common or very common Chills · constipation · diarrhoea · dizziness · fever · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · vomiting
- ▶ Uncommon Haemorrhage menstrual cycle irregularities postmenopausal haemorrhage uterine cramps
- ► Frequency not known Uterine rupture
- BREAST FEEDING Manufacturer advises avoid—present in milk, and may cause diarrhoea in nursing infants. Ever Tertiary sources state present in milk but amount probably too small to be harmful; to further reduce risk following termination of pregnancy, consider interrupting breastfeeding for 5 hours after a dose.

ANGUSTA EVG: Avoid for 4 hours after administration of the last dose.

HEPATIC IMPAIRMENT

ANGUSTA ® EvGr Caution in impairment—risk of increased exposure.

Dose adjustments EvGr Consider dose reduction and/or prolonged dosing interval in impairment.

RENAL IMPAIRMENT

ANGUSTA © EVGr Caution in impairment—risk of increased exposure; avoid if eGFR less than 15 ml/min/1.73 m².

Dose adjustments Ever Consider dose reduction and/or prolonged dosing interval in impairment.

PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

7 Vaginal and vulval conditions

Vaginal and vulval conditions

06-Aug-2021

Vaginal and vulval changes

Topical oestrogen for vaginal atrophy

Topical oestrogens are available as estradiol pessaries and vaginal rings p. 897, and as estriol pessaries, cream and gel p. 898. [EVG] They are used to treat the symptoms of vaginal

atrophy related to oestrogen deficiency in postmenopausal women. (a) Systemic effects of oestrogen are minimised by using the lowest effective dose to control symptoms; [EVG] the dose may be increased on the advice of a healthcare professional with expertise in menopause if there is inadequate symptom control. Treatment is continued for as long as needed to relieve symptoms and reviewed initially at 3 months, then at least annually.

Vaginal oestrogens can also be considered in women with pelvic organ prolapse who have signs of vaginal atrophy. For further information, see Urinary incontinence and pelvic organ prolapse in women p. 837.

Non-hormonal preparations for vaginal atrophy

Several non-hormonal vaginal moisturisers are available and some are prescribable on the NHS (consult Drug Tariff). Ever Menopausal women with vaginal dryness can use vaginal moisturisers and lubricants alone or in addition to vaginal oestrogen.

Vaginal and vulval infections

Vulvovaginal candidiasis

Vulvovaginal candidiasis (genital thrush) is symptomatic inflammation of the vagina and/or vulva caused by a superficial fungal infection; most cases are caused by *Candida albicans*.

[EvG] Acute vulvovaginal candidiasis is treated with either an oral azole drug (such as fluconazole p. 649 or itraconazole p. 651), or with an intravaginal imidazole pessary or cream (e.g. clotrimazole p. 896, econazole nitrate p. 896, or miconazole p. 897) inserted high into the vagina. (A) [EvG] Treatment may be supplemented with a topical antifungal cream for vulvitis and to treat other superficial sites of infection. (A) Local irritation may occur on application of intravaginal imidazole drug preparations and may be mistaken for treatment failure.

Intravaginal imidazole drugs are effective against candida in short courses of 1 to 14 days according to the preparation used. $\boxed{\text{EvGr}}$ Treatment can be repeated if the initial course fails to control symptoms or if symptoms recur after 7 days.

Vulvovaginal candidiasis in pregnancy

Ever Symptomatic vulvovaginal candidiasis is common during pregnancy and can be treated with intravaginal application of an imidazole (such as clotrimazole). Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. There is limited systemic absorption of imidazoles from the vagina. [Ever Treatment with an oral azole drug should be avoided during pregnancy.

Recurrent vulvovaginal candidiasis

Recurrence of vulvovaginal candidiasis is particularly likely if there are predisposing factors, such as recent (up to 3 months before) antibacterial therapy, poorly controlled diabetes mellitus, pregnancy, immunosuppression, HRT use, or possibly oral contraceptive use.

Evgr Treatment of recurrent vulvovaginal candidiasis involves initial treatment with oral fluconazole (induction regimen) to ensure clinical remission, followed immediately by a maintenance regimen for 6 months. When oral fluconazole treatment is unsuitable, an intravaginal imidazole can be given.

Other infections

Systemic drugs are required in the treatment of infections such as gonorrhoea and syphilis. Oral or intravaginal antibacterial drugs may be required for the treatment of bacterial vaginosis. For further information, see Genital system infections, antibacterial therapy p. 549.

Evgr Trichomonal infections commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole p. 590.

The antiviral drugs aciclovir p. 687, famciclovir p. 689, and valaciclovir p. 690 can be used in the treatment of genital infection due to herpes simplex virus; they have a beneficial effect on virus shedding, and reducing the severity and duration of episodes. A For further information, see Herpesvirus infections p. 686.

For information on the human papillomavirus vaccine, see Human papillomavirus vaccine p. 1403.

Vaginal and vulval infections

7.1a Vaginal and vulval bacterial infections

ANTIBACTERIALS > LINCOSAMIDES

Clindamycin

25-Oct-2021

• INDICATIONS AND DOSE

DALACIN® 2% CREAM

Bacterial vaginosis

- ► BY VAGINA
- ▶ Adult: 1 applicatorful daily for 3-7 nights, dose to be administered at night

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 applicatorful delivers a 5 g dose of clindamycin 2%.
- INTERACTIONS → Appendix 1: clindamycin
- SIDE-EFFECTS
- ► Common or very common Skin reactions
- ► Frequency not known Constipation · diarrhoea (discontinue) · dizziness · gastrointestinal discomfort · headache · increased risk of infection · nausea · vertigo · vomiting · vulvovaginal irritation

SIDE-EFFECTS, FURTHER INFORMATION Clindamycin 2% cream is poorly absorbed into the blood-low risk of systemic effects.

CONCEPTION AND CONTRACEPTION

DALACIN® 2% CREAM Damages latex condoms and diaphragms.

- PRESCRIBING AND DISPENSING INFORMATION For choice of antibacterial therapy, see Genital system infections, antibacterial therapy p. 549.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

Dalacin (Pfizer Ltd)

Clindamycin (as Clindamycin phosphate) 20 mg per 1 gram Dalacin 2% cream | 40 gram [PoM] £10.86 DT = £10.86

ANTISEPTICS AND DISINFECTANTS

Dequalinium chloride

- DRUG ACTION Dequalinium chloride is a bactericidal antiinfective which causes bacterial cell death by increasing cell permeability and reducing enzyme activity.
 - INDICATIONS AND DOSE

Bacterial vaginosis

- ▶ BY VAGINA
- Adult 18-55 years: 10 mg once daily for 6 days, inserted at night
- CONTRA-INDICATIONS Vaginal ulceration

- SIDE-EFFECTS
- ► Common or very common Increased risk of infection vulvovaginal disorders
- ▶ Uncommon Haemorrhage headache nausea
- ► Frequency not known Cystitis · fever
- CONCEPTION AND CONTRACEPTION Does not affect efficacy of latex condoms; however, manufacturer advises avoid use of non-latex condoms and intravaginal devices—no information available.
- PREGNANCY Manufacturer advises avoid unless essential—limited information available.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

▶ Dequalinium chloride (Fluomizin®) for treatment of bacterial vaginosis (November 2016) SMC No. 1194/16 Recommended with restrictions

All Wales Medicines Strategy Group (AWMSG) decisions

- ► Dequalinium chloride (Fluomizin®) for treatment of bacterial vaginosis after initial treatment is ineffective or not tolerated as an alternative option to clindamycin vaginal cream (November 2016) AWMSG No. 2775 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

► Fluomizin (Kora Healthcare) Dequalinium chloride 10 mg Fluomizin 10mg vaginal tablets 6 tablet [Pom] £6.95 DT = £6.95

CARBOXYLIC ACIDS

Lactic acid

24-Nov-2020

INDICATIONS AND DOSE

BALANCE ACTIV RX ® GEL

Prevention of bacterial vaginosis

- ► BY VAGINA
- Adult: 5 mL 1-2 times a week, insert the content of 1 tube (5 mL)

RELACTAGEL® GEL

Prevention of bacterial vaginosis

- Adult: 5 mL daily for 2-3 nights after menstruation, insert the contents of one tube

Treatment of bacterial vaginosis

- ► BY VAGINA
- Adult: 5 mL daily for 7 nights, insert the contents of one tube
- ALLERGY AND CROSS-SENSITIVITY EVGr Contra-indicated in shellfish allergy. (M)
- CONCEPTION AND CONTRACEPTION

RELACTAGEL ® GEL Not recommended if trying to conceive.

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Products without form

EXCIPIENTS: May contain Propylene glycol

- Balance Activ (BBI Healthcare Ltd)
- Balance Activ BV vaginal pH correction gel | 7 device £5.25
- Relactagel (Kora Healthcare)
- Relactagel vaginal pH correction gel | 7 device £5.25

Other drugs used for Vaginal and vulval fungal infections Fluconazole, p. 649 · Itraconazole, p. 651

ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS

Clotrimazole

10-Nov-2021

INDICATIONS AND DOSE

Superficial sites of infection in vaginal and vulval candidiasis (dose for 1% or 2% cream)

- ► BY VAGINA USING CREAM
- ▶ Adult: Apply 2-3 times a day, to be applied to anogenital area

Vaginal candidiasis (dose for 10% intravaginal cream)

- ► BY VAGINA USING VAGINAL CREAM
- Adult: 5 g for 1 dose, one applicatorful to be inserted into the vagina at night, dose can be repeated once if necessary

Vaginal candidiasis

- ► BY VAGINA USING PESSARIES
- Adult: 200 mg for 3 nights, course can be repeated once if necessary, alternatively 100 mg for 6 nights, course can be repeated once if necessary, alternatively 500 mg for 1 night, dose can be repeated once if necessary

Recurrent vulvovaginal candidiasis

- ► BY VAGINA USING PESSARIES
- Adult: 500 mg every week for 6 months, dose to be administered following topical imidazole for 10-14 days
- INTERACTIONS → Appendix 1: antifungals, azoles
- SIDE-EFFECTS Abdominal pain · discomfort · genital peeling · oedema · paraesthesia · pelvic pain · skin reactions · vaginal haemorrhage
- CONCEPTION AND CONTRACEPTION Cream and pessaries may damage latex condoms and diaphragms.

Dose adjustments Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during

- EXCEPTIONS TO LEGAL CATEGORY Brands for sale to the public include Canesten® Internal Cream.
- . MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

Econazole nitrate

08-May-2020

INDICATIONS AND DOSE

GYNO-PEVARYL® ONCE

Vaginal and vulval candidiasis

- ► BY VAGINA
- Adult: 1 pessary for 1 dose, pessary to be inserted at night, dose to be repeated once if necessary

GYNO-PEVARYL® CREAM

Vaginal and vulval candidiasis

- ► INITIALLY BY VAGINA USING VAGINAL CREAM
- Adult: 1 applicatorful daily for at least 14 days, dose to be inserted vaginally at night and (to the skin) apply daily for at least 14 days, to be applied to vulva at night, course can be repeated once if necessary

GYNO-PEVARYL® PESSARY

Vaginal and vulval candidiasis

- ▶ BY VAGINA
- Adult: 1 pessary daily for 3 days, pessary to be inserted at night, course can be repeated once if necessary

SIDE-EFFECTS

- ► Common or very common Skin reactions
- ▶ Uncommon Vaginal burning
- ► Frequency not known Angioedema
- CONCEPTION AND CONTRACEPTION Cream and pessaries damage latex condoms and diaphragms.
- PREGNANCY Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Gyno-Pevaryl (Karo Pharma) Econazole nitrate 150 mg Gyno-Pevaryl 150mg vaginal pessaries 3 pessary [PoM] £4.17 DT = £4.17

Cream

EXCIPIENTS: May contain Butylated hydroxyanisole, fragrances

► Gyno-Pevaryl (Karo Pharma)

Ketoconazole

04-Feb-2020

INDICATIONS AND DOSE

Vaginal and vulva candidiasis

- ► BY VAGINA USING CREAM
- ▶ Adult: Apply 1–2 times a day, to be applied to the anogenital area
- CONTRA-INDICATIONS Acute porphyrias p. 1150
- INTERACTIONS → Appendix 1: antifungals, azoles
- SIDE-EFFECTS
- ► Common or very common Skin reactions
- ▶ Uncommon Alopecia · angioedema
- ▶ Rare or very rare Taste altered
- CONCEPTION AND CONTRACEPTION Effect on latex condoms and diaphragms not yet known.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

► Nizoral (Janssen-Cilag Ltd)

Ketoconazole 20 mg per 1 gram Nizoral 2% cream | 30 gram PoM

£4.24 DT = £4.24

Miconazole

09-Feb-2022

• INDICATIONS AND DOSE

Vaginal and vulval candidiasis

- ► BY VAGINA USING VAGINAL CREAM
- Adult: 1 applicatorful once daily for 7 days, to be inserted into the vagina before bedtime, course can be repeated once if necessary

Superficial sites of infection in vaginal and vulval candidiasis | Vulvitis

- ► BY VAGINA USING VAGINAL CREAM
- Adult: Apply twice daily, apply to the anogenital area
- CAUTIONS Avoid in Acute porphyrias p. 1150
- INTERACTIONS → Appendix 1: antifungals, azoles
- SIDE-FFFFCTS
- ► Common or very common Dysmenorrhoea · skin reactions · vulvovaginal disorders
- ► Frequency not known Abdominal pain · angioedema · dysuria · headache · nausea · pelvic cramps · urinary tract infection · vaginal haemorrhage
- CONCEPTION AND CONTRACEPTION Gyno-Daktarin[®] damages latex condoms and diaphragms.
- PREGNANCY Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection.
- BREAST FEEDING Manufacturer advises caution—no information available.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Butylated hydroxyanisole

Miconazole nitrate 20 mg per 1 gram Gyno-Daktarin 2% vaginal cream | 78 gram PoM £4.33 DT = £4.33

7.2 Vaginal atrophy

OESTROGENS

Estradiol

27-May-2021

INDICATIONS AND DOSE

Vaginal atrophy in postmenopausal women | Prophylaxis of recurrent urinary-tract infection in postmenopausal

- ► BY VAGINA USING PESSARIES
- Adult: 10 micrograms daily for 2 weeks, then reduced to 10 micrograms twice weekly

ESTRING ®

Postmenopausal urogenital conditions (not suitable for vasomotor symptoms or osteoporosis prophylaxis)

- ► BY VAGINA
- Adult: To be inserted into upper third of vagina and worn continuously; replace after 3 months; max. duration of continuous treatment 2 years

Prophylaxis of recurrent urinary-tract infection in postmenopausal women

- ► BY VAGINA
- Adult: To be inserted into upper third of vagina and worn continuously; replace after 3 months
- UNLICENSED USE [EVGT] Estradiol pessaries or vaginal tablets, and Estring[®] are used for the prophylaxis of

- recurrent urinary-tract infection in postmenopausal women, **(E)** but are not licensed for this indication.
- CONTRA-INDICATIONS Active arterial thromboembolic disease (e.g. angina or myocardial infarction) history of breast cancer history of venous thromboembolism oestrogen-dependent cancer recent arterial thromboembolic disease (e.g. angina or myocardial infarction) thrombophilic disorder undiagnosed vaginal bleeding untreated endometrial hyperplasia
- CAUTIONS Acute porphyrias p. 1150 · diabetes (increased risk of heart disease) · factors predisposing to thromboembolism · history of breast nodules-closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease closely monitor breast status (risk of breast cancer) . hypophyseal tumours · increased risk of gall-bladder disease · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · review treatment at least annually to assess need for continued treatment · risk factors for oestrogendependent tumours (e.g. breast cancer in first-degree relative) · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size

CAUTIONS, FURTHER INFORMATION

- Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogenonly HRT.
- Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

- Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke.
 Combined HRT or oestrogen-only HRT increases the risk of stroke.
- Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.
- INTERACTIONS → Appendix 1: hormone replacement therapy
- SIDE-EFFECTS
- ► Common or very common Abdominal pain headaches nausea skin reactions vaginal haemorrhage vulvovaginal disorders
- ► Uncommon Hypertension vulvovaginal fungal infection weight increased
- Rare or very rare Diarrhoea embolism and thrombosis endometrial hyperplasia - fluid retention - genital pruritus increased risk of ischaemic stroke - insomnia - neoplasm malignant - neoplasms - vaginismus

- CONCEPTION AND CONTRACEPTION For estradiol pessaries or vaginal tablets, no evidence of damage to latex condoms and diaphragms.
- PREGNANCY Not known to be harmful.
- BREAST FEEDING Avoid: adverse effects on lactation.
- HEPATIC IMPAIRMENT Manufacturer advises caution; avoid in acute or active disease.
- MONITORING REQUIREMENTS
- History of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer).
- The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

Blissel (Flynn Pharma Ltd)

Estriol 50 microgram per 1 gram Blissel 50micrograms/g vaginal gel with applicator | 30 gram PoM £18.90 DT = £18.90

Prasterone

20-May-2019

• DRUG ACTION Prasterone is biochemically and biologically identical to endogenous dehydroepiandrosterone (DHEA), and is converted to oestrogens and androgens.

INDICATIONS AND DOSE

Vulvar and vaginal atrophy [in postmenopausal women with moderate to severe symptoms]

- ► BY VAGINA USING PESSARIES
- Adult: 6.5 mg once daily, at bedtime. Treatment should be reassessed at least every 6 months
- CONTRA-INDICATIONS Active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · acute liver disease · Acute porphyrias p. 1150 · history of breast cancer · history of liver disease (where liver function tests have failed to return to normal). oestrogen-dependent cancer · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia · venous thromboembolism
- CAUTIONS Assess need for continued treatment at least every 6 months · cholelithiasis · diabetes mellitus · factors predisposing to thromboembolism · history of endometrial hyperplasia · hypertriglyceridaemia · liver disorders (discontinue if jaundice or deterioration in liver function occurs during treatment) · migraine (or migraine-like headaches) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size

CALITIONS, FURTHER INFORMATION

 Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogenonly HRT.

Bleeding or spotting occurring during treatment should be investigated.

For oestrogen products for vaginal application, where systemic exposure to oestrogen remains within the normal postmenopausal range, it is not recommended to add a progestogen.

- Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, major surgery or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

- Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.
- Other conditions The product literature advises caution in other conditions including hypertension, asthma, epilepsy, otosclerosis, and systemic lupus erythematosus. Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.
- SIDE-EFFECTS
- ► Common or very common Cervical abnormalities weight
- ▶ Uncommon Breast neoplasm benign uterine polyp
- CONCEPTION AND CONTRACEPTION Manufacturer advises avoid use with condoms, diaphragms or cervical caps made of latex-may damage rubber.
- PREGNANCY Manufacturer advises avoid—no information available.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 16 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

SELECTIVE OESTROGEN RECEPTOR MODULATORS

Ospemifene

31-Aug-2020

 DRUG ACTION Ospemifene is a selective oestrogen receptor modulator that has an oestrogen-like effect in the vagina, increasing the cellular maturation and mucification of the vaginal epithelium.

INDICATIONS AND DOSE

Moderate to severe symptomatic vulvar and vaginal atrophy [in post-menopausal women who are not candidates for local vaginal oestrogen therapy]

- ► BY MOUTH
- Adult: 60 mg once daily
- CONTRA-INDICATIONS Breast cancer (suspected or actively treated) · endometrial hyperplasia · history of venous thromboembolism · sex-hormone dependent malignancy (suspected or active) · unexplained vaginal bleeding
- CAUTIONS Risk factors for stroke ⋅ risk factors for venous thromboembolism (discontinue if prolonged immobilisation)
- INTERACTIONS → Appendix 1: ospemifene
- SIDE-EFFECTS
- ➤ Common or very common Genital discharge · hot flush · increased risk of infection · muscle spasms · skin reactions · vaginal discharge · vaginal haemorrhage
- Uncommon Endometrial thickening · hypersensitivity · tongue swelling
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment—no information available.
- PATIENT AND CARER ADVICE Manufacturer advises
 patients and their carers should be advised to seek
 immediate medical attention if they experience symptoms
 of thromboembolism (such as sudden chest pain, dyspnoea
 or swelling of a leg).
- NATIONAL FUNDING/ACCESS DECISIONS

Immune system

Immune system disorders and transplantation

Immune response

29-Jun-2020

Inflammatory bowel disease

Azathioprine p. 902, ciclosporin p. 904, mercaptopurine p. 986, and methotrexate p. 987 have a role in the treatment of inflammatory bowel disease.

Folic acid p. 1112 should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid is usually given weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

Immunosuppressant therapy

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are maintained on drug regimens, which may include antiproliferative drugs (azathioprine or mycophenolate mofetil p. 911), calcineurin inhibitors (ciclosporin or tacrolimus p. 907), corticosteroids, or sirolimus p. 906. Choice is dependent on the type of organ, time after transplantation, and clinical condition of the patient. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

Impaired immune responsiveness

Modification of tissue reactions caused by corticosteroids and other immunosuppressants may result in the rapid spread of infection. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced stage before being recognised-important: normal immunoglobulin administration should be considered as soon as possible after measles exposure, and varicella-zoster immunoglobulin p. 1390 or an antiviral [unlicensed] may be required for individuals exposed to varicella (chickenpox) or herpes zoster (shingles); for further information, see Immunoglobulins p. 1383. Wherever possible, immunisation or additional booster doses for individuals with immunosuppression should be carried out either before immunosuppression occurs or deferred until an

improvement in immunity has been seen. Specialist advice should be sought on the use of live vaccines for those being treated with immunosuppressive drugs.

Antiproliferative immunosuppressants

Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced when allopurinol p. 1213 is given

Mycophenolate mofetil is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine.

There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil reduces the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher.

Cyclophosphamide p. 968 is less commonly prescribed as an immunosuppressant.

Corticosteroids and other immunosuppressants

Prednisolone p. 747 is widely used in oncology. It has a marked antitumour effect in acute lymphoblastic leukaemia, Hodgkin's disease, and the non-Hodgkin lymphomas. It has a role in the palliation of symptomatic end-stage malignant disease when it may enhance appetite and produce a sense of

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection

Ciclosporin a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-myelotoxic but markedly nephrotoxic. It has an important role in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease.

Tacrolimus is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects, but the incidence of neurotoxicity appears to be greater; cardiomyopathy has also been reported. Disturbance of glucose metabolism also appears to be significant.

Sirolimus is a non-calcineurin inhibiting immunosuppressant licensed for renal transplantation. Basiliximab p. 910 is used for prophylaxis of acute rejection in allogeneic renal transplantation. It is given with ciclosporin and corticosteroid immunosuppression regimens; its use should be confined to specialist centres.

Belatacept p. 913 is a fusion protein and co-stimulation blocker that prevents T-cell activation; it is licensed for prophylaxis of graft rejection in adults undergoing renal transplantation who are seropositive for the Epstein-Barr virus. It is used with interleukin-2 receptor antagonist induction, in combination with corticosteroids and a mycophenolic acid.

Antithymocyte immunoglobulin (rabbit) below is licensed for the prophylaxis of organ rejection in renal and heart allograft recipients and for the treatment of corticosteroid-resistant allograft rejection in renal transplantation. Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

Other drugs used for Immune system disorders and transplantation Anakinra, p. 1193 · Chloroquine, p. 669 · Eculizumab, p. 1104 · Everolimus, p. 1058 · Hydroxychloroquine sulfate, p. 1190 · Rituximab, p. 955 · Tocilizumab, p. 1195

IMMUNE SERA AND IMMUNOGLOBULINS > IMMUNOGLOBULINS

Antithymocyte immunoglobulin (rabbit)

17-Jul-2020

• INDICATIONS AND DOSE

Prophylaxis of organ rejection in heart allograft recipients

- ► BY INTRAVENOUS INFUSION
- Adult: 1-2.5 mg/kg daily for 3-5 days, to be given over at least 6 hours

Prophylaxis of organ rejection in renal allograft recipients

- ► BY INTRAVENOUS INFUSION
- Adult: 1-1.5 mg/kg daily for 3-9 days, to be given over at least 6 hours

Treatment of corticosteroid-resistant allograft rejection in renal transplantation

- ► BY INTRAVENOUS INFUSION
- ➤ Adult: 1.5 mg/kg daily for 7-14 days, to be given over at least 6 hours

DOSES AT EXTREMES OF BODY-WEIGHT

- To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight.
- CONTRA-INDICATIONS Infection
- INTERACTIONS → Appendix 1: immunoglobulins
- SIDE-EFFECTS
- ➤ Common or very common Chills · diarrhoea · dysphagia · dyspnoea · fever · hypotension · infection · lymphopenia · myalgia · nausea · neoplasm malignant · neoplasms · neutropenia · reactivation of infection · secondary malignancy · sepsis · skin reactions · thrombocytopenia · vomiting
- ► Uncommon Cytokine release syndrome · hepatic disorders · hypersensitivity · infusion related reaction

 SIDE-EFFECTS, FURTHER INFORMATION Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk—no information available.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- MONITORING REQUIREMENTS Monitor blood count.

- DIRECTIONS FOR ADMINISTRATION For continuous intravenous infusion (Thymoglobuline®), manufacturer advises give in Glucose 5% or Sodium chloride 0.9%; reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with infusion fluid to a total volume of 50–500 mL (usually 50 mL/vial); begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron); not to be given with unfractionated heparin and hydrocortisone in glucose infusion—precipitation reported.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- ► Immunosuppressive therapy for kidney transplant in adults (October 2017) NICE TA481 Not recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Antithymocyte immunoglobulin (rabbit) (Non-proprietary)
Antithymocyte immunoglobulin (rabbit) 20 mg per 1 ml Grafalon
100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] ∑
(Hospital only)

Powder and solvent for solution for infusion

► Thymoglobulin (Sanofi)

Antithymocyte immunoglobulin (rabbit) 25 mg Thymoglobuline 25mg powder and solvent for solution for infusion vials | 1 vial PoM £158.77 (Hospital only)

IMMUNOSUPPRESSANTS > ANTIMETABOLITES

Azathioprine

18-Nov-2021

 DRUG ACTION Azathioprine is metabolised to mercaptopurine.

INDICATIONS AND DOSE

Severe acute Crohn's disease | Maintenance of remission of Crohn's disease | Maintenance of remission of acute ulcerative colitis

- ► BY MOUTH
- Adult: 2-2.5 mg/kg daily, some patients may respond to lower doses

Rheumatoid arthritis that has not responded to other disease-modifying drugs | Severe systemic lupus erythematosus and other connective tissue disorders | Polymyositis in cases of corticosteroid resistance

- ► BY MOUTH
- Adult: Initially up to 2.5 mg/kg daily in divided doses, adjusted according to response, rarely more than 3 mg/kg daily; maintenance 1–3 mg/kg daily, consider withdrawal if no improvement within 3 months

Autoimmune conditions

- ► BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: 1–3 mg/kg daily, adjusted according to response, consider withdrawal if no improvement within 3 months, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

Suppression of transplant rejection

- ► BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: 1–2.5 mg/kg daily, adjusted according to response, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

Severe refractory eczema, normal or high TPMT activity

- ► BY MOUTH
- ▶ Adult: 1-3 mg/kg daily

Severe refractory eczema, intermediate TPMT activity

► BY MOUTH

▶ Adult: 0.5-1.5 mg/kg daily

Generalised myasthenia gravis

- ► BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: Initially 0.5–1 mg/kg daily, then increased to 2–2.5 mg/kg daily, dose is increased over 3–4 weeks, azathioprine is usually started at the same time as the corticosteroid and allows a lower maintenance dose of the corticosteroid to be used, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.
- UNLICENSED USE Azathioprine doses given in BNF for suppression of transplant rejection and autoimmune conditions may differ from those in product literature. Use for severe refractory eczema is unlicensed.

CONTRA-INDICATIONS

- When used for severe refractory eczema Absent thiopurine methyltransferase (TPMT) activity · very low thiopurine methyltransferase (TPMT) activity
- CAUTIONS Reduce dose in elderly · reduced thiopurine methyltransferase activity
- INTERACTIONS → Appendix 1: azathioprine
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Bone marrow depression (doserelated) • increased risk of infection • leucopenia • pancreatitis • thrombocytopenia
- ▶ Uncommon Anaemia hepatic disorders hypersensitivity
- ► Rare or very rare Agranulocytosis · alopecia · bone marrow disorders · diarrhoea · gastrointestinal disorders · neoplasms · photosensitivity reaction · pneumonitis · severe cutaneous adverse reactions (SCARs)
- Frequency not known Nodular regenerative hyperplasia sinusoidal obstruction syndrome

SPECIFIC SIDE-EFFECTS

With oral use Nausea

SIDE-EFFECTS, FURTHER INFORMATION Side-effects may require drug withdrawal.

Hypersensitivity reactions Hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and renal dysfunction) call for immediate withdrawal.

Neutropenia and thrombocytopenia Neutropenia is dose-dependent. Management of neutropenia and thrombocytopenia requires careful monitoring and dose adjustment.

Nausea Nausea is common early in the course of treatment and usually resolves after a few weeks without an alteration in dose. Moderate nausea can be managed by using divided daily doses, taking doses after food, prescribing concurrent antiemetics or temporarily reducing the dose.

- ALLERGY AND CROSS-SENSITIVITY Ever Contra-indicated in hypersensitivity to mercaptopurine.
- PREGNANCY Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported

following maternal or paternal exposure. Azathioprine is teratogenic in *animal* studies. The use of azathioprine during pregnancy needs to be supervised in specialist units. Treatment should not generally be initiated during pregnancy.

- BREAST FEEDING Present in milk in low concentration. No evidence of harm in small studies—use if potential benefit outweighs risk.
- HEPATIC IMPAIRMENT Manufacturer advises caution (impaired metabolism)—monitor liver function and complete blood count more frequently in those with severe impairment

Dose adjustments Manufacturer advises use doses at lower end of the dose range in hepatic failure; reduce dose if hepatic or haematological toxicity occur.

RENAL IMPAIRMENT EvGr Caution (may result in slower elimination)—monitor complete blood count more frequently in those with severe impairment.
 Dose adjustments EvGr Consider reducing starting dose (limited information available).

PRE-TREATMENT SCREENING

Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Manufacturer advises consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Seek specialist advice for those with reduced or absent TPMT activity.

MONITORING REQUIREMENTS

- ▶ Monitor for toxicity throughout treatment.
- Monitor full blood count weekly (more frequently with higher doses or if severe renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.
- Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, manufacturer advises give over at least 1 minute (followed by 50 mL sodium chloride intravenous infusion). For *intravenous infusion* (*Imuran*®), manufacturer advises reconstitute 50 mg with 5–15 mL Water for Injections; dilute requisite dose to a volume of 20–200 mL with infusion fluid. Expert sources advise give in Glucose 5% *or* Sodium Chloride 0.9%. Intravenous injection is alkaline and very irritant. Manufacturer advises intravenous route should therefore be used **only** if oral route not feasible.

• PATIENT AND CARER ADVICE

Bone marrow suppression Patients and their carers should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Azathioprine (Non-proprietary)

Azathioprine 25 mg Azathioprine 25mg tablets | 28 tablet PoM £5.52 DT = £1.56 | 100 tablet [PoM] £5.54-£33.26 Azathioprine 50 mg Azathioprine 50mg tablets | 56 tablet [PoM] £5.50 DT = £1.80 | 100 tablet [PoM] £3.21-£16.55

IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRIES

Ciclosporin

17-Sep-2021

(Cyclosporin)

 DRUG ACTION Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

• INDICATIONS AND DOSE

Severe acute ulcerative colitis refractory to corticosteroid treatment

- ► BY CONTINUOUS INTRAVENOUS INFUSION
- Adult: 2 mg/kg, to be given over 24 hours, dose adjusted according to blood-ciclosporin concentration and response

Severe active rheumatoid arthritis (administered on expert advice)

- ► BY MOUTH
- Adult: Initially 1.5 mg/kg twice daily, increased if necessary up to 2.5 mg/kg twice daily after 6 weeks, dose increases should be made gradually, for maintenance treatment, titrate dose individually to the lowest effective dose according to tolerability, treatment may be required for up to 12 weeks

Severe active rheumatoid arthritis [in combination with low-dose methotrexate, when methotrexate monotherapy has been ineffective] (administered on expert advice)

- ► BY MOUTH
- Adult: Initially 1.25 mg/kg twice daily, increased if necessary up to 2.5 mg/kg twice daily after 6 weeks, dose increases should be made gradually, for maintenance treatment, titrate dose individually to the lowest effective dose according to tolerability, treatment may be required for up to 12 weeks

Short-term treatment of severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

- ► BY MOUTH
- Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily) usual maximum duration of 8 weeks but may be used for longer under specialist supervision, if good initial response not achieved within 2 weeks. increase dose rapidly up to maximum

Short-term treatment of very severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

- BY MOUTH
- Adult: 2.5 mg/kg twice daily usual maximum duration of 8 weeks but may be used for longer under specialist supervision

Severe psoriasis where conventional therapy ineffective or inappropriate (administered on expert advice)

- ► BY MOUTH
- Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily), increased gradually to maximum if no improvement within 1 month, initial dose of 2.5 mg/kg twice daily justified if condition requires rapid improvement; discontinue if inadequate response after 3 months at the optimum dose; max.

duration of treatment usually 1 year unless other treatments cannot be used

Organ transplantation (used alone)

- ► BY MOUTH
- Adult: 10-15 mg/kg, to be administered 4-12 hours before transplantation, followed by 10-15 mg/kg daily for 1-2 weeks postoperatively, then maintenance 2-6 mg/kg daily, reduce dose gradually to maintenance. Dose should be adjusted according to blood-ciclosporin concentration and renal function; dose is lower if given concomitantly with other immunosuppressant therapy (e.g. corticosteroids); if necessary one-third corresponding oral dose can be given by intravenous infusion over 2-6 hours

Bone-marrow transplantation | Prevention and treatment of graft-versus-host disease

- ► INITIALLY BY INTRAVENOUS INFUSION
- Adult: 3-5 mg/kg daily, to be administered over 2-6 hours from day before transplantation to 2 weeks postoperatively, alternatively (by mouth) initially 12.5-15 mg/kg daily, then (by mouth) 12.5 mg/kg daily for 3-6 months and then tailed off (may take up to a year after transplantation)

Nephrotic syndrome

- ► BY MOUTH
- Adult: 5 mg/kg daily in 2 divided doses, for maintenance reduce to lowest effective dose according to proteinuria and serum creatinine measurements; discontinue after 3 months if no improvement in glomerulonephritis or glomerulosclerosis (after 6 months in membranous glomerulonephritis)

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ With oral use Manufacturer advises increase dose by 50% or switch to intravenous administration with concurrent use of octreotide.
- UNLICENSED USE Not licensed for use in severe acute ulcerative colitis refractory to corticosteroid treatment.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CICLOSPORIN MUST BE PRESCRIBED AND DISPENSED BY BRAND NAME (DECEMBER 2009)

Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration.

- CONTRA-INDICATIONS Malignancy (in non-transplant indications) · uncontrolled hypertension (in nontransplant indications) · uncontrolled infections (in nontransplant indications)
- ◆ CAUTIONS Elderly—monitor renal function · hyperuricaemia · in atopic dermatitis, active herpes simplex infections—allow infection to clear before starting (if they occur during treatment withdraw if severe) · in atopic dermatitis, Staphylococcus aureus skin infections—not absolute contra-indication providing controlled (but avoid erythromycin unless no other alternative) · in psoriasis treat, patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option) · in uveitis, Behcet's syndrome (monitor neurological status) · lymphoproliferative disorders (discontinue treatment) · malignancy
 CAUTIONS. FURTHER INFORMATION
- Malignancy In psoriasis, exclude malignancies (including those of skin and cervix) before starting (biopsy any lesions not typical of psoriasis) and treat patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option); discontinue if lymphoproliferative disorder develops.
- INTERACTIONS → Appendix 1: ciclosporin

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Eye inflammation SPECIFIC SIDE-EFFECTS
- ► Common or very common Appetite decreased · diarrhoea · electrolyte imbalance · fatigue · fever · flushing · gastrointestinal discomfort · gingival hyperplasia · hair changes · headaches · hepatic disorders · hyperglycaemia · hyperlipidaemia · hypertension · hyperuricaemia · leucopenia · muscle complaints · nausea · paraesthesia · peptic ulcer · renal impairment (renal structural changes on long-term administration) · seizure · skin reactions · tremor · vomiting
- ▶ Uncommon Anaemia encephalopathy oedema thrombocytopenia · weight increased
- Rare or very rare Gynaecomastia · haemolytic anaemia · idiopathic intracranial hypertension · menstrual disorder · multifocal motor neuropathy · muscle weakness · myopathy · pancreatitis
- ▶ Frequency not known Pain in extremity thrombotic microangiopathy
- PREGNANCY Crosses placenta; manufacturer advises avoid unless potential benefit outweighs risk-toxicity in animal
- BREAST FEEDING Manufacturer advises avoid—present in milk
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (risk of increased exposure). Dose adjustments Manufacturer advises consider dose reduction in severe impairment to maintain bloodciclosporin concentration in target range-monitor until concentration stable.
- RENAL IMPAIRMENT In non-transplant indications. manufacturer advises establishing baseline renal function before initiation of treatment; if baseline function is impaired in non-transplant indications, except nephrotic syndrome-avoid.

Dose adjustments See p. 21. In nephrotic syndrome. manufacturer advises initial dose should not exceed 2.5 mg/kg daily in patients with baseline renal impairment. During treatment for non-transplant indications, manufacturer recommends if eGFR decreases by more than 25% below baseline on more than one measurement, reduce dose by 25-50%. If the eGFR decrease from baseline exceeds 35%, further dose reduction should be considered (even if within normal range); discontinue if reduction not successful within 1 month.

MONITORING REQUIREMENTS

- ► Monitor whole blood ciclosporin concentration (trough level dependent on indication—consult local treatment protocol for details).
- ▶ Dermatological and physical examination, including blood pressure and renal function measurements required at least twice before starting treatment for psoriasis or atopic dermatitis. Monitor liver function. Monitor serum potassium, especially in renal dysfunction (risk of hyperkalaemia). Monitor serum magnesium. Measure blood lipids before treatment and after the first month of treatment. In psoriasis and atopic dermatitis monitor serum creatinine every 2 weeks for first 3 months then every month. Investigate lymphadenopathy that persists despite improvement in atopic dermatitis. Monitor kidney function—dose dependent increase in serum creatinine and urea during first few weeks may necessitate dose reduction in transplant patients (exclude rejection if kidney transplant) or discontinuation in non-transplant patients. Monitor blood pressure—discontinue if hypertension develops that cannot be controlled by antihypertensives. In long-term management of nephrotic syndrome, perform renal biopsies at yearly intervals. In rheumatoid arthritis measure serum creatinine at least

twice before treatment. During treatment, monitor serum creatinine every 2 weeks for first 3 months, then every month for a further 3 months, then every 4-8 weeks depending on the stability of the disease, concomitant medication, and concomitant diseases (or more frequently if dose increased or concomitant NSAIDs introduced or increased). Monitor hepatic function if concomitant NSAIDs given.

DIRECTIONS FOR ADMINISTRATION

- With oral use Manufacturer advises mix solution with orange or apple juice, or other soft drink (to improve taste) immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. Total daily dose should be taken in 2 divided doses.
- With intravenous use For intravenous infusion (Sandimmun®), manufacturer advises give intermittently or continously in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 50 mg in 20-100 mL; give intermittent infusion over 2-6 hours; not to be used with PVC equipment. Observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter.

• PRESCRIBING AND DISPENSING INFORMATION

Brand name prescribing Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin concentration, serum creatinine, blood pressure, and transplant function (for transplant indications). Sandimmun® capsules and oral solution are available direct from Novartis for patients who cannot be transferred to a different oral preparation.

- PATIENT AND CARER ADVICE Patients and carers should be counselled on the administration of different formulations of ciclosporin, Manufacturer advises avoid excessive exposure to UV light, including sunlight. In psoriasis and atopic dermatitis, avoid use of UVB or PUVA.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Sirolimus

21-Jul-2020

 DRUG ACTION Sirolimus is a non-calcineurin inhibiting immunosuppressant.

• INDICATIONS AND DOSE

Prophylaxis of organ rejection in kidney allograft recipients

- ► BY MOUTH
- Adult: Initially 6 mg for 1 dose, to be given after surgery once wound has healed, then 2 mg once daily; to be given in combination with ciclosporin and corticosteroid for 2–3 months (sirolimus doses should be given 4 hours after ciclosporin), ciclosporin should then be withdrawn over 4–8 weeks (if not possible, sirolimus should be discontinued and an alternate immunosuppressive regimen used), dose to be adjusted according to whole blood-sirolimus trough concentration

DOSE EQUIVALENCE AND CONVERSION

- The 500 microgram tablet is not bioequivalent to the 1 mg and 2 mg tablets. Multiples of 500 microgram tablets should not be used as a substitute for other tablet strengths.
- CAUTIONS Hyperlipidaemia · increased susceptibility to infection (especially urinary-tract infection) · increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light)
- INTERACTIONS → Appendix 1: sirolimus

SIDE-FFFFCTS

- ➤ Common or very common Abdominal pain · anaemia · arthralgia · ascites · constipation · diabetes mellitus · diarrhoea · dyslipidaemia · electrolyte imbalance · embolism and thrombosis · fever · haemolytic uraemic syndrome · haemorrhage · headache · healing impaired · hyperglycaemia · hypertension · increased risk of infection · leucopenia · lymphatic vessel disorders · menstrual cycle irregularities · nausea · neoplasms · neutropenia · oedema · osteonecrosis · ovarian cyst · pain · pancreatitis · pericardial effusion · proteinuria · respiratory disorders · sepsis · skin reactions · stomatitis · tachycardia · thrombocytopenia
- Uncommon Antibiotic associated colitis · focal segmental glomerulosclerosis · hepatic failure · nephrotic syndrome · pancytopenia · post transplant lymphoproliferative disorder
- ► Frequency not known Posterior reversible encephalopathy syndrome (PRES)
- CONCEPTION AND CONTRACEPTION Effective contraception must be used during treatment and for 12 weeks after stopping.
- PREGNANCY Avoid unless essential—toxicity in animal studies.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution (risk of increased exposure).

Dose adjustments Manufacturer advises maintenance dose reduction of approx. 50% in severe impairment—monitor whole blood-sirolimus trough concentration every 5–7 days until 3 consecutive measurements have shown stable blood-sirolimus concentration.

MONITORING REQUIREMENTS

- Monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses).
- Manufacturer advises pre-dose ('trough') whole bloodsirolimus concentration (using chromatographic assay) when used with ciclosporin should be 4–12 micrograms/litre (local treatment protocols may differ); after withdrawal of ciclosporin pre-dose whole blood-sirolimus concentration should be 12–20 micrograms/litre (local treatment protocols may
- Close monitoring of whole blood-sirolimus concentration required if concomitant treatment with potent inducers or inhibitors of metabolism and after discontinuing them, or if ciclosporin dose reduced significantly or stopped.
- ➤ When changing between oral solution and tablets, measurement of whole blood 'trough' sirolimus concentration after 1–2 weeks is recommended.
- Therapeutic drug monitoring assays Sirolimus whole-blood concentration is measured using either high performance liquid chromatography (HPLC) or immunoassay. Switching between different immunoassays or between an immunoassay and HPLC can lead to clinically significant differences in results and therefore incorrect dose adjustments. Adjustment to the target therapeutic dose range should be made with knowledge of the assay used and corresponding reference range.
- Monitor kidney function when given with ciclosporin; monitor lipids; monitor urine proteins.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises food may affect absorption (take at the same time with respect to food). Sirolimus oral solution should be mixed with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids.
- PATIENT AND CARER ADVICE Patient or carers should be given advice on how to administer sirolimus.

Patients should be advised to avoid excessive exposure to UV light.

• NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

NICE decisions

- ► Immunosuppressive therapy for kidney transplant in adults (October 2017) NICE TA481 Not recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCIPIENTS: May contain Ethanol

Rapamune (Pfizer Ltd)

Sirolimus 1 mg per 1 ml Rapamune 1mg/ml oral solution sugar-free 60 ml PoM £162.41 DT = £162.41

Tablet

Rapamune (Pfizer Ltd)

Sirolimus 500 microgram Rapamune 0.5mg tablets

30 tablet Pom £69.00 DT = £69.00

Sirolimus 1 mg Rapamune 1 mg tablets | 30 tablet PoM £86.49 DT =

Sirolimus 2 mg Rapamune 2mg tablets 30 tablet Pom £172.98 DT

= £172 98

Tacrolimus

02-Dec-2020

DRUG ACTION Tacrolimus is a calcineurin inhibitor.

INDICATIONS AND DOSE

ADODODT ®

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

- Adult: Initially 100-200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

- ► BY MOUTH
- Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

- ► BY MOUTH
- Adult: Initially 75 micrograms/kg daily in 2 divided

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

- Adult: Initially 75 micrograms/kg daily in 2 divided

Allograft rejection resistant to conventional immunosuppressive therapy

- ▶ BY MOUTH
- Adult: Seek specialist advice

Prophylaxis of graft rejection following liver transplantation, starting 12-18 hours after transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 100–200 micrograms/kg once daily, to be taken in the morning

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

- ► BY MOUTH
- ▶ Adult: Initially 200-300 micrograms/kg once daily, to be taken in the morning

Allograft rejection resistant to conventional immunosuppressive therapy

- ► BY MOUTH
- Adult: Seek specialist advice

ENVARSUS MODIFIED-RELEASE TABLETS

Prophylaxis of graft rejection following liver transplantation, starting within 24 hours of transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 110–130 micrograms/kg once daily, to be taken in the morning

Prophylaxis of graft rejection following renal transplantation, starting within 24 hours of transplantation

- ► BY MOUTH
- Adult: Initially 170 micrograms/kg once daily, to be taken in the morning

Rejection therapy

- ► BY MOUTH
- Adult: Seek specialist advice

MODIGRAF

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

- Adult: Initially 100-200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

- ▶ BY MOUTH
- ▶ Adult: Initially 200-300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

- ► BY MOUTH
- Adult: Initially 75 micrograms/kg daily in 2 divided

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

- ► BY MOUTH
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Rejection therapy

- ► BY MOUTH Adult: Seek specialist advice

PROGRAF® CAPSULES

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

- ► BY MOUTH
- ▶ Adult: Initially 100-200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

- ► BY MOUTH
- Adult: Initially 200-300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

- ► BY MOUTH
- Adult: Initially 75 micrograms/kg daily in 2 divided doses continued →

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

- ▶ BY MOUTH
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy

- ► BY MOUTH
- Adult: Seek specialist advice

PROGRAF ® INFUSION

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation when oral route not appropriate

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 10-50 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation when oral route not appropriate

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 50–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

- **▶** BY INTRAVENOUS INFUSION
- ► Adult: Initially 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Allograft rejection resistant to conventional immunosuppressive therapy

- ► BY CONTINUOUS INTRAVENOUS INFUSION
- Adult: Seek specialist advice (consult local protocol)

DOSE EQUIVALENCE AND CONVERSION

 For Prograf[®]: intravenous and oral doses are not interchangeable due to differences in bioavailability.
 Follow correct dosing recommendations for the dosage form when switching formulations.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ORAL TACROLIMUS PRODUCTS: PRESCRIBE AND DISPENSE BY BRAND NAME ONLY, TO MINIMISE THE RISK OF INADVERTENT SWITCHING BETWEEN PRODUCTS, WHICH HAS BEEN ASSOCIATED WITH REPORTS OF TOXICITY AND GRAFT REJECTION (JUNE 2012)

Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.

- Adoport[®], Prograf[®], Capexion[®] and Tacni[®] are immediate-release capsules that are taken twice daily, once in the morning and once in the evening;
- Modigraf® granules are used to prepare an immediaterelease oral suspension which is taken twice daily, once in the morning and once in the evening;
- Advagraf[®] is a prolonged-release capsule that is taken once daily in the morning.

Switching between tacrolimus brands requires careful supervision and therapeutic monitoring by an appropriate specialist.

Important: Envarsus® is not interchangeable with other oral tacrolimus containing products; the MHRA has advised (June 2012) that oral tacrolimus products should be prescribed and dispensed by brand only.

- CAUTIONS Increased risk of infections · lymphoproliferative disorders · malignancies · neurotoxicity · QT-interval prolongation · UV light (avoid excessive exposure to sunlight and sunlamps)
- INTERACTIONS → Appendix 1: tacrolimus
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Alopecia · anaemia · anxiety · appetite decreased · arrhythmias · ascites · asthenic conditions · bile duct disorders · confusion · consciousness impaired · constipation · coronary artery disease · cough · depression · diabetes mellitus · diarrhoea · dizziness · dysgraphia · dyslipidaemia · dyspnoea · electrolyte imbalance · embolism and thrombosis · eye disorder · febrile disorders · fluid imbalance · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal inflammatory disorders · haemorrhage · hallucination · headache · hepatic disorders · hyperglycaemia · hyperhidrosis · hypertension · hyperuricaemia · hypotension · increased risk of infection · ischaemia · joint disorders · leucocytosis · leucopenia · metabolic acidosis · mood altered · muscle spasms · nasal complaints · nausea · nephropathy · nervous system disorder · oedema · oral disorders · pain · peripheral neuropathy · peripheral vascular disease · primary transplant dysfunction · psychiatric disorder • renal impairment • renal tubular necrosis · respiratory disorders · seizure · sensation abnormal · skin reactions · sleep disorders · temperature sensation altered · thrombocytopenia · tinnitus · tremor · urinary tract disorder • urine abnormal • vision disorders • vomiting · weight changes
- ▶ Uncommon Asthma · cardiac arrest · cardiomyopathy · cataract · central nervous system haemorrhage · chest discomfort · coagulation disorders · coma · dysmenorrhoea · encephalopathy · feeling abnormal · haemolytic anaemia · hearing impairment · heart failure · hypoglycaemia · hypoproteinaemia · influenza like illness · memory loss · multi organ failure · neutropenia · palpitations · pancreatitis · pancytopenia · paralysis · paresis · photosensitivity reaction · psychotic disorder · shock · speech disorder · stroke · ventricular hypertrophy
- ▶ Rare or very rare Fall hirsutism mobility decreased muscle tone increased muscle weakness pancreatic pseudocyst pericardial effusion QT interval prolongation severe cutaneous adverse reactions (SCARs) sinusoidal obstruction syndrome thirst · ulcer
- Frequency not known Agranulocytosis neoplasms neoplasm malignant - polyomavirus-associated nephropathy - progressive multifocal leukoencephalopathy (PML) - pure red cell aplasia

SPECIFIC SIDE-EFFECTS

With intravenous use Anaphylactoid reaction (due to excipient)

SIDE-EFFECTS, FURTHER INFORMATION Cardiomyopathy has been reported to occur primarily in children with tacrolimus blood trough concentrations much higher than the recommended maximum levels. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur.

• ALLERGY AND CROSS-SENSITIVITY EVGr Contra-indicated if history of hypersensitivity to macrolides.

- CONCEPTION AND CONTRACEPTION Exclude pregnancy before treatment.
- PREGNANCY Avoid unless potential benefit outweighs risk-crosses the placenta and risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia.
- BREAST FEEDING Avoid—present in breast milk (following) systemic administration).
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment.

Dose adjustments Manufacturer advises consider dose reduction in severe impairment.

- MONITORING REQUIREMENTS
- ► After initial dosing, and for maintenance treatment, tacrolimus doses should be adjusted according to wholeblood concentration. Monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details.
- ► Monitor blood pressure, ECG (for hypertrophic changes risk of cardiomyopathy), fasting blood-glucose concentration, haematological and neurological (including visual) and coagulation parameters, electrolytes, hepatic and renal function.
- DIRECTIONS FOR ADMINISTRATION
- ▶ With intravenous use For intravenous infusion (Prograf[®]); manufacturer advises give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute concentrate in infusion fluid to a final concentration of 4-100 micrograms/mL; give over 24 hours. Tacrolimus is incompatible with PVC.
- PATIENT AND CARER ADVICE Avoid excessive exposure to UV light including sunlight.

Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).

 NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

- ► Immunosuppressive therapy for kidney transplant in adults Ifor immediate-release tacrolimus (October 2017) NICE TA481 Recommended with restrictions

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES

Canakinumah

 DRUG ACTION Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding.

INDICATIONS AND DOSE

Gouty arthritis [in patients whose condition has not responded adequately to treatment with NSAIDs or colchicine, or in those with contra-indications or intolerances to them, and in whom repeated courses of corticosteroids are inappropriatel

- ► BY SUBCUTANEOUS INJECTION
- Adult: 150 mg for 1 dose, in patients who respond, dose may be repeated after at least 12 weeks if symptoms recur, to be administered to the upper thigh, abdomen, upper arm or buttocks

Cryopyrin-associated periodic syndromes (specialist use only)

- **▶** BY SUBCUTANEOUS INJECTION
- Adult (body-weight 41 kg and above): 150 mg every 8 weeks, to be administered to the upper thigh, abdomen, upper arm or buttocks, additional doses may be considered if clinical response not achieved within 7 days-consult product literature

Tumour necrosis factor receptor associated periodic syndrome (specialist use only) | Hyperimmunoglobulin D syndrome (specialist use only) | Familial Mediterranean fever (specialist use only)

- **▶** BY SUBCUTANEOUS INJECTION
- Adult (body-weight 41 kg and above): 150 mg every 4 weeks, to be administered to the upper thigh, abdomen, upper arm or buttocks, a second continued →

dose may be considered if clinical response not achieved within 7 days—consult product literature

Still's disease (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 4 mg/kg every 4 weeks (max. per dose 300 mg), to be administered to the upper thigh, abdomen, upper arm or buttocks
- CONTRA-INDICATIONS Active severe infection · leucopenia · neutropenia
- CAUTIONS History of recurrent infection latent and active tuberculosis predisposition to infection

CAUTIONS, FURTHER INFORMATION

- Vaccinations [EvG] Patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature for further information.
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-FFFFCTS
- ➤ Common or very common Abdominal pain upper · arthralgia · asthenia · dizziness · increased risk of infection · leucopenia · neutropenia · pain · proteinuria · vertigo
- ▶ Uncommon Gastrooesophageal reflux disease
- CONCEPTION AND CONTRACEPTION Effective contraception required during treatment and for up to 3 months after last dose.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk.
- BREAST FEEDING Consider if benefit outweighs risk—not known if present in human milk.
- PRE-TREATMENT SCREENING Patients should be evaluated for latent and active tuberculosis before starting treatment.
- MONITORING REQUIREMENTS
- Manufacturer advises monitor full blood count including neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter.
- Manufacturer advises monitor for signs and symptoms of infection (including tuberculosis) during and after treatment.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8 °C).
- PATIENT AND CARER ADVICE Manufacturer advises
 patients and carers should be instructed to seek medical
 advice if signs or symptoms suggestive of tuberculosis
 (including persistent cough, weight loss and subfebrile
 temperature) occur.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and drowsiness.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Ilaris (Novartis Pharmaceuticals UK Ltd)

Canakinumab 150 mg per 1 ml Ilaris 150 mg/1ml solution for injection vials | 1 vial PoM £9,927.80

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES > ANTI-LYMPHOCYTE

Basiliximab

22-Mar-202

 DRUG ACTION Basiliximab is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation.

INDICATIONS AND DOSE

Prophylaxis of acute rejection in allogeneic renal transplantation used in combination with ciclosporin and corticosteroid-containing immunosuppression regimens (specialist use only)

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: Initially 20 mg, administered within 2 hours before transplant surgery, followed by 20 mg after 4 days, dose to be administered after surgery, withhold second dose if severe hypersensitivity or graft loss occurs
- CAUTIONS Off-label use in cardiac transplantation increased risk of serious cardiac side-effects
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS Anaemia · capillary leak syndrome · constipation · cytokine release syndrome · diarrhoea · dyspnoea · electrolyte imbalance · headache · heart failure · hypercholesterolaemia · hypersensitivity · hypertension · hypotension · increased risk of infection · myocardial infarction · nausea · pain · peripheral oedema · post procedural wound complication · pulmonary oedema · respiratory disorders · skin reactions · sneezing · tachycardia · weight increased
- CONCEPTION AND CONTRACEPTION Adequate contraception must be used during treatment and for 16 weeks after last dose.
- PREGNANCY Manufacturer advises avoid—no information available.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Simulect[®]), manufacturer advises give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute 10 mg with 2.5 mL water for injections then dilute to at least 25 mL with infusion fluid; reconstitute 20 mg with 5 mL water for injections then dilute to at least 50 mL with infusion fluid; give over 20-30 minutes.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Immunosuppressive therapy for kidney transplant in adults (October 2017) NICE TA481 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

► Simulect (Novartis Pharmaceuticals UK Ltd)

Basiliximab 10 mg Simulect 10mg powder and solvent for solution for injection vials | 1 vial [PoM] £758.69 (Hospital only)

Basiliximab 20 mg Simulect 20mg powder and solvent for solution for injection vials | 1 vial [PoM] £842.38 (Hospital only)

Belimumab

18-Jan-2022

• INDICATIONS AND DOSE

Adjunctive therapy in patients with active, autoantibodypositive systemic lupus erythematosus with a high degree of disease activity despite standard therapy

- **▶** BY INTRAVENOUS INFUSION
- Adult: 10 mg/kg every 2 weeks for 3 doses, then 10 mg/kg every 4 weeks, review treatment if no response within 6 months

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BELIMUMAB (BENLYSTA®): INCREASED RISK OF SERIOUS PSYCHIATRIC EVENTS SEEN IN CLINICAL TRIALS (APRIL 2019)

Clinical trials show an increased risk of depression, suicidal ideation or behaviour, or self-injury in patients with systemic lupus erythematosus on belimumab. Healthcare professionals should assess patients for these risks before starting treatment, monitor for new or worsening signs of these risks during treatment, and advise patients to seek immediate medical attention if new or worsening symptoms occur.

- CAUTIONS Do not initiate until active infections controlled history or development of malignancy predisposition to infection
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common Depression diarrhoea fever hypersensitivity increased risk of infection infusion related reaction leucopenia migraine nausea pain in extremity
- Uncommon Angioedema · skin reactions · suicidal hebaviours
- ► Frequency not known Progressive multifocal leukoencephalopathy (PML) • psychiatric disorder • selfiniurious behaviour

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related side-effects are reported commonly, including severe or life-threatening hypersensitivity and infusion reactions. Premedication with an antihistamine, with or without an antipyretic may be considered.

- CONCEPTION AND CONTRACEPTION Manufacturer advises adequate contraception during treatment and for at least 4 months after last dose.
- PREGNANCY Avoid unless essential.
- BREAST FEEDING Avoid—present in milk in animal studies.
- RENAL IMPAIRMENT EVGT Caution in severe impairment (limited information available).
- MONITORING REQUIREMENTS Delay in the onset of acute hypersensitivity reactions has been observed; patients should remain under clinical supervision for several hours following at least the first 2 infusions.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Benlysta®), manufacturer advises give intermittently in Sodium chloride 0.9%; reconstitute with water for injections (120 mg in 1.5 mL, 400 mg in 4.8 mL) to produce a solution containing 80 mg/mL; gently swirl vial for 60 seconds, then allow to stand; swirl vial (without shaking) for 60 seconds every 5 minutes until dissolved; dilute requisite dose with infusion fluid to a final volume of 250 mL and give over 1 hour.
- PRESCRIBING AND DISPENSING INFORMATION Belimumab
 is a biological medicine. Biological medicines must be
 prescribed and dispensed by brand name, see Biological
 medicines and Biosimilar medicines, under Guidance on
 prescribing p. 1; manufacturer advises to record the brand
 name and batch number after each administration.

NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

NICE decisions

► Belimumab for treating active autoantibody-positive systemic lupus erythematosus (December 2021) NICE TA752 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ▶ Belimumab (Benlysta®) as add-on therapy in adult patients with active, autoantibody-positive systemic lupus erythematosus (SLE) with a high degree of disease activity (e.g. positive anti-dsDNA and low complement) despite standard therapy (May 2017) SMC No. 775/12 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

IMMUNOSUPPRESSANTS > PURINE SYNTHESIS INHIBITORS

Mycophenolate mofetil

05-0ct-2021

INDICATIONS AND DOSE

Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and ciclosporin) (under expert supervision)

- ► BY MOUTH
- Adult: 1 g twice daily, to be started within 72 hours of transplantation
- ► BY INTRAVENOUS INFUSION
- Adult: 1 g twice daily for maximum 14 days, then transfer to oral therapy, to be started within 24 hours of transplantation

Prophylaxis of acute rejection in cardiac transplantation (in combination with ciclosporin and corticosteroids) (under expert supervision)

- ► BY MOUTH
- Adult: 1.5 g twice daily, to be started within 5 days of transplantation

Prophylaxis of acute rejection in hepatic transplantation (in combination with ciclosporin and corticosteroids) (under expert supervision)

- ► INITIALLY BY INTRAVENOUS INFUSION
- Adult: 1 g twice daily for 4 days, up to a maximum of 14 days, to be started within 24 hours of transplantation, then (by mouth) 1.5 g twice daily, the dose route should be changed as soon as is tolerated

CEPTAVA ®

Renal transplantation (specialist use only)

- ► BY MOUTH
- Adult: 720 mg twice daily, to be started within 72 hours of transplantation

DOSE EQUIVALENCE AND CONVERSION

 For Ceptava®: mycophenolic acid 720 mg is approximately equivalent to mycophenolate mofetil 1 g but avoid unnecessary switching because of pharmacokinetic differences.

MVEODTIC

Renal transplantation (specialist use only)

- ► BY MOUTH
- Adult: 720 mg twice daily, to be started within 72 hours of transplantation continued →

DOSE EQUIVALENCE AND CONVERSION

 For Myfortic[®]: mycophenolic acid 720 mg is approximately equivalent to mycophenolate mofetil 1 g but avoid unnecessary switching because of pharmacokinetic differences.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: MYCOPHENOLATE MOFETIL, MYCOPHENOLIC ACID: UPDATED CONTRACEPTION ADVICE FOR MALE PATIENTS (FEBRUARY 2018)

Available clinical evidence does not indicate an increased risk of malformations or miscarriage in pregnancies where the father was taking mycophenolate medicines, however mycophenolate mofetil and mycophenolic acid are genotoxic and a risk cannot be fully excluded; for further information, see Conception and contraception and Patient and carer advice.

• CAUTIONS Active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation) - children (higher incidence of side-effects may call for temporary reduction of dose or interruption) - delayed graft function elderly (increased risk of infection, gastro-intestinal haemorrhage and pulmonary oedema) - increased susceptibility to skin cancer (avoid exposure to strong sunlight) - risk of hypogammaglobulinaemia or bronchiectasis when used in combination with other immunosuppressants

CAUTIONS, FURTHER INFORMATION

- Hypogammaglobulinaemia or bronchiectasis Measure serum immunoglobulin levels if recurrent infections develop, and consider bronchiectasis or pulmonary fibrosis if persistent respiratory symptoms such as cough and dyspnoea develop.
- INTERACTIONS → Appendix 1: mycophenolate
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ➤ Common or very common Acidosis · alopecia · anaemia appetite decreased · arthralgia · asthenia · bone marrow disorders · chills · constipation · cough · depression · diarrhoea · drowsiness · dyslipidaemia · dyspnoea · electrolyte imbalance · fever · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal haemorrhage · headache · hyperglycaemia · hypertension · hypotension · increased risk of infection · insomnia · leucocytosis · leucopenia · malaise · nausea · neoplasms · oedema · oral disorders · pain · pancreatitis · paraesthesia · renal impairment · respiratory disorders · seizure · sepsis · skin reactions · tachycardia · thinking abnormal · thrombocytopenia · tremor · vomiting · weight decreased
- Uncommon Agranulocytosis
- Frequency not known Endocarditis hypogammaglobulinaemia - malignancy - meningitis neutropenia - polyomavirus-associated nephropathy progressive multifocal leukoencephalopathy (PML) - pure red cell aplasia

SPECIFIC SIDE-EFFECTS

- ► Common or very common
- ▶ With intravenous use Hepatitis muscle tone increased
- With oral use Anxiety burping confusion dizziness gout hepatic disorders hyperbilirubinaemia hyperuricaemia neuromuscular dysfunction taste altered vasodilation SIDE-EFFECTS, FURTHER INFORMATION Cases of pure red cell aplasia have been reported with mycophenolate mofetil; dose reduction or discontinuation should be considered under specialist supervision.
- CONCEPTION AND CONTRACEPTION
 Pregnancy prevention The MHRA advises to exclude
 pregnancy in females of child-bearing potential before
 treatment—2 pregnancy tests 8–10 days apart are

- recommended. Women should use at least 1 method of effective contraception before and during treatment, and for 6 weeks after discontinuation—2 methods of effective contraception are preferred. Male patients or their female partner should use effective contraception during treatment and for 90 days after discontinuation.
- PREGNANCY Avoid unless no suitable alternative congenital malformations and spontaneous abortions reported.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies
- RENAL IMPAIRMENT No data available in cardiac or hepatic transplant patients with renal impairment.
- MONITORING REQUIREMENTS Monitor full blood count every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops).

• DIRECTIONS FOR ADMINISTRATION

 With intravenous use For intravenous infusion (CellCept®), manufacturer advises give intermittently in Glucose 5%; reconstitute each 500-mg vial with 14 mL glucose 5% and dilute the contents of 2 vials in 140 mL infusion fluid; give over 2 hours.

PATIENT AND CARER ADVICE

Pregnancy prevention advice The MHRA advises that prescribers should ensure that female patients understand the need to comply with the pregnancy prevention advice, and they should be informed to seek immediate medical attention if there is a possibility of pregnancy; male patients planning to conceive children should be informed of the implications of both immunosuppression and the effect of the prescribed medications on the pregnancy. Bone marrow suppression Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding.

1.1 Multiple sclerosis

Multiple sclerosis

14-Sep-2020

Description of condition

Multiple sclerosis is a chronic, immune-mediated, demyelinating inflammatory condition of the central nervous system, which affects the brain, optic nerves and spinal cord, and leads to progressive severe disability.

Relapsing-remitting multiple sclerosis is the most common pattern of the disease. It is characterised by periods of exacerbation of symptoms (relapses) followed by unpredictable periods of stability (remission). The severity and frequency of relapses varies greatly between patients, but on average occur once or twice per year. This clinical pattern often develops into secondary-progressive multiple sclerosis, with progressive disability unrelated to relapses. Most patients develop secondary progressive disease 6–10 years after onset.

Primary-progressive multiple sclerosis follows a gradual course, with the development of symptoms that worsen over time, without relapses and remissions.

Progressive-relapsing multiple sclerosis follows a course of steadily worsening neurological function from onset, in addition to acute relapses.

Disease activity in relapsing-remitting multiple sclerosis

Active disease is defined as at least two clinically significant relapses occurring within the last 2 years. Highly active disease is characterised by an unchanged/increased relapse rate or by ongoing severe relapses compared with the previous year, despite treatment with interferon beta p. 915. Rapidly-evolving severe relapsing-remitting multiple sclerosis is defined by two or more disabling relapses in 1 year, and one or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

Aims of treatment

There is no cure for multiple sclerosis. The overall aims of treatment are to modify the course of the disease and manage symptoms, in order to improve quality of life. Treatment is aimed at reducing the frequency and duration of relapses and at preventing or slowing disability.

Drug treatment

Shared decision-making between the patient and their clinicians is particularly important in the treatment of multiple sclerosis, due to the unpredictability of the condition and the lack of evidence of long-term benefit of treatments. [EVG] A discussion about treatment options, disease activity, risk, and benefit should take place to ensure that treatment choices are right for the patient and their circumstances. (A) The choice of drug also depends on the patient's disability status, individual tolerance, disease severity and disease activity (see Disease activity in relapsing-remitting multiple sclerosis above). [EVG] Treatment should be initiated as early as possible, under the supervision of a specialist. (A)

Note: NHŠ England (May 2014) has provided guidance on the use of interferon beta, glatiramer acetate p. 917, fingolimod p. 920 and natalizumab p. 927 for the treatment of multiple sclerosis in England, see *Useful resources* below. This Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing these treatment options. See also *National funding/access decisions*, under individual monographs for teriflunomide p. 929, dimethyl fumarate p. 918 and alemtuzumab p. 926.

Low levels of vitamin D are believed to be a risk factor for developing multiple sclerosis. Patients with diagnosed multiple sclerosis are usually given regular vitamin D after assessment of their serum levels of vitamin D, but there is insufficient evidence to support its use as a treatment for multiple sclerosis. [EVGF] Patients should not be offered vitamin D solely for the purpose of treating multiple sclerosis.

Relapsing-remitting multiple sclerosis

[EvGr] Disease-modifying drugs are the recommended treatment for patients presenting with active relapsing-remitting multiple sclerosis. Interferon beta and glatiramer acetate may be the preferred choice for some patients, due to

their established safety profile, and the long term clinical experience associated with their use. Peginterferon betala p. 917 requires less frequent administration and is available as an alternative to the non-pegylated interferon beta therapies.

Teriflunomide and dimethyl fumarate are treatment options for patients with *active* disease. Ever They may be preferred due to their oral route of administration. A There is insufficient evidence for the use of either drug to treat highly active or rapidly-evolving severe relapsing-remitting multiple sclerosis.

Evgr More active disease may be treated with natalizumab or alemtuzumab. The MHRA has released restrictions on the use of alemtuzumab due to reports of serious cardiovascular and immune-mediated reactions, see *Important safety information* in the alemtuzumab drug monograph. Natalizumab may be preferred due to the complex safety profile associated with alemtuzumab. Natalizumab is only recommended for the treatment of rapidly-evolving severe relapsing-remitting multiple sclerosis.

Fingolimod is also taken by the oral route and is the recommended treatment for patients with highly active disease. The NHS England Clinical Commissioning Policy (see Useful resources below) advises that fingolimod is a suitable alternative for patients receiving natalizumab who are at high risk of developing progressive multifocal leukoencephalopathy (defined as patients previously exposed to the JC virus or who are receiving immunosuppressants or who have been receiving treatment with natalizumab for more than 2 years).

Secondary progressive multiple sclerosis

Currently, only interferon beta 1b is licensed for use in secondary progressive multiple sclerosis. Interferon beta 1b reduces the risk of relapse and of short-term relapse-related disability, but does not prevent the development of permanent physical disability or retard progression once it is established. Therefore its role in secondary progressive disease is limited

Primary progressive multiple sclerosis

Currently there are no effective disease-modifying treatments licensed for primary progressive multiple sclerosis. Interferon beta [unlicensed indication] has been used, but there is limited evidence to support its use due to the lack of a significant reduction in disability progression.

Progressive-relapsing multiple sclerosis

There are no specific treatment options for this type of multiple sclerosis. None of the currently licensed disease-modifying drugs are recommended in non-relapsing progressive disease.

Management of symptoms

Other than episodes of neurological dysfunction, chronic symptoms (such as fatigue, spasticity, visual problems, and emotional lability) produce much of the disability in multiple sclerosis. Evgr Smoking may increase the progression of disability in multiple sclerosis, and Smoking cessation p. 531 should be encouraged. (A)

Relapses

Suspected relapses should be referred to a specialist for diagnosis and treatment. [vor] Corticosteroids are recommended for reducing inflammation and accelerating recovery in acute relapses of relapsing-remitting multiple sclerosis. Oral methylprednisolone p. 746 is recommended as the first-line option. Intravenous methylprednisolone should be considered as an alternative if oral methylprednisolone has failed or is not tolerated or if hospitalisation is required. (A)

Fatigue and impaired mobility

EvGT Regular exercise may have beneficial effects on mobility and fatigue in patients with multiple sclerosis, and

should be encouraged. Cognitive behavioural techniques for fatigue should also be considered in combination with exercise. Amantadine hydrochloride p. 450 [unlicensed indication] may be used to treat fatigue related to multiple sclerosis. Vitamin B₁₂ injections are **not** recommended as a treatment for fatigue in patients with multiple sclerosis. Fampridine below is licensed for the improvement of walking in patients with multiple sclerosis who have a walking disability. [EVGF] NICE do not consider it to be a cost-effective treatment and do not recommend its use.

Spasticity

Many factors may aggravate spasticity in multiple sclerosis, including constipation, infection, poor mobility aids, pressure ulcers, posture and pain. Evgr These causes should be managed appropriately. The first-line options for managing spasticity in multiple sclerosis are baclofen p. 1219 or gabapentin p. 343 [unlicensed indication] (for important safety information, released by the MHRA/CHM, on the use of antiepileptic drugs and the risk of suicidal thoughts and behaviour, see Epilepsy p. 330). They may be used cautiously in combination if the individual drugs are ineffective or if side effects prevent an increase in the dose of either drug. Tizanidine p. 1221 or dantrolene sodium p. 1460 are second-line options; benzodiazepines may be used as third-line therapy and may also be effective in treating nocturnal spasms. A 4-week trial of cannabis extract p. 1219 can be offered as adjunctive treatment for moderate to severe spasticity in multiple sclerosis if other pharmacological treatments are not effective. Treatment with cannabis extract should be initiated and supervised by a specialist. For funding/access information, see NICE clinical guideline: Cannabis-based medicinal products (see Useful resources).

Oscillopsia

Ever Gabapentin [unlicensed indication] is the first-line treatment for oscillopsia (for important safety information, released by the MHRA/CHM, on the use of antiepileptic drugs and the risk of suicidal thoughts and behaviour, see Epilepsy p. 330.); memantine hydrochloride p. 329 [unlicensed indication] is the second-line option.

Emotional lability

Ever Amitriptyline hydrochloride p. 404 [unlicensed indication] may be used to treat emotional lability in patients with multiple sclerosis.

19-Aug-2021

INDICATIONS AND DOSE

Improvement of walking disability in multiple sclerosis (specialist use only)

- ▶ BY MOUTH
- Adult: 10 mg every 12 hours, discontinue treatment if no improvement within 2 weeks
- CONTRA-INDICATIONS History of seizures (discontinue treatment if seizures occur)
- CAUTIONS Atrioventricular conduction disorders ·
 predisposition to seizures · sinoatrial conduction disorders
 symptomatic cardiac rhythm disorders
- INTERACTIONS → Appendix 1: fampridine
- SIDE-FFFFCTS
- ➤ Common or very common Anxiety · asthenia · balance impaired · constipation · dizziness · dyspepsia · dyspnoea · headache · insomnia · laryngeal pain · nausea · pain · palpitations · paraesthesia · tremor · urinary tract infection · vomiting
- ▶ Uncommon Seizure skin reactions tachycardia
- PREGNANCY Avoid—toxicity in animal studies.
- BREAST FEEDING Avoid—no information available.
- RENAL IMPAIRMENT Ever Caution in mild impairment; avoid if creatinine clearance less than 50 mL/minute, see p. 21.
- PRESCRIBING AND DISPENSING INFORMATION Dispense in original container (pack contains a desiccant) and discard any tablets remaining 7 days after opening.
- NATIONAL FUNDING/ACCESS DECISIONS

► Fampyra (Biogen Idec Ltd)

Fampridine 10 mg Fampyra 10mg modified-release tablets | 28 tablet Pom £181.00 (Hospital only) | 56 tablet Pom £362.00 (Hospital only)

IMMUNOSTIMULANTS > INTERFERONS

Interferon beta

26-Nov-2020

• INDICATIONS AND DOSE

AVONEX ® INJECTION

For relapsing, remitting multiple sclerosis | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

- ► BY INTRAMUSCULAR INJECTION
- Adult: (consult product literature)

continued →

BETAFERON® INJECTION

For relapsing, remitting multiple sclerosis | For secondary progressive multiple sclerosis with active disease | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

- ► BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature)

ΕΧΤΔVΙΔ [©]

For relapsing, remitting multiple sclerosis | For secondary progressive multiple sclerosis with active disease | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

- **▶** BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature)

REBIF ® CARTRIDGE

For relapsing, remitting multiple sclerosis | For a single demyelinating event with an active inflammatory process (if at high risk of developing multiple sclerosis)

- ► BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature)

REBIF® PRE-FILLED PEN AND SYRINGE

For relapsing, remitting multiple sclerosis | For a single demyelinating event with an active inflammatory process (if at high risk of developing multiple sclerosis)

- ► BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature)
- CONTRA-INDICATIONS Severe depressive illness
 CONTRA-INDICATIONS, FURTHER INFORMATION
 Consult product literature for further information on contra-indications.
- CAUTIONS History of cardiac disorders history of depressive disorders (avoid in severe depression or in those with suicidal ideation) - history of seizures - history of severe myelosupression

CAUTIONS, FURTHER INFORMATION Consult product literature for further information on cautions.

- INTERACTIONS → Appendix 1: interferons
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Alopecia · appetite decreased · arthralgia · asthenia · chills · confusion · depression · diarrhoea · fever · headaches · hypothyroidism · influenza like illness (decreasing over time) · insomnia · malaise · menstrual cycle irregularities · nausea · pain · skin reactions · vasodilation · vomiting · weight changes
- ► Uncommon Emotional lability · glomerulosclerosis · hepatic disorders · nephrotic syndrome · seizure · thrombocytopenia
- ▶ Rare or very rare Cardiomyopathy · dyspnoea · haemolytic uraemic syndrome · hyperthyroidism · thrombotic microangiopathy
- ▶ Frequency not known Anxiety · chest pain · dizziness · injection site necrosis · muscle weakness · palpitations · pulmonary arterial hypertension

SPECIFIC SIDE-EFFECTS

- ► Common or very common
- With intramuscular use Muscle complaints · musculoskeletal stiffness · neuromuscular dysfunction · rhinorrhoea · sensation abnormal · sweat changes
- With subcutaneous use Anaemia · tachycardia
- ▶ Uncommon
- With subcutaneous use Suicide attempt

- ► Rare or very rare
- With subcutaneous use Bronchospasm · pancreatitis · thyroid disorder
- ► Frequency not known
- With intramuscular use Angioedema · arrhythmias · arthritis · congestive heart failure · hypersensitivity · neurological effects · pancytopenia · psychosis · suicide · syncope · systemic lupus erythematosus (SLE)
- With subcutaneous use Abdominal pain · abscess · capillary leak syndrome · conjunctivitis · constipation · cough aggravated · ear pain · erectile dysfunction · eye disorder · hyperhidrosis · hypertension · increased risk of infection · lupus · like syndrome · lymphadenopathy · muscle tone increased · myalgia · paraesthesia · peripheral oedema · urinary disorders · visual impairment
- PREGNANCY Manufacturer advises use if clinically needed—possible toxicity in animal studies, but limited human data do not suggest an increased risk.
- BREAST FEEDING Manufacturer advises suitable for use during breast feeding—amount in milk probably too small to be harmful (recommendation also supported by specialist sources).
- HEPATIC IMPAIRMENT Manufacturer advises caution; avoid in decompensated liver disease.
- RENAL IMPAIRMENT Manufacturer advises caution in severe impairment.
- MONITORING REQUIREMENTS
- ► Liver Function Manufacturer advises monitor liver function at baseline, then 1 month, 3 months and 6 months after initiation of therapy. Consider dose reduction if alanine aminotransferase (ALT) exceeds 5 times the upper limit of normal (consult product literature).
- Thrombotic Microangiopathy Manufacturer advises patients should be monitored for clinical features of thrombotic microangiopathy (TMA), including thrombocytopenia, new onset hypertension, fever, central nervous system symptoms (e.g. confusion and paresis), and impaired renal function. Any signs of TMA should be investigated fully and, if diagnosed, interferon beta should be stopped immediately and treatment for TMA promptly initiated (consult product literature for details).
- Nephrotic Syndrome Manufacturer advises patients should also be monitored for signs and symptoms of nephrotic syndrome, including oedema, proteinuria, and impaired renal function—monitor renal function periodically. If nephrotic syndrome develops, treat promptly and consider stopping interferon beta treatment.
- ➤ Thyroid Function Manufacturer advises baseline thyroid function tests and repeat if signs or symptoms of thyroid dysfunction occur.
- PRESCRIBING AND DISPENSING INFORMATION Interferon beta is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- ▶ Beta interferons [Avonex®, Extavia®, Rebif®] and glatiramer acetate for treating multiple sclerosis (June 2018) NICE TA527 Recommended with restrictions
- ► Beta interferons [Betaferon®] and glatiramer acetate for treating multiple sclerosis (June 2018) NICE TA527 Not recommended

NHS restrictions

NHS England Clinical Commissioning Policy NHS England (May 2014) has provided guidance on the use of interferon beta p. 915 for the treatment of multiple sclerosis in England. An NHS England Clinical Commissioning Policy outlines the funding arrangements and the criteria for

initiating and discontinuing this treatment option, see www.england.nhs.uk/commissioning/spec-services/npc-crg/ group-d/d04.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

Avonex (Biogen Idec Ltd)

Interferon beta-1a 12 mega unit per 1 ml Avonex 30micrograms/0.5ml (6million units) solution for injection pre-filled syringes | 4 pre-filled disposable injection PoM £654.00 | 12 prefilled disposable injection PoM £1,962.00 Avonex 30micrograms/0.5ml (6million units) solution for injection prefilled pens | 4 pre-filled disposable injection PoM £654.00 | 12 prefilled disposable injection PoM £1,962.00

► Rebif (Merck Serono Ltd) Interferon beta-1a 12 mega unit per 1 ml Rebif 22micrograms/0.5ml (6million units) solution for injection pre-filled syringes | 12 pre-filled disposable injection [PoM] £613.52 Rebif 22micrograms/0.5ml (6million units) solution for injection 1.5ml cartridges | 4 cartridge PoM £613.52 Rebif 8.8micrograms/0.2ml (2.4million units) solution for injection prefilled syringes | 6 pre-filled disposable injection PoM S Rebif 22micrograms/0.5ml (6million units) solution for injection prefilled pens | 12 pre-filled disposable injection [PoM] £613.52 Interferon beta-1a 24 mega unit per 1 ml Rebif 44micrograms/0.5ml (12million units) solution for injection pre-filled syringes | 12 pre-filled disposable injection PoM £813.21 Rebif 44micrograms/0.5ml (12million units) solution for injection prefilled pens | 12 pre-filled disposable injection PoM £813.21 Rebif 44micrograms/0.5ml (12million units) solution for injection 1.5ml cartridges | 4 cartridge PoM £813.21

Powder and solvent for solution for injection

- Betaferon (Bayer Plc)
- Interferon beta-1b 300 microgram Betaferon 300microgram powder and solvent for solution for injection vials | 15 vial Pom £596.63 DT = £596.63 (Hospital only)
- Extavia (Novartis Pharmaceuticals UK Ltd) Interferon beta-1b 300 microgram Extavia 300microgram powder and solvent for solution for injection vials | 15 vial Pom £596.63 DT = £596.63 (Hospital only)

Peginterferon beta-1a

25-May-2021

• DRUG ACTION Peginterferon beta-1a is a polyethylene glycol-conjugated ('pegylated') derivative of interferon beta; pegylation increases the persistence of interferon in the blood.

• INDICATIONS AND DOSE

Treatment of relapsing, remitting multiple sclerosis

- **▶** BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature)
- CONTRA-INDICATIONS Severe depression suicidal ideation
- CAUTIONS History of cardiac disorders history of depressive disorders (avoid in severe depression or in those with suicidal ideation) · history of seizures · history of severe myelosupression

CAUTIONS, FURTHER INFORMATION Consult product literature for further information about cautions.

SIDE-FFFFCTS

- ► Common or very common Arthralgia · asthenia · chills · depression · fever · headache · hyperthermia · influenza like illness · myalgia · nausea · pain · skin reactions · vomiting
- ▶ Uncommon Seizure thrombocytopenia
- ▶ Rare or very rare Glomerulosclerosis haemolytic uraemic syndrome · injection site necrosis · nephrotic syndrome · thrombotic microangiopathy
- ► Frequency not known Pulmonary arterial hypertension
- CONCEPTION AND CONTRACEPTION Effective contraception required during treatment-consult product literature

- PREGNANCY Do not initiate during pregnancy. Avoid unless potential benefit outweighs risk.
- BREAST FEEDING Avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe hepatic impairment.
- RENAL IMPAIRMENT EVGT Use with caution in severe renal impairment.

MONITORING REQUIREMENTS

- ▶ Monitor for signs of hepatic injury—hepatic failure has been reported rarely.
- ▶ Thrombotic microangiopathy Patients should be monitored for clinical features of thrombotic microangiopathy (TMA), including thrombocytopenia, new onset hypertension, fever, central nervous system symptoms (e.g. confusion and paresis), and impaired renal function. Any signs of TMA should be investigated fully and, if diagnosed, interferon beta should be stopped immediately and treatment for TMA promptly initiated (consult product literature for details).
- ▶ Nephrotic syndrome Patients should also be monitored for signs and symptoms of nephrotic syndrome, including oedema, proteinuria, and impaired renal functionmonitor renal function periodically. If nephrotic syndrome develops, treat promptly and consider stopping interferon beta treatment.

IMMUNOSTIMULANTS > OTHER

Glatiramer acetate

29-Jun-2021

 DRUG ACTION Glatiramer is an immunomodulating drug comprising synthetic polypeptides.

2 pre-filled disposable injection PoM £654.00 (Hospital only)

INDICATIONS AND DOSE

Multiple sclerosis [relapsing-remitting] (initiated under specialist supervision)

- ► BY SUBCUTANEOUS INJECTION
- Adult: 20 mg once daily, alternatively 40 mg 3 times a week, doses to be separated by an interval of at least 48 hours
- CAUTIONS Cardiac disorders

SIDE-EFFECTS

► Common or very common Anxiety · appetite decreased · arrhythmias · asthenia · chest pain · chills · constipation · cough · depression · dyspepsia · dysphagia · dyspnoea (may occur within minutes of injection) • ear disorder • eve disorders · fever · gastrointestinal disorders · headaches · hyperhidrosis · hypersensitivity · increased risk of infection · joint disorders · local reaction · lymphadenopathy · nausea · neoplasms · neuromuscular dysfunction · oedema

- oral disorders · pain · palpitations · rhinitis seasonal · skin reactions · speech disorder · syncope · taste altered · tremor · urinary disorders · vasodilation · vision disorders · vomiting · weight increased
- ▶ Uncommon Abnormal dreams abscess alcohol intolerance · angioedema · apnoea · arthritis · breast engorgement · burping · cataract · choking sensation · cholelithiasis · cognitive disorder · confusion · cyst · dry eye · dysgraphia · dyslexia · erythema nodosum · goitre · gout · haemorrhage · hallucination · hangover · hepatic disorders · hostility · hyperlipidaemia · hyperthyroidism · hypothermia · immediate post-injection reaction · inflammation · injection site necrosis · leucocytosis · leucopenia · mood altered · movement disorders · mucous membrane disorder · muscle atrophy · nephrolithiasis · nerve disorders · paralysis · pelvic prolapse · personality disorder · post vaccination syndrome · prostatic disorder · respiratory disorders · seizure · sexual dysfunction · skin nodule • splenomegaly • stupor • suicide attempt • testicular disorder • thrombocytopenia • urinary tract disorder • urine abnormal · varicose veins · vulvovaginal disorder

IMMUNOSUPPRESSANTS >

Dimethyl fumarate

20-Mar-202

 DRUG ACTION Dimethyl fumarate is converted into active monomethyl fumarate which is thought to work by activating the nuclear factor (erythroid-derived 2)-like 2 (Nrf2) pathway, resulting in immunomodulatory and antiinflammatory effects.

INDICATIONS AND DOSE

SKILARENCE ®

Plaque psoriasis [moderate-to-severe] (under expert supervision)

- ▶ BY MOUTH
- Adult: Initially 30 mg once daily for 1 week, dose to be taken in the evening, then increased in steps of 30 mg every week for 3 weeks, then increased in steps of 120 mg every week for 5 weeks, for further information on the dose titration and administration schedule, advice on establishing a maintenance dose, and for dose adjustments due to side-effects, consult product literature; maximum 720 mg per day

TECFIDERA ®

Multiple sclerosis [relapsing-remitting] (initiated by a specialist)

- ► BY MOUTH
- Adult: Initially 120 mg twice daily for 7 days, then increased to 240 mg twice daily, for dose adjustments due to side effects—consult product literature

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIMETHYL FUMARATE (TECFIDERA®): UPDATED ADVICE ON THE RISK OF PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY (PML) ASSOCIATED WITH MILD LYMPHOPENIA (JANUARY 2021)

A European review of safety data identified 11 cases of PML with lymphopenia associated with Tecfidera [®] treatment, including 3 cases in patients with mild lymphopenia (lymphocyte count between 0.8 × 10⁹/litre and the lower limit of normal); previously, PML had only been confirmed in the setting of moderate to severe lymphopenia.

Healthcare professionals are advised that $Tecfidera^{\oplus}$ is contra-indicated in patients with suspected or confirmed PML and should not be initiated in those with severe lymphopenia (lymphocyte count below 0.5×10^3 /litre); patients with low lymphocyte counts should be investigated for underlying causes before initiating treatment. During treatment, all patients should have a lymphocyte count at least every 3 months. Treatment should be re-evaluated in those with sustained moderate reductions of absolute lymphocyte counts (between 0.5 and 0.8×10^9 /litre) for longer than 6 months. $Tecfidera^{\oplus}$ should be stopped in those with severe lymphopenia persisting for more than 6 months, and permanently discontinued if a patient develops PML.

Patients should be advised to be vigilant for any new or worsening neurological or psychiatric symptoms, and to seek urgent medical attention if these occur. They should also inform their family or carer about the risks and when to seek medical attention, as they may notice symptoms of which the patient is unaware. Symptoms of PML can resemble those of a multiple sclerosis relapse.

CONTRA-INDICATIONS

TECFIDERA [®] See *Important safety information*.

SKILARENCE Do not initiate if leucocyte count below 3×10^9 /litre do not initiate if lymphocyte count below 1×10^9 /litre do not initiate if pathological haematological

abnormalities identified • severe gastro-intestinal disorders

• CAUTIONS Reduced lymphocyte count

TECFIDERA® Serious infection (do not initiate until infection resolved; consider suspending treatment if infection develops) - severe active gastro-intestinal disease SKILARENCE® Significant infection (consider avoiding initiation until infection resolved and suspending treatment if infection develops)

- INTERACTIONS → Appendix 1: dimethyl fumarate
- SIDE-EFFECTS
- ► Common or very common Appetite decreased · asthenia · constipation · decreased leucocytes · diarrhoea · eosinophilia · feeling hot · gastrointestinal discomfort · gastrointestinal discorders · headache · increased risk of infection · leucocytosis · nausea · paraesthesia · skin reactions · urine abnormalities · vasodilation · vomiting
- ▶ Uncommon Dizziness thrombocytopenia
- Rare or very rare Acute lymphocytic leukaemia pancytopenia
- Frequency not known Angioedema · drug-induced liver injury · dyspnoea · hypotension · hypoxia · JC virus infection · progressive multifocal leukoencephalopathy (PML) · renal failure · rhinorrhoea

SIDE-EFFECTS, FURTHER INFORMATION Severe prolonged lymphopenia reported, and patients are exposed to a potential risk of PML. Treatment should be stopped immediately if PML is suspected.

PREGNANCY

TECFIDERA Manufacturer advises avoid unless essential and potential benefit outweighs risk—toxicity in *animal* studies

SKILARENCE [®] Manufacturer advises avoid—toxicity in *animal* studies.

- BREAST FEEDING Specialist sources indicate present in milk but amount probably too small to be harmful. Monitor breastfed infants for flushing, vomiting, diarrhoea, adequate weight gain, and developmental milestones, especially younger, exclusively breastfed infants.
- HEPATIC IMPAIRMENT

TECFIDERA [®] Manufacturer advises caution in severe impairment (no information available).

SKILARENCE [®] Manufacturer advises avoid in severe impairment (no information available).

RENAL IMPAIRMENT

TECFIDERA [®] Manufacturer advises caution in severe impairment—no information available.

SKILARENCE Manufacturer advises avoid in severe impairment—no information available.

- MONITORING REQUIREMENTS
- Manufacturer advises monitor full blood count before treatment initiation then every 3 months thereafter consult product information for further information.
- Manufacturer advises monitor patient closely for features
 of progressive multifocal leukoencephalopathy (PML) (e.g.
 signs and symptoms of neurological dysfunction) and
 other opportunistic infections.
- Manufacturer advises monitor renal and hepatic function before treatment initiation and during treatment—consult product literature for further information.
- Manufacturer of Tecfidera[®] advises perform a baseline MRI as a reference and repeat as required during treatment.
- PRESCRIBING AND DISPENSING INFORMATION
 SKILARENCE The manufacturer of Skilarence has provided a Healthcare Professional Guideline, which includes important safety information on the risk of serious infections.

- PATIENT AND CARER ADVICE Manufacturer advises patients and their carers should be informed of the possibility of experiencing symptoms of flushing; they should also be advised to report symptoms of infection to their doctor. The MHRA recommends that patients and their carers should be counselled on the risk of progressive multifocal leukoencephalopathy and advised to seek immediate medical attention if symptoms develop.
- NATIONAL FUNDING/ACCESS DECISIONS

Diroximel fumarate

10-Mar-202

- DRUG ACTION Diroximel fumarate is converted into active monomethyl fumarate which is thought to work by activating the nuclear factor (erythroid-derived 2)-like 2 (Nrf2) pathway, resulting in immunomodulatory and antiinflammatory effects.
 - INDICATIONS AND DOSE

Multiple sclerosis (initiated under specialist supervision)

- ► BY MOUTH
- Adult: Initially 231 mg twice daily for 7 days, then maintenance 462 mg twice daily, for dose adjustments due to side effects—consult product literature
- CONTRA-INDICATIONS Progressive multifocal leukoencephalopathy (suspected or confirmed) • severe lymphopenia (lymphocyte count below 0.5 x 10⁹/litre) consult product literature
- CAUTIONS Reduced lymphocyte count—consult product literature · risk factors for progressive multifocal leukoencephalopathy · serious infection (do not initiate until infection resolved; consider suspending treatment if infection develops) · severe active gastrointestinal disease (no information available)

CAUTIONS, FURTHER INFORMATION

- Progressive Multifocal Leucoencephalopathy EvGr There is an increased risk of opportunistic infection and progressive multifocal leucoencephalopathy (PML) caused by JC virus associated with dimethyl fumarate and other fumarates. Prolonged moderate to severe lymphopenia increases the risk of PML, although risk cannot be excluded in patients with mild lymphopenia. Other factors that may increase the risk include treatment duration, profound decreases in CD4+ and CD8+ T cell count, and previous immunosuppressant or immunomodulatory treatment.
- INTERACTIONS → Appendix 1: diroximel fumarate
- SIDE-EFFECTS
- ➤ Common or very common Decreased leucocytes · diarrhoea · feeling hot · gastrointestinal discomfort · gastrointestinal disorders · increased risk of infection · nausea · paraesthesia · skin reactions · urine abnormalities · vasodilation · vomiting
- ► Uncommon Thrombocytopenia
- ▶ Frequency not known Angioedema · drug-induced liver injury · dyspnoea · hypotension · hypoxia · progressive multifocal leukoencephalopathy (PML) · rhinorrhoea
- PREGNANCY Ever Avoid unless potential benefit outweighs risk—toxicity in animal studies.
- BREAST FEEDING Specialist sources indicate present in milk but amount probably too small to be harmful. Monitor breastfed infants for flushing, vomiting, diarrhoea, adequate weight gain, and developmental milestones, especially younger, exclusively breastfed infants
- HEPATIC IMPAIRMENT EVG. Caution in severe impairment (no information available).
- RENAL IMPAIRMENT EvGr Caution in moderate or severe impairment (no information available).
- MONITORING REQUIREMENTS
- ► Evgr Monitor full blood count, including lymphocytes, before treatment initiation then every 3 months thereafter—consult product literature.
- Monitor patient closely for features of progressive multifocal leukoencephalopathy (e.g. signs and symptoms of neurological dysfunction) and other opportunistic infections.
- Monitor renal and hepatic function before treatment initiation and during treatment—consult product literature
- Perform baseline MRI and repeat as required during treatment.
- PATIENT AND CARER ADVICE Patients and their carers should be informed of the possibility of experiencing symptoms of flushing; they should also be advised to report symptoms of infection to their doctor. Patients and their carers should be counselled on the risk of progressive multifocal leukoencephalopathy and advised to seek immediate medical attention if symptoms develop.
 Missed doses If a dose is more than 8 hours late, the missed dose should not be taken and the next dose should be taken at the normal time
- NATIONAL FUNDING/ACCESS DECISIONS

Fingolimod

07-Jan-2021

 DRUG ACTION Fingolimod is a sphingosine-1-phosphate receptor modulator, which prevents movement of lymphocytes out of lymph nodes, thereby limiting inflammation in the central nervous system.

• INDICATIONS AND DOSE

Multiple sclerosis (initiated by a specialist)

- ► BY MOUTH
- Adult: 500 micrograms once daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: FINGOLIMOD—NOT RECOMMENDED FOR PATIENTS AT KNOWN RISK OF CARDIOVASCULAR EVENTS. ADVICE FOR EXTENDED MONITORING FOR THOSE WITH SIGNIFICANT BRADYCARDIA OR HEART BLOCK AFTER THE FIRST DOSE AND FOLLOWING TREATMENT INTERRUPTION (JANUARY 2013)

Fingolimod is known to cause transient bradycardias and heart block after the first dose—see *Cautions*, *Contraindications*, and *Monitoring* for further information.

MHRA/CHM ADVICE: FINGOLIMOD: NEW CONTRA-INDICATIONS IN RELATION TO CARDIAC RISK (DECEMBER 2017)

Fingolimod can cause persistent bradycardia, which can increase the risk of serious cardiac arrhythmias. New contra-indications have been introduced for patients with pre-existing cardiac disorders—see *Contra-indications* for further information

MHRA/CHM ADVICE: MULTIPLE SCLEROSIS THERAPIES: SIGNAL OF REBOUND EFFECT AFTER STOPPING OR SWITCHING THERAPY (APRIL 2017)

A signal of rebound syndrome in multiple sclerosis patients whose treatment with fingolimod was stopped or switched to other treatments has been reported in two recently published articles. The MHRA advise to be vigilant for such events and report any suspected adverse effects relating to fingolimod, or other treatments for multiple sclerosis, via the Yellow Card Scheme, while this report is under investigation.

MHRA/CHM ADVICE: FINGOLIMOD: UPDATED ADVICE ABOUT RISK OF CANCERS AND SERIOUS INFECTIONS (DECEMBER 2017)
Fingolimod has an immunosuppressive effect and can increase the risk of skin cancers and lymphoma.
Following a recent EU review, the MHRA has recommended the following strengthened warnings:

- re-assess the benefit-risk balance of fingolimod therapy in individual patients, particularly those with additional risk factors for malignancy—either closely monitor for skin cancers or consider discontinuation on a case-by-case basis
- examine all patients for skin lesions before they start fingolimod and then re-examine at least every 6 to
- advise patients to protect themselves against UV radiation exposure and seek urgent medical advice if they notice any skin lesions
- refer patients with suspicious lesions to a dermatologist

Fingolimod has also been associated with risk of fatal fungal infections and reports of progressive multifocal leukoencephalopathy (PML)—see *Monitoring* and *Side effects* for further information.

MHRA/CHM ADVICE: FINGOLIMOD (*GILENYA*®): INCREASED RISK OF CONGENITAL MALFORMATIONS; NEW CONTRA-INDICATION DURING PREGNANCY AND IN WOMEN OF CHILDBEARING POTENTIAL NOT USING EFFECTIVE CONTRACEPTION (SEPTEMBER 2019)

An increased risk of major congenital malformations, including cardiac, renal, and musculoskeletal defects, has been associated with the use of fingolimod in pregnancy. Females of childbearing potential must use effective contraception during, and for 2 months after stopping, treatment. Healthcare professionals are advised that fingolimod is contra-indicated in pregnancy and that female patients should be informed of the risk of congenital malformations and given a pregnancyspecific patient reminder card. Pregnancy should be excluded before starting treatment, and pregnancy testing repeated at suitable intervals during treatment. Fingolimod should be stopped 2 months before planning a pregnancy. If a female taking fingolimod becomes pregnant, treatment should be stopped immediately. and the patient referred to an obstetrician for close monitoring. Exposed pregnancies should be enrolled on the pregnancy registry.

MHRA/CHM ADVICE: FINGOLIMOD (*GILENYA*®): UPDATED ADVICE ABOUT THE RISKS OF SERIOUS LIVER INJURY AND HERPES MENINGOENCEPHALITIS (JANUARY 2021)

A European review of safety data identified 7 cases of clinically significant liver injury that developed between 10 days and 5 years of starting fingolimod, including 3 reports of acute hepatic failure requiring liver transplantation. The guidance for monitoring liver function and criteria for discontinuation have been strengthened to minimise the risks of liver injury.

Liver function tests including serum bilirubin should be performed before starting and during treatment at months 1, 3, 6, 9, and 12, then periodically thereafter until 2 months after discontinuation.

In the absence of clinical symptoms, if liver transaminases (AST or ALT) exceed:

- 3 times the upper limit of normal (ULN) but less than 5 times the ULN without increase in serum bilirubin, liver function tests should be monitored more frequently:
- 5 times the ULN or at least 3 times the ULN with any increase in serum bilirubin, fingolimod should be discontinued; treatment may be restarted when serum levels have returned to normal, after careful benefitrisk assessment of the underlying cause.

In the presence of clinical symptoms suggestive of hepatic dysfunction, liver function tests should be checked promptly and fingolimod discontinued is significant liver injury is confirmed; further treatment may be restarted after recovery, only if an alternative cause of hepatic dysfunction is established.

The review also considered reported cases of herpes zoster/herpes simplex infections with visceral or CNS dissemination (e.g. herpes meningoencephalitis), some of which were fatal. Healthcare professionals are reminded to continue to be vigilant for infections with fingolimod.

Patients should be advised to seek urgent medical attention if they develop any signs or symptoms of liver injury or brain infection (during fingolimod treatment and for 8 weeks after the last dose in the case of the latter).

• CONTRA-INDICATIONS Active malignancies · baseline QTc interval 500 milliseconds or greater · cerebrovascular disease (including transient ischaemic attack) in the previous 6 months · decompensated heart failure (requiring inpatient treatment) in the previous 6 months · heart failure in the previous 6 months (New York Heart Association class III/IV) · increased risk for opportunistic

infections (including immunosuppression) • myocardial infarction in the previous 6 months • second-degree Mobitz type II atrioventricular block or third-degree AV block, or sick-sinus syndrome, if the patient does not have a pacemaker • severe active infection • severe cardiac arrhythmias requiring treatment with class Ia or class III anti-arrhythmic drugs • unstable angina in the previous 6 months

- CAUTIONS Check varicella zoster virus status—consult product literature for further information · chronic obstructive pulmonary disease • elderly (limited information available) · history of myocardial infarction · history of symptomatic bradycardia or recurrent syncope. patients receiving anti-arrhythmic or heart-rate lowering drugs, including beta-blockers and heart rate-lowering calcium-channel blockers (seek advice from cardiologist regarding switching to alternative drugs, or appropriate monitoring if unable to switch) · pulmonary fibrosis · severe respiratory disease · severe sleep apnoea · significant QT prolongation (QTc greater than 470 milliseconds in women, or OTc greater than 450 milliseconds in men); if OTc 500 milliseconds or greater-see Contra-indications · susceptibility to OTinterval prolongation (including electrolyte disturbances) • uncontrolled hypertension
 - CAUTIONS, FURTHER INFORMATION
- Washout period A washout period is recommended when switching treatment from some disease modifying therapies—consult product literature for further information.
- Bradycardia and cardiac rhythm disturbance Fingolimod may cause transient bradycardia, atrioventricular conduction delays and heart block after the first dose. Fingolimod is not recommended in patients with the cardiovascular risks listed above unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist (including monitoring advice) is sought before initiation.
- INTERACTIONS → Appendix 1: fingolimod

SIDE-EFFECTS

- ► Common or very common Alopecia · arthralgia · asthenia · atrioventricular block · back pain · bradycardia · cough · decreased leucocytes · depression · diarrhoea · dizziness · dyspnoea · headaches · hypertension · increased risk of infection · myalgia · neoplasms · skin reactions · vision blurred · weight decreased
- ➤ Uncommon Macular oedema · nausea · seizures · thrombocytopenia
- ▶ Rare or very rare Posterior reversible encephalopathy syndrome (PRES)
- Frequency not known Autoimmune haemolytic anaemia haemophagocytic lymphohistiocytosis · hepatic disorders peripheral oedema · progressive multifocal leukoencephalopathy (PML)

SIDE-EFFECTS, FURTHER INFORMATION Basal-cell carcinoma Patients should be advised to seek medical advice if they have any signs of basal-cell carcinoma including skin nodules, patches or open sores that do not heal within weeks.

Progressive multifocal leukoencephalopathy (PML) and other opportunistic infections Patients should be advised to seek medical attention if they have any signs of PML or any other infections. Suspension of treatment should be considered if a patient develops a severe infection, taking into consideration the risk-benefit.

- CONCEPTION AND CONTRACEPTION Manufacturer advises females of childbearing potential should use effective contraception during treatment and for 2 months after last treatment—see Important safety information for further information.
- PREGNANCY Manufacturer advises avoid—teratogenic.
- BREAST FEEDING Avoid.

 HEPATIC IMPAIRMENT Manufacturer advises caution when initiating treatment in mild to moderate impairment; avoid in severe impairment.

MONITORING REQUIREMENTS

- All patients receiving fingolimod should be monitored at treatment initiation, (first dose monitoring—before, during and after dose), and after treatment interruption (see note below); monitoring should include:
- ▶ Pre-treatment
 - an ECG and blood pressure measurement before starting
- ► During the first 6 hours of treatment
- continuous ECG monitoring for 6 hours
- blood pressure and heart rate measurement every hour
- After 6 hours of treatment
- a further ECG and blood pressure measurement
- If heart rate at the end of the 6 hour period is at its lowest since fingolimod was first administered, monitoring should be extended by at least 2 hours and until heart rate increases.
- ▶ If post-dose bradyarrhythmia-related symptoms occur, appropriate clinical management should be initiated and monitoring should be continued until the symptoms have resolved. If pharmacological intervention is required during the first-dose monitoring, overnight monitoring should follow, and the first-dose monitoring should then be repeated after the second dose.
- If after 6 hours, the heart rate is less than 45 beats per minute, or the ECG shows new onset second degree or higher grade AV block, or a QTc interval of 500 milliseconds or greater, monitoring should be extended (at least overnight, until side-effect resolution).
- ➤ The occurrence at any time of third degree AV block requires extended monitoring (at least overnight, until side-effect resolution).
- ► In case of T-wave inversion, ensure there are no associated signs or symptoms of myocardial ischaemia—if suspected seek advice from a cardiologist.
- Note
- ► First dose monitoring as above **should be repeated** in all patients whose treatment is interrupted for:
 - 1 day or more during the first 2 weeks of treatment
 - more than 7 days during weeks 3 and 4 of treatment
 - more than 2 weeks after one month of treatment
- If the treatment interruption is of shorter duration than the above, treatment should be continued with the next dose as planned.
- Manufacturer advises eye examination recommended 3-4 months after initiation of treatment (and before initiation of treatment in patients with diabetes or history of uveitis).
- Manufacturer advises skin examination for skin lesions before starting treatment and then every 6 to 12 months thereafter or as clinically indicated.
- ► The MHRA advises to monitor liver function—see Important Safety Information.
- Monitor full blood count before treatment, at 3 months, then at least yearly thereafter and if signs of infection (interrupt treatment if lymphocyte count reduced) consult product literature.
- Monitor for signs and symptoms of haemophagocytic syndrome (including pyrexia, asthenia, hepatosplenomegaly and adenopathy—may be associated with hepatic failure and respiratory distress; also progressive cytopenia, elevated serum-ferritin concentrations, hypertriglyceridaemia, hypofibrinogenaemia, coagulopathy, hepatic cytolysis, hyponatraemia)—initiate treatment immediately.
- Manufacturer advises to monitor routine MRI for lesions suggestive of progressive multifocal leukoencephalopathy (PML), particularly in patients considered at increased risk; monitor for signs and symptoms of new neurological dysfunction.

 PRESCRIBING AND DISPENSING INFORMATION The manufacturer of Gilenya® has provided a Prescriber's checklist.

PATIENT AND CARER ADVICE

Patient reminder card Patients should be given a patient reminder card.

Female patients of childbearing potential should also be given a pregnancy-specific patient reminder card.

NATIONAL FUNDING/ACCESS DECISIONS

Ozanimod

25-Jun-2021

 DRUG ACTION Ozanimod is a sphingosine-1-phosphate receptor modulator, which prevents movement of lymphocytes out of lymph nodes, thereby limiting inflammation in the central nervous system.

• INDICATIONS AND DOSE

Multiple sclerosis (initiated by a specialist)

- ► BY MOUTH
- Adult: Initially 0.23 mg once daily on days 1–4, then increased to 0.46 mg once daily on days 5–7, then increased to 0.92 mg once daily from day 8 onwards, the same dose escalation regimen is recommended when treatment is interrupted for 1 day or more during the first 14 days of treatment, for more than 7 consecutive days between days 15–28, or for more than 14 consecutive days after day 28. For interruptions of shorter duration, treatment may be continued with the next planned dose
- CONTRA-INDICATIONS Active malignancy · decompensated heart failure (requiring inpatient treatment) in the previous 6 months · heart failure (New York Heart Association class III or IV) in the previous 6 months · immunodeficiency · myocardial infarction in the previous 6 months · phototherapy with UV-B radiation or PUVA-photochemotherapy (increased risk of cutaneous neoplasm) · posterior reversible encephalopathy syndrome (suspected or confirmed) · progressive multifocal leukoencephalopathy · second-degree Mobitz type II atrioventricular (AV) block, third-degree AV block, or sick sinus syndrome, if the patient does not have a pacemaker · severe active infection · stroke (including transient ischaemic attack) in the previous 6 months · unstable angina in the previous 6 months
- CAUTIONS Administration of vaccinations cerebrovascular disease · chronic obstructive pulmonary disease · diabetes mellitus (increased risk of macular oedema) · elderly (limited information available) · heart failure · immunosuppression or other risk factors for infection · myocardial infarction · patients receiving OTprolonging or heart rate-lowering drugs, including betablockers and heart rate-lowering calcium-channel blockers · pulmonary fibrosis · recurrent syncope · retinal disease (increased risk of macular oedema) · risk of discontinuation effects, including disease rebound . second-degree Mobitz type I atrioventricular block · severe respiratory disease · severe untreated sleep apnoea · significant QT prolongation (QTc greater than 500 milliseconds) · sinus bradycardia (heart rate below 55 beats per minute) • uncontrolled hypertension • uveitis (increased risk of macular oedema)

CAUTIONS, FURTHER INFORMATION

- ▶ Bradycardia and cardiac rhythm disturbance Ever Ozanimod may cause transient bradycardia, atrioventricular conduction delays and heart block after the first dose. It is not recommended in patients with a history of symptomatic bradycardia or recurrent syncope, uncontrolled hypertension, severe untreated sleep apnoea, or significant QT prolongation or other risk factors for QT prolongation unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist (including monitoring advice) is sought before initiation. ♠
- ➤ Vaccinations [vGr] Vaccination may be less effective during and for up to 3 months after treatment. Live attenuated vaccines should be avoided during and for 3 months after treatment; if they are required they should be given at least 1 month prior to initiation. Immunisation against varicella zoster is recommended prior to treatment in those without documented immunity.
- INTERACTIONS → Appendix 1: ozanimod

SIDE-EFFECTS

- Common or very common Bradycardia · hypertension · increased risk of infection · lymphopenia · postural hypotension
- CONCEPTION AND CONTRACEPTION Every Exclude pregnancy before treatment; females of childbearing potential should use effective contraception during treatment and for 3 months after last dose.
- PREGNANCY Evgr Avoid—toxicity in animal studies.
- BREAST FEEDING EVGT Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT EVGF Avoid in severe impairment (no information available).

MONITORING REQUIREMENTS

- Evgr Patients with certain pre-existing cardiac conditions should be monitored for bradycardia for 6 hours after the first dose. An ECG should be obtained before dosing and after 6 hours —consult product literature for further information.
- ► EvGr Monitor blood pressure regularly during treatment.
- Monitor hepatic transaminases and bilirubin before initiation of treatment and then at months 1, 3, 6, 9 and 12 and periodically thereafter (interrupt treatment if significant liver injury occurs: liver transaminases above 5 times the upper limit of normal).
- Monitor full blood count before initiation and periodically during treatment (interrupt treatment if lymphocyte count reduced)
 —consult product literature.
- ► EvGr Eye examination recommended in patients with diabetes or history of uveitis or retinal disease before initiation and periodically during treatment (interrupt treatment if macular oedema occurs). ♠
- PRESCRIBING AND DISPENSING INFORMATION The manufacturer of Zeposia[®] has provided a Prescriber's Checklist.
- PATIENT AND CARER ADVICE Patients should be advised to avoid exposure to sunlight without protection. Patients should be advised to promptly report symptoms of infection.

Patient reminder card Patients should be given a *Patient/Caregiver Guide*.

Female patients of childbearing potential should be given a *Pregnancy Reminder Card*.

NATIONAL FUNDING/ACCESS DECISIONS

Ponesimod

01-Mar-2022

 DRUG ACTION Ponesimod is a sphingosine-1-phosphate receptor modulator, which prevents movement of lymphocytes out of lymph nodes, thereby limiting inflammation in the central nervous system.

• INDICATIONS AND DOSE

Multiple sclerosis (initiated under specialist supervision) ► BY MOUTH

- ▶ Adult: Initially 2 mg once daily on days 1–2, then increased to 3 mg once daily on days 3–4, then increased to 4 mg once daily on days 5–6, then increased in steps of 1 mg once daily from days 7–11, then increased to 10 mg once daily from days 12–14; maintenance 20 mg once daily from day 15 onwards, for re-initiation after treatment interruption—consult product literature
- CONTRA-INDICATIONS Active chronic infections · active malignancies · decompensated heart failure (requiring inpatient treatment) in the previous 6 months · heart failure (New York Heart Association class III or IV) in the previous 6 months · immunodeficiency · macular oedema · myocardial infarction in the previous 6 months · phototherapy with UV-B radiation or PUVA-photochemotherapy (increased risk of cutaneous neoplasm) · second-degree Mobitz type II AV block, third-degree AV block, or sick sinus syndrome, unless pacemaker fitted · severe active infections · stroke (including transient ischaemic attack) in the previous 6 months · unstable angina in the previous 6 months
- CAUTIONS Administration of vaccinations cerebrovascular disease (including transient ischaemic attack or stroke more than 6 months ago) · chronic obstructive pulmonary disease · decompensated heart failure (more than 6 months ago) · diabetes mellitus (increased risk of macular oedema) · elderly (no information available) · history of cardiac arrest · history of second-degree Mobitz type II AV block, third-degree AV block, sick sinus syndrome, or sino-atrial heart block · history of significant liver disease · history of uveitis (increased risk of macular oedema) · immunosuppression or other risk factors for infection · patients receiving OTprolonging or heart rate-lowering drugs, including betablockers and heart rate-lowering calcium-channel blockers · pulmonary fibrosis · recurrent syncope · risk of discontinuation effects, including disease rebound · severe respiratory disease · significant QT prolongation (QTc greater than 500 milliseconds) or other risk factors for OT prolongation · sinus bradycardia (heart rate below 55 beats per minute) · uncontrolled hypertension · unstable ischaemic heart disease

CAUTIONS, FURTHER INFORMATION

- Bradycardia and cardiac rhythm disturbance EvGr Ponesimod may cause transient bradycardia, AV conduction delays, and heart block after the first dose. It is not recommended in patients with the cardiovascular risks listed above unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist (including monitoring advice) is sought before initiation.
- Vaccinations Ever Vaccination may be less effective during treatment. Live attenuated vaccines should be avoided during treatment; if they are required treatment should be stopped 1 week before and restarted 4 weeks after vaccination. Immunisation against varicella zoster is recommended prior to treatment in those without documented immunity.
- INTERACTIONS → Appendix 1: ponesimod
- SIDE-EFFECTS
- **Common or very common** Anxiety chest discomfort cough depression dizziness drowsiness dyspepsia •

- dyspnoea · fatigue · fever · hypercholesterolaemia · hypertension · increased risk of infection · insomnia · joint disorders · ligament sprain · lymphopenia · macular oedema · migraine · numbness · pain · peripheral oedema · vertigo
- ► **Uncommon** Bradycardia · dry mouth · hyperkalaemia
- Frequency not known Atrioventricular block neoplasms seizure
- CONCEPTION AND CONTRACEPTION EvGr Exclude pregnancy before treatment; females of childbearing potential should use effective contraception during treatment and for 1 week after last dose.
- PREGNANCY EvGr Avoid—toxicity in animal studies.
- BREAST FEEDING Ever Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT EVGT Avoid in moderate to severe impairment (increased exposure).
- MONITORING REQUIREMENTS
- ► Evgr An ECG should be obtained before initiation of treatment. Patients with certain pre-existing cardiac conditions should be monitored for bradycardia for at least 4 hours after the first dose ♠—consult product literature for further information.
- ► EvGr Monitor blood pressure regularly during treatment.
- ▶ Monitor full blood count before initiation and periodically during treatment ♠—consult product literature for further information.
- ► [EVGr] Monitor hepatic transaminases and bilirubin before initiation of treatment and then as clinically indicated (discontinue treatment if significant liver injury occurs).
- Eye examination recommended in all patients before initiation of treatment and then as clinically indicated (interrupt treatment if macular oedema occurs); patients with diabetes or history of uveitis to have eye examination periodically during treatment.
- PRESCRIBING AND DISPENSING INFORMATION The manufacturer of Ponvory® has provided a Prescriber's Checklist.
- PATIENT AND CARER ADVICE Patients should be advised to avoid exposure to sunlight without protection. Patients should be advised to promptly report symptoms of infection during and for up to 1 week after last dose.
 Patient reminder card Patients should be given a Patient/Caregiver Guide.

Female patients of childbearing potential should be given a *Pregnancy Reminder Card*.

Ponesimod 20 mg Ponvory 20mg tablets | 28 tablet PoM £1,073.97 (Hospital only)

Siponimod

03-Dec-2020

 DRUG ACTION Siponimod is a sphingosine-1-phosphate receptor modulator, which prevents movement of lymphocytes out of lymph nodes, thereby limiting inflammation in the central nervous system.

• INDICATIONS AND DOSE

Multiple sclerosis [secondary progressive, with active disease] (initiated by a specialist)

- ► BY MOUTH
- Adult: Initially 0.25 mg once daily on days 1 and 2, followed by 0.5 mg once daily on day 3, followed by 0.75 mg once daily on day 4, followed by 1.25 mg once daily on day 5, dose to be taken in the morning for the first 5 days; maintenance 2 mg once daily from day 6 onwards, in patients with a CYP2C9*1*3 or CYP2C9*2*3 genotype a reduced maintenance dose of 1 mg once daily is used from day 6 onwards. For dose adjustments based on lymphocyte count—consult product literature
- CONTRA-INDICATIONS Active malignancies cryptococcal meningitis · decompensated heart failure (requiring inpatient treatment) in the previous 6 months · heart failure in the previous 6 months (New York Heart Association class III or IV) · immunodeficiency syndrome · macular oedema · myocardial infarction in the previous 6 months · patients homozygous for CYP2C9*3*3 genotype (poor metabolisers) • phototherapy with UV-B radiation or PUVA-photochemotherapy (increased risk of cutaneous neoplasms) · progressive multifocal leukoencephalopathy · second-degree Mobitz type II atrioventricular block or third-degree AV block, or sick-sinus syndrome, if the patient does not have a pacemaker · severe active infection · stroke (including transient ischaemic attack) in the previous 6 months · unstable angina pectoris in the previous 6 months
- CAUTIONS Administration of vaccinations (may be less effective during siponimod treatment—consult product literature for further information) · diabetes mellitus (increased risk of macular oedema) · elderly (limited information available) · exposure to sunlight (increased risk of cutaneous neoplasms) · first- or second-degree Mobitz type I atrioventricular block · heart failure (New York Heart Association class Land II) · myocardial infarction · patients receiving QT-prolonging or heart ratelowering drugs, including beta-blockers and heart ratelowering calcium-channel blockers (seek advice from cardiologist regarding switching to alternative drugs or appropriate monitoring) · recurrent syncope · retinal disease (increased risk of macular oedema) · risk of discontinuation effects, including disease rebound · severe sleep apnoea · significant OT prolongation (OTc greater than 500 milliseconds) · sinus bradycardia (heart rate below 55 beats per minute) · uncontrolled hypertension · uveitis (increased risk of macular oedema)

CAUTIONS, FURTHER INFORMATION

- Bradycardia and cardiac rhythm disturbance Siponimod may cause transient bradycardia, atrioventricular conduction delays and heart block after the first dose. Siponimod is not recommended in patients with a history of symptomatic bradycardia or recurrent syncope, uncontrolled hypertension, severe untreated sleep apnoea, or significant QT prolongation unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist (including monitoring advice) is sought before initiation.
- INTERACTIONS → Appendix 1: siponimod
- SIDE-EFFECTS
- ► Common or very common Arrhythmias · asthenia · atrioventricular block · diarrhoea · dizziness · headache ·

- hypertension increased risk of infection lymphopenia macular oedema nausea neoplasms pain in extremity peripheral oedema seizure tremor
- Frequency not known Meningitis cryptococcal · vision disorders
- ALLERGY AND CROSS-SENSITIVITY Manufacturer advises contra-indicated in patients with hypersensitivity to peanut or soya products.
- CONCEPTION AND CONTRACEPTION Manufacturer advises exclude pregnancy before treatment; females of childbearing potential should use effective contraception during treatment and for 10 days after last dose.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises caution when initiating treatment in mild to moderate impairment; avoid in severe impairment.
- PRE-TREATMENT SCREENING Manufacturer advises CYP2C9 genotyping before treatment initiation—consult product literature. Manufacturer advises check varicella zoster virus status in patients with unconfirmed or incomplete vaccination history. A full course of vaccination against varicella zoster is required 1 month before initiating treatment in antibody-negative patients.

MONITORING REQUIREMENTS

- Manufacturer advises regular monitoring of heart rate, particularly during treatment initiation, and of blood pressure.
- Manufacturer advises patients with certain pre-existing cardiac conditions should be monitored for bradycardia for 6 hours after the first dose. An ECG should be obtained before dosing and after 6 hours—consult product literature for further information.
- Manufacturer advises monitor full blood count before initiation and periodically during treatment (reduce dosage or interrupt treatment if lymphocyte count reduced)—consult product literature.
- Manufacturer advises monitor hepatic transaminases and bilirubin before initiation of treatment and then as clinically indicated (interrupt treatment if significant liver injury occurs).
- Manufacturer advises eye examination recommended 3-4 months after initiation of treatment (and before initiation of treatment in patients with diabetes or history of uveitis or retinal disease).
- PRESCRIBING AND DISPENSING INFORMATION The manufacturer of Mayzent[®] has provided a Physician Education Pack.
- PATIENT AND CARER ADVICE Manufacturer advises patients to avoid exposure to sunlight without protection. Manufacturer advises patients should promptly report symptoms of infection.

Missed doses Manufacturer advises if a dose is missed during treatment initiation (days 1–6), the initial titration regimen should be restarted. If a maintenance dose is missed (after day 6), the missed dose should not be taken, and the next dose should be taken at the normal time. If 4 or more consecutive doses are missed, the initial titration regimen should be used to restart treatment.

Driving and skilled tasks Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness during treatment initiation.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► Siponimod for treating secondary progressive multiple sclerosis (November 2020) NICE TA656 Recommended

Scottish Medicines Consortium (SMC) decisions

- Siponimod (Mayzent®) for the treatment of adult patients with secondary progressive multiple sclerosis (SPMS) with active disease evidenced by relapses or imaging features of inflammatory activity (October 2020) SMC No. SMC2265 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

EXCIPIENTS: May contain Lecithin

► Mayzent (Novartis Pharmaceuticals UK Ltd) ▼ Siponimod (as Siponimod fumaric acid) 250 microgram Mayzent 0.25mg tablets | 12 tablet PoM £293.52 | 120 tablet PoM £1,761.12

Siponimod (as Siponimod fumaric acid) 2 mg Mayzent 2mg tablets | 28 tablet | PoM £1,643.72

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES > ANTI-LYMPHOCYTE

Anti-lymphocyte monoclonal antibodies

 DRUG ACTION The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

IMPORTANT SAFETY INFORMATION

All anti-lymphocyte monoclonal antibodies should be given under the supervision of an experienced specialist, in an environment where full resuscitation facilities are immediately available.

- SIDE-EFFECTS
- Common or very common Alopecia · anaemia · anaphylactic reaction · arthralgia · asthenia · conjunctivitis · constipation · cough · depression · diarrhoea · fever · headache · hypersensitivity (discontinue permanently) · increased risk of infection · infusion related reaction · leucopenia · myocardial infarction · neutropenia · night sweats · pain · thrombocytopenia · vomiting
- ▶ Uncommon Haemolytic anaemia progressive multifocal leukoencephalopathy (PML)
- ▶ Rare or very rare Hepatitis B reactivation

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related side-effects In rare cases infusion reactions may be fatal. Infusion-related side-effects occur predominantly during the first infusion. Patients should receive premedication before administration of anti-lymphocyte monoclonal antibodies to reduce these effects—consult product literature for details of individual regimens. The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management.

Cytokine release syndrome Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of antilymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored very closely (and a slower rate of infusion considered).

- PRE-TREATMENT SCREENING All patients should be screened for hepatitis B before treatment.
- MONITORING REQUIREMENTS Patients should also be monitored for cytopenias—consult product literature for specific recommendations.

06-0rt-2020

Alemtuzumah

INDICATIONS AND DOSE

Treatment of adults with relapsing-remitting multiple sclerosis with active disease defined by clinical or imaging features

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)
- UNLICENSED USE Although no longer licensed for oncological and transplant indications, alemtuzumab is also available through a patient access programme for these indications.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED FEBRUARY 2020): LEMTRADA®
(ALEMTUZUMAB): UPDATED RESTRICTIONS AND STRENGTHENED
MONITORING REQUIREMENTS FOLLOWING REVIEW OF SERIOUS
CARDIOVASCULAR AND IMMUNE-MEDIATED REACTIONS

Following a review of alemtuzumab by the European Medicines Agency, a revised indication, additional contra-indications (see Contra-indications), and strengthened monitoring requirements before, during, and after treatment have been recommended. Healthcare professionals are advised that alemtuzumab should only be used for the treatment of patients with relapsing-remitting multiple sclerosis (RRMS) that is highly active despite a full and adequate course of treatment with at least one disease-modifying agent, or in patients with rapidly evolving severe RRMS.

Healthcare professionals should monitor patients before, during, and after treatment for cardiovascular reactions and non-immune thrombocytopenia (see *Monitoring requirements*). Patients should be informed of serious cardiovascular symptoms that can occur within a few days of treatment, signs of autoimmune disorders that can occur 48 months or more after treatment, and symptoms of hepatic injury; immediate medical attention should be sought by patients if they experience any of these symptoms.

- CONTRA-INDICATIONS Angina (past history) · autoimmune diseases (excluding multiple sclerosis) · cervicocephalic arterial dissection (past history) · clotting abnormalities (including patients on anticoagulant therapy) · human immunodeficiency virus · hypertension (uncontrolled) · myocardial infarction (past history) · severe active infection (until complete resolution) · stroke (past history)
- CAUTIONS Hepatitis B carriers hepatitis C carriers not recommended for inactive disease not recommended for stable disease patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course pretreatment before administration is required (consult product literature)

CAUTIONS, FURTHER INFORMATION For full details of cautions, consult product literature.

- Autoimmune mediated conditions The risk of autoimmune mediated conditions may increase during treatment, including immune thrombocytopenic purpura, thyroid disorders, nephropathies, cytopenias, autoimmune hepatitis, and acquired haemophilia A. Manufacturer advises monitoring for autoimmune mediated conditions throughout the course of treatment (consult product literature).
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- Common or very common Abdominal pain · anxiety · asthma · cytokine release syndrome · endocrine ophthalmopathy · goitre · haemorrhage · hiccups · hyperhidrosis · hyperthyroidism · hypothyroidism ·

influenza like illness · leucocytosis · lymphadenopathy · lymphopenia · malaise · meningitis · menstrual cycle irregularities · multiple sclerosis exacerbated · muscle complaints · muscle weakness · neoplasms · nephropathy · oropharyngeal pain · peripheral oedema · sensation abnormal · skin reactions · stomatitis · thyroiditis · tremor · urine abnormalities · vertigo · vision disorders

- Uncommon Acquired haemophilia · appetite decreased · cervical dysplasia · dry mouth · dysphagia · ear pain · facial swelling · gallbladder disorders · gastrointestinal disorders · Goodpasture's syndrome · limb discomfort · musculoskeletal stiffness · nephrolithiasis · pancytopenia · pneumonitis · tension headache · throat irritation · weight changes
- ▶ Rare or very rare Haemophagocytic lymphohistiocytosis
- Frequency not known Artery dissection cerebrovascular insufficiency - hepatitis autoimmune (including fatal cases) - liver injury - myocardial ischaemia - reactivation of infections - thyroid disorder autoimmune
- CONCEPTION AND CONTRACEPTION Women of childbearing potential should use effective contraception during and for 4 months after treatment.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. Autoimmune thyroid disease during treatment may affect fetus (consult product literature).
- BREAST FEEDING Manufacturer advises avoid during and for 4 months after each treatment course unless potential benefit outweighs risk.
- PRE-TREATMENT SCREENING Screening patients at high risk of hepatitis B or C is recommended before treatment. All patients should be evaluated for active or latent tuberculosis before starting treatment.

MONITORING REQUIREMENTS

- ► The MHRA advises to check liver, thyroid, and kidney function, urinalysis with microscopy, blood counts, and vital signs (including blood pressure, heart rate, and ECG) before infusions.
- The MHRA advises monitor blood pressure and heart rate continuously or at least once every hour during infusions—discontinue infusion if severe adverse reactions occur.
- The MHRA advises monitor patients for infusion-related reactions for at least 2 hours after infusions; patients should be informed of the risk of delayed infusion-related reactions and to seek immediate medical attention if these occur.
- The MHRA advises monitor platelet counts after treatment—consult product literature.
- ► For further information on monitoring, see *Important* safety information.
- HPV screening should be carried out annually in female patients.
- PRESCRIBING AND DISPENSING INFORMATION All patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course.
- PATIENT AND CARER ADVICE Patients should be provided with a patient alert card and patient guide.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Alemtuzumab for treating relapsing-remitting multiple sclerosis (May 2014) NICE TA312 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

for solution for infusion vials | 1 vial Pom £7,045.00 (Hospital only)

Solution for infusion

► Lemtrada (Sanofi Genzyme) ▼
Alemtuzumab 10 mg per 1 ml Lemtrada 12mg/1.2ml concentrate

Natalizumah

06-0rt-2020

INDICATIONS AND DOSE

Highly active relapsing-remitting multiple sclerosis despite treatment with at least one disease-modifying drug, or those patients with rapidly-evolving severe relapsing-remitting multiple sclerosis (initiated under specialist supervision)

- ► BY INTRAVENOUS INFUSION
- Adult 18-65 years: 300 mg every 4 weeks, consider discontinuing treatment if no response after 6 months
- CONTRA-INDICATIONS Active infection · active malignancies (except cutaneous basal cell carcinoma) · immunosuppression · progressive multifocal leucoencephalopathy

CAUTIONS

Progressive Multifocal Leucoencephalopathy Natalizumab is associated with an increased risk of opportunistic infection and progressive multifocal leucoencephalopathy (PML) caused by JC virus. The risk of developing PML increases with the presence of anti-JCV antibodies, previous use of immunosuppressant therapy, and treatment duration (especially beyond 2 years of treatment). Patients with all three risk factors should only be treated with natalizumab if the benefits of treatment outweigh the risks. Manufacturer advises treatment should be suspended until PML has been excluded. Manufacturer also advises if a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.

For information on cautions consult product literature.

- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS Acute retinal necrosis · basophil count increased · eosinophilia · hyperbilirubinaemia · JC virus granule cell neuronopathy · liver injury · meningitis herpes · nucleated red cells

SIDE-EFFECTS, FURTHER INFORMATION Progressive Multifocal Leukoencephalopathy (PML) If suspected, treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.

Liver injury Discontinue treatment if significant liver injury occurs.

Infusion-related reactions Infusion-related reactions including dizziness, nausea, urticaria, chills, vomiting and flushing have been reported either during infusion or within 1 hour after completion of infusion.

- PREGNANCY Avoid unless essential—toxicity in animal studies.
- BREAST FEEDING Present in milk in animal studies—avoid.
- PRE-TREATMENT SCREENING

Progressive Multifocal Leucoencephalopathy A magnetic resonance image (MRI) scan is recommended before starting treatment with natalizumab.

Testing for serum anti-JCV antibodies before starting treatment or in those with unknown antibody status already receiving natalizumab is recommended and should be repeated every 6 months (consult product literature for full details).

MONITORING REQUIREMENTS

- ► Monitor liver function.
 - Progressive Multifocal Leucoencephalopathy A magnetic resonance image (MRI) scan is recommended annually.
 Patients should be monitored for new or worsening neurological symptoms, and for cognitive and psychiatric signs of PML.

All patients should continue to be monitored for signs and symptoms that may be suggestive of PML for approximately 6 months following discontinuation of treatment.

- Hypersensitivity reactions Patients should be observed for hypersensitivity reactions, including anaphylaxis, during the infusion and for 1 hour after completion of the infusion
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Tysabri®), manufacturer advises give intermittently in Sodium chloride 0.9%; dilute 300 mg in 100 mL infusion fluid; gently invert to mix, do not shake. Use within 8 hours of dilution and give over 1 hour.

PATIENT AND CARER ADVICE

Hypersensitivity reactions Patients should be told the importance of uninterrupted dosing, particularly in the early months of treatment (intermittent therapy may increase risk of sensitisation).

Progressive Multifocal Leucoencephalopathy Patients should be informed about the risks of PML before starting treatment with natalizumab and again after 2 years; they should be given an alert card which includes information about the symptoms of PML.

Liver toxicity Advise patients to seek immediate medical attention if symptoms such as jaundice or dark urine develop.

Alert card A patient alert card should be provided.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

 Natalizumab for the treatment of adults with highly active relapsing-remitting multiple sclerosis (August 2007)
 NICE TA127 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

 Natalizumab (Tysabri®) for use as single disease modifying therapy in highly active relapsing remitting multiple sclerosis (RRMS) (September 2007) SMC No. 329/06 Recommended with restrictions

NHS restrictions

NHS England Clinical Commissioning Policy NHS England (May 2014) has provided guidance on the use of natalizumab for the treatment of multiple sclerosis in England. An NHS England Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing this treatment option, see www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04/.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

Tysabri (Biogen Idec Ltd)

Natalizumab 20 mg per 1 ml Tysabri 300mg/15ml concentrate for solution for infusion vials | 1 vial PoM £1,130.00 (Hospital only)

F 926

Ocrelizumab

11-Nov-2020

• INDICATIONS AND DOSE

Multiple sclerosis (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: Initially 300 mg, then 300 mg after 2 weeks; maintenance 600 mg every 6 months, the first maintenance dose should be given 6 months after the first initial dose; a minimum interval of 5 months should be maintained between each maintenance dose, for dose interruption, adjustment of infusion rate or discontinuation of treatment due to infusion-related reactions or side-effects—consult product literature
- CONTRA-INDICATIONS Active infection active malignancies severely immunocompromised patients
- CAUTIONS Complete required vaccinations at least 6 weeks before treatment initiation • hepatitis B reactivation
- INTERACTIONS → Appendix 1: monoclonal antibodies

SIDE-FFFFCTS

- ► Common or very common Catarrh
- ► Frequency not known Malignancy
- CONCEPTION AND CONTRACEPTION Manufacturer advises women of childbearing potential should use contraception during treatment and for 12 months after the last dose.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—limited information available; monitor infants for B-cell depletion.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

MONITORING REQUIREMENTS

- ► Manufacturer advises monitor for signs and symptoms of progressive multifocal leucoencephalopathy (PML) (including any new onset or worsening of neurological symptoms)—if PML is suspected, interrupt treatment; discontinue treatment permanently if PML is confirmed.
- Manufacturer advises monitor for infusion-related reactions during the infusion and observe patients for 1 hour after completion of the infusion—if severe pulmonary symptoms occur, permanently discontinue treatment.
- PRESCRIBING AND DISPENSING INFORMATION
 Manufacturer advises to record the batch number after each administration
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for further information regarding storage conditions after preparation of the infusion.
- PATIENT AND CARER ADVICE Manufacturer advises
 patients and carers should be advised that infusion-related
 reactions can occur within 24 hours of infusion.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Ocrelizumab for treating relapsing-remitting multiple sclerosis (July 2018) NICE TA533 Recommended with restrictions

Ofatumumah

20-May-2022

• INDICATIONS AND DOSE

Multiple sclerosis (initiated by a specialist)

- ► BY SUBCUTANEOUS INJECTION
- Adult: Initially 20 mg once weekly for 3 doses (weeks 0, 1 and 2), then maintenance 20 mg once a month, starting on week 4 (2 weeks after the third dose)

- CONTRA-INDICATIONS Active hepatitis B infection · active malignancies · severe active infection · severely immunocompromised patients
- CAUTIONS Active infection · hepatitis B carriers (seek expert advice before starting) · history of progressive multifocal leukoencephalopathy

CAUTIONS, FURTHER INFORMATION

- ► Immunisation EvGr Patients should receive all recommended vaccinations before starting treatment; live vaccines should be given at least 4 weeks before, and inactivated vaccines ideally at least 2 weeks before, starting of atumumab. ♠
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common Cystitis increased risk of infection injection related reaction
- ► Frequency not known Hepatitis B reactivation JC virus infection progressive multifocal leukoencephalopathy
- CONCEPTION AND CONTRACEPTION Ever Females of childbearing potential should use effective contraception during treatment and for 6 months after the last dose.
- PREGNANCY EvGr Avoid unless potential benefit outweighs risk—no information available; if exposed during pregnancy, monitor infant for B-cell depletion.
- BREAST FEEDING Evgr Avoid during first few days after birth—possible risk from transfer of antibodies to infant. After this time, use during breast-feeding only if clinically needed. If ofatumumab is used throughout the third trimester, breast-feeding can start immediately after birth.
- PRE-TREATMENT SCREENING EVGr All patients should be screened for hepatitis B before treatment.
- MONITORING REQUIREMENTS [EVGT] Monitor for signs or symptoms of progressive multifocal leukoencephalopathy (withhold treatment if suspected).
- DIRECTIONS FOR ADMINISTRATION EVGT Usual sites for subcutaneous injection are the abdomen, thigh or upper outer arm. (*) After an initial dose administered under medical guidance, patients may self-administer Kesimpta* if they have been given the appropriate training in subcutaneous injection technique.
- PRESCRIBING AND DISPENSING INFORMATION Ofatumumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.
- HANDLING AND STORAGE Store in a refrigerator (2–8°C) and protect from light.
- PATIENT AND CARER ADVICE

Self-administration EvGr Patients and their carers should be given training in subcutaneous injection technique if appropriate.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

 Ofatumumab for treating relapsing multiple sclerosis (May 2021) NICE TA699 Recommended

Scottish Medicines Consortium (SMC) decisions

 Ofatumumab (Kesimpta®) for the treatment of adult patients with relapsing forms of multiple sclerosis with active disease defined by clinical or imaging features (July 2021)
 SMC No. SMC2357 Recommended with restrictions MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Disodium edetate, polysorbates

► Kesimpta Sensoready (Novartis Pharmaceuticals UK Ltd) ▼ Ofatumumab 50 mg per 1 ml Kesimpta Sensoready 20mg/0.4ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £1.492.50

IMMUNOSUPPRESSANTS > PYRIMIDINE SYNTHESIS INHIBITORS

Teriflunomide

20-Mar-2019

 DRUG ACTION Teriflunomide is a metabolite of leflunomide which has immunomodulating and antiinflammatory properties.

INDICATIONS AND DOSE

Treatment of relapsing-remitting multiple sclerosis (initiated under specialist supervision)

- ► BY MOUTH
- Adult: 14 mg once daily
- CONTRA-INDICATIONS Anaemia · leucopenia · neutropenia · serious infection · severe hypoproteinaemia · severe immunodeficiency · significantly impaired bone-marrow function · thrombocytopenia
- CAUTIONS Adult over 65 years · anaemia · dyspnoea—assess for interstitial lung disease and consider suspending treatment · hypoproteinaemia (avoid if severe) · impaired bone-marrow function (avoid if severe) · latent tuberculosis · leucopenia · persistent cough—assess for interstitial lung disease and consider suspending treatment · severe infection—delay or suspend treatment until resolved · significant alcohol consumption · signs or symptoms of serious skin reactions (including ulcerative stomatitis, Stevens-Johnson syndrome, and toxic epidermal necrolysis)—discontinue treatment · switching between other immunomodulating drugs · thrombocytopenia
- INTERACTIONS → Appendix 1: teriflunomide
- SIDE-EFFECTS
- Common or very common Abdominal pain upper · alopecia · anaemia · anxiety · arthralgia · cystitis · diarrhoea · headache · hypersensitivity · hypertension · increased risk of infection · menorrhagia · myalgia · nausea · nerve disorders · neutropenia · oral disorders · pain · palpitations · sensation abnormal · skin reactions · urinary frequency increased · vomiting · weight decreased
- ► Uncommon Thrombocytopenia
- ► Frequency not known Asthenia · hepatitis acute · interstitial lung disease · nail disorder · pancreatitis · sepsis

 SIDE-EFFECTS. FURTHER INFORMATION Hepatic injury

Discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.

Important: accelerated elimination procedure recommended following discontinuation due to serious adverse effects (consult product literature).

- CONCEPTION AND CONTRACEPTION Effective
 contraception essential for women of child-bearing
 potential during treatment and for up to 2 years after
 treatment. In patients undergoing treatment with
 teriflunomide that are planning to conceive, the
 accelerated elimination procedure should be used prior to
 conception. Use of non-oral contraception is
 recommended during the accelerated elimination
 procedure—consult product literature.
- PREGNANCY Avoid—toxicity in animal studies.
- BREAST FEEDING Present in milk in animal studies manufacturer advises avoid.

- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment.
- MONITORING REQUIREMENTS
- Monitor full blood count (including differential white cell count and platelet count) before treatment and as clinically indicated during treatment.
- Monitor blood pressure before treatment and periodically thereafter.
- Hepatic monitoring Monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks thereafter or as clinically indicated (pre-existing liver disease may increase risk). Increase to weekly monitoring if alanine aminotransferase (ALT) is 2–3 times the upper limit of reference range; discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.

• TREATMENT CESSATION

Accelerated elimination procedures To aid drug elimination in case of serious adverse effect or before conception, stop treatment and give either colestyramine p. 215 or charcoal, activated p. 1481. After the accelerated elimination procedure a plasma concentration of less than 20 micrograms/litre (measured on 2 occasions at least 14 days apart) and a waiting period of one and a half months are necessary before conception.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

► Teriflunomide for treating relapsing-remitting multiple sclerosis (January 2014) NICE TA303 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ➤ Teriflunomide (Aubagio®) for adults with relapsing-remitting multiple sclerosis (March 2014) SMC No. 940/14 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ► Teriflunomide (Non-proprietary)

 Teriflunomide 7 mg Aubagio 7mg tablets | 28 tablet PoM
 £1.037.84 (Hospital only)
- ► Aubagio (Sanofi Genzyme)

 Teriflunomide 14 mg Aubagio 14mg tablets | 28 tablet PoM
 £1.037.84

Malignant disease

1 Antibody responsive malignancy

ANTINEOPLASTIC DRUGS > MONOCLONAL ANTIBODIES

Amivantamab

17-Feb-2022

 DRUG ACTION Amivantamab is a human monoclonal antibody that targets and disrupts signalling in epidermal growth factor receptor (EGFR) and mesenchymalepithelial transition factor (MET) receptor pathways, thereby preventing tumour cell progression and also causing immune-mediated tumour cell death.

• INDICATIONS AND DOSE

Non-small cell lung cancer [with activating epidermal growth factor receptor (EGFR) exon 20 insertion mutations] (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

- CAUTIONS Pre-medication must be administered to minimise the development of infusion-related reactions
 CAUTIONS, FURTHER INFORMATION
- ▶ Infusion-related reactions EvG: Infusion-related reactions can occur and amivantamab should only be administered when appropriately trained staff and resuscitation facilities are immediately available; pre-medication with an antipyretic, antihistamine, and corticosteroid is recommended—consult product literature. ♠

SIDE-EFFECTS

- ➤ Common or very common Appetite decreased · asthenia · constipation · diarrhoea · dizziness · dry eye · electrolyte imbalance · eye discomfort · eye disorders · eye inflammation · facial swelling · gastrointestinal discomfort · hypoalbuminaemia · increased risk of infection · infusion related reaction · mucositis · myalgia · nail disorders · nausea · oedema · onycholysis · oral disorders · perineal rash · peripheral swelling · respiratory disorders · skin reactions · vertigo · vision disorders · vomiting
- ▶ Uncommon Toxic epidermal necrolysis
- ► Frequency not known Back pain · dyspnoea · fever · muscle weakness · pulmonary embolism
- CONCEPTION AND CONTRACEPTION Ever Females of childbearing potential should use effective contraception during treatment and for at least 3 months after last treatment.
 See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY EVGT Avoid unless potential benefit outweighs risk—limited information available.
 See also Pregnancy and reproductive function in Cytotoxic drugs n. 962.
- BREAST FEEDING EVGT Avoid during treatment and for 3 months after last treatment—no information available.

PRESCRIBING AND DISPENSING INFORMATION

Amivantamab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.

The manufacturer of *Rybrevant* [®] has provided a *Risk minimisation materials* document for healthcare professionals.

- HANDLING AND STORAGE Store in a refrigerator (2-8°C) and protect from light—consult product literature for storage conditions after preparation of the infusion.
- PATIENT AND CARER ADVICE Patients should be advised to limit sun exposure during treatment and for 2 months after last treatment; protective clothing and use of sunscreen are advisable. Patients should be advised to discontinue contact lens use until worsening eye symptoms are evaluated.

 Driving and skilled tasks Patients and carers should be

Driving and skilled tasks Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and visual impairment.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Edetic acid (edta), polysorbates

► Amivantamab (non-proprietary) ▼
Amivantamab 50 mg per 1 ml Rybrevant 350mg/7ml concentrate for solution for infusion vials | 1 vial PoM £1,079.00 (Hospital only)

Atezolizumah

24-Nov-2021

 DRUG ACTION Atezolizumab is a monoclonal antibody, which binds to the programmed death-ligand 1 (PD-L1), thereby reactivating the immune response to tumour cells.

• INDICATIONS AND DOSE

Urothelial carcinoma (specialist use only) | Non-small cell lung cancer (specialist use only) | Small cell lung cancer (specialist use only) | Breast cancer (specialist use only) | Hepatocellular carcinoma (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ATEZOLIZUMAB (TECENTRIO®) AND OTHER IMMUNE-STIMULATORY ANTI-CANCER DRUGS: RISK OF SEVERE **CUTANEOUS ADVERSE REACTIONS (SCARS) (JUNE 2021)** Severe cutaneous adverse reactions (SCARs), including cases of Stevens-Johnson syndrome (SJS) and toxic epidermal necrolysis (TEN), have been reported in patients treated with immunostimulant antineoplastic drugs, such as atezolizumab. Healthcare professionals are advised to monitor patients for suspected severe skin reactions and exclude other causes. Patients should be advised to seek urgent medical attention if severe skin reactions occur. If a SCAR is suspected, atezolizumab therapy should be withheld and the patient referred to a specialist for diagnosis and treatment. Atezolizumab should be permanently discontinued for any grade confirmed SJS or TEN, and for any grade 4 SCAR. Caution is recommended when considering the use of atezolizumab in patients with a history of severe or lifethreatening SCAR associated with other immunostimulant antineoplastic drugs.

- CAUTIONS Abnormal thyroid function—consider appropriate treatment · history of severe cutaneous adverse reactions—see *Important safety information* for details · patients may need pre-medication to minimise the development of infusion-related reactions—consult product literature
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ▶ Common or very common Abdominal pain · appetite decreased · arthralgia · ascites · asthenia · chills · cough · cystitis · cytokine release syndrome · diarrhoea · dysphagia · dyspnoea · electrolyte imbalance · euthyroid sick syndrome · eye disorders · fever · gastrointestinal disorders · goitre · hepatic disorders · hyperglycaemia · hypersensitivity · hypotension · hypothyroidism · hypoxia · increased risk of infection · influenza like illness · infusion related reaction · myalgia · myxoedema · nasal congestion · nausea · oesophageal varices · oesophageal varices haemorrhage · oropharyngeal complaints · pain · radiation pneumonitis · respiratory disorders · skin reactions · skin ulcer · throat irritation · thrombocytopenia · thyroid disorder · thyroiditis · ulcerative colitis · vomiting
- ► Uncommon Adrenal hypofunction connective tissue disorders diabetes mellitus diabetic ketoacidosis hyperthyroidism ketoacidosis meningitis muscle abscess myopathy nerve disorders pancreatitis photophobia severe cutaneous adverse reactions (SCARs)
- ► Rare or very rare Hypophysitis · myocarditis · nephritis · neuromuscular dysfunction · temperature regulation disorder

SIDE-EFFECTS, FURTHER INFORMATION Immune-related reactions Manufacturer advises most immune-related adverse reactions are reversible and managed by temporarily stopping treatment and administration of a corticosteroid—consult product literature.

Infusion-related reactions Manufacturer advises permanently discontinue treatment in patients with severe infusion reactions.

- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception in women of childbearing potential, during treatment and for 5 months after stopping treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid unless essential—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- MONITORING REQUIREMENTS Manufacturer advises monitor for signs and symptoms of infusion- and immunerelated reactions—consult product literature.
- PRESCRIBING AND DISPENSING INFORMATION
 Manufacturer advises to record the brand name and batch number after each administration.

All prescribers should be familiar with the *Physician Information and Management Guidelines* provided by the manufacturer

- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after dilution.
- PATIENT AND CARER ADVICE An alert card should be provided.

Driving and skilled tasks Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of drowsiness.

• NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

- Atezolizumab for treating locally advanced or metastatic urothelial carcinoma after platinum-containing chemotherapy (June 2018) NICE TA525 Recommended with restrictions
- Atezolizumab for untreated PD-L1-positive advanced urothelial cancer when cisplatin is unsuitable (October 2021) NICE TA739 Recommended
- Atezolizumab for treating locally advanced or metastatic nonsmall-cell lung cancer after chemotherapy (May 2018)
 NICE TA520 Recommended with restrictions
- Atezolizumab in combination for treating metastatic nonsquamous non-small-cell lung cancer (June 2019) NICE TA584 Recommended with restrictions
- ► Atezolizumab monotherapy for untreated advanced nonsmall-cell lung cancer (June 2021) NICE TA705 Recommended
- Atezolizumab with carboplatin and etoposide for untreated extensive-stage small-cell lung cancer (July 2020) NICE TA638 Recommended with restrictions
- Atezolizumab with nab-paclitaxel for untreated PD-L1-positive, locally advanced or metastatic, triple-negative breast cancer (July 2020) NICE TA639 Recommended
- Atezolizumab with bevacizumab for treating advanced or unresectable hepatocellular carcinoma (December 2020)
 NICE TA666 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Atezolizumab (Tecentriq®) for the treatment of adult patients with locally advanced or metastatic non-small cell lung cancer (NSCLC) after prior chemotherapy. Patients with EGFR activating mutations or ALK-positive tumour mutations should also have received targeted therapy before receiving Tecentriq® (July 2018) SMC No. 1336/18 Recommended with restrictions
- Atezolizumab (Tecentriq®), in combination with bevacizumab, paclitaxel and carboplatin, is indicated for the first-line treatment of adult patients with metastatic non-squamous non-small cell lung cancer (NSCLC) (November 2019) SMC No. SMC2208 Not recommended

- Atezolizumab (Tecentriq®) as monotherapy for the first-line treatment of adult patients with metastatic non-small cell lung cancer (NSCLC) whose tumours have a PD-L1 expression on 50% or more tumour cells (TC) or 10% or more tumour-infiltrating immune cells (IC) and who do not have epidermal growth factor receptor (EGFR) mutant or anaplastic lymphoma kinase (ALK)-positive NSCLC (November 2021) SMC No. SMC2379 Recommended
- Atezolizumab (*Tecentriq*[®]) in combination with carboplatin and etoposide, is indicated for the first-line treatment of adult patients with extensive-stage small cell lung cancer (November 2020) SMC No. SMC2279 Recommended
- ➤ Atezolizumab (*Tecentriq*®) as monotherapy for the treatment of adult patients with locally advanced or metastatic urothelial carcinoma: after prior platinum-containing chemotherapy, or who are considered cisplatin ineligible (November 2018) SMC No. SMC2103 Not recommended
- Atezolizumab (Tecentriq[®]) in combination with nab-paclitaxel for the treatment of adult patients with unresectable locally advanced or metastatic triple-negative breast cancer whose tumours have PD-L1 expression at a level of 1 % or more and who have not received prior chemotherapy for metastatic disease (November 2020) SMC No. SMC2267 Recommended
- Atezolizumab (Tecentriq®) in combination with bevacizumab for the treatment of adult patients with advanced or unresectable hepatocellular carcinoma who have not received prior systemic therapy (July 2021) SMC No. SMC2349
 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polysorbates, sucrose

► Tecentria (Roche Products Ltd)

Atezolizumab 60 mg per 1 ml Tecentriq 840mg/14ml concentrate for solution for infusion vials | 1 vial Pom £2,665.38 (Hospital only) Tecentriq 1200mg/20ml concentrate for solution for infusion vials | 1 vial Pom £3,807.69 (Hospital only)

Avelumab

10-Sep-2021

 DRUG ACTION Avelumab is a human monoclonal antibody, which binds to the programmed death-ligand 1 (PD-L1), thereby reactivating the immune response to tumour cells.

• INDICATIONS AND DOSE

Merkel cell carcinoma (specialist use only) | Renal cell carcinoma (specialist use only) | Urothelial carcinoma (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: 800 mg every 2 weeks, for information on dose delay or discontinuation due to side-effects and infusion-related reactions—consult product literature

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ATEZOLIZUMAB (TECENTRIQ®) AND OTHER IMMUNE-STIMULATORY ANTI-CANCER DRUGS: RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (SCARS) (JUNE 2021) Severe cutaneous adverse reactions (SCARs), including cases of Stevens-Johnson syndrome (SIS) and toxic epidermal necrolysis (TEN), have been reported in patients treated with immunostimulant antineoplastic drugs, such as avelumab. Healthcare professionals are advised to monitor patients for suspected severe skin reactions and exclude other causes. Patients should be advised to seek urgent medical attention if severe skin reactions occur. If a SCAR is suspected, avelumab therapy should be withheld and the patient referred to a specialist for diagnosis and treatment. Avelumab should be permanently discontinued for any grade confirmed SIS or TEN, and for any grade 4 SCAR. Caution is recommended when considering the use of avelumab in patients with a history of severe or life-threatening

SCAR associated with other immunostimulant antineoplastic drugs.

- CAUTIONS Patients should receive pre-medication to minimise the development of adverse reactions (consult product literature)
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ➤ Common or very common Anaemia · appetite decreased · arthralgia · asthenia · back pain · chills · constipation · cough · diarrhoea · dizziness · dry mouth · dyspnoea · fevergastrointestinal discomfort · headache · hypertension · hyperthyroidism · hyponatraemia · hypothyroidism · influenza like illness · influsion related reaction · lymphopenia · myalgia · nausea · nerve disorders · peripheral oedema · respiratory disorders · skin reactions · thrombocytopenia · vomiting · weight decreased
- Uncommon Adrenal hypofunction · arthritis · eosinophilia · flushing · gastrointestinal disorders · hepatic disorders · hyperglycaemia · hypersensitivity · hypotension · myositis · nephritis · neuromuscular dysfunction · renal failure · thyroiditis
- Rare or very rare Cardiac inflammation · diabetes mellitus · hypopituitarism · pancreatitis · systemic inflammatory response syndrome · uveitis
- Frequency not known Endocrine disorders
 SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions For treatment modifications in patients with grade 1 or 2 infusion-related reactions, consult product literature. Manufacturer advises permanently discontinue treatment in patients with grade 3 or 4 infusion-related reaction.

Immune-related reactions Most immune-related adverse reactions are reversible and managed by temporarily stopping treatment and administration of a corticosteroid—consult product literature for further information.

- CONCEPTION AND CONTRACEPTION Manufacturer advises women of child-bearing potential should use effective contraception during treatment and for at least 1 month after stopping treatment.
- PREGNANCY Manufacturer advises avoid unless essential—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid during treatment and for at least 1 month after stopping treatment—no information available.
- MONITORING REQUIREMENTS Manufacturer advises monitor for signs and symptoms of infusion- and immunerelated reactions.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises for intermittent intravenous infusion (Bavencia®), dilute requisite dose with Sodium Chloride 0.9%; give over 60 minutes via a separate line using a low-protein binding 0.2 micron filter.
- PRESCRIBING AND DISPENSING INFORMATION Avelumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for storage conditions after preparation of the infusion.
- PATIENT AND CARER ADVICE Patients should be provided with an alert card. A patient information brochure highlighting important safety information to minimise the risk of immune-related side-effects is also available.

Driving and skilled tasks Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Avelumab for treating metastatic Merkel cell carcinoma (updated April 2021) NICE TA517 Recommended with restrictions
- Avelumab for untreated metastatic Merkel cell carcinoma (April 2021) NICE TA691 Recommended with restrictions
- Avelumab with axitinib for untreated advanced renal cell carcinoma (September 2020) NICE TA645 Recommended

Scottish Medicines Consortium (SMC) decisions

- Avelumab (Bavencio®) as monotherapy for the treatment of adult patients with metastatic Merkel cell carcinoma (May 2018) SMC No. 1315/18 Recommended
- Avelumab (Bavencio[®]) in combination with axitinib for the first-line treatment of adult patients with advanced renal cell carcinoma (October 2020) SMC No. SMC2248 Recommended
- Avelumab (Bavencio[®]) as monotherapy for the first-line maintenance treatment of adult patients with locally advanced or metastatic urothelial carcinoma who are progression-free following platinum-based chemotherapy (August 2021) SMC No. SMC2359 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

Bavencio (Merck Serono Ltd)

Avelumab 20 mg per 1 ml Bavencio 200mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £768.00

Belantamab mafodotin

05-Jul-2021

 DRUG ACTION Belantamab mafodotin is an antibody-drug conjugate that contains belantamab linked to mcMMAF, a cytotoxic microtubule disrupting agent.

• INDICATIONS AND DOSE

Multiple myeloma (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: 2.5 mg/kg every 3 weeks, for dose adjustments, interruption, and discontinuation due to side-effects and infusion-related reactions—consult product literature
- CAUTIONS History of dry eyes
- SIDE-EFFECTS
- Common or very common Anaemia · decreased leucocytes · diarrhoea · dry eye · eye discomfort · eye inflammation · fever · increased risk of infection · infusion related reaction · nausea · neutropenia · thrombocytopenia · vision disorders · vomiting
- ▶ Frequency not known Eye disorders · fatigue · lethargy
- CONCEPTION AND CONTRACEPTION Evg: Females of childbearing potential should use effective contraception during treatment and for 4 months after last treatment; male patients should use effective contraception during treatment and for 6 months after last treatment if their partner is of childbearing potential. (*) See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY EVGT Avoid unless potential benefit outweighs risk—embryotoxic in animal studies.
 See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Ever Discontinue breast-feeding before starting treatment and for 3 months after last treatment.

MONITORING REQUIREMENTS

- ► Evgr Ophthalmic examination is advised at baseline, before the first 3 treatment cycles, and as clinically indicated during treatment—consult product literature.
- ➤ Obtain complete blood counts at baseline and monitor during treatment as clinically indicated—consult product literature. ♠
- PRESCRIBING AND DISPENSING INFORMATION Belantamab mafodotin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.
- HANDLING AND STORAGE Store in a refrigerator (2–8 °C) consult product literature for storage conditions after preparation of the infusion.
- PATIENT AND CARER ADVICE Patients should be advised to administer preservative-free artificial tears at least four times daily during treatment and to avoid wearing contact lenses until treatment is completed.
 Driving and skilled tasks Patients and their carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of vision disorders.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

EXCIPIENTS: May contain Disodium edetate, polysorbates

▶ Blenrep (GlaxoSmithKline UK Ltd) ▼

Belantamab mafodotin 100 mg Blenrep 100mg powder for concentrate for solution for infusion vials | 1 vial PoM £5,707.83 (Hospital only)

Bevacizumah

19-May-2021

 DRUG ACTION Bevacizumab is a monoclonal antibody that inhibits vascular endothelial growth factor.

INDICATIONS AND DOSE

Colorectal cancer (specialist use only) | Breast cancer (specialist use only) | Renal cell carcinoma (specialist use only) | Non-small cell lung cancer (specialist use only) | Epithelial ovarian cancer (specialist use only) | Fallopian tube cancer (specialist use only) | Primary peritoneal cancer (specialist use only) | Carcinoma of the cervix (specialist use only) | Hepatocellular carcinoma (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BEVACIZUMAB AND SUNITINIB: RISK OF OSTEONECROSIS OF THE JAW (JANUARY 2011)

Treatment with bevacizumab or sunitinib may be a risk factor for the development of osteonecrosis of the jaw.

Patients treated with bevacizumab or sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk.

Dental examination and appropriate preventive dentistry should be considered before treatment with bevacizumab or sunitinib.

If possible, invasive dental procedures should be avoided in patients treated with bevacizumab or sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

MHRA/CHM ADVICE: SYSTEMICALLY ADMINISTERED VEGF PATHWAY INHIBITORS: RISK OF ANEURYSM AND ARTERY DISSECTION (JULY 2020)

A European review of worldwide data concluded that systemically administered VEGF pathway inhibitors may lead to aneurysm and artery dissection in patients with

or without hypertension. Some fatal cases have been reported, mainly in relation to aortic aneurysm rupture and aortic dissection. The MHRA advises healthcare professionals to carefully consider the risk of aneurysm and artery dissection in patients with risk factors before initiating treatment with bevacizumab; any modifiable risk factors (such as smoking and hypertension) should be reduced as much as possible. Patients should be monitored and treated for hypertension as required.

■ CAUTIONS Elective surgery (withhold treatment and avoid for at least 28 days after major surgery or until wound fully healed) · history of cardiovascular disease (increased risk of cardiovascular events, especially in the elderly) · history of hypertension (increased risk of proteinuria—discontinue if nephrotic syndrome) · increased risk of fistulas (discontinue permanently if tracheo-oesophageal or grade 4 fistula develops) · increased risk of haemorrhage · increased risk of tumour-associated haemorrhage · intraabdominal inflammation (risk of gastro-intestinal perforation and gall bladder perforation) · risk factors for aneurysm or artery dissection · risk factors for arterial thromboembolism · uncontrolled hypertension · untreated CNS metastases

CAUTIONS, FURTHER INFORMATION

- Monitoring of blood pressure The MHRA advises to monitor blood pressure regularly—consult product literature if hypertension occurs during treatment.
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common Abscess · anaemia · appetite decreased · arthralgia · asthenia · congestive heart failure · constipation · cough · decreased leucocytes · dehydration · diarrhoea · drowsiness · dysarthria · dysphonia · dyspnoea · electrolyte imbalance · embolism and thrombosis · eye disorders · fever · fistula · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · healing impaired · hypersensitivity · hypertension · hypoxia · increased risk of infection · infusion related reaction · mucositis · muscle weakness · myalgia · nausea · neutropenia · ovarian failure · pain · pelvic pain · peripheral neuropathy · proteinuria · rectovaginal fistula · sepsis · skin reactions · stomatitis · stroke · supraventricular tachycardia · syncope · taste altered · thrombocytopenia · vomiting · weight decreased
- ► Rare or very rare Encephalopathy necrotising fasciitis (discontinue and initiate treatment promptly)
- Frequency not known Aneurysm artery dissection chest pain chills flushing gallbladder perforation hyperglycaemia hypotension nasal septum perforation osteonecrosis of jaw pulmonary hypertension renal thrombotic microangiopathy
- CONCEPTION AND CONTRACEPTION Effective contraception required during and for at least 6 months after treatment in women.
- PREGNANCY Avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid breastfeeding during and for at least 6 months after treatment.
- MONITORING REQUIREMENTS
- Monitor for necrotising fasciitis (usually secondary to wound healing complications, gastro-intestinal perforation or fistula formation)—discontinue and initiate treatment promptly.
- ▶ Monitor for congestive heart failure.
- Monitor for posterior reversible encephalopathy syndrome (presenting as seizures, headache, altered mental status, visual disturbance or cortical blindness, with or without hypertension).

- Consider dental check-up before initiating treatment (risk of osteonecrosis of the jaw).
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007) NICE TA118 Not recommended
- Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010) NICE TA212 Not recommended
- Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242 Not recommended
- Bevacizumab (first-line), sorafenib (first and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced and/or metastatic renal cell carcinoma (August 2009) NICE TAI78 Not recommended
- Bevacizumab in combination with a taxane for the first-line treatment of metastatic breast cancer (February 2011)
 NICE TA214 Not recommended
- Bevacizumab in combination with capecitabine for the firstline treatment of metastatic breast cancer (August 2012)
 NICE TA263 Not recommended
- Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013) NICE TA284 Not recommended
- Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013) NICE TA285 Not recommended
- Atezolizumab with bevacizumab for treating advanced or unresectable hepatocellular carcinoma (December 2020)
 NICE TA666 Recommended with restrictions
- Olaparib plus bevacizumab for maintenance treatment of advanced ovarian, fallopian tube or primary peritoneal cancer (April 2021) NICE TA693 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Bevacizumab (Avastin®) in combination with capecitabine for first-line treatment of metastatic breast cancer (May 2012) SMC No. 778/12 Not recommended
- Bevacizumab (Avastin®) in combination with paclitaxel, topotecan, or pegylated liposomal doxorubicin for the treatment of platinum-resistant recurrent ovarian, fallopian tube, or primary peritoneal cancer (September 2015) SMC No. 1063/15 Recommended with restrictions
- ▶ Bevacizumab (Avastin®) in combination with carboplatin and paclitaxel, for the front-line treatment of advanced (International Federation of Gynaecology and Obstetrics (FIGO) stages IIIB, IIIC and IV) epithelial ovarian, fallopian tube, or primary peritoneal cancer (November 2015) SMC No. 806/12 Recommended with restrictions

All Wales Medicines Strategy Group (AWMSG) decisions

- ▶ Bevacizumab (Avastin®) in combination with paclitaxel and cisplatin, or, alternatively, paclitaxel and topotecan in patients who cannot receive platinum therapy, for the treatment of adult patients with persistent, recurrent, or metastatic carcinoma of the cervix (September 2017) AWMSG No. 2166 Not recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection.

Solution for infusion

► Alymsys (Zentiva Pharma UK Ltd) ▼ Bevacizumab 25 mg per 1 ml Alymsys 400mg/16ml concentrate for solution for infusion vials | 1 vial PoM £810.10 (Hospital only) Alymsys 100mg/4ml concentrate for solution for infusion vials | 1 vial PoM £205.55 (Hospital only)

- Avastin (Roche Products Ltd)
- Bevacizumab 25 mg per 1 ml Avastin 400mg/16ml solution for infusion vials | 1 vial Pom £924.40 (Hospital only) Avastin 100mg/4ml solution for infusion vials | 1 vial PoM £242.66 (Hospital only)
- ▶ Avbintio (Organon Pharma (UK) Ltd) Bevacizumab 25 mg per 1 ml Aybintio 100mg/4ml solution for infusion vials | 1 vial Pom £218.39 (Hospital only) Aybintio 400mg/16ml solution for infusion vials | 1 vial Pom £831.96 (Hospital only)
- Oyavas (Thornton & Ross Ltd)

Bevacizumab 25 mg per 1 ml Oyavas 400mg/16ml concentrate for solution for infusion vials | 1 vial Pom £877.80 (Hospital only) Oyavas 100mg/4ml concentrate for solution for infusion vials 1 vial PoM £230.00 (Hospital only)

Zirahev (Pfizer Ltd)

Bevacizumab 25 mg per 1 ml Zirabev 400mg/16ml solution for infusion vials | 1 vial Pom £902.70 (Hospital only) Zirabev 100mg/4ml solution for infusion vials | 1 vial Pom £225.67 (Hospital only)

Blinatumomab

17-May-2021

• DRUG ACTION The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

INDICATIONS AND DOSE

Relapsed or refractory Philadelphia chromosomenegative acute lymphoblastic leukaemia (initiated by a specialist)

- ► BY CONTINUOUS INTRAVENOUS INFUSION
- Adult: (consult product literature)

Philadelphia chromosome-negative acute lymphoblastic leukaemia in complete remission with minimal residual disease (initiated by a specialist)

- ► BY CONTINUOUS INTRAVENOUS INFUSION
- Adult (body-weight 45 kg and above): (consult product literature)
- CAUTIONS Aphasia · brain injuries (severe) · cerebellar disease · dementia · elderly—limited information available · epilepsy · paresis · Parkinson's disease · patients may need pre-medication to minimise adverse reactions. psychosis · seizure · severe hepatic impairment · severe renal impairment · stroke

CAUTIONS, FURTHER INFORMATION

- Pre-medication Manufacturer advises pre-medication with a corticosteroid and an anti-pyretic—consult product literature.
- ▶ Neurological events There is potentially a higher risk of neurological events in patients with clinically relevant CNS pathology-manufacturer advises caution.
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · anaemia · arrhythmias · ataxia · chest discomfort · chills · cognitive disorder · confusion · constipation · cough · cranial nerve disorder · decreased leucocytes · diarrhoea · dizziness · drowsiness · dyspnoea · encephalopathy · facial swelling · fever · flushing · headache · hyperbilirubinaemia · hypersensitivity · hypertension · hypogammaglobulinaemia · hypoglobulinaemia · hypotension · immune disorder · increased risk of infection ·infusion related reaction · insomnia · leucocytosis · memory loss · nausea · neutropenia · oedema · pain · respiratory disorders · seizure · sensation abnormal · sepsis · skin reactions · speech impairment · thrombocytopenia · tremor · tumour lysis syndrome · vomiting · weight increased
- ▶ Uncommon Capillary leak syndrome haemophagocytic lymphohistiocytosis · lymphadenopathy · pancreatitis
- ► Frequency not known Consciousness impaired psychiatric disorder · viral infection reactivation

SIDE-EFFECTS, FURTHER INFORMATION Pancreatitis Lifethreatening or fatal cases of pancreatitis have been reported; manufacturer advises monitor for signs and symptoms of pancreatitis during treatment—temporary interruption or discontinuation may be required (consult product literature).

Cytokine release syndrome, infusion-reactions and tumour lysis syndrome Life-threatening (including fatal) cases of cytokine release syndrome and tumour lysis syndrome have been reported in patients taking blinatumomab. Manufacturer advises monitor signs and symptoms of cytokine release syndrome and infusion reactions during treatment; temporary interruption or discontinuation may be required—consult product literature.

- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during treatment and for at least 48 hours after treatment in women of child-bearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk-no information available; if exposed during pregnancy, monitor infant for B-cell depletion. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid during and for at least 48 hours after treatment—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (no information available).
- RENAL IMPAIRMENT EVGT Caution in severe impairment (no information available).
- MONITORING REQUIREMENTS Manufacturer advises neurological examination prior to the initiation of treatment and continued monitoring during treatment consult product literature.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2-8°C); consult product literature for storage conditions after reconstitution and dilution.
- PATIENT AND CARER ADVICE A patient alert card should be provided. Educational materials should be provided to patients, carers and healthcare professionals to ensure blinatumomab is used in a safe and effective way, and to prevent the risk of medication errors and neurological events—consult product information. Driving and skilled tasks Manufacturer advises patients and carers should be counselled about the effects on driving
 - and performance of skilled tasks-increased risk of confusion, disorientation, co-ordination and balance disorders, seizures and disturbances in consciousness.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

- ▶ Blinatumomab for previously treated Philadelphiachromosome-negative acute lymphoblastic leukaemia (June 2017) NICE TA450 Recommended
- ▶ Blinatumomab for treating acute lymphoblastic leukaemia in remission with minimal residual disease activity (July 2019) NICE TA589 Recommended with restrictions
- Scottish Medicines Consortium (SMC) decisions
- ▶ Blinatumomab (Blincyto®) as monotherapy for the treatment of adults with Philadelphia chromosome-negative CD19 positive B-precursor acute lymphoblastic leukaemia in first or second complete remission with minimal residual disease greater than or equal to 0.1% (March 2020) SMC No. SMC2234 Recommended with restrictions

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion **EXCIPIENTS:** May contain Polysorbates

▶ Blincyto (Amgen Ltd) ▼

Blinatumomab 38.5 microgram Blincyto 38.5 micrograms powder for concentrate and solution for solution for infusion vials 1 vial Pom £2,017.00 (Hospital only)

Brentuximab vedotin

03-Feh-2021

INDICATIONS AND DOSE

CD30 positive Hodgkin lymphoma (specialist use only) Systemic anaplastic large cell lymphoma (specialist use only) | CD30 positive cutaneous T-cell lymphoma (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)
- CAUTIONS Elevated BMI—risk of hyperglycaemia · high tumour burden-risk of tumour lysis syndrome · rapidly proliferating tumours-risk of tumour lysis syndrome
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · alopecia · anaemia · arthralgia · back pain · chills · constipation · cough · diarrhoea · dizziness · dyspnoea · fatigue · fever · hyperglycaemia · increased risk of infection · infusion related reaction · myalgia · nausea · nerve disorders · neutropenia · skin reactions · thrombocytopenia · vomiting · weight decreased
- ▶ Uncommon Anaphylactic reaction cytomegalovirus infection reactivation · pancreatitis acute · sepsis · severe cutaneous adverse reactions (SCARs) · tumour lysis
- ► Frequency not known Disease recurrence gastrointestinal disorders · gastrointestinal haemorrhage · progressive multifocal leukoencephalopathy (PML) · respiratory
- CONCEPTION AND CONTRACEPTION Effective contraception required during treatment and for 6 months after treatment in men and women.
- PREGNANCY Avoid unless potential benefit outweighs risk (toxicity in animal studies).
- BREAST FEEDING Avoid—no information available.
- MONITORING REQUIREMENTS
- Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or behavioural signs or symptoms).
- ▶ Monitor for new or worsening abdominal pain investigate and withhold treatment if acute pancreatitis suspected and discontinue if confirmed (fatal cases reported).
- ► Monitor for pulmonary toxicity—treat symptoms promptly.
- Routinely monitor hepatic function.
- ► Monitor for infusion-related (including anaphylactic)
- Monitor for signs of peripheral neuropathy—consult product literature for treatment adjustment.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

- ► Brentuximab vedotin for treating relapsed or refractory systemic anaplastic large cell lymphoma (October 2017) NICE TA478 Recommended with restrictions
- ► Brentuximab vedotin in combination for untreated systemic anaplastic large cell lymphoma (August 2020) NICE TA641 Recommended

- ► Brentuximab vedotin for treating CD30-positive Hodgkin lymphoma (June 2018) NICE TA524 Recommended with restrictions
- ► Brentuximab vedotin for treating CD30-positive cutaneous Tcell lymphoma (April 2019) NICE TA577 Recommended with

Scottish Medicines Consortium (SMC) decisions

- ► Brentuximab vedotin (Adcetris®) for the treatment of adult patients with CD30-positive cutaneous T-cell lymphoma (CTCL) after at least one prior systemic therapy (January 2020) SMC No. SMC2229 Recommended with restrictions
- ► Brentuximab vedotin (Adcetris®) in combination with cyclophosphamide, doxorubicin and prednisone for adult patients with previously untreated systemic anaplastic large cell lymphoma (sALCL) (January 2021) SMC No. SMC2310 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

EXCIPIENTS: May contain Polysorbates ELECTROLYTES: May contain Sodium

▶ Adcetris (Takeda UK Ltd)

Brentuximab vedotin 50 mg Adcetris 50mg powder for concentrate for solution for infusion vials 1 vial Pom £2,500.00 (Hospital only)

Cemiplimab

19-Jul-2021

 DRUG ACTION Cemiplimab is a human immunoglobulin G4 monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor thereby potentiating an immune response to tumour cells.

INDICATIONS AND DOSE

Cutaneous squamous cell carcinoma (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: 350 mg every 3 weeks, for dose interruption or discontinuation of treatment due to side-effects or infusion-related reactions—consult product literature

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ATEZOLIZUMAB (TECENTRIO®) AND OTHER IMMUNE-STIMULATORY ANTI-CANCER DRUGS: RISK OF SEVERE **CUTANEOUS ADVERSE REACTIONS (SCARS) (JUNE 2021)** Severe cutaneous adverse reactions (SCARs), including cases of Stevens-Johnson syndrome (SJS) and toxic epidermal necrolysis (TEN), have been reported in patients treated with immunostimulant antineoplastic drugs, such as cemiplimab. Healthcare professionals are advised to monitor patients for suspected severe skin reactions and exclude other causes. Patients should be advised to seek urgent medical attention if severe skin reactions occur. If a SCAR is suspected, cemiplimab therapy should be withheld and the patient referred to a specialist for diagnosis and treatment. Cemiplimab should be permanently discontinued for any grade confirmed SJS or TEN, and for any grade 4 SCAR. Caution is recommended when considering the use of cemiplimab in patients with a history of severe or lifethreatening SCAR associated with other immunostimulant antineoplastic drugs.

- CAUTIONS For full details consult product literature.
- INTERACTIONS → Appendix 1: monoclonal antibodies
- ► Common or very common Arthralgia · arthritis · asthenia · colitis · diarrhoea · hepatic disorders · hyperthyroidism · hypothyroidism · infusion related reaction · myalgia · pain · pneumonitis · skin reactions · stomatitis
- ► Uncommon Adrenal insufficiency · cardiac inflammation · diabetic ketoacidosis · encephalitis · hypophysitis · immune thrombocytopenic purpura · keratitis · meningitis · muscle

weakness · myasthenia gravis · nephritis · nerve disorders · nervous system disorders · Sjögren's syndrome · thyroiditis · type 1 diabetes mellitus · vasculitis

► Frequency not known Encephalitis non-infective • severe cutaneous adverse reactions (SCARs)

BNF 84

- CONCEPTION AND CONTRACEPTION Manufacturer advises females of childbearing potential should use effective contraception during treatment and for at least 4 months after the last dose. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises discontinue breast-feeding during treatment and for at least 4 months after stopping—no information available.
- MONITORING REQUIREMENTS Manufacturer advises monitor for signs and symptoms of infusion- and immunerelated side-effects—consult product literature.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises for intermittent intravenous infusion, dilute to a concentration between 1 mg/mL and 20 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 30 minutes through a low-protein binding in-line or add-on filter (pore size 0.2-5 micron).
- PRESCRIBING AND DISPENSING INFORMATION Cemiplimab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.

The manufacturer of *Libtayo* [®] has provided a *Risk minimisation materials* document for healthcare professionals.

- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature about storage after preparation of the infusion.
- PATIENT AND CARER ADVICE

Risk of immune-related side-effects A patient alert card and patient guide should be provided.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

► Cemiplimab for treating metastatic or locally advanced cutaneous squamous cell carcinoma (August 2019) NICE TA592 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Cemiplimab (Libtayo®) as monotherapy for the treatment of adult patients with metastatic or locally advanced cutaneous squamous cell carcinoma (CSCC) who are not candidates for curative surgery or curative radiation (February 2020) SMC No. SMC2216 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain L-proline, polysorbates, sucrose

► Libtayo (Sanofi) ▼ Cemiplimab 50 mg per 1 ml Libtayo 350mg/7ml concentrate for solution for infusion vials | 1 vial PoM £4,650.00 (Hospital only)

Cetuximab

20-May-2021

INDICATIONS AND DOSE

Metastatic colorectal cancer with a BRAF V600E mutation (in combination with encorafenib) | Treatment of wild-type RAS metastatic colorectal cancer in patients with tumours expressing epidermal growth factor receptor, as combination therapy, or as monotherapy if oxaliplatin- and irinotecan-based therapy has failed or if irinotecan is not tolerated | Treatment of locally advanced squamous cell cancer of the head and neck (in combination with radiotherapy) | Treatment of recurrent or metastatic squamous cell cancer of the head and neck (in combination with platinum-based chemotherapy)

- ► BY INTRAVENOUS INFUSION
- Adult (initiated by a specialist): (consult product literature or local protocols)

IMPORTANT SAFETY INFORMATION

Patients must receive an antihistamine and a corticosteroid at least one hour before infusion. Resuscitation facilities should be available and treatment should be initiated by a specialist.

MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diarnosed.

CONTRA-INDICATIONS

- When used for treatment of wild-type ras metastatic colorectal cancer in patients with tumours expressing epidermal growth factor receptor, in combination therapy with oxaliplatin-containing chemotherapy RAS mutated colorectal tumours (or if RAS tumour status unknown)
- CAUTIONS Cardiopulmonary disease · cardiovascular disease · history of keratitis · pulmonary disease—discontinue if interstitial lung disease · risk factors for keratitis · risk factors for ulcerative keratitis (including contact lens use) · severe dry eye
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common Appetite decreased · cytokine release syndrome · dehydration · diarrhoea · electrolyte imbalance · eye inflammation · fatigue · headache · hypersensitivity · infusion related reaction · mucositis · nausea · skin eruption · vomiting
- Uncommon Embolism and thrombosis · interstitial lung disease
- ► Rare or very rare Severe cutaneous adverse reactions (SCARs)
- Frequency not known Meningitis aseptic superinfection of skin lesions
- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Use only if potential benefit outweighs risk no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Avoid breast-feeding during and for 2 months after treatment—no information available.

■ PRF-TREATMENT SCREENING

- ▶ When used for Treatment of wild-type RAS metastatic colorectal cancer in patients with tumours expressing epidermal growth factor receptor, as combination therapy, or as monotherapy if oxaliplatin- and irinotecan-based therapy has failed or if irinotecan is not tolerated <code>EvGr</code> Evidence of non-mutated (wild-type) RAS status (at exons 2, 3, and 4 of KRAS and NRAS) is required before cetuximab is initiated, and should be determined by an experienced laboratory using a validated test method. ◆
- MONITORING REQUIREMENTS
- EvGr Monitor serum electrolyte levels prior to therapy and periodically during treatment.
- Monitor for signs and symptoms of infusion-related reactions—consult product literature.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises resuscitation facilities should be available.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Cetuximab for the treatment of locally advanced squamous cell cancer of the head and neck (June 2008) NICE TA145 Recommended
- Cetuximab for treating recurrent or metastatic squamous cell cancer of the head and neck (August 2017) NICE TA473 Recommended
- Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242 Not recommended
- Cetuximab and panitumumab for previously untreated metastatic colorectal cancer (updated September 2017)
 NICE TA439 Recommended with restrictions
- Encorafenib plus cetuximab for previously treated BRAF V600E mutation-positive metastatic colorectal cancer (January 2021) NICE TA668 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Erbitux (Merck Serono Ltd)

Cetuximab 5 mg per 1 ml Erbitux 100mg/20ml solution for infusion vials | 1 vial PoM £178.10 (Hospital only)

Erbitux 500mg/100ml solution for infusion vials | 1 vial PoM £890.50 (Hospital only)

Daratumumab

04-May-2022

 DRUG ACTION Daratumumab is a monoclonal antibody that binds to CD38, a cell-surface protein, resulting in tumour cell death by immune-mediated actions and apoptosis.

• INDICATIONS AND DOSE

Multiple myeloma (specialist use only)

- ► BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
 ► Adult: (consult product literature or local protocols)
- IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DARATUMUMAB (*DARZALEX*®): RISK OF REACTIVATION OF HEPATITIS B VIRUS (AUGUST 2019)

An EU cumulative review of worldwide data has identified reports of hepatitis B virus (HBV) reactivation in patients treated with daratumumab, including several fatal cases. Healthcare professionals are advised to screen all patients for hepatitis B before starting treatment; patients with unknown serology already being treated with daratumumab should also be screened. Those with positive serology should be monitored for signs of HBV reactivation during, and for at least 6 months after, treatment; immediate medical attention should be sought if signs and symptoms of

HBV reactivation develop. Daratumumab should be stopped in patients with HBV reactivation and appropriate treatment initiated, based on expert advice. Experts should be consulted before resuming daratumumab in patients with adequately controlled viral reactivation.

 CAUTIONS History of obstructive pulmonary disorder (consider additional post-medication—consult product literature) - patients may need pre-medication to minimise adverse reactions - risk of herpes zoster reactivation (consider antiviral prophylaxis)

CAUTIONS, FURTHER INFORMATION

- Infusion-related reactions Serious infusion-related reactions can occur following either intravenous or subcutaneous injection, and daratumumab should only be administered by appropriately trained staff where resuscitation facilities are available; manufacturer advises pre-medication with a corticosteroid, an antihistamine and an anti-pyretic and post-medication with oral corticosteroids—consult product literature. Manufacturer advises patients should be closely monitored for signs of infusion-related reactions during and after administration; in the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common
- ▶ With intravenous use Pruritus
- With parenteral use Anaemia · appetite decreased · arthralgia · asthenia · atrial fibrillation · chills · constipation · cough · decreased leucocytes · dehydration · diarrhoea · dizziness · dyspnoea · fever · headache · hyperglycaemia · hypertension · hypocalcaemia · increased risk of infection · infusion related reaction · insomnia · muscle spasms · nausea · neutropenia · pain · pancreatitis · paraesthesia · peripheral neuropathy · peripheral oedema · pulmonary oedema · rash · sepsis · thrombocytopenia · vomiting
- ► Uncommon
- ▶ With parenteral use Hepatitis B reactivation

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises treatment should be immediately interrupted if an infusion-related reaction of any grade or severity occurs—consult product literature for specific management recommendations.

- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception in women of childbearing potential during treatment and for 3 months after stopping treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- EFFECT ON LABORATORY TESTS Possible positive indirect Coombs test (may affect antibody screening).
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator at 2–8°C; consult product literature for storage advice following dilution.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

▶ Daratumumab with bortezomib and dexamethasone for previously treated multiple myeloma (April 2019) NICE TA573 Recommended with restrictions

- ► Daratumumab in combination for untreated multiple myeloma when a stem cell transplant is suitable (February 2022) NICE TA763 Recommended
- > Daratumumab monotherapy for treating relapsed and refractory multiple myeloma (April 2022) NICE TA783 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ► Daratumumab (Darzalex®) as monotherapy, for the treatment of adult patients with relapsed and refractory multiple myeloma, whose prior therapy included a proteasome inhibitor and an immunomodulatory agent and have demonstrated disease progression on the last therapy (October 2017) SMC No. 1205/17 Recommended with restrictions
- ► Daratumumab (Darzalex®) in combination with lenalidomide and dexamethasone, or bortezomib and dexamethasone. for the treatment of adult patients with multiple myeloma who have received at least one prior therapy (July 2019) SMC No. SMC2180 Recommended with restrictions
- ► Daratumumab subcutaneous injection (*Darzalex*®) in combination with lenalidomide and dexamethasone, or bortezomib and dexamethasone, for the treatment of adult patients with multiple myeloma who have received at least one prior therapy (October 2020) SMC No. SMC2301 Recommended with restrictions
- Daratumumab subcutaneous injection (Darzalex®) as monotherapy, for the treatment of adult patients with relapsed and refractory multiple myeloma, whose prior therapy included a proteasome inhibitor and an immunomodulatory agent and have demonstrated disease progression on the last therapy (October 2020) SMC No. SMC2304 Recommended with restrictions
- ► Daratumumab (*Darzalex*®) in combination with bortezomib. thalidomide and dexamethasone for the treatment of adult patients with newly diagnosed multiple myeloma who are eligible for autologous stem cell transplant (January 2021) SMC No. SMC2302 Recommended
- ► Daratumumab subcutaneous injection (Darzalex®) in combination with bortezomib, thalidomide and dexamethasone for the treatment of adult patients with newly diagnosed multiple myeloma who are eligible for autologous stem cell transplant (January 2021) SMC No. SMC2326 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Polysorbates, sorbitol

▶ Darzalex (Janssen-Cilag Ltd) Daratumumab 120 mg per 1 ml Darzalex 1800mg/15ml solution for injection vials | 1 vial Pom £4,320.00 (Hospital only)

Solution for infusion

EXCIPIENTS: May contain Polysorbates ELECTROLYTES: May contain Sodium

Darzalex (Janssen-Cilag Ltd) ▼ Daratumumab 20 mg per 1 ml Darzalex 100mg/5ml concentrate for solution for infusion vials | 1 vial Pom £360.00 (Hospital only) Darzalex 400mg/20ml concentrate for solution for infusion vials 1 vial Pom £1,440.00 (Hospital only)

Dinutuximab beta

• DRUG ACTION Dinutuximab beta is a chimeric monoclonal antibody; it specifically targets the carbohydrate moiety of disialoganglioside 2, which is overexpressed on neuroblastoma cells.

INDICATIONS AND DOSE

High-risk neuroblastoma (specialist use only)

- **▶** BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

- CONTRA-INDICATIONS Acute grade 3 or 4, or extensive chronic graft-versus-host disease
- CAUTIONS Avoid vaccinations during and for at least 10 weeks after treatment cessation (increased risk of immune stimulation and neurological toxicity) · ensure absence of systemic infection—any other infection should be controlled before treatment initiation · pre-medication must be administered to minimise the risk of infusionrelated reactions and neuropathic pain

CAUTIONS, FURTHER INFORMATION

 Pre-medication Severe infusion-related reactions can occur and dinutuximab beta should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises premedication with an antihistamine, and to monitor closely, particularly during the first and second treatment course; discontinue immediately if reaction occurs and treat as indicated-consult product literature.

Manufacturer advises pre-medication with non-opioid analgesics, gabapentin and opioids-consult product literature.

- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- Common or very common Anaemia · anxiety · appetite decreased · arthralgia · ascites · capillary leak syndrome · chest pain · chills · constipation · cough · cytokine release syndrome · decreased leucocytes · device related infection · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · eye disorders · eye inflammation · fever · fluid imbalance · gastrointestinal discomfort · gastrointestinal disorders · haematuria · headache · heart failure · hyperhidrosis · hypersensitivity · hypertension · hypertriglyceridaemia · hypoalbuminaemia · hypotension · hypoxia · increased risk of infection · left ventricular dysfunction · muscle spasms · nausea · neutropenia · oedema · oral disorders · pain · paraesthesia · pericardial effusion · peripheral neuropathy · photosensitivity reaction · pulmonary oedema · renal impairment · respiratory disorders · seizure · sepsis · skin reactions · tachycardia · thrombocytopenia · tremor · urinary retention · urine abnormalities · vision disorders · vomiting · weight changes
- ▶ Uncommon Disseminated intravascular coagulation eosinophilia · hepatocellular injury · hypovolaemic shock · intracranial pressure increased • peripheral vascular disease · posterior reversible encephalopathy syndrome
- ► Frequency not known Erythropenia
- CONCEPTION AND CONTRACEPTION Manufacturer advises women of childbearing potential should use contraception during and for 6 months after stopping treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid during treatment and for 6 months after the last dose-no information available.
- MONITORING REQUIREMENTS
- ▶ Manufacturer advises pre-treatment evaluation of pulse oximetry, bone marrow function, liver function and renal function—consult product literature for values required for treatment initiation.
- ► Manufacturer advises monitor circulatory and respiratory function—risk of capillary leak syndrome.
- ► Manufacturer advises monitor liver function and electrolytes regularly.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2-8°C)—consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.

PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients should not use or drive machines during treatment.

 NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

► Dinutuximab beta for treating neuroblastoma (August 2018) NICE TA538 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ► Dinutuximab beta (Qarziba®) for the treatment of high-risk neuroblastoma in patients aged 12 months and above, who have previously received induction chemotherapy and achieved at least a partial response, followed by myeloablative therapy and stem cell transplantation, as well as patients with history of relapsed or refractory neuroblastoma, with or without residual disease (November 2018) SMC No. SMC2105 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Qarziba (EUSA Pharma (UK) Ltd)

Dinutuximab beta 4.5 mg per 1 ml Qarziba 20mg/4.5ml concentrate for solution for infusion vials | 1 vial Pom £7,610.00

Dostarlimah

01-Apr-2022

• DRUG ACTION Dostarlimab is a humanised monoclonal antibody which binds to the programmed death-1 (PD-1) receptor, thereby potentiating an immune response to tumour cells.

• INDICATIONS AND DOSE

Endometrial cancer (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: 500 mg every 3 weeks for 4 doses on weeks 1, 4, 7, and 10, followed by 1 g every 6 weeks from week 13 onwards, for dose delay or discontinuation due to sideeffects and infusion-related reactions—consult product literature
- CAUTIONS History of severe or life-threatening cutaneous adverse reactions associated with other immunostimulant antineoplastic drugs · risk of transplant-related complications

CAUTIONS, FURTHER INFORMATION

- Transplant-related complications **EvGr** Patients who receive an allogeneic haematopoietic stem cell transplant before or after dostarlimab treatment may be at an increased risk of transplant-related complications, and should be closely monitored. There may also be an increased risk of rejection in solid organ transplant recipients.
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common Adrenal insufficiency anaemia arthralgia · autoimmune haemolytic anaemia · chills · diarrhoea · enterocolitis haemorrhagic · fever · gastrointestinal disorders · hyperthyroidism · hypertransaminasaemia · hypothyroidism · infusion related reaction · myalgia · nausea · pancreatitis · respiratory disorders · skin reactions · vomiting
- ► Uncommon Diabetic ketoacidosis eye inflammation hepatic disorders · hypophysitis · nephritis · thyroiditis · type 1 diabetes mellitus
- Frequency not known Hypersensitivity

SIDE-EFFECTS, FURTHER INFORMATION Immune-related reactions Manufacturer advises most immune-related adverse reactions are reversible and managed by temporarily stopping treatment and administration of a corticosteroid—consult product literature.

Infusion-related reactions Manufacturer advises permanently discontinue treatment in patients with severe infusion reactions.

- CONCEPTION AND CONTRACEPTION EVGr Females of childbearing potential should use effective contraception during treatment and for 4 months after last treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Evgr Avoid—limited information available. M See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING EVGT Avoid during treatment and for at least 4 months after last treatment—no information available.
- MONITORING REQUIREMENTS EVGT Monitor for signs and symptoms of infusion- and immune-related reactionsconsult product literature.
- DIRECTIONS FOR ADMINISTRATION EVGT For intravenous infusion, dilute to a concentration of 2-10 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 30 minutes via an infusion pump. (M)
- PRESCRIBING AND DISPENSING INFORMATION Dostarlimab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.
- HANDLING AND STORAGE Store in a refrigerator (2–8°C) and protect from light-consult product literature for storage conditions after dilution.
- PATIENT AND CARER ADVICE A patient card should be
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

> Dostarlimab for previously treated advanced or recurrent endometrial cancer with high microsatellite instability or mismatch repair deficiency (March 2022) NICE TA779 Recommended

Scottish Medicines Consortium (SMC) decisions

- Dostarlimab (Jemperli®) as monotherapy for the treatment of adult patients with recurrent or advanced mismatch repair deficient or microsatellite instability-high endometrial cancer that has progressed on or following prior treatment with a platinum-containing regimen (March 2022) SMC No. SMC2404 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polysorbates

▶ Dostarlimab (non-proprietary)

Dostarlimab 50 mg per 1 ml Jemperli 500mg/10ml concentrate for solution for infusion vials | 1 vial Pom £5,887.33 (Hospital only)

Durvalumab

19-Jul-2021

 DRUG ACTION Durvalumab is a human monoclonal antibody that selectively binds to programmed cell death ligand-1 (PD-L1), blocking its interaction with the programmed death-1 (PD-1) receptor and with CD80, and thereby potentiating an immune response to tumour cells.

INDICATIONS AND DOSE

Non-small cell lung cancer (initiated by a specialist)

- ► BY INTRAVENOUS INFUSION
- Adult: 10 mg/kg every 2 weeks, consult product literature for information on dose adjustments based on individual patient safety and tolerability

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ATEZOLIZUMAB (TECENTRIQ®) AND OTHER IMMUNE-STIMULATORY ANTI-CANCER DRUGS: RISK OF SEVERE **CUTANEOUS ADVERSE REACTIONS (SCARS) (JUNE 2021)** Severe cutaneous adverse reactions (SCARs), including cases of Stevens-Johnson syndrome (SJS) and toxic epidermal necrolysis (TEN), have been reported in patients treated with immunotimulant antineoplastic drugs, such as durvalumab. Healthcare professionals are advised to monitor patients for suspected severe skin reactions and exclude other causes. Patients should be advised to seek urgent medical attention if severe skin reactions occur. If a SCAR is suspected, durvalumab therapy should be withheld and the patient referred to a specialist for diagnosis and treatment. Durvalumab should be permanently discontinued for any grade confirmed SIS or TEN, and for any grade 4 SCAR. Caution is recommended when considering the use of durvalumab in patients with a history of severe or lifethreatening SCAR associated with other immunostimulant antineoplastic drugs.

- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-FFFFCTS
- ► Common or very common Cough · diarrhoea · dysphonia · dysuria · fever · flank pain · gastrointestinal discomfort · gastrointestinal disorders · hyperthyroidism · hypothyroidism · increased risk of infection · infusion related reaction · myalgia · night sweats · peripheral oedema · respiratory disorders · skin reactions · thyroiditis
- ► Uncommon Adrenal insufficiency · glomerulonephritis · hepatic disorders · myopathy · nephritis · type 1 diabetes mellitus
- ▶ Rare or very rare Diabetes insipidus hypophysitis hypopituitarism myocarditis

SIDE-EFFECTS, FURTHER INFORMATION Immune-related reactions Manufacturer advises that most immune-related adverse reactions resolved with appropriate management, including initiation of immunosuppressive treatment and treatment modifications—consult product literature.

Infusion-related reactions Manufacturer advises to permanently discontinue treatment in patients with severe infusion reactions.

- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception in women of childbearing potential during treatment and for at least 3 months after stopping treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.

- MONITORING REQUIREMENTS Manufacturer advises monitor for signs and symptoms of infusion- and immunerelated reactions—consult product literature.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises for intravenous infusion, dilute to a concentration between 1 mg/mL and 15 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 60 minutes through a low-protein binding in-line filter (pore size 0.2 or 0.22 micron).
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after preparation of the infusion.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

 Durvalumab for treating locally advanced unresectable nonsmall-cell lung cancer after platinum-based chemoradiation (May 2019) NICE TA578 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Durvalumab (Imfinzi®) for locally advanced, unresectable non-small cell lung cancer after platinum-based chemoradiation in adults (June 2019) SMC No. SMC2156 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polysorbates

Durvalumab 50 mg per 1 ml Imfinzi 120mg/2.4ml concentrate for solution for infusion vials | 1 vial PoM 5592.00 (Hospital only) Imfinzi 500mg/10ml concentrate for solution for infusion vials | 1 vial PoM 52,466.00 (Hospital only)

Elotuzumab

12-Apr-2019

 DRUG ACTION Elotuzumab is a monoclonal antibody that targets the signalling lymphocytic activation molecule family member 7 (SLAMF7) protein, thereby activating natural killer cells and mediating myeloma cell death.

• INDICATIONS AND DOSE

Multiple myeloma in patients who have received at least one prior therapy (in combination with lenalidomide and dexamethasone) (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: 10 mg/kg every week, on days 1, 8, 15 and 22 of cycles 1 and 2, then 10 mg/kg every 2 weeks, on days 1 and 15 of subsequent cycles
- CAUTIONS Pre-medication must be administered to minimise the development of infusion-related reactions consult product literature • secondary primary malignancies

CAUTIONS, FURTHER INFORMATION

- Secondary primary malignancies Manufacturer advises to monitor for the development of secondary primary malignancy before and during treatment with elotuzumab.
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common Chest pain · cough · decreased leucocytes · deep vein thrombosis · diarrhoea · fatigue · fever · headache · hypersensitivity · increased risk of infection · infusion related reaction · mood altered · night sweats · numbness · oropharyngeal pain · weight decreased
- ► Frequency not known Second primary malignancy SIDE-EFFECTS, FURTHER INFORMATION Side-effects reported when used in combination with lenalidomide and dexamethasone, bortezomib and dexamethasone, or pomalidomide and dexamethasone.

Infusion-related reactions Manufacturer advises for mild-to-moderate infusion reactions interrupt treatment or reduce infusion rate, and monitor closely (consult product literature); permanently discontinue therapy in severe infusion reactions.

- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception in men and women of childbearing potential; male patients should continue effective contraceptive measures for 180 days after stopping treatment if their partner is pregnant or of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid unless essential—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after preparation of the infusion.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

EXCIPIENTS: May contain Polysorbates, sucrose

Empliciti (Bristol-Myers Squibb Pharmaceuticals Ltd)

Empliciti (Bristol-Myers Squibb Pharmaceuticals Ltd)
 Elotuzumab 300 mg Empliciti 300mg powder for concentrate for solution for infusion vials | 1 vial Pom £1,085.00 (Hospital only)
 Elotuzumab 400 mg Empliciti 400mg powder for concentrate for solution for infusion vials | 1 vial Pom £1,446.00 (Hospital only)

I Gemtuzumab ozogamicin

06-Nov-2020

 DRUG ACTION Gemtuzumab ozogamicin is a monoclonal antibody that binds to CD33-expressing tumour cells to induce cell cycle arrest and apoptotic cell death.

• INDICATIONS AND DOSE

CD33-positive acute myeloid leukaemia (specialist use only)

- **▶** BY INTRAVENOUS INFUSION
- Adult: (consult product literature)
- CAUTIONS Adverse-risk cytogenetics (consider benefits and risks of treatment, consult product literature) haematopoietic stem cell transplantation (increased risk of hepatotoxicity) - pre-medication recommended to minimise adverse reactions

CAUTIONS, FURTHER INFORMATION

- Pre-medication Serious infusion-related reactions can occur and gemtuzumab ozogamicin should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises pre-medication with a corticosteroid, paracetamol and antihistamine 1 hour prior to dosing, and to take appropriate measures to help prevent the development of tumour lysis-related hyperuricaemia—consult product literature.
- INTERACTIONS → Appendix 1: gemtuzumab ozogamicin
- SIDE-EFFECTS
- ➤ Common or very common Anaemia · appetite decreased · ascites · chills · constipation · decreased leucocytes · diarrhoea · dyspnoea · fatigue · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · hypotension · infection · infusion related reaction (including fatal cases) · multi organ failure · nausea · neutropenia · oedema · pancytopenia · sinusoidal obstruction syndrome · skin reactions · stomatitis · tachycardia · thrombocytopenia · tumour lysis syndrome (including fatal cases) · vomiting
- ► Frequency not known Interstitial pneumonia

 SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions (including fatal cases) can occur during the first

- 24 hours after administration. Manufacturer advises interrupt treatment immediately and treat as clinically indicated (consult product literature); permanent discontinuation should be strongly considered in patients who develop signs and symptoms of anaphylaxis.
- CONCEPTION AND CONTRACEPTION Manufacturer advises
 women of childbearing potential should use 2 methods of
 effective contraception during treatment and for at least
 7 months after the last dose; male patients should use 2
 methods of effective contraception during treatment and
 for at least 4 months after the last dose if their partner is of
 childbearing potential. See also Pregnancy and reproductive
 function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid during treatment and for at least one month after the last doseno information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate-to-severe impairment—increased risk of developing hepatotoxicity; postpone treatment if serum transaminases (ALT or AST) greater than 2.5 times the upper limit of normal or total bilirubin greater than 2 times the upper limit of normal.
- MONITORING REQUIREMENTS
- ► Manufacturer advises monitor complete blood counts prior to each dose as well as signs and symptoms of infection, bleeding and other effects of myelosuppression during treatment; dose interruption or discontinuation of treatment may be required—consult product literature.
- Manufacturer advises monitor for signs and symptoms of infusion-related reactions—close clinical monitoring, including pulse, blood pressure and temperature, should be performed during infusion; monitor for signs and symptoms of tumour lysis syndrome.
- Manufacturer advises monitor for signs and symptoms of hepatotoxicity (including hepatic veno-occlusive disease); liver tests should be monitored prior to each dose—consult product literature.

PRESCRIBING AND DISPENSING INFORMATION Gemtuzumab ozogamicin is a biological medicine.

Gemtuzumab ozogamicin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

 HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after reconstitution and dilution.

PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue and headache.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

► Gemtuzumab ozogamicin for untreated acute myeloid leukaemia (November 2018) NICE TA545 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

▶ Gemtuzumab ozogamicin (Mylotarg®) as combination therapy with daunorubicin and cytarabine for the treatment of patients age 15 years and above with previously untreated, de novo CD33-positive acute myeloid leukaemia, except acute promyelocytic leukaemia (October 2018) SMC No. SMC2089 Recommended with restrictions MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ Mylotarg (Pfizer Ltd) ▼

BNF 84

Gemtuzumab ozogamicin 5 mg Mylotarg 5mg powder for concentrate for solution for infusion vials | 1 vial Pom £6,300.00 (Hospital only)

Inotuzumab ozogamicin

09-Nov-2020

 DRUG ACTION Inotuzumab ozogamicin is a monoclonal antibody that binds to CD22-expressing tumour cells to induce cell cycle arrest and apoptotic cell death.

INDICATIONS AND DOSE

Monotherapy for relapsed or refractory CD22-positive B cell precursor acute lymphoblastic leukaemia (under expert supervision)

- ► BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)
- CONTRA-INDICATIONS Prior confirmed severe or ongoing sinusoidal obstruction syndrome
- CAUTIONS History of, or predisposition to QT-interval prolongation (e.g. electrolyte disturbances, concomitant use of drugs that prolong the QT interval) patients may need pre-medication to minimise adverse reactions patients undergoing haematopoietic stem cell transplantation (increased risk of hepatotoxicity)
 CAUTIONS, FURTHER INFORMATION
- Pre-medication Manufacturer advises pre-medication with a corticosteroid, antipyretic and antihistamine prior to dosing in all patients and pre-medication to reduce uric acid levels and hydration in patients with a high tumour burden (increased risk of tumour lysis syndrome)—consult product literature.
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-FFFFCTS
- ► Common or very common Anaemia · appetite decreased · ascites · bone marrow disorders · central nervous system haemorrhage · chills · constipation · decreased leucocytes · diarrhoea · fatigue · fever · gastrointestinal discomfort · haemorrhage · headache · hyperbilirubinaemia · hypersensitivity · hyperuricaemia · increased risk of infection · infusion related reaction · nausea · neutropenia · QT interval prolongation · sepsis · sinusoidal obstruction syndrome · stomatitis · thrombocytopenia · tumour lysis syndrome · vomiting
- ► Frequency not known Hepatotoxicity
 - SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises interrupt treatment if an infusion related reaction occurs; depending on the severity, discontinuation of the infusion or administration of steroids and antihistamines should be considered (consult product literature); permanently discontinue treatment in severe or life-threatening infusion reactions.
- CONCEPTION AND CONTRACEPTION Manufacturer advises
 effective contraception in women of childbearing potential
 during treatment and for at least 8 months after the last
 dose; male patients should use effective contraception
 during treatment and for at least 5 months after the last
 dose if their partner is of childbearing potential. See also
 Pregnancy and reproductive function in Cytotoxic drugs
 p. 962.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- BREAST FEEDING Manufacturer advises avoid during treatment and for at least two months after the last dose no information available.

 HEPATIC IMPAIRMENT Manufacturer advises caution if bilirubin and transaminase levels are raised (limited information available); avoid in serious ongoing impairment

Dose adjustments Manufacturer advises dose interruption or discontinuation according to bilirubin and transaminase levels.

- PRE-TREATMENT SCREENING Manufacturer advises baseline CD22 positivity of greater than 0% is required prior to initiating treatment.
- MONITORING REQUIREMENTS
- ➤ Manufacturer advises monitor complete blood counts prior to each dose as well as signs and symptoms of infection, bleeding and other effects of myelosuppresion during treatment; dose reduction or interruption or discontinuation of treatment may be required—consult product literature.
- Manufacturer advises monitor for signs of infusion related-reactions during and for at least 1 hour after infusion; monitor for signs and symptoms of tumour lysis syndrome.
- Manufacturer advises ECG and electrolytes should be monitored prior to the start of treatment and periodically during treatment; monitor for increases in serum amylase and lipase.
- Manufacturer advises monitor for signs and symptoms of sinusoidal obstruction syndrome; liver tests should be monitored prior to and following each dose—consult product literature.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises resuscitation facilities should be available during administration.
- PRESCRIBING AND DISPENSING INFORMATION Inotuzumab ozogamicin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after reconstitution and dilution.
- PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

 Inotuzumab ozogamicin for treating relapsed or refractory Bcell acute lymphoblastic leukaemia (September 2018)
 NICE TA541 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Inotuzumab ozogamicin (Besponsa®) as monotherapy for the treatment of adults with relapsed or refractory CD22-positive B cell precursor acute lymphoblastic leukaemia (ALL). Adult patients with Philadelphia chromosome positive relapsed or refractory B cell precursor ALL should have failed treatment with at least 1 tyrosine kinase inhibitor (June 2018) SMC No. 1328/18 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

▶ Besponsa (Pfizer Ltd) ▼

Inotuzumab ozogamicin 1 mg Besponsa 1mg powder for concentrate for solution for infusion vials | 1 vial PoM £8,048.00 (Hospital only)

I Ipilimumab

08-Apr-2022

 DRUG ACTION Ipilimumab is a monoclonal antibody which causes T-cell activation resulting in tumour cell death.

INDICATIONS AND DOSE

Melanoma (as monotherapy) (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: 3 mg/kg every 3 weeks for 4 doses, for dose interruption or discontinuation of treatment due to immune-related side-effects—consult product literature

Melanoma (in combination with nivolumab) (specialist use only) | Renal cell carcinoma (in combination with nivolumab) (specialist use only) | Non-small cell lung cancer (in combination with nivolumab and platinumbased chemotherapy) (specialist use only) | Malignant pleural mesothelioma (in combination with nivolumab) (specialist use only) | Colorectal cancer (in combination with nivolumab) (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: IPILIMUMAB (YERVOY®): REPORTS OF CYTOMEGALOVIRUS (CMV) GASTROINTESTINAL INFECTION OR REACTIVATION (JANUARY 2019)

There have been post-marketing cases of gastrointestinal CMV infection or reactivation in ipilimumab-treated patients reported to have conticosteroid-refractory immune-related colitis, including fatal cases.

Patients should be advised to contact their healthcare professional immediately at the onset of symptoms of colitis. Possible causes, including infections, should be investigated; a stool infection work-up should be performed and patients screened for CMV. For patients with corticosteroid-refractory immune-related colitis, use of an additional immunosuppressive agent should only be considered if other causes are excluded using viral PCR on biopsy, and eliminating other viral, bacterial, and parasitic causes.

MHRA/CHM ADVICE: ATEZOLIZUMAB (TECENTRIQ®) AND OTHER IMMUNE-STIMULATORY ANTI-CANCER DRUGS: RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (SCARS) (JUNE 2021)

Severe cutaneous adverse reactions (SCARs), including cases of Stevens-Johnson syndrome (SJS) and toxic epidermal necrolysis (TEN), have been reported in patients treated with immunostimulant antineoplastic drugs, such as ipilimumab. Healthcare professionals are advised to monitor patients for suspected severe skin reactions and exclude other causes. Patients should be advised to seek urgent medical attention if severe skin reactions occur. If a SCAR is suspected, ipilimumab therapy should be withheld and the patient referred to a specialist for diagnosis and treatment. Ipilimumab should be permanently discontinued for any grade confirmed SJS or TEN, and for any grade 4 SCAR. Caution is recommended when considering the use of ipilimumab in patients with a history of severe or lifethreatening SCAR associated with other immunostimulant antineoplastic drugs.

- CAUTIONS For full details consult product literature.
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common Alopecia · anaemia · appetite decreased · arthralgia · asthenia · cancer pain · chills · confusion · constipation · cough · dehydration · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · eye discomfort · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache ·

- hepatic disorders · hypophysitis · hypopituitarism · hypotension · hypothyroidism · influenza like illness · lethargy · lymphopenia · mucositis · muscle complaints · musculoskeletal discomfort · nausea · nerve disorders · night sweats · oedema · pain · skin reactions · vasodilation · vision disorders · vomiting · weight decreased
- ▶ **Uncommon** Adrenal hypofunction alkalosis allergic rhinitis · amenorrhoea · arrhythmias · arthritis · brain oedema · depression · dysarthria · eosinophilia · eye inflammation · glomerulonephritis · haemolytic anaemia · hair colour changes · hypersensitivity · hyperthyroidism · hypogonadism · increased risk of infection · infusion related reaction · libido decreased · meningitis aseptic · movement disorders · multi organ failure · muscle weakness · myopathy · nephritis autoimmune · neutropenia · pancreatitis · paraneoplastic syndrome · peripheral ischaemia · polymyalgia rheumatica · psychiatric disorder • pulmonary oedema • renal failure • renal tubular acidosis · respiratory disorders · sepsis · severe cutaneous adverse reactions (SCARs) · stomatitis · syncope · systemic inflammatory response syndrome · thrombocytopenia · tremor · tumour lysis syndrome · vascular disorders · vasculitis
- ► Rare or very rare Myasthenia gravis proteinuria serous retinal detachment thyroiditis
- Frequency not known Cytomegalovirus infection reactivation · haemophagocytic lymphohistiocytosis · solid organ transplant rejection

SIDE-EFFECTS, FURTHER INFORMATION A corticosteroid can be used after starting ipilimumab, to treat immune-related reactions.

- CONCEPTION AND CONTRACEPTION Use effective contraception.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
 HEPATIC IMPAIRMENT Manufacturer advises caution if
- HEPATIC IMPAIRMENT Manufacturer advises caution if bilirubin greater than 3 times upper limit of normal range or if transaminases equal to or greater than 5 times upper limit of normal range (limited information available).
- MONITORING REQUIREMENTS
- ► [EVGT] Monitor liver function tests and thyroid function prior to initiation of treatment and before each dose.
- Monitor for electrolyte disturbances before and periodically during treatment.
- ► Monitor for signs and symptoms of gastrointestinal perforation, immune-related reactions, and cardiac and pulmonary reactions during treatment—consult product literature. Patients should be monitored for adverse reactions for at least 5 months after the last dose. ◆
- **DIRECTIONS FOR ADMINISTRATION** Ever For intravenous infusion, give undiluted or dilute to a concentration of 1−4 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 30 or 90 minutes (depending on dose—consult product literature) through an in-line filter (pore size 0.2−1.2 micron). ♠
- PRESCRIBING AND DISPENSING INFORMATION Ipilimumab
 is a biological medicine. Biological medicines must be
 prescribed and dispensed by brand name, see Biological
 medicines and Biosimilar medicines, under Guidance on
 prescribing p. 1; record the brand name and batch number
 after each administration.

Infusion-related side-effects have been reported. If mild or moderate reactions occur, premedication is recommended; treatment should be discontinued for severe reactions.

 HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8 °C) and protect from light—consult product literature for further information regarding

- storage conditions outside refrigerator and after preparation of the infusion.
- PATIENT AND CARER ADVICE A patient information guide and alert card should be provided. Driving and skilled tasks Patients and carers should be

counselled on the effects on driving and performance of skilled tasks-increased risk of fatigue.

 NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

- ► Ipilimumab for previously treated advanced (unresectable or metastatic) melanoma (December 2012) NICE TA268 Recommended with restrictions
- ► Ipilimumab for previously untreated advanced (unresectable or metastatic) melanoma (July 2014) NICE TA319 Recommended with restrictions
- ▶ Nivolumab in combination with ipilimumab for treating advanced melanoma (July 2016) NICE TA400 Recommended with restrictions
- ► Nivolumab with ipilimumab for previously treated metastatic colorectal cancer with high microsatellite instability or mismatch repair deficiency (July 2021) NICE TA716 Recommended
- ► Nivolumab with ipilimumab and chemotherapy for untreated metastatic non-small-cell lung cancer (September 2021) NICE TA724 Not recommended
- Nivolumab with ipilimumab for untreated advanced renal cell carcinoma (March 2022) NICE TA780 Recommended

Scottish Medicines Consortium (SMC) decisions

- ▶ Ipilimumab (Yervoy®) for the treatment of advanced (unresectable or metastatic) melanoma in adults who have received prior therapy (April 2013) SMC No. 779/12 Recommended
- ▶ Ipilimumab (Yervoy®) for the treatment of advanced (unresectable or metastatic) melanoma in adults (first-line use) (November 2014) SMC No. 997/14 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

► Yervoy (Bristol-Myers Squibb Pharmaceuticals Ltd) Ipilimumab 5 mg per 1 ml Yervoy 50mg/10ml concentrate for solution for infusion vials | 1 vial Pom £3,750.00 (Hospital only) Yervoy 200mg/40ml concentrate for solution for infusion vials 1 vial Pom £15,000.00 (Hospital only)

Isatuximab

 DRUG ACTION Isatuximab is a monoclonal antibody that binds to CD38, a cell-surface protein, resulting in tumour cell death by immune-mediated actions and apoptosis.

INDICATIONS AND DOSE

Multiple myeloma (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: 10 mg/kg every week on days 1, 8, 15 and 22 of the first 28-day cycle, then 10 mg/kg every 2 weeks on days 1 and 15 of subsequent 28-day cycles until disease progression or unacceptable toxicity, for dose interruption, adjustment of infusion rate or discontinuation of treatment due to infusion-related reactions or side-effects—consult product literature
- CAUTIONS Pre-medication must be administered to minimise the development of infusion-related reactionsconsult product literature · secondary primary malignancies

CAUTIONS, FURTHER INFORMATION

 Infusion-related reactions Serious infusion-related reactions can occur and isatuximab should only be administered when appropriately trained staff and resuscitation

- facilities are immediately available; manufacturer advises pre-medication with dexamethasone, an antihistamine, and an anti-pyretic—consult product literature. Manufacturer advises patients should be closely monitored for signs of infusion-related reactions during and after administration; in the event of a hypersensitivity reaction. treatment should be stopped immediately and appropriate management initiated—consult product literature.
- Secondary primary malignancies Manufacturer advises to monitor for the development of secondary primary malignancy before and during treatment with isatuximab and initiate treatment as indicated.

SIDE-EFFECTS

- Common or very common Appetite decreased · atrial fibrillation · diarrhoea · dyspnoea · fatigue · increased risk of infection · infusion related reaction · nausea · neoplasms · neutropenia · vomiting · weight decreased
- ▶ Uncommon Anaphylactic reaction
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception in female patients of childbearing potential during treatment and for 5 months after last treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid during first few days after birth-possible risk from transfer of antibodies to infant. After this time, use during breastfeeding only if clinically needed.
- EFFECT ON LABORATORY TESTS Manufacturer advises may cause false positive indirect Coombs test-consult product literature. Manufacturer advises may affect accuracy of both serum protein electrophoresis (SPE) and immunofixation (IFE) assays—consult product literature.
- PRESCRIBING AND DISPENSING INFORMATION The manufacturer of Sarclisa® has provided a Prescriber

Isatuximab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration

- HANDLING AND STORAGE Store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after preparation of the infusion.
- PATIENT AND CARER ADVICE A patient alert card should be
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

► Isatuximab with pomalidomide and dexamethasone for treating relapsed and refractory multiple myeloma (November 2020) NICE TA658 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- ► Isatuximab (Sarclisa®) in combination with pomalidomide and dexamethasone for the treatment of adult patients with relapsed and refractory multiple myeloma who have received at least two prior therapies, including lenalidomide and a proteasome inhibitor, and have demonstrated disease progression on the last therapy (April 2021) SMC No. SMC2303 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polysorbates, sucrose

 Sarclisa (Sanofi Genzyme) Isatuximab 20 mg per 1 ml Sarclisa 500mg/25ml concentrate for solution for infusion vials | 1 vial Pom £2,534.69 (Hospital only)

Sarclisa 100mg/5ml concentrate for solution for infusion vials | 1 vial | PoM| \$506.94 (Hospital only)

Mogamulizumab

04-Jan-2022

 DRUG ACTION Mogamulizumab is a monoclonal antibody, which binds to the CCR4 receptor, thereby potentiating an immune response to cancer cells.

• INDICATIONS AND DOSE

Mycosis fungoides (initiated by a specialist) | Sézary syndrome (initiated by a specialist)

- ► BY INTRAVENOUS INFUSION
- Adult: 1 mg/kg every week on days 1, 8, 15 and 22 of the first 28-day cycle, followed by 1 mg/kg every 2 weeks on days 1 and 15 of subsequent 28-day cycles, dose to be administered within 2 days of the scheduled day, for treatment interruption or discontinuation due to side-effects and infusion-related reactions—consult product literature
- CAUTIONS Patients may need pre-medication to minimise infusion-related reactions ⋅ risk factors for cardiac disorders ⋅ risk of serious infection and/or viral reactivation such as hepatitis B ⋅ risk of transplant-related complications

CAUTIONS, FURTHER INFORMATION

- Pre-medication Manufacturer advises pre-medication with an antihistamine and an anti-pyretic—consult product literature.
- Hepatitis B infection Manufacturer advises patients should be tested for hepatitis B infection before treatment initiation; expert advice on measures against hepatitis B reactivation should be sought for patients with positive hepatitis B serology.
- Transplant-related complications Manufacturer advises patients who receive an allogeneic haematopoietic stem cell transplant within 50 days of mogamulizumab treatment are at higher risk of complications, such as severe graft-versus-host disease, and should be closely monitored.
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- Common or very common Anaemia · constipation · diarrhoea · fatigue · fever · headache · hypothyroidism · increased risk of infection · infusion related reaction · leucopenia · nausea · neutropenia · peripheral oedema · sepsis · skin reactions · stomatitis · thrombocytopenia · vomiting
- ▶ Uncommon Hepatic disorders tumour lysis syndrome
- ► Frequency not known Cardiomyopathy · myocardial infarction · polymyositis · severe cutaneous adverse reactions (SCARs) · viral infection reactivation
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception in male and female patients of childbearing potential during treatment and for at least 6 months after last treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid—limited information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid during first few days after birth—possible risk from transfer of antibodies to infant. After this time, use during breastfeeding only if clinically needed.
- MONITORING REQUIREMENTS Manufacturer advises monitor electrolytes, hydration status and renal function, particularly in the first month of treatment—risk of tumour lysis syndrome.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises for intravenous infusion (Poteligeo[®]), dilute to a

- concentration between 0.1 mg/mL to 3 mg/mL with Sodium Chloride 0.9%; give over at least 60 minutes through a low-protein binding 0.22 micron in-line filter. Resuscitation facilities should be available.
- HANDLING AND STORAGE Store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after preparation of the infusion.
- PATIENT AND CARER ADVICE
 - **Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Mogamulizumab for previously treated mycosis fungoides and Sézary syndrome [in adults with mycosis fungoides] (December 2021) NICE TA754 Recommended with restrictions
- ► Mogamulizumab for previously treated mycosis fungoides and Sézary syndrome [in adults with Sézary syndrome] (December 2021) NICE TA754 Recommended

Scottish Medicines Consortium (SMC) decisions

- Mogamulizumab (Poteligeo®) for the treatment of adult patients with mycosis fungoides or Sézary syndrome who have received at least one prior systemic therapy (June 2021)
 SMC No. SMC2336 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polysorbates

▶ Poteligeo (Kyowa Kirin Ltd) ▼ Mogamulizumab 4 mg per 1 ml Poteligeo 20mg/5ml concentrate for solution for infusion vials | 1 vial FoM £1,329.00 (Hospital only)

Nivolumah

01-Apr-2022

 DRUG ACTION Nivolumab is a human immunoglobulin G4 monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor thereby potentiating an immune response to tumour cells.

• INDICATIONS AND DOSE

Melanoma (in combination with ipilimumab) (specialist use only) Renal cell carcinoma (in combination with cabozantinib or ipilimumab) (specialist use only) | Nonsmall cell lung cancer (in combination with ipilimumab and platinum-based chemotherapy) (specialist use only) | Malignant pleural mesothelioma (in combination with ipilimumab) (specialist use only) | Colorectal cancer (in combination with ipilimumab) (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

Melanoma (as monotherapy) (specialist use only) | Renal cell carcinoma (as monotherapy) (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: 240 mg every 2 weeks, for dose delay or discontinuation due to side-effects and infusionrelated reactions—consult product literature, alternatively 480 mg every 4 weeks, for dose delay or discontinuation due to side-effects and infusionrelated reactions—consult product literature

Non-small cell lung cancer (as monotherapy) (specialist use only) | Urothelial carcinoma (as monotherapy) (specialist use only) | Squamous cell cancer of the head and neck (as monotherapy) (specialist use only) | Classical Hodgkin lymphoma (as monotherapy) (specialist use only) | Oesophageal squamous cell carcinoma (as monotherapy) (specialist use only)

► BY INTRAVENOUS INFUSION

BNF 84

 Adult: 240 mg every 2 weeks, for dose delay or discontinuation due to side-effects and infusionrelated reactions—consult product literature

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: NIVOLUMAB (OPDIVO®): REPORTS OF ORGAN TRANSPLANT REJECTION (JULY 2017)

A European review of worldwide data concluded that nivolumab may increase the risk of rejection in organ transplant recipients. The MHRA recommends considering the benefit of treatment with nivolumab versus the risk of possible organ transplant rejection for each patient.

MHRA/CHM ADVICE: NIVOLUMAB (*OPDIVO* ®): REPORTS OF CYTOMEGALOVIRUS (CMV) GASTROINTESTINAL INFECTION OR REACTIVATION (OCTOBER 2019)

A European review of worldwide data identified cases suggestive of gastrointestinal CMV infection or reactivation in nivolumab-treated patients, including fatal cases

Patients should be advised to contact their healthcare professional immediately at the onset of symptoms of colitis. Possible causes, including infections, should be investigated; a stool infection work-up should be performed and patients screened for CMV. For patients with corticosteroid-refractory immune-related colitis, use of an additional immunosuppressive agent should only be considered if other causes are excluded using viral PCR on biopsy, and eliminating other viral, bacterial, and parasitic causes.

MHRA/CHM ADVICE: ATEZOLIZUMAB (TECENTRIQ®) AND OTHER IMMUNE-STIMULATORY ANTI-CANCER DRUGS: RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (SCARS) (JUNE 2021)

Severe cutaneous adverse reactions (SCARs), including cases of Stevens-Johnson syndrome (SJS) and toxic epidermal necrolysis (TEN), have been reported in patients treated with immunostimulant antineoplastic drugs, such as nivolumab. Healthcare professionals are advised to monitor patients for suspected severe skin reactions and exclude other causes. Patients should be advised to seek urgent medical attention if severe skin reactions occur. If a SCAR is suspected, nivolumab therapy should be withheld and the patient referred to a specialist for diagnosis and treatment. Nivolumab should be permanently discontinued for any grade confirmed SJS or TEN, and for any grade 4 SCAR. Caution is recommended when considering the use of nivolumab in patients with a history of severe or life-threatening SCAR associated with other immunostimulant antineoplastic drugs.

- CAUTIONS Haematopoietic stem cell transplant in patients with classical Hodgkin lymphoma · rapidly progressing or aggressive disease (delayed onset of effect)
 CAUTIONS. FURTHER INFORMATION
- Haematopoietic stem cell transplant
- ▶ When used for classical Hodgkin lymphoma [word Nivolumab may increase the risk of severe and potentially fatal graft-versus-host disease when used in patients with classical Hodgkin lymphoma who have undergone allogeneic haematopoietic stem cell transplant, particularly if there is a history of graft-versus-host disease. (★)
- INTERACTIONS → Appendix 1: monoclonal antibodies

SIDE-EFFECTS

- ➤ Common or very common Abdominal pain · alopecia · anaemia · appetite decreased · arthralgia · constipation · cough · decreased leucocytes · diarrhoea · dizziness · dry eye · dry mouth · dyspnoea · electrolyte imbalance · fatigue · fever · gastrointestinal disorders · haemolytic anaemia · headache · hyperglycaemia · hypersensitivity · hypertension · hyperthyroidism · hypoglycaemia · hypothyroidism · increased risk of infection · inflammation · infusion related reaction · muscle complaints · musculoskeletal discomfort · nausea · nerve disorders · neutropenia · oedema · pain · respiratory disorders · skin reactions · stomatitis · thrombocytopenia · vomiting · weight decreased
- Uncommon Adrenal hypofunction arrhythmias arthritis cardiac inflammation chest pain dehydration diabetes mellitus eosinophilia eye inflammation hepatic disorders hypophysitis hypopituitarism metabolic acidosis nephritis pancreatitis paresis pericardial disorders renal impairment sarcoidosis thyroiditis vision blurred
- ▶ Rare or very rare Connective tissue disorders · demyelination · diabetic ketoacidosis · histiocytic necrotising lymphadenitis · myopathy · neuromuscular dysfunction · severe cutaneous adverse reactions (SCARs) · vasculitis

▶ Frequency not known Cytomegalovirus infection

reactivation · haemophagocytic lymphohistiocytosis · hypoparathyroidism · meningitis aseptic · solid organ transplant rejection · tumour lysis syndrome SIDE-EFFECTS, FURTHER INFORMATION Immune-related reactions Manufacturer advises that most immune-related adverse reactions improved or resolved with appropriate management, including initiation of corticosteroids and treatment modifications—consult product literature for further information.

Infusion-related reactions Manufacturer advises that patients with mild or moderate infusion reactions may continue treatment with close monitoring and use of premedication according to local guidelines; discontinue treatment if severe infusion reactions occur.

- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception required during treatment and for at least 5 months after treatment in women of childbearing potential.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate to severe impairment (limited information available).

MONITORING REQUIREMENTS

- ► EvGr Monitor for signs and symptoms of immune-related reactions, and cardiac and pulmonary reactions during treatment. Patients should be monitored for adverse reactions for at least 5 months after the last dose
- ► Monitor for electrolyte disturbances before and periodically during treatment. ♠
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises for intermittent intravenous infusion, give undiluted or dilute to a concentration of not less than 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 30 or 60 minutes (depending on dose—consult product literature) through an in-line filter (pore size 0.2–1.2 micron).
- PRESCRIBING AND DISPENSING INFORMATION Nivolumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on

prescribing p. 1; record the brand name and batch number after each administration.

- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for storage conditions after preparation of the infusion.
- PATIENT AND CARER ADVICE Patients should be provided with a patient alert card with each prescription.
 Driving and skilled tasks Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Nivolumab for treating advanced (unresectable or metastatic) melanoma (February 2016) NICE TA384 Recommended
- Nivolumab in combination with ipilimumab for treating advanced melanoma (July 2016) NICE TA400 Recommended with restrictions
- Nivolumab for adjuvant treatment of completely resected melanoma with lymph node involvement or metastatic disease (March 2021) NICE TA684 Recommended
- Nivolumab for previously treated advanced renal cell carcinoma (updated November 2017) NICE TA417 Recommended
- Nivolumab with ipilimumab for untreated advanced renal cell carcinoma (March 2022) NICE TA780 Recommended
- Nivolumab for treating relapsed or refractory classical Hodgkin lymphoma (updated November 2017) NICE TA462 Recommended with restrictions
- Nivolumab for advanced squamous non-small-cell lung cancer after chemotherapy (October 2020) NICE TA655
 Recommended with restrictions
- Nivolumab for advanced non-squamous non-small-cell lung cancer after chemotherapy (July 2021) NICE TA713
 Recommended with restrictions
- Nivolumab with ipilimumab and chemotherapy for untreated metastatic non-small-cell lung cancer (September 2021)
 NICE TA724 Not recommended
- Nivolumab for treating locally advanced unresectable or metastatic urothelial cancer after platinum-containing chemotherapy (July 2018) NICE TA530 Not recommended
- Nivolumab for previously treated unresectable advanced or recurrent oesophageal cancer (June 2021) NICE TA707 Recommended
- Nivolumab for adjuvant treatment of resected oesophageal or gastro-oesophageal junction cancer (November 2021)
 NICE TA746 Recommended
- Nivolumab with ipilimumab for previously treated metastatic colorectal cancer with high microsatellite instability or mismatch repair deficiency (July 2021) NICE TA716 Recommended
- Nivolumab for treating recurrent or metastatic squamous cell carcinoma of the head and neck after platinum-based chemotherapy (October 2021) NICE TA736 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Nivolumab (Opdivo®) for the treatment of locally advanced or metastatic squamous non-small cell lung cancer (NSCLC) after prior chemotherapy in adults (July 2016) SMC No. 1144/16 Recommended
- Nivolumab (Opdivo®) for the treatment of locally advanced or metastatic non-squamous non-small cell lung cancer (NSCLC) after prior chemotherapy in adults (October 2016)
 SMC No. 1180/16 Recommended with restrictions
- Nivolumab (Opdivo®) in combination with ipilimumab and 2 cycles of platinum-based doublet chemotherapy for the first-line treatment of metastatic non-small cell lung cancer in adults whose tumours have no sensitising epidermal growth factor receptor mutations or anaplastic lymphoma kinase translocations (January 2022) SMC No. SMC2397 Not recommended

- Nivolumab (Opdivo®) for use as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adults (August 2016) SMC No. 1120/16 Recommended with restrictions
- Nivolumab (Opdivo®) in combination with ipilimumab for the treatment of advanced (unresectable or metastatic) melanoma in adults (November 2016) SMC No. 1187/16 Recommended with restrictions
- Nivolumab (Opdivo®) as monotherapy for the adjuvant treatment of adults with melanoma with involvement of lymph nodes or metastatic disease who have undergone complete resection (December 2018) SMC No. SMC2112 Recommended
- Nivolumab (Opdivo®) as monotherapy for the treatment of advanced renal cell carcinoma after prior therapy in adults (June 2017) SMC No. 1188/16 Recommended
- Nivolumab (Opdivo®) in combination with ipilimumab for the first-line treatment of adult patients with intermediate/poorrisk advanced renal cell carcinoma (June 2019)
 SMC No. SMC2153 Recommended
- Nivolumab (Opdivo®) for the treatment of adult patients with relapsed or refractory classical Hodgkin lymphoma (CHL) after autologous stem cell transplant (ASCT) and treatment with brentuximab vedotin (July 2017) SMC No. 1240/17 Recommended
- Nivolumab (Opdivo®) as monotherapy, for the treatment of squamous cell cancer of the head and neck (SCCHN) in adults progressing on or after platinum-based therapy (September 2017) SMC No. 1261/17 Recommended with restrictions
- Nivolumab (Opdivo®) as monotherapy for the treatment of locally advanced unresectable or metastatic urothelial carcinoma in adults after failure of prior platinum-containing therapy (January 2018) SMC No. 1285/18 Not recommended
- Nivolumab (Opdivo®) as monotherapy for the treatment of adult patients with unresectable advanced, recurrent or metastatic oesophageal squamous cell carcinoma after prior fluoropyrimidine and platinum-based combination chemotherapy (August 2021) SMC No. SMC2362 Recommended
- Nivolumab (Opdivo®) in combination with ipilimumab for the treatment of adults with mismatch repair deficient or microsatellite instability-high metastatic colorectal cancer who have been previously treated with fluoropyrimidinebased combination chemotherapy (December 2021)
 SMC No. SMC2394 Recommended
- Nivolumab (Opdivo®) in combination with ipilimumab for the first-line treatment of adult patients with unresectable malignant pleural mesothelioma (MPM) (February 2022) SMC No. SMC2385 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polysorbates ELECTROLYTES: May contain Sodium

F 926

Obinutuzumab

11-Nov-2020

• INDICATIONS AND DOSE

Treatment of previously untreated chronic lymphocytic leukaemia in patients for whom full-dose fludarabine-based therapy is unsuitable due to co-morbidities | Treatment of previously untreated advanced follicular lymphoma | Treatment of follicular lymphoma in patients who did not respond or who progressed during or up to six months after treatment with rituximab or a rituximab-containing regimen

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature or local protocols)
- CONTRA-INDICATIONS For obinutuzumab contraindications, consult product literature.
- CAUTIONS For full details on the cautions of obinutuzumab, consult product literature.
- Hepatitis B infection and reactivation Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking obinutuzumab. Manufacturer advises patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Manufacturer also advises patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection (consult product literature).
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-FFFFCTS
- ► Common or very common Arrhythmias · chest pain · dyspepsia · eye erythema · gastrointestinal disorders · heart failure · hypertension · hyperuricaemia · lymph node pain · nasal complaints · skin reactions · squamous cell carcinoma · tumour lysis syndrome · urinary disorders · weight increased
- Frequency not known Acute coronary syndrome angina pectoris chills dizziness dyspnoea flushing hypotension nausea viral infection reactivation
- CONCEPTION AND CONTRACEPTION Use effective contraception during and for 18 months after treatment.
- PREGNANCY Avoid unless potential benefit outweighs risk of B-lymphocyte depletion in fetus.
- BREAST FEEDING Avoid breast-feeding during and for 18 months after treatment—present in milk in animal studies.
- MONITORING REQUIREMENTS Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).
- PRESCRIBING AND DISPENSING INFORMATION Infusion related side-effects have been reported; Patients should receive premedication with paracetamol, an antihistamine, and a corticosteroid before each dose consult product literature for details.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Obinutuzumab in combination with chlorambucil for untreated chronic lymphocytic leukaemia (June 2015)
 NICE TA343 Recommended with restrictions
- Obinutuzumab for untreated advanced follicular lymphoma (March 2018) NICE TA513 Recommended with restrictions
- Obinutuzumab with bendamustine for treating follicular lymphoma after rituximab (May 2020) NICE TA629 Recommended

Scottish Medicines Consortium (SMC) decisions

- Obinutuzumab (Gazyvaro®) in combination with bendamustine followed by obinutuzumab maintenance is indicated for the treatment of patients with follicular lymphoma who did not respond or who progressed during or up to six months after treatment with rituximab or a rituximab-containing regimen (March 2017) SMC No. 1219/17 Recommended
- Obinutuzumab (Gazyvaro®) in combination with chemotherapy, followed by maintenance therapy in patients achieving a response, for the treatment of patients with previously untreated advanced follicular lymphoma (FL) (September 2018) SMC No. SMC2015 Not recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Gazyvaro (Roche Products Ltd)

Obinutuzumab 25 mg per 1 ml Gazyvaro 1000mg/40ml concentrate for solution for infusion vials | 1 vial Pom £3,312.00 (Hospital only)

Panitumumah

21-111-2020

 DRUG ACTION Panitumumab is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR).

• INDICATIONS AND DOSE

Treatment of non-mutated RAS metastatic colorectal cancer (combination therapy) | Treatment of non-mutated RAS metastatic colorectal cancer (monotherapy after failure of fluoropyrimidine-, oxaliplatin-, and irinotecan-containing chemotherapy regimens)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SEVERE SKIN REACTIONS
Severe skin reactions have been reported

Severe skin reactions have been reported very commonly in patients treated with panitumumab. Patients receiving panitumumab who have severe skin reactions or develop worsening skin reactions should be monitored for the development of inflammatory or infectious sequelae (including cellulitis, sepsis, and necrotising fasciitis). Appropriate treatment should be promptly initiated and panitumumab withheld or discontinued.

MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND III CERATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

- CONTRA-INDICATIONS Interstitial pulmonary disease the combination of panitumumab with oxaliplatin-containing chemotherapy is contra-indicated in patients with mutant RAS metastatic colorectal cancer or for whom RAS status is unknown
- CAUTIONS History of keratitis · history of severe dry eye · history of ulcerative keratitis · pulmonary disease · risk factors for keratitis · risk factors for severe dry eye · risk factors for ulcerative keratitis (including contact lens use)
- INTERACTIONS → Appendix 1: monoclonal antibodies

SIDE-EFFECTS

- ► Common or very common Alopecia · anaemia · anxiety · appetite decreased · asthenia · chest pain · chills · constipation · cough · dehydration · diarrhoea · dizziness · dry eye · dry mouth · dyspnoea · electrolyte imbalance · embolism and thrombosis · eye discomfort · eye disorders · eye inflammation · fever · flushing · gastrointestinal discomfort · gastrooesophageal reflux disease · haemorrhage · hair changes · headache · hyperglycaemia · hyperthidrosis · hypersensitivity (may be delayed) · hypertension · hypotension · increased risk of infection · insomnia · leucopenia · mucositis · nail disorders · nausea · oral disorders · pain · peripheral oedema · skin reactions · skin ulcer · tachycardia · vomiting · weight decreased
- ► Uncommon Angioedema · cyanosis · infusion related reaction · nasal dryness · onycholysis · respiratory disorders · severe cutaneous adverse reactions (SCARs)
- ▶ Rare or very rare Anaphylactic reaction
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for 6 months after treatment.
- PREGNANCY Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid breastfeeding during and for 2 months after treatment.
- PRE-TREATMENT SCREENING Evidence of non-mutated RAS status (at exons 2, 3 and 4 of KRAS and NRAS) is required before panitumumab treatment is initiated, and should be determined by an experienced laboratory using a validated test method.
- MONITORING REQUIREMENTS
- ▶ Monitor for hypomagnesaemia.
- ▶ Monitor for hypocalcaemia.
- Monitor for dermatological reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis (consult product literature).
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242 Not recommended
- Cetuximab and panitumumab for previously untreated metastatic colorectal cancer (updated September 2017)
 NICE TA439 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

► Vectibix (Amgen Ltd)

Panitumumab 20 mg per 1 ml Vectibix 400mg/20ml concentrate for solution for infusion vials | 1 vial PoM £1,517.16 (Hospital only) Vectibix 100mg/5ml concentrate for solution for infusion vials | 1 vial PoM £379.29 (Hospital only)

Pembrolizumah

01-Mar-2022

 DRUG ACTION Pembrolizumab is a monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor, thereby potentiating an immune response to tumour cells.

INDICATIONS AND DOSE

Melanoma (specialist use only) | Non-small cell lung cancer (specialist use only) | Urothelial carcinoma (specialist use only) | Classical Hodgkin lymphoma (specialist use only) | Head and neck squamous cell carcinoma (specialist use only) | Renal cell carcinoma (specialist use only) | Renal cell carcinoma (specialist use only) | Colorectal cancer (specialist use only) | Ossophageal carcinoma (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: 200 mg every 3 weeks, for treatment interruption or discontinuation due to side-effects and infusion-related reactions—consult product literature, alternatively 400 mg every 6 weeks, for treatment interruption or discontinuation due to side-effects and infusion-related reactions—consult product literature

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PEMBROLIZUMAB (KEYTRUDA®): REPORTS OF ORGAN TRANSPLANT REJECTION (JULY 2017)

A European review of worldwide data concluded that pembrolizumab may increase the risk of rejection in organ transplant recipients. The MHRA recommends considering the benefit of treatment with pembrolizumab versus the risk of possible organ transplant rejection for each patient.

MHRA/CHM ADVICE: ATEZOLIZUMAB (*TECENTRIQ*®) AND OTHER IMMUNE-STIMULATORY ANTI-CANCER DRUGS: RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (SCARS) (JUNE 2021)

Severe cutaneous adverse reactions (SCARs), including cases of Stevens-Johnson syndrome (SIS) and toxic epidermal necrolysis (TEN), have been reported in patients treated with immunostimulant antineoplastic drugs, such as pembrolizumab. Healthcare professionals are advised to monitor patients for suspected severe skin reactions and exclude other causes. Patients should be advised to seek urgent medical attention if severe skin reactions occur. If a SCAR is suspected, pembrolizumab therapy should be withheld and the patient referred to a specialist for diagnosis and treatment. Pembrolizumab should be permanently discontinued for any grade confirmed SJS or TEN, and for any grade 4 SCAR. Caution is recommended when considering the use of pembrolizumab in patients with a history of severe or life-threatening SCAR associated with other immunostimulant antineoplastic drugs.

- CAUTIONS May increase risk of severe graft-versus-host reaction in patients who have had prior haematopoietic stem cell transplant (particularly in those with a prior history) patients may need pretreatment to minimise the development of adverse reactions (consult product literature)
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ➤ Common or very common Alopecia · anaemia · appetite decreased · arrhythmias · arthritis · asthenia · chills · connective tissue disorders · constipation · cough · cytokine release syndrome · decreased leucocytes · diarrhoea · dizziness · dry eye · dry mouth · dyspnoea · electrolyte imbalance · enterocolitis haemorrhagic · eye inflammation · eyelid hypopigmentation · fever · fluid imbalance · gastrointestinal discomfort · gastrointestinal disorders · genital abnormalities · headache · hepatic disorders · hypersensitivity · hypertension · hyperthyroidism · hypothyroidism · increased risk of infection · influenza like illness · infusion related reaction ·

insomnia · joint disorders · lethargy · lip swelling · musculoskeletal discomfort · myalgia · myopathy · myxoedema · nausea · nerve disorders · neutropenia · oedema · pain · pressure ulcer · respiratory disorders · severe cutaneous adverse reactions (SCARs) · skin reactions · taste altered · thrombocytopenia · thyroid disorder · thyroiditis · torticollis · vomiting

BNF 84

- ▶ Uncommon Adrenal hypofunction · cardiac inflammation · diabetic ketoacidosis · eosinophilia · epilepsy · glomerulonephritis · hair colour changes · hypophysitis · hypopituitarism · nephritis · nephrotic syndrome · pancreatitis · pericardial effusion · renal impairment · sarcoidosis · tendon disorders · type 1 diabetes mellitus
- ► Rare or very rare Cholangitis sclerosing · cystitis · erythema nodosum · haemolytic anaemia · haemophagocytic lymphohistiocytosis · meningitis · meningitis non-infective · neuromuscular dysfunction · pure red cell aplasia · transverse myelitis · vasculitis
- Frequency not known Solid organ transplant rejection SIDE-EFFECTS, FURTHER INFORMATION Immune-related reactions Most immune-related adverse reactions are reversible and managed by temporarily stopping treatment and administration of a corticosteroid—consult product literature for further information.

Infusion-related reactions Manufacturer advises to permanently discontinue treatment in patients with severe infusion reactions

- CONCEPTION AND CONTRACEPTION Manufacturer recommends effective contraception during treatment and for at least 4 months after treatment in women of childbearing potential.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—no information available
- BREAST FEEDING Manufacturer advises avoid—no information available.
- MONITORING REQUIREMENTS Manufacturer advises monitor for signs and symptoms of infusion- and immunerelated reactions.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises for intermittent intravenous infusion (Keytruda[®]), dilute to a concentration of 1 mg/mL to 10 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 30 minutes using a lowprotein binding 0.2–5 micron filter.
- PRESCRIBING AND DISPENSING INFORMATION
 Pembrolizumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator at 2–8°C.
- PATIENT AND CARER ADVICE Patients should be provided
 with an alert card and advised to keep it with them at all
 times. A patient information brochure highlighting
 important safety information to minimise the risk of
 immune-related side-effects is also available.
 Driving and skilled tasks Patients should be counselled on
 the effects on driving and performance of skilled tasks—
 increased risk of dizziness and fatigue.
- NATIONAL FUNDING/ACCESS DECISIONS

- Pembrolizumab for treating relapsed or refractory classical Hodgkin lymphoma after stem cell transplant or at least 2 previous therapies (February 2022) NICE TA772 Recommended with restrictions
- Pembrolizumab with axitinib for untreated advanced renal cell carcinoma (September 2020) NICE TA650 Not recommended
- Pembrolizumab for untreated metastatic or unresectable recurrent head and neck squamous cell carcinoma (November 2020) NICE TA661 Recommended with restrictions
- Pembrolizumab for untreated metastatic colorectal cancer with high microsatellite instability or mismatch repair deficiency (June 2021) NICE TA709 Recommended with restrictions
- Pembrolizumab with platinum- and fluoropyrimidine-based chemotherapy for untreated advanced oesophageal and gastro-oesophageal junction cancer (October 2021) NICE TA737 Recommended

Scottish Medicines Consortium (SMC) decisions

- Pembrolizumab (Keytruda®) as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adults previously untreated with ipilimumab (November 2015) SMC No. 1086/15 Recommended
- Pembrolizumab (Keytruda[®]) as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adults previously treated with ipilimumab (December 2016) SMC No. 1087/15 Not recommended
- Pembrolizumab (Keytruda®) as monotherapy for the adjuvant treatment of adults with stage III melanoma and lymph node involvement who have undergone complete resection (May 2019) SMC No. SMC2144 Recommended
- Pembrolizumab (Keytruda®) for the treatment of locally advanced or metastatic non-small cell lung carcinoma (NSCLC) in adults whose tumours express programmed death ligand 1 (PD-L1) and who have received at least one prior chemotherapy regimen (January 2017) SMC No. 1204/17 Recommended with restrictions
- ▶ Pembrolizumab (Keytruda®) as monotherapy for the first-line treatment of metastatic non-small cell lung carcinoma in adults whose tumours express programmed death ligand 1 with a 50% or more tumour proportion score with no epidermal growth factor receptor or anaplastic lymphoma kinase (ALK)-positive tumour mutations (July 2017) SMC No. 1239/17 Recommended with restrictions

- Pembrolizumab (Keytruda®) in combination with carboplatin and either paclitaxel or nab-paclitaxel, for the first-line treatment of metastatic squamous non-small cell lung cancer in adults (September 2019) SMC No. SMC2187 Recommended with restrictions
- Pembrolizumab (Keytruda®) in combination with pemetrexed and platinum chemotherapy for the first-line treatment of metastatic non-squamous non-small cell lung carcinoma in adults whose tumours have no epidermal growth factor receptor or anaplastic lymphoma kinase (ALK)-positive mutations (October 2019) SMC No. SMC2207 Recommended with restrictions
- Pembrolizumab (Keytruda®) as monotherapy for the treatment of locally advanced or metastatic urothelial carcinoma in adults who have received prior platinumcontaining chemotherapy (February 2018) SMC No. 1291/18 Recommended with restrictions
- Pembrolizumab (Keytruda®) as monotherapy for the treatment of locally advanced or metastatic urothelial carcinoma in adults who are not eligible for cisplatincontaining chemotherapy (first line) (September 2018) SMC No. 1339/18 Not recommended
- Pembrolizumab (Keytruda[®]) as monotherapy for the treatment of adult patients with relapsed or refractory classical Hodgkin lymphoma who have failed autologous stem cell transplant and brentuximab vedotin, or who are transplant-ineligible and have failed brentuximab vedotin (March 2018) SMC No. 1296/18 Recommended with restrictions
- Pembrolizumab (Keytruda®) as monotherapy for the treatment of adult and paediatric patients aged 3 years and older with relapsed or refractory classical Hodgkin lymphoma who have failed autologous stem cell transplant (ASCT), or following at least two prior therapies when ASCT is not a treatment option (November 2021) SMC No. SMC2380 Recommended with restrictions
- Pembrolizumab (Keytruda[®]) in combination with axitinib for the first-line treatment of advanced renal cell carcinoma (RCC) in adults (September 2020) SMC No. SMC2247 Recommended with restrictions
- Pembrolizumab (Keytruda®) as monotherapy or in combination with platinum and 5-fluorouracil chemotherapy, for the first-line treatment of metastatic or unresectable recurrent head and neck squamous cell carcinoma in adults whose tumours express programmed death ligand 1 with a combined positive score of 1 or more (September 2020) SMC No. SMC2257 Recommended with restrictions
- Pembrolizumab (Keytruda®) as monotherapy for the first-line treatment of metastatic microsatellite instability-high or mismatch repair deficient colorectal cancer in adults (September 2021) SMC No. SMC2375 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Polysorbates

► Keytruda (Merck Sharp & Dohme (UK) Ltd)

 $\begin{array}{c} \textbf{Pembrolizumab 25 mg per 1 ml} & \textbf{Keytruda 100mg/4ml concentrate} \\ \textbf{for solution for infusion vials} & \textbf{| 1 vial} & \textbf{\underline{PoM}} & \textbf{£2,630.00 (Hospital only)} \\ \end{array}$

Pertuzumab

17-May-2021

 DRUG ACTION Pertuzumab is a recombinant humanised monoclonal antibody, and acts by inhibiting human epidermal growth factor receptor 2 protein (HER2) dimerisation.

INDICATIONS AND DOSE

HER2-positive early stage breast cancer (in combination with trastuzumab and chemotherapy) | HER2-positive metastatic or locally recurrent unresectable breast cancer (in combination with trastuzumab and docetaxel) (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature or local protocols)
- CAUTIONS Conditions that could impair left ventricular function history of congestive heart failure impaired left ventricular function prior anthracycline exposure radiotherapy to the chest area recent myocardial infarction serious cardiac arrhythmia uncontrolled hypertension
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECT
- ➤ Common or very common Alopecia · anaemia · appetite decreased · arthralgia · asthenia · chills · congestive heart failure · constipation · cough · cytokine release syndrome · diarrhoea · dizziness · dyspepsia · dyspnoea · excessive tearing · fever · headache · hypersensitivity · increased risk of infection · infusion related reaction · insomnia · left ventricular dysfunction · leucopenia · mucositis · myalgia · nail disorder · nausea · neutropenia · oedema · pain · peripheral neuropathy · respiratory disorders · skin reactions · stomatitis · taste altered · vomiting

 SIDE-EFFECTS, FURTHER INFORMATION Side effects mostly described for pertuzumab in combination with trastuzumab and docetaxel.
- CONCEPTION AND CONTRACEPTION Ensure effective contraception during and for six months after treatment in women of childbearing potential.
- PREGNANCY Avoid (toxicity in animal studies). Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.
- BREAST FEEDING Avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution (no information available).
- RENAL IMPAIRMENT EVGT Use with caution in severe impairment (no information available).
- MONITORING REQUIREMENTS
- Assess for signs and symptoms of congestive heart failure (including left ventricular ejection fraction) before and during treatment—consult product literature, and withhold treatment if necessary.
- ► Monitor for febrile neutropenia.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises resuscitation facilities should be available.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Pertuzumab for the neoadjuvant treatment of HER2-positive breast cancer (December 2016) NICE TA424 Recommended with restrictions
- Pertuzumab with trastuzumab and docetaxel for treating HER2-positive breast cancer (March 2018) NICE TA509 Recommended with restrictions

 Pertuzumab for adjuvant treatment of HER2-positive early stage breast cancer (March 2019) NICE TA569 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Pertuzumab (Perjeta®) for use in combination with trastuzumab and chemotherapy for the neoadjuvant treatment of adult patients with human epidermal growth factor receptor 2 (HER2)-positive, locally advanced, inflammatory, or early stage breast cancer at high risk of recurrence (December 2018) SMC No. SMC2119 Recommended
- Pertuzumab (Perjeta®) for use in combination with trastuzumab and docetaxel in adult patients with HER2-positive metastatic or locally recurrent unresectable breast cancer, who have not received previous anti-HER2 therapy or chemotherapy for their metastatic disease (January 2019) SMC No. SMC2120 Recommended
- Pertuzumab (Perjeta®) for use in combination with trastuzumab and chemotherapy for the adjuvant treatment of adult patients with human epidermal growth factor receptor 2 (HER2)-positive early breast cancer (eBC) at high risk of recurrence (September 2020) SMC No. SMC2284 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

BNF 84

Perjeta (Roche Products Ltd)
Pertuzumab 30 mg per 1 ml Perjeta 420mg/14ml concentrate for solution for infusion vials | 1 vial PoM £2,395.00 (Hospital only)

Pertuzumab with trastuzumab 06-Aug-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, pertuzumab p. 952, trastuzumab p. 958.

• INDICATIONS AND DOSE

HER2-positive early stage breast cancer (in combination with chemotherapy) (specialist use only) | HER2-positive metastatic or locally recurrent unresectable breast cancer (in combination with docetaxel) (specialist use

- ► BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature or local protocols)
- INTERACTIONS → Appendix 1: monoclonal antibodies
- CONCEPTION AND CONTRACEPTION Evgr Ensure effective contraception during and for 7 months after treatment in females of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING EVGT Avoid breast-feeding during treatment and for at least 7 months afterwards—no information available.
- PRESCRIBING AND DISPENSING INFORMATION Pertuzumab with trastuzumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; Evor record the brand name and batch number after each administration. ♠
- HANDLING AND STORAGE [EVG] Store in a refrigerator (2–8°C); consult product literature for storage conditions after preparation of the injection.
- PATIENT AND CARER ADVICE

Driving and skilled tasks [vor Patients and carers should be counselled on the effects on driving and other skilled tasks—increased risk of injection-related reactions and dizziness. (A)

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Pertuzumab/trastuzumab (Phesgo®) used in combination with chemotherapy for the treatment of adults with HER2-positive early stage breast cancer or in combination with docetaxel for the treatment of adults with HER2-positive metastatic or locally recurrent unresectable breast cancer (July 2021) SMC No. SMC2364 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Polysorbates, sucrose

▶ Phesgo (Roche Products Ltd) ▼

Pertuzumab 60 mg per 1 ml, Trastuzumab 60 mg per 1 ml Phesgo 600mg/600mg/10ml solution for injection vials | 1 vial Pom £3,617.00 (Hospital only)

Trastuzumab 40 mg per 1 ml, Pertuzumab 80 mg per 1 ml, Phesgo 1200mg/600mg/15ml solution for injection vials | 1 vial PoM £6,012.00 (Hospital only)

Polatuzumab vedotin

12-Nov-2020

 DRUG ACTION Polatuzumab vedotin is an antibody-drug conjugate that contains polatuzumab covalently linked to MMAE, a cytotoxic microtubule disrupting agent.

INDICATIONS AND DOSE

Relapsed or refractory diffuse large B-cell lymphoma (in combination with bendamustine and rituximab) (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)
- CONTRA-INDICATIONS Active severe infection
- CAUTIONS High tumour burden—risk of tumour lysis syndrome · patients may need pre-medication to mimimise infusion-related reactions · peripheral neuropathy · rapidly proliferating tumours—risk of tumour lysis syndrome
 CAUTIONS. FURTHER INFORMATION
- Pre-medication Manufacturer advises pre-medication with an antihistamine and antipyretic to minimise the development of infusion-related reactions —consult product literature.
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common Anaemia · appetite decreased · arthralgia · asthenia · bone marrow disorders · chills · constipation · cough · decreased leucocytes · diarrhoea · dizziness · electrolyte imbalance · fever · gait abnormal · gastrointestinal discomfort · hypoalbuminaemia · increased risk of infection · infusion related reaction · nausea · neutropenia · peripheral neuropathy · pneumonitis · pruritus · sensation abnormal · sepsis · thrombocytopenia · vision blurred · vomiting · weight decreased
- ► Frequency not known Gastrointestinal toxicity · hepatic disorders · progressive multifocal leukoencephalopathy (PML) · reactivation of infection
- CONCEPTION AND CONTRACEPTION Manufacturer advises females of childbearing potential should confirm pregnancy status before treatment and use effective contraception during treatment and for 9 months after last treatment; male patients should use effective contraception during treatment and for 6 months after last treatment if their partner is pregnant or of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962

- BREAST FEEDING Manufacturer advises avoid breast feeding during treatment and for at least 2 months after treatment.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in moderate to severe hepatic impairment. Manufacturer advises monitor liver enzymes and bilirubin levels (risk of hepatic toxicity)—consult product literature.
- RENAL IMPAIRMENT

Dose adjustments Manufacturer advises no dose adjustment required if creatinine clearance is more than 30 mL/minute; no established dose if creatinine clearance less than 30 mL/minute—no information available. See p. 21.

- MONITORING REQUIREMENTS Manufacturer advises monitor complete blood counts prior to each dose; more frequent monitoring may be required—consult product literature for treatment adjustment.
- PRESCRIBING AND DISPENSING INFORMATION
 Polatuzumab vedotin is a biological medicine. Biological
 medicines must be prescribed and dispensed by brand
 name, see Biological medicines and Biosimilar medicines,
 under Guidance on prescribing p. 1; manufacturer advises
 to record the brand name and batch number after each
 administration.
- HANDLING AND STORAGE Store in a refrigerator (2-8°C) and protect from light—consult product literature for further information regarding storage conditions after reconstitution and dilution.
- PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and other skilled tasks—increased risk of infusion-related reactions, peripheral neuropathy, fatigue, and dizziness.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

 Polatuzumab vedotin with rituximab and bendamustine for treating relapsed or refractory diffuse large B-cell lymphoma (September 2020) NICE TA649 Recommended

Scottish Medicines Consortium (SMC) decisions

- Polatuzumab vedotin (Polivy®) in combination with bendamustine and rituximab for the treatment of adult patients with relapsed/refractory diffuse large B-cell lymphoma (DLBCL) who are not candidates for haematopoietic stem cell transplant (September 2020) SMC No. SMC2282 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

EXCIPIENTS: May contain Polysorbates, sucrose

Polatuzumab vedotin 30 mg Polivy 30mg powder for concentrate for solution for infusion vials | 1 vial $[\Bbb DM]$ £2,370.00 (Hospital only) Polatuzumab vedotin 140 mg Polivy 140mg powder for concentrate for solution for infusion vials | 1 vial $[\Bbb DM]$ £11,060.00 (Hospital only)

Ramucirumab

20-Aug-2020

 DRUG ACTION Ramucirumab is a human monoclonal antibody that binds to the vascular endothelial growth factor receptor-2 (VEGFR-2), inhibiting VEGF-induced angiogenesis.

INDICATIONS AND DOSE

Treatment of advanced gastric cancer or gastrooesophageal junction adenocarcinoma, in combination with paclitaxel, in patients with disease progression after prior platinum and fluoropyrimidine chemotherapy

- ▶ BY INTRAVENOUS INFUSION
- Adult: 8 mg/kg on days 1 and 15 of a 28 day cycle, dose to be administered prior to paclitaxel infusion, consult product literature for dose adjustments due to sideeffects and infusion-related reactions

Treatment of advanced gastric cancer or gastrooesophageal junction adenocarcinoma, as monotherapy, in patients with disease progression after prior platinum or fluoropyrimidine chemotherapy, and for whom treatment in combination with paclitaxel is not appropriate

- ► BY INTRAVENOUS INFUSION
- Adult: 8 mg/kg every 2 weeks, consult product literature for dose adjustments due to side-effects and infusion-related reactions

Treatment of metastatic colorectal cancer, in combination with FOLFIRI (irinotecan, fluorouracil and folinic acid), in patients with disease progression on, or after, prior therapy with bevacizumab, oxaliplatin and a fluoropyrimidine

- ► BY INTRAVENOUS INFUSION
- Adult: 8 mg/kg every 2 weeks, dose to be administered prior to FOLFIRI administration, consult product literature for dose adjustments due to side-effects and infusion-related reactions

Treatment of locally advanced or metastatic non-small cell lung cancer, in combination with docetaxel, in patients with disease progression after platinum-based chemotherapy

- ► BY INTRAVENOUS INFUSION
- Adult: 10 mg/kg on day 1 of a 21 day cycle, dose to be administered prior to docetaxel infusion, consult product literature for dose adjustments due to sideeffects and infusion-related reactions

IMPORTANT SAFFTY INFORMATION

MHRA/CHM ADVICE: SYSTEMICALLY ADMINISTERED VEGF PATHWAY INHIBITORS: RISK OF ANEURYSM AND ARTERY DISSECTION (JULY 2020)

A European review of worldwide data concluded that systemically administered VEGF pathway inhibitors may lead to aneurysm and artery dissection in patients with or without hypertension. Some fatal cases have been reported, mainly in relation to aortic aneurysm rupture and aortic dissection. The MHRA advises healthcare professionals to carefully consider the risk of aneurysm and artery dissection in patients with risk factors before initiating treatment with ramucirumab; any modifiable risk factors (such as smoking and hypertension) should be reduced as much as possible. Patients should be monitored and treated for hypertension as required.

• CAUTIONS Elective surgery—discontinue treatment for at least 4 weeks prior to surgery · hypertension · impaired wound healing—discontinue treatment until wound fully healed · pretreatment is recommended to minimise the development of adverse reactions (consult product literature) · risk factors for aneurysm or artery dissection · risk of bleeding

CAUTIONS, FURTHER INFORMATION

- Monitoring of blood pressure The MHRA advises to monitor blood pressure regularly—consult product literature if hypertension occurs during treatment.
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-FFFFCTS
- Common or very common Arterial thromboembolism diarrhoea electrolyte imbalance epistaxis gastrointestinal discomfort gastrointestinal disorders headache hepatic coma hepatic encephalopathy hepatic
 pain hypertension hypoalbuminaemia infusion related
 reaction nephrotic syndrome neutropenia peripheral
 oedema proteinuria rash thrombocytopenia
- ▶ Frequency not known Aneurysm · artery dissection · cardiac arrest · cerebrovascular insufficiency · haemangioma myocardial infarction · thrombotic microangiopathy SIDE-EFFECTS, FURTHER INFORMATION Infusion-related hypersensitivity reactions have been reported with ramucirumab, particularly during or following the first or second infusion; if the patient experiences a grade 1 or 2 infusion-related reaction, the manufacturer advises to reduce rate of infusion by 50% and give premedication for all subsequent infusions—consult product literature. Manufacturer advises to permanently discontinue treatment in the event of a grade 3 or 4 infusion-related reaction.
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during treatment and for up to 3 months after treatment in women of childbearing potential.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- BREAST FEEDING Manufacturer advises discontinue breast-feeding during treatment and for at least 3 months after treatment—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe cirrhosis, cirrhosis with hepatic encephalopathy, cirrhosis with clinically significant ascites, or hepatorenal syndrome (risk of progressive hepatic failure, no information available).
- MONITORING REQUIREMENTS Manufacturer advises monitor for signs of infusion-related hypersensitivity reactions; monitor for development or worsening of proteinuria during treatment—consult product literature; monitor blood counts and coagulation parameters in patients at risk of bleeding.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Cyramza®), manufacturer advises give intermittently in Sodium chloride 0.9%; dilute requisite dose with infusion fluid to final volume of 250 mL and invert gently to mix. Do not exceed a rate of 25 mg/minute, and give over approximately 60 minutes via an infusion pump using a separate infusion line with a protein sparing 0.22 micron filter.
- PRESCRIBING AND DISPENSING INFORMATION For Cyramza[®], each 10 mL vial contains sodium 17 mg (equivalent to Na⁺ 0.74 mmol).
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Ramucirumab for treating advanced gastric cancer or gastrooesophageal junction adenocarcinoma previously treated with chemotherapy (January 2016) NICE TA378 Not recommended
- Ramucirumab for previously treated locally advanced or metastatic non-small-cell lung cancer (August 2016)
 NICE TA403 Not recommended

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

Ramucirumab 10 mg per 1 ml Cyramza 100mg/10ml concentrate for solution for infusion vials | 1 vial PoM £500.00 (Hospital only) Cyramza 500mg/50ml concentrate for solution for infusion vials | 1 vial PoM £2,500.00 (Hospital only)

F 926

Rituximab

INDICATIONS AND DOSE

Rheumatoid arthritis (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: 1 g, then 1 g after 2 weeks, consult product literature for information on retreatment

Non-Hodgkin's lymphoma (specialist use only) | Chronic lymphocytic leukaemia (specialist use only) | Granulomatosis with polyangiitis and microscopic polyangiitis (specialist use only)

- **▶** BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

Non-Hodgkin's lymphoma (specialist use only)

- ► BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature)

Pemphigus vulgaris (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: 1 g, then 1 g after 2 weeks; maintenance 0.5 g, at months 12 and 18, and then every 6 months thereafter if needed, consult product literature for the treatment of relapse

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Severe infection SPECIFIC CONTRA-INDICATIONS

- When used for granulomatosis with polyangiitis and microscopic polyangiitis Severe heart failure • severe, uncontrolled heart disease
- When used for pemphigus vulgaris Severe heart failure severe, uncontrolled heart disease
- When used for rheumatoid arthritis Severe heart failure severe, uncontrolled heart disease

CONTRA-INDICATIONS, FURTHER INFORMATION
For full details on contra-indications, consult product literature.

CAUTIONS

GENERAL CAUTIONS History of cardiovascular disease (exacerbation of angina, arrhythmia, and heart failure have been reported) · patients receiving cardiotoxic chemotherapy (exacerbation of angina, arrhythmia, and heart failure have been reported) · pre-medication recommended to minimise adverse reactions (consult product literature) · predisposition to infection · transient hypotension occurs frequently during infusion (antihypertensives may need to be withheld for 12 hours before infusion)

SPECIFIC CAUTIONS

- When used for granulomatosis with polyangiitis and microscopic polyangiitis *Pneumocystis jirovecii* pneumonia—consult product literature for prophylaxis requirements
- When used for pemphigus vulgaris Pneumocystis jirovecii pneumonia—consult product literature for prophylaxis requirements
 - **CAUTIONS, FURTHER INFORMATION** For full details on cautions, consult product literature or local treatment protocol.
- Hepatitis B infection and reactivation Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking rituximab. Manufacturer advises patients

with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Manufacturer also advises patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection (consult product literature).

- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ► Common or very common Angioedema · anxiety · appetite decreased · arrhythmias · bone marrow disorders · bursitis · cancer pain · cardiac disorder · chest pain · chills · dizziness · dysphagia · dyspnoea · ear pain · electrolyte imbalance · gastrointestinal discomfort · gastrointestinal disorders · hepatitis B · hypercholesterolaemia · hyperglycaemia · hyperhidrosis · hypertension · hypotension · insomnia · lacrimation disorder · malaise · migraine · multi organ failure · muscle complaints · muscle tone increased · nausea · nerve disorders · oedema · oral disorders · osteoarthritis · respiratory disorders · sensation abnormal · sepsis · skin reactions · throat irritation · tinnitus · vasodilation · weight decreased
- ► Uncommon Asthma · coagulation disorder · heart failure · hypoxia · ischaemic heart disease · lymphadenopathy · taste altered
- Rare or very rare Cytokine release syndrome · facial paralysis · renal failure · Stevens-Johnson syndrome (discontinue) · toxic epidermal necrolysis · tumour lysis syndrome · vasculitis · vision disorders
- ▶ Frequency not known Epistaxis hearing loss hypogammaglobulinaemia infective thrombosis influenza like illness irritability muscle weakness nasal congestion posterior reversible encephalopathy syndrome (PRES) psychiatric disorder seizure skin papilloma tremor

SIDE-EFFECTS, FURTHER INFORMATION Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

Progressive multifocal leucoencephalopathy has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded.

- CONCEPTION AND CONTRACEPTION Effective contraception in females of childbearing potential required during and for 12 months after treatment.
- PREGNANCY Avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus.
- BREAST FEEDING Avoid breast-feeding during and for 12 months after treatment.
- MONITORING REQUIREMENTS For full details on monitoring requirements consult product literature.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion, give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to 1-4 mg/mL and gently invert bag to avoid foaming; for further information, consult product literature.
- PRESCRIBING AND DISPENSING INFORMATION Rituximab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.
- PATIENT AND CARER ADVICE

Alert card

 When used for Granulomatosis with polyangiitis and microscopic polyangiitis or Rheumatoid arthritis or Pemphigus vulgaris Patients should be provided with a patient alert card with each infusion. • NATIONAL FUNDING/ACCESS DECISIONS
For full details see funding body website

NICE decisions

- Rituximab in combination with glucocorticoids for treating anti-neutrophil cytoplasmic antibody-associated vasculitis (March 2014) NICE TA308 Recommended with restrictions

Sacituzumab govitecan

BNF 84

01-Apr-2022

 DRUG ACTION Sacituzumab govitecan is an antibody-drug conjugate. The monoclonal antibody component, sacituzumab binds to tumor-associated calcium signal transducer 2 (Trop-2) expressing cancer cells to deliver the linked topoisomerase I inhibitor component into the cells, leading to apoptosis and cell death.

INDICATIONS AND DOSE

Breast cancer (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: 10 mg/kg on days 1 and 8 of a 21-day cycle, for dose adjustments or discontinuation due to sideeffects and infusion-related reactions—consult product literature
- CAUTIONS Patients with reduced uridine diphosphate glucuronosyltransferase 1A1 (UGT1A1) activity (increased risk of adverse reactions) · pre-medication recommended to minimise the development of adverse reactions and infusion-related reactions—consult product literature
- INTERACTIONS → Appendix 1: sacituzumab govitecan
- SIDE-FFFFCTS
- ► Common or very common Allergic rhinitis · alopecia · anaemia · appetite decreased · arthralgia · asthma · back pain · chest discomfort · choking · constipation · cough · decreased leucocytes · dehydration · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · epistaxis · eye inflammation · eye pruritus · facial swelling · fatigue · fever · flushing · gastrointestinal discomfort · headache · hyperglycaemia · hypersensitivity · hypotension · increased risk of infection · insomnia · nausea · neutropenia · oedema · oral disorders · respiratory disorders · scrotal oedema · seasonal allergy · skin reactions · swelling · taste altered · throat tightness · vomiting · weight decreased
- ALLERGY AND CROSS-SENSITIVITY Evg: Contra-indicated in patients with hypersensitivity to previous irinotecan therapy.
- CONCEPTION AND CONTRACEPTION Ever Females of childbearing potential should use effective contraception during treatment and for 6 months after last treatment; male patients should use effective contraception during treatment and for 3 months after last treatment if their partner is of childbearing potential. ♠ See also Pregnancy and reproductive function in Cytotoxic drugs p. 962. Ever Female fertility may be impaired—impairment of fertility has been observed in animal studies. ♠
- PREGNANCY EvGr Avoid—theoretically teratogenic (topoisomerase I inhibitor). (**) See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- BREAST FEEDING EVG: Avoid during treatment and for 1 month after last treatment—no information available.
- HEPATIC IMPAIRMENT EVGT Avoid in moderate or severe impairment (no information available).
- MONITORING REQUIREMENTS
- Evgr Monitor complete blood count before each dose and as clinically indicated.
- ► Monitor patients for signs and symptoms of infusionrelated reactions during and for at least 30 minutes after completion of each infusion. ♠
- DIRECTIONS FOR ADMINISTRATION Resuscitation facilities should be available during administration of sacituzumab govitecan.
- PRESCRIBING AND DISPENSING INFORMATION Sacituzumab govitecan is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.

- HANDLING AND STORAGE Store in refrigerator (2–8°C) consult product literature for storage conditions after preparation of the infusion.
- PATIENT AND CARER ADVICE Patients and their carers should be advised to seek immediate medical attention if they have black stools, rectal bleeding, dehydration or are unable to tolerate oral fluids.
 - **Driving and skilled tasks** Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- ➤ Sacituzumab govitecan (*Trodelvy*®) for the treatment of adult patients with unresectable locally advanced or metastatic triple-negative breast cancer (mTNBC) who have received two or more prior lines of systemic therapies, at least one of them given for unresectable locally advanced or metastatic disease (March 2022) SMC No. SMC2446 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

EXCIPIENTS: May contain Polysorbates

► Trodelvy (Gilead Sciences Ltd)

Sacituzumab govitecan 180 mg Trodelvy 180mg powder for concentrate for solution for infusion vials | 1 vial Pom £793.00 (Hospital only)

Siltuximab

30-Jul-2020

 DRUG ACTION Siltuximab is a monoclonal antibody that inhibits interleukin-6 receptor binding.

• INDICATIONS AND DOSE

Treatment of multicentric Castleman's disease (MCD) in patients who are human immunodeficiency virus (HIV) negative and human herpesvirus-8 (HHV-8) negative

- ► BY INTRAVENOUS INFUSION
- Adult: 11 mg/kg every 3 weeks
- CAUTIONS Patients at increased risk of gastrointestinal perforation—promptly investigate those presenting with symptoms suggestive of gastrointestinal perforation severe infection—withhold treatment until resolved • treat infection prior to treatment

CAUTIONS, FURTHER INFORMATION

 Hypersensitivity reactions Infusion-related side-effects are reported commonly with siltuximab; resuscitation facilities should be available during treatment.
 Consult product literature for further information about siltuximab cautions.

- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- Common or very common Abdominal pain · arthralgia · constipation · diarrhoea · dizziness · dyslipidaemia · gastrooesophageal reflux disease · headache · hypersensitivity · hypertension · hyperuricaemia · increased risk of infection · infusion related reaction · localised oedema · nausea · neutropenia · oral ulceration · oropharyngeal pain · pain in extremity · renal impairment · skin reactions · thrombocytopenia · vomiting · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Siltuximab therapy should be discontinued permanently in the event of a severe infusion-related reaction, anaphylaxis, a severe allergic reaction, or the occurrence of cytokine-release syndrome. Mild to moderate infusion-related reactions may improve by temporarily reducing the rate or stopping the infusion. When restarting treatment, a reduced infusion rate and the administration of antihistamines,

paracetamol, and corticosteroids may be considered. Consider discontinuation of siltuximab if more than 2 doses are delayed due to treatment-related toxicities during the first 48 weeks—for full details consult product literature

- CONCEPTION AND CONTRACEPTION Women of childbearing potential should use effective contraception during and for 3 months after treatment.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution (no information).
- MONITORING REQUIREMENTS
- Monitor neutrophil and platelet count, and haemoglobin levels prior to each dose of siltuximab treatment for the first 12 months and thereafter prior to every third dosing cycle. Consider delaying treatment if required neutrophil, platelet, and haemoglobin levels not achieved—consult product literature for details.
- Monitor for infection during treatment.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Sylvant®), manufacturer advises give intermittently in Glucose 5%. Allow vials to reach room temperature over approximately 30 minutes, then reconstitute each 100 mg vial with 5.2 mL of water for injection, and each 400 mg vial with 20 mL of water for injection, to produce a 20 mg/mL solution. Gently swirl without shaking to dissolve. Further dilute to 250 mL with glucose 5% and gently mix. Use within 6 hours of dilution and give over 60 minutes using an administration set lined with polyvinyl chloride or polyurethane, through a low-protein binding in-line 0.2 micron filter.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

➤ Sylvant (EUSA Pharma (UK) Ltd) ▼
Siltuximab 100 mg Sylvant 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £502.00 (Hospital only)
Siltuximab 400 mg Sylvant 400mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £2,009.00 (Hospital only)

Tafasitamab

02-Mar-2022

 DRUG ACTION Tafasitamab is a monoclonal antibody that binds to CD19, a cell-surface antigen, resulting in lysis of B lymphocytes by immune-mediated actions and apoptosis.

• INDICATIONS AND DOSE

Diffuse large B-cell lymphoma (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)
- CAUTIONS Active infection (should be treated and well controlled) - high tumour burden (risk of tumour lysis syndrome) - history of recurring or chronic infections patients may need premedication to minimise infusionrelated reactions - rapidly proliferating tumours (risk of tumour lysis syndrome)

CAUTIONS, FURTHER INFORMATION

- Premedication Ever Premedication with an antihistamine, antipyretic, or corticosteroid is recommended—consult product literature.
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- Common or very common Abdominal pain · alopecia · anaemia · appetite decreased · arthralgia · asthenia · basal cell carcinoma · constipation · COPD exacerbated · cough · decreased leucocytes · diarrhoea · dyspnoea · electrolyte

imbalance · fever · headache · hyperbilirubinaemia · hyperhidrosis · hypogammaglobulinaemia · increased risk of infection · infusion related reaction · malaise · mucositis · muscle spasms · nasal congestion · nausea · neutropenia · pain · paraesthesia · peripheral oedema · sepsis · skin reactions · taste altered · thrombocytopenia · vomiting · weight decreased

- ► Frequency not known Bone marrow depression tumour lysis syndrome
- CONCEPTION AND CONTRACEPTION Ever Females of childbearing potential should use effective contraception during treatment and for at least 3 months after last treatment. (*) See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY EvGr Avoid—no information available; if exposed during pregnancy, monitor infant for B-cell depletion.
 See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Ever Avoid during treatment and for at least 3 months after last treatment—no information available.
- MONITORING REQUIREMENTS [EVGT] Monitor complete blood counts before each treatment cycle and throughout treatment.
- PRESCRIBING AND DISPENSING INFORMATION Tafasitamab
 is a biological medicine. Biological medicines must be
 prescribed and dispensed by brand name, see Biological
 medicines and Biosimilar medicines, under Guidance on
 prescribing p. 1; record the brand name and batch number
 after each administration.
- HANDLING AND STORAGE Store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after preparation of the infusion.
- PATIENT AND CARER ADVICE

Driving and skilled tasks Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion EXCIPIENTS: May contain Polysorbates

► Tafasitamab (non-proprietary) ▼ Tafasitamab 200 mg Minjuvi 200mg powder for concentrate for solution for infusion vials | 1 vial PoM \(\bigve{S} \) (Hospital only)

Trastuzumab

20-Apr-2021

• INDICATIONS AND DOSE

Treatment of early breast cancer which overexpresses human epidermal growth factor receptor-2 (HER2) (initiated by a specialist) | Treatment of metastatic breast cancer in patients with HER2-positive tumours who have not received chemotherapy for metastatic breast cancer and in whom anthracycline treatment is inappropriate (in combination with paclitaxel or docetaxel) (initiated by a specialist) | Treatment of metastatic breast cancer in postmenopausal patients with hormone-receptor positive HER2-positive tumours not previously treated with trastuzumab (in combination with an aromatase inhibitor) (initiated by a specialist)

- ▶ BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature or local protocols)

Monotherapy for metastatic breast cancer in patients with tumours that overexpress HER2 who have received at least 2 chemotherapy regimens including, where appropriate, an anthracycline and a taxane (initiated by a specialist)

- ▶ BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- Adult: Women with oestrogen-receptor-positive breast cancer should also have received hormonal therapy (consult product literature or local protocols)

Treatment of metastatic gastric cancer in patients with HER2-positive tumours who have not received treatment for metastatic gastric cancer (in combination with capecitabine or fluorouracil and cisplatin) (initiated by a specialist)

- ► BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature or local protocols)
- CONTRA-INDICATIONS Severe dyspnoea at rest
- CAUTIONS Coronary artery disease elderly history of hypertension impaired left ventricular function symptomatic heart failure uncontrolled arrhythmias
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS

BNF 84

- ► Common or very common Alopecia · anaemia · angioedema · anxiety · appetite decreased · arrhythmias · arthralgia arthritis · asthenia · asthma · breast abnormalities · cardiomyopathy · chest pain · chills · constipation · cough · cystitis · depression · diarrhoea · dizziness · drowsiness · dry eye · dry mouth · dyspnoea · excessive tearing · eye inflammation • fever • gastrointestinal discomfort • haemorrhage · haemorrhoids · headache · heart failure · hepatic disorders · hyperhidrosis · hypersensitivity · hypotension · increased risk of infection · influenza like illness · infusion related reaction (may be delayed) · insomnia · leucopenia · malaise · mucositis · muscle complaints · muscle tone increased · nail disorders · nausea · neutropenia · neutropenic sepsis · oedema · oral disorders · pain · palpitations · paraesthesia · peripheral neuropathy · renal disorder · respiratory disorders · rhinorrhoea · skin reactions · taste altered · thrombocytopenia · tremor · vasodilation · vomiting · weight decreased
- ▶ Uncommon Deafness pericardial effusion
- ► Frequency not known Cancer progression · cardiogenic shock · glomerulonephritis · hyperkalaemia · hypoprothrombinaemia · hypoxia · pulmonary fibrosis (may be delayed) · pulmonary oedema (may be delayed) · renal failure
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception in women of childbearing potential during and for 7 months after treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid oligohydramnios reported. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Avoid breast-feeding during treatment and for 7 months afterwards.
- MONITORING REQUIREMENTS
- Cardiotoxicity Monitor cardiac function before and during treatment—for details of monitoring and managing cardiotoxicity, consult product literature.
- DIRECTIONS FOR ADMINISTRATION Resuscitation facilities should be available during administration of trastuzumab.
- PRESCRIBING AND DISPENSING INFORMATION When
 prescribing, dispensing, or administering, check that this
 is the correct preparation—trastuzumab is not
 interchangeable with trastuzumab emtansine or
 trastuzumab deruxtecan.

Trastuzumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand

- name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.
- HANDLING AND STORAGE Store in a refrigerator (2-8°C); consult product literature for storage conditions after preparation of the infusion.

Trastuzumab deruxtecan

11-Feb-2022

 DRUG ACTION Trastuzumab deruxtecan is an antibodydrug conjugate that contains trastuzumab covalently linked to deruxtecan, a topoisomerase I inhibitor.

• INDICATIONS AND DOSE

HER2-positive unresectable or metastatic breast cancer (specialist use only)

- **▶** BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature or local protocols)
- CAUTIONS History of interstitial lung disease or pneumonitis · impaired left ventricular function · patients aged 75 years and over (limited information available)
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ➤ Common or very common Alopecia · anaemia · appetite decreased · asthenia · constipation · cough · decreased leucocytes · diarrhoea · dizziness · dry eye · dyspnoea · epistaxis · flushing · gastrointestinal discomfort · headaches · heart failure · hypersensitivity · hypokalaemia · increased risk of infection · influenza like illness · infusion related reaction · lymphangitis · nausea · neutropenia · oral disorders · respiratory disorders · skin reactions · thrombocytopenia · vomiting
- CONCEPTION AND CONTRACEPTION Evgr Females of childbearing potential should use effective contraception during treatment and for at least 7 months after last treatment; male patients should use effective contraception during treatment and for at least 4 months after last treatment if their partner is of childbearing potential. ♠ See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY EVGT Avoid—oligohydramnios reported with trastuzumab. (**) See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- BREAST FEEDING [EVGT] Avoid breast-feeding during and for 7 months after treatment.
- HEPATIC IMPAIRMENT Evgr Caution in moderate or severe impairment (primarily biliary excretion).
- MONITORING REQUIREMENTS
- ► Evgr Measure complete blood counts prior to initiation, before each dose, and as clinically indicated.
- Test cardiac function before treatment and regularly during treatment—delay or discontinue treatment in cases of left ventricular dysfunction; discontinue treatment in symptomatic heart failure.
- Monitor for signs and symptoms of interstitial lung disease or pneumonitis—discontinue if confirmed (fatal cases reported). ♠
- PRESCRIBING AND DISPENSING INFORMATION When prescribing, dispensing, or administering, check that this is the correct preparation—trastuzumab deruxtecan is not interchangeable with trastuzumab or trastuzumab

Trastuzumab deruxtecan is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.

- HANDLING AND STORAGE Store in a refrigerator (2-8°C); consult product literature for storage conditions after preparation of the infusion.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

► Trastuzumab deruxtecan for treating HER2-positive unresectable or metastatic breast cancer after 2 or more anti-HER2 therapies (May 2021) NICE TA704 Recommended

Scottish Medicines Consortium (SMC) decisions

 Trastuzumab deruxtecan (Enhertu®) as monotherapy for the treatment of adult patients with unresectable or metastatic HER2-positive breast cancer who have received two or more prior anti-HER2-based regimens (January 2022) SMC No. SMC2388 Recommended

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Trastuzumab deruxtecan 100 mg Enhertu 100mg powder for concentrate for solution for infusion vials | 1 vial Pom £1,455.00 (Hospital only)

Trastuzumab emtansine

17-May-2021

 DRUG ACTION Trastuzumab emtansine is an antibodydrug conjugate that contains trastuzumab covalently linked to DM1, a cytotoxic microtubule inhibitor.

INDICATIONS AND DOSE

HER2-positive metastatic breast cancer (specialist use only) | HER2-positive early breast cancer (specialist use only)

- **▶** BY INTRAVENOUS INFUSION
- Adult: (consult product literature or local protocols)
- CAUTIONS Dyspnoea at rest—increased risk of pulmonary events · history of congestive heart failure · patients over 75 years · peripheral neuropathy (temporarily discontinue treatment—consult product literature) · recent history of myocardial infarction · recent history of unstable angina · risk of left ventricular dysfunction—consult product literature for specific risks with trastuzumab treatment · serious arrhythmias
- INTERACTIONS → Appendix 1: monoclonal antibodies
- SIDE-EFFECTS
- ➤ Common or very common Alopecia · anaemia · arthralgia · asthenia · chills · conjunctivitis · constipation · cough · diarrhoea · dizziness · dry eye · dry mouth · dyspnoea · excessive tearing · fever · gastrointestinal discomfort · haemorrhage · headache · hypersensitivity · hypertension · hypokalaemia · infusion related reaction · insomnia · left ventricular dysfunction · leucopenia · memory loss · musculoskeletal pain · myalgia · nail disorder · nausea · neutropenia · peripheral neuropathy · peripheral oedema · skin reactions · stomatitis · taste altered · thrombocytopenia · urinary tract infection · vision blurred · vomiting
- ► **Uncommon** Hepatic disorders nodular regenerative hyperplasia pneumonitis
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception must be used during and for 7 months after stopping treatment in women and men. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid oligohydramnios reported with trastuzumab. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid breastfeeding during and for 7 months after treatment.
- HEPATIC IMPAIRMENT Manufacturer advises caution—consult product literature.
 Dose adjustments Manufacturer advises dose reduction according to liver function tests—consult product literature.
- RENAL IMPAIRMENT EVGT Caution in severe impairment (no information available).

MONITORING REQUIREMENTS

- ▶ Monitor hepatic function before each dose.
- ▶ Monitor for signs and symptoms of neurotoxicity.
- ► Monitor closely for infusion-related and hypersensitivity
- ► Monitor platelet count before each dose and as clinically indicated (consult product literature for treatment modification in thrombocytopenia).
- ► Test cardiac function before treatment and regularly during treatment—delay or discontinue treatment in cases of left ventricular dysfunction.
- ► Monitor for dyspnoea, cough, fatigue and pulmonary infiltrates-discontinue if interstitial lung disease or pneumonitis confirmed (fatal cases reported).
- DIRECTIONS FOR ADMINISTRATION Resuscitation facilities should be available during administration of trastuzumab emtansine
- PRESCRIBING AND DISPENSING INFORMATION When prescribing, dispensing, or administering, check that this is the correct preparation—trastuzumab emtansine is not interchangeable with trastuzumab or trastuzumab deruxtecan.

Trastuzumab emtansine is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.

- HANDLING AND STORAGE Store in a refrigerator (2-8°C): consult product literature for storage conditions after preparation of the infusion.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

- ► Trastuzumab emtansine for treating HER2-positive advanced breast cancer after trastuzumab and a taxane (updated November 2017) NICE TA458 Recommended with restrictions
- > Trastuzumab emtansine for adjuvant treatment of HER2-positive early breast cancer (June 2020) NICE TA632 Recommended

Scottish Medicines Consortium (SMC) decisions

- ► Trastuzumab emtansine (Kadcvla®) for HER2-positive. unresectable locally advanced or metastatic breast cancer after trastuzumab and a taxane (April 2017) SMC No. 990/14 Recommended
- ► Trastuzumab emtansine (Kadcyla®) as a single agent, for the adjuvant treatment of adult patients with HER2-positive early breast cancer who have residual invasive disease, in the breast and/or lymph nodes, after neoadjuvant taxane-based and HER2-targeted therapy (November 2020) SMC No. SMC2298 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Carcinoid syndrome

ENZYME INHIBITORS

Telotristat ethyl

• DRUG ACTION Telotristat ethyl and its active metabolite inhibit L-tryptophan hydroxylases TPH-1 and TPH-2 which reduces the production of serotonin, thereby alleviating symptoms associated with carcinoid syndrome.

INDICATIONS AND DOSE

Carcinoid syndrome diarrhoea (specialist use only)

▶ BY MOUTH

- Adult: 250 mg 3 times a day, review treatment if no response after 12 weeks
- INTERACTIONS → Appendix 1: telotristat ethyl
- SIDE-EFFECTS
- ► Common or very common Appetite decreased constipation · fatigue · fever · gastrointestinal discomfort · gastrointestinal disorders · headache · peripheral oedema
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).
 - Dose adjustments Manufacturer advises consider dose reduction to 250 mg twice daily in mild impairment and to 250 mg once daily in moderate impairment, according to tolerability.
- RENAL IMPAIRMENT Manufacturer advises caution in mild-to-moderate impairment; avoid in severe impairment-no information available.
- MONITORING REQUIREMENTS Manufacturer advises monitor liver function at initiation and during treatment as clinically indicated—discontinue if liver injury
- PATIENT AND CARER ADVICE Manufacturer advises inform patients to report any symptoms of depression or decreased interest.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

► Telotristat ethyl (Xermelo®) for the treatment of carcinoid syndrome diarrhoea in combination with somatostatin analogue (SSA) therapy in adults inadequately controlled by SSA therapy (June 2018) SMC No. 1327/18 Recommended with

3 Cytotoxic responsive malignancy

Cytotoxic drugs

27-Sep-2018

Overview

The chemotherapy of cancer is complex and should be confined to specialists in oncology. Cytotoxic drugs have both anti-cancer activity and the potential to damage normal tissue; most cytotoxic drugs are teratogenic. Chemotherapy may be given with a curative intent or it may aim to prolong life or to palliate symptoms. In an increasing number of cases chemotherapy may be combined with radiotherapy or surgery or both as either neoadjuvant treatment (initial chemotherapy aimed at shrinking the primary tumour, thereby rendering local therapy less destructive or more effective) or as adjuvant treatment (which follows definitive treatment of the primary disease, when the risk of subclinical metastatic disease is known to be high). All cytotoxic drugs cause side-effects and a balance has to be struck between likely benefit and acceptable

Combinations of cytotoxic drugs, as continuous or pulsed cycles of treatment, are frequently more toxic than single drugs but have the advantage in certain tumours of enhanced response, reduced development of drug resistance and increased survival. However for some tumours, singleagent chemotherapy remains the treatment of choice.

Cytotoxic drugs fall into a number of classes, each with characteristic antitumour activity, sites of action, and toxicity. A knowledge of sites of metabolism and excretion is important because impaired drug handling as a result of disease is not uncommon and may result in enhanced toxicity.

Cytotoxic drug handling guidelines

- Trained personnel should reconstitute cytotoxics
- Reconstitution should be carried out in designated pharmacy areas
- Protective clothing (including gloves, gowns, and masks) should be worn
- The eyes should be protected and means of first aid should be specified
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard)
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material
- Staff exposure to cytotoxic drugs should be monitored

Intrathecal chemotherapy

A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available. Copies, and further information may be obtained from the Department of Health and Social Care website (www.gov.uk/government/organisations/department-of-health-and-social-care)

Safe systems for cytotoxic medicines

NHS cancer networks have been established across the UK to bring together all stakeholders in all sectors of care, to work collaboratively to plan and deliver high quality cancer services for a given population. NHS cancer networks have websites containing information on local chemotherapy services and treatment.

Safe system requirements:

- cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care coordinated by a multidisciplinary team
- cytotoxic drugs should be prescribed, dispensed, and administered only in the context of a written protocol or treatment plan
- injectable cytotoxic drugs should only be dispensed if they are prepared for administration
- oral cytotoxic medicines should be dispensed with clear directions for use

Cytotoxic drugs: important safety information

Risk of incorrect dosing of oral anti-cancer medicines
The National Patient Safety Agency has advised (January
2008) that the prescribing and use of oral cytotoxic
medicines should be carried out to the same standard as
parenteral cytotoxic therapy.

- non-specialists who prescribe or administer on-going oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity;
- staff dispensing oral cytotoxic medicines should confirm
 that the prescribed dose is appropriate for the patient.
 Patients should have written information that includes
 details of the intended oral anti-cancer regimen, the
 treatment plan, and arrangements for monitoring, taken
 from the original protocol from the initiating hospital.
 Staff dispensing oral cytotoxic medicines should also have
 access to this information, and to advice from an
 experienced cancer pharmacist in the initiating hospital.

Cytotoxic drug doses

Doses of cytotoxic drugs are determined using a variety of different methods including body-surface area or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient's neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from some of the drug entries in this chapter. However, even where dose statements have been provided, detailed specialist literature, individual hospital chemotherapy protocols, or local cancer networks should be consulted before prescribing, dispensing, or administering cytotoxic drugs.

Prescriptions should **not** be repeated except on the instructions of a specialist.

Cytotoxic drug side-effects

Side-effects common to most cytotoxic drugs are discussed below whilst side-effects characteristic of a particular drug or class of drugs (e.g. neurotoxicity with vinca alkaloids) are mentioned in the appropriate sections. Manufacturers' product literature, hospital-trust protocols, and cancernetwork protocols should be consulted for full details of side-effects associated with individual drugs and specific chemotherapy regimes.

Many side-effects of cytotoxic drugs often do not occur at the time of administration, but days or weeks later. It is therefore important that patients and healthcare professionals can identify symptoms that cause concern and can contact an expert for advice. Toxicities should be accurately recorded using a recognised scoring system such as the Common Toxicity Criteria for Adverse Events (CTCAE) developed by the National Cancer Institute.

Extravasation of intravenous drugs

A number of cytotoxic drugs will cause severe local tissue necrosis if leakage into the extravascular compartment

occurs. To reduce the risk of extravasation injury it is recommended that cytotoxic drugs are administered by appropriately trained staff. See information on the prevention and management of extravasation injury.

Oral mucositis

A sore mouth is a common complication of cancer chemotherapy; it is most often associated with fluorouracil p. 985, methotrexate p. 987, and the anthracyclines. It is best to prevent the complication. Good oral hygiene (rinsing the mouth frequently and effective brushing of the teeth with a soft brush 2–3 times daily) is probably beneficial. For fluorouracil p. 985, sucking ice chips during short infusions of the drug is also helpful.

Once a sore mouth has developed, treatment is much less effective. Saline mouthwashes should be used but there is no good evidence to support the use of antiseptic or anti-inflammatory mouthwashes. In general, mucositis is self-limiting but with poor oral hygiene it can be a focus for blood-borne infection.

Tumour lysis syndrome

Tumour lysis syndrome occurs secondary to spontaneous or treatment-related rapid destruction of malignant cells. Patients at risk of tumour lysis syndrome include those with non-Hodgkin's lymphoma (especially if high grade and bulky disease), Burkitt's lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration, and renal impairment are also predisposing factors. Features include hyperkalaemia, hyperuricaemia (see below), and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early identification of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

Hyperuricaemia

Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure. Allopurinol p. 1213 should be started 24 hours before treating such tumours and patients should be adequately hydrated. The dose of mercaptopurine p. 986 or azathioprine p. 902 should be reduced if allopurinol needs to be given concomitantly. Febuxostat p. 1214 may also be used and should be started 2 days before cytotoxic therapy is initiated.

Rasburicase p. 1017, a recombinant urate oxidase, is licensed for hyperuricaemia in patients with haematological malignancy. It rapidly reduces plasma-uric acid concentration and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

Bone-marrow suppression

All cytotoxic drugs except vincristine sulfate p. 1003 and bleomycin p. 993 cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as carmustine p. 966, lomustine p. 970, and melphalan p. 971. Peripheral blood counts must be checked before each treatment, and doses should be reduced or therapy delayed if bone-marrow has not recovered.

Cytotoxic drugs may be contra-indicated in patients with acute infection; any infection should be treated before, or when starting, cytotoxic drugs.

Fever in a neutropenic patient (neutrophil count less than $1.06\times10^9/\text{litre}$) requires immediate broad-spectrum antibacterial therapy. Appropriate bacteriological investigations should be conducted as soon as possible. Patients taking cytotoxic drugs who have signs or symptoms of infection should be advised to seek prompt medical attention. All patients should initially be investigated and

treated under the supervision of the appropriate oncology or haematology specialist.

In selected patients, the duration and the severity of neutropenia can be reduced by the use of recombinant human granulocyte-colony stimulating factors.

Symptomatic anaemia is usually treated with red blood cell transfusions. For guidance on the use of erythropoietins in patients with cancer, see MHRA/CHM advice and NICE guidance.

Alopecia

Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients. No pharmacological methods of preventing this are available.

Thromboembolism

Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

Cytotoxic drugs: effect on pregnancy and reproductive function

Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Exclude pregnancy before treatment with cytotoxic drugs. Contraceptive advice should be given before cytotoxic therapy begins- women of childbearing age should use effective contraception during and after treatment.

Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

Cytotoxic drugs: nausea and vomiting

Nausea and vomiting cause considerable distress to many patients who receive chemotherapy and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Patients vary in their susceptibility to drug-induced nausea and vomiting; those affected more often include women, patients under 50 years of age, anxious patients, and those who experience motion sickness. Susceptibility also increases with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered and to the individual's susceptibility to emetogenic stimuli.

Mildly emetogenic treatment—fluorouracil, etoposide p. 997, methotrexate p. 987 (less than 100 mg/m², low dose in children), the vinca alkaloids, and abdominal radiotherapy.

Moderately emetogenic treatment—the taxanes, doxorubicin hydrochloride p. 975, intermediate and low doses of cyclophosphamide p. 968, mitoxantrone p. 978, and high doses of methotrexate (0.1–1.2 g/m²).

Highly emetogenic treatment— cisplatin p. 996, dacarbazine p. 969, and high doses of cyclophosphamide.

Prevention of acute symptoms

For patients at *low risk of emesis*, pretreatment with dexamethasone p. 743 or lorazepam p. 369 may be used.

For patients at *high risk of emesis*, a 5HT₃-receptor antagonist, usually given by mouth in combination with dexamethasone and the neurokinin receptor antagonist aprepitant p. 465 is effective.

Prevention of delayed symptoms

For delayed symptoms associated with moderately emetogenic chemotherapy, a combination of dexamethasone and 5HT₃-receptor antagonist is effective; for highly emetogenic chemotherapy, a combination of dexamethasone and aprepitant is effective. Rolapitant and metoclopramide hydrochloride p. 464 are also licensed for delayed chemotherapy-induced nausea and vomiting.

Prevention of anticipatory symptoms

Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam can be helpful for its amnesic, sedative, and anxiolytic effects.

For information on the treatment of nausea and vomiting, see Nausea and labyrinth disorders p. 460.

Treatment of cytotoxic-induced side-effects

Anthracycline side-effects

Anthracycline-induced cardiotoxicity

The anthracycline cytotoxic drugs are associated with doserelated, cumulative, and potentially life-threatening cardiotoxic side-effects.

Anthracycline extravasation

Local guidelines for the management of extravasation should be followed or specialist advice sought.

See further information on the prevention and management of extravasation injury.

Chemotherapy-induced mucositis and myelosuppression Folinic acid p. 1015 (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate p. 987 and thus speed recovery from methotrexate-induced

mucositis or myelosuppression ('folinic acid rescue').
Folinic acid is also used in the management of
methotrexate overdose, together with other measures to
maintain fluid and electrolyte balance, and to manage
possible renal failure.

Folinic acid does not counteract the antibacterial activity of folate antagonists such as trimethoprim p. 625.

When folinic acid and fluorouracil p. 985 are used together in metastatic colorectal cancer the response-rate improves compared to that with fluorouracil alone.

The calcium salt of levofolinic acid p. 1016, a single isomer of folinic acid, is also used for rescue therapy following methotrexate administration, for cases of methotrexate overdose, and for use with fluorouracil for colorectal cancer. The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofolinic acid are also used for rescue therapy following methotrexate therapy, and for use with fluorouracil for colorectal cancer.

Urothelial toxicity

Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide p. 968 and ifosfamide p. 970; it is caused by the metabolite acrolein. Mesna p. 1015 reacts specifically with this metabolite in the urinary tract, preventing toxicity. Mesna is used routinely (preferably by mouth) in patients receiving ifosfamide, and in patients receiving cyclophosphamide by the intravenous route at a high dose (e.g. more than 2 g) or in those who experienced urothelial toxicity when given cyclophosphamide previously.

Anthracyclines and other cytotoxic antibiotics

Drugs in this group are widely used. Many cytotoxic antibiotics act as radiomimetics and simultaneous use of

radiotherapy should be **avoided** because it may markedly increased toxicity. Daunorubicin p. 974, doxorubicin hydrochloride p. 975, epirubicin hydrochloride p. 977 and idarubicin hydrochloride p. 977 are anthracycline antibiotics. Mitoxantrone p. 978 is an anthracycline derivative.

Doxorubicin hydrochloride is available as both conventional and liposomal formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable. Conventional doxorubicin hydrochloride is used to treat the acute leukaemias, Hodgkin's and non-Hodgkin's lymphomas, paediatric malignancies, and some solid tumours including breast cancer.

Epirubicin hydrochloride is structurally related to doxorubicin hydrochloride and can be used to treat breast cancer.

Idarubicin hydrochloride has general properties similar to those of doxorubicin hydrochloride; it is mostly used in the treatment of haematological malignancies.

Daunorubicin also has general properties similar to those of doxorubicin hydrochloride.

Pixantrone p. 978 is licensed as monotherapy for the treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas, although the benefits of using it as a fifth-line or greater chemotherapy in refractory patients has not been established.

Bleomycin p. 993 is given intravenously or intramuscularly to treat metastatic germ cell cancer and, in some regimens, non-Hodgkin's lymphoma.

Dactinomycin is principally used to treat paediatric cancers. Its side-effects are similar to those of doxorubicin, except that cardiac toxicity is not a problem.

Mitomycin p. 994 can be given intravenously to treat gastro-intestinal, breast, non-small cell lung, and metastatic pancreatic cancers; and by bladder instillation for superficial bladder tumours. It causes delayed bone marrow toxicity.

Vinca alkaloids

The vinca alkaloids, vinblastine sulfate p. 1002, vincristine sulfate p. 1003, and vindesine sulfate p. 1003, are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours. Vinorelbine p. 1004 is a semi-synthetic vinca alkaloid. See also, role of vinorelbine in the treatment of breast cancer.

Antimetabolites

Antimetabolites are incorporated into new nuclear material or combine irreversibly with cellular enzymes, preventing normal cellular division.

Alkylating drugs

Extensive experience is available with these drugs, which are among the most widely used in cancer chemotherapy. They act by damaging DNA, thus interfering with cell replication.

Cyclophosphamide is used mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours. It is given by mouth or intravenously; it is inactive until metabolised by the liver.

Ifosfamide is related to cyclophosphamide and is given intravenously.

Melphalan p. 971 is licensed for the treatment of multiple myeloma, polycythaemia vera, childhood neuroblastoma, advanced ovarian adenocarcinoma, and advanced breast cancer. However, in practice, melphalan is rarely used for ovarian adenocarcinoma; it is no longer used for advanced breast cancer. Melphalan is also licensed for regional arterial perfusion in localised malignant melanoma of the extremities and localised soft-tissue sarcoma of the extremities.

Lomustine p. 970 is a lipid-soluble nitrosourea and the drug is given at intervals of 4 to 6 weeks.

Carmustine p. 966 has similar activity to lomustine; it is given to patients with multiple myeloma, non-Hodgkin's lymphomas, Hodgkin's disease, and brain tumours. Carmustine implants are licensed for intralesional use in adults for the treatment of recurrent glioblastoma multiforme as an adjunct to surgery. Carmustine implants are also licensed for high-grade malignant glioma as adjunctive treatment to surgery and radiotherapy.

Estramustine phosphate p. 969 is a combination of an oestrogen and chlormethine used predominantly in prostate cancer. It is given by mouth and has both an antimitotic effect and (by reducing testosterone concentration) a hormonal effect.

Mitobronitol is occasionally used to treat chronic myeloid leukaemia; it is available on a named-patient basis from specialist importing companies.

ANTINEOPLASTIC DRUGS > ALKYLATING AGENTS

Bendamustine hydrochloride 02-Aug-2021

INDICATIONS AND DOSE

Treatment of chronic lymphocytic leukaemia | Treatment of non-Hodgkin's lymphoma | Treatment of multiple myeloma

- ► BY INTRAVENOUS INFUSION
- Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

· · · · · · ·

MHRA/CHM ADVICE: BENDAMUSTINE (LEVACT®): INCREASED MORTALITY OBSERVED IN RECENT CLINICAL STUDIES IN OFF-LABEL USE; MONITOR FOR OPPORTUNISTIC INFECTIONS, HEPATITIS B REACTIVATION (JULY 2017)

Recent clinical trials have shown increased mortality when bendamustine was used in combination treatments outside its approved indications. In addition, a recent European review of post-marketing data has suggested that the risk of opportunistic infections for all patients receiving bendamustine treatment may be greater than previously recognised.

The MHRA recommends monitoring patients for opportunistic infections as well as cardiac, neurological, and respiratory adverse events; known carriers of hepatitis B virus (HBV) should be monitored for signs and symptoms of active HBV infection. Patients should be advised to report promptly new signs of infection; consider discontinuing bendamustine if there are signs of opportunistic infections.

MHRA/CHM ADVICE: BENDAMUSTINE (*LEVACT*®): INCREASED RISK OF NON-MELANOMA SKIN CANCER AND PROGRESSIVE MULTIFOCAL ENCEPHALOPATHY (PML) (MARCH 2021)

Evidence from clinical trials and a European review of safety data found an increased risk of non-melanoma skin cancers (basal and squamous cell carcinoma) in patients treated with bendamustine-containing regimens. Healthcare professionals are advised to perform periodic skin examinations in these patients, particularly those with risk factors for skin cancer.

The review also identified very rare cases of PML in patients treated with bendamustine, usually in combination with rituximab or obinutuzumab. Healthcare professionals should consider PML in the differential diagnosis for these patients with new or worsening neurological, cognitive, or behavioural signs or symptoms. If PML is suspected, appropriate diagnostic evaluation should be undertaken and treatment suspended until PML is excluded.

- CONTRA-INDICATIONS Jaundice · low leucocyte count · low platelet count · major surgery less than 30 days before start of treatment · severe bone marrow suppression
- CAUTIONS Cardiac disorders—monitor serum potassium and ECG
- INTERACTIONS → Appendix 1: alkylating agents
- SIDE-EFFECTS
- ➤ Common or very common Alopecia amenorrhoea anaemia angina pectoris appetite decreased arrhythmias cardiac disorder chills constipation decreased leucocytes dehydration diarrhoea dizziness fatigue fever haemorrhage headache hepatitis B reactivation hypersensitivity hypertension hypokalaemia hypotension increased risk of infection insomnia mucositis nausea neutropenia pain palpitations respiratory disorders skin reactions stomatitis thrombocytopenia tumour lysis syndrome vomiting
- Uncommon Bone marrow disorders · heart failure · myocardial infarction · neoplasms · pericardial effusion
- ► Rare or very rare Anticholinergic syndrome · aphonia · ataxia · circulatory collapse · drowsiness · haemolysis · hyperhidrosis · infertility · multi organ failure · nervous system disorder · paraesthesia · peripheral neuropathy · sepsis · taste altered
- Frequency not known Extravasation necrosis · hepatic failure · necrosis · progressive multifocal leukoencephalopathy (PML) · renal failure · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Secondary malignancy Use of bendamustine is associated with an increased incidence of acute leukaemias.

Infections Serious and fatal infections are reported, including opportunistic infections such as Pneumocystis jirovecii pneumonia (PJP), varicella zoster virus (VZV) and cytomegalovirus (CMV)—manufacturer advises monitoring for respiratory signs and symptoms throughout treatment; patients should be advised to report new signs of infection, including fever or respiratory symptoms, promptly. Reactivation of hepatitis B is reported in patients who are chronic carriers of the virus—manufacturer advises monitoring for signs and symptoms of active hepatitis B during treatment and for several months after stopping treatment.

- CONCEPTION AND CONTRACEPTION Effective contraception is required during treatment in men or women, and for 6 months after treatment in men. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenic and mutagenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment—no information available.
 Dose adjustments Manufacturer advises reduce dose by 30% in moderate impairment.
- RENAL IMPAIRMENT No information available on use in patients with creatinine clearance less than 10 mL/minute. See p. 21.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Bendamustine for the first-line treatment of chronic lymphocytic leukaemia (February 2011) NICE TA216 Recommended
- Obinutuzumab with bendamustine for treating follicular lymphoma refractory to rituximab (August 2017) NICE TA472 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Bendamustine hydrochloride (Levact®) for chronic lymphocytic leukaemia (CLL) (April 2011) SMC No. 694/11 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► Bendamustine hydrochloride (Non-proprietary)

Bendamustine hydrochloride 25 mg Bendamustine 25mg powder for concentrate for solution for influsion vials | 5 vial | PoM | £27.75-5347.26 (Hospital only) | 20 vial | PoM | £1,241.14 (Hospital only) | Bendamustine hydrochloride 100 mg Bendamustine 100mg powder for concentrate for solution for influsion vials | 1 vial | PoM | £23.55-£1,379.04 (Hospital only) | 5 vial | PoM | £1,241.14-£1,379.04 (Hospital only) | 5 vial | PoM | £1,241.14-£1,379.04 (Hospital only) | 5 vial | PoM | £1,241.14-£1,379.04 (Hospital only) | 5 vial | PoM | £1,241.14-£1,379.04 (Hospital only) | 5 vial | PoM | £1,241.14-£1,379.04 (Hospital only) | 5 vial | PoM | £1,241.14-£1,379.04 (Hospital only) |

Busulfan

08-Jul-2020

(Busulphan)

• INDICATIONS AND DOSE

Chronic myeloid leukaemia, induction of remission

- ► BY MOUTH
- Adult: 60 micrograms/kg daily (max. per dose 4 mg); maintenance 0.5–2 mg daily

Conditioning treatment before haematopoietic progenitor cell transplantation

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- Adult: (consult local protocol)

Conditioning treatment before haematopoietic progenitor cell transplantation in patients who are candidates for a reduced-intensity conditioning (RIC) regimen

- **▶** BY INTRAVENOUS INFUSION
- Adult: (consult local protocol)
- DOSES AT EXTREMES OF BODY-WEIGHT
- Dose may need to be calculated based on body surface area or adjusted ideal body weight in obese patients consult product literature.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CAUTIONS Avoid in Acute porphyrias p. 1150 · high dose (antiepileptic prophylaxis required) · history of seizures (antiepileptic prophylaxis required) · ineffective once in blast crisis phase · previous progenitor cell transplant (increased risk of hepatic veno-occlusive disease) · previous radiation therapy (increased risk of hepatic veno-occlusive disease) · risk of second malignancy · three or more cycles of chemotherapy (increased risk of hepatic veno-occlusive disease)
- INTERACTIONS → Appendix 1: alkylating agents
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Common or very common Alopecia · diarrhoea · hepatic disorders · nausea · respiratory disorders · sinusoidal obstruction syndrome · skin reactions · thrombocytopenia · vomiting
- ▶ Uncommon Seizure
 - Rare or very rare Cataract eye disorders

SPECIFIC SIDE-EFFECTS

- ► Common or very common
- With intravenous use Anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · ascites · asthenia · asthma · cardiomegaly · chest pain · chills · confusion · constipation · cough · depression · dizziness · dyspnoea · dysuria · electrolyte imbalance · embolism and thrombosis · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hiccups · hyperglycaemia ·

hypersensitivity · hypertension · hypoalbuminaemia · hypotension · increased risk of infection · insomnia · mucositis · myalgia · nervous system disorder · neutropenia · oedema · pain · pancytopenia · pericardial effusion · pericarditis · reactivation of infections · renal disorder · renal impairment · stomatitis · vasodilation · weight increased

- With oral use Amenorrhoea (may be reversible) azoospermia bone marrow disorders cardiac tamponade delayed puberty hyperbilirubinaemia infertility male leucopenia leukaemia menopausal symptoms oral disorders ovarian and fallopian tube disorders testicular atrophy
- ▶ Uncommon
- With intravenous use Capillary leak syndrome · delirium · encephalopathy · hallucination · hypoxia · intracranial haemorrhage
- ► Rare or very rare
- With oral use Dry mouth · erythema nodosum · gynaecomastia · myasthenia gravis · radiation injury · Sjögren's syndrome
- ► Frequency not known
- With intravenous use Hypogonadism · ovarian failure · premature menopause · sepsis

SIDE-EFFECTS, FURTHER INFORMATION Lung toxicity Discontinue if lung toxicity develops.

Secondary malignancy Use of busulfan is associated with an increased incidence of secondary malignancy.

- CONCEPTION AND CONTRACEPTION Manufacturers advise effective contraception during and for 6 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution (no information available)—monitor hepatic function, especially following transplant (consult product literature).
- MONITORING REQUIREMENTS
- ▶ Monitor cardiac and liver function.
- Frequent blood tests are necessary because excessive myelosuppression may result in irreversible bone-marrow aplasia.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

► Busulfan (Non-proprietary)

Busulfan 2 mg Busulfan 2mg tablets | 25 tablet Pom £14.43-£69.02 DT = £41.73

Solution for infusion

Carmustine

13-Jul-2020

• INDICATIONS AND DOSE

Brain tumours | Multiple myeloma | Non-Hodgkin's lymphomas | Hodgkin's disease

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

Recurrent glioblastoma multiforme as an adjunct to surgery | High-grade malignant glioma as adjunctive treatment to surgery and radiotherapy

- ► BY INTRALESIONAL IMPLANTATION
- Adult: (consult product literature)
- CAUTIONS Avoid in Acute porphyrias p. 1150
- INTERACTIONS → Appendix 1: alkylating agents
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

► Common or very common Alopecia · anaemia · ataxia · constination · diarrhoea · dizziness · headache · nausea · seizures · vomiting

SPECIFIC SIDE-EFFECTS

- ► Common or very common
- ▶ When used by implant Abdominal pain abscess anxiety asthenia · chest pain · coma · confusion · conjunctival oedema · depression · diabetes mellitus · drowsiness · dysphagia · electrolyte imbalance · embolism and thrombosis · eve pain · faecal incontinence · fever · gait abnormal · haemorrhage · hallucination · healing impaired · hydrocephalus · hyperglycaemia · hypersensitivity · hypertension · hypotension · increased risk of infection · injury · insomnia · intracranial pressure increased · leucocytosis · memory loss · meningitis · oedema · pain · paralysis · paranoia · peripheral neuropathy · personality disorder · rash · sensation abnormal · sepsis · speech impairment · stupor · thinking abnormal · thrombocytopenia · tremor · urinary incontinence · vision disorders
- ▶ With intravenous use Acute leukaemia appetite decreased bone marrow depression · encephalopathy (with high doses) · hepatotoxicity · myelodysplastic syndrome (following long term use) • ocular toxicity • respiratory disorders · retinal haemorrhage · stomatitis
- ► Uncommon
- ▶ When used by implant Cerebral infarction intracranial haemorrhage
- ► Rare or very rare
- ▶ With intravenous use Gynaecomastia nephrotoxicity (cumulative) · peripheral vascular disease (with high doses)
- ► Frequency not known
- ▶ With intravenous use Infertility · myalgia

SIDE-FFFFCTS, FURTHER INFORMATION, Pulmonary toxicity Lung infiltration, pulmonary fibrosis. pneumonitis, and interstitial lung disease have been reported with intravenous use, some of which have been fatal. These appear to be dose-related, cumulative, and may be delayed.

Hepatotoxicity Hepatotoxicity has been reported to occur with high intravenous doses, and may be delayed up to 60 days after administration; usually reversible.

- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenic and embryotoxic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HANDLING AND STORAGE For intravenous infusion, manufacturer advises store in a refrigerator (2-8°C) and protect from light. For intralesional implant, manufacturer advises store in a freezer (-20°C)-consult product literature for further information regarding storage outside freezer.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

- ► Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007) NICE TA121 Recommended with restrictions

Chlormethine

10-Sep-2021

 DRUG ACTION Chlormethine is an alkylating agent which inhibits rapidly proliferating cells.

• INDICATIONS AND DOSE

Mycosis fungoides (initiated by a specialist)

- ► TO THE SKIN
- Adult: Apply once daily, apply thinly to the affected areas, for dose adjustments due to side-effects of the skin—consult product literature
- CAUTIONS Avoid contact with mucous membranes
- INTERACTIONS → Appendix 1: chlormethine
- SIDE-FFFFCTS
- ► Common or very common Hypersensitivity skin infection skin reactions skin ulcer
- CONCEPTION AND CONTRACEPTION Manufacturer advises contraception in women of child-bearing potential during treatment. See also Pregnancy and reproductive function in Cytotoxic drues p. 962.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies following systemic administration. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962
- BREAST FEEDING Manufacturer advises avoid—no information available.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises apply to dry skin at least 4 hours before or 30 minutes after showering or washing. The treated area should be allowed to dry for 5 to 10 minutes.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for storage in a freezer.
- PATIENT AND CARER ADVICE Patients and carers should be advised to wash hands after each application and should wear nitrile gloves for each application. If non-affected areas are exposed, these areas should be washed. Occlusive dressings should not be applied over the treated area.
- NATIONAL FUNDING/ACCESS DECISIONS

Cyclophosphamide

10-Jan-2022

• INDICATIONS AND DOSE

Rheumatoid arthritis with severe systemic manifestations

- ► BY MOUTH
- ▶ Adult: 1-1.5 mg/kg daily

Severe systemic rheumatoid arthritis | Other connective tissue diseases (especially with active vasculitis)

- ► BY INTRAVENOUS INJECTION
- Adult: 0.5-1 g every 2 weeks, then reduced to 0.5-1 g every month, frequency adjusted according to clinical response and haematological monitoring. To be given with prophylactic mesna

Used, mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours

- ► BY MOUTH, OR BY INTRAVENOUS INFUSION
- Adult: (consult local protocol)
- UNLICENSED USE Not licensed for rheumatoid arthritis with severe systemic manifestations.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CAUTIONS Avoid in Acute porphyrias p. 1150 · diabetes mellitus · haemorrhagic cystitis · previous or concurrent mediastinal irradiation—risk of cardiotoxicity
- INTERACTIONS → Appendix 1: alkylating agents
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Agranulocytosis · alopecia · anaemia · asthenia · bone marrow disorders · cystitis · decreased leucocytes · fever · haemolytic uraemic syndrome · haemorrhage · hepatic disorders · immunosuppression · increased risk of infection · mucosal abnormalities · neutropenia · progressive multifocal leukoencephalopathy (PML) · reactivation of infections · sperm abnormalities · thrombocytopenia
- ► Uncommon Appetite decreased embolism and thrombosis • flushing • hypersensitivity • ovarian and fallopian tube disorders • sepsis
- Rare or very rare Bladder disorders · chest pain · confusion · constipation · diarrhoea · disseminated intravascular coagulation · dizziness · eye inflammation · fluid imbalance · headache · hyponatraemia · menstrual cycle irregularities · nail discolouration · nausea · neoplasms · oral disorders · pancreatitis acute · renal failure · secondary neoplasm · seizure · severe cutaneous adverse reactions (SCARs) · SIADH · skin reactions · visual impairment · vomiting
- ► Frequency not known Abdominal pain · altered smell sensation · arrhythmias · arthralgia · ascites · cardiac inflammation · cardiogenic shock · cardiomyopathy · cough deafness · dyspnoea · encephalopathy · excessive tearing · facial swelling · gastrointestinal disorders · heart failure · hyperhidrosis · hypoxia · infertility · influenza like illness · multi organ failure · muscle complaints · myelopathy · myocardial infarction · nasal complaints · nephropathy · nerve disorders · neuralgia · neurotoxicity · oedema · oropharyngeal pain · palpitations · pericardial effusion · peripheral ischaemia · pulmonary hypertension · pulmonary oedema · QT interval prolongation · radiation injuries · renal tubular disorder · renal tubular necrosis · respiratory disorders · rhabdomyolysis · scleroderma · sensation abnormal · sinusoidal obstruction syndrome · taste altered · testicular atrophy · tinnitus · tremor · tumour lysis syndrome · vasculitis SPECIFIC SIDE-EFFECTS
- With intravenous use Infusion site necrosis · injection site necrosis

SIDE-EFFECTS, FURTHER INFORMATION Haemorrhagic

cystitis A urinary metabolite of cyclophosphamide, acrolein, can cause haemorrhagic cystitis; this is a rare but serious complication that may be prevented by increasing fluid intake for 24–48 hours after intravenous injection. Mesna can also help prevent cystitis when high-dose therapy (e.g. more than 2 g intravenously) is used or when the patient is considered to be at high risk of cystitis (e.g. because of pelvic irradiation).

Secondary malignancy As with all cytotoxic therapy, treatment with cyclophosphamide is associated with an increased incidence of secondary malignancies.

- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for at least 3 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding during and for 36 hours after stopping treatment.
- HEPATIC IMPAIRMENT Manufacturer advises caution (risk of decreased cyclophosphamide activation and increased risk of veno-occlusive liver disease).
 - **Dose adjustments** Manufacturer advises consider dose adjustment in severe impairment—consult product literature.
- RENAL IMPAIRMENT

Dose adjustments Ever Consider dose reduction (consult product literature).

- DIRECTIONS FOR ADMINISTRATION
- With intravenous use For intravenous infusion (cyclophosphamide injection; Baxter), manufacturer advises give via drip tubing in Glucose 5% or Sodium Chloride 0.9%; reconstitute 500 mg with 25 mL Sodium Chloride 0.9%; reconstitute 1 g with 50 mL Sodium Chloride 0.9%.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution, solution for injection, solution for infusion

Tablet

CAUTIONARY AND ADVISORY LABELS 25, 27

- ► Cyclophosphamide (Non-proprietary)
 - Cyclophosphamide (as Cyclophosphamide monohydrate)

 50 mg Cyclophosphamide 50mg tablets | 100 tablet Pom £139.00

 DT = £139.00
- Cytoxan (Imported (United States))
 Cyclophosphamide 25 mg (Cytoxan 25)

Cyclophosphamide 25 mg Cytoxan 25mg tablets | 100 tablet PoM €

Powder for solution for injection

► Cyclophosphamide (Non-proprietary)

Cyclophosphamide (as Cyclophosphamide monohydrate)
500 mg Cyclophosphamide 500mg powder for solution for injection vials | 1 vial Pom £8.21-£9.66 (Hospital only)

Cyclophosphamide (as Cyclophosphamide monohydrate)

1 gram Cyclophosphamide 1g powder for solution for injection vials |

1 vial Pom £15.22-£17.91 (Hospital only)

Cyclophosphamide (as Cyclophosphamide monohydrate)
2 gram Cyclophosphamide 2g powder for solution for injection vials
| 1 vial Pom £28.22 (Hospital only)

Dacarhazine

24-Jun-2021

• INDICATIONS AND DOSE

Metastatic melanoma | Soft-tissue sarcomas (combination therapy) | Hodgkin's disease (combination therapy)

- ► BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Adult: (consult local protocol)
- CAUTIONS Caution in handling—irritant to tissues

- INTERACTIONS → Appendix 1: alkylating agents
- SIDE-EFFECTS
- ► Common or very common Anaemia · appetite decreased · leucopenia · nausea · thrombocytopenia · vomiting
- ► Uncommon Alopecia · infection · influenza like illness · photosensitivity reaction · skin reactions
- Rare or very rare Agranulocytosis confusion diarrhoeaflushing headachehpatic disorders lethargy pancytopenia paraesthesia renal impairment seizure visual impairment
- CONCEPTION AND CONTRACEPTION Ensure effective contraception during and for at least 6 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (carcinogenic and teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT EVGT Caution in combined renal and hepatic impairment (elimination prolonged); avoid in severe impairment.
- RENAL IMPAIRMENT Ever Caution in combined renal and hepatic impairment (elimination prolonged); avoid in severe impairment.
- PRESCRIBING AND DISPENSING INFORMATION Dacarbazine is a component of a commonly used combination for Hodgkin's disease (ABVD—doxorubicin [previously Adriamycin®], bleomycin, vinblastine, and dacarbazine).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► Dacarbazine (Non-proprietary)

Dacarbazine (as Dacarbazine citrate) 500 mg Dacarbazine 500mg powder for solution for infusion vials | 1 vial [poM] £37.50 Dacarbazine (as Dacarbazine citrate) 1 gram Dacarbazine 1g powder for solution for infusion vials | 1 vial [poM] £70.00

Powder for solution for injection

Dacarbazine (Non-proprietary)

Dacarbazine (as Dacarbazine citrate) 100 mg Dacarbazine 100mg powder for solution for injection vials | 10 vial [PoM] £90.00 Dacarbazine (as Dacarbazine citrate) 200 mg Dacarbazine 200mg powder for solution for injection vials | 10 vial [PoM] £160.00

Estramustine phosphate

10-May-2021

• INDICATIONS AND DOSE

Prostate cancer

- ► BY MOUTH
- Adult: Initially 560-840 mg daily in divided doses; maintenance 140-1400 mg daily in divided doses

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CONTRA-INDICATIONS Peptic ulceration severe cardiovascular disease • thromboembolic disorders
- CAUTIONS Cardiovascular disease cerebrovascular disease • conditions which might be aggravated by fluid retention (such as epilepsy or migraine) • congestive heart failure • diabetes • hypercalcaemia • hypertension • metabolic bone disease
- INTERACTIONS → Appendix 1: alkylating agents
- SIDE-EFFECTS
- ► Common or very common Anaemia · congestive heart failure · diarrhoea · embolism · fluid retention · gynaecomastia · headache · hepatic function abnormal · lethargy · leucopenia · myocardial infarction · nausea · thrombocytopenia · vomiting

- ► Frequency not known Allergic dermatitis · angioedema · confusion · depression · erectile dysfunction · hypertension · muscle weakness · myocardial ischaemia
- CONCEPTION AND CONTRACEPTION Men should use effective contraceptive methods during treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- HEPATIC IMPAIRMENT Manufacturer advises caution monitor hepatic function; avoid in severe impairment.
- RENAL IMPAIRMENT Manufacturer advises caution.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises each dose should be taken not less than 1 hour before or 2 hours after meals and should not be taken with products containing calcium, magnesium or aluminium, including dairy products and antacid medication.
- PATIENT AND CARER ADVICE Patients should be given advice on how to administer estramustine capsules.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.
 Capsule

CAUTIONARY AND ADVISORY LABELS 5, 23

► Estracyt (Pfizer Ltd)

Estramustine phosphate (as Estramustine sodium phosphate)
140 mg Estracyt 140mg capsules | 100 capsule Pom £171.28 DT = £171.28

Ifosfamide

30-Jan-2022

• INDICATIONS AND DOSE

Malignant disease

- ► BY INTRAVENOUS INFUSION
- Adult: (consult local protocol)
- CONTRA-INDICATIONS Acute infection · cystitis · urinarytract obstruction · urothelial damage
- CAUTIONS Avoid in Acute porphyrias p. 1150 · cardiac disease
- INTERACTIONS → Appendix 1: alkylating agents
- SIDE-EFFECTS
- Common or very common Alopecia · appetite decreased · bone marrow disorders · haemorrhage · hepatic disorders · infection · leucopenia · nausea · reactivation of infection · renal impairment · thrombocytopenia · vomiting
- ► Uncommon Cardiotoxicity · diarrhoea · hypotension · oral disorders
- ► Rare or very rare Skin reactions
- ► Frequency not known Abdominal pain agranulocytosis amenorrhoea · anaemia · angina pectoris · angioedema · arrhythmias • arthralgia • asterixis • behaviour abnormal • blood disorders · bone disorders · cancer progression · capillary leak syndrome · cardiac arrest · cardiomyopathy · chills · conjunctivitis · constipation · cough · deafness · delirium · delusions · disseminated intravascular coagulation · dysarthria · dyspnoea · electrolyte imbalance · embolism and thrombosis • encephalopathy • eye irritation · fatigue · fever · flushing · gait abnormal · gastrointestinal disorders · growth retardation · haemolytic anaemia · heart failure · hyperglycaemia · hyperhidrosis · hyperphosphaturia · hypertension · hypoxia · immunosuppression · infertility · malaise · mania · memory loss · metabolic acidosis · movement disorders · mucosal ulceration · multi organ failure · muscle complaints · myocardial infarction · nail disorder · neoplasms · nephritis tubulointerstitial · nephrogenic diabetes insipidus · neurotoxicity · oedema · ovarian and fallopian tube disorders · pain · pancreatitis · panic attack · peripheral neuropathy · polydipsia · premature menopause · psychiatric disorders · pulmonary hypertension ·

pulmonary oedema · radiation recall reaction · respiratory disorders · rhabdomyolysis · secondary malignancy ·

sensation abnormal · sepsis · severe cutaneous adverse reactions (SCARs) · SIADH · sinusoidal obstruction syndrome · sperm abnormalities · status epilepticus · tinnitus · tumour lysis syndrome · urinary disorders · vasculitis · vertigo · visual impairment

SIDE-EFFECTS, FURTHER INFORMATION Urothelial toxicity Mesna is routinely given with ifosfamide to reduce urothelial toxicity.

Secondary malignancy Use of ifosfamide is associated with an increased incidence of acute leukaemia.

- CONCEPTION AND CONTRACEPTION Manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenic and carcinogenic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises avoid.
- RENAL IMPAIRMENT EVGT Avoid unless potential benefit outweighs risk (increased risk of toxicity; consult product literature).
- MONITORING REQUIREMENTS Ensure satisfactory electrolyte balance and renal function before each course (risk of tubular dysfunction, Fanconi's syndrome or diabetes insipidus if renal toxicity not treated promptly).
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

Ifosfamide (Non-proprietary)

Ifosfamide 1 gram Ifosfamide 1g powder for concentrate for solution for injection vials | 1 vial [PoM] £115.79-£119.27 Ifosfamide 2 gram Ifosfamide 2g powder for concentrate for solution for injection vials | 1 vial [PoM] £234.94-£273.77

Lomustine

10-May-2021

• DRUG ACTION Lomustine is a lipid-soluble nitrosourea.

• INDICATIONS AND DOSE

Hodgkin's disease resistant to conventional therapy | Malignant melanoma | Certain solid tumours

- ► BY MOUTH
- Adult: 120–130 mg/m² every 6–8 weeks, dose is for when lomustine is used alone

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CONTRA-INDICATIONS Coeliac disease
- INTERACTIONS → Appendix 1: alkylating agents
- SIDE-EFFECTS
- ► Common or very common Leucopenia
- ► Frequency not known Alopecia anaemia apathy appetite decreased azotaemia bone marrow failure (delayed) confusion coordination abnormal diarrhoea hepatic disorders lethargy nausea neoplasms neurological effects renal disorders renal impairment respiratory disorders speech impairment stomatitis thrombocytopenia vision loss (irreversible) vomiting SIDE-EFFECTS, FURTHER INFORMATION Prolonged use of lomustine is associated with an increased incidence of acute leukaemias.
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.

- PREGNANCY Avoid. See also *Pregnancy and reproductive* function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- RENAL IMPAIRMENT EVGr Avoid in severe impairment.
- PRESCRIBING AND DISPENSING INFORMATION The brand name CCNU® has been used for lomustine capsules.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule
 Cansule

► Lomustine (Non-proprietary)

Lomustine 10 mg CeeNU 10mg capsules | 20 capsule PoM Lomustine 40 mg Lomustine 40mg capsules | 20 capsule PoM

Lomustine 100 mg CeeNU 100mg capsules | 20 capsule Pom S

Melphalan

10-Nov-2021

• INDICATIONS AND DOSE

Multiple myeloma

- ► BY MOUTH
- Adult: 150 micrograms/kg daily for 4 days, dose to be repeated every 6 weeks, dose may vary according to regimen
- ► BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION ► Adult: (consult product literature)

Polycythaemia vera

- ► BY MOUTH
- Adult: Initially 6–10 mg daily for 5-7 days, then reduced to 2–4 mg daily until satisfactory response, then reduced to 2–6 mg once weekly

Localised malignant melanoma of the extremities | Localised soft-tissue sarcoma of the extremities

- ► BY REGIONAL ARTERIAL PERFUSION
- Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CAUTIONS Consider use of prophylactic anti-infective agents · for high-dose intravenous administration establish adequate hydration · haematopoietic stem cell transplantation essential for high dose treatment (consult local treatment protocol for details)
- INTERACTIONS → Appendix 1: alkylating agents
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ➤ Common or very common Alopecia · anaemia · bone marrow depression (delayed) · diarrhoea · nausea · stomatitis · thrombocytopenia · vomiting
- Rare or very rare Haemolytic anaemia · hepatic disorders · respiratory disorders · skin reactions

SPECIFIC SIDE-EFFECTS

- ► Common or very common
- ▶ With oral use Leucopenia
- With parenteral use Feeling hot · myalgia · myopathy · paraesthesia
- ▶ Rare or very rare
- With parenteral use Peripheral vascular disease SIDE-EFFECTS, FURTHER INFORMATION Secondary malignancy Use of melphalan is associated with an increased incidence of acute leukaemias.
- CONCEPTION AND CONTRACEPTION Manufacturer advises adequate contraception during treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.

- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- RENAL IMPAIRMENT
- **Dose adjustments EvGr** Reduce dose initially (consult product literature).
- MONITORING REQUIREMENTS Monitor full blood count before and throughout treatment.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

► Melphalan (Non-proprietary)

Melphalan (as Melphalan hydrochloride) 50 mg Melphalan 50mg powder and solvent for solution for injection vials | 1 vial PoM £26.64-£137.37 (Hospital only)

Table

Melphalan (Non-proprietary)

Melphalan 2 mg Melphalan 2mg tablets | 25 tablet PoM £16.48-£45.38 DT = £30.93

Streptozocin

09-0ct-2018

 DRUG ACTION Streptozocin is an antibiotic antineoplastic nitrosourea.

INDICATIONS AND DOSE

Neuroendocrine tumours of pancreatic origin (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)
- CAUTIONS Antiemetic pre-medication recommended avoid extravasation (risk of tissue necrosis) elderly hyperhydration required (consult product literature)
- INTERACTIONS → Appendix 1: streptozocin
- SIDE-EFFECTS
- ► Common or very common Acute kidney injury · diarrhoea · nausea · nephropathy · renal tubular injury · urinary disorder · urine abnormalities · vomiting
- ► Frequency not known Confusion depression extravasation necrosis fever glucose tolerance impaired hepatotoxicity hypoalbuminaemia lethargy
- CONCEPTION AND CONTRACEPTION Manufacturer advises women of childbearing potential should use effective contraception during treatment and for 30 days after last treatment; male patients should use effective contraception during treatment and for 90 days after last treatment if their partner is of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution.
 Dose adjustments Manufacturer advises consider dose reduction.
- RENAL IMPAIRMENT Manufacturer advises caution evaluate benefit/risk ratio if eGFR 30–45 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments Manufacturer advises reduce dose if eGFR 46–60 mL/minute/1.73 m²—consult product literature. See p. 21.

MONITORING REQUIREMENTS

 Manufacturer advises monitor renal function (plasma creatinine and eGFR derived from the MDRD formula) immediately before treatment initiation and 2 weeks after

- each course of therapy; proteinuria and serum electrolytes should also be monitored before treatment initiation and 2-4 weeks after the last cycle of treatment.
- ▶ Manufacturer advises monitor liver function tests, blood glucose levels and complete blood counts regularly.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2-8°C) and protect from light-consult product literature for storage conditions after reconstitution and dilution.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

Zanosar (Esteve Pharmaceuticals Ltd)

Streptozocin 1 gram Zanosar 1g powder for concentrate for solution for infusion vials | 1 vial PoM £570.00 (Hospital only)

Temozolomide

10-May-2021

• DRUG ACTION Temozolomide is structurally related to dacarbazine.

INDICATIONS AND DOSE

Newly diagnosed glioblastoma multiforme in adults (in combination with radiotherapy) and subsequently as monotherapy | Second-line treatment of malignant glioma in adults

- ► BY MOUTH
- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CAUTIONS Pneumocystis jirovecii pneumonia—consult product literature for monitoring and prophylaxis requirements
- INTERACTIONS → Appendix 1: alkylating agents
- SIDE-EFFECTS
- ► Common or very common Alopecia · anaemia · anxiety · appetite decreased · arthralgia · asthenia · cognitive impairment · concentration impaired · confusion · constipation · cough · Cushing's syndrome · decreased leucocytes · depression · diarrhoea · dizziness · drowsiness · dysphagia · dyspnoea · ear pain · embolism and thrombosis · eye pain · fever · gastrointestinal discomfort · haemorrhage · headache · hearing impairment · hemiparesis · hyperglycaemia · hypersensitivity · hypertension · increased risk of infection · influenza like illness · insomnia · level of consciousness decreased · malaise · memory loss · movement disorders · muscle weakness · myalgia · myopathy · nausea · nerve disorders · neutropenia · oedema · oral disorders · pain · peripheral swelling · radiation injuries · seizures · sensation abnormal · skin reactions · speech impairment · taste altered · thrombocytopenia · tinnitus · tremor · urinary disorders · vertigo · vision disorders · vomiting · weight changes
- ▶ Uncommon Altered smell sensation angioedema aplastic anaemia (sometimes fatal) · behaviour disorder · breast pain · chills · condition aggravated · diabetes insipidus · dry eye · dry mouth · emotional lability · erectile dysfunction · gait abnormal · gastrointestinal disorders · hallucination · hemiplegia · hepatic disorders · hepatic failure (sometimes fatal) · hepatitis B reactivation (sometimes fatal) · hyperacusia · hyperbilirubinaemia · hyperhidrosis · hypokalaemia · intracranial haemorrhage · meningoencephalitis herpetic (sometimes fatal) . menstrual cycle irregularities · nasal congestion · neoplasms · nervous system disorder · palpitations · pancytopenia (sometimes prolonged) · photosensitivity reaction · reactivation of infections · respiratory disorders ·

- respiratory failure (sometimes fatal) · secondary malignancy · sepsis (sometimes fatal) · severe cutaneous adverse reactions (SCARs) · thirst · tongue discolouration · vasodilation
- CONCEPTION AND CONTRACEPTION Manufacturer advises adequate contraception during treatment. Men should avoid fathering a child during and for at least 6 months after treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (no information available).
- RENAL IMPAIRMENT Manufacturer advises caution—no information available.
 - MONITORING REQUIREMENTS
- ► Monitor liver function before treatment initiation, after each treatment cycle and midway through 42-day treatment cycles-consider the balance of benefits and risks of treatment if results are abnormal at any point (fatal liver injury reported).
- ▶ Monitor for myelodysplastic syndrome.
- ▶ Monitor for secondary malignancies.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

- ► Temozolomide for the treatment of recurrent malignant glioma (brain cancer) (April 2001) NICE TA23 Recommended with restrictions
- > Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007) NICE TA121 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

CAUTIONARY AND ADVISORY LABELS 23, 25

Treosulfan

24-Sep-2020

• INDICATIONS AND DOSE

Ovarian cancer

- ▶ BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAPERITONEAL INSTILLATION
- Adult: (consult product literature)

TRECONDI®

Conditioning treatment before allogeneic haematopoietic stem cell transplantation in patients with malignant disease (in combination with other chemotherapy) (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

Conditioning treatment before allogeneic haematopoietic stem cell transplantation in patients with non-malignant disease (in combination with other chemotherapy) (specialist use only)

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Concomitant use of live vaccines

SPECIFIC CONTRA-INDICATIONS

- When used for conditioning treatment before allogeneic haematopoietic stem cell transplantation Active uncontrolled infection · Fanconi anaemia and other DNA repair disorders · severe concomitant cardiac, lung, liver and renal impairment
- CAUTIONS Avoid in Acute porphyrias p. 1150
- INTERACTIONS → Appendix 1: alkylating agents
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Alopecia · anaemia · bone marrow disorders · leucopenia · nausea · sepsis · skin reactions · thrombocytopenia · vomiting
- ► Uncommon Neoplasms · respiratory disorders · treatment related secondary malignancy
- Rare or very rare Addison's disease · cardiomyopathy · hypoglycaemia · influenza like illness · paraesthesia · pneumonia · scleroderma
 SPECIFIC SIDE-EFFECTS
- ► Common or very common
- With intravenous use Appetite decreased · arrhythmia · arthralgia · asthenia · chills · constipation · diarrhoea · dizziness · dysphagia · dyspnoea · febrile neutropenia · fever · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hypersensitivity · hypertension · insomnia · lethargy · myalgia · oedema · oral disorders · pain · renal impairment · weight changes
- ▶ Uncommon
- With intravenous use Confusion cough dry mouth hepatic disorders - hiccups - hyperglycaemia - hyperhidrosis hypotension - laryngeal pain - oesophageal pain peripheral neuropathy - sinusoidal obstruction syndrome
- ▶ With oral use Stomatitis
- ► Rare or very rare
- With intravenous use Inflammation localised
- With oral use Cystitis haemorrhagic
- ► Frequency not known
- With intravenous use Acidosis · agitation · amenorrhoea · cardiac arrest · cystitis · dry eye · dysphonia · dysuria ·

electrolyte imbalance · embolism · encephalopathy · extrapyramidal symptoms · feeling cold · glucose tolerance impaired · heart failure · hypoxia · intracranial haemorrhage · muscle weakness · myocardial infarction · oropharyngeal pain · ovarian suppression · pericardial effusion · skin ulcer · syncope

SIDE-EFFECTS, FURTHER INFORMATION Prolonged use of treosulfan is associated with an increased incidence of acute non-lymphocytic leukaemia.

- CONCEPTION AND CONTRACEPTION Manufacturer advises females of childbearing potential and male patients with partners of childbearing potential should use effective contraception during and for 6 months after treatment.
 See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT
- When used for conditioning treatment before allogeneic haematopoietic stem cell transplantation See *Contraindications* for information relating to severe impairment.
- RENAL IMPAIRMENT
- When used for conditioning treatment before allogeneic haematopoietic stem cell transplantation Manufacturer advises caution—treosulfan is excreted renally. See also Contraindications for further information relating to severe impairment.
- MONITORING REQUIREMENTS Manufacturer advises monitor full blood counts frequently during treatment.
- PATIENT AND CARER ADVICE

Driving and skilled tasks Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of nausea, vomiting or dizziness.

NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- ► Treosulfan with fludarabine for malignant disease before allogeneic stem cell transplant (August 2020) NICE TA640 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: LIPOSOMAL AND LIPID-COMPLEX FORMULATIONS: NAME CHANGE TO REDUCE MEDICATION ERRORS (JULY 2020)

Serious harm and fatal overdoses have occurred following confusion between liposomal, pegylated-liposomal, lipid-complex, and conventional formulations of the same drug substance. Medicines with these formulations will explicitly include 'liposomal', 'pegylated-liposomal', or 'lipid-complex' within their name to reduce the risk of potentially fatal medication errors.

The MHRA reminds healthcare professionals that liposomal, pegylated-liposomal, lipid-complex, and conventional formulations containing the same drug substance are **not** interchangeable. Healthcare professionals are advised to make a clear distinction between formulations when prescribing, dispensing, administering, and communicating about daunorubicin. The product name and dose should be verified before administration and the maximum dose should not be exceeded.

- CONTRA-INDICATIONS Myocardial insufficiency previous treatment with maximum cumulative doses of daunorubicin or other anthracycline recent myocardial infarction severe arrhythmia
- CAUTIONS Caution in handling—irritant to tissues neutrophil count less than 1500/mm³
- INTERACTIONS → Appendix 1: anthracyclines
- SIDE-EFFECTS Abdominal pain · alopecia · amenorrhoea · anaemia · arrhythmias · ascites · atrioventricular block · azoospermia · bone marrow disorders · cardiac inflammation · cardiomyopathy · chills · congestive heart failure · cyanosis · death · dehydration · diarrhoea · dyspnoea · extravasation necrosis · fever · flushing · gastrointestinal disorders · haemorrhage · hepatomegaly · hyperpyrexia · hyperuricaemia · hypoxia · infection · ischaemic heart disease · leucopenia · mucositis · myocardial infarction · nail discolouration · nausea · nephropathy · neutropenia · oedema · pain · paraesthesia · pleural effusion · radiation injuries · shock · skin reactions · stomatitis · thrombocytopenia · thrombophlebitis · urine discolouration · venous sclerosis · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Cardiotoxicity is cumulative and may be irreversible, however responds to treatment if detected early.

- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenic and carcinogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.

- HEPATIC IMPAIRMENT For solution for infusion
 manufacturer advises caution. For powder for solution for
 infusion manufacturer advises caution in mild to moderate
 impairment; avoid in severe impairment.
 Dose adjustments Manufacturer advises dose reduction
 - **Dose adjustments** Manufacturer advises dose reduction according to serum bilirubin concentration—consult product literature.
- RENAL IMPAIRMENT EvG! For solution for infusion use with caution. For powder for solution for infusion caution in mild to moderate impairment; avoid in severe impairment. Dose adjustments EvG! Reduce dose (consult product literature or local protocol). ♠>
- MONITORING REQUIREMENTS Cardiac monitoring essential.
- PRESCRIBING AND DISPENSING INFORMATION

Daunorubicin is available as *conventional* and *liposomal* formulations. These different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are **not** interchangeable.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► DaunoXome (Galen Ltd)

Daunorubicin (as Daunorubicin hydrochloride citrate liposomal pegylated) 2 mg per 1 ml DaunoXome 50mg/25ml concentrate for solution for infusion vials | 1 vial Pom £250.00

Powder for solution for infusion

Daunorubicin (Non-proprietary)

Daunorubicin (as Daunorubicin hydrochloride)

20 mg Daunorubicin 20mg powder for solution for infusion vials | 10 vial Poml £715.00 (Hospital only)

Daunorubicin with cytarabine 02-Sep-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, daunorubicin p. 974, cytarabine p. 983.

• INDICATIONS AND DOSE

Acute myeloid leukaemia

Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

► BY INTRAVENOUS INFUSION

MHRA/CHM ADVICE: LIPOSOMAL AND LIPID-COMPLEX FORMULATIONS: NAME CHANGE TO REDUCE MEDICATION ERRORS (JULY 2020)

Serious harm and fatal overdoses have occurred following confusion between liposomal, pegylated-liposomal, lipid-complex, and conventional formulations of the same drug substance. Medicines with these formulations will explicitly include 'liposomal', 'pegylated-liposomal', or 'lipid-complex' within their name to reduce the risk of potentially fatal medication errors.

The MHRA reminds healthcare professionals that liposomal, pegylated-liposomal, lipid-complex, and conventional formulations containing the same drug substance are **not** interchangeable. Healthcare professionals are advised to make a clear distinction between formulations when prescribing, dispensing, administering, and communicating about daunorubicin with cytarabine. The product name and dose should be verified before administration and the maximum dose should not be exceeded.

- CAUTIONS Wilson's disease or other copper-related disorders (each vial contains 100 mg of copper gluconate, equivalent to 14 mg of elemental copper)
- INTERACTIONS → Appendix 1: anthracyclines cytarabine

- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment.
- RENAL IMPAIRMENT Manufacturer advises caution in severe impairment.
- PRESCRIBING AND DISPENSING INFORMATION

Daunorubicin with cytarabine is available as a *liposomal* formulation. This is **not** interchangeable with other daunorubicin- or cytarabine-containing preparations; such preparations differ in their licensed indications, pharmacokinetics, dosage and administration.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

 Liposomal cytarabine-daunorubicin for untreated acute myeloid leukaemia (December 2018) NICE TA552
 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Liposomal daunorubicin and cytarabine (Vyxeos[®]) for the treatment of adults with newly diagnosed, therapy-related acute myeloid leukaemia (t-AML) or AML with myelodysplasiarelated changes (March 2019) SMC No. SMC2130 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

Vvxeos (Jazz Pharmaceuticals LIK Ltd)

Daunorubicin 44 mg, Cytarabine 100 mg Vyxeos liposomal 44mg/100mg powder for concentrate for solution for infusion vials | 1 vial PoM £4,581.00 (Hospital only)

Doxorubicin hydrochloride

05-0ct-2021

INDICATIONS AND DOSE

Acute leukaemias | Hodgkin's lymphoma | Non-Hodgkin's lymphoma | Some solid tumours including breast cancer | Advanced soft-tissue sarcoma

- ► BY INTRAVENOUS INJECTION
- Adult: (consult product literature)

Some papillary bladder tumours (bladder instillation) | Recurrent superficial bladder tumours (bladder instillation) | Transitional cell carcinoma (bladder instillation) | Carcinoma in situ (bladder instillation)

- ► BY INTRAVESICAL INSTILLATION
- ▶ Adult: (consult product literature)

CAELYX ®

For AIDS-related Kaposi's sarcoma in patients with low CD4 count and extensive mucocutaneous or visceral disease | Advanced ovarian cancer when platinum-based chemotherapy has failed | Progressive multiple myeloma (in combination with bortezomib) in patients who have received at least one prior therapy and who have undergone or are unsuitable for bone-marrow transplantation | Monotherapy for metastatic breast cancer in patients with increased cardiac risk

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: LIPOSOMAL AND LIPID-COMPLEX FORMULATIONS: NAME CHANGE TO REDUCE MEDICATION ERRORS (JULY 2020)

Serious harm and fatal overdoses have occurred following confusion between liposomal, pegylated-liposomal, lipid-complex, and conventional formulations of the same drug substance. Medicines with these formulations will explicitly include 'liposomal', 'pegylated-liposomal', or 'lipid-complex' within their name to reduce the risk of potentially fatal medication errors.

The MHRA reminds healthcare professionals that liposomal, pegylated-liposomal, lipid-complex, and conventional formulations containing the same drug substance are **not** interchangeable. Healthcare professionals are advised to make a clear distinction between formulations when prescribing, dispensing, administering, and communicating about doxorubicin. The product name and dose should be verified before administration and the maximum dose should not be exceeded.

- CONTRA-INDICATIONS Consult product literature
- CAUTIONS Cardiac disease · caution in handling—irritant to tissues · consult product literature · elderly · hypertension · previous myocardial irradiation
- INTERACTIONS → Appendix 1: anthracyclines
- SIDE-EFFECTS
- ► Common or very common Alopecia · anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · bone marrow depression · breast pain · cachexia · cardiovascular disorder · chest discomfort · chills · constipation · cough · decreased leucocytes · dehydration · depression · diarrhoea · dizziness · drowsiness · dry mouth · dysphagia · dyspnoea · dysuria · electrolyte imbalance · epistaxis · eye inflammation · fever · gastrointestinal discomfort · gastrointestinal disorders · headache · hyperhidrosis · hypersensitivity · hypertension · hyperthermia · hypotension · increased risk of infection · influenza like illness · infusion related reaction · insomnia · malaise · mucosal abnormalities · muscle complaints · muscle tone increased · muscle weakness · nail disorder · nausea · nerve disorders · neutropenia · oedema · oral disorders · pain · scrotal erythema · sensation abnormal · sepsis · skin reactions · skin ulcer · syncope · taste altered · thrombocytopenia · vasodilation · vision blurred · vomiting · weight decreased
- ▶ Uncommon Confusion embolism and thrombosis
- ► Rare or very rare Secondary oral neoplasms severe cutaneous adverse reactions (SCARs)
- ► Frequency not known Asthma · congestive heart failure · secondary malignancy · throat tightness

SIDE-EFFECTS, FURTHER INFORMATION Extravasation can cause fissue necrosis

Cardiomyopathy Higher cumulative doses are associated with cardiomyopathy and it is usual to limit total cumulative doses to 450 mg/m².

Liposomal formulations Liposomal formulations of doxorubicin may reduce the incidence of cardiotoxicity and lower the potential for local necrois, but infusion reactions, sometimes severe, may occur. Hand-foot syndrome (painful, macular reddening skin eruptions) occurs commonly with liposomal doxorubicin and may be dose limiting. It can occur after 2–3 treatment cycles and may be prevented by cooling hands and feet and avoiding socks, gloves, or tight-fitting footwear. It may also occur with non-liposomal formulations.

Elevated bilirubin concentrations Doxorubicin is largely excreted in the bile and an elevated bilirubin concentration is an indication for reducing the dose.

- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- PREGNANCY Avoid (teratogenic and toxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT For liposomal formulation, manufacturer advises caution. For solution for injection or infusion, manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

Dose adjustments Manufacturer advises dose reduction according to bilirubin concentration.

- RENAL IMPAIRMENT Consult product literature in severe impairment.
- MONITORING REQUIREMENTS Patients should be assessed before treatment, by echocardiography. Cardiac monitoring during treatment may assist in determining safe dosage
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises conventional doxorubicin is given by injection into a fastrunning infusion, commonly at 21-day intervals.
- PRESCRIBING AND DISPENSING INFORMATION Doxorubicin is available as conventional, liposomal and pegylated liposomal formulations. These different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389 Recommended
- ► Olaratumab in combination with doxorubicin for treating advanced soft tissue sarcoma (August 2017) NICE TA465 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection

► Doxorubicin hydrochloride (Non-proprietary)

Doxorubicin hydrochloride 2 mg per 1 ml Doxorubicin 50mg/25ml solution for injection Cytosafe vials | 1 vial PoM £103.00 (Hospital only)

Doxorubicin 50mg/25ml solution for infusion vials | 1 vial Pom £103.00 (Hospital only)

Doxorubicin 10mg/5ml solution for injection Cytosafe vials | 1 vial Pom £20.60 (Hospital only)

Doxorubicin 10mg/5ml concentrate for solution for infusion vials | 1 vial PoM £11.55-£19.57 (Hospital only)

Doxorubicin 10mg/5ml solution for infusion vials | 1 vial PoM £20.60 (Hospital only)

Doxorubicin 50mg/25ml concentrate for solution for infusion vials | 1 vial Pom £54.00-£97.85 (Hospital only)

Solution for infusion

► Doxorubicin hydrochloride (Non-proprietary)

Doxorubicin hydrochloride 2 mg per 1 ml Doxorubicin 200mg/100ml solution for infusion vials | 1 vial Pom £412.00 (Hospital only)

Doxorubicin 20mg/10ml concentrate for solution for infusion vials | 1 vial PoM 国 (Hospital only)

Doxorubicin 100mg/50ml concentrate for solution for infusion vials | 1 vial PoM S (Hospital only)

Doxorubicin 200mg/100ml solution for injection Cytosafe vials | 1 vial Pom £412.00 (Hospital only)

Doxorubicin 200mg/100ml concentrate for solution for infusion vials | 1 vial Pom £234.66-£391.40 (Hospital only)

Caelyx (Baxter Healthcare Ltd)

Doxorubicin hydrochloride (as Doxorubicin hydrochloride liposomal pegylated) 2 mg per 1 ml Caelyx pegylated liposomal 50mg/25ml concentrate for solution for infusion vials | 1 vial PoM 5712.49

Caelyx pegylated liposomal 20mg/10ml concentrate for solution for infusion vials | 1 vial | PoM | £360.23

Epirubicin hydrochloride

21-May-2021

• INDICATIONS AND DOSE

Breast cancer (specialist use only) | Gastric cancer (specialist use only) | Small cell lung cancer (specialist use only) | Ovarian cancer (specialist use only) | Colorectal cancer (specialist use only) | Lymphoma (specialist use only) | Leukaemia (specialist use only) | Multiple myeloma (specialist use only)

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: (consult product literature or local protocols)

Bladder cancer (specialist use only)

- ► BY INTRAVESICAL INSTILLATION
- Adult: (consult product literature or local protocols)
- CONTRA-INDICATIONS Bladder inflammation or contraction (when used as a bladder instillation) catheterisation difficulties (when used as a bladder instillation) haematuria (when used as a bladder instillation) invasive tumours penetrating the bladder (when used as a bladder instillation) myocardiopathy previous treatment with maximum cumulative doses of epirubicin or other anthracycline recent myocardial infarction severe arrhythmia severe myocardial insufficiency unstable angina urinary tract infections (when used as a bladder instillation)
- CAUTIONS Caution in handling—irritant to tissues
- INTERACTIONS → Appendix 1: anthracyclines
- SIDE-EFFECTS
- ► Common or very common
- With intravesical use Chemical cystitis
- With parenteral use Alopecia · amenorrhoea · anaemia · appetite decreased · arrhythmias · cardiac conduction disorders · chills · congestive heart failure · dehydration · diarrhoea · eye inflammation · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · increased risk of infection · leucopenia · malaise · mucositis · nail discolouration · nausea · neutropenia · oral disorders · skin reactions · thrombocytopenia · urine discolouration · vasodilation · vomiting
- ► Uncommon
- With parenteral use Asthenia embolism and thrombosis sensis
- ► Rare or very rare
- With parenteral use Hyperuricaemia
- ► Frequency not known
- With parenteral use Bone marrow depression cardiomyopathy · cardiotoxicity · photosensitivity reaction · radiation injuries · shock

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises extreme caution with cumulative doses exceeding 900 mg/m²—risk of congestive heart failure increased.

- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
 Dose adjustments Manufacturer advises dose reduction according to bilirubin level.
- RENAL IMPAIRMENT
 Dose adjustments Manufacturer advises consider dose reduction in severe impairment.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection

ANTINEOPLASTIC DRUGS > ANTIMETABOLITES

Azacitidine

10-May-2021

• DRUG ACTION Azacitidine is a pyrimidine analogue.

• INDICATIONS AND DOSE

Treatment of intermediate-2 and high-risk myelodysplastic syndromes, chronic myelomonocytic leukaemia, and acute myeloid leukaemia, in adults who are not eligible for haemotopoietic stem cell transplantation

- ► BY SUBCUTANEOUS INJECTION
- Adult: (consult local protocol)
- CONTRA-INDICATIONS Advanced malignant hepatic tumour
- CAUTIONS History of severe congestive heart failure unstable cardiac disease (consider cardiopulmonary assessment before and during treatment) - unstable pulmonary disease (consider cardiopulmonary assessment before and during treatment)
- INTERACTIONS → Appendix 1: azacitidine
- SIDE-EFFECTS
- ➤ Common or very common Alopecia · anaemia · anxiety · appetite decreased · arthralgia · asthenia · bone marrow disorders · chest pain · chills · confusion · constipation · dehydration · diarrhoea · dizziness · drowsiness · dyspnoea · fever · gastrointestinal discomfort · haemorrhage · headache · hypertension · hypokalaemia · hypotension · increased risk of infection · induration · inflammation ·

- insomnia · intracranial haemorrhage · laryngeal pain · leucopenia · malaise · muscle complaints · nausea · neutropenia · pain · renal failure · respiratory disorders · sepsis · skin reactions · stomatitis · syncope · thrombocytopenia · vomiting · weight decreased
- ▶ Uncommon Hepatic coma · hepatic failure · pyoderma gangrenosum · renal tubular acidosis
- ▶ Rare or very rare Injection site necrosis tumour lysis syndrome
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for 3 months after treatment in men or women.
- PREGNANCY Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (no information available)—monitor for adverse drug reactions.
 - **Dose adjustments** Manufacturer advises consider dose reduction—consult local protocol.

RENAL IMPAIRMENT

Dose adjustments [EvGr] Delay next treatment cycle if serum-creatinine or blood urea nitrogen greater than twice baseline value and above the upper level of normal until values return to normal or baseline, and then reduce dose by 50% on the next treatment cycle.

Reduce dose by 50% on the next treatment cycle if serum-bicarbonate concentration less than 20 mmol/litre.

MONITORING REQUIREMENTS

- Monitor liver function tests, serum creatinine, and serum bicarbonate before initiation of treatment and before each treatment cycle.
- Monitor full blood count before initiation of treatment, before each treatment cycle, and as clinically indicated.
- ▶ Monitor for bleeding.
- NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

NICE decisions

- Azactidine for treating acute myeloid leukaemia with more than 30% bone marrow blasts (July 2016) NICE TA399 Not recommended
- Azacitidine for the treatment of myelodysplastic syndromes, chronic myelomonocytic leukaemia and acute myeloid leukaemia (March 2011) NICE TA218 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for suspension for injection

► Azacitidine (Non-proprietary)

Azacitidine 100 mg Azacitidine 100mg powder for suspension for injection vials | 1 vial Pom £70.00-£321.00 (Hospital only)

➤ Vidaza (Bristol-Myers Squibb Pharmaceuticals Ltd)

Azacitidine 100 mg Vidaza 100mg powder for suspension for injection vials | 1 vial PoM £321.00

Capecitabine

27-Jul-2021

DRUG ACTION Capecitabine is metabolised to fluorouracil.

• INDICATIONS AND DOSE

Stage III colon cancer, adjuvant following surgery (monotherapy)

► BY MOUTH

 Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, recommended duration of treatment is 6 months, adjust dose according to tolerability—consult product literature

Stage III colon cancer, adjuvant following surgery (combination therapy)

- ► BY MOUTH
- Adult: 0.8-1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, recommended duration of treatment is 6 months, adjust dose according to tolerability—consult product literature

Metastatic colorectal cancer (monotherapy)

- ► BY MOUTH
- Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

Metastatic colorectal cancer (combination therapy)

- ► BY MOUTH
- Adult: 0.8-1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

Advanced gastric cancer (first-line treatment in combination with a platinum based regimen)

- ► BY MOUTH
- Adult: 0.8-1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, alternatively 625 mg/m² twice daily given continuously, adjust dose according to tolerability—consult product literature

Locally advanced or metastatic breast cancer (second-line treatment as monotherapy after failure of a taxane and anthracycline regimen or where further anthracycline treatment is not indicated) | Locally advanced or metastatic breast cancer (second-line treatment, in combination with docetaxel, where previous therapy included an anthracycline)

- ► BY MOUTH
- Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

MHRA/CHM ADVICE: 5-FLUOROURACIL (INTRAVENOUS), CAPECITABINE, TEGAFUR: DPD TESTING RECOMMENDED BEFORE INITIATION TO IDENTIFY PATIENTS AT INCREASED RISK OF SEVERE AND FATAL TOXICITY (OCTOBER 2020)

Patients with partial or complete dihydropyrimidine dehydrogenase (DPD) deficiency are at increased risk of severe and fatal toxicity during treatment with fluoropyrimidines. Healthcare professionals are advised to test all patients for DPD deficiency before initiating treatment and confirm their, including family, history of complete or partial DPD deficiency. Capecitabine is contra-indicated in patients with known complete DPD deficiency; in those with partial DPD deficiency, a reduced starting dose is recommended. Patients should be monitored for toxicity, particularly during the first cycle of treatment or after a dose increase: severe toxicity can occur even in those with negative test results for DPD deficiency. Healthcare professionals should also counsel patients on the benefits and risks of their treatment and ensure they are provided with the patient information leaflet.

- CONTRA-INDICATIONS Complete dihydropyrimidine dehydrogenase deficiency (increased risk of severe, lifethreatening, or fatal toxicity)—consult product literature
- CAUTIONS Diabetes mellitus diarrhoea or dehydration—consult product literature for guidance on dose modification and treatment interruption electrolyte disturbances history of angina pectoris history of arrhythmias history of significant cardiovascular disease nervous system disease partial dihydropyrimidine dehydrogenase deficiency—consult product literature

- INTERACTIONS → Appendix 1: capecitabine
- SIDE-EFFECTS
- ➤ Common or very common Alopecia · anaemia · appetite abnormal · asthenia · chest pain · constipation · cough · dehydration · depression · diarrhoea · dizziness · dry mouth · dyspnoea · embolism and thrombosis · eye disorders · eye inflammation · eye irritation · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hyperbilirubinaemia · increased risk of infection · insomnia · joint disorders · lethargy · malaise · nail disorder · nausea · neutropenia · oedema · pain · rhinorrhoea · sensation abnormal · skin reactions · stomatitis · taste altered · vomiting · weight decreased
- ▶ Uncommon Acute coronary syndrome · aphasia · arrhythmias · ascites · asthma · chills · confusion · diabetes mellitus · dysphagia · ear pain · facial swelling · haemolytic anaemia · hepatic disorders · hot flush · hydronephrosis · hypertension · hypertriglyceridaemia · hypokalaemia · hypotension · influenza like illness · ischaemic heart disease · leucopenia · libido decreased · lipoma · malnutrition · memory loss · movement disorders · muscle weakness · musculoskeletal stiffness · palpitations · pancytopenia · panic attack · peripheral coldness · peripheral neuropathy · photosensitivity reaction · pneumothorax · radiation recall reaction · sepsis · skin ulcer · syncope · thrombocytopenia · urinary disorders · vertigo · vision disorders
- ▶ Rare or very rare Cutaneous lupus erythematosus encephalopathy · QT interval prolongation · severe cutaneous adverse reactions (SCARs) · vasospasm
- ► Frequency not known Cardiomyopathy heart failure sudden death
- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises monitor liver function in mild-to-moderate dysfunction—consult product literature for guidance on treatment interruption; avoid in severe impairment.
- RENAL IMPAIRMENT EVGT Avoid if creatinine clearance less than 30 mL/minute. ♦

 Dose adjustments EVGT Reduce starting dose of 1.25 g/m² to 75% if creatinine clearance 30–50 mL/minute. ♦ See p. 21.
- MONITORING REQUIREMENTS
- ► Monitor plasma-calcium concentration.
- Monitor for eye disorders (including keratitis and corneal disorders).
- Severe skin reactions Monitor for symptoms of severe skin reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis)—permanently discontinue treatment immediately if symptoms occur.
- ► Hand-foot syndrome Monitor for symptoms of hand-foot syndrome—interrupt treatment if significant syndrome occurs and refer to product literature.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Bevacizumab in combination with capecitabine for the firstline treatment of metastatic breast cancer (August 2012)
 NICE TA263 Not recommended
- Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010) NICE TA212 Not recommended
- Capecitabine for the treatment of advanced gastric cancer (July 2010) NICE TA191 Recommended

- ► Capecitabine and tegafur with uracil for metastatic colorectal cancer (May 2003) NICE TA61 Recommended
- Capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes' C) colon cancer (April 2006) NICE TA100 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

► Capecitabine (Non-proprietary)

Capecitabine 150 mg Capecitabine 150mg tablets | 60 tablet PoM £30.00 DT = £30.00 | 60 tablet PoM £38.02 DT = £30.00 (Hospital only)

Capecitabine 300 mg Capecitabine 300mg tablets | 60 tablet PoM £76.04 DT = £76.04 (Hospital only)

Cladribine

22-Apr-2022

 DRUG ACTION Cladribine is a nucleoside analogue that is cytotoxic particularly to lymphocytes and monocytes, inhibiting both DNA synthesis and repair. Its effect on Band T-lymphocytes is thought to interrupt the cascade of immune events central to multiple sclerosis.

• INDICATIONS AND DOSE

Hairy cell leukaemia (specialist use only)

- ► BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: (consult product literature or local protocols)

B-cell chronic lymphocytic leukaemia (specialist use only)

- ► BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature or local protocols)

Highly active relapsing-remitting multiple sclerosis (specialist use only)

- ► BY MOUTH
- Adult: (consult product literature or local protocols)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CLADRIBINE FOR LEUKAEMIA: REPORTS OF PROGRESSIVE MULTIFOCAL ENCEPHALOPATHY (PML); STOP TREATMENT IF PML SUSPECTED (DECEMBER 2017)

• With intravenous use or subcutaneous use The MHRA is aware of 3 confirmed cases of progressive multifocal encephalopathy (PML) that developed 6 months to several years after cladribine treatment for haematological conditions. An association between cladribine and prolonged lymphopenia has been reported. PML should be considered in the differential diagnosis for patients with new or worsening neurological signs or symptoms. Patients should be monitored for signs and symptoms of new neurological dysfunction, and advised to seek urgent medical attention if they experience symptoms—stop treatment immediately if PML is suspected and ensure specialist investigation is received.

MHRA/CHM ADVICE: CLADRIBINE (MAVENCLAD®): NEW ADVICE TO MINIMISE RISK OF SERIOUS LIVER INJURY (MARCH 2022)

With oral use

A small number of cases of clinically significant liver injury have been reported during cladribine treatment for multiple sclerosis. Time to onset varied but most cases occurred within 8 weeks of starting the first treatment course. Some patients had underlying hepatic disorders or a history of drug-related hepatic injury; a causal mechanism had not been identified. Healthcare professionals are advised to:

check the patient's history for liver disorders;

- monitor liver function tests (including total bilirubin) before each treatment course in years 1 and 2, and during treatment if clinically indicated;
- urgently check liver function tests (including bilirubin) in patients with signs or symptoms of liver injury;
- discontinue or interrupt treatment in patients with hepatic dysfunction or unexplained increases in liver enzymes.

Patients and carers should be informed of the risk of serious liver injury and advised to seek immediate medical attention if signs of liver problems develop.

CONTRA-INDICATIONS

 With oral use Active chronic hepatitis · active chronic tuberculosis · active malignancy · HIV infection · immunocompromised patients

CALITIONS

GENERAL CAUTIONS Acute infection · use irradiated blood only (haematology consultation advised)

SPECIFIC CAUTIONS

- With intravenous use or subcutaneous use High tumour burden—consult product literature · symptomatic or severe bone marrow depression
- With oral use No prior exposure to varicella zoster virus prior malignancy (consider if potential benefit outweighs risk)

CAUTIONS, FURTHER INFORMATION

- Immunosuppressive effect of cladribine
- With intravenous use or subcutaneous use Cladribine has potent and prolonged myelosuppressive and immunosuppressive effects. Patients treated with cladribine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy should be considered in those at risk. Acute infections should be treated before initiating cladribine. To prevent potentially fatal transfusion-related graftversus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.
- Varicella zoster virus
- With oral use Manufacturer advises vaccination prior to initiation of therapy in patients who have no history of exposure to varicella zoster virus; delay treatment for 4–6 weeks after vaccination.
- INTERACTIONS → Appendix 1: cladribine

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Increased risk of infection SPECIFIC SIDE-EFFECTS
- ► Common or very common
- With intravenous use Anaemia · anxiety · appetite decreased · arrhythmias · arthritis · asthenia · chest pain · chills · confusion · conjunctivitis · constipation · cough · diarrhoea · dizziness · dyspnoea · febrile neutropenia · fever · flatulence · gastrointestinal discomfort · haemolytic anaemia · headache · hyperhidrosis · hypersensitivity · insomnia · joint disorders · malaise · muscle weakness · myalgia · myocardial ischaemia · nausea · neoplasms · oedema · pain · renal impairment · respiratory disorders · secondary malignancy · septic shock · skin reactions · thrombocytopenia · vomiting
- ▶ With oral use Alopecia · lymphopenia · rash
- With subcutaneous use Anaemia anxiety appetite decreased arrhythmias arthralgia arthritis asthenia bone marrow disorders chills constipation cough diarrhoea dizziness dyspnoea fever gastrointestinal disorders gastrointestinal pain haemorrhage headache hyperhidrosis hypotension immunosuppression insomnia lymphopenia malaise mucositis myalgia myocardial ischaemia nausea neutropenia oedema

pain · respiratory disorders · secondary malignancy · sepsis · skin reactions · thrombocytopenia · vomiting

- ▶ Uncommon
- With intravenous use Bone marrow disorders ·
 hypereosinophilia · level of consciousness decreased ·
 nerve disorders · neurotoxicity (with high doses) · paralysis
 · paraparesis · Stevens-Johnson syndrome · tumour lysis
 syndrome
- With oral use Liver injury
- With subcutaneous use Ataxia · cachexia · confusion · drowsiness · eye inflammation · haemolytic anaemia · paraesthesia · polyneuropathy
- Rare or very rare
- With intravenous use Heart failure
- ▶ With subcutaneous use Amyloidosis · cholecystitis · depression · dysphagia · epilepsy · graft versus host disease · heart failure · hepatic failure · hypereosinophilia · pulmonary embolism · renal failure · severe cutaneous adverse reactions (SCARs) · speech disorder · tumour lysis syndrome
- ► Frequency not known
- With oral use Malignancy
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during treatment and for at least 6 months after the last dose in men and women of childbearing potential.
- With oral use Manufacturer advises exclude pregnancy before each treatment course; if using a hormonal contraceptive, a barrier method should also be used for at least 4 weeks after the last dose of each course.
- PREGNANCY Manufacturer advises avoid—teratogenic in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.

BREAST FEEDING

- With intravenous use or subcutaneous use Manufacturer advises avoid during treatment and for 6 months after the last dose—no information available.
- With oral use Manufacturer advises avoid during treatment and for 1 week after the last dose—no information available
- HEPATIC IMPAIRMENT
- With intravenous use Manufacturer advises caution (limited information available).
- With subcutaneous use Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment (no information available).
- With oral use Manufacturer advises avoid in moderate to severe impairment (no information available).
- RENAL IMPAIRMENT
- With subcutaneous use Manufacturer advises caution in mild impairment; avoid in moderate-to-severe impairment.
- With oral use Manufacturer advises avoid in moderate-tosevere impairment—no information available.
- With intravenous use Manufacturer advises caution—limited information available.
- PRE-TREATMENT SCREENING
- With oral use Manufacturer advises exclude HIV infection, active or latent tuberculosis and active or latent hepatitis before starting each treatment course—delay treatment until infection adequately treated.
- MONITORING REQUIREMENTS
- Evgr Monitor for malignancy—follow routine cancer screening guidelines.
- Monitor for progressive multifocal leucoencephalopathy perform a baseline MRI.
- Monitor for haemolysis in patients who are or who become Coombs' positive.
- Haematological monitoring required—consult product literature.

- With intravenous use or subcutaneous use FVG Renal and hepatic function should be monitored periodically as clinically indicated.
- With oral use Evgr Hepatic function should be monitored
 —see Important safety information.
- DIRECTIONS FOR ADMINISTRATION Litak® for subcutaneous use only—no dilution required; manufacturer advises patients may self-administer, after appropriate training.

Leustat® for infusion use only.

- PRESCRIBING AND DISPENSING INFORMATION
- With oral use The manufacturer of Mavenclad® has provided a Prescriber Guide.
- HANDLING AND STORAGE

LITAK [®] Manufacturer advises store in a refrigerator $(2-8^{\circ}C)$.

LEUSTAT [®] Manufacturer advises store in a refrigerator $(2-8^{\circ}C)$.

PATIENT AND CARER ADVICE

- With oral use A patient guide should be provided.
 Driving and skilled tasks
 - With intravenous use or subcutaneous use Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and drowsiness.
- NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

NICE decisions

► Cladribine for treating relapsing-remitting multiple sclerosis (December 2019) NICE TA616 Recommended with restrictions Scottish Medicines Consortium (SMC) decisions

Clofarabine

13-Dec-2021

• INDICATIONS AND DOSE

Relapsed or refractory acute lymphoblastic leukaemia in patients who have received at least two previous regimens

- ► BY INTRAVENOUS INFUSION
- Adult 18-20 years: (consult local protocol)
- CAUTIONS Cardiac disease
- INTERACTIONS → Appendix 1: clofarabine
- SIDE-EFFECTS
- ► Common or very common Alopecia · anxiety · appetite decreased · arthralgia · capillary leak syndrome · chills · cough · dehydration · diarrhoea · dizziness · drowsiness · dyspnoea · fatigue · feeling abnormal · feeling hot · fever · flushing · gastrointestinal discomfort · haemorrhage · headache · hearing impairment · hepatic disorders ·

hyperbilirubinaemia · hyperhidrosis · hypersensitivity · hypotension · increased risk of infection · irritability · mucositis · multi organ failure · myalgia · nausea · neutropenia · oedema · oral disorders · pain · paraesthesia · pericardial effusion · peripheral neuropathy · psychiatric disorder · renal impairment · respiratory disorders · sepsis · sinusoidal obstruction syndrome · skin reactions · systemic inflammatory response syndrome · tachycardia · tremor · tumour lysis syndrome · vomiting · weight decreased

- ► Frequency not known Antibiotic associated colitis gastrointestinal disorders · hyponatraemia · pancreatitis · severe cutaneous adverse reactions (SCARs)
- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Manufacturer advises avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises use with caution in mild-to-moderate impairment; avoid in severe impairment-no information available.
- RENAL IMPAIRMENT [EVGr] Caution in mild to moderate impairment; avoid in severe impairment. Dose adjustments EvGr Reduce dose by 50% if creatinine clearance 30−59 mL/minute. M See p. 21.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

► Clofarabine (Non-proprietary)

Clofarabine 1 mg per 1 ml Clofarabine 20mg/20ml concentrate for solution for infusion vials | 1 vial Pom £1,326.18 (Hospital only)

Cytarabine

05-Oct-2021

• DRUG ACTION Cytarabine acts by interfering with

pyrimidine synthesis. • INDICATIONS AND DOSE

Induction of remission of acute myeloblastic leukaemia

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- Adult: (consult local protocol)

Lymphomatous meningitis

- **▶** BY INTRATHECAL INJECTION
- Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

Not all cytarabine preparations can be given by intrathecal injection—consult product literature.

- INTERACTIONS → Appendix 1: cytarabine
- SIDE-EFFECTS
- ► Common or very common Alopecia · anaemia · appetite decreased · consciousness impaired · diarrhoea · dysarthria · dysphagia · eye disorders · eye inflammation · eye stinging · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhagic conjunctivitis (consider prophylactic corticosteroid eye drops) · hyperuricaemia · leucopenia · nausea · oral disorders · renal impairment · skin reactions · thrombocytopenia · urinary retention · vasculitis · vision disorders · vomiting
- ▶ Uncommon Arthralgia dyspnoea headache increased risk of infection · myalgia · nerve disorders · pain · paralysis · pericarditis · sepsis · skin ulcer · throat pain
- ▶ Rare or very rare Arrhythmias
- ► Frequency not known Acute respiratory distress syndrome (ARDS) · amenorrhoea · ataxia · azoospermia · bone marrow disorders · cardiomyopathy · cerebellar dysfunction · chest

pain · coma · confusion · cytarabine syndrome · dizziness · drowsiness · haemorrhage · hepatic disorders · hyperbilirubinaemia · neurotoxicity · neurotoxicity rash ·

neutropenia · pancreatitis · personality change · pulmonary oedema · reticulocytopenia · rhabdomyolysis · seizure ·

- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution (increased risk of CNS toxicity).

Dose adjustments Manufacturer advises dose reductionconsult product literature.

MONITORING REQUIREMENTS

- ▶ Haematological monitoring Cytarabine is a potent myelosuppressant and requires careful haematological monitoring.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

Cytarabine (Non-proprietary)

Cytarabine 20 mg per 1 ml Cytarabine 500mg/25ml solution for injection vials | 1 vial Pom £19.50 (Hospital only) Cytarabine 100mg/5ml solution for injection vials | 5 vial PoM £20.48-£30.00 (Hospital only)

Cytarabine 500mg/25ml solution for injection Cytosafe vials 1 vial Pom £19.50 (Hospital only)

Cytarabine 100 mg per 1 ml Cytarabine 1g/10ml solution for injection Cytosafe vials | 1 vial Pom £39.00 (Hospital only) Cytarabine 1g/10ml solution for injection vials | 1 vial Pom £37.05-£40.00 (Hospital only)

Cytarabine 500mg/5ml solution for injection vials | 5 vial PoM £89.78-£100.00 (Hospital only)

Cytarabine 100mg/1ml solution for injection vials | 5 vial Pom £26.93 (Hospital only)

Cytarabine 2g/20ml solution for injection Cytosafe vials | 1 vial Pom £77.50 (Hospital only)

Cytarabine 2g/20ml solution for injection vials | 1 vial PoM £73.63-£79.00 (Hospital only)

Combinations available: Daunorubicin with cytarabine, p. 975

Decitabine

13-Aug-2021

• DRUG ACTION Decitabine is a pyrimidine analogue.

INDICATIONS AND DOSE

Treatment of newly diagnosed acute myeloid leukaemia in patients over 65 years of age who are not candidates for standard induction chemotherapy

- ► BY INTRAVENOUS INFUSION
- ► Elderly: (consult local protocol)
- CAUTIONS History of severe congestive heart failure history of unstable cardiac disease
- INTERACTIONS → Appendix 1: decitabine
- SIDE-EFFECTS
- ► Common or very common Anaemia · diarrhoea · epistaxis · fever · headache · hypersensitivity · increased risk of infection · leucopenia · nausea · neutropenia · sepsis · stomatitis · thrombocytopenia · vomiting
- ▶ Uncommon Acute febrile neutrophilic dermatosis pancytopenia
- ► Frequency not known Gastrointestinal disorders interstitial lung disease
- CONCEPTION AND CONTRACEPTION Men must avoid fathering a child during and for 3 months after treatment.

- PREGNANCY Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution—no information available.
- RENAL IMPAIRMENT Manufacturer advises caution if creatinine clearance less than 30 mL/minute—no information available. See p. 21.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Potassium, sodium

▶ Dacogen (Janssen-Cilag Ltd)

Decitabine 50 mg Dacogen 50mg powder for concentrate for solution for infusion vials | 1 vial PoM £970.86

Fludarabine phosphate

13-Aug-2021

INDICATIONS AND DOSE

Initial treatment of advanced B-cell chronic lymphocytic leukaemia (CLL) or after first line treatment in patients with sufficient bone-marrow reserves

- ► BY MOUTH
- Adult: 40 mg/m² for 5 days every 28 days, usually given for 6 cycles
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CONTRA-INDICATIONS Haemolytic anaemia
- CAUTIONS Increased susceptibility to skin cancer worsening of existing skin cancer

CAUTIONS, FURTHER INFORMATION

 Immunosuppression Fludarabine has a potent immunosuppresive effect. Patients treated with fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy can be used in those at risk. Co-trimoxazole is licensed for the prevention of pneumocystis infection.

To prevent potentially fatal transfusion-related graft-versus-host reaction, manufacturer advises only irradiated blood products should be administered.

- INTERACTIONS → Appendix 1: fludarabine
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ► Common or very common Anaemia · appetite decreased · asthenia · bone marrow depression (may be cumulative) · chills · cough · diarrhoea · fever · increased risk of infection · malaise · mucositis · nausea · neoplasms · nerve disorders · neutropenia · oedema · stomatitis · thrombocytopenia · vision disorders · vomiting
- ► Uncommon Autoimmune disorder confusion dyspnoea haemorrhage respiratory disorders tumour lysis syndrome
- ▶ Rare or very rare Agitation · arrhythmia · coma · heart failure · seizure · severe cutaneous adverse reactions (SCARs)

SPECIFIC SIDE-EFFECTS

- ► Common or very common
- ▶ With oral use Progressive multifocal leukoencephalopathy (PML) skin reactions viral infection reactivation
- With parenteral use Rash

▶ Uncommon

- With oral use Acquired haemophilia · crystalluria · electrolyte imbalance · haemolytic anaemia · hyperuricaemia · metabolic acidosis · renal failure
- ► Frequency not known
- With parenteral use Encephalopathy · intracranial haemorrhage
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (embryotoxic and teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- RENAL IMPAIRMENT Manufacturer advises avoid if creatinine clearance less than 30 mL/minute.
 Dose adjustments See p. 21.

Manufacturer advises reduce dose by up to 50% if creatinine clearance 30–70 mL/minute.

- MONITORING REQUIREMENTS
- ▶ Monitor for signs of haemolysis.
- ► Monitor for neurological toxicity.
- Assess creatinine clearance in patients over 65 years before treatment initiation.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises concentrate for intravenous injection or infusion must be diluted before administration (consult product literature).
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

Fludarabine phosphate 50 mg Fludara 50mg powder for solution for injection vials | 5 vial PoM £735.34 (Hospital only)

Fluorouracil

19-Jan-2021

INDICATIONS AND DOSE

Treatment of some solid tumours including gastrointestinal tract cancers and breast cancer | In combination with folinic acid in advanced colorectal cancer

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRA-ARTERIAL INFUSION
- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: 5-FLUOROURACIL (INTRAVENOUS), CAPECITABINE, TEGAFUR: DPD TESTING RECOMMENDED BEFORE INITIATION TO IDENTIFY PATIENTS AT INCREASED RISK OF SEVERE AND FATAL TOXICITY (OCTOBER 2020)

With intravenous use

Patients with partial or complete dihydropyrimidine dehydrogenase (DPD) deficiency are at increased risk of severe and fatal toxicity during treatment with fluoropyrimidines. Healthcare professionals are advised to test all patients for DPD deficiency before initiating treatment and confirm their, including family, history of complete or partial DPD deficiency. Fluorouracil is contra-indicated in patients with known complete DPD deficiency; in those with partial DPD deficiency, a reduced starting dose is recommended. Patients should be monitored for toxicity, particularly during the first cycle of treatment or after a dose increase; severe toxicity can occur even in those with negative test results for DPD deficiency. Therapeutic drug monitoring may improve clinical outcomes in patients receiving continuous fluorouracil infusions. Healthcare professionals should also counsel patients on the benefits and risks of their treatment and ensure they are provided with the patient information leaflet.

- CONTRA-INDICATIONS Bone marrow depression (after treatment with radiotherapy or other antineoplastic agents) - complete or near complete absence of dihydropyrimidine dehydrogenase activity (increased risk of severe, life-threatening, or fatal toxicity)—consult product literature - serious infections
- CAUTIONS History of heart disease · partial dihydropyrimidine dehydrogenase deficiency—consult product literature
- INTERACTIONS → Appendix 1: fluorouracil
- SIDE-EFFECTS
- ➤ Common or very common Agranulocytosis · alopecia · anaemia · anal inflammation · appetite decreased · asthenia · bone marrow disorders · bronchospasm · diarrhoea · gastrointestinal disorders · haemorrhage · hand and foot syndrome (long term use) · healing impaired · immunosuppression · increased risk of infection · ischaemic heart disease · leucopenia · malaise · mucositis · nausea · neutropenia · skin reactions · stomatitis · thrombocytopenia · vomiting
- ▶ Uncommon Arrhythmias · cardiac inflammation · cardiogenic shock · cardiomyopathy congestive · dehydration · dizziness · drowsiness · euphoric mood · eye disorders · eye inflammation · headache · heart failure · hepatic disorders · hypotension · movement disorders · myocardial infarction · nail discolouration · nail disorders · nerve disorders · ovulation disorder · parkinsonism · photosensitivity reaction · sepsis · spermatogenesis disorder · vision disorders
- Rare or very rare Biliary sclerosis · cardiac arrest · cerebral ischaemia · cholecystitis · coma · confusion · embolism and thrombosis · encephalopathy · fever · muscle weakness · peripheral vascular disease · renal failure · seizure · speech impairment · sudden cardiac death

- ▶ Frequency not known Vein discolouration
- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenic). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution (increased risk of hyperammonaemia and hyperammonaemic encephalopathy).
 Dose adjustments Manufacturer advises consider dose reduction.
- RENAL IMPAIRMENT Manufacturer advises caution (increased risk of hyperammonaemia and hyperammonaemic encephalopathy).
 Dose adjustments Manufacturer advises consider dose reduction.
- MONITORING REQUIREMENTS Manufacturer advises monitor cardiac function regularly
- HANDLING AND STORAGE Caution in handling—irritant to tissues.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

Fluorouracil (Non-proprietary)

Fluorouracil (as Fluorouracil sodium) 25 mg per 1 ml Fluorouracil 500mg/20ml solution for injection vials | 10 vial Pom £64.00 (Hospital only)

Fluorouracii (as Fluorouracii sodium) 50 mg per 1 ml Fluorouracii 1g/20ml solution for injection vials | 1 vial PoM £12.16 (Hospital only) | 1 vial PoM £12.80 | Fluorouracii 500mg/10ml solution for injection vials | 1 vial PoM £6.08-£6.40 (Hospital only) | 5 vial PoM £32.00 (Hospital only)

Solution for infusion

► Fluorouracil (Non-proprietary)

Fluorouracil (as Fluorouracil sodium) 25 mg per 1 ml Fluorouracil 2.5g/100ml solution for infusion vials | 1 vial PoM £32.00 (Hospital only)

Fluorouracil (as Fluorouracil sodium) 50 mg per 1 ml Fluorouracil 5g/100ml solution for infusion vials | 1 vial PoM £60.80-£64.00 (Hospital only)

Fluorouracil 2.5g/50ml solution for infusion vials | 1 vial PoM £30.40-£32.00 (Hospital only)

Gemcitabine

09-May-2021

INDICATIONS AND DOSE

First-line treatment for locally advanced or metastatic non-small cell lung cancer (as monotherapy in elderly patients and in palliative treatment; otherwise in combination with cisplatin) | Treatment of locally advanced or metastatic pancreatic cancer | Treatment of advanced or metastatic bladder cancer (in combination with cisplatin) | Treatment of locally advanced or metastatic epithelial ovarian cancer which has relapsed after a recurrence-free interval of at least 6 months following previous platinum-based therapy (in combination with carboplatin) | Treatment of metastatic breast cancer which has relapsed after previous chemotherapy including an anthracycline (in combination with paclitaxel)

- ► BY INTRAVENOUS INFUSION
- ► Adult: (consult local protocol)
- INTERACTIONS → Appendix 1: gemcitabine
- SIDE-EFFECTS
- Common or very common Alopecia · anaemia · appetite decreased · asthenia · back pain · bone marrow depression · chills · constipation · cough · diarrhoea · drowsiness · dyspnoea · fever · haematuria · headache · hyperhidrosis ·

influenza like illness • insomnia • leucopenia • myalgia • nausea • neutropenia • oedema • oral disorders • proteinuria • rhinitis • skin reactions • thrombocytopenia • vomiting

- ► Uncommon Respiratory disorders
- Rare or very rare Capillary leak syndrome · hypotension · myocardial infarction · posterior reversible encephalopathy syndrome (PRES) · severe cutaneous adverse reactions (SCARs) · skin ulcer · thrombocytosis
- Frequency not known Arrhythmias · colitis ischaemic gangrene · haemolytic uraemic syndrome · heart failure · hepatic disorders · pulmonary oedema · radiation injuries · renal failure · stroke · vasculitis
 - SIDE-EFFECTS, FURTHER INFORMATION Gemcitabine should be discontinued if signs of microangiopathic haemolytic anaemia occur.
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during treatment. Men must avoid fathering a child during and for 6 months after treatment.
- PREGNANCY Avoid (teratogenic in animal studies). See Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution (limited information available).
- RENAL IMPAIRMENT Manufacturer advises caution.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

- Gemcitabine for the treatment of pancreatic cancer (May 2001) NICE TA25 Recommended
- ► Gemcitabine for the treatment of metastatic breast cancer (January 2007) NICE TA116 Recommended with restrictions
- Bevacizumab in combination with gemcitabine and carboplatin for treating the first recurrence of platinumsensitive advanced ovarian cancer (May 2013) NICE TA285 Not recommended
- Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389 Not recommended
- Paclitaxel as albumin-bound nanoparticles with gemcitabine for untreated metastatic pancreatic cancer (September 2017)
 NICE TA476 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Gemcitabine (Non-proprietary)

Gemcitabine (as Gemcitabine hydrochloride) 10 mg per 1 ml Gemcitabine 1.6g/160ml infusion bags | 1 bag PoM £140.00 (Hospital only)

Gemcitabine 2.2g/220ml infusion bags | 1 bag Pom £200.00 (Hospital only)

Gemcitabine 2g/200ml infusion bags | 1 bag PoM £180.00 (Hospital only)

Gemcitabine 1.2g/120ml infusion bags | 1 bag Pom £120.00 (Hospital only)

Gemcitabine 1.8g/180ml infusion bags | 1 bag PoM £160.00 (Hospital only)

Gemcitabine 1.4g/140ml infusion bags | 1 bag PoM \(\) (Hospital only)
Gemcitabine (as Gemcitabine hydrochloride) 38 mg per

1 ml Gemcitabine 1g/26.3ml concentrate for solution for infusion vials | 1 vial PoM £175.05 (Hospital only)

Gemcitabine 200mg/5.26ml concentrate for solution for infusion vials | 1 vial PoM £33.69 (Hospital only)

Gemcitabine 2g/52.6ml concentrate for solution for infusion vials | 1 vial PoM £336.66 (Hospital only)

Gemcitabine (as Gemcitabine hydrochloride) 100 mg per

1 ml Gemcitabine 2g/20ml concentrate for solution for infusion vials | 1 vial PoM £26.86 (Hospital only)

Gemcitabine 1g/10ml concentrate for solution for infusion vials | 1 vial Pom £13.09 (Hospital only)

Gemcitabine 200mg/2ml concentrate for solution for infusion vials | 1 vial PoM £6.40 (Hospital only)

Powder for solution for infusion

Gemcitabine (Non-proprietary)

Gemcitabine (as Gemcitabine hydrochloride)

200 mg Gemcitabine 200mg powder for solution for infusion vials | 1 vial PoM £32.00-£32.55 (Hospital only)

Gemcitabine (as Gemcitabine hydrochloride) 1 gram Gemcitabine 1g powder for solution for infusion vials | 1 vial PoM £162.00-£162.76 (Hospital only)

Gemcitabine (as Gemcitabine hydrochloride) 2 gram Gemcitabine 2g powder for solution for infusion vials | 1 vial Pom £324.00 (Hospital only)

Mercaptopurine

09-May-2021

(6-Mercaptopurine)

• INDICATIONS AND DOSE

Severe acute Crohn's disease | Maintenance of remission of Crohn's disease | Ulcerative colitis

- BY MOUTH
- Adult: 1-1.5 mg/kg daily, some patients may respond to lower doses

Acute leukaemias | Chronic myeloid leukaemia

- ► BY MOUTH USING TABLETS
- Adult: Initially 2.5 mg/kg daily, adjusted according to response, alternatively initially 50–75 mg/m² daily, adjusted according to response
- ► BY MOUTH USING ORAL SUSPENSION
- Adult: Initially 25–75 mg/m² daily, adjusted according to response

DOSE ADJUSTMENTS DUE TO INTERACTIONS

 Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

DOSE EQUIVALENCE AND CONVERSION

- Mercaptopurine tablets and Xaluprine® oral suspension are not bioequivalent, haematological monitoring is advised when switching formulations.
- UNLICENSED USE Not licensed for use in severe ulcerative colitis and Crohn's disease.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Mercaptopurine has been confused with mercaptamine; care must be taken to ensure the correct drug is prescribed and dispensed.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

CONTRA-INDICATIONS

- When used for non-cancer indications Absent thiopurine methyltransferase activity
- CAUTIONS Reduced thiopurine methyltransferase activity CAUTIONS, FURTHER INFORMATION
- Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Those with reduced TPMT activity may be treated under specialist supervision.
- INTERACTIONS → Appendix 1: mercaptopurine
- SIDE-EFFECTS
- ► Common or very common Anaemia · appetite decreased · bone marrow depression · diarrhoea · hepatic disorders · hepatotoxicity (more common at high doses) · leucopenia · nausea · oral disorders · pancreatitis · thrombocytopenia · yomiting
- ▶ Uncommon Arthralgia · fever · increased risk of infection · neutropenia · rash

- ▶ Rare or very rare Alopecia · face oedema · intestinal ulcer · neoplasms · oligozoospermia
- Frequency not known Photosensitivity reaction
- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenic). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution (risk of increased exposure).

Dose adjustments Manufacturer advises consider dose reduction

- RENAL IMPAIRMENT [EVGr] Use with caution. (M) **Dose adjustments** EvGr Consider dose reduction.
- PRE-TREATMENT SCREENING Manufacturer advises consider measuring thiopurine methyltransferase (TPMT) activity before starting mercaptopurine therapy.
- MONITORING REQUIREMENTS Monitor liver function.
- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include raspberry.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

Oral suspension

EXCIPIENTS: May contain Aspartame

Xaluprine (Nova Laboratories Ltd)

Mercaptopurine 20 mg per 1 ml Xaluprine 20 mg/ml oral suspension | 100 ml PoM £170.00 DT = £170.00

Tablet

► Mercaptopurine (Non-proprietary)

Mercaptopurine 10 mg Mercaptopurine 10mg tablets 100 tablet PoM € DT = £457.52

Mercaptopurine 50 mg Mercaptopurine 50mg tablets 25 tablet PoM £49.15 DT = £10.22

Hanixol (Fontus Health Ltd)

Mercaptopurine 50 mg Hanixol 50mg tablets | 25 tablet PoM £34.39 DT = £10.22

Methotrexate

19-Oct-2021

 DRUG ACTION Methotrexate inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines.

INDICATIONS AND DOSE

Severe Crohn's disease

- ► BY INTRAMUSCULAR INJECTION
- Adult: Initially 25 mg once weekly until remission induced; maintenance 15 mg once weekly

Maintenance of remission of severe Crohn's disease

- ► BY MOUTH
- Adult: 10-25 mg once weekly

Moderate to severe active rheumatoid arthritis

- ► BY MOUTH
- Adult: 7.5 mg once weekly, adjusted according to response; maximum 20 mg per week

Severe active rheumatoid arthritis

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INTECTION
- Adult: Initially 7.5 mg once weekly, then increased in steps of 2.5 mg once weekly, adjusted according to response; maximum 25 mg per week

Neoplastic diseases

- ▶ BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION. OR BY INTRA-ARTERIAL INFUSION. OR BY INTRAMUSCULAR INJECTION, OR BY INTRATHECAL INTECTION
- Adult: (consult product literature)

Severe psoriasis unresponsive to conventional therapy (specialist use only)

- ► BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 2.5–10 mg once weekly, then increased in steps of 2.5-5 mg, adjusted according to response, dose to be adjusted at intervals of at least 1 week; usual dose 7.5-15 mg once weekly, stop treatment if inadequate response after 3 months at the optimum dose; maximum 30 mg per week
- UNLICENSED USE Not licensed for use in severe Crohn's disease.

IMPORTANT SAFETY INFORMATION

NHS NEVER EVENT: OVERDOSE OF METHOTREXATE FOR NON-**CANCER TREATMENT (JANUARY 2018)**

Patients given methotrexate, by any route, for noncancer treatment should not be given more than their intended weekly dose.

WEEKLY DOSING

Note that the dose is a weekly dose. To avoid error with low-dose methotrexate, it is recommended that:

- the patient or their carer is carefully advised of the dose and frequency and the reason for taking methotrexate and any other prescribed medication (e.g. folic acid);
- · only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the patient or their carer is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

MHRA/CHM ADVICE: METHOTREXATE ONCE-WEEKLY FOR AUTOIMMUNE DISEASES: NEW MEASURES TO REDUCE RISK OF FATAL OVERDOSE DUE TO INADVERTENT DAILY INSTEAD OF WEEKLY DOSING (SEPTEMBER 2020)

With oral use

Methotrexate should be taken once a week in autoimmune conditions and, less commonly, in some cancer therapy regimens. A European review highlighted continued reports of inadvertent overdose due to more frequent dosing (including daily administration), which has resulted in some fatalities. Subsequently, new measures have been implemented by the MHRA. Prescribers are advised to:

- ensure patients can understand and comply with onceweekly dosing before prescribing methotrexate, decide with the patient which day of the week they will take their dose, and note this down in full on the prescription;
- consider the patient's overall polypharmacy burden when deciding which formulation to prescribe, especially in those with a high pill burden;
- inform patients and carers of the potentially fatal risk of accidental overdose if methotrexate is taken more frequently than once a week, and reaffirm that it should not be taken daily:
- advise patients and carers to seek immediate medical attention if overdose is suspected.

The MHRA further advises dispensers to remind patients of the once-weekly dosing and the risks of potentially fatal overdose if they take more than directed. Where possible, the day of the week for dosing should be written in full in the space provided on the outer packaging. Patients should be encouraged to write the day of the week for dosing in their patient alert card and carry it with them.

- CONTRA-INDICATIONS Active infection · ascites · immunodeficiency syndromes · significant pleural effusion
- CAUTIONS Photosensitivity—psoriasis lesions aggravated by UV radiation (skin ulceration reported) - dehydration (increased risk of toxicity) - diarrhoea - extreme caution in blood disorders (avoid if severe) - peptic ulceration (avoid in active disease) - risk of accumulation in pleural effusion or ascites—drain before treatment - ulcerative colitis ulcerative stomatitis

CAUTIONS, FURTHER INFORMATION

- Blood count Bone marrow suppression can occur abruptly; factors likely to increase toxicity include advanced age, renal impairment, and concomitant use with another antifolate drug (e.g. trimethoprim). Manufacturer advises a clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy.
- Gastro-intestinal toxicity Manufacturer advises withdraw treatment if stomatitis or diarrhoea develops—may be first sign of gastro-intestinal toxicity.
- Liver toxicity Liver cirrhosis reported. Manufacturer advises treatment should not be started or should be discontinued if any abnormality of liver function or liver biopsy is present or develops during therapy. Abnormalities can return to normal within 2 weeks after which treatment may be recommenced if judged appropriate. Persistent increases in liver transaminases may necessitate dose reduction or discontinuation.
- Pulmonary toxicity Pulmonary toxicity may be a special problem in rheumatoid arthritis. Manufacturer advises patients to seek medical attention if dyspnoea, cough or fever develops; monitor for symptoms at each visit discontinue if pneumonitis suspected.
- INTERACTIONS → Appendix 1: methotrexate
- SIDE-EFFECTS
- ► Common or very common
- With intrathecal use Necrotising demyelinating leukoencephalopathy • neurotoxicity
- With oral use Anaemia appetite decreased diarrhoea drowsiness fatigue gastrointestinal discomfort headache increased risk of infection leucopenia nausea oral disorders respiratory disorders skin reactions throat ulcer thrombocytopenia vomiting
- With parenteral use Anaemia appetite decreased chest pain cough diarrhoea drowsiness dyspnoea fatigue fever gastrointestinal discomfort headache leucopenia malaise nausea oral disorders respiratory disorders skin reactions throat complaints thrombocytopenia

► Uncommon

- With oral use Agranulocytosis · alopecia · arthralgia · bone marrow disorders · chills · confusion · cystitis · depression · diabetes mellitus · dysuria · fever · gastrointestinal disorders · haemorrhage · healing impaired · hepatic disorders · myalgia · neoplasms · nephropathy · osteoporosis · photosensitivity reaction · rheumatoid arthritis aggravated · seizure · severe cutaneous adverse reactions (SCARs) · vasculitis · vertigo · vulvovaginal disorders
- With parenteral use Agranulocytosis · alopecia · arthralgia · bone marrow disorders · confusion · cystitis · depression · diabetes mellitus · drug toxicity · dysuria · gastrointestinal

disorders · haemorrhage · healing impaired · hepatic disorders · increased risk of infection · lipoatrophy · local reaction · myalgia · neoplasms · osteoporosis · pain · paraesthesia · photosensitivity reaction · rheumatoid arthritis aggravated · seizure · severe cutaneous adverse reactions (SCARs) · sterile abscess · vasculitis · vertigo · vulvovaginal disorders

► Rare or very rare

- With oral use Azotaemia · brain oedema · cognitive impairment · conjunctivitis · cough · dyspnoea · eosinophilia · gynaecomastia · hypotension · immune deficiency · infertility · insomnia · lymphadenopathy · meningitis aseptic · menstrual disorder · mood altered · muscle weakness · nail discolouration · neutropenia · oligozoospermia · pain · pancreatitis · paresis · pericardial disorders · pericarditis · proteinuria · psychosis · radiation injuries · renal impairment · retinopathy · sensation abnormal · sepsis · sexual dysfunction · speech impairment · stress fracture · taste metallic · telangiectasia · tinnitus · visual impairment
- With parenteral use Apnoea · asthma-like conditions · azotaemia · conjunctivitis · embolism and thrombosis · eosinophilia · gynaecomastia · hypotension · immune deficiency · infertility · influenza like illness · insomnia · lymphadenopathy · meningism · meningitis aseptic · menstrual disorder · mood altered · muscle weakness · nail discolouration · necrosis · neutropenia · paralysis · pericardial disorders · pericarditis · proteinuria · reactivation of infection · renal impairment · retinopathy · sepsis · sexual dysfunction · sperm abnormalities · stress fracture · taste altered · telangiectasia · vision disorders
- ► Frequency not known
- ▶ With oral use Encephalopathy
- With parenteral use Aphasia chills cognitive disorder defective oogenesis dizziness hemiparesis leukoencephalopathy metabolic change mucositis nephropathy pancreatitis pulmonary oedema skin ulcer sudden death tinnitus

SIDE-EFFECTS, FURTHER INFORMATION Give folic acid to reduce side-effects. Folic acid decreases mucosal and gastrointestinal side-effects of methotrexate and may prevent hepatotoxicity; there is no evidence of a reduction in haematological side-effects.

Withdraw treatment if ulcerative stomatitis develops may be first sign of gastro-intestinal toxicity.

Treatment with folinic acid (as calcium folinate) may be required in acute toxicity.

- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for at least 6 months after treatment in men and women.
- PREGNANCY Avoid (teratogenic; fertility may be reduced during therapy but this may be reversible).
- BREAST FEEDING Discontinue breast-feeding—present in milk.
- HEPATIC IMPAIRMENT When used for malignancy, avoid in severe hepatic impairment—consult local treatment protocol for details. Avoid with hepatic impairment in non-malignant conditions—dose-related toxicity.
- RENAL IMPAIRMENT Risk of nephrotoxicity at high doses.

 [EvGr] Use with caution; avoid in severe impairment.

 Dose adjustments [EvGr] Reduce dose (consult product literature).

 (**)
- PRE-TREATMENT SCREENING Exclude pregnancy before treatment.

Patients should have full blood count and renal and liver function tests before starting treatment.

MONITORING REQUIREMENTS

► In view of reports of blood dyscrasias (including fatalities) and liver cirrhosis with low-dose methotrexate patients should:

- have full blood count and renal and liver function tests repeated every 1-2 weeks until therapy stabilised, thereafter patients should be monitored every 2-3 months.
- be advised to report all symptoms and signs suggestive of infection, especially sore throat
- ▶ Local protocols for frequency of monitoring may vary.
- ► Treatment with folinic acid (as calcium folinate) may be required in acute toxicity.
- PRESCRIBING AND DISPENSING INFORMATION Folinic acid following methotrexate administration helps to prevent methotrexate-induced mucositis and myelosuppression.

The licensed routes of administration for parenteral preparations vary—further information can be found in the product literature for the individual preparations.

 PATIENT AND CARER ADVICE Patients and their carers should be warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort and dark urine), and respiratory effects (e.g. shortness of breath).

Patients should be advised to avoid self-medication with over-the-counter aspirin or ibuprofen.

Patients should be counselled on the dose, treatment booklet, and the use of NSAIDs.

 With oral use A patient alert card should be provided to patients on once-weekly dosing—see also Important safety information

Methotrexate treatment booklets Methotrexate treatment booklets should be issued where appropriate.

In **England**, **Wales**, and **Northern Ireland**, they are available for purchase from:

3M Security Print and Systems Limited Gorse Street, Chadderton Oldham

OL9 9QH

BNF 84

Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores.

NHS Hospitals can order supplies from www.nhsforms.co. uk or by emailing nhsforms@mmm.com.

In **Scotland**, treatment booklets can be obtained by emailing stockorders.dppas@theapsgroup.com or by fax on 0131 629 9967.

These booklets include advice for adults taking oral methotrexate for inflammatory conditions, and a section for recording results of blood tests and dosage information.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

Tablet

Methotrexate (as Methotrexate sodium) 2 mg per 1 ml Methotrexate 2mg/ml oral solution sugar free sugar-free 35 ml PoM £129.66 DT = £95.00 sugar-free | 65 ml PoM £125.00 DT = £125.00

 Jylamvo (Esteve Pharmaceuticals Ltd) Methotrexate (as Methotrexate sodium) 2 mg per 1 ml Jylamvo 2mg/ml oral solution sugar-free | 60 ml PoM £112.50

Nelarabine

10-Nov-2020

INDICATIONS AND DOSE

T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in patients who have relapsed or who are refractory after receiving at least two previous regimens

- **▶** BY INTRAVENOUS INFUSION
- Adult: (consult local protocol)
- CAUTIONS Previous or concurrent craniospinal irradiation (increased risk of neurotoxicity) • previous or concurrent intrathecal chemotherapy (increased risk of neurotoxicity)
- INTERACTIONS → Appendix 1: nelarabine
- SIDE-EFFECTS
- ► Common or very common Abdominal pain · anaemia · appetite decreased · arthralgia · asthenia · confusion · constipation · cough · diarrhoea · dizziness · drowsiness · dyspnoea · electrolyte imbalance · fever · gait abnormal · headache · hyperbilirubinaemia · hypotension · increased risk of infection · leucopenia · memory loss · movement disorders · muscle weakness · myalgia · nausea · neutropenia · oedema · pain · peripheral neuropathy · respiratory disorders · seizures · sensation abnormal · sepsis · stomatitis · taste altered · thrombocytopenia · tremor · tumour lysis syndrome · vision blurred · vomiting
- ▶ Rare or very rare Rhabdomyolysis
- ► Frequency not known Progressive multifocal leukoencephalopathy (PML)
 - SIDE-EFFECTS, FURTHER INFORMATION If neurotoxicity occurs, treatment should be discontinued.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months

- after treatment in men and women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- MONITORING REQUIREMENTS
- ▶ Neurotoxicity Close monitoring for neurological events is strongly recommended-discontinue if neurotoxicty
- PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling or driving).

 NATIONAL FUNDING/ACCESS DECISIONS For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- ▶ Nelarabine (Atriance®) for the treatment of patients with Tcell acute lymphoblastic leukaemia (T-ALL) and T-cell lymphoblastic lymphoma (T-LBL) (April 2008) SMC No. 454/08 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

Atriance (Novartis Pharmaceuticals UK Ltd) Nelarabine 5 mg per 1 ml Atriance 250mg/50ml solution for infusion vials 1 vial Pom £222.00 (Hospital only)

Pemetrexed

13-Aug-2021

• DRUG ACTION Pemetrexed inhibits thymidylate transferase and other folate-dependent enzymes.

• INDICATIONS AND DOSE

Treatment of unresectable malignant pleural mesothelioma which has not previously been treated with chemotherapy (in combination with cisplatin) First-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (in combination with cisplatin) Second-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (monotherapy) | Maintenance treatment in locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following platinum-based chemotherapy (monotherapy)

- ▶ BY INTRAVENOUS INFUSION
- Adult: (consult local protocol)
- CAUTIONS Diabetes · history of cardiovascular disease · prophylactic folic acid supplementation required (consult product literature) • prophylactic vitamin B₁₂ supplementation required (consult product literature)
- INTERACTIONS → Appendix 1: pemetrexed
- SIDE-FEEECTS
- ► Common or very common Appetite decreased fatigue mucositis · nausea · neuropathy sensory · oedema · pain · renal disorder • skin reactions • stomatitis • vomiting
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during treatment. Men must avoid fathering a child during and for 6 months after treatment.
- PREGNANCY Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs
- BREAST FEEDING Discontinue breast-feeding.
- RENAL IMPAIRMENT Manufacturer advises avoid if creatinine clearance less than 45 mL/minute-no information available. See p. 21.

NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

NICE decisions

BNF 84

- Pemetrexed for the treatment of non-small cell lung cancer (August 2007) NICE TA124 Not recommended
- Pemetrexed for the first-line treatment of non-small cell lung cancer (September 2009) NICE TA181 Recommended with restrictions
- Pemetrexed maintenance treatment for non-squamous nonsmall cell lung cancer after pemetrexed and cisplatin (August 2016) NICE TA402 Recommended with restrictions
- Pemetrexed for the maintenance treatment of non-small-cell lung cancer (updated August 2017) NICE TA190 Recommended
- Pemetrexed for the treatment of malignant pleural mesothelioma (January 2008) NICE TA135 Recommended with restrictions

Scottish Medicines Consortium (SMC) decisions

- Pemetrexed (Alimta®) as monotherapy for the second line treatment of patients with locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (September 2008) SMC No. 342/07 Recommended with restrictions
- Pemetrexed (Alimta®) for the first line treatment of patients with locally advanced or metastatic non-small cell lung cancer (February 2010) SMC No. 531/09 Recommended with restrictions
- Pemetrexed (Alimta[®]) as monotherapy for the maintenance treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology in patients whose disease has not progressed immediately following platinum-based chemotherapy (December 2014) SMC No. 770/12 Recommended
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Pemetrexed (Non-proprietary)

Pemetrexed 25 mg per 1 ml Pemetrexed 1g/40ml concentrate for solution for infusion vials | 1 vial PoM £1,280.00-£1,600.00 (Hospital only)

Pemetrexed 100mg/4ml concentrate for solution for infusion vials | 1 vial PoM £128.00-£160.00 (Hospital only)
Pemetrexed 500mg/20ml concentrate for solution for infusion vials |

Pemetrexed 500mg/20ml concentrate for solution for infusion vials 1 vial Pom £640.00-£800.00 (Hospital only)

Pemetrexed 850mg/34ml concentrate for solution for infusion vials | 1 vial Pom £1,360.00 (Hospital only)

Tegafur with gimeracil and oteracil

27-Jul-202

 DRUG ACTION Tegafur is a prodrug of fluorouracil.
 Gimeracil inhibits the degradation of fluorouracil and oteracil decreases the activity of fluorouracil in normal gastrointestinal mucosa.

INDICATIONS AND DOSE

Treatment of advanced gastric cancer when used in combination with cisplatin

- ► BY MOUTH
- Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

MHRA/CHM ADVICE: 5-FLUOROURACIL (INTRAVENOUS), CAPECITABINE, TEGAFUR: DPD TESTING RECOMMENDED BEFORE INITIATION TO IDENTIFY PATIENTS AT INCREASED RISK OF SEVERE AND FATAL TOXICITY (OCTOBER 2020)

Patients with partial or complete dihydropyrimidine dehydrogenase (DPD) deficiency are at increased risk of severe and fatal toxicity during treatment with fluoropyrimidines. Healthcare professionals are advised to test all patients for DPD deficiency before initiating treatment and confirm their, including family, history of complete or partial DPD deficiency. Tegafur with gimeracil and oteracil is contra-indicated in patients with known complete DPD deficiency; in those with partial DPD deficiency, a reduced starting dose is recommended. Patients should be monitored for toxicity, particularly during the first cycle of treatment or after a dose increase; severe toxicity can occur even in those with negative test results for DPD deficiency. Healthcare professionals should also counsel patients on the benefits and risks of their treatment and ensure they are provided with the patient information leaflet.

- CONTRA-INDICATIONS Complete dihydropyrimidine dehydrogenase deficiency (increased risk of severe, lifethreatening, or fatal toxicity)—consult product literature
- CAUTIONS Partial dihydropyrimidine dehydrogenase deficiency
- INTERACTIONS → Appendix 1: tegafur
- SIDE-EFFECTS
- ➤ Common or very common Anaemia · appetite abnormal · asthenia · constipation · cough · decreased leucocytes · dehydration · diarrhoea · dizziness · dry mouth · dysphagia · dyspnoea · electrolyte imbalance · embolism and thrombosis · eye disorders · eye inflammation · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hearing impairment · hiccups · hyperbilirubinaemia · hypertension · hypoproteinaemia · hypotension · insomnia · nausea · nerve disorders · neutropenia · oral disorders · taste altered · thrombocytopenia · vision disorders · vomiting
- ▶ Uncommon Aerophagia · allergic rhinitis · alopecia · angina pectoris · anxiety · aphasia · arrhythmias · ascites · breast abnormalities · burping · cerebrovascular insufficiency · chills · coagulation disorders · confusion · depression · drowsiness · dysphonia · ear discomfort · encephalopathy · eosinophilia · fever · gout · hallucination · heart failure · hemiparesis · hyperaemia · hyperglobulinaemia · hyperglycaemia · hyperlipidaemia · hypertrichosis · hypovolaemic shock · increased leucocytes · increased risk of infection · joint disorders · limb discomfort · loss of consciousness · memory loss · movement disorders · mucositis · muscle complaints · muscle weakness · myocardial infarction · nail disorders · nasal complaints · neoplasm complications · nephrotoxicity · oedema ·

oesophageal spasm · pain · palpitations · pancytopenia · pericardial effusion · personality disorder · renal impairment · seizure · sensation abnormal · sepsis · sexual dysfunction · skin reactions · smell altered · sweat changes · syncope · throat complaints · thrombocytosis · tremor · urinary frequency increased · vasodilation · vertigo · weight changes

- ▶ Rare or very rare Acute hepatic failure · chest discomfort · feeling cold · interstitial lung disease · local swelling · malaise · multi organ failure · pancreatitis acute · photosensitivity reaction · rhabdomyolysis · severe cutaneous adverse reactions (SCARs)
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for up to 6 months after treatment
- PREGNANCY Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- RENAL IMPAIRMENT EVGF Avoid if creatinine clearance less than 30 mL/minute.

Dose adjustments EvGr Reduce dose if creatinine clearance 30–50 mL/minute—consult product literature. See p. 21.

• NATIONAL FUNDING/ACCESS DECISIONS
For full details see funding body website

Scottish Medicines Consortium (SMC) decisions

- Tegafur with gimeracil and oteracil (Teysuno®) for the treatment of advanced gastric cancer when given in combination with cisplatin (September 2012) SMC No. 802/12 Recommended with restrictions
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 23

► Teysuno (Nordic Pharma Ltd)

Gimeracil 4.35 mg, Oteracil (as Oteracil potassium) 11.8 mg, Tegafur 15 mg Teysuno 15mg/4.35mg/11.8mg capsules | 126 capsule PoM £279.72

Gimeracil 5.8 mg, Oteracil (as Oteracil potassium) 15.8 mg, Tegafur 20 mg Teysuno 20mg/5.8mg/15.8mg capsules | 84 capsule PoM £248.40

Tioguanine

10-May-2021

(Thioguanine)

• INDICATIONS AND DOSE

Acute leukaemia | Chronic myeloid leukaemia

- ► BY MOUTH
- Adult: 100-200 mg/m² daily, can be given at various stages of treatment in short-term cycles

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

- CAUTIONS Thiopurine methyltransferase status CAUTIONS, FURTHER INFORMATION
- Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Those with reduced TPMT activity may be treated under specialist supervision.
- Long-term therapy Manufacturer advises long-term therapy is no longer recommended because of the high risk of liver toxicity.

- INTERACTIONS → Appendix 1: tioguanine
- SIDE-EFFECTS
- Common or very common Bone marrow failure gastrointestinal disorders - hepatic disorders hyperbilirubinaemia - hyperuricaemia - hyperuricosuria nodular regenerative hyperplasia - oesophageal varices sinusoidal obstruction syndrome - splenomegaly stomatitis - thrombocytopenia - uric acid nephropathy weight increased
- ▶ Frequency not known Photosensitivity reaction
- CONCEPTION AND CONTRACEPTION Ensure effective contraception during treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenicity reported when men receiving tioguanine have fathered children). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution.
 Dose adjustments Manufacturer advises consider dose reduction.
- RENAL IMPAIRMENT

Dose adjustments EvGr Consider dose reduction.

- PRE-TREATMENT SCREENING Manufacturer advises consider measuring thiopurine methyltransferase (TPMT) activity before starting tioguanine therapy.
- MONITORING REQUIREMENTS Monitor liver function weekly—discontinue if liver toxicity develops.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Tablet

► Tioguanine (Non-proprietary)

Tioguanine 40 mg Tioguanine 40mg tablets | 25 tablet \boxed{PoM} £76.35-£109.57 DT = £76.35

Trifluridine with tipiracil

29-Jun-2021

 DRUG ACTION Trifluridine is an antimetabolite that interferes with cancer cell DNA synthesis and inhibits cell proliferation; tipiracil is a TPase inhibitor that boosts trifluridine concentrations.

• INDICATIONS AND DOSE

Metastatic gastric cancer (specialist use only) | Metastatic colorectal cancer (specialist use only)

- ► BY MOUTH
- Adult: Initially 35 mg/m² twice daily (max. per dose 80 mg), given on days 1 to 5 and days 8 to 12 of each 28-day cycle, for dose adjustments or treatment interruption due to side-effects—consult product literature

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 962.

SIDE-EFFECTS

- ➤ Common or very common Alopecia · anaemia · appetite decreased · asthenia · constipation · decreased leucocytes · diarrhoea · dyspnoea · fever · gastrointestinal discomfort · hyperbilirubinaemia · hypoalbuminaemia · increased risk of infection · malaise · mucositis · nausea · neutropenia · oedema · oral disorders · peripheral neuropathy · skin reactions · taste altered · thrombocytopenia · urine abnormalities · vomiting · weight decreased
- ► Uncommon Angina pectoris · anxiety · arrhythmia · ascites · bile duct disorders · cancer pain · cataract · conjunctivitis ·

cough · cystitis · dehydration · dizziness · dry eye · dysphonia · ear discomfort · electrolyte imbalance · embolism · erythropenia · feeling of body temperature change · flushing · gastrointestinal disorders · gout · haemorrhage · headache · hepatotoxicity · hyperglycaemia · hyperhidrosis · hypertension · hypotension · increased leucocytes · insomnia · joint disorders · lethargy · menstrual disorder · muscle complaints · muscle weakness · nail disorder · neurotoxicity · neutropenic sepsis · oropharyngeal pain · pain · palpitations · pancreatitis acute · pancytopenia · photosensitivity reaction · pulmonary embolism (including fatal cases) · QT interval prolongation · renal failure · respiratory disorders · rhinorrhoea · sensation abnormal · septic shock (including fatal cases) · syncope · urinary disorder · vertigo · vision disorders

- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception in women of child-bearing potential and in men with a partner of child-bearing potential, during treatment and for 6 months after stopping treatment. Manufacturer also advises use of an additional barrier method in women using hormonal contraceptives—effect of trifluridine with tipiracil on hormonal contraception unknown.
- PREGNANCY Manufacturer advises avoid unless essential—reproductive toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in moderate to severe impairment (limited information available).
- RENAL IMPAIRMENT EVGT Caution in moderate to severe impairment—monitor haematological toxicities more frequently. Avoid in end-stage renal disease—no information available.

 Dose adjustments EvGT Dose reduction in severe

impairment—consult product literature.

- MONITORING REQUIREMENTS Manufacturer advises obtain baseline blood cell counts before and during treatment; monitor closely for myelosuppression. Manufacturer also advises monitoring for proteinuria before and during treatment.
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website

NICE decisions

BNF 84

- Trifluridine with tipiracil for previously treated metastatic colorectal cancer (August 2016) NICE TA405 Recommended with restrictions
- Trifluridine with tipiracil for treating metastatic gastric cancer or gastro-oesophageal junction adenocarcinoma after 2 or more therapies (January 2021) NICE TA669 Not recommended

Scottish Medicines Consortium (SMC) decisions

- Trifluridine / tipiracil (Lonsurf®) for the treatment of adult patients with metastatic colorectal cancer who have been previously treated with, or are not considered candidates for, available therapies including fluoropyrimidine-, oxaliplatin- and irinotecan-based chemotherapies, anti vascular endothelial growth factor agents, and anti-epidermal growth factor receptor agents (February 2017) SMC No. 1221/17 Recommended
- ➤ Trifluridine/tipiracil (Lonsurf®) as monotherapy for the treatment of adult patients with metastatic gastric cancer including adenocarcinoma of the gastroesophageal junction, who have been previously treated with at least two prior systemic treatment regimens for advanced disease (June 2021) SMC No. SMC2329 Recommended with restrictions

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

► Lonsurf (Servier Laboratories Ltd)

Tipiracii (as Tipiracii hydrochloride) 6.14 mg, Trifluridine

15 mg Lonsurf 15mg/6.14mg tablets | 20 tablet [PoM 5500.00

ANTINEOPLASTIC DRUGS > CYTOTOXIC ANTIBIOTICS AND RELATED SUBSTANCES

Bleomycin

28-Jul-2020

• INDICATIONS AND DOSE

Squamous cell carcinoma | Metastatic germ cell cancer | Non-Hodgkin's lymphoma

- ► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRA-ARTERIAL INFUSION, OR BY LOCAL INFILTRATION
- Adult: (consult product literature or local protocols)
- CONTRA-INDICATIONS Acute pulmonary infection significantly reduced lung function
- CAUTIONS Caution in handling—irritant to tissues · risk factors for pulmonary toxicity
- INTERACTIONS → Appendix 1: bleomycin
- SIDE-EFFECTS
- ➤ Common or very common Alopecia · angular stomatitis · appetite decreased · chills · fever (after administration) · haemorrhage · headache · interstitial pneumonia · leucopenia · malaise · nail discolouration · nail disorder · nausea · pain · pulmonary fibrosis (dose-related) · scleroderma · skin reactions · stomatitis · vomiting · weight decreased
- ▶ Uncommon Diarrhoea · dizziness · hepatocellular injury oliguria · shock · urinary disorders · vein wall hypertrophy · venous stenosis

SIDE-EFFECTS, FURTHER INFORMATION Progressive pulmonary fibrosis Progressive pulmonary fibrosis is dose-related, and may occur at lower doses in the elderly. Suspicious chest X-ray changes are an indication to stop therapy with this drug.

Pulmonary toxicity Patients who have received bleomycin may be at risk of developing pulmonary toxicity if exposed to high inspired oxygen concentrations, for example peri-operatively, or during lung function testing.

- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenic and carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962
- BREAST FEEDING Discontinue breast feeding.
- RENAL IMPAIRMENT

Dose adjustments Reduce dose by half if serum creatinine 177–354 micromol/litre; reduce dose further if serum-creatinine greater than 354 micromol/litre.

- PRESCRIBING AND DISPENSING INFORMATION To conform to the European Pharmacopoeia vials previously labelled as containing '15 units' of bleomycin are now labelled as containing 15 000 units. The amount of bleomycin in the vial has not changed.
- MEDICINAL FORMS No licensed medicines listed.

Mitomycin

28-Jul-2020

INDICATIONS AND DOSE

Recurrent superficial bladder tumours (bladder instillation)

- ► BY INTRAVESICAL INSTILLATION
- Adult: (consult product literature or local protocols)

Upper gastro-intestinal cancer (specialist use only) | Breast cancer (specialist use only) | Non-small cell lung cancer (specialist use only) | Pancreatic cancer (specialist use only)

- **▶** BY INTRAVENOUS INJECTION
- Adult: (consult product literature or local protocols)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: MITOMYCIN-C KYOWA® 40 MG RESTRICTED TO INTRAVESICAL ADMINISTRATION ONLY FOR TREATMENT OF SUPERFICIAL BLADDER CANCER (SEPTEMBER 2019)

Sub-visible particles, at levels above specification limits, have been observed after reconstitution of *Mitomycin-C Kyowa* [®] 40 mg; healthcare professionals are advised that its use has been restricted to the treatment of superficial bladder cancer via the intravesical route only.

- CAUTIONS Caution in handling—irritant to tissues
- INTERACTIONS → Appendix 1: mitomycin
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Common or very common Bone marrow disorders · coughcystitis · haemorrhage · leucopenia · malaise · nausea · respiratory disorders · skin reactions · thrombocytopenia · vomiting
- ▶ Uncommon Alopecia appetite decreased diarrhoea fever
- ► Rare or very rare Hepatic disorders increased risk of infection renal disorder sepsis
- Frequency not known Anaemia · asthenia · chills · constipation · eosinophilia · erythropenia · flushing · hypertension · lethargy · neutropenia · oedema · weight decreased

SPECIFIC SIDE-EFFECTS

- ► Common or very common
- With intravenous use Dyspnoea extravasation necrosis glomerulonephropathy nephropathy renal impairment
- With intravesical use Hypersensitivity · urinary disorders · urinary tract discomfort
- ▶ Uncommon
- With intravenous use Mucositis · oral disorders
- ▶ Rare or very rare
- With intravenous use Haemolytic anaemia · heart failure · pulmonary hypertension · sinusoidal obstruction syndrome
- With intravesical use Acute kidney injury · bladder disorders · urinary tract stenosis
- ► Frequency not known
- With intravenous use Abdominal discomfort · cholecystitis · injection site necrosis · neoplasms · shock · urine abnormalities · vascular pain
- With intravesical use Pain penile necrosis proteinuria pulmonary oedema ulcer
 - SIDE-EFFECTS, FURTHER INFORMATION Mitomycin is usually administered at 6-weekly intervals because it causes delayed bone-marrow toxicity. Prolonged use may result in a cumulative effect.
- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Pentostatin

02-Aug-2021

• INDICATIONS AND DOSE

Hairy cell leukaemia (initiated in specialist centres)

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
 Adult: To be given on alternate weeks (consult product literature)
- INTERACTIONS → Appendix 1: pentostatin
- SIDE-EFFECTS
- ► Common or very common Agranulocytosis · alopecia · amenorrhoea · anaemia · angina pectoris · anxiety · appetite decreased · arrhythmias · arthritis · asthenia · asthma · atrioventricular block · blood disorder · bone disorder · bone marrow disorders · breast mass · cardiac arrest · chest pain · chills · confusion · constipation · cough · deafness · death · depersonalisation · depression · diarrhoea · dizziness · drowsiness · dry eye · dry mouth · dysarthria · dysphagia · dyspnoea · ear pain · electrolyte imbalance · embolism and thrombosis · emotional lability · eosinophilia · eye disorders · eye inflammation · eye pain · febrile neutropenia · fever · fluid imbalance · flushing · gastrointestinal discomfort · gastrointestinal disorders · gout · graft versus host disease · haemorrhage · hallucination · hangover · headaches · heart failure · hostility · hyperbilirubinaemia · hyperglycaemia · hyperhidrosis · hypersensitivity · hypertension · hypotension · increased risk of infection · influenza like illness · jaundice · joint disorders · leucopenia · lymphadenopathy · malaise · memory loss · meningism · movement disorders · muscle complaints · nausea · neoplasms · nephrolithiasis · nephropathy · nerve disorders · neurotoxicity (withhold or discontinue) · oedema · oral disorders · pain · paralysis · pericardial effusion · photosensitivity reaction · pulmonary oedema · rash (withhold if severe) • renal impairment • respiratory disorders · retinopathy · seborrhoea · seizures · sensation abnormal · sepsis · sexual dysfunction · skin reactions · sleep disorders · splenomegaly · syncope · taste altered · thinking abnormal · thrombocytopenia · tinnitus · tremor · urinary disorders · urogenital disorder · vasculitis · vertigo · vision disorders · vomiting · weight changes Uncommon Angioedema · antibiotic associated colitis ·
- capillary leak syndrome · cardiomyopathy · cystitis · haemolytic anaemia · mucositis · multi organ failure · myocardial infarction · pure red cell aplasia · transplant failure · tumour lysis syndrome
- ▶ Rare or very rare Dementia · pericarditis · shock · Stevens-Johnson syndrome · systemic inflammatory response syndrome
 - SIDE-EFFECTS, FURTHER INFORMATION Pentostatin can cause myelosuppression, immunosuppression, and a number of other side-effects that may be severe.

Treatment should be withheld in patients who develop a severe rash, and withheld or discontinued in patients showing signs of neurotoxicity.

- CONCEPTION AND CONTRACEPTION Manufacturer advises that men should not father children during and for 6 months after treatment.
- PREGNANCY Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Manufacturer advises caution (limited information available).
- RENAL IMPAIRMENT EVGF Avoid if creatinine clearance less than 60 mL/minute. (M) See p. 21.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

Nipent (Pfizer Ltd)

Pentostatin 10 mg Nipent 10mg powder for solution for injection vials | 1 vial Pom £734.21 (Hospital only)

ANTINEOPLASTIC DRUGS > PLANT ALKALOIDS

Trabectedin

04-Aug-2021

INDICATIONS AND DOSE

Treatment of advanced soft-tissue sarcoma when treatment with anthracyclines and ifosfamide has failed or is contra-indicated | Treatment of relapsed platinumsensitive ovarian cancer (in combination with pegylated liposomal doxorubicin)

- **▶** BY INTRAVENOUS INFUSION
- Adult: (consult product literature or local protocols)
- CONTRA-INDICATIONS Elevated creatine phosphokinase (consult product literature)
- INTERACTIONS → Appendix 1: trabectedin
- SIDE-FEEECT
- ► Common or very common Alopecia · anaemia · appetite decreased · arthralgia · asthenia · back pain · constipation · cough · dehydration · diarrhoea · dizziness · dyspnoea · fever · flushing · gastrointestinal discomfort · headache · hyperbilirubinaemia · hypersensitivity · hypokalaemia · hypotension · infection · insomnia · leucopenia · mucositis · myalgia · nausea · neutropenia · oedema · paraesthesia · peripheral neuropathy · skin reactions · stomatitis · taste altered · thrombocytopenia · vomiting · weight decreased
- ▶ Uncommon Capillary leak syndrome · septic shock
- ▶ Rare or very rare Hepatic failure
- Frequency not known Extravasation necrosis rhabdomyolysis

SIDE-EFFECTS, FURTHER INFORMATION A corticosteroid, such as dexamethasone by intravenous infusion, must be given 30 minutes before therapy for its antiemetic and hepatoprotective effects (consult product literature).

- CONCEPTION AND CONTRACEPTION Effective contraception recommended during and for at least 3 months after treatment in women and during and for at least 5 months after treatment in men.
- PREGNANCY See Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Manufacturer advises avoid breastfeeding during and for 3 months after treatment.
- HEPATIC IMPAIRMENT Manufacturer advises caution (risk of increased exposure).

Dose adjustments Manufacturer advises consider dose reduction.

 RENAL IMPAIRMENT EvGr Avoid monotherapy if creatinine clearance less than 30 mL/minute. Avoid combination regimens if creatinine clearance less than 60 mL/minute.
 ♠ See p. 21.

MONITORING REQUIREMENTS

- Specific haematological, renal and hepatic parameters must be monitored and within certain ranges prior to starting treatment and repeated weekly during the first 2 cycles and at least once between treatments in subsequent cycles—consult product literature for full details.
- Monitor for signs and symptoms of rhabdomyolysis (including myelotoxicity, severe liver function disorder, renal failure, muscle weakness or pain)—monitor creatine phosphokinase closely and discontinue treatment (consult product literature).
- NATIONAL FUNDING/ACCESS DECISIONS
 For full details see funding body website
 NICE decisions
- ► Trabectedin for the treatment of advanced soft tissue sarcoma (updated February 2021) NICE TA185 Recommended
- Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389 Not recommended

Scottish Medicines Consortium (SMC) decisions

 Trabectedin (Yondelis®) for the treatment of adult patients with advanced soft tissue sarcoma, after failure of anthracyclines and ifosfamide, or who are unsuited to receive these agents (November 2020) SMC No. SMC2283 Recommended

 MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► Yondelis (Immedica Pharma AB)

Trabectedin 250 microgram Yondelis 0.25mg powder for concentrate for solution for infusion vials | 1 vial PoM £363.00 (Hospital only)

Trabectedin 1 mg Yondelis 1 mg powder for concentrate for solution for infusion vials | 1 vial Pom £1,366.00 (Hospital only)

ANTINEOPLASTIC DRUGS > PLATINUM COMPOUNDS

Carboplatin

16-Aug-2021

• INDICATIONS AND DOSE

Advanced ovarian cancer [epithelial origin]|Small cell lung cancer|High risk seminoma (stage I) testicular germ cell tumours [adjuvant treatment]

- ► BY INTRAVENOUS INFUSION
- Adult: (consult product literature)
- INTERACTIONS → Appendix 1: platinum compounds
- SIDE-EFFECTS
- ➤ Common or very common Alopecia · anaemia · asthenia · cardiovascular disorder · constipation · diarrhoea · gastrointestinal discomfort · haemorrhage · hypersensitivity · increased risk of infection · leucopenia · mucosal abnormalities · musculoskeletal disorder · nausea · neutropenia · ototoxicity · peripheral neuropathy · reflexes decreased · respiratory disorders · sensation abnormal · skin reactions · taste altered · thrombocytopenia · urogenital disorder · vision disorders · vomiting
- ► Rare or very rare Angioedema
- ► Frequency not known Appetite decreased · bone marrow failure · chills · dehydration · embolism · encephalopathy · extravasation necrosis · fever · haemolytic uraemic syndrome · heart failure · hypertension · hyponatraemia · hypotension · injection site necrosis · malaise · pancreatitis

- stomatitis stroke treatment related secondary malignancy tumour lysis syndrome
- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- PREGNANCY Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.
- BREAST FEEDING Discontinue breast-feeding.
- RENAL IMPAIRMENT Manufacturer advises avoid if creatinine clearance less than 30 mL/minute (consult product literature), see p. 21.
 Dose adjustments Manufacturer advises to reduce dose
- PRESCRIBING AND DISPENSING INFORMATION Carboplatin can be given in an outpatient setting.
